Henry B. Spencer, director of the Division of Purchases, United States Railroad Administration, presented a paper before the New York Railroad Club September 19, which was printed in the *Railway Age* of September 26, and which was largely in the nature of suggestions as to improvements in the purchasing and stores departments organizations, based upon observations of the practices of the roads under federal control. Mr. Spencer recommends that the purchasing, storing, handling, disbursing, etc., of all material and supplies be placed under the direction of an executive officer. That there is great need for better organization and methods on some roads is indicated by the comparative data as to the amount of stores carried by two unnamed roads, which are said to be typical of two extremes. Unfortunately, the discussion of the paper did not deal with the larger aspect of Mr. Spencer's recommendations. There is bound to be a wide difference of opinion over such a radical suggestion. Its success will, of course, depend upon getting a big enough man for the job and of having, at the same time, the very best methods for keeping an accurate record of the material and its movement. A perpetual or continuous inventory is essential in order that the exact condition may be ascertained promptly and at any time. Such records rightly used and accompanied by close co-operation between the purchasing and stores departments and those departments using material will bring results no matter what form of organization is followed. The question is to develop that form of organization which, under the peculiar conditions on a given road, will develop these ideal conditions.

Weak and Strong Coal Mines

The weak and strong road problem of the railroads is not unique; just at present an analogous problem is presented in the coal mining industry. Just as freight rates which will yield the Denver & Rio Grande or the Chicago Great Western a bare existence, will yield the Union Pacific or the Chicago, Burlington & Quincy a large profit, so the price per ton for coal which will little more than pay miners' wages in operations where the seams of coal are thin and difficult to work, will yield a very large profit—William G. McAdoo, former director general of railroads, speaks of 200 per cent—to other mines with broad, easily workable seams of coal. Just as in earlier discussions of the railroad problem there have been advocates of government ownership on the ground that the public and not private investors should profit by the earnings of the advantageously situated road, so there are now advocates of government ownership of the coal mines, in order that the public rather than the operators shall get the profit from rich, cheaply workable coal. One of the important factors in convincing the public of the undesirability of government ownership of railroads has been the quality of the service rendered during government operation. Service is not so important a factor in the coal situation, but another reason which applies to the operation and ownership of coal mines, as well as to the operation and ownership of railroads, namely, the higher cost of government business than of private business, has been demonstrated convincingly by government operation of the railroads. This country needs an increased, not a diminishing output of coal. Apparently the most practical as well as the cheapest way in the long run to get it, is to accept economic law, and permit owners and operators of cheaply workable coal mines to make the profit which their advantage over other coal mine operators gives them.

The Remarkable Revival of Railroad Freight Traffic

LAST SPRING the freight traffic of the railways of the United States declined to the smallest amount that it had since 1915. In October, 1919, the amount of freight traffic handled was the largest ever handled in any single month in the history of American railroads except August, 1918.

These statements show the remarkable way in which the industry and commerce of the country recovered after the slump which was caused by the cessation of the war in Europe. In February, 1919, the number of tons carried one mile by the railroads was only 25,700,000. This was the smallest month's business that had been handled since 1915. In October, 1919, the number of tons carried one mile was 40,300,000, an increase over February of 57 per cent. A comparison between February and October is unfair, however, because of the fact that October has a larger number of days than February. But March and October have the same number of days; and the business handled in October was 40 per cent greater than it was in March. October is always one of the busiest months of the year on the railroads and the traffic handled in October, 1919, was 1.3 per cent greater than that handled in October, 1918, which held the record for October up to this year.

The coal strike caused a sharp decline in the amount of business handled by the railroads in November. The rapid increase of freight business from February to October, however, and the fact that the business handled in October broke all records, show how large is the productive capacity of the country at the present time, and are very reliable indications of how large the production will be after the coal strike is over. Looking at the matter from a transportation standpoint, while the railroads have succeeded in handling 1.. per cent more freight than in October, 1918, they did not handle quite as much freight as they did in August, 1918 and it taxed their facilities to the limit to handle what they did.

With the productive capacity of the country so great as it is shown to be by the immense volume of business it began to give the railways as soon as it had partially recovered from the effects of the war, and with the difficulty that the railroads experienced in handling that business, the fact is made increasingly clear that under any system of operation the railroads for some years to come are going to find it impossible to handle all the business the country can give them unless there is a sharp industrial depression.

While this fact is so plain, and while it makes so obvious the necessity for the immediate revival of the expansion of railroad facilities, the government at Washington continues to refrain from adopting any definite and constructive measures for the solution of the railroad problem. President Wilson has announced that he will return the railways to their owners on January 1, but Congress has passed no legislation to prepare for their return.

Some people continue to predict that the failure of the administration and Congress to deal constructively with the subject of railroad *regulation* will make successful private management of railroads unavoidable. If the administration and Congress should show no more capacity to deal with the

railroad problems which would arise under public *ownership* than they show in dealing with those which arise under public *regulation,* it is obvious that government management would not be made any greater success than the government regulation has been and is being made.

The Dunkirk Collision

THE INTERSTATE COMMERCE COMMISSION issued on November 26 a report, dated September 2, and signed by W. P. Borland, chief of the Bureau of Safety, on the rear collision of passenger trains at Dunkirk, N. Y., July 1, when eight passengers were killed in a New York Central express train. The report says that the investigation was conducted in conjunction with the Public Service Commission of New York state, but that commission has published no report on it.*

The cause of this collision and the problem of preventing such disasters in the future, have been discussed by many writers. Different phases of the question have been touched upon in the *Railway Age.* In a letter printed July 18, page 92, S. G. Neal presented the claims of the "Automatic Straight Air" brake. In the issue of August 15, page 291, E. W. Pratt gave his experience with certain safeguards. In the issue of July 25 there was an editorial note. The question why no action was taken by any person on the train back of the engine is uppermost in many minds. C. W. Hoisington, of Wichita Falls, Tex., writes: "The engineman sounded the signal for brakes. How many trainmen realize and fully appreciate this signal? It is plain that many do not. Why? Simply because the trainmaster who employs them does not make them acquainted with its true importance. It may be admitted that the average brakeman could not have stopped that train in the distance available; but it would seem that two men, with the assistance of the conductor and the baggageman could have at least slackened the speed to such an extent as to have mitigated the consequences. How about the conductor's valve? How many trainmen are taught that on the first intimation of an impending collision or derailment they should pull the cord?"

Another correspondent asks, "Were the brakes applied, on the cars, either by hand or by pulling the conductor's valve? If they were applied did the application indicate full air pressure? If not applied, did the trainmen hear the whistle? If they did not hear it, why? Over how many cars can the New York Central standard whistle be heard by men in a train moving at high speed"?

It is pertinent to consider these questions. They suggest a great change which has taken place in railroad practice since the air brake became universal, but which we recognize only tacitly. By reason of the general and complete reliance on the air brake, hand brakes have not only fallen into disuse, so far as passenger trains are concerned, but, as an emergency safeguard, have become impossible. The task of keeping trainmen keyed up to the high state of vigilance which prevailed in the old days is practically out of the question. The rule books still keep up the fiction, but the practice has no respect for the rule books. Our correspondent asks if the trainmen of Train 7 heard the short blast of the whistle calling for the setting of the hand brakes; and if they did, why they did not respond. Mr. Borland's report settles it that the single blast was sounded, and was several times repeated; but it also gives the facts which explain the uselessness of the whistle signal in such an emergency. Ten witnesses testify to hearing the whistle stop-signal given by train No. 7, most of them saying that it was repeated three or more times; yet the conductor of the train (sitting in the seventh car) did not hear these repeated blasts; the baggageman did not hear them; the "second conductor," riding in the same car with the conductor, heard them, but took no action; and Brakeman Colmorgan heard them, but did nothing more than to "ask the conductors what they meant"! The second conductor "did not pay any attention" to what this brakeman said. The flagman of this train, when approaching Dunkirk, "heard more whistling than usual" and interpreted it as the engineman's warning to pedestrians to get off the track.

Discussion as to the amount of noise made by the train, or the size of the whistle on the locomotive, will not develop any profitable information. The conductor and the baggageman say that they did not hear the sounds; but it is a safe conclusion that if they had heard them no quicker action would have been taken. The hand brakes on heavy vestibuled cars are a slow and clumsy resource at best and nobody expects anything from them. The conductor's valve is the last (and only) resort. That does its duty if it is used; but the vital question is to get it used promptly. Our problem is that of the human agency; and the big problem, from that standpoint, is that of training common human beings to act as quickly in an emergency which may occur once in two or twenty years, as they would in an everyday procedure which has become second nature. The desideratum is to educate *all* of the employees on a train—including porters, waiters and cooks—to open the air valve as quickly, when they perceive that the train is in danger, as the engineman would open it if he saw danger. The most cursory comparison of the conditions in the cars with the conditions surrounding the engineman is sufficient to show the almost insuperable difficulty of doing this. Only the most regular and efficient attention to a thorough drill of all hands could accomplish even an approach to this theoretical safeguard.

It is true, as our correspondent suggests, that the ideal trainmaster, with unlimited resources at his command, might train a force of men up to a much higher degree of efficiency than is now to be found, even on the best roads. But, with conditions as they are, the practical operating officer must feel a strong sympathy toward the trainmaster who frankly admits that his trainmen depend wholly on the engineman to keep their train from running into danger. And our remedial measures must be directed to insuring to the engineman every possible means of doing this.

The statement of facts in this case, as given by the trainmen, has the earmarks of the kind of "testimony" so familiar at such hearings, where the directness of the questions and the positive and unequivocal nature of the replies (as recorded in the printed report) leave, as a final impression on the hearer's mind, the feeling that the real situation in the testifiers' minds is neither clear nor simple; that what they heard, or did, or thought, or said, in the crucial moment, was confused or indefinite, or could not be clearly described, and that what they said on the witness stand was correspondingly untrustworthy. Their conduct had fallen far short of their duties (duties as outlined by the questioner after his study of the rule book) and their narrative, two hours or two days afterward, thus was inevitably almost or quite worthless. Thus we have here, as in countless other cases, a puzzle for the investigator which he cannot solve. For an effective remedy he must direct his efforts in other directions.

*This collision was reported in the *Railway Age* of July 4, 1919, page 40. Westbound passenger train No. 41, second section, standing at the station, about 2 a. m., was run into at the rear by westbound passenger No. 7, moving at about 40 miles an hour; 12 persons were killed and 111 injured. A trespasser, riding between the tender and the leading car, is believed to have closed the angle cock in the air brake pipe, on the assumption that thereby he could stop the train. The present report summarizes the testimony of trainmen and other competent witnesses, 10 of whom heard a whistle signal given by the engineman of No. 7, calling for the application of hand brakes. Some of these witnesses said the whistle was sounded four times, some seven times and others an indefinite number. The report contains five photographic pictures of the wreck, but contains no conclusion except that the collision was caused by the closing of the angle cock.

Results of the Operation of the English Railroads

THE NET RESULT of the operation of the railroads of Great Britain by the government from August 5, 1914, to June 30, 1919, has been a deficit after the payment of the guaranteed rental to the private companies of £21,911,000 ($109,555,000). It is estimated, however, that in the fiscal year ending March 31 next, the deficit for that twelve months alone will be £45,000,000 ($225,000,000). It was not until 1918 that net operating revenues fell below the amount necessary to meet the government guarantee of rental. Since that time, however, a decline in gross revenues and a large increase in operating expenses have reduced the net operating income to but a fraction of the amount of the rental guarantees.

Under date of October 31, 1919, Sir Eric Geddes, minister of transportation, has issued a "white paper" giving the figures for revenue and expenses of railroads of Great Britain and Ireland during the period of governmental control. The total operating revenues for this period (five years lacking one month), was £749,065,000, ($3,745,325,000). The total net operating income was £220,810,000 ($1,104,050,000), and the total guaranteed rental was £222,721,000 ($1,113,605,000) leaving a net loss to the government of £21,911,000 ($109,555,000). The rental guaranteed by the government was based on the revenues and expenses of 1913. In 1913 the railroads of Great Britain earned £118,701,000 ($593,505,000) and operating expenses including taxes amounted to £75,127,000 ($375,635,000), leaving a net operating income of £43,574,000 ($217,870,000) available for interest and dividends. At the outbreak of the war earnings increased rapidly. The railroads under government operation made no charges for government service, but in all of the figures quoted above there is included an estimated amount as revenue from government service. Thus, in the period from August 5 to December 31, 1914, £3,500,000 ($17,500,00) is credited as revenue from government traffic; in 1915, £10,279,000 ($51,395,000); in 1916, £20,649,000 ($103,245,000); in 1917, £35,699,000 ($178,495,000); in 1918, £41,917,000 ($209,585,000), and in the first half of 1918, £12,919,000 ($64,595,000).

In addition to performing railway service the government took over the operation of railroad hotels, steam boats, docks, etc. In each year since 1914 there has been a deficit from these operations amounting to £158,000 ($790,000) in 1915, but to £2,190,000 ($10,950,000) in 1918. Furthermore, the government has paid the interest on additional capital since the beginning of the war. This interest amounted to £543,000 ($2,715,000) in 1915, and had reached the rate of £1,000,000 ($5,000,000) a year by June 30, 1919.

Included in the government statement of railroad expenses for the period of government operation is an amount covering arrears of maintenance. Apparently the government has been fairly liberal in making its estimate of arrears, although to prove this we would have to have available more detail than is covered in the ministry of transportation "white paper."

Maintenance of way in the test year, 1913, cost £11,818,000 ($59,090,000). A somewhat similar proportionate amount was spent in the last five months of 1914, but a charge of £800,000 ($4,000,000) was made for arrears. In 1915, £11,598,000 ($57,990,000) was spent on maintenance of way, and £2,985,000 ($14,925,000) was charged for arrears. In 1916, £11,924,000 ($59,620,000) was spent and £5,056,000 ($25,280,000) was charged for arrears. In 1917, £13,266,000 ($66,330,000) was spent, and £6,282,000 ($31,410,000) charged for arrears. In 1918, £16,145,000 ($80,725,000) was spent, and £6,485,000 ($32,425,000) charged for arrears; and in the first six months of 1919 £10,224,000 ($51,120,000) was spent and £1,357,000 ($6,785,000) was charged for arrears.

It should be born in mind that the track structures, etc., of English railroads are on the average more nearly permanent structures than the average on American railroads. The evil effects of delayed maintenance are slower, therefore, in making themselves apparent. The final result, however, is similar to that which has resulted from deferred maintenance on American railroads. Assuming that the estimates of arrears is based on impartial opinion, the jump in maintenance expense from less than £12,000,000 ($60,000,000) in 1916 to more than £13,000,000 ($65,000,000) in 1917, and to more than £16,000,000 ($90,000,000) in 1918, with a steadily increasing, not decreasing, amount chargeable for arrears is significant. The increased cost of labor and materials would not probably account entirely for the course taken by cost in maintenance of way and charges for arrears.

Figures for maintenance of equipment show similar conditions. Maintenance of equipment in 1913 cost £13,258,000 ($66,290,000) In the five months of 1914 quite a little less than a proportionate amount was spent and £315,000 ($1,575,000) only was charged for arrears. In 1915 the amount spent was £500,000 ($2,500,000) more than in 1913, but £2,477,000 ($12,385,000) was charged for arrears. In 1916 £15,212,000 ($76,060,000) was spent and £3,203,000 ($16,015,000) was charged for arrears. In 1917 £17,621,000 ($88,105,000) was spent and £3,668,000 ($18,340,000) was charged for arrears. In 1918 £21,888,000 ($109,440,000) was spent and £3,327,000 ($16,635,000) was charged for arrears, and in the first half of 1919 £14,157,000 ($70,785,000) was spent and £358,000 ($1,790,000) was charged for arrears. It will be noted that the jump in maintenance of equipment expenditures came a year earlier than in maintenance of way expenses, which is what would be expected if we are correct in assuming that a part of the large increase in maintenance expenses and charges in the later years of government operation are the result of accumulated deferred maintenance.

The English divide their transportation expenses into two general classes, those pertaining to the cost of running locomotives and those pertaining to train and station costs. Notwithstanding the fact that fuel is the largest item of locomotive running expenses, the so-called traffic expenses, which include train and station expenses, more than kept pace with the increase in locomotive running expenses. This is probably due in part to the very low wages paid to station agents, ticket collectors, porters, etc., prior to 1914. The increase in wages to this class of employees was proportionately greater even than the increase in fuel costs. Locomotive running expenses in 1913 amounted to £17,131,000 ($85,655,000) and increased steadily until in 1918 they were £29,974,000 ($149,870,000), and in the first half of 1919, £18,168,000 ($90,840,000) or at the rate of more than £36,000,000 ($180,000,000) a year. So called traffic (train and station) expenses amounted to £23,261,000 ($116,305,000) in 1913, and steadily increased until they amounted to £41,622,000 ($208,110,000) in 1918, and to £25,513,000 ($127,565,000) in the first half of 1919, or at the rate of over £51,000,000 ($255,000,000) a year. The increase in 1918 over 1913 in locomtive running erpenses was 43 per cent, and in traffic expenses 44 per cent.

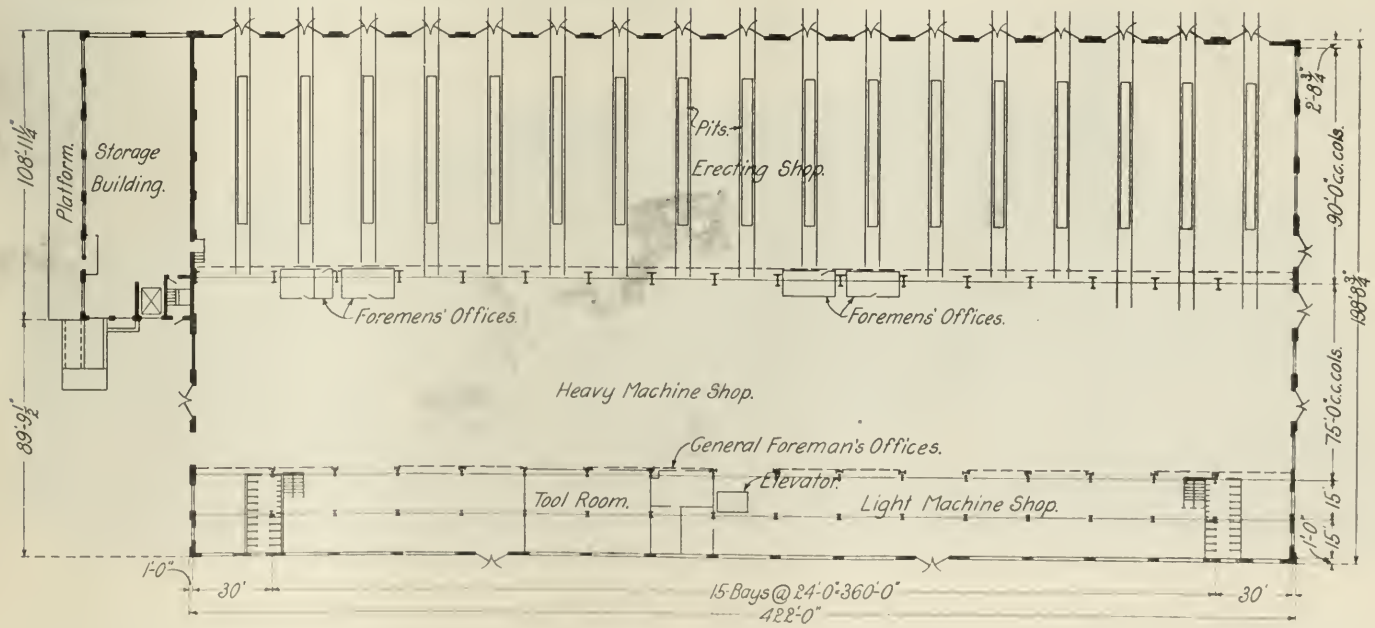
Had the English roads been returned to their owners at the end of 1918, the results of operation by the government would have placed but a very slight burden on the tax payers. The forecast which Sir Eric Geddes makes for the fiscal year ending March 31, 1920, is based on an expectation of traffic continuing at about the 1918 volume, but with a great increase in expense over 1918. If the estimate is correct, it shows a serious situation for the English railroads.

Heavy Machinery Bay, Logansport Shop

Pennsylvania Lines Improved Locomotive Facilities

Shop at Logansport, Indiana, and Roundhouse at Stark, Ohio, Illustrate Character of Designs Developed.

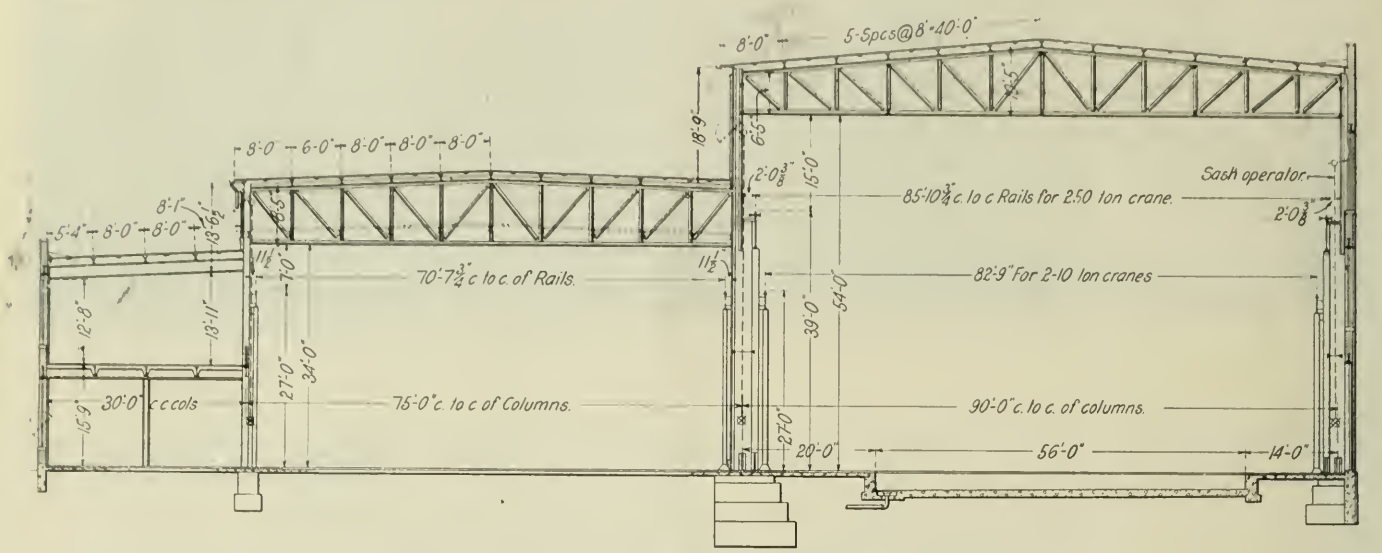
THE PENNSYLVANIA LINES WEST of Pittsburgh have probably made more extensive improvements and additions to their shop and engine terminal facilities in the last two years than any other railway system in the country. To some extent this has involved the extension of existing facilities, but in large measure it has involved the construction of complete new structures and in several cases of entirely new layouts. These new developments are of special interest as indicating the trend of modern design, and exemplifying the development and application of standard plans, as the principle of standard structures was applied extensively in this terminal program of the Pennsylvania Lines. At the Columbus (Ohio), locomotive shops, existing facilities have been extended so that this will serve as the central heavy repair shop of the Southwest system, while at Logansport, Ind., and at Stark, Ohio, complete new locomotive shops are being provided which, while smaller than those at Columbus, are to be equipped to take care of all locomotive repairs except those involving firebox renewals. These shops are, moreover, of special interest because the same standard design was applied at each point.



Plan of the Logansport Shop Building

In the case of engine houses, extensive additions to existing houses have been made at Logansport and Columbus,

while at Stark and Crestline, Ohio, Richmond, Ind., and one or two other points complete new roundhouses have been built, several of which conform to a standard plan that is notable for the novelty of design and the introduction of a number of unique features. For this reason, the following description of an example of a heavy repair locomotive shop recently put into operation at Logansport, Ind., and of a new roundhouse at Stark (Canton), Ohio, now nearing completion, will be of interest.



Cross Section of the Standard Locomotive Repair Shop Building

The Logansport Shop

The new shop at Logansport occupies a site at the extreme end of the shop property where a space could be had which was not being actively used in the shop operation, thus reducing interference between the construction and shop activities to a minimum. Another advantage of the site arose from the fact that rock underlies the natural ground surface at a depth of only four or five feet. The new facilities include a shop building 195 ft. by 422 ft. with a storehouse wing at the north end 37 ft. by 109 ft., a transfer table 60 ft. wide extending the entire length of the building and a parking space for locomotives consisting of 20 short tracks occupying a strip of land 72 ft. wide on the far side of the table. Access to the shop is afforded by lead tracks at each end of the building, connecting with the transfer table. At the south end of the shop there is a material yard, provided with a 10-ton gantry crane of 75-ft. span.

The shop proper consists of a 90-ft. erecting bay, a 75-ft. heavy machinery bay and a 30-ft. auxiliary bay which was built with a second or mezzanine floor. The ground floor of the 30-ft. bay is devoted to toilet rooms, fan rooms, general foreman's office, tool room and light machinery work, while the mezzanine floor is used for a tin shop, headlight repairs, air brake inspection and testing and locomotive pipe fitting.

The predominating feature of the erecting bay is the provision for two craneways, one above the other. The upper one carries a 250-ton Morgan crane equipped with two trolleys, each of which is provided with one 125-ton hook and one 20-ton auxiliary hook. This bay has a clear headroom of 54 ft. while the top of the upper craneway rail is 39 ft. and the lower craneway rail 27 ft. above the floor level. The lower runway carries a 10-ton Whiting crane. The erecting bay contains 17 engine pits 56 ft. long and spaced 24 ft. center to center. These pits all drain to the west end where catch basins are connected with a sewer system.

North End of the Logansport Shop Showing the Storehouse Wing and the Concrete Roadways

The 75-ft. bay which contains the heavy machine tools

is equipped with a 10-ton traveling crane. The roof is supported by roof trusses 34 ft. clear above the floor and grouped in pairs to form transverse monitors which afford the high degree of overhead lighting necessary to the absence of light from the sides of an interior bay.

In point of construction this building is typical of modern industrial plant practice, with steel columns and roof trusses, exterior curtain walls of brick with large window areas. The great height, wide span and heavy crane loads in the erecting bay necessitated extremely heavy construction in the columns, especially those between the 90-ft. and 75-ft. bay which make provision for two crane-ways on one side and one on the other. These columns weigh 21,940 lb. each. The mezzanine floor is of reinforced concrete supported on steel columns and girders. The roof is composed of 2-in. yellow pine decking on the steel purlins covered with a built-up roofing. The down spouts are of Aspromet corrugated asbestos covered steel. All floors with

Erecting Bay, Logansport Shop

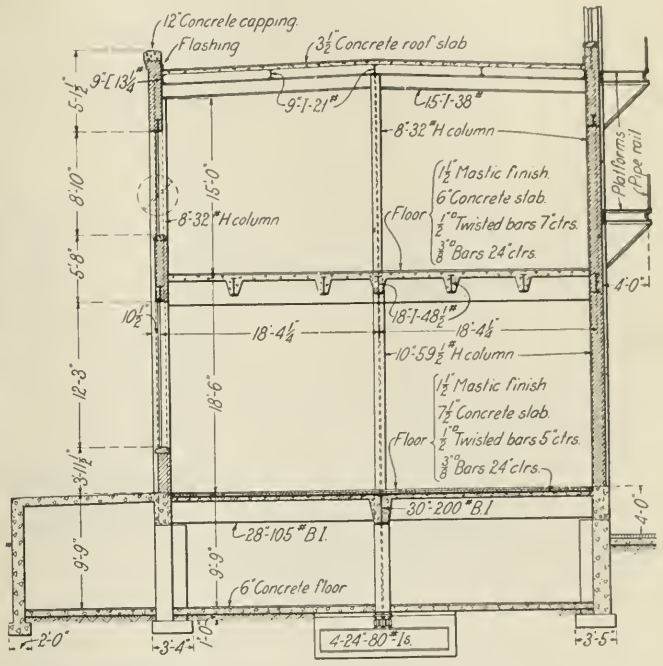
the exception of those in the toilet and wash rooms are creosoted wood blocks on concrete base. The toilet and wash room floors are covered with Sarco mastic, finished with a flashing 6 in. high against the walls on all sides.

The equipment of the building is operated by electric power supplied from a motor-generator set taking 3-phase, 60-cycle, 2300-volt alternating current and delivering direct-current at 250 to 275 volts.

The illumination has been well worked out. Natural light is supplied through large areas of factory-ribbed glass, mounted "rough side cut" in Truscon steel sash in addition to the monitor lighting previously mentioned. Artificial lighting in the 90-ft. bay is provided by 750-watt lamps placed in X-Ray shades, one of which is attached to the bottom of each roof truss, the position on these trusses alternating from the quarter point at one end of the truss to the quarter point on the other end of the next truss. In addition to this system of lighting, there are four 50-watt lamps spaced uniformly along the center line of the building to serve as illumination for the night watchman service. In the 75-ft. bay five lamps equipped with "intensive light" shades are provided in each panel.

The Heating System

The building is heated by the Vento system of hot air heating. This installation consists of duplicate plants, serv-



Cross Section of the Store Building at Logansport

ing the north and south halves of the building, respectively, and having fans and heaters located in the extreme north and south ends of the 30-ft. bay. Each power unit consists of a No. 10 Sirocco blower driven by a 20-hp. alternating-current motor, drawing air from the outside through a six-unit heater, and blowing the heated air through conduits to outlets in various parts of the house. For the 30-ft. bay, overhead sheet metal conductors were provided but in the two main bays underground concrete conduits were installed, leading to a row of eight outlets along the center line between the 90-ft and 75-ft. bays and 17 outlets along the outside wall of the erecting bay. Live steam is used in the heaters and a small motor-driven pump returns the condensation water to the boilers. Louvers for the admission of air from the outside are provided with adjustable vents so that a smaller amount of outside air may be taken in cold weather in conjunction with a certain degree of re-circulation of the air within the building.

Power service from the power house consists of a six-inch

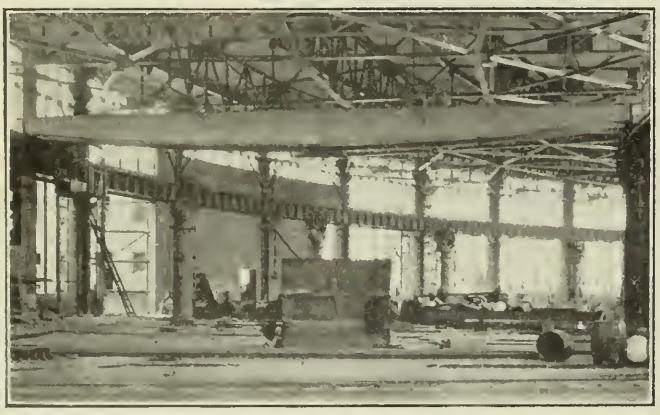
General View of the Stark Roundhouse

steam main, a three-inch condensation return pipe and a four-inch compressed air line. These are conducted through a concrete conduit, the top of which consists of pre-cast concrete slabs equipped with lift bars for ready removal.

Toilet facilities for shop employees are installed on the first floor at each end of the building and wash and locker rooms containing a total of 315 lockers on the mezzanine floor directly above. Provision has also been made for toilet facilities and lockers for women employees of the shop at the north end of the messanine floor.

The Store House

Store space is provided in a wing at the north end of the building, 37-ft. wide by 109 ft. long with two stories and basement. It has a steel frame, brick walls and concrete-covered girders and beams supporting reinforced concrete floors. The first floor is designed for a load of 600 lb. per sq. ft. and the second for a load of 350 lb. per sq. ft. With the exception of offices for the storekeeper and clerks on the second floor, the space in the building is taken up entirely by tiers of shelving. Loading and unloading from cars is facilitated by a concrete platform extending the entire length of the wing, the space underneath this serving as an addition to the basement area.

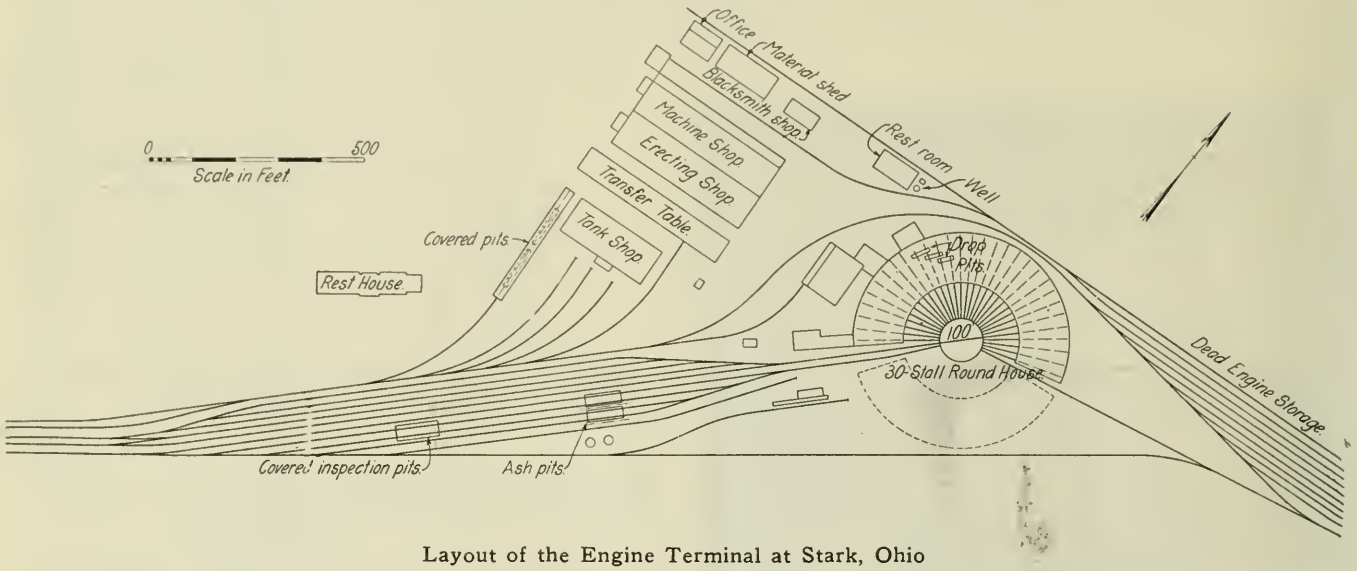


Interior of the Stark Roundhouse During Construction

The transfer table pit is 60 ft. wide by 532 ft. long and is equipped with five lines of 85-lb. A. S. C. E. rail to carry a table of 250 tons capacity. As in the case of the building, the presence of a rock foundation greatly simplified the construction. The rails are carried on continuous walls of concrete supported on the rock. The space inside the curb walls is paved with a concrete slab which slopes to four lines of drains. The table is operated by a 75-hp. motor at a speed of 100 ft. per min. with full load.

Another facility occupying a separate building is an electric welding shop 20 ft. 2 in. wide by 100 ft. long. This is divided into five separate rooms of which three are for electric operations, one for gas welding and one for the motor-generator set used to convert 3-phase, 60-cycle, 220-volt alternating-current to 75-volt direct current.

Inter-shop transportation is conducted very largely by the use of electric industrial trucks and this service has been greatly facilitated by provision for a concrete roadway along the west side of the building, at the angle at the north end adjacent to the storehouse wing and leading to other buildings and to the street entrances.



Layout of the Engine Terminal at Stark, Ohio

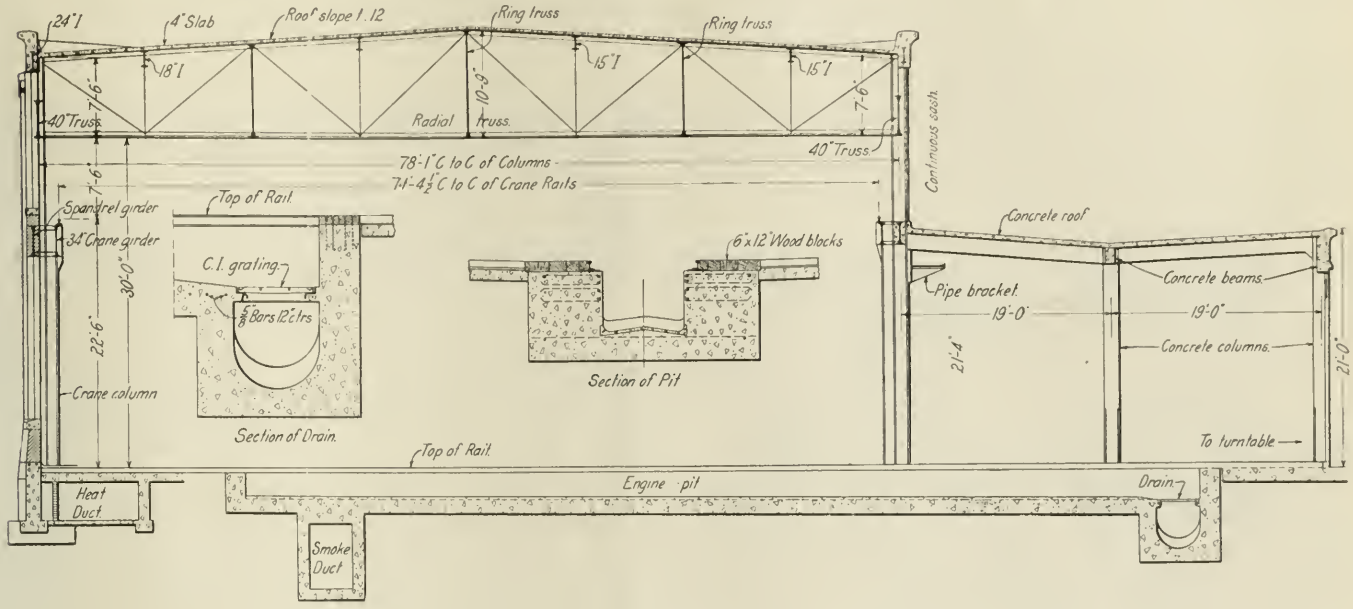
The Construction

The construction work was carried on under a contract with the Austin Company, Cleveland, and was handled in a manner to secure early completion although failure of steel delivery as a result of war conditions greatly interfered with the record for expeditious progress. Thus while the steel was scheduled to be delivered entirely by September, 1918, the last of it did not arrive until March, 1919. Considerable of the excavation, particularly for the transfer table was moved by a steam shovel. Concrete was mixed by a mixer mounted on a flatcar with cars of stone, sand and cement placed on the track to the rear of it in the order named. A platform erected alongside this track for each position of the cars was used for wheeling materials to the machine. The concrete was dumpted into two-wheeled carts of 6 cu. ft. capacity and wheeled to the point of delivery in the forms. About 12,000 cu. yd. of filling was placed in the shop building for which sand hauled from a pit on the railway was used. This was thoroughly wetted as it was placed and became thoroughly compact so that the concrete floor slabs could be laid on it without danger of settlement. The walls of the building contain 835,000 brick of which a large part were laid at the rate of 250,000 bricks per week, and the entire east wall of the shop was laid in 14 working days. Hanging scaffolds supplied by the Patent Scaffold Company, Chicago, were used for this work. The steel was erected with a double-boom traveler.

The Stark Engine Terminal

The engine terminal at Stark occupies a triangular piece of ground along the north side of a freight classification

yard located about two miles east of Canton, Ohio, the terminal having connections with the yard both to the east and to the west, with the main approach from the west. Inbound locomotives come in over the south track of the layout which expands into four tracks for the accommodation of the inspection and cinder pits, although only the two center tracks pass through the inspection shed. The outbound track is north of the inbound tracks and has a



Longitudinal Section of a Typical Stall of the Standard Engine House

separate connection with the turntable. North of the outbound track and with a lead connecting to it is a four-track engine storage yard with space for 44 85-ft. engines. The inbound and outbound tracks and the lead from the engine

One of the Cinder Pits at the Stark Engine Terminal

storage yard are served by a coaling station at the extreme west end of the layout and also by two penstocks located just west of the coaling station. Water supply is also provided by a third penstock located between the inbound and outbound tracks near the turntable. To the west of the roundhouse is a complete locomotive repair shop very similar to the one at Logansport, the principal difference being that the shop building is 30 ft. shorter that the one at Logansport, while a separate building 90 ft. by 300 ft. has been provided for a tank, wheel and pipe shop. A section of this group of buildings is shown in the same illustration as the map.

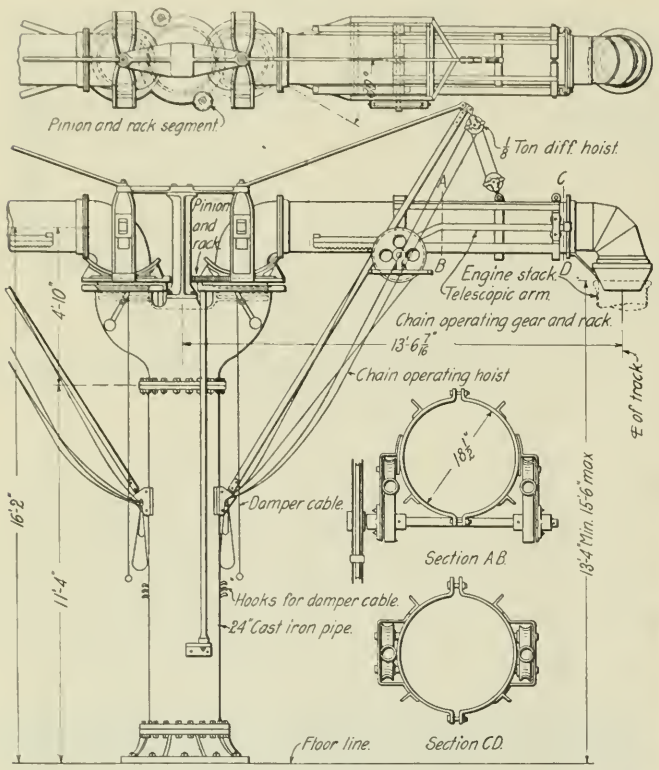
The roundhouse contains 30 stalls with space for the future addition of about 20 stalls more. The unusual features embodied in this engine house may be ascribed almost entirely to the desire to provide a traveling crane and to maintain the house as free as possible from gases from the locomotives. Provision for the traveling crane led to the adoption of a three-bay construction which comprised a wide, lofty bay for the traveling crane along the outer side of the house with two lower bays at the turntable side. The presence of the traveling crane did not permit the use of smoke jacks. Monitors in the roof were deemed ineffective in the removal of the smoke to a degree that would not be objectionable from the standpoint of illumination, corrosion of the steel work or discomfort to the crane operator, so it was decided to install a smoke exhaust system although there was no call for this in the way of public objection to smoke nuisance. The predominating feature of the smoke collector is an upright smoke receiver having much the appearance of a water penstock, connected by a system of underground ducts to an exhaust fan in the power plant. As seen in the drawings these smoke jacks are placed between every second pair of stalls and consist of a riser pipe 24-in. in diameter fitted at the top with two 18-in. branches with universal joints and telescope extensions so that the nozzle may be inserted in the top of a smoke stack with considerable variation in the position of the locomotive and the height of the stack. The gases are exhausted through the fans mentioned above into the chimney of the power plant. Horizontal bottom discharge fans are used so that both the inlet and outlet ducts are below the floor level. Owing to the corrosive nature of the gases handled a minimum of rolled metal is used in the housing of the fan, the walls of which are made of brick with circumferential plates of flanged cast iron segments.

Structurally the building is of a composite type, the large bay having a structural steel frame and concrete roof, while the two lower bays are entirely of reinforced concrete. The exterior walls are brick but a large part of the area consists of windows with Fenestra Steel sash. A clear height of 30-ft. to the underside of the roof trusses of the crane bay results in the unusual height of 39 ft. 4 in. for the outside

wall so that two tiers of windows 15 ft. 9 in. and 15 ft. 5 in. high, respectively, give a large glass area for the outer wall of the house, which, together with monitor windows over the lower bays, provide unusual natural lighting of the roundhouse.

Artificial illumination is provided by two 200-watt. ceiling lamps in the low part of each stall and two 400 watt lamps in the high portion. The lamps are equipped with Maxolite fixtures. Current is supplied by a local public utility company.

The floor of the roundhouse is paved with creosoted wood blocks on a concrete base. The track pits are unusual in the exceptional width of walls as shown in the cross-sectional view. In the half of the pit nearest the table the wall is of sufficient width outside the rail to carry 34 in. of jacking planks while the outer end has somewhat narrower walls.



Smoke Exhaust Duct

The pits drain to a concrete drainage duct which also receives the drainage from the entire roof through down spouts.

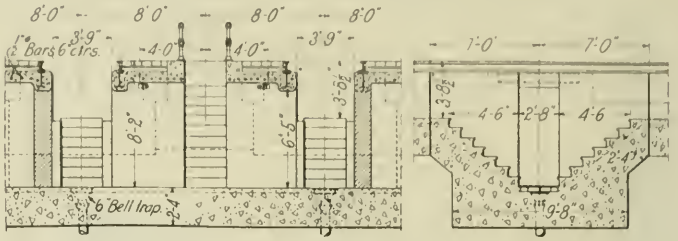
Three complete drop pits are provided, each embracing two-track pits in the manner indicated in the plan. The pits are of the type in which the ram is carried by a pit truck, a slot being provided in the bottom to accommodate the barrel of the ram. These pits have an average length of about 45 ft. with an inside width of 7 ft. 6 in. and a depth of 5 ft. 7 in. plus 5 ft. 4 in. for the ram slot.

The roundhouse is heated by the forced draft system of hot air heating common to most modern roundhouses, this system being very largely parallel to that for the smoke exhaust, that is, with the use of concrete ducts below the floor and vitrified pipe branches leading to outlets in the track pits. The heating system consists of two Sirocco pressure fans, one 65-in. and one 100-in., the smaller one to be replaced by a second 100-in. fan when the roundhouse is extended to the full number of stalls. These fans draw outside air through steam heater units and discharge the heated air into the concrete ducts.

Pipes for the washout, filling, blowout, cold water and air supply lines are carried on brackets attached to the inner side of the line of columns between the high and low parts of the roundhouse. Service from these lines is supplied at every other column while on the intermediate columns electric light service outlets are provided, these being six-plug revolving fixtures.

The Power Plant

The power plant occupies a separate wing to the rear of the house, connected with the latter by means of a smaller



Details of a Two-Track Inspection Pit

wing containing the heater and smoke exhaust fans. The main wing is 89 ft. by 108 ft. and contains a boiler room fitted with four 450 hp. boilers with space for one additional boiler. There is also an air compresser room 43 ft. by 60 ft., an electrical repair room and one for a boiler washout system. The boilers are equipped with automatic stokers and are served by a complete installation of mechanical coal and ash handling machinery in conjunction with a track hopper outside the building. Smoke from the furnaces is carried to a 150-ft. Custodis chimney of 11 ft. inside diameter which also takes the gases from the smoke exhaust system. To avoid interference between the natural chimney draft and the forced draft of the smoke exhaust fans, the

One of the Inspection Pits Covered by a Reinforced Concrete Shed

chimney is divided into two flues by a vertical diaphragm. Another wing of the building 55 ft. 7 in. wide by 50 ft. maximum depth serves as a light machine tool annex.

No small amount of attention has been given to the provision of adequate accommodations for engine house men and engine crews in a third wing of the roundhouse which also contains space for offices. This consists of a square two-story portion 58 ft. 7 in. by 67 ft. 4 in. which is connected with the roundhouse by a one story structure 32 ft. wide by 73 ft. 6 in. long. The lower floor of this wing contains toilet and locker rooms for engine men and engine house men and offices for the roundhouse foreman, road

foreman of engines and clerks. The second floor contains separate rest and toilet rooms for the shop and office women as well as a large record room.

The roundhouse is served by a 100-ft. turntable of the deck type which is unusual in that the table is turned by the application of power directly to the end wheels through line shafting from a motor mounted on one side of the table near the center. The trucks are equipped with spring bearings. Another detail which will add greatly to the possibility of keeping the turntable pit in a neat condition is a pavement of cull bricks in the pit.

Well Planned Inspection Pit Provided

One feature of the engine terminal is the complete provision made for inspection of incoming engines, in the form of a two-track inspection pit, covered with a reinforced concrete shed. These pits are 100 ft. long, 3 ft. 8½ in. deep and 16 ft. center to center, requiring a shed 37 ft. wide. To avoid the possibility of men being run over or injured while climbing in or out of the pits and to afford ease of access, the pits are connected by a transverse tunnel with stairways leading to the pits and from the tunnel up to the platform between tracks. This inspection pit is provided with a pneumatic tube connection to the roundhouse foreman's office for the delivery of inspection reports.

The ash pits are also of a design that differs considerably from prevailing practice. Two pits are provided, each serving two tracks 18 ft. center to center. As shown in the photograph the arrangement provides for the delivery of the ashes down an incline covered with paving brick to a central basin with the bottom 10 ft. 3in. below the base of rail level. Instead of using a locomotive crane to remove the cinders from the basin, a special crane mounted on a gallows frame is installed which travels on rails spaced 36 ft. center to center. This frame stands astride of the two tracks over one pit and has a cantilever projection to reach the basin of the other pit. With this arrangement the cinders can be removed from the pits without any interference with engines on the tracks. The outer rails of the running tracks are carried on the outer walls of the pit, while the inner rails are supported on built-up steel beams spanning between piers made of 18-in. cast iron pipe filled with concrete.

The Coaling Station

The coaling station is a reinforced concrete structure having a storage capacity of 700 tons, and was built by the Roberts & Schaefer Company, Chicago. The automatic hoisting equipment is capable of delivering 75 tons of coal per hour from the track hopper under the coal delivery track. Adjacent to this track is a wet sand storage bin, having a capacity of 1200 tons of wet sand. This wet sand is wheeled by hand to a hopper under a drying house built adjacent to the coaling station from which it is hoisted by a bucket elevator to a 60-ton storage bin over a battery of two Pennsylvania Lines coal-burning dryers. From the latter the dry sand is spouted down through screens to a pneumatic discharge which delivers the sand to a 10-ton wooden storage tank located in the top of the coaling station.

The engine terminal at Stark is being built by the Walbridge, Aldinger Company of Detroit with the exception of the coaling station and the design and installation of power plant equipment which is being handled by Westinghouse, Church, Kerr, New York. All of the terminal improvement work on the Pennsylvania Lines has been carried on under the general direction of Robert Trimble, chief engineer construction, Pennsylvania Lines, Pittsburgh. The work at Canton was under the supervision of T. M. Bole and later H. W. Hinkley, engineers in charge. The improvements at Logansport were under the immediate direction of W. E. Guignon, division engineer and T. L. Doyle, assistant division engineer.

French Opinions of American Methods of Railroading

By Francis Jaques

It is interesting, in talking with French railroad men, to hear their views of the improvements which the American Transportation Corps introduced into French methods of railroading during the war. The French have been particularly enthusiastic over certain features, some of the most important of which are mentioned here.

Train Despatching Methods

One which impressed them most favorably was the American method of train despatching. This was tried experimentally at the end of 1918 on the Paris-Orleans, between St. Nazaire and Saumur, a distance of about 115 miles, and the results were excellent. Four French train despatchers were installed in the American Transportation Office at Saumur to learn the despatching system. The chief despatcher was a man peculiarly fitted to acquire and appreciate the value of these new methods, and he and his three associates were immediately impressed with the opportunities which the centralized system of train control offered for improving train operation.

The Frenchmen were quite unfamiliar with the apparatus used in telephone train despatching, and had not before realized the peculiar adaptability of the selective telephone system for handling train movements. The rapidity with which officers were called, either singly or in groups, the clearness of the lines and the mechanical accuracy of the selective apparatus were a marvel to them.

These French despatchers quickly saw the good points of this centralized system of train control and when asked their opinion of this method, after they had tried it for a certain time, stated that they believed that it was better than their own system because it offered the following advantages: A perfect knowledge of the location of all train movements, delays, congestion, etc.; the possibility of giving advance information to the terminals as to the probable time of arrival of trains, thus facilitating the preparation of engines, crews and equipment and their proper use; the elimination of useless side tracking and the intelligent arrangement of movements out of turn; and also the chance of relieving an overloaded line in case of need. American railroad men are naturally familiar with all of these advantages, but they were a revelation to the French who had never before had a practical demonstration of this method of train despatching.

Because of the success of the trial on the Paris-Orleans between St. Nazaire and Saumur, the Paris, Lyons & Mediterranean is now installing the despatching system on the heaviest section of its line between Dijon and Lyons, and later it intends to put it in all the way from Paris to Marseilles—a distance of 550 miles. The Est is also going to adopt this improvement, and it has already begun to introduce the despatching system on the line from Paris to Metz.

Passing Tracks at Stations

Another thing which the A. E. F. transportation officers made the French realize was the importance of getting trains off the main lines by the use of passing tracks at stations where trains took water or coal, or waited for orders. A great many passing sidings were constructed, and others lengthened, by the A. E. F. during the war. This was, in fact, the chief means employed to increase the capacity of roads for, contrary to the generally believed myth, the Americans constructed very few entirely new lines.

The longest passing tracks in France before the war were not over 1,625 ft. (500 meters) long and, as they were too short to handle American trains, they were therefore lengthened. At first they were made about 2,210 ft. (680

meters) long, but towards the end of the war some were being lengthened to 2,372 ft. (730 meters). The improvement in train operation was most marked as a result of the lengthening of the sidings and of their proper use. Where these passing tracks are still useful for future commercial needs they will be kept. Where they were purely for war purposes and are no longer required, they will be removed and the material will be used elsewhere.

American Locomotives in France

With regard to locomotives, the French were favorably impressed by our engines for freight service. They consider them more suitable for this work than their own locomotives as they are simpler and contain fewer refinements. They therefore get out of order less easily and can be more readily repaired.

At first the French had considerable trouble due to the heating of the bearings, but this was chiefly because they did not understand them. Later they had no more difficulties on this account. They also had to make some slight changes in the buffing arrangements. Otherwise they found our freight locomotives adapted for their work, and they used them to great advantage during the war.

French ideas in regard to locomotives have recently changed radically. The "old school" of railroad engineers had gradually worked up a type of compound locomotive in order to obtain certain economies, particularly in the consumption of coal which is very expensive in France. With the introduction of the superheater, the results given by the simple locomotives equipped with this apparatus began to be quite as good as those given by the compound locomotives, whereas the use of superheated steam with the latter type added little to its value. For this reason the younger engineers, of the "new school," believe that it is better to construct, at the present time, two-cylinder simple locomotives equipped with superheaters, as they do not consider that the economies obtained by the use of the compound locomotives are sufficient to compensate for the high initial expense and the great cost of maintenance of this complicated type. A committee formed by the Paris, Lyons, Mediterranean, the Midi, the Paris-Orleans and the State Railroads is, therefore studying designs of two-cylinder, simple locomotives equipped with superheaters as being the best type for the immediate future in France.

It may be here stated that the A. E. F. left 1,333 locomotives in France divided up according to type as follows:

American	150
Baldwin	1,143
Saddle Tank	30
150 H. P. Gasoline	10
Total	1,333

American Freight Cars in France

The French considered the big American cars exceedingly practical, for in France cars of 10 tons (2,240 lb.), or less, capacity were used before the war. It is probable that all cars of less than 10 tons capacity will gradually go out of service, and that 20, 30 and 40-ton cars will be used almost entirely. The large American cars left in France by the A. E. F. will continue to show the excellent practical results of the use of larger cars, and this will soon lead to their being adopted universally. The tariff minimums will, of course, have to be adjusted because of the increased capacity of the cars and this question is now being studied.

	Number	Average Capacity
Box	8,649	33 tons
Flats	2,050	33 tons
Open	6,779	30 tons
Tanks	850	10 tons
Petrol Tanks	43	5,000 gals.
Refrigerator	1,450	25 tons
Ammunition	65	20 tons
Total	19,886	

It is interesting, in this connection, to note the foregoing figures, corrected to April 1, 1919, relative to the number of American freight cars left in France by the A. E. F.

Arrangement of Yards

The French consider the American yard layouts better than their own as being simpler, and for this reason more economical to build and to operate. They are planning to use some of the best features of our yards when building future yards in France.

Labor-Saving Machinery

The leading French engineers were enthusiastic, too, over the improved American shop machinery, and they intend to introduce it into France as fast as possible. This is particularly important, for it is necessary to economize in every way possible in labor to make up for the lack of operatives due to the large number of men killed during the war. Improved methods will have to be used also to compensate for the high wages which the railroads are now forced to pay.

The former prejudice of French workmen against modern machinery, because it reduced the number of laborers and so took away their jobs, is no longer as strong, particularly among the better class of workmen, as they are beginning to realize that they reap many advantages by the introduction of modern improvements; for instance the ensuing reduction of the high cost of living.

The heads of all the railroads are determined to put in this modern shop machinery as soon as they are able to do so; but this will require a tremendous initial expense. The great question is how to obtain the money for all such improvements. Loans and imports both affect the rate of exchange of the money market in a way which is disastrous to France, as is shown by recent events and yet these improvements are, in the end, absolutely essential for regaining the prosperity of the country. A rapid solution of this difficulty is most desirable for the future of France. Whether this would lead to the placing of large orders in America by the French railroads for shop machinery, etc., is a question, for it is the present policy of the government to restrict importations, thus preventing the placing of orders for railroad equipment and material elsewhere than with French firms, even when better prices and deliveries can be obtained abroad. This is done to help build up French industries and to offer employment to the demobolized soldiers, as well as to keep down the rate of exchange. One can readily understand this in cases where there is no immediate haste in procuring the finished articles. There are, however, many people in France who believe that certain machinery, such as railroad shop machinery, for instance, should be imported at once in order to permit the fast development of transportation facilities which are so essential for the future prosperity of the country.

It will be seen from the foregoing that, after studying American railroad methods introduced by the A. E. F. in France during the war, French railroad men propose to change French methods of railroading notably by: the introduction of the American despatching system; the increased use of passing sidings to keep trains off the main lines; the adoption of a simpler type of freight engine; the use of larger cars; the simplyfying of yard layouts, and the introduction of modern shop machinery. They believe that, although railroad conditions are entirely different in France than in the United States, they can use American experience and methods to great advantage. In the same way, American railroad men who were in France with the A. E. F. have gained a broader experience and many new and valuable ideas from their contact with the French. The cordial relations established between the Americans and the French during the war will certainly lead to a constant exchange of ideas in the future which will be most valuable for the entire railroad world.

Loading the Cane Train.

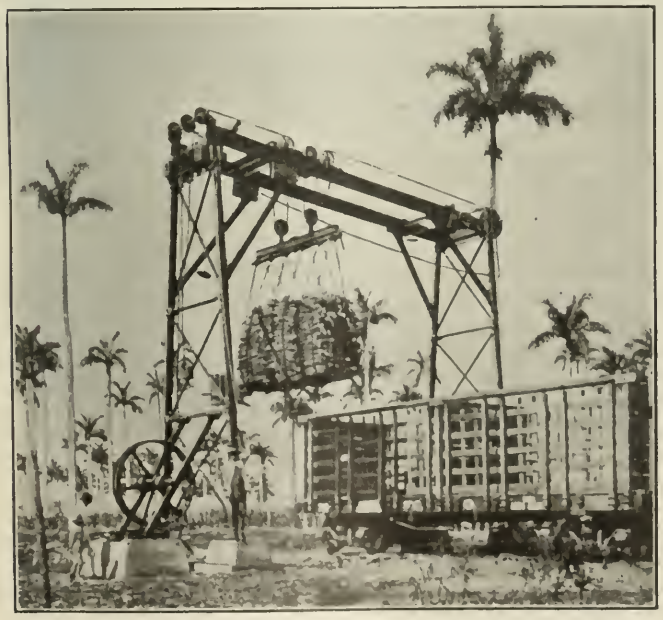
Cuba's Sugar Cane Railways a Large Market*

The Importance and Extent of the Sugar Plantation Lines—Possibilities for Improvements

By John P. Risque

Part III—Loading and Transporting the Cane

ALTHOUGH MECHANICAL CANE CUTTERS have appeared in a variety of designs in an effort to expedite and speed the big job of getting the cane to the mill, their success and adoption is measured by the cane growers' tenacious reliance on the wielder of the *machete.* These thousands of hand swung knives of great length and width have no apparent difficulty in keeping ahead of the supply of cars. In order to make up the deficiency in the supply of Cuban cane field labor, the passenger business of the main lines from the various ports, up and down the island, is considerably augmented by the arrival of thousands of professional harvesters who annually come from various parts of Spain and the Canary islands.



The "Trasbordador" or Cane Loader

Hand in hand with the methods of the primitive, but reliable hand cutters, go the traditional ox-carts with their eight-foot wheels. These cumbersome vehicles equipped with cane racks or bodies, called *jaulas,* collect the cane from the cutters in the fields and a sleepy looking pair of oxen slowly drag their burden to the *batey,* or park in front of the mill, if close by. If the mill is remote from the field, the cart is driven to the *trasbordador* at the side track of the plantation railway or the main line, as the case may be.

The process of unloading the cane from the carts to the waiting cane cars by means of the *trasbordador* or hoist is one of the few efficient links in the chain of transportation steps from the field to the mill. This apparatus is generally a simple drum hoist driven by oxen and occasionally by a gasoline engine. Its action is quick and efficient. The cart is weighed, checked on the books in favor of the contributing *colono,* chains swung around the load of cane which is quickly hoisted and swung over into the cane car. The train from the mill leaves a section of empty cars on the siding and on its return picks up the loads.

Burned cane is a bugbear that is a steady threatener; such cane must be gathered and ground before fermentation sets in. It is generally understood that burning his cane is the last desperate resort of the *colono* who is unable by threats or otherwise, to cajole trains to his district; a questionable method to be sure, but one which is usually successful as it means a choice between a total or a partial loss for all concerned.

Waste of Cane

If all the good sugar cane that is strewn along Cuba's cane railroads were added to the amount "lifted" from the cars at water tanks and way stations during the *Zafra* by well meaning native connoisseurs of raw cane, the total would doubtless run a mill a whole season. An investigation of the cause of more or less frequent complaints from *colonos*

*This is the third of three articles on the sugar plantation railways of Cuba. The first appeared in the *Railway Age* of October 17, and the second in the *Railway Age* of October 24, 1919.

claiming short weights would reveal a considerable loss of cane through the tendency to overload and wrongly load the cars. The cane shakes off the top or slides through between the stakes.

If the railroad end of the mill is not running behind in supplying the required hourly amount of cane, the yard will show it by the lines of waiting loads on the spare mill tracks. Cars are detached from the line one at a time (in the case of end dump mills), drawn by oxen onto the tipping table, upon which the car is then chained down, the table mechanically inclined, the door latch released and the cane dumped out into the hopper. The dumping platform is then lowered, the car unchained, and the car as slowly and methodically withdrawn to the empty track by the waiting ox-team.

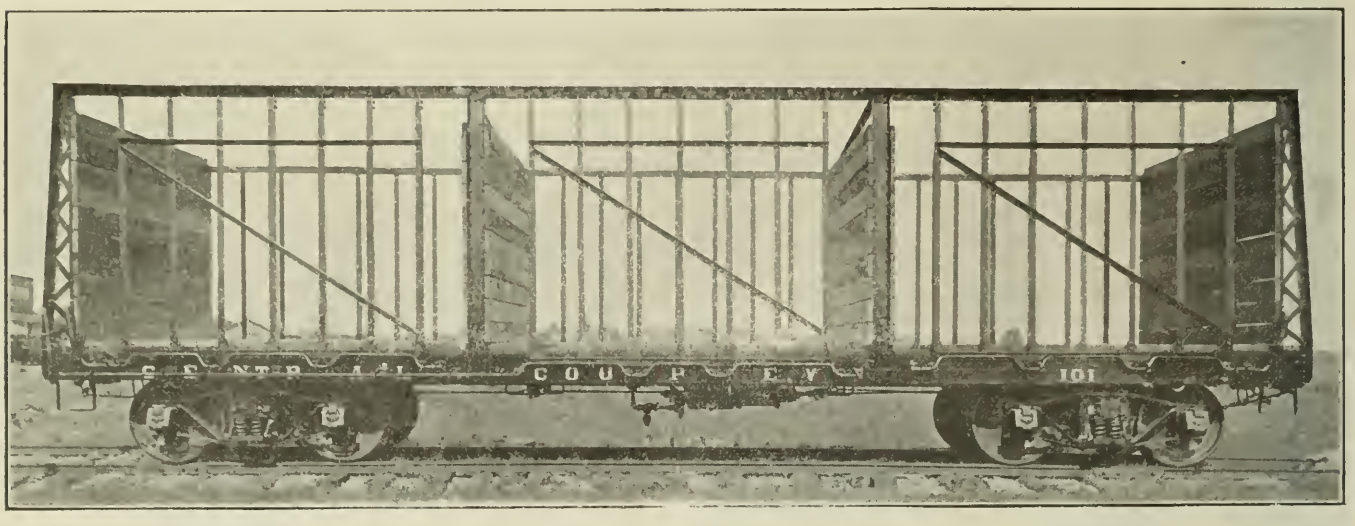
Mills arranged for the accommodation of side dump cars carry their entrance tracks over the tipping table and on past the receiving table, the table tips sideways, the cane is dumped from the side and when the table is returned, the train is pushed forward and the next car takes its place. In both of these cases—side and end dump—a light 0-4-0 saddle tank locomotive is utilized by some mills, dependent upon the capacity of the hopper to take care of such accelerated movement. Old mills to which additional rolls have been added or otherwise speeded up are most logical candidates for switchers to supersede the oxen.

The principal product of the mill, raw sugar, is packed in bags of 320 lb. each and stored in the plantation's sugar warehouses (or in the locomotive shed if there is one) or shipped in their own sugar cars to main line cars, to port. Molasses, which constitutes a small percentage of a mill's product, is most often shipped from the mill in main line tank cars. There are a few molasses cars owned by the plantation — luckily so, if the numerous complaints of "molasses on the tracks" (due to faulty condition of the cars) is any criterion.

Various complications exist in the transportation of sugar from the mills to ports, among which may be mentioned the very singular combination which governs the haul of sugar from one of the Santa Clara mills to a port near the city of Cienfuegos on the southern coast. The sugar cars of this plantation are provided with narrow gage bodies mounted on standard gage trucks. Extra long body bolsters of these cars carry steel rings at their outer ends. When the train arrives at the end of the standard gage line the cars are put under a four-post steel frame work, equipped with four hand-operated hoists—ordinarily chain blocks. The chains are hooked to the rings and the laborious job of raising the loaded car from the standard gage trucks by hand begins. Narrow gage trucks are rolled under the cars, one by one, and when the job is complete the re-equipped train proceeds on its way. A formidable crew of men is stationed at this point during the crop movement to take care of the business of swapping trucks and the three or four narrow gage locomotives which take care of their end of the business, repose in the open field when not otherwise engaged. Thus occurs another item in the cost of transporting sugar to the refinery, and consequently a relative enhancement in the cost of the finished product itself.

Cane Transportation Experiments

The vexing problem of field to mill has received serious thought and the expenditure of considerable money, not only by the pioneer of cane car construction, but from one of the best known sugar engineers of the island—the present manager of a large company. To a certain extent portable light railways are laid from the main stem of plantation lines with considerable success, but their use has not become general. It is understood, however, that under the present conditions,



Typical Three-Compartment Car. The Cane Is Loaded Lengthwise of the Car and Dumped at the Mill by Tipping the Car and Opening the Side Bars and Gates

—an increase in the value of oxen of about 150 per cent—the complexion of the cane field during the *Zafra* is due for a change, and the portable railways will compete with the tractor for efficiency. The introduction of a caterpillar tractor drawing several trailers is as yet considered an innovation. The trailers are provided with wide tread wheels and removable bodies, which when loaded are slid over on to the empty frames of a narrow gage train of cars on the mill's permanent railway.

Business Opportunities Among the Plantations

It has been the intention in this article to indicate primarily that there is a wide possibility for improvement in the repair facilities of locomotives owned by plantations in Cuba. Incidentally the field is open for an entirely new system of collecting cane; the eventual elimination of the patient *buey* (ox) and his cumbersome cart, however, painful to tradition, is none the less certain. Further sale of electric headlights is assured (two to a locomotive, for they back up as much as they go forward—there are no turn tables and but few wyes) as they are fast becoming recognized as nearly indispensable.

Shop equipment and storehouses naturally follow in plans for locomotive maintenance. Painting machines have not as

yet had a good tryout, although the United Railways maintain a special painting department, equipped with air machines. Plantation cars are painted by hand and it is slow work—and this job is a very necessary one owing to the excessive rust creating qualities of the climate. Oil storage tanks, piping and tank cars will be required as conversions to oil increase. Tube reclaiming machinery will eventually come into use when sufficient sugar warehouses are erected.

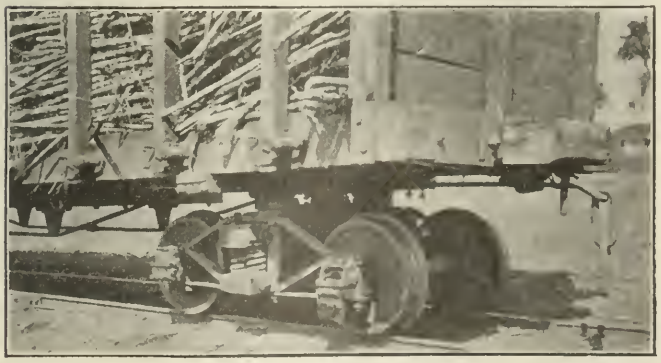
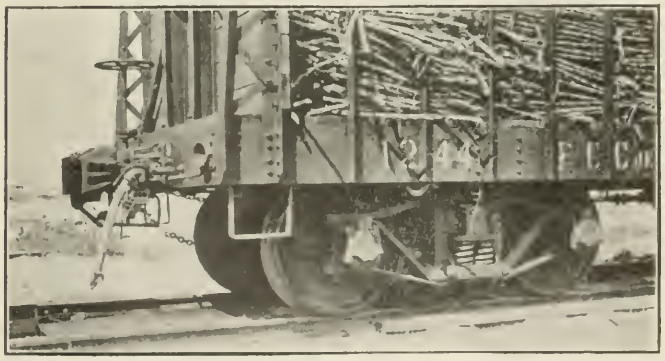
The Wrong Way to Load Cane—a Wooden Car Without Brakes



A Narrow Gage Wooden Cane Car; Note the Opportunity for Brakes, Couplers and Better Journal Box Lids



The Other Extreme in Cane Car Equipment. The End of a Modern Steel Cane Car

Electric and air tools are used and their use will increase. The list of materials annually purchased for 195 Cuban mills is enormous. The list of additional requirements which will be gradually added by the introduction of labor saving tools and better cane collecting systems will increase this amount.

Doing Business with the Plantation

Mill machinery and supplies come principally from the United States, although Scotch and German machinery is in evidence. Mill supply houses in Havana are numerous, large and very active. Salesmen cover the field regularly and often. Branch agencies of American firms are increasing in numbers and commission houses which handle American specialties are easy to find and are generally well equipped. The introduction of new methods and means for their accomplishment should, after a careful analysis on the ground, be planned by the newcomer, with a view to the careful cooperation with the forces which already exist. Competent Spanish speaking engineers and salesmen who know the country and its people are available and are well able to promote worthy enterprises under their own and outside direction and capital.

In New York City daylight saving is to be resumed next spring, regardless of federal law, according to an ordinance passed unanimously by the Board of Aldermen, and approved by the mayor on October 24. If this ordinance goes into effect the clocks will be set ahead on the last Sunday in March, 1920, and restored on the last Sunday in October, as was done the present year in conformity to the federal law.

How the "Plumb Plan" Will Work

[By L. C. Fritch in "Judge"]

THE FOLLOWING is an illustration of what will take place at a meeting of the board of directors of the Nationalized Railways when the brotherhoods are represented on the board of directors and the employees have ten directors and the public five:

At a meeting of the board of directors of the National Railways of America, January 1, 1925, the following members were present: Representing the public, one; representing the employees, ten.

The following business was transacted: Brother Janis, representing the employees as a whole, moved that a general wage increase of 25 per cent be adopted, effective January 1, 1920, all back pay bearing interest at six per cent compounded semi-annually; and to provide the funds necessary to meet this increase such advances be made in freight and passenger rates as will be required. Resolution adopted: Yeas, 10; Nays, 1.

Brother Smith, representing the trainmen, moved that Brother Barleycorn, who was dismissed on the X. Y. Z. Railway in 1918 for drinking on duty, be reinstated with full seniority rights and full pay from date of dismissal to time of resuming duty and with interest at six per cent compounded semi-annually, and that the officers who disciplined Brother Barleycorn be summarily dismissed from the service and shall not again be employed on the National Railways during their natural life. Carried: Yeas, 10; Nays, 1.

Brother Leasure, representing employees at large, moved that the original plan of the government to buy the railroads for twenty billions of dollars by assessing each of the 100,000,000 people $200; that the $200 assessed to each of the 1,000,000 employees be returned to them and the public other than railway employees be made to pay this amount into the treasury; also that the original plan to divide the surplus equally between the employees and the government be changed, and that the employees hereafter are entitled to all the surplus, as labor alone produces the surplus. Motion carried: Yeas, 10; Nays, 1.

Brother Carr, representing the trainmen, offered a resolution that all freight trains be hereafter limited to twelve cars in order that the number of crews be increased owing to reduction in traffic and in order that this be accomplished that the committee on equipment be instructed to purchase the necessary additional locomotives to accomplish this result. Carried: Yeas, 10; Nays, 1.

Chairman of the Board Rack offered a resolution that hereafter the board of directors meet twice a week, that absent members be paid their fees, and that the fees be increased from $20 to $50 for each meeting of the board.

Brother Straight of the trainmen offered a resolution that each freight train be provided with a Pullman car, including buffet, and that a chef and waiter and porters be provided, and that all equipment and supplies, including food, be purchased by the railways. Carried unanimously, the public director having left the meeting to attend a political meeting.

Brother Jones offered a resolution that special agents be appointed whose duty it shall be to report each case of employees doing anything outside of the specified duty, a second offense to meet with prompt dismissal. Carried.

The board considered the results of operation for the year 1924, which was as follows:

Miles operated	300,000
Gross earnings	$3,000,000,000
Expenses	3,500,000,000
Deficit	500,000,000

A resolution was offered that inasmuch as no surplus was earned and whereas it requires as much effort on the part of the employees to make a deficit as a surplus, that the employees be voted a bonus of ten per cent on the deficit, making the sum of $50,000,000 to be distributed among the employees, and that an increase in freight and passenger rates be made to meet the requirements. Carried: Yeas, 10; Nays, 1.

Seat Tickets in Dining Cars

THE RESERVATION of seats in dining cars, by means of tickets distributed to passengers before the beginning of the meals, has now been the regular practice on the Congressional Limited trains of the Pennsylvania Railroad for a whole year; and the officers of the road express decided satisfaction with the plan, though they do not as yet recommend it for trains which make stops during or near meal times. The Congressional Limited trains run for four or five hours without taking or leaving passengers. The southbound train leaves New York at 3:25 p. m.; Manhattan Transfer, 3:42; Baltimore, 7:30, and arrives in Washington 8:30 p. m. Northbound, the train leaves Washington at 4. p. m., Baltimore 5 p. m., and arrives in New York at 8:10 p. m. The southbound train takes on but few passengers at Baltimore.

The tables are set four times for periods of 45 minutes each—namely, from 5:30 to 6:15; from 6:15 to 7; from 7 to 7:45, and 7:45 to 8:30. A notice describing the arrangement for the dinner service is found by each passenger when he enters the train. All of the cars in the train are parlor cars, and each passenger, therefore, has a numbered seat which is identified by his ticket. Usually there is one dining car on each train. Each of the tables bears a card showing its number.

The steward distributes to passengers the tickets for seats according to their choice, each series of tickets, for each sitting, containing the numbers of six large tables and six small ones, there being four tickets, with the same table number, for each large table, and two tickets with the same table number for each small table. This plan works well, and there has been no attempt to number individual seats in the dining cars.

The car seats 36 persons, and four sittings will accommodate 144; in case of a larger number, when an extra dining car is provided, the extra car serves meals a la carte. The regular cars are manned by one steward, four cooks and six waiters.

The service in these cars is table d'hote, and the tickets for the different sittings are of different color, obviating any possible confusion in seating the passengers. On the southbound train the steward goes through the parlor cars immediately after leaving Manhattan Transfer, and on the northbound after leaving Baltimore; and therefore he has no trouble with the problem of passengers getting on the train after he has made his rounds.

The second period—6:15 to 7—is the most popular one, and all the seats for this sitting are quickly disposed of. The passenger who desires the most convenient hour and fails to get it occasionally enters an objection, but no great difficulty has been experienced. It is obvious that the chances of obtaining a desirable sitting are at least as good as under the a la carte system, which, though it might economize time, in some cases must labor under the disadvantage of crowding at other hours if the train is well filled.

The average length of time occupied by the passengers in eating is 35 minutes, leaving 10 minutes for the resetting of the tables. On one occasion 150 passengers were served by one car in one evening, but this made necessary a fifth sitting, beginning at 8:30 p. m.

Doings of the United States Railroad Administration

Additional Information Issued Regarding Schools for Mechanics and Apprentices

Director General Hines, on November 1, sent the following telegram to Henry J. Allen, governor of Kansas, in reply to one from the governor dated October 25, alleging discrimination in the car supply available to Kansas shippers:

"Referring first to relative loading in Central Western and Southwestern regions, seven weeks ending September 27 do not furnish fair comparison of relative loading in these regions. From July 1 to October 17, the railroads transported from Kansas farms 71,682,000 bushels of wheat, from Oklahoma farms 34,711,000 bushels, and from Texas farms 21,438,000 bushels, as compared with 11,898,000 bushels from Minnesota farms, 26,972,000 bushels from North Dakota farms and 15,120,000 bushels from South Dakota farms. Wheat transported from Kansas, Oklahoma and Texas farms was 73,841,000 bushels in excess of entire movement from Minnesota, North Dakota and South Dakota combined, being more than twice entire movement from these three Northwestern states. During same period wheat transported from Kansas alone was 20,000,000 bushels in excess of entire amount transported from Minnesota, North Dakota and South Dakota. During same period 62 per cent of entire wheat crop was transported from states of Kansas, Oklahoma and Texas as against only 55.8 per cent from Minnesota, North Dakota and South Dakota. Allegations of discrimination by Railroad Administration in favor of Northwest against Southwest, and particularly Kansas, are contrary to facts, and it is hoped that there will be no more of these charges from public officials holding responsible positions. Referring next your statement that daily market reports continue to show that grain receipts at Northwestern terminals are greater than at Kansas City, St. Louis and Chicago combined, thus showing improper distribution of cars, facts are that from October 1 to 29, grain receipts at Chicago, St. Louis and Kansas City amounted to 22,996 carloads as against only 20,985 at Minneapolis and Duluth. Also you have omitted Omaha, St. Joe and other Central Western terminals. Also you have overlooked heavy shipments of wheat from Kansas, Nebraska and Oklahoma to Minneapolis relieving producing sections. Also you have overlooked entirely movements earlier in season when nearly all grain cars were used for loading in Kansas and other Southwestern states. Referring to your statement that Kansas millers cannot ship flour while Minneapolis mills are guaranteeing prompt deliveries, our reports show that on October 25 there were only a few mills closed in Kansas while during last week no loading of box cars with either grain or flour was permitted for two days at Twin Cities. Referring your statement that there are now in Kansas warehouses more than one million barrels flour sold but which cannot move, official records of United States Grain Corporation show that on October 17 there were only 300,000 barrels of flour and food products in stock at Kansas mills. Referring your statement as to capacity Kansas mills, records of United States Grain Corporation show a present daily grinding of somewhat less than 300,000 bushels. Referring your statement concerning car shortage for cement and other industries in Kansas, shortage in Kansas is no greater relatively than in other states. Supply of preferential cars for loading grain, grain products and sugar in Kansas and elsewhere has necessarily diminished available supply for other commodities. Your suggestion that Kansas situation is not understood by Railroad Administration is without foundation in fact. Situation is fully understood and Kansas will continue to receive just and impartial treatment. Referring instructions issued result of Chicago conference, you will understand that it takes a little time to make such instructions fully effective. All available cars suitable for grain, grain products and sugar are now being so applied and regional directors advise me that with movement of empties now tided west prospects are favorable for progressive improvement in Kansas loading. As advised in my telegram of October 18 to you, individual instances requiring relief should be drawn to attention of superintendents of transportation named in my telegram."

Vocational Education for Mechanics and Apprentices in Railroad Shops

For the guidance of railroads contemplating the establishment of schools and classes for training of mechanics and apprentices under provisions of the federal vocational education act and the Division of Operation circular of August 1, 1919, the following additional information on the matter is submitted in a circular issued by Frank McManamy, assistant director of the division:

The federal vocational education act provides that schools organized under its provisions shall be conducted by the particular state in which the school or class may be located, and under the general direction of the state board for vocational education.

In establishing such schools and classes under the authority of Division of Operation circular, August 1, 1919, railroads in federal operation will co-operate with the state board for vocational education.

It is expressly stated in the vocational education act that the controlling purpose of the work to be aided under its provisions is to fit for useful employment those who are preparing for a trade or industrial pursuit or who have entered upon the work of a trade or industrial pursuit.

Since the state director for vocational education is informed on all provisions of the federal law, as well as the state plans under which the schools will be operated, such arrangements as may be necessary for installing this system of training in any railroad shop should be made by the railroad with that official, and in conducting a school at any point the railroads should designate some local officer at that particular place to cooperate with the local superintendent of schools.

A list of the names and addresses of the state directors for vocational education is appended.

The purpose for which federal money has been appropriated and may be expended by the state and under what conditions the state may allot such funds is determined in general by the provisions of the law, all details of which will be furnished the railroads upon application to the state board for vocational education.

The general conditions set up in the act are as follows:

1. The school or class must be under public supervision or control.
2. The controlling purpose must be to prepare for useful employment.
3. The instruction must be of less than college grade.
4. All pupils must be over 14 years of age.
5. To meet the requirements of the vocational education act, the instruction must be given for not less than 144 hours

per year. The United States Railroad Administration authorization for 208 hours of instruction per year meets this condition.

6. Every dollar of federal funds must be matched by a dollar of state or local money, or both. The expenditures are to be made by the state board direct or by the local community, and reimbursement made from federal funds by the state board for vocational education.

7. Reimburesement may be made from federal funds only for money expended for salaries of teachers. This does not include any reimbursement for buildings, equipment, or supplies.

8. The railroad must supply the plant and equipment adequate for the type of instruction to be given. This has already been authorized by the Railroad Administration in circular August 1, 1919.

9. The course of study may include trade drawing, trade science, trade mathematics, and actual shop work. In all cases the instruction given shall be of the trade-extension type, supplementing in character the regular employment of the pupil.

10. The methods of instruction must be such as will insure the functioning of that instruction in the trade which the apprentice is learning. This means that the instruction should be given as far as possible by the individual method rather than through lectures. Demonstrations, illustrations, and examples should be drawn from the shop in which the pupil is employed. A careful coordination must be maintained between the instructor responsible for the related instruction in the classroom and the training which the apprentice is receiving in the shop.

11. All instructors for whose work reimbursement is to be made through the state board for vocational education must be thoroughly qualified and meet the qualifications set up by the state plan in the state in which the work is to be given. The instructor of related subjects should be a man possessing at least two years' technical education of college grade, or equivalent technical education, and having a satisfactory practical expereince and contact in one or more of the trades represented in the railroad shop—a contact sufficient of giving an appreciation and working knowledge of the principal trade processes. It is recognized that whenever a man can be found possessing, in addition to the technical training, a journeyman's experience in a trade, he is more likely to be successful as an instructor.

The Federal Board for Vocational Education, in cooperation with the United States Railroad Administration, will prepare suggested courses of study for at least three trades, namely, machine shop, boiler making, and sheet-metal work, and these suggested courses of study will be placed at the disposal of the various state boards, and through these boards can be obtained by the railroads upon application.

There are certain condidtions which should be considered in making arrangements for railroad shop apprentices' schools under this plan:

1. There should be an advisory committee. Such committee may properly include representatives of the workers in the trades, the shop management, and public school.

2. This advisory committee should be responsible for insuring cooperation between the workers, shop management and public-school authorities.

3. The instructors employed for this work should be satisfactory to the advisory committee, as well as meeting the qualifications set up in the state plans.

4. The courses of study should be satisfactory to this advisory committee.

5. The classrooms to be used should be suitably fitted up for the instruction which is to be given, and they should be so located that the apprentices may readily have access from the shop to the classroom and the classroom to the shop without the necessity of making an entire change of clothing or entailing an unnecessary loss of time.

It is understood that railroads may conduct their own schools independent of these arrangements with the Federal Board for Vocational Education, but in such cases the entire expense will be borne by the railroad, and no reimbursement can be made from federal funds under provisions of the federal vocational education act.

Instructions Covering the Apportionment of Revenues from Interline Passenger Traffic

1. Effective December 1, 1919, the provisions of General Order No. 20, in so far as they relate to passenger accounts, are hereby canceled.

2. Effective with the business on and after December 1, 1919, General Order No. 32, and Accounting Circulars Nos. 12, 12-A and 106, are hereby canceled. On and after the date all bases and practices in effect December 31, 1917, as published in the Official Digest of Passenger Fares and Divisions, circulars issued by the various territorial passenger associations division circulars issued by individual carriers in effect December 31, 1917, and the recommendations of the Railway Accounting Officers Association as published in 1917 Synopsis, and as subsequently amended, shall govern the division and apportionment of interline passenger revenue, excess baggage collections and other analogous revenues derived from the interline passenger service, between roads under federal control.

3. The preparation of division slips on a revenue basis shall be started at once, in order to facilitate the work of making apportionments for the month of December, 1919, and to permit reports to carriers to be rendered not later than the last day of the succeeding month.

4. Adjustments made in the accounts for December, 1919, and subsequent months, covering tickets sold prior to December, 1919, and settled on "passengers carried one mile" basis, shall be made by applying the average revenue per passenger per mile that was used by the issuing carrier in the apportionment of interline ticket sales made during November, 1919.

5. Adjustments made in the accounts for December, 1919, and subsequent months, on account of excess baggage collections prior to December, 1919, that were apportioned on a mileage basis, shall be made by applying the average revenue per mile that was used by the issuing carrier in the apportionment of interline excess baggage collections for November, 1919.

6. In rendering reports of interline passenger traffic, carriers shall use the forms prescribed by the Railway Accounting Officers Association, as published in 1917 Synopsis, and as subsequently amended.

7. Claims shall not be rendered nor adjustments made for errors developed in interline passenger traffic reports for the period of federal control, but errors shall be brought to the attention of the initial carrier. Tracers for unreported tickets shall be rendered and adjusted, and revenues allocated by each carrier in accordance with the practice in effect at the beginning of federal control.

8. Effective December 1, 1919, General Order No. 49 and Accounting Circulars Nos. 42 and 43 are hereby conceled. The use of the forms and the application of the methods set forth therein are, however, left to the discretion of the individual carrier except that the present uniform forms and methods shall be continued at the consolidated ticket offices and union stations.

Contracts Executed

The Railroad Administration has executed compensation contracts with the Susquehanna & New York for $56,884, the Morgantown & Kingwood for $51,362, and the Maryland, Delaware & Virginia for $49,543.

Interstate Commerce Commission's Annual Report

Organization Had a Busy Year in Spite of Reduced Authority —Recommendations Presented to Congress

THE THIRTY-THIRD ANNUAL REPORT of the Interstate Commerce Commission to Congress, covering the year ending October 31, 1918, contains little in the way of new recommendations for the future because its views have been so fully expressed before the Congressional committees engaged on the proposed railroad legislation.

The routine report of the activities of the commissioners and the various bureaus shows, however, that the commission has been fully occupied in spite of the fact that its authority has been somewhat curtailed by federal operation of the railroads.

The commission's recommendations are summarized in the report as follows:

Summary of Recommendations

1. That consideration be given to our recommendation in the 1916 annual report that the power to award reparation be placed wholly in the courts; that a condition precedent to an award of reparation by a court for unreasonable rates or charges be that we have found such rates or charges unreasonable as of a particular time; that the law affirmatively recognize that private damages do not necessarily follow a violation of the act; that provision be made that sections 8, 9, and 16 of the act to regulate commerce shall be construed to mean that no person is entitled to reparation except to the extent that he shows he has suffered damage; and that the law should provide that if a rate is found to be unreasonable the rule of damages laid down in the *International Coal Case,* 230 U. S., 184, should control.

2. That section 20 of the act be amended to provide that its terms shall be applicable to holding companies.

3. We renew the recommendations made in previous reports favoring the standardization of railroad operating rules.

In connection with the subject of reparation, the commission refers to its previous report, in which it said it should be borne in mind that the standard of reasonableness under the commerce act is not a definite fixed standard, and whether a certain rate is reasonable or not often cannot be known by the carrier until the commission has passed upon it. The report refers to the fact that the shipper claiming reparation has frequently in fact passed the unreasonable charge along to the consumer in the price of his goods. The commission discusses the decision of the Supreme Court in the Darnell-Taenzer case, in which the defendant carrier offered this fact as a defense, in which the court said that the plaintiffs suffered loss to the amount of the verdict when they paid the freight rate. Their claim accrued at once in the theory of the law, and it does not inquire into later events. The commission says the law might well affirmatively recognize that private damages did not necessarily follow a violation of the act, and provide that sections 8, 9 and 16 shall be construed to mean that no person is entitled to reparation except to the extent that he shows that he has suffered damage. Incidentally, it says, the law now permits carriers to retain certain unreasonable charges in excess where rates are found to be unreasonable, and reparation is awarded only to the parties claiming it within the statutory period, and an unreasonable rate under existing conditions is in the last analysis a matter of judgment and in legal sense not generally an extortion.

As to the extension of the act to make it applicable to holding companies, the commission says that in the investigation of the affairs of operating railroad companies its work has been obstructed by reason of the fact that desired information concerning the carrier under investigation was obtainable only from the records of a holding company, which questions its authority to inspect its records and accounts. The information thus sought usually has to do with the financial status of operating accounts and their relationships to other carriers—matters of manifest concern to the public and important in the performance of their regulatory duties.

An abstract of the report is as follows:

Abstract of Report

Shortly after the armistice the Committee on Interstate Commerce of the United States Senate requested us to designate one of our members to present at the hearings of the committee "available data and other information bearing on the railroad situation in the country." Commissioner Clark, the senior member of the commission and chairman of its legislative committee, was designated as such representative. After consideration in conference the commission authorized him to present to the Senate committee statements embodying the prevailing views of the members of the commission and outlining generally the legislative program to which as a body we gave our support; and, second, the somewhat divergent views of Commissioner Woolley.

Commissioner Eastman did not become a member of the commission until February 17, 1919, and was therefore not a participant in the deliberations which led to the adoption of the program so submitted. Under date of July 8, 1919, Commissioner Eastman issued an individual statement. The formal statements were supplemented by extensive oral testimony and statistical date.

Subsequently the Committee on Interstate and Foreign Commerce of the House of Representatives made a similar request, in response to which much additional testimony was submitted and numerous illustrative and explanatory statements compiled.

As stated in our last report the service section created by the director general supplanted the carriers' commission on car service and took over its organization and personnel as well as a part of our Bureau of Car Service, thus in effect continuing the arrangement which then existed for handling car service and transportation generally. This method of operation has continued. The experience had under federal control has demonstrated the public benefits which can be derived from unified direction of car service and emphasizes the necessity for expanded power in the commission in order that those benefits may be continued and, where practicable, enhanced after operation of the railroads is resumed by their respective owners.

Certification of the Standard Return

Last year we certified to the President the average annual railway operating income of 282 carriers. During the current year we certified the average annual railway operating income of 285 carriers. After reviewing the accounts of 117 carriers we found that some of the reported figures should be corrected to harmonize with our accounting rules, and that 27 corrected certifications should be made to the President. Ninety of the original certifications were based upon accounts and computations which required no corrections. Additional

corrected certifications will be made where warranted by the further examinations now being conducted.

Boards of Referees

Under the provisions of section 3 of the federal control act and in response to petitions filed by railroad corporations, we have appointed eight boards of referees, and upon a petition filed by the director general we have appointed one such board, to hear claims for just compensation not adjusted by agreement upon a contract, as is contemplated in section 1 of the federal control act. These boards have proceeded promptly with a view to reporting, as soon as practicable in each case, to the President the just compensation. One of these cases has been concluded, and in four of them the evidence has been presented and briefs are soon to be filed.

Consolidated Classification

In our thirty-second annual report we advised that we had continued to endeavor to stimulate uniformity in freight classification. We stated that we had inquired of the carriers as to why they could not by January 1, 1919, or earlier, effect an assimilation or consolidation of the three general freight classifications into one volume containing one set of uniform rules and regulations and with three rating columns, one for each territory; that this was followed by the appointment by the director general of a small committee, of which our classification agent was a member, to take up and finish the work delegated in September, 1908, to the carriers' committee on uniform classification; that the special committee duly submitted such a volume and that request was made upon us by the director general to make an investigation and submit our recommendations to him.

The hearings were concluded shortly after our report was submitted, some 15,000 pages of testimony having been taken and 800 exhibits filed. Our report and recommendation was submitted to the director general on September 22, 1919, 54 I. C. C., 1. All of the carriers subject to the act and which were not under federal control were made respondents in order that the same classification might, if that course were found advisable, be prescribed for their use also.

The consolidated classification was not proposed as, and is not, a uniform classification in the generally accepted sense of the term. It would preserve the identity of the official, southern and western classifications. In consolidating the classifications and unifying the rules and descriptions numerous concessions were made and some long-standing and deep-rooted controversies growing out of territorial

Nature of changes	Number of changes in the classification			
	Official	Southern	Western	Total
Increase in ratings	890	2,574	393	3,857
Reduction in ratings	478	898	464	1,840
Carload ratings eliminated*	136	1	4	141
Increases in minimum weights	342	599	194	1,135
Reductions in minimum weights	229	73	61	363
Carload minimum weights to which rule 34 is added, subjecting them to the graduate scale	39	49	132	220
Additions or new items	1,144	1,665	425	3,234
Total	3,258	5,859	1,673	10,790

*The number of carload ratings established does not appear, but they are included in the reductions.

or local traffic policies were cast aside. Some radical changes were necessary in order to accomplish the desired uniformity as to rules and descriptions. There was no concerted effort to make the ratings uniform, but uniformity seems to have been kept in mind. The special committee was not directed to change ratings that were not necessarily or reasonably incident to changes in descriptions, and most of the increases and reductions in ratings proposed by the classification chairmen had no necesary connection with the work assigned to the special committee. Our representative thereon had no voice in assigning the ratings. Changes proposed for the purpose of attaining a greater degree of uniformity had more of an upward than a downward trend. While some of the proposed changes had been discussed with the public, the great majority of changes were laid before the public in the consolidated volume for the first time. The following table will give some idea of the magnitude and scope of the general revision put forward by the carriers:

An increase of more than one class in the rating effects an increase in the average charges ranging from 15 to 25 per cent. Many reductions were proposed, but it happens that, upon the whole, they would not apply to traffic of the same importance as would the increases. The director general did not intend the consolidated classificaiton as a revenue measure, and the classification committeemen disclaimed any purpose on their part to make it such. The record showed that, in the main, the proposed increases reflected conscientious efforts to bring about a proper relationship of ratings and to fairly distribute the transportation expenses over the various articles of traffic. Generally speaking, the consolidated classification, as proposed by the carriers, would bring them more revenue. So far as western classification territory is concerned, most of the increases proposed were of minor importance and comparatively few of them were protested, but in the two other territories some of the increases would apply on important kinds of traffic, and were the subjects of vigorous protest. The uniform rules, descriptions and estimated minimum weights were generally recognized as desirable and were received with favor. Objections were voiced mainly to increased ratings and to a general rule relating to charges on mixed carload shipments.

An absolute uniform classification could be prepared and proposed only in connection with a uniform system of rate scales having a uniform number of classes. Until that is worked out, however, there is no real bar to complete uniformity except in so far as carload freight in the lower classes is concerned. The percentage relationships between the classes are not uniform, even within any one of the three classification territories, nor among the tariffs of the same system of railroads, or even for different distances in the same tariff. This should not be a bar, however, to partial uniformity.

A study of the changes in ratings proposed disclosed inconsistencies which we could not endorse. We, therefore, had a comprehensive analysis made to ascertain whether or not we could properly recommend, with modifications, the somewhat general revision of ratings proposed, or an amplification of those proposals. We found that we could not properly recommend either, for the reason that many and important changes as to which interested shippers had had no notice or opportunity to be heard would be included.

So far as general rules, commodity descriptions, packing specifications and estimated and carload minimum weights are concerned, and subject to the modifications thereof indicated in our report, we recommended the adoption of the consolidated classification for application in lieu of the present official, southern and western classifications by carriers under federal control. With but two or three exceptions we did not recommend changed ratings, except as the establishment of new items indirectly effected changes and such as may be a reasonably necessary part of the establishment of uniform descriptions, specifications or minimum and estimated weights. The same rules, descriptions, packing specifications and minimum and estimated weights, subject to the same modifications and limitations, were, tentatively, and without prejudice, found just and reasonable for carriers not under federal control. We also tentatively sug-

gested a 10-class classification for the entire country and uniform percentage relationships among the classes in the class-rate scales throughout the country.

The director general has instructed the territorial classification committees to prepare a consolidated classification conforming to our recommendations, and it is expected that such an issue will be filed at an early date. The proposed classification is the result of effort toward uniformity extending over a long term of years, and since uniform rules and descriptions are necessary before uniformity in ratings is possible it marks an important step toward a uniform classification.

In connection with the consolidated classification, the director general requested that we hear evidence as to the effect of cancelling various state classifications and substituting therefor the consolidated classification. This request was not made until the hearings as to the latter were well advanced and no order was made broadening the scope of the hearings. Generally speaking, the states of Alabama, Florida, Georgia, Illinois, Iowa, Mississippi, Nebraska, North Carolina and Virginia have their own classifications. Evidence was accordingly received on this subject. Our conclusion was that while ordinarily there could be not justification for a different rating on an article when transported wholly within a state than when moved into or out of the state or between states in the same general territory, equality between intrastate and interstate ratings should not be accomplished by such substantial increases on important articles of traffic as would result if the proposed consolidated classification were substituted for the state classifications. We expressed the view that the respective situations should be worked out carefully and gradually after full investigation and co-operation with the interested shippers and state commissions with a view to not depriving any commodity or community of fair and reasonable rates and that, therefore, we could not recommend the substitution of the proposed consolidated classification for the state classifications. The question of the elimination of the Illinois classification was pending before us at the close of the period.

The question of eliminating exceptions to the territorial classifications was not referred to us by the director general.

Formal Docket

The formal complaints filed numbered 838, of which 695 were original complaints, and 143 subnumbers, which may be compared with 342 original complaints and 114 subnumber complaints filed during the previous period. We decided 458 cases and 140 have been dismissed by stipulation, or on complainant's request, making a total of 598 disposed of, as againt 653 during the previous year.

We conducted 839 hearings and took approximately 106,591 pages of testimony, as compared with 596 hearings and 104,983 pages of testimony during the preceding year.

Subjoined is a statement which shows certain facts as to the condition of our docket upon November 1, 1917, 1918 and 1919:

	1917	1918	1919
Cases at issue, but not set for hearing	185	21	54
Cases set for hearing, but not heard	111	142	184
Cases heard, but not fully submitted	110	87	234
Cases submitted	643	386	274
Total cases pending	1,217	768	860

Applications to Increase Rates Under the Amended Fifteenth Section

The total number of these applications filed since the amendment of August 9, 1917, is 8,439; number pending October 31, 1918, 1,237. During the year 1,755 applications have been filed; 1,041 have been approved; 37 have been denied in full, and 68 denied in part; 1,024 have been withdrawn by the applicant carriers; 8 have been assigned to dockets for formal hearings, and 814 are now pending.

The amendment of August 9, 1917, to section 15 of the act, expires by limitation January 1, 1920.

Investigation and Suspension Docket

No proceedings were instituted on this docket. We declined to suspend protested schedules in 10 instances, and disposed of 8 proceedings previously instituted.

Express Companies

After hearing upon application of the express companies for a 10 per cent increase in their interstate rates, we authorized such increase on June 17, 1918. Proposed Increase in Express Rates, 50 I. C. C., 385. These rates were made effective July 15, 1918.

On November 16, 1918, the President took possession, control and operation of the American Railway Express Company and placed it under the charge of the director general of railroads.

Effective January 1, 1919, by his general order No. 56, the director general adopted the block system of stating express rates in the three states which had not theretofore adopted that system and increased the express rates generally about 8 per cent.

During the period covered by this report schedules of rates substantially in accordance with the block system applicable to less than carload shipments of fruits and vegetables produced in 10 of the southern states have been established interstate, and similar schedules were also established on intrastate shipments in several of the states. Schedules of interstate carload rates on these commodities are still under consideration by the express company.

The director general has filed with us, to become effective December 10, 1919, regulations governing the packing of property shipped by express. These regulations contemplate better protection to the property transported and consequent reduction in loss and damage claims.

Numerous informal complaints have been received because of delays in payment of claims for loss of, damage to, or delays in the transportation of property by express. These have been taken up with the several companies and in general disposed of. The Adams Express Company, not now engaged in the transportation of property, has in some instances failed to give claimants definite response within two years after delivery of the property or after a reasonable time for delivery has elapsed, and has refused to pay claims when suits were not brought within the period of two years and one day after delivery, as was stipulated in the contract of shipment. In some instances it has offered to adjust the claim by payment of 60 per cent of the amount claimed, explaining that if that offer were not acceptable investigation would be continued and the claim disposed of on its merits. While the several companies were merged under a contract with the director general, apparently on provision was made for the assumption by the American Railway Express Company of claims against the constituent express companies the cause of action in which accrued prior to the creation of the consolidated company.

The Fourth Section

The operation of the transportation systems of the country by the director general of railroads has had a marked effect upon the applications for relief from the requirements of the fourth section of the act to regulate commerce. The director general has, in important instances, declined to defend carriers' applications for relief under the fourth section, but requested relief in a few instances. The applications filed have been in the main on behalf of carriers not under fed eral control, and as these carriers form in the aggregate but a small part of the transportation system of the country, and

have comparatively few situations where such relief is necessary, the number of applications has been less than in previous years.

The number of applications received for relief from the provisions of the fourth section was 51, a decrease of 214. The number of fourth-section orders entered was 182, of which 127 were permanent in character and 55 for temporary relief. Of the orders entered, 122 were in response to applications included among the original 5,030 applications for authority to continue then existing fourth-section departures, and 60 were in response to applications filed subsequently. Applications withdrawn after correspondence with carriers numbered 23. Orders granting relief in whole or in part total 82; orders denying relief in whole or in part numbered 124. Applications were assigned in whole or in part for hearing in connection with other proceedings in 157 instances.

Rate Schedules

There were filed 95,961 tariff publications containing changes in freight, express and pipe-line rates, passenger fares and classification ratings. These figures indicate a decrease in the number of rate changes established during the period, but this period followed the general increases in rates and fares ordered by the director general of railroads, and most of the changes in these publications were made to restore relationships between points and commodities which were disturbed by the percentage increases.

The file of schedules which is maintained for the use of the public, including shippers, carriers and departments of the government, has been used to the limit of its capacity, and, in addition, the Bureau of Tariffs has continued to furnish rate information to shippers, to the Railroad Administration and to other departments and bureaus of the government in constantly increasing volume.

Bureau of Inquiry

Twenty-eight indictments were returned for violations of the act to regulate commerce and the Elkins act. Three of these were against carriers or carriers' agents and 25 against shippers, passengers or other non-carriers. During the year 65 cases were concluded. Pleas of guilty were offered by the defendants in 57 of these cases and a plea of nolo contendere in 1. A verdict of not guilty was rendered in 1 case and indictments were dismissed in 6 upon motion of the government.

Several prosecutions have been instituted against shippers who filed with carriers false claims for alleged loss and damage to shipments in transit, in violation of section 10 of the act to regulate commerce, and thereby obtained payments from the carriers of substantial offsets against the transportation charges paid by such shippers, a discrimination against honest shippers who did not engage in such fraudulent practices. The obtaining of money from carriers under federal control by means of such false claims is practically equivalent to the obtaining of money from the Treasury of the United States by the presentation of false claims against the government.

In our last annual report reference was made to prosecutions under the Elkins act undertaken against dealers who had obtained the transportation of lumber into embargoed districts by using, without authorization, the names of government officials upon the billing for such shipments with intent to show that the lumber was intended for the use of the government when in fact intended for private purposes. Most of these prosecutions have been concluded successfully. A few still await trial.

Bureau of Law

On October 31, 1918, there were 16 cases involving orders or requirements of the Commission pending in the courts, of which 5 have been concluded. During the year 3 cases were instituted, so there are now pending in the different courts 14 cases. Of these 3 are in the Supreme Court and 11 in district courts. Of the 5 cases finally disposed of 2 were dismissed on motion of the petitioner, 2 were dismissed on motion of the parties and 1 was concluded by a decision of the Supreme Court.

Bureau of Statistics

The work of making the computations underlying the certificates of average annual railway operating income has been practically completed. The following table gives a survey of the number of steam roads of each class for which such computations were made, and the amount of the income involved. It is perhaps needless to say that the amounts here shown will not be exactly the aggregate of the amounts for which contracts are signed nor necessarily the ultimate amount payable to those classes of roads when all corrections and adjustments are made:

SUMMARY OF COMPUTATIONS OF AVERAGE ANNUAL RAILWAY OPERATING INCOME, AS DEFINED IN THE FEDERAL CONTROL ACT, FOR THE THREE YEARS ENDED JUNE 30, 1917

Item	Number of roads	Amount of income
Class I companies under Federal control	[1]163	$887,650,248.12
Class II companies under Federal control	03	8,671,996.48
Class III companies under Federal control	[2]35	379,387.46
Switching and terminal companies under Federal control	[2]124	22,014,303.34
Total	415	918,715,935.40
Class I companies not under Federal control	[3]11	4,624,908.25
Class II companies not under Federal control	[4]122	8,097,419.00
Class III companies not under Federal control	[6]223	2,365,702.99
Switching and terminal companies not under Federal control	[6]48	3,331,200.21
Total	404	18,419,230.45
DEFICITS NOT INCLUDED IN ABOVE		
Class I companies under Federal control	4	653,814.22
Class II companies under Federal control	27	1,195,815.35
Class III companies under Federal control	25	347,770.97
Switching and terminal companies under Federal control	8	76,723.95
Total	64	2,274,124.49
Class I companies not under Federal control	0	.....
Class II companies not under Federal control	[7]21	643,082.74
Class III companies not under Federal control	[8]144	973,879.36
Switching and terminal companies not under Federal control	37	636,713.57
Total	202	2,253,675.67
The net railway operating income with deficits deducted would be:		
Roads under Federal control	...	916,441,811.00
Roads not under Federal control	...	16,165,555.00

[1]Excludes Cincinnati, Hamilton & Dayton Railway Company not certified.
[2]Excludes two companies not certified.
[3]Excludes Utah Railway Company not certified.
[4]Includes 28 companies operated under co-operative contract.
[5]Includes 37 companies operated under co-operative contract, and excludes 53 companies not certified.
[6]Includes 1 company operated under co-operative contract, and excludes 1 company not certified.
[7]Includes 3 companies operated under co-operative contract.
[8]Includes 18 companies operated under co-operative contract.

The federal operation of the roads has necessitated a change in the annual report form of steam roads. Two reports have been required for 1918 for each controlled road, the one returned by the federal auditor and covering the revenues, expenses and operating statistics of the road, and the other returned by the corporate auditor and covering the financial transactions of the corporation. Owing to the numerous new accounting questions which have been raised by federal control, carriers have again been unable to comply with our rule that annual reports must be rendered within three months after the close of the reporting year. Our statistics for the calendar year 1918 will for this reason be much delayed.

The attempt of the Railroad Administration to inaugurate a more elaborate method of reporting statistics of the various classes of commodities received our approval. General Order 59, issued by the director general, contemplated the re-

porting of the commodities carried in such a way as to show not only the number of tons carried but also the freight revenue for each class of traffic, and further to show the number of tons of each class carried from any one state to each other state. This order was, however, rescinded. A new attempt is being made to work out a practicable improvement in this kind of statistics.

Bureau of Carriers' Accounts

The activities of this bureau have been directed chiefly to the execution of duties imposed upon us by the provision of the federal control act, which requires that as a basis for compensation of railroad owners we shall determine and certify the average annual railway operating income for the three years ended June 30, 1917. As the work has been prosecuted without additional force it has been necessary temporarily to defer the broader investigations of accounts usually conducted by this bureau. The review has nevertheless resulted in substantial benefits through the discovery and correction of erroneous practices in connection with the important accounts involved, as well as material changes in the amounts reported by the carriers as their operating income, which was the immediate subject of inquiry.

Of approximately 560 carriers whose accounts it became necessary to examine for the purpose of verifying the average annual operating income as reported by them, there have been submitted by the field force of the bureau reports of 387 examinations, leaving 173 examinations yet to be made, of which 33 are now in progress.

Bureau of Correspondence and Claims

The number of informal complaints received was 4,450, a decrease of 1,008. Carriers filed 1,885 special docket applications for authority to refund amounts collected under the published rates admitted by them to have been unreasonable, a decrease of 876. Orders authorizing refund were entered in 1,755 cases, a decrease of 997, and reparation was awarded thereon in amounts aggregating $420,867.77. In addition, 648 cases were dismissed or otherwise disposed of without orders. The bureau also handled approximately 48,000 letters, many of which, while not classified as complaints, had the characteristics of complaints.

Bureau of Safety

The casualties on steam railroads in connection with the operation of trains during the calendar year 1918 are summarized as follows:

Class of persons	Number of persons	
	Killed	Injured
Trespassers	3,255	2,805
Employees	2,928	47,556
Passengers	471	7,316
Persons carried under contract, such as mail clerks, Pullman conductors, etc.	48	766
Other nontrespassers	1,995	5,701
Total of above classes	8,697	64,144

In addition, there were 589 persons killed and 110,431 injured in nontrain accidents during the year.

During 1918 there were 164 employees killed and 2,332 injured in coupling and uncoupling cars; casualties due to employees coming into contact with overhead and side obstructions, falling from and getting on and off cars, resulted in 630 deaths and 14,533 injuries. As compared with the figures for 1917, there was a decrease of 2 in the number killed and 176 in the number injured in the former class of accidents, and an increase of 39 in the number killed and a decrease of 1,851 in the number injured in the latter class of accidents.

During the year information of violations of safety-appliance laws by railroads operated under federal control was not filed with United States district attorneys for prosecution, but reports of such violations were furnished to the United States Railroad Administration to enable it to take corrective measures as contemplated by Order No. 8 of the director general. Reports of 1,569 specific instances of violations of the law were transmitted to the director general.

In connection with the consolidation and unification of terminal facilities effected by the Railroad Administration, investigations conducted by us have disclosed that in some instances proper inspection was not being given equipment in such terminals and available repair facilities were not being sufficiently utilized to insure that cars having safety-appliance defects would not be moved in violation of law. Several cases of this character were called to the attention of the director general, and in each case corrective measures were taken to secure compliance with the requirements of law.

Investigations have disclosed that situations exist on several railroads where trains are still controlled on mountain grades by means of hand brakes. Measures are being taken by us to bring about the discontinuance of this practice and to secure full compliance with the law. In some cases, joint investigations and demonstrations have been conducted for the purpose of fully establishing the practicability and safety of operating practices which conform to the requirements of the law.

The results of safety-appliance inspections also direct attention to the fact that improvement in the condition of air-brake equipment is required. Our order of June 6, 1910, specifies that not less than 85 per cent of the cars in a train must have their brakes used and operated by the engineer of the locomotive drawing the train, and this requirement is generally understood and recognized. The order also provides that "all power-brake cars in every such train which are associated together with the 85 per cent shall have their brakes so used and operated." This latter requirement is not generally observed. It is common practice at the present time for trains to leave terminals having some cars with inoperative brakes or having brakes cut out, notwithstanding the fact that facilities are available at such terminals for making repairs or replacements necessary to place all power-brake equipment in operative condition.

The period within which carriers subject to the safety-appliance laws were required to equip their cars to comply with the standards fixed by our order of March 13, 1911, was, as to paragraphs *b, c, e* and *f* of the order, extended on February 1, 1918, to September 1, 1919. On August 15, 1919, application was made to us by the United States Railroad Administration, and by the American Railroad Association for an additional extension of nine months. At the hearing it was shown that there remained yet unequipped about 80,000 cars, 16,596 of which would require reconstruction of the ends in order to provide sufficient end ladder clearance. It was also shown that on account of difficulty in obtaining men and material, in locating nonequipped cars and getting them unloaded and to repair tracks, it would be necessary to grant additional time within which to equip them, or it would be necessary to take from service cars otherwise suitable for use and needed particularly for transportation of coal and grain. In view of this showing, on August 29, 1919, an order was issued granting a further extension of time until March 1, 1920.

With respect to railroads which are not operated under federal control, there were, during the fiscal year, 15 cases of violations of the safety-appliance law, involving 73 counts, transmitted to United States district attorneys for prosecution. Cases aggregating 57 counts were tried, of which 49 counts were decided in favor of and 8 counts adversely to the government.

During the fiscal year there were transmitted to the several United States district attorneys for prosecution 10 cases of violation of the hours-of-service act, involving 61 counts.

Cases aggregating 21 counts were tried, of which 2 counts are pending decision, 2 counts were decided in favor of, and 17 adversely to, the government. Of these 17 counts, 16 have been appealed. There were also 42 counts decided against the government on demurrers to defendants' answers. There were 461 counts confessed and 46 counts dismissed. In the various circuit courts of appeals there were decisions in 3 cases involving 23 counts, all in favor of the government. In 2 cases decided by the Supreme Court involving 29 counts, the decisions were in favor of the government; application for a writ of certiorari was denied in two cases which were consolidated and tried as one case, involving 120 counts, wherein the decision of the circuit court of appeals was favorable to the government. Pending trial in the various district courts are 71 cases involving 651 counts.

Reports of 225 instances of violations of the law were transmitted to the director general. Of the cases filed for prosecution in the district courts, 4 were instituted against the officers and agents in charge of the employees who exceeded the statutory periods of service, involving 18 counts. These officials were employed by four railroads which are operated under federal control.

During the year ended June 30, 1919, we investigated 79 train accidents. These included 53 collisions, 25 derailments, and one miscellaneous accident. The collisions resulted in 261 deaths and 1,083 injuries, the derailments resulted in 55 deaths and 231 injuries, while the one other accident resulted in 20 deaths and 19 injuries, a total of 336 persons killed and 1,333 persons injured.

Of the 53 collisions investigated, 28 occurred on lines operated by some form of block signal system, 19 on lines operated by time table and train order; 6 were yard accidents.

Of the 28 collisions occurring on block signal roads, 18 occurred in automatic block signal territory, of which 12 were rear-end collisions, 5 were head-end collisions, and 1 was a side collision.

Eleven of the accidents occurring in automatic block signal territory were due, directly or in part, to the failure of enginemen properly to observe and obey signal indications; in some cases improper performance of duty by flagmen was a contributing cause. In one of the rear-end collisions the primary cause was the failure of a crew to wait a sufficient time after opening a side-track switch before passing out upon the main line. Two of the collisions investigated were caused by lack of proper maintenance of signals In one of these cases a false clear signal was the primary cause of the accident, while in the other, which occurred on an interurban line, orders had been issued by the dispatcher for train crews to disregard automatic block signals, several of which were not in operative condition and had been out of order for some time. The crews of the trains involved in this accident overlooked a meeting point which was fixed by time table as well as by a train order.

Of the 10 collisions which occurred in nonautomatic block signal territory, 4 were rear-end and 6 were head-end collisions. One was due to improper flagging. In 4 collisions train orders were involved. In one case the engineman failed to stop and take siding as directed; in another case a train crew failed to obey a wait order; in the third case an operator made an error in copying a train order, and the crew accepted the order, which was incomplete and also contained an erasure and an alteration; and in the other case the operator failed to deliver an order. Two accidents were due to enginemen not operating their trains under proper control in occupied blocks, as required by signal indications; another was due to the failure of an engineman to observe and obey the stop signals of a flagman, another to a runaway due to cars being left on a grade without sufficient number of hand brakes being set, while another was due to a work train occupying the main track without protection.

The 6 yard accidents investigated consisted of 1 rear-end collision, 4 head-end collisions, and 1 side collision. The most serious of these was a head-end collision between a light engine moving away from a roundhouse, and a heavily loaded employees' train. It occurred in a dense fog and was the result of both enginemen failing to take proper precautions in view of the prevailing weather conditions.

The 19 collisions on lines operated by the timetable and train-order system consisted of 5 rear-end collisions, 12 head-end collisions, and 2 side collisions. All of the rear-end and side collisions were due to failure properly to protect trains by flag. Errors in transmitting, receiving and fulfilling train orders were responsible for 5 of the 12 head-end collisions. Of the remaining 7 head-end collisions, 5 were due to trains occupying the main track on the time of superior trains, 1 to running by meeting point on account of excessive speed, and the other to the failure of a dispatcher to provide a meeting point between 2 extra trains. Among the accidents due to occupying the main track on the time of a superior train was the most disastrous accident ever investigated by us; it resulted in 90 deaths and 180 injuries. In this case a passenger train, inferior by direction, passed from double to single track and collided with the opposing superior train. No train register was maintained at the end of double track, and the conductor, who was busy collecting tickets, thought that a train which had been passed while on the double-track section was the opposing superior train. The engine crew were killed in the collision.

Three of the 25 derailments were due to defective equipment and 14 derailments were due to track conditions, including broken rails, switches being open or partly open, washouts, the malicious removal of rail connections, and to the poor condition of track. Five derailments were due to excessive speed; one was caused by an obstruction maliciously placed on the track and one resulted from an arrangement of signal lights at the end of double track which was such that the engineman thought a derail was closed and the signal clear, when the contrary was the case.

The failure of enginemen to observe and obey signal indications and the failure to provide adequate flag protection for trains continue to be the principal causes of collisions. Misreading signals, failing entirely to see signals due to fog, smoke, and steam, being temporarily engaged in other duties, or being asleep, constitute the more common reasons for the failure of enginemen to observe and obey signal indications. Accidents due to these causes have occurred on roads where the best trained and most competent men are employed. The only remedy proposed which appears to be adequate to check and provide protection against the occurrence of disastrous accidents of this character is the adoption of some form of automatic train control system for the purpose of compelling obedience to automatic block-signal indications.

The matter of providing proper flag protection for trains is in most cases essentially a question of observance or enforcement of rules. It has been clearly established as a result of accident investigations that numerous disastrous railroad accidents would beyond question be prevented by strict adherence on the part of the flagmen to the requirements of the flagging rules. Improvement in this regard can be effected by railroad companies by exercising proper supervision and care in the selection, training, instruction, and assignment of flagmen. In this connection attention is again called to the recommendation made in previous reports for the standardization of railroad operating rules. The adoption by railroads throughout the country of uniform operating rules, specific and definite in their requirements, and embodying the best operating practices now in vogue, would constitute an important step in providing increased safety in railroad operation.

Collisions continue to occur on lines which are operated by the time-table and train-order system, due to the weaknesses inherent in the train-order system of operation, which have been discussed in previous reports. There have also been several collisions in block-signal territory, which resulted from lack of necessary maintenance of automatic signals and failure to observe rules essential to the safe operation of the nonautomatic block system. Block-signal statistics indicate a very slight increase in railroad mileage operated by the block system during the calendar year 1918, and during the past four years the average net increase in block-signal mileage has been less than a thousand miles per year.

Investigations of a number of fundamental questions pertaining to railroad rails and the causes of their failure are now in progress. These investigations include both manufacturing conditions and service conditions encountered in the track.

Under authority of the act of October 22, 1913, tests have been conducted of an automatic train-control device and an automatic train-pipe connector. Detailed reports of the results of these tests have been transmitted to the Congress. During the fiscal year plans of 89 devices were examined and opinions thereon transmitted to the proprietors.

During the fiscal year three applications for medals of honor under the act of February 23, 1905, were received. In two cases we recommended to the President that the applications be denied, and he approved the recommendations. The third case is still under consideration.

Bureau of Locomotive Inspection

The work of this bureau during the fiscal year ended June 30, 1919, is shown in detail in the report of the chief inspector, published separately.

The tables below show in concrete form the number of locomotives inspected, the number and percentage of those inspected found defective, and the number ordered out of service because of not meeting the requirements of the law, together with the total defects found.

The amendment to the locomotive boiler inspection law of March 4, 1915, to include the entire locomotive and tender and all appurtenances thereof, did not become effective until September 4, 1915; therefore the record for the fiscal year ended June 30, 1916, includes accidents and casualties investigated under the amended act for only 9 months and 26 days of that year.

The following table shows the total number of persons killed and injured by failure of locomotives or tenders, or some part or appurtenances thereof, during the four years ended June 30, 1916-1919:

	Year ended June 30							
	1919		1918		1917		1916	
	Killed	Injured	Killed	Injured	Killed	Injured	Killed	Injured
Members of train crews:								
Engineers	14	194	11	245	16	230	11	205
Firemen	22	265	19	306	21	304	12	225
Brakemen	11	82	6	62	13	60	9	74
Conductors	2	16	..	21	3	14	1	6
Switchmen	1	7	2	8	1	8	...	6
Roundhouse and shop employees:								
Boiler makers	1	9		11	...	11	1	11
Machinists	..	5	...	11	...	8	1	11
Foremen	..	3	1	4	...	1	1	3
Inspectors	..	6	4	4	...	3	...	3
Watchmen	..	2	...	3	...	5	...	8
Boiler washers	..	7	1	4	...	7	...	10
Hostlers	..	6	...	8	...	6	...	6
Other roundhouse and shop employees	1	17	2	19	2	19	1	21
Other employees	3	23	...	26	5	22	...	7
Nonemployees	2	11	...	24	1	23	1	3
Total	57	647	46	756	62	721	38	599

All accidents which have been reported to this bureau, as required by section 8 of the law, and rules 55 and 162 promulgated thereunder, have been carefully investigated and a report rendered, as required, for the purpose of determining, as far as possible, the exact cause of such accidents, and applying a remedy that will tend to prevent recurrences. Copies of such reports have been furnished to all interested parties, when requested, and to railroad officials, in order to acquaint them with the conditions, as disclosed by our investigations.

Locomotives Inspected, Number Found Defective, Percentage Inspected Found Defective, Number Ordered Out of Service, and Total Defects Found, by Comparison

	1919	1918	1917	1916
Number of locomotives inspected	59,772	41,611	47,542	52,650
Number found defective	34,557	22,196	25,909	24,685
Percentage found defective	58	53	54.5	47
Number ordered out of service	4,433	2,125	3,294	1,943
Total defects found	135,300	78,277	84,833	71,527

Number of Accidents, Number Killed, and Number Injured, by Comparison, Covering Failures of All Parts and Appurtenances of the Entire Locomotive and Tender

	1919	1918	1917	1918
Number of accidents	565	641	616	537
Decrease from previous year..per cent	11.8	[1]4.1	...	...
Number killed	57	46	62	38
Decrease from previous year..per cent	[1]23.9	25.8	...	...
Number injured	647	756	721	599
Decrease from previous year..per cent	14.4	[1]4.8	...	...

[1]Increase.

Note.—Percentage of decrease not shown for 1916, because of amended act not being in effect the entire year.

Number of Accidents, Number of Persons Killed and Number Injured; Due to the Failure of Some Part or Appurtenance of the Locomotive Boiler Only, with Their Percentage of Decrease, by Comparison of the Fiscal Years Ended June 30, 1912-13, With the Fiscal Years Ended June 30, 1918-19

	1919	1918	1917	1916
Number of accidents	341	398	820	856
Decrease 1919 from 1918.....per cent	14.3	...	...	...
Decrease 1919 from 1912.....per cent	60.2	...	...	...
Number killed	45	36	36	91
Increase 1919 over 1918.....per cent	25	...	...	...
Decrease 1919 from 1912.....per cent	50.5	...	...	...
Number injured	413	510	911	1,005
Decrease 1919 from 1918.....per cent	19	...	...	...
Decrease 1919 from 1912.....per cent	58.9	...	...	...

The fact that it is known that all accidents will be carefully investigated, and the existing conditions made known by parties whose only interest in such matters is to prevent recurrences, has had a most beneficial effect in reducing the number of casualties to employees and travelers upon railroads, as indicated by a comparison of the reports rendered.

The reduction in the number of accidents and casualties is gratifying when it is remembered that up to September 4, 1915, the law applied to the locomotive boiler and its appurtenances only, since which date it has covered the entire locomotive and tender and all of their appurtenances.

A summary of all accidents and casualties occurring during the fiscal year ended June 30, 1919, covering the entire locomotive and tender and all of their appurtenances, shows a decrease of 11.8 per cent in the number of accidents, an increase of 23.9 per cent in the number killed, with a decrease of 14.4 per cent in the number injured, as compared with the year ended June 30, 1918.

A summary of all accidents and casualties, caused by the failure of the locomotive boiler and its appurtenances only, for the fiscal-year ended June 30, 1912, which was the first year of the existence of the law, compared with a summary of all accidents and personal injuries which occurred during the fiscal year ended June 30, 1919, shows the substantial decrease in the number of accidents of 60.2 per cent; a decrease in the number of persons killed of 50.5 per cent; and a decrease in the number injured of 58.9 per cent, caused by the failure of such parts.

The increase in the number of persons killed during the

last year over the year previous is, to a considerable extent, due to some very violent explosions resulting from firebox crown-sheet failures. These failures serve to illustrate the prime importance of proper firebox construction, inspection, and repair, together with the location, inspection, and maintenance of such appliances as water glasses, gauge cocks, injectors, steam gauges, and safety valves.

Substantial progress has been made in equipping locomotives with headlights which will meet the requirements of our orders of December 26, 1916, and December 17, 1917, the effective date of which was fixed as of July 1, 1918. Notwithstanding the strenuous opposition offered, by certain carriers, to the adoption of these requirements, the use of such lights as a safety device is meeting with the general approval of the employees who are employed where locomotives are so equipped; and a number of the officials, under whose jurisdiction these lights are being operated, have expressed their opinion that such lights are economical and add materially to the safety of operation.

Under our order of April 7, 1919, certain modifications in the rules which were granted in our order of September 20, 1917, because of conditions brought on by war, were abrogated and others substituted. Experience had demonstrated that certain modifications granted in our order of September 20, 1917, could be made permanent without adversely affecting the safety of operation; therefore, such modifications were retained in the rules.

It has been the purpose to co-operate with the United States Railroad Administration and the officials of the various carriers to the fullest extent consistent with our duties and the purpose of the law, and avoid as far as possible, being compelled to order locomotives removed from service for unsafe conditions at a time when traffic might be seriously delayed.

This bureau has also furnished transcribed reports showing defects found on all locomotives ordered out of service and all defects found approaching violations of the law and rules to the federal managers or the chief operating officers of the carriers. This was done for the purpose of keeping them informed so that proper repairs might be made to such defects before they became violations and to prevent, as far as possible, failures which might result in serious accidents to persons and property, and consequently serious delay to traffic.

Bureau of Valuation

Fifty-three tentative valuations have been served, and hearings are now being held upon protests which have been filed. In connection with the properties of the Texas Midland Railroad, the Winston-Salem Southbound Railroad Company, and the Kansas City Southern System, action upon protests has been taken and final reports published, except that we have not fixed a single sum as the final value of the common-carrier property of any of these carriers.

As stated in our last annual report, the work of the bureau had been seriously interfered with during the war by inability to obtain and retain competent men, and it was expected that with the cessation of hostilities this condition would disappear, but it has not. The difficulty of finding men with the requisite expert qualification has not lessened, and the cost of employing them has materially increased. This has to an extent interfered with progress.

The field work of the engineering section has been substantially finished. The road and track parties, which make the major part of the field inventory, have been disbanded in the Southern, Western, and Pacific districts and will be disbanded in the Central district about January 1. A small amount of branch work, that is, the inventorying in the field of buildings, bridges, and equipment, is still to be done in all districts except the Southern; and owing to a mistake in estimating the mileage assigned to the Eastern district, road and track work in this district will run some four or five months beyond the previously estimated average date of completion of January 1, 1920.

In the land section our progress has not been as great as was anticipated owing mainly to the inability of carriers to supply necessary preinventory information, like maps of their right of way. Our appraisers can not fix the value of these lands until the carrier has pointed out their location and extent.

The greatest difficulty is being experienced in the accounting section and here again the delay arises from the inability of the carriers to furnish us proper information, especially as to the cost of their equipment and the original cost of their lands. The effect of the war has been to increase the demand for accountants, especially of the higher grade, more in proportion to the supply than in case of any other class of employees engaged in our valuation work. Not only is there an unusual demand for accountants in private occupation but the government itself has become a large employer. The federal control of railroads has imposed upon the railroad accountant a great amount of additional work for which an adequate number of competent men has not been available.

In our report in the Texas Midland case, we said:

"* * * Tentative valuations in which a simple sum as the value of the property is not stated will in due course be supplemented by such finding and a final valuation, including a single sum as the value of the property, will be duly issued."

At the time that report was issued it was our thought that action concerning final value should not be taken until after a comparatively large number of tentative valuations had been prepared and served and the interested parties had been given an opportunity to be heard fully upon the question. All parties to the record represented to us that in the presentation of this question they would be greatly aided by the observation and study of a comparatively large number of cases, and that we could act in the premises more intelligently than would otherwise be possible. We have therefore arranged to hear argument early in January.

Orders of the Regional Directors

Report of Operating Conditions. — The Southwest regional director, by Supplement 3 to Order 36, directs reports of operating conditions to be made monthly instead of semi-monthly.

Export Bills of Lading Via North Atlantic Ports.—Supplement 2 to Circular 240, of the Southwestern regional director, gives additional names to the list under paragraph 8 of the original circular (*Railway Age,* page 424, August 29).

Disposition of Old Ties.—Order 236, of the Southwestern regional director similar to file 113-1-1 of the Northwestern regional director (*Railway Age,* September 12, page 518).

Condition of Locomotive Cabs. — The Northwestern regional director, file 66-1-122, states that the condition of many locomotive cabs is such that in cold weather severe hardship to the men as well as loss of efficiency will result. Openings in cabs around boilerheads, injector pipes, reverse levers and other places must be properly closed; clear vision windows must open and close properly; cab heaters must be applied and be put in proper condition for service, and suitable cab curtains must be provided as soon as needed.

Cold Weather Fire Warnings. — The Southwestern regional director, in Order 242 (renewal of Order 85), quotes Bulletin 3 issued by the manager of the Insurance and Fire Protection Section, relative to prevention of fires in the winter and the necessity for eliminating fire hazards.

Double Sheathed Box Cars Built by C. M. & St. P.

Underframe Has Steel Center Sill and Wooden Side Sills; Wooden Frame Body with Steel Ends

A 40-TON BOX CAR in which many interesting features have been incorporated has been designed by the Chicago, Milwaukee & St. Paul, and a lot of 1000 is now being built in the company's shops at Milwaukee. The general outside dimensions of the car are as follows: length 42 ft. 1½ in.; height at eaves 13 ft. 2 in., and width at eaves 9 ft. 11 in. The inside of the body is 41 ft. 5½ in. long, 8 ft. 10⅜ in. wide, 9 ft. 1⅞ in. high at the center and 8 ft. 8⅝ in. high at the sides with a door opening 8 ft. 2¼ in. high. The cubical capacity of the car is 3267 cu. ft. and the average light weight is 44,800 lb.

Underframe

The underframe is made up of a steel center sill with three wooden sills and three truss rods on each side. The center sill consists of two 12 in., 40 lb., channels, 43 ft. long, with a ¼ in. by 20 in. cover plate extending practically the full length on top of the sill. A double body bolster of the built-up type is used. The top chord members are ¾ in. by 7 in. and pass through the center sill channels near the neutral axis and over a combined filler and center plate casting. The bottom bolster members are 1 in. by 7 in. and pass under the center casting. Malleable iron fillers are bolted between the two members at each intermediate sill and also at the side bearings.

The end sill is of wood, 6½ in. wide by 8½ in. high. It is cut out to a height of 3¾ in. where it passes over the center sill. Two nailing strips 3¾ in. high are bolted along each side of the center sill. With the four intermediate and two side sills, there are eight points of support for the floor boards. The sills are all 8½ in. high, the width of the intermediate sills being 4 in. and of the side sills 4½ in. The truss rods are 1¼ in. in diameter, with ends upset to 1½ in. The needle beams are secured to substantial spacing castings attached to the bottom of the sills.

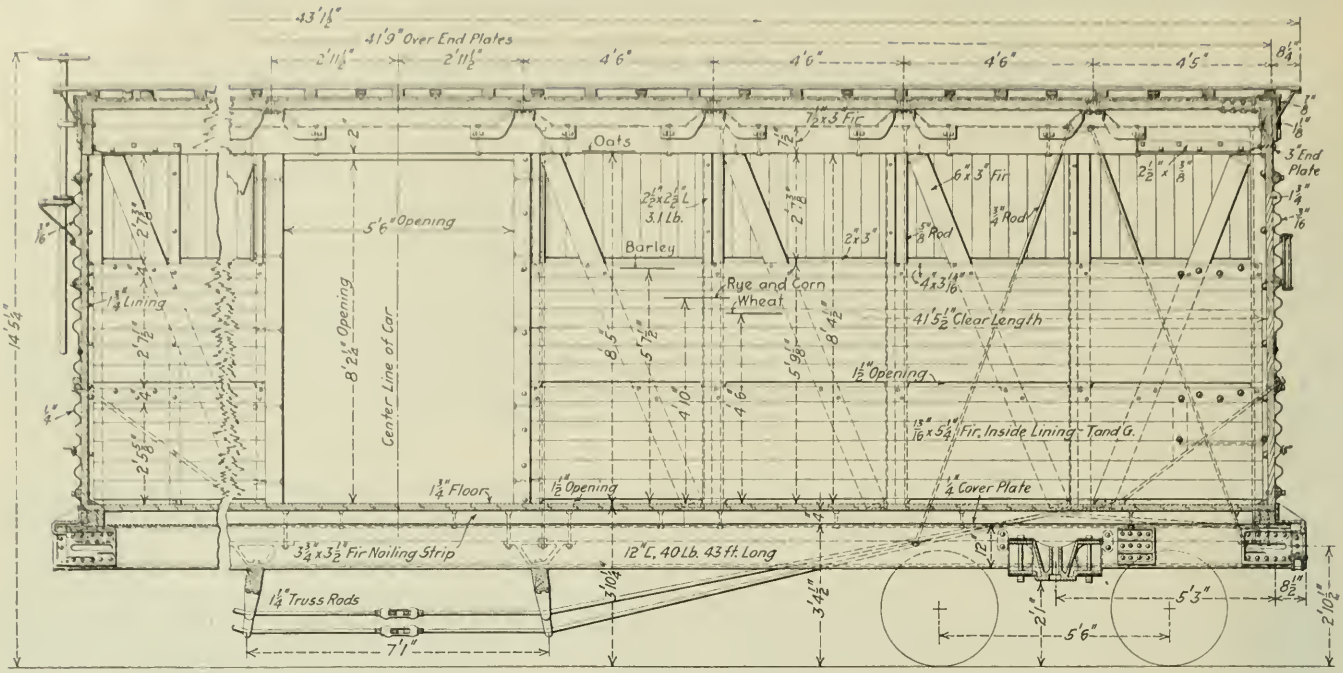
The draft gear is of the Cardwell friction type. One of the illustrations shows the details of its application. A coupler with a 5 in. by 7 in. shank is used but slots for a coupler key are provided in the sills.

Body Construction

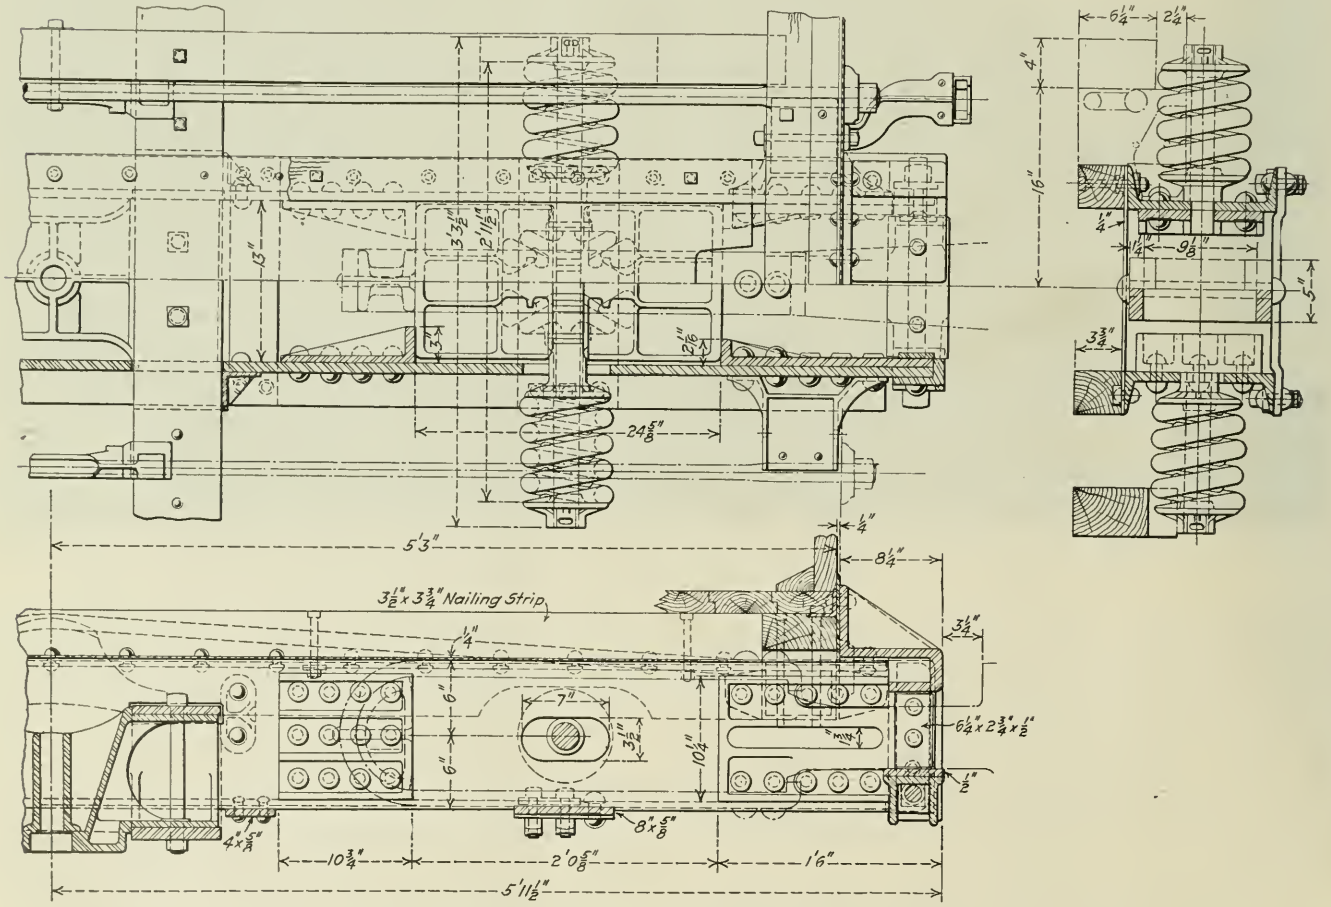
The side trusses are made up of 6 in. by 3 in. posts and braces, each vertical post being reinforced by a 2½ in. by 2½ in. angle iron weighing 3.1 lb. per ft. The door posts are made up of a 4½ in. by 5⅝ in. and a 2 in. by 3 in. post with a 2¼ in. by ¾ in. wrought iron strip between. These parts are bolted together and the front post is further reinforced by the door stop. The side plate is 7½ in. by 3 in. There are two belt rails, 4 in. by 3 13/16 in., located 2 ft. 5⅝ in. and 5 ft. 5⅛ in. from the floor. The flooring is 1¾ in. thick and the inner and outer sheathing are 13/16 in. thick.

The ends are of the Murphy two-piece type, ¼ in. plates being used for the lower section and 3/16 in. plates for the upper. The lower plate extends down behind the striking casting and over the end sill, and a 2½ in. by 2½ in. angle iron riveted to the plate sets into the upper face of the sill. This construction is clearly shown in the drawing of the draft rigging. Diagonal braces extend from the post pocket casting

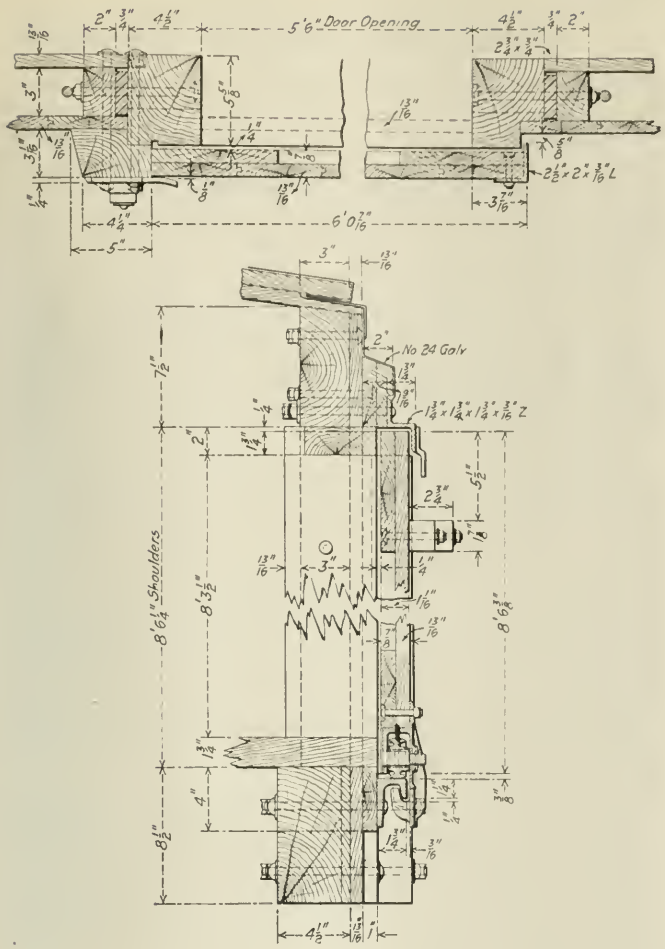
Double Sheathed 40-Ton Capacity Box Car Designed and Built by the C. M. & St. P.



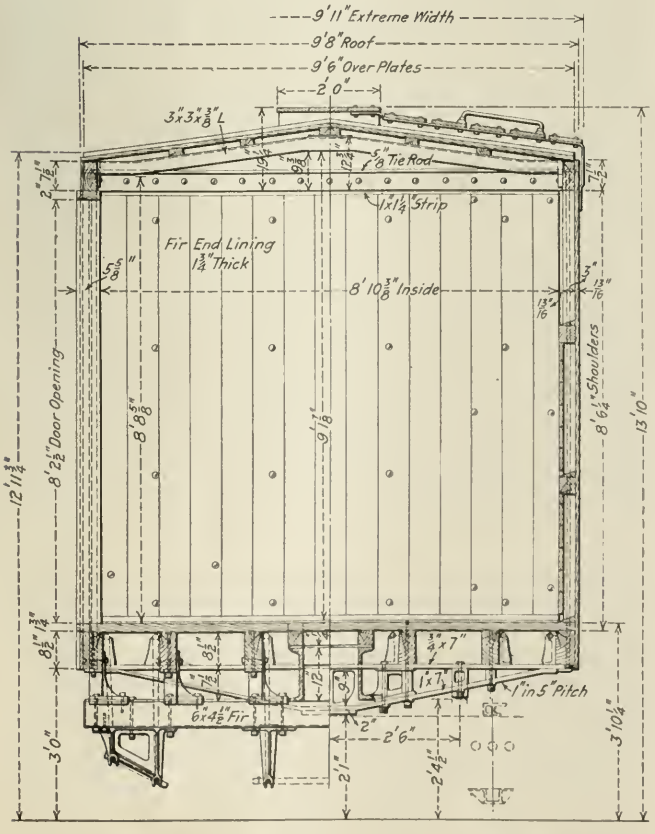
Longitudinal Section Showing the Arrangement of the Body Framing



Details of the Draft Gear Application



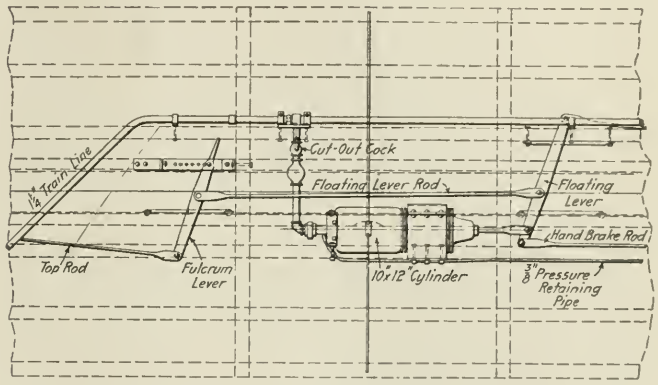
Details of the Door Construction



Half Sections of the C. M. & St. P. Double Sheathed Box Car

over the bolster to the top of the lower end section on each side. The end plate, to which the upper section is joined, is 3 in. thick and is fastened to the side plate with strap bolts. The end is lined with 1¾ in. matched boards placed vertically.

The roof is supported on Ideal carlines formed of two 3 in. by 3 in. by ⅜ in. angles, to which are bolted the wooden purlins and ridge pole. The roof is the Murphy type X L A flexible. The doors are of the bottom supported type with



Arrangement of the Foundation Brake

Camel door fixtures. Details of the construction at the doors are shown in one of the illustrations.

Brake Slack Adjuster

An interesting detail of the brake rigging is the method employed for taking up the slack. No adjustment is provided in the bottom or top rods. Instead the fulcrum lever is attached to a bracket which has several holes for adjusting the piston travel. The lever is provided with a handle and lettering on the side of the car calls attention to the fact that excessive travel is to be taken up at the fulcrum lever and not at the trucks. The convenience of this arrangement has proved of great assistance in eliminating excessive piston travel.

Amending Section Four of the Act to Regulate Commerce

G. W. Luce, freight traffic manager of the Southern Pacific at San Francisco, Cal., has recently written a treatise on the disadvantages which would accrue if the "long-and-short-haul" clause of the Act to Regulate Commerce is amended as proposed in the bill recently introduced in the Senate. Mr. Luce says in part:

"There was introduced in the Senate, on May 20, 1919, a bill to amend Section Four (commonly called the long-and-short-haul clause) of the Act to Regulate Commerce. Much has been said by the press of interior cities regarding this bill, giving the impression that a great disaster would befall such communities if the bill were not passed. The following is a quotation from articles that have appeared in some of the interior papers:

> 'Inland towns and cities no longer will be compelled to pay higher freight rates than terminal points if the bill to amend the long-and-short-haul clause in the Interstate Commerce Law is passed.'

"This statement, taken by itself, may be true, but the freight rates which interior communities will be required to pay, if the bill is passed, will be higher than they are today, or ever have been, for this reason: If the pre-war service between the Atlantic seaboard and the Pacific coast is resumed, and the transcontinental railroads are prohibited

from meeting the water rates, unless they make the same, or lower, rates to interior points (which they cannot afford to do unless water rates are sufficiently high) the traffic will move by water, and if the railroads forego the revenue on that traffic, it is quite evident they must increase the rates sufficiently on the only remaining traffic, which is that to the interior, to earn the necessary money to pay their bills. The traffic between the Atlantic and Pacific coasts is only one of the many such situations. They exist in all parts of the United States.

"Are the railroads now to be compelled by such an amendment to so adjust their rates as to prevent their handling any traffic that can move by water, and be limited to interior traffic that can only be handled by rail and to increase their rates on such traffic so that their earnings will be sufficient for fixed charges, operating expenses, taxes, and a reasonable profit? Also, are the railroads to be restrained from making necessary rates on United States manufactured goods from interior points to the Atlantic, Gulf or Pacific coast cities to meet competition of foreign-made goods reaching these cities by water?

"It is not contended here that the railroads should be permitted to make rates that will force the water lines out of business. I suggest, therefore, that the railroads be permitted to fairly meet the water line rates and enjoy a share of the business, utilizing their facilities to the fullest extent; the Interstate Commerce Commission to say to what extent the railroads may go towards meeting water competitive rates without affecting intermediate rates, which must at all times be reasonable in, and of, themselves.

"If the traffic is forced to move by water, and then transshipped to interior points, the railroad not being permitted to fairly meet water competition, it follows that the railroads must fix the interior point to which they can afford to handle the traffic from points of origin at rates based on the water rate, plus the rail rate back to such interior point. Further, if rates on traffic from points of origin to destinations beyond such fixed point must be the same, or higher, the traffic would then be forced to the water lines.

"What difference does it make to the merchant at 'inland towns and cities' whether his freight is moved via rail direct, or via water and rail route, so long as the through charge is about the same by both routes? It is to his advantage to have at his command the use of either route. He would have the benefit of daily service by rail, and not be dependent wholly upon specific sailing days, a week or so apart, by water routes.

"Viewing the situation also from the standpoint of moving traffic by rail through interior points to terminals, or coast cities; it is helpful to the interior, for the more trains handling traffic through the interior to water terminals, the more trainmen are employed and more material and supplies are used, which is always beneficial to both interior and terminals. Again, it is beneficial or harmful to the interior as that service is increased or diminished, depending on whether or not the railroads are compelled to retire from handling traffic to water terminals.

"Are the terminals, or coast cities, to be denied the choice of either rail or water service and are they to be compelled to use the water lines and be denied the use of the rail lines by the passage of a law forbidding an adjustment of rates by rail, fairly competing with the water lines in both rates and service?

"It seems to me that all manufacturing industries, as well as all jobbers, both at interior and coast cities, should not be favorable to the passage of an amendment to the Fourth Section of the Act to Regulate Commerce which will create a rigid-long-and-short-haul clause.

"Measured by test the Fourth Section, as it now reads, is just and fair to all interests, and if continued to be properly and fairly administered will continue helpful to both rail and water carriers, also the public both at interior and coast cities, especially if the rates of the water lines in the future are also controlled and regulated by the Interstate Commerce Commission."

Plumb "Conference" Urges Continued Government Control

THE CONFERENCE on Democratic Control of the Railroads organized by the Plumb Plan League, has issued a statement urging that pending railway legislation be delayed until an investigation of the whole subject can be made by an official commission created for the purpose. It suggests that government control be continued until such an investigation is laid before Congress and the country. Statement said in part:

"There is no justification for precipitate haste in turning the railroads back to their owners. Neither the public, shippers nor consumers are suffering under the present arrangement. In many ways they are receiving better service than ever before, and at much lower rates than the railway owners are demanding.

"Abnormal war conditions created deficits under federal control. These deficits have disappeared. The railroads are now more than paying their way. Official reports of the Railroad Administration for July and August, 1919, show that the roads are earning all operating charges, including maintenance, as well as the governmental rental of over $900,000,000 a year. They are actually earning a surplus for the government. In July they earned a surplus of $2,316,501, and in August $16,296,025, in excess of all charges.

"These earnings are likely to increase, rather than decrease, in the future, as business once more assumes normal conditions.

"Despite this showing, railroad owners are demanding an immediate increase in operating and freight rates of at least 25 per cent. This will amount to nearly a billion dollars a year. Other railway representatives, speaking for different classes of securities, are demanding an increase running up to 50 per cent which would amount to approximately $2,000,000,000 a year."

The conference says that to return the railroads now would be to restore them to the bank syndicate which previously controlled them. The conference recommends that:

1—Congress postpone action on pending legislation and continue federal control for two years.

2—That an expert commission be created representative of railroad, financial, industrial, agricultural, and labor interests with instructions to investigate the entire problem of transportation with the definite aim of developing it into an agency for the upholding of industry, the promotion of production, the expansion of foreign trade; that means be devised by which all transportation agencies, rail, water and truck be integrated into a single system from producer to consumer as a means of stimulating production and reducing the cost of living, and that means of decentralized administration be worked out so that the railroads will come in close and intimate contact with shippers, producers, and the public and for such democratic control as will awaken the interest of officials and workers as well. Investigations should be made into the transportation agencies and proposals in foreign countries.

THE RAILWAYMEN'S BUNS.—Is it higher pay or greater leisure that has filled railwaymen with a craving for tea and buns? At many of the great London stations now it is difficult for the mere passenger to get served in the refreshment rooms, so great is the rush of men in railway uniforms. This writer dropped into the refreshment room opposite No. 18 platform at Liverpool street yesterday morning and counted fourteen porters and other railwaymen busy with tea or coffee and buns. It was pleasant to meet them and to overhear their cheery "shop."—*London Chronicle.*

Annual Convention of Railway Electrical Engineers

Present Applications of Electricity to Railroad Work Presage Great Development in the Future

THE ELEVENTH ANNUAL CONVENTION of the Association of Railway Electrical Engineers was held at Hotel Morrison, Chicago, October 28-31. The opening session was called to order by the president, J. E. Gardner, of the Burlington, at 10:00 a.m., October 28.

In a brief address President Gardner called particular attention to the necessity for active participation in the discussion by the members. He also expressed the appreciation of the association for the splendid array of exhibits which the Railway Electrical Supply Manufacturers' Association had provided.

The report of the secretary-treasurer, which followed the president's address, showed the excellent financial status of the association.

Locomotive Headlights

The present importance of the electrical headlight on steam locomotives is clearly emphasized by the fact that three distinct committee reports out of a total of nine were devoted to various phases of this subject. The time limit set by the Interstate Commerce Commission when all locomotives must be equipped with high power headlights is but a few months away, and this fact was responsible for the great interest shown in the numerous details of electric headlight installation and maintenance.

The reports of the committee on electric headlights opened up a discussion of many construction and operating details of the various equipments. The committee's reports showed that it held two meetings in conjuction with representatives of the manufacturers of electric headlight equipment, the companies represented being the General Electric Company, the Pyle-National Company, the Schroeder Headlight & Generator Company, the Electric Service Supplies Company, the Buda, Ross Company, the United States Headlight Company, and the Loco Light Company. The object of these meetings was to arrive, if possible, at some basis for the standardization of certain parts of headlight apparatus. Among other things a standard generator base plate was recommended by the committee, such a plate having been designed by one of the members. This plate is made in such a way as to make it possible to bolt it to any type of headlight generator now on the market.

It was recommended that the manufacturers furnish headlight turbo-generator sets of such design and capacity as to operate with practically constant voltage under any load within the rated capacity of the equipment, and with steam pressure ranging from 100 lbs. to 250 lbs. boiler pressure, without the necessity for change of nozzle or governor parts.

Ball bearings of rugged construction were recommended. These were to be of standard size and manufacture, which would enable the railroads to obtain them for their requirements in the open market, if so desired.

It was recommended that turbo-generator sets be so designed as to enable the use of either oil or grease for lubrication, sufficient capacity being provided to lubricate bearings for a minimum of one month at one application of lubricant. Much discussion developed on the question of proper lubrication. Some roads that have been using grease have had satisfactory results, while others have had more or less trouble with this lubricant. One representative said that he had found that when using a stiff grease the balls were never lubricated and that when a thin grease was substituted, they became clogged. His particular problem had been solved by using a good grade of oil. Representatives of two of the headlight manufacturers offered further testimony on this point, which seemed to corroborate the statement that oil was superior to grease. Each manufacturer had run tests with both grease and oil, and each had eventually arrived at the same conclusion—that oil was the better lubricant.

An interesting point was brought out in the discussion when it was suggested that it might be advisable to increase the capacity of the headlight turbo-generator sets in order that their range of usefulness might extend to other fields. The specific use mentioned was the equipping of tugboats to supply power to wireless telegraph sets. Such a use is, of course, restricted, as far as railroads are concerned, to companies operating tugboats as a part of their regular equipment. There is, no doubt, however, that in time the efficient, compact turbo-generator will find other uses than that of locomotive lighting, but it is also probable that various sizes will be built to meet the requirements of different fields, rather than attempt to make one type for universal use.

In view of the fact that so many thousands of locomotives will shortly be equipped with electric headlights the problem of instructing those who are to maintain this apparatus becomes one of special importance. The work of co-ordinating the information and instruction necessary for the use of headlight maintainers was assigned to the Committee on Electric Headlight Handbook. In its report this committee outlined a book, comprising five sections, as follows:

Introduction. Descriptions and illustrations, covering the various makes and types of practically all locomotive lighting, including suburban lighting, equipment manufactured in this country. Instructions for operation and maintanance of all the various makes and types of locomotive lighting equipment manufactured in this country. Methods of installation, as used by a number of the railroads at the present time, both for locomotive lighting and suburban lighting. Standard practices for conduiting and wiring locomotive headlight equipment as recommended by the association.

It was the idea of the committee to bring out a handbook on electric headlights, worked up along the same general lines as the handbook for car lighting, which was published by the association last year. Among the association members the general opinion seemed to be that the sooner the book could be placed in the hands of the headlight maintainers, the better it would be, as the need for some trustworthy source of information on this subject is beginning to make itself felt.

Another phase of the headlight question that is developing side by side with the installation of the equipment, is the necessity for some system of keeping operating and maintenance records. The committee on compiling costs for maintenance of headlight equipment submitted a number of sample forms as recommended practice for the use of railroads in keeping actual records for their costs of operation and maintenance of electric headlights, with the idea that if such information is to be exchanged between different railroads, it would be comparable on account of having been drawn up on the same, or practically the same form.

Electrification

The Committee on Electrification presented a unique and valuable report of the most unusual character. The re-

port consisted of two sections, the first being an outline of the many factors to be considered in any investigation in the matter of electrifying existing steam roads. The great mass of details that must be given careful consideration to determine whether or not the electrification of any piece of track will prove practical is truly remarkable. To those who have never had the occasion to make inquiry into any electrification project, this first section of the report was a revelation. The investigation form as presented in the first section of the report is undoubtedly the most comprehensive and complete outline ever compiled, and it will be of greatest value to those interested in electrification either in the near future or within the next 10 or 15 years.

The second section of the report consisted of a bibliography which covers practically everything that has been written on the subject of electrification from 1908 to the present time. In most cases the author's name is given, so that ready reference is had to any article or book, by any particular author. The vast amount of information contained in these several hundred articles and books forms a source of inestimable value to any engineer making a study of electrification problems. This report may be found in the 1919 proceedings of the Association of Railway Electrical Engineers, and also in the October, 1919, issue of the *Railway Electrical Engineer.*

Electric Car Lighting

The work of the Committee on Illumination was divided between two sub-committees. Sub-committee *A* presented a report on car illumination, which included a large number of photographs of car lighting fixtures used in both coaches and Pullman cars. A number of curves were also included in this report, showing the intensity of illumination obtained with various types and arrangements of fixtures at different terminal voltages. Parts of the report were exceedingly technical in nature, but the greatest portion treated the subject in an easy, descriptive manner. From the evidence presented, the indications are that while the average illumination of day coaches is by no means poor, the demands of the traveling public for more light will probably result in increased illumination in the future. It was brought out in the discussion that little or nothing had been done to improve the lighting of diners and baggage cars, and that it might be of advantage to confine the investigations of the association for a time to these two types of cars.

Sub-committee *B* of the Illumination Committee presented a report on incandescent lamps and lamp specifications. This report included specifications for tungsten lamps of various types and voltages. One of the things that falls within the scope of lamp specifications is the satisfying of the demand for a rugged carbon incandescent lamp for portable service. The advent of the tungsten lamp with its greatly increased efficiency has all but driven the carbon lamp from the market. This condition has been much deplored, for while the carbon lamp cannot compare with the tungsten for efficiency, it does prossess rugged physical characteristics, which make it particularly desirable for use on extension cords. In connection with car lighting lamps, the fact was brought out that very recently the manufacturers had developed a lamp for lighting country homes that was designed for operation on 30-32 volts, and it was thought perhaps that there might be some possibility for getting the wrong lamp when purchasing. In fact, such an instance did occur on one road and was not discovered until the lamps began to fail. Although designed for car lighting voltage, these country home lamps lack the rugged construction necessary to stand the vibration in car service and failed very quickly after being installed.

In preparing the specifications for electric train lighting equipment, the committee assigned to this subject earnestly recommended as much reduction as could possibly be made in the variety of apparatus without impairing the quality of the service. The subject is complicated and the progress necessarily slow. The aim of this committee was to present the matter before the association as a progress report, so as to obtain the opinion of the car lighting engineers, which would act as a guide during the coming year. One of the most important matters considered was the recommendation for a standard rating for axle generators. Another was the question of increasing the height of battery boxes from 21½ in. to 23 in.

Stationary Power Plants

The Committee on Railroad Stationary Power Plants presented an exceedingly long report, full of great detail. It should be considered, perhaps, as an essay on ideal power plant installation and operation rather than a report of existing or proposed equipment. There was practically no discussion on this subject.

Electric Welding

The Report of the Committee on Electric Arc Welding consisted principally of a series of additions and changes to the masterly work presented by the welding committee at last year's convention. For the greater part, these changes were not of great importance, but were simply such details as had come to light through another year's experience with the welding art. The report included many photographs showing the various types of welding accomplished on actual machinery. One of the applications of electric welding in which much interest is shown at present, is the welding of cast iron, such as broken cylinders. By setting studs into and alongside the broken surfaces and placing the welded metal around these studs, a joint is made in broken castings that possesses fully as much tensile strength as any equivalent cross-section of the same casting.

In the discussion of the report the question of whether or not a welding supervisor was necessary for railroad welding aroused much comment. In the opinion of representatives from roads that have gone into the matter of arc welding most extensively, it is absolutely essential that some one be appointed to make a thorough study of the art if successful welding is to be expected. During the discussion the question was asked as to the relation in time consumed in welding tubes by the open fire method and by the electric welding process. From the statements of those who are doing much of this work by the electric welding process, its vast superiority to the open fire method was immediately apparent. Twenty to 25 tubes can be welded per hour by the open fire and in some cases possibly a few more, but with the attendant danger of sacrificing the quality of the work. With the electric process it is quite possible to make as many as 80 welds per hour, the average weld requiring from 25 to 30 seconds.

At the final session of the convention the following officers were elected for the ensuing year: President, L. S. Billau, assistant electrical engineer, Baltimore & Ohio, Baltimore, Md.; senior vice-president L. C. Hensel, chief electrician, St. Louis-San Francisco, Springfield, Mo.; junior vice-president, E. S. M. Macnab, electrical engineer car lighting, Canadian Pacific, Toronto, Canada; secretary and treasurer, Joseph A. Andreucetti, assistant electrical engineer, Chicago & North Western, Chicago. Executive committee: L. C. Moore, electrical engineer, Missouri Pacific, St. Louis, Mo.; J. R. Sloan, electrical engineer train lighting, Pennsylvania Lines East, Altoona, Pa.; A. E. Voight, car lighting engineer, Atchison, Topeka & Santa Fe, Topeka, Kan.; C. H. Quinn, electrical engineer, Norfolk & Western, Roanoke, Va.; E. Lunn, chief electrician, Pullman Car Lines, Chicago; F. J. Hill, chief electrician, Michigan Central, Detroit, Mich.

Commissioner Woolley Opposes Return of Roads

Increase in Freight Rates Will Add Greatly to the Cost of Living—The Labor Question

Robert W. Woolley, of the Interstate Commerce Commission, in an address before the American Academy of Political and Social Science, on October 18, at Philadelphia, opposed the return of the railroads to private management on the ground that such a step would result in an increase in rates which he declared would be multiplied in its effect in the cost of living. He proposed to check the profiteer by holding down the rates. Mr. Woolley said in part:

"Mr. Cuyler, chairman of the railroad executives, testifying before the interstate commerce committee of the Senate last winter, sounded an alarm, although he may not have meant to do so, when he stated that upon the return of the railroads to their owners it will be necessary for the Interstate Commerce Commission to grant a further increase in freight rates. What the measure of this increase may be I am sure I do not know. It seems to be generally agreed that it will have to be at least 25 per cent; some have placed it as high as 50 per cent. In a speech delivered at St. Louis in June last, Director General Hines stated that an advance of $300,000,000 in freight rates would be reflected in the cost of the finished article to the consumer to the extent of $1,500,000,000. Investigations made in normal times amply justify such a prediction. For instance, when an increase of 10 cents per ton was granted on anthracite coal in 1902, the price of a ton of anthracite to the consumer advanced 50 cents, and it never came down. An increase of 25 per cent in freight rates would mean approximately $875,000,000, which the people would have to pay to the railroads, and using Mr. Hines's ratio, $4,375,000,000, which the ultimate consumer would have to pay for what he uses, eats or wears because when he buys a finished article he pays an accumulation of increases.

"Does Congress propose to turn back the railroads to their owners at this perilous time and thereby make new high price levels instead of lower price levels inevitable, or does it propose to enact legislation requiring the holding of these roads for a fixed reasonable period following the proclaiming of peace and thereby aid the vitally important work of checking the profiteer and getting us back to normal? That is the problem in a nutshell.

"We are at the cross-roads. Return the railroads and increase freight rates and I fear no measure before the House or the Senate today can save us. For nearly a year now, in statements to Congress and in addresses before conventions and commercial clubs, I have been contending that the present freight rates are ample, that the operating revenue of the railroads in the period of shrinking or vanishing traffic following the signing of the armistice was no test of their sufficiency and that as we approach a general resumption of industrial activity, the soundness of my contention would become evident. In other words, though hostilities ceased with the signing of the armistice, economic disturbances due to the war did not cease by any means.

"That there should have been an operating deficit tremendous in proportions following the cessation of hostilities was inevitable. As a war-making measure there had been stored in all big centers and in many smaller ones, large reserves of coal in order that the fearful experience of the winter of 1918 might not be repeated. Building operations, other than those conducted by the government, had practically ceased, private enterprise had either put its shoulder to the wheel in the winning of the war or it had stepped aside. When you consider that the products of the mines, chiefly coal and ores, road and building material constitute fully 70 per cent of all the freight traffic of the railroads, it is easy to understand that the Savior of man himself, with the Arch-angel Gabriel as his chief assistant, could not have earned the standard return without increasing freight rates and consequently making higher and higher the cost of living, unless he had performed a miracle.

"I hope you will pardon me for taking pride in the fact that my prediction as to the early disappearance of the monthly operating deficit has come true. Since July 1 the railroads have earned the standard return and a few millions besides. Congress should treat the total amount of the operating deficit incurred from the beginning of federal control to July 1, 1919, as a war cost, and appropriate for it out of the public treasury just as only one year ago it was appropriating billions for munitions with which to vanquish the Hun. Let the government retain the railroads during the period of reconstruction and hold freight rates where they are. By pooling receipts of all the roads it does, with the present operating ratio of 85 per cent, what would be impossible for most roads under private control. Let it help, not hinder, the President in his fight on the high cost of living.

"The President and the director general have dealt successfully with labor. As I say this I realize what is running through the minds of some of you. You are thinking of the substantial increases in wages granted railroad workers.

"Denouncing the government for doing what capital did in the steel plants, the munition plants, the shipyards, and in many other industries has been a favorable sport with those who refuse to deal with this problem fairly, who find it convenient to forget what the presidents of the great railroads of the eastern United States said they needed money for, how many rate increases they might need for the same purpose, when they testified in the fifteen per cent case before the Interstate Commerce Commission in November, 1917.

"How easy it is for those who seem to be afraid that the government will not remit the railroads once more to the mercies of great banking houses for capital with which to finance additions and betterments to forget the picture of labor conditions on the railroads in the autumn of 1917 painted by Samuel Rea, how skilled labor was leaving to take up unskilled employment at much better wages in the shipyards, munitions plants and steel plants; how it was necessary to use three men where formerly two men would do; how the shortage in Official Classification territory especially was becoming alarming. But joyfully do they point to the fact that on the date of the signing of the armistice there were approximately 145,000 more men employed on the railroads than there were at the time the railroads were taken over by the government. I have asked this question once before. Suppose Director General McAdoo had not so augmented his force that he could get approximately 100 per cent efficiency no matter what the emergency, and a crisis had found him unprepared, would those who now talk of waste and prodigality have come forward with paeans of praise for the niggardly policy he had pursued? The ratio of labor cost to the entire operating cost in 1917 was 61.36; in 1918 it was 65.54 and I am informed by the Railroad Administration that for the first seven months of 1919, it is estimated to have been 64 per cent. I wonder

how this showing compares with that made in some of our other big industries?

"If the present unified control is done away with and each road now under federal control is turned back to its owners on January 1, what is to be the policy of those owners toward labor? Have the executives of the corporations who have been sitting on the side lines criticising for two years caught a vision out of all that has happened, and are they ready to deal with the labor problem sanely and fairly—and by that I do not at all mean abject surrender to labor's every demand—or do they propose to pursue the mailed fist policy and run the risk of seriously crippling the transportation systems of the country in the hour of its greatest economic need?

"Several days ago one of the foremost traffic attorneys of the country told me an interesting story. He was shouting a few months ago to give the railroads back; today he says the service the shippers are receiving is so much better than they ever got under private control that he now wants the government to hold the roads. He came to Washington to see what could be done about the recent coal car shortage in Kentucky. 'I called on Mr. Hastings, assistant traffic director,' he said, 'and immediately he got on the wire with Atlanta. He directed the Southern Railroad to turn over 500 coal cars to the Louisville & Nashville. When I get back to Kentucky the relief will be under way. Under private control we would have stewed in our own grease before such a thing could have happened.'

"A few weeks ago Clifford Thorne, who represents many of the big independent oil companies, and other considerable shippers in actions before the Interstate Commerce Commission, told the House Committee on Interstate and Foreign Commerce that now is no time to be turning back the railroads; that they should be held for two years following the proclaiming of peace. Mr. Thorne was one of the bitterest critics of the Railroad Administration during the war and one of the first to demand, almost viciously, that the railroads be given back to their owners at the earliest possible moment.

"When you consider that we have never had federal control in its real sense, that we have only had what amounts to a receivership and a loose-jointed one at that, that the morale of the director general's organization has for many months been admittedly low, due to uncertainty as to what is going to happen, don't you think the testimony of such men tells a story which is worth considering in these critical times?"

Valparaiso, Chile's Chief Port

Wheat Shipments to Be Treated as an Emergency Movement

WHEAT WILL BE TREATED as an emergency shipment and given right of way over all other traffic demands in an effort to insure its prompt movement to grain elevators, Director-General Walker D. Hines announced after a conference held on October 16 at Chicago. Julius Barnes, director of the United States Grain Corporation; B. F. Bush, regional director of the Southwestern region; Hale Holden, regional director of the Central Western region; J. E. Gormley, assistant regional director of the Northwestern region; W. C. Kendall, manager of the Car Service Section; Max Phelan, director of the Division of Public Service, and the federal managers of the principal roads in the West and Southwest were present. Following the conference at which the car situation in the Western wheat growing states was fully discussed, Director-General Hines issued the following statements:

"The Railroad Administration is again reviewing the situation today with respect to the movement of this year's wheat harvest from the country to primary markets and other places of storage, has had reported to it the quantities already moved from southwestern states and is impressed with the comparatively small amount of wheat yet to be handled.

"Approximately 20,000,000 bu. of the Texas crops have already been moved, leaving 11,000,000 bu. on farms. The entire movement of wheat last year in Texas was 5,500,000 bu. In Oklahoma, of the total crop of 45,000,000 bu., 33,000,000 bu. have been moved in three months, leaving 12,000,000 bu. yet in the country. Against this movement of 33,000,000 bu. this year, it is to be noted that the total movement of wheat from Oklahoma in twelve months last year was 28,000,000 bu.

"In the entire southwest there have already been moved to market 134,000,000 bu. in the last three months, leaving 99,000,000 bu. on the farm. Against this movement of 134,000,000 bu. so far this year, the total movement for the previous twelve months was 137,000,000 bu.

"In the state of Kansas there have been moved to market 66,000,000 bu. of wheat, leaving 63,000,000 bu. on the farm.

"Notwithstanding the extraordinary transportation of wheat which has already been performed this year, and notwithstanding the heavy demands for transportation by all other sorts of traffic, the Railroad Administration is taking steps to increase still further the handling of wheat. Preference is to be given so as to move wheat that is on the ground, additional equipment is to be provided to relieve the elevators at Kansas City, Mo., and Omaha, Neb., and the various railroads located in the wheat territory are to give additional intensive supervision to the handling of local wheat."

WASTE OF CAR SPACE still constitutes a serious leak. A warning to the shipping public has been issued by K. M. Nicoles, chairman of the San Francisco (Cal.) Terminal Efficiency Committee. Loss of car space in these days means loss of business handled; a matter of concern to the shipper as well as to the carrier. A comparison of the loading for September, says Mr. Nicoles, shows that, in wheat, shippers are using but 95 per cent of car capacity this year, as against 101 last year; in corn and oats, only 77 per cent as against 94; in sugar, 89 per cent as against 106; in canned goods, 96 per cent compared with 100; and in rice, 98 per cent compared with 109 per cent last year. As practically all cars can be loaded to ten per cent above their marked capacity, the loss is seen to be large

General News Department

Advances to railroads by the War Finance Corporation have amounted to $204,794,520; and of this $134,436,310 had been repaid up to November 15, according to the annual report of the secretary of the Treasury; leaving a balance of $70,358,210 outstanding.

The airplane mail carrier who made the regular trip from Washington to New York on Tuesday, December 2, covered the distance of about 218 miles in one hour, 34 minutes, or at the rate of 138 miles an hour; and the load of mail weighed 630 lb. The airplane was a new DeHaviland-4 with twin motors. The start was made from College Park, Washington, at 12 o'clock noon, and the plane arrived at Belmont Park, New York, 1:34 p. m.

Daylight saving and the advantages of the plan are now under discussion in 16 states, according to Marcus M. Marks, of New York City, who says that public sentiment is being crystallized so that these 16 states will be ready by next spring to follow the aldermen of New York City in the adoption of a law to set the clocks forward in 1920 the same as was done in 1919 under the now obsolete federal statute. Mr. Marks thinks that there will be a general movement next year to begin the use of "summer time" a month later than heretofore, and to terminate its use a month earlier.

Prize for Report on Lakewood Trucks

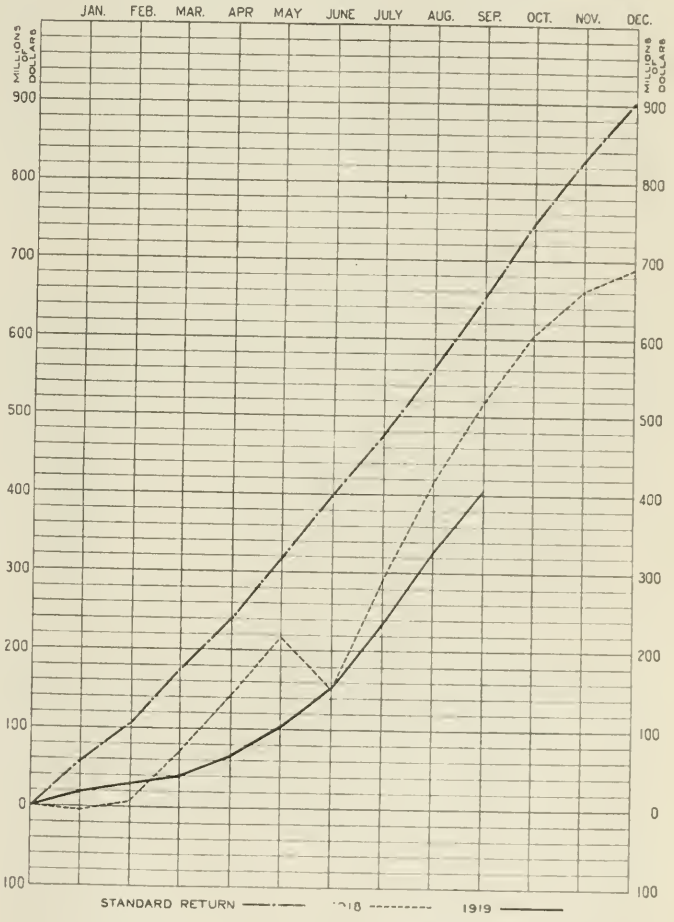
The Lakewood Engineering Company, Cleveland, Ohio, announces prizes of $1,000, $500 and $250 for the three best papers describing experience with the Tier-lift trucks made by that company. This truck, which is of two tons capacity, is propelled by power from a storage battery, and also is arranged to lift its load, by means of its motor, to any height up to 76 in. Papers must be sent to A. R. Bond, Scientific American, New York city, by January 30, and within a month thereafter the awards will be made by a committee consisting of Mr. Bond, Prof. D. S. Kimball, Cornell University, and Irving A. Berndt, New York City.

Kansas City Switchmen Strike

Approximately 1,500 switchmen members of the Brotherhood of Railway Trainmen left their work in the Kansas City terminal district on Saturday, November 29, and returned again on Monday, December 1. Definite reasons for this action were not given, but it is believed that the walkout was due to dissatisfaction over the present wage scale and because the national officers of the brotherhood "failed to get action" on their demands. The ending of the strike immediately followed the sending of telegrams to the governors of Missouri and Kansas by the mayors of Kansas City, Mo., and Kansas City, Kan., and the president of the Kansas City Chamber of Commerce. The messages were sent in compliance with a resolution unanimously adopted at a mass meeting of representative citizens called to discuss measures to meet the serious coal situation in Kansas City resulting from the national coal strike and abetted by the strike of the local switchmen. The strike had already been termed unauthorized by national officers of the Brotherhood of Railway Trainmen and a representative of the national organization attended a meeting of the strikers held on November 30, counseling the men to return to work. The vote was taken at that meeting which resulted in the ending of the strike. The two-day walkout practically paralyzed freight shipping in the terminal yard.

Net Operating Income

The chart made by the Bureau of Railway Economics shows the net operating income of the Class 1 Roads in 1919, compared with the average in the test period (1915-1916-1917) on which government rental is based. The table gives the figures on which the chart is based.



Net Operating Income, Cumulated by Months, 1918 and 1919, Compared with Standard Return, Class I, Railways of United States.

Month	Average net operating income (Standard return) in 3-year test period		Net operating Income earned in 1919		Deficit in 1919	
	By months	Cumulative	By months	Cumulative	By months	Cumulative
January	$56,613,000	$56,613,000	$18,783,702	....	$37,830,0 00	.....
February	47,934,000	104,547,000	10,106,268	$28,889,970	37,828.000	$75,658,000
March	68,251,000	172,798,000	10,842.608	39,660,778	57,409,000	133,067,000
April	67 289,000	240,087,000	26,115,214	65,916,807	41,174.000	174,241,000
May	77,385,000	317,472,000	39,462,367	105,215,450	37,923,000	212,257,000
June	82,550,000	400 022.000	52,270,702	157,448 669	30,279.000	242 573.000
July	75,341 000	475,363,000	77,176,933	234,625,602	1,835,933	240,737,067
August	86,860,000	562,223,000	.....	.....	(Increase)	.....
September	91,273,000	653,496,000	.....	.....	.....	.....
October	94,333 000	747,829,000	.....	.....	.....	.....
November	83,536,000	831.365.000	.....	.....	.....	.....
December	73,282,000	904,647,000	.....	.....	.....	.....

Traffic News

Wilson C. Redding, representative at Pine Bluff, Ark., for Arkansas for the Chevrolet Motor Company, has resigned, having been elected traffic manager for the traffic bureau of the Chamber of Commerce of Pine Bluff.

Commutation tickets on the Pennsylvania Railroad for certain long distance journeys must bear the photograph of the holder. This rule goes into effect on December 5 and, according to an announcement of the company, is made necessary because of frequent misuse of tickets between Philadelphia and Trenton (31 miles) and between Trenton and New York (58 miles).

According to a report on overseas traffic for the week ended November 19, made to the director general, 5,442 cars of commercial export freight were received at North Atlantic ports during this period as compared with 912 cars for the same week of 1918. This shows an increase of 4,530 cars, or 496 per cent for November 19, 1919, as against the corresponding period last year. For the week ended November 19, 1919, there were 16,339,185 bushels of grain stored in elevators at North Atlantic ports. There were received during the week 2,940,240 bushels, while 4,912,416 bushels of grain were cleared. The deliveries exceeded the receipts by 1,972,176 bushels. The total amount of grain in elevators at these ports represented 77.7 per cent of the total elevator capacity. There were 8,478,216 bushels of grain stored in elevators at Gulf ports on November 19, representing 82.5 per cent of the total elevator capacity.

Canadian Cars in the United States

The problem of the shortage of cars in Canada has been brought to the attention of the United States Railroad Administration by the Department of Railways and Canals of Canada. The Canadian Railway War Board has advised that department that the following is the status of the Canadian-United States freight car situation:

Canadian box cars in United States	43,661
United States box cars in Canada	21,240
An adverse balance of	22,421
Canadian livestock cars in United States	1,830
United States livestock cars in Canada	158
An adverse balance of	1,672
Canadian refrigerator cars in United States	1,800
United States refrigerator cars in Canada	1,246
An adverse balance of	544

Coal Production

Coal production during the second week of the strike was 33 per cent of normal as compared with 29.4 per cent during the first week, according to the weekly bulletin of the Geological Survey. The output of the seven days, November 9 to 15, including lignite and coal coked, was 3,990,000 net tons, an increase of 438,000 tons, or 12.4 per cent, as compared with the week before. The average production during the four weeks ending October 25 was 12,089,000 tons. As the strike order was withdrawn on the afternoon of November 11, the week contained two days during which the order was in force and four days after it had been withdrawn, but, the report says, production was not resumed during the week on a considerable scale except in scattering districts outside of the central competitive field. The report contains an analysis of operating conditions during the first week of the strike, November 2 to 8, inclusive, but shows that in the central competitive field the strike was practically 100 per cent effective. Virtually no coal was mined in Illinois, Indiana, Michigan, Ohio and the Pittsburgh district. In the tier of states immediately west of the Mississippi the tie-up was also practically complete and from Iowa south of Oklahoma about 99 per cent of the capacity was closed. The closing of so many mines afforded to the others which remained at work exceptional car supply and, thanks to the efforts of the railroads, transportation disability as a limiting factor practically ceased to exist. Only one small district afforded serious shortage of cars and, the report says, there is little doubt that the percentage of loss on account of car shortage for the entire country will be found to be less than 1 per cent.

Commission and Court News

Interstate Commerce Commission

The Commission has declared the Chicago & Calumet River to be a common carrier and, therefore, lawfully entitled to participate in interstate rates with other common carriers, or to have its charges on interstate shipments absorbed under proper tariff provision by the roads having a line haul. The road now serves the Ryan Car Company, the Camel Company, the General Fuel & Supply Company and the Western Steel Car & Foundry Company and is making arrangements with the Koppel Industrial Car & Equipment Company and the Fidelity Storage Company for similar service. The commission has ordered the company to file a tariff for its approval.

Demurrage on Grain

A recommendation of dismissal is made in a tentative report by Attorney Examiner Charles F. Gerry on complaints instituted by the Armour Grain Company, the Minneapolis Traffic Association and others against the railroads arising from the imposition of demurrage on carloads of inbound transit grain at Chicago and Minneapolis during the periods of car congestion in the fall of 1916 and 1917 when the railroads did not furnish enough cars for outbound shipments to keep a steady flow through the transit elevators. Several hundred thousand dollars in demurrage charges is involved, but the tentative report finds that the carriers were not liable for failure to furnish cars under such unusual conditions and that the transportation of transit grain involved two contracts of carriage, of which the first was complied with after proper placement of car and a reasonable opportunity afforded for unloading it.

Illinois Classification

The Interstate Commerce Commission has issued a decision written by Commissioner Meyer on an investigation initiated at the request of the director general, who asked advice as to whether the present Illinois classification and the present class and commodity rates applicable between points in Illinois should be continued in effect. The Commission recommends:

1. That for the rules, descriptions, packing specifications and minimum and estimated weights of the Illinois classification there be substituted the corresponding portions of the consolidated classification, subject to the modifications thereof indicated in Consolidated Classification Case, 54 I. C. C., 1.

2. That the Illinois scale of class rates and ratings applicable thereto under the Illinois classification be canceled; and the Disque scale, governed by the official classification, be substituted therefor and applied between points in the Illinois district south and east of the lines indicated, extending from Chicago through Peoria to St. Louis, Mo.; and that class rates, governed by the contemporaneous western classification, and not higher than the level of interstate rates between points in northwestern Illinois and adjoining states, be substituted therefor and applied between points in the Illinois district on, north, and west of the Chicago-St. Louis line.

3. That a review of particular commodity rate structures be made in order to remove discriminations which now exist or may arise from any readjustments growing out of these recommendations.

4. Specific recommendations made with respect to commodity rates on certain articles.

Commission Reduces Rate Initiated by Director General

The Interstate Commerce Commission in the case of the Solvay Process Company vs. Delaware, Lackawanna & Western has decided that an increase from 17 cents a long ton to 30 cents a net ton in the rate on limestone, c. l., from Jamesville, N. Y., to Solvay, N. Y., made by the Railroad Administration in connection with its general rate advance in 1918 was unreasonable

in itself in spite of the general need of the Railroad Administration for increased revenues; and that a rate in excess of 25 cents a long ton is unreasonable. Reparation is awarded from June 25, 1918, at which time the rate was increased to 40 cents a long ton, although it was reduced to 30 cents a net ton on September 16, 1918. The case has attracted interest because the Secretary of Commerce took part in it, was represented at the hearing and filed a brief supporting generally the contentions of the complainant, but urging also the power and primary duty of the Railroad Administration to foster and protect commerce, with only secondary regard to the adequacy of rates as sources of revenue. He differentiated in this regard between federal and private control, pointing to the fact that the Railroad Administration was given the support of public funds derived from general taxation. He urged also the importance of relieving complainant's traffic from any unnecessary burden in view of the utility of its products and their wide distribution. However, in considering its powers and duties under the federal control act, in reviewing the rates initiated by the director general, the commission has concluded that the words "just and reasonable" as used in that act have substantially the same meaning as in the act to regulate commerce, from which they are drawn, and the case was decided upon the facts of record pertaining to the particular rate involved. The director general filed formal answer denying any violation of law, but was not represented at the hearing. The defendant carrier offered no denfense of the 40 cent rate, but in defense of the 30 cent rate cited the act of August 29, 1916, the President's proclamation taking over the railroads, the federal control act, and General Order No. 28. "These recitals tend, however," the commission says, "to justify the rate increases under that order as a whole and not necessarily the increase in every rate. When General Order No. 28 was promulgated, an immediate increase of revenue was doubtless deemed imperative. It is not, however, to be presumed that there was any intent permanently to abandon the standards by which the rights of individual shippers had been determined during a period of peace. It is rather to be presumed that the constituted authorities had in contemplation ultimate readjustment in cases where the universality of their methods might be shown to work undue hardship upon particular shippers." The commission, therefore, found it unnecessary to consider the justification for the general increases in rates, but said that the question concerns the specific increase applied to what is an almost unique movement of this particular traffic.

Court News

Safety Appliance Acts

The New York Supreme Court, Trial Term, Erie County, holds that the federal Safety Appliance Acts requiring that cars engaged in interstate commerce shall be "equipped with couplers coupling automatically by impact, and which can be uncoupled without the necessity of men going between the ends of the cars," does not apply to a defect in the timber bolted to the car frame, to which timber the drawbar was fastened. The purpose of these acts is to relieve railroad employees from the necessity of going between the ends of cars and the couplers. The supplementary act of 1916 does not extend the carriers' liability for defects in couplings outside of the statutory requirements. It is an extending act only in declaring that carriers shall not escape liability to employees for the reason that cars not meeting with statutory requirements are being moved for repair. This is the first time this particular question has been passed upon by the courts.—Buschalewski v. N. Y. C., 173 N. Y. Supp. 506.

United States Supreme Court

"Knowingly" Accepting a Rebate

The Lehigh Coal & Navigation Company was convicted and fined in the district court of New Jersey for accepting rebates and concessions from the Central of New Jersey in violation of the Interstate Commerce law. A case was certified to the Supreme Court of the United States on the following facts: When the coal company leased its railroad, the Lehigh & Susquehanna, to the Central in 1871, covenant 10 of the lease provided that on coal shipped by the company at the northern end of the Nesquehoning tunnel the rates should not exceed those on coal from the Lehigh region, from Penn Haven to the same points, either by the Central or by the Lehigh Valley. In August, 1906, and thereafter the tariffs filed by the Central contained a footnote providing that in compliance with this covenant, a lateral allowance was made to the coal company on all anthracite originating on its tracks in the Panther Creek, Nesquehoning and Hacklebarnie districts mined and shipped by it, when coming via the Hanto, Nesquehoning, and Mauch Chunk gateways. All subsequent tariffs, 262 in number, contained the foot note. The allowance was 19.18 cents a ton, and this was credited in the monthly settlement of the company's account with the railroad. This credit was the point of the government's attack.

The certificate asked the following question: "In the criminal prosecution of a shipper for knowingly accepting transportation at less than the duly established rate by receiving an allowance that was referred to in the tariff but was not specified in figures therein, has the defendant a right to offer in evidence that the allowance was received under the honest belief that it was lawfully established by the tariff, and under the honest belief that in receiving it he was not disregarding what he believed to be the provisions of the tariff, but was complying therewith?" The Supreme Court answers the question in the affirmative. There was no misunderstanding of the law, or of what it required. The misunderstanding was induced by practice and the opinion of those in authority that the act was complied with, and a tariff was filed. The word "knowingly" in the statute required to incur the guilt of a misdemeanor by accepting a rebate was therefore to be given exculpating effect.—Lehigh Coal & Navigation Co. v. United States. Decided November 10, 1919.

Rear End Platforms—Mail Cars

State and Federal Legislation

Complaint was made to the Pennsylvania Public Service Commission that the Pennsylvania Railroad ran a specified train in interstate commerce, the last car of which was not equipped at its rear end with a platform thirty inches wide, guard rails and steps, as required by a Pennsylvania statute of 1911. The railroad contended that it was not bound by the statute because the rear car was a mail car constructed in accordance with the regulations of the Post Office Department, and because the Federal Government had assumed control of the matter so far as to exclude such intermeddling on the part of a state. The Commission and the State Superior Court decided against the railroad.

The Supreme Court of the United States has now reversed that decision. The court says, by Mr. Justice Holmes, that if all that had been done on behalf of the United States in the way of regulation had been to determine how mail cars should be built, and to exclude a thirty-inch platform, it might be said that the state law could be obeyed by putting a different car at the end of the train. It would be a tax upon the railroad when it wished to run a mail train wholly made up of mail cars; but it could be done. But when the United States has exercised its exclusive powers over interstate commerce so far as to take possession of the field, the states no more can supplement its requirements than they can annul them. In the present instance the rules for the construction of mail cars, admitted to be valid, not only exclude the wide platform, but provide an equipment for them when used as end cars. The Safety Appliance Act, with its careful requirements for the safety of the men was followed by most elaborate regulations issued by the Interstate Commerce Commission, which include three large pages of prescriptions for "Caboose Cars Without Platforms." Caboose cars constantly are used as end cars and these pages, like the Post Office order as to mail cars, recognize the lawfulness of an end car such as the Pennsylvania statute forbids. "The subject matter in this instance is peculiarly one that calls for uniform law and in our opinion regulation by the paramount authority has gone so far that the statute of Pennsylvania cannot impose the additional obligation in issue here. The Interstate Commerce Commission is continually on the alert, and if the Pennsylvania law represents a real necessity, no doubt will take or recommend steps to meet the need." Mr. Justice Clarke dissented, being of the opinion that the United States had not taken possession of the field involved in this controversy.—Pennsylvania Railroad v. Public Service Commission. Decided November 10, 1919.

Foreign Railway News

The contract awarded by the German Government to the Krupp Works for the construction of rolling stock is reported by the United States commercial attache at The Hague, as calling for 2,000 freight cars, of 15 tons capacity, and 100 locomotives each year. It is said that the contract stipulates that the price must correspond to costs of material and labor and that the factory shall make a profit of only two per cent.

Underground Railway for Marseilles

The Marseilles Municipal Council has decided to proceed with the construction of an underground railway in the city, a project which has long been in contemplation in view of the ever-increasing congestion of the streets.

Prussian Railways Deficit

For 1919 the deficit on Prussian railways amounts to 634,000,000 marks (nominally $158,500,000), of which 160,000,000 marks ($40,000,000) goes to cover indemnities for railway thefts. The total working expenses for the year will amount to 7,500,000,000 marks (nominally $1,875,000,000).

Oil Fuel on the Central Uruguay

The directors of the Central Uruguay Railway, in its annual report, say that having regard to the present high prices and the difficulty in obtaining coal and wood, the board has made arrangements to extend the use of fuel oil, and has contracted for supplies to be delivered during the next two years.

Cost of the Eight Hour Day on the Underground

London.

In the cost of the eight-hour day on the London omnibus services, tramways and railways operated by the Underground, an additional expenditure is incurred of approximately £700,000 ($3,500,000) per annum. An addition of about 20 per cent to the staff is required to work the services.

Uruguay East Coast Railway Sale

Cable advices have been received in London from the general manager in Uruguay of the Uruguay East Coast Railway Company, Limited, that the sale and transfer of the railway to the Uruguayan Government was completed on October 15 of this month, the sale and transfer to take effect as from October 1, 1919.

Argentine Railway Projects

Buenos Ayres advices state that the Chamber of Deputies is shortly to discuss a project which will authorize a French company to construct a railway across the Federal territory of Formosa to an extent of 300 kilometres. It is understood that several deputies intend strenuously to oppose this project, with the object of giving preference to a company which has been formed with Brazilian, Argentine and North American capital.

English Railway Earnings

The British Board of Trade Journal, reporting revenue and expenditure of railways of great Britain and Ireland for the years 1916, 1917 and 1918, shows that the average rate of dividend for the first time during the war exceeded the 1913 average of 3.63 per cent. For 1918 the figure given is 3.70 per cent. The total receipts again increased, but the per cent of expenses was greater than in the previous year (the proportion in 1914 was 63 per cent):

	1916	1917	1918
Total receipts, thousands	£154,468	£168,721	£197,293
Expenditure, thousands	102,520	115,994	143,342
Net income	51,948	52,727	53,951
Per cent of expenses	66	69	73

London Subway Officials Visiting America

London.

A. R MacCullum, assistant to the mechanical engineer of the underground lines in London; C. J. Spencer, manager of the London and Suburban group of tramways, and Frank Peck, commercial manager and C. J. Spence, engineer of the London General Omnibus Company, are visiting the United States to make a close study of the present day traffic and transport conditions in New York and other principal cities.—Modern Transport.

Nationalization of Mines Demanded in England

An extract from an article in the London Times states that by an almost unanimous vote on September 10, the Trades Union Congress declared its readiness to cooperate with the Miners' Federation of Great Britain to the fullest extent with a view to compelling the government to adopt the scheme of national ownership and joint control recommended by the Coal Industry Commission. The figures were as follows: For the resolution, 4,478,000; against, 77,000; making a majority in favor of the resolution of 4,401,000.

Railway Extensions in Jamaica

London.

The Times Trade Supplement states that the question of railway extensions in Jamaica is attracting a good deal of attention. At present the total length of the Jamaica railway is 1,970 miles. The island is 4,450 sq. miles and the population in 1916 was 892,406. It is stated that there is a project to extend the railway and that a scheme had been projected to electrify the railway and thus do away with steam haulage. The waterfalls in Jamaica should make this possible. Trinidad had mapped out its railway extension program, and the new work will involve an expenditure of upwards of $10,000,000.

Trade with Germany

London.

About 18 months ago the Textile Trade section of the London Chamber of Commerce passed a resolution deciding to have no trade relations with Germany for at least 10 years. On Wednesday, October 29, the mover of that resolution proposed, at a meeting of the section, another resolution to exactly the opposite effect, expressing the opinion that resumption of business with Germany and other enemy countries should be regarded as properly open to members of the section. Consideration of the motion was deferred for a week.—London Times Trade Supplement.

High Cost of Fuel in South America

London.

An extract from the Engineer states that Follett Holt, M.I.C.E., the chairman of the Entre Rios Railway of Argentina, speaking at the annual meeting stated that the fuel bill has absorbed 23 per cent of the total expenses of the company, and it was now seriously considering the oil fuel question. It had under construction an 8,000 tons capacity oil plant and would use oil fuel for the locomotives and ferry steamers. He states that during the past few years all the South American railways had been bled almost to death by coal prices, and that the market for some million tons of coal in South America was in danger of being lost to England.

Locomotive Building in England

London.

The first locomotive to be built by Sir W. G. Armstrong, Whitworth & Co., Ltd., at its Scotwood works, was tested on November 12. This engine is a main line 0-8-0 superheater locomotive with a 6-wheel tender for the North Eastern. At the date of the armistice the Scotswood works were entirely devoted to the production of munitions. Large quantities of shells of every calibre, from the smallest to the giant naval projectile of over a ton weight, were reproduced; the output during the period of hostilities reaching the total of 14,500,000 shells, in addition to vast number of cartridge cases, fuses, etc. These works were selected for the manufacture of locomotives and a remarkable transformation has taken place. A large task was involved

in clearing away the quantities of shell machinery and in reorganizing and equipping the shops for locomotive manufacture. It is reported that this plant will employ 3,000 men and produce one finished locomotive per day.

The War and Indian Railways

LONDON.

An abstract from the Times engineering Supplement states that the pressure of the Mesopotamian, East African and other distant campaigns on India's still very inadequate railway resources may be gaged to some extent from official statements made in the Viceroy's Legislature last month.

The materials belonging to Indian railways sent out of the country for war purposes included 774 miles of new and second hand rails, 217 locomotives and 5,423 vehicles. Of the rolling stock 196 locomotives and 4,508 vehicles were meter gage. The other materials sent were varied in character and very large in quantity. Before the cessation of hostilities the replacement of 157 meter gage locomotives and 2,500 vehicles had been arranged.

Motor Vehicles as Feeders to Italian Railroads

The use of motor vehicles as feeders to the railroads is said to be more extended in Italy than in any other country in the world. This is owing to the fact that Italy is a mountainous country in which railroad lines can only be built at considerable cost and labor. The total length of railroad lines in Italy is 8,700 miles, while the length of routes over which motor services are run with a fixed time table is 8,070 miles. There are 400 of these lines over which regular public services are run either as feeders to the railroad or in order to open up country which has remained inaccessible to the railroad.

These public automobile services for goods and passengers were begun in a small way ten years ago in order to meet the deficiencies of the railroad system.

Traffic Between Italy and Germany

LONDON.

The London Times Trade Supplement says that Italy and Germany have entered into an agreement with a view to re-establishing traffic between them through Switzerland. Passenger and freight traffic already have thus been reopened, though subject to certain restrictions. This is of great economic significance for Italy because of the abnormal exchange rate, German goods can now be bought by Italians at 60 centesimi the mark, as compared with more than double that rate under pre-war conditions.

Italy is struggling for the life of her industries. Many trains are not running for lack of fuel, and if it were not for the receipt from Belgium of 2,000 tons coal daily, Italy would be in great distress.

American Imports and Exports Into France

LONDON.

The Fortnightly Information Review of the American Chamber of Commerce give the imports into France from America as follows for the first seven months of the years 1919, 1918 and 1917:

	1919	1918	1917
Machines and machinery..	Fcs.320,824,000	Fcs.202,748,000	Fcs.291,631,000
Tools and hardware.....	*142,996,000	123,995,000	327,259,000

*This figure includes the quantities imported to regularize the imports made in 1918 for the Government.

The exports from France into the United States for the same period are as follows:

	1919	1918	1917
Machines and mechanical appliances.	Fcs.786,000	Fcs.223,000	Fcs.497,000
Tools and manufactures of metal....	444,000	542,000	892,000

The English Steel Strike

The steel strike was caused in England through the skilled men employed in the steel works at Ebbw Vale and Dowlais asking for a certain minimum which the employers could not see their way to accede. As a result of the demand put forward by about 200 men, who struck to enforce it, between 4,000 and 5,000 other workers have been put out of work. A conference held at the Ministry of Labor between Sir David Shackleton and the Engineering Employers' Federation, to enable the latter to state their views on the consolidation of present earnings, including war advances, into permanent rates of wages and the stabilization of existing wages. Representatives of the Trade Unions have submitted a general claim for stabilization until November, 1920, which would necessitate an extension for another year of the Wages (Temporary Regulations) Act. The employers are pressing for certain amendments and conditions if the Act is renewed. The Minister of Labor has promised to consult the government, and the position will probably be further discussed with the parties concerned.

England's Export of Railway Material

LONDON.

According to the Board of Trade Returns, the value of railway material exported during the first eight months of the present year was as follows:

	1919	1918
Locomotives	£675,403	£900,987
Rails	1,246,608	381,104
Carriages	324,168	443,423
Wagons	907,465	210,166
Wheels and axles	438,246	247,650
Tires and axles	638,876	402,760
Chairs and metal sleepers	177,812	88,397
Miscellaneous permanent way	533,106	418,356
Total permanent way	1,986,414	895,530

The weight of rails exported was 77,694 tons, as against 20,899 tons for the same period in 1918, and of chairs and metal sleepers 10,875 tons, as against 5,610 tons last year. Locomotives to the value of £63,767 and rails £38,930 were sent to India during the month of August.

Electrification of the North Eastern Railway

LONDON.

The directors of the North Eastern Railway have provisionally sanctioned a scheme for the electrification of the main line between York and Newcastle (a distance of 80 miles). The scheme provides also for the electrification of the loop line (31 miles in length) from Northallerton to Ferryhill via Stockton. On these portions of the railway there is a very heavy and varied traffic, ranging from East Coast and other important through trains to local freights. Hitherto the experience of the company with electric traction has been confined to the working of a dense local passenger traffic on Tyneside, between Newcastle, North Shields, Tynemouth and Whitley Bay, and of the coal traffic between Shildon and Newport (Middlesbrough). No other company in Great Britain has, however, experimented with the electric haulage of freight trains.

On Tyneside the third rail system is in use, but between Shildon and Newport overhead electrical equipment has been adopted. The new proposal is a combination of the third rail and overhead systems, and the general idea is that the former should be used on the running lines, and the latter adopted in the freight yards and at large stations.

Railway Reconstruction in Patagonia

LONDON.

The London Times Trade Supplement says that the recent blockading on the Transandine line (Buenos Ayres to Valparaiso), on account of snowstorms blocking the Uspallata Pass, has again brought forward suggestions for a new transcontinental line in South America. The most immediately practical idea is that necessitating the construction of only 175 miles of railway, and even though this includes the crossing of the Andes, the height to be negotiated does not exceed 6,000 ft. By this means the line would be free from danger of blocking through snow blizzards, and that the expense and difficulties connected with railways constructed to climb higher altitudes would be obviated.

The transcontinental line in existence at present in South America is the Buenos Ayres-Valparaiso railway, about 1,030 miles in length, crossing the Andes at a height of 10,470 ft., the Andean section of this line being of a gage different from that of the railways of Argentina and Chile, which on either side complete the link, and necessitating three handlings of freight on each through journey. Completion of the new route would mean the creation of a second sea-to-sea railroad, over an all broad gage line (5 ft. 6 in.), traversing ascents of such easy grade that no rack sections would be necessary.

Supply Trade News

F. W. Sinram, general manager of the **Van Dorn & Dutton Company**, gear specialists, of Cleveland, Ohio, has been elected president of the company. Mr. Sinram is also president of the American Gear Manufacturers' Association.

Fairbanks, Morse & Co., Chicago, have purchased a lot 300 ft. by 150 ft. in the central manufacturing district of that city for the purpose of erecting a new warehouse, to cost $15,000. It will be of brick and concrete, three stories and a basement.

The Sherwin-Williams Company, Cleveland, Ohio, is contemplating the erection of a factory at Kansas City, Mo., to cost $500,000. The first unit will be equipped for the manufacture of paint and will be followed by the construction of a varnish factory.

M. M. Drake, sales manager for the Deeming-Endsley Company, Chicago, with headquarters in that city, has been appointed manager of the railway supply division of **The Pierce Company**, Kansas City, Mo., with office in the Transportation building, Chicago.

R. E. Trout, who has resigned as signal engineer of the St. Louis-San Francisco, to become general sales manager of the primary battery division of **Thomas A. Edison, Inc.**, with office at Bloomfield, N. J., as was announced in our Emergency Bulletin of November 6, was born at Miles Grove, Pa., now North Girard, on August 18, 1874. He began his railway career in 1892 with the Union Switch & Signal Company, Swissvale, Pa., as an apprentice in shop and construction work. He entered the service of the Michigan Central in 1896 as construction foreman and signal inspector. In 1898 he returned to the Union Switch & Signal Company, in charge of the installation of an electro-pneumatic interlocking plant at the South Station, Boston, Mass. In 1900 he was appointed signal inspector on the New York, New Haven & Hartford, with office at Providence, R. I. Mr. Trout again returned to the service of the Union Switch & Signal Company in 1901 as inspector of material and construction work. From May, 1902, to July of the same year he was connected with the signal department of the Chicago & Alton. On the latter date he was appointed signal engineer of the St. Louis-San Francisco, which position he held until his recent appointment. Mr. Trout has been a vice-president of the Railway Signal Association and later became president, which position he held until that association became the Signal Division of the Engineering Section of the American Railroad Association, at which time he was elected chairman of the Signal Division.

R. E. Trout

The business and property of the **O. S. Walker Company**, Worcester, Mass., manufacturers of grinding machines and magnetic chucks, has been sold by Oakley S. Walker to a group of men prominently connected with the machine tool and supply business, and the reorganization of the company has been completed. The name of the company will remain unchanged and the new officers are: President, **W. B. McSimmon**, Boston; vice-president, **J. H. Drury**, Athol; general manager, secretary and treasurer, **Clayton O. Smith**; the third director being **William F. McCarthy, Boston.** The new ownership brings with it increased financial resources which will make possible future development and increase of the business. The company manufactures grinding machines of various types and magnetic chucks used in holding iron and steel parts while they are being ground or machined.

C. F. Neudorfer, general plant superintendent for the Standard Tank Car Company, Masury, Ohio, has been promoted to general manager, a position which has been vacant for some time. **N. L. Mabey**, chief engineer, becomes assistant general manager. **Frederick Burroughs**, chief estimator, has been made chief engineer, and **J. W. Todd**, assistant chief engineer, has been appointed assistant purchasing agent in the office of the superintendent of transportation. **J. T. O'Connor**, superintendent of transportation, has been appointed purchasing agent. **J. R. Sweeken** succeeds Mr. O'Connor as superintendent of transportation.

E. L. Chollman, whose election as vice-president and sales manager of the **Paxton-Mitchell Company**, Omaha, Nebr., was announced in the *Railway Age* Emergency Bulletin of October 13, was born at Omaha, Nebr., on August 5, 1877. He entered railway service in 1892 as a machinist's apprentice on the Union Pacific at its Omaha shops. From 1897 to 1901 he was machinist on various railroads and from 1901 to 1902 was roundhouse foreman on the Union Pacific, with office at Evanston, Wyo. In 1902 he was appointed assistant general foreman at Cheyenne, Wyo. From 1903 to 1904 he was master mechanic for the La Follette Coal & Iron Railway Company, La Follette, Tenn. In the latter year he was appointed general foreman on the Southern, with office at Alexandria, Va. In 1905, he was appointed general foreman at Danville, Va., and in 1906 was transferred to Greensboro, N. C., which position he held until 1909, when he was appointed superintendent of car shops at Knoxville, Tenn. In July, 1914, he was elected vice-president of the Southern Locomotive Valve Gear Company, Knoxville, Tenn., a position which he held until his recent election as vice-president and sales manager of the Paxton-Mitchell Company.

E. L. Chollman

The **American Steel Foundries**, Chicago, in its report for the year ending September 30, 1919, shows a decrease in surplus over the corresponding period in 1918 of $144,150. The decrease in net earnings before taxes, the statement shows, is $2,823,232. The comparative income account is as follows:

	1919	1918
Net earnings	$3,751,696	$6,858,017
Depreciation	210,826	305,860
Balance	$3,540,870	$6,552,157
Other income	330,118	142,063
Total income	$3,870,988	$6,694,220
Charges	*165,302	117,497
Federal tax reserve	1,243,113	3,970,000
Surplus	$2,462,573	$2,606,723

*Includes $122,739, net earnings subsidiary companies applicable to stocks not owned by American Steel Foundries.

The International Cement Corporation has been incorporated under the laws of Maine, with headquarters at New York. It is a consolidation of the Cuban Portland Cement Corporation, with properties in Cuba, the International Portland Cement Corporation, with properties in Argentina, the Compania Uruguaya de Cemento Portland, with properties in Uruguay, and the Texas Portland Cement Company, operating two plants in the United States, one at Dallas, Tex., and the other at Houston, Tex. The directing heads of the

International Cement Corporation are **F. R. Bissell**, chairman of the board of directors, and **Holger Struckman**, president and general manager.

Harry M. Giles, who has been appointed general superintendent of the South Philadelphia works of the Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa., as was announced in our Emergency Bulletin of October 13, has risen from the ranks in the Westinghouse organization, having for a number of years been superintendent of marine erection. He was born in Boothby, Me., on March 23, 1869, and when a small boy his parents moved to Providence, R. I., where he received his schooling. Leaving high school, he went to work at an early age in the shops of the Corliss Steam Engine Company. While working he took a night course in the Rhode Island School of Design and later received private instruction in mechanics, kinematics and mathematics. In 1900 he became superintendent of Corliss engines with the Westinghouse Machine Company, a position he held until the company became a part of the Westinghouse Electric & Manufacturing Company.

Huntley H. Gilbert, who has been appointed manager of sales, Western district, of the **Pressed Steel Car Company** and the **Western Steel Car & Foundry Company**, with offices at 425 Peoples Gas building, Chicago, Ill., as was announced in our Emergency Bulletin of October 20, graduated from Cornell University in June, 1907, with degree of mechanical engineer. He then was in the employ of the Illinois Steel Company at its South Works and later served as sales agent of the Scully Steel & Iron Company and then as western representative of the George E. Molleson Company. He entered the employ of the Pressed Steel Car Company in June, 1912, as sales agent in the Chicago office and in 1915 was sent to England and France as special representative to investigate the manufacture of shell forgings. In July, 1917, he was commissioned captain in the Ordnance Officers Reserve Corps and reported for duty July 25, 1917, as assistant to the chief of the Field Artillery Section, Carriage division, Ordnance Department, serving in Washington until February, 1918, when he was transferred to the Rock Island Arsenal, serving there as executive assistant to the commanding officer, later administrative officer, and on July 25, 1918, he was promoted to major. He attended the October, 1918, staff class at the War College, and was then appointed division ordnance officer, 97th Division, Camp Cody, N. M., serving there until the division was demobilized, at which time he was honorably discharged from military service. In January, 1919, he re-entered the service of the Pressed Steel Car Company and Western Steel Car & Foundry Company as assistant manager of sales, Western district, and was recently promoted to manager of sales of the same district.

H. H. Gilbert

Lieutenant Vernon S. Henry, who has re-entered the service of the **Safety Car Heating & Lighting Company**, New York, and is now connected with the Philadelphia office as a sales representative, as was announced in our Emergency Bulletin of October 13, is a graduate of Stevens Institute of Technology. At the outbreak of the war he attended the first training camp at Fort Myer, Va., and received his commission as first lieutenant in August, 1917. He went to France the following November and was in charge of automatic rifles in the A. E. F., remaining there until May, 1918. He then returned to the United States to assist in the production of machine gun tripods, model 1919, and for his development in this work he afterwards received a citation for meritorious and conspicuous service. In 1918 he returned to France and was in charge of the development of machine gun and anti-aircraft material until discharged from the service in February, 1919.

Reorganization and Expansion of the Reading Iron Company

The Reading Iron Company, Reading, Pa., manufacturer of wrought iron pipe, is undergoing reorganization under the direction of **L. E. Thomas**, the newly elected president, who succeeded F. C. Smink. Mr. Thomas was formerly vice-president and general manager of the Birdsboro Steel Foundry & Machine Company. He has had a broad and varied experience in the iron and steel business, having held several important operating positions in the Ohio works of the Carnegie Steel Company, and, later, while identified with the United Engineering & Foundry Company, installed some of its equipment in the leading steel plants of this country. For 14 years he was vice-president and general manager of the Birdsboro Steel Foundry & Machine Company.

L. E. Thomas

W. Woodward Williams has been appointed general manager of the company to succeed George Schuhmann, who retired on August 1, 1919, on account of ill health. Mr. Williams formerly served with the A. M. Byers Company, Pittsburgh, as general sales manager and general manager. Craig Geddis has been appointed advertising manager. He was formerly connected with the sales and publicity departments of the National Tube Company, and later was publicity manager for the Mesta Machine Company. Edgar F. Blessing has been appointed metallurgical engineer and W. E. Dunham production engineer. Mr. Blessing was formerly connected with the Doehler Die Casting Company, Brooklyn, N. Y., and Mr. Dunham was, until recently, service manager for the A. M. Byers Company.

W. W. Williams

The Reading Iron Company has also bought the George B. Lessig Company plant at Pottsdam, Pa., giving the Reading Iron Company an additional monthly muck bar capacity of 2,600 tons. It has also bought from the Empire Steel & Iron Company ten acres of land adjoining its tube works for use in future extensions. Branch offices for the district sales representatives have been established at New York, Philadelphia, Pa., Pittsburgh, Chicago, Dallas, Texas and Cincinnati, Ohio. Additional branches are now being located and will be opened by the company in the future.

Trade Publications

CONCRETE PIPE.—The American Concrete Pipe Association, Chicago, has issued an illustrated bulletin on the manufacture, use and testing of concrete pipe for culverts, drains, pressure pipes and sewers. The illustrations show almost every phase of this important industry.

CURTAIN FIXTURES.—Bulletin F-1, published by the Curtain Supply Company, New York, describes and illustrates the action of the ring curtain fixtures developed by this company and contains sketches showing standard types of open and enclosed grooves to aid in selecting the proper style of ring fixture.

STORAGE BATTERY CARS.—Bulletin No. 106, describing Edison equipped railway storage battery cars, mention of which appeared in these columns in the September 26 issue, was published by the Railway Storage Battery Car Company and not by the Edison Storage Battery Company, as incorrectly stated.

EDISON PRIMARY BATTERIES.—Batteries for electric lighting of railroad signals are described in a handsome eight-page pamphlet issued by Thomas A. Edison, Inc., Bloomfield, N. J. The pamphlet contains also a handsome portrait of Mr. Edison and a brief sketch of the history of incandescent lamps since he made the first one on October 21, 1879.

ASBESTOS.—The Magnesia Association of America, Philadelphia, Pa., is now publishing a monthly booklet, which is devoted to the interests of the asbestos and magnesia industries. The magazine is known as "Asbestos" and contains information regarding market condition and prices, and articles on subjects of special interest to users and manufacturers of asbestos and allied products.

VALVE FACING TOOLS, ETC.—An illustrated catalogue and price list of valve facing tools, ball check valves, solid and hollow balls, pneumatic tube welding machines, ball finishing tools for repairing superheater ball joints, pneumatic locomotive turntable motors, etc., products of the Draper Manufacturing Company, Port Huron, Mich., has been issued by this company and is known as Catalogue No. 7.

PULVERIZED COAL FOR LOCOMOTIVES.—The Fuller Engineering Company, Allentown, Pa., describes its equipment for burning pulverized fuel on locomotives in Bulletin No. 21. Figures are given covering the cost of drying and pulverizing coal and of installing a pulverizing plant. The advantages of this method of firing locomotives are described and sectional drawings show the equipment applied to locomotives.

A SHOCKLESS CROSSING.—The Alexander Railroad Crossing & Equipment Company has issued an illustrated folder describing the Alexander crossing and pointing to the satisfactory results secured with this construction on various railroads during the last 10 years. Vibration charts are also shown illustrating the marked reduction in the vibration secured by the use of Alexander crossings as compared to other types.

PROCESS METAL.—The Robertson Company, Pittsburgh, Pa., formerly the Asbestos Protected Metal Company, has issued a small pamphlet on the use of the Robertson process metal or steel plates, sheets, and shapes, covered with a coating of asphalt, asbestos and water proofing. Illustrations and descriptions tell how this material is used for roofing, sheathing, ventilators, window sash, skylights and many other purposes.

FANS, BLOWERS AND EXHAUSTERS.—The various types of blowers, exhausters and fans manufactured by the Buffalo Forge Company, Buffalo, N. Y., are described in catalogue No. 400, with illustrations and tables of specifications. Diagrams and illustrations of countershafts designed for use with these blowers and exhausters are shown, together with dimensions and price lists. This booklet, consisting of 35 pages, contains information of special value to fan users.

STEEL WINDOWS.—The Truscon Steel Company, Youngstown, O., has issued a complete new catalogue on its line of steel sash windows including pivoted, continuous and balanced sash, with photographs of typical installations. Most of the space is given to large-scale cross sections of the varied applications of this construction in a manner that gives the architect all the information necessary to prepare a complete working layout.

VULCAN SOOT CLEANER.—Bulletin 541, issued by the Vulcan Soot Cleaner Company, Du Bois, Pa., contains a discussion of the merits of the Vulcan patented diagonal method for cleaning soot from the tubes of horizontal water tube boilers, covering such features as maintenance cost and first cost, accessibility for inspection and repairs and ease of installation and cleaning. Illustrations in two colors show typical designs as applied to horizontal water tube boilers with vertical baffling. The bulletin also contains an analysis of the cost of Vulcan cleaners and their value as investments.

WHITING RAILROAD EQUIPMENT.—The Whiting Foundry Equipment Company, Harvey, Ill., has prepared catalogue 145, containing 36 pages, to show the advantages and labor saving features of the various railroad specialties manufactured by this company. The equipment described in this catalogue consists of screw jack locomotive and coach hoists, transfer tables for locomotives and coaches, cranes, and turntable tractors. For those contemplating new shops a drawing of a modern shop layout, showing the most practical and economical arrangement of the equipment, is included.

BOILER FEED CONTROL.—An eight-page bulletin, embodying specifications for the Copes system of boiler feed regulation, has been published by the Northern Equipment Company, Erie, Pa. A cover is provided with punched holes for adding future bulletins or specifications that will be published by the company. The bulletin discusses the principle and operation of the regulator and its mechanical construction, heat storage, reduction of furnace temperature fluctuations on sudden load changes, service performance, and the Copes steam pump governor. It contains a number of charts and photographs.

FEEDWATER HEATER.—Bulletin 5 of the Locomotive Feed Water Heater Company, New York, is a complete treatise on the application and operation of the Type E locomotive feedwater heater developed by this company. A colored chart shows how the heater performs its functions and is arranged to show in a graphical manner just where all of the heat that comes from the burning coal on the grates of the locomotive is distributed and its amount at various points throughout the route between the fuelbed and the top of the stack. A sectional drawing shows the arrangement of the equipment on a locomotive, with all pipe connections.

AUTOMATIC CUT-OFF VALVES.—The Lagonda Manufacturing Company, Springfield, Ohio, in catalogue S-2 describes the Lagonda automatic cut-off valves for power plants, which are designed to close automatically in case of an abnormal flow of steam in either direction through the valve. The booklet contains an account of tests made by the Department of Commerce of the United States to determine their reliability of operation and adaptability for different conditions. External dashpot valves for use when the flow of steam from boilers to the header is practically constant, and internal dashpot valves for installation where load conditions are unsteady are fully described, with illustrations showing sectional views of the various classes. Lagonda non-return valves which close in case of tube rupture or an accident to the boiler are also covered in the catalogue, which contains 32 pages.

FUEL OIL.—This is the title of a 46-page booklet published by the Tidewater Oil Company, New York, which gives a brief survey of experiences of various users of fuel oil and gas oil, and is intended to be of service not only to non-technical executives and plant managers, but also to plant engineers. It contains many charts, diagrams and illustrations and is divided into 15 chapters. The following chapter headings will give some idea of its contents: Advantages of Fuel Oil Over Coal; the Nature and Refining of Crude Oil; Greater Economy of Heavy Over Light Fuel Oils; Results Obtained Where Fuel Has Been Changed from Coal to Oil; Installation, Burner and Furnace Requirements. Under the heading, Estimating the Saving, Fuel Oil vs. Coal, a formula is given for computing roughly the amount which a particular plant can afford to pay for oil as computed from the present price of coal firing.

Railway Financial News

Chicago, Peoria & St. Louis.—Chellis A. Austin, president of the Mercantile Trust Company of New York, is chairman of a committee formed to act for the holders of Chicago, Peoria & St. Louis equipment 6 per cent notes due November 1, 1919, for the payment of which no provision has been made. Notes of this issue maturing a year ago were purchased by the Railroad Administration and the interest thereon paid by it, but the Railroad Administration has declined to act similarly in regard to this year's maturity. The receiver for the road has no means with which to pay the notes. The committee states that the equipment securing the notes appears to have a present value largely in excess of the notes outstanding, but insurance thereon has expired and the receiver is without funds to renew it. Holders are asked to deposit their notes with the Mercantile Trust Company.

Grand Trunk.—The Hon. J. D. Reid, minister of railways of Canada, recently made public at Ottawa, Ont., a schedule of the total liabilities which the Dominion government assumes by taking over the Grand Trunk. These consist of:

(1) The debenture stock in perpetuity, amounting to a total of $155,373,806.

(2) Second mortgage equipment bonds, 6 per cent, $1,814,780.

(3) Northern third mortgage, 6 per cent bonds, $70,566.

(4) Canada Atlantic, 4 per cent bonds, $16,000,092.

(5) Wellington, Grey & Bruce bonds, $295,893.

(6) Matured bonds unpaid, $3,407, or a total of $18,184,738.

In addition, Canada will assume liability for the interest at 4 per cent on the guaranteed stock of £12,500,000 in perpetuity, with the exception that the government will have the right at he end of 30 years to take over that stock, instead of paying the 4 per cent interest that has been guaranteed on it so long as the government leaves it in its present position, in the meantime the stock being divested of its voting privileges. Also included are the following stocks: First preference 5 per cent stock, $16,644,000; second preference 5 per cent stock, $12,312,666; third preference 4 per cent stock, $34,884,535, or a total of $63,841,201.

New York, New Haven & Hartford.—Judge Learned Hand, in the Federal District Court at New York, granted a motion asking that the $150,000,000 restitution suit brought by Edwin Adams and other stockholders of this company against William Rockefeller and other officers and directors of the New Haven be restored to the court for trial. In the same proceeding Harold Norris and another group of stockholders asked the court to appoint a limited receiver to press the trial of the Adams suit which has been pending for more than a year. This motion is scheduled to be heard by Judge Julian T. Mack on December 11.

Wabash.—An opinion handed down in the United States Circuit Court of Appeals at St. Louis on November 24 holds that the Equitable Trust Company of New York is entitled to collect approximately $51,000,000 from the Wabash Railway Company. This opinion affirms the judgment given by Judge Adams, following the foreclosure of the old Wabash Railroad in 1915.

William L. Carlisle, the notorious train robber, escaped recently from the state prison at Rawlins, Wyo., where he was serving a life sentence for the robbery of three Union Pacific trains in 1916; and within a few days he stopped westbound Union Pacific passenger train No. 19 between Medicine Bow, Wyo., and Rock River, about 100 miles west of Cheyenne, and took some $250 from passengers. He got away safely, and during the next few days telegrams signed "Carlisle" and referring humorously to the efforts of police to find him were received by railroad officers and others; but he was at last captured, seriously wounded, near Glendo, Wyo., on December 2, after a long chase through snow covered mountains.

Railway Officers

Railroad Administration

Regional

E. L. Brown, federal manager of the Denver & Rio Grande, has been appointed transportation assistant to the regional director of the Southwestern region, with headquarters at Dallas, Tex., a newly created position.

Federal and General Managers

Benjamin B. Greer, assistant regional director of the Central Western region, whose appointment as federal manager of the Chicago, Milwaukee & St. Paul, the Ontonagon and the Escanaba & Lake Superior, was announced in the Emergency Bulletin of the *Railway Age* of November 11, was born at Chicago on August 6, 1877. He began his business career with the Pullman Company in the summer of 1899 and a few months later entered the service of the Great Northern at St. Paul, Minn., as a clerk in the accounting department, after which he was successively material clerk in the superintendent's office, extra gang foreman, assistant roadmaster, chief clerk to the division superintendent and assistant superintendent, with headquarters at Minneapolis, Minn. On December 15, 1908, he left the Great Northern to become transportation inspector on the Chicago, Burlington & Quincy, with office at Chicago. In 1910 he was promoted to superintendent of the St. Louis terminal. In May, 1911, he became superintendent of the Hannibal division and in January, 1912, was transferred to the St. Joseph division. He was promoted to assistant to the general manager of the Lines East of the Missouri river, with headquarters at Chicago, in 1913, and in 1914 became assistant general manager of the Lines East. From 1915 until July, 1916, he was assistant general manager of the Lines West and on the latter date became assistant to the vice-president in charge of operation, which position he held until September, 1917, when he was elected vice-president and general manager of the Colorado & Southern. In November, 1917, he was also elected president of the Colorado Springs & Cripple Creek, with office at Denver, Colo. These positions he resigned later in that year to become assistant regional director of the Central Western region.

B. B. Greer

Traffic

C. H. Stinson, assistant traffic manager of the Wabash, with headquarters at St. Louis, Mo., has assumed the duties of traffic manager, succeeding **W. C. Maxwell,** who has resigned to become connected with the Wabash Railway Company.

J. H. Wingfield, whose appointment as manager of dining cars of the Southern Railway, Lines East was announced in *Railway Age* of Sept. 19 (page 602), was born in Richmond, Va., June 6, 1871, and educated in the public schools of that city. He entered railroad service in October, 1886, in the office of the purchasing agent of the Richmond & Danville, now part of Southern, at Manchester, Va.; was trans-

ferred to the auditing department in March, 1889, and to the passenger department in May, 1896. Three years later Mr. Wingfield entered dining car service and in August, 1910, was appointed superintendent of dining cars of the Mobile & Ohio. In July, 1913, he was promoted to superintendent of dining cars of the Southern Railway and Sept. 15 last became manager as mentioned above.

Walter A. Rambach, whose appointment as freight traffic manager of the Missouri Pacific, with office at St. Louis, Mo., was announced in the Emergency Bulletin of October 13, was born in St. Louis on August 10, 1878. He began railroad work in 1895 with the Missouri Pacific and the St. Louis Iron Mountain & Southern as a clerk. From 1895 to 1908 he was successively chief clerk in the office of the assistant general freight agent and chief clerk in the office of the freight traffic manager at St. Louis. In September, 1908, he was appointed assistant general freight agent at St. Louis, and in January, 1914, was appointed assistant to the vice-president. He was promoted to assistant freight traffic manager with office at St. Louis in 1915, which position he held until his recent promotion. Mr. Rambach succeeds **C. E. Perkins,** who resigned to become general freight traffic manager of the Missouri Pacific Railroad Company.

C. E. Perkins, whose appointment as general traffic manager of the Missouri Pacific with office at St. Louis, Mo., was announced in the *Railway Age Emergency Bulletin* of October 13, was born in Chicago in 1871. He received his education in the public schools of Kansas City, Mo., the Williston Seminary, East Hampton, Mass., and Amherst College. He entered railroad service as a clerk in the office of the Kansas City, Fort Scott & Memphis in 1891. In 1896, he was appointed chief clerk to the general agent of the St. Louis-San Francisco with office at Kansas City. In 1897, he entered the service of the Kansas City, Pittsburg & Gulf, now the Kansas City Southern, as chief tariff clerk, later becoming successively chief clerk and assistant general freight agent, with office at Texarkana, Tex. In 1909, he was appointed assistant general freight agent of the St. Louis, Iron Mountain & Southern, with office at St. Louis, and in 1910, he was promoted to general freight agent. In 1913, he was appointed assistant general traffic manager of the Missouri Pacific-Iron Mountain System and in the same year was promoted to freight traffic manager, which position he held until his recent appointment on the Missouri Pacific, where he succeeds H. M. Adams, recently elected vice-president of the Union Pacific.

Engineering and Rolling Stock

W. W. James has been appointed assistant valuation engineer of the Central of New Jersey and the New York & Long Branch.

H. L. Laning has been appointed assistant valuation engineer of the Philadelphia & Reading, the Atlantic City, and the Port Reading.

E. Y. Allen, assistant valuation engineer of the Philadelphia & Reading and the Central of New Jersey, with headquarters at Philadelphia, Pa., has been appointed valuation engineer of those roads and of the New York & Long Island Branch, the Atlantic City, the Port Reading, the Baltimore & Ohio New York Terminals, the Baltimore & New York, the Staten Island Rapid Transit and the Staten Island.

M. Lipman, supervisor of the Pennsylvania, Eastern Lines, at East Liberty, Pa., has been appointed division engineer of the West Jersey & Seashore division; **C. L. P. Russel,** supervisor at Verona, Pa., has succeeded Mr. Lipman, and **J. R. Scarlett,** main line assistant supervisor at Baltimore, Md., has been appointed Mr. Russel's successor. **R. Woodcock,** assistant supervisor at Youngwood, has been transferred to Baltimore, Md., and **H. P. Heil,** transit man of the Philadelphia Terminal division, has been appointed Mr. Woodcock's successor.

Purchasing

J. M. Mitchell, storekeeper of the Virginian at Roanoke, Va., has been transferred to Victoria, Va., succeeding **K. A. Fernstrom,** assigned to other duties; **J. V. Bland,** storekeeper at Sewalls Point, Va., has been appointed Mr. Mitchell's successor. **G. C. Donovan,** has been appointed acting storekeeper succeeding Mr. Bland.

Corporate

Executive, Financial, Legal and Accounting

Ralph Budd, whose appointment as president of the Great Northern with office at St. Paul, Minn., was announced in the *Emergency Bulletin of the Railway Age* of October 20, was born at Waterloo, Iowa, on August 20, 1877. He graduated from Highland Park College of Engineering at Des Moines, Iowa, in 1899, and began railroad work in the same year in the engineering office of the Chicago Great Western. Until 1902 he was successively draftsman, levelman, instrument man and assistant engineer, and from 1902 until 1905 he was successively roadmaster, general superintendent of construction on the St. Louis division and division engineer of that division. From 1902 until 1906 he was division engineer on the same road with headquarters at Chicago. The following year he became chief engineer of the Panama railroad with headquarters at Colon, Panama. In 1909 he resigned to become chief engineer of the Oregon Trunk, with headquarters at Portland, Ore., having charge of the construction of that line into Central Oregon. From 1910 to May, 1914, he was also chief engineer of the Spokane, Portland & Seattle, and from 1911 to January, 1913, also chief engineer of the Spokane & Inland Empire and the Spokane Traction Co. Mr. Budd was appointed assistant to the president of the Great Northern in January, 1913, and in February of the same year was appointed chief engineer. In May, 1914, he again became assistant to the president which position he retained until February, 1918, when he was elected executive vice-president. He served as assistant to the regional director of Western railroads in charge of capital expenditures with office in Chicago in April, 1918, returning to his former duties late in that year.

Charles Donnelly, whose election as executive vice-president of the Northern Pacific Railway Company was announced in the Emergency Bulletin of October 13, was born at Grand Rapids, Wis., on November 9, 1869. He received a high school education in that city and later entered the Georgetown University Law School at Washington, D. C., graduating in 1896. He began railroad work on September 8, 1903, with the Northern Pacific as assistant division counsel on the Montana division, with headquarters at Helena, Mont. In January, 1908, he was appointed assistant general counsel, with headquarters at St. Paul, Minn. In May, 1918, he was appointed general solicitor of the Northern Pacific under federal control and on October 1, 1919, was elected to his present position, with office at St. Paul, Minn. Mr. Donnelly, in addition to his duties as executive vice-president, will temporarily take over part of the duties of Thomas Cooper, vice-president and land commissioner, who has been given a leave of absence because of ill health.

C. Donnelly

Alexander C. Brown, president of the Brown Hoisting Machinery Company, Cleveland, Ohio, has been elected president of the northeastern Ohio division of the National Safety Council.

Uncertainty Destroys Market For Securities

In November, 72 large corporations and some smaller corporations sold $294,845,000 worth of securities to raise new capital or for refunding purposes, and not one of these corporations was a railroad corporation. In the first eleven months of 1919, railroads sold $250,919,000 worth of securities, according to the compilation which is made by Dow Jones & Company (Wall Street Journal). This is less than a tenth of the total corporation financing done in the eleven months of 1919, and furthermore, not a dollar of it represents further partnership participation in the railroad business. There were $118,331,000 of railroad bonds sold, and $132,588,000 of railroad notes, but not a share of stock. The fact that no railroad securities of any kind were sold in November reflects one thing — uncertainty. Uncertainty is more deadly to credit than worry to the proverbial cat. The law of supply and demand is set aside by uncertainty. The fact that industrial corporations sold nearly two billions of dollars of securities in the eleven months of 1919, shows the broad market which has been developed for investment securities. A study of the maturing obligations and immediate capital needs of the railroad corporations, shows how large is the supply of railroad securities which should be marketed. Uncertainty prevents the joining of issue between the supply and demand. Of more far-reaching importance, however, than this temporary present uncertainty is the fact that no railroad stock has been sold this year. An industry in which nobody wants to become a partner, is in an unhappy situation.

The Safety Movement and Past Experience

The recent accident prevention drive furnishes additional evidence of the tendency on the part of the railroads during recent years to improve the working conditions of their employees, and it is to be hoped that the termination of the drive on October 31 has not marked the end of concerted efforts to reduce the number of accidents. There would seem to be no good reason why an active safety campaign should not be maintained continuously, if it is not overdone. But in carrying out these activities one should profit from experience gained in the past with movements of somewhat similar character and avoid the old pitfalls. It is easy to recall the enthusiasm which attended the so-called "Welfare" movement and easier to recall how it was killed by its friends in allowing the idealistic phase of the problem to obscure the practical side. That there is danger of defeating the purpose, or at least of lessening the efficiency of the "Safety" movement in a similar manner is evidenced by the fact that it is not difficult to find division officers who, because of the local conditions under which they work, are forced to devote as much as one week in each month to safety matters and meetings. Granting the great importance of the movement it is hard to conceive of any division officer being willing to give a week of his time continuously to these matters. That his interest will eventually be lost seems certain. The fact that such conditions exist is due, probably, to the fact that it is common practice for the roads to employ specialists from outside to head the safety committees. Naturally their first interest is in actual results and, as naturally the viewpoint of others is lost sight of. It seems that the employment of men experienced in actual railroad work and thoroughly awake to comparative values would go a long way to relieve the situation.

Handling Labor Controversies

That there is a feeling of unrest among all classes of railroad labor despite the large wage increases the majority of workers have received, is generally admitted. The boards created by the Railroad Administration to pass on labor disputes have performed an important function during the period of federal control by providing a channel for the orderly settlement of the disputes arising due to this general air of dissatisfaction. Each successive bulletin dealing with labor matters brought up innumerable controversies, a large share of which were finally passed on by the board of adjustment. Important agreements governing the working conditions in the mechanical and maintenance of way departments have recently gone into effect. The labor organizations are now strongly intrenched on all the large roads and they will undoubtedly try to place their own interpretation on these agreements. As the Division of Labor will go out of existence at the end of federal control, the managers will have a serious labor problem to face during the first few months of private operation. It is essential that during this period of readjustment railroad officers should be free to devote their attention to the problem of operating the properties in the most efficient manner. In the past too much of the time of the higher executives has been spent in long drawn out disputes, over petty questions concerning wage matters. The climax has been reached during federal control. After one of the wage supplements was issued the superintendent motive power of a certain large road spent three weeks in conferences with representatives of the shop crafts, yet only one-fourth of the questions brought up were disposed of, the remainder being referred to the adjustment board. Such procedure is an unjustifiable waste of time, of which the executives should be relieved. With the extremely complex wage agreements now in force it might be well to have an officer in each department, reporting directly to the department head, who would be the final authority on the interpretation of wage contracts. The representatives of the labor organizations have little to attend to aside from these disputes and if their demands are refused, seldom fail to take their case to the highest tribunal. It goes without saying that the higher officers must keep in close touch with the general labor situation, but it is quite unnecessary that they should be called on to settle trifling differences with regard to the meaning of the various provisions of the contracts. Some such plan as suggested above should prove helpful by taking this burden off the shoulders of the executives.

Puzzles of the Accident Investigators

THAT the block system is safer than the time-table and time-interval system of running trains, goes without saying; but it does not go far enough. Too many railroads or parts of railroads are managed by men who accept this fact in theory but do not heed it in practice. The block system is safer because of its simplicity; but in what does the simplicity consist? Some things are so simple that to impress them on the unreceptive mind it is necessary to build up a line of auxiliary argument in order to arouse the reasoning faculties, as is done in teaching the beautiful simplicities of geometry. The simplicity of the block system can sometimes be best set off by looking at the confusion which is inseparable from the other plan. This confusion is illustrated in a striking way by a recent collision. While the circumstances attending it have scarcely any element of novelty they may, nevertheless, be studied with profit. We have been studying the same kinds of facts for years; but there is need of keeping on, for we learn the lesson so poorly that we continue to kill people, because of our ignorance—or perversity.

Confusion is the term which may properly be applied to the lack of correspondence between the mental processes and the outward conduct of enginemen (and conductors) and the theoretical mental operations (for running trains without the block system) in the rule book. In this case an engineman (passenger, eastbound) displaying green flags, said that he sounded the whistle to call the attention of a freight engineman (westbound) on a side track and that there was a sound from the whistle of the engine on the siding; but whether or not this sound was the prescribed acknowledgement of his own signal he could not say; there was too much noise on his own engine. The freight engineman did not see the flags; he denied hearing the whistle signal (and of course did not answer a signal which he did not hear); the fireman and the head brakeman corroborated his statement that the eastbound train did not whistle; the conductor of the eastbound could not corroborate his own engineman; and the government investigator distrusts the testimony of those who did back up the engineman. In fact, the investigator was so confused by the multitude of discrepancies in the testimony of the ten or eleven men who ought to have been able to give clear, truthful, and consistent testimony concerning the whole situation that he gave up in despair, and he only said that he "believed it possible" that the whistle signal was not sounded.

The rest of this story would take a column or two. It is more, interesting than fiction; but like the popular fiction of the day, its length compels us to send the reader to another page (our account of train accidents in September). The most comprehensive conclusion of the investigator is that embodied in his statement that all of the men on the westbound train, except the pilot, were inattentive to their duties.

Adding to the foregoing the other confusing features shown in the account of the collision and the subsequent investigation, what do we see? A dozen questions of veracity which no ordinary man could settle without the skilful aid of the Supreme Court; and as many more questions about qualifications, discipline, personal habits and daily practices, which the trainmaster could, indeed, settle if he had unlimited time and financial resources, but which, with things as they are, simply baffle him. Any one who gets at the real state of mind of the typical trainmaster finds him burdened with an assortment of unsettled problems concerning the training of his men that is truly amazing to one who comes to the subject fresh from the outside. Simplification of collision puzzles by the use of the block system serves markedly to reduce these problems, (and it is the only way to reduce them. Compare any investigation of a collision under the block system with any report of a case like that here referred to; the difference is obvious at a glance. Questions of veracity are not absent, of course; where two men are involved in any serious error, all sorts of desperate efforts of each to shift the blame to the other are always to be expected; but the investigator's task is greatly simplified, nevertheless. This case was a good deal more complicated than the average but it was not unusual. The records of the Interstate Commerce Commission would show numbers of them every year, if not every quarter. The collision at Kelleyville, Okla., on September 28, 1917, killing 23 passengers, was of the same kind as the present case, though not so many men were at fault.

On the other hand, look at South Byron, Ivanhoe and Mount Union, the three most prominent recent collisions under the block system; the question of responsibility was pretty well settled in each case by or before the time the formal investigation was started. These were great disasters, involving difficult questions; but at least we can say that the technical definition of what ought to be done in such cases is reasonably clear. These three collisions all occurred under automatic signals. With nonautomatic the situation is not usually so free from complication; but with either system the problem is simplicity itself as compared to that of dealing with men who have "fallen down" in their grapple with the intricacies of the Standard Code.

As intimated above, this article is predicated on a collision reported in the record of last September (the second item in the list); but its lesson applies without change to a large class; to most of those on lines not worked wholly by the block system, where the realiability of the conductor and the engineman are supposed to be bolstered by the vigilance of brakemen and firemen.

Increased Investment Required to Reduce Labor Costs

AMONG the most interesting statistics which have been made public by the Railroad Administration are those which it recently furnished to the Senate Committee on Interstate Commerce regarding the number and compensation of railroad employees in the year 1919 as compared with December, 1917, the last month of private operation.

These statistics show that in December, 1917, the number of employees of the railways now under government control was 1,703,748, while in July, 1919, it was 1,894,287, an increase of 190,539, or 11.2 per cent. The total compensation paid to the employees of Class I railways—which are substantially the same as those under government control—in the entire year 1917 was $1,740,000,000. The total compensation paid to the employees of the railways under government control in July, 1919, was $226,141,000. This is at the annual rate of over $2,700,000,000. Some advances have been granted since July to shop employees and train service employees. These statistics confirm estimates previously made by the *Railway Age* that wages on the Class I railways are now running at the rate of approximately $2,800,000,000 a year. If the wages being paid by the Class II and III railways were added this amount would be increased to approximately $3,000,000,000.

Director General Hines calls attention to the fact that the increase in the number of employees has been almost entirely due to reduction in the hours of work per day. He points out that in December, 1917, the total number of hours worked by the persons then on the pay roll was 434,000,000, while in July, 1919, with over 190,000 more persons on the pay roll, the total number of hours worked was less than 417,200,000.

The average number of employees of Class I roads

throughout the year 1917 was 1,732,876, and it may be pretty safely assumed that this was approximately the number employed in July, 1917. The amount of passenger traffic handled in July, 1919, was substantially larger than the amount handled in July, 1917. On the other hand, the amount of freight business handled in July, 1919, was substantially less than in July, 1917. In other words, the increase in the number of men employed was not due to or accompanied by an increase in the amount of traffic handled, and, in consequence, there was a decline in the total amount of traffic handled per employee. Such statistics as are available indicate that the number of tons moved one mile per employee in July, 1917, was 21,000, and in July, 1919, only 18,500; while the number of passengers moved one mile per employees in July, 1917, was about 2,300, and in July, 1919, it was 2,400. During all the years when the question of an eight-hour working day in the railroad and other businesses has been under discussion it has been contended by some persons that a reduction of hours would result in a reduction of production and by others that it would not result in a reduction of production because the average worker would accomplish as much in a working day of eight hours as in a working day of ten hours, for example. The statistics of the Railroad Administration demonstrate that the effect of reducing the average hours worked per day per employee has been to make it necessary to employ over 11 per cent more men to do a somewhat smaller amount of work.

The reduction made in working hours probably was justifiable. It was justifiable if, in the circumstances existing at the time, the establishment of an eight-hour day in any industry was justifiable. But the fact that the reduction in hours has resulted in a reduction in the amount of work done per employee and therefore in a large increase in the number of employees required to handle the same amount of traffic, must not be overlooked. The eight-hour day in railway service having been adopted, it is practically certain that it will never be abolished. Under private operation the companies may succeed, even with existing facilities, in handling a slightly larger business with the present number of employees. But all the big increases in the amount of traffic handled in proportion to the number of men employed which occurred before government operation was adopted, were due, not to the fact that the average employee did more work, but to the fact that the managers and officers of the railroads worked out better operating methods and designed or adopted larger or better yards, cars, locomotives, and so on, and that the owners of the railroads furnished the capital required to provide the additional and improved facilities. They were due chiefly, not to the work of the employees, but to the investment of more and more brains and capital in the industry.

The establishment of the eight-hour day, with its consequent effect of rendering it necessary to employ about 11 per cent more men to handle actually a smaller traffic, has of itself caused a large increase in railroad expenses. This increase in the number of employees required for a given amount of work has been accompanied by a large increase in wages per employee, which has had the effect of pyramiding the increase of expenses and making it very large. There is only one way in which the effect of these influences on expenses can be even partly nullified, and that is by adopting better operating methods and providing facilities which will again begin to reduce the amount of labor required to move a given amount of traffic, as was being done steadily for years before the eight-hour day was established. But these larger and better facilities cannot be provided without a large investment of capital. It will be true in the future as it has been in the past, that the only way to effect very large economies in operation will be to make large investments of capital in facilities which will increase the amount of traffic which can be handled in proportion to the number of persons employed.

There has been much said in our own columns and elsewhere about the need for a large investment of capital to enable the railroads to expand their facilities. Another most important reason why a large investment of capital is needed is afforded by the enormous increase which has occurred in the railroad pay roll. The fact cannot be too forcibly emphasized that the effect of this on operating expenses cannot be materially offset in any way except by a large investment of capital in equipment and facilities which will reduce, as past investments of capital have reduced, the amount of labor required to move a ton or a passenger one mile.

It is most unfortunate that such fundamental principles of railway economics as this one are understood by very few people outside of the class who finance and operate railways. If it were possible to make economists, members of regulating commissions, shippers and lawmakers understand that whatever tends excessively to restrict the amount of capital invested in railroads not only tends to prevent them from adequately increasing their facilities, but also tends to prevent them from effecting economies in operation which are necessary to enable them to make low rates, we should soon have the railroad problem discussed and acted upon with more intelligence than it has been in the past.

New Books

Proceedings, American Wood Presevrers' Association, 1919, 6 *in. by* 9 *in.,* 310 *pages of text,* 30 *pages of advertising, illustrated. Published by the American Wood Preservers' Association, F. J. Angier, secretary-treasurer, Baltimore & Ohio Railroad, Baltimore, Md.*

This book contains the running report including committee reports and personal papers presented at the fifteenth annual meeting of the American Wood Preservers' Association held at St. Louis on January 28 and 29, 1919. Studies of substitute preservatives to compensate for the growing scarcity of creosote, specifications of the United States Railroad Administration for ties and for preservative treatments of timber were among matters of special interest presented at this meeting. The last 40 pages of the text consist of statistical data on the consumption of preservatives, the amount of timber, ties, piles, poles, etc., treated, as prepared by the United States Department of Agriculture, Office of Forest Products, in co-operation with the American Wood Preservers' Association.

Development of Government Ownership in the Dominion Produces a Peculiar Transportation Situation

THE DOMINION OF CANADA seems to be drifting steadily and surely toward the nationalization of her railways. Despite a lesson more convincing every day of the failure of government operation of railways in the United States, and in spite of the similarity between the two countries in respect to almost all conditions which affect railroad operation and management, the experience of the United States with government operation during the past two years has, to all appearances, meant little to those in Canada who are formulating national policies. In fact, the long struggle with the railroad problem south of the international boundary has had little or no effect on developments in the Dominion.

This apparent checkmating of national railway policies by the two nations goes even further. When the United States turned to government operation as a war-time measure, the Dominion refrained from such drastic action and allowed the roads which were then leading a corporate existence, to prove that they were able to handle the increased volume of war-time traffic as expeditiously and as successfully as they had handled the smaller peace-time business. While our government shouldered the burden of operating the railways, Canada went to the source and controlled the shipper instead of the railroad—and succeeded. This policy of *laissez faire,* in transportation, which made Canada's war problem much less complex than it otherwise would have been, proved the efficiency and versatility of the privately owned and operated railroad under the abnormal conditions incident to the war.

Again, our recent railway ailments promise to be eradicated at the present session of Congress by a return to private management with governmental regulation as a permanent national policy, whereas Canada, which has long been dabbling in government ownership, seems now to be entering upon a very extensive nationalization policy. Where our troubles are seemingly to diminish in the near future, Canada's real troubles are seemingly just about to begin.

It is the purpose of the present article to outline only the present railway situation in the Dominion of Canada. The events which have led up to this situation, the seeming inevitableness of the steps which the Dominion government has taken so far, and the probable effects upon Canada's contemporary and future railway history of the steps already taken and those which appear about to be taken, will be dealt with in later articles.

Canada's Transportation Plant

At the present time Canada's seven main lines may roughly be segregated into three classes insofar as the nationalization program is concerned first, roads owned by the government and managed by an operating organization; second, roads in which the government is heavily interested financially, but which are operated by private management and, third, roads, or rather a road, wholly privately-owned and operated.

Of roads belonging to the first class there are consolidated under the direction of one operating organization (that of the Canadian National Railways Company) the four government-owned lines, formerly known as the Inter-Colonial, the Prince Edward Island, the National Transcontinental and the Canadian Northern. This operating company was formed after the mileage of government-owned lines had been so increased by the addition of the 9,648 miles of the Canadian Northern System as to make their unified management and operation seem desirable. The executive officers of this company are in the main the old executive officers of the Canadian Northern. Its operating staff is composed substantially of the same men who have been operating the Canadian Northern and the Canadian Government Railways, i. e., the Prince Edward Island, the Inter-Colonial and the National Transcontinental. Until recently the Canadian National Railways Company was a temporary arrangement, but, with the passage by both houses of the Canadian parliament of a bill, House Bill 70, incorporating the company, the temporary organization became a permanent one.

Under the provisions of this bill there has been created a "railroad company" in every sense of the word except in that, instead of shareholders being the power behind the management, the government has assumed this position. The powers conferred upon the new organization are substantially those conferred upon a private railroad corporation by its stockholders; the voice usually retained by the shareholders in a privately owned railroad corporation is retained by the government; and the government, like the shareholders in a private corporation, supplies the money for the operation and development of the plant. In other words, Canada now has in the case of these lines something approximating to government ownership and private operation.

All statistical statements used in the compilation of the cost of construction, indebtedness, etc., of Canada's roads which appear in this series of articles, are taken from the Sessional Papers presented before the Canadian Parliament up to and including the report for the year 1916. Figures for these items after that date are not available, but with higher operating costs, higher costs of material and labor, and no corresponding increases in rates, the financial position of the roads has not improved since then. The Canadian railways have been granted rate increases equal to those granted by the Interstate Commerce Commission in the United States. At the same time the Canadian roads have granted wage increases equal to those granted in the United States. The increase in the cost of materials and labor have more than counterbalanced the advantages arising from the increased earnings.

The Intercolonial and Prince Edward Island

The oldest railroad in point of ownership by the Dominion is the Intercolonial, running from Sidney, N. S., and Halifax north to the Gulf of St. Lawrence, and thence southward along the St. Lawrence river to Montreal, passing through Moncton, N. B., and Quebec, and forming the eastern link in the government-owned transcontinental line. The government's ownership dates back to 1867, approximately 52 years. The mileage of the Intercolonial is approximately 1,500 miles. A large part of this mileage is through unproductive, rocky sections of eastern Canada, with great stretches of non-traffic producing territory lying between the main terminals. Because of this uneconomic location, determined years ago by political and military considerations, plus the inevitable results of political interference under government ownership, the road has been a consistent drain on

* First of a series of three articles outlining the present situation of the Dominion of Canada's railways, the events which led up to this situation and the results that might ensue as a result. The second and third articles of the series will appear in subsequent issues of the Railway Age.

the public treasury. Never since its purchase and development by the Dominion government has it been able to meet both its operating expenses and interest charges on the capital invested, and in a majority of years it has not even earned its operating expenses. Probably, situated as it is with regard to traffic producing territory, it could never have been successful as a separate venture. Now, however, it is linked with other roads which are traffic producers and the decision as to whether it will be successful or not depends not so much on its operation as a single unit as on its operation as one link in the government-owned transcontinental chain of roads.

Of the Prince Edward Island, the second road named in this group of roads which are now under the jurisdiction of the newly formed Canadian National Railways Company, little need be said because of its remoteness from the general railway situation in Canada. It is a narrow gage road of approximately 278 miles, serving Prince Edward Island and was formerly under the same management as the Intercolonial. However, it has one characteristic in common with the other roads in this group, namely, the propensity to consistently incur deficits. Never in any year in its history has the Prince Edward Island been able to earn its operating expenses, much less its interest charges. It has had little effect on the present situation in Canada except as a drain upon the public treasury.

National Transcontinental

In the case of the third of these government-owned railroads, the National Transcontinental, an entirely different situation presents itself. The National Transcontinental was built directly by the Dominion government, beginning in 1904, and has been operated by the government since its completion in 1913. Running from Quebec to Winnipeg with a mileage of approximately 2,067 miles, the National Transcontinental forms the second link in the new government chain across the continent. It was built as a result of an agreement between the Dominion government and the Grand Trunk Railway Company, the details of which will be given in the second of this series of articles. In regard to the present situation, however, the cost of construction of this road up to 1917 amounted to $164,000,000. The government commission which built it was composed of men inexperienced in railroad construction. Another government commission, composed of F. B. Gutelius and J. Lynch-Staunton, which was appointed in 1912 to investigate charges of extravagance, corruption and mismanagement in the road's construction, reported a waste of many millions of dollars.

As an operating success it has been equally deficient. The total operating expenses up to 1916 were $4,744,129 as compared with operating revenues of $3,956,234, leaving an operating deficit of $787,895. The road has many miles of main lines with few miles of branch lines or feeders. The main part of the route between Quebec and Winnipeg passes through undeveloped territory, originating little traffic other than wood pulp and timber. Whether the National Transcontinental will be a success as a part of the new government transportation system depends on the latter rather than upon it.

Canadian Northern

The fourth road now owned by the government and operated as an integral part of the Canadian National Railways is the Canadian Northern, running from Quebec in the East to the Pacific coast at Vancouver, B. C., and with a network of lines in Manitoba, Saskatchewan and Alberta. The total mileage of the road is 9,405 miles. It provides an alternative route from Winnipeg east through Toronto and Montreal to Quebec, and the section from Winnepeg west forms the western link in the new system. The line was constructed by Sir William MacKenzie and Sir Donald Mann with liberal government assistance. Briefly, the financial story of the road developed in such a manner as to make the governments, Provincial and Dominion, in one way or another the guarantors of about 75 per cent of the company's liabilities. The war, higher operating costs, invasion of the territory served by the Canadian Northern by other railways and a faulty policy pursued by the road brought it into financial difficulties and it was unable to finance itself. Ostensibly there was nothing left for the government to do, in the light of the necessity for maintaining uninterrupted service throughout this part of the Canadian west and protecting its already large investment in the property, but to take over the road. After arbitration proceedings Messrs. MacKenzie and Mann, who held 60 per cent of the common stock, were paid approximately $10,000,000 for their holdings and the road was placed under the jurisdiction of the Canadian National Railways. The extent of the interest of the government in the Canadian Northern at the time of the report made by Sir H. L. Drayton and W. M. Acworth, members of a Commission of Inquiry appointed in 1917 to investigate the railway problem, was $298,253,263, which sum includes subsidies, proceeds of land sold, loans outstanding on investments and guarantees outstanding. In view of the prospect of the necessity of constantly aiding the road from funds in the public treasury, it was taken over by the government on July 1, 1918, thereby bringing the total mileage of the government-owned lines up to 13,200 miles.

This system as now constituted gives to the Dominion government a nationally owned transcontinental line. However, this line has a serious lack of traffic originating branch lines in those districts in which much of Canada's products originate. The one exception to this lack of feeders is in the Western grain-producing provinces where the Canadian Northern had built a large network of branch lines to handle the wheat crops. A transcontinental line, so much of which passes through unproductive territory as does the Canadian National Railways, could never be successful without a complete system of branch line feeders to originate traffic, which in turn supports the expense of the long haul.

Fortunately, perhaps, for the nationalization plan the financial trouble which precipitated the acquisition and amalgamation of the Canadian Northern has also affected two other lines, one of which, the Grand Trunk Pacific, traverses rich traffic-producing territory in the western provinces and extends to the Pacific coast, and the other, the Grand Trunk, forms a network of traffic-producing lines in Canada's industrial districts. These two roads comprise the second division, i. e., roads in which the government is heavily interested financially, but which are not yet government-operated in the ordinary sense.

The Grand Trunk Pacific

The Grand Trunk Pacific, with a mileage of 2,809 miles, the eastern terminal of which is at Winnipeg, and which traverses the richer portions of the provinces of Manitoba, Saskatchewan, Alberta and British Columbia to Prince Rupert on the Pacific coast, is now nominally a government railroad, although it is not operated as a part of the Canadian National Railways. The Honorable J. D. Reid, minister of railways, was appointed by the government as receiver for the road, on March 7, 1919, under the War Measures Act. This action was taken immediately after its parent and sponsor, the Grand Trunk, had notified the Dominion government that it could not operate the road after March 10, because of the heavy deficit incurred in its operation and the refusal of Parliament to grant further aid for the maintenance of service on the Grand Trunk Pacific. This rather complicated situation is due to the conditions under which the Grand Trunk Pacific was constructed and the relations of the Grand Trunk and the Dominion government to it.

It may be recalled here that the Grand Trunk Pacific was constructed by the Grand Trunk, liberally assisted by the Dominion government as part of an agreement entered into between the government and the latter company for the construction of a transcontinental line, the Grand Trunk Pacific, part of which was to be constructed by the Grand Trunk and the eastern half, the National Transcontinental, by the Dominion government. This latter portion of the line, east of Winnipeg, was to be leased, after its completion, to the Grand Trunk Pacific Company, the rental to be based on the cost of construction. Upon the completion of the National Trancontinental the Grand Trunk refused to take over its operation because of its excessive cost of construction, which, of course, greatly raised the rental to be paid. Insofar as the Grand Trunk Pacific is concerned, the financial development of the road arrived at a point where the Dominion government was interested to the extent of about half of the approximate expenditure of $200,000,000 through the payments of deficits and the guarantee of bonds, and the Grand Trunk was responsible for approximately an equal amount.

The upward trend of operating costs and, as stated before, the refusal of the acting premier, Sir Thomas White, to ask Parliament to appropriate further funds for the maintenance of service on the Grand Trunk Pacific led the officers of the Grand Trunk, who are likewise the officers of the Grand Trunk Pacific, to notify the Dominion government that it would be impossible to continue operating the Grand Trunk Pacific after March 10. As a result, at the present time the Honorable J. D. Reid, minister of railways, is head of the Grand Trunk Pacific company as receiver, and its former officers are continuing operation. But this arrangement is at best only a temporary device to maintain uninterrupted service until it is possible to absorb the Grand Trunk Pacific into the Canadian National system. It is generally conceded that this action will be taken in the near future and that the Grand Trunk Pacific will become an integral part of the Canadian National Railways. This development, however, depends largely upon the future relations between the Dominion government and the Grand Trunk.

The Grand Trunk

As to the other line or system falling into this classification, the Grand Trunk, little can be said with certainty as to its present situation. The government had been extending liberal financial aid to the company, and in January, 1918, opened negotiations for the perpetual lease of the property. These negotiations, after passing through a series of proposals and counter proposals, in which the Grand Trunk's liability for the Grand Trunk Pacific played a major role, seem to be nearing completion. The outcome of these negotiations has not been announced, but when the strategic position of the Grand Trunk lines is considered, the assumption that the negotiations will end in government acquisition seems safe.

The main part of the Grand Trunk's mileage lies in Ontario, east of Lake Huron and north of Lakes Erie and Ontario. In this district is produced the major part of Canada's manufactured products. The Grand Trunk's lines have been constructed to handle the traffic produced here as well as possible, and the result is a network of lines, all serving a definite purpose. In this district, too, the cities and towns are old and well developed, making the establishment of new terminals in this territory doubly hard and expensive. On the other hand, the Grand Trunk has built fairly adequate terminal and switching facilities throughout this district. The needs of government lines can be largely met by the Grand Trunk, and it is therefore safe to assume that some co-ordinating arrangement will be made. Without some arrangement with the Grand Trunk the Canadian National Railways would be obliged, in order to operate efficiently and successfully, to duplicate lines and terminals of the Grand Trunk, at a cost of approximately $150,000,000.

The Canadian Pacific

Against these two closely interwoven groups of railroads, which may be viewed even now as one, is arrayed the successful privately owned and operated transcontinental line, the Canadian Pacific. Operating approximately 13,000 miles of splendidly equipped and maintained road from St. John, N. B., on the Atlantic coast to Vancouver on the Pacific coast, it stands out as one of the best examples in the world of a successful privately owned and operated railroad.

Financially it is a powerful corporation; this too in spite of rapidly rising operating costs and stationary revenues. Since July 1, 1913, the road has had relatively a very small funded debt and the government now has practically no definite financial interest in the Canadian Pacific other than an indirect interest figured in the value of land granted the road. Physically the road is in its normal state, which, however, is a standard to which it would take millions to elevate most of the roads now or to be under the Canadian National Railways Company. The position of the Canadian Pacific is too well known to require detailed exposition; the interest lies not in the Canadian Pacific's present status, but in the status of the Canadian National Railways and especially in what this peculiar Canadian railroad situation may develop into in the future.

The Present Situation Summed Up

Briefly, then, the present railway situation may be summarized as follows: The Dominion government owns and is operating as one system approximately 13,200 miles of line, namely, the Intercolonial, the National Transcontinental and the Canadian Northern, which represented up to and including 1916 a total public interest officially reported at $600,000,000. The Dominion government further controls the Grand Trunk Pacific with 2,809 miles of line and is negotiating for the control of the Grand Trunk with 3,567 miles more. Thus it may be assumed that there will be under the banner of the Canadian National Railways and operated as one system in the near future almost 20,000 miles of railways, in which will be included not only a transcontinental line but a system with a network of traffic-producing lines to feed the main lines.

In competition with this will be operated the Canadian Pacific with its records for service, its established traffic and its admitted financial strength. This situation of a government owned transcontinental railway, operating in competition with a privately owned transcontinental railway, each with its network of branches for the gathering of traffic and practically paralleling each other across the American continent will be without precedent in the history of steam transportation.

There is an interesting international complication in connection with this situation, which has not been without its influence upon the developments so far and will not be without influence upon developments in the future. The Canadian Northern, now owned by the government, has a mileage in the United States of 225 miles, of which 44 miles are proprietary and 181 are leased. Most of this mileage is in the Duluth, Winnipeg & Pacific, but this line is practically a separate corporation. The fact that this mileage is comparatively small has not and probably will not make a great difference in international relations, as the present arrangement of a separate corporation controlling this mileage in the United States will probably be continued by the Dominion government.

The Grand Trunk, however, controls approximately 1,868

miles of road in the United States. The controlling of this mileage by the Grand Trunk would, if the Grand Trunk were purchased by the Dominion government, create a rather complicated international situation, with the Dominion government practically taking orders from the Interstate Commerce Commission and being forced to abide by laws made by the United States government. To obviate this situation the Dominion government is negotiating for the perpetual lease of the Grand Trunk rather than its purchase.

The Canadian Pacific also has a mileage of 4,948 miles in the United States, of which 145 are proprietary, 32 leased, and 4,771 miles controlled. This mileage of the Canadian Pacific has no influence on the present situation, but it would have an influence if there should be a move toward nationalization of the Canadian Pacific itself.

Whatever may be said of the railway nationalization program in Canada the fact remains that some of these roads had fallen into financial difficulties, and that because of the Canadian policy of government assistance to railway construction, the government was faced with the necessity of paying ever-increasing deficits out of the public treasury. The government decided that, since it had to pay these deficits, it might as well be sure of its reward in the event that the roads whose deficits were paid should become successful in the future.

The developments which have led Canada to the present situation will be discussed in the next article in this series, after which the bearing the present situation may have on the future of Canada's railroads will be treated in a third article.

Wood Preservation Statistics for 1918

THE PROCEEDINGS of the American Wood Preservers' Associates for 1919 contains a statistical report on the wood preserving industry for 1918 and previous years which contains many data of interest to railroad men concerned with the treatment of timber used in railroad work. The statement below was prepared from material contained in this report.

There was a reduction of over 10 per cent in the cubic feet of wood subjected to treatment during 1918 as compared with the year previous. The cubic feet of wood treated in 1918 was 122,612,890 cu. ft. as compared with 137,338,586 cu. ft. in 1917. The number of railroad cross ties treated in 1918 was 30,609,209 or 2,850,261 less than the 33,459,470 reported for 1917. The number of piles treated in 1918 was 12,286,517 lin. ft. as compared with 12,695,567 lin. ft. in 1917. The quantity of wood blocks treated was 2,398,869 sq. yd. or 1,062,071 sq. yds. less than the quantity treated in 1917. In the case of construction timber which includes bridge timber, switch ties, etc., the quantity treated in 1918 was 122,587,120 ft. b. m. or a decrease of 15,000,000 ft. b. m. from the quantity reported in 1917.

This decrease in the amount of timber treated during the year has, of course, a direct relation to the amount of preservative used. In the case of coal tar and creosote, of which there was a distinct scarcity during the latter part of the war period, 47,787,998 gal. were used or a reduction of 22,610,611 gal. or 30 per cent as compared with the quantity reported for 1917. The consumption of water-gas tar, 2,822,652 gal., paving oil, 4,057,862 gal. and miscellaneous preservatives 28,013 gal., also represent decreases as compared to 1917. However, in the case of zinc chloride of which 31,101,111 lb. were used during 1918, there was an increase to the amount of 4,656,422 lb. as compared to 1917.

These statistics were gathered by the Forest Products Service from signed statements received from 101 treating plants out of a total of 107 plants of all kinds in active operation during 1918. There are 125 treating plants in the country at the present time but 16 of these were idle for one reason or another during the year.

