"It is notable that despite the mass of data he submitted, Mr. Warne does not demonstrate generally, and certainly in the case of the officers of the Baltimore & Ohio he fails to establish a single instance where because an officer or employee had any such interest, it had in fact operated injuriously either to the railroad or the public, and it is also to be noted that notwithstanding their full investigation, conducted under the supervision of Mr. Justice Brandeis, the Interstate Commerce Commission in their report in the case (five per cent) made no statement that any improper relations or practice had been disclosed.

Some Other Facts Mr. Warne Overlooked

"Mr. Warne dwells at much length on the reply which was submitted by the Baltimore & Ohio to the questionnaire of the commission in the case just mentioned, because, as he states, that company furnished such complete information. Mr. Warne neglected to advise this committee, however, that in the answer

submitted by the Baltimore & Ohio, it was shown that *the chief executive*, the man who was directly and personally responsible for all of the affairs of the company, *was not interested in any way in any company with which the Baltimore & Ohio had business relations*, and furthermore that its purchasing agent and chief engineer, who reports to the chief executive, were not interested in any way in such companies.

"Aside from the fact that neither the president, purchasing agent or chief engineer of the Baltimore & Ohio (the three officers primarily responsible for all purchases and contracts entered into by the company) appear as being interested directly or indirectly in any corporation with which the company had transactions, the method used by Mr. Warne in presenting the subject to this committee was such as to exaggerate the situation and to give impression that a large number of the company's officers were interested in a great many institutions and that the situation he presented was that currently existing instead of one developed more than nine years ago. As a matter of fact this statement, on which Mr. Warne lays so much stress, gives the names of but 19 out of a total of more than 150 officers and directors of the company, and of the items he enumerates in 23 instances the parties named were bondholders where their interest was that of a creditor holding an obligation upon which they could receive only a fixed rate of interest.

"A review of the situation shows that of the more than 150 present officers and directors of the Baltimore & Ohio, only 10 in 1913 held interest in any one of the 20 concerns with which the company had transactions. Such interest was relatively small and in many instances the transactions involving so-called relationships were trivial. For instance, in three cases the parties appear as stockholders in a street railway company to which it chanced that the Baltimore & Ohio Railroad had sold through its purchasing agent some second-hand bridges, and in another instance a director was a shareholder in a trust company with which the railroad company maintained a small deposit account, and in another case a Baltimore & Ohio director was a shareholder in a trust company which had purchased a ground rent of \$29.72 upon property perpetually leased to the railroad company.

"Of the 19 directors and officers reported as having some interest, six are no longer associated with the company, three being dead and therefore unable to refute Mr. Warne's implications.

"I note particularly the name of Oscar G. Murray, formerly president and, at the time of his death, chairman of the board of directors of the Baltimore & Ohio. While Mr. Murray appears as having had an interest in a number of companies, in no case was this interest substantial, and from my long and intimate personal acquaintance with him, I am unwilling to believe that Mr. Murray used his position in such manner as to inure in any way to his personal or private advantage and to the disadvantage of the property of which he was in charge. Mr. Murray was a bachelor who lived within his income, and at his death left his entire estate in trust in perpetuity for the benefit of widows and orphans of Baltimore & Ohio employees. In view of Mr. Warner's wholly unsupported intimations, I have thought it not only proper but my duty to say this much with respect to the late Mr. Murray.

"I need hardly remind this committee of the fact that this whole question of dealings between common carriers and companies in which officers or directors may have substantial interest has been given consideration by Congress, resulting in the passage of the Clayton act, wherein it is recognized that the extent and character of the investments of individuals should not be controlled, but wherever substantial interest is had, purchases can be made only through complete competitive bidding as provided in the law.

"In view of the fact that this whole subject has had the consideration of Congress and legislation duly enacted protecting the railroads and the public, it might appear that I have given this question more space than its importance dictates, but it seems proper to show how false and misleading impressions can and have been drawn from such statements as those referred to and given such prominence in Mr. Warne's testimony when no real or substantial evidence in support is produced."

"As to some of Mr. Warne's statements regarding railroad "propaganda" in the five per cent rate case, Mr. Willard said that while it is true, as Mr. Warne states, that he served as chairman of the committee of eastern presidents in the five per cent case, no publicity fund was raised or made use of in connection with that case, nor was a publicity committee appointed or charged with the duty of conducting propaganda. As chairman of the presidents' committee he did personally appear before and address the members of many trade organizations, commercial bodies, etc., in such cities as Boston, New York, Baltimore, Cincinnati, Chicago and others.

"I also wrote many letters in connection with the matter to the publishers of newspapers," he said, "and particularly so when I observed statements in such papers that from my point of view were incorrect and misleading, and it is a fact that the public became very much interested in that rate case and seemed to be sympathetic with the contention of the carriers, and if we may judge at all by subsequent expressions which have appeared in the public press and which have even been given voice on the floors of Congress itself, it is at least an open question whether in that particular case the public was not more nearly right than the commission. However that may be, I maintain that the action of the railroads concerning the case was in every sense proper and justifiable. We knew, of course, that if the public, or particularly the trade organizations, believed our request for an increase in rates to be unjust and unwarranted that they would undoubtedly appear before the commission in opposition thereto, and consequently we made diligent, frank and intelligent efforts to bring the public, in advance, to our point of view. I am personally unable to see anything in connection with that phase of the question that was or is properly subject to criticism in a country and under a government such as ours.

"On page 1335 Mr. Warne uses the following words: 'In other words, you have your railroads organized as an operating machine; you have such men as Mr. Rea, of the Pennsylvania; Mr. Willard, of the Baltimore & Ohio; and Mr. Smith, of the New York Central; and other men whom I could mention, who are at the head of the operating side of the railroad machine. I believe emphatically that if those men had the determination of policies as to the relation of the railroads to the public, and the relation of the railroads to their employees, that the policies would be quite different than they are at the present time.'

"Naturally I have no knowledge whatever concerning the relations existing between Mr. Rea and Mr. Smith and their respective boards of directors. I do wish to say, however, that never at any time during the 12 years that I have been president of the Baltimore & Ohio has the board of directors endeavored directly or indirectly, or in any manner whatever, to influence me to pursue a line of action with reference to the public, to our employees, or concerning our financial requirements or the purchases we should make with which I was not in full and complete accord. On the contrary, the Baltimore & Ohio board of directors have given me their most complete support at all times, and if the policy of the Baltimore & Ohio company concerning any of the matters referred to by Mr. Warne has not been wise and enlightened, the fault is primarily mine and is not the fault of the Baltimore & Ohio board of directors. It is true, of course, that the board of directors at all times had authority to over-rule the president or to remove the president if they so desired; I wish to say, however, that at all times they gave me their most helpful and sympathetic advice and support."

In reply to a statement by Mr. Warne as follows: "Now, at one time the Pennsylvania Railroad owned a considerable amount of the stock of the Baltimore & Ohio. That has since been discontinued by what I think is a fictitious maneuver," Mr. Willard said:

"There is absolutely no foundation whatever, for such a statement as is contained in the last sentence of this question. It is

true that at one time the Pennsylvania Company did own a substantial block of Baltimore & Ohio stock. I think its holdings at one time amounted to approximately 46 per cent of the entire Baltimore & Ohio stock issue at that time outstanding. Later on, however, it sold substantially one-half of its holdings to the Union Pacific, and for a period the Pennsylvania and the Union Pacific companies may be said to have had together a controlling interest in Baltimore & Ohio stock. At the same time the Union Pacific was the owner of a considerable amount of the capital stock of the Southern Pacific Company. In 1913 as a result of court decisions the Union Pacific decided to divest itself of its ownership of Southern Pacific stock and as a step in that direction the Union Pacific exchanged its Southern Pacific stock or some of it with the Pennsylvania Railroad for its Baltimore & Ohio stock. I have no knowledge whatever concerning the terms of the exchange so effected, but the result of the exchange gave the Union Pacific Company an ownership of approximately 46 per cent of the Baltimore & Ohio stock.

"In 1914 the Union Pacific company decided to dispose of its Baltimore & Ohio shares and they were distributed ratably as a dividend to all Union Pacific stockholders. The effect of the distribution was to increase the Baltimore & Ohio stockholders from 14,000, which had been the number previous to the Union Pacific distribution, to about 28,000, which was the number after such distribution. At the present time the Baltimore & Ohio Company has more than 36,000 stockholders, and the average holding is 60 shares per individual. We have 19,000 shareholders having 10 shares or less apiece. The largest single shareholder of the Baltimore & Ohio company today is the Oregon-Washington R. R. & Navigation Company, which is a part of the Union Pacific System. That company, as last reported, had in its treasury 50,000 shares of the Baltimore & Ohio stock. Neither the Union Pacific nor the Oregon-Washington R. R. & Navigation Company is represented on the Baltimore & Ohio board and neither company has any voice whatever in the Baltimore & Ohio management, or anything to do with the affairs of the company. The Pennsylvania Railroad Company has not held a single share of Baltimore & Ohio since the exchange was made in 1913 and to which I have above referred. The Pennsylvania Company has no representation on any Baltimore & Ohio board, nor has it any interest or influence whatever in any of the affairs of the Baltimore & Ohio Company. These facts have long been known to the public, and had Mr. Warne desired to know the truth concerning this matter he could have obtained full information from my office at the mere cost of mailing a letter of inquiry."

Freight Car Loading

WASHINGTON, D. C.

THE NUMBER of cars loaded with revenue freight during the week ended April 1 showed a drop of over 19,000 as compared with the previous week, but an increase of 163,000 over the corresponding week of last year. The total was 827,011 as compared with 663,171 in 1921 and 858,827 in 1920. The decrease as compared with the week before is

entirely accounted for by the decreased movement of coal as this week included the first day of the strike. Increases as compared with last year were shown in all districts and in all classes of commodities. While a large part of the increase as compared with last year was the increase in coal loading which amounted to about 77,000 cars, there was also an increase of 28,000 in the loading of merchandise and of 40,000 in the loading of miscellaneous. The summary as compiled by the Car Service Division of the American Railway Association is given on the preceding page.

Applying Photography to the Study of Track Stresses

IN VIEW of the widespread interest which engineers and metallurgists are taking in the question of the magnitude of the stresses which exist in rails in service, it is interesting to note that the art of photography has been applied to the study of this problem by H. F. Roach, president of the Reinforced Rail Joint Company, St. Louis, Mo. In this investigation, Mr. Roach has photographed locomotives and the deflections which they produce in the rail in a way which has magnified the deflections many times vertically without

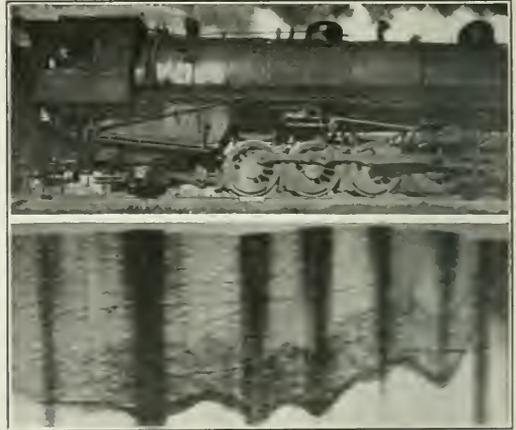

A Heavy Passenger Locomotive Moving at the Rate of 55 Miles per Hour with a Graph of Rail Deflections on a Vertical Scale 400 Times the Scale of the Photograph

distortion horizontally to enable them to be studied more intelligently.

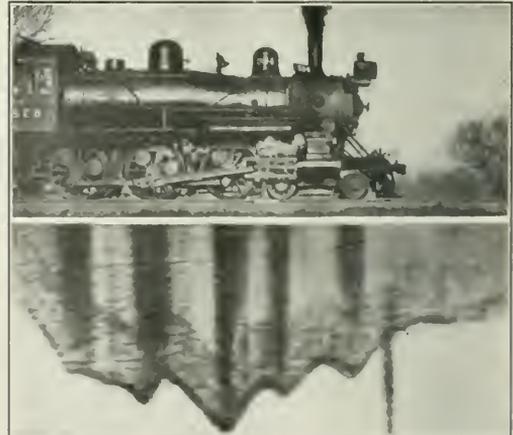

This method of photography has been applied to the study of the action of rails in the eastbound track of the St. Louis-San Francisco near South Webster, Mo., under (1) a light passenger engine starting from a stationary position, producing a maximum stress in the rail of 61,390 lb. per sq. in.; (2) a locomotive pulling a heavy passenger train at a speed of 55 miles per hour, resulting in a maximum stress of 36,810 lb. per sq. in., and (3) a heavy freight locomotive traveling at 25 miles an hour, producing a maximum stress of 33,030 lb. per sq. in. The track on which these observations were made is laid with 90 lb. A.S.C.E. rail supported on good ties imbedded in chats ballast and with good drainage. The track at the point of observation is tangent. The illustrations show the locomotives passing over the track in question and the graphs of the distortion which they produce.

In a report to F. G. Jonah, chief engineer of the St. Louis-San Francisco, Mr. Roach claims that the method of investigation makes it possible to determine (1) the rail stresses at any point for any position of load or loads; (2) the points of maximum stress; (3) the stress in rail joints at any point and for any position of load or loads; (4) the effect of the

A Heavy Freight Locomotive Traveling at 25 Miles per Hour with a Graph of Rail Deflections on a Vertical Scale 400 Times the Scale of the Photograph

counterbalance of the locomotive drivers both collectively and individually, and also whether the equalizers are properly installed so as to distribute the load over the respective drivers as intended; (5) the tie reactions, and (6) the work being done by the ballast. Attention is also directed to the fact that with a high grade moving picture camera with a

A Light Locomotive at Starting Speed with a Graph of Rail Deflections on a Vertical Scale 400 Times the Scale of the Photograph

fast lens as many as 800 pictures per second may be taken which will make it possible to take a picture of the track for every $1\frac{1}{4}$ in. of progressive movement of a train moving at a speed of 60 miles an hour, by which means the complete distortion of the rail can be shown.

Mr. Roach has applied for a patent on this development.

Boston & Maine Has 1921 Deficit of \$7,348,086

Revenue Ton-Miles Fall Off 27.8 Per Cent.—Fuel Costs
and Per Diem Also Disturbing Factors

THE SHARP FALLING OFF in traffic which took place in 1921 prevented the Boston & Maine from realizing on the drastic savings which it succeeded in making in operating expenses. Its report to the Interstate Commerce Commission for December showed a deficit after rentals of \$1,401,770; its annual report made public on Thursday of last week showed a deficit after taxes, equipment and joint facility rents and fixed charges of \$7,348,086. It is not difficult, in the light of such results as these, to understand the tenacity with which the New England carriers have carried through their fight to secure increased divisions. The deficit shown in the corporate income account—as noted above, \$7,348,086—compared with a net income available for dividends in 1920, of \$614,730. The difference as between 1921 and 1920 is explained by the fact that in the former year the road received standard return and guaranty, whereas in 1921 it had not been sufficiently restored to normalcy to be able to get its net earnings back to the pre-war basis.

However, although 1921 was an extremely poor year from the standpoint of the operating results, it was considerably better than 1920; that is, outside of the fact that in the former year there was standard return and guaranty. The actual deficit in 1920, excluding the payments from the government, was \$17,132,481. This reduction of \$9,784,395 represents the ground the Boston & Maine succeeded in covering in its efforts to overcome the disadvantages of after the war readjustment.

The Boston & Maine in 1920 came far—very far—from earning for the government its standard return for January and February and its guaranty for the following six months. In fact, in 1920, it had a deficit after rentals of nearly \$12,000,000 whereas its standard return, based on the results of the three years ended June 30, 1917, approximated \$10,000,000. In 1921 the deficit after rentals was reduced to \$1,401,770—a deficit still, but a deficit sufficiently smaller to indicate considerable improvement and to make one presume that with more normal traffic the figure of net after rentals would have been in black instead of in red.

A 27.8 Per Cent Reduction in Traffic

In view of all that has been said on the subject, it seems quite in order to remark that the Boston & Maine's primary trouble is that it is a New England road. In 1921 it had the additional difficulty that it had a comparatively small traffic to move. This, to be sure, was not a difficulty that was confined to the Boston & Maine, but the Boston & Maine experienced it in rather severe degree. The revenue ton-miles carried by the road in 1921 were 27.8 per cent less than in 1920. On the Class I railroads as a whole, the decrease in traffic was 25.2 per cent; in the Eastern district, 26.4 per cent. The Boston & Maine's traffic in 1921, measured as before in revenue ton-miles, was but slightly more than in 1914. The revenue tons were less than those carried in 1905, but the average haul was longer than in that year.

The Boston & Maine operated in 1921 at a ratio of 94.3. In 1920 the ratio was 105. The ratio of transportation expenses to revenues was 52.4 as compared with 59.3. This indicates improvement, to be sure, but roads do not make money with an operating ratio of 94.3, and especially if they are terminal carriers and their per diem debit balances are large.

"The freight business and passenger business," says the annual report, "which had reached a high record in 1920,

fell off in 1921 to an extent never before experienced in the history of the railroad as between one year and another." The revenue tons carried were 20,060,610. The ton-miles were 2,673,769,008 as compared with 3,705,528,286 in 1920, a decrease as noted above of 27.8 per cent. The freight revenues totaled in 1921, \$47,660,728 as compared with \$53,306,738 in 1920, a decrease of \$5,646,009. The passenger revenues of \$23,662,146 were \$1,058,290 less than in 1920. Total operating revenues of \$78,289,750 compared with \$86,652,745 in 1920. The operating expenses in 1921 totaled \$73,833,472 as compared with \$90,989,433. The decrease in operating revenues was \$8,362,995; in operating expenses, double that figure, or \$17,155,960.

An analysis of the savings in operating expenses brings out the familiar details which we may expect to see in most of the annual reports which will appear during the coming year, with the important exception that in the matter of fuel costs—always a bugbear for the New England carriers—the savings were not as great as might have been expected. The reductions in expenses, naturally, were primarily due to the smaller amount of business done. There were savings in the number and compensation of employees and in material costs. There were also savings in maintenance, especially in equipment. In the case of maintenance of way, more rail and ties were put in track than in 1920.

With reference to labor the details are given that the average number of employees on the payrolls was reduced from a maximum of 34,138 in September, 1920, to a minimum of 26,161 in May, 1921. Wage decreases and changes in the rules and working conditions made further savings, but reference to them is not necessary, as readers of the *Railway Age* are sufficiently familiar with this feature.

Cut in Equipment Maintenance

In the case of maintenance of equipment, the drastic cut in expenses is shown in an increasing percentage of bad order cars throughout the year, another familiar story. The Boston & Maine's bad order car situation is bad. On March 15, 1922, the percentage was 19.4 as compared with a percentage on all roads of 14.5. The same applies in the case of locomotives, the percentage of unserviceable locomotives (out of service for repairs requiring more than 24 hours) on March 1, 1922, was 27.3 which, as compared with the figure for all roads of 20.2, is rather too high to indicate favorable conditions.

Ties and rails put in track in 1921 were considerably above the totals for 1920, even though there was a decrease in expenses of maintenance of way of over \$2,000,000. The number of ties put in track was much greater than in 1920, but not in excess of the yearly average over a term of years. The tons of rail laid in 1921 totaled 24,834; in 1920, only 9,632. The yearly average for previous years would be about 20,000.

Fuel—\$7.88 Per Ton

Fuel costs rival per diem as one of the leading difficulties of the New England roads. This is plainly evidenced by the fact that in 1921, the Boston & Maine's average cost of fuel on locomotives was \$7.88 per ton. The average in 1920 was \$7.95, or in other words, the decrease was slight. A maximum of \$9.26 was reached in November, 1920, but in December, 1921, costs had dropped to \$6.82. "While the savings in the cost of fuel and other material have been substantial in certain items as compared with war period

prices," says the report, "the effect of these reductions has not been fully reflected in operating results for two causes—the first due to contracts in force before the reduction in prices obtained and the second due to the accumulation of stocks on the basis of normal volume of traffic." The actual savings in "fuel for train locomotives" amounted to \$2,720,935, the decrease being primarily due to the smaller traffic handled. However, there were evidences of economy because there were more traffic units moved per ton of coal consumed.

The debit per diem balance of the Boston & Maine in 1921, was \$3,178,427, a figure of rather staggering proportions but, nevertheless, \$1,223,496 or 27.7 per cent less than in 1920. This factor does not need extended attention as it has been the subject of considerable discussion in connection with the divisions case. However, it is worth noting that the average cars on line daily was lower in 1921 than in any year since 1908.

Passenger Cars Ordered

The Boston & Maine in 1921 had a net charge for additions and betterments of \$4,420,142, which seems a sizable amount under the conditions governing during the year. This includes new bridges at various points, extensions to the yard at Rotterdam, N. Y., and a new engine terminal at Concord, N. H. These were mostly paid for by a loan from the revolving fund administered by the Interstate Commerce Commission. The loan authorized late in 1920, amounted to \$5,443,979. There was also a loan of \$1,212,500 to assist in the purchase of new locomotives, but as a result of the falling off in traffic the purchase of this power was deferred and the I. C. C. has since approved a change whereby fewer locomotives will be purchased than originally intended and steel passenger cars will be secured instead. The placing of an order for 98 passenger train cars and 25 milk cars was noted in last week's issue of the *Railway Age*.

It is difficult to make any surmises as to what the Boston & Maine may be able to do in 1922. There can be no question but that it will be able to secure a much better net than it did in 1921. The extent of the improvement will depend very largely upon the outcome of the divisions case, the Interstate Commerce Commission's decision in which the trunk line carriers have sought to hold up by injunction. The Boston & Maine has the advantage that it has readjusted its financial structure and has put behind it the difficulties that formerly confronted it as a system made up of leased lines. The morale of the road seems to be good and there is not much doubt but that President Hustis has won for the road the good feeling of the shipping public in New England. These two assets it has to help it overcome the fact that it is a New England carrier.

Railroads Preparing New Terminal Plans at Chicago

WORK IS NOW IN PROGRESS on two entirely new plans for complete passenger and freight terminals in Chicago for all the railroads now using the Dearborn, La Salle and Grand Central passenger stations in that city. This fact was made public on Friday, April 7, by Edward J. Noonan, engineer of the Chicago Railroad Terminal Commission, before a committee of the city council and introduces an entirely new factor in the solution of the problem of new facilities for these railroads. The roads concerned are those now occupying terminal property between the Chicago river and State street, for which no plan for rehabilitation has yet been determined upon, all the other railroads being parties to the Chicago & Northwestern, Union Station or Illinois Central Terminal ordinances which have either been carried to completion, are now in progress, or definitely arranged for.

Studies by the Chicago Railroad Terminal Commission under the direction of Mr. Noonan and the late John F. Wallace have been in progress for a long time, in the development of plans for new terminals for the railroads in question, looking toward the opening of streets and other civic improvements which would greatly encourage the city's development in the territory occupied by these railroads. The plan for the Illinois Central Terminal approved by city ordinance in 1919, also provides for the accommodation of as many of these railroads as so desire in the passenger terminal which the Illinois Central will build at Twelfth street and the lake front. The new plans now being prepared will be submitted to the city as alternatives for plans previously proposed by the city's terminal commission and the Illinois Central.

One of the new plans is being prepared by the interests owning and occupying the Dearborn station, or what is known as the Chicago & Western Indiana group. This includes the Atchison, Topeka & Santa Fe, the Wabash, the Monon, the Erie, the Chicago & Eastern Illinois, the Grand Trunk and the Chesapeake & Ohio. The plan embodies complete new facilities for these roads with an alternative plan which will also take care of the railroads using the other two stations, namely, the La Salle street and Grand Central terminals.

The other plan is being developed by the railroads of the two groups, last named. These include the New York Central, the Rock Island, and the Nickel Plate, now in the La Salle station and the Baltimore & Ohio, the Pere Marquette, the Minneapolis & Sault Ste. Marie and the Chicago Great Western now in the Grand Central station. The plan being developed for these roads contemplates a new terminal in substantially the location of the existing La Salle street station of adequate size to take care of all the railroads in the three groups.

The complete details for these new terminal development plans have not yet been made public, but enough is known to make clear that they contemplate a fulfilment of the requirements outlined by the city's terminal commission for an improvement in the street layouts throughout the territory involved. In the case of the Western Indiana project, the plan includes a development on the property in the area bounded by State street, Clark street, Sixteenth street, and Polk street. Dearborn street would be opened up as a new north and south street throughout the length of this territory and four or more east and west streets would also be opened. The entire improvement is estimated to cost about \$50,000,000.

Mr. Noonan's announcement of these plans in advance of their formal presentation to the city by these railroads was brought about in connection with a discussion of work on the Twelfth street viaduct. Sometime ago, the city commenced the construction of this viaduct, which is a monumental structure in reinforced concrete, designed to carry the street over the terminal area in question, but was compelled to suspend work for lack of funds. Recently there has been considerable agitation for the resumption of the construction but Mr. Noonan pointed out that it would be unwise to go ahead with it now owing to the fact that the viaduct as now designed is committed to the present track layout and this would interfere seriously with the radical changes which would be required in carrying out new terminal plans in this territory. It is understood that the railroads involved will be ready to submit their plans to the city within the next few months.

THE RAILWAYS OF GREAT BRITAIN paid £11,055,408 in taxes in 1921, an increase of 128 per cent over 1913, according to Modern Transport (London).

The Women's Aid of the Pennsylvania System

A "Ladies' Aid" Covering 10,000 Miles of Railroad, Business
Methods Make Friendly Neighbors

THE ABOVE TITLE is the name of an organization which now has scores of thousands of members; which mustered over 1,200 women at its annual meeting at West Philadelphia on March 30, and which has during the past year done an immense amount of social welfare work, including the expenditure of over \$25,000 in relief work in one region, the Eastern (east of Altoona and Renovo).

Using as a starting point the welfare work done by their organization for soldiers and soldiers' families during the war, the wives of the officers of the Pennsylvania Railroad have built up a permanent organization which carries out on a gigantic scale the several kinds of neighborhood work that are characteristic of ladies' aid societies of churches and local brotherhoods; and reports indicate that they are making of the work a grand success.

The constitution, the by-laws and all of the activities are planned to produce an organization which shall be thoroughly democratic in its activities and its results, though the management is entirely in the hands of wives of officers. Membership is open to the wives and daughters of all officers and employees, active or retired; to widows of employees and to women employed by the road; and the membership fee is uniformly 25 cents a year. This makes for an outward and formal uniformity. For the maintenance of actual uniformity of status and the avoidance of all offensive caste spirit, the dependence is on the skill, discretion and tact of the officers of the association and members of committees.

Large sums of money have been dispensed in aiding sick or unfortunate families of employees; but this is not charity, for the payments are from a fund which is made up mainly of dues paid by members; and the leaders keep always prominent the fact that friendliness and sympathy, not measured in money, are the main elements in their purposes. Flowers taken to a sick man in a hospital, or the activities of an experienced housekeeper or nurse in the home of the overworked or incompetent wife of a foreigner who works on the track, may constitute more important features, in the

final summing up, than would the definite expenditure of money for food, or fuel or medical attention. While many of the doings of the committee may look like the rich patronizing the poor, this appearance is not true, except to the extent that the officers' wives, with their years of experience and advantages, are, indeed, "rich" in the qualities of head and heart which make pleasant homes and the benefit of which they, as members of visiting committees, give, freely, to those less fortunate than themselves.

The annual meeting above referred to was held in the building of the Railroad Young Men's Christian Association in West Philadelphia, one of the sessions being presided over by Mrs. W. W. Atterbury, director for the entire system and the other by Mrs. Elisha Lee, associate director.* Following the afternoon meeting, brief addresses were made by President Samuel Rea, Vice-President W. W. Atterbury, Vice-President George L. Peck, Vice-President Elisha Lee and General Manager Charles S. Krick. In each region the wife of the regional vice-president of the road is an associate director, and is in charge of the work of that region. Mrs. Lee, in charge of the Eastern region, reported on March 30 a total enrollment of 49,600 members in that region; and total expenditures in relief work \$25,243. Members of local committees in that region have made calls on 11,547 families of employees; and in the cases of 2,271 families, financial and miscellaneous aid have been rendered. The funds of the Aid are replenished not alone by the dues

*In the picture at the head of this page, Mrs. W. W. Atterbury, director, sits at the right, and Mrs. Elisha Lee, associate director, (Eastern region) at the left. The others, as numbered, are as follows, those indicated by an asterisk being members of Mrs. Atterbury's staff and the others members of Mrs. Lee's staff:

- | | |
|-------------------------|--------------------------|
| 1 Miss Constance Schell | 10 Mrs. G. LeBoutillier |
| 2 Mrs. J. A. Huntzinger | 11* Mrs. A. H. Rudd |
| 3* Mrs. W. B. McCaleb | 12 Mrs. J. D. Jones |
| 4 Mrs. J. M. Henry | 13 Mrs. I. A. Miller |
| 5* Mrs. E. B. Hunt | 14 Mrs. J. C. Johnson |
| 6 Mrs. H. M. Carson | 15 Miss E. Kathryn Krick |
| 7 Mrs. A. M. Parker | 16 Mrs. C. S. Krick |
| 8 Mrs. C. L. Leiper | 17* Mrs. Joseph V. Reaph |
| 9 Mrs. Gamble Latrobe | |

of members, but also by bazaars, candy sales, picnics, excursions, etc. On one occasion a dance was given in the Hotel Pennsylvania, New York City, at which \$3,000 was realized.

The local committees, in their relief work, are aided by and co-operate with the officers of the Employees' Voluntary Relief Department, which department is intimately related to substantially all of the employees of the road, and employs medical officers on all divisions throughout the railroad system. The Aid also co-operates in the Americanization work of this road which for several years has instructed foreign born employees in the English language and the social standards of American life.

At the various local centers, meetings are usually held once every month. The Aid is organized on precisely the same basis as the organization of the management of the road, the chief of the women's work at a given place being the wife of the highest officer at that point. Their associates are the wives of their husband's staff officers.

The constitution of the Women's Aid consists of nine sections and the by-laws of six sections. There are ten associate directors, the plan being that each one of these shall be the wife of a vice-president; but the rules allow for variation of the plan in case the wife of a given officer declines to serve. In the event of no wife of a vice-president being ready to serve, there is a provision under which a vice-president may nominate a woman connected with his department.

In each region there are associate directors and these, with the wives of subordinate officers, called general superintendents, form a regional commission in charge of the work in that region. In each region also there are lower officers called superintendents, assistant superintendents and auxiliary superintendents; and if the extent of the work makes necessary further sub-division, "supervisors" will be appointed.

The constitution may be amended, under proper regulations, by a majority vote of the board of managers.

One-eighth of the dues are applied to general expenses, and the other seven-eighths reserved for relief work.

There are on each division of the road (or each department) three committees; one on membership and visiting; one on relief and one on finance. Where necessary, because of extensive territory, sub-committees are organized. All work of committees is to be summarized in monthly reports. At the regular monthly meeting of the relief committee, reports must be made of the families visited and aided, and cases requiring discussion will be discussed, but names of persons are not to be used in these discussions. As a rule, names of persons aided are known only to the person conferring the aid and to the vice-chairman or chairman.

The finance committee must, as necessary, secure funds to replenish the treasury; and the committee must meet once a year, or oftener as may be found necessary or desirable.

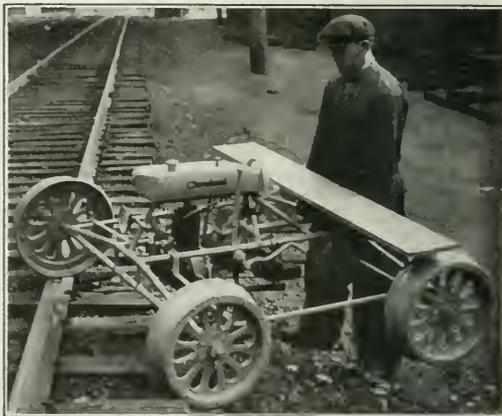

Where an employee is seriously injured, or is killed, by accident, the Women's Aid is to be notified; and the doctors of the Voluntary Relief Department are to advise semi-weekly of cases of illness involving a probable absence from work for more than ten days; also notify promptly in cases of death. A visitor can expend relief to the amount of \$10 at her own discretion; but for larger expenses she must go to her general superintendent; while for expenditures of more than \$25, consultation must be had with the associate director. All information obtained by the relief committee must be treated as confidential.

THE SPOKANE TRANSPORTATION CLUB, Spokane, Wash., has moved its largest quarters in the Title building, Sprague and Wall streets, in that city. The officers of the club, recently elected, are as follows: President, A. S. Cobble; vice-presidents, G. B. Paul, R. F. Carlson; secretary-treasurer, E. J. Greene.

A New Lightweight Railway Motor Car

A NEW LIGHTWEIGHT railway motor car has recently been put on the market which embodies a number of unusual features. The car, while only weighing about 260 lb., has a carrying capacity of five men. It is equipped with a starter, clutch control and a two-speed transmission, which, with the engine proper, form a self-contained unit that is removable as a whole by the loosening of two special bolts.

The framework of the car is made from cold drawn seamless tubing, brazed and welded at the joints over reinforcing forgings of the proper shape. The engine is of the valveless type, having a single cylinder, two-cycle motor with a 2 3/4-in. bore and stroke, rated at 3 1/2 h. p. It is the standardized power unit used by the Cleveland Motorcycle Manufacturing Company, Cleveland, Ohio, in the motor cycles manufactured by that company. The transmission contains the usual spur gear arrangement, the gears, however, being in mesh constantly, the speed change being effected by the use of "dogs." The drive from the transmission is made through an alloy steel worm of generous pitch meshing with a titanium bronze worm-gear which is clutch-connected to a

One Man Can Handle the New Car Easily

large size sprocket. A large size roller chain furnishes the drive to the live axle. All bearings in the power unit are ball bearing and all wheel bearings and line axle bearings are of the roller type. The crank case and transmission and the worm-gear housing are of aluminum. All other parts of the unit which are subjected to heavy stress are made from molybdenum steel.

The clutch has 13 hardened steel discs running in oil and is controlled by a hand lever which permits of the engine being started while the car is at a standstill, or of the motor being allowed to run free. The two-speed transmission may be operated with or without the use of this clutch. A starter is included in the unit, this consists of a foot-operated lever, geared to the motor, one movement causing four revolutions of the motor. Ignition is by a direct-driven high-tension Bosch magneto. A generator furnishes current through an automatic voltage regulator for a head light and a tail light. The brake is a contracting band which is designed to work on the live axle. The railroad sales for this car are handled by Craft Incorporated, 52 Vanderbilt Avenue, New York City.

Wages of M. of W. Employees Before Labor Board

Eastern and Western Carriers Reply to Testimony of B. M. Jewell
and F. J. Warne

THE RAILROADS' ANSWER to B. M. Jewell's recent attack upon the nation's industrial system and the financial and statistical evidence presented to the Railroad Labor Board by F. J. Warne was concisely and emphatically given by J. G. Walber, representing the eastern carriers, and J. H. Higgins, representing the western carriers, to that body during the past week. Mr. Jewell's testimony was abstracted in the *Railway Age* of April 1, page 821, and Mr. Warne's testimony was abstracted in the *Railway Age* of April 8, page 884.