The prices paid for preservative materials did not increase as much between 1917 and 1918 as in the period previous to 1917. The following table gives the range of prices for the years 1917 and 1918 compared:

Preservative	1917	1918
Coal tar creosote, per gal.	$0.065 to $0.230	$0.075 to $0.360
Water gas tar, per gal.	0.043 to 0.060	0.054 to 0.075
Zinc chloride, 50 per cent solution, per lb.	0.029 to 0.075	0.030 to 0.045
Zinc chloride, fused, per lb.	0.063 to 0.085	0.065 to 0.085

Of the total quantity of timber subjected to treatment during the year, measured in cubic feet, 75 per cent consisted of cross ties. Of the total number of ties treated,

CONSUMPTION OF WOOD PRESERVATIVES BY THE TREATING PLANTS OF THE UNITED STATES 1909 TO 1918

Year	Plants number	Creosote (a) gallons	Zinc chloride pounds	Other preservatives (b) gallons
1909	64	51,431,212	16,215,107	(c)
1910	71	63,266,271	16,802,532	2,333,707
1911	80	73,027,335	16,359,797	1,000,000
1912	84	83,666,490	20,751,711	3,072,462
1913	93	108,373,359	26,466,803	3,885,738
1914	94	79,334,606	27,212,259	9,429,444d 2,486,637
1915	102	80,859,442	33,269,604	3,205,563d 1,693,544
1916	117	90,404,749	26,746,577	5,675,095d 582,754
1917	115	75,541,737	26,444,689	7,579,819d 137,361
1918	107	52,776,386	31,101,111	4,057,862d 28,013

(a) Includes coal-tar creosote and water-gas tar.
(b) Includes refined coal-tar, corrosive sublimate, and carbolineum oils.
(c) Statistics not available.
(d) Paving oil.

30,609,209, the number that were hewed ties was 19,502,999 as compared to 11,106,210 sawed. Of the total number 38 per cent or 11,714,728 were oak ties, 33 per cent or 10,216,-064 were yellow pine ties and 12 per cent or 3,855,318 were Douglas fir. Four million more ties were treated with creosote than with zinc chloride, but with the scarcity of creosote in 1918 larger use was made of zinc chloride, with the result that during the year covered by the report, 17,055,-382 ties were treated with that material as compared with 11,546,049 treated with creosote. A total of 2,007,778 were treated with zinc creosote emulsion, while no ties were subjected to treatment with miscellaneous preservatives. During 1918 lighter injections of preservatives were given. In the case of creosote, water-gas tar and paving oil, the amount of preservative forced into the wood was 7.77 lb. per cu. ft. For zinc chloride it was 0.47 lb. per cu. ft., while with the zinc creosote emulsion the injection averaged 2.61 lb. of creosote and 0.49 lb. of zinc per cu. ft.

The piles subjected to preservative treatment during the year were principally Douglas fir and Southern yellow pine with a small amount of oak. In treating piles with creosote, water-gas tar and paving oil an average injection of 13.79 lb. per cu. ft. was obtained, while in the case of zinc chloride the average absorption was 0.46 lb. per cu. ft., and in the case of the emulsion it amounted to 2.5 lb. of creosote and 0.51 lb. of zinc per cu. ft.

A SCHEME has been prepared for converting the section of the New York subway between Forty-second street and Times Square into a moving platform. It is proposed to provide four moving platforms. The nearest will run at walking speed, the second at 6 miles per hour, the third at 9 miles per hour, and the furthest at 12 miles per hour. The last will be 5 ft. 10 in. wide and have seats, each to hold three persons. The other platforms will be 2 ft. wide.

Director General Reports on Railroad Wages

11.2 Per Cent More Employees Worked 3.9 Per Cent Less Hours—Unit Wage and Monthly Earning Compared

DIRECTOR GENERAL HINES on November 14 submitted to the president of the Senate the following letter and accompanying statements in response to the resolution of the Senate of August 20, calling for information as to the amount of railroad labor, its rates of pay and its average compensation in December, 1917, and in each month from January to July, 1919:

The amount of labor, measured by the time worked and paid for, for which the United States Railroad Administration has paid in months from January to July, 1919, as compared with the month of December, 1917, is listed in the table at the right.

In considering this comparison, it is important to bear in mind that the amount of labor paid for in December, 1917, was reduced because of the extreme cold weather, which resulted in the suspension of much outside work and because the competition of war industries, generally

		Total number of hours worked	Increase in percentage as compared with December, 1917
1917	December	434,252,656	.....
1919	January	440,699,731	1.5% increase
	February	375,204,721	13.6% decrease
	March	398,689,315	8.2% decrease
	April	393,578,428	9.4% decrease
	May	409,674,681	5.7% decrease
	June	396,385,011	8.7% decrease
	July	417,182,290	3.9% decrease

"*d*" and italics—decrease.

NOTE.—*d* indicates days worked.

paying higher wages, and the demands of military and naval service created a scarcity of labor which prevented the obtaining of all the labor which could be worked even in such cold weather. On the contrary, in January, 1919, the winter was exceptionally mild and made practically the prosecution of an unusual amount of outside work and the labor supply was relatively greater because of the cessation of war activities and because of higher wages.

The total number of employees in December, 1917, and in the months of 1919 from January to July is as follows:

		Increase in percentages as compared with December, 1917
1917—December	1,703,748	.....
1919—January	1,848,774	8.5%
February	1,840,197	8.0%
March	1,823,220	7.0%
April	1,830,093	7.4%
May	1,864,561	9.4%
June	1,863,741	9.4%
July	1,894,287	11.2%

It will be observed that while the amount of labor which the government has paid for, as measured by the hours paid for, has decreased, there has been an increase in the number of employees. This is due to the fact that the general establishment of the eight-hour basis has necessitated a larger number of employees to perform the same number of hours service. In December, 1917, prior to the adoption of this basis, many employees worked unduly long hours. This is brought out by the attached comparison between hours worked per employee, by classes, in December, 1917, and July, 1919.

A comparison as to the increase in the average compensation of employees in December, 1917, as compared with conditions established up to July, 1919, is given below:

	July, 1919	December, 1917
Number of employees	1,894,287	1,703,748
Days worked	6,122,435	5,819,486
Hours worked	368,202,810	387,696,788
Total compensation	$226,140,935	$153,039,988
Average compensation per day for employees reported on a daily basis	4.93	3.52
Average compensation per hour for employees reported on an hourly basis	.532	.342

Per cent of increase for July, 1919, over December and calender year 1917, 35.3 per cent.

Number of Days or Hours Worked by Employees

It is only fair to point out that this showing does not completely reflect the condition as it exists at this date, because in order to equalize the shop crafts with what has been done for other classes of railroad employees, it was found necessary in August, 1919, to make increases in their wages effective May 1, 1919. These, however, could not be included in August or the preceding months affected, but it is believed that if they could have been included in the accounts for July, 1919, the average percentage of increase in the unit of compensation for all railroad employees for the month of July, 1919, as compared with the month of December, 1917, would have been 56 per cent instead of 53 per cent.

It is important to point out, however, that the individual railroad employee did not get in the month of July, 1919, an actual increase in his earnings equal to the increase above indicated in his rate of pay. This is due chiefly to the introduction of the eight-hour day, as a result of which the employee did not on an average work as many hours in July, 1919, as he did in December, 1917. This is emphasized by the attached statement, above referred to, showing by classes of employees the average hours per employee worked in December, 1917, and in July, 1919.

On the other hand, a comparison with December, 1917, is not conclusive, because in that month employees were working a great deal more overtime than they were working on an average during the year 1917, and also many employees had received increases in the latter part of the year 1917, which were not enjoyed throughout the year.

In order to bring out these comparisons (and taking into consideration, as far as it can be done at present upon an estimate, the readjustments recently made to the shop crafts —which were retroactive to May 1, 1919), a comparison of average monthly compensation is as follows:

	July, 1919	December, 1917	Calendar year 1917
Average monthly compensation per employee for all employees, including an estimate of the effect of the increases recently granted to the shopmen	$121.50	$89.83	$83.64
Per cent of increase for July, 1919, over December and calendar year 1917	.....	35.3%	45.3%

The figures as they actually appear in the accounts, with-

out taking into consideration the readjustments with the shop crafts, are as follows:

	July, 1919	December, 1917	Calendar year 1917
Average monthly compensation per employee for all employees	$119.38	$89.83	$83.64
Per cent of increase for July, 1919, over December and calendar year 1917	.....	32.9%	42.7%

While the above comparisons and those in the attached statements are made for the periods specified in the Senate resolution, it is important to remark that the view is generally held both by railroad officers and by employees that the wage statistics of the past are not entirely reliable. This is due to the fact that the subject of wage statistics is a matter of more recent development in railroad accounting than other sorts of statistics which have been compiled for a longer period and with greater care. For example, the month of December, 1917, was the first month for which the compilation of wage statistics was required, all former requirements of the Interstate Commerce Commission having been based upon annual requirements. There has been a gradual improvement in the accuracy with which these reports have been made and it is believed that the most recent reports are substantially more accurate than the reports for December, 1917, or for the calendar year 1917, with which comparisons are here attempted.

The Senate resolution calls for the information stated separately as to different classes of railroad employees and statements as below inumerated are attached hereto. It is very important, however, to call attention to the fact that the comparisons between the average compensation for individual classes of employees in 1919 with the single month of December, 1917, or, indeed, with the entire year of 1917, is misleading. To a considerable extent same classes of employees had, prior to December, 1917, obtained reductions in hours (which resulted in their average compensation per hour being substantially increased) or increases in rates of pay, or both, whereas other classes of employees secured corresponding treatment only after December, 1917, so that the disparity in the rates of increase of pay for the different classes of employees is not nearly so great as this

restricted comparison suggests. The records do not indicate the amount of "punitive" overtime, i.e., for which "time and a half" or more was paid, but it is probably true that in December, 1917, numerous classes of employees were working punitive overtime to a larger extent than in July, 1919, and consequently, the increase in rates of pay for these particular classes of employees has been somewhat more than this restricted comparison would indicate. There have also been numerous reclassifications of employees which materially affect the comparisons mentioned.

The statements submitted with the report, which were compiled by the Operating Statistic Section, are as follows:

Schedule 1. Statement for Class I railroads in federal operation showing the number of employees for the months of December, 1917; January, 1919; February, 1919; March, 1919; April, 1919; May, 1919; June, 1919; July 1919.

Schedule 2. Statement for Class I railroads in federal operation showing the total compensation of employees for the same periods covered by Schedule 1.

Schedule 3. Statement for Class I railroads in federal operation showing the number of days of employees reported on a daily basis and the number of hours of employees

68	All other employees	2.94	1.99	...	...	....	..	48
69	Totals	4.93	3.52	...	.532	.342	..	53

Averages per day and per hour shown opposite class 69, "Totals," are for those classes only whose time worked is reported by days and by hours, respectively.

This report is compiled according to the classification prescribed by the Interstate Commerce Commission in accordance with the Act to regulate commerce, which classification has been the prescribed form since July 1, 1915.

The Interstate Commerce Commission classification sub-divides Items 1 and 2, General Officers, and Items 3 and 4, Division Officers, as between those receiving over and under $3,000 per annum, and sub-divides Items 5 and 6, Clerks, as between those receiving over and under $900 per annum. As the sub-division of these classes on such a basis is purely arbitrary and has no relation to the class of work performed, the sub-divisions are omitted from these reports.

The classification of employees prescribed by the Interstate Commerce Commission and used in the reports does not correspond with the classification of employees used in the wage orders of the Railroad Administration, with the result that employees in a given class (of wage orders) receiving either higher or lower wages may be included with the employees of another class (of the Interstate Commerce Commission classification).

Generally speaking, the averages of a single month present such a restricted view that such figures should be used with the greatest caution.

Speaking specifically, some of the conditions which exemplify this (and it is obviously an exceedingly difficult thing to give in detail all the conditions which would affect the situation) are as follows:

A comparison between the rates of pay in 1919 with the single month of December, 1917, is likely to be misleading because to a considerable extent some classes of employees had, prior to December, 1917, obtained reductions in hours (which resulted in their average compensation per hour being substantially increased) or increases in rates of pay, or both, whereas other classes of employees secured corresponding treatment only after December, 1917, so that the disparity in the rates of increase of pay for the different classes of employees is not nearly so great as this restricted comparison suggests. The records do not indicate separately the amount of punitive overtime, but it is probably true that in December, 1917, numerous classes of employees were working punitive overtime to a larger extent than in July, 1919, and consequently, the increase in rates of pay for those particular classes of employees has been somewhat more than this restricted comparison would indicate.

NOTE.—Italic figures indicate estimate of increase to shopmen in September, 1919, retroactive to May 1, 1919.

d—and *italics*—decrease.

reported on an hourly basis for the same periods covered by Schedule 1.

Schedule 4. Statement for Class I railroads in federal operation showing the average daily compensation for employees reported on a daily basis and the average hourly compensation of employees reported on an hourly basis for the same periods covered by Schedule 1.

Schedule 5. Statement for Class I railroads in federal operation showing the number of employees; number of days worked for employees reported on a daily basis; number of hours worked for employees reported on an hourly basis; total compensation; average compensation per day for employees reported on a daily basis; average compensation per hour for employees reported on an hourly basis for the average for the months of May, June and July, 1919, and for the month of December, 1917, and showing the percentage of increase in the hourly or daily rates comparing the average for the months of May, June and July, 1919, with December, 1917.

Schedule 6. Statement for Class I railroads in federal operation showing the number of employees for the average of the months of May, June and July, 1919; the average monthly compensation per employee for the average for the months of May, June and July, 1919; for December, 1917; and for the calendar year 1917, together with the percentage of increase for the average of May, June and July, 1919, over the month of December, 1917, and the monthly average for the calendar year 1917.

Schedule 7. Statement for Class I railroads showing comparison by classes of employees and hours worked per employee in December, 1917, and in July, 1919.

In addition there were submitted copies of all orders making advances in wages, and of all schedules explanatory thereof, as requested in the resolution.

In connection with the schedules, attention was called to the fact that inasmuch as certain employees are required to be reported only in days worked, it is not possible to show a precise comparison of the hours worked in each month. In order to present an approximately correct comparison the statement of the number of hours worked was made on the assumption of eight hours per day for the employees whose time is reported on a daily basis (amounting to between 10 and 11 per cent of the total hours of all employees). It was also noted that the classification of employees prescribed by the Interstate Commerce Commission and used in the reports does not correspond with the classification used in wage orders of the Railroad Administration. The number of employees as used in the tables refers to the count as of the 16th day of the month except when that day falls on a Sunday or a holiday, in which case the count is made as of the last preceding business day. It is stated that, generally speaking, the averages of a single month present such a restricted view that such figures should be used with the greatest caution.

The total compensation as shown by Schedule 2 was as follows: December, 1917, $153,039,988; January, 1919, $230,800,589; February, 1919, $204,059,816; March, 1919, $211,228,547; April, 1919, $207,120,939; May, 1919, $218,606,040; June, 1919, $215,271,437; July, 1919, $226,140,935. Schedules Nos. 3, 5 and 6 (with which is combined No. 7), are reproduced herewith.

British Export Credits.—The Board of Trade has announced that the British Government is prepared, through the Export Credits Departments, to consider applications for advances up to 80 per cent of the cost of the goods, plus freight and insurance, for goods sold to Finland, the Baltic provinces (Latvia, Esthonia, and Lithuania), Poland, Czecho-Slovakia, Jugo-Slavia and the areas in Russia to which the scheme for insurance against abnormal commercial risks applies.

Orders of the Regional Directors

EXPORT BILLS OF LADING.—Supplement 1 to Circular 286 of the Central Western regional director states revise paragraph 1 in regard to what officers may issue through export bills of lading when traffic originates with Class 1 Federal controlled roads, the bills will be issued only by the initial road-haul carrier. Other Federal controlled roads, or non-Federal controlled roads may, if in a position to do so, issue through bills of lading, or the bills may be issued by their immediate Class 1 connections; or by port terminal lines through their offices at ports of exit. Through export bills of lading will be issued only by the general freight departments or designated general or commercial agents, district freight agents, export agents or division freight agents, unless other arrangements are specifically authorized.

Forest and Field Fires.—The Northwestern regional director, file 9-1-31, directs that rules for the prevention of forest and field fires, contained in the report of the committee on Conservation of Natural Resources, Section 11—Engineering, American Railroad Association, be put in effect on all railroads.

Demurrage on Coal.—The Northwestern regional director, file 35-1-88, quoting Edward Chambers, director of the Division of Traffic, directs that where coal has been held by the Railroad Administration under the order of the Fuel Administrator and has subsequently been released to a consignee, or to the original consignee, the demurrage rules become applicable from the time of such release.

American Red Cross.—The Northwestern regional director, file 33-1-17, urges that every officer and employee be given an opportunity to take a Red Cross membership for the coming year in view of the great humanitarian work the American Red Cross has performed.

Issuance of Through Bills of Lading.—Supplement 2 to Circular 252 of the Southwestern regional director states that on export forest products agents at shipping points will issue a domestic bill of lading and waybill to the point of trans-shipment, with the following notation: "Inland charges to be collected at port of exit." The terminal road at port of exit will issue through export bill of lading for such shipments in exchange for the initial road's domestic bill of lading, but only after collection of the inland charges.

Transportation of Bananas.—The Southwestern regional director, in Circular 253, states that messengers accompanying bananas in transit have no authority to sell or remove any of the freight from any car. Violations of this rule will be prosecuted. It does not conflict with tariff provisions for stopping in transit to partly unload, as stipulated on the way bill.

Interchange Records.—Supplement 1 to Circular 250 of the Southwestern regional director amends paragraph 5 of the original circular to require that the original copy of the monthly statement should be sent to J. W. Smith, manager, Car Hire Bureau, Buffalo, N. Y., instead of to W. G. Kendall, manager, Car Service Section, Washington, D. C.

Permit System for Grain Shipments.—Supplement 16 to Circular 270 of the Central Western regional director states that effective November 10, a blanket basis of permits was substituted for individual permits for shipments of grain from country stations to interior primary markets. Individual permits will be required for shipments between primary markets.

Merchandise.—Car Conservation.—Circular 256 of the Southwestern regional director states that statistics show that practically one half of all the box cars of the entire country are continuously used in handling L. C. L. traffic and that it is of the greatest importance, therefore, that every effort be made to increase the supply of cars for use in handling carload traffic by increasing the number of through merchandise cars.

President Will Address Congress on Railroads

Message on December 2 Related to Domestic Problems and Largely to the Labor Question

WASHINGTON, D. C.

SOME SURPRISE WAS CAUSED by the President's failure to include a discussion of the railroad question in his message to Congress at the beginning of the regular session on December 2, because it was hoped he would make a more definite announcement regarding the return of the railroads than his rather casual statement of last May that they would be relinquished at the end of the year. He said, however, that "in the matter of the railroads and the readjustment of their affairs growing out of federal control," he would address the Congress at a later date. The President will defer this message until after receiving a report from Director General Hines who was to confer with Chairman Cummins and Esch of the Congressional Committees on Interstate Commerce. Mr. Hines talked with Senator Cummins on Wednesday.

While the Railroad Administration has for some time been making active preparations for the return of the roads and plans for the organization it will retain to wind up its affairs, and has even allowed some of its officers who are to return to their former positions an opportunity to devote some time to their own preparations for the return to company management, the officers of the Railroad Administration in referring to the prospective relinquishment have usually been careful to make a reservation for "contingencies" and a plain statement from the President would be accepted with considerable relief.

The message was devoted entirely to domestic problems and repeated recommendations made at the last session, including those urging action to help reduce the cost of living. A large part of the message was devoted to the labor problem, which is of acute interest to the railroads at this time, but the President did not apply his remarks specifically. He particularly emphasized the need for the establishment of some acceptable tribunal for adjusting the differences between capital and labor, but while his statements were in sympathy with many of the principles urged by the labor organizations they can hardly find much support for their opposition to proposed legislation for compulsory arbitration in his statement that "the right of individuals to strike is inviolate and ought not to be interfered with by any process of government." No one is proposing to interfere with "individual" strikes and moreover, the President followed this statement immediately with the declaration that "there is a predominant right and that is the right of the government to protect all of its people and to assert its power and majesty against the challenge of any class."

The president's statement regarding the labor problem was in part as follows:

"No one who has observed the march of events in the last year can fail to note the absolute need of a definite programme to bring about an improvement in the conditions of labor. There can be no settled conditions leading to increased production and a reduction in the cost of living if labor and capital are to be antagonists instead of partners. The failure of other nations to consider this matter in a vigorous way has produced bitterness and jealousies and antagonisms, the food of radicalism. The only way to keep men from agitating against grievances is to remove the grievances. An unwillingness even to discuss these matters produces only dissatisfaction and gives comfort to the extreme elements in our country which endeavor to stir up disturbances in order to provoke governments to embark upon a course of retaliation and repression. The seed of revolution is repression. The remedy for these things must not be negative in character. It must be constructive. It must comprehend the general interest. The real antidote for the unrest which manifests itself is not suppression, but a deep consideration of the wrongs that beset our national life and the application of a remedy.

"Congress has already shown its willingness to deal with these industrial wrongs by establishing the eight-hour day as the standard in every field of labor. It has sought to find a way to prevent child labor. It has served the whole country by leading the way in developing the means of preserving and safeguarding lives and health in dangerous industries. It must now help in the difficult task of finding a method that will bring about a genuine democratization of industry, based upon the full recognition of the right of those who work, in whatever rank, to participate in some organic way in every decision which directly affects their welfare.

"The great unrest throughout the world, out of which has emerged a demand for an immediate consideration of the difficulties between capital and labor, bids us put our own house in order. Frankly, there can be no permanent and lasting settlements between capital and labor which do not recognize the fundamental concepts for which labor has been struggling through the years. The whole world gave its recognition and endorsement to these fundamental purposes in the League of Nations. It is, therefore, the task of the statesmen of this new day of change and readjustment to recognize world conditions and to seek to bring about, through legislation, conditions that will mean the ending of age-long antagonisms between capital and labor and that will hopefully lead to the building up of a comradeship which will result not only in greater contentment among the mass of workmen but also bring about a greater production and a greater prosperity to business itself.

"To analyze the particulars in the demands of labor is to admit the justice of their complaint in many matters that lie at their basis. The workman demands an adequate wage, sufficient to permit him to live in comfort, unhampered by the fear of poverty and want in his old age. He demands the right to live and the right to work amidst sanitary surroundings, both in home and in workshop, surroundings that develop and do not retard his own health and well-being; and the right to provide for his children's wants in the matter of health and education. In other words, it is his desire to make the conditions of his life and the lives of those dear to him tolerable and easy to bear.

"The establishment of the principles regarding labor laid down in the covenant of the League of Nations offers us the way to industrial peace and conciliation. No other road lies open to us. Not to pursue this one is longer to invite enmities, bitterness, and antagonisms which in the end only lead to industrial and social disaster. The unwilling workman is not a profitable servant. An employee whose industrial life is hedged about by hard and unjust conditions, which he did not create and over which he has no control, lacks that fine spirit of enthusiasm and volunteer effort which are the necessary ingredients of a great producing entity.

"Governments must recognize the right of men collectively to bargain for humane objects that have at their base the mutual protection and welfare of those engaged in all industries. Labor must not be longer treated as a commodity. It

must be regarded as the activity of human beings, possessed of deep yearnings and desires. The business man gives his best thought to the repair and replenishment of his machinery, so that its usefulness will not be impaired and its power to produce may always be at its height and kept in full vigor and motion. No less regard ought to be paid to the human machine, which after all, propels the machinery of the world and is the great dynamic force that lies back of all industry and progress. Return to the old standards of wage and industry in employment are unthinkable. The terrible tragedy of war which has just ended and which has brought the world to the verge of chaos and disaster would be in vain if there should ensue a return to the conditions of the past. The right of labor to live in peace and comfort must be recognized by governments and America should be the first to lay the foundation stones upon which industrial peace shall be built.

"Labor not only is entitled to an adequate wage, but capital should receive a reasonable return upon its investment and is entitled to protection at the hands of the government in every emergency. No government worthy of the name can "play" these elements against each other, for there is a mutuality of interest between them which the government must seek to express and to safeguard at all cost.

"The right of individuals to strike is inviolate and ought not to be interferred with by any process of government, but there is a predominant right and that is the right of the government to protect all of its people and to assert its power and majesty against the challenge of any class. The government, when it asserts that right, seeks not to antagonize a class but simply to defend the right of the whole people as against the irreparable harm and injury that might be done by the attempt by any class to usurp a power that only government itself has a right to exercise as a protection to all.

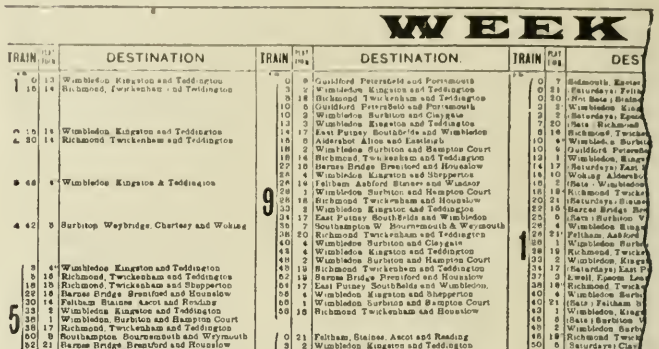
"In the matter of international disputes which have led to war, statesmen have sought to set up as a remedy arbitration for war. Does this not point the way for the settlement of industrial disputes, by the establishment of a tribunal, fair and just alike to all, which will settle industrial disputes which in the past have led to war and disaster?

"There are those in this country who threaten direct action to force their will upon a majority. Russia today, with its blood and terror, is a painful object lesson of the power of minorities. It makes little difference what minority it is; whether capital or labor, or any other class; no sort of privilege will ever be permitted to dominate this country. We are a partnership or nothing that is worth while. We are a democracy, where the majority are the masters, or all the hopes and purposes of the men who founded this government have been defeated and forgotten. In America there is but one way by which great reforms can be accomplished and the relief sought by classes obtained, and that is through the orderly processes of representative government. Those who would propose any other method of reform are enemies of this country. The instrument of all reform in America is the ballot. The road to economic and social reform in America is the straight road of justice to all classes. Men have but to follow this road to realize the full fruition of their objects and purposes. Let those beware who would take the shorter road of disorder and revolution. The right road is the road of justice and orderly process."

FELTON ENGINEERING PRIZE.—Samuel M. Felton, president of the Chicago Great Western Railroad, has established a prize at the Pennsylvania Military College, to be awarded annually to the student who has led his class in the study of engineering subjects for the junior and senior years. The gift will be known as the Felton engineering prize. Mr. Felton was a student in the college from 1868 to 1870.

Departure Poster, Waterloo Station

AT Waterloo station, London, on the London & Southwestern Railway the large bulletin, showing the numbers of the platforms from which passenger trains make their departure, is now printed in a novel style, illustrated in the engraving. The hour numeral being shown in bold figures greatly facilitates the location of the section of the poster which a passenger may desire to consult.



The part here shown includes about one-fourth of that section of the poster devoted to week-day trains.

The list of trains departing between one o'clock and two o'clock in the afternoon is abnormally long because of the inclusion of a number of trains which run only on Saturdays. The list of those between five and six o'clock in the afternoon shows 40 trains, departing from 16 platforms.

Scenes on the Government's Alaska Railroad. Mile 24, Matanuska Branch

Burleson Finds Railway Mail Service "Perfect"

WASHINGTON, D. C.

THE ANNUAL REPORTS of government departments which come out in great volume about December 1 are ordinarily rather dry reading, but occasionally they contain some news. The report of the postmaster general contains an example which will be of great interest to all who have had much experience with the mails during the past year or two. In connection with its discussion of the railway mail pay question and the inauguration of the space basis plan of compensating the railroads which was put in operation on November 1, 1916, the report says:

"So carefully were plans of the post office department worked out and so flexible was the new system of space that during the trying war period, notwithstanding it was subjected to the severest test, when the freight and express agencies broke down and laid embargoes on shipments practically throughout that period, the post office department was the only transportation medium that functioned unrestricted and transported not only the great normal parcel post load but an immense additional parcel post load thrown upon the department through the internal breakdown of these other agencies. This tremendous task was performed without interruption and with dependability and despatch except in so far as it was handicapped by the very irregular train schedules and the reduction of train speed and withdrawal of trains by the railroads as necessitated by the exigencies of war."

The report does not attempt to explain why the freight and express agencies, which were also under government control, broke down in spite of the increases in freight and express rates, but the inference is that the reason why they did not also perform a perfect service was that they were not under the management of the post office department which, the report says, was able to get its railroad transportation, for the fiscal year ending June 30, 1919, for $54,563,534.49 with a largely increased volume of mail, whereas the cost of transporting the mails by railroads for the fiscal year ending June 30, 1916, was $62,176,943.05.

"Notwithstanding the disruption of railroad schedules," the report says, "the railway mail service has functioned perfectly. The proof of this is that there was less unworked mail in the railway mail service during the year than in any previous year of which there is a record and a comprehensive investigation has shown that no serious delay to mail of any character occurred in the railway mail service during the year."

Since the close of the war the department notes a gradual improvement in the operation of railroad train schedules. A number of the trains which were withdrawn or discontinued during the war period have been restored and the schedules of others have been shortened and otherwise modified so as to furnish better connections for the transmission of mails. The passenger service, however, it says, is not as efficient as it was prior to the war and there is still an insistent demand on the part of business interests throughout the country for adequate service. The report adds that the "railroad companies" (*sic*) are now more responsive to the demands of the business interests and the post office department and it is hoped that shorter schedules will be put into effect and additional trains provided as rapidly as circumstances will permit. It should be added, it says, that the postal transportation service is limited to the facilities afforded by passenger train service, over which the post office department has no control.

The space basis plan is described as "a scientific and business-like method of railway mail pay" that "enables the department to pay for what it receives and the railroads to receive what they earn, which was not possible under the old system of average weights taken once in four years. As a result of the advantages of the new system the department was enabled during the war period to remit to the railway companies for other transportation work 72,906,490 car miles per annum no longer needed for mail transportation. This, reduced to a 60-foot car basis, means 15 trains of 10 cars each running every day between Chicago and New York." The report does not say that these 15 trains were actually run nor does it explain how the mail cars which it had previously required the railroads to buy were made useful for the transportation either of troops, coal or other war materials. It says that this great saving was accomplished through scientific loading of cars, rational rearrangement of letter distribution on cars, and the elimination of despatches of mail at periods when such despatches by reason of trains not making direct connections failed to expedite the delivery of mail.

The scope of the authorized service on space and weight basis routes combined, as of June 30, 1919, is stated as follows: Number of routes, 2,897; length of routes, 259,580.7 miles; annual travel (including emergency service), 519,674,375.69 miles; annual rate of expenditure, $51,086,238.68; average rate of cost per mile of route, $196.80; average rate of cost per mile of travel, 9.83 cents.

The annual rate of regular authorizations on space basis routes, which on June 30, 1918, was $52,022,070.43 had on June 30, 1919, been reduced to $49,918,031.16. The lowest annual rate of authorized service since the inauguration of the space basis system — $47,706,842.46 — was reached during the December quarter and, the report says, "it is obvious, therefore, that transportation requirements have been gaged and adjusted to the needs of the service."

In the investigation before the Interstate Commerce Commission as to the proper basis for paying railroads for carrying the mails and as to the fair and reasonable rates for such service, extensive hearings were held in Washington on November 4, 1918, January 7 and from April 8 to May 6, 1919, after which arguments were had before the commission. The report says the department believes that the space basis plan has been thoroughly justified and that its contentions with reference to rates have been sustained. The decision and order of the commission is looked for at an early date.

In describing the method of shipping blue tag mail "by fast freight," the report says that since the cessation of the war activities the railroads have been able to maintain their schedule of fast freight movements with regularity and but few complaints of delays have been received which were attributable to the movement of this matter by freight. Twelve requests were received from publishers for exemption of their publications from the blue tag freight movement, seven of which were approved by the department. The total shipments of periodicals (blue tag matter) by fast freight during the fiscal year consisted of 2,684 carloads at a cost of $866,639.63. This represents a saving to the department as compared with the cost of carrying it in the regular mails of approximately $498,857.65.

In the more detailed part of the report it is admitted that "in common with practically all other activities of a kindred nature, both governmental and private, employing large quantities of labor and dependent upon railroad transportation for success during the war, the postal service unavoidably deteriorated in some localities to a certain extent from the high standard previously maintained. This was a natural and inevitable effect of the war, due to conditions over which the department had no control, including impaired train service, loss of highly trained employees, inability to obtain competent clerical assistance to fill vacancies and delay in the receipt of equipment and supplies. Coupled therewith, in addition to handling a greatly increased volume of postal

business and the provision of adequate postal facilities for the great army camps established throughout the country, the department, owing to its extensive organization, was called upon to perform for other branches of the government innumerable duties wholly foreign to the postal service, but which were vital to the successful prosecution of the war. Notwithstanding these handicaps the postal service was continued throughout the critical period without curtailment or restriction of any character."

Railroad Bill Taken Up in Senate

CONSIDERATION of the Cummins bill for the reorganization of the railroads and for their regulation after their return to private management was begun in the Senate on Tuesday as the unfinished business before the Senate, which gives it the right of way over most other matters.

Chairman Cummins of the committee on interstate commerce, spoke for two afternoons explaining the provisions of the bill and urging the necessity for prompt action upon it in an effort to get it passed before the end of the year. He was frequently interrupted by Senators, although scarcely more than a dozen remained in the chamber, and apparently had considerable difficulty in getting them to understand his explanations of the complicated financial transactions and accounts between the railroad companies and the Railroad Administration. He said that Congress would have to appropriate at least $625,000,000 to settle the accounts of the Railroad Administration and possibly $330,000,000 more if it became necessary to return to the railroads the amount of working capital that was taken over at the beginning of federal control. He also expressed the opinion that 25 years of litigation would be required to settle the claims of the railroads against the government and the government's counter claims. He said the government's actual loss from the operation of the railroads for two years was estimated by the Railroad Administration at $646,000,000, but he would not predict that the amount would be greater after taking into consideration the deferred maintenance. Some roads, he said, would be returned in better condition than when they were taken over, while many would be in worse condition.

Senator Cummins recently filed with the Senate a supplemental report giving estimates and an explanation of the accounts between the government and the railroads by Swagar Sherley, director of the Division of Finance of the Railroad Administration, which included the following statement, giving a comparison of the amounts to be funded and appropriated under the provisions of the Cummins bill, the Esch bill as it was introduced and the plan proposed by the Division of Finance, which was later adopted by the House in an amendment to the Esch bill:

COMPARISON OF AMOUNTS TO BE FUNDED

[(1) Under the provisions of Senate Bill No. 3288. (2) Under the provisions of H. R. 10453 (as introduced). (3) Under the provisions of the section originally submitted by the Division of Finance of the Railroad Administration permitting offsets in accordance with the provisions of the standard contract.]

Class I roads	Senate Bill No. 3288	H. R. 10453	Standard contract
1. Total cost of additions and betterments (excluding allocated equipment	$775,551,000	$775,551,000	775,551,000
2. Amount that may be deducted therefrom account compensation or open account due company.....	223,823,000	133,911,000	415,016,000
3. Net amount of additions and betterments (excluding allocated equipment) to be funded.....	551,728,000	641,640,000	260,535,000
4. Open account due Government, to be evidenced by demand notes	158,884,000	16,876,000	105,646,000
5. Long-term loans (including N. Y., N. H. & H. R. R. and Boston & Maine...	68,375,000	68,375,000	68,375,000
OTHER PROPERTIES			
6. Additions and betterments and open account due Government to be funded	53,000,000	53,000,000	53,000,000
7. Total amount of funded and demand indebtedness (exclusive of allocated equipment)	831,987,000	779,891,000	587,556,000
OTHER REQUIREMENTS			
8. Allocated equipment not covered by equipment trust.	172,345,000	172,345,000	172,345,000
9. Additions and betterments—inland waterways	14,342,000	14,342,000	14,342,000
10. Operating loss 24 months—all properties (note 2).	646,777,000	646,777,000	646,777,000
11. Total requirements.....	1,665,451,000	1,613,355,000	1,421,020,000
12. Appropriations already made	1,250,000,000	1,250,000,000	1,250,000,000
13. Appropriations now required (note 1)	415,451,000	363,355,000	171,000,000

Note 1.—The foregoing estimate is predicated upon the conversion into cash of all assets of the Railroad Administration, other than those shown above as being carried. In point of fact, in dealing with figures as large as these and matters as complicated, it will necessarily follow that there will be a considerable amount of assets of the government subsequently convertible into cash that can not be immediately realized, or even realized contemporaneously with the need of paying out an account of liabilities of the government.

It is safe to estimate that this amount will be at least $200,000,000, so that, practically, to carry out the requirements under the Senate or House bill, or the substitute proposal in accordance with the existing standard contract, the Congress should appropriate a sum at least $200,000,000 in excess of that stated in item 13.

Note 2.—The operating loss shown above represents an estimate for the two years of federal control of the amount by which the net operating income of the railroads fell short of the standard return, estimated amount of interest on accounts due from the government to the railroad companies, and on accounts due from the railroad companies to the government; and is predicated on the present basis of earnings, the latest available figures on an actual basis being for the month of August, 1919, so that for the last four months the figures are necessarily speculative.

The operating loss also includes an estimate of $95,000,000 on account of adjustment of materials and supplies, under provisions of the standard contract. It should be added that beyond these things there are various matters that will reach adjustment, and a status sufficient to enable them to be stated in money only after presentation and determination of claims, respectively, by the government and the railroads, touching many items incident to federal control; so that in particular the items of operating loss must be considered as subject to considerable change in amount because of the subsequent bringing into it of debits and credits which can not now even be approximated.

In describing the proposed plan for the reorganization of the railroads in order to group them into systems of approximately equal earning power, Senator Cummins said he looked forward with very little optimism to private ownership and operation of the railroads but that he proposed to do his best to create conditions under which it could be successful. If the railroads cannot be returned under conditions which will result in an improvement in the system of railroad regulation which will give them a chance for a success, then he would feel obliged to favor government ownership although he was opposed to government ownership because he believed it would result in less efficient operation than private management. But without the provisions of the bill providing for the reorganization of the railroads, he said, it would not be advisable to pass the bill at all because it would be impossible for private management to succeed and the experiment would end in utter collapse.

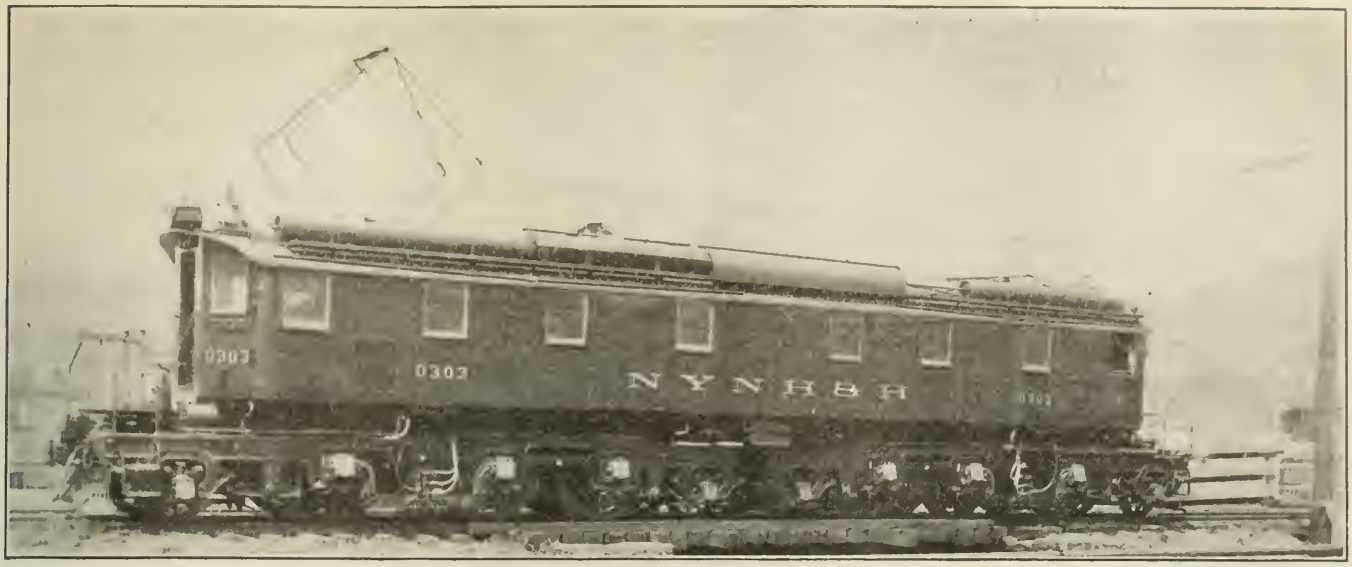
In the House Representative Sims reintroduced his bill providing for an extension of federal control until December 31, 1921, with an added provision to prevent increases in rates being put into effect without consent of Congress.

Chairman Good of the House committee on appropriations is reported to have announced that a bill to provide an appropriation for settling the accounts of the Railroad Administration will probably be considered soon. He estimated the amount at possibly $400,000,000 but expected to confer with Director Sherley of the Division of Finance on the subject.

Congress is being flooded with petitions and resolutions of various lodges of railroad labor organizations protesting against the provisions of the Cummins bill and urging a two-year extension of the present federal control.

Director General Hines conferred with Senator Cummins on railroad legislation on Wednesday.

LUMBER IMPORTS.—During the first eight months of 1919 an aggregate of 760,554,000 board feet of lumber, or an average of about 95,000,000 feet a month, was imported into the United States, duty free, from various foreign countries. Nearly all of this came from British Columbia.



One of the 180-ton Baldwin-Westinghouse Locomotives Built for the New York, New Haven & Hartford

The Use of Electrical Energy on the Railroads

Application of Electricity to the Operation of Railroad Equipment Is Being Greatly Extended

THE MANY APPLICATIONS of electrical machinery to railroad service were treated in five papers presented at the fifteenth annual electrical night of the New York Railroad Club. The program was a departure from the usual one in which electric traction has been the only topic under discussion. The papers presented touched on the use of electricity in all its ramifications.

There were 625 members and visitors present which was the largest attendance on record at any previous meeting except for a patriotic rally last year at which the attendance was about 750. Six papers were prepared, five of which were read. The subject of Electric Shop Power and Light was to have been covered by J. L. Minick, foreman, electrical department, Pennsylvania Lines East, but he was unable to attend the meeting and his paper, prepared in the form of notes, was therefore not transcribed. An abstract of the other five papers follows:

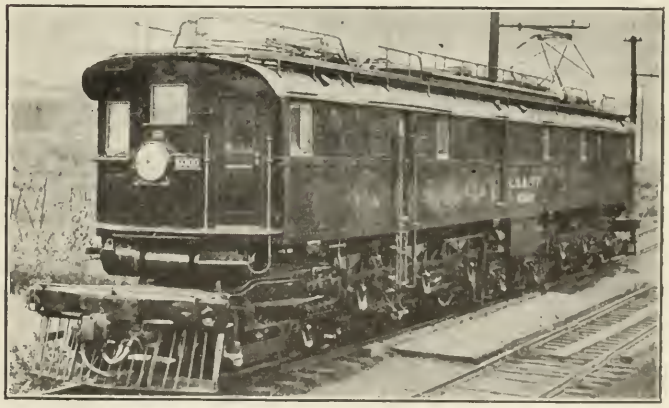
Electrification of Steam Railroads in 1919

By Edwin B. Katte

Chief Engineer Electric Traction, New York Central

First of importance comes the electrical extension of the Chicago, Milwaukee & St. Paul from Othello to Seattle, a distance of 127 miles over the Casacde range of mountains. This work is pratcically complete and is in partial operation, full service is delayed pending the delivery of the passenger locomotives. The system is 3,000 volt direct current with a double overhead working conductor or trolley, exactly the same as the existing and very successful 440 miles now in its third year of operation on the Rocky mountain and Missouri divisions.

The most interesting thing about this extension is two new types of passenger locomotives which are just ready for service. These locomotives are designed to operate a 950-ton train at 65 miles an hour on level track and to average 25 miles an hour over 18 miles of average 2.2 per cent grade and 20 miles of average 2 per cent grade. The Westinghouse Electric & Manufacturing Company will supply ten locomotives, each weighing 275 tons; the drive is through gears and quills by six twin motors of 700 h. p. each. The General Electric Company will supply five locomotives, each weighing 265 tons, and equipped with twelve bi-polar gearless motors of 270 h. p. each. One locomotive of each type has been completed and tested, and the balance of each order is well under way, so that soon after the new year, all 15 of



Baldwin-Westinghouse 275-ton Electric Locomotive. Ten Locomotives of this Type Will Be Used on the Rocky Mountain Electrified Division of the Chicago, Milwaukee & St. Paul

these locomotives will be in service. The table shows the more important and complete data.

	Westinghouse	Electric
Total weight	275 tons	265 tons
Weight on drivers	168 tons	220 tons
Number and horsepower of motors	12-350 H. P.	12-270 H. P.
Total H. P. one hour rating	4,200 H. P.	3,240 H. P.
Tractive effort, one hour rating	66,000 lb.	46,000 lb.

New Haven Passenger Locomotive

While describing passenger locomotives, I must mention the new electric locomotives of the New Haven which are

designed to haul 900-ton trains in express service between New Haven and the Pennsylvania Terminal, New York City, over the Hell Gate Bridge Connecting Railroad, operating either alternating current at 11,000 volt overhead trolley or direct current at 600 volts on the third rail. Each locomotive weighs 180 tons of which 115 tons are on the drivers. The motor equipment consists of six twin motors of 170 h. p. normal rating each. The drive is through gears and quills. The total one hour rating of the motors is 2,000 h. p. and at this rating, the tractive effort is 21,000 lb. The motor armatures are permanently connected in four groups of three in series. Several of these locomotives are now in successful operation.

Pennsylvania Freight Locomotive

A description of recent electric locomotives, be it ever so brief, would be incomplete without recalling that the engineers of the Pennsylvania and the Westinghouse Electric Company have developed and tested an electric freight locomotive weighing 250 tons for service over mountain grades. This locomotive, known as No. 3931, was tried out in June, 1917, and after the usual test track trials was put in regular freight service between Philadelphia and Paoli, where to date it has traveled about 5,000 miles. The electric equipment is designed to operate on 11,000 volts single-phase current, taken from an overhead trolley wire. At each end of the locomotive there are a pair of motors, each driving a jack shaft, the power being transmitted through springs and side rods to a set of three driving axles. The combined one hour rating of the motors is 4,800 h. p. and at this rating the tractive effort is 87,200 lb. The maximum speed is 20.6 miles per hour.

Electrification of the Melbourne Suburban System

Not only in this country have things been happening electrically on steam railroads during the past year, but also in other countries, notably Australia. The electrification of the metropolitan railway system of Melbourne was put in service last May.

In 1908, C. H. Merz, the distinguished English authority on electric railroading, first reported favorably on the electrification of the Melbourne suburban section of the Victorian Railway System. Proposals were received in 1912, based upon a single-phase 11,000 volt alternating current system, and other proposals upon the 1,500 volt direct current system. Under both methods the propulsion current was to be collected from an overhead catenary trolley supported by steel masts or bridges. It is reported that the single-phase scheme would cost 23 per cent more than the direct current, and it was estimated that the single-phase system would cost 21.7 per cent more in annual operation. Hence, the adoption of high voltage direct current. The delay in completing this work is attributed to war conditions.

The service is entirely suburban and the longest individual line extends a distance of 26 miles from the terminal. Trains running beyond the electric zone are drawn by steam locomotives. Multiple unit cars are used and they are of the compartment type with cross seats and wide side doors, following the usual English practice. The installation includes a large modern power station with two boiler rooms, set at right angles to the turbine room, much like the Fisk Street station of the Chicago Edison Company. The ultimate capacity of the turbine room is six 12,000 k. w. generators. This generating station is regarded as the nucleus of a scheme that will make available cheap electrical energy for future industrial development throughout the state of Victoria.

The electric power is transmitted at 20,000 volts. The transmission system is part underground cables and part aerial carried on the steel masts of the trolley system. There are 15 substations in the complete electrification scheme. Of these, seven are now in operation. The substations are in unit form and contain static transformers and rotary converters to change the transmission current from 20,000 volts, three-phases, 25 cycles, to the working current of 1,500 volts direct current on the trolley wire.

Electric Automechanical Freight Handling

By Zenas W. Carter

Secretary-Treasurer, The Material Handling Machinery Manufacture's Association

The railroads are to go back into private hands. The first problem executives and managing heads of all departments of railroading must face and work to solve is that of costs; both cost for materials and costs for manual service. The second problem is labor shortage; the third problem is lack of equipment; the fourth problem is condition of equipment; and last, but not least, is "attitude and productiveness of the entire personnel from the section hand to the directing chief."

Unfortunately, under government ownership and especially on account of the war re-action which is influencing men so strangely, there has been little serious attempt on the part of the operating and working forces to keep down costs. Further, man-power shortage is the natural result of the war. This same cause may be given as the reason for lack of railroad equipment and condition of equipment. Depreciation in productiveness is partly psychological and partly the result of the sudden increase in the distribution and rotation of money among the masses. Rotation of money tends to develop a sense of luxuriousness which directly results in a slacking of effort.

Knowing the problem and the factors of the problem is half the solution, however, and the real work for the railroad executive is the application of methods which will change the factors into a co-ordinated unit. It is possible therefore to visualize electric automechanical freight handling as a very important method which may be used to change the factors of high costs, labor shortage, lack of equipment, etc. We may even conceive that used thus, electricity may be the collodial to improve both the attitude of the individual toward his labor and to increase his productiveness. To visualize this it is only necessary to consider the changes electricity has already made in our daily life, and to make the application specific as it relates to the use of electricity in new ways in railroad progress, it is only necessary to check over the present activity at some few points. For instance, few men in this country, even in the railroad lists, are familiar with the fact that the British Government is right now considering very seriously the elimination of every one of the 74 freight yards and stations in the city of London.

The Gattie System

The idea is to combine the entire interchange of all freight both carload and l. c. l. into one immense central freight station and distributing point. This would be absolutely impossible without electricity as the all-powerful, infinitely flexible force with which to operate. When such an idea is even mentioned the average man simply must smile to himself and look to assure himself that the man who makes the statement is not a victim of shell shock. Nevertheless, this scheme, known as the "Gattie System," has received the consideration of the government and financial and business interests and although an unusual one it is not at all an impractical proposition.

Mr. Gattie has worked out every detail from planning an immense depressed area of 30 acres to be known as the "Crypt" to the detail of the floor section and stalls on each of the planned nine stories of a gigantic fifteen acre freight station. The "Crypt" will be used for all incoming trains

and in making up trains to travel over all lines radiating in and out of London.

Of course the use of gondola cars in England—much smaller cars than in America—has made his plan workable, and he is to utilize the flexibility of electricity throughout to operate 196 powerful overhead electric traveling cranes, supplemented by a system of conveyors. The entire plant being planned to handle heavy loads in bulk. The cranes will lift uniform containers bodily from the platform of a car on the London & Northwestern say, and take it over and place it on the platform of a car on the Great Eastern. This will eliminate the present need for that car to pass through dozens of switches and suffer from four to ten days delay in its transfer across London.

In the handling of l. c. l. freight the containers are lifted bodily and taken to one of the four distributing floors. All goods, as they term freight in England, will then be handled from these central distributing floors to every part of that tremendous station by electrically operated conveying systems, oscalators, elevators, chutes and electric trucks and trailers. Each lot goes from the central distributing floor directly to stalls where are particular containers for each railroad station or group of small stations. These containers filled with goods for one particular town will be lifted from the car platform by local cranes when the train reaches that town. The car platform then empty, may be at once utilized for a local container which has been previously loaded at that station just as we now load a box car with l. c. l., and the local traveling crane will place the container on the empty car platform and the train may then proceed towards its destination.

It will take just a little reflection to completely bring to your mind's view just what is necessary in the way of electric automechanical freight handling equipment to completely handle a system of this kind. Certain it is, however, that it is all-possible through the use of electrically operated shuttle cars, electric traveling cranes, electrically operated conveyors or both the overhead trolley and the belt and apron and gravity types, and automatic elevators, and electric trucks and trailers.

The result of using such a system will be great economy, the release of the great spaces now used for yards and switch storage tracks and freight stations and it is figured that the value of the 74 stations will be much greater than the entire cost of the proposed gigantic station. This would also solve much of the problem of reducing freight handling costs, labor shortage and equipment shortage. In addition the psychological effect upon groups of men operating machinery under sanitary and healthful conditions in all kinds of weather, and with a minimum of physical effort, is certain to be such as to change their very attitude toward this work, while the synchronization of the whole would automatically speed up the productivity of each worker. What is still more important it would tend to give both regularity of hours of toil and continuity of employment, with a resultant uplift in the mental calibre of the men employed which would be incalculable.

Freight Handling System for Cincinnati

Just to prove that electricity right here in the United States is going to help solve the coming problem of the railroad executives and managers and employees of the railroads in the United States—all the railroads of Cincinnati, Ohio, have made arrangements with a private operating company for the installation of a patented system of terminal operation. This company has almost completed all the installation of the electrically operated machinery necessary to carry out its method of handling l. c. l. freight at Cincinnati, and it is my opinion this or a similar system is going to revolutionize the transfer point interchange of l. c. l. freight all over the United States.

Starting from the results which will accrue at Cincinnati and working back to the principles of operation, the facts seem almost as revolutionary at first as the "Gattie System" will be in England. For instance, this Cincinnati plan to handle freight by automechanical methods, using electric and gas motor trucks and machines instead of steam coal, switch engines, engine and switch train crews, and switches, is estimated to release 66,000 freight cars previously used exclusively in "spotting," transfer, trap, or ferry service in the Cincinnati terminal territory. There is problem one, two, three and four met in a way which at first tends to stagger even our American imagination. Cost is reduced; equipment both released and saved from deterioration, and labor shortage overcome.

But that is only part of the saving. The complete motorization of Cincinnati l. c. l. will save the railroads entering that city just about 300,000 switch cut movements per year, and also will extend existing terminal facilities over 30 per cent and make a reduction of 25 cents per ton in handling costs. All at the insignificant cost to the railroads of approximately $150,000. Furthermore, to date over 140,000 tons of general classification merchandise freight have been moved without a single loss or damage claim resulting, and the current movement of all connecting line and substation freight has been greatly facilitated. Thus electricity functions tremendously as a force to help overcome these five problems of railroad management at Cincinnati.

The detail of the operation at Cincinnati is not a new untried scheme as it has been under practical every-day test for almost two years between main and sub-stations of the Big Four. The actual figures resulting from the tests were used in making the estimates for the complete plants now being installed. The system is a combination of motor trucks, overhead electric traveling cranes and uniform containers, with which will ultimately be combined many forms of mechanical handling machinery such as industrial electric trucks, stacking and tiering machines, portable conveyors, and other electrically operated devices which reduce physical labor and tend to improve the morale of the men who serve in the handling of freight.

It is the combination which is the essential element of saving as all of these devices and machines are now daily reducing manufacturing costs in most of our American industries, and most of them will soon be in service at terminal and transfer points handling ocean and river cargoes as well as freight.

The handling of l. c. l. interchange at Cincinnati is as follows: bearing in mind that at the present time the railroads are not making any attempt at store door delivery, although this also is undoubtedly going to be the outgrowth of the use of this system. At Cincinnati only railroad freight is being handled. The cars are spotted alongside the freight station in the usual manner. Doors are opened and hand trucks or electric trucks receive the goods in the usual manner. They are then conveyed to the uniform containers and packed into the container identically as you pack a freight car.

These containers are placed in rows in the freight station, each container being plainly marked for one of the seven railroads entering Cincinnati. The ocntainers are wood and steel boxes, 17½ feet long, 8 feet wide, 7 feet high, and are usually loaded not to exceed four tons. The containers each have wide side doors and wide end doors so they may be easily loaded with miscellaneous freight of all kinds. Also each container (at least most of them) is fitted with large substantial casters so that it may be rolled across the station floor or rolled along the platform alongside a car. When the container is filled or loaded it is lifted by a traveling electric crane, swung from its position and transported by the crane to the point where a motor truck chassis stands ready to receive the container as the complete body of the motor truck. Clamps are set and tightened, and the motor truck dashes

off to the station of the railroad over which the goods in that particular container are routed.

At some stations the traveling crane delivers the container to the motor truck sidewise and at others the delivery to the chassis is endwise. In most cases where endwise delivery is made, and in cases where crane operation is not necessary on account of the few containers per day to be handled, the containers are set on a type of skid, which is just high enough and wide between its supports to permit the truck chassis to be backed underneath the container, and the lifting and lowering is then done through the use of electrically driven chain hoists. Where this latter method is in use, the skids are in bays extending into the station shed.

When the truck reaches the destined station, the traveling crane immediately relieves the chassis of the container and then places a return container on the chassis, effecting a minimum of delay for the motor truck. A central despatcher handles the operation of all of the motor trucks, insuring their operation for a maximum percentage of the day.

The electric traveling came of course carries the container with its load to the point nearest the spotted car of the connecting line and it is unloaded direct from the container into the car of the connecting line; or, if the goods in the container are for various small stations along the line, they are placed in proper cars in the usual manner, remaining in the container until cars are spotted for that particular freight division on which the station is located. It is entirely practicable to haul the containers about by means of a winch or an electric tractor truck although they are not yet equipped for movement by electric tractor.

Of course, it is but a step from the development of this system into an electrically operated unit for the complete system of freight service, including delivery and receipt of freight from store door, which will be a very simple step ahead—involving merely the use of the same type of trucks and ocntainers for the door to door service as is now employed in the inter-railroad service. It is almost necessary for similar plans to be put into use throughout the country in order to meet the demands of the economic situation of costs, manual service need and equipment shortage.

Because of this engineers and railroad operatives are making exhaustive studies of these different machines and their co-ordination into handling systems. With its adoption will also ocme a fuller appreciation by the railroads of the value of all types of mechanical handling machinery. In our manufatcuring plants, men are given the benefit of every conceivable type of machine or device which will save physical effort and conserve time and energy, of speed up production, but little use has been made of these electrically operated machines in freight and ocean cargo handling.

An automobile plant is equipped with numerous systems of conveyors, cranes, etc., all electrically operated. And in all large plants coal is handled by crane, belt ocnveyor or trolley with grab bucket, oftentimes without manual labor service from coal car to furnace grate bars, and even the ashes are automechanically carried to refuse piles.

Endless instances of the use of mechanical handling machines could be given, where savings have resulted sufficient to pay for equipment in one or two months after installation; and it is logical to believe that the very first moves on the part of the actual owners of the railroads after January 1, will be to purchase and install electric auto-mechanical handling machinery of many kinds.

Electric Trucks and Tractors

The Elwell-Parker Electric Co.

By Frederick B. Fink

With the present labor shortage, high wages and shorter hours it becomes necessary for railroad officials to investigate ways and means for handling freight, baggage, materials in their shops, etc., at a less cost and in shorter time than is accomplished at present by the manual labor method. Man power is not entirely done away with by the adoption of electric trucks and tractors, but their usage will displace from six to ten men for each machine installed, depending upon conditions, and the services of those men can be employed in more profitable ways.

The use of electric trucks and tractors not only means a great saving in dollars and quicker service, but it makes the lot of the operator a more contented one. Thomas A. Edison has said, "It is my belief that the world's most immediate scientific need is inventions which will lighten the grinding toil of labor." The more machines brought forth to become identified with industry which can prove themselves labor saving, the more they will be the cause of enlarging the forces of employed labor, notwithstanding the belief by some classes of labor that these men-displaying units cause them to lose employment. This belief is wrong, as the men are placed in other classes of work. For example the automobile displaced many men, but it has given employment to hundreds of thousands of chauffeurs, a million men and women in automobile factories, branches, offices, service stations, and parts and accessory manufacturers.

The electric truck, and tractor, are offered as labor saving machines and also as assistants to the remedy for the shortage of labor, but principally as a means of saving money on the cost per ton of material handled, and this is accomplished by means of their displacing men and handling more material in a shorter space of time. For the purpose of more clearly analyzing the handling of material in railroad service, it would be best to divide the subject into four sections, viz., piers, transfers, depots, shops and storehouses.

Piers

In the handling of freight on piers, the first object is to do so as cheaply as possible; the second is to handle the freight quickly, keeping the bulkhead clear for outbound freight and the inbound freight moved rapidly to the piles on the piers, ready for consignees trucks.

Freight congestion at piers and freight terminals is caused by cramped quarters and lack of proper schedules. Old fashioned methods, hand trucks of the two wheel type such as now used, were in use when the pyramids were built, as any one interested sufficiently can see for himself by visiting the Metropolitan Museum of Art. A pier is not elastic and where a pier is handling from 5 to 10 times the freight it was designed to handle, it is not surprising that congestion should occur resulting in confusion and extensive delays. It is all very well to talk about longer piers and larger terminals, but these in many cases are physical, if not financial, impossibilities. We must work with what floor areas we have at present and by bringing efficient methods to bear upon the handling of merchandise, endeavor to relieve the pressure until such time as improved conditions are possible.

To do this properly, if the pier is of sufficient length to warrant the use of tractors, then tractors and trailers are advised. The height of the trailer should be governed by the height of the average tailboard from the floor of the bulkhead, on outbound freight, so that the freight may be placed directly on the trailer, pushed onto the scales and weighed. It is then ready to be made into a train for the tractor to pick up and pull onto the car float, where each trailer is dropped at the car door, to be pulled into the car, or pushed in by tractor if very heavy material such as machinery, etc., is on the trailer.

Objections to this method of unloading from tail board to trailers have been put forth because of the inability of the receiving clerk to give the exact weights to the different classifications, which he has to estimate if the consignor has failed to put the weight on the bill of lading. This, of course, applies only to mixed classifications on the same

trailer and does not apply to solid loads made up of one classification.

To offset these objections some of the railroad, companies unload to the platform of the bulkhead, where the freight is hand trucked to the scale and there hand trucked a few feet to waiting trailers on a level with the platform. Each trailer stands at a place bearing the corresponding number of the car, and when fully loaded the tractor picks it up and trails it to the car where the freight properly belongs and the verichecks are given either to the tractor operator or to the coupler of the trailers, who rides with the train.

Objections to the latter method have been raised, in that it causes an additional handling of the freight, thereby increasing the cost per ton for handling, but the users of this method claim accuracy for it, while with the tailboard to trailer method too much estimating has to be done.

Adherents of the tailboard to trailer method claim there is but little estimating to be done, but its greatest value is that by this method the bulkhead is kept clear, allowing the delivering street trucks to unload and get away quicker because the platform of the bulkhead is not congested. It is a noticeable fact that on those piers where hand trucks are still used the platforms are congested all day and at about 4 o'clock in the afternoon the freight is piled half way to the ceiling, while on the piers where electric trucks and tractors are used the freight is moved away as fast as it is unloaded and at 4 o'clock the platform is as clear as it has been at any hour during the day.

As a further indication of the saving to be effected by the use of electric trucks and tractors, at one pier on the Hudson river where the tonnage handled per day is comparatively small, an electric truck with platform, known as a "load carrying truck" to differentiate from a tractor, was placed to try out its possibilities for pier work. It was found however that the truck was not the proper unit, as the time consumed in loading and unloading was too great to warrant the investment. It was then decided to try it out using the truck as a tractor and five trailers were put in service with it. This is about one-tenth the proper number of trailers to a tractor and is mentioned here to indicate the handicap of the test. Notwithstanding the handicap and the unfamiliarity of the force with tractor and trailer operation, 119 tons were handled at a cost of .264 cents per ton.

To have moved this same tonnage by hand trucks, would have cost .56 cents per ton, showing a saving by the use of the tractor of .296 cents per ton. In spite of the handicap mentioned above the operation kept two doors of the bulkhead clear. We furthermore found in the experiment that when using hand trucks, the driver of the street vehicle would place the boxes or packages on the tailboard of his vehicle and wait for the freight handlers to unload it on to the platform, while there was no hesitancy on his part to place the boxes or packages on the trailer himself when it was backed up to the tailboard, thereby freeing at least one freight handler for other work.

Transfers

Here also seems to be a division of opinion, as to whether the tractor and trailer system or the load carrying low platform electric truck, is the most efficient and economical. Both systems of handling have their adherents, but with either method as compared to the use of hand trucks the handling is done quicker and with considerable saving in money. From figures received from transfers where load carrying trucks are used the conclusion can only be arrived at that while the initial investment is greater than that for tractors and trailers, the cost per ton is less.

To illustrate this, one of the large transfers using a number of load-carrying trucks, handles about 1200 tons per day at a total cost per ton, including everything chargeable to the operation, of 61 cents per ton, and this with trucks that are now about nine years old with the higher cost of maintenance due to their age. In this operation, manual labor is reduced to a minimum as the loaded truck runs into and to the end of the car where its load is removed from the low platform by hand, and vice versa when loading. In another large transfer, where only tractors and trailers are used, and where about 1200 tons average per day are handled, it is interesting to note that on November 7, 1918, 19 gangs of 5 men each with two-wheel hand trucks; 14 tractor gangs of 3 to a gang; 14 floaters and 41 packers, or 192 employees in all were thought necessary to handle 1352 tons of miscellaneous freight, at a cost of .955 cents per ton. By proper supervision and rearrangement of the handling it was found that, after the wrinkles had been ironed out, 1221 tons could be handled by 4 gangs of 5 men each with two-wheel hand trucks; 11 tractor gangs of 3 men each; 13 floaters and 39 packers, or a total of 105 employees at a cost of .769 cents per ton, or a saving of .186 cents per ton over the cost without proper supervision.

It will be seen therefore that in two transfers handling about the same class of freight and about the same tonnage per day, a difference of .159 cents per ton is shown in favor of the load carrying truck over the tractor and trailer system. Handling 1200 tons per day, would amount to $190 per day or $57,000 per year, thereby proving the contention that the difference in initial cost is soon made up. Further, in the use of the tractor and trailer method, the tractor drops the loaded trailer at the car door, when it becomes necessary for man power to be used to push the trailer into the car and possibly to the end of the car over floors that often are none too smooth and very often wet, and when unloaded has to be used to push the trailer out onto the platform for the tractor to pick up. By the use of the man power, in this operation the tractor becomes only partly a labor saving unit, which is wrong when units better adapted to the service are available.

However, in small transfer stations tractors are being used with good results, two of these small transfers reporting that in the handling of 300 tons each per day, each with one tractor, one transfer having 16 trailers and the second having 40 trailers—both tractors working under adverse conditions, as to crossovers, platforms, etc.,—the first showed a saving of six cents per ton, due to the small number of trailers used and the second a saving of 10 cents per ton. Both are showing a saving, but in addition, the receiving platforms are kept clear, something unknown before, and the entire operation is speeded up.

The belief that any one type of electrical truck or tractor is the proper unit is erroneous and there is an inclination toward the use of electric elevating platform truck for transfer work, as by its use castered platforms may be picked up with their load and deposited in the car at the point of stowage, the truck picking up an unloaded platform and returning it for a load, depositing it and immediately picking up a loaded platform which the laborers have loaded while the truck was in transit with its previous load. By this method the pushing of trailers into and out of cars is eliminated, as in the tractor and trailer system, and the objection to the load carrying truck without the elevating platform of having the truck tied up so long for loading and unloading has been overcome.

Another type of electric truck which is a valuable adjunct on piers, in transfers and shops, is the crane truck of 2000 lb. capacity, used for handling heavy pieces of machinery and other heavy materials and in the case of piers or transfers, lifting that machinery or other heavy material onto the load carrying trucks or onto trailers, as the case may be, thereby saving a great amount of labor and time.

The sight of electric trucks hauling baggage and mail in passenger terminals is a common one, but its importance can scarcely be enlarged upon, as while it is an established fact

that the savings shown by these trucks are from 58 to 80 per cent over the old method of pulling the trucks by hand, there are some items which must be taken into consideration and on which it is impossible to place a value in dollars and cents; those are the relief to terminal congestion and the prompt despatch of trains resulting from avoidance of baggage detention. This also applies to express and mail haulage.

Shops and Storehouses

The electric truck, particularly the elevating platform type and the crane truck, or a combination of the two types, are of such value in the shops and storehouses that the saving is almost unbelievable, as the records submitted on 51 electric trucks in 14 shops show a saving in labor as high as 89 per cent, and that without the later types of trucks designed for use in shops and storehouses.

Records show that with the installation of one truck in the shops on one of the large eastern railroads, four men were displaced who were receiving 39 cents per hour which equals $3,744 per year. On the same railroad, in the shops located in another city, three trucks were installed, which displaced 11 men, who were receiving 42 cents an hour, or $11,088 per year.

In the shop of another well known eastern road, an electric truck was installed for handling car seats to and from the upholstery department to the cars. This truck showed a saving of $3,024 a year, and that at the time when the labor the truck displaced was receiving but 24 cents per hour.

The shops of still another road in the east have in service four load-carrying trucks and one tractor and these have displaced 25 men with hand trucks, 8 horses or mules with drivers and the services of a switch engine for 2 hours a day; they show a saving over the former method of handling of $34,363 per year.

The electric crane truck of 2000 lb. capacity will be found to be a valuable unit in shops for the handling of pumps to and from the locomotive, as well as in the handling of heavy castings, etc., picking the material up, placing it on the platform of the truck, carrying it to its destination quickly and depositing it where wanted, saving a great deal of time and labor.

Electric Welding

By H. A. Currie

Assistant Electrical Engineer, New York Central

During the past three years numerous articles have been written describing the progress in the art of electric welding, covering the relative merits of machines, electrodes, methods of welding, current values and so forth. These show the ever-increasing interest in the subject.

The keen interest displayed by the Emergency Fleet Corporation was reflected in the appointment of the well known welding committee composed of representatives of shipping men, engineers, the government, colleges and railroads. The wide publicity given the work of this committee has had much to do with the great interest taken by manufacturers, builders and railroads.

This paper will be devoted to a brief resume of the welding facilities and general character of work done in the motive power shops of the New York Central. One phase of welding that has had but little attention paid to it is the fundamentally important one of preparation. This will be emphasized in the present paper. Railroad shops are are perhaps the largest users of arc welding machinery for repair purposes.

The facilities in New York Central shops consist both of D. C. and A. C. units of various makes. Depending on local requirements they are either portable or in a fixed location. Satisfactory results have been obtained from both types of equipment.

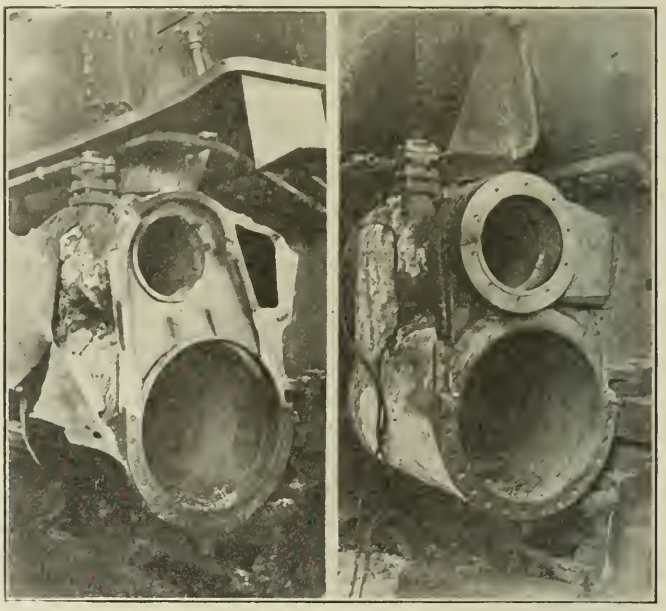
The welding facilities consist of the single operator type of machine suitably located throughout the buildings and so connected by bus lines that machines can be electrically connected to any outlet throughout the shops. This arrangement gives all the advantages of multiple operator machines with none of the disadvantages.

The saving in our locomotive shop since electric welding was installed can hardly be calculated and the additional mileage that is obtained from locomotives is remarkable. This is mainly due to the following:

A. Greater permanency of repairs.

B. Shorter periods in the shop, giving additional use of equipment.

C. Existing shop facilities permit taking care of a larger number of locomotives than originally expected. Shop congestion relieved.



Example of Locomotive Cylinder Repair Work Done by Electric Arc Welding.

D. The use of worn and broken parts which without electric welding would be thrown in the scrap pile.

E. The time required to make repairs is much less and requires fewer men.

F. A smaller quantity of spare parts carried in stock.

The following is a brief description of some of the work done on steam locomotives:

Flue and Fire Box Welding

The most important results are obtained by welding the boiler tubes to the back flue sheet. The average mileage between shopping an account of leaky flues on passenger locomotives was 100,000 miles. This has been raised to 200,000 miles with individual records of 275,000 miles. For freight this average has been raised from 45,000 to 100,000 miles. At the time of locomotive shortage this effect was of inestimable value.

Good results have been obtained without the use of sand blast to prepare the tubes and sheets. The engine is either fired or an acetylene torch used to burn off the oil, after which the metal is cleaned off with a scraping tool. The ferrules are of course well seated and the tubes rolled back. The boiler is filled with water in order to cool the tubes, which having a much thinner cross section than the sheets, would overheat sufficiently to spoil the weld or burn the tube.

The metal is then laid on, beginning at the bottom of the bead and working to the top. Records show that the time to weld a Pacific type locomotive boiler complete is 12 hours.

A variety of repair work is readily accomplished in locomotive fireboxes such as the welding of crown sheet patches, side sheet cracks and the reinforcing and patching of mud rings. Smokebox studs are also welded on.

Side Frames, Couplers and Wheels

Cracked main members of side frames are restored and wearing parts built up and reinforced. Because of accessibility no special difficulties are encountered in this work. Formerly this work was chiefly done with oil welding and some acetylene and thermit work, but it was very much more expensive as the preparation required considerable effort and took a good deal of time.

Fifty per cent of the engines passing through the shops have worn and broken coupler parts and pockets. By welding an average saving of about $15 per coupler is made. It costs about $30 in material and labor to replace a coupler and only $4 to repair the average broken coupler. The scrap value is about $5.

Great success has resulted from various repairs to steel wheels and tires. Flat spots have been built up without removing the wheels from the locomotives, thus effecting a great saving in time and money. Building up sharp flanges saves about 5/8 inch cut off the tread, which when followed through means about $30 for a pair of wheels, a great increase in tire life and reduction. in shop costs.

Cylinders

The most interesting feature developed by arc welding was the accomplishment of cast iron welding. The difficulty in welding cast iron was that while the hot metal would weld into the casting, on cooling the strain would tear the welded portion away from the rest of the casting. Small studding was tried out with no success. Not until wrought iron studs, proportioned to the sectional strength of the casting, were used did any satisfactory welds turn out. Studding of this large size was looked upon with distrust as it was thought that the only weld was to the studding. This naturally meant that the original structure was considerably weakened due to the drilling. This, however, was not the case. The large studding was rigid enough to hold against the cooling strains and prevented the welds in the casting from pulling loose, thus adding the strength of all the welded portion to that of the studs. In most cases where external clearance will permit, sufficient reinforcing can be added to more than compensate for the metal removed in drilling for the studs.

Perhaps more skill is required for this class of welding, but with a properly prepared casting success is certain. A concrete case of the economy effected in welding a badly damaged cylinder on a Pacific type engine is as follows:

Welded Job.	
Cost of welding broken cylinder, labor and material	$125.00
Length of time out of service, 5 days at $20 a day	100.00
Scrap value of old cylinder (8,440 lb. at 2.09 lb.)	177.00
Total	$402.00
Replaced Cylinder	
Cost of new cylinder ready for locomotive	$1,000.00
Labor charge to replace it	150.00
Locomotive out of service 18 days at $20 a day	360.00
	$1,510.00
Less cost of welding	402.00
Total saving	$1,108.00

Some 25 locomotives have been repaired in this way at one shop alone.

Many axles are being reclaimed by building up the worn parts. These are tender and truck axles which are worn on the journals, wheel fits and collars. The saving is about $25 per tender axle and $20 for truck axles.

The range of parts that may be repaired or brought back to standard size by welding is continually expanding. Wearing surfaces on all motion links and other motion work, crosshead guides, piston rod crosshead fits, valves and valve seats, air, steam, sand and other pipes, keyes, pins and journal boxes have all been successfully welded.

A large saving is effected in welding broken parts of shop tools and machinery. During the war this was of untold value, as in some cases it was out of the question to get the broken part replaced.

Training of Operators

This is the most important feature of arc welding. Success depends solely on the men doing the work. They must be instructed in the use of the arc, the type, size and composition of the electrode for various classes of work and the characteristics of the various machines they will be called upon to use. A properly equipped school for teaching these matters would be a valuable adjunct for every railroad. Manufacturers of equipment have recognized the importance of proper instruction and have equipped schools where men are taught free of charge.

Supervision

Co-ordinate with the actual welding is intelligent supervision. The scope of the supervisors should include preparation of the job for the welder and general oversight of the equipment in the shop.

Thus the duties of the inspector might be summarized in the following points:

1. To see that the work is properly prepared for the operator.
2. The machines and wiring are kept in good condition.
3. Proper electrodes are used.
4. To inspect the welds in process of application, and when finished.
5. To act as advisor and medium of interchange of welding practices from one shop to another.

In work such as flue welding and industrial processes which repeat the same operation, piece work rates may be fixed. For varying repair jobs this method cannot be used with justice either to the operator or the job.

Bare electrodes are used almost exclusively, even for A. C. welds. Whenever a new lot of electrodes is received it is good practice to make up test piece samples and subject them to careful tests and analysis.

The sizes of electrodes and uses to which they are put are shown in the table.

Size	Type of Work
1/8 -in.	Flue welding.
5/32-in.	For all repair work, broken frames, cylinders, etc.
7/32-in.	For building up wearing surfaces.

General Rules

In closing it will be well to point out a few general rules required to obtain satisfactory welds.

1. The work must be arranged or chipped so that the electrode may be held approximately perpendicular to the plane of welding. When this cannot be accomplished the electrode must be bent so that the arc will be drawn from the point and not the side of the electrode. For cast iron the studding must be properly arranged and proportioned. The surfaces to be welded must be thoroughly clean and free from grease and grit.
2. The proper electrode and current value must be selected for the work to be done.
3. The arc should be maintained as constant as possible.
4. For nearly all work the prepared surface should be evenly welded over and then the new surfaces welded together.

5. Suitable shields or helmets must be used with proper color values for the lenses.

For locomotive work a good operator will deposit an average of 1 and 1½ lb. of electrode per hour. The limits are from 1 to 2 lb. High current values give more ductile welds, in proportion to deposited metal. For locomotive welding the great advantage of the arc over thermit, oil or acetylene welding is that preparation at the weld is all that is necessary. No secondary preparation for expansion of the members is necessary. This is the great advantage in welding side frames.

German Ships

A fine tribute was paid to railroad work when a committee consisting of railroad men was appointed by Capt. E. P. Jessop, U. S. Navy, to report on the feasibility of making repairs by electric welding to the damaged German ships. This committee, headed by D. H. Wilson, after careful examination reported that it was practicable to weld the damaged parts, as similar cast iron welding work was daily done in railroad shops. Machines and operators borrowed from the railroads were responsible for the speedy and thorough repairs to these ships.

By being able to weld the damaged parts without removing them, the ships were released for transport service in three or four months instead of a year or more, as the Germans anticipated.

The Secretary of the Navy, in his report on the repairs to the German ships, has stated "that the repairs to these ships resulted in a saving of 12 months in time, enabling us to transport at least 500,000 troops to France and effected an economy which is conservatively estimated at upwards of $20,000,000. He further states that there was not a single instance of a defective weld, nor has one developed during the months of arduous service in which these ships have been engaged."

When it is considered that these repairs released a tonnage of nearly 290,000 tons, it will be realized what an important part electric welding played during the war.

Electric Car Lighting

By A. G. Oehler

Associate Editor, *Railway Age*

It is generally conceded that the railroads are in need of much new passenger car equipment. This, of course, includes car lighting equipment, and those interested in car lighting are asking what the equipment will consist of and how much is needed.

At one time cars were lighted with candles. Candles were superseded by oil lamps, and oil lamps in turn were largely displaced by gas light. Now, if present day practice is continued, gas will in time become little more than a memory.

Types of Equipment in Use

Electric train lighting can be divided into three general classes, *i. e.*, head end, straight storage and axle systems. Head end systems usually consist of a steam turbo-generator set located in the baggage car, supplied with steam from the locomotive, working in conjunction with two or more storage batteries placed on the coaches. Where head end systems are used in conjunction with electric locomotives, a motor-generator set on the locomotive supplies the power for train lighting. For short suburban trains, some consideration is being shown to the use of a turbo-generator set located on the locomotive. The cars for this service are equipped with train lines, but without batteries. There is also a head-end axle system in which a large axle generator in the baggage car supplies power for lighting all the cars in the train. Straight storage lighting is still in use to a considerable extent, but is being rapidly displaced by axle lighting.

There is still a large percentage of gas lighted cars in use in the United States, but the general tendency is to adopt the 32-volt axle generator systems.

There are six different types of axle lighting systems manufactured in the United States, each of which has its merits. Practically all of this equipment which is in service, is belt driven and generators are either truck-mounted or body-hung. There are two general types of batteries, namely, the lead-acid and the nickel-iron. There is but one make of nickel-iron battery, but several of the lead-acid type.

Maintenance

The two biggest maintenance costs are, first, batteries and second, belts. Battery maintenance is kept at a minimum by keeping battery compartments and containers clean and painted, by proper flushing and particularly in the case of the lead cells, by avoiding excessive overcharge and complete or nearly complete discharge. It is also essential that the battery box be dust tight, that vent plugs be kept in place, connectors carefully maintained and regular inspection made for leaky tanks and general repairs.

There are different kinds of current control for maintaining proper charge in the batteries. In this connection it is of interest to mention the fact that modern practice indicates that the cutting in speed of the automatic switch is of much less importance than the minimum full load speed of the generator. The size of the generator and of the battery is governed by the kind of car and the class of service in which the car is to be used. Recommendations have been made by the Association of Railway Electrical Engineers regarding a standard method for rating generators, material for armature shafts, bearings, grease retainers, etc., which will be of considerable interest to the prospective purchaser. These recommendations will appear in its 1919 proceedings.

The factors of first importance in applying belts, whether for truck-mounted or body-hung generators, are that the pulleys must be in line, that the belt will clear the end sill and brake rigging by at least three inches and that the pulleys run true. This last consideration has been deemed of sufficient importance by the Master Car Builders' Association to warrant the adoption, as recommended practice, of the use of rough turned axles for mounting axle pulleys. Careless switching in the yards is a common cause of belt trouble. Belts may be snapped off in the yards in this way, or so strained that they are lost when the generator load is applied.

Two gear-driven machines have recently appeared in the field which may prove to have considerable merit. Other types of gear and direct drive have been tried out in the past and discarded because of inherent faults such as difficulty of applying and removing the equipment and the high first cost. Much progress has been made, however, in the last few years in the use of gears in general and should a special axle be considered essential for belt operation, there would be several added arguments in favor of a gear drive.

Lighting Fixtures

The selection and placing of lighting fixtures in the cars has become a problem in illuminating engineering, and, following modern lighting practice, the tendency has been to provide general illumination with a few large units, placed along the center line of the car. Fixtures are designed and placed so as to give a certain number of foot candles illumination on the reading plane. Aside from light intensity are considered efficiency, uniformity, distribution, quality of illumination produced and artistic merit. For coach lighting and other classes of cars where efficiency is the primary object, the open-mounted reflector is the one most universally used, and where appearance is the primary consideration,

enclosing units are usually applied and efficiency somewhat sacrificed.

Special lighting is required for certain cars and consists of berth lamps, reading lamps for parlor cars and composite or club cars, and special novelties for table lighting in diners. Aisle night lights for sleepers are probably the most recent development in car lighting. They are placed under alternate seat ends and consist of a fixture fitted with a ten-watt straight side bulb which throws light onto the aisle carpet through a green glass. They tend considerably to enhance the value of the upper berths. For postal cars, the specifications of the Standard Car Committee of the Post Office Department must be met. Aluminum or aluminized metal reflectors are in very general use in postal and baggage cars, due to their high efficiency and durability.

Lamps

Both the type B and type C tungsten lamps are used, the type B supplying the need for units of 50 watts and less, and it appears that the type C lamps will be used to fill the requirements for 75 and 100 watt units. The type B lamps are made both as round and straight sided lamps. Based on 1918 records, the sales of straight sided lamps exceeded those for round bulb lamps. This is probably due to the lower cost of the straight sided lamp, particularly in the larger sizes.

Train Lines

The time is too short to say more about car wiring than to mention the fact that the practice of equipping cars with train lines is generally recommended. It has been practically demonstrated that good train lighting service may be had without them, but it is apparent that facilities for train line connections will greatly reduce the possibility of light failures. They are particularly desirable for the protection of mail cars.

Amount of Equipment Needed

I have stated that the railroads were in need of passenger cars and have endeavored to outline the fundamental considerations which enter into the purchase of car lighting equipment. Perhaps you would be interested in an estimate of how much the railroads are short.

Between the years 1910 and 1916, the number of passenger cars in service increased from 47,095 to 54,774 or 16 per cent. Meantime, the increase in amount of travel was 36 per cent. In 1917 the increase in the number of passenger cars in service was 1,167. Government control was established at the beginning of 1918 and during that year only 131 cars were ordered for all the railroads. This year no substantial orders for passenger cars have been placed and owing to retirement of cars, there may have been some decrease.

Passenger traffic in the meantime has increased. As already stated, the increase in travel from 1910 to 1916 was 36 per cent. In 1917 alone, it was 14½ per cent. In 1918 the increase over 1917 was 8 per cent. In the first eight months of 1919, the passenger business handled was 6.3 per cent greater than that handled in the same months of 1918. These cumulative increases since 1916 aggregate 32 per cent.

The large increase in passenger traffic in 1917 and 1918 has been attributed chiefly to the movement of troops and to the traveling of their relatives and friends to and from the cantonments where they were located. Since 1918, however, there has been a very large reduction in the movement of troops, and yet the statistics of the Railroad Administration show that the amount of travel in July, 1919, was 12½ per cent greater than in July, 1918.

There is no apparent reason for doubting that the present large amount of travel will continue, and even increase. In addition to this, the railroads have had to postpone their steel car program and, of course, in the past the replacement of wooden by steel passenger equipment has been a very important factor. If the railroads during the last three years had bought only as many passenger cars per year as they did in the preceding six years, they would have bought in this three years at least 7,000 more cars than they actually did. But the increase in passenger business in the last three years has been almost as great as in all of the preceding six years together. Taking into consideration both the very small number of passenger cars that has been bought during the last three years and the enormous increase in passenger business which has occurred, it is safe to say that the railways after they are returned to private operation would have to have at least 8,000 and probably 10,000 more passenger cars than they actually will have in order to handle their passenger business in the same way that they handled it in 1916.

The largest number of cars ever built in one year in the United States and Canada was only 4,412, so it is apparent that conditions can not be entirely corrected at once, but I hope that consideration of these figures may aid the car lighting men in anticipating the size of the job they have ahead of them.

A. R. E. A. Rail Studies

Bulletin no. 218 of the American Railway Engineering Association which has just been issued contains the annual compilation of statistics of failed rails and the results of a number of individual and committee investigations of different phases of the rail problem. The rail failure statistics, which have been compiled by M. H. Wickhorst, engineer of tests for the rail committee, include the failures reported by the railroads of the United States and Canada for the year ending October 31, 1918, and cover rails rolled for 1913 and succeeding years. The ages of the rollings in track average as follows for the years shown below:

1913	5 years	1916	2 years
1914	4 years	1917	1 year
1915	3 years	1918	several months

The tonnage covered by the statistics in the report are as follows:

Year rolled	Bessemer	Open-hearth	Total
1913	155,417	1,550,938	1,706,355
1914	59,918	1,060,763	1,120,681
1915	12,141	1,034,531	1,046,672
1916	42,399	1,191,628	1,234,027
1917	24,223	1,077,832	1,102,055
1918	12,967	470,768	483,735

It will be noted that rails of Bessemer steel have formed only a small part of the tonnage covered by the reports. The average weight of open-hearth rail reported for 1918 was 101.5 lb. per yard, while that of Bessemer rail was 87.4 lb. per yard, indicating that the open-hearth rail was placed in tracks demanding heavier service. In spite of this fact the Bessemer rail show a larger number of failures per 100 track miles as is indicated by the following table:

Year rolled	Years service	Failures per 100 track miles		Comparative failures	
		Open-hearth	Bessemer	Open-hearth	Bessemer
1913	5	90.3	107.7	100	119
1914	4	47.4	111.1	100	234
1915	3	33.8	62.7	100	186
1916	2	27.9	41.6	100	149

The most encouraging feature of the railroad situation as indicated by these reports is the steady decrease in the total number of failures per 100 track miles. The number of these failures per 100 track miles for five years' service, as

shown in the reports of the rail committee for 1913 to 1918 inclusive, is as follows:

	1913	1914	1915	1916	1917	1918
Bessemer	413.3	373.9	236.9	214.1	134.1	107.7
Open hearth	370.5	198.8	154.0	161.9	102.7	90.3
Total	398.1	277.8	198.5	176.3	107.1	91.9

Study of Transverse Fissures on the Santa Fe

On December 10, 1917, a train on the Gulf Lines of the Atchison, Topeka & Santa Fe was derailed by a rail which broke into 10 pieces and showed 13 transverse fissures. This rail was of 90-lb. Santa Fe section. The 51 remaining rails of this heat were located, removed from track, and sent to Topeka, Kan., where they were subjected to extensive tests to detect further indications of fissures. The drop and etching tests indicated the presence of great numbers of cracks in the interior of the head of some of the rails, a few of which acted as nuclei for the growth of fissures in service. Chemical analyses showed rail steel of about the usual composition, fairly evenly distributed and that the rails with fissures were all about the same composition as the other rails. The physical properties of the rails were about normal in the different parts of the section, except that the rails with fissures were low in ductility in the head, both longitudinally and transversely.

Relation Between Length of Service and Transverse Fissures

W. C. Cushing, chief engineer maintenance, Pennsylvania Lines West of Pittsburgh, has prepared a monograph describing a set of rails which have given long service to determine whether these rails show any indication of transverse fissures.

The study started with the assumption that if stored up internal stresses in rails proceeding in combination from three principal components which affect them in service, namely: (1) cooling strains of fabrication; (2) cold-rolling strains from wheel loads; (3) direct stresses in the track, tell the whole story of the cause of "transverse fissures" then it might be reasonably expected that rails especially long in service would be not only likely to have that type of defect, but would be almost certain to have it, particularly if the elastic limit of the metal were very low, thus reducing the ration between it and the wheel load, six rails were selected as follows:

	Years
English rails (wrought iron), Louisville Division	41
German rails (iron and steel pile), Long Island R. R.	45
P. R. R., Bessemer, Pittsburgh Division	25
P. R. R., Bessemer, Columbus Division	22
A. S. C. E., Bessemer, Pittsburgh Division	10
P. R. R., Bessemer, Cincinnati Division	19

Nothwithstanding the high internal stresses, low elasticity and lack of homogeneity in the structure, a close examination failed to disclose any signs of transverse fissures. Mr. Cushing concluded that "it is reasonable to expect, therefore, that, if severity of service, especially by exceedingly heavy wheel loads, be the sole cause of the defect known as transverse fissure, these rails, after their unusually long service, and in some of the cases under the heaviest wheel loads in use, would be sure to be filled with transverse fissures. That such was proved by careful examination not to be the fact, that rails adjacent to and undergoing precisely the same conditions of service as those in which transverse fissures have been found to not have any, and that rails never put into service as well as those which have been in service, have been shown by Waring and Wickhorst to contain microscopical cracks, seems to prove beyond a doubt that the cause, the real cause of transverse fissures must be sought in the processes of manufacture. The wheel loads are the instruments of development from the initial defect, and it is true that the service has become uncommonly severe. The real office of a rail is to undergo service, and we will continue to seek a material which will fulfill the requirements of the service."

Intensity of Pressure on Rails

A sub-committee of the Rail committee which has been investigating the intensity of pressure due to wheel loads submitted a report based on a series of tests from which the following conclusion is taken:

The service experiment seems to indicate that with this section and composition of rail (100 lb. P. S. section, practically the same as the A. R. A., "B" section, of 0.666 carbon), the load of 25,000 lb. per car wheel should not be exceeded, but the committee is not prepared to accept this as a general conclusion. The intensity of pressure which a given spot on the head of a rail will stand is evidently influenced by the resistance of the metal surrounding that spot, a larger or differently shaped head may yield to a much less extent. Some of the New York Central experiments show that where the wheel and rail contour fit, the areas of contact with a given load are much increased and this by longer contact across the head. If but one wheel contour and but one rail contour existed and could be maintained, this would go far toward settling the question, but it must be remembered that with the existing diversity due to modifications of the original contour produced by service, this ideal condition is not likely to be reached. It is very certain that the practice of allowing wheel contours to depart widely from the original standard before renewal or returning is at the direct expense of severe punishment of any rail section that can be devised.

Convention of State and Federal Regulators

Walker D. Hines and Clyde B. Aitchison Address the Railway and Utilities Commissioners

THE OUTSTANDING FEATURES of the thirty-first annual convention of the National Association of Railway and Utilities Commissioners, held at the Claypool Hotel, Indianapolis, Ind., October 14 to 16 inclusive, were the addresses by Walker D. Hines, director general of railroads, Clyde B. Aitchison, chairman of the Interstate Commerce Commission, Charles E. Elmquist, president of the Association, and Max Thelen, director of the Division of Public Service of the United States Railroad Administration. In addition the numerous reports, especially the one of the committee on public ownership and operation, evoked widespread interest and called forth earnest discussion.

Representatives of state commissions of 24 states answered the roll call at the opening session of the convention, the total number of delegates being approximately 100. With the heads of the Railroad Administration, the Interstaee Commerce Commission and the Division of Public Service on the program it was but natural that the major portion of the convention's time was devoted to the discussion of problems relating to the regulation of common carriers by both state and federal bodies. In many of the addresses and reports relating to these subjects it was conceded by both federal and state regulating officials that state regulation of common carriers was essential. The conflict over the right of state and federal regulating bodies to prescribe rules for the transportation systems which had arisen during the period of federal control seemed to be satisfactorily adjusted.

A majority of those who spoke on the general subject of public ownership and operation of railroads, including those named above, declared themselves heartily in favor of a return to private operation with suitable federal legislation. The champion of the opposing side was Laurence B. Finn, chairman of the Kentucky Railroad Commission, who addressed the convention at his own request on the necessity for government ownership and operation of common carriers.

The convention was opened on October 14, by John W. McCardle, a member of the Indiana Public Service Commission, who delivered the address of welcome. In addition Governor Goodrich of Indiana welcomed the delegates to Indianapolis and outlined his views on the railway situation as follows:

Governor Goodrich Emphasizes Need for Increase in Rates

"I am of the opinion that the railroads should be returned to their owners at the very earliest possible moment. There is no good reason for delay, once Congress has provided a method of control and arranged to compensate them for equipment purchased by the federal administration and not necessary in peacetime operation, and for other losses incident to the government's seizing these properties.

"If present rates are not adequate, the director should immediately increase them, or in case of his failure to act, Congress should direct the advance of rates so as to fully cover the deficit in current operating revenues. This deficit should not be met out of the federal treasury.

"So long as the railroads are under government supervision, they should be freed from the operation of the Sherman and Clayton acts and encouraged to consolidate, but in such fashion as to preserve the great competitive systems which have developed in our country and which have made the American railroads, before the government took possession of them, such marvels of efficiency and economic operation.

"There is only one way to restore the old spirit of loyalty, the morale of the organization, and that is to restore the roads to their owners and permit the rebuilding of the human element, which is so vital to efficient and economical management. The longer the return is delayed, the more difficult the problem and the longer will it take again to restore our railroads to their former efficiency.

"I can see no good reason why the roads cannot be returned at once under adequate rates to permit them to go on, with the assurance that the government will fully compensate them for losses incurred by reason of government operation, and aid them in financing their obligations to the government and then work out the final plan afterward."

Clyde B. Aitchison on Railroad Problem

Clyde B. Aitchison, chairman of the Interstate Commerce Commission, who followed Governor Goodrich at the opening session of the convention concurred in the letter's views regarding the necessity for a return to private ownership and operation, and in addition outlined specific recommendations for the final solution of the railroad problem.

Mr. Aitchison said there must be a far greater degree of unification and utilization of facilities, terminals and equipment than ever before and that future railway construction should be limited to that which is necessary and convenient for governmental purposes and the public.

As a necessary means of preventing wasteful competition, he recommended a national regulating body, which would have power to prescribe the minimum rate as well as the maximum. This authority, he said, has long reposed in many of the state regulating tribunals, but has never been vested in the Interstate Commerce Commission. He also said a modification of the present plan of district traffic committees, under the direction of public authority, may be necessary during the readjustment stage that the carriers and the country may be spared the burden of anything approaching a rate war.

With the return of the properties and until the corporations have had an opportunity to make their own adjustments it seems reasonable, Mr. Aitchison said, that the government should stand behind unavoidable losses from operation on the ground that to a large extent the increased costs constitute a direct cost of war and should be borne as such.

Regarding the labor situation, the speaker declared that legislation must be provided for speedy and adequate means of enforcing the just demands of employees, but that the country is entitled to protection against the irretrievable damage which must follow if either party to the dispute insists upon being the final judge of the justice of its own cause and stops the wheels of commerce.

President Elmquist on Federal and State Regulation

Charles E. Elmquist, president of the association, in delivering the president's address at the opening session, reviewed the war-time activities of the state public service commissions, their relationship with the federal Railroad and Fuel Administrations, and cautioned the commissioners to give particular attention in the future to the tendency of the public in peace time to demand lower rates from public utilities, while the cost of materials and supplies are in-

creasing. In regard to the railroad problem Mr. Elmquist said in part:

"Advocates of government ownership, or the Plumb plan, and those who favor a continuation of government operation for the political advantage which might arise therefrom in the ensuing national campaign, naturally oppose the final consideration of railroad legislation during the special session. But adjournment without passing such legislation may throw the whole question into the national campaign, in which event remedial legislation may be indefinitely postponed.

"There should be no uncertainty upon this question. Delay seriously interferes with the readjustment of our business activities and strengthens the conviction of many persons that the time has come for this government to assume the permanent ownership and operation of the transportation lines, coal mines, packing plants, flour and lumber mills, coal and oil lands, steel plants, banks and many other important industries.

"We are accustomed to privately operated railroads, and the experience which has been gained during the two years of federal operation has not convinced the American people that private operation is a failure. We are convinced, however, that regulation must be rounded out so as to give the people more perfect control over the rates, service, standardization, operating costs, consolidations, and extensions of those arteries of commerce. No serious consideration should be given to the question of public ownership until it has been demonstrated by experience that private operation, subject to more perfect regulation, fails to produce satisfactory service at reasonable rates, or that the enforcement of statutory laws will prevent periodical financial mismanagement.

"Congress is about to kick the anti-trust law into the middle of the ocean and permit consolidations subject to the approval of public authorities. It is difficult to say whether sentiment for the consolidation of railroads is real or artificial, but it nevertheless exists. Every combination of railroads means an extension of monopoly and imposes upon Congress and the states the absolute duty of seeing to it that the arm of regulation shall secure for the people that adequate service which competition has in a large measure provided for them.

"Remarkable as it may seem, the railroads, bankers and securities holders unite in demanding government regulation of capital issues.

"Corporations have taken advantage of federal operation to standardize and unify rates, charges, practices and classifications. They have persistently advocated centralization of all rate-making power in the federal government. 'Regulation by forty-eight commissions' is held forth as a great menace, although most railroad systems operate through only a few states. Railroad emissaries fail to mention the good work done by state authorities, but any mistake or alleged radical action of a state commission or court is shouted from the housetops."

In concluding his address Mr. Elmquist presented his resignation as general solicitor of the National Association of Railway and Utilities Commissioners to take effect on December 1, 1919. Mr. Elmquist has held this position for the past two years, and in addition to the aid he has given in the carrying on of valuation work both by federal and state commissions he has served as representative of the state commissions in dealing with the Railroad Administration and has been instrumental in the elimination of difficulties which have arisen over the right of state and federal regulating bodies.

The principal addresses before the convention were delivered at the annual banquet held on the evening of October 15. The speakers were Director General Hines, who talked of the railroads under government control; Chairman Aitchison, of the Interstate Commerce Commission, who spoke of the transition from government to private control; Charles E. Elmquist, retiring president of the association, who spoke on state commissions, and Max Thelen, director of the Division of Public Service.

Director General Hines Reports on His Stewardship

Mr. Hines said in part:

"My experience in Washington has convinced me if I had not been convinced of it before that this country is too big a place to be run from Washington; I attach the very greatest importance to representation of the public through local agencies which are directly in touch with the people, so from the time I became director general I felt one of the important things to do was to endeavor to avail myself to the fullest possible extent of the assistance and support of the state utility commissions throughout the country. It is therefore gratifying to me at this time that I have this audience of the state utility and public service commissioners of the country, to whom I can render an account of my stewardship as director general of railroads.

The railroads of the country at the present time are handling a larger business than they handled last year, and the business they handled last year was larger than the business they had handled in preceding years. They are doing that at rates which represent a lower proportion of the value of the things transported than I believe has ever been true in the past. We know from experience that the price of nearly everything has gone up far more than the cost of its production has justified, but the price of transportation has gone up in less proportion than has the cost of producing it.

"It is hard to express adequately the scope of the work of the movement of troops. In the twenty months ending with August, 1919, there were seven billion passenger miles of service performed in the handling of troops in this country, and that was to a very large extent in addition to a practically normal passenger traffic.

Inadequacy of Equipment

"In spite of this enormous volume of traffic the freight traffic is larger now than it was at the same time last year and it was larger then than in preceding years, so we have a condition where we are unable to meet the demands for traffic. This has always been true in times of heavy volume of business, but there are some special and obvious reasons for the difficulty which now confronts the railroads in handling all the business which is being offered, and that is the inadequacy of facilities and especially of freight cars. The reason more facilities are not provided is that in the year or two preceding federal control of the railroads the normal addition to cars and other transportation facilities were not met, because prices were very high, labor was scarce, and financing on the part of the railroad companies was unusually difficult. When federal control began it therefore began with a railroad plant that was not as large as it ought to have been to handle the business. During the first year of federal control there was a severe limitation as to the amount of material that could be taken from other war purposes to use for providing additional railroad facilities. After the most careful study it was decided that the Railroad Administration could not hope to get material for more than a hundred thousand freight cars, and that was the number that was ordered, and even then we found it was so difficult to get the materials for these freight cars that very few of the cars could be constructed in the year 1918.

"When the year 1919 began we were confronted with a new difficulty in the way of adding to the facilities and that was that federal control naturally was approaching its end from the time the armistice was signed. The government was not in a position with the end of federal control in sight to provide new government funds to acquire additional facilities beyond what had already been provided. More than

that, the failure of the appropriation on the 4th of March last, which had been sought by the Railroad Administration to enable it to meet its obligations already incurred, postponed the construction of even the hundred thousand cars that had been ordered, because they could not be paid for, and the equipment companies naturally had to slow down on their production. The railroad companies were unwilling to furnish money for new equipment because of uncertainty as to their own future, so the result has been that the Railroad Administration during the year 1919 has not been in position to provide any additional facilities except those which were needed, as an emergency measure, unless the railroad companies were willing to furnish the money, and the result is that at the present time the Railroad Administration has been unable to order or obtain authority to order any cars in addition to the hundred thousand that were ordered last year. So that that inadequacy of facilities, which were inadequate before the federal control began, and which have become increasingly inadequate since that time, principally accounts for the fact that the facilities now are not sufficient to handle all of the enormous business which is offering to the railroads of the country. And yet, even with that, we are handling more business than we did last year, and then we handled more than we ever did before.

Facing a Grave Peril

"We are in a waiting and uncertain situation with reference to the provision of transportation facilities, and it is a matter of very grave concern to the country. I have no reason to believe that the business will not be heavy again next year, when the railroads will be back under private control and when they may find it difficult to pool their facilities and use them as fully as they can be and are used under a unified control. Now, if this period of uncertainty and waiting shall be prolonged for any considerable length of time the result is going to be that there can be no timely planning for facilities to handle next year's business. In my judgment, if the legislation cannot take definite shape during the month of December, so that the railroads will know where they stand, and can begin making their plans to get the additional facilities they will undoubtedly need to handle the business of next fall, the country will be most disastrously handicapped next fall in having its business moved, so I regard that as perhaps the most compelling reason why the legislation providing for the future of the railroads shall be pushed through with the greatest expedition, and shall be adopted not later than some time in December, because unless these plans can be entered upon by the first of the new year I do not see how they can be effectively brought to a realization in time to handle the heavy business of the latter part of next summer and the following fall. I say, I think this ought to be done in December, and that carries with it the implication of what the President has already announced—his intention to hand the railroads back to the owners on the thirty-first of December.

"Our handling of this larger freight business at the present time is being accomplished without some of the important aids which we had last year in dealing with this matter. One matter of very great importance last year was the zoning of coal, whereby we acquired a very much larger efficiency out of the coal equipment, because consumers were required to get their coal from nearby mines, and unnecessarily long hauls of coal were prevented. That naturally terminated with the war and the result has been that the old custom has again been resorted to, and the amount of car mileage now required to carry a given tonnage of coal in the country has been very greatly increased.

"Again, under the control of the Food Administration and with the patriotic zeal of the people we got a heavy car loading last year, which had never been realized before, and which admitted of the traffic being carried in fewer cars than before. We are doing what we can to accomplish heavy loading this fall, but we can hardly hope to get the result which could be and was accomplished under war conditions.

Moving the Grain Crop

"We are endeavoring as far as necessary by an emergency movement to provide whatever cars are required to transport grain to the capacity of the elevators. We are now making a study to find any elevator space that is not occupied, with a view to finding the cars and supplying them to haul grain until that space is filled and then to supply cars to whatever extent is necessary to keep the elevators filled. The extent to which the elevators can be relieved of grain will largely depend on the rapidity of the export movement, and that will depend on foreign buying, and on the ocean tonnage available, so that in the last analysis the speed with which the grain crop will move is likely to be controlled by export movement, and that in turn will be controlled by the foreign buying and by the ocean tonnage.

"There were a number of very complicated influences which had the result of bringing about an unusual proportion of bad order cars, in the early part of the summer. In June we gave instructions to overcome that difficulty. About the time those instructions got into effect we had the very serious and widespread strikes on the part of the shop men in the month of August, and that set back our program to a very serious extent, but beginning with about the middle of August we have rapidly overcome that position. We have diminished the number of bad order cars by about 45,000, and at the same time we have brought into service some of the new cars which we ordered last year, to the extent of about 40,000; so that the situation with respect to the number of cars available for service is rapidly improving, and yet the demands for services are apparently increasing more rapidly than the cars can be found for that service. All of which goes back to the condition that there are not enough cars in the country and that there will not be until we can get a definition of the situation on the basis to which the railroad companies can proceed to buy the additional equipment they need.

The Labor Situation

"You have heard a great deal, and should, about extreme cases of increases in pay to the railroad employees. In that, as in so many other things, it is the extreme cases that are dwelt upon, whereas in a matter of this sort we must look at the general situation. The general situation is that the average increases in rates of pay which have been made for railroad employees throughout the United States has been about 50 per cent over the rates of pay which were in effect in December, 1917. I have yet to learn of any important industry which has shown a more conservative average of increase in pay in the same time, in view of the war conditions which made increases in pay both proper and necessary, and while this increase in the rate of pay has been about 50 per cent, the increase in the earnings per individual has been less than that, because the number of hours the individual employee works is less than the number of hours he was working in December, 1917, under the war pressure then prevailing and under the longer hours which were then established.

"I am aware that it is the present habit to condemn labor unsparingly. I believe this is unjust. I believe most of the extreme positions which have been taken by labor have been the reaction from extreme and unjust positions which have been taken in the past by employers, and I believe, too, that a large part of the present manifestations on the part of labor are simply a part of the world-wide unrest that we see on every hand. I think it is unfortunate for us to drift into an attitude of settled antagonism to labor, because labor is a very important part of the community, and in the long

run we must find a proper modus vivendi whereby we can secure the proper co-operation with labor, and I believe, by patience and fairmindedness, as well as firmness, that that can be accomplished, and I think it is unfortunate and not in the public interest to develop a bitter hostility on account of these manifestations at present, which I regard as temporary and which are momentary growths of the unsettled conditions which have been the result of the war.

Examples of Improved Efficiency

"I believe there is the most earnest desire to find ways to improve the efficiency of railroad operation. And I want to give you a few illustrations, which are mere types of many things that have been done.

"At the outset of the Railroad Administration it was decided to make a careful check of the practices that obtained in the roundhouses, in the handling of locomotives, and the practices that obtained in handling locomotives in terminals. A most careful study was made of that subject and it was found that there was room for very considerable improvement, and the present indications are that we are saving from fifteen to twenty million dollars a year on account of improved methods of handling the locomotives in the roundhouses and at the terminals.

"Another matter that was taken up with great activity was the matter of fuel conservation, to get a better quality of fuel, to see that it was fired with more care, to see that greater efficiency was gotten out of it. The railroad officers and engineers, the firemen and trainmen, and the shopmen throughout the country were interested in that work. Conferences and discussions were held all over the country, and our present belief is that we are saving from twenty to thirty millions of dollars a year on account of the improvements that have been made in our conservation of locomotive fuel, without any reference to the conservation of fuel in stationary power plants.

"We undertook early in the Railroad Administration to adopt standard operating statistics, so as to bring out the various elements of railroad efficiency, and so that we could compare what was done on one railroad with what was done before, and what was done on one railroad with what was done on another railroad. The result is that these statistics, which had never before been developed for the railroads of the country, as a whole, have been so developed that many of the railroads now get information about their own operation which they did not have before, and all the railroads now have an opportunity to compare theirs with those of other railroads, which was before impossible.

"Another matter: In the spring I took up the proposition that the railroads were not in a position to supervise their expenditures for maintenance of way and structures, and expenditures for equipment, to the same extent and with the same success that they supervised their expenditures in the movement of trains. The regional directors took the matter up at my request, and each one held conferences with all his federal managers. They exchanged the minutes of their meetings, and the federal managers then held conferences with all their subordinates, and local committees were formed and there has been a study of ways and means to improve the efficiency of supervision in all maintenance matters, and that is where a very large part of the total operating expense is found. There has been a greater study of that phase of railroad administration than ever before in the history of the country, and there has been a reaching out to find new units of comparison, so that each officer can see whether his subordinates are using their labor and material to the best advantage, so that one operating division can be compared with another, and so that there may be more efficient supervision of the men themselves. And I believe that we are getting very important progress in that direction.

"The most progressive railroads had been doing things of this sort for years. We do claim that we did take advantage of a very broad opportunity that was given to us to develop a similar interest on the part of all railroads, and to develop a comparative interest as between different railroads.

"In addition to that we have been endeavoring to encourage the enlistment of the interest of the employees in these matters, because the employees see a great deal that can be improved upon, and we are trying to encourage a situation where they will feel encouraged to come forward with their suggestions and criticisms, and will feel that they will be welcome in doing so, instead of being criticised. My sincere judgment is that in all these matters that I have used for illustrations, as well as in a great many others, the things that have been done by the Railroad Administration, simply on account of the opportunity it had, and which the railroads themselves did not have before, are going to bear fruit in increasing measure for a long time to come.

Maintaining the Properties

"We have another branch to our work which is of supreme importance. We are charged with the task, representing the United States government, of settling with the railroad corporations, after two years of occupation of property worth, perhaps, sixteen to eighteen billions of dollars, or more, and with perhaps two hundred and twenty-five or two hundred and fifty thousand miles of railroad, with all sorts of incidental properties which have been included.

"We devised a standard form of contract which the railroad companies and the government entered into. Those contracts are necessarily complicated, because they deal with one of the most complicated of subject matters. The questions that arise under those contracts are bewildering in number, and in their complexity, and it will be a work of supreme importance, involving hundreds of millions, and even billions, of dollars of the government money in working out a proper and just final settlement.

"One of the most important phases of that subject is the question of the maintenance of the properties. The statute contemplates, and the standard contract provides, that the properties shall be turned back in the condition in which they were received. But the contract also provides that the government shall be deemed to have complied with the obligation if it shall have spent upon the properties the same amount that was spent on them during the test period of three years, for similar purposes, making due allowances for differences in prices of wages and use of the property. So that is one of our greatest problems, to maintain the properties up to what the contract contemplates, and to avoid over-maintenance. We have given that a great deal of study. We have had in many instances to cut down budgets that were proposed for railroad companies. On the other hand, it has been impossible, on account of the scarcity of materials which existed during the war, to obtain for all railroads all of the materials that they put on the properties during the test period.

"Broadly speaking, my judgment is that we will be able to show, at the end of this year, that in the aggregate we have spent on the property what the contract contemplates; that what we may be short in some respects has been made up in other respects. The general impression, which has been disseminated to a considerable extent, is that the railroads have been seriously under-maintained during federal control, is altogether erroneous, and the balance, one way or the other, will not be a large figure, considering the enormous amounts that are involved.

"Now, in addition to these problems, we have another one, and that is not a small one. That is the problem of effecting the transfer of these properties back to private control. That is a vastly more difficult problem than was that of the government in taking over these properties. I am particularly anxious that this transfer back to private control shall

be made without disturbing the public service, and without subjecting the traveler or the shipper to confusion or uncertainty as to how he shall conduct his business when the railroad companies resume control, which control will not be unified, and may not have the uniform practices which have prevailed during government control."

The reports made by the several committees to the association were all adopted, although in several instances they brought forth lengthy discussion. These reports are briefly as follows:

Valuation

The valuation committee of the association reported the status of valuation work in the United States during the past year and outlined briefly the work of the association's Bureau of Valuation in assisting the federal government in this work. The committee also recommended that, in view of the fact that many of the carriers will urge that the cost of reproduction new should be based upon the prices which have prevailed during the abnormal war period, all regulating commissions should begin now to give close attention to that question.

Railroad Rates in Inter-Mountain States

The special committee appointed to confer with the director general of railroads in reference to passenger rates on federal controlled railroads in the states of Arizona, Nevada and New Mexico with a view of having the rates in those states reduced from 4, 5 and 6 cents to the general basis of 3 cents per mile, reported the results of its conferences with William G. McAdoo and Walker D. Hines, and after outlining the financial result of this extra fare in Arizona, Nevada and New Mexico stated that the commission of the three states involved have decided to file a joint complaint before the Interstate Commerce Commission in the hope of obtaining a 3-cent per mile rate by attacking the interstate rates from and to those states. Immediately following the presentation of this report Commissioner F. A. Jones of the Arizona Corporation Commission introduced a motion that the convention go on record as opposing more than a 3-cent per mile passenger rate on any of the Class A railroads of the United States. A substitute motion was later presented by Mr. Jones, and when the attitude of the convention seemed to be fully against adoption of the motion it was withdrawn.

Special War Committee

The report of the special war committee dwelt largely on the action taken by its chairman and members on legislative questions in connection with the solution of the railroad problem. In addition the report outlined the efforts of this committee to adjust satisfactorily the status of state commissions as regulating bodies, and the recommendations made by the committee to the House and Senate committees investigating the railroad problem. The position taken by the committee was, in general, in opposition to any form of government ownership or operation of the railroads and in support of the Esch-Pomerene bill with amendments which would preserve the police powers of the state with respect to service, utilities, abandonment, extensions and rates, and also to the proper co-operation between state and federal authority. In addition, the committee recommended that the existing interstate and intra-state rates, fares, charges and classifications, be continued in force for a period not beyond July 1, 1921.

Railroad Service, Accommodations and Claims

"Inquiries made by your committee through the commissions of the various states," said the committee on the above subject, "disclose that owing to jurisdiction being limited largely to acting in an advisory capacity to officers of the federal Railroad Administration, state authorities have been unable to accomplish as much as might be hoped for with reference to an improvement surrounding railroad service and accommodations, and the handling of railroad claims during the past year.

"With respect to restoration of train service, particularly on branch lines, the attitude of railroad officials has been generally that the trains which were discontinued were those which were the least profitable, and in fact unprofitable, and that therefore these trains should not be restored. While these contentions as to unprofitableness are in many instances true, the convenience of the public has frequently been overlooked. The reasonable convenience of the public, to whom the carrier owes its first duty, should be the determining factor in such matters. Even though the passenger revenue derived from a particular train on a branch line may not indicate a profit, it will generally be found that the total revenues of all kinds received from traffic on the branch will amply justify the operation of passenger trains as a convenience of the public. The operation of passenger trains for the reasonable convenience of the public is a part of the price which the carrier should justly pay for the privilege of enjoying the generally profitable freight business of a branch line.

"With reference to the handling of package freight, there appears to be some conflict of opinion as to the results obtained by the 'Sailing Day' plan inaugurated by the Railroad Administration, and which was later curtailed to a large degree. In most instances where the plan proved a failure, it was probably due to inadequate freight house terminal and transfer facilities, which continue to be the biggest problem to contend with in the handling of package freight. Considerable objection is made against delays occasioned by holding package shipments until a minimum weight of 10,000 lb. has accumulated. However, in order to properly conserve equipment, it is doubtful if this practice should be discontinued.

"The establishment of more refrigerator car lines on way-freight runs, should be encouraged in every possible way. Commissions in the various states might properly co-operate with the state agricultural and marketing departments, with a view of having refrigerator car lines established, in order to get the excess overproduction of perishable food stuffs to populous centers.

"The closing of stations and the abandonment of unprofitable lines, both steam and electric, constitute a class of cases which appear to be steadily increasing before many commissions. The reported decisions indicate that all commissions grant the desired authority in such cases only with the greatest reluctance, and after showing is made of hopeless insolvency or long continued operation at a loss. A carrier should be permitted to forego its obligations to the public, only in cases of the most extreme urgency, and it is needless to say that the caution displayed by all commissions with respect to such cases, is to be highly commended.

"Claims for loss and damage, and overcharges, while apparently being handled more expeditiously on the part of some carriers, continue to be a constant source of annoyance and friction with others. Overcharge claims as in the past are occasioned largely through failure of agents and rate clerks t o properly revise billing. It appears a hopeless matter for agents at small stations to keep their tariff files in proper order, making it impossible to keep in touch with the current rates, even if the agent possesses sufficient knowledge to interpret a tariff. Some of the more progressive lines have a corps of tariff inspectors employed, whose duty it is to visit all stations frequently for inspection of the tariff file, and to instruct agents and rate clerks in the proper use of such tariffs. This work is to be commended in every way, as enabling employees to make correct quotations to the public, and eliminating many overchange claims.

"Complaints are made in some sections, of refusal of cer-

tain carriers to join with shippers in reparation claims, unless claimant can furnish proof of actual financial loss, the practice resulting in some instances in injustices to claimants.

"Complaint is also made that numerous carriers are going back in their records, over a period of several years, and digging up undercharges of all kinds, and presenting bills for collection. This entails in most instances a severe hardship on former consignees, who had no knowledge of the fact that their freight bills were incorrect, and who cannot now collect, in turn, by deducting from the invoice, or adding to the selling price of the merchandise involved. The enactment of statutes of limitation, fixing a reasonable time within which undercharge claims may be collected, would appear to be a proper matter for serious consideration on the part of legislative bodies.

"Public health officials and physicians of prominence have issued country-wide warnings of the danger of a recurrence of the influenza epidemic during the coming winter and spring. Railway stations and waiting rooms, and passenger coaches, where large numbers of people necessarily congregate, offer a fertile field for the dissemination of the germs of this dread malady. Your committee respectfully urges upon all commissions, the propriety of immediate action, with view of having all station buildings placed and kept in proper sanitary condition. It is further urged that after consultation with the health officials of your states, instructions be issued to railroads, to be promulgated to all agents, as to proper care of waiting rooms, with respect to ventilation, heating, disinfectants, etc., with a view of minimizing the chances for the spread of this scourge."

Public Ownership and Operation

There is now before Congress what is known as the Sims bill, embodying the so-called "Plumb Plan" for government ownership and labor operation of the carriers. It is apparent that so far as it has gone it has gained little support in Congress, and that it will not have serious consideration in the framing of railroad legislation. It is the most radical movement toward government ownership yet broached, but the fact that sentiment for it has been aroused and fostered by as well organized and widespread propaganda as can well be imagined has given it publicity which it does not merit. There is need, however, of the committee's calling attention to the fact that so deep-rooted in some quarters has become the belief in this measure by the use of propaganda that it must be combated by sane dissemination of information and not summarily dismissed as visionary.

We cannot fail, also, to note the growth of the nationalization idea in this country, especially in the middle west. North Dakota has made more rapid strides in socialization than any other state in the union. We will be able in a few years to judge dispassionately of the proposition.

The movement toward public ownership and operation has received succor from a wide variety of sources. The argument that the public should hold in its name the fee and title of those activities which serve the public and which the public regulates is an argument which many people accept as the last word on the subject. The argument that the public can do as it pleases with that which is its very own is in many quarters equally conclusive. One of the arguments that is seldom used, and never can be truthfully used, is that public ownership and operation is more efficient than private ownership and private operation. Instances do exist where a well-managed, publicly-owned property is more efficient than a poorly-managed, privately-owned property, but these are rare and do not in any way weaken the statement that the final desideratum in a public property is that degree of efficiency which is being obtained under private ownership and operation.

There has been considerably more agitation for public ownership during the past few years than ever before. The underlying reasons are many, and may perhaps all be traced back to the war and the conditions growing out of it. The reasons for the impetus given to the movement for public ownership and operation may briefly be summarized as follows:

1. The propaganda started by the governmental control of wire lines and railroads.
2. The failure of utility managements to meet the increased demands upon them.
3. The failure of regulatory bodies, either state or local, to sense the seriousness of situations and to give utilities the needed assistance in time to avert disaster.
4. The inherent thought with many people that public ownership and operation is a panacea for all ills.
5. Increased rates have had a great effect.

Your committee recommends that the members of this organization as individuals and as members of regulatory bodies keep awake to the tendency and see to it that whatever legislation is perfected to help solve the problem be the result of experience and study.

This report was not concurred in by all members of the committee, George R. C. Wiles, chairman of the West Virginia Public Service Commission, filing a supplemental report stating that the committee's report was not vigorous enough in its denunciation of government ownership; W. G. Busby, chairman of the Missouri Public Service Commission, objected to some of its clauses, and Lawrence B. Finn upheld its conservative language.

State and Federal Legislation

Your committee met in conjunction with the Executive and Special War committees, and the president of the association on two occasions in Washington deliberated for several days each time and attended congressional committee hearings at which the results of their conferences were presented.

The first meeting was in January, 1919, and the position taken is as follows:

First, that no general reconstruction of the laws relating to carriers should be attempted by the Congress then in session, but that certain remedial legislation was imperatively needed.

Second, that federal control of the carriers should be subjected to the authority of federal and state commissions as it existed prior to government operation.

Third, that the proposal to continue federal operation of the railroads five years beyond the ratification of peace treaties, and the wires indefinitely, be rejected, and that Congress provide in lieu thereof that the railroads be returned to their owners on December 31, 1919, and the wires on June 30, 1919.

Fourth, that the Commerce Act be amended so as to provide for co-operation between the Interstate Commerce Commission and the state commissions affected in the establishment of non-discriminatory state and interstate rates.

Fifth, power to merge all railroad operation into one system in times of stress or emergency should be lodged in some federal authority, but the conditions under which the authority may be exercised should be carefully defined and provision made for the return of the properties when such conditions cease to exist. Consolidations should be permitted when in the public interest as determined by the Interstate Commerce Commission on interstate roads and by the proper state authorities as to terminals and intrastate roads.

Sixth, the construction of additional railroad facilities should be limited to those required by public necessity and convenience, with concurrent jurisdiction over the subject in both state and federal authorities as to interstate roads and where the proposed construction substantially affects

interstate commerce. The states should have exclusive jurisdiction over spur and industry tracks.

Seventh, the issuance of securities by interstate carriers should be regulated by the Interstate Commerce Commission.

Eighth, the membership of the Interstate Commerce Commission should be increased or state commissions empowered to act as regional commissions under the federal commission.

Ninth, co-ordination of railway and water transportation systems should be provided for and the regulating tribunals empowered to fix minimum as well as maximum rates.

Tenth, shippers should have the right to route traffic except in cases of emergency.

Eleventh, the proposal to empower the Interstate Commerce Commission to fix the wages of railroad employees was disapproved as a serious interference with the efficiency of the commission along other lines.

Twelfth, the proposal to create a federal secretary of transportation was disapproved; also the federal incorporation of the carriers.

Thirteenth, in the event extensive consolidations of the carriers take place, a larger control by both nation and state was favored.

The second meeting of the Association committees was held on the Esch-Pomerene bill. The consensus of opinion of the members present was that, assuming the constitutionality of the bill, it would deprive the states of practically all their powers over the railroads and wires. This conference recommended several amendments to the bill.

On September 3, 1919, Senator Cummins, chairman of the Senate Committee on Interstate Commerce, introduced a bill, which, together with the Esch-Pomerene bill, is to become the foundation of national railroad legislation, in the opinion of your committee. The Esch-Pomerene bill, amended in harmony with the greater part of the suggestions made by your committees, is incorporated in the bill.

Your committee has been unable to confer as to the general wisdom of the bill, but we believe that it embodies the most practical plan of dealing with the railroads fundamentally that has so far appeared. The committee recommends, in view of the prestige the bill has by reason of its authorship, that the convention consider it in detail and take definite position as to all its provisions.

Grade Crossings and Trespassing on Railroads

In addition to recommendations in 1916 which were endorsed by the association, this committee strongly urges the adoption of standard signs showing the hours on duty of crossing watchmen and "STOP" signs which should be displayed when such crossings are left unprotected, similar to those approved by the Public Utilities Commission of Connecticut. It is very important to the public using the railroad crossings that dangerous crossings not protected by a watchman should be provided with movable warning signals or other devices.

With the popularity of the automobile as a medium of locomotion, there is a widespread demand for the elimination of grade crossings or the separation of grades, especially in populous communities where trains pass frequently and where the physical conditions are such as to prevent a clear view of approaching trains. The public welfare certainly requires that there should be some protective device at all dangerous crossings to warn the unwary. It would seem advisable to carry out the recommendations of your committee in 1916 in reference to the installation of uniform crossing signs, supplemented by automatic warning signals at grade crossings where traffic is more or less continuous and no flagman or crossing gates are maintained, and standard signs showing the hours on duty of crossing watchmen. Every crossing should be plainly marked if it is only to be the familiar crossed arms and sign "Look out for the Cars."

Force stop rises or humps in the road or a pile of rocks in the center of the highway calling attention to the proximity of a grade crossing undoubtedly do a good job of abruptly checking the speed of an automobile bowling along toward the crossing at a lively clip, but they are at best crude devices and temporary expedients. It is questionable whether they are more of a menace than an aid to safety. The carriers in the opinon of this committee should spare no pains in making their crossings safe, and at crossings in cuts there should be dugouts or yards to provide an avenue of escape in the event of an impending collision. It might be well to have all crossings at right angles where possible as a further means of safety to give a motorist or driver an opportunity of getting out of a tight place should such an emergency arise.

Some of the states already have laws providing for the prorating of expenses incurred in the elimination of grade crossings, for the removal of the old crossing and the establishment of a new roadway. The commissions of most states probably can apportion the expense between the railroad companies and the public when grade crossings are ordered eliminated or separated.

Practically every state in the Union has a law or laws designed to prevent trespassing on railroads and providing penalties for violation. However, judging from the large number of trespassing accidents occurring annually, it would appear that these statutes are not strictly enforced. It is out of the question to expect the railroad companies to police their entire rights of way to guard against trespassing. Every effort should be made to co-operate with the railroad companies in suppressing the trespassing evil and curtailing the casualties resulting therefrom.

Statistics and Accounts of Railroad Companies

We recommend that a resolution by the convention be adopted that will provide that operating expenses of steam railroads shall be divided between states on the following bases:

1. Maintenance of way and structure expense accounts shall be charged to the state in which the expense is incurred. All other maintenance of way and structure expenses which are incurred for the common good of a railroad system shall be divided between states on the basis of the allocated expenses for this group of accounts found chargeable to the several states through which the system runs.

2. Maintenance of equipment group of expenses as to yard engines shall be charged to the state in which the engine performs service. Maintenance of road locomotives shall be charged to the state in which the service is wholly performed, on train divisions which overlap state lines, the expense of maintaining such engines shall be apportioned between states on the locomotive miles made by the locomotive in each state. The expense of maintaining passenger train cars shall be divided between states on the car mile basis, for the different classes of passenger train cars stated in the Interstate Commerce Commission's accounting circulars, which require railroad companies to state separately the mileage of passenger train equipment. The expense of maintaining freight and work train equipment shall be divided between states on the freight car mile basis.

3. The traffic group of expenses shall be charged to the state in and for which the services are performed as far as possible; all other expenses of this group of accounts shall be divided between states on the basis of the allocated expenses found for the traffic expenses for each state.

4. The transportation group of accounts shall be charged to the state in which the services are performed; such accounts as station wages and expenses, yard wages and expenses, road train operating expenses that run over train divisions which lay wholly within one state, should be charged to the state affected. On train divisions which run

crossed the state line the expenses of operating such trains shall be prorated between states on the train mileage basis of the trains affected. All other transportation expenses which cannot be allocated by states shall be divided between states on the allocated expense basis found for the transportation group of accounts.

5. The expense of operating dining cars shall be divided between states on the dining car mile basis.

6. The general expense group of accounts shall be divided between states after all expenses incurred in and for an individual state have been charged to that state, on the basis of the found allocated expenses for the several groups of accounts, maintenance of way and structures, equipment, traffic, transportation, and dining car services.

Accrued city, county and state taxes shall be charged to the state in which the taxes are accrued. All other taxes shall be prorated between states on the basis of the allocated taxes.

The hire of equipment, debit or credit, shall be divided between states on the ratio of the freight train car mileage in each state to the total freight car lines of the system.

We further recommend that the convention go on record as favoring the following plan or method for dividing operating expenses between freight and passenger services after said expenses have been divided between states.

1. Maintenance of way and structure group of accounts shall be charged direct where possible to the class of service for which the expenses are incurred. By this we mean that the expenses of maintaining freight yards shall be charged to freight. The expense of maintaining passenger stations should be charged to passenger, and exclusively freight depots should be charged to freight service. Station buildings used in common for both classes of traffic should be divided between freight and passenger on the space occupied basis. All expenses incurred for the maintenance of railway and track structures used in common shall be divided between passenger and freight on the "gross ton mile" basis. The expense of maintaining roadway buildings such as water tanks and coal chutes, shall be divided between freight and passenger on the gross ton mile basis.

2. Maintenance of equipment expenses shall be charged direct to the class of service for which the expenses are incurred. Road locomotives that perform mixed freight and passenger services shall be divided between the two classes of business on the gross ton mile basis of the trains affected. The expense of maintaining yard engines shall be divided between freight and passenger on the switch engine hour basis.

3. Traffic expenses shall be charged direct to the class of service for which the expenses are incurred; where possible, the common expenses shall be divided on the allocated expense basis for this group of accounts.

4. Transportation group of accounts shall be charged direct where possible to the class of service for which the money is expended. The train despatchers and telegraph operators shall be divided between passenger and freight on the revenue train mile basis. Station employees' wages and expenses that cannot be charged direct shall be divided between freight and passenger on the time employed basis. The yard group of expense accounts shall be divided on the switch engine hour basis. All other unallocated expense accounts in this group of accounts shall be divided on the found expenses freight and passenger in the transportation group of expenses.

5. Dining car expenses shall be charged direct to passenger service.

6. General expenses shall be divided between freight and passenger on the found expenses for all of the other group of accounts described in former paragraphs on this subject.

We further recommend that the convention adopt a resolution recommending to the Interstate Commerce Commission that that commission change their present accounting rules so that the money spent for the maintenance of equipment where the car or engine is given a general overhaul, be charged to the depreciation reserve account.

Resolutions Adopted at Closing Session

The following resolutions regarding the railroad problem were adopted at the closing session of the convention:

"The thirty-first annual convention of the Railway and Utilities Commissioners, in convention assembled at Indianapolis, Ind., being fully advised as to the purpose for which the railroads were taken over by the government and the results of its operations; and being of opinion that the war emergency is now over and that there is no need for the further continuation of the government control of railroads, declares itself in favor of the return of the railroads to private ownership and operation not later than December 31, 1919. The transition from federal to private control should be made with as little disturbance as possible. Realizing that the immediate restoration of pre-war intrastate rates would result in violent discriminations between intrastate and interstate commerce, we thus recommend that the existing interstate and intrastate rates, fares, charges and classifications initiated by the director general may continue in force for a period not beyond July 1, 1921, unless sooner changed by the state or federal authorities.

"Congress is now considering remedial railroad legislation. We believe that certain principles should be incorporated into the law and do earnestly recommend the favorable consideration of the following:

"We favor the prompt merger, without friction, of all the carriers' lines, facilities and organizations into a continental and a unified system in times of stress or emergency.

"We favor the merger, within proper limits, of the carriers' lines and facilities in such part and to such extent as may be necessary in the public interest to meet the reasonable demands of our domestic and foreign commerce. Consolidations of interstate lines or systems should be made with the approval of the Interstate Commission, with ample provision for proper state authorities to appear and be heard for or against the proposition.

"We favor the consolidation of terminal facilities whenever the public interest will be promoted thereby. In these matters the local state authorities are in a better position to pass upon the merit of the question than a federal body and, therefore, we suggest that such consolidation should not be made without the approval of local authorities. In passing upon consolidations, the public officers should have due regard to the value of competition.

"We favor the limitation of railroad construction to the necessities and convenience of the public and believe that no new construction should be permitted without the issuance of a certificate of public convenience and necessity.

"If the construction is for a line passing between two or more states, there can be no objection to having the federal authorities approve the same, but its action should be in addition to and not exclusive of the action of local authorities.

"Federal authority over this subject should not extend to the construction of sidetracks, spur, industry, team or switching tracks, street cars and electric interurban lines or the extensions of lines to be located wholly within one state.

"We favor the control of the securities of interstate lines by the federal government under such laws, rules and regulations as will require copies of the applications to be filed with the proper local authorities in the states through which the lines operate.

"In respect to this question we do not believe that the power should apply to street car companies or electric interurban companies nor should it apply to telephone or telegraph companies, the major portion of whose physical prop-

erties, devoted to public use, measured by its value, is located within one state.

"We favor the development and encouragement of inland waterways and co-ordination of railroad land and water transportation systems.

"We believe that employees of public service corporations should be adequately compensated and that rates should be established on a basis which will permit the payment of just wages. Public service should not be jeopardized by strikes or lockouts. The responsibility of capital and labor is equal. Each owes to the public the highest measure of duty. Thus, we favor the development of some plan for the final determination of wage disputes.

"We favor the creation of a transportation board charged with the duty of making a comprehensive study of transportation conditions, rail, water and highway, including consolidations of railroad systems and terminals. The conclusion of this board should be submitted to the Interstate Commerce Commission and its functions should be wholly advisory.

"We do not believe that a transportation board should be given any of the jurisdiction which is now exercised by the Interstate Commerce Commission over rates, valuation, accounting, car service, safety appliances or any other duties now embraced by statute.

"We are opposed to federal incorporation of railroads, either permissive or required.

"In view of the inherent social and practical objections to the establishment of a definite guaranteed return to private service corporations, we wish to record ourselves as unalterably opposed to such a plan.

"Under any form of regulation, due consideration must be given to the necessity of preserving local control over the rates, service, accounting, extensions and abandonment of the properties employed in public service.

"We iterate the resolutions heretofore adopted by this convention favoring co-operation between state and federal authorities in respect to rates.

"Proper co-operation between these officials will eliminate, to a very great extent, unjust discrimination which may exist between state and interstate rates."

Other Business

A special committee appointed to select a place for the 1920 convention reported that it had decided upon Washington, D. C. The date set for the next national gathering of the commissioners is November 9, 1920.

The election of officers resulted in the selection of the following men, each by a unanimous vote: President, Walter A. Shaw, commissioner, Illinois Public Utilities Commission; first vice-president, James A. Perry, commissioner, Georgia Railroad Commission; second vice-president, Carl E. Jackson, chairman of the Wisconsin Railroad Commission; secretary, James B. Walker, secretary of the Public Service Commission of New York (First District), and assistant secretary, L. S. Boyd, librarian of the Interstate Commerce Commission, Washington, D. C.

The movement of wheat over the lines of the Atchison, Topeka & Santa Fe, in Texas, New Mexico, Oklahoma and Kansas was greater during November than any similar movement in the history of the Southwest. Much of the grain was loaded from heaps on the ground and the total movement was about 2,000,000 bushels, principally to Galveston, for foreign shipment. A total of 3,693 cars were moved from Texas and New Mexico during the last week of the month. It is estimated that there are still approximately 1,000,000 bushels on the ground waiting to be moved in Texas and about 500,000 in Kansas.

Train Accidents in September

THE FOLLOWING is a list of the most notable train accidents that occurred on the railways of the United States in the month of September, 1919:

Collisions

Date	Road	Place	Kind of accident	Kind of train	Kil'd	Inj'd
10.	Monongahela	Brownsville	bc	F. & F.	1	2
15.	Balt. & Ohio	Brooklyn	bc	F. & F.	0	6
21.	Phil. & R'd'g	Acorn	bc	P. & F.	1	8
23.	A., T. & St. F.	Kennedy, N. M.	bc	P. & F.	0	42
29.	Central N. Eng.	Holmes	rc	F. & F.	3	7

Derailments

Date	Road	Place	Cause of derailment	Kind of train	Kil'd	Inj'd
1.	Atlanta, B. & A.	Fitzgerald	washout	P.	2	14

28.	Southern Pacific	Salinas, Cal.	exc. speed	P.	2	40

Other Accidents

Date	Road	Place	Cause of accident	Kind of train	Kil'd	Inj'd
*17.	Louisville & N.	Hygeia	boiler	F.	1	1

The trains in collision on the Monongahela Railroad, near Brownsville, Pa., on the 10th, were through freights, the trains meeting on a curve while running at a moderate speed. There was a dense fog at the time. One trainman was killed and two were injured.

The trains in collision near Brooklyn, Ohio, on the 15th, were westbound freight No. 97 and eastbound No. 60, second section, the latter consisting only of a locomotive and two cabooses. The enginemen and firemen jumped off and escaped, but six trainmen were injured. The cause of the collision was the failure of No. 97 to regard the superior right of the opposing train. Train No. 97 was on a side track at Willow, about 4 miles east of Brooklyn. No. 60 was a first-class train, and the first section sounded the whistle to warn the westbound train to wait for the second section. The engineman claims that this whistle was given at both the front end and the rear end of No. 97; the men at the front end say that they did not hear it, and they also failed to observe the flags on first 60; the men at the rear of the standing train did hear the whistle, but nevertheless they took no action to prevent the engineman from moving forward on the main track; and the collision occurred 1½ miles east of Brooklyn.

No. 97 was a train of about fifty cars, and as the side track was not long enough or it, a flagman had to be sent out to stop first No. 60; the engineman of No. 60 acknowledged the flag, but there was conflicting testimony as to whether he sounded the whistle again until he reached the rear end of the freight train. In or near the freight caboose there was a pilot, who saw the green flags on the passenger train and communicated by word of mouth with men on the passenger train, and with the rear brakeman of the freight; but neither the pilot nor the brakeman took any action to prevent their own train from proceeding. The train might readily have been stopped by the use of the conductor's valve in the caboose. The flagman claims that he swung his red flag as a stop signal, but the line of road is curved and he did not know that any one at the front end of the train saw his signal. He and the pilot assumed that the engineman and the conductor (who was on or near the engine) had probably received some order from the passenger train. The freight had moved forward and cleared the main track before the passenger reached the east switch.

The train despatcher, in issuing orders to the freight had

rc, Rear collision——bc, Butting collision——xc, Other collisions——b, Broken——d, Defective——unf, Unforeseen obstruction——unx, Unexplained——derail, Open derailing switch——ms, Misplaced switch—acc, obst., Accidental obstruction——malice, Malicious obstruction of track, etc.——boiler, Explosion of locomotive on rad——fire, Cars burned while running——P. or Pass., Passenger train—F. or Ft., Freight train (including empty engines, work trains, etc.)—Asterisk, Wreck wholly or partly destroyed by fire——Dagger, One or more passengers killed.

furnished no copy for the pilot, explaining this by saying that he thought the conductor was better qualified for duty on that part of the road than the pilot was. The pilot had protested, when called, that he was not fully posted on the characteristics of the line, but he was told that the trainmaster said he must go. On reaching the train the conductor told the pilot that he did not need a pilot. Sometime after the freight had started from Willow the pilot asked the conductor, who had just come back from the front end of the train, where he was going for second No. 60; the conductor said that they were going to R D Tower, and that "second No. 60 has better stay there." The pilot, even then, did not ask to see the conductor's orders; he, the conductor, had been on that run for six or seven months and, said the pilot, must know more about the work than himself.

The men in charge of the freight train had been on duty about 13 hours, and all of the men, of both trains, were experienced and with long records of satisfactory service, except one brakeman; but the conductor and the pilot of the freight had been disciplined for not properly protecting their trains by flag, and the engineman of the freight had been responsible for a rear collision.

The investigator for the Interstate Commerce Commission concluded that all of the men involved had been inattentive to their duties; and he did not attempt to clear up all of the discrepancies in the statements of those who testified.

It appears that space interval rules are in force on this part of the road for the protection from each other of first-class trains moving in the same direction; and second No. 60 was held at R D Tower, the first office west of the point of collision, until first No. 60 had passed South Park, the first office east of the point of collision.

The trains in collision near Acorn, Pa., on the 21st were southbound passenger No. 112, and a northbound extra freight. The fireman of the freight was killed and eight passengers were injured. The collision was due to failure of the men in charge of the freight to observe, by the schedule of train No. 112, that it ran on Sunday. These men, Howard Long, conductor, and William Andrews, engineman, were tried in court on a criminal charge; and at Norristown, on November 15, they were sentenced each to six months' imprisonment.

The trains in collision near Kennedy, N. M., on the 23rd, were a westbound passenger and an eastbound locomotive without train. Forty-two passengers were injured, none of them very seriously. The collision was due to forgetfulness on the part of the engineman of the eastbound locomotive, who overlooked a train order.

The trains in collision on the Central New England at Holmes, N. Y., on the 29th, were an eastbound extra freight, and a train ahead of it consisting of two locomotives and one caboose, the caboose being occupied by a number of trainmen who were being carried to their homes deadhead. The freight, disregarding a stop signal, and also because not properly warned by the flagman of the leading train, ran into the caboose, and eight train-service men were injured, three of them fatally. Two other trainmen were injured by jumping off the engine of the freight just before the collision.

The train derailed on the night of the first of September, near Fitzgerald, Ga., was northbound passenger No. 20. The engine and first two cars were derailed at a washout and fourteen passengers were slightly injured.

The train involved in the accident on the Merchants Bridge, St. Louis, Mo., on the 18th, was an eastbound freight of the Wabash Railroad. One of the three locomotives at the rear of the train was thrown off the track while on the bridge and fell 50 ft. to the ground below. The engine turned over in its descent and as it fell against a pillar at or near the ground the steam dome was knocked off and the boiler exploded. The engineman and fireman were killed. The bridge was slightly damaged. The engine was derailed by the lifting of the wheels off the track on one side by the breaking of the main rod, the rod striking against a tie.

The train derailed at Black Oak, Tenn., on the evening of the 21st was southbound passenger No. 16, consisting of a locomotive and seven cars well filled. The engine and five cars were thrown off the track by a broken rail. Six passengers and one trainman were injured.

The train derailed near London Mills, Ill., on the evening of the 21st was a westbound freight. The engine was derailed by the breaking of a tender-wheel and with six loaded cars fell through a trestle bridge. The engineman and one brakeman were killed.

The train derailed near Confluence, Pa., on the morning of the 23rd was eastbound passenger No. 8. One of the two locomotives drawing the train, and the smoking car, were overturned. One fireman was killed and one engineman fatally injured. The collision occurred about 2 a. m.

The train derailed near Petersburg, Va., on the night of the 27th was southbound through passenger No. 5. The engine was thrown off the track at a switch, and with four freight cars and two baggage cars was overturned, the speed of the train at the time being about 40 miles an hour. The engineman, fireman, and one trespasser were killed. The derailment was due to malicious displacement of some part of the switch.

The train derailed on the Kansas City, Mexico & Orient, near Foard City, Tex., on the 28th was northbound passenger No. 4. Three coaches were overturned, and twelve passengers were injured.

The train derailed on the Southern Pacific near Salinas, Cal., on the 28th of September, was northbound passenger No. 77, first section. The engineman and fireman were killed, and 40 passengers were injured, most of the injuries being reported as slight; damage to cars and engine about $15,000. The train was running at excessive speed on a 10-degree curve.

The train involved in the accident at Hygeia, Tenn., on the 17th was a northbound freight. While it was standing in front of the station, preparatory to entering a side track, the boiler of the locomotive exploded, and several freight cars and the station building were set on fire. The fireman was killed, and the engineman injured. The explosion was due to low water.

Electric Car Accidents.—Of the eight serious accidents to electric cars, reported in the newspapers as having occurred in the month of September, two resulted fatally, a butting collision near Worcester, Mass., on the third, in which one person was killed and nine were injured, and a similar collision at Gary, Ind., on the 25th, when a motorman and one passenger were killed and about 50 passengers were injured. Both are reported as due to failure of block signals.

The Headquarters Yard "Goat" at Hailor, Mongolia, Where Some of the Russian Railway Service Corps Are Still Stationed

Doings of the United States Railroad Administration

Deficit for Ten Months—Regional Directors Given Authority to Curtail Passenger Service

The government's deficit from the operation of the railroads for the 10 months of this year ending October 31, as compared with ten-twelfths of the standard return guaranteed to the companies, was $269,768,158, according to a preliminary estimate issued by the Railroad Administration. The net operating income for the 10 months was approximately $479,000,000, as compared with the guarantee for that period of approximately $748,000,000.

In order to break even with the standard return it would be necessary to earn over $400,000,000 more of net operating income in November and December. In 1918 the net operating income for those two months was only about $85,000,000 but it was reduced by retroactive wage increases. The net operating income for October, in which the volume of traffic handled was greater than for October, 1918, or October, 1917, was about $77,000,000, whereas for October, 1918, it was about $87,000,000. After making allowance for the per diem balance, which will not appear until the November accounts are compiled, the Railroad Administration statement estimates that the net operating income for the month would be about $86,000,000. This does not reflect the loss of traffic caused by the coal strike but it does reflect extraordinary expenses incurred in making preparation for it. The statement authorized by the director general follows:

"Detailed statistics will shortly become available of the operating results for the month of October for practically all class 1 railroads and large terminal companies in federal operation. Those results are substantially affected by several abnormal conditions, two of them operating to understate the revenues and two operating to make the expenses more than normal. The revenues are understated by about $9,000,000, first, because beginning with the month of October per diem charges for the use of freight cars were reinstated with the result that in October there were approximately $6,000,000 included in car per diem debits while the corresponding car per diem credits which inure on this account to other railroads in federal operation on account of October transportation will not appeal until November, and second, because a large amount of revenue, estimated to be not less than $3,000,000, from coal traffic transported in October does not appear in that month because, on account of the impending coal strike, such coal traffic was held in transit in the last few days in October and the revenues shown on the waybills relating thereto where not taken in the revenues for the month. Taking these two conditions affecting revenues into consideration there would be a net operating income for the month of October, 1919, of about $86,000,000, but the results as shown by the reports for the month are about $77,000,000. The operating expenses were abnormally large, first, because of an extraordinary shifting of open top equipment in order to furnish the maximum number of cars to be loaded with coal in the two weeks immediately preceding the coal strike and, second, because of exceptional expenditures for maintenance of equipment growing out of the prevention of a normal amount of repairs in August on account of the unauthorized strikes of the shopmen. It is not practicable, however, to make a reliable estimate as to the effect of these two abnormal increases in operating expenses, although they are believed to amount to several million dollars.

"Last month a statement was made showing what the net gain or loss was by months from May to September, inclusive, after redistributing to those various months the appropriate charges on account of the back pay to shopmen. That table is repeated, together with a showing for October, taking into consideration in the last mentioned month the additional $9,000,000 of revenue which is not actually reflected on account of the two conditions above referred to:

Month	Net gain	Net loss
May	.....	$37,642,128
June	.....	26 031.860
July	.....	2,031,547
August	$12,397,112	.....
September	19,000,000	.....
October	11,000,000	.....

"The net gain or loss for these properties by months for the present calendar year, on the basis of the accounts as they stand is as follows:

	Net Gain or Loss to the Government after allowing for one-twelfth of the annual rental	
Month	Net gain	Net loss
January	.....	$57,782,557
February	.....	65,439,850
March	.....	64,881,856
April	.....	48,757,056
May	.....	33,642,128
June	.....	22,031,800
July	$1,968,453	.....
August	16,397,112	.....
September	2,392,584	.....
October (Estimated)	2,000,000	.....
Net loss for ten months		$269,768,158

"The following comparison of net ton miles per mile of road per day indicates that the freight business during the month was greater than in October, 1918, and October, 1917, and about the same as in September, 1919.

	Revenue and non-revenue ton miles per mile of road per day		
Month	1919	1918	1917
January	4,275	3,878	4,770
February	4.002	4,591	4,511
March	4,059	5,273	5,192
April	4,134	5,471	5,257
May	4,524	5,226	5,617
June	4,615	5,423	5,694
July	4,878	5,487	5,441
August	5.075	5,691	5,351
September	5,625	5,731	5.217
October	5,651	5,584	5,385
Ten months ended October 31	4,687	5,234	5,168

"The preliminary reports on passenger traffic during October indicate a substantial increase over October, 1918, so that both freight and passenger traffic were greater than last year."

The Fuel Situation

Hopes that the offer of a 14 per cent increase in wages would induce a considerable number of the striking coal miners to return to work seem to have been disappointed. Although there has been a gradual increase in coal production the coal loading for Monday, December 1, was only 40 per cent of normal and the highest percentage reached on any day has been 48 per cent. Production was 42 per cent of normal on Tuesday. Director General Hines announced on Tuesday that with a view to the further conservation of coal by the Railroad Administration the regional directors had been instructed to review the situation carefully and had been authorized to eliminate passenger trains which can be spared with the least inconvenience to the traveling public. It was also announced that in pursuance of Dr. Garfield's order instructions had been issued placing coal transported on the inland waterways on the same basis as coal handled

by rail, that is subject to allocation by the Railroad Administration coal committees.

The 40 per cent of normal coal production allows practically no coal to be distributed to industries which will be obliged to shut down when their reserves are exhausted, and some of them have already had to do so. The available new supply is only about sufficient for the railroads, public utilities and retail dealers. The requirements of the railroads are being gradually reduced as traffic is diminished. The use of coal for coking has been reduced by 25 per cent.

None of the winter resort trains to the South scheduled to be put in service before January 1 will be put on.

Overtime Pay for Express Employees

In amendment No. 1 to Supplement No. 19 to General Order No. 27, issued on November 22, by Director General Hines, effective November 16, it is ordered that the following articles shall supersede and be substituted for the articles of the same numbers in Supplement No. 19 to General Order No. 27, applying to employees in express service in federal operation. Except as changed hereby, Supplement No. 19 to General Order No. 27 remains in full force and effect.

Article VII.—Overtime and Calls

(a) For all employees, excepting these coming within the provisions of Article VI, Section (b), Supplement No. 19 to General Order No. 27, and Article VIII of this order, time in excess of eight hours, exclusive of meal period, on any day will be considered overtime. When the full number of hours per week (produced by multiplying by eight the days of the weekly assignment) are worked, overtime will be computed at the rate of time and one-half time. Where the total hours worked in regular assignment do not equal the number of hours so produced, overtime will be computed pro rata until the weekly period is fulfilled; thereafter overtime will be computed at the rate of time and one-half time.

It is not the intention of this section to change the number of days upon which the present monthly or weekly wages are based.

(b) For employees coming within the provisions of Article VI, Section (b), Supplement No. 19, the first two hours of overtime accruing after eight hours of service within the spread of twelve hours shall be computed pro rata, and thereafter (including overtime after 12 hours) at the rate of time and one-half time on the actual minute basis.

(c) Employees who are notified or called to work outside of the eight consecutive hours, exclusive of the meal period and continuous service, constituting their regular assignment, shall be paid a minimum allowance of two (2) hours at time and one-half time for 2 hours work or less; if held over 2 hours, time and one-half will be paid, computed on the actual minute basis.

(d) Exclusive of employees whose regular assignment includes Sundays or holidays, employees notified or called to work on Sundays and or holidays will be paid not less than a minimum allowance of two (2) hours at time and one-half time for 2 hours work or less, and thereafter on the actual minute basis at the pro rata hourly rate. When the entire number of hours constituting the week-day assignment are worked, they shall be paid for at the pro rata hourly rate up to eight hours service, with time and one-half thereafter on the actual minute basis.

(e) Employees will not be required to suspend work during regular hours to absorb overtime.

Article VIII.—Hours of Service and Overtime Rules.

Train Service Employees

(a) For all employees in the train service, except those in combination service as defined in Article IX of Supplement No. 19 to General Order No. 27, two hundred and forty (240) hours or less in regular assignment shall constitute a basic month's work. Deadhead hourage properly authorized to be counted as service hourage. Time for trip of employees up to designated scheduled time of first station shown in working time-table after midnight on a car scheduled to leave prior to 12 o'clock midnight of the last day of a month will be credited to the month in which the train handling the car is scheduled to leave.

(b) Train service employees included in the preceding Section shall be paid overtime on the actual minute basis for all time on duty each month in excess of two hundred and forty (240) hours at the rate of time and one-half times the hourly rate which shall be determined by dividing the monthly wage by 240. Time shall be counted as continuous for each trip from the time required to report for duty until released from duty, subject to the provisions contained in the last sentence of Section (a) of this Article. Even hours shall be paid for at the end of each day period; fractions thereof shall be carried forward.

(c) Extra employees performing road service in the place of a regularly assigned employee or on an extra assignment shall be paid the compensation a regularly assigned employee would receive for the same service, which will be determined, in the case of a regularly assigned run or trip over the same district, by dividing the monthly wage by the number of trips (initial terminal to final terminal) required for a month's work; for a trip where there is no regular assignment the compensation will be determined by multiplying the time on duty by the following rates per hour:

Express messengers .....50c.
Express messenger helpers.....40c.

The minimum allowance for a trip where there is no regular assignment will be eight hours. For the purpose of calculating time under this Section, where time end at first station shown in working time-table after midnight, the trip will not be considered as completed until released at terminal.

Article X.—Relief Period

Not less than 96 hours off duty each calendar month in 24 consecutive hour periods, or multiples thereof, will be allowed at designated home terminal for employees specified in Article VIII whose assignment and service do not permit of at least 12 hours off duty period at their designated home terminal each 48 hours. Employees required to work on assigned lay-over days will be paid extra therefor on the basis provided in Section (d) of Article VII.

Consolidated Classification to Be Put Into Effect

The director general has authorized the publication and filing with the Interstate Commerce Commission, effective on December 30, 1919, of Consolidated Freight Classification No. 1, which is a reissue in one volume of the Official, Southern and Western classifications.

This new classification, which is a substantial step toward uniform classification, is published in accordance with the Interstate Commerce Commission's recommendation in the Consolidated Classification Case, in which the commission approved the uniform rules, descriptions, minimum weights and package requirements as proposed by the classification committee of the Railroad Administration, but did not approve the changes proposed in ratings except as the establishment of new items may indirectly effect changes, and such as may be a reasonably necessary part of the establishment of uniform descriptions, specifications, or minimum weights.

In publishing this new classification the director general has followed all of the recommendations of the commission, except that he has modified Rule 10, applying on mixed

car loads, so that in Southern and Western classification territories the provisions of the rule are applicable only in connection with class rates. This modification has been made in response to the request of many shippers that the mixed carload rule should not be made effective in those territories. The rule as adopted will provide uniformity in all territories as to shipments moving at class rates, but in the South and West the exception on commodity rates will make no change in the movement of freight taking commodity rates, of which there are many more in the South and West than in the East or Official Classification territory, and it is believed that this modified rule will more nearly fit the different conditions and meet with more general approval by the shippers than would the rule as proposed by the classification committees.

Through Export Bills of Lading Via North Atlantic Ports

On June 28 announcement was made that an understanding had been reached between the Railroad Administration and practically all the steamship companies operating on the Pacific coast under which those companies would assume any demurrage or storage charges for which they might be responsible in connection with through export bills of lading issued by the railroads under federal control through those ports, that understanding to be effective as soon as tariffs could be published. At the same time announcement was made that a similar understanding had been reached with Osaka Shosen Kaisha, which had recently inaugurated service between the port of New Orleans and the Far East. It was stated that negotiations to bring about a similar understanding with steamship companies operating from Gulf and South Atlantic ports were being conducted and also that efforts made by the Railroad Administration to bring about the same understanding as to North Atlantic ports had up to that time proved unsuccessful, the steamship companies serving North Atlantic ports having failed to assume the storage or demurrage as had been done with regard to Pacific ports. It was added that in order to go as far as possible to meet the desires of exporters and pending further discussions with steamship companies, the Railroad Administration was making arrangements to issue instructions to restore through export bills of lading via North Atlantic ports on the basis that prevailed prior to January, 1918; namely, that through bills of lading would be issued to shippers who would agree to assume any demurrage or storage charges which might accrue in accordance with published tariffs.

Announcement is now made that in pursuance of an agreement entered into between the Railroad Administration and the Shipping Board through export bills of lading will be issued in connection with the Shipping Board or its agents under practically the same conditions outlined. The following is the basis of the arrangement agreed upon with the Shipping Board:

Through export bills of lading will only be issued when founded on written ocean contract, and then only when shipper gives written guarantee that any demurrage or storage charges accruing at the seaboard will be paid (see Exception).

Exception

In pursuance of an agreement entered into between the United States Railroad Administration and the United States Shipping Board, through export bills of lading will be issued in connection with the United States Shipping Board and or its agents on the following basis:

1. Through export bills of lading will be issued when founded on written ocean contract with the United States Shipping Board and or its agents.

2. Carload freight covered by through export bills of lading issued in connection with the United States Shipping Board and or its agents will be held in warehouse, or, at option of carriers, in cars, (free of charge at the port of exit for a period of not exceeding 15 days, exclusive of date of arrival).

3. In the event of the omission or failure of the United States Shipping Board and or its agents to clear carload freight on any vessel for which booked, all demurrage or storage charges accruing after the period of free time of 15 days shall be paid by the United States Shipping Board.

4. If the rail carriers fail to transport shipments regularly booked to the port in time to clear on steamer for which specifically booked, demurrage or storage charges will not apply until announced date of the steamer on which it is again booked, after which the liability of the United States Shipping Board will be the same as in connection with the original tranaction.

5. In the event storage or demurrage charges should accrue, due to interference with transportation by shipper, or his agents through the issuance of orders to hold such freight, or to divert such freight, or due to delay in securing, or error in preparing proper export documents, or for any other cause for which shipper or his agent may be responsible, such charge shall be collected from and paid by the shipper.

6. The arrangement covered by the five preceding paragraphs is applicable only in connection with carload export freight moving under through export bills of lading and which has been booked for transportation on vessels owned or operated by or for the account of the United States Shipping Board via the following named ports and agents of the United States Shipping Board:

Boston — Lawrence & Co., via Providence and Portland, Me.; J. S. Emery & Co.; Red Star Line; Atlantic Transport Line; American Line; C. H. Sprague & Sons; Patterson & Wylde.

New York — Moore & McCormick; New York & Cuba Mail; France & Canada SS Co.; U. S. & Brazil SS Co.; Munson Steamship Line; Kerr Steamship Line; Barber Steamship Line; Oriental Navigation Co.; J. L. Elwell & Co.; South Atlantic Maritime Corp.; Independent Steamship Co.; U. S. & A. Line; Luckenbach SS Co.; A. H. Bull & Co.; W. R. Grace & Co.; Nafra Line; Red Star Line; Cosmopolitan Line; The Globe Line; American Line; J. H. Winchester & Co.; Atlantic Transport Co.; Phelps Bros.

Philadelphia—American Line; International Freighting Corp.; Red Star Line; Atlantic Transport Line.

Baltimore—Red Star Line; Export Transportation Co.; Baltimore Steamship Co.; Standard Steamship Co.; Baltimore Oceanic Steamship Co.

Norfolk—American Line; Harriss McGill & Co.; Robert Hasler.

As indicating the attitude taken by the Railroad Administration the following is an extract from a letter sent by the representative of the Railroad Administration to the Secretary of the Trans-Atlantic Associated Freight Conferences, which is an association of the principal foreign lines operating out of North Atlantic ports:

"Referring to conference in New York with Messrs. Peteroff, Love and Blake, the committee appointed by your association to confer with the undersigned relative to demurrage and storage charges at North Atlantic ports on export traffic.

"The proposition that we submitted contemplated that the interest responsible for the accrument of demurrage or storage, should assume the amount,—that is to say,—if the railroad fails to deliver the cargo at port in time to connect with designated sailing, demurrage or storage charges would

be waived; and on the other hand, if the steamship company failed to lift the cargo within the free time period, the steamship company should pay any charges that might accrue.

"In the event storage or demurrage charges should accrue, due to interference with transportation by shipper, or his agent, through the issuance of orders to hold such freight, or to divert such freight, or due to delay in securing, or error in preparing, proper export documents, or for any other cause for which shipper or his agent may be responsible, such charges shall be collected from and paid by shipper.

"We also offered to extend the present free time period, which is 10 days, to 15 days, although the Interstate Commerce Commission has held that the 10 days period is reasonable.

"We also advised your committee that the United States Shipping Board had accepted our proposition, and that tariffs would be published accordingly, as quickly as might be possible.

"Your committee rejected the proposition, which in our judgment, was a fair and liberal one in all the circumstances. We believe you will agree with us that differing conditions on export traffic at the same ports are impracticable, or at least, undesirable. Furthermore, we feel that as a progressive measure in transportation of export traffic, the time has come when the shipper should know, at the time he contracts for shipment, what the through transportation charges will be, and that the plan that has heretofore obtained, of attempting to hold the shipper responsible for something for which he is not responsible, cannot any longer be justified."

Terminal Committees Appointed and Special Storage Charges Imposed

To study the expedition of the movement of freight cars, both loaded and empty, within terminals in order to overcome avoidable delays and thus increase the efficiency of the freight car equipment of the country, special terminal committees have been arranged for at 70 of the principal terminals of the nation, each to be composed of local railroad representatives and a representative of shippers. The work on these committees will be pushed vigorously and every possible effort made to prevent delays to freight cars at terminals.

The Railroad Administration has received numerous complaints recently that refrigerator cars were being unduly detained at destinations and that cars loaded with lumber held for reconsignment were also being unduly held. During the present emergency, in order to prevent undue detention of equipment, authority has been given to publish immediately for account of all carriers under federal control effective on seven days' notice, the following rules:

1. On refrigerator cars which are not unloaded at the expiration of five days after the hour at which free time begins to run under the demurrage rules, a storage charge of $10 per car will be assessed for each day or fractional part of a day thereafter that such car is held under load.

2. On cars loaded with lumber held for reconsignment, a storage charge of $10 per car will be assessed for each day or fractional part of a day that a car is held for reconsignment after 48 hours after the hour at which free time begins to run under the demurrage rules.

3. These charges will be assessed regardless of whether cars are held on railroad hold tracks or delivery tracks, including consignee's or other private sidings and will be in addition to any existing demurrage and storage charges.

These rules were authorized for publication after consultation with shippers.

Number of Bad Order Cars Reduced

Since the unauthorized shopmen's strike early in August, which interfered with the repairing of cars, very gratifying progress has been made in connection with the bad order car situation, according to a statement authorized by Director General Hines. Excluding cars held out of service as not worth repairing, the percentage of bad order cars has fallen from 172,270 or 6.9 per cent on October 4, to 146,702 or 5.8 per cent on November 1. Including cars held out of service as not worth repairing the percentage of bad order cars has fallen from 191,656 or 7.6 per cent on October 4, to 166,514 or 6.5 per cent on November 1.

Miles Per Car Per Day Increased in September

The volume of freight traffic in September nearly approached the record of last year, according to the monthly report of the Operating Statistics Section. The net ton miles of revenue and non-revenue freight handled amounted to 38,860,311,000, a decrease of only 1.8 per cent as compared with September, 1918. Train miles decreased 3.5 per cent and car miles decreased 4.8 per cent, while the loaded car miles increased 4.8 per cent. The net ton miles per mile of road per day were 5,625 as compared with 5,731. The net ton miles per train mile show an increase of 1.8 per cent, from 735 to 748, but the net ton miles per loaded car mile shows a decrease from 30.2 to 28.3.

The percentage of loaded to total car miles was 69.6 as compared with 66.9 in September last year. The percentage of unserviceable freight cars shows an increase from 6.5 to 8.5 and the number of serviceable cars was 2,265,549 as compared with 2,304,497 in September last year. The average miles per car per day was 26.55 as compared with 26.5 last year and the net ton miles per car day averaged 523 as compared with 535. For the nine months ending with September the net ton miles amounted to 288,485,-362,000, a decrease of 12 per cent as compared with last year. This was handled with 14.1 per cent less train miles and 8.6 per cent less car miles.

Comment has been made, from time to time, upon the fact that the average miles per freight car per day made by the railroads during the early part of this year was relatively low. The Railroad Administration has explained that the low average per car per day in the early part of the year was due in part to the fact that the freight business was exceedingly low and that many cars were on that account entirely out of service for the time being and yet these cars out of service were figured with the divisor which is used to determine car miles per car per day and thus diminish the resulting average. The fact that this explanation was correct and also the fact that increased efficiency is being attained is shown by the figures for September when the increased business was reflected and when the average miles per freight car per day made by the railroads exceeded the record of September, 1917, and has equaled the splendid record of September, 1918, two months prior to the signing of the armistice, when business was unusually heavy.

The statistics compiled by the Division of Operation for the month of September, 1919, show the average miles per freight car per day for that month as compared with September of 1917 and 1918 to be as follows:

September, 1917	26.4
September, 1918	26.5
September, 1919	26.55

The method of making the foregoing computation is somewhat misleading as an indication of relative car performance for the reason that the divisor used to determine car miles per car day includes all cars entirely out of service for the time being.

Subtracting the latter figure and confining the computation to the efficiency of the cars in service, the average miles per freight car per day were as follows:

September, 1917	28.3
September, 1918	29.1
September, 1919	29.1

Results of the Gulf Coast Storm

THE EFFECTS on the railroads operating in the districts recently devastated by a tropical storm and tidal wave, which swept across the Southern Texas gulf coast, have but recently been fairly definitely determined. On account of the fact that the water driven onto sections of the main land by the storm receded very slowly, it has been practically impossible up to this time to ascertain the amount and extent of the damage done to the right of way of lines passing through this district. However, the conditions on some of these lines have been reported as follows:

The Gulf, Colorado & Santa Fe's main line escaped extensive damage, although a series of washouts on the causeway over Galveston Bay interrupted traffic for approximately 48 hours. On the Port Bolivar division the water thrown on the peninsula, on which a part of this line runs, has drained off slowly and several days elapsed before it was possible to do any repair work. As a result it was necessary, on September 16, to place an embargo on that district, covering freight and passengers for Seabreeze, Tex., Galveston and intermediate points, which embargo was cancelled on September 20. During that period freight and passengers destined to Galveston were detoured via Houston.

The main line on the Galveston division of the Southern Pacific was under water at several places between Seabrook, Tex., and Galveston, obstructing passenger service approximately 44 hours and freight traffic approximately 72 hours. On the El Paso division of the Southern Pacific, on the edge of the storm area, rainfall aggregating 7.5 inches for the first 36 hours quickly filled Osman Canyon, the head of which is approximately 50 miles north of the Galveston, Harrisburg & San Antonio main line, which follows the canyon several miles and crosses it a number of times, and completely washed out eight bridges, aggregating approximately 3,000 lineal feet, including one 144-ft. steel girder span, together with approximately one-half mile of bridge approaches and track. Temporary repairs were undertaken immediately, but continued rains and high water have been washing out foundations and greatly interfering with repair work. The latest estimate of property damage in this district is approximately $200,000. Traffic over this line was detoured and an embargo placed upon the sale of through tickets over Southern Pacific lines pending the restoration of service.

Six miles of track, including a long reef bridge, in the vicinity of Corpus Christi, on the San Antonio & Aransas Pass, were washed away, and heavy damage was also inflicted upon the Rockport branch of this road. The work of reconstructing the damaged portions has been greatly retarded by high water, which is now beginning to recede. The heavy rains which resulted in the washouts on the El Paso division of the Southern Pacific have swollen all streams in the territory served by the San Antonio & Aransas Pass, the Nueces and Frio rivers being out of their banks and endangering approaches. The total estimated damage on this line is $125,000.

Heavy damage was inflicted between Odem, Tex., and Corpus Christi on the San Antonio, Uvale & Gulf, approximately 13 miles of track being washed off the embankment. The approaches to bridges have also been washed out, and the decks and stringers swept away. Because of the high water, which has not yet receded, it has not been practicable to estimate the amount of property damage, but from casual inspections the damage is said to be in excess of $100,000. It will be at least 30 days, according to reports made by officers of the road, before the line can be opened for traffic.

The tidal wave which accompanied the tropical storm passed over the Gulf Coast Lines at several places, washing out the right of way at Lavaca, Tex., for a distance of one-half mile and damaging it to the extent of $2,000; at a point near Calallen, Tex., 5,500 ft. of track was washed entirely outside of the right of way and the ballast carried away. Near Angelita, Tex., one-third of the bank (which was 8 ft. high) was washed away and the track completely washed out for a distance of one mile, causing an estimated damage to the track and embankment at this point of approximately $10,000. At Kingsville, Tex., on the Gulf Coast Lines, the machine shop, roundhouse and car shop were damaged to the extent of $3,000, and the station at Port O'Connor, Tex., was completely destroyed, in addition to which a half mile of track was completely washed out, inflicting an estimated damage of $5,000. The latest reports indicate that the Gulf Coast Lines' fuel oil tanks at Aransas, Tex., were badly damaged and that much of the 30,000 barrels of fuel oil stored at this point has been lost. Such oil as is left in the tanks cannot be recovered for several months. After restoring the line between Houston and Corpus Christi another washout occurred at Agua Dulce creek near Driscoll, Tex., cutting off traffic on this line for 24 hours. The total damage on the Gulf Coast Lines prior to the Nueces river flood has been estimated at approximately $30,000, and when the present flood damage is computed and an accurate check made this damage will probably total close to $50,000.

In addition to the damage already enumerated, the heavy rains and water have softened roadbeds in many places in this district and the storm inflicted minor damage to the right of way and to terminal facilities, making it practically impossible to estimate the total amount of damage. Reconstruction work is being carried on as rapidly as possible by all of the affected railroads, and in the majority of cases traffic has already been restored to a normal basis.

Improvements on Jordan Spreader

IN KEEPING with the increasing demands for labor saving devices, the O. F. Jordan Company, East Chicago, Ind., recently added two improvement to the Jordan spreader, which increase its range and adaptability. Under the old arrangement a solid bar rigidly supported the outer end of the spreader wing, keeping it horizontal at all times throughout its range of operation, which included a vertical movement of the entire wing and allowed it to cut to a maximum depth of 26 in. below the top of rail. The first improvement substitutes for the old rigid type of wing support and an adjustable brace operated by a 12-in. air cylinder mounted on the upper end and connected to the main air supply by a flexible air hose, thus permitting the same vertical movement as before. Through the addition of this air cylinder and the adjustable brace, a longitudinal movement of 39 in. is obtained along the length of the brace whereby the wing may be inclined to provide a maximum cutting depth at the tip of 60 in. or a slope of 34 in. along its length. This is especially important where it is desired to give a designated slope to enbankments as in the construction of second track, where settlement is to be provided for, etc.

The second feature of the Jordan spreader consists of a substitute wing or improved ditching attachment which is used in place of the regular spreading wings for the purpose of cutting new ditches or the cleaning of old ones. This wing is built in two sections which are hinged at the joint, the inner one being the templet or cutting wing which, because of its design, is enabled to produce ditches of the standard cross section desired by the road using the spreader. This wing is fastened to the same support used for the regular Jordan spreader wing, is raised and lowered, by the air from the train line and is controlled through the regular valve installations; the adjustable brace is fastened

in this case near the joint of the inner and outer wings. With the outer wing fully extended it will shape the ballast and cut a ditch and bank of any cross section up to 19 ft. from the center of the track and to a maximum depth of 3 ft. below the top of rail and by the use of a specially designed spreader it is possible to form a ditch 4 ft. below the top of rail.

The improved ditching attachment is intended for operation under two conditions, depending upon the depth of the cut. When used for ditching in cuts over 7 ft. in depth the outer wing is swung forward and held parallel to the car by two braces fastened at the tip of the wing and running in triangular form to an adjustable sliding support on the forward end of the car. This support is connected to the main raising and lowering supports by two braces, the two adjustable supports working together whenever the depth of cut is changed, thus keeping the same relatve position of outer wing and templet.

The tip of the outer or carrying wing is provided with a cast steel nose plow at its lower front corner, which is adjustable to different angles and when in operation holds the carrying wing down to its work. In actual operation the wing is lowered sufficiently so that the pocket formed by the

Outer Wing Swung Forward Forming Wing Pocket. Deep Cut

two wings will be filled as the spreader is pushed through the cut. This is repeated dropping the wing lower each time until the desired depth is reached, the pocket holding from 8 to 10 cu. yd. of material which is considered to be the maximum amount which can be handled at one time in a satisfactory manner. The usual procedure is to start the ditcher at the end of the cut where the dirt is to be wasted so that not more than 10 cu. yd. will be handled at a time, the spreader being then moved back so that approximately the same amount of dirt is removed in the process of each operation.

In forming ditches in shallow cuts, the carrying wing is swung back to form a continuation of the templet and the outer end, which is adjustable for slopes from horizontal to 1 to 1 is then raised to the desired height and secured in that position by a diagonal brace. Two additional braces are attached to the rear of the car to hold the wing out when at work. When operating the attachment in this manner, it is sometimes necessary to take two or three cuts to form a ditch and bank on account of the total amount of material to be removed.

The first of these improved ditching attachments, owned by N. K. Snead, railroad contractor, Huntington, W. Va., has been employed on the Gulf, Florida & Alabama where it worked in both deep and shallow cuts where no ditches of any kind had been maintained for a considerable length of time. Under these conditions and in open cuts not over 5 or 6 ft. deep where the original cross section of roadway was about 4 in. higher than the top of the ties, two and one-half miles of completed ditches were formed per hour, the bottom of the finished ditch being 36 in. below the top of rail and necessitating the removal of ⅔ cu. yd. of material per lineal foot of ditch. On a bisis of $125 per day for the entire cost of operating the ditcher the dirt was removed in this case for 0.17 cents per cu. yd. or at the rate of $0.25 per mile of completed ditch on one side of the track.

In cuts over 6 ft. deep the problem was somewhat different

Outer Wing Extended Cutting Both Ditch and Slope. Shallow Cut

though the original ground level was about the same as in the preceding case, being about 4 in. above the top of the tie. For this work it was necessary to move the material a considerable distance to be wasted on fills in spite of which 400 ft. of ditch was completed to a depth of 36 in. below the top of rail in 35 min. The dirt in this instance was moved at the rate of ⅔ cu. yd. per lin. ft. of ditch over an average distance of 250 ft. at a cost of approximately 3½

Standard Spreader Equipped with Adjustable Wing Brace and Air Cylinder

cents per cu. yd. or $121.44 per mile of completed ditch on one side of the track.

In case of a deep cut ending at a road crossing or where for other reasons it is impossible to waste the material on fills it may be carried to piles of from 30 to 50 cu. yd. each which will materially facilitate its handling with a steam ditcher.

Where ditches have already been formed and only cleaning is necessary the amount of material to be moved is much less with an accompanying reduction in cost. Ditches formed by this attachment were perfectly uniform in cross section, with no loose material in the bottom to retard the flow of water, nor was there any fouling of the ballast.

General News Department

At Brookfield, Mo., 700 citizens, mostly farmers and employees of the Chicago, Burlington & Quincy, have organized a co-operative store, to sell groceries, meats and clothing at cost. One store selling groceries, meats, bakery goods and work clothes is now in operation and it is planned to open a second one.

"The Increasing Necessity for Steam Railway Electrification will be the subject to come before the next meeting of the Western Railway Club which will be held at the Hotel Sherman, Chicago, on December 15, with a paper by Norman W. Stone, of the Westinghouse Electric & Manufacturing Company.

George Bradshaw, supervisor of safety of the Grand Trunk Western lines and the Pere Marquette, says that the Grand Trunk Western had the fewest casualties per 100 employees during the period of the recent "No accident drive" of any railroad in the United States having the same or a greater number of employees.

The Federal Trade Commission on December 2 began hearings on complaints against the continuance of the use of the Pittsburgh basing-point system in fixing prices for steel products, under which the freight rate from Pittsburgh is added to the price at Gary. The commission is to decide whether to issue a formal complaint against the practice.

The steam locomotives used in the recent test with the C., M. & St. P. electric locomotive at Eria, Pa., have 79 in. and 69 in. drivers. In the October 10 issue of the *Railway Age*, page 749, the diameters given for the Pacific and Mohawk type locomotives were 72 in. and 62 in., respectively, whereas these dimensions are for the driving-wheel centers; the diameter over the tires being 79 in. and 69 in.

At Steubenville, Ohio, two young men who stepped out of the way of a passenger train and into the path of a yard engine and who, in consequence, were both carried to a hospital, got their names into the papers recently, with a prominent headline, by reason of the fact that when they made this mistake they were on their way home from a safety-first campaign on the Pennsylvania Lines.

Delegates from farmers' organizations, denouncing the recommendation of government retention of control of the railroads for two years more, voted by the Public Ownership Conference held in Chicago, November 15, 16 and 17, declared that the action was the outcome of "steam-roller" methods. These delegates, from the South and Southwest, deny that such was the opinion of their constituents. William Hale Bowen, of Arlington, Tex., representing the Texas Farmers' Union, J. T. McElderry, of Talladega, Ala., representing the Alabama Farmers' Union, and John A. Simpson, of the Oklahoma Farmers' Union, in statements made public following the conference, assert that organized farmers oppose government control and operation of any private industry by a large majority. The delegates say that their organizations instructed them to oppose such government control resolutions, but that, despite their opposition, resolutions embodying the disputed points were "railroaded" through.

At the fiftieth anniversary dinner of the Western Society of Engineers, held at the Hotel Morrison, Chicago, on Tuesday evening, December 2, announcement was made of the setting aside of $5,000 by Robert W. Hunt, president of Robert W. Hunt & Co., Chicago, the income from which is to constitute a prize to be awarded annually to the person, not over 30 years of age, presenting the best paper before the society on the manufacture of iron and steel. Three prominent engineers are to constitute a committee on award, one of whom must be a person of recognized authority in the iron and steel field. In the event that the judges do not consider that any paper worthy of this prize has been presented during a given year, the income from the fund for that year will go to St. Luke's hospital, Chicago, while in the event that no award is made for five consecutive years, the principal itself will be turned over to the hospital and the trustees discharged. The establishment of this award has for its purpose the encouragement of the younger men and to direct attention to the problems of the steel industry in the Middle West.

Meetings and Conventions

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

AIR BRAKE ASSOCIATION.—F. M. Nellis, 165 Broadway, New York City. Next convention, May 5-7, 1920, Chicago.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontious, Supervisor of Demurrage and Storage, C. & N. W. Ry., Chicago.

AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—S. W. Derr, C. R. R. of N. J., Philadelphia, Pa.

AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, Illinois Central, Chicago. Next annual meeting, June, 1920.

AMERICAN ASSOCIATION OF GENERAL BAGGAGE AGENTS.—E. R. Reynolds, C. G. W. R. R., Chicago.

AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—J. Rothschild, Union Station, St. Louis, Mo.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 8 W. 40th St., New York.

AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—C. F. J. Dell, 50 E. 42nd St., New York.

AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPE FITTERS' ASSOCIATION.—Otto E. Schlinck, 185 W. 5th St., Peru, Ind.

AMERICAN RAILROAD ASSOCIATION.—J. E. Fairbanks, 75 Church St., New York:

- Section I, Operating (including former activities of Association of Railway Telegraph Superintendents). W. J. Frippe (chairman), N. Y. C. R. R., New York, N. Y.
  - Telegraph and Telephone Division—M. H. Clapp, U. S. R. R. A., Washington, D. C.
- Section II, Engineering—E. H. Fritch, 431 South Dearborn St., Chicago.
  - Signal Division.—H. S. Balliet, 75 Church St., New York.
- Section III, Mechanical (including former activities of Master Car Builders' and Master Mechanics' Association).—V. R. Hawthorne, 431 South Dearborn St., Chicago.
- Section IV, Traffic (including former activities of Freight Claim Association).—Robert C. Wright, (chairman), Assistant Director, Division of Traffic, U. S. R. R. A., Washington, D. C.
- Section V, Transportation (including former activities of Association of Transportation and Car Accounting Officers).—E. J. Pearson chairman), Federal Manager, N. Y., N. H. & H. R. R., New Haven, Conn.
- Section VI, Purchases and Stores (including former activities of Railway Storekeepers' Association). J. P. Murphy, N. Y. C. R. R., Collinwood, Ohio.
- Section VII, Freight Claims (including former activities of the Freight Claim Association).—H. C. Pribble (chairman), A., T. & St. Fee, Topeka, Kan.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W. Ry., 319 N. Waller Ave., Austin Station, Chicago.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—(Works in co-operation with the American Railroad Association, Section II.) E. H. Fritch, 431 South Dearborn St., Chicago. Next convention, March 16-18, 1920, Chicago.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—(See American Railroad Association, Section III, Mechanical.)

AMERICAN RAILWAY PERISHABLE FREIGHT ASSOCIATION.—E. F. McPike, 135 E. 11th Place, Chicago. Regular meetings, 2d Wednesday in March and September.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—R. D. Fletcher, 1145 East Marquette Road, Chicago.

AMERICAN SOCIETY FOR TESTING MATERIALS.—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Charles W. Hunt, Engineering Societies Building, 33 W. 39th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 33 W. 39th St., New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.

AMERICAN TRAIN DESPATCHERS' ASSOCIATION.—D. L. Darling, Northern Pacific Ry., Spokane, Wash.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next annual meeting, February 10-12, 1920, Hotel Sherman, Chicago.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—Willis H. Failing, C. R. R. of N. J., Jersey City, N. J. Next meeting, May, 1920, Atlantic City, N. J.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—(See American Railway Association, Section I, Operating.)

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—(See American Railroad Association, Section V, Transportation.)
BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—M. J. Trees, Chicago Bridge & Iron Works, Chicago.
CANADIAN RAILWAY CLUB.—W. A. Booth, 131 Charron St., Montreal, Que.
CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 626 North Pine Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, New Morrison Hotel, Chicago.
CAR FOREMEN'S ASSOCIATION OF ST. LOUIS.—Thomas B. Koeneke, Federal Reserve Bank Bldg., St. Louis, Mo.
CENTRAL RAILWAY CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 2d Thursday in November, and 2d Friday in January, March, May and September, Hotel Statler, Buffalo, N. Y.
CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.—H. J. Smith, D. L. & W. R. R., Scranton, Pa.
CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S SUPPLY MEN'S ASSOCIATION.—D. B. Wright, Lehon Company, 45th and Oakley Sts., Chicago.
EASTERN RAILROAD ASSOCIATION.—D. G. Stuart, Washington, D. C.
FREIGHT CLAIM ASSOCIATION (See American Railroad Association, Section IV, Traffic).
GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Sta., Chicago. Regular meetings, Wednesday preceding 3rd Friday in month, Room 856, Insurance Exchange Bldg., Chicago.
INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, B. & O., Lima, Ohio.
INTERNATIONAL RAILWAY FUEL ASSOCIATION.—J. G. Crawford, 702 E. 51st St., Chicago. Next annual meeting, May, 1920, Hotel Sherman, Chicago.
INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1061 W. Wabash Ave., Winona, Minn.
MAINTENANCE OF WAY MASTER PAINTERS' ASSOCIATION.—F. W. Hager, 1323 Hurley Ave., Ft. Worth, Tex.
MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York. Next annual meeting, May 25-28, Curtis Hotel, Minneapolis, Minn.
MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass.
MASTER CAR BUILDERS' ASSOCIATION.—(See American Railroad Association, Section III, Mechanical.)
NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES COMMISSIONERS.—James B. Walker, 49 Lafayette St., New York.
NATIONAL FOREIGN TRADE COUNCIL.—O. K. Davis, 1 Hanover Square, New York. Next convention, May 12-15, 1920, San Francisco.
NATIONAL RAILWAY APPLIANCES ASSOCIATION.—C. W. Kelly, Kelly-Derby Co., Peoples Gas Bldg., Chicago.
NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, excepting months of June, July, August and September.
NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting 3d Friday. in month, except June, July and August, 29 W. 39th St., New York.
NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—George A. J. Hochgrebe, 623 Brisbane Bldg., Buffalo, N. Y. Regular meetings, 3d Tuesday in each month, Tenjost Hall, Buffalo, N. Y.
PACIFIC RAILWAY CLUB.—W. S. Wollner, 64 Pine St., San Francisco, Cal. Regular meeting 2d Thursday in month, alternately in San Francisco and Oakland.
RAILWAY ACCOUNTING OFFICERS' ASSOCIATION.—E. R. Woodson, 1116 Woodward Bldg., Washington, D. C. Next convention, May 12, Atlantic City, N. J.
RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York. Next annual meeting, December, 1919, New York, N. Y.
RAILWAY CLUB OF PITTSBURGH.—J. D. Conway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month except June, July and August, Americus Club House, Pittsburgh, Pa.
RAILWAY DEVELOPMENT ASSOCIATION.—D. C. Welty, Missouri Pacific R. R., Little Rock, Ark.
RAILWAY ELECTRIC SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, General Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.
RAILWAY EQUIPMENT MANUFACTURERS' ASSOCIATION.—D. L. Eubank, Galena Signal Oil Company, Richmond, Va.
RAILWAY FIRE PROTECTION ASSOCIATION.—G. L. Ball, St. Louis-San Francisco Ry., St. Louis, Mo.
RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrison, C. & O., Richmond, Va.
RAILWAY SIGNAL ASSOCIATION.—(See American Railroad Association, Section II, Signal Division.)
RAILWAY STOREKEEPERS' ASSOCIATION.—(See American Railroad Association, Section VI, Purchases and Stores.)
RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 1841 Oliver Bldg., Pittsburgh, Pa.
RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, Waterbury Battery Co., 30 Church St., New York.
ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrews, C. & N. W. Ry., Sterling, Ill.
ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August.
SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, West Nyack, Rockland County, New York.
SOCIETY OF RAILWAY FINANCIAL OFFICERS.—L. W. Cox, 1217 Commercial Trust Bldg., Philadelphia, Pa.
SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, P. O. Box 1205, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.
SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, Western Ry. of Ala., Atlanta, Ga.
SUPPLY ASSOCIATION OF AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—C. N. Thulin, Duff Manufacturing Company, 935 Peoples Gas Bldg., Chicago.
TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y.
TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. P. Finan, A. T. & S. F. Ry., Needles, Cal.
TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., Cleveland, O.
WESTERN ASSOCIATION OF SHORT LINE RAILROADS.—Clarence M. Oddie, Mills Bldg., San Francisco.
WESTERN RAILWAY CLUB.—J. M. Byrne, 916 W. 78th St., Chicago. Regular meetings, 3d Monday in month, except June, July and August.
WESTERN SOCIETY OF ENGINEERS.—Edgar S. Nethercut, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except July and August.

Traffic News

The shipment of approximately 500 deer carcasses daily through Birchwood, Wis., to the homes of hunters in Wisconsin and Illinois is reported as causing considerable delay to both passenger and freight trains in the Birchwood district.

The first big shipment of news print paper into the Great Lakes region of the United States from Western Canada recently arrived at Minneapolis, Minn. The shipment consisted of 26 carloads, made at Powell River, B. C., 2,000 miles away, and valued at $75,000.

A special terminal committee has been appointed to study the best means to expedite the movement of cars through the El Paso (Tex.) terminals. This committee will function in a similar manner to committees appointed in other large terminals. A. U. Tatlock, traffic manager of the El Paso Chamber of Commerce, has been appointed shippers' representative on the committee, the appointment having been made by Max Thelen, director of the Division of Public Service, United States Railroad Administration.

George R. Browder, traffic manager of the Container Club, Chicago, an organization intended to maintain proper standards for fibre shipping cases, has been appointed general manager in charge of the Chicago office,. He is to have general supervision over the activities of the club under the direction of the executive committee. The position of traffic manager has been abolished. W. S. Felt will continue to act as secretary and treasurer of the club, A. J. Neumann as assistant secretary-treasurer and Dr. E. O. Merchant as statistician.

Oregon is the state which forms the subject of the latest illustrated booklet which has been issued by the Agricultural Section, Division of Traffic, United States Railroad Administration. It has the endorsement of Governor Olcott and President Kerr, of the Agricultural College. Oregon, with a total area of 96,699 squares miles, has great diversity of soil and climate; irrigated lands with mild seasons; the broad prairies of the Central and Southeastern sections and the foothills of the mountain ranges. These latter offer innumerable home sites that for natural beauty are unexcelled. Information is given about public lands, including state schools and forest homesteads.

The Beauties of Arkansas are presented in an illustrated booklet issued by the Agricultural Section, United States Railroad Administration, to meet the demand of homeseekers and other investors for information. It contains descriptions of the three agricultural empires of the State—Alluvial Area, Coastal Plains and Ozarks. There are chapters on cotton, rice, corn, alfalfa, oats, wheat, peanuts, apples, peaches, strawberries, melons, grapes, Irish potatoes, sweet potatoes, pecans, beef cattle, hogs, sheep, dairying, poultry and bee culture. Almost always two, and often three, crops may be secured from the same tract of land in one year. No section of the United States offers natural advantages which are superior to Arkansas for livestock production of all kinds.

The report on overseas traffic for the week ended 26th November, shows 6,813 cars of commercial export freight received at North Atlantic ports, as compared with 832 cars for the same week of 1918, an increase of 5,981 cars, or 718 per cent. The deliveries to ships during the same period increased 6,497 cars, or 566 per cent. At South Atlantic and Gulf ports as of November 24, 1919, there were 11,589 cars of export freight on hand as against 12,289 cars on November 17, an increase of 700 cars. Of grains, 14,692,819 bushels were in elevators at North Atlantic ports in the week ended November 26, 1919. There were received during the week 3,473,231 bushels, while 5,100,666 bushels were cleared. There were 8,453,717 bushels of grain stored in elevators at Gulf ports on November 26, 1919, representing 82.3 per cent of the total elevator capacity.

Commission and Court News

State Commissions

The Railroad Commission of Louisiana, acting on complaint of land owners, well contractors, and others interested in the Harmon-Bayou oil field, has ordered the Texas & Pacific to put on an additional passenger train between Shreveport, La., and Gahagan, 47 miles. The railroad objected, arguing that automobiles would take much of the traffic to and from these oil fields, but the commission held that poor roads would make automobile traffic impracticable in the winter season. Heretofore there has been one train a day between these points, and many of the patrons of the road were obliged to take two days for a round trip.

Personnel of Commissions

Edgar E. Clark has been nominated by the President for reappointment as a member of the Interstate Commerce Commission.

James H. Wilkerson, a member of the Illinois Public Utilities Commission, has been appointed chairman of that body, succeeding Thomas E. Dempcy. Mr. Dempcy has resigned as chairman because of ill health, but retains his membership in the Commission.

The Department of Public Utilities, of Massachusetts, succeeding to the functions of the Public Service Commission, consists of five members, and the chairman is Henry C. Attwill, who has been appointed commissioner for a term of five years. The other appointments for four, three, two years, and one year, respectively, are E. E. Stone, A. R. Weed, D. A. Ellis and H. G. Wells. Messrs. Attwill and Stone were members of the Public Service Commission. Under the reorganization which took effect December 1, under a law passed this year, this department will take up the work of the gas and electric light commission. Under the new organization the chairman will have a salary of $8,000 a year, and each of the other four members will have $7,000. The new chairman was formerly attorney general of the state. The former chairman of the Public Service Commission, F. J. MacLeod, is now out of office.

Court News

Fraud of Railroad's Agents by Overcharges

Although there is a presumption that knowledge of an agent is that of the principal, that presumption does not apply where the agent is engaged in a scheme to defraud his principal. Therefore the Circuit Court of Appeals, Eighth Circuit, holds that a railroad company will not be charged with a scheme between its station agent and an employee of a shipper whereby freight in a greater amount than was earned was collected, and the two divided the surplus.—Scullin Steel Co. v. North American Co., 255 Fed. 945.

Excessive Valuation for Taxation

The Illinois Supreme Court holds that where the railway committee of the State Board of Equalization arbitrarily increased the assessed valuation of certain railway property by fixing it at six times the valuation returned by the railroad and such valuation was arbitrarily approved by the board under suspension of the rules, the railroad's objection as to five-sixths of the tax should have been sustained.—People v. Chicago, Lake Shore & Eastern, 286 Ill. 576, 122 N. E. 109.

Federal Employers' Liability Act—Assumption of Risk

The Circuit Court of Appeals, Second Circuit, holds that an interstate commerce employee, of experience, who after refusal of a light, and without assurance of safety or a light forthcoming in a reasonable time, continues to work in the dark removing a metal platform which had been used as a passageway between freight cars on parallel tracks, must be held to have assumed the risk. It is only risk of employment from violation by the master of a federal statute which the employee is not held to assume under the federal Employers' Liability Act.—D. L. & W. v. Tomasco, 256 Fed. 14.

Standing Cars Not Attractive Nuisances

While the doctrine of the "attractive nuisance," or of the so-called "turntable cases," has been accepted in the state of Missouri, the Supreme Court of that state holds that a standard gage railroad flat car of light construction on a side track, unbraked and unlocked, requiring from 6 to 8 boys from 9 to 13 years of age to move it was not within the attractive nuisance rule as to a 10-year-old child, caught between the car and an adjacent pile of construction material while the car was being moved by children. The danger is obvious, like that from fire or water, and not latent.—Buddy v. Union Terminal (Mo.), 207 S. W. 821.

Change in Passenger Rates—Ejection from Drawing Room

Suit was brought by a passenger for ejectment from the drawing room of a Pullman car. He was informed when he bought a first-class ticket from Reno to Tonopah and when he entered the train that under the railroad's rules he could not occupy the drawing room unless another person holding a first-class ticket occupied it with him, or unless he bought another first-class ticket. He said that he expected a friend to occupy it with him. During the night, no one else having appeared with the required ticket, the conductor awoke him and informed him that he would have to vacate the drawing room or pay for another first-class ticket. After discussion, and against his will, he was ejected from the drawing room. The sole question in the case was whether the railroad was justified in ejecting him. For a long time the company had permitted a passenger holding one first-class ticket between Reno and Tonopah to occupy the drawing room, but some time prior to the date of the plaintiff's ejection the company had changed its tariff so as to require two passage tickets for use of a drawing room. It was held that the change in tariff had been properly made and it was lawful to eject the plaintiff.—Crumley v. Southern Pac. (Nev.), 177 Pac. 17.

Apportionment of Cost of Crossing and Interlocking

The Washington Supreme Court affirmed an order of the State Public Service Commission apportioning the cost of crossing of the track of the Northern Pacific by the Tacoma Eastern (the railroads having been unable to agree thereon) as follows: the cost of the grading, of the frogs, and the installment thereof to be borne entirely by the Tacoma Eastern; the cost of the interlocking plant and its installation, one-third by the Northern Pacific and two-thirds by the Tacoma Eastern; maintenance of the whole to be borne in equal proportions by the two companies. The court held, at the same time, that, the necessity for the crossing being found, there can be no favor shown the company whose line is crossed merely because it is a pioneer company. If, when a petition is filed for permission to cross an existing road, the State grants the right to cross, all questions of prior right or occupancy of the ground must give way, for the order is a finding by the sovereign state that the need of the public demands two roads instead of one, and the order ipso facto forecloses all questions of seniority or priority between the contending roads. In this the court followed State ex rel. Puget Sound & Willipa Harbor v. Northern Pacific, 94 Wash. 10, where it was held, contrary to former holdings of the Washington Supreme Court, that it was within the power of the legislature to apportion the cost of a crossing and interlocking devices between the two companies. State ex rel. Tacoma Eastern v. Northern Pacific (Wash.) 176 Pac. 539.

Foreign Railway News

LONDON.

Railway Construction in Madagascar.—According to the London Times Trade Supplement, railways lines are being built from Antsirable to Tamatave on the east coast, and from the famous lake of Alaotra to Majunga.

A strike of employees of the Central Railway of Peru, which had caused a suspension of traffic for eight days, was settled on September 27. According to press despatches the strikers were granted all of their demands, the government having authorized an increase of freight rates to cover the addition to the payrolls.

Railway Communication Between Rome and Athens

Italy and Greece have signed a convention providing for railway communication between Rome and Athens, with a ferry from Otranto to Valona.

New Alpine Tunnel

French and Italian engineers lately arrived at Salanches to reconsider plans made by the engineer, M. Monod, in 1908, for piercing Mont Blanc with a new railway line from Salanches, on the Swiss side of the frontier, to Aosta, in Italy. The new line will be 50 miles long, with a tunnel 9 miles in length, similar to the famous Simplon tunnel. It is expected that work on the new undertaking will begin next spring.

Electrification in Chile

The London Times Trade Supplement states that the government of Chile has decided to electrify all railways under State control, utilizing for this purpose the abundant water power available from falls of the western slopes of the Andes. The State railways, administered from Santiago, comprise about 2,300 miles projected or under construction; they include the Longitudinal Railway, the Arica-La Paz, the Copiapo, and branches, the line to Coquimbo and branches, the Los Vilos line and the Central system.

Deficit on Paris Metropolitaine Railway

LONDON.

An extract from the Engineer states that during the year 1918, there were a dozen stations on the Paris Metropolitaine at each of which over six million tickets were sold. Among these were: Vincennes 11¼ millions, Porte Maillot 10 millions, Bastille 9¾ millions, Gare du Nord 9¼ millions, Gare de l'Est 9 millions. While the total receipts increased by 3½ million francs, the expenditure rose by 12½ million francs, and the receipts were not sufficient to pay the fixed charges, there being a deficit of three million francs. In 1913 the ratio of expenditure to receipts was 42.79 per cent, in 1916 it was 47.14 per cent, in 1917, 50.93 per cent, but last year it was 61.28 per cent.

Some Figures Regarding Great Britain's Railways

LONDON.

An article in the Times Trade Supplement states that there is in Great Britain some 23,500 miles of railway, and reckoned in single track, including the length of sidings, the total mileage in operation is in round figures 55,000 miles. The total length of running track included in this total is over 40,000 miles. The number of passenger journeys made in the last year of normal conditions was approximately 1,233,000,000. which produced a revenue of about £54,250,000. The amount of goods traffic was 372,037,000 tons. The engine mileage of loaded trains was 405,300,000, and the shunting mileage 137,-865,000, the total engine mileage, including the haulage of empty trains, being 628,324,000.

New Scale of Pay for English Railway Clerks

LONDON.

An extract from the Engineer states that under the new scheme of pay for railway clerks, station masters, agents, etc., arranged between the Railway Excutive Committee, the Railway Clerks' Association and the National Union of Railwaymen, clerks engaged continuously on night duty re-commencing before 4 a. m., or ceasing after 10 p. m., are to be relieved where possible, one turn of duty every ten nights. When it is not possible to find the relief, an extra day's pay is to be given. Clerks continuously working on a middle turn, that is, when the hours of duty fall between 8 a. m. and 6 p. m., are to have a weekly half-holiday.

Station masters, too, are to have a half-holiday. Twelve days' holiday is given to all and in some of the higher grades 15 and 18 days.

Considering New Wage Demands in France

LONDON.

The London Times of October 8, published a cable from Reuter, Paris, in which it is stated that the permanent commission of railwaymen employed on the Paris-Etat lines has addressed a note to all unions and groups of French railwaymen inviting them to take an urgent decision with regard to a proposal to demand a new rise of wages of 100 per cent plus present bonuses, with a minimum wage of 800 francs per month. The note adds that the commission is also anxious to have within a period of ten days the opinion of the unions on such questions as intervention in Russia, the amnesty, definite recognition of syndical organizations, etc. This initiative has apparently been taken by the Paris-Etat group on its own responsibility and outside the National Federation of Railwaymen, which has not even been consulted.

New French Plan of Railroad Control

A decree has been issued, says a press despatch from Paris, instituting the "Committee of Exploitation" to have control of the railroads in France. This is in accordance with the plan of M. Claveille, minister of public works, which provides for the collaboration of representatives from the different classes of railway workers with the heads of departments and directors in the management of the roads.

The committee will comprise a high official of each line as president, the operating managers of all the lines, three representatives of commerce and industry designated by the minister of public works and three representatives of the employees, also designated by the minister.

A technical committee has also been instituted to supervise the rolling stock. This is composed of the chief engineers of all the lines, three manufacturers of railroad material and three representatives of the employees appointed by the minister of public works.

A representative of the government will attend the meetings of the committees, and his assent will be necessary for the execution of exceptional measures.

Railway Traffic Needs of Danish Island

LONDON.

The Times Engineering Supplement states that the demand for railway bridges across the Little Belt, between the Island of Funen and Jutland, and across the Storstrom between the islands of Sjelland and Falster, as a link in the Danish-German railway traffic, has of late been pressed in an increasingly urgent manner, and the director general of the Danish state railways has now promised that measures for their construction shall be laid before the Danish Legislature in the course of the next session, if the plans are ready in time.

Some interesting figures in connection with the traffic across the two waters in question are available. The steam ferry traffic across the Little Belt in 1893 was 110,000 tons of freight; in 1913 this rose to 562,000 tons and in 1917 to 880,000 tons. The passenger traffic was 222,000 in 1893, 598,000 in 1913, and 713,000 in 1917, and the actual expense of the ferry traffic, exclusive of interest on cost of material and harbors, repairs, etc., rose from 144,000 krone ($38,000) in 1893, to 393,000 krone ($98,250) in

1913, and 873,000 krone ($218,250) in 1917. A bridge across the Little Belt it is argued would greatly enhance the practical capacity of the rolling-stock now stationed in the Island of Funen, and at the same time would save time, increase the comfort of passengers and facilitate traffic.

Special Correspondence From South Africa

JOHANNESBURG, September 8.

Considerable progress has been made towards the complete application of the eight-hour working day for Railway and Harbor servants. From April 30 to August 7, 12,000 additional servants of the Administration were placed on the 48-hour week. On August 7, 28,000 of the European staff in service at that date were working 48 hours or less and 9,000 more than 48 hours a week. More than 800 additional learners have been taken on in connection with this change and in addition a very large number of railway servants returned from active service have been absorbed. The Administration has decided that all daily-paid employees in the grades to which the 48-hour week will be applied—that is, the whole of the daily-paid staff, with very few exceptions—will be paid on the 48-hour week basis as from the beginning of January, 1920, pay month.

The question of electrifying certain sections of the South African Railway System is being vigorously inquired into by Charles Merz, of the firm of Merz & McLellan, who is at present in this country. He will report to the Union Government in this connection in due course, as well as in regard to the generation of electrical power in South Africa generally.

The proposal for the establishment of a Union owned line of steamers is being received with general acclamation. Already three of the boats captured in South African waters are in commission, one of these being engaged in coal bunkering trade between East London and Durban.

Owing to the necessity of withdrawing a considerable number of trucks from general traffic for the conveyance of coal to the ports, coupled with the already sadly depleted available railway material, traffic on the South African Railways has been affected most acutely lately. Durban requires at least 60,000 tons of coal, while the ships at Delagoa Bay, or due there within the next week or so, will want another 50,000 tons to be supplied. Cape Town also requires an additional quantity of this commodity. To relieve the position no other course was open than to utilize trucks employed in the carriage of general goods. Fortunately the inconvenience is only of a temporary nature, every nerve being strained to meet the situation. The position is due largely to the arrival of more transports and other ships than anticipated. Exclusive of coal for locomotives and railway workshops—something like 150,000 tons per annum—the traffic conveyed by the South African Railways has since the outbreak of the war increased by at least 2,000,000 tons per annum, last year's quantity having been approximately 14,000,000 tons. To cope with this increased volume of traffic besides meeting other requirements 4,000 wagons have been on order for some time past already, 2,500 of these being for livestock and sheep, but also suitable for coal traffic and general purposes. There are also included in the former number 200 insulated and refrigerator trucks of the latest pattern for the carriage of meat and other perishables. The need of additional engine power is most pronounced. At the beginning of the year there were 174 engines on order and of these 29 only are in service, while another 20 have arrived and are being assembled in the railway workshops. A further 66 are expected by the end of this year.

Equipment and Supplies

Locomotive Deliveries

The following locomotives were shipped during the week ended November 22:

Works	Road	Number	Type
American	MP	2	USRA Mount.
Baldwin	P&R	3	USRA Consol.
	LV	1	Santa Fe
		4	
Total		6	

Locomotives

THE SOROCOBANA RAILWAY, Brazil, has ordered 8 locomotives from the American Locomotive Company.

Freight Cars

THE SOROCOBANA RAILWAY, Brazil, is inquiring for 200 freight cars.

THE BAS CONGO-KATANGA, Belgian Congo, Africa, is inquiring for 80 box cars.

THE CENTRAL OF NEW JERSEY has bought 1,000 55-ton steel hopper cars from the Standard Steel Car Company.

THE CARNEGIE STEEL COMPANY is in the market for 40 tank cars of 10,000 gal. capacity and 27 tank cars of 15,000 gal. capacity.

THE AMERICAN LINSEED COMPANY, Woolworth Building, New York, has ordered 10 10,000 gal. tank cars from the Pennsylvania Tank Car Company.

THE CHILEAN EXPLORATION COMPANY, New York, reported in the *Railway Age* of October 10, as being in the market for 50 70-ton ore cars, has ordered this equipment from the Pressed Steel Car Company.

Miscellaneous

RODNEY D. CHIPP, United States representative, at New York, of the San Paulo-Rio Grande Railway Company and the Parana Railway, is in the market for 450 locomotive and tender tires; 450 truck and car springs; eight complete sets of mounted axles and wheels; 26,400 lb. of ingot copper; 26,400 lb. of ingot lead; 7,700 lb. of ingot tin; 1,320 lb. of ingot zinc; 1,320 lb. of ingot phosphor bronze; 100 tons of pig iron; 55 tons of refined iron in bars and sheets; 11 tons of steel bars and sheets; 1,320 lb. of high speed tool steel; also miscellaneous railway hardware, tool, etc., for the above railroads.

Locomotives Shipped in October

The Railroad Administration has compiled the following statement of locomotives shipped for the month of October, 1919.

		On order prior to Federal control		USRA orders		Constructed in railroad shops			
Name of road	Region	Type	No.	Type	No.	Type	No.	Total	Builders
B. & O.	Allegheny		..	USRA Pacific	4		..	4	American

Supply Trade News

H. S. Waterman, sales manager for the **Hutchins Car Roofing Company**, Detroit, Mich., died in that city on December 1, after an illness of 10 days.

W. D. Horton, district sales manager of the Patton Paint Company, has resigned to accept a position with the Murphy Varnish Company, Western Railway Department, with headquarters at Chicago, effective December 1. Mr. Horton was born in Brooklyn, N. Y., December 3, 1880, and was educated in the public schools of that city. On June 1, 1908 (at the time of the consolidation of the *Railway Age* and the Railroad Gazette) he joined its staff and from 1908 to 1914 acted as traveling subscription representative, on April 1, 1914, being appointed circulation manager. Mr. Horton has had a wide selling experience, having spent several years, previous to 1908, selling various commodities, such as stationary engines, boilers, wood-working and other machinery. In this work he traveled extensively throughout the United States, Canada, Mexico, Cuba, the West Indies, and in South and Central America. As circulation manager, he obtained a wide personal acquaintance among executive officers and department heads of nearly all the railways in the United States and Canada.

W. D. Horton

Westinghouse Air Brake Company Celebrates Fiftieth Anniversary

At the meeting of over 800 veterans of the Westinghouse Air Brake Company and its subsidiary companies at the William Penn Hotel at Pittsburgh, September 27, which was announced in our Emergency Bulletin of October 16 to celebrate the fiftieth anniversary of the formation of the company, A. L. Humphrey, president of the company, presided as toastmaster, and in commenting on the celebration, said: "Officials of our company realizing that September 28 marks the closing of 50 years of air brake development, as well as standing as a milestone in the remarkable growth of a Pittsburgh industry, debated a long time concerning a fitting method of recognition. We decided that the men themselves who had been with the founder, the late George Westinghouse, and others who had been associated with us for over 21 years, were justly entitled to the honor of the occasion. With this end in view we invited every employee of this company and its subsidiaries to a jubilee dinner at the William Penn Hotel. A large number of these men have seen the Air Brake Company expand from a modest beginning at the old Twenty-eighth street plant and in Wilmerding to its present size, and who is more interested in this day than they are?"

Veterans were present in large delegations from the National Brake & Electric Company, Milwaukee, Wis.; Pacific Coast Brake Company, Emeryville, Cal.; Canadian Westinghouse Company, Hamilton, Ont.; American Brake Company, St. Louis, Mo.; Locomotive Stoker Company, Pittsburgh, Pa., and Union Switch & Signal Company, Swissvale, Pa. On the same evening celebrations were also held in London, England, by the Westinghouse Brake Company, Ltd., of London; at Paris, France, by the Compagnie des Freins Westinghouse, Sevran, France, and at Turin, Italy, by the Compagnia Italiana Westinghouse dei Freni.

The first speaker of the evening at Pittsburgh was Thomas Kerr, New York, general patent solicitor of the Westinghouse Air Brake Company. As the office boy for a Pittsburgh attorney, Mr. Kerr witnessed the application for the fundamental Westinghouse air brake patent No. 88,929. H. H. Westinghouse, brother of the late George Westinghouse, spoke on "Westinghouse and Allied and Subsidiary Interests." E. M. Herr, president of the Westinghouse Electric & Manufacturing Company, and a member of the board of directors of the Westinghouse Air Brake Company, responded to the toast, "Our Husky Infant." Paul B. Cravath spoke on "Mr. George Westinghouse, As I Knew Him and His Achievements." Thomas Oakley, a machinist at the Wilmerding works, who has been in the service of the company continuously for over 35 years, spoke on "A Word to My Present and Future Co-workers."

Trade Publications

NICKEL.—For the purpose of briefly describing its nickel products, the International Nickel Company, New York, has published a small illustrated booklet. These products consist of nickel shot and ingots, electrolytic nickel, nickel oxides and nickel salts, for use in the manufacture of malleable nickel.

METALLIC PACKING.—A four-page folder, issued by Harry Vissering & Company, Inc., Chicago, describes and illustrates the construction of Crescent metallic packing for valve stems and piston rods of locomotives. This packing is made of four flexible pieces, all the joints overlapping, and is adapted for use with either saturated or superheated steam.

STEEL TREATING.—Detailed instructions for treating Colonial tool steel and tools have been compiled as the result of experience, by the Colonial Steel Company, Pittsburgh, Pa., and published in a booklet entitled The Colonial Tool Steel Treating Book. In addition to tre directions for hardening and treating, the book contains a complete list of tools with the grades of Colonial steel best adapted for their use, with a separate list of railroad tools.

HIGH SPEED AND ALLOY STEEL.—An attractive cloth bound book of 92 pages, 4 in. by 6 in., entitled Catalogue and Hints on Steel, is being distributed by the Halcomb Steel Company, Syracuse, N. Y. This catalogue contains a brief description of the company's various grades of crucible and electric tool and alloy steel and their uses, with instructions for treating. It also contains a large number of tables of useful information on areas, weights, etc.

HIGH TEMPERATURE CEMENT.—Hytempite, a material for bonding firebrick and kindred uses, which is manufactured by the Quigley Furnace Specialties Company, New York, is described in a pamphlet entitled Hytempite in the Foundry. This material can be used as a binder wherever fire clay, silica brick or tile are used, requiring no heat to effect a bond between materials joined. A number of applications of Hytempite in foundry work are described, with directions for applying the materials.

A "SHOCKLESS" CROSSING.—The Alexander Railroad Crossing & Equipment Company, Chicago, has issued a folder, entitled "Take the Shock Out of Your Crossings." In addition to describing and illustrating the swing rail construction of the crossing manufactured by this company, the folder discusses briefly the disadvantages of ordinary types of crossing construction and points out the highly satisfactory experience which a number of railroads have had with the Alexander crossing during ten years of actual service.

CASEHARDENING MATERIALS.—Bell & Gossett Company, Chicago, Ill., briefly describe several products manufactured by them for use in casehardening, in a pamphlet entitled Casehardening Materials. These specialties include a carbonizer known as Hi-Carbon Compound; B-G Compound for hardening, serving the same purpose as cyanide without giving off deadly fumes; Enamelite, which when applied to low carbon steel will prevent the steel from absorbing carbon during the casehardening process, producing soft areas where they are desirable; Bath-ite, a compound used for preheating between 1,200 and 1,600 deg. F., making it possible to heat the work to a uniform temperature away from the air in order to eliminate scale and oxidization, and Cleancoat, for scouring the steel heated in lead baths.

Railway Officers

Railroad Administration

Operating

C. E. Milliron has been appointed superintendent of dining car service with headquarters at Columbus, Ohio, succeeding **E. W. Westlake,** transferred to Chicago as supervisor of dining car service.

S. V. Rowland, has been discharged from military service and resumed his position as trainmaster on the Northern division of the Chicago Great Western, with headquarters at St. Paul, Minn., succeeding **E. J. Whalen,** who has been transferred.

Engineering and Rolling Stock

C. E. Trotter has been appointed master mechanic of the Lake Erie & Western, the Fort Wayne, Cincinnati & Louisville and the Northern Ohio at Lima, Ohio.

T. J. Mullin, general foreman shops of the Lake Erie & Western at Lima, Ohio, has been appointed shop superintendent of that road, as well as of the Fort Wayne, Cincinnati & Louisville and the Northern Ohio, with the same headquarters.

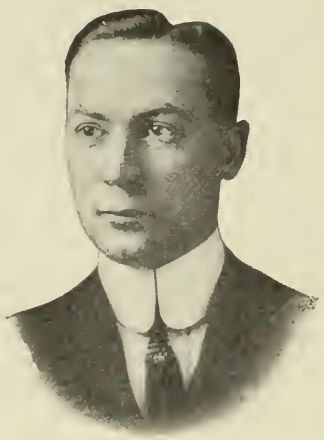
Purchasing

W. N. Pollard, division storekeeper of the Southern at Columbia, S. C., has been transferred to South Richmond, Va., succeeding **W. F. Lamb,** deceased; **J. H. Smith** has been appointed Mr. Pollard's successor.

Corporate

Operating

W. G. Curren, who has been appointed general superintendent of transportation of the Baltimore & Ohio, with headquarters at Baltimore, Md., succeeding **H. B. Voorhees,** promoted, was born in Webbs Mills, N. Y., and graduated from the high school there. In December, 1901, he entered railroad service as agent of the Northern Central, now part of the Pennsylvania. The following year he became trainmaster's clerk and secretary to the division superintendent of the Erie. In 1903, he was transferred to New York as secretary and chief clerk to the superintendent of transportation of the same road and later that year promoted to fast freight clerk. Three years after he was made night transportation clerk and later the same year passenger transportation clerk. Appointed general car distributor in 1906, he was promoted to inspector of transportation in 1908. In September of 1908 he went to the Kansas City Southern as chief clerk to the general superintendent and in November two years later became superintendent of car service. The Baltimore & Ohio appointed him assistant superintendent in 1912 and he was promoted that year to supervisor of transportation and later to the position of assistant to the general superintendent of transportation, with headquarters at Baltimore, Md. The next year he was transferred to Cincinnati, Ohio, with the Baltimore & Ohio, Lines West, including the Cincinnati, Hamilton & Dayton. In 1917 he was appointed superintendent of transportation of the Baltimore & Ohio and in 1918 transferred on furlough to the staff of the regional director of the Eastern region at New York City as special agent in charge of transportation. He was promoted to transportation assistant in 1919. He returned to the Baltimore & Ohio as general superintendent of transportation, as mentioned above, September 15 of the present year.



W. G. Curren

Executive, Financial, Legal and Accounting

John Duffy, assistant to F. L. Blendinger, federal manager of the Lehigh Valley, has been appointed assistant to **E. E. Loomis,** president.

J. L. Lancaster, federal manager of the Texas & Pacific, the Trans-Mississippi Terminal, the Weatherford, Mineral Wells & Northwestern, the Gulf Texas & Western, the Denison & Pacific Suburban, the Fort Worth Belt, the International & Great Northern, the Galveston, Houston & Henderson and the Houston & Brazos Valley, has been appointed receiver of the Texas & Pacific Railway Company. A successor will not be appointed for the remaining period of federal control but **A. G. Whittington** will be general manager of the International & Great Northern, the Galveston, Houston & Henderson and the Houston & Brazos Valley; and **J. A. Somerville,** general manager of the remaining lines. The general managers will have jurisdiction over all departments of the lines under their control, reporting to the regional director of the Southwestern region.

Engineering and Rolling Stock

Henry Gardner, supervisor material conservation of the Baltimore & Ohio, with headquarters at Baltimore, Md., has been appointed corporate mechanical engineer succeeding **Morgan K. Barnum,** notice of whose death appeared in the Railway Age of October 3 (page 722). Mr. Gardner was born in Salem, Mass., in 1872, and graduated from the Massachusetts Institute of Technology in 1896. Immediately after graduation he began railroad work as special apprentice of the Boston & Maine shops in Boston, Mass., at which work he remained until 1900 when he was appointed shop draftsman and inspector at Concord, N. H. During 1904 and part of 1905 he was assistant master mechanic at the same place. Between 1905 and 1911 he was respectively erecting shop foreman for the American Locomotive Company at Allegheny, Pa., locomotive designer for the H. K. Porter Company, Pittsburgh, Pa., assistant superintendent apprentices of the New York Central at New York City; and from 1911 to 1914 was superintendent apprentices and shop systems. In 1914 he went to the Baltimore & Ohio as assistant superintendent of shops at Baltimore and the following year was appointed special engineer in the office of the vice-president, at Baltimore also, an office he held until 1917 when he was chosen for the position he filled at the time of his recent appointment.

Rebuilding Obsolete Locomotives

The problem of disposing of locomotives when they become obsolete for through service is one for which no generally satisfactory solution has been found. On roads which have a proportionately large mileage of branch lines, small engines can be gradually retired by reassigning them from time to time on divisions having light traffic. This, however, represents an unusual condition. The majority of roads have more light locomotives than can be used to advantage, and the tonnage per train in through service is limited by the necessity for keping light power on important divisions. In considering such a condition, railroad managers are confronted with a dilemma; the cost of new equipment is extremely high, yet the operation of light power is wasteful as regards both fuel and wages. Many roads have added superheaters, brick arches and other devices on comparatively small engines. Such changes save fuel and also reduce wages by shortening the time trains are on the road. A rather unusual policy in the modernizing of power is that adopted by the Northern Pacific, as described elsewhere in this issue. This road has not only added devices to increase the efficiency of the engine, but has also taken advantage of the possibility of securing greater tractive effort by adding another pair of drivers and lengthening the boiler. The operating results secured from the rebuilt locomotives show the large savings that can be effected by a relatively small change in the design. Roads that have an overabundance of small power may well consider the advantages to be gained by converting locomotives to a heavier type, thereby increasing the capacity and postponing the time when they must be retired as obsolete and uneconomical.

The Coal Strike Muddle

No other industry except that of coal mining itself is more affected by the coal strike than the railroad industry. The railroads are the largest consumers of coal and therefore the strike directly affects their operation. Coal constitutes the largest single class of their traffic and therefore a cessation of production speedily and seriously affects their earnings.

The immediate causes of the coal strike and the chaotic conditions, business and other, which have resulted from it are obvious. Everybody who has dealt directly with the matter has blundered. Probably there has never been committed a more perfect and unbroken series of blunders in the handling of any great industrial and public problem.

First, the mine operators, although they knew that the irregularity of employment in the mines was little short of barbarous and should have known that the ultimate result would be an explosion, did nothing constructive to remedy the conditions which caused this irregularity.

Second, the United Mine Workers demanded an increase of 60 per cent. in wages and the establishment of a maximum 30-hour week simply because, as they contended, miners were given opportunity to work an average of only 30 hours a week. In other words, they tried to capitalize the irregularity of their employment—which instead, should have been remedied—and in addition, tried to get an exhorbitant advance in wages.

Third, the United Mine Workers, before any conferences had been held with the operators, ordered a strike to begin on November 1 unless before that time all their demands had been complied with.

Fourth, the government officials have made one blunder after another. The Secretary of Labor publicly announced that the miners should have an advance in wages of 31 per cent. The operators offered 20 per cent, provided they should be allowed to advance prices. Fuel Administrator Garfield who, as this paper once before remarked, knows nothing about fuel and less about administration, decided, with the concurrence of the cabinet, that the miners should be offered only a 14 per cent advance, which should not be accompanied by any increase in the price of coal. Naturally, the miners were not disposed to accept 14 per cent after the operators had indicated they were entitled to 20 per cent and the Secretary of Labor had indicated they were entitled to 31 per cent.

Finally, the Department of Justice compelled the officers of the United Mine Workers to recall the order for a strike by proceeding under the Lever act, and having done this took no further steps to compel the miners to carry out the spirit as well as the letter of the order of the court. The Lever act was a war measure. The miners knew that the war was over. It is not very surprising that even the law-abiding men among them were not much disposed to obey a court mandate issued under a law passed to deal with a war emergency which had ceased to exist. It was probably a blunder to use the law at all. Having once used it, however, it was certainly a blunder not to use it effectively.

The result of this extraordinary series of outrages and blunders is, that the strike has been in effect since November 1, that there has been an enormous reduction in the supplies of coal on hand, that the country's business has been compelled largely to shut down, and that while industry and the people suffer government officials continue to play with legal and economic theories and conditions go from bad to worse. It is one of the ironies of the situation that at the very time when the Department of Justice was using the Lever law to break the strike, the President of the United States in his annual message pronounced the right of labor to strike inviolate!

Presumably, the country will finally, after great loss and suffering, muddle through the terrible situation which has been created by the recklessness of some people and the stupidity of others. There is much talk of applying the principle of compulsory arbitration to the coal mines, of smashing unions, and so on. Certainly, the situation existing does raise in a very serious form the question whether the increase of the great labor unions in numbers and in power, and the growth of radicalism in their ranks, are not beginning to constitute a danger of the first magnitude to the industrial and political institutions of the country. It seems evident that if the great labor organizations continue to take the country by the throat and try to choke it into submission to their wishes, as they have been doing within recent months,

the result is bound to be a great struggle between the government and the public on the one side and the labor unions on the other to decide which is the master

Meantime, however, it is best that we should recognize frankly the fact that conditions such as now exist in the coal mining industry, have real causes: that labor never shows such a spirit of discontent without their being some reason for it; and that while the struggle is going on to prevent organized labor from getting control of government and industry an effort should be made to remedy the conditions which cause so much discontent.

The miners have real reason for being discontented with the conditions of their employment. They are at fault for having attempted to improve their lot in the way they have, but many classes of persons are at fault because of the conditions which have given rise to their discontent. The great irregularity of their employment has been due to irregularity in the operation of the mines. This in turn has been due to wide fluctuations from season to season in the market for coal. Because most coal is consumed in the late fall, winter and early spring months it has been customary to produce it in much larger volume in some seasons of the year than in others. It must continue to be consumed in much larger quantities in some parts of the year than in others, but it would be perfectly feasible for the public, the railroads, and the coal operators to enter into arrangements which would cause a more nearly uniform coal production throughout the year.

Everybody agrees that it is desirable that coal for domestic consumption should be stored in houses and apartment buildings in the spring and early summer, but the public will not buy it at that time unless given an incentive to do so. That incentive should be afforded by the railways making lower rates and the coal operators and dealers making lower prices in the spring and summer than they do in the fall and winter, and then using their utmost efforts to get people to buy at the right time. The railroads, which are the largest consumers of coal, should move and store a much larger part of their supplies than they do now in the spring and summer Of course, stored coal has to be rehandled, but the cost of rehandling could be offset by the operators making lower prices in the spring and summer than in other parts of the year and by the railroads moving it at that time, when the amount of traffic moving is normally less than at other seasons and when, therefore, the operating expense of moving it would be less than at other seasons. Manufacturers also could buy and store a great deal more coal in the spring and summer months than they have in the past, and probably would do so if they were given the incentive of lower railway rates and lower prices.

The effect of the adoption of these measures would be greatly to reduce the irregularity of employment in the mines, and thereby to reduce the number of miners that would be necessary, and the economic cost of producing and transporting fuel. The reduction of the irregularity of employment would be beneficial to the miners, and the reduction in the cost of production and transportation would be beneficial to all classes of consumers. Why have not these obvious remedies for the entirely unsatisfactory conditions under which coal has been produced and transported been adopted? Because the leaders of the public and the miners, and the leaders in the fields of transportation and mine operation have not seen and admitted that they have had a duty to perform and co-operated in the performance of it.

The strike will be ended sooner or later. When it is ended the plain duty, which the crisis through which we are passing points out, should be performed. Somebody must take the initiative in bringing about its performance. If nobody else takes it the managers of the railways ought to take it. Some people doubtless will say that government officials should take it, but in view of the way that government officials have dealt with the coal strike it seems probable that the less interference there is from them the better the results will be for everybody.

The Cost of British Locomotives

London, Eng., October 19, 1919.

OUR LONDON CONTEMPORARY, the Railway Gazette, in a recent editorial criticises the Egyptian State Railway Administration for spending several thousand pounds for locomotives in America, indicating that the purchases were made without due consideration of prices even though the British concerns quoted prices from 76 per cent to 81 per cent higher than that quoted by the successful American locomotive builder. Its implication was, although they took great pains to forestall any criticism in this respect, that even though the quotations of the British manufacturers were much higher than those of the American manufacturer "the quality of British workmanship and the class of material put into the engines, compared with those produced in other countries, result in an economy in repairs and maintenance and an increased life which more than repay the higher first cost."

The figures quoted as the bids of the British manufacturers were from £15,000 ($63,000)* to £17,000 ($71,400)* with a possible delivery in 1921, as against the American locomotive builder's figures of £8,500 ($35,700)* to £9,400 ($39.500)* with delivery in four months. In other words the Railway Gazette would imply that the workmanship of the British locomotive builders is sufficiently better to warrant the Egyptian State Railways paying from $27,000 (76 per cent) to $32,000 (81 per cent) more a piece for their locomotives. We are well aware that the expense of maintenance and repairs should be as carefully considered as the first cost of an article, but at the same time we also believe that the interest on the investment is as important a factor as the cost of maintenance. Figuring money at five per cent, which is an exceedingly conservative rate at the present time, had the Egyptian State Railways purchased their locomotives from the British manufacturers at the quoted figures they would have had additional yearly capital charges varying from $1,400 to $1,600 to apply to each one of these engines.

Before the war, the manufacturers in Great Britain were in a particularly advantageous position as regards the cost of labor. They could economically put more labor in their manufactured articles and produce a product of greater refinement at a much lower cost than was possible in the United States. At the same time the low cost of labor made unnecessary the development and use of so-called labor saving machinery. During and since the war, however, the cost of labor has increased in Great Britain to such an extent that the cost of the final product when made according to pre-war practice, is greatly increased. America on the other hand having had to carefully watch its labor cost has constantly improved its manufacturing methods by the installation of inproved machinery and on the other hand has found it impractical and uneconomical, in the final analysis, to go to the refinement of the British manufacturers.

The real lesson to be learned from the fact that the colonies of Great Britain can buy so much cheaper from America is that greater development has been made in America in the use of improved machinery. It has been repeatedly stated by careful students in manufacturing costs that with the greatly increased cost of labor both Great

*Based on an exchange rate of $4.20.

Britain and many of the European countries will find it increasingly necessary to improve their manufacturing methods and to use more modern labor saving machinery than they have in the past.

The Salaries of Railway Officers

Representative Sims has rendered a real service to railway officers, the railways and the public by publishing in the Congressional Record a list of the salaries amounting to $20,000 or more, which were paid by the railway companies in 1917, the last year of private operation. This list was given in the delayed issue of the *Railway Age* for October 10, which was published on November 26.

There has been much talk for years about the "fancy" salaries paid by the railways. What has been said on this subject has led many persons to believe that the large salaries were so numerous and excessive as to result in "exploitation" of employees, stockholders and public. Doubtless the large salaries paid in 1917 were larger, and there were more of them than ever before. It is, therefore, interesting and instructive to find how few really large salaries were paid and what a trifling sum they aggregated in comparison with the total earnings, expenses and pay roll of the roads.

There were about 20,000 general and divisional officers in 1917. The list published in the Congressional Record shows that just 200, or about 1 per cent of these, received $20,000 or more. The aggregate amount paid to these 200 officers was $6,644,074. This was $16 out of each $10,000 of the total earnings of the roads; $24 out of each $10,000 of their operating expenses, and $31 of each $10,000 that they paid out in salaries and wages. The amount was so small that if instead of having been paid to the officers it had been divided between the employees the average employee would have received less than $4 a year more than he actually did. The aggregate salaries of all those receiving $50,000 or more were less than $1,900,000. This amount, if divided between the employees, would have added less than $1.25 to their average wages for the year.

It may be asked, however, why this many salaries ranging from $20,000 to $100,000 a year were paid? There are two answers: First, bidding among the railway companies themselves for the best brains in the business has placed a premium upon those brains and this premium is represented by the salaries paid to the principal officers. Second, the railways have had to bid for brains against other industries. It has been no uncommon thing for men of ability to leave the railroad business in order to secure in other lines of business incomes larger than they could get in the railroad business. If the railroad companies did not pay high salaries to men of first-class ability most of the men of first-class ability in the industry would be attracted away to positions in other fields.

While to a man who is receiving an income of perhaps $1,000 or $2,000 a year salaries of $20,000 to $100,000 may seem very large, the fact is that the incomes which railway officers have enjoyed in proportion to the amount of energy and ability they have devoted to their work have been much smaller than the incomes made by men of corresponding rank in other lines of industry. While it is very unusual for a railway officer to receive a salary of $75,000 a year, it is by no means unusual for men in purely industrial and commercial businesses to make incomes largely exceeding this amount. In fact, there are thousands of men running small businesses in the country in which they own substantial amounts of stock, who are receiving salaries and dividends ranging anywhere from $100,000 to $1,000,000 a year. We know of the case of a railway president who a very few years ago refused a salary of $250,000 a year as head of a large manufacturing concern. We know of two cases of railway officers of lower rank than that of president who very recently became the heads of large industrial concerns under arrangements which will yield them larger incomes than that received by any of the railway officers whose names appeared in the list published in the Congressional Record. It is the misfortune of a man of ability in the railroad field that he has to depend for his income almost entirely upon his salary, because in the railway field the opportunities for making profitable investments are much more restricted than in almost any important line of commerce or industry.

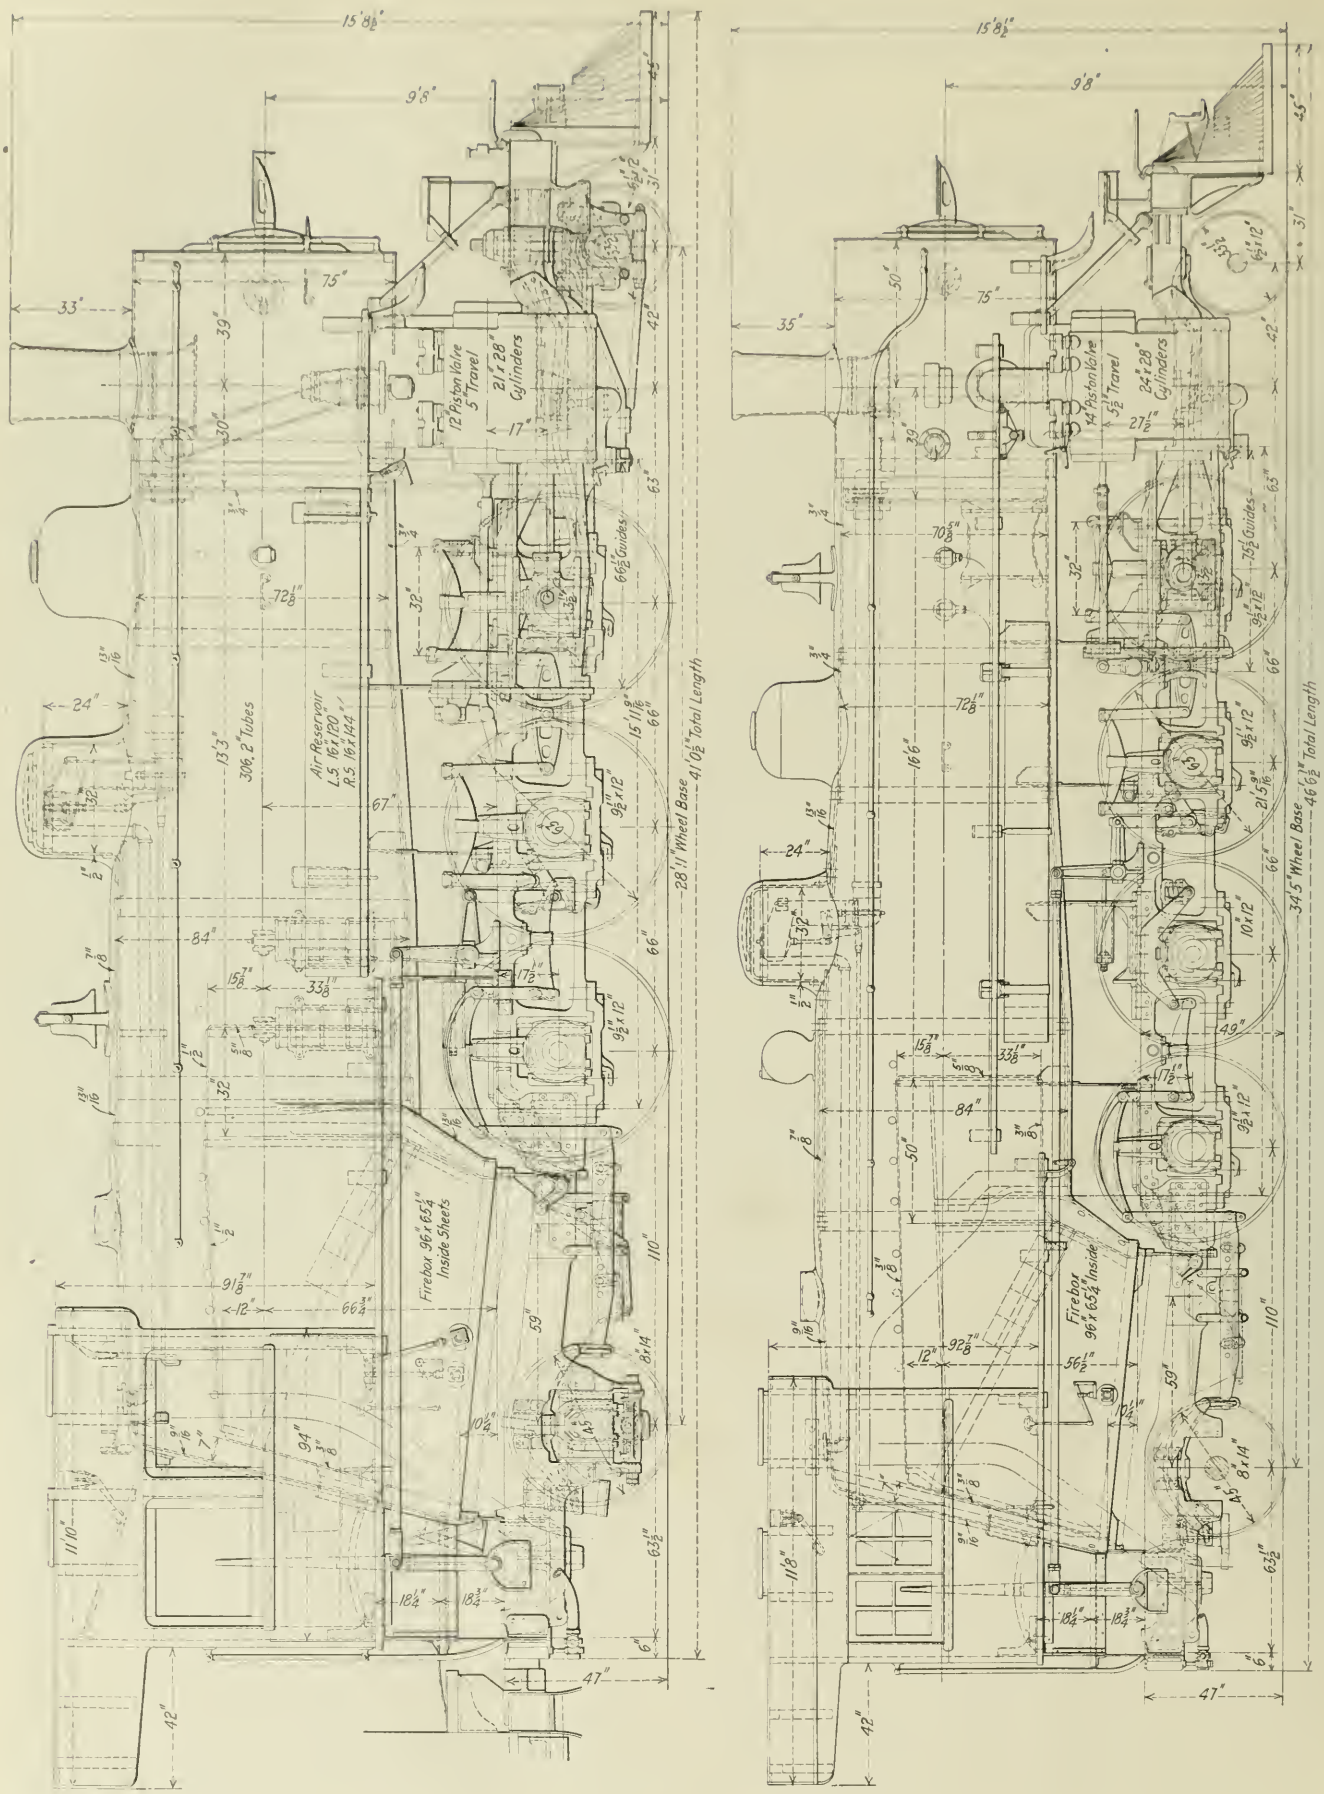
A certain newspaper, in commenting upon this list of salaries of railway officers, remarked that it was adapted to increase the sentiment for government ownership among railway employees, because it would make them feel more sharply the difference between their incomes and those of the higher officers. As a matter of fact a very large majority of the men receiving large salaries on railways have risen from the ranks of the employees. The number of individual officers receiving $50,000 or more whose names appeared in this list is 29. The following list gives the positions in which and the ages at which 18 of these 29 men entered railway service:

R. H. Aishton, axman, 18 years old,
W. G. Besler, trainmaster's clerk, 16 years old,
H. E. Byram, call boy, 16 years old,
A. J. Earling, telegraph operator, 17 years old,
J. M. Hannaford, clerk in general freight office, 16 years old,
Walker D. Hines, attorney, 23 years old,
Marvin Hughitt, telegraph operator, 19 years old,
L. E. Johnson, fireman, 20 years old,
E. F. Kearney, telegraph operator, 17 years old,
J. Kruttschnitt, engineering department, 24 years old,
L. F. Loree, assistant in engineering corps, 19 years old,
R. S. Lovett, local attorney, 24 years old,
W. T. Noonan, employee in accounting department, 14 years old,
Edmund Pennington, warehouseman and brakeman, 21 years old,
Samuel Rea, engineering corps, 16 years old,
E. P. Ripley, contracting freight agent, 23 years old,
T. M. Schumacher, telegraph operator, 17 years old,
W. H. Truesdale, clerk, 18 years old.

A. H. Smith, William Sproule and F. D. Underwood have modestly rendered it impracticable for us to ascertain offhand how old they were when they entered railway service, but Mr. Smith entered it as a foreman of bridges, Mr. Sproule as a clerk, and Mr. Underwood as a clerk, who soon graduated into a brakeman.

It will be noted that a large majority of these high-salaried men entered railway service when they were mere boys; and most of them had been continuously in the service for more than 30 years before they became heads of railroads and began to draw really large salaries. When it is considered that the 200 men included in the list as receiving $20,000 or more were the principal officers and managers of properties representing an investment of approximately $19,000,000,000 and having earnings of over $4,000,000,000 a year and operating expenses of almost $3,000,000,000 a year, it is rather difficult to understand how anybody having any knowledge of the character of the work they had to do and the responsibilities they had to carry can say that they were paid too much.

Furthermore, since a very large majority of them rose from the ranks, it would seem that the larger were the salaries paid to them the greater would be the incentives afforded to the ambitious men in the service to strive, by increasing their efficiency, to increase their chances of rising to the highest positions.



Elevation of Mikado and the Prairie Type from Which It Was Built

Northern Pacific Converts Prairie Type to Mikado

Increased Tractive Effort and More Efficient Use of Fuel Secured by Changing Old Power

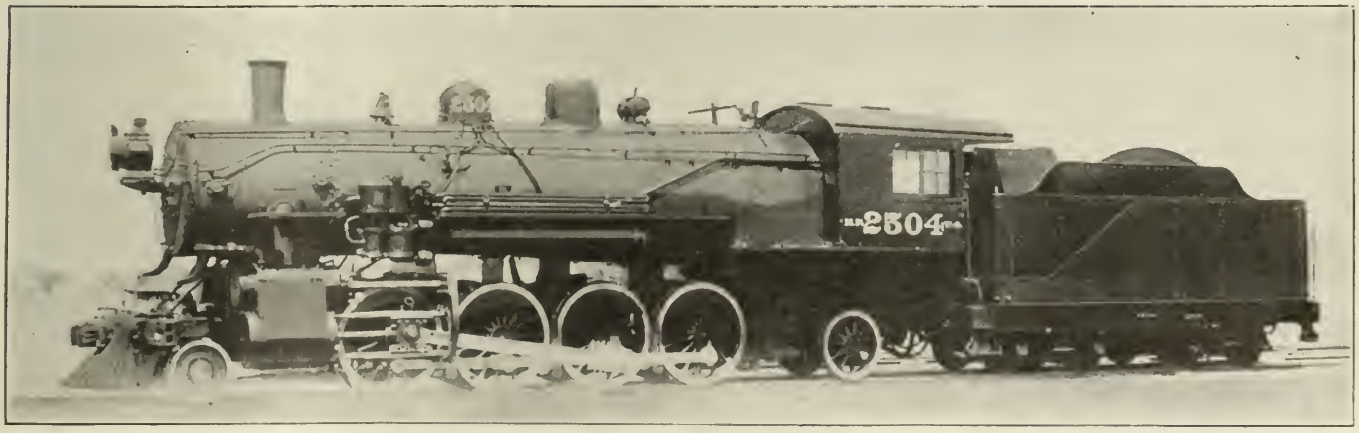
THE RECONSTRUCTION of a Prairie type locomotive to the Mikado type, with a consequent increase of 21 per cent in the tractive effort and a substantial improvement in the efficiency of the boiler and cylinders, has recently been effected on the Northern Pacific. The details of this work are of particular interest as illustrating how motive power which is no longer suitable for heavy service can be redesigned to increase the train load and decrease the unit consumption of fuel. The changes that were made not only raised the tractive effort but also improved the steaming qualities of the locomotive, so that an even greater increase in the train load was secured.

The reconstructed locomotives were intended for use between Glendive and Billings, Mont. On this division the heaviest grade is opposing the westbound movement, the ruling gradient being 26 ft. per mile. In this direction the rating of the Prairie type, or class T, which has a rated tractive effort of 33,300 lb. is 1,600 tons, while the rating for the Mikado, class W-4 with 40,300 lb. rated tractive effort is 2,600 tons, an increase of 62 per cent. On the eastbound movement the rating is controlled by the passing siding, the ratings for the two types being as follows: From Billings to Forsyth, class T, 2,900 tons, class W-4, 3,400 tons; from Forsyth to Glendive, class T, 2,800 tons, class W-4, 3,300 tons.

An additional advantage secured by the conversion to the Mikado type is uniformity of train loads on several divisions. The heavier Mikados in use on the Northern Pacific have tractive efforts of 46,000 lb. and 57,100 lb. and, in connection with the class T and class W-4, provide motive power units adapted for hauling approximately equal tonnage on lines with grades that vary widely, thus facilitating through movement without breaking up trains at division points.

The class T Prairie locomotives which were rebuilt were purchased in 1906. The weight on drivers was 153,500 lb. and the total weight of the engine 204,500 lb. The new class W-4 Mikado weighs 204,000 lb. on drivers, with a total weight of 249,000 lb. It will be noted that in making the change, the weight per driving axle remains substantially the same and, by the addition of the fourth pair of wheels, the weight on drivers was increased in a greater ratio than the tractive effort. The 21 in. by 28 in. cylinders were replaced by cylinders 24 in. by 28 in. with 14 in. piston valves and outside steam pipes. To provide ample steaming capacity for the larger cylinders, the size of the boiler was increased and a superheater was added. The grate area was not changed and no alterations were made in the brick arch. The boiler barrel was lengthened 57 in. by adding a new front course. This was utilized by increasing the distance between the tube sheets, making the tubes and

Northern Pacific Prairie Type Locomotive, Class T



Mikado Type, Class W-4, Rebuilt from Class T

flues 10 ft. 6 in. long, and by increasing the length of the combustion chamber from 32 in. to 50 in. The increase in the length of the frame to provide for the fourth wheel was 66 in. The additional space of 9 in. was taken up by the increased length of the smokebox from the center line of the stack to the first ring of the boiler which was necessary to provide room for the superheater header. The length of the smokebox ahead of the cylinder center was also increased from 39 in. to 50 in. The change in the boiler and the application of the superheater increased the equivalent heating surface from 2,359 sq. ft. to 3,186 sq. ft. or 35 per cent.

The frames were replaced with new cast steel frames of larger section. The uniform spacing of 66 in. between driving wheels was retained, thus reducing the number of new parts required. A heavy cast steel crossbrace was added over the main driving axle. In redesigning the running gear no radical changes were necessary. The engines as originally built had a short rigid wheel base and the distance from the cylinder to the front axle was unusually short for locomotives of the Prairie type, making it necessary to couple the main rod to the rear driving wheel. For this reason, the distance from the transverse center line of the cylinders to the center line of the front drivers was maintained unchanged in the new design, making it possible to use the same spring rigging on the Mikado with the addition of equalizers for the main drivers. The equalizing system, as before, is divided between the second and third wheels.

In order to provide for the increased stresses due to the larger cylinders, the axle of the main wheel was made 10 in. in diameter. The piston rod was lengthened 3½ in. and the main rod was shortened a corresponding amount. The valve gear was changed by substituting an indirect for a direct rocker arm, the travel being increased from 5 in. to 5½ in.

The improvements in the smokebox were designed to overcome the trouble of throwing sparks. With the class T engines this has been very annoying in the past, particularly when used in the district where semi-bituminous coal is burned.

The converted engines ride much easier than the Prairie type and, because of the better load distribution, are much easier on the track.

For the purpose of comparison, the principal weights, dimensions and ratios of the two types are tabulated below:

General Data

	Class T 2-6-2	Class W-4 2-8-2
Gage	4 ft. 8½ in.	4 ft. 8½ in.
Service	Freight	Freight
Fuel	Bit. coal	Bit. coal
Tractive effort	33,300 lb.	40,300 lb.
Weight in working order	204,500 lb.	249,000 lb.
Weight on drivers	153,500 lb.	204,000 lb.
Weight on leading truck	20,500 lb.	19,600 lb.
Weight on trailing truck	30,500 lb.	25,400 lb.
Weight of engine and tender in working order	353,000 lb.	397,500 lb.
Wheel base, driving	11 ft. 0 in.	16 ft. 6 in.
Wheel base, total	28 ft. 11 in.	34 ft. 5 in.
Wheel base, engine and tender	57 ft. 3½ in.	62 ft. 9½ in.

Ratios

Weight on drivers ÷ tractive effort	4.61	5.06
Total weight ÷ tractive effort	6.14	6.18
Tractive effort × diam. drivers ÷ equivalent heating surface*	889.3	796.9
Equivalent heating surface* ÷ grate area	54.2	73.2
Firebox heating surface ÷ equivalent heating surface,* per cent	10.0	8.15
Weight on drivers ÷ equivalent heating surface*	65.1	64.0
Total weight ÷ equivalent heating surface*	86.7	78.2
Volume both cylinders	11.20 cu. ft.	14.62 cu. ft.
Equivalent heating surface* ÷ vol. cylinders	210.6	217.9
Grate area ÷ vol. cylinders	3.88	2.98

Cylinders

Kind	Simple	Simple

Coal capacity	12 tons	12 tons

* Equivalent heatting surface = total evaporative heating surface + 1.5 times the superheating surface.

Orders of the Regional Directors

Oil in Train Loads.—Order 248, of the Southwestern regional director cancels the instructions in Order 211 stipulating that 20 or more cars of oil for one destination, distributing center or junction would be symbolled, reported and handled as a trainload

Clergy Tickets.—Order 246 of the Southwestern regional director modifies current instructions governing the issuance of half fare clergy tickets. Ticket sellers must punch each ticket, coupon and contract "one-half," and stamp thereon "Clergy." Federal auditors must see that tickets and coupons punched "one-half," are checked against local or interline reports, and call attention of reporting carriers to all tickets reported at one-half fare, where coupons are found not punched and stamped.

Export Bills of Lading.—Supplement 2 to Circular 248. Southwestern Region, contains instructions for the distribution of the 11 copies which should be made of all through export bills of lading.

Fires Resulting from Derailments.—Supplement 2 to Circular 189 of the Southwestern regional director calls attention to recent derailments in which loaded oil tank cars caught fire resulting in damage of $6,380, and points out the necessity for observing certain precautions prescribed by the Bureau of Explosives.

Vacations for Train Despatchers.—Supplement 14 to Circular 28 of the Northwestern regional director contains rules and regulations regarding rates of pay and vacations for train despatchers adopted at a recent meeting of regional directors in Chicago, with W. T. Tyler, director of the Division of Operation. These rules were effective on October 1.

Through Bills of Lading Via North Atlantic Ports.—Circular 282, canceling Circular 277, of the Central Western regional director contains instructions governing the issuance of through export bills of lading via North Atlantic Ports which supersede all previous instructions. The Southwestern regional issues similar instructions in Circular 2521.

The Coal Strike and the Railroads

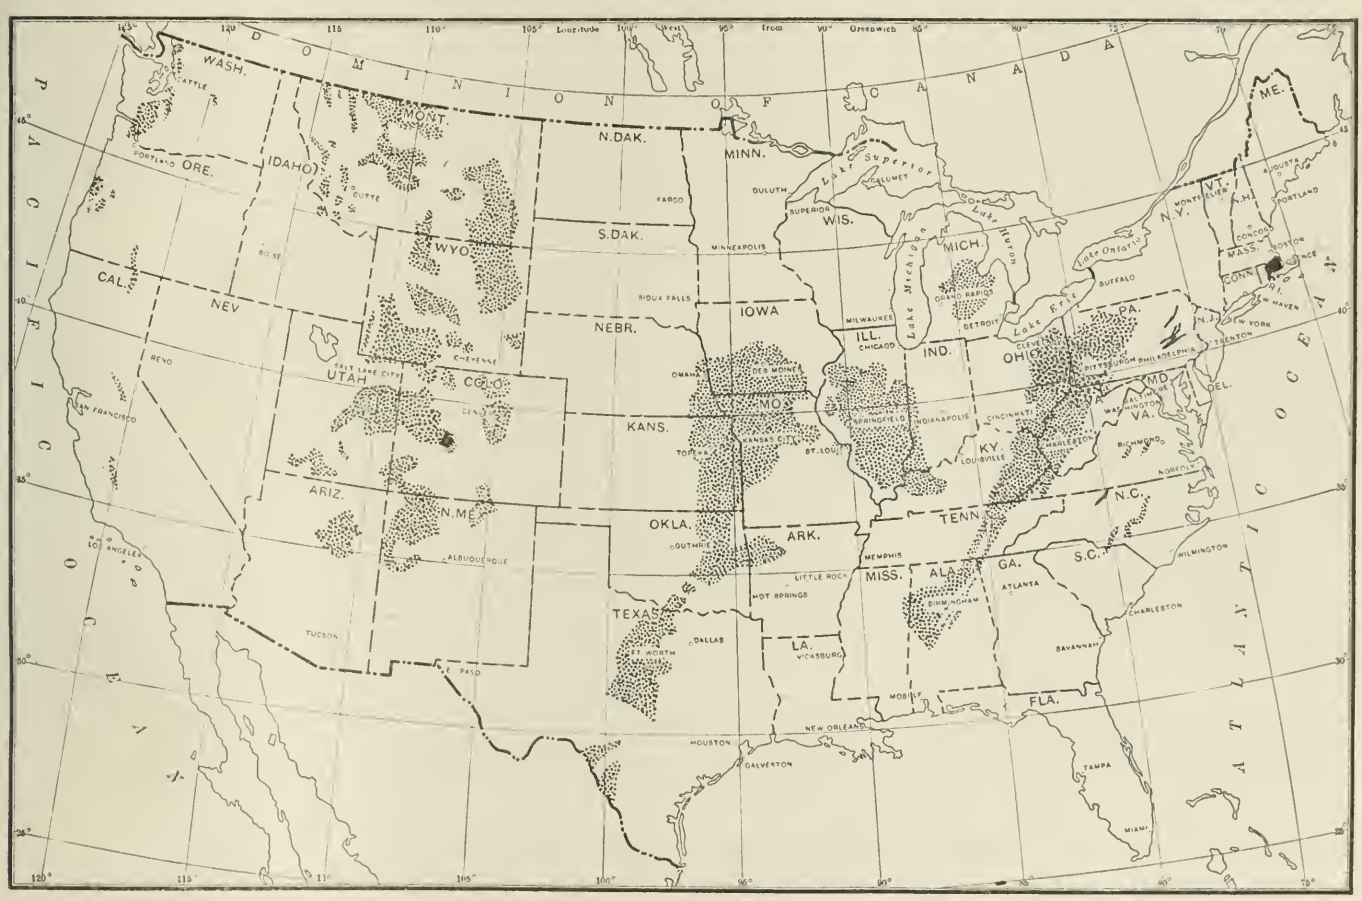
Coal Necessary to the Operation of Railroads and Railroads Necessary to Distribute Coal to Consumers

Director General Hines on December 6 authorized the following statement:

"The shortage of coal has reached a point where it is vitally necessary to reduce passenger train service and to call upon the public to assume the inconvenience and discomfort which this action will inevitably entail.

"On Monday, December 8, in the Western regions; Tuesday, December 9, in the Southeastern regions, and Wednesday, December 10, in the Eastern and Allegheny regions, certain passenger trains will be annulled and a large number of parlor cars will temporarily be discontinued. The people will appreciate the gravity of the situation and will give full and cheerful co-operation."

The railroads of the country under present conditions consume about 30 per cent of the total output of bituminous coal of the United States. The strike has reduced coal production to about 40 per cent of the normal production at this time of year. The railroads head the list of the industries to which priority in coal deliveries are to be allowed. Were they, therefore, to continue to consume as much coal as heretofore but 10 per cent of the total normal production would be left for the domestic consumers and for industries



The Principal Coal Fields of the United States. Bituminous Fields Shown Shaded and Anthracite Shown Black

average seating capacity of a parlor car is less than half the average seating capacity of a coach, and this step is taken for the purpose of providing the maximum seating capacity consistent with the necessary reduction in train mileage. These changes are being worked out in detail by the regional directors, and promptly upon their completion will be given wide publicity. Before making arrangements for travel inquiry should be made of railroad agents as to available trains.

"It is the plain duty of the administration to warn the public that until this emergency has passed travel conditions will be difficult and unsatisfactory, and to urge everyone who can possibly do so to refrain from travelling.

"It is unfortunate that the emergency comes as the holiday season approaches, but it is hoped and believed that our

in general. They will not, however, continue to consume their full quota. In the first place, bituminous coal as a commodity carried by railroads furnishes about 27 per cent of the total tonnage of freight carried by all the railroads of the country. Were the tonnage of coal carried to industries therefore to be cut down to one-seventh of normal a very considerable part—varying from 15 to 20 per cent—of freight service would automatically cease. Furthermore, as soon as industries begin to shut down on account of shortage of coal a large part of freight traffic other than coal would also cease to flow.

The problem, therefore, for the railroads is to themselves consume as little coal as possible while continuing to deliver as large an amount as possible to domestic consumers and to industries. Obviously the first step is reduction in

passenger train mileage. The administration has announced a general cut in passenger train service.

The aim in the Eastern region is to reduce passenger train mileage 10 per cent. The Twentieth Century Limited is to be taken off, as is also, in the Allegheny region, the Pennsylvania's 20-hour train, the Broadway Limited. In the West the reduction is more drastic.

A reduction of even 10 per cent in passenger train mileage over the entire country would mean a saving of 57,500,000 passenger train miles a year, or a saving, roughly, of 10,000 tons of coal per day, making a rough allowance for the continuance of full service on roads burning oil for fuel.

The Director General Takes Control of Coal

On October 31 Director General Hines issued an order by which the Railroad Administration took control of all coal in the possession of the railroads. The order said: "The title of the purchaser, consignee or consumer, in the case of any such shipments of coal or coke, which by custom or law might become vested at the time and place of such shipment, shall, from and after the effective date hereof, be subject to the condition that the coal or coke so shipped may be diverted . . . the title and interest of such purchaser . . . shall be completely divested and terminated, and his liability to pay therefor shall cease. The person or the consumer to whom any such coal or coke is diverted shall become liable, as of the time of such diversion to pay the shipper thereof the price in force at the date of shipment . . . plus transportation charges and a handling charge of 15 cents a net ton. . . ."

On November 4 the following order of priority was fixed:

(Class A) Railroads—This includes inland and coastwise vessels.

(Class B) army and navy, together with other departments of the federal government—This includes bituminous coal consumed by manufacturers or producers of supplies for departments of the federal government when such department officially approves the request.

(Class C) State and county departments and institutions—This includes municipal institutions.

(Class D) Public utilities—This includes the manufacture of newsprint paper for daily issue and the printing and publishing of same."

Coal Operators' Difficulties

This order threw on the coal operators the burden of financing all the coal that they produced and shipped for an indefinite period. The Railroad Administration took over the coal as soon as it was loaded into railroad cars. No payment was made to the operator, nor could the operator bill anyone for this coal, since its disposition was fixed by the Railroad Administration. The coal operators claim that the sum involved is very large indeed and that the period over which they may have to carry an unknown purchaser is likely to be as much as six months. To remedy this situation the Railroad Administration proposed to issue a receipt for the coal, which the operators could discount at their banks and which their banks could discount with the federal reserve bank.

The Secretary of the Treasury, however, has held that the coal operators can now draw a note to cover their shipments of coal and that this note can be discounted with their own banks and rediscounted at the federal reserve banks without attaching to it a receipt for the coal delivered to the Railroad Administration. This, however, throws the burden of financing back on the individual operators. They are using their credit to finance the purchase of coal by unknown parties. They claim, therefore, that since the Railroad Administration—the government—takes title to the coal as soon as it is put into railroad cars the administration or some other branch of the government should pay the operators and undertake collection from those to whom the Railroad Administration delivers the coal.

The Situation in the East

On the Pennsylvania Railroad the average loading of bituminous coal before the strike was 38,000 cars daily. The minimum so far has been 1,491 cars daily, and the present loading (December 5) is 19,000 cars daily. On the Baltimore & Ohio, Eastern Lines, the average daily loading from May to October was 2,117 cars daily. In November the average was 1,204 daily, and the average loadings in the first three days of December was 1,421 cars. On the Baltimore & Ohio, Western Lines, the average daily loadings prior to the strike were 627 cars. This dropped to no loadings at all for some days, and the average loadings since November 1 to December 4 have been but 7 cars a day.

In the Ohio-Indiana region the average daily loadings amounted to 2,740 cars during October, dropped to an average of 144 cars in November and averaged 83 cars in the first three days of December.

In the Pocahontas region the average before the strike was 4,874 cars loaded, and on November 4 this had dropped to 3,250 cars. On November 12 3,897 cars were loaded, and on November 25 the record was 5,216 cars loaded; the present rate of loading is about 4,393 cars.

Situation in the West

A conference was held in Chicago on December 3, in which Hale Holden, regional director of the Central Western region; F. E. Clarity, assistant regional director of the Central Western region; P. S. Eustis, chairman of the passenger traffic committee of the Northwestern, Central Western and Southwestern regions, and M. J. Gormley, assistant regional director of the Northwestern region, participated. As a result of the discussion it was agreed that Mr. Eustis should draw up the requirements for the curtailment of passenger traffic and the resulting orders should be issued simultaneously in the Central Western, Southwestern and Northwestern regions.

The order as prepared by Mr. Eustis, in general, calls for a reduction in passenger service on lines using coal for fuel of at least one-third in train miles, eliminating those passenger trains which can be spared with the least inconvenience to the traveling public. At the same time the order calls for the abolition of practically every train luxury calculated to increase coal consumption.

The regulations as prepared by Mr. Eustis and distributed from the three regional offices are as follows:

(1) Effective at 12:01 a. m. Monday, December 8, the existing regular passenger train service using coal for fuel must be reduced on your road at least one-third in train miles, eliminating those passenger trains which can be spared with the least inconvenience to the traveling public.

(2) Discontinue all parlor cars, and also all exclusive club and lounge cars. Also withdraw from service all observation sleeping cars where the result is to save any switch engine service, provided you can obtain for substitution sleeping cars of regular type where necessary.

(3) No special trains are to be run for business or pleasure traffic.

(4) There must be no second sections of regular trains. Business must be cared for by adding extra cars, but not beyond the prescribed limit, and by lengthening the schedules of existing trains. When capacity of regular trains is reached, overflow of travel will of necessity wait over or seek carriage elsewhere.

(5) Exclusive mail and express trains need not be reduced in number, but no additional trains nor extra sections may be run for such traffic. The prospective heavy business to be cared for by adding extra cars to and lengthening the schedules of existing trains.

(6) Care must be used to give publicity as early as possible

to changes in your train service. This may be done by paid advertisements in the press and by bulletin notices in stations in such manner as you decide. Keep all ticket agents fully advised that the public may obtain information on application.

(7) It has been arranged to keep all consolidated ticket offices and passenger departments posted as to reductions, but you should also fully inform your immediate connections of changes.

(8) The Western Passenger Committee will, by general notice through press associations and by advertisement in some large cities, advise the public of intended curtailment of service, with the request that people abstain from unnecessary travel. Please have your officers and agents supplement and emphasize this plea as quickly as possible.

It is believed that, by thus conserving the use of coal which would ordinarily be used in passenger service, extensive embargoes on freight traffic will not be necessary. It is also true, on the other hand, that if the present shortage continues it will be practically impossible to carry out even this program for passenger service for any length of time, and it may be necessary to extend the curtailment of service to freight traffic as well.

Although suffering a heavy loss in coal traffic because of the cessation of mining operations, the railroads in the Northwestern and Central Western regions have felt practically no other direct effect of the coal strike until the last few days. While some of the roads curtailed passenger train service several weeks ago, these measures were initiated more for the purpose of preparing well in advance to meet the inevitable fuel shortage than because of any immediate necessity at that time for a reduction in fuel consumption. The roads in the Northwestern region have now loaded practically all of their reserve supply and little more than two or three days' supply is in sight. This led to the drastic orders referred to above.

The Northwestern Region

Generally speaking, the territory tributary to the lines of the Northwestern region is not coal-producing, the figures for 1917 production indicating that less than 3 per cent of the total bituminous coal production of the country came from that territory. The coal mined is mostly lignite, and in some of the fields a large percentage of it is used by the railroads. A comparison of classified traffic figures for the months of November, 1919 and 1918, respectively, show an increase of 8 per cent in the number of car loads of coal and coke originating on the Northwestern roads in 1919, with a similar increase of 7 per cent in the total number of car loads of freight originating on these lines and an increase of about 5 per cent in the total number of revenue cars handled, including that originating in the regio and received from connections. This increase in coal-loading during the month of November, 1919, that is, during the period affected by the strike, has been due to the large amount of Eastern coal loaded from storage at the head of the lakes.

The principal mining districts in the Northwestern region are in Washington, Montana and Iowa, the latter territory also being tributary to the railroads in the Central Western region. The Montana and Washington lignite mines are closed tight, with the result that the railroads in this territory have been forced to supply the divisions depending upon these fields with coal received from the East. The result has been an additional long haul and the further depletion of reserves stored at the lake ports.

The railroads in the Northwestern region draw heavily on the Illinois field for their coal supply, and this source has been shut off entirely throughout the period of the strike. This has been made up by a heavy draft on the coal received at the lake ports by such roads as the Northern Pacific, the Great Northern and the Soo Line and accounts for the increased loading of coal and coke shown by the railroads in the Northwestern region during the month of November, 1919, as compared with November, 1918. That the winter's supply of coal received at lake ports during the summer and fall has been depleted for immediate use is indicated by the fact that the coal loading of the Great Northern has increased from 6,049 cars in November, 1918, to 9,328 cars in 1919; the Northern Pacific from 12,451 cars in November, 1918, to 17,653 in 1919, and the Soo Line from 2,179 cars in November, 1918, to 4,503 in 1919. The total coal loading for the region was 57,217 cars in November, 1919, as compared with 52,813 for November, 1918.

Central Western Region

The territory through which the Central Western railroads operate produced approximately 20 per cent of the bituminous coal mined in the United States in 1917, but a number of the more important western fields are not served exclusively by the railroads in this region, the traffic being divided between Central Western, Southern and Southwestern lines. In general, in spite of the severe curtailment in coal production in this region during the month of November, there has been only a slight reduction in the total amount of traffic handled. This is accounted for by an increase in general merchandise freight, which may be due to an attempt on the part of the consumers to provide against the contingency of a curtailment of transportation should the coal strike continue. The principal exception to this is the Chicago & Eastern Illinois, on which there has been a 45 per cent decrease in traffic, due to the coal strike.

Some coal is now being produced in the central western territory. The Utah, Wyoming and Colorado mines, which normally produce about 5,000 cars a day, are now producing 1,000 cars daily. The Wyoming field, which was closed by the strike, is now in partial operation. The mines along the Union Pacific, which have successively been closed and placed in operation several times since the strike was called, are now closed. The Illinois field, which produces half of all the coal originating on central western lines, is now and has been closed tight throughout the period of the strike.

While the operation of the roads, with the exceptions above noted, has been normal up to the present time, reserves have now been reduced so that there is not more than two or three days' supply in sight.

General Situation

The annual capacity of the bituminous coal mines is estimated at 700,000,000 net tons. The production in 1917 was 551,000,000, and in 1918 it was 579,000,000. The production from January 1 to November 1, 1919, was 404,040,000, as compared with 504,339,000 during the corresponding period of 1918, according to the Geological Survey report of November 8, which said that, bearing in mind the great decline in consumption following the armistice, it is believed that the stocks now in the hands of consumers compare favorably with those at the same season in previous years.

The railroads had on hand, on wheels and in storage, on November 1 about 22,000,000 tons (439,000 cars) of soft coal, and on December 4 it was 265,000 cars, or nearly a month's supply, and they expect to be able to maintain that amount. From November 6 to November 9 2,655,300 tons were released by the railroads to consumers other than railroads, which was 1,213,200 tons more than the amount loaded in the same period. On the day the strike order was officially called off the railroads had on hand about 15,000,000 tons, or about a 30-day supply. On December 31, 1917, when the railroads were taken over by the government, the stocks on hand in storage amounted to 9,000,000 tons. On July 1 of this year they had about 12,500,000 tons in storage. During the first week of the strike the average car-loading of bituminous was 26 per cent of the pre-strike

average, and the second week it was 30 per cent; the third week it was nearly 40 per cent; on December 1 it was 40 per cent; on December 2, it was 42 per cent; on December 3, it was 43 per cent, and on one day recently it reached 48 per cent.

The total tonnage of bituminous coal transported by the railroads in 1917 was 631,0000,000 tons. This, of course, includes duplications where it was handled by more than one railroad. The tonnage originating on road was 355,873,000 tons.

The strike does not seem to be reducing railroad earnings materially as yet, because traffic that was held back by car shortage is taking the place of coal. Operating expenses in the latter part of October were increased by the extraordinary shifting of open-top equipment in order to furnish the maximum number of cars to be loaded with coal in the two weeks immediately preceding the strike and in the effort to give 100 per cent car supply. There is also an extraordinary movement of coal cars, and many are kept empty near the mines so as to be ready for use at once. The decrease in coal traffic, however, has relieved the condition of car shortage which existed up to the middle of October, and has enabled the railroads to handle practically all of the coal offered, which they were not able to do for a time before the strike. It has also released open-top cars for other traffic, which in turn released some box cars for other traffic, such as grain, that can be handled only in box cars.

As to the effect on the movement of freight traffic, the ton mileage handled in October showed an increase for the first time this year since January, and was greater than for October, 1918 and 1917. November traffic was also affected to some extent by the steel strike, and December traffic will be still further reduced by the loss of steel tonnage because of the shortage of coal and coke for the steel plants. The use of coal for coking has been cut down by 25 per cent.

On December 6 an embargo was issued, effective Monday, December 8, against the shipment of fuel oil from the west to points east of the Illinois-Indiana state line and north of the Ohio river, except on permits issued by W. L. Barnes, assistant manager, Car Service Section, Chicago, who will give permits for industries that have used fuel oil before November 1, or for export. The object is to avoid the eastward shipment of fuel oil that might be used in the west to avoid the westbound shipment of coal, on the theory that new users of oil should be those located in the west, where there is no coal, rather than in the east where the coal is.

There have been some newspaper statements that the Railroad Administration was trying to get its coal now at a lower price than others and that it has had a lot of coal standing around that it refuses to let go of. It has deliberately tried to build up and keep a reserve which could be used for the most essential purposes, as coal has been consumed faster than it has been mined.

During the month of November the Railroad Administration delivered to essential consumers other than railroads a quantity of coal equal to the entire tonnage mined during the month—that is, the railroads used up some of their own reserve stocks.

The railroads are now paying the full government prices for coal under the orders re-established on November 1, which represents a considerable increase, as they have been getting coal during the year at prices considerably less than the fixed prices which they paid last year.

Lieut.-Gov. Oglesby of Illinois and other representatives of the governor called on Mr. Hines December 6 to urge an increase in coal shipments to Chicago and Illinois. After they had explained the situation to the Central Coal Committee it was arranged to place additional orders for 1,500 cars a day to the Central Western and Northwestern regions, from which 500 cars will go to the Chicago district and 600 cars to Illinois outside of Chicago.

On December 6 Fuel Administrator Garfield issued an order extending the previous orders regarding the fixing of prices and the allocation of coal to apply to beehive or by-product coke.

End of Coal Strike Expected

Prospects for the ending of the bituminous coal strike this week appeared certain Saturday night, December 7, when John L. Lewis, acting president, and William Green, secretary-treasurer of the United Mine Workers, agreed to urge the acceptance by the miners of a "definite, concrete proposition" from the President "looking to a speedy termination of the strike situation and an adjustment of the entire controversy," placed before them during the day at a conference at the office of the attorney general, who had earlier in the day conferred with the President. The officers of the miners' union, faced with prosecution in contempt of proceedings for violation of the Indianapolis injunction under which the strike order was ostensibly recalled on November 11, agreed, in response to the suggestion of the President, to call a meeting of the general scale committee, the representatives of the district organizations and the international executive board of the United Mine Workers to be held at Indianapolis on Tuesday, December 9, at which time the President's proposal was to be considered and its acceptance by the miners urged by Mr. Lewis and Mr. Green. Tuesday was the day set for the hearing in the contempt proceedings before Judge Anderson, and it was understood these would be postponed or called off.

The nature of the President's proposal was not disclosed, but as it is understood the administration has approved the position taken by Fuel Administrator Garfield that no increases in wages should be allowed that will require an advance in coal prices it was thought that the proposed basis of settlement would approximate the 14 per cent advance proposed by Dr. Garfield.

The leaders of the miners' union had been put in a position, by the efforts of the Department of Justice, where the prospect that some of them would go to jail had become prominent as one of the alternatives to be considered. The department was said to be in possession of evidence that the notices recalling the original strike order, sent out on November 11 by order of the court, had not represented a compliance in good faith with the court's order, but had been sent out without the official seal of the union and in such a way as to leave doubt in the minds of those to whom it was addressed as to whether it was official. Evidence was also said to be available that some of the strike leaders had adopted surreptitious means of advising their followers to keep the strike alive pending the wage negotiations. Coal production had been gradually increased, and during the week ended November 29 was 5,429,000 tons, or about 45 per cent of the normal bituminous output.

Government Ownership No Alternative.—If money put into railroad securities is only to be thrown away, there will be no money put into railroad securities. And if the railroads cannot support themselves in a healthy condition, able to obtain fair rates for their maintenance, and new capital for their expansion, why, then, they cannot exist. There is no use of suggesting government ownership as an alternative. The American people have had of late about as much connection of the government with public utilities as they can stomach. As tested practically, it has been shown to mean little else than deficits soaring into the billions.—*Albany Knickerbocker Press.*

The Senate Discusses the Railroad Bill

Various Amendments Have Been Offered, but Comparatively Little Progress Has Been Made

LITTLE PROGRESS HAS BEEN MADE thus far in the consideration of the railroad bill in the Senate, which was begun on December 2. The first three days were taken up with an opening speech by Senator Cummins, chairman of the committee on interstate commerce, who explained in detail the provisions of the bill and the reasons which actuated the committee in adopting them and answered various questions put by the Senators. On December 5 the bill was read for amendments, and amendments were offered by Senators Curtis, Watson and Spencer, after which Senator Kellogg began a long speech which was occasionally interrupted by calls for a quorum Senator Kellogg favored the bill's principal provisions, including the anti-strike provision, and charged the Railroad Administration with enormous extravagances in the operation of the railroads and with building up a great central organization which, he said, "had benumbed the incentive and enterprise of every railroad organization." He also declared that inequalities in wage awards had added grossly to the cost of operation and lowered the morale of the service.

Senator Cummins said he thought it would tend to simplicity and clearness if the Senate should proceed with the consideration of the Senate bill, and after having made such changes in it as commended themselves to the judgment of the Senators should substitute it for the Esch bill as passed by the House, and in that way present a foundation for a conference between the two houses. That course, he said, was approved by the committee.

Senator Cummins said he did not intend to discuss at any length the merits of private operation, as compared with public operation, because the committee was so nearly unanimous that it was unnecessary for him to defend its position. He believed the great majority of the people of the United States, in view of the experience of the last two years, did not desire that public operation shall be continued, and it desired that the railroads shall be returned to their owners under such strict supervision and regulation as will insure justice at once to the owners of the properties and to the public as well. He expressed the opinion that the operation of a system of transportation is a proper governmental function, and it is only a question of how the people of the country can be best and most efficiently served. He would adopt public ownership and operation in a moment if he believed the people would thereby secure better, more adequate and cheaper transportation. In answer to the claim that government operation has not had a fair trial during the last two years, he said:

"Whatever may be the merits of government operation, I feel no hesitation in saying that the trial of the last two years in the United States has been the fairest trial to which that form of regulation could be submitted. The government has had every possible advantage in demonstrating efficiency in operation. First, the volume of the traffic of 1918 was substantially the same as the volume of the traffic in 1917, and in 1919 that volume had been not greatly diminished. The government has had the advantage of absolute authority. It has had no interfering or embarrassing conflicts with any department of the government. The director general, together with those officers who have been appointed to assist him in the administration, has been supreme; and I say again that it is not in my heart to criticise the action of the director general, save in one or two respects that may become material a little later on; but I now want to impress upon those who believe in government operation that the director general has been master of the whole situation. It was for him, and him only, to say what unification should take place. It was for him, and him only, to declare upon what routes traffic should be moved. There was no one to dispute his authority, no one to question his decisions, and if government operation could have a fairer opportunity to demonstrate its efficiency I can not imagine it. The director general had complete authority over rates. We dispossessed the Interstate Commerce Commission of all authority over the subject when we transferred these properties to the President of the United States."

Government Operation Expensive

Senator Norris asked whether if the government had not taken over the railroads they would have gotten through the war without trouble, and whether the country would have escaped the difficulties that have ensued.

"In my opinion," replied Senator Cummins, "they would have had very much less trouble than we have had so far as losses are concerned. Of course, if the people of the country desire to pay the price, government operation is entirely feasible. There is nothing that stands in its way if the people are willing to pay the cost." He added that he was not saying that either private operation or government operation could have gone on doing business at the same rates that prevailed before the war, but, he said, the government had a great deal better chance for successful operation under war conditions than the railroad companies had under peace conditions and that the main thing gained by public operation was the right to move traffic on any line that it was desired to move it on

"It is my judgment," he said, "that the railroads at the time the President took them over were doing better in the movement of traffic than they ever did afterward, but I do not say that the railroads could have continued to do business upon the rates which were then in effect any more than the government could continue under those rates."

Senator Norris said that those who favored government ownership would be opposed fundamentally to the kind of government control that we have had in the last two years. Senator Cummins said it was his judgment that the organization we have had for the last two years was better qualified, more competent to operate the railroads than the organization suggested by the Senator from Nebraska. He did not think it was an ideal organization, because it had too much arbitrary power. He believed that Mr. McAdoo and, following him, Mr. Hines, and especially Mr. Hines, had done the very best that could be done and had operated the properties just as cheaply as they could be operated, barring the increase in wages. No one, he said, can question the energy and the ability with which the railroad operations have been carried on. Senator Walsh suggested that the government's operation had been less successful than it might have been because it retained so many railroad men who retained all their prejudices and predilections against government ownership and that "while perhaps there was nothing in the nature of a conspiracy to depreciate in the public mind the policy of government ownership, yet there was no disposition evinced to make it a grand success."

Senator Cummins replied that if there has been a spirit

or motive of that kind, in his judgment it has been with those who have been excluded from the active management of the properties, and he firmly believed that the regional director, the superintendents and the railroad men, all the way down the list, have been faithful and loyal and have done all they could to secure an efficient and economcial management. However, he said, the government during the war has had the advantage of something which it can never again enjoy. It has had the advantage of the war loyalty.

Radical Change in Regulation Required

Turning to the changes in the methods of regulation proposed by the bill, Senator Cummins said it would be absurd for the government to restore these properties to the railroad corporations which formerly owned them unless the government believed at least that those corporations could resume the operation of the railroads and render to the people of the country the service which must be rendered if our commerce is to be sustained. One of these conditions is ability to borrow money. "No matter what we may think with regard to the wrongs which have been done in the past by the railroad companies, the railroads must be able to borrow money, because even if the government carries a billion dollars of their obligations for 10 years, as it must, in my judgment, or some such amount as that, the railroads must borrow another billion dollars, or some such large sum, in the coming year."

"Private operation of railroads cannot be continued as a permanent policy unless there is a radical change in our system of regulation. Our Interstate Commerce Commission has been a faithful. intelligent body of men. It has been, however, utterly impossible for the commission to establish a body of rates that would enable the railway systems to maintain themselves. It has been utterly impossible for any body of men to make a system of rates that will sustain the weaker railroads of the country without giving to the stronger railroads an income excessive and intolerable in its extent, and there lies the great fundamental obstacle in our system of rate-making. I look forward with very little optimism so far as private ownership and private operation are concerned. I am going to do my best to make private ownership and operation possible, but if these railway properties cannot be restored to their owners under such conditions and with such regulation as, in my judgment, will make private ownership and operation successful, then I am instantly and from that time forward for government ownership and operation."

In discussing the proposal that the commission shall be required to allow an average return of 5½ per cent, Senator Cummins said that 5½ per cent is more than he thought it ought to be. It seemed to him that a lower basis would furnish the credit which the railway companies must have, but the majority of the committee were of the opinion that 5½ per cent is a fair basis, and to that he finally agreed. He said he had previously stated that the compensation provided by the federal control law was something like $200,000,000 more than it ought to be. He was of the same opinion still, but he wished to point out that that was not inconsistent with his advocacy of a 5½ per cent basis, because in the federal control bill Congress was providing for an income for each individual railway, and he felt that the amounts which it was agreed to pay to a great many were excessive, but under the proposals of the bill there is no provision to pay to the stronger railroad companies the excessive income which is permitted under the federal control act.

Moreover, he said, the war has wrecked the world in a way. Conditions are abnormal and uncertain, and he looked with no optimism at best upon the return of the properties to their owners, because in view of a movement that is sweeping over the world with regard to property, its ownership, its use and its profit, he had the gravest doubt about whether those who have money will be willing to invest it in railway securities, no matter what rate of return is provided.

Regarding the provision for a division of excess earnings above 6 per cent, Senator Cummins said that, singularly enough, it is assailed from two quarters. The railway executives attack it bitterly on the ground that it is not only unjust but unconstitutional, and some very enthusiastic citizens who have no interest in railways attack it on the ground that it is an approach towards socialism or communism.

Dealing With Labor as a Commodity

Regarding the provision for a division of excess earnings Cummins said he was the father of a somewhat famous statement in the Clayton anti-trust law that the labor of a human being is neither a commodity nor an article of commerce, but, he said, "I am just as much opposed to Mr. Foster dealing with human labor as a commodity as I am opposed to Mr. Gary dealing with it as a commodity. It is just as fatal to the welfare of the United States to allow the American Federation of Labor to deal with labor as a commodity as it is to allow the National Association of Manufacturers to deal with it as a commodity."

He also said he believed in collective bargaining, and that nothing could be more wicked than the assertions which are being made that the bill would manacle the working man and reduce him to involuntary servitude. The bill, he said, does not pretend to interfere with or embarrass any man who desires to leave his employment. "He can quit, or 100 of them or 1,000 of them, can quit whenever they desire to do so, but I am not willing to allow the statement to go unchallenged that it is a fundamental and a constitutional right that every man can enjoy to quit his employment whenever he pleases. That is not true. A soldier cannot quit whenever he desires, an engineer upon a railway train cannot quit whenever he may desire to quit; a physician or surgeon cannot leave a dangerous operation half performed because it is his pleasure no longer to continue the work of his profession. It is our profound conviction that the civilization of America cannot continue, cannot endure unless organized society can find some plan to preserve industrial peace and order. This bill punishes only a combination or agreement between railway employees. Even if I were to grant that the individual right to cease employment is perfect and complete, I cannot grant that the right to enter into a combination or conspiracy to accomplish a purpose inimical to the welfare of society is a natural or constitutional right."

Compulsory Consolidation Objectionable

Provisions in the bill for compulsory consolidation were attacked as "objectionable" and "unworkable" by Senator Kellogg, who continued his speech on December 6. Senator Curtis, who followed him, opposed the proposed transportation board and urged that complete supervision of the railroads be placed in the hands of the Interstate Commerce Commission. He also opposed the consolidation provisions. Senator La Follette was expected to speak in opposition to the bill on Monday.

Director General Hines has conferred with Chairmen Cummins and Esch of the interstate commerce committees of the Senate and House, respectively, regarding the legislative situation, with a view to reporting to the President. He has also conferred with Senators Kellogg and Watson, who are members of the Senate committee.

A settlement of the coal strike would remove one of the factors of uncertainty in the plans for the return of the railroads.

German Railways Suffer from Lack of Equipment

Loss of Locomotives and Cars Delivered to Allies Severely Felt, Complaints Against Peace Treaty

By Robert E. Thayer
European Editor of the *Railway Age*

LONDON, August 12, 1919.

LITTLE INFORMATION has been made public relating to the actual condition of the German and Austrian railways, but what has penetrated beyond the frontiers of those countries has shown that the equipment of the railways is in poor condition, and that there is a large amount of rehabilitation to be done there in the matter of deferred maintenance and in the recuperation of the losses suffered from the war, both from destroyed and abandoned equipment and materials, and from equipment and materials that had to be given over to the Allies under the terms of the Armistice and the Peace Treaty

An Investigation

Considerable information of value, however, is given in a report of British army officers who made an investigation of transport conditions in Germany the early part of last April. In this report, which was made public only recently, conditions are analyzed in the several industrial districts of Germany.

Conditions in Silesia

It was shown that in Silesia there was a very great and real shortage of locomotives and rolling stock at that time. Furthermore, due to the use of substitute materials and lack of lubricating oils, those locomotives which were available were constantly breaking down. Table I gives some statistics of the Breslau railway.

TABLE I.—STATISTICS FROM THE BRESLAU RAILWAY

	Monthly average of locomotives	Average service of locomotives in kilometers
1913—		
October	1,277	3,640
November	1,286	3,444
December	1,295	3,527
1914—		
January	1,295	3,401
February	1,293	3,017
March	1,295	3,433
1918—		
October	1,233	2,789
November	1,248	2,517
December	1,226	2,436
1919—		
January	1,145	2,475
February	1,120	2,230

Percentage of total locomotives under repair

1918—	1919—
October ..... 34.1 per cent	January .....36.9 per cent
November .....33.7 per cent	February .....40.1 per cent
December .....34.2 per cent	March .....40.3 per cent

Cars requisitioned and supplied for the transport of coal during February

	Upper Silesian coal area		Lower Silesian coal area	
	1919	1914	1919	1914
Asked	171,447	273,363	30,092	33,437
Supplied	97,502	273,363	16,104	33,437
Lacking	73,945	.....	13,988	.....
March—				
Asked	158,865	276,493	30,847	32,163
Supplied	134,323	276,493	24,608	32,163
Lacking	24,542	.....	6,239	.....

Requisition of trucks of all descriptions (with exception of coal trucks) in February and March, 1919

February, 1919—	Required	Supplied	Lacking
Covered wagons	46,953	46,566	387
Open wagons	41,017	26,819	14,198
Straw wagons	6,563	3,951	2,612
Trucks for logs, etc.	1,760	565	1,195
Rail trucks	1,295	662	633
Lime trucks	1,828	1,116	712
Workmen's trucks	7,190	5,970	1,220
March, 1919—			
Covered wagons	63,137	61,130	2,007
Open wagons	68,825	23,360	40,465
Straw wagons	8,888	5,603	3,285
Trucks for logs, etc.	3,943	672	3,271
Rail trucks	2,777	960	1,817
Lime trucks	1,825	1,654	171
Workmen's trucks	12,342	8,745	3,597

During peace time the number of box cars and open top cars in actual use were as follows:

In February, 1914....	60,492 covered cars	72,548 open cars
In March, 1914.....	75,964 covered cars	80,702 open cars

The situation in this part of the country was, at that time, extremely critical owing to the lack of transport. Factories were at a standstill, and unemployment was daily increasing.

Conditions in Bavaria

The Bavarian railway system (apart from the Palatinate) is divided into five areas, three of which were visited by the English military officers, as follows, Wurzburg, Nurnberg and Regensberg.

Tables II, III and IV were arranged from information and figures compiled by the presidents of the railway administration of these three areas. There is notably a lack of locomotives and cars, which was alleged to be due—

(a). To the obligation to deliver locomotives and cars to the Entente.

(b). Losses on the eastern front.

(c). Delayed repairs owing to the war.

(d). Shorter running life of locomotives and wagons owing to inferior materials (iron, for example, as a substitute for copper removed from the locomotives to be used in the manufacture of munitions, lack of lubricating oil, etc.).

(e). Lack of raw materials for executing repairs.

The situation has been partially improved by reducing passenger service as much as possible in favor of goods service. There were no repair shops at Wurzburg, but at Konig, the Bauer's Printing Press Factory was being used for repairing cars, and rails were being laid to enable that plant to repair a greater number of cars. There were at Nurnberg 42 locomotives and 59 wagons awaiting repairs. An average of 13 to 14 were being delivered monthly. The Maschinenfabrik Augsburg-Nurnberg has undertaken to repair all railway equipment at this point and 12 locomotives and some 70 cars were in the course of repair. It takes from 8 to 10 weeks to repair the locomotives and from one to three weeks to repair the cars. In the Regensberg area on April 5 there were 119 locomotives under repair, 230 passenger cars and 1,208 freight cars with average weekly deliveries of 10 heavy and 81 light locomotive re-

TABLE II.—NUMBER OF TRAINS IN WURZBURG, NURNBERG AND REGENSBERG AREAS ON AUGUST 1, 1914, OCTOBER 1, 1918, AND APRIL 1, 1919

	Main line passenger trains	Branch line passenger trains	Freight trains
Nurnberg—			
August 1, 1914.	453	346	197

pairs, 22 heavy and 68 light passenger car repairs, and 129 heavy and 670 light freight car repairs.

At that time there was a lack of raw material, both for the purpose of repair and to keep the rolling stock in use in good repair. Lubricating oil, copper and rubber were most urgently needed. Iron, varnish, tin, axles, leather and cotton waste (as a substitute for which thin wood shavings were used) are also needed.

Conditions in Munich

Owing to the disturbed condition in Munich during the time the British representatives were there, but little information was obtainable. However, it was reported that on all except the most important lines fast trains had been entirely discontinued. On April 13 two trains per day were running to Berlin (by different routes), and one fast train ran three times a week on the Landshut, Salsburg and Lindau lines. The last three services were run with one locomotive only. The slow trains had been reduced to one-sixth their former number, while the number of freight trains had fallen by about ten per cent. In the case of the latter, however, the average load had been reduced by some 30 per cent owing to the fact that the heaviest locomotives had been handed over to the Entente, and those which remained were not capable of doing the same amount of work. The number of locomotives available in August, 1914, and April, 1919, are as follows:

	August, 1914	April, 1919
Augsburg area	91	51
Munich area	209	147
Ratisbon area	148	92

During the week ending March 29, 1919, there were required 22,260 box cars and 36,591 open top cars. Of these 2,200, or about nine per cent of the box cars, and 29,699, or 81 per cent of the open top cars, could not be put into service. Furthermore, there were practically only 10 to 12½ tons capacity cars available, as the 15 and 20-ton capacity cars had been handed over to the Entente under the terms of the Armistice.

At that time about 40 per cent of the locomotives were under repair, whereas before the war the average was 18 per cent. The output of the shops has diminished by over 30 per cent, in spite of an increase in the number of employees from 8,000 to 13,000 men. This was due chiefly to the fact that the equipment was in very bad shape, and also to the reduction of the efficiency of the workmen owing to insufficient food.

The efficiency of the railroads as a whole is about 40 per cent less than before the war, owing to the increased necessity for repairs, and the delivering of the best heavy locomotives to the Entente. Over 10,000 freight cars were waiting repair at the time this report was written, and the work cannot be carried forward very fast owing to the lack of tools and material.

Articles published in German papers and abstracted in the Reconstruction Supplement to the Review of the Foreign Press, a fortnightly publication issued by the War Office of Great Britain, bring to light further interesting information.

German Complaints on the Peace Treaty

German papers have complained bitterly of the effect the Peace Treaty has on the German-Austria railway system. The Neue Freie Presse in commenting on the new boundaries states:

The frontier now cuts off from German-Austria the railway line from Hungary to Switzerland, passing through Pragerhof, Marburg, Unterdrauburg, Klagenfurt, Villach, Frauzenfeste, Bozen, Meran and Mals, and forms a connecting link with the eastern part of Switzerland, on the one hand, and Landeck, in the Tyrolese Upper Inn Valley, on the other (the Arlberg line). Only the short section leading from Vienna into the Klagenfurt Basin is to be left to German-Austria. This line is not only regarded as a through line, but is intended to link up the railway lines of German-Austria with the south. If the new frontier is legalized all the lines running from north to south would be cut through at, for the most part, unimportant places, and would be left without any connection, one with another, in German-Austria. It would be impossible to extend the Aspang line to Pettau, as the Slavs would naturally prefer to build a line to the Hungarian plains. The Spielfeld-Luttenberg and Vienna-Trieste lines would be open to foreign countries at Spielfeld, the Zeltweg-Unterdrauburg line at Lavamund, the Luttenberg-Launsdorf line at Brückl, the Vienna-Klagenfurt line at a point south of St. Veit, and the Brenner line at the Brenner, but a connection inside German-Austria would only be possible by a roundabout route, and there is no money for the building of new branch railways. Only the Vienna-Semmering-St. Michael-Villach-Arnoldstein line, affording direct connection with the sea at Venice, would be left to German-Austria, and Central Styria, being far removed from the line, would lose all importance. In the north the railway junction at Gmünd and the March, and with the latter the possibility of a Danube-Oder Canal and a sufficient coal supply would be lost to German-Austria.

Undue Preference to Poland Alleged

Dr. Walther Plenk writes to the Oesterreichische Volkswirt (June 28) complaining bitterly of the undue preference shown to Poland in the Peace Treaty. In no direction is this more apparent than in the matter of the railways, for not only is German-Austria compelled to surrender to Poland all the railway construction works and plant in a perfect condition and all the rolling stock appertaining thereto in a condition of normal repair, but in addition an Experts Committee appointed by the Allied and Associated Powers is to determine how many locomotives, passenger coaches, and trucks are to be surrendered.

Poland, a country which now demands rolling stock from German-Austria, was unable, Dr. Plenk says, to provide one single locomotive passenger coach, or goods wagon in order to maintain the railway traffic indispensable for the economic life of the country, but year by year many millions of Austrian money were invested in Russian Poland for railway purposes, the investors relying on the loyalty of Polish people. When at the end of 1918 the Austro-Hungarian Empire collapsed, nearly all the Austrian rolling stock remained in Russian Poland, but this in Dr. Plenk's view, should not be regarded as Polish war booty, but as property loaned to a neighbor friendly up to that time. It is therefore extremely unfair to demand further rolling stock from German-Austria in addition to the locomotives and wagons thus illegally detained.

The Austro-Hungarian army authorities bent on strengthening Russian Poland economically and in opening up to traffic districts hitherto neglected by Russia were not frightened by the vast expense of constructing light railways 400 km. in length. Huge masses of railway and light railway material belonging to the army authorities were left behind in Poland, and German-Austria, as one of the States succeeding to the heritage of the old Empire, has a right to a share of this material. But the Peace Treaty ignores this fact, complains Dr. Plenk, and only pays attention to the advantages of the Allies.

Equipment Builders

On account of the coal shortage in Germany and the labor trouble the output of the manufacturers has been reduced to the extent that the Danish and Norwegian State railways, customers of long standing of the Hanover Engineering Company, have gone to America for large locomotive orders. On the other hand, the war manufacturing plants are turning their energies to equipment building.

The Frankfurter Zeitung (July 11) states that the directors of the Krupp Works in Essen-Ruhr intend to re-engage in the manufacture of railway material in future.

Before the war Krupps had a considerable output of railway material, and an arrangement has been made with the Prussian state Railways Administration that contracts will be assured to the firm; but this could only be achieved by granting the Government comprehensive insight into the conduct of the business of the construction of locomotives and carriages. The late gun-carriage works have been recently fitted out for the production of railway material, so that this section can now employ 2,000 workmen. The State Railways Administration has promised to order 100 locomotives and 2,000 carriages every year. In accordance with the agreement, only a certain percentage of profit is to be allowed to Krupps, the State Treasury is to benefit from any surplus. Any loss which may arise is to be borne by the firm. The State is to examine every item in the cost of production. The firm is endeavoring to secure other peace work for the former artillery workshops, but this is very difficult. A staff of 34,000 would be required to keep the works fully employed. Lack of coal and raw material in general keeps the present output at a low level.

Expediting the Release of Cars in Company Service

Measures to Be Taken by the Maintenance Department to Avoid Unnecessary Use of Equipment.

THE NECESSITY for practicing economy in the use of cars employed in company work is fully as urgent as with those employed in revenue service, but all railway employees and officers have not realized this fact to the fullest extent. This matter is of greater importance to those engaged in some branch of maintenance of way work since this department uses the largest number of cars, and with the idea of indicating what can be done, four officers of this department discuss measures which may be taken to reduce the use of cars to a minimum.

Understanding of Traffic Methods Essential

By John Evans

Division Engineer, Michigan Central, Detroit, Mich.

As shippers, maintenance employees can aid in car conservation by the intelligent selection of loading points when there is more than one place from which shipment can be made; by loading cars as soon as placed; by loading to capacity; by promptness and care in carding and billing and by sending consignee immediate and complete notice of shipment.

Where material to be shipped is available at more than one point, consideration should be given to the amount of switching necessary and the probable amount of time required in getting the empty car to the point of loading and in getting the loaded car from point of loading to destination.

In carding and billing, care should be used to make shipping instructions correct, clear and complete. This is particularly important on shipments into large terminals. On these shipments the particular yard and track to which cars are destined should be shown. If shipments involve a large number of cars, the operating department should be consulted on making out the billing so that any additional information which might facilitate movement or tend to avoid confusion may be shown.

The shipper should lose no time in sending notice to consignee. If the shipment arrives in advance of this notice, it is frequently necessary to defer unloading while the consignee is trying to find out where the material is from and what work it is to be used on. On account of the possibility that car cards may have been made out incorrectly and also on account of the liability of cards becoming lost or misplaced, it is not advisable to take them as authority for unloading cars in the absence of notice from the shipper. All parties handling shipping information between loader and consignee should give the forwarding of this data preferred attention.

A foreman should be given to understand that he is responsible for getting the car placed and should advise his superior in case his request for placing is not complied with within a reasonable time. The interests of the maintenance and operating departments in the prompt release of cars are mutual and the matter will be taken care of, if called to the attention of the proper authorities. Therefore, in case of serious delay in unloading the cars, the excuse that the car was not placed should not be accepted.

The car shortage has been met by commercial shippers to some extent by the use of motor trucks in both long and short hauls. There are localities where the use of teams or trucks in handling maintenance of way material offers a promising field. This is particularly the case around terminals where the amount of material to be moved is large and where the hauls on cars, though short in distance, require a great deal of time on account of the slowness of yard movements.

Shipping Bureau Suggested

By M. A. Box, Roadmaster, and F. C. McKnight, Roadmaster's Clerk, Kansas City Southern, Neosho, Mo.

Centralization of responsibility, with a directing head, is essential to any scheme which will effect the efficient handling of company material with the fewest possible number of cars. For this reason, in so far as it is possible to do so without encroachment on the powers of any department, it would be wise to create a subdivision in an appropriate department vested with authority to plan and direct the assembling, transportation and distribution of company material, or with authority to determine and exact certain requirements of any department wishing the use of cars for such work. Such a subdivision might be established in and conducted through the roadmaster's office with the following particular advantages: (1) This office is in direct control of permanent labor forces at all points of the road, by reason of which it could arrange more effectively for the use of these forces in co-operation with other departments for the prompt release of rolling equipment without interference with the regular duties of such forces; and (2) the great bulk of company material is handled under the immediate direction of this office, by reason of which this office would have the problem well in hand at the outset and might, therefore, the more readily determine its solution.

The following is a summary of measures suggested as affording considerable benefit in effecting an economical use of cars:—(1) Utilizing local freight service in assembling and distributing small shipments of track and switch material. (2) Distributing small shipments of rail on one car, each section crew to unload its own allotment. (3) Instituting shipping days when track gangs can arrange to be near stations to assist in loading or unloading. (4) Emphasizing the necessity of foresight in ordering before the need becomes emergent. (5) Impressing the doctrine of "capacity loads" on work train foremen. (6) Avoiding shipments of material away from a point where it will soon be needed. (7) Providing emergency facilities for coaling engines to avoid holding coal cars. (8) Co-operation between departments in making shipments. (9) Using placards, posters and circulars to urge employees to exercise vigilance in releasing cars.

Handling Bridge and Building Materials

F. L. Burrell, supervisor of bridges and buildings, Chicago & North Western, Fremont, Neb., submits a method of procedure which he follows in handling bridge and building material.

Our plan is to load the cars and send them to the station nearest to the unloading point, have the local train following pick them up and the bridge men unload the materials and rebill the car to the division material yard. Instructions have been given the yard material foreman to see that all cars are loaded to their full capacity.

In order to get the capacity load we take one or more bridges, as the case may be, requiring renewals, and have the material loaded in such manner as to allow unloading at each bridge, without having to tumble the load about to get at any of the material.

In the matter of repairs, the gang or line foreman is given a schedule of the work to be done and he will either send in a statement of the territory he is to cover and have us make up the loading or he can make up a list of the material that will be a full load.

To insure promptness in the handling of cars we have a list of the cars received each morning and of those unloaded and if any delay is shown we ascertain the reason. If the reason is unsatisfactory we go after the man responsible and straighten him out.

The Supply Train

The supply train has a number of advocates. S. C. Tanner, master carpenter, Baltimore & Ohio, Baltimore, Md., gives the following rules under which his system has proven successful:

(1) In all carload shipments the car should be loaded to full capacity, billed out promptly and the exact destination given so that the transportation department can deliver the car with the least possible delay, and the agent at destination should advise by wire as soon as the car arrives. (2) Cars should be unloaded and released as soon as they arrive. This should be arranged for by the officer in charge before shipment is made. (3) When large shipments of rails or ties are made, a work train should be ordered to unload and distribute the material as soon as it arrives. (4) Single carload shipments, and less-than-carload shipments should be handled by the monthly supply train, and should not be loaded until a day or so before the supply train starts out.

On a heavy territory like the Baltimore division of the Baltimore & Ohio the supply train will cover an average of 60 miles per day. The force consists of 10 to 15 local track men in charge of a track supervisor and an assistant storekeeper. The rail unloader is always part of the equipment of this train. Bridge and building materials are also shipped on the supply train, and so marked that the proper amount will be unloaded at stations, or between stations, as the case may be, and at the exact location needed. Surplus materials are also collected by the supply train and moved to other places where they are most needed.

Freight Traffic Movement and Car Performance

In October for the first time this year since January, the number of net ton miles of revenue and non-revenue freight handled by the railroads exceeded that for the corresponding month of last year, according to the monthly report of the Operating Statistics Section. The net ton miles in October this year amounted to 40,343,750,000, an increase of 1.3 per cent. For 10 months of the year the net ton mileage was 328,792,002,000, a decrease of 10.6 per cent as compared with the corresponding period of 1918. For the 10 months' period decreases are shown in all regions. For October there were decreases in the Central district, the Ohio-Indiana district and the Eastern region as a whole, and in the Northwestern region.

In the New England district there was an increase of 20 per cent. The net ton miles per mile of road per day in October averaged 5,651 as compared with 5,584. The train mileage showed an increase of 1 per cent and the car mileage of 6.6 per cent. The net ton miles per train mile increased from 720 to 722, but the net ton miles per loaded car mile decreased from 29.7 to 28. The car miles per car day increased from 26 to 27.3 and the net ton miles per car day averaged 524 as compared with 525. The percentage of loaded to total car miles was 68.4, as compared with 67.9. The average number of freight cars on line daily show an increase of 1½ per cent, while the percentage of unserviceable cars was 7.4 as compared with 5.9.

For the 10 months' period the net ton miles per mile of road per day averaged 4,687 as compared with 5,234. The train miles show a decrease of 12.6 per cent and the car miles a decrease of 7 per cent. The net ton miles per car day averaged 442 as compared with 492 in 1918. The net ton miles per train mile were 697 as compared with 682 and the net ton miles per loaded car mile were 27.9 as compared with 29.2.

Development of Present Railway Situation in Canada*

The Events and Policies Which Have Tended to Create a Dominion Owned Transcontinental Line

THE PECULIAR SITUATION which now exists in Canada, viz., that of a government-owned transcontinental line in direct competition with a privately owned transcontinental line, each with its network of branch lines throughout the traffic-producing districts and practically paralleling each other across the continent, cannot be thoroughly understood without a knowledge of the events which led up to this situation. No explanation of the extensive adoption of railway nationalization in Canada has been made other than that it seemed inevitable because of the financial difficulties into which certain roads fell. It has been taken for granted by government officials that the people of Canada would regard this action as inevitable, and most of the people have done so, and in consequence the tendency toward nationalization has not been made a clear-cut issue, while neither has nationalization been openly announced as part of the government policy, nor has there been a serious discussion of its effects upon the public welfare. In Canada's railway history are to be found the causes of the present peculiar situation. In the policies pursued by earlier political administrations, and the action taken as a result of these policies, one will find the real causes of the present situation, fraught as it is with possibilities of disaster, but which is, as yet, too new to admit of the forming of definite conclusions.

Early Railway History

Canada's railways were born of the necessity for uniting the provinces of eastern British North America as well as to secure for Canada the opportunity of carrying its share of the products of the West to the world's markets. In this early development were included the inception and construction of the Grand Trunk and of the Intercolonial, in both of which the Maritime provinces in the east and the Imperial government were interested.

In 1846 the repeal of the Corn Laws by England, enabling American grain to enter Great Britain on the same terms as Canadian grain, brought the Grand Trunk project to a head and made doubly necessary the construction of lines to lower the cost of transportation from the producing areas in the west to England. The St. Lawrence river and the Gulf of St. Lawrence were very difficult of navigation, and consequently involved higher charges than were in effect from New York. The construction of the Grand Trunk was also hastened by the extension of railways into the grain-producing districts of the United States, and the resultant fear on the part of the Canadians that Canada's grain would eventually find its way southward to these direct and convenient lines in the United States, thereby injuring the heavy capital investments already made in the western provinces. Thus the Grand Trunk was conceived as a main trunk line to connect with Canada's inland navigation system and to compete with the railways of the United States.

Up to this time the Intercolonial and Grand Trunk projects could not be viewed as separate. The scheme as formulated provided for a main trunk line having an outlet at Halifax, with an extension into the Maritime provinces. Two surveys had been made for a road of this kind, one by the British government from Halifax to Quebec along the coast of New Brunswick, because of the military considerations involved; the other, an earlier proposed route, in a more direct line to Quebec along the American boundary. The people of New Brunswick were not desirous of contributing to the construction of a line of railway which would pass through a sparsely settled portion of their province and terminate at a Nova Scotian seaport.

As the discussion of the building of Canada's first railways continued it became apparent that because of the inability of the Imperial government and the provincial government to agree the two projects would eventually be separated. The expected break finally came and the main trunk line scheme, which afterwards became the Grand Trunk, was officially started by the passage in the Canadian Parliament of three measures in 1852 providing for a Dominion guarantee of £3,000 to the mile, the amalgamation of a number of existing charters and the incorporation of the Grand Trunk. A prominent English contractor made arrangements with the Hon. Francis Hincks, then Inspector General for Canada, both to construct a line and to promote the company.

The years immediately following the start of the Grand Trunk, from 1852 to 1857, were years in which the building of railroads comprised the chief financial activity in Canada. Towns and villages, under a municipal loan act, pledged their credit for railroad enterprises recklessly, and in the end created a serious financial situation. The Grand Trunk project was soon in difficulties and the provincial government was forced to come to its aid repeatedly.

As the line neared completion this unfortunate condition failed to improve, because the traffic the railway had expected to carry did not materialize. The road was originally projected to co-operate with the St. Lawrence river, but it was located entirely independent of this idea, due principally to the efforts of its English directors. The route selected made the Grank Trunk a through line and consequently a competitor of American railroads and also of the Canadian canals. In addition, the Grand Trunk came in competition with the Great Western, built beween 1853 and 1856 from the head of Lake Erie to Niagara to compete with the Welland canal. As a result of this change in policy and location not enough traffic was offered to the road to make it a paying proposition, and the company was in financial difficulty practically from 1855 to 1862, when it defaulted in interest payments on its bonds and threatened to close the road. The result was that the government was forced to supplement its previous loan by permitting the issue of second preference bonds and by withdrawing the interest claims on its loan until dividends were earned on the common stock.

In 1862 the company was reorganized and its bond issues converted into preferred stock. From this point the history of the Grand Trunk concerns itself with the following of a safer policy, a policy freer from political interference and national consideration. Connections were obtained enabling it to bid for long-haul service, branch lines were developed to further the local service and several connections were acquired, among them the Great Western and the St. Lawrence & Atlantic, the latter a Portland, Me., connection.

Meanwhile the Intercolonial portion of the original railway scheme had been developing. After the subdivision of the original plan into the two projects already mentioned, the eastern colonies began constructing roads which they believed best served their respective interests. In the end

*This is the second of a series of articles on railway nationalization in Canada. The first appeared in the *Railway Age* of November 7, page 907. The concluding article, treating the development of the present situation, will appear in the next issue.

these separate provincial enterprises were consolidated because of the strained relations existing between Great Britain and the United States and the desire to bring about confederation of the Canadian provinces. The Intercolonial was made part of the compact to bring the Maritime provinces into the confederation and, in being located uneconomically as it was, it served the purpose of uniting the colonies and providing a military road far from the American frontier. It was realized that a road so located could never be successful from the standpoint of traffic, but this consideration was thrown aside because of the demand of the government for a line accessible to the sea and at the same time remote from the American boundary. The whole line was opened for traffic in 1876 and, true to form, has never been a financial success to this day.

Thus Canada's railway system was born of a mixed and complicated policy of government and provincial assistance, ownership and operation, and private ownership and operation. Indirectly the present situation in Canada can be traced back to these early policies. The completion of these two roads marks the close of the first period of Canada's railway history. The colonies in the confederation were united, the provinces of Quebec and Ontario were made accessible to Canadian ports during all seasons, and Canada was enabled to compete effectively with American roads for the grain traffic to Europe. Following the construction of these two main lines the customary development and construction of branch lines continued, giving Canada after a time a fairly well-defined railway system.

The Era of Transcontinentals

The next step in Canada's railway history concerns itself chiefly with the extensions westward. Not only does it concern itself with these extensions but also the carrying westward of the same considerations that had been instrumental in building both the Intercolonial and the Grand Trunk in the east.

There enters into the first transcontinental railway project the necessity for the uniting of Canada's provinces —in this case British Columbia to the other provinces— the race westward between railway construction in Canada and in the United States and the fear prevalent at that time that the United States might, through the development of its railways, win the traffic of the grain provinces of western Canada and the military necessity for the establishment of communications with these new western territories.

It might be well to note here that with the apparent complexity of the policy pursued by the government in regard to railway construction, and the controversies it has caused, there had been up to this time a remarkable consistency in this policy. The construction of the Canadian Pacific Railway, or the Pacific railway as it was called at that time, came as a step subsequent to the entrance of British Columbia into the Canadian federation. A provision in the British Columbia entrance agreement stipulated that a transcontinental line should be built for, first, national unity and, second, commercial advantage. It is on these two fundamentals that the Canadian government's railway policy has thus far been constantly built.

From 1872 to 1880 the Pacific railway project was to a large extent a matter of controversy between political parties and competing contractors. The Liberal party, then in opposition, urged the gradual construction of the transcontinental line as traffic developed, whereas the Conservatives advocated pushing the project through to the coast as rapidly as possible. The project remained in a nebulous state until 1880, when the Conservatives, on their return to power, submitted a contract to Parliament providing for the construction by the Canadian Pacific Railway Company of a road from Lake Nipissing to the Pacific coast, the portion already constructed to be taken over as part of the system. This contract was accepted.

Sir John MacDonald, then head of the Canadian government, stated that it was the government's intention to be liberal with the company, and the agreement as prepared provided for a money subsidy of $25,000,000 and a land subsidy of 25,000,000 acres. These grants, however, did not complete the assistance granted the Canadian Pacific. The company was allowed entire freedom in locating its lines, a provision was included in the agreement to the effect that for 20 years no line of railway should be permitted to be constructed south of the new line, and the road was granted such privileges as freedom from taxation and the remission of customs duties on construction materials. On the other hand, there was included in the agreement a clause which provided that if the profits should exceed 10 per cent of the capital invested the rates then in effect might be reduced. Thus the Canadian Pacific began as a private company, but with liberal assistance from the government.

The main line was completed in 1885, the whole distance of 2,906 miles being covered approximately five years before the termination of the contract time. Meanwhile, the promoters of the Canadian Pacific had been busy forming connections for the road, acquiring other branch line properties and in general building up a network of traffic-producing lines throughout the territory which it was designed to serve. This development work on the part of the road's directors created a system of 4,338 miles by the time the main line was completed in 1885.

However liberal the terms may have been, they were not sufficient to prevent the Canadian Pacific from applying to the Dominion treasury for financial assistance. The amount of this assistance at the time of the Drayton-Acworth report in 1917 was placed at $66,905,481, which is exclusive of the value of the land grants and also of the road built and surveys made by the government previous to this agreement and turned over to the company free of cost. The cost of this government work, according to the Drayton-Acworth report, was $37,785,320, and the proceeds of land sold to June 30, 1916, $123,810,124, making a total public assistance to the Canadian Pacific of $228,500,925. The period immediately following the completion of the line in 1885 was one of rapid development in mileage, due both to the construction of branches and the acquisition of lines already constructed.

This brief résumé of Canada's railway history brings it up to approximately 1903. Aside from the deficits which the government was called upon from time to time to make good, it was up to this time free from any serious trouble from the railways. Beginning with that year there is a more direct connection between the policies followed and the present situation.

As the Canadian Pacific developed and expanded rapidly it began to encroach upon territory in Ontario formerly served exclusively by the Grand Trunk. The latter naturally viewed this development jealously, and when the rapid development of the provinces of Manitoba, Saskatchewan and Alberta began to tax the transportation facilities and equipment of the Canadian Pacific a second transcontinental line was conceived. This project, backed by Sir Wilfrid Laurier and his party, was presented to the people of Canada, who immediately endorsed the project on the basis of the necessity for the development of the northwest. Back of this support there seemed to be a certain amount of hostility toward the Canadian Pacific, especially in the western provinces, on the grounds that it was monopolistic and that it was charging unduly high freight rates. In defense of the Canadian Pacific it should be said that this hostility was due to the monopolistic position of the road rather than to its actions.

The agreement for the construction of the new road was drawn up between the Grand Trunk railway and the Dominion government, providing that the road was to consist of two sections, from Moncton, N. B., to Winnipeg, Man., a distance of 1,800 miles, and from Winnipeg to the Pacific coast, a distance of 1,756 miles. The eastern division, called the National Transcontinental, was to be constructed by the government and, after its completion, leased to the Grand Trunk Pacific for operation. The western division, the Grand Trunk Pacific, was to be built by that company under a bond guarantee of three-quarters of the cost of construction, such cost not exceeding $13,000 per mile. Furthermore, the government agreed to make up under an implement clause the difference between the amount realized on certain bonds and their par value. In the case of the mountain division the government agreed to pay the interest on the bonds for seven years. It was under such an agreement, which can readily be seen to have made it practically a government undertaking, that the second transcontinental line was conceived.

At this stage the project seemed feasible and, because of the exceptionally rapid development of the western grain provinces, it gave every promise of being a success. When, however, the actual work of construction on the two sections of the road began it was found that the estimates were far below the actual cost. The expenditures on the National Transcontinental so far exceeded the estimates that, upon its completion, the Grand Trunk Pacific refused to undertake its operation, it being provided in the agreement that the rental of the road should be based upon its cost of construction. The refusal of the Grand Trunk Pacific to take over the National Transcontinental made it necessary for the government itself to place it in operation.

During this period there was an enormous amount of railway construction under way in western Canada and a consequent rapid development of this territory, all of which produced a great increase in the price of all railway materials and in the cost of labor. The Grand Trunk Pacific found that the task of financing its own line had proved to be too heavy. The result was that the government had not only to operate the National Transcontinental but to assist the Grand Trunk Pacific to complete its lines. This aid at the time of the Drayton-Acworth report totaled $70,311,716, which includes subsidies and other cash aid and which, coupled with the Dominion government investment in securities and guarantees made by the Dominion, totaled $114,470,884. More recently in the 1918 session of Parliament the Grand Trunk Pacific was granted $7,500,000, which was expected to enable the line to operate until July, 1919. However, owing to a bad harvest and heavy increases in operating expenses, this subsidy was rapidly exhausted and it was necessary to take the action indicated in the first of this series of articles.

It is almost impossible to speak intelligently of the situation of the Grand Trunk Pacific during these past few years without taking into consideration its relation to the Canadian Northern project. The Laurier government, soon after entering into the agreement with the Grand Trunk Pacific for the construction of the second transcontinental line, backed the promoters of the Canadian Northern for the construction of lines which constituted practically a third transcontinental, and which parallels approximately 2,000 miles of the Grand Trunk Pacific.

The Canadian Northern came into being with the purchase in 1896 of the charter of the Lake Manitoba Railway & Canal Company by Sir William MacKenzie and Sir Donald Mann. The following two years chronicled rapid additions of new and old charters and the construction of a network of lines in the prairie provinces, until finally the MacKenzie-Mann roads reached the head of the lakes at Port Arthur. The system at this time might be termed successful. MacKenzie and Mann had secured large dominion and provincial subsidies, and all of the new lines were constructed cheaply with heavy grades and little grading, timber bridges, etc., the idea being first to open large areas with as small expenditures as possible and then, as the traffic developed, gradually to improve the lines to a normal basis. In so opening up the country the roads developed a heavy tonnage of grain, and this traffic largely made their early success.

Had the system remained in this position it probably would have been successful today, but MacKenzie and Mann felt that their system could not be the success they wished it to be unless it extended to the eastern ports. Port Arthur is closed for approximately four months of the year, and the extension eastward was conceived to give the Canadian Northern all the year traffic. While the Grand Trunk was maturing its plans to build into the grain areas of the west, the Canadian Northern was authorized to build eastward toward Ottawa and Montreal and at the same time westward to the Pacific coast. At the same time the Grand Trunk idea of extending into the grain areas of the west was maturing, and it would naturally be supposed that in some way the two plans would have become co-ordinated, but this did not take place.

The Candian Northern built its line to Toronto, Ottawa, Montreal and Quebec through a wilderness. This extra mileage, built at a heavy expense, brought practically no additional traffic in eastern Canada, where the older roads were strongly entrenched. The heavy load of this added expenditure overcame the earnings of the western lines and soon put the Canadian Northern in financial difficulties. In 1914 the road notified the Dominion government that it would be unable to meet its fixed charges, and since then, up to the time of the Drayton-Acworth report, approximately $60,000,000 had been given the Canadian Northern in order to maintain operation. As a result of this lack of co-ordination and lack of foresight in the railway policies adopted by the Dominion government at that time, both the Canadian Northern and the Grand Trunk Pacific have been in financial difficulties ever since.

Results of Canadian Railway Development

The preceding is a brief resumé of the beginning and development of Canada's transportation system. The government from the beginning has extended encouragement and aid to practically every transportation project which has been brought to its notice, and has not only aided the original project but has granted liberal assistance for the maintenance of service on the lines after their completion. The results of this policy are now coming to light. In fact, the climax came with the appointment of a Royal Commission of Inquiry in July, 1916, for the purposes of presenting a solution of the grave financial problems presented by the position of the Grand Trunk Pacific, the Canadian Northern and the Canadian government railways.

The policy of the government always has been based on national considerations. Whether it was for the purpose of obtaining eastbound traffic, for military purposes in case of an American invasion, for development of the western territory or for the retention of western Canada traffic for Canadian trade channels, the fundamental purpose has been the same. In addition, there have been economic considerations, although these, unfortunately, have not been given much weight. Had the construction of the railways been based on economic grounds many of them would not be developed to the stage to which they are now.

Whatever may be said in justification of this national policy, one fact remains indisputable, namely, that roads so conceived and constructed could not reasonably be expected

to be for a long time, nor have they been, successful from an economic standpoint. Those who were responsible for the construction of many of Canada's roads apparently were unable to see this. Perhaps in their enthusiasm for the development of Canada they believed that this development would compensate for any deficits which might be incurred in the early operation of the roads. In the long run this view may prove to have been right. It is certainly true that portions of Canada are still undeveloped, and in the future these railroads which have been in financial difficulties may be able to vindicate their existence. This, however, does not alter the present situation. One development which cannot be defended is the wholesale duplication of lines in territories in which the traffic was unable to support more than one line. Especially has this been true in the case of the Canadian Northern and the Grand Trunk Pacific. Traffic sufficient to maintain these parallel lines simply could not be produced. The undercurrent of animosity in western Canada toward the Canadian Pacific must also be considered a cause contributing to the present situation. This animosity partially led to the acceptance by the public of the construction of much of the western mileage, and especially the Grand Trunk Pacific and the Canadian Northern.

There are two causes which might be said to be the final and direct causes of the present situation. The first of these is the war. When Canada entered the war in 1914 as part of the British Empire the cost of railway materials and labor shot upward far faster than railway rates and revenues. It was in this period that large parts of both the Canadian Northern and the Grand Trunk Pacific were private ownership of the Grand Trunk this is difficult to bring about, but if the Grand Trunk were to become the property of the government it is argued that it would be but a natural step to turn the branch lines of this portion of the government system over to the Hydro Electric, and other government enterprise, for electrification. This has caused a great deal of propaganda to be spread in Ontario supporting the nationalization program.

In the third and last article of this series it is proposed to discuss what may be expected to ensue as a result of the present railway situation in Canada and the probable effects upon the country's transportation system and upon Canada in general.

Women in Railroad Service

The director general has received from the manager of the Woman's Service Section a statement showing the number of women employed on railroads under Federal control on January 1, 1919, April 1, 1919, and July 1, 1919. Because of the extremely heavy character of the work instructions are outstanding that women shall not be employed in station parcel room, as section laborers or truckers.

The figures show that between April 1, 1919, and July 1, 1919, there was a decrease of 4.9 per cent in the number of women railroad employees. The total number on April 1, 1919, was 86,519 and on July 1, 1919, it was 82,294. The class showing the largest shrinkage was roundhouse work, in which the decrease in the number of women employed between the two dates mentioned was 23.0 per cent. There was a shrinkage of 18 per cent both in the number of women employed in signal service. There was a falling off of only 4.4 per cent in the number of women employed in clerical positions. The largest number of women employed in railroad service continues to be engaged in clerical or semi-clerical work. The double column table shows the figures for all classes of work in which women were engaged.

Number of Women Employed and Character of Employment (Class I Roads)

Classes of Employees	Eastern territory			Southern territory			Western territory			Total			Per cent increase or decrease Apr. 1 to July 1	
	Jan. 1	Apr. 1	July 1	Jan. 1	Apr. 1	July 1	Jan. 1	Apr. 1	July 1	Jan. 1	Apr. 1	July 1	Increase	Decrease

Freight rates will be one of the subjects which will be discussed at the annual convention of the Michigan State Horticultural Society at the Hotel Statler, Detroit, on December 3, 4 and 5. Among those who will address the convention are F. B. Coombs, secretary of the Michigan Traffic League; former governor Charles S. Deneen of Illinois and R. G. Phillips, secretary of the International Apple Shippers' Association, Rochester, N. Y.

Bridge and Building Men Meet in Cleveland

Twenty-Ninth Annual Convention Had Record Attendance and Interest in Papers and Discussions.

The American Railway Bridge and Building Association met for its twenty-ninth annual convention at the Hotel Statler, Cleveland, on October 21-23 inclusive. Over 250 members were in attendance, the largest number in the history of the association, while the interest in the reports and discussions was equally high. Over 80 new members were received, a larger number than in any previous year. The report of the secretary-treasurer showed a balance in the treasury of $1,328, an increase of $300 over last year.

The convention was called to order by Lee Jutton (C. & N. W.) president, who introduced D. C. Moon, assistant to the federal manager of the New York Central at Cleveland. In welcoming the association to that city Mr. Moon referred to his contact with bridge and building men for over 40 years. He emphasized the necessity for the display of sound judgment in the construction and maintenance of bridges which may cost $1,000 or more per lineal foot while the earnings are no greater than for a similar stretch of track costing $5 per foot. He stated that as between so-called practical "horse sense" and technical or book knowledge, he would select a man with the former qualifications for the majority of positions. He urged members to combine these qualifications and to study formulae, for they must be used, but not to forget the practical phases of the work.

Report on Bridge Inspection Methods

There are, generally speaking, two kinds of inspection of bridges, one for the detection of defects involving immediate safety, and the other for the detection of waning serviceability. Since the first is primarily a matter of constant patrol of the railway lines, the second is the subject of this investigation. What is herein contained pertains exclusively to the matter of inspection as involved in current maintenance from year to year.

Metal Bridges

While climatic conditions have a marked effect on the durability of metal bridges, from the replies to a questionnaire received from 40 roads with an aggregate mileage of 90,000, no general statement can be made that territorial location is responsible in any way for the methods used in inspection. It can be stated generally that an annual inspection of metal structures is more generally in effect than that of any other periodicity. It may also be stated that the officer conducting the inspection of metal bridges is more frequently chosen directly from the staff of the chief engineer than from any other group of officers. The motor car seems to be the most common means of locomotion for the inspection party.

By far the greater number of railways and the greater portion of the mileage represented in the replies to the committee report the use of regular forms for taking and recording notes in the field. These forms are diversified in character and extent and range from ordinary mimeograph forms to bound note books.

By far the greater number of railways make inspection of metal bridges separately for the various members. It is probable that in most cases in the inspection of metal bridges, the general appearance and the judgment of the inspector are the criteria as to whether actual measurements are necessary.

A decidedly major portion of the replies indicate that recommendations as to repairs and renewals are made at the time of inspection and are recorded with the notes, but in the case of metal bridges, it is more than likely that such recommendations are appended to the inspector's report after mature consideration of the conditions reported. While different courses of movement of the inspection reports are described in the replies, it may be said that before definite action is taken their consideration is strictly a matter for the bridge engineer with whom the reports are finally lodged.

Wooden Bridges

Entirely different results are to be expected from the effects of climate on wooden bridges than with metal structures, although railroads in the same territory differ as to the frequency of inspection. A tabulation of the returns shows the periodicity of inspection and the percentage of the total mileage reporting under that periodicity as follows:

	Per cent
Annually	41.55
Semi-annually	32.22
Three times annually	5.95
Four times annually	2.62
Six times annually	13.11
Monthly	4.55

The officer most often made responsible for bridge inspection is either the supervisor or superintendent of bridges and buildings. Nearly 75 per cent of the mileage represented in the replies customarily uses the motor car as a means of conveying the inspection party over the line, while only about 21 per cent uses regular or special trains.

Regular forms for recording inspection notes in the field are used by 85 per cent of the mileage represented in the returns to the questionnaire. The condition of each member is recorded separately by lines aggregating about 70 per cent of the total mileage reporting, but we are inclined to believe this pertinent to metal bridges only. Actual measurements are reported as being taken by 52 per cent of the reporting mileage, while general appearance and judgment are used by the remainder, viz., 48 per cent. By far the larger portion of the lines record in the notes recommendations as to repairs and renewals at the time the notes are taken.

General practice is about evenly divided as to giving authority to the inspector to order repairs or replacement in distinction from simply making recommendations as to these matters.

Conclusions

1. A well organized plan of thorough and periodical bridge inspection should be in effect on all railroads. Inspection should preferably be made semi-annually and in any event not less frequently than annually

2. The inspector should be particularly fitted by training and experience for the work, technical education and training being requisite for metal bridges and both judgment and experience for wooden structures.

3. Motor cars afford the best means of conveying the inspection party over the line.

4. Such tools, either special or standard, as he may consider useful for his purpose should be furnished the inspector.

5. Special inspection forms for taking and recording notes are essential. Adequate provision should be made for reporting the condition of bridge members individually or by groups and classes, dependent upon the facts disclosed by the examination.

6. Sufficient assistance to insure the thorough and com-

prehensive examination of structures inspected should be supplied.

7. Where necessary to determine the extent of the deterioration, actual measurements of members should be made.

8. Recommendations of the inspector as to corrective measure which should be applied to observed conditions are not only desirable but practically necessary. These recommendations should be recorded in the notes at the time of inspection and upon its completion should be followed up through proper channels for necessary action thereon.

9. The inspector should be vested with authority to order through proper channels the correction of any imminently unsafe conditions discovered.

10. Prescribed limitations in stress should, if possible, be established, especially for metal bridges.

11. The general program of inspection can best be formulated by the individual railroad and must needs be developed by a consideration of the operating organization in vogue, methods of effecting repairs and renewals and the number, magnitude and character of bridges maintained.

12. At least one complete counterpart of all notes, recommendations, records and papers pertaining to the inspection and corrective measures applied as a result thereof should be kept in one file of ready access.

The report was signed by Arthur Ridgway, (D. & R. G.) chairman; J. S. Huntoon, (M. C.); J. H. Johnston, (G. T.); Herbert C. Keith, (cons. engr.); G. W. Rear, (S. P.); J. L. Winters, (S. A. L.).

Discussion

This report brought out active discussion. G. W. Rear (S. P.) described the system followed on that road in inspecting over 715,000 lin. ft., of wooden structures. To promote uniformity of inspections over the system, inspectors are employed throughout the year, working on the Southern lines in the winter and the Northern lines in the summer. These inspectors are accompanied by the division engineer, division bridge inspector and division bridge supervisor on their respective territories. They examine every structure on the line and recommendations for their repair or renewal are agreed upon at the time, these recommendations being subject to review in the general office to bring them within the limits of available appropriations. Copies of the recommendations are also sent to the division superintendents, who prepare requests for work authorities for tranmission to the general manager for approval.

The action of the committee in dividing the subject between structures of metal and wood was criticised by Mr. Rear, who advocated their classification as between truss and stringer bridges. The action of the committee was defended by R. H. Reid (N. Y. C.) who pointed out that the nature of the deterioration of timber and metal structures is essentially different, and that they therefore require different forms of inspection.

A wide divergence of opinion was expressed regarding the frequency of inspections. Some members thought the annual inspection was all that was necessary, while others favored semi-annual inspections and C. W. Wright (L. I.) advocated making them every two or three months.

A number of those present opposed the computation of stresses in old timber too closely, one member stating that it had been his experience in the handling of a large number of structures that in almost every case the timber was found to have been in worse shape than had been anticipated.

Report on Inspection and Repair of Roofs

A roof should receive as close if not more careful inspection than any other part of a building. It should include everything on the roof, such as skylights, ventilators, flashings, gutters, eaves, troughs, adjoining masonry, etc.

A supervisor should always make a thorough inspection of the masonry and fire walls adjoining the roof, because the joints in the coping and brick work become so washed out within a few years, that water percolates down inside the wall, resulting in a report of a leak in the roof for which the roof proper is in no way responsible. The remedy is to remove the coping, repair and point up mortar joints in brick, lay in a damp-proofing course of prepared roofing, and replace the coping, pointing it up with a plastic bituminous cement. Sometimes a layer of plastic cement is used instead of the prepared roofing.

Flashings are a common source of leaks; those which are supposed to be permanently cemented to the brick work are rarely found thus after a few years of exposure to the elements. Large cut nails and flashing hooks should be used freely to hold the upper edges of flashings in place. A rich cement mortar or bituminous cement should be employed in the repair work, applying it along the upper edge of the flashing.

In localities where melting ice during the day and frozen leaders during the night are a common experience, gutter heads are an active cause of leaks, which are rarely cured entirely. The flat metal portion of the gutter head should always be nailed down securely over the full thickness of the roofing and wall jointings; then the flat metal should be covered with solid moppings of felt and pitch, carried back at least 18 inches from the opening. If the metal is not closed in on both sides, the expanding ice in the downspout or leader will surely break the roofing away from it while it is cold and brittle. Straight runs of gutter which are improperly applied underneath roofing of various sorts frequently cause trouble of the same kind. The best remedy for leader troubles is the use of inside drains with heads like the Holt roof connection, clamped securely in place without the use of nails.

Roof coverings that depend on paint or other coatings to prolong their life are apt to become neglected, creating a liability of damage or premature loss. Especially is this so in the case of railroad buildings where frequent changes are made among officers and workmen.

Wooden shingle roofs usually have to be repaired with wooden or tin shingles. When such roofs become old they are a fire menace, especially when they are in close proximity to coal-burning locomotives.

Tin roofs require soldering or patching when in need of repairs. Temporary repairs may be made by the use of tested elastic bituminous compounds while leaks of a minor nature can be checked for a time by the application of a heavy coat of paint. Tin roofs should be painted with a good mineral paint about every four years.

There are many brands of composition roofings, commonly termed prepared roofings, which are laid in sheets or from rolls. Some of these will last 10 to 15 years, while some of the cheaper grades depend on an occasional coating of some special preparation in paint form to prolong their life. Such roofs can be patched successfully, this being about the only manner in which repairs can be made.

The last few years have seen the introduction of the asphalt shingles. When laid on suitable inclines to shed water it rarely leaks because there are always two and sometimes three thicknesses of roofing material.

There are all sorts of gravel roofs; many of them have been bought too cheaply. A three-ply roof made of light felt, put together with 60 lb. of pitch and tar, and covered with possibly 100 lb. of gravel, will need repairs inside of three years. A five-ply roof made of 70 lb. of felt and 100 lb. of pitch, properly graveled in will last seven years. The addition of 25 lb. of pitch at the time the roof is built, will make it last from 10 to 15 years. A roof containing about 80 lb.

of felt and 150 to 250 lb. of pitch, depending upon whether the roof deck is of wood or concrete (as recommended in the Barrett specification), will surely outlast its 20-year guarantee, and probably be good for 35 or 40 years.

Standard gravel roofs or makeshift gravel roofs can profitably be recoated at any time before the felt becomes exposed and begins to turn brown. The method is to sweep up all roof gravel with a stiff brush, pour on an ample amount of coal-tar pitch, and then resurface with clean gravel. It is safe to use the old gravel if it is screened, but a considerable amount of new material must be added to the old in order to secure a good job.

If the roof has been neglected until leaks develop, it is necessary to go over it carefully after it is swept up and in all places where cracks or serious rotting of the felt is found, such places should be covered with at least three thicknesses of felt and pitch, leaving margins in successive layers of the repair of at least four inches all around before the recoating is done. Most roof troubles develop angles where the roofs join walls, scuttles, skylights, etc. Two or three layers of solidly-mopped pitch and felt in such places never do any harm, and assist in making a good job.

About the only way to repair clay tile roofs is to replace the broken tile with new material of the same kind. When such roofs are constructed originally a number of the tile should be laid aside for repairs, especially if the material is of an odd design and not readily obtained in the market. The repair of tile roofs requires skilled labor. Large precast cement tile are also coming into use, being applied to steel frames for inclined roofs.

A number of roofs have been laid in recent years with hard shingles made from a composition of asbestos, cement, etc., more nearly resembling slate in size and degree of hardness. In case of failure they must necessarily be replaced with new material of the same kind, if second-hand pieces are not available. These shingles have not been in use long enough to determine their lasting qualities.

Slate roofs are usually repaired by substituting new slate and this can be done readily because standard sizes are always available. A good slate roof having greater than half pitch will last many years without repairs.

The report was signed by M. J. Flynn, (C. & N. W.), chairman; C. A. Lichty, (C. & N. W.); W. F. Meyers, (C. & N. W.).

Discussion

The discussion of this report centered largely about the use of plastic cements for the repair of roofs of various types. Some members told of the use of these cements successfully on metal roofs, while others stated that while the cement had eliminated leakage for 18 months to 2 years, at the end of that time it had been found that the metal itself had been destroyed. The use of high grade built up roofs on slopes of moderate pitch was advocated by several members who reported excellent service from this form of construction, where it was properly installed originally.

Report on Methods and Equipment in Renewing Timber Bridges

A committee of which Mr. Johnson (I. C.) was chairman, submitted an extended report on the organization of gangs and the methods followed in the renewal or repair of piles, caps, stringers and ties singly and also incidental to the general renewal of the entire bridges. This report discussed in detail the various steps in the carrying out of this work.

The discussion centered largely about the advisability of renewing ties on bridges singly or out of face. Referring to structures on which tie plates are not used, E. K. Barrett (F. E. C.) advocated inserting a number of new ties together because of the difficulty of securing an even bearing for the rail when they are applied singly between old rail-cut ties. One member described the practice of turning the ties over to overcome this objection, while another stated that it was his practice to frame each tie to the proper height in the shop before shipment to the bridge, in order that it might then be installed between ties which were rail-cut.

Internal Combustion vs. Steam Engines

A paper of Internal Combustion Versus Steam Engines for Pumping Water, presented by C. A. Lichty, was similar to one which he read before the convention of the International Railway Fuel Association in Chicago in May, and abstracted in the *Railway Age* of June 6.

In the discussion of this paper it was evident that there is a wide difference of opinion regarding the merits of these two forms of pumping equipment. Some members favored steam units because of the less skilled attendance necessary, while others advocated oil engines because of their greater economy at small stations. L. A. Cowsert (C. N. O. & T. P.) stated that it was the present practice of that road to install oil engines whenever making a change in pumping station equipment and that one of the large economies has been found to result from the delivery of fuel oil from the tracks to isolated stations by gravity through pipe lines, instead of hauling coal by wagons, as had formerly been necessary.

Report on Painting Metal Railway Structures

The greatest enemy of steel is rust and to make a job of painting successful the rust must be thoroughly removed. All of the 17 roads replying to a questionnaire, specify scrapers, wire brushes, chisels, and bars for this purpose, and three use the sand blast occasionally. There can be no doubt that the sand blast is by far the most thorough method of cleaning, but the cost is excessive and it is not generally used on that account. Some of the roads specify sledges and bars for the removal of rust, but it would seem that a structure that is so rusty as to require such heroic treatment would be seriously weakened and would indicate faulty methods of inspection.

All are agreed that the first coat of paint should be applied as soon as possible after cleaning, providing the steel is dry, as paint will not adhere to a wet surface. The use of spravers is not advised, 16 of the roads reporting unfavorably while one says it believes it to be as good as brushing but remarks that he has had no experience. The operation of brushing is of vital importance and should receive more attention than it usually does. In painting steel only enough paint should be used to cover and that should be thoroughly brushed, mixing it with whatever rust or other impurities may have been left on the surface and working it into all crevices.

Thirteen of the roads favor red lead in some form for the primer. One favors the addition of white lead in the proportion of one-third white to two-thirds red; another advocates the addition of one per cent of lamp black with the idea of filling voids in the coarser red lead and tending to make the paint denser and more impervious to moisture. A proprietary paint is used by four.

For the succeeding coats the preference is about equally divided between lamp black and graphite, while two roads report the use of brown mineral with satisfactory results.

The method which seems to be giving the greatest satisfaction and to be followed most universally is to prime with red lead, the second coat to consist of a mixture of red lead and lamp black and finish with lamp black or graphite. Only one of the roads reports the use of any other oil than

linseed; in this case soya bean oil receives favorable mention. The addition of about six per cent of turpentine is recommended in nearly all cases to assist in penetration and to give the paint better spreading qualities. This is not to be considered a substitute for linseed oil, but is added to the paint for a specific purpose.

The materials used on water tanks and coaling stations do not differ materially from that used on bridges, except that in a few instances the inside surfaces of water tanks have been painted with hot tar. No satisfactory results have been reported from the use of special coatings on coaling stations, ordinary bridge paint giving as much protection against the fumes of engines as any special preparation that has been tried. No preparation to be used as a paint can give adequate protection to overhead members subject to the direct blast from locomotive smokestacks; all such members are better protected by a cement covering or a suspended slab of asbestos or other indestructible material.

The question of painting galvanized iron brought out a great many formulas for washes to be applied to the iron before it was painted. These washes are supposed to prevent the paint from peeling, but none of them have any very enthusiastic advocates. The most successful method seems to be the weathering of the iron until the zinc coating is removed. If it is necessary to remove the zinc coating from the iron before it can be painted successfully, the zinc may as well be saved and plain iron used instead. The following chemicals are quoted as being used on galvanized iron for the above purposes: sal soda, sal ammoniac, hydrochloric acid, copper chloride, aqua ammonia, copper sulphate, nitric acid, benzine and turpentine.

The report was signed by C. T. Musgrave (O. S. L.), chairman; C. Ellenger (I. C.); E. S. Airmet (O. S. L.); F. Gaunt (O. S. L.); B. D. Rich (S. P.); J. R. Shean (Pac. El.).

Discussion

The discussion of this report centered largely around the necessity of securing mechanics of the proper experience if good results are to be obtained. I. W. Swaney, (Sherwin-Williams Company) presented a discussion of painting practices, in which he made a plea for the standardization of paints and paint specifications, stating that this would cut the cost of manufacture from 25 to 50 cents per gallon.

Report on the Economical Use and Storage of Fuel

To avoid undue deterioration, coal should not be stored to exceed 60 days. The storage supply should be located outside of and at a convenient distance from the pump house, away from other buildings and near an unloading track where one is available so that coal may be handled direct from the cars. To avoid the retention of some portion of the coal in the bin for an indefinite time there should be two openings to remove the coal.

Steam, water and other wastes must be prevented. Pump houses should be built with a view to warmth. To minimize heat losses, boilers, steam pipes and the steam ends of pumps should be insulated where the saving will justify the expense.

Beginning at the grates upon which the fuel bed rests, see that the air spaces are properly proportioned to avoid the loss of combustible material into the ash pit. This will depend on the kind of coal used. Study the fuel with this point in mind. Five per cent is not an unusual loss from this cause.

The amount of grate surface is important, as it determines the rate of combustion. For power purposes in handfired plants do not permit the rate of combustion to fall below 15 lb. of coal per square foot of grate surface per hour, or go above 28 lb. with bituminous coal.

With settings tight to prevent the infiltration of air, heating surface clean, radiation losses reduced by proper covering, piping and steam mains lagged, engine valves tight and properly set, all condensation returned to the feed-water heater a good start will have been made in fuel conservation. However, merely placing the plant in good physical condition will not suffice. Conditions change from day to day, from hour to hour, even from moment to moment. These changes must be interpreted, and the degree of intelligence with which they are interpreted marks the degree of success which will be realized in fuel saving. A good plant poorly operated will show low efficiency, while a poor plant skillfully operated will sometimes show a relatively high efficiency.

Unlike coal, oil, if stored in closed tanks, does not deteriorate when standing nor is it subject to spontaneous combustion; but the greatest care should be given to its storage, as oil and its vapors are very searching and extreme precautions are advisable, though with proper ventilation of the tanks the danger from fire is nil.

Steel tanks for the storage of oil may be secured in all sizes and in accordance with any particular specification, but it is more economical and satisfactory to have sizes and specifications conform to the gage and sizes of sheets commonly carried in stock by the manufacturers, as specifying tanks of special size causes waste through cutting sheets rolled to standard sizes and increases the cost of storage.

Partly or wholly burying oil tanks in the ground is a common practice. However, the ultimate economy is questionable, as the depreciation of the shell from soil corrosion may be rapid, and leaks, unless relatively large, are hard to detect and expensive to repair.

Oil losses by seepage from properly constructed steel and concrete tanks can be considered practically negligible. However, the volume of useful hydrocarbon products lost through evaporation in oil storage is a considerable item, the loss, of course, being greater in the lighter oils than in the heavy oils, although there is a continued stream of the light hydrocarbons escaping from its surface as long as it remains in storage, even with oil of low gravity. There are two general rules to follow to prevent evaporation losses: (1) keep the temperature of the oil in the tank as low as possible, and (2) make the contalners as tight as practicable.

The report was signed by F. M. Case, (C. & N. W.), chairman; C. R. Knowles, (I. C.); E. A. Demars, (O. S. L.); A. D. McCallum, (C. H. & D.).

Discussion

A number of members pointed out losses resulting from the extended storage of fuel. A. W. Harlow (Erie) described the emphasis placed upon economical firing of pumping plants by the officers of that road, as a result of which the jurisdiction of supervisors of locomotive operation has been extended over pumping plants insofar as this phase of the work of the pumper is concerned. The operators of pumping stations are required to fire a shovelful at a time.

Railway Fire Protection Equipment

By C. R. Knowles
Superintendent Water Service, Illinois Central

The five principal fire extinguishing agents in use on railroads are bicarbonate of soda, caustic soda and sulphuric acid, carbon-tetrachloride, dry sand and water.

Bicarbonate of soda is useful only in incipient fires and is of but little value as a fire extinguisher.

Chemical fire extinguishers using soda and acid are usually furnished in the 2½-gal. hand type and in the 40-gal. type mounted on wheels. The hand type is one of the best fire extinguishers known for small incipient fires. As many

of them are located at points where there is no other fire protection it is important that they be kept in perfect order at all times. They should be discharged, cleaned and recharged at least once each year, the date of recharging to be marked on the tag attached to the extinguisher. At least two extra charges should be on hand for each extinguisher.

The care of extinguishers should be assigned to some particular man at each point as a division of responsibility for their condition will lead to neglect. They should be inspected weekly; this inspection should include a careful examination of the nozzle, hose and hose connection and the renewal of defective parts as soon as discovered.

Carbon-tetrachloride is particularly effective on fires in hazardous liquids, other rapidly burning materials, electrical fires and other fires not readily extinguished by water. The extinguisher for using this liquid is usually of the one-quart pump type and, on account of the small size, is of value only in incipient and small fires. The freezing point of carbon-tetrachloride is 25 to 50 degrees below zero, therefore, it is very desirable where low temperatures prevail. These extinguishers should receive the same care as other chemical extinguishers and should be kept full of liquid at all times. A reserve supply of liquid for refilling should also be available.

Sand is useful chiefly in oil fires and should be contained in pails or properly constructed sand boxes with scoops for throwing. The sand should be clean and dry and the supply should be located near a doorway in order that it may be accessible.

Water is, of course, the principal agent used in fighting fire, all other agents being of value chiefly on incipient fires, or in chemical, oil and electrical fires which are usually limited in extent. Therefore, from whatever source water is obtained for fire purposes, the supply should be ample and constant. Second only to an ample supply of water is the importance of adequate facilities, properly constructed and so located as to permit fighting the fire with a minimum of delay.

The fire underwriters have laid down extensive rules and regulations governing the design, location, maintenance and operation of pumps used for fire purposes, which rules are well known. Unfortunately there are but few pumps used exclusively for fire protection on railroads, the average pump being designed and used primarily for general service pressure. Fire protection being incidental, therefore, it is impractical to apply these regulations to all pumps without impairing the service for which they are primarily designed. Where service pumps are also used for fire protection their operation should conform as closely as possible to the rules laid down for fire pumps.

Pipe lines serving fire hydrants and fire connections should be independent of general service where possible, but if a part of the general service system they should be so constructed and arranged that service connections can be cut off and full fire pressure maintained on hydrants and hose connections.

Fire hydrants should be of an accepted type offering the lowest resistance to the flow of water. Ground or outside hydrants should be of the two-way type and should be designed to drain automatically when the valve is closed, to prevent freezing. They should be painted white so they may be located readily at night. They should be inspected frequently to see that they are in proper condition and that they drain properly to prevent freezing. Under no circumstances should fire hydrants be used for other than fire purposes. Hydrant wrenches and spanner wrenches for tightening hose should be located conveniently and in sufficient number to provide at least one for each hydrant.

The number of water barrels and buckets recommended is as follows:

In passenger stations, three pails for buildings of ordinary size, increasing the number by one pail for about each 500 sq. ft. of floor space over the first 2,000 sq. ft.

In freight stations at least one barrel and two pails for buildings of ordinary size, increasing the number in larger buildings by one barrel and two pails for each additional 3,000 sq. ft. of floor space over the first 3,000 sq. ft. so as to make them readily accessible to all parts.

In combined passenger and freight stations, one barrel and two fire pails to be placed in the freight room, increasing the number in larger buildings as indicated for freight stations.

In shop buildings, one barrel and two pails to be distributed for about each 3,000 sq. ft. of floor space.

In warehouses, two pails for a floor space of 1,000 sq. ft. or less, increasing the number by one pail for each additional 500 sq. ft.

Barrels to have a capacity of not less than 50 gal.

When fire barrels and pails are located where there is a liability of the water being frozen in cold weather, it is recommended that calcium chloride or salt be placed in each to retard freezing. The density of the solution required will depend upon existing temperatures.

Fire hose is one of the most important fire-extinguishing agencies, and it should be of the best material and workmanship. It should always be in perfect working order and at all times properly cared for. Fire hose is subjected to a severe class of service, the importance of which makes it essential that the utmost care be given to the quality of the materials and the character of the workmanship employed in its manufacture. By purchasing only the best hose and giving it the small amount of attention suggested, the greatest practicable durability will be assured. Experience has shown that a good cotton rubber-lined hose, properly cared for, will frequently last 10 or 15 years

Discussion

C. W. Wright (L. I.) urged that every employee using any form of fire protection equipment be required to make a report to the proper officer immediately, in order to insure that this equipment is at all times ready for service. The question of the location of water barrels on high bridges was also discussed by G. W. Rear (S. P.) who stated that it had been found on that road that other than railway employees would not venture out to barrels placed on the end of caps on high structures to secure water with which to put out a small fire. For this reason it is the practice of this road to build platforms at the level of the track on which the barrels are placed.

Closing Business

At the closing session Thursday morning the following subjects were selected for consideration by committees during the next year: (1) Filling Bridges with Special Reference to Maintenance of Structures During Filling; (2) Standard Forms for Bridge Inspection; (3) Abuse of Treated Timbers; (4) Repair and Maintenance of Tank Hoops; (5) Maintenance and Repair of Freighthouse Floors; (6) Use of Electricity for Pumping Water; (7) Application of Paint for Spraying; (8) Maintenance of Timber Docks; (9) Reclamation of Bridge, Building and Water Service Materials.

The following officers were selected to serve for the ensuing year:

President, F. E. Weise, chief clerk to chief engineer, C. M. & St. P., Chicago; first vice-president, W. F. Strouse, Baltimore, Md.; second vice-president, C. R. Knowles, superintendent of water service, I. C., Chicago; third vice-president, Arthur Ridgway, assistant chief engineer, D. & R. G., Denver, Colo.; fourth vice-president, J. S. Robinson, division

engineer, C. & N. W., Chicago; secretary-treasurer, C. A. Lichty, inspector, purchasing department, C. & N. W., Chicago; members of executive committee: J. P. Wood, supervisor bridges and buildings, P. M., Saginaw, Mich.; A. B. McVay, supervisor bridges and buildings, L. & N., Evansville, Ind.; J. H. Johnston, superintendent bridges and buildings, G. T., Montreal, Que.; E. T. Howson, Western editor, *Railway Age*, Chicago; C. W. Wright, master carpenter, L. I., Jamaica, N. Y., and G. A. Manthey, assistant superintendent bridges and buildings, D. S. S. & A., Marquette, Mich.

Atlanta, Ga., was selected as the location for the next convention.

On Wednesday afternoon the members made an inspection of the Orange avenue freight terminal of the New York Central and of the ore handling docks of the Pennsylvania lines. Following the adjournment of the convention on Thursday noon, a party visited the plant of the Goodyear Tire & Rubber Company at Akron, Ohio. The annual dinner of the Bridge & Building and the Supply Men's associations was held at the Statler Hotel on Wednesday evening.

Supply Men's Exhibit

The Bridge and Building Supply Men's association held an exhibit in a room adjacent to the convention hall, in which 34 firms presented literature, photographs and models of their equipment. The officers of the association for the past year were: President, P. J. Jacobs, H. W. Johns-Manville Company, Chicago; vice-president, Tom Lehon, the Lehon Company, Chicago; treasurer, C. E. Ward, United States Wind Engine & Pump Company, Batavia, Ill.; secretary, M. J. Trees, Chicago Bridge & Iron Works, Chicago; members executive committee, C. L. Cockrell, Philip Carey Company, Chicago; E. T. Howson, *Railway Age*, Chicago; G. R. McVay, The Barrett Company, Chicago; W. O. Washburn, American Hoist & Derrick Company, St. Paul, Minn.; A. J. Filkins, Paul Dickinson Company, Inc., Chicago.

The following is a list of the firms represented, with the nature of their exhibits and the names of their representatives:

American Hoist & Derrick Company, St. Paul, Minn.; W. O. Washburn and F. J. Johnson.

American Tar Products Company, Chicago; P. J. Griffiths and S. H. Fields.

American Valve and Meter Company, Cincinnati, Ohio; Fenner non-freezable drop spout, Poage style H water column; J. T. McGarry and D. J. Higgins.

Barrett Company, New York City; Holt vent and leader connection; G. R. McVay and A. E. Thompson.

Bird & Co., Chicago; Mr. Caton and Mr. Inwood.

Buda Company, Chicago; Bridge gang motor car; H. C. Beebe and G. E. Bryar.

Chicago Bridge and Iron Works, Chicago; Illuminated photographs; H. C. Brown and F. L. Cook.

Detroit Graphite Company, Chicago; L. D. Mitchell, J. J. Hogan, W. B. Waugh and W. E. Bates.

Devilbiss Manufacturing Company, Toledo, Ohio; W. F. Gradolph and C. D. Ward.

Paul Dickinson Company, Chicago; Arthur J. Filkins.

Dixon (Joseph) Crucible Company, Jersey City, N. J.; Dixon graphite paint; H. A. Nealley and N. C. Cameron.

Duff Manufacturing Company, Pittsburgh, Pa.; E. A. Johnson.

Fairbanks, Morse & Co., Chicago; catalogues; F. M. Condit, H. E. Vogel, C. B. Skelton, B. S. Spaulding, A. A. Taylor, H. E. Vergasen, Stephen Smith, J. C. Flanagan, G. Howard, G. Lang, F. M. Gardner and G. J. Akers.

Heath and Milligan Manufacturing Co., Chicago; G. W. Lindholm and W. H. Pratt.

High Grade Manufacturing Co., Cleveland, Ohio; Gilso cement; S. A. Baber and J. N. Kina.

Ingersoll, Rand & Co., New York City; Pneumatic riveter, drill and bridge repair outfit; J. N. Thorpe, Jr., and George C. Williams.

H. W. Johns-Manville Company, Chicago; Asbestos roofing and pipe covering; C. E. Murphy, W. L. Laurence, J. E. Meek and H. B. Sewell.

The Lehon Company, Chicago; Mule-Hide roofing and shingles; Tom Lehon, D. B. Wright and Chas. V. Eades.

Luther Grinder Manufacturing Company, Milwaukee, Wis.; Tool grinders; C. R. Pfeifer and Bert St. Germain.

Massey Concrete Products Company, Chicago; G. H. Redding and A. E. Humphrey.

Mudge & Co., Chicago; Jean K. Vanatta.

National Water Main Cleaning Co., New York City; Burt B. Hodgman.

Nichols (George P.) & Bros., Chicago; Geo. P. Nichols.

Patent Vulcanite Roofing Company, Chicago; Asphalt shingles and roofing, A. J. Van Page.

Patterson & Sargent Company, Cleveland, Ohio; G. W. Anderson, J. K. Patterson and W. H. McBride.

Philip Carey Company, Chicago; Roof coating and shingles; C. L. Cockrill and F. R. Schueler.

Railway Age, New York City; E. T. Howson, H. H. Marsh and B. J. Wilson.

Railway Review, Chicago; Harold A. Smith and Charles L. Bates.

Sherwin-Williams Company, Cleveland, Ohio; George G. Mowat and E. W. Lutes.

T. W. Snow Construction Company, Chicago; T. W. Snow.

Standard Asphalt Company, Chicago; R. F. Trumbull and E. L. Hedrick.

U. S. Wind Engine and Pump Co., Batavia, Ill.; C. E. Ward.

Upson-Walton Co., Cleveland, Ohio; H. B. McCreary and E. H. Porter.

Volkhardt Company, Inc., Stapleton, N. Y.; Yard and cinder pit hydrant, W. Volkhardt.

The supply men elected the following officers to serve for the ensuing year:

President, Tom Lehon, the Lehon Company, Chicago; vice-president, C. E. Ward, United States Wind Engine & Pump Company, Batavia, Ill.; treasurer, M. J. Trees, Chicago Bridge & Iron Works; secretary-treasurer, G. R. McVay, the Barrett Company, Chicago; members executive committee, E. T. Howson, *Railway Age*, Chicago; Charles Thulin, G. W. Anderson, Patterson & Sargent Company, Cleveland, O.; D. J. Higgins, American Valve & Meter Company, Cincinnati, O.; F. M. Condit, Fairbanks, Morse & Company, Chicago.

September Earnings Show Some Surplus

Director General Hines has announced that detailed statistics which will shortly become available of the operating results for the month of September of practically all Class I railroads and large terminal companies in federal operation will indicate that, after including in September the estimated back pay for shopmen for the five months, May to September, inclusive, the net operating income for the month of September, 1919, was about $78,000,000. On this basis the net gain to the government, for the month of September, after allowing for one-twelfth of the annual rental due the railroad companies whose railroads are covered by these statistics, is $3,000,000, but if there be charged against September only its own part of the shopmen's back pay, the net gain to the government for the month of September is about $19,000,000. If the results of operation for the five months from May to September should be restated so as to apply to each of these months its approximate proportion of this increase in pay for the shopmen, the net gain or net loss for the months in question would be approximately as follows:

	Net Gain	Net Loss
May	.....	$37,642,128
June	.....	26,031,860
July	.....	2,031,547
August	$12,397,112	.....
September	19,000,000	.....

The net gain or loss for these same properties by months of the present calendar year on the basis of the amounts as they stand, and therefore including in the figures for September the increased wages for shopmen for the months from May to September, inclusive, is as follows:

Month	Net gain or loss to the Government after allowing for one-twelfth of the annual rental	
	Net gain	Net loss
January	.....	57,782,557
February	.....	65,430,850
March	.....	64,881,856
April	.....	48,757,056
May	.....	33,642,128
June	.....	22,031,860
July	$1,968,453	.....
August	16,397,112	.....
September (Estimated)	3,000,000	.....
Net loss for nine months		$371,160,742

Principal Provisions of the Esch Railroad Bill

Text of the More Important Sections of the Bill as Passed by the House on November 17

WASHINGTON, D. C.

FOLLOWING IS THE COMPLETE TEXT of some of the more important sections of the Esch bill as it was passed by the House and particularly those which were radically changed, by amendments adopted by the House, from the form in which the bill was reported by the committee on interstate commerce, of which a synopsis was given in Chairman Esch's report published in our issue of October 10, (printed November 26).

Termination of Federal Control

Sec. 200 (a) Federal control shall terminate (1) at the end of the last day of the month in which this Act is passed, if this Act is passed on or before the fifteenth day of the month, or (2) at the end of the last day of the month following the month in which this Act is passed, if this Act is passed after the fifteenth day of the month; and the President shall then relinquish possession and control of all railroads and systems of transportation then under Federal control and cease the use and operation thereof.

(b) Thereafter the President shall not have or exercise any of the powers conferred upon him by the Federal Control Act relating—

(1) To the use or operation of railroads or systems of transportation;

(2) To the control or supervision of the carriers owning or operating them, or of the business or affairs of such carriers;

(3) To their rates, fares, charges, classifications, regulations, or practices;

(4) To the purchase, construction or other acquisition of boats, barges, tugs and other transportation facilities on the inland, canal, or coastwise waterways; or (except in pursuance of contracts or agreements entered into before the termination of Federal control) of terminals, motive power, cars, or equipment, on or in connection with any railroad or system of transportation;

(5) To the utilization or operation of canals;

(6) To the purchase of securities of carriers, except in pursuance of contracts or agreements entered into before the termination of Federal control; or

(7) To the use for any of the purposes above stated (except in pursuance of contracts or agreements entered into before the termination of Federal control, and except as provided in section 202) of the revolving fund created by such Act, or of any of the additions thereto made under such Act, or by the Act entitled "An Act to supply a deficiency in the appropriation for carrying out the Act entitled 'An Act to provide for the operation of transportation systems while under Federal control, for the just compensation of their owners, and for other purposes,' approved March 21, 1918," approved June 30, 1919.

(c) Nothing in this Act shall be construed as affecting or limiting the power of the President in time of war (under section 1 of the Act entitled "An Act making appropriations for the support of the army for the fiscal year ending June 30, 1917, and for other purposes," approved August 29, 1916) to take possession and assume control of any system of transportation and utilize the same.

Government-Owned Boats on Inland Waterways

Sec. 201. On the termination of Federal control, as provided in section 200, all boats, barges, tugs and other transportation facilities, on the inland, canal and coastwise waterways (hereinafter in this section called "transportation facilities") acquired by the United States in pursuance of the fourth paragraph of section 6 of the Federal Control Act (except the transportation facilities constituting parts of railroads or transportation systems over which Federal control was assumed) are transferred to the Secretary of War, who, through the Chief of Engineers, shall utilize or operate such transportation facilities, and assume and carry out all contracts and agreements in relation thereto entered into by or through the President in pursuance of such paragraph prior to the time above fixed for such transfer. All payments under the terms of such contracts shall be made out of moneys available under the provisions of this Act for adjusting, settling, liquidating and winding up matters arising out of or incident to Federal control. Moneys required for such payments shall, from time to time, be transferred to the Secretary of War as required for payment under the terms of such contracts. All other payments after such transfer in connection with the construction, utilization and operation of any such transportation facilities, whether completed or under construction, shall be made by the Secretary of War out of funds now or hereafter made available for that purpose.

The utilization and operation of such transportation facilities shall be subject to the provisions of the Commerce Act as amended by this Act or by subsequent legislation, and to the provisions of the "Shipping Act, 1916," as now or hereafter amended, in the same manner and to the same extent as if such transportation facilities were privately owned and operated; and all such vessels while operated and employed solely as merchant vessels shall be subject to all other laws, regulations and liabilities governing merchant vessels, whether the United States is interested therein as owner, in whole or in part, or holds any mortgage, lien, or interest therein. For the performance of the duties imposed by this section the Secretary of War is authorized to appoint or employ such number of experts, clerks and other employees as may be necessary for service in the District of Columbia or elsewhere, and as may be provided for by Congress.

Settlement of Matters Arising Out of Federal Control

Sec. 202. The President shall, as soon as practicable after the termination of Federal control, adjust, settle, liquidate and wind up all matters, including compensation, and all questions and disputes of whatsoever nature, arising out of or incident to Federal control. For these purposes and for the purpose of making the payments specified in section 201, all unexpended balances in the revolving fund created by the Federal Control Act or of the moneys appropriated by the Act entitled "An Act to supply a deficiency in the appropriation for carrying out the Act entitled 'An Act to provide for the operation of transportation systems while under Federal control, for the just compensation of their owners, and for other purposes,' approved March 21, 1918," approved June 30, 1919, are hereby reappropriated and made available until expended; and all moneys derived from the operation of the carriers or otherwise arising out of Federal control, and all moneys that have been or may be received in payment of the indebtedness of any carrier to the United States arising out of Federal control, shall be and remain available until expended for the aforesaid purposes.

Causes of Action Arising Out of Federal Control

Sec. 204. Actions at law, suits in equity and proceedings in admiralty, based on causes of action arising out of the possession, use, or operation by the President of the railroad or system of transportation of any carrier (under the provisions of the Federal Control Act, or of such Act of August 29, 1916) of such character as prior to Federal control could have been brought against such carrier, may, after the termination of Federal control, be brought against such agent or agency as the President designates to adjust, settle, liquidate and wind up matters arising out of Federal control. Such actions, suits or proceedings may, within the periods of limitation now prescribed by State or Federal statutes but not later than two years from the date of the passage of this Act, be brought in any court which but for Federal control would have had jurisdiction of the cause of action had it arisen against such carrier.

Process may be served upon any agent or officer of the carrier operating such railroad or system of transportation, if such agent or officer is authorized by law to be served with process in proceedings brought against such carrier and if a contract has been made with such carrier by or through the President for the conduct of litigation arising out of operation during Federal control. If no such contract has been made process may be served upon such agents or officers as may be designated by or through the President. The agent designated by the President to adjust, settle, liquidate and wind up matters arising out of Federal control, shall cause to be filed, upon the termination of Federal control, in the office of the clerk of each District Court of the United States, a statement naming all carriers with whom he has contracted for the conduct of litigation arising out of operation during Federal control, and a like statement designating the agents or officers upon whom process may be served in actions, suits and proceedings arising in respect to railroads or systems of transportation with the owner of which no such contract has been made; and such statements shall be supplemented from time to time, if additional contracts are made or other agents appointed.

Actions, suits or proceedings of the character above described pending at the termination of Federal control shall not abate by reason of such termination, but may be prosecuted to final judgment, substituting the agent or agency designated by the President to adjust, settle, liquidate and wind up matters arising out of Federal control.

That the period of Federal control shall not be computed as a part of the periods of limitation in actions against carriers or in claims for reparation to the commission for causes of action arising prior to Federal control.

Refunding of Carriers' Indebtedness to United States

Sec. 205 As soon as practicable after the termination of Federal control the President shall ascertain the amount of the indebtedness of each carrier to the United States, incurred for additions and betterments made during Federal control and properly chargeable to capital account, which may exist at the termination of Federal control; and (2) the amount of the indebtedness of the United States to such carrier arising out of Federal control. The amounts so ascertained shall be set off against each other to the extent permitted under any contract now or hereafter made between such carrier and the United States in respect to the matters of Federal control, or, where no such contract exists, to the extent permitted under paragraph (b) of section 7 of the standard contract between the United States and the carriers relative to deductions from compensation.

(b) Any remaining indebtedness of the carrier to the United States in respect to such additions and betterments shall, at the request of the carrier, be funded into not exceeding ten equal parts, one of such parts to be payable annually, beginning at the expiration of five years after the termination of Federal control, with interest at the rate of 6 per centum per annum from the date of funding, payable semi-annually, subject to the right of such carrier to pay, on any interest-payment day, the whole or any part of any such installment before it is due. Any carrier obtaining the funding of such indebtedness as aforesaid shall give, in the discretion of the President, such security, in such form and upon such terms, as he may prescribe

(c) Any other indebtedness of any such carrier to the United States which may exist after the settlement of accounts between the United States and the carrier shall be evidenced by notes payable on demand, with interest at the rate of 6 per centum per annum, and secured by such collateral security as the President may deem it advisable to require.

(d) With respect to any bonds, notes or other securities acquired under

the provisions of this section or under the provisions of the Federal Control Act, the President shall have the right to make such arrangements for extension of the time of payment or for the exchange of any of them for other securities, or partly for cash and partly for securities, as may be provided for in any agreement entered into by him or as may in his judgment seem desirable.

Existing Rates to Continue in Effect

Sec. 206. All rates, fares and charges, all divisions of joint rates, and all classifications, regulations and practices in anywise changing, affecting or determining any part or the aggregate of rates, fares or charges, or the value of the service rendered, which immediately preceding the termination of Federal control are in effect on the lines of carriers subject to the Commerce Act, shall continue in force and effect until thereafter changed by State or Federal authorities, respectively, or pursuant to authority of law; but this shall not be construed as affecting the rights of any party to a proceeding, involving rates, fares, charges, classifications, regulations or practices, which has been or may be instituted under the Commerce Act or other law.

Guaranty to Railroads After Termination of Federal Control

Sec. 207. (a) When used in this section—

The term "carrier" means a carrier by railroad or partly by railroad and partly by water, (1) whose railroad or system of transpotation is under Federal control at the time Federal control terminates, or which has heretofore engaged as a common carrier in general transportation and competed for traffic with a railroad or railroads of which the President has taken and retained possession, use and control (excepting, however, from such railroads not under Federal control any street or interurban electric railway which has as its principal source of operating revenue urban, suburban, or interurban passenger traffic or sale of power, heat and light, or both) and (2) which, within sixty days after the termination of Federal control as provided in section 200, has filed with the Commission schedules embodying general increases in its rates, fares and charges;

The term "guaranty period" means the first six months after the termination of Federal control; and

The term "test period" means the three years ending June 30, 1917.

(b) The United States hereby guarantees to each carrier that its railway operating income for the guaranty period as a whole shall not be less than the average of its railway operating income for the three corresponding periods of six months each during the test period. If during such corresponding periods in the test period, averaged together, the carrier had no railway operating income, the guaranty shall be the amount by which any deficit in railway operating income for the guaranty period as a whole exceeds the deficit for the three corresponding periods during the test period, averaged together.

(c) For the purposes of this section the railway operating income for the periods during the test period corresponding to the guaranty period shall be computed in the manner provided for in section 1 of the Federal Control Act.

(d) In computing railway operating income for the guaranty period for the purposes of this section—

(1) Debits and credits arising from the accounts, called in the monthly reports to the Commission equipment rents and joint facility rents, shall be included, but debits and credits arising from the operation of such street electric passenger railways, including railways commonly called interurbans, as are not under Federal control at the time of termination thereof, shall be excluded;

(2) Proper adjustments shall be made (a) in case any lines which were, during any portion of the period of Federal control, a part of the railroad or system of transportation of the carrier, and whose railway operating income was included in such income of the carrier for the test period, do not continue to be a part of such railroad or system of transportation during the entire guaranty period, and (b) in case of any lines acquired by, leased to, or consolidated with, the railroad or system of transportation of the carrier at any time since the end of the test period and prior to the expiration of the guaranty period, for which separate operating returns to the Commission are not made in respect to the entire portion of the guaranty period;

(3) There shall not be included in operating expenses, for maintenance of way and structures, or for maintenance of equipment, more than an amount fixed by the Commission. In fixing such amount the Commission shall so far as practicable apply the rule set forth in the proviso in paragraph (a) of section 5 of the "standard contract" between the United States and the carriers (whether or not such contract has been entered into with the carrier whose railway operating income is being computed), except that instead of taking the whole of the test period for the purposes of comparison there shall be taken the periods during the test period corresponding to the guaranty period; and

(4) The Commission shall require the restatement of the operating expenses (other than for maintenance of way and structures, or maintenance of equipment) for the guaranty period, to the extent necessary to correct any abnormal charge to such expenses for such period.

(e) The Commission shall, as soon as practicable after the expiration of the guaranty period, certify to the Secretary of the Treasury the amount of the railway operating income of the several carriers during such period, and the several amounts necessary to make good the guaranty to each. The Secretary of the Treasury is hereby authorized and directed thereupon to draw warrants in favor of each such carrier upon the Treasury of the United States, which shall be paid out of any moneys in the Treasury not otherwise appropriated, for the amount shown in such certificate as necessary to make good the guaranty.

(f) Upon appplication of any carrier to the Commission, asking that during the guaranty period there may be advanced to it from time to time such sums, not in excess of the estimated amount necessary to make good the guaranty, as are necessary to enable it to meet its fixed charges and operating expenses, the Commission may certify to the Secretary of the Treasury the amount of, and times at which, such advances, if any, shall be made. The Secretary of the Treasury, on receipt of such certificate, is authorized and directed to make the advances in the amounts and at the times specified in the certificate, upon the execution by the carrier of a contract, secured in such manner as the Secretary may determine, that upon final determination of the amount of the guaranty provided for by this section such carrier will repay to the United States any amounts which it has received from such advances in excess of the guaranty with interest at the rate of 6 per centum per annum from the time such excess was paid. If any such application is made before the carrier has filed with the Commission schedules embodying general increases in its rates, fares and charges, no advances shall be made under this paragraph unless such carrier enters into a contract, secured in such manner as the Secretary of the Treasury may determine, that if it fails to file such schedules within sixty days after the termination of Federal control it will repay to the United States the amount of such advances, with interest at the rate of 6 per centum per annum. No advances shall be made to any carrier after the expiration of sixty days after the termination of Federal control unless it has previously filed such schedules with the Commission.

(g) The contract of June 21, 1918, between the American Railway Express Company and the Director General of Railroads as amended and continued by agreement dated November 21, 1919, shall remain in full force and effect during the guaranty period so far as the same constitutes a guaranty on the part of the United States to the American Railway Express Company against an operating deficit: *Provided*, That such express company shall within sixty days after the termination of Federal control file with the Commission schedules embodying general increases in its rates, fares and charges.

The Commission shall, as soon as practicable after the expiration of the guaranty period, certify to the Secretary of the Treasury the amount of the operating deficit, if any, of the American Railway Express Company during such period and the amount necessary to make good such guaranty. The Secretary of the Treasury is hereby authorized and directed thereupon to draw warrants in favor of such express company upon the Treasury of the United States, which shall be paid out of any moneys in the Treasury not otherwise appropriated, for the amount shown in such certificate as necessary to make good the guaranty.

New Loans to Railroads

Sec. 208. (a) For the purpose of enabling carriers by railroad subject to the Commerce Act properly to serve the public during the transition period immediately following the termination of Federal control, any such carrier may, at any time after the passage of this Act and before the expiration of two years after the termination of Federal control, make application to the Commission for a loan from the United States, setting forth the amount of the loan and the term for which it is desired, the purpose of the loan and the uses to which it will be applied, the present and prospective ability of the applicant to repay the loan and meet the requirements of its obligations in that regard, the character and value of the security offered, and the extent to which the public convenience and necessity will be served. The application shall be accompanied by statements showing such facts and details as the Commission may require with respect to the physical situation, ownership, capitalization, indebtedness, contract obligations, operation and earning power of the applicant, together with such other facts relating to the propriety and expediency of granting the loan applied for and the ability of the applicant to make good the obligation, as the Commission may deem pertinent to the inquiry.

(b) If the Commission, after such hearing and investigation, with or without notice, as it may direct, finds that the making, in whole or in part, of the proposed loan by the United States is necessary to enable the applicant properly to meet the transportation needs of the people, and that the prospective earning power of the applicant and the character and value of the security offered are such as to furnish reasonable assurance of the applicant's ability to repay the loan within the time fixed therefor, the Commission may certify to the Secretary of the Treasury its findings of fact and its recommendations as to: the amount of the loan which is to be made; the time, not exceeding five years from the making thereof, within which it is to be repaid; the character of the security which is to be offered therefor; and the terms and conditions of the loan.

(c) Upon receipt of such certificate from the Commission, the Secretary of the Treasury, at any time before the expiration of 26 months after the termination of Federal control, is authorized to make a loan, not exceeding the maximum amount recommended in such certificate, out of any moneys in the revolving fund provided for in this section. All such loans shall bear interest at the rate of 6 per centum per annum, payable semi-annually to the Secretary of the Treasury, and to be placed to the credit of the revolving fund provided for in this section. The time, not exceeding five years from the making thereof, within which such loan is to be repaid, the security which is to be taken therefor, which shall be adequate to secure the loan, the terms and conditions of the loan, and the form of the obligation to be entered into, shall be prescribed by the Secretary of the Treasury.

(d) Loans so made shall be preferred liens upon the income and property of the applicant in the same manner and to the same extent that certificates issued by receivers appointed by United States courts are preferred liens upon the income and property that is being administered by the receiver.

(e) The Commission or the Secretary of the Treasury may call upon the Federal Reserve Board for advice and assistance with respect to any such application or loan.

(f) There is hereby appropriated out of any moneys in the Treasury not otherwise appropriated the sum of $250,000,000, which shall be used as a revolving fund for the purpose of making the loans provided for in this section.

Sec. 209. Any carrier securing a loan under the provisions of section 208, or funding under section 205 its indebtedness to the United States, shall not be subject, as regards the evidences of indebtedness given to the United States under either of such sections, to the provisions of section 20a of the Commerce Act added to such Act by section 437 of this Act.

Execution of Powers of President

Sec. 210. All powers and duties conferred or imposed upon the President by the preceding sections of this Act may be executed by him through such agency or agencies as he may determine.

Investigation of Needs of Water Transportation

Sec. 211. It shall be the duty of the Secretary of War, through the Chief of Engineers, with the object of promoting, encouraging, and developing inland waterway transportation facilities in connection with the commerce of the United States, to investigate the appropriate types of boats suitable for different classes of such waterways; to investigate the subject of water terminals, both for inland waterway traffic and for through traffic by water and rail, including the necessary docks, warehouses, apparatus, equipment, and appliances in connection therewith, and also railroad spurs and switches connecting with such terminals, with a view to devising the types most appropriate for different localities, and for the more expeditious and economical transfer or interchange of passengers or property between carriers by water and carriers by rail; to advise with communities, cities, and towns regarding the appropriate location of such terminals, and to cooperate with them in the preparation of plans for suitable terminal facilities; to investigate the existing status of water transportation upon the different inland waterways of the country, with a view to determining whether such waterways are being utilized to the extent of their capacity, and to what extent they are meeting the demands of traffic, and whether the water carriers utilizing such waterways are interchanging traffic with the railroads; and to investigate any other matter that may tend to promote and encourage inland water transportation. It shall also be the province and duty of the Chief of Engineers, under the direction of the Secretary of War, to compile, publish, and supply, from time to time, such useful statistics, data, and information concerning transportation on inland waterways as may be of value to the commercial interests of the country.

The words "inland waterways" used in this section shall be construed to include the Great Lakes.

Disputes Between Carriers and Their Employees

Sec. 300. That it shall be the duty of all carriers subject to this Act and their agents, officers, and employees to exert every reasonable effort and adopt every available and reasonable means to avoid interruption to the operation of a carrier subject to this Act growing out of controversy or dispute over any question of wages, working conditions, or discipline of employees.

Questions affecting wages, working conditions, or discipline or employees on a carrier's line shall be considered, and, if possible, adjusted in conference between representatives of the class or classes of employees affected, or to be affected thereby, and representatives of the carrier or carriers designated or authorized by it to so act. If any such question can not be adjusted in such conferences it shall be referred to the appropriate board of adjustment, hereinafter provided for. If such question can not be decided or adjusted by such board it shall be referred to the Commission on Labor Disputes, herinafter provided for.

Boards are hereby created and established to be known as Railway Board of Adjustment Number One, Railway Board of Adjustment Number Two, and Railway Board of Adjustment Number Three, for the purpose of handling and adjusting disputes that have not otherwise been disposed of, affecting the question of wages, working conditions, discipline, and personal grievances of employees of carriers subject to this Act.

Railway Board of Adjustment Number One, represented by the Brotherhood of Locomotive Engineers, the Brotherhood of Locomotive Firemen and Enginemen, the Order of Railway Conductors, and the Brotherhood of Railroad Trainmen.

Railway Board of Adjustment Number Two, represented by the International Association of Machinists; the International Brotherhood of Boiler Makers, Iron-Ship Builders and Helpers of America; the International Brotherhood of Blacksmiths and Helpers; the Brotherhood of Railway Carmen of America; the Amalgamated Sheet Metal Workers' Alliance, and the International Brotherhood of Electrical Workers.

Railway Board of Adjustment Number Three, represented by the Order of Railway Telegraphers, Switchmen's Union of North America, Brotherhood of Railway Clerks, and the United Brotherhood of Maintenance of Way Employees and Railroad Shop Laborers.

All controversies growing out of questions of wages, the interpretation or application of the provisions of wage schedules, or agreements which are not promptly adjusted by the officials, and the employees on any of the carrier lines subject to the provisions of this Act shall be disposed of in the following manner:

There shall be created within thirty days after the passage of this Act a board to be known as Railway Board of Adjustment Number One, to consist of eight members, four to be selected and compensated by the carriers subject to the provisions of this Act, and one each by the chief executive officer of each of the four organizations of employees hereinbefore named, and to be compensated by such organization.

There shall be created within thirty days after the passage of this Act a board to be known as Railway Board of Adjustment Number Two, to consist of twelve members, six to be selected and compensated by the carriers subject to the provisions of this Act, and one each by the chief executive officer of each of the six organizations of employees hereinbefore named, and to be compensated by such organization.

There shall be created within thirty days after the passage of this Act a board to be known as Railway Board of Adjustment Number Three, to consist of eight members, four to be selected and compensated by the carriers subject to the provisions of this Act, and one each by the chief executive officer of each of the four organizations of employees hereinbefore named, and to be compensated by such organization.

The aforesaid Railway Boards of Adjustment shall meet in the city of Washington within ten days after the selection of their members, and each elect a chairman and vice chairman, who shall be members of the board, and each chairman or vice chairman shall preside at all meetings of their respective boards, and shall be required to vote upon the adoption of all decisions of the board of which they are members.

The boards shall meet regularly at stated times each month and continue in session until all matters before them are considered.

Unless otherwise mutually agreed, all meetings of the boards shall be held in the city of Washington: *Provided,* That each board shall have authority to empower two or more of its members to conduct hearings and pass upon controversies, when properly submitted, at any place designated by the board: *Provided further,* That such subdivision of the board will not be authorized to make final decision. All decisions shall be made and approved by the entire board as hereinbefore provided.

Should a vacancy occur in any board for any cause, such vacancy shall be immediately filled by the same appointive authority which made the original selection.

All authority invested in the committee commonly known as the Commission of Eight to adjust disputes arising out of the application of the so-called eight-hour law is hereby transferred to Railway Board of Adjustment Number One, in the same manner as has heretofore been done by the Commission of Eight. All decisions of a general character heretofore made by the so-called Commission of Eight or by the United States Railroad Administration, affecting the questions of wages, hours of service or conditions of employment, are hereby confirmed and shall apply to all carriers subject to this Act, unless exempted in such eight-hour law. Decisions which have been rendered by the so-called Commission of Eight or the United States Railroad Administration, and which apply to individual carriers subject to the provisions of this Act, shall remain in effect until superseded by mutual agreement between the carrier and the employees, or by the decision of Railway Board of Adjustment Number One, or the Commission on Labor Disputes made in accordance with the provisions of this Act.

All decisions of a general character heretofore made by the United States Railroad Administration affecting the questions of wages, hours of service, or conditions of employment, are hereby confirmed and shall apply to all carrier lines subject to this Act. Decisions which have been rendered by the United States Railroad Administration, and which apply to the individual carriers subject to the provisions of this Act, shall remain in effect until superseded by mutual agreement between the carrier and the employees or by decision of Railway Board of Adjustment Number Two, or Railway Board of Adjustment Number Three, or the proper Commission on Labor Disputes made in accordance with the provisions of this Act.

The respective railway boards of adjustment shall render decisions on all matters in dispute and as provided herein and when properly submitted to the boards.

Questions of wages, hours of service, and conditions of employment, including controversies arising from interpretation of wage agreements, shall be decided by the railway boards of adjustment, when properly presented to them.

Wages, hours of service and conditions of employment, when fixed by the boards or commissions on labor disputes, shall be incorporated in existing agreements on the several carrier lines subject to the provisions of this Act, and should differences arise between the officials and the employees of any of the carriers subject to this Act, as to such incorporation, intent, or application, such questions of difference shall be decided by the respective railway boards of adjustment when properly presented.

Personal grievances or controversies arising under interpretation of wage agreements and all other disputes arising between officials of any carrier subject to this Act and its employees will be handled in their usual manner by general committees of their employees up to and including the chief operating officer of the carrier (or some one officially designated by him), when, if an agreement is not reached, the chairman of the general committee of employees may refer the matter to the chief executive officer of the organization concerned; and if the contention of the employees' committee is approved by such executive officer of the organization, then the chief operating officials of the carrier and the chief executive officer of the organization concerned shall refer the matter, with all supporting papers, to the proper Railway Board of Adjustment, which board shall promptly hear and decide the case, giving due notice to the chief operating officer of the carrier interested and the chief executive officer of the organization concerned of the time set for hearing.

No matter will be considered by the respective Railway Boards of Adjustment unless officially referred to them in the manner herein prescribed.

In hearings before the respective Railway Boards of Adjustment, in matters properly submitted for their consideration, the carrier shall be represented by such person or persons as may be designated by the chief operating officer, and the employees shall be presented by such person or persons as may be designated by the chief executative officer of the organization concerned.

All clerical and office expenses shall be paid by the United States Government. The carrier directly concerned and the organization involved in the hearing will, respectively, assume any expense incurred in presenting a case.

In each case an effort should be made to present a joint concrete statement of facts as to any controversy, but the respective boards are fully authorized to require information in addition to the concrete statement of facts, and may call upon the chief operating officer of the carrier or the chief executive officer of the organization concerned for additional evidence, either oral or written.

All decisions of the respective Railway Boards of Adjustment shall be approved by a majority vote of all members of such board.

After a matter has been considered by a board and in the event a majority vote can not be obtained, then any four members of Railway Board of Adjustment Number One, or any six members of Railway Board of Adjustment Number Two, or any four members of Railway Board of Adjustment Number Three, depending upon the board considering the matter, may elect to refer the matter upon which no decision has been reached to the proper Commission on Labor Disputes for a final decision.

Each Railway Board of Adjustment shall keep a complete and accurate record of all matters submitted for its consideration and of all decisions made by the board.

Each Railway Board of Adjustment shall file a report of all cases decided, including the decision, with the Interstate Commerce Commission,

with the chief operating officer of the carrier affected, and with the chief executive officers of the organizations concerned.

Sec. 301. Within thirty days from the passage of this Act there shall be created and established three commissions, which shall be known and designated as Commission on Labor Disputes Number One, Commission on Labor Disputes Number Two, and Commission on Labor Disputes Number Three, in the following manner:

Commission on Labor Disputes Number One shall consist of eight members, four of whom shall be selected by the carriers subject to the provisions of this Act, and four who shall be the chief executive officers of the organizations of employees, or some person designated by them, hereinbefore mentioned in connection with the creation of Railway Board of Adjustment Number One.

Commission on Labor Disputes Number Two shall consist of twelve members, six of whom shall be selected by the carriers subject to the provisions of this Act, and six who shall be the chief executive officers of the organizations of employees, or some person designated by them, hereinbefore mentioned in connection with the creation of Railway Board of Adjustment Number Two.

Commission on Labor Disputes Number Three shall consist of eight members, four of whom shall be selected by the carrier subject to the provisions of this Act, and four who shall be the chief executive officers of the organizations of employees, or some person designated by them, hereinbefore mentioned in connection with the creation of Railway Board of Adjustment Number Three.

It shall be unlawful for any member of a Railway Board of Adjustment or any member of a Commission on Labor Disputes to be a member at the same time of any other board of commission herein provided for; nor shall he act as a member of any Commission on Labor Disputes in any case in which he took part during its presentation and consideration before any Railway Board of Adjustment herein provided for.

Any controversy growing out of questions of wages, interpretation or application of the provisions of wage schedules or agreements, discipline, or personal grievances of the employees, arising on any carrier line subject to this Act, on which no agreement has been reached by Railway Board of Adjustment Number One, or Railway Board of Adjustment Number Two, or Railway Board of Adjustment Number Three, may be referred to the Commission on Labor Disputes Number One, or Commission on Labor Disputes Number Two, or Commission on Labor Disputes Number Three, respectively for final action.

The Commission on Labor Disputes shall meet in the city of Washington within ten days after the selection of their members and elect a chairman and vice chairman, who shall be members of the commission. The chairman or vice chairman will preside at all meetings of the commission, and both shall be required to vote upon the adoption of all decisions of the commission.

The commissions shall meet at such time as is deemed necessary and continue in session until matters referred to them are disposed of.

Unless otherwise mutually agreed, all meetings of the commissions shall be held in the city of Washington: *Provided,* That the commissions shall have authority to conduct hearings and pass upon controversies, when properly submitted, at any place designated by the commissions.

Should a vacancy occur in either of the commissions from any cause, such vacancy shall immediately be filled by the same appointive authority which made the original selection.

A Commission on Labor Disputes shall render decisions on all matters in dispute as provided herein when properly submitted to such commission.

No matter will be considered by a commission on Labor Disputes unless officially referred to it in the manner herein prescribed.

In hearings before a commission, in matters properly submitted for its consideration, the carrier shall be represented by such person or persons as may be designated by the chief operating officer, and the employee shall be represented by such person or persons as may be designated by the chief executive officer of the organization concerned.

The clerical and office expenses of the commissions will be paid by the United States Government. The carrier directly concerned and the organization involved in the hearing will, respectively, assume any expenses incurred in presenting a case.

Each commission on labor disputes shall keep a complete and correct record of all matters submitted for its consideration and all decisions made by the commission.

A commission will have authority to hear and decide only such cases as are properly referred to it by the railway boards of adjustment. All decisions of a commission on labor disputes shall be approved by a majority vote of all members of the commission.

A report of all cases decided, including the decisions, shall be filed with the Interstate Commerce Commission, with the chief officer of the carrier affected, and with the chief executive officers of the organizations concerned.

Additional boards of adjustment and commissions on labor disputes may be organized from time to time to cover other employees or classes of employees under the provisions of this Act.

For the purpose of making this section effective the members of railway boards of adjustment or commissions on labor disputes, or either of them, shall have the power to administer oaths and affirmations, sign subpœnas, require the attendance and testimony of witnesses and the production of books, papers, contracts, agreements, and documents material to a just determination of any matter under investigation, and may invoke the aid of the United States courts to compel witnesses to attend and testify and to produce such books, papers, contracts, agreements, and documents to the same extent and under the same conditions and penalties as are provided for in the Act to regulate commerce.

Testimony before railway boards of adjustment or commissions on labor disputes shall be given under oath or affirmation when it is deemed necessary by such boards or commissions. Any railway board of adjustment or commission on labor disputes may employ such assistants as may be necessary in carrying on this work. Any railway board of adjustment or commission on labor disputes shall whenever practicable be supplied with suitable quarters in any Federal building located at its place of meeting or at any place to which it may adjourn for its deliberations.

The United States Railroad Administration and the Board of Mediation and Conciliation are hereby authorized to turn over to railway boards of adjustment or to the commissions on labor disputes upon request any properties or documents heretofore filed with them and bearing upon mediation, arbitration, or other adjustments or proceedings held under the provisions of the Act approved June 1, 1898, or the Act approved July 15, 1913, providing for mediation and arbitration, or decisions rendered by the United States Railroad Administration.

The sum of $50,000, or so much thereof as may be necessary, is hereby authorized to be immediately available and continue available until the close of the fiscal year ending June 30, 1920, for the necessary and proper expenses incurred in connection with carrying on the work of railway boards of adjustment and commissions on labor disputes, including rent in the District of Columbia, furniture, office fixtures and supplies, assistants, clerical work, and other necessary expenses to be approved by the chairmen of the railway boards of adjustment and commissions on labor disputes and audited by the proper accounting officer of the Treasury.

Any person, corporation, organization, or association violating any of the provisions of sections 300 and 301 of this Act shall be deemed guilty of a misdemeanor, and for each offense, on conviction, shall pay to the United States a penalty of $500.

Sec. 400. The first five paragraphs of section 1 of the Commerce Act, as such paragraphs appear in section 7 of the Commerce Court Act, are hereby amended to read as follows:

"(1) That the provisions of this Act shall apply to common carriers engaged in—

"(a) The transportation of passengers or property wholly by railroad, or partly by railroad and partly by water when both are used under a common control, management, or arrangement for a continuous carriage or shipment; or

"(b) The transportation of oil or other commodity, except water and except artificial gas, by pipe line, or partly by pipe line and partly by railroad or by water; or

"(c) The transmission of intelligence by wire or wireless;—

from one State or Territory of the United States, or the District of Columbia, to any other State or Territory of the United States, or the District of Columbia, or from one place in a Territory to another place in the same Territory, or from any place in the United States through a foreign country to any other place in the United States, or from or to any place in the United States to or from a foreign country.

"(2) The provisions of this Act shall also apply to such transportation of passengers and property and transmission of intelligence, in so far as such transportation or transmission takes place within the United States, but shall not apply—

"(a) To the transportation of passengers or property, or to the receiving, delivering, storage, or handling of property, wholly within one State and not shipped to or from a foreign country from or to any place in the United States as aforesaid; nor

"(b) To the transmission of intelligence by wire or wireless wholly within one State and not transmitted to or from a foreign country from or to any place in the United States as aforesaid.

"(3) The term 'common carrier' as used in this Act shall include all pipe-line companies; telegraph, telephone, and cable companies operating by wire or wireless; express companies; sleeping-car companies; and all persons, natural or artificial, engaged in such transportation or transmission as aforesaid as common carriers for hire. Wherever the word 'carrier' is used in this Act it shall be held to mean 'common carrier.' The term 'railroad' as used in this Act shall include all bridges, car floats, lighters, and ferries used by or operated in connection with any railroad, and also all the road in use by any common carrier operating a railroad, whether owned or operated under a contract, agreement, or lease, and also all switches, spurs, tracks, terminals, and terminal facilities of every kind used or necessary in the transportation of the persons or property designated herein, including all freight depots, yards, and grounds, used or necessary in the transportation or delivery of any such property. The term 'transportation' as used in this Act shall include locomotives, cars, and other vehicle, vessels and all instrumentalities and facilities of shipment or carriage, irrespective of ownership or of any contract, express or implied, for the use there, and all services in connection with the receipt, delivery, elevation, and transfer in transit, ventilation, refrigeration or icing, storage, and handling of property transported. The term 'transmission' as used in this Act shall include the transmission of intelligence through the application of electrical energy or other use of electricity, whether by means of wire, cable, radio apparatus, or other wire or wireless conductors or appliances, and all instrumentalities and facilities for and services in connection with the receipt, forwarding, and delivery of messages, communications, or other intelligence so transmitted, hereinafter also collectively called messages.

"(4) It shall be the duty of every common carrier subject to this Act engaged in the transportation of passengers or property to provide and furnish such transportation upon reasonable request therefor, and to establish through routes and just and reasonable rates, fares, and charges applicable thereto, and to provide reasonable facilities for operating through routes and to make reasonable rules and regulations with respect to the operation of through routes, and providing for reasonable compensation to those entitled thereto; and in case of joint fares, fares, or charges, to establish just and reasonable divisions thereof as between the carriers subject to this Act participating therein which shall not unduly prefer or prejudice any of such participating carriers.

"(5) All charges made for any service rendered or to be rendered in the transportation of passengers or property or in the transmission of intelligence by wire or wireless as aforesaid, or in connection therewith, shall be just and reasonable, and every unjust and unreasonable charge for such service or any part thereof is prohibited and declared to be unlawful: *Provided,* That messages by wire or wireless subject to the provisions of this Act may be classified into day, night, repeated, unrepeated, letter, commercial, press, Government, and such other classes as are just and reasonable, and different rates may be charged for the different classes of messages: *And provided further,* That nothing in this Act shall be construed to prevent telephone, telegraph, and cable companies from entering into contracts with common carriers for the exchange of services.

"(6) It is hereby made the duty of all common carriers subject to the provisions of this Act to establish, observe, and enforce just and reason-

able classifications of property for transportation, with reference to which rates, tariffs, regulations or practices are or may be made or prescribed, and just and reasonable regulations and practices affecting classifications, rates, or tariffs, the issuance, form, and substance of tickets, receipts, and bills of lading, the manner and method of presenting, marking, packing, and delivering property for transportation, the facilities for transportation, the carrying of personal, sample, and excess baggage, and all other matters relating to or connected with the receiving, handling, transporting, storing, and delivery of property subject to the provisions of this Act which may be necessary or proper to secure the safe and prompt receipt, handling, transportation, and delivery of property subject to the provisions of this Act upon just and reasonable terms, and every unjust and unreasonable classification, regulation, and practice is prohibited and declared to be unlawful.

"(7) No common carrier subject to the provisions of this Act shall, after January 1, 1920, directly or indirectly, issue or give any interstate free ticket, free pass, or free transportation for passengers, except to its officers, agents, and employees, and their families; to its surgeons, physicians, and attorneys at law, who devote the principal part of their time to its service; to ministers of religion, traveling secretaries of railroad Young Men's Christian Associations, inmates of hospitals and charitable and eleemosynary institutions, and persons exclusively engaged in charitable and eleemosynary work; to indigent, destitute, and homeless persons, and to such persons when transported by charitable societies or hospitals, and the necessary agents employed in such transportation; to inmates of the National Homes or State Homes for Disabled Volunteer Soldiers, and of Soldiers' and Sailors' Homes, including those about to enter and those returning home after discharge; to necessary caretakers of live stock, poultry, fish, milk, and fruit, transported by it; to employees on sleeping cars or express cars, moving over its line; to Railway Mail Service employees, post-office inspectors, custom inspectors, and immigration inspectors, traveling in the discharge of their duties; to newsboys on its trains; to baggage transfer agents on duty; to witnesses attending any legal investigation in which it is interested; or to persons injured in wrecks, and physicians, surgeons, and nurses attending such persons, or to the remains of persons killed in wrecks; nor after such date shall any such carrier directly or indirectly give or issue any free frank for or free transmission of intelligence, except to its officers, agents and employees, and their families; or to its surgeons, physicians, and attorneys at law, who devote the principal part of their time to its service: *Provided,* That this provision shall not be construed to prohibit the interchange of passes or franks for the officers, agents, and employees of common carriers, and their families; nor to prohibit any common carrier from carrying passengers free with the object of providing relief in cases of wreck, general epidemic, pestilence, or other calamitous visitation: *Provided, however,* That no such free pass or free transportation shall be given to or asked or received or used by any such person if he be a Member of the Congress of the United States or an officer of the United States who under existing laws is now prohibited from accepting or using free passes or free transportation: *And provided further,* That the term "employee" as used in the paragraph shall include furloughed, pensioned, and superannuated employees, persons who have became disabled or infirm in the service of any such common carrier, and the remains of a person killed in the employment of a carrier, and ex-employees traveling for the purpose of entering the service of any such common carrier; and the term "families" as used in this paragraph shall include the families of those persons named in this proviso, also the families of persons killed, and the widows during widowhood, and minor children during minority of persons who died, while in the service of any such common carrier. Any common carrier violating the provisions of this paragraph shall be deemed guilty of a misdeameanor, and for each offense, on conviction, shall pay to the United States a penalty of not less than $100 nor more than $2,000; and any person, other than the person excepted in this paragraph, who uses any such interstate free ticket, free pass, free frank, or free transportation shall be subject to a like penalty. Jurisdiction of offenses under this paragraph shall be the same as that provided for offenses in an Act entitled 'An Act to further regulate commerce with foreign nations and among the States,' approved February 19, 1903, and any amendment thereof."

SEC. 402. The paragraphs added to section 1 of the Commerce Act by the Act entitled "An Act to amend an Act entitled 'An Act to regulate commerce,' as amended, in respect of car service, and for other purposes," approved May 29, 1917, are hereby amended to read as follows:

"(10) The term 'car service' in this Act shall include the use, control, supply, movement, distribution, exchange, interchange, and return of locomotives, cars, and other vehicles used in the transportation of property, and the supply, movement, and operation of trains, by any carrier by railroad subject to this Act.

"(11) It shall be the duty of every carrier by railroad subject to this Act to furnish safe and adequate car service and to establish, observe, and enforce just and reasonable rules, regulations, and practices with respect to car service; and every unjust and unreasonable rule, regulation, and practice with respect to car service is prohibited and declared to be unlawful.

"(12) It shall also be the duty of every carrier by railroad to make just and reasonable distribution of cars for transportation of coal among the coal mines served by it, whether located upon its line or lines or customarily dependent upon it for car supply. During any period when the supply of cars available for such service does not equal the requirements of such mines it shall be the duty of the carrier to maintain and apply just and reasonable ratings of such mines and to count each and every car furnished to or used by any such mine for transportation of coal against the mine. Failure or refusal so to do shall be unlawful, and in respect of each car not so counted shall be deemed a separate offense, and the carrier, receiver, or operating trustee so failing or refusing shall forfeit to the United States the sum of $100 for each offense, which may be recovered in a civil action brought by the United States.

"(13) The Commission is hereby authorized by general or special orders to require all carriers by railroad subject to this Act, or any of them, to file with it from time to time their rules and regulations with respect to car service, and the Commission may, in its discretion, direct that such rules and regulations shall be incorporated in their schedules showing rates, fares, and charges for transportation, and be subject to any or all of the provisions of this Act relating thereto.

"(14) The Commission may, after hearing, on a complaint or upon its own initiative without complaint, establish reasonable rules, regulations, and practices with respect to car service by carriers by railroad subject to this Act, including the compensation to be paid for the use of any locomotive, car, or other vehicles not owned by the carrier using it, and the penalties or other sanctions for nonobservance of such rules, regulations or practices.

"(15) Whenever the Commission is of opinion that shortage of equipment, congestion of traffic, or other emergency requiring immediate action exists in any section of the country, the Commission shall have, and it is hereby given, authority, either upon complaint or upon its own initiative without complaint, at once, if it so orders, without answer or other formal pleading by the interested carrier or carriers, and with or without notice, hearing, or the making or filing of a report, according as the Commission may determine: (a) to suspend the operation of any or all rules, regulations, or practices then established with respect to car service for such time as may be determined by the Commission; (b) to make such just and reasonable directions with respect to car service without regard to the ownership as between carriers of locomotives, cars, and other vehicles, and to handling, routing, and movement of traffic, during such emergency as in its opinion will best promote the service in the interest of the public and the commerce of the people, upon such terms of compensation as between the carriers for the use of facilities and for handling, routing, or movement of traffic as they may agree upon, or, in the event of their disagreement, as the Commission may after subsequent hearing find to be just and reasonable; (c) to require such joint or common use of terminals as in its opinion will best meet the emergency and serve the public interest, and upon such terms as between the carriers as they may agree upon, or, in the event of their disagreement, as the Commission may after subsequent hearing find to be just and reasonable; and (d) to give directions for preference or priority in transportation, embargoes, or movement of traffic under permits, at such time and for such periods as it may determine, and to modify, change, suspend, or annul them. In time of war or threatened war the President may certify to the Commission that it is essential to the national defense and security that certain traffic shall have preference or priority in transportation, and the Commission shall, under the power herein conferred, direct that such preference or priority be afforded.

"(16) The directions of the Commission as to car service and to the matters referred to in paragraph (15) may be made through and by such agents or agencies as the Commission shall designate and appoint for that purpose. It shall be the duty of all carriers by railroad subject to this Act, and of their officers, agents, and employees, to obey strictly and conform promptly to such orders of directions of the Commission, and in case of failure or refusal on the part of any carrier, receiver, or operating trustee to comply with any such order or direction such carrier, receiver, or trustee shall be liable to a penalty of not less than $100 nor more than $500 for each such offense and $50 for each and every day of the continuance of such offense, which shall accrue to the United States and may be recovered in a civil action brought by the United States: *Provided, however,* That nothing in this Act shall impair or affect the right of the State, in the exercise of its police power, to require just and reasonable freight and passenger service and the fair exchange and distribution of equipment for intrastate business.

"(17) After ninety days after this paragraph takes effect no carrier by railroad subject to this Act shall undertake the extension of its line of railroad, or the construction of a new line of railroad, or shall require or operate any line of railroad, or extension thereof, or shall engage in transportation under this Act over or by means of such additional or extended line of railroad, unless and until there shall first have been obtained from the Commission a certificate that the present or future public convenience and necessity require or will require the construction, or operation, or construction and operation, of such additional or extended line of railroad, and no carrier by railroad subject to this Act shall abandon all or any portion of a line of railroad, or the operation thereof, unless and until there shall first have been obtained from the Commission a certificate that the present or future public convenience and necessity permit of such abandonment.

"(18) The application for and issuance of any such certificate shall be under such rules and regulations as to hearings and other matters as the Commission may from time to time prescribe, and the provisions of this Act shall apply to all such proceedings. Upon receipt of any application for such certificate the Commission shall cause notice thereof to be given to and a copy filed with the railroad commission, or public service or utilities commission, or other appropriate authority, or the governor, of each State in which such additional or extended line of railroad is proposed to be constructed or operated, or all or any portion of a line of railroad, or the operation thereof, is proposed to be abandoned, with the right to be heard as hereinafter provided with respect to the hearing of complaints or the issuance of securities; and said notice shall also be published for three consecutive weeks in some newspaper of general circulation in each county in or through which said line of railroad is constructed or operates.

"(19) The Commission shall have power to issue such certificate as prayed for, or to refuse to issue it, or to issue it for a portion or portions of a line of railroad, or extension thereof, described in the application, or for the partial exercise only of such right or privilege, and may attach to the issuance of the certificate such terms and conditions as in its judgment the public convenience and necessity may require. From and after issuance of such certificate, and not before, the carrier by railroad may, without securing approval other than such certificate, comply with the terms and conditions contained in or attached to the issuance of such certificate and proceed with the construction, operation, or abandonment covered thereby. Any construction, operation, or abandonment contrary to the provisions of paragraph (17), (18) or (19) of this section may be enjoined by any court of competent jurisdiction at the suit of the United States, the Commission, any commission or regulating body of the State or States affected, or any party in interest, and any carrier knowingly violating any of the foregoing provisions shall be guilty of a misdemeanor and upon conviction shall be liable to the penalties provided for violation of this Act.

"(20) The Commission may, after hearing, in a proceeding upon complaint or upon its own initiative without complaint, authorize or require

by order any carrier by railroad subject to this Act, party to such proceeding, to provide it with safe and adequate facilities for performing as a common carrier its car service as that term is used in this Act, and to extend its line or lines: *Provided*, That the Commission shall find that such provision of facilities or extension is reasonably required in the interest of public convenience and necessity and will not impair the ability of the carrier to perform its duty to the public. Any carrier subject to this Act which refuses or neglects to comply with any order of the Commission made in pursuance of this paragraph shall be liable to a penalty of $100 for each day during which such refusal or neglect continues, which shall accrue to the United States and may be recovered in a civil action brought by the United States.

"(21) The authority of the Commission conferred by paragraphs (17) to (20), both inclusive, shall not extend to the construction or abandonment of any line located or to be located wholly within one State or to any street car or electric interurban line."

Sec. 405. The first paragraph of section 3 of the Commerce Act is hereby amended by inserting "(1)" after the section number at the beginning thereof.

The second paragraph of section 3 of the Commerce Act is hereby amended to read as follows:

"(2) All carriers, engaged in the transportation of passengers or property, subject to the provisions of this Act, shall, according to their respective powers, afford all reasonable, proper, and equal facilities for the interchange of traffic between their respective lines, and for the receiving, forwarding, and delivering of passengers or property to and from their several lines and those connecting therewith, and shall not discriminate in their rates, fares, and charges between such connecting lines. The Commission may require the terminals of any such carrier to be open to the traffic of other such carriers upon such just and reasonable terms and conditions, including just compensation to the owners thereof, as the Commission after notice and full hearing, upon complaint or upon its own initiative, may by order prescribe."

Sec. 407. The first paragraph of section 5 of the Commerce Act is hereby amended to read as follows:

"Sec. 5. (1) That, except upon specific approval by order of the Commission as in this section provided, and except as provided in paragraph (15) of section 1 of this Act, it shall be unlawful for any common carrier subject to this Act to enter into any contract, agreement, or combination with any other common carrier or carriers for the pooling of freights of different and competing railroads, or to divide between them the aggregate or net proceeds of the earnings of such railroads, or any portion thereof; and in any case of an agreement for the pooling of freights as aforesaid each day of its continuance shall be deemed a separate offense: *Provided*, That whenever the Commission is of opinion, after hearing upon application of any carriers or carriers, engaged in the transportation of passengers or property, subject to this Act, or upon its own initiative, that the unification, consolidation, or merger by purchase, lease, stock control, or in any other way, similar or dissimilar, of two or more such carriers subject to this Act, or of the ownership or operation of their properties, or of designated portions thereof, or that the pooling of their traffic, earnings or facilities, to the extent indicated by the Commission, will be in the interest of better service to the public, or economy in operation, or otherwise of advantage to the convenience and commerce of the people, the Commission shall have authority by order to approve and authorize such unification, consolidation, merger, or pooling, under such rules and regulations, and for such consideration as between such carriers and upon such terms and conditions, as shall be found by the Commission to be just and reasonable in the premises The power and authority of the Commission to approve and authorize the unification, consolidation or merger of two or more carriers shall extend and apply to the unification, consolidation or merger of four express companies into the American Railway Express Company, a Delaware corporation, if application for such approval and authority is made to the Commission within thirty days after the passage of this amendatory Act; and pending the decision of the Commission such unification, consolidation or merger, shall not be dissolved.

"(2) The Commission may from time to time, for good cause shown, make such supplemental orders in the premises as it may deem necessary or appropriate, and may by any such supplemental order modify or set aside the provisions of any previous order as to the extent of the pooling, or as to the rules, regulations, terms, conditions, or consideration currently moving in respect of any unification or consolidation of operation and not of ownership, or of pooling, so theretofore approved and authorized.

"(3) The carriers affected by any such order shall be and they are hereby relieved from the operation of the 'anti-trust laws,' as designated in section 1 of the Act approved October 15, 1914, entitled 'An Act to supplement existing laws against unlawful restraints and monopolies, and for other purposes,' and of all other restraints or prohibitions by law, in so far as may be necessary to enable them to effect any unification, consolidation, merger or pooling so approved by order under and pursuant to the foregoing provisions of this section."

Sec. 408. The paragraph of section 5 of the Commerce Act, added to such section by section 11 of the Act entitled "An Act to provide for the opening, maintenance, protection and operation of the Panama Canal and the sanitation and government of the Canal Zone," approved August 24, 1912, is hereby amended by inserting "(4)" at the beginning thereof.

The two paragraphs of section 11 of such Act of August 24, 1912, which follow the paragraph added by such section to section 5 of the Commerce Act, are hereby made a part of section 5 of the Commerce Act. The first paragraph so made a part of section 5 of the Commerce Act is hereby amended by inserting "(5)" at the beginning thereof, and the second such paragraph is hereby amended to read as follows:

"(6) If the Commission is of the opinion that any such existing or proposed new specified service by water, other than through the Panama Canal, is being or will be operated in the interest of the public, and is or will be of advantage to the convenience and commerce of the people, and that a discontinuance of the existing service, or a failure to establish the proposed new service, will be substantially injurious to the commerce or localities affected, the Commission may, upon such just and reasonable terms as it may prescribe, by order extend the time during which such existing service by water may continue to be operated, or authorize the establishment and maintenance of the proposed new service, until its further order after hearing: *Provided*, That no new service shall be authorized except in or upon the Great Lakes and their connecting waterways, or on a navigable water (other than through the Panama Canal) where the major portion of the service is upon the high seas or upon Long Island Sound. In every case of such extension or authorization the rates, schedules and practices of such water carrier shall be filed with the Commission and shall be subject to this Act and all amendments thereto in the same manner and to the same extent as is the railroad or other common carrier controlling such water carrier or interested in any manner in its operation."

Sec. 415. Section 13 of the Commerce Act is hereby amended by inserting "(1)" after the section number at the beginning of the first paragraph and "(2)" at the beginning of the second paragraph, and by adding at the end thereof two new paragraphs to read as follows:

"(3) Whenever in any investigation under the provisions of this Act, or in any investigation instituted upon petition of the carrier concerned, which petition is hereby authorized to be filed, there shall be brought in issue any rate, fare, charge, classification, regulation or practice made or imposed by authority of any State, the Commission, before proceeding to hear and dispose of such issue, shall cause such State or States to be notified of the proceeding. The Commission may confer with the authorities of any State having regulatory jurisdiction over the class of persons and corporations subject to this Act with respect to the relationship between rate structures and practices of carriers subject to the jurisdiction of such State bodies and of the Commission; and to that end is authorized and empowered, under rules to be prescribed by it, and which may be modified from time to time, to hold joint hearings with any such State regulating bodies on any matters wherein the Commission is empowered to act and where the rate-making authority of a State is or may be affected by the action taken by the Commission. The Commission is also authorized to avail itself of the co-operation, services, records and facilities of such State authorities in the enforcement of any provision of this Act.

"(4) The Commission shall have authority, after full hearing, to make such findings and orders as may in its judgment tend to remove any undue advantage, preference or prejudice as between persons or localities in intrastate commerce on the one hand and interstate or foreign commerce on the other hand, or any undue burden upon interstate or foreign commerce, which is hereby forbidden and declared to be unlawful, and such findings or orders shall be observed while in effect by the carriers parties to such proceeding affected thereby, the law of any State or the decision or order of any State authority to the contrary notwithstanding."

Sec. 417. The first four paragraphs of section 15 of the Commerce Act are hereby amended to read as follows:

"Sec. 15. (1) That whenever, after full hearing, upon a complaint made as provided in section 13 of this Act, or after full hearing under an order for investigation and hearing made by the Commission on its own initiative, either in extension of any pending complaint or without any complaint whatever, the Commission shall be of opinion that any individual or joint rate, fare or charge whatsoever demanded, charged or collected by any common carrier or carriers subject to this Act for the transportation of persons or property or for the transmission of messages as defined in the first section of this Act, or that any individual or joint classification, regulation or practice whatsoever of such carrier or carriers subject to the provisions of this Act, is or will be unjust or unreasonable or unjustly discriminatory or unduly preferential or prejudicial, or otherwise in violation of any of the provisions of this Act, the Commission is hereby authorized and empowered to determine and prescribe what will be the just and reasonable individual or joint rate, fare or charge, or rates, fares or charges, to be thereafter observed in such case, or the maximum, or minimum, or maximum and minimum, to be charged, and what individual or joint classification, regulation, or practice is or will be just, fair and reasonable, to be thereafter followed, and to make an order that the carrier or carriers shall cease and desist from such violation to the extent to which the Commission finds that the same does or will exist, and shall not thereafter publish, demand or collect any rate, fare or charge for such transportation or transmission other than the rate, fare or charge so prescribed, or in excess of the maximum or less than the minimum so prescribed, as the case may be, and shall adopt the classification and shall conform to and observe the regulation or practice so prescribed.

"(2) Except as otherwise provided in this Act, all orders of the Commission, other than orders for the payment of money, shall take effect within such reasonable time, not less than thirty days, and shall continue in force until its further order, or for a specified period of time, according as shall be prescribed in the order, unless the same shall be suspended or modified or set aside by the Commission, or be suspended or set aside by a court of competent jurisdiction.

"(3) Whenever, after full hearing upon complaint or upon its own initiative, the Commission is of opinion that the divisions of joint rates, fares or charges, applicable to the transportation of passengers or property, are or will be unjust, unreasonable or unduly preferential or prejudicial as between the carriers parties thereto (whether agreed upon by such carriers, or any of them, or otherwise established), the Commission shall by order prescribe the just and reasonable divisions thereof to be received by the several carriers, and in cases where the joint rate, fare or charge was established pursuant to a finding or order of the Commission and the divisions thereof are found by it to have been unjust, unreasonable, or unduly preferential or prejudicial, the Commission may also by order determine what (for the period subsequent to the filing of the complaint or petition or the making of the order of investigation) would have been the just and reasonable divisions thereof to be received by the several carriers, and require adjustment to be made in accordance therewith. The Commission may also, after full hearing upon complaint or upon its own initiative, establish through routes, joint classification, and joint rates, fares or charges, applicable to the transportation of passengers or property, or the maxima, or minima, or maxima and minima, to be charged, and the divisions of such rates, fares or charges as hereinbefore provided, and the terms and conditions under which such through routes shall be operated; and this provision shall apply when one of the carriers is a water line. The Commission shall not, however, establish any through route, classifica-

tion or rate between street electric passenger railways not engaged in the general business of transporting freight in addition to their passenger and express business, and railroads of a different character; nor shall the Commission have the right to establish any route, classification, rate, fare or charge when the transportation is wholly by water, and any transportation by water affected by this Act shall be subject to the laws and regulations applicable to transportation by water. And in establishing such through route the Commission shall not, except as provided in section 3, require any carrier by railroad, without its consent, to embrace in such route substantially less than the entire length, of its railroad and of any intermediate railroad operated in conjunction and under a common management or control therewith, which lies between the termini of such proposed through route, unless such inclusion of lines would make the through route unreasonably long as compared with another practicable through route which could otherwise be established: *Provided*, That in time of shortage of equipment, congestion of traffic, or other emergency declared by the Commission it may (either upon complaint or upon its own initiative without complaint, at once, if it so orders, without answer or other formal pleadings by the interested carrier or carriers, and with or without notice, hearing or the making or filing of a report, according as the Commission may determine) establish temporarily such through routes as in its opinion are necessary or desirable in the public interest.

"(4) Whenever there shall be filed with the Commission any schedule stating a new individual or joint rate, fare or charge, or any new individual or joint classification, or any new individual or joint regulation or practice affecting any rate, fare or charge, the Commission shall have, and it is hereby given, authority, either upon complaint or upon its own initiative without complaint, at once, and if it so orders without answer or other formal pleading by the interested carrier or carriers, but upon reasonable notice, to enter upon a hearing concerning the lawfulness of such rate, fare, charge, classification, regulation or practice; and pending such hearing and the decision thereon the Commission, upon filing with such schedule and delivering to the carrier or carriers affected thereby a statement in writing of its reasons for such suspension, may suspend the operation of such schedule and defer the use of such rate, fare, charge, classification, regulation or practice, but not for a longer period than one hundred and twenty days beyond the time when it would otherwise go into effect; and after full hearing, whether completed before or after the rate, fare, charge, classification, regulation or practice goes into effect, the Commission may make such order with reference thereto as would be proper in a proceeding initiated after it had become effective. If any such hearing can not be concluded within the period of suspension, as above stated, the proposed change of rate, fare, charge, classification, regulation or practice shall go into effect at the end of such period, but, in case of a proposed increased rate or charge for or in respect to the transportation of property, the Commission may by order require the interested carrier or carriers to keep accurate account in detail of all amounts received by reason of such increase, specifying by whom and in whose behalf such amounts are paid, and upon completion of the hearing and decision may by further order require the interested carrier or carriers to refund, with interest, to the persons in whose behalf such amounts were paid such portion of such increased rates or charges as by its decision shall be found not justified. At any hearing involving a rate, fare or charge increased after January 1, 1910, or of a rate, fare or charge sought to be increased after the passage of this Act, the burden of proof to show that the increased rate, fare or charge, or proposed increased rate, fare or charge, is just and reasonable shall be upon the common carrier, and the Commission shall give to the hearing and decision of such questions preference over all other questions pending before it and decide the same as speedily as possible."

Sec. 424. The seventh paragraph of section 16 of the Commerce Act is hereby amended to read as follows:

"(8) Any carrier, any officer, representative, or agent of a carrier, or any receiver, trustee, lessee, or agent of either of them, who knowingly fails or neglects to obey any order made under the provisions of sections 3, 13 or 15 of this Act shall forfeit to the United States the sum of $5,000 for each offense. Every distinct violation shall be a separate offense, and in case of a continuing violation each day shall be deemed a separate offense."

Sec. 437. The Commerce Act is further amended by inserting therein a new section between section 20 and section 21 to be designated section 20a, and to read as follows:

"Sec. 20a. (1) That from and after one hundred and twenty days after this section takes effect it shall be unlawful for any common carrier by railroad (except a street or electric interurban passenger railway not engaged in the general business of transporting freight in addition to its passenger and express business) which is subject to this Act, or any corporation organized for the purpose of engaging in transportation subject to this Act (hereinafter in this section called 'carrier'), to issue any share of capital stock or any bond or other evidence of interest in or indebtedness of the carrier (hereinafter in this section collectively termed 'securities') or to assume any obligation or liability as lessor, lessee, guarantor, indorser, surety or otherwise, in respect of the securities of any other person, natural or artificial, even though permitted by the authority creating the carrier corporation, unless and until, and then only to the extent that, upon application by the carrier, and after investigation by the Commission of the purposes and uses of the proposed issue and the proceeds thereof, or of the proposed assumption of obligation or liability in respect of the securities of any other person, natural or artificial, the Commission by order authorizes such issue or assumption. The Commission shall make such order only if it finds that such issue or assumption: (a) is for some lawful purpose compatible with the public interest, which is necessary or appropriate for or consistent with the proper performance by the carrier of service to the public as a common carrier, and which will not impair its ability to perform that service, and (b) is reasonably necessary and appropriate for such purpose.

"(2) The Commission shall have power by its order to grant or deny the application as made, or to grant it in part and deny it in part, or to grant it with such modifications and upon such terms and conditions as the Commission may deem necessary or appropriate in the premises, and may from time to time, for good cause shown, make such supplemental orders in the premises as it may deem necessary or appropriate, and may by any such supplemental order modify the provisions of any previous order as to the particular purposes, uses, and extent to which, or the conditions under which, any securities so theretofore authorized or the proceeds thereof may be applied, subject always to the requirements of the foregoing paragraph (1).

"(3) Every application for authority shall be made in such form and contain such matters as the Commission may prescribe. Every such application, as also every certificate of notification hereinafter provided for, shall be made under oath, signed and filed on behalf of the carrier by its president, a vice-president, auditor, comptroller or other executive officer having knowledge of the matters therein set forth and duly designated for that purpose by the carrier.

"(4) Whenever any securities set forth and described in any application for authority or certificate of notification as pledged or held unencumbered in the treasury of the carrier shall, subsequent to the filing of such application or certificate, be sold, pledged, repledged, or otherwise disposed of by the carrier, such carrier shall, within ten days after such sale, pledge, repledge or other disposition, file with the Commission a certificate of notification to that effect, setting forth therein all such facts as may be required by the Commission.

"(5) Upon receipt of any such application for authority the Commission shall cause notice thereof to be given to and a copy filed with the railroad commission, or public service or utilities commission, or other appropriate authority of each State in which the applicant carrier operates, or to the governor of such State. The railroad commissions, public service or utilities commissions, or other appropriate State authorities thus notified shall have the right to make before the Commission such representations as they may deem just and proper for preserving and conserving the rights and interests of their people and the States, respectively, involved in such proceeding. The Commission may hold hearings, if it sees fit, to enable it to determine its decision upon the application for authority.

"(6) The jurisdiction conferred upon the Commission by this section shall be exclusive and plenary, and a carrier may issue securities and assume obligations or liabilities in accordance with the provisions of this section without securing approval other than as specified herein.

"(7) Nothing herein shall be construed to imply any guaranty or obligation as to such securities on the part of the United States.

"(8) The foregoing provisions of this section shall not apply to notes to be issued by the carrier maturing not more than two years after the date thereof and aggregating (together with all other then outstanding notes of a maturity of two years or less) not more than 10 per centum of the par value of the securities of the carrier then outstanding. In the case of securities having no par value, the par value for the purposes of this paragraph shall be the fair market value as of the date of issue. Within ten days after the making of such notes the carrier issuing the same shall file with the Commission a certificate of notification, in such form as may from time to time be determined and prescribed by the Commission, setting forth as nearly as may be the same matters as those required in respect of applications for authority to issue other securities.

"(9) The Commission shall require periodical or special reports from each carrier hereafter issuing any securities, including such notes, which shall show, in such detail as the Commission may require, the disposition made of such securities and the application of the proceeds thereof.

"(10) All issues of securities and assumptions of obligation or liability contrary to the provisions of this section or of any order issued thereunder by the Commission shall be void. If any security so made void or any security in respect to which the assumption of obligation or liability is so made void, is acquired by any person for value and in good faith and without notice that the issue or assumption is void, such person may in a suit or action in any court of competent jurisdiction hold jointly and severally liable for the full amount of the damage sustained by him in respect thereof, the carrier which issued the security so made void or assumed the obligation or liability so made void, and its directors, officers, attorneys and other agents, who participated in any way in the authorizing, issuing, hypothecating or selling of the security so made void or in the authorizing of the assumption of the obligation or liability so made void. In case any security so made void was directly acquired from the carrier issuing it, the holder may at his option rescind the transaction and upon the surrender of the security recover the consideration given therefor. Any director, officer, attorney or agent of the carrier who knowingly assents to or concurs in any issue of securities or assumptions of obligation or liability forbidden by this section, or any sale or other disposition of securities contrary to the provisions of the Commission's order or orders in the premises, or any application not authorized by the Commission of the funds derived by the carrier through such sale or other disposition of such securities, shall be guilty of a misdemeanor and upon conviction shall be punished by a fine of not less than $1,000 nor more than $10,000, or by imprisonment for not less than one year nor more than three years, or by both such fine and imprisonment, in the discretion of the court.

"(11) After December 31, 1921, it shall be unlawful for any person to hold the position of officer or director of more than one carrier, unless such holding shall have been authorized by order of the Commission, upon due showing, in form and manner prescribed by the Commission, that neither public nor private interests will be adversely affected thereby. After this section takes effect it shall be unlawful for any officer or director of any carrier to receive for his own benefit, directly or indirectly, any money or thing of value in respect of the negotiation, hypothecation or sale of any securities issued or to be issued by such carrier, or to share in any of the proceeds thereof, or to participate in the making or paying of any dividends of an operating carrier from any funds properly included in capital account. Any violation of these provisions shall be a misdemeanor, and on conviction in any United States court having jurisdiction shall be punished by a fine of not less than $1,000 nor more than $10,000, or by imprisonment for not less than one year nor more than three years, or by both such fine and imprisonment, in the discretion of the court."

Sec. 438. Section 24 of the Commerce Act is hereby amended to read as follows:

"Sec. 24. That the Commission is hereby enlarged so as to consist

of eleven members, with terms of seven years, and each shall receive $17,000 compensation annually. The qualifications of the members and the manner of payment of their salaries shall be as already provided by law. Such enlargement of the Commission shall be accomplished through appointment by the President, by and with the advice and consent of the Senate, of two additional Interstate Commerce Commissioners, one for a term expiring December 31, 1923, and one for a term expiring December 31, 1924. The terms of the present commissioners, or of any successor appointed to fill a vacancy caused by the death or resignation of any of the present commissioners, shall expire as heretofore provided by law. Their successors and the successors of the additional commissioners herein provided for shall be appointed for the full term of seven years, except that any person appointed to fill a vacancy shall be appointed only for the unexpired term of the commissioner whom he shall succeed. Not more than six commissioners shall be appointed from the same political party. Hereafter the salary of the secretary of the Commission shall be $7,500 a year."

Sec. 439. The Commerce Act is hereby further amended by adding at the end thereof two new sections, to read as follows:

"Sec. 25. That the Commission may, after investigation, order any carrier by railroad subject to this Act, within a time specified in the order, to install automatic train-stop or train-control devices, which comply with specifications and requirements prescribed by the Commission, upon the whole or any part of its railroad, such order to be issued and published at least one year before the date specified for its fulfillment: *Provided*, That a carrier shall not be held to be negligent because of its failure to install such devices upon a portion of its railroad not included in the order; and any action arising because of an accident happening upon such portion of its railroad shall be determined without consideration of the use of such devices upon another portion of its railroad. Any common carrier which refuses or neglects to comply with any order of the Commission made under the authority conferred by this section shall be liable to a penalty of $100 for each day that such refusal or neglect continues, which shall accrue to the United States, and may be recovered in a civil action brought by the United States.

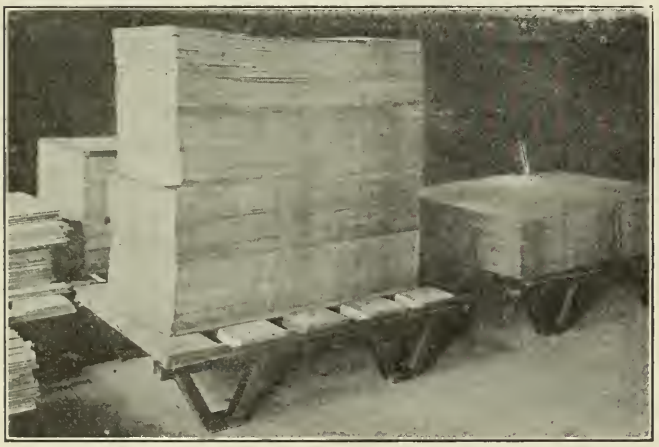
"Sec. 26. That this Act may be cited as the 'Commerce Act, 1887.'"

Trays for Elevating Platform Industrial Trucks

THE LYON METALLIC MANUFACTURING COMPANY, Aurora, Ill., has developed a type of side frame to be used in making up trays or platforms for elevating platform industrial trucks, known as the Lyon steel skid leg.

The skid leg consists of two welded feet which are, in turn, welded to a steel channel. This channel is provided with bolt holes, which are spaced so as to make it convenient to bolt on either a wood or steel top. The legs have rounded corners and a wide bearing surface for preventing damage to floors and resisting lateral thrust.

Additional supplies of platforms may be carried in stock,

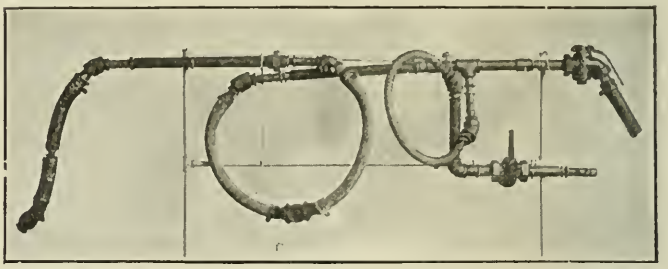


The Load of Tin Plate on the Center Tray Is Greater Than the Lifting Capacity of a Truck, But Was Placed to Show What a Tray May Carry.

knocked down, so that they take up little space and yet may be quickly assembled. The wooden cross pieces may be drilled to fit the skid legs, which are punched to a standard pattern. All that is necessary to have a new platform complete and ready for use is to get out the required number of cross pieces and bolt them to the skid legs. The platforms may be made any width, as width depends only on the length of the cross pieces.

Emergency Connections For Brake Pipes

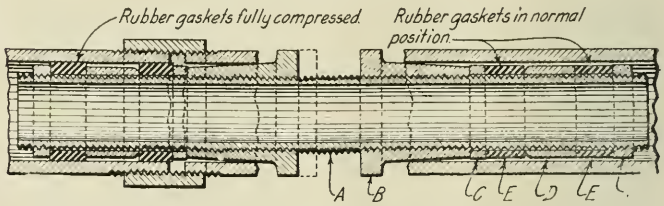
A METHOD OF COUPLING broken pipes which does away with the necessity of cutting threads has been devised by J. L. Boschart and is now being manufactured by the Broschart Threadless Pipe Coupling Company, Trenton, Mo. The object is to facilitate repairs in case of breakage of pipes forming part of the air brake or steam heating system either on locomotives or cars. In actual service as a part of the equipment carried on locomotives and cabooses, the threadless coupling has been found useful in preventing delays and engine failures, eliminating the necessity of switching cars to the rear of the train or



Method of Using the Emergency Connection in Making Temporary Repairs to Broken Brake Pipes

cutting them out with the consequent expense of sending a mechanic to make repairs.

As shown in the illustration the coupling consists of a short section of pipe *A*, which carries two jam nuts *B*, sleeves *C* and *D*, rubber gaskets *E*, and look nuts *F*. In case a break occurs in the train line, the ends are separated about four inches enabling the coupling to be inserted in the pipe. By turning the jam nuts, the rubber gaskets are compressed and forced out against the walls of the pipe making an air tight connection. If the break occurs at the end of a pipe coupling or union, the tapered end of the jam nut is sufficiently long to allow the gasket to extend through into the pipe and make a tight joint. By the use of other fittings



A Pipe Coupling Which Can Be Applied Without Tools

train lines can be connected even though the broken ends cannot be separated and in a similar manner angle cocks can be replaced and other air or steam pipes can be connected or plugged. The coupling can be applied without the use of any tools. It will withstand the standard train-line pressure and will not interfere with either service or emergency applications of the brakes.

Hog Island launched its fiftieth ship on August 23. The vessel was the S. S. Noble.

General News Department

Engineering Council has requested, and the Director of the Census, has ordered that the next census shall include a more detailed classification of engineers so that technical engineers will be listed separately from non-technical engineers (stationary engineers, locomotive enginemen, etc.), enabling anyone to ascertain readily the number of technical men in the United States and in each state. Technical engineers will be sub-divided between civil, mechanical, electrical and mining.

A committee of Engineering Council consisting of 16 engineers from all parts of the United States has for some time been studying the question of the licensing or registering of engineers. At a meeting held in Chicago recently a suggested form of statute was drafted which it is expected will be presented to Engineering Council at its December meeting for approval. The proposed law will then be available for use in the forming of legislation in those states in which there is a demand for the licensing of engineers. Eleven states have already passed such laws, but with widely differing provisions, while 17 have laws regulating the practice of architecture.

As It Looks to a "Literary Feller"

If the idea of the gentleman who suggested that we all work an extra hour a day were put into effect there would be one working man in the country who couldn't do it without actually overworking. The world's greatest gluttons for work are the men who take the trains out on the roads. This is not pure and simple devotion to duty. The pleasant prospect of overtime has a little something to do with it. The official working day on the road is eight hours long. The reason that the trainman gets a salary bigger than that of some of our most industrious governors is because he usually sleeps only eight hours out of 24 and spends every waking hour in building up his pay envelope. With a fair share of overtime an engineer's monthly pay runs up from $250 to $400.

He literally clamors for the chance to work. And as he can't go to work until the caller calls him and as the caller sometimes calls somebody else, he does most of his clamoring in the caller's ears. Sleep, with the road man, is a grudging concession to nature and the Interstate Commerce Commission, both of whom agree that he must have at least eight hours off duty. If he has worked steadily for more than 16 hours he must have 10 hours to himself. Of course, it is his own business whether or not he spends it in sleeping. He usually does because he wants to be in shape for another 16 hours of work as soon as he wakes up. And woe to the caller who calls him an hour too early or an hour too late. By the former contingency he loses sleep and by the latter he loses money.—R. S. Tompkins, in the Baltimore Sun.

Cost of Marine and Shipyard Strikes

The United States Shipping Board estimates that since the first of January, strikes have cost the Shipping Board a total of $37,000,000. Marine and harbor strikes, longshore strikes and shipyard strikes have occurred on the Atlantic, Pacific and Gulf coasts. The estimate does not include results of the coal strike, or losses by foreign or privately operated American vessels; nor indirect losses to the public due to interruption of regular movement of shipping, congestion in ports, spoilage of perishable cargo, etc. The marine strikes in New York harbor tied up 600 boats (16,000 men) for 13 days. In a marine strike in July some 25,000 men were out for about three weeks. A longshoremen's strike in New York in October involved 40,000 to 50,000 men for about thirty days. A further longshore strike occurred at New Orleans in the same month, lasting thirty-one days.

Among the 200 strikes in the shipyards, one of the largest was that in the Northern Pacific district, beginning in January, lasting for fifty days and involving some 40,000 men. In the San Francisco Bay and Southern district in October 35,000 men were out thirty days. A strike in the shipyards in the New York district began in October, lasted about thirty days and involved some 20,000 men.

New Industrial Conference Meets in Washington

The new industrial conference called by President Wilson to make another attempt to work out a plan for improving the relations between employers and employees began its sessions at Washington Monday, December 1, and entered upon a policy of working in non-public sessions, without stenographic record. Secretary of Labor W. B. Wilson was chosen chairman; Herbert Hoover, temporary vice-chairman, and Stanley King, temporary secretary. All of the members invited by the President were present except George T. Slade, who was said to be in Europe.

Elimination of Grade Crossings in Chicago

The question of the elimination of grade crossings in the city of Chicago has again come into notice in figures presented by Cook County Coroner P. M. Hoffman. Coroner Hoffman estimates that $94,972,561 has been spent in Chicago to eliminate grade crossings of railroads during the 27 years this work has been in progress. Approximately 963 grade crossings have been eliminated; yet deaths from grade crossing accidents are again increasing. At the end of the first seven years of track elevation work, deaths resulting from accidents of this nature began to decrease, but in 1916 there was an increase of almost 50 per cent. Since this time there has been some reduction, but the total for each year has remained above the record prior to 1916. At the same time the total number of railroad deaths in Chicago has not fluctuated in the same proportion nor at the same periods. The following compilation, prepared by Coroner Hoffman, illustrates this point:

Year	At grade crossings	Total R. R. deaths	Year	At grade crossings	Total R. R. deaths
1918	79	318	1911	62	334
1917	71	355	1910	68	381
1916	91	335	1909	68	329
1915	65	239	1908	55	270
1914	65	282	1907	84	393
1913	59	360	1906	100	371
1912	52	326			

The city track elevation bureau has prepared statistics concerning the expenditures by various roads for track elevation in Cook County. From the time grade separation work began in Cook County to January 1, 1919, the following expenditures have been made by railroads entering this district, according to the city track elevation bureau:

Road	Expenditures
Atchison, Topeka & Santa Fe	$990,000
Baltimore & Ohio	1,578,284
Baltimore & Ohio Chicago Terminal	5,856,593
Central Terminal	1,913,345
Chicago, Burlington & Quincy	4,263,000
Chicago Junction, yards	1,710,000
Chicago, Milwaukee & St. Paul	10,025,000
Chicago, Rock Island & Pacific	5,466,000
Chicago & Alton	1,133,277
Illinois Western	101,000
Western Indiana Belt	14,596,372
Chicago & North Western	13,900,770
Grand Trunk	732,000
Illinois Central	6,131,050
Indiana Harbor	598,000
Illinois Northern	321,700
New York Central	7,001,500
New York, Chicago & St. Louis	1,428,707
Pan Handle	6,386,836
Fort Wayne	9,156,000
Wabash	267,937
Total	$93,557,561

Alderman G. M. Maypole, chairman of the City Council committee on track elevation, has directed the committee's engineer to make a survey of all railroad grade crossings in the city with the purpose of making further recommendations.

REVENUES AND EXPENSES OF RAILWAYS

NINE MONTHS OF CALENDAR YEAR, 1919

Name of road.	Average mileage operated during period.	Operating revenues: Freight.	Passenger.	Total (inc. misc.)	Operating expenses: Maintenance of Way and structures.	Maintenance of Equipment.	Traffic.	Transportation.	General.	Total.	Operating ratio.	Net from railway operation.	Railway tax accruals.	Operating income (or loss).	Increase (or decr.) comp. with last year.

Commission and Court News

Interstate Commerce Commission

Commission Requires Additional Traffic Statistics

The Interstate Commerce Commission has issued an order requiring class I and class II carriers, beginning with January 1, 1920, to compile freight traffic statistics monthly, and report them quarterly and annually to the commission showing the number of carloads, the number of tons of 2,000 pounds originating on respondent's line, and the number of tons received from connecting carriers of 69 commodities and l. c. l. merchandise.

As a special study covering waybills included in accounts for the month of April, 1920, but not thereafter until further order, carriers of class I are to compile and report additional data for the 15 following classes of commodities: Wheat, corn, cotton, fruits and vegetables, cattle and calves, hogs, fresh meats, bituminous coal, lumber, timber, box shooks, staves and headings, refined petroleum and its products, sugar, syrup, glucose and molasses, bar and sheet iron, structural iron and iron pipe, cement, automobiles and auto trucks, and fertilizers.

For each of the above classes, there shall be reported for the received tonnage only, except as otherwise provided below, the number of carloads, the number of tons (of 2,000 pounds), the total revenue, the state in which the point waybilled from is situated, and the state of the waybill destination. So far as practicable, the revenue reported by each carrier shall correspond to the state-to-state movement which it reports. On shipments to or from Canada, or Mexico, the revenue reported shall be only the proportion accruing to the respondents within the United States. The state waybilled from and the state waybilled to shall govern on rebilled traffic.

The data is to be compiled from the audited records covering local traffic including shipments rebilled at junctions with other than class I roads), and inbound interline traffic, including traffic moving to other than class I roads, to Canada, to Mexico, and to all other countries, when such traffic is waybilled to the junction points of delivery to other than class I or foreign carriers. When such traffic is waybilled through, class I carriers shall include in their reports traffic delivered on through billing to all other than class I roads. Interline accounts rendered by such carriers will be used to obtain the data. No adjustment of revenues or tonnage will be required on account of transit privileges at intermediate points.

Court News

Actions Against Government Owned Railroad Corporation

The Circuit Court of Appeals, Ninth Circuit, holds that the United States, by its purchase of the property, stock and bonds of the Alaska Northern, under authority of Act of Congress, March 12, 1914, became the owner, not only of the property, but of the corporation and is now its agent for governmental and public purposes; and without its consent the corporation cannot be sued in tort.—Ballaine v. Alaska Northern, 259 Fed. 183. Decided July 7, 1919.

Erroneous Quotation of Interstate Rates

The Arkansas Supreme Court holds, following I. C. v. H. E. Co., 226 U. S. 441, 33 Sup. Ct. 176, that an interstate carrier cannot be mulcted in damages by a shipper for failure to post its freight rates, as fixed by the Interstate Commerce Commission, in its station, or for misquoting the existing rate. The question arose in an action to recover undercharges on an interstate shipment of lumber, where the station agent, having received no notice of an advance in freight from 10½ cents to 13 cents, quoted the old rate to the shipper. Judgment was directed for the railroad.—St. Louis, I. M. & S. v. Wood (Ark.), 207 S. W. 32.

Federal Operation—Repair of Bridges

General Order No. 50 relates to actions at law, etc., and requires suits to be brought against the Director General of Railroads and not otherwise; and the rule shall not apply to proceedings for the recovery of fines, penalties or forfeitures. The rule has no application to a proceeding to compel the performance of a duty required by statute (in this case to repair a bridge over a railroad's tracks). The fact that the Director General has control or management of the affairs of a railroad company does not excuse the railroad from performing any duty owing to the state.—*In re* Morris Ave. Bridge in City of New York, Supreme Court, Special Term, 174 N. Y. Supp. 682.

Stop—Look—Listen Rule

In a crossing accident case the Arkansas Supreme Court, while recognizing that some courts hold that it is the duty of a traveler to stop and look and listen for the approach of a train, says: "We have not laid down the rule so strictly, but have uniformly held that a person who would pass over a railroad track at a crossing or elsewhere must do all that a man of ordinary care would do under similar circumstances to avoid any probable or possible danger from a passing train, and, if need be, stop as well as look and listen. Whether such care requires stopping as well as looking and listening depends upon whether, without it, the danger to be apprehended could be so well ascertained and avoided.—St. L.-S. F. v. Stewart (Ark.), 207 S. W. 440.

United States Supreme Court

Effect of Federal Control—Injuries to Passengers and to Freight

In an action against the Director of Railroads and the Missouri Pacific for an injury to a passenger, the railroad demurred (1) because the complaint did not sustain a sufficient cause of action against it, and (2) because the plaintiff had not a lien on the railroad for the damage alleged. The federal district court for the Western District of Arkansas sustained the demurrer, holding that under the acts of 1916 and 1918, and Presidential Proclamation of 1917, and in view of General Order No. 50, action cannot be maintained against a railroad company for injuries to a passenger resulting from negligence of its employees after the President had assumed control of the railroads, for the act of 1918 did not annul the previous presidential proclamation as to orders of the Director General, and the employees of the railroad being no longer subject to the orders of the railroad company, the maxim respondent superior (let the master answer) does not apply.—Mardis v. Hines, 258 Fed. 945. Decided July 17, 1919.

The federal district court for the District of Colorado holds that under the 1916 and 1918 acts a railroad cannot be made liable for injuries to shipments while the government has taken over the entire operation of the road, though section 10 of the 1918 act subjects the carrier to all laws and liabilities, whether arising under state or federal law, or at common law.—Hatcher v. Atchison, T. & S. F., 258 Fed. 952. Decided June 25, 1919.

The federal district court for the Northern District of Ohio holds that within the Federal Control Act March 21, 1918, section 10, subjecting carriers, while under federal control, to all liabilities as common carriers, except so far as may be inconsistent with the provisions of the act, and permitting actions to be brought and judgments rendered as now provided by law, it would be inconsistent with all the provisions of the act to subject a railroad company to liability for acts and conduct of public agents operating its property under federal control. [Citing Rutherford v. Union Pacific, 254 Fed. 880. The court did not agree with such holdings to the contrary as it had seen. It concluded: "It will not be assumed that the United States will terminate federal control and cover into the United States treasury the residue of the revolving fund and excess income, if any, without providing for debts and liabilities incurred during federal control."—Maubert v. B. & O., 259 Fed. 361. Decided September 3, 1919.

Foreign Railway News

Exports of Car Wheels and Axles in September

The exports of car wheels and axles in September reached a total value of $1,013,440 as compared with a total of $1,302,546 in August. Of the September exports, large shipments were made to Japan, France and British India. The detailed figures as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce are as follows:

Countries	Dollars
France	210,864
Italy	36,663
Canada	11,335
Honduras	1,562
Nicaragua	116
Panama	102
Mexico	4,594
Cuba	26,597
French West Indies	544
Dominican Republic	1,370
Brazil	36,897
Chile	32
Ecuador	3,981
British Guiana	426
Venezuela	41
China	1,003
Japanese China	55,167
British India	123,730
Dutch East Indies	79,761
Japan	409,106
Australia	7,292
Philippine Islands	2,221
British South Africa	36
Total	1,013,440

Exports of Locomotives in September

The exports of locomotives in September totaled 78, of a value of $2,326,339. This total was considerably larger than the totals for July and August, but not as great as in May or June. Of the September total of 78 locomotives, 15 were consigned to Cuba and 14 to Japanese China. The detailed figures as compiled by the Bureau of Foreign and Domestic Commerce are as follows:

Countries	Number.	Dollars.
France	2	75,550
Norway	3	60,450
Canada	5	37,674
Cuba	15	306,755
Argentina	3	94,600
Brazil	6	189,600
Ecuador	1	10,650
China	4	199,000
Japanese China	14	701,800
British India	4	44,160
Straits Settlements	6	170,700
Dutch East Indies	1	4,500
Japan	3	27,900
Russia in Asia	2	90,000
Philippine Islands	1	2,000
Portuguese Africa	8	311,000
Total	78	2,326,339

Avoiding Prussian Railways

The Inter-Allied schemes for the provision of international railway routes which shall so far as possible avoid German and Austrian territory, are causing alarm in commercial circles in Germany. Owing to the Orient express, for instance, which runs to Constantinople and Athens, being arranged to travel in future, via Venice, Trieste and Belgrade, thus avoiding Vienna and Budapest, which were formerly on the route, two celebrated connecting trains, the Hamburg-Berlin-Vienna and the Berlin-Oderberg-Budapest expresses, will find their occupation gone. Similarly, the famous "Nord Express," to Russia and the Far East, which before the war provided a very striking example of the extent to which international communications depended on Germany, will no longer run via Cologne and Berlin, which in turn affects two other connecting trains,, the Frankfort-Berlin and Hamburg-Berlin expresses. The German route to Copenhagen, formerly giving the quickest service to and from London, loses its monopoly of speed, while the route between Switzerland, Cologne and Frankfort has already given way to the Franco-Belgian route via Brussels and Strasbourg. German commercial fears at the result of this isolation in transport matters are shown demonstrated by the fact that one of the reasons for the establishment of the great industrial exhibition at Frankfort, which is to be held twice a year, is the hope of salvaging some of the international traffic. The main station at Frankfort, it should be added, is one of the largest, finest and costliest in the world, and most of the capital expenditure incurred in building it was undertaken because of the pre-war importance of the city as an international traffic centre.

Exports of Railway Track Material in September

The exports of spikes in September amounted to 4,298,046 lbs. valued at $179,197; of rails 58,424 tons valued at $3,403,771 and of switches, frogs, splice bars, etc., to the value of $473,753. Of the shipments of rails and switches, etc., Japan was the largest customer, while in the case of spikes, it was second. The figures in detail as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce, were as follows:

	Spikes		Steel Rails	Switches, frogs, Splice Bars, etc.	
Countries	Pounds	Dollars	Tons	Dollars	Dollars
Belgium	.....	.....	451	31,570	2,125

England's Railway Rates Advisory Committee

LONDON.

Sir Eric Geddes, Minister of Transport, has appointed F. Gore-Browne, K.C., nominated by the Lord Chancellor as chairman of the Railway Rates Advisory Committee; Lionel A. Martin, representative of trade, nominated by the Board of Trade; W. W. Berry, representative of agriculture, nominated by the Board of Trade; W. J. Davis, representative of labor, nominated by the Minister of Labor; W. A. Jepson, representative of transportation, nominated by the Minister of Transport; W. M. Acworth, additional member for question of immediate increase of rates, nominated by Minister of Transport.

This committee will ultimately have to advise the Minister of Transport on the question of a general revision of the bases of rates and charges on railways. The present classification of freight traffic and the statutory powers for its conveyance were based on conditions prevailing some 30 years ago. When the maximum rates were fixed in 1891 and 1892 the various commodities were divided into eight classes. Rates have been provided for the eight classes on a fairly uniform scale throughout the country, but not more than one-fourth of the total business is carried at those class rates, the remaining three-fourths being carried at what are known as "exceptional" rates, which are lower than the class rates, with the result that a most complex

system of varying rates has been built up. It is also pointed out that there is a great want of elasticity about the present system.

Exports of Freight and Passenger Cars in September

The exports of freight cars in September totaled 1,774, valued at $3,538,002, of which the larger portion were consigned to France. The exports of passenger cars totaled 12, all consigned for Mexico. The detailed figures as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce, are as follows:

Countries	Passenger Number	Passenger Dollars	Freight and Other Number	Freight and Other Dollars
France	..	.....	1,500	3,162,010
Norway	..	.....	30	66,375
Sweden	..	.....	20	43,600
Canada	..	.....	36	27,750
Mexico	12	81,975	4	2,862
Cuba	..	.....	11	10,050
Dominican Republic	..	.....	20	25,175
Peru	..	.....	10	4,180
China	..	.....	8	15,300
Hongkong	..	.....	4	10,200
Russia in Asia	..	.....	100	170,000
Philippine Islands	..	.....	1	500
Total	12	81,975	1,774	3,538,002

The Nationalization of French Railways

LONDON.

The Federation of Railwaymen and, with it, the whole of the socialist party, has risen against the tariff increase announced by the Finance Minister. Both socialists and syndicalists see in nationalization a remedy for the deficit.

One can certainly adduce argument in favor of the working of the railways by the state, says Agence Radio in the Journal des Transports, Paris, but to claim to have found in such a measure the means of solving the financial crisis which is affecting our system, is to set one's face against the most conspicuous facts.

The coefficient of railway working, that is to say, the ratio between the cash receipts and working expenditure only (financial charges, interest and capital redemption of shares and debentures not included) was as follows in 1918:

	Per cent		Per cent
Orleans	85	East	96
Midi	87	North	112
Paris, Lyons & Mediterranean.	90	State (et al.)	120

This means that the state railways exceed even the coefficient of the two railways which operate in the war zone and which were deeply affected by the war.

The only system which may be fairly compared with the State is that of Orleans, the composition, geographical position and traffic of which are almost similar. Now, during the last ten years, the coefficient of working of Orleans fluctuated between 52 per cent and 85 per cent, whereas that of the State varied between 68 per cent and 120 per cent.

The Orleans deficit reaches 241,000,000; if it had worked at the same price as the State, its immediate neighbor, its deficit would have reached over 1,200 millions.

These figures cannot be refuted and they are not, at all events. To represent nationalization, under those conditions, as a means of re-establishing the balance of exploitation without raising the tariffs, means, either to ignore the facts, or to deny the well-tried power of experience.

If it is wished that the State should be the future sole owner of all railway systems of general utility, and at the same time, however, leave the exploitation a certain elasticity, a certain independence, relieve it from the strict forms and rules of public administration, it might be possible to apply to the railways the system of "Régie intéressée (exploitation under the State's supervision) which has been well tried, particularly in connection with the municipal gas supply of Paris.

But one cannot repeat too often that this is a solution for the future, an administrative solution, which does not do away with the deficit incurred in the past and which does not ensure financial equilibrium for the future.

Only a little common sense will suffice to realize that no industry, whatever the system may be (concession, "régie intéressée," or direct management) cannot be compelled to work below the cost price.

Supply Trade News

Sidney Williams, who was for 15 years assistant director of purchases and assistant to the vice-president of the Union Pacific, until the change in organization was made by the United States Railroad Administration, is now vice-president of the United Products Company, exporters, at 66 Broadway, New York.

The Standard Asphalt & Refining Company, Chicago, has made arrangements with the **Insulite Products Company, Inc.,** Railway Exchange Building, Portland, Ore., to handle its products. The Insulite Products Company is a new company which has been organized recently under the management of **F. B. Gilman,** formerly of the F. B. Gilman & Co. Branch offices are to be opened in Spokane, Wash.; Tacoma, Seattle; San Francisco, Cal.; and Los Angeles.

Trade Publications

FORGING.—A series of pamphlets entitled National Forging Machine Talks is being distributed by the National Machinery Company, Tiffin, Ohio. No. 36 describes a method of forming the eyes on brake hangers.

LOCOMOTIVE REPAIR SHOP DESIGN.—The Austin Company, Cleveland, Ohio, has issued an attractive pamphlet containing a reprint of an article published in the August 8, 1919, issue of the *Railway Age*, under the title "The Design of Locomotive Repair Shops," by Gustave E. Lemmerich.

SHOP ACCESSORIES.—Armstrong Brothers Tool Company, Chicago, has recently issued its general catalogue B-17, covering the complete line of tool holders, ratchet drills, lathe dogs, clamps and wrenches which this company manufactures. Among the new products listed are special tool holders for use with Stellite cutters and a safety pulley hanger for mounting split pulleys.

MILLIKEN BUILDINGS.—The Milliken Brothers Manufacturing Company, Inc., New York, has issued catalogue No. 10, illustrating and describing Milliken buildings and steel specialties, including transmission towers, radio towers and pinlock poles. This booklet is supplemented by catalogue No. 11, an erection handbook which is designed as a guide for the erection of buildings.

TWIST DRILLS.—The manufacture of Celfor drills is described in an interesting manner in a booklet, entitled "Putting Mettle Into Metal," issued by the Clark Equipment Company, Buchanan, Mich. The successive operations in the making and testing of drills are illustrated and described. A portion of the book contains views of the company's plant, together with the hospital and recreational facilities provided for the employees.

BLAW FORMS FOR LIGHT WALLS AND FOUNDATIONS.—A 28-page pamphlet, recently issued by the Blaw-Knox Company, Pittsburgh, Pa., as Bulletin No. 203, is devoted to the advantages of this type of form. It is well illustrated, showing to some extent the variety of work for which these forms are adapted, while considerable space is given to describing in detail the method of assembling and applying them to different types of construction.

ERIE SHOVELS.—The Ball Engine Company, Erie, Pa., has issued Bulletin S-36, a large six-page folder, with 12 illustrations, devoted to the use of Erie shovels in handling rock. The illustrations show actual conditions under which these shovels have worked and the classes of material handled. Data on the amount moved, time and cost, etc., are furnished through the medium of letters from owners who are using the Erie shovel in rock work.

TYPICAL GRAPHIC RECORDS.—The Esterline Company, Indianapolis, Ind., has issued a 24-page pamphlet containing a large number of typical charts produced by automatic recording instruments. While intended primarily to illustrate the character of work accomplished by these instruments, many interesting facts

concerning power input and output and load variation, with different classes of industrial equipment, are demonstrated by the charts.

Steel Castings.—Harrison Steel Castings is the title of a profusely illustrated book issued by the Harrison Steel Castings Company and the National Car Coupler Company, Chicago. After a brief account of the origin of steel castings, data concerning the company's plant is given and the successive steps in the manufacture of a steel casting are illustrated and described. The book forms a very interesting non-technical treatise on the manufacture of steel castings.

Blaw Forms for Buildings.—The Blaw-Knox Company, Pittsburgh, Pa., has recently acquired the patents, personnel and equipment of the Uniform Company of Boston and has taken up the manufacture and sale of forms for reinforced concrete building construction developed by the Uniform company. The nature of these forms, and their application to various purposes, is described and illustrated in a 40-page catalogue recently issued by the Blaw-Knox Company.

Malleable Iron.—The American Malleable Castings Association, Cleveland, O., has prepared a short treatise on malleable iron, explaining its structure, uses and treatment, and indicating a few of the principles on which the process of making malleable iron castings is based, as well as some of the results that have been attained. The booklet is illustrated with a number of photographs showing results of various kinds of tests to determine the strength of the material.

Centrifugal Pump Sales Service Data.—A large amount of information on the theory, design and testing of centrifugal pumps, originally sent out in the form of sales letters to its own men, has been compiled by the Goulds Manufacturing Company, Seneca, N. Y., into Bulletin No. 122. There are 18 chapters dealing with methods of use, characteristics, effects of changes, performances, proper installation and operation, etc., with illustrations and a considerable number of data curves.

Standard Locomotives.—The Locomotive Superheater Company, New York, has compiled and published in Bulletin No. 7, general arrangement drawings and details of construction, together with a photograph and general data for each of the 12 types of standard locomotives designed by the United States Railroad Administration. Wheel loading and clearance diagrams for each are also given, making it a convenient reference book for information pertaining to the stadard locomotives.

Cutters.—The Cleveland Milling Machine Company, Cleveland, Ohio, has revised its list of cutters in Catalogue B. This catalogue contains 140 pages, giving standard sizes and prices, and illustrating the line of tools, such as cutters, end mills, collets, hobs, etc., made by this company. Many valuable tables are contained in the catalogue, including tables of cutting speeds, correspondinb diametral and circular pitches, decimal and millimeter equivalents, drill size decimal equivalents, screw threads and spur gear tooth spacing and thickness.

Industrial Management.—L. V. Estes, Incorporated, industrial engineers, Chicago, have published a small booklet entitled Human Relations in Industry, for the purpose of pointing out the underlying principles of personal relations and industrial management that are essential to industrial harmony and maximum production. It contains a statement showing the trend of present conditions and the need for definite action by employers, and outlines in a general way the procedure necessary for putting in effect plans tending toward a betterment of human relations in industry.

Air Hoists and Elevators.—Catalogue No. 149, issued by the Whiting Foundry Equipment Company, Harvey, Ill., is devoted to the description of pneumatic and hydro-pneumatic hoisting equipment. The air hoists include both the vertical and horizontal type, these designs being made in two different styles, the one for ordinary service, the other for use where delicate control is necessary. The accessories described include special valves to stop the hoists at any point on the upward stroke or to maintain the load at any desired height, and also trolleys for use where unusually long hose is required. The compressed air elevators are intended for one-story lifts only and have capacities up to 6,000 lb.

Financial and Construction

Railway Financial News

Boston & Maine.—At an adjourned meeting of stockholders on December 3 the following directors were elected: Norman L. Bassett, Augusta, Me.; Richard Billings, Woodstock, Vt.; Charles W. Bosworth, Springfield, Mass.; Frank P. Carpenter, Manchester, N. H.; Charles Sumner Cook, Portland, Me.; Henry B. Day, Newton, Mass.; James L. Doherty, Springfield, Mass.; Charles P. Hall, Newton, Mass.; Woodward Hudson, Concord, Mass.; Benjamin A. Kimball, Concord, N. H.; George von L. Meyer, Hamilton, Mass.; Walter M. Parker, Manchester, N. H.; Jarvis P. O'Brien, Troy, N. Y.; J. Duncan Upham, Claremont, N. H.; George R. Wallace, Fitchburg, Mass.; Henry E. Warner, Lincoln, Mass.

The new members represent the new first preferred stock given to the leased lines and the old preferred stock.

Samuel Carr, F. C. Dumane and J. M. Prendergast, who have served on the board of many years, desired to be relieved from further service. It is expected that James H. Hustis will resume his position as president as soon as he can settle the matters of the receivership.

Lehigh Valley.—This company has declared the regular quarterly dividend of 1¾ per cent on the common stock, payable to stockholders of record December 13 on or soon after January 3 as the company receives from the government an adequate payment of the rental now due. The regular quarterly dividend of 2½ per cent on the preferred stock was also declared, payable January 3 to stockholders of record December 13. This is same rate as declared on the common stock three and six months ago.

Wichita & Northwestern.—This road has applied to the Kansas Public Utilities Commission for permission to issue $9,000,000 in securities for the purchase of railroad property and for railroad construction. According to the statement filed with the commission, the roads intend to take over the Anthony & Northern, purchase the Iuka branch of the Missouri Pacific and construct a line from Wichita, Kans., to Olcott.

Railway Construction

Atchison, Topeka & Santa Fe.—This road will construct a one-story, steel frame, car repair shop, 50 ft. by 128 ft., at Chicago. The cost is estimated at approximately $10,000.

Chicago Union Station Company.—A contract for the erection of the Harrison street viaduct has been given to the Kelly-Atkinson Construction Company, Chicago, at a figure of $206,000.

Eastland, Wichita Falls & Gulf.—The company has 15 miles of road graded ready for ties and rails, from Mangum, Texas, on the Central branch of the Missouri, Kansas & Texas, through Eastland, to the Eastland and Stephens county line north. Contracts have been let for grading an additional nine miles to Wayland in Stephens county. It is expected that all the track will be laid and the line opened for operation by April, 1920. O. B. Colquit, president, Dallas, Texas.

The Cost of the Great War was $337,946,179,657, according to an estimate made by Ernest L. Bogart, professor of economics at the University of Illinois.

Passenger Traffic in July.—The number of passengers carried one mile in July was 4,535,725,858, an increase of 12.4 per cent over July, 1918, according to the monthly report of the Operating Statistics Section. In the Northwestern region the increase was 23.8 per cent, while in the Ohio-Indiana district and the Southern region there were decreases. For the seven months ending July 31 the number of passengers carried one mile was 25,856,907, an increase of 5.9 per cent.

More Funds for the Universities

Universities, colleges, technical schools and other institutions of learning largely dependent on the more or less fixed returns from investments, are feeling seriously the effects of advancing costs of operation and many of them are making appeals to the public to avoid the only other alternate—curtailed scope. These appeals should meet with a generous response. The railroads and industries in general are to a large extent dependent upon the technical schools. It is to the technically trained men that business must look for the perfecting of mechanical devices, scientific investigations, etc. Any loss of efficiency in the schools must surely be followed by a corresponding let down in the efficiency of the various organizations dependent for advancement on the work of the technically trained men in their employ. For these reasons the appeals must not fall on deaf ears. The railroads in particular cannot, from a purely selfish viewpoint, view these calls with indifference. Taken collectively they, perhaps, employ more technically trained men than any other single industry. The engineering, the mechanical, and the electrical departments of the roads must necessarily look to the technical schools as the source of supply in recruiting forces. To these departments the recruiting of high grade technical men is as necessary as securing an adequate appropriation.

Greatest Danger to Private Management

Many of those prominently connected with commerce and industry wish to see propaganda against the Plumb plan carried on with energy as they believe that the agitation for it is a menace, first, to private ownership of railroads, and, second, to private ownership of property of all kinds. But the real danger at present to private ownership and management of railroads is not the Plumb plan. It stands no chance of early adoption, and probably no real chance of adoption at any time. The greatest danger to private ownership and management of railroads comes from those who profess to be, and who really are, in favor of that policy, but who are unwilling to support the demand for the kind of legislation and regulation which are indispensable to the success of private management. Ten years ago Judge C. A. Prouty said, in an address at Yale University: "If we are ever brought face to face with the proposition of government ownership it will not be by the imposition of excessive charges, for we can deal with that situation, but by the impossibility of obtaining adequate facilities. * * * If we are to look in the future as in the past to private capital for the providing of our railroad transportation, it is fundamentally necessary that confidence in the fair treatment of that capital shall be established." The only way in which confidence in the fair treatment of private capital invested in railroads can be established is by Congress in its law-making capacity, and the regulating bodies in their administrative capacity, providing for the railways to be allowed and enabled to earn a return sufficient to enable them to pay approximately the same return upon capital which is paid by other large and equally well managed concerns. A large part of those who say they favor, and really do favor, private management are today either opposing legislation to require that the railways shall be allowed to earn sufficient to enable them adequately to develop their facilities or are giving such legislation either lukewarm or no support. It is high time that those who believe private management will be best for the commerce, the industry, and the people of the United States should clarify their minds upon this subject and begin vigorously to promote action in accordance with their professed principles.

Technical, But Not Too Technical

Discussions of the railroad question such as that at the recent meeting of the Academy of Political Science in New York, are of great value in promoting thought among the general public about the great economic problems involved. It is always a question, however, as to how far it is possible to expect such a discussion to throw new light on a tremendously complicated and technical matter. Men of all shades of opinion participated in the discussion, but for this very reason they did not talk the same language. A man like John E. Oldham, the Boston banker, who has made a life-long study of the railroad problem, would have had to spend days, not hours, in giving his audience a preliminary knowledge of the facts involved, were he to have discussed the subject in the full possibilities of his own technical knowledge. On the other hand, most men called on to discuss such a question before a general audience, feel that a certain amount of old ground must be gone over as a foundation for what new suggestions they have to make. But the going over of old ground in a non-technical way is not without its value, especially to the speaker himself. Trying to put into non-technical words, what he knows and thinks about the situation, tends to clarify the mind of a man, no matter how thoroughly familiar he is with his subject. To have a proposition stated, a fact made concrete, by way of illustration, is a contribution to the solving of a complicated problem. Even if, therefore, no startlingly new suggestions were made at the meeting of the Academy of Political Science, the re-statement in non-technical terms of various phases of the railroad question was of real value.

Signal Lines Crossing Over Railways

Within a few weeks the Bureau of Standards, Washington, D. C., expects to adopt and publish revised rules and regulations of at least a portion of its "National Electrical Code." Of particular interest to the railroads is that portion of the code which relates to signal lines crossing over railways. The term "signal lines" here referred to should not be confused with the facilities applied to railway signal department appliances, but should be considered as that general class of wire lines operating below a certain stated voltage used mainly for some form of communication.

The crossing of wire lines over the tracks of railways has always been a matter of considerable importance and in the past it has been somewhat of a task to get some of the wire owning companies to install crossings provided with ample

strength to withstand the force of the elements and in many cases proper clearances have not been adhered to. As a result, troubles of various kinds have developed, some of which have been of a very serious nature, even to the extent of causing loss of life. Railway despatching and message lines as well as automatic block and other similar signal circuits have been interfered with because crossing wires have dropped, causing dangerous crosses bteween wires. Many cases could be cited to show how important it is for the railroads to insist that wire crossings should have ample strength.

It is not the intention to imply that great progress has not been made in the development of satisfactory wire crossings. The old rule of thumb methods have practically been abandoned for those based strictly on engineering principles. For instance, in 1913 at the annual convention of the Association of Railway Telegraph Superintendents, now the Telegraph and Telephone Division of the American Railroad Association, a specification covering the type of construction for signal line crossings over railways was accepted. This specification was the work of a joint committee on which the Bureau of Standards was represented, and was based largely on engineering principles. Later the American Railway Association adopted it and a large number of roads and wire owning companies accepted it as standard practice. Now the Bureau of Standards is prepared to issue a revised set of rules and regulations, which it believes are superior to its former code and it is quite certain the railroads will welcome the progress which has been made from the standpoint of safety alone.

However, the Telegraph and Telephone division, which held a special three-day session in Chicago on December 3 to 5 inclusive, feels that in some instances the revised code, insofar as signal line crossings are concerned, does not meet exactly with its views; particularly in the case of such wire crossings over spur tracks. For instance, the revised code states that a grade of construction, known as "grade E" and which is equivalent to two-thirds the strength of the type known as "grade D" used for crossings over main lines, shall be used for signal lines crossing over spurs not exceeding two tracks in the same span. It is a well-known fact that there are any number of such spurs, some of which are of considerable length, that are as important as main line tracks which require "grade D" construction.

The revised code also states that signal lines crossing over branch tracks, on which no regular schedule of operation is maintained, shall conform to "grade E" construction. There are also any number of branch lines that may be so classified; but they are considered just as important as main line track which requires "grade D" construction.

The matter of spur and branch tracks here mentioned, which are classed by some as minor tracks but which in reality are important tracks, should receive a great deal of consideration on the part of those who must pass upon the class or grade of construction to be adopted for signal line crossings. The most important factor involved and the one which should receive the greatest consideration, is the hazard to life. A very large part of the deaths and injuries of railroad employees engaged in transportation occur upon these so-called minor tracks. Because of the particular class of these tracks and because their use is for a certain service, employees are obliged to ride upon car sides, ladders and roofs much more frequently and under more hazardous circumstances than those engaged in work upon ordinary yard and main tracks. It would seem advisable, therefore, that extra care should be taken to avoid scant lateral and vertical clearances between electrical conductors, their supports and standard freight cars; and to provide ample strength in the conductors, their attachments and supports at crossings over such tracks.

The Only Way to Make Private Management a Success

THE REASONS WHY it is essential that the Government should provide a system of regulation which will enable the railway companies to raise sufficient new capital have been stated in various forms on many occasions, but they never were better and more concisely stated than by Judge C. A. Prouty, Director of Valuation of the Interstate Commerce Commission and also Director of Accounting of the Railroad Administration. Judge Prouty's summing up of the situation was made in the following words:

"The government might have built and operated its own railways, but instead of doing so it has invited private capital to discharge for it this public function, upon the assurance that such capital shall be allowed to exact a fair compensation for the service. Nothing can be more unjust than to deny to this capital that right.

"Not only does a sense of justice require this; self interest also dictates it. The railroads of this country must, in the immediate future, be very largely extended and improved; additional facilities must be provided to meet the increased demands which will be made. This will require the outlay of vast sums of capital; and this capital must come mainly, not from the earnings of the railroads, from the investing public. We can provide by legislation the sort of cars which a railroad shall use and the rates which it shall impose; we cannot by legislation force one single dollar of private capital into railroad investment against its will.

"Capital will seek investment in this field for exactly the same reason that it will in any other; namely, upon the expectation of making a profit out of the investment. It is not necessary that the return should be large; but it is necessary that it should be certain; that the people who put their money into this form of investment shall feel confident of fair and honest treatment.

"A want of adequate railway facilities would mean industrial paralysis. Unless they are provided when needed, the government will find itself confronted with a demand from all sources—from the merchant, the manufacturer, the farmer—which will force it to meet in some way the necessities of the occasion; and this can only be by either furnishing the capital or providing the railroad itself. If we are ever brought face to face with the proposition of government ownership, it will not be by the imposition of excessive charges, for we can deal with that situation, but by the impossibility of obtaining adequate facilities. The possibility of such an emergency is by no means fanciful. We were upon the brink of it in the fall of 1906, and the winter of 1907, when crops were rotting upon the ground because they could not be carried to market and when people were freezing because coal could not be transported to keep them warm.

"This phase of the matter is too little considered. If this government hopes to continue its present system; if we are to look in the future as in the past to private capital for the providing of our railroad transportation, it is fundamentally necessary that confidence in the fair treatment of that capital shall be established."

The reader who is familiar with existing conditions and with the legislative proposals pending in Congress might very naturaly assume that this statement of fundamental facts and principles was made by Judge Prouty with special reference to the situation which exists at the present time. On the contrary, the paragraphs quoted are from a lecture delivered by him before the senior class of the Sheffield Scientific School of Yale University in 1909, over ten years ago.

The railroad situation was very unsatisfactory at that time, but it was almost perfect compared with that which exists now. The shortage of facilities which existed then was complete adequacy compared with the inadequacy which exists at present. The ratio of total earnings to operating expenses was then small compared with what it is now. The net operating income in relation to the investment on which a

return had to be paid was large compared with what it is now. The rate which had to be paid by the railroads for new capital was comparatively small and railroad credit relatively excellent compared with what they are now.

If it was desirable that the public and the Government should ten years ago heed the statement of principles which Judge Prouty then made and the implied warning which he then gave, how much more important it is that they should heed his warning and act on the principles ennunciated by him at the present time.

Do Not Abandon Any Good Methods

One of the dangers in the transition of the railways from federal to private control is that they may discard some beneficial practices which have been adopted during unified operation by the government, in the general desire of railway officers to free themselves from the numerous unsatisfactory measures which have come into vogue during the last two years. This danger arises primarily from the fact that many men have become so exasperated at the restrictions of one kind or another that have been imposed upon them that they are disposed to be hostile to every measure that has originated under federal control, good or bad. As a matter of fact, unified control has afforded an opportunity for the introduction of many measures long advocated by railway officers, but impossible of attainment under the former law-enforced competitive private operation. To destroy these measures now would only result in permanent loss to the road and in many instances to shippers.

A prominent example of a good measure now in imminent danger of being discarded is the new tie specifications. The Railroad Administration took over the purchase of ties early in 1918. Late in the same year standard specifications were put into effect and uniform inspection inaugurated. These specifications have now been in force on all roads under federal control for over a year, and are therefore generally known. While opposed in some quarters they have been approved by a large majority of the tie producers and railway men as well, yet at a meeting called by the American Railroad Association the Track Committee of the Engineering Section of that organization recommended that the specifications of the Railroad Administration be superseded by those of the American Railway Engineering Association.

The Tie Committee of the American Railroad Association also considered this matter at a two-day session the first week in December. The specifications of the Railroad Administration are not perfect; their most ardent advocate will admit that certain defects have been shown to exist. Yet the fact remains that they are in use today on almost the entire mileage of the country, and their requirements are known alike to producer and purchaser.

The hostility to them really does not arise from the specifications themselves, but from other measures of the Railroad Administration in buying ties under them. That the centralization of the purchase of ties has not proved satisfactory to the producer or railway men is well known; few activities have aroused greater hostility, yet most of the measures giving rise to the opposition by the producers originated prior to the preparation of the specifications. Indeed, much of the opposition which exists to the specifications themselves can be attributed to the hostile frame of mind engendered by these earlier acts.

The uniform specifications have much of good in them. The roads should not permit them to be discarded because of hostility to ill-advised measures. Every method which has been adopted under government control should be considered on its individual merits and should be accepted or rejected as such without reference to other measures.

Letters to the Editor

Automatic Stops and Signals

To the Editor:

The letter describing a certain train control system published in your issue of September 26 on page 620 contains the following statement: "That trains have been stopped (automatically) when the following dangerous conditions prevailed—open switches—block occupied by train—cars fouling the main track—broken rails (on three occasions)." Anyone well informed on automatic steps and railway signaling is well aware that just such results would be obtained by the use of any one of a number of train control systems.

While the writer is in favor of automatic stops and feels sure that their use will prevent a number of a certain class of accidents, is it not a fact that the automatic stop is but an adjunct to the present signal system and its real or primary function is to enforce obedience to proper signal indications as controlled by standard track circuits?

Technical railroad men and other railroad officers who are familiar with the operation of automatic signals clearly understand that properly placed signals would have given stop indications for the above mentioned conditions and that the function of the automatic stop is to correct the engine man should he for any reason be unable to see or fail to obey such signal indications. A. T. C.

Supervision Versus Efficiency

To the Editor:

I note in the article on page 675 on "The Shop Craft Agreement" in your delayed issue of October 3, that you state "One great weakness of American railroads is the lack of adequate supervision."

I could more readily agree with this statement had the word "adequate" read "efficient," as I believe there are few of the larger roads which have not already an adequate corps of supervisors—in fact most of the local officers on those lines will, I think, readily concede that there generally is a superfluity in the number of supervising officers. In my opinion if the present officers could be required to exercise the efficiency for which they are paid, less rather than more supervision would better meet the needs.

I travel almost constantly on the railroad which employs me and I am assigned to do general efficiency work—to be the eyes, so to speak, of the chief operating officer and to remedy locally, when practicable, anything I observe which is not efficient or up to standard. In this capacity I am constantly finding items which the local and other officers concerned should and would discover themsevles were they doing their work with the efficiency that should naturally be expected of them. The laxness of supervision on railroads generally is inexcusably appalling. A man who draws a salary for supervising and fails to do so is, in a sense, obtaining money under false pretenses; if his failure is due to his ignorance he has no right to be a supervisor—and in either event should be removed.

One superintendent said to me not long ago that most of his time was taken up with the various specializers sent out from the general office—each having a list of items pertaining to their department which were not up to standard on his division. I asked him whether he and his subordinate officers concerned were familiar with the standard require-

ments and if so why they did not see they were observed and thereby make these specializers useless. He said these men look only for the things upon which they are specializing and having trained their minds on those particular features could see what the others could not. I know from my own experience this is a gross exaggeration and a mere excuse to cover inefficiency. Their superior officers, having as a rule risen through their superintendent's experience, take much the same viewpoint, and in consequence this lack of efficiency not only is allowed to exist but, being unchecked, is growing with impunity.

As the attitude of the chiefs is reflected all the way down to the ranks, the tendency of officers and foremen is to become complacent, self-satisfied individuals, imperturbed appendages and expensive adjuncts. An Observer.

Inadequate Compensation for Supervision

To the Editor:

The writer was very much interested in an editorial printed in one of the recent delayed copies of the *Age*. It referred to the compensation of railroad supervision.

By way of illustration, I should like to cite the predicament of the shop superintendent on a certain trunk line railroad:

We have about 500 employes, doing a general line of repair work consisting of about everything from wheel-barrows to business cars. Our output monthly consists of about 900 classified, repaired freight cars and an average of about 40 passenger cars. We also do a considerable amount of work for the maintenance of way department, and manufacture forgings, etc., for other smaller shops along the line.

The monthly compensation for the shop superintendent will average a little less than that earned by members of the wreck crew. Is it possible, under this arrangement of compensation, that the management can expect one to put forth his best efforts, especially with the order in effect that supervision may not be engaged by another road under federal control without first getting permission from the Railroad Administration?

Shop Superintendent.

The Train Despatcher and His Opportunities

Council Bluffs, Iowa.

To the Editor:

The probable near approach of normal life in the railroad world—superseding petrified existence as governed from Washington—prompts me to put in a word once more in behalf of the despatcher.

At first thought one might draw the conclusion that a despatcher fills a secluded position; but as a matter of fact the position has to do with one of the broadest fields of railroad work, and it depends on the individuality of the despatcher himself as to what benefit he shall derive from the opportunities offered by his position.

Being assigned to regular hours with a certain routine, he may easily allow himself to do his work in a mechanical way. Too many despatchers labor under the impression that their only duty consists of making provision for the meeting and passing of trains, leaving the other details to the chief despatcher; but the more attention given by the despatcher to the smaller details the better will be his efficiency, and only by efficiency can he prepare himself for more responsible positions.

The despatcher on duty has a better knowledge of general conditions than any other person on the division. He is in position to furnish first-hand information that even the superintendent could not furnish. To display the proper spirit and care in giving information to all concerned, from superintendent to section foreman, is one of the chief opportunities of a train despatcher to gain favor with these men. This is a plain duty to himself.

His duty to familiarize himself with the physical characteristics of his territory offers him a grand opportunity. He should know not only the location of tracks, switches, grades and bridges, but also the location of the principal industries and the things that they require. He can become personally acquainted with the owners of the different industries, thereby broadening and cultivating his own personality. By personal contact with these men he is better qualified to serve his company in its intercourse with them. Some may claim that these are matters to be handled by the superintendent and train masters. True, but the despatcher can do these things in an unobtrusive manner, keeping in mind that he is only a despatcher.

Again, the despatcher should make it a point to become personally acquainted with the yardmasters and assistants at the terminals. Everyone knows that better results are obtained by personal interviews than through any other medium. Such acquaintance will often change the tone of all subsequent correspondence.

In his frequent trips over the road the despatcher should do his very best to become better acquainted with the train and enginemen; learn their dispositions, character and manner of doing their work. Get on the engine and have the enginemen show you the different parts of the machinery; then when an engine failure occurs you have a nearer conception of the trouble. When failures occur which the despatcher does not understand let him keep it in mind and at the first opportunity have some engineman explain it. Enginemen will be glad to do this.

When the trainmen learn that the despatcher possesses clear knowledge of how things are being conducted on the road they have greater confidence in him. Compliment the man on the road as often as possible for good work performed.

The foregoing may be what the newspaper man calls "tame stuff," but commonplaces make up the most of life. The despatcher can increase his efficiency, make his position more secure and live happier by making use of diplomacy and tact and not following a beaten path. We all aspire to better positions. Let us study some of the requirements that are felt by the man higher up. The despatcher, in the discharge of his duty, often has to assume the authority of officers, from the rank of superintendent down. Why, therefore, should he not inject some of their ingenuity into his work?

We cannot succeed by theory alone, but must carry theory into practical execution. Let us try it.

Keep wide awake all the time! Don't let any eight-hour limitation dwarf your interest in your employer's prosperity. Keep your mind on good railroading sixteen hours a day. Is this too much? Well, try it for three days in the week and see how it works. H. S. M.

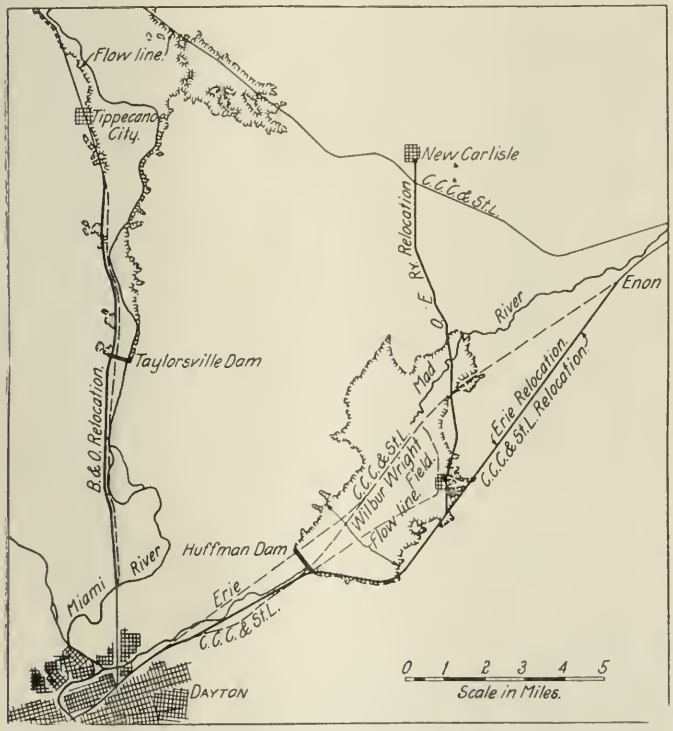
Every westbound train is filled with passengers who admit that they are emigrating to a warmer climate to avoid the inconveniences of cold weather and little coal. It has been a common remark among passenger traffic officers on western roads leading to southern California and other regions of balmy atmosphere, during the past few weeks. Sleeping car berths have been engaged many days in advance, and for weeks every transcontinental train had to have a second section. The traffic originates in the east and north partly, but they say that Iowa and Nebraska have been furnishing more California tourists than any other section.

The Miami Conservancy Relocates Four Railways

Fifty-five Miles of New Track Constructed to Replace Lines Lying Within Flood Basin

It is not often that a railroad is built by the public for a public utility corporation, but this is what actually is taking place near Dayton, Ohio, where the Miami Conservancy District is now completing about 55 miles of track or 40 miles of roadbed at its own expense for the Cleveland, Cincinnati, Chicago & St. Louis, the Erie, the Baltimore & Ohio, and the Ohio Electric. The work is under the joint supervision of engineers representing the Conservancy project and the railroads, the former covering matters contingent upon the District's interest in the cost and the latter with respect to the completion of the work to standards acceptable to the railroads.

This work is a necessary detail of the flood prevention project undertaken by the Miami Conservancy District in the valleys of the Miami and Mad rivers above Dayton. A



Map Showing How the Two Retardation Basins Interfered with the Railroads

great dam is being built at Taylorsville, on the Miami river, and another at Huffman, on the Mad river, to hold back flood waters in great retarding basins behind these dams. Discharge spillways are provided which will release the water in quantities readily handled by the river channels through the lower valleys where much damage was done by the flood of 1913. All land located within the flood limits of the reservoir is, of course, subject to potential inundation, and for this reason has been vacated through purchase by the District. Included in the property thus condemned are the lines of the four railroads mentioned, which must be relocated outside of the flood limits. This work has involved not only the reconstruction of new lines to replace those stretches of track lying within the reservoir areas, but also entails considerable mileages both up and down stream which were required to secure satisfactory approach grades to the higher elevation of the lines to avoid high water.

The expense of the relocations is borne entirely by the Conservancy district and will amount to about $4,000,000, although the railroads, like all other owners of property within the Conservancy district, are assessed "benefits" for the advantages assumed to accrue through decrease of flood hazards. Agreements with the railroads also cover adjustments for the relative values of the new and old lines, from

Steam Shovel at Work in the Huffman Cut

an operating standpoint. Thus, while ruling grades were not changed, it was impossible to provide new lines which were not either longer or shorter than the old ones or which did not contain either a greater or a less amount of curvature. For instance, in the case of the relocation of the Big Four and the Erie, the railroads are entitled to $400,000 extra compensation for 4,000 ft. of increased length and 100 deg. additional curvature. In the case of the Baltimore & Ohio line the case is the reverse, and the railroad will compensate the District for providing a better line than

Double Levees to Protect the Railways

its old one. Recognition has also been given to the increased cost of maintenance in the early years of operating a newly constructed line, and allowance is made to the roads covering such cost during the first six years of use.

The lines affected are the Cincinnati, Hamilton & Dayton line of the Baltimore & Ohio north of Dayton in the valley of the Miami river, and the Cincinnati line of the Erie, the Cleveland-Cincinnati line of the Big Four between

Dayton and Springfield and the Ohio Electric, which occupy the flood plain of the Mad river.

As seen on the map, the old Erie and Big Four lines were located side by side most of the distance from Springfield to Dayton in a location close to the Mad river. Near the middle of the Wilbur Wright Field the two lines separated, the Erie occupying the north side and the Big Four the south side of the stream until a point close to Dayton, where the Erie again joined the Big Four on the south side. The relocation of these roads commences about two miles east of Dayton and extends for a distance of 15.2 miles. These two roads have been operating their single-track lines as joint double track for a number of years and will continue to do so after the relocation has been completed. The old lines of the Ohio Electric lay parallel to the Big Four for a distance of about five miles out of Dayton, and occupied an independent location for the remaining distance.

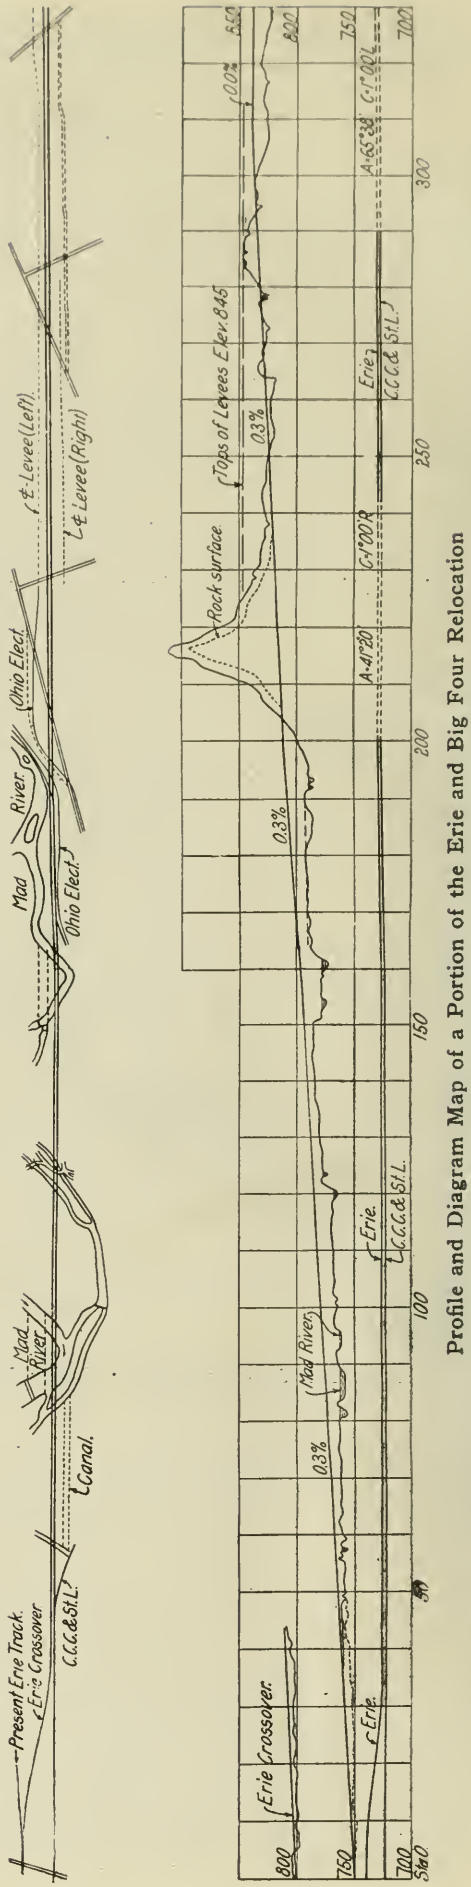
The critical point in the relocation project is the dam site at Huffman, where the required position of the great dam and spillway made it necessary to place the new lines about 400 ft. south of the existing track of the Big Four. This involved two difficulties, the presence of a massive shoulder of rock rising abruptly from the south abutment of the dam and the requirement of a 0.3 per cent approach grade for the railroads from the west. Because of definite restrictions on the location of the foot of this grade within the city of Dayton it was possible to raise the line at the dam site only about 31 ft. above the old grade line and 10 ft. below the crest elevation of the dam, with the result that a rock cut 4800 ft. long and 119 ft. deep (on the upper side) was required. This entailed the excavation of 683,000 cu. yd. of material, most of which was rock. Because of this restriction on the elevation of the grade line a further com-

Twin Three-Arch Bridges for the Big Four and the Erie

plication was encountered at the east end of the cut where the line enters the south fringe of the flood area at an elevation below the maximum flood level. As a consequence, it was necessary to protect the tracks on both sides for a distance of 3500 ft. by the construction of levees to a maximum height of 35 ft. These were located 200 ft. center to center and have the effect of placing the line in an artificial cut.

For drainage of the highlands to the south of the track, culverts were built under the tracks and levees which will serve also to equalize water levels on both sides of the levees during flood periods. These levees are continued to a point where the 0.3 per cent grade ascending eastward raises the line above the flood water level. For the remaining distance the location was determined by requirements of suitable connections with the existing lines. This was accomplished with the use of an 8-mile tangent.

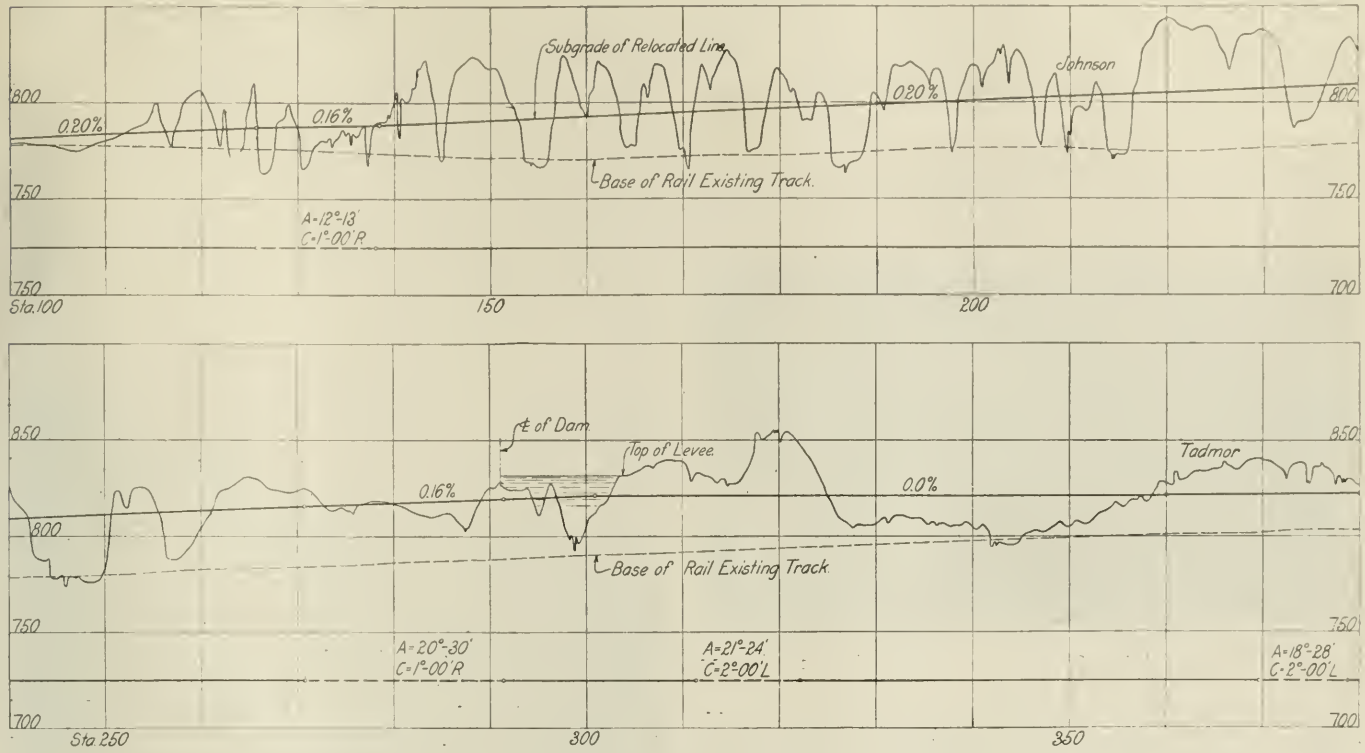
No change was required in the location of the Ohio Electric between Dayton and a point a short distance west of the Huffman cut. After passing underneath the new embankment of the Erie and the Big Four through a skew under-



Profile and Diagram Map of a Portion of the Erie and Big Four Relocation

crossing accommodating both the electric line and the Springfield pike, both the electric road and the highway occupy a shelf in the face of the hill outside of the big railroad cut, while to the east of this the Ohio Electric will be placed in the top of the inner levee protecting the railroad tracks.

The west approach of the railroad relocation is on a tangent approximately midway between the two old locations of the Big Four and the Erie, throwing a considerable portion of it into the Mad river flats. This entailed an extensive channel change of the river, which was excavated by a

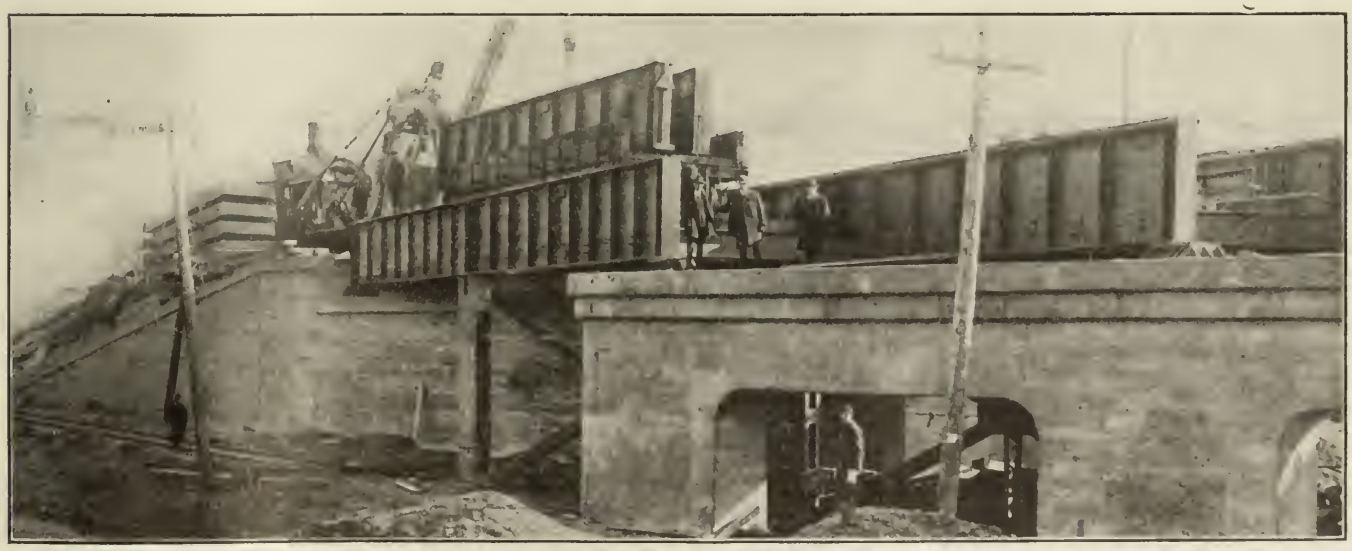


Profile of a Portion of the Baltimore & Ohio Relocation

The tracks of the Erie and the Big Four occupy a single roadbed at 14-ft. centers from the junction point near the city limits of Dayton to the eastern end of the levees, where they spread to 60-ft. centers and occupy separate roadbeds for the remaining distance to the end of the relocation. Single track roadbeds are 20 to 30 ft. wide and double track 34 to 44 ft., with slopes of 1½ to 1 for earth and 1 to 1 for rock. The maximum rate of curvature is 1 deg. and the 0.3 per cent grade is compensated 0.04 per cent on curves. The width of roadbed in the big cut is 70.5 ft.

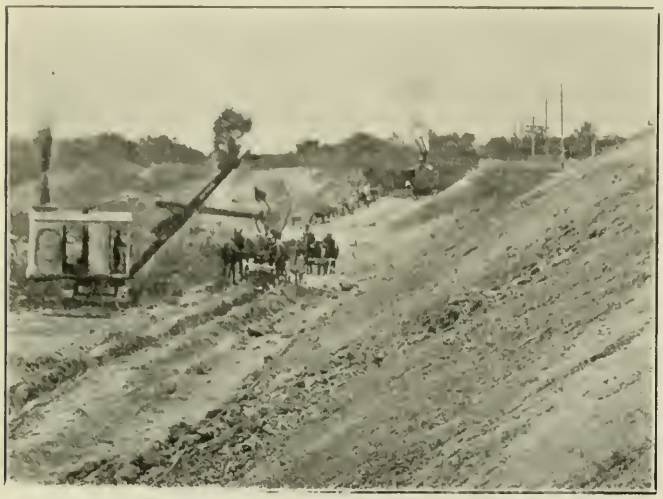
clam shell bucket operated by a portable derrick. The approach is entirely on embankment involving 374,000 cu. yd of filling, which was made largely from material taken from Huffman cut and excavation for the outlet of the conduits at the south end of the dam.

The Huffman cut was by far the most formidable portion of the railway work and controlled the date on which it could be completed. The work was done by the forces of the Walsh Construction Company, Davenport, Iowa, the general contractor for the entire railroad project on the Mad



Skew Undercrossing West of the Huffman Cut

river. The total volume of material removed is 683,000 cu. yd., of which about 80 per cent is rock, which extends to the surface in many places. The upper stratum of material is Brassfield limestone, under which is an Elkhorn shale, underlaid in turn by limestone and clay formations of the Cincinnatian period. This material had to be loosened by blasting, using 40 per cent gelatine in holes drilled both with well drill and steam hammer outfits. These holes were placed from 12 to 18 ft. apart and from 6 to 16 ft. deep. They were usually sprung before shooting and then loaded



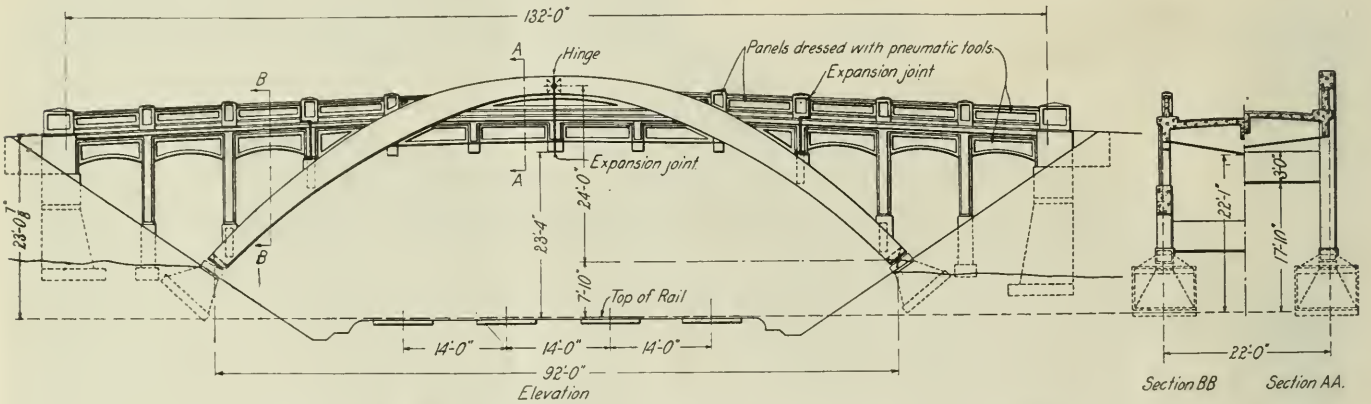
Grading with Revolving Shovels and Horse-Drawn Wagons

with 100 lb. of explosive and shot in groups of about 11 holes at a time. In moving the material from the cut after the excavation had progressed to a point where it was possible to eliminate switch backs in getting the dirt trains down onto the embankment, the loading track was made continuous through the cut, so that the trains could carry the spoil in either direction. This was done so that the material could be used in the levees to the east of the cut as well as in the long approach embankment to the west. The construction equipment consisted of a 70-C Bucyrus steam shovel with three-foot gage cars and locomotives were installed to remove the remaining portion of the material for the construction of embankments at greater distances from the cuts.

The structures on this portion of the work included an underpass for the Ohio Electric and Springfield pike west of the Huffman cut in the form of a 4-span through girder structure on a 25-deg. skew, involving 320 tons of structural steel. Toward the east end of the project where the Big Four and the Erie occupy independent roadbeds, there is a pair of twin three-span arch bridges, shown in one of the photographs. Other structures include a considerable number of concrete culverts of various sizes. Some of these, which pass under the roadway, and two levees are over 300 ft. long. The masonry for the skew under-crossing mentioned above was built by the Walsh Construction Company, but all of the other structures were built by the Conservancy District with its own forces.

The Baltimore & Ohio Work

The Baltimore & Ohio location is of an entirely different nature than that in the Mad river basin. The old track of the railroad occupies a location close to the river and at a relatively small elevation above the normal water level, and continues at this low grade for such a distance upstream that the railroad does not reach an elevation above the flood level of the retarding basin until within the vicinity of Tippecanoe City, some four miles above the site of the Taylorsville dam. The sides of the Miami river valley, which is quite narrow, are much steeper than those of the Mad river, so the relocation of the railroad in this case consisted essentially in shifting it up the hillside for a maximum difference in elevation of about 32 ft. As in the case of the Mad river project, the matter of approach grade was of vital concern. The ruling gradient to be applied in the Baltimore & Ohio work is 0.2 per cent, compensated for curvature. To obtain the desired elevation at the dam with this limiting gradient it was necessary to carry back the foot of the approach nearly 6½ miles, or almost a mile south of the Miami river bridge, which is about a mile out of Dayton. The grade over this bridge was raised 6 ft. in connection with a reconstruction of the structure. North of the dam the new



Elevation of the Highway Arch Over the Baltimore & Ohio at Taylorsville

shovel and three standard-gage trains. This shovel handled as much as 4,000 cu. yd. of rock in a 10-hr. shift, with an average of about 36,000 to 38,000 cu. yd. of material per month.

East of the levees the heavier work consists of four cuts of 35,000, 85,000, 105,000 and 23,000 cu. yd., respectively, which were handled as sub-contracts by the George W. Condon Company of Omaha. The last cut was handled entirely by teams. In the others excavating graders and teams were used within the limits of economy, and then a grade line is virtually level until it reaches the point where it intersects with the old line. To protect the roadbed at the dam, which has a crest about 14 ft. above base of rail level, levees are also being provided on each side of the track for short distances. While the old line was built for the most part on a low bench at the foot of the hillside, the new line, being elevated half way up the slope, traverses a succession of short cuts and fills, producing a very choppy ground line, as shown on the profile.

The line is built for double track, for which the railroad

pays the district the additional cost over single track at all points where the existing line has no second track in the form of a passing track or otherwise. No provision has been made for new passing tracks outside of the double-track roadbed.

The entire project on this road involved the excavation of 850,000 cu. yd. of material, nearly all of which is earth, and it is distributed among a large number of moderate sized cuts. The work was awarded as a general contract to Grant Smith of New York, but was handled directly by H. C. Kahl of Davenport, who sublet portions of the work to Kahl Brothers, the Vang Construction Company, and Condon & Smith. The work was handled according to a variety of methods. From stations 110 to 126 a sub-contractor used an excavating grader and teams. Between sta-

The Baltimore & Ohio Project Was Largely Side Hill Work. Old Line in the Foreground, New Line Above

tions 126 and 154 the material was removed with a 70-C Bucyrus shovel and loaded onto narrow-gage dump cars, while the distance between station 154 and Johnson two revolving Erie shovels were used with teams. North of Johnson two more 70-C shovels were used with narrow-gage cars.

By far the most important structure on this portion of the line is a 92-ft. reinforced concrete arch for a highway overcrossing at Taylorsville, and which connects with the highway on top of the dam. This is a two-ribbed, three-hinged structure of a combination of the open spandrel and suspended floor types. This form of design was selected to accommodate conditions under which the center line of the arch ribs at the crown could be 6 ft. higher than the crown of the roadway. As a result the deck of the structure is suspended from the ribs for a length of 44 ft. at the crown, while the outer portions over the haunches are carried above the ribs on a column-and-girder spandrel construction in connection to two additional spans carried on independent abutments and piers beyond the limits of the arch structure on either side. The ribs are reinforced with built-up structural steel frames, having bolted connections to the hinge castings.

Owing to the irregular nature of the ground line a great many waterway openings were required under the embankment, which were taken care of by concrete culverts and concrete culvert pipes. At four places provision for highway under-crossing and waterways was made by concrete arches varying from 12 to 30 ft. in span.

The railway project has been carried on under the direction of Arthur E. Morgan, chief engineer of the Miami Conservancy District, the railroad work being under the immediate direction of Albert Larsen, division engineer for the District. The interests of the Cleveland, Cincinnati, Chicago & St. Louis and of the Erie were represented by G. P. Smith, consulting engineer of the Cleveland, Cincinnati, Chicago & St. Louis at Cincinnati, while the interests of the Baltimore & Ohio on the Miami river project were represented by E. G. Lane, chief engineer, Baltimore & Ohio lines west at Cincinnati. The work was started in April, 1918, and is to be finished early in 1920.

Railroad Fuel Promptly Paid For

WALKER D. HINES, director general of railroads, on December 6, authorized the following:

"Statements having been given circulation to the effect that the Railroad Administration is delaying payments for coal in order to obtain a lower price, and that as a result mines now producing coal will have to be shut down within 17 hours, I feel that the public should be reassured and informed that there is not the slightest foundation for such statements.

"The coal now being produced falls into two classes, first, the coal actually used by railroads, and second, the coal which is diverted under the orders of the fuel administrator to essential consumers. The coal within the second class, under the plain terms of the fuel administrator's orders which are the same as those in effect during the war is to be paid for by the new consignee, and not by the railroads. Much of this coal is being shipped long distances, because practically no coal is now being produced in the West, and as a result, it takes some time to render bills to the new consignees.

"As to railroad fuel, instructions were issued by the Railroad Administration prior to the present agitation of this subject that it should be paid for promptly, and in addition special arrangements have been put into effect under which operators actually needing money to continue operations may be enabled to obtain money through the railroads. As an evidence that such instructions are being carried out, arrangements have been completed under which the Chesapeake & Ohio has obtained one million dollars from the Railroad Administration to pay operators on that road, and railroads in the Allegheny region have been instructed to pay for coal on a weekly basis.

"To assist further operators to obtain funds, the Federal Reserve Board was requested to rule, and has ruled that the note of a shipper of coal who has coal in the possession of a railroad to be transported, delivered or diverted, and who is to be paid by the consignee or divertee, is a note issued or drawn for a commercial or industrial purpose, within the meaning of Section 13, of the Federal Reserve Act, and is eligible for rediscount by federal reserve banks. The Railroad Administration has arranged that certificates shall be given by the agents of the Railroad Administration to a shipper on the loading of coal so that it may be established that a note is of that character and to make it desirable paper for rediscount, by federal reserve banks.

"The Railroad Administration is not delaying any payments on account of any dispute as to price. The only questions at issue as to price involve some wholesalers, as to whom the intent of one of the Fuel Administrator's orders has not been entirely clear, and as to some coal sold under contracts made prior to October 30 and shipped after November 13. Neither of these questions involve serious problems.

"The public should demand that the Railroad Administration will not permit any coal operator to close down because coal delivered to railroads for their own use has not been

paid for and, therefore, the statements mentioned are causing undue alarm.

"It should also be understood that these statements emanate from the same source which, soon after the present strike began, protested against the fixing of the government maximum prices on coal and regarding which the attorney general stated in a letter that your proposition amounts in effect to a declaration that coal dealers should be permitted to take advantage of these abnormal conditions, and have their prices based entirely upon the law of supply and demand, which is only another way of saying that they should be permitted to charge the public whatever they please."

In response to Senate Resolution 243 directing a report to the Senate of the arrangements that have been made or will be made for the prompt payment of coal diverted in transit from the original consignee, Director General Hines on December 6 sent to the Vice President a statement in part as follows:

"The Railroad Administration has been acting as the agency of the Fuel Administration in distributing coal to those users entitled thereto under the priorities described by the Fuel Administration and in performing this difficult work has been particularly solicitous to facilitate the promptest payment for coal by the users thereof to which the same might be diverted. Arrangements have been made to make sure that such users pay for the coal and pay for it promptly, and imperative instructions have been issued and reiterated that coal taken for railroad use should be promptly paid for. In addition, the Railroad Administration has cooperated with the Federal Reserve Board in adopting methods to facilitate the borrowing of money by the operators upon coal in transit. Further than this the Railroad Administration has requested the coal operators to give specific information as to any mines actually in difficulty on account of inability to collect their coal bills with sufficient promptness, and in the only instances which have accordingly been reported to the Railroad Administration it has made arrangements to purchase for railroad use enough coal and made immediate payment therefor to furnish the operators affected sufficient funds to meet their immediate needs.

"On November 3, 1919, the Central Coal Committee which the director general of railroads appointed at Washington to supervise the distribution of coal telegraphed all regional directors as follows:

The question which is being raised and which is deserving of immediate consideration is the prompt payment for coal confiscated by the railroads for fuel purposes. The point is made that mines which continue to operate will have difficulty in meeting their pay roll if payment for such coal is withheld for any considerable length of time.

The matter is, therefore, brought to your attention with suggestion that arrangements be made with all your roads for the promptest possible payment of coal that is confiscated for railroad use.

"On November 3 and 4 after representation by the National Coal Association and the Pocahontas Coal Operators' Association that coal operators were apprehensive about securing payment promptly for diverted coal, and in some instances that the operators might not receive such payment with sufficient promptness to enable them to meet their payrolls and other production expenses, the Central Coal Committee suggested that the operators in each district should interest themselves in this matter in their district, and arrange so that operators whose mines were working should be able to secure the needed financial assistance by borrowing money from banks against outstanding coal. It was suggested by the National Coal Association that payment for diverted coal would be facilitated if the railroad showed on the coal waybills the selling price of the coal when advised of this by the shippers, and on November 6, instructions were given all regional directors to see that this was done.

"On November 20, after being advised by the representative of the National Coal Association that apparently some operators did not know of the arrangement permitting the price of coal to be shown on coal waybills, instructions were therefore sent to regional directors by the Central Coal Committee to have agents advise shippers in writing of this arrangement. On November 26 instructions were sent to the regional directors that as far as practicable they should dispose of the oldest coal on hand first when making diversions or deliveries.

"On November 28 the Central Coal Committee, on being advised that some operators were claiming to be financially embarrassed, and this arrangement was desirable to assist them in securing their money, telegraphed the regional directors as follows:

To avoid financial embarrassment to shippers of diverted coal and consequent restriction of production, regional coal committees and federal managers should be instructed to insure prompt payment of bills by final consignees by making delivery of coal conditional on such payment if necessary. Arrangement should also be made that shippers are immediately advised of consignees to whom their coal is diverted. Every effort should also be made to pay for railway fuel with utmost promptness. This repeats previous instruction and is sent you to emphasize the importance of giving the subject special consideration.

"On being informed that banks in coal field districts were being drained of funds through loans to coal operators, conferences were held with representatives of the coal operators and later with the Federal Reserve Board to see what arrangements could be made to relieve the situation. As a result of this, the arrangements covered by the inclosed press notice of Dec. 3 were made and representatives of banks and operators agreed that this would be of material assistance.

"Again on December 3, telegraphic instructions were sent to all regional directors to put into effect at once the arrangements for issuing such form of receipt for coal shipments.

"Further on the same day the following telegraphic instructions were sent all regional directors:

See my telegram November 28 advising that prompt payment for diverted as well as contract coal was necessary to avoid financial embarrassment of shippers and consequent restriction of production. Also that every effort should be made to pay for railway fuel with utmost promptness. Our information is that operators are not receiving remittances promptly and instructions should be given by you to have all bills prepared, vouchered and paid immediately on receipt. This is of utmost importance.

"At various times since this matter was brought up, representatives of the coal operators have been requested to furnish information as to specific instances where there was a possibility the mines would be unable to obtain funds to meet payroll and other operating expenses, and no such specific instances were reported to the Central Coal Committee prior to December 4, when they were advised that two operators located on the line of the Chesapeake & Ohio Railroad were in such strained circumstances that a shut-down might possibly occur. Arrangements were made with the Chesapeake & Ohio Railroad to purchase for railroad use and pay for immediately sufficient coal now being produced by these operators to furnish them sufficient funds to meet their immediate needs. In addition to written and telegraphic instructions sent to regional directors, the question of prompt payment for railroad coal and prompt notice to shippers of diverting of commercial coal has been made the subject of frequent telephone conversations with interested railroad officers.

"The Central Coal Committee has arranged to secure daily reports of the number of cars of diverted coal and information as to whether or not shippers have been notified so that delinquencies can be corrected.

"As may be seen from the foregoing the Central Coal Committee and all representatives of the director general of railroads have appreciated the necessity and desirability of prompt payment for coal diverted and every effort has been made and will be made to secure such prompt payment."

The Future of Canada's Transportation Problem*

Development of Present Situation Should Show Relative Merits of Government and Private Ownership

THE PRESENT RAILROAD SITUATION in Canada and the events which brought it about have been discussed in previous articles. The question that naturally follows is, what will be the effect of this unique situation upon future railway history? The Dominion government is now operating approximately 13,200 miles or about 34 per cent of Canada's total mileage under the jurisdiction of the Canadian National Railways Company. In addition, the government is operating under the form of a receivership, with the Hon. J. D. Reid, Minister of Railways, as the receiver, the Grand Trunk Pacific which without doubt will become an integral part of the Canadian National system. The Dominion government, furthermore, is negotiating for the perpetual lease of the Grand Trunk and, because of its value to the Canadian National project, it is safe to assume that the Grand Trunk will also become a part of the Canadian National system. Assuming that the Canadian National Railways will ultimately include the Prince Edward Island, the Intercolonial, the National Transcontinental, the Canadian Northern, the Grand Trunk Pacific and the Grand Trunk, making a total mileage of 20,000 miles, what will be the effect of this merger?

We have, or will have in the near future, two great Canadian transcontinental systems, one owned and operated by the government, the other owned and operated by a private corporation. The parts comprising the former have been in more or less constant financial difficulty, whereas the latter has been financially successful, and has been earning a substantial return for its shareholders. The service given the public by the units of the former when compared with the service given by the latter is deficient. But it is only just now that the government lines are being welded into a single system.

What will happen to this system will depend on two things, the policy of the government and the education of the public. However, neither of these forces can produce an immediate effect. Regardless of whether this peculiar situation of a great government owned line in direct competition with a great privately owned line is desirable or not, it will certainly afford an opportunity to all students of railway affairs to view the relative merits of government ownership and operation and private ownership and operation.

Political Influences

Government ownership, it is often argued, cannot be divorced from politics. The Canadian National Railways typify government ownership. The logical conclusion, therefore, is that the Canadian National Railways cannot be divorced from politics. Certainly it is true that there has been political interference with government management in almost every democratic country where it has been tried. But the case of the Canadian National, the advocates of the nationalization program in Canada say, is different. It is true that House Bill 70, which incorporates the Canadian National Railways Company, has several clauses which are openly directed against political interference in the operation of the government system. The principal clauses of this nature are contained in Sections 14 and 15, which place the operation of the system under the control of the Board of Railway Commissioners which acts in a capacity similar to the Interstate Commerce Commission, and give the public the right to sue the Canadian National in any court of competent jurisdiction as well as the right of appeal to a higher court.

However, this does not necessarily mean that there will be no political interference in the affairs of the Canadian National. There are too many ways in which political interference can achieve its purpose aside from those against which certain clauses of the incorporating bill are directed for one to believe that the provisions of this bill entirely destroy the probability of this interference.

It is claimed that the executive and operating staff of the Canadian National Railways is now free from political influence. Apparently this is true. At the same time it must be remembered that there is not now a political party in power in Canada. The present government is a coalition Union government established by the Liberal and Conservative parties in order to remove politics from the conduct of the war. The present government is strongly intrenched, but it is essentially a product of the war, and there is a general feeling that the return to party lines should be made as soon after peace is signed as may be practicable. Both the Liberal and the Conservative parties have been seriously disorganized by the establishment of the present government and the result is a mixed situation which may bring a third party into existence. It is hardly probable that the same relations between the Dominion government and the Canadian National Railways will continue after this resumption of party activities.

Taking the two possible outcomes of the political situation in Canada, let us see what each will mean to the railway nationalization program. A return to the old party lines and the consequent fall of the present government, will probably mean a consideration of the advantages and disadvantages of the nationalization program. The result may be that the two parties will not agree upon its merits and that the question of nationalization will become a political issue. The fate of the natioalization program and consequently of the Canadian National Railways will then depend upon the party in power. In any consideration of the espousing of the nationalization program by either one of these two parties, it should be remembered that representation in the Canadian Parliament is based upon a membership of 65 from Quebec and the remainder proportionally according to population. This gives the growing west a heavy representation. If the policies of the old parties remain substantially the same as they were before the war, it is probable that the nationalization scheme will be supported by the Liberals, who practically control the west, and opposed by the Conservatives, whose strength is in the east. It is then that Parliamentary representation will count.

On the other hand, if the Union government is perpetuated much will depend upon the attitude taken toward the question by Prime Minister Borden, whose opinion as yet has not been publicly announced. It is significant that statements have been made by men prominently associated with the government advocating an extensive nationalization program. In this connection the Minister of Finance in addressing Parliament on May 15, 1916, said: "I believe relief (from the present situation) will probably involve the taking over by this government of one or more of the existing railway systems and may involve later on the nationalization of all the railway systems of Canada."

Railway nationalization to the extent to which it has progressed in Canada is due to the acts of the present Union government and it is but natural to suppose that if this

*Third and last of a series of articles on the railway problem of the Dominion of Canada. The first of this series appeared in the *Railway Age* of November 7, and the second in the issue of November 14.

government becomes the nucleus of a party, it will not reverse its previous acts.

All of the assumptions just made indicate that the question of nationalization will be one for political consideration in the future. This seems to be inevitable. The railroad financial transactions in which the government will have to engage make it inevitable that nationalization shall come in for a large amount of parliamentary and political discussion, and it appears certain that there will be clear cut differences of opinion. Here a point made by A. H. Smith, a member of the Commission of Inquiry appointed by the government in 1916 to investigate the conditions of Canada's transportation system and to present a solution of the problem, naturally is recalled. Mr. Smith, in dissenting from the report made by Sir H. L. Drayton and W. M. Acworth, based his dissent partly upon the impossibility of one Parliament binding succeeding Parliaments to a permanent policy in regard to railways. With all the conditions in mind it is impossible to believe that the Canadian National Railways will always be free from political interference.

The only real question which arises in this connection is the probable extent of the political interference. Those who are opposed to the nationalization program maintain that this interference will inevitably be extensive and cite the experiences of Canada with her government-owned roads during the past 50 years. On the other hand, those who favor the nationalization program claim that the past incidents in Canada's railway history do not necessarily indicate what government management will be in future.

Education of the Public

One of the most surprising features of the present situation in Canada is the apparent apathy of the public regarding the steps so far taken by the government along the road of nationalization and its tendency to travel further in the same direction. Even the passage of House Bill 70, incorporating the Canadian National Railways Company and granting almost unlimited power to that organization, besides making adequate provisions for the complete nationalization of all Canada's railways, caused comparatively little comment. This doubtless is due to the serious financial difficulties into which some of the railways had fallen. The seeming inevitableness of the action so far taken has dulled the sense of Canadians to the dangers ahead. Whatever the cause, the public has been apathetic regarding this tendency and only recently has begun to be awakened. But the fact that Canadians are now beginning to awaken means that they will be in a receptive mood to be educated as to the advantages and disadvantages of a policy to which they have already subscribed in part.

The public may be educated as the public of the United States has been educated regarding certain railway policies. The nationalization program will be a matter of political discussion; it may resolve itself into a clear cut national issue. Both sides of the case will then be adequately presented to the people as they have been in the United States and it will not be long before Canadian newspapers and periodicals will be as replete with arguments pro and con as are the newspapers and periodicals of the United States. This is not a matter of today but rather of the future, and by that time there will be brought home to every Canadian who pays taxes or who has occasion to use the railroads in any manner pleasant or unpleasant experiences with government or privately owned lines and he will have formed definite preliminary conclusions as to the respective merits of the two systems. It is in the future, then, that the public will begin asking what this nationalization policy has cost and whether the services rendered and the results achieved by government management are or are not in the public interest.

In contra-distinction to this assumption it is stated by advocates of the nationalization program that the people of Canada do not care particularly about the railway problem, for the cost to the government of nationalized railroads does not directly affect the masses. In support of this argument it is cited that there are but two taxes in Canada, income and municipal, and that these taxes do not affect the majority of the people. If enormous deficits are incurred in the operation of the Canadian National Railways, the public will have to pay them, directly or indirectly, and the cost will appear in taxes in such a manner that every person in the Dominion of Canada will definitely feel the extra burden.

The Canadian national debt, as a result of the war, is now estimated at $1,950,000,000, or $220 per capita. The burden of this enormous debt will call for rigid economy for years to come. With this debt and with probable reductions in the government revenues, it is rather hard to see how large deficits incurred in the operation of nationalized railways will fail seriously to affect every Canadian.

Influence on Development Work

Another of the arguments for government ownership and operation of railways is that as a result of it extensive work for the development of the country's resources will be carried on. Yet in Canada itself is an example of the development work which can be carried on by a privately owned and operated line, for there are few who deny the Canadian Pacific credit for the opening up of the Canadian northwest, and it would be difficult to point out any railway which has done less effective development work than has the Intercolonial under government management.

The Canadian Pacific has spent for development purposes $45,000,000 on 34,000,000 acres, or $1.34 an acre, while the Dominion government has spent roughly $10,000,000 on 84,000,000 acres or $0.13 an acre. Surely these figures tell a story of the power of privately-owned railroads to carry on such work.

The development of new territories depends upon capital, not government capital, but primarily private capital, for it is private initiative based upon the investment of private capital that makes for success in new fields. With government ownership of railways in the undeveloped territories of Canada it seems probable that there will not be the same amount of enterprise and capital invested as would be the case were the territory served by privately owned and operated lines. With the bringing of the nationalization question to the light of political discussion and appraisal, the people of Canada will begin to measure the quality and quantity of the development work which has been done or will be done by the Canadian National Railways as compared with the results achieved by the privately owned and operated Canadian Pacific. Fortunately there will be no duplication of lines by the two systems, for authorization for new construction will be based solely upon the relative merits of the claims for such work presented to the Railway board instead of to the Minister of Railways as has been the practice in the past.

Service to Be Rendered the Public

There is another factor that will enter into the education of the public which will have even more effect than the cost of government ownership or the extent of development work; that is, the relative quality of the service rendered the public by the government-owned transcontinental and the privately owned transcontinental. The service renderd to the public will be a definite matter regarding which a great many Canadians will form their own opinion. On the Canadian Pacific an efficient and loyal operating and executive staff has been developed and one has but to travel over a portion of its lines to appreciate the excellence of the passenger service rendered. In regard to freight service the Canadian Pacific has gone even farther to provide assistance to every industry and person that has occasion to deal with it. It is with this service

that the Canadian National Railways will have to compete. Under government ownership there almost always has been a notable lack of interest and initiative on the part of employees. The indifference of all classes of government employees is proverbial. The Canadian National employee is a government employee, and it remains to be seen whether he will or will not use the traditional "government stroke."

Service to the public is dependent largely upon the physical condition of the railway rendering it. The units comprising the Canadian National Railways have been in serious financial difficulties for many years. Such a state of affairs is hardly likely to be conducive to the maintenance of a property to high standards. In viewing the physical conditions of these separate units at the time of their amalgamation into one system, one can gain a rough idea of the present physical status of the government-owned transcontinental line. Beginning in the east and following this chain of roads across the country one will find that the Intercolonial might be said to be in mediocre condition. Its maintenance expenditures have not equalled those of the Canadian Pacific which traverses in part the same territory. Compared, then, with the physical condition of the Canadian Pacific in the east the Intercolonial cannot be said to be its equal, although in recent years there has been a serious effort to better the physical condition of the Intercolonial.

Moving westward, one will find that the National Transcontinental, being of recent construction, may be said to be in fair condition. This fact, however, is due to the newness of the road rather than to an effort toward maintaining it to certain standards. Being a new road it will take large expenditures to place it in shape to compete with corresponding portions of the Canadian Pacific. Furthermore, the National Transcontinental is badly lacking in equipment, although this is a condition which will be remedied to a certain extent by its inclusion in the government-owned system. The physical condition of the Canadian Northern is bad. A large proportion of the mileage was built to low standards, due primarily to the policy adopted by Messrs. MacKenzie and Mann to construct lines on these low standards and later as the traffic and consequent revenues increased to gradually improve them. Coupled with this is the fact that the equipment is poor and insufficient although this, as with the National Transcontinental, will be compensated for to a certain extent by its inclusion in the government-owned system. In the arbitration to determine the price to be paid by the government for the Mackenzie-Mann holdings an estimate of $110,000,000 was made by officers of that road as being necessary to place it in good condition. The cost of materials and labor since that time has risen and it is probable at the present time that $150,000,000 would have to be expended on the Canadian Northern alone to put it on a sound operating basis.

In regard to the Grand Trunk, its physical condition in 1916 at the time of the Drayton-Acworth report was such that an officer of the company in testifying as to its condition stated that "If we had $25,000,000 now it would put us in fine shape." Howard G. Kelley, president of the Grand Trunk Railway Company, in testifying before the commission of Inquiry at the same time, estimated that deferred expenditures on the Grand Trunk totaled $21,181,345, of which $8,943,971 was chargeable to the rebuilding and reinforcing of freight car equipment and $11,761,598 to deferred renewals in the maintenance of way department. Since that time these conditions have not been greatly improved and because of the higher costs of material and labor these estimates will have to be augmented greatly.

The Grand Trunk Pacific, like the National Transcontinental, being practically a new road may also be said to be in only fair shape and will require more than the ordinary capital expenditures to maintain it to the normal standard of efficiency. On the other hand, the lines of the Canadian Pacific paralleling these units of the Canadian National Railways have been maintained at an exceptionally high standard and because of these efforts in the past the road can be maintained at the same standard of efficiency at a cost far less than is the case with the Canadian National.

It is possible, then, to deduce from these rough estimates of the physical condition of the roads comprising the Canadian National Railways that in comparing the service likely to be rendered by the two systems, the Canadian National is not in a position at the present time to compete successfully with the Canadian Pacific on the basis of the relative condition of the two lines. In fact, enormous expenditures will have to be made by the government in order to place its lines in a position to compete effectively with the Canadian Pacific.

Of the other factors influencing the matter of service to the public, it might be said for the Canadian National Railways that by this consolidation the mileage between certain points in Canada will be reduced. Furthermore, the Canadian National will have certain advantages in grades, especially from Toronto, Montreal and Quebec to Winnipeg and Vancouver. However, it is rather hard to determine the advantage which this superiority in mileage and grades over the Canadian Pacific will give to the Canadian National system.

Attitude of Labor

There is still another factor to be considered in relation to the eduation of the public, namely, the attitude assumed by labor. As yet Canadian labor organizations have taken no definite stand in regard to this nationalization program. However, with the wage increases awarded railway workers it is probable that the same condition will prevail as now prevails in the United States, namely, that labor, because of these wage increases, will be reluctant to countenance any deviation from the application of the nationalization program. This, however, is merely a surmise and it is also possible that labor in Canada after hearing the nationalization program discussed as a political issue, will realize its defects as well as its advantages.

Relation of Situation to Canadian Pacific

We have outlined so far in this article the factors which will to the largest extent influence future railway developments in Canada. The consideration which remains is what effect all these conditions will have on the remaining privately owned line, the Canadian Pacific? To some the situation, however it may develop, means eventual confiscation of one of the most successful railway operations in the world. This assumption is based on several considerations, the principal one of which is the expressed attitude of the people of Canada toward the right of railways to earn interest on the capital invested in them and the fact that rates on a government transcontinental line can legally be reduced without limit. Throughout the history of the Intercolonial one can find members of Parliament and publicists stating, in defense of the continued deficits incurred on this road, that a government-owned railway, merely because of its ownership, should not be operated with a view to realizing interest on the capital invested. This belief has extended throughout Canada, and it may at any time cause a demand that the Canadian National Railways, being owned by the government, be operated in such a manner as to realize only their operating expenses, leaving the interest on the capital invested to be assumed by the taxpayer. Certainly the Canadian National Railways as a government enterprise have a certain right to reduce their rates ostensibly for the benefit of the people. If this is done to any considerable extent the Canadian Pacific will be forced into the hands of the government.

However easy it may be to put into effect radical reductions in rates it will be found that there are many factors which mitigate against such action on the part of the Canadian National Railways. The action taken in bringing the Canadian Northern and other roads under the jurisdiction of the

Canadian National and amalga[illegible] roads into one system was taken because of t[illegible] the part of the government to end a steadil[illegible] upon the public treasury. It ca[illegible] ra[illegible] would only serve to increase th[illegible] n it must be recalled that Canada's nati[illegible] greatly increased as a result of the war, and that the burden of this increased debt must be borne by taxpayers for many years to come. With these factors in mind it is hard to conceive how the Canadian National can afford to reduce its rates materially even for the purpose of development.

Another viewpoint taken by those who are studying the present situation is the direct opposite of this belief in the eventual confiscation of the Canadian Pacific. They think it is the purpose and intent of the government to avoid any action which will tend to force the Canadian Pacific into the nationalization scheme. It is their belief that the government, in adopting this policy, is doing so with a view of awakening and maintaining keen competition between the two transcontinental lines and in this manner nullifying some of the bad features of government ownership, especially indifference and lack of initiatives on the part of employees.

Sir Thomas White, the Minister of Finance, in reporting the last year's budget to the House of Commons, said, "Insofar as railroad rates and such are concerned, the railway rates in Canada, although recently raised, are certainly not more than sufficient to make a carrying return on the value of the properties used for transportation. Indeed, having regard to railway investments, railway returns, owing to the very great increases in the cost of operation, may well be described as low. In view of this it is impossible to expect a reduction in railway rates to be ordered by the Railway Commission. As a rate making proposition reductions at the present time are impossible."

If we are to accept the optimistic views of this latter class of railway students the situation will resolve itself into the development of the Canadian National Railways as a business enterprise rather than as a political project and the natural development of the Canadian Pacific.

Opportunity Afforded by This Situation

There has been outlined in this series of articles the present situation, the development which led up to this situation and the probable effect upon Canada's future railway history. Whatever the solution of this present and future problem may be, whether it be complete nationalization of all of Canada's railways or a reversion to private ownership, one thing is certain, and that is, that for a period of years, students of railway history will have in Canada an opportunity of noting a direct comparison of the respective results of government operation and private operation.