Regarding the "living wage" advocated by Mr. Jewell, Mr. Walber cited the history of that principle and said:

In view of the impropriety and irrelevancy of urging upon the Board consideration of the co-called "living wage" we feel that it would be improper for us to undertake to present to this Board any detailed answer to that contention. We submit that our position is sound not only because the law does not recognize the so-called "living wage" as a relevant subject for consideration here, but also because in the very nature of things the subject is intangible and based on averages that do not exist and conditions that do not prevail. It must be borne in mind that the amount of money which a family expends is not without substantial dependence upon the tastes and inclinations of the individual families, and their ability to manage the family budget. We all know of instances where families are able to live in reasonable comfort on incomes under which families are unable to pay their bills. The subject of the "living wage" and of family budgets has filled volumes and economists without number have undertaken to deal with the subject. An examination of this output of literature impresses one with the thought that no two of the treatises agree and yet each is convinced that he has a 100 per cent solution of the whole problem.

The budget information submitted by Mr. Jewell was also discussed at length by Mr. Walber, who pointed out numerous fallacies in the facts and figures presented by the former. "It must be evident that the board cannot accept these budgets as being representative or typical," Mr. Walber said.

Referring to other phases of Mr. Jewell's lengthy presentation, Mr. Walber said:

There is no need to discuss the soundness or fallacy of the conclusions reached in these sections of the presentation because they are obviously irrelevant to the issue now before the Board and, at most, present sociological problems not only beyond the power of the Board to consider and decide but as well not even concerning the transportation industry. Notwithstanding this fact, however, we think it will be interesting to the Board if we point out a few instances wherein these conclusions are erroneous, misleading, unfair and entirely irrelevant when applied to the railroad situation, which is the only subject that the Board may at this time consider.

There followed a brief analysis of several other phases of Mr. Jewell's testimony, ending in an analysis of the comparative purchasing power of the wages received by members of the Federated Shop Crafts in different years. Tables presented by Mr. Walber, making allowance for the reduced purchasing power of the dollar, showed that machinists, electricians, sheet metal workers, boiler makers, blacksmiths and moulders are able to purchase 47 per cent more of the necessities of life with their wages at the present time than they were in 1914, while carmen are able to purchase 81 per cent more than they were in 1914. Mr. Walber, in addition, showed that, measured in actual purchasing power, the return upon investment of the eastern railroads for the year 1921 was but 1.84 per cent instead of 3.01 per cent. "If it is right to convert the wages into the equivalent in purchasing power," Mr. Walber said, "certainly as far as the individual stockholders are concerned it is proper to convert the returns of the railroads on the same basis."

In closing his analysis of Mr. Jewell's testimony, Mr. Walber said:

We definitely disclaim any purpose to answer the statements, figures, theories and conclusions contained in Mr. Jewell's presentation. The few to which we have in passing made any reference whatever are those only in which it seemed to us there might at least be some interested although not the slightest relevancy. If time permitted and useful result might thereby be served, we could point out instance after instance of half-truths, distorted figures and illogical conclusions.

The presentation shows that it opens with certain questions and ends with certain questions without any answers in either place. The only possible conclusion that we can draw is that it is an advocacy of communistic doctrines. It is well known that there have been various experiments of this kind on a small scale and at different times in different portions of this country, and they have in every case dismally failed. Our faith in this country makes us believe that it will never be misled into such a pitfall.

J. G. Walber Points Out Inconsistencies in Warne's Position

In taking up the testimony of Mr. Warne, Mr. Walber pointed out the inconsistencies in the employees' position in submitting the wages being paid by the steel and coal industry, for instance, in support of wage increases and then denying that the wages paid to employees in these industries should be considered in connection with wage decreases as was contended by Mr. Warne. He pointed out in addition, that Mr. Warne's testimony on the holdings of railway officers in other industries, which the latter contended should eliminate these industries as factors in the determination of wage scales because of "control," was of no value because Mr. Warne did not state the amount of the holdings of the individuals he named and furthermore, because many of the men named are not living at the present time. As an illustration, Mr. Walber cited the fact that of the 15 directors of the New York, New Haven & Hartford, cited by Mr. Warne, only two are still directors, two died in office in 1913 and the others' terms expired in 1913 or 1914, and they have not been in office since then.

Referring to the financial testimony produced by Mr. Warne, Mr. Walber said:

It seems that no presentation of a dispute regarding either rates or wages is quite complete in the minds of the representatives of the employees without reference to alleged improper financial transactions of one kind or another on the part of the railroads in the remote past, notwithstanding the remedial legislation that has been passed by both Congress and the states within the past few years, making such alleged improper financial transactions impossible today. We submit that it is an unfair and unjust assault upon the railroad industry as a whole and can serve no possible useful purpose in a hearing of this kind other than to excite the prejudice of the Board and the public against the industry hoping that in this artful way they may draw into the case for consideration, a matter which is wholly irrelevant and unimportant.

Graded Rates for Mechanics Defended

The application of the railroads for the right to establish varying rates of pay for mechanics' work based upon the skill and training required, was attacked by the employees and termed impossible. Taking up this phase of the controversy, Mr. Walber defended the railroads' request on the ground that this practice was in effect more or less throughout the country prior to federal control, that it is now being done in other industries and that therefore there is no reason why it cannot be established on the railroads.

In closing his presentation Mr. Walber said in part:

The Board certainly realizes that the discussion during the progress of this case wandered far afield. We believe that the opening statement which we made on behalf of the Eastern railroads clearly and briefly outlines the matters involved in the present controversy and the basis upon which the Eastern railroads feel that they are justified in asking their employees to accept reductions in wages. This statement was made March 9 and it may not be amiss to recall to the minds of the members of the Board that the basis of the contentions of the Eastern railroads was set forth as follows:

The Transportation Act enumerates seven specific criteria to be considered by the Board, etc.; that the Board has interpreted "other relevant circumstances" in Decision No. 2; that it must be obvious that these circumstances are of paramount importance; that the prosperity of the railroad workers is interwoven with and dependent upon the success of the railroad business itself; that so long as wages must be maintained at a wartime level the railroads will be prevented from adjusting their conditions to a peace-time basis; that if the income of the railroads is to be absorbed by such wartime scales of pay it necessarily follows that corresponding reductions must be made in the working forces; that it is to the greater interest of the railroad employees and the public in general that the employees be placed upon a basis which will permit of working the maximum forces, so producing employment for the greater members, increasing the consuming public and in that way contributing to the general revival of business; that it was not only because of the compelling necessity for reductions in labor cost that the carriers proposed to their employees reductions in wages, but also because the carriers are convinced that the new scales of pay which they propose are just and reasonable in the light of the specific elements enumerated for the determination of wages. The Board will recall that we then proceeded with an analysis of wages in outside industries and with changes in the cost of living and supported our contentions in those directions with exhibits relevant thereto. We did not introduce exhibits on the "Hazards of Employments"; "Training and Skill Required"; "Degree of Responsibility," as we considered that there had been no material changes in these respects since the previous decision of the Labor Board.

J. H. Higgins, representing the western carriers, also replied to the contentions of the employees, stating in reference to Mr. Jewell's attack upon the industrial system:

We all agree that workers should have a fair and even liberal share of the profits of industry. We understand that the workers of this country obtain a greater share of such profits than do the workers of any other country. The workers' profits are expressed in wages, which is the most practicable way of giving to the worker the variety of products he requires for his own needs. Mr. Jewell did not explain how the workers will get their share under his dictum. He did not show you where he would find those willing to operate at a loss to themselves in order to give others profits in the form of wages.

J. H. Higgins Attacks Warne's Testimony

The charge that the railroads precipitated the present coal strike is absurd and unsupported, according to Mr. Higgins. Mr. Warne had said, "The railroad companies, in conjunction with the steel companies . . . are forcing 500,000 coal mine workers to go out on strike."

Mr. Higgins, replying to this charge, said:

Without offering a scintilla of supporting evidence, Mr. Warne has brazenly charged the railroads with precipitating a nationwide coal strike. The thing is so absurd that even a poorly developed sense of the ludicrous would have made such a statement impossible. With as much truth he might have outlined holdings of railroad officers in ballast pits and for tie timber and then charged that such holdings control the stone, gravel, sand and lumber business of the country.

Speaking of the employees' evidence in general, Mr. Higgins said:

Their presentation seems to wholly satisfy their minds and they aim to convince the Board that directors and managers of corporations are unworthy of confidence. No evidence is submitted by them outside of the fact that those men are the responsible trustees of the property and guardians of the corporate interests of hundreds of thousands of other owners. Without a iota of supporting evidence, they pillory these directors and managers as men with a predilection for conspiracy—even the small holder of a share of stock or a bond of other industry, if he happens to be a railroad man, fall under their suspicion.

Mr. Higgins closed his remarks with the request that the Board refuse to take into consideration any evidence pre-

sented by the employees bearing upon the railroad situation prior to July 1, 1921, when "after a hearing and consideration of all factors, the board fixed fair and reasonable wages in accordance with the law."

Carriers Ask for Lower Wages for M. of W. Employees

The wide difference between the rates of pay of unskilled labor on western railroads and common labor employed by other industries in the same territory was cited by Mr. Higgins on April 10, in support of the carriers' plea for lower wages for railway maintenance of way department employees. In presenting the results of a survey of wage and employment conditions made by railroad officers, Mr. Higgins said:

Of the total of 318,893 employees of all classes studied in other industries in 28 Western states in December, 1921, 121,866 or 38 per cent were performing work analogous to that performed by railroad employees in the maintenance of way departments. Of these 121,866 employees, 87,113 or 72 per cent are getting lower wages than are paid by Western carriers for like service. Furthermore, of the 121,866 workers, 111,939 or 92 per cent are laborers performing work similar to that performed by the unskilled laborer in the maintenance of way department, and 82,153 or 74 per cent of these men are receiving less than the railroads pay for like services.

Even in the large cities where it is generally understood the industrial rates of pay more nearly approximate the railroad rates we find similar conditions. This is shown by the studies made in 26 principal cities of 125,425 workers, 98,814 or 79 per cent of whom are being paid lower wages than are paid by the railroads for analogous work. Of this 125,425 employees 33,903 or 27 per cent are doing work similar to that being done by railroad employees in the maintenance of way departments. Approximately 73 per cent of these men, or 24,822 employees are receiving less than the railroad rate for like services. In addition, of these 33,903 employees, 29,211 or 86 per cent are unskilled laborers performing work comparable to that performed by the common laborer on the railroads, and 21,570 or 74 per cent of them are receiving lower wages than are paid on the carriers.

It is largely because of this disparity between the wages paid by the railroads and the wages in effect in other industries for employees performing comparable services that the western roads are asking the Labor Board to authorize: (1) a decrease of five cents in the hourly rate of bridge building and painter foremen, assistant foremen, track and maintenance foremen, assistants and mechanics; (2) a decrease of seven and one-half cents in the hourly rate of mechanics' helpers in the maintenance of way departments; and (3) the railroads to pay unskilled laborers the prevailing rates in the territory in which they are employed.

After calling attention to the fact that the present railroad rate for unskilled labor is from 139 to 153 per cent above the 1915 rates and 80 per cent above the 1917 rates, Mr. Higgins added that "this confirms our position that railroad rates are entirely out of line when considered in connection with the rates of pay in outside industries and the other relevant circumstances named in the law for determining just and reasonable wages."

In discussing the principle of the "living wage" which has been advocated by representatives of the employees, Mr. Higgins said:

The railroads are in full accord with the principles that all workers have a right to a "living wage" and that "minimum rates of pay should be established which will insure the subsistence of the worker and his family in health and reasonable comfort." They believe that this Board can and should fix a minimum wage commensurate with the living requirements in the different sections of the country, giving heed to the difference as between large cities, smaller cities and rural communities and likewise to the climatic, geographical and other conditions which have a direct influence on living costs.

Mr. Higgins also called attention to the advantages enjoyed by certain employees in the maintenance of way departments of the railroads such as company houses at nominal rent, bunk cars for extra gangs, economical subsistence in railroad labor camps, opportunity to buy produce direct from farmers along the line, etc., and asked that these factors be taken into consideration in fixing new rates.

J. H. Higgins Asks for Latitude to Meet Local Conditions

The efforts of the railroads in the present wage controversy are directed toward a return to the long-established and recognized practices of pre-war times when the managements had sufficient latitude to meet local wage and employment conditions in the different sections of the country, Mr. Higgins contended in closing the testimony of the western roads on the wages of maintenance of way employees. He said in part:

It is a well known fact that the rates for common labor are always the first to go up, and that these rates in industries were increased in much greater proportion than those of most of the classes during the war period. In many cases the increase was over 200 per cent, and in comparatively few cases did it increase less than 100 per cent.

While we want wage rates for such employees to be fair and adequate, we hold that under the provisions of paragraph (d), Section 307 of the Transportation Act, Congress did not intend by those provisions that a flat rate should prevail throughout the entire country. On the contrary, by requiring that the wages for railroad employees should be considered and related to wages paid similar work in other industries, Congress undoubtedly intended that comparison should be made with the rates paid in such industries in localities contiguous to each road. Therefore, the comparison should be with natural rates in other industries in the various sections of the country, and not with an artificial flat rate.

After outlining the manner in which "rigid" rates for unskilled labor came to be applied on the railroads during the war and the effect of these conditions, Mr. Higgins continued:

It has been impossible to make agreements with the men to fit local conditions and hence our appeal to this Board for relief from the high rates and anomalous situation thus created. We think the Board should not persist in retaining this disability. As the situation stands the railroads, being obliged to pay higher rates than paid in outside industries for this unskilled work, are under a great financial disability that also subjects them to criticism from the public, not only as shippers, but as employers of labor.

J. G. Walber Shows Difference Between Railroad and Industrial Wages

If the reduction asked by the eastern roads in the rates of pay of railroad maintenance of way employees were to be granted the wages of these men would still be higher than the wages of men doing comparable work in other industries. This fact was brought to the attention of the Board on April 10 by Mr. Walber, representing the eastern carriers. A mass of wage data was briefly summarized by Mr. Walber and is partly contained in the following table:

RATES OF PAY IN CENTS PER HOUR

	Rate in Outside Industries	Present R. R. Rate	Rate Proposed by R. Rs.	Rate Proposed by Men
Foremen	66.9	75.9	70.9	85.9
Carpenters	54.3	61.6	56.6	71.6
Iron Workers	39.1	74.2	69.2	84.2
Painters	47.3	62.1	57.1	72.1
Masons, Bricklayers, Plumbers, etc.	66.5	67.5	62.5	77.5

In addition, Mr. Walber showed that:

Of 705 employees in outside industries who are comparable with these foremen, only 317 (45 per cent) received rates equaling or exceeding the present prevailing rate on the railroads and only 361 (51 per cent) received rates equaling or exceeding rates which would obtain under the railroads' proposal. Fifty-eight (eight per cent) were receiving rates equal to or in excess of the average requested by the employees.

Of 2,016 employees in outside industries who are performing work comparable with that of carpenters, 461 (23 per cent) received rates equaling or exceeding the present prevailing rate on the railroads; 764 (38 per cent) received rates equaling or exceeding rates which would obtain under the railroads' proposal; 262 (13 per cent) were receiving rates equal to or in excess of the average requested by the employees.

Of 300 employees in outside industries who are comparable with bridge and building iron workers, 85 (28 per cent) received rates equaling or exceeding the present prevailing rates on the

railroads; 85 (28 per cent) received rates equaling or exceeding rates which would obtain under the railroads' proposal; 55 (18 per cent) were receiving rates equal to or in excess of the average requested by the employees.

Of 493 employees in outside industries who are comparable with bridge and building painters, 20 (4 per cent) received rates equaling or exceeding the present prevailing rates on the railroads; 86 (17 per cent) received rates equaling or exceeding rates which would obtain under the railroads' proposal; two (four-tenths of one per cent) were receiving rates equal to or in excess of the average requested by the employees.

Of 1,190 employees in outside industries who are comparable with other skilled maintenance of way employees, 366 (31 per cent) received rates equaling or exceeding the present prevailing rates on the railroads; 531 (45 per cent) received rates equaling or exceeding rates which would obtain under the railroads' proposal; 293 (25 per cent) were receiving rates equal to or in excess of the average requested by the employees.

Regarding unskilled labor, Mr. Walber showed that whereas these employees were receiving from the railroads a weighted average hourly rate of 39 cents per hour, the average hourly rate of 91,734 employees in other industries performing work comparable to that performed by common laborers on the railroads is but 33 cents. Of these 91,734 workers, 36,865 were receiving 30 cents an hour, 25,856 were receiving 33 cents an hour, and 29,013 were receiving 37 cents an hour, Mr. Walber said.

During the war the Eastern territory was particularly affected by competition for labor. The result was that to a very large extent the former differentials in the rates between cities and rural points, large terminals and way points were practically eliminated.

An examination of the disputes from the railroads shows that each railroad proposes adjustments to meet conditions peculiar to it. It is of course recognized that unless the Board were to render a separate decision upon each dispute, each proposal could not be met, but based upon the disputes, it is evident that the intent running through all of them, is to be placed in position to apply certain rates to main line operations, differentials thereunder for branch lines, where the work is less responsible, with differentials above the main line rates for labor engaged in engine terminals, etc. To work this out it would appear that, considering that practical standardization exists today, a decision permitting graded reductions to apply to the different services indicated would meet the problem.

Of 36,865 employees in outside industries who are comparable with common laborers in the shops and roundhouses, only 575 (two per cent) received rates equaling or exceeding the present prevailing rate on the railroads; only 10,535 (29 per cent) received rates equaling or exceeding rates which would obtain under the railroads' proposal, (preponderating rate 32 cents) while only four were receiving rates equal to or in excess of the average rate requested by the employees.

Of 25,856 employees in outside industries comparable with laborers in the maintenance of way department, approximately 12,400, or about 48 per cent, were receiving rates equal to or below the rate proposed of 32 cents. Approximately 22,500, or 87 per cent, were receiving rates below the present average wage of 39.8 cents. Only 44 were receiving rates equal to or in excess of the average rate requested by the employees.

Of course the Board understands that labor in other industries does not do precisely the same kinds of work that track labor performs, but it must be admitted that in the large manufacturing centers common labor freely shifts between the railroads and the industries, but it is all of the same general character and such common labor in the industry affords the most direct comparison that it is possible to make.

F. P. Walsh Directs Defense of Present Wage Scales of M. of W. Employees

Representatives of the maintenance of way employees began the defense of their present wage scales before the board on April 11, Frank P. Walsh, W. J. Lauck and Arthur Sturgis testifying. Mr. Walsh's opening remarks were confined to pointing out the inability of maintenance of way employees, particularly section men and other unskilled labor, to live on a wage of \$70 a month or \$840 a year, which he said these men were now receiving.

Mr. Lauck dwelt at length on the effect of "unduly low wages on infant mortality." "Further reductions in the already pitifully low wages of these men," he said, "will mean

the death of thousands of children through malnutrition or through the enfeebledness of the mother."

Lowering wages, he contended, is not a statistical, economic or industrial problem but rather a problem of public policy, morals, ethics and of humanity itself.

A request was made by Mr. Lauck that the Board summon a list of expert witnesses "to demonstrate conclusively that it would be equivalent to depriving laborers and their families of the very means of existence, that it would be violative of public and private morals and contrary to all considerations of a sound and enlightened public policy, for the Board now even to consider any reduction in the rates of pay of unskilled labor." In addition he stated that by these witnesses he would attempt to "prove that if the Board should reduce wages of section men and unskilled labor, it would impair the efficiency of the railroad, it would be directly contrary to enlightened public policy, it would result in the physical and moral deterioration of these employees and their families and in the malnutrition and actual death of their children."

The Board later ruled that it would not grant this request immediately but would again consider it when all of the evidence now available has been presented.

In closing his remarks, Mr. Lauck contended that there is a "stopping place" below which wages cannot go. "We claim it has already been reached in the case of unskilled and low paid workers," he said, "and therefore, all the testimony and exhibits presented by the railroads and bearing on their wages are here irrelevant and valueless."

Mr. Sturgis' testimony opened with the statement that, "justice to the workers would demand an immediate increase in wages but a wage tribunal must keep at least one foot firm on the ground and in my opinion this is no time for a wage increase even if leaving wages as they are now results in hardship and sacrifices on the part of the railroad workers."

He also discussed the "so-called law of supply and demand" which he contended was not now a law in the determination of just and reasonable wages and should not be considered in this case through the admittance of testimony presented by the carriers and showing the disparity between the rates of pay on the railroads and the rates of pay prevailing for analogous work in other industries, the employees of which, Mr. Sturgis contended, were subject more or less to the workings of supply and demand.

The witnesses asked for by Mr. Lauck include:

Prof. William F. Oglburn, Columbia University, New York; Dr. B. S. Warren, assistant surgeon general, U. S. Public Health Service, Washington; Edgar Sydenstricker, chief statistician, U. S. Public Health Service, Washington; William E. Mosher, director of the New York Bureau of Municipal Research, New York, and Ethelbert Stewart, commissioner of labor statistics, Department of Labor, Washington.

A. F. of L. Leaders Denounce Labor

Board and Transportation Act

With Samuel Gompers, president of the American Federation of Labor, and B. M. Jewell, head of the Railway Employees' Department of the federation, on the firing line, the Labor Board and the Transportation Act were targets of a double barreled attack at the opening session of the railway department's sixth biennial convention at Chicago. More than 500 delegates, representing 750,000 workers in the six railway shop-crafts and the clerks' and switchmen's unions are attending the convention which probably will last two weeks.

Mr. Gompers assailed the Transportation Act as "injurious and a failure" and implied that railroads get the "break" in decisions of the Board. Mr. Jewell's remarks were even more pointed. He denounced the Transportation Act as the

"most vicious piece of legislation ever foisted upon the people," adding that the next two years will tell whether employees will continue to abide by decisions of the Board.

"The attention of the workers of this continent are fixed on your deliberations here," said Mr. Gompers, "for out of them will come certain settled policies which make for the good of men and women in your industries. It is essential that you know your cause well, depend on it strongly, and be willing to do and dare the right thing for the working masses of the country. There has come a time when men must show they have teeth and can bite."

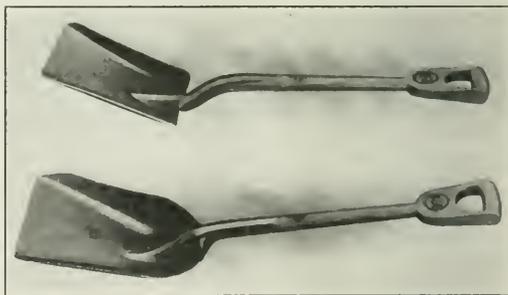

F. P. Walsh's Human Exhibits

On April 12 Mr. Walsh began the presentation of a series of human exhibits to prove his contention that it is impossible to live decently on present wages. A number of section men and section foremen and their wives testified as to their living costs during the past year. Several of the witnesses presenting detailed figures on their expenditure. The majority of these witnesses stated that since the wage cut of last July they have been forced to go into debt for food, clothing, et cetera, and stated their belief that it is impossible for them to maintain their present standard of living and educate their children on the present or reduced wage scale.

Molybdenum Steel in

Shovel Construction

A MOLYBDENUM steel scoop for firing locomotives and stationary boilers has been placed on the market by the Wood Shovel & Tool Company, Piqua, Ohio. The blade of the scoop is made of molybdenum steel, especially treated to give great hardness combined with remarkable toughness. The greater strength of molybdenum steel permits lighter construction with its resultant saving of energy for the worker. A feature of the new scoop is the welding of the straps to the blade, making the two parts virtually one. The bolts are countersunk into the handle which is of

Track Shovel and Fireman's Scoop Made of Molybdenum Steel

seasoned second-growth northern ash. The rigidity of this construction assures long life in actual service.

The molybdenum shovel is made in different types, one being designed for track maintenance and similar work. In designing the track shovel, the manufacturers recognized the fact that it is frequently used in place of a sledge or a crowbar in addition to its normal function, hence, a shovel was constructed to stand up under the gruelling strain and abuse of track maintenance service. Shovels made of the new alloy have been subjected to rigid tests by the Wood Shovel & Tool Company and have demonstrated the value of molybdenum steel for shovel construction.

Julius Kruttschnitt Before Senate Committee

Testimony Offered in Rebuttal of Statements Made by Former Directors General McAdoo and Hines

WASHINGTON, D. C.

JULIUS KRUTTSCHNITT, chairman of the Southern Pacific, testified before the Senate Committee on Interstate Commerce on April 12 in reply to statements by Mr. McAdoo and Walker D. Hines. Mr. Kruttschnitt told the committee that the charges made before the committee by Mr. McAdoo to the effect that federal control was necessary because the railroads "broke down" in 1917 contradicted statements made previously not only by Mr. McAdoo but by President Wilson, the Interstate Commerce Commission and others. Mr. Kruttschnitt said that Mr. McAdoo's charges were made after "Mr. McAdoo's failure to make good his prophecies as to the results of his operation of the railroads."

The McAdoo of 1918 and of 1922

"The authorities we cite," Mr. Kruttschnitt said, "prove that the McAdoo of January and February, 1918, rightly gave the reasons for taking over the railroads. It follows inevitably that the McAdoo of February, 1922, was inconsistent and wrong and that the changed dates and decisions make it clear that little weight should be attached to his testimony before you in 1922. Although in January and February, 1918, Mr. McAdoo gave the true reasons why the government found it necessary to take over the roads, in February, 1922, he asks you to believe it was because the railroads were broken down physically to such an extent and so inoperative as to be 'the strongest ally of the German Kaiser.'"

Mr. Kruttschnitt said that "two bad features stand out prominently in the government management of railroads which were responsible for most of its shortcomings and subjected it to most criticism. They were extreme centralization of authority, established by the first director general and attributable to his temperament and unwillingness to delegate adequate and necessary power to his local officers, and excessive and unintelligent standardization.

Lack of Discipline

"To the first must be attributed the destruction of morale and discipline. The teaching of labor to ignore and condemn their officers, to look to Washington to save them from punishment for neglect of duty and breaches of discipline, for increases of pay and indirect increases, for services never performed, double pay for the same hours of service, all of which produced poor service and indifference to the public. The 'public be damned' policy, unjustly and improperly accredited to private railroad management, was inaugurated and worked to such an undreamed of degree that at the end of the war the return of the railroads to private management was demanded, by those who used them, with substantial unanimity.

"After 26 months of mismanagement the government surrendered the roads with a heritage of \$1,800,000,000 of debt, according to Senator Cummins, saddled on the country, conveniently alleged to represent a legitimate war cost, although much of it was inexcusable, avoidable waste, a scale of government-control operating expenses that ran up to over \$3,000,000,000 more than in 1917 before it could be checked and so burdensome as to make it cost almost 100 cents to earn each dollar of gross revenue."

Mr. Kruttschnitt said that the President in taking over control of the railroads had given assurance to security holders that their rights and interests would be as scrupulously looked after as they would be by the directors of the several railway systems and that there would be as little dis-

turbance of the operating organization and personnel of the railroads as possible.

"These promises and the guarantees of Congress that the roads should be maintained in as good repair and in as complete equipment as when taken over, were completely ignored," said Mr. Kruttschnitt. "The percentage of operating expenses to earnings was raised from 70.48 to 93.47 per cent, the renewals of rails, ties and ballast, was skimmed to the danger point; and the equipment, scattered all over the United States, had been given scant attention and was in the worst condition ever known. At the beginning of federal control 128,780 freight cars were reported in bad order and at the end of federal control 153,727 cars were in bad order, an increase of 24,947 cars. This increase alone would fill a track 192 miles long, but Mr. McAdoo did not disclose the real situation as to the physical condition of freight cars at the end of federal control.

Savings Due to Less Service

"Mr. McAdoo summarizes alleged savings by him of \$118,000,000 in 1918 over 1917. These are substantially the same figures analyzed by us before your committee when we showed that out of the total savings \$79,665,000 represents the cost of suppressed passenger train mileage, service of which the public was deprived during government control and which from patriotic motives they endured patiently. The total amount claimed to have been saved outside of the cost of suppressed passenger service, \$19,193,000, is sixty-five one-hundredths of one per cent only of the total operating expenses. The director general informed your committee in April, 1919, that monthly payrolls of central and regional administrations amounted to \$513,000 in December, 1918, or at the rate of \$6,390,000 per annum; that in addition, office and traveling expenses for the year amounted to \$778,625; grand total at close of 1918, \$7,168,000 per annum or \$1.17 for every dollar saved in salaries of corporate officers.

"Mr. McAdoo out-Hines Mr. Hines in claiming that the railroads were in very bad condition before federal control; that the Railroad Administration increased efficiency, and that the heavy traffic moved in 1920 was due directly to the good conditions in which the properties were turned back," said Mr. Kruttschnitt. "Private operation neither failed nor broke down in 1917 and with the plant provided by railroad owners it gave service that had never been equalled in railroad history."

Praise from the Executive

Calling attention to the statement made by the President in his message to Congress on January 4, 1918, explaining why he took over the railroads, as well as statements of the Secretary of War, the Quartermaster General, and the National Association of Railway Commissioners regarding the accomplishments of the railroads in 1917, Mr. Kruttschnitt added:

"If all of those unbiased gentlemen including the Commander in Chief of the Army and Navy, commend the loyal and co-operative service of the railroads, all of them according to Mr. McAdoo must be aligned with the strongest allies of the German Kaiser."

Asked as to his opinion of the plan proposed by the Association of Railroad Security Holders relative to the pooling of equipment, Mr. Kruttschnitt said that the plan "seems to be full of glittering generalities," but that he had recommended the appointment of a committee to study it.

European Experience with Cab Signals

THE USE OF AUDIBLE cab-signals in Europe, reviewed by L. Weissenbruch in 1920 (*Railway Age*, July 2, 1920, page 29) is the subject of two papers that have been prepared for the International Railway Congress being held this month at Rome, which bring the history of this subject down to date.

The first of these two papers is by Ferdinand Maison, an officer of the railway department of the French Government, bringing the subject down to the beginning of the war, in 1914; and the second is by Jules Verdeyen, inspector of management of the Belgian State Railways (apparently the successor of the late Louis Weissenbruch). The first paper is printed in the Bulletin of the International Railway Association for November, 1921, and the other in the Bulletin for March, 1922. The first one fills about 90 pages, and discusses at length all proposals for assisting engineers in the observing of signals; describes the devices of the principal inventors and has a chapter on speed recording indicators, four of which are described.

The "crocodile" of Lartigue, the well-known cab signal in use on the Northern Railway of France, was put in use on all of the double-track lines of that company as far back as 1880. In September, 1891, Ribard's automatic stop apparatus was tried in France, following the disaster of St. Mandé, when 46 persons were killed. In 1898 another disaster aroused the public, and the Minister of Public Works of France issued a circular to the railroads calling upon them to develop some preventive of collisions. Two years later another circular was issued, and the subject was discussed again at the International Railway Congress in Paris in 1900; but actual progress was slow and halting, for reasons apparently quite similar to those which have prevailed in America. Numerous trials were made in France in 1901 and 1902, a dozen devices being mentioned, but there were no permanent results of much consequence. About 1907 the Eastern Railway of France and the Paris, Lyons & Mediterranean began trying the "crocodile" or something similar to it.

Finally, in November, 1913, occurred the disastrous collision at Melun; and the reflections of the reviewer at that time indicate that all of the efforts of the government had amounted to little. "With the exception of the Northern Railway, the managements have not thrown into the investigation of this problem all the energy and ingenuity which they have displayed in the study of other problems which appeared to them to be of higher interest."

Following this introduction, Mr. Maison occupies 40 pages with descriptions of the various appliances that have been tried; and then there are 20 pages of theory and 10 pages describing speed recorders. On January 1, 1914, the number of locomotives equipped with speed recorders in France was 10,894, of which about four-fifths were passenger engines. All of the six principal companies had locomotives thus fitted, the State Railways having the largest number. Four-fifths of all engines on all roads were equipped. The Flaman apparatus, noted in the *Railway Age* of May 7, 1920, page 1351, appears to be the one most generally used, being found on all of the roads except the Southern and the Orleans.

Mr. Verdeyen begins with a brief review of the few advances made during the war. The circular issued by the French government in 1919 called upon the railroads to make, without delay, a definite selection from the various appliances that had been tried; and, in the meantime, to make more general use of torpedoes, to be placed on the rails behind halted trains, the same as is done in America. Since 1920 the Eastern, the Orleans, the State and the P. L. M. have decided to adopt the crocodile as used on the Northern Railway, with minor modifications. The crocodile has been

improved by an arrangement for keeping its surface coated with paraffin or oil which makes it easy for the brush to clear the surface of frost or snow.

The State railways abandoned the various contact devices which had been under trial since 1911 and adopted the Augereau wireless apparatus which was described in the *Railway Age* of May 7, 1920. The extent to which this apparatus was installed is not stated; although it is said that the experiments on the line between Paris and Chartres included 40 signals. In a subsequent paragraph Mr. Verdeyen says that the Augereau apparatus has been abandoned and that the crocodile of the Northern Railway has taken its place: this with a view to securing uniformity.

The Southern Railway, acting on the suggestion of the government in 1919, that torpedoes should be more generally used, installed a torpedo machine, set at the side of the road, made apparently on the same general principle as that which has been brought out in this country by the Federal Signal Company, as recently noted in the *Railway Age* (March 4, page 517). Mr. Verdeyen seems to think that if the good results thus far shown are confirmed by longer trial, the Southern Railway will be in favor of adopting this machine instead of using cab signals.

Mr. Verdeyen, in his summing up, referring to the favorable opinion entertained by the Southern Railway concerning roadside audible apparatus, says that experiments with apparatus of this kind in Belgium, extending over two years had produced less favorable results; there had been a considerable number of failures of torpedoes and there was trouble because of the premature exhaustion of the store of torpedoes.

The Northern Railway now has cab signals on all of its road locomotives; and the number of fixed contacts on the roadway is 3,800 on a length of 2,360 miles of track. The Eastern, the State and the P. L. M. are making good progress in extending installations. The Northern and the Eastern railroads both have added to the cab signal an audible warning, different from the cautionary warning, to sound when the signal is at clear.

Mr. Verdeyen finds that in 1920 the total number of locomotives in France fitted with speed recording apparatus was 12,655. Supplementing the descriptions of speed recorders given by Mr. Maison, this paper contains a brief description of the Deuta apparatus which is in use on the railways of Alsace-Lorraine. Of these and other designs of recorders, the railroads of Alsace-Lorraine have 1,018 in use.

Automatic Train Control Hearing Is Resumed

I. C. C. Hears Train Control Companies Present Facts Pertaining to Their Systems

IN ORDER that automatic train control companies could present evidence in connection with the proposed order of the Interstate Commerce Commission on automatic train control, the Commission at the close of the testimony of the railroads on March 24 (reported on page 837 of the *Railway Age* for April 1) continued the hearing until April 12.

Before the train control companies were called on, M. C. List, attorney for the Commission, presented for the record a list of acts and documents pertaining to train control showing the government's activity on this subject. Mr. List outlined the reasons which led up to the formation of the Block Signal and Train Control Board in 1907; the amount appropriated and spent by the government in its investigations through the Board and later by the Bureau of Safety. Extracts pertaining to automatic train control were read into the record from the reports of the Board and from the Bureau of Safety's annual reports after the Board was discontinued.

Performance and Accident Records

The Bureau of Safety prepared and submitted through Mr. List a tabulation of the operating records of the American Automatic Train Control Corporation, the Miller Train Control Corporation and the Regan Safety Devices Company which were based upon the reports of the engineer-examiners and the inspectors of the Joint Committee on Automatic Train Control of the American Railway Association. These tabulations cover the same period as that portion of the report of the subcommittee of the Joint Committee (of the A. R. A.) which relates to the devices in use which was presented by J. A. Peabody at the hearing on March 20, and in connection with the tabulation prepared by the Bureau of Safety a careful check of the Joint Committee's compilation was made. Differences in the classification and record of failures and undesirable stops were shown in the statement accompanying the memorandum.