The Canadian National Railways will, whatever the future brings, run in direct competition with the Canadian Pacific long enough at least for conclusions to be drawn as to the merits of the two methods of conducting transportation. There is no doubt that advocates of government operation and private operation alike will look towards Canada for an answer to the problem, and this answer Canada will be prepared to give before many years have passed. Even at the present time the Canadian Pacific has accepted this challenge to private management and is bending all energies toward improving its service, awakening its employees to their new responsibilities and instilling in the minds of the public the excellence of the service rendered on its lines. Indicative of this movement is the establishment of the Trans-Canada Limited with 92-hour service between coasts.

Should government operation, as compared with private operation, prove unsatisfactory to the public, it is not inconceivable the result might be to cause all the lines in Canada to be turned over to private management. It will be noted that the officers of the Canadian National Railways are in the main the old officers of the Canadian Northern system. These men were the able lieutenants of Messrs Mackenzie and Mann. Why may not Messrs. Mackenzie and Mann, after the nationalization program has failed to vindicate the claims made for it, if it does, come before Parliament with an offer to take over this transcontinental system and operate it as a private enterprise in competition with the Canadian Pacific?

Messrs. Mackenzie and Mann in all of their business enterprises have shown themselves to be exceptionally shrewd, enterprising business men.

Orders of Regional Directors

PERMIT SYSTEM FOR CONTROLLING GRAIN SHIPMENTS.—Supplement 4 to Circular 247 of the Southwestern regional director states that, effective October 25, all grain shipments destined to Chicago, St. Louis, Mo., East St. Louis, Ill., Kansas City, Mo., Omaha, Neb., Council Bluffs, Iowa, St. Joseph, Mo., Fort Worth, Tex., and Milwaukee, Wis., will require individual permits. Rules are also promulgated in the order for the application for such permits and the form to be used.

Purchase of Material for Use After 1919.—Order 247 of the Southwestern regional director states that it is important that the director general should not be obligated for any material or supplies delivered to railroads after the termination of federal control. It is equally important that the delivery of material and supplies necessary for the operation of the railroads should not be seriously interfered with by the termination of federal control. A statement showing all of the outstanding unfilled orders or contracts, the delivery of which will not be completed by December 31, 1919, with the terms and prices of purchase, should be presented to the corporate officers of the railroads in order that the corporate officers may determine to what extent they desire to assume the obligations of the director general after the termination of federal control; and they should be requested to render a decision in writing as to which, if any, of the outstanding orders, they desire to assume. Upon receipt of this information the general purchasing agent should be instructed to immediately cancel the undelivered portion of any such orders which the railroad company has signified its unwillingness to accept and at the same time the shippers should be notified that the railroad company has assumed the obligation to pay for such material as is shipped after the termination of federal control. As soon as the railroad companies have signified their decision with respect to outstanding unfilled orders and contracts, they should be requested to authorize the federal manager or the general purchasing agent, as federal purchasing officer, in writing, to place orders for account of the railroad company for such material and supplies as may be necessary to insure the continuous operation of the railroad or designate a representative authorized to approve, on behalf of the railroad company, all orders for material and supplies which it is necessary to place after December 1, 1919, and the delivery of which will not be completed by December 31, 1919, and to obligate the railroad company to pay for such portion of the material as shall be undelivered on that date. No orders for material or supplies of any nature should be placed after December 1, without approval of the corporate officer so designated except in cases of emergency where the material is required for immediate use and where it will be delivered prior to December 31, 1919. All orders and contracts for the purchase of material should continue to carry the clause relating to their termination with respect to the director general, and in addition thereto all orders or contracts made subsequent to December 1, 1919, must have printed or stamped on their face the agreement of the railroad company to assume the obligation to pay for such portion of the material as remains undelivered at the termination of federal control.

Work of the Fuel Conservation Section

By Securing Co-operation and Without Issuing Orders, a Startling Saving Was Effected

By Eugene McAuliffe
Manager, Fuel Conservation Section, United States Railroad Administration

A study of the railroad fuel situation made by the Railroad Administration early in 1918 developed a marked tendency toward increased consumption per unit of service rendered; this investigation also brought out the fact that the railroads receiving fuel coal from certain localities were being supplied with material of a quality far below that delivered in pre-war times. This situation not only added greatly to the fuel bill, but in addition very seriously interfered with the movement of heavy freight and passenger trains, with resultant general delay to traffic and marked increases in general operating costs directly chargeable to fuel conditions, were developed. It therefore seemed advisable to attempt at the very beginning the broadest possible campaign for the conservation of railway fuel, this program predicated on not only greater effort on the part of officials and men responsible for the use of coal and fuel oil, but in addition thereto the necessity for greater effort and care in the mining, loading and preparation of the fuel sent out from the mines was strongly emphasized.

That this important work might be taken up and carried to a conclusion along definitely determined lines, the Fuel Conservation Section of the Division of Transportation (now the Division of Operation), United States Railroad Administration, was created on May 1, 1918, and a manager, with offices in Washington and St. Louis, was appointed. The work assigned to the Fuel Conservation Section was that of "giving attention to the conservation of fuel on all railroads, with special reference to its preparation and proper use," as well as to "investigate and make recommendations in connection with the transportation of fuel and the handling of same at fueling stations."

Immediately after the creation of the section and before circular announcement of its existence could be made, the work of organizing for cleaner fuel and its more economical use was well under way, and the co-operation of the United States Fuel Administration was sought toward the prompt preparation of a program, which would bring quick results.

A Whirlwind Campaign

The International Railway Fuel Association, whose membership is almost wholly made up of railway operating officials and coal producers, was decided upon as representing the most forceful and direct instrumentality that could be employed toward securing the preliminary concerted effort sought, and on May 23 and 24, 1918, this association, setting aside its usual technical convention program substituted therefor a whirlwind campaign for better fuel and greater economy in its use. This meeting, covering two days, packed one of the largest Chicago theatres, taking the form of a great revival, and there men prominent in the mine labor world, together with men high in railroad labor councils, joined forces with railway operating and motive power officials, coal operators, fuel engineers, and others, specialists in their respective lines, urging not only the maximum possible production of coal, but that such coal that was loaded, be loaded as clean as it was possible to prepare it, contributing in this way the first essential element necessary to fuel economy. These appeals were supplemented by eloquently urgent requests that every man connected with the transportation, handling and consumption of fuel coal and oil, exert the maximum effort toward securing the best possible service from it.

The stirring addresses delivered at this convention were printed and mailed to every miner's home, to every mine office, railroad employers' lodge room, machine shop and roundhouse in the United States, with the result that the echo of the May, 1918, appeal for clean fuel and fuel economy reached every mine official in charge of coal properties, every mine employee engaged in the production of coal, and every railway official and employee in any way connected with the handling and use of same. Next to the several drives made by the Treasury Department in connection with the financing of the war budget, and the work of the Food Administration, the fuel economy drive of May, 1918, was, perhaps, the greatest general concerted effort made toward strengthening the hands of the Administration in the conduct of the war.

Simultaneous with the work done at the Chicago convention, men experienced in the handling of fuel, locomotives, and stationery plants were called to service in the several regions, and the office of assistant manager of the Fuel Conservation Section, with headquarters in New York City, was established to take charge of the work in the Eastern regional district, in which territory the maximum amount of fuel trouble had developed; the measure of freight and passenger traffic handled in the Eastern region was also heavier than that handled in any one of the remaining six regions.

To cover the Allegheny, Pocahontas, Southern, Northwestern, Central Western and Southwestern regions, the office of regional fuel supervisor was created in each region, and the necessary assistants and office force were provided for each region. A survey of the fuel inspection forces of the several railroads was quickly made and arrangements consummated with the United States Fuel Administration, whereby each field inspector was furnished a credential authorizing him to act in behalf of and for the Fuel Administration, as well as the Railroad Administration, in the matter of securing the proper preparation of fuel coal, the Fuel Administration withholding equipment from certain mines and shutting down others which refused to establish the standard of preparation commonly maintained in their immediate fields.

Strengthening Field Inspection Forces

More recently the work of co-ordinating the efforts of the individual railroad fuel inspectors, to the end that fuel found to be of inadequate preparation or quality and declined by one road, would not be accepted by another, thereby standardizing inspection methods, has been worked out, and with the extraordinary increase in the price paid for fuel f. o. b. cars at mines compared with that paid in the pre-war period, plus the additional expense incident to hauling same, greater discrimination in the purchase and acceptance of coal has been strongly urged on those responsible for the fuel supply.

This strengthening of the field inspection forces was immediately reflected in the shape of reduced motive power failures, decreased operating expense, and a decrease in the unit consumption of fuel. In the meantime, the assistant manager in the Eastern region and the fuel supervisors in the other six regions, with their assistants, undertook the

work of calling together on each railroad all officials who were in any way connected with the transportation and use of railway fuel, again urging the greatest possible measure of co-operation, including the better maintenance of, and the proper rating of locomotives, the elimination of terminal and intermediate station delays; supplemented by such simple direct supervision and education of the many new employees whose entrance into railroad service was made necessary by the movement of the great volume of troops, munitions and other war business, as well as those employed to take the place of the thousands of experienced men who had left railway service to enter the combat force. The patriotic assistance of the heads of the several railway brotherhoods, as well as that of the mine workers, was also solicited, these appeals meeting with a wholesome and hearty response.

How Co-Operation Was Secured

In connection with the work of directing the more economic consumption of fuel on locomotives and in miscellaneous fuel consuming plants, a definite line of procedure was laid down, this program including a complete abstinence from anything that savored of bureaucratic methods, and from the date of the inception of the Fuel Conservation Section to this time, not a single positive order has been issued by any representative of the section to any official or employee engaged in the operation of the railroads under government control. On the other hand, every suggestion involving novel and untried methods toward fuel conservation was denied support, the fundamental principle underlying the work of the section being that of securing the adoption on the part of every official and employee of the best of the several methods proven and commonly in use on the several railroads, which, in substance, meant nothing less than more vigorous effort along the lines, and in the manner the individual roads had previously laid down as representing the best line of conduct.

The full support of all operating officials has been given to the work of saving fuel as a result of the simple, concise presentations made by the section, many federal and general managers now leading the work on their respective lines. In connection with the field methods employed in improving the quality of the coal loaded at the several mines, no unreasonable demand has at any time been made on either the coal operator or the mine employees, and a full recognition of the limitations that attach to the mining of coal has invariably been accorded the mining industry; nor has any demand whatever been made toward the transfer of fuel purchases from the mines or localities established during the pre-war period as the logical and proper source of fuel supply for the several railroads. To this broad recognition of the acknowledged skill of both coal mine and railway officials and employees, is due to the extraordinary measure of co-operation accorded the section, and no claim for credit can be made by the section with respect to the results obtained, except that which is due the working staff of the section who have, in every instance considered themselves, not only as responsible to the Railroad Administration, but to the operating heads of the several roads located in their respective regional districts.

Supplementing the general work above referred to, the campaign toward fuel economy was conducted and exemplified through divisional meetings of officials and employees, at which time specific results of progress made were presented through the medium of comparative divisional and system fuel statistics, studies made of fuel used on individual locomotives, the savings obtained at individual power plants, etc. Fuel conservation committees were organized on many roads, employees as well as officials making up the personnel, all of which have done splendid work. Road tests were conducted from time to time, and the more serious operating and maintenance disabilities affecting fuel consumption were located and brought to the attention of officials and employees in a brief, concise way, with suggestions for such remedial measures as could be employed without heavy capital or labor expenditures.

These investigations and studies, including the losses due to air ingress and steam leaks in locomotive front ends and front end apparatus, with consequent reductions in the size of exhaust nozzles entailing back pressure losses, which in turn lead to fuel wastes and decreases in tractive power; losses sustained by the inadequate maintenance of superheater equipment and the adequate maintenance of grates and ash pans; losses due to the improper adjustment of locomotive front ends, and those incident to the operation of locomotives suffering distorted and defective valve motion, were all clearly brought out and remedies were suggested through several circulars setting out the results of the specific tests referred to above which were made by the Fuel Conservation Section in connection with motive power officials.

A special circular covering the maintenance and operation of stationary plants was also prepared for the use of men in charge of, and handling same and a circular covering approved methods of storing coal, to the end that storage losses be reduced to the minimum, was prepared and placed in the hands of officials in charge of this work, and a further special circular on the maintenance and operation of locomotive stokers was recently published for the use of roundhouse and locomotive men.

Careful investigation of the fuel losses sustained by inadequate air brake maintenance developed that an annual loss of over 6,000,000 tons of coal was being suffered from leakage of air in brake pipes and connections under freight cars. The section therefore arranged for a study of the best method of preventing these losses, which was made by a volunteer committee from the Air Brake Association. Specific recommendations were prepared directing the attention of yard repairmen and freight train employees to the serious fuel loss susatined from excessive air line leaks, as well as the methods which should be employed to overcome same. In this manner the campaign for fuel conservation was carried directly into the car repair department, the yard masters' offices, and to the men in the freight train cabooses. In no instance was the influence of the maintenace of way men lost sight of.

Fuel Consumption Statistics

A growing amount of fuel oil is used in certain sections of the country for locomotive and miscellaneous fuel purposes, and special attention has been given to the more economical consumption of fuel of this character, the majority of the items adversely affecting the consumption of fuel coal equally affecting the use of fuel oil. Through its Washington office the section early arranged for the assembling and compilation of such statistics of fuel consumption as would, when published, not only show the operating officers of each road just what was being accomplished on their individual lines and in their respective regions, but, in addition, these statements set out the results obtained on all roads under government control, thereby enabling each federal manager to judge the results obtained on the particular road under his direction when compared with those obtained on other lines whose grade conditions, volume of traffic, etc., made such reasonably comparable.

These statements, distributed monthly with a quarterly and annual cumulative statement, represent the most complete fuel performance presentation ever published. During the year 1917 the pounds of fuel used per 1,000 gross freight ton miles and per passenger train car mile, when compared with the 1916 performance, showed an increase approximating five per cent, and by the middle of the year 1918 this

increase in consumption had grown to a point approximating eight per cent over the 1916 performance, but in July, 1918, the effect of the personal inspiration received by railway officials at the big Chicago meeting, and the results obtained from the sending out of some 2,200,000 copies of the appeals made at that meeting, began to show in the fuel performance, until at the end of the year 1918 the losses sustained during the first half of the calendar year, in part due to extremely rigorous winter weather, were caught up, and a saving totaling $19,231,000 stood as a credit to the efforts toward fuel economy made by railway officials and employees.

Tremendous Saving

During the year 1919 the program determined upon at the inception of the work has been maintained throughout and the stride toward lower unit fuel consumption which began with the May, 1918, Chicago meeting has been quickened. An estimate of the total saving which will be made in 1919, when compared with the previous year, based on the progress made in the first nine calendar months of the year, indicate the following results:

Class of Service	Consumption Tons	Saving Tons	Saving Value
Freight	72,098,000	5,993,000	$20,687,000
Passenger	29,615,000	2,524,000	8,714,000
Switch	20,310,000	986,000	3,409,000
Miscellaneous	16,643,000	1,395,000	4,803,000
Total	138,666,000	10,898,000	$37,613,000
Saving in reduced haul on users' rails at 75 cents per ton			8,176,000
Total savings			$45,789,000

The fuel bill of the Railroad Administration for the year 1919, exclusive of any increase in mine price that may be occasioned by changes in the miners' wage scale taking effect in November and December, 1919, will approximate (including an allowance of 75 cents per ton for company haul) a total of $665,000,000. Unless checked by a decreased unit consumption it will in a few years reach the billion dollar mark. The 1919 fuel (fuel oil reduced to the basis of coal) would, if put into standard capacity coal cars, make a train 26,261 miles long, a distance materially exceeding the circumference of the earth. The fuel saving of this year would make a train of 2,064 miles long, extending if coupled up solid from New York to Chicago by way of the Pennsylvania, thence back to New York by way of the New York Central and doubling back on the New York Central to Albany. The value of the fuel saved would buy 763 modern heavy type locomotives or 15,263 modern freight cars.

Measured in area of coal land exhausted it represents a territory approximating 2,178 acres in extent. Thus far our comparisons have been of the major variety, but the real results have been accomplished by using *one less scoop full of fuel one and a half billion times.* The Fuel Conservation Section has contributed toward the dissemination of certain fundamental principles, among which can be mentioned the success that will always result from concerted effort, the effort which individually examined seems small, but when totaled assumes splendid proportions. That the influence of the work done in 1918 and 1919 will continue there can be no doubt, as many of the suggestions made were of a character that will insure their permanence. The Fuel Conservation Section has fulfilled the expectations of its creators; it has fully justified the outlay involved to maintain the organization, a sum equivalent to approximately three-tenths of one per cent of the value of the *fuel saved* in 1919.

Operation of Panama Canal.—During the fiscal year ended June 30, 1919, the ordinary expenses for the operation and maintenance of the Panama Canal, including those of civil government and sanitation, amounted to $6,121,194, as compared with $5,920,342 in 1918 and $6,788,047 for 1917.—*"Nauticus."*

National Industrial Traffic League Convention

The election of officers and the reports of special committees, especially the committee appointed to report on the Cummins bill as the legislative solution of the railway problem, were the high lights of the annual meeting of the National Industrial Traffic League held at Chicago on November 12 and 13. A significant feature of the convention was the interest displayed by those present in the solution of the present railroad problem as compared with their interest in subjects confined wholly to the different phases of shipping and transportation.

Legislative Recommendations

C. E. Childe, chairman of the legislative committee of the league and also chairman of the special committee appointed to report on the Cummins bill presented the reports for both committees of which he is chairman. Among the recommendations made by Chairman Childe in reporting for the legislative committee are the following:

"On the question of cancellation of war tax on transportation charges, the committee recommends that the league oppose the cancellation of such tax at this time and the committee's recommendation was upheld by the members at the Milwaukee meeting.

"There are now pending in Congress several bills designed to suppress bribery and other corrupt practices in interstate and foreign commerce, namely, House bill No. 263 by Mr. Sims; Senate bill No. 54 by Mr. Fletcher, and Senate bill No. 1024 by Mr. Cummins. Bills are now in the hands of the Interstate Commerce committees of the House and Senate and will be acted upon after the general railroad legislation is disposed of. The purpose of all three of the bills above mentioned is to forbid the giving of any gratuity or thing of value as an inducement, bribe or reward to influence the actions of any employee or agent in relation to the affairs or business of any employer or principal engaged in or affecting interstate commerce, and further forbidding the receiving of such gratuity by any such employee or agent. The American Bar Association has endorsed the general principles of these bills at its meeting in Boston in September, 1919, without recommending any one in particular in preference to another. The principal interest of the league members in these bills lies in the fact that they would suppress the giving of bribes or inducements to railroad employees to influence the handling of cars or shipments, and would make it unlawful for railroad employees to accept bribes from shippers. Your committee recommends that the League strongly endorse the general principle of this legislation to the end that the soliciting of bribes by railroad employees and giving of such bribes by shippers may be effectually done away with and that the interstate commerce committees of Congress be notified accordingly.

The report of the special committee appointed to analyze the Cummins bill as the legislative solution of the railroad problem, did not go into exhaustive explanation of the details of the bill but confined its analysis to certain objectionable features. Recommendations were prepared by the committee to eliminate these features of the bill and the report as presented to the convention was summarized as follows:

"Your committee believes and recommends to the membership that since the Esch-Pomerene bill includes in the main the good features of the Cummins bill and omits its bad features, the Esch-Pomerene bill should be advocated by shippers as a basis of railroad legislation to be passed by Congress, rather than the Cummins bill."

In arriving at this conclusion the committee presented an analysis of the objectionable features contained in each section of the Cummins bill and the reasons for its recommendations in each case. In presenting the report Chairman Childe stated that the references to the Esch bill were to the bill before it was revised in committee and pointed out the differences in the House bill before and after this revision. After

some discussion it was voted that the executive committee of the League be instructed to report to the members by circular its conclusions as to the Cummins bill and the revised Esch bill and that recommendations be made to senators and representatives not only by the executive committee, but by individual members of the League.

Other Committee Reports

Among the other reports presented and accepted by the convention were those of the special committee on minimum class rates, the committee on car demurrage and storage, the express committee, the bill of lading committee, the classification committee, the special committee on coke and coal claim rules, the membership committee, the special committee on through export bills of lading, the committee on inland waterways, the demurrage committee, a sub-committee of the demurrage committee to consider storage rules and the committee on freight claims. In connection with the discussions following the report of the last committee, Max Thelen, director of the Division of Public Service, United States Railroad Administration, who was present, stated that the 887,197 loss and damage claims unpaid on March 1, had been reduced to 486,492 on September 1; the 363,476 loss and damage claims unpaid over four months old, on April 1, had been reduced to 193,042 on September 1, and the overcharge claims unpaid and 90 days old had been reduced from 72,215, on January 31, to 14,721 on September 30.

Resolutions Adopted

Among the resolutions adopted by the convention were the following:

A resolution, offered on the instruction of the executive committee, endorsing Commissioner E. E. Clark for reappointment on the Interstate Commerce Commission.

A resolution, submitted by the legislative committee at the direction of the executive committee, declaring that the Railroad Administration was not abiding by the terms of Reparation Circular No. 7, issued by the director of the Division of Traffic, United States Railroad Administration, and protesting against having to submit proof other than that charges were unjust and unreasonable.

A resolution offered on the recommendation of the export and import committee expressing opposition to the Greene bill (H. R. 8873), which was characterized as an attempt to modify the present mortgage law.

Election of Officers

The election of officers for the coming year necessitated the re-arranging of the usual election plan because of the peculiar situation arising through the re-election last year of President G. M. Freer. The custom has been to advance the vice-president to the presidency each year, but W. H. Chandler, vice-president last year, was not advanced to that position at the end of President Freer's first term as president. The re-election of the latter and the election of R. D. Sangster as vice-president at that time presented the problem of how the League could advance its vice-president in the usual manner and at the same time allow Mr. Chandler to serve the customary term as president. As a result of this situation a representative nominating committee was appointed to bring in a list of two candidates for every office to be filled. Mr. Chandler and Mr. Sangster were both nominated for the presidency and the election was held on the last day of the convention. As a result of this election the following officers were elected: President, W. H. Chandler; vice-president, C. E. Childe; treasurer, O. F. Bell; honorary vice-president, New England territory, C. B. Baldwin; Trunk Line territory, W. J. L. Banham, George P. Wilson, G. F. A. territory; F. H. Baer, G. L. Cory, D. O. Moore, F. E. Williamson; Western territory, P. W. Coyle, Seth Mann; Southwestern territory, U. S. Pawkett; Southern territory, J. S. Davant; Southeastern territory, W. W. Ingalls, Jr

Address of Max Thelen

The convention was concluded on the afternoon of November 13, and the members attended the annual dinner of the Traffic Club of Chicago in the evening. Max Thelen, director of the Division of Public Service, was the principal speaker at the banquet. Mr. Thelen asserted that, had there been a normal amount of freight traffic during the first six months of 1919, the government would have broken even, or nearly so, from its operation of the railroads this year at the rates now in effect. He predicted that the freight business for the first six months of 1920 would be much heavier than the abnormally low business during the first half of 1919.

"Bearing in mind this increased traffic, which we have every reason to expect," said Mr. Thelen, "it is clear to me that if the government continued to operate the railroads in 1920 it would be unnecessary to make any increase in rates or fares."

Referring to the bad-order freight car situation Mr. Thelen announced that the total number had been reduced from 228,549 on August 16, to 146,702 on November 1. However, the Railroad Administration will not relax its efforts to still further reduce the percentage of bad order cars as long as there is any reasonable grounds for believing that the situation can be improved, Mr. Thelen said.

Referring to the freight business as a whole during the month of October, the Railroad Administration transported a larger amount of freight than during any other corresponding period in the nation's history.

"During the week ending October 25, the Administration transported coal estimated by the Geological Survey to have amounted to 13,118,000 tons, the largest amount transported during any week in the history of the country," said Mr. Thelen. "During the week ending October 4 the Administration transported 7,869 loaded revenue cars more than during the same week in 1918; during the week ending October 11, increased loads were only 2,293, but during the week ending October 18, there were transported 42,125 loaded cars in excess of the number transported during the corresponding week in 1918, and during the week ending October 25, the increase amounted to 67,222 cars. Finally during the week ending November 1, the last week for which figures are available, there were transported 80,400 loaded freight cars in excess of the number transported during the same week of 1918. For the month of October, as a whole, there were transported, in 1919, 200,000 more loaded cars of freight than in 1918. I also invite your attention to the fact that the car shortage was considerably less in 1918."

Mr. Thelen stated that he was in favor of the return of the roads to private ownership at the earliest practicable date, giving as his reasons that it is absolutely essential to construct at the earliest possible date a large amount of new equipment —freight, passenger, baggage, and express—to meet the deficiencies in construction during the last three or four years and to assist in taking care of the tremendous volume of business which will undoubtedly be offered for transportation in 1920.

In concluding his address, Mr. Thelen urged that the public make a careful survey of the results accomplished by the Administration and insist that whatever of value has been made effective during federal operation should be retained under private operation. Among these were the pooling of equipment, the unification of terminals, the retention of consolidated ticket offices, the retention by the carriers of the right to disregard routing instructions wherever necessary to relieve congestion, the permit system, the elimination to a large extent of competitive train service and the retention of the traffic committees which have recently been appointed by Director General Hines.

Problems Involved in Return of Railroads

Mere Relinquishment Not Sufficient. Legislation Must Provide for Adequate Development. Some Lessons Learned

By Brice Clagett
Assistant to Director General of Railroads

SOONER OR LATER—probably on January 1—government control of the railroads of the United States will terminate and the roads will go back to the management of their private owners. And simultaneously, if past expressions of sentiment mean anything, the American people will heave a sigh of relief. "Get the government out of the realm of private business," the people have said, and so the government is getting out, at least is getting out of the direct, day-by-day management of the railroads. Unless the Congress shall extend the period of government control, we are going to have private operation again and naturally we ought to know as accurately as possible what the change will mean.

The really big lesson which must be learned, if we are to obtain satisfactory railroad service, is that something more must be done to remedy conditions than merely turning the carriers back to private control under the same form of legislation in existence prior to government operations. The idea has grown up that once the railroads go back to private management all the ills will disappear. That trouble started when the opponents of government ownership over-played their hand. They set out to prove that the government could not successfully run the railroads and they ended by convincing almost everyone that everything that has gone wrong with the railroads during the last two years has been due to government control.

Problem Before Congress

Congress just now is wrestling with the problem of whether government control is to be continued, or just what kind of private control we are to have. On the outcome of the action of Congress will depend in large measure whether the railroads are to give satisfactory service or whether the troubles existing before the war are to be repeated. But, meanwhile, it may be possible to learn something of what has been disclosed by government operation—something of what the change back to private control promises the public.

So far as the general public is concerned, its interest in the railroads is that satisfactory service, both passenger and freight, be rendered as cheaply as possible. The traveler and the shipper, and through the shipper the ultimate consumer, want trains run on time, want courtesy, want cheap rates, want safe service. None of these things can be secured unless the railroads are able to get the money to make the necessary additions and betterments, buy the badly needed equipment, put the roads on a financial basis they have not had since long before the war; they cannot be solved unless the railroad companies treat labor fairly and take advantage of the lessons learned during government control.

The sooner the idea is dispelled that all the railroad difficulties of the last two years have been due to government operation, the quicker will the railroads get on their feet again. One does not have to be an advocate or believer in permanent government ownership or control to honestly believe that. Already there are beginning to be signs that the real facts are being understood.

Before government operation began we believed we had private control, and in a sense we had—but only in a sense. The income of the railroads—the rates—were controlled by national and state governmental bodies. The service—the operations—were being more and more controlled through national and state hours-of-service laws, safety appliance laws, various regulations and statutes. The government controlled, but did not take the responsibility.

However much the blame may have rested on the few railroad owners who betrayed their trust and prostrated great properties, the fact remained that long before government operation began the public generally had begun to appreciate that something had to happen or railroad troubles were ahead.

The War Task of the Railroads

Then came the war, and after the war had lasted something more than six months the troubles became so manifest that the government stepped in and took over the operation of the railroads. What would have happened had the government stayed out it is impossible accurately to say. It is sufficient to remember that compelling demands for increased wages were pending, many of the railroads were facing bankruptcy, conflicting government priority orders and lack of unification among the railroads were throwing traffic into confusion, and there was not sufficient equipment to handle normal business, let alone the vast war needs. Time after time have I asked some of the biggest railroad men of the country what would have happened had the government not taken over control of the railroads. The answers have been varying, but in one respect they have been uniform: the railroads could not have carried the load had they been continued under the old laws and regulations and diversified control.

Government control accomplished one thing if it accomplished nothing else. Under it the railroads handled the war business without faltering. Forget for the moment the inconveniences which you suffered or read about; forget the wage increases so widely advertised; forget the lack of individual attention; forget the government railroad deficit. Remember that primarily the railroads were placed under government control to help win the war, and see how they measured up to that standard.

This is neither the time nor the place to go into details on the accomplishments of government control. But the country perhaps should remember always that its railroads, operated by trained railroad men temporarily under direction of the government moved 13,446,859 soldiers and sailors and marines from January, 1918, to November 1, 1919. If there has been a serious complaint about how the troop movements on America's railroads were handled I have not heard of it. From home to camp and cantonment and from cantonment to port, sometimes across the entire continent, then back from port to camp and lastly on reduced fare discharge certificates home again, virtually every man who enlisted or was drafted into the army or navy of the United States was moved one or more times on an American railroad in comfort and in safety, adequately fed, delivered on time.

Perhaps the picture may be more vivid if it is remembered that 213,749 railroad coaches and Pullmans were used in

* Abstract of an article published in the Philadelphia Public Ledger of November 16, 1919.

these troop movements, that 18,400 special trains were operated and that the movement was equivalent to transporting one passenger 5,917,658,719 miles.

An then the other branch of the war work of the American railroads—the movement of war supplies. There has been no complaint about this. The country was not told, could not be told, how in the spring of 1918 the allied ambassadors at Washington, backed by telegrams from their premiers, told the director general of railroads that the Allies would lose the war if a certain amount of foodstuffs was not moved to the Atlantic seaboard in a certain number of days. Empty freight cars were rushed to the West—an expensive movement—and rushed back again in long trains, loaded, and before the time was up the allied ambassadors had to call a halt because they did not have ships enough to load the foodstuffs piling in on them.

In brief, it has never been denied, and I think never will be denied, that at least so far as handling war business is concerned—the business they were taken over to handle—the American railroads under government operation performed their job in true American fashion. And in saying that I mean much more credit to the officers and men out on the road than to the few who happened to be in Washington directly representing the government. I mention it not to uphold government control of railroads, not to praise any man or group of men, but entirely because I earnestly believe that, unless what government control of railroads did accomplish and failed to accomplish is clearly understood and the record made, there will be no satisfactory settlement of the problem now before Congress and the people.

To learn what the change back to private operation involves, suppose we see what the chief complaints against government operation have been and then examine them to discover whether they can be cured merely by a change from government to private operation, or whether we have got to have more than the old private operation we had before the war.

Charges Against Government Management

Broadly, these are the charges against the railroads under government control as I have recognized them in the newspapers, in debates in Congress, in resolutions of trade bodies, and in conversation from one end of the country to the other:

First. The government-controlled railroads have lost money and have incurred a deficit to be paid by the taxpayers. (This deficit I have seen stated at anywhere from $500,000,000 to $5,000,000,000.)

Second. Rates have been too high.

Third. Wages of railroad employees have been increased too much.

Fourth. The railroad properties have been run down.

Fifth. The service, both passenger and freight, has deteriorated, and employees have been less polite than under private control.

So that there may be no misunderstanding of the facts, let it be said immediately that after paying operating expenses and paying to the railroad corporations rental of approximately $940,000,000 a year or approximately $1,880,000,000 for the two years of government control, the net loss to the government on account of operating expenses will be about $236,000,000 for 1918 and $250,000,000 for 1919, or a total of $486,000,000 for the two years.

Put the operating loss for the two years down at $486,000,000 and the figure will be as near as it is possible to estimate until government control is actually wound up.

What are the compensations for that loss? The primary compensation has been that the railroads were kept in a position to adequately perform the war business of the nation at a time when failure to carry on that business would seriously have endangered the outcome of the war. One minor result was that a large proportion of the soldiers and sailors in the United States, in many cases distant from their homes, were able to visit their families on reduced fare furlough certificates.

Rates Kept Down

One other major compensation was that railroad rates were kept down and, therefore, a restraining hand held on the cost of living—which in all truth needed a restraining hand. Another result was that railroads were enabled to keep their employees at a time when shipyards and other war industries were paying extremely high wages to attract skilled men. Without a decided increase in rates undoubtedly it would have been impossible for the railroads under private control to have granted any such wage increases as were allowed by the railroads under government control.

The big losses came in the spring of 1918 and the spring of 1919. In the spring of 1918 rates were the same as they had been under private control, although under war conditions prices were constantly mounting. In the spring of 1919, the spring following the signing of the armistice, business had fallen off alarmingly. At the present time, and since July, with unusually heavy business, the government is making money out of the railroads; making money, but not enough to compensate for that lost in the early months of the year.

From articles appearing sometimes in newspapers it is apparent that there is some misunderstanding as to how much freight and passenger rates have been increased under government control. The fact is that, considering the country as a whole, passenger rates have been increased approximately 25 per cent and freight rates have also been increased approximately 25 per cent. When it is remembered that the cost of practically everything entering into railroad operation has been increased more than 25 per cent, it is evident that this increase in rates has not been extravagant. While the charge to the public for railroad transportation has increased 25 per cent, it is evident that the charge for practically everything else in the country has been increased in the same period decidedly more than 25 per cent.

Increase in Wages

As to the charge that railroad wages have been increased too much, here again it is necessary to get at the actual facts, and I think that I cannot do better than to quote from a recent address which has not been published to any extent, made by Mr. Walker D. Hines, the director general of railroads:

"You have heard a great deal about extreme cases of increases in pay to the railroad employees. In that, as in so many other things, it is the extreme cases that are dwelt upon, whereas in a matter of this sort, we must look at the general situation. The general situation is that the average increase in rates of pay which has been made for railroad employees throughout the United States has been about 50 per cent over the rates of pay which were in effect in December, 1917. I have yet to learn of any important industry which has shown a more conservative average of increase in pay in the same time, in view of the war conditions which made increases in pay both proper and necessary, and while this increase in the rate of pay has been about 50 per cent, the increase in the earnings per individual has been less than that, because the number of hours the individual employee works is less than the number of hours he was working in December, 1917, under the war pressure then prevailing and under the longer hours which were then established.

"I think it is a mental habit that all of us have got into—on account of my peculiar situation I suppose I have escaped it—to assume the government's treatment of the labor question is bad because the government did it, and then

assume that the government control is bad because it treated the labor movement like it did. I think I have seen a great many comments running around in a circle that way.

Covenant to Be Fulfilled

As to the claim that the railroad properties have been run down under federal control, it should be remembered that the contract which has been made with a large proportion of the railroad corporations and which is based upon the federal control act, provides that the properties shall be turned back in the same condition as they were when they were taken over, and contains the covenant that if it desires the government can satisfy this provision by spending on each property the same amount as was spent on the average in the test period, taking into consideration the changed prices for labor and materials. The government, of course, will fulfill this covenant.

On some railroads it has already been fulfilled; on others, adjustments in money may be necessary. On some railroads the way and structures are in better condition today than they were prior to government control, whereas the equipment is not in such good condition, and on other railroad properties the contrary is true. The process of carefully checking up on each property has been in progress for months past, and the figures plainly show that, taking the country as a whole, the government should be able easily to satisfy its contract obligation and return the railroads of the country to their owners in substantially the same condition as when they were taken over.

The next serious charge against government control has been that, under it, service has deteriorated, and that employees have been less polite and attentive. To take up that charge we should divide government control into two parts; first, the part during the war and immediately thereafter, and second, the period after the soldiers got home and the country began to do peacetime business again, say since July 1, 1919.

Early Deterioration Admitted

During the first period railroad service, meaning the everyday service to the individual civilian passenger and shipper, did deteriorate. There is no use trying to disguise the fact, nor is there any object in doing so, and we must face facts if we are to know what is to happen after government control is over. After watching the situation closely, month after month, reading innumerable letters, going through newspaper editorials from every state and town, traveling on the railroads in all parts of the country, I firmly believe that the deterioration in service during the war and immediately thereafter was due, in a small degree, to government control, and to a much larger degree to the war and consequences of the war.

The part that was due to government control did not result from anything the government or any one representing the government did, that could have been avoided, as I see it. One reason was the lack of the competitive spirit. The other was the drawing in of solicitors and traffic representatives. As a result of the latter, many shippers who had previously been given special attention no longer received it. The part that was due solely to the war was involved in the loss to the army of many skilled employees, to the use for strictly war purposes of equipment, which otherwise could have been used for civilian and business purposes, to the necessity of putting civilian and business needs always behind war needs.

But when preparing for what is to come after government control the comparisons should be made not with the period 18 months ago, when the war was at its height, or with the period in the spring when business was just getting over the effects of the war, but with the last few months, when peace had been more fully restored.

The fact is that the difficulties as to service which exist now are difficulties which will be very slightly influenced merely by turning the railroads back to private control. Some of those difficulties are more apt to be increased than diminished. Leaving aside the personal attention which can be given by traffic solicitors and which undoubtedly will be increased under private control, the railroad plant of the country has been functioning with unusual facility for the last few months. Competition, to a certain extent, already has been restored even under government operation. Both within and between regions, railroads are trying to get more trains on time, and as a result, during September 88 per cent of all the passenger trains of the country were either on time or made their runs in as good as, or better than, schedule time. Before the coal strike the railroads of the country were doing a heavier business than was ever done before. The bad order car situation on November 1 was down below 6 per cent. There were more than 1,800 locomotives in repair and in storage awaiting use. And in the last week before the coal strike, meeting the emergency presented, the railroads hauled more bituminous coal than ever before, 13,200,000 tons.

From the above do not think I believe that the railroads of the country have given perfect service during the last few months. I do not. I realize, of course, that for a time there was a shortage of cars to move coal, and that there is still a shortage of cars for the movement of grain and some other commodities. I appreciate there are other difficulties. But these are difficulties of the railroads rather than difficulties of government operation.

The railroads need equipment, they need all sorts of additions and betterments, they need to spend from $750,000,000 to $1,000,000,000 in the year 1920, they need to make extensions into new territory. But those are needs of the railroads whether under government or private operation. Turning the railroads back to their owners will not get those things unless there goes with the turning back legislation which will permit the owners to get the money to do those things; unless there goes with the turning back legislation which will perpetuate some of the consolidations, some of the unifications, some of the saving which has grown up during government control and which should be added to under private control rather than wiped away; unless there goes with the turning back real constructive legislation, rather than makeshift legislation and the thought that the return to private operation will cure all the ills.

Need for Improvements

During the last year of private control in 1917 and during the two years of government control there have not been the needed additions and betterments and the needed equipment.

The railroads during the last year of private control did not have sufficient money to make these improvements, and during the war they were not made, first, because of the shortage of materials and labor; second, because of the lack of needed appropriations; and third, because in the closing months of federal control it was impossible for the government to make plans when its tenure of control was limited.

Virtually all of these reasons would have applied to the railroads had they been under private control during the entire period of the war, but this does not change the fact that now that the war is over and the railroads are about to go back to private control some steps must be taken to put the railroads on such a basis that they will be enabled to make the necessary additions and betterments and buy needed equipment, so that a really adequate public service may be given not only in the year 1920 but in years to come.

The fact is that if the railroads are to give adequate public service after government control they must adopt many

of the plans which have been worked out during government control. They will want to retain many of the consolidated ticket offices and consolidated terminals; they will want to continue the elimination of many circuitous routes previously employed; they will want to continue the pooling of repair shops; it is to be hoped that they will want to continue the permit system for the loading of grain and certain other commodities which prevents the use of railroad equipment for warehouse purposes; many will want to continue the utilization of universal mileage books; to a degree at least, they will want to push forward the standardization of equipment; certainly many will want to continue the maintenance of common time-tables between important points; they will want to continue the promotion of standard operating statistics to bring out the various elements of railroad efficiency. They will want to continue and possibly further develop the control over equipment, particularly over freight cars, so that the entire nation may get the benefit of the equipment in existence; they will want to go on with a score or more of developments which had either not been developed under private control or had been prevented by laws and regulations or over-developed competition.

Through co-operation between the Railroad Administration and the American Railroad Association during the last few months many of the improvements developed under government control seem certain to be continued, whatever legislation is adopted; but what is really needed for the service of the public is the development of really adequate legislation which will permit the making of needed improvements and the purchasing of the necessary equipment, and which will put the entire railroad plant at the service of the entire country. Unless these things are obtained the mere passing back to private control almost certainly will prove a snare and delusion.

War Blamed for Losses

To sum up, therefore, the large proportion of the money lost by the government in operating the railroads has been due to the war and to readjustments following the war and, the situation having changed, this condition will neither be bettered or made worse by the return of the railroads to private control. There may be some economies in operation brought about, but this will be largely offset by losing the economies of unified control; the rates control; the physical condition of the properties will not be bettered under private control unless the railroads are placed in position to secure money; the service, both passenger and freight, may be bettered under private control as far as individual attention is concerned, but can hardly be bettered as far as the aggregate service to the public is concerned; certainly it will not be bettered or even kept as good unless the railroad companies retain many of the unifications, consolidations, etc., which have been built up under government operation.

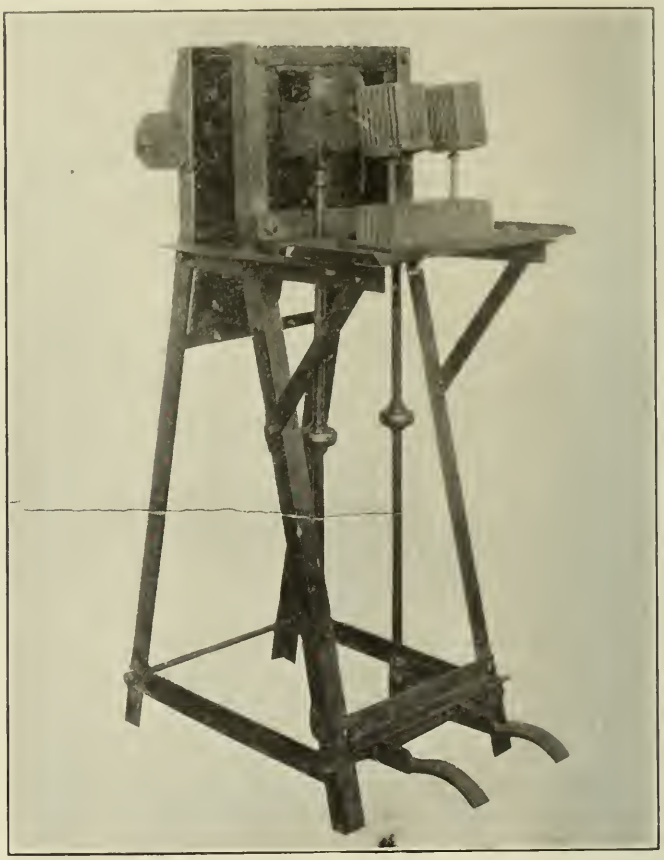
Whether the Congress decides upon returning the railroads back to their owners under virtually the same legislation in existence prior to government control; whether government ownership is adopted; whether federal control is continued for a year or more or whether really radical legislation reconstructing the existing railroad companies is put into effect will be determined during the present session of the Congress.

All of the proposals mentioned have received strong support. It is to the highest degree important that the public decide as promptly as possible which of these proposals will give after January 1 the most adequate railroad service to the country.

THE PRODUCTION OF PETROLEUM in the United States in October, 1919, amounted to approximately 33,319,000 barrels (barrels of 42 gallons), as compared with 33,667,000 barrels in September, 1919, and 31,255,000 barrels in October, 1918.

An Electric Rivet Heater

IN AN EFFORT to reduce the waste and losses experienced in present methods of heating rivets, as well as to provide a portable machine which may be used in localities where electric power is available and where fire, gases and smoke cannot be tolerated, the General Electric Company, Schenectady, N. Y., has designed an electric rivet heater which includes a transformer rated at 15 kw. mounted on angle iron legs which may be fitted with wheels. At the front of the transformer two copper bars are fitted with heavy air-cooled electrode blocks of cast copper and under these is another copper block which acts as a support and electrical connection for two rivets in series. When the rivets are placed on the block and the electrodes are allowed to drop on the heads of the rivets the circuit is closed and the heating begins. The two electrodes may be raised independently by two-foot pedals and a primary top switch mounted on the back legs of the machine compensates for the different diameters and lengths of the rivets. Higher efficiency owing to the localizing of the heat energy, better regulation of heat, elimination of smoke and gases and the losses due to uneven heating and consequent failure to upset in the hole, thereby causing a leaky rivet hole, are some of the more important advantages claimed for the machines.



Front View of the Rivet Heater

SAFETY-FIRST WITH TEETH IN IT.—At Altoona, Pa., on the fifth of December, five employees of the Pennsylvania Railroad were arrested by railroad police officers and arraigned before a magistrate who fined them each $1—merely the amount of costs in the case—for walking on the tracks. These employes of the road, taking a short cut from their work to their homes, crossed the yards at the eastern end, in violation of a well-known rule. The magistrate reprimanded the men for thus needlessly exposing themselves to being struck by trains.

Annual Meeting of the National Safety Council

Discussion of Industrial Relations Occupies Important Place in Convention Sessions

LABOR UNREST AND COLLECTIVE bargaining for a time usurped safety's place in the sessions of the Eighth Annual Congress of the National Safety Council held at the Hotel Statler, Cleveland, Ohio, October 1 to 4 inclusive. Organized primarily to promote safety among workmen in industries, the National Safety Council has been forced to widen the scope of its activities and enter the broader field of industrial relations because of the labor developments during the past year. For this reason the discussion of labor problems occupied a prominent part in the proceedings of the general sessions of the congress and in many of the sectional meetings. Both sides of the present economic struggle between employee and employer were presented to the delegates, the result being an open and entirely frank discussion of the fundamental causes of this unrest and of the principles of real democracy in labor.

The steam railroad section led all other sectional meetings both in point of attendance and in the interest displayed by those present. The largest available meeting room was assigned to this section for its meetings of which there were three; nevertheless, at each of these meetings the room was overcrowded and many railroad safety men were forced to remain outside.

The congress was opened on Wednesday morning October 1, by the annual meeting of members at which the chairman, David Van Schaack, president of the National Safety Council, presided. Thereafter four general sessions were held, two of which were devoted almost exclusively to the presentation and discussion of papers on industrial relations. The sectional meetings, of which there were 32, were divided into 19 groups.

The first general session devoted to the general subject of employees' representation was featured by three addresses, those of Cyrus McCormick, Jr., works manager of the International Harvester Company, Chicago, who spoke on "Co-operation and Industrial Progress"; Mathew Woll, vice-president of the American Federation of Labor, who spoke on "Employees' Representation from the Standpoint of Organized Labor," and W. M. Leiserson, impartial chairman of the Labor Adjustment Board for the clothing industry of Rochester, N. Y., who spoke on "Labor Management and Collective Bargaining."

The first session of the Steam Railroad Section, presided over by R. C. Richards, chairman of the Central Safety Committee, Chicago & North Western, Chicago, was featured by the address of A. F. Duffy, manager of the Safety Section, United States Railroad Administration, who said, in part:

R. C. Richards, President National Safety Council

A. F. Duffy on Work of Safety Section

Safety is basic in any business where physical hazard is involved, for if you will look about you, I venture you will perceive that the best railroad is the safest railroad and the most efficiently and satisfactorily operated from the standpoint of the people, the government, the owners of the property, and last but very important, the men who work on that railroad and who have it in their hands to make it a successful organization or a mediocre enterprise.

I have been a practical railroad man during all of my working life, and I predict, without qualification, that when once the railroad men of this country thoroughly understand what safety work we are endeavoring to do, why it is necessary, and what are the possibilities they will take hold of this subject in such a manner as to accomplish results which will startle the railroad fraternity.

Safety on railroads has been advanced many years by virtue of the recognition which has been given it by the United States Railroad Administration, and I believe its permanency is already assured; it has demonstrated its capabilities and is now at the crucial time when a realization of its fullest possibilities is all but at hand.

I give it as my unbiased opinion that railroads—like many other industrial organizations—have not, up to a comparatively recent time, given due consideration to the human factor in industry by recognizing the fact that men and women are infinitely more important than machines, structures, or appliances of any description. When we contrast the degree of care which is exercised in the purpose, use, and maintenance of locomotives with the employment, service, and training of the average employee of the average railroad we are disappointed to learn the inequality which exists as between the machine, which can be replaced with money, and the life, which is absolutely irreplaceable, and which, when once gone, can never be brought back.

Some of us are disposed to be altogether too conservative and reactionary in the activities we employ in conducting this work, and sometimes we are apt to underestimate the value which comes from the financial expenditure required to carry it on. I do not subscribe to the theory that within

intelligent and reasonable limitations it is possible to become overzealous or to overdo in a matter of this kind. We must, from the very nature of the work, consistently and continuously develop new plans and methods for creating and sustaining the interest of railroad employees, and of all persons subject, directly or indirectly, to the hazard of railroad operation. It is just as good business, if we must for the moment regard the matter from a monetary standpoint, to expend money for safety activities as it is to make investments for approved devices which will conserve fuel, increase car loading, improve efficiency, or reduce maintenance cost. It is a great deal more important, and, as a rule, will pay materially larger returns.

In deliberating these matters, however, I urge you not to lose sight of the fact that the aim and purpose of the work of the Safety Section is not to save money, but always has been and always will be to conserve human life and limb. If any saving of money is made by reason of a reduction in casualties surely that result is not subject to criticism, for in order to save money we must first avoid the casualties themselves.

The recognition of the human element, then, is the most important factor in railroad service, and its training and education in safety is the foundation upon which are built the aims and purposes of the Safety Section. And, since the whole scheme of things revolves around the safety committee organizations it is to this phase of our work that the greatest attention must be given. There is no more honorable position today on a railroad than that of safety committeeman. His is a real service to mankind, and he can be proud of that service, if he is doing all that may reasonably be expected of him. If he is not measuring up to his responsibilities it is probably because he has not been properly instructed and trained in his work. Our safety committee meetings must be so regulated that the members thereof will be not merely interested in their work, but enthusiastic about it. To this end it is essential that safety officers or their assistants attend committee meetings frequently in order to insure their proper functioning and to sustain the interest which is so necessary on the part of safety committeemen.

A fact which is of prime importance in the relation of safety to railroad operation, is that when experienced men are taken out of the service because of casualties the employment of new or inexperienced men in their stead not infrequently causes additional casualties to occur, because of the lack of familiarity with the work in hand; and always such a situation decreases efficiency and output, and otherwise costs money and causes hardships. This fact emphasizes too the real necessity for constructive thought and action in relation to the safety education, and training of the new man in the service, and of the employee who is promoted or changed from his customary occupation to one with which he may not be familiar.

Another of the aims and purposes of the Safety Section is to secure liberal publicity of the work we are doing and the necessity for it; of the altogether too large number of railroad men who are killed and injured every year in the business of operating the railroads of this country; of the appalling number of people who are killed and injured each year while wrongfully trespassing on railroad premises, and of the alarmingly increasing number of people who meet death and injury while passing over highway crossings.

Concretely, this publicity in the case of employees should be in the form of bulletins, posters, pamphlets, casualty statements, and such other data and information as may be deemed advisable. We must never lose sight of the fact that safety is fundamentally a work of the employees who do the physical tasks incident to railroad operation. They are almost entirely responsible for the accomplishments heretofore made in this great movement and will be the strength and power for good which will come in the future.

The railroad men of America have responded nobly to the activities of the Safety Section of the United States Railroad Administration. But if we expect them to continue in their interest and enthusiasm it will not suffice simply to beseech them to stop deaths and injuries. It will be necessary to keep them constantly informed as to the number of casualties which occur, what causes them, and whot may be done to prevent a repetition of similar casualties. The data, so far as is practicable, should be prepared in some competitive form so that rivalry will be created between the various units of the railroad.

In the case of trespassing and highway-crossing accidents, it has seemed to me for some time that we have not applied ourselves to this vital question with deserved attention. We are too prone to take for granted that nothing can be done to check these evils. Consistent publicity, posters, and the medium of public and parochial schools, automobile clubs, and commercial associations, village, city, county, and state officials represent available avenues of approach in this matter.

It is but natural that certain developments during the past year should stand out preëminently as auguring well for the future of safety. One of these developments is the truly remarkable interest which has been manifested in safety by railroad men, as evidenced by the endorsements of the work of the Safety Section in the national conventions of the Brotherhood of Locomotive Firemen and Enginemen; Brotherhood of Railroad Trainmen; Switchmen's Union of North America; Order of Railway Conductors; Order of Railroad Telegraphers; Order of Railroad Station Agents; Brotherhood of Railway Clerks, Freight Handlers, and Station and Express Employees; Brotherhood of Maintenance of Way Employees; with a total membership of 1,182,000 railroad men and women.

Another development of significance is the universal approval of the safety committee organization and the entire plan for conducting this work as promulgated by the Safety Section. It is encouraging thus to observe as we go along that we are on the right track, and because we are right we are bound to achieve the goal of all safety men, whereby the lives and limbs of men, women, and children will be saved from railroad casualties, so far as it is humanly possible so to do.

M. A. Dow, general safety agent, New York Central, New York City, addressed the meeting on the "Value and Necessity of Safety Agents" and R. H. Doolittle, supervisor of safety, Colorado Southern, Denver, Colo., spoke on the co-operation of employees and officers in safety work on railroads.

A Big Improvement

The second session of the Steam Railroad Section was addressed by W. G. Lee, president of the Brotherhood of Railway Trainmen; T. H. Carrow, supervisor of safety, Pennsylvania Railroad, Philadelphia, Pa., and Robert Scott superintendent of insurance and Safety, Atlantic Coast Line, Wilmington, N. C.

Mr. Lee said in part:

No class of people can be more vitally interested in the progress of the safety movement than the trainmen. It is wholly due to the progress of the safety first idea that accidents and subsequent expenditure of money for death and disability claims has been lessened during the past year.

Additional promotion of care and safety propaganda and use of new safety appliances can lessen this loss in life and efficiency to a still more appreciable degree.

Approximately $4,000,000 was paid out in 1918 for death and disability claims in the railroad industry. So far in 1919 this figure has fallen below the three million

mark. This is due entirely to the safety movement, in my opinion.

Let's talk safety, plan safety, and above all, practice safety.

Study the Human Factor

Mr. Carrow presented a general outline of the salient features of safety committee work and methods of treating and disposing of suggestions and recommendations made to eliminate unsafe practices and conditions.

Mr. Scott said in part:

Safeguarding and education represent the essential elements of any safety organization, which naturally requires efficient planning, direction and supervision.

I have observed a tendency on the part of safety committeemen to confine their attention to the obvious mechanical and structural conditions, which should have been remedied by the foremen or supervisors, instead of studying the broader and more productive field of dangerous practices. In other words, there is always a tendency to superficial inspection which is difficult to overcome.

After selecting as head of the organization a man who has an abiding faith in the necessity for the work, it is apparent that next in importance is to place upon the committees only such men as are believed would prove loyal to the cause and can grasp the real meaning of safety, i. e., that it deals with human nature and human relations more than with structural or mechanical conditions. It is believed that if safety committeemen are of the type mentioned in the foregoing paragraph, they will create an atmosphere of intolerance, of careless and reckless habits in the territory in which they work. Not only will they be active aids to the safety department, but they will serve in various ways as the connecting link between the management and the rank and file men—between staff and labor. These are the men who will come to the assistance of the management in time of stress; who will come forward with information beyond the officials' vision, and who, in countless ways, will promote the unity of the entire organization.

The general safety committees should be composed of general and division officers, chosen in such a manner that the different departments of service shall be represented on that committee. The chief operating officer usually acts as chairman. It is desirable that this committee shall have general supervision of the safety organization.

A division safety committee, composed of division officers, with the superintendent as chairman, and one or more representatives of each of the different classes of service, should be formed and can be of much assistance to the general committee provided it has the proper conception of its functions, and will with intelligence and zeal seek to perform these functions.

At all shops employing more than several hundred men a safety committee composed of the principal officers of the shop, with the ranking officer as chairman, and one or more representatives of each of the different classes of service, should be formed. If the shop is under the jurisdiction of the division superintendent, the committee should report to the division safety committee, otherwise to the general safety committee. Too much care cannot be exercised in the selection of men to serve upon shop committees because of the necessity for having intelligent and enthusiastic committeemen who will take it upon themselves to instruct and advise new employees or older ones who are not inclined to follow safe methods in the performance of their work.

At each large terminal a safety committee should be formed, compose d of the officers in charge, with the superintendent or ranking officer as chairman and one or more representatives of each of the different classes of service. If the terminal is under the jurisdiction of the division superintendent, the committee should report to the division safety committee, otherwise to the general safety committee.

Where conditions require, local committees may be organized in yards, roundhouses, smaller shops, large freight houses, etc.

No accident prevention work can be successfully carried on without the hearty support of executive and supervising officers. As the first and essential step, then, in inaugurating a safety educational movement, should be a clear, unequivocal statement by the management as to where it stands.

To properly maintain interest in safety among the officers it is necessary that the man in charge of the work of accident prevention must be possessed of a compelling personality and that he will with diplomacy, tact, and perseverance keep the subject of safety ever before these officers, and present to them such interesting facts as will not only command attention but will actually cause them to become and remain deeply interested in it.

After having aroused the interest of employees, a more difficult problem arises as to how this interest can be held. I am convinced this cannot be done by following any one scheme, but can only be successfully accomplished by the employment of a combination of methods.

Among the things that have been used with the greatest success is the motion picture car, accompanied by a lecturer, on account of the benefit that accrues from placing the importance of safety before employees and their families, also in enlisting their interest and support in accident prevention. Carelessness has slain, crippled, and blinded more men, has made more widows and orphans, has left on the face of this earth more hands outstretched for charity than all the great wars or other calamities that have befallen mankind. Let us fight it with all the intelligence we are capable of developing and with the full strength of our manhood to the end that the world will be a better place for our having lived in it.

At the third session of The Steam Railroad Section, G. L. La Fountaine, general safety supervisor of the Great Northern at St. Paul, Minn., presented a paper on the "Importance of Proper Inspection of Tools Used in Shops and by Maintenance of Way Gangs" and J. L. Walsh, superintendent of safety of the Missouri, Kansas & Texas of Texas at Dallas, Tex., spoke on motor and hand car accidents. In addition a discussion was held on the causes and remedies for accidents in train service.

Mr. La Fountaine said in part:

For the purpose of formulating a definite plan of inspection, all hand tools used in shops and engine houses may be roughly divided into two classes—those which are circuated in general use and those which are regularly assigned to individual workmen.

In connection with the first class, I would suggest that every shop or engine house employing any considerable number of workmen maintain a tool room in which all hand tools of general use be assembled at the close of the day's work. A competent man should be placed in charge of this room with the care and inspection of those tools as his sole duty; he should maintain his stock in a good, serviceable condition at all times, and any tools worn to any appreciable degree, such as a chisel with a burred or mushroomed head or a wrench with rounded jaws, the further use of which invites one of these minor accidents, should be repaired or replaced at once. It should be impressed upon this man that the primary purpose of his being employed is in the interest of accident prevention, and that the responsibility for any accident resulting from the use of a worn or defective tool which left the tool room in that condition must lie directly with him.

In respect to those tools regularly assigned to shop employees, we encountered our greatest difficulties. These tools are kept in private lockers, and in a great many cases are subject to no other inspection but that of the employee him-

self. You will find as a rule, although he is known to be a conscientious and thoroughly dependable workman, that his tools have been gathered during a long period of selection and he regards them with not a little pride resenting inspection which may question their further serviceability. We must have frequent inspections. Since the majority of workmen cannot be relied upon to inspect their own tools, that duty must devolve upon the shop foreman.

To my mind, the foreman can make the most effective inspection of tools while they are in actual use because of the opportunity this affords him tactfully to demonstrate and explain the elements of danger in the imperfection, thereby teaching the employe by example, as well as precept, which will leave a lasting and favorable impression.

The inspection by the foreman might well be supplemented by a competent safety committee, such as now exists in practically all well-organized shops. Imbued with the proper spirit, the members of the committee can make frequent inspections of their fellow-worker's tools with their own daily experiences as a guide.

The importance of keeping the tools used by the maintenance of way gangs in good, serviceable condition is just as essential as that of every other department upon the railroad, and what I have said in connection with the method of inspecting tools assigned to individual workmen in the shops, will serve equally well with the maintenance of way gangs. The foreman of the gang should inspect the tools daily and know that they are in first class condition before permitting the employees to use them, and should be held strictly responsible for all accidents resulting directly from the use of worn or defective tools.

This inspection by the foreman should be especially severe during those seasons of the year when "new" men are added to his gang. Many of these men are absolutely inexperienced in the use of tools of any kind, and defective tools in their hands are a cause of far greater concern than such tools would be if their use were confined to experienced men.

Not only is such inspection an absolute necessity in the interest of safety, but they all should contribute much toward economy and efficiency. A well conducted method of tool inspection serves a double purpose: safety and efficiency, the two great factors of modern industry, which go hand in hand. If a tool is to do the work it was originally designed to do, it must be kept in its original entirety. The more it lapses from that state, the less efficient and more dangerous it becomes.

Motor and Hand Car Accidents

Mr. Walsh said, in part:

When efforts are made to reduce the number of hand and motor car accidents, the first consideration is usually given to the rate of speed at which cars are operated. When accidents occur, the speed of the car is not usually the primary cause of the accident. While division inspection cars might be operated safely at 20 or 25 miles per hour between stations on straight track, I think the general rule for section and B & B cars should provide a maximum speed of 15 miles per hour between stations and a maximum of 10 miles per hour over road crossings, over frogs and switches, in cuts, on curves, and during foggy weather.

Railroads adopting the motor car as standard for the maintenance of way department, and others having occasion to use them, should organize a motor car department, in charge of experts to keep the cars in repair, to make frequent inspections and adjustments from time to time, and to educate the employees using the car in its proper maintenance and safe operation. The expense of such a department should be offset by less delays and greater efficiency in cars in use.

On some railroads it has been the practice in the past to allow foremen to purchase their own motor car or gasoline engine with their personal funds, and in the latter case, a foreman usually fits the engine to a dismantled hand or push car, and creates a home-made motor car. This practice I think should be prohibited, as it is wrong in principle to require the employees to purchase their cars, and it leads to bad practices on the part of the foremen in many cases.

In addition hand and push cars are not constructed sufficiently strong to stand up well in service under the strain and pounding to which they are subjected when equipped with gasoline engines. These home-made motor cars in many cases are not properly equipped with the necessary safety devices, such as seats, guard or hand rails on the front of the car, toe boards, and proper hand brakes.

Cars I think should be of the direct-connected type, two-cylinder engine with its few parts to get out of order and adjustment. If possible to attach a speed governor restricting the speed to a maximum of 15 miles per hour to these cars, one that cannot be easily disconnected or tampered with, one that is simple and will not cause engine trouble, I would suggest that all cars for general use be so equipped. There should be a curved hand rail or guard extending to the floor on front of car, and also a toe board to prevent tools and material from bouncing off and derailing it. The wheels should not be more than 16 in. in height, and the floor of the car should be extended flush with the outer edge of the wheels to prevent men getting their feet under the wheels in attempting to board the car from the side. Last but not least, each car should be fitted with a positive acting, effective hand brake.

The surest method of keeping hand and motor car accidents to a minimum after adopting a practical, properly-equipped car as standard, best suited for the purpose intended, is I think, to promulgate a practical set of rules covering their inspection, maintenance, and operation, and see that they are strictly complied with.

Election of Officers

R. C. Richards, chairman of the Steam Railroad Section for the past year, was elected president of the National Safety Council to succeed David Van Schaack, and Fred Meyers superintendent of safety at the Wabash, St. Louis, Mo., was elected chairman of the Railroad Section succeeding Mr. Richards. Robert Scott, superintendent of insurance and safety of the Atlantic Coast Lines at Wilmington, N. C., was elected vice-chairman and H. M. Mayo, superintendent of safety of the Southern Pacific, Tex., was elected secretary of the Steam Railroad Section. Mr. Richards is the first railroadman to be elected president of the National Safety Council. A. F. Duffy, manager of the Safety Section of the United States Railroad Administration, was elected a member of the board of directors and Isaiah Hale, safety superintendent of the Atchison, Topeka & Santa Fe, Topeka, Kan., and R. C. Richards, chairman of the Central Safety Committee, Chicago & North Western at Chicago, were re-elected directors.

An exhibit of safety devices was held at Gray's Armory in connection with the convention and under the joint auspices of the National Safety Council and the Safety Institute of America. Among those who exhibited were the following:

American Abrasive Metals Co., New York City.
Benjamin Electric Manufacturing Co., Chicago.
The Buda Company, Chicago.
Central Electric Co., Chicago.
James B. Clow & Sons, Chicago.
General Electric Co., Schenectady, N. Y.
Norton Company, Worcester, Mass.
Pneumatic Safety Tool Co., Boston, Mass.
John A. Roebling's Sons Co., Cleveland, Ohio.
Safety Nut & Bolt Co., Cleveland, Ohio.
The Trumbull Electric Mfg. Co., New York City.
West Disinfectant Company, New York City.
Westinghouse Electric & Mfg. Co., E. Pittsburgh, Penn.
Steam Railroad Section, National Safety Council.
National Safety Council, Chicago.

Report on the Senate Committee's Railroad Bill

Chairman Cummins Discusses Need for Improvement in System of Transportation Regulation

Chairman A. B. Cummins of the Senate Committee on Interstate Commerce, on November 10 submitted a report on the railroad reorganization bill, of which the following is an abstract:

The first thought which the committee desires to impress upon the Senate is the importance of an early consideration of the measure and the establishment of a reasonably permanent status for our systems of transportation. The health, commerce, peace, prosperity, and growth of the United States are absolutely dependent upon adequate and constantly increasing facilities for transportation. Everybody understands that the existing condition is a temporary one; and, as we draw near the end of government operation the demoralizing influences multiply. The conceded return of these properties to their owners, within a short time, necessarily destroys or at least seriously impairs the morale of the operating force and it becomes less and less efficient. A still greater difficulty lies in the fact that no plans can be made for future improvements in the way of additions and betterments, to meet the growing demands of an expanding commerce. Naturally and properly, the Railroad Administration is disinclined to make expenditures of this character involving the execution of a program which, to be effectual, must be consistent and continuous, and the railroad companies are manifestly incapable of either making or carrying out provisions for the enlargement of their facilities for transportation. The result is a practical suspension of work in this direction. There is no practical way in which the period of partial paralysis can be avoided or prevented; but it is obvious, even to the most casual observer, that the period should be shortened by the most diligent attention on the part of Congress.

The bill repeals the act of March 21, 1918, commonly known as the federal control act; continuing it only in so far as is required to close up all matters growing out of federal control. The act takes effect at midnight on the last day of the month in which it becomes a law, and at that time the transfer of the properties in the possession of the government is to occur. All rights and remedies, both of and against the government, are preserved. Without commenting in detail upon what these rights are, it may be said that it will be many years before all the matters growing out of federal control will be adjusted, for the disputes already developed are numerous enough to occupy the attention of the courts for a decade. All that this report will attempt to do, in that respect, is to present an estimate of the uncontroverted condition as it will probably be on the 1st of January, 1920. The estimate has been prepared and furnished to the committee by the financial department of the Railroad Administration; but, as Mr. Sherley, who compiled it, very well indicates, it is only an estimate, for many things may happen before the end of the year to affect it.

To understand fully the financial statement, it is necessary to refer to the federal control act under which the director general of railroads has been operating about 230,000 miles of our 260,000 miles of railways. Whether the President took possession of all the railways at the beginning of the year 1918, is a subject of controversy. It is sufficient to say that the act of March 21, 1918, authorized the President to relinquish at any time prior to July 1, 1918, "control of all or any part of any railroad or system of transportation." About July 1, the President exercised this power and relinquished a large number of the shorter lines, retaining, as already suggested, something like 230,000 miles which had been from the first day of January, 1918, and still are being operated by the director general of railroads.

The federal control act empowered the President to agree with each carrier, whose property was taken over, for the payment of a maximum compensation equivalent to its average annual railway operating income for the three years ending June 30, 1917. Upon this basis the aggregate annual compensation for the use of the railways passing into the hands of the government and retained until the present time is, in round numbers, $900,000,000. At various times the President has entered into contracts with the several railway companies, adopting his maximum authority as the "standard return." With respect to the exact number of contracts so made, the committee is not advised, but it has information to the effect that while in the main the larger systems are under contract there are yet quite two-thirds of the whole number of carriers whose property is being operated by the government which have not signed what is known as the "standard contract." These companies may or may not sign in the future; and, if they do not, each of them will be entitled to recover from the government the just compensation which the law may award. With regard to those carriers, very many in number, which claim that their properties were taken over on January 1, 1918, but which were formally relinquished prior to July 1, 1918, they may or may not be entitled to compensation; and they are mentioned only to say that they are not included in the statement of the existing financial relations between the government and the transportation systems. The director general has made contracts with some of these carriers, but the committee assumes such contracts have not been made under the authority to agree upon compensation but are merely traffic agreements of the general character that one common carrier may lawfully make with another.

The Government's Loss

According to the estimate of the Railroad Administration, the net operating income of the systems in the hands of the government for the two years 1918 and 1919, will be $551,777,459 less than the compensation to which the carriers are entitled, computed as provided in the law and as prescribed in the standard contract; that is to say, when all accounts have been adjusted and paid the government will have lost that amount in its two years of operation. It is the opinion of the committee, without reflecting in any wise upon the Railroad Administration, that in the end the loss will be found to be much greater than the estimate submitted; but, however that may be, it must ultimately be paid from the Treasury of the United States.

As is well known, Congress has appropriated, in all, $1,250,000,000 for the use of the Railroad Administration. This sum, so far as the committee is advised, has been expended, or will be expended, for the purposes and under the conditions prescribed in the federal control act.

Assuming that the government's loss for the two years will be, in round numbers, $600,000,000, it is obvious that if the railways could pay on December 31 all that they owe the government, $650,000,000 of the appropriation would be returned to the Treasury; but that will not be the situation, for it is entirely impossible for the railways to repay out of income the sums which have been advanced by the government for additions and betterments—expenditures which are ordinarily charged to capital account. It will be-

come necessary for the government to pay the railways a large part of the compensation in order that the carriers may pay the interest upon their bonds and other fixed charges and make such distribution in the way of dividends as will prevent undue hardship among their stockholders. If the government retains about $400,000,000 and applies that sum upon the amount due from the railways on account of additions and betterments, the government would still carry about $525,000,000 of the additions and betterments. If, however, it shall carry for future payment all expenditures during the two years for additions and betterments, it must fund nearly $950,000,000 on that account alone. If it is also to carry the amount of cash in the hands of carriers on January 1, 1918, taken over by the government, and the balances in the hands of agents, the amount to be funded would be increased $383,000,000; making a total substantially of $1,300,000,000.

The bill before the Senate pursues a middle course with respect to funding the indebtedness due from the carriers to the government which is thought to be just both to the public and the railways. Nearly three weeks ago the committee asked the Railroad Administration to furnish a statement applying the provisions of the bill to the settlement of accounts and showing just what the result would be; but, up to this time, the statement has not been received.

October 22 the Railroad Administration, through the director of the Division of Finance, sent to the chairman of the committee a letter which presents the basis of the general conclusions above stated. It is in part as follows:

"I beg to give you below a statement showing, on the basis of the best estimate that we can make at this time, an approximation of the amount that would be needed to defray operating deficit, the amount that the Railroad Administration will have temporarily tied up in various assets and the additional amount that will be required in order to aid in the liquidation of the affairs of the Railroad Administration.

The figures are necessarily tentative because the latest balance sheet is for June 30, 1919, and necessarily the most careful estimates can not possibly disclose the precise facts as they would develop during the last six months.

"The figures given are upon the assumption that disposition will be made in accordance with the terms of the standard contract. The other possible disposition suggested in amendments proposed to provide for funding a certain amount of the indebtedness of the railroads would naturally present the matter in a different aspect.

"In order to enable settlements with the railroad companies at December 31, 1919, it will necessitate the payment to them of approximately $326,541,893, arrived at as per the following table:

Accounts with the corporations immediately payable at December 31, 1919.

Due the Government:		
Demand loans		$53,078,186
Short term notes		75,553,167
Open account balances due Government	$220,053,510	
Less amount not now collectible	66,028,228	
		154,025,282
For additions and betterments, other than allocated equipment, financed from income		370,381,494
Allocated equipment financed under general equipment plan		200,000,000
For additions and betterments financed through open account due company		45,100,132
Total immediately payable to Government		$898,138,261
Due the corporations:		
Balance due on compensation		$855,395,851
Depreciation and retirements		304,179,281
Open account balances due corporations		65,105,022
Total immediately payable to corporations		$1,224,680,154
Amount needed to be appropriated to enable the Railroad Administration to immediately pay to the corporations the net amount due them		$326,541,893

"When the Railroad Administration shall have made settlement with the railroad companies in accordance with the foregoing the situation will be as follows: The Railroad Administration will have expended and there will, in consequence, have been correspondingly consumed or tied up—

1. Amount necessary to defray operating deficit, the difference between the standard rental payable to the railroad companies and the estimated net operating income for the 24 months ended December 31, 1919	$551,777,459
2. Amount of cash working capital necessary to leave temporarily with the corporations until the returns from the operation of their properties after Federal control become available	357,943,276
3. Amount of open account due Government by the corporations, representing payments by Government of corporate liabilities which the corporations can not repay at this time	66,028,228
4. Amount of additions and betterments' expenditures including equipment, made to the railroad companies' properties during 1918 and 1919, which must be carried by the Railroad Administration for the time being	518,075,309
5. Improvements on inland waterways	14,341,885
6. Loans during 1918 and 1919 to railroad companies not immediately repayable	48,375,735
7. Boston & Maine reorganization	20,000,000
Total	$1,576,541,893

"Appropriations heretofore made and applicable, to the foregoing aggregate $1,250,000,000, so that to discharge its obligations as they exist at December 31, 1919, on the basis of the standard contract, the Railroad Administration will need an additional appropriation, it is estimated at this time, of $326,541,893.

"Concerning the proposal to fund the indebtedness of the railroad companies to the Railroad Administration, it will be noted that a settlement under the contract contemplates that there will have been retained in settlement with the companies, on account of additions and betterments to their properties, the sum of $415,481,626 and that it is contemplated that even with that deduction from the compensation that the government, nevertheless, will be carrying $518,075,309 of additions and betterments which the companies are not able to repay at this time, so that if the whole amount of the indebtedness for additions and betterments should be funded the above appropriation would have to be increased by the amount of $415,481,626 and the government would then be required to fund for additions and betterments the sum of $933,556,935.

"Regarding the proposal of the corporations that the amount of the working capital taken over should also be funded, it is to be observed that at the beginning of federal control the amount of cash in the hands of the treasurers, so taken over by the Railroad Administration, aggregated $239,190,605. In addition, the balances in the hands of agents and conductors aggregated $143,899,424.

"If the proposal looks to the furnishing of these amounts in addition to amounts sufficient to pay off the liabilities of the Railroad Administration, that amount would have to be added to the requirements shown above. However, the fact is that the Railroad Administration used such cash and agents' and conductors' balances in liquidating the liabilities of the corporations in the earlier months of federal control and it is to be assumed that a like process will take place at the end of federal control.

"If, therefore, the Railroad Administration leaves in the hands of the corporations a sufficient amount of working assets to liquidate its liabilities, not all of which must be paid simultaneously with the end of federal control but which will be liquidated doubtless spreading over a period of from 30 to 90 days (it is true that a considerable part of such liabilities must be met in the first 15 days following the return of the roads to private control and a sufficient amount of cash or other quick assets should be left with the corporations to protect them) it would be ample protection to the corporations in point of working capital and would practically duplicate the situation as it developed when federal control intervened.

"As stated above, the Railroad Administration used the cash assets of the corporations, generally, for the payment of the corporations' liabilities. To the extent that there is a balance in the hands of the Railroad Administration, resulting from such trasactions, the statement showing the account with the companies on page 2 of this letter, contemplates that such amount will be paid over to the companies except to the extent that any such amounts may be properly

applied to the repayment of the indebtedness of the companies to the Railroad Administration.

"To the extent that such process resulted in the Railroad Administration paying corporate liabilities in excess of assets, the account on page 2 of this letter contemplates, moreover, the collection thereof from the corporations only in cases where it is practical for such corporations to make payment thereof from balances of compensation due them.

"On this theory, the foregoing indicates that the government will be required to carry, for the time being, balances due from the corporations on open account aggregating $66,000,000.

"With reference to the amount shown above for working capital temporarily tied up, it should be observed that a considerable part of the assets of the Railroad Administration are represented by items other than cash. For example: traffic balances, accounts receivable and various unadjusted items, both debit and credit, that are necessarily incident to a business of such magnitude and which can not finally be cleared up short of several months. The amount shown represents the balance between such unsettled assets and unsettled liabilities—the net being the figure which is shown as the amount which the government will temporarily have tied up as working capital.

"If for any cause the plan for a general equipment trust should not be carried out, there will be needed a sum greater than has been set up. How much, it is now impossible to foretell. The general equipment trust plan contemplates a repayment to the government of at least $200,000,000 which figure has been used in the foregoing statements. In the absence of a general equipment trust plan, some moneys could be immediately secured through equipment trusts of individual carriers. Perhaps something like $100,000,000 could be obtained in this regard. So that the figure given above, $326,541,893, might need to be increased by $100,000,000.

"I think it is desirable that I again emphasize the fact that this statement, though made from a somewhat detailed examination of accounts with the respective carriers, of necessity can not be considered as final. The need to forecast events more than two months away of itself introduces elements unstable enough to make conclusions necessarily tentative only.

"In addition, there are various matters that will only reach adjustment and a status sufficient to enable them to be stated in financial terms after presentation and determination of claims respectively by the government and the railroads touching many items incident to federal control. So that in particular the item set out under the designation of 'Amount necessary to defray operating deficit, etc., must be considered as subject to considerable change because of the subsequent bringing into it of debits and credits which can not now be even approximated. I am sure that you will appreciate these facts and I emphasize them simply that a cursory statement of the figures therein submitted may not lead others to erroneous conclusions."

The Policy Established by the Bill for Future Control and Regulation

Having made clear, as it is hoped, the terms upon which the railways are to be returned to their owners for private operation under public control and regulation, the committee advances to these parts of the bill which create the permanent system for such control and regulation. In considering this phase of the subject, it should be constantly borne in mind that if our policy is to be private operation of the instrumentalities of transportation there must be a large and constant inflow of capital. As commerce increases in volume, the facilities of transportation must increase; and, without reckoning the funds which must be secured to discharge maturing obligations already in existence, it will be conceded by everybody that immense sums will be required from year to year for new construction, additional equipment, and necessary improvement. The capital thus demanded must be drawn from those who have money to invest, and, of course, it must be voluntarily contributed. If the people who have money will not invest it in the transportation enterprise, private ownership and operation under public control must necessarily fail. It is apparent, therefore, that any legislation which may be proposed upon the hypothesis of private ownership and operation must tender to the future investor reasonable security for the investment he is asked to make and reasonable assurance of such yearly return upon his money as will induce him to enter the field. The better the security and the more certain the return, the less will be the rate required to attract the investment.

It is here that our present system of regulation has failed. Taking the railways as they are, with their widely varying conditions, both of construction and environment, it is wholly impossible for the Interstate Commerce Commission, no matter how wise and faithful its members may be, to prescribe schedules of charges for transportation that will be, at the same time, just to the public and that will maintain the railways which must continue to function if the people of the country are to be provided with adequate transportation. In a given competitive area the rates which will furnish one company a grossly excessive income will lead another into bankruptcy. The writer of this report is firmly convinced that when the government assumed the operation of the railways they were, taken as a whole, earning all they should be permitted to earn; but, in the inevitable distribution of these earnings among the various railway companies, the railways which carried 30 per cent of the traffic were earning so little that they could not, by any economy or good management, sustain themselves. Nevertheless, it is unthinkable that these highways of commerce shall be abandoned, and some system must be devised not only for their continuance but for their betterment and growth. Government ownership would solve the problem, but it is the judgment of the committee that government operation is attended with so many disadvantages—notably in the increased cost of operation—that this plan must be discarded. There is but one other solution. It is consolidation, and here two policies at once present themselves. The first, complete consolidation into one ownership; second, consolidation into comparatively few competitive systems. The first has some advantages over the second, but it has some disadvantages, and the disadvantages outweigh, in the opinion of the committee, the advantages.

The superior efficiency of several systems need not be enumerated at length, but there is one consideration to which attention should be called: Competition, not in rates or charges but in service, will do more to strengthen and make public regulation successful than any other element which can be introduced into the business of transportation. Honorable rivalry among men is the most powerful stimulus known to human effort. For this reason, largely, the committee, recognizing the necessity for consolidation, determined in favor of the gradual unification of the railways into not less than 20 or more than 35 systems; not regional or zone sytems but systems that will preserve substantially existing channels of commerce and full competition in service. In the grouping of the railways into these systems, another vital rule is to be observed; namely, that they are to be so divided that the operating incomes of the several consolidated companies will bear substantially the same relation to the value of their respective properties held for and used in transportation.

The procedure for bringing about the proposed consolidation may now be considered. The bill creates a transportation board, with large duties and powers, which will be more fully explained hereafter. Section 9 declares the policy of consolidation; prescribing that, as soon as practicable and in the manner provided for in the act, the railways of the continental United States shall be divided in ownership and for operation into not less than 20 or more than 35 separate and distinct systems; each of said systems

to be owned and operated by a distinct corporation organized or reorganized under the act. Section 9 concludes:

In the aforesaid division of the said railways into such systems, competition shall be preserved as fully as possible, and wherever practicable the existing routes and channels of trade and commerce shall be maintained. The several systems shall be so arranged that the cost of transportation as between competitive systems and as related to the value of the properties through which the service is rendered shall be the same, so far as practicable, so that these systems can employ uniform rates in the movement of competitive traffic and under efficient management earn substantially the same rate of return upon the value of the railway properties involved in the comparison.

Especial attention is directed to the sentence last quoted, for it expresses the object to be attained; and until it is attained rate regulation can not be fully equitable to both the public and the carriers.

Immediately upon its organization, the transportation board is to prepare and adopt a tentative plan for consolidation. The plan is to be submitted to a public hearing, at which it is assumed that all persons interested will appear. After the hearings are concluded, a final plan is to be adopted and submitted to the Interstate Commerce Commission for its approval. This arrangement will make known to the whole country the consolidations which must eventually occur. Section 12 presents the authority for the reorganization of existing railway corporations, and all consolidations must be either through a reorganized railway corporation or one originally organized under the terms of the act. It is to be noted, also, that if a partial and voluntary consolidation is carried into effect it must be in harmony with and in furtherance of the complete plan established by the board. Sections 21 and 22 provide for the original incorporation of railway companies; and, concerning this part of the bill, it need only be remarked that any such corporation must be organized "for a specific and defined purpose, namely, the ownership, maintenance, and operation of one of the railway systems or for the construction, ownership, maintenance, and operation of new lines or systems into which the railways of the United States are to be divided by the aforesaid board."

For the period of seven years after the act becomes a law, voluntary consolidations are authorized, under the strictest supervision by either the board or the commission. The distinctive feature of the voluntary as well as the involuntary consolidations is that the capitalization is not to exceed the actual value of the property held for or used in the transportation service. When the Interstate Commerce Commission finishes the valuation in which it is engaged and when those values, as they are judicially determined and only those values, pass into the capitalization of the newly organized or reorganized corporations under this act, that serious obstacle in the way of effective regulation will have disappeared.

At the end of seven years the compulsory consolidation begins. It is carried out as provided in section 13. If, during the seven years, voluntary consolidation has accomplished the purpose, this section, of course, will not be operative; but, during the voluntary period, its presence in the law will be a compelling force which, in the judgment of the committee, will stimulate the present railway companies to carry forward the declared policy of Congress.

The full advantages of the proposed policy of consolidation can not be secured for 10 or 12 years. The railways must be returned to their owners at once. This situation makes it necessary to provide a plan for immediate relief that will tend, at least, to overcome the difficulties confronting us and render private operation possible.

A Review of The Plan

In this regard the bill attempts to accomplish three results: First: By prescribing a basis of return upon the value of the railway property, to give such assurance to investors as will incline them to look with favor upon railway securities; that is to say, by making a moderate return reasonably certain to establish credit for the carriers.

Second. In making the return fairly certain to secure for the public a lower capital charge than would otherwise be necessary.

Third. In requiring some carriers, which under any given body of rates will earn more than a fair return, to pay the excess to the government and in so using this excess that transportation facilities or credit can be furnished to the weaker carriers and thus help to maintain the general system of transportation.

To bring about these results, section 4 requires the Interstate Commerce Commission immediately to divide the country into rate districts, having in view the similarity or dissimilarity of transportation and traffic conditions therein and to institute hearings to determine the adequacy of the rates in any such district from the revenue standpoint and considered as a whole. The rule to be applied in passing upon such issues is announced in section 6, wherein it is stated that the rates shall be so adjusted "as nearly as may be so that the railway carriers as a whole allocated to each district and subject to this act shall earn an aggregate annual net railway operating income equal, as nearly as may be, to 5½ per centum upon the aggregate value, as determined in accordance with the provisions hereof, of the railway property of such carriers in the district held for and used in the service of transportation." To this basis the commission is authorized to add, in its discretion, one-half of 1 per cent upon this value as a current contribution to improvements, betterments, or equipment unproductive in character, but which are customarily charged to capital account. This part of the revenue, however, if raised at all, is, in the future, not to be capitalized by any carrier whose net railway operating income for the year is more than the basis adopted; namely, 5½ per cent.

The basis thus established has been the subject of much criticism. On the one hand, it is asserted by the carriers that it is too low and will not enable them to obtain the money which they must have in order to develop their properties and provide further transportation facilities which the country demands. On the other hand, it is asserted, with equal emphasis, by some advocates representing the shippers, that the basis is too high and will give the carriers a greater revenue than they need or ought to have. There were differences of opinion in the committee with respect to the matter, and it is but fair to say that the basis presented is a compromise of these differences. It is believed, however, that both sides of the controversy somewhat exaggerate the facts, or, rather, fail to take into consideration all the facts which influence the subject. In reaching a conclusion, it ought to be borne in mind that the property to which the basis is to be applied is railway property only; that is, the property which renders the service of transportation. All outside investments by railway companies are excluded. Further, in valuing these properties the commission is to be guided by the rules of the law and is not bound by either capitalization or by what is commonly known in the accounting system of the commission as "property investment accounts."

Those who insist so earnestly that the basis will provide insufficient revenue generally ignore the fact that at the present time there are outstanding more than eleven billions of railway bonds which bear an average interest of about 4½ per cent, and on that part of the value of the property the carriers will save 1 per cent. It must also be remembered that the 5½ per cent basis for a rate district will not give to each carrier in that district 5½ per cent upon the value of its property. To some carriers the return will be much higher and to others correspondingly lower. To illustrate: In the test period for ascertaining compensation under the

act of March 21, 1918, the average net annual operating income of the class I railways was 5.2 per cent upon the aggregate property investment account. There are, however, wide differences when the individual carriers are considered. Under this average, the New York Central System earned 6.09; the Pennsylvania Co., 6.25; the Pennsylvania Railroad, 5.36; the Delaware & Lackawanna, 7.54; the Erie, 3.56; the Baltimore & Ohio, 4.67; the Chicago, Burlington & Quincy, 7.02; the Chicago & North Western, 6.13; the Missouri Pacific, 4.43; the Union Pacific, 6.72; the Southern Pacific, 4.99; the Northern Pacific, 6.27; the Great Northern, 6.70; Atchison, Topeka & Santa Fe, 6.16; Chicago, Milwaukee & St. Paul, 4.71; Chicago, Rock Island & Pacific, 4.72; Chicago Great Western, 1.77; Chicago & Alton, 2.64; Western Pacific, 2.28; Colorado Southern, 3.04; Missouri, Kansas & Texas, 2.81; Texas Pacific, 3.76; Wabash, 2.91; Western Maryland, 2.58; New York, New Haven & Hartford, 5.96; Boston & Maine, 4.80; Cincinnati, Hamilton & Dayton, 1.95; Atlantic Coast Line, 5.76; Seaboard Air Line, 3.68; Southern Railway, 4.12; Louisville & Nashville, 6.32; Illinois Central, 5.48.

The basis adopted by the committee is three-tenths of 1 per cent higher than the basis of the test period; and, assuming, though not conceding, that the value of the property is equal to the aggregate of the property investment accounts, it will yield for all the railways a net operating income of $54,000,000 in excess of the income of the test period.

There were two considerations which led the majority of the committee to believe that this increase is not only warranted but necessary:

First. The railways are being returned to their owners when everything is unsettled and abnormal; when there is suspicion and distrust everywhere. Just what rate of return will enable the carriers to finance themselves under such conditions can not, with certainty, be determined. It was, therefore, felt that some increase over the pre-war period is justifiable.

Second. As compared with all kinds of commodities, money is much less valuable than it was a few years ago, and it would seem to be only fair that the returns from railway investments should be reasonably advanced.

The committee, however, recognized that the present situation may be temporary, and that in the course of time the country may be restored to something like its former circumstances, and it provided for this very probable change in the last paragraph of section 6, as follows:

> That in the year 1925 and in every fifth year thereafter the commission shall determine what, under the conditions then existing, constitutes a fair return upon the value of such railway property, and it may increase or decrease the 5½ per centum basis herein prescribed, or the basis for the determination of excess income.

These are the reasons, in chief and in brief, which convinced the committee that the 5½ per cent basis for computing the annual operating income of the carriers is fair and just, both to the public and the railway corporations.

It is obvious that if the law gives to the carriers the assurance of income heretofore mentioned there should be a maximum beyond which an individual carrier shall not be permitted to retain for its own use all it may receive under a given body of rates. Referring to the illustrations already given, it is seen that with uniform rates, and they must be uniform in competitive territories, one carrier will receive an operating income of 2 per cent, another 4 per cent, another 6 per cent, another 8 per cent, and others still more. The bill fixes a standard of excess income and requires the carriers which receive an excess income (which will hereafter be explained in detail) to pay the excess to the transportation board for uses that have been mentioned and which will be more fully stated in a subsequent paragraph of this report.

Upon this requirement there has been a long-continued and earnest controversy before the committee. It has been contended by eminent lawyers that the provision is unconstitutional in that it takes property without compensation. It has been urged by equally eminent lawyers, and probably more of them, that it is not only constitutional but absolutely necessary if private ownership and operation are to be continued. It would unduly prolong this report to enter upon a review of the authorities or an argument which would embrace all the considerations which are material to the question. It is sufficient to say that a large majority of the members of the committee entertain no doubt with respect to the authority of Congress in establishing this policy. Heretofore the regulation of transportation has been regarded merely as a restriction imposed upon particular carriers. For the first time it is proposed to look upon transportation as a subject of national concern and from a national standpoint. It is the duty of the government so to exercise its power of regulating commerce among the states and with foreign nations that all parts of a common country shall enjoy adequate transportation facilities at the lowest cost consistent with fairness to the capital invested and to the men who manage and operate these facilities. The commerce of one community, in these days, is deeply involved in the commerce of every community in the land. All the railways we have, or substantially all, must be maintained; and, from time to time, they must be enlarged and additional facilities must be provided.

If the lawyers who insist that taking excess income is unconstitutional are right in their premises, their conclusion would be unassailable. They assume that all the earnings of a given railway under a prescribed body of rates become the absolute property of the carrier which receives them. This is not true under the system which the bill creates; and, therefore, the conclusion is unsound. If there were but one railway in the country, it would be entirely possible for the regulating commission to fix rates for it under which it could not earn more than 6 or 7 per cent upon the value of its property, but we have a thousand railways; and rates for transportation must be fixed with reference to all of them and to the needs of the people to whom all of them render their service. These conditions make it utterly impossible to fix rates which are reasonable for one carrier, considered apart from all the remainder. It is, therefore, in the competence of Congress to declare that the income which any particular carrier receives beyond a fair return upon the value of its property, it receives as a trustee for the public and not as its own absolute property. If this analysis of the power of regulation is not sustained, then the authority granted in the Constitution is a mere delusion.

With reference to excess income, the bill provides that any carrier receiving a net railway-operating income in any year of more than 6 per cent upon the value of its property, one-half of the excess between 6 and 7 per cent is to be placed in a company reserve fund, and the remaining one-half is to be paid to the transportation board. Of any excess above 7 per cent, one-fourth is to be placed in the company reserve fund, and the remaining three-fourths is to be paid to the board. When the reserve fund equals 5 per cent of the value of the railway property and is maintained at that amount, one-third of the excess above 6 per cent is to be at the disposition of the carrier for any proper purpose, and two-thirds is to be paid to the board.

The company reserve fund may be drawn upon by the carrier whenever its annual net railway operating income falls below 6 per cent of the value of its property. The reserve fund is, of course, the absolute property of the carrier; and the purpose in requiring it to be created and maintained is to give stability to the credit of the carrier and enable it to render more efficiently the public service in which it is engaged.

The sums which are to be paid to the transportation board

are to be placed in a general railroad contingent fund, which is to be used by the board, together with all its accretions, "in furtherance of the public interest in railway transportation," "in avoiding congestions, interruptions, or hindrances to the railway service of the United States," or "in furthering the public service rendered by them (carriers), either by way of purchase, lease, or rental of transportation equipment and facilities to be used by such carriers whenever the public interest may require, or by way of loans to such carriers, upon such fair and reasonable terms and conditions, in either case, as the board may prescribe."

The Transportation Board

Section 7 creates a new public authority for the regulation of commerce. Its title is "Transportation Board." It is to be composed of five members, until the consolidation heretofore mentioned is complete and, thereafter, of three members.

The first duty of the board is to prepare and, after hearing, adopt the plan of consolidation. Its general powers with respect to transportation are stated in the latter part of section 10, and these include certain functions now exercised by the Interstate Commerce Commission, among which may be mentioned the following: (*a*) The administration of the car service act; (*b*) of the safety appliance acts; (*c*) of the hours of service act; (*d*) of the locomotive boiler inspection act; and others of like character. It is also charged with a series of important duties relating to water transportation, mainly by way of investigation but leading to most important results. The committee hopes that this part of the bill will be carefully examined, for it is the first real recognition of the coordination of water and land transportation which must eventually be accomplished.

Section 11 confers further powers upon the board. These powers are new to our system of regulation but are considered by the committee as essential. They look toward unification in operation where conditions demand either a diversion of traffic or a common use of facilities.

In section 24 the board is also given control over the issuance of railway securities. It is deemed unnecessary to enlarge upon this subject, because it has been so often before Congress that we are all familiar with it in a general way. The car service act, which is to be administered by the board, is greatly enlarged; and, as now proposed to be amended, will be found in section 34. The thirteenth paragraph of section 6 of the act to regulate commerce is amended in important particulars, and the administration of that paragraph is given to the board.

Section 45, an entirely new regulation, which is intended to increase our export and coastwise trade by making it easier for the interior shipper to avail himself of the ocean routes, is to be administered by the board.

Having thus indicated the chief duties and powers of the transportation board under the bill, it may be helpful to state some of the reasons which led the committee to the conclusion that it is wise to create this additional tribunal in our regulatory system instead of committing to the Interstate Commerce Commission all the new duties and leaving with it all its present duties.

Every member of the Senate knows that the Interstate Commerce Commission is the most overworked body of men in the government; its members are able and industrious, and they labor continuously from the beginning to the end of the year. Nevertheless, they can not keep pace with the demands already made upon them, and, oftentimes, justice delayed is justice denied. The bill the committee has presented increases tremendously the work which some body of men must do if its provisions are promptly carried into effect. It was apparent to the committee that it must adopt one of two alternatives: It must either recommend a very considerable enlargement of the commission, with such division into sections as would permit independent action; or it must recommend the creation of a distinct body. It chose the latter alternative. In determining the division of work, power, and responsibility as between the two bodies, the committee has traced a clear, obvious line. It has not been able, always, to observe the exact distinction; but, in the main, it has succeeded in doing so.

The bill leaves with the Interstate Commerce Commission the quasi-judicial powers; that is to say, everything pertaining to rates and rate-making will be as heretofore, in the hands of the commission. The valuation of railway property, under the act of 1913, remains with the commission. The accounting or reporting system is to be conducted by the commission as inseparable from rate making. There are many other and most important duties to be performed by the commission, so many, indeed, that the committee has some doubt whether it will be able to do its work promptly. These, however, need not be specified, as a reading of the bill and a familiarity with the existing law will disclose them. The transportation board is given, chiefly, the powers which are more nearly and directly connected with the physical operation of the railways and the issuance of securities, power over the things tending for safety, both to employees and the public. It is believed that the division of powers and duties has been so adjusted that opportunity for conflict or discord is practically excluded. It may be here remarked that one of the most vital powers given to the board relates to the settlement or adjudication of disputes between railway employers and employees; but this part of the bill deserves separate consideration and to that subject the committee now invites your attention.

Labor Provisions

It is not necessary to enter upon the details of the establishment of the tribunals created for the adjudication of demands, disputes and controversies which may arise from time to time between railway corporations and railway employees. These provisions will be found in sections 25, 26, 27, and 28 of the bill. It is sufficient to say that there are to be appointed three regional boards of adjustment and a committee of wages and working conditions. These four tribunals, made up in each instance of an equal number of men nominated by railway crafts and railway corporations, have original jurisdiction of all complaints, demands, disputes, and controversies between employers and employees which are not adjusted or settled between the parties themselves. In the event of the failure of these boards of adjustment or the committee of wages and working conditions to reach a decision, the transportation board has final authority; and, indeed, all decisions of these boards or the committee must be approved by the transportation board. It is intended in these sections to bring into existence governmental tribunals so composed that, in so far as mortal man can do justice, there will be complete, impartial justice done to both railway corporations and railway employees and to the public as well.

Hitherto, the government has not undertaken to adjudge the disputes which have so disturbed the field of transportation and which promise to be still more serious in the future than they have been in the past. All that legislation has done up to this time has been to authorize mediation and conciliation and to present an opportunity for voluntary arbitration. After the most careful consideration, it is the judgment of the committee that the time has come to make another advance in the settlement of disputes likely to end in the suspension or restraint of transportation. This forward step must be clearly understood in order to be justly considered. In a controversy between railway workers and railways managers with respect to wages and working conditions and which could only be settled by agreement between the disputants, the right to strike, that is, a concerted cessation of work, seems inevitable; for it is the

only weapon which the workers could effectually employ. A proposal to prohibit an agreement among workers to quit their employment at a given time without substituting some other instrumentality for securing justice would not receive at the hands of Congress a moment's consideration. In making the strike unlawful, it is obvious that there must be something given to the workers in exchange for it. The thing substituted for the strike should be more certain in attaining justice and should do what the strike can not do; namely, protect the great masses of the people who are not directly involved in the controversy. The committee has substituted for the strike the justice which will be administered by the tribunals created in the bill for adjudging disputes which may hereafter arise.

From the public standpoint and in the interest of the people generally, it has become perfectly clear that, in transportation, at least, both the strike and the lockout must cease. This country has been so developed, its population is so situated, its commerce so crystallized that regularity and continuity in transportation have become absolutely indispensable to the lives and health of the people and the existence of our industrial and commercial welfare. A general suspension in the movement of traffic for a fortnight would starve or freeze, or both, a very large number of men, women, and children; and, if it were continued a month or two months, it would practically destroy half our population. Our business affairs would be so disordered that the loss would be greater than in any conceivable war in which we might engage. It is just as much the function of the government in these circumstances to see to it that transportation is adequate, continuous, and regular as it is to maintain order, punish crime and render justice in any other field of human activity. It is clear, therefore, that the government must settle the controversies between railway managers and railway employees which, if left to be fought out between the parties themselves, will lead to the consequences just described. There is but one way in which this can be done: The government must undertake to declare, in any such case, what is justice, what is fair and right, between the parties to the dispute, and then there must be no concerted rebellion or conspiracy among those whose rights have been adjudged for the purpose of coercing either of the parties to the dispute into another and different settlement.

The railway unions are especially opposed to these provisions of the bill, and the committee addresses a word directly to them. In the step the committee has taken there is no hostility to unionized labor; no opposition to collective bargaining. Indeed, the unions and collective bargaining are necessary parts of the plan suggested in the bill. The unions can be more effective in securing justice under the proposed arrangement than they ever have been through the strike, for after all, even the most zealous of the union leaders must admit that their efforts through the strike, from their own standpoint, have substantially failed. The existing complaints with respect to wages and working conditions must be sufficient evidence to these leaders that they have not been able to attain their objects in the old way. Why not, then, exchange the instrumentality which they are now insisting upon and which can be tolerated no longer in a free country, for a better one; namely the justice of an impartial governmental adjudication? The committee is aware that the union leaders feel that they can not hope for justice from the government, but in the opinion of the committee this distrust has no foundation and ought to give way to confidence and hope. If we can not organize tribunals which will do justice to employees, employers, and to the public in a business which so vitally affects the welfare of the nation, then the government is a complete failure and free institutions must be abandoned as an unsuccessful experiment. The committee believes that, when the heat of the immediate conflict over this legislation has subsided, a great majority of the railway workers will hail the substitution of intelligent and impartial tribunals, which will render justice to them, for the right to enter into an agreement or combination to destroy transportation as a deliverance; and as a better way to secure what rightly belongs to them than the methods which they have heretofore employed.

The committee has now reviewed those parts of the bill which propose legislation along lines distinct from those which have been already attempted. There are, in the bill, many amendments of the act to regulate commerce remedying defects which have been disclosed in the administration of the present law; but it is believed that these corrections need not be specifically enumerated in this report. When the bill is presented in debate, all these matters will be carefully explained.

It is but fair to say that this report has not been considered by the committee. It is the work of the chairman, and he alone must be held responsible for it.

Ripley Becomes Chairman and Storey President of the Sante Fe

EDWARD P. RIPLEY, president of the Atchison, Topeka & Santa Fe Railway Company, has been elected chairman of the Board of Directors, effective January 1, 1920. He will be succeeded as president by William B. Storey, Jr., federal manager of the Atchison, Topeka & Santa Fe; the Panhandle & Santa Fe; the Rio Grande, El Paso & Santa Fe; the Kansas Southwestern; the Grand Canyon; the Atchison Union Depot & Railroad and the Pueblo Union Depot & Railroad. Prior to government control of the railroads Mr. Storey was vice-president in charge of construction and operation, with headquarters at Chicago,

Edward P. Ripley

William B. Storey, Jr.

Ill., and his election to the presidency follows the policy of the Santa Fe in filling higher positions from its own staff.

Mr. Ripley has been president of the Atchison, Topeka & San Fe Railway Company since the reorganization of the road went into effect on January 1, 1896. Mr. Storey has been vice-president in charge of construction and operation of the Santa Fe System for the past nine years, excepting during his service as federal manager.

For the *Railway Age* at this time to publish a long sketch of Mr. Ripley's railroad career would be a work of supererogation. For many years his career has been followed with keen interest by railway men of all ranks throughout the country. On October 30, 1915, three hundred men, who included the leading railway and business men of the United

States, attended a dinner in Chicago to do him honor on his seventieth birthday. In the issue of the *Railway Age* for November 5, 1915, were published the addresses made on that occasion, which thoroughly reviewed and appraised Mr. Ripley's work.

If he had continued to be president of the Santa Fe until January 1, 1920, he would have filled that office for 24 years, and his record throughout that period has been one of constantly increasing reputation and achievement. When he became president of the Santa Fe it had just emerged from bankruptcy. At the time of his retirement from the presidency the road is universally recognized as one of the best physically, and soundest financially, in the world, besides having a reputation for rendering service of the highest order. Nobody will question that to Mr. Ripley's foresight and ability the creation of the Santa Fe System of today is chiefly due. While he is retiring from the presidency of the company he is taking the chairmanship and this means that when the railway is returned to private control he will continue to play a very important part in its management, although of course Mr. Storey will become its executive head.

Mr. Ripley was born at Dorchester, Mass., on October 30, 1845, and entered railway service in 1868 as contracting agent for the Star Union Line, with headquarters at Boston, Mass. On October 1, 1870, he entered the service of the Chicago, Burlington & Quincy as a clerk in the office of the general eastern agent, with offices at Boston. From 1872 to 1875 he was New England agent for the same road with the same headquarters, and from 1875 to 1878 he was general eastern agent, and on June 15 of the latter year was appointed general freight agent. In 1887 he was promoted to traffic manager and in 1888 to general manager of the same road. In August, 1890, he was elected third vice-president of the Chicago, Milwaukee & St. Paul, which position he held until his election to the presidency of the Santa Fe. Under Mr. Ripley's administration the system's mileage has increased from a total of 6,435 miles to 10,732 miles.

When Mr. Ripley was elected to the presidency, among his first undertakings was the sale and abandonment of some lines not considered desirable, which had been owned and operated by the old railroad company. In accordance with the widely entertained theory of over-construction, Mr. Ripley engineered the sale of the interests owned by the Santa Fe in the St. Louis & San Francisco Railroad Company; the sale to David R. Francis and John Scullin, of St. Louis, Mo., of the St. Louis, Kansas City & Colorado Railway, a line extending west of St. Louis to Union, Mo., and the exchange of the Sonora Railway for the Mojave division of the Southern Pacific. One of the earliest moves made by Mr. Ripley was to call on the chief engineer of the system, the late James Dun, to report on the shortest practicable line between Chicago and Los Angeles, Cal. Under Mr. Dun's survey the line has since been constructed.

Mr. Storey was born at San Francisco, Cal., on November 17, 1857, and graduated from the University of California in 1881. Prior to his graduation from college, Mr. Storey in 1877 served as an axman on the Southern Pacific for one year. After completing his college course he re-entered railway service in 1881 as a rodman on the Southern Pacific and was later levelman, transitman and assistant engineer. From 1893 to 1895, he was assistant engineer with the United States Hydraulic Mining Commission. In the latter year he was appointed chief engineer and general superintendent of the San Francisco & San Joaquin Valley, in which position he remained until 1900, when he was appointed chief engineer of the Santa Fe System as above noted.

Mr. Storey, as federal manager of the railway, has been its chief executive officer since government control was adopted. He has long been regarded as Mr. Ripley's logical successor. He happily combines the technical training and experience of the engineer with the experience and outlook of the operating officer and executive. His election as president makes practically certain that there will be no radical change in the organization of the Santa Fe, of which he has been an important part, and the Santa Fe organization has long been recognized as one of the best in the railroad world.

88.4 Per Cent of Trains on Time

An average of 88.4 per cent of all passenger trains on Class 1 roads under federal control made on-time runs during October, or, if late at initial terminals on account of waiting for connecting trains, made as good as schedule time or better, according to a statement issued by the Railroad Administration. This is a slight improvement over the figure for September, 88.1 per cent, and for August, 87.3 per cent.

Of the trains which left their initial terminals on time, and which arrived at their destination on time, the percentage was 84.2, as compared with 84.3 per cent in September and 83 per cent in August.

The Pocahontas region, with 8,923 passenger trains, put 8,262, or 92.6 per cent, over the road in as good as schedule time or better, while at the larger regions the Allegheny region operated 70,882 of its 77,480 trains, or 91.5 per cent, in as good as schedule time or better.

Suburban trains are not included in the compilation.

Following are the figures showing the passenger train performance in the various regions, as compared with September and August:

Region	Month	No. of roads	Total Trains Operated	Trains which arrived on schedule time: Number	Trains which arrived on schedule time: % of total trains	Trains which arrived on Schedule time or which if late made run in schedule time or less: Number	Trains which arrived on Schedule time or which if late made run in schedule time or less: % of total trains

General News Department

Philadelphia has followed New York in the adoption of an ordnance providing for changing clocks, for the purpose of daylight saving, beginning the last Sunday in March, 1920, and continuing seven months, as was done this year.

F. Lavis, consulting engineer of the American International Corporation, has been re-appointed special lecturer on railway engineering, at Sheffield Scientific School, Yale University, and will resume his course of lectures which had been interrupted during the war.

Alumni of the University of Minnesota, St. Paul, Minn., have revived a movement for the removal of the Northern Pacific tracks from the university's campus. It has been planned, tentatively, to run the tracks underground to make way for new buildings which will eventually be erected. The Minnesota Alumni Weekly, a publication of the university's alumni, is carrying on the campaign for the removal of the tracks altogether, asserting that the cost of doing so will not be as great as would be the amount involved in the sinking of the tracks, aside from possible damage to the buildings under which they would run.

St. Louis Municipal Bridge

C. B. Fox, corporate director, and Baxter Brown, engineer of the Alton & Southern, have been requested to appear before the St. Louis (Mo.) Aldermanic Ways and Means Committee for the purpose of obtaining a definite statement whether they will agree to use the St. Louis Municipal Bridge across the Mississippi River. This action is the result of a proposed municipal bond issue of $1,750,000 to be expended on the bridge and which is now pending in the Aldermanic Committee. According to P. W. Coyle, traffic commissioner of the St. Louis Chamber of Commerce, officers of the Alton & Southern have promised to make use of the bridge provided an additional railroad approach and terminals are built at the west end of the structure. The Alton & Southern crosses most of the trunk railroads in East St. Louis, Ill., and the eastern bridge approach is connected with its lines. The aldermanic committee desires definite information concerning what use will be made of the bridge before approving the bond issues. Representatives of the Chamber of Commerce and the Manufacturers' Association have appealed to the committee for added funds for the proposed new bridge approach, which would run south along the Mississippi river front and connect with a proposed municipal road leading into the River des Peres Valley. It is proposed to establish an industrial district in this valley similar to that in the northwest part of the city.

Wages and Earning Power

[Letter in the Louisville (Ky.) Times, signed "A Conductor's Wife."]

I have been much interested in your editorials, as I am an L. & N. conductor's wife, and would just like to give you my side of the story. Now, I am not at all in favor of unions, although my husband is an O. R. C. man.

We have a family of six and my husband draws from $85 to $100 every two weeks, and I can live comfortably on that salary. What I mean is the way a poor, laboring man's family ought to live, not to try to belong to the "400" society. Railroad people get the swell head. They cannot get along on that salary. Then there is the man who plays poker and shoots craps all night in cabooses, especially around pay days. . . . Now this class needs more salary. Then again you take most railroad men—they are men raised in small towns and surrounding country along the line of road upon which they work and very few country boys have what I would call an education. Then what can you expect? I am not educated myself, which I guess you can see from my letter, but I would have loved to have gone to high school, but happened to be a poor man's daughter and was raised to be a good, hard-working woman, which I hope has done me just as much good. . . . My husband admits he is satisfied with his salary and I think he ought to be, for it is more than he ever made in his life, and with the education he had he could not begin to make that money anywhere else, and so it is with the rest of those country boys who shoved a plow from sunrise till dark for $1 a day. Now, with the salary they make, they want to be the president of the railroads and are trying to get Walter D. Hines' place. I would love to give my name, but you know it would never do, but I sure do love to read your editorials.

Here's luck to you and I hope there shall be no strike. If there is I think I'll take a captain's place and run a train, for I understand it better than some of these pumpkin rollers

Government Drops Oil Land Suits

The Attorney General has announced that the government will not appeal from the adverse decisions in the cases brought by the United States against the Southern Pacific and others to set aside patents to lands in California on the ground that the lands were known to contain oil when the patents were procured. The principal case was commenced in 1912. All of the cases were consolidated for trial, and the trial court found squarely against the contention of the government on the facts. The Elk Hills case recently decided by the Supreme Court in favor of the government involved facts which differed widely from those presented in these cases.

Coal Production

The rate of bituminous coal production on the working days of the fourth week of the strike (November 23-29) was 48.3 per cent of normal, according to the weekly report of the United States Geological Survey. During the first week it had been 29.6 per cent of normal; during the second 33.3, and during the third, 44.5 per cent. Because of the Thanksgiving holiday, however, the actual output was a little greater than that of the preceding week. The total production is estimated at 5,429,000 net tons, an increase of 53,000 tons, or one per cent over the week before. The output on Thanksgiving Day itself was 560,000 tons. On the five full-time days it averaged 974,000 tons. The average production per working day during the four weeks ended October 25, which may be regarded as normal, was 2,015,000 tons.

The Central Interstate Wage Conference was in session in Washington during the first four days of the week, adjourning *sine die* on Thanksgiving Day. Production increased on Monday and Tuesday, as men returned to work in the Cumberland-Piedmont, Fairmont, and other fields of the Appalachian region. No break in the strike occurred elsewhere. Production on Friday was the second highest in the week, but Saturday showed the usual week-end drop.

The total output during the month of November was 18,815,000 tons. The littleness of this tonnage—by far the smallest in any month of recent years—is conspicuous in contrast with the production of October, which revised reports now place at 56,270,000 tons, the largest in the history of the country.

The output of anthracite fell off nearly 300,000 tons during the week of November 29, but the decrease appears to be entirely due to the Thanksgiving holiday. Compared with the corresponding week last year, the production showed an increase of 185,000 tons, or 12 per cent. The total output since the beginning of the coal year now amounts to 61,555,000 tons, or about 5½ million tons less than during the corresponding period of 1918. At the present rate of production, however, the anthracite mines are rapidly catching up with their performance of last year.

Commission and Court News

Personnel of Commissions

Walter M. O'Loughlin, senior railway signal engineer in charge of the field party of the Central District, Bureau of Valuation, of the Interstate Commerce Commission, with headquarters at Chicago, has been promoted to have charge of the signal branch of the same office with the same headquarters. Mr. O'Loughlin was born at Terre Haute, Ind., in 1885. He graduated from Rose Polytechnic Institute, Terre Haute, in 1907, and in the same year entered railway service with the Pennsylvania Lines as a special signal apprentice. He remained in this position until 1909 when he was appointed a draftsman in the Chicago office of the Chicago, Rock Island & Pacific. From 1909 until 1913 he was successively draftsman, engineering draftsman and signal supervisor. As signal supervisor his headquarters were at Lincoln, Neb., and later at Chicago. In 1913 he was appointed signal supervisor in charge of maintenance and construction on the eastern district of the Northern Pacific with headquarters at St. Paul, Minn., which position he held until 1915, when he was appointed senior railway signal engineer in charge of the field party of the Central District, Bureau of Valuation, of the Interstate Commerce Commission. As senior railway signal engineer in charge of the signal branch of the Central District, Mr. O'Loughlin assumes part of the duties of Joseph Beaumont, whose resignation was announced in the delayed October 17 number of the *Railway Age* issued on November 29.

W. M. O'Loughlin

Alexander C. Jenkins, telegraph and telephone engineer for the Bureau of Valuation, Interstate Commerce Commission, supervising field and office forces on telegraph and telephone inventory, with office at Chicago, Ill., has been promoted to senior telegraph and telephone engineer of the Central District of the Bureau, in charge of the field and office forces on telegraph and telephone inventory, with the same headquarters. Mr. Jenkins assumes part of the duties of Joseph Beaumont, whose resignation was announced in the delayed October 17 number of the *Railway Age*, issued on November 29. Mr. Jenkins was born at Alamosa, Iowa, in 1874, and was graduated from Iowa State College, Ames, Iowa, in 1902. The same year he entered telephone service with M. H. Harter, engineer and contractor, in the construction of electric light plants and independent telephone plants in Iowa and South Dakota. In 1903 he became connected with the engineering department of the Bell Telephone Company, with headquarters at Pittsburgh, Pa., having to do with the design of aerial and underground telephone plants, electrical interference of high tension lines with telephone lines and studies determining office locations, conduits, cable- and pole-line extensions. In 1907 he was promoted to assistant to the plant superintendent in which capacity he served until 1910. In the latter year he was promoted to district construction superintendent of the same company, with headquarters at Kansas City, Mo. From 1912 until 1914, he was plant supervisor at Newcastle, Pa. In September, 1914, he was appointed telegraph and telephone engineer, as above, which position he held until his recent promotion.

A. C. Jenkins

J. S. Worley, member of the Engineering Board of the Bureau of Valuation of the Interstate Commerce Commission in charge of valuation work in the western district with headquarters at Kansas City, Mo., has resigned, effective January 1, 1920, to engage in other service.

State Commissions

The contention of the Southern Pacific Company that it should be considered in the same category as the ordinary householder to whom the East Bay Water Company, Oakland, Cal., is under obligation to provide service at any time and for brief periods, was not sustained by the Railroad Commission of California in a recent decision. The Commission granted the East Bay Water Company authority to remove certain pipe lines and facilities supplying water to the Southern Pacific at its Oakland Pier roundhouse, yard, freight office and wharves. Under the authority granted by the Commission the water company is empowered to substitute smaller pipes unless the railroad agrees to pay certain amounts monthly in addition to the established rates for water.

Court News

Decisions Under Employers' Liability Act

The Illinois Appellate Court holds that where a switching crew after delivering a cut of cars, concededly a task involving interstate commerce, returned to the yardmaster's quarters for the purpose of obtaining orders for future work, the crew while awaiting such orders was not engaged in interstate commerce, and an injury sustained during the time of waiting by one of them was not within the act.—Bishop v. Chicago Junction Ry. Co., 212 Ill. App. 333.

The New York Appellate Division holds that a railroad employee who was fatally burned while cleaning a car homeward bound on an interstate trip while it was standing in the railroad's yard awaiting delivery to another carrier, was at the time engaged in "interstate commerce," and was not entitled to recover under the Workmen's Compensation Act.—Kinsella v. N. Y. C., 186 App. Div. 856, 175 N. Y. Supp. 363.

Federal Employers' Liability Decisions

The Supreme Court of Illinois holds that a janitor in shops in which slight repairs were made upon certain trains, both in interstate and intrastate commerce, and who was injured by a splinter when breaking kindling, was not engaged in interstate commerce.—Heed (receiver of C. & E. I. v. Industrial Commission, (Ill.) 122 N. E. 801.

The Oklahoma Supreme Court holds that an employee injured while engaged in transporting in a motor-driven car workmen from their residences to the roundhouse of the company, where they were to make running repairs on cars and engines used in both interstate and intrastate commerce, was not engaged in interstate commerce.—St. Louis I. M. & S. v. True (Okla.) 176 Pac. 758.

The Kansas Supreme Court holds that a station agent who was injured by attempting to start a fire in the stove by the use of kerosene was not engaged in interstate commerce; it cannot be said that his work at the time had a real and substantial connection with interstate commerce.—Benson v. Bush, (Kan.) 178 Pac. 747.

Foreign Railway News

Bolivia Plans Railroad

Press despatches from La Paz, Bolivia, report that announcement has been made that the Minister of Public Works has named a commission to survey a route for the proposed railroad to run from the city of Puno, in Peru, around the eastern end of Lake Titicaca to Cuaqui, the Bolivian port on Lake Titicaca.

The construction of this line would obviate the necessity of transshipment by the Lake Titicaca Steamship Company of goods bound from Mollendo to La Paz, on the Southern Railroad of Peru. This transshipment is expensive, for it necessitates two extra handlings, and it is believed that if this could be done away with by a railroad around the lake the resultant decrease in expenditures would make possible a lowering of the rates from Mollendo to La Paz. Such a decrease in rates is greatly needed, for at the present time the revenues of the Southern Railroad are suffering severely from the competition of the shorter Arica-La Paz Railroad.

New Express Locomotives for Holland

London.

An extract from De Ingenieur by the Technical Review gives the description of the latest and most powerful locomotives supplied to the Dutch Central Railway just before the war by J. A. Maffer of Munich.

Four of the engines are fitted with ordinary superheaters placed in the smokebox, and the four with Schmidt's fire-tube superheaters. The locomotives are similar in other respects and of the following general dimensions:

	Engine Nos. 71-74	Engine Nos. 75-78
Number of cylinders	4	4
Diameter of cylinders	15¾ in.	15¾ in.
Length of stroke	25½ in.	25¼ in.
Diameter of coupled wheels	6 ft. 2 in.	6 ft. 2 in.
Diameter of boiler	5 ft. 3 in.	5 ft. 3 in.
Height of boiler above rail level	9 ft. 8 in.	9 ft. 8 in.
Grate surface	37 sq. ft.	37 sq. ft.
Diameter of boiler tubes	1¾ to 2 in.	1¾ to 2 in.
Number of tubes	285	169
Number of flue tubes	.....	24
Diameter of flue tubes	.....	5 in. to 5¼ in.
Length between tube plates	13 ft. 9 in.	13 ft. 10 in.
Heating surface, firebox	.....	168 sq. ft.
Heating tube surface, sq. ft	1,890	1,555
Heating smokebox superheater	296	.....
Heating firetube superheater, sq. ft.	.....	500
Total heating surface	2,360	2,230
Steam pressure in lb. per sq. in	.....	174 lb.
Tractive force in lb	20,300	20,300
Weight of locomotive when working	69.5 tons	70 tons
Adhesive weight of engine	48 tons	48 tons
Weight of tender in working order	48.3 tons	49.1 tons
Water capacity	4,620 gallons	4,620 gallons
Coal capacity	5 tons	5 tons

The locomotives are provided with spare boilers arranged in such a manner that the working boiler can be removed and a spare fitted in its place while the old boiler is overhauled. Owing to scarcity of copper all spare boilers are constructed with fireboxes of steel instead of copper.

The locomotives are, in addition, provided with Knorr cylindrical feed water heaters having a heating capacity of 146 sq. ft. and a capacity of 55 gallons of water per minute. They are fixed on plate supports between the boiler and engine frame. frame.

Chilean Railroads

Santiago-Valparaiso via Casablanca.—The engineers who have been surveying from Valparaiso to Santiago via Casablanca are in Santiago, arranging the results of their field work. It is calculated that July next will see this survey completed if the necessary funds are forthcoming.

Arica-La Paz.—An increase of $214,387 gold has been agreed upon in the extraordinary subsidy conceded to the Arica-La Paz Railway by the Law No. 3319 of September, 1917; and the one hundred covered 25-ton cars and the three Mallet locomotives bought in North America are declared free from import duty.

General Improvements.—A bill is being laid before Congress asking for authority to use 15,000,000 pesos of the funds set apart for the purchase of ships for the navy, in carrying out the urgent improvements necessary for the service of the railway department; the money to be returned to the naval funds out of the loan of 160,000,000 pesos which probably will be arranged for November. Some reports say the probable financiers are English firms, other reports say a group of United States bankers are taking it up.

Hump Shunting in Rhineland

London.

An article published in the North Eastern Railway Magazine describes the methods employed in shunting and marshalling trains in Rhineland.

The heaviest gradient of the hump is about 1 in 8 from the summit to a distance of about 150 ft., from which point to the middle of the yard there is a slightly falling gradient. Similarly from the other end of the yard a sister hump performs the same office, the total distance between each hump being about 2,700 ft. On a normal day an average car (loaded or empty) is found to travel half the distance quite comfortably, and a strong opposing wind is found not to hold the car appreciably. On every hump there are two shunting tracks, on one of which a light engine is standing ready to run down and pick up a wrongly shunted car and reshunt it off its own hump, thus avoiding any delay to the main shunt. There are two signal cabins, one at the foot and one at the summit of the hump. The signal cabin at the foot of the hump is fitted with an electric frame. When the switches are turned, a bell rings in the cabin and as soon as the switch is closed, it ceases ringing. If the switch is not properly closed the bell keeps up a continuous ringing, giving the signalman time to switch the car to another track and advise the cabin on top of the hump that the points are defective.

During daylight the signalman sets his switches according to the large chalk numbers on the buffers of the cars, which he can see as the cars come over the hump. At night he obtains this information from the shunter's cabin on the hump through a telephonic megaphone fixed above the electric frame, which he can hear or speak into from any part of his cabin. The lamp indicators of the points have a lever number affixed for the information of the signal fitters in their work. It is also arranged that a "dolly" indicates by the arrow on one side that the turn-out is open, otherwise a vertical line shows the points are set for a straight run through.

As German cars are not constructed with side brakes, an effective method has been devised for stopping the cars in the use of the shoes. The shoe is placed on the rail about four to five car lengths from the train in dry weather and twice that distance when the rails are greasy. With an experienced "shoeman" the cars drop on to their train very gently.

The German shunting poles are an iron fork very similar to a hoe with two prongs. One prong is placed in the link of the coupling and the shunter levers the other prong against the hook.

All classes of traffic pass over the hump, from ordinary cars to special vehicles such as are required for heavy machinery, etc. The engine shunting the train operates at about 3 m. p. h. and it is proved that there is a considerable saving of coal and oil compared with other forms of shunting. The cars leave the top of the hump about two or three car-lengths apart, except in the case of special vehicles, when more space is allowed. During busy shunting periods there is usually one "shoeman" to every two tracks, and one to every three when the shunting is less. Cars are shunted according to the stops of the train, viz., those for first stopping place and exchange being placed next to the engine and so on.

A rule of the German yard is that not more than three loaded or five empty cars may travel together unaccompanied by a brakeman to their line. In one case a train composed of 40 cars requiring 24 shunts was dealt with in ten minutes on dry rails. The German estimate is 15 minutes for every train of approximately 50 cars.

Equipment and Supplies

Locomotives Shipped in August

The Railroad Administration has compiled the following statement of locomotives shipped for the period August 1 to August 31, inclusive:

For period August 1 to August 2

Works.	Road	No.	Type
American	Vgn.	3	USRA Mallet
		3	
Baldwin	AT&SF	2	Santa Fe
	PLW	2	USRA S. F.
	T&P	2	USRA Mik.
	A&V	3	Santa Fe
	A&V	1	Mikado
	B&O	1	USRA Pac.
	PLW	1	Mallet
		12	

For week August 3 to August 9

	Grand total	128	

In addition to the above, the American Locomotive Company completed 119 foreign and shipped 18 miscellaneous domestic locomotives, and the Baldwin Locomotive Works completed 54 foreign and shipped 14 miscellaneous domestic locomotives.

Supply Trade News

The heat treatment department of the **Quigley Furnace Specialties Company**, 26 Cortlandt street, New York, has been placed under the management of **H. H. Harris**, who has a wide experience in the heat treating field and comes to the Quigley company well equipped with information and practical experience in this important department.

Trade Publications

CHAIN DRIVES.—"A Chain of Evidence" is the title of a 20-page illustrated booklet published by the Morse Chain Company, Ithaca, N. Y., describing the construction of Morse silent chains, a distinguishing feature of which is the "rocker joint," consisting of a rolling or rocking bearing in each joint, which permits a rolling friction in place of the sliding fricton common to other types of jonts. Among a number of illustrations of large power drives contained in the booklet is one showing the largest chain drive in the world—of 5,000 hp. for hydro-electric purposes.

STEEL CONVERTER FOR SMALL FOUNDRIES.—The Whiting Foundry Equipment Company, Harvey, Ill., has issued catalogue No. 150, describing the Whiting side-blow steel converter. This device is adapted for the production of steel castings in limited quantities and is particularly applicable in connection with apparatus for making grey-iron castings. The catalogue describes the construction of the converter and explains its operation in the manufacture of steel. A layout of a combined grey-iron and steel foundry installed in a railroad shop is also described and illustrated.

SUPERHEATERS.—Two circulars dealing with the maintenance and operation of superheaters are being distributed by the Locomotive Superheater Company, New York. Bulletin No. 6 is entitled "The Most from Superheating," and contains a reprint of the committee report of the Traveling Engineers' Association on superheater locomotive performance. Bulletin No. 8 contains instructions for properly maintaining and operating superheaters. It deals with such matters as lubrication and drifting, flue cleaning, handling units during repairs, etc. Another bulletin, No. 5, describes the company's model "496" pyrometer equipment for locomotive service.

PORTABLE WELDING OUTFITS.—Three types of trucks for transporting portable oxy-acetylene and oxy-hydrogen welding and cutting equipment manufactured by the Davis-Bournonville Company, Jersey City, N. J., are described and illustrated in an eight-page pamphlet. One of these is a cabinet truck which provides permanent mountings for the regulators and gages within a steel locker, which also affords space for the torches, hose, accessories and supplies. The other two are open trucks, one having large wheels especially fitted for traversing rough ground and the other having small wheels, designed for use on floors, pavements and level ground.

CELFOR DRILLS.—Putting Mettle Into Metal is the title given by the Clark Equipment Company, Buchanan, Mich., to a booklet describing the making of Celfor drills and precision tools and telling of various innnovations which the company has put into effect for the benefit of employees, which tend to give them a keener interest in their work and promote harmony between employer and employees. The booklet contains numerous illustrations, one colored two-page illustration showing a general view of the plant and grounds which have been made into an attractive park. Other illustrations show a theatre which is operated by the company without profit and is used by the employees for a great variety of activities; a hospital which is conducted by a hospital association formed among member employees, and several homes which are typical of a large number built by the company and sold to employees at actual cost on their own terms.

Usefulness of the Wedge

The young man who aspires to promotion must constitute himself a wedge, so as to be ready to let somebody force him into the first available opening where there will be an appointment to assume larger responsibilities. This bit of wisdom is brought to mind on reading the letter from H. S. M., published in our issue of November 21. The train despatcher, on occasion, should not hesitate to "butt in" where, if a narrow view were to be taken, only the trainmaster, or some one higher up, could rightfully act. This is true, for example, in cultivating friendly relations with shippers at outlying sidings; or customers who do not see the station very often. Despatchers (and others) do well to do a lot of thinking outside their own immediate field, even if it is but rarely that such thoughts can be put in practice. We all know of clerks who have got ahead by doing some job for the "old man" without being told to do it; taking the boss's own work out of his hands, as it were. Never encroach on a superior's exclusive territory; never meddle; but don't be too fearful of being accused (wrongfully) of doing something of that kind! The thin end of a wedge resembles a knife, but it does not cut.

Paying the Bill for the Steel Strike

It has often been said that increased production must be the chief factor in bringing down the cost of living. Decreased production has proven itself many times the main cause of a rise in prices, a concrete example, and one that is of considerable interest to the railroads, being at present time afforded by the steel industry. Before the steel strike in the latter part of September, 1919, the steel market had practically recovered from the effects of war-time production and was getting on a firm and steady peace basis. During the period of about two and a half months between the beginning of the strike and the first of December prices advanced nearly 20 per cent on rails and other steel products this being almost entirely due to the shortened supply resulting from decreased production. Now, to fill the cup to overflowing, there has come the coal shortage with its resulting curtailment of important and much needed production of iron and steel products. The industry is much farther down in the list of essentials, and as a result is far more affected by the rulings of the Fuel Administration, than during the heatless days of 1918. With such a serious situation confronting them, the steel companies have practically suspended operation of their sales departments, but business continues to come in from all directions and is piling up at an alarming rate. It need hardly be said that the output lost through the steel strike and the coal shortage has caused a deficiency which cannot for a long time be made up. With the demand continuing heavy, as in all probability it will, the result must be increased prices to the consumer, unless prices are held down by artificial means. The amount of the advances will largely depend upon what the large interests in the steel industry can do to check the upward swing, which if it went too far would prove a serious detriment not only to the railroads, but to the country generally. It is, of course, to be regretted that a few labor leaders could bring about such a state of affairs with little or no justification for their actions, and without even the thorough understanding and voluntary support of working men themselves. Nothing of any importance has been gained, and much has been lost, the public paying as usual through the higher prices made unavoidable.

Brooklyn and Belmont

The fatal train wreck at Belmont, N. Y., October 19, reported in our monthly record of derailments, printed in this issue, gives prominence to some lessons as striking as those of the Brooklyn collision, reported in the September record—striking, that is, in their simplicity. They are so obvious that we all know them. The remedies for the errors which caused this wreck can be agreed upon in a minute, when we are ready; but the habit of shutting the eyes to the future—or of trusting to luck—has become so easy that grave problems are deferred indefinitely. Fundamental principles of safe train operation are constantly neglected, and for no other definable reason, apparently, than that one of the characteristics of a great corporation is the spread-out character of its functions and the perfect facility with which responsibility can *always* be shifted from one bureau to another.

One of the fundamentals is that enginemen's eyes, physical and mental, are not infallible. The most experienced and conscientious runners have been running past switch targets, on straight lines, in clear weather, without seeing them, for the last 60 years; and probably they are doing not much better today than they were 60 years ago, for the fault is a deep-seated characteristic of the mind, not entirely curable by human wit. This makes it fundamental that for safe running at high speed the runner's eyes must be given a second chance—at least. This is done by providing a distant signal —what used to be called an advance signal—one to give advance information. The use of signals set from 1,000 ft. to 4,000 ft., in the rear of danger points—switches—has prevented innumerable errors from mental laxness or infirmity, and in that sense has saved innumerable lives.

The New York Central placed distant signals at all facing switches on the main line between Albany and Buffalo away back in 1875-80, when most railroad men in this country knew (and thought) very little about scientific signaling except what they had learned from a Saxby & Farmer model at the Centennial exhibition in Philadelphia. Yet here, in the twentieth century, on a main line between two of the chief cities of the State of New York, trains are run at a mile a minute without a distant signal. One way to meet such a situation—assuming that automatic signals with track circuits are out of the question because of the low income from the traffic of the line—would be to impose a very low speed limit on all trains. (The low speeds then in vogue serve largely to explain why more people were not killed on the railroads 60 years ago). But the only sure means of imposing such a limit today would be automatic governors such as we read of as having been used on the automobiles of our army in France; an expedient which as yet has not been thought of in railroad service.

Another fundamental *fact*, developed by experience, is that

a fireman cannot be depended on to monitor his engineman—even when, as in this case, the result of his inattention will be the loss of his own and the engineman's lives. The only way to insure the vocal calling of signals across the cab at numerous designated places would be to have the oral function supplemented by the operation of some apparatus which should make a permanent record of each instance; and that would not be easy.

It is fundamental that a satisfactory force of reliable men for the delicate responsibilities of track foremen such as is needed on any road running fast trains, cannot be assured except by systematic training, long continued; yet, as everybody knows, the most of our training in that line is unsystematic and far from ideally satisfactory.

These are obvious fundamentals, too little disputed to need demonstration. It is also undisputed that in the operating department most of our railroads are under-officered; or, in more scientific phrase, do not have the right quantity (and quality) of supervision.

The Boston & Maine Re-Organization Complete

On December 1 James H. Hustis was discharged as receiver of the Boston & Maine, and it is understood that Woodward Hudson, who is now president, will soon resign and Mr. Hustis will be elected president.

The Boston & Maine was re-organized under federal supervision and during federal operation of the property. It is the only road that has had its financial affairs re-organized during the two years of government operation of the railroads. The re-organization of the Boston & Maine necessitated the relinquishing of presumably valid legal rights on the part of the holders of stock of six of the eight leased lines—the Fitchburg, the Boston & Lowell, the Connecticut River, the Concord & Montreal, the Lowell & Andover, the Manchester & Lawrence, and the Kennebunk & Kennebunkport. Before the Boston & Maine receivership, of the total 4,370 miles operated but 1,374 were owned and the remainder was leased. The re-organization provides for the direct ownership by the Boston & Maine of 3,315 miles out of the total 4,370 miles operated. Owners of the stock of the leased lines, on which stock the Boston & Maine had guaranteed dividends at varying rates as rental, agreed under the re-organization plan to accept new preferred stock of the Boston & Maine, dollar for dollar for their holdings of leased line stock. Dividends on this new preferred stock, however, are to be 20 per cent less for the first five years than the dividends on the old leased lines stock. The re-organization is to be retroactive to cover the entire year 1919.

The fact that the re-organization took place under federal supervision was probably of help to the re-organization committee in bringing pressure to bear on the holders of leased lines stock, to force them to accept a reduction for five years in their income. The re-organization presents many points of interest. In 1910, the Boston & Maine common stock sold at 152, and as late as 1913 the preferred stock sold at 133. The re-organization of the system did not scale down the outstanding debt or stock, but did reduce the interest and guaranteed dividends, and provided for funding unfunded debt. The total unfunded debt before re-organization was $88,317,000 and in addition there was $19,879,000 unfunded debt. The re-organized company has no unfunded debt and $103,167,000 funded debt. The interest charges and guaranteed dividends before re-organization amounted to $8,056,000 and now amount to $4,407,000 interest and $2,036,000 dividends on the new first preferred stock. It is hardly likely that under government operation in 1919 the property will have earned the full dividend on the preferred stock in addition to interest charges, but the interest charges will have been shown as safely earned, and the increase in freight rates of 25 per cent on business within New England which the Interstate Commerce Commission has already approved of, but which has not as yet gone into effect, will add nearly $8,000,000 to the earnings in 1920.

There were many causes contributory to the Boston & Maine receivership. The Massachusetts law permitted the sale of stock only at approximately the market price. Thus when Boston & Maine stock was selling at 130, and new financing had to be done, stock could be offered to stockholders at about 130. Naturally there was no incentive to absorb any considerable new offering of stock, and financing, therefore, could not be done through the sale of stock, notwithstanding the fact that the stock was selling above par. The refunding of a floating debt has now been done, although the prospects of a company like the Boston & Maine doing further financing through the sale of stock depends on the general railroad legislation which is adopted by Congress. Leased line dividends as a fixed charge were a burden on the old company which has now been done away with.

The management of the Boston & Maine prior to the election of Mr. Hustis as president, was sound rather than progressive, and was made more difficult by the relations between the New York, New Haven & Hartford, and the Morgan-Mellen attempt to control the Boston & Maine with the resulting lack of confidence both among officers and employees, and on the part of the general public.

The new company will start operation with a management which has actually been in charge of the property both under receivership and during the period of government control. Long steps have already been taken to bring the details of up-keep, replacement, operating methods, etc., up to modern standards, and the confidence and loyalty of employees and officers and the public has been gained by Mr. Hustis, both during the receivership and in the trying period when he was acting as district director of the New England roads. With a favorable general railroad situation, the Boston & Maine has for the first time in very many years a chance to become a first-class railroad property.

Government Operation Under Mr. Hines

In a recent discussion of railroad legislation Senator Morris of Nebraska said that those who favored government ownership would be fundamentally opposed to the kind of government control that we have had during the last two years. Senator Cummins of Iowa replied that while he did not think the organization under which the railways have been operated has been ideal, because it has had too much arbitrary power, he believed it has been more competent to operate the railroads than one such as probably would exist under government ownership. He paid especial tribute to Director General Hines, who he believed had operated the railways as economically as was practicable.

Nobody who really knows anything about the railroad business will question that Senator Cummins was right in the position he took. There have been many things to criticize in the way in which government control has been exercized; but the Railroad Administration has never varied from the policy originally adopted by Mr. McAdoo of keeping trained railroad men in almost all the important positions on the railroads; and these men have almost without exception rendered it as energetic and able service as they ever rendered the companies. They "stayed with the ship" largely because the country was at war, however; and it can-

not be assumed that they would all, or most of them, stay if a policy of permanent government ownership were adopted.

Senator Cummins' complimentary references to the character of the services which have been rendered by Mr. Hines were particularly deserved. Mr. Hines became and has served as director general under especially unfavorable conditions. The war was over when he became director general, and therefore the spirit which the war had infused into railway officers, employees and patrons was on the wane. The freight traffic and earnings of the railways were rapidly declining. Labor, in spite of these facts, was beginning to ask again for large advances in wages, and to threaten to tie up the railroads if they were not granted. The Railroad Administration was in sore need of funds to meet its obligations to the railroad companies and to carry out an improvement program, and yet about two months after Mr. Hines became director general the railroad appropriation bill was defeated by a filibuster, and subsequently, when Mr. Hines asked for a larger appropriation than he had sought at first, Congress gave him only part of what he asked for.

In May President Wilson announced that the railways would be returned to private operation, and before and since then some of the ablest men in the Railroad Administration have left it to return to the corporations with which they were formerly connected. To cap the climax, just as the railroads had begun to handle a large freight traffic again and to earn enough monthly to pay the government's guarantees to the companies, the coal strike came, with its inevitably very bad effects upon railroad expenses and earnings. In spite of these and other difficulties, the Railroad Administration has come through the year much better than seemed at all probable when Mr. Hines became director general. It has succeeded in avoiding a general railroad strike while at the same time refusing to grant employees the large increases in wages which they demanded. It has bridged over the financial chasm which yawned beneath it when the railroad appropriation bill failed. It has restored operating efficiency to something near normal and has rendered about as good service as was practicable with the facilities available. It has kept the deficit smaller than seemed possible six months ago.

While all the railway officers who served the government deserve credit for the way in which the railways have been operated in 1919, the chief credit belongs to Mr. Hines. He has made mistakes, and has received criticism from many sources, but we believe that most persons competent to judge will agree that in handling the situation he has shown rare courage, fairness, resourcefulness and ability. It is difficult to conceive how, in the circumstances, he could have done better in most respects than he has.

Senator Cummins is entirely right in saying that under government control the railways have been better managed than they would be under government ownership. The very autocratic power possessed by the director general which he regards as objectionable has been one of the principal reasons why they have been as well managed as they have been. If the director general had not had autocratic power he would have been subjected to more political interference. If there had been serious political interference it is inconceivable that men such as Mr. Hines and the other important railroad men in the Railroad Administration would have stayed in it. If they had not stayed the efficiency of railroad operation, instead of having increased as it has since Mr. Hines took charge, would have decreased. Those who say that the results of government control are no measure of the results which would be secured under government ownership and operation are right. The results under permanent government ownership and operation undoubtedly would be very much worse.

Letters to the Editor

Politeness and Intelligence Combined

New York City.

To the Editor:

In discussing the Dunkirk collision (issue of October 31) you refer to the ideal trainmaster and the joys and sorrows connected with his difficult task. We all sympathize with him, for his problems every day are as puzzling as the puzzles to which you refer as afflicting the investigator of collisions—who at least has a little rest between collisions.

But whatever may be the obstacles to becoming an ideal trainmaster, the traveling public demands that such obstacles be overcome, for it is the trainmaster that keeps trains running; without him and his principal aide, the chief despatcher, the wheels would stop. I wish to cite an illustrative incident. A certain New York paper says: "Most of those who got off the 5 o'clock train yesterday at M—— emerged from a car whose door was opened by a passenger. There was no trainman at hand, and when the trainman's attention was called to the fact that there was nobody to open the door he said, "Go ahead and report it. We can't be everywhere at once. . . ."

That brakeman gave a reply which was all right in substance but all wrong in style. According to the letter and spirit of the instructions which are usually given to passenger trainmen on the best roads, this man should have said, "I regret that you have been inconvenienced, but I have no authority to improve the situation, and if you are seriously aggrieved I shall have to refer you to the passenger traffic manager. He, no doubt, will adjust the matter to your satisfaction; at least he has done so on all previous occasions of this kind, so far as I can recall. The trouble, you see, is that we are shorthanded. To this train of eight cars only two trainmen are assigned, and as one of these must remain at the rear end to flag or to be prepared to flag (our block signal system, costing $3,000 a mile, being slightly unreliable at times), I alone am left to attend to the vestibule doors of four or five cars. Usually I get around so as to open them all before we reach the station platforms, but today I am delayed because one of the doors stuck and caused me a lot of trouble. I assure you that we are doing about as well as you have a right to expect. You (through the cheap character of the men you send to the legislature) have forced the railroads to spend millions of dollars too much in hiring men to man their freight trains, and now you see they are spending millions too little on passenger train crews."

Now, in all seriousness, is not that about the course of reasoning which the brakeman is expected to employ? If employees who come in contact with passengers are to be really polite in their conduct habitually, and without straining or worrying, they must do their own thinking, and if they think these things they are pretty likely to express some of them. One of the trainmaster's big tasks is to educate the brakeman (and conductors and ticket sellers as well) to put the best foot forward; to "speak a good word for the company," even when to do so he must put a prodigious pressure on his feelings in order to avoid exposing the unpleasant things which he thinks about his employer. How can this be done? Readers of the *Railway Age* would like to hear from any trainmaster who has succeeded in educating his brakemen to carry out his best theories in this matter.

This letter may seem like a pretty stiff attack on the train-

master, but it is not; it is intended mainly for his superiors. Will you not call on a dozen or so of your friends among the superintendents to explain why they do not strengthen their trainmasters? They do not educate, do not encourage, do not fully pay the better men among their trainmasters, and they are not severe enough in getting rid of the poorer ones. These superintendents are in duty bound to defend themselves, if any defense is possible. Some superintendents need a lot more boldness when they face the general manager. It is the duty of superintendents—all of them combined—to force him to make such appropriations as are necessary to elevate the character of the trainmasters generally.

In his immediate staff the general manager aims to employ men in whom politeness and intelligence are combined; in the train service he falls very far below 100 per cent in this respect; and yet he tells the public that 100 per cent is what he is aiming at. This is a feature of his work in which many a general manager has the reputation of being a very poor marksman. J. E. J.

A Woman Stockholder on Railroad Legislation

DENVER, COL.

TO THE EDITOR:

As a small holder of railway securities, I am very greatly perturbed by the recent action of the House of Representatives in cutting out from the proposed railway bill, as reported by its committee, that provision establishing a definite formula for the guidance of the Interstate Commerce Commission in fixing a basis for rates.

According to my understanding, the House bill as now amended would leave the whole matter of railway rates and revenue to the discretion of the Interstate Commerce Commission, and that without any definite expression from Congress itself as to what such rates should be.

There are thousands of women (in one of my companies there are 11,000 women stockholders) who, like myself, are small holders of railway securities, either left to them, or bought by them for cash, at different times as a permanent investment. It seems to me that Congress having resumed the responsibility of regulating the railways, should also assume that of outlining a definite policy for the guidance of the Interstate Commerce Commission.

In this regard, I feel that the Cummins bill is far more satisfactory than even the House bill as reported by its committee and that when the matter is taken up as I suppose it will be by a conference committee of both houses, I hope that Section 6 of the Cummins bill will be accepted.

While it seems to me that even the Cummins bill has dealt niggardly with the situation, it will surely be better to have a definite law based on Section 6 of the present Cummins bill, than to leave the whole matter in the indefinite shape in which it has been heretofore.

As I understand it, Section 6 recommends a minimum return of 6 per cent. to investors. This I think is fair. Unless this can be brought about, so as to relieve our terrible uncertainty, I know that many will be compelled to dispose of their holdings.

As strongly as I can, I wish to urge in the interests of small investors, like myself, that Congress recognize and assume the responsibility resting upon it, of giving to its agent, the Interstate Commerce Commission, definite instructions regarding the future treatment of the railroads. Unless Congress itself is willing to determine and announce such a policy, I shall feel strongly inclined to dispose of my railway holdings even at a loss, due to present low prices and invest in some other enterprise that has not yet been brought under the definite control of Congress.

Regarding any of the other features in either of the bills now before Congress, I do not express an opinion, because I do not feel that I am sufficiently acquainted with the subject to justify me in doing so. I am, however, deeply interested in the solvency of our American railroads, and it seems to me, that this is a matter wholly dependent upon an adequate basis of rates and depending entirely upon either the action of Congress itself or its agent, the Interstate Commerce Commission. (MRS.) ANNA C. TOLMAN.

Information About Profit Sharing

No. 1 Madison Avenue,
NEW YORK CITY.

TO THE EDITOR:

"Profit Sharing by American Employers," the report of an investigation of profit sharing between employer and employee, which was published by the National Civic Federation in 1916, is greatly in demand and is to be reissued with certain amplifications. To make it as comprehensive as possible, information is desired from all employers concerning the six different plans, namely: 1, percentage of profits; 2, special distributions; 3, stock ownership plans; 4, exceptional plans; 5, abandoned plans; 6, proposed plans. Any concern which uses any form of profit sharing is requested to give date of installation; and, if not in force when discontinued, and why; average number of employees at this time and how many participate in the plan; state of feeling toward the plan by those for whose benefit it was intended; whether the plan has been the means of modifying the tendency toward labor troubles; whether limited to heads of departments; and whether an unqualified success, or if not, where it has failed. Information marked confidential will be so treated. GEORGE W. PERKINS.

Chairman Profit Sharing Department, National Civic Federation.

The Trans-Andine Railway Operating Under Difficulties

The Canadian Pacific Builds Refrigerator Cars

Equipped with Tank Bunkers, Meat Racks and Ventilators; Steel Underframe Construction, 41 ft. Long

THE CANADIAN PACIFIC has recently built at its Angus shops, Montreal, an order of steel underframe refrigerator cars, which embody a number of interesting features, both in the underframe and body construction as well as in the refrigerating equipment.

These cars are 41 ft. long, and have an average tare weight of 59,000 lb. to 60,000 lb. They are carried on 40-ton trucks, which gives them a load limit capacity, including ice, of 72,000 lb. to 73,000 lb. They are designed for satisfactory service when handling any of the several different commodities which require transportation in insulated cars because of the need of protection from heat or frost, and also for other miscellaneous freight which may properly be loaded in refrigerator cars when they are not required for the transportation of perishables.

As packing house products are regularly handled in Canada by railroad owned refrigerators, these cars are equipped with galvanized iron tank bunkers which permits the use of salt as required to obtain the proper degree of temperature. To prevent the exchange of air through the hatch openings at any time and especially when the hatches are opened for re-icing, the tanks fit well around the ceiling. Regulation meat racks are included as part of the roof and ceiling construction.

For berry and fruit traffic it is necessary to provide a means of ventilation. This has been taken care of by providing openings in the fronts of the ice tanks near the top, so that when the hatch covers and plugs are opened, air will circulate freely into and through the car. The ventilator openings are fitted with malleable iron frames and close fitting plate slides which are secured in a closed position at all times except when the cars are operating under ventilation.

The use of ice or ice and salt when operating under ventilation, is optional, thus providing a wide range of regulation which may be varied to suit the seasons, conditions of the load, and the distance to be moved. Fruit fresh from the field is a very difficult commodity to transport, as the field heat and heat generated by the ripening process produces a condition that is difficult to handle. However, the brine tank ventilator car when equipped with suitable floor racks arranged so that free circulation will take place around the ice and out under the racks, is particularly suited to this traffic, as the use of salt on the initial icing lowers the temperature of the car rapidly, absorbing the field heat and checking the process of ripening. For fruit shipments it is well to apply temporary slats along the sides of the car to provide space for circulation at the sides as well as underneath. All other perishables may easily be transported safely in these cars, provided reasonable care is used in loading so that the air within the car may circulate freely.

Steel Underframe Refrigerator Car with Brine Tanks and Ventilators, for the Canadian Pacific

Whenever the lading requires protection from frost, charcoal heaters are placed in the corner ice tanks, two or more per car as required.

The Refrigerating Equipment

Permanent floor racks made of 1¾-in. by 3¾-in. fir are installed in sections, five sections on each side of the car. They are secured with hinges, similar to those used on side doors, to the lining base plank and when propped up against the car sides, the racks are entirely clear of the floor, thus

permitting the floor to be thoroughly and easily cleaned and swept out through the side door openings. The racks are made of relatively heavy material to insure durability, especially when the car is loaded with miscellaneous merchandise freight.

The ice bunkers consist of four rectangular galvanized iron tanks at each end of the car; the tank bottoms are ⅛-in. pressed steel, galvanized after pressing, and the sides are 10-gage galvanized iron. Substantial lugs are riveted near the top. These lugs bear against the underside of the hatch frame and prevent the tanks from jumping when the cars are being switched. The tank supports consist of angle irons which are arranged so that the front supporting angle may be removed without disturbing any tank. After the removal of this angle one or more tanks may be removed and reapplied without disturbing the others.

The drip pan under the tank is sloped from the rear end towards the front of the tank, so as to be as nearly self-clearing as possible. The front edge of the drip pan is made of ⅛-in. pressed steel plate, galvanized. This arrangement avoids, to a considerable degree, the obstruction of free circulation of air down around the tanks and out under the floor racks.

Only the center tanks at the ladder corners are equipped with a drain valve. The remaining three tanks at each end of the car are coupled to this tank by hose connections located two feet above the tank bottom. The drain valve is connected to a pipe extending directly through the car floor.

Insulated bulkheads are provided in front of the ice bunkers. These bulkheads are hinged at one side of the car so that they may easily be swung open for inspection, cleaning or repairing the tanks. These bulkheads have an extension at the bottom with horizontal slats to prevent small crates or boxes from sliding under the bulkhead.

The ice hatches are of U. S. R. A. design, modified only as absolutely necessary to suit conditions.

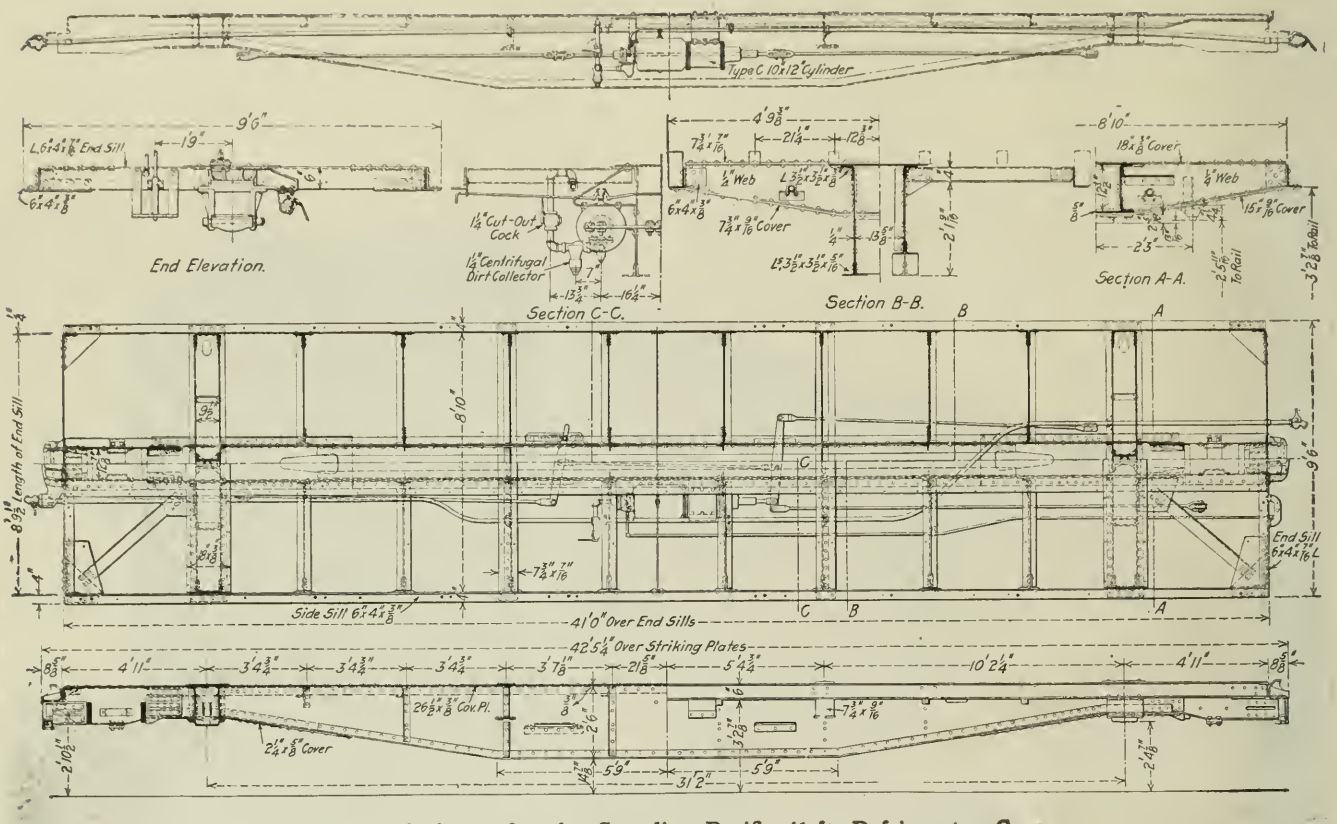
Insulation

The floor insulation consists of one layer of 90-lb. waterproof insulation paper applied in one piece from side to side and end to end of the car, thereby covering the entire underframe and sub-floor. On top of this are placed the floor stringers. The center stringers rest on and are bolted to the edge of the center sill cover plate, while the intermediate stringers rest on and are bolted to the bolsters, crossbars and floor beams. Between the stringers four layers of ½-in. insulation are applied in strips, continuous from end to end of the car. Each layer consists of hair or fibre felt between two courses of 90-lb. waterproof insulation paper. The four layers are applied in two courses of double layers with nailing strips and ⅜-in. tongued and grooved boards between.

The floor consists of two courses of tongued and grooved boards, the under course ⅝ in. thick, over which is spread a heavy coating of felt, waterproof asphalt, and over this one layer of two-ply asphaltum roofing paper. The top course boards are 1⅛ in. thick.

The side and end walls are insulated with three layers of ½-in. insulating material, each layer stitched between two layers of 90-lb. waterproof insulation paper. Side and end wall insulation extends continuously from floor to ceiling and from the door opening to the end of the car, across the end and to the door post opposite the starting point. One layer of the insulation is applied on the outside of the superstructure frame, overlapping and fastened to the sills and plates. Two courses are applied on the inside of the framing, against the ⅜-in. tongued and grooved sheathing. The outside sheathing consists of standard 13/16-in. tongued and grooved car sheathing and the inside lining is 13/16-in. tongued and grooved basswood or spruce. The total thickness through the side walls is 6½ in.

The roof insulation consists of six layers of ½-in. insulating material, each layer stitched betwen two courses of 90-lb. waterproof insulation paper. The insulation is applied in



Steel Underframe for the Canadian Pacific 41-ft. Refrigerator Cars

one piece between the carlines from side plate to side plate. It is applied in three double layers, each double layer supported on ⅜-in. tongued and grooved boards.

On the top side of the ceiling boards one layer of 90-lb. waterproof insulation paper is applied in one piece from side to side and end to end of the car.

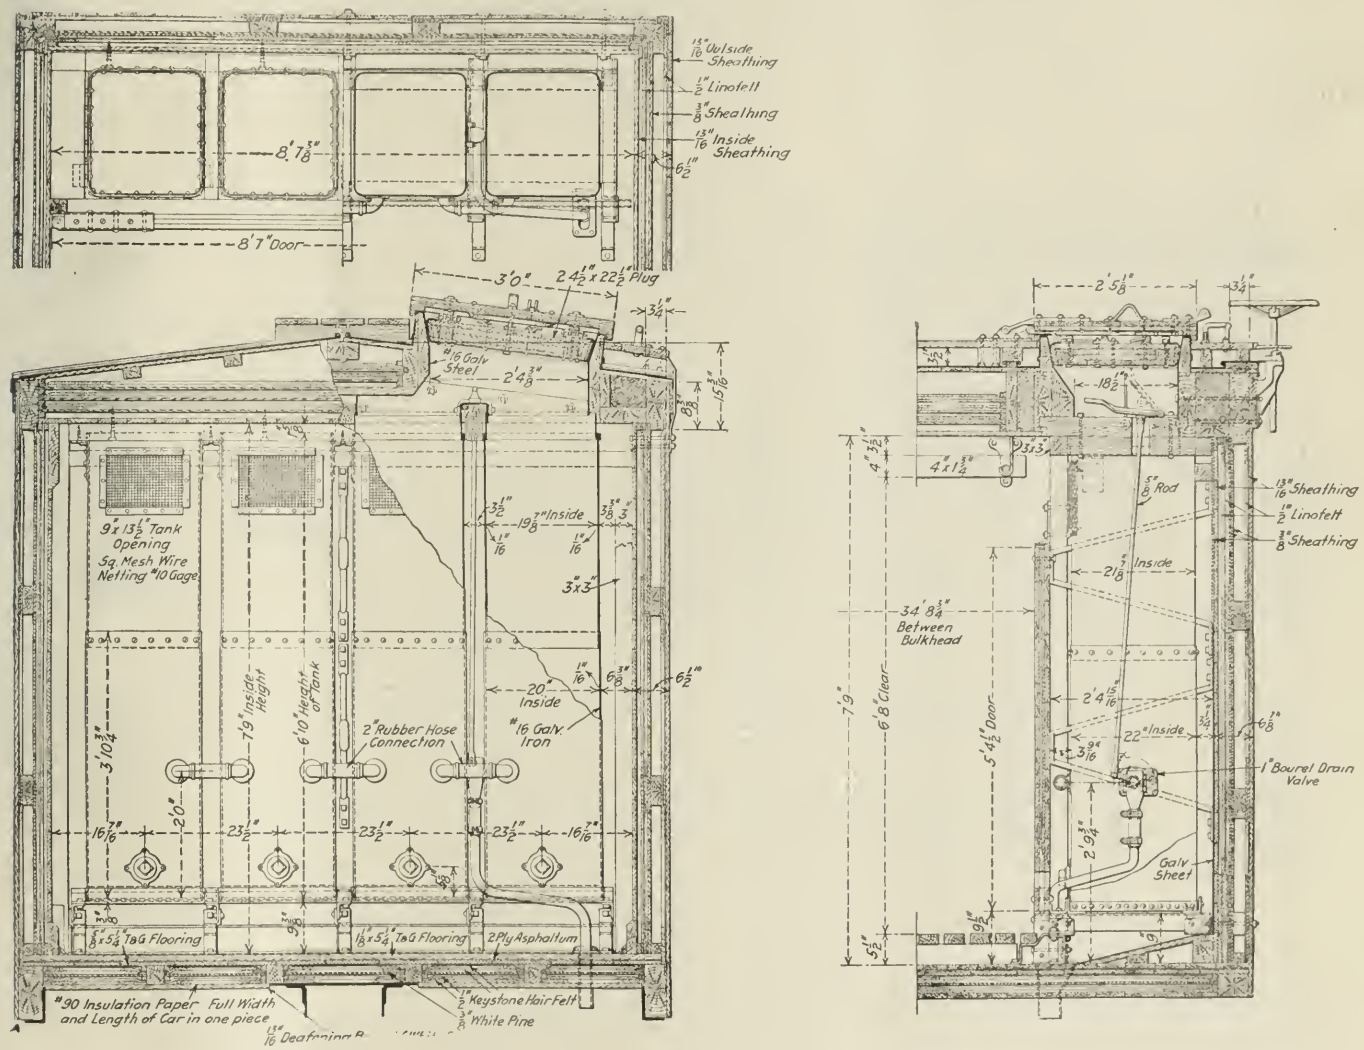
Superstructure Frame

The principal framing members of the car body are fir, excepting end sills, end posts and end braces, which are of oak or maple. All of the posts and braces are set in cast iron pockets with the exception of the end post and braces, which are set in special cast steel pockets each having a high flange on the outside to prevent the lower ends of the posts and braces from springing over the top of the casting. Each

that the roof frame may be assembled on the shop floor and then placed on edge, while the ceiling boards are applied. This enables the builders to work at all times to the best possible advantage, with the result that good work is rapildy done.

The roof is galvanized iron, type XLA, flexible, applied over a single course of boards and one layer of two-ply asphaltum roof paper. As already noted, the spacing of the carlines is governed by the spacing of the meat rack supports and on account of the roof insulation the roof mullions and running board saddles are spaced to coincide with the carline centers; this provides a solid construction for nailing the mullions.

The roof sheet pivot saddles are secured by carriage bolts applied through a special washer nailed on the underside of



Arrangement of the Brine Tanks and Body Construction Details of the C. P. R. Refrigerator Cars

casting is bolted directly through the steel end sill flange with two ⅝-in. bolts. This is to prevent the pocket from tipping out and also to avoid trouble caused by dowels splitting the wood end sill.

Diagonal brace rods are employed at each side frame panel to reduce racking to a minimum.

The spacing of the carlines coincides with the spacing of the meat rack cross supports and the supporting bolts pass through the carlines, thus avoiding longitudinal blocking which is undesirable, particularly on account of interference with insulation. At alternate carlines ¾-in. cross tie rods are applied.

The framing and insulation of this car are so arranged

the ridge pole; this washer when applied is L-shaped and is secured by two nails. After the carriage bolt has been applied the projecting end of the washer is bent back under the bolt head so as to prevent the bolt from dropping down. The hole in the washer is square to suit the shank in the bolt head.

The side doors are equipped with W. H. Miner fasteners. The threshold plates are of pressed steel with a shallow shoulder at the inside edge for the stripping on the lower inside edge of the door to close against. The open door fastener consists of a link and bolt arrangement that cannot become unfastened accidentally.

Side door thresholds and all metal work on the interior of

the cars are heavily galvanized by the most reliable known process.

The Underframe

The underframe is of the center carrying type. The center sills are 30 in. deep at the center portion, composed of web plates ¼-in. thick, a ⅜-in. by 26½-in. top cover plate continuous in one piece from end to end of the car, top flange angles of 3½-in. by 3½-in. by ⅜-in. section, and 3½-in. by 5/16-in. bottom flange angles. The center sill bottom cover is of ⅝-in. by 21½-in. plate.

The bolsters are of the box girder type, composed of ¼-in. pressed steel diaphragms, with a ⅜-in. top cover plate, 18 in. wide, and a 9/16-in. bottom cover plate, 15 in. wide. The crossbearers are of single web girder construction, consisting of ¼-in. pressed steel diaphragms, with a 7/16-in. by 7¾-in. top cover and a 9/16-in. by 7¾-in. bottom cover. The floor beams are 4-in., 8.2-lb. Z-bars and the side sills are 6-in. by 4-in. by ⅜-in. angles. The end sill angles are of 6-in. by 4-in. by 7/16-in. section.

The draft arms are of ⅜-in. pressed steel. The rear draft lugs are secured to the draft arm and center sill splice, and are also riveted to the center sill bottom cover. The front draft lugs are designed to receive a cast steel coupler striking plate and cast steel carry iron; the latter is secured by a 1⅜-in. bolt passing through the lower front corners of the draft lugs. The cast steel striking plate has an extension arm for the angle cock bracket, so arranged that the bracket may be located correctly for either 9¼-in. or 12-in. coupler heads.

The cars are equipped with friction draft gear, cast steel yokes and 5-in. by 1⅛-in. coupler yoke keys.

Trucks

The cars are equipped with C.P.R. standard 40-ton arch bar type trucks, having Simplex bolsters designed to support the center pin in the truck bolster. The truck columns are of the Harigan pinless brake hanger bracket type. Side bearings are the roller type located 27-in. from the center of the car.

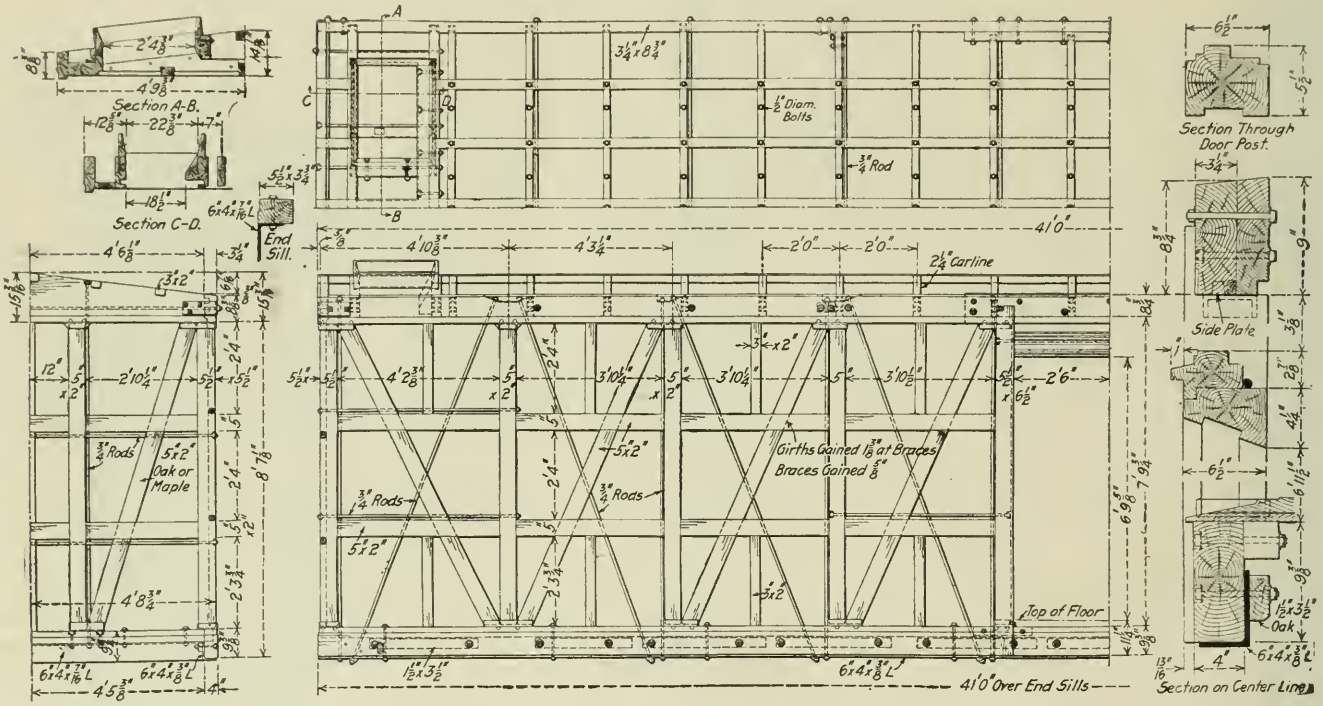
Adjustment of brake piston travel is provided for on the floating lever fulcrum, making it unnecessary to change the adjustment on the trucks after they have been correctly adjusted when the car is built, except that variations in the dimensions of brake beams and rods applied in renewals may require the truck levers to be readjusted.

The brake mast is 1¼-in. square and is fitted with a snow and ice proof ratchet and dog.

Freight Traffic Movement and Car Performance in August

THE NET TON MILES of revenue and non-revenue freight handled during the month of August decreased 10.8 per cent as compared with August, 1918, according to the monthly report of the Operating Statistics Section. The net ton miles per mile of road per day were 5,075 miles, as compared with 5,691 in August of last year. Train mileage decreased 11.2 per cent and car miles decreased 6.7 per cent, while the percentage of loaded to total car miles increased 4 per cent, from 67.7 to 74. The net ton miles per train mile increased from 737 to 740, but the net ton miles per loaded car mile decreased from 30.4 to 28. The car miles per car day decreased from 25.9 to 24.2. The net ton miles per car day decreased 11 per cent. The percentage of unserviceable freight cars was 9.2, as compared with 7 in August, 1918, and as compared with 8.7 in July of this year. The total number of serviceable cars shows a decrease from 2,292,372 to 2,241,609, while the number of unserviceable cars was approximately 226,000, as compared with 171,000 in August, 1918.

For the eight months of the calendar year ended August 31 the net ton miles show a decrease of 13½ per cent and the net ton miles per car day of 13.1 per cent. The net ton miles per train mile show an increase from 670 to 685 and the net ton miles per loaded car mile show a decrease from 28.9 to 27.8. The car miles per car day for this period average 22.2, as compared with 24.4 in the corresponding period of 1918.



Superstructure Frame of the Canadian Pacific Refrigerator Cars

Steam Railroad Statistics to December 31, 1918

Summaries of Reports of Class 1 Corporations and of Federal Operations as Compiled by I. C. C.

THE INTERSTATE COMMERCE COMMISSION has issued tables giving summary of the annual reports of Class 1 steam roads for the calendar year 1918, prepared for use in the Preliminary Abstract of Statistics of Common Carriers, the appearance of which has been greatly delayed due to unusual delay on the part of carriers in filing their annual reports for 1918.

The summary covers only Class 1 roads, excluding switching and terminal companies, and is in three parts:

1. Summary of the reports of the Class 1 corporations, whose property was operated by the United States Railroad Administration.

2. Summary of the reports of federal operations, Class 1 roads.

SUMMARY NO. 1.—GENERAL BALANCE SHEET, INCOME ACCOUNT, PROFIT AND LOSS ACCOUNT, OPERATING REVENUES, OPERATING EXPENSES, AND MILEAGE; FROM THE CORPORATE REPORTS OF CLASS I ROADS, THE PROPERTY OF WHICH WAS OPERATED BY THE UNITED STATES RAILROAD ADMINISTRATION FOR THE YEAR ENDED DECEMBER 31, 1918

3. Summary of the reports of Class 1 roads not under federal control.

The income from lease of road received by the corporations under federal control is shown as $890,632,748. This includes the rental from the United States government so far as accrued by the corporations on their books.

The profit and loss credit balance of the Class 1 corporations, including those not under federal control, at the close of the year 1918 was $1,536,805,230, as compared with a corresponding amount of $1,473,359,933 shown in the Preliminary Abstract for 1917.

The dividends declared from income and surplus in 1918 by these Class 1 corporations amounted to $275,375,300 as against $321,055,780 for 1917. The net income of Class 1 corporations amounted to $398,659,958 as against $589,044,923 in 1917.

SUMMARY NO. 2.—GENERAL BALANCE SHEET, INCOME ACCOUNT, PROFIT AND LOSS ACCOUNT, OPERATING REVENUES, OPERATING EXPENSES, MILEAGE, EQUIPMENT AND CERTAIN STATISTICS OF RAIL-LINE OPERATIONS; FROM REPORTS OF OPERATIONS OF CLASS I ROADS BY THE UNITED STATES RAILROAD ADMINISTRATION, FOR THE YEAR ENDED DECEMBER 31, 1918

†Includes 3,637,685 miles in yard-switching service.
‡Includes 2,523,083 miles in yard-switching service.
§Includes 1,114,602 miles in yard-switching service.

The interest on funded and unfunded debt accrued by the Class 1 corporations amounted to $425,774,298 as compared with $418,229,507 in the calendar year 1917.

The corporations, although they did not operate their properties, show some entries against operating revenues and expenses. This is explained by the fact that some of the accounts of 1917 were not settled until after the close of that year. Most of the overlap items, however, appear in the income and profit and loss accounts.

The summary of federal operations is an aggregate of the reports of the individual operating units and does not include the expenses of the regional and central offices of the United States Railroad Administration, amounting to $3,647,143.23. No showing is made of the general financial transactions of the Railroad Administration, which must be obtained from reports by the director general of railroads.

The aggregate income accounts of the Class 1 operating roads under federal control show an operating income as defined in the federal control act of $682,555,220. The standard return for these roads is approximately $891,000,000. The standard return is not entered in individual reports of federal operations. Attention is called to the items of $93,954,358, miscellaneous income, and $15,330,682, miscellaneous income charges, which include the 1917 overlap items of operating expenses and revenues passing through the federal books.

The summaries covering the corporate reports and those of federal operating are given in this article.

Summary No. 3 covering the Class 1 roads not operated by the Railroad Administration covers 2,929 miles of road operated, which had railway operating revenues amounting to $29,211,246, railway operating expenses amounting to $23,677,956, and railway operating income amounting to $3,144,613.

The Coaling plant which is to be erected in the harbor of Melbourne, Australia, when completed will consist of four electrical hoists with grab buckets, which pick up four or five tons of coal at a time and deliver it to mechanically operated conveyors, which in turn, will carry to bins of 30,000 tons capacity.

Putting Our Railways on a Business Basis*

Factors Are Suggested Which Are Vital to a Satisfactory Solution of the Railway Problem

By Alba B. Johnson
President Railway Business Association.

WHAT LEGISLATION is to be passed in order to make it possible for the owners to operate their railroads without bankruptcy, has become a question pressing upon the public attention more strongly than any other at this time, save only that of the League of Nations and the Peace Treaty. We have had two years in which to think it over; yet when the time is approaching, not a matter of months, but a matter of weeks, when this problem must be solved, we find ourselves with some 36 plans offered, of which no less than seven have become widely known. The voice of the business men of the United States has been a discordant medley. Every conceivable plan has been urged for consideration. The Railway Business Association has prepared no plan, but has felt that there are certain principles which are involved, and if these principles are adopted, we care not what plan embodies them.

National Chamber Referendum

The directors of the Chamber of Commerce of the United States received the report of their Railroad Committee on the first of May last. The polls closed on the referendum July 24. The voice of the country was almost unanimous in approving such of these recommendations as favored private operation of railways and certain other principles; but since July 24, although this question changes its aspect daily, the Chamber of Commerce has been constrained to restrict its discussion to the precise recommendations upon which the constituent bodies voted in July.

This restriction is due to a rule of the Chamber which the Railway Business Association voted for when it was adopted and which we approve now. We would deplore any impairment of the system under which after deliberate study by a competent committee upon a subject of first national importance the Chamber submits the fundamentals to the business organizations of the country for a dignified and impressive expression of deliberate and enlightened opinion, the Chamber never speaking business sentiment without having ascertained it. No doubt some of the constituent bodies misunderstand this process. There is evidence that many of them expect the Chamber officers to go outside the scope defined in the referendum, believe that it does so, and fold their hands in confidence that great national measures will be carried to enactment with constant and always up-to-the-minute participation by organized business without their doing anything after voting.

That the Chamber recognized the need for supplementary machinery was shown when it authorized the calling of the National Transportation Conference, conducted under auspices of the Chamber but in no way authorized to speak for it. All the members of the Railroad Committee were appointed members of the Conference and several of them participated actively. The result was one of the seven leading plans—a plan containing matter in several aspects vitally wider than the referendum. The conferees sat as individuals. They bore no commission from organizations. They had no ways or means of rallying the constituents of the Chamber to their plan.

*An address delivered before the American Mining Congress at St. Louis, November 17, 1919.

Cooperative Committee

In these circumstances Harry H. Merrick, president of the Chicago Association of Commerce and also of the Mississippi Valley Association, arranged for a conference of officers of organizations in Atlantic City at the time of the International Trade Conference in October. Among those who accepted the invitation to be present were National Chamber officers—the chairman of the executive committee, a director, the chairman of the Railroad Committee and the general secretary. These officers were asked whether they saw any objection to the formation of a committee, representing constituent bodies, to discuss principles not inconsistent with the Chamber referendum and others not dealt with by it; and if so whether the Chamber would prefer or not to act as recipient of replies to a circular inviting cooperation from associations.

As to the second question, attention was called to the difficulty, as shown by experience, of making members of Congress understand the distinction between official recommendations of the Chamber and those of groups to which it merely lends its good offices; and it was suggested that the proposed committee keep itself wholly independent.

As to the first main question, a statement was made and was subsequently used by the Chamber in answering inquiries by constituent bodies, that the proposed independent activity of a group of associations was deemed entirely proper.

The Atlantic City conferees, including officers of four national and seven city associations, agreed to constitute themselves into what is called the Cooperative Committee on Railway Legislation. The chairman is Mr. Merrick.

Recommendations

What will the Cooperative Committee urge upon Congress? This is for the Committee to say; but I hope they will put some questions to all those who are engaged in agriculture, mining, industry or commerce. These are the questions:

I. Defective Governmental Policy

Do you not believe that apart from misdeeds of railway managers and financiers, which should be restrained, and apart from their assertions of poverty, which are a matter of business justment, the impairment of railroad credit has been in part due to the policy of the federal and state governments in the regulation of rates?

Managers Made Scape-Goat

In support of the assertion that the railroads were themselves responsible for the impairment in their credit, it has been declared that railroad-wrecking had spread its odium over properties otherwise sound and that the managers by their calamity-howling had "beared" their own credit; so that if these two elements were eliminated no change in government regulation of rates would be necessary. But investors do not invest on "front" or refrain from investing on second-hand odium; they act on expert advice, which is based on knowledge with regard to each individual property as to its income and prospects of income, and as to the integrity and stability of its management. Practically no

influence is exerted upon investment in a strong road by misdeeds or misfortunes afflicting other roads. Each road stands or falls on its own condition.

As for calamity-howling, are railway managers seriously supposed to think that statements of inadequate income laid before rate tribunals can escape the eye of those who advise investors? In any event every railroad board includes, quite properly, bankers who make a part of their living as wholesalers of securities. Who believes that they would consent, as railroad directors, to a campaign certain to curtail their dealings as bankers, if the income situation had not become desperate beyond remedy within the reach of the managers and financiers? Railroad boards contain the ablest, most successful, best respected and most fully trusted men in the country—merchants, manufacturers, professional men.

To accuse such men either of imbecility or villainy of this sort is to indict the best there is in the nation. It is incredible. It is not true.

Credit can only be restored by adapting the policy of the government to the course of events. Such a change in policy is long overdue. It should wait no longer.

Attitude of Congress

What is the apparent attitude of the two branches of Congress on this vital point?

The House bill, which has been passed, leaves the Interstate Commerce Commission without obligatory mandate to permit such rates as will yield revenue sufficient to attract capital. The spirit of the House committee is, we fear, indicated by the annexation to their report of a statement by Interstate Commerce Commissioner McChord, who says: "Whatever decline there was in railway credit previous to federal control was not due to any action of the Interstate Commerce Commission."

The Senate bill attacks the credit question directly and in a mandatory manner, requiring that such rates be permitted as will yield a specified rate of return on the value of the property. The Senate committee report, moreover, has this: "Legislation . . . must tender to the future investor . . . reasonable assurance of such yearly return as will induce him to enter the field. . . . It is here that our present system of regulation has failed."

It is the task of citizens to aid the Senate committee in commanding support in the Senate for the position set forth in that quotation and to persuade the House to concur.

II. Federal Jurisdiction Over Rates

Since the federal authorities must sanction adequate total revenue for all roads from all sources, do you not believe that any business-like regulation of carriers which are parties to interstate hauls requires that all rates of all such carriers shall be under the jurisdiction of federal authorities?

Neither the railroads nor any line of public business can be successfully regulated by 49 regulatory bodies. In order to prevent discrimination and undue burden on interstate commerce through state regulation, every carrier which hauls any interstate cargo should be subject to the regulation of all its rates by the federal authority.

III. Adequacy of Rates

Do you not believe that resumption of railway development requires, among other things, that Congress supplement its present statutory policy of restrictions only, by enacting that rates shall be such as to yield revenue sufficient for necessary expenses and for the credit basis which will enable the average road to secure improvements and extensions?

This applies to the proposition contained in Question I. That was that Congress should recognize the necessity for a change in government regulation in order to restore railway credit. Question III deals with one of the essentials in carrying out that proposal. The law as it stands gives the jurisdiction over each individual rate as to its justness and reasonableness. The Commission has no authority to sanction whole rate structures primarily to yield a certain amount of total revenue. The Senate committee bill explicitly bestows such power. The House bill does not. Such power should be a feature of the act.

IV. Advance Ascertainment and Report of Needs

Do you not believe that an indispensable requirement in putting the railways on a business basis is that the regulatory authorities at workable intervals ascertain for a forthcoming period the transportation needs of the country, and report to Congress or to the public their findings as to such needs and their estimate of the necessary revenue?

The House committee bill as introduced provided that the Commission should keep itself informed of transportation needs and operating revenues necessary to adequacy and efficiency of facilities and service. Newspaper despatches not yet verified in detail indicate that possibly this passage was eliminated on the floor.* Even if left in, it does not require the Commission to keep the public informed. The Senate committee bill provides for a similar inquiry by a Transportation Board, which is to certify its findings to the Commission, such certificate to be prima facie evidence. Whether there is to be a new board or not the results of such observation and study should be a public report of findings, and such report should cover, not past periods, like the statistics of large-scale rate-advance cases hitherto, but the future. We do not care anything about the water that has passed over the dam. You have to be prepared for the flood that is coming.

V. Announcement of Necessary Rate of Return

Do you not believe that in estimating the net income required for each group in order to attract capital in the amount approved as necessary the regulatory authorities should have the power and the duty to ascertain and announce the rate of return which under money market conditions at a given time it is necessary to allow?

"And announce." Nothing is more vital. If the regulatory authority is required to announce its estimates as a whole, and specify what rate of return this is based upon, the public will be able at all times to judge what, if any, adjustments are required to bring the estimates into line with the facts; the public, with this complete understanding of the situation, will acquiesce in such adjustments; the Commission, having set a mark to attain, will itself realize with some exactness what is required of it and bend every energy toward performance.

Are you not willing to help Congress put the railways on a business basis without regard to your preferences as to methods, by informing Senators and Representatives what you and others, whose view you have ascertained, regard as the necessary objects of railway legislation?

This last question may be summarized in two words—"Get busy." Now is the time. These next thirty days or less may be the time during which this great question of the future condition of the railways of the United States is to be established, not for next year or for the next ten years, but for an indefinite period ahead—possibly for all time.

*On the day this address was delivered the House in passing the bill eliminated the following: "The Commission shall be charged with the duty and responsibility of observing and keeping informed as to the transportation needs and the transportation facilities and service of the country, and as to the operating revenues necessary to the adequacy and efficiency of such transportation facilities and service. In reaching its conclusions as to the justness and reasonableness of any rate, fare, charge, classification, regulation or practice, the Commission shall take into consideration the interest of the public, the shippers, the reasonable cost of maintenance and operation (including the wages of labor, depreciation, and taxes), and a fair return upon the value of the property used or held for the service of transportation."

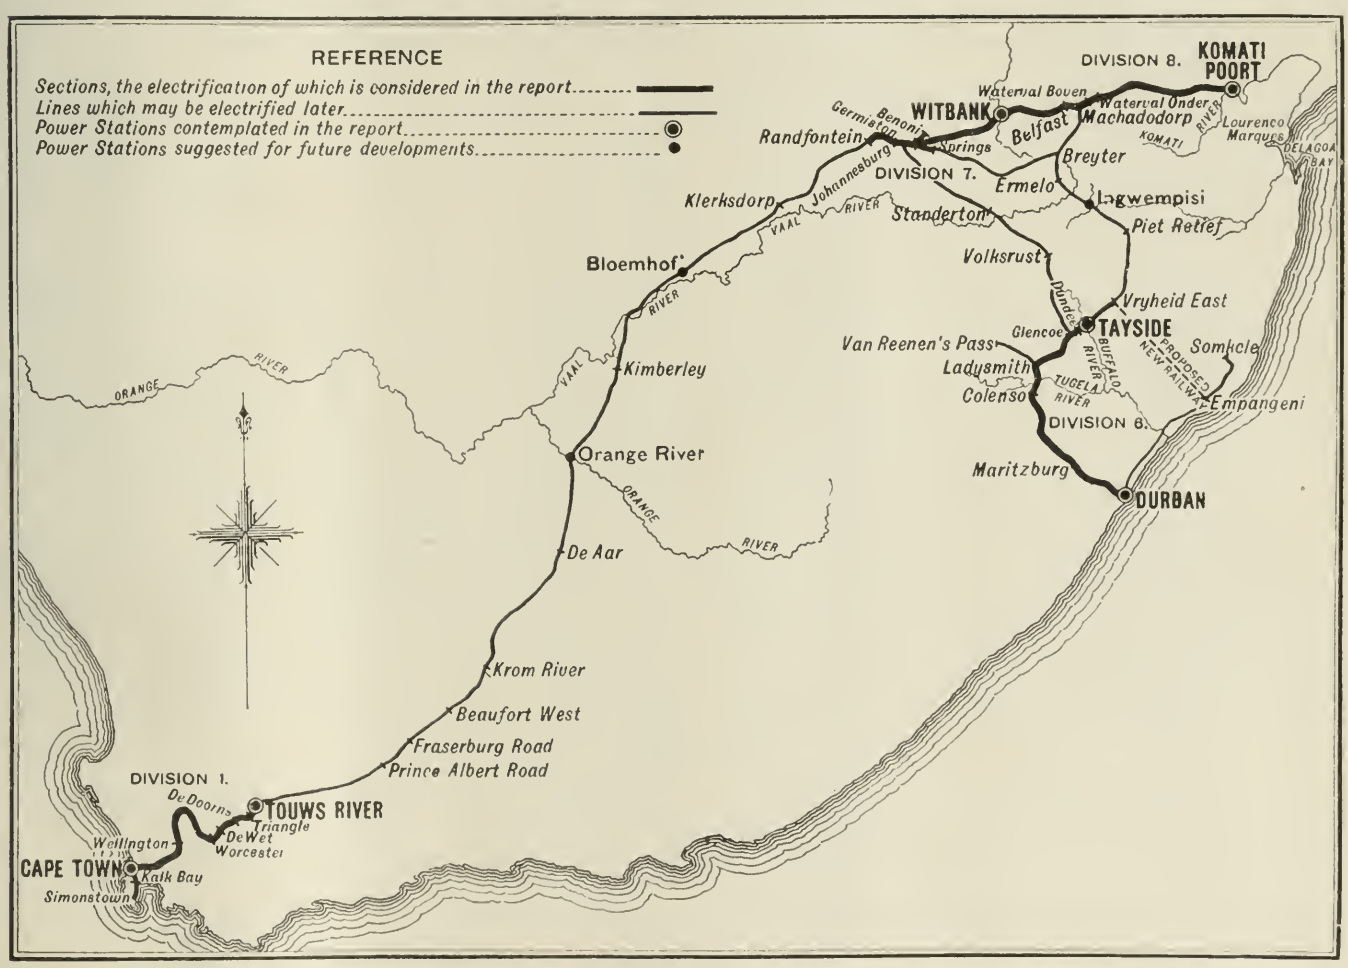
Electrification of the South African Railways

Estimated Net Expenditure of $50,000,000 to Equip 860 Route Miles—Direct Current to Be Used

By Robert E. Thayer
European Editor of the *Railway Age.*

THERE HAS BEEN PUBLISHED in London recently by Merz & McLellan, consulting engineers, a most complete report on the proposed electrification of portions of the South African Railways. There is so much interest in this report that an abstract is given below:

The South African Railways in preparation for an increase in traffic has given consideration to electrification of the more congested portions of its line by means of which heavier trains can be handled at higher average speeds than is possible at present. As an alternative to electrification material changes would have be made on the road as in some cases the traffic density has about reached the limit of that which can be handled.

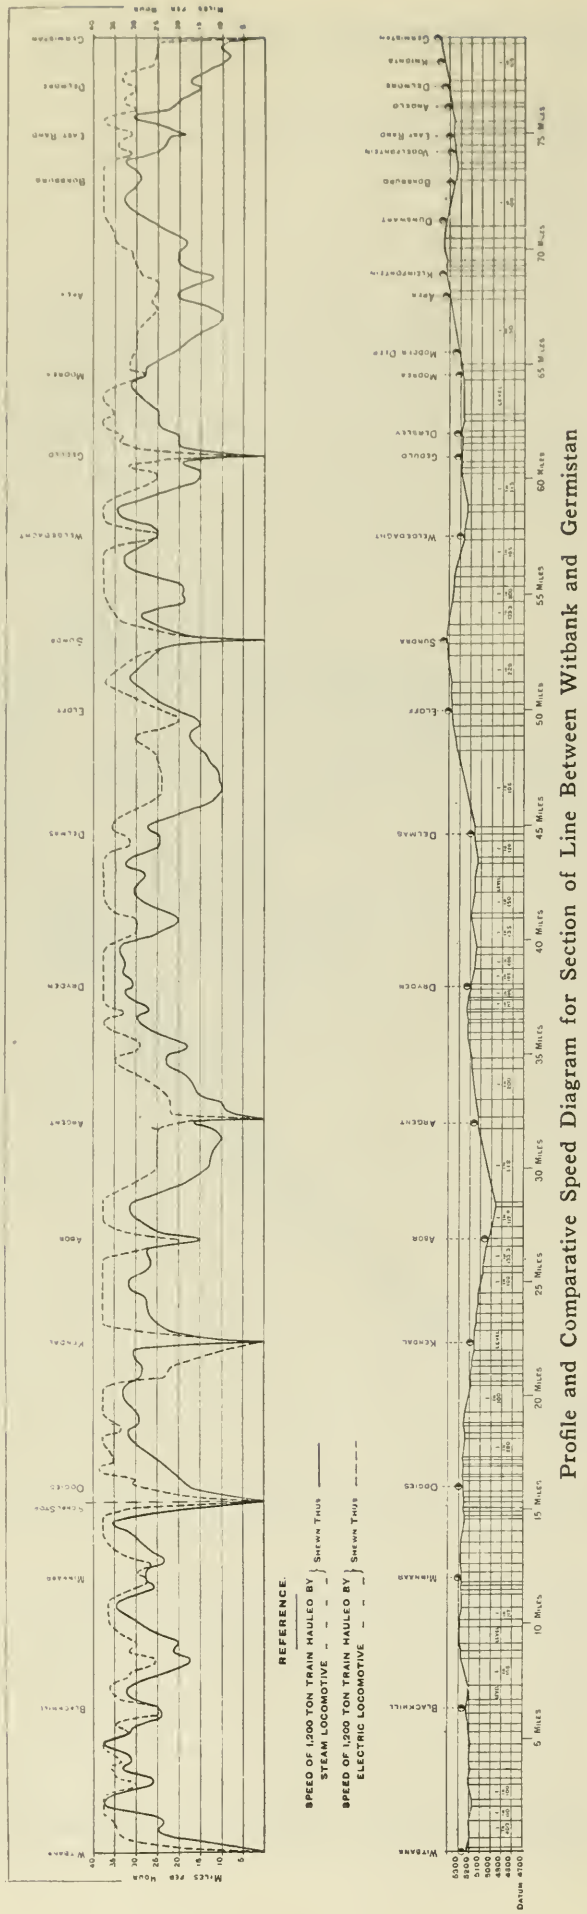


Map of South African Railways

The proposed plans contemplate an increase of traffic at 50 per cent over the electrified portions with the present trackage. Four portions of the lines are considered, which involve 860 route miles and a total trackage, including yards, sidings, etc., of 1,219 miles. The estimated net capitalization involved for this electrification amounts to £11,670,485 of which £6,396,350 is the estimated cost of power stations and transmission lines. A credit of £5,033,197 was deducted from the estimated gross total expenditure on account of the equipment that would be released from actual service in the electrified portions and on account of the cost of alterations to the lines and the additional equipment that would have been required to provide for an increase of 50 per cent in traffic under steam operation. The return on the net capital expenditure is estimated to be £801,900.

With the existing conditions in South Africa it has been deemed practical to operate electrified portions by direct current at 3,000 volts. The power will be generated in the form of three-phase alternating current at a frequency of 50 cycles.

The report recommends electric freight locomotives weighing 268,800 lb., having a tractive effort of 48,000 lb. for one hour and 64,000 lb. for short periods such as when starting a train. With the maximum traffic effort a factor of adhesion of 4.2 is obtained. For passenger service a locomotive of 161,280 lb. has been recommended which will have a tractive effort of 30,000 lb., one hour rating, and



Profile and Comparative Speed Diagram for Section of Line Between Witbank and Germistan

a maximum tractive effort of 38,400 lb. For shunting service an electric locomotive weighing 125,440 lb. has been recommended of sufficient capacity to exert a tractive effort of about 14,000 lb. at about 12.5 m. p. h., or a maximum tractive effort of about 24,000 lb. For suburban service the multiple unit system made up of combinations of one motor coach with a trailer is suggested. Regenerative braking is recommended for adoption on certain portions of the electrified lines.

Portion of Line to Be Electrified

The portion of line which is considered for the present electrification is shown on the map in Fig. 1. There are four distinct portions indicated as Divisions 1, 6, 7 and 8. In all but Division 8 there are branch lines to be electrified in addition to the main line. In the vicinity of Cape Town these branch lines deal with the suburban traffic almost exclusively and the traffic on the branch lines of the other two divisions is principally freight.

The conditions of the line in Division 6, between Durban and Glencoe, are such that electrification there is very desirable. Under the present conditions the volume of traffic which is carried on the single track line has approached the limit of the capacity of the section and the increase of 50 per cent, which is traffic on which the electrification scheme is based, would require an expenditure of at least £750,000 for sidings and double tracks, whereas the total outlay required for electrification of this portion apart from the costs of power stations and transmission lines is only £952,713.

The estimated profit chargeable to electrification of this line is estimated to be £384,110. The length of line between these two points is 249 miles and the traffic consists principally of coal from the Naval coal fields in the neighborhood of Glencoe. This line contains exceptionally heavy grades and sharp curves, the maximum grade being 3.33 per cent and the minimum radius of curvature 300 ft. Durban is, of course, at sea level and the altitude of Glencoe is about 4,300 ft. with a maximum altitude between the two places of over 5,000 ft.

The main line from Cape Town to Touws river, Division 1, is 160 miles and the ruling grade is 2.5 per cent.

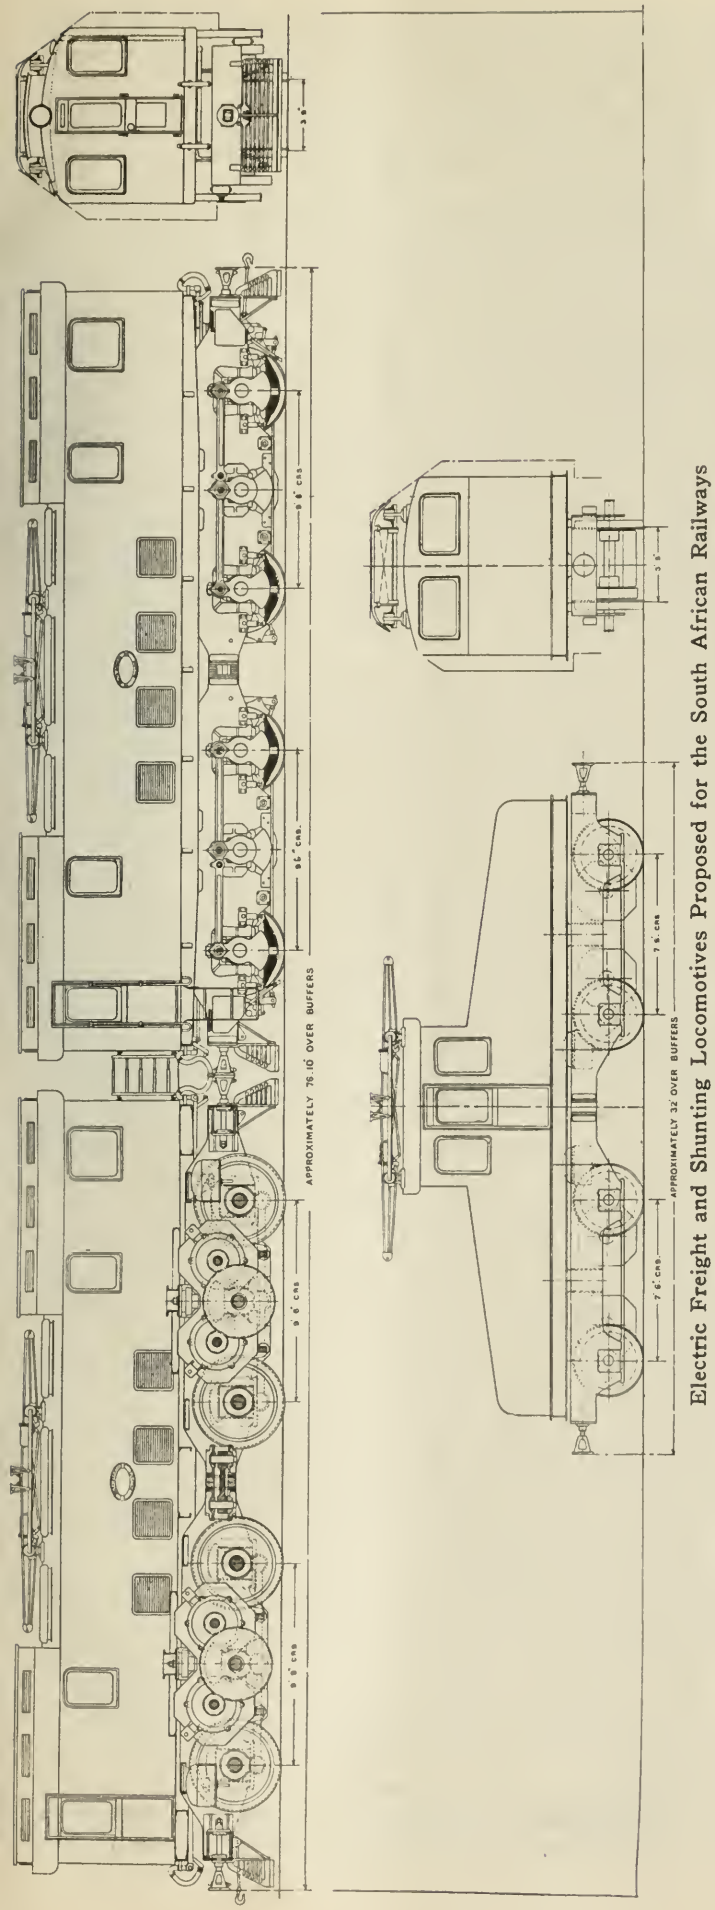
In Division 7 the main line between Witbank and Randfontein is 131 miles and the traffic consists almost entirely of coal from Witbank for Cape Town. The ruling gradients are against loaded traffic; between Witbank and Johannesburg it is 1 per cent and there are numerous heavy grades throughout the whole line as indicated in the profile of the line between Witbank and Germiston shown in Fig. 2.

The main line from Witbank to Komati Poort in Division 8 is 223 miles. The general character of line is similar to that of the main line in Division 6. Komati Poort is about 600 ft. above sea level and the line rises very steadily to 4,144 ft. at Waterval Onder. Between the latter station and the Waterval Boven which is not more than two or three miles air line, there is a rise of about 700 ft. which is covered by 8.5 miles of track, the ruling grade being 2 per cent.

It will thus be seen that there are some heavy grades throughout the territory which makes electrification particularly desirable.

Electrical System Recommended

As stated above, the conditions in South Africa favor the operation of the electric trains by direct current at 3,000 volts, with three-phase alternating current being transmitted to the sub-stations at a frequency of 50 cycles. Direct current meets the needs of the suburban service admirably and the results of the Chicago, Milwaukee & St. Paul electrification at 3,000 volts d. c., presents a practical example of the



Electric Freight and Shunting Locomotives Proposed for the South African Railways

adaptability of this system for long distance freight and passenger traffic. The chief objection to the use of the direct current system as compared with the single phase system is that more substations will be required. On the Chicago, Milwaukee & St. Paul the average distance between substations is about 32 miles and in the present case it is believed that sub-stations could logically be placed from 25 to 30 miles apart. A further objection to the direct current is that of designing the driving equipment for locomotives and motor coaches for 3,000 volts, but regardless of the fact that the narrowness of the gage of the South African railways, which is 3 ft. 6 in., presents its limitations, it has been possible to design suitable equipment. The gage, however, will not permit of placing the motors between the driving wheels, and the design of the locomotive involves the use of outside connecting rods, coupling the crank on each pair of driving axles to those of a central jack shaft which is driven through gearing by a pair of motors.

The use of direct current enables a simple construction of electrical equipment for the motor cars and locomotives in which the first cost is low and the maintenance easy and cheap. It provides for variable speeds and is well adapted to the requirements of a general system including suburban and main line traffic. In view of the several heavy grades mentioned above the use of regenerative braking is desirable. While the use of this feature is most easily accomplished with 3-phase motors it can be applied to direct current motors with the added advantage that the motors can be worked regeneratively over a wide range of speeds whereas with the 3-phase motors the current can be regenerated continuously only at one or two different speeds.

An overhead wire over the centre of each track supported at intervals by steel structures is believed the most desirable for the conditions in South Africa. The general arrangement proposed is the same as that already adopted for the electrified Sheldon-Newport branch of the North Eastern Railway in England. The contact wire is to be supported by a catanery and the line is to be divided into sections by the means of section isolators.

It is planned to locate the sub-stations at Kalk Bay, two at Cape Town, Booth Junction (near Durban), Maritzburg, Ladysmith, Glencoe and at suitable intervals between the power stations which are to be located at Cape Town, Touws River, Witbank, Komati Poort, Tayside and Durban.

The location of the generating plants required considerable study. Because of the fact that the divisions to be electrified are so far from each other, with the exception of Divisions 7 and 8, this problem had to be considered separately with a view of possible extension of the electrification system.

The possible use of water power was carefully studied, but the rainfall in South Africa is very irregular and the flow of water in most of the rivers crossed by the portions of the railway under consideration is unreliable and occasionally ceases altogether. Even the Orange and the Vaal rivers have been known to cease flowing altogether and this is a common occurrence with other rivers of less importance. Thus hydro-electric plants are out of the question. Furthermore in South Africa coal at the pit is cheap and the cost of freight is low, which again favors the use of steam-driven generating plants.

In deciding the location of the power sites, the security of supply was carefully considered and they were chosen with the idea of enabling duplication of work. Thus in Division 6 it is recommended that power plants be located at Tayside and Durban. In Division 7, a power plant is to be located at a station on the Great Olifants river. In this locality, however, it is possible to draw power from the Victoria Falls and Transvaal Power Company. For Division 8, it is recommended that power plants be located at

Komati Poort on the Komati river which with an increase of capacity of the Great Olifants river plant would be able to take care of that division. In Division 1 it is recommended to place the plants at Cape Town and Touws river. The Cape Town plant will provide power for the suburban branches around Cape Town and for a portion of the main line to Touws river. Although the distance between Cape Town and Touws river is only 160 miles by rail, it was considered inadvisable to depend upon a single source (Cape Town) and a transmission line of this length for a supply for the whole section and it was therefore recommended that the Touws river plant be included.

In considering the general question of power supply the report states that the engineers had in mind the possibility of supplying power to municipalities and possibly to private consumers in addition to the railways. It is believed that it would be a mistaken policy to regard railway electrification as distinct from the general use of electricity throughout the country. The majority of the power undertakings in South Africa have already adopted the 3-phase alternating current with a frequency of 50 cycles which would make co-operative working a simple matter. A splendid opportunity presents itself for co-operative working for a large power plant at Cape Town as the municipality of Cape Town will in the near future be obliged to increase its power facilities.

For the entire electrification project twenty-four 8,000 k. w. units and two 5,000 k. w. units have been suggested, distributed as follows:

Cape Town—Eight 8,000 k.w. units.
Touws River—One 8,000 k.w. unit.
Durban—Four 8,000 k.w. units.
Tayside—Three 8,000 k.w. units.
Great Olifants River—Eight 8,000 k.w. units.
Komati Poort—Two 5,000 k.w. units.

Electric Motive Power

As above mentioned it is believed advisable to use electric locomotives for main line passenger and freight trains and for switching work with multiple unit system for the suburban traffic.

Electric freight locomotives.—In South Africa where all the cars are fitted with air brakes, the controlling feature is the drawbar pull required to haul the train up the ruling grade. Investigation showed that the draft gear on some of the freight cars (which is to be systematically placed on all of the freight cars) was of a sufficient strength to enable a train of 1,800 short tons to be hauled up a grade of one per cent. This corresponds to a pull of about 48,000 lb. An electric freight locomotive was therefore designed to meet these conditions and the characteristics suggested were that it should have a tractive effort of 48,000 lb. and weigh 268,000 lb. The locomotives are designed for hauling a 1,200-ton train composed of loaded cars at a speed of about 40 m. p. h. on the level, or a train of 1,800 tons at not less than 30 m. p. h. Furthermore, they are designed to operate at a speed of 20 to 23 m. p. h. up to the ruling grade. Thus a substantial increase in general speed in freight trains is anticipated. The actual horse power of the proposed freight locomotives under these conditions works out at about 2,800 (one hour rating). This may be compared to from 1,000 to 1,400 h. p., the capacity of the present steam locomotives. The general arrangement of these locomotives is shown in Figure 3.

Electric passenger locomotives.—The average maximum load of the passenger train is about 600 tons. Platform and station accommodations generally limit the number of coaches per train to a maximum of 15 or 16. The maximum grade of any of the sections under construction on which a special passenger locomotive would be used is 2.5 per cent. Thus a tractive effort of about 40,000 lb. would be required. Inasmuch as these maximum grades are comparatively short and few, it was believed better to use a pusher in addition to the train engine and for that reason passenger locomotives of 161,280 lb. exerting a tractive effort of 13,000 lb. at one hour rating and a maximum tractive effort of 38,400 lb. were proposed. This locomotive would be able to haul a 600-ton train up a 1.67 per cent compensated grade without assistance and would be amply sufficient for all probable requirements.

Speed restrictions due to local conditions will not permit speeds higher than 60 m. p. h. and for that reason these locomotives have been designed for a normal speed on the level with a train of 15 main line coaches of not less than 55 m. p. h., or 28 to 29 m. p. h. on the grades. The design of the express passenger locomotive is similar to the freight locomotives with the addition of a leading four-wheel truck to adapt these engines to the higher speed. The use of this special design of passenger locomotive will, under the extent to which present electrification is to be carried, be restricted to Division 1, for on the other divisions there are but few places where a high speed is possible owing to the large number of sharp curves. It is therefore suggested that single-unit electric freight locomotives should be used on Divisions 7 and 8 for passenger and double-unit electric freight locomotives on Division 6, where the trains are heavy and the grades severe.

Electric shunting locomotives.—A large amount of shunting has to be carried out at Cape Town, Durban and Kendal, and for this purpose a special shunting locomotive has been recommended. It is of the double truck type, with a center driver's cab, weighing about 135,440 lbs., and has a tractive effort of 14,000 lbs. at 12 m. p. h. It is planned to have the electrical equipment practically identical with that of the passenger coaches of the suburban passenger trains.

Anticipated Results From Electrification

One of the chief reasons for the electrification of the South African lines was the purpose of increasing the capacity of the tracks as they now stand. The investigations were based on a 50 per cent increase in traffic. This is to be brought about by the increase in the average speed at which the trains will be operated and by increasing the train load so that greater tonnage can be hauled with a fewer number of trains. As most of the sections under consideration are single track lines, a reduction in the number of trains and an increase in speed will produce a great improvement in regard to delays at stations.

With electrical operations the average speed of the two different classes of traffic will be more equal than it is at the present time and there will be less necessity of side tracking the slower traffic. An example of what this means on the run between Witbank and Germiston is illustrated by the diagram in Fig. 2. The full lines show a record of an actual test with a steam locomotive commonly used on this line loaded to 600 tons, and the dotted lines show the calculated speed for the same load with an electrical locomotive. Electrically hauled trains will take 2 hours 40 minutes, exclusive of stops, as compared with 3 hours 45 minutes for the steam train, or a reduction of nearly 30 per cent in the running time. The saving of time on other sections is even greater. For instance, the running time for fast freight trains from DeDorns to Touws river, allowing one intermediate stop for water, is at present 2 hours 24 minutes, whereas with the electrically operated train the same distance will be covered in 1 hour 12 minutes. In passenger service the present running schedule between Cape Town and Touws river is 7 hours 50 minutes, whereas under electrical operation the journey could be done in 5 hours 45 minutes.

In regard to the suburban passenger trains operated under the multiple-unit system it is the universal experience that

such improvements in travelling facilities produce a larger volume of traffic, which is due to a growth of the population in the remoter suburbs and to more frequent use of the improved services.

With the increase in speed less equipment will be required to handle the same amount of traffic. There will be a reduction in the amount of coal consumed, with the accompanying decrease in the number of cars used for the transportation of company coal. There will be an increase in engine mileage. In the case of the freight service between Glencoe and Durban the yearly mileage of the electric locomotives would be at least 70,000 miles. Thus fewer electric locomotives will be required. In this respect it is estimated that with 262 electric freight, psasenger and shunting locomotives and 136 motor coaches, 448 steam locomotives would be available for sale or service elsewhere and that the 152 steam locomotives would not have to be purchased in order to deal with the 50 per cent increase in traffic the 262 electric locomotives and 136 motor coaches are expected to handle. In addition to this, electrification would, on account of increase in speed and the reduction in fuel consumed, make unnecessary the purchase of 1,038 new 40-ton freight cars, or their equivalent, which would be required for dealing with the increased demands under steam operation.

The decrease in annual train mileage, considering the estimated 50 per cent increase in traffic, is well illustrated in the through freight service. With steam locomotives it has been estimated that train mileage of the four divisions would be 9,846,800 miles, and with electric operation this would be 6,890,610 miles, or a saving of 2,956,190 train miles, or 30 per cent.

The saving in working expenses involves a comparison of the cost, under steam operation, of coal, water, wages of train crews, engine house expenses, lighting and heating, locomotive repairs, depreciation with, under electric operation, the cost of electrical energy, wages of train crews, engine house expenses, repairs and depreciation of the locomotives and motor equipment, depreciation, maintenance and working expenses of the sub-stations and the maintenance of the track equipment necessary for electrification. On the four divisions the estimated profit for electrical operation amounts to £801,900.

Capital Expenditures

The various items of capital expenditure involved in the electrification of these lines involves the cost of new rolling stock, electric locomotives, etc., the cost of the distribution system, the cost of the sub-stations and the cost of the power plant and transmission lines. There are other items, such as alterations to engine houses, telegraph and telephone lines, lengthening of sidings, etc. The net outlay on rolling stock is obtained by deducting from the gross expenditure for the new electric locomotives or train equipments the value of the existing steam locomotives displaced, the new steam locomotives that would be required for the additional traffic under consideration, the new wagons that would be unnecessary to purchase on account of the increased speed of the traffic, and the new wagons that it would be unnecessary to purchase due to the reduction in fuel consumption. The cost of the distribution system and sub-stations present an entirely new item of expenses, from which there is nothing to be deducted.

There are, however, additional credits which enter into the present discussion, such as the cost of alterations in the track to handle the 50 per cent increase in traffic under steam working, and which would not be necessary by electrical working. A balance of these items, exclusive of the power stations and transmission lines, show the estimated net capital outlay to be £5,274,153. The cost of power stations and transmission lines had not been included in this estimate because of the possibility of purchasing power from various outside sources. However, in the working expenses interest at 5 per cent per annum on the capital required for new stations and transmission lines in event of the railroad producing its own power is included, together with a depreciation charge of 3 per cent on the power stations. The estimated capital outlay on power stations and transmission lines amount to £6,396,350. The net return on the net capital outlay, exclusive of the cost of power stations and transmission lines, is approximately 15 per cent. If the cost of the power stations and transmission lines are included the net return would be approximately 7 per cent.

War Time Fuel Restrictions Ordered

THE LOSS OF COAL PRODUCTION during the strike has so reduced the Nation's coal supply that restrictions in the use of coal paralleling those put into effect during the war were ordered on the very eve of the proposed settlement of the strike.

The fuel administrator, Dr. Harry A. Garfield, on December 8, issued the following order giving the Railroad Administration authority to issue regulations covering the delivery, use and consumption of coal, coke or other fuel or of power generated or produced by the use or consumption of coal, coke or other fuel:

"*The United States Fuel Administrator* acting under authority of an Executive Order of the President of the United States, dated 23 August, 1917, and of subsequent Executive Orders, and in furtherance of the purpose of said Orders, and of the Act of Congress therein referred to and approved August 10, 1917.

"*Hereby orders and directs* that the Director General of Railroads and his representatives acting by and under his authority be, and they thereby are, authorized and empowered to make and prescribe such local or general regulations restricting the delivery, use and consumption of coal, coke or other fuel or of power generated or produced by the use or consumption of coal, coke or other fuel as may from time to time be necessary in the present emergency. All regulations made pursuant to the authority hereby granted shall be valid and binding as and for regulations of said Administrator.

"This order shall be effective December 8, 1919."

On December 1, the fuel administrator gave out a statement urging the conservation of coal for these uses and suggested that local authorities adopt regulations and put them into effect to carry out this purpose.

A careful survey of the coal situation indicates that even if there is a prompt settlement of the coal strike, it will take some time to adjust the country to a normal basis and that, therefore, certain restrictions will have to be placed on the consumption of bituminous coal and of light, heat and power derived therefrom, so that urgent domestic needs may be cared for, the necessary food stuffs produced and really essential light, power and heat supplied. Already in many parts of the country restrictions as to the use of coal and coke for lighting and heating purposes and for the production of electricity and power for such purposes have been adopted. Regulations were tonight issued to make such restrictions uniform over the country and thus aid in the conservation of coal. They follow:

"Pursuant to authority of the United States Fuel Administrator the following regulations governing the use of heat, light and power from bituminous coal and coke are made effective generally and uniformly in the interest of conser-

vation of existing fuel supplies, and supersede any previous instructions:

LIGHT FROM BITUMINOUS COAL AND COKE.

1. No ornamental lights, white way or other unnecessary street lights, outline lighting, electric signs or illuminated billboards, show window or show case lights, are to be operated. This does not affect street lighting necessary for the safety of the public.

2. No cabaret, dance hall, pool hall or bowling alley shall be permitted to use light except between 7 p. m. and 11 p. m.

3. Stores, including retail stores but excepting stores selling food, and warehouses must not use light (except safety lights) except for six hours per day. Manufacturing plants shall be allowed to use light only during the time prescribed for the use of power.

Exceptions:

(a) Drug stores and restaurants may remain open according to present schedules, but must reduce lighting one half.

(b) Railroad stations, hotels, hospitals, telephone, telegraph and newspaper offices are not included insofar as necessary lighting is concerned.

(c) General and office lights must be cut off not later than 4 p. m. in office buildings except necessary federal, state and municipal offices, and except where office operation of vital industries is involved.

(d) Dairies, refrigerator plants, bakeries, plants for the manufacture of necessary medicinal products, water works, sewerage plants, printing plants for the printing of newspapers only, battery charging outfits in connection with plants producing light or power for telephone, telegraph or public utility companies are exempted.

HEAT FROM BITUMINOUS COAL AND COKE.

1. Only enough heat may be used in offices, stores, warehouses and manufacturing plants to keep the average temperature at 68 deg. Fahrenheit, and then only during the hours for which light is permitted. During other hours only enough heat is to be used to prevent freezing of water pipes or sprinkler systems.

2. In manufacturing plants or plants coming under power curtailment rules, heat (to 68 deg. Fahrenheit) will be allowed only during that time prescribed for use of power.

POWER FROM BITUMINOUS COAL AND COKE

1. No manufacturing plant or factory shall be furnished bituminous coal or coke, or heat, light or power from bituminous coal or coke furnished by or through the United States Fuel Administration for operation in excess of three days a week on the basis of present working hours.

Exceptions:

Dairies, refrigerating plants, bakeries, plants for the manufacture of necessary food products, of necessary medicinal products, water works, sewerage plants, printing plants for the printing of newspapers only, battery charging outfits in connection with plants producing light or power for telephone, telegraph or public utility companies are exempted.

2. Elevator service must be curtailed as much as possible in accordance with above regulations on use of heat, light and power.

ELECTRIC RAILWAYS

1. Electric railways shall reduce schedules to minimum requirements of service under revised hours of heating, lighting and power as herein provided.

2. No heat shall be provided on electric cars during rush hours and heating during non-rush hours shall be curtailed as much as possible.

GENERAL

1. Electric railways and manufacturing plants, stores and offices shall co-operate in arranging, within the provisions of this order, schedules, days and hours of work to permit the maximum utilization of transportation equipment."

Distribution of the Railway Dollar

ONE OF THE MOST striking features of the annual report of the Bureau of Railway News and Statistics for the year ended December 31, 1918, is the diagrams on the back cover of the report showing the distribution of the railway dollar in 1918 and in 1916. According to these diagrams, the railway dollar was distributed in these two years as follows:

	Where it went to—	
	in 1918	in 1916
Labor	54.06	40.60
Fuel and locomotive supplies	11.11	7.45
Material and supplies	14.40	15.77
Loss and damages	2.02	1.67
Taxes	3.87	4.46
Total expenses	85.46	69.95
Interest	8.74	12.48
Rent of leased lines	2.59	3.96
Betterments	.56	1.83
Available for dividends, reserves and surplus	2.65	11.78
Total	100.00	100.00
For deficits	....	....

Commenting on this, the report says that "Experience has shown that when the expenses and taxes of American railways as a whole exceed 70 per cent of their revenues many roads are in distress and more lack credit."

It will be perceived that for the year 1916, when the operating income of all the roads was $1,105,106,214, the operating expenses were only .05 per cent within the zone of safety. It is this fact that makes the comparison of the diagram especially valuable. A similar diagram for the calendar year 1917 showed that the operating expenses had crossed the line of safety into the zone of danger to the extent of 6.15 degrees. In 1918 the margin of safety was left 15.46 per cent in the rear.

The first nine months of 1919 show that there has been no halt in the march of expenses into the territory abounding in deficits, defaults and receiverships, from which the taxing power of the United States alone saves its railways today. The other means to save the situation—the power to raise the rates to yield sufficient revenues—the government has so far declined to adopt.

Another figure in the diagram for 1918 commands attention—the 54.06 per cent of gross revenues paid to labor against only 40.60 per cent in 1916. Practically the entire increase in expenses is accounted for here by the increase in the percentage distributed to employees. Moreover, this 54.06 per cent is computed on the largest operating revenues in the history of American railways.

The aggregate compensation of railway employees in 1918 was $2,686,734,498, or nearly $300,000,000 more than the total operating revenues in 1908! The average pay of 1,897,741 railway employees in 1918 was $1,416 a year and the average per day was $4.52 against only $2.25 in 1908, an increase of over 100 per cent in ten years. These figures do not include the administration's pay roll, which numbers 2,500 persons whose average pay is $2,567 per year; or the 2,619 officers and employees of the corporate organizations whose pay averaged $2,147 per year. These last figures are interesting as affording a comparison between the pay of the officials dismissed by the director general and of those appointed in their places.

Another revelation contained in this report is the enormous increase shown in the pay of clerks from $120,766,765 in 1915 to $263,657,074 in 1918. The class of clerks receiving less than $900 per annum, of whom there were 101,751 in 1917, has been practically eliminated. Where this branch of the service accounted for a total of only 1.9 per cent of the operating expenses in 1907, in 1918 it amounted to 6.2 per cent.

The report covers 250,473 miles of operated line and presents the first complete review of the railways of the United States for the first year of government operation.

The Signal Engineers' December Meeting

Signal Division Holds Large Meeting in New York—Standards Discussed—Plan Next Annual Meeting

THE FOURTH MEETING of the Signal Division, Engineering Section, American Railroad Association, was held at the McAlpin Hotel, New York, on December 2 and 3. As a result of the recent letter ballot, the times of holding the meetings were changed to March and December for the stated meetings, with the annual meeting in July. A tabulation of the vote shows that 338 voted for the change and 105 against. The change was proposed so that all reports could be sent to the executive committee of the American Railroad Association, by October 15, but there is still some dissatisfaction.

The attendance at this meeting was very good—140 active and affiliated railroad members, 7 junior and 89 associate and affiliated non-railroad members, with 19 guests, a total of 250. The meeting was presided over by the chairman of the Division, C. J. Kelloway (A. C. L.). Secretary H. S. Balliet (N. Y. C.), deferred the reading of the minutes of the September meeting, as because of the printers' strike in New York, they had not been printed.

The first discussion was that on the report of Committee No. 3, power interlocking, F. B. Wiegand (N. Y. C.), chairman. This committee presented a specification for universal electric locks for hand operated switches, first and second range voltage; and a specification for an electric lock for power interlocking machines. Both were presented only for discussion, not for final adoption. Mr. Wiegand, in presenting the report, gave an abstract of information received from the Bureau of Standards, Washington, relating to proposed action by the Bureau looking to revision of the publication containing national standards of screw threads.

The discussion was participated in by Messrs. W. H. Elliott (N. Y. C.), P. E. Carter (G. R. S.), B. H. Mann (M. P.), J. C. Mock (M. C.), A. H. Rudd (Penn.), and F. L. Dodgson (G. R. S.). Questions as to the height at which a switch box shall be placed, whether indicators should or should not have doors, and as to the advisability of having contacts on locks for power interlocking machines were considered. Mr. Mock spoke of the need of improvement in arranging apparatus on power machines; there is a tendency to put too much on these machines; he has taken off such things as polarized relays and placed them in separate places, a change which was found to facilitate proper maintenance. As to locks on these machines, it was the sense of the meeting that they should have no contacts.

Committee No. 5, on maintenance rules and instructions, L. R. Mann (M. P.), chairman, presented a code of questions and answers for an examination paper for signal maintainers. This fills a dozen pages of the program issued for the meeting and was discussed at considerable length. These questions and answers were presented only as information and the dozen or more members offering criticisms dealt only with minor details. It appears that some of the things which, in this document would be required of maintainers, are forbidden by the agreement between the railroads and the maintainers as recently drawn up by the United States Railroad Administration. Another significant suggestion was that some of the clauses referring to flagging would seem to forbid a maintainer to stop a train in case of danger.

Standard Designs

Committee No. 6 submitted for approval six drawings containing standard designs, and a seventh, a base for a 4-in. mast, for discussion only, the report being presented by J. C. Mock (Michigan Central), vice-chairman. The first drawing, No. 1010, crank and jaw pins, was adopted without discussion. This and the next two are former standards revised in a few details. No. 1015, one-inch signal pipe, was adopted after brief discussion. The committee had changed the rivet holes; a member proposed that the rivet be made one-sixteenth inch smaller. This the committee promised to consider. One member wanted the plug to be made a tighter fit, but this view did not prevail. The drawing was adopted subject to possible change as to the length of rivet. Drawing No. 1220, crossarm bolts, was adopted. The list of standard cotter pins, drawing No. 1409, was adopted without discussion.

Drawing No. 1430, a semaphore lamp with two lenses, facing in opposite directions, was the subject of considerable discussion. Mr. Ralph (Northern Pacific) proposed the placing of a mark on the inside of the lamp, opposite the peep hole, to simplify the work of the instructor who has to tell illiterate men how to adjust the height of the flame. The casting shown in the drawing is designed for a backlight and a peep hole, both in one casting, although both of these holes may not be called for in all lamps; the object being to reduce the number of standard castings required. This explanation answered some inquiries as to the arrangement of the holes. W. H. Elliott, New York Central, believes backlights no longer necessary.

Mr. Beck (N. Y. C.) objected to the adoption of a standard for a two-lens lamp as such a lamp gives satisfactory service only where the line of road is straight; but to this Mr. Ralph replied that on his road a lamp made by Adams & Westlake was used with satisfaction, in which one of the lenses is adjustable for curved track. Criticism being made of the outer hood surrounding the lens in this drawing, which does not extend out quite so far as the bullseye, Mr. Mock said the committee would consider the adoption of a deeper hood; and the drawing was accepted.

Drawing No. 1449, a base for a four-inch iron mast, was explained by Mr. Mock as having been made for the purpose of providing for heavy highway crossing signals a stronger post than that usually used, while yet not so heavy as the standard semaphore post. This drawing was submitted for discussion only.

Drawing No. 101 A. R. E. A., a 16 ft. 6 in. split switch, was presented by the committee for the purpose of showing the location of the holes drilled in the switch points; after brief discussion this arrangement of drilling was adopted.

Committee No. 11, batteries, R. B. Elsworth, chairman, presented revised standard drawing No. 1224 showing a storage battery jar, cover, sand trays, etc. A few details have been added. The changes have been commended by the manufacturers, and after a brief discussion the drawing was adopted for submission to letter ballot and inclusion in the Manual. The committee submitted a specification for type A, caustic soda primary cells and renewals. Mr. Elsworth said that this had been fully discussed with the manufacturers and, except section 6, it was quickly approved. That section, prescribing the required capacity of a battery, was discussed at some length. Section 6 deals with the capacity of batteries but does not indicate the maximum capacity nor does it describe the method of making a test, the battery makers having been unable to agree on a recommendation to the committee.

There was some discussion of the question whether

primary batteries should be used for low-voltage switch machines; but Mr. Siebert, Mr. Rainey, and others said that they were using these primary batteries successfully, using two sets in multiple. Mr. Siebert's low-voltage machines operate in 30 seconds. E. W. Kolb (B. R. & P.), reporting on results brought out in his laboratory for testing primary batteries, suggested in detail a complete revision of section 6 defining capacities.

There was some discussion over the desirability of a clause in the specification providing for jars of rectangular shape. There was considerable sentiment in favor of this shape. Mr. Kelloway had found that 14 cells and 5 cells for track circuits, by using this shape, could be installed without making special provision for housing.

Committee No. 13, P. M. Gault, chairman, presented a specification for ranges and scales for voltmeters for alternating current, which was briefly discussed.

Committee No. 2, on mechanical interlocking, Samuel Miskelly, chairman, presented a specification for mechanical interlocking machine, style "A" locking. This was discussed very briefly and the meeting then turned to the specification for lever locking for mechanical machines presented by the same committee for inclusion in the Manual. It was argued that this matter should be combined with the specification for the machine, paragraph 6, but to this it was answered that considerable reprinting could be saved by keeping material concerning lever locking separate.

A discussion then arose as to whether specifications presented at a stated meeting could be acted upon by letter ballot. The rules allow this but there was doubt concerning the advisability of submitting to letter ballot specifications and other matter which has been discussed at only one meeting. It appeared to be the sense of the meeting that there should be discussion at two meetings so that all parts of the country would be more fully represented. Mr. Elliott moved that the mechanical machine lever locking be accepted for presentation at the annual meeting, and it was so voted.

Committee No. 7 on direct current relays, E. G. Stradling, chairman, presented a specification for lifting armature direct current relays, which was briefly discussed. The committee had made a number of modifications since the report was presented at Atlantic City last June. A few further changes were suggested.

Committee No. 10 on signaling practice, J. A. Peabody, chairman, presented a brief report on methods of control to cause signals to indicate stop in emergencies, giving a condensation of information received from a number of railroads replying to a circular. The committee had sent out 36 circulars and received useful information from ten roads. The Western Maryland and the Illinois Central have arrangements for opening track relay connections and also have knife switches. The New York Central uses knife switches and also arrangements for conveniently cutting by pliers. The Union Pacific opens the signal circuit wire by a knife switch or breaks the track circuit by knife switch. The Norfolk & Western shunts the track circuit by knife switch. On the Louisville & Nashville and the Chicago, Rock Island & Pacific, special indicators are provided for the information of signal maintainers. On the Northern Pacific track circuits are shunted by a controller operated by hand.

The committee recommends that for temporary protection the maintainers should be instructed to disconnect the signal circuits. Where a permanent arrangement is desired it may be provided by: (A) Opening track relay through knife switch. (B) Opening circuit wires through circuit controllers. (C) Shunting track by circuit controller or knife switch. Indicators may be provided to advise track workers of the approach of trains.

In the discussion the use of shunt wires was criticized as unreliable, especially in the hands of trackmen and others unskilled, but it was pointed out that sometimes a good deal of time can be saved by their use, as it may take a good while for a track walker to reach a relay box. If the track watchman can be depended upon to report dangerous conditions he ought to be competent to manage a shunt wire.

Valuation Work Done by the Government

Committee No. 15, J. M. Carley, chairman, presented a report detailing some of the methods employed by the Interstate Commerce Commission in its work of valuation of railroad property. This report was discussed briefly by C. H. Morrison (N. Y., N. H. & H.), T. E. Beck (N. Y. C.), G. K. Thomas (A., T. & S. F.) and K. E. Kellenberger, associate editor of the *Railway Age*. Whether or not functional depreciation should or should not be considered was the main topic under discussion.

Lubricating Oils

Committee No. 16, I. S. Raymer, chairman, presented a specification for zero lubricating oil and one for 45 degrees below zero lubricating oil. It was proposed, and the committee will consider the naming of the different kinds of oils by numbers so as to provide short names which will be distinctive and can be readily remembered. There was a long discussion on what elements should be included in describing zero oil. Because of the great demand for oil at the present time, and the consequent impracticability of always securing oil from the same field, there is a good deal of variation in quality, and oil frequently fails to behave as well in service as it does in the laboratory; but the only remedy mentioned for this condition was to get the aid of the signal manufacturer in securing satisfactory oil.

The last paragraph of each specification calls for clean, dry containers as specified by the purchaser, and in discussing this paragraph there was a demand that the committee recommend standard sizes of containers, one as small as one-half pint. No action was taken. Both of these oil specifications were accepted for submission to letter ballot with a view to including them in the Manual, but the motion evidently was adopted with the tacit understanding that changes would be made by the committee and that final disposition would be made at the annual meeting.

Committee No. 4, on D. C. automatic block signaling, C. F. Stoltz, chairman, presented for discussion a specification for universal switch circuit controllers. In the clause relating to ventilation, the committee accepted a suggestion that caps might be put on the inside of the case; also that binding posts should be prescribed of larger size. Mr. Elliott, New York Central, has used for several years binding posts 5/16-inch in diameter and finds them satisfactory. A large size is necessary to withstand the jarring to which these boxes are subject. A member called attention to the absence of any clause requiring an inside cover for the operating cams, but the committee replied that this point was omitted because on so many roads it is the practice to have no such inside cover.

The specification was accepted to be referred to the annual meeting with a view to having it referred to letter ballot and inclusion in the Manual.

Annual Meeting

At the close of the meeting, Secretary H. S. Balliet announced that the next meeting of the Division would be held in Chicago on March 16, next, and the annual meeting at Thousand Islands Hotel, Alexandria Bay, N. Y., on July 14, 15 and 16, 1920. It is intended to arrange for the reservation of rooms at the hotel by the secretary of the division, Grand Central Terminal, New York City, early in June. He and the secretary of the Signal Appliance Association will co-operate in this matter. In view of the probability of a large attendance, arrangements are being made with two other hotels within 500 feet of the Thousand Islands house.

Concerning the Utilization of Freight Cars*

Obligations of the Carrier and of the Shipper—Need of Co-operation—Car Pools

By W. C. Kendall,
Manager of the Car Service Section, Division of Operation, United States Railroad Administration

THE STEAM RAILROAD is now nearly 90 years old. The units used for transportation are still in process of development and new questions arise year by year. I am posing neither as a reformer nor a critic; but I do believe that we are just now at a period when we must take heed as to whither we are drifting.

Freight cars now number about 2,500,000 and to replace one will cost at present prices close to $3,000. In what other business can you find an article of such value literally turned loose for your use and mine? I firmly believe the experiences of the recent past have demonstrated beyond peradventure the complete interdependence of the railroad and shipping public. The railroad has found that it can no longer act in its own interest, but that the public will find a way to demand a reasonable share of consideration. The shipper has found that there are problems other than his own which must be considered. There must be some measure of give and take. Our real progress must be measured by the friendly spirit of understanding and co-operation which has grown up between those who have the commodity of transportation to sell and those who purchase. In probably no other commercial transaction does the one party have so much to say as to the fairness or otherwise of the other, either in fixing the price of the commodity which is for sale, or the value of the trade to the purchaser.

The Obligation of the Railroad

We have a country which spreads 3,000 miles in one direction and 1,500 to 2,000 miles in the other, within which area we have a public with a widely varying opinion. The coal shipper of Pennsylvania—or possibly I should say the consignee—is, relatively speaking, of a different opinion as to the type of coal car which is best adapted for his business, from that held in Missouri. One shipper of lumber demands open cars for the convenience of loading and assumes the expense of staking, while another shipper of the same kind of lumber demands a closed car to save the expense of staking, disregarding the inconveniences and increased cost of unloading. A shipper of early vegetables in one section of the country may feel that the market available to him will be better served if his product is moved under ventilation, while another shipper of the same commodity will demand refrigeration for the same distance and perhaps in the same general territory. We have constantly an exacting, and if I may be permitted to say it, finicky public to be served.

We must try to please when and as we can, sacrificing somewhat where necesary. Shippers have been generous in using unsuitable cars and in other patriotic acts, often to their loss, carriers have given some poor service, but it is to be borne in mind that in response to the demands of war time production the wheels have almost literally been run off the cars. There has not until the past six or eight months, been opportunity to stop the cars long enough for overhauling; but covering the dissipated repair forces which were so largely upset by war no effort or expense is being spared to properly and promptly condition the cars now awaiting repairs.

A road under-equipped is not doing its duty to the public. Generally, a railroad owns sufficient cars to market the commodities produced on it, but there are varied circumstances. The coal loading road has, as a rule, provided cars in sufficient quantity to carry the product of its road to destination, irrespective of whether that destination is on its rails or not. This has required a heavy outlay entirely inconsistent with purely local requirements. On the other hand, a road may be a heavy receiver of box car freight and originate little or nothing; such a road may not reasonably be expected to provide box cars for it would never succeed, except in times of serious car shortage, in getting these cars into service. Another line may be a heavy producer of perishable fruits and require large quantities of refrigerator cars. The movements may be over two or three intermediate lines which may not reasonably be expected to contribute refrigerator cars for this through movement. This question must be studied in all its variations and some formula arrived at which shall properly and equitably distribute the burden of ownership among all lines. This is not an easy question, but is one to which a competent committee, duly authorized, concentrating for a few weeks, could find the answer. By such an arrangement the roads altogether might be saved a capital expenditure approaching $300,000,000 (100,000 cars).

Service

Terminal and divisional yards must be so policed that cars may not get caught and held. In spite of such action as has been taken to correct delays in yards, I have never seen anything really effective except a record which will work automatically and force those responsible to immediate action. The individual card record can doubtless be adapted to this purpose, and is the nearest proof against error I have ever seen. While the clerical expense involved may be increased somewhat, it is but little comparatively speaking and is as nothing when measured against the possibility of saving in car days.

The shipper cares not so much for quick movement as he does for regularity and dependability. Fast service has been advertised and practically all of the special attention given has been concentrated on these particular trains while the remainder of the traffic, probably comprising 90 per cent of the whole, has been given no special thought. The public generally will be better served if the supervision is spread equitably over all freight movements. We probably lack supervision. Its first cost is expensive; but we must devise some means, automatic or otherwise, which will enable us to check our overdue movement.

Car Distribution

When a car shortage prevails the railroad must determine an equitable basis upon which cars may be divided between shippers and between commodities. Certain obligations must be met and the question of preferential treatment must not interfere. In the first place, freight houses must be kept open. This is a public necessity. All the cars required to move l.c.l. freight to other towns, must be furnished. Certain commodities such as newsprint paper must be provided for. The question of distribution gives a railroal much concern lest it be accused of discrimination.

The distribution of cars for coal and grain is on a well-established and equitable basis. It might be possible to do

*Abstract of an address delivered before the New York Railroad Club, October 17, 1919.

as well with lumber. I doubt the practicability of giving a mathematical rating to all shippers. Fair treatment of shippers, as between commodities and between stations, and between individual shippers is an element to which the railroads must give further attention, arriving at some well established and acceptable basis.

The Obligation of the Shipping Public

The average railroad official is ready to admit shortcomings and to assume his share of the burdens, but there are well-defined obligations resting upon the shipper and consignee: (1) prompt loading and unloading; (2) capacity loading of cars; (3) proper use of the reconsignment privilege. The shipper is frequently careless, not conforming his orders for cars to his actual daily requirements, he is not apt to be considerate as to specific type and capacity. The shipper should order cars in writing and well ahead of requirements; and be precise as to ability to load. Under our present system we have many cases of duplication and inflation which are misleading with a consequent derogatory effect on the car supply in general.

Some hold that demurrage is a device of the devil, designed to extract money from the unsuspecting and innocent, others that the demurrage rules are built for their benefit, to give them certain rights with property not their own, to be exercised without limit; neither position is correct. Demurrage is by necesity a punitive measure to protect one against another's neglect. [Here the speaker made a strong appeal for concentration of effort with respect to prompt loading and unloading. He finds that even after a consignee has been to considerable trouble in speeding up the unloading of his car the railroad sometimes fails in its obligation to move the car with corresponding promptness.]

Our Car Service Section records show that on a certain date 1,922 consignees on 158 railroads were holding 7,764 cars under load, an average of 3 days each *beyond* the free time, or a total of 5 days per car. This represents a total of 23,292 car days beyond the free time which divided by 16 days—an assumed average turning time of a coal car—represents the equivalent of 1,456 cars continuously tied up.

Capacity Loading

During the railroads' campaign of 1917 when all were fired with patriotism, the average loading of cars was increased by something over two tons a car, a gain of from 10 to 16 per cent. If in the flight of your imagination you consider the 250 billion ton miles already recorded as moved by the railroads under federal control for the first eight months of this calendar year, and equate the loss of 3 tons per car which is the figure for August, you will find a possible theoretical saving of something in excess of 200,000 cars for daily use. That is, instead of having 2,250,000 cars available for service daily we should have the equivalent of close to 2,500,000. In August our ton miles deceased 10.8 per cent while our loaded car miles decreased but 2.9 per cent, which gives a picture of the loss of car efficiency due to light loading. We must study the possibilities as between commodities, and the effect of minimum weights. The possibilities of double and triple loading are daily before us. One car can be made to do the work of two in moving salt, sugar, flour, feeds, etc., a saving which is of tremendous importance. Money invested in supervision of this element of transportation will return a hundred fold. Eternal vigilance is the only way.

Reconsignment

Reconsignment is a reasonable and a legitimate traffic privilege but it is subject to abuses. The broker who deals in bills of lading and has no established place of business is a parasite on the railroads; he is on a very questionable basis. There are those who send shipments from one market to another, taking chances on possible sales; and they will reconsign again and again, possibly with the object in view of dodging demurrage charges. Meantime the car is kept under load and out of the service to which it belongs. Who has not seen that sale list of a hundred or more cars of lumber "on wheels" and each with its little code word? Why, we all know that at least half of those cars do not exist!

These then are some of the more important elements of transportation in which the public has a direct responsibility toward improvement. I am sure I cannot be accused of undue bias in making the statement that none of these things represent as much actual effort or expense as do those factors for which the railroad is responsible. Supervision is the answer. But it is impossible for the railroads to have officials responsible for every little thing, with eyes and ears spread over the last inch of 200,000 miles of line, and the railroad and the shipper should sit down together, in a spirit of helpfulness, and see that the tag ends existing here and there are caught up according to the best judgment and conscience of the individual. I do not believe that corporations have no souls, for I have abiding faith in the conscience of the individual railroad official.

Advanced Movements

It is to the interest of all, economically speaking, that the traffic movements be spread as evenly as possible throughout the year. Some commodities do not lend themselves readily to this practice. Melons, peaches and grapes will not wait for transportation; transportation must wait on them. Fertilizer must move generally according to the whim of the farmer; he does not want to tie up his money and cannot store this commodity in advance of requirement. To find adjustment as between seasonal or semi-seasonal commodities and the general run of traffic presents an opportunity for the shipper, the consignee and the railroad to get together in real hedpfulness. Such commodities as pulpwood and clay for the paper mills; phosphate rock for the fertilizer plants; the winter's stock of bituminous and anthracite; wood for the chemical plants; should be moved when tracks are not crowded, and placed in storage. The phosphate rock mines of Florida have been practically idle for the past six or seven months, but the commodities necesasry for next season's fertilizers are not yet moved and they must be moved between now and February 1, our period of heaviest movement and most difficult operation. For the calendar year up to July 1 the bituminous coal production averaged about 8,500,000 tons a week with literally thousands of coal cars idle. Now, in response to vigorous demands of the public, we are hitting 11,500,000 tons weekly, which represents an increased transportation requirement of over 35 per cent for this commodity alone, accompanied by a shortage of cars for this and other commodities, and also a bit of hysteria. Here is presented real opportunity for exercise of the principle of community of interest.

Market Conditions

An established market is helpful to the railroads. It prevents a tendency to panicky conditions among shippers and creates a spread of transportation which is helpful. A shortage in the potato market at New York will send the quotations up and the Maine farmer will call for cars instantly. The warehousemen are all in the same state of mind, desiring to catch a sale on that market, and orders for cars for potatoes jump from zero to hundreds overnight, presenting to the railroads an impossible task. Suppose cars were supplied to fill all the potato orders; the shipments would then be so heavy that the market would break and the producer would immediately cease shipping. . . . There is a considerable tendency to traffic in wheat and other grains already on wheels which ties up cars and which a stabilized market would help to correct. To some extent a similar situation exists with respect to the lumber traffic. Possibly there are certain advantages in having live stock arrive at the large markets on

Monday or Tuesday, but what a saving would follow if shipments of livestock were spread through four or five days of the week! Car supply would be stabilized and train runs would be adjusted to a more even basis.

I appreciate that we cannot interfere with the inexorable law of supply and demand, but nevertheless there would seem to be presented an opportunity for movements such as these to be stabilized; perhaps through association membership which will voluntarily give control to some of these elements without in any way jeopardizing the interests of the industry or the individual.

Shipping Day Plan

The "shipping day plan" has not gained the popularity which I believe it deserves. No doubt the shipping public feel they have exercised all the patience as to the practice of this idea which can be expected. It must be borne in mind that it was presented at a time when railroads were struggling with a shortage of experienced labor, also that available labor was somewhat short of experience. Furthermore, there was not full cooperation among all railroads. But it was a bit of pioneering which should have a stronger support. The theory is excellent; it is not fool proof; it needs help and not so much suspicion that the railroad is trying to put something over.

Permits and Embargoes

In some instances of abnormally rapid development of industries a quite impossible burden is imposed on the railroad. War-time Bridgeport (Conn.) and the oil craze at Burkburnett, Tex., are instances of what I mean. Probably the development of the Texas oil fields represents the most rapid growth of railroad requirements of any period in our history. * * * But for reasons of his own the consignee does not release cars promptly. He clogs the ways. He falls behind for perhaps perfectly legitimate reasons. The embargo is then necessary. This creates a wave-like line of transportation. The permit plan of handling traffic strictly on a basis of ability to dispose of at destination becomes necessary. It creates a "delinquent" list which is quite psychological in its effect. Generally speaking the public are favorable to the permit system, for with it goes a sense of realization of its benefits. Wherever there is opposition I feel railroads must ask the public to be patient in its operation, as I am convinced that in no other way can the traffic of this country be at all times satisfactorily handled. The system has fully justified itself.

Propaganda

A certain industry anticipating a possible car shortage—it positively had not arrived—apparently communicated with all of its branch offices and correspondents in various states and definitely suggested that the question be brought to the attention of the powers that be through senators and congressmen. As a result we had complaints from practically every state in the Union, all as to a single situation at one loading station. We were in receipt of seven letters from the people's representatives of one state with enclosures which read identically the same. Propaganda of a different sort comes indirectly from newspapers and newsprint mills. If there is a temporary car shortage at a paper mill there is likely no preference as to whose paper shall have priority of movement so *all* newspapers are notified that *their* paper cannot be shipped and to get busy. There is relatively no storage of newsprint at points of consumption. We then hear of it from widely separated sources. There is only a certain quantity of cars for distribution and innumerable telegrams and letters cannot increase this quantity. To give preference where no preference is due will involve unjust dealing. Much time and energy would be saved for more important matters with a policy of direct dealing.

Car Service Rules

One of the most important questions before us today, and one in which the public will claim a vital interest, is whether we shall follow the rules observing the ownership of the car or consider all cars common railroad property and load them accordingly. In the fall of 1916 the demands for cars became so urgent that there was a tendency for every road to grab all available equipment and appropriate it to its own uses regardless of rules or obligations. The result was that the cars gravitated naturally into those arears where the industrial activity was the greatest; and not only did they gravitate to these regions but they stayed there, making a corresponding shortage in the producing sections. Then penalties were provided to force the cars home. In the following spring and after various experiments with a strict ownership plan, the war pressure became so urgent that the lid was off; it was "catch as catch can"; and a common-use plan for box cars was authorized with a forced relocation of empties as occasion might demand. In the fall and early winter of that year the situation became so acute in the industrial centers that in the interests of greater production of coal and easier operation a limited coal car pool was authorized. Both of these situations exist today and they present a somewhat complicated situation.

This brings to the fore, as the time approaches for the return of the roads to private control, the question of right or opinion as between the two schools of thought—the adherents of the ownership plan on the one side and those of the pool on the other. Probably the answer lies somewhere between the two. It probably will be conceded, based on the experience and practice of the past two years that with an ownership plan in operation there must be more flexibility than was had in the past. On the other hand, if a modified plan of common use is authorized some protection must be given the owner. Each railroad executive will probably insist that this money was expended for a certain type of car particularly adapted for the shippers and receivers on his lines. Then, too, there is a general pride of ownership which, from a psychological point of view, is important. The consensus of opinion among the lesser operating officials, and this is meant to also include the yard forces, is probably favorable to the flexibility of the common-use plan, for it gives them an opportunity to respond to the demands of their superiors for decreased operating expenses and is a very considerable factor. Thus we have the railroad family somewhat divided on this question.

The shipper is not particularly concerned as to whose car he may be using. What he asks for is a unit of a type to suit his needs—box, coal, flat, stock or refrigerator—which is in good condition and which he can load to whatever destination he chooses. If his car is not forthcoming as he has ordered it he is not at all concerned as to the marks which may be on the side of a car already in his possession. The privileges which have been extended to the shipping public the past two years with respect to the common use of cars have served to form habits which may not be easily broken. As shortages occur the shipper will demand a car without respect to any railroad rules which in his judgment deprive him of something to which he believes himself entitled. If it were possible to standardize cars overnight the problem would be easier. Standardization of equipment does not seem near at hand, although progress has been made for years; but in the nature of things standards must change as ideas develop. Great progress has been made during federal control in the way of standard types of cars and locomotives. Purchases of these standards are however but a small proportion of the whole in point of numbers. Inasmuch as the life of a car will probably average 20 years the period within which standardization can be fully accomplished is thus seen to be a very indefinite one.

I do not think that with a concentrated effort the proposi-

tion will prove an impossible one to deal with. Merely as a suggestion I believe that if ten railway presidents, ten operating executives, ten mechanical superintendents, ten transportation superintendents and ten yardmasters, all selected so as to cover a wide geographical distribution, were to assemble in committee, guaranteed the privilege of free speech and protection from the consequences thereof, and with full authority to act, in two or three days' time they would develop principles which could form the basis for a smaller committee to frame a code or an understanding under which all roads could handle cars to the best advantages and maintain them to the highest possible standards. Like every other move toward real progress this involves the good faith of the individual and, what is all-important, sufficient and efficient supervision.

There are probably car units enough in this country to handle present production. The freight equipment must however be so kept in repair that only a reasonable number of cars shall be out of service; and shipper, consignee and railroad must each do their part in conserving time and avoiding wasteful practices. For the present we should promptly replace all dismantled units, car for car, but of modern capacity. It is not altogether a lack of cars which accounts for our shortages; it is lack of utilization. Show me the actual number of cars short and I think I can show you where there are cars which are or can be made available if we will all fulfill our obligations.

Converting Cross Compound Locomotives to Simple

DURING THE YEARS 1905 and 1906 the Minneapolis, St. Paul & Sault Sainte Marie purchased considerable number of cross-compound locomotives of the Consolidation type. These engines were among the heaviest of their class at the time they were built, the total weight in working order being 101 tons. At the present time they are still used in through freight service, and in order to eliminate the unsatisfactory features of the compound, one of the class was recently converted into a simple locomotive, using superheated steam. Tests conducted to determine the relative fuel consumption of the compound and the simple superheated engine showed that the change resulted in a substantial saving of fuel.

For the purpose of the test two engines were chosen, which were in practically the same mechanical condition. Engine 448 was a cross-compound, while engine 468 was superheated with simple cylinders. One engine crew was assigned to the test and was used on all the runs. In order to obtain a close check on the fuel used, approximately the correct amount of coal for the run was weighed and put into the coal space of the tender. An additional supply was weighed out into 100 lb. sacks and was carried on the back of the tender. The fuel used in firing up and before the test started was taken from the sacks and accounted for separately. After the main supply had been burned sacked coal was used, or in case the pit was not emptied the remainder was removed and weighed. A record of the water used was made each time the tank was filled.

The division on which the test trains were run extends from Moose Lake to Boylston Junction, Minn., a distance of 38 miles. The regular tonnage for the cross-compound locomotives is 90 cars, or 1,440 tons, and the majority of the trips were made with this tonnage. On two trips with the superheated simple engine the train was increased to 100 cars of 1,600 tons. Although the increase in the rated tractive effort of the simple over the cross-compound is only six per cent, these runs showed that engine 468 would handle 100 cars better than engine 448 would handle only 90 cars.

On hauls out of the ore mines the regular rating for the compounds is 50 cars, but on test trips engine 468 handled 55, 59 and 60 cars without any difficulty. Another trial run was made from Superior to Glenwood, Minn., a distance of 200 miles. On this division the tonnage rating for the cross-compound engine is 2,200 tons, but in order to make the trip in less than 16 hours the train must be reduced to from 1,800 to 2,000 tons. With engine 468 a train of 2,157 tons was hauled from Superior to Glenwood in 10 hrs. 7 min. actual running time.

The fuel performance with the two engines on the trips between Boylston Junction and Moose Lake is summarized in the accompanying table:

Engine number	Test number	Number of cars	Tonnage	Coal per 1,000 ton miles	Decrease for Engine per cent	Coal per sq. ft. of grate per hour	Actual evap. per lb. coal	Running time
468	1 and 2	90	1,440	124	13.9	78.0	6.93	1 hr. 42 min.
448	5 and 6	90	1,440	144	....	56.5	7.78	2 hr. 37 min.
468	3 and 4	100	1,600	128	....	80.0	6.96	1 hr. 52 min.

It will be noted that the actual evaporation per pound of coal with the superheated locomotive was 10.9 per cent less than with the saturated locomotive, due no doubt to the reduction in tube heating surface resulting from the application of the superheater. In spite of this the superheated engine used 13.9 per cent less coal per 1,000-ton miles.

The principal dimensions, weights and ratios for the original and the converted locomotive are given below:

	Engine 448 (Cross compound)	Engine 468 Simple Superheated
General Data		
Gage	4 ft. 8½ in.	4 ft. 8½ in.
Service	Freight	Freight
Fuel	Bit. coal	Bit. coal
Tractive effort	37,300 lb.	39,500 lb.
Weight in working order	201,500 lb.	197,800 lb.
Weight on drivers	174,000 lb.	169,800 lb.
Weight on leading truck	27,500 lb.	28,000 lb.
Weight of engine and tender in working order	318,400 lb.	314,700 lb.
Wheel base, driving	17 ft. 0 in.	17 ft. 0 in.
Wheel base, total	25 ft. 11 in.	25 ft. 11 in.
Wheel base, engine and tender	55 ft. 9½ in.	55 ft. 9½ in.
Ratios		
Weight on drivers ÷ tractive effort	4.67	4.30
Total weight ÷ tractive effort	5.40	5.01
Tractive effort × diam. drivers ÷ equivalent heating surface	811.2	909.2
Equivalent heating surface* ÷ grate area	61.8	58.4
Firebox heating surface ÷ equivalent heating surface,* per cent	5.45	5.77
Weight on drivers ÷ equivalent heating surface*	60.1	62.0
Total weight ÷ equivalent heating surface*	69.6	72.3
Volume equivalent simple cylinders	11.45	.....
Volume both cylinders	15.65 cu. ft.	
Equivalent heating surface* ÷ vol. cylinders	252.8	174.9
Grate area ÷ vol. cylinders	4.08	3.00

Equivalent heating surface*	2897 sq. ft.	2737 sq. ft.
Grate area	46.89 sq. ft.	46.89 sq. ft.

*Equivalent heating surface = total evaporative heating surface + 1.5 times the superheating surface.

Improving the Manufacture of Steel Rails

Several Practical Suggestions for Raising the Quality by Better Inspection and Mill Practice

By Robert W. Hunt
President, Robert W. Hunt & Co., Chicago.

FROM THE EARLIEST CONSIDERATION of the subject, the value of proper inspection has always been recognized, and some of the most important points of discussion have been as to how that inspection should be conducted. It has been the writer's fortune to have been connected with the manufacture of steel rails during the whole of the existence of that industry in America and therefore he has had, from practical contact, an intimate knowledge of the various developments that have taken place in that industry; and, particularly, as during the last 31 years he has made a specialty of steel-rail inspection, he feels that he may claim to have had the best of opportunities to become familiar with the details of the procedure.

This familiarity led him, early in 1912, to recommend to his clients a more detailed system of inspection than had until then been used, which should more thoroughly supervise the progressive steps in the manufacture of the rails; beginning at the making of the steel down through the various stages of manufacture to the loading of the finished rails upon the cars for shipment. On this line, the firm of Robert W. Hunt & Co. at the request of one and with the approval of several others of its more important patrons, established in 1912 what is known as its "Special Inspection." This consists in placing inspectors in all the departments of the steel works, beginning at the open-hearth furnaces or Bessemer converters, at the soaking pits and the blooming mill, the rail mill, the drop-testing machines, the hot beds, drilling and straightening departments, and, finally, the inspection of the finished rails. These men are placed at each of these several departments day and night, their duties being to observe carefully all the details taking place; and if there should be any deviation from the provisions of the specifications under which the rails were purchased, or deviations from the accepted practice of the mills, or abnormal conditions of any kind, to make note of the same; and while not at liberty to interfere directly with the workmen, to call the attention of the foreman of the particular department in which the occurrence is taking place to what is happening, and also to pass a written report to the inspector stationed in the next succeeding department, and so on to the finished-rail inspectors. The chief inspector is also required to give a written report of unsatisfactory conditions to the superintendent of the mill, so that there may be an absolute record of what has happened to each heat of steel made on either turn, be it day or night, and as the rails are stamped with their heat numbers, and location in the ingots from which they were rolled, the mill management will possess an individual history of each rail, with the possible identification of the individual workmen who were in control of the manipulation of the rail from beginning to end.

Moreover, a comprehensive report is rendered to the proper officer of the railway company for which the rails are manufactured, resulting in the archives of that railroad possessing a detailed history of the making of the rails. Hence, should a rail fail in service, it will be possible to not only have cognizance of all the details of its manufacture, but the makers will be able to determine the workmen who participated in that manufacture. As can be appreciated, this leads to a personal responsibility being attached to every rail. It must be remembered that the workmen at the mills are paid by the ton, hence they are naturally desirous of producing as large an output as possible, and under the ordinary system of inspection, as soon as the rail left the works, all individual connection with it vanished, or, at best, any process of personal connection was extremely difficult and uncertain.

The result of this special system of inspection has been most satisfactory to both the manufacturers and the purchasers, and it receives the approbation of the workmen themselves, as each man knows that if he properly performs his duties he is protected against the danger of being held responsible for the acts of a less careful operative, while the mill management has given it, without cost, a thorough system of supervision. That it has proved satisfactory to the railway companies who have been employing it is best evidenced by the following, gathered from the records of the American Railway Engineering Association.

The statistics covering open-hearth steel rails give the failures that have occurred in five years, ending October 31, 1917, on 37,862 miles of track. Forty-five per cent of this mileage comprised rails rolled under special inspection, and therefore 55 per cent was made under other conditions. The total number of failures per hundred track miles on all of the mileage reported was 31.1, while the number of failures per hundred track miles on the rails covered by special inspection was 26.6, and the number of failures per hundred track miles of those not covered by special inspection was 34.8. Thus, there was 30 per cent in favor of specially inspected rails.

As each ingot is a separate and individual casting, I believe that, in addition to the tests representing the whole heat of metal, there should be some way of determining the physical character of the steel rolled from each and every ingot. As a destructive test seems to be the only way to actually ascertain that point, and as, of course, you cannot destroy all the rails, I, in 1915, installed what is known as the nick-and-break test, under which a test piece is cut from the top end of the first, or *A*, rail rolled from each ingot. This is nicked and broken, thus enabling the inspector to examine the fractures and, in case of the presence of segregation, pipe, or some other mechanical defect, to reject the rail represented by the test piece. Following such rejection, a test piece shall be cut from the bottom end of the same rail and broken; if that piece has similar defects, the second, or *B*, rail is rejected, and a piece cut from its lower end, and tested. In case of failure, the procedure is continued for the succeeding rails until a sound one has been reached. This has proved an expeditious and cheap procedure, and in my judgment very satisfactory.

A large tonnage of rails made under it is in American railway tracks and a much larger tonnage in those of Canadian railways. In fact, at the present time every standard steel rail rolled in Canada, and for all of that country's roads, is so made.

As the chemical composition of the steel is a fundamental part of rail specifications, a very important point is the taking, for analysis, of the drillings representing the heats of steel from which the rails are rolled. The drillings must

*A paper presented before the American Institute of Mining Engineers at a meeting in Chicago this week.

be taken from test ingots, and the time and manner of casting these ingots, as well as their shape, is receiving attention. In fact, the whole matter of ladle-test ingots is now receiving the attention and study of a committee of the American Society for Testing Materials in conjunction with the U. S. Bureau of Standards. Pending a full report on the subject by them, it would appear desirable to require the adoption of a standard sized and shaped ladle-test ingot and to insist that it be cast as sound as possible by the addition of aluminum to the molten steel; further, that two or three should be cast at equal intervals in a heat during the pouring of the large ingots and drillings from them carefully mixed. Thus, greater protection would be afforded as against a single small test ingot not representing, thoroughly, say, a 100-ton heat of steel.

All specifications should demand that the inspector representing the purchaser should have the right to witness the taking and mixing of the drillings, from which mixture, upon his request, he is given a portion for the purpose of check analysis. As a rule this is done, but at some plants it is a subject of dispute which should be prevented.

A few years ago there were many rail failures through what were designated as crescent-shaped breakages; that is, ruptures in the rail flanges extending from the outside inward toward the web, the broken pieces being of crescent shape. These fractures were frequently followed by complete cross-fractures of the rails, resulting in many costly and oftentimes fatal accidents. It was found that, as an almost inevitable rule, there was a longitudinal seam in the bottom of the rail flange at the point of fracture, which was directly under the web of the rail. This situation caused great anxiety and led to much discussion as to the causes of the seams or laps. One steel company developed and established a de-seaming adjunct to its rail mill, by which the outer steel of that part of the blooms subsequently forming the heads and flanges of the rails was milled off. The works claim success from the scheme. The later adopted sections have thicker flanges and the crescent-shaped breaking trouble seemed to have become minimized; but I regret to say that during the past year one of the prominent railway systems has been having a large number of such failures from heavy rails. Another system encountered the same kind of defects, which, in this case, fortunately were discovered before serious damage occurred. The rails were from different steel companies; therefore, it is again a matter demanding prompt and effective action. To require all producers to establish de-seaming mills is very radical, but if that is the only way property and life can be protected from such danger, it may have to be done.

Another point of less importance, but still of prime necessity, is the milling of both ends of the rails. This has been the practice of English mills for years and some American makers mill one end of some of the rails made by them. Depending on chipping and filing for the finishing of the ends of the rails is very unsatisfactory. Milling would not only eliminate all fins resulting from the hot sawing, but positively assure squareness of ends and accuracy of lengths, all three of which are of great importance in relation to joints, a part of track maintenance that is receiving more and more attention.

Much thought and considerable experiment have been given to the betterment of the cold straightening of rails. From the time of that procedure being represented by the blows of a heavy sledge swung by a sturdy man, the practice has been a brutal one. To accomplish the semblance of the desired result, the steel has to be bent beyond its elastic limit, thus enabling strains with an ever-present danger of causing actual or incipient ruptures in the metal, which may result in complete rail failures. In my judgment, it is practical to do away with cold straightening, by proper hot straightening of the rails. If, in case of uncontrollable conditions, a few rails should come from the hot beds unsuitable for use, they could, after some cold straightening, be classed as seconds and used for other than main-track purposes.

In the present practice, a rail is put under the cold press and most carefully, but brutally, punched into seeming straight line and surface. Frequently, it is later put on the ties and with equal care spiked out of a straight line into curves of varying degrees. Rails can be hot straightened without any short kinks and with lines that will permit good loading for transportation and satisfactory track laying; thus can the expense and danger of the cold straightening be avoided. There are now at least a thousand tons of rails, finished as above advocated, giving satisfactory service in the lines of several railroads having heavy traffic, and they have had over three years of trial. The rail makers will welcome such a departure from present practice and, I am confident, make it successful.

To secure sound rails it is of supreme importance to make sound ingots. Sir Robert Hadfield presented a paper before the Iron and Steel Institute in October, 1912, which attracted wide attention and much discussion. The plan is broadly designated as using a "hot-top ingot," and many plans of obtaining such castings, other than directly following Sir Robert's, have been and are being employed successfully, notably on ingots to be used in ordnance work. As yet hot-top ingots are not used in rail making; both encouraging and disappointing experiments have been made, but I am satisfied that this method is practical and will be so proved. Based on the results obtained with other than rail ingots, its success with them is bound to come. Therefore, while I am not at this time prepared to incorporate hot-top ingots in rail specifications, the time is near when it will be entirely practical to do so. It may involve a somewhat greater first cost, to be at least partly offset by saving in scrap, but if the outlay is justified when making steel to be used in destroying life, should it not be even more so when producing metal on the soundness of which human safety will so largely depend?

The threatened shortage of high-grade manganiferous ores during the late war years led to economy in the use of metallic manganese, particularly through the more general adoption of the practice of adding it to the charges in a melted condition. The obtained results from a metallurgical point of view have been very satisfactory and specifications should insist on the practice.

The importance of the chemical composition of rail steel cannot be gainsaid. In former times, when acid Bessemer steel was used for rails, its composition was restricted to a large extent by the character of the original ores, it was controlled with considerable ease by the condition of the process itself. Heat after heat of fairly uniform composition was produced and, in short, the desired aim for the various ingredients of the steel was readily obtained. But basic open-hearth steel manufacture is fraught with far more difficulty, for, while the initial composition of the charge does not exert so much influence, the attainment of the desired composition for the heat is dependent on so many constantly varying conditions that a wider latitude in the range for some of the different elements must be provided. The time will come when this will not be necessary and the practice of using molten additions for recarburizing enables operations on a much more consistent basis with respect to furnishing steel of the analysis desired.

The most harmful physical characteristic of rail steel is, of course, brittleness. The low amount of phosphorus present in open-hearth steel renders protection against the dangers from that element and permits freer use of carbon as a hardening element. Experience has pretty well demonstrated that the safe upper limit for carbon in rail steel is approximately 0.75 per cent; and accepted practice has

allowed a working range of 13 points, with the result that the lower limit of carbon has been most frequently specified as 0.59 per cent, but in some cases 0.62 or 0.63 per cent; speaking, of course, of the almost universally accepted practice of having the steel contain not over 0.04 per cent phosphorus. The problem of always making basic open-hearth steel within this range is difficult and frequently heats are cast slightly outside the limits specified. There is a much greater commercial opportunity for manufacturers to find other than rail uses for steel containing the lower amounts of carbon than when containing the higher amounts; therefore, they naturally aim to have the carbon content nearer the low side of the permitted range. Hence, the larger percentage of heats is on the low side of the allowed carbon. In repeated cases, "off heats" are produced which fail to be within the prescribed limits of the particular specification to which the rails are being rolled, but are entirely applicable to another rail specification for which the mill has orders. This leads to the ingots from such heats being temporarily discarded, later to be re-heated and rolled on the other specification. This means re-heating and rolling of cold ingots, which is invariably accompanied by an increased production of second-quality rails, largely augmented by the lack of proper control and treatment in the soaking pits.