A summary of the accidents which have occurred between 1906 and 1921 inclusive shows a total of 106,473 which resulted in 6,142 killed, 95,936 injured and a loss of \$80,386,694. There were 17,042 rear end collisions resulting in 1,914 being killed, 25,974 injured and a loss of \$21,507,894. During this period the number of head end collisions were 9,255 in which 2,412 were killed and 34,708 were injured. This resulted in a loss of \$19,461,769.

Collisions investigated by the Commission from July 1, 1911, to March 31, 1922, were as follows:

Kind of Collision	Number	Persons	
		Killed	Injured
Head end	255	863	5,462
Rear end	205	773	3,948
Side	43	130	738
Miscellaneous	15	41	139
Totals	518	1,807	10,287

The collisions investigated by the Commission which occurred in automatic block signal territory due directly or indirectly to the failure of enginemen to observe or be governed by signal indications from July 1, 1911, to March 31, 1922, numbered 80 which resulted in the death of 416, the injury of 1,837 and a property loss of \$1,081,583.35. This loss did not include damage to lading. In addition to the above and among other exhibits presented by Mr. List was one listing the roads cited in the proposed order on train control giving their total automatic block signal mileage; total passenger lines operated; territory designated in the Commission's order of January 10; mileage covered by this

territory and the automatic block signal mileage in it with certain explanatory notes.

American Train Control Corporation

C. W. Hendrick, in presenting his brief, stated that "after 14 years, on the part of the Commission, through its safety division, to secure the co-operation of the railroads by getting them to recognize that the present wayside signals are not giving sufficient protection, your Commission, after careful and extensive investigation, and not until two years after the passage of the Transportation Act giving you power, did you take any positive action until the issuance of the present order now under discussion. For this committee (the Carrier's Committee) to come forward at this late date and endeavor to discredit your investigation and order by trying to show that train control is in an undeveloped stage and does not warrant your having issued the order is clearly a desire on their part to secure further delay, which is largely based on prejudice. We are perfectly justified in taking the stand that wayside signals are also in a developing stage * * * after 30 years of development. Knowing that a first impression is difficult to overcome, special efforts have been made to create an unfavorable impression by magnifying small things and belittling important accomplishments of train control, at the same time praising wayside signals."

Mr. Hendrick told how long freights can be handled on mountain grades without danger of losing the air through gradual application. Regarding the service record on the Chesapeake & Ohio, attention was called to the testimony of the signal engineer in which he stated that during two years of service, out of 1,120,000 operations there were only two false clear failures. The objections of the Carrier's Committee were next answered in detail.

In speaking of installation costs, Mr. Hendrick said that he did not want these costs mixed up with the cost of signals and that the costs should be based on three things:

(1) Installation of train control in connection with wayside signals, when wayside signals are provided. (2) Installation of train control when no wayside signals are provided. (3) Apparatus to be supplied for the engine equipment. The approximate cost of this system was given for installations where wayside signals are already in. Engine equipment was listed at \$850; each ramp location at \$200 and the cost of attaching the equipment to engines is \$50 per engine. Maintenance costs were given as \$14.03 per engine per month. In concluding his brief, Mr. Hendrick said that "if you (the Commission) defer the issue, you can rest assured the signal companies, who have been advising the railroads through these years of opposition, will not work overtime to aid in developing a system that will eventually cause them a heavy loss by putting the wayside signals in the same class as the horse car is to the electric car." C. C. Paulding, attorney for the railroads, asked Mr. Hendrick on what grounds he based his charge that the railroads were influenced by signal companies and he stated that it was from general observation. Mr. Hendrick was asked if that was basis enough on which to make such grave charges and he could not present any specific instances to substantiate his statement.

B. F. Wooding Presents Brief

Dr. Wooding said: "If all the presidents of railways were to appear before your Honorable Commission and it was

put up to them that they must either kill one of their number each year or install all the railroads with the automatic train control, can you guess what their answer would be?" Dr. Wooding gave a description of his device and told of the difficulties experienced in developing it and the trouble he had in arranging for and conducting experiments on the railroads. In touching on the induction type of train control he said that it "is far behind the contact, though having had every advantage with the latter. * * * With the contacts * * * all complications and uncertainties are eliminated which are common to the transference of electrical impulses in comparison with definite mechanical operation. Besides, the maintenance cost for current along the roadway cannot help but be expensive."

The cost for locomotive equipment was placed at \$450; track equipment for 100 trains daily, complete, \$800; 200 trains daily, \$900 and for 300 trains daily, \$1,000. Fixed charges for locomotive maintenance, if the battery is charged from the headlight dynamo was placed at from \$2 to \$5 per month while that for track maintenance was placed at \$5 for 100 trains a day; \$10 for 200 trains a day and \$15 for 300 trains.

Commissioner McChord asked if he thought that engineers would be less alert with train control than without it and was answered in the negative. Dr. Wooding explained why he felt that an emergency application of the brakes should be made and stated that it would be a mistake for the railroads to make installations of signals without also installing train control. Interlocking construction, in his opinion, could well be delayed until after installations of train control.

F. J. Sprague Takes the Stand

Stating that many of the objections raised to train control were of the "rubber stamp" type, F. J. Sprague said that it was unfortunate that the same committee of the American Railway Association which had been appointed to co-operate with the Commission was the one to handle the case against train control for the carriers. He pointed out that the opposition raised by the railroads to the adoption of Section 26 of the Transportation Act was based largely on a statement made by S. M. Felton, president of the Chicago & Great Western, who had ventured in a field of prophecy already disproved by facts. Mr. Sprague felt that the Carrier's Committee could have done much better had it offered constructive criticisms rather than presenting every defect against the devices found in service. The wayside signals, in his estimation, gave only a limited indication of traffic conditions ahead and that if an accident happened every time an engineman passed a red signal the newspapers would be full of them as they are of automobile accidents. Accident statistics, he stated, were a dry menu for the widows and orphans and as to the victims themselves it was a 100 per cent loss. In giving a general description of his device, Mr. Sprague said that he had adopted certain requirements which he felt should be met and that the application of magnetic induction to other fields such as the telegraph, electric railways, signal systems, etc., proves that it is available for the train control field and that any system, in his opinion, should be a thorough mentor and guide to the engineman to assist him in his work. He stated that the price for his equipment would be furnished those railroads asking for estimates and that estimates given by the railroads were absurd.

When the meeting adjourned the Miller Train Control Corporation was presenting its brief which was continued over for the Thursday morning session. Other train control companies yet to be heard in the order of their hearing are the Sumner, Shadle, Webb, Schweyer, Clifford, Richards, Wharton, Bevan-Wallace, General Railway Signal Company, Finnegan and Regan.

Railways Should Make Vast Expenditures

THE RAILWAYS of the United States should spend one and one-half billion dollars per year on enlargements and extensions to bring their facilities up to the point that they were in 1914 with reference to the business of the country, according to W. B. Storey, president of the Atchison, Topeka & Santa Fe. Mr. Storey made this statement in the course of an address before the eighth annual conference of the seventeenth district of the International Association Rotary Clubs at Muskogee, Okla., on March 31. In discussing the railway situation of today, Mr. Storey based his arguments on the two facts that the railways and the people are interdependent and that the roads must build and grow as the country grows. He spoke in part as follows:

"In regard to the first, the people of this country are absolutely dependent on the railways. This country has developed only by reason of the transportation afforded by the railways. The railways are necessary to bring in all necessities of life—to bring in coal and supplies of all kinds and carry away all produce. They may be likened to the circulatory system of the body and are as essential to the life of the country as the arteries and veins are to the health of the human system. Conversely, the railways are just as dependent on the people. They must have people to serve, to give them business and hence life. A railway goes into a new country, finds no people—hence no products to haul—and generally loss results. Many railways went bankrupt because they did not recognize this until too late. The Santa Fe made this mistake in that it over-extended too rapidly, and as a consequence 30 years ago it became bankrupt. Now it adds mileage only as fast as it can be digested; that is, made productive. We count on a new branch being unproductive for a few years. * * *

"The second fact is that the railways must build and grow as the country grows. This means that branches must be built, that additions in the way of sidings and new and larger stations must be provided, that more cars and more locomotives must be bought, with the shops and roundhouses to take care of them. Secretary Hoover, in a recent statement before the Interstate Commerce Commission, used the following language:

"One thing is absolute—our transportation facilities are below the needs of our country and unless we have a quick resumption of construction the whole community, agricultural, commercial and industrial, will be gasping from a strangulation caused by insufficient transportation the moment that our business activities resume."

"To give you some idea of what this matter of growth means on a road like the Santa Fe, we expended for extensions, for additions and betterments, and for equipment over \$20,000,000 a year for the five years prior to 1914. This has nothing to do with the ordinary expenditures for maintenance, but is new money put into new appliances to take care of the growth of the country along our lines. That amount of money today will not buy or provide the same that it would. Twenty millions then means forty now * * *

"The same situation obtains on all other roads throughout the country, and applying the same expenditure to the entire mileage of the country we find the prodigious total of one and one-half billion dollars which ought to be expended on enlargements and extensions alone per year for three years to bring the railroads of the United States up to date. Mr. Hines, in testimony before the Interstate Commerce Commission on January 31, last, said: 'It would be a conservative estimate to say that for several years the public interest would be promoted if about a billion dollars a year could be expended for this purpose.' Mr. Hines' figures are large, but I believe them not large enough, and in my judgment one and one-half billions should be spent."

General News Department

Z. G. Hopkins, assistant to the chief operating officer of the Missouri, Kansas & Texas, with headquarters at St. Louis, Mo., addressed the St. Louis Railway Club on Friday evening, April 14, on "The Field for a Railroad Bloc."

Union Pacific's Proposed Expenditures

The Union Pacific has recently announced its intention to spend \$29,000,000 for additions, betterments, equipment, and extensions during 1922. The construction of three short extensions is contemplated, and \$9,200,000 has been set aside for new equipment. The major portion of this sum will be for freight cars, for which a large number of contracts have already been let. The Pacific Fruit Express, which is jointly owned by the Union Pacific and the Southern Pacific, will spend \$9,000,000 for betterments during the ensuing year, of which sum \$8,000,000 will be spent for new equipment and \$1,000,000 for new ice plants.

A Correction

In the article entitled "New Specifications for Rail," which appeared on page 828 of the *Railway Age* of April 1, the statement was made that the rail manufacturers had agreed to accept orders for rails to be rolled in accordance with the new experimental specifications this year without additional charge. While this statement is in the main correct, it has given rise to some misunderstanding. The facts are that some mills have agreed to permit a portion of the 1922 tonnage to be rolled under this experimental specification for the purpose of ascertaining the practicability of this specification and with the understanding that for the specific test tonnage (the amount of which is to be determined by agreement between the mill and the road in question) there is to be no extra charge.

D. T. & I. Earnings Increasing

The Detroit, Toledo & Ironton, which had shown a steady reduction in net operating income since last April, until it had a deficit of \$331,000 for December, has been showing an improvement since then, according to its reports filed with the Interstate Commerce Commission, as its traffic and earnings have increased. In January the road had a net operating income of \$23,159, while for February it was \$131,538. For the corresponding two months of 1921 the road showed a deficit of \$311,370. For the first two months of 1922 the operating revenues were \$1,056,022, an increase of \$617,425 over 1921, while operating expenses were \$764,464, an increase of \$99,364. Expenditures for maintenance of way and structures were \$55,328 less than for the corresponding months of 1921, while expenditures for maintenance of equipment were \$31,697.

The Air Mail

The Airplane Mail Carriers, carrying mail between New York and San Francisco, have flown, since July, 1921, about one million miles; and 94 per cent of the trips were completed satisfactorily. In that time there has been but one accident, a pilot falling from a distance of 300 feet at San Francisco while flying in a plane without mail. He was killed. No other accident, fatal or non-fatal, is recorded. This and other facts are given in an article published in the Union Pacific Magazine for February, by A. R. Dunphy, superintendent of the Central Division of the Air Mail Service. In the three years and three months prior to last July, 21 pilots and eight mechanics or other employees were killed, an average of one death to every 75,000 miles flown. Mr. Dunphy says that the New York-Washington air mail was discontinued on July 1, 1921, the appropriation for the current fiscal year having made no provision for that, or for any line except the one between New York and San Francisco. He gives interesting data concerning the machines used and condenses figures showing the

volume of traffic since the beginning of this service, which was on May 15, 1918. He also relates some of the thrilling adventures of the flyers in the Rocky Mountains.

April Meeting of the New York Railroad Club

Harrington Emerson, of the Emerson Engineers, who will be the principal speaker at the meeting of the New York Railroad Club to be held on April 21 at the Engineering Societies' Building at 8 p. m., was from December, 1920, to June, 1921, field director as to wastes in transportation in the study which the Federated American Engineering Societies made of the elimination of waste in industry. During the summer of 1921 he went abroad and studied railway conditions in England, France and Germany. He then spent three months in Mexico, studying the national railways of that country at the request of the Mexican government.

The railways of all countries are suffering from the same difficulties. Mr. Emerson will attempt to diagnose the troubles that have recently come upon the railway world and will suggest remedies. His address will be illustrated with charts and diagrams.

Illinois Central Plans Hotel on Wheels

The Illinois Central is preparing to house 6,000 of the 30,000 visitors expected to attend the triennial conclave of Knights Templar to be held in New Orleans, La., April 24-27. There will be a hotel on wheels, consisting of 250 Pullman sleeping cars, in the railroad's Poydras yards, between Poydras and Lafayette streets, and extending five blocks from Magnolia to Saratoga streets. To provide the necessary space, eleven new tracks are being built.

The sleeping cars will be operated after the pattern of a miniature city, with dining cars at convenient intervals. A section of warehouse No. 3 is being converted into a temporary clubhouse, containing toilets, 24 shower baths, a three-chair barber shop, and a laundry agency. The municipal water supply will be tapped with laterals leading to each car. Two locomotives will furnish steam for heating the cars and the clubhouse. The railroad company is spending about \$65,600. In addition to the facilities in Poydras yard tracks will be laid on neighboring territory immediately east of the yard, and this will be available as parking space for more cars, while if still more space is needed, cars will be switched to several tracks directly west of the Union station. Arrangements have been made for the handling of 200 cars.

Production of Non-Union Coal Fields

Conditions in some of the more important fields are reported by the Coal Review to be as follows:

In the non-union fields of Pennsylvania production is running at about the pre-strike rate. In the non-union fields of Eastern Kentucky and Tennessee, output is not up to normal solely because of lack of orders for coal.

West Virginia, with operation for the entire State at 65 per cent of normal, is held down by lack of orders. The Kanawha Field of West Virginia reports 1,250 cars standing unsold and that, if there were sufficient orders on hand to justify running the mines, a larger percentage of the men now idle would return to work under conditions offered them by the operators on April 1. In the Winding Gulf Field of West Virginia, 4,200 cars are standing unsold on the tracks.

Ohio, Indiana and Illinois are nearly 100 per cent closed down, but a large number of cars loaded during the last week before the strike are still unsold. West of Mississippi, union mines are closed; non-union mines are operating so far as orders for coal enable the mines to run.

Western Kentucky reports that, while a large number of mines are not working, the explanation is to be found in the lack of orders and the unsold cars of coal already standing at the mines.

REVENUES AND EXPENSES OF RAILWAYS

MONTHS OF FEBRUARY AND TWO MONTHS IN CALENDAR YEAR 192

Table with columns: A verage per cent, Name of road, Operating revenues, Total, Traffic, Trans- portation, General, Total, Operating ratio, Net from operations, Operating income or loss, Net after rentals, and Net after rentals 1921. Rows include various railroads like Atlantic Coast Line, Baltimore & Ohio, and Chicago & North Western.

REVENUES AND EXPENSES OF RAILWAYS

Annual Meeting of Signal Section

11. S. Balliet, secretary, 30 Vesey street, New York, announces the tenth meeting of the Signal Section, American Railway Association to be held at the Monmouth Hotel, Spring Lake, N. J., on Wednesday, Thursday and Friday, June 14, 15 and 16. The reports of committees are contained in the advance notice which will be mailed May 22. Hotel reservations should be made direct with the hotel management. Rates, on the American plan, range from \$8 a day for single rooms without bath to \$18, \$20 and \$22 for double room with bath. The stipulation for occupancy of rooms is one person to a single room and two people to a double room. Members who desire to remain at the hotel beyond the convention period will be accommodated at the same rates until the evening of June 18. Spring Lake is reached from New York by the Pennsylvania or the Central of New Jersey, in eighty minutes, with fast train service about every hour.

Report of Pennsylvania Reviewing Committees

The reviewing committees of the Pennsylvania Railroad—committees composed of officers of the road and representatives of the employees brotherhoods—who consider controversies between the company and its employees, have during the year ending December 31 last, considered 6,196 cases, of which 3,729 were adjusted or compromised in favor of the employees; 2,314 cases were withdrawn and 43 were decided in favor of the management. The remaining 110 cases, equal to two per cent of the total, were either dropped, pending appeal, or were brought up at a later date in some other shape. The cases decided in favor of the employees equaled 60 per cent of the whole; the cases withdrawn, with those decided in favor of the management equaled 37.94 per cent. The committees which deal with complaints of engine and train service employees have been in existence since January 1, 1921, but those which deal with the other classes of employees were not established until August or September.

Of the 3,729 cases settled in favor of the employees, 1,409 were decided by officers below the grade of superintendent; 1,935 were settled by superintendents; 258 by general superintendents; 59 by general managers and 28 by reviewing committees.

Accident Bulletin No. 81

The Interstate Commerce Commission has issued quarterly accident bulletin No. 81, dated February 8, giving statistics of railroad accidents occurring in the United States in the three months ending with September, 1921. During this quarter 11 passengers, 51 employees and 21 other persons were killed in train accidents, and 900 passengers, 338 employees and 62 other persons were injured; a total of 83 persons killed and 1,300 injured.

Adding train service accidents, the total number of casualties occurring in train operation was as follows: passengers killed 46, employees killed 302, other persons killed 1,331; passengers injured 1,992, employees injured 7,236, other persons injured 2,508; a total of 1,679 killed and 11,666 injured. As compared with the corresponding quarter in 1920, (Bulletin No. 77) all items show a decrease. The total number of persons killed in the earlier quarter was 2,044 and of injured 1,947.

Of passengers killed in train accidents the total this year, 11, compares with 24 in Bulletin No. 77. Under the head of employees killed in train accidents the diminution is 59.5 per cent, the total last year having been 126. The nontrain accidents now reported total 119 killed and 20,997 injured, as compared with totals in the same quarter of 1920 of 124 killed and 29,057.

Southern Pacific Will Send Enginemen to Fuel Association Convention

Eleven engineers and eleven firemen from the Southern Pacific Line, together with several officers of the road, will be sent to the convention of the International Railway Fuel Association to be held in Chicago, April 22 to 25, as a recognition for maintaining an excellent fuel record during the past twelve months. Individual fuel performance records are kept on the Southern Pacific for each engineer, fireman, and locomotive, and by means of these records the most efficient enginemen are selected. Competition throughout the year has been keen and interest has been maintained through the publication of an honor roll each month showing the enginemen and firemen making the best fuel performance

in through freight, local freight, through passenger and local passenger service.

In order to arouse the interest of all employees on the different divisions, a fuel conservation banner made of silk, suitably inscribed and trimmed with gold braid and tassels, is awarded to the division making the best fuel performance for a three-months period. The winning division is indicated by a gold lettered strip which is fastened on the bottom of the banner on which the winning date, as well as superintendent's name, is shown. Gold hat badges are awarded to the engineer and fireman who make the best showing in fuel economy for each three-months period. The Southern Pacific has rewarded enginemen who made unusually good fuel records with a trip to the convention in previous years and the continuation of this practice indicates that the results of attendance at the sessions of the Fuel Association have been found beneficial.

Reparation During Federal Control

The Interstate Commerce Commission has issued a decision holding that the question whether reparation should be awarded on the same basis in respect of transportation during federal control before and after June 25, 1918, depends upon the facts of record in each case.

This proceeding was instituted upon the commission's own motion to afford interested parties an opportunity to argue orally the question whether, in finding unreasonable the rates charged by the director general on traffic which moved during federal control, and in awarding reparation therefor, it should apply a lower basis to shipments made prior to June 25, 1918, when rates were increased approximately 25 per cent, than on shipments made on or after that date.

The position of the director general was that the commission should adopt a uniform rule based upon the principle that any rate found unreasonable on such shipments made prior to June 25 should include the general increase effective on that date because the increase in wages of railroad employees was made retroactive to the beginning of federal control on January 1, 1918, and because railway materials and other expenses had substantially increased before the increase in rates was operative. In this respect he asked that consideration be given to the fact that although certain economies were instituted as an incident of federal control there was a deficit in operating results for the period from January 1 to June 24, 1918. His position was that if, in awarding reparation against him, the same basis is not applied on shipments made prior to June 25 as on shipments thereafter, the effect is to penalize the government for having failed to initiate at an earlier stage of federal control the increased rates which would doubtless have been found reasonable.

The report, by Commissioner Hall, says in part: "Shippers urge that the rule suggested by the director general is unsound and if adopted would bring about anomalous situations. In Sulzberger & Sons Co. v. C. R. I. & P., 55 I. C. C., 691, the complaint was filed in 1916. The decision was in 1919. If the reasonable maximum rates there prescribed had been established prior to June 25, 1918, they would have been subject to the general increase of that date. Can it be said that because a case is decided after June 25 the fact that rates prior to that date were on a different level should be disregarded? The director general asks in effect that, where particular rates are found unreasonable after June 25 on shipments which moved during federal control both before and after that date, we arbitrarily use January 1, 1918, as the dividing line because the retroactive application to January 1 of the wage award substantially increased the operating expenses during the ensuing period down to June 25, although operating revenues were not increased until the latter date. That is another way of saying that the increases effective on June 25 should be applied retroactively to January 1, 1918, in so far as affecting complaints. If that contention is sound as applied to the director general it is likewise sound as applied to the corporate carriers. Their rates were increased on August 26, 1920, and, as the wage award of July, 1920, was applied retroactively to May 1, 1920, the question would arise in determining the reasonableness of rates on shipments made prior to August 26, 1920, whether any rate, found to have been unreasonable prior to that date may nevertheless properly include the percentage increase authorized in that case. Shippers might with equal propriety ask that general reductions apply retroactively.

"The fact that in some of the decided cases we have awarded reparation to the same basis upon shipments made before and after June 25, 1918, does not necessarily reflect any variance in principle. Operating conditions prior to June 25, 1918, including the retroactive application of the wage award, were important factors, but they were not necessarily controlling in determining the reasonableness of rates after January 1 of that year. Unconsciously, it may be, but none the less really, counsel for the director general asks us to decide cases in advance by laying down some principle of determination which will be controlling before we know anything about the state of facts to which it will be applied. We are convinced that we would not be warranted in announcing any rule of general application as a basis for determining the reasonableness of rates exacted on shipments moving before or after June 25, 1918, or any other date. We are equally convinced that in proceedings against the director general, as in all others, we must adhere to the sound and salutary principle that whether and to what extent a rate was or is unjust or unreasonable in a particular case is a question of fact, to be determined by the exercise of good judgment, informed by experience, in the light of all the pertinent facts of record in that case."

Cogary Cogs

The above title is not so cryptic as it seems. It is the name of a quarterly magazine which has been started by the Central of Georgia Railway Clerks' Organization, to enable the clerks in the operating, accounting and mechanical departments, and in the station agencies, to keep in touch with each other. The clerks recognize that they are only cogs in the railroad machine, but they mean to demonstrate the importance of having every such member exactly fitted for its duty. They forgot to put into the magazine the name of the editor or of the city where it is printed; but we will assume that Savannah is the place.

Railroad Earnings for February

Reports filed with the Interstate Commerce Commission show that the Class I railroads of the United States had a net operating income in February of \$47,762,600, which, on the basis of their tentative valuation, would be at the annual rate of return of 4.57 per cent, compared with an operating deficit during the same month last year of \$5,176,867. This was short \$14,884,000 of the amount necessary to have enabled the carriers to earn a 6 per cent return. In January their net operating income was \$29,476,000 or at the annual return of 2.69 per cent on their tentative valuation.

Operating revenues amounted to \$401,328,700, a decrease of 1.3 per cent as compared with last year, while operating expenses totaled \$324,423,800, 15.6 per cent below those for February, 1921. Virtually complete reports filed with the commission showed that the railroads in February handled approximately 14 per cent more freight than they did during that month last year.

The carriers in the Eastern district in February had operating revenues of \$204,382,100, an increase of 5 per cent, while their operating expenses totaled \$162,328,700, a reduction of 15.1 per cent. Their net operating income was \$29,535,800 compared with an operating deficit of \$7,627,592 the year before. The net operating income for the month was at the annual rate of return of 7.17 per cent on the tentative valuation, exceeding by \$4,833,000 a 6 per cent return.

The railroads in the Southern district had operating revenues of \$53,024,800, a decrease of 3.6 per cent. Operating expenses totaled \$42,225,800, a reduction of 17.7 per cent, while their net operating income was \$7,048,800, compared with \$466,257 during the previous February. This was at the annual rate of return of 3.98 per cent but \$3,584,630 below a 6 per cent return on their tentative valuation.

With the Green Bay & Western alone missing, the operating revenues for the carriers in the Western district amounted to \$143,921,700, a reduction of 8.2 per cent, while their operating expenses totaled \$119,869,100, a decrease of 15.6 per cent. Their net operating income totaled \$11,177,900 compared with \$1,984,468 in February, 1921. This amount, which is at the annual rate of return of only 2.46 per cent, fell \$16,133,000 short of the amount contemplated to be earned under the transportation act.

Traffic News

The Ann Arbor Railroad resumed its car ferry service between Frankfort, Mich., and Menominee, on April 5.

The Chicago & North Western and the Union Pacific have opened a joint ticket office at 37 Plural street, Council Bluffs, Iowa.

The Great Northern has announced its intention to inaugurate Pullman sleeping car service on its lines next month. Heretofore this company has furnished its own sleeping car equipment.

The Wabash has announced a reduction in fares from Chicago to New York, similar to that of the Erie, effective April 17. The round trip fare will be \$43, with stop-over privileges at Detroit, Buffalo and Niagara Falls.

The Erie has announced a 30 per cent reduction in its round trip fare from Chicago to New York, to be effective April 17. The tickets will be good for one week with certain stop-over privileges. The reduction is from \$61.40 to \$43.

The House committee on interstate and foreign commerce, which recently completed a series of hearings on various bills to require the use of interchangeable mileage books at reduced rates, has postponed any further consideration of these various bills until May 2.

The Chicago & North Western has announced week-end excursion fares from Chicago to points in Central Wisconsin to be effective from May 15 to October 1. The fares will be on a basis of 2.7 cents a mile. Tickets will be valid between Friday and Monday mornings, within 30 days.

The Canadian Pacific has announced a reduction of 5½ cents per 100 lb. on grain to be consumed at destination (domestic consumption) and one cent per 100 lb. on grain for export, applicable between the head of the Great Lakes and points in eastern Canada and eastern United States. The reduction in export rates goes into effect on April 20, and in domestic rates on April 29.

The Spokane, Portland & Seattle has announced that effective May 18, it will establish proportional rates of forest products from Pacific Coast and interior points as shown in tariff 18-D, applicable on traffic destined to the lake ports of Michigan, also to Ohio, Pennsylvania and New York or beyond. The reductions on the various commodities will be as follows: shingles from the coast 5½ cents, and from interior points 4½ cents; fir lumber, from the coast 5½ cents, and from interior 4½ cents.

R. C. Dearborn, whose appointment as chairman of the National Perishable Freight Committee, with headquarters at Chicago, to succeed E. S. Briggs, was announced in the *Railway Age* of March 18, was born in Yorkville, Ill., on August 8, 1877. He became a stenographer on the Michigan Central in 1900 following a period of service in the employ of the North Shore Dispatch and later in the general freight office of the Michigan Central at Chicago. In 1902 he was employed by the Santa Fe Refrigerator Dispatch Company, where he remained for a year, when he became associated with the Fruit Growers' Express, with which company he served until 1907. With its successor, the Pacific Fruit Express, he served as chief clerk and general agent until July 1, 1920, when he was appointed traffic manager, the position he held at the time of his recent appointment.

At the annual meeting of the Chicago Traffic Club, held on March 28, the following officers were elected for the ensuing year: President, J. A. Brough, traffic manager, Crane Company; first vice-president, E. K. Fleming, general agent, Chicago, Burlington & Quincy; second vice-president, C. E. Barnes, warehouse department, Peter Schoenhofen Brewing Company; third vice-president, E. L. Whitney, assistant general freight agent, New York Central; treasurer, R. J. Wallace, traffic manager, Jaques

Manufacturing Company; secretary, E. S. Buckmaster, assistant general agent, American Railway Express, Directors: H. H. Bascom, traffic manager, Steel & Tube Company of America; B. S. Garvey, vice-president of the Illinois Bell Telephone Company; J. F. Coykendall, treasurer, Chicago Great Western; and the retiring president, R. B. Robertson, assistant freight traffic manager, Union Pacific.

To Investigate Western Coal Rates

Considerable dissatisfaction having been manifested against the rates on bituminous coal in the western part of the United States, the Interstate Commerce Commission has concluded to institute an investigation into all such rates from producing points in Montana, Wyoming, Colorado, New Mexico and all states west thereof to destinations in those states and to El Paso, Tex. To afford all interested parties an opportunity to be heard hearings will be held in May at representative points, including Denver, Salt Lake City, Butte, Seattle, San Francisco, Phoenix, and El Paso. In so far as practicable it is desired that rates to points in Colorado be considered at the hearing at Denver, to points in Utah at Salt Lake City, to points in Montana and Idaho at Butte or Salt Lake City, to points in Washington and Oregon at Seattle, to points in Nevada and California at San Francisco, and to points in Arizona and New Mexico at Phoenix or El Paso.

Traffic Statistics for January

Class I railroads in January handled 23,682,356,000 ton-miles of revenue freight, as compared with 26,627,393,000 in January, 1921, according to the Interstate Commerce Commission monthly bulletin of revenue traffic statistics. The average revenue per ton-mile was 1.164 cents as against 1.215 last year and the average haul per road was 198.67 miles as against 188.11. The number of passenger miles for the month was also less than in January last year, 2,698,888,000, as against 3,378,782,000. The average revenue per passenger-mile was 3.102 cents as against 3.114 and the average journey per road 33.21 as against 35.69. The average number of revenue passengers per car was 14.54 as against 17.11.

The number of revenue passenger-miles in commutation service was 511,373,000 and the commutation revenue was \$5,726,063. As indicating how the average revenue and the average journey per passenger were reduced by commutation service and rates, the bulletin shows that the average journey in commutation service was 13.87 miles, while the average in other service was 49.26 miles. The average revenue per passenger-mile in commutation service was 112 cents and in other service 3.565 cents.

Anthracite Shipments—March, 1922

The shipments of anthracite for March, 1922, as reported to the Anthracite Bureau of Information, Philadelphia, amounted to 6,778,667 gross tons, an increase over the preceding month of February of 1,539,653 gross tons, and over the month of March last year of 1,040,896 gross tons.

March, 1922, stands third as a record for that month, shipments in excess of this figure being made during the years when the anthracite industry reached the high water mark, a record of 7,276,777 gross tons being established in March, 1918, and 6,989,075 gross tons in March, 1917.

The total shipments for the coal year ending March 31, 1922, have amounted to 67,039,037 gross tons, as compared with 69,346,731 gross tons shipped during the previous coal year ending March 31, 1921, a decrease of approximately 2,300,000 gross tons. Shipments by originating carriers were as follows:

	March, 1922	March, 1921	Coal Year 1921-1922	Coal Year 1920-1921

Commission and Court News

Interstate Commerce Commission

The commission has suspended until July 30 the operation of schedules published by the Illinois Central which propose reduced rates on coal from Illinois mines on the Illinois Central to points on the St. Louis Southwestern, the present rates ranging from \$4.00 to \$4.94 per net ton while the proposed rate to all the stations is \$4.45 1/2.

The commission has suspended from April 5 to August 3 the operation of schedules which propose changes in routing of shipments of grain, grain products, cereals and cereal products, carloads, on traffic originating in Colorado, Iowa, Kansas, Missouri, Nebraska, Oklahoma and Wyoming, destined to Arizona, California, Mexico, Nevada, New Mexico, Oregon and Utah.

The Interstate Commerce Commission on April 7, vacated its order advancing intrastate rates in Indiana because the Indiana commission had withdrawn on April 4, its order which had prevented the railroads from making effective as to intrastate rates the increases ordered by the federal commission in Ex-Parte 74, until the federal commission issued the intrastate rate order.

The commission has suspended to August 8, the operation of schedules published by the Chicago & North Western and the Chicago, Milwaukee & St. Paul, which propose new joint and proportional reshipping rates on wheat, corn and other grains from Chicago in connection with those roads to Milwaukee, Wis., thence by car ferry in connection with the Grand Trunk and the Pere Marquette to eastern cities, on both domestic and export traffic, which are the same as the reshipping rates, currently in effect from Chicago, in connection with eastern lines and from Milwaukee, when routing via Chicago, or by car ferry across Lake Michigan.

The Commerce Commission has issued a notice to all railroads saying that for some time it has been receiving very many requests for a waiver of that portion of section 6 of the act, which requires changes in rates to be established on not less than 30 days' notice. Because of the relationships which exist in rates between points and between commodities, the establishment of rates on short notice frequently results in discrimination and necessitates the filing of additional applications. The purpose of the notice is to advise all concerned that the commission will not approve the establishment of changes in rates on less than statutory notice unless carriers make in their applications a substantial showing of an emergency which warrants the waiver of statutory notice, nor will the commission, under any circumstances, approve an application for waiver of statutory notice, which application covers only a portion of an adjustment and gives no heed to similar changes in rates at related points or on related commodities. Administrative ruling No. 58 of tariff circular No. 18-A has been amended in line with the foregoing.

State Commissions

The Public Service Commission of New York has issued an order, to go into effect at once, calling for a reduction in the rates for the transfer of baggage in New York City. The Commission has revised the zones under which the baggage transfer companies have worked for many years and has reduced most of the rates. In the center of the city—Manhattan, south of 59th street—the rate is \$1 for each trunk and 75 cents for each bag. Hitherto the charges have been \$1.25 for a trunk and 90 cents for a bag. On commercial trunks the rate may be 15 cents (each) higher than the scale for ordinary trunks; and on baggage taken by the wagonload of not less than 20 trunks, the rate will be 30 per cent less than the normal tariff. Under the order the Westcott Express Company and the New York Express Company are required to report to the commissioner monthly.

showing the number of pieces of baggage handled in and between the zones with a statement of operating expenses; also withdrawals from and additions to their capital accounts. The order evidently leaves open the question of further and more detailed investigation of the reasonableness of these rates.

Photographs on Commutation Tickets

The New York Public Service Commission holds in the case of Crosby v. New York Central that a requirement that a commutation ticket for exclusive use of the purchaser is valid only when presented with a holder containing the purchaser's photograph and signature is reasonable, not discriminatory and not in violation of the legal tender act as requiring the tender of value in addition to the price of the ticket.—Decided December 14, 1921.

Personnel of Commissions

The Senate on April 11 confirmed the President's appointments of G. W. W. Hanger, J. H. Elliott and A. O. Wharton as members of the Railroad Labor Board for a five-year term.

Charles D. Mahaffie, an attorney in the Law Department of the United States Railroad Administration, with office at Washington, D. C., has been appointed director of the Bureau of Finance of the Interstate Commerce Commission, effective on May 1, succeeding W. A. Colston, who has resigned to become vice-president and general counsel of the New York, Chicago & St. Louis. Mr. Mahaffie is 37 years of age and has been with the Railroad Administration since July 1, 1921, having formerly been solicitor for the Interior Department from 1916 to that date. From 1909 to 1916 he was engaged in the practice of law at Portland, Ore.

Court News

Negligent Cause of Damage to Live

Stock Must Be Proved

The mere fact that hogs, apparently sound when delivered for shipment, arrive at their destination sick with pneumonia, does not raise a presumption that the railroad has been guilty of negligence which caused it. This might have been caused by inherent weakness or infirmity of the animals. Nor is the railroad chargeable with delay in unloading the hogs due to congestion of cars at the stockyards, or other causes beyond its control.—Bragg v. Payne (Mo. App.), 235 S. W., 148.

Cotton Not in Possession of Carrier, as Carrier,

Until Shipping Directions Are Given

Cotton was destroyed by fire after it had been loaded on cars by a compress company at the owner's request. The loading certificate issued by the compress company was held by the owners, who had given no shipping directions and had made no application for bill of lading. In an action by the owners the Circuit Court of Appeals, Fifth Circuit, holds that the defendant railroad was not in possession of the cotton, as a common carrier, and was therefore not liable for its loss.—Harris, Cortner & Co. v. L. & N., 276 Fed. 277.

Defect in Hand Brake Must

Cause Injury to Warrant Recovery

In an action for the death of a man employed by a street railway company to unload coal from cars received from defendant, the Chicago, Burlington & Quincy, who was killed while riding a freight car down a grade on the street railway company's premises, it appeared that, through no fault of the railroad, the car broke away from the engine and the deceased could not stop it by means of the hand brake. The plaintiff claimed the brake was defective, the shoe being worn and the chain knotted. The Minnesota Supreme Court held that, in the absence of evidence that these defects impaired the efficiency of the brake, the trial court properly directed a verdict for the defendant.—Benedict v. Chicago, B. & Q. (Minn.), 186 N. W. 296.

Labor Board Decisions

Switchman Not Always a Baggage-master

Station employees of the Boston & Maine claimed that the term "switchtender" as used in memorandum 16-27 of Railway Board of Adjustment No. 1, means an employee who is assigned to handle a main line or lead switch. The employees contend that certain of their members are devoting four or more hours time to work which is usually assigned to baggage-masters, while still under the pay and classification of a switchtender. The carrier states that while the employees in question do not handle switches for yard engines or freight trains, they do handle one or more main line switches in connection with a terminal where a yard engine is maintained, and therefore, come within the scope of the decision of the Railway Board of Adjustment No. 1 of the United States Railroad Administration. The position of the carrier was sustained.—Decision No. 765.

Watchman Not Entitled to

Overtime for Emergency Work

A crossing watchman on the Aetehison, Topeka & Santa Fe was employed on a monthly basis for eight hours daily. For a period of six days he was required to work three hours extra each day on oral instructions received from the station agent and no additional compensation was paid. The employee's representative claimed that he should have been paid under section A-12 of the agreement which specifies that overtime shall be paid on the hourly basis for the ninth and tenth hours and time and one-half for hours in excess of ten. The decision of the board was that this clause was not intended to cover temporary assignments for emergency purposes and decided that the watchman was not entitled to extra compensation for his work. The decision stated further, however, that it is not intended to permit the assignment of employees for any considerable period without payment of overtime.—Decision No. 808.

Brakemen to Receive Baggage-men's Pay

If Any Baggage is Handled

The brakemen on two through passenger trains on the Missouri, Kansas & Texas were required in connection with their other duties to handle a limited amount of baggage carried in the head end of a combination car. These employees made claim for additional pay for this service, after which the duty was transferred to the train porter. The employees then contended that the baggage should be handled by the brakemen and paid for at the rate shown for baggage-men, which at that time was \$4 additional monthly. The carrier stated that the amount of baggage was not enough to justify the employment of a baggage-man and that the train porter could handle it without interfering with his other duties. However, the Labor Board decided that the work of handling baggage on these trains should be paid for at the rate shown for baggage-men and that the practice of having the work performed by trainmen was approved.—Decision No. 772.

Seniority Rights of Signal Maintainers

The Brotherhood of Railroad Signalmen of America brought before the Labor Board the case of a signal maintainer on the Chicago, Burlington & Quincy, who was "bumped" from his position by a supervisor whose position was abolished. It was contended that when the maintainer was hired no mention was made of the position being a temporary one and that because of the fact that the supervisor of signals was considered an official he did not come within the provisions of the signalmen's agreement. The Labor Board decided that the appointment of this man to the position of signal supervisor did not constitute a temporary appointment in this case and that his service with the carrier was not disturbed by such an appointment. It further decided that the man demoted is entitled to the position of signal maintainer by displacing the employee having the least seniority

rights on the seniority district and that the man originally holding the position of maintainer before the supervisor was demoted was entitled to retain his position, provided his position was not that of junior signal maintainer.—*Decision No. 801.*

Right to Close Telegraph Office on Certain Days

In a controversy between the Order of Railroad Telegraphers and the Baltimore & Ohio it developed that in March, 1921, because of light traffic the telegraph office at Cheat Haven, Pa., was closed on a Sunday and a Monday and that at Mount Braddock on a Monday. The employees claimed that no provision was made in the agreement for notifying employees when they are not required to work on week days, which they claim indicated that the carrier did not contemplate suspending an employee on any other days than Sundays and holidays. The carrier contended that to agree to the claim of the employee would guarantee pay for 306 days each calendar year whether employees worked or not and would prohibit reductions in force to meet future fluctuations in business. The claim of the employees was denied.—*Decision No. 789.*

Elevator Men Not Rated As Stowers or Stevedores

Prior to Federal control, the men operating elevators in the freight house of the Michigan Central at Chicago, were rated with stevedores and certain other classes of employees who were paid a differential of one cent an hour over truckers. In the application of Supplement No. 7 to General Order No. 27, this differential was absorbed by the provision of that supplement which fixed a maximum rate of 43 cents per hour for all such classes of employees. The increase of 10 cents per hour provided for the elevator operators in section 5, Article 11, of Decision No. 2, was added to the rate of 43 cents per hour, effective May 1, 1920. The employees state that while they are classed as elevator men, they perform other duties incident to the handling of freight which justifies a differential over truckers, and, inasmuch as they received the same differential as stevedores, etc., prior to federal control, they should receive the increase provided for such classes in paragraph (b) section 8 Article 11 of Decision No. 2. The carrier contends that these employees are classified as elevator men and that their duties consist of operating elevators between the various floors of the freight house and, that they do not perform the other duties mentioned. The contention of the carrier was sustained.—*Decision No. 788.*

Must Reinstatement Employee Discharged

For Alleged Insubordination.

In a case where an assistant division accountant of the Chicago, Milwaukee & St. Paul was dismissed from the service of that road on February 24, 1921, for alleged insubordination caused by his refusing to work overtime in order to make up such work as accumulated during his vacation period, the Labor Board was requested to reinstate the man in question and pay him for the time since lost. The carrier contended that he was granted a vacation with pay from November 19, 1920, to December 3, under a rule which provided that employees would receive vacations with pay with the understanding that the other employees would keep up the work, or that the employees who received vacations with pay, would be required when they returned to make up the work accumulated on their desks without extra compensation. Upon returning from his vacation this assistant division accountant was informed that there was sufficient work to require the overtime performance of his duties, and he thereupon insisted for extra payment for any such overtime work which he might do. He showed an uninterested attitude toward the work and welfare of the service, with the result that certain reports were delayed. The employees state that he did not refuse to work overtime when ordered to do so, and that the reports had not been delayed any more than had been frequently the case in that office. Also, that if overtime was required it should have been ordered from proper authority and that the controversy for overtime payment should be likewise submitted for settlement in accordance with the provision of the clerks' national agreement. The Labor Board has decided that the discipline in the case was not well sustained and ordered the employee reinstated with seniority rights unimpaired, though it denied claim for pay during time since lost.—*Decision No. 734.*

Foreign Railway News

Further Reduction in British Wages

LONDON

A further reduction of 2 shillings a week (about 48 cents at the normal rate of exchange) in the sliding scale wages of the railway workers in Great Britain came in operation on April 1, 1922, owing to the fall in the cost of living index from 99 points in December to 86 points at the present time, both figures representing the increases over the 1914 level.

German Industry and Java

LONDON

It is reported that a German industrial syndicate, the Siemens-Rhine-Elbe-Schuckert Union Works, is erecting a factory in Cheribon, North Java, for the manufacture of rolling stock and steel and iron goods. The works are planned so as to make them independent of the parent company as regards the construction of locomotives, railway carriages, freight cars and wagons, railway bridges, and so forth. The local government has already placed orders for a large number of locomotives and general railway rolling stock.

1922 Budget of Swiss Railways

On January 24, according to Commerce Reports, the Swiss National Assembly passed the 1922 budget for the Swiss Federal Railways, which shows estimated receipts of 412,000,000 francs and estimated expenses of 335,000,000 francs. There is, therefore, a credit balance of 75,000,000 francs, against a smaller balance of 20,000,000 in 1921. The credit balance for 1922 does not cover fixed charges or amortization, which, if included, would turn the favorable balance into a 30,000,000 franc deficit. After approving the budget the National Assembly authorized the Federal Railway Council to raise a loan of 250,000,000 francs.

Turbo-Electric Locomotive Being Tried in England

LONDON

Trials are being made on the London & North Western Railway, England, of a turbo-electric locomotive constructed by Messrs. Armstrong Whitworth & Company, for the Ramsay Condensing Locomotive Company. The engine has a length over all of 69 ft. 7 in. and weighs 130½ long tons, including coal and water. The boiler, which is in front, generates steam at 200-lb. pressure and 300 deg. F. superheat. The main three phase turbo-alternator and the auxiliary exciting turbo-generator are also in the front. The current is taken to four 275 h.p. electric motors, two of which drive the wheels of the front part and two those of the back part or tender. The exhaust steam is conducted to the tender, where it is condensed in a condenser of special construction. The condensed water returns to the hot well and thence to the boiler. The object sought is economy of coal and water.

American Ability to Compete for

Argentine Car Business

Commerce Reports gives some gratifying figures of American ability to compete against foreign bidders on railway equipment in Argentina in spite of adverse exchange rates. On bids for supplying 650 freight cars of 750 millimeter gage the bids were as follows: Belgian, 1,080,000 pesos; American, 1,160,000 pesos; British, 2,000,000 pesos; German, 2,480,000 pesos. The quotations include three years' interest. The American offer is based upon an exchange rate of 1.22 pesos per U. S. dollar, against a par of 1.04—or a disadvantage of 17 per cent. In spite of this fact, however, the American bid was but 7 per cent over the Belgian. Attention is called to the fact that Germany with exchange all in her favor quoted more than double the American price. All of which goes to show our strength in the market, which will become greater if the Argentine peso continues its move to parity with the dollar.

Failure of Soviet Railways Brings Starvation

The number of persons who will survive the famine conditions in stricken Russia is almost wholly dependent on the Russian railways now transporting grain for the American Relief Administration, Secretary Hoover has declared.

During the past thirty days 100,000 tons of seed wheat and foodstuffs have been delivered to seven different ports on the Baltic and Black seas, but only 25,000 tons has been transported over Russia's demoralized rail system.

American relief ships have delivered the seed and foodstuffs to Reval, Riga, Libau and Danzig, on the Baltic, and Novorossisk, Theodosia and Odessa on the Black Sea. From 120,000 to 140,000 additional tons of stuff, according to Mr. Hoover, will be delivered at these same ports during the next thirty days and the prospects are that shipments will continue to pile up at the ports, with very little chance of the Russian railroads being able to transport to the famine area much more than the amount shipped during the last thirty days.

The best shipment in one day into the famine area was 1,400 tons. Normally the Russian railroads to this region should be able to transport 20,000 tons. Mr. Hoover said, attributing the difficulty experienced in handling the grain in Russia to lack of fuel, dilapidated equipment and incompetent management of the railways.

Waterloo Station Completed

Waterloo station, the London passenger terminus of the London & South Western, has just been completed after 20 years spent in building. This station is, according to Modern Transport (London), the largest and probably the best designed in England.

It was in 1900 that authority was secured for undertaking the remodeling of the Waterloo terminal. It was soon discovered that an entire remodeling of the layout would be required. Accordingly, in addition to the rebuilding of existing facilities, 8½ acres of additional lands were taken over and improved.

The completed station has 21 stud-end platforms, varying in

Photo by Kadel & Herbert

The New Memorial Arch, Waterloo Station

length from 531 feet to 860 feet, and all of them giving onto a concourse. In addition, passenger and baggage subways connecting 15 of the platforms are provided beneath the tracks and electric elevators are provided to connect the baggage subways with the platforms. There are ample facilities for the comfort and refreshment of employees and passengers.

One of the features of the station is the arch, erected in memory of the 585 members of the railway's staff who lost their lives in the war. This arch in process of completion is shown in the accompanying illustration.

Equipment and Supplies

Locomotives

THE NORFOLK SOUTHERN contemplates buying 5 locomotives.

THE LONG ISLAND has ordered 6 eight-wheel locomotives from the American Locomotive Company.

THE BOSTON & MAINE is inquiring for 2 Mallet 0-8-8-0 type and 20, 0-8-0 Switching locomotives.

THE ALABAMA GREAT SOUTHERN has ordered 10 Mikado locomotives from the American Locomotive Company.

THE WICHITA FALLS & SOUTHERN has ordered 2 Mogul type locomotives from the Baldwin Locomotive Works.

THE TENNESSEE, COAL, IRON & RAILROAD COMPANY has ordered 4 locomotives from the American Locomotive Company.

THE CINCINNATI, NEW ORLEANS & TEXAS PACIFIC has ordered 10 Mikado type locomotives from the American Locomotive Company.

THE MOBILE & OHIO, which was reported in the *Railway Age* of April 1 as inquiring for 10 Mikado type locomotives, has ordered this equipment from the American Locomotive Company.

THE LOUISVILLE & NASHVILLE has ordered 4 Mikado type and 6, 0-8-0 switching locomotives from the American Locomotive Company, in addition to the 6 Mikados previously reported.

THE TENNESSEE CENTRAL, reported in the *Railway Age* of April 8 as inquiring for from 4 to 6 Mikado type locomotives, has ordered 8 Mikado type locomotives from the American Locomotive Company.

THE CHICAGO & NORTH WESTERN, reported in the *Railway Age* of March 25 as contemplating the purchase of 50 locomotives, has plans drawn for 50 locomotives and will have them built if prices are satisfactory.

THE NEW YORK CENTRAL, reported in the *Railway Age* of March 25 as inquiring for 50, 0-8-0 type switching locomotives, has ordered 40 locomotives from the Lima Locomotive Works and 35 from the American Locomotive Company.

Freight Cars

THE TENNESSEE CENTRAL is inquiring for 350 gondola cars.

THE WABASH is inquiring for 250 hopper car bodies of 50 tons capacity.

THE ATLANTIC SEABOARD DISPATCH is inquiring for 400 refrigerator cars.

THE CHESAPEAKE & OHIO will close bids on April 17 for 1,500 40-ton box cars and 200 40-ton stock cars.

THE SOUTHERN PACIFIC will close bids on April 17 for 2,000 single-sheath automobile cars.

THE KIMBERLY CLARK COMPANY, Neenah, Wis., is inquiring for a small number of coal cars.

THE MISSOURI, KANSAS & TEXAS will close bids on April 25 for 2,000 single-sheath automobile cars.

THE ST. LOUIS SOUTHWESTERN has awarded a contract to the American Car & Foundry Company for repairing 200 cars.

THE SOUTHERN PACIFIC will build 200 double-sheathed box cars of 40-tons capacity in its shops at Los Angeles, Cal.

THE CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS has ordered 200 sets of underframes and superstructures from the Pullman Company.

THE ELGIN, JOIET & EASTERN has ordered 200 car bodies for 50-ton structural steel side dump cars and 300 car underframes from the J. W. Heggie Company, Joliet, Ill.

THE ATLANTIC COAST LINE, reported in the *Railway Age* of February 25 as inquiring for 100 steel phosphate cars, has ordered this equipment from the Chickasaw Shipbuilding Corporation.

THE MISSOURI, KANSAS & TEXAS, reported in the *Railway Age* of April 8 as contemplating the purchase of 2,000 automobile cars, is asking for bids on this equipment until 12 o'clock noon April 25. These cars are to be of 40 tons capacity.

THE AMERICAN REFRIGERATOR TRANSIT COMPANY, St. Louis, Mo., has awarded a contract to the American Car & Foundry Co. for repairing 200 refrigerator cars at Memphis, Tenn., and also has awarded a contract to the Missouri Pacific for repairing 100 refrigerator cars.

THE LOUISVILLE & NASHVILLE, noted in the *Railway Age* of March 25 as inquiring for 500 all-steel hopper cars, of 55 tons capacity and for 500 to 1,000 composite gondola cars of 50-ton capacity, has ordered 1,000 hopper cars from the Chickasaw Shipbuilding Company and 1,000 all-steel gondola cars from the Cambria Steel Company.

THE CHICAGO & NORTH WESTERN has renewed its inquiry for 2,750 freight cars and will accept bids until noon, April 22, for 1,250 40-ton, single-sheathed steel underframe box cars; 500 40-ton steel under and upperframe stock cars; 500 50-ton steel underframe and wood floor flat cars; 250 40-ton steel underframe and wood upper structure refrigerator cars, with insulated bodies and basket rack ice bunkers, and 250 50-ton steel underframe and composite body gondola cars.

New York Central Orders 16,000 Cars

THE NEW YORK CENTRAL, reported in the *Railway Age* of April 1 as negotiating with the car builders for the purchase of about 16,000 freight cars, has placed orders for 16,000 cars as follows:

Cincinnati Northern	750	40-ton	Box	Am. Car & Fdy. Co.
	750	55-ton	Hopper	Pullman Company.
New York Central	1,000	55-ton	Hopper	Am. Car & Fdy. Co.
	1,000	50-ton	Box	Am. Car & Fdy. Co.
	1,000	50-ton	Box	Standard Steel Car Company.
	1,000	50-ton	U.S. Gond.	Pressed Steel Car Company.
Cleveland, Cincinnati, Chicago & St. Louis	1,000	55-ton	Hopper	Am. Car & Fdy. Co.
	2,000	50-ton	Box	Am. Car & Fdy. Co.
Pittsburgh, McKeesport & Youngstown	1,500	70-ton	Hopper	Pressed Steel Car Company.
	1,000	70-ton	L.S. Gond.	Standard Steel Car Company.
Pittsburgh & Lake Erie	1,500	70-ton	Hopper	Standard Steel Car Company.
	1,000	70-ton	L.S. Gond.	Standard Steel Car Company.
Michigan Central	1,000	50-ton	Box	Standard Steel Car Company.
	500	50-ton	U.S. Gond.	Gen'l. American Car Company.
	500	50-ton	U.S. Gond.	Buffalo Steel Car Company.

Passenger Cars

THE MISSOURI, KANSAS & TEXAS is inquiring for 30 passenger cars.

THE SOUTHERN PACIFIC is rebuilding 23 mail cars in its own shops.

THE CHESAPEAKE & OHIO will close bids on April 22 for 53 passenger train cars.

THE CANADIAN PACIFIC has ordered 50 express refrigerator cars from the Canadian Car & Foundry Co.

THE A. B. C. TRANSIT REFRIGERATOR COMPANY, Chicago, is inquiring for from 100 to 200 40-ton express refrigerator cars.

THE BALTIMORE & OHIO, reported in the *Railway Age* of January 28 as inquiring for 40 coaches, 2 dining cars, 3 combination baggage and mail cars and 5 mail cars, has ordered 50 cars from the Pullman Company.

Iron and Steel

THE NEW YORK CENTRAL has ordered 2,000 tons of rail from the Illinois Steel Company.

THE LONG ISLAND will receive bids until 12 o'clock noon, April 27, for 2,500 tons of rail.

THE UNION PACIFIC has ordered 760 tons of steel to be used for reconstruction of a bridge at Parker, Wash.

THE SOUTHERN PACIFIC will install an electrically operated turntable, 100 ft. in length and weighing 183,000 lb. at Siskiyou, Ore.

THE CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS will receive bids for its requirements of high speed tool steel for the period from April 1 to June 30.

THE CHICAGO, MILWAUKEE & ST. PAUL has ordered 140 tons of structural steel from the American Bridge Company, for track elevation work in Chicago.

THE NEW YORK, CHICAGO & ST. LOUIS has ordered 10,000 tons of rails, divided as follows: 6,000 tons from the U. S. Steel Corporation; 1,000 tons from the Inland Steel Company; and 3,000 tons from another company. The same company is soon expected to order 2,000 additional tons.

Track Specialties

THE TERMINAL RAILWAY ASSOCIATION of St. Louis is inquiring for 75 track frogs.

THE TEXAS & PACIFIC is inquiring for 50,000 tie plates to be used on 75 and 85-lb. rails.

THE NORTHERN PACIFIC, noted in the *Railway Age* of April 1 as inquiring for 5,000 tons of tie plates, has placed its order with the U. S. Steel Corporation.

Machinery and Tools

THE ATCHISON, TOPEKA & SANTA FE is inquiring for a 15-ton electric traveling crane.

THE WESTERN MARYLAND has placed orders for six machine tools including 2 lathes, 2 shapers, and one radial drill.

THE ATCHISON, TOPEKA & SANTA FE is inquiring for four 20-in. lathes, an emery wheel stand and a boilermaker's flange clamp.

THE IMPERIAL JAPANESE GOVERNMENT RAILWAYS have ordered through Mitsui & Co., New York City, 4 locomotive cranes, from the Browning Company, Cleveland, Ohio.

Miscellaneous

THE NEW YORK, NEW HAVEN & HARTFORD will receive bids until 12 o'clock noon April 17, at New Haven, Conn., for its requirements until December 31, 1922, of malleable iron castings.

THE CHILEAN STATE RAILWAYS will open bids on May 10, at Santiago, Chile, for railway equipment, consisting of replacement materials for locomotives, coaches and tenders. The New York City representative, Carlos Schneider, 141 Broadway, is authorized to receive tenders for transmission by cable up to the day previous to the opening of tenders.

Signaling

THE CENTRAL OF NEW JERSEY has contracted with the General Railway Signal Company for the installation of an electric interlocking at Nesquehoning Junction, Pa., a 64-lever machine of the unit lever type. Complete approach and sectional route locking will be provided, also electric lighting of signals and alternating current track circuits. This apparatus will be installed by the signal company.

Supply Trade News

Howard Cook has been appointed vice-president of the Columbia Nut & Bolt Co., Bridgeport, Conn.

E. T. Pelton, vice-president of the Armstrong Steel Castings Company, Huntington, Ind., resigned on April 1.

The George Oldham & Son Company, Baltimore, Md., has opened a Philadelphia, Pa., office at 527 Commercial Trust building.

William E. Dougherty has joined the sales force at the Philadelphia, Pa., office of the Independent Pneumatic Tool Company, Chicago.

The Whiting Corporation, Harvey, Ill., has removed its Chicago sales office from 1245 Marquette building to 945 Monadnock building.

The National Railway Appliance Company has removed its office from 50 East Forty-second street, to suite 3002, Grand Central Terminal, New York City.

Ralph Barstow, sales manager of the Greenfield Tap & Die Corp., Greenfield, Mass., has resigned and Edward Blake, vice-president, has taken over his duties.

The International Filter Company, Chicago, has moved its general offices from the First National Bank building to its works at 333 West Twenty-fifth place.

The Hulson Grate Company, Keokuk, Iowa, has recently established a grate assembling plant at 209 Johnson street, Keokuk, Iowa, to which address it has also moved its general offices.

The Roberts-Pettijohn-Wood Corporation, accounting service, has moved its offices from 20 East Jackson boulevard, Chicago, to 30 Cedar street in that city, where it has recently purchased a building.

Prof. C. C. Williams, professor of civil engineering at the University of Kansas, has been appointed head of the civil engineering department of the University of Illinois, succeeding I. O. Baker retired.

George W. Schalchlin, sales engineer of the Allen-Bradley Company, manufacturers of electrical controller apparatus, Milwaukee, Wis., has been appointed district manager of this company's new office in St. Louis, effective April 10.

S. W. Linheimer, formerly vice-president of the Walter A. Zelnicker Supply Company, St. Louis, Mo., has resigned from that company and has opened offices under his own name, at 428 First National Bank building, Chicago, as a dealer in second hand railroad equipment.

W. A. Van Hook, cost engineer of the Bureau of Valuation of the Interstate Commerce Commission, and formerly assistant district engineer of the Central District of that body, has resigned to become chief engineer of the Roberts-Pettijohn-Wood Corporation of Chicago.

W. C. Ames has been appointed district sales manager of the Sharon Pressed Steel Company, New York, with office at 20 East Jackson boulevard, Chicago, and Ralph E. Phillips has been appointed district sales manager with headquarters at 66 Broadway, New York City.

O. A. Lawrie has been appointed district sales manager in the New England territory with headquarters at Boston, Mass., of the Ohio Brass Company, Mansfield, Ohio. For the past 16 years Mr. Lawrie has been with the American Copper Products Company, Bayway, N. J.

F. Lavis has recently returned to New York from Bolivia where he has been engaged as consulting engineer to the Bolivian government and the Ulen Contracting Corporation

in connection with the railway from Atocha and La Quiaca and other railway projects in that country.

H. H. Roberts, chief engineer of the Franklin Railway Supply Company, New York, has been elected vice-president in charge of engineering; G. L. Winey, secretary, has been elected executive vice-president and G. W. Floyd Coffin, vice-president of the company, has been elected vice-president in charge of production and service.

C. J. McGregor, assistant sales agent of the American Steel & Wire Company, with headquarters at Cleveland, Ohio, has been promoted to sales agent, with headquarters at Buffalo, N. Y., succeeding E. A. Niven, who has been transferred to New York City, and will be succeeded at Cleveland by P. B. Gilroy, who has been transferred from the Detroit office. Mr. McGregor has been in the service of this company for 20 years, first traveling in the New England territory for a period of 12 years, after which he was transferred to the Chicago, Ill., and Milwaukee, Wis., districts, where he remained for a year and eight months. He was made assistant sales agent at Cleveland in 1915, which position he was holding at the time of his recent promotion.

The Replogle Steel Company, Wharton, N. J., has acquired the property of the Empire Steel & Iron Company, Oxford, N. J. This addition to the Replogle Company has increased its pig iron production capacity 250,000 tons a year, bringing its total producing capacity to 600,000 tons and it has secured a controlling interest in the Mount Hope Mineral Railroad. It already owned the Wharton & Northern Railroad. The Replogle company is contemplating an early resumption of operation at its new furnaces at Wharton, N. J., and Catsauqua, Pa., where a large furnace has recently been modernized. J. Leonard Replogle, chairman of the board of Replogle Steel will remain in that capacity and Leonard Peckett, president of the Empire Steel & Iron Company, will be elected president of the Replogle Steel Company.

Obituary

Knox Taylor, since 1910 president of the Taylor-Wharton Iron & Steel Company, High Bridge, N. J., died at his home in High Bridge, on April 4. He was born at High Bridge on

Knox Taylor

October 19, 1873, and was graduated from Princeton University with the degree of bachelor of science in 1895. In January, 1902, he entered the service of the Taylor Iron & Steel Co. and worked up through various departments in the foundry and the old wheel shop until he became general manager in October, 1905. The High Bridge plant had been engaged in the production of manganese steel since 1892, under license of the Hadfield patents.

In 1912 the company purchased all the interests of William Whar-

ton, Jr. & Co., Inc., of Philadelphia, and its subsidiary, the Philadelphia Roll & Machine Co. The Wharton Company had originated the application of manganese steel in track work in co-operation with the old Taylor Iron & Steel Company, and the new combination became known as the Taylor-Wharton Iron & Steel Company. In 1913 the company also bought out the interests of the Tioga Iron & Steel Company, Philadelphia. During the war, Mr. Taylor, in addition to the work of his company's own contracts for gun forgings, helped supply railway track material for the American Expeditionary Forces. Mr. Taylor was a vice-president of the Railway Business Association and a member of many clubs.

Railway Construction

ATCHISON, TOPEKA & SANTA FE.—This company has authorized the construction of a brick combined freight and passenger station and the making of necessary track changes at Lyons, Kan. It has also begun the construction of a 7½-mile extension north-east from a point on its main line between Apperson and Burbank into the Hickman oil fields.

BALTIMORE & OHIO.—This company has awarded a contract to the Empire Engineering Company, Baltimore, Md., for the grading and masonry work on the ventilating plant on tunnel No. 1 at Ocean, W. Va. The contract for the motors and fans has been awarded to the B. F. Sturtevant Company, Washington, D. C. and the installation of the nozzle ducts and the housing of the equipment to the Virginia Bridge & Iron Works, Roanoke, Va.

CANADIAN PACIFIC.—This company has a location party in the field running surveys northwest from Tuffnell, Saskatchewan, to Wadena and north from Wadena to the North Saskatchewan river in contemplation of completing a line started 15 years ago.

CHICAGO & NORTH WESTERN.—This company will receive bids until April 20 for the construction of a 450-ton mechanical coal-station and ash handling facilities at Chicago avenue, Chicago, the construction of which will involve an expenditure of approximately \$100,000.

CHICAGO, BURLINGTON & QUINCY.—This company closed bids on April 13 for the construction of a 20 ft. by 60 ft. frame station at Pattensburg, Mo.

CHICAGO, BURLINGTON & QUINCY.—This company has awarded a contract to the Thompson Black Company, Chicago, for the superstructure of its new inbound freight terminal at Chicago, this terminal to consist of a five-story building to form a part of the Chicago Union Station development.

CHICAGO UNION STATION.—This company has awarded to the Mellon-Stuart Company, Chicago, a contract for track slabs for the new station project and will close bids next week for foundations for a hoiler plant and for a retaining wall along Canal street; and also for the construction of a concrete tunnel to be used in conjunction with the boiler house.

ILLINOIS CENTRAL.—This company which was noted in the *Railway Age* of March 4 as accepting bids for work incident to the construction of a third track from Matteson to Kankakee, Ills., a distance of approximately 25 miles and which was noted in the March 18 issue as awarding a contract to M. L. Windham, Centralia, Ills., for work between Kankakee and Tucker, has awarded a contract to the Walsh Construction Company, Davenport, Ills., for the work from Peotone to Matteson. The Bates & Rogers Company, Chicago, will do all masonry work in the vicinity of Matteson, including the extension of box culverts, the erection of overhead bridges over the Elgin, Joliet & Eastern and the construction of subways incident to grade separation work.

MISSOURI PACIFIC.—This company closed bids on April 14 for the construction of a pumping plant, reservoir and treating plant at Hoisington, Kan. The work to involve an expenditure of approximately \$250,000.

NORFOLK & WESTERN.—This company has awarded a contract to H. M. Waugh, Bluefield, W. Va., for the construction of a line 1.5 miles in length from Lamberts Point to Atlantic City, Va. The work involves the laying of 7,900 ft. of main line track and 1,800 ft. of spur tracks and sidings.

SOUTHERN PACIFIC.—This company has made definite plans for the rebuilding of timber preservation plants at Wilmington and Oakland, Cal., the plant at Wilmington to have 4 retorts, each 6 ft. in diameter and from 117 to 132 ft. long with two operating tanks of a total capacity of 62,000 gal., storage tanks of 31,000 gal. capacity and an annual treating capacity of 673,000 ties. The plant at Oakland will have 3 retorts, each 18 ft. in diameter and 132 ft. long, with adzing and tie boring machines, 3 operating

tanks having a total capacity of 195,000 gal., storage yards for 350,000 ties served by a 20-ton locomotive crane and an annual treating capacity of 7,500,000 board ft. of timber and 384,000 ties by the Reuping process as well as capacity for 625,000 ft. of piling by the dipping process. John D. Isaacs, consulting engineer, Southern Pacific, New York, is handling this work.

ST. LOUIS-SAN FRANCISCO.—This company has awarded a contract for a new hospital building to be erected at Springfield, Mo., at a cost of approximately \$800,000 to the William McDonald Construction Co., St. Louis.

NEW YORK CENTRAL.—This company has awarded a contract to the McClintic-Marshall Company, Pittsburgh, Pa., for the 23,000 tons of steel work for the Castleton bridge over the Hudson river.

PHILADELPHIA & READING.—This company has awarded a contract for the filling in of the Ringtown, Pa., viaduct. About 1,000,000 yards of dirt will have to be handled. A contract has been awarded to Bennett & Randall, Lebanon, Pa., for rebuilding a stone arch bridge north of Reading, Pa. This road is also contemplating the installation shortly of an interlocking plant and automatic block signals in connection with the completion of the Harrisburg bridge.

TUCKASEEGEE & SOUTHEASTERN.—This company has applied to the Interstate Commerce Commission for a certificate authorizing the construction of a line from Sylva to Blackwood, Jackson County, N. C., and also for authority to issue \$300,000 of capital stock.

Pennsylvania to Spend \$8,000,000 at Pittsburgh

The Pennsylvania Railroad has authorized the expenditure of \$8,000,000 for improvements in the vicinity of Pittsburgh, Pa., as announced in last week's issue of the *Railway Age*. The expenditure forms a part of a general program of improvement work on the Central region which the company expects to carry out, step by step, in succeeding years. Little other work except as noted below has been authorized as yet. The various projects included in the Pittsburgh authorization are as follows:

At Pitcairn, 12 additional stalls of the reinforced pre-cast concrete type with drop pits and other facilities will be added to the existing facilities, making a full 34-stall house. The old 100-ft. turntable will be removed and the stalls connected up to a 110 ft. turntable now in place. The estimated cost of this work is about \$380,000.

At the Sharpsburg yard, additional running and yard tracks will be constructed and present tracks and layout consolidated to form one unit of a final yard development at that location. A part of this work will include two main freight running tracks from Etna to Aspinwall. The estimated cost is \$776,000.

The line from the west end of the Sharpsburg yard (Etna) will be extended to Thirtieth street, a distance of about three miles, at a cost of about \$713,000. This forms an extension of the four track system and will require the construction of two additional main tracks and the rearrangement of the existing tracks.

The construction of the Kenwood to Rochester low grade line on which work was suspended in 1921 will be resumed and about \$1,623,000 expended. This line will be two tracks from Kenwood Junction, Pa., along the Beaver river to West Rochester, Pa., and will have a maximum grade of 0.3 per cent compensated.

Two other items of improvement work, regarding which the exact location and details have not been announced as yet, include about one and one-half miles of heavy grade elevation and crossing elimination work to cost about \$2,365,000; and the enlargement and improvement of a yard and the construction of additional connecting tracks at a cost of nearly \$2,000,000.

Bids have been closed on other work not included in the \$8,000,000 authorization mentioned above as follows: A through truss overhead, highway bridge with a span of 108 ft. 6 in.; flanked by concrete viaduct approaches, at an estimated cost of about \$62,000, and a half through girder bridge, 84-ft. 2-in. span with concrete viaduct approaches, at an estimated cost of about \$77,000. In addition there are six more highway bridges to be constructed, the details of which are not as yet available.

Railway Financial News

Dividends:		
7 per cent preferred.....	2,059,547	2,059,547
6 per cent preferred.....	1,506,148	1,507,938
Total dividends.....	3,567,695	3,567,485
Balance surplus (carried to profit and loss)	2,212,564	1,095,670

FORT WORTH & DENVER CITY.—*Asks Authority to Issue Equipment Trusts.*—This company has applied to the Interstate Commerce Commission for authority for the issuance of \$750,000 of equipment trust certificates.