The various railway systems of the country are now using as their standard practice about the same weight of rails. There are some variations of sections, but I do not see any serious objection to the adoption of a general or common chemical specification. We know that hundredths of percentages are very delicate variations and, especially in relation to carbon, errors may occur in the results obtained by two different chemists, particularly if working under modern manufacturing pressure. If a common carbon, silicon, manganese and phosphorus specification prevailed, the work of the open-hearth steel melter would be simplified, the cold-ingot trouble eliminated, and, I think, better general results obtained.

As a means of lessening the tendency on the part of the manufacturers to protect themselves by keeping the carbon content of the metal toward the lower range, it would be well to accept not over an agreed upon small per cent of heats slightly higher in carbon than the specifications. These rails could be specially marked and shipped, so that the roads would have them by themselves and use them in places for which they would be well adapted. I think that there would be but a very small percentage of such rails produced, but the very fact that the danger of rejection from over high carbon would be eliminated would cause the steel makers to feel less restricted in their procedure. In other words, it would allow a certain elasticity which would, undoubtedly, work to the advantage of both producers and consumers; of course, for acceptance, the high-carbon steel must have successfully passed the prescribed physical tests.

Another development of great interest is the triplex processes, both on the Bessemer open-hearth electric and the Bessemer and double open-hearth plans. These are being worked out in practice and, I believe, will soon be adding much toward the production of more regular and, hence, better steel, and, of course, also better rails.

A Convertible Stock Car

A DEVICE designed to convert the ordinary live stock car into a box car for general merchandise purposes has been placed on the market by the U. S. Convertible Car Company of Fort Worth, Texas. This equipment consists of moveable floors of 2-in. pine and steel folding side walls, which are hinged to the moveable floor and to the inside of the car near the roof. As shown in the illustrations, the moveable sides and floor are operated by means of ratchet cranks attached to a worm and sector device located under the car and connected to the moveable floor at each corner by a 3/8-in. steel cable moving over sheaves located inside of the car.

An old stock car to which this device has been applied is shown in Fig. 1. The water-tight live stock door *1*, with the protector or water seal *4*, is part of the necessary equipment, although not an integral part of the convertible device. The worm and sector *3*, the ratchet cranks *5* and *6*, and the side lock bolts are located as shown. This car operated successfully for a period of more than a year.

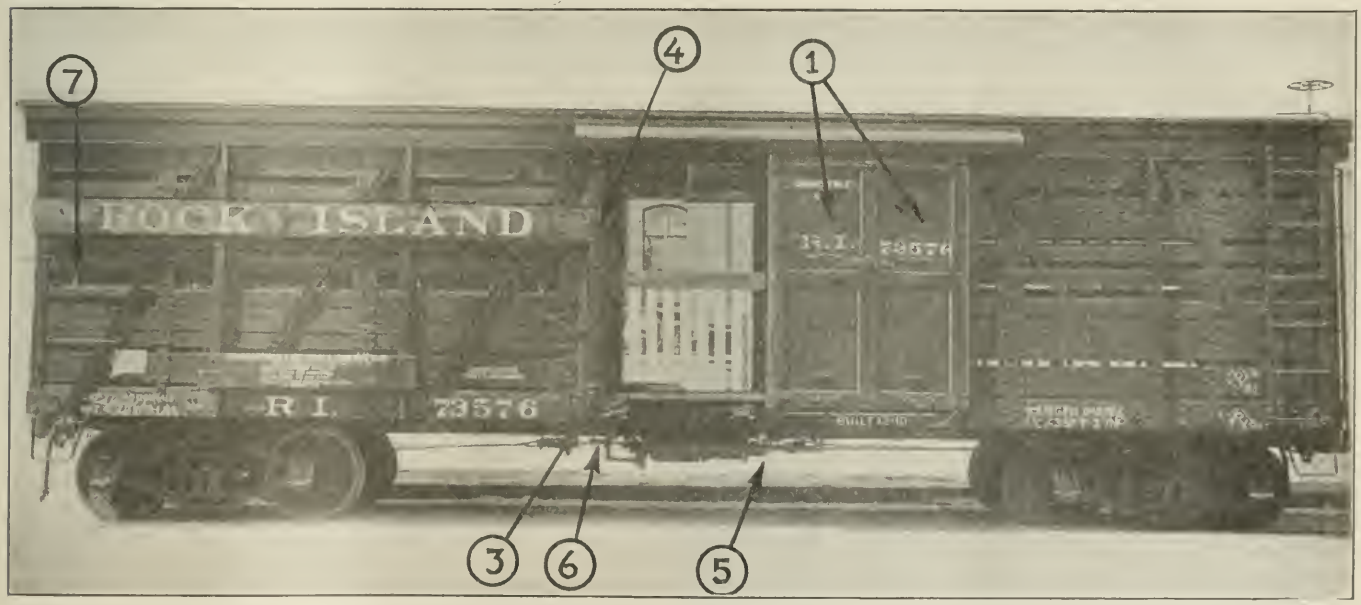

Fig. 1—A Rock Island Stock Car Equipped with the Convertible Device.

In Fig. 2 the car is shown with one end having the convertible device raised to the top of the car, as when live stock is carried, and the other end with the device in place, as when the car is used for general merchandise or grain.

The manner in which the device operates is clearely indi-

cated in Fig. 3, which shows the folding side walls 6 and 7 as they automatically unfold, as the moveable floor 8 is lowered into position on top of the permanent live stock floor 10. In the foreground of Fig. 3 the merchandise, or moveable, floor 8 is lowered down on top of the live stock floor 10 by operating the ratchet crank. The cable 4 running over the sheave, 5 lowers the floor and the side walls unfold, the slot hinge 1 and 2, secured by the U-bolt 3, permitting the movement without any binding. The side

Fig. 2—One End of Car Arranged for Merchandise. (1) Safety lock; (2) Moveable floor; (3) Showing absence of any nails or projections to injure live stock; (4) Instructions for operating device; (5) Door water seal; (6) Provision for fastening grain doors.

walls are then secured against the slatted sides 11 of the car by the side lock bolts, which are secured in place by the lock bolt button 13.

The general appearance of the interior of the car when arranged for merchandise is illustrated in Fig. 4. This shows

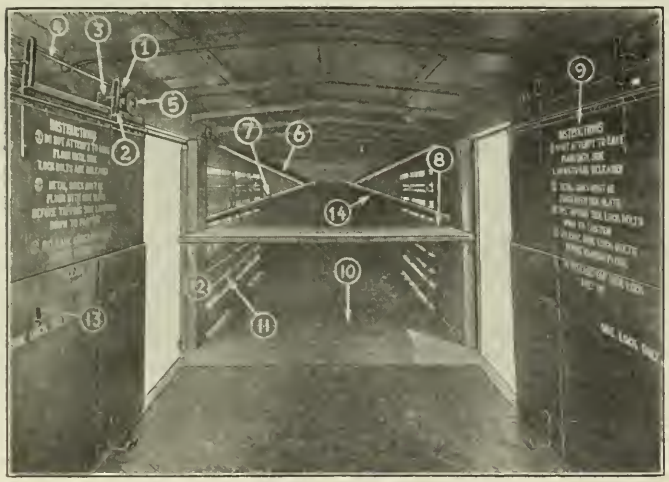

Fig. 3—One end of Car Ready for Merchandise and Convertible Device Lowering into Position in the

the clean merchandise floor 2 in place on top of the live stock floor and the ventilated door 3 closed for merchandise loading. An end door 1 is provided, so that live stock can be given necessary attention. The ends of the steel folding side walls are crimped, so that the door jamb 4 is exposed to permit the application of a grain door. With the addition of a grain door this arrangement can also be used for the transportation of grain.

A number of advantages is said to be gained by the use of this device. The transportation of live stock necessitates a type of car for which it has been impossible to find freight, of a kind that can be handled in them, in sufficient quantities to load in the cars on their return trip to the stock-

Fig. 4—Interior of Car as Arranged for General Merchandise.

raising sections of the country. This results in great loss, due to non-revenue or empty car-miles. As there are long periods when there is no live stock business, these cars must frequently lie idle, and it is estimated that the average time in service of such cars is only from 25 to 40 per cent.

This convertible appliance makes it possible to keep stock cars in practically continuous service, and the operation of the device is so simple that it is claimed that a station agent or any other person can convert from one type of car to the other without any assistance from the mechanical department.

Passenger Traffic in December

THE NUMBER OF PASSENGERS carried one mile by the railroads under federal control during the month of September amounted to 4,331,339,003, an increase of 9.2 per cent over September, 1918, according to the monthly report of the Operating Statistics Section. All regions and districts showed increases except the Southern region, which showed a decrease of 17.3 per cent. For the nine months ended September 30 the number of passengers carrid one mile was 34,949,294,185, an increase of 6.7 per cent. Decreases were shown by the Ohio-Indiana district and the Southern region.

Tie Production

THE PRODUCTION OF TIES for the 10 months ended October 30 this year has been approximately 84,500,000, according to reports received by the Forest Products Section. It is estimated that the production for November and December will amount to 10,250,000, which will make the total for the year approximately 95,000,000. The number of ties inserted for renewals up to October 30 this year was 76,580,185. The production in 1918 was only 65,000,000 while 86,000,000 were inserted during the year. The number of ties on hand when the railroads were taken over in December, 1917, was about 44,000,000. This had been reduced to 36,000,000 on January 1, 1919, but on November 1 the number of ties on hand had increased to 51,000,000.

Railway Fire Protection Association Convention

Methods of Storing and Handling Inflammable Liquids and Means of Reducing Fire Hazards

THE SIXTH ANNUAL MEETING of the Railway Fire Protection Association held at the Hotel La Salle, Chicago, on November 18, 19 and 20, inclusive, was featured by extended reports and discussions on the best methods for handling and storing fuel oil and inflammable liquids and by lengthy discussion of the means of reducing the fire hazard in rolling stock. Both of the business sessions on the first day of the convention, November 18, were fea'ured by the presentation of reports and papers dealing with the handling of inflammable and explosive liquids and fuel oil and throughout both sessions there was much discussion as to the recommendations made. The two business sessions on the second day of the convention were devoted mainly to the presenation of reports concerning heating appliances in freight and passenger equipment and the discussion thereon. The last session of the convention on November 20, was devoted largely to the question of protecting wooden bridges and trestles against fire.

The convention was formally opened at 10 o'clock on November 18, by President Robert Scott, superintendent of insurance and safety of the Atlantic Coast Line at Wilmington, N. C., who stated in his opening address that the problem before the members of the Association was to make the employees on the railroads understand their responsibility for the results arising from fire waste.

Reports of Resolution and Membership Committees

The reports of the executive committee and the committee on resolutions immediately followed Mr. Scott's address. E. B. Berry, superintendent of fire prevention of the Southern at Washington, D. C., and vice-president of the Association, speaking for the former committee, stated that the total membership in the Association had increased to 184 during the past year, or a growth of 72 per cent. C. N. Rambo, manager of the Fire Loss and Protection Section of the United States Railroad Administration presented the resolutions prepared by the latter committee. These resolutions which were unanimously adopted by the convention called attention to the following facts and measures:

(1) The reduction in the fire waste can only be accomplished through the enforcement and acceptance of individual responsibility as a matter of daily duty, through which means carelessness and defects which produce fires may be eliminated.

(2) To continue on each individual railroad the concerted work undertaken during federal control of railroads that there may be no let-up in protecting properties, even though actual war conditions may be past, and that the comprehensive system of education as to fire dangers and the use of every means possible of lessening the likelihood of fire occurring be continued.

(3) The encouragement of fire-restrictive building construction and a more genral recognition on the part of engineers and architects that through them and the adoption of improved building construction the first and gravest responsibilities rest in the elimination of much of the fire loss.

(4) The more extended use of fire walls dividing structures of large areas as a means of reducing the spread of flames.

(5) A wider general use of automatic sprinklers as a means of extinguishing fires at their incipiency and a comprehensive study of the use and service of standpipes and hose, fire hydrant systems, all with abundant water supply. A greater study of the economic results of the installation of adequate fire fighting devices, eliminating a too prevalent consideration only of the initial cost.

(6) The co-ordination of all fire prevention activities on each railroad through a central administrative officer for the promulgation of rules and regulations for the proper protection of properties and the guidance of officers and employees in the proper care of property in their charge or where they may be employed to guard against fire hazards.

(7) The appointment of fire marshals on divisions, districts or terminals to have charge of all fire equipment, and the formation and drilling of fire brigades and to make frequent inspections as to general care and cleanliness, in their respective territories.

(8) The full co-operation of all railroads with the Bureau of Explosives in the enforcement of rules and regulations for the safe transportation, storage and use of explosives and other dangerous articles.

(9) The continued employment of experienced inspectors to report on the conditions and adequacy of fire equipment, the condition of properties affecting the fire risk and the safeguards required to protect dangerous processes and occupancies.

(10) The rigid investigation of all fires, with particular effort to trace the cause and fix the responsibility for damage or destruction of property.

(11) The education of employees in careful habits with respect to common fire dangers through bulletins, meetings, etc.

(12) A full realization that fire insurance only partially ocmpensates for the fire waste and is in a measure but a tax imposed on carelessness and neglect and that there is always a large consequential loss that must be considered, which is not compensated for by insurance.

Report of the Committe on Statistics

The report of the committee on statistics presented by E. B. Berry, chairman of this committee, contained interesting data concerning the number and origin of fires on railroads of the United States during the past year. This report is substantially as follows

Through the co-operation of the Fire Loss and Protection Section of the Administration, it is possible for me to present for your information and consideration a very complete and comprehensive statement of fire losses in railroad properties for the calendar year 1918. The statement is based upon report of fires from 419 roads having trackage of 239,761 miles.

Briefly, the 419 roads under the Federal Administration reported 20,628 fires with a total loss of $12,263,220, an average loss of $594.50 per fire and $51.10 per mile of road. These figures, however, include 9.923 right-of-way fires with a loss of $1,610,190. As right-of-way fires were not reported nor included in our 1917 statement, if we eliminate the fires charged to this specific classification we have 10,705 fires with a loss of $10,653,030 in other railroad properties. With this elimination or reduction, the average loss per fire during 1918 amounted to $995.15 with loss per mile of road of $44.42, as against $857.59 average loss per fire and $34.47 average loss per mile of road during 1917.

Notwithstanding the very large percentage of increase in the number of roads sending in statistics over previous years, we find under the risk classification report that, as in past years, rolling stock and merchandise in transit have suffered 59.9 per cent of the number of fires and 48.7 per cent of the loss. It might also be of interest to note under the risk classification statement that passenger and freight stations suffered approximately 6 per cent of the total number of fires and 9 per cent of the total loss during 1918, which compares favorably with 9.3 per cent of the loss during 1917; coaling stations suffered 1.3 per cent of the total fires and 3.6 per cent of the loss during 1918, while during 1917 the

loss on this class of property was 3 per cent; mechanical property is charged with 4.3 per cent of the number of fires and 14.5 per cent of the loss during 1918, as compared with 4.8 per cent of the loss during 1917; bridges and trestles show approximately 9 per cent of the number of fires and 4 per cent of the loss during 1918 while in 1917 the loss on this class of property amounted to 2.9 per cent.

Under the origin classification statement you will find 62.74 per cent of the number of fires and 24.42 per cent of the loss was caused by locomotive sparks. The other origins following in their relative importance as to the number of fires are as follows:

	Per cent.
Unknown	13.82
Heating appliances	4.47
Ashes and cinders	2.42
Adjacent property	2.20
Hot coals from locomotives	2.13

Of the 20,628 fires reported, there were but five individual fires with loss between $100,000 and $250,000, four of these were between $100,000 and $150,000 and one fire was $242,000, so it is obvious that our heavy aggregate losses in railroad properties come from fires reporting relatively small losses.

Statement of Fire Losses by Origin Classification for Year 1918

Origin Classification	No. fires	Per cent	Loss	Per cent 1918	Per cent 1917
Adjacent property	455	2.205	$697,930	5.691	5.492

Number of fires	*20,628	5,701
Loss	†12,263,220	4,899,146
Average loss per fire	594.50	857.59
Average (excluding right-of-way fires)	995.15	.....
Average loss per mile of road	51.10	34.47
(Excluding right of way loss)	44.42	.....

*Includes 9,923 right-of-way fires not included in 1917 statement.
†Includes loss of $1,610,190 not included in 1917 statement, being right-of way loss.

Comments by C. N. Rambo

The principal address of the morning session was given by C. N. Rambo, manager of the Fire Loss and Protection Section of the United States Railroad Administration, who after outlining the history of the Fire Loss and Protection Section and the results that it has accomplished in reducing fire hazards said in part:

"Fire prevention work is carried on because of the well-founded knowledge that fire hazards are ever present on railroad properties. It is a continual subject for study, developing experts in recognizing defects in material things and in practices and conditions. It is the study of the elimination of causes of fires. Fire protection, on the other hand, shows its value more directly in the study of the proper application of fire apparatus of all kinds and in the study of property construction.

"I think the railroads should feel that the fire prevention service is a necessary part of their operating plan, with the removal of certain uncertainties as to extensive property loss and interference with operation, which would seem to make any reasonable expenditure for fire protection quite desirable.

"Through the work of the Fire Loss and Protection Section of the Railroad Administration there has been a constant effort to reduce the fire waste of approximately $30,000 per day on railroads, an average loss per fire reported of nearly $1,000 and on average loss per mile of road reported of nearly $40. I believe that at least 50 per cent of this can be prevented, possibly more, by the exercise of individual care and by the acceptance of individual responsibility. There has been an effort made to prevail upon the approximate 2,000,000 employees to realize this individual responsibility and to prevent carelessness. This large fire loss means that much charged against the railroads' revenues, that much added to the operating expenses."

Other Reports at Opening Session

The report of the committee on use of inflammable and explosive compounds and liquids in shops was also presented at the morning session by Charles P. Beistle of the Bureau of Explosives and chairman of the committee. This

Statement of Fire Losses by Risk Classification for Year 1918

report went into detail concerning the uses of gasoline, benzine, paint and varnish, oils, wood alcohol, paint and varnish removers, lacquers and compressed gases in railway shops and contained many recommendations for reducing the fire hazard in handling these commodities. The paper evoked considerable discussion regarding its recommendation for the handling of gasoline and the containers therefore. As a result of this discussion the report was accepted as a progress report and suggestions were made to the committee for further consideration.

The morning session was closed with a paper presented by F. H. Elmore, on the "History of Our Association and What It Has Accomplished."

Use and Handling of Fuel Oil

The afternoon session on the first day of the convention was featured by the presentation of the report of the committee on oil burning appliances by B. S. Mace, chairman of the committee, and a paper presented by A. M. Schoen on "Fuel Oil vs. Coal for Locomotives." The report of the committee on oil burning appliances indicated that the committee had taken a great deal of care in its preparation and the report was prepared and distributed in booklet form. A liberal use was made of drawings to illustrate its recommendations. The length and detail of this report prohibit its reproduction here; however, the committee has printed 1,000 copies of the report which are to be sold through the secretary of the association. The report is the result of three years' work on the part of this committee and it contains specific rules and requirements for the storage and use of fuel oil and for the construction and installation of oil burning equipment.

Mr. Schoen's paper on "Fuel Oil vs. Coal for Locomotives" contained many recommendations concerning the various kinds of fuel oil, the methods of handling oil and the fire hazards involved, and said in part:

While oil has been used for locomotives in the West and on the Florida East Coast for a number of years, there would appear to be no well-defined standards to govern; even the individual roads seem not yet to recognize this fuel as permanent to such an extent as to formulate standards for their own use. The time now appears to have arrived, however, for changing all this and formulating standard specifications in an advisory form at least, that may be adopted by these roads preparing to adopt oil as fuel and to be worked toward, either in changes or new work by those roads having equipment already installed. From all reports the Mexican oil fields appear almost inexhaustible and bearing in mind the case of handling, reduced cost of firing and the independence of mine strikes incident to this fuel as compared with coal, there is reason to anticipate its very widespread adoption especially by roads not remote from large navigable waterways, while the recently developed colloidal fuel in which pulverized coal to a percentage of something like 35 per cent can be held in suspension in the oil will doubtless go far toward justifying the adoption of foil by many of the far inland systems.

Much more attention has been paid to locomotive efficiency than to safeguarding the storage at points along the right of way, the loading and unloading of the oil and the fueling of tenders. Among special weak points noted may be included: unloading tank cars to storage tanks, location and protection of large storage tanks, inadequate valve equipment in pipe lines, gravity feed to locomotive tenders, electric driven pumps having remote control not arranged to best advantage, oil columns dirty, wasteful and unsafely arranged, gravity and flash point of oil not kept within safe limits.

The wide variation in the flash test and viscosity test of the oils used for fuel purposes in different parts of the United States forms one of the obstacles to the determination of uniform standards, the gravity test varying from 12 or 13 deg. Baumé to as high as 30 and 32 deg. Baumé, while the flash test of untopped or undistilled oil varies from atmospheric temperatures up according to their constituents; at this date, however, it would be quite safe to say that almost without exception only topped oils are being used in railroad work.

There are two distinct kinds of oil obtained from the earth's underground reservoirs, one having a paraffine base such as that found in Pennsylvania, West Virginia, and now being found in Texas, which contains all the valuable petroleum products and is subjected to the process of fractional distillation, being too valuable to use for fuel purposes; the other has an asphaltum base, most of it being found in Mexico, California and Louisiana, with some in Texas; this oil has only a small proportion of the more valuable petroleum products in consequence of which it is subjected to fractional distillation to only a moderate extent, most of it being merely "topped" by which the lighter or more dangerous ingredients are taken off and the residue is sold for fuel purposes. Under flash test the oil used for fuel should not test lower than 150 deg. F. closed cup, or 160 deg. F. open cup test. So far as the fire hazard is concerned, of course, the gravity test is of small importance except that the lighter the oil the more readily it flows. Oil testing from 18 deg. to 26 deg. Baumé is ordinarily a good viscosity for practical purposes and the heavier oils are oftener blended to bring them within these limits. When the viscosity is very low, especially in cold weather, it is found necessary to equip both storage tanks and tenders with circulating steam coils so that the oil may be warmed sufficiently to enable it to flow more freely. Where this warming process is used the oil should never be heated to a point higher than 40 deg. F. below its flashing point.

The generally accepted standard today for large storage tanks of this character so far as capacity is concerned is 55,000 bbl. at 42 gal. The standard tank as constructed is steel throughout, that is, top as well as bottom and sides. In the past many of these tanks have been built all steel, except the top, which was built of matched boards and covered with galvanized iron. Investigation shows, however, that this form of tank has been the one to especially suffer from fire, and it is now uniformly agreed that the highest degree of safety lies in the all-steel tank with proper protective equipment provided. The covers of the tank should be equipped with manhole, explosion hatches and relief vent; the relief vent should be protected by not less than two thicknesses of not larger than 30-mesh nickel gauze separated one-half inch or more to prevent any fire striking back through escaping gases. The explosion hatches should operate quickly and positively and form a gas tight closure, as should the hatch to the manhole. Tanks should be set solidly on adequate foundations and should be enclosed by a levy or dyke having capacity of at least one and one-half times the capacity of the tank and built with a crest of not less than three feet and a slope on either side of not less than two to one. Any pipes should either be carried over the embankment or through wing walls of concrete. An O. S. & Y. valve should be set in the supply pipe inside the levy and near the tank.

The large tanks should be at a distance of not less than 350 feet from buildings or other combustible property, and this may well be made the minimum distance from the main line of the road as well, owing to the fact that should the tank be on fire and a strong wind blowing in the direction of the tracks the burning gases and dense smoke could be driven a considerable distance, and if the tank is not sufficiently isolated the operation of the main line trains might be affected for a considerable time. Also the tanks should be so located and protected that under no circumstances

could the oil reach streams, either flowing or tidal, by means of which it might be carried into the proximity of destructible property.

It is strongly recommended that the fueling of tenders by gravity pressure be avoided, in view of the danger of the entire contents of the tank escaping in event of accident. Most approved practices would require the oil to be pumped into the tender from reservoirs constructed below the grade level, which would permit of the flow being promptly shut off in event of accident to the piping or apparatus. These wells can be filled at regular intervals either by gravity feed from the large storage tanks or else direct from the tank cars. These underground reservoirs, if completely covered over, may be located at such points as may be most convenient for their intended purpose. Usually they should be constructed either of reinforced concrete or steel.

Tank cars are arranged for unloading through a pipe in the bottom, fitted with a cap at the outer end and a valve where it leaves the tank. This valve is opened and closed manually from the top of the car. With the cap screwed tightly in place, the tank car may be filled with the valve wide open, and no one will be the wiser until the cap is removed, when a large part of the contents will be lost before a man can climb to the top of the car and close the valve. It seems that this sometimes occurs and two or three thousand gallons of oil escape into the yards before the trouble can be remedied. For this and other reasons it is recommended that at unloading points pits be constructed between the tracks, 4 to 6 inches in length, over which the tank cars may be placed and their contents allowed to discharge into these pits. Through proper size pipes the oil can be flowed from this point to underground pumps of suitable capacity, from which it may be pumped to the storage tanks. This arrangement will reduce the time of unloading, improve surrounding conditions as to care and cleanliness and minimize the fire hazard.

Oil columns are vertical pipes, with a horizontal arm used for conveying the oil to the opening in the tender. In some forms the arms are arranged to swing vertically, in others horizontally, and others the vertical pipe or column itself can be turned on its axis in a horizontal plane. Oil-tight stuffing boxes are provided at the joints to prevent escape of the oil. Of the various oil columns I have seen, each has its objectionable features. The drop pan arrangement on the Rose column commends it for cleanliness, but the rigid self-cleaning telescoping device that transcends into the tender opening sometimes results, I am told, in the whole column being torn down when the locomotive moves off prematurely. The determination of the type of oil column desired would be a matter for the consideraiton of the motive power department, but whatever type is determined upon should be equipped with rapid closing gate valves at the base of the standpipe, and unless a man is to be kept at this valve while filling there should be another on the horizontal arm that can be reached by the man standing at the tender opening, and if an electrical signal to pump house or remote pump control is used the button should be promptly available to the man at the filling point. All stuffing boxes should be well made mechanically and kept in non-leaking condition.

Oil should be pumped from reservoirs to tenders by steam or electric pumps, which pumps should, wherever practicable, be arranged in duplicate in order that pumps in bad condition may be shut down at suitable times for repairs without interrupting the service. At shop yards and other places where steam is at all times available, the pumps should have permanent steam connections, and if so located that an accident to any of the oil equipment might make them unapproachable they should be equipped with remote control, by means of which they could be stopped quickly in case of emergency. At points where oil stations are considered necessary but no steam is available the pumps could be arranged for connection to the locomotive blower pipe and steam for filling furnished from that source. Air pressure from the locomotive air system might be used for filling purposes under extreme conditions, but this is considered ordinarily undesirable for mechanical reasons.

The greatest hazard to which tanks under ordinary circumstances have been subjected has been from lightning, though there has been a general misapprehension as to just how the tanks have been affected, it being thought that the steel tanks are struck by the lightning discharge and their contents ignited. As a matter of fact, tightly closed oil tanks need not be considered in any special danger from lightning, as they are not very high, expose a large mass of metal and, ordinarily resting on the ground, may be expected to provide a very fair path to earth even if struck. The tanks that are in most danger are those from which the lighter hydro-carbon gases are being thrown off, as a lightning flash in the vicinity may ignite these and flash back to the oil in the tank, which will then burst into flame and continue to burn. This is especially liable to happen when sulphuretted hydrogen gas has been brought over in suspension and is being liberated.

Naturally these accidents generally happen to the tanks containing crude oil, or else the very light products of petroleum. Fuel oil that has been properly treated should be very nearly immune, especially if it stand in properly constructed tightly closed *all-steel* tanks. The necessary vent can be effectually protected by means of small mesh metal gage, using the same principle as that embodied in the Humphrey Davy miner's lamp. When the ground on which the tank rests is very dry, or when raised on supports, artificial grounds should be provided.

The two principal agents that have been employed for the extinguishment purposes are steam and Firefoam foamite, both of which embody the same principle, namely, shutting off the air from the surface of the burning liquid and thus depriving it of the supply of oxygen that supports combustion. So long as the tank remains tight steam will render effective service, otherwise the blanketing effect is largely lost. This protection is accomplished by means of steam jets inside the tank above the surface of the oil supplied from boilers and through pipes of adequate capacity.

Foamite is a foam very much like soapsuds and is produced by bringing together two chemicals in liquid form which react when mixed to form a thick foam like soapsuds, which floats on the surface of the oil and blankets the fire. The equipment necessary to the protection of large tanks is rather extensive as well as expensive, and ordinarily is not justified except in yards or terminals, when a single equipment can be extended to protect all tanks. Foamite is especially valuable when the oil surface is exposed. All-steel tanks properly constructed, well grounded, with all seams tight, equipped with explosion hatches and proper vent and surrounded by well-constructed devices, present little if any fire hazard, unless it be from exposure of other property. In case of an installation of this kind, however, the greatest danger point will be the vent which should be regularly inspected to see that the gage service continue intact.

In addition, a paper was presented to this session of the convention by W. A. Fravel on "The Disposition of Sweepings and Rubbish from Warehouses, Freight Cars. etc."

Protection of Rolling Stock

The morning session on the second day of the convention was featured by the report of the committee on freight car heaters, presented by E. A. Ryder, chairman of the committee. The report brought forth considerable discussion as

to its recommendations; it was finally adopted by the association as a progress report.

W. S. Topping, assistant chief inspector, Bureau of Explosives, also presented a paper on "Methods of Handling Wrecks or Derailments Involving Tank Cars of Oil, etc." Mr. Topping recommended that in case of a wreck involving tank cars containing inflammable liquids the following rules should prevail:

(1) Post guards and keep all spectators away.

(2) Locate all leaks and stop them if possible, using only electric flashlights or electric hand lanterns when lights are necessary. If open flame lights must be used keep them elevated as much as possible.

(3) Dig holes and trenches to bury exposed and leaking gasoline that cannot be transferred promptly to tight containers.

(4) Allow reasonable time after stoppage of leaks and burial of gasoline for vapors to escape from wreck and vicinity.

(5) Keep steam crane fire to windward as much as possible and not less than 500 feet away until completion of work to this point.

(6) First move to safety the least injured cars to avoid starting new leaks during handling by crane. When leaks are to be expected in handling, empty the car first either by transfer of contents to other car or container, or by drainage to a hole or trench in the ground for burial.

(7) Do not allow trains to pass on adjoining tracks, especially on same or lower level, as long as gasoline is leaking or exposed in quantity. When allowed to pass keep fire doors and ash pan slides closed and draught shut off.

(8) The placing of leaking tank cars for repairs in close proximity to shops where fires or naked lights are maintained must be avoided.

Handbook on Railroad Fire Prevention and Protection

E. B. Berry, chairman of the committee preparing for Handbook on Railroad Fire Prevention and protection, presented a tentative outline of the book. In general, it is the idea of the committee that the book will be divided into two major sections, one being a general section, the other a special section. The general section will include the various railroad properties by risk classifications, to be treated in detail, showing the risk, common and special hazards, practical remedies and fire protection recommended. It is proposed that the general section be divided into sub-sections, each dealing with a specific class of risks. In other words, there will be a sub-section for mechanical property, transportation property, a section for merchandise and traffic at stations and rolling stock, etc. The special section will treat on all other independent subjects applicable to fire prevention and protection of railroad properties.

W. H. Merrill, president of the Underwriters' Laboratories, Chicago, also addressed the morning session.

Protection of Passenger Train Equipment

The afternoon session of the second day's cconvention was featured by the report of the committee of fire protection in passenger train equipment, which was presented by E. W. Osborne, chairman of the committee. The general conclusions in this report are as follows:

(1) We believe that, except in local trains specified, every coach, whether metal or wood, in main line trains should be equipped with at least one fire extinguisher, and that in local or branch trains of four cars or less there should be two in each car.

(2) That in general the liquids used in fire extinguishers should be non-freezing, but exceptions may be made where means are available for protecting liquids that are not in themselves resistive against cold.

(3) That an extinguisher with a capacity of at least 2½ gals. containing a chemical charge which has the cooling effect of water, such as is found in the calcium chloride or acid-soda types is especially to be desired in baggage and other non-passenger carrying cars.

(4) That some method should be adopted to make upholstering fire resistive.

(5) That all cars should, as far as practicable, be lighted with electricity installed according to requirements of the National Electric Code.

(6) That smoking cars should be positively prohibited in non-passenger carrying cars.

(7) That all fire extinguishers should be given the necessary tests or examinations at terminals prior to each trip to insure their being in good condition.

(8) That sufficient supplies should be kept in coach yards for immediate charging of extinguishers.

This report, like many others presented at the convention, brought forth considerable comment, and it was finally adopted as a progress report. After the presentation of a paper by E. B. Berry on the "Future Work of Our Association," the convention adjourned to visit the Underwriters' Laboratories in Chicago.

Protection of Wooden Bridges and Trestles

The closing session of the convention on Thursday morning was featured by a paper by O. B. Heppner, chief chemist of the St. Louis-San Francisco, who spoke on "The Relation of the Chemist to Fire Protection," and the report of the committee on the protection of wooden bridges and trestles against fire, which was presented by A. W. Smallen, chairman of this committee, and the election of officers. Mr. Heppner's paper told of the assistance which could be rendered to fire protection by the chemist and the chemist's relation to the success or failure of fire prevention measures. The report of the committee on the protection of wooden bridges and trestles against fire contained specific recommendations for preventative measures and for fighting fires which have been able to gain some headway. These recommendations are as follows:

As preventative measures it is recommended:

(1) That effective spark screens be provided in the front end of all locomotives and carefully maintained.

(2) That ash pans and grates be made tight and kept in good working order, as the dropping of hot coals or ashes is a source of a large amount of our trouble.

(3) That special places be provided for the dumping of cinders and ashes, and grates are not to be shaken down except at safe points.

(4) That all combustible refuse such as dry leaves, dead grass, weeds, brush and rubbish be cleared away from under and around all wooden bridges.

(5) That the decks of all wooden bridges, between the rails, be covered with No. 22 galvanized iron, this to prevent sparks from setting fire to the structure should they be dropped from the locomotive.

(6) As a further preventative measure, it is recommended that all wooden bridges be coated with a fireproof or fire retardent paint, demonstration having proven some of them to be of excellent protection, and can be applied at a cost no greater than that of ordinary paint.

As protective measures it is recommended:

(1) That one water barrel and one pail be provided for all wooden bridges of a length of 50 ft. or less, and two water barrels and two pails one to each barrel, be provided for all bridges whose length is more than 50 ft. up to a length of 150 ft., and that one water barrel and one pail be provided for each additional 150 ft.

(2) That where a bridge requires one or two barrels and pails the same are to be placed at the ends of the bridge, located at proper clearance from the track and buried in the ground to within six inches of the top, and where barrels and pails are located in the middle of the bridge, they are to be located at proper clearance from the rails and the top of the barrel is to be provided with a wooden or galvanized cover.

(3) In the past a great difficulty has been experienced in keeping pails intact with the water barrels, especially where galvanized iron pails or fire buckets have been used, and they are invariably missing when wanted and it is therefore recommended that a square wooden bucket of unfinished lumber be

provided and that the same be suspended in the water inside of the barrel.

(4) As a further means of extinguishing the blaze, it is recommended that all locomotives be equipped with fire-fighting apparatus so that they may cope with the situation should occasion arise.

The report, after considerable discussion, was accepted as a progress report, with the understanding that the next report of this committee will be made to include all bridges of all types. Considerable discussion arose over the fifth preventative measure and also over the second recommendation for extinguishing the blaze.

Other Business

The following companies arranged exhibits in connection with the convention: Aero Alarm Company, New York; Ohio Injector Company, Chicago; Nu-Ex Fire Appliance Company, Ohio; Pyro-Non Paint Company, and the Fire Protection Equipment Company, Chicago.

The election of officers, held at the last session of the convention, resulted as follows: President, E. B. Berry, superintendent of fire prevention, Southern Railway, Washington, D. C.; vice-president, W. F. Hickey, superintendent of fire prevention, New York, New Haven & Hartford; secretary and treasurer, R. R. Hackett.

Train Accidents in October[1]

THE FOLLOWING is a list of the most notable train accidents that occurred on the railways of the United States in the month of October, 1919:

Collisions

Date	Road	Place	Kind of Accident	Kind of Train	Kill'd	Inj'd
20.	Southern	McGriff, Ga.	xc	P. & P.	0	80
30.	Ft. Worth & D.	Rhome	rc	P. & P.	0	6
*30.	G. C. & St. Fe.	Crowley	rc	F. & F.	0	1

Derailments

Date	Road	Place	Cause of Derailment	Kind of Train	Kill'd	Inj'd
2.	Pennsylvania	Doylesford	acc. obst.	P.	0	1
4.	Pennsylvania	S. Elizabeth	b. rail	P.	0	25
4.	Pitts. & L. Erie	W. Ellwood J.	b. wheel	P.	0	17
10.	Erie	Belmont	ms.	F.	2	0
†12.	Missouri Pac.	Wagoner	b. rail	P.	1	15
14.	Central N. J.	Marlboro	acc. obst.	P.	1	1
17.	St. Johnsb'y & L. C.	Cambridge J.	d. eq.	P.	0	2
22.	Cent. Georgia	Eatonton	.....	P.	0	2
28.	Wabash	Percy, Ia.	b. rail	P.	0	1
29.	Gulf Coast L.	Mariana	d. wheel	P.	2	1
†29.	Sou. Pacific	Vincent, Cal.	exc. speed	P.	10	139
30.	Erie	Jersey City	exc. speed	P.	0	0
30.	Tenn. Central	Obey City	unx	F.	2	0

The trains in collision at McGriff, Ga., on the 20th, at 1:50 a. m. were southbound passenger No. 7 and northbound passenger No. 8. The northbound train was entering a side-track, and was struck in the middle by the southbound, wrecking and overturning one coach. About 80 passengers were injured, none seriously. The southbound train had an order to hold the main track and meet No. 8 at McGriff, which is the schedule meeting point for these trains. No. 8 had arrived three or four minutes before No. 7 and a trainman had thrown the switch for the side track and signaled the engineman to proceed into the side track. The electric headlight of No. 8 was not burning, because of an armature having been burnt out; and the engineman of No. 7 thought that the other train was clear of the main line; and seeing the hand signal given by the trainman to No. 8 he construed it as for himself. This engineman had been in the service 33 years, and was classed as one of the best on the division.

[1]Abbreviations and marks used in Accident List: rc, Rear collision——bs, Butting collision——xc, Other collisions——b, Broken——d, Defective——unf, Unforeseen obstruction—unx, Unexplained——derail, Open derailing switch——ms. Misplaced switch——acc. obst., Accidental obstruction——malice, Malicious obstruction of track, etc. ——boiler, Explosion of locomotive on road——fire, Cars burned while running——P. or Pass., Passenger train——F. or Ft., Freight train (including empty engines, work trains, etc.)——Asterisks, Wreck wholly or partly destroyed by fire——Dagger, One or more passengers killed.

The trains in collision on the Fort Worth & Denver, at Rhome, Tex., on the 30th, were southbound passenger trains. The leading train was standing at the station. The impact crushed its rear car. Six passengers were injured. There was a dense fog at the time.

The trains in collision on the Gulf, Colorado & Santa Fe, at Crowley, Tex., on the 30th, were southbound freight. The leading train, standing at a water tank, in a dense fog, was run into at the rear by the following train, and twelve cars were ditched. Nine tank cars, containing oil were burnt up, together with parts of the locomotive and of other cars. One brakeman was injured.

The passenger train derailed on the Pennsylvania Railroad near Daylesford, Pa., on the 2nd, was the Metropolitan express, eastbound, No. 40, traveling on track No. 2. A freight train moving westward on track No. 3, two engines and 105 cars, was preparing to make a stop when the ninety-third car, an empty wooden box car of 30-ton capacity, buckled and, with three other cars, was thrown off the track, blocking track No. 2. Train No. 40 ran into the wreck, a dense fog and the speed of the train thwarting the efforts of the flagman of the freight to stop it.

The locomotive was overturned. The fireman was slightly injured. One baggage car and four sleeping cars ran off the track, but no other personal injuries were reported.

The train derailed at South Elizabeth, N. J., on the fourth, was eastbound local passenger No. 3800 carrying about 350 passengers, moving at about 35 miles an hour. Four coaches were derailed and 25 passengers sustained minor injuries. The accident was due to a broken rail which failed because of a transverse fissure.

The train derailed at West Ellwood Junction, Pa., on the night of the 5th, was a westbound express passenger No. 19. The train running at about 50 miles an hour was derailed by a broken wheel. Four employees and 13 passengers were slightly injured.

The train derailed on the Erie Railroad at Belmont, N. Y., on the morning of the 10th, was a first-class train, westbound, No. 9, consisting of a locomotive, 16 express cars, and a car at the rear in which the train crew were riding. While running at about 60 miles an hour, the engine was thrown off the track by passing over a misplaced switch and into a side track; and the engineman and fireman were killed. Track repairers working near the spot had left the switch open. The line approaching this switch is straight for about two miles. The track foreman and his men were close to the switch; they had removed their car from the track but had neglected to straighten the switch. This accident occurred in broad daylight. The switch target is plainly visible for a good distance. The trackmen were within about 60 ft. of it and the foreman stood close to the switch-stand. The line is operated under the manual block system, but this switch is not near a block station and it has no distant signal.

The train derailed near Wagoner, Okla., on the 12th, was a northbound passenger. Two coaches were overturned. One passenger was killed and 15 were injured. The derailment was due to a broken rail.

The train derailed at Marlboro, N. J., on the 14th, was a passenger No. 220. The locomotive was derailed by striking an automobile on a crossing and was overturned. The engineman was fatally scalded, and a brakeman was injured.

The train derailed on the St. Johnsbury & Lake Champlain, near Cambridge Junction, Vt., on the 17th, was an eastbound mixed train. While running at about 40 miles an hour, a milk car near the front of the train was derailed and ditched. One passenger and one express messenger were slightly injured. The derailment was due to a loose chafing iron which became detached and fell out of position.

The train derailed near Eatonton, Ga., on the 22nd,

about 10 p. m., was northbound passenger No. 19. The locomotive was thrown of the track at a switch and was overturned, the engineman and fireman were injured.

The train derailed near Percy, Iowa, about 20 miles east of Des Moines, on the evening of the 28th, was eastbound passenger No. 14. Four coaches were overturned but the reports say only one passenger was injured. The derailment was caused by a broken rail.

The train derailed at Mariana, Tex., on the 29th, was southbound passenger train No. 3. Moving at about 20 miles an hour the locomotive and tender were derailed at a frog, by reason of a broken tender-wheel flange, and were overturned; and the engineman and fireman were fatally injured. The locomotive fell against a freight car standing on a side track and a man in charge of one of these cars was injured.

The train derailed on the Southern Pacific near Vincent, Cal., on the 29th, was eastbound passenger No. 50. The locomotive, the tender, two baggage cars and five coaches fell down a bank. One passenger, two trainmen and two trespassers were killed and 143 passengers were injured, five of them fatally. The train ran off the track at a curve of 8 deg. 10 min., on a descending grade of 2.2 per cent; the cause was excessive speed. Estimated damage to engine, cars and roadway, $40,000. All evidence concerning the track indicates that it was in perfect condition.

This is the first serious train accident in which a passenger has been killed, on the Pacific System of the Southern Pacific—7,050 miles—since July 4, 1908, or over 11 years.

The train derailed near Jersey City, N. J., on the 30th, was eastbound passenger No. 1112. Seven cars, well filled with passengers, ran off the rails, but no personal injuries are reported except those classed as "slight." The cause of the derailment is given as excessive speed in passing from the Northern of New Jersey branch to the main line.

The train derailed near Obey City, Tenn., on the 30th, was a westbound freight. The two locomotives drawing the train crossed a trestle (No. 7.83) in safety, but 13 of the 20 cars in the train fell through to the ravine below. Two brakemen were killed. The cause of the derailment was not determined.

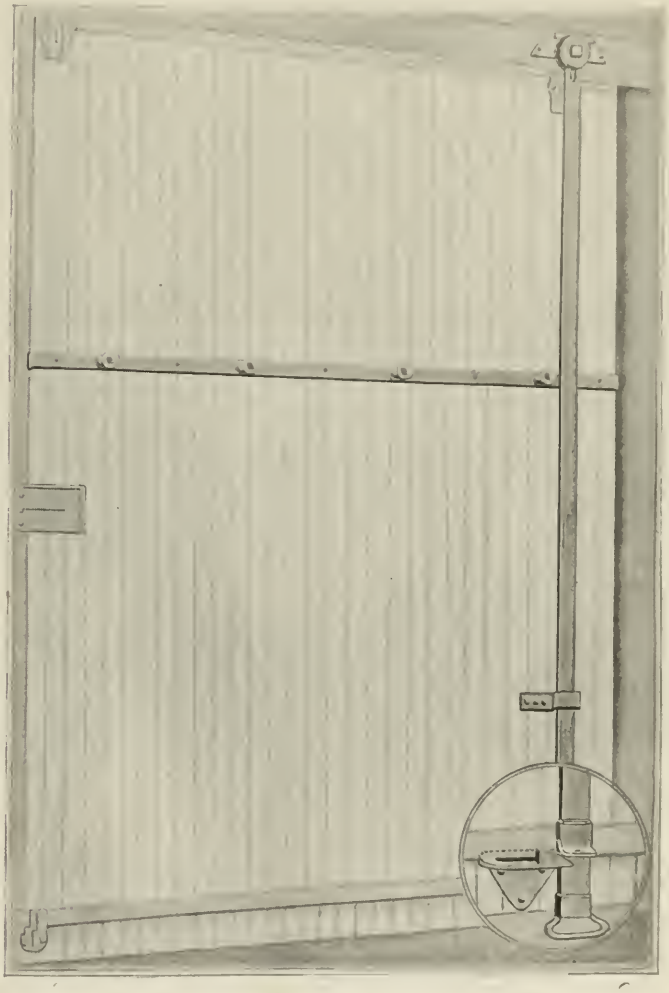
Canada.—Westbound express train No. 19 of the Grand Trunk, moving at full speed, ran off the track at Rideau, Ont., on the morning of October 23, about 1 o'clock, 11 cars going off the rails; but a broken rib of the express messenger is the only serious injury reported.

Electric Car Accidents.—In a rear collision of electric cars near Fredonia, N. Y. on the 4th, five persons were killed and 13 injured; and in a rear collision on the Interborough Elevated line in the Bronx, New York City, on the 21st, three persons were killed and 14 injured. In the New York collision two passenger cars were badly crushed, but there were only a very few passengers in them.

Freight congestion was troublesome in England even before the great strike. The London Times of September 9 reported manufacturers in Leeds as bitterly complaining of the holding up of merchandise owing to inadequate railway facilities. "Many hundreds of tons of goods have been held up for some time, and business men are at their wits' end to deliver goods to their customers. The railways are still refusing to take goods, except small consignments at occasional intervals. One woolen mill head reports that the Great Northern allowed him to send 10 cwt. of cloth to London last Thursday. Although he had tons waiting to go, since then he had not been able to get anything away. For more than a fortnight he had been wanting to dispatch a number of bales of cloth to Bristol via the Midland Railway, but the company refused to take it until yesterday, when only a small portion of an order was accepted."

A Radical Departure in Freight Car Door Fixtures

ONE OF THE TRYING PROBLEMS which railway employees have to face is that of opening freight car doors without damage to the doors. A new device which is intended to overcome this difficulty is the Jerry Loc-Lever. The Loc-Lever works on the leverage principle and when applied takes the place of locks, hasps and starters. The iron bar which forms the lever proper is suspended from the side plate of the car by a bolt and reaches a point a few inches below the lower edge of the car door. Another bar is fastened to the car door and extends across it horizontally about one-third the way from the top. To this are attached four fulcrum pinions formed of bolts inserted



A Combined Floor Lock and Opener

through steel tubes, large enough in diameter to revolve around the bolt and thus form a roller bearing. The handle of the main lever is so constructed that the seal or the lock of the car can be inserted through convenient orifices.

In operation, when the door is closed the Loco-Lever bar lies against the last pinion and holds the door securely in place. When the door is to be opened the seal is broken, thus releasing the lever, which is then raised away from the car a distance sufficient to pass it over the last pinion, against which it then lies in a diagonal position. A pull is exerted on the handle and from the resulting leverage the door is forced open a short distance. The operation is repeated on the three other pinions in turn, with the result that the door is fully opened without damage.

The device takes its name from the nickname of its in-

ventor, H. F. Jerolaman, of the traffic department of the Atchison, Topeka & Santa Fe, who is familiarly known as "Jerry." In his work Mr. Jerolaman noted the difficulties encountered in connection with the opening of car doors and this device is his idea for overcoming the trouble. Besides effecting a considerable saving in the damage ordinarily done the car door, it is anticipated that the device will also save time at stops and transfer points.

Standard Stock Sheets for Storekeepers

By W. L. W.

ONE OF THE MOST DIFFICULT THINGS confronting the storekeeper today is the problem of preparing a suitable record for recording the receipts, issues and consumption of material. The primary and essential thing to know is what is standard material and, therefore, each railroad should have a stock book in which should be shown by stock accounts the material which is standard for the various classes and kinds of equipment. Sufficient copies of this book should be made and supplied to all storehouses and departments, so that in ordering material, uniform sizes and kinds will be furnished.

It is a very common practice on most railroads today for every shop to order a different kind of material for the same purpose, and the result is that it is most difficult to transfer such material from one point to another. On the Pennsylvania Lines West a number of years ago a standard stock book was prepared showing in detail all of the items of material that were standard in the motive power department. On this sheet is shown the page and line number, description, entry number, blue print specification, etc., with columns for amount on hand, due, consumed, etc. These books are corrected currently by the general superintendent motive power when it is necessary to change specifications or reissue blue prints. Among the principal reasons for adopting this method were:

(a) Standardization of items; (b) to keep up to date the record of reissues of prints and specifications; (c) elimination of non-standard material; (d) to insure the use of uniform names for various items of material; (e) to provide an easy and simple method of checking surplus material; (f) to give a standard record of material ordered, received and consumed; (g) to assist the purchasing agent in placing orders by insuring uniformity in all items on requisition.

In standardizing the items it was found that after all the records were compiled, there were 156 different sizes of window glass. After checking over the standard items it was possible to eliminate 101 sizes. In the item of belting, one-third of the sizes were eliminated, even though it was necessary to change some pulleys to do so. Bar iron, lumber, brass castings, screws of all kinds, magnesia lagging, wheels and axles, small tools, and practically all other items showed substantial reductions. As an illustration, seven different sized cores of cast-iron wheels were being specified in order to take care of requirements, not only for home but also for foreign equipment. On account of the wheel-boring capacity of the shops it was felt that by ordering the cores of various sizes, an increase in output could be secured from the machines on account of reducing the number of cuts necessary to bore the wheel. It was found, however, in anticipating the requirements for wheels on the various weel makers, that they were also in a measure anticipating our requirements, and the result was that at times we had a large supply of wheels on hand, but not the kind of bore required. The blue prints were changed, reducing the number and sizes of cores to two for each wheel, and the whole situation was much improved, as this made it practical for the shops and also the foundries to carry fewer wheels than before, without holding a surplus on account of core measurements.

For another example, take the small tools, such as wood boring bits. It developed in the check that at 26 shops there were practically every size known or made. As an illustration, the 3/4-inch size varied from 6 inches in length to 20 inches, with 14 different lengths. It would seem that one size would be all that was necessary; that is, the size that would bore any piece of wood that would pass under the housing of the machine and likewise the thinnest piece. It was amusing when the various foremen were questioned as to why they wanted certain sizes, and finally admitted that they had always ordered and used them. Three lengths were finally agreed to, reducing the number of this size alone 11 items

6,000 Items Eliminated

Every item of material was gone over and a standard was established, resulting in the elimination of some 6,000 items from the stock books. After this record was put in use a comparison was made of January 1, 1915, with January 1, 1904, and the results were as follows:

Locomotives in service increased	92 per cent
Passenger cars increased	36 per cent
Freight cars increased	17 per cent
Stock on hand increased	9 per cent
Stock consumed per locomotive mile, decreased	21 per cent
Stock on hand per man employed, decreased	30 per cent

However, the stock on hand today is in value greatly in excess of this amount, due largely to the increase in price as well as quantity on account of conditions brouhgt about by the war.

In checking surplus material and transfering it from one shop to another, by having the standard book it is unnecessary to mention the articles, as all articles are on the same page and line. Only the page and line number are given in communications between shops. It has been of great assistance in the placing of orders by the purchasing agent to have one name, standard sizes, etc.

Another very important thing that has developed, which probably every shop has experienced, is the question of charging out material in the freight car repair yard. On account of a large percentage of car repairmen being foreigners, it was very difficult for them to learn the names of the innumerable kinds of material so that they could intelligently describe to the foreman what was wanted. It was a common sight to see from four to eight men waiting in line to secure their material orders. It was the practice to account for the material issued just as carefully as for material received. On account of the shortage of experienced help, it was decided to change the methods of handling material in the freight car repair sections. The rough material of all kinds is now carefully piled or placed in bins, the new separated from the second-hand. Instructions have been issued in the form of notices printed in as many different languages as there are employees, calling attention to the fact that they are permitted to take material from bins or piles just as needed, but they must not disturb the material nor take more than required to complete the job. Special attention is given to the material received, new or reclaimed, and at the end of the month an inventory is taken, and the quantity represented by the inventory at the close of the previous months, plus the quantity received during the month, less the quantity on hand per inventory at the close of the current month, represents the charge to freight car repairs. A record of all this material is carried through the charge-out book kept at the repair yard. This scheme has many advantages, and no disadvantages have been noted. It has reduced clerical work, saved time of foremen and workmen, and permitted the foremen to give to supervision the time formerly consumed in handling material orders.

A Conservative View of National Railroad Problem*

Merits and Faults of the Cummins Bill; Need of Specific Constructive Legislation

By Samuel Rea
President of the Pennsylvania Railroad

IT IS A PLEASURE to address those in charge of the savings banks for they have, through their guardianship and investment of the savings of our thrifty people, a substantial financial interest in the proper solution of the railroad question. The savings banks are the chief reliance of our people of small means who should not risk their savings, but should have them within convenient call at all times, and without hazard of diminution. I commend your faithfulness to the trust reposed in you by millions of our people. The investment of their money by you in safe and useful enterprises has been an important factor in developing our country and assisting its people to prosper. . . . The Senate and House committees have listened to about 50 plans; but I now hope we can soon close our talking season, and that Congress will adopt constructive railroad legislation that will recreate railroad credit. Today railroad credit is based not solely on railroad earnings but directly on the treasury of the United States, which is bad for the nation's finances and business, and a burden which increases its taxation. [The speaker here described the plan presented by the Association of Railway Executives, reported in the *Railway Age,* August 22, p. 353, and went on to explain its main features.]

Dangers of Fixing Maximum Returns

As a result of close contact with the railroad problem here and abroad and with the results of past experience of the national and state governments with public works and railroads before us, we felt that government ownership or a government guarantee was not desirable for the railroads of the country. In its last analysis a government guarantee means government operation, as, if the government is to supply the funds, it must have a controlling force in expenditures.

Although we realized our plan was not perfect, we avoided fixing a maximum return to all the railroads on their property investment, and a division of profits by individual companies if they exceeded that maximum, believing that any attempt to confiscate surplus earnings of any individual company would surely eliminate initiative, restrict competition and injure credit. Interest rates are exceedingly high compared to the pre-war period, and with the capital necessities of the world far from satisfied, any suggested maximum like 6 per cent would be too low for a period when the credit of the government itself, if left free from bank and treasury support, is nearly 5 per cent. The railroads have to raise about a billion dollars annually of new capital for improvements and equipment, as well as provide for maturing notes and securities, and may find 6 per cent insufficient for several years. The danger of maximum earnings may be illustrated by the experience of street railways. The five-cent maximum fare was regarded as providing a sufficient margin of profit to meet all conditions, but it has proved totally inadequate, so that public utility companies are as bad a problem for the country to adjust as the railroads. Many of us remember leases in which 60 per cent or 70 per cent of gross was considered an ample compensation to a lessee to operate a road but the lessees in most cases were later compelled to buy up the stocks of such roads and cancel the leases, because 60 per cent or 70 per cent of gross proved insufficient to pay operating expenses; while the rent of 40 per cent or 30 per cent of the gross paid to the lessor, as earnings increased, became a bonanza.

From a long experience I distrust arbitrary maximum returns unless all other factors such as income, taxes, interest, etc., are likewise fixed, because we cannot foresee or control future business and financial conditions. I have more sympathy with specifying a minimum return as a guide to our commissions of what is an unreasonably low transportation rate and an unfair return on the investment low transportation rate and an unfair return on the investment, instead of relying on the courts to save the carriers from confiscation. I would consider a return of 6 per cent on the property investment a minimum return, especially now when money will cost the railroads even higher figures. Judging by past experience there did not seem to be the requisite authority or initiative in the commissions—federal and state—to make rates that would produce a return of even 6 per cent for a traffic district, or rate making group of railroads, except in years when the roads showed an unexpected expansion of business and when costs continued somewhat stationary, as in parts of the calendar years 1909 and 1916. I have been informed that a minimum would not be specified by Congress, unless it be an absurdly low return, like 4 per cent, upon which even the government itself has not been able to borrow the moneys it required.

Neither a maximum nor a minimum is required, if Congress will take the responsibility of directing the federal commissions to enable the railroads to resume business on a self-sustaining credit basis, and attract the necessary additional capital for improvements to properly serve the public. The railroads cannot serve the public if they continue on the "bread line."

The Cummins Bill

Now in response to all the testimony on the railroad question, and the various plans suggested, and the serious condition of railroad credit, a tentative bill, Senate 2906, has been introduced by Senator Cummins to solve our problem. It is the first broad, friendly legislative expression towards railroads in the last fifteen years. Therefore, I propose to briefly and, I trust, constructively, review some of its salient features, with the expectation that Senator Cummins will not consider the railroads and their owners ungrateful for the work he and his committee have tried to do for the country, but with the sincere hope that he and his associates will endeavor to correct some features of the bill. . . .

The indebtedness of the roads to the government for capital expenditures made during federal control certainly ought to be funded for not less than ten years rather than five years, considering financial conditions generally, and the annual requirements for capital by the railroads. For general indebtedness, some security other than demand notes should be provided, otherwise credit will be imperiled rather than helped by such funding. The government should leave the railroads in at least as sound physical and financial condition as when they were taken over. Merchants, farmers and others have been protected by higher prices, but the railroads were not placed in that position; and they should not be asked

*An address before the savings bank section of the American Bankers' Association, at St. Louis, Mo., October 1. Abridged.

to pay the large capital expenditures of the war period without assistance from the government to fund them for a long period and at low interest rates. These capital expenditures were made to assist in protecting the life of the nation, and the roads should also have transporation rates sufficient to hereafter sustain them. [The speaker here enumerated certain features of the bill which are accepted as beneficial or which at least were subjected to no unfavorable comment; exclusive federal regulation of securities; new rates to be suspended only five months instead of ten; creation of a transportation board; better definition of the elements to be considered in prescribing a rate; prevention of strikes; pooling; commission to prescribe minimum rates.]

Objectionable Features—Cummins' Bill

Some of the objectionable features are:

The Interstate Commerce Commission is not given effective authority over intrastate rates. Without this authority how can the Commission and the transportation board fully protect railroad credit? The provisions as to making compensatory rates and permitting a return sufficient to maintain railroad credit and provide adequate facilities are not sufficiently definite and mandatory to produce that result. The labor provisions are too diffuse to be effective. The purposes for which voluntary consolidations can be made, are too restrictive in their scope and the provisions as to compulsory consolidations are fatal to railroad credit. The commandeering of the so-called excess earnings of individual companies, and penalizing surplus earnings if used to provide better railroad facilities, is a decided blow to operating initiative and conservative financing. Railroad valuation in its present form cannot be used for the various purposes proposed in the bill, nor can it be completed to enable the Commission or the carriers to promptly carry out the various provisions of this proposed law.

Valuation

The valuation found by the Interstate Commerce Commission, under the present law, is claimed by the government to be a valuation only for rate making purposes, but this bill requires the same valuation to be used for rate making, capitalization, consolidation, and the measure of a fair return, or as a selling price of the property, and apparently the commission may change that valuation from time to time. To wait for the final valuation will cause great delay and any intention of its use for all of these purposes is bound to be disappointing. Therefore, rather than stop all progress in fixing reasonable rates, let the existing records of "property investment" be used pending final valuation. It is the return on the property investment of a traffic district that is a guide to the Commission in rate making, and not that of single companies; and so far, in those districts, the return has been found too low for sound railroad credit.

Authorization of Betterments

The bill provides that the right of eminent domain cannot be exercised without a certificate of the Transportation Board and the Interstate Commerce Commission for acquisition, construction, maintenance or operation purposes, or any authorized extension or addition; but authority to proceed with any new construction is divided between the states and the federal commissions. The construction of a new line of railroad or extension must be authorized by the Transportation Board; but this Board is specifically excluded from authorizing the construction of side tracks, spurs, industrial, team or switching tracks located wholly within one state—for that the railroads must apply for state authority.

The question of branches and terminals does not seem to be very accurately defined. This serious question is further tied up by the approval of the issuance of securities, to carry out such work, being solely under federal authority. Therefore, I regard the provisions for carrying on improvement work and exercising eminent domain under such divided federal and state authority as detrimental to business. Industries cannot defer the establishment or extension of their plants on such a divided and dilatory process. The entire responsibility for authorizing the acquisition of all additional right of way or terminal areas, as well as all new capital expenditure work, should at least be concentrated under one board, just as this issuance of securities is to be solely under the Interstate Commerce Commission. When improvements are so authorized, no public benefit is secured by requiring the consent of any governmental body to the exercise of the power of eminent domain. The requirement of such consent would mean delay and enhanced cost.

Labor Provisions

The labor provisions of the bill primarily concern not only the management and investors but the welfare of 1,900,000 employees; and may affect the payment of $2,800,000,000 in wages. The final decision on railroad wages is given to the Transportation Board. No qualifications are stated for the members of this important board, which is to deal with the operating and administrative questions of all the railroads, including wages. Subordinate to this board is a committee on wages and working conditions, consisting of eight members, four to be selected from the persons nominated by the organized railroad working crafts on each railroad to represent labor, and four from among the persons nominated by all the railroad corporations; and I suppose the Transportation Board is expected to represent the public. Four years is the term of office and $4,000 each the compensation of the members of the committee on wages and working conditions. Unless this committee is expected to pass all disputes to the transporation board, surely that short term and that salary are insignificant compared to the magnitude of this responsibility, which has tested the ability of the President and the director general, and the railroad managers. For that task the best railroad managers, who understand social questions as well as operating questions, are needed, and the labor members must be up to the same standard. Any suggestion as to standard wages that takes no account of the varying living costs and conditions as between New York, Florida, California, Kansas and Maine is contrary to economic experience. No equitable plan for the avoidance of future disputes as to wages will be complete or protective against strikes, unless a sliding scale is adopted, whereby wages will be adjusted to living costs. Settlement of wages under pressure or as a compromise, is bound to produce dissatisfaction.

A further labor proviso is that on the board of directors of each carrier there shall be two labor directors and two government directors after June 30, 1920. The two labor directors shall be selected from the classified employees and nominated by the employees. The two government directors are to be appointed by the transportation board, and apparently whether satisfactory or unsatisfactory to each corporation. On all committees of the corporations' boards there shall be at least one labor director and one government director. These labor and government directors are to be compensated and their expenses paid by the corporation for attending board and committee meetings. There is nothing to show whether they are to be on the two thousand or more railroad boards of the country, or only on the boards of the operating carriers. Wages and working conditions are to be settled by the committee on wages and working conditions and by the transportation board in Washington so that no individual carrier corporation will have any responsibility for wages. Further, no carrier can prescribe the wages of its own employees independent of other railroads. Therefore, these labor and government directors on the board of directors of every carrier corporation seem to be like the fifth wheel of a wagon.

They have no prescribed responsibilities or qualifications, and nothing is said as to the responsibility of the government for their votes.

Looking for the results to be expected from the two government directors, the bill does not permit railroad companies to make capital expenditures, to exercise the power of eminent domain, or to issue securities except upon government approval. What useful service, therefore, will these two government directors render? If these four directors, instead of sitting on the carrier's board of directors, could be elected one-half by the carrier and one-half by the employees and work as subordinates to the committee on wages and working conditions, they might give a touch of home rule to the labor question, and form a thread of a labor organization, starting from the local ground and ending with the transportation board, which might be of some benefit. This is a suggestion and not a solution of the railroad labor question but it indicates the necessity for careful revision. It would appear wiser to let the transportation board, which has final responsibility for wages and for governmental supervision of the railroads, direct how employees and corporations and the public shall be represented, and avoid prescribing elaborate machinery.

There is another labor provision, *i. e.,* an employees' advisory council selected from each organized craft of railroad employees requesting representation, to administer a fund consisting of one-half of any excess earnings over a fair return, which any company guilty of that rare offense under a system of rates which must be reasonable and uniform, shall pay over to the transportation board. This duty might very easily be performed by the committee on wages and working conditions or the transportation board and this advisory council be dispensed with.

Consolidation of Roads Into Competitive Systems

I am in favor of consolidation. The bill declares it is the policy of the United States to divide the railroads into not less than 20 nor more than 35 separate and distinct systems —this division to be a division in ownership and for operating purposes. Each of the systems is to be owned and operated by a distinct corporation and, where practicable, the existing routes and channels of trade and commerce are to be maintained. The systems are to be so arranged and equalized as far as practicable, that uniform transportation costs, uniform rates and the same rate of return on value may be earned. The transportation board is to devise and adopt the system plans, but may thereafter change them. The Interstate Commerce Commission must also approve them. The government will have no financial responsibility for their formation either in the voluntary consolidation plans, or in those regional companies to be mandatorily formed after seven years by order of the transportation board. The arresting of the law of gravitation would be as easy to accomplish as to arrange and maintain these ideal systems, considering the divergent traffic conditions, physical, financial and other conditions of the various roads in even a single traffic district.

If anything is calculated to stop consolidations, and make them impossible to finance, it is a railroad alinement of this arbitrary character. The existing systems have been formed under a competitive system and follow the lines of the natural traffic routes, and are feeders and extensions of the original trunk lines, and in that way became attached to them as systems. Others might be formed gradually on similar lines, and as their organizations could be trained for the enlarged responsibilities.

The necessity for absorption, merger and consolidation of smaller corporations is apparent. In the last complete Interstate Commerce Commission report, that for the year ending June 30, 1916, we find 1590 companies divided into the following classes: Class I, 189 railroads; Class II, 276 railroads; Class III, 431 railroads; Switching and terminal companies, 227; Lessor companies, 467. These 1590 companies do not include about 600 roads that are privately owned, or industrial lines not common carriers, some of which report only to state commissions. The 189 first-class roads, together with their lessor companies, earned 97.4 per cent of the total operating revenues of the country. Now taking 162 of the chief operating companies, which earned 94.6 per cent of the total operating revenues of the country, we find that they already constitute 86 systems. But only 18 systems during the three-year test period earned over 6 per cent on their property investment . . . Until earnings are increased, it is hard to see the basis on which the railroads can proceed with any wholesale plan of absorption or consolidation. The 86 systems existing can be reduced, not arbitrarily, but as traffic and earnings justify. Indeed, as 23 systems already handle about 80 per cent of the total operating revenues, there seems to be no necessity or benefit to be obtained from constituting, valuing and financing new systems arbitrarily put together. . . .

What the railroads need is not an arbitrary division of the country into 20 or 35 distinct systems formed by mandate of the federal government and the changing views of various boards or commissions; nor any attempts to tie the weak and the strong together, in the hope that in some way or other the few strong railroads of the country can support the weak lines, including lines that have thin traffic or should never have been constructed. The railroads want laws that will permit the existing railway systems to absorb and eliminate the affiliated companies now owned, operated, leased or affiliated with their systems. Such further connecting roads may be added as may be required to round out these systems on a basis that would be approved by the federal commissions.

In the Pennsylvania system there are about 140 live companies, consisting of railroad companies, ferry companies, bridge companies, water companies and warehouse companies —all essential for transportation purposes. They are leased or operated, wholly owned, or owned in part by the parent company. Therefore, an absorption law to clear up the barriers in the existing charters and divergent state laws that prevent the absorption of such affiliated companies, to round out a single system and leave the name and securities of the parent companies unchanged, seems desirable. No such absorption of small companies by the large systems can proceed on any large scale without reasonable earnings to enable that course to be pursued, and thereafter leave the system in a strong position to do its financing on reasonable terms.

The big systems have absorbed many weak lines, and are now supporting other weak lines, and they have about reached the limit in that respect.

At the conclusion of federal control the bill states that rates are to remain in effect until changed by competent authority. This means state as well as federal. You can see what a hopeless state of confusion will be caused by throwing all the states into rate regulation again. The carriers are to file new schedules of rates, fares and charges with the commission within thirty days after federal control terminates, the same to become effective four months after they have been filed. During this period of readjustment, but for not exceeding five months, the compensation under the federal control act is to be guaranteed. During the calendar year 1917 it took about 75 cents out of every dollar to pay operating expenses and taxes, and now it is costing over 90 cents out of every dollar. Certainly for this period of reconstruction, affecting the entire nation, the United States government should readjust all rates—state and interstate—to meet the transportation costs, and properly establish railroad credit, by exercising the same control over rates as was done during federal control. It is true that the bill authorizes the Interstate Commerce Commission to co-operate with the state commissions and remove any unreasonable discrimination

against interstate and foreign commerce, but the act specifically states that it does not amend or affect the existing state laws or powers in relation to taxation or the lawful police powers of the several states, including the power to make and regulate intrastate rates, except as in the act otherwise provided. It will, therefore, be seen that such reservations will produce extensive proceedings or controversies so as to delay justice to the carriers, or to other states that may be affected by the rates made in a single state. It also divides the responsibility as to the credit of the carriers. The declarations of policy and elements affecting reasonable rates should be made so mandatory that the federal commissions should have a positive duty to see that the rates, both state and interstate, are adequate to protect that credit.

The Cummins bill as it stands, gives us no definite or prompt assurance of adequate rates, nor does it get us away from conflicting state regulations. To make it a truly constructive measure it must be strengthened and amended in these fundamental particulars.

Commandeering of Earnings

The provisions relative to commandeering and using for other railroad companies and for railroad employees the so-called excess earnings of individual companies will throw many railroad investments again into a condition of uncertainty, because a fair return is not prescribed or defined. What may be a fair return for one company, and for one year, may at the lapse of the next year be reversed by the commission, or be varied for other companies. There will be no incentive to any carrier to earn any money in excess of the payment of an ordinary dividend, not only because of the confiscation of the so-called excess earnings, but the further provision that any surplus earnings invested in the property cannot be capitalized or used as a basis for increased returns. These provisions will force all future additions, betterments and improvements to be provided from the issue and sale of securities. Such provisions would terminate conservative financing, as under private ownership, the money for new improvements could be had only from the sale of bonds under these conditions, and at higher interest rates to accord with the risk of bad years. If this system is once established for the railroads, it will in time be applied to all public utility companies at the outset, and later to industrial and manufacturing concerns, because their products are just as essential for the daily life of the citizen as railroad transportation.

I desire to emphasize the fact that the conservative railroads which have successfully weathered the various panics, industrial and financial, here and in England, without wiping out or reducing their dividends, are those railroads which used their surplus over reasonable dividends to provide additional facilities and equipment for the public use, instead of selling stocks or securities for that purpose. The Pennsylvania system is a fair example. Its property cost and marketable securities, not including holdings of securities of companies forming part of the system, exceeds the total outstanding securities in the hands of the public to the extent of over $500,000,000. If the company instead of following that practice had distributed all its yearly surplus in dividends, and had sold securities for all additions and betterments to its property and equipment, it would now require $30,000,000 per annum of additional net income to pay its 6 per cent dividends; or the company's stock would have been reduced to a 4 per cent dividend, and its bonds would have had to carry a much higher rate of interest because of weaker credit. It would have been impossible for it to have sold its stock on the market, and that would have been to the detriment of the country and industry, as well as to the company's security holders and owners.

The company's surplus was not derived from excessive transportation charges. These charges have been materially below those authorized by its charter. The freight charges especially were materially reduced from the beginning of operation, about seventy years ago, to within recent years, and almost ruinous competition among the various roads had a great effect in reducing these charges. The surplus for improving the company's credit and property was obtained not only from moderate profits in the transportation business, but by paying low dividends on its stock for a long series of years, from selling its stock at premiums, and from profits realized on its investments. This surplus was invested in the property for the improvement of the same for the public use, when legitimately it might all have been disbursed in dividends to the stockholders.

This practice was also followed by other companies without any regulation or legal requirements, and the public was benefited. What I object to is: (1st) the reprehensible feature that what a company earns under fair and uniform rates through good management and efficient transportation can be taken from it and given to others, thereby sapping the spirit of initiative and competition, and (2nd) federal regulation that ultimately will create a situation in which no surplus earnings over a fair return can exist, and that absolutely penalizes the railroads if they invest any surplus earnings in the property for the benefit of the public. If these provisions are allowed to stand, then the least I can ask is that an allowance of some surplus over a fair return in good years should be made mandatory, and not permissive, to assist in lean years. Otherwise in bad years, rates would have to be increased when shippers could least afford to pay them.

If the Pennsylvania Railroad Company after paying its fair dividends is not to have a surplus to sustain the credit and operations of weak roads in its system, then several hundred miles of railroads must stop operations and improvements, and communities must suffer.

The Pennsylvania system represents about 6.5 per cent of the whole track mileage of the country, about 13 per cent of the ton mileage, and 13.5 per cent of the passenger mileage. Its track mileage is about one-half of that of Great Britain and Ireland, and it has invested for public use $1,800,000,000, in its road and equipment, approximately one-tenth of the whole railroad investment of this country. It has been opened for traffic 67 years, and during that time its management has observed a sane and conservative financial and operating policy, and dealt generously with labor in wages and welfare funds to the extent the earnings permitted. I have the honor of having served the company, with the exception of a few years, since 1871, and for over 30 years have been closely associated with the executive department, familiar with the construction of new lines and branches to serve the public and the financing, upbuilding and compacting of the system. Therefore, I can speak intelligently, and indeed feelingly, about the company's policy and affairs. So far as public regulation is concerned, for the last ten years the company has not been allowed sufficient revenues to earn 6 per cent on the cost of its property and equipment except in 1909 and 1916. Yet so far as the management is concerned, long before there was any regulation of the railroads, as we now understand it, the Pennsylvania Railroad Company did not distribute all of its net income in dividends, but judiciously applied a substantial portion to promoting, helping and upbuilding its feeders and connecting lines, to eliminating grade crossings, and for other similar construction items. It was not alone in this policy. Other companies pursued the same course, and they could be depended upon to continue such policies, under proper regulation, without injustice to the public. Then why must Congress now propose, as a future national policy, to confiscate their so-called surplus earnings and stop incentive, and on the other hand fail to definitely order reasonable rates that must produce a fair return upon which railroads can live and make progress?

The Problem and the Remedy

The railroad problem has not changed, nor is it shrouded in mystery. It is this: Railroad earnings and credit must be created sufficient to support the existing railroad investment and attract the additional capital the transportation business requires in the public interest. New capital cannot be commandeered. Therefore, adequate rates made under public approval, with opportunity for competition, initiative and incentive, is the effective remedy for the whole problem, in my opinion. If adequate rates had been granted in the past decade, there would not have been a railroad problem. I desire to see the Cummins bill amended to definitely accomplish that result. If that mandate is not positively forthcoming as the result of the new legislation, all the boards and machinery created for regulatory purposes will be useless. Extreme care must be exercised to insure sound credit, and not theorize about it. If public regulation does not allow earnings sufficient to sustain railroad credit, and provide necessary transportation facilities, the public will be forced to regard regulation as a huge waste of money, time and effort, and demand a simplification of the situation, and start with a new slate, or drive straight for government ownership with its train of higher costs, inefficiency, and political domination of the employees and of the industries depending on the railroads. National reconstruction cannot be accomplished while railroad investments and credit are left in an unsatisfactory condition. This should spur Congress, the commissions, the investors, the employees, railroad management, and the public to work together for an equitable and prompt solution of this great problem. To that end the railroad executives are prepared to devote their whole time and attention, if the Congressional committees so desire. Further delay is extremely dangerous to all concerned.

Cost of Freight Train and Locomotive Service in August

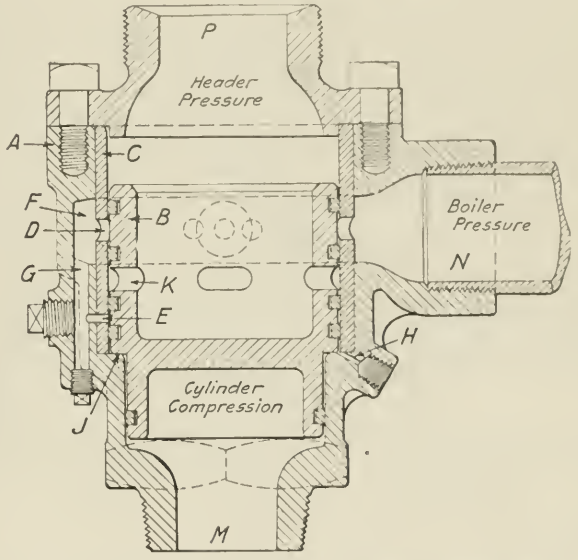
THE TOTAL COST of freight train service per 1,000 gross ton miles in August was 99.5 cents, according to the monthly report of the Operating Statistics Section. This is the lowest point it has reached this year and compares with 101.1 cents for August, 1918, a decrease of 1.6 per cent. In July it was 100.6 cents. Per mile, however, the costs are still greater than last year. The cost of freight locomotive service per locomotive mile in August was 103.2 cents, which is an increase of 1.5 per cent as compared with August, 1918, when it was 101.7 cents. In July it was 104.8 cents. The cost of freight train service per train mile in August was 152.8 as compared with 149.8 cents in August, 1918, an increase of 2 per cent. In July it was 153.8 cents. The items of locomotive repairs and fuel show decreases. The combined figures for all regions and the comparative figures for last year are as follows:

	August	
	1919	1918
Cost of locomotive service per locomotive mile	103.2	101.7
Locomotive repairs	32.3	33.6
Enginehouse expenses	8.3	7.0
Train enginemen	20.2	19.0
Locomotive fuel	39.1	39.2
Other locomotive supplies	3.3	2.9
Cost of train service per train mile	152.8	149.8
Enginehouse expenses / Locomotive repairs	46.3	46.8
Locomotive fuel	44.6	45.3
Other locomotive supplies	3.8	3.4
Train enginemen	23.0	21.9
Trainmen	26.5	25.6
Train supplies and expenses	8.6	6.9
Cost of train service per 1,000-ton miles	99.5	101.1
Locomotive repairs / Enginehouse expenses	30.1	31.6
Locomotive fuel	29.1	30.5
Other locomotive supplies	2.5	2.3
Enginemen and trainmen	32.2	32.1
Train supplies and expenses	5.6	4.6

Ripken Automatic Drifting Valve for Locomotives

SINCE SUPERHEATED STEAM has come into general use the trouble experienced with deposits on locomotive pistons and cylinders has increased greatly. The use of the drifting throttle has proved effective in eliminating this trouble, but it is difficult to insure that the engineer uses the proper amount of steam and for that reason an automatic drifting valve has important advantages over the drifting throttle. Several types of drifting valves are in use at present, the majority being arranged to come into action when a vacuum is formed in the cylinder. Since the vacuum which operates the valve will also draw in the front end gases which cause deposits on the cylinder walls, any drifting valve operated on this principle cannot entirely remove the trouble.

In order to do away with the formation of a vacuum in the cylinder, a valve has been devised which is operated by the compression in the cylinder. This device is known as the Ripken automatic drifting valve and is in use on the Minneapolis, St. Paul & Sault Sainte Marie. The valve



Section Showing the Connection of the Ripken Automatic Drifting Valve

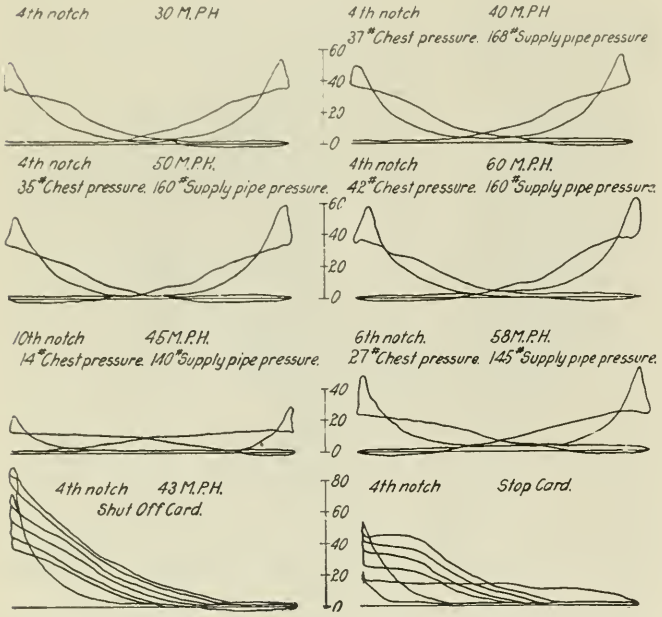
comes into operation before the cylinders are emptied of steam pressure after the throttle has been closed and is kept in operation and furnishes the needed amount of steam until the pistons cease to move. It is automatically closed just as the engine stops by the building up of pressure in the steam chest.

Only one valve per engine is used as the steam is passed directly to the branch pipe or the saturated end of the superheater header. This arrangement is advantageous as it reduces the amount of steam required and also protects the superheater elements against overheating. It is unnecessary to use either air relief valves or by-pass valves in conjunction with the Ripken drifting valve.

One illustration shows a section of the valve which serves to illustrate its operation. The operating portion consists of a cage *A*, and a differential piston valve *B*. The cage has an opening *M* at the bottom which is connected by the most direct means possible with one end of the cylinder so that the cylinder pressure is transmitted to the lower side of the piston. The side opening *N*, is connected through a two-inch pipe to a live steam line from the turret. The opening *P* at the top of the valve communicates with the branch pipe or superheater header.

Within the cage A is a bushing C, in which are ports D and E. The port D is surrounded by a duct F, which is always filled with live steam. From the duct F live steam passes through the passage G to port E. At the lower end of the bushing C is a small regulating and relief port H, connected by piping to the exhaust chamber of the locomotive.

When the main throttle is closed the pressure on top of the differential piston B falls and the compression in the cylinders acting on the bottom of the valve being in excess of the steam chest pressure raises the valve B off the shoulder J, upon which it normally rests, placing the port K in communication with port D. This permits steam to flow through the valve into the steam chest maintaining the required pressure to prevent a vacuum while drifting. The raising of the valve also uncovers port E and the steam entering the annular cavity under the valve is restricted by the port H and furnishes the counter pressure necessary to hold ports D and K in communication until the engine is almost at a standstill. As the speed decreases the pressure in the steam chest will rise, and overcoming the pressure on the bottom of the differential valve, will force the valve



Typical Indicator Cards from an Engine Fitted with the Ripken Drifting Valve

to its seat, where the fraction of the rings will hold it closed. Any slight leakage past the lower rings is taken care of by the port H and it is, therefore, practically impossible for the valve to open while the engine is at rest.

Tests on a superheater locomotive with 25 in. by 26 in. cylinders supplied with steam from a two-inch pipe showed that the valve when adjusted to close at about 40 lb. per sq. in. would maintain between 25 and 30 lb. pressure in the steam chest at 25 per cent cutoff at a speed of 60 miles an hour, preventing the formation of a harmful vacuum even at such high speed. After a shut-off with the reverse lever in running position, the valve would open when the steam chest pressure dropped to about 30 lb. The valve would close again when the steam chest pressure rose to 40 lb. which occurred just before the stop, allowing time for the superheater to empty itself before the engine came to rest. The Ripken drifting valve has been in use nearly two years with excellent results. It has required little attention and has prolonged the life of cylinder and piston rod packing on the engines to which it has been applied.

Cost of Freight Train and Locomotive Service in July

THE TOTAL COST of freight train service, including locomotive service, continues to show a steady decrease each month as compared with preceding months, although increases as compared with last year, according to the monthly report of the Operating Statistics Section. For the month of July it was 100.6 cents per 1,000 gross ton miles, as compared with 101.8 cents in June, 103.9 in May, 112.7 in April, 119.5 in March and 126.5 in February. No comparison of this figure with last year is given. The cost of freight locomotive service per locomotive mile in July was 104.8 cents, as compared with 98.7 in July, 1918, an increase of 6.2 per cent, and as compared with 107.1 cents in June of this year. The cost of freight train service per train mile was 153.8 cents, as compared with 144.2 cents in July, 1918, an increase of 6.7 per cent, and as compared with 154.7 cents in June. All items of cost continue to show increases as compared with last year, except locomotive fuel, which for July shows a slight decrease.

	July 1919	July 1918
Cost of locomotive service per locomotive mile	104.8	98.7
Locomotive repairs	35.6	32.3
Enginehouse expenses	8.3	7.0
Train enginemen	19.8	18.5
Locomotive fuel	37.7	37.9
Other locomotive supplies	3.3	2.9
Cost of train service per train mile	153.8	144.1
Enginehouse expenses / Locomotive repairs	50.1	45.3
Locomotive fuel	43.0	43.6
Other locomotive supplies	3.8	3.4
Train enginemen	22.6	21.3
Trainmen	26.1	24.8
Train supplies and expenses	8.2	5.9

	July, 1919	June, 1919	May, 1919	April, 1919	March, 1919	Feb'y, 1919
Cost of train service per 1,000 gross ton miles	100.6	101.8	103.9	112.7	119.5	126.5
Locomotive repairs / Enginehouse expenses	32.7	33.7	35.4	38.6	40.8	43.1

General News Department

Profane language, or anything repugnant to the clause in the rule-book calling for "the faithful, intelligent and courteous" discharge of duty may afford good cause for dismissal from the railroad service. This is the salient feature of a circular recently promulgated on the Pennsylvania Railroad. Already, according to a local paper, a number of employees on the Middle Division have been suspended for using foul and profane language.

Cars were not held at Louisville for whiskey; so says Director General Hines. In accordance with shippers' orders, instructions were issued to furnish cars for such shipments on December 8, "consistently with the performance of other transportation requirements," if the ban of the law should be lifted by the court; but cars were not held idle for that purpose. No decision having been made by the court, these orders were rescinded and no cars are being held.

Three thousand is the number of empty freight cars said to have been standing on side tracks in and near Louisville, Ky., last Monday morning, held in the expectation that by an anticipated decision of the Supreme Court, but which was not handed down on that day, the cars could be used to carry off 36,500,000 gallons of whiskey which distillers in that region are anxious to dispose of before the constitutional prohibition of liquor traffic goes into effect. Plans had been made to load the whiskey into the cars as fast as the revenue stamps could be pasted on the barrels. Whether or not any one is paying demurrage on these cars at the present time, while the decision of the Supreme Court is breathlessly awaited, is not stated.

Contracts Executed

The Railroad Administration has executed compensation contracts with the Maine Central for $2,955,696, the Hocking Valley for $2,637,167 and the Atlanta, Birmingham & Atlantic for $480,000.

Passengers Burned to Death at Muscatine, Iowa

In the derailment of a gasoline motor car on the Muscatine, Burlington & Southern, three miles south of Muscatine, Iowa, on the evening of the 4th of December, three persons were burned to death, and 13 or more were injured, every occupant of the car being either killed or injured. According to the Des Moines Register, the car was thrown off the track by a defective rail which had already been reported; the gasoline tank was punctured, when the car fell on its side, and the gasoline took fire. The only available exit from the car was a side door, which was on the side next to the ground, and, because of the rapidly spreading flames, passengers struggled in vain to escape, until a man broke a window in the rear end. Some of the escaping passengers were burned.

The Muscatine, Burlington & Southern extends from Muscatine, Iowa, southward 54 miles to Burlington. The timetable in the Official Guide shows four trains each way on week days, marked "motor car," and one other train each way.

Railway Revenues for October

The Interstate Commerce Commission has issued for October its regular compilations of revenues and expenses of class I roads (186 railroads and 17 switching and terminal companies). Net operating income for October, 1919, was $86,523,011, and the average per mile of road operated was $369. This compares with $428 per mile for the month of October in the years 1914, 1915 and 1916, included in the "test period."

The details are shown in the large table.

Railway Revenues and Expenses for October and Ten Months

		October				Ten months			
		Amount		Per mile of road operated		Amount		Per mile of road operated

Foreign Railway News

Reports from Trieste say that freight rates on the Austrian State Railways, as well as on the private railways in Austria, were increased 150 per cent on October 15.

The Irish Railway Executive has had its attention drawn to the fact that a link line between the city terminus of the Cork & Macroom Railway and the Bandon & South Coast Railway, which was constructed for military purposes during the war, might now be utilized for commercial purposes with great advantage to the public and a manifest economy in labor and expense. The executive has been asked by the local authority to make such arrangements as may be necessary to adapt the link for commercial purposes.—(Modern Transport).

Automatic Signals in Australia

LONDON.

The Queensland government railway has installed a 4½-mile section of 3 position upper quadrant automatic signals.

Electrification in Bolivia

The Government of Bolivia is studying the problem of the electrification of the railroads and has declared as public domain the waters of the rivers having sufficient power for that purpose.

Raising of Rates on Uganda Government Railway

LONDON.

The proposal to raise the rates on the Uganda Government railway by 40 to 70 per cent, according to distance, is to be suspended, says the Engineer, pending further consideration.

Proposed Connection of India and Burma by Railway

LONDON

The Times Trade Supplement states that sanction has been given to a preliminary survey by State engineers for a meter gage railway line by way of Hukong Valley to connect India and Burma. This will connect the existing line to Lakhimpur with the line from Mandalay along the Upper Irrawaddy valley.

Wood Fuel on Swiss Railways

LONDON.

The Times Trade Supplement states that the results obtained from the use of wood fuel in Switzerland, are of considerable interest. The technical difficulties were not so great as were anticipated. On lighting the fires with one cubic meter of wood a steam pressure of from five to six atmospheres was obtained in 1½ hours, for which otherwise 300 kilos of coal would have been required. The cost was only £1:12:0, or approximately $13 (pre-war rate), as against £2:18:4, or approximately $15 (pre-war rate) with coal. The same maximum driving rates were obtained as with coal. The difficulty for storing fuel for long journeys was met by running a special truck behind the engine.

A Car Renting Scheme in Czechoslovakia

Several important Bohemian banks have formed a ten million crown company for the renting of freight cars under the name of Tschechoslovakische Wagonleih-A. G. Negotiations will be taken up with foreign car manufacturers. The cars will be purchased outright and rented only to such industrial undertakings as are stockholders and in proportion to the amount of stock they hold.

Oil Fuel in France

Press despatches from Paris dated November 27 say that on the day preceding the first locomotive on a French railroad to use oil as fuel was sent out on an experimental trip yesterday and hauled a heavy train with complete success. It is announced that railroads in France have planned to alter their engines so as to use oil fuel instead of coal, and that 200 locomotives may be thus changed.

German Railway Contracts

LONDON.

An extract by Modern Transport from the Koelnische Volkszeitung states that the German government has given Krupps a contract for the manufacture and delivery of 100 locomotives and 2,000 fifteen-ton freight cars per year. Full details of this contract are not yet known, but it is reported that the price to be paid will be based upon the actual cost of the material used and of the labor, and that the manufacturers themselves will only be allowed a commission profit of 2 per cent. It is also stated that directly after the armistice, Krupps converted two of its munition factories into rolling stock factories, and these two factories have a total capacity of 300 heavy locomotives and 2,500 fifteen-ton freight cars per year.

New Trans-Balkanic Railway

LONDON.

An extract from the Times Trade Supplement states that the completion of a new railroad to run from Valona on the Adriatic to Monastir will not only benefit the undeveloped country of Albania, but will give Italy through communications across the Balkans with Constantinople. The efficiency of the railway will further be increased by two ferries which will carry the train over the Otranto Canal. Thus the Italian system will be linked up with the new railway.

It is also proposed to link up Durazzo, the most important port of Albania, by a branch which will run in an almost straight line through the plain of Kavaja along the old Roman road, via Egnatia. After diverging from this road and taking the Musekeja road, it will join the Trans-Balkanic not far from Pekini, at a suitable spot between Fieri and Berat.

Mikado Locomotive for the Korean Government Railways

One of 12 locomotives recently built by the American Locomotive Company. These locomotives are for 4 ft. 8½ in. gage. They have 25 by 28 in. cylinders; 57 in. driving wheels; a total weight in working order of 210, 000 lb.; a weight on drivers of 158,500 lb. and a tractive effort of 39,800 lb.

English Railway Shopmen's Demands

LONDON.

At a meeting of the local railway shops' committees connected with the Engineering and Shipbuilding Trades' Federation recently held at York, the following draft of a national program for the railway shops of Great Britain was formulated.

1. That all craftsmen be called upon at once to join their respective craft unions.
2. District rate of wages to all grades.
3. Consolidation of all war bonuses, including the 12½ per cent, into standard district rates.
4. A 44-hour working week.
5. Abolition of systematic overtime, local arrangements to be made for overtime in cases of emergency, breakdown, repairs of plant, etc., overtime rates to be not less than time and a half for time workers and rate and a half for piece workers.
6. A week's holiday with pay, and payment for all recognized statutory holidays.
7. Abolition of the age limit in the medical examination and a share in the management and control of railways.

British Labor to Participate in Railway Control

LONDON.

J. H. Thomas, the general secretary of the National Union of Railwaymen, who has been conducting negotiations with the British Government relating to railwaymen's wages, in a speech before railwaymen at Bristol on November 16, outlined the government's offer to the railwaymen regarding their participation in government control of the railways. In brief, the plan is that three union representatives will join the Railway Executive Committee with powers equal to those of the general managers on this committee; a joint board is to be formed composed of five general managers and five representatives of the unions to deal with conditions of service; a committee of 12 is to be formed composed of four representatives from the unions, four from the railway companies and four from the public with an independent chairman, which will consider questions on which the joint board fails to agree, and, further, local committees will be formed made up of an equal number of representatives from the management and the men to deal with local grievances.

Mr. Thomas made it clear that the negotiations relating to the participation in railway control were independent of the negotiations dealing with the standardization of wages. The latter is still being discussed. In the joint board three of the five union representatives will represent the National Union of Railwaymen and two the Associated Locomotive Engine Drivers and Firemen. This joint board will have pleniary powers, but only in the sense that the men's side will be subject to their executive committee.

In commenting on the committee of twelve, representing the railwaymen, the railway companies and the public, Mr. Thomas said in regard to the four members representing the public, one will be a trade unionist not connected with the railways and another will be a representative of the great cooperative movement. Furthermore, he said: "We want you, however, clearly to understand that while they will be in a position to give recommendations and to advise and suggest, neither body will have the power to take away the right to strike so far as the men are concerned, but obviously we would not strike while a matter was being considered. That, in my judgment, is the first step towards some real machinery for dealing with working conditions."

In speaking of the three union representatives on the Railway Executive Committee, Mr. Thomas said, "I deny the possession of a monopoly of brains by the employing classes, whoever they are, and I have never hesitated to affirm that to general management the workers could contribute much." Two of the three labor members to join the Railway Executive Committee will come from the National Union of Railwaymen and the third from the Associated Locomotive Engine Drivers and Firemen.

In recommending the acceptance by the unions of the government's offer of share in control, Mr. Thomas said, that while this scheme will not render strikes impossible, it will, if properly worked in a fair and genuine spirit on both sides, do much to make trade unionism not only a means of improving men's condition, but also to smooth working on the railways of the country.

Equipment and Supplies

Cars Constructed in Railroad Shops in September

New cars were constructed in railroad shops during the month ended September 30 as follows:

Class of cars	Steel	Steel under-frame	Steel center sills	Wood	Total
Passenger—

Freight Cars

THE CHESAPEAKE & OHIO is in the market for 1,000 hopper car bodies.

THE INTERSTATE RAILROAD has ordered 510 55-ton hopper cars from the Pressed Steel Car Company.

THE NEW YORK CENTRAL is inquiring for 1,000 hopper car bodies for the Pittsburgh & Lake Erie.

THE U. S. STORES COMPANY, Salt Lake City, Utah, has ordered 11 box cars from the Mt. Vernon Car & Manufacturing Company, Mt. Vernon, Ill.

THE BRIAR HILL STEEL COMPANY, Youngstown, Ohio, has ordered 50 mine cars from the American Car & Foundry Company.

Passenger Cars

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, Pa., is in the market for six passenger coaches.

THE ST. LOUIS, BROWNVILLE & MEXICO has ordered 10 70-ft. coaches and 6 70-ft. baggage cars from the American Car & Foundry Companu.

Signaling

THE CANADIAN NATIONAL RAILWAYS have awarded contracts to the Union Switch & Signal Company, Swissvale, Pa., for two half-interlocking plants at Fort William, Ont.

THE NEW YORK CENTRAL has ordered from the Federal Signal Company, Albany, N. Y., a 64-lever, style "A," mechanical interlocking machine to be installed at Warners, N. Y.

THE LEHIGH VALLEY has awarded a contract to the Federal Signal Company, Albany, N. Y., for an electric interlocking at Newark, N. J. The machine will be a 32-lever, Federal type 4, direct current.

Railway Financial News

Boston & Maine.—See editorial elsewhere in this issue.

Canadian Pacific.—Sir John Eaton, of Toronto, has been elected a director to succeed Wilmot D. Matthews, deceased.

Chicago, Peoria & St. Louis.—The committee representing the the general and refunding mortgage bondholders has adopted a resolution declaring that "unless Congressional enactments and other subsequent developments" should make the company's prospects more promising than they now appear, the bondholders should no longer subject themselves to the loss and risk of loss involved in continuing the operation of the road. The committee calls upon the Bankers Trust Company, trustee under the mortgage, to take immediate steps to foreclose the mortgage, with the object of reducing the property under the mortgage to cash, by sale, or scrapping, or otherwise. The resolutions declare further that, pending foreclosure, the receivers should not risk further losses by operating the poperty.

The Chicago, Peoria & St. Louis owns 234 miles of line in Illinois and operates a total of 255 miles, the main line extending from Pekin to Peoria. Interest on the $2,850,000 general and refunding mortgage bonds has been in default about two years. It has $2,000,000 other bonds and $4,000,000 stock, or a total capitalization of about $38,000 per mile of line owned. Receivers were appointed in July, 1914.

Of a small issue of equipment notes, the principal and interest due November 1, 1918, were paid by the Railroad Administration, which refused to provide the funds for the notes due November 1 last.

Pere Marquette.—This company has filed a petition with the Public Utilities Commission of Illinois for an order authorizing the issue of $1,568,000 additional 5 per cent gold bonds of Series "A."

Pittsburgh, Ft. Wayne & Chicago.—This company has declared an extra dividend of $5.75 a share, addition to the regular quarterly dividends, on the common and preferred stocks.

Texas & Pacific.—J. L. Lancaster and Charles L. Wallace have been appointed receivers, succeeding Pearl Wight, former sole receiver, who has resigned.

The Long Island Railroad reports that in the month of September 95.5 per cent of its passenger trains reached destination on time. The number of trains reported was 1,986 and the number on time was 1,897.

Railway Officers

Railroad Administration

Operating

J. A. Mercer has been appointed acting trainmaster of the Montana division of the Northern Pacific, relieving D. A. MacMillan, granted leave of absence, due to illness.

W. J. Jenkins, conductor of the Denver & Rio Grande, has been appointed trainmaster of the Salt Lake division at Soldier Summit, succeeding **M. J. Ruland,** who has been transferred to the Green River division with the same headquarters.

G. M. Lillis, locomotive engineer of the Denver & Rio Grande, has been appointed traveling engineer and train master of the Salt Lake division, at Soldier Summit, Utah, succeeding **G. T. Bourne,** who has been transferred to the Green River division, with the same headquarters.

L. B. Allen, assistant general manager on the Chicago, Burlington & Quincy, with office at Chicago, has been promoted to general manager of the Lines East, with the same headquarters, succeeding **E. P. Bracken,** whose appointment as federal manager was announced in the *Railway Age* of October 10 (page 763).

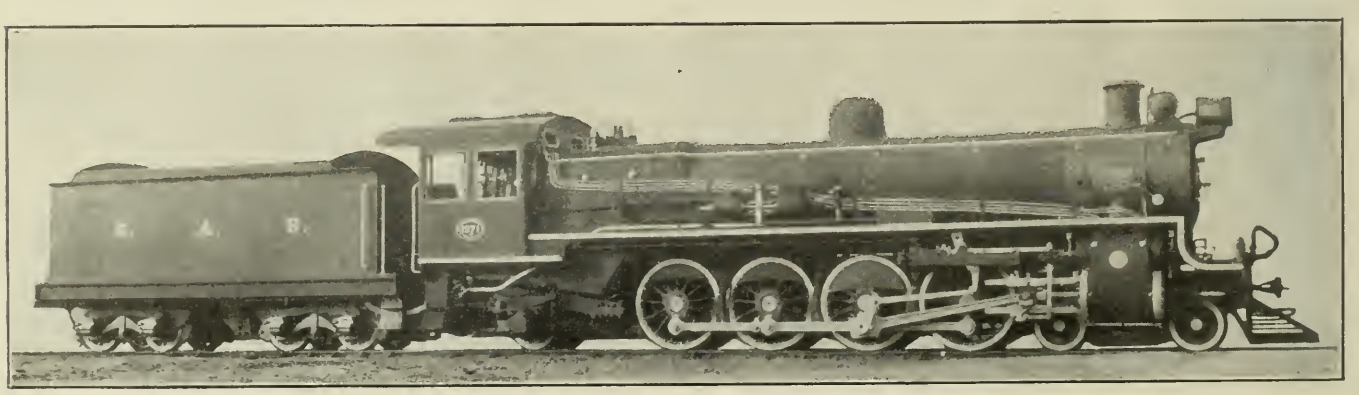
Corporate

Executive, Financial, Legal and Accounting

Pearl White, sole receiver of the Texas & Pacific, has resigned, and **J. L. Lancaster,** federal manager of that road, and **Charles L. Wallace,** assistant to the receiver, have been appointed co-receivers to succeed Mr. White. The appointment was made by the United States District Court for the Western District of Louisiana.

Special

Miss Daisy Oden, head of the information service in the general offices at Chicago of the Chicago, Burlington & Quincy, has been appointed supervisor for women service, with the same headquarters. Miss Oden will have charge of the welfare of all women in the employment of the road, looking after their comfort in the offices and other places in which they work. This is a new departure in railroad service, the outgrowth of the great increase in the number of women employed in all departments. Miss Oden was formerly passenger agent at Davenport, Rock Island and Moline for the Chicago, Burlington & Quincy.



Mountain Type Locomotive for the South African Railways

One of 20 recently ordered from the American Locomotive Company. The locomotive is superheated. It is of 3 ft. 6 in. gage; has 22 by 28 in. cylinders, 57 in. driving wheels; a total weight in working order of 194,000 lb.; a weight on drivers of 144,500 lb. and a tractive effort of 37,400. The American Locomotive Company is also building 20 other Mountain type locomotives for the South African Railways weighing 192,000 lb. with 22 by 26 in. cylinders and 48 in. driving wheels.

Labor a Commodity

Samuel Gompers in protesting before the Cummins Committee of the Senate against the strike clause of the Cummins bill, asserted many times that labor was not a commodity. In questioning Mr. Gompers, members of the committee not infrequently prefaced their remarks with a disclaimer of implying that labor was a commodity. The President in his recent message to Congress reiterated the statement that labor is not a commodity. Is not this a confusion of the words labor and laborer? Laborers are not a commodity, any more than capitalists or college professors or artists are commodities. On the other hand, what the capitalist possesses, capital; what the artist produces, pictures or statuary; what the professor writes, books or lectures, are commodities. Why then all this political horror of calling labor a commodity. The Century Dictionary defines the noun labor as "work done by human being or an animal; exertion of body or mind or both for the accomplishment of an end; effort made to attain useful results in distinction from exercise, for the sake of recreation or amusement." Labor in this sense would certainly seem to be a commodity. The importance in distinguishing between the laborer and that which he has to sell goes further, however, than a mere nice distinction between words. It has led to a confusion of thought about economic problems which is peculiarly insidious because of lending itself so easily to sentimentality. Trade unionism while taking as the slogan to use in its political discussions "labor is not a commodity," clearly distinguishes between the laborers and labor when it attempts to restrict the output of the individual laborer. Then labor becomes a commodity subject to the law of supply and demand, and the laborer who sells more labor than his most inefficient brother workmen, is regarded as cheapening the price of labor because he increases the supply of it. Every article used in commerce is composed of material and of labor. Why distinguish between the two component parts and call one a commodity but not the other? Labor is a commodity in the same sense that capital is a commodity.

A Mere Nothing to Show for It.

"To the creation of our railroads, the public has contributed about $700,000,000 of public moneys, and a land area about equal to that of Texas. . . . For this tremendous contribution of public property to railroads privately owned, the public now has nothing to show." The city of Chicago, of Cincinnati, of Denver, of Dallas, in fact every inland city in the United States, owes its existence as a great city to the privately owned railroads of this country. The $700,000,000 mentioned above is but a small part of the increase in land values in Texas alone, directly attributable to the railroads created by private capital. What would wheat be worth a bushel in the Dakotas if it had to be hauled to the Great Lakes by wagon, or even by motor truck. For that matter, what would coal in West Virginia and Kentucky be worth were it not that hundreds of millions of dollars of private capital has been invested in building so perfect a transportation machine that a ton of coal can be hauled 300 miles for about 90 cents. Every commodity in commerce, has as one of its attributes, place. The value that has been added by railroad transportation to commodities is incalculable. Copper in Arizona, pork in Indiana, cotton in Texas, coal in West Virginia, silver in Colorado, are all commodities, but the consumer must have these commodities at the point of consumption. The value which is added by transportation is at least as great as the value of the article itself. Transportation to the point of consumption is as necessary to create value as is the existence of the article to be consumed. The Virginian Railway was recently enough built so that the event of its opening is still fairly fresh in the memory of the citizens of Norfolk. Let any one ask them whether new values were created for the public by the building of the Virginian. There are people still alive who can remember the first railroad built into Denver, Colorado. It is safe to say that these people would testify to the fact that the railroads have added value to Colorado. For this contribution of $700,000,000, about a tenth of one of the Liberty Loans—the public has to show the development of this United States as it is, a development inconceivable without the railroads. The statement quoted at the beginning of this paragraph was made by G. W. Anderson, for about a year a member of the Interstate Commerce Commission.

Of Negative and Destructive Character

It is significant that the Public Ownership League recently met in Chicago and endorsed the Plumb plan with minor reservations. The incident is significant because it shows the ignorance and want of rational principle on which most of the agitation for government ownership has been and is based. Until the Plumb plan was put forward the advocates of government ownership also favored government management, and their arguments were roughly divisible into two classes. The first class of arguments consisted of attacks upon private management as being dishonest, selfish, inefficient and so on. The second class of arguments were directed to showing that government management would be greatly superior to private management because the managers would represent and be responsible to the public and would therefore strive to give it good service at low cost, rather than merely to make profits.

Under the Plumb plan the government would own the railroads, but it would not manage them. They would be managed by a board of directors, one-third of whose members would be appointed by the President of the United States and two-thirds by the official employees and the classified employees. All salaries and wages would be fixed by a board consisting exclusively of official employees and classified employees. In other words, the management would be one of the employees, by the employees and for the employees. There is not a single argument that has been used in favor of government management of railroads which can rationally be advanced in favor of the kind of management proposed in the Plumb plan, because the two kinds of management would be as different from each other as private management would be from either of them.

Why, then, have those who composed the Public Owner-

ship League suddenly decided to abandon the advocacy of government management and take up the advocacy of Plumb plan management? There is only one possible answer, and that is that they have never been so much in favor of *government* management as they have been opposed to *private* management and that they are willing to take any scheme which seems to stand any chance of supplanting private management. In other words, their attitude and agitation have been much more negative than positive; they have been bent rather on destroying something they have not liked than on establishing in place of it something which knowledge and experience, and reasoning based on knowledge and experience, have led them to believe would work better than the thing they have been trying to destroy. They were bent on destroying private management; and they advocated government management only because they had to advocate something; and that, on a superficial view, it seemed the most available substitute for private management. They took up the Plumb plan because it seemed to have a chance of winning more supporters than government management.

This incident is an illustration of the most important characteristic of the modern radical movement—a characteristic which expresses the very essence of the movement. It is a movement, not so much to create new institutions, industrial or political, as to tear down existing ones; a movement not so much to enrich the poor as to impoverish the rich; a movement based not so much on solicitude for the masses as on envy of the classes; a movement not so much to "socialize" property as to destroy the private ownership of it, even though incidentally the property itself be destroyed. The only country in which the movement has been entirely triumphant is Russia, and there the destruction not only of the private ownership of property but of property itself has been so great that while the rich have been made poor the poor have been largely frozen and starved to death. The American people cannot too early become fully alive to the purely negative and destructive character of the radical movement. The prosperity and progress of the human race have been promoted, not by those who have been dominated by the instinct of destruction, but by those whose instincts have been chiefly or wholly constructive.

The Virginian's Train Rules

THE VIRGINIAN RAILWAY adopted a few months ago, a new book of rules for the operating department, which deserves mention for the numerous examples of felicitous language with which its pages are sprinkled. The officers of the road, no doubt, will look with amusement, if not with mild contempt, on the critic who gives attention first to language instead of to practice; to form instead of substance; but "there is a reason." Rule-book makers have to expend most of their energies on the form of the words. That is the element in which they can do good work and make real improvement, and improvements in language constitute the feature for which they deserve credit. Changes in the substance of the rule, on the other hand, are subject to varied dangers comparable to lightning, earthquake and other cataclysmic disturbances. For example, Rule 93, in this book, requires *all* trains to run under control within yard limits, a simplification of practice in the interest of safety which would seem at least to deserve a thorough trial; but the new rule had hardly got started before it was knocked off its pedestal; it was modified, as regards passenger trains, within a few weeks after the new code went into effect.

Rule 4 (for changing time tables) is another in which practice and language do not "function" together with any success. Innumerable conferences have used up reams of paper in rewriting this rule, and one man has written a book about it; but differences concerning its language do not seem likely to be settled in the present age. This is one of the points where all the code makers combined have failed to achieve a success. The Virginian's book settles the question in the only way that is both simple and practicable; it says that when a time-table expires all trains lose all rights. To the old-school despatcher it seems, no doubt, like sacrilege thus to cast aside the work of scores of minds through scores of years; but there is no real cause for their surprise; the simplified rule, after all, is no more radical a simplification than is the block system; and the block system is now familiar to everybody.

To make an adequate review of this book would extend far beyond the scope and limits of an editorial article. There would be many things to praise and many to criticize. Much of the clumsy and stilted language of the standard code is retained in this one, and not all of the additions which have been made can be called improvements. But we must at least take the space to give our reason for favoring the Virginian's version of Rules 93 and 4. The rule to require all trains to run under control within yard limits is really an essential element in the management of the block system on those roads which have only one signal at each station. The Virginian, on the greater part of its line, has not as yet adopted the block system; but it belongs to that class of roads which usually defer indefinitely the introduction of automatic signals and therefore affords a good example of a line where the use of the manual system is "indicated." The manual system, as it is operated on thousands of miles of single-track American lines which have nothing more than a train-order signal at most of the stations, is an example of straddling which is anything but satisfactory. It is a combination of space-interval protection and time-table protection which every operating officer ought to be glad to get rid of; and the adoption of Virginian Rule 93 would make the abolition of the patch-work practicable. It is true that such a change would purchase safety at the expense of speed; but safety always costs something.

The simplification of Rule 4, as exemplified in this book, is also desirable and commendable for the same general reason. The abolition of the complicated form of the rule helps the despatchers to recognize more fully in practice the block system principle of always giving trains absolute right to definite points. We have heard of cases where conductors and enginemen actually have lain off, when a new time table went into effect, because of their dread of problems which they would encounter in the transition from the old table to the new one, under the longer form of Rule 4.

The extensive substitution of Form 19 for Form 31 in train despatching is authorized by this book. This saves valuable time for freight trains, and is a change which is gratifying; while the retention of green signals, on the front of engines (inconsistent with green for proceed in Rule 10) produces the contrary impression; Rule 525 embodies a commendable innovation; while the mixing of instructions for officers with those for laborers (in the non-standard part of the book) is objectionable; but as has been said, the substance of the book is too large a subject for discussion in this place and must be dropped; our appeal to the reader is to examine the wording of the rules.

Some examples of the language are copied in the margin. Take, for example, Rules 526 and 529; or 538. We do not set up these examples as models of perfect English; a full discussion by railroad and linguistic experts would improve them; but they are worthy of notice as a marked improvement over ordinary railroad English. Evidently the editor of the book, in this part of his work, had full freedom to fit the words exactly to the thought which it was desired to express, a process which, in a good deal of railroad "literature" falls far short of success. "Incongruity" may be a big word for some brakemen, and nearly all brakemen may need advice

as to just what the superintendent is calling for when he tells them to "observe the conduct" of passengers; but there is much valuable suggestion in the variety of expression here presented. And if there are numerous new words in this book which need to be defined, the author will still be in good company; the same need will be found in rules of the best roads.*

As was intimated at the outset, the language of trainmen's rules everywhere is susceptible of decided improvement, and the wideawake operating officer will, of course, embrace every opportunity, such as the appearance of a new book, to re-examine the good and bad features of his own rules. The American Railway Association when, years ago, it laid on the table (or, rather, consigned to the garret) the excellent matter presented by its committee as an enlargement of the standard code, deferred a useful and needed improvement. The fact that these rules have lain buried in the dust for 20 years does not alter their value. Good rules do not insure good practice; neither is uniformity in language a satisfactory substitute for precision and clarity. The present argument is not intended to encourage the superintendent who depends on a book to enforce obedience, nor to support any Congressional bill to establish a uniform code throughout the United States; but the duty of greatly improving our rule books is exceedingly plain to every one who examines the subject with discrimination and care.

Continue Fuel Conservation Measures

THE WORK of the Fuel Conservation Section of the United States Railroad Administration may soon be brought to an end by the return of the railroads to private operation, and a brief survey of the results which have been accomplished is not out of place in relation to the future of the fuel conservation movement on the railroads.

At the beginning of its organization the Railroad Administration was confronted with a serious fuel problem. The production of coal had been greatly reduced by the extraordinarily severe winter of 1917 and 1918, and the demand for coal in 1918 gave promise of materially exceeding the supply. Aside from the necessity for conserving the available supply of fuel, the efforts at increased production had led to a heavy increase in the amount of non-combustible material in the coal, which also needed attention if the railways were effectively to meet the transportation demands of the country. The latter problem was the first to be taken up by the Fuel Conservation Section following its official birth on May 1, 1918. This part of its work was conducted largely through the fuel inspectors of the various railroads and in co-operation with the Fuel Administration.

In its efforts toward the reduction of coal consumption the Fuel Conservation Section has acted largely as a clearing house of proved practices and a source of inspiration to those needing it. As well established as the fuel department had become on some railroads during the decade prior to government control, there were a large number of roads on which no special attention had been given to the fuel problem. Many of these roads have been induced to establish strong organizations for the supervision of the distribution and consumption of the road's fuel supplies and on other roads, although distinct fuel organizations have not been established, more adequate supervision of locomotive operation has been provided, making it possible to give more attention to fuel matters. To the credit of the Fuel Conservation Section it must be said that in all its work no serious antagonism has been aroused, while a vast amount of whole-hearted co-operation has been inspired even where managements were loath to go as far as the importance of the problem of fuel conservation justifies.

The concrete result of this work is reflected in the figures of locomotive performance for the first nine months of 1919 which, making due allowance for differences in traffic handled, show a saving of 8.4 per cent in freight service and 8.3 per cent in passenger service, when compared with the same period of the previous year. For both classes of service this is a saving of $32,051,312 over the same period of the preceeding year. That this cannot be attributed entirely to the extraordinary conditions existing during the early months of 1918, is evident from the fact that for the three months of July, August and September of 1919, a saving of 5.3 per cent in freight service and 3.7 per cent in passenger service are shown as compared with the same period of 1918, making a total saving for both classes of service of $4,238,021.

It is highly desirable that such results be continued. During the year 1917 alone the average value per net ton of bituminous coal at the mine increased 94 per cent in the United States, while fuel for locomotive use alone increased from 10.3 per cent of all operating expenses in 1916 to 13.9 per cent in 1917, or from $984 to $1,697 per mile of line, and these figures do not take into account the further increase in the price of coal which has taken place since the removal of the price control exercised by the Fuel Administration during 1917-18.

It will probably not be practicable to maintain a permanent central organization or national supervision of fuel conservation after the roads return to private operation. With the economic soundness of such a course so well demonstrated, however, there is no reason why fuel supervision should not be established under strong staff control on every railroad of importance in the country and the departments already established be effectively maintained.

Coal is a bulky commodity which does not lend itself to the same care in handling as is readily exercised with most of the other materials used by the railroads. The quantity in which it is used and the ease with which it may be wasted without detection demands a degree of supervision to insure that it is not wasted in the several hands through which it must pass from the mine to the firebox, which need be given to no other material. With these facts and the results obtained during the war in mind, the magnitude of the coal bill is ample warrant for the expectation of a large return for the comparatively small cost of maintaining an effective organization for conserving the fuel supply.

*EXTRACTS FROM VIRGINIAN RAILWAY RULE BOOK.

525. . . . The proper place for flagman of a passenger train making an unusual stop in yard limits or remaining to exceed three minutes at a regular stop within yard limits is at rear of train, on ground, with flagging equipment ready to act in any emergency.

526. No passenger trainman should report for duty unless neat in appearance, uniform clean and neatly pressed, clean shaven, clean linen, and shoes polished. There should be no incongruity in dress and no unnecessary adornment.

527. Brakemen should station themselves at the point at which passengers will board or leave the train, to render any assistance that may be required. In no case must they lounge or stroll about the platform or cling to the handrailing of the cars for support, but maintain an erect attitude, alert and watchful. It is bad taste for a man in uniform to thrust his hands into his pockets, keeping them there.

528. After leaving stations, they should notice whether or not persons are hanging to sides of cars unable to enter on account of closed vestibules, and if so, go immediately to their assistance.

529. Under no circumstances should passenger trainmen engage in unnecessary conversation with each other or with passengers, at stations, or on trains. To do so will sooner or later result in their overlooking some important duty. Necessary conversations of a business character should be conducted in a dignified and respectful manner, with never-failing courtesy.

530. Passenger trainmen are required to exert themselves constantly to see after the comfort of passengers. However, care should be taken not to render themselves objectionable to particularly sensitive people.

534. Passenger trainmen should refrain from reading on duty or congregating in the same car. They should pass through the cars frequently, looking after the wants of passengers and observe their conduct, seeing that none are engaged in anything that might be offensive to others or violation of rules.

538. The announcing of stations must be done in a CLEAR and DISTINCT tone of voice and not less than twice in each coach, and in such a manner as that each person in the car can hear the name of the station, except such as may be deaf, who are entitled to special attention. This announcement should be made with closed doors approaching the station and at such a time as that the roar of the train or the whistle of the engine will not prevent the announcement being disinctly heard. Brakemen should, as far as practicable, learn the destination of passengers and assist the conductor in preventing their being carried by their destinations.

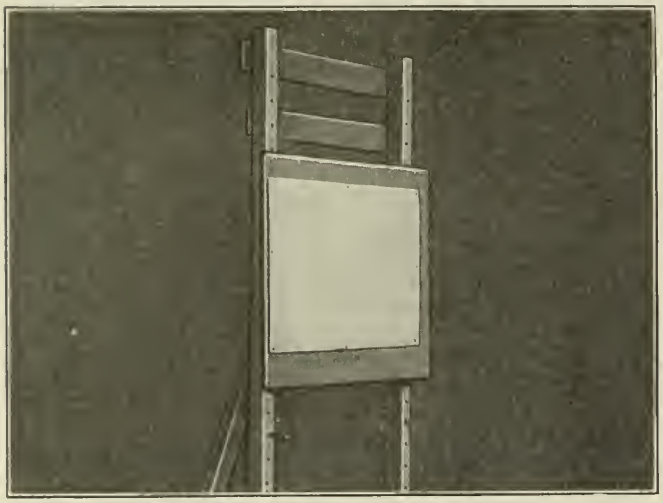
Deflections of Staybolts in Locomotive Boilers

Relative Action of Rigid and Flexible Staybolts and the Sheets of Locomotive Fireboxes

By George L. Fowler

For many years the breakage of staybolts in locomotive boilers has been a source of danger and this danger was emphasized very soon after the locomotive took its rapid leap ahead in size when it was found that it was no longer necessary to limit firebox dimensions to the space available between the driving axles and the frames.

The increase in the length of fireboxes caused a corresponding increase in staybolt breakages. It was assumed that this breakage was caused by the bending of the staybolts due to a variation in the expansion of the two sheets which they connected, by which they were strained beyond their elastic



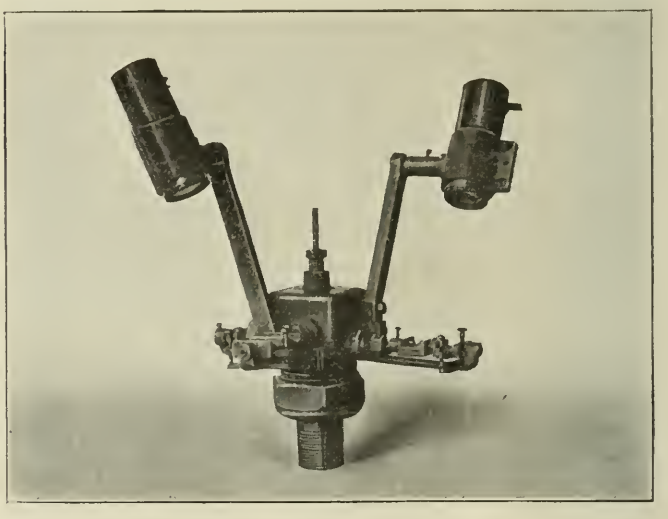
Screen for Recording the Movement of the Beams of Light Reflected by the Mirrors

limits, thus producing a progressive fracture. It was also assumed when the boiler was working under normal conditions that staybolts were straight in their normal position and were subjected only to that stress which would be imposed upon them by the steam pressure acting upon the plates. It was further assumed that the deflection of the bolts occurred during the process of raising steam, and that, because the breakage occurred at the ends of the firebox, there was a neutral vertical zone at the longitudinal center of the firebox along which there was no staybolt deflection. But, while assumptions and theories were as plentiful as autumn leaves, there was no data on the subject and no one knew. The most that had been done, in the way of investigation, was to determine that, under certain conditions, there was an upward and downward movement of the crown-sheet and the tubes.

The object of the investigation described in this article was to determine, by actual measurement, the amount of relative movement between the inner and outer sheets of a locomotive firebox and also when that motion occurred as well as its general character. There was no precedent upon which to proceed nor any thing more than the vaguest of guesses as to the amount of motion to be looked for—except that probably it would be very slight.

The apparatus used was of a very simple character and involved only one moving part. Its work consisted of resolving the motion of the inner sheet relatively to the outer one, into its vertical and horizontal components and projecting them on a screen. These were afterwards recombined to plot this relative movement in the form of a diagram. The mechanism of the apparatus consisted of two small metallic mirrors that were first adjusted to a perfect parallel. A beam of light from a narrow slit was reflected back to a screen. One mirror was fastened rigidly to the outer sheet and traveled with it and remained parallel to it at all times. The main body of the apparatus including all lenses and adjustments was also attached to this same sheet. The second mirror was suspended on the main body of the apparatus but was so connected to the inner sheet that, if any motion took place between the two sheets, the mirror would be rotated. This would cause a separation of the two beams of light on the screen and the amount of separation was a measure of the relative movement of the sheets. The calculation of the motion was simply dependent upon the distance at which the screen was set from the mirrors.

The first setting was such that separation of 1/16 in. indicated a relative movement of 1/20,000 in. between the two plates. This was found to give finer measurements than were needed and the whole of the work, hereinafter detailed, was done with the screen so set that each 1/16 in. separation



The Original Apparatus

of the beams of light indicated a relative movement of 1/6400 in. between the plates.

The first boilers subjected to investigation were of the radial stayed type as illustrated in the accompanying engravings. There were two of them that were identical in construction except that one was fitted with a complete installation of the ordinary rigid staybolts and the other with a complete installation of the Tate flexible staybolts.

The firebox dimensions were:

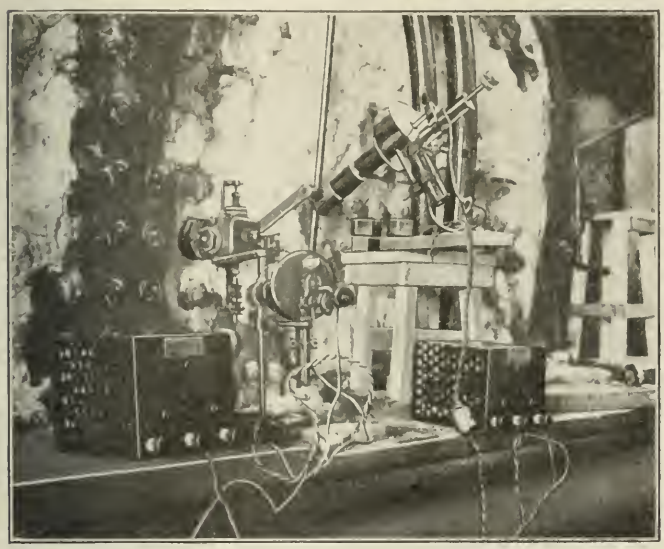
Length at bottom	8 ft. 3 in.
Length at top	8 ft. 8½ in.
Width at bottom	5 ft. 2 in.
Width at top	4 ft. 8 in.

The general arrangement of the apparatus is shown in the illustrations. Each firebox was fitted with four water tubes for carrying a brick arch which was located as shown.

New fireboxes had been placed in each of the boilers immediately prior to the tests so that all of the sheets affected were fresh and clean.

Scope of Investigation

The scope of the investigation was as follows: Determination of the difference in the movement of the inner and outer side sheets of the firebox at eight points; the difference in movement of the crownsheet relatively to the roofsheet; of the back firebox sheet relatively to the back head; of the throat sheet relatively to the front tubesheet and of the front tubesheet relatively to the shell. Determination of the temperature of the fire and water sides of the inner firebox sheet at the side at five points; the water temperatures in the



The Original Apparatus Applied to a Radially Stayed Boiler

throat at the foundation ring and in front of the arch tube openings, while steam was being raised in the boiler and while it was at work.

Two methods of conducting the tests were employed. In one the fire was kindled and the fireman instructed to raise steam in the manner usual in regular roundhouse work. When the safety valve opened, the fire was maintained so as to keep the valve blowing for from 10 to 20 minutes, when the fire was dumped and the boiler allowed to cool. The time required to raise the steam pressure to the blowing off point varied from 50 to 90 minutes.

The second method was the same as the first insofar as the raising of steam pressure is concerned; but, when this was done, the distribution valves having been removed from the locomotive, the throttle was opened and, with the injector running to capacity, the fire was maintained so as to hold the steam pressure at the blowing-off point—195 lb.—for about 30 minutes and then the fire was dumped and the boiler cooled.

In raising steam the shop blower, carrying a pressure of about 60 lb. per sq. in., was attached to the locomotive and used until the boiler pressure reached that amount, after which the regular locomotive blowers were used.

In cooling the boiler steam was blown out so as to cause a fall of pressure of about 1 lb. per min., taking about three hours to reduce the pressure to zero.

In making the tests the apparatus was successively located at the staybolts marked 1, 2, 3, 4, 5, 6, 7 and 8.

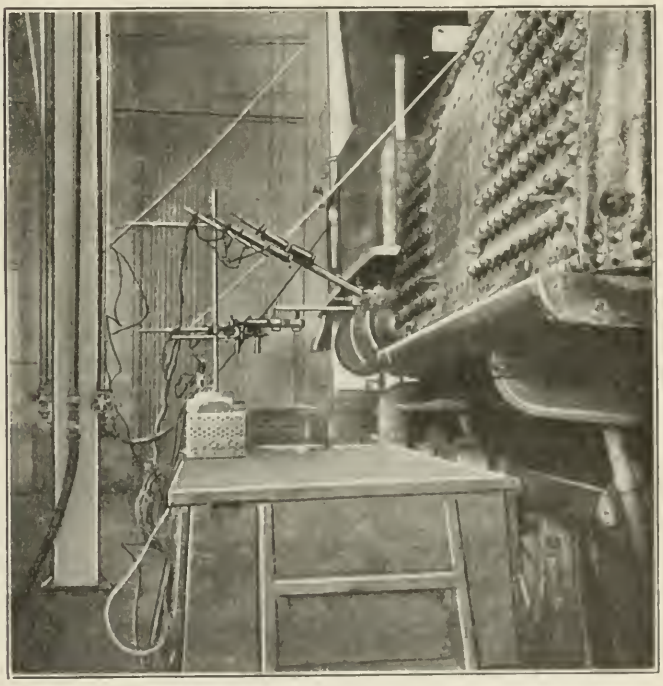
Lack of space will make it impossible to enter into the details of all of the work done, and only enough of it will be described to give an idea of what was learned and the basis for the tentative conclusions that have been reached. I say "tentative" because the investigation has not yet been completed and full information is not available as to how all kinds of fireboxes act in service. The reasons for this will appear as the description proceeds.

In the tests at staybolt No. 1, which was at the front upper corner of the firebox, the first method of testing was used, and the results obtained are shown in the diagram. In this, as in all diagrams to follow, the scale of movement is in thousandths of an inch, on either side, vertically or horizontally, of the starting point at O which denotes the normal position of the two sheets when the boiler was cold at the commencement of the test.

In the first test at staybolt No. 1, it will be noticed that the initial movement of the inner sheet relatively to the outer one was downward and to the rear, and it will be seen later that this initial downward movement was characteristic of nearly all of the tests. Both the downward and rearward movements were, however, quickly reversed and the inner sheet moved up and to the front.

There are features brought out in this diagram that are characteristic of all of the others and to which attention may be called here. One is that the sheets do not expand and return to their normal position when a steam pressure is raised; a second that the sheets are in constant motion relatively to each other at all times, and that the relative motion is much greater with a boiler fitted with flexible stays than it is with one having rigid stays.

In the case of staybolt No. 1, this difference in movement



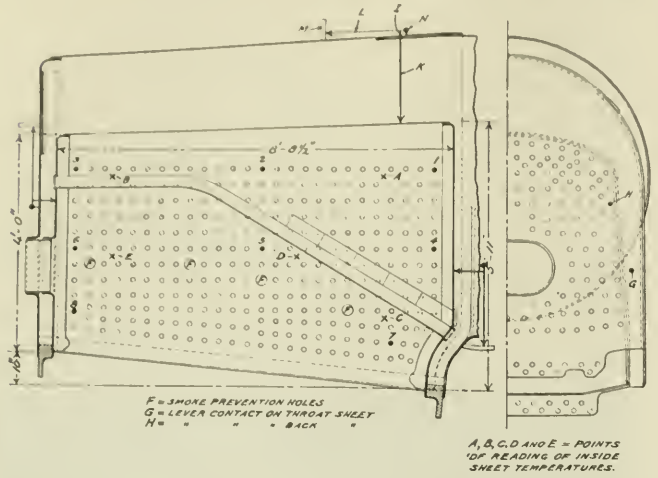
The Redesigned Apparatus Applied to a Boiler Having a Wootten Firebox

is very marked and the total maximum deflection of the flexibly stayed boiler is more than twice that of the rigidly stayed. If the variation of vertical movement alone is taken into consideration, that of the flexibly stayed boiler is more than five times as great as that of the rigidly stayed. It will be seen, too, that there is a general progressive movement until the blowing-off pressure is reached, then, while that is being maintained, there was a movement of the sheets to and fro, with a general return movement towards the original normal position after the fire was dumped and until the boiler had been cooled to the disappearance of all pressure.

In this first diagram, the rigidly stayed sheet returned to within about .001 in. of its original position, while the

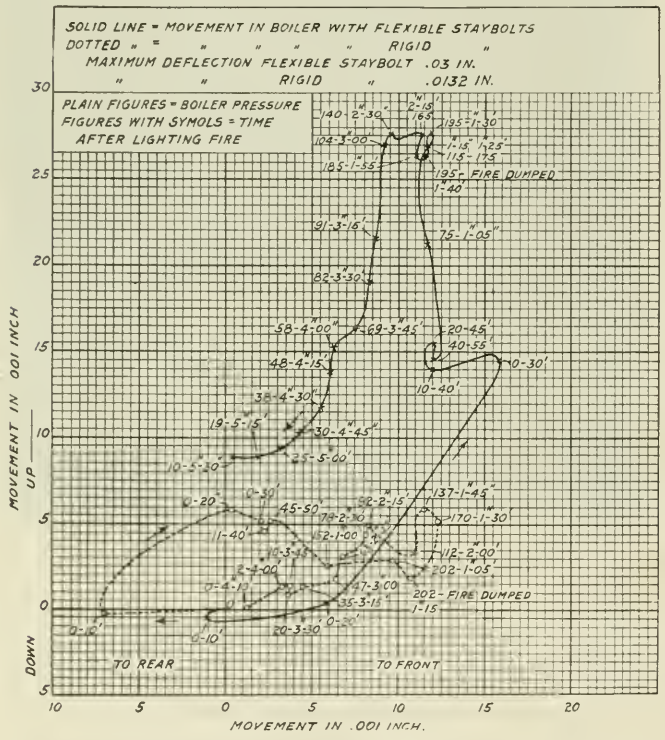
flexibly stayed sheet was out about .009 in. at the conclusion of the test.

Owing to the fact that, in rigidly stayed boilers, the breakage at the upper front and back corners of the side sheet was much greater than it was midway between the two, it has been assumed that there was a neutral point on this midway



Arrangement of Firebox in Lake Shore Michigan Southern Locomotive for Temperature and Expansion Tests

line, on which the staybolt deflection was little or nothing. That this surmise was approximately correct is shown by the diagram of the tests made at staybolt No. 2 which was at the center of the upper row. Here, in both the flexibly and rigidly stayed boiler, we find that the horizontal motion was



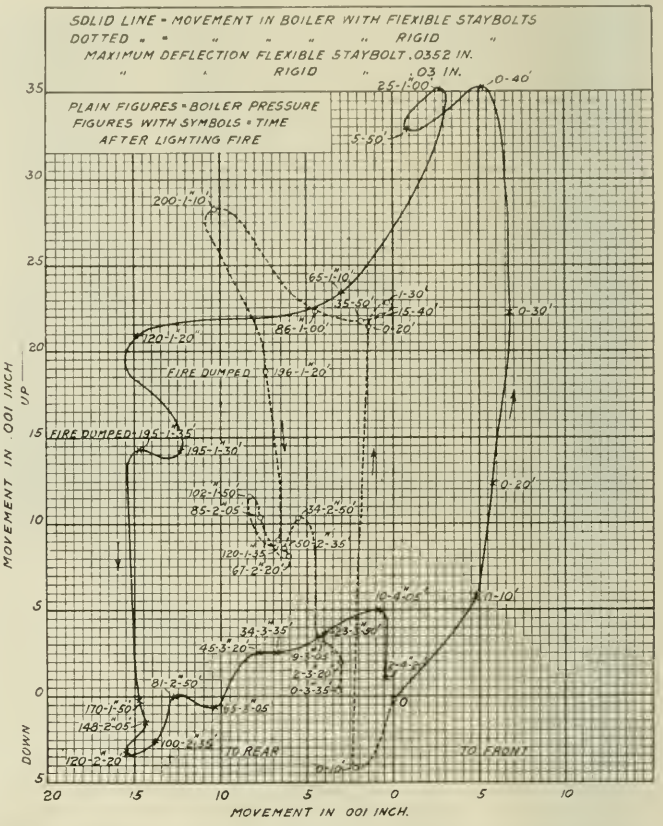
Staybolt No. 1 Top Row Front—Lake Shore & Michigan Southern Locomotive

much less than the vertical, indicating an approach to a neutral zone, but, as at staybolt No. 1, we find the horizontal movement of the sheet to be something more than twice as much on the flexible as on the rigidly stayed boiler.

It is impossible to state positively that there is no neutral line with the rigid boiler, but the statement can be made regarding the flexibly stayed boiler. Of course, if the front end of the inner sheet goes to the front and the back end to the rear there is, possibly, an instantaneous neutral line, but it must be in constant motion and, therefore, does not fulfil the preconceived ideas as to the neutral line.

From a study of the curves of movement of the staybolts examined on the rigidly stayed boiler, the evidence is that the same holds true for that boiler, namely, that the point of no movement—that is, where the two sheets occupy their original or normal positions—is in constant motion. This means that all staybolts are being constantly bent back and forth, which is corroborated by the determination of sheet temperatures which formed a part of this investigation.

In the case of staybolt No. 3, which was at the back end



Staybolt No. 2 Top Row Center—Lake Shore & Michigan Southern

of the top row and close to the back head, there was a sudden and rapid movement of the inner sheet to the rear on both rigidly and flexibly stayed boilers, and the maximum of the horizontal movement was reached in a very short time after the kindling of the fire; the rigidly stayed boiler reaching it in 10 and the flexibly stayed in 20 minutes.

Without going into details of the other tests, it may be stated that while the amount of movement varied, the character of the motion did not vary essentially and the same relationship between the rigidly and the flexibly stayed boilers was maintained.

When tests were made at the next to the bottom row of staybolts, however, a matter developed that proved to be of very great importance. Attention has already been called to the fact that in the test at staybolt No. 1, the first apparent motion of the sheet was downward, but as this only amounted to .00075 in. it was regarded as a negligible quantity. At the bolt below it, (No. 4,) there was a drop of .00225 in. which was still not enough to excite suspicion, but at No. 7 this drop increased to .009 in., apparently indicating a downward movement of the inner sheet at a point

only a few inches above where it was riveted to the mud ring. Evidently this is an impossibility, and the only explanation to be made was that the sheet had buckled and, by throwing the apparatus out of line, caused it to indicate a downward movement.

These first tests therefore must be regarded as showing but two things: the constant movement of the staybolts while in service and the relative movement of the sheets of a rigidly and flexibly stayed boiler.

With no precedent to serve as guide, the apparatus had been designed on the assumption that the two sheets would remain parallel to each other at all times. When this evident buckling was discovered the apparatus was redesigned so as to indicate not only the movement of the sheets but any buckling that might take place.

This redesigned apparatus was used on some boilers having a Wootten firebox with general dimensions as follows:

Length	10 ft.	1	in.
Width at foundation ring	8 ft.	11¾	in.
Height at front	5 ft.	8	in.
Height at back	5 ft.	1½	in.
Depth of combustion chamber		5¼	in.
Number of 2 in. tubes		411	
Length of tubes	14 ft.	6	in.
Inside diameter of shell (front)	6 ft.	1	in.
Height of roof over crown (front)	1 ft.	6¾	in.
Height of roof over crown (rear)	1 ft.	9½	in.

There were three rows of expansion stays at the front to hold the crown sheet and eight on each side of the center line as shown in the drawing. The staybolts were spaced on four in. centers and the rigid bolts were ⅞ in. in diameter.

The two boilers were not as distinctly flexibly and rigidly stayed as were those used in the first tests. The boiler which has been designated as the rigidly stayed had a number of Tate flexible staybolts as indicated in the drawing. In the throat sheet all of the bolts in the seven upper rows and all of the bolts in the outer row, were flexible. In the side sheets there were 15 Tate flexible bolts in the front row, and 12 other scattering Tate bolts that had been put in for repairs, in the locations shown in the drawing.

The other boiler, which is designated as the flexibly stayed boiler, had a complete installation of flexible bolts in the throat sheet, with the exception of 20 bolts near the foundation ring that were rigid as shown in the drawing. Of a total of 510 staybolts in the side sheet, 248 were flexible bolts. These were located in equal numbers and with the same arrangement at the front and back end of the firebox. There were six in the top horizontal row next to the crown sheet, with a gradual increase from the top to the bottom as shown in the drawing and the photograph. This left a wide section of firebox at the center that was stayed by rigid bolts and which, evidently, exerted an important influence on the results as will be pointed out later.

The staybolts at which these tests were made were located at the numbered points 1 to 9 on the two drawings, and the tests were made as before, by raising steam, holding the throttle open for 30 minutes and then blowing down at the rate of 1 lb. per min., readings of the sheet movements having been made during the whole period at 10-minute intervals.

Whether it is because the apparatus used on the radially stayed boilers only indicated the apparent motion of the sheets while that used on the Wootten boilers indicated the actual movement, that the diagrams of these movements are much more complicated for the latter boilers cannot be stated positively. That the buckling that evidently did occur in the sheet of the radially stayed boilers had its effect on the actual movement of the sheets is a reasonable supposition, but certainly there is a great difference in the character of the two.

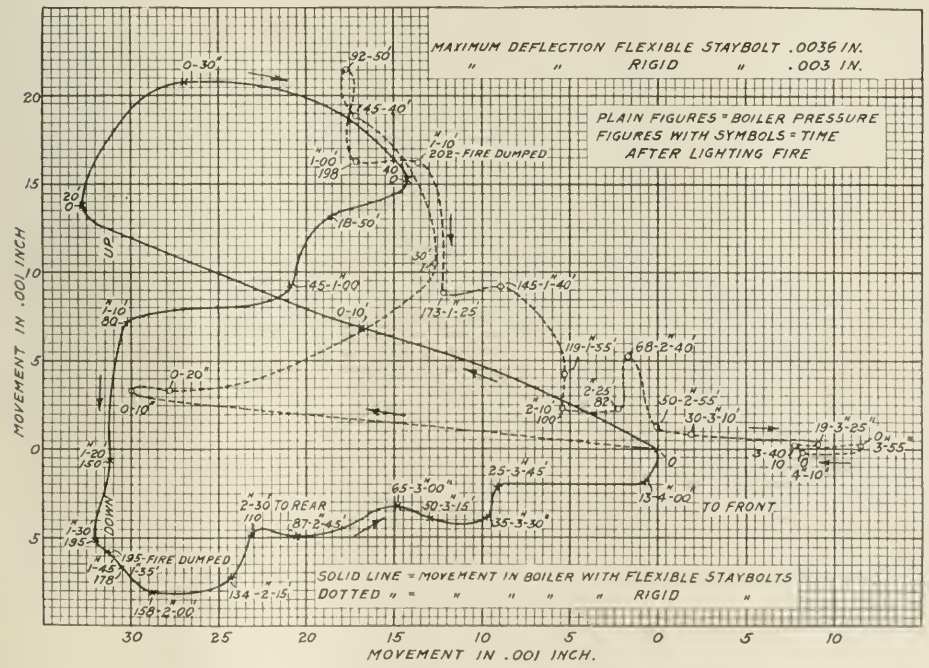
Comparison of Two Types of Boilers

Let us compare those for staybolts No. 1, in the two types of boilers: In the radial stayed boilers there is a steady even motion of the sheet with little or no doubling back and looping over itself. There was a constant movement, but it was, in the main, a progressive movement ending with an apparent deflection of about .008 in. from the starting point of the flexibly stayed boiler.

The rigidly stayed boiler was a little more complicated in its motion, but still not at all confusing, and ended with a deflection of a little more than .001 in. from the starting point.

The diagram for the corresponding staybolt of the Wootten boiler is a mass of knots and loops and back doubling. This is especially true of the period prior to the development of the first steam pressure. This appeared at the point marked O-2H-10′ in the diagram when steam began escaping from the whistle valve. Then there was a rapid upward movement for 20 minutes until a pressure of 75 lb. was reached followed by an equally rapid forward and downward movement during a quick building up of the pressure to 200 lb. Then came a quick recovery horizontally during the period that the throttle was open with only a very slight change in vertical position between the beginning and the end.

This movement is easily explicable if the tube action as indicated by other tests is taken into consideration. It was found that during the early period of raising steam the tubes were heated more rapidly than the shell with the result that the back tube sheet and with it, probably, the front end of the firebox was pushed to the rear. This explains the slight rear-



Staybolt No. 3 Top Row Back—Lake Shore & Michigan Southern Locomotive

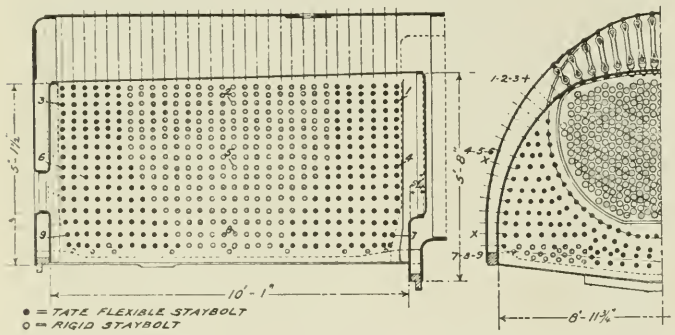
ward movement of the staybolt at the starting of the test. Then, as the water became heated there was a tending toward equalization of the temperatures of the tubes and the shell. This resulted in a relative forward movement of the tube sheet permitting the firebox to expand normally. Then, when the throttle was opened, there was a rapid increase of firebox temperature resulting in a corresponding increase in the temperature of the gases in the tubes themselves, which again pushed the tubesheet to the rear carrying the front end of the firebox with it. Then followed the looping and doubling of the movement during the cooling down, ending with the staybolt a little more than .002 in. from its original position.

In the rigidly stayed boiler the entanglement of the line of the movement is equally marked and is of the same general character, but, as in the other cases, the extent of the movement is much less.

This condition holds throughout the whole range of the work, varying in extent with the location of the staybolt and the method of staying. In general the movement was greater at the ends and upper portions of the firebox than at the center and lower portions.

There is another matter in connection with the rigidly stayed boilers that does not fully appear in the diagrams: The evident reason for the lesser deflection of the rigidly stayed boiler is that it is rigid. The staybolts tend to hold the sheets in one position and resist all tendency to move, and this manifests itself in the jerky character of such motion as takes place. That is to say, there are sudden variations in the distance from the original position which indicate that the stays resist the effect of the expansion of the sheet to move them, possibly buckling the sheet, and then when the pressure becomes more than they can carry, they suddenly yield.

The one point where a close comparison and check between the radially stayed and Wootten type is possible is in the movement of the staybolts when the boiler is in service. In both cases it was found that the sheets were in constant motion relatively to each other from the instant the fire was built until the boiler was cold. Also the extent



Delaware & Hudson Locomotive No. 813 with Flexibly Stayed Wootten Firebox

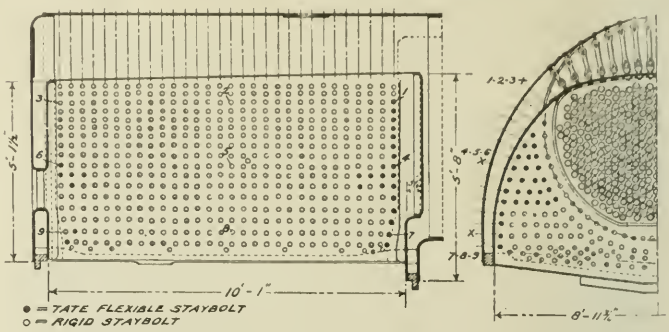
of the movement was much greater in the flexibly stayed boiler than in the rigidly stayed.

The character of the movement was, however, apparently quite different in the two types of boilers. There was more bending to and fro in the Wootten as well as a much greater movement. This is especially manifest in staybolt No. 1, where the maximum deflection of the flexible bolt in the Wootten type was about nine times that of the radially stayed, and this amount entirely in a vertical direction.

There may have been several reasons for this. The Wootten firebox was 1 ft. 4½ in. longer and 1 ft. 1½ in. deeper and the staybolt was 8 in. long as against 5¾ in. for the radially stayed boiler. Each of these items would tend to increase the deflection, while the comparatively small amount of horizontal deflection is explicable from the fact that there was a complete installation of flexible bolts in the radially stayed boiler, while in the Wootten type there was a line of 18 rigid bolts in the central section that tended to stiffen the boiler and prevent a relative movement of the sheets. These are set forth as suggested reasons, not as demonstrated proofs.

The main fact, however, stands out very prominently that the character and amount of the staybolt deflection is quite different in the two boilers. As yet, there is not sufficient data accumulated to be able to state definitely as to just why this is so, and what should be done to the general design of one or both of the boilers to put the least possible strain on each.

In the matter of the buckling of the sheets caused by the



Delaware & Hudson Locomotive No. 794 with Rigidly Stayed Wootten Firebox

combined action of sheet expansion and resultant staybolt deflection, it was found that the buckling was greater with the flexible than with the rigid bolts; but, it must be borne in mind that the deflection was also greater, and a study of the details shows that the ratio of the buckling of the flexibly stayed to the rigidly stayed was less than the corresponding ratio of deflection. In other words, given a fixed amount of staybolt deflection the buckle put in the sheet would be less with a flexible than with a rigid staybolt.

While at work on the rigidly stayed boiler having the Wootten firebox an attachment was made in the space just ahead of the No. 5 staybolt. As might have been expected, the actual movement of the sheet was about the same as at the No. 5 staybolt, but there was less buckling. This developed the probability that, in this long and wide firebox at least, the whole sheet, while under steam pressure, assumes a series of shallow corrugations that hold it out of alinement with its original shape, and which are sweeping over it in waves, as it were, according as the sheet expands or contracts. The depth of the corrugations is slight and the angle made by the sides of the same with the original line of the sheet is never as much as one degree. The greatest angle obtained on the Wootten type was 48 minutes 52 seconds with a general average for all points tested on the flexibly stayed boiler of 7 minutes 29 seconds.

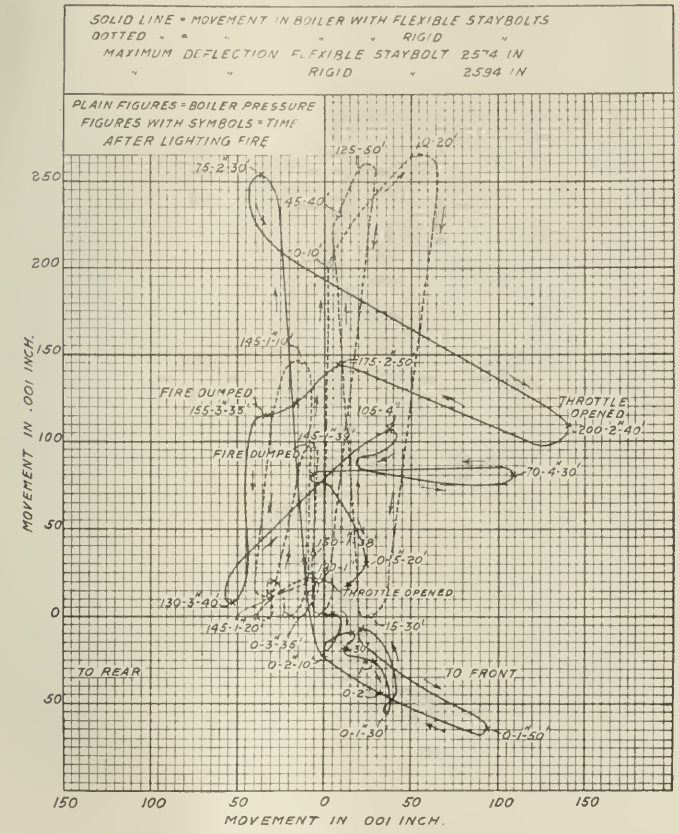
It is also possible that the buckling of the sheet might be appreciably decreased by a change in the original adjustment of the flexible staybolts, and also that there might be an increase in the deflection of the bolts. The suggested methods of accomplishing this is to give a little more play in the head of the bolt and the allowing of a little slack under the heads in the first place. This would permit of an easier adjustment to the movement of the sheet during the period of raising steam, when there is no load on the bolt, and the allowance of a little freedom of angular motion when the sheet and bolt are under strain.

Other matters were taken up in connection with this investigation for which there is no space to deal in full at this time. There were the effects of the admission of cold air to the firebox on sheet temperature and the apparent lack of circulation in the water leg.

Conclusions

The fundamental facts fully brought out were that the staybolt deflection is much greater in a flexibly stayed boiler than in a rigidly stayed boiler, that certainly during the whole period of operation and probably until the boiler temperature had reached that of the atmosphere the staybolt is in constant motion as evidenced by the fact that, out of the hundreds of measurements taken, there were no two consecutive measurements alike; that the two types of boiler construction (Wootten and radially stayed) have quite different effects on staybolt deflection; and that firebox temperatures and the action of the tubes have a marked influence on staybolt deflection at the front end of the firebox.

These tests also showed in a marked degree the extreme



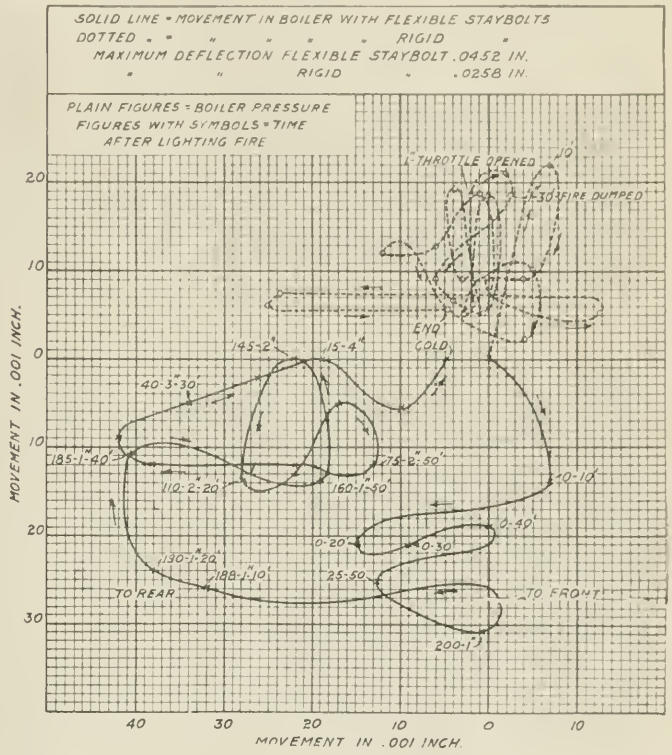
Staybolt No. 1 Top Row Front—Delaware & Hudson Locomotive

sensitiveness of the plates to changes of temperature. For example, a cold boiler may be filled with water of any temperature from cold to boiling and there will be no relative motion between the sheets. But let the fire be laid and a piece of lighted waste thrown in to ignite it, and it has, thus far, been impossible to get a reading before the sheets would show a movement, though this has been done within ten seconds from the time of the ignition of the waste.

This investigation is merely indicative and not conclusive. The absence of any data upon which to estimate the probable movement and buckling of the sheets made a redesigning of the apparatus necessary, and the use of boilers with a mixed assortment of staybolts in the second case, gave results that would probably be greatly modified were boilers with complete installations to be used. But there is this indication, that the boiler will expand and the staybolts deflect if they have a chance, and that this chance is much greater with a flexible bolt than it is with a rigid one.

As has already been intimated, the difference in the conditions of operation of the apparatus makes a clean-cut comparison between the Wootten type and the wide firebox radially stayed boiler impossible. But the impression left by the test is that the Wootten firebox is much more rigid than the wide firebox when rigidly stayed with the radial stays, and that if it were given a complete installation of flexible bolts the difference between the two would be very much greater than that indicated in these tests.

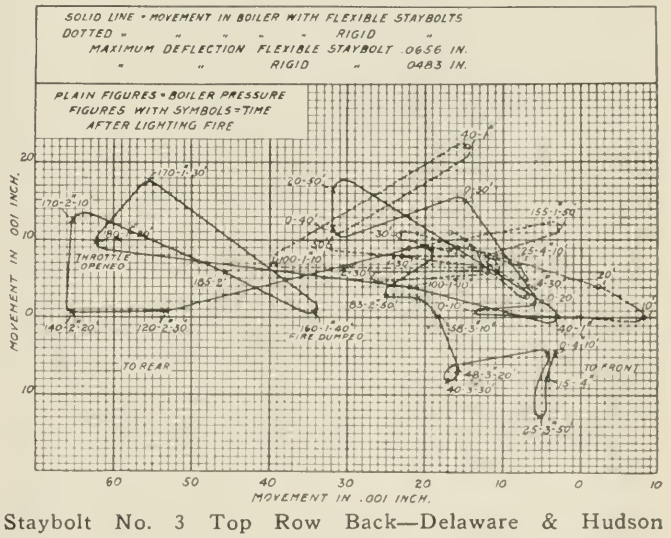
In every case the extreme sensitiveness of the sheets to



Staybolt No. 2 Top Row Center—Delaware & Hudson Locomotive

any changes of firebox temperature was noted. This fully explains the constant bending motion to which the bolts are subjected while the boiler is at work.

It naturally follows from this that a boiler which is so



Staybolt No. 3 Top Row Back—Delaware & Hudson Locomotive

built as to permit the sheets to expand under the influence of temperature changes, will put less stress upon the staybolts and sheets than one where such freedom of motion does not exist. There is no reason to think that there was any great difference in the temperatures of the sheets of the two boilers, and yet, as I have already indicated, there was

a marked difference in the movements of the staybolts and the sheets. If a given change of temperature produces a definite change of dimension in the sheet, anything that prevents this change must itself be subjected to stress and must put a similar stress upon the sheets. Hence, so far as these investigations have been carried, they indicate the value of using the flexible in preference to the rigid bolt.

There is one point that cannot be expressed in cold figures and that is the impression that this work makes on observers. After watching the delicate and sensitive movement of the sheets and staybolts and the difference in the action of the flexible and the rigid bolts, everyone was greatly impressed with the superiority of the flexible bolt as a means of reducing the probable stresses that the several parts of the boiler are called upon to sustain. The progress of this work has driven home in a convincing manner the advantages of flexibility in boiler construction.

Coal Strike Settled

The strike of the bituminous coal miners begun on November 1 at the call of the United Mine Workers was definitely called off on December 10 when the officers of the union at a meeting in Indianapolis agreed to accept a plan of settlement proposed on December 6 by President Wilson and sent telegrams to the striking miners urging them to return to work. The President's proposition was that the miners immediately return to work with the 14 per cent increase in wages which was recently offered by Fuel Administrator Garfield and which was put into effect for the men who remained at work by the coal operators, and that the President should appoint a commission composed of a practical miner, a mine owner or operator in active business and one other, which commission will consider further questions of wages and working conditions as well as profits of operators and proper prices for coal, readjusting both wages and prices if it shall so decide, including differentials and internal conditions in and between districts. The report is to be made within 60 days if possible and will be accepted as the basis of a new wage agreement, the effective date and duration of which shall also be determined by the commission.

The 14 per cent increase was given on the condition that it should not increase the government prices for coal and therefore comes out of the profits of the operators as long as the government's prices remain in effect. The original demand of the miners was for a 60 per cent increase in wages, a five-day week and a six-hour day. They refused to accept an offer from the operators of a 20 per cent increase and also the 14 per cent offer when made by Dr. Garfield.

Walker D. Hines, director general of railroads, authorized the following statement:

"The dislocation which the strike has created in the production, transportation and distribution of coal cannot be instantly remedied, and pending readjustment it is highly important for the public to continue to exercise great caution in the consumption of coal and it is hoped there will be a due appreciation of the difficulties which cannot be immediately overcome.

"During the strike the weekly production of coal was cut from 11 to 12,000,000 tons to about 5,000,000 tons and this much reduced tonnage was mostly mined in Pennsylvania and West Virginia. Widely distant portions of the country which were ordinarily dependent upon other coal fields had to be supplied from these and other unusual sources of supply. The central part of the country, the great consuming territory of the Mississippi and Missouri valleys, is depending on shipments from the East and West, 41 per cent of present production in the Allegheny and Pocahontas regions now being delivered to the West. The result has been that the Railroad Administration has been compelled to transport coal over the most unusual routes and for distances far in excess of the normal hauls. This has required a much greater amount of equipment than would be required in normal times to move the same tonnage to its usual destinations and has resulted in equipment constructed for use in special parts of the country being scattered widely to other parts of the country. A period of time will be required for the complete relocation of this equipment and meanwhile it is not to be anticipated that all mines can be fully supplied with cars.

"The director general today saw a committee of the National Coal Association and pointed out these difficulties and urged that as rapidly as that organization had information concerning the expected resumption of mining operations such information be duly communicated to the Railroad Administration as well as to the local railroad officers. There was manifested a policy to assist in this matter as far as practicable. It is hoped that the general public, the coal operators and the miners will appreciate these difficulties and make allowances for the time required to restore normal conditions.

"The loss of production of coal since the strike began 5½ weeks ago has been a serious economic loss to the country. In many important respects the losses to the country cannot be made up at all and it will require some time before coal production can bring the country's supply up to the point where it ought to be.

"At the beginning of the strike and when the fuel administrator turned over the distribution of coal to the Railroad Administration, the railroads had in their possession either in storage or in cars about 22,000,000 tons of coal. It is estimated that the consumption during November was 40,000,000 tons, of which 18,800,000 tons were produced during the month, 11,200,000 tons were used from consumers' stocks cumulated prior to November 1, and 10,000,000 tons were taken from the 22,000,000 tons in possession of the railroads.

"Since the end of November the stock in the possession of the railroads has been still further depleted.

"Of the 22,000,000 tons in the possession of the railroads at the beginning of the strike, 12,000,000 tons were held by the railroads for their own consumption, representing approximately 30 days supply. Subsequently the Railroad Administration adopted the policy of cutting its supply to 15 days and now as a temporary measure to aid in the most rapid possible meeting of the needs of other consumers the Railroad Administration will where necessary reduce the supply of coal for its own consumption to a 10 days supply.

"As a preliminary to bringing back normal conditions, the Railroad Administration will as soon as practicable place in effect an arrangement under which coal as mined will be allowed to run as billed except that tidewater and export embargo will continue; orders placed for coal to western regions from Pocahontas and Allegheny regions will be cancelled, but coal billed on these orders prior to cancellation will be permitted to go and be expedited, so that these cars can be promptly released for mines.

"Just as soon as practicable regulations in connection with the use of bituminous coal for power, light and heat will be rescinded or modified and the same is true of the supplying of coal to necessary industries. It will be necessary to observe conditions as the situation progresses before definite time can be fixed for changing of these regulations and orders.

"It is highly important for the public to realize that serious scarcity of coal is likely to continue for some time. It will require time to bring consumption of coal back to normal and meanwhile there is a tremendous shortage which needs to be made up. On all hands, therefore, great caution ought to continue to be the rule in the consumption of coal."

The question of the extent to which the curtailed passenger service can be further curtailed was to be taken up for consideration on Thursday.

Railroad Bill Debated in the Senate

Very Nearly Passed by Default; Senator La Follette Blocks Its Passage and Opens Attack on It

WASHINGTON, D. C.

THE RAILROAD BILL came near to being passed by the Senate by default but has since encountered what almost amounts to a filibuster by Senator La Follette. After having been before the Senate for a week as the unfinished business, while the attendance scarcely exceeded a dozen at any time except for roll calls, the Cummins bill was reported to the Senate from the committee of the whole on December 8, read the third time and a vote on its final passage had been called for, when the proceedings were interrupted by a call for a quorum by Senator La Follette. Some of the senators who were called into the Senate by the call for a quorum, however, displayed more interest in the matter than they had previously and on a motion by Senator Lenroot it was voted to reconsider the vote whereby the bill was passed to a third reading. This left it in the Senate as in legislative session and open to amendments.

On the following day the bill was restored to the committee of the whole and an attack upon it was opened by Senator La Follette. Only one amendment had been offered up to that time, that by Senator Curtis of Kansas to strike out section 7 of the bill, which provides for the creation of a transportation board. Senator Curtis explained that he was opposed to other provisions of the bill, such as that providing for compulsory consolidations, but thought the sentiment of the Senate could be tested by his amendment which would eliminate the transportation board. If this had been adopted he proposed to strike out other provisions of the bill relating to the functions to be exercised by the transportation board, but the amendment was rejected without a roll call.

Confidence has been expressed by Senate leaders that the bill can be passed before the holiday recess, tentatively set to begin on December 20, when it will go to conference for a reconciliation of the differences between it and the Esch bill. Senator Cummins on December 9 reported the Esch bill from the committee with a recommendation to strike out all after the enacting clause and that the Senate bill be substituted, in order to lay the foundation for a conference. There is no expectation that the conferees will be able to reach an agreement short of nearly a month but it is expected that after the passage of the Senate bill a resolution will be offered providing for a temporary continuance of the guaranty to the railroads.

Dirctor General Hines on December 9 submitted to the President a report on the railroad and legislative situation, after conferring with Chairman Cummins and Esch of the committees on interstate commerce and with other members of the Senate committee. This was for the information of the President in preparing his proposed message to Congress on the railroad situation which was expected to set at rest the question of the date for the return of the railroads. Many members of Congress seem to feel that the President might postpone the relinquishment for a short time after December 31 to wait for the completion o fthe permanent railroad bill, but there has been no confirmation to indicate that the belief is well-founded.

Senator Kellogg on Government Operation

Four formal speeches were made while the bill was in committee of the whole, by Senators Cummins, Kellogg, Curtis and Myers.

Senator Kellogg gave estimated figures for the earnings of the railroads showing a net income for 1919 of $536,500,000, or nearly $400,000,000 less than the standard return. He said the people are now paying over a billion and a half dollars more in expenses for handling less traffic in 1919 than was handled in 1917. In 1917 the Class I railroads earned 5.38 per cent on their property investment. In 1918, he said, they earned 3.71 per cent, and during the first six months of 1919 only .84 per cent. For nine months of the year the net operating income was 2.19 per cent and for the year it is estimated at 2.92 per cent, or less than the interest and fixed charges. For the nine months, Senator Kellogg said, 57 railroads earned $111,000,000 more than their fixed charges, while 108 railroads earned $168,000,000 less than their fixed charges.

Referring to statements by Director General McAdoo expressing the hope that large economies in operation would be accomplished, Senator Kellogg said that in no single department of railroad management, except possibly the legal department, has there been economy, but, on the contrary, enormous extravagance. He referred to the increase in the number of employees and while he said he would not contend that the general average wage of the principal classes of employees is too high, having been increased in about the same proportion as the cost of living since 1915, he criticized the policy of standardizing wages throughout the United States, irrespective of local conditions, and of allowing very large increases to some employees by reclassification. The inequalities, he said, have added grossly to the cost of operation, have created unrest and have had a bad effect upon the morale of the service.

Senator Kellogg commended the provision of the bill which would extend the guaranty temporarily, but he criticized the provision for division of so-called excess earnings above 6 per cent. He said it may be that the public necessity for keeping all the roads operating as efficient systems would justify a plan which would take away from the more fortunate a portion of what is called their excess earnings, but a sufficient percentage on the earnings above 6 per cent should be left with the road producing it to encourage economical operation and good service. He questioned whether the 5½ per cent return would be sufficient and pointed out that it is not merely the so-called weak roads, but the stronger roads which need most to borrow large sums of money with which to make large extensions and improvements and buy needed equipment. Senator Kellogg also put in the record voluminous statistical tables illustrating the effects of government operation.

"We are now facing the most tremendous economic problem ever presented to this country for solution, to a large extent incident to the direct result of the government's operation of the railways during the last two years," Senator Kellogg said. "When the President indicated, in December, 1917, his intention to take over, for government operation, all the railways of the United States, many were convinced that there was no necessity for it and that it would be disastrous. The experiment has amply justified all our fears. It has cost the taxpayers of this country hundreds of millions of dollars, destroyed the efficiency of the service, and placed the railroads today in a position where unless some drastic steps are taken this country faces a financial crash, which will not only destroy hundreds of millions in property held by the people of the United States but destroy the efficiency of our transportation system.

"When the war broke out we had in this country, all in

all, the best, cheapest, and the most efficient transportation system in the world. That it was not perfect goes without saying. But this is true, and will be conceded by substantially all the experts in the world, that nearly all the inventions, improvements, and advancements of transportation facilities have resulted from American incentive, genius, and energy and enterprise. An efficient and constantly growing transportation system is absolutely necessary to the very life and prosperity of this nation and must be had to maintain the growth of the country. In the main, the present deplorable condition of the railroads is due to inefficient and extravagant government management and stupid bureaucratic control. There was no necessity for taking over the railroads any more than there was for taking over the telegraphs, telephones, and cables, which has now been demonstrated beyond question, and which proved so expensive to the government and disastrous to good service. The postmaster general reports a loss to date of $14,418,237 in the operation of telephone, telegraph and cable systems, and there are many companies with which a settlement has not yet been made.

"Because there was temporary congestion on account of the sudden and enormous increase of business in a comparatively small territory, the President took over all the railroads of the United States for government operation, created a great central bureau, which, as everyone knows, always is inefficient. I do not claim that after the war broke out the transportation system of this country was sufficient to effectively take care of the sudden increase of business. But during the first nine months of the war the railroads themselves, with all the handicaps of government interference, priority orders, and laws which prevented the co-ordination of their facilities, handled as great a business under more adverse conditions at a less expense than has been handled by the Railroad Administration since that time."

Regarding the proposed guaranty during readjustment, Senator Kellogg said: "I think it is evident to everyone that the government, having produced this condition of the railroads, without regard to the merits of the increase of operating expenses, incurs the duty for a reasonable time, while the rates are being readjusted, to meet operating costs and continue its guaranty. We have no right to take over a public-service corporation and use it for government purposes, increase its operating expenses so as to render the property valueless, and turn it back without any remedy. Furthermore, should this be done, a financial collapse in this country is bound to follow, and as the bonds of these railroads are held in savings banks, insurance companies, and by millions of individuals, and are a large basis of credit, the greatest care should be taken to preserve their integrity.

"It may be said that the government, having taken over the railroads and fixed the rentals, owes no duty after the properties are turned back. The railroads were not consulted about being taken over. The Congress practically fixed the terms of the agreement, and the agreement was presented to the railroads to accept or reject, as they saw fit. Their only remedy, if they refused to accept the agreement, was to go into the Court of Claims, and sue the government—a remedy which, of course, was entirely inadequate, as the roads needed their income to pay interest and taxes.

"The true relation of the government to a public-service corporation is that the government has regulatory powers to prevent the companies from earning more than a reasonable income. But it has no right to reduce that income to the basis of confiscation or to take the property over and destroy it. So the least that can be done is to continue this guaranty for a few months while the rates and operating expenses are being readjusted."

Senator Myers devoted himself particularly to the anti-strike provisions of the bill, which he declared are absolutely necessary to the welfare, good order and domestic tranquillity of the people of the United States. The regulate commerce, he said, certainly includes power to prevent interference therewith or extinction thereof and he thought the time has come when Congress should create a tribunal to hear and determine disputes between railroad companies and their employees with power to enforce the granting of reasonable wages and fair working conditions, but as a corollary this should be accompanied by a provision to prevent a nation-wide or territorially extensive railroad strike from being suddenly and arbitrarily precipitated upon the people of the country.

Senator Myers on Anti-Strike Provisions

"In my opinion," Senator Myers said, "the time has come when the people are entitled to know whether their government is to be supreme in the realm of domestic tranquillity, general welfare, law and order, or whether a class of citizens, only a small part of the people, banded together by class organization, is to be supreme; whether the government or organized labor is more powerful. There appears to be in labor circles a belief that labor is now in the saddle and has things coming its way, and a determination to go to the uttermost extremity regardless of consequences."

Senator Myers expressed the opinion that the Adamson law was a grave mistake and that the country is now reaping its consequences because much of the trouble which has since arisen in regard to the operation of the railroads, much of the government's deficit in the operation of the railroads, may be traced to that act.

"As a result of class legislation in favor of wage workers," he said, "there has grown up in this country an inner government. It is inside of the regular or constitutional government. It is not an invisible government. It is very visible. It does not operate under the surface or behind the scenes. It is bold and open and very much aboveboard. The inner government consists of combined organized labor and it is a grave question if the inner government today is not superior to and more powerful than the constitutional government."

Senator Curtis Opposes Transportation Board

Senator Curtis moved to strike out the section providing for the transportation board, on the ground that the bill provides entirely too many boards and commissions and because he believed the Interstate Commerce Commission could do the work more satisfactorily and also because he was opposed to the plan of consolidation which under the provisions of the bill would be worked out by the board.

Senator Cummins said he sincerely hoped the Senate would not mutilate the bill in that way. If the amendment should prevail it would become necessary to re-form the entire measure because it would so destroy the machinery through which the bill is to be administered that it would become entirely unworkable. The time has come, he said, when the Interstate Commerce Commission must be largely occupied in what are known as quasi-judicial or semi-judicial duties and it is desirable to disassociate the purely administrative duties from them. He also said that one purpose of the bill is to prevent strikes and if strikes are to be prohibited it is necessary to create a governmental tribunal that will adjudicate the merits of a dispute between the employer and the employee. The proposed transportation board is to exercise this function where an agreement is not reached by the wage boards.

Senator King supported the Curtis amendment, expressing the opinion that the Interstate Commerce Commission could perform all the functions proposed for the transportation board, including final authority in wage matters.

Senator Cummins said there is no sanctity about the Interstate Commerce Commission, but agreed that it has or has had the confidence of the people and he wanted it to continue to have the confidence of the people but it cannot do so unless it can do its work with much more rapidity and much

more promptly than it has done its work in former times.

After a vote on the passage of the bill had been interrupted by the call for a quorum and the motion to reconsider, several senators objected to the rapidity with which the bill was apparently being put through. Senator Cummins replied to the effect that it was not his fault if senators were not sufficiently interested in the bill to be present and participate in the discussion and that the voting stage had been reached merely because no one had interposed anything else. He objected to a proposal to re-commit the bill to the committee of the whole, pointing out that it was open to any amendments that might be offered after the vote by which it was passed to third reading had been reconsidered.

Senator Thomas expressed wonder that the attendance had been so small during the consideration of a bill of such vast importance. He said he thought he could say with propriety and within bounds that except immediately after roll calls scarcely 10 senators had remained on the average during the speeches.

Senator Cummins on December 9 withdrew his objection to the restoration of the bill to the committee of the whole, after which Senator La Follette made a four-hour speech attacking the bill. He said it was a "railroad bill," on whose passage "railroad stocks will go kiting" and that T. De Witt Cuyler, of the Association of Railway Executives, and S. Davies Warfield, of the National Association of Owners of Railroad Securities, were responsible for it. His argument followed closely that of his minority report, in which he urged a five-year extension of government control, and charged that the railroads had broken down in 1917.

Senator Dial of South Carolina opposed the bill because he said it undertook to say that every dollar invested in railroad property shall receive enough return to pay 5½ per cent interest on the value of the property. He objected to this because of the great difficulty in finding out the value of the railroad property and also because he seemed to be under the impression that the bill was to guarantee to every railroad that has not been making as much as 5½ per cent a return equal to that amount for all time to come.

Senators King, Cummins and Pomerene tried to disabuse the senator's mind, but apparently made little impression. They pointed out that the bill does not contain any guaranty, but merely an instruction to the commission to make rates produce as nearly as may be to 5½ per cent, that many railroads under the bill would receive much less than 5½ per cent, while others would receive more and would have to give up two-thirds of the excess over 6 per cent. Senator Cummins also pointed out that provision was made for a readjustment of the rate of return by the Interstate Commerce Commission after five years, but Senator Dial continued his speech on the assumption that it was proposed "to stamp a certificate of value upon every dollar invested in railroad property, without taking into consideration whether or not it was necessary to build more railroads or whether it was necessary to maintain them." He said he did not complain of the rate of 5½ per cent because if he could have gotten that rate on the money he had borrowed during his life he would be much better off today, but he objected to giving that percentage to all railroads. He said that government operation had been generally conceded to have resulted in failure, but he thought the failure was not so great as had sometimes been made to appear and that the results of the war should be taken care of by paying the bills and a new start made. He suggested that instead of an elaborate bill in an effort to stabilize railroad returns, it would be preferable to write a short bill promising the railroads the return of their properties after 90 days or something like that with a provision for the guaranteed standard return for six months to allow them to get back to the old basis of operation and to become normal again. Then, he said, if the anti-combination law ought to be repealed it could be repealed later and he would like to repeal also the Adamson law.

Senator La Follette resumed his discussion on Wednesday. It was reported that he had planned a twelve-hour speech.

Imperator Takes Too Much Coal

The steamship "Imperator" which had been held up at the request of the Railroad Administration for loading too much coal was allowed to depart from New York on December 11. Following a conference between representatives of the Railroad Administration, of the British Ministry of Shipping and of the Cunard Line, regarding the loading of 5,900 tons of coal in excess of amount of 2,500 tons for which permit was issued by the Railroad Administration acting under authority of the Fuel Administrator. The British Minister of Shipping has expressed his regret over the occurrence, and offered to replace the coal so loaded in violation of the regulations of the Railroad Administration within one month. As a result of the Railroad Administration, with the concurrence of the Department of Justice officials handling the matter, requested the Treasury Department to grant the "Imperator" clearance, it being understood, however, that this action will in no way impair civil or criminal action in connection with the supplying of this coal by the coal companies involved or the receiving of it by the steamship. Permit had been issued only for coal sufficient to take the boat to Halifax, the first available coaling station. Following the conference correspondence on the subject was exchanged and made public.

The letter from S. M. Raeburn, director general of the British Ministry of Shipping to H. B. Spencer, chairman, Central Coal Committee of the Railroad Administration, said:

"The British government is the owner of S. S. Imperator which is operated for and on behalf of the British government by the Cunard Line. I have been informed that owing to an error, which the British Ministry of Shipping greatly regrets, 5,900 tons of coal have recently been loaded on board her without due permit and that yesterday clearance was refused the vessel at New York on this account, and that the excess coal, amounting to 5,900 tons, has been ordered removed from her, and that clearance papers will not be granted until this coal has been removed. I submit herewith copy of report of survey held December 9, 1919, at 6.00 p. m. by technical experts, from which it appears that owing to the structural conditions of the ship and the arrangement of her stoke holds and bunkers, it will take at least a period of seven weeks to remove the coal. I am further advised that the vessel while lying at her pier is consuming about 240 tons a day.

"The British government and the British Ministry of Shipping had no knowledge of any violation of any United States statute or regulation, and desires to clear the vessel so soon as possible. To that end, I offer on behalf of the British government, if the vessel is allowed to clear tomorrow, to replace the coal taken in excess of permit, that is to say, 5,900 tons, and to do so at New York harbor within one month of the date of vessel's clearance. Every effort will, of course, be made to get the coal here sooner, if possible."

The coal turned over in reparation must be coal produced outside of the United States.

The California Railroad Commission has denied the petition of the Pacific Electric Railway Company for authority to increase freight rates on petroleum, c. l. The company desired to place its rates on a parity with those charged by competing federal controlled roads, but the Commission finds that the proposed change would result in advances ranging as high as 225 per cent.

A. R. A. Issues New Specifications for Track Scales*

These New Rules Are the Work of a Joint Committee Representing a Number of Associations

THE AMERICAN RAILROAD ASSOCIATION has issued a new set of specifications for the purchase of track scales, which were drawn up by a joint committee representing the American Railway Engineering Association, the United States Bureau of Standards, The Railroad and Warehouse Commission of Minnesota, the National Scale Men's Association and the Scale Manufacturers' Association. The specifications are modeled largely after those previously prepared by the Bureau of Standards and the Minnesota commission, and, with the standing they will have under the sponsorship of the American Railroad Association, they are certain to effect a distinct advance in scale practice.

They are intended to apply to knife edge scale of the straight and torsion lever types for weighing cars in regular interchange service. They do not apply to overhead suspended scales, nor to scales now in service, except that reinstallations of old scales should be governed as nearly as practicable by the provisions of the specifications relating to the installation of new scales. They are intended, except in special cases, to secure reasonable uniformity in scales for similar service, but without preventing improvements in types of scales or in scale parts.

Classes of Scales

Character of Classification: Scales shall be divided into two classes, namely, heavy service scales and light service scales; and except when otherwise specifically provided these specifications are to apply to both classes of scales.

Heavy Service Scales: Heavy service scales are those over which a large number of cars are to be weighed; and they shall have sectional capacities of 75 or 100 tons, except for special cases.

Light Service Scales: Light service scales are those over which only relatively few cars are to be weighed; and they shall have sectional capacities of 60 or 75 tons, except for special cases.

Special Cases: For special cases which cannot be covered in these specifications, it is recommended that the material, workmanship, etc., shall be at least equal to that required in these specifications, and that the principles herein set forth be followed in so far as they apply.

Capacity

Capacity Defined: The capacity of a scale is equal to the weight of the heaviest car it will weigh, provided that the scale will support a train of such cars passing over the scale without stresses being developed in the members of the scale which are in excess of those hereinafter specified.

Sectional Capacity: The sectional capacity of the scale is the greatest weight which, if applied on the load knife edges of each pair of main levers, will produce stresses in the scale parts not exceeding those given in the table of working stresses.

Plans

Plans: The manufacturer shall furnish to the purchaser plans of design showing stresses and detailed dimensions for all scale parts, and the material of which they are to be fabricated; also assembly plans showing location of all field connections and all information necessary for the purchaser to design and construct the pit and parts not furnished by the scale manufacturer.

Working Stresses

The following unit stresses shall not be exceeded when the scale is loaded to its capacity as defined above. These stresses include an allowance for impact caused by moving loads. The strength of each member shall be determined by its weakest cross-section.

*Abstracted from the complete specifications.

Iron and steel working stresses in pounds per square inch:

IRON AND STEEL, WORKING STRESSES IN POUNDS PER SQUARE INCH

Nature of stress	Cast iron	Steel Cast-ings	Machin-ery steel	Struc-tural steel	Steel for pivots and bearings: High carbon	Steel for pivots and bearings: Special alloy
Tension	1,500	8,000	8,000	10,000	24,000	30,000
Compression	8,000	10,000	8,000	10,000	24,000	30,000
Transverse bending:						
Tension	2,500	8,000	8,000	10,000	24,000	30,000
Compression ..	8,000	10,000	8,000	10,000	24,000	30,000
Shear	2,500	6,000	5,000	7,000	.....	.....
Torsion	2,500	6,000	.....	7,000	.....	.....

The bearing stress on steel pins shall not exceed 15,000 lb. per sq. in.

Knife Edge Bearing Stresses: For heavy service scales the load per linear inch of knife edge shall not exceed 5,000 lb. for high carbon steel or 6,000 lb. for special alloy steel.

For light service scales the load per linear inch of knife edge shall not exceed 6,000 lb. for high carbon steel, or 7,000 lb. for special alloy steel.

Concrete Bearing Stresses: Stresses to be allowed for bearing on concrete shall not exceed 300 lb. per sq. in. under scale lever stands, and at all other points shall not exceed 400 lb. per sq. in.

Loops, Formula for Stresses: Considering the end of the loop as a simple beam, its section at the point of maximum bending shall be determined by the formula $\frac{W}{4}\left\{L-\frac{l}{2}\right\}$ wherein W equals the maximum load applied to the loop, L equals the distance between the center lines of the depending sides, and l equals the distance over which the load is distributed.

LENGTH OF SCALE AND NUMBER OF SECTIONS.

Scale Length Defined: The length of a scale shall be considered as the effective weighing length of the live rails. In no case shall this effective weighing length be greater than the distance between the centers of end sections.

Scale Lengths Standardized: The length of scales, except in restricted traffic movements, or for special cases, shall be 50, 56 or 60 ft.

Number of Sections: Scales of 60 ft. or less in length shall not be constructed in more than four sections.

Motion Weighing: When cars are to be weighed in motion the speed shall not exceed four miles per hour, and each car shall be entirely and alone on the scale a minimum of three seconds. This condition applies to cars normally weighed. When scales are of such a design or length as not to permit of the above condition, cars shall be spotted to secure accurate weights.

Scale Levers

Machined Ways for Nose Irons: Levers that are to be equipped with nose irons shall have those portions of the lever ends receiving them machined for the full distance over which the nose irons are to move.

Leveling Lugs: In scales of the straight lever type each lever shall be provided with leveling lugs for longitudinal alinement. In scales of the torsion lever type, leveling lugs shall be provided on the pipe or torsion member for transverse alinement and on the extension arm for longitudinal alinement. Each pair of lugs shall be spaced 11 in. The leveling surfaces of each pair of lugs shall be finished to a common plane which shall be parallel to the plane established by the knife edges of the end pivots.

Length, Allowable Variation: All main levers shall be true to within ⅛ in.; and all extension levers shall be true to within ¼ in. of their nominal lengths between the knife edges of end pivots.

Loading of Levers Other Than Main Levers: In establishing the load for determining the stresses in the levers other than main levers, it shall be assumed that the end extension levers carry a total live and dead load corresponding to 100 per cent

of the sectional capacity; the portion of the middle extension levers carrying the load from the end section only, 100 per cent of the sectional capacity; and the portion of the middle extension levers carrying the combined load from the end section and inner section, 160 per cent of the sectional capacity; the transverse extension lever, shelf lever and beam, 300 per cent of the sectional capacity.

Pivots and Knife Edges

Material: The requirements for physical properties of the steel used for pivots shall be as follows:

Special Alloy Steel in the Annealed State:

Elastic limit	Not over 75,000 lb. per sq. in.
Tensile strength	Not over 110,000 lb. per sq. in.
Elongation in 2 in.	Not les than 20 per cent.
Reduction in area	Not less than 35 per cent

Special Alloy Steel Hardened:

Elastic limit	Not les than 160,000 lb. per sq. in.
Tensile strength	Not less than 200,000 lb. per sq. in.
Elongation in 2 in.	Not less than 5 per cent.
Reduction in area	Not less than 25 per cent.
Shore hardness	Not less than 85.

High Carbon Steel in the Annealed State:

Elastic limit	Not over 55,000 lb. per sq. in.
Tensile strength	Not over 117,000 lb. per sq. in.
Elongation in 2 in.	Not less than 15 per cent.
Reduction in area	Not less than 25 per cent.

High Carbon Steel Hardened:

Elastic limit	Not less than 135,000 lb. per sq. in.
Tensile strength	Not less than 180,000 lb. per sq. in.
Elongation in 2 in.	Not less than 3 per cent.
Reduction in area	Not less than 12 per cent.
Shore hardness	Not less than 85.

Design: All pivots shall be designed and manufactured so that the two sides joining to form the knife edge shall make an angle that will not exceed 90 deg.; that the tolerance for offset of the knife edge of the pivot, as figured from the center line of the pivot at its base, shall be within 10 per cent of the width of the pivot for "machined in" pivots, and 15 per cent of the width of the pivot for "cast in" pivots.

Machining: For heavy service scales all pivots of the main levers shall be machined and fitted into machined ways.

Continuous Contact: All pivots shall be mounted so as to secure equal and continuous contact of the knife edges with their respective bearings for the full length of the parts designed to be in contact; in loop bearings the knife edges shall project slightly beyond the bearings in the loops.

Position: The pivots shall be so mounted that each knife edge in a given lever will be maintained in a horizontal plane under any load; and shall be so mounted that a plane bisecting the angle of a knife edge wil be perpendicular to the horizontal plane established by the knife edges of the end pivots, and shall be so mounted that the knife edges in a given lever will be parallel to each other.

Support for Projecting Pivots: The reinforcing on the levers to support projecting pivots shall be tapered off to prevent lodgment of dirt next to the pivots and to provide proper clearances.

Location of Main Lever Load Knife Edges: The load knife edges of the main levers shall be so located that the center line of the live rails can be placed in the vertical plane established by the centers of those knife edges.

Nose Irons

Design and Fastening: The nose irons shall be firmly fastened in proper position by means of screws or bolts of a recognized standard size and thread, or other equally effective mechanical devices.

The means for clamping nose irons in position shall be of such design that identations in the lever will not be made, and shall be independent of any means provided for adjustment.

The means for clamping nose irons in position shall force or hold them against the lever in the same direction as they would be forced by the load.

The movement of the nose irons shall be controlled by means of adjusting screws of recognized standard size and thread. These screws shall be made of a material which will not corrode.

Finish and Pivot Mounting: Those surfaces of the nose irons intended to come in sliding contact with the levers shall be made true so as to secure an accurate fit of the nose irons on or in the levers. Each nose iron shall be of such design that when adjustments are made the knife edge will be held parallel to its original position.

Lever Fulcrum Stands

Design: The height of the pillars and the dimensions of the bases of the stands shall be sufficient to prevent a tipping action. In stands of the two-pillar type, both pillars shall be of equal height.

The pillars or upright portions of the stands carrying the bearings shall be so placed on the bases that the centers of the bearing lines shall be over the center of gravity of the bearing surfaces of the stands.

Bases for Lever Stands: The bases of the stands shall be finished to within a tolerance of 1/32 in. or machined when to be mounted on metal bed plates; accurate to a plane perpendicular to the axis of the upright portion of the stand, and the knife-edge bearing line shall be parallel to the surface of the base.

Pillars, Finish of Tops: The tops of the pillars for receiving the bearing steels, caps or blocks shall be finished to a tolerance of 1/32 in.

Bearings, Bearing Blocks and Links

Material for Bearing Steels: The bearing steels shall be equal to or greater in hardness than the knife edges which oppose them. It is found good practice to have the bearing steels not less than 95 points hardness on the Shore recording scleroscope for high carbon steel, and not less than 90 for special alloy steel.

Design of Bearings: Scales shall be so designed that, when the load is applied to the live rails, the oscillation of the weigh-bridge will not displace the bearings at points of contact on the knife edges.

Mounting of Bearing Steels: All like bearing steels shall be interchangeable or mounted in interchangeable bearing steel blocks. When the steels are separable and interchangeable in the blocks they shall be fastened in position by means of set screws of a recognized standard size and thread, and of a material which will not corrode, or by other equally effective devices.

Weigh-Bridge Bearings: The tops of weigh-bridge bearings making contact with the weigh-bridge girders shall be finished to within 1/32 in. of a true plane that will bring them all to the same height when in position, and in a plane parallel to the bottom of the bases of the fulcrum stands. These tops shall be provided with bolt holes of a sufficiently large diameter to allow for adjustment both tranversely and longitudinally to secure a proper alinement of parts.

Loops and Connections

Design Proportion: In loops which form bearings for projecting pivots, the radius of the portion of the bearing making immediate contact with the knife edges and the radius of the eye of the loop shall be not less than the length of the longest side of the cross-section of the pivot to be used in the loop.

Length: All loops in like connections, except where made adjustable, shall be of the same length.

Checks

Type: All weigh-bridges shall be checked by adjustable checks of the rod or other approved type which shall be equal to the rod type in functioning. Both longitudinal and transverse checks shall be provided.

Number: Not less than four longitudinal and eight transverse checks shall be provided. When the rod type is used, they shall be assumed to act in tension only.

Strength: The combined area in square inches of the check rods at either end or side shall be not less than the sectional capacity in pounds divided by 60,000 when steel check rods are used.

Weigh-Beam and Accessories

Capacity: The maximum capacity of the beam shall be not greater than 1⅔ times the sectional capacity.

Full Capacity Beam: Except for special cases a beam of the full capacity type shall be provided.

Notches: The number of notches for the main poise shall not exceed six per inch.

Registering Beam: Scales that are to be used exclusively for

spot weighing of cars or carload freight shall be equipped with a type registering, or other registering beam, of a capacity that will enable the entire load to be weighed in one draft, and without the use of additional weights of any kind, except for special weighing.

Fractional Bar Stops: On registering beams the fractional poise shall be equipped with means to insure a positive stop at any 20-lb. interval, and a stop shall be provided to prevent the movement of the fractional bar beyond its proper travel in either direction.

Operating Lever: A substantial double or other approved type of hand grip shall be provided to facilitate the printing or registering of the weight on the ticket with the least possible disturbance of the beam.

Receptacle for Weight Ticket: On registering beams, means shall be provided to prevent the placing of the weight ticket in its receptacle in any position in which an incorrect weight can be registered.

Intervals: The notches and graduations on the main beam shall be made at the thousand-pound intervals.

Balance Ball: A balance ball shall be provided and its movement shall be controlled by means of a self-contained hand operated screw or other device which will not require that the ball be rotated in making any adjustments. A means for locking the ball in position shall be provided. The balance ball shall be provided with vertical adjustment.

Counterbalance Weight: If counterbalance weights are to be used, the lower end of the hanger stem shall be threaded; a cup for the loose balancing material shall be screwed to the lower end of the stem and each additional weight shall be provided with an elongated hole in the center through which the hanger stem may pass. No slotted counterbalance weights are to be used. When no counterbalance weights are necessary on top of the counterbalance cup the cavity shall be closed by a cover, secured in a positive manner. No counterbalance weights shall be used in any place in the scale, except at the beam.

Multiplication: A pivot with a loop shall be provided at the tip of the beam. The multiplication to this pivot knife edge shall be 7,000 or 10,000, which shall be plainly and permanently stamped on the beam.

Beam Fulcrum Stand: The beam shall be supported on a stand provided with compensating bearings, and shall not be suspended. The height of the pillars and the dimensions of the base of the stand shall be such as to prevent a tipping action.

The bearing surface of the base of the stand shall be finished to a plane perpendicular to the axis of the upright portion of the stand, and the knife-edge line of the bearing shall be parallel to the base. The center of the bearing line shall be vertically over the center of gravity of the bearing surface of the base.

Trig Loop: The contact parts of the trig loop shall be made of a non-magnetic material.

The play of the beam in the trig loop shall be not more than 2 per cent of the distance from the trig loop to the knife edge of the fulcrum pivot.

The beam shall be fitted with a pointer to be used in connection with a fixed graduation or other device on the trig loop to indicate a central position in the trig loop when the beam is horizontal.

Anti-Friction Points and Plates

Required: Anti-friction points and plates shall be provided to limit the relative lengthwise displacement of all knife edges with respect to their bearings.

Material: The anti-friction points and plates shall be made of hardened carbon steel and the plates shall be at least as hard as the points which come in contact with them.

Clearances: The clearances between the anti-friction plates and anti-friction points shall not exceed 1/16 in. on the beam, ⅛ in. on the shelf lever, and ¼ in. on all other levers, and the minimum clearances shall be not less than one-half these amounts, respectively.

Clearances

The clearance around and between the fixed and live parts of the lever system of a scale shall be at least ¾ in. except at points where other clearances are specified.

Factory Adjustments

Levers: The design, workmanship and factory adjustment of the levers and beam shall be such that the proper ratio of the lever arms will be maintained.

Beams: Each notch in the beam shall be adjusted to within .002 in. of the nominal distance from the zero notch.

Interchangeability

Like parts of all like scales of the same design and manufacture shall be interchangeable unless otherwise herein specified. The scale drawings and the parts of the scale shall be marked to indicate the proper positions of the parts in the scale, so as to prevent parts not symmetrically designed being incorrectly placed when the scale is set up.

Sensibility Reciprocal

Definition: The sensibility reciprocal shall be that weight required to be added to or removed from the live rails to turn the beam from a horizontal position of equilibrium in the center of the trig loop to a position of equilibrium at either limit of its travel.

Value: The sensibility reciprocal shall not exceed 50 lb. in any case.

Tolerance

The manufacturers' tolerance to be allowed on the first field test, after installation corrections, of all new railroad track scales shall not exceed 1/20 of 1 per cent, or 50 lb. per 100,000 lb., for any position of the test car load on the scale. The minimum test car load to be applied shall be 30,000 lb.

Scale Weigh-Bridges

Type of Girders: In scales of more than two sections, weigh-bridge girders may be either of the continuous type or the non-continuous type, but non-continuous girders of such design of joints over centers of bearings as will admit of flexure vertically without derangement of sections are recommended.

Steel Specifications: Structural steel work shall conform to the specifications of the American Railway Engineering Association.

Bracing: Each weigh-bridge span shall be designed for a lateral force of 200 lb. per lin. ft. plus 4 per cent of the sectional capacity of the scale, applied at the top of the live rail and uniformly distributed.

Diagonal Bracing: Diagonal bracing shall consist of not less than 3-in. x ⅜-in. angles and not less than three diagonals per span shall be used, or the equivalent of this bracing shall be employed.

The Essentials of Efficiency in Railroad Shops*

Machine Tools and Other Facilities Are Far Behind Developments in Motive Power and Cars

By Frank McManamy
Assistant Director, Division of Operation, United States Railroad Administration.

SHOP EFFICIENCY is a subject that is usually very closely associated in the minds of most of us with intensive production and stop-watch studies of the different operations in connection with shop output, and from that viewpoint it is a subject which can never be exhausted. There is no doubt but that a great deal has been and can be accomplished in that way in the matter of increasing production, although it is usually done at the expense of a more or less serious dispute with the workmen. I have sometimes found that while making time studies of shop operations with split-second stop-watches, we were overlooking conditions and methods where the time that might be saved could be measured with the hour-glass, and that we are, in many of our shops, using machines and methods that are as far behind the most modern and up-to-date practices as the hour-glass is behind the split-second stop-watch.

The transportation machine has, perhaps, been left by the war in more nearly a normal condition than any other industry for the reason that while it was worked to capacity during the war—in fact, most of the time was overworked—yet, owing to the limited facilities, it is not possible to greatly enlarge the plant, and there are no greatly increased forces because both were impossible to obtain during the war. The increased transportation furnished represented almost wholly increased effort on the part of those producing transportation and increased output of existing facilities.

The change which appears to be most important and far-reaching, so far as the railroad shops are concerned, is the change in working conditions and the increase in the rates of pay of railroad shop labor, both skilled and unskilled, and to my mind, this is a change which is permanent; therefore, it must be reckoned with in all calculations relating to the purchase or maintenance of shop equipment. These changes have made it essential to see that our men are provided with modern tools and improved facilities, because in no other way can operating costs be reduced.

The use of out-of-date tools and machinery in railroad shops—although never satisfactory—may have been in the interests of economy at the rates paid for labor before the war, but under the rates now paid the use of inefficient machinery is not only unsatisfactory but decidedly expensive.

It is a well-known fact that many railroad shops, together with their equipment were, at the time the railroads were taken over by the Government, and are today almost hopelessly out of date, and that the methods which this lack of facilities makes necessary are such that no manufacturing industry, operated on a competitive basis, could practice and exist. In fact, it has been stated that $10,000,000 spent for shops and shop machinery prior to 1917 would have made it unnecessary for the Government to have assumed control of the railroads. Whether or not this statement is true, it is a fact that one of the principal reasons for taking over the railroads was the condition of locomotives and cars in certain sections of the country which, together with insufficient terminal facilties and the effort of many shippers to use the cars as storehouses, caused such a congestion that nothing short of centralized control with complete authority could have met the situation.

A survey of the situation immediately following Federal control showed many railroads hopelessly behind in the matter of repairs to equipment, due to their limited shop capacity, although it was proved that the total shop capacity of the country, if properly distributed, was sufficient to maintain the equipment. The inadequacy of existing shops and the character and quantity of shop machinery was one of the things that received immediate consideration from the Railroad Administration, and while it was impossible in the time at hand and under war conditions to start and complete large, new projects, the matter of providing additional equipment and facilities at existing shops received earnest consideration and vigorous handling.

Investigations of shops and shop facilities during this period confirmed a belief that many of us had that the importance of having shop facilities on any railroad keep pace with other improvements is usually neglected and frequently entirely overlooked. To promote efficient operation, grades are cut down, curvature reduced, terminal facilities are added, bridges and roadbed improved and strengthened to meet the requirements of new and heavier equipment, but the last thing that is given consideration—if, in fact, it receives any consideration at all until it is forced by the condition of power and terminal delays—is the question of providing shop and roundhouse facilities for the new and heavier equipment.

The general rule in the matter of making improvements is that if the saving to be brought about by the improved facility will pay the carrying charge on the investment, the improvement is a justifiable one, and under this rule, we have all seen locomotives and other equipment scrapped because of obsolescence—that is, because the work performed by the more modern equipment was sufficient to pay the carrying charge on the investment and, therefore, the additional investment was justifiable. Locomotives from 15 to 20 years old are either modernized by rebuilding or scrapped to make room for modern power, yet a trip through the shops on practically any railroad will show that we are trying to maintain this modern power with shop tools and machinery, much of which is more than 50 years old and which should have been replaced by modern equipment years ago.

I am familiar with the statements which will probably be made that the reasons for failure to provide proper equipment in the shops is because of the difficulty in financing, but this does not cover the case because a check of the service performed by locomotives and the time lost at terminals will show that in many cases it would have been profitable to have spent the money that was spent for the last order of locomotives in providing shop facilities to maintain locomotives already on the line and that, if this had been done, the additional locomotives would not have been needed.

Efficiency

Efficiency, as applied to railroad shops, is, therefore, the ratio of the shop output to the time, labor, material and capital expended. In order that a railroad shop may be efficient it is necessary to have: first, suitable shop buildings with proper equipment and lay-out; second, an effective shop organization; third, necessary schedules so that the

*Abstract of a paper read before the New England Railway Club.

various departments of the railroad in any way related to the shop organization may coordinate their efforts.

The efficient railroad shop must have as its fundamentals proper equipment suitably disposed and properly housed. It is difficult to understand, in view of the saving to be effected thereby, why we have so long failed to erect suitable buildings for shop purposes, and this not only applies to the car department where suitable buildings do not exist, but also to the locomotive department where the loss of output in decreased efficiency due to placing machines in badly lighted, poorly arranged buildings where unusual effort is required to deliver material to and from machines which are not accessible, even to an ordinary warehouse truck, is really a very serious question. So far as possible, the travel of material through the shop should be arranged to eliminate backhauls. The material should move in as nearly a straight line as possible from the foundry or smith shop to the locomotive or car. I have seen shops where driving-box brasses were machined at one end of the shop and pressed into the box at the other end of the shop, several hundred feet distant; then returned for boring.

When any new shop machinery is requisitioned at the present time, the purchase is objected to on the grounds of the high cost, and this argument has been very effectively used. We must now, however, consider this in the light of the comparative cost for machinery and labor, and when we consider the rate paid to shop labor at the present time, we will realize that in the life of the average machine, its cost will be paid many times by the saving in the time of the workmen, to say nothing of the increase in efficiency and shop output and the additional service obtained from locomotives and cars, which are often sorely needed.

A very costly part of shop operation is the handling of material in the shop. For that reason, crane transportation, where it can be installed, is desirable, and in any event, wide aisles for the trucking of material should be provided.

Shop machinery should be located with a view to the use to be made of it, with machines or appliances for each particular kind of work in one group. For example, all the work belonging to the valve motion should be handled in one place. Similarly, driving-box work and brake rigging work should be located in one particular portion of the shop.

Someone has said, "Information is the essence of efficient operation." Nowhere is this more true than in the proper conduct of a railroad shop and, generally speaking, in few places is information as to probable requirements so sparingly furnished. Locomotives sent to the shop for repairs which are said to require the renewal of a set of flues are found to require fireboxes, and locomotives sent to the shop for fireboxes are found to need only a set of flues. It is of great importance that proper record of the condition of locomotives and cars be kept and the shops furnished as much in advance as possible with information as to the repairs which will be required on equipment destined for the shop within the next two or three months, in order that the shops can provide the necessary material when the locomotive or car is placed in the shop, thereby avoiding the too common practice of having them occupy valuable space while waiting on material.

Organization

Organization is defined as "A systematic union of individuals in a body whose officers, agents and members work together for a common end." This is especially applicable to railroad shops where the ends sought are efficient production and minimum costs. While to some it may seem unfair that brilliant, individual performances should be submerged in an average, at the same time, whether in baseball or business, team work is essentially the thing that counts.

Without an organization embodying as well as implying cooperation, little, if anything, will be gained, and this is entirely up to the supervision. Each investigation made of points where shop output is unsatisfactory confirms the belief which I have long had that effective and constant supervision is necessary in order to obtain a satisfactory output. Quality as well as quantity in production comes from the top downward. The average workman will give you, in the matter of output, exactly what you are willing to take. If the supervision is satisfied with a minimum performance and low-grade work, that is exactly what they will get.

If we are to have efficient operation in any shop, we must have supervision that is constantly on the job, and will show that the officials and foremen are as much interested in both the quantity and quality of output as they expect the workmen to be, and that they are willing to aid in promoting efficiency by seeing that the workmen have: first, a suitable place to work; second, necessary tools that are as well maintained as they can be, and third, material and supplies promptly delivered so that the workmen will not be required to lose time waiting for their helpers to obtain material from a storehouse inconveniently located, or have to hunt it themselves from the scrap pile, or rob other locomotives or cars in order to obtain it.

An important factor in obtaining shop output is properly scheduling the work through the shop so that the work of the various departments may be properly coordinated and in harmony. Scheduling will have a decided influence to keep everything moving and avoid delays due to one department waiting on another, and these schedules should not be interrupted from day to day by switching in jobs of running repairs which could perhaps be better performed in the roundhouse.

Locomotive schedules must be made very carefully. It is almost as much of a task to make out a proper schedule for locomotives through the shop as it is to make out a time card for a division. Schedules that work satisfactorily in one shop will no more apply to another than a time card for one division can be made to apply to another. A schedule once made must be carefully followed, or one gang or machine will be crowded with more work to be done at one time than it is possible to accomplish.

Locomotive schedules bear the same relation to getting work through the shop that time cards do to getting trains over the line. Every possible effort should be made to live up to the schedule, but when something goes wrong, the despatcher in the case of trains, or the general foreman in the case of the shop, must take a hand, make new meeting points, or devise new methods, hold some work back and advance other; in fact, take whatever action is necessary until the business is straightened out again.

It is no more possible to keep every engine in a big shop moving on schedule time than it is to keep every train between New York and Boston on time. If it is found that locomotives are continually behind schedule, it may be due to two causes: first, the schedule may be too fast; or second, something may be wrong in the shop that needs straightening out.

A schedule of any kind is of very little use unless some real and earnest effort is made to live up to it.

Equipment

The equipment of railroad shops is an important factor with respect both to efficiency and output. It is not efficient to continue in service, machine tools which have long since outlived their usefulness. A few conditions noted on a trip over a railroad which operates about 1,500 locomotives will, perhaps, explain more clearly than any other method of discussing the situation, the conditions I have in mind which must be given attention if we are to reduce shop costs.

The principal shop is an old structure that has been added to from time to time, and has no modern facilities or crane service. Locomotive driving wheels are removed on drop

pits in the shop. On account of the length of the shop, when removing wheels from 2-10-2 type locomotives, they are moved over the pit and spotted with the shop locomotive, and two pairs of driving wheels are removed. The locomotive is then taken out of the shop to the roundhouse turntable about 150 yards distant and turned around, returned to the shop, and the other three pairs of driving wheels are removed. To handle these wheels requires all the men that can get around them. In re-wheeling the locomotive the same process is followed; that is, three pairs of wheels are applied to the locomotive, it is then taken to the roundhouse turntable, turned around and returned to the shop so that the other two pairs of drivers may be applied.

At another shop on the same railroad, in checking the movement of parts of locomotives from the stripping pit, it was found that the driving boxes, rods, cross-heads, driver brake rigging, springs, hangers, etc., are trucked through the entire length of the shop to the lye vat, a distance of 700 feet, and then distributed to the respective places for repairs, and finally returned to the point they started from. This movement of material which is trucked through a congested shop could be eliminated by placing the lye vat at the stripping pit and in re-grouping some machines in the shop.

The driving boxes move 1,900 feet from the stripping pit until returned finished. This could be reduced to 400 feet by re-grouping the machines.

At various other points on the same railroad, we found repairs being made with the following obsolete machinery:

Wheel lathe, which was installed in 1878, on which it requires seven hours to bore a driving wheel tire which could be done with a modern, heavy duty boring mill in 30 minutes.

Tender truck wheels being turned on a 36-inch engine lathe in which but one tire can be turned at a time; therefore, the operation is very expensive. It requires five hours to turn tires which on a modern, heavy duty wheel lathe could be turned in 30 minutes.

Crown brass turning machine, built in 1861, which is entirely unsuitable for doing this work.

Wheel lathe, date of installation not obtainable, but is very old and requires seven hours to turn one pair of driving-wheel tires and six hours to turn one pair of engine or tender truck wheels.

Wheel lathe, old type, which requires six hours to turn one pair of 50-inch driving wheels, and four and one-half hours to turn tires on one pair of engine or tender truck wheels.

Wheel lathe, which was placed in the shop in 1879 and was second-hand at that time. On this machine it requires from three and one-half to four hours to bore one driving-wheel tire.

At another point locomotives are used to haul a transfer table, and this practice has been in existence for about six years.

Planers of different sizes, built in 1864 and in 1867. These machines have but one cross rail head and no side head, and are entirely unsuitable for present-day requirements.

On a mountain railroad with over 100 locomotives, a large percentage of which are Mallets, there is no wheel lathe. Tires are removed from the wheel centers and turned on a boring mill, and when necessary to turn the journals the wheels are pressed off the axles and the journals turned in an engine lathe.

This list could be added to, either on this same railroad or by going to any one of a number of others where this is fairly representative of their shop conditions, and when we consider that these and other similar machines must be used to maintain some of the heaviest, modern locomotives now in service, we will realize what some of the mechanical departments are up against in their efforts to maintain equipment.

Modern appliances are an absolute necessity, and it seems a shame that some of the up-to-date shops should be filled with hopelessly back-number machinery. In such cases, aside from improved facilities for handling, no decrease in the cost of machine work and no adequate output can be expected, and a road with such equipment will require a greater investment in motive power and cars to handle the business. The principal question is not how many locomotives a road has, but how many good, serviceable locomotives, and this depends entirely upon the facilities for repairing them and keeping them in service.

Next to the machine installation, it seems to me that the problem presented in shop operation which is most deserving of study is the question of transportation of parts; traveling cranes, mono-rail runways and jib cranes are wonderful factors in efficient shop operation.

Manufacture of Parts

It is usual for railroad shops to purchase some material and manufacture other. In some shops, the manufacturing of material is a large portion of the work done. In others, the material purchased much outweighs the material manufactured. Of course, shops, generally speaking, are repair plants and not manufacturing establishments; therefore, if we are to manufacture material or parts, I believe that a sharp line should be drawn as between material or parts to be purchased and material or parts to be manufactured, and having decided what is to be manufactured, prepare to do it in an economical and efficient manner.

The railroads have not as a general rule organized their mechanical departments on a manufacturing basis, but have depended upon outside sources for the majority of their manufactured products and such shop facilities as they have maintained have been largely for repair and maintenance work. Because of the diversified products of the ordinary railroad repair shop of today, the question of production has not been given the consideration it has in other fields. On some railroads, a start has been made towards the introduction of manufacturing methods by the establishment of centralized shop facilities which act as manufacturing plants for such commodities as can be distributed to outlying points where facilities for economical manufacture are not maintained. Such work, however, has usually been carried on as a side line at the largest repair shops on the individual roads. On this basis, it has been found economical to install special machinery and methods at a centralized point and manufacture pieces in quantities for storehouse stock to be distributed on requisition to the smaller shops or terminals over the system.

It is hardly to be expected that in railroad work, it will be possible to introduce the methods used in automobile manufacture or kindred lines, but it should be quite possible profitably to produce parts used in sufficiently large quantities at a centralized shop or manufacturing plant. Inasmuch as the finished parts for locomotives and cars are not designed to be absolutely interchangeable, either in design or manufacturing tolerances, it is necessary for the most part to provide sufficient latitude to permit of the final fitting of each piece at the point where application is to be made.

During the past few years, great improvement has been made and is being made in the design of machine tools and special machinery for railroad shop work. The installation of automatic and semi-automatic machinery adapted for railroad shop uses has been extended. The introduction of modern high capacity and special machinery into railroad shops has not always been an economical procedure, however, because of the fact that the output of the shop, where installed, has not been particularly adapted to the machinery, or because in the average shop such machinery can only be used a part of the time for the purpose to which it is par-

ticularly adapted. If parts are to be manufactured on a substantial scale, it could probably best be accomplished through the establishment of centralized manufacturing shops equipped with up-to-date machine tools and shop equipment, with particular attention to automatic and semi-automatic machines for the production of locomotive and car parts in quantities.

One of the most important factors in the successful operation of a centralized shop for manufacturing purposes is the relation between the mechanical and storehouse departments. In order to derive the maximum or even satisfactory results from such an organization, it is essential that the shop be organized for quantity production on requisitions originating with the stores department; otherwise, we would be apt to have duplication of unnecessary parts and an accumulation of expensive manufactured parts which represent obsolete designs and have no value other than scrap.

With increasing cost for material and labor, it will be necessary to reorganize railroad shop facilities with a view to keeping equipment maintenance costs within reason; therefore, modern methods of shop production should be applied to railroad work in a much greater degree than is prevalent today. Locomotives and cars should be looked at from the viewpoint of a large investment, the productivity of which increases in exact ratio to the percentage which is available for service. It is usually estimated that the locomotives on a railroad represent approximately eight per cent. of the total cost of the property, but it is this eight per cent. which makes the other 92 per cent profitable, so that even assuming that by suitable shop facilities and efficient shop operation we are able to reduce our percentage of unserviceable locomotives from 12 per cent to 10 per cent, we have done more than the percentage figures indicate since the amount of transportation which can be furnished is represented by the number of serviceable locomotives.

Steel Car Repairs

While it is true that there has been failure in many instances on the part of railroads to provide locomotive shop facilities, the situation is even worse so far as steel freight cars are concerned, and with the exception of a very few railroads, practically nothing has been done along the line of facilities for the repair of steel freight cars. Where these facilities are provided they are, as a rule, of the most meagre character; frequently home-made furnaces, which result in extravagant consumption of fuel, totally inadequate equipment of clamps, formers, etc., worn out pneumatic tools, an insufficient supply of compressed air and, in a great many cases, actual shortage of repair material is found to exist.

Hundreds of thousands of rivets are being cut by hand which could be cut by proper pneumatic appliances in a fraction of the time. With proper buildings, proper equipment and a sincere and determined effort on the part of those responsible, the steel car plant can and should be as well organized and as efficient as any portion of our repair facilities. It can be made so only by presenting to the proper officers, a list of needs, clearly showing the saving which will result from their installation and, if they are installed, by making efficient use of them. The only locomotive and the only car that earns revenue is the serviceable one.

Do not understand this as a criticism of the men in charge of the mechanical departments on the various railroads except as it may be considered a criticism of their failure more aggressively to urge that adequate facilities more promptly and economically to repair equipment be provided. Neither is it intended to make us dissatisfied with what we have, because all must realize that we must do the best we can with existing facilities.

It is rather intended to be an outline of existing conditions and is given for the purpose of directing attention to the importance of formulating and following a definite and progressive policy of railroad shop improvement, because under the changed conditions which confront the railroads at the present time, with respect to labor costs, if we are to keep shop costs within reason, efficient and adequate facilities in the way of improved shops and shop equipment, particularly machine tools, must be provided.

The Great Northern Railway of Russia

By Kenneth Durant

A CONCESSION for the building of the long projected Great Northern Railway in Russia was granted recently to a Norwegian-American syndicate, according to information transmitted to the Department of Commerce by Norman L. Anderson, the American trade commissioner at Stockholm.

The "Svensk Handelstidning" of Stockholm recently reprinted an official report of the franchise from the "Severnaya Kommuna" (Northern Commune), of Petrograd, stating that the constructing syndicate was backed by American capital, and mentioning the name of "Hannevig"—well known in Norwegian financial and commercial circles—as one of the principals. The report adds, in conclusion, that if this group does not assume the undertaking, the concession will be offered on the international financial market.

The Great Northern Railway, which is essential to all plans for the development of the great natural resources of North Russia, was planned and its immediate construction urged by a special commission created under the Russian Ministry of Ways and Communications in 1916 for the purpose of outlining the whole railroad program of the Russian Empire. The commission was headed by the assistant minister of ways and communications, I. N. Borissov. At that time the traffic on the Siberian lines was growing at the rate of 20 per cent annually and the entire railroad system of Russia was suffering from rapidly increasing congestion. The commission reported that the construction of several new trunk lines, equipped for heavy traffic was immediately essential if the economic development of the country was not to suffer serious interference. The commission outlined an extensive program of railroad construction, which included the building of 4,150 miles in the five years 1917-1821, with an additional 1,400 annually during the succeeding five years. (This estimate left out of account special lines urged on the grounds of strategic necessity.) The whole program called for the construction of between 28,000 and 30,000 miles of railway between 1917 and 1926. If this plan had been realized, Russia would have between 70,000 and 75,000 miles of railroad by 1927; still greatly less, of course, than the railroad mileage of the United States in 1914. The plans outlined by the commission would have given Russia only 4.5 miles of railroad per 10,000 population and only 9.4 miles per 1,000 square miles of territory. The budget for materials and labor necessary for this program was estimated by the commission at $600,000,000.

Among the roads recommended for immediate construction by this commission was the Great Northern Railway, running north of, and parallel to, the Trans-Siberian railroad, and designed to relieve the heavy traffic on the latter and to stimulate the development of the vast coal and mineral resources of the Urals.

The Great Northern Railway is planned to run from Soroka, a station midway on the Murman Railway, near the Gulf of Onega, via Kotlas, a town on the Dvina river, thence across the Urals, and so on to the junction of the Obi and Irtish rivers in Siberia. From Kotlas it is proposed also to run two main lines to Zvanka, where the Murman Railway joins the Petrograd-Vyatka-trans-Siberian line, or else to run

past Zvanka directly to Petrograd. In addition there are planned shorter spur lines into important industrial districts. In all, the project represents about 2,000 miles of railway.

The concession first comprises the construction and operation of a Russian standard gage (5 ft.) road for general traffic. In addition the contracting syndicate secures the right to exploit about 22,000,000 acres of Russian forest. Of this about 5,500,000 acres are for the needs of the constructing company for a term of 80 years, the net profits from whatever mills and factories the company may establish to be included in the surplus of the railway. The remaining 16,500,000 acres of forest are given to the company for 48 years with the right to fell the whole district. Besides the forest concessions, the constructing syndicate is given the right to exploit all live mineral lodes found on examination of the lines. The company also has the right to establish and run shipyards, ports, and steamship lines, and will be given, free of charge, districts suitable for the establishment of towns and villages. Further, it may use all water power in the neighborhood of the railway. All such undertakings are considered a part of the railway enterprise.

In return the Russian Soviet Republic is to be paid one half kopeck per pood (36 lb.) for ore mined, without regard to the kind of ore; and will collect a charge of 5 per cent of the London market price on all timber cut. The company is relieved from income and industrial taxes, paying, instead, 25 per cent of its net profit.

The road, should it be built, would be of incalculable importance to the future development of North Russia, bringing transportation for the first time to the vast mineral, coal, timber, petroleum and agricultural resources of North Russia.

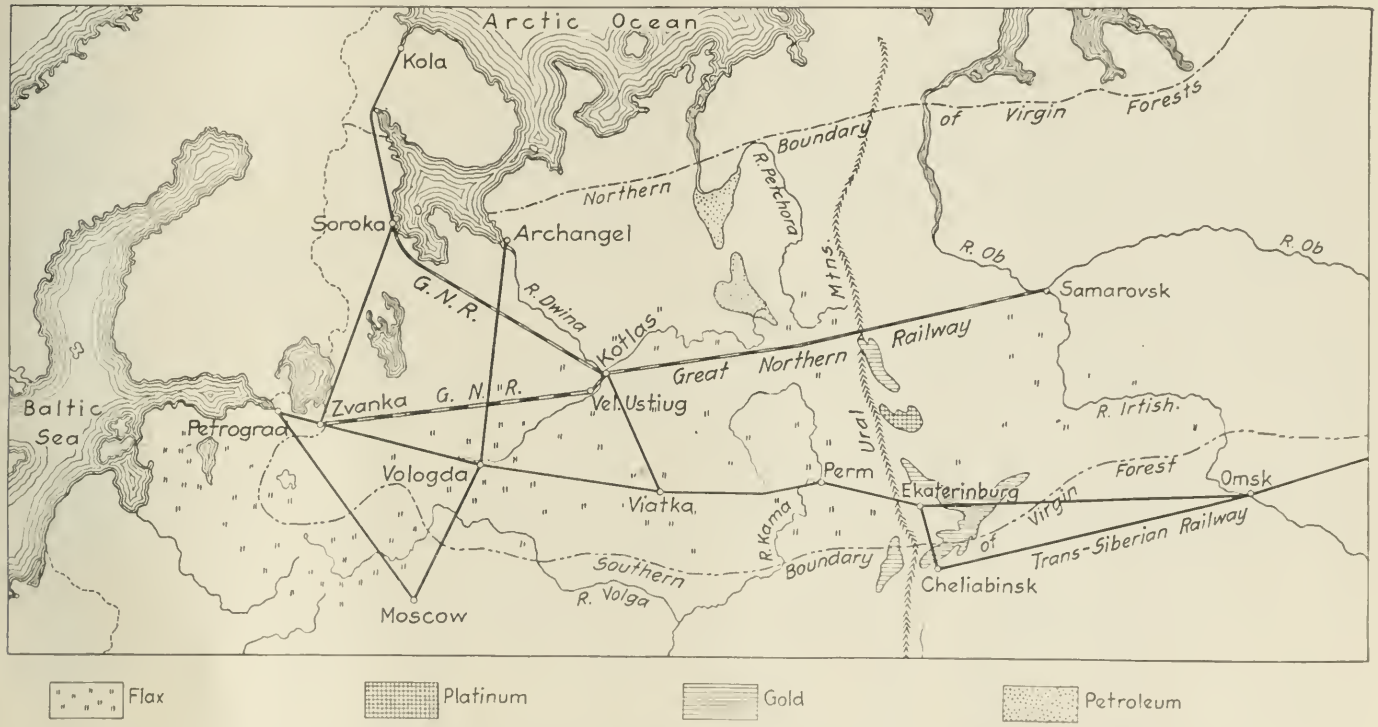

Diagram Showing the Proposed Great Northern Railway and Its Relation to Russia's Present Railways

Farmers Would Build Railway.—The farmers of Lake St. John, Canada, are applying for a provincial charter to build and operate their own railway through the entire region, covering several hundred miles and giving the remote districts of the north an outlet on the gulf board of the St. Lawrence, probably at the mouth of the Saguenay river.

Relation of Freight Charges to Values of Commodities*

By Julius Kruttschnitt

Chairman of the Executive Committee and President of the Southern Pacific Company

As THE GENERAL IMPRESSION of the relation of increases in steam railroad freight rates to the present high values of commodities is greatly exaggerated, the time seems peculiarly opportune to place some computations before you which show that transportation charges have played but a small part in lifting commodity prices to their present unparalleled level. This erroneous impression has been inspired and fostered by public speakers, by representatives of organized labor and by others, due we believe almost entirely to ignorance of the slight influence of freight charges on costs of commodities. The cumulative effect of all steam railroad freight charges, which in their remotest ramifications could affect the values of commodities, for the year 1914, which marked the opening of the war, has been weighed, and the same has been done for 1919. As we seek to establish the comparative effect of freight charges on commodity prices in two periods, six years apart, the Commission's methods used in computing tonnage and revenue statistics and ours in establishing prices being the same in both periods, will not affect the soundness of our conclusions.

	1919	1914
Average commodity value per ton of "freight originated" dollars	119.00	56.00
Freight charges per ton originated, dollars	2.80	2.00
Ratio of charges to value, per cent	2.4	3.6
Increase in cost to consumer, 1919 over 1914, dollars	63.00	.....
Increase in freight charges per ton, dollars	0.80	.....
Relation of freight increase to cost increase, per cent	1.3	.....

In other words, only 80 cents out of $63, or 1.3 cents out of every dollar of increase in value of commodities in 1919, was caused by increased freight charges; the responsibility for the remaining $62.20, or 98.7 cents out of every dollar,

*A letter to Hon. John J. Esch, chairman of the committee on interstate and foreign commerce, House of Representatives.

must be sought elsewhere; it was not caused by freight charges.

So many commodities originate on railroads, the values of which are affected by freight charges, some exerting substantial and some exerting negligible influence, that their influence on commodity values in individual cases cannot satisfactorily be computed, but the relation that the nation's entire yearly freight bill bears to the value of all commodities transported by the railroads can be satisfactorily and accurately measured.

In the year ended June 30, 1914, the Interstate Commerce Commission reports show that all Class I and Class II steam roads in the United States originated 1,094,123,895 tons of classified freight, (tonnage of Class III roads that earn less than $100,000 per annum, whose aggregate freight revenue is but 0.53 per cent of the total, is not reported by the Commission), for transporting which the carriers collected $2,114,697,629, an average of $1.93 per ton; they also received $75,541,569 express revenue for transporting additional tonnage of unknown amount; nevertheless, we have added express revenue to freight revenue without any addition to aggregate tonnage or values, thereby increasing the average freight charge per ton from $1.93 to $2, and the percentage of freight revenue to commodity value from 3.4 to 3.6. The 1,094,123,895 tons are classified by the Commission under 38 heads, to which appropriate unit values, based on data obtained from publications of the United States Department of Labor, from the United States Railroad Administration, from quotations in the press and from other reliable sources, have been assigned.

The aggregate value of all tonnage originated and transported by the railroads, thus determined, is $61,482,000,000 (*does not include the value of express tonnage, which is unobtainable*), which, divided by the number of tons originated, gives the average value per ton of all commodities $56, to which the $2 freight charge bears the relation of 3.6 per cent.

Under the heading of "tons originated," the Interstate Commerce Commission includes every ton of freight that originated on the lines of the carriers. A ton originating at San Francisco, for example, and shipped through to New York is counted as but one ton, regardless of the number of carriers over whose lines it passes. Freight and express revenues as reported by the Interstate Commerce Commission include all freight and express charges accruing both before and after manufacture. No transportation charge, however small or remotely affecting the cost of either a raw or of a manufactured article, can escape detection and inclusion in aggregate freight and express charges.

	Bradstreet's index No.		Ton mile rate (cents)	
Year	Actual	Relative	Actual	Relative
(1)	(2)	(3)	(4)	(5)
1899	7.21	100.00	.724	100.00
1900	7.88	109.35	.729	100.69
1901	7.57	105.06	.750	103.59
1902	7.88	109.24	.757	104.56
1903	7.94	110.07	.763	105.39
1904	7.92	109.83	.780	107.73
1905	8.10	112.33	.766	105.80
1906	8.42	116.75	.748	103.31
1907	8.90	123.50	.759	104.83
1908	8.01	111.09	.754	104.14
1909	8.52	118.10	.763	105.39
1910	8.99	124.66	.753	104.01
1911	8.71	120.85	.757	104.56
1912	9.19	127.42	.744	102.76
1913	9.21	127.71	.729	100.69
1914	8.90	123.49	.733	101.24
1915	9.85	136.66	.732	101.10
1916	11.83	164.01	.716	98.89
1917	15.66	217.15	.723	99.86
1918	18.73	259.84	.862	119.06
1919	18 11	251.21	.986	136.46

We have had to estimate data for the entire year 1919 from those that have already appeared for the first six months, and as the estimated traffic is substantially the same as that of 1916 we have applied 1919 prices to the tonnage of classified commodities of 1916, whence the average value per ton is $119, or 112 per cent more than that of 1914. Freight charges per ton, including express charges received by the carriers, are found to be $2.80, or 40 per cent more than in 1914. From this it appears that the relation of average freight charges to the average value of commodities, because of the more rapid rise in values than in charges, is less in 1919 than it was in 1914.

The preceding table shows the relation of average freight rates to values for the past 21 years. Column 2 gives Bradstreet's Index Numbers of commodity prices, Column 3 reduces these numbers to the basis of that of 1899. Columns 4 and 5 give actual and relative average ton mile rates.

The following will be observed:

From 1899 to 1900: Rise in prices 100 to 109.35, freight rates substantially unchanged. From 1907 to 1908: Fall in prices 123.5 to 111.09, rates substantially unchanged. From 1908 to 1912: Rise in prices 111.09 to 127.42, fall in rates. From 1915 to 1916: Rise in prices 136.66 to 164.01, fall in rates. In 1916 and 1917 prices were *higher* and freight rates *lower* than at any time in 19 years. From 1918 to 1919 a fall in prices of 259.84 to 251.21 and a sharp rise in rates.

The New York Sun, August 31, 1919, gives Dun's index numbers of living costs for each of the first seven months of 1919. During this period freight rates were unchanged; nevertheless, the index number for August is 10.4 per cent higher than in April.

In the case of imports that reach our shores unaffected by domestic freight charges, the slight influence of freight charges on their selling prices is ascertainable. For example:

Commodity	From	To	Miles	Freight per 100 lb.	Value per 100 lb.	Per cent frt. to value
Brazil coffee,	New York,	Pittsburgh	444	$0.27	$20.50	1.30
Japan rice,	New York,	Pittsburgh	444	.225	13.00	1.70
Japan tea (Yg. Hyson),	New York,	Buffalo	440	.60	65.00	0.92
Japan tea (Breakfast),	New York,	Buffalo	440	.60	34.00	1.80

California oranges have at times been bought by the box in the East *at the California price.* Prices of cantaloupes by the case are shown in the United States Department of Agriculture review of Imperial Valley, cantaloupe crop of 1919, as follows:

PREVAILING MARKET PRICES—(BOX OF 45s)

	San Francisco	Miles from Imperial Valley	N. Y.	Miles from Imperial Valley
July 1	$3.10	700	$2.75	2,580
2	3.35	700	3.35	2,580
5	3.25	700	3.35	2,580

In dealing with the almost numberless commodities embraced in a total of over a billion tons, it is impossible, in casting up "average commodity value per ton of freight originated," to assign to each its exact influence, although great care was exercised in selecting unit values. Criticism of our investigation in some direction is perhaps unescapable, but as the relation of commodity values in 1914 to those of 1919, computed by us, is 100 to 212 and that of the United States Department of Labor, published in the Labor Review of July, 1919, is 100 to 210, we feel that the close coincidence of these figures strengthens our confidence in our computations and conclusions, which we believe are free of substantial error.

A JAPANESE COMMISSION of railway and civil engineers is now in Mexico for the purpose of making a study of the topography of the Isthmus of Tehuantepec. This has given rise to reports that Japanese interests will build a railroad across the Isthmus. Recently it was announced that Japanese merchant ships were making Salina Cruz, on the west coast of Mexico, a port of call. Japanese settlers are said to be entering through this port. The only present railroad across the Isthmus of Tehuantepec is owned by British capital, but is controlled by the Mexican government.

Maintenance of Way Painters Convene at St. Louis

Propose Vocational Training and Labor Saving Equipment to Offset Shortage of Workman

THE SIXTEENTH ANNUAL CONVENTION of the Maintenance of Way Master Painters' Association, which was held at St. Louis, Mo., on October 23, 24 and 26, was devoted for the most part to a discussion of ways and means of overcoming the prevailing shortage of skilled painters. As a means to this end, the spray process was accorded the most interested discussion, but considerable attention was also given to a paper on the employment of painters the year round as a means of attracting and holding a better class of workmen, and to an address on the need of vocational training to replace the abandoned apprenticeship system. Other papers were devoted to further matters of direct application to the special problems of the trade. G. W. Thompson, Research Laboratories, National Lead Company, Brooklyn, N. Y., presented a paper entitled "The Limited Palette," in which he demonstrated that a wide variety of colors and shades could be obtained by the intelligent mixing of a few basic colors. Martin Kane, bridge and building master, Delaware & Hudson, Albany, N. Y., recalled the work of the grainer, which was once so popular and pointed to a number of modern tendencies that were leading to a revival of graining as a surface treatment. F. C. Rieboldt, master painter, Chicago, Milwaukee & St. Paul, Milwaukee, Wis., outlined the precautions necessary to obtain good results in painting under extremes of temperature. H. B. Wilson, master painter, Bessemer & Lake Erie, Greenville, Pa., submitted a very complete list of tools and equipment required for all classes of maintenance of way painting together with a discussion of the requirements of the more important items in the list. Economy in the handling of tools was also subjected to a lively discussion.

The officers of this association during the past year were: President, H. E. Conrad, master painter, Pennsylvania Railroad, Huntingdon, Pa.; first vice-president, H. F. Jones, master painter, Cleveland, Cincinnati, Chicago & St. Louis, Wabash, Ind.; second vice-president, Ole Stubstad, master painter, Chicago & North Western, Winona, Minn.; secretary-treasurer, F. W. Hager, master painter, Fort Worth & Denver, Fort Worth, Tex.

Address of the President

The most pertinent feature of President Conrad's address to the convention at the opening session was his reference to the Plumb plan, which is presented in part below:

"I wish to make an appeal to the members of this association on the subject of loyalty to our employers. At the present time much propaganda is being spread for the Plumb plan of government control and it has many followers among the radical class.

"The most ordinary common sense, awakened self-interest and knowledge of human nature and human experience should quickly repudiate the fallacies inherent in this plan. The danger is that public thought will not be quickened to the situation, and through lack of understanding and organization, legislation may be forced through Congress by means of organized political pressure, backed by abundant funds for propaganda and lobbying, which will work irreparable mischief before the public is aroused to the peril. As to the labor unions, they are on trial before the public of this country, and they must cleanse themselves of their anarchistic elements or fall. Therefore, let each and every one of us, who believes in American institutions, in property rights, in orderly government, line up in opposition to those who wish to confiscate our industries and bring about a chaotic state in our government."

The report of the secretary recorded a net gain in membership of 11, giving a total of 82 members in good standing. Thirty members were in attendance at the meeting.

Below is given an abstract of three of the papers presented, together with the discussions following their presentation.

Keep Men Employed Throughout the Year

BY HARRY F. JONES

Master Painter, Cleveland, Cincinnati, Chicago & St. Louis, Wabash, Ind.

It is impossible to keep practical men by working them six months of the year and laying them off the other six. Under this system we are merely operating a trade school. The men we get are inexperienced. We spend our time during the summer trying to teach them, but some other industry gets the benefit, for when we lay them off in the fall we very seldom get them back in the spring. When the time comes to put on men we open up our trade school again and pay another gang of inexperienced men good wages to teach them the trade.

The problem of arranging the work so as to keep men employed throughout the year would be a very small job for the master painter were he allowed to do so. My system of handling the work is as follows: We do our road work as early in the spring as possible, using motor cars and men enough to finish it in as short a time as possible. Consequently, we do not drag it along in the middle of the summer, using valuable time and weather that should be used to better advantage on other work. After completing the road work we give the steel work the attention it should have. I think steel structures should be taken care of during the warm months of the year. My experience has been that we get better results—a better job of cleaning and longer life of the paint.

After completing the steel I start the station work, doing the exterior work first, leaving interior work wherever possible for winter months, especially all offices, interiors of shops, etc. During October we take care of all the glass requirements, replacing all broken glass, also reglazing all sash that require it.

The first of the year I make a schedule of the work to be done that year, showing the amount of labor and material that will be required to execute the work we have listed We have been using this system for several years and I find it much better and more practical than the old way under which we had no system. We get a better class of work at less cost by keeping the men employed throughout the year.

Results Secured with Spray Painting

BY H. S. BIRD

Master Painter, Philadelphia & Reading, Philadelphia, Pa.

Spray painting is not of a recent origin. My first experience with it was in 1897. The machine was a rather crude affair, composed of a hand pump for compressing air into a storage tank, a receptacle for mixed paint and a hose with a nozzle attachment. The paint used was rather thin in character; owing to the low pressure obtained with a hand-

pump the heavier paints could not be used. Two men were required to operate this machine. The spray produced was of a cloud effect and as the operator received a large portion of the spray and inhaled a considerable quantity, the results were not at all satisfactory.

The modern spray machine is quite different. It is equipped with power air compressors which provide air at higher pressures and make it possible to use a heavier bodied paint, which is applied with considerable force and in a satisfactory manner. The nozzle or gun can be adjusted to a broad or fine spray, the broad spray being adapted to large flat surfaces. The finer spray can be adjusted to narrow surfaces and deep crevices which cannot be reached with a brush.

Some reports I have received from concerns using spray equipment complain of the heavy bodied paints clogging the nozzle. This may be due to many reasons other than the fault of the equipment. The pigment may not be thoroughly mixed, or an incompetent operator may be at fault.

Spray painting applied by an experienced operator is economical in more ways than one. He is not only able to cover a large surface in much less time than with brush work, but he has a greater reach, therefore saving in the moving of planks and scaffolds. He is also able to reach inconvenient places, thereby eliminating the erection of special scaffolds or rigging, which would be necessary in brush work. I find in some cases a saving in the labor cost of 80 per cent and in material of 30 per cent. This is no doubt true where a competent operator is employed, but in painting railings or lattice work it is the general opinion that the spray is wasteful of paint. This loss, however, is small in comparison to the saving in the cost of labor.

As to the permanence of coatings, this is a question which seems yet to be in doubt. Some report that the spray coatings seem to be equal to that of the brush method, while others are of the opinion that it is not as satisfactory as brushing the material thoroughly. This, of course, could be determined by making a comparative test.

Discussion

Several members raised a question as to the saving of 30 per cent of the material. One or two related some unsatisfactory results secured with the spray process, but upon inquiry by others it developed that these experiences concerned the use of home-made devices or to attempts to use the spraying machines without proper instruction or training. President Conrad stated that in painting some girders stored in a yard one man with a spray accomplished as much as five men with brushes, but he did not claim that this record could be equaled on all classes of work. He found the spray of particular advantage for close quarters, as on the inside of box girders, but felt that there was a considerable value in the thorough brushing of paint, which was not obtained with the spray process.

He also emphasized the necessity for thorough instruction of the workmen in the proper use of the spray; in his experience, the men were very much opposed to the machine at the start but became very enthusiastic about it after becoming accustomed to its operation. In answer to a question, Mr. Conrad said that he mixed a certain amount of turpentine with the paint to thin it, but had found it practicable to use straight lead and oil in the machine.

The general tenor of the discussion indicated a serious interest in the possibility of the spray process as the solution of the labor problem of the master painter. Several expressed a willingness to co-operate with the manufacturers in the development and application of this labor-saving device.

C. B. Lyons, representing the DeVilbiss Manufacturing Company, Toledo, Ohio, presented a lantern slide talk on camouflage spray painting in France and a general exposition of spray painting practice, which served to answer many of the questions which had been raised in the course of the preceding discussion.

Vocational Training

By D. Louis Ireton

Chairman, The International Trade Education Development Committee of the United States and Canada, New York.

The need for more and better trained workmen in the painting trade is recognized everywhere. The abandonment of the old-time apprenticeship system, and our dependence upon foreign trained or untrained brush hands has caused a great deterioration in the quality of the work, and a lowering of its standards, until now we find it very hard to attract ambitious boys and young men to the trade. Unless there is a great awakening among those directly interested and greater co-operation and support of some definite apprenticeship system by master painters and manufacturers of paint materials, we are bound to suffer the consequences.

Ever since the passing of the old apprenticeship system, little or no consideration has been given to providing a substitute, because in our rush for greater production, and the ease with which we obtained the foreign trained worker immigrating to our shores, caused us to forget and willfully neglect our own American youth, who were left to drift haphazardly into all sorts and kinds of blind-alley jobs that lead nowhere.

America is a great industrial nation and must in the future depend upon her own resources for supplying the necessary skill and efficiency. It can no longer rely upon the foreign trained product, as in the past, but it is our own American youth who must meet the new conditions, and right now is the time for us to adopt a system of training that will fit them for present emergencies, and for others that are bound to follow as additional demands are made upon us. This presents problems, the solution of which calls for the fullest co-operation of all trades.

It is generally recognized that in abandoning the training which was given by apprenticeship and falling in line with the trend towards specialization in modern industry our workmen became greatly handicapped. There is a vast difference between the mechanic trained in one operation and the craftsman who has been trained thoroughly for all operations. The industries still have need for workmen who are qualified to assume every part of the particular trade in which they are engaged, and this can be provided for only through a properly organized apprenticeship system, either in the shops or schools, where a trade is taught in its entirety and a definite standard of ability established.

We must meet the issue fairly and squarely and solve the problem through compulsory laws if need be, but let us put a stop to this vast waste that results from our present faulty system, which menaces the welfare of thousands of our youth and causes millions of dollars of loss to employers through the lack of efficient and properly trained workmen. Let us have trade schools that will not only extend vocational training, but also help in increasing civic efficiency.

The national government believes in this new and much needed form of education as very essential to the country in establishing standards of efficiency for all vocations. But you must bear in mind that no scheme of education is self-operating, and that your craft will not be represented in this broad and most liberal provision unless you personally take the initiative in your own locality and thereby show the necessity for training apprentices in your craft.

In conclusion, I would warn you of the great problems facing us, of the unrest among the laboring classes; of the dangerous propaganda and influence of agitators striving to obtain control of our labor element for personal gains. The demoralization of our laboring classes by this alien element

is far reaching, and its influence will be felt not only in our workshops but also in our homes.

We must have 100 per cent Americanism among our workers, and we must insist that in our system of education and training, and also in the utilization of our resources, we recognize and maintain a standard that will insure 100 per cent Americanism in our civic, social and industrial life.

Closing Business

Acting upon the suggestion of President Conrad, the date of the next convention was selected so as not to conflict with that of the Bridge and Building convention, and it will be held at Detroit, Mich., on October 5, 6 and 7, 1920. The annual election of officers resulted in the selection of the following officers for the coming year: President, H. F. Jones, master painter, Cleveland, Cincinnati, Chicago & St. Louis, Wabash, Ind.; first vice-president, H. B. Wilson, master painter, Bessemer & Lake Erie, Greenville, Pa.; second vice-president, Bert. E. Darrow, master painter, Atchison, Topeka & Santa Fe, Kansas City, Mo.; secretary-treasurer, and E. E. Martin, master painter, Union Pacific, Kansas City, Mo.

Operation of the New York Terminal District*

Export Freight Has More Than Doubled in Five Years, but Facilities Were Built Forty-five Years Ago

By J. J. Mantell
Terminal Manager, New York Terminal District

THE PORT of New York presents, I believe, the largest and most difficult freight handling problem in the world today. It has fifty miles of waterfront with berthing facilities for from 450 to 500 vessels; 90 per cent of these facilities are located on the Staten Island, Brooklyn and Manhattan shores, the remainder on the Jersey side. The percentage of piers equipped to handle freight direct from car to vessel is negligible. The carriers have provided accommodations at the rail-heads for 31 vessels; these piers, however, are principally used for storage and for the transfer of freight from storage and from cars to lighters and barges.

New York is essentially a lighterage port and differs materially from other large ports, both here and abroad, in that practically all of them have rail-head service more or less on the order of Boston, where direct deliveries are made from cars to steamships. Furthermore, within a radius of twenty miles of lower Manhattan reside one-tenth of the population of the entire country. When you consider the industrial needs of this population together with the large import and export tonnage handled, and the peculiar physical characteristics of the harbor, it will give some conception of the magnitude of the railroad facilities necessary and the expensive operation that must obtain to serve a community and a port of this kind.

Before attempting a description of the facilities including marine equipment and piers it might be well to give some data as to tonnage handled by the railroads. The total imports and exports of the United States for the fiscal year ending June 30, 1918, amounted to approximately 45,000,000 tons; 18,000,000 or 40 per cent was handled through the port of New York. As a comparison the Seattle district handled 5,400,000 tons, New Orleans 4,800,000, Philadelphia 3,000,000, Norfolk 2,800,000, Baltimore 2,250,000, San Francisco 2,300,000, Boston 2,200,000, Galveston 1,100,000 and Savannah 260,000 tons.

The daily average local handling is 6,000 cars. There are maintained for this purpose 95 freight stations with storage capacity for 4,000 carloads and team track facilities for 3,500 cars. Practically all of the stations in Manhattan and Brooklyn are what is known as "pier stations" served from car-floats. The movement to these latter stations via car-float is 2,000 cars daily and there originates at these same stations 1,400 carloads of outbound freight. Advantage is taken of cars made empty on car-floats for outbound loading and the surplus empties are returned across the harbor for forwarding. The direct rail station service on Manhattan and Brooklyn approximates 600 cars per day; the same traffic on the New Jersey side amounts to 800 cars per day and service to the industrial sidings in the territory amounts to 1,200 cars per day.

The fruit and vegetable traffic affords a very interesting study of the highly specialized character of one of the operations. There are 90,000 cars of fruits and vegetables handled to New York yearly and this movement is confined almost exclusively to two railroads, the Pennsylvania handling practically all the southern and the Erie the western business. The California fruit, arriving over the Erie, is not only delivered at its Duane Street pier station but is first unloaded and sorted, then displayed and auctioned on the premises, after which it is removed by the buyers. The southern movement over the Pennsylvania Railroad from the Virginia gateways is disposed of in like manner, except that the sale is conducted privately on the piers. Considering that this is a seasonal movement, some conception may be had of the demand made upon the railway facilities involved.

Of the export freight 90 per cent is handled at the Jersey shore terminals. With but very few of the steamships docking on the Jersey shore, it is necessary that practically all cargo be lightered to ship's side at steamship piers. To handle the lighterage business in the port the railroads maintain for ordinary freight 1,600 open and covered barges with a capacity of 12,000 carloads, 371 car-floats with a total capacity of 5,300 cars and a fleet of 134 tugboats for towing purposes. This is the fleet maintained under normal conditions but, of necessity, is augmented by charter when business is above normal. Export grain and tidewater coal is handled by special equipment, the export grain being handled by five elevators and one trestle, four of which have facilities for direct vessel loading. When steamers do not take full grain cargo it is handled to ship's side on special barges and there loaded by floating elevators. The carriers operate some 100 grain boats in this service. In the tidewater coal traffic there are 2,590 coal boats in use and during the past year 537,324 carloads of tidewater coal were received at the port of New York, aggregating 24,968,313 tons, of which 4,770,320 tons were destined and carried by water to New England points as far east as Boston, the latter figures being exclusive of that coal moved to this section on car-floats through New York harbor. The transfer of the fuel from car to boat is accomplished by 12 McMyler auto-

*Address before the New England Railroad Club, December 9, 1919.

matic dumpers having a ten-hour capacity of 250 cars each. There are also 13 old style coal trestles, the latter being maintained more as an emergency than for general daily use.

There are nine principal trunk lines serving the port of New York and with the exception of the New Haven, all maintain terminals on the New Jersey shore. The New York Central is the only line that enters Manhattan by rail; the freight movement via this route is confined practically to team track, industrial side track and inland station deliveries. Export as well as other domestic freight is routed over the West Shore road to the terminals at Weehawken on the New Jersey shore.

Between the Hudson river and the Palisades and Newark bay the carriers maintain tidewater yards through which the business for pier stations in Manhattan and Brooklyn as well as the interchange is handled over 50 float-bridges, some of these are electrically operated and capable of loading six floats per hour. In these yards there are maintained 70 covered and open docks for the accommodation of domestic and export lighterage freight. The covered docks have a storage capacity of 9,000 carloads of freight and storage has been developed on the ground in the various terminals for 20,000 carloads of rough freight. Local team tracks, freight stations and warehouse facilities are also maintained in these yards. The team tracks, local stations, lighterage piers and other warehouses are served from these yards, cars being regulated to the tidewater yards from the large classification yards which all railroads maintain on the west side of the Palisades and Newark bay, and which are connected to the tidewater yards through mile long tunnels, open cuts and bridges. The open docks are equipped with mechanical cranes, both electrically and steam operated, of the locomotive, Gantry, etc., type. In addition, the suburban passenger traffic of all lines but the New York Central, New Haven and Long Island discharges at stations in this highly congested territory.

West of the Palisades and Newark bay on the meadowland are located the general classification yards or break-up yards, which include receiving, hump or gravity classification and storage yards, some of which have a capacity as high as 7,000 cars. In addition to the purely rail operation, all the necessary facilities such as icing stations, car repair shops, transfer platforms and ground or open storage are provided. Here inbound trains are received and broken up, cars reclassified and held until such time as they can be accepted in the advance or tidewater tracks. The capacity of all yards in the New York district is 90,000 cars, the normal in and outbound daily movement is 25,000 cars. At times in the past year there have been as high as 65,000 cars held in this territory. The movement of the freight traffic requires 640 eight-hour switch engine shifts.

Handling Export Freight

It is noteworthy to mention some of the important features in the handling of export freight. The fluctuation in the number of available ocean bottoms, the uncertainties of scheduled arrivals causing congestion at the piers, and the necessity of proper time distribution of weight and measurement cargo for ship's side, require a highly specialized car and lighter handling. These factors coupled with the complicated requirements of the consular and customs departments of the different receiving countries, made necessary the institution of the ten day free time feature on export freight. To obviate the necessity for holding this cargo on wheels awaiting movement to vessels the railroads have provided the storage previously mentioned. This necessitates a second handling but increases the capacity of the port by that many cars and results in the saving of an inestimable number of car days. Single, double and triple deck piers, equipped with elevators and gravity conveyors, electric trucks, electric tractor trucks and trailers and various other mechanical devices are used in conjunction with this export lighterage operation. Local consignees also have the privilege of lighter service at any of the 114 equitably distributed public piers and bulkheads or at any place they may designate within the harbor. This is, of course, in addition to the deliveries made at the established freight stations.

Prior to and during the war the railroads developed berthing space alongside the various piers on the New Jersey shore to accommodate 31 vessels. The traffic intended for direct vessel loading was regulated from the interior in practically full cargo lots and was handled direct from car to steamer. There was as high as 104 steamers per month handled at these railroad piers with a resultant saving of barges, lighters, tugboats and expense. The tendency during the last few months has been against direct loading of this kind owing to the lack of teamways at certain piers to take care of a small amount of freight originating at New York City. This condition could no doubt be taken care of until such time as teamways were improved or provided by the lightering of the New York City freight to the Jersey shore piers; this freight would not amount to 10 or 15 per cent of the entire cargo.

Exports Doubled in Five Years

The export handling through the port of New York has doubled in the last five years. If New York is to retain its supremacy as the foremost port serious and immediate consideration must be given to its proper economic development, considering the port as a whole and not only that part which is under the jurisdiction of the city of New York and state of New York but, as well, the section on the Jersey shore. The pier development in New York is by no means modern, with the probable exception of the Chelsea district; practically all the piers from the Battery to this district were planned and built over 45 years ago, and with the exception of the extensions that have gone on from time to time these piers remain the same narrow piers as originally constructed, being from 60 to 95 feet wide. The slips are narrow and intended for the accommodation of the old type steamer. With two modern steamships in a berth there is little room for the accommodation of freight barges, and in many instances when steamers are taking bunker coal, with other barges alongside loading and unloading, it is impossible to shift out empty barges from the forward hatches. Railroad equipment is seriously delayed and it takes practically twice as long to turn over marine equipment today in comparison with the operation five years ago, with a resultant increase in expense to the carriers. The city must also give serious consideration to the fact that the ever increasing population increases the traffic that must be handled by the carriers, and that practically all of the railroad stations serving the city are pier stations municipally owned and are now being used to the utmost of their capacity. While many plans have been prepared by the different city administrations nothing definite has been worked out, nor has any start been made. There have been many plans for marginal railroads, interior freight stations and warehouses; most of them looked good from an engineering viewpoint but lacked the essentials of practical operation, did not comprehend the volume of business to be handled and made no provision for the future. To handle the present domestic business now handled by car-float and lighter to pier stations and to care for prospective increases in the business for the next 15 to 20 years would require several batteries of floatbridges taking up a considerable portion of the space available through the release of pier stations, and would tremendously increase the expense incidntal to the operation of an underground marginal railroad with its heavy overhead and heavy direct operating expenses, in addition to the switching expense necessary to serve the floatbridges, inland freight stations, team tracks, etc.

It is a question in my mind whether you or I will see the

day when the railroads can get away from the pier stations in New York, but it is certain most of them will be forced to make increasing deliveries of New York City freight at team tracks and stations on the Jersey shore. In fact, during the peak periods it is now necessary that some volume of the New York City business be handled on the Jersey shore. A vehicular tunnel has been planned by the States of New York and New Jersey to connect Manhattan Island and Jersey City, with the New York end to be located at Canal street and the Jersey City end at 12th street. The traffic which is now trucked via ferry will no doubt be diverted to the tunnel, but the full benefits of the proposed tunnel will not be felt until the railroads have money available for the further development of their Jersey shore properties. They will require additional freight stations, team tracks, warehouses, etc. The territory in Manhattan to be served by the tunnel is somewhat limited; I have in mind the large stretch of territory from the Battery to the Bronx, and in this connection the Brooklyn and Long Island situation. Further, the heavy interchange of cars between the New Jersey and New England roads should be via tunnel connecting Greenville and Bay Ridge under New York Bay. A tunnel of this kind would cost approximately thirty million dollars.

Heavy Cost of Terminal Handling

To emphasize the expensive operation at this port I might say that on many of the commodities handled the cost of the terminal handling from receipt of car at the outside classification yard to delivery in New York equals the operating cost of hauling cars from Buffalo to Pittsburgh to the terminal. This situation can be corrected by the development of facilities along the lines of economic handling with the co-operation of the States interested, the Federal Government and the railroads. The solution, I believe, is the development of two large clearing yards in New Jersey, one to the south and one to the north, to take the place of present individual classification yards. It would be necessary to have two clearing yards as one yard sufficiently large to accommodate the business of the port would be unwieldy in its handling. These yards could be connected by a belt line railroad; floatbridges could be centralized and the water front developed to provide multiple story steamship piers along the New Jersey shore from Greenville to Weehawken, a distance of approximately nine miles, the upper floors to be used for storage and the lower floor equipped with teamways and tracks for the handling of freight direct from car to steamer. Piers should be developed to suit the needs of the individual interests and so constructed as to provide for the handling of weight and measurement cargo at the same pier. Outside open tracks should be provided, where necessary and piers equipped with overhead cranes and various other mechanical devices, detailed description of which would take up too much time.

What is true of conditions in New York, in respect to modern facilities and mechanical devices, modern piers and adequate slip room between piers is also true of practically all the other ports in this country. We Americans have the inventive genius but we do not seem to apply it at home. New York and other American ports cannot be compared with some of the ports abroad, particularly Hamburg. The import and export freight of the United States is increasing in volume from year to year; the increase is more pronounced at the North Atlantic ports and there is at present some competition among the various ports for the handling of this business. To my mind the port that will get the greatest volume is the one that will economically handle freight, both from a railroad and a steamship standpoint in the way of effecting rail head deliveries and in the quicker turnover of steamships. The economy in handling can only be brought about by modernization. There is very keen competition in the steamship business and I have no doubt that steamers will naturally flow to that port where a quicker turnover of steamships will make it possible for steamship companies to increase the number of round trips made by their vessels during the year.

The Erie Commended

The Erie can be commended for its farsightedness in the planning and erecting, prior to the war, of a modern pier 1000 feet long, 100 ft. wide, at their freight terminals at Weehawken, N. J. On this pier are five railroad tracks and it is equipped with four electric traveling portal Gantry cranes which have a capacity of ten and twenty tons. These cranes operate overhead and the switching operations are carried on independent of crane operation. Ocean freighters are brought direct to this pier for loading direct from car to boat using the mechanical facilities of the pier in loading. This is a radical departure in cargo handling and the most modern unit in the harbor. The time consumed in loading ships with these facilities is about one-half of that consumed under the old method of unloading from cars to lighters and towing lighters alongside of vessels and arranging for special derricks to handle heavy commodities such as locomotive boilers, car parts, etc. The expense of direct handling from the pier is considerably less and there is twice as much freight handled than under the old method. This facility is fully described in the April 18, 1919, issue of the *Railway Age*.

I would like to degress for a moment to touch in a brief way upon some modern facilities at Norfolk, Va., and Seattle, Wash. The coal piers located at Norfolk and maintained by the Virginian, Norfolk & Western, and Chesapeake & Ohio R. R., are, I believe, the most modern to be found anywhere. When I visited that port not long since I was greatly impressed with the operation; the ease and facility with which the handling was performed brought forcibly to my mind the necessity for immediate modernization of all large freight handling ports. Steamers are turned over at these piers twice as quickly as is possible at New York and the expense of the operation is considerably less than at ports with less modern facilities.

The city of Seattle has given serious consideration to modern pier facilities. They have already made a good start in the construction of a modern pier, municipally owned; one-half of this pier is open and is equipped with stiff leg derricks and Gantry cranes. The open section of pier is on the land end and the steamship berths at that end to take on its weight cargo, moving backwards to the river end of the pier, which is covered and equipped for the handling of measurement cargo.

Speaking of pier development, New York has practically stood still for several years and with the exception of the development in the Chelsea district, which was more or less on the old order of pier construction, no recent improvements have been made. The city of New York has many plans and many others are being prepared for the development of Staten Island, where only a limited amount of freight can be delivered at rail heads. There are other plans for the development of Jamaica bay which contemplate the use of it as a distributing center for Brooklyn, Manhattan and the Bronx. Staten Island is approximately six miles from the center of lighterage activity and Jamaica Bay is approximately seventeen miles from the consuming and forwarding center of the city. You can readily appreciate that such a scheme is impractical. Any development along these lines should consider only the needs of the territory within a radius of six or seven miles. Manhattan, as well as the large New Jersey district, which is fast developing, should be taken care of by the modernization of the New Jersey shore front somewhat on the order heretofore outlined. Of course any development on such a large scale as that pro-

posed could not be undertaken by the railroads alone; to carry out a project of this kind it would require considerable financial assistance from the two states and the Federal Government. When you consider that a development along modern lines would undoubtedly reduce by 50 per cent the lighterage that is now perfromed and, proportionately, other terminal costs and would place the port on an economic basis to compete with the other American ports, it is very evident that some comprehensive development must be made if New York is to retain its present supremacy as the foremost American port. These are the questions engaging our attention at the present time and they will be before us more than ever in the future.

A Word About Passenger Travel

My talk would not be complete without mentioning the enormous passenger travel in and out of the city; there are approximately 522,000 passengers handled in and out of the various passenger stations each working day or very nearly the population of the city of Boston. The flexibility of the terminal organizations will be appreciated when it is considered that for the war period, prior to November 11, 1918, in addition to the normal volume of business, 80 per cent of the total movement or 1,650,679 troops were moved through the port of New York to points overseas.

The following table will give an idea of the passenger movement as between the railroads and the different passenger stations:

NUMBER OF PASSENGER TRAINS AND PASENGERS IN AND OUT OF NEW YORK FOR ONE MONTH

Station	Railroads	Number of trains: Inbound	Number of trains: Outbound	Number of passengers: Inbound	Number of passengers: Outbound
Grand Central Station, N. Y.	N. Y. C. and N. Y. N. H. & H.	5,648	6,101	1,384,376	1,443,336
Pennsylvania Station, N. Y.	Long Island	3,592	3,432	756,098	754,982
	PER L.V. & B.&O.	5,593	5,640	403,444	403,444
		9,185	9,072	1,159,542	1,158,426
Flatbush Ave., Brooklyn	Long Island	3,964	3,920	1,069,280	1,048,027
Jersey City	Erie	3,724	3,713	1,050,000	1,050,000
Jersey City	C. R. R. of N. J.	3,814	3,684	821,272	836,668
Hoboken	D. L. & W.	2,874	2,955	875,195	900,359
St. George, Staten Island	S. I. R. T.	4,494	4,494	382,566	382,566
Jersey City	P. R. R.	2,172	2,230	309,680	330,460
Weehawken	West Shore	851	843	290,102	272,244
Total		36,726	37,012	7,342,013	7,427,066

Percentage of Trains on Time in September

DURING SEPTEMBER an even higher percentage of passenger trains made on-time runs than in August, according to a statement issued by the Railroad Administration, although the results in August were adversely affected by various unauthorized strikes of shopmen. Figures compiled by the Operating Statistics Section show for the month for all regions that an average of 84.3 per cent of the passenger trains arrived at their terminals on time, compared with 83 per cent in August. Including trains leaving initial terminals late because of delay to connections, 88.1 per cent made their runs in schedule time or better, compared with 87.3 per cent in August.

In the Southern region, comprising 33 roads, on which 48,905 passenger trains were operated in September, 43,216, or 88.4 per cent, arrived on schedule time, while 44,940, or 91.9 per cent, made their runs in schedule time or better.

The following compilation, covering all regions, embraces the Class 1 roads under federal control. Suburban trains are not included:

Region	Month	Number of roads	Total trains operated	Trains which arrived on schedule time: Number	Trains which arrived on schedule time: Per ct. of total trains	Trains which arrived on schedule time or which, if late, made run in schedule time or less: Number	Trains which arrived on schedule time or which, if late, made run in schedule time or less: Per ct. of total trains
Eastern	September.	43	95,972	80,985	84.4	83,598	87.1
	August ...	43	98,081	82,071	83.7	85,989	87.7
Allegheny	September.	15	77,523	68,745	88.7	70,700	91.2
	August ...	15	86,261	76,756	88.1	72,912	90.8
Pocahontas	September.	3	7,648	6,460	84.5	6,920	90.5
	August ...	3	3,970	2,949	74.3	3,073	77.4
Southern	September.	33	48,905	43,216	88.4	44,940	91.9
	August ...	33	49,683	42,224	85.0	44,668	89.9
Northwestern	September.	15	25,372	20,431	80.5	21,399	84.3
	August ...	15	25,960	19,939	76.8	21,064	81.1
Central Western	September.	24	42,312	32,412	76.6	35,485	83.9
	August ...	24	42,474	32,390	76.3	35,272	83.0
Southwestern	September.	23	20,010	15,459	77.3	16,792	83.9
	August ...	23	20,289	15,855	78.1	16,992	83.8
Average for all regions	September.	156	317,742	267,708	84.3	279,834	88.1
	August ...	156	320,718	266,184	83.0	279,970	87.3

In the foregoing trains arriving at final terminal 10 minutes late or less are considered on time. When considering time of departure, delays at initial terminal chargeable to causes other than waiting for connections are considered as part of running time. Delays at intermediate points waiting for connections are considered as part of running time.

The Broken Hill Steel Works at Newcastle, New South Wales, Australia

The Relation of Standardization to Progress

President of the Railway Business Association Presents Concrete Illustration to Congress

DURING THE HEARINGS before the House Committee on Interstate and Foreign Commerce, a number of manufacturers of railway equipment presented voluntary statements as to certain phases of the question of the disposition of the railroads at the expiration of federal operation. During their appearance before the committee these men were practically all asked for their opinions relative to standardization of railway equipment. In response to these questions the following letter was addressed to Representative Esch, chairman of the committee, by Alba B. Johnson, president of the Railway Business Association. The letter, which presents a concrete illustration of the part competition and initiative have played in the rapid development and improvement of railway facilities, is as follows:

Manufacturers of railway equipment upon concluding voluntary statements before your committee were asked by you their opinion regarding standardization. They replied that they favored interchangeability of car or locomotive parts through standardization of dimensions, but regarded it as essential to progress that there be variety of design and competition among inventors and developers of appliances.

Competition Essential to Progress

It is due to you and to ourselves that a fuller explanation of our view and of the reasons underlying it should be made. By conference and correspondence we have obtained the knowledge and judgment of members of our association and others. In the subjoined statement we endeavor to demonstrate that competition is essential to progress in service and in economy, that voluntary standardization by the railways acting collectively has long afforded and can continue to afford all desirable interchangeability, and that diversity of design is the indispensable condition for exertions by inventors and by developers of appliances. As bearing upon diversity of design, a description is given of a typical competitive appliance, the brake beam rigging. Authorities quoted in the statement are connected with the several concerns which make such rigging, and speak in response to our request.

As a factor in progress what is at stake is competition. If Congress adopts the principles set forth in Section 9 of the Cummins Bill (S. 2906), which deals with consolidations, the 20 to 35 ultimate systems will be so formed that 'competition shall be preserved as fully as possible.' The government determines rates, in which competition has therefore largely ceased. What remains is competition in service and economy.

Such competition in the past has been maintained between railways and between makers of devices. The makers' occupational motive for maintaining competition in both directions is self-preservation; but the public has a vital interest in the preservation of these manufacturing enterprises and in the continuance of competing railway systems, since upon such enterprises and such railway competition depends quality and cheapness of transportation performance.

From economical operation, the public benefits through larger railway income, stronger railway credit, more vigorous improvements of and additions to facilities and through a tendency to keep down rates.

Standardization means the elimination of competition.

Insofar as standardization is desirable for the sake of practical stability and convenience of repairs, the railroads themselves, with the co-operation of the manufacturers, have in the natural course of business adopted and employed it. A standard specification in vogue on American railways is not the edict of a potentate or board of potentates. It comes up from below. It must make its way into general approval before it can have the force of a regulation which the minority will observe. So far as the manufacturer goes, the matter of applicability, of usability, which is the same thing as interchangeability, is out of his hands without action of government.

For several decades the Master Car Builders' Association and the Railway Master Mechanics' Association (locomotive), scientific institutes of railway officers, have annually added to the appliances whose dimensions and requirements for performance are specified. These the American Railway Association, as it existed prior to government control, recommended to all the roads. Generally, they were put into effect as soon as announced.

The need of standardization of locomotives is almost wholly imaginary. A locomotive rarely leaves the road owning it or even the division for which it was built; hence in time of peace and almost entirely in time of war all locomotive repairs are made at home.

As to cars, interchangeability has been made universal in the United States. Accompanying this statement we present to your committee copies of two dictionaries issued annually by the Simmons-Boardman Publishing Company, publishers of the *Railway Age,* one dealing with locomotive appliances, the other with car appliances. The latter part of each book contains the standards referred to, with pictures and drawings. From these books your committee can derive a conception of the extent to which the railroads when occasion required have standardized voluntarily.

Fundamentals of Railroad Economy

To grasp the significance of the burden which a developing mechanical practice sustains in transportation progress, it is necessary to bear in the mind the fundamental of railroad economy.

In freight, the problem is the number of tons that can be hauled by one locomotive with one crew—in a word, the train-load. Possibly the largest single factor in the notable prosperity of such a road as the Union Pacific has been the success of the management in attaining heavy train-loading. It was in pursuit of this economy that the late Mr. Harriman gave his days to experiment and devoted hundreds of millions to capital improvements. For augmentation of train-load, railroads in all parts of the country which had been permitted to accumulate the investment basis have poured out expenditures. They have built larger and stronger cars. They have constructed more powerful engines to haul the larger cars and more of these cars to the train. They have provided heavier roadway, rails, and bridges to sustain the enormously more ponderous train and cargo.

These expenditures, by reducing the cost of drawing freight per ton per mile, not only paid for themselves, but so far offset the rising cost in wages and material as to postpone for years before 1910 the necessity for asking that freight rates be raised. The train-load as a foundation basis of railroading explains the despair of managers when employees proposed extra men in crews and a limit on length of trains.

Passenger trains have been made heavier also. More

persons are carried to the car. Steel has taken the place of wood for safety. Speed has been increased for convenience.

Development of Air Brake

To all this development there has been at every stage and in every phase a mechanical limit. For instance, the movement of the train must be controlled. The engineer must be able to slow down or stop in any emergency. That is to say, railways can progress in economy of operation no faster than the development of the brake. The air brake of the 60's replacing for more exacting uses the hand brake, achieved a stupendous advance; but stopping the toy trains of that era was to the stopping of the 100-car train of 125-ton loaded cars of today what the air brake of 1870 was to the air brake of 1919. Progress in the trainload and in the brake has gone hand in hand.

Even in the years when because of patent protection there was only one maker of air brakes, competition was an ever-present influence. First there was the competition between railways. The most progressive-minded of the managers were perpetually engaged in rivalry for cheaper operation. If practice had been standardized for all lines no departure could have been undertaken on any of them until the whole national system, perhaps a central omnipotent board, could be persuaded. Cars of a certain capacity would have been obligatory until all news cars for all lines contracted for after a specified date might be built larger. Territorial and topographical contrasts in conditions confronting the several lines might imperfectly and tardily be met. The working of this tendency in practice can be observed in the government standard cars allocated to some roads which had long since adopted larger capacity as best suited to their special problems.

Second there was the potential competition of makers who might bring out competing brakes sufficiently original to convince the patent office. A rival actually established itself, though it now in part covers its patent situation by a license arrangement. What kept one concern so long alone in the field was that it diligently developed improvements —in short, it acted as it would have had to act if competition had been actual instead of merely potential. A vivid form of potential competition was that of makers ready to enter the field the moment patent rights expired. To maintain its commercial position the single maker long before each such expiration abandoned the air brake of yesterday and substituted a new device, protected in turn by new patents. The public was benefited because the essential advantage which induced progressive railways to try and use the newer appliance was the net saving in cost of operation through enlargement of the trainload.

A significant feature of the standard vehicles built by the United States Railroad Administration was the effort, in some cases successful, to use an appliance upon which patent rights had run out and thus to exclude from the bidding more recent inventions still protected. From the point of view of the public this is penny wise and pound foolish. It attains a little immediate cheapness. In doing so it exterminates by starvation the breed of inventors whose work is to promote not alone little economies but great ones.

Brake Beam Standardization

An illustration more typical than the air brake is its adjunct, the brake beam. In what follows it has been thought convenient to employ for concrete illustration one appliance rather than several. For this purpose the deveice selected is the brake beam. This appliance is attached both to locomotives and to cars. Rigid standardization of its dimensions and of its strength is necessary and is enforced. From six to a dozen types are in use, while unsolved problems with regard to it are today the object of study and experiment. A somewhat full description of this rigging will facilitate an understanding of subsequent references.

The air brake can develop no faster than the beam. For between the air cylinder, whose piston is operated by pressure initiated in the locomotive cab, and the metal shoe which in action is forced against the wheel, there is a mechanism which directly applies the power to the shoe. A failure of that mechanism puts the brake out of commission. The cylinder piston operates a rod located under the vehicle midway laterally, and by a system of levers moves the two, three or four trussed brake beam structures toward the pairs of wheels which they are to brake. The performance which is expected of the beam rigging is this: that it receive the cylinder power; that it move so that simultaneously the shoe, which is fastened to it, will be pressed against the wheel; and that it stand the strain.

It is in standing the strain—that is, the dependability and durability—that progress has been made and is still promised in the brake beam. If a manufacturer claims superiority for his type it is to those qualities that he refers.

The Master Car Builders' standards tell him how many inches the beam must measure from tip to tip and throughout its external outline in order to fit the various cars. They prescribe the height at which the beam must hang above the rail. They require specified dimensions and locations for certain parts of trussed structures. Consequently when a car off the rails of the owning road is found with a damaged brake beam and the road on whose rails it is sojourning is addicted to a beam of another type, the defective beam can be replaced by one carried in stock by the road which does the repairing.

The argument in favor of standardization is that while interchangeability of beams as a whole is maintained with variety of detail, each several part of the beam structure cannot be replaced by a part from another type of beam, but the whole beam must be substituted. Another view prevails. This is that serviceable and safe brake beam repairs are only made when the parts of the beam structure have been put together under the same tests and conditions as surround the manufacture, inspection and acceptance of new beams; whereas such conditions are not and cannot be presented on yard repair tracks. The discarded beam is not wasted. It is sebsequently carried to a place where under rigid conditions qualified mechanics restore it; and it takes its course of standard inspection like a new beam before it can again be placed on a vehicle.

In their requirements the Master Car Builders' Association includes loads that beams shall successfully carry; but the means by which the maker shall impart the specified power of resistance to the beam and its parts is within his own province. That is, the field in which progress lies.

The original brake beam was wooden. As trainloads began to enlarge it was seen that a wooden beam strong enough for the new conditions would be a monstrosity in size. C. F. Huntoon writes that "the best design of truss metal beam 15 years ago weighing approximately 63 lb., carried a load of 6,500 lb. at 1/16-in. deflection, this deflection being the maximum allowed by the M.C.B. Association, while today a beam of 77 lb. weight, or 20 per cent increase, will carry a load of 15,000 lb. at 1/16-in. deflection, an increase of over 125 per cent in strength and efficiency." Mr. Huntoon attributes such progress "to specialists who have directed their efforts to some one device or detail—each vying with the other to produce an article of superior merit" and he says, "without this competition and the protection afforded by letters patent, there would be no fast schedule trains and boats, no telephones on the desk or automobiles for convenience or pleasure; in fact, the industrial progress of this country has been stimulated by and is largely due to these very factors."

The advance proceeded through various forms in metal. At first light metal beams met the situation, beginning with

a trussed structure of pipe. Further increase in train weights led from year to year to development of more adequate trussed brake beam structures by various manufacturers, differing in the various parts, most notably in the "beam" or "compression" part proper—for example, the "U," the solid bar, the "channel," the angle, the "T" and so on. Each of these types taken in cross section has a distinctive value within itself and within its relation to other parts of the brake beam structure. Each of them represents the means by which inventive genius competes for superiority in meeting conditions as they evolve. Tests of these types and features are continually going on.

There have been strong and eminent advocates of a standard beam. The railway men as a whole have prefered to leave the opportunity open for continued improvement. Since the proposal for a standard beam was made seriously in 1910 substantial improvement has been made.

A. H. Peycke writes: "The brake beam manufacturers have conferred with the Brake Shoe and Brake Beam Committee this last year with a view to straightening out a good many points in relation to interchange dimensions, clearance conditions, etc., and cites a report delivered before the M.C.B. convention in Atlantic City in 1919 by B. B. Milner, of the New York Central, suggesting changes which are necessary; also giving a complete synopsis of the brake beam situation since about 1905. Mr. Peycke's opinion is that "The standardization of brake beams would be decidedly disadvantageous to the railroads and people of the country, and any attempt to adopt a standard beam would suppress initiative, invention, genius and progress."

Albert Waycott observes: "Seven or eight different types of brake beams, all interchangeable on equipment in service and all meeting the M.C.B. tests, will surely illustrate how both improvement and competition might easily have been greatly reduced had any one type been insisted upon."

The manifest need today, according to C. Haines Williams, "is a more strict enforcement of existing M.C.B. rules and more rigid application of test and manufacturing requirements. * * * No single design of beam has advantages sufficient to compensate for the penalty of having brake beams stand still for years. * * * The initiative and unhampered genius that produced the brake beam and brake transmission rigging that has always satisfactorily controlled our high speed trains cannot with safety be destroyed. * * * The success of past practice guarantees proper care of future problems if not interfered with by standardization, which would unquestionably develop indifference on the part of the interested brake beam manufacturers of today. All the present M.C.B. rules, specifications, requirements and safeguards have come, without exception, from the recommendations and practices of brake beam manufacturers."

Whatever may be the future of voluntary standardization, it is our conviction that the best interest of the public lies in leaving the railways free without any government participation in the process.

Centralized Buying

An important consideration cognate to this view in every line of railway requirements is that of centralized buying. Standardization would, we fear, do more than put a stop to the maintenance of vigorous departments of the manufacturing establishments for the testing and development of new devices and features. Not only would all the companies be reduced, so to speak, to automata filling orders to specifications, but there would be the further tendency to concentration of purchasing in some central bureau. Its responsible heads would probably not get and keep personal knowledge of the reliability and resources of individual makers. Bidding would tend to be controlled more and more by the element of price, and less and less by the element of quality and durability. The bureau would tend to leave in the hands of subordinates the designation of those makers permitted to bid. Inevitably this would degenerate into a stereotyped process bereft of commercial enterprise and intelligence on both sides of the counter.

What demands the future will make who can phophecy? Charles J. Graham remarks: "Had the thought of standardization of parts been put into effect some years ago, we would still be using wooden brake beams. * * * The same is true today. There remains ample field for further improvements if they are not stifled by the fixing of standard details for parts."

We are told that locomotives and cars have reached nearly if not quite their maximum capacity; that they already crowd the overhead clearance of bridges and tunnels; that to widen the traffic gage would involve expenditures of appalling magnitude not only in acquirements of wider rights of way but in shifting and relaying existing tracks while traffic was carried on; that to lengthen the vehicles would involve us in costly track problems and complications involving station platforms and the like.

Such pessimism is a counsel of sloth. For freight transportation at least higher actual speeds may be a possibility contained in the now rapid elimination of grade crossings. To what extent will this and other tendencies toward fuller use of cars affect the stresses placed upon every part of the rolling stock? Is it certain that electric propulsion will bring no new conditions in this respect, or that fuel or other source of motive energy in the future is even yet identified? Who can affirm that the controlling factor in transportation development is yet dreamed of in our physics and chemistry or other branch of scientific pioneering?

The manufacturer has always anticipated each new demand. When it came he was ready for it. He can exist and perform that function only if experimentation is free on the several railway systems and if achievements for the welfare of mankind promise reward to the inventor of appliances and profit to the developer.

Operating Locomotive Boilers Using Treated Water

Instruction of Enginemen in the Use of the Blow-Off Cock Essential to Secure Best Results

By F. W. Dunning

TREATING WATER for locomotive boilers has received much attention for years. Today it is attracting still more consideration and those informed on the subject agree as to the benefits derived. It would not be feasible here to go into the merits of every method now used; suffice it to say that the majority of the roads have decided on the use of soda ash, or soda ash and lime together, as the most economical means for treating the average boiler water. The following discussion, therefore, deals chiefly with water treated in this manner.

The process of water treatment must be divided into two equally important phases; first, the actual mechanical features involved in introducing the chemical into the water; second, the handling of the water in the locomotive boiler, after treatment has been received. Both of these divisions need careful attention and close supervision. One of the greatest errors that can be made in water treatment is neglect of the latter feature. Very often the handling of the water in the locomotive boiler is entirely ignored, and due to this oversight the treatment is doomed to failure. Improper handling of the treated water can cause as much damage as the raw or untreated water.

The substances contained in the water in solution cause such trouble as scaling, pitting and foaming. It is utterly impossible to overcome these troubles by simply placing certain chemicals in the water, unless attention is given to other details. Some of these substances can be removed and the chemical form of others can be changed, but not all the troublesome matter can be removed. Therefore it is necessary to call on the engineman to help out, particularly where soda ash is used.

Interesting Enginemen in Water Treatment

The engineman cannot assist in securing the best results from the treatment unless he has the necessary information, and while this is not simple, yet it is fairly easy to assimilate. Whether the instructions are given by bulletin or by talks collectively or individually does not matter parcticularly, although it is necessary to use all these methods to a greater or lesser extent. The point is, the engineman must know how to handle the boiler when using treated water. Few men will continue to carry out mere instructions unless they have reason to believe they are accomplishing some useful result. Therefore the objects and purposes of the water treatment should be fully explained.

One good method for educating the enginemen is as follows: Some capable person should be placed in charge of the educational work, local conditions determining how much time must be allotted to this subject. First, a list of all enginemen and firemen in the territory under consideration should be procured, and preferably by personal observation these men should be graded as to their knowledge, ability and performance in handling the locomotive boiler. The men at the bottom of the list can be given special attention and instruction. It is then a simple matter quickly to remedy boiler troubles insofar as man failures are concerned.

Causes of Foaming and Priming

All the trouble resultant from water treatment is caused by the foaming or priming of the water. Generally, foaming can be attributed to the following substances contained in the water: animal or vegetable matter, mud or sediment, and alkali salts. It is not necessary to consider the first cause as this is not a result of treatment, and should be avoided by changing the source of supply, or removing the substances before passing the water to the engine tank. Alkali salts and sediment such as sludge are a result of soda ash treatment, although these substances frequently occur from natural causes. Soda ash, when introduced into the water, attacks the sulphate of lime, changing it into carbonate of lime and sulphate of soda. Only a small portion of the carbonate of lime is precipitated before the water reaches the boiler; the remainder causes the white sludge present in the boiler. The sulphate of soda is an alkaline salt and remains in solution. As water is continually being evaporated the sulphate of soda continues to increase in quantity since it does not pass off with the steam.

When the boiler is allowed to remain quiet, the mud or sludge has a tendency to settle and work back toward the firebox. Thus it will be found that the suspended matter is much more heavily concentrated at the blow-off valve than it is at the water glass. The distribution of the alkaline salts, which are in solution, is practically uniform throughout the boiler. To reduce the mud, it must be allowed to settle and then be removed by opening the blow-off valve. To reduce the alkaline salts, part of the water must be blown out and replaced with water containing less alkaline salts. This does not require separate blowing for each case.

Reducing Concentration in Boilers

For instance, assume the alkaline salts have reached a concentration of 200 parts per hundred thousand. The concentration is not reduced by simply removing part of the water. The alkaline salts are uniformly distributed and the water remaining in the boiler has the same amount in solution as the water blown out. It is necessary to open the injector and replace the water blown out. If the tank water has only 20 parts of alkaline salts and 10 per cent of the contents of the boiler is added as fresh water from the tank, the result is the boiler water will now show 182 parts of alkaline salts per 100,000 parts of water. It is apparent then that the reduction of the alkaline salts can only be accomplished by blowing out and replacing with water of a lower concentration.

As water is continuously being evaporated, and the amount of mud and alkaline salts continuously increased in the boiler, it is necessaray to remove these substances before they get to a troublesome point. This means the boiler must be blown out at equal time intervals during a run. These intervals and the amount to remove must be determined by the quality of the water. Heavy treatment will entail heavy blowing and light treatment a lesser amount of blowing.

Use of the Blow-Off Cock

The proper time for blowing out is four or five minutes after both the throttle and injector have been shut off. This allows violent circulation to stop and the sludge to settle where the blow-off valve can remove it. It is well not to remove more than six inches of water as measured in the water glass at one time, because an undue amount of cold

water has a bad effect on the flues and firebox sheets and may cause leaking. The blow-off should never be opened while the injector is working (except in emergency) as this brings the cooling effect on the firebox sheets to the extreme limit, and also allows a great deal of fresh water to pass out.

Definite directions for blowing out cannot be given without investigating thoroughly the quality of the water in use in the territory in question, or running several tests to determine the proper amount of blowing that is necessary. Foaming trouble can be materially lessened by carrying the water low in the boiler. Arrangements should always be made at terminals to have the hostler give the boiler a certain amount of blowing out, thus lessening the amount of blowing which must be done on the road.

The whole question of taking care of the boiler using treated water resolves itself into a matter of the proper way and proper time to do the blowing out. The proper way is explained above. The proper time must be determined by conditions and should be extended to three or four periods, occurring at about equal intervals during a run. All the blowing out should never be attempted at one time, neither at the beginning, middle, or end of the trip, as satisfactory results will not be obtained in this manner. When the proper amount and time for blowing off have been determined, this schedule should be strictly adhered to.

The La Crosse division of the Chicago, Burlington & Quincy has averaged about 2,000 miles per boiler per washout. This means about one washout per month for each boiler. This division uses soda ash treatment at all of its water stations. Other divisions will approximate this performance when the blowing out proposition is given sufficient attention.

Analyzing Samples from Boilers

At the various terminals or sub-division points on those divisions of the Chicago, Burlington & Quincy system where treatement is used, samples of water are collected at least once a month from locomotive boilers. These samples are analyzed and reports sent to the master mechanics in charge of the territorty affected. Explanations accompanying each report state whether the treatment is correct or not, and also call attention to the amount of blowing out, as determined by the total dissolved solids or alkaline salts in the water. It then devolves largely on the master mechanic to take such corrective measures as are necessary to insure the proper blowing out. The treatment itself is maintained correct by frequent inspections and analyses at the various treating plants, and these boiler samples serve also as an additional check on the various waters last used by the locomotive.

Thousands of dollars have been saved in locomotive repairs, flue failures, washing out, and in coal consumed, through the medium of treated water. Thousands of dollars have been wasted on water treatment because enginemen were not informed about their part of this work, and the project in many instances has been given up.

Results Secured by Co-operation

Many cases have come to my attention where one engineman on a certain division would have no trouble with treated water, while the next man would continually have difficulty. The first man had made it a point to inform himself on the subject, while the other had made no effort to get the all-important information. One particularly striking case occurred with two passenger enginemen on the same run. The first man had a "regular" engine on a hard local run. Conditions were excellent on this run for foaming trouble, as every water station on the division furnished water treated with soda ash. However, this engineman had no trouble and repeatedly offered to run his engine 30 or even 60 days to a washout. As a matter of fact, the boiler was washed out every 15 days. One day the regular engineer "layed off" sick, and his run was taken by a second man, who was also a regular passenger engineman. There was no end of foaming trouble while he was on the run. The boiler must be washed out after each trip. This man was of the type who did not take kindly to the information at his disposal. His attitude was, "I have run engines thirty years ago, before we ever heard of water treatment, and I can see no advantage at this late date in using soda ash. It is all rot." When the other engineer came back on the job there was no further trouble. The engineman who would not assist in getting the best results from treated water did not bother to learn that the life of this same locomotive boiler had been increased over 100 per cent between shoppings for boiler repairs since the water treatment was introduced.

The same point is illustrated in connection with the introduction of water treatment on two railroad divisions; the first division had its entire force of enginemen lined up in about four months from the time it was introduced, and the locomotive performance was remarkable as compared to the previous period. In this case the two traveling engineers made a special point of instructing these men on handling the boiler. The second division, after ten months, was still having trouble. In the latter case the traveling engineers made no special attempt to educate the men on the proper handling of the locomotive boilers. The results in each case illustrate my point.

It cannot be emphasized too strongly that where water treatment is contemplated, the handling of the locomotive boiler must be given full and proper attention. By neglecting this phase of the subject, water treatment can be made an entire failure where otherwise it would effect a big saving.

Why the Railroads Should Be Returned

A. H. Smith, formerly regional director under the Railroad administration, who recently resigned to return to the presidency of the New York Central, has outlined his views regarding the railways in a letter to Senator Calder of New York, in which he says:

When I resigned as regional director of the United States Railroad Administration certain newspapers asked for a statement of my impressions of government operation of the railroads and my views of the railroad problem generally. I have refrained from issuing such a statement, believing that it would be best to convey any ideas that I have on the subject to you and the other gentlemen who are working on the problem. Therefore, if your mind is still open with reference to the solution of the railroad situation, perhaps what I have to say may be acceptable to you.

The human element in American railroads represents 90 per cent of its effectiveness. The other small percentage of the whole would be useless without individual vision, effort and experience. Fixed responsibility really has seemed to be impossible under government management. It leads into such a maze of interests and interferences that the employees do not get into that state of mind that they do in private operation, and the state of mind is one of the most important parts of railroad operation. Destroy it and the effect is manifest all through the rank and file and every part of the great machine.

I know that you realize fully that it is a business that must have the individual concern of the employee—the engineer at the throttle, the fireman beside him, the conductor, the flagman, the signalman, the section foreman, and on up to the officers of the company—they all must have a

fixed responsibility. Most of the work is done beyond the eye of the officers, because it spreads over a vast territory. The man at midnight and in the storm must do his duty absolutely and fully, with no one to see him and no one to direct him. He must have an incentive—not one of mere salary, but one of pride and hope that he may some time be more than he is.

It has been stated, and so far as I know never disputed, that before the war the American railroads for each dollar paid them rendered considerably greater and substantially better service than the railways of England, France or Germany. The European railways, however, do not in any degree compare with the American railways in extent. They are short railways for the most part, with dense populations, while the American railways are spread over a vast and, in some cases, sparsely settled territory.

If we are to become what we are destined to become if we make no mistakes—a great commercial country, from a foreign as well as a domestic standpoint—we must have sufficient and efficient transportation. Those that produce it by providing the capital and labor should be properly rewarded. The manufacturers and the merchants and the public as a whole owe that to them. Ours is a country of great distances, and with that handicap we shall not be able to compete successfully with those countries with shorter distances unless our transportation system is adequate and efficient. The American railways require capital properly and liberally expended to furnish more facilities and modern equipment to offset the labor and other charges which have been placed upon them. To my mind, it is important, therefore, that a fair return be allowed, so that capital will enter and provide those facilities.

Looking backward, it is a little over a year ago when the congestion was so acute that the people were willing to pay almost anything for transportation if they could have it, and such conditions should be avoided. These railroads have stood still in their expansion and development, broadly speaking, for a long time. Economy is going to come in their expansion and refinement, and economy in rates will result, not from radically cutting wage costs, but by giving the railroads and employees a better machine to work with, more facilities, more yards and shops, and other essentials that go to make up a successful transportation instrumentality. Pre-war we had approximately $450,000,000 of equipment standing idle. Since the signing of the armistice we have seen substantially the same condition repeated. This is a situation that is inevitable and the compensation to the railroad companies must provide for the lean years which produce such a condition, for the reason that it is impossible to provide the facilities as fast as the business demands in periods of abnormal traffic.

In the matter of the return of the railroads to the corporations: My opinion is that they should be restored at an early date. It will eliminate uncertainty in the state of mind referred to previously, and the morale will improve. The government said when the roads were taken over that they would be returned in as good condition as when they were taken. That means not only physically but as nearly as possible mentally, and the government can not afford to do other than to keep its promise. Perhaps a law can be written that will cover all the involved questions that exist and permit settlement with the restoration. But the situation is very complicated, and it may be that the government will find it advisable to appoint a commission or board to make the settlement after the return, in the meantime giving the benefit of private operation to the people—the present system of compensation being continued as a guaranty pending settlement—a limited time to be allowed after the return to effect the settlement and avoid protracted delays. This commission might well be made a permanent feature of our system of railroad regulation and should be composed of at least three commissioners and be charged with the responsibility of keeping informed with respect to the transportation necessities of the country generally, and to make representations to the Interstate Commerce Commission with respect to the revenues required to provide the necessary facilities and service and insure proper development of the transportation system.

The cases of the weak and the strong roads, so to speak, should be weighed out by this commission. If the road is so weak that it can not stand, it should have special treatment. If it is absolutely necessary to the needs and comfort of the people it should have some extra allowances locally or otherwise. The entire rate structure should not be thrown out of proper position because of some exceptional case any more than any other business undertaking in our country should be gaged by the exceptions. The question of rates, in which the public are most deeply concerned, because it affects the cost of living and the amount of business we may do, is a matter for study by experts. Much has already been accomplished in this direction by the Interstate Commerce Commission and those drafted into government service, and they have shaped up a great amount of valuable information which is available to any authority that the government might designate. Rates established as a war measure and to meet the changed conditions should be continued as presumptively reasonable. Pre-war rates should not be the basis of future rate regulation. I believe that it is generally admitted that the interstate commerce law sought to regulate the railways on a basis of reasonableness and justice. The operation of that act, however, has put the burden of proof in all instances on the railroads, and that, it seems to me, is a fundamental violation of justice. As I see it, what is needed is to bring order out of the confusion of conflict of regulation between the various authorities.

Briefly, the foregoing suggestions contemplate the prompt return of the railroads; the continuance of the present rates until changed and adjusted to meet the largely increased charges; the continuance of the guaranteed standard return until this is accomplished; the creation of a board or commission which will act as an administrative board, charged with the responsibility to represent the public interest in respect to the adequacy of facilities and service, and in addition to exercise the functions and powers of the present Interstate Commerce Commission, except as to accounting, valuation, rates, etc.

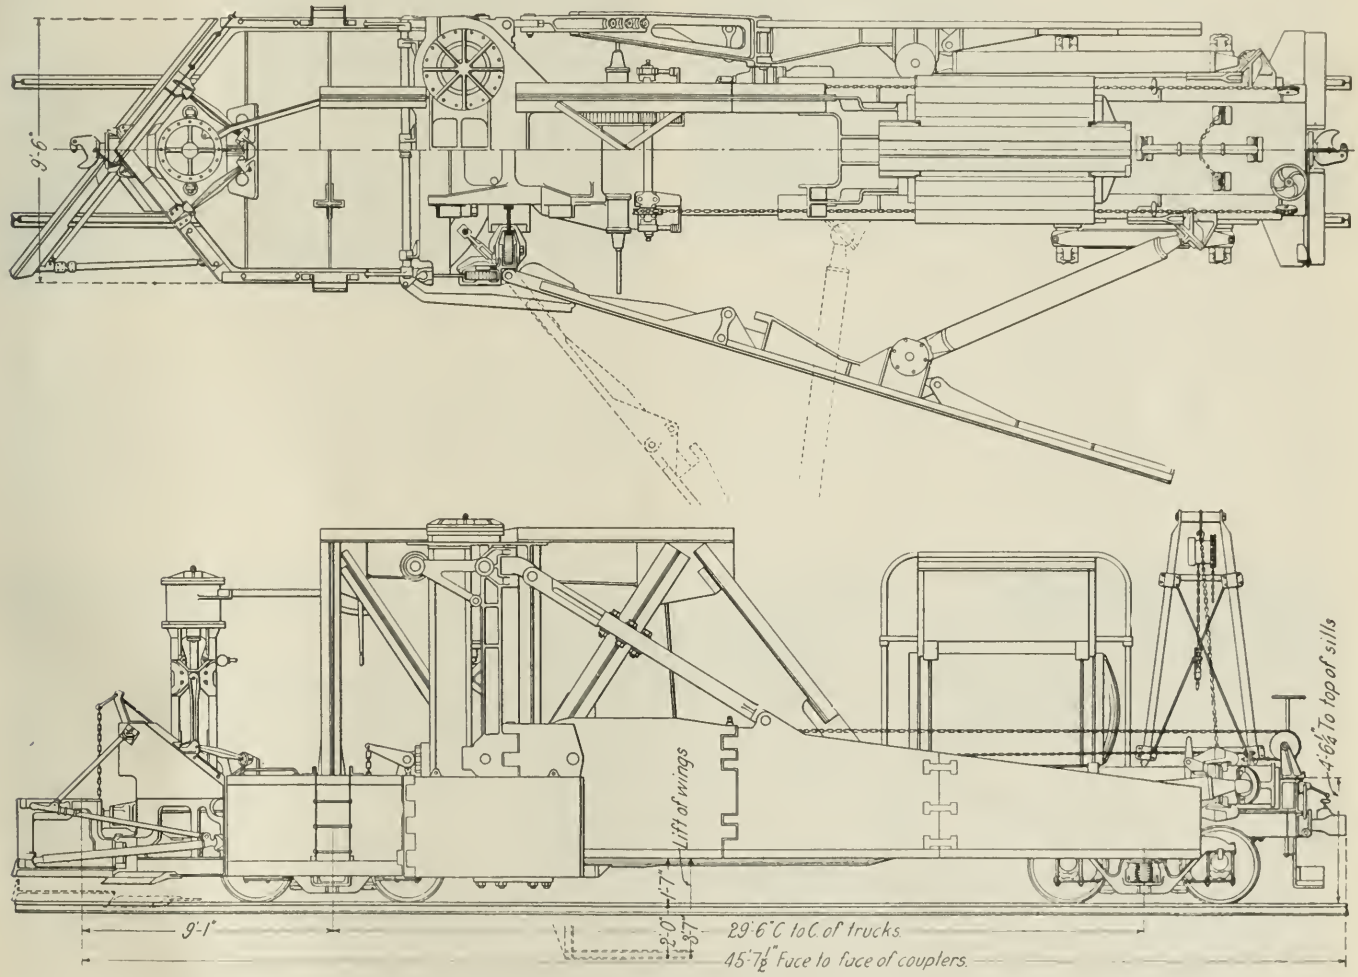
It is estimated that 12 per cent of the Nation's wealth is invested in the country's transportation systems. It is safe to say that 100 per cent of the public interest is involved therein. It is one of the great problems that we have before us. It is of prime importance that it be solved properly. Politics or theories have no place in its consideration; it is a business of manufacturing transportation. Good machinery should be used, together with good brains and full effort, to the end that the country and the people shall continue to have what they always have had—the best transportation in the world; the greatest in volume and heretofore the least in cost.

On Guard Against the Wicked Railroads.—The New York Board of Trade and Transportation has written to Chairman Esch of the House Committee on Interstate and Foreign Commerce, requesting the passage of a joint resolution (a draft of which is offered) "to continue in effect rate making laws until Congress shall enact the general railway laws" for which the country is waiting. The letter declares that in the probable absence of the passage of any such general railway legislation this month the effect of President Wilson's recent veto of the Senate bill to restore the Interstate Commerce Commission's pre-war powers will be to give the railroads full power to raise rates without hindrance.

All Steel Spreader Plow Embodies New Feature

Unusually Heavy Machine Was Recently Subjected to Series of Severe Service Tests

THE BUCYRUS COMPANY, South Milwaukee, Wis., has developed and is now introducing a spreader plow which embodies a number of new features, and also involves much heavier construction than any previous designs. This spreader has recently been subjected to an extended series of tests under heavy service on the lean ore and waste dumps of the Oliver Iron Mining Company, at Hibbing, Minn., where it has demonstrated it's ability to stand up under unusually severe conditions. It is designed to plow material from between the rails to either or both sides to a depth of 2½ in. below the top of the rail and to spread



General Plan and Elevation of New Spreader

it at either side to a maximum distance of 22½ ft. from the center of the track.

This spreader plow is of unusually heavy design and is built of steel throughout. It weighs 136,620 lb. of which 80,640 lb. is carried on the front truck, this latter weight being an important factor in holding the spreader on the track and reducing the liability of derailment. The frame is designed throughout for 100,000 lb. draw bar load. It is equipped with the Waugh friction draft gear, which with the trucks is built to M. C. B. Standards.

The wings, which weigh approximately 12,000 lb. each, are solid steel castings made in three sections with a total length of 25 ft. The section at the outer end is hinged to the rest of the wing and held in position by three Bishop bolts or shrink links so designed that they will break and allow this section of the wing to swing back on striking a stationary object, before the wing itself suffers injury. When in position the wing spreads a minimum width of 12 ft. and a maximum of 22½ ft. when horizontal or when inclined at the greatest angle. It can spread to a level of 19 in. above the top of rail or 24 in. below, giving a maximum vertical range of 43 in., which can be secured in increments of three inches. The wing can also be inclined at the outer end to a maximum depression of 12 in. below or to an elevation of 84 in. above the inner end. The wearing edge of the wings is of high carbon steel angle castings. An important and distinctive development in this spreader plow is the arrangement whereby the wings can be folded in to the car regardless of the pitch or angle at which they may be standing.

The spreader wing is held in plowing position by a tubular brace built of 9-in. extra-heavy, lap-welded steel pipe. The forward end of this brace is connected to the wing by means of a universal joint, while the rear end is connected to a movable cross-head by means of a ball and socket joint.

The travel of this cross-head determines the width of spread. This width of spread may be varied by increments of approximately 1 ft. between 12 and 16 ft. and by increments of 6 in. from 16 ft. to 22½ ft. This arrangement is also a unique feature and makes it possible to open and close the wing from the cab automatically to any pre-determined width of spread. This may be accomplished with little effort and with no loss of time. The vertical inclination of the wing above and below the horizontal is accomplished by shortening or lengthening the inclined support brace.

The V-shaped pilot plow is located in front of the main

Rear View of the Wing, Showing Construction

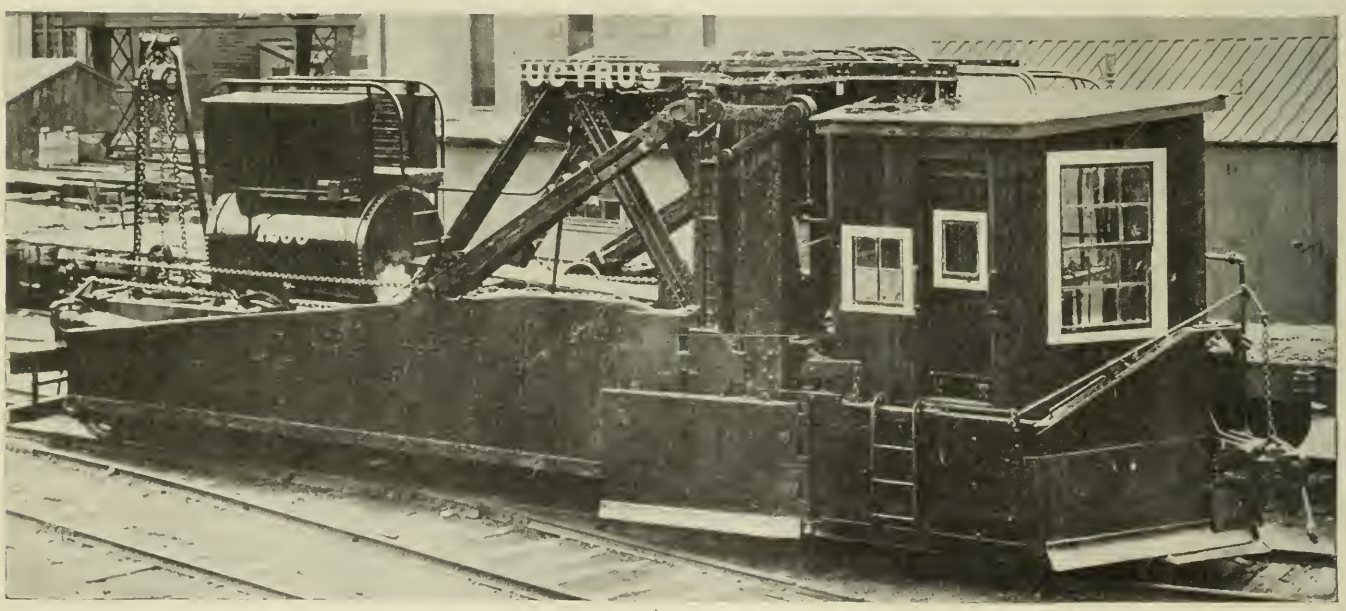
car body and is arranged in such a manner that it may be used for plowing and flanging either snow or ice from between the rails to a depth of 2½ in. below the top of the rail. Each side of the pilot plow carries a transfer or shift wing that can readily be opened and fixed in position by one man, for the purpose of transferring loose material from one side of the track to the other.

Four air cylinders control all the operations of the plow. The air for the operating cylinders is taken from the locomotive and the machine is provided with an air reservoir four feet in diameter by seven feet long.

All movable parts of the spreader are machine finished which tends not only toward accuracy of fit but towards ease of operation with resulting conservation of air. The contact between the wings and the vertical sliding posts on

Plowing a Shoulder Down

which they are raised and lowered is by rollers, greatly reducing the friction from that with a sliding contact. As a result the wings can be raised with a minimum air pressure of 50 lb. while the spreader plow can be operated readily with the average train line pressure of 70 lb. Summing up, the plow presents to railroad men. A wide range of spread



The Spreader With Wings Folded Back

One cylinder is employed for raising and lowering each of the two large wings, one for raising and lowering the pilot plow and one for opening and closing both wings. These cylinders are controlled by four-way valves located on a table in the front of the car which may be enclosed in a cab.

both in width and elevation; The automatic opening and closing of the wings to any pre-determined width; The opening and closing with the wings to any vertical angle; Adaptability to flanging snow and ice from between the rails and use as a snow plow in yards or on the main line.

Interchange Inspectors' and Car Foremen's Meeting

Discussion of Changes in the Rules of Interchange; Uniform Inspection Records Advocated

THE CHIEF INTERCHANGE CAR INSPECTORS' and Car Foremen's Association met at the Planters Hotel, St. Louis, Mo., September 23-25, with W. J. Stoll, chief interchange inspector at Toledo, Ohio, presiding. At the first session, prayer was offered by Captain Arthur Andrews of the Salvation Army; L. McDaniel, prosecuting attorney, welcomed the convention, T. J. O'Donnell responding for the association.

President's Address

In his address as president of the association, Mr. Stoll spoke in part as follows: "The discussion of the M. C. B. rules and other matters pertaining to the construction and maintenance of cars is an important question and one which requires sound judgment and executive ability. The changes in the M. C. B. rules of interchange, which take effect October 1, while not numerous, are quite important. The rules now in effect have not as yet been discussed by this association, and I hope the members will take advantage of this opportunity to discuss them. I would also call attention to the fact that the loading rules have been rearranged and a discussion of them would be of interest and beneficial, as many cars are being improperly loaded. This association might well recommend that shippers should be furnished with copies of the loading rules. Because of the conditions which have been brought about by the war, such as pooling certain portions of the equipment, routing cars away from home where material was not available to make proper repairs, insufficient help, etc., it is necessary for this association as well as others to put forth its best efforts to remedy conditions."

The report of the secretary-treasurer was then read; it showed that the total membership was 508 and that there was a satisfactory balance in the treasury.

Discussion of the Rules of Interchange

At the session on Tuesday afternoon, the discussion of the Rules of Interchange was taken up. The first question raised was with regard to the meaning of paragraph 6 in Rule 2, which reads, "Empty cars offered in interchange, if in safe and serviceable condition, must be accepted." T. J. O'Donnell (Buffalo) asked what constituted a serviceable empty car and whether this rule was to be construed as permitting the offering in interchange of cars with minor defects, which could readily be repaired. F. C. Schultz (Chicago) advocated ignoring slight defects in order to expedite traffic. There was considerable difference of opinion as to whether the receiving line had the power to refuse cars which were not serviceable for the commodities for which they were desired. F. Trapnell (Kansas City) stated that instructions had been received from the regional director defining what should be regarded as a serviceable car and in the Kansas City Terminal district inspectors had been working under this interpretation. Several expressed the opinion that under present conditions it is necessary for the joint interchange inspectors to allocate cars to the various railroads, taking whatever measures local conditions make necessary to move the traffic. Mr. O'Donnell contended that there should be some general ruling which could be applied regardless of the immediate circumstances. G. Lynch (Cleveland) brought out that the rules make a definite distinction between the handling of loaded and empty cars. While loaded cars must be accepted by the receiving line and run, repaired or transferred, the empty cars can be rejected if in the judgment of the receiving line they are not in safe and serviceable condition. This rule has made it easy for roads that originate a great deal of traffic to get cars off their lines, while roads that offer a great many empty cars to connections have suffered from the accumulation of bad order cars which they are unable to dispose of.

The discussion showed that there was a wide diversity of practice in different sections of the country, due in part to lack of uniformity in the orders issued by the regional directors. A committee was appointed to consider the matter further and to present a report to the convention. The committee after deliberation reported that it did not feel it consistent with the basic intent and purpose of this rule and the decisions thereon by the Railroad Administration, that any changes in the application of the rule should be recommended other than the proper supervision by those in authority at the several terminals and interchange points consistent with local conditions.

Changes Recommended by the Arbitration Committee

Following the discussion of Rule 2, the association proceeded to consider changes in the rules as recommended in the report of the Arbitration Committee presented at the 1919 convention of the Mechanical Section of the American Railroad Association. The revised text of the rules, together with the discussion concerning them, are given below:

Rule 32. (Delivering line responsible) Damage to any car (including cars on ferries or floats) if caused by (a) derailment, (b) cornering, (c) side swiping, (d) collision or impact other than that occurring in regular switching, (e) handling of cars with broken or missing couplers, or couplers out of place, (f) colliding with or shoving over bumping post or other fixed obstruction, (g) shifting of loads from other cars, (h) overloading, (i) explosion, (j) collapsing buildings or other structures on right of way, (k) unconcealed fire damage, (l) flood, (m) storm where car is derailed or destroyed, (n) failure to close hopper or drop doors before moving car.

The former wording of this rule made the delivering company responsible for damage due to wrecks, and this indefinite term had caused many controversies. H. W. L. Porth (Swift & Company) brought out that while the changes clarify the meaning of this rule, the judgment of the inspector will still enter in determining what constitutes regular switching. F. C. Schultz stated that the rules now in force made it possible for roads to break up cars in switching and yet hold the owners responsible for the damage if the trucks were not derailed. G. Lynch called attention to the fact that the terms collision, impact and regular switching are still indefinite and even the new rule will be hard to interpret. J. P. Carney (Michigan Central) expressed the opinion that the changes in the rule were not intended to put the responsibility for damage to weak equipment on the handling line. A motion was adopted stating that it was the sense of the meeting that if cars are damaged the owner is to be held responsible, if the trucks are not derailed and the car is not cornered or side swiped.

Rule 66. (Owners responsible) Periodical repacking of journal boxes, regardless of the responsibility of delivering company for change of wheels, journal boxes or journal bearings. No charge shall be made for repacking unless all boxes are repacked. No charge shall be made if the repacking is done within nine months from date stenciled on the car. If car bears no stenciling showing date of previous repacking, all journals may be repacked if necessary and charged for.

(a) All journal boxes shall be repacked with properly prepared packing (new or renovated) at least once every 12 months, at which time all packing will be removed from the boxes and the boxes cleaned. Dust guards to be renewed when wheels are changed.

The requirements for periodical repacking of journal boxes were endorsed by all who discussed the rule. The opinion was expressed that this practice would improve op-

erating conditions and result in a large saving. Attention was called to the fact that the work is often slighted and it was suggested that improper repacking could be eliminated by requiring the work to be done only at stations which are equipped with apparatus for reclaiming oil and waste.

Inspection of Loads in Open-Top Cars

A question was raised as to the advisability of inspectors making records of depressions in loads shipped in open-top cars in order to eliminate leakage en route and to protect the railroads in case claims for shortage are filed by the shipper. The discussion brought out that at most terminals the inspectors who examine the roofs of the cars are required to note any apparent shortages. A report is made to the agent and the cars are weighed to determine the loss of contents and to establish the amount occurring on each line in case the shipment is hauled over more than one road. In general, if the road does not transfer the load it must participate in any expense due to loss of lading.

Interchange Inspection Record

President Stoll stated that a communication had been received from one of the large interchange points asking that uniformity of inspection records at interchange points be discussed at the meeting. T. J. O'Donnell stated that in the Niagara district some roads require the inspectors to take the numbers of all cars interchanged, while others record only the defective cars. J. C. Keene (Wabash) brought out the fact that there is no standard form for keeping the record of cars interchanged. Mr. Keene advocated the adoption of a uniform form which would be a check against the interchange record. F. W. Trapnell (Kansas City) assented that the car inspector's record is valuable, as no record of seal numbers is taken and there is less liability of error. H. J. Smith (D. L. & W.) objected to any practice which would compel the car inspectors to write the number of every car interchanged, on the grounds that it would consume much time that should be devoted to other work. This contention was sustained by several other members. One member brought out the fact that claim agents often request records of the condition of cars when interchanged from the car inspectors and no information can be furnished on cars not found defective unless the numbers and initials of each car are taken down. J. C. Keene brought out that the interchange record does not necessarily furnish proof that the car has been inspected at the time it was interchanged. T. S. Cheadle (Richmond) stated that since the inspectors had been relieved of the necessity of recording the numbers of all cars, more efficient inspection had been secured. A committee was appointed to consider the matter and report upon it at the next convention.

Other Business

On Wednesday a special train was provided for the members so that they might make an inspection trip around the St. Louis Terminal district. At the closing session addresses were delivered by A. E. Bouchner, superintendent of the Terminal division of the Missouri, Kansas & Texas and also chairman of the Interchange Committee of St. Louis, and by L. T. Canfield, of the Union Draft Gear Company.

The following officers were elected: president, J. J. Gainey, general foreman car department, Southern; first vice-president, E. Pendleton, car foreman, Chicago & Alton; second vice-president, A. Armstrong, chief interchange inspector, Atlanta, Ga.; secretary-treasurer, J. C. Keene, general car inspector, Wabash.

List of Exhibitors

The following is a list of the companies exhibiting at the convention:

American Brake Company, St. Louis, Mo.—Foundation brake gear for cars and locomotives. Represented by R. E. Adreon.

American Brake Shoe & Foundry Company, New York.—Brake shoes for freight and passenger cars and locomotives. Represented by C. G. Weaver.

American Steel Foundries, Chicago.—Simplex adjustable coupler pocket with detachable shelf, Economy draft arm, Simplex coupler, Atlas safety guard. Represented by W. C. Walsh, J. H. Tinker, M. De Anglis and W. G. Wallace.

Bettendorf Company, Bettendorf, Iowa.—Freight cars, Bettendorf car trucks, steel castings. Represented by J. W. Clasen.

Boss Nut Company, Chicago.—Boss lock nuts, bolts, rivets and screws. Represented by W. G. Willcoxson, J. W. Fogg and W. C. Irwin.

Buckeye Steel Castings Company, Columbus, Ohio.—Cast steel coupler yokes, Major couplers, M. C. B. type D couplers, Andrews channel section side frames, U. S. R. A. standard tender bolsters, Buckeye truck bolsters, cast steel box section body bolsters. Represented by F. J. Cooledge.

Chicago-Cleveland Car Roofing Company, Chicago.—Pressed steel ends, outside metal roofs, all steel roofs and pressed steel parts. Represented by R. C. Munro and J. L. Stark.

Chicago Pneumatic Tool Company, Chicago.—Little Giant air drills, Boyer pneumatic hammers. Represented by L. C. Sprague, C. W. Cross and H. W. Buker.

Chicago Railway Equipment Company, Chicago.—Cresco brake beams, Cresco third point support. Represented by E. A. LeBeau.

Columbia Nut & Bolt Company, Bridgeport, Conn.—Lock nuts. Represented by H. P. Cook and J. E. Eipper.

Commonwealth Steel Co., St. Louis, Mo.—Underframes and ends for passenger cars, transom draft gear, steel castings. Represented by G. E. Howard and C. S. Shallenberger.

Duff Manufacturing Company, Pittsburgh, Pa.—Barrett car repair jack, Duff ball bearing journal jacks and car and locomotive jacks. Represented by C. N. Thulin.

Galena Signal Oil Company, Franklin, Pa.—Lubricating oils. Represented by W. E. Auger, W. J. Burnett, T. J. Powell and R. E. Webb.

Gold Car Heating Company, New York.—Gold vapor system of car heating, steam pressure regulators, steam hose couplings, thermostatic control end valve. Represented by W. H. Ivers and A. Sheldon.

Griffin Wheel Company, Chicago.—Chilled iron car wheels. Represented by H. N. Scott

Grip Nut Company, Chicago.—Grip nuts. Represented by H. J. Tierney.

Heath & Milligan, Chicago.—Railway paints. Represented by W. H. Pratt.

Hutchins Car Roofing Company, Detroit, Mich.—Hutchins flexible all steel roof, Hutchins standard all steel roof, Hutchins Type D outside light gage metal roof, Hutchins plastic roof. Represented by A. R. Wilson and C. F. Pape.

Imperial Appliance Company, Chicago.—Uncoupling attachments. Represented by J. T. Cralley.

Independent Pneumatic Tool Company, Chicago.—Thor air drills, hammers, pneumatic hoists, air hose couplings, Universal electric drills. Represented by R. S. Cooper and F. J. Passino.

Joliet Railway Supply Company, Chicago.—Bolsters, brake beams, side-bearings, journal boxes. Represented by J. E. Simons.

Lehon Company, Chicago.—Mule hide canvas roofing for cabs, Mule hide insulating paper and fabric, plastic car roofing. Represented by D. B. Wright and C. V. Eades.

McCord & Company, Chicago.—Journal boxes for freight and passenger cars. Represented by J. A. Lamon.

Mahr Manufacturing Company, Minneapolis, Minn.—Oil burning torches and rivet forges. Represented by N. S. Griffith and D. W. Simonds.

W. H. Miner, Chicago.—Friction draft gear, side-bearings, Ideal safety hand brake, bolster locking center pin and drawbar yokes. Represented by A. L. Canavan and J. R. Mitchell.

National Malleable Castings Company, Chicago.—National quadruple shear cast steel yoke for passenger couplers, M. C. B. Type D coupler, Sharon coupler, National extended floor engine pockets. Represented by C. H. McCrea and G. V. Martin.

Oxweld Railroad Service Company, Chicago.—Cutting and welding torches and tips, oxygen and acetylene regulators. Represented by Wm. Leighton, J. P. Furbeck and A. L. West.

Pierce Oil Corporation, St. Louis, Mo.—Lubricating oils. Represented by J. J. Casey, E. S. Marshall, F. Reardon and R. M. Wiggin.

Scarritt Car Seat & Manufacturing Company, St. Louis, Mo.—Seats for railroad coaches. Represented by B. C. Howard.

Simmons-Boardman Publishing Company, Chicago.—Railway Age, Railway Mechanical Engineer, Car Builders' Dictionary, Locomotive Dictionary. Represented by C. L. Smythe, J. W. Bailey and J. W. George.

Southern Wheel Company, St. Louis, Mo.—Chilled iron car wheels. Represented by W. C. Doering.

Union Draft Gear Company, Chicago.—Cardwell friction draft gear. Represented by J. W. Hathaway and C. J. Gorman.

Union Spring & Manufacturing Company, Louisville, Ky.—Car springs. Represented by A. C. Woods and J. W. Chandler.

Universal Draft Gear Company, Chicago.—Cast steel draft arms, draw bar yokes, draft lugs and tandem draft castings. Represented by C. C. Kirsman.

Western Railway Equipment Company, St. Louis, Mo.—Car door fixtures, malleable journal bearing wedge, Western steel carline, Western timber pockets, Acme pipe clamp, security dust guard, Western brake jaws. Represented by S. H. Campbell and R. M. Hoerr.

Westinghouse Air Brake Company, Wilmerding, Pa.—Air brakes for freight and passenger cars. Represented by F. B. Johnson.

Wine Railway Appliance Company, Toledo, Ohio.—Wine steel ladders, Wine side bearings, Wine hopper door latches, Wine ventilators. Represented by W. E. Wine, W. F. Cremain and C. J. Holland.

The San Francisco (Cal.) Chamber of Commerce has complained before the State Railroad Commission that the Southern Pacific charges excessive rates on lumber between San Francisco and all California points, but the complaint has been dismissed by the Commission. The Commission holds that it lacks jurisdiction because the lines in question are under federal control. For the same reason the Commission discontinued its investigation into the intrastate lumber rates of the Atchison, Topeka & Santa Fe, the Western Pacific, the San Pedro, Los Angeles & Salt Lake, the Southern Pacific and the Northwestern Pacific.

The Unification of Terminals and Foreign Commerce*

Formation of Local Commissions Proposed to Develop and Operate All Port Facilities

By T. C. Powell
Director of Capital Expenditures, U. S. Railroad Administration

IT IS A TRITE SAYING that history repeats itself, but, as a matter of fact, shipping has always been ahead of the port facilities. In 1860, the Great Eastern (sometimes called the Leviathan) made her first trip from England to the United States, and then found that there was no port in this country with sufficient depth of water to accommodate her draft. We pass over a period of a great many years and reach the year 1918, when we operated as a transport of the United States, one of the German ships which had been interned in New York, and which was also christened the Leviathan. On the first trip that this Leviathan made with American troops, she also encountered the difficulty of inadequate port facilities, and was compelled to land in Liverpool because there was not a port in France deep enough to accommodate her great draft.

Under the impetus of war, and under the direction of the War Department, of which S. M. Felton, director general of military railways, was the representative, the ports of France assigned to the American army were radically improved. The channels were deepened, new piers were constructed and unloading machinery was installed, so that in these ports of France there were cranes of a size such as had never been put in use in any port of the United States. If this can be done by the United States government in an emergency within a few months from the time the emergency appeared, it seems as though we should, in the next few years, provide equal, or greater, facilities in this country for all of the ports of the Union.

Lack of Information Regarding Ports

It was because of the lack of information regarding American ports and because of the need of assembling all available data for further consideration and use by the U. S. Shipping Board, that that board created the Port and Harbor Facilities Commission. The commission, through its department of statistics, has collected, and is collecting, all possible available data, not only with respect to the American ports as they now are, but also in regard to foreign ports in Great Britain and France.

The chief engineer of the commission, Captain Chambers, was sent to Great Britain, and has returned with a very large amount of data obtained through the courtesy of the officials of Great Britain. Director General Felton, who is also vice-chairman of the commission, made an exhaustive examination of the French ports. Captain Chambers developed that the English ports, to some extent, were very much in the same condition as the American ports with respect to the diversified authority in charge of the facilities. . . .

Scope of the Harbor Commission's Work

The Port and Harbor Facilities Commission is making studies not only of the physical conditions at each port, but of all conceivable factors affecting foreign traffic. In cooperation with the Department of Commerce and the Railroad Administration, the commission is securing statistics of the products of each state and each industrial community and is comparing and analyzing that proportion of traffic which is exported, as compared with the domestic traffic marketed in the United States.

Many tables and charts have already been prepared, and by extending the studies to an analysis of the imports from foreign countries, the commission will be able to show at any time the relative volume moving into and out of the United States, thereby posting the exporter as to the most economical ports and routes.

In addition to these investigations, the Port and Harbor Facilities Commission, under the resolution creating it, is also authorized to investigate the situation as to drydocks, coaling piers, ship repair plants, etc., and to recommend to the Shipping Board additional facilities of this character.

The commission has established close relations with the Department of Commerce. The speaker is one of the unofficial advisors of the secretary, and it is gratifying to know that the recommendations of Secretary Redfield have been approved by the Appropriations Committee, and the indications are they will be approved by Congress, with the result that for the development of foreign commerce alone, there will be a fund of over $900,000 available, enabling the Department of Commerce to establish something like 30 representatives throughout the foreign countries to report on the possibilities of commerce, including information as to port facilities which will be embodied in the data of the Port and Harbor Facilities Commission and be available for any port commission in the United States.

Diverse Control of Port Facilities in This Country

The authorities in charge of port facilities in this country are varied. First come historically the private owners; next the development by local authorities; next come the steamboat and steamship companies which acquired their own property. Probably next in order come the railroads, which provided such facilities as seemed necessary to handle the traffic of the railroads; then the War Department and the Navy Department, each developing to a certain extent its own facilities, especially during the last year. In addition to any facilities on land, the War Department has had charge of the deepening of channels, while the Department of Commerce is responsible for the safeguarding of the harbor lights, lighthouses, etc.

In all of this there is not definite co-operation between the different authorities responsible for the port facilities. In some cases one railroad has built against another railroad; at other ports the municipality has built in competition with the railroads and in competition with private owners. In some cases steamship companies have developed their facilities independent of any other development in the same locality, while private owners, for personal profit, have built piers, warehouses and coaling facilities.

The result of this has been in many cases excessive prices; in others, unnecessary duplication of facilities, so that it has seemed clear to the Port and Harbor Facilities Commission that there should be at each port a single controlling head authorized to operate the facilities as a whole to the best advantage of the commerce of the port and of the country.

Freight Congestion a Reflection of Terminal Deficiencies

I suppose as long as any of us live we shall remember the freight congestion of 1917-18, resulting partly from the enormous tonnage shipped overseas and partly from the

*Address delivered before the Mississippi Valley Foreign Trade Convention at New Orleans, La.

extraordinary weather conditions. Nothing paralyzes transportation operations, whether by rail or water, as congestion. And the congestion was not only on this side. Through lack of facilities, ships carrying munitions and supplies to the Allies were held up at French ports, not simply for days and weeks, but sometimes for months, because the facilities for unloading were inadequate.

The war is practically over, but the quick turn-around of a vessel, reduction of lay days, and the cutting off of demurrage are among the essentials of successful foreign commerce. These reforms must be brought about by unified action, and recognizing this the Railroad Administration has for the last year been carrying out the policy of unifying terminals, placing at every important terminal and port one official in charge of the entire zone. This may appear to be in opposition to the former policy of railroad corporations. It is, therefore, interesting to note that the committee, of which S. Davies Warfield is chairman, and which is said to represent a very large number of security holders, has already publicly endorsed unification of terminals. The Interstate Commerce Commission has recommended the continuance of this policy. Many railroad officials concur in this view, and . . . finally, the committee of Railway Executives, in the plan submitted by its chairman to the Senate committee within the last week, has provided for a Secretary of Transportation, one of whose specific duties shall be to harmonize any differences arising between the railroads using the same terminals.

Therefore, I think it can be safely said for the first time in the history of transportation in the United States, that the national and corporation interests and the state and municipal authorities have united in the thought that all terminals must be unified and must be made common between all parties, and it necessarily follows that this should include not only the tracks and warehouses property of the railroad companies, but particularly as to the ports of the United States, should apply to all facilities of whatever character necessary in the handling of foreign and domestic traffic within and through the port terminal zone.

The Local Port Commission and Its Duties

Not only is it necessary that these port facilities shall be unified and operated on the most economical basis possible consistent with efficiency, but it is also necessary to advertise these conditions and to notify the manufacturers and shippers of the United States, and the manufacturers and shippers of foreign countries with which we deal.

It has not always been easy for a man located directly at a port to understand the conditions, and it is infinitely more difficult for a man located 500 or 1,000 miles in the interior to keep track of the conditions, not merely of one port, but of several possible ports through which he may undertake to forward his traffic. It is for that reason that the Port and Harbor Facilities Commission has strongly advocated through the press and by correspondence the formation in every port of a local port commission to be made up of representatives of not only the transportation interests, rail and water, but also state and municipal authorities, banks, and of the commercial organizations of that particular port.

It is particularly necessary that on such a commission there shall be responsible representatives of the banking interests, who will naturally solicit the accounts of those engaged in export and import traffic by making a specialty of handling the documents of those corporations and individuals so engaged.

The local port commission should be the medium through which advice as to conditions at that port shall be given to the country. In such advertising there should be sufficient detail so that the foreign producer or buyer will have some idea of the relative advantages of the different ports and, of course, the same information should be given to the domestic manufacturer and shipper.

Correspondence with over 1,000 manufacturers of the United States has shown that these may be divided into several classes:

(1) Those who have been engaged in foreign trade so long and are so well posted that they are the ones to give us information rather than for us to give them information.

(2) Those who depend upon export agents, associations or commission houses to make all necessary arrangements, including methods of packing, and for information as to all those details which a single manufacturer could not perhaps afford to enter into until his trade has grown to greater volume.

(3) Those who sell outright and ship to a port without any clear idea as to whether their product is to go abroad or not

There must, therefore, be a constant growth from Class 3 to Class 2 and Class 1, and further study by the commission shows that there is a tendency for export traffic to move through those ports which are best equipped with responsible export agents or commission houses. Such organizations relieve the shipper and manufacturer from the burden of many details, and, in my opinion, it is necessary for any port which expects to be successful to see that these organizations are encouraged, so that at each port, and especially at each of the Gulf ports, there will be a medium developed through which information regarding the possibility of shipping through that port will be made known to the interior manufacturer.

The local port commission should assume the responsibility of supervising the handling of freight through the port of which it is in charge. If a shipper sends his business through a certain port, which we will designate Port A, and finds that complaints are received alleging damage to packages and he is told that the tackle is old-fashioned and so inadequate that in spite of his best efforts his goods arrive at destination in bad condition, he will no longer patronize that port because, in spite of the fact that in some cases the charges may be lower, the annoyance of his correspondence and the dissatisfaction of his customers will more than counteract this charge.

Informative Work By Commissions Important

The possibility of working out through such a local port commission the necessary details for the development of foreign commerce can hardly be conceived until it is investigated.

I saw the other day a map of Persia. At this particular time trade with Persia is curtailed, but sooner or later the War Trade Board will release these restrictions, and it will be possible to trade freely with Damascus, which is a terminal point for overland caravans bringing from Bagdad rugs, figs, dates, tobaccos and other articles of American import and luxury.

This map of Persia was on a scale of probably 25 miles to the inch, and is in such detail that by studying the symbols one may get all of the information, and more, too, than I shall now enumerate. In the first place, there is a symbol for a steam railroad; another for tramways. Another shows important highways available for every kind of vehicle and beast of burden; another the highways not suitable for vehicles, but which can be used by beast of burden, while still another shows highways that can be used by oxen, mules and horses, but not by camels. Another direction shows that certain highways cannot be used by camels by day because of the stifling heat, but can be used by camels by night. All this information has been worked out in detail for the benefit of the merchant intending to trade with Persia, and I need not tell you that it was prepared in Berlin.

Now, if the Gulf ports will work out the data with the same detail with which Berlin prepared this map of Persia, and will put the information in the hands of every manufacturer of this country, and in every foreign country with which the United States expects to do business, there will be such a distribution of reliable information as has never been equaled before in the history of the commercial business of the United States.

General News Department

Canadian control of railroads in this country is the subject of a report by the Interstate Commerce Commission, made in response to a Senate resolution asking for information as to present or prospective ownership, etc. The Commission has examined the facts regarding the ownership or control of the lines in question: (a) some short subsidiaries of the Canadian Northern operated by the Canadian National Railways and (b) the lines of the Canadian Pacific and the Grand Trunk which are operated by the United States Railroad Administration. The report says it does not appear that there is any present or prospective ownership or control by the Canadian government of any lines in the United States other than those included in the systems named.

Chairman Good, of the House Committee on Appropriations, in discussing the estimates submitted by the Secretary of the Treasury for the expenses of the government during the fiscal year ending June 30, 1921, stated that no estimate for the Railroad Administration had been included because on the date of the report the Railroad Administration was unable to make an estimate; the sums that will be required are almost entirely dependent upon Congressional action in connection with the return of the railroads to their owners' control. Aside from the question of guaranteeing a return to the railroads after they have been restored, there will remain enormous obligations of the government to pay the deficit; but the amount of these depends on the settlements which the Railroad Administration may be able to make in the disposition of cars and engines bought by the government and in the collection of advances already made to railroad companies.

The accident near Parkersburg, W. Va., on August 14, last, when 12 passengers in a street car were killed, has been made the subject of a special report by the Interstate Commerce Commission. This report, dated October 13, is signed by W. P. Borland, chief of the Bureau of Safety. The accident was briefly noted in the *Railway Age* of October 10, page 750. The electric car, a high speed interurban, ran into a switching engine of the Baltimore & Ohio, at a crossing of an industry track, and was wrecked. The locomotive was hidden from the oncoming street car by a building. It had just started from a standstill and had moved but a few feet; and the conductor and a brakeman were in front of the engine and should have given stop signals to the street car; but the investigator finds that they were inattentive to their duty, and did not notice the street car until it got within about 150 ft. of the crossing. The street car, however, was running too fast. It appears that there are no specific printed regulations at this crossing, but trainmen had been specially instructed in the trainmaster's office in regard to it, and the conductor of the switching train was responsible for the safe movement of his engine over the crossing. Street cars do not make a regular stop for the crossing. The locomotive was moving very slowly. The conductor was making his first trip on this job as conductor, though he had served as flagman and was thoroughly acquainted with the conditions.

New England Governors and Business Men

The six governors of the six New England States met in Boston on December 10 to consider transportation and fuel problems; and they adopted resolutions urging that financial assistance be given to the New England railroads by the Federal Government after their return to private control, and that the United States Shipping Board be requested to "allocate some of its large ships to New England owners, operators and managers of steamers." Representatives of the New England railroads and business interests were present at the conference. To return the roads to private control without legislation to restore former conditions "would be disastrous to New England industries, institutions and investors," said the resolution. Financial assistance to New England railroads was requested so as to provide "for the payment of the government guarantee until rates have been put in effect by the Interstate Commerce Commission which shall restore the pre-war relationship of rates between New England and other rate districts, with such increased divisions and allowances as shall assure to the New England roads sufficient revenue properly to serve the New England public without undue increase in intra-New England rates. . . ."

The resolution recited that "owing to increases in expenses the New England roads have been more severely affected than roads in any other section of the country; they cannot under rates now in effect render sufficient service to the public; their working capital has been depleted and they are substantially without credit."

Edward G. Buckland, president of the New York, New Haven & Hartford, presented a statement showing that the railroads in New England during the three years prior to the war averaged a combined net income totalling $38,883,011, during the twenty-two months of government operation net income was reduced to $10,612,375, and in place of a surplus of $10,511,828 there was a deficit of $19,968,991.

The roads in this district, he said, had earned during the period of government control 29.9 per cent of the government guarantee, whereas roads in other sections had earned between 75 and 76 per cent. The relatively poor showing, he explained, was due to increased costs of carrying coal, terminal charges that were excessive because of peculiar geographical conditions and wage advances that had been particularly severe on the New England roads because in this section pre-war wages were below the average.

Machinery for Disposing of Administration Business

A discussion as to the kind of organization that would be necessary to dispose of unfinished business at the time of the return of the railroads to private control was started at the recent annual meeting of the National Industrial Traffic League at Chicago. After some consideration of the subject it was agreed that O. W. T. Tong, traffic manager and secretary of the Northern Potato Traffic Association, Minneapolis, Minn., who started the discussion, should communicate his views to the executive committee of the league in order that some definite agreement as to the league's stand on this subject might be taken. In compliance with this arrangement, Mr. Tong in a letter to H. C. Barlow, chairman of the league's executive committee said in part:

"The bills now before Congress appear to make adequate provision for the preservation of shippers' rights in all matters that may remain unadjusted on the date of return to private control. These bills, however, do not furnish the necessary machinery to carry out the legal intent, and it is, therefore, important for the National Industrial Traffic League to aid in getting the necessary organization to protect the shippers' rights in their future dealings with the government.

"It is not difficult to foresee disastrous times ahead for shippers if they do not now act intelligently in arranging for an organization subsequent to return to private control. There will be, for instance, many overcharge, loss and damage and reparation claims which will be unadjusted, and there must, necessarily, be an organization which will be competent, efficient and duly authorized to dispose of these unadjusted matters in a manner satisfactory to parties interested. Furthermore, it is altogether probable that the Interstate Commerce Commission will issue, after January 1, 1920, many

reparation orders directed to the Railroad Administration.

"When the Railroad Administration was created there was a great deal of unadjusted private control business, and the employees, who then became employees for the government, were allowed to proceed to dispose of this private control business the same as though the carriers had not been taken over. It would be natural, of course, upon return to private control, to have all the carriers continue to handle the business of the government and dispose of it the same as though there were no change in the management, but it is my view this would, in all probability, not work out satisfactorily unless safeguarded, as I doubt very much whether, after the expiration of from three to six months, the carriers would take the same interest in disposing of government affairs as they formerly took in disposing of the corporation affairs after they were on the government payrolls. This is not said in a spirit of criticism. It would be natural for the carriers to attend to their own affairs first, after return to private control, and this outstanding government business would then be given secondary consideration, whereas the affairs will be important and should be efficiently and promptly handled.

"In my view, arrangements should be made to continue in office, for the disposition of government business, all treasurers of the railroads who may, after return to private control, be appointed as treasurers of the corporations. They should act in the dual capacity of treasurer for the government and for the corporation. In the same manner, all other officers of the corporations, after return to private control, should act in the dual capacity of officers for both the corporation and the government. In addition thereto, every effort should be made to retain the present officers of the Railroad Administration, such as Hon. Max Thelen, Mr. Edward Chambers, Hon. Chas. A. Prouty, and the others who are at the head of the various departments at Washington, they to be given such authority as to retain on the government payrolls the necessary employees. Provision should also be made to insure government employees' obedience to every request or order from such government departments.

"The preferable way, of course, is to retain the present Railroad Administration at Washington, with full power to dispose of the unfinished business, but my fear is that many of these officers will desire to leave the service immediately upon return of carriers to private control, and if this is done it is imperative that exceedingly good judgment be used in selecting successors. This will be difficult on account of the natural inclination to reject positions with dead and obsolete departments, particularly as the departments will handle business which will be, to say the least, very uninteresting and with no particular incentive to be wholly efficient."

National Chamber Urges Rule of Rate-Making

Unless the public in the regulation of railroads adopts a policy that will enable the private corporations to meet their expenses and to secure necessary capital, corporate operation will fail, and the government will have to resume the burden of operating and probably of owning the railroads, according to a statement by the special committee appointed by the board of directors of the Chamber of Commerce of the United States to make effective the results of the national chamber's referendum No. 28 on needed railroad legislation.

Elliot H. Goodwin, general secretary of the chamber, in a letter advising officers of local chambers of the views of the special committee, says that the time has come for the business men of the country to urge their representatives in Congress to include in the railroad legislation about to be enacted a rule of rate making designed to yield sufficient revenue to enable the railroads to furnish the service that is required by the public.

Mr. Goodwin calls attention to the referendum taken last summer which declared almost unanimously in favor of a rule of rate-making. The Cummins railroad bill, now being considered in the Senate, includes such a rule. The Esch bill originally included a rule of rate making, and the House committee on interstate and foreign commerce recommended it; but when the House took the measure up for consideration the rule was stricken out.

"All commercial organizations that stand for the rule of rate making—all business men who believe in it—should immediately communicate their views to their senators and representatives and urge them to do all in their power to have this principle incorporated in the law that will provide for the regulation of the railroads after they are returned to private operation," General Secretary Goodwin says. Reasons why the rule of rate-making should be adopted, prepared by the special committee, are attached to Secretary Goodwin's letter.

"It is generally recognized," the committee points out, "that when the railroads were taken over by the government their revenues were not sufficient to enable them to supply the country with adequate transportation facilities and to furnish the services needed by the public. During the period of government operation the financial burden of maintaining transportation has been borne by the government, which has drawn part of the funds necessary for maintaining the roads from the Treasury of the United States.

"The railroads are soon to be returned to their owners, who must necessarily incur large expenditures for postponed construction and for deferred maintenance.

"It is clear that the revenues of the railroads in the future must be greater than in the past, both because extraordinary capital expenditures must be made and because current expenses, due to increased wages and higher costs of materials and supplies, will be much larger than they have been in the past. Unless the public in the regulation of railroads adopts a policy that will enable the private corporations to meet their expenses and to secure necessary capital, corporate operation will fail and the government will have to resume the burden of operating and probably of owning the railroads.

"A choice must be made of one of three courses of action; (1) the statutory power and responsibilities of the Interstate Commerce Commission as regards the rates and revenues of the carriers may be left unchanged and reliance be placed upon the commission to adopt and adhere to a policy of rate regulation that will cause the carriers to obtain the income needed to provide the transportation facilities and services necessary for the public; (2) the government may guarantee a definite minimum return upon capital now devoted to railroad transportation or hereafter invested therein; or (3) Congress may adopt a statutory rule to be observed by the Interstate Commerce Commission in regulating, adjusting, and prescribing rates and fares.

"To adopt the first of these three policies and to enact no legislation to make railroad revenues more definite and the credit of the railroads more stable would be to invite financial disaster on the part of a large share of the railroads and to make probable the failure of corporate ownership and operation. Public regulation would defeat its own object and would start the country upon the fatuous course of government ownership and operation.

"The objections to a guarantee by the government of a minimum return to each railroad company either upon its capitalization or upon the property devoted to the public service are definite and conclusive. As the Railroad Committee of the Chamber of Commerce of the United States stated in the report which accompanied Referendum 26, 'a government guarantee would tend to lessen initiative and cause both the prosperous and the unprosperous roads to feel less responsibility for efficient management.'

"The reasons in favor of the adoption by Congress of a statutory rule of rate-making are as convincing as are the arguments against either no action by Congress or the adoption of the policy of government guarantee of the return upon the capital of the railroad companies. Such a rule would give the Interstate Commerce Commission definite guidance. It would establish a form of rates and revenues which the commission, the carriers, the shippers, and the public could recognize as determining their obligations and rights. It would not be a government guarantee because the government would assume no financial responsibility. It would not lessen initiative on the part of the carriers because it would not take away from them the incentives to improvements in economy and efficiency of service."

Commission and Court News

Court News

Refusal to Carry on Wrongly Routed Ticket

A passenger bought a ticket at Columbia, S. C., for Florence, between which places there are two routes. She specified the route she wished, but the conductor subsequently refused the ticket because it was not so routed. In an action for actual and punitive damages, the South Carolina Supreme Court held that the testimony was not at all suggestive of the willful conduct of the conductor, but merely of negligence of the ticket seller, for which the plaintiff was compensated by a verdict for actual damages, assessed by the jury at $2.20.—Penn v. Atlantic Coast Line (S. Car.) 98 S. E. 793.

Damages for Refusal to Accept Mileage Book

A conductor refused to accept a mileage book coupon, thinking the book was not good on that road, and demanded the cash fare—15 cents—which was paid. He discovered his mistake the same day, and next day, when the passenger tendered the same book, he accepted the coupon, acknowledged his mistake, and tendered three cents—the difference between the cash fare paid and the value of the coupon. The passenger declined the offer and sued the railroad for $100 damages. The South Carolina Supreme Court affirmed a judgment for three cents, as the actual damage sustained, holding that the circumstances did not warrant the finding of punitive damages.—Schirmer v. Charleston & Western Carolina (S. Car.) 98 S. E. 134.

Construction of Uniform Bill of Lading

An action to recover damages for the loss of merchandise delivered to the Erie Railroad for transportation from Passaic, N. J., to New York City involved the proper construction of Uniform Bill of Lading, section 5, providing that property when received from private or other sidings, etc., shall be at owner's risk until cars are attached to trains. The merchandise had been loaded by the consignors on a car placed on a track laid by the railroad on its own land for the use and convenience only of shippers whose warehouses were adjacent thereto. The New York Court of Appeals holds that the track was a "private or other" siding within the bill of lading, the words "or other" following the word "private" include not *all* sidings, but only sidings *like* private sidings, such as this.—Bers v. Erie (N. Y.) 122 N. E. 456.

Modification of Freight Rate Contracts

The Pennsylvania Supreme Court holds that equity will not restrain a railroad from charging a higher rate than that fixed by a contract made in consideration of the grant of a right of way over a shipper's land, though made prior to 1913, where the railroad is charging regular rates fixed by the Public Service Commission. The shipper's remedy is by application to the commission for a reduction of rates under the act of 1913. It would be impossible for the commission to enforce an equality of reasonable rates, except upon the basis that it is not bound by contracts previously entered into between a public service company and either a municipality, another corporation or a private individual. A party entering into a contract with a railroad relating to rates is presumed to do so with knowledge that the state's right to exercise its police power is expressly reserved, and that, if public interest demands, its provisions may be modified without violating the provision of the Constitution of the United tates forbidding impairment of the obligation of contracts.—Teiper v. Baltimore & Philadelphia (Pa.) 105 Atl. 551.

Foreign Railway News

Armstrong Whitworth's Locomotive Shops

LONDON.

On November 12, one year after the signing of the Armistice, Sir W. G. Armstrong, Whitworth & Co., Ltd., celebrated the conversion of its shell works at Scotswood to a locomotive manufacturing plant, by the official steaming and trial of the first locomotive completed at these works. This engine is a freight engine of the 0-8-0 type and is the first of an order of 50 for the North Eastern Railway.

In view of the extreme difficulties of obtaining suitable equipment immediately after the signing of the Armistice, the change from war work to that of locomotive building was exceptionally interesting. These shops are designed to produce from 300 to 400 locomotives a year, and the erecting shops have a capacity of 50 locomotives without tenders.

The First Locomotive Built at the Former Shell Works of Armstrong-Whitworth, at Its Trial at Newcastle, November 12

The management of the shops is in charge of R. B. McColl, who was for 15 years with the American Locomotive Company at Montreal, and who came to England at the beginning of this year from a one year's engagement with the Baldwin Locomotive Works of Eddystone. Under his direction a well laid out plant has been built, which is undoubtedly the most up-to-date locomotive building plant in England. Orders have already been received for locomotives for India, which will be built at this plant.

The official opening ceremony at the works was presided over by Sir Vincent L. Raven, chief mechanical engineer of the North Eastern Railway. At a banquet given in the evenning Mr. Faulkner, chairman of the Armstrong, Whitworth Company presided and mentioned the fact that this was the third attempt of this company in the manufacture of locomotives since 1849. He stated that this plant will be in a position to manufacture electric locomotives shortly.

RAILROAD DEVELOPMENT AT CHICAGO.—The Illinois Central Railroad Company and the Michigan Central Railroad Company have made a joint application to the Public Utilities Commission of Illinois for an order consenting to the acceptance of an ordinance for the establishment of Harbor District No. 3, the construction by the Illinois Central of a new passenger station at Chicago, the electrification of certain of the lines of the Illinois Central and the Michigan Central within the city of Chicago and development of the Chicago lake front, passed by the Chicago City Council on July 21, 1919.

Equipment and Supplies

Freight Cars

The New York Central is inquiring for 1,000 55-ton hopper cars.

The Ann Arbor is inquiring for from 100 to 200 U. S. R. A. standard, single sheathed box cars.

The Detroit, Toledo & Ironton is inquiring for 700 U. S. R. A. standard 40-ton double sheathed box cars.

The Briar Hill Steel Company, Youngstown, Ohio, has ordered 50 gondolas from the Ralston Steel Car Company, Columbus, Ohio.

The Manhattan Oil Company, Minneapolis, Minn., reported in the *Railway Age* of October 24 as being in the market for 200 tank cars, has ordered 100 tank cars from the General American Tank Car Company.

Passenger Cars

The Long Island Railroad, reported in the *Railway Age* Emergency Bulletin of November 6 as inquiring for 50 trailer cars, 30 steam coaches and 20 motor cars, is negotiating with the American Car & Foundry Company for this equipment. The American Car & Foundry Company, it is reported on reliable authority, will probably build the cars if it decides to accept the proposal of the Long Island by accepting payment in car trust certificates and notes extending over a period of ten years. The American Car & Foundry Company is asking the manufacturers of the material specified for use on the cars to accept their respective shares of the burden; and if they all consent the contract will probably be signed by the end of the month.

Locomotive Deliveries in September

The Railroad Administration has issued the following statement of locomotives shipped for the month of September:

	On order prior to Federal control		USRA Administration orders		Constructed in railroad shops

The Traffic Club of Chicago held a memorial meeting on December 8, as a tribute of respect to Frank B. Montgomery, formerly president of the Traffic Club and traffic manager of the International Harvester Company, who died on November 24.

The Lake Tahoe Railway Transportation Company has been authorized by the Railroad Commission of California to issue to the Union Trust Company of San Francisco, Cal., 6 per cent notes aggregating $50,000 to renew notes now held by the latter company.

Supply Trade News

Franklin Schneider, president of the Van Dorn Electric Tool Company, has been elected vice-president of the **Van Dorn & Dutton Company**, Cleveland, Ohio.

George Royal, western railroad representative of the Nathan Manufacturing Company, New York, with office at Chicago, has been appointed railroad representative of **Jenkins Brothers**, Chicago, manufacturers of valves and packings, with the same headquarters.

Fairbanks, Morse & Company are planning to erect a $1,500,000 foundry at Beloit, Wis. The erection of the new plant, which is to be 900 ft. long, 550 ft. wide and will contain 495 sq. ft. of floor space, will be started next spring. The foundry, when completed, will consist of one large building covering 11 acres of ground and including facilities for the storage of flasks, iron, sand, etc. The capacity of the new plant will be approximately 350 to 400 tons of gray iron daily. Plans and specifications for the structure are rapidly nearing completion and the raw material for its construction will be placed on the ground during the winter. Much of the equipment in the foundry will be electrical, the present plans calling for electric cranes, grab buckets, magnets and conveyors.

Trade Publications

Oil Burning Appliances.—The Aeroil Burner Company, Union Hill, N. J., manufacturers of oil burning appliances, has issued an eight-page bulletin describing their outfits for thawing out frozen cars, pockets, hoppers, pipes, switches, loading gates, chutes, etc. The bulletin is fully illustrated showing the application of the various outfits to the particular work to which they are adaptable.

Condensers, Pumps and Cooling Towers.—Bulletin No. 112-B revised and enlarged, entitled "Condensers, Pumps, Cooling Towers, Etc." has just been published by the Wheeler Condenser & Engineering Company, Carteret, N. J. This bulletin illustrates the latest developments in condenser practice and shows photographs of a number of actual installations of surface condensers. It illustrates and describes surface condensers, jet condensers, barometric condensers, the Wheeler-Edwards air pump, the Wheeler rotative dry vacuum pump, the Wheeler turbo-air pump, the patented Wheeler steam jet air pump, Wheeler centrifugal pumps for all services, jet condensers, barometric condensers, natural and forced draft cooling towers, feed water heaters, and Wheeler evaporators and dryers.

Railway Age

(Table of Contents Will Be Found on Page 5 of the Advertising Section)

The Latest in Unification

The operation of the railways of the United States as one unified system has resulted in the very general pooling of the supplies of the individual roads for the common use of all. As a result the relatively large quantities of materials held in stock by the more forehanded roads have been drawn on to replenish the depleted supplies of others, to the interest of the railway supply companies. This practice has been introduced very generally in the mechanical department; it has been followed in the transportation department; the maintenance of way department has not been immune from its influence. More recently this wave has reached the dining car department; the waiters on a dining car on the most important train on one of the leading trunk lines have been observed a few days ago to be wearing jackets bearing the initials of three different roads. Surely, the possibilities of unified operation are great and the limitations are few.

Judge Dickinson's Big Railroad "Salary"

In the issue of the *Railway Age* for October 10, which was printed on November 26, there was given, beginning on page 351, a list of railway salaries paid in 1917 which was published in the Congressional Record of November 18 at the instance of Representative Sims of Tennessee. In this list the name of Jacob M. Dickinson, receiver of the Chicago, Rock Island & Pacific Railway Company, appeared, and it was stated that his salary was $120,732.90. The *Railway Age* has received a letter from Frank Nay, vice-president and comptroller of the Rock Island company, in which he states the correct facts regarding Judge Dickinson's compensation. "In the amount named," says Mr. Nay, "is a special fee granted by the court in July, 1917, amounting to $100,000, which in reality covered the entire period of the receivership from April 19, 1915, to June 24, 1917, inclusive, a period of more than 26 months, or about $3,800 a month. Your remarks give the impression that Mr. Dickinson received about $120,000 a year, which, you will note, is far above the fact." It is probable that if similar explanations were made regarding the amounts stated to have been paid to other railway officers the alleged "fancy salaries" paid would be substantially reduced in many cases.

Place Your Order Now

If labor conditions are still in an unsettled and unsatisfactory state, as now seems probable, at the start of the 1920 construction season and the railroads, through legislation, find themselves in a favorable financial condition to start work on a construction program which will anywhere nearly approach their needs, there will arise the important question of developing means to carry out the work. The logical answer will be the increased utilization of mechanical substitutes for manpower. This would seem to be the proper time for each officer concerned with construction or maintenance to undertake careful studies to determine the character of the work to be done under his direction, in the prosecution of which labor-saving devices are most applicable, and if the proper equipment is available. Each year it is being demonstrated that the field of railway work in which machines may be used economically is enlarging. It is only within recent years that section motor cars have been adopted to any considerable extent, and while many roads already consider them indispensable still each year's experience discloses new uses to which they may be put advantageously. The history of other devices in the long list of labor-saving machines already used by the roads is similar. There never was a time when the need for more extensive use of these substitutes for labor was more urgent. After there is reasonable assurance that the most is being made of existing equipment there remains the question—is the present equipment sufficient to meet the requirements of the emergency which it seems certain will confront the roads in the spring? In many cases the probable answer is "no." If so the opening of the season's work will be marked by a demand for machines beyond the capacity of manufacturing plants to supply on short notice. An analysis of the needs made now followed promptly with orders will ensure more timely deliveries and save much valuable time during the working season.

An Example of War-Time Engineering

No record of the part played by engineers in the recent world conflict is complete without reference to their work in the conduct of purely civil pursuits. In an effort to meet the conditions imposed by the state of war, practices were adopted and measures instituted which might be considered highly questionable under normal circumstances, but which under war conditions represent excellent engineering. In many cases as high a degree of ingenuity was displayed in the design and building of what might be termed makeshift constructions of the war period as in the permanent work of peace times. One excellent illustration of war construction is the new Chamberlain bridge of the Chicago, Milwaukee & St. Paul over the Missouri river, described elsewhere in this issue. At first thought the use of 300 ft. spans on timber piers in a river subject to a shifting bottom and heavy ice floes seems unwarranted, but after a careful study of the circumstances under which the structure was built, as outlined in the introduction of the article referred to, the reasons for adopting this particular design will be readily appreciated. The combination of reinforced concrete with timber is unique, but, with respect to this also, careful analysis will disclose that there were excellent reasons for adopting its use. It is not alone in expensive permanent construction that the design is afforded opportunities to evince his technical knowledge and ingenuity. The limitations placed on construction by war conditions served to foster skillful engineering rather than to suppress it.

"Don't Take Chances"

THIS WARNING, peculiarly appropriate in addressing automobile drivers, is being sent by the State of New York to four hundred thousand of its citizens, owners of automobiles, addressed personally to each individual, in the shape of a card which is reproduced herewith in facsimile, reduced one third in width and height. Francis M. Hugo, secretary of state, is sending the cards in the envelope with his regular annual circular advising automobile owners of the approach of the date when their licenses expire and need to be renewed. This is a highly commendable example of co-operation between the state and the railroads, the cards being furnished by the safety department of the New York Central Railroad.

The card is particularly commendable in itself. Its forceful language is addressed to the head and to the heart. The first paragraph is arresting even if the reader had no heart. The fact that fatalities are increasing month by month is just as certain and obvious as the fact that the city of Detroit is turning out 5,000 new automobiles every day. The multiplication table alone should be sufficient to call a halt. The heart is appealed to in the word "deplorable." The immediate reason why we Americans so persistently pursue our course of self-destruction is that we do not deplore the

STOP! Each year more than 1500 persons are killed and 4000 injured on railroad crossings in the United States. The number is steadily increasing.

LOOK!! The majority of the deplorable accidents **can be avoided** by automobilists exercising care at grade crossings. **Don't take chances.** Even if a crossing is protected by gates, flagman or bell, be sure you are safe.

LISTEN!!! The best safety device in the world is a careful driver. **Stop,** look **both** ways, and **listen.** Play safe. A moment's caution may save your life.

Francis M. Hugo
Secretary of State.

tragedies which are thrust before us every day in the newspapers. As long as it is someone else, we continue serene. If that word "LOOK!" could turn the reader's eyes to such a disaster as that at Clarksboro, N. J., on November 7, last, when 16 or more men and women were killed at midnight, it would impress the necessity of caution with real effectiveness.

It is desirable to repeat such warnings occasionally. With a tithe of the ingenuity displayed in warning people not to buy some other manufacturer's garters, or razors, or cigars, "safety first" could be impressed on those who need the warning, in a way that would be astonishing. The word "caution" in the last line of this card should be the subject of an essay by itself. It implies (in this case) the cultivation of the *habit* of stopping at crossings *whether the stop is necessary or not.* The people of Massachusetts and Connecticut, through their legislatures, adopted this rule for railroad trains crossing other railroads and crossing drawbridges, about 60 years ago; and they still keep it on their statute books: but like the people of the other states, they have thus far failed to adopt the rule for themselves. The automobilist, today, comes pretty near being in the same class with the locomotive enginemen of 1853 (the year of the South Norwalk drawbridge disaster) and he needs the stop rule just as much as they did. They were liable by carelessness to kill a hundred people: he may kill only a half dozen, but there is always the possibility that one of the half dozen may be *himself.*

The Railroad Problem and the "Party of Business"

THE RAILWAY AGE is not a political newspaper, but it is within its province as a railway paper to discuss the relationship of party politics to the railroad question.

Government control of railroads was adopted by a democratic administration and the railroad control law was passed by a democratic Congress. The Republican leaders and newspapers have made much political capital out of the results of the policy of government operation established under democratic auspices. The unpopularity of government operation of the railroads and the telegraph and telephone lines was one of the principal reasons for the election of a Republican Congress in 1918. The Republican party has always prided itself upon being the "party of business and of general prosperity," and we were assured both before and after the election of 1918 that a Republican Congress would speedily pass constructive legislation under which the railroads could be and would be safely returned to the more efficient management of the private companies.

President Wilson, who usually has shown himself to be an astute politician, passed over to the Republican Congress both the opportunity and the responsibility of drafting and passing the needed railroad legislation. He announced last May that the railways would be returned to their owners at the end of this year. He called Congress in special session early last summer. He made no specific recmomendations regarding the legislation which should be enacted. The Republicans had a majority in the House of Congress. Congress had ample time in which to frame and pass the needed legislation before January 1, and the country knew it then and knows it now.

Work upon the proposed legislation was begun at once by the Senate and House committees on Interstate Commerce. These committees conducted hearings at which the facts about the railway situation were fully presented and able men representing all points of view put forward and advocated plans for the solution of the problem. The hearings and subsequent developments disclosed that the committees of both houses were headed by and composed of able men who had a good grasp of the situation. The Democrats and Republicans upon these committees acted together amicably. They did not play politics. Each committee reported to its own house a railroad bill. While these bills differed in many respects, and while each had shortcomings from the standpoints of all classes of students of the railroad problem, most of those who really knew anything about the subject conceded that either bill if passed would effect a great improvement in our system of railroad regulation and management.

The House with its Republican majority could have passed the Esch bill as originally reported from committee. It did not do so. It emasculated the bill by eliminating some of its best and most needed provisions. It inserted other provisions some of which, especially those relating to the handling of labor controversies, are so bad that the enactment of the bill as a whole into a law probably would make the country's system of regulation worse rather than better than it has been in the past. A Republican majority in the House could have passed a good bill, but it passed, or permitted to be passed, a bad bill.

The Senate adjourned without acting on the Cummins bill. Since it has met again the bill has been discussed at length, especially by members of the committee that drafted it. Although the bill deals with the most important of the nation's post-war reconstruction problems, it has been almost impossible to keep in the Senate chamber a quorum to hear and participate in these discussions. What the news-

papers call " unexpected opposition" has developed. This opposition is directed principally first, against the provisions which are intended to assure to the railway companies opportunity to raise sufficient capital adequately to develop their facilities; and, second, against the provisions which are intended to prohibit strikes upon the railways and to establish means of peaceably and equitably settling labor controversies.

The date on which the President originally said he would return the roads to their owners is now (December 15) only two weeks away. In ten months out of the twelve which ended on October 31 the railways incurred a deficit as compared with the net operating income earned by the companies under private operation on which the guaranteed returns to the companies are based. The total deficit for the year ended October 31 was about $375,000,000. There is no doubt that the railways will also show large deficits in November and December. Their facilities have become so inadequate that they are unable to handle the commerce of the country, and therefore they are the limiting factor in production in America. The country will never again be able to produce to its maximum capacity until the capacity of the railroads is increased. Until the questions whether and when the railways are going to be returned to their owners, and under what kind of permanent legislation, are settled, the imperatively needed enlargement of transportation facilities will not be and cannot be commenced.

It is by no means a certainty that the President will not return the railways to their owners at the end of the year and withdraw the government guarantees whether any legislation is passed or not. Everybody knows that this would result in widespread railroad bankruptcy; and yet the members of Congress continue their course of paltering inaction. To return the railways to their owners under temporary legislation merely continuing the guarantees would postpone the time when rehabilitation of their facilities could be commenced. Because of the understanding that the return to private operation is imminent, the Railroad Administration is daily losing able men from its organizaton by their return to the companies. In these circumstances it cannot continue to operate the properties with any satisfactory degree of efficiency.

The foregoing is a plain statement of facts. No man can dispute its accuracy in any detail. All that is needed to precipitate a national catastrophe is for Congress, with its Republican majority, to continue for awhile along the course which it has been following.

If as a result of the way in which this problem has been handled in Congress the railways are not returned to private operation, or if they are returned without adequate legislation, there cannot be in the mind of any intelligent person the slightest question as to the political party which will have to assume responsibility for the consequences. The Republican party, because it has a majority in both houses of Congress, and because President Wilson passed the whole question over to Congress, will have to assume the responsibility. Is the Republican party going to vindicate its claims as the "party of business and prosperity," or is it going to stultify them?

The Republican party may be the "party of business and prosperity," but certainly the Republican majority in Congress has not thus far dealt with the railroad problem in a way which commends itself to the business men of the country, or which is adapted to promote the prosperity of the American people. The "party of business" had better get down to business, or it will go into the next political campaign with a record for dealing with the railroad problem which will estop its newspapers and spellbinders from making any effective criticisms of government control and operation of railroads under Democratic auspices.

Letters to the Editor

Good and Bad Whistling

Buffalo, N. Y.

To the Editor:

What is this preposterous announcement that I find in your issue, Number 17, October 24, page 822, that some committee recommends the modification of the rule for the highway-crossing whistle-signal so as to require the engineman to rend the air for nine seconds? What are these committeemen thinking of? Do they dwell continually in the tomb and in the barren mountains, like the wild man that we read of in the Gospel? That man was continually crying out and cutting himself with stones—a sort of self-punishment for his sins! To make larger the unavoidably large volume of noise which comes from the big locomotive of today is little less than an outrage. What is the purpose of the highway crossing signal? Is it to alarm all of the farmers within a mile? I should like to have any member of that committee, who can conveniently get hold of a buzzer or a common electric door bell, go through the motions of making the "7" signal of such a length as to occupy nine seconds. He will be ashamed of the disturbance which he finds himself making. *Three seconds* is ample time in which to make a loud, distinctive and in all respects sufficient signal.

Look at a few familiar facts. For many years the crossing signal consisted of only one blast; and everybody was happy. What need is there for having this signal different from the signal signifying the approach to a station? It has been argued that the way to improve our whistling is to make it easier for the engineman to adjust his mind to what is demanded; if that is the case a change from four blasts to one blast would be a very simple way to go about it. One prominent road has—at least on some divisions—discontinued the use of the station approach signal. Discontinuing it everywhere might not be an unprofitable experiment. You, Mr. Editor, have been arguing for years for moderation and common sense in whistling; perhaps the easier way to make such arguing effective would be to propose to modify the whistling in this way—urge its abolition. Where crossings have an attendant the use of the crossing whistle, in numerous instances, has been wholly discontinued, and with satisfactory results.

The American Railroad Association has been noted for its persistent conservatism. Assuming that the signal ought to be changed, this committee might naturally be expected to demand that the proposition be supported by a good body of experience in favor of changing. What have they got to offer? Many men in that association, as many other railroad officers, all over the country, are Morse telegraphers; and every one familiar with the Morse alphabet will agree that the way to make the crossing signal, which is equivalent to "7," is to do it in comparatively quick time. The specialists in psychology will tell you that there is a pleasing rhythm in "7" that is lacking in the long drawn out screeching which is now proposed.

The whistle nuisance is bad enough, in all conscience, already. No reasonable man, considerate of the public, can think of making it worse. Some of the safety sharps in the National Council have demanded that the crossing whistle be drawn out longer, but these men are thoughtless extremists. They are simply following some of the shortsighted legislators of former years, who actually prescribed by statute the continuous blowing of the whistle of every train, for

80 rods before reaching a crossing! And there are enginemen who are willing to aid and abet such a crime. Foolish people who recklessly approach crossings without looking and listening are, indeed, entitled to a good warning, but there is no reason in going to extremes; their lives are not worth it.

The lives of innocent people residing near crossings deserve consideration. The passengers in trains are to be considered also; I have ridden a hundred miles in an express train on a prominent Eastern road, in a coach next to the engine; and the frequent and excessive whistling for crossings were an absolute nuisance. It was, perhaps, a necessary evil, but an engineman with a conscience, with the musician's ear for time, and with *proper instruction* from his superintendent, could have reduced the evil 50 per cent or more. Some of the best runners habitually make the signal in *two seconds*.

R. C. G.

Remodeling Locomotives

To the Editor:

The interesting account in the *Railway Age* of November 14 of the rebuilding of the Prairie type into Mikado type locomotives on the Northern Pacific is of extreme interest, and one that officials in charge of the motive power of our railroads can well study.

It is true that every motive power official must study this question from his own "angle," and that a remedy suggested for one road would not cure another, but the problem is one of importance for all that.

For some years the writer has been a close observer of the motive power of the various roads in the east, and while the "east is east," the "cure" may not fit those of the west at all. I think one of the best examples and most successful ones at rebuilding locomotives occurred on the New York Central when they rebuilt a large number of their Consolidation locomotives into Mikados; I have been informed that the results obtained for this rebuilding has given them one of the best working type of freight locomotives on that road.

In July, 1918, I had reason to make a trip over the Buffalo, Rochester & Pittsburgh and stopped off at East Salamanca, N. Y. I saw there a line of locomotives, perhaps half a dozen, Consolidation and 4-8-0 type, not in use, and when I made inquiries concerning these locomotives, I received the reply that they were to be sold—that it was the policy of this road to dispose of its locomotives whenever they became too light for service and replace them with thoroughly modern power. This policy has its advantages —provided a purchaser can be found.

On the other hand, take a large road the size of the Pennsylvania. It was not very long ago that that road offered for sale some of its Atlantic type locomotives; yet as late at 1905 in their own Juniata shops they built eight-wheel locomotives for their lighter passenger trains, a commendable policy. A road the size of the Pennsylvania with its subsidiaries should have little difficulty in assigning the proper class of locomotive for service which it can handle most economically.

The New England roads, with their short runs and requirements of frequent service present a different problem. For years the eight-wheel passenger locomotive was the only type used for passenger trains. On the New Haven, the ten-wheel type was not introduced until 1904 and the Pacific and Atlantic until 1907; consequently this road has an abundance of the eight-wheel type that can be used very advantageously on shorter runs and lighter trains.

As I view the problem, the chief difficulty confronting our officials at the head of the motive power departments is not so much in the specifications of new locomotives, but in what way can the present power, ten to fifteen years old, be remodeled to handle the constantly increasing loads caused by heavier equipment, etc. Brick arches, though used here long ago by Mr. Griggs on the Boston & Providence and superheaters, and other devices have and will help—but the locomotive itself, can any more power be gotten out of it, and is it worth it? This looks to me like the vital problem that is going to soon confront the motive power officials after January first, next.

It seems to the writer to be folly to run some of these trains, two and three cars, with locomotives intended for heavier service and half worn out, but I have seen it many a time and know that on some back shop track there are probably three or four smaller ones, which with a little fixing up would do the work and burn less coal. Up to last summer, locomotives designed by Mr. Buchanan and built in the early nineties ran out of Rochester over the Auburn road with three steel coaches behind them, yet I have seen on other roads two- and three-car trains which were handled by Pacific, Atlantic, yes and even by Mogul locomotives.

The problem is distinctive with each road, and it is bound to present itself, sooner or later, and is one that our motive power officials must wrestle with and answer according to the requirements or needs of his own system.

Chas. E. Fisher.

The Switchman as Diplomat.—The switchman who does industry work has to deal with the public and he has a better chance to use his qualifications as a salesman than those who work on inside jobs. He is not only selling his labor, but he is in a position to represent his company. If he does his work promptly and cheerfully, he will have no trouble to throw all the shipments from these industries over to his employer. By obtaining this additional business for his employer he is building a reputation for himself and getting more work for his fellow employees to do.

Give the public all the help and information you can because it is the public that keeps us busy. The public also pays for the fine passenger trains that travel over our line. When you have work to do on these trains do it carefully. If you do not handle passenger trains carefully the public will be afraid to ride on your line and you will be the cause of some "old timer" returning to the freight service.—*Duit Wright.*

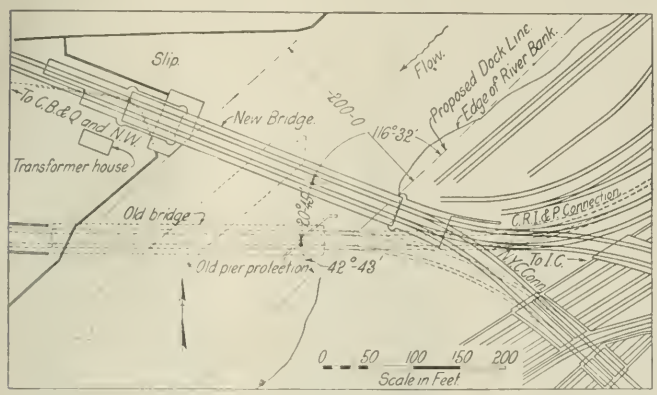
The Russian People Bid Farewell to the American Troops Leaving

World's Longest Bascule Span Erected at Chicago

Recently Completed St. Charles Air Line Bridge Contains a Single-Leaf Span 260 Ft. Long

A NEW RECORD in bridge construction has been established in the recent completion of the St. Charles Air Line structure over the Chicago river, which comprises the longest single-leaf bascule bridge ever built. Aside from the introduction of special details necessary for the completion of a record structure of this type, the prosecution of both the substructure and superstructure work involved the application of some unusual construction methods.



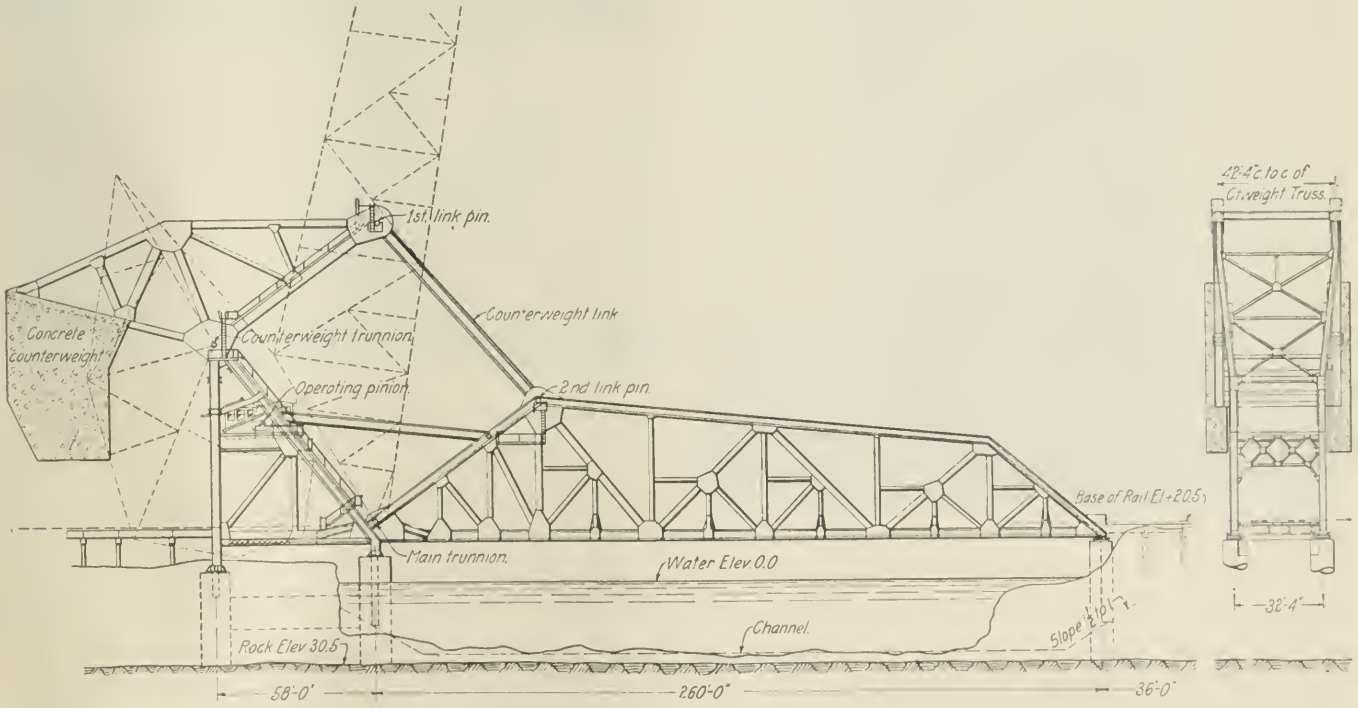
Location Map Showing Re-alinement of the Crossing

This structure occupies the approximate site of one of the earliest railroad bridges in Chicago, since the St. Charles Air Line was one of the first lines of railroad built in that city. Projected in 1857 as a trunk line railway extending westward from the city, the St. Charles Air Line is now but a short east and west transfer facility, extending from the Illinois Central property on the lake front in the vicinity of Sixteenth street to a point a short distance west of the Chicago river. Although it is considerably less than a mile in length it connects the Illinois Central and its tenant, the Michigan Central, at the eastern end with the New York Central, the Chicago, Rock Island & Pacific, the Chicago, Burlington & Quincy, and the Chicago & North Western. It is owned jointly by the Illinois Central, the Michigan Central, the Burlington and the North Western and is operated by the Illinois Central. The traffic over the bridge is entirely interchange, largely between the owning and operating roads. However, it is also used for the transfer of mail and express between the Union and the La Salle street stations, while during the war many troop trains were handled across this line.

The new structure replaces a swing span built in 1882, which is 297 ft. 6 in. long and crosses the river at an angle of 42 deg. 45 min., providing two channels, one of 59 ft. and one of 55 ft. The alinement and track arrangement were changed, as indicated, to accommodate the new double-track bridge which crosses the river at an angle of 63 deg. 28 min., being 260 ft. long between end bearings of the moving leaf and providing a clear channel for navigation 200 ft. wide.

Superstructure

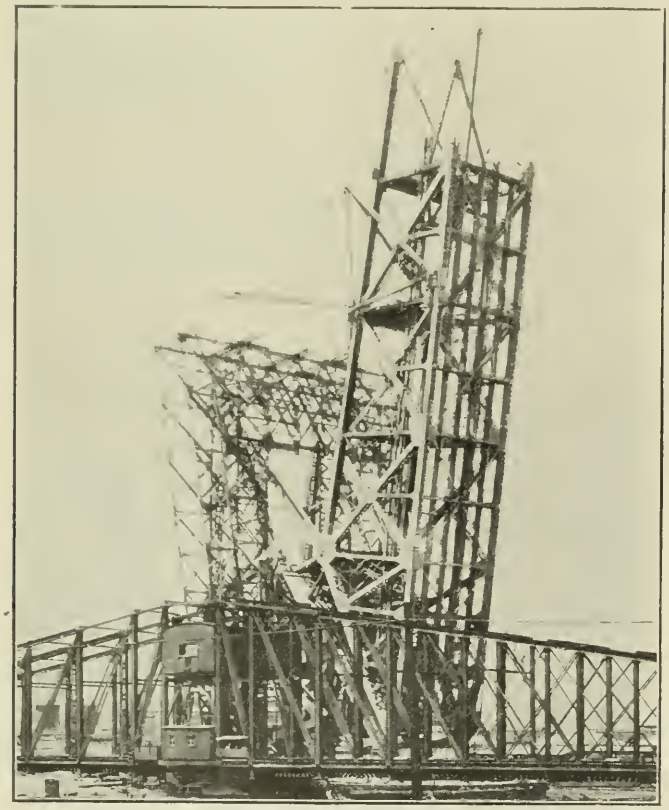
The location of the new structure was selected to avoid interference with the old bridge during construction and to reduce the skew of the crossing and, therefore, the length of the bridge as much as possible. However, the track layout on the east side of the river, particularly the south wye, gave little latitude in the location of the bridge. The drawings show the general plan and elevation of the new bridge, including the concrete trestle approaches, which will readily



Side and End Elevation of the Bridge

be recognized as the Strauss heel trunnion type of bascule bridge.

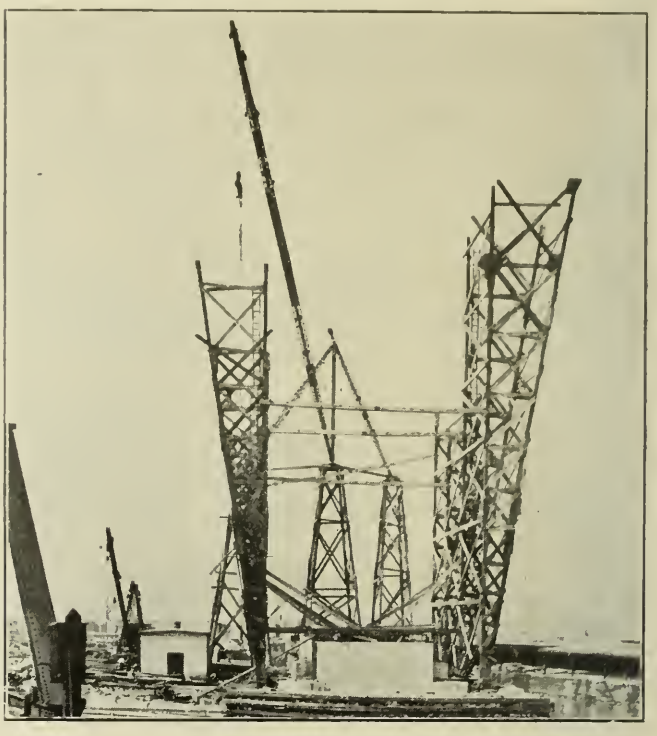
The superstructure consists of a through Warren truss double track movable span, with subdivided panels and inclined top chords, 260 ft. long between end bearings designed for Cooper's E60 loading, and a 58-ft. counter-weight fixed tower span, all in accordance with the Illinois Central standard specifications. The principles of counterbalancing and operation are much the same as in other bridges of this type. The counterbalancing is effected by a pair of concrete slabs, termed "wing counterweights," such as were used in the North Western three-track bascule bridge over the north branch of the Chicago river at Deering (described in the *Railway Age-Gazette* of August 11, 1916, page 233). For large bridges these are found more economical than the single block of counterweight often used on account of the increase in leverage thus gained. They are 5 ft. 7 in. thick, 60 ft. high and 37 ft. wide, and are built around the structural steel members of the counterweight trusses which support them, and are reinforced in vertical planes with ¾-in. round rods and in horizontal planes with ½ in. square rods. In addition, 3-in. expanded metal is placed 2 in. from the outer faces of the concrete. Each concrete counterweight weighs approximately 885 tons, at 148 lb. per cu. ft. The rectangular apertures showing in the face of the counterweight are for the purpose of adding adjustment blocks to obtain the exact required weight. The calculations were based on half of the number of these apertures being filled when the bridge is in equilibrium. The total weight of the blocks equals 7 per cent of the total counterweight.



Erection View—Moving Leaf Nearing Completion; Stiff-Leg Derrick Dismantling the Traveler

As the bridge opens the counterweights move entirely outside of railroad clearance and outside of the lower portion of the supporting tower. When fully opened their lowest point is eight feet below the base of rail. To accomplish this the counterweight trusses are located in planes five feet outside the planes of the moving leaf and tower trusses, the counterweight trunnions being supported on supplemental vertical and inclined tower posts carried by deep portal girders extending beyond the main posts. The distance from the counterweight trunnion to the concrete counterweight is such that the latter swings below the overhanging portion of the tower.

The two counterweight links, which are structural members connecting the forward points of the counterweight trusses with the hips of the moving leaf trusses, are each offset 5 ft. in their length of 85 ft. 8 in. The resulting lateral component of the stress in these members due to this offset is taken care of by lateral bracing between them. The location of the above parts can be seen by reference to the general drawing and the photographs. Below the track level the retaining walls between piers 2 and 3 and the concrete trestle approach hold the earth fill from interference with the counterweights.



Method of Erecting the Traveler

Operation

The bridge is opened or closed in 1¾ min., being operated in the usual manner characteristic of this type by means of straight racks bolted to a pair of operating struts, one pivoted to the end posts of each truss and engaged by operating pinions located in the portal of the counterweight tower. The bridge is electrically operated, and current from a 12,000-volt public utility circuit is brought underground to a sub-station at the bridge site, where it is stepped down to 440 volts through three 75-kva. transformers. The operating machinery is located in a fireproof house in the counterweight tower frame and above the tracks. This house contains gearing, motors, engine, air and water tanks, switchboard, controllers and other operating devices.

The pinions are actuated through an equalizer and reduction gears by two Westinghouse motors of 150-hp. capacity, each working on a 440-volt, 3-phase, 60-cycle circuit and capable of developing a maximum torque of 3,080 lb. (each) at a one-foot radius. Each motor is equipped with a solenoid brake, adjusted for braking 100 per cent of normal running torque of the motor. These motors are controlled

by the Cutler-Hammer magnet type control, consisting of four reversing contactors and five accellerating contactors for each motor. The master controller for these contactors is mounted on a stand and interlocked with the lock motor in such a way that neither can be operated out of proper sequence. The operations of the lift and lock motors are in turn interlocked with the signal interlocking machine. In opening, all track signals must be set at "stop" indication before the motor controllers are released.

The auxiliary power consists of a four-cylinder 62-hp. gasoline engine operating at a speed of 1,000 r. p. m. The engine is provided with a self-starter operated from a storage battery. The engine was made by the Wisconsin Motor Manufacturing Company.

On account of the unprecedented size of this bridge it was considered advisable to use an air buffer on the operating strut in addition to the oak bumping blocks ordinarily em-

The Completed Bridge in the Open Position

ployed. This is a new feature in bridges of this kind and comes into play when the bridge reaches the nearly-open position. It consists of an air cylinder with 15-in. bore and 23½-in. stroke secured to the top of each strut near the moving leaf end with a piston rod 4 in. in diameter and 6 ft. 3 in. long, normally held in its extended position by a pair of coiled springs. When the bridge nears the limit of its opening the extended piston rods come into contact with a short I-beam bumping girder secured to the inclined post of the counterweight tower just above the path of the operating strut, and the compression of the air in the cylinder gradually arrests any further movement of the bridge after the power has been cut off and the motor brakes applied. A similar air buffer is located underneath the front end of the leaf which comes into play when the bridge closes, the piston rod coming into contact with the bridge seat of the rest pier.

The bridge is locked in the closed position by motor-driven latch bars moving in guides in the bottom chords of the main trusses and engaging the end shoes. These locks are operated by a five-hp. squirrel-cage motor of the high-resistance type. Both lock motor and main lifting motors are controlled through limit switches at the ends of their respective travels. The main line contactors for the lifting motors, located on the control panel, are tripped out when the moving span is within 15 deg. of the fully closed position; to close it the remaining distance a foot switch is provided for releasing the brakes and a push switch for closing the circuit through the contactors, thus short-circuiting the limit switch. The motors may then be started by the master controller. In case the line contactors go out, due to overload or short circuits, the controller handle must be brought to the neutral position before a new start can be made.

An emergency brake is also provided, acting on each operating strut incorporated with the operation strut guide. These brakes are operated by single action compressed air cylinders in line with the strut secured to flanges on the bottom of the guide. The pistons of the cylinders are connected by means of connecting levers and eccentrics to eight brake shoes—four each for the top and bottom flanges of the strut. The operator applies the brakes by admitting compressed air into the cylinders, a control valve being located in the operator's cabin immediately adjacent to the leaf motor controllers.

Air is supplied to the strut brakes and also to a warning whistle at 125-lb. pressure by a General Electric 25 cu. ft. direct-connected, motor driven, air compressor with automatic governor and unloader. The storage capacity consists of one 65 cu. ft. tank, located on platform outside of operating house.

The warning and indicating signals on this bridge are most complete. In addition to the usual channel warning lights required by the government, a wig-wag warning to river traffic has been introduced as a signal to vessels in event of failure of motive power for the bridge. The wig-wags are located in the center of the bridge on the lower chord and can easily be seen from the river. They are controlled by a snap switch on the controller stand.

The Substructure

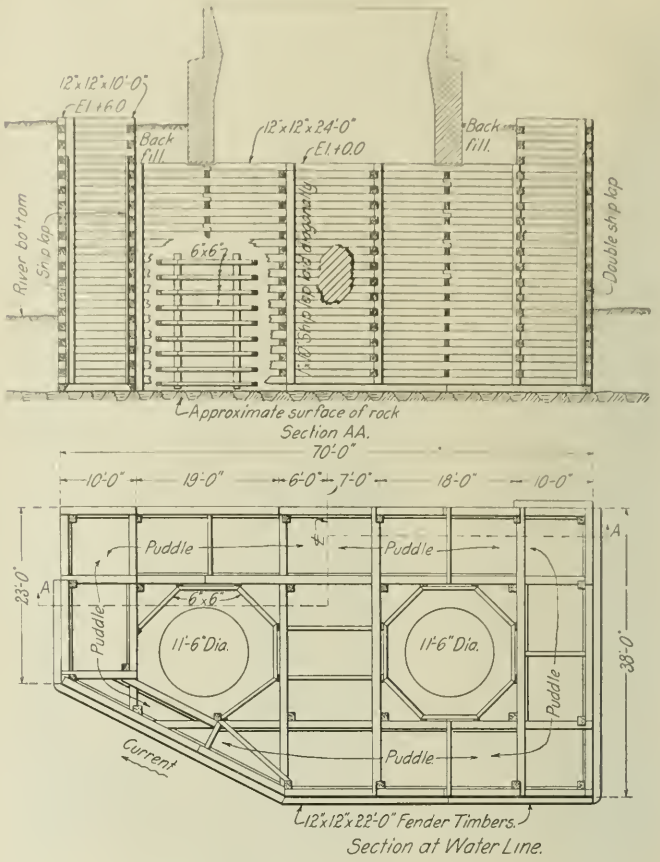
The substructure for the pivot end of the span is the conventional form for this type of movable span, comprising four cylindrical piers, to carry the four posts of the counterweight tower, the two forward ones also supporting the pivot ends of the movable leaf. These piers are connected by walls which function at once as ties, struts and retaining walls for the filling that supports the tracks in the space enclosed by four walls. The rest pier is of similar design, consisting of two piers connected by a concrete diaphragm. These are concrete trestle approaches to the rear of the piers on both sides of the river, this type of construction being adopted primarily to avoid the building of abutments to resist the earth pressure close to the river. On the west side the trestle was especially applicable because of a slip adjoining the bridge immediately to the north, which would have necessitated an expensive retaining wall along that side had an embankment been used. The trestle for the north track is 98 ft. long, while that for the south track is only 42 ft., so that for a length of 56 ft. the embankment for the south track slopes out underneath the trestle for the north track. The seeming inconsistency of using a retained fill within the pier structure is explained by the fact that the tie walls connecting the piers were necessary in any event, and were made to serve also as retaining walls at very little increase in expense.

The foundation conditions are more favorable at this

point than at most other bridge sites in the city. Rock was encountered at elevation 28.0, borings for a depth of 11 ft. into the rock establishing the security of this material beyond any reasonable doubt. The east substructure and the southwest pier of the west substructure were far enough behind the existing dock line to permit of the successful use of the "Chicago" method of open-well excavation, but the northwest pier on the west side was so close to the private slip that a puddled coffer dam was required. This was constructed with wooden sheet piling on the outside and steel sheet piling on the inside.

It was the two east piers on the west side of the river that imposed the real problem in foundation work. The lack of a sufficient earth cover over the rock made it impossible to hold sheet piling effectively and precluded the use of a coffer dam. As a consequence a design of cellular crib was developed, as shown in the drawing. This consists of 12-in. by 12-in. timbers, with a double layer of shiplap on the interior, arranged so as to provide for a puddle wall surrounding two interior cells on the sites of the two piers. This puddle proved sufficiently tight to enable the water level within to be lowered to a depth of 10 or 12 ft. In the spaces thus partially unwatered steel sheet piling was driven in circles of the near sizes of the piers. To accomplish this wooden forms or cages were built in the shape of segmental centers, disposed horizontally with vertical guides to connect them. The space within the circles of sheet piling were pumped out and excavated to a depth of about two or three feet into the rock and filled with concrete. The cages were taken out piecemeal as the concrete was brought up. The wooden crib was built to a height of four or five feet on ways in the slip adjoining the bridge, launched and then completed while floating and finally towed into position. Because of the impracticability of holding piles in front of the piers, this crib will remain in place permanently as a fender to protect the pier and superstructure against navigation.

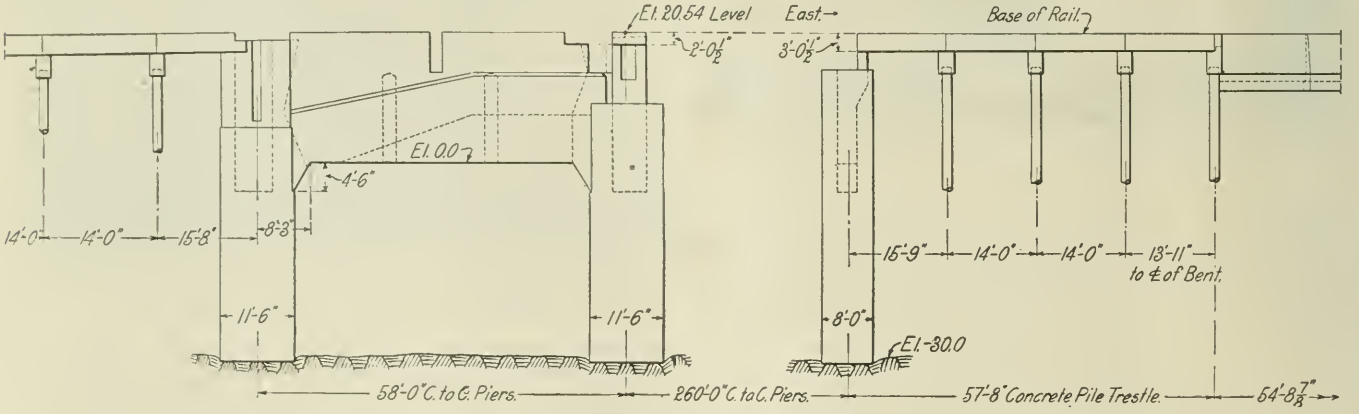
Because of the presence of the slip a timber bulkhead was driven along the north side of the west substructure, which is supported in part by tie rods from a row of piles along the south side. The entire substructure contains 2,000 cu. yd. of concrete, including the concrete trestle approach. The trestle conforms to Illinois Central standards, with concrete piles of the pre-cast and drive type. The superstructure



Details of the Cellular Crib Used for the Construction of the West Abutment

outer end was elevated some 265 ft. above the track level, or about as high as a 22-story building. Obviously this entailed something more than ordinary erection methods.

The tower and counterweight trusses were erected first with the aid of a gantry traveler, composed of four gallows-frame bents 168 ft. high above a traveler track built along each side of the bridge at a level about 14 ft. below the bridge track level. The north traveler track was supported on the bulkhead and the south one on a row of piles, including those used as backstays for the bulkhead. This traveler was set up first by a stiff leg derrick mounted on a three-legged tower with a 100-ft. boom. The gantry frame carried a row of longitudinal girders on each side, each of which carried two sets of fall lines operated by a hoisting engine,



Outline Elevation of the Masonry

was built by the Foundation Company of New York during the winter of 1917-18, one of the severest in local history.

Erection

In conformity with common practice in such structures, the bridge was erected in the raised or open position. Owing to the great length of the span this meant that the extreme

set on the ground to the rear of the bridge. As the traveler was tall enough to cover the highest part of the tower and counterweight trusses, these fall lines were readily used to set all members of the structure. The heaviest one wos the rear section of the bottom chord of the counterweight truss, weighing 70 tons. In doing this portion of the erection the traveler was first used in a forward position to erect the tower, then moved back 40 ft. to erect the counterweight trusses and again moved forward to erect the moving leaf to the height of the hip verticals.

The rest of the moving leaf was erected by a method more nearly comparable to that used in the erection of tall steel frame buildings than steel bridges, namely, by means of a

The West Abutment

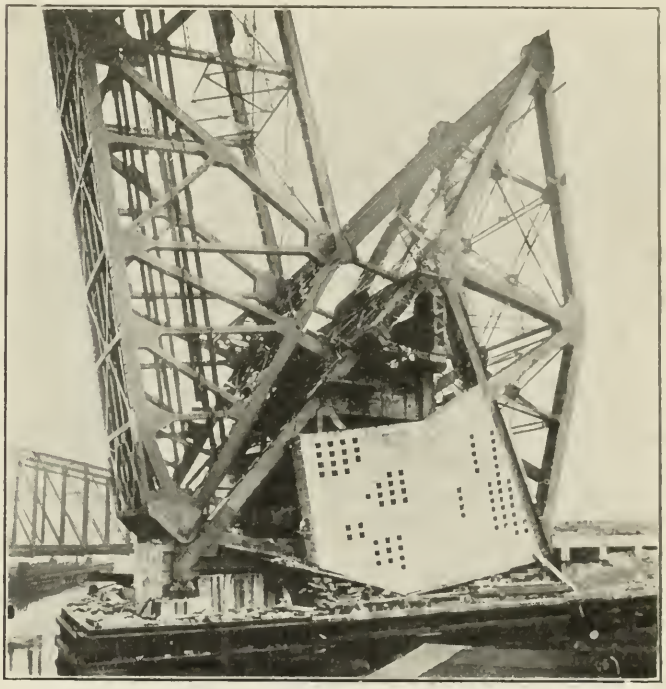
derrick that was used from time to time as the work progressed. The manner in which this was carried is particularly interesting.

The span in its vertical position may be considered as forming an enormous elevator shaft in which the erection equipment is comparable with the elevator. As in an actual elevator, a guide was provided along each side, in the form of two lines of heavy timbers bolted to the web members of the trusses. These guides were somewhat closer to the bottom chords than to the top chords and were parallel with the former. The derrick, which moved upward with the aid of these guides, consisted of a vertical A-frame made of two 12-in. by 12-in. timbers and standing on a girder composed of four 8-in. by 16-in. stringers spanning crosswide from guide to guide. This girder, reinforced by a shallow truss underneath, carried the load of two booms mounted at the center on opposite sides of the A-frame, so that one boom was used to erect the bottom chords and floor system, while the other one was engaged in setting the top chords, top laterals, etc. The weight of this derrick and the loads it lifted was carried on two columns of 12-in. by 12-in. timbers set up under the ends of the A-frame and held in place by bolting to the guide timbers. This derrick was raised from time to time by lines lashed to members that had been erected to some considerable elevation above the position of the derrick.

The steel for the bridge was unloaded in a yard north of the slip, from which it was brought to the work partially on barges and partially on cars. During the erection of the span the gantry traveler was taken down with the aid of a stiff-leg derrick mounted on the outside of the span at the level of the second panel point above the hip. This was facilitated by moving the traveler forward as it was taken down, one gallows-frame at a time.

The construction of the bridge was concerned to a certain extent with the plans of the Chicago Railway Terminal Commission for straightening the Chicago river which provide for a new river channel about 400 ft. westerly from the present channel. The designers of the type of bridge finally adopted have proposed a plan for revolving the superstructure of the new bridge intact on a circular track and rollers to the new site. No provision has been made in the substructure as yet for the prosecution of such a plan.

The bridge was built by the Illinois Central under the direction of A. S. Baldwin, formerly chief engineer and now vice-president of the corporation, and F. L. Thompson, chief engineer. Maro Johnson, assistant engineer, assumed direct charge during the construction of the sub and superstructure. The Strauss Bascule Bridge Company, Chicago, acted as consulting engineers. The Foundation Company, New York, built the substructure, beginning construction in October, 1917, and completing it in August, 1918. The American Bridge Company (Gary plant) fabricated the steel and machinery, which was erected by the Ferro-Construction Company of Chicago, which began work in October, 1918, but was interrupted by delays in receipt of material in November, resuming operations in February, 1919, and completing the erection with minor interruptions in August, 1919. C. H. Norwood of Chicago furnished and installed all air and



The Counterweights, the Counterweight Trusses and the Tower

electrical equipment and the auxiliary gas engine drive. The structural steel weighs 1,544 tons and the trunnion pins and operating machinery 166 tons. The main trunnions are 25 in. in diameter, the counterweight trunnions 46 in. and the first and second link pins 20½ in. and 31 in., respectively.

Number of Locomotives on Japanese Railways.—There are in operation on the Imperial Government Railways of Japan the following locomotives: 1,182 tank engines, 600 of which are of British make, 308 American, 171 German, and 103 Japanese. There are 8 light railway locomotives, 4 of German manufacture and 4 of unknown make; 1,778 tenders, 711 of which are Japanese, 671 American, 336 British, and 60 German. The electric locomotives number 13, of which 12 are German and 1 Japanese. Although these figures give a considerable number of Japanese types of both tanks and tenders, the most of the parts and equipment of these engines have been purchased either in America or England and assembled in Japan.

Investigation of Plumb Charges Demanded

Representatives of the Plum Plan League were given a brief hearing before the Rules Committee of the House of Representatives on October 10 for the purpose of urging the passage of the resolution introduced in the House by Representative Huddleston of Alabama, providing for an investigation by a Congressional committee of the charges of railroad financial manipulation, and that the railroads seek legalization of a fraudulent property investment as a basis of valuation, made by Glenn E. Plumb, counsel for the organized railroad employees. Representative Huddleston introduced the speakers, saying they were prepared to prove that eight or nine billion dollars of the railroad capitalization is "pure water." He declared that an investigation of elements affecting the valuation of the railroads was especially important because of its bearing on the level of rates, and he declared that the railroad interests were seeking to prevent the investigation. As evidence of this, he stated that the financial journals and the *Railway Age* have been very "abusive" of the railroad labor organizations.

Warren S. Stone, grand chief of the Brotherhood of Locomotive Engineers and president of the Plumb Plan League, said it was the unanimous wish of the employees that the resolution be reported out by the committee and the investigation made, because the employees were prepared to prove in detail every charge that Mr. Plumb had made.

Chairman Campbell asked what would be added by such an investigation to what the Interstate Commerce Commission is doing in connection with its valuation of the railroads. Mr. Stone replied that the commission's work will not bring out many of the facts charged because of differences of opinion as to what the commission ought to do. He said some people think they ought to ascertain the "cost price" of the railroads, while the railroads say they ought to ascertain the cost of reproduction. He also referred to "abuse" by the *Railway Age* and the New York Times, but said it ought to be taken as a compliment because these papers never had an idea that was not dominated by Wall Street.

A member of the committee suggested that as the hearing was to be brief, it would be well to have some of the facts charged put into the record, whereupon Mr. Stone gave way to F. J. Warne, a statistician representing the railway employees, who began a long statement attacking the property investment accounts and the financial management of the railroads, using material from previous investigations by the commission, which are the source of most of the facts stated by Mr. Plumb in his charges, and also making quotations from statements by the Interstate Commerce Commission regarding the unreliability of the property investment accounts.

Mr. Warne declared that government regulation has been as "dismal a failure" as was ever the unregulated private management before 1888. That fact, he said, presents only the alternatives of government ownership and operation and some compromise on a plan of "industrial democracy" as represented in the Plumb plan. Mr. Plumb's charges, he said, were based on the fundamental idea of the failure of government regulation. In answer to the statements that the Plumb charges are old, he said that was no reason why they should not be investigated now because Congress has never done anything about them and there is no law to prevent a repetition of the financial manipulations that were practiced in the past. Mr. Warne did not finish his statement, and Representative Huddleston asked for another hearing for that purpose and also to allow Mr. Plumb to appear, as he was unable to be present.

Benjamin C. Marsh, secretary of the Farmers' National Committee on Transportation of the Farmers' National Council, also urged the passage of the resolution, saying the farmers were confident that such an investigation, "if fearlessly and thoroughly conducted," will reveal the methods of the financial interests and show that they are detrimental to the best interests of the farmers and the people of the entire country. He said an effort was being made to jam legislation through Congress to "secure a system of valuation which would add about eight billion dollars to the present capitalization" of the railroads, and that the railroads are making every effort to prevent an investigation of Mr. Plumb's charges.

Chairman Campbell of the committee said he had not heard of any effort on the part of the railroads to prevent the investigation, but Mr. Marsh said he had newspaper clippings which showed the efforts the railroads are making.

Alfred P. Thom, counsel for the Association of Railway Executives, at the request of Chairman Esch of the House committee on interstate and foreign commerce, has filed statements with the committee for each railroad referred to in Mr. Plumb's charge that various railroads had given bonuses to their stockholders or had issued new stock for less than its market value. Each statement gave the circumstances under which the stock was issued, and Mr. Thom stated that it appears that no stock was issued by any of the companies named during the period mentioned at less than par. In some circumstances stock was issued by a company to its own stockholders at par when it was selling in the market at a higher figure, but the laws of many states require any new stock to be offered to existing stockholders at par before any of it is disposed of to the public. Mr. Thom also gave an explanation of the reasons for such a rule, showing that where there has been an issue of stock to the public at a greater value than par, but at less than the market value, it can never be expected that a large issue of new stock can be disposed of at the market value of the similar amount outstanding.

Common Use of Coal Cars

The regional director, Central Western region, has announced that beginning December 13, as a temporary measure to insure an adequate supply of cars in the Central bituminous field with the re-opening of the mines, it has been decided to make effective the common use of coal loading equipment belonging to the principal coal-shipping railroads in that coal field. D. I. Forsyth, with headquarters at 547 West Jackson boulevard, Chicago, is appointed manager of Coal Car Distribution, Western Lines, and will supervise and direct the distribution of coal loading equipment between the roads named.

The roads in the Central Western Region whose cars are included in this arrangement are the Atchison, Topeka & Santa Fe, the Chicago & Alton, the Chicago & Eastern Illinois, the Chicago, Burlington & Quincy, the Chicago, Peoria & St. Louis, the Chicago, Rock Island & Pacific, the Chicago, Terre Haute & South Eastern, the Evansville & Indianapolis, the Peoria & Pekin Union, the Peoria Railroad Terminals and the Wabash; the roads in the Northwestern region included are the Belt Railroad of Chicago, the Chicago Great Western, the Chicago Junction, the Chicago, Milwaukee & St. Paul, the Chicago River & Indiana, the Chicago & North Western, the Chicago & Western Indiana, the Elgin, Joliet & Eastern, the Indiana Harbor Belt, the Minneapolis & St. Louis, and the Minneapolis, St. Paul & Sault Ste. Marie. There is also included one road in the Southern Region, the Illinois Central.

Scientific Development of the Steam Locomotive*

Factors Affecting the Cost of Maintenance and Operation Analyzed and Improvements Suggested

By John E. Muhlfeld

PART I

MARKED PROGRESS has been made in the development of the steam locomotive as the result of superior engineering ability, and the results have in many respects been exceedingly effective. This progress, however, has been confined largely to an increase in size, weight, evaporating capacity and hauling power, and while the general use of superheaters and firebox baffle walls during the past ten years has substantially assisted in improving sustained boiler capacity and increasing thermal efficiency as well as in keeping the steam locomotive in advance of the electric locomotive, the opportunity for further improvement in thermal and machine efficiency and to reduce smoke, cinders, sparks and noise is untold.

The desiderata in a steam locomotive may be summed up as: a reasonable first cost; maximum capacity for the service within roadway weight, curvature and clearance requirements; ability to handle the heaviest gross tonnage practicable at the highest permissible speed; positive control of mechanical operation; economy as regards fuel and water consumption and repairs; minimum manual labor for road and terminal handling; construction of the least number of parts, and capacity to perform continuous mileage without failure.

Modern types of steam locomotives fulfill quite satisfactorily all of these requirements, with the exception of wastefulness in fuel, water and steam consumption, as may be gathered from the fact that the thermal efficiencies now obtained are only from 50 to 65 per cent at the boiler, from 60 to 75 per cent for the combined boiler and superheater, and from 4 to 6 per cent at the drawbar. These as compared with thermal efficiencies of from 3 to 5 per cent at the drawbar of an electric locomotive, 18 to 19 per cent at the switchboard of a modern steam-electric central power station, 25 to 30 per cent for internal-combustion engines, and 40 to 45 per cent as claimed for the full range of from one-quarter to full load for combination internal-combustion and steam motors.

The increase in the first cost and in the cost for labor, fuel, material and supplies for operation and maintenance of the steam locomotive has been most marked during the past ten years, particularly since the war. It is now being operated and maintained by highly paid enginemen and mechanics, with high-priced materials and supplies, and the machine and its performance must be brought up to a more respectable basis of engineering efficiency if it is to be perpetuated.

The supporting data of this paper, which apply to the United States, present the reasons why the general improvement of the steam locomotive should embrace the following changes which are now being embodied in the construction of a new type of locomotive, the first of which it is planned to have in regular service in 1920: *a*, steam at a pressure of about 350 lb. to be employed, superheated about 300 deg. F.; *b*, improved boiler, furnace and front-end design and appliances; *c*, greater percentage of adhesive to total weight, and a lower factor of adhesion; *d*, more efficient methods of combustion; *e*, use of exhaust-steam heater and flue-gas economizer for boiler feedwater; *f*, better steam distribution and utilization; *g*, reduced cylinder clearances and back pressure; *h*, lighter and properly balanced reciprocating and revolving parts; *i*, lower heat, frictional and wind-resistance losses; *j*, improved safety and time, fuel and labor-saving devices.

*Abstract of a paper presented at the annual meeting of the American Society of Mechanical Engineers, December 5, 1919. Owing to the length of Mr. Muhlfeld's paper, it is not possible to publish it in full in this issue. The sections dealing with the generation and utilization of steam will appear in next week's issue.

Reasons for Perpetuation of the Steam Locomotive

Much more has been said and written during the last few years about the electrification of the steam roads of the United States for the purpose of fuel and labor saving and conservation, but practically nothing has been set forth as to the possibilities to accomplish much greater results per dollar of investment and operating cost by a scientific development of the steam locomotive.

As the average use of power at any considerable load factor is for only 8 hours per day, and as there is more or less irregularity in the demand, due to the small use on Sundays and holidays, the available water power would be used only about 2,400 out of a possible 8,760 hours per annum, or about 27 per cent of the time, so that the remaining 73 per cent would be wasted. Therefore, where continuous water power is available it should be diverted to the special requirements of large and regular amounts, such as in electrochemical and metallurgical processes, in order to reduce this waste to a minimum.

The methods at present employed for generating electric power from fuel in large modern central power stations represent from 18 to 19 per cent thermal efficiency, and as the investment cost for a steam plant is from one-third to one-quarter of that for a water-power development, the same total investment would produce from three to four times as much power from a steam as from a hydroelectric plant.

Complete electrification of some portions of the large transcontinental trunk lines has been effected, all of which are representative of progressive engineering skill, but reliable reports and statistics available have not proven the actual operating economies predicted, and with the present unsettled state of the electrical art numerous objections present themselves, among which may be noted: *a*, prohibitive capital and non-productive cost per mile for road, equipment and facilities; *b*, non-interchangeable equipment adaptable to certain electric zones only; *c*, entire operation dependent upon single power plants and transmission systems; *d*, widely varying load factors—dependent upon business conditions—requiring enormous outlay to meet uncertain peak movement and emergency conditions; *e*, complication and congestion of road and terminal trackage with transmission and contact lines; *f*, first cost from five to ten times, and operating cost from two to three times that of steam; *g*, liability for complete tie-ups due to storms, snow, sleet, rain and short-circuits.

Any general plan to electrify the steam roads to meet other than terminal and trunk-line congestion conditions, at an absurd cost, would mean lack of efficiency and prohibitive

financing, which would result in bankruptcy for most of the railroads affected and in a further burden upon the public. In fact, it would be a source of real danger to the rehabilitation of these transportation systems, as to discard steam locomotives where coal or oil is available and can be burned with efficiency, comfort and economy represents absolute waste.

Proposed Order of Development of the Steam Locomotive

The opportunity for steam locomotives to produce economy by increasing train loads, reducing transportation and mechanical delays and saving fuel and labor, is enormous.

The principal parts of a steam locomotive assembly are the boiler, engine, running gear, tender and special appliances, and the functioning of these parts in operation, jointly or independently, will involve particular factors that are capable of scientific development, viz.:

1 Design, Material and Workmanship.
2 Adhesive Weight, Tractive Power and Factor of Adhesion
3 Tracking, Curving and Riding.
4 Boiler Feedwater
5 Boiler-Feedwater Purifying
6 Fuel
7 Combustion.
8 Boiler-Water Circulation.
9 Heat Radiation, Convection and Conduction.
10 Steam Generation.
11 Steam-Pressure Increase.
12 Steam Superheating.
13 Steam Distribution and Utilization.
14 Waste-Heat Distribution and Utilization
15 Friction and Resistance
16 Acceleration
17 Deceleration.
18 Lubrication
19 Insulation
20 Safety Appliances
21 Special Appliances.
22 Power for Accessories.
23 Time Saving.
24 Fuel Saving
25 Labor Saving

The supporting data relating to the improvement of these factors are presented below:

Design, Material and Workmanship

Only by greater refinement in construction can requisite operating results be produced to offset the increased cost of equipment, supplies and labor. Therefore the designing should now be done along more scientific lines through the substitution of boiler, cylinder and drawbar horsepower and drawbar pull calculations for tractive power; thermal efficiency for evaporation results; distributed for centralized thrusts, strains and stresses; light, high-grade alloy and high-carbon steels and other metals for heavy, low-grade plates, forgings and castings; and in the more general use of high-grade engineering practice in lieu of rule-of-thumb methods.

In the modern high capacity locomotive it is necessary that certain parts be made as light as possible. On the other hand, the items of fatigue and shock of metals due to continued vibrations and impact as well as of inherent combinations of weakening chemical and physical characteristics, are responsible for many sudden failures of staybolts, plates, springs, axles, crankpins, tires, piston and main rods, frames and like parts that are subject to reversal of stress or to hundreds of thousands of repeated and localized loads. As it has been found that the elastic limit is not necessarily representative of the fatigue strength, these factors require that further careful research and study be made for the purpose of determining upon a reliable quick test that will insure against unsuitable material entering into the construction.

The same degree of refinement applies equally to workmanship for construction and upkeep, which should be brought up to the same standard as obtains in other machinery that is producing more efficient and economical power for other modes of travel.

Adhesive Weight, Tractive Power and Factor of Adhesion

Adhesive Weight. In the ideal locomotive all of the weight is carried on the driving wheels for utilization as tractive power. The extended use of non-productive trailing wheels and the four-wheel leading truck has become an expensive fashion in that it has greatly reduced the percentage of total engine weight on drivers for adhesive purposes. For example, where a modern Mikado type locomotive will average 75 per cent adhesive to total engine weight, a modern Consolidation will run as high as 92 per cent, thereby utilizing much more of its weight to produce drawbar pull, hauling power and earning capacity.

Boiler design and weight distribution should be so correlated to the running gear as to make the use of trailer wheels unnecessary except where required by wheel load limitations, and with the more recent improvement in constant resistance leading truck designs any four-wheel arrangement, except for high-speed passenger service, should be entirely satisfactory.

Tractive Power. In calculating tractive power the usual practice is to use 85 per cent of the indicated boiler pressure in lb. per sq. in. for two and three-cylinder single expansion, and 52 per cent for two and four-cylinder compound engines. However, for a superheated steam locomotive the use of a higher percentage of the indicated boiler pressure should receive due consideration when making tonnage rating schedules before the train load is finally determined upon, as dynamometer tests have indicated that as high as 92 per cent for two-cylinder single expansion locomotives is permissible for train-loading purposes.

Factor of Adhesion. In the same way that the leading and trailing truck type of locomotive has reduced the percentage of adhesive weight, so also has it increased the factor or ratio of adhesion, due to the "bridging effect" thus obtained over the driving wheels, tending to release the weight on the latter. Whereas many successful Consolidation types of locomotives are now operating with factors of adhesion of from 3.55 to 4.0, the Mikado types will usually range from 4.0 to 4.5. The co-efficient of static friction or adhesion between driving wheel tires and very dry, clean rails reaches a maximum of about 0.35, and for moist, muddy, greasy and frosty rails a minimum of from 0.15 to 0.20, giving factors ranging from 2.85 to 6.65.

In general, the factor of adhesion should be as low as practicable in order that the maximum power will always be available to start trains that can be easily handled when in motion and should about equal the ratio between the limiting friction in pounds and the weight on driving wheels in pounds, which for average dry rails is from 3.5 to 4.

Tracking, Curving and Riding

With the increased length, higher center of gravity, extended front and back overhang, and smaller proportion of spring-borne weight there have been many difficulties to overcome in order to maintain proper tracking, curving and riding qualities in locomotives of great power, and in the majority of cases these have been met with unusually satisfactory results.

Certain changes can be made, however, that will bring about a general betterment in the way of reduced rolling, oscillation, nosing and pounding, namely, reduced spread of cylinders; more uniform distribution and equalization of weight over driving and truck wheels; maximum permissible diameter of driving wheels; reduction in weight of revolving and reciprocating parts and counterbalance and proper distribution between wheels; improvement in constant-resistance lateral-motion devices; more uniform cylinder pressures when using steam and drifting; and greater refinement

in control of end play, wheel and rail clearances, and tire-tread coning.

As the centrifugal power force of surplus counterbalance, the swinging movement of spring-borne weight and the rotative force on the crankpins are constantly changing in combination with speed and cut-off, the importance of giving particular attention to all of the foregoing cannot be overestimated.

Friction

Friction. Friction due to oscillation, concussion, rolling, wheel flanges and treads, journals, cylinders, valves, valve gear, crossheads, center and side bearings, coupler side play and the like absorbs a considerable percentage of the power developed by the steam.

Maximum machine efficiency, or ratio of drawbar to indicated horsepower, is usually obtained at speeds of from 25 to 50 miles per hour and ranges from 80 to 85 per cent, above which speeds, due to increased friction, it gradually decreases to about 70 per cent at 75 miles per hour. For example, with a locomotive developing about 2,000 i.hp. at a speed of 30 miles per hour, about 325 hp. would be lost in internal or machine friction.

During the past ten years the increased rigid wheelbase and axle loads, greater lateral rigidity, larger cylinders, valves and revolving and sliding bearings, substitution of grease for oil lubrication, and greater number of frictional parts, have tended to increase the machine friction and consequently the horsepower, drawbar pull, and steam and fuel losses.

All of these are factors that should receive proper consideration in new designs.

Resistance

Resistance. Other than the resistance resulting from machine friction, the locomotive is subject to those due to grades, curves, weather, wind and head air, which latter is more particularly affected by the general design. As the horsepower required to overcome front air pressure increases with the cube of the speed plus the resistance due to the "air in motion," reduction of transverse flat surfaces, smoothing off of projections, vestibuling of openings and use of general curves parallel to the natural flow of the air should be carefully considered in high speed locomotives, particularly in view of the high fuel consumption and machine friction and the relatively small proportion of drawbar pull available for hauling trains at high velocities.

While the complicated design of a steam locomotive, particularly as regards the application of its accessories, makes the use of relatively smooth outside surfaces generally impracticable, still much has been done along this line on some of the European railroads that can be adopted by us to good advantage.

Acceleration

As the train resistance increases and the drawbar pull of the locomotive decreases due to speed, acceleration rapidly becomes a diminishing quantity. Therefore in order to expedite train movement locomotives should be designed and adjusted so as to permit of the highest possible rate of acceleration in the shortest distance after starting, in order that the maximum desired running speeds can be reached in the minimum of time during which the greatest evaporating capacity of the boiler is available. In locomotives designed with trailer wheels a great deal of otherwise available adhesive power, particularly for starting and acceleration purposes, is being wasted and the utilization of this lost adhesive weight by the elimination of trailer wheels, or by the application of an independent means of power for their propulsion, would accomplish a great deal in the way of starting and accelerating trains to speeds of from 15 to 20 miles per hour.

Deceleration

Deceleration is as much a factor in expediting train movements as acceleration, particularly with long and heavy trains and grades, and improved brake-shoe design, material, flexibility and bearing area in combination with clasp types of brakes for all wheels would do much toward providing greater stopping control over large and high speed steam locomotives and thereby avoid the necessity for resorting to the use of the engine cylinder back pressure to produce adequate braking power without liability for skidding and flattening the driving wheels.

Lubrication

Valve Oil. The usual method of feeding valve oil is through a steam-condensing lubricator. However, this method gives an irregular feed of oil to engine valves and cylinders if no change is made in the adjustment of the sight feeds when the locomotive is at rest, working with a light or a full throttle, or drifting. With high steam pressures and superheat a suitable automatic force-feed lubricator, located near the steam chests, with individual feeds to engine valves and cylinders and adjusted to insure a positive and uniform feed of 50 per cent of the oil to each of the valves and cylinders at all times when the locomotive is moving, will unquestionably give better results.

Piston and valve rods equipped with a suitable aluminum-zinc lead alloy metallic packing should not require lubricators or swabs except on roads where a high percentage of drifting obtains.

Superheat valve oil is unnecessary, as carbonization of oil is due to air admission to engine valve chests and cylinders when their temperature is greater than the finish point of the oil used and is also aggravated by the induction of gas and cinders through the exhaust nozzle.

The results of tests made to determine the respective coefficients of friction of oil and grease-lubricated journals show the former to be about 0.02 and the latter about 0.03. Therefore, while the internal or machine friction of the modern locomotive has been considerably increased due to the use of solid lubricants in combination with relatively high bearing pressures, and the wear on these frictional surfaces has been materially increased, grease has nevertheless protected bearings that would otherwise have heated, and its use will no doubt be continued until a satisfactory automatic force-feed method of oil lubrication is devised.

Machinery Oil. This is the ideal lubricant for wearing parts not subjected to excessive concentrated pressures and temperatures, and should be employed wherever a better distribution of the work, proportion of parts, or method of application will permit of its use. There is opportunity for much to be accomplished in the development of a more satisfactory and automatic means for its application.

Insulation

The loss of heat through radiation justifies a considerable expenditure for its prevention, and the most practical method for reducing this waste is to first design and locate the heat-transmitting parts so that they will be the least exposed to the surrounding atmosphere and to then make use of a good non-conducting lagging, properly applied.

With the available non-corrosive heat-insulating materials that can now be readily molded into sectional blocks to any form and size desired for ready application and removal, and which will withstand the disintegrating effects of heat, vibrations and concussions incident to modern locomotive operation, there is no good reason why boilers, fireboxes, steam pipes, valve chests, cylinders and heads, air pumps

and other heat-radiating accessories or parts should be left exposed in the way they generally are, with the resultant steam and fuel losses.

Safety Appliances

While the annual reports of the Interstate Commerce Commission on personal injury accidents chargeable to locomotive equipment indicate that considerable remains to be done to improve safety with respect to boiler fireboxes, staybolts, flues, tubes, plugs, studs, blow-off cocks, water gages and grate shakers; injectors and connections; lubricators; squirt hose; reverse gears; main and side rods, and draft gear, a great deal in this direction has been accomplished during the past seven years through the co-operation of the railroads and the locomotive and equipment builders with the Interstate Commerce Commission inspectors.

Special Appliances

Tender Trucks. The present use of staggered instead of square rail joints in track laying results in considerable vibration and surging of tenders when first-class track surface and alignment are wanting. This derailing action necessitates the use of a flexible type of tender truck, such as will make it possible for each wheel to always follow and remain on the rail with which it is in contact without regard to any other wheel in the truck, if liability to derailment is to be avoided.

Truck Wheels. According to the reports of the Interstate Commerce Commission there were 954 derailments on the steam railroads during the year 1917 that were due to broken flanges and broken and burst wheels; these caused damage to railroad property amounting to $1,132,030, and resulted in the killing of 16 and the injury of 72 persons. While these reports apply to both locomotives and cars, still they indicate the urgency for improvement.

With increasing wheel loads and speeds and higher and longer braking pressures the chilled-iron and cast and forged steel wheels must not only be of the best design, material and construction to meet the most severe requirements with a proper degree of safety, but the weights should be reduced to an economical maintenance and operating basis. Chilled iron and forged steel wheels have become particularly notorious with respect to non-productive deadweight resulting from unsuitable or surplus metal, or both, and necessity will now demand an early betterment.

Mechanical Stokers. Reports indicate that stoker-fired locomotives burn from 10 to 40 per cent more coal than those hand fired, which includes the additional coal used for operating the stoker equipment, and that the cost for stoker repairs ranges from 2 to 4 cents per locomotive mile. Also that failures occur due to broken stoker parts, foreign matter in coal and wet coal. The kind and preparation of fuel are also items of importance, particularly as relating to low-volatile bituminous and anthracite coal.

It is doubtful whether any considerable progress in efficiency or economy will be made in the stoker firing of locomotives in combination with the limitations now imposed by burning coal on grates or in retorts with forced draft, and this is a matter of the greatest concern in the economic development of the steam locomotive.

Air Compressors. Compressed air is one of the most expensive mediums for producing power, particularly when the compressing is done by the single-stage system which is still in use on the majority of locomotives. As the steam is used at long cut-off and the heat of compression is dissipated and represents lost work, an average of from 70 to 85 lb. of saturated steam at 200 lb. pressure is required per 100 cu. ft. of free air compressed to from 100 to 130 lb. pressure.

For air pressures of 100 lb. and over a cross-compound steam and two-stage air compressor with intercooler between the air cylinders should be used. This will easily give an equivalent compressed-air production on from one-third to one-fourth of the steam consumption, which result can be further improved by the use of superheated steam.

Main-Driving-Axle Boxes. These are the seat of one of the serious deficiencies in locomotives of great power. As any change in the alignment of the main driving axle or an accumulation of lost motion therein immediately affects the movement of the directly or indirectly connected main and inside rods, valves and pistons, it is most important that this axle be kept in close adjustment at all times. Increasing the length of driving boxes and the various means devised for applying and adjusting the crown bearings, hub plates and shoes and wedges have not yet produced the required result, and considerable opportunity for improvement still remains.

Lateral-Motion Devices. Restricting the lateral movement over leading and trailing truck and driving wheels as well as in tender trucks has been responsible for many derailments and much wheel-flange and rail resistance and wear, particularly with modern designs of locomotives of long wheelbase and high center of gravity. Promising results have obtained from the development of constant-resistance lateral-motion devices, but further improvement is needed along these same lines to meet the more extended rigid-wheelbase conditions.

Throttle Valves. These should be removed from the boiler where they are now an obstruction to making boiler inspections and are inaccessible for inspection, adjustments and repairs.

Power for Accessories

The steam locomotive must not only produce superheated steam for the development of drawbar pull, but also supply saturated steam to various accessories of its own and for train operation. Not only has the use of compressed air been found to be most expensive for the working of these accessories, but the reserve supply for train braking has been frequently drawn upon for their operation. As power reverse gears, fire doors, water scoops, coal pushers, ashpan doors and like devices can be equipped for steam operation, such substitution offers possibilities for less drain on the boiler and much needed economy in the cost for this auxiliary power production. Moreover, as all of this power for accessories is produced by saturated steam, some means for substituting the use of superheated-steam for those purposes where it is more suitable and economical should be given due consideration.

Time Saving

The principal time-saving factors other than speed reductions and stops necessary to take on and set off business and to meet roadway, train-despatching and operating requirements, may be stated as: *a,* acceleration; *b,* deceleration; *c,* mechanical road delays; *d,* mechanical terminal delays; *e,* fueling; *f,* watering.

Acceleration and Deceleration. These factors have already been considered in preceding paragraphs, and it is only necessary to add that much time is to be gained in quickening the starting and stopping of locomotives. Any engineer who has noted the length of time usually taken to get a passenger, freight or switching locomotive, either light or loaded, under headway and to reduce the speed for a stop, will appreciate what this may amount to.

Mechanical Road Delays. These may be classed as due to engine, fuel, water and man causes.

With the adaptation of locomotives best suited for regional requirements and with proper improvements in design, material, construction, inspection, testing and upkeep, "engine causes" can practically be eliminated.

Through the installation of modern fuel-preparing facili-

ties, provision for adequate tender capacity, adaptation of locomotives to utilize the most inferior and cheapest fuels available, use of simplified manual means of firing, and particularly by reducing the consumption required per boiler horsepower developed, the "fuel causes" can be substantially reduced.

The proper systems and time for washing out boilers and the supplying of suitable, treated if necessary, boiler water to adequate tender tanks will dispose of "water causes."

"Man causes" can best be avoided through the employment of competent men, the inauguration of proper systems for education and instruction, and by equipping locomotives so that they will require the least amount of arduous work in order that the engineer and fireman can devote their time to the observation of train rules and signals and to the proper regulation of the time, fuel, steam, water and labor-saving mechanical appliances that should be efficiently and economically utilized at all times during operation.

Mechanical Terminal Delays. These are due principally to sanding, ashpan and fire cleaning, fire building, boiler washing, firebox, flue and smokebox cleaning, inspection, testing, machinery cleaning and repairs. Of these delays those due to ashpan, fire, firebox, flue and smokebox cleaning are the most prolonged and non-productive and can be reduced only by improved methods of firing, reduced fuel consumption per unit of work performed, and substitution of mechanical appliances for arduous labor, so that upon arrival at terminals locomotives can be run directly into the enginehouse instead of being held outside for this class of work and delaying upkeep attention.

Fueling. Many facilities for fueling locomotives, either with coal or oil, are obsolete, inadequate and uneconomical. Fuel should be prepared ready for firing before being placed on tenders, and with modern facilities practically no time should be lost in supplying, either on the road or at terminals.

Fuel Saving

The problem of locomotive fuel saving has never received more intelligent thought and attention from a supervising standpoint than during the past two years. This has been due to the war-time necessity for the conservation of both the fuel and the labor required for its production and to the fuel cost reflecting a constantly increasing percentage of the total expense for railroad operation.

While the furnishing of coal or oil of a proper kind and preparation by an intelligent, trained and careful fireman to a locomotive in good working order and properly operated should result in effective and economical performance, the vast difference in the amount of fuel actually used by different train despatchers, engineers, firemen and locomotives to produce the same ton-mile movement under like transportation conditions indicates the necessity for reducing the amount of fuel to be fired per ton-mile by effective mechanical means and methods instead of depending upon the directly involved and responsible human element for equivalent results.

There is no questioning the fact that avoidable low boiler and mean-effective cylinder pressures, saturated steam, indifferent boiler circulation, excessive firebox draft, clogged grates and boiler and superheated tubes, forced combustion, high smokebox temperatures, unnecessary non-adhesive weight and generally indifferent steam generation, distribution and utilization factors, for which the engineer and fireman are not responsible, have more to do with high fuel and water rates than those factors within their control. Therefore the proper procedure, particularly in view of the relatively small increase in cost for the improved locomotive equipment as compared with the otherwise total locomotive cost and the annually reduced expense for its upkeep and operation, is to design and equip the modern steam locomotive so that it will, through its self-contained mechanical operation, more fully utilize the thermal heat value of the fuel fired and thereby not be so dependent upon manual control to bring the fuel used for equivalent productive work within the proper limitations.

Making initial capital and continual upkeep and operating expenditures in order to provide well-known inefficient and uneconomical mechanical means for handling, firing and wasting greater quantities of fuel than are within the easy range of one-man hand firing, in preference to diverting an equivalent amount of money for capacity increasing and fuel and water-saving appliances, represents a policy that is not at all consistent with existing and future labor and fuel costs if the railroads are to be continued on an investment basis.

Labor Saving

The labor now required for the upkeep, terminal handling and operation of the steam locomotive is divided into three classes, i. e., shop and enginehouse men, hostlers, cleaners and supply men, and enginemen.

The item of maintenance is distributed between general and running inspection, testing and repairs and is taken care of at the shops and enginehouses, respectively. During the past fifteen years a great deal of attention has been given in the planning of these facilities to provide labor-saving tools and machinery for dismantling, repairing and assembling locomotives and appurtenances, and there are today many conspicuous examples of modern railroad shops and enginehouses, even though many more are needed on railroads that have not given proper consideration to this important factor in their operation.

Great progress has been made in the establishing of adequate and suitable terminal handling, cleaning and supplying facilities which now include power-operated coal, sand and ash handling plants and turntables, high capacity water cranes, hot water boiler washing and locomotive cleaning systems, steam and compressed air stack and flue blowers and similar appliances. The cleaning and dumping of fires, ashpans and front ends and the rebuilding of fires is, with the increasing size of locomotives and the use of inferior coal, becoming a matter of great concern, delay and expense in the terminal handling, particularly during congested traffic and cold-weather periods, and a satisfactory solution of this problem still remains to be provided.

In the operation of locomotives the hours of service law established the general practice of pooling locomotives and crews, which system until that time had been adopted by only a few of the railroads. The divorcing of the engineers and firemen from regularly assigned locomotives, in combination with the increasing size of the latter, resulted in relieving the enginemen of work which was transferred to the enginehouse forces, such as: detailed inspection, adjustment of driving-box wedges and main and side rod brasses, repacking boiler head fittings and journal cellars, filling grease cups, cleaning head, cab and marker lamps and various other equipment and parts, filling lubricators, looking after tools and supplies, hostlering at terminals, and similar detailed attention which in combination with the more extended use of power-operated brakes, reverse gears, ashpans, grates, stokers, coal pushers, water scoops, fire doors, bell ringers, cylinder cocks and like devices have practically eliminated arduous manual operation on locomotives of great power.

The mechanical requirements and status of the engineer and fireman on the large steam locomotive having been substantially changed through relief from long hours on the road, work at terminals and by means of these labor-saving devices on the road, there should now be a resulting higher standard of operation, efficiency and economy.

Garfield Resigns As Fuel Administrator

Dr. H. A. Garfield has tendered to the President his resignation as United States Fuel Administrator because of dissatisfaction with the method adopted for the settlement of the coal strike as proposed by the President and accepted by the United Mine Workers. Dr. Garfield, in proposing a 14 per cent increase in wages, which has been allowed the miners pending a permanent adjustment, insisted that the price of coal as fixed by the government should not be increased. The President's plan, which was announced without consulting Dr. Garfield, provides for a commission to determine both wages and prices. It was announced at the White House that the resignation would be accepted and that Walker D. Hines, director general of railroads, would continue to exercise the functions of allocating and distributing coal under the powers of the Fuel Administration which were delegated to him at the time the strike went into effect.

Bituminous coal operators of Central Pennsylvania, operating 700 mines and producing approximately 60,000,000 tons annually—approximately 12 per cent of the entire output of the United States—on December 12 issued the following statement, declaring that "settlement of the bituminous coal strike under the plan accepted by the mine workers officials at Indianapolis, is no settlement whatever of principles at stake in the controversy. It is merely a postponement of the showdown which, in our opinion, is bound to come.

"The miners' strike was in direct violation of a wage contract approved by the government and to continue until April 1, 1920, or until the declaration of peace, if prior to that date," the statement continued. "The miners violated that contract. They are left free to violate any other contract they may make to take its place. There is no restraining influence upon them. The public, under the form of settlement adopted, may be subjected again at any time to the discomfort and distress through which it is now passing. Organized labor has the say as to when this shall occur.

"The method proposed by Dr. Garfield for settlement of the strike was interfered with by government officials who knew little of the situation. The problem was taken out of his hands. The operators and the public, as a result, have been delivered into the hands of the United Mine Workers of America. The operators in their resolution earnestly protest against this sham settlement of a controversy which will arise again to plague the American people—a controversy which will not down until it is permanently and finally settled.

"There can be no dodging of the issue. It will arise again. It must be met. It has not been met by the coal strike settlement, and until it is met the country is at the mercy of organized labor, whose leaders have been congratulated for their patriotism by government officials."

Resolutions were adopted by unanimous vote by the operators of the Central Pennsylvania district, stating that, "in accepting this method of settling the wage controversy, the operators of Central Pennsylvania earnestly protest against the form of the commission and its powers. They demand that a representative commission, similar to that which settled the anthracite strike in 1902, be appointed and empowered to investigate by public hearings the facts which the American people have a right to know, and the principles upon which depend the future peace and prosperity of this country, and the safety of our democratic institutions. To neglect this duty is to surrender this industry and other basic industries to an overbearing group that has welded coal labor interests into a weapon for use against American freedom, and the principle of majority-rule upon which this republic was founded."

Fuel Restrictions Modified

Restrictions as to the use of coal for light, heat and power, ordered by the Railroad Administration, as the agent of the Fuel Administration on December 8, were authorized on December 12 to be lifted by the regional directors in accordance with the local conditions in their territories. It was expected that relief orders would be issued at once in the eastern regions and by the first of the following week in others.

Director General Hines authorized the following:

"The conservation order of December 8, 1919, restricting the use of heat, light and power generated or produced from bituminous coal or coke was issued to make uniform in all parts of the country the restrictions which had already been adopted in many parts of the country and to save coal and coke. Until the production of bituminous coal becomes normal, it is vitally necessary that it be conserved in every way possible and even after production reaches normal, it will be necessary to continue to conserve coal because of the loss in production of between thirty and thirty-five million tons during the coal strike. It is important, therefore, that the public exercise the greatest caution in the consumption of coal.

"It being the desire to remove restrictions just as rapidly as possible, the conservation order of December 8 has been modified today to permit the resumption as conditions warrant of the supplying of light, heat and power restricted by this order. Coal is now being moved and will continue to be moved from the East to the West in as large quantities as the relative situation in the two sections permits. The first increase in production that has resulted from the termination of the strike of the coal miners has been in the East where already the bulk of the production was being obtained. Conditions in the several regions differ and accordingly the order of December 8 will be modified on recommendation of the regional directors as their respective situations may permit.

"Regional directors have been instructed today to restore all train service removed or curtailed because of the strike situation as soon as the general coal supply in their respective regions justifies in their judgment doing so, subject to such exceptions as may be ordered by the Railroad Administration in Washington."

The new instructions did not affect the priority regulations previously put into effect governing the delivery of coal.

Academy of Political Science on Railroad Problems

Relation Between the Railroads and the Shippers, the Investors, the Government, Labor and the Public

THE thirty-ninth annual meeting of the Academy of Political Science in the City of New York was held Friday and Saturday, November 21 and 22 at the Hotel Astor, New York. Samuel McCune Linsay, president of the board of trustees, opened the meeting, calling attention to two charts prepared by Richard Waterman of the United States Chamber of Commerce, showing a summary of the principal plans which have been proposed for legislation, to take the railroads out of the hands of the government and to restore the credit of the private owning corporations. The charts were distributed and then Professor T. W. Van Meter of Columbia University took the chair for the morning session.

Opening Address of T. W. Van Meter

The chairman in his opening address said that it was formally customary for railroads and shippers to look on each other in the light of their being natural enemies, and unfortunately, in some quarters, that feeling still persists to a certain extent. One of the most healthy conditions which shows itself in our present railroad problem is the apparent willingness of representatives of the shipping interests and of the railroad interests to get together in the discussion of the railroad problem. The relation between the railroads and the shippers was the subject of the morning session. The first speaker on the program was Frank Haigh Dixon, professor of railway economics at Princeton University.

The Shippers and the Railroads

By Frank Haigh Dixon

Prof. Frank Haigh Dixon spoke in part as follows: "The railroad problem from the standpoint of the shipper is in the last analysis the same problem as from the standpoint of the public. It may be assumed that private railroad corporations, rather than the government, will operate the railroads, because I have been able to discover little evidence of a desire in this country at present for railroad nationalization.

"What the shipper requires may all be summed up in the one word, service. Frequently this demand is embodied in the words 'efficient service at reasonable rates,' but I have intentionally omitted this letter requirement because I question whether, by and large, the shippers are seriously concerned as to whether the rate structure as a whole is high or low. Where the shipper's interests in rates does appear, is in such matters as equalization of the burden upon different commodities, and the equalization of market opportunities for different sections of the country. The shipper, to obtain service, needs a greater unification of the facilities of transportation, and a greater unity in the agencies that regulate the operation of these facilities. Efficiency in service, demands a smooth running machine all the time, and this can only be attained through unified regulation in the hands of a central body.

"Equitableness in rates requires that the units of transportation shall be thrown into larger systems, and regardless of how many such systems there are, they should follow well-established lines of traffic, and should be guided in their construction by commercial rather than geographical considerations. Regional grouping would have no economic justification. I venture the opinion that voluntary consolidation would not succeed, and sooner or later compulsion would have to be resorted to. I do not personally think that competition should be eliminated, although there may come a time when such competition will no longer be of importance.

"Adequate oversight of these systems would assist in giving to the federal commission powers sufficient in addition to what it now possesses to insure the most complete utilization of equipment and terminals without regard to private corporate ownership. The federal commission also should have the power to prescribe minimum rates. It is vital to the solution of the entire problem that a railroad corporation should be prevented from demoralizing the rate structure by a policy of rate reductions. The shippers should demand, also, a greater utilization of water ways. Physical connections between the water ways and the railways should be encouraged.

"Turning to the other side of the question, what have the railroad corporations a right to require of the public? Private capital invested in railroads has a right to require a return on its investment in the property devoted to public service, that shall be sufficient (1) to cover cost of operation efficiently extended, together with taxes and other public obligations; (2) to cover the interest of obligations, the proceeds of which have actually been invested in the property; (3) to cover a dividend on an honest stock capitalization, at a rate high enough to insure that the capital needed for developments can be obtained, which means not alone enough to pay a dividend in any one year, but in addition, the accumulation of a sufficient reserve to satisfy the public that its dividends will be continuous, and (4) to accumulate a surplus sufficient to keep its property up to the standard of service demanded by the public, such surplus to remain uncapitalized.

"To insure an adequate return to capital, it is proposed that Congress should adopt a rule of rate making, as a guide to the Interstate Commerce Commission, the object of which would be to make clear that the discussion of the commission embraces a consideration of the general financial condition of the carrier. The commission would become the protector and promotor of transportation service as a whole.

"A second proposal is that a government guarantee should be given for a minimum return on railroad investments. Railroad executives have opposed this, because it would remove all incentive to efficiency, but my own conviction is that a government guarantee will be found to be necessary, and I see no reason why such a guarantee cannot be made sufficiently elastic to prevent the destruction of private initiative."

Legislative Program of Interstate Commerce Commission

By Balthasar H. Meyer

Interstate Commerce Commissioner Meyer's paper was read, since the commissioner was unable to be present. The paper was in part as follows:

"There is no such thing as a permanent solution of the railroad problem. The problem is permanent, not the solu-

Note—All of the papers abstracted herein and all others presented at the meeting will be printed in full by the Academy of Political Science, Columbia University, New York City. In the above report of the meeting, no attempt is made to cover all the papers read.

tion. The railway itself as we now know it may not prove to be as permanent an institution as we are accustomed to think it to be. Even though time should demonstrate it to be such, it does not follow that legislation governing the use of the railroad and prescribing relations between owners and users and workers can be permanent. Perhaps no lesson in history has been more forcefully and repeatedly brought home to every thinking man than the changing character of our institutions. One of the highest functions of the legislator and the administrator is to adapt these institutions to the conditions of time, place and circumsance. Having accomplished this adaptation, all has been done that can be done. This applies to railways and the railway program as much as it applies to taxation, education, suffrage, police regulations and all other matters governing or affecting the conduct and well-being of citizens.

"When we contemplate questions of rates and service we see that which is ever-changing and ever-present. No matter what legislative and administrative changes are made, questions of rates and service remain. In general and in principle they are always the same.

"Responsive to a request of the Committee of Interstate Commerce of the Senate, the commission submitted a statement outlining our views. These views were predicated upon the continuance of private ownership and operation under regulation, and were approved by every member of the commission as it was then constituted except one. These views are indicated as follows:

> If the policy of private ownership and operation under regulation is continued, the following subjects will require legislative consideration: (1) Revision of limitations upon united or cooperative activities among common carriers by rail or by water; (2) emancipation of railway operation from financial dictation; (3) regulation of issues of securities; (4) establishment of a relationship between federal and state authority which will eliminate the twilight zone of jurisdiction and under which a harmonious rate structure and adequate service can be secured, state and interstate; (5) restrictions governing the treatment of competitive as compared with non-competitive traffic; (6) the most efficient utilization of equipment and provision for distributing the burden of furnishing equipment on an equitable basis among the respective carriers; (7) a more liberal use of terminal facilities in the interest of free movement of commerce; and (8) limitations within which common carrier facilities and services may be furnished by shippers or receivers of freight.

"First of all, our recommendations are based upon experience and past development. They have grown out of that which has been, and therefore have their roots in the past. To illustrate, from the beginning of railway history individual lines have been extended through construction, purchase or lease into systems; and through a continuing process of construction and consolidation great systems have been developed. We favor a continuance of that character of development within the limits and under the guidance of the statute, whereas in the past that development has taken place largely outside of the law.

"We have not deemed it necessary to work out special regulatory provisions relating to the so-called poor or weak roads as contrasted with the so-called strong or affluent roads. Railroads have in the past earned varying rates of profit. We see no reason why they should not continue to do so in the future. In view of well understood imperfections in the investment in property accounts of carriers it has been generally impossible to know just what different carriers' earnings have been on the real investment. When the necessary facts are available I expect they will show that in some, if not in many, cases the so-called weak road is actually making more money on such business as it does than many of the strong or supposedly affluent roads. This feature of the railroad situation has been practically ignored.

"Our recommendations do not lead to a hybrid system of railroads in the United States. There will result from them no such linking of private and public finance and accounts that it will be difficult to know what is public and what is private and what the true results of operation may be from the standpoint of both public and private interest. Personally, I have a strong aversion toward all plans that propose to weave together public and private interests in such a way that a clear-cut accounting representing either is practically impossible. Rather than accept some of these plans I should deem it the part of wisdom to enter upon government ownership and operation outright. I do not believe the time has come for this country to enter upon public ownership of railroads. I believe that what we have recommended will meet the present situation much more effectively and with less danger of failure than government ownership. However, if the country should be driven into government ownership it will undertake it with courage and vision and make it a success. It can be done. I do not wish to see it forced upon the country at this time.

"We have not asked to be relieved of so-called "prosecutor" functions of the commission. We have been criticized with great persistence for performing the functions both of the prosecutor and the judge. This is a purely captious and theoretical criticism. Any one at all familiar with the conduct of our work will realize how impossible it is as a practical matter to have these so-called prosecuting functions influence the members of the commission in arriving at a judgment in rate questions. The records of the courts will show that not only have railroad officials and employees been indicted, fined and imprisoned as a result of investigations made by us, but shippers have been indicted, fined and imprisoned because of matters brought to the attention of the respective courts by our agents assisting United States attorneys. During certain periods, the number of shippers thus punished has been greater than the number of railroad officials similarly punished, yet I have never heard any one complain that the commission could not be fair to shippers because it is instrumental in prosecuting shippers for defrauding the railroads.

"Suggestions have been made for a commission of from 15 to 25 or 30 members. Such a commission is an impossibility. It could not be a commission in the sense in which a body of five or seven men is a commission. It would be a convention of men. Three men are sufficient to dispose of the less important matters and matters which merely follow previous decisions of a larger body. Five men generally afford all the points of view and deliberative judgment which important questions require. Seven men certainly furnish it; and seven is to my mind the maximum number of commissioners who, acting as a whole, can constitute an efficient administrative and regulatory body. One of the problems of the future relating to our internal organization therefore is the problem of reducing the number of things which the entire commission of 11 or more members must consider sitting as a body, and increasing the volume of business which may be handled by a subdivision.

"I cannot refrain from referring to one element of regulation as it unfolds itself in the future, which is entirely new. Two years of federal control have initiated into the public service a great body of men who otherwise had been accustomed to take only the point of view of private officials of private companies. With their peculiar experiences and traditions behind them, these men assumed the duties and responsibilities of public officials with the advent of federal control. They have been compelled to consider not only the private company standpoint but also the public point of view. They have been obliged to act as judges between conflicting public and private interests. They have come to appreciate the position of a distinterested party in controversies affecting such conflicting interests. When these men return

to private employment with their respective companies they will be different men from what they were before federal control. Their recent experiences and observations should make them much more efficient in handling the public aspect of their companies' business and without sacrificing legitimate private interests they will contribute a point of view and lend a support to the work of the Interstate Commerce Commission which would have been impossible otherwise."

Inadequacy of Facilities

By Frank Noxon

Frank Noxon, secretary of the Railway Business Association, spoke under the ten-minute rule, in part as follows:

"Let us compare the background from which Dr. Dixon speaks and that from which Interstate Commissioner Meyer speaks. I wonder if there is any one who, at any point in that discussion, admirable and competent as it was, could detect the slightest anxiety whether facilities were to be adequate in the future. You noticed that in the enumerated list of recommendations made by the commission, there was something about adequacy of facilities; you heard no statement to the effect that facilities has been inadequate, and least of all, did you hear any acknowledgement that one factor in the restoration of railroad development must be the government and its policy.

"What does the House bill mean to do? A court, in considering what was intended to be done by the legislature, will always give very great weight to a provision introduced but rejected. If a legislative body refused to do a thing which was asked of it, the court will usually hold that the legislature did not mean to do that thing at least. Two sentences were contained in the bill as it came from the house committee as follows: 'The commission shall be charged with the duty and the responsibility of observing and keeping informed as to the transportation needs and the transportation facilities and service of the ocuntry, and as to the operating revenues necessary to the adequacy and efficiency of such transportation facilities and service. In reaching its conclusions as to the justness and reasonableness of any rate the commission shall take into consideration the interests of the public, the shippers, the reasonableness of the cost of maintenance and operation, including the wages of labor, materials and taxes, and a fair return upon the value of the property used or held for the service of transportation.'

"Last Saturday the House cut these two sentences out. I have studied this bill from beginning to end. I can find no other place where the idea involved in those two sentences stands. The House of Representatives bill goes to conference without having said those two things.

"The court would also consider debate, and when the bill was brought in, there was a statement prepared by C. C. McChord of the Interstate Commerce Commission, the general tenor of which was that while there was a decline in railroad credit, there was no remissness on the part of the government in its policy, and no need for a change in policy.

"In the Senate bill there is a provision which explicity recognizes that a return must be made upon railroad securities. In the debates and reports on the Senate bill, there is the explicit acknowledgement by the full Senate committee that "the regulatory system has failed in the past because it has not recognized that one of the essential elements and one of the essential aims of government regulation of rates is to attract capital.

"I wish to submit to you a sentence or two which Congress, it seems to me, ought to embody in substance in any legislations it passes. 'To supplement the present federal policy by which the term of the law is wholly one of restriction, by enacting that rates shall be such as to yield revenue sufficient in the average year to provide necessary expenses and the credit basis so that the average railway may secure adequate improvements and extensions.' Some of those concerned will tell you that the commission would do that anyway. Then why not say it?

"To require that the regulatory authorities from time to time investigate and estimate for a reasonable period in advance, the transportation needs of the country and report to Congress or to the public, their findings as to such needs, and their estimate of the amount of revenue that will in the average year, assure approximate accomplishment of such necessary developments.

"If you put into the bill a prescribed rate of return which is to be permitted, you should also say that the commission is authorized and required to permit not only that minimum rate but such additional rate as may prove by experience necessary to attract capital for improvements and extensions."

More Extended Use of Waterways

By R. A. Hiscano

R. A. Hiscano, general manager of the Catskill and New York Steamboat Company, Ltd., spoke in part as follows:

"The railroads of the country cannot entirely take care of the country's traffic, and extensions of railroad systems is not possible in the more densely settled sections of the United States. A more intensive use of the rivers, lakes and canals of the United States is necessary. The bulk of the tonnage of the country sixty years ago was shipped by water, but gradually the railroads have extended, and with their extension, the water lines declined. The most important reason for this was the smaller scale on which a navigation company was operated. This condition still exists today. A second reason for the decline was the unceasing warfare waged by the railroads. The problem of today is to restore to our rivers and canals, the service which is required, and to do so, Congress should be discouraged from enacting additional legislation tending to drive water lines from business. Congress should pass legislation to compel a railroad company to extend to a connecting water carrier the same division of through rates or terminal facilities, or share of unrouted traffic as is given to a connecting railroad.

"Financial and banking interests can assist materially in the movement to revive the use of our inland waterways by helping to finance legitimate and sound proposals put forward by navigation companies. The splendid New York State barge canal cost $150,000,000 and has a capacity of 10,000,000 tons a year, and last year barely 1,000,000 tons were shipped through it due entirely to the lack of navigation companies."

General Discussion

The meeting was thrown open to general discussion and H. H. Winkler spoke briefly. He said that from his own personal observation as an investor, and representing people who invest in railroad securities, he felt that the attitude of Commissioner McChord was more instrumental in destroying railroad credit than that of any other man on the commission since 1899.

Charles Whiting Baker said that he thought that there was a side to the Interstate Commerce Commission's case which ought in fairness to be presented. Prior to 1907 the Interstate Commerce Commission law did not have teeth in it. In the years from 1900 to 1907, the total payments on railroad capital in the United States were about $250,000,000 to $300,000,000. In the years after 1907, they went up and up until the average payments in the years 1915, 1916 and 1917 were 40 per cent in excess of any three-year period previous to that. That is, under Interstate Commerce Commis-

sion regulation you will find a much larger percentage of stock was paying dividends and higher rates of dividends than it did before the Interstate Commerce Commission law had teeth in it.

With the war entered an entirely different factor. The cost of living of the railroads has more than doubled since 1914, and the price of the product which they manufacture —transportation—increased only 25 per cent. Now the railroads are in a very serious financial condition. Mr. Baker after saying this in defense of the Interstate Commerce Commission said that frankly, he thought that the time was past when the commission could meet the present situation. It was organized from the wrong point of view.

Pierpont V. Davis of the National City Bank of New York, discussed the question from the point of view of the bond salesman, laying emphasis on the indisputable fact that railroad bonds are not now as readily saleable as are industrial bonds.

S. E. Heberling of the Switchmen's Union of North America, spoke in part as follows: "Mr. Warfield said that the association which he represented, owned the railroads. Then why didn't they discharge the management of these railroads that wrecked the number of railroads that the gentleman stood up here and spoke about this forenoon. Mr. Davis, a banker, gives the earnings of the railroads to 1910, but he says nothing of the additional capitalization of these properties since 1910. If I owned a property and the earnings on that property up to 1910 was 5½ per cent, and I double the capitalization, whose fault is it? Is it the fault of the good people of the United States or the government? Oh no! Look at the Union Pacific. Go back 25 years when it went through the receivership, and on down the line to the present day. A few men in this city of New York are responsible for this misery that you are talking about in the transportation systems. It makes no difference how well I manage a railroad. I have seen managers of railroads whose ability could not be questioned, yet their property was wrecked. It was wrecked by the credit system, so called, by inflating or depreciating the value of securities on the market.

"The Rock Island—most of you ought to know the history of it—and your New Haven, your pet road here in this elite east—you ought to know the history of that. I am going to make this prediction. These people who are being pointed to in this country today as Americans who are not patriotic, are not going to be bilked in this country for any decade for the sake of credit. The men who are running these railroads today, who are actually running them, can run them, and run them cheaper than they are being run now, if they were left to do it."

The House Bill

By Congressman Merritt

Senator Cummins was to have spoken at the banquet in the evening but was unable to be present, and Congressman Merritt, who was an active member of the House Committee on Interstate Commerce, spoke in part as follows: "Those of you who are old enough, not many I think, will remember that when a conservative deacon in the church of Henry Ward Beecher reproached him for something startling which he had said in a sermon, Beecher replied: 'If you only knew some of the things I didn't say, you would praise me instead of blaming me,' and so I think that whatever you may consider concerning the bill which we (The Esch Committee) have passed, you will at least praise us for some things that we have not passed.

"You will agree that we did well in not putting anything into the bill which even looked toward public ownership. The committee became convinced that in all the states which had public ownership, such for example as Australia and France, where the conditions were not different from our's, that the service was poor, was more expensive and was tainted by politics; nor was the committee—I won't say attracted—but certainly not much influenced by the very long and able presentation of the plan called the Plumb plan. The Plumb plan would not be the embodiment of democracy in ownership, because of the bills for buying the railroads, amounting to some eighteen or twenty billions of dollars, would be footed by the public, but when it comes to the control, it would be vested under that plan in fifteen directors, two-thirds of whom are to be elected in one way or another by approximately two million employees of the railroads. That seems to me to be a case of introducing into this country the soviet on a large scale, because you have two million people, something less than two per cent of the population, electing the directors to run the property which is bought by somebody else, and that property controls the entire industrial life of this country. The Plumb plan in a large way was a plan for two per cent of the population to elect a board of fifteen men to control the industrial life of this country, and secondly, a plan to drive brains out of running the railroads. I say that last, because you can see what a tremendous amount of wire-pulling and politics would occur at once among the two million men on these roads, to elect people to run them.

"The bill which is passed by the House of Representatives, takes up three phrases of the matter—the actual return of the roads, the necessary period of re-establishing of personal and ordinary operation of the roads under their owners, and the question of the continued operation. The committee felt bound to take into account the reasons why the present problem exists. They could not take up the problem as if the roads were in the hands of the government by negotiation, or through their own will, but the problem as it existed, which was and is, that the roads were taken over without their consent by operation of the law. The House bill takes care of the transition period by providing for funding the debts incurred under government operation. The Cummins bill of the Senate is more generous to the roads, and perhaps when the bill finally passes the Senate and comes to Congress, that may be modified.

"Now as to continued operation. The creation of a transportation board, approximately a state commerce commission, was strongly urged before both the House and Senate committees. Such a board is provided for in the Senate bill, but not in the House bill. The House committee has been, and is adverse to adding to the great number of boards and committees now in Washington transacting the business of the United States. A board created by Congress differs from almost everything else created by man. You all know that in most human affairs, when things are created, the great difficulty is to keep them alive, but when you create a board in Washington, the great thing is to make it die.

"It was urged by a large body of gentlemen that rules should be established to produce a definite percentage of return on the value of the property used in transportation. Each committee felt, and the House acted on this recognition, that if that were done, it would go far toward removing incentive and the necessity of economy. We thought further, that if after a road by good management had made a certain percentage, it would certainly not be any incentive to take away from it what it had earned by its economy and good judgment and foresight.

"The labor provision, which the committee reported to the House had not much teeth. It was a mild form of compulsory arbitration, but that was defeated, and the present clause put in the bill during the haste of a debate under the five-minute rule. I cannot help feeling that if the provision which was in the bill could have been debated and understood, it would hardly have passed. This bill on its

face would look like a bill for conciliation and arbitration, but if it is examined carefully, it will be found that disputes which arise, if they are not settled by certain boards—if it comes to a point where the men cannot agree with the carriers—the only way to get that dispute before the final board of appeals is by the consent of the officers of the Brotherhood. In other words, it is compulsory arbitration if the brotherhoods want it. It is nothing if they do not want it. There is no possible way for the roads to get any of the disputes before these boards without the consent of the brotherhood.

"All thinking people in this country must view this railroad question in a broad light and must see to it that men in Congress and elsewhere are impressed with the importance, not of criticizing what has been done in the past, not trying to make this generation suffer for the sins of the past generation, but considering facts as they are, and doing all we can to help this great transportation system, because if that is prosperous, the whole country will and must be prosperous."

Reconstruction of Railroad Credit

By John E. Oldham

The following is an abstract of the paper read by John E. Oldham of Merrill, Oldham & Co., bankers, of Boston, Mass.:

As the railroad problem is primarily a problem of finance, its solution must be sought along lines which recognize the need for corporations of sound credit and for corporations also with ability to raise new capital both readily and economically.

For the purpose of determining the relative number and importance of the railroads whose credit has been affected by each of several unfavorable conditions, the railroads of the country have been divided into three groups.

The first contains the larger railroads which have paid regular dividends for many years. In this group are included 32 system, with a total gross operating income amounting to approximately 60 per cent of the gross operating income of all the railroads in the United States.

The second group contains the larger non-dividend paying roads. In this group are all of the railroads with a gross operating income of upwards of $10,000,000 each, few of which have paid any dividends in recent years. It includes 24 systems with a total gross operating income amounting to approximately 30 per cent of the aggregate earnings of the railroads of the United States.

The third group contains the remaining systems, the small roads. It includes approximately 100 Class 1 roads, with earnings of less than $10,000,000, and it also includes upwards of 250 Class II roads, with earnings of less than $1,000,000 and more than $100,000. The group is made up of more than 350 individual roads, but the aggregate gross operating income is only 10 per cent of the total of the country.

As dividend-paying railroads in the first group have demonstrated their ability to compete with each other under the same rates, it is fair to assume that the credit of these roads would be restored if rates were adequate to provide a satisfactory margin over dividends and investors had confidence that rates would be permanently maintained on such a basis.

A comparison of the statistics relating to the operation of the dividend-paying roads in the first group with the non-dividend-paying roads in the second, covering what is called the "test period"—the three years ended June 30, 1915, to 1917—clearly indicates that the average traffic conditions are much the same in each case. The general character of the business is the same. It is made up of substantially the same proportion of passenger and freight traffic. There is a similarity of tonnage, products of mines, forests, agriculture, manufactures and other commodities representing about the same proportionate part of the total. The rate per ton per mile and the rate per passenger per mile are approximately the same. With maintenance adjusted to a uniform basis the cost of operation is relatively the same. Inasmuch as a similar volume of traffic handled at the same rates produces substantially the same operating income, it may be assumed that the plant facilities required to handle the business—track, equipment and terminals—are likewise much alike in quantity and character. In view of the fact that the cost of operation is not materially different in the two cases—

Per Cent Which Roads in This Comparison Bear to Whole in Southern and Western Districts

	Per cent mileage	Per cent Gross earnings
Group I	58.8	63.5
Group II	29.5	27.
Total of Groups I and II	88.3	90.5

Per Cent Gross Operating Income Distributed

	Group I (16 roads)	Group II (16 roads)
Operating expenses and taxes	41.9	44.5
Maintenance (uniform) (adjusted to uniform basis)	28.3	28.3
Net earnings	29.8	27.2
Other income	1.5*	1.5
Total net earnings	31.3	28.7
Fixer charges	12.3	20.8
Dividends	10.5	1.1
Total fixed charges and dividends	22.8*	21.9
Surplus	8.5	6.8

* Allowance has been made for the difference in receipts from outside income by reducing the amount of outside income of the Group I roads from 6.2 to 1.5 to compare with the amount received by the Group II roads, and deducting a corresponding amount from the amount of charges and dividends proportionally divided between the two.

Per Cent of Gross Revenue

Passenger revenue	21.2	20.9
Freight revenue	69.5	69.3
Miscellaneous revenue	9.2	9.8
Passenger rate per mile	$0.02040	$0.02280
Freight rate per mile	.00806	.00840
Tons per train	503	413
Gross earnings per mile	$11,309	$9,591

Classification of Tonnage

Products of	%	%
Agriculture	20	17.1
Animals	4	3.4
Mines	39.8	39.4
Forests	14.5	16
Manufactures	14.3	17
Miscellaneous commodities	2.2	2.5
L. C. L. Goods	5.2	4.6
	100.0	100.0

Figures for operation cover test period, June 30, 1915, to 1917.
Figures for tonnage cover year ended June 30, 1916.

if the capitalization were proportionate to earnings—the return on capital would necessarily be substantially the same. It may be said further that the relative value of individual properties arrived at by using the market value of securities, under normal conditions, will be found to very closely approximate results obtained by capitalizing earnings.

In the absence of definite information in regard to the value of the railroads of the country a valuation, therefore, based on earnings or market value of securities, where traffic conditions are similar, appears to offer a better gage of the relative value of individual properties than the property investment accounts of these companies, even though the aggregate of these accounts may be accepted as representing the best basis of value for the railroads considered collectively for rate-making purposes.

The average conditions under which the railroads in these two groups operate are substantially alike; from a traffic standpoint neither group is "more favorably situated" or "less favorably situated." The difference is largely the amount and form of capitalization, and this difference is reflected in the statistics especially relating to fixed charges and dividend payments. Using, for example, figures which cover the Western and Southern districts only, the railroads in the first group required on an average a sum equivalent

to approximately 23 per cent of gross earnings to pay fixed charges and to maintain dividends. This total was apportioned approximately 12 per cent for fixed charges and 11 per cent for dividends. The railroads in the second group, on the other hand, while paying out substantially the same proportionate part of gross earnings for fixed charges and dividends—the sum being equal to 22 per cent—nevertheless required 21 per cent for fixed charges, leaving only 1 per cent for dividends.

For the purpose of illustration these statements have been reduced to figures in a comparison of the dividend and non-dividend-paying roads in the Western and Southern districts. The roads in the Eastern district are not included, but similar comparisons produce similar results.

As the railroads in the two groups operating under the same rates, with a valuation or capitalization based on earnings, would earn substantially the same return on their investment or capitalization, it might be expected that each would be entitled to the same credit if the capitalization were similarly divided between stocks and obligations. With adequate rates and some adjustment of capitalization on the part of the railroads in the second group, the credit of the railroads, representing approximately 90 per cent of the railroad business of the country, would therefore be placed on the same credit basis and on such a basis that the securities of the larger systems should command confidence and be attractive to investors.

The Strong and Weak Road Problem

To establish the credit of upwards of 350 small roads by any method of rate-making presents a difficult if not impossible problem if the roads are to continue to operate independently. These roads for the most part are at a disadvantage from a traffic standpoint with the larger systems and may be termed properly "less advantageously situated." They occupy a less favorable field for operation, and yet are obliged to handle their business on a basis of rates made more largely with a view to the conditions surrounding the more favorably situated roads. Attention has frequently been called to the fact that rates cannot be made with a view to the specific conditions surrounding the less favorably situated railroads, which represent but a small part of the transportation systems of the country, without providing too generous a return for the large majority of roads which are more favorably situated. This has frequently been referred to as the problem of the "weak" and "strong" roads, and the different methods of meeting this difficulty have been an essential feature of most of the plans which have undertaken to deal with the railroad problem. It may be said further that even if rates could be made which would enable these small companies to make a satisfactory financial showing, their securities would have such a narrow market that financing would be difficult and expensive, if not impossible, in many cases.

The proposal made in some of the plans, and which has met with some favor, to make advance to weak roads from a fund accumulated from the surplus earnings of the more favorably situated systems is in itself an acknowledgement that these roads are not expected to be placed in a position to maintain themselves in independent operation.

The most practical plan which has been suggested for taking care of these roads in such a way that the territory which they serve will be assured of adequate railroad facilities is by merging the smaller with the larger system with which they have natural traffic relations.

Consolidation with the strong systems may also provide the surest and most effective way of meeting the problem of the roads whose credit is poor because of the form of their capitalization. Consolidations would facilitate the reorganization and adjustment of the capitalization of these companies and put them in a position to obtain the capital necessary to meet the requirements of the territories which they serve. It may be assumed that these mergers would take place on a basis which would represent fair relative values, and in the process of consolidation capitalization would be so adjusted that the credit of the strong systems would not be impaired.

A brief statement covering the number of existing railroad systems which operate independently will show that a substantial part of the railroad business of the country is already concentrated within a relatively few systems, and if the existing large systems were used as a basis for such further consolidations as might be desired the result would be accomplished without seriously disturbing present relations. The railroads of the United States have been classified by the Interstate Commerce Commission as Class I and Class II roads. The Class I roads include all the railroads, 177 in number, whose gross operating income equals or exceeds $1,000,000 annually. The roads represent approximately 97 per cent of the railroad business of the country. The Class II roads include all the railroads whose gross operating income is over $100,000 but less than $1,000,000 and, while large in number, they represent only 3 per cent of the business. Eighty-seven of the 177 Class I roads are controlled through stock ownership by 45 systems. The earnings of the 45 systems, together with the earnings of the controlled roads, amount to $3,210,256,842, or 96 per cent of the total earnings of the Class I roads, and 92.8 per cent of the mileage.

The problem of further consolidation would thus narrow down to the means of absorbing the numerous small systems and such further mergers as might be desirable and necessary among the 45 systems.

A careful consideration of all the circumstances which are involved in meeting the large financial requirements of the railroads leads to the conclusion that railroad credit as a whole will be established on a safer and more satisfactory basis, and capital will be made more certainly available and at less cost by consolidating existing railroad companies into a few large competing systems along the lines proposed by the Cummins bill. This method has received the endorsement of the Transportation Conference, representing the United States Chamber of Commerce, and the principle was approved by the counsel of the Association of Railway Executives in his testimony before the House Committee on Interstate and Foreign Commerce.

A policy of railroad consolidation along these lines is not a new policy; it is a policy consistent with the practices which have been followed in developing the transportation systems of the country in their present form. All the large railroad systems represent the merging of many railroads, some strong and some weak, with the result that these systems represent average conditions and, where they compete in the same territory, show average operating results. The consolidations which have taken place in the past, for the most part, have been an advantage to all interests concerned. By this means railroad service has been extended and improved and financing has been more economical than if the various railroads constituting these systems had remained in independent operation and each had been obliged to finance its own requirements.

Whatever difference of opinion there may be as to methods, no plan will prove a success which does not further strengthen the credit of the strong roads and establish credit for the roads heretofore weak financially, whether the weakness is the outcome of unfavorable operating conditions or a failure to observe sound standards of capitalization. On no other basis will the railroads individually and as a whole be able to meet the requirements of the country for adequate transportation.

Cummins Railroad Bill Encounters Opposition

Senators La Follette and McKellar Speak Against It; Senators Show Little Interest

WASHINGTON, D. C.

OPPOSITION to the passage of the Cummins bill for the reorganization of the railroads and of the system of railroad regulation has occupied most of the time of the Senate during the past week. The opposition thus far has consisted principally of Senator LaFollette of Wisconsin and Senator McKellar of Tennessee. Senator LaFollette, who objects to nearly all the provisions of the bill and who is advocating continuation of federal control of the railroads for five years, has had control of the floor and has been making one of his characteristic long distance speeches. He has been interrupted only by the routine business of the Senate, but has yielded the floor at times to Senator McKellar, who objects to the bill, but who desires the railroads returned under a temporary guaranty with a minimum of change in the system of regulation. The discussion of the bill is attracting very little interest in the Senate and the attendance has been very small, only a minority of the committee on interstate commerce having been present most of the time.

On December 11 an effort was made to displace the bill to permit of consideration of the bill to continue the government control of sugar, but it was defeated by a vote of 27 to 33. Senator Cummins opposed the proposal, saying that it would be a desertion of duty to lay aside the railroad bill for the purpose of taking up any other legislation that is on the calendar. He said he intended to do all he could to keep the bill before the Senate until it is disposed of. Senator Underwood also objected to a displacement of the railroad bill, saying the country could pay a high price for sugar without affecting the cost of living except as to that one item, while the railroad bill involves the cost of living in every item of human life and human endeavor. He did not agree with all features of the bill, but thought that on the whole it is a very good bill, which will meet a situation that must be met at an early day, or disaster will follow. He said he did not know whether the President would return the railroads on January 1, regardless of legislation, or not, but he had generally found that when the President said he was going to do a thing he did it. He said the bill affects the entire industrial life of the United States, and that if the Republican party dares to adjourn this Congress without an honest attempt to pass either this bill or some other bill to meet the conditions that confront the country, the American people will repudiate them in every state in the union.

Senator McKellar suggested that the reason why no more interest is being taken in the bill by the Senate is because senators are so dissatisfied with it that they have no desire to do anything to expedite its passage.

Senator Myers urged his amendment to take out of the bill the provision that would put representatives of the employees and of the public on the board of directors of each railroad. This proposal he characterized as "rank paternalism" from which nothing was to be gained. Senator Cummins said it was somewhat discouraging to argue a question of this character in the presence of so few senators, but he briefly opposed the amendment as attacking provisions which are indispensable parts of the general arrangement which the bill contemplates respecting the relations between employer and employee. A vote on the amendment was postponed by the effort to take up the sugar bill, which was allowed to be passed on the following day before the discussion of the railroad bill was taken up.

Senator LaFollette declared that the enactment of the bill would constitute the greatest stain on legislation in the history of the American nation, and that there is nowhere in the bill one clause in the interest of the people. He said the measure sought to validate "all the chicanery of 70 years of railroad jugglery," and in arguing for a continuation of government control he laid great stress on the fact that since July the Railroad Administration has been able to earn a small surplus above the guaranteed return.

Senator McKellar, before beginning his speech, submitted a resolution proposing that the Cummins bill be recommitted to the committee with instructions to strike out all after the enacting clause and to report back a brief bill providing for the termination of federal control and "the restoration of the railroads to their owners in a manner by which active competition and service may be restored and maintained." For the purpose of enabling carriers properly to serve the public during the transition period, he proposed a plan of loans to the railroads under the direction of the Interstate Commerce Commission, with a temporary guarantee or present income for a period of not longer than six months. He also proposed to give to the commission increased powers, including a supervisory jurisdiction over the arbitration of labor troubles, the issuance of railroad securities and the chartering of additional lines, all dealings between railroads and their employees of subjects arising out of federal control, refunding the carriers' indebtedness and the establishment of minimum as well as maximum rates. He also proposed that the existing rates shall be continued in effect with full power in the Interstate Commerce Commission to increase them "to the end that the railroads and the public shall be fairly treated and that each well and efficiently and economically managed railroad shall have a fair chance to earn a reasonbale and just income."

Senator McKellar said that practically no interest has been taken in the bill. Senators have absented themselves during the entire discussion. If they feel any interest in it they do not indicate it either by their presence in the Senate or by talking about it. It is the most important measure affecting the interests and prosperity of this country that was ever before Congress, and yet it has been allowed to pass along practically without any comment in the newspapers and practically without notice on the part of the public. About one senator in four or five apparently has looked over the bill, and the country itself seems almost oblivious to the fact that it is pending. He was greatly disappointed in the bill as reported by the committee, and thought it was wholly opposed to sound business principles. In a large sense, he said, it is as bolshevistic as the Plumb plan. "Under the Plumb plan the railroads are to be paid for by the government and turned over to the brotherhoods. Under the proposed measure the railroads are put in a trust and turned over to the security holders. The government holds the bag under both plans."

Senator McKellar insisted that the bill provides practically for a guarantee of 5½ per cent upon the investment of the railroads because the Interstate Commerce Commission would be required to fix the rates for 1920 without opportunity to find the valuation. He objected to the idea of a guarantee rather than to the rate and to the proposal to take away a part of the earnings of the most efficient roads. He referred to the opinion rendered by Charles E. Hughes that such a plan would be unconstitutional.

Senator Underwood said the bill had been amended to get around the objections made by Mr. Hughes in that the bill does not take earnings from one railroad for the benefit of another, but puts them in a contingent fund for common railroad purposes.

Senator Cummins suggested that it would be well to take into consideration the fact that Mr. Hughes was employed by the railway executives to render an opinion on the constitutionality of the bill, while Elihu Root was employed by the security owners' association to render an opinion on the other side. "Notwithstanding some things that have been said in this chamber," he said, "the railway executives are opposed to this bill and are doing everything in their power to defeat it, and in order to help it they employed ex-Justice Hughes to render an opinion for them with regard to this feature of the bill. The securities association, representing in a general way the bonds of the railway companies, employed ex-Senator Root to render an opinion with regard to a feature in their plan that required the taking of excess earnings—not the same plan we have here, but a plan that would present the same legal questions. I want the country and the Senate to know that these opinions, coming indeed from distinguished men and lawyers, are the opinions of advocates of their respective interests, advocates of the two sides of that question. They are honest men and they are great lawyers, but they cannot both be right upon this proposition, inasmuch as they are diametrically opposed to each other."

Senator McKellar said that the bill proposed a guarantee of 5½ per cent to the railroads, that it is not compensation for services done. Instead of requiring service of the railroads, he said, a premium is put upon a lack of service. The well-managed and prosperous road is penalized while the poorly managed road is rewarded, and he would never vote to take away the just earnings of a railroad that is well managed, that gives the public an efficient service and turns those earnings in part over to another railroad that is not well managed and that does not give the public a good service. He did not object to the railroads earning 5½ per cent. He hoped they would all earn that or more. "Five and one-half per cent is not unreasonable. That is not my objection to this bill," he said. "I am against the guarantee."

Senator Cummins pointed out that the difference between a strong road and a weak road is not always entirely due to the difference in management. The difference, he said, is usually attributable to the conditions over which neither road has any control whatsoever, and that rates made with reference to the railroads as a whole or any group will necessarily give the better-situated road an excessive earning as compared with their competitors.

When Senator McKellar declared that the railroads have been earning a profit since August, Senator King of Utah interrupted to say his information was quite the reverse. "It is possible the books may show some profit," he said. "but I assert that the Railroad Administration is not maintaining the roads as they ought to be maintained and that they are taking money from the maintenance column and crediting it to profit. I know of roads in this country that have deteriorated very greatly under the Railroad Administration, and I have no doubt that the statement of the Senator from Iowa is true, that there will be claims against the government for millions and tens of millions of dollars, which it may take years to decide, for unliquidated damages because of deterioration of the roads through the maladministration of the Railroad Administration."

Senator McKellar also opposed the labor provisions of the bill providing for decision on wage questions by the transportation board in the event of a failure of the wage boards to agree. He said that in case of a demand of the employees for a big increase in wages, the board will naturally take the line of least resistance. "Which will be the easiest horn of the dilemma for them to take?" he asked. "They will do just what the Congress did in the case of the Adamson law. They will say 'All right, we will just let your wages be raised $50,000,000, and we will certify the matter to the Interstate Commerce Commission and let them raise the rates of the public to pay for it.' The railroads are not interested in whether wages are high or low. They are guaranteed their 5½ per cent whatever the wages may be.

"If this bill were recommitted to the committee," he said in conclusion, "with instructions to prepare a bill along those lines (referring to his resolution) it would be for the manifest benefit of the American public and the railroads themselves. In turning the railroads back—and we ought to have done it long ago—we ought to make the terms fair and just toward all. We should not put any theoretical plan on the statute books. We must not let the government continue to hold the bag."

The North and South Trans-Continental of Australia*

THE MUCH DISCUSSED North and South Australian transcontinental railway project is again coming to the front after having been shelved for five years on account of the war.

A recent cablegram from Australia stated that Timms & Kidman, railway contractors, of Adelaide, had offered to build a line from Adelaide to Port Darwin within three years at a cost of £8,000,000, payable in government bonds. The undertaking would provide work for 5,000 men.

It is likely that the offer referred to the gap of rather over 1,000 miles between Oodnadatta—the northern terminus of the South Australian system—and Katherine river, where the railway from Port Darwin ends. For the most part the line would traverse semi-desert country, suitable only for sheep ranges. Apart from the strategic value of a railway connecting the settled portions of Australia with Port Darwin its principal merit would be that it would eventually form a link in the quickest route from Europe to Australia. That route—involving the extension of the Bagdad railway across Persia to a junction with the Indian system and the linking up of the Indian Burmese, and Siamese railways—would be via Paris, Constantinople, Bagdad, Calcutta, Mandalay, and Bangkok to Singapore.

When the linking up of the existing gaps has been effected, which may be within the next 15 years, it will be possible to travel from London to Sydney in less than three weeks. By that time, if the Channel tunnel has been completed and the Bosphorus bridged or tunnelled, travellers should be able to reach Singapore with only two changes—at the junction of the 4-ft. 8½-in. European gage with the Indian 5-ft. 6-in. gage, somewhere in Persia, and at the junction of the Indian broad gage lines with the metre gage system in use in Siam and the Federated Malay States. From Singapore to Port Darwin the distance is rather over 1,900 miles, which could be traversed by fast steamers in four days. From Port Darwin it should be possible to reach any of the Australian State capitals in from two and a half to five days.

Rival Routes

The route of the proposed railway to connect Port Darwin with the Australian railway system has been the subject of controversy in the Commonwealth for many years. At the beginning of the century, before the Northern Territory was transferred from the control of the South Australian State Government to that of the Commonwealth, the South Australian authorities contemplated bridging the gap between

*Reproduced by permission from the Times (London) Trade Supplement.

Oodnadatta and Port Darwin. After the transfer of the Northern Territory took place the Commonwealth Territory became responsible for carrying out the project, but the greater urgency of the now completed east and west line from Port Augusta to Kalgoorlie led to the shelving of the north and south line for the time being.

For many reasons it would be preferable to connect Port Darwin with the south-east by utilizing the "Great Western Railway" of Queensland, the construction of which has long been authorized by the Queensland Parliament. This line is to connect Camooweal, on the border of Queensland and the Northern Territory, with Tobermory, about 250 miles north-west of Bourke, the terminus of a branch of the New South Wales system. It will pass through much more fertile country than the proposed Port Darwin-Oodnadatta line. It will also link up the four principal east and west lines in Queensland and will, therefore, carry a considerable local traffic. From Camooweal to Katherine river, the present terminus of the railway from Port Darwin, is about 550 miles in a direct line. The route from Katherine river to Bourke would be longer than that from Katherine river to Oodnadatta, but it would be a more useful line in most respects. It remains to be seen which project will be adopted, but the probabilities

The Principal Railways of Australia and the Proposed New Lines

are that the Commonwealth Government will favor the Oodnadatta route for reasons connected with the breaks of gage which are the curse of the Australian railway systems.

Evil of Broken Gages

These gage difficulties can be best illustrated by pointing out that the journey from Perth to Brisbane under present conditions involves no fewer than five unavoidable changes of carriage. From Perth to Kalgoorlie, where the Commonwealth Trans-Continental begins, the gage is 3 ft. 6 in. The Trans-Continental is a standard-gage (4 ft. 8½ in.) line. This ends at Port Augusta, where 3-ft. 6-in. portion of the South Australian system begins and continues to Terowie. From Terowie *via* Adelaide and Melbourne to Albury on the New South Wales border the gage is 5 ft. 3 in. At Albury a change is made to the New South Wales 4-ft. 8½-in. system, which continues to the Queensland border. There the gage reverts to 3 ft. 6 in. It is, therefore, necessary to change carriages at Kalgoorlie, Port Augusta, Terowie, Albury, and Wallangarra, the New South Wales-Queensland border station. In actual practice eight changes are necessary, since Sydney, Adelaide and Melbourne are terminal stations.

To provide a through route connecting the state capitals (with the exception of Adelaide and Melbourne), by a 4-ft. 8½-in. system the construction of various lines has been proposed.

The conversion of the section from Port Augusta to Terowie (now 3 ft. 6 in.) to 4 ft. 8½ in. and the construction of a standard-gage line from Terowie, *via* Morgan to Hay, where it would connect with an existing line of the same gage to Sydney, would provide a through standard-gage route from Kalgoorlie to Sydney. The line from Fremantle *via* Perth to Kalgoorlie would have to be relaid to 4-ft. 8½-in. gage or a new line built to extend the standard-gage system to the Western Australian capital and the chief port, Fremantle.

Another project is the connection of Deniliquin, at the end of a 5-ft. 3-in. line from Melbourne, with Hay, and the construction of a new standard-gage line from Hay *via* Nyngan and Moree to Warwick and Brisbane. If these lines were built, Perth, Sydney, and Brisbane would be connected by standard-gage lines, while Melbourne and Adelaide would be in direct touch with one another by the existing 5-ft. 3-in. line and would be joined by 5-ft. 3-in. lines to the standard interstate route. It would not be difficult to lay a third rail on these connecting lines so that through standard gage trains could be run between all the capitals.

Standard Inter-State System

It is clear that the Oodnadatta route would fit in better with the scheme for a standard-gage inter-state system than the utilization of the authorized Queensland Great Western 3-ft 6-in. route as a means of connecting Port Darwin by rail with the rest of the continent. The existing sections from Port Augusta to Oodnadatta and from Port Darwin to Katherine river would have to be relaid to standard gage, but this would probably be worth while, since the north and south line is likely to be at no very distant date a link in the railway route from London to Sydney.

The muddle of the gages in Australia places serious difficulties in the way of interstate traffic. It will be remedied to some extent by the completion of the various standard gage lines projected by the Commonwealth Government, but nothing short of a most expensive wholesale sonversion of gages can undo all the harm that has been done by the lack of foresight of past generations of state politicians. In 1912 the cost of converting all the existing Australian lines to standard 4-ft. 8½-in. gage was estimated at £37,164,000. The cost of a more limited scheme, involving only the main trunk lines and some of the more important branches, was set down at £12,-142,000. Since then, in May, 1916, the laying of a third rail on the more important sections was discussed by a Premier's Conference. This matter again came up for discussion in May, 1918. In August last a report was drawn up by a conference of engineers of the Commonwealth and State railways.

The present cost of conversion would in all probability be at least double the 1912 estimate. At that rate the more limited scheme would involve the expenditure of some £25,000,000. So large a sum is unlikely to be forthcoming in the near future, so that there is little likelihood of any speedy elimination of the present disadvantages. Probably the most practical course would be to convert by degrees the Victorian and South Australian 5-ft. 3-in. lines to standard gage, and to extend the standard gage system to Fremantle and Brisbane. This would leave alone the bulk of the Queensland and Western Australian systems at their extremity of the main network, but less inconvenience would be caused by such a policy than by any other short of complete conversion. For example, the reduction of gage in Victoria and South Australia would involve little alteration to the road bed apart from relaying track, whereas where 3-ft. 6-in. track has to be widened much work in opening

out curves, strengthening bridges, and culverts, and altering track layouts is necessary.

Loss Due to Breaks of Gage

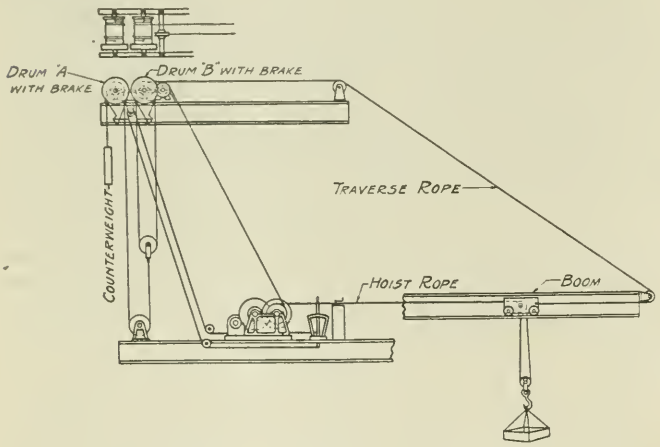
What the loss through breaks of gage amounts to in the aggregate may be judged from the fact that the transhipment of goods at Albury—where the Victorian and New South Wales systems exchange traiffs—costs from 1s. 6d. to 2s. 6d. per ton. This goes on at Kalgoorlie, Port Augusta, Terowie, Albury, and Wallangarra, not to mention various local stations in South Australia where 3-ft. 6-in. feeder lines meet the 5-ft. 3-in. main routes.

If the Imperial Government had exercised a little persuasive guidance in the early days of railway building much of the present gage muddle in various parts of the Empire might have been avoided. Now that the linking up of the Indian and European systems is likely to be undertaken at no very distant date, the unwisdom of adopting the 5-ft. 6-in. gage in India is becoming apparent.

New Developments in Hoisting Machinery

THE ABNORMAL CONDITIONS which have obtained for the past few years have been especially conducive to the development of labor-saving devices of all kinds. This has been particularly true of transportation facilities in terminals and ports where promptness in handling materials is directly reflected in the degree of efficiency of the transportation system as a whole.

Among the recent developments along this line are two improvements in hoisting equipment which are applicable to installations where the hoisting and horizontal movement of loads are required. The first is the so-called balanced hoist and transporter in which a single drum is used for these two movements in place of the customary two drums,



The Balanced Hoist and Transporter

the shift between the vertical and the horizontal motion being accomplished by means of a lever which controls a pair of rope grips.

This new type of balanced hoist and transfer is adaptable for use on all hoisting apparatus in which there is a free hoist and a horizontal movement of the load. An important feature of this apparatus is that during the hoisting operation the entire dead load of the skip is balanced by a counterweight which enables the size of the hoist and the motor to be reduced and also effects an important saving in the amount of power required as compared with other types of apparatus in which no counterweight is used. During the operation of lowering, the motor is working to raise the counterweight, thus obtaining a control somewhat similar in effect to dynamic braking. As the hoist drum is rigidly keyed to its shaft, no friction clutch is required.

In connection with the balanced hoist, another improvement consists of an extension boom which is especially suited for use on cranes for loading and unloading vessels. The boom may be extended or withdrawn in the direction of its own length. An important feature in the design is the means adopted for paying out the ropes supporting the outer end of the boom at a predetermined varying rate. When used in combination with the balanced hoist equipment the hoisting apparatus is operative at all points of extension of the boom as the slack rope resulting from the drawing in of the boom is taken up by a counterweight.

The balanced hoists and the extensible boom have been placed on the market recently by N. B. Payne & Co., New York.

Increasing the Capacity of Hand Trucks

THE TWO-WHEEL HAND TRUCK is very largely used for handling the average run of package at freight houses because of its adaptability, but it is not well suited for handling heavy loads. To increase its capacity there has been developed a device known as the Rysco Third Wheel Truck Attachment, which has been placed on the market by the Pierce Company, Chicago. The third wheel

A Two-Wheel Truck Equipped with the Three Wheels

attachment consists of a frame, one end of which is attached to the axle of the truck, while the other carries a small castor, giving a wheel base of 22½ in. Mounted on the top of the frame is a standard for supporting the truck, which can be adjusted to hold the truck platform at an angle of about 30 deg., or practically horizontal as desired.

It is claimed for this attachment that a truck equipped with it has every loading and unloading convenience of a two-wheel truck, combined with the hauling capacity of a four-wheel truck. It requires less space than a four-wheel truck, and since the third wheel is equipped with a ball-bearing swivel caster it can be turned in a very short radius. Trucks so equipped can be used as trailers for storage battery trucks if desired. It is stated that by taking the load off the handle, which the trucker must ordinarily sustain, the capacity is greatly increased and the cost of heavy trucking is reduced as much as 75 per cent.

"GIVE THE RAILROADS BACK and give them a chance to live!" should be the slogan of every man in the country who has good sense and who desires that the business of the country should get to a normal basis.—*Syracuse Post-Standard.*

Progress Made by the Railroad Y. M. C. A.

Also a Report of the Transportation Bureau of the National War Work Council.

THE ACTIVITIES of the Railroad Department of the Young Men's Christian Association, as covered in the report of the International Committee at the fortieth international convention of the Y. M. C. A. at Detroit, Mich., November 19-23, are of unusual interest. The report is as follows:

"In the exigencies of war days when transportation was vital to military operations the Railroad Department in the very maintenance of its regular work rendered a war service of untold value. The approximately 2,000,000 railroad employees in North America constituted a strategic force. Adequate provision for their social, physical, educational and moral welfare, together with wholesome provision for their leisure and lay-over hours, was of advantage alike to them, to the corporations they served and to the nation in a time of stress. Among the striking developments and marks of progress the following may be indicated:

"Railroad associations are now established at 287 points, as compared with 252 in 1916, a gain of 35.

"During the two years of government control new buildings, additions or enlargements were authorized at more than 70 different points, totaling in cost above $2,000,000.

"Coincident with material extension has come a striking growth in membership. In 1916 the total membership of railroad associations was 85,287. In that year all railroad associations united in the first continental membership week, securing 40,000 new members and bringing the total membership up to 120,000. Retrenchment owing to war conditions reduced the railroad working force, with the result that the membership fell to 105,000. In May, 1919, in a second membership effort 49,000 new members were secured, making the membership at present approximately 150,000, or 65,000 in excess of that at the time of the Cleveland convention.

An advanced program of activities, in which all railroad associations will unite, has been carefully planned, and definite weeks selected for continent-wide organization and promotion as follows: Religious work, boys' work, educational work, citizenship and social, health and happiness, thrift, membership.

"The Bureau of Transportation of the War Work Council, while reported in detail elsewhere, needs mention here, for this bureau was practically the Railroad Department at war service. Both the Railroad Department and the Bureau of Transportation were under the same general administration. The bureau's departmental leaders were almost without exception railroad secretaries, and the great service rendered throughout the war by secretaries on troop trains became possible because of the initial demonstration made by volunteer railroad secretaries on draft trains early in the war. In all nearly 10,000 troop trains were accompanied and served by association representatives.

"For various war work financial campaigns the department also released several of its most efficient international secretaries. Local railroad secretaries served on transports carrying soldiers overseas, while others rendered invaluable service in camps at home and abroad.

"During the past three years Railroad Summer Schoools, now six in number, have had a tonic effect upon the associations. Although during the war attendance was relatively small, during the summer of 1919 about 150 railroad secretaries and assistants were in attendance.

"During the past three years the department has continued to give attention to visiting foreign railroad officials. Occasional luncheons have been tendered them, usually in a Railroad Association building. They have been shown the work in New York and other cities, and courtesies have been extended and services rendered them. The seed sown will in time bring forth abundant harvest.

"Mention should be made of the generous attitude of the United States Railroad Administration. At the outset careful thought was devoted to submitting to it full information regarding the scope, character and extent of our movement. The result was gratifying, for the administration, whenever it could consistently do so, has cordially endorsed building projects and approved appropriations for maintenance.

"The most pressing and important problems of this department are the following:

"*The Present Unsettled Railroad Conditions.*—For some time the future has been so uncertain as to make the Washington administration and individual operating heads fearful of expenditure, action or precedent. Needed association enterprises have been deferred, and not until the situation is clear will associations be free from embarrassment and delay. Strikes and threatened strikes are also keeping the railroad world in suspense. Misunderstandings between capital and labor react upon the associations and aggravate a difficult situation.

"*The New Membership.*—How successfully to conserve the striking results of two fruitful continental membership campaigns, assimilating the thousands of new members and transforming them from mere members into an aggressive working force, is a large and hitherto baffling problem.

"*The Unoccupied Field.*—A recent investigation demonstrated that there were 250 division and terminal points in Canada and the United States where Railroad Associations would be of great benefit. Many are large centers, but more are small isolated points where the need is marked.

"*Railroad Boys.*—Many Railroad Associations are established in small communities where the boy problem is pressing. Its solution will require a railroad boys' work secretary and additions to many buildings. The field is ripe, but owing to present limitations cannot be harvested.

"*Street Car Employees.*—Only a beginning has been made in work for street car men. The handful of street railway associations now in successful operation would doubtless be enlarged were not the present staff of supervisory secretaries so wholly occupied with steam railroad responsibilities as to make impossible giving attention to this inviting field.

"*Construction and Maintenance-of-Way Employees.*—The large number of negroes employed in various capacities on railroads in the South, the Mexicans in the Southwest and the Japanese in the Far West call for thought, planning and service.

"*The Merchant Marine.*—An investigation has been made at a selected number of inland and seaboard ports with the object of ascertaining the need for merchant marine work by the association. A report of this investigation has been submitted to the International Committee for consideration.

The Recommendations Were Approved at Detroit

"Points of policy which call for special emphasis are the following: To make the most of the opportunity for extension that will come with the adjustment of the railroad ques-

tion by Congress; to make of the seventh-week united advanced program a telling success; to point out to the entire brotherhood through this intensive effort a plan which may be adopted by other groups of associations; to enlarge the work for street railway employees; to develop work among boys in railroad communities, and find the way for service to the negroes, Mexicans and Japanese employed in so-called menial labor."

Transportation Bureau

The report of the work of the Transportation Bureau on the activities of the association was included in the report of the National War Work Council of Young Men's Christian Associations, and is as follows:

"The Transportation Bureau required the services of 598 secretaries to fill in the gaps between the work of the local associations and the various camp Y. M. C. A. activities at home and overseas. The work of the bureau was conducted on troop trains, at transfer centers, at embarkation and debarkation points, on ocean transports, on cargo ships and at debarkation piers in receiving troops returning from overseas.

"This service was inaugurated July, 1917, and from that time up to September 1, 1919, 8,901 troop trains, carrying 4,450,400 soldiers and covering a total distance in excess of 8,900,000 miles, have had on them association representatives serving soldiers in every possible way and distributing without cost millions of bars of chocolate, packages of gum, cigarettes, etc. During July alone 840 such troop trains had Y. M. C. A. secretaries on board.

"At the more important transfer centers, as, for instance, Chicago, Pittsburgh, Denver and Cincinnati, the bureau had representatives, and in co-operation with the local associations served the many thousands of soldiers and sailors in daily transit. At St. Louis two huts were operated in conjunction with the Railroad Young Men's Christian Association and rendered unusual service. Over one and a half millions of men en route through St. Louis were served either in the yards, in the passenger station or in the huts.

"At Hoboken, the greatest home port of embarkation and debarkation, five rented buildings and a sixth owned building (the largest hut of its character in America) were at the disposal of the men. These buildings during a single month served 276,100 men. An average of 4,500 were served daily in the two cafeterias. One hundred and seventy-six thousand pieces of writing material were used, and over 52,000 soldiers and sailors attended 183 different social, educational and religious gatherings during a single month. At Newport News a hut, costing approximately $50,000, was opened early in 1919. More than 500,000 men have already paid over one and a half millions of visits to this building. At Boston, Mass., Charleston, S. C., and Philadelphia, Pa., the men were served by Transportation Bureau representatives on the piers before departing for camps; while in San Francisco the troops en route to and from Siberia were served by the Transportation Bureau in co-operation with the Western Department.

"Ocean transport service was inaugurated March 4, 1918, from which date to June 6, 1919, when it ceased, a total of 1,512 secretaries served on 1,102 different sailings, carrying a total of 3,173,200 soldiers. The cost of free equipment placed on transports, exclusive of salaries and traveling expenses of secretaries, and distributed absolutely without cost to soldiers and sailors, was $951,396. Among the items were 20,085,442 cigarettes, 1,009,097 bars of chocolate and 25,333,880 pieces of stationery. Each ship also carried moving picture machines, music boxes, athletic equipment, etc. From March 4, 1918, until the signing of the armistice, our Transportation Bureau representatives were the only welfare representatives assigned to ocean transports.

"The bureau also had representatives on ships carrying soldiers from America to Siberia to render similar service. Here also the association was the only agency represented.

"The thousands of men constituting the cargo ship force of the overseas cruiser and transport service were not overlooked. While it was not feasible to assign secretaries to these smaller vessels, nevertheless, equipment, consisting of victrola, athletic supplies, etc., was placed on 1,081 cargo vessels for the use of the crew at a cost exceeding $81,075.

"At Hoboken, Boston, Philadelphia and Charleston "Flying Squadrons" of Transportation Bureau secretaries were organized to meet all ships upon arrival, and in addition to greeting the men served them without cost with chocolate, chewing gum, newspapers, postcards, telegraph blanks, etc. Secretaries also accompanied these men on their journeys from ships to debarkation camps. At Hoboken alone thirty-five secretaries were kept busy in meeting ships, and on a single day rendered definite service to 26,417 men."

Winter "Gets on the Job" in Chicago

Carl R. Gray

CARL R. GRAY, chairman of the board and president of the Western Maryland and formerly director of the division of operation of the United States Railroad Administration, has been elected president of the Union Pacific. Before the roads were taken over by the government E. E. Calvin was president of the Union Pacific, C. B. Seger was vice-president and comptroller, and Judge Robert S. Lovett was chairman of the executive committee. When the government took over the road Mr. Calvin became federal manager, Judge Lovett went with the Railroad Administration, and Mr. Seger became president of the corporation. Not long ago Judge Lovett resigned from the Railroad Administration and returned to the Union Pacific as president, Mr. Seger having resigned to become president of the United States Rubber Company. Judge Lovett has again been elected chairman of the executive committee and Carl Gray now becomes operating executive of the Union Pacific, and Mr. Calvin will be vice-president when the road is returned to the private corporation.

Presumably Judge Lovett and Mr. Gray worked closely together during the last two years while they were members of the Railroad Administration. Carl Gray is a Western man brought East in 1914 by John D. Rockefeller and his associates to pull the Western Maryland out of the slough of despond in which it had gotten after the Connellsville extension to a connection with the Pittsburgh & Lake Erie had proved a failure in so far as making the Western Maryland the Atlantic seaboard outlet for a considerable part of New York Central's west of Buffalo traffic.

Mr. Gray began railroad work as a telegraph operator, but after four years became a clerk in the traffic department, and for eleven years was in a subordinate position in the St. Louis & San Francisco traffic department. In 1897 he was made a division superintendent of the St. Louis & San Francisco. From that time on his rise has been rapid and his experiences unusually broad and varied. In 1904 he was made general manager of the St. Louis & San Francisco. This was about the time of the mis-alliance between the Frisco and the Rock Island. Mr. Gray was after a few months made vice-president and had become senior vice-president by 1909. This covered the period of the Frisco-Rock Island merger, with the rivalries, quarrels, stock manipulations and hopeless struggle against the Yoakum-Reid-Moore control of Rock Island-Frisco lines.

The position of chief operating officer on the Frisco during this period must have been a peculiarly trying one. In some ways Mr. Gray probably went through as an unwilling subordinate with a fairly large number of what-not-to-do's-in-the-proper-management-of-a-railroad. It is a difficult thing for a railroad officer to build up a loyal, ambitious organization when his board of directors is taken up primarily with rivalries and stock speculation. A personality which can gain the loyalty and respect of subordinates under such circumstances is an unusual one.

Mr. Gray is a large man, mentally and physically. He gives the impression of freedom from conventionality, open-handedness and a lack of suspicion which we associate with the best traditions of the West. With his hearty non-conventional manner, however, Mr. Gray has a keen sensitiveness of the feelings of others and a consideration both in his manner and his actions toward subordinates that is not always found in the operating officer who has driven his way upward through the rough experiences which railroading in the Southwest entails.

In 1911 Louis Hill invited Mr. Gray to become president of the Great Northern. He thus stepped from a position of having to inaugurate and defend his own operating methods and to apply in so far as he could scientific principles to railroad operation in the face of indifference or actual opposition on the part of his board, to responsibility for the operation of a great transcontinental system where the minutest details of scientific railroad operation had been worked out under the personal supervision of James J. Hill. As an experience in railroad operation the presidency of the Great Northern was of the greatest value to Mr. Gray.

Carl R. Gray

When he became president of the Western Maryland he acted also as advisor to the Rockefeller interests in the affairs of other railroads in which they had investments. It was a remarkable opportunity for a man who had spent all his life on Western roads and who came fresh from the management of the Great Northern to take hold of a comparatively small coal road in the management of which about every mistake that could have been made had been made. It was not a surprise to any one who had followed Mr. Gray's work to see what he, with the aid of M. C. Beyers and S. Ennis, did with the property; if a statistician were to study the operating results which were obtained in the few years that Mr. Gray was there, without any knowledge of the personalities involved, it would resemble a miracle in railroad transformation.

As to his work for the Railroad Administration, the fact that Judge Lovett, who was closely associated with him, should now choose him as president of the Union Pacific speaks for itself. He had the universal liking and respect of both federal and corporation officers.

THE LEHIGH & SOUTHERN RAILROAD COMPANY has applied to the Public Utilities Commission of Illinois for authority to lay out and build its railroad in the county of Kankakee. A supplemental petition was filed by the same company to complete the construction of a track from the end of its present tracks in a southerly direction to the right-of-way of the Illinois Central in Kankakee.

A Study of the Treatment of Water for Locomotives*

The Solution of the Problem Imposed by Each Water Supply Requires Individual Investigation

By William M. Barr
Consulting Chemist, Union Pacific System, Omaha, Neb.

WATER SUPPLY was merely an incident in railway operation only a few years ago. The nearest ample supply of water, regardless of quality, was developed for use in locomotives. It was many years before railway officers came to realize fully that some of these waters which were easily obtained in ample quantity were costing the railroads large sums of money. It is hardly necessary here for me to point out the various conditions resulting from the use of bad waters that made the use of these waters expensive.

I have noted that the American Railway Engineering Association has tried to reduce the saving to figures showing that every pound of scale forming ingredients removed from any water results in a saving of 7 cents. This has been recalculated to meet present price and wage conditions and has been given as 11 cents. My personal belief is that no matter how competent the men may be who have collected the data and reduced the saving to cents per pound, the figures at which they have arriced can only be an approximation. It is safe to assume, however, that the figure given is small enough as the error usually results from the omission of savings that cannot be reduced to figures. There are so many factors that enter into the saving to be accomplished, some of which cannot be accurately calculated, that it becomes practically impossible to say that a certain definite treatment will save a fixed number of dollars. We, therefore, must content ourselves in a discussion of the treatment of water for locomotives by making the assumption that in general all improved water conditions are profitable to the railroad.

In attacking the railroad water problem one must lay down as a fundamental principle that the primary object of the railroad is to move tonnage that everything that interferes with such movement is bad practice. We may for example, take one of the worst waters that can be found and so treat it that the amount of scale forming solids it contains will be almost negligible, but an engine taking this water might fail before it had covered one-half of its run. It would immediately be concluded by both the operating and mechanical departments that the water treatment, whatever it might be, was wrong, and these departments would be justified in such conclusions.

A water at one station contained 123 grains of dissolved solids per gallon. Other stations on the same district were high in sodium salts. Had this water been treated to remove the incrusting solids, the sodium salts in the treated water would have been approximately 90 grains per gallon. This would have been certain to cause engine failures from foaming. A new supply containing 35 grains of dissolved solids per gallon was obtained at this point and treatment of this water gave good results.

I have frequently said that the first thing to be done on any railroad is to make a thorough survey to determine how many good waters can be developed within a reasonable distance from the line. This seems like a very simple statement and it may be said that this is what any one would do. I will, however, venture the further statement that there are few railroads in this country where thorough field work and a careful study will not develop some good water supplies that have heretofore either been overlooked or ignored.

At a station in the arid region of the southwest the water supply for both town and railroad is brought in by pipe line from springs a distance of two and a half miles. Later geological studies and deep borings show that a deep well at the tank would give an ample supply of soft water which would flow into the tank.

What constitutes a reasonable distance to go from the line for a water supply depends upon the amount of water required at the station to be considered, the character of other water supplies on the district, and the character and quality of water that may be already available at the station. I take the position that in order to avoid a water treatment of any kind the railroad can afford an expenditure entirely out of proportion to the actual cost of water by treatment at the station. The cost of water should not be figured in cents per thousand gallons at a single station, but should be figured as an average cost over the division or, if you please, over the entire line. When all available good supplies have been developed on a district or division it is then time to determine the best method for improving such supplies as may not be satisfactory.

The Use of Boiler Compound

Many statements have been made to the effect that water should not be treated within the boiler or that treatment with boiler compound is irrational and unscientific, and some have gone so far as to denounce it as a fraud. I have heard chemists make the statement that water could not be successfully treated with a boiler compound because enough of it could not be used to react with all the scale forming solids in the water and still maintain successful operation.

It is true that if enough chemicals are put into a boiler to precipitate all of the carbonates of lime and magnesia that exist in many of the waters of the middle west, and then enough soda ash be added to react with all the sulphates of lime and magnesia that exist in many of these waters foaming and priming would certainly take place. It is my judgment that the intelligent and rational use of a property made boiler compound is frequently beneficial. There will probably always be some places on any railroad where compound may be used with benefit. Naturally I prefer to control the composition of any compound used under my direction, as this enables one to judge results more accurately and to modify treatment so as to improve results that may not be satisfactory.

It has been said that the use of boiler compound is an incomplete treatment, and is never sufficient to react chemically with all of the scale forming solids in the original water.

It is obvious that with a large percentage of heavy scale waters encountered in railway operation it would not be practicable to put enough chemicals in the tender or in the boiler to throw out of solution all of the incrusting solids. If this were done the engineer would soon have trouble from foaming and excessive accumulation of mud in the boiler.

In using boiler compound enough chemicals are added to form a soft and somewhat flocculent precipitate. Thus when the other scale forming substances in the water are thrown out by heat, this precipitate already formed will carry down

*Abstracted from a paper presented before the Western Railway Club at Chicago on November 17, 1919.

the bulk of scale in the form of a soft sludge, preventing it from building up on the flues and keeping it in a condition to bs discharged from the boiler by means of the blow-off. The natural result to be expected would be a more frequent washing of boilers. However, this sludge is more easily washed out and any scale that does adhere to the flues is more easily removed than would be the case with the untreated water.

There are many districts where the waters carry a light scale which would not justify a line of treating plants. The use of a compound here would keep the scale soft and with the use of the blow-off would result in improved boiler efficiency, and less shop work.

Water Softening

For a long time the problem of water softening was generally considered to be a treatment of a water outside the boiler, which removed by chemical precipitation the scale forming solids held in solution in natural waters. Those who have studied this problem, both in connection with stationary boilers and locomotives, have come to the conclusion that the problem is much deeper than the mere removal of boiler scale.

In treating water it is important to consider not only the amount of scale to be removed, but other properties of the softened water, which may or may not result from the process of removing the scale forming constituents. One author has very aptly stated the case by saying, "A modern boiler is not merely a basin in which liquid water is converted into gas but a receptacle for the mineral impurities contained, in greater or less quantities, in all natural waters even when softened. The boiler is in reality an autoclave in which chemical solutions are concentrated and partially evaporated at high temperatures and pressure, and should be looked upon as a chemical factory in which various chemicals are produced during the conversion of ordinary water from initial temperatures, of, say 60 deg. F. into steam, often highly superheated."

It would be an ideal situation if we could put nothing but pure water into a boiler, but in practice this is a condition which it is rarely possible to obtain. We must, therefore, study the chemical reactions which take place in the boiler under pressures and temperatures which are not normally found when studying similar reactions in the laboratory.

If the problem of railway water supply involved the handling of but one water in each boiler it would be much simplified and many desirable results could be obtained, which are not within the range of possibility under railroad conditions. Our experience has shown that where an attempt was made to carry a pronounced excess of lime and soda ash in the treated water, engineers experienced trouble from the liming of injectors and branch pipes. If a sufficient excess of soda ash was used the tendency toward foaming was aggravated and on many districts became serious. There may be certain cases where it is possible to carry an excess of caustic soda in a treated water with pronounced improvement in engines as regards corrosion. Such would be the case on a district where it was necessary to treat all waters so that a uniform alkalinity would appear in all waters that entered the boiler. There are, however, few railway districts that have come under my observation where this would be advisable in practice.

An engine district may have eight or more water supplies. The character of these waters may be such that only half of them require treatment for scale removal. If then, an attempt is made to treat these waters so that an excess alkalinity is shown at the softeners it is quite probable that some of this alkaline water is put into a tender which already contains a considerable quantity of untreated water. This water may carry enough bicarbonate to destroy any caustic alkalinity which was carried in the treated water and if this mixture showed alkalinity at all it would be in the form of carbonate, which would defeat the object of the treatment proposed. In most western districts the water in the tender would show no alkalinity after mixing and would contain calcium salts which would incrust the injector.

It may be suggested that all waters on the district should be treated, but unless most of these waters carry enough scale to be injurious it is hardly probable that the saving that could thus be effected in the life of flues and fire boxes would be sufficient to justify the expenditure and increased cost of operating water stations.

In the operation of water softeners there are three conditions that are essential to the success of the treatment: (1) Ample settling space, (2) thorough agitation, (3) careful supervision. Attempts have been made in the construction of many water softeners to limit the capacity in an effort to reduce the initial cost of equipment. This is a common and serious error, in the first place because it allows no margin to provide for the expansion of business, and secondly because the original time allowed is frequently too small at the start. In addition to allowing five hours' reaction time it is good practice to make provision for a reasonable increase of business, which American railway operation has shown to be almost certain on the majority of our transportation lines.

The necessity for agitation is sometimes overlooked in water treatment on the assumption that if the chemical mixture is uniformly distributed throughout the entire volume of water treated reaction must take place and no mixing beyond this point is required. Even though thorough agitation is accomplished and ample settling time allowed, I believe it is always desirable to provide filtration for the treated water, if for no other reason as a safeguard to the removal of any suspended matter that might get through.

The supervision of water softeners has frequently been a weak spot, not only in railway operation, but in the general operation of treating plants. As a rule, the men directly responsible for the operation of the machines are non-technical men and there is a lack of appreciation of the requirements or the performance of these machines. It is, therefore, essential that frequent checking of the treatment by analysis as well as frequent inspection of the machines should be made. To get the best results in this particular it is important that a spirit of co-operation be developed between the chemical staff and the department operating the water softeners. Much depends upon the personality of the men who make the inspections and give instructions to pumpers for the handling of the chemical treatment.

My own practice requires that daily reports be made by the pumper showing: The exact time of operation; the time and amount of each chemical charge; the time of dumping sludge; appearance of water when it leaves the machine; condition of all mechanical parts; amount of chemicals on hand; in case of surface waters, a test on both raw and treated waters showing hardness, alkalinity and causticity; and repairs needed.

A copy of this report is sent to the water service foreman as well as to my own office. Pumpers are also instructed to make telegraphic report of any unusual conditions which may arise. Machines are inspected and water tested by traveling chemists on an average of once in 10 days, and weekly samples are sent to the laboratory for analysis.

In addition to this inspection, men experienced in the use of water in locomotives as well as water treatment make occasional trips with traveling engineers or with the engine men alone, in order to determine whether or not good results are being obtained in the operation of locomotives under existing water conditions. These men also visit round houses and shops, examine flues and fire boxes, conferring freely with foremen and the general boiler inspector.

The work of such men has to do not only with treated

waters, but with general water conditions and use of boiler compounds. If traveling engineers report trouble of any kind arising from the water supply the master mechanic reports promptly to my office and to the superintendent of motive power. One of these men is sent to work with the traveling engineer in order to determine the source of the trouble and correct the condition causing the complaint.

Foaming

Foaming is to the engineer one of the most serious troubles that arises from the use of water, and as this interferes seriously with traffic, it is important that efforts be made to reduce this condition to a minimum. There seems to be some difference of opinion as to the primary cause of foaming. I note that the American Railway Engineering Association has revised the manual to read, "This action is due primarily to the presence of suspended matter in the water. The suspended matter gives a mechanical strength or tenacity to the liquid in the thin films over the steam bubbles, which, rising to the surface, retain their films and collect to produce foam. It is aggravated by the concentration of alkali salts present in the natural waters or added by the process of water softening, which increases the viscosity of the surface films."

I cannot agree with the statement that foaming is primarily due to the presence of suspended matter. If a water is pure insoluble suspended matter will not increase the viscosity of the surface film, and will not in itself produce foaming. On the other hand dissolved solids may be increased to such a point that foaming will result without the presence or assistance of suspended matter. It is true that this condition is greatly aggravated by the presence of suspended matter, and foaming in muddy water or dirty boilers takes place most easily. I would say that foaming is due primarily to the presence of any matter in solution which sufficiently increases the viscosity of the surface film in the boiler and is greatly aggravated by the presence of suspended matter.

In locomotive operation it is difficult to separate the two conditions. All locomotive boilers contain suspended matter in varying amount, therefore, as the dissolved solids are increased by concentration there will be a tendency to foam.

I have under my jurisdiction a district that receives perfectly clear water at all stations. These waters are either filtered or come from deep wells which furnish clear water. About the middle of this district there is a water supply that is high in sodium salts, carrying a rather large amount of sodium carbonate. It is necessary for all engines running on this district to carry a supply of anti-foam compound, which is usually applied when this water is taken. The concentration is also relieved by frequent use of the blow-off. By such means engine failures from foaming are prevented or reduced to a minimum.

As an overtreated water has a tendency to increase foaming troubles it is necessary, particularly on districts where the waters contain excessive amounts of sodium salts, to hold the treatment below the point of excess alkalinity.

Boiler Washing

Water treatment bears such a close relation to boiler washing that some consideration should be given here to this subject. It is frequently recommended that anything should be done that is possible to increase the time between washouts. If this can be done by increasing the purity of the water, the extension of such time within reasonable limits is desirable and profitable. I do not believe, however, that this time should be extended to the limit by artificial means simply because it is possible to keep an engine moving.

Serious foaming trouble is usually accompanied by a dirty boiler and where waters are of such a character that foaming occurs frequently it is necessary to use a compound for safe operation and to avoid failures. In such cases, however, I cannot recommend that engines be operated between washouts for such a time as the use of compound will avoid failure. By doing this the cost of an occasional washout may be saved, but one failure resulting from this policy will compensate for the cost of several boiler washings.

In calculating the saving effected by extending the time between washouts the increased efficiency in operation with clean boilers resulting by the more frequent washouts, if often overlooked, though it is sufficient to deserve consideration. The more frequent washout usually results in a reduction of boiler work.

On a certain district where boiler compound is used for the removal of scale it is possible to run engines 30 days between washouts. Boilers were washed at intervals of four weeks. A thoroughly competent and interested foreman on this district now washes boilers at intervals of two weeks, and owing to the ease with which boilers are washed under this condition there is little difference in his costs for this work resulting from the changed method. At the same time he has shown a saving in flue and fire box work and an increased efficiency in operation as a result of cleaner boilers. With modern equipment for hot water washing these experiences indicate that the time between washouts should not be extended beyond such reasonable limits as this practice would dictate.

Corrosion

Much has been written on the subject of corrosion in boilers and various theories have been proposed to account for it. It still remains the most difficult feature of water treatment for locomotive boilers. The electrolytic theory offers a reasonable explanation for much of the corrosion which takes place, particularly cases of pitting and corrosion around stay bolts. It is beyond question that a segregation of impurities in steel will result in such spots having a different electric potential from that of the main portion of the steel, and in many waters which are good electrolytes would set up galvanic action and start corrosion.

There are, however, corrosive conditions existing in the use of many waters where the action can be explained by reactions that are purely chemical. Owing to the fact that steel is not a homogeneous material there are spots where the metal contains impurities that are attacked first and will corrode more readily than the uniform portion of the metal.

Carbonic acid, either free or combined, is one of the potent factors in accomplishing corrosion in most boilers. It is present in practically all natural waters and being quite soluble, particularly in the cold, it enters the boiler in nearly all feed waters. Waters containing magnesium sulphate and sodium chloride give the same corrosive properties. All of the nitrates found in natural waters behave in the same manner and when the concentration is sufficient are very corrosive. The nitrates are especially active because in the process of corrosion the original nitrate is regenerated or converted to nitrate. While the nitrates and chlorides can be converted to their sodium salts by treatment and by carrying an excess alkalinity the corrosive effect reduced, experience shows that waters containing high chlorides or nitrates are unsatisfactory on account of their corrosive properties even when treated.

Enough has been said here to give some idea of the range of the problem of water treatment for locomotives. It has been pointed out that the water should be studied from the source of supply to the engine washout. One man should follow these problems from beginning to end and should not at any stage turn them over to be handled by another person or department. I believe that the greatest success can only be obtained in railroad water treatment when the responsibility for the entire problem is centered in a single department. This might be accomplished by handling the problem in one of the existing departments of normal railway operation, but this does not seem to me to be advisable.

National Rivers and Harbors Congress

Declaration of Principles to Promote and Increase Facilities of Transportation by Water

THE FIFTEENTH CONVENTION of the National Rivers and Harbors Congress closed its final session at Washington on December 11 with the election of new officers and the transaction of other business. Congressman John A. Small of North Carolina was unanimously elected president to succeed Senator Joseph E. Ransdell of Louisiana, who was made a director for life.

The most important business transacted was the resolution adopted embodying the principles of the organization in its activities to promote and increase the facilities of transportation by water. The resolution was in part as follows:

"The industrial fabric of the country depends upon production and distribution. While these two factors may vary from time to time as the demand increases or diminishes, still the continued growth of the country creates an ever-increasing demand upon the facilities of both production and distribution. At this particular juncture there is a dearth of both. Economists are reiterating the need of greater production whereby the supply may be augmented and the cost of living reduced. From many sections come complaints of inadequate facilities of transportation by rail. Freight cars and engines are either not available or shortage is reported. Even where coal mines are operated there are frequently no cars to move the coal. Embargoes caused by congestion of traffic are frequently announced. The country requires enlarged production and at the same time increased facilities of distribution.

"Distribution may only be accomplished through the facilities of transportation. These agencies are the waterways, the railways and the highways. While this organization is committed primarily to the promotion of transportation by water, it can best effectuate its purpose through a friendly co-operation both with the railways and the highways. We would have the public deal fairly with the owners of the railroads and their securities. While they should be compelled to render equality of service without discrimination against any shipper or section, they should receive a revenue yielding a fair return upon the investment. We observe with gratification the nation-wide activity in the construction of improved highways by the states and local agencies, and we anticipate co-operation with the federal government in the construction of national highways connecting the several states and sections.

"At the same time it is an admitted fact that the railroads and the highways combined are not adequate to meet the demands of distribution. It is a problem in which is involved the continued prosperity of the country. Its wise solution should arrest the attention of every thoughtful citizen.

"Of course the carrying capacity of the railroads may be increased. Double tracks may replace single tracks, rolling stock and engines might be supplied, enlarged terminals insuring quicker movement might be provided, and new lines of roads might be constructed. But all these extensions require very large amounts of new capital and the railroads have neither the revenue nor the credit to obtain the same.

"It is apparent that increased facilities of transportation to meet the ever-enlarging demands of distribution can only be provided through the improvement and utilization of our waterways.

"We would have it understood that the Congress favors only the improvement of such waterways as will be utilized when an adequate channel is provided. Navigable waterways are intended primarily for commerce, and the expenditure of public moneys can only be justified when they are to be used for this purpose. The improved waterway which only offers potential use and thereby coerces lower rates by rail competition with such waterway does not justify its improvement. In this connection, we commend the policy of Congress in the enactment of annual river and harbor bills. This should be considered one of the continuous activities of the government requiring annual budgets and appropriations just as any other essential activity. We commend to the favorable consideration of the federal Congress the wisdom of largely increased appropriations for projects which have been or may hereafter be adopted, to the end that they may be completed and opened to traffic within a reasonable time.

"It has been said that Congress has improved some waterways which have not been utilized, and most of the criticism heretofore directed against river and harbor appropriations have been predicated upon this statement. We may admit that a few waterways have little commerce and have not justified the expenditures for their improvement. We may further admit that some waterways are not adequately used in moving traffic which should ordinarily be carried by water. While the tonnage carried upon the waterways of the country is very large in the aggregate, it may be much greater. It will be interesting to inquire why this condition exists. It is not because of lack of traffic or because the waterways are not needed.

It is not because the railroads are sufficient to meet the traffic demands of the country. It is not because traffic can be moved more efficiently and cheaper than by water. On the other hand, it is because of certain arbitrary conditions which exist and because certain essentials for successful water transportation are lacking.

"a. For many years water carriers were subjected to unfair competition and treatment by competing railroads. Competitive rail rates were unduly reduced. Unfair discrimination was practiced. The boat lines were purchased by the competing railroad and operated in an inefficient manner and finally abandoned. In other and devious ways water competition was destroyed. As a co-ordinate agency of transportation, boat lines are entitled to co-operation and not destruction. We recommend legislation which will assure a readjustment of rail rates, competitive with waterways, and which will require a discontinuance of such unfair practices.

"b. Water carriers have not been permitted to interchange traffic with connecting railroads with through rates and bills of lading. It will be admitted that the system of pro-rating which prevails between the different lines of railroads has been the most potential factor in our system of rail transportation. The cost of movement by water, particularly of bulky products, is less than by rail. Where products are to be carried partly by water and partly by rail between the points of origin and destination the public should have the benefit of the cheaper movement by water in making the joint and proportional rate between the rail and water lines. The amendment to the Commerce Act of 1912 gave the Interstate Commerce Commission jurisdiction to establish interchange of traffic between rail and water lines which has not been effectively enforced. We recommend legislation which will compel such interchange of traffic in all cases where the interests of the shippers will be subserved.

"c. Another amendment to the Commerce Act of 1912,

prohibited the railroads from owning and operating competing boat lines, giving the Interstate Commerce Commission jurisdiction to determine the fact of competition and also a discretion to suspend temporarily the enforcement of the law for sufficient reasons. We submit that this provision of law was wise, and it should not be amended or relaxed. Transportation by water and rail are so essentially different that they should not be held under common ownership where they compete with one another. We respectfully request the federal Congress to resist any efforts to amend the existing law as applicable to any section of the country.

"d. Water terminals are essential to water transportation. Even where the traffic is local and exclusively by water, terminals are most convenient, but they are absolutely essential in the operation of through traffic partly by rail and partly by water. The transfer between the boat and the rail carrier should be effected in the cheapest and most expeditious manner and this can be accomplished only through the medium of an adequate water terminal. At the present time the construction of terminals devolves either upon the boat line and the railroad, separately or combined, or upon the municipality. We submit that ordinarily the construction of such a terminal should be at the expense of the state or municipality, to be maintained and regulated in the interests of the public. We cannot emphasize too strongly the necessity of such terminals. No progressive city located upon a navigable waterway can afford to neglect this imperative obligation.

"e. Another reason why some waterways are inadequately utilized lies in the lack of an intelligent comprehension upon the part of the shippers of the importance of developing water transportation as a co-ordinate part of any transportation system. Frequently the men who control production and distribution are lacking in vision. They accept existing facilities for transportation with all its imperfections and fail to realize that co-operative efforts for the use of the waterways would supply existing edficiencies of movement.

"f. In so far as legislation will remove the arbitrary conditions which have impeded water transportation, we submit that the bills pending in Congress providing for the restoration of railroads to their owners afford an unusual opportunity for removing these impediments and for emancipating water carriers.

"There should be some federal agency clothed at least with recommendatory powers over water transportation. This activity requires not only boat lines, terminals, arrangements for interchange of traffic with railroads and other boat lines, but skilled traffic management. It may not be easy to secure all these essentials within the territory traversed by the boat lines. They need encouragement, assistance and advice. Among all the varied activities of the federal government there is no one to whom the projectors of boat lines can appeal for such expert advice and assistance. We recommend legislation creating a federal agency, qualified to advise as to the appropriate type of boats, as to the location, plans and costs of water terminals, which shall intervene in establishing exchange of traffic with railroads and in other ways assist in the solution of difficult problems. We believe that such a duty should be imposed upon the Department of Commerce and we recommend legislation to that end.

"Under the railroad control bill, the President was authorized in his discretion to utilize canals and waterways and to construct boats and barges for operation on same. Under this authority the President, through the director general of railroads, has constructed or authorized the construction and operation of boats upon the Mississippi river, the Warrior system of rivers, the New York Barge Canal and other waterways. As a part of the pending legislation for the return of railroads to their owners, we recommend that provision be made for the transfer of such boat lines to some other agency of the government, with authority to operate the same for a term of years, to complete all unfulfilled contracts for the construction of boats and to build other boats where necessary, to the end that the experiment which was initiated shall be continued sufficiently long to demonstrate its value and establish traffic upon the said waterways. If it shall appear advisable to discontinue the operation of such boats upon the New York Barge Canals, the sale of such boats and the discontinuance of operation upon such waterways should be effected. We believe that such transfer of authority should be made to the United States Shipping Board or the Department of Commerce.

"The president of this organization several months ago invited a Committee of its members to meet in Washington to consider proposed amendments to the pending railroad bills in the interest of water transportation. Amendments in accordance with the foregoing recommendations were provided and Senator Ransdell was instructed to present same to the Senate Committee while Representative Small was selected to present same to the House committee. This was done and such amendments were printed. Among other amendments was one providing that the absorption by water carrier of the switching terminal or other charge of a rail carrier for service within the limits of a port terminal should not be held to constitute an arrangement for a continuous carriage within the meaning of the act to regulate commerce and should not subject such water carriers to the provisions of such act. We also commend this amendment to the existing law.

"Out of the exigencies of war arose a necessity for creation by the federal government of a large number of ships for over-seas service. At the beginning of the war, less than 10 per cent of our foreign trade was carried in ships of American registry and sailing under the American flag. The government has provided a sufficient number of ships to carry a large proportion of our foreign commerce. We anticipate hopefully the establishment under permanent conditions of an American merchant marine. Whether these ships shall be temporarily held and operated by the government or sold for private operation, we submit that the foundations should be securely laid for the retention and maintenance of a permanent American merchant marine.

"We submit that neither the Interstate Commerce Commission nor any other department of the government should have jurisdiction over port-to-port rates by water, except insofar as may be necessary in effecting interchange of traffic between rail lines and water lines, and we oppose any legislation which seeks to conserve such jurisdiction."

Scenes on the Government's Alaska Railroad. Looking North from Near Mile 99, Turnacain Arm

Reduction in Passenger Train Service

Coal Shortage Forced Railroad Administration to Take Drastic Steps; Orders Have Been Modified

THE UNITED STATES Railroad Administration, having the responsibility of the distribution of coal to all consumers, ordered the regional directors to make a reduction in passenger train mileage by taking off parlor cars and otherwise curtailing service to the extent necessary to make a drastic reduction in the consumption of coal. These reductions in passenger service which the regional directors authorized became effective about December 10, but by Saturday, December 13, the resumption of work by the coal miners was complete enough to permit a modification of the drastice annulment orders, and in the East by Monday, December 15, there had been a return almost to normal service, although the Twentieth Century Limited and the Broadway Limited, the two twenty-hour trains between New York and Chicago, were not restored. Sleeping cars to points south of Washington were again run on the Pennsylvania out of New York. As indicative of the extent of resumption of normal passenger business the New York, New Haven & Hartford, which discontinued a total of 182 trains, restored 72. The New York Central restored 130 trains. The Delaware, Lackawanna & Western announced full restoration of passenger service. As indicative, however, of what can be done on American railroads to meet an emergency, the details of what was done last week are of interest.

Eastern Region

In the Eastern region the discontinuance of trains became effective December 10. The New York Central discontinued ten westbound main line trains, including the Twentieth Century Limited, and nine eastbound main line trains. On the Hudson division five trains each way were discontinued on week days and seven northbound and four southbound trains were discontinued on Sundays. On the Troy and Schenectady branch all Sunday trains were discontinued. On the Auburn division two trains each way on week days were discontinued. On the Buffalo division four trains each way were discontinued. On the Buffalo and Lockport branch one train each way was discontinued. On the Harlem division seven trains each way on week days were discontinued and nine trains each way were discontinued on Sundays. On the Putnam division three trains on the main line northbound and two on the main line southbound were discontinued, and five each way week days on the Yonkers branch. On Sundays two trains each way were discontinued on the main line, and all service on the Yonkers branch was discontinued. On the Ontario division, St. Lawrence division, Cape Vincent branch, Carthage & Adirondack branch, Carthage and Watertown branch, and Ogdensburg & DeKalb branch a total of 12 trains were discontinued, making a total of 121 trains for the New York Central.

The New York, New Haven & Hartford discontinued two trains each way between New York and Boston and operated No. 50 and 51, a train heretofore running between New York and Boston only, between New York and Springfield. There were 13 trains eliminated between New York and New Haven in addition to the New York and Boston trains mentioned above and four New Haven and Springfield trains. Two trains were eliminated between New Haven and Willimantic, four between Amston and Colchester, two between Vernon and Rockville, two between South Norwalk and Danbury, three between Bridgeport and Pittsfield, four between Branchville and Ridgefield, three between Danbury and Brookfield Junction, four week-day trains and four Sunday trains between New Haven and Waterbury, four Sunday trains between Hartford and Waterbury, two Sunday trains between Hartford and Putnam, two trains between Hartford and Poughkeepsie, and two trains between Poughkeepsie and Beacon, and one Saturday and one Sunday train between New York and Pittsfield.

On the lines east of New London and Willimantic on the New York, New Haven & Hartford, 4 round-trip week-day trains and 3 round-trip Sunday trains between Boston and Providence, 2 round-trip week-day trains between Canton Junction and Taunton, one round-trip week-day train between Boston and Providence, 3 round-trip week-day and 3 round-trip Sunday trains between Boston and New Bedford, 2 round-trip daily trains between Boston and Dedham, 2 round-trip daily trains between Boston and Franklin, one week-day and 2 Sunday trains between Boston and Woonsocket, one round-trip daily train on the Needham branch, 5 one-way trains between Boston and South Braintree, 2 round-trip daily trains between Boston and Mattapan, 4 round-trip daily trains between Boston and Greenbush, 2 round-trip trains between Boston and Plymouth, one between North Abington and Hanover, 3 between Boston and Campello, 4 week-day round-trip trains and 5 Sunday round-trip trains between Providence and Worcester, one round-trip daily train between Providence and Willimantic, 2 Sunday round-trip trains and one week-day round-trip train between Providence and Taunton, one week-day round-trip train between Mansfield and Framingham, 2 between New London and Worcester, and one Sunday round-trip train between Putnam and Hartford were discontinued.

Allegheny Region

The following is a statement of the trains and train mileage discontinued in the Allegheny region:

Statement of curtailment of passenger train service, effective 12.01 A. M. December 10, 1919, account coal strike:

Pennsylvania Railroad, Eastern Lines—	Trains	Miles	Miles
Through Service—			
East and West	6	1,457	
New York, Philadelphia and Washington	12	2,530	
Washington-Buffalo	2	756	
Total			4,743
Local Service—			
Western Pennsylvania Division		1,328	
Northern Division		560

Buffalo & Susquehanna Railroad—2 trains	17
Grand total—mileage	123,955

Southern Region

In the Southern region the details of passenger train reduction were not completed up to the time this paper went to press but the reduction was to have been between 20 and 25 per cent.

Sleeping cars on the Pennsylvania from New York for points south of Washington were discontinued, but were put back in service on December 13.

What Was Done in the West

The coal shortage in the West was, of course, far more acute than in the East. The following tables show the reduction in train service which was put in effect in the Central Western region and on certain lines in the Southwest:

30-33	Little Rock-Hoxie	238.8	
	No. 6 and No. 3 to make local stops between Little Rock and Hoxie.		
105-106	Coffeyville-Little Rock	655.2	
141-142	Little Rock-Spadra	210.0	
143-144	Russellville-Ft. Smith	166.58	
147-144	Little Rock-Epps	368.4	
810-805-804-809	Monroe-Vidalia	244.4	
831-830	Memphis-McGehee	335.8	
231-232	Batesville-Newport	58.6	
849-848	Luna-Crossett	100.6	
304-307	Helena-Poplar Bluff	346.0	
431-434	Cairo-Poplar Bluff	147.8	
			5,387.98
			10,014.82

PASSENGER TRAIN SERVICE CURTAILMENT PROGRAM, MISSOURI, KANSAS & TEXAS LINES.

Effective 12:01 *A. M., Monday, December* 8, 1919.

Main Line Passenger Service to Be Discontinued as Follows:

Trains No. 7, 8, 9 and 10 between St. Louis and Parsons.

Note: For Train No. 9 substitute daily express, St. Louis to Parsons to connect with Train No. 11.

CENTRAL WESTERN REGION

	Reduction		42.9%
	Grand Total mileage—passenger train service using coal as fuel	6,142	
	Total Reduction, both lines	2,113	or 34.4%

On the Kansas City Southern the total daily mileage of coal-burning passenger locomotives was 1,924. No trains were taken off, but 676 train miles per day were saved by the use of oil-burning instead of coal-burning locomotives.

On the Texas & Pacific 984 train miles daily were handled by coal-burning locomotives. A round-trip train between Texarkana and Whitesboro was discontinued, saving 346 miles, but it was planned to restore these trains as soon as oil-burning locomotives could be used in place of coal-burning locomotives.

In all, in the Southwestern region, about 30,471 passenger train miles daily were eliminated, amounting to a saving of 1,500 tons of coal a day.

Northwestern Region

Details of the discontinuance of trains throughout the Northwest region are incomplete, but a daily saving of train mileage was made as follows:

Railroad	Miles
Chicago, Minneapolis & St. Paul	12,071
Duluth, Missabe & Northern	9,720
Duluth & Iron Range	9,570
Duluth, South Shore & Atlantic	1,348
Minneapolis & St. Louis	1,100
Minneapolis, St. Paul & Sious San Marie	(approximately) 2,000
Northern Pacific	500 to 600

A New Grip for a Pneumatic Hammer

THE BOYERGRIP is a device recently brought out by the Chicago Pneumatic Tool Company, Chicago, which combines a convenient hammer grip with an absolutely safe set retainer. As shown in the illustration, it fits over the end of the riveting hammer and enables the operator to secure a firm grip without grasping the heated cylinder. This arrangement makes the operation of the hammer more convenient and allows the workman to drive hot rivets without danger of burning his hands. The device also provides an unobstructed view of the work from all angles. The Boyergrip is made of steel and is practically indestructible. A modified form has also been placed on the market, which is adapted for use on chipping and calking tools.

The Device and Manner of Using It

"LENDING" CARS AND ENGINES.—Would you loan your automobile to a friend and would your friend loan his to you? You would have to be pretty good friends to loan an automobile, because automobiles cost money. Switch engines cost lots of money. Your employer has spent nearly $60,000 for the switch engine he loans you to work with and it is costing him about twenty cents a minute to operate this switch engine. These figures include coal, water, sand, repair parts, wages of shop employees, wages of yard and engine crews and depreciation. It costs our employer not less than $96 to operate a switch engine eight hours. Are you getting $96 worth of work out of this engine and are you getting more than $96 worth of work out of it so that your employer can make money out of the labor you are selling him?—*Duit Wright.*

General News Department

R. M. Calkins, vice-president of the Chicago, Milwaukee & St. Paul Railway Company, has resigned from the standing committee of the Association of Railway Executives, and H. E. Byram, president of that road, has been elected to succeed him.