ILLINOIS CENTRAL.—*Authorized to Execute Equipment Agreement.*—The Interstate Commerce Commission has authorized the execution of an agreement for the lease and purchase of 650 refrigerator cars from the Pullman Company at an estimated cost of \$1,748,500.

MISSOURI & NORTH ARKANSAS RAILWAY.—*New Company.*—This company has been granted a 50-year charter by the State Board of Railway Incorporation of Arkansas. The new company was organized to take over the lines of the defunct Missouri & North Arkansas Railroad, operating from Joplin, Mo., to Helena, Ark., a distance of 368 miles. The road will be sold at a receiver's sale to be held in St. Louis, Mo., on April 10, and it has been stated that it will again be in operation by May 1. The new company has been capitalized at \$3,000,000, divided into 30,000 shares of \$100 each. In addition to the capital stock, the Interstate Commerce Commission authorized a federal loan of \$350,000 to any new corporation formed to take over the road, provided it is capitalized at not less than \$3,000,000. The former company's indebtedness, \$2,062,750, will be assumed by the new owners.

Asks Authority to Issue Securities.—Application has been made to the Interstate Commerce Commission for authority to issue securities for the purpose of taking over the property of that company in accordance with conditions proposed by the Commission in connection with a loan of \$3,500,000 from the government. It is proposed to issue \$3,000,000 of common stock to the holders of the receiver's certificates to the amount of about \$2,000,000 who propose to secure the payment of \$50,000 additional working capital and \$60,000 to provide competent supervision and operation of the property, and a 6 per cent first mortgage bond for \$5,000,000 to be given as security for the government loan.

MISSOURI & NORTH ARKANSAS.—*Application for Loan Approved.*—The Interstate Commerce Commission has certified its approval of a loan of \$3,500,000 to this company to meet maturing indebtedness, conditioned on the carrying out of a plan of reorganization in accordance with suggestions made by the commission. Application for authority to issue securities on this plan was filed recently.

NEW YORK CENTRAL.—*Bond Sale.*—A syndicate headed by J. P. Morgan & Co. has sold \$60,000,000 90-year 5 per cent refunding and improvement mortgage bonds at 94 3/4. The proceeds are to be used to liquidate 6 per cent notes and other indebtedness to the director general of railroads, to reimburse the treasury for expenditures, and to pay and refund bonds of affiliated companies. The issue has been authorized by the Interstate Commerce Commission.

NEW YORK, NEW HAVEN & HARTFORD.—*Annual Report.*—The annual report issued this week shows a corporate income account for the year ending December 31, 1921 as follows:

	1921	1920
Railway operating revenues:		
Freight.....	\$53,593,929	\$55,348,919
Passenger.....	50,934,294	52,270,794

Government guarantees (see note), credit.....	1,205,012	22,798,519
Net corporate income.....	def. 14,121,623	def. 4,621,506

Note—Government guarantees in 1920 included United States Railroad Administration operations and standard return for January and February, 1920, and guarantees under Transportation Act six months ending August 31, 1920. The figures shown against this item in 1921 cover lap-over items audited during the year but applying to the federal control or guaranty periods.

BALTIMORE & OHIO.—*Authorized to Abandon Branch Lines.*—The Interstate Commerce Commission has issued certificates authorizing the abandonment of 2.76 miles of the Magnolia branch, and the Pigeon Run branch, 7.31 miles, in Ohio.

BOSTON & MAINE.—*Annual Report.*—See article on another page of this issue entitled "Boston & Maine Has 1921 Deficit of \$7,348,086."

Opposes New Haven Directors.—There was no election of directors at the annual meeting on April 12 owing to the controversy which has arisen among certain groups of stockholders over the attempt of the New York, New Haven & Hartford to place a representation on the directorate. A hearing had been scheduled for April 8 in the District Court of the Southern District of New York on the New York, New Haven & Hartford's petition for a modification in the decree of 1914, so as to enable the New Haven to secure a representation on the Boston & Maine directorate proportionate to the Holding Company's voting rights, but this hearing was postponed until May 12.

Owing to this move by the New Haven there developed a sharp contest for proxies to be used at the annual meeting. One group of stockholders asking for proxies to run to Charles F. Adams, Philip Dexter and E. Sohler Welch, sent the following communication to holders of Boston & Maine first preferred and preferred shares:

There is no apparent reason which might now lead the preferred shareholders of the Boston & Maine to think that the nominees which the New Haven seeks to place on their board could devise means which would produce either the credit or the earnings which the Boston & Maine needs before the preferred dividends can be resumed. On the contrary, the preferred shareholders are bound to feel that this action of the New Haven is intended in its own interest.

The voting strength of the first preferred and preferred shares is nearly double that of the New Haven shares held by the trustees. These preferred shares, however, are widely distributed and have had no opportunity for concerted action since the reorganization. There was perhaps no occasion for such action so long as the New Haven needs before the preferred dividends should be voted in the sound discretion of trustees charged by the terms of the decree with a public interest, and in whom other shareholders of all classes felt a justified confidence.

The attempt of the New Haven, whether it be successful or not, shows that the preferred shareholders can no longer rest safely in this position, and that the time has come for them to look to their own interests.

Another group to bid for proxies was the Boston & Maine Stockholders' Protective Association. President Edward F. Brown of that organization strongly attacked the motive of the other group and asked for proxies for Edmund D. Codman.

BUFFALO, ROCHESTER & PITTSBURGH.—*Authorized to Draw Down Bonds.*—This company has been authorized by the Interstate Commerce Commission to procure the authentication and delivery of \$4,269,000 of consolidated mortgage bonds. The company had applied for authority to issue 8,351,000 of bonds, but inasmuch as it did not desire to dispose of them at the present time the authority was limited to the bonds which the applicant is entitled to draw down at this time under its consolidated mortgage.

CHICAGO, ROCK ISLAND & PACIFIC.—*Annual Report.*—The corporate income account for the year ended December 31, 1921, as shown by the annual report issued this week, follows:

	1921	1920
Operating revenues:		
Freight.....	\$99,000,440	\$94,973,798
Passenger.....	30,579,092	34,648,808
Total railway operating revenues.....	139,272,024	142,026,152
Operating expenses:		
Maintenance of way and structures.....	20,790,435	26,238,501
Maintenance of equipment.....	23,852,510	34,648,808

Asks Authority to Abandon Line.—The New York, New Haven & Hartford has applied to the Interstate Commerce Commission for a certificate authorizing the abandonment of 1.52 miles of track and of other railroad facilities at Saybrook Point, Conn.

Asks for Representation on B. & M. Board.—See Boston & Maine.

NEW YORK, ONTARIO & WESTERN.—Annual Report.—The annual report issued this week shows the following income account for the year 1921:

	1921	1920
Operating revenues	\$14,127,867
Operating expenses	12,067,086
Net from railway operations	2,060,781
Tax accruals	449,215
Operating income	1,603,349
Non-operating income	761,813
Gross income	2,365,163	2,378,815
Deductions from gross income	1,728,703	1,523,477
Net income	636,550	855,339
Less expenses prior to January 1, 1918, settled through federal accounts	49,449
Balance carried to profit and loss account	636,550	805,890

For the purpose of comparison, the following details of revenues and expenses show for 1920 the combined figures of the corporation, March 1 to December 31, inclusive, and those of the United States Railroad Administration for January and February:

OPERATING REVENUES		
	1921	1920
Merchandise freight	\$3,220,694	\$3,115,005
Coal freight	5,498,964	4,885,788
Milk	179,616	1,457,518
Passenger	3,421,743	3,098,508
Total, including other	\$14,127,867	\$13,154,689
OPERATING EXPENSES		
	1921	1920
Maintenance of way and structures	\$2,291,227	\$2,249,094
Maintenance of Equipment	3,194,650	3,449,277
Traffic	1,457,518	1,457,518
Transportation	6,025,267	6,484,478
General	376,706	355,750
Total operating expenses	\$12,067,086	\$12,684,317
Net revenue from railway operation	2,060,781	470,372
Railway tax accruals	449,215	457,040
Total railway operating income	\$1,603,349	\$10,714
PASSENGER TRAFFIC		
	1921	1920
Number of revenue passengers carried	1,645,586	1,925,897
Number of passengers carried one mile	95,065,432	98,911,515
Average distance carried	57.77	51.36
Average receipts per passenger per mile	\$0.360	\$0.313
MILK TRAFFIC		
	1921	1920
Number of tons carried of milk earning revenue	148,623	152,835
Number of tons carried one mile	28,607,128	27,131,032
Average haul of one ton	192.48	177.52
Average receipts per ton per mile	\$0.457	\$0.430
FREIGHT TRAFFIC		
	1921	1920
Number of revenue tons carried	4,944,135	5,279,972
Number of tons carried one mile	669,994,265	691,073,698
Average distance haul of one ton	135.51	130.89
Average receipts per ton per mile	\$0.310	\$0.116

NORTHERN PACIFIC.—Asks Authority to Issue Bonds.—This company has applied to the Interstate Commerce Commission for authority to issue so many of its 5 per cent refunding and improvement mortgage bonds maturing July 1, 2047, as may be necessary to pay off joint Great Northern-Northern Pacific 6½ per cent bonds which may be turned in for payment in cash after being called for redemption under the provisions of the joint indenture securing them. Of the issue of \$230,000,000 of joint 6½ per cent bonds, \$115,000,000 have already been converted into Great Northern bonds and about \$11,000,000 have been converted into Northern Pacific 6 per cent refunding and improvement mortgage bonds, leaving the Northern Pacific liable for \$104,000,000 of the joint bonds outstanding. It appears to the Northern Pacific that it can bring about a large reduction in its future interest payments by calling for redemption as soon as possible all outstanding 6½ per cent joint bonds at 103½. Holders of the bonds have the right to convert into 6 per cent bonds, which would reduce the interest by ½ per cent, but the company believes that the holders of a large amount of the joint bonds will take cash instead of converting them. It has received from J. P. Morgan & Co. and the First National Bank a proposal to purchase 5 per cent bonds at 90 and interest to whatever amount may be required to furnish the cash to retire the joint bonds, providing authority for the entire transaction is obtained from the commission.

Directors Resign.—F. M. Willis, assistant secretary and assistant treasurer of the Northern Pacific, and E. A. Gay, secretary of the company, have been elected directors to succeed James N. Hill and Thomas W. Lamont, resigned. Mr. Lamont, of J. P. Morgan & Co., has resigned as a director because his firm will float the issue of new proposed 5½ per cent bonds, which the company will offer in exchange for the joint 6½ per cent bonds, issued jointly with the Great Northern last summer.

Restoration of 7 Per Cent Dividends.—Howard Elliott, chairman of the board, in reply to a stockholder who asked when the restoration of dividends at the former annual rate of 7 per cent might be looked for, said:

In 1921, because of the large extra dividend, the Northern Pacific received from the Burlington \$13,000,000 more than it will receive from that company this year. This extra dividend enables the Northern Pacific, as is shown by the annual report, to meet its interest charges and to pay the full 7 per cent on the stock.

At the recent meeting of directors, at which the dividend was reduced, it was decided that it would not be conservative, in view of the prevailing conditions and uncertainties, to pay the full rate. I cannot say when it will be restored, but at that time the board hoped that business would resume next Autumn to such an extent as to justify that action.

The returns on the Northern Pacific for the first three months of this year were discouraging. Business is better, but there are still many elements of uncertainty. The pay of our employees has been cut to the bone, and no further reduction can be made unless the Railroad Labor Board gives relief as to the units of wages.

OREGON TRUNK.—Asks Authority to Abandon Line.—This company has applied to the Interstate Commerce Commission for authority to abandon its line between South Junction and Metolins, Or., 28.9 miles, because it is paralleled by the Central Oregon branch of the Oregon-Washington Railroad & Navigation Company and the two companies have entered into an agreement for the joint use of the latter's track.

ULSTER & DELAWARE.—Guaranty Certified.—The Interstate Commerce Commission has issued a final certificate stating the amount of this company's guaranty for the six months following federal control at \$314,250, of which the balance due was \$69,450.

UNION PACIFIC.—New Directors.—Newcomb Carlton and Paul M. Warburg have been elected directors to succeed Otto H. Kahn and Mortimer L. Schiff, who resigned December 1 in accordance with the Interstate Commerce Commission's ruling against interlocking directorates.

VIRGINIAN.—Authorized to Issue Bonds.—This company has been authorized to issue \$1,590,000 5 per cent, first mortgage, 50-year gold bonds to be pledged as part collateral security for a 6 per cent promissory note of \$2,000,000 to be issued to the director general of railroads.

WEST JERSEY & SEASHORE.—Annual Report.—The annual report issued Wednesday shows an income account for December 31, 1921, as follows:

	1921	*1920
Total operating revenues	\$12,929,706	\$12,476,036
Total operating expenses	11,683,649	11,995,283
Net revenue from railway operations	1,246,058	480,753
Railway tax accruals	711,611	473,848
Railway operating income	534,779	6,654
Net railway operating income	286,636	Def. 301,282
Total non-operating income	318,439	281,960
Gross income	605,075	140,102
Total deductions from gross income	414,547	503,801
Net income	190,528	Def. 363,699
Appropriations in sinking fund	103,045	99,445
Balance transferred to credit of profit and loss	87,483	463,144

*Operating results March 1 to December 31, 1920.

Railroad Administration Settlements

The United States Railroad Administration reports the following final settlements, and has paid out to the several roads the following amounts:

Lehigh & New England	\$675,000
Ogden Union Railway & Depot Company	15,000

The payment of these claims on final settlement is largely made up of balance of compensation due, but includes all other disputed items as between the railroad companies and the administration during the 26 months of federal control.

Trend of Railway Stock and Bonds Prices

Average price of 20 representative railway stocks, close of business	64.27	62.03	53.42
Average price of 20 representative railway bonds, close of business	84.54	83.83	73.78

Railway Officers

Financial, Legal and Accounting

C. L. Snyder has been appointed assistant auditor of disbursements of the Philadelphia & Reading, succeeding **W. K. Bean**, assigned to other duties.

Operating

S. A. Johnson, general superintendent of the St. Paul Bridge & Terminal, having resigned, the position has been abolished.

H. D. Green, division superintendent of the Cleveland division of the Baltimore & Ohio until its consolidation with the New Castle division as announced in the *Railway Age* of April 1 has been appointed general agent with headquarters at Cleveland, Ohio.

T. R. Baird has been promoted to district supervisor of transportation of the Southern district of the Southern Pacific at Los Angeles, succeeding **L. P. Hopkins** who has been promoted to trainmaster of the Salt Lake division in place of **W. H. McBean**. Mr. McBean has been promoted to assistant superintendent of the Tucson division at Tucson, Ariz., succeeding **A. E. Brown**, deceased.

Mechanical

J. P. Puette has been appointed supervisor of electric appliances, New York Central, lines west of Buffalo, with headquarters at Cleveland, Ohio. Mr. Puette was born near

Lenoir, N. C., and was educated in public and private schools of that section. He entered the service of the Ashville Street Railway Company, Ashville, N. C., in 1896. He remained with this company for a period of two years, 1896-1897. The next two years were spent with the Whiting Lumber Company, Elizabethtown, Tenn., and the following year and a half, 1900-1902, with the Pittsburgh Railway Company, Pittsburgh, Pa. The following year he was in the employ of the Variety Iron & Steel Company, Cleveland, Ohio. In the fall of 1903, Mr. Puette entered the service of the Lake Shore & Michigan Southern as an electrician at Collinwood, Ohio, and held this position until January, 1908, at which time he was transferred to Chicago as foreman electrician of car lighting, holding this position until May, 1910, when he was transferred to Collinwood, Ohio, as general foreman electrician of car lighting. In February, 1913, he was transferred to the General Office Building, Cleveland, Ohio, as assistant to the supervisor of electrical appliances in this position until the time of his recent promotion.

J. P. Puette

Traffic

T. L. Darneal has been appointed district freight and passenger agent of the Missouri, Kansas & Texas with headquarters at Denver, Colo.

W. E. Bock has been appointed district freight and passenger agent of the Missouri, Kansas & Texas with headquarters at Seattle, Wash.

B. M. Croll has been appointed general agent, freight department, of the Philadelphia & Reading with headquarters at New York City. **I. L. Fish** has been appointed assistant general agent with the same headquarters.

Roy Pearce, special representative of the Passenger Department of the Chicago & Alton with headquarters at Chicago, has been promoted to general agent, passenger department, with the same headquarters, to succeed **Harry K. McEvoy**, resigned to engage in other business.

William Pugh, whose appointment as assistant general freight agent of the Buffalo, Rochester & Pittsburgh was announced in the *Railway Age* of April 8, page 900, was

Wm. Pugh

born in England on August 22, 1871. He was educated at a boarding school in England, at the Highbury School, London, and at the night sessions of Central High School, Rochester, N. Y. In May, 1889, he entered the service of the Buffalo, Rochester & Pittsburgh as a messenger in the accounting department. Later he became a clerk in the ticket auditing department and was later transferred to the freight auditing department. He served in the claim department for more than a year

and was then appointed assistant paymaster, which position he occupied for two years, when he was assigned to the position of rate revision clerk. He held this position for six years and was then appointed chief clerk in the freight auditing department. Seven years later he became a rate clerk in the freight department and, two years later, was promoted to chief clerk in the department, which position he held at the time of his promotion as above noted.

J. R. Holcomb has been promoted to Pacific Coast agent of the Toledo, St. Louis & Western with headquarters at Los Angeles, Cal., where he will assume the duties of **W. H. Andrew**, general agent who has resigned, the office of general agent at San Francisco having been abolished.

Fred Wight, city passenger agent of the Chicago, Great Western at St. Paul, Minn., has been promoted to general agent, passenger department, with headquarters at Des Moines, Iowa, to succeed **W. L. Feeley**, who has been transferred to Minneapolis, Minn., succeeding **J. D. Elmer**, resigned.

A. W. Noyes, general traveling passenger agent of the Chicago Great Western, with headquarters at Chicago, has been promoted to assistant general passenger agent with the same headquarters. **Fred White**, division freight and passenger agent at St. Paul, Minn., has been appointed city passenger agent at St. Paul to succeed **Warren L. Seeley**, who has been promoted to general agent, passenger department, at Des Moines, Iowa, in place of **C. D. Fisher**, assistant general passenger agent at Des Moines, who has been appointed general agent, passenger department, at Minneapolis, Minn., to succeed **J. D. Elmer**, resigned to engage in other business, the offices of assistant general passenger agent at Des Moines and Minneapolis having been abandoned.

Eugene B. Finegan, who has been promoted to general freight agent of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, to relieve **T. W. Proctor**, also general freight agent, of duties incident to management of the general office and of handling tariffs, rates divisions, etc., in all territory east of Moberge, S. D., was born at Iron Ridge, Wis., November 16, 1880. He entered railway service in December, 1899, as an assistant in the car shops of the Chicago, St. Paul, Minneapolis & Omaha at Hudson, Wis., where he remained until February, 1903, when he became a stenographer

and clerk in the office of the general agent of the Great Northern at St. Paul. In May, 1904, he was employed in a similar capacity in the office of the commercial agent of the Chicago, Milwaukee & St. Paul at St. Paul and continued in this work until November, 1906, when he was transferred to Chicago as chief clerk to the assistant general freight agent of the same road. Thereafter he was successively chief clerk to the general freight agent, chief clerk to the freight traffic manager and chief clerk to the vice-president until April, 1916, when he was promoted to chief of the tariff bureau. In February, 1917, he was promoted to assistant general freight agent, with the same headquarters, and continued in this capacity until his recent promotion to general freight agent.

Engineering, Maintenance of Way and Signaling

G. W. Rear, general bridge inspector of the Southern Pacific, with headquarters at San Francisco, Cal., who was recently given the newly created title of engineer of bridges, as announced in the *Railway Age* of April 1, was born in Ontario on June 13, 1873, and attended the Campbellford Collegiate Institute from 1886 to 1889, when he entered the engineering department of the Midland Railway of Canada as a student. He held various positions in this department on the Midland until its acquisition by the Grand Trunk in 1894 and continued in similar positions with the latter company until 1901, when he became connected with the Southern Pacific. His first work on this road was in steel bridge erection, in which service he was employed until April 1, 1902, when he became assistant general bridge inspector. He served in this capacity until August 15, 1905, when he was promoted to general bridge inspector, with duties similar to those of engineer of bridges, his new position.

Elmer Irving, division engineer of the Pennsylvania Railroad with headquarters at Harrisburg, Pa., has been promoted to engineer maintenance of way with headquarters at Williamsport, Pa., succeeding C. H. Niemeyer, deceased. Mr. Irving was born at Trenton, N. J., on January 4, 1878, and entered the services of the Pennsylvania as a rodman in the office of the assistant engineer in New York on June 15, 1895. Later he enrolled in Cooper Institute and was graduated from that institution in 1900. On July 20, 1901, he was promoted to drafterman on the New York division and on April 25, 1902, he was advanced to the position of trainman under the principal assistant engineer at Albany, Pa. On January 1, 1903, he was promoted to assistant supervisor of the West Jersey & Delaware Valley division at Haddonfield, N. J., being subsequently transferred in that capacity to New Lorenz, Pa., on January 15, 1904. On August 1, 1905, he was promoted

Geo. Rear

Elmer Irving

to supervisor of track with headquarters at Osceola Mills, Pa., being transferred to Earnest, Pa., on December 1, 1908, and to Lancaster, Pa., in 1912. On September 28, 1916, Mr. Irving was promoted to division engineer on the Trenton division with headquarters at Camden, N. J., serving at this point until May 26, 1918, when he was transferred to the Philadelphia division with headquarters at Harrisburg, Pa., where he was located at the time of his recent promotion.

W. R. Triem has been appointed assistant division engineer of the Logansport division of the Pennsylvania.

Purchasing and Stores

H. H. Disher has been appointed purchasing agent of the Toronto, Hamilton & Buffalo Railway and of the Toronto, Hamilton & Buffalo Navigation Company, succeeding **G. W. Holmes**, resigned on account of ill health.

Obituary

J. H. Campbell, treasurer of the Interborough Rapid Transit Company, New York, died at Garden City, Long Island, on April 5.

John D. Smith, retired superintendent of telegraph of the Canadian Pacific, died in Chicago on April 7 from heart failure.

John W. Midgley, whose death in Chicago on April 4 was announced in the *Railway Age* of April 8, was born in Leeds, England, on September 24, 1843, and entered railway service in 1868 as a stenographic secretary to the general superintendent of the Illinois Central at Chicago. After serving in this capacity for three years he became stenographic secretary to the president and from 1872 to 1876 was employed in similar positions in the office of the president, general manager and general solicitor of the Chicago & North Western. In 1876 he became the secretary of the South Western Railroad Rate Association, in which association he was made a commissioner in 1878. He remained a commissioner of this association from 1878 to 1887 and from January, 1881, to April, 1887, was also a commissioner of the Colorado Traffic Association, from October, 1882, to December, 1883, a commissioner of the Iowa Trunk Line Association and from October, 1884, to January, 1887, a commissioner of the Pacific Coast Association. On April 1, 1887, he became chairman of the Associated Southwestern Colorado, Utah and Pacific Coast Lines and was chairman of the Western Freight Association until its dissolution in 1898. In April, 1891, he organized the Bureau of Car Performances and began the agitation which led to the substitution of per diem mileage for rental of freight cars. During 1903 and 1904 he carried on an investigation of private car uses which resulted in the federal investigation of this activity and in 1905 promoted the sentiment which led to information of the American Railway Clearing House Bureau. Mr. Midgley retired from active service in 1908 because of blindness and took up his residence in Evanston, Ill., where he was living at the time of his death.

John Midgley

THE SPOKANE TRANSPORTATION CLUB, Spokane, Wash., has moved to larger quarters in the Title building, Sprague and Wall streets in that city. The officers of the club, recently elected, are as follows: President, A. S. Cobb; vice-presidents, R. F. Carson, G. B. Paul; chairman house committee, W. N. Joyner; and secretary treasurer, F. J. Greene.

There is a tendency in some quarters to cast suspicion on those railroads which

Nothing New About Contracting

have arranged to conduct certain maintenance operations by contract. It is intimated that these contracts are but a subterfuge designed to avoid compliance with the terms of the Transportation Act, and that they are, withal, an unwarranted and unprecedented arrangement. Those who look askance at these measures may be surprised to learn that, after all, there is nothing new about such contracting, and that there is a precedent for it to an extent far exceeding anything that the railroads are now doing. An article appearing elsewhere in this issue describes the methods pursued by one railroad in contracting practically all of its operating activities, including the operation of trains, the conduct of passenger stations and freight houses and even the soliciting of traffic. All this occurred, not in recent years, but *before the Civil War*. Just what conditions were responsible for the initiation of these arrangements is not made clear. The object in view, however, is definitely stated—to reduce expenses—and the results as tabulated in the article speak for themselves. There are just two reasons why the managements of the railroad or any other commercial undertaking should let work to contract. The first of these is to have the work done more cheaply; the second is to expedite the work during times when the company's own forces and facilities are inadequate to complete it within the time available.

"I think that the most serious complaint that can be made of the Railroad Administration lies in the fact that it did

Not Returned Self Sustaining

not return the railroads to their owners self-sustaining. . . . It was just as much the duty of the government to return these roads with rates that would sustain them in their operations as it was its duty to return them in as good condition physically as it took them." This statement, made by Senator Cummins at the hearings before the Senate Committee on Interstate Commerce, must be regarded as one of the most valuable contributions which has thus far been made to all the arguments pro and con relative to the activities of the Railroad Administration. It must be regarded in this light not only because of its intrinsic truth but because it is the opinion of a man who is in a position to know whereof he speaks and who can speak and will be recognized as speaking with unbiased mind. The idea expressed by Senator Cummins is not new. It is restated, however, at an opportune moment, because just now the railroads in their annual reports are giving evidence of the success which they have been having during the past year in restoring their net income to the pre-war level. The figures in the case of practically every road show a great measure of improvement, the degree of which can only emphasize how much improvement there was room to make. The difficulty is, of course, that this improvement was made partly as a result of economies of a drastic sort, which economies served to intensify a period of depression sufficiently severe without that factor. The improvement similarly was partly due to higher rates—these rates having been made higher when the tendencies in industry were in the other direction. The Railroad Administration,

in failing to raise its rates at the proper time, did the un-economic thing and created a situation which has been extremely difficult to get out of. Now that we are getting out of it, is a good time to take a look back over the rough ground that has been traveled. Senator Cummins helps us do so and adds a contribution which will serve to keep the view in its correct perspective.

Second or multiple track work always imposes a heavy burden on the operating department. The fact that the

Light Traffic An Aid To Construction

added track has been authorized is proof positive that the traffic has approached the limit of the existing track capacity. Therefore, to impose the added burden of slow orders, frequent shifts of the operated tracks, temporary run-offs, work trains, and the presence of contractors' grading equipment on the main line, and other inconveniences that go with second-track projects, adds greatly to the problems of the operating officers until the time when the pressure can be gradually reduced by the opening of section after section of the newly completed second track. Conversely, this pressure of a heavy revenue business places certain restrictions on the construction work that add to its cost. Expensive bridge construction arrangements must be adopted to avoid even an hour's interruption of traffic. In some cases the contractor may be required to build considerable stretches of construction track when the operated tracks would have served just as well but for the heavy traffic. These conflicts of the opposing interests of the operating and construction departments must be settled by compromise, and it makes but little difference which department bears the brunt of the burden, for the railroad, as a whole, suffers in any event. These difficulties can be relieved in great measures if the work is undertaken at times of light traffic. Thus, at present, the coal strike has resulted in greatly reducing the train movements on certain lines, and in the case of the Illinois Central this condition has been taken as an opportunity for the completion of a stretch of third track which has been badly needed for some time. Other railroads will find it to their advantage to follow the example of this road.

It should be self-evident that the banners on automatic highway crossing signals should present a uniform aspect to the

Standard Aspect for Highway Crossing Signals

highway traveler regardless of the railroad he is approaching. In the past manufacturers have supplied banners painted according to the best known indications or have furnished special markings or designs to suit their individual tastes. This has resulted in the installation of a variety of banners which are confusing to the automobile driver who has no means of ascertaining whether all of these moving banners are intended to indicate that a train is approaching. Realizing the need for standardization, the Signal Section of the American Railway Association has recently prepared a new specification which provides that the word "DANGER" shall appear in black with a semi-circle above also in black, on

a white disk 24 in. in diameter, thus presenting an optical effect of decided contrast that can be distinguished at a maximum range. Efforts are being made to secure the adoption of this specification at the annual meeting of the Signal Section in June. It would seem advisable for all railroad officers who are interested to give the matter serious and expeditious consideration in the meantime in order that a standard may be established without delay.

That railroad freight traffic and general business have been improving rapidly during the early months of this year is indicated by the fact that the number of carloads of freight handled up to April 1, when the coal strike began, has been greater than it has been for any other of the past five years except the record year 1920. The total car loading since April 1 has naturally shown a reflection of the reduced coal production, but from January 1 to April 1 the total number of cars loaded with revenue freight was 9,996,184, as compared with 9,015,934 during the corresponding period of 1921, although it was less than for 1920, when a total of 10,223,813 cars were loaded. The number of cars of freight received by the railroads for transportation up to April 1 was, of course, swelled considerably by the amount of coal ordered for storage in anticipation of the strike, just as the reduction in coal loading at the present time will doubtless be made up later on when the strike is over or when the present reserves become diminished. However, there have also been large increases in the loading of merchandise and miscellaneous freight. It is also true that a carload of freight represents less tons this year than it did when the shortage of freight cars made the shippers more responsive to the efforts of the railroads to induce them to load cars to capacity. However, the tonnage and ton-mile figures will not be available for some time and in their absence the gains shown in car loading totals represent one of the reasons for optimism which have recently been reflected in a beginning of railroad purchases on a much larger scale than has prevailed for several years. While there are still some 300,000 freight cars out of service for need of repairs, the number of serviceable surplus cars had been reduced from 500,000 a year to 206,746 by March 31 this year.

The *Railway Age*, in the reviews of the operations of various railroads, which have recently appeared in its columns, has been, in a measure, emphasizing the factor of maintenance.

The Per Cent of Bad Order Cars

With the increasing value of the dollar brought about by changing wage scales and material costs, it is difficult, if not

impossible, to compare maintenance in one year and another on a dollar basis. Thus, if a road's expenses of maintenance-of-way show a sharp reduction as between 1921 and 1920, it is not clear whether this may be due to lesser work done, to economies in carrying on the maintenance activities, or merely to lower wage and material costs. In other words, the expense figures do not serve the purpose. A more better basis of comparison is to be found in the cost of rail road ton put in track, yards of ballast, etc., and in several cases these details have been utilized. In the case of equipment, there are similar details available for comparison, the percentage of bad order cars to total on line and the percentage of unserviceable locomotives. These figures appear in a very few cases in the annual reports. They are given in the form of a monthly and cumulative average in the operating statistics reported to the Interstate Commerce Commission and they are similarly reported—in much greater

detail—to the Car Service Division of the American Railway Association. We believe these figures to be valuable and of considerably greater value than the attention that has been paid them would indicate. It is simple enough to say, for example, that if the average percentage of bad-order cars on all the roads at a certain time is, say, 14 per cent, and the X. Y. & Z. is reporting only 6 per cent, its car condition is good; or that if it reports 20 per cent, its condition is bad. Of course, we know the average of the country should be not 14 per cent but between 4 and 7 per cent; that factor must also be borne in mind. Further, there may be many cars in the bad-order list that will never be repaired but will be retired. The effect on the maintenance of equipment expenses will be similar whether the charge is to repairs or to retirements. As concerns operation, the car is not ready for service in either case. This is the reason the *Railway Age* uses the bad-order figures extensively. It believes that, if they are used properly, the bad-order percentages are of great value as an index to equipment maintenance.

It would be difficult to over-estimate the importance of modern car and driving wheel lathes in efficient railroad shop operation. Obviously cars and locomotives can be put through a repair shop no faster than tires can be turned.

The Wheel Lathe a Barometer of Shop Efficiency

In fact the production and morale of the entire shop is dependent on the output of the wheel department as limited by its wheel lathes. A superintendent of motive power is quoted as saying recently, "Before I had the new 90-in. wheel lathe, the driving box gang always took its own good time because the driving wheels were always behind; but now driving wheels are always waiting for the box gang which has been compelled to speed up. This speeds up all the other gangs so the whole shop tries to keep up with the big, new wheel lathe which is the pace-maker. Naturally engines are going out faster and cost less." The modern wheel lathe is a highly specialized machine, designed to develop great cutting power and tax the capacity of high speed steel tools to the utmost. Heavy internal stresses are continuous for long intervals and price should be the last thing considered in purchasing this type of tool where there is sufficient work to keep it busy. Continuous high production during 15 or 20 years, with economy in power consumption, easy control by the operator, and freedom from breakdown are essential features which should be given first consideration in selecting wheel lathes. A railroad can ill afford to sacrifice anyone of these features for the sake of a few hundred or even a few thousand dollars in first cost. Railroads can also ill afford to continue the operation of the many inefficient wheel lathes now in constant use.

A newly designed locomotive or car always and properly attracts careful attention and inspection. A shop superintendent or master mechanic invariably takes occasion to point out to a higher officer or other visitors the latest new machine or improved method which turns out more or better work than the machine or method which was replaced. This spirit is natural and commendable, but in a search for the new and spectacular do we not oftentimes overlook something that might be learned from the old or even discarded device or part? One of the most interesting spots around any shop, roundhouse or car repair yard is the scrap heap. Many a railroad man might learn a lesson from the traveling mechanical representatives of the various railroad supply firms

Study the Scrap Heap

who early learn the importance and location of the scrap piles, no matter in what out-of-the-way corner they may be situated; immediately after calling at the office they make a bee-line for these interesting points. Here are found car brake shoes that have overlapped or crowded against the flange due to improper condition of foundation brake rigging and have had to be removed before any benefit had been obtained from a large part of the wearable metal; locomotive brake shoes tapered and hardly worn at one end due to lack of attention to maintenance of the driver brakes; brake beams distorted because of some inherent weakness in the design or improperly hung and allowed to come in contact with the wheel flanges; broken spring hangers and other worn or broken parts of locomotives and cars that have gone to the discard. Our present rolling stock has assumed much of its present form as a result of a long period of evolution and a study of failures. For a designer or one looking for improvements, something of interest can always be found by going over a scrap pile. The men responsible for maintenance also will find the time spent at such points equally profitable, even though they do not find much material that might have been repaired by welding, or otherwise, instead of being scrapped.

Railway officers who have a desire to serve beyond the actual requirements of their ordinary duties are availing themselves

**A Symposium
on Railway
Economics**

more and more of opportunities to speak before chambers of commerce and other public gatherings. To do this successfully they must be well informed on railroad economics generally and keep abreast of current thought along these lines. For those who are desirous of improving their knowledge of current problems of railway economics, the semi-annual meeting of the Academy of Political Science at the Hotel Astor, New York, on April 28, offers an exceptional opportunity. Railroads and Business Prosperity is the subject for discussion and from the list of the speakers who are going to talk upon this subject it is evident that it will be treated thoroughly and ably. The meeting will be divided into three sessions—morning, luncheon and afternoon, beginning at 10 a. m., 1 p. m. and 3 p. m., respectively. The first session will be devoted to the consideration of railway labor problems, with Professor Henry R. Seager of Columbia University presiding. At this session E. M. Loomis, president of the Lehigh Valley; W. N. Doak, vice-president of the Brotherhood of Railroad Trainmen; C. B. Heiserman, general counsel of the Pennsylvania; and Professor Frank H. Dixon of Princeton University will be the principal speakers. Professor Samuel McCune Lindsay of Columbia University will preside at the luncheon session and Henry Wallace, Secretary of Agriculture; Hale Holden, president of the Chicago, Burlington & Quincy; and Walker D. Hines, formerly director general of railroads, will speak on Railway Policies and the General Welfare. Freight Rates and Business Revival will be the topic at the afternoon conference. The speakers will be T. C. Powell, vice-president of the Erie; R. H. Aishton, president of the American Railway Association; Professor W. J. Cunningham of Harvard University; C. R. Cook, vice-president of the American Rolling Mill Company; and J. D. A. Morrow, vice-president of the National Coal Association. The conclusion is inescapable that attendance at these sessions will be an education in present day railway economics. Certainly railway officers who are seeking to increase their service and who feel the need of further knowledge of current developments in railway economics will do well to attend these sessions in person or, if that is impossible, to study the proceedings when they are published.

The extensive use of timber for pole lines has made such inroads upon the supply of suitable species of wood that the costs are becoming so high as to

**The Permanency
of Pole
Lines**

force pole-using companies to seek means of construction that will give greater permanency. Also the labor costs of replacing poles and the damage to the line wires when making changes represent a high percentage of the operating costs. Increased life of pole lines may be secured by treating the butt of the poles with preservatives or by banding them with other materials, such as expanded metal or reinforced concrete. The average 30 ft. western cedar pole costs approximately \$5.50 in the central states and has a life of from 12 to 18 years, while this same pole butt-treated with a preservative at an additional cost of \$3.50 is said to last for approximately 36 years. The Telegraph and Telephone Section of the A. R. A. recently presented a detailed estimate of a 93-mile pole line, showing that the additional investment for wood preservative will produce a saving of over \$3,000 per year during the 36-year life of the poles. On the average railroad which expects to construct additional tracks, change grades, etc., the added expense for a pole line with a life of more than 36 years might not be justified. However, at corner turns, crossing spans, terminal poles and transformer locations, the labor cost for transferring equipment when renewing poles is so high that still more permanent construction, such as reinforced concrete, is being used to some extent; the advisability of its more general use on railroads considered as permanently located is also being studied. A 30-ft. reinforced concrete pole costs from \$28 to \$49, depending on the number of wires to be carried. Therefore in order to justify the additional cost, permanency must be the first consideration. With the increased installation of railroad-owned telegraph, telephone, signal and power lines the railroads have a vital interest in the cost of construction and maintenance of the poles used and it would seem advisable for them to offer every assistance to the Telegraph and Telephone Section of the A. R. A. in securing data concerning the life of pole lines.

Will newspaper reporters ever learn that, as motive power for heavy passenger and freight service, the Mogul locomotive is no more? Recently bandits held up main line freight train on one of the largest roads in the East. In telling the public about it the next morning one of New York's greatest papers

**The
Mogul
Obsession**

said in all solemnity that the train was drawn by a large locomotive of the Mogul type. Well, perhaps it was, but we doubt it. The chances are several hundred to one that few up-to-date roads are using Moguls in heavy main line freight service. About a year ago there was a serious accident not far from Chicago involving two limited trains. Once again we were told by the big dailies all over the country that the locomotives in the accident were Moguls. They published photographs of the engines, however, which showed that they were Pacifics. The obsession about Moguls is just a symptom and is not the disease itself. Or to say the same thing in other words—the reporters, assigned by many of our best newspapers to “cover” railroad news, know little or nothing about the subject. Consequently, when there is a big accident or some other news involving technical railroading, the newspapers find themselves completely at a loss. As a result, when a railroad man reads what they say, he can get no adequate idea of just what has happened, but has to seek accurate information elsewhere. There is little specialization in an American newspaper office outside the fields of politics, sports, the theater, finance and literature. The same reporter may in any week be assigned to such various

subjects as a murder case, a strike of garment workers, a meeting of the W. C. T. U. and a collision on the X. Y. & Z. Railroad. He cannot be an expert in so many lines. Consequently omissions and inaccuracies creep into almost everything he writes. In England they do things differently. There court cases are reported by men trained in the law, medical matters by doctors, railway affairs by men with railway experience, and so on. One of the most important steps toward improving the quality of railway news in our daily papers would be taken if railway officers would protest to papers in which they find inaccurate information.

Attacking the "Recapture" Provision

THE *Railway Age* believes that from the standpoint of the railways as a whole a serious mistake will be made if the plan now being considered for attacking in the courts the so-called "recapture" provision of the Transportation Act is carried out. The railways themselves are opposing repeal of the rate-making provision of the Transportation Act. A successful attack in the courts upon the recapture provision probably would make inevitable the repeal of all the rate-making provisions. The mere beginning of litigation to test the recapture provision might under present conditions be sufficient to cause Congress to wipe out all the rate-making provisions.

The recapture provision is, of course, that which requires any railway which earns over six per cent in any year to in effect pay one-half of the excess earnings over to the government. From a constitutional point of view this provision may be assailable, but the Supreme Court of the United States upheld the Adamson law, which from a constitutional point of view surely seemed much more vulnerable than the recapture provision. The Supreme Court has upheld many kinds of railway legislation which our legal friends did not expect it to. The *Railway Age* hazards a layman's prediction that if a case involving the constitutionality of the recapture provision ever reaches the Supreme Court it will be upheld.

There is involved a question of public policy and of railway policy far more important than the question of law. The purpose of the rate-making provisions was to insure that the railways as a whole would be allowed to earn a reasonable average return. It was argued by some, however, that if the average return allowed to be earned by all the railways should be reasonable the returns earned by the more prosperous individual railways would be excessive. The *Railway Age* never accepted this argument as logical or fair. On the most rigorous "fair return" theory of reasonable rates it must be that if the railways as a whole earn only a fair average return the rates from which it is derived are reasonable. How can the net return of an individual railway be excessive if it is derived from rates which for the railways as a whole are reasonable?

However, facts are stubborn things. In every important rate case for years the making of rates which would be reasonable for the railways as a whole was successfully opposed with evidence and arguments which convinced commissions and the public that under these rates the returns earned by the more prosperous railways would be excessive. Many railway executives and financiers favored the recapture provision because they were convinced that without some such provision in the law rates never would be permitted to be made which would enable the railways as a whole to earn an average return which would be reasonable for all and enable them to raise needed amounts of new capital.

The situation in this respect has not changed since the Transportation Act was passed. There is no evidence whatever that Congress, commissions or public have been convinced that the rates should be made high enough to enable

some railways to earn relatively large returns in order that the railways as a whole may be enabled to earn a reasonable average return. So long as the sentiment of Congress, commissions and public remains what it apparently is now it seems most probable that a successful attack upon the recapture clause would involve the complete destruction of the rate making provisions. It seems very likely the result would be in the long run that the more prosperous railways would not be allowed to earn and keep any more money than if the recapture provisions were retained, while the poorer roads and the average roads would not be allowed to earn and keep as much money as they would be if the recapture provisions were retained.

If the railways want to get rid of the recapture provisions without at the same time completely destroying the rate-making provisions they should take their case to Congress and the public and not to the courts. If they go to the courts and win it is to be feared that as in some past instances they will merely win a battle and lose a campaign unless they also present and win their case in the court of public opinion.

On What Basis Should Paint Be Bought?

OF THE THOUSANDS of materials which the railroads buy there is probably none which proves more troublesome to the purchasing agent and to the department using it than paint. The policy adopted with regard to the paint question is serious in its consequences. Paint, considered in the broad sense as including enamel and varnish, forms one of the large items in the expenditure for supplies. To meet the needs of all departments requires material of varying character, color and composition. Scores of different products are bought and as there are over 200 paint manufacturers doing more than a local business, the range of choice of the purchasing department is almost unlimited.

In general, railroads follow one of three methods in buying paint. Some buy on practically no consideration except price. Often these roads have a specification, so called, but it allows so much latitude or is so seldom enforced that it affords no assurance of the quality of the product. In contrast with this many of the large roads have detail specifications, and every shipment of paint is checked in the laboratory to make certain that it conforms to the requirements. Another practice followed by some roads is to specify the purpose for which the product is to be used, leaving the composition to the judgment of the manufacturer and holding the maker responsible for the service obtained. Bidding is restricted to a limited number of well-established companies. Results are checked by service tests and any manufacturer whose product does not give satisfactory service is removed from the list of bidders.

Recently there has been a noticeable tendency on the part of some railroads to try to save money by buying paint solely on a price basis. This is one of the worst crimes that has been committed in the name of economy. The economy of paint is not measured in cents per gallon, nor in square feet covered per gallon. The cost of the paint is usually less than the labor of applying it. The combined cost of paint and labor is usually insignificant in comparison with the value of the equipment or structures which it protects. To determine the true value of a paint, it is necessary to consider the first cost, the covering properties, the cost of application, the time the equipment is out of service and the length of time between paintings. How many roads have ever had a report on paint that considered all these factors? Is not such an analysis justified when many roads spend from \$50,000 to \$100,000 for each of several varieties of paint? These are some of the fundamentals which is now causing more than one road serious concern. Other phases of the question will be discussed in succeeding issues.

Letters to the Editor

[The RAILWAY AGE welcomes letters from its readers and especially those containing constructive suggestions for improvements in the railway field. Short letters—about 250 words—are particularly appreciated.]

Public Relations Work and Advertising

BOSTON, Mass.

TO THE EDITOR:

We have waited long—oh, so long—for you to recognize the continued neglect, and in many cases the utter abandonment by many American lines of two important essentials of successful railroad management—public relations work and advertising. However, if this recognition has been delayed, your perception and understanding of the situation has certainly been clearly and forcefully presented in your excellent editorials in recent issues. Indeed, it makes in every respect an admirable introductory text to a study of the problem that exists—a text, in fact, that is worthy of thought upon the part of those who decide questions of policy. Truly you have hit the mark and hit it hard!

During the last year and a half the slogan of a closely related industry, the electric railways, has been "Salesmanship in Transportation." At last its bigger, older, and we wonder if not characteristically more conservative, brother seems to be rubbing his eyes, and speculating why the awakening process has been so slow.

As you point out, the railroads have really got something to sell. Today they have competitors, imitators, call them what you will. Yet railroads should certainly lay claim that theirs is the genuine, the best, form of transportation. And there is a wealth of reasons to support such a claim. Without expanding upon this point, however, the truth is that railroad men, both officers and employees, have been convinced that the rails constitute the standard method of transportation. It has been the strength of this assurance that has been detrimental. The lack of aggression on the part of the roads has been the opportunity of the relatively weak electric roads and the motor trucks. Now the situation does seem to be pretty well appreciated, but the realization was admittedly very slow.

It is the passenger service, however, that I am especially considering. Let us ask a few pertinent questions.

Take any large city: How many people know what points of special interest are located within 50 miles by rail?

Take the city that is not a metropolis: How many people know to what principal points its railroads radiate, to what places through trains, including Pullman cars, are operated?

Take the smaller town out "on the line." How many of the people know the destinations of the trains that they see every day? How many have even a hazy idea of the distance to the destination of these trains, the distance in hours as well as in miles?

How many citizens of any of these communities have ever heard a railroad representative at any sort of public gathering?

To most readers of the *Railway Age*, Niagara Falls and the Mammoth Cave are not unfamiliar—we know how quickly and easily these places may be reached. And so rather unconsciously we assume that the average person knows all about these and other pleasure resorts. The contrary is true. A great new generation has sprung up that knows virtually nothing of these wonders in every part of the country. Tell them about these things, educate them until they want to go and see.

Also there is a vast multitude, not undesirable either, which has never enjoyed a Pullman car or visited a diner. The issue is clear: We have got to drive away, through the carefully planned dissemination of information, firmly rooted beliefs common to a large class, that these luxuries are only intended for and within the reach of millionaires.

Let us mention in passing the observation car. Assuredly, from an operating standpoint, particularly here in the east, it has many objections. And yet even if not actually much used by passengers (I am speaking here only of the platform), because of road conditions, its very presence on a train, both in the terminal and along the line is worth pages of advertising.

Keep up the good work you have started. If we must consider our various railroad systems as necessary utilities, let us have continually before us the principle that volume of traffic carried measures the degree to which a railway is a public servant. More advertising, closer public relations. Bigger, better business. But don't wait for it to come—go get it, fight for it, make it. C. RADFORD SANDS.

Educate Employees in the Use of Appliances

BROOKLINE, Mass.

TO THE EDITOR:

Every description of a new locomotive carries a lengthy list of appliances, all more or less complicated. Many are so generally used that they are accepted as a matter of course; others are still in the development stage. That these improvements will come in time no one denies. Orders for recent equipment show that. How are these devices to be handled by the men and what steps will be taken by the management to instruct them in their proper use?

Most of the men who sit at the throttle today entered the service of the railways through the attraction railroad life had for them. This class of men is fast disappearing and those who are entering the service now enter it only because of the pay envelope. Unless something happens, it is going to be these men that are going to handle our trains.

The back head of the boiler of a modern locomotive today presents a mass of pipes, gages, cocks, valves and levers, with the use of which the engine man must be familiar and every new device added means an additional something for the man in the cab. When we hear of a green fireman making the excuse to the engineer that his steam was low because he did not know how to blow her up, the problem becomes serious.

To my mind there is only one cure for it and the mechanical department must act right soon. Engineers and firemen must receive a more thorough and better training in regard to the proper use and care of the locomotive and new devices. Call it going to school if you will, make it compulsory if necessary. Do it in the lay-over on the runs, take the men who are there on the spare board and pay them for the time spent in the class room. Have as many pieces or parts as necessary; extend it to the roundhouse men; include shop men if you wish; but to carry the thing through to a success, compulsory attendance must be enforced.

Would the men kick at this? Doubtless some would. Some would kick at anything anyway. But, I'll guarantee that the brotherhoods would stand behind this plan, would probably be willing to reproduce some of the material in their publications and, moreover, public opinion would shortly silence any opposition from any party, once it was learned what was being attempted.

As for the expense, it would be slight compared to the results. Can anyone imagine what the saving would be to have every engineer and fireman thoroughly interested in his

locomotive to see that it is in proper condition, that the roundhouse forces are interested in doing a thorough and an honest job when it is reported to them? Can anyone estimate these savings? Is it possible, and is it not worth trying? Without some direct handling of this subject the American railways within the next 25 years are going to lack the sound timber they have been producing for locomotive engineers and will have themselves solely to blame.

CHAS. E. FISHER.

For a Better Understanding Between the Railways and the Public

NEW YORK

TO THE EDITOR:

Your recent editorials on railway advertising are much to the point. The railways are spending little or no money on making their facilities or their attractions known. The propaganda of the railway executives is about the driest reading imaginable. At the present time the interest in railway day-to-day affairs is at the lowest ebb.

Years ago the people talked of railway items, but such is no longer the case. No one seems to care about train performance, or the performance of individual engines. Before me I have a current English railway magazine full of such items. There are seven pages of replies to correspondents inquiring about the Midland coat-of-arms, locomotives on Isle of Wight, the largest station in the world, etc. All of this evidences the deep interest of the travelling public. Our lines have become highly standardized, but nevertheless there is much that might be told of daily interest. Clean engines should always appeal to the traveler and the naming of locomotives is not a matter to be considered as of no advertising value—especially of large passenger engines.

Music is essential in the army; so are the small items of the daily doings of the railways to a real interest in their welfare. Tactics in the army and tons per mile on the railway are not for everybody. If one of the large systems were to paint an engine pink and send it over the system, the fact would get into all local papers and the line would be talked about in thousands of homes where ton-miles are unknown. This would not minimize the importance of study of train loads to those who are responsible for them. One recalls the Ghost train of the old New England road in this connection.

Your editorials speak of the selling of transportation as the sole function of a railway. Technically so, but not the real fact. What a railway sells is the community it serves to the rest of the world in competition with other communities; in other words, it sells transportation plus service, and service covers many factors, such as punctuality and properly timed trains in passenger service, proper freight car supply, efficient local freight service, smooth handling of trains, minimum destruction of merchandise in transit and not a few other items. This will not be done as it should be till some line establishes a service department with an executive in charge who will have time to study the requirements of the line intimately—not incidentally. He will ascertain traffic which needs encouragement—the establishment of, say, fruit or fish trains, and likewise in passenger service—make people travel, for one reason or another, more often than they otherwise would. To such an officer should come all complaints, it being his prime duty to investigate them and not to have such complaints pigeon-holed. He should seek the boards of trades, tell them how they can create new business, ask what can be done to help them; this in contrast to the boards of trade seeking the railway officials and asking or demanding why such and such business is being handled in an unsatisfactory way.

Many of our lines are so large that with the present system of executive organization the actual contact with the communities and the personnel is of a most superficial nature and if the systems are merged as has been discussed, it would be less. The effect of the recent mergers in England in this respect will be watched with interest. Till the soil well, plow deep, rather than cultivate too large a field superficially. One railway under present conditions in a highly competitive territory is earning nearly 10 per cent, due to the service rendered. The same line a few years ago was in a deplorable condition.

There are over 57 varieties of the railway problem and most of them are just human problems which can be and only can be solved as human problems have to be; by knowledge, fraternity and honesty.

I am not unmindful of the excellent work done by the Long Island in its agricultural experiment station; of its showing the farmers how to ship commodities to secure the best market prices. The war stopped such work but its need exists today in many sections. James J. Hill, I believe, at one time distributed many thoroughbred bulls along the Great Northern; but such efforts have been few and far between.

More advertising in printer's ink and in every way ought to be distinctly helpful to railways and to a better understanding between the railways and the public.

GEORGE B. LEIGHTON.

Another Complaint Against American Passenger Service

NEW YORK CITY

TO THE EDITOR:

I was pleased to read in your journal of April 15, Mr. Langdon's able attack on the ridiculous designs of the steel cars now in use on American railroads.

In yet another way, however, have American railway men proved their inferiority to their English contemporaries in the handling of passenger traffic. I refer to the absurd platform accommodations provided at most passenger stations.

These platform accommodations are inadequate in two essentials. In the first place they are seldom higher, and often lower, than the top of the rail, making necessary the use of steps in entering or leaving the cars. In the second place, many double-tracked railroads have only one platform for trains in both directions, necessitating the crossing of tracks by passengers. Not only is this an unsafe practice which, moreover, blocks both running tracks when only one is in use, but it also makes necessary the use of a step box, since the platforms cannot, under such an arrangement, be higher than the top of the rail. The use of the step box further slows up the loading and unloading of trains.

The adoption of the English scheme of two platforms on the car floor level would, of course, restrict clearances to some extent and would involve minor changes which could be brought about over the entire country only during a period of years. My complaint is that practically nothing is being done to initiate this innovation. We do have raised platforms in ample number at a few of our metropolitan stations, but other stations even in same city are not so equipped. The result is that steps and trap doors have to be provided. If the raised platform were generally adopted, these steps could be done away with entirely—this, in addition to providing greater safety and comfort for passengers and reducing the waiting time of trains at stations about 75 per cent.

Will some of the officers of our roads which enjoy a heavy passenger traffic tell us why no steps are being taken to bring about these improvements, the need for which is so obvious?

R. C. LEWES.

New Locomotive Facilities at Clifton Forge, Va.

The Chesapeake & Ohio Has Provided a New Roundhouse, Power Plant and Other Utilities in a Congested Location

TO MEET the rapidly growing requirements for locomotive repair and terminal operations at Clifton Forge, Va., the Chesapeake & Ohio has prosecuted a program of intensive rehabilitation and renewal of the facilities at that point. This work has resulted in the recent completion of the new 10-stall roundhouse, a power plant, a storehouse, an oil house and a lavatory and locker building. This work had its inception in 1917, when it became apparent to the officers of the railroad that the facilities at Clifton Forge were becoming inadequate. The situation was aggravated by the enormous growth of traffic during the war period,

a plan was perfected for taking down certain of the old buildings and rebuilding over the same area.

The new roundhouse has 10 stalls, the greater number of which are 120 ft. deep. The section of the building is similar to the one constructed at Richmond, Va., where it was found that the arrangement of the roof, together with the outlets at the edges of the monitors and the louvred openings in the monitors, provided adequately for the escape of smoke, gases and steam. This will be seen readily by referring to the drawing showing the roundhouse in section. The roof rafters and purlins are laid radially from the center of the turn-

Above—Two Exterior Views of the Power Plant. Lower Left—Belt Conveyor for the Coal Handling Equipment. Lower Right—View Above the Boilers Showing the Steam Headers

and after an extended study of the situation work was undertaken actively late in 1920.

The Roundhouse Has Long Stalls

Clifton Forge is an important division point on the main line at the junction with the James River division and midway between engine terminals at Hinton, W. Va., and Charlottesville, Va. Heavy grades on all lines leading to and from Clifton Forge require the use of the heaviest type of locomotives and Clifton Forge is the logical location for the engine terminal, as well as for shops for running repairs and certain heavy repairs. The space available for shops and terminal buildings and for the necessary track facilities is limited by hills on one side and by the Jackson River on the other; the problem was further complicated by the fact that the existing buildings were very close together and by the necessity for minimum interference with the shop and terminal operations during the alterations and improvements. Because of the obstacles imposed to any construction work,

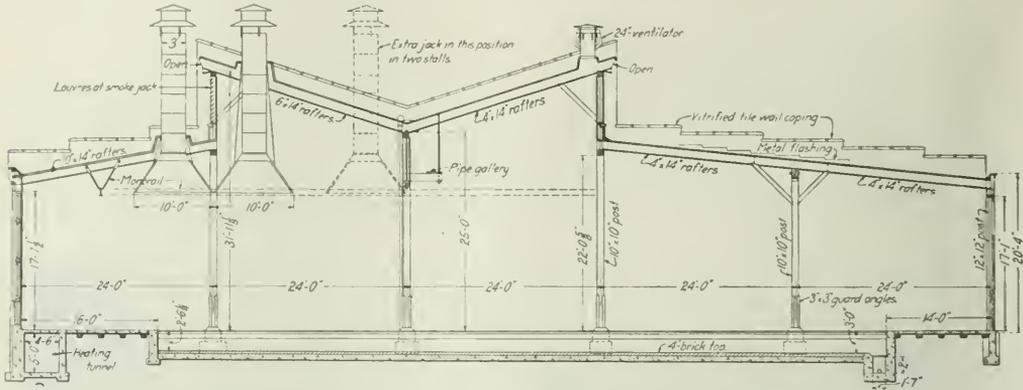

the roof sheathing or deck being laid cross-wise over them. There are no pockets or obstructions under the roof sheathing to prevent the movement of smoke along the sheathing to the outlets in the monitor, and the removal of gases from the building is accelerated by the action of wind across the roof, similar to the action in a properly designed roof ventilator.

This building is constructed with a concrete foundation and side walls, extending up to the window sill line. From that level to the eaves, the side and end walls are brick. The building columns and the superstructure framing throughout, including the roof sheathing, are of wood. The roof deck is covered with a four-ply, pitch and slag roofing. The engine doors are 14 ft. wide by 17 ft. 1 in. high, heavily reinforced with iron hinges and provided with hand-operated locking devices for holding them either in a closed or open position. The engine pits are of a very heavy design which has been adopted by the railway as standard. A truck and tender wheel drop pit, equipped with a Watson-Stillman hydraulic

jack, embraces two of the engine pits. Two driving wheel drop pits, also equipped with jacks, have been provided. The building has a concrete floor throughout and the engine pit walls are all capped with heavy oak jacking timbers.

Two "transits" smoke jacks are installed over the front end of each engine pit with a third jack over the two pits

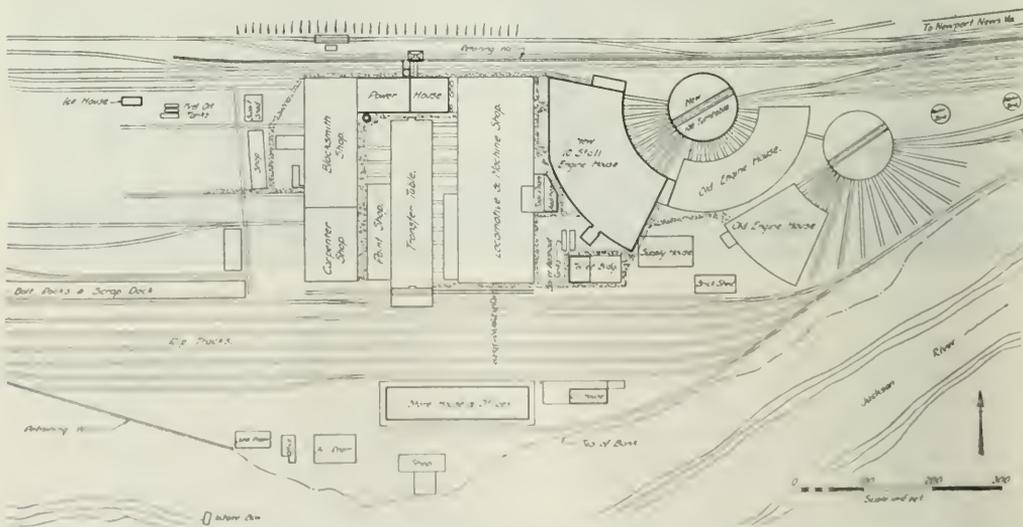

pressed air outlets are placed between all pits, on two rows of columns, one near the center of the building and the other near the outside walls. Steam blower outlets, fitted with extended drop pipes and Barco flexible connections, have been placed between each of the engine pits at the most convenient points for connecting to the engine blowers. The

Ample Provision for Smoke Jacks Was Made in the Roundhouse

intersected by the drop pits, to take care of the smoke, when engines are spotted over the truck wheel drop pits. A monorail track extends around the outer wall of the building. This track is, in general, placed 10 ft. from the outer wall and extends out of the building across a 20-ft. passageway

boiler washing pumps and heater are located in a room adjacent to the rear of the building, which opens directly into the roundhouse, the storage and settling tanks being located adjacent outside the building. The roundhouse is provided with a room 16 ft. wide by 49 ft. long, on the north side of

The New Facilities Were Added to the Best Advantage in the Space Available

and into the machine shop, making it possible to convey air pumps, rods and links and other heavy parts directly from any stall in the roundhouse to the machine shop, and vice versa. A two-ton electrically-operated, hand-controlled traveling monorail hoist operates on this track

The house is supplied with a 4-in. cold water filling line, with valved outlets between each two engine pits. Com-

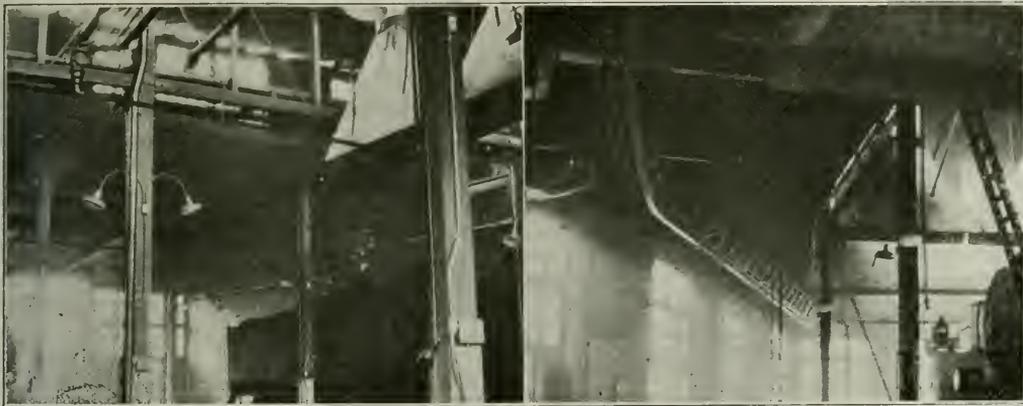

the building, to afford space for lockers, lavatories and toilet facilities for employees of the roundhouse.

Heat is furnished to the building by an indirect system through underground conduits by an American Blower steam engine-driven fan. This apparatus, together with the vent-heater, is located in one corner of an adjacent remodeled building, which is arranged to house the heating apparatus

for the roundhouse, together with toilet and lavatory facilities for both the colored and white employees in the machine and blacksmith shop. There are also 217 steel lockers in this building. All of the lavatories are supplied with hot and cold water, and the plumbing is modern throughout.

A new 100-ft. twin-span turntable, of the type recently

steam, compressed air and electric current and accessible for coal supply and ash removal. An unoccupied location to fit this specification was not to be had, so it was decided to remove the pipe and tin shop building to make room for the power house. The location is shown in the map. Here advantage could be taken of the excellent situation of an

Two Interior Views of the Roundhouse. Monorail Shown at the Right

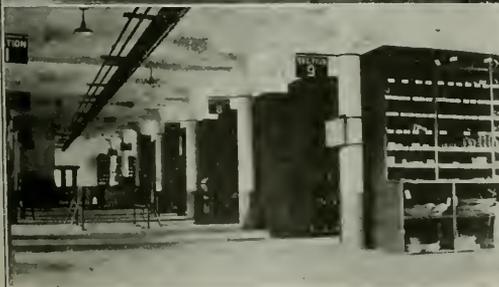

developed by the Bethlehem Steel Bridge Corporation, of Bethlehem, Pa., has been installed by the railroad in a heavy concrete turntable pit. This turntable serves the new roundhouse, together with that portion of the old roundhouse which has not yet been rehabilitated.

A Centrally Located Power House

The most desirable spot for the power plant was naturally one that would be central with respect to the distribution of

existing track, elevated 12 ft. above the boiler room floor, which afforded an unusual opportunity to construct a coal unloading and receiving hopper, without the need of a deep excavation.

The power-house building is 134 ft. long by 52 ft. wide. A length of 76 ft. 6 in. at one end is used for the boiler room while the remainder of the building, 57 ft. 6 in., serves as the air-compressor room. The building is of concrete, brick and steel construction throughout and has a concrete tile slab

Upper Left—The Storehouse. Upper Right—The Oil House. Below—Two Interior Views of the Storehouse

roof deck, covered with four-ply pitch and gravel roofing. Reinforced concrete overhead coal bunkers provide storage capacity for 200 tons of coal within the building.

The boiler equipment consists of two 200-hp. and three 350-hp. Sterling water tube boilers, making a total capacity of 1,100 hp. These boilers are fitted with Detroit Murphy type stokers. Draft is provided by a Heinecke radial brick chimney, 8 ft. inside diameter, 175 ft. high.

The furnaces are fitted with Blonck efficiency draft meters. A new Cochran boiler feedwater heater of 1,666 hp. capacity, together with two 10-in. by 6-in. by 12-in. Deane horizontal duplex outside packed, plunger type boiler feed pumps are installed at the rear of the boilers. An 8-in. by 10-in. by 10-in. American Marsh vacuum pump is installed in connection with the shop heating system.

The coal and ash elevators and conveyors were furnished by the Ogle Construction Company, Chicago, and the coal crusher by the Stephens-Adamson Company. The coal for the plant is dumped from drop-bottom cars into the track hopper and then elevated by an automatic electric inclined bucket-skip-hoist, to a crusher, placed above the coal bunkers in the plant. From the crusher the fuel is carried on a belt conveyor which distributes it to the bunkers, from which it is fed by gravity to the stokers. Ashes, when removed from the ash pits, are elevated by an automatic electric skip-hoist and stored in an elevated steel, concrete-lined ash bin and discharged by gravity into standard gage cars, spotted on the track below it.

The compressor room houses two air compressors, of 888 cu. ft. capacity each, driven by individual motors, one 1,700 cu. ft. steam-driven air compressor, one 150-kw. motor-generator set and one 800-ampere, 75-volt motor-generator welding set together with the switchboard, which controls the motor-driven units in the compressing room and the distribution of low tension current throughout the shops.

Adjacent to and just outside of the compressor room are three 350-kv.a. transformers and two steel air reservoirs.

The Storehouse

The greater portion of the power plant equipment was moved from the old power house, located adjacent to and west of the machine shop. The old house had to be partially taken down to make room for the new roundhouse. The moving of all of this equipment was accomplished satisfactorily, without interruption to the daily operation of the terminal or shops.

The new storehouse is a reinforced concrete building, 209 ft. 6 in. long by 49 ft. 6 in. wide, two stories high, with a space 48 ft. square, provided on the third floor for a drafting and file room and the apprentice instruction department. On the first floor, at the east end of this building, are the offices for the time-keeper and storekeeper and on the second floor the master mechanic's office, together with spacious offices for his clerks, the road foreman and general storekeeper. The building is located at the south edge of the property, the natural contour of the site here sloping towards the river. This made it possible to place the first floor of the storehouse level with the shop floor and eliminate the usual ramp leading to the platform in most railroad storehouses. A standard-gage material track is laid parallel with the platform on the south side of the building, this track being on a level four feet below the platform, thus bringing the platform level with the floor of cars spotted on this track.

The first and second floors of the storehouse proper are furnished with steel material racks and steel shelving. A two-ton electric freight elevator is being installed to serve the second floor. The building is equipped with steam heat and electric light throughout and the building and equipment represent the best in construction and equipment that is now used in railroad shop warehouses.

The Oil House

The oil house is a reinforced concrete, fire-proof building, 34 ft. 2 in. wide by 60 ft. 2 in. long, with an oil delivery room on the first floor and oil tank storage room in the basement. The basement is furnished with five 8,000-gal. steel oil storage tanks and one 1,600-gal. tank. Self-measuring, hand-operated oil pumps control the distribution of oil from these tanks, the pumps being located in the oil delivery room. A fire-proof waste storage room, having a capacity of a carload of waste, is constructed at one end of the first floor. The remainder of the first floor is utilized for the storage of oil and paint in barrels and is further supplied with a battery of five 110-gal. and one 320-gal. rectangular, steel storage tanks, with self-measuring pumps. Suitable pipe terminals, with valved outlets, are provided underneath the edge of the platform for making connections to tank cars so that oil can be unloaded by gravity directly from tank cars to the storage tanks in the basement.

Water for the shop service system and engine supply is taken from the Clifton Forge water mains and also from a gravity line, recently laid to the city reservoir. The power house contains two auxiliary motor-driven pumps for taking water from the Jackson river, in case of emergency.

The new buildings are all abundantly supplied with electric lighting fixtures, all of which are equipped with steel, enameled reflectors. The main wiring for the roundhouse lighting is carried on brackets around the outside wall. From these mains, branches extend in conduits through and down the wall and underneath the floor to the building columns, where they are brought up to the lighting fixtures supported on these columns. Ralco plug receptacles placed three between each of the engine pits, supply extension cord lights in the pits or elsewhere, when required.

The layout, including the design and preparation of the plans and specifications for all of the new buildings and equipment, was made by the Arnold Company, Chicago, co-operating with the motive power department of the railroad, under the direction of J. R. Gould, superintendent of motive power. The construction was carried out by the Arnold Company, under the supervision of C. W. Johns, engineer of construction for the Chesapeake & Ohio.

Entrance to the Connaught Tunnel, C. P. R.

Further Testimony Before Senate Committee

Julius Kruttschnitt Replies to Former Director-General and W. J. Lauck Assails Railroad Financial Management

WASHINGTON, D. C.

JULIUS KRUTTSCHNITT, chairman of the board of the Southern Pacific, in continuing his testimony on April 12 before the Senate interstate commerce committee charged that the Railroad Administration respected neither the promise of the President nor the guarantee of Congress to maintain the railroads in as good repair and in as complete equipment as when taken over on January 1, 1918. He also said that it is "a just cause of complaint against the director general that he refused to recognize the moral obligation he was under to make an increase in the carriers' revenues corresponding to the enormous and destructive burden of expenses he had placed on them."