The Surgical Association of the Minneapolis, St. Paul & Sault Ste. Marie held its twelfth annual meeting at the Radisson Hotel, Minneapolis, Minn., on December 8 and 9, with about 100 of the 176 surgeons of the road present. The officers elected for the ensuing year are: President, Eric P. Quain, Bismarck, N. D.; vice-president, Earnest V. Smith, Fond du Lac, Wis.; secretary-treasurer, John H. Rishmiller, Minneapolis, Minn.

The city of Detroit, Mich., will sell to the Pennsylvania (Railroad) Company a tract of land 30 ft. by 30 ft. at the foot of 24th street. This action was taken recently by the city council, and the land is part of a ten-acre tract which the city has condemned for use as a warehouse for waterborne freight. The city had made an informal agreement to sell this land at the price which it costs, and the amount to be paid by the railroad will be $28,785.

Livestock found running at large on or around railways ought to be impounded. This is the suggestion of the Railway Association of Canada as a means of reducing loss and as a measure of safety to the passengers and trainmen. It is recommended that the railways notify the officers of municipalities, wherein trouble of the kind mentioned is experienced, that the suggested action is contemplated and that the co-operation of such officers is desired. Where there are no pounds the Association suggests that arrangements be made for their establishment.

J. Parke Channing, chairman of Engineering Council, has issued a circular to professional engineers and engineering assistants throughout the United States calling for personal contributions for the maintenance of Engineering Council for the calendar year 1920. The circular states that the increased cost of services and printing are absorbing the Council's income and causing deficits. For the calendar year 1919, member societies have been able to provide $25,000. Including the cost of the National Service Committee's head quarters in Washington, the Council will need not less than $50,000 for the calendar year 1920.

The Chief of Transportation Service of the United States Army, Brig. Gen. Frank T. Hines, recommends the centralization of all matters of military transportation into one service under the War Department. Speaking, in his annual report, of the Motor Transport Corps, he says that it is an independent agency of transportation; and the control of military railroads in the theater of operations is a matter under the control of the chief of engineers. He believes that economy in administration, efficiency in operation, and greater co-ordination justify all transportation for the War Department being combined into one service.

Dr. Charles W. Eliot, summarizing his experiences during his three weeks at the industrial conferences at Washington, tells his Boston friends that the only industrial peace that can be expected from the American Federation of Labor and the railroad brotherhoods is the peace of absolute domination of industry and of the government itself. Speaking before the Economic Club, he characterized the time he spent at the conference as "three unhappy weeks." From the first, he said, the conference was doomed to death as a thing futile and a waste of time. At no time, he added, was any serious effort made to consider the original objective President Wilson set as the goal of the discussions.

The burning of worn-out ties without warming anyone, is the subject of complaints which have been received by the Railway Association of Canada. A circular has been issued by the Association noting these complaints and referring to the existing shortage of fuel. The complainants have been informed that the railways would be glad to give surplus old ties to people who want them, and thereby alleviate the fuel shortage to some extent, provided this can be done without expense to the railways. The Association further suggests that where surplus worn-out ties are available the railways give to notice to municipal officers.

The Bay Point & Clayton has reached a compromise with the Oakland, Antioch & Eastern in proceedings brought by the former company to secure a right-of-way to the bay shore near Bay Point, Cal. As a result of this compromise both roads will use an overhead crossing over the county highway near Bay Point. A petition for authority to build the crossing was filed with the Railroad Commission of California recently. The compromise with the Oakland, Antioch & Eastern will provide passenger transportation facilities to employees of the Bay Point shipyards residing in Clyde and other communities on the Oakland, Antioch & Eastern. The Bay Point & Clayton is used principally to haul cement made at Cowell, Cal., and the bay terminus is needed to enable the company to ship by water from Bay Point. Water transportation is now very necessary because of the shortage of freight cars.

R. J. Clancy, assistant to the general manager of the Southern Pacific finds evidence that carelessness in crossing railroad tracks by occupants of automobiles is slowly yielding to the safety campaign conducted by the press, schools, churches and railroads. In a recent circular he says: "An analysis by months discloses no distinguishing relationship between climatic conditions and crossing accidents; accidents have occurred in like proportion during the summer and the winter months, so that whether curtains are up or down does not appear to matter much. The causes of these accidents appear to narrow down to misjudgment of speed of trains; minds of occupants being distracted by conversation; shifting gears and stalling on tracks; noise of machine interfering with hearing locomotive whistle, or bell or noise of train; inexperience of driver; not looking until about on the track, and inability to stop on account of speed * * *."

Senator Jones introduced in Congress on December 10 a bill to amend the Cummins railroad bill so as to forbid the practice of Canadian lines of cutting rates on bonded freight moving between the East and West and interior points. He would make it unlawful for any United States carrier or carriers by rail or water to participate in the international transportation of passengers or property where the through charge for such transportation, whether by rebate, by absorption of storage charges, wharfage charges, or any other charge or charges, or in any manner whatsoever is less than the through charge by combination of rates between such points on file with the Interstate Commerce Commission or the Shipping Board or the Interstate Commerce Commission and the Shipping Board, applying at such time for like transportation by United States carriers by rail or water or by rail and water. Advocates of this bill point out that "while American transcontinental lines are in dire straits as to finances, so that Congress is called on to bolster them financially, the Canadian Pacific, one of the principal offenders, is paying dividends at the rate of 10 per cent per annum, and its stock is selling in the market around $150 per share. By getting this domestic freight this Canadian road is having practically a balanced traffic, while 45 per cent of the west-

bound car movement on the transcontinental roads of the United States consists of empty cars. In the Alaska trade the inroads of the foreign railroad-owned water carriers operating to a small, but productive part of Alaska, have created a very difficult transportation problem for Alaska as a whole, particularly western and central Alaska, and it is declared that Alaska may be robbed of its American service unless it is protected against the foreign carrier.

A Condensed View

Neither the Cummins bill in the Senate nor the Esch bill in the House is satisfying everybody; in fact, they are satisfying nobody. The final legislation will probably be a mixture of the provisions of both bills. Labor is committed to the Plumb plan so that it is not to be expected that it will accept the more conservative measures. It will not take kindly to legislation forbidding strikes, nor is it enthusiastic over the elaborate machinery provided in the Esch bill. In short, labor desires to be left alone to do as it pleases, according to its own sweet will, and does not favor legislation of any character unless it be of the negative variety, exempting it from provisions of law which apply to the rest of the community. . . .—*New York Commercial.*

Chicago Monuments

The plans for the reconstruction of Chicago's Harbor District, the electrification of the Illinois Central and the Michigan Central Railroads and the construction of new terminal facilities by the Illinois Central on the lake front will necessitate the removal of several historical monuments in the city of Chicago which mark the sites of events in Chicago's early history. The monument at Eighteenth street and Prairie avenue, which marks the site of the Fort Dearborn Massacre and which was presented to the city by George M. Pullman, is among the land marks which must be moved. One of the connections to the new terminal is to cut through the spot where the monument now stands. The Chicago Historical society, the Chicago Plan Commission and other organizations interested in preserving the city's works of art are considering new sites for these land marks. It is planned among other things to dedicate the new ornamental bridges which are to be a part of the improvement to the memory of the early explorers—Joliet, La Salle, Pere Marquette and others.

Culvert Pipe Committee

The Joint Concrete Culvert Pipe Committee, the organization of which was mentioned some months ago, has issued a progress report including a statement of the complete membership, which is as follows: American Concrete Institute, B. S. Pease, American Steel & Wire Company, Chicago, and A. B. Cohen, Delaware, Lackawanna & Western, Hoboken, N. J.; American Association of State Highway Officials, T. R. Agg, Iowa State College, Ames, Iowa, and J. N. Mackall, Maryland State Roads Commission, Baltimore, Md.; American Railway Engineering Association, Job Tuthill, chief engineer, Pere Marquette, Detroit, Mich., and A. F. Robinson, bridge engineer, Atchison, Topeka & Santa Fe, Chicago; American Society for Testing Materials, H. T. Shelley, assistant engineer, sewer construction, Department of Public Works, Philadelphia, Pa., and A. E. Phillips, sanitary engineer, Washington, D. C.; American Society of Civil Engineers, George H. Tinker, bridge engineer, New York, Chicago & St. Louis, Cleveland, Ohio, and T. L. D. Hadwen, engineer of masonry construction, Chicago, Milwaukee & St. Paul, Chicago; American Concrete Pipe Association, Paul Kircher, Massey Concrete Products Corporation, New York, and C. F. Buente, Concrete Products Company of America, Pittsburgh, Pa.; Office of Public Roads, T. H. MacDonald, and A. T. Goldbeck, Office of Public Roads, Department of Agriculture, Washington, D. C. A sub-committee of this association held a meeting at Ames, Iowa, to witness tests made at the Experiment Station of the Iowa State College in conjunction with the Iowa State Highway Commission.

Traffic News

The report of overseas traffic for the week ended December 3 shows 6,648 cars of commercial export freight received at North Atlantic ports during this period as compared with 998 cars for the same week of 1918, an increase of 5,650 cars or 565 per cent. At South Atlantic and Gulf ports as of December 1, 1919, there were 12,490 cars of export freight on hand, as against 11,589 on November 24, 1919, an increase of 901 cars. On December 3, 1919, there were stored in elevators at North Atlantic ports 12,895,824 bushels of grain. There were received during the week 3,082,662 bushels, while 4,793,806 bushels were cleared. The deliveries exceeded the receipts by 1,711,144 bushels. The total amount of grain in storage at these ports represented 65.4 per cent of the total elevator capacity. At South Atlantic and Gulf ports there were stored in elevators on December 3, 1919, 8,671,900 bushels of grain, representing 82.4 per cent of the total elevator capacity.

Exports of Cars in October

The exports of freight cars in October, numbering 4,319, of a value of $9,179,902, were more than double those of September and have been exceeded during but one month so far this year, June, during which 5,055 cars valued at $13,675,186, were exported. The detailed figures for passenger and freight cars exported in October as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce were as follows:

	Passenger		Freight and other	
Countries	Number		Number	
France	..	.....	2,651	$6,222,843
Italy	..	.....	930	1,780,450
Canada	5	$13,950	4	5,510
Mexico	..	.....	31	27,962
Cuba	..	.....	173	197,722
Dominican Republic	..	.....	9	12,000
Brazil	..	.....	135	242,595
China	..	.....	56	142,800
Russia in Asia	..	.....	324	530,800
Australia	..	.....	6	17,220
Total	5	$13,950	4,319	$9,179,902

The Pittsburgh Basing Point System

Hearings before the Federal Trade Commission on the application for abolition of the Pittsburgh single price basing point system were held in Washington on December 1, 3, 5 and 6. John S. Miller, general counsel for the complaining fabricators, declared that the consuming public is taxed $30,000,000 a year through increased prices of manufactured steel products because of the Pittsburgh base system under which rolled steel is sold throughout the United States at the Pittsburgh ruling price plus freight from Pittsburgh to destination. He pointed out that steel rails and rail joints are sold throughout the country at f. o. b. mill prices, whereas other rolled steel products follow the Pittsburgh base price.

Miller produced figures to show that freight rates on a large number of finished steel products are identical with rates on rolled steel. Thus, he said, Eastern fabricators purchasing at Pittsburgh are enabled to place finished products in the Chicago market on a parity with the finished products of competing fabricators in the Chicago district who, while buying of Chicago producers, pay the "fictitious" freight from Pittsburgh. He declared that the Gary producing mills were only operating at 65 per cent capacity prior to the strike.

Miller said those supporting the Pittsburgh base system are "all either producers or beneficiaries of the system." Pittsburgh fabricators, he said, "are to be found supporting the system on which they feed fat." Included among the complaining interests, he pointed out, are the War and Navy Departments, the United States Railroad Administration, and state, municipal and civic organization, as well as steel consumers.

The system was defended by R. V. Lindabury, general counsel for the United States Steel Corporation. He said that any government order interfering with the Pittsburgh base system would

"shackle competition and create an artificial situation," and that "the system which exists is due to the operation of natural laws and the free play of competition." The primacy is with Pittsburgh because of Pittsburgh's predominance in production, and by the operation of natural trade laws Pittsburgh dominates steel prices. Chicago, he said, "will become, primate in steel production in the United States before very long if the operation of natural law is not interfered with. Chicago now produces but 19 per cent of the steel output and only one half of the requirements of the Chicago district. If Chicago producers can only supply one half of the Chicago demand, Pittsburgh, being required to supply the other half, necessarily dominates the price, because there would be no advantage to the Chicago producers in selling at less than the Pittsburgh price when they could not profit by any extra demand so created. Therefore, they naturally sell at what they can get, which is up to the Pittsburgh level."

Abolition of the Pittsburgh base, Mr. Lindabury declared, would prevent the establishment of steel plants in new territory. "There wouldn't be another steel mill established anywhere in the west," he declared. He argued that the discrimination prohibited by the Clayton act, "is not the discrimination resulting from natural laws of trade," and that, therefore, there is no element of discrimination in the Pittsburgh base system.

On Friday, Frank H. Scott, representing the Steel & Tube Company of America, testified. He declared that the 6,000,000 tons produced in the Chicago district could not possibly supply the demand of that district. You can't force investors to supply the extra mills needed to meet Western requirements by governmental edict.

L. A. Manchester representing the Youngstown Sheet & Tube Company, described the Pittsburgh base as being "a unit of measuring prices" and likened it in general to the standards of weight and measures.

C. W. Wickersham, representing the Lackawanna Steel Company, denied the commission's jurisdiction, stating that the basing point system is not a method of competition and is not a practice as between two competitors.

James Bowron, Birmingham, president of the Gulf State Steel Company, spoke against the application to abolish the system, as did Paul Cravath, representing the Bethlehem Steel Corporation.

On Saturday, John S. Miller, in closing rebuttal, declared that the Pittsburgh base price is maintained "by a meeting of minds that is tantamount to agreement." He said the producers were "all taken care of" by the Pittsburgh price and that is was a "happy family." Countering the claim that Pittsburgh dominates because of its excess production, he declared that both the Duluth and Birmingham districts produce in excess of the requirements of their respective territories, but still adhere to the Pittsburgh base price.

John Walsh, counsel for the Petroleum Steel Company, of Sharon, Pa., fabricator of steel tanks, declared that the "entire issue is whether the Pittsburgh base system tends to lesson competition or to create a monopoly." He declared it did not. He said that if the system were abolished, the Petroleum Steel Company "would either have to quit producing at Sharon and locate westward, or operate in both sections."

Anthracite Shipments for November

The shipments of anthracite for November as reported to the Anthracite Bureau of Information, amounted to 5,971,671 gross tons, as compared with 5,276,659 tons for the same month last year, an increase of 695,012 tons, and with 6,560,150 tons with October of this year, a decrease of 588,479 tons. The decrease as compared with the preceding month was due to the fewer working days, there being only 21 full working days. The average daily shipments were 284,365 tons for November, against 262,406 tons for October. The shipments by railroads were as follows:

	November, 1919	November, 1916	Coal year, 1919-1920	Coal year, 1916-1917
P. & R.	1,358,643	1,200,814	9,298,481	8,383,663
L. V.	1,079,266	1,082,453	8,631,660	8,074,729
C. R. R. of N. J.	506,737	546,348	4,291,891	4,254,101
D. L. & W.	860,356	979,607	7,202,048	6,921,568
D. & H. Co.	663,782	628,239	5,394,387	4,776,686
Penna.	406,606	438,869	3,333,221	3,665,338

	5,971,671	5,992,997	46,971,921	44,085,610

Commission and Court News

State Commissions

The Railroad Commission of Kentucky now consists of J. Sherman Cooper (chairman), Frank N. Burns and E. C. Kash. The new commissioners entered upon the duties of their office on December 9, taking the places of L. B. Finn, S. T. Douthitt and H. G. Garrett.

Court News

Injury to Passengers—Proof of Negligence

Where the petition of a passenger on the defendant's train averred that a vestibule door was negligently left open, and that as a result of a sudden jar or jolt he was thrown from the car platform onto the tracks, the Missouri Supreme Court holds that proof of the concurring acts of negligence is essential to recovery.—Giles v. Michigan Central (Mo.) 212 S. W. 873.

Recovery From Shipper—Bill of Lading Issued by Mistake

The Maryland Court of Appeals holds that a carrier which signs three bills of lading for three cars, made out by the shipper, but receives only two carloads, and is forced to reimburse a party advancing money on the third bill of lading, may recover the amount so paid from the shipper.—P. B. & W. v. Roberts (Md.) 106 Atl. 615.

Crossing Accident—Contributory Negligence

The Michigan Supreme Court holds that where the driver of an automobile running 10 miles an hour had an unobstructed view while the defendant's on-coming train, running 40 miles an hour, was traversing 225 feet before it reached the crossing, and he failed to look and apply the brakes in time to prevent a collision, the railroad was entitled to a directed verdict.—Pershing v. D. G. H. & M. (Mich.) 172 N. W., 530.

Liability for Defects in Boiler

The Texas Court of Civil Appeals holds that under U. S. Comp. St. § 8631, making it unlawful to use a locomotive in moving interstate traffic unless the boiler and appurtenances are in proper condition, the receivers of a railroad are liable to the widow of a locomotive engineer killed by a boiler explosion due to a defect in the bolts and stays designed to sustain the crown sheet.—Lancaster v. Carroll (Tex.) 211 S. W. 797.

Pullman Car Facilities

The Oklahoma Supreme Court holds that the Oklahoma Corporation Commission is vested with authority to require all reasonable and proper facilities to be furnished by a railroad company, such as Pullman cars, and the fact that an order of the commission requiring such facilities may incidentally affect interstate commerce does not render the order a nullity; but where a railroad company has furnished all proper and reasonable facilities of the character required by the order, the commission has not the power to require the furnishing of additional facilities, where its order will interfere with interstate commerce, or where such additional service can only be furnished at a loss to the railroad company. What is or is not reasonable and adequate must be determined in the light of conditions existing at the time and in relation to all surrounding circumstances.—Atchison, T. & S. F. v. State (Okla.) 176 Pac. 393.

Garnishment of Salaries Under Federal Control

The Tennessee Supreme Court holds that the salary of an employee of a railroad corporation being operated by the federal government under the 1918 act is not subject to garnishment in Tennessee at least. The reason given is that under that act the railroads of the country are merely agencies or instrumentalities of the United States Government and it is the settled policy of the state to hold immune from garnishment all municipalities and other governmental agencies—Dickens v. Realty Co. (Tenn.) 210 S. W. 644.

Excessive Assessment of Railroad Franchise

In granting a railroad relief from an excessive assessment of its franchise, the Kentucky Court of Appeals holds that, under Ky. St. §§ 4079, 4080, the value of a railroad franchise subject to taxation will be determined by deducting from the value of the capital stock fixed by the board of valuation by capitalizing the net income derived from the business in the state, the assessed value of all its tangible property assessed in the state.—Bosworth v. Kentucky Highlands (Ky.) 210 S. W. 671.

Foreign Shipments—Freight Refund

The Texas Court of Civil Appeals holds that a shipment from Texas to France (in this case a shipment of cotton) is subject to the tariff, regulations and rules of the Interstate Commerce Commission. In such a case the carrier was not required to refund to the shipper the amount paid for freight from the points of origin to the point of concentration (Hillsboro, Tex.) under order of the Railroad Commission of Texas, though the goods had not been sold at the time of concentration:—St. Louis Southwestern v. White, Jackson & Co. (Tex.) 211 S. W. 315.

Safety Appliance Act—Buffers

In an action for injuries received in uncoupling a car the Kansas Supreme Court points out that there appears to be no federal decision or rule requiring buffers or bumpers on cars for the protection of brakemen in coupling or uncoupling cars.—George v. Atchison, T. & S. F. (Kan.) 178 Pac. 403.

Same—Sufficient Compliance with Act

The Oklahoma Supreme Court holds that where it is shown that a sufficient number of cars in a train have been equipped with power brakes, and the locomotive was equipped with power driving-wheel brakes and appliances for operating the train brake system, as required by the act, the mere fact that the air brake connections became uncoupled furnishes no proof whatever of a violation of the statute.—Rock Island v. Guthridge (Okla.) 179 Pac. 590.

Expert Evidence as to Space Required to Stop Train

The New Hampshire Supreme Court holds, in an action for damage to an automobile at a crossing, that it is not such a matter of common knowledge that a modern locomotive, running 25 miles an hour on a descending grade of one-fifth to one-half per cent, can be stopped in less than 30 rods, that counsel can argue or the jury decide it without any evidence. The only case found by the court where the precise question was passed upon was Union Pacific v. Shannon, 33 Kan. 446, 6 Pac. 564, where cattle were killed at a crossing. There the jury disregarded the undisputed testimony of the engineer that the train, going at 45 miles an hour, was stopped in about 300 yards, and that this was the quickest a train of that kind, going at that speed, could be stopped, and found without any evidence whatever that it could have been stopped in from 350 to 375 feet. This, it was held, they had no right to do, and that to determine how long it takes to stop an engine or train requires experience in the running of trains and in checking their speed. Verdict for the plaintiff was set aside and a new trial granted.—Chellis Realty Co. v. Boston & Maine (N. H.) 106 Atl. 742.

Foreign Railway News

Australian Firemen Want Increased Wages.—The engine drivers and firemen on the Australian Trans-Continental Railway, according to despatches, flouted the Arbitration Court and recently struck for increased wages.

Hungarian Railways to Be Handed to the British.—The Vossische Zeitung recently contained a report from Budapest that the Hungarian Cabinet and the British Commissioner had concluded an agreement stipulating that the whole Hungarian railway system will pass into British hands.

The Jugo-Slav government intends sometime in the near future to send an official commission to this country in the hope of raising a loan here to facilitate reconstruction, including building and repairing railways, etc. The idea of sending such a commission has been in hand for some time, but cablegrams from the American minister at Belgrade on December 2 indicated that the visit has been postponed for a few weeks.

Southern Nigeria Railroad Completed

It is announced that the railway in Southern Nigeria from Port Harcourt to the Udi coalfields has been completed, and that large quantities of coal are being obtained.

Standardization of Railways for Brazil

A commission has been appointed by the Minister of Communications and Public Works in Brazil to make a study and prepare a report for standardization on the State-owned railways. (Engineer).

Arica-La Paz Railroad Leased

Commerce Reports, issued by the Bureau of Foreign and Domestic Commerce, reports the receipt of a cablegram from La Paz, Bolivia, to the effect that the Arica-La Paz line, owned by the Chilean Government, has been leased by the Antofagasta & Bolivia Railway.

Demand for Machinery in Morocco

LONDON.

The London Times Trade Supplement says that there is an increasing demand for machinery in Morocco. The principal demand is for milling machinery, gas and petrol engines, and electric light plants. In 1913 France supplied 51 per cent, Germany 22 per cent and Great Britain 21 per cent of the total imports of machinery.

Proposed Sales of German Railways

A proposal to sell the German State Railways to the United States has recently been the subject of lively discussion in the German press. According to the Berlin correspondent of the National Tidende the proposal was put forward by a well-known financier in Germania, Herr Erzberger's principal organ, on the plea that all other attempts to obtain foreign credit had failed. The writer estimates the present calue of the railways as at least 90 to 100 billion marks.

Japan to Build Submarine Tunnel

Several months ago announcement was made that the Imperial Government Railways of Japan intended to build a tunnel under the Shimonoseki Strait. Two years are to be spent in studying the geological formation of the sea bed in the strait and in drafting of the general plan of work in preparation for the actual undertaking of tunneling, so that the real work will not commence until 1921. Engineers and

workmen will be sent to America and Europe to make a study of what has been achieved in these countries in the way of tunnel engineering. The line is to be 7 miles long, one mile of which will be entirely under the sea. The approximate cost of the undertaking will be about $10,000,000, and the work is expected to be completed in 1928.

Electrification of the Central of Brazil Railway

In accordance with recommendations from the director of the Central of Brazil Railway, says Commerce Reports, the Minister of Communications and Public Works of Brazil has named Hector Lyra da Silva as assistant technical engineer for the special work of undertaking the necessary studies for the electrification of the line from Barra do Pirahy. He has instructions to prepare the estimates and the tenders for public bids. Further details, continues Commerce Reports, may be obtained from the commercial attache at Rio de Janeiro. (Refer to file No. L. A. 21 for financial interests connected with project.)

Exports of Locomotives in October

The exports of locomotives during October, totaling 170, valued at $5,284,019, were the greatest for any month thus far in 1919, the best previous month being May, when 97 locomotives, valued at $4,040,551, were exported. Of the October exports nearly half were consigned to Italy. The detailed figures as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce were as follows:

Countries	Number	Dollars
Finland	15	375,000
France	1	4,100
Italy	75	2,372,000
Norway	12	405,754
Canada	1	13,500
Honduras	1	14,650
Mexico	1	35,000
Barbados	1	11,200
Cuba	9	151,392
Brazil	6	122,800
Peru	1	5,748
China	17	842,500
Japanese China	2	104,200
Chosen	3	129,500
British India	1	29,280
Straits Settlements	6	170,700
Japan	6	37,500
Russia in Asia	8	403,995
Australia	4	55,200
Total	170	5,284,019

Tunnel Project in Colombia

American contracting companies may be interested, says a recent issue of Commerce Reports, in bidding on a tunnel project on the Antioquia Railway, in Colombia. The tunnel, which is to extend through the La Quiebra Mountain, will be 3,760 meters, or approximately 12,250 feet in length, with the cost estimated by the department of Antioquia engineers at $2,000,000 gold. More recent information regarding developments can be secured through the American consular agent at Medellin, or the name of the engineer in charge may be obtained from the Bureau by referring to file No. 40802a. Correspondence with this official should be in Spanish and all figures in the metric system.

A 24-Hour Clock at Waterloo Station, London

Considerable interest is now being taken in England in the idea of timing trains on the 24-hour system. This method is general on the continent, and is regarded as having the important advantage of rendering more clear the actual arrival and departure times of trains. Difficulties with regard to a. m. and p. m. are altogether surmounted, and on long distance bookings it is a very simple matter to ascertain whether one will get to any point during the day or in the night. With this in mind a 24-hour clock has recently been installed at the Waterloo station of the London & South-Western, London, with a view to putting English "timings" into line with continental. The clock has the usual dial with Roman numerals, the figures 13 to 24 being placed in smaller Arabic numerals inside opposite their respective Roman numerals. Most of the time-tables of continental bookings now printed in England now use the 24-hour system.

Exports of Car Wheels and Axles in October

The exports of car wheels and axles during October totaled $962,351, as compared with a total of exports during September of $1,013,440. The detailed October figures as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce were as follows:

Countries	Dollars
Finland	366,460
France	290,133
Italy	102,785
Netherlands	1,785
Spain	2,750
Canada	12,267
Honduras	575
Mexico	16,739
Cuba	11,291
French West Indies	1,525
Dominican Republic	11
Argentina	4,347
Brazil	20,385
Chile	292
Colombia	179
Ecuador	488
Peru	8,583
Chosen	2,250
Dutch East Indies	11,935
Japan	86,805
Russia in Asia	19,600
Australia	908
New Zealand	246
Philippine Islands	12
Total	962,351

Wage Questions in Western Australia

A deputation representing the staff of the state-owned and state-controlled railways of Western Australia recently waited on the Minister of Railways to express what was described as "the unanimous desire of the railway employees" for a wages board for the adjustment of differences between the railway authorities and the staff.

The spokesman of the deputation stated that "the railwaymen were dissatisfied with the decision of the Arbitration Court (a legally constituted tribunal for the settlement of industrial disputes generally), and urged the creation of a board consisting of salaried railway service representatives, with an independent chairman." He urged the government, as the owners and controllers of the railways, to "take action before the men got out of hand and did something desperate." The Minister promised to appoint a committee to advise the government on the matter, and the deputation undertook to nominate a representative on the proposed committee.

The Institute of Transport

There has been formed in London a society, which bids fair to become prominent not only in England but throughout the world, called the Institute of Transport. As the name implies, it is to cover the entire field of transport, including railways, waterways, tramways and roads. It is supported by eminent persons well known in the transport field in England and is to start its career with none other than Sir Eric Geddes, the Minister of Transport, as its first president. For many years past suggestions for the formation of such a society have been made but no concerted action could be obtained towards the fruition of this idea. With the formation of the Ministry of Transport, however, by which the government took control of all transport facilities, a new impetus was given to the formation of this society.

At a luncheon given on November 3 by Sir Albert H. Stanley, the head of the London Underground Railway combine, to which were invited representative members of the Ministry of Transport, representatives of the railways, municipal tramways, company owned tramways and motor vehicles, passenger and goods transport undertakings, this institute was formed "to promote and encourage knowledge of the traffic science and of the art of transport in all its branches and the means and appliances connected therewith to provide facilities for the study of and the exchange of information on ideas of traffic problems and of means and methods of transport, and to raise the status of those engaged in

traffic and transport." Meetings are to be held between October and June of each year, presumably monthly, at which subjects on traffic and transport will be read and discussed.

In addition to this the institute is to provide for lectures, exhibitions of appliances or systems of transport, to compile and publish "the proceedings and reports of the institute or any paper, communications, works or treatises on traffic and transportation, to form a library of works relating to traffic and transport," etc.

Exports of Railway Track Material in October

The exports of steel rails during October totaled 43,730 tons, valued at $2,479,648; of spikes, 2,899,162 lb., valued at $130,941, and of switches, frogs, splice bars, etc., valued at $533,246. With the exception of the last figure these totals were not as great as those for September. The October figures in detail as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce were as follows:

Countries	Spike		Steel rails		Switches, frogs, splice bars etc
	Pounds	Dollars	Tons	Dollars	Dollars

Railway Construction in Africa

London.

The Times Trade Supplement says that the Portuguese Government's sanction has been obtained for the modification of the original concession for the construction of the Beira-Zambesi railway. This line will form a portion of a great trunk route, which will be an alternative means of travel to the Congo route, between Cape Town and Cairo. To complete this route it will be necessary to extend the Shire Highlands railway to the southern end of Lake Nyasa, the construction of a connecting line between Lakes Nyasa and Tanganyika and the building of the proposed Tabora-Mwansa branch of the Central Railway. All these lines it is expected will be commenced during the next decade. The number of changes from train to boat and vice versa will be 10 in both cases between Cape Town and Cairo. The new line will be about 170 miles long and will be owned and operated by a separate company which is to be known as the Trans-Zambezia Railway Company. It is hoped that the railway will be completed in about two years.

Railway Officers

Railroad Administration

Regional

Frank E. Clarity, whose appointment as transportation assistant to the regional director of the Central Western region was announced in the *Railway Age* Emergency Bulletin of November 6 (page 673), succeeding B. B. Greer, resigned, was born at Sauk Centre, Minn., on September 10, 1877. He entered railway service in September, 1894, as a car checker on the Great Northern at Superior, Wis., and later held various positions in the local freight offices of this road at Superior, Minn., and Duluth. From 1902 to 1904 he was car distributor for the Lake district of the same road and from November, 1904, to August, 1907, he was consecutively assistant chief clerk and chief clerk to the general superintendent of transportation, with headquarters at St. Paul, Minn. In 1907 he was appointed traveling car agent and in 1911 was made chief clerk to the general superintendent of the Western district, with office at Seattle, Wash., later being transferred to Spokane, Wash. In 1912 he was appointed inspector of transportation on the Denver & Rio Grande and in 1913 was promoted to superintendent of transportation. In 1917 he was promoted to assistant general manager of the Denver & Rio Grande, which position he held until July 1, 1918, when he was appointed transportation assistant to the regional director of the Central Western region.

Traffic

J. W. Karns, division passenger agent on the Pere Marquette, with headquarters at Detroit, Mich., has resigned and the position has been abolished.

F. A. Young, division passenger agent of the Pere Marquette, with headquarters at Saginaw, Mich., has been appointed to the newly created position of general agent of the passenger department with office at Detroit, Mich. **E. L. Niles** has been appointed to succeed Mr. Young at Saginaw.

A. C. Johnson, whose appointment as traffic manager of the Chicago & North Western, with headquarters at Chicago, was announced in the *Railway Age* of October 3 page 720 was born in 1861. He entered railway service in 1894 as a special agent of the Chicago & North Western. In March, 1899, he was appointed general agent with jurisdiction over the state of South Dakota and from February 1900, to May 1910, he was transferred to Winona, Minn., at the same time being general freight and passenger agent of the Pierre, Rapid City & Northwestern. From May 1, 1910, to May 26, 1916, he was passenger traffic manager of the North Western with headquarters at Chicago. In June, 1916, he was appointed general traffic manager with the same headquarters. In 1917 he became chairman of the Freight Traffic Committee of the Northwestern, Southwestern and Central Western regions, which position he held until his recent appointment.

Engineering and Rolling Stock

Carl Tombo, principal assistant valuation engineer of the Philadelphia & Reading and the Central of New Jersey with headquarters at Philadelphia, Pa., has resigned and taken up private practise of engineering in the West, with headquarters at Placerville, Cal.

T. M. Price, master mechanic of the Seaboard Air Line at Hamlet, N. C., has been transferred to the Virginia division, with headquarters at Raleigh, N. C., succeeding **F. L. Stockwell,** resigned; **G. W. Gilleland,** master mechanic of the East Carolina division at Andrews, N. C., has been appointed Mr. Price's successor and **J. B. Brown,** general foreman of the car department at Raleigh, N. C., has succeeded Mr. Gilleland.

The uses of the word credit in the discussions of the railroad question which are now going on are liable to be confusing to the man who thinks of credit only as ability to borrow money. The railroads need something more than ability to go on piling up their funded debt. Credit in this sense might be achieved by the assurance of a fixed rate of return guaranteed directly or indirectly by the government. At least, such credit would permit of borrowing so long as the fixed rate was as high or higher than the current market rate and as long as those who have money to lend felt absolute confidence in the good faith and stability of the government. Most of those who have discussed the railroad problem in the light of long experience, thorough study and a knowledge of economics and finance, are inclined to the belief that it is not desirable to continue to finance railroads entirely through the sale of bonds; in other words, through borrowing. This means that credit, in the sense of making partnership in earnings attractive enough to offset the possibility of loss, will have to be established. Even a Senator La Follette knows perfectly well in his own business transactions that if he is invited to put money into a business as a partner, the only incentive which is strong enough to offset the risk of loss is the expectation of profits—not a fair return on capital invested. A Senator La Follette would be as quick as Samuel Rea to tell a man who asked him to come into partnership with the expectation of a 4½ per cent on his investment that he could get that much interest from a savings bank. Credit to borrow money is one thing, an expectation of profits is quite another thing, and an expectation of profits is the only incentive which will permit the sale of railroad stock representing partnership—risks as well as gains—in railroad corporations or in other corporations.

Partnership Not Creditorship

The *Railway Age* has commented at length on the unnecessarily expensive passenger service maintained for competitive purposes when the roads were under private management. When, however, an emergency arises, such as that of the coal strike, where it becomes necessary not only to cut off passenger service maintained for competitive reasons, but also every train that is not absolutely essential to the transportation of all whose business necessitates their travelling, we get some realization of the quality of passenger service which was developed on American railroads under private operation. Had the private railroads desired to give just as little to the public as they possibly could, few, if any, of the trains which are now cut off, in the Eastern region at least, where the reduction in service was about 10 per cent, would have ever been established. In other words, this 10 per cent of passenger service represents business which is largely only indirectly profitable. The taking off of 10 per cent of the trains will presumably cut down revenues only to a very small extent. All who need to make a journey can take trains other than those discontinued, and those who may be deferred from traveling because they cannot get a luxurious through fast train are so few that their number may be disregarded. Especially in commutation service, the trains taken off represent almost entirely service which is for the convenience of the people in suburban communities and profitable only in helping to build up these communities by making them attractive through comfortable accessibility. Take for instance the Harlem division of the New York Central, which serves Westchester county. There are seven northbound trains cancelled; an 11 a. m. express to White Plains, which is a convenient train for people going out to take luncheon and spend the afternoon with friends in the country; a 12:55 p. m. train, with a small average number of passengers; a 10:30 p. m. train, which is convenient for people living in Westchester county, who take dinner in the city but do not stay for the theater; an 11:35 a. m. local train, the discontinuance of which simply spreads hourly service to two-hourly service, and the same with a 2:35 p. m. train; the other two trains are local expresses, skipping nine stops, and followed by locals making all the stops. It is easy to make the accusation that the railroads under private ownership took all they could get, but a practical demonstration like the present makes it easier to realize how much of only indirectly profitable good service has been developed.

Service Only Indirectly Profitable

It appears probable that the government will give the employees of the British railways some voice in the management. The government under recent legislation is to operate the railways two years more; and it is announced that it has offered to permit "three (labor) union executives to join the Railway Executive Committee with co-equal powers to the general managers." The actual operation of the railways ever since they were taken over by the government in 1914 has been in charge of a large committee of the general managers of the roads. In addition, it is proposed to create, first, a joint board composed of five general managers and five representatives of unions to deal with conditions of employment; second, a board of twelve (four from the employees, four from the railway companies and four from the public, with an independent chairman) to which will be referred questions on which the joint board fails to agree; and, third, bodies set up locally with equal representation of management and men to deal with grievances. It should be borne in mind that under the existing law the Minister of Transport, who is at present Sir Eric Geddes, has final authority regarding railroad matters, the Railway Executive Committee, which is in direct charge of operation, being subordinate to him. However, the appointment of three representatives of the labor unions to membership on the Railway Executive Committee would be a substantial concession to the demand of the employees that they be permitted to participate in the management. The joint board to deal with conditions of employment would be similar to the Board of Railroad Wages and Working Conditions which has existed under the Railroad Administration in this country. The board of twelve, composed equally of representatives of the employees, the

British Railway Employees in the Management

railway companies and the public, would be similar in its constitution to the arbitration boards to which the railway companies in this country have contended that labor disputes should be appealed but which the railway employees have refused to accept. If the plan outlined is adopted by the British government in its operation of the railways the results will be followed with interest in the United States.

Railway Traingram Service

TRAINGRAM SERVICE, in general, does not seem to have proved as successful as some of its advocates would like it to be, nor has it been sufficiently reliable, efficient or safe to cause the average railway officer to feel that communications which require expeditious handling should be transmitted in that manner. The question is not as to whether there is a need for such service, for it is quite generally conceded that the demand exists for an efficient and safe scheme of transmission which will be less expensive than the telegraph.

Some roads have used the traingram for at least a small part of their business for many years. Various schemes have been tried to expedite such message traffic, but the results have been far from satisfactory. However, there are two general schemes of handling traingrams in use today which seem to have possibilities that are worth developing. Briefly, one scheme provides that each department of a railroad shall traingram its own messages, whereby the communications are handled as train mail; while the other concentrates the traingram service under the control of the telegraph department with special messenger service. The advocates of the first plan claim that its success depends upon proper supervision. The advocates of the second scheme can hardly claim less, because the control of the service is placed in the hands of a particular department. If proper supervision is the desirable feature in the first scheme, the question resolves itself into that of centralizing the supervision, otherwise there will be no supervision; so that ultimately both schemes are essentially the same, except that in the second plan the supervision has already been centralized in a single department, with the mail and baggage departments co-operating. At the recent meeting of the Telegraph and Telephone Division of the American Railroad Association a committee on message traffic presented a report on traingram service which advocated the centralization of control of such service in the telegraph department.

The volume of railroad business which can be handled economically by traingram service depends to some extent upon local conditions on each individual road, including the locations of the various large offices and the intermediate train service. It is quite generally true that the bulk of the railroad business handled by message traffic reaches the telegraph department in large offices late in the afternoon; consequently, at least a portion of it cannot be transmitted to the receiving offices along the road before their closing times. It is practical, therefore, to convert some of the messages into traingrams, which are sealed under a special cover provided for the purpose and properly addressed; then despatched by messenger to the proper train, and delivered to the train baggageman, who in turn exercises special care in handling and delivering them to employees of the telegraph department at the designated stations, who make the final distribution in the same manner as telegrams. If, under the traingram system messages were despatched as promptly as they could be to the trains and delivered as promptly as telegrams are after reaching their destinations, and if mailgrams were confined to that part of railway business which might otherwise be considered as requiring telegraph service, it is quite likely that railway officers would appreciate the importance of traingram service and feel safe in permitting a relatively large portion of their business to be handled by that system at a large saving in cost of transmission.

A Personnel Department for the Railways

ODIUS CONTRASTS between the efficiency of railway organizations and those of large industrial plants, to the disadvantage of the former, are usually made without any thought as to the obstacles imposed on the roads in the administration of their widely scattered forces. To be truly comparable, the industry set up as a standard for comparison should have its manufacturing functions scattered in small units over a wide territory and under the direction of sub-foremen who see their superiors but once or twice daily on a passing train or during a weekly or fortnightly visit. In other words, the conditions with which the railroads are confronted in an endeavor to perfect a thoroughly efficient organization are far more severe than those imposed on most other lines of endeavor conducted for profit.

But to point out the difficulties of the problem is not to solve it, and this question is now one of utmost importance on the eve of the return of the railroads to private management. For some time employment on railroads has been considered entirely in terms of the prerogatives and rights of groups or common masses, but fortunately there are those who still insist that some consideration should be given to the individual who shows superior initiative, industry and reliability, and in the last analysis the success of any undertaking involving the employment of men in large numbers is largely dependent on the proper selection of the natural leaders. After two years of concerted effort to magnify the importance of the group, is it not time to give more recognition to the individual?

This problem has two phases, namely, the selection of the workmen best suited for a given class of employment and the discovery of likely material for the development of officers. The one is about as important as the other, and neither has received the recognition it deserves. The first is left largely in the hands of subalterns of each department; the other falls upon the higher officer to be disposed of as his individual ideas may dictate. This course has a certain amount of justification from the fact that leadership is founded primarily on an ability to know men, and that therefore great leaders are adept in selecting men to serve their lieutenants.

On the other hand, advanced thought in industrial management points to the shortcomings of this system. It fails to develop the latent possibilities of those men who, under this hit-or-miss plan, lack opportunity to assert themselves and, becoming discouraged, seek other forms of employment which seem to offer more opportunities for recognition. This system tends also to engender a one-sided organization. We find some roads on which nearly all executive officers are graduate train despatchers, others where they are for the most part engineers, etc. Like begets like. Most executives are inclined to the opinion that his own particular line of training was best suited to develop the most efficient and the broadest general manager. The effect of this is that one department looms much larger in the eyes of the management than any other and produces a poorly balanced property.

The cure for this condition implies both scientific selection and broad training, so as to insure not only a supply of good material, but also a graduated, diversified training that will develop the qualities of leadership, afford broader expe-

rience and serve to weed out the defectives. The first of these requirements, selection, has received insufficient attention from the railroads. The second, training, has been accorded more consideration, as, for instance, through special apprenticeship systems and plans for rotation of officers. It is also commonly practiced individually by many a railway executive who, having hit upon some promising yardmaster or chief clerk, pushes him around from one job to another, so that the protege is given opportunities for broadening his experience, while his sponsor is also afforded an opportunity to determine his real worth.

The opportunity for improvement does not imply the use of new methods, but the doing through a preconceived, thoroughly organized system for the entire scope of employment, what is now being done through unorganized individual efforts. Presumably this should be carried on by an employment service or personnel department. Marked advancements have been made along this line by the industries, but owing to the peculiar conditions surrounding all classes of railway employment, with the possible exception of the shop crafts, the exact nature of such an organization for the railroads can only be determined after very careful study and experimentation.

To obtain real results from such an undertaking implies no little sacrifice. Non-revenue-producing bureaus entail considerable expense, while the benefits derived are not readily identified on the ledger. Courses of training involving the shifting of individuals from one department to another will result in considerable seeming waste, since training in one department does not necessarily fit one for effective output in another. The man's time is occupied partly in learning and partly in producing. This raises the question as to some pecuniary sacrifice on the part of the individual beneficiary of such a system. These are only a few of the problems to be considered in establishing a personnel department, but, after all, if it has been found profitable and necessary to maintain separate branches of the railway organization for the purchase and care of inanimate materials, why should it not be equally necessary to provide a separate department for the procurement and selection of the human material?

The Influence of Variations in Traffic on Maintenance Expenditures

THE EXTENT to which maintenance of way expenditures should vary with fluctuations in traffic is assuming new importance at the present time. It is evident that an increase in the tonnage passing over a given track will result in accelerated deterioration of that track, which must be made good by more maintenance work. It is likewise recognized that an increase in traffic does not necessarily give rise to an equivalent expenditure for upkeep. The problem is to determine the relation between traffic and the wear and tear on the property. Its solution is of special importance at the present time because of the radical readjustment of traffic which has resulted from its wholesale diversion from one line to another during the two years of federal control and the obligation of the government to return the roads to their owners in as good condition as when turned over. Since it is generally conceded that three has been a certain deficit in the maintenance of the properties as a whole, the problem is to fix this amount.

Certain expenditures for maintenance of way are independent of traffic. Typical of these are the repair of fences and highway crossings, the mowing of the right-of-way, the clearing of snow from the switches and station platforms, etc. Other expenses, such as the renewal of ties, are influenced to a limited degree by variations in traffic, while still others, such as the renewal of rails, are affected directly.

This is not a new prbolem. It has been discussed for years. It has been considered by committees of the American Railway Engineering Association from time to time without tangible results. More recently a special committee has been working on it with officers of the maintenance of way section of the Division of Operation of the Railroad Administration. While this committee has not reached any definite decision, it is to be hoped that its work will be prosecuted to a point where some basis of comparison may be arrived at.

So many elements which are more or less intangible in character enter into the maintenance of tracks that it is exceedingly difficult if not impossible to determine whether a particular line has been maintained to a given standard during the period of federal control. The indefinite nature of such units of measurements as are now available will lead to much difficulty and possible controversy in arriving at an ultimate settlement. However, the value of a comparative unit such as this is not limited to the present, for the same question confronts the officer in charge of the maintenance of a considerable mileage of line in distributing his appropriations over various divisions with different traffic densities.

Railroads Are Still Incurring a Deficit

STATEMENTS BEING ISSUED by the Railroad Administration are adapted to give the impression that before the coal strike came the railways had ceased to incur a deficit. It has been indicated in these statements that in the months of July, August, September and October the traffic of the railways had approached normal; that during these months they more than earned the government guarantees to them; and that the very large deficit incurred in the earlier part of the year was due to the comparatively small amount of traffic during that part of the year.

These statements of the Railroad Administration, while doubtless not intended to be misleading, are adapted to give the public a false impression regarding the existing railroad situation. The way in which the Railroad Administration arrives at its conclusion that the railways have ceased to incur a deficit is very simple. The government guarantees amount to an *average* of about $75,000,000 a month. Therefore, when the railroads earn more than this amount of net operating income in a month the Railroad Administration announces that they have earned a surplus. But the railroads always have earned more net operating income in the last six months than in the first six months of each year. The government guarantees are based on the average amount earned under private operation during the three years ended on June 30, 1917; and if we are to know how well the railways are really doing under government operation we must compare their actual results month by month under govern-

	Average net operating income in test period			Net operating income earned Nov. 1918 to Oct. 1919, inclusive	Loss or gain
November ..	$83,536,000	November ...	1918	$57,123,000	—$26,413,000
December ..	73,282,000	December ...	1918	28,237,000	—45,045,000
January	56,613,000	January	1919	18,784,000	—37,829,000
February ...	47,934,000	February	1919	10,106,000	—37,828,000
March	68,251,000	March	1919	10,843,000	—57,408,000
April	67,289,000	April	1919	26,115,000	—41,174,000
May	77,385,000	May	1919	39,462,000	—37,923,000
June	82,550,000	June	1919	52,271,000	—30,279,000
July	75,341,000	July	1919	77,177,000	+ 1,836,000
August	86,860,000	August	1919	92,397,000	+ 5,537,000
September ..	91,273,000	September ..	1919	77,763,000	—13,510,000
October	94,333,000	October	1919	76,397,000	17,936,000
	$904,657,000			$566,675,000	—$337,972,000

ment operation with the actual results obtained by them in the *same months* of the test period.

The foregoing table gives the average net operating income earned month by month by the Class I railways in the test period, the average net operating income actually earned by them in the 12 months November, 1918, to October, 1919, inclusive, and the increase or decrease in net operating income during the year ended October 31 as compared with the test period.

This table shows that the only two months of the entire 12 in which the net operating income earned was as great as the average amount earned in the corresponding months of the test period were July and August, 1919. The net loss for the entire 12 months as compared with the test period was $337,972,000. The most interesting and important figures in the table are those for the months July to October, 1919, inclusive. These are the months during which it has been stated that railway traffic had become about as large as it was in 1918 and that a surplus was earned instead of a deficit being incurred. The traffic handled in these four months actually was about as large as in the same four months of 1918, which is practically the same as saying that it was almost equal to the largest traffic ever handled. The total earnings also were about the same as in the corresponding months of 1918, being $1,955,613,000 in these four months of 1918 and $1,935,572,000 in 1919. The table shows, however, that in spite of the fact that the traffic and total earnings in these four months of 1919 were almost the largest in history, the railways made a gain of only $7,373,000 in net operating income in the months of July and August and made a loss of $31,446,000 in September and October as compared with the test period, making a net loss for these four months of $24,073,000.

The facts regarding the deficit being incurred are even worse than the statistics given in our table indicate. The government is not only guaranteeing to the railways the average net operating income earned in the three years ended June 30, 1917, but, in addition, interest must be paid on the new investment which has been made in the railroads under government control, which now amounts to approximately $850,000,000. The interest on this additional investment, which must be paid by the government directly or indirectly although its amount cannot be accurately stated, must now be running at the rate of about $42,500,000 a year, or about $3,500,000 a month. The total deficit, including this interest, incurred in the year ending with October was close to $375,000,000, and the deficit for the four months ending with October, including this interest, must have been about $38,000,000. The deficit in October itself, in which it has been stated a surplus was earned, must have been, including this additional interest, about $22,000,000; and the ratio of operating expenses to total earnings was 80 per cent.

It is necessary to emphasize the fact that the government when the coal strike came, although it was handling almost all the business the railroads could move, was still incurring a large deficit because otherwise the shippers and the public may get the idea that the railways can be safely returned to private operation without an advance in rates. The facts show that the railroads under the most favorable conditions have been unable to earn the guarantees under government operation, and undoubtedly the coal strike will have an effect upon both earnings and expenses which will largely increase the deficit. The October, 1919, figures afford us as good a test as we have had of the financial results that the railroads can produce with existing prices, wages and rates, and they show that to continue the existing rates, if government operation were continued, would be to go on incurring a big deficit, while to continue them after the railways were returned to private operation would be to throw a large part of the railways into bankruptcy.

Letters to the Editor

Hand-Motion Signals in South Africa and United States.

Hartford, Conn.

To the Editor:

Your discussion of fundamental principles of train operation in a recent issue awakens interest in a good many questions which might be profitably considered from that standpoint, rather than in our usual superficial way. For example, look at the circumstances of the collision of passenger trains at McGriff, Ga., reported that same issue (November 28, page 1072), where an engineman, presumably of long experience, moved forward, on a dark night, on a hand signal which he was not sure was intended for his train.

One of the fundamental principles of giving hand signals is, or should be, to give them where they cannot be seen by any engineman except the one for whom they are intended. It would appear in this case that the brakeman, being in front of the northbound train to which he was motioning, might just as well have stood in such a position that his body would have hidden his lantern from the southbound engineman, who made the mistake. Why do we not conform our every-day practice to this simple fundamental principle?

This point is particularly important where a hand signal is given by a man who is in front of the engine which is to be moved on the signal. In making a rule that the same motion shall always mean "move forward" we have deprived ourselves of the important principle that the natural way to give a hand signal to another person is to tell him to move either *toward* you or *from* you. That principle applied in the old days; but we have grown to be so scientific nowadays that we cannot endure anything so simple. I remember reading some years ago in the rules of the railroads of South Africa—or perhaps it was Australia—that what we call the go-ahead signal was there defined to mean "move from the person giving the signal," and the signal which we use to move backward meant "move toward the person giving the signal."

Sometimes it is necessary to go to the other side of the globe to learn very simple things which we ought to learn at home.

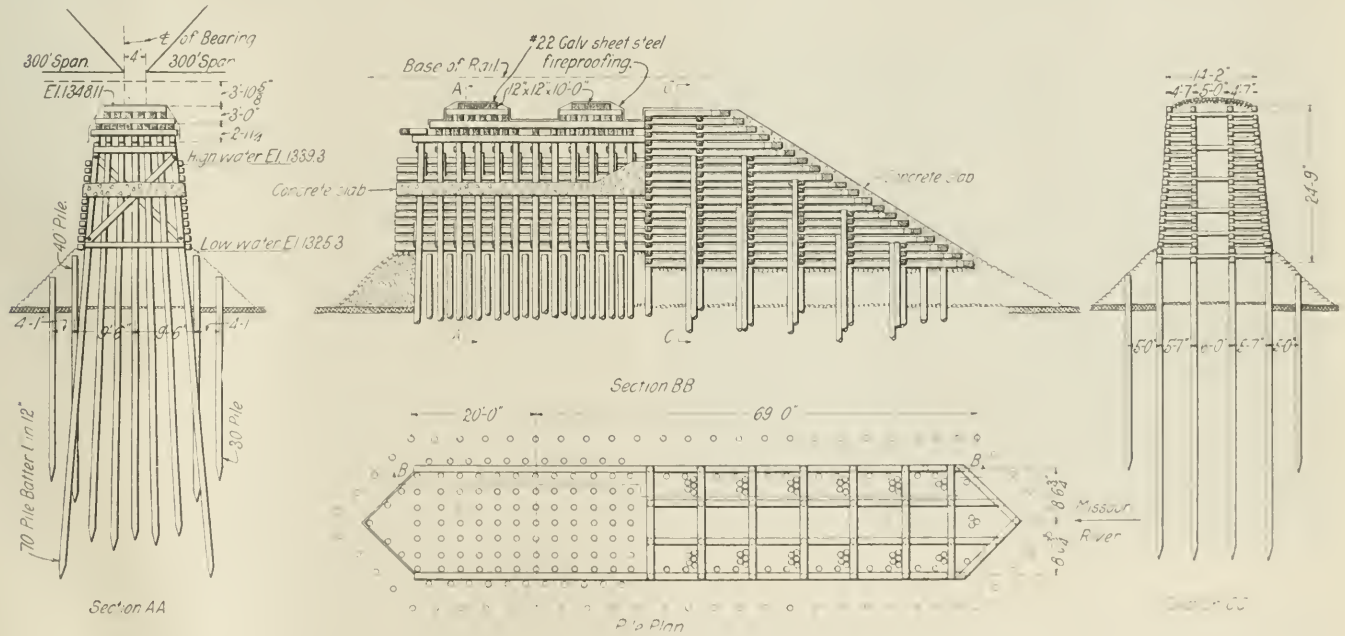
Two 300-ft. Spans on Pile Piers

An Unusual Design for a Missouri River Bridge

Wartime Conditions Enforce Use of Unique Piers Under Heavy Trusses of C. M. & St. P. Structure

ONE OF THE BEST illustrations of engineering practices under war-time conditions is to be found in the recently completed bridge of the Chicago, Milwaukee & St. Paul over the Missouri river at Chamberlain, S. D. Not only does this embody the extraordinary use of pile piers as supports for 300-ft. steel truss spans, but it also involves an interesting combination of reinforced concrete and timber construction as the most effective solution of a difficult engineering problem.

This crossing of the Missouri river serves the Black Hill's division of the St. Paul, a light traffic line extending 219 miles west to Rapid City, S. D. Built in 1905 and 1906 through an undeveloped territory, the line did not have promise of sufficient traffic to warrant the outlay necessary for a permanent bridge at the start. The original structure consisted of 1,770 ft. of pile trestle, with a pontoon barge 366 ft. long to meet government requirements for a draw opening for the river traffic. In the years subsequent to the completion of this bridge studies were made from time to time for a suitable permanent structure for this crossing. These considerations were responsible for the purchase, in 1917 from the Kansas City Terminal, of two 300-ft. single-track, through truss spans released from a bridge over the Kaw river, but plans for a new structure were brought to a head suddenly in the spring of 1918 when the pontoon, which had seen 13 years of severe service, developed leaks which caused it to be withdrawn from service. Traffic was restored in a short time by the use of some second-hand girders to form a temporary swing span, which afforded a



Plan and Sections of One of the Pile Piers and Its Ice Breaker

50-ft. channel opening, while the remaining draw opening was closed by a pile trestle.

While the maintenance of a temporary structure had been the source of no little trouble to the railroad because of periodic floods of protracted duration, the construction of a permanent bridge was open to serious objection, not only because of the established war policy of the government—and particularly the Railroad Administration—to discourage any undertaking that would interfere with the directing of

all national energies to the winning of the war, but also because the bridge site is in many ways unfavorable to permanent construction. Foundation conditions are such as to require a very expensive substructure, entailing large expenditures both in money and in labor and a long construction period. The location of the crossing is also subject to objections. Certain characteristics of the river upstream from the bridge indicated the desirability of a better location for a permanent structure, and the change of line which this would involve was out of the question under war conditions. As a consequence, it was highly desirable to avoid the use of masonry piers if a substitute construction could be designed that would meet the requirements imposed by the unfavorable characteristics of the Missouri river.

The bottom of the river is a deep bed of alluvial silt over sand and gravel. This material is so light that the increase in the velocity of the current during flood periods results in a marked lowering of the river bottom, so that the increased volume of water is accommodated by the enlargement of the channel thus obtained as well as by the raising of the flood level. This condition, of course, introduced no little conjecture as to the security of any substructure not founded on bed rock. Another serious matter is the prevalence of ice floes during the spring breakup, which are capable of exerting enormous pressures against any structure interposed in the river channel. The problem then was to develop pile piers that could be made safe against scouring and capable of resisting the ice pressures.

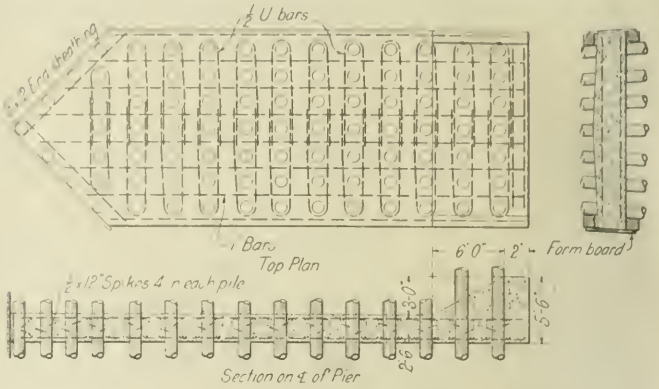
The manner of accomplishing this may be learned from a study of the detailed drawing of one of the piers as built. The construction consists essentially of a combination of a pile pier supporting the superstructure with a rock-filled ice breaker of timber cribbing protected against scour by

Weaving the Willow Mattress

willow mattresses and rip-rap. The vertical load imposed on the pier is carried by 70-ft. piles, capped by a grillage of crossed timbers. It was the intention to provide a bridge seat in the form of a concrete slab 3 ft. thick, but this was abandoned in favor of a top grillage of 3 tiers of 12-in. by 12-in. timbers because of lack of sufficient time to place the concrete in position for the steel work before the spring breakup.

Each side of the pile pier is protected by 12-in. by 12-in. timbers bolted to the outside piles, with 3-in. open joints between. These ties are long enough to extend upstream and form the outer walls of the ice breaker, the sides of which extend 49 ft. 6 in. beyond the upstream end of the pier. The ice breaker also has two interior longitudinal walls as well as cross walls spaced 8 ft. center to center. The upstream end is pointed and slopes back at an angle of 30 deg. with the horizontal. The crib was erected on piles driven at the intersections of the longitudinal and cross walls, while other piles driven in groups of five next to the cross walls serve as a measure of resistance against the ice thrust.

The application of concrete to this construction serves primarily to increase its effectiveness in resisting the ice floes. The most natural development was the provision for



Details of Reinforcing Slab for the Pier

a concrete armor over the nose of the crib. This has a minimum thickness of 1 ft. and is reinforced by 1-in. bars placed longitudinally at 1-ft. centers and transversely (horizontally) at 2-ft. intervals in elevation. The edge of the nose is protected by a relayer rail adequately anchored into the concrete. This construction forms a strong, smooth surface to lift and break the ice as it is carried against the pier by the current of the river.

The other concrete feature, while not of as obvious utility, is equally important. This is a horizontal diaphragm or slab of concrete 2 ft. 6 in. thick, covering the entire area of the pier and surrounding the pier piles at a level slightly below high water. The slab increases in thickness at its upstream end so as to present a face 5 ft. 6 in. high against the upstream end of the crib. Thus the slab is designed to receive the thrust of the ice pressure and transmit it uniformly to all the piles in the pier. This slab is supported against sliding down the piles by four ½-in. by 12-in spikes driven part way into each pile, so that the exposed portions were in the concrete when the slab was cast. Both upper and lower faces of the slab were reinforced with 1-in. bars.

Rip-rap was placed in the crib to fill it to the top, while in the pier the space around the piles was filled with rock to the low water level. As the walls of the pier and crib have their bottoms at about the low water level, or slightly below, the rock spreads out below this level on a natural slope all around the structure. Additional piles driven outside of the pier and ice breaker tend to stabilize the rock slopes thus formed.

To protect the piers against scour the plan called for willow mattresses 150 ft. by 220 ft. in area surrounding each pier and built according to standard methods of mattress construction and sunk by weighting with rock.

Construction

As the project involved the use of a large number of piles, the pile driving was a major feature of the construction work. The work was started in July, 1918. All piles coming underneath the existing pile trestle were driven by track drivers, one fitted with a No. 1 Union Iron Works steam

hammer and the other with a 4,000-lb. drop hammer. All other piles required were driven by a steam hammer mounted on a 40-ft. by 60-ft. power barge that had been used to operate the old pontoon bridge. A water jet was used with each pile. The power boat was also fitted up to supply the water for jetting. A 7-in. by 12-in. by 7-in. steam pump with a 6-in. discharge was installed for this purpose, using 1¼-in. pipes as nozzles for the jets. The driving downstream from the existing structure was handled readily by controlling the position of the scow with lines from the bridge, but upstream from the bridge the position of the

End View of the Bridge Showing One of the Ice Breakers With Its Concrete Covered Nose

boat had to be maintained by means of an anchor placed in the river about 500 ft. upstream. A 3,000-lb. drop hammer was first employed for this purpose, but it was not heavy enough, and it was reinforced with a concrete block weighing about 4,000 lb.

Further difficulty was encountered when it came to driving the piles for the north end of the west pier, where a sand bar had formed at a level of 5 ft. above that of the water in the river. To get the scow up to the pier a portion of this sand bar was removed by sand pumps set up on the scow. While the barge was being advanced into the sand bar in this manner, a dike was thrown up behind it, so that when the pumping was finished the scow was entirely surrounded by the sand bar. This protected it from the current of the river, and was also of advantage when it came to placing the lower sheathing for the pier, since it was possible to pump out the water within the bar and place the sheathing with the top 2 ft. below the prevailing stage of water in the river. The piles in the piers were 60 to 75 ft. long and were driven to refusal, some of them reaching bed rock, while others stopped in gravel and boulders after penetrating 30 to 40 ft. of sand and gravel.

The design for the new structure included a 262-ft. pontoon to replace the original one. The construction of this pontoon formed an important part of the work. This entailed a large amount of heavy woodwork, which was facilitated by the use of power equipment. Much of the framing was done on a band saw, all holes were bored by air tools and bolts were driven with pneumatic hammers. Another feature of the work in which power equipment proved a great labor saver was in the construction of the three longitudinal bulkheads, consisting of 8-in. by 16-in. timbers laid flat and separated ¾ in. by the use of Howe truss packing washers 6 in. in diameter, with rims 3 in. thick. These washers were counter-sunk into the timber, and as there were over 2,000 of them a large amount of special recessing was required. As no tool could be found on the market to cut these recesses a local machinist finally made one from design prepared in the field office which was operated by a Little Giant reversible drill. This was found to work very satisfactorily.

All sheathing was beveled for caulking, and each spike through the bottom and side sheathing was wrapped with oakum before driving. The bottom and sides were caulked with one thread of cotton and two of oakum. The first three threads were hawsed up before the last two threads were driven. The last two threads were placed and caulking strips were extended to cover the seams. The deck of the pontoon was caulked with one thread of cotton and two of oakum and the seams then filled with pitch, 10 per cent of tallow being added to make it more pliable.

Work on the pontoon was started on December 5, 1918, and the pontoon was ready for launching on March 1, 1919, although this did not take place until April 7 on account of low water.

This work was done under the general direction of C. F.

Type of Barge Driver Used for All Piles That Could Not Be Driven from the Trestle

Loweth, chief engineer of the Chicago, Milwaukee & St. Paul. The design was under the immediate supervision of H. C. Lotholz, engineer of design, while the construction was under the direction of A. Daniels, district engineer, with the aid of W. E. Duckett, assistant engineer.

Precept and Practice.—When I started my railroad career I studied the Book of Rules just enough to let me slide by in the examination. My next move was to find out what I didn't have to do. I got more information from the fellows regarding what I didn't have to do than I did on the book of rules. Well, it wasn't very long until I told the yardmaster that I didn't have to do something and he moved those below me one notch higher on the seniority list. I didn't approve of this. I was discharged. I was away for more than a year and I had plenty of time to think the matter over. The more I thought about it the more I agreed with the yardmaster and I have thanked him since for teaching me this lesson. He gave me enough rope and I hung myself. Each time you study the schedule study the Book of Rules and before long you will know them both.—*Duit Wright*

National Park Travel in 1919

SOME INTERESTING FIGURES showing the amount of travel to the national parks during 1919 are contained in the annual report of the Secretary of the Interior, from which the following extracts have been taken:

The tremendous popularity of our national parks was fully attested by the unprecedently large number of visitors during the 1919 season, which closed about the middle of September. Freed from the restrictions against war-time travel, which had been a war necessity, the appeal of the great natural attractions of the parks was irresistible and the response spontaneous. The national parks became the cynosure of the eyes of a war-weary and hard-worked people, bent on taking a holiday where they could derive the greatest benefits. There the refreshing atmosphere of the great out of doors, the soothing diversion of the natural scenery, and the specific qualities of the fresh air brought mental and physical relief to hundreds of thousands. When one considers that travel to our national parks and monuments exceeded 810,000 visitors—over 755,000 to the parks and over 55,000 to the monuments—it is evident that the recreative value of the parks is a tremendous factor in the health, wealth, and contentment of the nation.

The following tables will give an itemized review of the travel:

VISITORS TO THE NATIONAL PARKS IN 1919

Hot Springs	[1]160,490
Yellowstone	62,261
Sequoia	30,443
Yosemite	58,564
General Grant	21,574
Mount Rainier	55,232
Crater Lake	16,645
Wind Cave	26,312
Platt	[1]25,000
Sullys Hill	4,026
Mesa Verde	2,287
Glacier	18,956
Rocky Mountain	169,492
Lassen Volcanic	12,500
Hawaii	([2])
Mount McKinley	([2])
Grand Canyon	37,745
Lafayette	[1]64,000
Total	755,527

[1]Estimated. [2]No Record.

VISITORS TO SOME OF THE NATIONAL MONUMENTS IN 1919[1]

Capulin Mountain (New Mexico)	[2]1,500
Casa Grande (Arizona)	3,795
Colorado (Colorado)	[2]3,000
Muir Woods (California)	[2]43,200
Petrified Forest (Arizona)	[2]3,000
Zion (Utah)	1,814
Total	55,309

[1]No records for other 17 national monuments. [2]Estimated.

An analysis of these figures shows that the travel in 1919 was 67 per cent over that of 1918 and 54 per cent more than that of the previous high-water mark in park travel of 1917. An astounding increase occurred also in motor travel to the national parks. The increase of the number of cars, 95,140 in 1919 over that of 55,296 in the record year 1917, is 72 per cent. While no accurate general record is kept in all the parks of the number tourists entering in motor cars, in Yellowstone it is found that they average about four to the car, as will be seen from the following tables for the past three years:

Year	Number of private cars	Number of tourists
1917	5,703	21,268
1918	4,734	17,317
1919	10,773	40,986

With this average in mind it is estimated that about 400,000 visitors entered the parks and monuments by motor. The travelers came from every state in the Union and from foreign countries, and the motorists from every corner of the country and from Canada and Mexico. Some of the motorists visited all of the national parks of the continental west and others toured from two to five. More than half carried their own supplies and camp equipment, and they enjoyed the playgrounds in their own way.

In these large travel figures the influence of the activities of the United States Railroad Administration is also reflected. During the war travel was discouraged. Soon after the cessation of hostilities, however, the administration changed to a stand just the opposite to the former policy, and by judicious advertising and educating of those of its employees who come in direct contact with the tourists, stimulated the patronage of the winter resorts in the South and West to unusually gratifying proportions. Later, through its passenger traffic committee, it directed its efforts toward the summer resorts of the country with special emphasis on the national parks. The promotion of park travel, of course, fell naturally to the western committee of the railroads and to the Bureau of Service, National Parks and Monuments, with headquarters at Chicago. This latter bureau was well organized and prepared to perform its functions without delays when the restrictions were raised. By attractively designed and well-written national park booklets they presented a feature of their campaign that offered at once the most important inducement to travel in the parks that has appeared since the publication of the National Parks Portfolio some three years ago. The very satisfying result achieved by this bureau testifies to its great importance and the extreme desirability of its surviving as one of the institutions of the Railroad Administration whenever the railroads are turned over to private operation.

At this writing restrictions against overseas travel have also been removed. The competition of Europe for tourist travel will begin with renewed activity. We have in this country scenery that is the peer and in most instances the superior of that found abroad, but the value of tourist travel as an industry has hardly been recognized in this country. Various industries of the United States are protected as a matter of course, but what protection will the great resorts of this country have from the greatest campaign for tourist travel in the foreign lands that will ever have been waged? As a nation we have failed to grasp the significance and value of the tourist industry. Every dollar of revenue received from it stays here. Before the war Americans spent in England alone about $200,000,000 a year, and in France and Switzerland $400,000,000. We should develop this industry, as other countries are doing, into one of our biggest economic assets.

To properly develop this the establishment of a touring agency is a present national necessity. It is vitally important to the nation, and, as there is no other agency of the government that is so interested or so closely in touch with the traveling public as the National Park Service, the agency should be established there. Such an activity could co-operate closely with the resorts of the United States, the railroads, automobile associations, highway associations, mountaineering clubs,, etc. Promotive literature bearing the stamp of approval of the department and of the National Park Service would most effectively stimulate and maintain travel in the United States because its data would not be selfish or exaggerated and would have the confidence of everybody using it.

SPAIN HAS TOO MUCH COAL.—Spain, in common with most European countries, has a coal problem, but its situation is diametrically opposite to that of its neighbors; that is, it has a supply greater than the demand. Piled up at the heads and in the coal ports of Asturias lies a stock estimated at from 750,000 to 1,000,000 metric tons (metric ton equals 2,204.6 pounds), and the problem of the moment is how to dispose of this surplus.—*N. Y. Tribune.*

Railroad Legislation as Developed up to Date*

Neither the Esch Bill Nor the Cummins Provides a Means for the Restoration of Railroad Credit

By R. S. Lovett
Chairman, Union Pacific System.

IT SEEMS USEFUL to take stock at this time of the progress made by the present Congress during its first session toward the enactment of legislation necessary to meet the railroad emergency. The controlling necessity for additional railroad legislation is to re-establish railroad credit, which failed even before the war under the system of regulation in force, and to save from bankruptcy and ruin many, and perhaps most, of the railroads of the country because of the extraordinary increases in wages and in prices of fuel and other materials during federal control. Unless railroad credit is re-established, it will be impossible for the railroads to reasonably keep pace with the growth of the country or to finance any substantial part of their requirements for extensions and betterments, generally estimated at one billion dollars annually. Let us therefore examine what Congress has proposed to date, and determine how far it meets this fundamental necessity, and what the country faces if these proposals are really as far as Congress means to go in solving the railroad problem.

Both the Senate Committee on Interstate Commerce, of which Senator Cummins is chairman, and the House Committee, of which Mr. Esch is chairman have presented bills designed to embrace all the legislation they deem necessary upon the subject. The Esch bill, after many amendments in open session of the House, was passed by that body and has gone to the Senate. The Senate did not consider either bill during the first session, but has taken up the subject in the session which has just convened. If the usual course is followed, it will substitute its own bill for the House bill, and after extended debate and probably amendments, it will pass its bill, and the differences between the two measures will be worked out in conference.

The Esch Bill in the House

The Esch bill as amended and passed by the House contains the following discouraging features:

1. The first and fundamental objection is that it bases its whole scheme of relief upon the Interstate Commerce Commission. It imposes upon the already overburdened commission the performance of many new duties and the administration of many new regulations. It creates no new agencies to assist the commission in rate matters, such as regional commissions; and it leaves the commission still burdened with the administration of the Car Service Act, the Act Relating to the Construction and Operation of Switch and Sidetrack Connections, the Act of August 24, 1912, the Safety Appliance Acts of March 2, 1893, the Act of May 6, 1910, relating to Railroad Accidents, the Safety Act of February 23, 1905, the Hours of Service Act of March 4, 1907, the Safety Act of May 30, 1908, the Act Relating to the Transportation of Explosives, approved March 4, 1909, the Boiler Inspection Act of February 17, 1911, the Act Relating to Block Signal Systems and Appliances, approved June 30, 1906, and many other duties of an administrative character having nothing to do with rates, which could be better performed by a smaller board—leaving the commission free to devote its time and talents to the making of rates and to the hearing and determining of rate cases and other important controversies. The bill adds two new members to the commission, it is true, making the membership eleven instead of nine, as at present. But it is still a single commission. And though its membership be increased and it divide itself into sections, it remains a single body, governed by the same semi-judicial rules of procedure and methods, and with the same diffused and all-embracing duties, many of which are in no wise related and require wholly different experience and talents and methods for their correct solution. It is obvious that the commission must employ subordinates, not merely to assist, but actually to decide and dispose of many of its important duties; and the bill authorizes it to do this and the commission has been doing it heretofore of necessity, even with its present duties. This is one of its defects. It is not right to put the practical decision of questions of such vast public importance upon subordinates of the commission who are unknown, who get no credit or recognition for what they do, who hold their places at the pleasure of the commission, and who receive salaries insufficient, without any certainty of tenure of office, to command the ability and experience that ought to be brought to bear in the decision of such questions. No reflection upon the subordinates of the commission is intended, for I believe them to be, individually and as a class, quite equal in ability and character to any other men in similar lines of work. But my point is that the system is not calculated to produce the wisest decisions, and that decisions by even the best of men in such subordinate, precarious, underpaid and unrecognized positions would be unsatisfactory as a rule.

All experience suggests that regional commissions and administrative boards for administrative duties, composed of members appointed by the President and confirmed by the Senate, for definite terms, and receiving fixed salaries, would be better suited to decide and dispose, subject to review by the main commission in rate cases, all these important questions, and be more in keeping with our traditions and ideals. The Interstate Commerce Commission must either leave wholly and entirely to subordinates the final decision and disposition of a great multitude of important matters, or it must devote to the review and revision of the conclusions of its subordinates an amount of time that will be seriously needed for rate questions and controversies, and its more important work. Delay in rate making and revision and in the decision of rate questions is deadly to railroad and commercial interests alike. It has been a great evil in the performances of the Interstate Commerce Commission in the past, and with the additional duties imposed by the Esch bill, it will, in my judgment, become intolerable.

2. The Esch bill, as introduced and as amended and passed by the House, recognizes that the revenues from existing rates remaining after the payment of wages and other operating expenses will be insufficient, due to conditions arising during federal control and still existing, to save many of the railroads from bankruptcy and to conserve the credit of the others. It therefore provides a guaranty for a period of six months after federal control. But this "guaranty" is illusory if not worthless. It does not provide, as one would suppose, that one-half of the "standard return" for twelve

*An article printed by the author for distribution among those interested in the railroad question.

months now paid shall be guaranteed the companies for the period of six months, but provides instead that the guaranty to each company shall be the average of the corresponding periods of six months during the test period. That is to say, assuming that federal control terminates December 31, as now believed, the bill provides that the average net earnings during the test period for the six months from January to June inclusive, rather than one half of the earnings for the whole year, shall be taken. Now we know that the first six months of the calendar year are the worst for the railroads. The crops have been moved and the traffic is light, and during the three winter months of January, February and March, the snows are heaviest, the weather generally is the worst, and the operating difficulties are the greatest of the year, while in the Spring months of April, May and June, the maintenance work is actively resumed to repair the ravages of winter and to prepare for the heavy traffic of the late summer and autumn. As a result many railroads have deficits for the first six months of the year. Hence I say the "guaranty" tendered by the Esch bill as passed by the House, fails to meet the emergency which it recognizes and assumes to provide for.

3. The provision of the Esch bill as amended by the House with respect to the funding of amounts charged by the Government to the railroad companies for additions and betterments made during federal control is a serious menace to the credit of companies without great financial resources and strength. It requires that the amount due from the government to any company, even for rental, shall be set off against amounts incurred for additions and betterments made during federal control and chargeable to capital account, to the extent permitted under the standard contract between such company and the United States relative to deductions from compensation. Any balance due by the company with respect to additions and betterments may be funded into not exceeding ten equal amounts, one of such amounts to be payable annually beginning at the expiration of five years from the termination of federal control, with interest at the rate of six per cent per annum from date, subject to the right of the carrier to pay before maturity. Any other indebtedness existing at final settlement shall be evidenced by notes payable on demand with interest at the rate of six per cent per annum and secured by such collateral as the government may require. No progressive railroad company in a growing country such as ours, can pay for its additions and betterments out of earnings, as this act thus requires. Such expenditures are for capital account, and as such must, to a great extent if not entirely, be provided for by the issue of capital securities. Furthermore, the bill provides that even the balance which the government cannot collect by setting off the rental because of the restrictions in the standard contract, shall be founded for only five years and shall be thereafter payable in annual instalments, provided the company is able to give good security, which many of them cannot do. Funding for five years, it is true, allows a breathing spell, but the requirements that the amounts shall be paid in ten annual instalments thereafter, is a method which only financially strong companies can avail of; and such payments probably will have to be taken care of out of current income.

When it is considered that the additions and betterments were ordered by the government, and many of them to meet the emergencies of the war, and especially when there is considered the very liberal treatment accorded by the government to war industries with respect to improvements, it would seem not unreasonable to allow the railroads which need the indulgence a long term in which to pay the capital expenditures charged against them by the government while under federal control. The provision leaves the railroad companies without a dollar of working capital, with a large indebtedness to the government for equipment and for additions and betterments ordered and made by the government during federal control, with an increased pay roll of over a billion dollars a year added during federal control, confronting a scale of prices for fuel and other materials comparable with the increased cost of living for individuals, and with a rate increase insufficient to save the government itself from a huge deficit in its own operation of the railroads. Such a refunding provision certainly does not tend to the enhancement and re-establishment of railroad credit.

4. But the most amazing provision of the Esch bill as amended by the House is that with respect to labor. It effectually perpetuates every wage increase and every working rule or regulation made by the railroad administration under the stress of the world war and the abnormal conditions resulting therefrom, no matter how radically conditions may change nor how soon normal conditions of living may be restored. As reported by the committee, the bill contained an elaborate provision for a "Railway Labor Adjustment Board" and a "Railway Board of Labor Appeals" for hearing labor disputes, but no means were provided for enforcing such decisions. Where a *contract* existed, it was provided that the railroad company and the unions respectively and members advising should be liable in damages and civil actions for violation of such contract. But this would simply discourage or prevent the making of wage contracts. Strikes and lockouts were not made unlawful, and no penalties were prescribed therefor. But even this "milk and water" provision called forth the usual denunciation from the union leaders, and when the bill came up in the House, a strictly union labor amendment was adopted by a vote of 161 for to 108 against. The bill as thus amended and passed recognizes the various railroad brotherhoods and unions by name and provides for boards of adjustment composed equally of representatives of such unions and of the railroad companies, but makes no provision for enforcement of the decisions of such boards or for the decision of cases, of which there must be many, where the equally divided board cannot agree; and it does not prohibit or in any wise discourage strikes. But the most remarkable provision is that the act as thus amended makes every decision of the United States railroad administration or of the commission of eight permanent, for it says all such decisions

> "affecting questions of wages, hours of service or conditions of employment are hereby confirmed and shall apply to all carrier lines subject to this act. Decisions which have been rendered by the United States railroad administration and which apply to the individual carriers subject to the provisions of this act shall remain in effect until superseded by mutual agreement between the carrier and the employes or by decision"—

of one of the adjustment boards created by the act. Of course this provision means that no change can ever be made except in the way of further wage increases, since the requisite "mutual consent" to a reduction or modification will not be given by the unions, and will not be "superseded" by the adjustment boards, since under the act the unions have one-half the membership of each board. The same provision exists with respect to the Adamson eight-hour law. I am not advocating a reduction of wages at this time or any change in working rules and regulations, although some of them are absurdly unjust to the railroads and to the people who pay the freight bills.

But it is almost unbelievable that the House realized that by adopting this amendment it would saddle upon the country by law the railroad wage scales and working rules established under the stress of war and at a time when the cost of living and the profits of labor both were above anything known for generations, and enforce the same by the penalties prescribed in the act, while prescribing no penalties for strikes. Legislation of this sort is not likely to attract investors to railroad securities or to inspire much con-

fidence in the future provision of the transportation facilities which the country will need.

The Esch bill as passed by the House contains other provisions that will not be helpful though less objectionable; some that seem merely formal and of no particular consequence; and some that undoubtedly are wise, as for, example, giving the federal government exclusive regulation of the issue of railroad securities. But I comment only on those which in my judgment tend to defeat what I conceive to be the main object and reason for any legislation by Congress at this time, namely, the re-establishment of railroad credit to the extent necessary to enable the railroads to obtain the means required to provide the transportation facilities which the country must have.

The Cummins Bill

The bill introduced by Senator Cummins and reported by the Senate committee has the merit at least of recognizing the facts of the railroad situation and the courage of grappling with them in an honest attempt to solve the problem. It recognizes that the Interstate Commerce Commission is overburdened now with duties that interfere with its more important work of making and revising rates and deciding rate controversies. The bill, therefore, relieves the commission of various administrative duties with respect to other matters which can be as well or better performed by some other board, and confers upon it additional duties of a much more important character and provides it with the assistance necessary for the proper performance thereof. The bill also recognizes for the first time in our Congressional legislation the responsibility of the federal government to create some agency charged with the duty of promoting the establishment of adequate railroad facilities requiring it to keep an eye on transportation service and find out what is necessary to provide that which is needed, and cooperate with the railroads and the commission in bringing it about. The bill creates a transportation board composed of five members to be appointed by the President with the consent of the Senate, and charges it with the duties just mentioned, and transfers to it the various administrative duties with which the Interstate Commerce Commission is now burdened with respect to the Car Service Act, the Safety Appliance acts, the Railroad Accident act, the Hours of Service act, the Act Relating to the Transportation of Explosives, the Boiler Inspection act, the Automatic Signal act, and other acts referred to above. The bill also recognizes the danger to the whole people in the power of four men, whoever they may be and however wise, who lead the trainmen's brotherhoods, armed with a strike vote given merely to support them in negotiations, to tie up the railroad transportation of the country and to throttle the life of the nation. The bill therefore provides means for promoting the just settlement of all railroad labor disputes through tribunals created by the bill; and, this done, it prohibits strikes under severe penalties by provisions that are undoubtedly consistent with the constitution. The Association of Railway Executives has taken no position upon this question, because it relates to disputes between the companies and their employes, and it is for the public to determine what measures it will take, and how far it should go, in protecting itself against the results of such disputes, in the form of strikes or otherwise.

The Cummins bill also contains rather elaborate provisions with reference to the merger or consolidation of the railroads of the country into from twenty to thirty-five competing systems—voluntarily for seven years, and thereafter compulsorily. I do not believe the plan is workable, but as its operation is not immediate and as experience and time will demonstrate its defects before the plan becomes obligatory, it need not be discussed here.

The bill contains many other provisions of a wise and far-seeing nature, and in my judgment it would go a long way in solving the railroad problem, but for one feature, which I believe would be fatal:

The bill proposes that for the first time in the history of this country, Congress shall declare that railroad owners shall not be entitled to the earnings they may be able to save out of rates which the Government itself prescribes. Hitherto it was supposed that the duty and power of the Government were to determine the rates which the carrier should be entitled to charge and the shipper required to pay. With the rates once fixed by the Government, it was supposed that all carriers in the district could seek the business and each would be entitled to all that it could make and save through ability, enterprise, efficiency, economy and otherwise. But the Cummins bill makes a novel and radical departure by providing that no railroad company shall retain out of the earnings it my save under rates which the Government itself authorizes or approves in the manner provided in the act, more than "a reasonable return on its *property investment.*" It then proceeds to declare in effect that 5½ per cent on the "value" of the property as determined by the commission is a "reasonable" return, and confiscates all in excess of 6 per cent upon such value. But it allows the company to retain one-half of its savings between 6 and 7 per cent and one-fourth of its savings in excess of 7 per cent, to be put in a "reserve fund" until the reserve funds amounts to 5 per cent of the value of the property—the reserve fund to be drawn upon for dividends or interest in years when the savings amount to less than 6 per cent. After such reserve fund amounts to 5 per cent of the value of the property, the carrier is allowed one-third of its earnings in excess of 6 per cent.

Except these fractions, all earnings and savings of the company in excess of 6 per cent on the value of its property as fixed by the commission, are to be paid over by the company to the government within four months after the end of each year, to be used by the government.

> "in furtherance of the public interest in railway transportation by carriers subject to the act to regulate commerce, and avoiding congestions, interruptions or hindrances to railway service * * * or in furthering the public service rendered by them, either by way of purchase, lease or rental of transportation equipment and facilities * * * or by way of loans to such carriers," etc.

whatever such clause may mean.

Whether the "value" referred to in such limitation of return is the "book value" or the value which the commission is already engaged in making is not clear. In one paragraph the provision is that no carrier shall retain more than a reasonable return upon its *"property investment,"* which undoubtedly means the investment, whether good or bad, wise or foolish, and regardless of real, intrinsic or earning value. In another paragraph the provision is that the "commission shall from time to time determine the value of the property in each district and rate making group." A literal construction of these two paragraphs means that for rate making purposes by groups, the commission should determine the value, but that for limitation of earnings of individual roads, the "book value" should be the guide.

But the most extraordinary provision is that commanding that the Interstate Commerce Commission

> "shall, so far as practicable, adjust rates, fares, charges and classifications that the net operating income of the several carriers shall bear the same relation to the value of their respective properties."

That is to say, that the commission shall disregard earnings, efficiency, ability of management, economy, wise expenditures in development, location of line, volume of business, and every other consideration entering into and ordinarily

controlling relative values of properties in the every day, common sense transactions of men, and shall instead observe a rule which is never observed by anybody. To the extent of "property investment" or to the extent of "value" as determined by the commission (which, according to the tentative valuations thus far filed by the commission, means "junk" value—as so many second hand ties, rails, bridges, structures, engines, cars, etc.—and not a going *railroad*) it shall be the lawful duty of the commission under this provision to manipulate "rates, fares, charges and classifications" so that the value of a low grade, highly efficient, first located line, and the value of another line in the same group but located well up toward the top of the Rocky Mountains, with steep grades and high costs shall be equalized; and that the value of every modern and highly efficient railroad shall be equalized with the most inefficient and unprofitable railroad in the same territory! Obviously this equalization can be accomplished only in one of two ways—either by raising the value of the inefficient or reducing the value of the efficient lines. The value of the inefficient can be raised only by raising the rates to a point where sufficient net is realized or by giving them in some form a share of the savings of the efficient lines. In any case, the inevitable effect of such provision, if it be possible for the courts to regard it seriously, will be to ruin the credit of the railroads by which the great bulk of the business of the country is and must be transported. I am as confident as one can be of a legal proposition that the courts will annul the provision as confiscation prohibited by the fifth amendment of the federal constitution. But the damage to railroad credit from the willingness of Congress to enact such legislation will be irreparable.

But that is not all. The same section provides that in 1925 and in every fifth year thereafter, the commission shall determine what, under conditions then existing, constitutes a fair return, and that it may "increase or decrease the five and one-half per centum basis herein prescribed or the basis for the determination of excess income." So that the commission at such periods hereafter is at liberty under the bill to determine that 6 per cent upon the value is too high a rate, and that 5 per cent, or 4 per cent, or a lower rate is enough for a railroad investor, and that all net earnings in excess of such lower rate should be forfeited to the Government.

Is it conceivable that the money necessary to provide the railroad facilities which this growing country needs—generally estimated at not less than one billion dollars per annum—will be obtainable from investors under legislation of this sort? The whole world is borrowing—governments, municipalities, railroads, steamships, industries, mines and enterprises of every kind. The rest of the world realizes as never before that credit—fidelity to financial obligations—is something that every people must sacredly guard at all times in order to obtain means in emergencies. Opportunities for safe and profitable investments are almost unlimited and are bound to continue so for many years. Profits on industrial, commercial, financial, mining and other enterprises in our own country are unrestricted and most attractive to our investors. It is with such competition as this that railroad executives must contend for the money necessary to maintain and increase our transportation facilities. The best railroads, under the legislation proposed, could offer a return of only only six per cent on the value of their property, and even that return only in case it is earned, for, mind you, the bill does not propose that the Government shall guarantee the return. As a matter of fact, money everywhere is today worth more than 6 per cent, and the strongest railroad companies cannot sell their securities now on a 6 per cent basis. It is in the face of these facts that the bill proposes to confiscate all the company earns in excess of 6 per cent. Thus a measure designed to reassure investors and attract new capital to railroad enterprises defeats itself by discriminating against investments in the railroad business by confiscating all the rewards of wisdom in investing and efficiency in operations.

As part of the plan the same section 6 of the bill provides that

> "The commission shall initiate, modify, or adjust rates, fares, charges, and classifications, as nearly as may be, so that the railway carriers as a whole allotted to each district and subject to this act shall earn an aggregate annual net railway operating income equal, as nearly as may be, to 5½ per centum upon the aggregate value, as determined in accordance with the provisions hereof, of the railway property of such carriers in the district held for and used in the service of transportation."

Of course this includes the railroad that operates at a loss as well as the railroad that earns a surplus, the road that should never have been built as well as the most useful line, the badly managed as well as the best managed railroad, for all in the district or group must be included and rates made sufficient to yield the specified return on the "aggregate value" in the rate group. I have already pointed out that the "property investment" in one sentence of the bill is taken as the basis for limiting the return, and that in another sentence in the same section, the commission is empowered —without any guide—to determine the "value" of the railroad property. As indicated by the tentative valuation reports thus far filed by the commission, that body takes the estimated reproduction cost of the elements entering into the railroad, such as rails, ties, bridges, buildings and other structures, cuts, fills, etc., less depreciation—or what I have called a "junk" value, rather than the value as a going railroad—as its guide of value; and according to that method an unwisely built and improperly located railroad operating at a perpetual loss might be valued even higher than a wisely built and profitably operated line. But if "property investment" is to be taken as the guide, the more overcapitalized a railroad has been, the greater would be its value, for, until the bookkeeping rule was changed by the commission in very recent years, all securities issued were carried in the property investment account by most companies at par, regardless of the price received for them. It certainly will be a number of years before the commission can complete the valuation work upon which it is already engaged; and advocates of this scheme outside of Congress urge property investment as the basis of such value.

The promoters of this scheme, before it was incorporated in the Senate bill recognized that it would involve a very substantial increase in rates, and in order to lull the people into submission, they devised the plan of confiscating, in the manner and to the extent above described, the net earning of the wisely built and developed and well managed railroads in excess of 6 per cent. They assumed apparently that the controlling objection on the part of the people to an increase in rates was that some roads would be able to save more from such rates than others and more than a moderate profit. But what will it profit the shippers for the Government to confiscate the earnings in excess of 6 per cent, as proposed by this bill?

The amount is not returned to the shippers. It in no wise reduces the rates they pay. It goes into a fund for the very vague railroad purposes indicated by the provision hereinbefore quoted from the bill. The leading advocate vehemently denies that the amount is for the benefit of the weak lines. The shippers are to go on paying the high freight rates in order that the so-called "weak" lines, however inefficiently managed or improperly built, may get increased revenue in that way, but are expected to be lulled into acquiescence by the delightful reflection that the inherently

valuable and efficient railroads shall not be allowed to retain the benefit they get from the increased charges.

This assumption involves two fundamental mistakes: The first is that the people are willing to pay more than a reasonable rate in order to reward improvidence or mistakes or misfortune in locating and building railroads, or possible inefficiency in management and operation (for all the risk of these is put upon the public by the bill in dealing with *net* earnings); and the second is that the people of this country are unwilling to reward wisdom in construction and development, and efficiency in management and operation of railroads —the property in the success of which the public at large is more interested than in any other class of property existing.

I deny that our people are in favor of confiscating the net earnings of a railroad company saved by it out of reasonable rates established or approved by the Government itself. The people are interested in the rates they pay—not in what the carrier by economy, efficiency, wise foresight or otherwise, is able to save out of such rates. Our people view with complacency, and indeed approval, large earnings by well managed banks, manufacturing industries, commercial institutions and enterprises of various kinds, out of prices and rates fixed by themselves—free from regulation by the Government. How preposterous then that the people should object because some railroad companies by wise foresight and good management in competition with others should be able to make out of rates made—not by themselves but prescribed by the Government itself—a profit much less than that commonly made in other lines of business. That, too, when the people are enormously interested in the maintenance and development and increased efficiency of railroad transportation, which is a necessity for all—whereas the success or failure of the other enterprises are not matters of such vital public concern. The cloud of fiction and prejudice which has so long befogged this aspect of the railroad question is vanishing and the people are learning that, if private capital is to supply railroad facilities, it must receive as fair treatment as that employed in other and much less necessary enterprises.

It is not the weak roads that transport the country's commerce. It is not the weak roads on which the traffic becomes congested. Many of the "weak" roads are weak because they serve territories which, for various reasons, afford little traffic. But they are giving the service which the traffic justifies and requires. Some are weak because they are in competitive territory, and their rivals, through more fortunate location, or accessibility to industries, or for other good reasons, are more convenient and satisfactory to shippers and therefore able to get the business. Others are weak as a result of mistakes in policy, unsound financing or bad management; and others are weak because building in the first instance never was justified by the traffic obtainable, and was merely a speculative effort.

It has seemed almost impossible to attract sufficient attention in this connection to the supremely important fact that the country's transportation service is performed by the "strong" lines and not by the "weak." The industries are located on the strong lines; and such lines, by location and otherwise, are best adapted to the business. Their growth and development have been more in conformity with the needs of the traffic. They serve better the convenience and requirements of the people. It is the strong lines to which traffic inevitably flows, and upon which congestions occur. The congestion of traffic in 1917-1918 did not occur on the weak roads, but on the strong. Very few of the weak lines were taxed except with the overflow of traffic in excess of what the strong lines could handle. This was because the bulk of the traffic is normally on the strong lines; and this tends to make them strong. The most prominent exceptions to this are certain of the New England lines and certain large bituminous coal carriers.

Without speaking definitely from statistics, I feel safe in asserting that not less than 80 per cent of the railroad traffic of the United States in transported by railroad companies which regularly pay dividends. Their credit depends upon the continuance of such dividends. Their stocks are held by hundreds of thousands of individuals—many representing the savings of almost a lifetime. Unless such dividends are continued—and indeed practically assured—it will be impossible for these companies, so situated as to be called upon to handle the great bulk of commerce of the country, to obtain the money for improvements and development required to meet the needs of our growing commerce. It was the commission's policy of stationary and inflexible rates in the face of increasing wages and other operating costs, and the conflicting regulations of the various states, that made investors anxious about the stability and continuance of dividends, and deterred many of the strong railroads from making the improvements, additions and extensions which all now know to be necessary. The fact undoubtedly is that it is the strong roads upon which the bulk of the business naturally falls that need the additional facilities, and it is the strong roads whose credit must be conserved if such facilities are to be provided.

Hence I protest against the confiscatory provisions of section 6 of the Senate bill, as not only failing to provide for the transportation emergency confronting the country, but as making it infinitely worse by attacking for the first time in the history of this Government—not the transportation rates to be charged the shipper (which the Government may and ought to prescribe) but the *net* saved out of such rates, which is as much the private property of the stockholders as the money and assets in the treasury, and by seeking to bring the valuable and the worthless, the important and the unimportant, and the efficient and inefficient railroads to a dead level.

To base rates upon "property investment," as advocated by representatives of some of the "weak" lines, or upon the separate appraisement of the different elements entering into the construction and making up the physical structure, as seems to be the method thus far adopted by the commission in its valuable work, undoubtedly will require radical changes in the rate structure and the rate relations now existing, which represent growth and commercial needs for generations, and to which commerce is adjusted. And it is a false and wholly arbitrary basis.

Further increases of freight rates undoubtedly are necessary, as the Government's own experience with the railroad shows. No well informed person expects railroad wages to be materially reduced under existing conditions; and the prospect of material reductions in the prices of fuel and other supplies for many months is certainly not encouraging. Added to this must be the expense of traffic organization and soliciting agencies incident to a restoration of competitive conditions, which were not necessary during federal control. Hence large deficits from operations—like those suffered by the Government—confront nearly all the railroad companies unless freight rates are further increased very substantially.

The practice and only effective method of making such increases is to take the rates as they exist and base upon them such increases and adjustments as may be necessary to meet the increased wages of labor, the increased cost of material and other operating expenses and taxes, and provide a return on the new capital that has been put into the properties in such enormous amounts and which must be provided for the future. The commission should be left free to consider new rates from time to time, so as to adjust the revenue to the changing expense of operation, the rise and fall of wages and prices, and the expenditure for new capital. So far as it becomes necessary to consider the value of the railroads: the average earnings during a series of years, taking into

account the conditions then existing, plus a fair return on the new capital expended for betterments, additions, equipment and extensions, is economically and in sound common sense the rule that ought to be followed.

A railroad is legitimately worth nothing to its owners except what it can earn and pay in the way of interest and dividends. True, earnings depend in large measure upon the rates a carrier is allowed to charge, and these rates in turn may be fixed by the government so long as they are not confiscatory. But our railroad rates have been under Congressional regulation since the creation of the Interstate Commerce Commission in 1887. Since 1906 at least, the commission has had power and has effectually exercised it, to reduce rates when found too high, and railroad earnings have been open to the commission and the public. No one can justly claim that our railroad rates as a whole, or in any substantial territory, or on any important line, have been too high. The fact is that they have been too low. Under this system, railroad values have worked themselves out. Railroads that could earn net returns have demonstrated their ability, and those that had little earning capacity have been disclosed—all under rates for which the government is responsible. The securities of all these roads have been bought and sold at prices based upon their demonstrated earning capacity, and are today held by those who bought at such prices. The prices of these securities are the evidence of popular judgment of the relative value of these railroads—as one compared with another—and these values were based upon net earnings made under rates that the roads were allowed by law to charge. The government should not, and consistently with fair dealing cannot, question the value of the railroads as demonstrated through many years by rates established by or under the regulation of its own agencies. New money has been put into the properties by investors for additions, betterments and equipment, thus increasing the transportation facilities—which it would be the duty of the government itself to provide, if not furnished by private capital; and much of this capital has been too recently invested to be yet reflected in increased earnings. It is upon such considerations as these, with the values established under earnings from rates prescribed or sanctioned by law for years, that rates should be based, and not upon "property investment" or upon the value of so many second-hand ties, so many second-hand rails, bridges, structures, etc., etc.

One point more: Both the Senate bill and the House bill recognize the obvious necessity for increases in railroad rates, and contemplate immediate application therefor by the carriers to the Interstate Commerce Commission, in the meantime continuing to a greater or less extent—as already pointed out—the present guaranty for five or six months, within which it is assumed such increases may become effective. But both bills carefully refrain from preventing any state railroad commission or legislature from immediately reducing state rates, thereby depriving the carrier of revenue which the government itself has been collecting during federal control. More than that, such changes in state rates generally affect interstate rates and often disturb a wide and important interstate rate structure. Often a railroad company will not dare to increase an interstate rate unless it knows that a corresponding increase will be made in a competitive state rate. How will the railroads be able to carry out the increases which both these bills contemplate until they know what will be done by the state commissions with respect to state rates?

True, both bills give the Interstate Commission the power to review all state rates which affect interstate rates. But the Senate bill provides that before the commission shall hear or dispose of any such issue, it shall cause the state to be notified of the proceeding; it requires that the commission "shall confer with the authorities of any state having regulatory jurisdiction," etc., with respect to the relation between rates, fares, charges, classifications, regulations or practices of carriers, etc.; and also "to hold joint hearings with any such state regulatory bodies on any matters wherein the commission is empowered to act where the rate making authority of the state may be affected by the action of the commission." It is only "after full hearing" that the commission may make any order removing interference of the state rate. It is obvious that the delay in the adjustment of such differences under the provisions of this bill would be disastrous to railroads suffering for revenue. The provision of the Esch bill upon the subject is much to the same effect, but admits of more prompt action with respect to the matter by the Interstate Commerce Commission than is possible under the provisions of the Senate bill.

Foremen in Mechanical Department Classed as Officers

Because of the exceptional importance of the work of supervisory foremen in the mechanical departments, and the fact that economical and efficient shop operation depends so largely upon their efforts and co-operation, W. T. Tyler, director of the Division of Operation, has issued a circular letter to the regional directors stating that it is desired that their classification, working conditions and privileges be made definite and uniform.

To that end the director general directs that general foremen, roundhouse foremen, departmental formen and assistants will be classified as officers and will be given consideration and advantages attaching to officers of similar rank in other departments, as follows:

(A) Reasonable period of time lost on account of sickness without loss of pay.

(B) Two days off each month for all salaried foremen whose tour of duty consists of seven days per week.

(C) Two weeks vacation a year with pay for all salaried foremen who have acted as officials continuously for one year or more.

(D) Privilege of resigning instead of being shown as discharged or dismissed.

(E) When charged with an offense likely to result in dismissal, a hearing to be given by a superior officer other than the immediate superior, at which hearing the foreman in question may be represented or assisted by any other foreman whom he may select for that purpose.

(F) Card transportation to be granted to all salaried foremen, the extent of such transportation to be based on the general practice for other division officers and the importance of the position the foreman occupies.

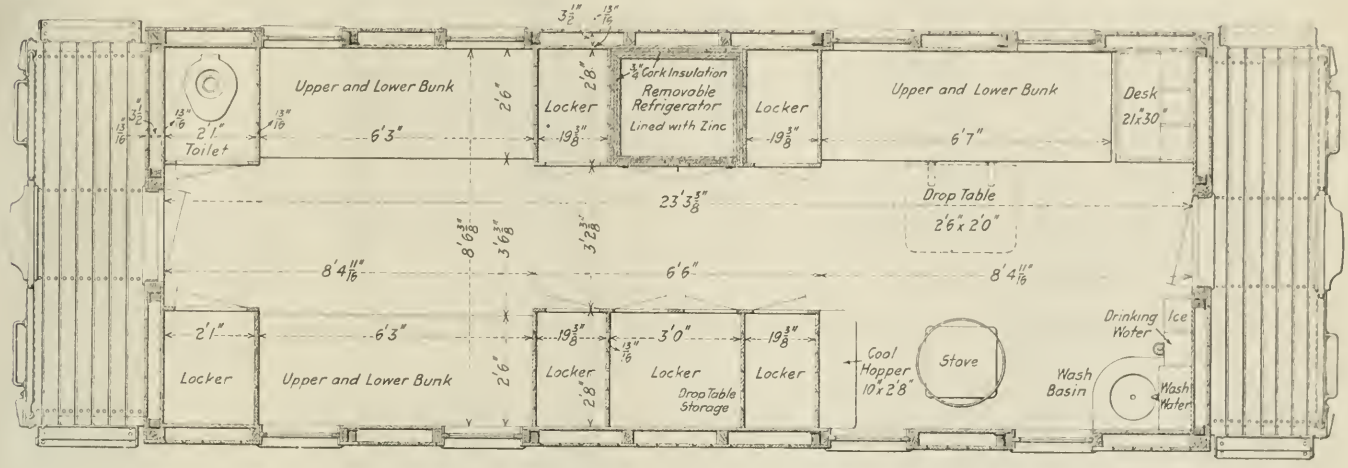
The letter says: "It is not possible to lay down a definite seniority rule because ability and merit are of paramount importance in this highly responsible work and, in any event, must govern, but where the ability and merit of two men are equal, the choice of positions on a division should, as far as practicable, be determined upon the basis of seniority. I am sure that the uniformity brought about by the above rules will result in more loyal and efficient service by the foremen affected and will reduce complaints to a minimum. Will you please take necessary action to have this put in effect in your region at once."

The California Railroad Commission has extended to October 1, 1920, the time in which the San Diego Electric Railway may dispose of the bond issue of $4,478,000 authorized by the Commission in October, 1914.

Approved Standard Design for Caboose Cars

Railroad Administration Issues General Drawings for Caboose Cars of the Composite Type

A STANDARD DESIGN for railroad caboose cars has been prepared and is recommended by the Railroad Administration for general use in the future construction of such cars in the United States. The laws of the various states, many of them conflicting regarding the construction of caboose cars, make it desirable to have a standard design that will meet the legal requirements of any of them. The proposed design is offered by the Railroad Administration in the hope that the railroads will conform to a general design and thus gradually eliminate cabooses of weak construction or faulty design. The proposed design is a 24-ft. caboose of the composite type, having a steel underframe and superstructure, with wood outside sheathing and interior finish.

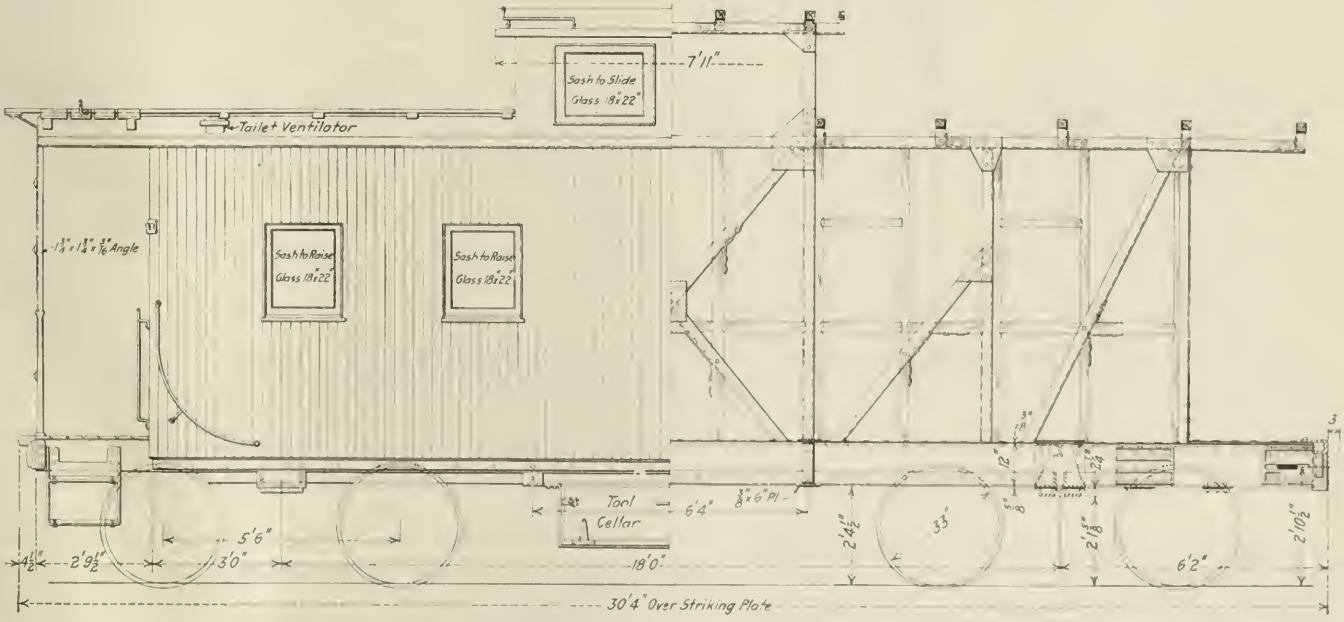


Floor Plan of Proposed U. S. R. A. Standard Caboose Car.

The body framing is built up of 3-in. by 3-in. by 5/16-in. angles, the side and end posts being adequately braced by angles of the same size and with gussets of ¼-in. steel plate securely riveted at the side sills and top plates and at intermediate points on the side posts.

The Superstructure

The carlines are of the composite type, with 2½-in. by 2½-in. by 5/16-in. angles, formed to a 24-ft. radius and secured by rivets to the side top plates. The cupola frame is constructed of 3-in. by 3-in. by 5/16-in. angles, with the same type of carline that is used on the main body framing. The roof may be a canvas or plastic covering over roof boards secured to the carlines. Wooden filler posts and plates are secured to the angle iron frame, and to these the 13/16-in. inside and outside sheathing is secured.



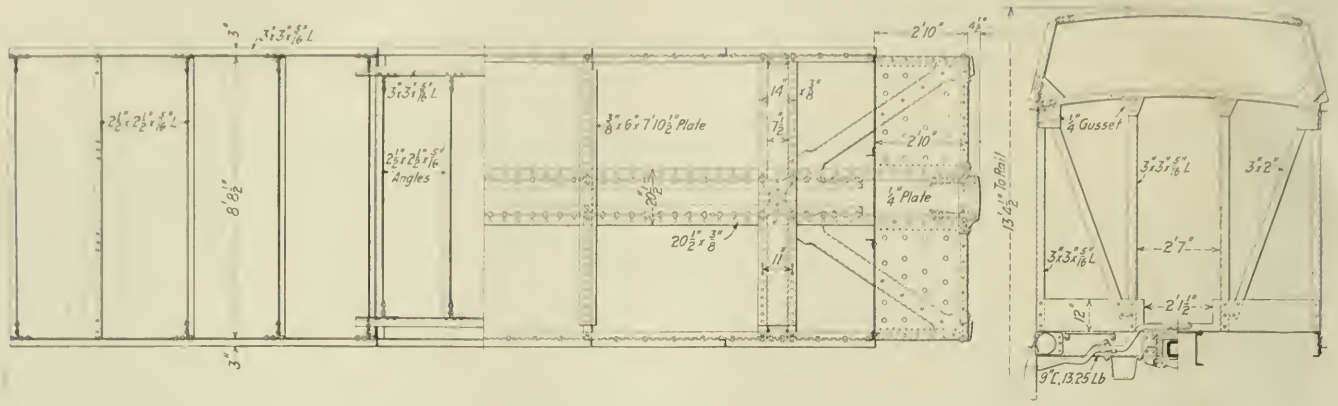
Side Elevation of U. S. R. A. Standard Caboose Car.

The floor space is 23 ft. by 33⅛ in. by 8 ft. 63⅛ in. inside of the sheathing, with a clear space of 3 ft. 23⅛ in. at the closest

point in the aisle between the interior fittings. Two upper and two lower bunks, 6 ft. 3 in. by 2 ft. 6 in., and one upper and one lower bunk 6 ft. 7 in. by 2 ft. 6 in. are conveniently located. The upper bunks fold upward against the car-lines, giving ample headroom above the fixed lower bunks, which can be used as seats when not in use for sleeping purposes. The conductor's valve, train indicator and air gage are located in the cupola, and seats are provided in each side of the cupola for observation purposes. The headroom in the main body of the car is 7 ft. and in the cupola 9 ft. 2 in. A desk is provided, so located that one end of a whistle at both ends of the car. The uncoupling apparatus is connected by a chain to the platform rail, so that the car may be uncoupled without leaving the platform.

The Underframe

In order to withstand the severe service in which many cabooses are used, where there are heavy grades and pusher service, the underframe is of unusually strong construction. The center sill is built up of 12-in. 34.2-lb. shipbuilding channel, with a 3½-in. by 4-in. by 7/16-in. angle riveted to the bottom inside edge of the channel for the entire length



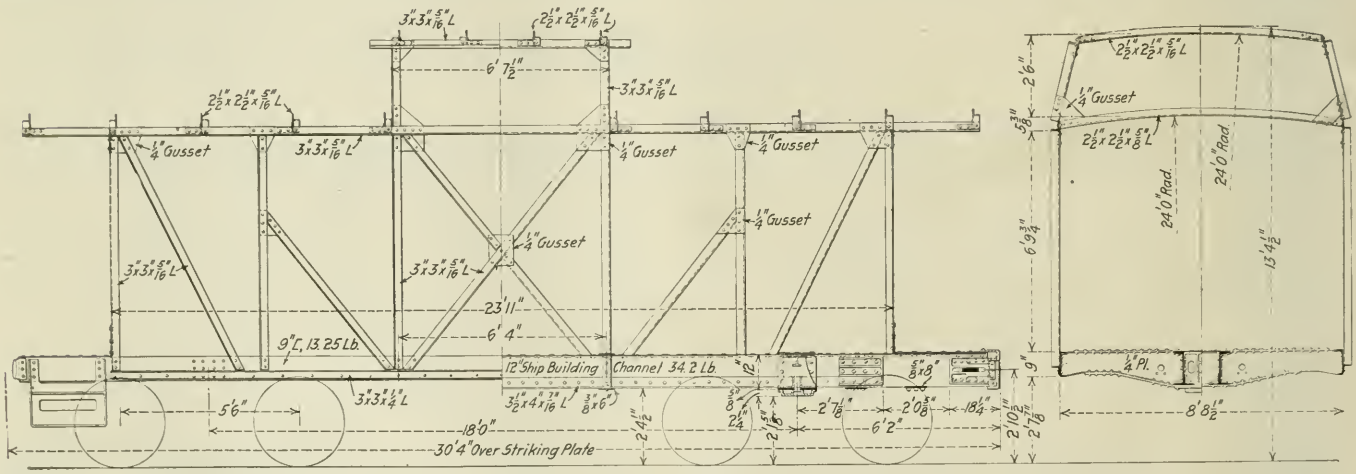
Plan of Underframe and Plan and End View of Body Framing of U. S. R. A. Standard Caboose Car

lower bunk serves as a seat. The tank for wash water, the wash basin and a drinking water tank are conveniently arranged in one corner of the caboose. A refrigerator, numerous lockers and drop tables, a toilet and a coal stove for heating the car complete the equipment.

There are four windows in each side of the car (18 in. by 22 in. glass) which may be raised; there is a window having a glass area of 10 in. by 28 in., with an upper drop sash, in the door at each end, and four windows with sliding sash having glass 18 in. by 22 in. in the cupola. The floor consists of 1⅜-in. rough flooring, a half-inch layer of cork covered with a waterproof paper, and a 13-16-in. top flooring. A platform of ample width, formed of ¼-in. steel plate with wooden cleats laid crosswise of the car, is provided at each end. The roof canopies over the platform, thus giving some protection from the weather. Handholders, ladders and steps are placed in the most convenient locations. A ratchet hand brake is applied and provision made for the application of a back-up signal

of the sill. The top cover plate is of ⅜-in. steel plate 20½ in. wide. The side sills and end sills are made of 9-in. 13.25-lb. channel section, the side sills being reinforced on the outside with a 3-in. by 3-in. by ¼-in. angle, which also serves as a support for the side nailing strips. The body bolster diaphragms are formed of ¼-in. pressed steel plate, with a 3-in. flange. The top bolster cover plate is of ⅜-in. and the bottom cover plate of ⅝-in. steel plate, both 14 in. wide. The two intermediate crossbearers are of ¼-in. pressed steel plate, with a ⅜-in. steel top and bottom cover plate 6 in. wide. Diagonal braces at each end give additional rigidity to the underframe, and it should meet the requirements of the most severe service. The draft sills are designed to permit the application of any of the standard draft gears. A tool cellar of ample size is secured to the underframe.

The car trucks recommended by the Railroad Administration are of the four-wheel type, with cast steel bolsters and side frames, and have a 5-ft. 6-in. wheel base. The



Side Elevation and Cross Section of Steel Frame for U. S. R. A. Standard Caboose Car

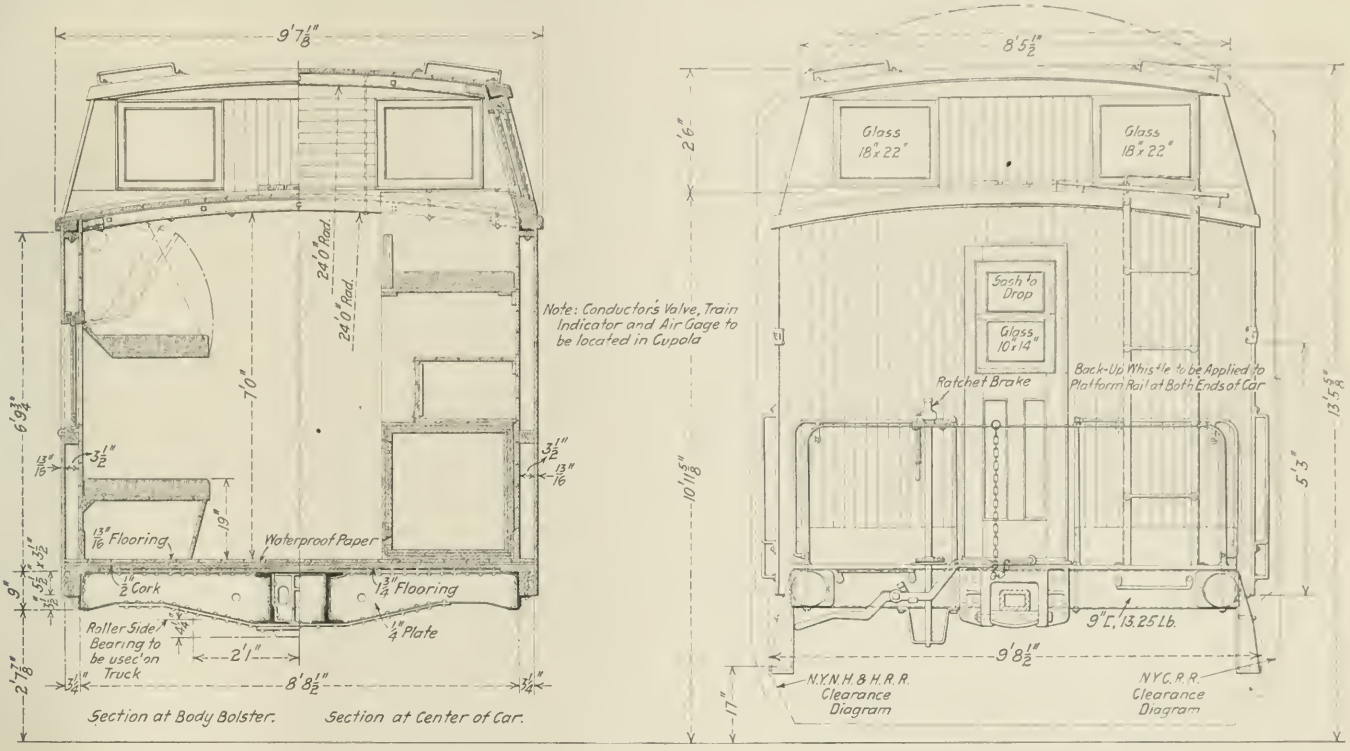
wheels are 33 in. in diameter, mounted on axles having a 4¼-in. by 8-in. M. C. B. journal.

General Data

Length over striking plates	30 ft. 4 in.
Length over body framing	24 ft. 0 in.
Width over body framing	9 ft. 2½ in.
Width over side sills	8 ft. 8½ in.
Height from rail to top of main roof	11 ft. 1 in.
Height from rail to top of cupola roof	13 ft. 4½ in.
Diameter of truck wheels	33 in.
Wheel base	5 ft. 6 in.
Distance center to center of trucks	18 ft. 0 in.

This design is made to conform to the laws of all of the states except those of Missouri, which differ radically from those of the other states. It is intended to prevent the agitation of railway employees for state laws which, if adopted, might make it impossible in such states to use cabooses that are lawful in other states and would result in the poorest cabooses collecting in those states having no stringent laws on the subject.

No attempt has been made by the Railroad Administration to specify all of the details of construction, but only to provide a general design for common use by the various railroads.



End Elevation and Cross Sections of Steel Frame for U. S. R. A. Standard Caboose Car

---

Economic Resources of Poland.—The first number of the Polish Economic Bulletin, which is being issued by the Commission Internationale de Ravitaulement, gives a large amount of information as to the economic resources of Poland, from which it appears that in 1913 the yearly production of the oil industry was 1,632,000 tons. The output of coal was 58,006,000 tons, and that of manufactured iron was nearly 1,600,000 tons.

The California Railroad Commission, in its annual report, recently issued, says that steam railroads earned approximately $135,620,000 in California during 1918, as compared with $125,250,000 in 1917. In 1918 they paid out in operating expenses, exclusive of taxes, approximately $104,920,000 in California, as compared with $81,400,000 in 1917. The net operating revenues in 1918 is reported at about $30,700,000, as compared with $43,850,000 in 1917. Annual financial reports of 62 steam railroads were filed with the Commission during the year.

Weekly Traffic Report

According to a report on traffic conditions for the week ended December 8, 1919, made to Walker D. Hines, director general of railroads, the revenue freight loadings and receipts from connections for the various regions were as follows:

Eastern region—Revenue freight loaded, 180,085 cars, as compared with 177,612 for corresponding period last year; receipts from connections, 229,759, as against 227,108 in 1918. Allegheny region—Revenue freight loaded, 163,965, as compared with 171,068 in 1918; revenue freight received from connections, 149,295, as against 160,736 in 1918. Pocahontas region—Revenue freight loaded, 39,507 for the week ended December 4, 1919, an increase of 1,770 over preceding week; received from connections, 16,051, a decrease of 104 cars over last week. Southern region—Revenue freight loaded, 107,573, an increase of 2,556 over last week; received from connections, 77,087, an increase of 9,077 over last week. Northwestern region—Revenue freight loaded, 104,350, a decrease of 39,289 under last week; received from connections, 65,503, a decrease of 2,227 over last year. Central Western region—Revenue freight loaded showed a 5 per cent decrease as compared with last year; receipts from connections, 60,762, an increase of 8 per cent over last year. Southwestern region—Revenue freight loaded, 54,251, as against 46,093 last year; receipts from connections, 49,308, an increase of 9,557 over last year.

A summary of the report follows:

Eastern region—Freight traffic has begun to be affected to a considerable extent by the coal situation, which has already interfered with the improvement that has been going on in traffic to and from iron and steel industries. Reports from Chicago and Chicago junctions show the Eastern region received 81,522 cars coming from the East during the month of November, compared with 63,069 November, 1918; 95,671 loaded cars forwarded to the East, compared with 95,794 last year. In view of the bunker coal situation traffic control managers have been instructed that export freight

only is to be transported in vessels of the United States registry. Total carloads of export freight at New York other than bulk grain and coal, 11,532; about 1,500,000 bushels of grain in elevators or boats and about 525,000 in cars. Arrangements have been made for considerable cut in passenger train and car service, but it is, of course, impossible to say as yet what the effect will be in the amount of travel.

Allegheny Region—Conditions with respect to the coal distribution have changed in the past week, which should permit of a greater run of empty equipment through the Pittsburgh gateway. Blast furnaces in the region during the week ending November 29 had 107 stacks in blast, 84 being out of blast, an increase of 2 as compared with last week. The strike of bituminous coal miners continues, and there is noted a falling off in the production as compared with the preceding week. Full car supply has been maintained the entire week in the anthracite and bituminous fields. Coal dumped at tidewater piers decreased 94,312 tons, and there is a reduction of 243 cars under load in terminals. Coal dumped at lake ports reflected an increase of 21,228 tons, with a reduction of 140 cars held under load. During the week ending November 29, which covered the Thanksgiving period, passenger travel was exceedingly heavy.

Pocahontas Region—Tidewater coal dumping decreased 2,071 tons under last week. General movement increased 3 per cent over last week and 8 per cent over same period last year. The movement of coal and coke continues above normal, although the increase over previous week is not so pronounced or in the same ratio as the increases of the past few weeks. Loaded cars from connections also show some improvement. All in all, the past week was generally satisfactory and car supply was ample, Passenger travel normal; earnings, however, show a considerable decrease over November, 1918, figures.

Southern Region — The total number of cars handled shows a decrease of 10,487 cars under last week's figures. Grain and grain products decreased 14 per cent, live stock 13 per cent, coal and coke 41 per cent, ore 2 per cent. As compared with last week, grain and grain products decreased 17 per cent, live stock 20 per cent, ore 16 per cent, and miscellaneous traffic 10 per cent, while coal and coke increased 14 per cent. There was some increase in the number of furnaces in blast in the Gadsden district. The cotton mills are operating on full time and receipts are largely in excess of those of last year for the same period. Passenger travel has been very good for the week. Tourist travel increasing. There has been some reduction in the volume of passenger travel, due to restricted service and the apparent disposition on the part of some to avoid travel during the coal shortage. The total, however, shows a slight increase over last year.

Northwestern Region—The reduction in loading by non-essential industries was responsible for a decrease in revenue loading, which, while below that of last week, was a slight increase over same period last year. General business conditions continue good, but the coal strike and severe weather conditions during the past week have curtailed movement somewhat. So far few industries have had to restrict their operations on account of shortage of coal, but it is expected that a large number may be affected the coming week. Merchandise movement continues in good volume, while Christmas stock is moving in large quantities. With the exception of refrigerators, for which there is a heavy demand throughout the region, the car situation shows some improvement. During the week 11,451 cars of coal were loaded, all of which consisted of dock coal. Cars are being furnished for this loading in preference. The light movement of iron ore represents the season's clean-up, and the few vessels now loading will take all that is in the docks.

Central Western Region—The week ending December 2 shows a heavy decrease in coal and ore loading, which resulted in a 5 per cent decrease in the loading of all freight as compared with last year's figures for same period. Coal production in the region, about 23 per cent of the output of November last year. No change from the previous week is noted in the supply of empty equipment, but cold weather and storm conditions will tend somewhat to slow up the movement of empty cars. The wheat acreage sown in New Mexico this year is reported as being 35 per cent greater than last year. From present indications the total citrus crop to be moved from California this season will amount to over 40,000 cars. Passenger travel for the past week has been very heavy, and considerable extra equipment was required during the Thanksgiving day period. The heavy movement to California continues, necessitating the running of double sections on nearly all trains.

Southwestern Region — Considerable improvement has been made in moving sugar from Louisiana, and the accumulation due to light car supply during the first few days the refineries were in operation is being rapidly disposed of. With the exception of the usual movement of lignite coal from Texas mines which has not been interfered with, coal mining is practically at a standstill. Some coal is, however, being taken out of strip pits in the Pittsburgh district of Kansas by volunteer miners. During the week railroads in this region have been working under instructions to furnish 75 per cent car supply for movement of cotton from compresses and, due to the necessity for affording further relief, instructions have now been issued to furnish 100 per cent. Refrigerator equipment is being provided to protect the winter vegetable movement, which will increase from now on. Regular passenger travel was heavy during the week; adequate equipment was in all cases provided. There is in prospect very heavy travel during the Christmas holidays, and arrangements are being made with a view to giving the operating department advance notice of the traffic to be moved, so that adequate equipment can be provided.

Fuel Situation—The decreased production over last week owing to the Thanksgiving holidays, combined with the increased requirements of certain industries, made necessary further restrictions in the distribution of coal, so that now distribution is strictly confined to very essential industries. All foreign flag bunkering has been discontinued, while the bunkering of American flag ships is by license. In the West the situation is more complicated because of the long haul in transporting coal from the Allegheny and Pocahontas regions. Car supply is excellent, the weak spots heretofore noted in this respect having been overcome.

The Morristown & Erie Uses a Motor Bus on Rails Between Essex Fells, N. J., and Morristown

The Senate Debate on the Cummins Railroad Bill

The Senators Show a Marked Interest in Learning the Sources of Various Propaganda

Washington, D. C.

Debate on the Cummins railroad bill was resumed in the Senate on Monday, December 15, with a plan for holding night sessions in an effort to expedite the passage of the bill during the week and under a notice served by Republican leaders that unless a vote is taken on the bill during the week it will be necessary to postpone the holiday recess proposed to begin on December 20. An unexpected amount of opposition to the bill had developed during the preceding week which raised some doubts in the minds of those who were trying to pass it as to whether the bill will be approved by the Senate unless it is radically modified, but efforts have been made to induce those advocating amendments to permit the bill to be passed in order that the differences may be threshed out by the conferees who will be appointed to reconcile the differences between the Senate and House bills and it was believed that the fear of losing the holiday recess might bring about a favorable vote on the bill. A very large number of amendments touching almost all phases of the bill have been submitted.

Senator LaFollette on Saturday resumed and concluded his speech in opposition to the bill, which had continued with some interruptions throughout the week, after which Senator Norris of Nebraska created a diversion by demanding an investigation of alleged propaganda on behalf of the railroads to bring about the passage of the bill. Senator Norris referred to the plan which has been announced by the Association of Railway Executives for a campaign of national advertising to begin shortly for the purpose of placing fundamental facts regarding the railroad situation before the public, but he interpreted it as being designed to promote the passage of the Cummins bill, notwithstanding the fact that a large number of the railway executives are strongly opposed to the bill. He presented a resolution, which was referred to the committee on interstate commerce, instructing that it make an investigation "for the purpose of ascertaining to what extent there has been organized in the country a propaganda to influence Congress in the passage of S. 3,288 * * * and particularly to ascertain the amount of money that has been expended and that it is contemplated to expend for such purposes by the Association of Railway Executives and to what extent such associations or others representing other railroads, or directly or indirectly representing the security holders, are using the newspapers of the country in an advertising propaganda for the purpose of bringing about the passage of said bill."

Senator Pomerene demanded that the scope of the resolution be broadened when it comes before the committee to include the propaganda being conducted by the Plumb Plan League against the bill. Senator Norris said that if any one thought that any other propaganda in connection with the bill should be investigated he would be glad to see the resolution amended to that end.

"I have reached the conclusion," Senator Norris said, "that there is quite a propaganda going on at the present time in the country with reference to the pending railroad bill. While I am not complaining of that and while I fully concede that all citizens or any group of citizens interested either for or against this or any other legislation have a perfect right to pursue any honorable means to advance their interests and have them placed on the statute books if possible, I think when such propaganda is apparent that the people ought to know just what is being done, how it is being done and, if possible, what it costs. I am offering the resolution and saying what little I shall say in connection with its presentation in that kind of a spirit. I am not complaining that the propaganda is wrong or that it is illegal, but I think the people of the country ought to know, if possible, who is behind it, who is interested in it and what it is costing."

Senator Norris then read from a copy of what purported to be an advertisement, signed by Thomas De Witt Cuyler, chairman, and a list of members of the Association of Railway Executives, headed as follows:

"To the American People:

"It is the declared purpose of the United States Government to restore the railroads at an early date to the control of their owners.

"The Association of Railway Executives represents those upon whom at that time responsibility will again rest for the prompt and succesful movement of the country's commerce.

"Those constituting this association are keenly conscious of their accountability to the public.

"They have accordingly determined to present as fully as they can the fundamental facts and considerations which they themselves must face in their efforts to provide satisfactory railroad service.

"It is hoped to engage the interest of the whole American people, whose welfare is so vitally dependent upon adequate transportation.

"The country can grow only as the railroads grow. The railroad problem must be solved—and solved rightly and soon—if our country is to prosper.

"It is to promote that prosperity—permanently and in the interest of the whole people—that railroad executives will present to the public the situation as they see it."

"I think that is a fair and honorable statement," said Senator Norris, "and I am not finding fault with what is said. I do not want any one to get that idea. I think, however, that the propaganda will go much further and that its indirect influences will be much greater than is outlined by the plan suggested in the paper which I have read. I take it that it is an advertisement that is going into the newspapers of the country."

He also read from an article by Frederick M. Kirby, which said that the railroads are about to spend a million dollars in six weeks "to educate the people and all the legislative and governmental officials of the United States" and "to inspire legislation favorable to private operation," and that the million would be spent before the end of December. He also read a resolution said to have been adopted at a conference of farmer and labor delegates at Chicago on November 21 and 22 stating that the authors of the resolution were reliably informed that the railway security holders have urged an active propaganda campaign through the press to cost over "ten million dollars" to secure the enactment by Congress of legislation to put into effect "the security holders' plan for the return of the railroads." The resolution did not state whether or not this plan had any connection with the million dollars to be spent by the railway executives.

Senator Norris also presented a statement by Benjamin C. Marsh, secretary and director of legislation of the Farmers' National Council, that he had been shown a quarter page copy of an advertisement to be issued by the Associa-

tion of Railway Executives and informed that the contracts for placing the advertisements were in the hands of Thomas F. Logan & Co., New York City, and that if he desired to get any advertisements for the Farmers' Open Forum he should communicate with that agency. Mr Marsh was informed that the railroad executives were planning to spend "hundreds of thousands and perhaps millions of dollars" in this advertising "to educate the people of America on the railroad situation." He had also been informed of contracts for these advertisements having been signed with the Newspaper Enterprise Association, but it had not yet received its copy of the advertisements. Senator Norris then called attention to the fact that Thomas F. Logan had testified during an investigation conducted by the Senate Agricultural Committee about a year ago to having received large sums from the packers and other large corporations for services in connection with advertising and publicity work.

Senator Pomerene said he had no objection to the resolution, but he would go a little further and would like to know the source of the propaganda against the bill as well as that for it. "I think," he said, "there has been some propaganda in favor of certain other proposed legislation which probably have been more satisfactory to the security interests, but when the so-called Plumb plan was presented it was heralded throughout the country that a fund of four million dollars was to be raised to defeat this legislation and to promote the so-called Plumb plan and secure its enactment. It seems to me that fairness to the public requires that there should be an investigation on both sides so that we may know who it is that is back of a proposition which requires the purchase of all the railroads of the country at the public expense, to be turned over to a certain class of employees."

Senator Norris said he had not heard of such propaganda but would join with the Senator in amending the resolution or helping to pass any other resolution to cover any other propaganda with relation to the bill.

"I recognize the fact that there is certain propaganda for or against any legislation that comes up before the Senate," said Senator Pomerene. "I am constantly receiving, as no doubt the Senator is, communications by wire and by letter demanding in the interest of the public that I vote either for or against certain legislation, all of which is inspired by lobbyists here in the city of Washington. I like to know what is going on and I like to see the wheels going around when it comes to propaganda either for or against any legislation. It is very interesting."

Senator King remarked that he had received many thousands of petitions and statements "demanding" that he shall vote for the Plumb plan, but that he had received only perhaps 10 or 15 in favor of either the Cummins bill or the Esch bill.

The amendment offered by Senator Myers to strike out the provisions for representation of the employees and of the public on railroad boards of directors was rejected on December 15.

An amendment offered by Senator Poindexter was adopted providing that where no agreement has been made by a carrier with the government for compensation, the President shall pay to such carrier the total amount of the standard return in all cases where such amount may be necessary to pay the interest upon bonds or other indebtedness of such carrier and such payment shall not deprive the carrier of the right to present its claim for additional compensation, to be determined as provided in the act.

Senator Thomas offered an amendment which was adopted providing that if any part of the bill shall for any reason be adjudged by any court of competent jurisdiction to be invalid, such judgment shall not effect, impair or invalidate the remainder of the act.

Senator Spencer of Missouri offered an amendment which was adopted after some discussion, providing for the creation of a special board of adjustment to pass on differences between subordinate officials and railroad companies concerning complaints, grievances and disputes, including questions of discipline and controversies arising in ordinary operation. The board would be composed of four members representing subordinate officials and four representing the carriers, organized in the same manner as the boards proposed for the adjustment of controversies with employees. The term "subordinate officials" is defined to mean those heretofore classified as such by the Railroad Administration which, Senator Spencer said, includes train despatchers, traveling auditors, yardmasters, claim adjusters and investigators, roadmasters, storekeepers and others of that class. Senator Cummins said the committee would assent to that amendment because, while it had intended to make the provisions of the bill applicable to all classes of employees, the language probably would not be construed to include the subordinate officials.

Discussion as to Return of Roads

The question of whether the railroads ought to be returned on January 1 aroused a lively discussion in the Senate on December 15 after Senator Lenroot had made a speech advocating his plan for a single railroad corporation not directly owned by the government, but under federal control and opposing the anti-strike provision of the Cummins bill. He said the railroads ought not to be returned until April or May and that if they were retained for that period the Senate would have more opportunity to consider the question. He said it did not seem possible that the President would take any such responsibility as that of driving the major portion of the railroads into bankruptcy, but he did not know what the President might do. Senator Smith of Georgia, said he had heard quite a number of senators say they are not satisfied with the bill and not ready to vote on it. He believed they would vote against it at the present time and he thought that a more satisfactory conclusion could be reached if the bill were allowed to go over until January. Senator Cummins pointed out that the Senate committee has been studying the railroad question for at least two years and that this bill was reported on October 23.

"The Senate will never be in a better position to consider the railroad question than now," he said. "The members do not usually give close, undivided study to a subject until it is imminent. I am sure that senators all have opinions with regard to it and to the general subject. It is of the highest concern that the bill be disposed of very soon for if it is not disposed of this week nothing will excuse senators, I think, from staying here and considering it during the holidays. I cannot with complacency think of having the disposition of this bill, or any other bill upon the subject, go over until after the first of January. If the bill were laid aside senators would lay aside the subject and would not take it up again until the bill came before the Senate."

Senator Smith said that, of course, if the railroads are to be turned back to their owners on the first of January without any legislation the situation would be very bad, but he could not think that possible. He thought the railroads ought not to be turned back before the middle of the spring.

Senator Watson said that some months ago the President had stated in unequivocal terms that he expected to return the railroads on the first of January. Since then there has emanated from the White House no statement to show that the President has altered his purpose or changed his intention. He thought it was incumbent upon the Senate to enact such legislation as will save the railroads from conditions that will inevitably result if they are turned back without legislation. Senator Smith retorted that he did not think

the Senate responsible for the situation which the railroads are in. He thought those upon the committee might well communicate with the President and "let him understand the labor of this work which is put upon Congress without any help from those who put it upon Congress."

Senator Watson replied that in company with Senator Kellogg he had visited the director general of railroads and asked him what the President intended to do about the railroads, whether they would be returned on the first day of January with or without legislation. Mr. Hines responded, he said, that he had placed the matter before the President, that he had made a report as the President had requested and that he had offered a suggestion, although he did not volunteer to state what the suggestion was, and that as soon as the President signified what his intention was he would let the senators know. They returned four or five days later and sought to ascertain whether or not he had received an answer, in order that Congress and the railroads might know precisely what the intention of the President is, but there had been no response.

Inasmuch as there has been nothing to negative the assertion that the President made some time ago, Senator Watson thought the Senate was warranted in believing that they will be returned whether legislation is passed or not. Senator Smith pointed out that the President had given no formal announcement by proclamation of the time the roads would be returned. Senator Cummins referred to a letter written by Mr. Hines to himself and to Chairman Esch of the House committee saying that it was impossible for the government to continue in the operation of the railroads unless Congress were willing to fix a definite time in which it would be sure that government operation would continue and to make the necessary appropriations.

"The director general," he said, "cannot make contracts, or hesitates to make contracts that must be made for supplies for the coming year. There must be millions of ties bought and they ought to be bought now, because they should be taken out of the woods in the winter."

Senator Smith asked whether the railroads are making such contracts.

"Certainly not," replied Senator Cummins. "The railroads cannot make such contracts. They neither have the money with which to pay for supplies nor do they know when the railroads are going to be returned to their owners. The railroads are utterly powerless to do anything. There ought to be 20,000 refrigerator cars ordered now in order to get them next summer, when they will be absolutely needed. The director general does not feel that he ought to put that burden upon the carriers if the property goes back immediately and the carriers are utterly incapable of doing it for themselves. There has been no contract made for rail replacements. Everyone knows that it is necessary to have a large volume of rails for use during the coming year. They cannot be had unless they are ordered months in advance and there is nobody to order them. The situation is really most distressing. I cannot understand how senators are willing to postpone the passage of some kind of legislation for a single day."

Senator Smith asked if the railroads ought not to have a formal notice before the railroads are returned and if it is not also true that they are not ready to take their property back on January 1. Senator Cummins replied that if a railroad bill has passed at that time or if it is reasonably certain that within a month after the first of January a railroad bill will become a law, the roads can be turned back with perfect safety and there will not be a jar. "If, however, they are turned back without any prospective legislation and with the known habit of Congress to delay everything until the necessity becomes obvious to even the most indifferent mind, then there will be paralysis. There will be chaos."

Senator Watson quoted from the President's message to Congress on May 20, in which he said: "'The railroads will be turned over to their owners at the end of the calendar year; if I were in immediate contact with the administrative questions which must govern the re-transfer of the telegraph and telephone lines I could name the exact date for their return also.'"

"There," he said, "is a straight, square, unconditional assertion that the railroads will be handed back to their owners at the end of the year. The President has never stated anything to the contrary and yet the railroads have not been in any position to prepare themselves for receiving their property because they have not known whether the roads would be turned back, inasmuch as there were certain statements emanating from the Railroad Administration which led the railroad men to believe that the roads would not be turned back on the first of January."

Senator Cummins interjected that the Senate is not responsible for the Railroad Administration nor for the President. "I assume," he said, "that each of those functions will perform its duty according to the way it sees its duty. What we have to do is to perform the duties of Congress so far as the Senate takes a part in legislation. Now we have a duty.

I supposed it was the desire of a very large majority of the Senate and of the Congress, too, and I know of the people of the United States, to relieve the Railroad Administration of the operation of the railroads. If there is any one thing upon which the people of this country are united, it is that the railroads ought to be returned to private management and operation. If there is any dissent from that opinion except among certain employees of the government, I have not heard it now.

Now, our duty is to put the railroads back in private management if we believe they ought to be in private management and that is what this bill does. This bill does not wait upon the President or the director general to determine when government operation shall cease. This bill declares that it shall cease at the end of the month in which the bill becomes a law and if I understand the temper of the people of this country, that is what they want. They want the roads returned and the management of the railway corporations regulated by the laws, but we cannot return them and answer that sentiment of the people of the country until we pass some such bill to protect not only the interests of the carriers but the interests of the public as well, for if the roads should be returned without effective legislation they could exist about a month and then they would fall into hopeless confusion and two-thirds of them would be in the hands of receivers."

At the evening session on December 15 a number of minor amendments to the bill were adopted. Senator Curtis of Kansas, offered an amendment providing for a guarantee to short line railroads taken over by the Railroad Administration and subsequently relinquished to the extent of any actual operating deficit that may have been incurred since January 1, 1918. He said he had in mind particularly the Kansas City & Northern, which had made a net profit of $17,000 a year before it was taken over, but that the administration took over the road, handled it for a time, refused to make a contract, took possession of and retained its terminals, directed the movement of its cars, took its coal and diverted its freight, with the result that the road finds itself in debt from $300,000 to $400,000 and has ceased operation. This led to considerable discussion of the short line situation in which Senator Kellogg argued against opening the door to every railroad that was taken over and then turned back again. He said the bill proposes to give such roads the same six months' guarantee as is given to other roads, but that to extend the guarantee back to 1918 would make it necessary for Congress to take care of a large number of roads that have not been particularly affected by government operation.

The amendment was allowed to be printed and held over for further consideration.

Amendments

Senator Walsh of Montana offered an amendment which was adopted, providing that any railroad proposing to undertake any work of new construction may apply to the transportation board and be granted permission to retain for not over 10 years all or any part of its earnings from such new construction instead of being required to contribute to the general railroad contingent fund. The senator said this amendment was offered in the conviction that the bill as reported does not offer sufficient inducement to hold out the hope that there will be any further railroad construction. He would not believe that anyone would be quite willing to put money into new railroad construction being assured beforehand that the only return which can be secured is the equivalent of 6 per cent with an additional one-half per cent on earnings between 6 and 7, and one-third of earnings over 7 per cent. He said it would be better to buy Liberty bonds at their present depreciated price.

Senator Stanley of Kentucky proposed an amendment to strike out the provision of the bill relating to labor and wages, and spoke for two hours on the question, but had not concluded when an adjournment was taken to the following day, and Senator Stanley withdrew his amendment.

Senator Jones of Washington offered a series of amendments, which were adopted, reducing the jurisdiction of the Interstate Commerce Commission over waterways for the purpose, he said, of avoiding interference with the jurisdiction of the Shipping Board. One amendment provided that the act shall not be construed to affect, diminish or interfere with the power or jurisdiction of the United States Shipping Board over water transportation or otherwise. Senator Jones said he did not want to give the Interstate Commerce Commission power to regulate the rates of water carriers on the inland waterways. They ought to be perfectly free. The other amendment proposed by Senator Jones inserted the word "inland" before waterways in the section directing the transportation board to inquire into water transportation facilities, etc.

Senator Watson offered a series of amendments which were adopted, to exempt street, suburban and interurban electric railways which are not operated as a part or parts of a general steam railroad system of transportation from the proposed plan of consolidation. The language of the bill exempted "street railways and interurban railways whose chief business is the transportation of passengers."

Senator Spencer of Missouri offered an amendment which was adopted, providing that the restriction against the commissions requiring a railroad to embrace in a through route substantially less than its entire length shall not operate to hinder or prevent the commission establishing or maintaining a through route where one of the carriers is a water line.

Senator Gay of Louisiana offered an amendment providing that the proposed consolidation of carriers and the rule for the adjustment of rates shall not be construed to apply to or affect belt line railroads and terminal facilities owned, exclusively and operated and controlled by any state or political subdivision thereof, but after some discussion it was withdrawn for the purpose of perfecting it.

Senator Calder offered an amendment which was agreed to, making it unlawful for a carrier to provide a shorter period for giving notice of claims than 90 days, for the filing of claims than four months, and for the institution of suits than two years, to be computed from the day that notice in writing is given by the carrier that it has disallowed a claim.

Senator Sheppard of Texas offered an amendment which was adopted, to provide that nothing in the act shall change or limit the present liability of common carriers as it exists under common law and by statute.

Senator Jones also secured the adoption of an amendment exempting water carriers from the provision relating to regulation of security issues. Senator Poindexter offered an amendment to the long and short haul clauses to omit the provision for relief on the authority of the Interstate Commerce Commission, which was allowed to go over until the following day.

An amendment by Senator Kenyon, intended to make it clear that claims for reparation and for unjust and unreasonable charges during federal control shall be filed with the commission and that the commission shall continue to have the same jurisdiction which it has had heretofore in that respect, was adopted without discussion.

Senator France of Maryland offered an amendment which was rejected, prohibiting a railroad from refusing to furnish equal and identical rights, accomodations and privileges in interstate transportation on account of "race, color or previous condition of servitude."

An amendment by Senator Calder of New York to extend the jurisdiction of the Interstate Commerce Commission to the transportation of natural gas was rejected. The senator urged the amendment on the ground that cities in New York had no control over the gas supply which came from Pennsylvania and that if they attempted to reduce the rates the gas companies could refuse to send the supply into New York and he wanted some tribunal to have control over the situation. Senator Cummins and others pointed out that the commission could only regulate the transportation of the gas through the pipe lines and not its price, but the senator thought it would be useful to have somebody exert some control.

Agreement with Brotherhoods on Time and one-Half for Overtime

THE PRINCIPLE of time and one-half for overtime in road freight service, which was demanded by the brotherhoods in 1916, waived in the negotiations preceding the passage of the Adamson eight-hour law and since reiterated in connection with the demands made by the brotherhoods upon the Railroad Administration, has finally been conceded by the Railroad Administration with some modifications and offsets by way of concessions made by the brotherhoods and has been made effective as to slow freight service as of December 1.

On November 15 announcement was made that the Railroad Administration, in discharging its responsibility to make readjustments necessary to avoid unjust inequalities in compensation of different classes of railroad employees, had proposed to the four brotherhoods representing the train and enginemen that, in order to give additional measure of compensation to the train service employees in the slow freight service, time and one-half would be paid for time required to make runs in excess of what would be required if an average speed of 12½ miles per hour were maintained, provided, however, that arbitraries and special allowances previously paid in various forms of freight train service are eliminated for the railroads as a whole. At the same time it was announced that the proposal thus made had been taken under consideration by the representatives of the train and enginemen's organization with a view to consideration and further discussion.

Following the consideration of this proposal by the representatives of the train and enginemen's organizations, conferences have been held between such representatives and the representatives of the Railroad Administration with the result that a final agreement has now been reached. Under this agreement, which was announced on December 15, time

and one-half for overtime will be put into effect as of December first affecting employees in slow freight service. Under the settlement all arbitraries and special allowances formerly applicable between terminals are eliminated. Special allowances for switching and similar work at initial terminals are preserved but at the former rates. Allowances for switching and delays at the final terminals are preserved payable at the former rates where the work is performed prior to the overtime period. These allowances have been agreed to in the past for relieving men of work which has not been considered a part of their regular duties and correspondingly it is felt that the same conditions existed in connection with the payment of time and one-half for overtime.

The former announcement stated that it had been estimated that the proposed rule would add about $36,000,000 a year to the payroll unless it was possible to reduce the amount by reducing the overtime.

Representatives of the brotherhoods stated that the proposed elimination of arbitraries and special allowances would largely offset the money value of the time and one-half rule and after a conference of their committeemen at Cleveland, a committee including the officers of the four brotherhoods came to Washington for a further conference with Mr. Hines to ask for a further interpretation of his proposal regarding the elimination of arbitraries and special allowances. After several conferences with the director general and members of his staff a compromise has been reached as outlined above.

Progress of Alaskan Railroad

In his annual report to the President Franklin K Lane, secretary of the interior, discusses the progress made in the government railroad in Alaska in part as follows:

"One of the first recommendations made by me in my report of seven years ago was that the Government build a railroad from Seward to Fairbanks in Alaska. Five years ago you intrusted to me the direction of this work. The road is now more than two-thirds built and Congress at this session after exhaustively examining into the work has authorized an additional appropriation sufficient for its completion. The showing made before Congress was that the road had been built without graft; every dollar has gone into actual work or material. It has been built without giving profits to any large contractors, for it has been constructed entirely by small contractors or by day's labor. It has been built without touch of politics; every man on the road has been chosen exclusively for ability and experience. It has been well and solidly built as a permanent road, not an exploiting road. It has been built for as little money as private parties could have built it, as all competent independent engineers who have seen the road advise.

"The road has not been built as soon as expected because each year we have exhausted our appropriation before the work contemplated had been done. We could not say in October of one year what the cost of anything a year or more later would be, and we ran out of money earlier than anticipated. It has not been built as cheaply as expected because it has been built on a rising market for everything that went into its construction from labor, lumber, food supplies, machinery, and steel to rail and ocean transportation. I believe, however, it can safely be said that no other piece of government construction or private construction done during the war will show a less percentage of increase over a cost that was estimated more than four years ago.

"The men have been well housed and well fed. Their wages have been good and promptly paid; there has been but one strike and that was four years ago and was settled by department of labor experts fixing the scale of wages. The men have had the benefit of a system of compensation for damages like that in the reclamation service and Panama canal. They have had excellent hospital service, and our camps and towns have been free of typhoid fever and malaria. That the men like the work is testified by the fact that hundreds who came out the past two years, attracted by the high wages of war industries, are now anxious to return to Alaska.

"There has been but one setback in the construction and that was the washing out of 12 miles of tracks along the Nenana river. This is a glacial stream which, when the snows melt, comes down at times with irresistible force. In this instance it abandoned its long accustomed way and cut into a new bed and through trees that had been standing for several generations, tearing out part of the track which had been laid.

"The work of locating and constructing the road has been left in the hands of the engineers appointed by yourself. The only instruction which they received from me was that they should build the road as if they were working for a private concern, selecting the best men for the work irrespective of politics or pressure of any kind. As a result, we have a force that has been gathered from the construction camps of the western railroads, made up of men of experience and proved capacity. That they have done their work efficiently, honestly, and at reasonable cost is my belief.

"It is not possible during the construction of a railroad to tell what it costs per mile because all the foundation work, the construction of bases from which to work, the equipment for construction, and much of the material is a charge which must be spread over the entire completed line. The best estimate that can be made today as to the newly constructed road is that it has cost between $70,000 and $80,000 per main-line mile, or between $60,000 and $70,000 per mile of track.

"This cost per mile includes the building of the most difficult and expensive stretch of line along the entire route from Seward to Fairbanks—that running along Turnagain Arm, which is sheer rock rising precipitously from the sea for nearly 30 miles. There are miles of this road which have cost $200,000 per mile. Even to blast a mule trail in one portion of this route cost $25,000 a mile.

"The only government-built railroad — that across the Isthmus of Panama—cost $221,052 per mile. The only two recently built railroads in the United States are the Virginian, built by H. H. Rogers, which cost exclusive of equipment $151,000 per mile, with labor at from $1.35 to $1.75 per day and all machinery, fuel, rails, supplies at its door, and the Milwaukee line to Puget Sound, which is estimated as having cost $130,000 per mile exclusive of equipment.

"The work has been conducted with its main base at Anchorage, which is at the head of Cook's Inlet. This point was chosen as the nearest point from which to construct a railroad into the Matanuska coal fields. That was the primary objective of the railroad, to get at the Matanuska coal. From Anchorage it was also intended to drive farther north through the Susitna Valley and across Broad Pass, and to the south along Turnagain Arm toward the Alaska Northern track. To secure coal for Alaska was the first need. So in addition to Anchorage as a base, one was also started at Nenana on the Tanana river from which to reach the Nenana coal fields lying to the south. If these two fields were open, one would supply the coast of Alaska and one the interior. This program has been acted upon, with the result that the Matanuska field is open to tidewater with a down grade road all the way. The Nenana road has been pushed far enough south to touch a coal mine near the track, which may obviate the immediate necessity for reaching into the Nenana field proper.

"There is an open stretch across Broad Pass to connect

the Susitna Valley with the road coming down from Nenana. This gap closed, there will be through connection between Seward and Fairbanks."

The report of the Alaskan Engineering Commission says:

During the fiscal year ending June 30, 1919, the following work on the Alaska Railroad was accomplished:

Considerable rehabilitation work on the old Alaska Northern Railway, from Seward (mile 0) to mile 70.

Thirty-eight miles of grading between mile 227 and mile 265 was practically completed; also the greater part of the grading for the 36 miles between mile 417 and mile 453 was completed.

Seventeen miles of rail were laid between mile 74 and mile 91; also 26 miles between mile 365 and mile 391; also 3 miles between mile 414 and mile 417; also 6 miles between mile 453 and mile 459—a total of 52 miles.

Location surveys were continued between mile 265 and mile 365 over the Broad Pass region.

The bridge over the Talkeetna river at mile 227 was completed.

Approach to dock in Anchorage harbor was practically completed.

Necessary maintenance of sections of the line in operation was attended to.

Fifty-five thousand three hundred and ninety tons of coal were mined at the two government mines in the Matanuska field.

During the year work was seriously hampered through lack of funds caused by the delay in the passage of the deficiency and sundry civil bills until July. Such a handicap is not expected to recur, as the bill authorizing the appropriation of $17,000,000 (in addition to the $35,000,000 originally appropriated) for the completion of the government railroad was passed by Congress in October. Six million dollars of this amount has been appropriated for the fiscal year ending June 30, 1920, and it is expected that the balance of the $11,000,000 will be appropriated as it may be needed.

Since June 30, 1919, and prior to the time that this report went to press, grading has been completed and track laid from mile 417 to mile 453, thus connecting Nenana and Fairbanks; also about 10 miles of rail has been laid north from Talkeetna at mile 227; also such progress in the construction of the dock at Anchorage has been made that the largest steamers now dock there.

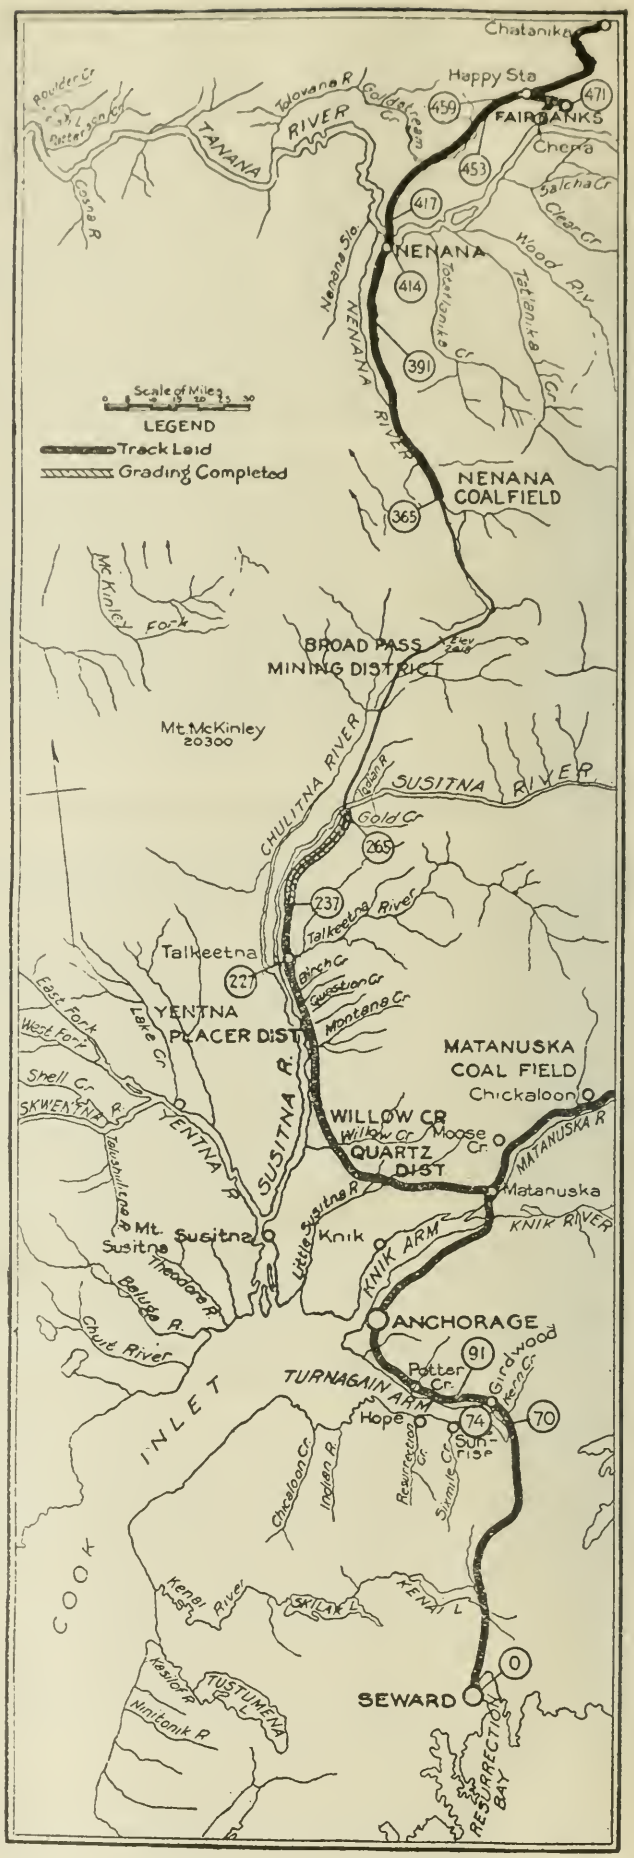
The work which remains to be done includes the following:

Completion of the rehabilitation of the Alaska Northern Railway, including construction of snowsheds and enlarging of tunnels.

Construction of line from mile 237, ten miles north of Talkeetna, to mile 365, five miles north of Nenana Canyon. This is now the only gap in the line from Seward (mile 0) to Fairbanks, mile 471, with the exception of the bridge at Nenana, crossing the Tanana river, and a permanent bridge at mile 373 over the Nenana river. Completion of the dock at Anchorage.

Col. Frederick Mears, shortly after his return from France in July, was appointed chairman and chief engineer of the Alaskan Engineering Commission. Wm. C. Edes has been appointed consulting engineer.

"Devil's Basin," near Roundup, Mont., on the line of the Chicago, Milwaukee & St. Paul, is the locality from which comes the latest report of prospectors striking oil, and a rush of oil seekers has already set in. But whether or not the new development is a large one or merely a small pool, is a point on which the owner of the "basin" has not yet given out information which can in any way be considered satisfactory.



Progress of Work on Government Railroad in Alaska, 1919

Scientific Development of the Steam Locomotive*

Means of Securing Higher Efficiency in the Generation, Distribution and Utilization of Steam

By John E. Muhlfeld

Part II

In relation to boiler feedwater observations and experiments indicate that any scale porous to water has little effect on boiler economy. However, such scale when dried out or hardened next to the metal by the expulsion of the carbonic acid, as usually occurs when boilers are forced, will not only become an excellent heat insulator and cause a heat loss of about 10 per cent when ⅛ in. thick, but it exposes the sheets and staybolts to overheating and "mud burning," with resulting leakage and shopping for repairs and cleaning.

In the preparation of recent data on the expense resulting from bad water supplied to steam locomotives on eight divisions of a large Eastern trunk line, the cost averaged $1,000 per locomotive per annum for fuel, repairs, time out of service and boiler washing, with specific cases of mud burning costing as high as $400 for repairs and time out of service only.

In view of the increasing size of locomotive boilers and the high ratings to which they are subjected, the importance of purifying unsuitable water to prevent incrustation, corrosion, leakage and burning, as well as to eliminate delays and cost for cleaning, repairing and extra fuel consumed, cannot be overestimated, and until the many existing conditions of this kind are corrected, neither the existing nor improved steam locomotives can be expected to render satisfactory and economical service.

Boiler Feedwater Purifying

When an adequate and suitable supply of boiler feedwater cannot be obtained from the usual sources, then the proper treatment of the available unsuitable water becomes necessary by settling; filtration; chemical treatment in treating plants, supply tanks or tenders; or, in the case of suspended matter and carbonates, by partial purification in a combination open and closed type of exhaust-steam feedwater heater on the locomotive.

While the supplying of suitable natural or treated boiler water to the locomotive tender is the most satisfactory and economical method, in the absence of such the tender treatment or feedwater-purification method will be an improvement over feeding the raw water into the boiler without treatment, or attempting to treat it in the boiler.

Fuel

The principal fuels now used in steam locomotives are the commercial grades of bituminous and anthracite coal and fuel oil. While millions of tons of the by-products of anthracite and bituminous coal mining are available, as yet practically no progress has been made in their utilization although satisfactory means and methods are now developed. This applies as well to the enormous deposits of sub-bituminous coal and lignite that are only awaiting mining operations to come into effective and economical use as locomotive fuel.

Regardless of the kind of fuel now used by steam locomotives, more general attention is being given to its proper preparation for the class of service to be performed and the method of firing to be followed, before it is supplied to tenders. However, the factors of kind and size of coal and method of firing must each be carefully considered and co-ordinated in order to insure the best results.

With the cost for locomotive fuel on tenders practically doubled during the past two years, and next to labor the largest single item of railway operating expense, the best methods for its use will now begin to receive the consideration that this large item of operating cost justifies.

Combustion

The locomotive fuel bill for the year 1918 was approximately $750,000,000, and while full recognition is given to the fact that from 25 to 50 per cent of the available energy in the fuel is still needlessly wasted and that present methods of mechanically firing, as compared with the average hand firing, and burning coal on grates or in retorts increase this waste, but little has been accomplished in regulating combustion so that this loss may be reduced.

The capacity of the average steam-locomotive boiler is dependent upon the activity, temperature and radiation of combustion, which in turn are usually controlled by the limitations of combustion when fuel is burned on grates, the furnace volume and evaporating surfaces, the length of the boiler flues, tubes and bafflewall arrangement, and the draft, and not so much upon the inability of the evaporating and superheating surfaces to absorb the heat.

Table 1. Consumption of Dry Bituminous Coal by Locomotive with the Best Hand Firing.

Total indicated horsepower of locomotive.	Dry coal per i. hp.-hr.
500	2.8
750	2.7
1000	2.6
1250	2.5
1500	2.6
1750	2.8
2000	3.0
2250	3.2
2500	3.4

The combustion rate generally follows the increase in draft until about 100 lb. of bituminous and about 50 lb. of anthracite coal are burned per square foot of grate area. After this the additional coal supplied is not effectively consumed due to the difficulty in supplying sufficient air, uniformly distributed, through the grates and fuel bed to oxidize the fixed carbon and volatile matter in process of combustion without a large excess of air such as obtains when forcing takes place, and it becomes necessary to open the fire door so that combustion can be completed by the admission of air above the fuel bed.

The greatest loss in heat is that due to the heat carried off in the stack gases, sparks and cinders, which usually results in a smokebox temperature of from 500 to 750 deg. F. for the best practice. Adding to this the heat losses due to combustible in ash, vapors of combustion, carbon monoxide and otherwise, leaves an average of from 25 to 40 per cent of the heat in the fuel as fired unabsorbed by the boiler and superheater.

Where locomotives are worked at from 25 to 35 per cent cut-off and hand-fired, with a thermal efficiency of about 65 per cent for the combined boiler and superheater,

*The first section of Mr. Muhlfeld's paper, which was presented at the annual meeting of the American Society of Engineers, appeared in the *Railway Age* of December 12, page 1139.

the heat balance will be approximately as shown in the following table.

However, at high rates of boiler capacity and draft, when stoker-fired coal is burned on grates the front-end and stack cinder and spark losses will run as high as from 12 to 25 per cent, the carbon monoxide from 2 to 7 per cent, and the unburned fuel from 10 to 35 per cent. With the best hand firing, when using dry bituminous coal averaging 14,400 B.t.u. and 60 per cent fixed carbon, 32 per cent volatile and 8 per cent ash, the fuel rates in Table 1 will usually obtain.

	Per cent
Heat absorbed by boiler	55
Heat absorbed by superheater	10
Heat loss in smokebox gases	14
Heat loss in cinders	8
Heat loss in vapors of combustion	4
Heat loss in combustible in ash	3
Heat loss in carbon monoxide	2
Heat loss in radiation and unaccounted for	4
Total	100

As compared with hand firing, stoker firing will result in an increase of from 10 to 25 per cent in the fuel fired, while if the same coal be pulverized and burned in suspension there will be a decrease of from 15 to 25 per cent in the amount of fuel fired.

As the locomotive firebox, which in the best practice represents only from 7 to 10 per cent of the total boiler evaporating surface, must generate all and absorb from 30 to 40 per cent of the heat energy that is converted into drawbar horsepower, the fuel effectively consumed, not fired, is the measure of work done. Therefore the largest permissible combination of fire box and combustion-chamber volume, heating surface and grate area should be provided and equipped with an arrangement of firebrick baffle walls placed on water-circulating supports in a manner to produce long flame travel, high firebox temperature and the maximum radiant heat for absorption by the surrounding water.

With the usual limitations in firebox volume, too much importance cannot be placed on the arrangement of heat-absorbing and radiating walls for the purpose of flame and radiant-heat propagation. Carefully conducted tests have shown that the best results are obtained from solid firebrick baffle walls and that the unburned-gas, coal-dust, spark, cinder and smoke losses are reduced with an increase in their length and gas-passage arrangement, and a saving of from 10 to 15 per cent in bituminous coal as fired is effected.

The greatest difficulty in controlling combustion occurs at high horsepowers and long cut-offs, where grates are used, and for the best results the air openings should be equal to about 50 per cent and those in the ashpans to about 15 per cent of the total grate area so that firebox temperatures of from 2,000 to 2,500 deg. F. can be obtained and the unburned solid fuel, carbon monoxide and excess air over the fuel bed reduced to the minimum.

Other important factors influencing combustion, as well as evaporation and superheating, that should receive consideration are: ratios of length to diameter of boiler flues and tubes and the spacing between them; distribution of gas area between boiler flues and tubes; the effect of closed superheater dampers on firebox draft when locomotive is not using steam; free passage of gases through front end by elimination of unnecessary baffles, steam pipes and superheater parts; arrangement of exhaust stand and nozzle to change form of exhaust jet and produce greater entrainment of gases and improved co-ordination of exhaust jet and stack.

As with any pulverized coal of 12,430 B.t.u. value, an average boiler efficiency of 69.2 per cent at 1080 boiler hp., and an average combined boiler and superheater efficiency of 78.1 per cent at 1220 boiler hp., with an equivalent evaporation averaging 42,100 lb. of water per hour from and at 212 deg. F., has already been obtained on a Mikado simple-cylinder type of locomotive hauling fast freight trains over a 113-mile division, the possibilities for reducing the steam-locomotive fuel consumption are practically unlimited and much remains to be done in this direction by good hand firing, through a combination of the fireman's eyes, brain and brawn, provided the thermal efficiency of the modern locomotive at the drawbar is brought up to where it should be.

Boiler Water Circulation

Water is practically a non-conductor of heat but expands when heated above 39 deg. F. and rises due to its relatively lower specific gravity. Unimpeded circulation will therefore increase its ability to take up heat, maintain greater uniformity of temperature throughout the boiler, and decrease the liability of incrustation of heat-absorbing surfaces and of priming.

In designing a boiler it is extremely desirable to secure the most rapid circulation practicable, as with high combustion rates and temperatures and the abnormal state and behavior of the water film in contact with the heating surfaces, the load on the firebox sheets is very intense, the conduction rate averaging from 75,000 to 100,000 B.t.u. per square foot of evaporating surface per hour.

Therefore, in order to avoid resistance to heat transfer, with resultant overheating of metal and reduced efficiency, a relatively high velocity of circulation and at least a rate of 125 ft. per min. in the most sluggish locality is very essential.

The average locomotive boiler, with its combination of cylindrical and box shell, water legs, staybolts and rods, flues, tubes and generally irregular design of water spaces does not present ideal water-circulation possibilities, but the enlarging of contracted spaces, increasing of water-leg, flue and tube clearances, and provision of suitable outlets from choked water pockets will not only reduce the resistance to the "slip" of the steam bubbles through the water, but will enable the accelerated action of the former to increase the velocity of the latter and thereby improve general circulation and heat-transfer results.

Heat Radiation, Convection and Conduction

The transmission of the heat of combustion produced in a locomotive boiler is by means of radiation and convection to the firebox, flue, tube and superheater heating surfaces, by conduction to the water in the boiler and the steam in the superheater, and by convection through the boiler water and the superheater-steam mass. In addition there are the direct radiation losses, which in many instances are considerable.

Heat Radiation. In a locomotive boiler the efficiency of combustion heat transfer through the firebox plates and boiler flues and tubes is from 20 to 25 per cent greater as applying to those heating surfaces directly affected when subjected to the radiant effect of the incandescent combustible and non-combustible particles which have passed through the minimum distance, than the heat-transfer efficiency when convection only is available. For example, when coal is hand or stoker-fired and burned on grates or in retorts the radiant heat is at a minimum and applies only to the heat-absorbing surfaces adjacent to the fire bed while the heat of convection is at a maximum; whereas when the coal is burned in pulverized form in suspension this condition is reversed, as is evidenced by the intense incandescent flame which obtains not only in the furnace and combustion chambers of the firebox proper, but well into the boiler flues and tubes. The locomotive boiler of the future will undoubtedly depend more largely on radiant heat.

With respect to the loss of power through radiation to the atmosphere from all parts of locomotive boilers and machinery that are generators and containers of heat and pres-

sure—to prevent which rather indifferent efforts have as yet been put forth, as the rate at which this loss of heat extends will depend upon the difference between the temperature of the body emitting the heat and the temperature and velocity of the surrounding atmosphere, there is sufficient justification for completely and properly lagging the boiler, firebox, cylinders and heads, steam chests and all other radiating surfaces, as well as for polishing certain machinery parts, in order to reduce the dissipation of heat that now takes place through these parts from the existing steam pressures and superheat.

Heat Convection. In the locomotive boiler convection acts particularly in the transfer and diffusion of the heat in the products of combustion throughout the firebox, flues, tubes and superheater by means of the smokebox draft and in the carrying of the heat through the boiler-water mass by the currents produced by circulation. In the present locomotive boiler by far the greatest proportion of the heat is imparted to the evaporating and superheater surfaces by convection.

To secure the fullest benefit from heat convection the combustion volumes and gas areas must be so co-ordinated as to establish a "velocity pressure" or "frictional" action between the gases and the heat-absorbing plates and tubes in order to increase the rate of heat transmission. Likewise must the boiler circulation be expedited in order to quickly disengage and release the steam bubbles from the water side of the same plates and tubes in the final heat transfer. The possibilities for improving heat transmission by convection in the locomotive boiler with its high water rate, *i. e.,* a boiler horsepower for an average of less than two square feet of total evaporating surface, fully justifies additional study.

Heat Conduction. In the locomotive boiler heat conduction is principally associated with the thermal conductivity of the firebox, flue, tube and superheater materials and with the accumulation of soot and scale on the fire and water or steam sides, respectively. Any increase in the rate of external conductivity, considering the present kinds and thickness of firebox, flue and tube materials as practically fixed, must be through an increase in the rate of flow of the heated gases, and this in turn means the expenditure of a greater amount of energy to pull these gases through the boiler.

However, questions as to the proper gas areas, rate of flow of gases, best sizes of flues and tubes for the maximum rate of heat transfer, and relating to like factors should be carefully analyzed in order that the highest absorptive efficiency may be obtained, not only with the high but also with the low gas temperatures. While there is no difficulty in now obtaining a boiler horsepower from each 1½ to 2 sq. ft. of total evaporating surface, whatever further improvement can be made in this direction will provide just that much more margin of boiler over cylinder horsepower requirements and produce a corresponding gain in efficiency.

Steam Generation

Efficient absorption of heat for the generation of steam in the modern locomotive boiler can be more readily provided for than can suitable feedwater, effective boiler-water circulation, efficient combustion or the maximum pounds of dry saturated steam per hour, which latter is a fundamental requirement.

In present locomotive operation the quality of the steam, *i. e.,* the percentage of vapor in a mixture of vapor and water, is one of the most important and least-referred-to factors in road and laboratory test reports, particularly as the average modern locomotive boiler is notorious for delivering saturated steam to the superheater or to the steam pipes with a high percentage of entrained moisture. This is due largely to the relatively small steam space in the boiler, the close proximity of the water level to the throttle valve and the backlash due to the firebox tube sheet, and also to the fact that the most rapid movement of the steam is next to the throttle valve so that any water coming near it is immediately entrained due to the high velocity.

Road tests recently conducted on modern Mikado types of locomotives showed an average quality of from 94.7 to 96.3 per cent for the saturated steam as delivered to the superheater, indicating from 5.3 to 4.7 per cent of moisture, which is valueless so far as its power for doing work is concerned but which greatly increases the work to be performed by the superheater by throwing upon it work which should properly be done in the boiler.

The delivery of dry saturated steam from the boiler is an item that has been given but little consideration in steam-locomotive practice, the principal idea having been to produce evaporating capacity and depend upon the superheater to perform auxiliary boiler functions. Many changes can and should be made to improve this condition.

Steam Pressure Increase

One of the greatest and simplest improvements to be made in the steam locomotive can be effected by an increase in the boiler pressure in combination with greater quantity and better quality of saturated-steam production, higher and more uniform superheat, and compounding.

While the loss in steam pressure between the boiler and the valve chests of saturated-steam locomotives is considerable, this loss is substantially increased in a superheated-steam locomotive. Tests have indicated that the loss in boiler pressure at the valve chests when working at low rates of speed and cut-off will be about 5 per cent, at medium rates about 10 per cent, and at high rates about 15 per cent.

During recent years stationary-boiler engineers have not only determined upon their efficiency but have inaugurated the use of relatively high steam pressures, and with the urgent necessity for keeping the cylinders as small in diameter and the reciprocating and revolving parts as light as practicable, there would appear to be no good reason for not now utilizing saturated steam of 350 lb. pressure, which, in combination with 300 deg. F. of superheat, should provide, in addition to the many other advantages, a much greater opportunity for economy in power generation.

Steam Superheating

The use of superheated steam has done more to increase sustained hauling power, reduce fuel and water consumption and increase thermal efficiency than any of the other means and methods that have been generally adopted on the steam locomotive since its introduction, either singly or in combination. Sustained hauling capacity is increased due to the longer cut-off possible at comparative speeds and fuel and water economy result from the elimination of cylinder condensation, the increase in efficiency being progressive and in proportion to the amount of superheat up to the point at which the exhaust steam begins to show superheat.

With the average superheat now used, from 175 to 250 deg. F., the drawbar pull at a speed of 20 miles per hour is increased about 15 per cent; and at 50 miles per hour about 40 per cent; and due to the combination of superheat, larger diameter of cylinders and reduced cylinder back pressure, resulting from the use of superheated steam, it is possible to increase train tonnage about 30 per cent at speeds of about 30 miles per hour.

In the best existing steam-locomotive practice the superheat generally increases with the cut-off up to 50 per cent cut off, beyond which there is usually a falling off in the superheat. Furthermore, with short cut-off a fair water rate, *i. e.,* about 19 lb. per i.hp., can be maintained; but if the cut-off at the same speed is increased to over 50 per cent the superheat must be increased to about 300 deg. F. in order to maintain the same water rate, or otherwise, for example,

at 67 per cent cut-off, the steam consumption will increase to 21 lb. or more per i.hp. This for the reason that as the amount of superheat is increased the range of temperature in the cylinder during the stroke of the piston is decreased, until with sufficient superheat the changes in temperature cease entirely.

While the increased superheat results in a greater number of B.t.u. being exhausted from the cylinder, any such loss of a marked degree is more than offset by the smaller amount of heat exhausted per stroke, due to the fewer B.t.u. admitted to the cylinder per stroke at a given cut-off.

The use of highly superheated steam results in a saving of about 35 per cent of the total water evaporation per unit of power and in from 10 to 45 per cent saving in fuel, when using steam, depending upon the power output.

Existing fire-tube superheaters produce the maximum superheat only when the locomotive is forced to its boiler capacity, whereas the maximum economy is more desirable when the locomotive is working under average conditions at economical cut-offs and when the superheater should give as nearly as possible a uniform degree of high superheat under all conditions of working, regardless of the boiler evaporation. For example, if the degree of superheat obtainable at speeds of 50 miles per hour with 50 per cent cut-off could be obtained at 25 per cent cut-off, a water rate of considerably less than 15 lb. could be obtained as compared with existing rates of about 19 lb. Therefore, as the present limitation in the hauling power of the modern superheated-steam locomotive is the capacity of the boiler to produce continuously sufficient dry saturated steam of high pressure and of the superheater to maintain a uniform high degree of superheat, the possibility of improving it by means of average higher boiler pressures and superheat temperatures and better utilization of fuel, steam and waste heat, in combination with radical changes in the design and arrangement of the boiler and superheater equipment and in the saturated- and superheater-steam connections, offers one of the greatest opportunities to increase efficiency and economy. This applies particularly to the larger locomotives, many of which consume more fuel and water and do less work than the small locomotives of the same general design and equipment.

The proposed changes, while applying especially to the production of greater efficiency at economical cut-offs for maximum power and speed, would also improve the maintenance and operation of superheaters, boilers, flues, front ends, valves, cylinders, and exhaust nozzles and provide for the better equalization of a lower draft through the flues and tubes, lower front-end temperatures, less throwing of smoke, sparks and cinders, and lower cylinder back pressure, all of which would reduce loss of power, fuel consumption and wear and tear on machinery.

Some of the particular troubles reflected in both maintenance and operation, due to the existing, generally used boiler and superheater equipment, may be stated as follows: *a* Air leaks around outside steam pipes where they pass through the front ends, resulting in steam failures, burning out of front ends, reduction in the size of exhaust nozzles for the purpose of making engines steam, and increased water and fuel consumption. *b* Joints between superheater units and the saturated and superheated chambers of the headers leaking, and the cutting out of the units at the neck, between the ball joint and the tube *c* Too little water and steam space over top of firebox and combustion-chamber sheets and flues, particularly on grades and curves, contributing to lower superheat temperature and cylinder efficiency, and to superheater-unit tubes distorting due to entrained water being carried over with the saturated steam from the boiler to the superheater, causing obstructions in and damage to superheater tubes and obstructions at the header. *d* Extreme losses in steam pressure between boiler and steam chests: *e* Boiler flues clogging, due to ash and cinders packing in around return bends and centering clamps and tubes.

While the superheater has generally been considered as a part of the boiler, particularly as regards its evaporation of entrained moisture in the saturated steam it has no relation whatsoever thereto insofar as its individual functioning is concerned, and the more that the saturated-steam-conducting and superheated-steam-delivering conduits, as well as the superheater equipment in itself, can be divorced from the boiler and front-end connections and their proper functions without introducing separately fired apparatus, the better will be the general results from the standpoint of efficiency, maintenance, operation and economy of the locomotive as a whole.

Some of the points to be considered in correcting existing deficiencies may be stated as follows:

Steam Temperatures. The steam temperature should be uniform for the variable speeds and capacities of operation. At the present time high temperatures obtain only at high speeds and capacities. A minimum temperature of 650 deg. F. quickly after starting, and of 700 deg. at maximum power and speed, would be much more effective and economical. For example, a locomotive equipped for generating 350 lb. steam pressure and 300 deg. superheat, representing a total temperature of about 736.4 deg. F., will, as compared with one using 200 lb. steam pressure and 300 deg. superheat—representing a total temperature of about 687.9 deg. F., require an increase of only 18 B.t.u., or 1.3 per cent in total heat in the steam, and an increase of only 48.5 deg., or 7.05 per cent in the temperature of the steam to produce an increase of 150 lb. or 75 per cent in the steam pressure.

Dome or Steam Outlet. This should be fitted with baffles for the purpose of reducing liability of priming and entrainment of water with saturated steam.

Saturated-Steam Delivery Pipe. This should be located outside of the boiler and be of adequate cross-sectional area to reduce steam-pressure losses.

Steam Trap or Separator. A steam trap or separator should be installed between the saturated-steam delivery pipe and the superheated saturated-steam chamber for the purpose of further eliminating moisture and condensation from the superheated units and also as a re-evaporation chamber.

Superheated Header or Saturated- and Superheated-Steam Chambers should be removed from the interior of the front end.

Superheated Units should consist of not more than two tubes per boiler flue and should be of such design and arrangement as will admit of location close to the top of the flue, in order to permit free passage for cinder and ash and cleaning of flues.

Unit Joints to Saturated- and Superheated-Steam Chambers. Unit joints should be removed from the direct path of gases and cinders so as to avoid cutting out, and should be supported in a positive, equalized and flexibly yielding manner to prevent leakage due to the loosening of one joint causing the loosening of another and so that the joint bolts can be tightened at the top of the header castings.

Superheated Dampers. These should be kept in good operating condition so that when the steam ceases to flow through the superheated units the products of combustion will stop flowing through the superheated flues, particularly when drifting at high speeds.

Steam Delivery Pipes from the Superheated-Steam Chamber should be made of adequate cross-sectional area to reduce steam-pressure losses and removed from the interior of the front end so that no joint where they pass through the front end will be necessary.

Automatic Saturated-Steam Supply When Drifting. This is essential to eliminate the human element and insure a

proper supply of saturated steam with the superheated steam just before the throttle closes and continuously thereafter. A jet of saturated steam should also be supplied to the exhaust nozzle to neutralize the gases ordinarily drawn through the same into the valve chests and cylinders.

Modern types of locomotives have developed at low speed 3,000 i.hp. and at high speed 3,200 i.hp., and comparative average water rates through the complete range of the effective capacity of the locomotive, with piston speeds of from 600 to 1,000 ft. per min., have been obtained as shown in Table 2. At piston speeds of less than 600 ft. per min. the water rate of the double-expansion saturated-steam locomotive will approximate that of the single-expansion superheated-steam locomotive.

Table 2—Comparative Water Rates of Locomotives When Using Saturated and Superheated Steam

Cylinders	Steam	Water rate per i.hp.-hr., lb.
Single-expansion	Superheated	16 to 20
Single-expansion	Saturated	24 to 29
Double-expansion	Superheated	15 to 18
Double-expansion	Saturated	19 to 22

Compounding. With the exception of the Mallet articulated type of compounding, the multiple-expansion system of steam utilization, which has been so successful in marine and stationary practice, has not made the progress in this country that it has in Europe.

The failure of various types of cross, four-cylinder, four-cylinder balanced and tandem double-expansion locomotives, introduced from 25 to 15 years ago, to produce the predicted economy was due largely to factors of indifferent design, low boiler pressure, excessive condensation, lack of proper maintenance and operation, poor fuel and road failures. Clearance limitations also restricted the size and arrangement of the low-pressure cylinders, while at the same time the single-expansion-cylinder superheated-steam locomotives gave opportunity for greater hauling capacity and economy.

The three-cylinder compound has frequently been advocated owing to the allowable reduced cylinder diameters and piston thrusts and a more uniform turning movement, but its use has been deferred owing to central main-rod and axle complications.

There is no doubt but that a properly designed superheated cross-compound locomotive embodies many advantageous features such as greater starting and hauling capacity per unit of weight, less evaporating surface per indicated horsepower, reduced fuel and water consumption and less boiler repairs, and that it will return to favor for freight service in combination with higher boiler pressures and superheat, due to the necessity for greater drawbar pull and horsepower and for utilizing all superheat before its final exhaust.

The Walschaerts gear, as well as other outside valve gears now generally used, is accessibly located outside of the frames and driving wheels and driven from both the crosshead and an eccentric crank, but they all have the disadvantage of a constant lead and of being affected by the vertical displacement of the axle.

By eliminating the disadvantages of the outside valve gears now in use and adding certain improvements for the purpose of increasing the ratio of expansion and shortening the ratio of compression, the tractive effort can be increased at least 10 per cent at all points of cut-off and the fuel consumption reduced 5 per cent through ability to develop the same drawbar pull with a shorter cut-off. Such a change will add greatly to the efficiency of the steam locomotive.

Where compound cylinders are used a steam expansion regulator should be incorporated with the motion gear to effect the automatic independent adjustment of the cut-off for each of the high and low-pressure cylinders for the purpose of obtaining certain cylinder ratios, and at the same time bring the cut-off in harmony at the center of the quadrant. By this means the ratio between the high and low-pressure cylinders, which, for example, should properly be 1 to 3 at starting, can be brought to 1 to 4 at cut-off, thereby insuring easy exit of the exhaust steam from the low-pressure cylinder and at the same time automatically distributing the work properly between the two cylinders at speed. In this way a compound locomotive of the Mallet articulated type can be made to develop at least 55 per cent of its rated tractive power at a speed of from 8 to 10 miles per hour, when operating at 25 miles per hour, and there will be a gain in tractive power of about 15 per cent at 25, and of about 10 per cent at 30 miles per hour. In fact, a drop in the drawbar pull in a Mallet articulated compound locomotive on account of speed should not materially increase beyond that of a single-expansion engine.

Cylinder Clearance. The inauguration of the use of the inside-admission piston valve and of superheated steam has brought with it the wasteful effects of larger cylinder clearance, due principally to the use of a valve of too large diaameter and an indifferent design of valve chest and ports in combination with the cylinder castings. To somewhat overcome this trouble the piston valves were increased in length, with subsequent breakage of castings through the vertical ports, particularly as the result of water from condensation and unstayed flat surfaces.

The use of smaller-diameter piston valves located close to the cylinder and connected with properly designed expanding steam ports will, in combination with improved material and workmanship, correct these generally existing deficiencies.

Cylinder Back Pressure. About 75 per cent of the cylinder back pressure is due to the use of the exhaust steam to produce draft for combustion, evaporation and superheat. Assuming that for every 100 hp. in steam used only 60 per cent is utilized in producing actual tractive power, then 40 per cent is wasted through the exhaust, of which 75 per cent is chargeable to steam and superheat generation.

Much remains to be done in the way of enlarging exhaust-steam openings from the cylinder to the atmosphere and in reducing existing sharp turns, cramped passages and obstructions to the free passage of steam through them; and also in the development of an exhaust stand and nozzle that will combine the advantages of the single and double types. It has been found that by enlarging a 5½-in. diameter exhaust nozzle to 5¾ in., or about 9.3 per cent in area, fuel consumptions have decreased from 15 to 20 per cent, depending upon fuel and weather conditions, and that the locomotive efficiency has been increased from 10 to 15 per cent, depending upon cut-off and speed.

Valves and Cylinders. Inside-admission piston valves, although inherently deficient with respect to water and compression-relieving capacity, have many advantages, particularly for superheated steam, and the application of double-ported valves for low-pressure cylinders has worked out satisfactorily.

Various tests and many years' experience have demonstrated through the better use of steam and the resulting reduction of jerking, pulling and stresses on valve stem and gear, unbalanced pressure, frictional contact, valve and bushing wear, leakage and lubrication, the practical advantages of a minimum diameter and weight of valve with the circumference no greater than the length of a slide-valve port and with every inch of bushing port made effective and designed in conformity with the well-known principles governing the flow of gases so as to eliminate eddies and baffling in the steam flow between valve and cylinder.

In addition to reducing the weight of a valve by reducing its diameter, it can be further lightened by using a smaller spool, as experience has proven that with simple cylinders an area of opening through the valve body equal to one-half

the area of a single exhaust nozzle orifice is sufficient to obviate the hammering of the exhaust steam on the valve ends. With cross-compound cylinders the conditions are even more favorable, due to the receiver pressure. Furthermore, there is still a possibility of considerably reducing weight in bull-ring and follower designs, which will further reduce the stresses in valve rods and gears that have been found to increase with the speed, cut-off and weight of valve.

There is also considerable opportunity to improve packing rings by locking and putting them in absolute steam balance, preventing exhaust rings from collapsing under compression or being forced from grooves into ports between bridges, and stopping leakage of live steam to the exhaust side of the valve. Extended rods and carriers for the front ends of both valves and pistons have also been found essential to the best results. Two refined-gray-iron packing rings should be sufficient for all pistons, and two-piece one-ring piston and valve-rod packing of a suitable aluminum alloy should be satisfactory. Wherever possible the center line of each cylinder, under normal working condition, should be in horizontal alinement with the centers of the driving axles. All cylinders should be equipped with suitable bypass valves.

Piston Speeds. Frequent errors have been made in not properly proportioning the driver-wheel diameter and stroke of the piston. Slow speed and high ratios of expansion are factors particularly favorable to superheated steam, and piston speeds of from 700 to 1,000 ft. per min. will insure the best results.

General. With superheated steam too much attention cannot be given to the foregoing and other details in valve and cylinder design and material, as the waste of steam, heat and power at these points has much to do with keeping down the thermal efficiency of the locomotive as a whole.

Waste-Heat Distribution and Utilization

As a reasonable estimate would show that 40 per cent of the heat in the steam and in the products of combustion is exhausted from the stack, any considerable part of this heat that can be reclaimed for preheating boiler feedwater will add greatly to the overall efficiency of the locomotive and to the saving in fuel. The principal means through which to accomplish this saving, in a practical way, are exhaust-steam heaters and flue-gas economizers, both of which can be readily adapted to a modern steam locomotive.

Exhaust-Steam Heaters. With the many steam-using auxiliaries, such as those for air compressing, boiler feeding, valve-gear operating and electric lighting, which operate when the locomotive is standing, drifting or working, a combination open and closed type of feedwater heater and purifier for the utilization of the exhaust steam from these auxiliaries, supplemented if necessary by steam from the main engine's exhaust, should receive prompt consideration.

From actual service tests of closed types of heaters, made on modern superheated-steam locomotives, using a portion of the main-engine exhaust steam only, it has been found that a feedwater temperature approximating 240 deg. F., or within 15 deg. of the exhaust-steam temperature, can be obtained without interfering with the draft required for maximum steam and superheat generation.

Flue-Gas Economizers. Owing to the high rate of combustion and evaporation and in the process of superheating much heat is usually wasted, as the gases from which the steam receives its heat must be hotter than the steam itself. The higher the steam pressure the less is the average difference in temperature between the gases of combustion and the contents of the boiler, therefore the slower the transmission of heat the greater the work of the economizer may be. Likewise the lower the efficiency of the boiler will be if it is not supplemented by an economizer.

An economizer will heat the feedwater to a higher temperature than an exhaust-steam heater and will recover most of the waste heat resulting from high steam pressure and high superheat, as it is able to recover low-temperature heat that has escaped from the boiler evaporating or superheater surfaces because the average temperature of the feedwater within the economizer, which should, if practicable, be brought up to the boiler evaporating temperature, is much lower than the temperature of the water in the boiler.

As locomotive smokebox superheaters, now obsolete, have demonstrated that 50 deg. of superheat may be obtained from flue gases at 600 deg. F., there should be no difficulty in devising a locomotive economizer that will produce very effective results, in combination with high boiler pressures, superheat and draft, without baffling the boiler draft and evaporating capacity. In fact, with an average boiler efficiency of 60 per cent and an economizer efficiency of 50 per cent the possibility of recovering from 25 to 50 per cent of the stack gas losses and increasing the thermal efficiency of the entire unit, is within the limits of possibility.

General. Another factor favoring the use of combination exhaust-steam heaters and flue-gas economizers is the opportunity to reduce the noise and nuisance now created by the steam exhausting from the main and auxiliary engines through the muffling of the exhausts.

Discussion

F. J. Cole (American Locomotive Company) took issue with many of Mr. Muhlfeld's statements. He cited the fact that a modern locomotive will produce a horsepower hour on less than two pounds of coal to prove that the locomotive is an economical power plant. He stated that the usual design of locomotive boiler is not suited for a pressure of 350 lb. and that it must be radically changed to carry such high pressure. Mr. Cole pointed out that by the use of trailing wheels the boiler design is improved and higher efficiency secured. He thought it doubtful whether increased water volume would add to the efficiency of the boiler. Mr. Cole also stated that while the high cost of coal undoubtedly justified the introduction of devices that increase capacity and economy, the increased maintenance cost resulting from their use must be considered.

Clement F. Street (Locomotive Stoker Company) questioned the data Mr. Muhlfeld submitted regarding the cost of electric operation. He defended the performance of locomotive stokers, and stated that while the fuel performance secured on stoker-fired engines did not equal the results obtained by the best firemen, the stoker would save coal as compared with the average fireman.

H. B. Oatley (Locomotive Superheater Company) stated that the program of improvement laid out by Mr. Muhlfeld was not entirely practical as regards economy, though almost ideal from the standpoint of the generation and utilization of steam. He stated that with the proper design of boiler a steam pressure of 500 lb. would prove both safe and economical, and stated that condensing operation was not beyond the realm of possibility.

E. B. Katte (New York Central) disagreed with Mr. Muhlfeld's conclusions regarding the objections to electrification. He stated that experience had proved that the capital cost was not prohibitive, that electrical operation had been demonstrated efficient, economical and reliable for every class of service. He pointed out that electrification increased the capacity of tracks approximately 30 per cent and that while the first cost of the installation was higher than for a steam operated road the operating expense was less.

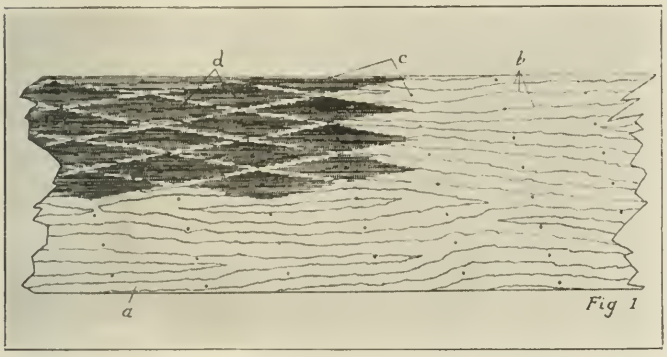
In closing the paper Mr. Muhlfeld stated that the cylinder temperature is the limiting factor in the boiler pressure carried. Superheated steam locomotives have been operated with steam temperatures as high as 750 deg., and this he considered the practical limit at the present time.

Timber Perforating Patent Released

Improved Method of Preparing Douglas Fir for Treatment is Dedicated to the Public

ONE OF THE RECENT DEVELOPMENTS in the timber preservation field is the dedication to the public of a process for perforating cross-ties and timbers to facilitate and better their preservation. The rights to this process were retained until October 6, 1919, by O. P. M. Goss under his letters patent No. 1252428, issued on January 8, 1918, when they were acquired by the Association of Creosoting Companies of the Pacific Coast and, by them, together with Mr. Goss, were released for general use; the dedicating document being filed with the U. S. Patent Office at Washington, D. C.

This process, which was developed to relieve the difficulties and uncertainties found in the treating of Douglas fir cross-ties and timbers, was described in considerable detail in an



Plan-view Showing Location of Holes and Spread of the Preservative

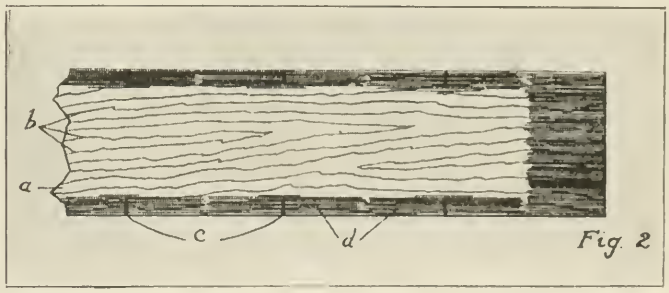
article by O. P. M. Goss on page 783 of the April 13, 1917 issue of the *Railway Age*. The results obtained in the treatment of this wood were seldom satisfactory, due chiefly to its high refractory character and its non-uniform resistance to the penetration of preservatives. This characteristic was more marked in the treatment of sawn Douglas fir where preservatives had to be injected into the heartwood, and it was not uncommon to find a decided difference in the depth of penetration and spread of the preservative in the same piece of timber.

The improvement in the method of treatment consisted primarily of a method of perforating the surface of the wood to be treated by holes systematically located at uniform distances apart, both transversely and longitudinally. These distances depended on the known normal absorption of the preservative with and across the grain of the wood under a given time of immersion, pressure and size of perforations. The result of the treatment gives a substantially uniform penetration of the preservative to a depth equal to that of the holes and without waste.

In Figs. 1 and 2, there is represented a block of timber whose treatment has been partially completed, the letters a, b, c and d representing respectively the timber, the grain, the perforations and the areas over which the preservative spreads from each hole. In the illustrations, the areas adjacent to each hole have not yet come together, as will be the case when the preservative has been fully absorbed by the timber, for, as will be noted, the extent of the absorption of the preservative is much greater along the grain of the wood and, as this extent of absorption can be determined by experiment, the perforations can be so located that the minimum areas impregnated will overlap at their margins. Through the staggering of the holes, the uniform and even treatment of the timber was promoted without the danger of the holes being so close together as to appreciably reduce the transverse strength of the timber.

In preparing Douglas fir for the open tank method of treatment, the timber was perforated with small holes 1/16 in. in diameter spaced 4 in. apart along the grain and ⅛ in. across the grain. The pieces to be treated were then boiled in a preservative oil for four hours at a temperature of 215 deg. F., after which the material was allowed to cool in the oil, the total time of the treatment being approximately 12 hours. A complete and practically uniform penetration was obtained in this way, while a similar result was obtained by the pressure retort method by previously perforating the wood to a depth of ¾ in. and ⅛ in. wide across the grain, the holes being spaced 7 in. with and ⅜ in. across the grain. The pieces were then placed in a pressure retort, the preservative oil introduced and raised to a temperature of 170 deg. F. The material was subjected to this temperature for four hours, after which a pressure of 120 lb. per sq. in. was applied, one hour being required to bring it to this pressure, which was held for a period of two hours, the temperature remaining the same.

While this process was developed in the study of the treatment of Douglas fir, it is applicable as well to other timbers, such as Southern pine and oak. Its application to bridge and structural timbers may require some modifications in the cross-sections designed to carry standard loading, but it is not expected that the perforating will materially reduce the strength of the timber, as it is done along the fibres of the wood and not across them. The machinery which has been built and used up to the present time for this purpose is applicable only to dimension stock such as cross-ties, switch-ties, bridge timbers and structural timbers. Studies are being



Split-section of Tie Showing Perforations and Corresponding Depth of Absorption

made, however, of the design of a machine that is expected to perforate poles and piling with equal satisfaction. One of the main advantages claimed for this method of preparation for treatment is that in addition to controlling or preventing the "checking" of material as commonly found, especially in sawn Douglas fir, and the giving of an even penetration of the preservative, it will also accomplish the important commercial result of reducing the period of treatment required to inject a given amount of preservative into the timber.

A short time after the patent was granted, its control was vested in Mr. Goss and the Charles R. McCormick & Co.,

San Francisco, Cal.; the St. Helens Creosoting Company, St. Helens, Oregon; the J. M. Colman Company, Seattle, Wash.; the Pacific Creosoting Company, Seattle, Wash.; the St. Paul & Tacoma Lumber Co., Tacoma, Wash., and the Columbia Creosoting Company, Portland, Oregon, composing the Association of Creosoting Companies of the Pacific Coast. No development progress was made during the European war, but an attempt was made by the owners early in 1919 to introduce the use of perforating before treatment. Royalty charges of one-half cent per cross-tie and 15 cents per 1,000 bd. ft. for lumber were adopted and announced to the railroad and commercial treating plants of the United States, where they met with considerable opposition. Believing that the best interests of the Douglas fir industry in the Pacific northwest would be furthered by the elimination of royalty charges, Edmund M. Blake of the Charles R. McCormick & Co. took the initiative in an effort to bring about this result. This was successfully accomplished on October 6, 1919, with the full co-operation of the above mentioned creosoting companies.

Railroad National Advertising

Thomas DeWitt Cuyler, chairman of the Association of Railway Executives, has announced that the fundamental facts of the railroad situation would be presented to the country by means of national advertising. The opening statement, to appear in the daily newspapers during the next few days, is signed by nearly a hundred executives of the principal railroads. It will be followed by a series of advertisements in the daily and weekly newspapers and in other publications.

"The unmistakable verdict of public opinion," said Mr. Cuyler in making the announcement of the plan of the railroad companies, "is that this great national industry shall continue to be conducted by private companies under strict public regulation. Modern railroad companies, of course, are not private affairs. Their capital is subscribed by a vast number of individual investors as well as by institutions, such as savings banks and life insurance companies, holding the savings of millions of people, and they are subject to the most minute regulation by the public authorities. In Europe such corporations are called public companies, and this name more accurately describes them.

"With the return of the railroads to the control of their owning companies, after two years of war service under government operation—a period of unprecedented industrial and financial change—the railroad managers will have many difficult problems to face. But the most important problem—the one most affecting the public welfare—will be that of attracting to the railroad business a flow of new capital, without which the railroads cannot grow and without which the country cannot grow.

"The whole railroad problem sifts down to this fundamental fact that in a growing country like ours, with the transportation demands increasing much faster than the population, there must be a continuous investment of new funds in the expansion of railroad facilities.

"Railroad freight traffic reached 200,000,000,000 ton-miles in 1906; it rose to 300,000,000,000 in 1913, and last year it crossed the 400,000,000,000 mark. The railroads are now hauling five times as much traffic as they did 30 years ago. And traffic is going to keep right on growing, because this country is going to keep right on growing."

"To keep pace with this increase in business the railroads before the war were expending about $500,000,000 a year of new capital for expansion. That, as we all know, was not enough. But railroad earnings were not large enough to attract the funds of investors in greater amount. In fact, for several years the market for new railroad stock had vanished. Nearly all the new capital had to be obtained through the sale of mortgage bonds and short-term notes. The companies were obliged to increase the number of their creditors because they could not attract more shareholders.

"During the period of war control the government has been unable to keep up normal expenditures for railroad upbuilding. Last year the labor and materials had to be devoted to the prosecution of the war, and this year the government has not had the money to spend. So with the return of the roads to their owners the managements will be faced with the necessity of very large capital expenditures for betterments and improvements. And this work will have to be done at a cost for labor and materials about double what it was before the war. New capital expenditures at the rate of $1,000,000,000 a year would, therefore, seem to be the minimum required if the railroads are to be enabled to handle the growing traffic of the country.

"To attract the new capital for upbuilding the railroads, the transportation industry must be able to earn a fair return on this capital. Adequate earnings are only possible with adequate rates for service. The rates now are admittedly too low to meet the greatly increased expenses of operation and leave a fair margin for capital."

In the opening statement to the public, signed by the executives of nearly all the principal railroad companies, the Association of Railway Executives states:

"It is the declared purpose of the United States government to restore the railroads at an early date to the control of their owners.

"The Association of Railway Executives represents those upon whom at that time responsibility will again rest for the prompt and successful movement of the country's commerce.

"Those constituting this association are keenly conscious of their accountability to the public.

"They have accordingly determined to present, as fully as they can, the fundamental facts and considerations which they themselves must face in their efforts to provide satisfactory railroad service.

"It is hoped to engage the interest of the whole American people, whose welfare is so vitally dependent upon adequate transportation.

"The country can grow only as the railroads grow. The railroad problem must be solved—and solved rightly and soon—if our country is to prosper.

"It is to promote that prosperity—permanently and in the interest of the whole people—that railroad executives will present to the public the situation as they see it."

A Queue on the Thames Embankment Waiting for Tram Cars

Hearing Before the House Commerce Committee*

Commissioner Clark Favors Compulsory Arbitration; Mr. Gompers Clashes With Representative Webster

Edgar E. Clark, member of the Interstate Commerce Commission, appeared before the House Committee on Interstate Commerce on Thursday and Friday of last week, devoting most of his time to comments on points that have been developed in the discussion before the House committee and the Senate committee. He denied that regulation of railroad rates had operated to reduced revenues. In this connection he said: "Much has been said about restoring railroad credit. I confess I do not yet definitely understand just what is meant by that phrase. Certainly it cannot be proposed that Congress shall by legislative fiat provide all railroads with a standard and uniform basis of credit." In his opinion, some railroads had good credit and some had poor credit, the former being the result of good management or favorable conditions and the latter of poor management, financial juggling or unfavorable conditions. He said that the trend of railroad earnings in recent years under regulation had been upward. It was not true, he said, that the commission had neglected to take into consideration the credit of all the roads. He cited numerous benevolent expressions of the commission in rate cases (notably those in which the application of the roads for higher rates were denied). On the other hand, he said, he doubted very much whether railroad credit had been helped by statements of railroad representatives.

He discussed the short line situation and said that he believed it would be unwise to give the Interstate Commerce Commission or any other agency the power to route unrouted shipments of freight. He was asked: "How can the weak roads be helped?" and replied: "When the legislature has provided a good law giving the weak railroads a fair opportunity and protection against unfair discrimination by stronger competitors, the law has done all that it can do.

"I personally would be against a guarantee unless based squarely on the value of property.

"I object to taking the profits from strong roads and giving them to weaker roads."

He thought that the only thing that can be done with the weak roads was to put them through a reorganization and he thought that the poor roads could be left out of a government guarantee. The case of the guarantee of bank deposits in Oklahoma was cited, but Representative Rayburn pointed out that the analogy between deposits is not good, whereas the guarantee that depositors would not lose the money they had put in a certain bank because the resources and credit of all the banks would be used to make good the assets of one bank, was not the same as providing that a sinking fund of, say, 1 per cent should be established by all the roads and that this fund should be used to meet a deficit of earnings of certain roads.

Returning to the case of the short lines, Commissioner Clark said that he believed that these lines should and could be aided by their trunk line connections as long as this aid did not constitute a rebate in favor of an industry which controlled or owned the majority stock of a short line.

Commenting on the testimony of witnesses who had discussed the taking of the water lines away from the jurisdiction of the Interstate Commerce Commission, he said that, in his opinion, no benefit had accrued to the public by any divorcement of water lines from railroad lines by the Panama Canal act.

He was then asked about the labor provisions of the Cummins bill and expressed the opinion that while no legislative enactment could compel a man to work when he wanted to quit work, nevertheless some legislative provision could be made which would prevent, apparently through compulsory arbitration, a tying up of the railroads of the country.

Mr. Clark was asked whether he thought there ought to be another governmental agency to consider the general railroad problem of the entire country, condition of railroad credit, etc., and to act in an advisory capacity to the Interstate Commerce Commission for the purpose of aiding the commission in fixing rates. He answered that he did not think this would be a good thing, because he thought that if the commission were to be influenced by the information collected, the commission itself ought to collect the information. He thought that there would be a disagreement between the board and the commission after a time. Mr. Clark said that rate-making would be simplified if Congress were to lay down in the act as a rule of law for the administrative tribunal the standard by which it is to measure the determination of reasonable and just rates and that he thought it would be better for Congress to do this directly than through some other governmental agency.

A. P. Thom, general counsel for the Association of Railway Executives, said that he wanted to get the most authoritative expression of opinion that it was possible to get on the provisions of the Cummins bill, which would take away all of the profits of a successful road above a certain fixed percentage. He, therefore, asked Charles E. Hughes, former justice of the Supreme Court of the United States, to render an opinion in the form of a letter to Mr. Thom. He introduced this letter into the testimony.

Justice Hughes' Letter

This opinion refers to section 6 of the Cummins bill, which proposes to take from the railway companies all earnings in excess of what from time to time the Interstate Commerce Commission holds to be a "fair return" on the value of their property. This is the same provision against which T. DeWitt Cuyler, chairman of the Association of Railway Executives, protested in his letter to the Senate Interstate Commerce Committee on September 9, holding that it would practically destroy the incentive to efficient and economical railroad management, and that it would make it impossible to raise the amounts of private capital needed for railway expansion in the future.

Judge Hughes' opinion in brief is that if rates which produce so-called excess earnings are just and reasonable rates, as they are presumed to be when fixed and regulated by a public authority like the Interstate Commerce Commission, then the earnings from those rates are the property of the railroad companies. They may be taxed but they cannot be taken away. That would be confiscation.

Judge Hughes says:

"Section 6 of the bill provides that: 'Rates of transportation shall at all times be just and reasonable.' It is provided in Section 1 of the bill that rates, fares and charges in force at the time of the repeal of the federal control act

* Because of the delayed issues of the *Railway Age* and the necessity of giving our readers as early advice as possible concerning the Esch bill and its passage by the House, the story of the latter part of the hearings before the House Committee on Interstate Commerce was held back. Some of our readers, however, insist that it be placed on record to complete the story which we have already published, and so that it will be available for reference in following the course of the bill through conference and to the final passage of a railroad bill.—Editor.

of March 21, 1918, shall remain in force until changed by competent authority. It is further provided in Section 5 of the bill that schedules of rates, fares and charges filed with the commission in accordance with the 'Act to Regulate Commerce' within 30 days after federal control ceases shall become effective at the end of four months after they are so filed, with such modifications as may be ordered by the commission, and the commission is required within that time to determine whether they shall be modified 'in order to make them fair, just and reasonable rates for the service to be performed.' It is further provided in Section 44 of the pending bill, amending Section 15 of the 'Act to Regulate Commerce,' that whenever the commission after a hearing either on complaint or on its own initiative shall be of opinion that any individual or joint rate, fare or charge whatsoever charged or collected by any carrier is or will be unjust or unreasonable the commission is authorized to determine what will be the just and reasonable individual or joint rate, fare or charge to be thereafter observed, and the carrier is prohibited from making any charge which is in conflict with this determination. Thus all the rates fixed and maintained are at all times open to inquiry and the commission has full authority to insist that the rates shall never be more than just and reasonable compensation for the services which the carrier renders. Nor does the bill interefere with the reparation proceedings which may be entertained on the application of persons aggrieved by extortionate charges.

"Taking all the provisions of the bill into consideration, it would seem that the rates as fixed and permitted to be charged and collected by the carrier, assuming that the rates are not confiscatory, should be regarded as just and reasonable rates fixed and maintained by competent authority. It is also to be observed that Section 6 of the bill providing for the payment to the Railway Transportation Board of the so-called 'excess' earnings does not provide for a determination that the rates under which the described 'excess' has been collected by the carriers were not just and reasonable rates for the services rendered.

"If, however, the rates thus fixed, charged and received by a carrier are to be deemed just and reasonable for the services rendered, the carrier is entitled to these receipts as its property, and the taking by the government of any portion of these receipts (except under a valid tax) for general governmental purposes or for the benefit of other carriers would appear to be taking of property contrary to the fifth amendment of the federal constitution.

"The provision of the pending bill is not a tax laid upon all carriers with respect either to gross receipts, or net receipts, or any other basis for the assessment of a tax, but is simply a requirement of the payment to the government board of the 'excess' earnings of a carrier which the Interstate Commerce Commission determines to be more than a 'fair return' upon the value of its property. Such an exaction goes beyond the limits of any decision known to me, and if the rates under which the so-called 'excess' earnings are collected by the carrier are to be deemed to be just and reasonable rates, fixed and maintained as such under the authority of law, I am unable to escape the conclusion that the requirement as to the payment of the so-called 'excess' earnings of a carrier exceeds the constitutional authority of Congress as applied to carriers not transacting their business under a federal franchise or contract imposing such a condition."

To the argument that the fixing of rates by a regulating authority may be considered only tentative, and that the rates so fixed may be assumed to be unreasonable if they produce excess earnings, Judge Hughes holds that what is a reasonable rate cannot be determined in this way, which is not a regulation of either rates or service, but of earnings. Congress and the Interstate Commerce Commission have no power to permit the collection of rates which are extortionate, even for a temporary period; and, therefore, what is a reasonable rate for a given service at a given time must be ascertained at the time the rate is made.

Judge Hughes' argument on this point is as follows:

"It is difficult to understand upon what theory of proper regulation such rates are to be deemed to be unreasonable without any further inquiry as to the conditions of the service or as to matters directly relating to the rates themselves, but solely upon an inquiry with respect to the value of the carrier's property and the amount of the total net earnings derived by the carrier from its operations. The latter may be a legitimate inquiry for a court in determining whether a legislative body or its subordinate agency has transcended its authority in fixing a body of rates so low as to be confiscatory. But it is a different thing thus to conclude that rates which are not confiscatory, and which as individual or joint rates have been expressly found in the case of the particular carrier to be just and reasonable for the services rendered were in fact not reasonable rates.

"Moreover, whether the rates which have produced the so-called 'excess' earnings of the carrier have or have not been sustained in proceedings under Section 15 of the 'Act to Regulate Commerce,' as amended, with respect to the individual and joint rates of the particular carrier, the fact remains that the rates charged and collected have been fixed and maintained as just and reasonable rates, and that the bill does not require as a necessary preliminary to the required payment of the 'excess' that there should be a finding that the rates were in fact unreasonable rates. The only finding required is that a particular carrier has earned more than the amount which the commission determines to be a 'fair return' upon the value of its property held or used for the service.

"The argument in support of the provision seems to assume that Congress, under the guise of regulating rates, either directly or through the commission, can abandon the fixing of what are reasonable rates for the services rendered by the carrier, and without any determination that the particular rates or the tariff schedule of a carrier are unreasonable, take the earnings of a carrier simply upon a determination that the carrier has received an 'excess' over a 'fair return' upon the value of its property.

"This would appear to be not a regulation of rates, or of service, but of earnings. I do not understand that it is within the authority conferred upon Congress to regulate interstate commerce to determine how much a carrier not exercising a federal franchise, or operating under a federal contract, shall earn in interstate commerce, assuming that the carrier discharges all the public obligations incident to its sevice and charges reasonable rates. In my view the regulation of such a carrier must have direct relation to the service it renders and if the question is of the amount of money it should receive for its service, to the reasonableness of its charges.

"Again, if the assumption could be indulged that the carrier has received more than a 'fair return', is to be regarded as tantamount to a finding that the rates which produce the 'excess' earnings are unreasonable rates, and that such a finding with an inquiry with respect to the rates themselves, but only as to earnings, could be sustained, there would be a further difficulty.

"If it is established that the rate is a reasonable one for a shipper or passenger to pay, it is the carrier that renders the service for which the rate is to be paid and it is proper that the carrier lawfully performing the service, and furnishing all the required facilities therefor, should receive and enjoy the proceeds of the rate thus charged. An attempt to

divest the carrier of any portion of its earnings thus obtained, on the theory that the charges which it was reasonable for shippers and passengers to pay for its services it was unreasonable for the carrier to receive and retain would, in my judgment, be outside of the scope of appropriate and valid regulation. The mere fact that it is proposed to devote the moneys or property of a carrier or of any other person to good uses cannot be regarded as justifying the deprivation of the carrier or such person of the right to enjoy and retain his own property, except as it may be taken for proper governmental purposes through valid taxation, or for public use on the payment of just compensation.

"For the reasons stated, I am constrained to the conclusion that the provision in section 6 of the pending bill as to the payment of 'excess' earnings, in its application to carriers not operating under a federal franchise or contract permitting the imposition of such a condition, violates the federal constitution."

Mr. Warfield Replies to Mr. Hughes

S. Davies Warfield, president of the National Association of Owners of Railroad Securities, has filed with both the Senate and House committees on interstate commerce an opinion by Elihu Root, John G. Milburn, John S. Miller, Hugh L. Bond, Jr., and Forney Johnston, advisory counsel of the association, that Congress has the constitutional power to regulate excess earnings of railroads over and above a fair return upon the value of their property. The opinion takes decided issue with that recently furnished by Charles E. Hughes and states that such excess earnings are the result of rates made to meet the actual necessities essential to the preservation of the life of the transportation system of the country.

"Without this power Congress must acknowledge is inability to sustain competitive agencies of transportation and the power to regulate commerce on a constructive basis would fail at the first test," the opinion states; "we have heretofore pointed out the desirability that any act of Congress proposing to regulate excess earnings thus produced should clearly set forth in the act the theory upon which the regulation is based and should make it clear that, to the extent to which rates established with this end in view shall be found to produce more than a fair and reasonable return upon the property of particular carriers, they are to be received conditionally and in trust for administration by the United States for the benefit of the general public interest in transportation.

"Most of the criticism directed against the process is based upon the assumption that the published rates kept in force from time to time by public authority are necessarily final and unconditional as to the carrier as well as to the shipper; and that legislation dealing with any portion of the proceeds of such published rates constitutes a mere effort to recover revenue which has become the absolute property of the carrier.

"We have heretofore advised that the legislation now under consideration by Congress should prescribe that while rates are to be just and reasonable so far as the shipper is concerned, the result is not to be regarded as attained unless they are also sufficient to sustain the agencies of transportation as a whole in the several rate-making groups; and, further, that the act should clearly state that although individual rates paid a given carrier in the group in order to sustain these agencies as a whole may include an element of excessive return for the specific service as rendered by that particular carrier, this excess is necessary to be paid by the shipper to sustain transportation in the group and will be dealt with by Congress in the interest of transportation as a whole rather than be left subject to recovery in a proceeding for reparation by the shipper. Recovery by the shipper would obviously amount to a rebate which would defeat the purpose. The question of 'reasonableness' from the shipper's standpoint is to be determined by the necessities of transportation in the group. He cannot insist upon a rate that would destroy essential agencies of transportation by attracting all of the business to their competitors. From the carrier's standpoint the question as to what each particular carrier shall be entitled to retain out of its earnings over and above a reasonable return upon its property is dependent upon entirely different considerations. The carrier cannot complain of action by Congress appropriately exerted under the commerce clause if such action leaves it with a fair and reasonable return.

"Singular confusion has arisen out of the reluctance in certain quarters to recognize the fact that a rate may be reasonable for a shipper to pay, because of the necessity of sustaining competitive agencies for transportation, which would be wholly unreasonable for individual carriers to demand if their case alone were being considered.

"This necessity would produce returns for certain carriers in each competitive group so excessive as to stand as a stumbling block to rates adequate to sustain transportation as a whole unless the excess is regulated. Denial of the right of Congress to deal with the excesses thus produced is tantamount to a denial of the power of Congress to regulate and conserve commerce. This excess is obviously a by-product resulting from the exertion by Congress of its regulatory power. We entertain no doubt whatever of the power of Congress, under appropriate legislation so stated as to demonstrate with accuracy just what is being done, to administer this by-product in the general public interest in transportation. No shipper can complain; and as it is a gratuitous excess temporarily conceded by Congress over and above a resonable return, it is difficult to ascertain any sound basis for complaint by the carrier." * * *

Testimony of A. P. Thom

Mr. Thom took up the question of the relation of state rates to interstate rates. He pointed out that the operating ratio prior to the government taking over the roads (in 1917) was 76 and that now the best that the roads could do was to retain 5 cents out of every dollar, the rest being required to pay operating expenses and taxes. He said that this situation was recognized specifically in the Cummins bill in Section 5, which provided for procedure during a period of reconstruction, but that in this provision nothing was said about state rates. Therefore, with the termination of federal control state rates would automatically go back to what they were in 1917, although interstate rates would be continued on present levels during the reconstruction period. This, Mr. Thom said, would create an impossible situation State rates must be readjusted; otherwise interstate rates could not be collected in practice even if they could remain on paper as they now are. He cited the case of coal moving from Pennsylvania coal fields to New York, Philadelphia and Baltimore. It would be impossible to charge a much higher interstate rate on coal to New York and to Baltimore and to charge the much lower intrastate rate on the same quality of coal to Philadelphia. The same would be true of wheat moving on an interstate rate from farms west of the Red river and intrastate rates on grain moved from farms just east of the Red river. He introduced the accompanying tables showing that state rates on distances from 35 miles to 400 miles were only about half what the interstate rate was.

He said that under the Esch bill some recognition of this situation was shown, but that under the Esch bill interstate rates would be regulated comprehensively, while state rates

would be regulated, if at all, only reluctantly. He was asked whether a state could not charter a road to do only intrastate business, and said that he thought legally it could but that practically it never would.

He thought that it was absolutely essential that one federal body should be given jurisdiction over the rates on every interstate carrier whether the carrier itself was wholly within one state or not and whether the haul was wholly within one state or not. He said, however, that if at this time Congress did not wish to go so far as to make a specific declaration of this scope there should be an amendment made to the Esch bill to provide:

1. That the carrier should have the right to complain to the Interstate Commerce Commission against a state rate.

2. That not only discrimination but inequality and undue burden on other rates could be complained of in regard to a state rate and,

appliance act, which act the Supreme Court held as applying to a state train as well as to an interstate train. The Shreveport case plainly indicated that the federal commission had the power to correct discrimination, but Mr. Thom contended that now this doctrine should be extended so that the power of the Interstate Commerce Commission over intrastate rates could and would be used to prevent wrongs as well as to correct them.

Members of the committee were eager to press Mr. Thom to the logical conclusion of his theories. He was asked whether Congress under his theory could except railroads from state taxes. He said he believed Congress could; in fact, that Congress could treat a railroad just as it could treat a national bank. A state had a right to be protected against any other state. The national legislature was not a foreign body, but represented the individual states just as much as a town councillor represented his community;

COMPARISON OF COMMODITY RATES

3. To confer power on the Interstate Commerce Commission to suspend intrastate rates and to grant reparation in respect to such rates.

Asked whether or not the logic of his position in regard to intrastate rates would not lead to the conclusion that Congress could take away from the state commissions all of their powers and confer them on the Interstate Commerce Commission. he said that he thought legally and constitutionally this was so, but that it would not be a wise thing to exercise this power; that as to rates only should this power be definitely vested exclusively in the Interstate Commerce Commission.

Mr. Thom was asked whether the first federal employee case in the Supreme Court did not conflict with his theories. He said that it did absolutely, but that he believed that since rendering that opinion the Supreme Court had gotten away from the contention in that case. and he cited the safety that the duty, therefore, of the national legislature was to legislate in favor and in fairness to all the states and not to permit one state to discriminate against or lay unfair burdens on the other states.

Mr. Gompers Against Compulsory Arbitration

Samuel Gompers, president of the American Federation of Labor, testified before the committee on October 4 in opposition to any provision that may be inserted in the railroad bill providing for compulsory arbitration. His testimony was similar to that presented before the Senate committee previously, and his position led to a sharp clash with Representative Webster of Washington, who questioned Mr. Gompers as to what he would do if Congress should pass an anti-strike law and the law were held constitutional by the courts. After attempting to evade a direct answer, Mr. Gompers said he thought he would obey such a law, but he

was sure the working men would not. In reply to continued questions he said that he would not counsel obedience to such a law but would remain silent, advising organized labor to appeal to the country by trying to select a Congress that would repeal the law. It is impossible, he said, to prevent men from quitting their employers, no matter what law makes them lawbreakers.

Urged to state his position regarding the Plumb plan, Mr. Gompers finally asked that the committee should not press him for a statement at this time. Arbitration, he said, must be voluntary or it cannot be successful, and labor must always have the right to strike. Mere discussion of such legislation is likely to produce serious consequences by giving the radical element the means of undermining the more conservative element.

Following is part of the colloquy between Mr. Webster and Mr. Gompers, as taken from the record:

"Mr. Webster: It is my purpose to make some observations in Congress upon your testimony, and I have not the slightest purpose to misquote you or to misconstrue anything you say. I want you to keep me from doing that by telling me frankly, without any qualification or condition, just what your position is. I had gotten the impression from the newspaper reports of your testimony before the Senate committee that you had in effect taken the position that you would defy the laws of your country. Of course, I would not act upon that, and I should like before this committee, speaking in an official capacity, to ask you this question, and I want you to give me a fair answer so that there will be no possibility of misconstruction of what your position is.

"Suppose this Congress should incorporate in the bill that we now have under consideration some provision or provisions relating to compulsory arbitration and denying to some extent or qualifying your right to strike, and that law should be tested through the ordinary channels and in accordance with the established procedure to the point where the Supreme Court of the United States declared that law in all respects to be constitutional and valid, would you advise the men constituting the organizations which you represent to go counter to the provisions of that law so interpreted and construed by the Supreme Court of the United States?"

"Mr. Gompers: The question that has been propounded is one to which I have made answer.

"Of course, I do not think that I shall ever again work as a wage-earner in a factory; it would be simply impossible, that is, for practical purposes. I would say that if I were a wage worker I would still assert my right to quit my employment, even though in asserting that right it involved a violation of a declared constitutional statute. I would assert my right to quit work, to leave my employment, the same right as you have, sir; the same right as every other man in business has or in the law has, to quit employment, to quit his client at any time when his interest or his whim or his fancy prompt him. No one undertakes to stop any man from quitting his business."

"Mr. Webster: Would you counsel or advise the workmen to obey it?"

"Mr. Gompers: No, sir. I should probably remain quiet upon that subject and permit them to act as their judgment as law-abiding citizens directed them, but I would appeal and make the most strenuous efforts of which I was capable to secure a reversal of the Supreme Court's decision by the people through their Congressmen in the next Congress, as the decisions of the Supreme Court have been reversed in many instances by Congress and by the people."

"Mr. Webster: You have just stated that if this law should be declared constitutional, though it were your personal opinion that it was unconstitutional, that you would not advise the members of your organization to obey the law. Am I to understand from that that you would withhold the benefit of your very great influence as an expedient of labor in this country in a matter of encouraging obedience to the laws?"

"Mr. Gompers: Your question is entirely speculative and hypothetical. My work and the character of my work, my services stand. I am willing to submit them to any prejudicial opinion which may be held of me."

"Mr. Webster: Well, then, Mr. Gompers, you may answer this question for me, yes or no. The Congress of the United States places upon the statute book a law relating to compulsory arbitration and the right of labor to strike, which, in your judgment, trenches upon the constitutional right of an American freeman in that behalf, and that law is brought on for a test in the courts as to its constitutionality, and it finally reaches the Supreme Court of the United States and that tribunal declares that the law is constitutional, that the limitations placed upon the right to strike are valid and that the machinery arranged for the arbitration of disputes are valid and constitutional, would you, as the president of the American Federation of Labor, advise and counsel obedience to the law or not?"

"Mr. Gompers: Perhaps I may be entirely in error, but I think the question is unintelligibly stated. It occurs to me that it is unintelligible, that part of the question that if the Congress should enact a law for compulsory arbitration and the right to strike. What I think was intended was to prevent the right to strike."

W. N. Doak Also Opposes Compulsory Arbitration

W. N. Doak, vice-president of the Brotherhood of Railroad Trainmen, also opposed any kind of compulsory arbitration and said that Congress ought not to "start anything" that would further alienate labor and capital. He said a get-together conference between railroad operators and employees is probable after the railroads are given up by the government and that voluntary agreements without additional legislation will prove more satisfactory. He said that the organizations would not attempt to strike to force the adoption of the Plumb plan.

Return of Railroads Still in Doubt

The Railroad Administration, Congress, and railroad men and others throughout the country are awaiting anxiously the message which President Wilson is expected to send to Congress shortly regarding his intentions as to the restoration of the railroads to private management. The Railroad Administration has been proceeding all along on the assumption that the President has not changed his mind since he stated in his message to Congress in May that the railroads would be returned at the end of the year, but whereas two weeks ago most railroad men seemed fairly certain that the transfer would take place on that date, the delay in making the formal announcement and the uncertain situation as to railroad legislation in Congress has brought about a change in sentiment and the prevailing opinion now seems to be that a postponement of the transfer is to be expected. While varying opinions have been expressed, it seems to be true that at this writing no one knows what is to happen unless it be the President and there are many who believe that he has not finally made up his mind and will not until the fate of the Cummins bill in the Senate is known with certainty.

Director General Hines submitted a report to the President on both the railroad and the legislative situation on December 9, which it is understood merely outlined the facts and prospects for the President's determination. Later Mr.

Hines submitted another report which is understood to have contained a specific recommendation, the nature of which has not been disclosed.

One theory which is being discussed is that in the event of the failure of the Senate to pass a bill by the end of the year, the President would say that he had given Congress a full opportunity to legislate and as it had been unable to agree on a program he would keep the roads for another year, thus giving satisfaction to the labor organizations. This opinion is most frequently expressed by those who believe in a further continuation of government operation.

On the other hand there appear to be many more adherents to the opinion that the President is anxious to get rid of the railroads as soon as he can do so with safety and that if the Senate should pass a bill that would make it reasonably certain that a completed bill could be put through a conference committee and be accepted by the Senate and the House in a month or so he would consider it safe to return the roads on January 1 or shortly afterward.

If the Senate fails to agree before the holiday recess or before January 1, according to this theory, the return would be postponed for a month or two or three to give Congress further time to complete its permanent legislation.

As the Cummins bill has encountered a more all-round opposition in the Senate than was expected, the chances seem to favor a delay in the return of the roads beyond the first of the year, particularly as it is no longer possible to give the railroad companies an adequate notice.

Labor Leaders Ask Two-Year Extension of Government Control

That the President's mind is "still open" on the railroad question was stated by Joseph P. Tumulty, secretary to the President, to a delegation of labor leaders who called at the White House on December 17 and left a letter urging the President to set at rest rumors that he intended to return the railroads, and to retain them for at least two years. The delegation was made up of representatives of the conference of labor leaders, called by the American Federation of Labor and the officers of the train service brotherhoods that began a meeting on December 13 to consider general labor questions including opposition to the Cummins bill. Earlier in the day, headed by President Gompers of the American Federation of Labor, they had called on Senator Cummins, chairman of the Senate committee on interstate commerce and asked him to withdraw the Cummins bill and give government operation of the railroads a "fair and thorough test" in peace time.

The letter to the President was as follows:

"Proponents of the Cummins bill for the immediate return of the railroads with a high guaranteed compensation are attempting to justify this bill by asserting that it is your plan to return the railroads to their owners by January 1, 1920, and that some legislation providing for such return must be enacted immediately.

"We believe that this assertion is a great injustice to you. As you will doubtless know, an overwhelming majority of the farmers, of the members of the American Federation of Labor, of the railway brotherhoods, as well as of the general public, favor an extension of the period of government operation of the railroads for at least two years, in order that a fair test may have been made of government operation and a plan may be worked out for the ultimate disposition of the railroads which would be fair to all interests involved. Such recommendation was made by Mr. McAdoo when director general of the railroads, who urged a five-year extension of government operation, while members of the Interstate Commerce Commission have also urged extension.

"Director General Hines and members of the Interstate Commerce Commission have shown clearly that the return of the railroads will involve an increase in freight revenue of close to a billion dollars, the rates being increased 25 to 50 per cent. This increase in rates, according to these same authorities, will be reflected in an increased cost of living of at least four billion dollars a year, possibly five billion. The American people cannot and should not stand such increase.

"Government operation, as reported by Director General Hines, showed a net profit at the rate of $168,000,000 a year for the three months prior to the coal strike.

"The Senate is now being asked to investigate serious charges against certain officials and railroads during the period of food control, and they had committed sabotage and had wilfully and purposely attempted through unfair methods while presumably serving the Government, to discredit government operation.

"We respectfully request, Mr. President, on behalf of the farmers, the American Federation of Labor and the railway brotherhoods, as well as the general public, that you stop the rumors that you plan to return the railroads to private control, and that in view of the changed conditions and the prevalent industrial unrest you re-establish public confidence by advocating that the period of government operation be continued for at least two years, so that under peace conditions there may be a more thorough and more consistent trial of government operation, and that carefully considered plan for the ultimate disposal of the railroads may be worked out and adopted."

The letter was signed by the following:

Samuel Gompers, president of the American Federation of Labor.
George P. Hampton, managing director of the Farmers' National Council.
Warren S. Stone, grand chief of the Brotherhood of Railway Locomotive Engineers.
L. E. Sheppard, president of the Order of Railway Conductors.
Timothy Shea, acting chief of the Brotherhood of Locomotive Firemen and Engineers.
W. G. Lee, president, Brotherhood of Railway Trainmen.
Fred J. Chamberlain, representative of Washington, Oregon, Idaho and Colorado State Granges.
H. A. Fuller, vice-president of the American Society of Equity.
O. H. McGill, Seattle Cooperative Shingle Mills.
Martin F. Ryan, Brotherhood of Railway Carmen of America.
J. W. Kline, general president, International Brotherhood of Boiler Makers, Drop Forgers and Helpers.
Wm. H. Johnston, International Association of Machinists.
N. P. Alifas, International Association of Machinists, chairman.
George A. Luther, secretary, Brotherhood of Railway Clerks.
H. E. Wills, Brotherhood of Locomotive Engineers.
B. M. Jewell, acting president Railway Employees' Department.
Rolla S. Sextob, American Federation of Labor.
Henry Sterling, American Federation of Labor.
John T. McCrudden, Brotherhood of Railway Clerks.
R. T. Wood, U. B. of Maintenance of Way Employees and Railway Shop Laborers.
T. M. Pierson, Order of Railroad Telegraphers.
Charles J. McCowan, Brotherhood of Boilermakers.
W. N. Doak, Brotherhood of Railroad Trainmen.
W. M. Clark, Order of Railway Conductors of America.
W. L. McMenimen, Brotherhood of Railroad Trainmen.
P. J. McNamara, Brotherhood of Locomotive Firemen and Enginemen.

Mr. Hampton, Mr. Stone and W. H. Johnston acted as spokesmen and expressed similar sentiments.

In addressing Senator Cummins, Mr. Gompers said that organized labor wanted the government to retain control of the railroads for two years "for the purpose of testing out the best method for their continued operation" and, referring to the anti-strike provisions of the bill, he said the proposal was "filled with the gravest consequences. It will not stop strikes but will make respected citizens law-breakers." George P. Hampton, Fred J. Chamberlain and H. E. Wills also spoke.

Senator Cummins said he had no authority to withdraw the bill but offered to lay the request before the committee.

October Earnings and Expenses

THE OPERATING STATISTICS SECTION of the Railroad Administration has published figures covering the financial results of operation for October for all Class I roads in federal operation. These comprise 232,149 miles of road, or 97 per cent of the total of 240,177 miles of road federally operated. The condensed income account is as

	Month of October		Increase or decrease	
	1919	1918	Amount	Per cent
Operating revenues	$503,488,334	$484,372,562	$19,115,772	3.9
Operating expenses	399,400,554	378,975,377	20,425,177	5.4
Net operating revenue	104,087,780	105,397,185	d1,309,405	..
Taxes, rents, etc.	27,128,003	19,212,699	7,915,304	..
Net Operating income	76,959,777	86,184,486	d9,224,709	..

NOTE: d indicates decrease.

One-twelfth of the annual rental due the companies covered by the report amounts to $74,356,354, so that the net profit to the government was $2,603,423.

"In this connection it should be observed," the statement says, "that on account of the restoration on October 1 of car per diem charges the equipment rents in October, 1919, included $6,000,000 car per diem debits, while the corresponding credits to other railroads on account of October transportation, will not appear until November; also that there was a large amount of revenue estimated to be not less than $3,000,000 from coal traffic transported in October, which is not included in the October revenues because, on account of the then impending coal strike such coal traffic was held in transit in the last few days in October and the revenues shown on the waybills relating thereto were not taken into account for the month. The net result of these two items would be to add approximately $9,000,000 to the net operating income as stated above, which would result in a net profit to the government of $11,603,423.

"In making comparison with last year it should be noted that freight and passenger rates are on substantially the same basis in both years. The expenses in October, 1918, include about $12,800,000 back pay applicable to prior months, but they do not, on the other hand, reflect the increases to quite a number of classes of employees granted subsequent to October, 1918, which are included in the October, 1919, expenses. In addition the expenses for October, 1919, include about $4,800,000 back pay applicable to previous months."

There was an increase in the revenue and non-revenue ton miles during the month compared with the corresponding month of 1918 for the first time since January, 1919.

The results for the 10 months ended October 30 were:

	10 months ended Oct. 31		Increase or decrease	
	1919	1918	Amount	Per cent
Operating revenues	$4,234,992,130	$3,985,178,160	$249,813,970	6.3
Operating expenses	3,556,720 774	3,201,838,204	354,882,570	11.1
Net operating revenue	678,271,356	783,339,956	d105,068,600	..
Taxes, rents, etc.	199,288,721	183,363,173	15,925,548	..
Net operating income	478,982,635	599,976,783	d120,994,148	..
10/12 of annual rental	743 563 540	743 563 540	.....	..
Operating loss	264,580,905	143,586,757	120,994,148	..
Operating ratio	84.0	80.3	3.7	..

NOTE: d indicates decrease.

The comparison between the ten months' periods is substantially affected by the fact that the rate increases, approximately 25 per cent, which were in effect this year, became effective for passenger and freight traffic respectively the middle and latter part of June, 1918, and also by the fact that numerous important wage increases which were effective for all of 1919 were effective for only part or none of 1918.

Ore Loading Docks on the Great Lakes

THROUGH THE COURTESY of W. A. Clark, chief engineer of the Duluth & Iron Range and the Duluth, Messabi & Northern, we are able to publish the following table of statistics relative to ore-loading docks situated on the Great Lakes. This table has been revised to May 1, 1919, and shows the locations, numbers and capacities, etc., of all of the docks in use up to that date:

ORE LOADING DOCKS ON THE GREAT LAKE

Railway	Location	Dock No.	Number of pockets	Capacity per pocket in tons	Storage capacity in gross tons	Height of water to deck of dock	Width of dock outside to outside of partition posts	Length of dock	Angle of pockets	
A. C. & H. B.	Michipicoten, Ont.	1	12	...	.....	43 ft. 4 in.	25 ft. 0 in.	311 ft. 9 in.	44° 0′

General News Department

Plans for a bridge at Detroit over the Detroit river recently reported as under discussion are assuming a more definite form, following investigations of the project. The American and Canadian corporations that are interested in the construction of a bridge have established a joint board. Gustave Lindenthal, consulting engineer, New York city, has been made consulting engineer of this board, and Charles Evan Fowler, consulting engineer, New York city, has been made chief engineer. The plans provide for a double deck bridge, carrying both highway and railway traffic with a central span of 1,800 ft. or 2,400 ft., depending upon the location adopted.

Recent press despatches from Winnipeg, Man., have indicated that members of the Brotherhood of Railway Trainmen and the Order of Railway Conductors have made a new agreement with the Canadian Pacific providing for increases in wages; but an officer of the Railway Association of Canada says that the agreement is only a local adjustment of rates of pay and working conditions for trainmen and conductors as provided in a supplement to the McAdoo award. The association officer has further announced that there are no negotiations either in progress or pending looking to any general increase in wages for Canadian railway employees.

The map of the railroads operated by the Canadian Government, printed in the *Railway Age* dated November 7, page 906, should have shown also the Temiskaming & Northern Ontario, which is an important north and south connection between the new trans-continental line and the older portions of the Canadian railroad system. The Temiskaming & Northern Ontario is owned and operated, not by the Dominion but by the Ontario Provincial Government. The main line extends from North Bay, on the line from Ottawa to Sudbury, northward 254 miles to Cochrane, which is a division point on the Trans-Continental, about 60 miles west of the boundary between Quebec and Ontario.

The Order of Railroad Station Agents has issued a circular discussing certain sections of the Esch bill, recently passed by the House of Representatives. The sections of the bill which the circular treats are those legalizing the machinery used by railroads and their employees before and during federal control for the settlement of wage and working condition disputes. The circular, after briefly outlining the plan contained in the bill for the settlement of labor disputes, says: "No provisions seem to have been made for a representation on the boards of adjustment of the thousands of railroad agents and the station supervisory forces and it becomes a matter of personal importance to every agent that he should be represented by one of his class. The station supervisory forces greatly outnumber the machinists, blacksmiths, sheet metal workers, electrical workers and switchmen. Unless we have a representative on one of these boards of adjustment our cases will be decided by a telegrapher, a clerk, a switchman, a maintenance of way and shop laborer and four railroad representatives." The circular closes with an earnest appeal to station agents and station supervisory officers to protest against the apparent oversight and to demand representation on one of the adjustment boards.

Minneapolis Track Plans

An ordinance requiring the depression of the tracks of the Chicago, Milwaukee & St. Paul in Minneapolis, Minn., and calling for the elevation of the city streets over the tracks is now pending before the Minneapolis city council. The ordinance is practically a compromise in a discussion between the city of Minneapolis and the Chicago, Milwaukee & St. Paul relative to the matter of separating grade crossings which has been in progress since 1916. At that time an ordinance was introduced and adopted by the city council requiring this road to depress its tracks and carry them under certain streets and avenues. This ordinance was resisted in the United States Court by the railroad company and was consequently held to be void.

New York Railroad Club

William L. Chenery, one of the editors of "Survey," will conduct an open forum to discuss The Industrial Conflict at the next meeting of the New York Railroad Club on Friday evening, December 19, 1919, at 29 West 39th street, New York City.

The Tie Merchants

The National Association of Railroad Tie Producers will hold its annual meeting at the Hotel Sherman, Chicago, on February 12 and 13, 1920, in conjunction with the annual meeting of the American Wood Preservers' Association. The program for this meeting is now in preparation.

An Idealist's View

The railroads should be compelled to adhere to their function as carriers. Let us demand that freight rates be based scientifically on the cost of service and that all agencies be co-ordinated and made to have proper arrangements for the inter-change of traffic. Let us see to it that the powers granted are rightfully used ,and that the expenditures for development are justified by proper service; that any route to be developed, railway, waterway, or highway, shall be worthy of development and when developed be used for the public service at rates which can be defended as representing the cost of the service rendered. Let the Federal agency be truly an inter-state commerce agency and not simply a regulator of railways. Can we not learn a lesson from the war? Is there not a golden mean between the unthinking machine developed by autocracy and the extreme individualism of democracy? Have we not had proof of the necessity for concerted action where great public issues are involved? Should we not have a Department of Transportation charged with the development and co-ordination of all the transportation agencies of the nation?—*Maj. Gen. W. M. Black.*

American Association of Engineers' Position on Unionism

The American Association of Engineers has issued a statement of its position with reference to trade unionism in the profession. The following is an abstract from this statement:

"Production should be increased—not limited. The profession cannot support strikes or lockouts or any other methods that may benefit any class at the expense of the nation as a whole.

"Rewards should be according to ability, initiative and constructive effort. Men are not equal in these respects. Each man should be encouraged to do his utmost and be given compensation according to ability and will to increase production and to achieve large results.

"The engineer, as an educated professional man, believes in basing his claims for proper and just reward for his services upon the justice of the facts presented, upon enlightenment of public opinion, upon loyalty between employer and employee, and upon the underlying fundamental desire of the great majority to do what is fair and right when the merits of the case in question are clearly presented and demonstrated. We believe in organized representation for

the correction of wrong, the advancement of the profession and service to the public, but are opposed to methods inconsistent with the dignity of the profession and which would lessen public confidence."

Canadian People Operating Canadian Railways

Employees may be represented on the governing board of the Canadian National Railway System; this was intimated in a recent address by Sir Robert Borden, Prime Minister of the Dominion of Canada, to the legislative board of the Brotherhood of Locomotive Firemen and Engineers. Sir Robert said, in part:

"In a country of vast area and scattered communities the problem of transportation is all important, and the efficiency of transportation in Canada is an essential factor in the national life. About one-half the total railway mileage of Canada is, or shortly will be, in the ownership of the state. You must realize, and I hope you will agree, that this condition emphasizes the importance of devising some means by which this great essential and national activity shall not be interrupted or prejudiced by disputes between employers and employed. Even as between a private corporation operating a great public utility and its employees there should be some more reasonable method than the imposition upon the general public of the inconvenience, the loss and the suffering which are occasioned by strikes. If, between jealous and sometimes antagonistic nations, the principle of settling international disputes by peaceful means has been acknowledged and adopted, surely disputes between employers and employed can be investigated and adjusted by means other than those which may bring upon the whole people distress and suffering comparable to that entailed by war. So far as railways in the ownership of the state are concerned, there is one additional consideration of which you should not lose sight. Those responsible for the administration of state railways are not actuated or influenced therein by any motive of private interest. Their duty is on the one hand to the public whom they serve, and on the other hand to the employees, who also serve the same public. So that in this instance employers and employed alike serve the people as a whole.

"I commend to your most thoughtful consideration the results which have been obtained in this country by the establishing of the tribunal known as Board of Adjustment No. 1, in connection with the Canadian Railway War Board. The Board has given decisions in 52 cases, as well as 6 supplementary cases, or in all 58 disputes which have thus been settled without resort to strike In addition, about a dozen potential disputes have been adjusted through the good offices of the Board without the necessity of a formal hearing. Disputes have also been adjusted for organizations which were not parties to the agreement. It is open to any class of railway or transportation employees to present a case to the Board, provided they agree to be bound by its decision.

"Is there not in this record food for the most careful reflection and consideration as to the future determination of disputes between organizations of railway employees and those responsible for the administration of the railways? In other countries there have recently been legislative proposals for the prohibition of strikes. It would not be my purpose to have the question approached in that way. The members of the railway organizations are citizens of this country, interested like others in its development, its progress and its orderly government. Any movement to make permanent and still more efficient the methods which have had such good results during the past eighteen months might well originate with them. This obligation is imposed and this responsibility is created not only by the power and influence of the organizations in question, but by the duty which their members owe to the state as good citizens. On our part we must not be unmindful of corresponding obligations. The problem of administering about 22,000 miles of railways in this country is one of exceptional moment and difficulty. Upon its successful solution probably depends the success of state ownership, not only in Canada but upon the whole North American continent. We must give earnest attention to some means by which the employees shall have just representation in the executive administration of this great system. I have given to this question some study in the consideration of the problem as a whole and you may be assured that such a proposal will command my entire sympathy."

Traffic News

At Evansville, Ind., cattle are coming into the stockyards in box cars, the shippers having been unable to obtain cattle cars.

M. T. Scanlan, commercial agent for the Chicago, Lake Shore & South Bend, with office in Chicago, has been appointed commercial agent for the Chicago, Racine & Milwaukee, with the same headquarters.

The Traffic and Transportation Association of Pittsburgh, Pa., at its monthly meeting at the Fort Pitt Hotel on December 4, elected the following officers: President, H. N. Holdren, assistant traffic manager, Pittsburgh-Des Moines Company; vice-president, S. R. Hosmer, Jones & Laughlin Steel Company; financial secretary, S. C. Corfield, traffic manager, Columbia Steel & Shafting Company; recording secretary, A. C. Schweitzer, Carnegie Steel Company; custodian, H. B. Parmelee, Carnegie Steel Company; treasurer, J. F. Sturm, National Tube Company; executive committee, W. H. Patton, Pittsburgh & Lake Erie Railroad Company; S. S. McKeever, W. H. Walker & Company; F. G. Wood, Canadian National Railways Company; G. H. Waggoner, Stalnaker Steel Company; R. J Zinsmeister, W. H. Herman Company.

The director general announces that an understanding has been reached between the United States Shipping Board and the Railroad Administration in the matter of storage or demurrage charges on export coal and freight, moving via North Atlantic ports under through bills of lading, under which these charges will be assumed by the party at fault—the shipper, the inland carrier, or the ocean carrier. He has also announced the names of members of the Trans-Atlantic Associated Freight Conference, which constitute practically the entire membership, also independent steamship lines or operators (not members of the associated conferences) that have agreed to become parties to the same understanding. It is expected that it will be possible to publish necessary amendments to tariffs, so that this arrangement may become effective not later than December 29.

The Cunard steamship line, and allied interests are credited by a New York paper with having made substantial progress with plans for the establishment of an immense freight terminal at Weehawken, N. J., the west side of the Hudson River, opposite 42d street, New York, which probably will dwarf anything of the same character now existing in New York. It is stated, on the authority of persons familiar with the project, that negotiations in progress for some time may be expected to mature in the spring. The proposed development will include the entire Weehawken frontage on the Hudson from the West Shore ferry slips south to the Erie Railroad piers. It does not involve any change in connection with the larger ships of the Cunard and allied lines, which dock at the Chelsea piers below Twenty-third street, New York. The new piers will have electrical and mechanical equipment equal to the best.

Coal Allowed for Ocean Vessels

Restrictions against the delivery of coal for bunkerage were removed on December 15 by the Railroad Administration, which will permit delivery in the following order of priority under the permit system: (1) Inland and coastwise vessels; (2) American ocean vessels; (3) foreign vessels.

Causes of Mail Delay

The post office department has issued a statement concerning train delays. It says that during the four weeks from February 16 to March 15, 1919, the number of letters delayed in the railway mail service as the result of being undistributed, from various causes, were 2,810,000, the delay ranging from one hour to twenty-four hours in reaching destination. During this same period there were 40,000 trains due to make connections that were missed. The number of letters delayed as a result of these failures of trains to main-

tain schedule connections aggregates over 35,000,000. The delay of 2,810,000 letters, as a result of being undistributed, was due for the most part to the clerks receiving mails from delayed trains in greater volume than they were prepared to handle. In November, 1917, there were 87,000 failures of mail trains to maintain their schedule connections, or more than double the number that occurred in March, 1919.

Coal Production

Bituminous coal production during the week ending December 6, according to the weekly report of the Geological Survey, was 43.5 per cent of normal, or less than at any time since the first two weeks of the strike. Compared with the fourth week, when the wage negotiations were broken off, the tonnage per working day fell off 8 per cent. The revised figures show that production during the first week of the strike was 29.6 per cent of normal, during the second week 33.3 per cent, during the third week 44.5 per cent, and during the fourth week 47.3 per cent. The total output for the week ending December 6, including lignite and coal coke, was 5,259,000 net tons. The average during the four weeks ending October 25, which may be regarded as normal, was 12,089,000 tons. The report says that production during the week reflected the state of the industry at a time when negotiations had been broken off because this was the period after the Central Interstate Wage Conference had adjourned after failing to reach an agreement. Comparatively few of the striking miners accepted the proffered increase of 14 per cent, and returned to work, while many mines which had resumed operations during the Washington negotiations had again shut down, notably in Wyoming, West Virginia, and the Cumberland-Piedmont field.

St. Paul Business Men

The St. Paul (Minn.) Association of Public and Business Affairs, having discussed the general railroad problem, has adopted resolutions advocating:—

"(1) That in returning the railroads Congress make liberal provision for refunding the indebtedness of the railway companies to the government on account of the creation by the government of additions and betterments upon railway property, the cost of which has been charged to the carriers, in order that all current assets may be forthwith available, for the betterment of transportation facilities; that until railway credit has been reestablished by such a readjustment under the supervision of a federal commission of railway revenues and expenses as will result in net earnings sufficient to attract the new capital required for the creation of additional facilities and the acquisition of needed equipment, the compensation guaranteed to the carriers during federal control be continued, and, if necessary to provide such capital, the government loan same to the carriers at reasonable rates of interest;

"(2) That the Interstate Commerce Commission be clothed with broader and more general authority over all rates, to the end that it may fix minimum and maximum rates, co-ordinate interstate and state rates, and thus bring about a more uniform, fair and non-discriminatory scale of rates throughout the country;

"(3) That some effective federal agency be created as the final arbiter in wage disputes and that lockouts and strikes be prohibited during the consideration and determination by such agency of any disputes;

"(4) That the Federal Commission be given exclusive supervision and control over the issuance of railway securities, with authority, when the public interest will be served, to permit consolidation of railways and railway facilities and service.

"In the judgment of the St. Paul Association the above deemed essentials can be best accomplished by amplifying and extending the jurisdiction and authority of existing governmental agencies rather than by the creation of new agencies; that the demand of the public is not for more regulatory machinery, but for a better transportation machine, more fully and adequately equipped, affording service, uninterrupted by strikes and lockouts, under the regulation of such effective governmental agencies as will at the same time protect railway capital, secure fair wages for the employees and protect the public against undue exaction from either railway companies or the employees thereof."

Commission and Court News

State Commissions

The Southern Railway Company has petitioned the Public Utilities Commission of Illinois for a modification of supplemental Order No. 1 to General Order No. 55, so that only one crossing sign need be maintained at highway crossings that are not "extra hazardous."

Court News

Crossing Accident—Standing Train

The Vermont Supreme Court holds that a railroad company is not liable for injuries to an automobile, the driver of which in coming down a steep hill at night, by reason of the slippery condition of the oiled road, was unable to stop on discovering a standing train on the crossing, whereby the automobile hit the train just as the latter was starting, though the railroad took no precautions to avoid such injury. The railroad's servants would be amply justified in acting on the belief that travelers in automobiles properly lighted and driving at reasonable speed would observe the cars on the crossing in time to avoid a collision.—Gilman v. Central Vermont (Vt.) 107 Atl. 122.

Interstate Commerce Act—Grain Elevators

The Oklahoma Supreme Court holds that by reason of the provisions of the act to regulate commerce (U. S. Comp. St. § 8563) the State Corporation Commission is without jurisdiction to require a railroad to designate a point on its right of way for the location of a portable grain elevator and to spot cars thereon for interstate shipments, when the effect of such order is to obstruct interstate commerce by materially interfering with the movement of cars to and from elevators permanently located near the right of way, and with the loading of cars on the right of way by track shippers.—Rock Island v. State (Okla.) 180 Pac. 246.

Demurrage

To a railroad's claim for demurrage on interstate shipments of ore to the defendant on an interchange track at its works at Kittanning, the defense was that, during the time charged for the railroad's tracks were so flooded as to suspend the road's operations. The interchange tracks, however, were not flooded, and there was no difficulty in the consignee returning the cars to the interchange track. It was claimed that as the railroad could not have removed the cars, or in any manner make use of them, it could not charge demurrage for the consignee's failure to deliver them there. The Pennsylvania Supreme Court held that this claim could not be sustained.—Pennsylvania v. Kattinning I. & S. Mfg. Co. (Pa.) 106 Atl. 207.

Limiting Liability to Carrier's Own Line

In an action by a shipper of live stock against an initial carrier for damages in transit, it appeared that the stock was shipped over the lines of connecting carriers, but each carrier made an independent contract with the shipper. The shipment was intrastate, and moved from Graham, Tex., to Ft. Worth over the Rock Island, thence to Sweetwater over the Texas & Pacific, thence to Post over the Panhandle & Santa Fe. The through rate was paid to the Rock Island, which limited its liability to its own line. The Texas Court of Civil Appeals holds that Texas Rev. St. 1911, Arts. 731, 732, relating to contracts for through shipment, recognized or acquiesced in by the carriers, had no application, and the Rock Island was not liable for damages accruing upon the lines of the connecting carriers.—Rock Island v. Hallam (Tex.) 211 S. W. 809.

United States Supreme Court

State Legislature's Power to Leave Question of Contributory Negligence to Jury

In an action against the Rock Island for knocking down and killing a person who stepped upon the track when a train was approaching in full view, the Supreme Court of the United States, per Mr. Justice Holmes, says on appeal from a judgment of the Oklahoma Supreme Court, that it may be assumed, as the State court assumed, that if the question were open for a ruling of law it would be ruled that the plaintiff could not recover. But the Oklahoma Constitution provides that "the defense of contributory negligence or of assumption of risk shall, in all cases whatsoever, be a question of fact, and shall, at all times, be left to the jury." Art. 23, Sec. 6. The case was left to the jury, and they found a verdict for the plaintiff. Judgment was entered for her and was affirmed by the Supreme Court of the State, which held that the provision applied to the case and that when so applied it did not contravene the Fourteenth Amendment. .

The Supreme Court of the United States holds that the railroad had only such right to the defense as the State Constitution allowed. Conceding that legislation cannot change the standard of conduct which is matter of law in its nature into matter of fact, the material element in the Oklahoma constitutional enactment is not that it called contributory negligence fact, but that it left it wholly to the jury. Judgmen for the plaintiff was affirmed.—Rock Island v. Cole. Decided December 8, 1919.

Compensation for Carrying the Mails

The New York, New Haven & Hartford sued the United States to recover the difference between amounts received through the Post Office Department and what it claimed should have been paid for its services in carrying the mails during a series of years, ending June 30, 1914. The demand was based on implied contracts alleged to arise from the following circumstances: First—Acceptance and transportation of the mails in reliance upon section 4002, Revised Statutes, as amended. This directs payment of specified sums per mile per annum according to weights; and the claim was that because the Post Office Department improperly construed and applied it, the railroad received much less than it should have received. Second—Acceptance and transportation of the mails under orders and coercion of the Post Office Department, followed by failure to allow reasonable compensation. The railroad claimed its property was taken for public use and adequate compensation must be paid.

Concerning the challenged interpretation and application of section 4002 R. S. resulting in payments during each four-year term on the basis of weights taken immediately prior to the beginning of the same instead of annually, the Supreme Court of the United States holds (opinion by Mr. Justice McReynolds) that the action taken accords with prior practice followed for many years; the letter of the statute permits it; the carrier submitted with full knowledge; and, impliedly at least, it was sanctioned by the Supreme Court in D. L. & W. v. United States, 249 U. S. 385. The court thought it must be held as settled that prior to the Act of July 28, 1916, Ch. 261, 39 Stat. 412, 419—with the exception of certain roads aided by land grants—railroads were not required by law to carry the mails. (Eastern v. United States 129 U. S. 391, 394; Atchison, T. & S. F. v. United States, 225 U. S. 640, 650; D. L. & W. v. United States, supra.) And as the railroad voluntarily accepted and performed the service with knowledge of what the United States intended to pay, it cannot now claim an implied contract for a greater sum. It may be, the court says, that any railroad by failing to carry the mails would incur the hostility of those living along its lines and as a consequence suffer serious financial losses; but the fear of such results does not amount to compulsion by the United States and cannot constitute the basis of a justiciable claim against them for taking property. The judgment of the Court of Claims dismissing the petition on demurrer (53 Ct. Cl. 222) was affirmed, Mr. Justice Brandeis dissenting.—N. Y., N. H. & H. v. United States. Decided December 8, 1919.

State Statute Imposing Penalty for Overcharge of Authorized Passenger Fare Upheld

By an Arkansas statute regulating rates for the transportation of passengers between points within the state, any railroad company that demands or collect a greater compensation than the statute prescribes is subjected "for every such offense" to a penalty of "not less than $50 nor more than $300 and costs of suit, including a reasonable attorney's fee," and the aggrieved passenger is given a right to recover the same in a civil action. In June, 1915, the St. Louis, Iron Mountain & Southern demanded and collected 66 cents more than the prescribed fare from each of two sisters returning to their home from a school commencement; and in suits separately brought, and afterwards consolidated, these passengers obtained judgments against the company for the overcharge; a penalty of $75 and costs of suit, including an attorney's fee of $25. The company appealed, asserting that the provision for the penalty was repugnant to the due process of law clause of the Fourteenth Amendment; but the Supreme Court of the state sustained the provision and affirmed the judgments. 131 Ark. 442. The railroad took the case to the Supreme Court of the United States.

The grounds on which the provision was said to contravene due process of law were, first, that the penalty was "so severe as to deprive the carrier of the right to resort to the courts to test the validity" of the rate prescribed, and, second, that the penalty was "arbitrary and unreasonable, and not proportionate to the actual damages sustained." The Supreme Court said, however, per Mr. Justice Van Devanter, that it did not appear that the carrier had not been afforded an adequate opportunity for safely testing the validity of the rate, or that its deviation therefrom proceeded from any belief that the rate was invalid. On the contrary, it was practically conceded, and the court took judicial notice of the fact, that if the carrier really regarded the rate as confiscatory, the way was open to secure a determination of that question by a suit in equity against the Railroad Commission of the state, during the pendency of which the operation of the penalty provision could have been suspended by injunction. Therefore it was held the first branch of the company's contention could not prevail.

The second branch was more strongly urged. The provision assailed is essentially penal, because primarily intended to punish the carrier for taking more than the prescribed rate. Yet it was held that giving the penalty to the aggrieved passenger did not require that it be confined or proportioned to his loss or damages; for, as it is imposed as a punishment for the violation of a public law, the legislature may adjust its amount to the public wrong rather than the private injury, just as if it were going to the state. The ultimate question was whether a penalty of not less than $50 and not more than $300 for the offense in question could be said to bring the provision prescribing it into conflict with the due process of law clause of the Fourteenth Amendment. The court said: "That this clause places a limitation upon the power of the states to prescribe penalties for violations of their laws has been fully recognized, but always with the express or tacit qualification that the states still possess a wide latitude of discretion in the matter and that their enactments transcend the limitation only where the penalty prescribed is so severe and oppressive as to be wholly disproportionate to the offense and obviously unreasonable. . . . When the penalty is contrasted with the overcharge possible in any instance it of course seems large, but, as we have said, its validity is not to be tested in that way. When it is considered with due regard for the interests of the public, the numberless opportunities for committing the offense, and the need for securing uniform adherence to established passenger rates, we think it properly cannot be said to be so severe and oppressive as to be wholly disproportionate to the offense or obviously unreasonable." Judgment for the plaintiffs was affirmed, Mr. Justice McReynolds dissenting.—St. Louis, Iron Mountain & Southern v. Williams. Decided December 8, 1919.

Foreign Railway News

The Channel Tunnel

Prime Minister Lloyd George recently made the important announcement to a private deputation that the British Cabinet had decided that there was no longer any political objection to the construction of the Channel Tunnel. He was not yet in a position to say that the military objection had also been removed. The Cabinet, before coming to a final decision, had asked for the considered views of the Admiralty, War Office, and Air Force Staffs, and their reports were now being awaited.

Deisel Locomotives for the Prussian Railways

LONDON.

The Zeitschrift des Vereines Deutsche Ingenieure in commenting on the problem of electrification of the Prussian Railway system states that Prussia, Bavaria and Duchy of Baden are partial to the 15,000-volt, 16-cycles, single-phase, alternating current system, which is that used in Switzerland. In combination with electric working this road is contemplating the use of internal combustion locomotives of the Deisel type to also be used on the electrified lines, and it has already been decided that such locomotives will be built for experiment having a horse power of 3,000. It is hoped to reserve about one-fifth of the total mileage for the use of these locomotives. One of the purposes attributed to this work is that in case of war these locomotives could be used over any tracks, even though electric power was not available.—*Le Genie Civil.*

Market for Light Railway Material in China

A number of native coal companies in China whose mines are adjacent to the Shantung railways, writes Vice Consul N. F. Allman, Tsinanfu, are now negotiating for the construction of light railways to connect their mines with the above line. The approximate total length of the light railways to be constructed is 50 miles; 25 miles of which have already been surveyed. The Chinese mine owners are desirous of obtaining American materials, if possible, and the dealers in railway material that may be interested would be expected to furnish complete equipment, including locomotives and several hundred coal cars. Good second-hand equipment would be acceptable for one of the lines, about 12 miles long, the material for which would have to be delivered immediately. The material for the other lines is desired not later than February, 1920.

(The names of two firms in this district who correspond in English and who are interested in negotiating direct for the proposed light railways, may be obtained, says Commerce Reports, from the Bureau of Foreign and Domestic Commerce or its district and co-operative offices. Refer to file No. 126417.)

Carbon Contact Trolley Bows

The Engineer states that on account of the scarcity of copper during the war, the copper contact bows of some of the electric trains in Germany were replaced by bows of aluminum, which had already been used for that purpose before the war. Aluminum, however became unobtainable, and zinc was used, but this did not answer particularly well. Experiments were then made with contact pieces of carbon. At first the wear was one gramme of carbon per 10 car-kilometers, but this was improved upon until some of the bows had reached a life of 110,000 car-kilometers. The carbon was first greased, but ultimately that was found to be unnecessary. The bows have a length of one meter and are built up of sections. The whole is mounted on a flat strip of steel plate, which is turned up on both sides so as to grip the carbon pieces, bars of cast iron are interposed between the carbon and the steel edges so as to secure good contact. In cross section the carbon is not solid and a tension device adjustable by means of screws if fitted into the hollow to press the carbon against the holder. There is less sparkling than with aluminium bows, and worn-down carbon sections can be renewed so that the carbon of the whole length of the bow is utilized.

French Engineering Society Forms British Section

LONDON.

The members of the Société des Ingénieurs Civils de France have formed a British Section which will meet periodically in London. The purpose of this section is to improve the relations between English and French engineers, not only civil, but in every branch of science. In describing the purposes of this new section, the president, T. J. Guéritte said that during the great war English and French engineers got in much closer contact with each other than at any other previous time, and it was the desire of the French and English engineers to prolong and further the kindly feeling and cooperation that had existed between the engineers of the two countries during the war. This London section will be used as a medium for keeping both English and French societies in touch with each other. The section has very broad ambitions and even contemplates arranging for the exchange of engineering students between engineering firms in both countries. Furthermore, there are many engineering questions of international importance which can be discussed between the two nations with very beneficial effect, such as the Channel Tunnel, the effect of the shortage in coal on the hydro-electrical development in France, etc. It is also the desire to make arrangements with the various English and French societies for the purpose of enlarging the foreign membership of these institutions.