"He left to the owners," said Mr. Kruttschnitt, "the unpopular task of seeking before the public an increase of revenue to meet this increase of expenses. It was easy to shift this burden to the carriers, which at the threshold of resuming their relations with the public were confronted with a necessity of asking a large increase in rates. In equity this obligation was not theirs. It was the obligation of those who had created the necessity."

"What do investors in railroad securities think of the degrees of the respect paid by the director general to the President's assurance 'that their rights and interests will be as scrupulously looked after as they would be by the directors of the several railway systems' when he returned their properties with a margin of but 6.53 per cent between operating expenses and earnings compared with 29.52 per cent when he received them."

Mr. Kruttschnitt said that the statistics compiled by the Interstate Commerce Commission show that the director general skimmed in the use of both ties and rails.

"In two years cross-tie renewals," he said, "were 32,628,360 short—enough to lay 11,500 miles of track or about 3½ tracks stretching from New York to San Francisco. Rail renewals were cut 440,230 tons—enough to lay 3,120 miles or a track from New York to San Francisco. There was also a shortage of 1,816,155 cubic yards of ballast used in repairs."

"Mr. McAdoo tries to convince himself that it was not his duty to put into the track an average number of ties annually, determined by the test-period average, in order to fulfill the obligations of the government to return the properties in substantially as good repair as they were on January 1, 1918. If the federal administration has discovered a way to maintain a track for two years on a 28 per cent reduction annually from the number normally used, it has discovered something of inestimable value to maintenance engineers."

Ties Skimped and Repairs Neglected

The effect of skimping ties and neglect of car repairs on derailments was shown strikingly in a chart which Mr. Kruttschnitt had prepared for all Class 1 roads. Deraillments rose rapidly from 5.26 in 1917 to 12.34 in 1920 per million locomotive miles run, or 135 per cent higher in the latter than in the former years. There was an increase of derailments on the Louisiana and Texas Lines of the Southern Pacific from 4.37 per million locomotive miles in 1917 to 13.57 in 1920, or 211 per cent, confirming the assertion that these lines were conspicuously neglected by the federal directors general and in many places were dangerous. Mr. Kruttschnitt also presented photographs of track and car conditions in 1920 after the return to the owners.

"The low total number of derailments due to defective equipment and permanent way in 1917, 1916 and 1915, both

on all Class 1 roads and on Southern Pacific Lines in Texas and Louisiana, and the rapid decline from the peaks of 1920—all based on the records of the Interstate Commerce Commission—afford the strongest possible confirmation of the repeated assertions of the carriers," he said, "that the roads and their equipment were in safe and satisfactory physical condition when taken over by the government at the end of 1917, disprove conclusively Mr. McAdoo's assertion that the railroads were broken down physical wrecks, and show clearly by the great increase in accidents that depreciation under federal control was rapid and excessive and maintenance as to both track and equipment was neglected to such an extent as to be absolutely unsafe and in a condition (convincingly proved by government statistics) far below that required by the president's promise and the contracts entered into with the carriers."

As to Traffic Volume

"Mr. McAdoo asserts that the handling of the greatest volume of traffic on record in 1920 disproves the charges of the carriers that their properties were returned in March, 1920, in deplorable condition—much worse physically than when turned over in January, 1918. We assert with equal force that handling by the federal administration the largest volume of tonnage in 1918 ever moved up to that time disproves Mr. McAdoo's charge that the railroads were broken down and the equipment in wretched condition when he took them over."

The truth is, the federal administration *worked* the track and equipment received on January 1, 1918, so as to make them handle the record-breaking traffic of 1918, but did so at the expense of their physical condition; as shown by records, the percentage of bad-order freight cars rose from 5.1 per cent in January, 1918, to 7.0 per cent in March, 1920—an increase of 37 per cent. Private management pursued the same course to handle the record traffic of 1920 and the number of bad-order freight cars arose from 7.0 per cent in March, 1920, to 8.7 per cent in January, 1921—an increase of 24 per cent. In both cases the work was forced by high pressure out of the properties at the expense of its condition *with this vital difference, however*: that the federal administration got the increased service out of equipment by increasing the number of bad orders by 37 per cent *at the expense of the owners*, notwithstanding it was obligated by contract and the promise of the president, to bear it; whereas the expense of repairing the 24 per cent increase of bad-orders after the restoration of private control fell on the owners, where it belonged. The further increase of bad-orders from 8.7 per cent, January 1, 1921, to 15.4 per cent in September, 1921, being due to neglect in restoring cars to the owning lines from all over the United States, the expense of relocation and making good the deterioration during relocation, although incurred long after the return to private operation, is directly chargeable to the Railroad Administration, which caused it, and in common justice should be paid by it. All admit it was necessary as a war measure to use cars regardless of ownership, but it was grossly negligent and a flagrant breach of contract *not to keep them in repair*.

The government received about 45.5 per cent of home cars on home roads and returned only 21.9 per cent of home cars on home roads, leaving the owners to get the balance back at their own expense as best they could.

The record-breaking traffic of 1917, 1918 and 1920 was handled with substantially the same number of equipment

units provided by private management, the number of locomotives alone showing a slight increase. While the data relates to equipment solely, the same is true as to general improvements: they were the same substantially in all the years covered by the statement.

Notwithstanding Mr. McAdoo asserts in many places the inadequacy of equipment and its wretched condition, the average number of locomotives and freight and passenger cars ordered in the years 1918 and 1919 of federal control, when Mr. McAdoo says the need was most pressing, was the smallest of any two years in railroad history.

Citing the maintenance instructions issued by the Railroad Administration in 1919, Mr. Kruttschnitt said: "The condition of the railroads when received by the government was the result of maintenance policies followed before and during the test period ended June 30, 1917, when maintenance policies could not be influenced by knowledge that the government would take the properties over, therefore, the owners are clear of suspicion of having unduly highly maintained their properties in order to impose on the government a higher standard than called for by normal conditions. It was no concern of the federal administration whether an unusual amount of replacement or repair work of a character not usually spread evenly from year to year had been done during the test period; nor was it any concern of the government, under the President's pledge, whether the condition of the carriers had been sub-normal prior to 1915 and had been restored to normal in the test period; nor was it its concern whether in the test years improvement programs had been followed which involved unusual charges to operation; nor whether heavy retirements were made during the test period that might not have been found necessary during government control; nor whether unusual expenditures were incurred in the test period incidental to raising the standard or character of a railroad from a lower to a higher class; but it was the sole concern of the government and its bounden duty under the solemn promise of the President and under the contracts made with the director general to return the properties in the condition in which it received them on January 1, 1918. Recalling how the railroads were taken over by the President over night, it is evident that the condition of the railroads on January 1, 1918, cannot remotely be attributed to the intention of the carriers to make their roads appear much better than they normally were for the purpose of obliging the government to maintain them to an abnormally high standard.

Citing the Louisiana and Texas lines of the Southern Pacific system specifically, Mr. Kruttschnitt charged that tie replacement made during federal control on those lines were inadequate both in quantity and quality and that "hundreds of thousands of low grade ties were used in violation of the President's promise and contract obligation." He said Mr. McAdoo had sought to prove the incorrectness of these statements by giving replacement figures for the entire Southern Pacific system.

"The damage to the railroad property," he said, "is continuing until the inferior ties are removed but as long as they remain in the tracks the maintenance expense is increased largely over what it should be under the company's specifications."

"Out of every dollar of expense for 1920 for the railroads of the country, 82½ cents was paid out at prices directly fixed by the government itself," he said. "Materials and supplies used during the last 10 months of 1920 costing 15 cents out of every dollar were purchased by the carriers at prices fixed by general market conditions beyond their power to control. In other words prices fixed by the government or by market conditions covered 97½ cents out of every dollar of operating expenses."

The laudable effects of government practices necessarily continued after the return of the properties and notwith-

standing strenuous efforts to correct them are still responsible for the unsatisfactory condition of the railroads.

"The effect of government control of labor costs which began with the passage of the Adamson Act in 1916 has been to yield to labor under the operation of Class I railroads of the United States \$3,698,216,000 and to the railroads \$21,661,782 net operating income in 1920 or in the proportion of over 170 times as much to labor as to the railroads.

"We admit that increases in the wages of railroad employees were necessary to keep them on a parity with wages in outside industries due to war conditions, but we deny emphatically that railroad employees were underpaid to such an extent when the government took control as asserted by Messrs. McAdoo and Hines as to justify the unreasonable increases which they authorized."

U. S. R. A. Did Not Return Railroads

Self-Sustaining, Says Senator Cummins

"I think the most serious complaint that can be made of the Railroad Administration lies in the fact that it did not return the railroads to their owners self-sustaining," said Senator Cummins at the conclusion today of the testimony. "It ought to have established rates before the railroads were returned that would make the railroads reasonably self-sustaining. The failure to do that not only imposed upon the railroads a most unpopular, and I think unnecessary duty, or at least necessity, but it imposed upon Congress the requirement to make the guarantee running from March 1, 1920 to September 1, 1920.

"If the Railroad Administration—in anticipation of the increase in wages which it knew would come about, and in consideration of the existing fact that the rates were not even then maintaining the properties—had increased the rates as it should have done, the railroads at least would not have inherited that very disagreeable performance and the guarantee that the government has to bear now for the six months would not have drawn upon the Treasury as it had drawn and as it must continue to draw.

"I feel that there is a very just complaint against the Railroad Administration in that regard, far beyond any other controversy that it may have with the railroads. It was just as much the duty of the government to return these roads with rates that would sustain them in their operations as it was its duty to return them in as good condition physically as it took them. And that is a matter that has not been sufficiently understood by the people of the country. I think when it is fully understood, that very much of the criticism that has fallen upon the railroads since that time will disappear."

"I had the same thing in mind when I called attention to the fact that they increased expenses and made no attempt to increase the revenues during the first five months of 1918," said Senator Pomerene of Ohio.

"The roads made repeated requests on Director General Hines in the last half of 1919 to increase the rates," said Mr. Kruttschnitt, "but he kept saying, 'wait, wait, things will probably improve; prices may fall and you will be better off,' and it was finally delayed until it was not done at all."

Lauck Praises Mechanical and Operating Officers

Responsibility for the "present plight" of the railroads was placed upon the financial rather than the operating end of railroad management by W. J. Lauck, who testified on April 17 before the Senate committee on interstate commerce as the consulting economist of the Railway Employees' Department of the American Federation of Labor.

"Their properties are depleted," said Mr. Lauck, "their efficiency is seriously impaired, their credit is undermined, their profits are dwindling, it is hopeless to ask for higher rates, because the traffic cannot stand higher rates, and, caught in this impasse, they find themselves between the horns of

government control or bankruptcy. And this situation has largely arisen because the railroads have been dominated by men who knew how to manipulate stocks and bonds, rather than by men who knew how to carry on the service of transportation on the basis of a maximum of load for a minimum of energy."

"We realize that freight and passenger charges may be too high," said Mr. Lauck, "but we do not concede that it arises from wages paid to railway employees. We acknowledge that labor costs of the operation of the railroads are excessive, but this is due to the delinquencies of railway management and policy, and not to unreasonable wages, working standards, or inefficiencies of railway employees. We will even admit that too much has been paid for labor as a whole, and that, while the individual employee's rates of pay have not been sufficient, labor costs of operation have been too great. This has not been due, however, to any lack of productive efficiency of railway workers, but to the inadequate and impaired facilities of the railroads which are acknowledged even by railroad officials to be a generation behind the commercial and industrial requirements of the nation."

Mr. Lauck explained that he did not bring charges of wastefulness and extravagance against present railway executives, who, he said, are struggling under a handicap they cannot overcome, but against those who made and directed the financial policy of the railroads. The operating and mechanical officers, he said, are "geniuses who have efficiently, honestly and unselfishly devoted themselves to the service, and whom," he said, "we have accorded unstinted praise."

Failure to set aside a sufficient percentage of their earnings to cover depreciation was one of the counts in Mr. Lauck's indictment. He submitted a table purporting to show that in the eight years from 1911 to 1918 the depreciation fund of the railroads was \$2,155,500,000 less than it should have been and said that if this money had been set aside and expended properly an annual saving of approximately \$800,000,000 in operating expenses would have been effected.

Mr. Lauck said the railroad executives look upon labor simply as an item of operating costs and the first to be attacked when economies and retrenchment are necessary. The workers, on the other hand, regard labor as essentially a human factor in the operation of the roads and insist that wage reductions should not be considered until every other measure has been taken to reduce operating costs.

A Living Wage Basis

Mr. Lauck went into a detailed discussion of the wages of railway workers and said that they should be determined upon a living wage basis, with differentials for skill, experience, hazards of employment and productive efficiency. Senator Cummins said he agreed with him in this; that a government body could adopt no lesser standard as "just and reasonable." To arrive at what constitutes a living wage Mr. Lauck cited the various so-called "comfort budgets" and said that on the basis of living costs in May, 1921, they averaged \$1,970. As against this he computed the average annual compensation of railway workers in 1920, as corrected by deducting overtime on the basis of figures presented by the railroads, to have been \$1,603.36, further reduced to \$1,475.89 by the decision of the Railroad Labor Board effective July 1, 1921.

Large numbers of railroad workers fall far short of any such earnings, however, according to Mr. Lauck. Section men to the number of 275,352 can only earn \$925.32 annually under the present scale, if they work full time; construction gang and work train employees, numbering 28,760, can average but \$970.08 annually; other unskilled labor numbering 108,977 can average but \$1,000.68, and 22,572 crossing flagmen and gatemen can earn only \$810.84.

"Here," said Mr. Lauck, "is a total of over 430,000 em-

ployees, about one-quarter of all railroad employees, whose average earnings run between \$810 and \$1,000 per year, and for the largest group—section men—average only \$925 per year. Moreover, the earning of these amounts per year depends on absolutely continuous employment.

Instead of seeking further to reduce the wages of men now inadequately paid Mr. Lauck said the railroad executives should at least first make some effort to economize on their outlays for fuel, supplies and equipment, a conservative estimate of the possible annual saving in that direction being one billion dollars, on the basis of 1920 prices.

"There never has been and is not now any public protest on the part of railway management against excessive prices for steel rails, coal, or other materials and supplies," said Mr. Lauck. "Although in 1920 their fuel bill at prices then prevailing was \$700,000,000, and their cost of supplies and materials was \$2,000,000,000, there was no protest. The indefensible prices of materials, fuel and supplies were accepted, but a most determined drive was made in 1921, and has been growing in strength ever since, to reduce railroad wages.

"This seemingly inconsistent attitude on the part of the railroad executives would be inexplicable were it not for the results of official and private investigations as to the control of credit in this country, and the relations between large producers of fuel, iron and steel and other basic railroad materials, and certain groups of private banking houses and financial institutions. It has been shown that the control of railroads, manufacturing and mining finance and credit centers in a small inner group of New York bankers and financiers of which the banking house of J. P. Morgan & Co. is the apex. This group controls and directs the Association of Railway Executives and through the members of this organization gives expression to its public policies and propaganda."

Billions Needed, Says Lauck

Additional capital to the amount of at least four billions of dollars must be provided for the railroads of the United States if the nation's transportation problem is to be solved, according to Mr. Lauck. "The transportation industry requires a major operation and further palliatives will only accentuate its deplorable conditions," he said. "It should be financed and placed on a proper basis. In order to develop co-operation between employees and management, practical measures should be formulated to give to the railway workers proper participation in all branches of management. Friction and controversy between management and employees should be supplanted by team work and united effort. The experience of the Railroad Administration furnishes concrete demonstration of what splendid achievements can be obtained from such a policy. If our fundamental suggestions are accepted by the committee we are sure that better and more efficient transportation facilities will be provided, operating costs greatly reduced, freight and passenger rates decreased with net gains in operating income, and a larger measure of peace and co-operative effort between management and employees will prevail in the transportation industry."

In estimating the new capital outlays required by the railroads Mr. Lauck divided the amounts under two headings, (1) The capital necessary to bring the properties up to a par standard, which should have been taken care of by depreciation reserves, and (2) The capital needed to meet increased traffic requirements. Under the first heading the items were as follows: Locomotives, \$500,000,000; track and yard facilities, \$224,200,000; bridges and grade revisions, \$26,700,000; signal equipment, \$82,000,000; freight and passenger stations, \$300,000,000; miscellaneous properties, \$25,000,000; total, \$1,822,900,000.

Under the second heading the items were: 5,000 new locomotives, \$265,000,000; 300,000 new freight cars and 6,000

new passenger cars, \$882,000,000; locomotive terminals and repair shops, \$100,000,000; 15,000 miles of new main track, \$600,000,000; signal equipment, \$61,500,000; re-location of terminals, \$200,000,000; miscellaneous properties, \$100,000,000; total, \$2,748,500,000.

The grand total of all items of estimated new capital requirements was \$4,571,400,000.

"We do not agree with the railroad executives that this requisite capital is practically unobtainable," said Mr. Lauck. "We believe that it is the duty of the banking group which controls the railroads to produce this required credit or capital, that it is practically possible for them to do so, and that they should be required to do so as a condition of their continued control of the transportation system. "We estimate that if all possible improvements and economies were adopted, and if all the necessary capital and credit were available to the railroads to remedy their inadequate facilities, and to install economy devices and methods, an annual savings in operating costs could be made amounting to more than two billions of dollars, or, to be exact, \$2,026,000,000, or approximately 40 per cent of the operating expenses of Class One railroads for 1920. Of this amount of possible annual savings, approximately \$1,137,508,000 is dependent on new capital outlays. The remainder is based on changes in operating methods or on the introduction of new processes and methods and on unified control.

"The immense saving which could be realized from a conservative plan for properly financing the railroads (\$1,137,508,000) would alone reduce total operating expenses at least one-fourth, and constitutes more than one-third of the total outlay for railroad labor. In other words, it would be equivalent to the savings in operating costs if the earnings of railroad employees were further reduced approximately 33½ per cent. It would be an amount sufficient to pay the 6 per cent guarantee on the \$18,900,000 valuation placed on the railroads by the Interstate Commerce Commission.

"If a broad, scientific and honest policy were outlined by the banking interests who control the railroads, setting forth what savings might be made and what returns might be expected, there can be no doubt that the required amount of new capital would be quickly absorbed by the investing public. So far the bankers have refused to adopt this policy because there is a more profitable field immediately for new capital in other branches of industry, and it is easier and more profitable to take advantage of this and at the same time deflate general labor costs and require the employees and the public ultimately to pay the costs of railroad rehabilitation.

"If the banking combine which controls the railroads will not accept this new policy as a condition of the continuance of their control, then adequate railroad financing should be done under public auspices."

Objections to Contracting Out Work

Mr. Lauck also referred to the petition which he had filed with the Interstate Commerce Commission as counsel for the International Association of Machinists, asking it to prohibit railroads from contracting out repair and maintenance work without its permission. He said that many of the railroads are following the practice of telling their men that unless they will accept lower wages they will "farm" the work out and that this practice is running through all branches of railroad labor except transportation service. If allowed to continue, he said, it will circulate the transportation act and deprive the labor board of jurisdiction over a million and a half men. He said that while the Interstate Commerce Commission had practically substantiated the charges made by the unions regarding the locomotive repair contracts, the commission had done nothing about it except express an opinion, but if the commission should not have authority to issue such orders,

the only way to prevent the practice would be to amend the law to provide specifically that the men engaged on railroad work of this kind are under the jurisdiction of the labor board even if the work is done outside. But, he said, legal opinion seems to be that if locomotives are taken out of service to be repaired they are temporarily not in interstate commerce and, therefore, the men engaged on the work would not be in interstate commerce. Mr. Lauck said that the labor board should not take judicial notice of a reduction of wages made by the United States Steel Corporation, for instance, because it was purely arbitrary and should not be a standard to be followed by a governmental body. He said the railroad representatives would not concede that they are asking for less than a living wage, but they are under great pressure. He also said that the law does not provide specific standards for determining railroad wages, but that if the board does not take the position that it requires an adequate living wage it will become merely a barometer for registering supply and demand. He said the board had accepted the principle of an adequate living wage, but had not yet given it practical effect.

Nature of Mr. Lauck's Testimony

Mr. Lauck's testimony continued for three mornings and consisted largely of repetition of testimony previously given before the Railroad Labor Board. Most of the time only Chairman Cummins and Senator La Follette of the committee were present and on Wednesday Senator La Follette was the only member of the committee present. At the conclusion of Mr. Lauck's statement, Senator La Follette asked him to file for the record a large number of detailed exhibits, to which he had referred, but which he had said were too voluminous to put into the record, and practically gave the witness permission to file such statistical material as he cared to. Mr. Anderson was also given permission to read into the record a large amount of detailed testimony that had been presented before the labor board.

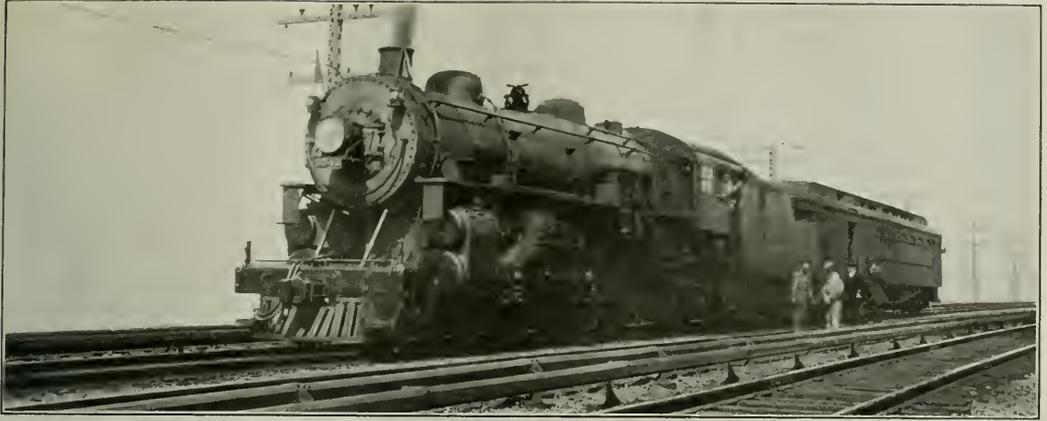

J. F. Anderson, vice-president of the International Association of Machinists, preceded Mr. Lauck, urging that the law be amended to make the formation of boards of adjustment mandatory instead of optional. He said there should be four national boards for the four principal groups or classes of railway employees, saying there would be danger with regional boards of confusion of decisions. He also urged that the law should be changed to prevent railroads from contracting out repair work

The Train Now Being Used in the New York Central to Test the Train Control System

The Sprague System of Auxiliary Train Control

Apparatus Is Now Undergoing a Series of Daily Tests on a Section of New York Central Track

THE SPRAGUE SYSTEM of auxiliary train control, in the words of Frank J. Sprague, who is responsible for its development, is not an automaton in the place of an engineman, but an auxiliary system of train control which, while fully protecting the train and re-inforcing the engi-

the block, and there is a differential reset magnet near the exit end.

The brake-application magnets are of the permanent magnet type with neutralizing coils wound on the two ends or pole pieces, while the reset is simply an electro magnet. All of the magnets are controlled by the track circuit relay of the section in advance, the brake applying magnets being normally alive and the reset normally dead.

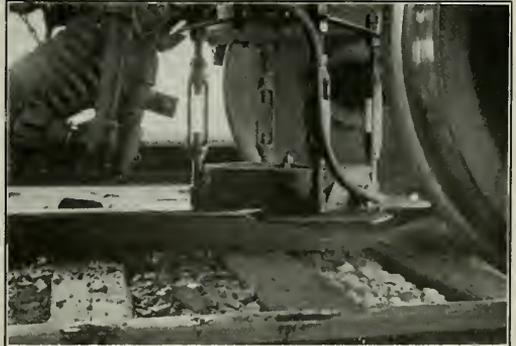

When a train enters this approach block, and the block

The Two Pole Pieces of a Brake Application Magnet. The Permanent Magnet Which Connects Them is Underneath the Ballast

neer's intelligence, leaves him practically undisturbed in the handling of his train so long as he performs his duty.

All apparatus on the track, as well as on the locomotive, is operated on the normal danger plan. Assuming a train

The Receiver Under the Forward End of the Tender

A Reset Magnet

ahead is clear, the application magnets are made inactive by the neutralizing coils, thus permitting the magnetically responsive receiver on the locomotive to pass through the space over the magnet poles without being affected. If the advance block is not clear then the application magnets will remain normal, or active, and the magnetic receiver on the locomotive is subject to their influence. The reset magnet then is inert.

The track magnets are enclosed for protection in sealed

in the block section approaching the block to be protected (which may or may not be occupied by a preceding train) it encounters two normal-danger, brake-application magnets, one near the entrance end and one at the critical point in

manganese steel casings which are supported in the ballast, between adjacent ties, by extension arms resting upon and secured to the ties. The application and reset magnets are placed at right angles to each other in the center of the track, the application magnets being parallel to the ties, and the reset magnets parallel to the rails. This insures proper registration and operation of the apparatus on the locomotive regardless of the direction of motion or heading of the locomotive. The faces of the magnet poles are between four and five inches lower than the tops of the running rails.

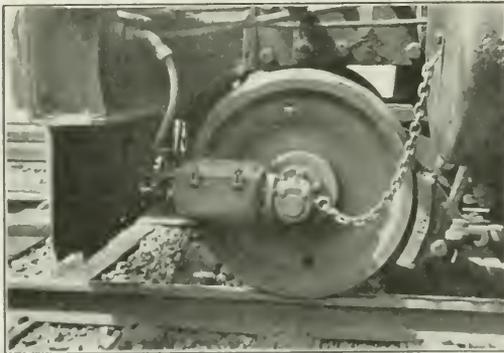

Locomotive Equipment

A double receiver is hung under the forward end of the tender on adjustable supports. This receiver is composed of two pairs of flat iron collector plates attached to the bottom of a non-magnetic box. These plates are from three to four inches higher than the tops of the running rails, thus making the distance from the track magnet to the receiver about seven or eight inches.

The magnetic flux from the track magnet is carried, through movable iron cores within the receiver box, to a floating receiver in which this flux is concentrated on one or the other of two moving armatures of small mass. The application magnets affect one armature while the reset magnets affect the other. The tops of the pole pieces are eight inches in diameter, and when a locomotive is running at a high speed the receiver will pass over the track magnet in less than 1/100th of a second. During this time the small armature in the receiver breaks contact momentarily.

RELAYS

The momentary breaking of contact by the armature in the receiver is translated into action by relays mounted in a box located on the running board. There are three relays, operating self-centering pressure contacts in definite se-

The Speed Control Mechanism

quence. These relays will respond to impulses as short as 1/1000th of a second. They are sealed and cushioned, and it is claimed they are unaffected by vibration.

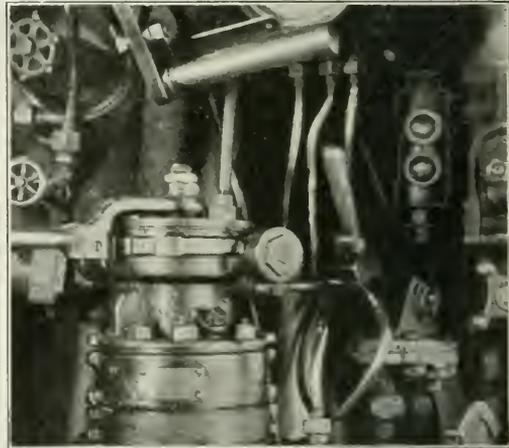

VALVE ASSEMBLY

The impulses picked up by the receiver and passed on by the relays, result in influencing the action of two pilot control valves located underneath the cab on the fireman's side. The function of these control valves is to establish an opening to atmosphere from one or another of the piston chambers which control the movement of a ported slide valve. The operation of this valve will, as may be determined by a selector valve, effect any required combination of measured and limited light and heavy service and emergency brake applications under speed control, with or without enforced

stop if the automatic brakes come on, or with the privilege of proceeding under limited speed until released. The operation of this valve assembly may cover any one of a number of different possibilities, depending upon the conditions of train make-up and of operation met in practice. Under usual conditions of operation, caution and stop signals will cause two brake applications, called primary and secondary. The character of these two applications is governed by the selector valve. Primary and secondary braking may be used in any combination, for example as follows: 10-lb. and 25-lb. reduction; 25-lb. reduction and emergency application; nothing and 25 lb., and so on. The valve assembly is applicable to any kind of standard brake equipment.

SPEED CONTROL MECHANISM

The speed control mechanism is carried on the front end of the locomotive, one end of it being supported on an ex-

The Special Head for the Engineman's Brake Valve and One Pair of Signal Lamps

tension of the forward truck axle. The other end has a spring-suspended nose support. The drive is by enclosed bevel gearing running in oil, while the governor assembly is carried in a dry chamber in which there is a centrifugal governor, a small air cylinder and fixed and movable end-contact steel brushes.

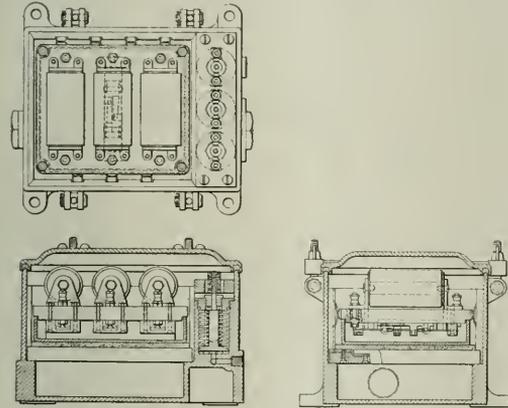

A single flexible air hose and a flexible electric cable, terminating in a standard coupling, are attached to the free end of the speed control mechanism. The air hose is connected to the engine brake system. The whole constitutes a combination of a speed-responsive device (not an odometer) and a brake-responsive device, by means of which the necessary co-ordination may be automatically secured to prevent unnecessary operation of automatic braking.

The remainder of the equipment on the locomotive consists of a small storage battery and the headlight generator for supplying the storage battery; a manually and power-operated engineer's valve interchangeable with the standard valve; and two pairs of signal lamps, one on each side of the cab. The engineer's valve is operated by air-oil pressure when a track impulse is received. This pressure is used to move the handle of the valve to lap position, the actual braking, other than manual, being accomplished by the automatic valves under the left side of the cab. The green lights show when the equipment is in running order and the block ahead is clear, and the yellow ones when the relation between speed and manual braking makes it safe to proceed under control.

Operation

On entrance to every block the cab signals indicate whether or not the next block in advance is occupied. If the signal at the entrance of the advance block is at caution, then, on passing over a live distant magnet, the green light disappears, an audible warning is given and a service brake application is initiated, this being light or heavy, depending upon how the selector valve is set. The yellow proceed light appears if braking is sufficient to forestall secondary braking at the home magnet.

The engineer's brake handle will be moved to lap position, but it can then, with effort, be pushed back to the re-

Plan and Sections of the Relays and Relay Case

lease position, against the brake-head operating pressure on the motor pistons, which pressure will then be promptly released if the train is not running above the predetermined caution entrance speed. If the engineer is attending to his duty he may, therefore, forestall actual braking of the train or he may promptly release his brakes in response to a change in roadside signal indications. The automatic service brake application may be augmented or diminished manually at will.

If the selector valve has been set for no primary brake application, as may be required in the movement of slow freights, then only an alarm will be given if the speed is under control.

If the engineer, while approaching the home magnet, makes a service brake application, the yellow light will appear in the cab whenever there is sufficient braking to insure reducing the speed to "control" speed in a suitable distance after passing a live home magnet without automatic secondary braking.

If the danger condition persists when passing the home magnet a second service braking will be initiated, which may likewise be released by the engineer, but conditions are established for an immediate or subsequent secondary brake application, according to the speed and braking conditions which then or thereafter obtain within the block.

If when getting the second impulse at a live home magnet the locomotive is running without braking and below the determined control speed, say 15 or 20 miles an hour, as indicated by the yellow lamp, and so continues until reaching the reset magnet, there will be no secondary brake application, but if the speed is increased and goes above the control speed before passing an active reset magnet, the brakes will be applied.

If the engine when passing a live home magnet is running

below the predetermined speed limit, say 45 or 50 miles an hour, and the train as a whole is being properly braked under a manual or automatic service application, the secondary braking will not take place; but if the brakes are released before reaching the control speed, then a heavy service or emergency braking will occur, depending upon the setting of the selector valve. The secondary brake cannot be released, however, until it has completed its function, no matter how short the initial impulse or whatever the engineer attempts to do with his brake handle.

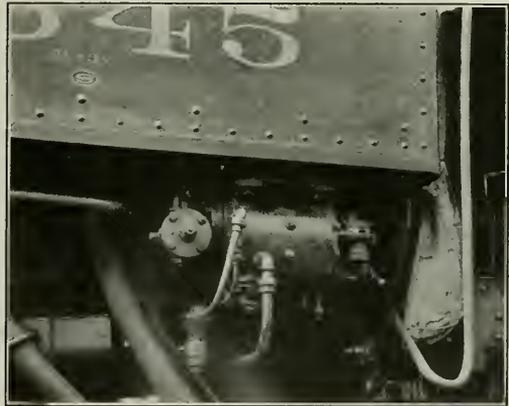

When the speed has been reduced to "control," the brakes may be released, but if the speed is later increased above the low limit before passing an active reset magnet, the secondary or emergency braking will again take place.

If the engine when passing a live home magnet is running above a predetermined high speed limit then there will be an uncontrolled secondary braking which cannot be released until its function has been completed.

When running above a predetermined allowed maximum speed on a clear track, a service brake will come on, regardless of the roadside signal indication, and the train speed must be pulled down to a safe caution block entrance speed to have the pressure on the engineer's brake handle released before passing a reset magnet.

If under these conditions a train, having had a maximum speed brake impulse and not having been pulled down to a suitable speed, should enter a caution block, then it will get a secondary braking at the first application magnet.

If under any conditions the secondary brake has come on, the predetermined set of the selector valve will determine

The Valve Assembly

whether the train can proceed under control on the engineer's initiative alone, or whether the train must first be brought to a stop and require the co-operation of the engineer and fireman outside of the cab to release the brakes.

When passing over a live reset magnet the engine relays will be restored to normal position, ready for response to the next live application magnet, no matter whether there have been one or two application impulses received, and if none has been received the reset impulse will have no effect on the apparatus. The reset only restores the control relays to normal; it has no effect on the brakes.

If, however, when passing the reset magnet it is not energized by the clearing of the home signal, the reset will not act and the allowed speed will be held down to the control limit, but the train may proceed into and through the next block under control.

If the conductor unlocks a control switch he can tem-

porarily give to the engineer and fireman the privilege of joint action to establish an early reset, if and only when the proceed cab light is in evidence.

In interlocked or other special territory an additional reset magnet may be installed to permit earlier acceleration in case the signals go to clear, and provision can also be made, subject to the positive control of the train conductor, so that simultaneous co-ordinated action by an engineer and his fireman can reset the relays to normal.