The P. L. M. Disaster

The French railway companies have been very unfortunate of late in the matter of railway accidents. On September 4, 15 passengers were killed in the Toulouse express, which had stopped owing to want of steam, due, it is said, to bad coal, and was run into by a train from Bordeaux. The disaster on the P. L. M. at Pont-sur-Yonne on November 3, when the Simplon express was run into and 26 passengers killed, was, it is believed, due to the same cause. This latter accident has an interest for railway officers in that automatic signals, lock-and-block and cab signals have all cropped up as a result. The P. L. M. has, for 20 years, had some automatic signaling on the Nevers branch, 30 miles south of the site of the present accident. It schould be noted, though, that the representative of that company who was present at the Washington International Railway Congress of 1905 did not favor automatic signals because they could not do all that the human agent was capable of. Little lock-and-block has been used in France, except within what the Americans call "station limits." The military training the men have had has made them careful and no such interlocking has, therefore, been considered necessary. At the time of the outbreak of war the P. L. M. was trying a cab-signal.

Italian Railways Under Nationalization

An Italian engineer has recently published a study, reproduced in the Reforme Economique, of 14 years' experience of railway nationalization in Italy, from which the following figures are taken. In 1905 the State took over a railway system of over 11,500 km., which had previously been paying over some $12,400,000 a year to the national treasury, in the shape of a tax on profits. During the first year of State operation, this contribution had fallen to $8,900,000 and the system was being operated at a loss. Under company management, a policy of double tracking was adopted, but this work has been so slow under State ownership that 72 per cent of the mileage is still single track. Between 1899 and 1903 the companies made considerable progress with electrification; in 12 years the State has electrified only 25 miles, although electrification is especially urgent in Italy because the mountain lines, although representing only a seventh of the total mileage, consume 40 per cent of the coal used on the railways, and coal is extremely dear and scarce in the country. The same critic also contends that while the companies were very successful in the development of local traffic along the Adriatic coast, and had thus stimulated the transport of agricultural and industrial commodities to Great Britain and Central Europe, "no

serious measure" of the kind has been taken since 1905. The only appreciable increases are apparently the size of the staff and the ratio of expenses, so that "on certain lines of secondary importance the employees outnumber the passengers."

French Railways and Demobilization

Figures were recently given in the Journal des Transports, showing the very heavy traffic which the French railways have been called on to handle since the armistice in connection with demobilization. Between April 1 and October 1 last, 14,000 trains were run for the conveyance of 2,000,000 demobilized French soldiers and men on leave. A further 2,000 trains, averaging 50 cars each, were required for the transport of soldiers to garrison towns and of the war material to depots, and the addition of the trains carrying foodstuffs and other essential commodities and those run in connection with the victory celebrations brought the total for the eight months to 20,000 military trains. Approximately 9,000 trains, a large percentage of which traversed practically the whole of the country, were required for the American Army during the same period, in which the total number of the military trains amounted to about 30,000. This is exclusive of troop movements by sea; some 740,000 men and 5,000 horses were carried between France, Algeria, Morocco, the French colonies and eastern Europe. These figures have been published officially with a view to explaining why the French railways should still be so congested so many months after the cessation of hostilities. As the work of demobilization is now practically finished so far as the railway system is concerned, it is hoped that the general transport position will before long undergo an appreciable improvement.

Railway Notes from China

Peking, Oct. 23, 1919.

The Ministry of Communications apparently has now got the subject of statistical reports firmly in hand. Two annual reports covering the years 1916 and 1917 respectively, have come from the press during the present calendar year, and announcement is now made that report for the year 1918 will appear shortly. A condensed summary of the report has been given to the press. In addition, 10-daily Approximate Returns of Traffic (revenues) have been appearing regularly during the past three or four months.

The returns for the year 1918 are surprisingly good as will be seen from the following statement:

	1918	Compared with 1917 Increase	Decrease
Operating revenues	$77,652,153	$13,778,449	.....
Operating expenses	34,322,615	4,282,051	.....
Net operating revenues	$43,324,538	$9,496,399	.....
Income debits	$11,033,562	.....	$2,269,878
Income credits	1,209.144	108,647	.....
Net income debits	$9,824,418	.....	$2,378,525
Surplus for the year	$33,505,120	$11,874,924	.....

Operating expenses contain $1,777,422 for depreciation of rolling stock. The operating ratio was slightly over 44, compared with 47 in 1917 and 52 in 1915. Net operating revenues represent a return of 10.4 upon the cost of road and equipment, and are sufficient to cover net income debits more than four times. The surplus for the year is equivalent to 29 per cent upon the funds which the government has invested in the properties out of its own funds. Out of surplus $3,967,487 was invested in Additions to Property and $1,617,811 was used in retiring funded debt. By these means and the investment of other funds, the government equity in the property was increased during the year by $7,644,488.

The report shows an increase in the length of line by 28 kilometres only. Seven locomotives were purchased and 21 goods wagons were constructed. In addition, 200 wagons were leased upon a more or less permanent basis. The increase in performance per unit of equipment, however, indicates that purchases will have to be made more freely in the near future. Locomotive performance increased from 43,772 kilometres per year to 47,512. Carriage performance increased from 97 passenger kilometres per seat per day to 103, and wagon performance, measured in "Ton kilometres per ton of carrying capacity per running day" increased from 49.1 to 64.5. This measure is more severe than "kilometres per loaded car" in that it penalizes a wagon by the number of days that it was available for loads but was not used. Average train load shows an increase from 244 to 257 "long" tons. Train load has shown a consistent increase since the first statistics were compiled. Also the average haul per ton has been steadily increasing, from 165 kilometres in 1917 to 184 in 1918. In 1915 this figure was 141 kilometres. Passenger traffic exhibits similar tendencies.

It is explained in the preliminary statement that the season of 1918 was remarkably favorable for a good showing and that a similar improvement in 1919 is not to be expected, but the published figures for revenue, including results up to the end of July, indicate that the 1918 figures will be exceeded comfortably in 1919.

* * *

Col. John Stevens, chairman of the Technical Commission of the Trans-Siberian Railway, has returned to Vladivostock after a visit of nearly a week in Peking and Tientsin. No reports have been given out, but it is believed that his visit concerned the attitude to be assumed by China upon the withdrawal of American forces along the Chinese eastern section. This withdrawal has been reported as imminent several times by the press of a certain country.

* * *

The sixth conference of the traffic managers and accountants of the Chinese Government Railways upon the subject of through traffic has taken a temporary adjournment after a session of two weeks. The session just closed made history in that for the first time plans have been agreed upon for a comprehensive interchange of goods wagons. Under the plans now formulated, through shipments may be transferred at the option of the receiving line, but at its own expense. The rate of car hire is 10 cents per ton per day. At the end of 12 days a penalty rate of 40 cents begins to run, as a means of forcing return to home line promptly. (It is anticipated that after locomotive superintendents have brought about uniform standards of repairs, inspection and lubrication, this penalty can be modified or removed.) Settlements are to be made between lines on the basis of daily balances and will be effected through the clearing house, attached to the Ministry of Communications. Wagons unfit for service are to be returned to home line for heavy repairs. So far as consistent with safe operation, light repairs will be left for the home line to make, the line upon which discovered to be responsible for costs. All repairs are to be made at cost, with no percentage for overhead. Junction reports will be made to the clearing house which will keep a car register of movements and be responsible for accuracy of charges. This subject has been under discussion ever since through traffic was attempted first, five years ago.

* * *

The adjourned session of the traffic managers will convene two weeks hence for the purpose of taking under consideration the report of a sub-committee upon uniform classification of goods.

* * *

There is an unconfirmed report here that the Ministry of Communications has engaged the services of four foreign experts to assist in the standardization of rolling stock. France, England, Japan and America are said to be represented upon this group. For two years or more a Railway Technics Commission composed of Chinese has been working upon this subject. It is reported that this commission will submit to a convention of the mechanical officers of the lines, to be called next spring, a set of standards for goods wagons. It is expected naturally that the representatives of the various national types will have criticisms to offer. In order to meet these criticisms and to insure fair treatment to all concerned, the group of technical advisers, referred to above, will be constituted as a quasi board of arbitration, with powers of recommendation only. Such recommendations in the past, however, have carried great weight with the Ministry.

Equipment and Supplies

Locomotives

THE CENTRAL OF NEW JERSEY is inquiring for 11 Mikado locomotives.

BELGIAN GOVERNMENT. Unconfirmed reports are to the effect that the Belgian Government has divided an order for 660 Consolidation locomotives equally between the American Locomotive Company and the Baldwin Locomotive Works.

Freight Cars

THE GULF REFINING COMPANY is reported as having ordered 1,000 tank cars from the Standard Steel Car Company.

THE PRESSED STEEL CAR COMPANY has issued inquiries for the Koppel Industrial Car Company for specialties for 20 to 50 and 300 cane cars.

Trade Publications

BALANCING APPARATUS.—A small pamphlet has been issued by the Vibration Specialty Company, Philadelphia, Pa., describing briefly the service which this company is prepared to render and its balancing apparatus to eliminate vibration in heavy machinery. Several illustrations show rotors and crank shafts which were put in balance on equipment of this company.

AEROIL THAWING OUTFITS AND TORCHES.—Bulletin No. 10 has recently been issued by the Aeroil Burner Company, Inc., 400 Main street, Union Hill, N. J. This illustrates the Aeroil thawing outfit and shows their application in thawing out hoppers of coal cars. The outfits are designed especially for use in the removal of ice and snow from frozen coal, sand and ore cars, hoppers, pockets, tracks and switches, etc.

WELDING AND CUTTING EQUIPMENT.—The Carbo-Hydrogen Company of America, Pittsburgh, Pa., has issued nine bulletins bound in a folder, describing cutting and welding torches and tips, regulators, and a portable cutting outfit mounted on a truck. All of the parts for carbo apparatus are catalogued in one of the bulletins and another contains directions for operating carbo cutting torches, bringing out some points that should be carefully observed when operating any cutting torch.

DROP FORGINGS.—J. H. Williams & Co., Brooklyn, N. Y., manufacturers of Superior drop forgings and drop-forged tools, have issued the seventeenth edition of their catalogue, containing 160 pages, 4 in. by 6 in., fully illustrating and describing their standard stock specialties. These include several new lines, namely, "Agrippa" set screw pattern turning tool holders, "Agrippa" boring tool posts, "Vulcan" forged-cutter tool holders and several new sets of drop-forged wrenches. The book also contains a description of the drop-forging process in simple, non-technical style for the benefit of those not conversant with its details.

FURNACES FOR HEAT TREATING.—Catalogue No. 75, containing 80 pages, 8½ in. by 11 in., has been published by the Chicago Flexible Shaft Company, Chicago, and is devoted to Stewart gas and oil furnaces, which are adapted to a wide range of heat treating operations. These furnaces burn only gas or oil fuel and are built in many designs and sizes to meet a great variety of conditions, the line being divided into oven, crucible and forge types. Several special features of the Stewart furnaces are described, including a U-shaped bottom slab which makes it unnecessary to use muffles and gives to the furnace area the advantage of the transfer of heat through the bottom and sides of the enclosure. The many types of furnaces are separately described and illustrated, specifications and prices being given also, in addition to which the book contains instructions as to the proper methods of hardening steel, carbonizing, cyanide treating, etc.

Railway Officers

Railroad Administration

Regional

Riley Williams has been appointed federal superintendent of operation of the Brooklyn Eastern District Terminal succeeding E. J. Sullivan, assigned to other duties.

Operating

T. J. Scott, assistant freight trainmaster of the Pennsylvania, Eastern Lines, at Mifflin, Pa., has resigned. Mr. Scott has been succeeded by **W. R. Lockard,** assistant freight trainmaster at Altoona. **E. L. Lowder,** yard master at Altoona, has been promoted to succeed Mr. Lockard.

Corporate

Executive, Financial, Legal and Accounting

Carl R. Gray, president of the Western Maryland, has been elected president of the Union Pacific, with headquarters at Omaha, Neb. (Particulars of the appointment are given elsewhere in this issue.) **E. E. Calvin,** federal manager, has been elected vice-president in charge of operations, effective at the end of federal control.

J. M. Lee, Kansas City, Kan., has been appointed receiver of the Kansas City Northwestern, with office in that city, succeeding **L. S. Cass,** who has resigned. The appointment was made by Judge William C. Hook of the United States District Court, at Leavenworth, Kan., who recently ordered that all operations of the road be stopped.

Obituary

Samuel M. Brown, formerly general freight and passenger agent on the Denver & Rio Grande, at Leadville, Colo., died recently in that city.

Stephen Pearson Brown, vice-president and general manager of the Ford, Bacon & Davis Corporation, managing engineer of Ford, Bacon & Davis, engineers of New York City, and from 1912 to 1917 chief engineer in charge of design and construction of the Mount Royal tunnel and terminal development in Montreal for the Canadian Northern, was drowned December 14 after breaking through the ice at Sebec Lake, Me. Mr. Brown was born in Dover, Me., April 29, 1877. Upon being graduated from the Massachusetts Institute of Technology, he gained shop experience as a blacksmith, machinist and carpenter in the Brown Mills at Dover. His professional career began in 1900 as junior partner in the firm of Collier & Brown, consulting engineers, of Atlanta, Ga., with whom he remained until 1904, when he became inspector of the Bridgeport Station works of the New York, New Haven & Hartford. The following year he was appointed resident engineer on the Port Morris depression of the New York Central. From 1906 until 1908 he was respectively principal assistant engineer in charge of construction and general superintendent of all work west of Fifth avenue on the crosstown section of the Pennsylvania tunnels under New York City. In 1908 he went abroad to investigate European tunnel practise. During 1909 and until 1912, he was chief engineer of the Tidewater Building Company and the T. B. Bryson Company, which built a section of the Fourth Avenue Rapid Transit four-track subway in Brooklyn, N. Y. His chief work until his death has been mentioned above. In addition to his business connections Mr. Brown was a member of the American Society of Civil Engineers, American Society of Mechanical Engineers, American Railway Engineering Association, Engineering Institute of Canada, Institution of Civil Engineers (British) and the Engineers' Club of New York.

EDITORIAL

Railway Age

Table of Contents will be found on Page 5 of the Advertising Section.

The Decline of Railway Bridge Work

It has been so long since the railroads have undertaken certain classes of major improvements that their absence has ceased to be conspicuous. This is most decidedly the case in the field of bridge construction. Many large projects undertaken before the beginning of the European war were continued for some years thereafter, but the feats of engineering brought to mind by the names Quebec, Hell Gate, Memphis, Brunot's Island, Metropolis and Sciotoville have all passed into history, followed more recently by the work at Blacks Run, New London and Louisville. That large bridge construction is not absolutely dead is indicated by the work now in progress on the Baltimore & Ohio bridge at Pittsburgh and by occasional references to proposed projects at Niagara Falls, Castleton, Cincinnati, Detroit and New Orleans, some of these being quite definite while others are decidedly visionary. All of these, however, are in a more or less dormant state at the present time and will continue to be until the ability of the railroads to secure funds for such purposes has been restored to normal.

Senator Cummins' Appeal to Congress

When the history of the relations between the government and the railroads during recent years is written the two facts which probably will stand out in that history as the most extraordinary will be the defeat of the railroad appropriation bill in March, 1919, and the attitude toward the return of the railways to private management which was assumed by Congress almost, if not quite, to the end of the year 1919. The railroad appropriation bill was defeated by a filibuster last spring, although everybody recognized the fact that the appropriation was actually needed and that the defeat of the bill might prevent the Railroad Administration from functioning at all and would certainly prevent it from carrying out any substantial program of railroad improvements—the latter being the effect which it actually has had. But extraordinary and astonishing as was the defeat of the railroad appropriation bill, it was not so extraordinary and astonishing as the fact that when, according to President Wilson's announcement, the date on which the railways would be returned to private management was less than two weeks away, Congress complacently prepared to take a recess without having passed any railroad legislation. Every intelligent man in America knows that the return of the railways to private operation without some kind of legislation having been passed would result in financial disaster not only to them but to the nation; yet Senator Cummins considered it necessary this week to appeal to Congress to do something about this before taking its ease before the holidays. The effects of failure to pass any legislation, or the passage of bad legislation, would be felt throughout the country both immediately and for years to come. The facts about the railroad situation have been dinned into the ears of Congress for months. And yet Congress continues to do nothing. Under government ownership and management Congressional action upon railroad questions of the greatest importance would be necessary at every session. If, under present conditions, Congress cannot be made to appreciate the railroad situation and influenced to do something, how can any person who is not a downright lunatic believe it could be influenced to act with the intelligence and promptness that it would be necessary for it to act under government ownership if the railways were to be adequately developed and efficiently managed?

Emergency Train Protection

The need for emergency protection arises at times on all railroads. In meeting such demands it is evident that some lines equipped with automatic block signals are not getting the maximum possible protection from these installations. Many lines traverse rough country, with deep cuts and numerous tunnels; run along the banks of streams that are liable to overflow or are subject to other dangerous conditions. As a protection watchmen or track walkers are employed to inspect constantly the conditions existing at such locations, and provision is made for quick communication with headquarters in cases of emergency. At those locations where automatic signals are in service it would be to the advantage of the roads if more general use were made of them by providing means whereby the watchman or track walker might be able to place the signals in the "stop" position on each side of the danger point as an emergency protection until he is enabled to notify the proper officers. Objections might be raised that these men should not be allowed to manipulate the signals, but certainly if they are capable of being intrusted with the responsibility of protecting trains otherwise in emergencies there should be no objection to their opening a track relay by means of a knife switch conveniently located or by cutting a circuit wire which might be made readily accessible. This is not an untried idea, as is evidenced by its application to some roads which now provide permanent emergency signal protection for trains at dangerous locations. It is a practice which should be more generally followed in the future in order to more nearly obtain the maximum benefits which can be derived from an installation of signals. The application of such protection to a particular road is a matter of detail which may be worked out by the signal department on that road.

The Railroads' Advertising Campaign

It is no reflection on advertising that the great American circus was one of the first large national institutions to test out its possibilities on a scale commensurate with the scope of the business. But one of the easiest ways to advertise is to pile adjective on adjective in an appeal to imagination rather than reason. As a matter of fact, this kind of advertising has been so widespread as to be synonymous with advertising in the minds of, probably, the majority of people. Very recently, however, advertising of an entirely different kind has been tried out fairly extensively. Those most conservative of institutions, the national banks, have tried it with success. Men and institutions that have been played upon by demagogues and yellow newspapers, have found it possible

to tell their side of the story to the public effectively and without loss of dignity, through buying space in national magazines and in the daily papers. Now the railroad executives have decided to undertake a national advertising campaign with the double purpose, first, of informing the public of the facts regarding the situation at the time the railroads are about to be returned to their owners, and second, of keeping the general public informed of what railroad managements are doing, what their problems are and of the progress being made in the solution of these problems. The millennium is not going to arrive in railroad affairs on the day the private corporations resume operation. Every shipper is not going to have his freight moved promptly and safely whether it is correctly marked or not. Every traveler is not going to encounter a courteous ticket agent, baggage man, brakeman and conductor. The best that can be hoped, is for the immediate inauguration of a drive to improve the railroad service and lift it from the sad estate into which it has fallen under war conditions and during the last year of confusion under government operation. It is eminently fitting and should be mutually helpful for the railroad executives to lay before the public the progress being made in carrying out this undertaking, and it is both fitting and just that investors should have the fullest information in regard to the properties in which they are vitally interested. The following resolutions have been introduced in Congress to investigate the advertising campaign of the railroads and also the propaganda campaign of the Plumb Plan League. There has been no secrecy about the fact that the railways are preparing to spend about a million dollars in their advertising campaign and that the advertising is to run some weeks and is to appear in daily, weekly, agricultural, trade and labor papers throughout the country. The amount it is planned to spend is not large relatively to the size of the railroad industry, the importance of the railroad problem and the number of people it is necessary to reach.

Why Speed Is Imperative in Dealing With the Railroad Problem

THE GOVERNMENT ought not to relinquish control of the railroads or to terminate the guarantees of standard return without permanent legislation insuring the companies that they will be given rates which will not only maintain their solvency but also enable them to raise the vast amounts of new capital they need. The railroads ought not to be returned to private operation at all without at least temporary legislation continuing the guarantees of standard return until permanent legislation has been enacted.

While these things are plain to those who know the existing railroad situation, the additional and almost equally important fact should not be overlooked that the welfare of the country demands that permanent legislation shall be passed and the railroads returned to private control as soon as possible. The facilities of the railways are today far more inadequate to the present and prospective demands of commerce than they ever were before. There is good reason for believing that the demands on them will increase during the coming year and will be larger in the late summer, fall and winter of 1920 than ever before. Therefore, a large expenditure for additions and improvements should be made in 1920. But until permanent legislation is passed the railway companies cannot begin raising funds for this work; they cannot begin making preparations for it until they know the exact date on which the properties will be returned to them; and they cannot actually begin the work until the properties are back in their hands. There is now talk of delaying the return of the railways to April 1. If it were definitely announced that they were not going to be returned until then Congress probably would defer passing permanent legislation until almost that date. The result would be to render it impossible to carry out a program of improvements which would be of any help in handling business in 1920.

The budgets providing for needed work can be made up in a short time. Many companies already have them practically made up for the next year. But after the budgets are made up the new capital for whose investment they provide must be raised. Most of the companies will not be able to raise any new capital until permanent legislation is passed.

Improvements and additions are of two kinds, those to permanent structures, such as tracks, yards and buildings, and those to locomotives and cars. After the money for additions to, and improvements in, permanent structures is raised the orders for materials must be placed. This involves negotiations of more or less length with the railway supply companies. Then the materials and supplies must be made by the manufacturers before they can be delivered to the railway. Meantime the railway companies must be getting ready the organizations, including large numbers of employees, that are to do the work for them after the materials have been received. Under present conditions in the iron and steel and other industries the delivery of materials will be slow and labor will be difficult to get. Unless the railway companies are able to begin placing orders for materials and getting ready their organizations within a few months, it will be impossible for them to do in 1920 any considerable amount of additions and betterments work which will help them to handle the traffic of 1920.

The same reasoning applies with equal force to the obtaining of new equipment. In January, 1918, immediately after government control was adopted, the *Railway Age* began urging the Railroad Administration to place at once whatever orders it was going to place for locomotives and cars upon the ground that if it did not place them at once it would not get the equipment in time to be of any service to it in the year 1918. Instead, the Railroad Administration entered upon a policy of wholesale standardization, and the orders for equipment were not placed for some months. When they were placed it was optimistically announced by some officials of the Railroad Administration that most of the equipment ordered would be delivered and ready for service by fall. The *Railway Age* said it would not be, because it could not be. Our prediction proved only too correct. Not all of the 100,000 freight cars ordered in 1918 have been delivered yet, and only a small part of the new locomotives and cars were ready for service in the fall of 1918. The course of events will be similar in 1920 unless the railway companies are put in a position where they can place their orders for equipment very early in the year. It takes time to design equipment, to make the contracts for it, and especially for the builders to get materials and labor and to do the actual work of building.

If the return of the railways to their owners is to be postponed beyond January 1 the program which should be adopted seems obvious. First, the date on which they are to be returned should be finally and irrevocably settled, and it should not be later than March 1. Then Congress should work unremittingly on permanent railroad legislation and pass it not later than February 1. The railway companies will then know pretty early in the year just what kind of regulation they are going to have. They will be able to begin placing orders and to perfect their organizations for the work which is to be done after the properties are returned. The properties ought to be returned not later than March 1, because improvement work should be begun throughout the country in March.

If Congress and the administration fail to pass legislation by February 1 or to return the railroads to their owners by

March 1 they will assume a serious responsibility for the effects which their delays will produce upon the ability of the railroads to handle the commerce of the country when it again reaches its peak in the latter part of 1920.

The Storage of Railway Fuel

THE RECENTLY SETTLED STRIKE of bituminous coal miners and the acute stage of fuel which has resulted in many sections of the country brings forcibly before the public the urgent need of stabilizing the soft coal mining industry. As indicated by the demands of the miners, one of the most serious causes of discontent is the lack of steady employment which, while the wages appear to be adequate on a daily basis, results in the aggregate earnings of the men in this industry being too small to provide a satisfactory living when distributed over the many periods of unemployment.

In a statement issued by Eugene McAuliffe on October 1, the difficulties surrounding the industry are divided into three classes as follows: First, a measure of mine development in excess of that required if it were reasonably employed, this excess development working short time during the summer, thereby materially increasing the cost of production, with the recurring opening during the winter season of mines producing low grade coal, employing transitory and unskilled labor; second, a season of idleness on the part of mine labor, which is being used as the basis of a demand for a six-hour working day and wage increases approximating one hundred per cent; third, the difficult task set the railroads to provide sufficient coal cars to move the winter's coal supply from August to December, inclusive, with material increase in the cost to the consumer necessary to recover the losses sustained by the producer during the idle summer period, plus the premiums that invariably follow a heavy demand, however made, for any commodity.

The remedying of these conditions is a national problem in which no section of the public is not interested. Aside from the mines themselves, however, probably no industry is more directly affected than the railroads and the benefit to them of any measure of stabilization which may be effected are ample justification for the taking of special measures on their part to that end. At least two such measures have been proposed: The publication of seasonal coal freight rates and the storage of the railway fuel supply during the spring and summer months. Among the benefits of storing coal for the railroads are the transfer from the period of heavy traffic movement during the fall and early winter months, of the movement of a large portion of the railway fuel supply to the spring and summer months, when the traffic movement is at its lowest ebb; the insurance of an adequate fuel supply for the transportation needs of the country during possible fuel shortages due to strikes or extraordinary winter weather conditions, and the possibilities of some advantages in price as well as in the quality of the coal received. These advantages in a measure are off-set by the necessity for providing proper storage facilities, the cost of the extra handling involved and the deterioration in the quality of the fuel resulting from storing and handling. With efficient care in the provision of storage facilities, however, the latter objection may be reduced to such an extent that the net result will be a fair profit. The railroads normally consume something over one-quarter of the total output of the bituminous mines and a reasonable program of storage involving this proportion of the total coal supply undoubtedly would exercise a strong influence in overcoming the evils of the present highly speculative condition of the soft coal mining industry. A study of the problems involved in satisfactorily establishing such a program is, therefore, worthy of vigorous prosecution by the railroads throughout the country.

Letters to the Editor

Labor Union Guarantees

St. Paul, Minn.

TO THE EDITOR:

Will some one offer a reasonable explanation why the various railroad labor organizations, when they contract with the railroads to carry out the provisions of their schedules, could not, in all fairness and as an efficient business method, be required to guarantee their contract performance by a suitable bond?

For instance, a concern will make a contract with a railroad to handle its coal docks—a matter of comparative minor importance—and the first requisite is for the contractor to give the railroad a satisfactory guaranty bond. But a railroad will contract with labor organizations for the most important feature of its operation, and all they secure are a few signatures, which means the contract provisions can be and are violated with impunity.

A certified check of a railroad union, securely deposited as a guarantee for faithful performance, would, in my opinion, go a long way to prevent injudicious action on the part of union officers and members. As long as these affairs are cold business propositions why not bind the bargain *on both sides* in the way I have above mentioned? It is not a matter of intangible honor—it is a matter of tangible dollars—so let the dollars do the work. I believe it would put a stop to a good deal of railroad labor trouble, could make "unauthorized" strikes unknown, and do much toward guaranteeing the men and the railroads a squarer deal.

AN OBSERVER.

Salaries of Railroad Officials

New York

TO THE EDITOR:

The article bearing the above title, which appears on page 751 of your issue of November 26, and your editorial on the subject in the issue of November 14, are interesting reading. It seems that Representative T. W. Sims, in a speech before the House, makes the statement that the salaries are exorbitant and extravagant and in order to prove his statement gives the amounts of the salaries received by the 23 highest paid officials of the U. S. Government.

It is said, and truly, that comparisons are odious, but if Mr. Sims wishes to draw them he should by no means stop where he does, but in all fairness should go on far enough to enable the drawing of some just and reasonable conclusions from his comparisons. He should go on clear down the line and show that as a class the employees of the railroads of this country are today drawing as high a rate of compensation for the service rendered as any class of employees in the world. He should also show that the employees of our government are drawing a lower rate of pay for the service they are supposed to render than any other class of employees in this country. He should also show that these same railroad employees were at least 25 per cent more efficient under the management of the men given in the list referred to than they were under government management. One of the first acts of our government when it took over the railroads was to abolish piece work, and as a result it took ten men to do the work heretofore done by six men. Here is a difference of 40 per cent.

The 23 government offices named were created and had salaries attached to them before railroads existed, and there-

fore there must have been a time when the salary paid to any one of these 25 government officials was much higher than that paid to any railroad officer. There must be some good and sufficient reason for the change which has taken place, and perhaps the best explanation can be found in the results which have followed. In the period during which it has been gradually brought about there has been an increase which is almost beyond the grasp of the human mind, in the volume of the business handled by both groups of officials, and also in the intricacy and complication of the problems which they have had to solve. While this was taking place the records show that on the railroads there was a corresponding increase in efficiency and economy of operation.

The job of the railroad operating officer is to produce transportation, and the railroads of this country, while under the management of the 208 general officers whose names are given in the list referred to, were producing railroad transportation at the lowest costs ever known. There has never been a time or place where as much railroad transportation, either freight or passenger, could be purchased for a given amount of money as from the railroads of the United States during several years before the government took over their operation. Taking them as a whole, our railroads were at this time the most complicated and at the same time the most efficiently managed industry the world has ever known.

The reason that these men were able to consummate this wonderful achievement was, as you say, because they began at the bottom and worked up. Any one who knows the game knows that it was work all the way. Taking them as a class, the fact that any man reached the top was proof that he was a man of more than ordinary ability and a big man in every way, because this road is not traveled by any other kind. There may be some exceptions to this rule, but if there are they are so few that they are not worthy of consideration when looking at the subject as a whole.

Railroad management is the most complicated and most difficult management the world knows because the human element enters into it to such a great extent. Most any one can manage a lot of machines because machines have a set pace and can always be depended on to do certain things, but human beings have no set pace and by far the largest percentage of them are not dependable. An indifferent manager of men can make a good showing when he comes in fairly constant personal contact with his men, but when the manager must be distant from them at long intervals he must be a big man and have a strong personality in order to retain their loyalty.

There is no other line of business which depends so largely on the human element, and therefore so largely on the loyalty of the employees. The manner in which one or two disloyal, disgruntled, inefficient or lazy employees can tie up a whole division of a railroad is simply appalling, as every man who has been a division superintendent knows to his sorrow.

What about the salaries? They are only an incident and one of the smallest in the consideration af the subject. The little old law of supply and demand fixed them as, in the long run, it fixes most things in this world. We are hearing a lot about human effort of certain kinds not being a commodity and not being for sale, but the name which you give it does not seem to change its status very much, as it is always up against this law and always will be so long as human nature is what it is. The salaries have been increased from time to time as demanded, and I mean demanded, by this law.

And while the railroads were going ahead in this way what was our government doing? Was it keeping up? It was not. It was not even holding its own, but actually going back, and, outside of the military departments, there is probably not a single one of its many activities which is not carried on with less efficiency than it was 25 years ago, and today it is wasteful and inefficient to such an extent as to almost imperil its very existence. This does not apply to our Navy Department, which is efficient, and the reason is set forth by Admiral Fisk in his recent book, "From Midshipman to Rear Admiral," in the following statement:

"In the Navy no young man can be admitted to the lowest class in the naval academy unless he is of good moral, mental and physical character; he cannot graduate until after he had passed a satisfactory moral, mental and physical examination of great rigidity; he cannot be promoted to any rank thereafter until he has passed rigid moral, mental and physical examinations."

This is why our Navy is efficient. It recognizes and rewards good work. Admiral Fisk says further: "Yet in almost every other government organization—Congress, the Supreme Court, the Cabinet, the departments and all state and municipal positions, no examination of any kind is held, and the matter of fitness for a position seems to be the last point considered in appointing a man to fill it."

This is the reason for government operation under these departments being inefficient and wasteful. Good work is neither recognized nor rewarded.

The railroads, taking them as a whole, and during the period referred to, recognized good work and rewarded it. There was always a demand for good men and the employees knew that their advancement depended on their industry and ability. As an example: About 25 years ago one of the officials whose name is in the list referred to was filling a subordinate position and drawing a salary of $3,500 a year. A manufacturing company offered him a position at a salary of $12,000 per year and he refused the offer, saying that he expected some day to be president of the railroad for which he was working. He is almost there now.

Mr. Sims says in his judgment the Pennsylvania is the greatest railroad system in this country, and in the year 1917 it had a president at a salary of $75,460 and eleven vice-presidents at salaries beginning with $40,620 and running down to $25,000. Can it be that it has not occurred to Mr. Sims that one of the reasons for this being the greatest railroad system is *because* it has these officials and pays them these seemingly high salaries.

As a general rule, when a man buys anything he comes pretty near getting what he pays for, and this rule applies particularly to the purchase of service of any nature. Service is purchased to fill certain specifications and withstand certain tests just as materials are, and the price commanded by both is governed largely by the specifications they will meet and the test they will withstand. Any price paid for a piece of material is exorbitant if that material fails. Any price paid for service is exorbitant if the service is not delivered, and there is no redress. Good material has always commanded a high price and always will. Good service has always commanded a high price and always will; and in the long run, as a general rule, the highest priced material and the highest priced service are the best investment.

Our government chooses to use low priced service and gets just what it pays for. CLEMENT F. STREET.

PEAT CONSUMPTION IN IRELAND.—It is estimated that at the present time the Irish bogs contain between 3,500,000,000 and 4,000,000,000 tons of anhydrous peat, or 5,000,000,000 tons of air-dried peat. At present about 6,000,000 tons of peat are burned as fuel in Ireland per annum and over 4,500,000 tons of coal are imported. If this coal were replaced by peat fuel at the rate of two tons of air-dried peat to one ton of coal, the total consumption of peat in Ireland would be about 15,000,000 tons per annum, and the peat deposits would be sufficient to satisfy the fuel and power requirements of the country at the present rate of consumption for more than 300 years.—*The Engineer,* London.

The Condition of Rolling Stock in France Today

A Great Sufficiency, but Task of Putting It In Condition Is a Difficult One

By Francis Jaques

Paris, France.

"THE FRENCH RAILROADS at the present time are to be considered as being among the seriously wounded of the war, and neither the armistice nor the coming of peace can put them on their feet as with the touch of a fairy wand." Such were the words of one of the leading French railroad men shortly after the armistice, and the serious condition of the railroads today only goes to bear out the truth of his statement.

The rolling stock suffered particularly, for the magnificent effort of the railroads during the long war—one of the principal factors of the final success—was made under such conditions that it was practically impossible to make repairs or replace the worn-out equipment until the arrival of the Americans. As a result of this long-prolonged strain the condition of French rolling stock today is deplorable, and this is one of the causes of the very serious transportation crisis which is having such a disastrous effect at the present time on the whole life of the country.

It should be distinctly understood that it is not from a lack of equipment that France is suffering, but because its rolling stock is in exceedingly bad condition, literally worn out by the effort of the war. We shall first give some figures, which are extremely eloquent, showing the quantity of rolling stock in France before, during and after the war, and then explain what measures are being taken to improve conditions.

In addition to this rolling stock belonging to the principal railroads, the enemy captured locomotives, passenger cars and freight cars belonging to the secondary railroad companies, to the mines and to private parties. An estimate has never been made of the amount of this equipment taken.

France has already received, and is now receiving, a certain amount of rolling stock from two sources, the so-called "Felton Equipment" and German equipment. This is not included in the above figures.

The "Felton Equipment" is rolling stock ordered by the American army from America during the war by contracts with various companies. The coming of the armistice naturally made a vast change in the state of affairs, and the American army no longer required this equipment. The French government, therefore, being in need of rolling stock, took over the contracts for the delivery of this "Felton Equipment," which is quite apart and in addition to the 1,300 odd locomotives and 19,000 odd cars left in France by the American army for the French government. The following are the figures with regard to the so-called "Felton Equipment" which is being erected by the Middletown Car Company—the cars at St. Nazaire and the locomotives at La Rochelle:

"FELTON EQUIPMENT"

Freight Cars—	
Total number	19,860
Now in service	8,043
Locomotives—	
Total number	485
Already assigned to French railroads	431
Assigned to Roumania	15
Not yet assigned	39

A certain amount of rolling stock has been received by France from Germany as her share of the 150,000 cars and 5,000 locomotives assigned to the Allies by the armistice. Its final disposition has not yet been decided by the Peace Conference, but it is expected that France will keep as much of the equipment as it needs, returning the rest to Germany. In this case the value of the equipment kept will be probably deducted from the amount of the war indemnity which Germany will have to pay. The following figures show the amount of this equipment received by France to date:

Freight cars	63,871
Passenger cars	5,953
Locomotives	2,749

Intensive Use of Equipment During the War

It will be seen from all of the accompanying figures that there is not a lack of rolling stock in France today, but that the amount of equipment under repair is deplorably great. By the third year of the war the quantity of rolling stock was very low, most of this equipment having been lost at the very beginning at the time of the battle of Charleroi. This loss, coupled with the decrease in the number of the personnel, was felt tremendously. This was all the more the case because of the fact that the needs became greater and

* Including 7 locomotives, 146 passenger cars and 6,292 freight cars belonging to the Belgian Nord Railroad.

greater. It was not until 1916, however, that a certain number of passenger trains were taken off in order to try to help the situation.

The greatest effort came at the time of the powerful German offense at the end of March, 1918. The Nord and Est railroads had to increase nearly ten fold the number of trains moved daily for military purposes. When the enemy was advancing rapidly on Amiens, an important train escaped one day by its speed while the Germans and French were both heavily bombarding the line.

In November, 1917, the Paris, Lyons & Mediterranean was advised only 48 hours ahead that it would have to move 100,000 French and English troops to Italy, supplying them with food and ammunition. In spite of the difficulties of the country through which this movement had to be made, the Paris, Lyons and Mediterranean accomplished this formidable task as desired and without increasing its personnel.

During the war the traffic on the Nord, Est and Paris, Lyons & Mediterranean was 80 per cent greater than in time of peace, and all this had to be handled with a smaller amount of rolling stock and a greatly reduced personnel. The task of the personnel was still further complicated on the Nord by the fact that it had to work in collaboration with a personnel only speaking English and operating on the same lines.

American Assistance

With the arrival of the American army in France, the transportation requirements became even greater. The leaders of the American Transportation Corps, however, soon adopted very radical methods to improve the situation, always remaining in close collaboration with the French. Arrangements were made to import a large number of freight cars and locomotives from America, and these were erected by the American army in France. The Americans worked in the shops either independently or together with the French workmen. The former method was found the more successful because of the impossibility of rapidly accustoming men to work together of two races with such radically different customs, methods and hours of work, and speaking different languages.

Towards the end of the war, when speed was of vast importance, erected locomotives were imported from America and unloaded in France with the huge cranes which the American army had installed. This feat was accomplished with very sucessful results.

Thanks, therefore, to this American assistance in importing cars and locomotives and in repairing the worn-out French rolling stock, the equipment situation began to improve towards the end. It was high time, for the condition of the French rolling stock was indeed desperate in April, 1917.

Proposed Measures for Increasing the Quantity of Serviceable Equipment

By the addition of the American and German cars and locomotives to the French stock, a total amount has now been reached which is not far from that in existence just before the war. A glance at the figures at the beginning of this article will show the vast amount of equipment under repair which has accumulated during the war. Some of this rolling stock has been literally used up to the extreme limit, and, like the famous "one hoss shay," is on the point of falling to pieces. For this reason it has even been proposed to destroy a great many cars which are beyond repair and are taking up siding and yard space all over France. A short trip in any direction will soon convince the observant traveler of the wisdom of this proposal.

On August 29, 1919, M. Claveille, minister of public works, sent a note to the railroad companies in which he insisted for the eighth time upon the necessity for adopting exceptionally radical and energetic measures for relieving the serious transportation question. He urged that efforts be made to stop the rapid increase of bad order equipment. He suggested that the companies use the artillery and powder shops, now useless, and also the installations left in France by the Americans and English for this work. He asked the companies, utterly unable to cope with the situation themselves, to make contracts with private firms, and drew attention to the fact that the measures proposed in his circulars of December, 1918, and January, 1919, had not been carried out.

On October 2, 1919, M. Claveille sent a new letter to the principal railroads stating that he considered the situation as very serious. In that he says: "Our situation is such that not a minute is to be lost for adopting all the remedies, without exception, which may have a favorable influence on the operation of the railroads." The minister requested that a report be submitted to him by October 15, suggesting measures to improve the transportation situation.

The Technical Committee for the Operation of Railroads replied in a formidable document. The following passages of this report are extremely enlightening with regard to the equipment situation:

"The effort of the French railroads, so important a factor in the successful result of the war, was made under conditions which rendered the repairing and replacing of rolling stock impossible. This has caused a general depreciation of the equipment and lessened efficiency of personnel.

"The defects existing before the war have increased. In quantity the amount of rolling stock is at present sufficient. There were more locomotives and more cars in August, 1919, than in 1913.

"It is not, therefore, the number of cars which is not sufficient, for we are waiting for equipment to be delivered to us which represents about 1,500 locomotives, 3,000 passenger cars and 36,000 freight cars.

"However, although it is true that we have so many cars, we have the following percentage of worn-out equipment which needs repairs.

"Locomotives, 20 per cent instead of 9 per cent in time of peace; passenger cars, 26.4 per cent instead of 8.8 per cent, and freight cars, 15.7 per cent instead of 3.7 per cent.

"Also, among the other locomotives, unfortunately not a day passes but what a great many have to receive some slight repairs which keep them out of service. This fact has a considerable and disastrous effect on the regularity of the operation of trains.

"Without delay, repair shops are going to be created in connection with the engine terminals, and small yards are going to be built everywhere, following the example set by the Paris, Lyons & Mediterranean, in order to reduce the lengths of hauls for equipment.

"On October 1, 1919, 193 contracts were being made for the repairing of rolling stock, 52 for locomotives, 54 for passenger cars and 87 for freight cars.

"On the other hand, with the application of the 8-hour law, it is to be feared that we shall soon lack locomotives. It will then be necessary either to give up the facilities given the workmen by the 8-hour law or operate the locomotives under the pool system."

The Technical Committee did not believe it its duty to make this decision.

The above passages from the report of this committee give a very good idea of the serious situation with regard to rolling stock, resulting not from the lack of equipment but from its bad condition.

Motive power difficulties are made still worse by the very poor quality of the coal. It often happens that the coal which has to be used is not even in the form of "briquettes," but is literally dust. If a fireman rakes his fire down a

little too energetically, he is liable to cause it to fall through the grate.

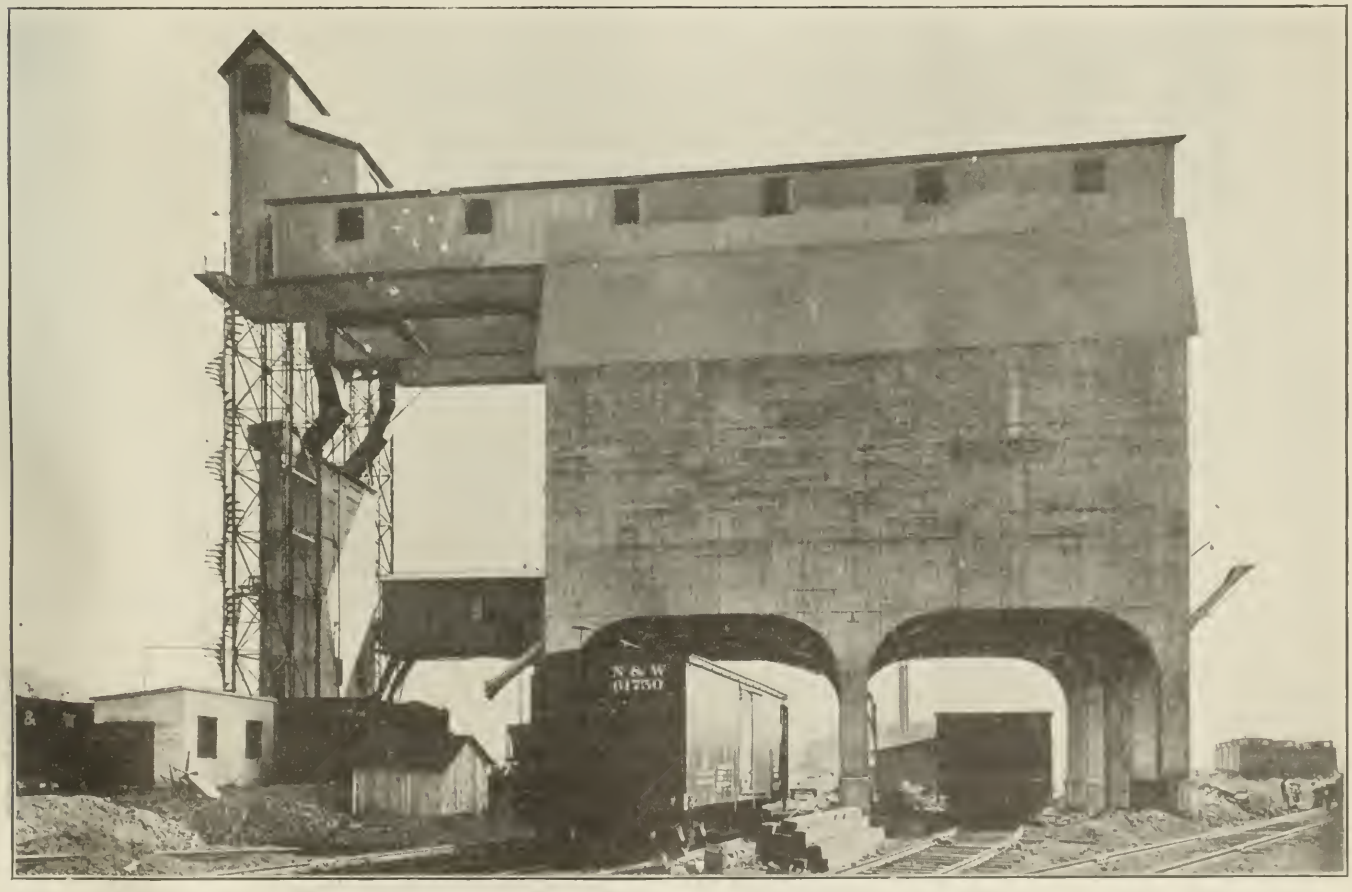
American firms will naturally be eager to know whether American assistance is going to be called upon to relieve the serious situation in which the French rolling stock now is, and, if so, what the business opportunities will be. The writer does not believe that much raw material will be imported from America. It is the policy of the present French government to restrict importations as much as possible in order to protect French industries and to try to stop the disastrous fall of the franc which is at present ruining France. Then, too, as a result of the war, France has acquired the opportunity of obtaining minerals in large quantities from the region of the Saar, and a great many orders have been placed in that district.

One of the great difficulties with which the French have to cope at present is the lack of organization. In this respect, American firms could co-operate with them by the organization of repair shops, employing French workmen and material. Unfortunately, however, the state of mind of the workmen in France is now very much upset. There is a widespread fight for shorter hours and higher pay, and this is coupled with a general spirit of laziness mingled with "bolshevism." The application of the 8-hour law has come too rapidly, and the workmen, encouraged by the fact that their reasonable demands were granted at once, are now inclined to go too far, asking for such short hours and such large wages that the companies would be unable to operate the railroads under such conditions. One of the highest railroad officials in France said recently that, in his opinion, if matters kept on going in the same direction as at present, the only solution of the financial problem would be to increase the rates by 100 per cent.. The effect on the public can be imagined.

To return to the rolling stock situation, it may be said, therefore, that there is equipment enough in France today or ordered; but that the great difficulty arises from the amount of bad order cars and locomotives. The remedy lies in the destruction of the equipment beyond repair, and in the proper organization of shops to put into shape the vast quantity of rolling stock now lying idle and blocking the traffic and rendering the proper operation of the railroads impossible. The solution of this problem is a vital one for the future of France, and there is an excellent chance for American concerns to get their share of the private contracts being made, upon condition that their work be organized and executed in France.

Large Coaling Station Embodies a New Feature

PROVISION FOR THE PREPARATION of coal for stoker-equipped engines is a feature of a large coaling station recently completed for the Norfolk & Western at West Roanoke, Va. The 1,200-ton coal pocket is divided into two bins of 600 tons capacity each. One of these is for the storage of lump coal and the other one for screenings to be used in the stoker-equipped engines. Each of the bins is provided with six spouts to deliver coal to engines on six tracks simultaneously.



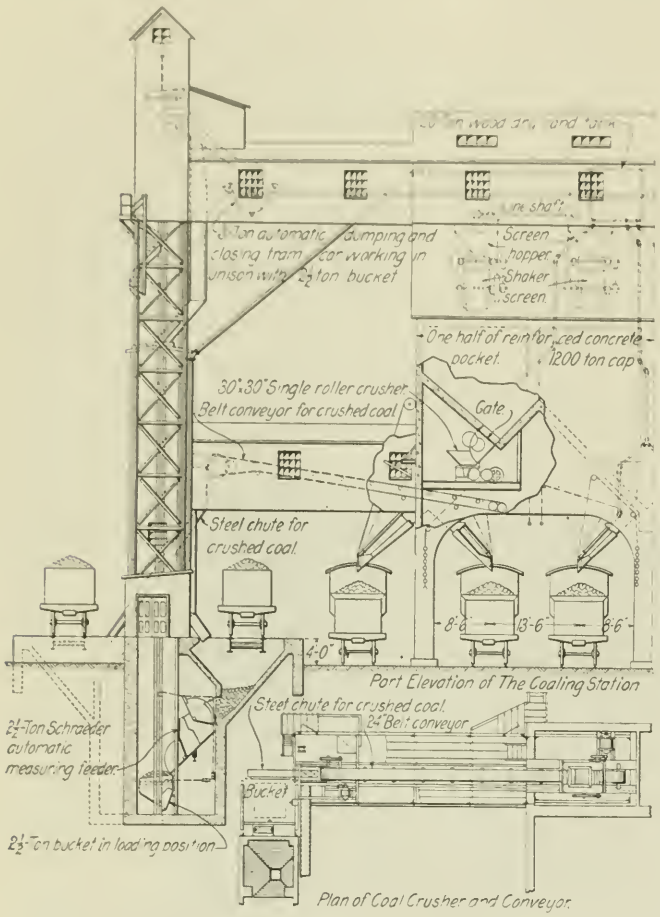
General View of the New Coaling Station at West Roanoke

To grade the coal for the two bins it is screened with electrically-operated shaker screens, which divide the coal into the two grades, that through two-inch perforations dropping into one bin and all the oversize coal passing off the end of the screen into the lump coal pocket.

To take care of a possible inadequate supply of the fine

coal as obtained merely by screening the run of coal delivered to the station, provision has been made for the manufacture of screening coal. An electrically operated crusher is included in the equipment, being installed as shown on the drawing under one end of the lump coal pocket, so that the coal from this bin may be run through this crusher. The crushed coal is carried by a belt conveyor to the elevator tower, where it may be chuted to either track hopper and returned to the storage bin.

This coaling station was designed and erected by the Roberts & Schaefer Company, engineers and contractors, Chicago, and all equipment for handling the coal conforms to



Elevation Showing Track Hoppers and Elevator and One-Half of the Storage Pocket

the standard designs of that company. There are two track hoppers for receiving coal and two separate elevating towers, each having a capacity of 75 tons of coal per hour. The delivery of coal from the elevator bucket to the bins is accomplished by two tram cars running on independent turnways according to an arrangement used previously in other large stations of the same type. These tram cars each dump coal into any one of four hoppers, the hoppers being arranged in pairs over transverse conveyors that deliver the coal to the four sets of shaker screens.

This station is also equipped with the "R and S" gravity sand plant and Beamer steam sand dryer. A reinforced concrete bin of 120-tons capacity is provided for the wet sand between the two coal elevator towers with the dryers located beneath. The dry sand is delivered to a 20-ton capacity dry sand tank in the deck house above the coal pocket from which the sand is chuted by gravity to each one of the coaling tracks. This station was designed and built under the direction of J. E. Crawford, chief engineer of the Norfolk & Western.

Coal Loading Heavy

DESPITE THE GREAT difficulties in getting empty coal cars back to their normal channels of traffic after the extraordinary dislocation during the coal strike, gratifying progress is being made in supplying empties at the coal mines, according to a statement issued by the Railroad Administration on December 19.

On December 12 1,058,000 tons of bituminous coal was produced, equivalent to 52.5 per cent of the pre-strike average. By December 16 this volume had risen to 1,595,000 tons, or 79.1 per cent of the pre-strike average (based on the high rate of production during October), or in other words 30,392 cars, a greater amount than the average daily production during the corresponding week in December, 1917, which average was 30,000 cars, and it is considerably in excess of the production during the corresponding week of December, 1916 and 1918.

"Inevitably there are car shortages," the statement says, "but they are not as numerous as might have been expected. It is highly probable, however, that the next few days will be exceptionally difficult in a few fields. The Railroad Administration, in co-operation with the National Coal Association, is doing everything possible to remedy the abnormal conditions, and it is expected that very shortly all facilities for the transportation of coal will be again on a normal basis.

"On December 10 attention was called to the dislocation of production, transportation and distribution of coal caused by the miners' strike, and expressing the hope that the general public, the coal operators and the miners will all appreciate these difficulties and will make allowances for the time required to restore normal conditions.

"This interruption of normal activities inevitably resulted in a disarrangement of coal car supply, in that the needs of the public, being of paramount concern, necessitated the movement of great numbers of cars great distances from the source of loading and into sections of the country not usually supplied from sources which were called upon during the period of the strike. For instance, certain mining regions had therefore always shipped their coal to the Atlantic seaboard, but owing to the pressing needs of the Middle and far Western states much of this coal was transshipped there, resulting in depleting somewhat the territory east of the Alleghenies and in operating difficulties in returning these cars to the mines. Adverse weather conditions in many sections are adding to these difficulties.

"No more coal is being held in storage on wheels than territorial needs make advisable, and every possible effort is being made with a view to the expeditious handling of empty cars."

Following is a statement of the average daily car loading of bituminous coal for the week ending on December 20 for the years 1916, 1917 and 1918, as compared with the car loading for December 17, 1919:

Region	Roads	Average loading per day week ending December 20			Loaded December 17, 1919	Percentage as compared with 1917
		1916	1917	1918		
Eastern	24	4,230	4,865	4,560	4,629	95.1
Allegheny	24	7,404	7,758	9,380	9,143	117.9
Pocahontas	6	4,000	2,914	3,400	4,699	161.3
Southern	17	3,900	4,756	4,357	5,664	119.1
Northwestern	12	1,950	2,123	1,776	1,174	55.3
Central Western	27	4,957	5,770	4,310	5,932	102.8
Southwestern	19	2,608	1,566	2,190	1,748	111.6
Total	129	29,049	29,752	29,973	32,989	110.9

THE NORTHWESTERN PACIFIC has secured from the Railroad Commission of California an extension to December 31, 1920, of the time granted by the Commission for the sale of its bonds.

Economics of Freight Car Maintenance and Operation

Relative Saving Effected by Rebuilding or Retirement—Great Increase in Cost of Repairs

By L. K. Sillcox

Master Car Builder, Chicago, Milwaukee & St. Paul

THE ECONOMIC SITUATION with respect to the performance of that great vehicle of commerce, the freight car, is one of basic importance. Any success in railroad operation corresponds largely to the net number of car miles attained per car per day, which figure ought to be as nearly 40 or above as possible. Why many roads are only showing 30 or even less miles is probably due to many causes beyond the exact knowledge of the writer, but in any event, so far as the problem is affected from the standpoint of design, maintenance and inspection of freight car equipment, there are a number of conditions which deserve calm and clear analysis.

The comments which follow are submitted with due consideration for the varying experiences and circumstances which obviously have to be allowed for, knowing that they must be met conservatively and frankly in view of whatever limitations may present themselves. We are dealing with a work which in practice is responsible for millions of dollars expended annually, and each individual task in design and maintenance deserves its full share of study and careful analysis. The inspection of freight trains can be discussed on a more uniform basis and greater similarity in practices can be obtained than at present, and I think to considerable advantage.

Weak Draft Members Most Serious Defect

One noteworthy fact, the explanation of which I have tried to investigate, should be first mentioned. Of all the complaints which are general in the operation of freight train equipment at the present time, the behavior of the weakly constructed design of car is found to be the most perplexing, principally due to draft attachment failures in combination with dangerously inadequate running gear members, such as truck, side frames, axles and bolsters. Although this difficulty is in greater measure due to wooden underframe cars, yet it is also noticeable in the case of improperly designed steel cars. Right at the present time there is a tremendous demand for suitable cars, which is not being satisfied, and yet it would appear to any thoughtful man that too many cars are standing idle which ought to be making their just proportion of revenue mileage. It does not seem to be altogether a case as to shortage of cars, but rather a matter of having more cars made really and honestly fit.

It has been said that a very large percentage of cars should be destroyed, especially those of wooden construction. A careful check, extending over a period of seven months in normal heavy trunk line service, has demonstrated that we can expect about 20 per cent or 30 per cent of the house cars used at this time to be of the type which we generally term as weakly constructed, not being as yet reinforced with metal attachments or ends. The problem to be determined in a decision concerning the retirement or reconstruction of any such car is generally influenced by the distinctive demand for the equipment on the owner's line and a knowledge of whether the expense of betterment or improvement to the existing equipment is offset by the capitalized value of the saving which can be realized in the maintenance account, as well as keeping in mind the better characteristic operation which is practically guaranteed from such a program.

Extended observation has often brought out the fact that the capitalized saving in the repair account through the adoption of an intensive retirement program and the acquisition of new high capacity units in equal number or tonnage, which are bound to present very much greater service capacity and earning power, if there is a paying demand for tonnage space, has proven most practical. It will never be found possible satisfactorily to determine upon any general policy without a most careful unit study for each class of car, besides being fortified with a liberal knowledge of the exact operating possibilities of the property owning the equipment.

Repairs of Foreign Lines Must Be Considered

Another serious limitation to our field of selection in the matter of deciding between reinforcement or retirement, and subsequent replacement in satisfactory designs, is the fact that the majority of defects occurring in connection with car equipment when off home lines, except in case of derailment or fire, have only in late years been made owner's responsibility.

This is where a vast amount of money is apt to be applied beyond the control of the car owner, and will undoubtedly bring about, of its own accord, more systematic analysis in the future as to deficiencies in each class of car in order to guard against the possibility of duplicating repairs to failed members which do not meet present-day requirements; so that the sum total of expense for any class of rolling stock does not become excessive, due to a large part of the work being repeated so continuously and carried out beyond the immediate observation of the car owner, resulting in extravagance, though not necessarily for the total equipment owned. Of course, under these circumstances excessive maintenance charges will not often be so easily reflected in system statements covering total ownership, but only in particularly grouped classes, which it may be desired to observe.

Attention Before Loading Prevents Delays

It is especially urgent that the best interests of the shippers and dealers, as well as of the railroads which serve them, be maintained by the inauguration of substantial repair practices which will insure a minimum delay of cars on shop tracks and line or road chargeable to their general condition and style of construction. Thorough inspection and repairs of cars before loading, and careful attention to brakes, lubrication, running gear and lading after classification at originating terminals, are a fundamental necessity.

Cars set off on the line, due to bad order condition of couplers, draft rigging, wheels, brakes, heated bearings, shifted lading and other similar causes, are usually the outcome of lack of proper attention at the originating terminal, which results in accidents, destroyed lading and cars, reduced train rating, delays to traffic, blocking of passing tracks, engine and train crew overtime and extraordinary

*From a paper presented before the Western Railway Club, October 20, 1919.

expense for sending men and materials out on the line to eventually make repairs.

Weak Cars Should Be Kept on Owner's Lines

At the present time nearly all systems are offering in interchange some load and empty cars that are of such design or condition as to make them entirely unfit for the service to be performed on the average trunk line railroad. This class of equipment, which cannot be depended upon to pass properly in main line movements, should be restricted to owner's lines, where it can haul the maximum amount of commercial and company lading with the least liability for delays, transfer or repairs. When a freight car of undesirable class and capacity has outlived its usefulness, from the standpoint of commercial utility, age, decay, corrosion, obsolescence or accident, so that the expenditure necessary to put it in serviceable condition is not justified, it should be dismantled forthwith. The intensive movement of tonnage, creating an acute demand for power and a severe congestion in terminals, has at many points made it impractical, due to the time consumed and necessary switching required, to place weakly constructed cars in the rear of long trains. That is why this subject looms so prominently before us today. Tremendous damage is done to these weak cars, and especially when not protected against the hammer blows of modern operation. Not only this, but delays and accidents are multiplying daily from the continued handling of these weak cars in this manner.

There is no question which demands so much attention and would result so advantageously as a serious and clear investigation covering the proper design for recommended reinforcement of existing obsolete equipment, with a view of causing it to be mandatory to so strengthen cars or retire them for interstate service, as well as that of shops and facilities, provided for its construction and upkeep.

Repair Facilities Are Inadequate

Freight car repair yards have been located at inconvenient out-of-the-way places; repair tracks have been set too closely together for convenience; the facilities for repairing have not been the best, and the consequence has been that cars which should have been returned to service promptly and with repairs properly made have been held out of service longer than necessary and were not properly repaired. Never before has there been such pressing necessity for intelligent work, for proper tool equipment and for shelter for the men employed as at the present time. It is a reflection on good judgment when cars are held out of service for which there is a paying demand at the time, and it would appear that with the attention now concentrated on the railroads, the best efforts are not only desirable but are absolutely necessary for a relief of the conditions considered.

The scope of the operations in commercial value; the great numbers of men coming under the control of the mechanical department; the drift of the times concerning methods for carrying out the work, and the very intensive service necessary to transportation matters, as well as the growing importance of economics, all tend to make us focus our attention on these questions. There is no denying the fact that all these matters involve, more than any one thing, the element of men, and if we are going to get the best from our men we must provide responsible supervision, with necessary support and initiative, so as to maintain action and make good from day to day. The moral responsibility of every one is as great and as constant, whether one is here or there, or doing one thing or another, and this responsibility is in exact proportion to the intelligence of the individual, coupled with whatever measure of freedom for action is allowed. It implies leadership and teaching, not in some things to be sure, but in all of the relations that bring individuals together in industry and business, so that our choice, especially among our highest supervisors, should be along most practical and fundamental lines. This is only referred to as a timely suggestion, since it has so far-reaching an effect that words could not be found sufficiently to emphasize its importance.

Greater Interchangeability Desirable

The first division of the subject assigned to me has regard for the design of rolling stock. I do not thing it is reasonable to believe that the roads will adopt and maintain one standard type of car indefinitely to a single inflexible pattern. There are sure to be improvements and modifications which different groups of railroad men think it desirable to make, and such motive would be difficult to subdue. It would seem proper for the draft lugs, truck frames, truck bolsters, center plates, striking castings, coupler carriers, brake beams, truck springs, drawbar yokes, uncoupling mechanism, brake hangers, drawgear carriers and center-plate height of truck to be standardized and made interchangeable to a greater degree than at present, both in new and repair work.

It does seem indefensible that the slight variations made in these parts should necessitate their being obtained from the car owners. In designing a car, what must be considered is the service in which its paying demand rests, not the service in which it may possibly run. It is only fair to assume that every railroad management aims to place in service cars built in a substantial manner. Standards in detail construction have been adopted by the Master Car Builders Association, which have assisted greatly in reducing the amount of stock necessary to be carried. The difficulty seems to be that these standards have not been enforced under mandatory rules, and their full practical value has never been properly felt on this account. I believe the time has arrived to introduce additional standards affecting the maintenance of box cars which can also be applied to all types used in interstate service.

The application of steel center sills as well as draft arms to old cars will not only prolong their life but cause them to have a more continuous earning capacity, due to not becoming marked out to shop tracks every few hundred miles for the application of draft timbers and end sills, as well as avoiding damage to adjacent equipment and delays to trains and in terminals, to say nothing of the tremendous losses due to damaged lading and loss of patronage, where delays and slow delivery become epidemic.

Poorly Designed Cars Are a Source of Trouble

Mechanical and transportation officers have seen and appreciate the results of poor designing and inferior construction, both as regards wooden and steel cars. One of the surprising features with regard to many steel cars in service which cause the greatest trouble and embarrassment is that they are not of particularly light construction, but the metal has been disposed with very little regard to the engineering feature of service requirements actually encountered. There is no doubt whatsoever but that many of these cars could be built with at least equal or even less weight, and a perfectly satisfactory structure obtained. This is what is so confusing to the minds of executive officers when they have purchased and placed in service not a cheap or even a light car and it fails; then on top of it all it is necessary later to recommend reconstruction and additional expense in order to stop permanently a severe leak in the maintenance account.

New fads in the design and building of car equipment should not be permitted, or any innovations until thoroughly tried out and known to be reasonable and capable of standing up in normal heavy service for at least a period of five

years, besides being passed upon and judged by uninterested, well-experienced and competent authorities.

It is not alone the larger locomotives being used today which have called for a more thorough investigation of the subject of car design and construction, but also the severe shocks which cars are receiving in classification yards. The superstructure of box cars should receive just as much attention as the underframe and trucks, otherwise leakage and subsequent loss of metal roof sheets, through racking and frames not being kept in alinement, is bound to result; when this happens it places restrictions on the ultimate utility of the car for certain classes of service where leakage is detrimental.

Wooden Frame Cars Need Steel Centersills

The strongest argument in favor of the general adoption of the steel underframe, and one which is barely, if ever, touched upon, is the fact that wooden framed cars are always damaged when in collision with steel underframe cars, while the latter escape uninjured. If, because of their decided economy, the more recent designs of metal construction are continued in use, then it is essential that other cars associated with them should be made strong enough to withstand the severe shocks incident to the movement of heavy tonnage trains now so generally experienced.

There is no doubt that the light wooden cars may be strong enough to carry the load for which they were designed, but they need a stiff backbone in the underframe to protect them from being crushed in the middle of a long train or between two heavy cars under impact. The same argument of uniformity holds true of couplers, draft gear and brake equipment. It is for this reason that we must at this time give more positive backing to the need of metal reinforcement programs for cars of light design rather than hesitating on a questionable economy in operating expense, due to carrying larger loads and less dead weight. It simply must be determined whether the cars are to be modernized or retired from service.

Wooden Versus Steel Cars

With respect to the life of the wooden car compared with steel, it is well to state that none of the modern steel cars have been in use long enough in general operation to determine their ultimate length of useful service. It has been found, however, what may be expected of all metal coal and other special classes of cars on prescribed lines having a given commodity and territory; this, of course, is of value for local comparative use only. There is great difference of opinion about the loss of weight in steel due to corrosion, and this may well be expected because of varying climatic conditions, and until some definite conclusions can be drawn, based on a wide range of observation under every service condition, any data used must be employed with caution.

Records indicate foundation for the opinion that wooden cars have been in continuous use from 20 to 30 years, but it is probable that such cars have been rebuilt from the sills up once or even more times in that period, so that we ought not to be disposed to question the assumption of the average life of such cars being 20 years. With respect to the high cost of repairs to wooden as compared to steel equipment referred to, and which is almost always carried on gradually, we must not forget that for steel cars, up until the time rebuilding is necessary, usually only light repairs are made, due to the various roads not being equipped to do the heavy work at this time. Therefore any comparative costs should be viewed with these thoughts in mind and wrong conclusions avoided.

Increase in Cost of Freight Car Repairs

Such a large proportion of failures in units of freight car equipment as is now being experienced appears to indicate that there is something radically defective in the elementary handling of the transportation problem or else the maintenance features have been neglected and have not kept in step with the advance movement of the service to be rendered. The cost of freight car repairs has been continually increasing and in somewhat greater proportion than the advance in labor and material accounts would explain. The tendency for such increases can only be offset by providing all means that aim to reduce the number employed and get the greatest possible output from each man. This not only makes itself felt upon the payrolls but reduces the time cars are held out of service, which is another source of revenue. In dealing with concrete cases, showing the increase in freight car repair costs, a table is shown below for eight of the largest Western railroads:

Road	Year	Number of freight equipment cars	Average miles per freight car per year	Cost of freight car repairs per car per year	Cost of freight car repairs per mile, cents
A	1916.....	66,409	11,593	$69.13	0.599
	1917.....	70,396	11,853	68.12	0.558
	1918.....	70,400	12,064	146.52	1.221
B	1916.....	57,401	8,931	53.98	0.60
	1917.....	58,256	8,396	66.64	0.80
	1918.....	55,819	8,987	147.13	1.64
C	1916.....	57,985	10,974	58.76	0.54
	1917.....	47,845	11,171	74.98	0.67
	1918.....	50,079	10,376	133.60	1.29
D	1916.....	46,925	11,098	85.59	0.80
	1917.....	46,281	11,191	126.92	1.13
	1918.....	45,993	10,459	201.23	1.92
E	1916.....	68,339	13,059	74.66	0.57
	1917.....	67,828	14,553	88.46	0.61
	1918.....	69,622	11,145	149.88	1.35
F	1916.....	67,370	13,053	98.16	0.75
	1917.....	67,168	11,214	122.93	1.09
	1918.....	61,457	11,905	266.57	2.24
G	1916.....	63,143	11,646	120.20	1.03
	1917.....	64,919	12,377	113.12	0.91
	1918.....	66,741	12,810	177.18	1.38
H	1916.....	81,034	9,468	71.48	0.76
	1917.....	83,147	9,499	84.84	0.89
	1918.....	72,141	9,377	146.36	1.58

The serious increases in total expense from year to year are attributed more to the character of equipment owned than any other feature, and the logical proposal is, therefore, that more rapid retirement of obsolete equipment should be carried out. When such cars are dismantled and permanently removed from service, one of the features which can be expected to effect a saving and prevent such increases as indicated above is the relative reduction in the amount of material used for repairs to old cars.

It can be fairly well stated that the total car repair expense is about equally divided between labor and material under normal conditions where extensive reclamation operations are resorted to locally, thus holding down the amount of new material obtained to a minimum. Most wooden cars are at least 15 years old, and many have seen 25 or more years service. Comparatively few of the weakly designed cars complained of have been reinforced with metal draft rigging. Failure of draft attachments and associated parts contribute most seriously to the unprecedented increase in cost of repairs. In maintaining these weakly designed cars, such a large part of the available time and expense is absorbed that the better cars are permitted to drift along and deteriorate much faster than they should.

Setting Limit for Repairs Does Not Force Retirement of Cars

It seems to be a general practice to place small limits of expense on these older cars with the idea that these limits would force such cars to be automatically taken out of service as they become deteriorated beyond a point where repairs would be economical. It can be shown that this equipment is on the repair track a large portion of the time,

and in each instance just sufficient work is done to run the car a little further owing to the policy of concentrating on light repair work first where a demand for equipment exists. Such a plan of retirement does not work satisfactorily, and in the end the roads have far exceeded any proposed sum of money which they planned on placing against these old cars to keep them in service. I do not think anyone who has followed the plan in question has ever found the result in practice any different than stated.

Low Stresses Prolong Life of Parts

During winter months, and at time of heavy tonnage movements, wrecks and delays caused through breaking down of trucks are very serious matters, and the question is always asked as to why such things happen. Fatigue failure in metal truck frames, axles, bolsters and other portions of equipment is characterized by suddenness, and oftentimes occurs immediately after careful inspection has been made. The fractures sometimes disclose a crystalline appearance over part of the surface, and it is this feature which has many times given rise to the term "crystallized." This supposition, however, has been found generally false, since close examination of metals under stress shows no change of the general scheme of internal structure, but under severely heavy stress there appears a gradual breakdown of the crystals forming the member.

Metal used for the running gear of cars is more or less ductile, and when these parts are deformed cold the first yielding occurs in the particular grains which either take the most stress or have the lowest elastic limit. The failure in such metals subjected to repeated stress takes place with substantially no general deformation, but there is, however, considerable localized distress among the structural particles, which increases directly with the number of applications of stress.

Car trucks have imposed upon them repeated stress in service, and failure seems to develop in proportion to the continuous mileage made. In analyzing specific cases of breakages, they seem to appear almost exclusively through the unification of yielding particles, with the result that cracks develop with final added stress, promoting the extension of this crack into the adjacent area on both sides. Steel must be considered as filled with a multitude of minute flaws, originating at the time the metal becomes solidified. In static testing steel, under stress of about one-half its ultimate strength, passes into a semi-plastic condition, in which there is a gradual flow of the material. Under such condition the small flaws have almost no effect upon the flow or upon the static strength. When steel is loaded to moderate stresses the yield is almost entirely elastic in general, but a small portion of its inelastic energy being taken up by the steel itself.

In this way it can be reasoned that sufficient material is necessary to any truck side frame or bolster in order to keep down the working load of the material and give long life to the part. Of course, where springs are improperly designed to carry the load truck members receive hammer blows in service for which they were never designed, and this seems to be particularly true in the case of the M. C. B. grouping of springs for 50-ton cars, as often they stand practically solid under the static weight of the car and lading. This is a subject which should be placed before the proper committee of the M. C. B. Association.

As a plan of interesting local foremen in the discharge of their duties it is well for them to have a working knowledge of the money they are spending, and attached is copy of the form shown in Fig. 1, which is filled out daily and wired to the general offices twice a month. Very interesting results have been obtained from this practice, and it establishes the plan of foremen going over time slips personally to know that labor charges are being properly distributed. With this data, and knowing the amount of work turned out, a good practical analysis is obtained concerning relative efficiency month by month, which guards against excess overtime payments and similar wastes.

Form Used by Local Foremen to Show Distribution of Pay Roll Expense

On the road with which I am connected practices have been adopted which have done a great deal to unify our efforts, especially in through business, besides positively maintaining the responsibility of each individual engaged and avoiding any duplication of inspection or excess within reasonable mileage limits.

The desire to save time and cost of inspection by resorting to the so-called safety inspection of some roads has about reached its limit. The class of men that railroads are obliged to draw from, in some districts at least, do not make the most expert inspectors. The saving in reducing the number of men and time to make the usual superficial safety inspection oftentimes proves a serious loss, for the result

of a derailment or wreck on account of a loose or defective wheel, or some other important part of the running gear, or brakes which have been overlooked on account of time or judgment, is worthy of serious consideration. No one will deny that all cars are rankly abused, but very little is heard of crews being suspended or even censured on account of damage to rolling stock, no matter what the extent. The ultimate loss cannot be measured by figuring the cost of renewing certain broken parts when cars are handled roughly, for premature failure of other parts will follow.

Consideration of overtime and the sixteen-hour law, as well as expeditious train movement, demands the minimum lapse of time between that for which the crew is called and that when the train departs. Hence a train prepared for departure should require no more brake work after the engine is coupled than, at the most, stopping a few leaks in those couplings and making the formal test. But often today there are greater delays due to making other repairs, or the train proceeds with less efficient brakes than it should have.

To avoid this the repairs required must be determined with arriving trains. The incoming engineer should add to the reduction required for stopping enough to fully apply the brakes, and the brakeman should await his advice that this has been done before cutting off the engine. Car inspectors should be present to make an immediate examination and to bad order all defective brakes. Such repairs as ordinary brake pipe leaks, defective hose and wrong piston travel—those requiring little time—should next be made, but cars requiring heavy brake repairs should be marked for the repair tracks.

In this matter judgment must be exercised, as perishable or other very important loads, as well as empties needed at once for such lading, must not be delayed. Neither should other less important cars be held in numbers far greater than the local force can repair in a day if such force is as great as the regular amount of work, including such repairs, would keep busy. The car foreman and the yardmaster should consult to adjust the foregoing, but when the former removes bad order marks without repairs having been made he should fill out and apply an air brake defect card to better insure prompt repairs at the earliest practicable date.

Discussion

G. S. Goodwin (C., R. I. & P.) stated that at the present time the railroads were justified in making more extensive alterations when reinforcing old cars. He cited the fact that steel frame box cars which formerly could be purchased for $900 now cost $3,000.

T. H. Goodnow (C. & N. W.) expressed the opinion that the retirement of wooden cars is one of the most important problems confronting the mechanical department at the present time. There are still in service a great many wooden cars of 80,000-lb. capacity, built between 1902 and 1907, which have as high cubical capacity as cars now being built. These cars will give good service if reinforced, and the work should be done without delay. Mr. Goodnow called attention to the many circumstances which must be considered in analyzing statistics regarding freight cars. He doubted whether any reliable figures showing the relative life and cost of wooden and steel cars were available, because the early all-steel cars were confined almost exclusively to gondola and hopper types, which cost less to maintain than house cars. He called attention to the large percentage of foreign cars which all the railroads had on their lines during 1918, and stated that for this reason the expenditures for freight car repairs did not furnish a true indication of the relative cost of maintenance of the equipment of the various companies. He said the past two years had proved that cars cannot be taken care of as well away from home as when the equipment occasionally reaches the owning road and favored greater standardization of truck and draft gear parts to facilitate maintenance. He indorsed the system of organization in force on the C., M. & St. P., and stated that an individual car department was necessary in order to get the best results from the local organization.

J. W. Luke (A. T. & S. F.) expressed the opinion that some roads are not keeping cars in fit condition, and the standard of equipment maintenance would not be improved unless the burden of repair work could be distributed among all the roads. From the year 1917 to 1919 the Santa Fe's expenditure for repairs to foreign cars rose from $1,690,000 to $7,700,000, an increase of 355 per cent. Mr. Luke advocated the reinforcement of wooden cars with steel channel center sills, and stated that the cost of maintenance of cars so improved compared favorably with modern equipment.

C. Wymer (C. & E. I.) mentioned that sometimes equipment is designed with no thought of future repairs, and the replacement of minor parts necessitates expensive dismantling. Such construction inevitably increases the cost of repairs.

In the course of the discussion Mr. Sillcox elaborated on some of the points brought out in the paper. To emphasize the necessity for retiring cars of wooden construction, he quoted statistics showing that 76 per cent of the cars damaged in service were cars with wooden underframes. The failures were distributed as follows: Draft gear, 63 per cent; knocked off center, 14 per cent; end frame failure, 14 per cent; cornered, 9 per cent. He called attention to the fact that the roads showing the least cost of freight car maintenance had had the most rapid rate of acquisition and also the most rapid retirement. On some roads the acquisition and retirement were so slow that the freight equipment would only be renewed in a period of 40 or 50 years. Mr. Sillcox favored the modernizing of cars of 40 tons capacity, but stated that the reinforcement of 30-ton cars was usually not economical because it would involve an increase in the weight of the car, and since the total weight was limited by the capacity of the axles the maximum allowable load would be less than 66,000 lb.

Orders of Regional Directors

RENTAL RATES FOR LOCOMOTIVES.—Supplement 1 to Order 207 of the Southwestern regional director states that the following will govern with respect to the rental charges for other line locomotives:

"On locomotives delivered by owners having direct physical connection with borrowing road, rental will commence with delivery, and where there is no such connection rental will commence upon delivery by owner to first connecting road.

"The rental will cease with delivery of locomtive to owning line rails, whether there is direct physical connection with owner or not, except that:

"When a locomotive is no longer required by renting line, and instead of being returned to owner is sent elsewhere for service, the rental of delivering line will cease and the rental of receiving line will begin when locomotive is ready for service at point of interchange; i. e., in case where the locomotive is interchanged direct between these roads. If the delivery in such a case involves movement over an intermediate railroad, rental of receiving line will begin when the locomotive is ready for service at interchange point where they receive it."

Incomplete Brakes on Gondola Cars.—Supplement 2 to Circular 201 of the Southwestern regional director states that 500 U. S. Standard hopper cars, allocated to the Pere Marquette, built by the Ralston Steel Car Company and num-

bered 13,000 to 13,499 were placed in service without sheave wheels on brake and hand brake pull rod. The circular instructs that, where these cars are found with sheave wheels omitted on the end of the hand brake rod, changes should be made at once, regardless of ownership.

Weekly Traffic Report

ACCORDING TO A REPORT on traffic conditions for the week ended December 15, made to Walker D. Hines, director general of railroads, revenue freight loadings and receipts from connections for the various regions throughout the country were as follows:

Eastern region—Revenue freight loaded, 197,682 cars, a decrease of 4,687 over same period last year; receipts from connections, 227,692 cars, an increase of 1,709. Allegheny region—Revenue freight loaded, 177,007, a decrease of 13,981; receipts from connections, 150,753, a decrease of 14,401 cars. Pocahontas region—Revenue freight loaded, 36,458 cars, an increase of 1,049 cars; receipts from connections, 15,010 cars, a decrease of 3,558. Southern region—Revenue freight loaded, 118,019 cars, an increase of 2,546 cars; receipts from connections, 75,943 cars, an increase of 5,379 cars. Northwestern region—Revenue freight loaded, 116,709 cars, a decrease of 3,199 cars; receipts from connections, 73,114 cars, a decrease of 1,502 cars. Central Western region—Revenue freight loaded, 105,921 cars, a decrease of 8,446 cars; receipts from connections, 63,357 cars, an increase of 3,721 cars. Southwestern region—Revenue freight loaded, 57,095 cars, an increase of 699 cars; receipts from connections, 49,103 cars, an increase of 3,965 cars.

A summary of the report follows:

Eastern Region—Report from the iron and steel territories shows some deduction in the number of blast furnaces in operation, due to the shortage of coal. The output and movement of traffic to and from a considerable number of industries was largely interfered with by the acute coal situation, but improvement has already begun. Passenger business is good, but curtailment of service, brought about to conserve coal, of course had a serious effect on passenger traffic.

Allegheny Region—Notwithstanding the coal situation there was an increase of one stack in the number of iron furnaces in blast in this region, as compared with same week of last year. There has been a slight improvement in the box and flat car situation. The withdrawal of numerous passenger trains for a few days resulted in overcrowding trains, but service was improved and is now operating on normal basis.

Pocahontas Region—Business generally was affected by the coal situation and also by high water troubles and embargoes. Passenger travel continues good, although earnings are not as large as for the same period last year, which is accounted for by the discontinuance of the heavy military travel of a year ago. A number of passenger trains were also discontinued in this region in order to conserve fuel.

Southern Region—There has been a gradual improvement in the box car situation. Southern Pine Association reports orders received during the week, 3,874 carloads. This is a substantial reduction in average orders, but the association reports an increase in average shipments and average production. Unfilled orders on hand amounted to 24,128 cars. Cotton movement continues active, with a specially heavy movement to the ports for export. Merchandise traffic to Florida is in excess of any previous year, and Cuban freight continues to offer in excess of carrying capacity of the East Coast car ferries. Unprecedented rainfalls during last few days of the week resulted in serious interruptions to traffic generally by washouts. Passenger travel was very good during the week, notwithstanding the general uneasiness which prevailed on account of the coal situation and curtailment of train service.

Northwestern Region—General business conditions are sound, but some industries have been forced to shut down or reduce their working time, account of coal shortage. However, the general feeling is optimistic as to the future. There is a specially heavy demand for refrigerators to load perishable freight. Lumber and forest product loading showed an increase of 3,792 cars, but grain and live stock loading both showed decreases. Passenger train service was temporarily curtailed on account of fuel shortage.

Central Western Region—Shipments of California commodities requiring refrigerator cars from January 1 to November 24 this year amounted to 123,128 cars, showing an increase of 37,765 cars over the same period of last year. Notwithstanding reduction in passenger train service and efforts to discourage unnecessary travel, the number of passengers handled continued very heavy.

Southwestern Region—Business conditions generally were reported as satisfactory, notwithstanding the fact that some plants were forced to suspend operations and others were unable to work to maximum capacity, account of insufficient fuel supply. Preferred attention is being given to furnishing cars for sugar and rice loading in Louisiana. Rice continues to bring high prices, and there is an active demand, both foreign and domestic. Due to completion of additional pipe lines, there has been an increased production of oil in the Burk-Burnett district, it being estimated that the average daily production in this field amounts to over 100,000 barrels. Gas and oil well activities also continue in Louisiana. Notwithstanding curtailment of passenger train service, regular travel continued above normal, with heavy travel in the Little Rock, Ark., district and from and through Memphis gateway. California travel was quite heavy.

Relative Durability of Green and Seasoned Timber

WHILE OPINIONS have always differed as to the comparative durability of untreated green and seasoned timbers when used for poles, posts and ties, etc., recent experiments of the Forest Products Laboratory, Madison, Wis., indicate that there is practically no difference in their life when exposed to the weather and in contact with the ground.

A test of untreated green and seasoned ties of Douglas fir and western larch, laid in tracks of the Northern Pacific at two different points, showed that the life of the green fir ties was 7.65 years, while that of the seasoned timber was 7.75 a difference of 1/10 year in favor of the seasoned. In the case of the larch the results were about the same, the green ties lasting an average of 7.3 years and the seasoned 7.4 years. Tests of telephone poles showed the rate of decay in green poles to be a trifle less than in the seasoned.

This almost equal durability of untreated green and seasoned poles and ties, or in fact any exposed timber in this condition, is due to the fact that as soon as the timber is placed it begins to take up or give out moisture, according to its condition of seasoning and the conditions of exposure. Thus in a relatively short time both green and seasoned timbers reach the same moisture content, and as this is the determining factor in decay, their life will necessarily be approximately equal. This does not apply, however, to wood used in building construction, as this does not usually dry out so rapidly after being placed, resulting in shrinkage, which is objectionable, and also in decay before it seasons. Only seasoned wood should be used for this class of work.

Second Meeting of Telegraph and Telephone Division

Wire Crossings, Pole Line Consrtuction and Mailgram Service Among Important Subjects Considered

The Telegraph *and* Telephone division of Section 1—Operating of the American Railroad Association held its second meeting at the Congress Hotel, Chicago, on December 3, 4 and 5. The resignation of Martin H. Clapp, chairman of the division, made it necessary for the Committee of Direction to appoint a successor, and J. F. Caskey, superintendent of telegraph of the Lehigh Valley and first vice-chairman of the division, was selected and presided at this meeting. These changes made it necessary to fill other vacancies which resulted therefrom, and the Committee of Direction appointed H. Hulatt, manager of telegraphs, Grand Trunk System, as first vice-chairman and W. H. Hall, superintendent of telegraphs, Missouri, Kansas & Texas Lines, second vice-chairman. E. L. King, superintendent of telegraph, Southern Pacific Lines, was appointed a member of the Committee on Direction to fill the vacancy caused by Mr. Hall's promotion. The total registration of railroad representatives at the meeting was about 170.

Report of Committee of Direction

The Committee of Direction felt that each railroad should assume the expenses of its representative in attendance at sessions of the Telegraph and Telephone division, other than those involved in attendance at committee meetings, which will be assumed by the American Railroad Association. In the event of an employee who is not a representative member being required to attend a meeting of a special committee on whose work he is engaged, a request for his attendance should be forwarded to the senior representative member of his road.

In order to clear up any misunderstanding concerning the question of membership of the division, methods of voting, etc., the Committee of Direction submitted several additional paragraphs to be added to the regulations of the division, the most important of which was as follows:

> Representatives of members shall be those actively connected, in official or supervisory capacities, with railroad telegraph or telephone service, who have general charge of such service over an entire railroad or grand division of a railroad consisting of two or more transportation divisions. In addition, other officers and employees in like capacities and in service may be designated by the railroads as their representatives or may be called upon by the division for special duties.

The method of voting at meetings of the division was given consideration, and the Committee of Direction decided that it was not necessary to take any action upon the subject owing to the fact that representative members of the division can call for a vote by roll call (which is based upon the number of memberships held by each railroad in the association) upon any motion at a session of the division.

This committee has given consideration to the question of a manual of recommended practices, which is to be of the loose-leaf binder type and of convenient size, so that recommended practices may be issued from time to time as desired.

It was decided that two sessions of the division shall be held each year, one in the spring and one in the fall. The spring session for 1920 will be held in St. Louis on March 30 and 31 and April 1, and the fall meeting, which will be the annual meeting, will be held in Winnipeg on September 22, 23 and 24 unless some emergency arises which makes a change necessary.

Almost all of the discussion concerning the report of the Committee of Direction was based on the question of membership and the voting power of members. It was explained that each road supporting the American Railroad Association is a member of the Telegraph and Telephone division and therefore has a right to appoint representative members, consisting of any number of represenatives it sees fit to select. Each representative member has a right to a vote on the floor, but when a disputed question arises a roll call vote is necessary; the ranking representative member of each road is the only one qualified to vote in accordance with the mileage of the road or roads he represents. The privilege of voting on letter ballot is restricted in the same manner. Affiliated members (those not in railroad service) have the right to vote in committtees with which they may happen to be working. However, such members do not have the right to vote at division meetings in the adoption or rejection of matters presented at such meetings.

Maintenance and Construction of Pole Lines

Sub-Committee "A"—of Committee No. 1—Construction and Maintenance—Outside Plant, presented a report of progress in the revision of specifications for the Maintenance and Construction of Pole Lines, and it expects to present acceptable specifications at the next annual meeting. The report was accepted as information.

Wire Crossings

The report of Sub-Committee "B"—Wire Crossings, of Committee No. 1—Construction and Maintenance—Outside Plant, contained a synopsis of its activities since the meeting of the division held in Chicago in June, 1919. Since that date this committee held two separate meetings and one joint meeting for the purpose of arriving at a definite conclusion relative to the proposed revision of the National Electrical Safety Code, a portion of which deals with signal lines crossing over railways.

At the joint meeting, which was called by M. G. Lloyd of the Bureau of Standards, there were present, besides members of Committee "B," representatives of the Bureau of Standards, the American Electric Railway Engineering Association and three representatives of the railroad engineering departments, besides several wire-owning companies. At this meeting Sub-Committee "B" of the Telegraph and Telephone division advocated the changes recommended in its report submitted at the Chicago meeting in June. The Bureau of Standards asked the committee to endeavor to draft a clause which would allow weaker construction over some of the minor side tracks to take the place of the Rule, Signal Lines Crossing Over Unimportant Railroads, which appeared in an earlier revised Bureau of Standards Code and which the Telegraph and Telephone division persistently objected to; the committee taking the stand that there are no unimportant railroads. The Bureau of Standards also wished to get further opinions in regard to the use of No. 12 galvanized steel wire for spans 125 ft. long or less.

Sub-Committee "B" recommended that the Rule, Signal Lines Crossing Over Unimportant Railroads, be corrected to Signal Lines Crossings Over Minor Tracks (not including any main tracks), and that this rule should provide

for narrow gage tracks, tracks used only temporarily for construction purposes for a period not to exceed one year, tracks on which standard freight cars cannot, for physical reasons, be operated, street railway tracks on public highways and industrial spur tracks with not exceeding two tracks under the same span. Besides the above, other recommendations were submitted to the Bureau of Standards on rules and regulations to cover signal lines crossing over railways. The Bureau of Standards then presented its revisions to the Telegraph and Telephone division at its December meeting. The portion of the Bureau of Standards revised code on Signal Lines Crossing Over Railways, which received the greatest amount of discussion, reads as follows:

Signal lines crossing over tracks included in the following list shall conform to the requirements of Grade E:

1. Spurs not exceeding two tracks in the same span.
2. Branches on which no regular schedule of operation is maintained.
3. Narrow-gage tracks or other tracks on which standard rolling stock cannot, for physical reasons, be operated.
4. Tracks used only temporarily for construction or similar purposes for a period not exceeding one year.
5. Tracks not operated as a public utility, such as industrial railways used in logging, mining, etc.

In presenting this report E. C. Keenan, general superintendent telegraph and telephone Eastern region, United States Railroad Administration, said that the Bureau of Standards expected to publish a revised National Electrical Safety Code and that Sub-Committ "B" of the Telegraph and Telephone division was endeavoring to get the best possible form of construction for signal lines crossing over railways, that it could under the conditions and that it was necessary to grant several concessions to the Bureau of Standards if the matter was to be cleaned up in a satisfactory manner. Regarding the several items covering various classified tracks, Sub-Committee "B" recommended that the first two classifications be revised as follows:

Signal lines crossing over minor tracks included in the following list shall conform to requirements of Grade E:

1. Spurs less than 2,000 ft. long and not exceeding two tracks in the same span.
2. Branches on which no regular schedule of operation is maintained.

The committee recommended that item 2 be eliminated entirely because it felt there were many such branch lines which were as important as main lines. Items 3, 4 and 5 were considered satisfactory as presented.

William Bennett (C. & N. W.) stated that he believed the entire matter was based on the wrong principle. He objected to the methods used for determining the classification of standard gage steam railroad industry or spur tracks as minor by the number of tracks under a span of wires. He stated that the proper method required a primary consideration of the exposure of persons to risk and injury. He further said that a very large part of the deaths and injuries of railroad employees engaged in transportation occur upon minor tracks, called industry and yard tracks, and that electrical conductors crossing over such tracks in many cases are attached to buildings and structures of various kinds other than poles. Industry tracks are largely composed of curves of unusually short radii, which are introduced to avoid objects which cannot be removed to permit tangent alinement. These objects constitute obstructions to the view of railroad employees engaged in switching cars, and because of these conditions employees are obliged to ride upon side ladders and roofs much more frequently and under more hazardous circumstances than when engaged in work upon ordinary yard and main tracks, this greater exposure being necessary to permit them to occupy positions from which their manual signals can be seen. He therefore believed that it was extremely important that extra care should be taken to avoid scant lateral and vertical clearances between electrical conductors and their supports and standard freight cars, and that ample strength should be provided in the conductors and their attachments and supports at crossings over such minor tracks.

E. C. Keenen stated that Grade "E" construction was one-third weaker in crossing span supports than Grade "D," the requirement over main line crossings, and that the proposed construction is the strongest the A. R. A. can secure from the Bureau of Standards. Sub-Committee "B" was instructed to continue its work on the balance of the revised National Electrical Safety Code submitted by the Bureau of Standards and to recommend the necessary changes it felt would be agreeable to the division, so that the Bureau of Standards would have the advantage of such recommendations in preparing its final draft of the code, which it expects to complete within a short time.

Underground Construction and Transportation

Sub-Committee "C"—Underground Construction, Committee No. 1, Construction and Maintenance, Outside Plant, submitted specifications for conduit castings, creosoted wood conduit and plank, fibre conduit, pulling-in iron, steel pipe conduit and for vitrified clay conduit.

The committee found that the Signal division of the A. R. A. already had prepared certain specifications which meet the requirements, and these, with similar specifications of telegraph and other companies, were embodied in the specifications mentioned above. Each of these specifications was submitted to the division for its approval, and is to be submitted to letter ballot for inclusion in the manual. After brief discussion each specification was approved.

Sub-Committee "D" Transpositions, Committee No. 1, Construction and Maintenance—Outside Plant, submitted complete a specification for locating and installing transpositions in telephone circuits. This specification is practically the same as that presented at the June meeting of the division, only a few minor changes being made by the committee, based on comments received since the June meeting. The Sub-Committee also submitted specifications for the line materials referred to in the specifications, these being complete manufacturing specifications which can be used in purchasing and inspecting the materials required for transposition in telephone circuits.

W. Roger, telegraph and telephone engineer, Southwestern region, United States Railroad Administration, stated that a very heavy line between St. Louis and Kansas City, with transposition such as shown in the plans, has proved very successful. After a brief discussion of the various specifications they were accepted by the division, to be submitted to letter ballot for approval.

Committee No. 2—Construction and Maintenance—Inside Plant, submitted specification for the installation of telegraph and telephone equipment in railroad offices. A draft of the specification was submitted to the division at its Chicago meeting in June, at which meeting recommendations were offered, and the committee was instructed to proceed with the development of the specification after receiving written comments and criticisms from the members. Its report at the December meeting included the preliminary draft, together with the revised draft. After brief discussion the report was accepted as information and progress.

Report on Electrolysis and Lightning Protection

Committee No. 3—Protection Against Electrolysis, made no detailed report on the subject of protection against electrolysis, as its report presented at the June meeting, which which was accepted as information, was later adopted for in-

clusion in the manual. This committee's present work is to keep in touch with electrolysis in general and be prepared to make any recommendations that may seem necessary, so as to keep the instructions which have already been adopted up-to-date.

Committee No. 4—Protection Against Lightning or Electric Light and Power Circuits, submitted a preliminary draft and specifications for such protection. E. C. Keenan objected to any separation of the wires and apparatus owned by railroads from that not owned by the railroads. He believed that from the standpoint of the protection of life and property there should be no separation of the wires and that any clauses so separating such wires and apparatus should be eliminated.

H. W. Drake, apparatus engineer, Western Union Telegraph Company, said he believed in practical methods, and wondered if any one could imagine that the telegraph and telephone companies would attempt to put in apparatus which would introduce a hazard to lives and property. He further stated that it would be almost impractical to expect a complete and thorough inspection of installations for the purpose of determining whether each and every wire, of which there are great quantities entering railway buildings, had the protection such as might be specified in the division specifications. He said that protective apparatus designed for commercial company purposes may necessarily have to be different for the protection of its apparatus than that required for protecting the apparatus on railroad circuits.

The committee's report, with the exception of the specification for line fuses, was accepted for submission to letter ballot for inclusion in the manual after necessary corrections were made in the matter of what constitutes approved methods.

Committee No. 5—Telegraph and Telephone Development, presented a report upon a number of recent improvements, which was accepted as information.

Message Traffic

Committee No. 6—Message Traffic—submitted recommended practices for traingram service, the education covering the proper use of traingram facilities, of the examination of telegraph operators on switchboard manipulation and a program of future work to be undertaken by the committee. The committee recommended that traingram service shall be under the control of the telegraph department, the baggage department and other departments co-operating to maintain prompt and efficient service between offices, stations and trains. Where there is a large volume of business to be handled by traingrams between designated points daily it may be found advantageous to provide small leather or canvas pouches with proper tags for this service. Where the business does not justify this, envelopes should be used; two envelopes of light green color being provided, one 3½ in. by 6½ in. and the other 4¼ in. by 9½ in., with traingrams printed blank, 8½ in. by 5½ in., of light green color to correspond with the envelopes.

A member of the telegraph office staff, especially assigned, should make a record of traingrams, placing a copy of this record in the envelope with the traingrams and retaining one copy in the telegraph office file; address envelopes to the representative of the telegraph department at destination and see that traingrams are delivered to the station or train baggagement, who will give this class of mail special attention.

Train baggagemen will keep traingrams in packages separate from other mail and will stamp on the envelope the date and the train handled. The representative of the telegraph department at divisional and relay offices should have a clerk or messenger meet passenger trains, obtain traingrams and deliver them to the telegraph office, where they will be checked, their receipt acknowledged by wire by giving the sheet number accompanying the traingrams and delivery made in the same manner as telegrams. If any traingrams are missing from the package the originating office shall be advised.

The question was raised as to why green traingrams and envelopes were recommended in place of the pink, which on some roads has become common practice. E. L. King, superintendent telegraph, Southern Pacific, explained that green was recommended because it was desired to establish a standard to be used throughout the country. It was further explained that green was chosen because it was found to be less expensive than other colors.

G. A. Cellar, superintendent telegraph, Pennsylvania Lines West, inquired whether all traingram service was to be handled through the telegraph office, and if so if such service at way stations was to be handled by the operator. In such an event he concluded that traingram service might become very complicated. Mr. King explained that the committee did not advocate that, stating that the more elaborate system was to be used only for large offices.

A number of the members were in favor of the system which provided that the various departments traingram their own department. H. Hulatt, manager of telegraphs, Grand Trunk System, stated that many offices did not trust traingram service, so that it was the desire of the committee to establish a system which could be relied upon so that they would have confidence in the service.

E. C. Keenan said that traingram service had been in use on the New York Central for about 30 years to his knowledge and that various schemes had been tried out from time to time under the supervision of the telegraph office. He stated that the results proved that it was necessary to eliminate the red tape and that he believed the originator of the message should handle and send it out. It is now the practice to send traingrams direct from the originating office to the baggage department. He said it resolved itself into a question of supervision and that he believed that traingrams should not be used promiscuously.

After considerable discussion the committee moved that that portion of the report be accepted by the division. Mr. Keenan offered a substitute motion to the effect that the recommended practice relative to handling of traingrams be further considered by the committee; that it should obtain the views of the members of the division in writing as to their methods of handling traingrams, especially as to whether this service should be handled by the originator of the message or sent to the telegraph office for handling, and after receiving such information the committee draft its recommendations for submission to the division. After a ballot vote the substituted motion carried.

Inductive Interference

Committee No. 7—Inductive Interference, which is a new committee, submitted preliminary information on inductive interference to telegraph and telephone lines due to various causes. High tension lines throughout the country are rapidly increasing, so that it is important that the telegraph department should have the benefit of such studies as have been made. This committee presented exhibits made up in part from papers by H. S. Waren, presented before the American Institute of Electrical Engineers in April, 1918; by P. J. Howe at the St. Louis meeting of the Railroad Telegraph Superintendents in May, 1913; on "Toll Telephone Practice" by Thiess and Joy, edited by F. F. Fowle; also General Order No. 52 of the Railroad Commission of the State of California. After a brief discussion this report was accepted as information.

Increased Wages Consumed 97 Per Cent of Increased Rates

Increases in freight and passenger rates made during federal control amounted to $1,835,000,000 when applied to the traffic moved up to July 31, 1919, while the increases in wages applied to the number of employees and the hours or days worked in July, 1919, amounted to $1,774,800,000, or 97 per cent of the revenue from the increased rates, according to a statement compiled by the Interstate Commerce Commission at the request of Senator E. D. Smith of South Carolina and presented by him in the Senate on December 20. Senator Smith also asked to have a large amount of more detailed statistics on the subject printed as a Senate document. A part of the commission's statement as presented to the Senate is as follows:

While the statistics of revenues and expenses are available for October, 1919, the wage data are available only as late as July, and it is necessary to put all steps in the following series of computations on the same basis.

I. The volume of traffic under federal control up to and including the month of July, 1919, was as follows:

CLASS I ROADS ONLY

	Ton-miles of revenue freight	Passengers carried 1 mile
Year ending December 31, 1918	398,442,020,000	42,566,343,000
Seven months ending July 31, 1919	196,289,549,000	25,856,377,000
Total	594,731,569,000	68,422,720,000

II. The average revenue per ton-mile and per passenger-mile at the rates prevailing in 1917, before federal control, and in 1919, after the rate increases coming into effect subsequently, were as follows:

	Calendar year 1917	First seven months of 1919	Increase
Revenue per ton-mile, mills	7.15	9.73	2.58
Revenue per passenger per mile, cents	2.09	2.53	.44

III. Applying the increases shown under paragraph II, we get the following approximation of the increase in money which would have been paid by the public on the traffic of 19 months if the higher rates now enjoyed by the Railroad Administration, as compared with those prevailing in the calendar year 1917, the last year of private control, had been in effect from January 1, 1918:

Increased freight revenue	$1,534,000,000
Increased passenger revenue	301,000,000
Total	$1,835,000,000

IV. The aggregate time worked by employees of Class I railroads during federal control, from January 1, 1918, to July 31, 1919, was as follows:

	Calendar year 1918	First seven months of 1919
Reported on hourly basis, hours	4,950,985,160	2,499,458,577
Total	7,450,443,737	
Reported on daily basis, days	71,534,214	41,494,450
Total	113,028,664	

V. The average rates of pay per hour and per day for the year 1917 and in July, 1919, the latest month available, were as follows:

	Year ended December 31, 1917	Month of July, 1919	Increase
Reported on hourly basis, per hour	$0.318	$0.532	$0.214
Reported on daily basis, per day	3.334	4.989	1.596

VI. Applying these increases, we get an increased compensation on the aggregate time above shown as follows:

Reported on an hourly basis	$1,594,400,000
Reported on a daily basis	180,400,000
Total	$1,774,800,000

This takes account not only of the increased rate per hour, but also of the additional men required because of the shorter working day.

VII. Comparing the increase represented by the freight rates and passenger fares, under paragraph III above, with the increase due to increased basis of compensation and reduction in hours per day, we have the following:

Payable by public	$1,835,000,000
Received by labor, or 97 per cent	1,775,000,000

The balance would be absorbed by increased prices of materials.

It should be noted that the higher basis of freight rates and passenger fares shown above was not actually operative during the whole period of federal control nor was the wage basis of 1919 actually used during the whole period of federal control.

VIII. The number of freight cars and their average capacity is shown by the following table:

Date	Number of freight cars	Average capacity (tons)
June 30, 1915	2,341,567	39.7
June 30, 1916	2,313,378	40.5
December 31, 1916	2,359,475	40.9
December 31, 1917	2,379,472	41.5
December 31, 1918	2,380,879	41.5

IX. The ton-miles and passenger-miles in the last two years under private control compared with the two years of federal control are as follows, for a mileage corresponding to Class I roads under federal control:

Year ended —	Ton-miles	Passenger-miles
December 31, 1916	360,751,781,794	34,502,599,882
December 31, 1917	392,623,247,073	39,381,719,320
Total	753,375,028,867	73,884,319,202
December 31, 1918	398,442,019,620	42,566,342,892
December 31, 1919	366,303,547,875	44,788,784,401
Total	764,750,567,495	87,355,127,293
Per cent of increase, 1918 and 1919 over 1916 and 1917	1.5	18.2

The ton-miles are based on the revenue and nonrevenue ton-miles shown in the operating reports issued by the Railroad Administration. The nonrevenue ton-miles have been excluded on a percentage basis. In completing the year 1919 and 1918 figures have been used for the months for which 1919 data are lacking, namely, November and December as to ton-miles, and October, November and December as to passenger-miles. The 1916 and 1917 figures published by the Interstate Commerce Commission have been slightly reduced to bring them to a basis comparable with the mileage of Class I roads under federal control.

X. The railway operating revenues, expenses, and railway operating income during and since the test period may be summarized as follows:

Year	Railway operating revenues	Railway operating expenses	Operating income as defined under the Federal control act
Three years ending June 30, 1917	$3,374,030,692	$2,280,653,433	$996,524,492
Year ended December 31, 1917	4,010,463,579	2,858,212,210	974,778,937
Year ended December 31, 1918	4,913,319,604	4,006,894,762	690,418,778
Ten months of 1919	4,292,802,493	3,615,440,558	481,082,531

XI. Statement as to various wage increases. This information is given in a separate statement which is being prepared by the Railroad Administration.

XII. Prices of railway materials. The following data from the Federal Reserve Bulletin for October, 1919, are illustrative:

Year and month	Coal, bituminous, run of mine: Average price per short ton	Coal, bituminous, run of mine: Relative price	Steel rails, open hearth, Pittsburgh: Average price per short ton	Steel rails, open hearth, Pittsburgh: Relative price
July, 1914	$2.20	100	$30	100
August, 1914	2.20	100	30	100
1915	2.20	100	30	100
1916	2.20	100	35	117
1917	4.40	200	40	133
1918	4.10	186	57	190
1919	4.00	182	47	157

AN AERODROME is to be constructed at Goregaon, Bombay, by the Government of India. The area of land purchased for this purpose is 300,000 square yards.

Laboratory Tests on Holding Power of Track Spikes

Some Screw and Cut Spikes Are Subjected to Comparison with an Entirely New Type of Fastening

A SERIES OF TESTS was recently conducted in the Civil Engineering Testing Laboratories of Columbia University for the purpose of comparing the holding power of a new form of track spike with that developed by the ordinary cut spike and the screw spike. These tests were reported by Albin H. Beyer and William J. Krefeld in Bulletin No. 1 of these laboratories, which presents some interesting facts for the consideration of engineers of track and other railway officers concerned with track maintenance.

The new spike is known as the Sessler Grip spike, manufactured by the American Spike Company of New York.

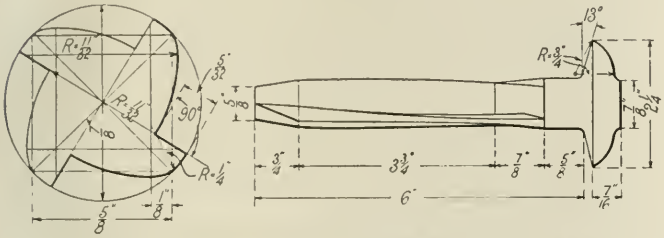

Fig. 1. Details of the Sessler Grip Spike

As shown in Fig. 1, this spike has a round shank with grooves in it and a round head not unlike that of a screw spike with the nut portion removed. The grooves in the shank, which are of a peculiar shape, as shown in the cross section on the illustration, have a slight twist, so that the spike revolves slightly in driving and drawing. The spike is driven in a manner similar to the ordinary cut spike.

The following is an abstract from the laboratories' bulletin:

The spikes were investigated for resistance to direct pull and resistance to direct pull as affected by redriving. The spikes tested were: (a) A chisel-pointed cut spike furnished by the Pennsylvania Lines with a shank 6 in. long and 21/32 in. square in section, the average weight being 0.81 lb. per spike; (b) a standard screw spike submitted by the Delaware, Lackawanna & Western with an average weight of 1.31 lb.; (c) the Sessler spike, which had an average weight of 1.1 lb. per spike.

The ties used in these tests were furnished by the various railroads and represent average quality. They included untreated chestnut, and white oak ties sawed on two sides, an untreated white oak hewn tie, untreated Douglas fir ties sawed on four sides and creosoted yellow pine ties sawed on two sides.

The pulling tests made to determine the holding power of the three kinds of spikes were conducted under the following conditions:

(*a*) 4 Pennsylvania cut spikes driven 5½ in. without bored hole;

(*b*) 4 Pennsylvania cut spikes driven 5½ in. into ½ in. bored hole;

(*c*) 4 D. L. & W. screw spikes screwed 6 in. into ⅝-in. hole;

(d) 4 D. L. & W. screw spikes driven 6 in. into ⅝-in. hole;

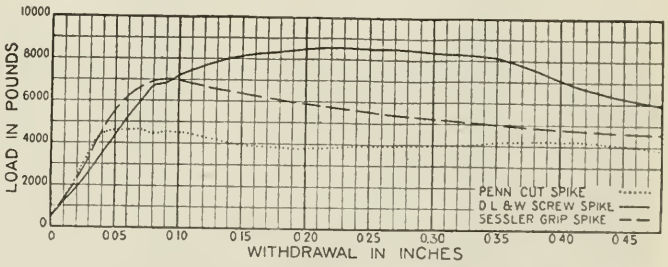
(*e*) 4 Sessler Grip spikes driven 5½ in. without bored hole;

(*f*) 4 Sessler Grip spikes driven 5½ in. into 7/16-in. bored hole.

All cut and Sessler Grip spikes were driven by a man inexperienced in track work. The screw spikes were inserted in accordance with the personal instructions of W. L. Madill, roadmaster on the Lackawanna at Hoboken, N. J. One set of screw spikes in each kind of tie was driven for the full 6-in. depth to determine also the effect upon the holding power of driving as compared with the standard method of screwing the spike in.

All tests were made in the civil engineering testing laboratory at Columbia University. The tie, with the spikes to be tested facing downward, rested upon two steel blocks upon the upper head of a 100,000-lb. Riehle testing machine. The spike was gripped by means of a special holder forged in the form of a closed yoke and provided with a slot of width sufficient to engage the shank of the spike below the head. The same holder was used for the screw and Sessler Grip spikes as they had the same sized shank under the head. The holder used for the cut spike was similar except for the slot, which was slightly narrower. The load, therefore, was applied to the spike head at two points directly opposite each other, thus tending to insure an axial pull. The lower ends, or shanks, of these holders were held by the pin of a shackle, which was in turn held by a yoke gripped by the wedges in the lower head of the testing machine. Deformation measurements were made in a number of ways to insure a degree of accuracy commensurate with the purpose for which the measurements were to be used.

For purposes of comparison the resistance of the spikes as they were pulled were tabulated for definite amounts of withdrawals, and these were used for the plotting of curves, of which the one in Fig. 2 is typical, except that in cases where the screw spikes were driven all or part way, instead of being screwed into place, the holding power was not nearly



Cut Spike and Sessler Spike Were Driven into Holes 5½ in., Screw Spike Was Screwed into Hole 6 in.

Fig. 2. Direct Pull Test in a Treated Yellow Pine Tie

so large. In the case of white oak ties the resistance obtained for all of the spikes was much greater than in yellow pine, reaching about 12,000 lb. for the Sessler spikes and 16,000 lb. for the screw spikes. One phenomenon of these tests, as illustrated in Fig. 1, is that, within the limits within which the withdrawal is approximately proportional to the load, the withdrawal for both the cut spike and the Sessler spike is proportionately less for a given load than it is for the screw spike.

Redrive and Pulling Tests

In accordance with the suggestion made by the engineers of several Eastern railroads, redrive and pulling tests were made to determine the effect of the successive redriving of a

spike after having been withdrawn 0.25 in. It is believed that such tests will give some information as to the influence upon the holding power of the spike when redriven after having been lifted in service. Six such tests were made for each type of spike in each of the four kinds of ties.

The method of testing was similar to that in the direct pulling tests, except that the spikes were withdrawn only ¼ in. The cut spike and the Sessler Grip spike were then redriven, and the screw spike reserved the full amount of the withdrawal in all cases. The spikes were then repulled ¼ in., redriven or rescrewed, respectively, and again repulled ¼ in.

The results obtained from these redriving and repulling tests were computed and plotted in the same way as those for the straight pulling tests and in the same manner. Fig. 3 shows an example of the curves obtained in these repulling tests for the spikes in an untreated white oak tie. These curves show higher values by over 100 per cent than those obtained in the treated yellow pine ties and also evidence a considerably greater difference between the screw spike and the Sessler spike than was obtained in the case of the pine ties.

Relative Ultimate Holding Power

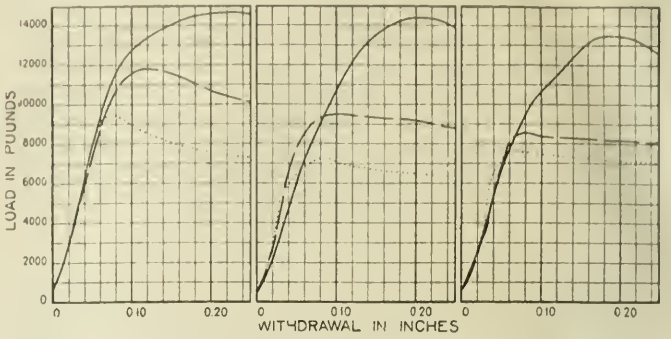
The relative ultimate holding powers of the three types of spikes tested expressed in terms of the cut spike driven without a hole for the various ties is as follows:

Tie	Method of driving	Cut	Screw*	Sessler grip
Chestnut	Without hole	100 %		139.5%
	With hole	95.2%	176.6%	118.5%
Creosoted yellow pine	Without hole	100 %		142.1%
	With hole	96.9%	175.2%	134.1%
White oak	Without hole	100 %		114.3%
	With hole	97.6%	172.7%	130.8%
Douglas fir	Without hole	100 %		121.4%
	With hole	82.7%	167.4%	107.5%
Average, all woods	Without hole	100 %		129.3%
	With hole	93.1%	172.9%	122.7%

*Screw spike screwed full depth.

These results appear to indicate that both the cut and the Sessler Grip spike develop a slightly higher initial resistance to withdrawal when driven without a pre-bored hole than when driven into ½-in. and 7/16-in. holes, respectively. This increase in initial holding power secured when a spike of this type is driven without pre-forming the hole is of doubtful value; for the efficiency and ultimate life of a spike in a tie depends not so much upon the ultimate initial resistance to withdrawal as it does upon the range of elastic behavior of the wood fibers, provided the friction between the wood fibers and the surface of the spike is sufficient.

A cut spike driven into a tie without first pre-forming the hole crushes and bunches the fibers over a wide area, due largely to the splitting and wedging action being confined to one plane. With the Sessler grip spike, this splitting action appears to be less, due party to the shape of the point tending to produce a combined cutting and splitting action, but much more to the rotation of the spike on driving, averaging 63 deg. when driven without a hole and 68 deg. when driven into a hole. The crushing and bunching of the wood fibers can be materially reduced both with the cut spike and the Sessler grip spike by pre-forming the hole, as shown in Fig. 4.

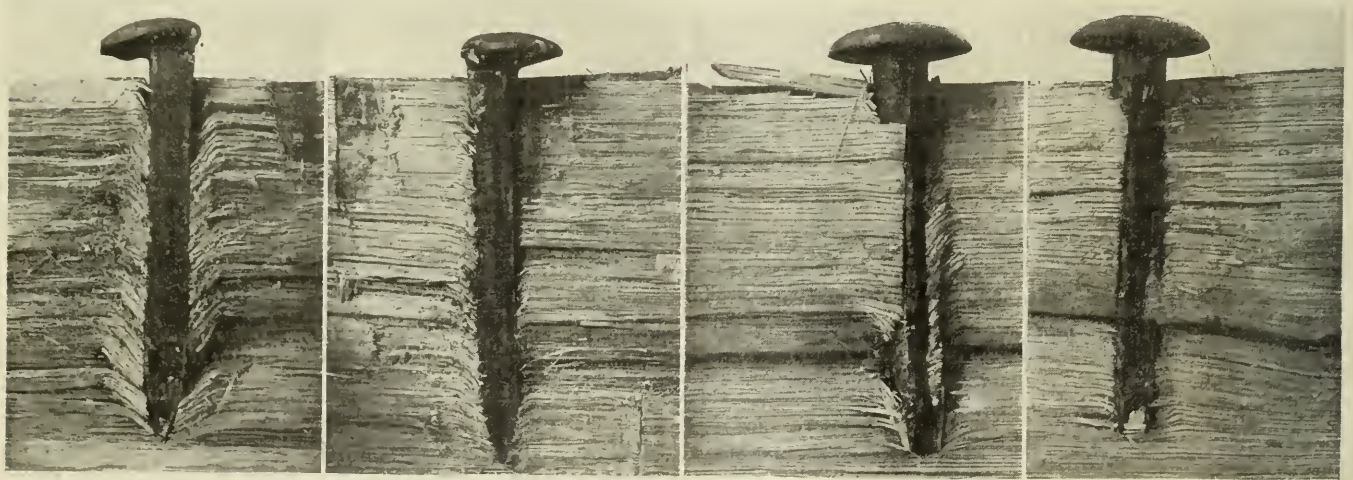


Cut pike and Sessler Spike Were Driven into Holes 5½ in., Screw Spike Was Screwed into Hole 6 in.

Fig. 3. Re-pulling Test in an Untreated White Oak Tie

Elasticity of a Spike Fastening

When a spike is driven into a tie the fibers of the wood are forced downward and pressed simultaneously outward. When such a spike fastening is subjected to a direct pull, within its elastic range, the friction between the wood fibers and the surface of the spike tends to hold it in place, and whatever yielding does take place is due solely to the elastic distortion of the wood fibers. The elastic withdrawal limit of a spike fastening is reached either when the wood fibers in contact with the surface of the spike are strained beyond their elastic limit, or the bond or adhesion between the fibers of wood and the surface of the spike is insufficient to prevent relative motion between the two. Both in the cut and Sessler Grip spike failures appear to take place simul-



Cut Spike without Hole. *Cut Spike in Pre-Bored Hole,* *Sessler Spike without Hole.* *Sessler Spike with Pre-Bored Hole..*

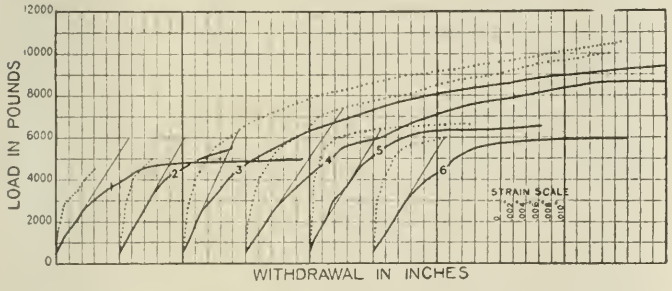
Fig. 4. How Pre-Bored Holes Reduce the Injury Caused by Spike Driving

taneously in the two ways just described. In the screw spike, on the other hand, failure is more gradual, but incipient failure takes place at very low loads, probably due to the crushing of the fibers against the thread of the screw.

Within the elastic withdrawal limit the resistance to direct pull developed by a spike is directly proportional to the displacement of the spike in the wood. Also within the elastic withdrawal range the permanent set is practically negligible.

When the load upon a spike exceeds its elastic withdrawal limit, sliding friction comes more and more into play and the permanent sets become appreciable. The ultimate resistance to withdrawal that is actually developed by a spike depends somewhat upon the elastic strength of the wood fibers, but much more upon the friction of the bunched and distorted fibers upon each other and the surface of the spike; the amount of friction varies in very wide limits even in the same tie, especially in the cut spike, this friction varies suddenly and irregularly with the amount of withdrawal, giving the load strain curve a saw-tooth appearance.

To be a permanent rail fastening, a spike must not be loaded in excess of its elastic withdrawal resistance, irrespective of its ultimate resistance. A rail fastening should, therefore, be designed with a sufficient number of spikes, so that the load per spike does not exceed the elastic withdrawal



1 and 2—Cut Spike, 3 and 4—Screw Spike, 5 and 6—Sessler Spike. Full Line Is Strain Curve, Dotted Line Is Set Curve.

Fig. 5. Relation Between Applied Load and Corresponding Withdrawal and Set

resistance of any spike. It is obvious that the least number of spikes and greatest efficiency per rail fastening will be obtained with that type of spike having the highest elastic withdrawal resistance. A proper safety factor should also be introduced in the design to allow for any possible lowering of the elastic withdrawal resistance resulting from the fatigue and physical deterioration of the wood fibres with time.

The true elastic withdrawal limits can be only approximately determined from the load stress curves, as the inaccuracies of measurements introduced by the compression of the tie on the bearing blocks and the twisting, especially of a more or less warped tie, have in some cases modified the curves. This is especially true in the case of the screw spike, which requires the most sensitive instruments to locate the point of incipient failure. For these reasons only general conclusions can be drawn from these tests as to the actual and relative elastic withdrawal resistances of the three types of spikes under the various conditions tested.

To determine the true elastic behavior of the three types of spikes a limited number of tests were made, in which the withdrawal of the spike was measured directly to the nearest 1-10,000 part of an inch. In this investigation a creosoted yellow pine tie was used and two spikes of each type were tested, using prebored holes.

Based upon the results of these tests, the relative average elastic limits, taking the cut spike at 100 per cent, is:

Cut spike	100 per cent	
Screw spike	90 per cent	elastic limit in bearing
	178 per cent	final yield point
Sessler Grip spike	129 per cent	

To determine the true elastic behavior of three kinds of spikes, a limited number of tests were made, in which the withdrawal of spikes was measured directly to the nearest one ten-thousandth part of an inch. In this investigation a creosoted yellow pine tie was used and two spikes of each type were tested, using pre-boring the holes. The results of these tests are given in Fig. 5. Based on these results, the relative average elastic limit, taking the cut spike as 100 per cent, is 90 per cent for the elastic limit in bearing of the screw spike, 178 for the final yield point of the screw spike, and 129 per cent for the Sessler spike.

The behavior of the screw spike, as already mentioned, is somewhat peculiar; at about 2,700 lb. the true elastic limit is reached, evidently due to a bearing failure of the thread upon the wood, represented by the lower percentage in the above table. From this point up to about 5,000 lb. the load strain curve is still substantially straight, but slightly more inclined. At this upper limit, represented by the higher value in the above statement, there is a decided change in direction, increasing rapidly with the load, practically a yield point. Because of the limited extent of this investigation, covering two spikes of each kind in one tie only, the results cannot be considered conclusive and require further verification.

General Conclusions

1. The tests outlined herein, although of limited extent, show conclusively that the rail fastenings tested act as elastic structures within certain limits, depending upon the character of the wood and type of spike.

2. In the softer woods the elastic limit of the fastening is reached at very small withdrawals, ranging from 0.004 to 0.006 in. In an oak tie these limits appear to be somewhat higher.

3. Within the elastic range of the fastening the resistance developed by the fastening is directly proportional to the amount of withdrawal.

4. Small permanent withdrawals or sets have been recorded within the elastic range of the rail fastening, but these are no greater than would be reasonably expected in a material such as wood.

5. A rail fastening to approach permanency must at no time be stressed beyond its elastic holding power, making due allowances for the fatigue and physical deterioration of the wood fibers during the life of the fastening.

6. In view of the importance of these facts to the railway profession, a more complete investigation should be made to definitely establish the elastic behavior of various types of spikes, both without and with preformed holes of various sizes driven into ties of various stages of deterioration.

The Bagdad Railway Under British Control. Turkish Prisoners on Their Way to Prison Camp

Say Farmers Oppose Government Ownership of Railroads

Assertions that the farmers of the United States favor government ownership or operation of the railroads, which are frequently circulated by the labor organizations and by Benjamin C. Marsh, secretary of one of the farmers' organizations, are denied in a letter addressed to President Wilson by Thomas C. Atkeson, Washington representative of the National Grange, which claims a membership of more than 1,000,000 farmers, and also by representatives of other farm organizations, quoted in an article in the Washington Star of December 21 by William Harrison Moore.

In a letter to President Wilson, Professor Atkeson sets forth the resolution adopted by the National Grange urging the return of railroads to private ownership. Professor Atkeson states that it is his belief that "a large majority of the farmers of the nation believe that government operation of all railroads should cease at the earlist possible moment.

"It is also my belief," he says, "that persons who have sought recently to give currency to statements that organized farmers favored government ownership are not farmers themselves and do not represent any considerable proportion of the men or women actually engaged in farming. In this belief I am strengthened by the fact that the agricultural press, with few and inconspicuous exceptions, oppose government ownership, and continuation of government operation, and the leaders of the great agricultural organizations other than the National Grange are unanimous in opposition to government ownership."

Professor Atkeson, in discussing the question of how many farmers are actually in favor of government control of railroads or the Plumb plan, said that less than 5 per cent of the agriculturists in America believe in government ownership.

"Articles appearing in the press of the country last week gave prominence to the visit of a delegation of 27 men to the White House to protest against the return of railroads to the owners for a period of at least two years," said Professor Atkeson. "This delegation, the newspapers stated, was 'composed of representatives of union labor and farmers' organizations.' Now, this is a fallacy. There was a large number of union labor men present, all right, but only two men claimed to represent the 'farmers of the country.' These men are George P. Hampton and Benjamin C. Marsh. They claim to represent the Farmers' National Headquarters. Hampton is in charge, and Marsh is his assistant.

"The delegation which waited upon the President—they were greeted by Mr. Tumulty, by the way—sang loud the praises of government ownership, according to the newspaper reports. A letter to Mr. Wilson, setting forth in one part how strong the farmers of the country were for government ownership, and how bitter was their opposition to the Cummins railroad bill, made interesting reading.

"But the letter had the facts wrong. The truth of the matter is, these so-called farmers' delegates did not represent the great mass of American farmers. I doubt if they represent 150,000 farmers in the entire country. The great farmers' organizations are for the most part heartily in favor of the Cummins railroad bill and bitterly opposed to the government retention of railroads."

That Hampton and Marsh of the farmers' national headquarters "faithfully represent some farmers with radical tendencies in the western states" is the opinion expressed by Charles A. Lyman, secretary of the National Board of Farm Organizations."

Mr. Lyman said that while Hampton and Marsh have lined up the American Society of Equity, containing perhaps 40,000 farmers of Wisconsin, Minnesota, Iowa and North Dakota, and a couple of other farmers' protective societies, the total number of farmers represented by these men will not exceed 200,000.

The majority of members of the National Board of Farm Organizations, Mr. Lyman said, are heartily opposed to government ownership and favor the return of the railroads to their owners.

A. M. Loomis, assistant to Professor Atkeson, pointed out that at the fifty-third annual session of the National Grange, held November 12 at Grand Rapids, Mich., the organization without a dissenting voice, went on record as being unalterably opposed to government control. The resolution on nationalization, adopted at the meeting, reads in part as follows:

"We declare our opposition to government ownership and to nationalization of business and industry unless clearly required in the public interest. We favor the safeguarding and protection of every right of private property on the broad ground that only by the full development of the right of private property can there be perpetuated the full measure of individual initiative and emulation upon which a democracy is based and by which its future is assured."

On the same day this resolution was adopted, Mr. Loomis said, the American Farm Bureau in Chicago also voiced its opposition to federal ownership. The same week the state committees of agriculture met in Chicago and adopted a similar resolution.

Early in November the National Farmers' Congress, composed of "steady, clear-thinking delegates," named by the governors of the various states, met at Hagerstown, Md., and went on record as being opposed to government ownership.

In the face of this opposition to government ownership, according to Mr. Loomis, the letter to President Wilson made it appear that the farmers were "all keen for this business of government control, and the newspapers naturally played up the fact."

In the address of Oliver Wilson, master of the National Grange, delivered at the annual meeting, the following was stated:

"One of the imperative necessities of today is the putting of emphasis upon the sacred rights of property, as opposed to the wild orgies of radicalism, nationalization and anarchy, which are sweeping the land and threatening to destroy every industry, every farm and every home."

On December 16 Professor Atkeson dispatched a letter to Senator Cummins urging prompt action by the Senate in turning back to the owners the railroads of the country and enacting proper legislation for this purpose.

Orders of Regional Directors

Inspection and marking of cotton.—Supplement 1 to Circular 235 of the Southwestern regional director amends Section 3 of the original order so that compressed cotton properly covered with bagging and which is to be further compressed for high density within the territory governed by these rules, may be accepted without patches, provided that in addition to the shipping marks, there is attached to each bale a waterproof shipping tag showing the name of shipper, point of origin, consignee and destination, and provided further that the shipper shows on his bill of lading "Cotton to be compressed to high density at . . . ." Section 7 is also amended so that cotton linters, which have been compressed before delivery to the carriers, in carload lots of not less than 75 bales consigned from one consignor to one consignee, upon which a carload rate is applicable, may be received without being tagged.

Wage Agreement for the Shop Employees

For First Time Railroads of This Country Have Entered Into National Agreement With Shopmen

DIRECTOR GENERAL HINES entered into the following agreement, effective October 20, with the shop employees on roads under federal operation, represented by the Railway Employees' Department of the American Federation of Labor and it affiliated organizations of the Mechanical Section and Divisions Nos. 1, 2 and 3, thereof, including the International Association of Machinists, International Brotherhood of Boilermakers, Iron Ship Builders and Helpers of America, International Brotherhood of Blacksmiths and Helpers, Amalgamated Sheet Metal Workers' International Alliance, International Brotherhood of Electrical Workers, and the Brotherhood Railway Carmen of America.

It is understood that this agreement shall apply to those who perform the work specified in this agreement in the maintenance of equipment, maintenance of way, signal maintenance (except electricians engaged in signal maintenance, telegraph maintenance and all other departments of all railroads in federal operation, shop employees of American Railway Express, and Pullman Car Line employees having the same working conditions as specified in Supplement No. 4 to General Order No. 27. It is understood that this agreement does not annul agreements already in effect with other organizations unless and until a majority of the employees concerned express a desire for a change.

GENERAL RULES

Hours of Service.—Rule 1. Eight hours shall constitute a day's work. All employees coming under the provisions of this schedule, except as provided for in Rule 15, shall be paid on the hourly basis.

Rule 2. When one shift is employed, the starting time shall be not earlier than 7 o'clock, and not later than 8 o'clock. The time and length of the lunch period shall be subject to mutual agreement.

Rule 3. Where two shifts are employed, the starting time of the first shift shall be governed by Rule 2, and the second shift shall start immediately following the first shift, or at 8 p. m. The spread of the second shift shall consist of eight consecutive hours, including an allowance of 20 minutes for lunch within the limits of the fifth hour.

Rule 4. Where three shifts are employed, the starting time of the first shift shall be governed by Rule 2, and the starting time for each following shift shall be regulated accordingly. The spread of each shift shall consist of eight consecutive hours, including an allowance of 20 minutes for lunch within the limits of the fifth hour.

Rule 5. The time established for commencing and quitting work for all men on each shift shall be the same at the respective points, but where three shifts are worked by running repair forces, and two shifts by back shop forces, the quitting time of the first shift and the commencing and quitting time of the second shift of the back shop forces will be governed by the provisions of Rule 3.

Exception.—It is agreed that three eight hour shifts may be established under the provisions of Rule 4, for the employees necessary to the continuous operation of power houses, millwright gangs, heat treating plants, train yard running repair and inspection forces (not repair tracks) without extending the provisions of Rule 4 to the balance of the shop forces.

Rule 6. All overtime, except as the provisions of Rules 7, 9, 10 and 15 apply, outside of bulletin hours, up to and including the sixteenth hour of service in any one 24-hour period, computed from the starting time of the employee's regular shift, shall be paid for at the rate of time and one-half and thereafter at the rate of double time, up to the starting time of the employee's regular shift. This to include work performed on Sundays, New Year's Day, Washington's Birthday, Decoration Day, Fourth of July, Labor Day, Thanksgiving Day, Christmas and such state holidays as are now recognized as punitive overtime days at the various points on the respective railroads within the different states.

Rule 7. For continuous service after regular working hours, employees will be paid one hour for forty minutes' service or less, and shall not be required to work more than one hour without being permitted to go to meals. Employees called or required to return to work will be allowed five hours for three hours and twenty minutes' service or less. They shall be required to do only such work as held or called for.

Rule 8. Employees regularly assigned to work on Sundays or holidays, or those called to take the place of such employees, will he allowed to complete the balance of the day unless released at their own request. Those who are called will be advised as soon as possible after vacancies become known.

Rule 9. Employees required to work during lunch period shall receive pay for one hour straight time and be allowed necessary time to procure lunch without loss of time. This does not apply where employees are allowed the twenty minutes for lunch without deduction therefor.

Rule 10. Employees, except as the provisions of Rules 12 and 15 apply, sent out on the road for emergency service, shall receive continuous time from the time called until their return as follows:

Overtime Emergency Service Road Work.—Overtime rates for all overtime hours and straight time for the recognized straight time hours at home station, whether working, waiting or traveling, except that after the first 24 hours, if relieved from duty and permitted to go to bed for five or more hours, they will not be allowed time for such hours, provided that in no case shall an employee be paid for less than eight hours on week days, and eight hours at one and one-half time for Sundays and recognized holidays, for each calendar day. Where meals and lodging are not provided by the railroad, actual expenses will be allowed. Employees will receive all allowances for expenses not later than the time when they are paid for the service rendered. Employees will be called as nearly as possible, one hour before leaving time, and on their return will deliver tools at point designated.

Rule 11. When it becomes necessary for employees to work overtime, they shall not be laid off during regular working hours to equalize the time. At points where sufficient number of employees are employed, employees shall not work two consecutive Sundays (holidays to be considered as Sundays). Record will be kept of overtime worked and men called with the purpose in view of distributing the overtime equally.

Rule 12. When necessary to fill temporary vacancies at outlying points, employees, excluding those specified in Rules 14 and 15, will be sent out and will be paid for this service as follows: Continuous time for time called up to time of reporting at point to which sent, overtime rates for all overtime hours, and straight time for the recognized straight time hours at home station, whether waiting or traveling (the same provisions to apply for return trip). While at such point they will be paid straight time and overtime in accordance with practice at home point with a guarantee of not less than eight hours' pay, at the established rate, for each calendar day, including Sundays and holidays at overtime rates. Where meals and lodging are not provided by the railroad, actual expenses will be allowed. Rules in existing agreements or shop rules covering the road service described in Rules 10 and 12, which are more favorable to the employees, are to be preserved.

Rule 13. Employees changed from one shift to another will be paid overtime rates for the first shift of each change. Employees working two shifts or more on a new shift shall be considered transferred.

Rule 14. Employees regularly assigned to road work whose tour of duty is regular, and who leave and return to home station daily (a boarding car to be considered a home station) shall be paid continuous time from the time of leaving the home station to the time they return, whether working, waiting or traveling, exclusive of the meal period, at straight time for the regular hours, and overtime rates for all overtime hours, as per overtime rules. The starting time to be not earlier than 6 a. m., nor later than 8 a. m. Where two or more shifts are worked, the starting time of each following shift will be regulated accordingly.

Rule 15. Employees regularly assigned to perform road work and paid on a monthly basis, shall be paid not less than the minimum hourly rate established for the corresponding class of employees coming under the provisions of this schedule, on the basis of 365 eight-hour days per calendar year, with pay at the rate of time and one-half time for Sundays and holidays designated herein; otherwise, overtime will not be paid. Where meals and lodging are not furnished by the railroad, or when the service requirements make the purchase of meals and lodging necessary, while away from home point, employees will be paid actual expenses. This service is distinct and separate from that performed by any other class of employees coming under the provisions of this schedule and is not to be confused therewith; the employees assigned to it shall not be assigned to or used to perform the construction, repair and emergency work assigned to the other employees under the provisions of the general and special rules of this schedule.

NOTE

The following is an example to be followed in arriving at the monthly rate:

365 days multiplied by 8 equals	2,920 hours
59 Sundays and holidays at one-half time will be 59 x 4, equaling	236 hours
Total hours to be paid for	3,156 hours

The monthly salary is arrived at by dividing the total earnings of 3,156 hours by 12; no overtime is allowed for time worked in excess of eight hours per day; on the other hand, no time is to be deducted unless the employee lays off of his own accord.

Filling Vacancies.—Rule 16. When an employee is required to fill the place of another employee receiving a higher rate of pay, he shall receive the higher rate, but if required to fill, temporarily the place of another employee receiving a lower rate, his rate will not be changed.

Rule 17. Employees serving on night shifts, desiring day work, shall have preference when vacancies occur, according to their seniority.

Rule 18. When new jobs are created or vacancies occur in the respective crafts, the oldest employees in point of service shall, if sufficient ability is shown by trial, be given preference in filling such new jobs or any vacancies that may be desirable to them. All vacancies or new jobs created will be bulletined. Bulletins must be posted five days before vacancies are filled permanently. Employees desiring to avail themselves of this rule will make application to the official in charge and a copy of the application will be given to the local chairman.

Rule 19. Mechanics in service will be considered for promotion to posi-

tions as foremen. When vacancies occur in positions of gang foremen men from the respective crafts will have preference in promotion.

Rule 20. Employees transferred from one point to another, with a view of accepting a permanent transfer, will, after 30 days, lose their seniority at the point they left and their seniority at the point to which transferred will begin on date of transfer, seniority to govern. Employees will not be compelled to accept a permanent transfer to another point.

Rule 21. When the requirements of the service will permit, employees, on request, will be granted leave of absence for a limited time, with privilege of renewal. An employee absent on leave who engages in other employment, will lose his seniority unless special provisions shall have been made therefor by the proper official and committee representing his craft. The arbitrary refusal of a reasonable amount of leave of employees when they can be spared, or failure to handle promptly cases involving sickness or business matters of serious importance to the employee, is an improper practice and may be handled as unjust treatment under this agreement.

Absence from Work.—Rule 22. In case an employee is unavoidably kept from work he will not be discriminated against. An employee detained from work on account of sickness or for any other good cause shall notify his foreman as early as possible.

Faithful Service.—Rule 23. Employees who have given long and faithful service in the employ of the company and who have become unable to handle heavy work to advantage, will be given preference of such light work in their line as they are able to handle.

Attending Court.—Rule 24. When attending court as witnesses for the railroad, employees will receive pay for all time lost at home station, with a minimum of eight hours' time each week day and eight hours at rate and one-half for Sundays and holidays, either at home station, away from home, or traveling. Time and one-half will be paid for traveling during overtime hours where employees are unable to secure sleeping car accommodation. Actual expenses will be allowed when away from home station, and necessary expenses will be allowed when at home. When necessary, the company will furnish transportation and will be entitled to certificate for witness fees in all cases.

Paying Off.—Rule 25. Employees will be paid off during their regular working hours, semi-monthly, except where existing state laws provide a more desirable paying off condition. Should the regular pay day fall on a holiday or days when the shops are closed down, men will be paid on the preceding day. Where there is a shortage equal to one day's pay or more in the pay of an employee, a voucher will be issued to cover the shortage. Employees leaving the service of the company will be furnished with a time voucher covering all time due within 24 hours where D. C. checks are issued and within 48 hours at other points, or earlier when possible.

Rule 26. During inclement weather provision will be made where buildings are available to pay employees under shelter.

Reduction of Forces.—Rule 27. When it becomes necessary to reduce expenses, the force at any point or in any department or sub-division thereof shall be reduced, seniority as per Rule 31 to govern; the men affected to take the rate of the job to which they are assigned. Five days' notice will be given men affected before reduction is made, and lists will be furnished local committee. In the restoration of forces, senior laid off men will be given preference of re-employment, if available, within a reasonable time, and shall be returned to their former position; local committee will be furnished list of men to be restored to service; in reducing force the ratio of apprentices will be maintained.

Rule 28. Employees laid off on account of reduction in force, who desire to seek employment elsewhere, will, upon application, be furnished with a pass to any point desired on the same railroad.

Rule 29. When reducing forces, if men are needed at any other point they will be given preference to transfer to nearest point, with privilege of returning to home station when force is increased, such transfer to be made without expense to the company. Seniority to govern all cases.

Rule 30. Employees required to work when shops are closed down, due to breakdown in machinery, floods, fires, and the like, will receive straight time for regular hours, and overtime for overtime hours.

Seniority.—Rule 31. Seniority of employees in each craft covered by this agreement shall be confined to the point employed in each of the following departments: Maintenance of Way (Bridge and Building where separate from Maintenance of Way Department); Maintenance of Equipment; Maintenance of Telegraph; Maintenance of Signals; four subdivisions of the Carmen as follows: Patternmakers, Upholsters, Painters, and other Carmen. The seniority lists will be open to inspection and copy furnished the committee.

Assignment of Work.—Rule 32. None but mechanics or apprentices regularly employed as such shall do mechanics' work as per special rules of each craft, except foreman at points where no mechanics are employed.

Rule 33. In compliance with the special rules included in this agreement, none but mechanics and their apprentices in their respective crafts shall operate oxy-acetylene, thermit, or electric welders; where oxy-acetylene or other welding processes are used, each craft shall perform the work which was generally recognized as work belonging to that craft prior to the introduction of such processes, except the use of the cutting torch when engaged in wrecking service.

Filling Foremanship Temporarily.—Rule 34. Should an employee be assigned temporarily to fill the place of a foreman, he will be paid his own rate, straight time for straight time hours and overtime for overtime hours, if greater than the foreman's rate. If it is not, he will get the foreman's rate. Such positions shall be filled only by mechanics of the respective craft in their departments.

Grievances.—Rule 35. Should any employee subject to this agreement believe he has been unjustly dealt with, or any of the provisions of this agreement have been violated, the case shall be taken to the foreman, general foreman, master mechanic, or shop superintendent, each in their respective order, by the duly authorized local committee or their representative. If stenographic report of investigation is taken, the committee shall be furnished a copy. If the result still be unsatisfactory, the duly authorized general committee, or their representatives, shall have the right of appeal, preferably in writing, to the higher officials designated to handle such matters in their respective order, and conference will be granted within ten days of application. All conferences between local officials and local committees to be held during regular working hours without loss of time to committeemen.

Rule 36. Should the highest designated railroad official or his duly authorized representative and the duly authorized representative of the employees fail to agree, the case shall then be jointly submitted in writing to the chief executive officer of the railroad and the chief executive officer of the Railway Employees' Department of the American Federation of Labor for adjudication or final disposition. The methods of procedure will be those prescribed by the Railroad Administration. To the extent that these rules may remain in force after the expiration of federal operation, the methods of procedure will thereafter be such as may be agreed to by the representatives of the railroads and the representatives of the organizations herein specified. Prior to the assertion of grievances as herein provided, and while questions of grievances are pending, there will neither be a shut down by the employer nor a suspension of work by the employees.

Rule 37. An employee who has been in the service of the railroad 30 days shall not be dismissed for incompetency, neither shall an employee be discharged for any cause without first being given an investigation.

Rule 38. If it is found that an employee has been unjustly discharged or dealt with, such employee shall be reinstated with full pay for all time lost.

Committees.—Rule 39. The company will not discriminate against any committeemen, who from time to time, represent other employees, and will grant them leave of absence and free transportation when delegated to represent other employees.

Apprentices.—Rule 40. All apprentices must be able to speak, read, and write the English language and understand at least the first four rules of arithmetic. Applicants for regular apprenticeship shall be between 16 and 21 years of age, and if accepted, shall serve four years of 290 days each calendar year. If retained in the service at the expiration of their apprenticeship they shall be paid not less than the minimum rate established for journeymen mechanics of their respective crafts. In selecting helper apprentices, seniority will govern and all selections will be made in conjunction with the respective craft shop committees. (NOTE: See special rules of each craft for additional apprentice rules.)

Rule 41. All apprentices must be indentured and shall be furnished with a duplicate of indenture by the company, who will also furnish every opportunity possible for the apprentice to secure a complete knowledge of the trade.

No apprentice will be started at points where there are not adequate facilities for learning the trade.

Rule 40 shall govern in the employment of apprentices.

FORM OF INDENTURE

This will certify that.....was employed as a .....apprentice by the.....Railroad, at.....on.....19..., to serve four years, a minimum of two hundred and ninety days each.

.....
(Title of officer in charge.)

SERVICE PERFORMED DURING APPRENTICESHIP

.....
.....
.....

This will certify that on..... ....., 19...., ... completed the course of apprenticeship specified above and is entitled, if employed by the.....Railroad to the rates of pay and conditions of service of.....

.....
(Title of officer in charge.)

NOTE: *The above form is to be used both for regular and helper apprentices. (Helper apprentices to serve 3 years.)*

Rule 42. The ratio of apprentices in their respective crafts, shall not be more than one to every five mechanics. Two apprentices will not be worked together as partners. The distribution of apprentices among shops where general repairs are made on the division shall be as nearly as possible in proportion to the mechanics in the respective trades employed therein. In computing the number of apprentices that may be employed in a trade on a division, the total number of mechanics of that trade employed on the division will be considered. If, within six months, an apprentice shows no aptitude to learn the trade, he will not be retained as an apprentice. An apprentice shall not be dismissed or leave the service of his own accord, except for just and sufficient cause, before completing his apprenticeship. Apprentices shall not be assigned to work on night shifts. An apprentice shall not be allowed to work overtime during the first three years of his apprenticeship. If an apprentice is retained in the service upon completing the apprenticeship, his seniority rights as a mechanic will date from the time of completion of apprenticeship. Preference will be given to sons of employees in the selection of apprentices to the extent of at least 80 per cent of the number employed.

Rates of Pay.—Rule 43. The rate for all mechanics who were receiving 68 cents per hour or more under Supplement 4 to General Order 27, except those provided for in Rule 45, will be increased 4 cents per hour, effective May 1, 1919. Steel car workers and other mechanics in the car department who were receiving the rate of 63 cents per hour, under Supplement 4 to General Order 27, will be increased 4 cents per hour, effective May 1, 1919. Other mechanics in the car department who were receiving 58 cents per hour, under Supplement 4 to General Order 27, will be increased 9 cents per hour, making a rate of 67 cents per hour, effective May 1, 1919.

Rule 44. Apprentices, helpers, and other classes of workmen covered by Supplement 4 to General Order 27, except those provided for in Rule 45, will be increased 4 cents per hour above the present rate, effective

May 1, 1919. This increase to apply also to men paid on the step-rates provided for in Section 2 and 2a of Article 2, Supplement 4 to General Order 27, except those provided for in Rule 45, effective May 1, 1919.

Rule 45. Linemen and others covered by Rule 141 shall receive 68 cents per hour, effective May 1, 1919. Groundmen covered by Rule 142 shall receive 62 cents per hour, effective May 1, 1919. Coal pier elevator operators and coal pier electric hoist operators as covered by Rule 143 shall receive 55 cents per hour, effective May 1, 1919.

Applicants for Employment.—Rule 46. Applicants for employment will be required to make statement only as to their ability, and address of relatives, except when their duties require them to distinguish signals or do flagging when they shall be required to pass the usual eyesight and hearing tests.

Conditions of Shops, Etc.—Rule 47. Good drinking water and ice will be furnished. Sanitary drinking fountains will be provided where necessary. Pits and floors, lockers, toilets and wash rooms will be kept in good repair and in a clean, dry and sanitary condition. Shops, locker rooms and wash rooms will be lighted and heated in the best manner possible consistent with the source of heat and light available at the point in question.

Personal Injuries.—Rule 48. Employees injured while at work will not be required to make accident reports before they are given medical attention, but will make them as soon as practicable thereafter. Proper medical attention will be given at the earliest possible moment, and employees shall be permitted to return to work without signing a release pending final settlement of the case. At the option of the employee, personal injury settlements may be handled under the provisions of Rules 35 and 36. Where death or permanent disability results from injury, the lawful heirs of the deceased may have the case handled as herein provided.

Rule 49. A place will be provided inside all shops and roundhouses where proper notices of interest to employees may be posted.

Shop Trains.—Rule 50. Existing conditions in regard to shop trains will be maintained unless changed by mutual agreement. The company will endeavor to keep shop trains on schedule time, properly heated and lighted, and in a safe, clean and sanitary condition. This not to apply to temporary service provided in case of emergency.

Free Transportation.—Rule 51. Employees covered by this agreement, and those dependent upon them for support, will be given the same consideration in granting free transportation as is granted other employees in service. General committees representing employees covered by this agreement to be granted same consideration as is granted general committees representing employees in other branches of the service.

Rule 52. Employees will not be required to work on engines or cars outside of shops during inclement weather, if shop room and pits are available. This does not apply to work in engine cabs or emergency work on engines or cars set out for or attached to trains. Should it become necessary to establish a regular night shift in shops, such men will not be used on running repair work unless work is brought to shop. When it is necessary to make repairs to engines, boilers, tanks and tank cars, such parts shall be cleaned before mechanics are required to work on same. This will also apply to cars undergoing general repairs. Employees will not be assigned to jobs where they will be exposed to sand blast and paint blowers while in operation. All acetylene or electric welding or cutting will be protected by a suitable screen when its use is required.

Rule 53. Emery wheels and grindstones will be installed at convenient places in the shop and will be kept true and in order.

Help to be Furnished.—Rule 54. Craftsmen and apprentices will be furnished sufficient competent help, when needed to handle the work, if available. When experienced helpers are available, they will be employed in preference to inexperienced men. Laborers when used as helpers will be paid the helpers' rate.

Rule 55. When dismantling or scrapping engines, boilers, tanks, cars (except wood cars) or other machinery, this work will be done by mechanics of their respective crafts. Sufficient help will be furnished. When wood cars are dismantled for scrapping, parts to be removed before car is burned or destroyed will be removed by carmen.

Rule 56. No employee will be required to work under a locomotive or car without being protected by proper signals. Where the nature of the work to be done requires it, locomotives or passenger cars will be placed over a pit, if available.

Rule 57. In shops and roundhouses not now equipped with connections for taking the steam from engines arrangements will be made to equip them so that steam from locomotives will not be blown off inside the house.

Rule 58. All engines will be placed under smoke jacks in roundhouses where practicable, when being fired up.

Rule 59. At shops and roundhouses equipped with electricity, electric light globes and extensions will be kept in tool rooms available for use.

Rule 60. When employees are required to check in and out on their own time, they will be paid one hour extra at the close of each week, regardless of the number of hours worked during the week.

MACHINISTS' SPECIAL RULES

Qualifications.—Rule 61. Any man who has served an apprenticeship or has had four years' experience at the machinists' trade and who, by his skill and experience, is qualified and capable of laying out and fitting together the metal parts of any machine or locomotive, with or without drawings, and competent to do either sizing, shaping, turning, boring, planing, grinding, finishing, or adjusting the metal parts of any machine or locomotive whatsoever shall constitute a machinist.

Classification of Work.—Rule 62. Machinists' work shall consist of laying out, fitting, adjusting, shaping, boring, slotting, milling, and grinding of materials used in building, assembling, maintaining, dismantling, and installing locomotives and engines (operated by steam or other power), pumps, cranes, hoists, elevators, pneumatic and hydraulic tools and machinery, scale building, shafting, and other shop machinery; ratchet and other skilled drilling and reaming; tool and die making, tool grinding and machine grinding, axle truing, axle, wheel and tire turning and boring; engine inspecting; air equipment, lubricator and injector work; removing, replacing, grinding, bolting, and breaking of all joints on superheaters; oxy-acetylene, thermit and electric welding on work generally recognized as machinists' work; the operation of all machines used in such work, including drill presses and bolt threaders using a facing, boring or turning head or milling apparatus, and all other work generally recognized as machinists' work.

Machinist Apprentices.—Rule 63. Include regular and helper apprentices in connection with the work defined by Rule 62.

Machinist Helpers.—Rule 64. Employees assigned to help machinists and apprentices, operators of drill presses and bolt threaders not equipped with a facing, boring or turning head or milling apparatus, bolt pointing and centering machines, wheel presses, bolt threaders, nut tappers and facers; crane men helpers, tool room attendants, machinery oilers, box packers, grease cup fillers and oilers, and applying all couplings between engine and tenders; locomotive tender and draft rigging work except when performed by carmen.

Assignment to Running Repairs.—Rule 65. Machinist assigned to running repairs, shall not be required to work on dead work, at points where dead work forces are maintained.

Dead Work.—Rule 66. Dead work means all work on an engine which can not be handled within 24 hours by the regularly assigned running repair forces maintained at point where the question arises.

Dead Work and Running Repair Forces.—Rule 67. Dead work forces will not be assigned to perform running repair work, except when the regularly assigned running repair forces are unable to get engines out in time to prevent delay to train movement.

Work at Wrecks.—Rule 68. In case of wrecks where engines are disabled, machinist and helper (more if necessary) shall accompany the wrecker. They will work under the direction of the wreck foreman.

Apprentices Classification of Work.—Rule 69. Apprentices shall be instructed in all branches of the machinists' trade. They will serve three years on machines and special jobs. Apprentices will not be required to work more than four months on any one machine or special job. During the last year of their apprenticeship they will work on the floor. Apprentices shall not work on oxy-acetylene, thermit, electric or other welding processes until they are in their last year.

Helper Apprentices.—Rule 70. Helpers who have had not less than two consecutive years' experience as machinist helper at the point where employed, at the time application for apprenticeship is made may become a helper apprentice. When assigned as a helper apprentice they must not be over 25 years of age.

Rule 71. Helper apprentices shall serve three years, a minimum of 2990 days each calendar year, and shall be governed by the same laws and rules as governed regular apprentices.

Rule 72. The number of helper apprentices must not at any time exceed 50 per cent of the combined number of regular and helper apprentices assigned.

Rule 73. Helper apprentices shall receive the minimum helper rate for the first six months, with an increase of 2 cents per hour for every six months thereafter until they have served three years.

Helpers.—Rule 74. Helpers, when used in any way in connection with machinists' work shall in all cases work under the orders of the machinist, both under the direction of the foremen.

Rule 75. When vacancies occur under classification of machinist helper (temporary or permanent) machinist helpers in the service will be given preference in promotion to position paying either same or higher rate at station employed, seniority to govern.

Rule 76. Laborers, or similar class of workmen, shall not be permitted to do helpers' work as outlined in Rule 64 if regular machinist helpers are available.

Differentials for Machinists.—Rule 77. Machinists required to inspect locomotives and swear to reports required by the Federal Locomotive Inspection Law shall receive 5 cents per hour above the minimum rate paid machinists at the point employed. Autogenous welders shall receive 5 cents per hour above the minimum rate paid machinists at the point employed.

[Here follow special rules, similar to those for the machinists, for the boilermakers, blacksmiths, sheet metal workers, electrical workers and carmen.—EDITOR.]

MISCELLANEOUS

Scope of General and Special Rules.—Rule 180. Except as provided for under the special rules of each craft, the general rules shall govern in all cases.

Effect on Existing Agreements.—Rule 181. In consideration of the standardization of hours of service and rules governing working conditions hereby established on all railroads in Federal operation, the general and special rules of this agreement shall supersede and be substituted for the general and special rules of existing agreements in conflict herewith; rules of existing agreements dealing with conditions of employment not specifically provided for herein shall remain in effect and be recognized as addenda to this agreement by the several railroads who negotiated such rules. Rulings that have been made by the Director General of Railroads and Railroad Board of Adjustment No. 2, where not in conflict with the rules of this agreement, shall remain in effect.

Duration of Agreement.—Rule 182. These general and special rules and regulations shall remain in full force and effect during federal operation unless superseded or amended as herein provided. They shall be printed by the railroads and each employee affected thereby shall be provided with a copy on request.

Revision of Agreement, Etc.—Rule 183. Should either the Railroad Administration or the organizations desire to revise these rules, a written statement containing the proposed changes shall be given and conference held within thirty days to arrange details necessary to negotiate to a conclusion.

Rule 184. Except as herein provided, nothing in these rules shall be construed to supersede methods of procedure promulgated by the Railroad Administration for the handling of grievances, or the application or interpretation of the provision of this agreement.

Rule 185. This agreement shall become effective 30 days after date signed by the Director General of Railroads, and the representatives of the employees' organizations.

Rule 186. Differentials provided for in this agreement for highly skilled employees shall become effective as of May 1, 1919.

Train Accidents in November[1]

THE FOLLOWING is a list of the most notable train accidents that occurred on the railways of the United States in the month of November, 1919:

COLLISIONS

Date	Road	Place	Kind of accident	Kind of train	Killed	Injured
11	Penn	Crestline	rc	F. & F...	0	7
14	Louis'l. & N.	Edenwold	rc	P. & F...	0	4
24	Seaboard A. L.	Littleton	rc	P. & F...	0	2
*†25	Penn	McDonald	rc	F. & F...	2	2
26	A. T. & S. F.	Ft. Madison	bc	P. & F...	2	3

DERAILMENTS

	Road	Place	Cause of derailment	Kind of train	Killed	Injured
13	Boston & M.	Berlin, N. H.	Washout	P.	1	0
17	Penn	Lancaster	Neg.	F.	2	1
17	Penn	Lancaster	Acc. obst.	P.	0	4
20	Gulf Coast	Settegast	Cattle	P.	0	4
*21	Georgia	Greensboro, Ga.	ms.	F.	0	1
24	Macon & B.	Skipperton, Ga.	Boiler	F.	1	1

OTHER ACCIDENTS

Date	Road	Place	Cause of accident	Kind of train	Killed	Injured.
6	Bessemer & L. E.	Hewitts, Pa.	Boiler	F.	3	0

The trains in collision on the Pennsylvania Lines at Crestline, Ohio, on the 11th, were an eastbound wrecking train, which had just stopped at the yardmaster's office, and a following locomotive without train, the locomotive crushing the rear car of the wrecker, injuring seven employees.

The trains in collision near Edenwold, Tenn., on the morning of the 14th, about 5 o'clock, were northbound passenger No. 4 and northbound freight No. 14, the passenger train running into the freight. Four trainmen were injured. The freight, entering the side track, was stopped before the caboose cleared the derail and this made it impossible to set the switch straight, and the passenger train entered the siding. It had passed an automatic block signal set at caution, but the signal nearest the switch indicated clear, the caboose of the freight having cleared the track circuit controlling that signal. It is said that a fusee had been placed about 700 ft., in the rear of the freight.

The trains in collision near Littleton, N. C., on the 24th were northbound passenger No. 16 and a preceding freight, the freight being run into by the passenger while standing at a station. The engineman and fireman were injured.

The trains in collision on the Pennsylvania Lines at McDonald, Pa., on the 25th were a westbound stock train standing at a water station; a locomotive without train following the stock train, and a third train, a freight, which ran into the light engine, pushed it forward, and wrecked the caboose of the standing train. A drover in this caboose was killed and his body partly destroyed by fire, and one fireman was fatally injured. Two other trainmen were badly hurt. The fire was started by coals from one of the fire boxes.

The trains in collision at the east end of the bridge across the Mississippi River near Fort Madison, Iowa, on the 26th, were westbound passenger No. 1, and an eastbound freight. The engineman and fireman of the passenger train were killed, and three other trainmen were injured. Both locomotives and two baggage cars were partly submerged in the river.

The train derailed on the Boston & Maine near Berlin, N. H., on the 13th, was a southbound local passenger, double-headed. Both locomotives and the two first cars were derailed at a washout and the locomotives were overturned. One fireman was killed and four other trainmen injured.

The trains involved in the accidents near Lancaster, Pa., on the 17th, were an eastbound freight, Extra 1137, and eastbound passenger No. 576. The freight train running past distant and home block signals set against it was thrown off the track at a derailing switch, and the engine was upset. The passenger train, running on the middle track, was derailed by running into the freight wreck and its locomotive was overturned. The engineman and one brakeman of the freight were killed. Seven other employees and six passengers were injured; two cars in the passenger train being damaged. The accidents happened at 7:46 a. m., in a dense fog.

The train derailed on the Gulf Coast Lines at Settegast, Tex., on the evening of the 20th, was westbound passenger No. 3. Four cows on the track were struck by the locomotive and killed, and one of them, being thrown against a switch stand, knocked it over, opened the switch and derailed three of the cars of the train, two coaches being overturned. The train was crowded, but only ten persons were injured, and these injuries were classed as slight.

The train derailed near Greensboro, Ga., on the 21st, was an eastbound freight. The train ran off the track at a misplaced switch and ten cars were wrecked, together with the station building. Six freight cars and a part of the station were burned up. A traveling fireman was injured. The switch had been left wrong by a bridge foreman. The fire started from the stove in the station.

The train involved in the accident on the Macon & Birmingham, near Skipperton, Ga., on the 24th, was a westbound freight. The locomotive and tender were derailed by the explosion of the boiler, and the engineman was fatally scalded. The fireman was slightly injured. The cause of the explosion was low water.

The train involved in the accident at Hewitt, Pa., on the 6th, was a southbound freight. The boiler of the locomotive exploded and the engine was wrecked. The engineman, fireman and one brakeman were killed. The cause of the explosion was an overheated crown sheet, due to low water.

Canada—In a butting collision of passenger trains on the Canadian Pacific near Terrebonne, Que., on the evening of the 22d, one engineman and one express messenger were killed and six passengers were injured.

[1]Abbreviations and marks used in Accident List:
rc, Rear collision——bc, Butting collision——xc, Other collisions——bb, Broken——d, Defective——unf, Unforeseen obstruction——unx, Unexplained——derail, Open rerailing switch——ms, Misplaced switch——ass, obst., Accidental obstruction——malice, Malicious obstruction of track, etc. ——boiler, Explosion of locomotive on road——fire, Cars burned while running——P. or Pass., Passenger train——F. or Ft., Freight train (including empty engines, work trains, etc.)——Asterisk, Wreck wholly or partly destroyed by fire——Dagger, One or more passengers killed.

His Letter to Santa Claus

The Proposed Trans-Saharian Railway

Technical Consideration Involved in the Construction of a Railway Across the Desert of Sahara

FOR MANY YEARS France has recognized the desirability and value of a rail connection across the Sahara desert between Southern Algeria on the North and Western French Africa on the south. The "Genie Civil" has in the past discussed several proposed routes and has but recently reviewed the situation, describing some of the technical problems that must be met in the construction of this railway, from which the following is taken:

Before the war the two principal Sahara rail routes mentioned were those of the engineer in chief for bridges and roads, Souleyre, who suggested a line from Biskra to Tombouctou via Touggout and In-Salah, with a branch line to Lake Tchad (Fig 1-Line B), and the project of M. Andre Berthelot, which takes as the point of departure Colomb-Bechar, the terminus of the line Sud-Oranais (Fig.1-Line A). Other promoters suggested a program even more extended, suggesting communications between Algiers, the Niger, the Belgian Congo and British East Africa by branch lines going respectively to Tombouctou, the terminus (Kano) of the Nigerian railway, then Stanleyville on the River Congo and finally to Port Florence on Lake Victoria (terminus of the British railway running from Mombasa, a port on the Indian Ocean). It was a question first of connecting Algeria (and as a result Morocco and Tunis) with West and equatorial Africa, of which the wealth (notably the mineral reaches of Katanga, in the Belgian Congo) gives great hopes, and then, by a junction with the future "Cape to Cairo" railway, with the vast and prosperous regions of South Africa.

As indicated in the legend, the full lines indicate existing railroads; the cross hatched lines the new Trans-Saharian project; heavy dotted line, other lines proposed for construction by the French and the dot and dash line, older Trans-Saharian projects.

Fig. 1—Map of Africa, Showing New Lines Proposed Before the War

Quite recently other projects have been introduced, hardly less striking, such as the Paris-Madrid-Tangiers-Dakar line and the Trans-Soudanese line starting from Dakar (and from Conakry) going to Fort Lamy and Khartoum, with a terminus at Port Soudan and Djibouti on the Red Sea, which was recommended by M. Tilho. On account of the economic conditions brought about by the war, however, there is, of course, no possibility of the immediate realization of any of these plans. Nevertheless there is no reason now for not making some surveys in order to facilitate the work for the next generation.

Two memorandums on this subject were published quite recently, one by Lieut.-Colonel Godfrey, director of the Biskra-Houggourt Railway and another by M. L. Durandeau, director of technical service works of Southern Algerian territory. M. Godefroy in his discussion of the Trans-Saharian railway takes into consideration that the "Trans-Africans" aspire to a continental trade and even to a transcontinental one. With a line across the Sahara, London and Paris could be put in easy communication by a combined service of steamers and rapid trains with Central Africa on the one hand (via Marseilles, Algeria, the Belgian Congo and the Great Lakes), and with South America on the other hand (via Marseilles, Algeria, the buckle of the Niger, Dakar and the crossing from Dakar to Pernambuco (See Fig. 1).

M. Godefroy considers that if it is wished to establish a junction between Algeria and the "Cape to Cairo" railway, it would be advantageous instead of joining up with this line in the center of Africa, to join it at Cairo itself by a line running from Fez-Algiers-Tunis-Tripoli and the Tripoline and Cyrenean Coast. This railway would have, besides general traffic, the advantage of serving the immense number of Mussulman pilgrims to Mecca, pilgrims who every year fill up entire ships, and for whom the railway from Damascus to Medina was constructed by the Turkish government in 1908. The Fez-Cairo railway exists already in part up to Gabes on one side and from Daba to Cairo via Alexandria on the other. On the other side the strategic railway constructed by the British to revictual its Palestine Expeditionary Force could be easily extended as far as the Mecca railway.

The Trans-Saharian line which is recommended by M. Godefroy starts from Touggourt, the present terminus of the Algerian system (Algiers and Constantinople-Biskra-Trouggourt railway) and descends via Ouargla (the date region), In-Salah, crosses the Tidikelt and the Adrar in order to arrive near Bourem. This involves about 1,470 miles of line. (See Fig. 2.) The point at which this line crosses the Niger, at Tosaye, the river flows between two steep banks where a bridge could easily be erected. With the line from Touggourt to Algiers the journey from Algiers to the Niger would be about 1,860 miles. At the present time the line has been surveyed as far as In-Salah.

Trans-Saharian Traffic

With this line in operation western French Africa would be able to send numbers of workers into Algeria and Tunisia for agriculture and the mines which are in want of manual labor; thence there would be a very nearly constant stream

of natives between the North and the South. Higher class passengers would obviously be few, but this railway would easily supplant the sea route for mail and freight which is very much slower than the service that could be provided by this new line. The freight frame would consist chiefly of rice from the Soudan and cattle on foot or frozen meat from the buckle of the Niger going North; conversely wheat, fruit, dates from Algeria, textile fabrics and manufactured products and stock of mechanical tools going South.

Technical Problems Involved in the Construction

The experience acquired in the working of the Southern Algerian Oranais railways will be of great assistance in the construction of the Saharian railroad. A summary of M. Durandeau's discussion of the problems to be encountered is given below. The construction and maintenance of such a line differs above all in its details of construction and maintenance from a European railway on flat ground.

The plans for this railway as recommended by Souleyre and Berthelot included the use of a normal gage, but this exists only on one part of the Algerian railway system. The line of the Southern Oranais is of 1.05 meter gage while the Southern Algerian line is 1 meter gage. Thus, if the line is extended over either of these roads a transhipment will have to be made if the normal gage is to be used. It would seem, therefore, more practical for the use of a gage to accommodate the connecting lines and thus obviate the necessity of a transhipment. Furthermore a narrow gage would not necessarily mean a restriction of traffic and with track of easy curves and grades sufficient speed can be obtained provided the track is sufficiently strong. Furthermore if in a certain number of years the traffic justifies a change from a narrow gage to the normal gage it could easily be done without interrupting the service, by widening the road bed and by placing ties for the normal gage between the existing ties and supplying the new rails to them. M. Durandeau proposes to use the double head rails of 65-ft. in length, weighing 85-lb. per yard, placed on chairs weighing about

Fig. 2—Map of West Africa, Showing the Proposed Trans-Saharian and Trans-Soudanian Lines

The use of double headed rails mounted in chairs is believed necessary in order to raise the track as high as possible above the ballasting so as to facilitate the passage of the fine gravel driven by the wind between the ties and to lessen the risk of sand banks on the rails. Furthermore, due

31-lb. These chairs to be mounted on cedar ties measuring 7-ft. 2½-in. by 10½-in. by 6-in. or upon metallic ties weighing 99lb. which are to be 6-ft. 11-in. long. It is anticipated that this track will be able to support an axle load of 36,500-lb. and speeds of 37 miles an hour.

to the saline nature of the ground in a large part of the territory to be covered, it is necessary to keep the rails as high above the ground and as dry as possible, to prevent serious corrosion. The chlorides and sulphates under the influence of the variations of humidity give off acids which will attack the metal very rapidly. In such districts it is obviously necessary to use the wood ties instead of the metallic ties.

In order to avoid the drifting of the sand on to the switches, which has often caused accidents on the Southern Algerian railways, it will be necessary to place the switches on chairs and, furthermore, place the ties on a floor composed of other ties parallel to the track and joined. This will enable the sand to slip away between the switches and the ties.

The question of width of the road bed and of ballasting is of first importance for a Saharian railway, for the maintenance staff will be inevitably small. It will of necessity be made of sand for a large part of the way and it will be difficult to maintain it properly on account of the wind and it will be necessary to clear the track of the drifted sand frequently.

Ballasting with good quality broken stone would cost a great deal on account of the long haul. Ballasting made of gypsum of which there is a large quantity readily available would become quickly disintegrated and would be a detriment not only to the track but to the health of the staff.

When laying out the line it will be necessary to keep away from sand-hills as much as possible and to build windbreaks on those which are near the track. Plantations of tamaris can be used to very good advantage for this purpose. The location of the line should be carried out much less with the idea of obtaining a straight line than to avoiding slopes and inclines; provided that large gradients are maintained for curves, the visibility of the track and the maximum speed obtainable are almost the same as on a straight line.

The great inconvenience pointed out, relative to the possible corrosion of the rails, is met with again in connection with mortar, lime or cement, to which the saline nature of the soil is absolutely injurious. The experience with masonry of the railways of the Southern Constantinois has shown that the variations of heat and cold, of dryness and humidity, influence in an unfavorable way the resistance of cements which are at the same time affected by chemical decompositions.

M. Durandeau advises using freestone, without mortar, and cedar wood, or drystone masonry, and the use of thick lime when mortar is indispensable.

In the Sahara where materials for construction are wanting, only rough stone of gypsum is found which for all works of masonry such as buildings, small aqueducts, etc., can be perfectly well used with mortar of thick lime and sand found on the spot. It will be very desirable to construct the drystone masonry in metallic gabions. The use of these gabions permits raising the piles and gives greater security.

Organization for Construction

It is obvious that the line across the Sahara Desert will have to originate from Southern Algeria. All material can be supplied to the construction workshops from the lines already laid in that country. The advance working party which would lay the ballasting would require in the neighborhood of 2,000 "navvies" and it is anticipated that 2 kilometers of rail could be laid per day. The workmen and the foremen could be lodged in a train of some 50 freight cars (the small freight cars or wagons are used in this country) and the working train would consist of one tractor equipped for generating electricity, one office wagon, one store wagon, including a kitchen and restaurant, two wagons for the housing of the foremen, one ambulance wagon, wagons for the European workmen, and finally a large number of wagons for the natives.

Every morning and evening a train with working stock and stores would bring along a kilometer of track for laying in the evening or on the following morning. This material would be unloaded behind the train for the use of the staff and would be picked up by some special arranged loading device under the trucks of the working train and carried forward to the point of working. As the line progressed, stations would be instituted at intervals of 100 kilometers for stocking working train at the front.

Traction Units for Use on the Desert

On account of the scarcity of water and particularly on account of the extremely bad water found on the Desert it is impracticable to use steam locomotives for hauling the trains. Furthermore, coal for use on locomotives would have to be brought to the railway from Europe at great expense. It therefore seems preferable to plan on the use of Diesel or Still type of internal combustion engines or electric traction. It is a question which is still to be studied, but it is believed no difficulty will be experienced in this respect by the time the Trans-Saharian railway is built, due to the rapid progress in this particular subject.

Such are the problems involved in the construction of a conditions, particularly in Europe, it evidently will be some Trans-Saharian railway, and due to the present economic time before the work can be undertaken.

Freight Locomotive and Freight Train Costs

THE TOTAL COST of freight train service, including locomotive service, per 1,000 gross ton miles, which had been decreasing each month this year, including August, has been increasing in the fall months and was slightly greater in September than in August and in October, as compared with September, according to the monthly report of the Operating Statistics Section, although the report shows a decrease as compared with October, 1918. For October, 1919, it was 105.8 cents, as compared with 108.2 cents in October, 1918, and 101.1 cents in September, 1919. In August, 1919, it was 99.5 cents. Per locomotive mile and per train mile the cost was greater than for October of last year. The cost of freight locomotive service per locomotive mile in October was 109.8 cents, as compared with 108.7. In September it was 106.7 cents. The cost of freight train service per train mile in October was 159.8, as compared with 157.8. In September it was 156.2. The combined figures for all regions and the comparative figures for last year are as follows, (costs for 1918 have been readjusted for back pay, while the costs for 1919 apply to the month of October only, the back pay applicable to previous months having been eliminated):

	October 1919	October 1918
Cost of locomotive service per locomotive mile (cents)	109.8	108.7
Locomotive repairs	35.5	35.1
Enginehouse expenses	8.0	8.4
Train enginemen	21.1	19.3
Locomotive fuel	41.7	42.5
Other locomotive supplies	3.5	3.4
Cost of train service per train mile	159.8	157.8
Locomotive repairs, Enginehouse expenses, Locomotive fuel	49.4	50.1
Other locomotive supplies	4.0	4.9
Train enginemen	24.0	22.2
Trainmen	27.6	25.8
Train supplies and expenses	7.5	6.8
Cost of total train service per 1,000 gross ton miles	105.8	108.2
Locomotive repairs, Enginehouse expenses, Locomotive fuel	32.7	34.4
Other locomotive supplies	31.3	33.5
Enginemen and Trainmen	2.6	2.7
Train supplies and expenses	34.1	33.
	5.0	4.7

Railroad Surplus or Deficit Depends on Method of Figuring

THE INTERESTING QUESTION as to "when is a surplus not a surplus?" which has been agitating Congress, the labor leaders and others who have been discussing the railroad problem ever since the Railroad Administration gave to the press the surprising news that it had earned a surplus in July and followed it with similar statements for August, September and October, has now been answered by a statement authorized by Director General Hines explaining the matter. The statement for some reason received little publicity, but he shows that while in those four months the net operating income of the roads was $22,516,446 greater than four-twelfths of the standard return, it was also $29,573,000 less than the roads earned in the corresponding four months of the test period on which the standard return is based.

Senator LaFollette and other advocates of government ownership or continued government operation of the railroads have been using the surpluses derived by comparison with one-twelfth of the standard return for each month as arguments to prove that the railroads are now on a self-sustaining basis and if retained by the government could be operated without a rate increase, ignoring the fact that the Railroad Administration has not yet succeeded in standardizing the months of the year and that the roads ought to earn much more than that in the fall months in order to make a favorable showing. Also the representatives of organized labor and of some of the farmers that recently called at the White House to urge the President to keep the railroads went so far as to say that the railways showed a net profit "at the rate of $168,000,000 a year" for the three months prior to the coal strike.

This reminds one of Abe Kabibble's boast that he made "$5,000 a year some weeks." In those three months the roads actually earned $68,000,000 less than they did in the corresponding months of 1918, in which year the deficit was $236,000,000, whereas this year it is $269,000,000 for only 10 months. The $168,000,000 was arrived at by multiplying by four the $42,000,000 surplus for August, September and October arrived at in a statement issued by the Railroad Administration by comparison with three-twelfths of the standard return after charging out the back pay applicable to prior months and also by reaching into November for about $9,000,000 for business done in October, which would not be taken into the accounts until November.

In its press notices regarding monthly operating results, the Railroad Administration has consistently made its comparisons with one-twelfth of the standard return—$74,356,354—because it is payable in equal quarterly instalments, although this method had the effect of overstating its deficit in the early months of the year and of understating it in the later months. In a condensed income account compiled monthly for the Class I roads by the Operating Statistics Section, however, the "net federal income" is compared with the standard return for the period covered by the report based on the proportion which the railway operating income in the same period of the three years of the test period bore to the total railway operating income during the test period. The proportions to be used for each month, as given in a footnote to its reports, are:

	Per cent		Per cent
January	6.228	July	8.363
February	5.257	August	9.643
March	7.517	September	10.113
April	7.438	October	10.436
May	8.568	November	9.222
June	9.149	December	8.066

The total net operating income for the 10 months of this year for which reports are available was $478,982,635, as compared with $599,976,783 in the corresponding period of 1918. Ten-twelfths of the annual rental is $743,563,540, and on that basis the 10 months' deficit is $264,580,905, but the proportion of it that accrued in the corresponding 10 months of the test period was $748,252,000, and on that basis the deficit is $269,000,000, a difference of less than $5,000,000. But for October alone the two methods produce very different results.

The net operating income was $76,959,777, which represents a surplus of $2,603,423 as compared with one-twelfth of the standard return, but a deficit of $17,417,000 as compared with the $94,387,000 which the roads earned in the average October of the test period. In October, 1918, the net operating income was $86,184,486, so that there was actually a greater deficit in October this year than last year. Mr. Hines' statement, which also takes into account some adjustments for back pay, is as follows:

"For each of the four months, July, August, September and October, the Class I railroads in federal operation have shown an aggregate profit after deducting one-twelfth of the rental. The total of the profits for the four months thus shown were $22,516,446. The question has been raised as to whether there ought not to have been deducted a larger proportion of the rental corresponding with the proportion of net operating income which the railroads under private management earned on an average in the corresponding months of the three-year test period. The Railroad Administration has adopted the same policy in the four months in question that it adopted in the preceding six months. Uniform deduction of one-twelfth of the rental was made each month, because the standard contract provides that three-twelfths of the annual rental shall be paid at the end of each three months, so that in effect the Railroad Administration must account for one-twelfth of the annual rental each month, and hence it seemed appropriate to charge it accordingly.

"But since the method thus used for the months of July to October has been questioned, it seems desirable to call attention to what the result would be for this four months' period if there were deducted a proportion of the annual rental in excess of four-twelfths and equal to the proportion of the annual operating income earned by the railroads in the corresponding four months of the test period. In arriving at this result there has also been deducted the back payments made the shopmen for the four months in question. A deduction has also been made of the estimated cost of recent readjustments of wages and working conditions, such as allowance of time and a half for overtime to certain additional classes of employees, including train and enginemen in road freight service. While none of these readjustments were actually applicable to the months in question, the deduction of the estimated amounts thereof serves to make the result for the four months more indicative of the result for the future, and hence a more useful index to the real earning capacity of the railroads in federal operation, on the basis of existing wages and working conditions. The hire of equipment is also treated on a uniform basis, though a different method of accounting therefor was adopted in October.

"On the basis thus indicated the loss for the four-month period, after deducting the larger proportion of the rental as above explained, would have been approximately $29,573,000. This amount is two and two-tenths per cent of the operating revenues from freight traffic for the period. This gives full effect to the relatively heavy business normally done in these four months, as indicated by the operating income of the same four months during the test period.

"As bearing on the significance of this result as an index to real earning capacity of railroads in federal operation, it is desirable to emphasize that on the average the maintenance expenditures for the four-month period were adequate to maintain the property and were fairly related to the ex-

penses for the test period after taking into consideration the increases in prices and wages.

"It must be remembered that to the extent to which this larger deduction for rental is made in the four-month period in question, there must be a corresponding diminution in the rental, and hence in the deficit heretofore shown in the first six months of the year.

"Attention has heretofore been called in the monthly statements issued by the Railroad Administration to the fact that there was an abnormal falling off in freight business in the early part of the year and that this was prolonged over an abnormal period of time, covering the entire first six months, and that to a substantial extent the relatively large deficit incurred in the first six months was due to this great and prolonged diminution of freight traffic. The traffic for the months of July, August, September and October has been on a more normal basis, although in the latter part of October it was seriously deranged and carried on under especially unfavorable conditions by reason of the impending coal strike."

Cummins Railroad Bill Passed by Senate

Sent to Conference with Esch Bill—President Fixes March 1 for Return of Railroads

THE SENATE on December 20 passed by a vote of 46 to 30 the Cummins bill for the reorganization of the railroad system of the United States and of the system of railroad regulation, without having heard from the President on his intentions as to the return of the roads. The bill, together with the Esch bill passed by the House on November 20, was then sent to conference for the reconciliation of the many important differences between them; and the conferees have begun work during the holiday recess of Congress, which lasts until January 5, in the hope that they can submit a report some time in January. The conferees are Senators Cummins, Kellogg, Poindexter, Pomerene and Robinson and Representatives Esch, Barkley, Hamilton, Sims and Winslow, who constituted the sub-committees of the Senate and House committees on interstate commerce, respectively, that did most of the work on the bills, having drafted the tentative bills which constituted the basis for the bills later reported by the full committees.

Only Eleven Votes for Government Operation

The Senate passed the bill apparently without any great degree of enthusiasm, after three weeks of debate, during which there was a very slim attendance, including five night sessions. It seemed far more interested in getting the bill out of the way in time for the holiday recess and as to its provision a large number of senators relied on the judgment of the committee on interstate commerce, that had worked on the bill throughout the greater part of the year, or upon the conferees, upon whom rests the responsibility of drafting the final bill. Many who did not fully understand or were in doubt as to the wisdom of many features of the bill voted for it because it provides for the return of the railroads to private management or because the conferees may save them trouble of making up their minds as to many of its provisions or will give them another chance to vote.

The most pronounced expression of sentiment in connection with the bill came on Senator LaFollette's motion to substitute for it a two-year extension of the present federal control, which received only 11 votes, while there were 65 against it. On the motion to substitute the Senate bill for the House bill there were 41 votes to 17, but this probably was influenced more by the desire to get the two bills into conference than by the exact division of opinion as to the two bills.

Efforts to eliminate or change the fundamental principles of the bill met with little support, and were represented rather by the votes against the bill than by proposals for modifications in it. The most important change made in the Senate was the addition of a provision for a revolving fund of $500,000,000 for loans to railroad companies for capital improvements.

The Senate apparently had difficulty in drawing a clear-cut issue on the bill, although the party line was in evidence as 33 of the votes for it were Republican and 13 Democratic, while 22 of the votes against it were Democratic and 8 Republican. Three Republicans, Gronna, LaFollette and Norris, and eight Democrats, Ashurst, Chamberlain, Henderson, Johnson of South Dakota, Kendrick, Nugent, Sheppard and Walsh of Montana voted for the continuation of government operation.

The organized propaganda against the bill carried on by the labor organizations and one of the several organizations that claim to represent the farmers, was based on the assertion that the bill had been dictated by and was wholly for the selfish interests of the railroads, but this was so manifestly untrue and railroad support for the bill was so conspicuously absent that it hardly represented a satisfactory issue and probably as many votes were cast against the bill on the ground that it was not sufficiently generous to the railroads as because of a belief that it gave them too much.

The railroad executives themselves indicated far more opposition to the bill than support of it, although their efforts were directed more particularly for or against individual provisions of the bill and in general they apparently took the position of being grateful for whatever they could get. Senator Chamberlain of Oregon at one time asserted that the railroad executives were repeating the performance of the brotherhoods at the time they were said to have forced the passage of the Adamson law "at the point of a gun" and he declared that the railroad presidents and general managers were in the galleries demanding the passage of the bill. The only railroad executive in the galleries at the time was S. Davies Warfield, who is chairman of the Seaboard Air Line, but who is also president of the National Association of Owners of Railroad Securities. Senator Cummins replied to Senator Chamberlain, saying that the railroad executives were opposed to the bill and that if any one knew of a railroad president in favor of it he would be glad to have him named.

Mr. Warfield was an interested observer of the proceedings throughout and Bird M. Robinson, president of the American Short Line Railroad Association, was also in the gallery part of the time but railroad officers were most conspicuous by their absence.

A considerable number of amendments to the bill were adopted but most of them applied to details. Some of the provisions which it had been predicted would meet with bitter opposition, such as those for federal incorporation and compulsory consolidation, aroused comparatively little discussion. The labor provisions were the cause of the liveliest controversy but the prohibition against strikes

was left intact. It was apparent that the labor organizations had much less influence in the Senate than they had in the House because, whereas the House had adopted by a large majority the Anderson amendment which incorporated the views of the labor organizations, including the confirmation of all wage orders of the Railroad Administration for the future, the Senate voted down by a large majority the amendment in which the labor organizations were particularly interested—that to strike out the labor provisions entirely—and only 11 votes were cast for their proposal for a two-year extension of government operation.

The character of the bill that will ultimately be adopted now depends very largely upon the work of the conferees, because the bills are so fundamentally different that a great deal depends upon which of the conflicting provisions are sacrificed for trading purposes in the efforts to reach an agreement. It is also regarded as certain that it will be necessary for the two groups of conferees to seek instructions from their respective houses. Moreover, a great deal depends upon the character of the changes that are agreed upon in the provisions of the two bills that are somewhat similar in purpose and intent but vary in important details. A very large part of the Esch bill is also in the Cummins bill, but the latter included many important features not in the Esch bill.

Differences Between House and Senate

These include the rule of rate-making, based on an instruction to the Interstate Commerce Commission to make rates produce a net operating income as nearly as may be to 5½ per cent on the aggregate value of the property in each rate-making district, with a division of earnings above 6 per cent; the proposed consolidation of the railroads into 20 to 35 systems, the creation of a transportation board to take over many of the present functions of the Interstate Commerce Commission, as well as the new functions provided for in the bill; the anti-strike provisions and the provision for federal incorporation. While the House bill provides for bi-partisan wage boards without any provision for a decision in the case of their failure to agree, the Senate bill provides for an appeal to the transportation board.

Both bills provide for the return of the railroads to private management, but greatly increase the extent of their regulation by federal authority. While the Senate bill would return the roads on the last day of the month in which the act is approved, the House bill provides that if this shall take place after the fifteenth day of the month the transfer shall be at the end of the following month.

Both bills provide for the funding of indebtedness of the carriers to the government, but under different conditions, and while the House bill provides for a period of 10 years, not beginning until after the first five years from the date of the act, the Senate bill makes the 10-year period begin at once. The House bill also reduces the amount of the capital expenditures that may be funded by deducting a large part of the indebtedness of the government to the railroads on account of compensation.

Both bills provide for a temporary guaranty to the railroads pending a decision of the Interstate Commerce Commission as to a proper level of rates. The Senate bill allows the roads two months within which to file tariffs and provides for the guaranty and the commission shall render its decision, or for four months after the filing of tariffs, while the House makes the guaranty period a straight six months, but the Senate bill would allow a guaranty based on a proportionate amount of the guaranteed standard return, which would be one-twelfth of the annual rental for each month of the guaranty period, while the House bill provides for a guaranty not less than the average operating income for the three corresponding periods of six months in the test period, which would be considerably less than one-half of the year's rental if the guaranty period begins in the first part of the year. The Senate bill provides that any railroad earning more than its guaranty during the period shall pay the excess into the treasury of the United States, but the House bill contains no such provision.

The House bill provides for a loan fund of $250,000,000, while the Senate bill provides for $500,000,000.

A summary of the principal provisions of the Cummins bill was published in the *Railway Age* of October 3 (issued November 19).

No Message from President

It had been fully expected that the President would send to Congress his promised message on the readjustment of the affairs of the railroads growing out of federal control before the members left the city for the holiday recess, but Congress was allowed to recess without having heard from him as to whether or not he had changed his mind about relinquishing the railroads at the end of the year. This made it impossible for him to address Congress before January 5, which led to a belief in the minds of many that he had decided to let the legislation take its course and let the date for the return of the roads be fixed by Congress. The fact that both bills provide in a generally similar way for the return of the roads would make it possible for him to take the position that Congress had taken the matter out of his hands after he had announced his intentions last May.

The plan which had been proposed in November to enact temporary legislation providing for an extension of the guaranty pending the completion of permanent legislation was abandoned in view of the fact that the passage of the bill by the Senate made it possible to hope for the final passage of the bill some time in January.

Debate on the Senate Bill

The debate in the Senate up to December 16 was reported in last week's issue.

On December 16 Senator Poindexter of Washington delivered a lengthy address in favor of his amendment to strike out the proviso in the long and short haul clause, which gives the Interstate Commerce Commission discretion in permitting exemptions from the strict application of the law in order to leave the so-called long and short haul rule as contained in the act to regulate commerce unqualified.

The Senate committee on interstate commerce at one time had reported favorably the Senator's bill to provide for a rigid long and short haul clause, but in the Cummins bill it adopted a compromise attaching to the commission's discretion the requirement that the lesser charge for the longer distance must be fairly compensatory and that no relief shall be allowed on account of merely potential water competition.

Senator King of Utah stated that many of the senators are very earnestly in favor of Senator Poindexter's amendment and would not allow the bill to go through if they could have their way unless the proviso were stricken out. After some discussion the amendment was allowed to go over until the following day, when it was defeated by a vote of 25 to 41.

An amendment was offered by Senator Gay of Louisiana to exempt from the provisions relating to the grouping, consolidation or federal incorporation of carriers and the adjustment of rates to yield the return prescribed in the bill and the disposition of excess operating income of belt line, terminal or switching railroads or other terminal facilities owned and operated by any state or political subdivision thereof. The purpose was to exempt the belt line owned by the city of New Orleans. Senator Cummins explained that

the bill does not apply to belt lines and switching facilities, but the amendment was adopted.

Revolving Fund Increased

Senator Frelinghuysen of New Jersey offered an amendment providing for a revolving fund of $750,000,000, from which loans could be made to railroads by the transportation board under provisions similar to those included in the Esch bill, which provides a fund of only $250,000,000. The Senator explained that the necessity for such a loan fund had become apparent in the last few days, because a committee of bankers, advising in respect to the proposed general equipment trust to take care of cars and locomotives purchased by the director general, has advised that market conditions are not favorable now to the placing of even that gilt-edged security, and therefore apprehension had been expressed that less attractive securities offered by the railroads during the coming year may not be any more successful.

The vital public interest in adequacy of facilities and service in the immediate future seems to require, he said, that in the absence of a public market for railroad securities Congress should provide a credit with which the railroads can proceed with essential work. If the Senate bill contains no such provision, under the conference rules the conferees would be limited to the acceptance or rejection of the provision in the House bill providing for a fund of $250,000,000, and he desired to include provision for a possible $750,000,000 in order that the conferees may exercise their discretion between the two sums.

Senator Frelinghuysen read a letter from Director General Hines, whom he had asked for an estimate, in which Mr. Hines expressed the opinion that the railroads would hardly be able to expend more than $400,000,000 on capital account during 1920, but that at least 50 per cent additional ought to be expended. The Senator said that maturities in 1920 would amount to $221,000,000, one-fifteenth of the sums to be paid on the rolling stock already purchased by the Railroad Administration would require about $25,000,000, and that improvements other than equipment already contracted for are estimated by the director of capital expenditures of the Railroad Administration at from $200,000,000 to $250,000,000 of new money, making a total of $446,000,000. It seems obvious, he said, that an insurance of $750,000,000 of loans would be moderate in case investment conditions should continue for any length of time as they now are, or at least it would be pertinent for the Senate to permit the conferees the latitude suggested. Mr. Hines' letter was as follows:

"Your inquiry presupposes that the capital expenditures would be planned and carried out by the railroad companies. On that assumption it must be borne in mind that the companies will require time to formulate and adopt plans and arrange for financing. This will all require considerable time, and it is not probable that the companies would be able to enter in a confident and effective way upon the making of provision for either betterments to roadway or acquisition of additional rolling stock upon an extensive scale prior to March 1, next. The amount that they would be able to spend in the calendar year 1920 would be considerably curtailed by such a late start in putting their plans into effect. Taking this into consideration, my judgment is that $400,000,000 would represent approximately the expenditure of cash which they would actually be able to make in the remaining part of the calendar year 1920. There is a possibility that this might be somewhat exceeded, but I do not think, in any event, it would go beyond $500,000,000, and I think the probability is much more in favor of $400,000,000.

"I do not mean by the foregoing that the figure of $400,000,000 represents the full amount that ought in the public interest to be expended during the year 1920. On the contrary, I should say that at least 50 per cent additional ought to be expended in order reasonably to provide for the needs of the public service; but, in my opinion, this larger and more desirable provision cannot be made because of the delay which will inevitably be connected with the transition back to private control and with each company thereafter making its own independent plans and necessarily waiting until it can obtain some more definite light as to its financial status."

Senator Frelinghuysen said it would be good business for the United States government at this time, when the credit of the transportation systems of the country is at its lowest ebb and when underlying securities are selling at figures which have not been reached before in 20 years, to help the railroads to rehabilitate themselves when they go back into private management.

Senator Cummins said he had hoped that Congress would adopt such legislation as would enable the railroads to command the credit necessary to meet the exigencies of the coming year, and he was not willing to assume that the railroads could not borrow the money which they unquestionably will need. He did not doubt that their requirements would amount to $750,000,000, but he was not willing to admit that the legislation which is to be adopted would not make it possible for the railroads to finance themselves without government loans.

"If I did not believe," he said, "that the legislation which will be adopted by Congress would put the transportation system of the United States in position to take care of itself, I would not be in favor of returning the railroads to their present owners. To me the suggestion implies great doubt of the efficacy of the legislation which we are proposing, and inasmuch as I do not maintain a doubt of that character I cannot support the amendment."

At the suggestion of Senator Pomerene, Mr. Frelinghuysen changed his figure to $500,000,000, and after having been allowed to go over until the next day for further discussion the amendment was adopted by a vote of 28 to 20.

Increase in Rates Necessary

Senator Underwood of Alabama discussed the bill at length on December 16, supporting the bill in general and partricularly the provisions designed to improve the credit of the railroads by establishing a rule of rate-making. He also favored the proposed limitation of earnings in order that rates might be made to improve the general condition of the railroads without giving the more prosperous companies earnings which would be regarded as excessive. Senator Underwood declared that unless Congress legislates on the question of railroad transportation at a very early date the entire transportation system of the country will be in danger. He said the President had twice indicated his desire to return the railroads, and he did not believe it is possible to do so under present conditions and without remedial legislation without danger to the business interests of the country. The policy of regulation of railroads in the past has been correct, so far as policy is concerned, but its practical workings, in his judgment, had been a mistake. He thought that freight should be carried at a reasonable rate, but that it was far more important to the shipper to have railroad facilities that will properly put him in contact with his ultimate market than to have cheap freight rates.

He pointed to the fact that wages have been increased by an amount more than all the railroads have ever paid in any year for interest and dividends and that the increased expenses, as well as increases in cost of fuel and materials and supplies, must be paid for some way. "Whether this bill passes or does not pass," he said, "it will be necessary to take up the slack or the railroads cannot run. Even if we do not pass this bill, the Interstate Commerce Commission or the director general must make increases in rates to meet the increased expenditures for labor, for fuel, for the procurement of money, or the railroads cannot run. Such

an increase is going to come whether the bill is passed or whether it is not passed."

Surplus Earnings Questioned

Senator Stanley of Kentucky asked for an explanation of the statements that the railroads have earned a surplus during recent months. Senator Cummins said he had given the matter some investigation, which possibly the Senator from Alabama had not, and that he would answer the question. In the first place, he said, the cost of the general administration has not been charged to operating expenses, and, secondly, the fall months are those in which the net earnings of the railroads are much higher than in other months.

"The statement that a profit has been made is arrived at in this way," said Senator Cummins. "The earnings of the railroad companies for these favorable months have been aggregated and then one-twelfth of the annual compensation has been deducted, with the result stated by those who have occupied the floor. I assume that the fallacy of that kind of computation is at once observable to any student of the subject. The only way in which you can ascertain whether or not a railway is profitable in its operation is to take in the entire year with all of its variations, and I think that when the year is over it will be found that the Railroad Administration for this year has lost more than $325,000,000."

"Does not the Senator himself know," said Senator Underwood, "that what they gain in October, November and December is not going to be a gain in January, February and March?"

Senator King said he had been informed that the Railroad Administration during the last few months had curtailed necessary expenditures for improvement and maintenance. Senator Underwood said he could not speak by the card on that subject, but that he rides on the railroads sometimes and that it is common knowledge to everybody that rides on the railroads how many freight cars are standing on the side tracks and cannot be used because they are out of repair.

Better Service Under Private Management

Senator Underwood also expressed the opinion that a return to private management would result in better service, saying that there is no one man of sufficient ability to sit in Washington and make all the railroads function as successfully as they could do under presidents, general managers and boards of directors who are interested in the property and have a specific line of road under their observation. It was certain that if Congress would declare a permanent policy of continued control by the government the Railroad Administration would be compelled to increase freight rates, but that, expecting that the roads will be turned back to their owners in January, it was very natural for the administration to try to work through the present condition without an increase in rates. He also declared that the Cummins bill would provide for a very small increase in the income of the railroads. He said the guarantee, based on the earnings of the test period, averages 5.22 per cent on the property investment account, while the bill gives them 5½ per cent on the value of the property as determined by the commission. Assuming that the property investment fairly approximates the value, this would result in an increase of only $50,400,000, he said, and if the railroads are approaching a condition where they are earning a guarantee, a very slight increase would be needed. "All this talk about a $4,000,000,000 charge upon the American people, all this talk about a tremendous increase in freight rates under the bill is a mere smoke cloud blown by the enemy to conceal its own operations," he said.

Senator Curtis offered as an amendment a provision for extending the effective date of section 10 of the Clayton anti-trust law until January 1, 1920, which was adopted. A resolution containing a similar provision had previously passed the Senate but had not passed the House.

Lenroot Criticises Bill

Senator Lenroot also criticized the proposed rate-making which he devoted to a criticism of the Plumb plan and an analysis of the Lenroot-Amster plan for a public corporation to control the railroads as a single system. He objected to many provisions of the Cummins bill, saying that the practical guarantee of an average of 5½ per cent would remove incentive to efficiency and would be unfair to the most efficient roads, and he also objected to the labor provisions of the bill on the ground that the proposed transportation board, because of the nature of most of its functions, would not be so situated as to be an impartial tribunal on wage questions. He also objected to the provisions regarding the temporary guarantee of the standard return on the ground that the roads that would not need such a guarantee could not be required to turn over any surplus to the government. Senator Cummins thought the bill provided a contractual relation created by the acceptance of the guarantee. Senator Lenroot said that a road that expected to make more than the guarantee would not accept any guarantee, and therefore there would be no contractual relation. Senator Cummins said that possibly there was an oversight on the part of the committee in that respect.

Senator Lenroot also criticized the proposed rate-making rule, saying that if, under a system of rates that would produce 5½ per cent of the aggregate value of the property in a district, a road that earned only 2 per cent might go into court and secure an additional increase that would disturb the whole system. Senator Lenroot asked Senator Cummins if he thought it would be entirely safe for the government to say to the railroads that they can operate as many trains as they like, as extravagantly as they wish, and that the government will pay the bills during the period of the temporary guarantee. Senator Cummins said that the bill already provided that the commission in calculating the amount of the guarantee should take into consideration for maintenance expenditures only an amount equal to that provided for in the standard contract, but that the bill might go further and authorize the commission to exclude any operating expenses that ought not to have been incurred. He understood that Senator Curtis had an amendment covering that point which he would offer later.

Senator Lenroot also objected to the provision for a temporary guarantee in the discretion of the transportation board to companies going through a process of consolidation. Senator Cummins thought that this point was of little importance, because the proposed guarantee was only that of the standard return which, based on the earnings of the test period, would be small in relation to the future condition of the railroads. "If there are very many roads," he said, "which do not earn in the years to come the average return of 1915, 1916 and 1917, the transportation of the country will be in a bad way."

On December 17 Senator Lenroot's amendment to eliminate this guarantee during consolidation was adopted.

An amendment by Senator Jones of Washington to limit the authority of the Interstate Commerce Commission over docks and waterway terminals, which would be provided for in the bill, was adopted on December 16.

On December 17 a vigorous effort was made by senators who were anxious to secure consideration of the sugar bill to displace the railroad bill temporarily. Senator Cummins objected to this, saying he thought it would be possible to pass the railroad bill in shorter time than would be required by the sugar bill, and his position was sustained by a vote of 23 to 41.

Senator LaFollette Criticised

Senator Townsend of Michigan delivered a speech in support of the bill on December 17. He said the most bitter opposition to the measure came from a senator who was a member of the committee, and yet during all the weeks of conscientious and full consideration of the bill by the committee he had never heard him make one single constructive suggestion before the committee. This referred to Senator LaFollette. He thought this bill, for the first time in the history of railroad legislation, has for its cardinal principle protection of the people's rights. It has nothing in it which has in view the serving of any special interest. The bill is not what the railroad owners wanted, he said, and a statement to the contrary is in reckless disregard to the facts and the evidence as they have been disclosed. It is not in the interest of the railroad employees, although every one of their rights is protected, in harmony with the same principles which have been applied to owners.

Regarding the labor provisions, he said that six times since he has been in Congress he has introduced bills providing for compulsory investigation of the questions growing out of the controversies between capital and labor. Every time that measure has been opposed by both capital and labor. Yet Mr. Lewis, acting president of the United Mine Workers, in explaining to his followers the agreement which has recently been made with the representatives of the government for the settlement of the questions involved in the coal strike, has stated that the proposal, which is really for compulsory arbitration, was a great victory. "Possibly this particular agreement," Senator Townsend said, "contained other understandings than those submitted to writing, but on its face it is a provision for compulsory arbitration."

He also argued against the Poindexter amendment on the long and short haul clause, and after the conlusion of his speech a vote was taken and it was rejected.

Senator Jones of Washington offered an amendment to strike out section 14, which authorizes the Interstate Commerce Commission to fix minimum rates, because he thought it would hurt the water lines. Senator Ransdell of Louisiana, former president of the National Rivers and Harbors Congress, also supported the amendment, stating that if the commission were given the right to fix minimum rates it might fix such a minimum that shippers could not afford to use the waterways. After various senators had explained that the purpose of the bill was to prevent railroads from reducing rates unduly to kill water competition, the amendment was withdrawn.

The Labor Provisions

An amendment offered by Senator Sterling of South Dakota to strike out of the labor provisions of the bill the word "crafts" an insert in lieu thereof the words "classified employees" was adopted after the senator had explained this was to prevent a possible interpretation of the bill that would give the employees outside of the unions no votes in the nomination of the committee on wages and working conditions, and he submitted another amendment, which was adopted, providing that all classified employees without other distinction shall have the right and opportunity through proper notice to participate in such nominations. Senator Smith of South Carolina offered an amendment to strike out the provision in the bill requiring a certificate by the transportation board before the construction of a new line or the extension of a line can be undertaken.

Senator Stanley again offered his amendment to strike out the labor provisions of the bill, to which Senator McCormick of Illinois offered a substitute to fix a specific time of 90 days during which the committee on wages and working conditions or the regional boards of adjustment will be required to pass on wage questions, and to make it illegal to call a strike until 60 days after a decision had been made. This, he said, was patterned after a Canadian law, but was intended to correct the principal objection which has been raised to the Canadian law, which does not provide a definite time within which the wage boards must render a decision. He said that the Senate must reckon with the grave improbability that the provision of the bill as reported making strikes illegal can ever become a law.

Amendments proposed by Senator Cummins were adopted on December 16 to include employees of sleeping car companies in the wage provisions of the bill, to insert the words "value of the railroad property" in one place where "property investment" had been inadvertently used, and to provide that through rates for transportation wholly by railroad shall be made for the ordinary transportation service from point of origin to the destination and delivery at the usual unloading places and in the case of live stock destined to public stock yards to include the service of unloading and delivery. This was offered at the suggestion of the American National Live Stock Association.

The amendment offered by Senator Curtis of Kansas to guarantee the short lines relinquished by the Railroad Administration to the extent of any actual operating deficit since January 1, 1918, was adopted on December 16.

The Anti-Strike Provision

Discussing the Stanley amendment to strike out the labor provision, on December 18, Senator Underwood declared that the question of the right of railroad employees to strike goes far beyond the question of labor and capital. So far as railroad labor is concerned, he said, it has no issue with invested capital, because as a practical proposition the wages of labor engaged in railroad industry have long ceased to come out of invested capital. They come out of freight rates and passenger rates as prescribed by the government and the earnings of the roads must come out of the public.

"If that is the case," he asked, "is it fairly stating the proposition to say that labor must still carry this weapon of offense against capital, that the value of its wage must be determined on the battle ground between labor and capital, and then after the battle is fought and won the result of the victory must be assessed against the public, which has had no interest or no hand in the dispute? But it does not even stop there. The public are not only required to pay the bill, but they must bear the burden of the fight. The reservation to labor of the right to strike is either an actual fact, a weapon that is poised on its way to the blow, or it is a mere theory and is of no value."

Senator Thomas of Colorado and Senator Stanley delivered the principal speeches on the anti-strike provisions, although a large number of senators participated in the debate. Senator Thomas pointed out that the total number of men who went on strike in the United States during the war exceeded the total number of soldiers sent to France by about 350,000 men. The total number of strikers, he said, was 2,386,285, while the total number of men sent to France was 2,053,347. Senator Thomas said the increases in wages granted by the Railroad Administration could not be considered excessive, but that there were excessive instances. He told a story of an instance on the Wabash Railroad, which, he said, had formerly paid a farmer $20 a month for turning on and off a switch in a water tank operated by electricity, who had been classified by the Railroad Administration as an electrician, paid for his entire day at the rate of about $300 a month and given over $2,500 back pay.

This, however, was denied in a letter sent to the Senator by Director General Hines, which he inserted in the record later. Mr. Hines said the statement had been circulated some time ago, at which time he challenged and denied it, but the untrue statement continues to receive currency. He

said he had been unable to find anything in the wage transactions of the Railroad Administration which resembled the statement in any respect and that such a case could not have been evolved from the principles of wage adjustment adopted by the Railroad Administration.

Senator Stanley's amendment was defeated by a vote of 46 to 25, after which Senator McCormick's substitute amendment to prohibit strikes until after 60 days after a decision by the wage board was defeated by a tie vote of 31 to 31. On the following day a separate vote was taken on the Stanley amendment, and it was again defeated by a vote of 39 to 24, while Senator McCormick's substitute was again defeated by a vote of 30 to 33.

Senator Pomerene offered an amendment authorizing the transportation board to require carriers to furnish sufficient refrigerator cars for the transportation of fresh meat, but later withdrew it after it had been pointed out that this in effect would require the railroads to purchase the cars owned by the packers and would probably require another revolving fund to enable them to do so.

An amendment proposed by Senator Smith of South Carolina to strike out the provision requiring a certificate of public interest for the construction of new lines was defeated by a vote of 23 to 44. The senator argued that the provision would prevent the development of new or sparsely settled territory by the construction of local lines. Senator Cummins expressed the opinion that the passage of his bill would do more to encourage and promote the building of railroads into undeveloped parts of the United States than anything that has been suggested for years.

Senator Jones of New Mexico offered an amendment to include within the things to be considered by the commission in fixing rates the requirements for additional capital to encourage needed new construction, which was rejected. Two other amendments intended to facilitate new construction were also rejected.

Senator Myers of Montana proposed to increase the proportion of so-called excess earnings which may be retained by a carrier prior to the building up of its reserve fund from one-half to two-thirds of the net operating income between 6 and 7 per cent, but it was rejected without a record vote.

Senator Smith of Georgia introduced an amendment, which was adopted, to continue the effect of the amendment to the fifteenth section of the commerce act requiring the permission of the commission for the filing of a tariff containing an increased rate, which was adopted at his proposal in 1917, but which by its terms expires on January 1, 1920.

Senator Pomerene offered another amendment, which was agreed to, authorizing the transportation board to require any carrier to furnish refrigerator cars for the transportation of vegetables, fruits and fresh meats and such other perishable commodities as require a refrigerator service, but also authorizing it to expend, if the revenue of the carrier is inadequate for that purpose, a portion of the revolving fund therefor. It was provided, however, that this provision shall not in any wise relieve common carriers from their duty to furnish such refrigerator cars as are required for the transportation of vegetables, fruits, fresh meats and other perishable commodities.

Senator Walsh of Massachusetts offered an amendment which he said was intended to guarantee to the railroad employees reasonable wages. It provided for the stabilization of wages less than $3,000 a year by an adjustment in accordance with the average cost of living as determined by the Bureau of Labor Statistics quarterly, providing nothing in the provision should operate to reduce wages below the amount to which the employees were entitled in December, 1919. The amendment was rejected.

Senator Chamberlain of Oregon opposed the passage of the bill, saying that whereas in 1916 the railroad brotherhoods were accused of demanding the passage of the Adamson law at the point of a gun, the railroad owners and the security holders are now demanding that Congress pass a bill at once and in a hurry to prevent the railroad companies going into bankruptcy. "Instead of the labor men holding the gun and sitting in the galleries looking down upon Congress," he said, "the railroad presidents, managers and their representatives are sitting in the galleries looking down upon Congress and insisting—what? Not only that their rates shall be increased but that we shall grant them large sums of money out of the treasury of the United States and out of the pockets of the taxpayers. Whose ox has been gored this time, Mr. President, and who will ring the changes now or in the coming campaign?"

Senator King remarked that, aside from those that had come from those favoring the Plumb plan, the only communications he had received opposed to the legislation were from those who owned railroad securities. The only railroad executive in the gallery at the time was S. Davies Warfield, who is chairman of the Seaboard Air Line, but who is also president of the National Association of Owners of Railroad Securities, which has been strongly supporting the bill. Senator Cummins said he did not know of a railroad president in the United States who is in favor of the bill, and he did not believe that the Senator from Oregon knew of any. "On the contrary," he said, "so far as I know, they all protest against its provisions. It has been asserted here a great many times that this is a bill made up by the railroad companies, but if any senator knows of a single railway executive who is favoring this bill I should like to hear him named."

Senator Chamberlain said he had not taken the trouble to inquire, to which Senator Cummins replied:

"The senator from Oregon has just asserted that railroad presidents were looking down upon the Senate insisting upon the passage of this bill. Now, that is not accurate, whatever else may be true. It is true that an association of bondholders, or some part of it, believes that this bill ought to be passed."

Senator Ransdell offered an amendment striking out the provision authorizing the commission to prescribe minimum rates, and also another declaring that the commission shall have no authority to establish any route, classification, rate, fare or charge when the transportation is wholly by water. These were adopted after Senator Cummins had said that he did not think the commission was given the power to establish such a rate by water and that the provision regarding minimum rates was included in the House bill, so that the whole question could go to conference in any event.

Senator Henderson of Nevada introduced a new amendment designed to restore a rigid long and short haul clause, which was lost by a tie vote, and Senator Poindexter secured another vote on his amendment to strike out the provision authorizing the commission to grant exceptions, which was also rejected.

Senator Brandegee of Connecticut offered an amendment to create a board of adjustment to adjudicate disputes between the government and the railroad companies growing out of the contracts entered into under the federal control act, but it was rejected.

An amendment by Senator Thomas of Colorado was adopted providing that passenger tickets, excepting special rate tickets for excursions, conventions, etc., shall not be limited and shall be honored when presented in payment for passage by any lawful owner thereof.

Senator King of Utah offered an amendment to strike out the rate-making section of the bill and to substitute for it a rule that rates by groups shall from time to time be adjusted by the Interstate Commerce Commission, so as to provide revenue sufficient to pay the wages of labor and all other

expenses of operating, including taxes, to earn proper current capital charges, to maintain necessary funds for repairs, replacements and working operations and establish credit sufficient to attract the new capital required to meet the public need for present and reasonable prospective transportation facilities and service. The amendment also provided that in applying the foregoing rule a comprehensive view of the conditions of each rate-making group shall be taken and the level of rates, fares and charges shall be determined with reasonable reference to railroads fairly representative of average conditions therein. In support of his argument for this amendment, Senator King presented part of the argument against the rate-making provisions of the Cummins bill recently published by Judge Lovett. The amendment was rejected without a record vote.

La Follette Delays Passage

It was expected that the bill would be passed at a late session on Friday night, but after it had been voted 41 to 17 to substitute the Senate bill for the House bill, Senator LaFollette offered as a substitute a provision for an extension of the present system of federal control for two years, prohibiting the relinquishment of the railroads prior to that time by the government or by any officer or agent thereof. Senators Sheppard of Texas and Kirby of Montana spoke in favor of this proposal, and a vote was about to be taken when Senator LaFollette announced that he had a few remarks to make. It had been understood that Senator LaFollette had promised not to filibuster against the passage of the bill when it became apparent that the Senate would refuse to adopt any amendments to the labor provisions, and therefore that there were no provisions in the bill which the labor organizations desired to insist upon, but Senator LaFollette did want to make a speech on the two-year extension which has been demanded by organized labor. He did not want to make the speech that night, however, as he had a bad cold, and he appeared to be able to speak only with great difficulty. After it had become apparent, however, that he proposed to hold the floor unless the bill could be postponed until the following day, a unanimous consent agreement was arranged providing for a final vote on the passage of the bill not later than 3:30 p. m. on Saturday, whereupon Senator LaFollette allowed his speech to be interrupted. This gave him, however, four hours on Saturday, which he devoted to an impassioned denunciation of the bill and of the railroads generally, after which his amendment was voted on and defeated and the bill was adopted without further formality.

The conferees were immediately appointed both in the Senate and in the House. In the House Representative Meade proposed a motion to instruct the House conferees to insist on the retention in the bill of the Anderson amendment, including the labor provisions. At the request of Mr. Esch, who asked that the conferees be left unhampered, he agreed to withhold the motion. Mr. Esch said that in view of the fact that the labor provisions are so radically different in the two bills it is almost certain that the conferees may have to go back to the House for further instructions.

The conferees held their first session on the bill on December 23 and another on December 24, after which they adjourned until Monday, December 29.

The Railroad Commission of California, in the year ending June 30, 1919, investigated 54 accidents. The commission requires the railways to examine the qualifications and physical fitness of employees in train and engine service, and has required the smaller companies to operate their roads in accordance with rules and methods which have been found to be most satisfactory by other companies.

Roads Will Be Returned March 1

President Wilson on Wednesday evening, December 24, issued the following proclamation concerning the relinquishment of federal control of railroads and systems of transportation:

"Whereas, in the exercise of authority committed to me by law I have heretofore, through the Secretary of War, taken possession of, and have, through the Director General of Railroads, exercised control over certain railroads, systems of transportation and property appurtenant thereto or connected therewith, including systems of coastwise and inland transportation and property appurtenant thereto or con- or controlled by said railroads or systems of transportation; including also terminals, terminal companies and terminal associations, sleeping and parlor cars, private cars and private car lines, elevators, warehouses, telegraph and telephone lines and all other equipment and appurtenances commonly used upon or operated as a part of such railroads and systems of transportation; and,

"Whereas, I now deem it needful and desirable that all railroads, systems of transportation and property now under such Federal control be relinquished therefrom,

"Now, therefore, under authority of Section 14 of the Federal control act approved March 21, 1918, and of all other powers and provisions of law thereto me enabling, I, Woodrow Wilson, President of the United States, do hereby relinquish from Federal control, effective the first day of March, 1920, at 12:01 o'clock a. m., all railroads, systems of transportation and property of whatever kind taken or held under such Federal control and not heretofore relinquished, and restore the same to the possession and control of their respective owners.

"Walker D. Hines, Director General of Railroads, or his successor in office is hereby authorized and directed, through such agent and agencies as he may determine, if in any manner not inconsistent with the provisions of said act of March 21, 1918, to adjust, settle and close all matters, including the making of agreements for compensation, and all questions and disputes of whatsoever nature arising out of or incident to Federal control, until otherwise provided by proclamation of the President or by act of Congress. And generally to do and perform as fully in all respects as the President is authorized to do, all and singular the acts and things necessary or proper in order to carry into effect this proclamation and the relinquishment of said railroads, systems of transportation and property.

"For the purposes of accounting and for all other purposes this proclamation shall become effective on the first day of March, 1920, at 12:01 a. m.

"In witness whereof I have hereunto set my hand and caused the seal of the United States to be affixed.

"Done by the President, through Newton D. Baker, Secretary of War, in the District of Columbia, this 24th day of December, the year of our Lord one thousand nine hundred and nineteen, and of the independence of the United States of America the one hundred and forty-fourth."

A similar proclamation was also issued relinquishing the American Railway Express Company.

Forty-one years at the throttle without one accident to mar his work is the remarkable record established by Lew Patrick, as reported by the Canadian Pacific. Up to October 31, 1919, Mr. Patrick was an engineman, running trains out of Revelstoke on the mountain division. He is one of the pioneers who went west with the railroad, starting at St. Boniface, Manitoba, when a young man of twenty-five years. From June, 1896, to the spring of 1918, Patrick was a runner on the Imperial Limited passenger trains.

General News Department

J. L. Truden, general superintendent of the Boston & Albany, has received from the King of the Belgians a medal of the Order of Leopold II, presented in appreciation of the efficiency with which King Albert's train was managed while moving over the Boston & Albany line.

The Kansas City Northwestern, having ceased to operate trains, as ordered recently by the United States District Court, Eastern District of Kansas, the court has ordered Jay M. Lee, the newly appointed receiver, to discharge all operating employees, retaining only the office men in the legal, auditing and grain departments.

The Twentieth Century Limited express train of the New York Central, and the Broadway Limited of the Pennsylvania were put in service on December 20, following the ten-days' suspension of their trips because of the scarcity of coal and the disturbance in freight traffic. The restoration of these trains completed the return to normal timetables on all lines east of Chicago.

E. C. Davidson, secretary-treasurer of the International Association of Machinists, has been quoted as saying that nearly 100 per cent of the members of the organization have voted in favor of a strike if the anti-strike provisions of the Cummins bill are adopted by the Senate, and that there will be a general strike of railroad employees, except possibly the enginemen, conductors and firemen, if the bill goes through.

Engineering Council recently mailed to 50,000 engineers an appeal for funds to carry on its work. This extraordinary measure was necessitated by present financial conditions resulting from the war. Engineers are expecting much of the council and commending the work which it has done. In order, however, that the council may continue its work for professional welfare and civic service, not less than $45,000 is needed for 1920. Of this amount, $30,000, at least, must come from general contributions. To December 16, 550 contributions have been received, totaling $3,843. They range from one dollar to $100 each and average $7.

The Illinois Southern Railroad, extending from Salem, Ill., southwest 127 miles to Bismarck, Mo., has ceased operation, under an order entered on December 11 by Federal Judge George Carpenter in the United States District Court at Chicago. The order was issued at the request of W. W. Wheelock, receiver of the property, after foreclosure proceedings had been started by the bondholders, represented by the Chicago Clearing-House Association. The railway was capitalized at $5,000,000 and is asserted to have lost $100,000 in the recent past, struggling to operate against financial odds. It has been losing money for two years and has paid no interest on its bonds. The recent coal strike produced complete insolvency, as the road derived its main traffic from the Illinois coal fields.

The Safety Section, Division of Operation, of the United States Railroad Administration reports for the month of September 193 railroad employees killed and 11,887 injured, as compared with 261 killed and 12,476 injured in September of last year. The number of meetings of safety committees held in September on the railroads under federal control was 1,888, with an attendance of 28,935. The number of men who, during the month, received instruction or advice on safety matters either by attending meetings or by being spoken to individually by committee-men was 183,383; and 160,320 safety bulletins, circulars, etc., were distributed. Other safety "literature," including magazines, etc., in addition to the foregoing, was distributed to the number of 1,108,189 copies. For the first nine months of 1919 the total net decrease in casualties, reported by regions, was, for the whole country, 1,002 employees killed, and 23,986 injured; or, in round numbers, and crediting the safety committees with the whole of the saving in life and limb, 25,000 personal injuries prevented. A. F. Duffy, manager of the Section, urges safety supervisors to be careful not to allow discussion of the possible change in the management of the railroads to have any influence in relaxing activities for safety.

The fire insurance men are preparing to renew business with the railroads when the lines are returned, according to the New York Journal of Commerce. Notwithstanding the doubt as to the return of the railroads to private ownership on January 1, the underwriters are preparing to re-enter the field closed to them when the Government took over the railroads. The premiums paid by the railroads to the fire insurance companies before the Government took control have been estimated all the way from $10,000,000 to a much larger sum. Considerable organization work will be necessary before the insurance companies can take up the railroad lines again, but the underwriters propose to be ready. Many of the inspectors, and in some cases entire organizations, went over to the Government when the roads were transferred, and these it is expected will come back.

Public Ownership League Wants Railroads Retained

A petition bearing 22,000 signatures secured by the Public Ownership League in 38 states, protesting against the return of the railroads to private management, was filed in Congress on December 20 by Representative Sinclair of North Dakota. On the back of the sheets bearing the signatures was the following statement.

"Keep the railroads. The people have bought and paid for them twice over. The people should own and operate them. The people of this nation have invested more than $900,000,000 in rehabilitating the railway system that private ownership had so exploited and plundered and mismanaged that it was utterly inadequate.

"The people have invested another $975,000,000 in improving labor conditions and pulling the railroads out of an impossible situation that private ownership had created.

"The government has rehabilitated the dilapitated system, unified it, effected numerous economies and guaranteed the private owners their usual dividends. And yet they are not satisfied. They want the railroads back again for further exploitation and plunder. We protest."

Disastrous Collision at Onawa, Me.

In a butting collision between an immigrant train and a freight, on the Canadian Pacific, near Onawa, Me., at 7:15 on the morning of the 20th of December, 19 passengers and four trainmen were killed, and 35 passengers were injured, some of the killed being burned to death, and some of the injured severely burnt before they could be rescued. The enginemen and firemen of both trains were killed.

Onawa is about 50 miles northwest from Bangor, and lies between two junctions of the Canadian Pacific with the Bangor & Aroostook, Greenville about 15 miles to the west, and Brownville Junction, about 20 miles to the east. Trains were sent over the Bangor & Aroostook until the track was cleared.

The immigrant train, carrying about 300 passengers, was the fourth section of westbound passenger train No. 39, and the freight was an eastbound extra. Both locomotives were wrecked and the freight engine crashed through the first two coaches of the passenger train. The wreck took fire from coals in the fireboxes. The freight had met the third section of the passenger train at Bodfish, one mile west of Onawa, and should have waited there for the fourth section. The temperature at the time of the collision was about 20 deg. below zero.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF OCTOBER, 1919—CONTINUED

Dissolution of the "Packers' Trust"

The government's anti trust action against the five large meat packing companies, Swift, Amour, Morris, Wilson and Cudahy, has been compromised under an agreement by which the packers will confine themselves hereafter to the meat and provision business. An injunction decree to which the packers have acceded will be entered in the federal courts and under its terms the companies have agreed to sell, under supervision of the United States District Court, all their holdings in public stock yards, all their interests in stock yard railroads and terminals, all interest in public warehouses, except as necessary for their own meat products, to abandon the use of the branch houses, route cars and auto trucks (comprising their distribution system) for any other than their own meat and dairy products, and to dissociate themselves from the retail meat business and "unrelated lines" of business.

Organized Labor Adopts a "Declaration of Rights"

The conference of officers of national and international unions affiliated with the American Federation of Labor and of the four railway brotherhoods of train service employees, held at Washington beginning on December 13, adopted a declaration of rights which asserted that "the right to cease work—strike—as a final means of enforcing justice from an autocratic control of industry must be maintained." The anti-strike provision of the Cummins bill and all similar proposed legislation were specifically denounced as "un-American, vicious in character and as establishing by legislation involuntary servitude." It was urged that the judges of federal courts shall be elected by the people for terms not exceeding six years. Regarding the railroads, the declaration includes the following:

"Since the government has not worked out a constructive railroad policy, we urge for and on behalf of the railway workers and of the general public, that the railroads be retained under government administration for at least two years after January 1, 1920, in order that a thorough test may be made of governmental operation under normal conditions.

"The common carriers of this country are the arteries of travel, commerce and industry. Transportation service and rates are intimately bound up with industrial production in all parts of the country."

Board Named to Consider Miners' Wages and Coal Prices

Members of the commission to carry out the government's plan for the settlement of the coal strike controversy were appointed by President Wilson on December 21 as follows: Henry M. Robinson, of Pasadena, Cal., as the representative of the public; John P. White, representing the miners, and Rembrandt Peale, representing the coal operators. In his letter asking them to serve on the commission the President said that if in their judgment a readjustment of the price of coal shall be necessary to meet any increase of wages beyond the 14 per cent put into effect to induce the striking miners to return to work he would clothe the commission with the powers vested in the Fuel Administration for that purpose, but only in the event of a unanimous decision by the commission.

The Bituminous Coal Operators' Association issued a statement denying an assertion made by the President that the operators had generally agreed to the terms of the settlement offered to the miners' union on December 6. The statement asserted that the operators had not been consulted and had not seen the memorandum of agreement. To this Attorney General Palmer replied that failure of the operators to agree now to the government's plan would be "an amazing repudiation of their own statements." The operators say they had agreed to the plan previously proposed by Dr. Garfield for a 14 per cent increase in wages with no increase in coal prices and that the attorney general had later compromised with the miners, while Mr. Palmer has taken the position that the government had forced a settlement.

Traffic News

The Governor of Kansas on December 14 sent urgent messages to Walker D. Hines, director general, and Hale Holden, regional director of the Central Western region, asking them immediately to investigate the car shortage situation which is causing enormous loss to farmers. The messages stated that 49 per cent of the wheat crop in the northwestern quarter of Kansas still is in the hands of the farmer, some of it on the ground. All elevators are said to be full and no cars available to move the wheat to markets.

According to a report on overseas traffic for the week ended December 10, 1919, made to Walker D. Hines, director general of railroads, 6,749 cars of commercial export freight were received at North Atlantic ports for this period, as compared with 1,041 cars for the same week of 1918. This shows an increase of 5,708 cars or 548 per cent, for December 10, 1919, as against the corresponding period last year. For the same period deliveries to ships increased 6,004 cars or 512 per cent. At South Atlantic and Gulf ports as of December 7, 1919, there were 13,228 cars of export freight on hand, as against 12,498 cars on December 1, an increase of 730 cars. On December 10, 1919, there were 11,978,708 bushels of grain stored in elevators at North Atlantic ports. There were received during the week 3,757,888 bushels, while 4,661,885 bushels were cleared. The total amount of grain in elevators at these ports on the date mentioned represents 60.7 per cent of the total elevator capacity, compared with 65.4 per cent for the week previous. At South Atlantic and Gulf ports there were stored in elevators on December 10, 1919, 8,416,109 bushels of grain, representing 82.6 per cent of the total elevator capacity.

Coal Restrictions Relaxed

Because of the increased production of coal incident to the return of a large proportion of the striking miners to work on December 15, the Railroad Administration has relaxed most of the restrictions on the distribution of coal and has allowed shipments to run practically as billed except as it has been necessary to divert shipments occasionally to meet emergency situations. Some local embargoes were necessary in the middle west for a time.

Seven Hundred Automobile Stock-cars

According to a circular issued by the National Automobile Chamber of Commerce, 700 loaded motor trucks have entered the stock yards at Indianapolis, Ind., in a single day, some of them having come from points 80 miles away. On one day recently the number of hogs delivered at these stock yards by motor trucks was 6,800, valued at $200,000. These animals were brought by about 500 vehicles and the total number of hogs was 2,000 more than the number received on the same day by steam and interurban railroads. It was estimated that the 500 trucks had traveled 2,500 miles and had consumed 300 gallons of gasoline. In the year 1918 the number of hogs received at Indianapolis by motor trucks was 462,313, more than 50 per cent greater than in 1917.

Receipts of hogs by motor truck at Sioux City, Iowa, are reaching enormous proportions. The number received at this point during January, February and March, 1917, totalled 9,655; for a similar period in 1918, this had increased to 13,750, while for a similar period in 1919, the amount had jumped to 26,195. It is expected that the figures for this year will be more than 90,000.

The vice-president of the St. Joseph (Mo.), stockyards reports the following receipts by motor truck:

Year	Cattle	Hogs	Sheep
1918	20,686	121,138	37,137
1917	15,043	56,529	31,094

This livestock is coming in from a radius of 50 miles. It is declared to be in better condition than ever before.

Commission and Court News

Personnel of Commissions

The Senate has confirmed the President's reappointment of Edgar E. Clark as a member of the Interstate Commerce Commission for a term expiring December 31, 1926.

Court News

Condemnation of Land for Connecting Track

The Illinois Supreme Court holds that a contract for joint use by the railroads and the consent and approval of the Public Utilities Commission are not conditions precedent to a railroad's right to condemn property for a connecting track.—Chicago, M. & St. P. v. Frauzen (Ill.), 122 N. E., 492.

Contributory Negligence of Volunteer

In an action by an infant for bodily injuries received on its acceptance of an invitation of an employee of the defendant railroad to couple engines, the Texas Court of Civil Appeals holds that in order to recover it must be shown that the infant was not capable of appreciating the danger.—Trinity Valley & Northern v. Scholz (Tex.), 209 S. W., 224.

Care of Passenger in Aisle of Car

The Texas Court of Civil Appeals holds that the conductor of a passenger train was not negligent in standing in the aisle about the middle of a car, bent over talking to someone as a woman approached, walking to the rear, and became overbalanced while attempting to stop to wait until the conductor would let her pass.—Gulf, Colorado & Santa Fé (Tex.), 209 S. W., 772.

Assisting Alighting Passengers

Whether or not a person comes within the excepted class of passengers who require assistance to alight as being sick or infirm is a question for the jury, the standard of the carriers' duty not being fixed but variable and shifting with circumstances; but the Oklahoma Supreme Court holds that where there is no evidence to bring the plaintiff within the exception, it is reversible error to submit the question to the jury on a purely hypothetical case.—Dickinson v. Tucker (Okla.), 176 Pac., 949.

Stop, Look, Listen Rule—Pennsylvania

The Pennsylvania Supreme Court holds that in an action for injury at a crossing, the railroad's point for a charge that it is a positive duty of an automobile driver approaching a grade crossing where there is restricted vision to stop, look and listen at a place where that will be effective, and that failure to do so is negligence per se, and that, if unable to get a sufficient view from his car, he should get out and go to a place affording a sufficient view, should have been unqualifiedly affirmed.—Knepp v. Baltimore & Ohio (Pa.), 105 Atl., 636.

Indorsement of "Order" Bill of Lading

The Georgia Court of Appeals holds that where an "order notify" bill of lading contains a provision requiring the surrender of the original bill of lading, properly indorsed, the fact that the shipper, by mistake, sends the original bill of lading (instead of the memorandum bill of lading) direct to the party to be modified, but sends it unindorsed, does not relieve the carrier from requiring it to be properly indorsed before delivering the shipment; and where, under such circumstances, the carrier so delivers the property, without requiring such indorsement, and the party to whom delivered obtains the shipment and subsequently becomes insolvent, without having paid the purchase price of the property, the principle of law that, where one of two innocent persons must suffer for the act of a third person, he who puts it in the power of the third person to inflict the injury must bear the loss, does not apply. The antecedent error of the shipper in sending the original bill of lading to the wrong party did not put it in the power of that party to inflict the injury, as its possession of the unindorsed bill of lading did not vest it with any apparent right to the property. The loss resulted from the negligence of the carrier in failing to require the proper indorsement of the bill of lading—Southern R. v. Massee, etc., Lumber Co. (Ga.), 98 S. E., 106.

Sale of Freight to Pay Demurrage

The South Carolina Supreme Court holds that a shipper was not entitled to recover the value of lumber sold by the terminal carrier to pay freight and demurrage charges, where the new consignee to whom the plaintiff shipper directed the initial carrier to divert shipments defaulted in giving instructions, and where the instructions finally received gave notice that no demurrage charges would be paid after a certain day.—Thomas v. Northwestern of South Carolina (S. Car) 98 S. E. 336.

What a Right of Way Condemnation Award Includes

The Virginia Court of Appeals affirms the rule that the conveyance to a railroad of a right of way vests in the company the same rights as though the land had been acquired by condemnation, and the grantor cannot recover for any damages to the remainder of his land resulting from a proper construction, use, and operation of the property conveyed; and where part of a tract of land is taken by condemnation proceedings for a right of way, the award includes damages to the residue of the tract which are due to the construction and operation of the railroad on a grade different from the natural surface of the land.—Pamplin v. Norfolk & Western (Va.), 98 S. E., 51.

Warning Signals on Bridge Under Repair

The Alabama Supreme Court holds that a pedestrian who saw barriers and red lights intended to warn against the use of a bridge maintained by a railroad under authority of a city and which was being repaired, was conclusively charged with knowledge that the barriers and lights were placed to warn him not to attempt to cross. Although they were insufficient, a pedestrian, who saw both, and attempted to cross without looking for holes and defects, could not recover for injuries sustained. The mere fact that he saw others using the bridge did not justify him in disregarding the signals and red lights, and when he did he assumed the risk.—Morgan v. Mobile & Ohio (Ala.) 80 So. 845.

Promise to Pay Claim Not Binding Without Consideration

The Texas Court of Civil Appeals holds that a mere promise by a railroad to pay for goods lost, for which it was not liable, and which was not in the nature of a compromise, is not binding on the railroad, because it was without consideration. This rule was applied where the shipper presented a claim to the receiver of the M., K. & T., which stamped it "vouchered," meaning that the claim had been passed upon, approved, and ordered paid by the receiver, acting through the claim department. It was held that if the M., K. & T. was not liable on the claim, its promise to pay was without consideration and not binding on it.—Mistrort-Calahan Co. v. M., K. & T. (Tex.), 209 S. W., 775.

Interstate Shipment—Innocent Purchaser of Bill of Lading

The Texas Court of Civil Appeals holds that a car of grain carried from St. Joseph, Mo., to Temple, Tex., was an "interstate shipment" as between carrier and shipper, though the bill of lading indicated it was intrastate; but the carrier was held estopped from asserting the interstate character of the shipment as against the purchaser, who paid the draft drawn on him to which the bill of lading was attached, without knowledge that the grain was originally shipped from another state.—Missouri, K. & T. v. Clement Grain Co. (Tex.) 211 S. W. 347.

Railroad's Title to Lands Acquired

Under the Texas statutes, a railroad may condemn property, not only for right of way, but for other necessary uses. But it also has the right to acquire real estate without limitation or restriction in use; and, when so acquired, its title is as absolute as that of a private individual, at least insofar as concerns immunity from attack by anyone but the state. It may, of course, often be a question whether or not the deeds when properly construed convey a fee upon condition or limitation, or merely an easement in the property. The Texas Commission of Appeals holds that deeds by trustees to a railroad on condition that the premises shall be used exclusively for railroad purposes, and that after they shall cease to be used for such purposes they shall revert to the grantors or their "successors," naming a small consideration, the real consideration being expected enhancement in value of the grantors' adjoining property, conveyed a fee upon condition subsequent, and not upon limitation, and the railroad took an indefeasible title after the grantors' sale of the adjoining land.—Stevens v. Galveston H. &. S. A. (Tex.) 212 S. W. 639.

Decisions Under Federal Employers' Liability Act

The New Hampshire Supreme Court holds that a locomotive engineer, acting under two orders, one to help an interstate freight train to a summit and the other to return with his engine, was within the federal act when injured on his return trip.—Callahan v. Boston & Maine (N. H.) 106 Atl. 37.

The New Jersey Court of Errors and Appeals holds that a workman of an independent stevedoring corporation contracting with a railroad at a stipulated charge per ton to load and unload freight at a water front terminal and which selects, pays and directs its men, is not an employee of the railroad while engaged in such work, within the meaning of the act, and is not entitled to the benefits of the act in an action against the railroad.—Drago v. Central of New Jersey (N. J.) 106 Atl. 803.

The Pennsylvania Supreme Court holds that where a local train operating entirely within the state, while switching an empty freight car from one track to another in a private yard, attached it to the rear end of a train, the mere fact that several cars in the train were consigned from points without the state to the owner of the yard was not sufficient to sustain a finding that a brakeman injured by an alleged defective brake, while riding on the empty car, was engaged in interstate commerce as distinguished from a mere local switching operation.—Murray v. Pittsburgh C. C. & St. L. (Pa.) 107 Atl. 21.

The Illinois Supreme Court holds that a locomotive boiler washer shot and killed by another employee of the railroad while engaged in washing a boiler on a locomotive, not assigned to any particular train or work, but standing in the yard ready to be assigned to either intrastate or interstate commerce, is not engaged in interstate commerce.—Rock Island v. Industrial Commission (Ill.) 123 N. E. 278.

The North Dakota Supreme Court holds that an employee of an interstate railroad who is injured while removing snow from a track over which interstate trains are being run regularly, is engaged in interstate commerce within the act.—Koofors v. Great Northern (N. Dak.) 170 N. W. 859.

The Iowa Supreme Court holds that a freight conductor employed on a line entirely within the state, who fell from the platform of the caboose and was killed while taking the caboose and motor to the barn, subsequent to reporting at the yard office after having uncoupled from a train containing one car consigned to a point in another state, was not engaged in interstate commerce.—Smith v. Interurban (Iowa) 171 N. W. 134.

The New York Appellate Division holds that the watchman of a lot of freight placed upon a pier after its interstate shipment, who was killed while so employed before the consignee had taken possession or paid freight charges and before the expiration of the 48-hour period allowed in which to remove the goods, is not entitled to an award under the state Workmen's Compensation Act, having been killed while guarding an interstate shipment.—O'Brien v. Pennsylvania, 176 N. Y. Supp. 390.

Foreign Railway News

The railway delegates of all the states of the Australian Commonwealth have passed, says *Modern Transport*, a resolution demanding a share in the management of the railways.

South African Railway Rates Increased

Increases in railway rates have recently been made effective in South Africa as follows: Passenger fares, 10 per cent.; luggage, parcels and live stock 25 per cent., goods 25 per cent., except coal for export and coal for local consumption conveyed less than 500 miles.

Road Transport Cheaper Than Rail Transport?

Francis White, borough engineer and surveyor of Blackpool, stated in a paper before the Road Transport Congress recently that motor car-a-bancs could be run at a substantial profit at a two cents per mile per passenger as compared with three cents per mile on railways.

Råilway Station Roof Air Signs

Airplane travel in England has now reached such an importance as to bring out the recent notice to airmen by the Air Ministry: "The roofs of the following railway stations are now marked with the name of the place in large white letters: Redhill, Tonbridge and Ashford (South Eastern and Chatham Railway), and Hitchin (Great Northern Railway).

22,600 New Wagons for English Railways

In reply to a question asked in the House of Parliament, Sir Rhys Williams, Parliamentary Secretary to the Ministry of Transport, stated that from the beginning of the year to the end of September 8,480 railway wagons had been constructed in the United Kingdom. Orders for the construction of 22,600 wagons had been placed with the railway companies, including contracts with outside firms for 5,400. No wagons have been ordered by the Ministry of Transport.

Cost of Government Locomotives

Three hundred and five Great Central railway type, ten New South Wales Government type and fourteen tank engine Dutch railway type superheated locomotives were built in Great Britain and sent to France. The average cost of these locomotives varied between £5,500 and £8,300. The tank engine Dutch railway type locomotives were sold for 200,000 francs each (approximately £8,000). The others are being allocated to the British railway companies under a pooling arrangement under the direction of the Ministry of Transport; 154 having already been allocated. About one hundred of the locomotives built for government use have been sold. The bulk of these engines have been sold to the Great Western and Great Eastern railways, while a few have been disposed of to the South Eastern & Chatham.

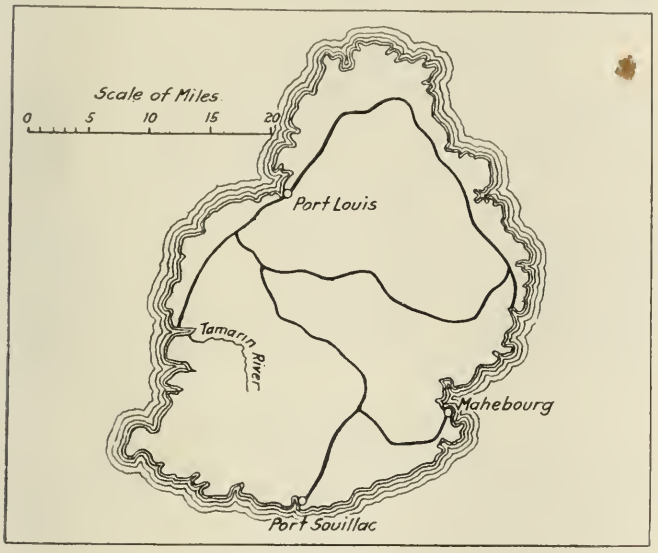
A Bill to Prevent "Lightning Strikes"

The Liberty and Property Defence League of England has prepared for immediate presentation to Parliament a bill under the title of the Trade Disputes Bill, with the double object of securing an interval for reflection before a trade dispute is allowed to develop into a strike or lockout, and of vesting in the members of a union (as distinct from the executive) the right to say whether the authority and funds of the union shall be employed for the purpose of a strike or lockout. It is proposed to provide that a strike or lockout, whether or not a union is concerned, shall not take place until 14 days after a statement relative to the dispute has been published by the Minister of Labor, and that a union shall not be concerned in a strike or lockout until it has obtained the approval of the members. It is not intended to interfere with the right of members of the union

to strike or not to strike, whatever the result of the ballot, but if the ballot went against the strike they could not receive strike pay from the union.

Electrification of Mauritius Railways

Major G. McAlpine, who was electrical adviser to the Government of Mauritius, drafted a report in 1904 recommending the electrification of all the Mauritius railways. This island in the Indian Ocean has about 120 miles of standard gauge railway. Major McAlpine showed in his report that power could be obtained by utilizing the waterfalls, which are numerous on the island. The plan met with favor in the legislative council, and now that the island's finances are in a prosperous condition, the matter has been brought forward for re-examination. A committee has been appointed to go into the whole question over again, but owing to the popular feeling in favor of the change



The Railways of Mauritius

its recommendation is a foregone conclusion. It has been computed that one of the waterfalls—that of Tamarin—will alone suffice to provide the power required to supply the whole of the island with electricity as well as to work the railways electrically. Eleven of the 132 villages and towns of the colony are already lighted by electricity, and authority has just been given by the legislative council to extend the services to seven other towns. Difficulty is, however, being experienced by the two local electric undertakings as well as by the municipality of Port Louis, in getting supplies of wire lamps and meters from England. Inquiries have been made in the United States by one newly-established firm in Port Louis to meet the demand, but the response so far, it is reported, has not been favorable.

New Fuel for French Locomotives

The Paris, Lyons & Mediterranean has decided to adapt 200 of its locomotives to crude oil or Mazout. The modification is expected to be effected at the rate of two engines a day. Reserve tanks will be set up at suitable points on the system to hold between 40 and 100 tons of fuel.

The plant modifications are neither difficult nor costly, being simply a reservoir in place of the coal bunkers, conducting tubes to the burners and refractory bricks in the firebox.

At an official test held at Bercy on November 25, the locomotive drew a heavy goods train upon approximately half the weight of fuel which would have been necessary for the work if coal had been used. There is practically no smoke and it is expected that this fuel will save much labor in the engine houses.

The International Commission of the Rhine

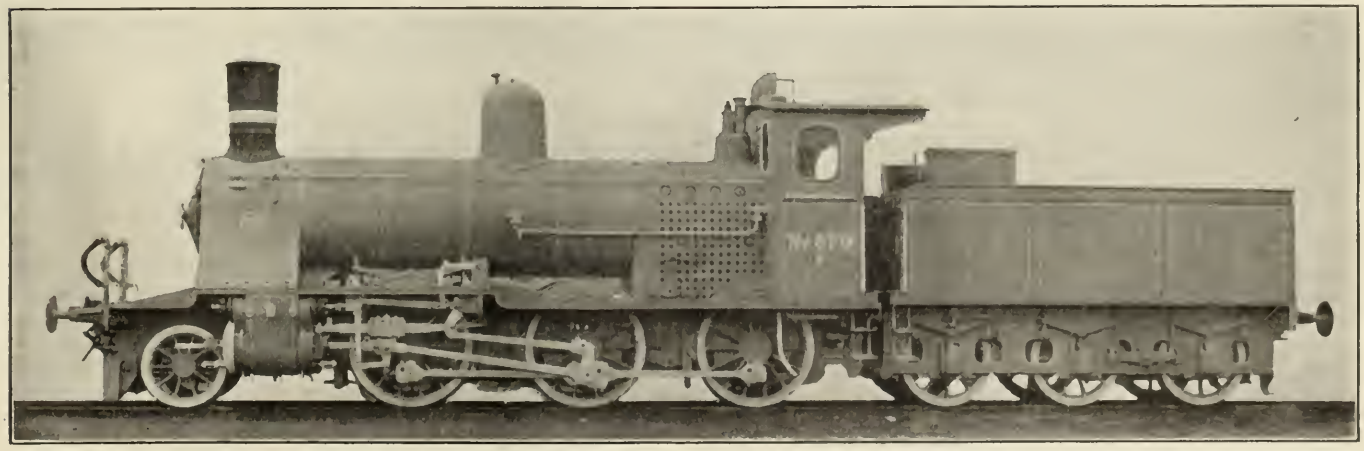
It appears, said La Presse de Paris, in its issue of November 21, that when the Treaty of Versailles goes into effect, M. Claveille, Minister of Public Works, will be appointed president of the International Commission of the Rhine. M. Cels, deputy from the Department of Lot and Geronne, at present assistant secretary of state at the Ministry of Public Works, will probably succeed M. Claveille at the head of this Ministry.

It is known that the Treaty of Peace stipulates that the Mannheim Agreement of October 17, 1868, will continue to regulate the navigation on the Rhine. Within six months of the date upon which the treaty goes into effect, a central commission will convene for the revision of this Mannheim Agreement. Germany has already agreed to abide by the decisions of this commission which will be composed of 19 members—two representatives of each of the following countries: Holland, Switzerland, Great Britain, Italy and Belgium; four for the German States on the river and four for France which will, moreover, name the president of the Commission.

The duty of this Commission will be to assure the freedom of navigation on the Rhine which will become an international river. It will also control the execution by Germany of the handing over of the tugs and boats, as well as its installations, in the Port of Rotterdam.

France alone, may take from the Rhine the water required for the operation of its lateral canals. That country will have an exclusive right to the power produced by the river.

M. Claveille has prepared a vast project to make the most of these advantages granted France by the Treaty, either by the use of the navigable waters of the Rhine for importing



Mogul Locomotive Built for the Danish State Railways by the Baldwin Locomotive Works.

This is one of an order for 16. The locomotive is built for standard gage, has 460 mm. by 610 mm. cylinders, a total weight in working order, engine only, of 44,630 kgs.; a weight on drivers of 36,470 kgs., and is superheated. It burns coal and is intended for freight service.

and exporting between Basle and Rotterdam, or by the creation, along the river, of large hydro-electric plants to furnish electric power for the whole Parisian Region, thus doubling the producing capacity almost without expense

Woolwich Arsenal to Manufacture Railway Rolling Stock

Lloyd George, Prime Minister of Great Britain, recently visited the Woolwich Arsenal in order to make himself acquainted with the view of the men on the question of discharges and to inspect certain parts of the works which are now being used for civil work. During the war about 110,000 men were employed and the number has now been reduced to 30,000. One of the main points of the men's case is that there are thousands of men who are skilled at their own particular work in the Arsenal but who, if they were discharged, would have to face the labor market as practically unskilled men. By utilizing their labor in the Arsenal in other directions, such as in the work of repairing railway wagons, locomotives, etc., these men would be doing useful work and at the same time their presence in the Arsenal would be a kind of war insurance. In the event of emergency they could be readily turned on to the special munition work in which they are skilled.

This plant has, since the armistice, turned out 10,000 milk churns, freight car repair work is in progress, orders have been received for 2,500 new railway freight cars and one hundred 100-ton standard gage locomotives. The Prime Minister informed the committee that Woolwich is to be developed for the manufacture of locomotives and cars.

Sale of Railway Material by British Government

Among war material offered for sale by the British Government were the following:

Locomotives.
Six 0-6-0 type, 4-ft. 8½-in. gage, by Kerr, Stuart & Co. Cylinders 17-in. by 24-in. stroke.
A number 0-4-0 type, 4-ft. 8½-in. gage, by Baldwin Locomotive Co. Cylinders 16-in. by 24-in. stroke.
A number 0-6-0 type, 4-ft. 8½-in. gage, by Baldwin Locomotive Co. Cylinders 16-in. by 24-in stroke.
A number 0-6-0 type, 4-ft. 8½-in. gage, by Manning, Wardle & Co. Cylinders 12-in. by 18-in. stroke.
A number 0-4-0 type, 4-ft. 8½-in. gage. Cylinders from 8-in. diameter to 12-in. diameter with stroke from 8-in. to 24-in.
Two 1 side tank and one saddle tank, rebuilt by J. Wake, of Darlington. 3-ft. 6-in. gage.
18 side tank engines, 2-ft. 6-in. gage, built by Hunslet Engine Co., Leeds. Cylinders 9½-in. by 12-in. stroke.
One 2-6-2 type, 2-ft. 6-in. gage, by the Yorkshire Engineering Co. Cylinders 6-in. diameter by 14-in. stroke.
Three 0-4-2 type, 2-ft. gage, by Kerr, Stuart & Co. Cylinders 8-in. by 12-in. stroke.
Two 0-4-0 type, 2-ft. gage, by Kerr, Stuart & Co. Cylinders 5-in. by 9-in. stroke.
Three 0-4-0 type, 2-ft. gage, by R. Hudson & Co. Cylinders 6-in. by 9-in. stroke.
One 0-4-0 type, 2-ft. gage, by Avonside Engineering Co. Cylinders 8-in. by 12-in. stroke.
A number of 0-4-0 type, 60 c/m gage, by W. G. Bagnall. Cylinders 6-in. by 9-in. stroke.
A number of 4-6-0 type, 60 c/m gage, by Hunslet Engineering Co. Cylinders 9½-in. by 12-in. stroke.
A number of 4-6-0 type, 60 c/m gage, by Baldwin Locomotive Co. Cylinders 9-in. by 12-in. stroke.
Two 2-6-2 type, 60 c/m gage, by American Locomotive Co. Cylinders 9-in. by 14-in. stroke.
One 0-4-0 type, 1 ft. 8-in. gage, by W. G. Bagnall. Cylinders 5-in. by 7½-in. stroke.
Wagons.
Four-wheeled open wagons, 60 c/m gage. Weight 1,868 lbs. Loose sides and ends.
Four-wheeled open wagons, 60 c/m gage. Weight 2,016 lb. Folding sides and ends.
Bogie low-sided wagons with falling doors, 60 c/m gage. Weight 5,040 lbs.
Bogie tank wagons without tanks, 60 c/m gage. Capacity 1,500 gal.
Four-wheeled light ration wagons with falling sides, 6 ft. 8 in. long by 4 ft. 10 in. wide.
Spare wheels and axles with roller bearings for tip wagons.
Spare parts for all above mentioned rolling stock.
40 4-ft. 8½-in. gage covered vans.
80 3-ft. gage timber frames and sheet-iron lined side tip wagons, 1½ cubic yards capacity.
16 flat-topped 3-ft. gage timber framed bogies.
Track.
10,025 tons of rails, 75-lb., F/B., B.S.S.
650 tons Fishplates, 75-lb., F/B., B.S.S.
202 tons Fishbolts, 75-lb., F/B., B.S.S.

Equipment and Supplies

Locomotive Deliveries

The following locomotives were shipped during the week ended December 6:

Works	Road	No.	Type	Individual engine No.
American	T. & P.	2	Pacific	709-10
		2		
Baldwin	B. & O.	7	U. S. R. A Mall.	7153-59
	P. & R.	6	U. S. R. A. Consol.	1689-94
	L. V.	1	Santa Fe	4066
		14		
	Total	16		

Locomotive Shipments in November

The Railroad Administration has issued the following statement of locomotives shipped in November:

Road	On order prior to Federal control		U.S.R.A. Orders		Constructed in Railroad shops		Total Builders
	Type	No.	Type	No.	Type	No.

Freight Cars

The Sinclair Refining Company, Chicago, is inquiring for three dump cars.

Frederick W. Glardon, 165 Broadway, New York, is inquiring for one 30,000-gal. tank car for export.

The Sterling Coal Company, Philadelphia, Pa., has ordered 100 mine cars from the Pressed Steel Car Company.

The Bagdad Lumber Company, Bagdad, Fla., has ordered 40 steel logging cars from the American Car & Foundry Company.

The Jamison Coal & Coke Company, Greensburg, Pa., has ordered 180 mine cars from the American Car & Foundry Company.

The Greenleaf-Johnson Lumber Company, Norfolk, Va., has ordered 15 15-ton logging cars from the American Car & Foundry Company.

The Eastern Steel Company, Pottsville, Pa., has ordered five 50-ton steel gondolas and 17 50-ton steel hopper cars from the American Car & Foundry Company.

Machinery and Tools

The Greenville Steel Car Company, Greenville, Pa., is inquiring for tool equipment for an additional machine shop which it contemplates building at Greenville.

Comity Between Competitors.—Erie Railroad commuters yesterday told a story of an obliging engineer who stopped their train to give away hot water. At Heller Field, the eastern landing field of the aerial mail service on the West Orange (New Jersey) branch, Pilot P. W. Smith was ready to start with the Chicago mail when it was discovered that the water pipes at the field were frozen and there was not enough hot water on hand to start his motor. As the train came in sight, someone flagged the train, and told the engineer of the pilot's trouble. "Glad to help you out," said the engineer. Two fifty-gallon tanks were rolled up the railroad embankment and the obliging engineer filled both with hot water.—*New York Times.*

Supply Trade News

The Van Dorn Girder Plate Company, manufacturer of railway car appliances, has removed its general offices from 2325 South Paulina street, Chicago, to 608 South Dearborn street.

The United States Railway Supply Company has been incorporated at Mobile, Ala., with a capital of $100,000, by **J. M. Walsh** and **George L. Kilmer,** of Mobile, and **George L. Morton,** of Atlanta, Ga.

The Mid-Continent Equipment & Machinery Company has been organized at St. Louis, Mo., to deal in railway supplies. **F. W. Glauser** is president, **R. H. Wilson,** vice-president, and **J. B. Fidler** is secretary-treasurer. The offices of the new company will be in the Security building.

J. M. Fitzgerald has disposed of his interests in the **Alger Supply Company,** Chicago, dealers in railway supplies and concrete products, to his former partner, **O. S. Flath,** and the latter has incorporated the **O. S. Flath Company, Inc.,** retaining the same offices in the Peoples' Gas building.

Herbert S. Crocker and **Francis S. Crowell,** civil engineers, have associated under the firm name of Crocker & Crowell with offices at 101 Park avenue, New York City, to engage in the design and supervision of industrial and engineering projects and the investigation of engineering features of proposed investments. They will also act as owners' representatives in the administration of contract work let on a percentage basis.

D. L. Eubank has been appointed district manager in charge of the Cincinnati office of the Galena-Signal Oil Company. Mr. Eubank was born November 24, 1869, and was in the employ of the Chesapeake & Ohio from September, 1889, to February 1911, as locomotive fireman, locomotive engineer and road foreman of engines. In February, 1911, Mr. Eubank accepted a position as mechanical expert with the **Galena-Signal Oil Company.**

Lester W. Collins, recently refrigeration technologist for the United States Department of Agriculture in charge of the development of a standard heater car for the Refrigerator Car Committee appointed by the United States Railroad Administration, has been appointed chief engineer of the **Refrigerator Heater & Ventilator Car Company,** St. Paul, Minn., with office in that city. For seven years prior to his government service Mr. Collins was assistant to the engineer of tests on the Atchison, Topeka & Santa Fe.

The Chicago Pneumatic Tool Company reports, for October, an influx of orders in excess of the record of any previous month since the armistice. The same is true of the company's English and German subsidiaries. Following this country's entrance into the war the German subsidiary was seized by the German government and has been run under "compulsory administration," but that administration has now been abolished and the management is being transferred back to the company through the courts of commerce.

The Sinclair Refining Company, Chicago, has organized an asphalt sales department at its Chicago office to handle the output of the Meraux (La.) refinery, formerly owned and operated by the Freeport & Michigan Fuel Oil Corporation. **E. F. Fitzpatrick,** assistant sales manager of the general oil section of the **Sinclair Refining Company,** has been appointed manager of the new department. **J. M. Woodruff,** general manager of the Southern Asphalt Association, Atlanta, Ga., and formerly manager of the paving and publicity departments of the Standard Asphalt & Refining Company, has been appointed assistant manager. The headquarters of the department will be in the Conway building.

Railway Financial News

Augusta Southern.—See Georgia & Florida.

Baltimore & Ohio.—The directors have declared the usual semi-annual dividend of 2 per cent on the preferred stock.

Boston & Maine.—A special meeting of the stockholders has been called for December 23 to authorize the issuance of bonds to the amount of $2,273,000, to be secured by the company's present mortgage with the Old Colony Trust Company and another as trustees, dated December 1, 1919.

The proceeds of the issue will be used solely in taking up the 6 per cent bonds issued to the director general of railroads. Stockholders will also be called upon to authorize an issue of $10,000,000 bonds, the proceeds to be used in paying the government money expended for improvements and additions, and an issue of $620,000 bonds, the proceeds to be used for the purpose of paying notes of the Boston & Lowell Railroad.

Stockholders will be asked to amend the by-laws of the company to the effect that the directors may provide for the election by their board or appointment by the president of five or more of their members to constitute an executive committee which may exercise all powers of the board of directors in the management of the business, and that the president of the railroad shall act as chairman of this executive committee.

Chesapeake & Ohio.—H. E. Huntington has been elected chairman of the board of driectors to succeed Frank Trumbull, resigned. Mr. Trumbull will continue as a director and a member of the executive committee of both the Chesapeake & Ohio and the Hocking Valley companies.

Georgia & Florida.—Judge Hammond of the Richmond County Superior Court of Georgia has ordered the sale of this road on Tuesday, February 3, 1920. The sale will include the Augusta Southern Railway, which is owned by the Georgia & Florida.

London Motor Bus Stops.—In spite of the arduous nature of their work, the number of involuntary stops made by motor buses on the London streets during the last twelve months works out at the extremely low figure of one stop for every 10,000 miles run.

The Switchman as "Salesman."—How can a switchman become a good salesman? . . . When the yardmaster gives you work to do get it done and when you have completed the job report to him for another one. If you happen to be working on a lead keep the engine moving. Don't think that you can stay down in the track thirty minutes each time you go after a "cut" and be a good salesman. You are "skinning" the buyer. Better be honest and have the good will of the yardmaster, because you cannot tell when you will need his help. One night I was the direct cause of a passenger train "side swiping" some cars. Fortunately the accident caused but little damage and delay. The damage amounted to about $500. I fully realize what $500 means to the average man and that a few $500 credit on his bank book would put him on "Easy Street," yet it doesn't take much of a wreck to cost your employer $500. I fully realized the seriousness of my position and I fully expected to be discharged. I knew that the accident was caused by misjudgment and not by gross carelessness, but how was I to convince my employer? I wasn't discharged. I had always sold my yardmaster the best I had and he showed his appreciation by fighting for me. He was so successful in his fight for me that I did not lose a minute's time. It was some time before I found out why I wasn't discharged and I can assure you that I resolved more than ever to be a better switchman. You often hear of cases like this and you wonder, "How he got by with it." Put in a good line in place of the stuff you are selling the yardmaster and he will help you as he did me.—*Duit Wright.*

Railway Officers

Railroad Administration

Operating

C. A. Turney has been appointed trainmaster of the Northern division of the Chicago, Milwaukee & St. Paul at Milwaukee, Wis., succeeding A. Mallum, assigned to other duties.

C. L. Wilson, trainmaster of the Western division of the Toledo & Ohio Central at Columbus, Ohio, has been appointed to the newly created position of superintendent of terminals at Toledo, Ohio; Harry M. Rittenhouse, trainmaster of the Kanawha & Michigan at Charleston, W. Va., has been appointed Mr. Wilson's successor. Ira B. Chadwick, assistant superintendent at Bucyrus, Ohio, has been transferred to Columbus.

Traffic

James Cameron has been appointed chief of the tariff bureau of the Grand Trunk, Western Lines, with headquarters at Chicago, Ill., succeeding S. L. Strauss, notice of whose death appears in this issue.

J. M. Wooddall has been appointed assistant general passenger agent of the Georgia at Atlanta, Ga.; F. L. Nelson has been appointed passenger service agent and E. O. Pritchard freight service agent, also at Atlanta.

Engineering and Rolling Stock

P. G. Winter has been appointed mechanical valuation engineer of the Chicago, Milwaukee & St. Paul at Chicago, succeeding W. F. Lynaugh, assigned to other duties.

S. E. Mueller, general foreman in the locomotive department of the Chicago, Rock Island & Pacific, at Cedar Rapids, Iowa, has been promoted to master mechanic of the Dakota division, at Estherville, Iowa, succeeding R. J. McQuade, who has resigned.

R. C. Bennett, master mechanic of the Pennsylvania at Pittsburgh, has been appointed superintendent of motive power, Eastern Pennsylvania division, succeeding E. W. Smith, notice of whose transfer appeared in the *Railway Age* of October 10 (page 764). F. S. Robbins has been appointed Mr. Bennett's successor.

Corporate

Executive, Financial, Legal and Accounting

J. H. Hustis, receiver for the Boston & Maine, has been elected president of the newly organized company. Woodward Hudson, president during the period of Railroad Administration, has been elected vice-president and general counsel. Both will have their headquarters in Boston.

John Leistad, of Atlantic, Iowa, has been elected vice-president of the Atlantic Northern, with headquarters at Atlantic, and Bertel Christensen, of the same city, has been elected treasurer. The elections were to positions which have been vacant since the government took control of the roads. A refinancing fund of $110,000 has been raised, saving the road from receivership. S. C. Pederson, Kimballton (Iowa) banker, has again been chosen president of the road, and C. E. Spar been re-elected secretary, general manager, auditor and general freight agent.

Operating

G. G. Dodge, freight claim agent of the United Railways of Havana, has been appointed assistant to E. M. Wise, general manager of the Guantanamo & Western, at Guantanamo, Cuba.

Traffic

J. A. Simmons, general freight agent of the Cincinnati, Indianapolis & Western, with headquarters at Indianapolis, Ind., has been appointed general traffic manager of the Cincinnati, Indianapolis & Western Railroad Company, with the same headquarters, the position he held prior to government control.

Obituary

Sidney L. Strauss, chief of the tariff Bureau of the Grand Trunk, Western Lines, with headquarters at Chicago, died on December 8, in that city.

Joseph M. Denyven, general freight agent of the Mobile & Ohio, died suddenly of apoplexy, December 18, at his office in the Fullerton building, St. Louis, Mo.

John H. McEwen, auditor of disbursements of the Nashville, Chattanooga & St. Louis, died at his home in Nashville Aug. 27. Mr. McEwen was born in Nashville in 1862 and educated in the public schools of that city. He began railroad work in 1895 as clerk in the car accountant's office of the Nashville, Chattanooga & St. Louis, where he remained until 1897 when he became clerk in the disbursement office of the same road. In September, 1900, he was appointed auditor of disbursements, the position he held at the time of his death.

John H. McEwen

Garret Iseman is reported dead at Sparkhill, N. Y., at the age of 95. Mr. Iseman was a locomotive engineman on the Erie Railroad as far back as 1847, and continued in that service for about 40 years. As a boy he was engaged with the workmen who laid the track of the Erie Railroad in the region of Piermont, about 1836.

Col. Henry W. Hodge, consulting bridge engineer, died at his home in New York, on December 21. Col. Hodge was born in Washington, D. C., on April 14, 1865, and was graduated from the Rensselaer Polytechnic Institute in 1885. He began his engineering work in the engineering department of the Chesapeake & Ohio and entered the employ of the Phoenix Bridge Company as assistant engineer. In 1893 he began practice as an independent engineer. In 1895 he entered the employ of Alfred P. Boller, becoming a partner to Mr. Boller in 1899, under the firm name of Boller & Hodge, which lately became the firm of Boller, Hodge & Baird. Among some of the railroad bridges which he designed and built were the Great Northern bridge at St. Louis, Mo., the Chicago, Rock Island & Pacific bridge at Duluth, Minn., the bridge of the Choctaw, Oklahoma & Gulf, now part of the Chicago, Rock Island & Pacific, the cantilever bridges of the Wabash-Pittsburgh Terminal Company at Pittsburgh, Pa., and Steubenville, the Pecos Valley viaduct of the Southern Pacific, the Harlem river 4-track drawbridge of the New York Central and all the structures on the National Railroads of Mexico. Col. Hodge also was retained by the Canadian Government as a consulting engineer on the Quebec bridge. In 1916 he was appointed Public Service Commissioner of the first district of New York, from which position he resigned in July, 1917, to go to France on the request of General Pershing, being commissioned Major in the Engineering Corps; later Lieutenant-Colonel and then Colonel. Col. Hodge was attached to General Pershing's staff in France as Director of Military Railroads and Bridges.