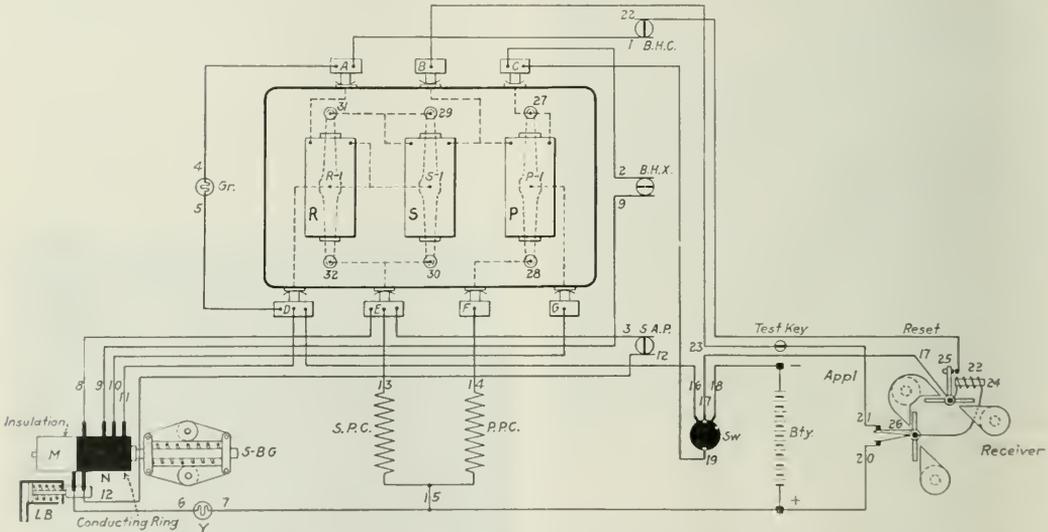

The response to the service brake impulses, and to the secondary brake impulses when exceeding the speed limits, as well as to the resets, is exceedingly rapid, and both brake controls are operated on closed circuits.

Sections under speed control, as for example, dangerous curves or bridge or crossing approaches, may be treated as permanent signal blocks, each being provided with one or more permanent application magnets to initiate service braking at the proper point if the speed is excessive, or later if it is augmented, and a permanent reset magnet after the

The re-closing of contact 21 immediately energizes relay S and picks up armature S-1.

The application of pressure to the engineer's brake head puts pressure on the BHC switch, opens the reset circuit, breaks green lamp Gr, de-energizes reset relay R, drops armature R-1 and breaks contacts 31 and 32, relay S remaining energized through stick contact 29. There is, therefore, a condition established in which, instead of P, S and R being all active, as in normal running, P and R are opened and S is still alive.

The movement of the brake head pistons opens BHX to atmosphere and closes circuit from relay P through speed brush 9 and cylinder contact N to negative line through brush 11 and switch Sw. This response is permissible only when cylinder contact N, which is normally shifted to the left with increase of speed, is moved sufficiently far to the right to permit brush 9 to make contact with cylinder N. Under these conditions relay P picks up and there is now established these conditions: P and S active and R dead.

A Complete Diagram of the Electrical Circuits and Connections on the Locomotive

- Bty Batteries.
- SW Main switch.
- P, S and R Primary, secondary and reset relays.
- PPC and SPC Primary and secondary pilot valve coils.
- MN Speed-brake controller.
- 26, 25 Application and reset armatures.

- Gr and Y.L. Green and yellow lights.
- BHC and SAP Contacts operated by pressure in brake head cylinder and straight air pipe.
- BHX Contact operated by absence of pressure in brake head exhaust.

curve is passed. Portable magnets may also be used for wayside emergency conditions control.

The brakes once applied, the actuating pressure on the brake valve handle persists until the speed is reduced to a predetermined limit, which is individual to each class of locomotive.

All of the electrical connections in the apparatus are shown in the diagram.

FIRST IMPULSE

When application contact 21 is momentarily opened, relays P and S are de-energized and drop their armatures P-1 and S-1. The dropping of P-1 opens stick contact 27 and the circuit of the primary pilot valve coil PPC, with resultant primary brake application. The dropping of armature S-1, while opening the stick contact 29, does not then break circuit of relay S because the additional stick contact 21, controlled by armature R-1 of reset R, is still closed.

BHC being meanwhile closed on release of brake head pressure, relay contact 22, however, being left open.

SECOND IMPULSE

On second impulse from the track the contact 21 is again momentarily opened and P and S again de-energized, but this time (contact 31 at reset relay R being now open) the dropping of armature S-1 opens the stick contact 29 of relay S, and this relay therefore remains dead, although contact 21 has closed; relay P can be restored as before. The condition of the relays now is: P alive and S and R dead, and two of the four circuits, 8-3-30 and 32, in parallel and connected through 13 to the secondary pilot valve SPC, are opened, leaving the control of SPC through brush 8, or movable brush 12 and the switch operated by SAP.

Brush 12 and brush 6, connected to proceed light Y, are moved to the left by pressure in the locomotive brake system in the same direction as NM is moved by the centrifugal

governor. If SAP is opened then the final control is on brush 8, but if SAP is closed the control is shifted to brush 12, that is, to a co-ordinated position depending upon speed and braking. Contact 6 breaks before contact 12, and hence the yellow light Y becomes a warning and proceed light.

RESET IMPULSE

On receiving a reset impulse, contact 22 is closed by armature 25 and locked closed by holding coil 24, which is a part of the receiver. Relay R is, therefore, made active; contacts 31 and 32 are closed by R-1 and green lamp Gr is lighted, while S is likewise re-energized and through contact 31 all circuits, relays and pilot valve coils are restored to normal condition. If only one application impulse has been received, the reset contact on the receiver simply restores R and Gr to an active condition, S already being energized.

Tests are now being carried on for seven hours a day, six days a week, on a section of the New York Central, between Ossining and Tarrytown, covering six signal indications on eastbound track No. 2. This is about 30 miles from New York. All other trains are temporarily excluded from this section and several hundred recording operations, under varying conditions, are made each week. Electric locomotives and multiple unit trains which take direct current from a third rail, with a traffic rail return, are operated on this section of the road. The automatic block signal system is normal clear and the rail circuits are alternating current. The normal danger track magnets are supplied from storage batteries located along the right-of-way maintained by a trickling charge from the alternating current power lines.

This train control system was developed by the Sprague Safety Control & Signal Corporation, 421 Canal street, N. Y.

The Relation of Freight Rates to Agriculture

Chairman Anderson of Joint Commission of Agriculture Inquiry Forecasts Commission's Report

WASHINGTON, D. C.

CHAIRMAN ANDERSON of the Congressional Joint Commission of Agriculture Inquiry has given out a forecast of the section of the forthcoming report on transportation dealing with the economic relation of transportation to agriculture and industry.

"The joint commission has decided to report to Congress," said Chairman Anderson, "that the transportation rates on many commodities, more especially the products of agriculture, bear a disproportionate relation to the price of such commodities; that immediate reductions in transportation rates should be first applied to farm products and other basic commodities; that reductions in rates upon the articles of higher value, or upon tonnage moving upon so-called 'class rates,' are not warranted while the rates upon agricultural products and other basic commodities remain at their existing levels; that greater consideration should be given in the future by public rate-making authorities and by the railroads in the making of transportation rates to the relative value of commodities and existing and prospective economic conditions.

"It also appears from our inquiry that the pyramided per cent advances in rates authorized by the Interstate Commerce Commission or made by the United States Railroad Administration caused the dislocation of long standing rate relationships between rates upon agricultural and industrial products and between competitive enterprises and competitive sections of the country; also, that the railroads and public rate-making bodies should seek to readjust rates so as to preserve as far as practicable the general relationship existing prior to 1918 with due regard to present and future economic conditions.

"We have found that freight rates on perishables normally take about one-third of the selling price and frequently two-thirds, and in periods of low prices and light demands, they constitute a heavy burden upon this traffic. It is manifest from the evidence we have secured that the purchaser and the farmer are dependent to a marked degree upon the transportation charges of farm products. Regardless of the distance involved these transportation charges must enable both the carrier and the producer to realize a profit from his operations.

"The report will show that in October, 1921, farm products were at an index figure of 102 and railway rates at 169, and that in this period of falling prices for farm products the increased freight charges made the farmer feel more keenly

the relationship of freight charges to the price obtained for his product.

"In the opinion of the commission as a whole," Chairman Anderson said, "both the producers and consumers of grain and its products should have the following advantages of transportation:

- (a) Competitive avenues of distribution through which the largest number of consumers can reasonably be reached;
- (b) Through rates from points of production to points of final consumption through two or more competitive primary grain markets;
- (c) General application of the Interstate Commerce Commission's recent conclusion applying lower rates on coarse grain than on wheat, except where rates are affected by water competition or other factors outside the jurisdiction of that Commission;
- (d) Adequate and suitable box car equipment.

"Hay," the commission will declare, "must have a reduction in both rates and sales margins before there can be a resumption of normal shipments and in order that the producer may get a reasonable share of the final sales price.

"We are convinced," said the chairman, "that freight rates are still too high to permit the production and marketing of hay at a profit to the producer, and further reductions are essential before the production and marketing of hay will be upon a normal basis. The price of hay on the farm is now at or below the pre-war level, and if that price is maintained both freight rates and marketing costs must likewise be readjusted to a similar level."

The commission has found that livestock shows marked fluctuations in daily, weekly, monthly, and yearly shipments, and it urges that railroads, shippers, and stock yards should co-operate to bring about a more even distribution of shipments at the livestock markets. Increased marketing costs, including freight, commission, and other charges are found to have borne with the greatest severity upon the livestock producer farthest from market.

"Farm prices of livestock in 1921," Chairman Anderson said, "were below the 1913 level. If higher prices cannot be realized, it is obviously necessary that all the cost in marketing and distribution must be stabilized at approximately the 1913 level. If, as now appears to be the case, prices of livestock are going to find their level somewhat higher than in 1913, freight, commission charges, feed, yardage, and other

costs may also find a level corresponding to that of the price of livestock."

Present freight rates have been found by the commission to be but a small percentage of the value of the cotton crop, but it says that they do add to the cotton planter's burden.

"Any increase in freight rates, therefore," said the chairman, "presses with undue severity upon the cotton producer because of the high cost per bale of cotton production. It is pertinent to call attention to the fact that the export of cotton has in the past been the principal factor in balancing the trade of the United States and that it is greatly to the interest of the whole country to have profitable production and large export of cotton continue."

Wool Producers' Low Returns

Figures in the report will show, Chairman Anderson says, that the difference between market prices for wool and the return to the producer plus freight is unduly large. In 1913 the spread varied from \$0.17 to \$5.74, and in 1920-21 from, low, \$3.54½, to, high, \$6.28½. The chairman said on this point: "It is difficult to believe that the cost of marketing increased in any such ratio. We believe that the price of wool to the producer has been depressed somewhat by the freight rates but primarily by disorderly and unscientific marketing." The steps taken toward co-operative grading and selling will help to bring the wool producer closer to the consumer.

In dairy products the commission has found that the freight rate has a varying influence upon the return to the producer and the price to the consumer. For the United States the weighted average freight rate on whole milk is probably less than one cent per quart. Since buttermaking changed from a farm industry to a factory production, the transportation charge has entered largely into the price of butter to the producer and consumer. The farmer's price for butter fat is obviously more largely influenced by fluctuations in market prices than by the freight rate. Cheese rates have been found to be on a very high level and out of alignment with rates on more valuable and more perishable commodities such as eggs or grapes.

"Aside from their direct application to the products of agriculture," said Mr. Anderson, "transportation charges have an indirect but important effect on agriculture through their relation to the cost and selling price of the basic commodities. We have gone into the subject from that angle and will be able to present some definite conclusions in our report.

"For example, fertilizer prices are now close to the pre-war basis except for the higher freight costs now prevailing. Material prices and costs of manufacture are almost back to normal, leaving the present freight costs almost entirely responsible for the difference between present cost of fertilizer and that which prevailed prior to the war.

Farm Implements

"We have found that the weighted average of farm implements factory price, exclusive of power of equipment and twine, shows that price to be 41 per cent above 1913; inclusive of power equipment and twine, these prices are now approximately 20 per cent above 1913. It would appear that the factory price of agricultural implements does not show price advances to such a marked degree as other commodities and that they are rapidly receding to a lower price level. In 1914 the transportation charge on agricultural implements was about 11 per cent of the selling price to the farmer, including the freight on raw material entering into the manufacture, and in 1921, same increased to 15 per cent. A reduction in freight rates on each basic commodity, such as pig iron, steel, coal, coke, and lumber, would assist in reducing the farmer's expense for farm implements."

The report will show that the farmers are the second largest consumers of steel, coming next to the railroads, and

purchasing annually about 30 per cent of the country's steel production. They are, therefore, intimately interested in the relationship of transportation cost to the sales price of steel. The freight element in a ton of steel is declared by iron and steel makers to be in excess of 41 per cent of the selling price of the finished article and still higher in the case of pig iron.

The farmer is similarly interested in coal freight charges, since he is directly or indirectly concerned in from 20 to 22 per cent of the annual consumption of bituminous coal. Mine prices, freight rates, sales margins on both bituminous and anthracite coal have very greatly increased since 1913. There has been practically no depression in this industry although prices were somewhat lower in 1921 than in 1920. The commission believes that reduction in mine prices, freight rates, and sales margins on coal, especially on bituminous coal, would probably be promptly reflected in improved business conditions.

As to Coal

With further reference to bituminous coal, Mr. Anderson said that the commission had reached these conclusions:

- (a) That the wages of the coal industry should be considered in the light of the prevailing economic conditions;
- (b) That the transportation charges should be adjusted with due regard to the prevailing conditions;
- (c) That items of immediate expense in handling should be reduced to the lowest possible minimum;
- (d) That duplication of any items of expense intermediate between producer and consumer should be eliminated where such expense can be avoided without unnecessary interference with the broad avenue of distribution now existing.

Directly or indirectly, the commission has found that the farmers consume 46 per cent of the country's lumber production, largely in the so-called lower grades, and on these grades the retailer now realizes on the long hauls more in his sales margin on the freight cost than upon the lumber's mill value.

"From the standpoint of the railways as a whole," Chairman Anderson said, "they could better afford to obtain the needed revenue from the lumber business by the assessment of relatively higher rates to apply to their short haul business in order to give needed relief to the long haul traffic and still maintain a total compensatory railroad revenue."

Oil Products

The price of gasoline and kerosene, of which farmers are large consumers, has been found to be influenced little or not at all by changes in freight rates. As to cement, which is in the same category, the commission has found that both freight rates and prices of this commodity should show the trend of price levels of other basic commodities. "When the freight rates are reduced," Mr. Anderson said, "such decrease should be reflected in the price to the consumer and not absorbed as profit by various other factors in the distribution system. We believe that the public constituted authorities might properly analyze retail price trends of this commodity in relationship to the level of rates established."

Canned goods prices have been found to be practically back to pre-war levels. The price and distribution of canned products is not materially affected by present freight rates, the freight rate bearing a relatively small ratio to the final sales price.

Freight rates on such articles as boots, shoes, dry goods, men's and women's clothing, in the commission's judgment, are not materially responsible for the price of these commodities. Where the freight rate is not absorbed by the merchant but is made a part of the cost basis upon which margins and profits are figured, it represents a small proportion of the final sales price.

B. R. & P. Ton-Mileage Reduced 53.92 Per Cent

Result of Sharp Decline in Traffic Is 1921 Deficit of \$965,508,
Which Equals 5.85 Per Cent on Stock

BITUMINOUS COAL makes up about two-thirds of the total tonnage of the Buffalo, Rochester & Pittsburgh. The tonnage of this commodity in normal years runs about 10,000,000 tons and the total tonnage of all commodities about 15,000,000. In 1921, the Buffalo, Rochester & Pittsburgh carried only 3,854,947 tons of bituminous and its total tonnage was only 7,503,909 tons. The result was a corporate surplus available for dividends shown in red—in other words, a deficit of \$965,508, or a return on capital stock figuring out at a loss of 5.85 per cent. These figures, compared with a net of \$2,295,049 in 1920, amounting to 13.91 per cent on the capital stock. The contrast between 1921 and 1920 is made all the more striking because 1920 was the best year in the company's history and 1921 the poorest for an extended period of time. The past year was the first in which the company experienced a deficit since 1894.

In 1920, the road was unusually fortunate. It did not succeed in doing anything at all spectacular during the last two months of federal control—January and February—nor did it shine particularly during the guaranty period. It did, however, do some rather remarkable work during the last four months of 1920 when it was operating on its own account. It then had the advantage of the increased rates effective in August and it had a heavy traffic movement which lasted well into December. It was its earnings for these four months which enabled the road to show the large corporate net which it did show for 1920—namely 13.91 per cent on the capital stock. The decline in traffic, when it did come, was extremely sharp. Its sharpness was evidenced in the figures for January and was accentuated in the following months. Thus in October, 1920, the net ton-miles, including both revenue and non-revenue freight, were 251,562; in November, 213,321; in December, 197,064; in January, 1921, the figure had dropped to but 115,072 and in February there was a further drop to the low figure of 85,276. Nor was there during 1921 any sign of recovery. The best month in 1921 was October; in that month the net ton-miles totaled only 122,708.

The decline in traffic on the Class I railroads as a whole from 1920 to 1921 was 23.3 per cent. The Buffalo, Rochester & Pittsburgh, however, suffered a loss of 49.78 per cent in revenue tonnage and of 53.92 per cent in revenue ton-miles.

With a decline such as this one, no one could expect any railroad, no matter how efficiently managed—and the Buffalo, Rochester & Pittsburgh is noted for its efficient management—not to suffer a severe loss even with the advantage of higher rates and the most drastic sort of economy.

Extraordinary Unfavorable Conditions in Coal Fields

The road serves what may be generally termed the central Pennsylvania bituminous field, which in 1921 experienced, as President Noonan puts it in his annual report, "extraordinary unfavorable conditions." Bituminous coal, as noted, makes up about two-thirds the total tonnage. The road also has an important tonnage of iron ore, coke and pig iron. In 1921 this latter traffic, like coal, was also conspicuous by its approach to absence. The details may be given briefly as follows: The total tonnage of all commodities carried was 7,503,909 as compared with 14,941,182 tons in 1920, a decrease, as above noted, of 49.78 per cent. The tonnage of bituminous coal was 3,854,947 tons as compared with 9,402,558 in 1920, a decrease of 5,547,611 tons.

Coke which totaled in 1921, 154,388 tons was 442,393 tons less than in 1920. The iron ore tonnage was but 99,727 tons, 642,614 tons less than in 1920.

"Other freight" did not suffer as severely; it was 3,300,670 tons in 1921 as compared with 3,954,892 tons in 1920. The tons one mile were 1,136,943,603 as compared with 2,467,398,051 in 1920, a decrease of 1,330,454,448, as above noted, or 53.92 per cent. It is well, in using these 1920 figures, to point out that although the net income of the property in 1920 was the best in the company's history—due to the results of the last four months—the traffic carried in 1920 did not break any records. The revenue ton-mileage was greater in both 1917 and 1918.

Putting these on a revenue basis gives us more interesting details. The freight revenues in 1921 totaled \$11,962,147 as compared with \$19,014,479 in 1920, a decrease of \$7,052,331. The road shows its revenues from coal transportation separately: the 1921 coal revenues were \$6,261,050 as against \$11,828,281 in 1920, a decrease of \$5,567,231. The total revenues, including passenger, etc., totaled in 1921, \$14,399,526, or \$7,334,198 less than in 1920. As would be natural under the circumstances and as we would expect it to be the case in any report of 1921 operations, there were sharp cuts in operating expenses. The operating expenses were actually \$13,917,032 as compared with \$21,127,624, a decrease of \$7,210,592 from 1920. It seems hardly worth while to go into an analysis of these figures as we have already pointed out the effect of the reduction in tonnage and have shown that the good corporate result for 1920 was the result of the favorable earnings of the past four months of that year.

Cost and Profit per Ton-Mile

The company's annual report gives some unusually interesting figures of cost and profit per ton and per ton-mile. The figures are on an annual basis—in other words, insofar as concerns 1920, the unfavorable conditions of the first eight months of the year are averaged out with the good conditions of the last four months. Thus it is shown that in 1921 the receipts per ton were 159.41 cents as compared with 127.26 cents in 1920. The cost per ton in 1921 was 151.69 cents as against 123.54 in the previous year and the profit per ton was 7.72 cents as against a profit in 1920 of but 3.72 cents, which profits per ton, incidentally compare with a loss in 1919 of 6.08 cents and a profit of 17.75 cents in 1917, or 20.28 cents in 1916. The figures per ton-mile show receipts in 1921 of 1.052 cents; in 1920, .771, and profits in 1921, of .051 cents; in 1920, .023 cents, or in 1917, .104 cents.

Naturally, with the sharp reduction in traffic, the operating statistics do not show favorably. Thus, in 1921, the average revenue train load was 754 as compared with 943 in 1920. The tons per loaded car were 34.50 as against 39.98.

The Buffalo, Rochester & Pittsburgh is an extremely high-grade road financially and physically. It is a well-managed property. It is to be presumed that the poor results of 1921 will not be far-reaching because they have been the result of a single thing—lack of traffic. Of course, conditions at present are disturbed by the coal strike, and in general, the desired improvement in earnings is not in sight. The road, however, is prepared to handle a heavy business and apparently its only problem at present depends upon its getting that business through restoration of normal conditions in the territory which it serves.

Rail Production in 1921

THE PRODUCTION of rails in the United States during 1921 was the lowest in any year since 1914, according to statistics of the American Iron and Steel Institute. The total, 2,178,818 gross tons, is less by 425,298 tons than the production in 1920.

Year	Open-hearth	Bessemer	Re-rolled*	Electric	Iron	Total
1907	2,377,704	3,180,025	925	3,633,654
1908	2,717,901	1,849,153	71	1,921,015
1909	1,356,634	1,767,171	3,023,805
1910	1,751,959	1,884,442	230	3,636,031
1911	1,676,923	1,053,420	91,751	234	2,822,790
1912	2,195,144	1,099,926	119,390	3,455	3,327,915
1913	1,512,911	1,117,591	155,043	2,436	3,507,981
1914	1,525,851	323,897	95,169	178	1,945,095
1915	1,775,168	326,952	102,083	2,204,203
1916	2,269,660	440,092	144,826	2,854,578
1917	2,292,197	533,325	118,639	2,944,161
1918	1,845,443	494,193	101,256	2,540,892
1919	1,893,111	214,121	96,422	50	2,203,843
1920	2,334,252	142,899	126,698	297	2,604,116
1921	2,027,145	55,559	96,039	5	2,178,818

*Re-rolled from old steel rails. Included with Bessemer and open-hearth steel rails from 1907 to 1910, inclusive.
 *Small tonnages, rolled in 1909 and 1910, but included with Bessemer and open-hearth rails for these years.

It is interesting to note that there has been a further reduction in the use of Bessemer rail as indicated by the table below. In 1921 only 2.55 per cent of the rail rolled was Bessemer as compared with 5.49 per cent in 1920.

Kinds	1920	Per cent	1921	Per cent	Decrease	Per cent
Open-hearth	2,334,252	89.63	2,027,215	93.04	307,037	13.15
Bessemer	142,899	5.49	55,559	2.55	87,340	61.12
All other	126,995	4.88	96,044	4.41	30,951	24.37

Total, 2,604,116 100.00 2,178,818 100.00 425,298 16.33
 Girders and high T-rails for electric and street railways are included in the figures given above. For recent years the tonnage was as follows: 1916, 127,410; 1917, 91,674; 1918, 20,834; 1919, 112,712; 1920, 100,910; 1921, 89,162 gross tons. The total production of rails as given above includes, in addition to new rails rolled, rails re-rolled from defective rails and from old rails. The total of renewed or re-rolled rails so included is given in gross tons below.

Years	Produced from new steels, new defective rails, etc		Rolled from old rails		Total re-rolled
	Open-hearth	Bessemer	Total	Decrease	
1914	13,538	13,234	26,772	95,169	121,941
1915	6,477	2,652	9,129	102,083	111,212
1916	1,711	2,149	3,860	144,826	148,686
1917	1,825	7,182	9,007	118,639	127,646
1918	11,296	19,462	32,758	101,256	134,014
1919	1,933	5,768	7,701	126,698	134,399
1920	19,493	1,979	21,472	126,698	148,170
1921	6,525	702	7,227	96,039	103,266

The tendency toward the use of heavy rail is indicated by

the following table showing the production of rails by weight per yard. This shows an increasing preponderance in rails weighing 85 lb. or more. Attention is also called to the fact that rail weighing 100 lb. or over now represent almost the same tonnage as rails weighing 85 lb. and less than 100 lb. As an evidence of the greater use of heavy rail it is also interesting to note that during the past year the tonnage of rails weighing 85 lb. or more represents 80.5 per cent of the total, whereas in 1915, when the tonnage of all weights was almost the same, the rails weighing 85 lb. or more represented only 65.0 per cent of the total.

Years	Under 45 pounds	45 and less than 85	85 and less than 100	100 pounds and over	Total Gross tons
1905	228,252	1,601,624	1,546,053	1,375,929	3,375,929
1906	284,612	1,749,650	1,943,625	3,977,887	3,977,887
1907	295,838	1,569,985	1,767,831	3,633,654	3,633,654

Freight Car Loading

WASHINGTON, D. C.

FREIGHT CAR LOADING during the week ended on April 8 naturally reflected the decrease in coal traffic resulting from the strike, but it still represented an increase as compared with the corresponding week last year. The total was 714,268 cars as compared with 694,851 in 1921 and 801,559 in 1920. The decrease as compared with the week before was 112,000 cars. The number of cars of coal loaded fell from 184,952 in the week ended April 1 to 69,456 in the week of April 8, a decrease of 115,000. During the corresponding week of 1921 the coal loading was 126,461 cars.

As compared with last year there was a decrease in the loading of grain and grain products, livestock and coal, but increases in coke, forest products and ore and large increases in merchandise and miscellaneous freight which more than made up for the decrease in coal. In the Pocahontas district, where many of the non-union mines are located, the coal loading was greater this year than last year.

REVENUE FREIGHT LOADING

SUMMARY—ALL DISTRICTS, COMPARISON OF TOTALS THIS YEAR, LAST YEAR, TWO YEARS AGO, WEEK ENDED SATURDAY, APRIL 8, 1922

District	Year	Grain and grain products	Live stock	Coal	Coke	Forest products	Ore	Miscellaneous	Total revenue freight loaded

Hearing on Train Control Concluded at Washington

Train Control Proprietors' Testimony Completes Evidence on Which Commission Will Base Decision

THE MILLER TRAIN CORPORATION had not completed the submission of its brief before the Commission at the time of our going to press last week and was not included in our report (page 927), which covered the hearing on Wednesday the 12th. The first witness on the morning of April 13 was H. H. Orr, signal engineer of the Chicago & Eastern Illinois, who testified as to the operation of the Miller device on that road.

The Miller Train Control Brief

W. B. Murray, chief engineer of the Miller Train Control Corporation, began with a discussion of the faults cited by the railroads' committee. He said that action had been taken to remedy them, and that his company was working in closest accord with the committee of the American Railway Association, the representatives of the Interstate Commerce Commission and the officers of the Chicago & Eastern Illinois. Regarding the possibility of a ramp being accidentally displaced, he said that the chances of this are extremely remote as has been demonstrated during the eight years of regular service on the C. & E. I.

As to operation under adverse weather conditions the roads' committee stated that no dependable records were available prior to May 1, 1921; but daily reports, similar to those made of the automatic signal performance, are made of the operation of the train control apparatus by the railroad; and during these eight years there have been all kinds of weather, including many storms of snow, sleet and ice; experience has conclusively proved that operation is satisfactory under all weather conditions which permit train movement. In February, 1914, it was necessary to plow snow drifts from the tracks, and the ramps were covered with snow and ice, but there was no interruption. The winter of 1918-1919 was the most severe for many years and the control operated satisfactorily on all classes of trains.

The device has been in service on 107.2 miles, double track, for eight years; 85 engines equipped and 175 ramp locations. Mr. Murray traced the development work carried on since 1908, showing the low cost of installation and maintenance. Averages of operation and maintenance for one year based on

actual figures of the railroad company for five years are as follows: Engines, \$8,330; ramps, \$8,160; total, \$16,491; an average yearly cost per engine of \$98.01, and average yearly cost per ramp, \$46.64. These figures include the usual 10 per cent added for supervision and use of tools on cost of labor, and 15 per cent for freight and handling on cost of materials. The interest on investment is not included. The price of installation of apparatus such as is now used on one engine division of the C. & E. I., 107.2 miles, double track, is 85 engines complete at \$500 each, \$42,500; 175 ramps complete at \$300 each, \$52,500, or a total of \$85,000.

Mr. Murray said that his company could deliver 50 of the engine devices a day. All material except ramp stands, control instrument and shoe is of standard manufacture, which can be obtained anywhere. Arrangements have been made with large foundries and machine shops which have patterns of their material and are acquainted with their work.

Statement by H. H. Orr

Mr. Orr, signal engineer of the C. & E. I., has been connected with the signal department in various capacities throughout these introductory years. Replying to Attorney Lyon, he said that in the main he concurred in the report of the Miller Train Control Corporation as read.

Mr. Lyon:—Has the stop as installed and operated on your line a permissive feature?

Mr. Orr:—Yes.

Mr. Lyon:—Why do you install and operate it in that way?

Mr. Orr:—In order that the engineman may retain control of the train if he is alert. The engineman would have to release it wilfully to prevent a stop.

Commissioner McChord:—Why wilfully? Might it not be thoughtlessly?

Mr. Orr:—In my opinion it would have to be wilfully.

Replying to further questions, Mr. Orr said he had never heard of an engineman releasing brakes thoughtlessly after an automatic application.

After the conclusion of the testimony the carriers' attorney waived cross-examination, this being the only train control

company with an extensive installation which was not cross-examined.

Various Devices

Clifford Automatic Train Control & Signal Corporation.—F. J. Clifford sketched the development of train control devices during the last 50 years. Automatic train control has been advocated in the public press for a good many years, and especially after each serious collision. The speaker quoted from a paper read by W. G. Bierd, president of the Chicago & Alton, before the Western Society of Engineers at Chicago on October 21, 1920, after which he gave a general description of his device. The functioning of his device when a train is in live territory cannot be prevented by manipulation of the engineman.

H. W. Richard stated that he had been engaged in development work for about seven years. He described his device, and in reply to Mr. McChord, said that he expected to have it ready to be installed in about three weeks.

Warthen Automatic Train Control Corporation.—A. F. Dulin, presenting the brief for this company, said that up to the time of Mr. Warthen's death in 1919 he had kept in close touch with the development of this field and with the Bureau of Safety. Mr. Dulin set forth his claims regarding patents, cost, and adaptability. He declared that the intermittent contact type had proved its case. The carriers have stated that the induction type is preferable and want time for it to be developed; but they have had time to try out all of these devices, and the unnumbered millions of the traveling public demand protection without further delay.

H. A. Brown, speaking for the Warthen company, presented an itemized statement of cost. The estimated cost of wayside apparatus is \$585.95 and locomotive apparatus \$497.50, or a total of \$1,083.45 for one location of wayside apparatus and one locomotive. Reductions might be made if the electric headlight generator were to be used.

Nevins-Wallace Train Control Company.—L. R. Wallace presented the brief for this company, stating that its device was of the mechanical ground trip type electrically controlled.

The General Railway Signal Company and the Union Switch & Signal Company did not take the stand but presented statements for the consideration of the Commission.

Abstract of Remarks by G. P. Finnegan

George P. Finnegan presented a written statement in which the railroads were criticized for their attitude on the whole train control question. He has worked on this subject for over 20 years developing and patenting trips, ramp rails, electric and mechanical contacts on engine, continuous a. c. control with a plurality of frequencies and, finally, intermittent induction. The avoidable losses due to wrecks and the absence of train control would finance the installation of train control on the principal railways of America.

"Railroads are so positive that trains will make prompt arrivals that they sell insurance, guaranteeing that the passenger will be delivered on time; and the whole responsibility rests on the engineer, and he depends on the wayside signals to guide him in his flight. Although signals have been in a state of development for the past 50 years under the supervision of the most able engineers in the world, they still fail to function perfectly and they have the physical defects of being unreadable under various conditions, such as snow storms, fogs or a blanket of smoke. Therefore, aside from the ability of the track circuit to report a defect in the rail, what does the most up-to-date form of signals add to railroad safety? They simply accelerate traffic over the rails, admittedly at the cost of safety. However, the higher railroad officials naturally do not want to spend money for new things and they wonder why the signal companies have not up to the present time shown any determined interest in

train control. There are hundreds of engineers employed by railroads in the maintenance of signal systems, and the majority of these engineers are pupils of the signal concerns, many of them having worked for these corporations. The stock of goods that are put in their hands to work with are mostly manufactured by and purchased from the signal companies, and so naturally these engineers prefer to deal with those who have an able force of engineers to help them install and maintain; so the signal companies have been sitting back in their traces with respect to train control. The signal makers know that reliable cab signals are more desirable than the junk that they deliver to the railroad companies today, therefore, why not wait; in fact, why not retard, if possible, any movement towards automatic train control and cab signals? But at the eleventh hour we see them rushing about trying to bite a mouthful from some poor inventor's dream and go out after the business that seems forthcoming.

"The Interboro Rapid Transit Company of New York, the Pennsylvania and the Baltimore & Ohio afforded us every courtesy in assisting to develop the principles of train control. There are also other railroads which have granted permission to inventors whereby they might develop their devices; such as the Erie (18 years ago).

"The Lackawanna has permitted the installation of several devices, including those of the Union Switch & Signal Co., within the past 15 years, and, strange as it may seem, they are still determined to find an efficient system of speed control. We are glad to inform this commission, and some of the old guard of signal engineers who 20 years ago thought Finnigan's train control ideas were loony, that the Lackawanna has entered into an agreement to install 15 to 30 miles of the Finnigan induction traffic speed control with a view of equipping the whole system. The installation will be made on the main line between Hoboken, N. J., and Scranton, Pa., work to begin at once. Who's loony now? Yes, hoys, 'the world do move.'

"Many signal engineers for a long time have been in favor of train control and have endeavored to keep themselves posted; but there are many dyed-in-the-wool anti-control signal engineers who have not missed a single chance to submerge train control when the opportunity was offered. These men are on record at every official meeting within the past 12 years as train control knockers.

"In 1910 and 1911 on the Interboro line, in New York, our system of train control was commended by J. M. Waldron, signal engineer of the Interboro. With this induction apparatus we developed a remarkably simple form of speed control. The engine apparatus designed on a closed circuit had no contacts or moving parts, and if it failed it failed safe.

"Some of the parties who inspected this system at that time were J. P. Coleman and F. L. Howard (U. S. & S. Co.), Oler and Allen (P. R. R.); also Charles Stephens (C. & O.), who since that time has done more to develop and operate automatic train control on steam railroads than any man in America. The device was also inspected by the famous 'we-don't-want-to-find-train-control' committee of the New York Central, composed of Elliott, Mock, Balliet, Rose and Denney. These men saw the device under all conditions of flexibility that could be required by any railroad and it functioned 100 per cent.

"For a practical device for mixed railroad traffic we are confronted with cold, hard facts, and these facts have been laid down in commandments issued by your commission. There is nothing in these requisites but what should be conformed to. The conditions are reasonable. The engine apparatus should be of few parts, as it is almost impossible to maintain electrical contacts or moving parts on an engine, due to impact and vibration.

"We have recently heard much discussion of automatic train control on the engine subject to manual control. Is not

the object of automatic control to eliminate the human element, and does not this feature re-introduce it? Why is train control desirable or worthy of consideration if the human element still exists in operating trains? Are all these years of toil and millions of dollars that have been consumed by hundreds of inventors trying to eliminate the human element to be annulled and the conditions made more hazardous by introducing instead of one engineer, two 'piano players' on each locomotive, whereby the cardinal principle is submerged? Has not an engineer running at 75 miles an hour with signals appearing every 50 seconds, enough responsibility, with the care of his engine, without adding to his burden the task of synchronizing himself with the other piano player in letting themselves past the signals and creating a condition more hazardous than the present signal system?

"Anyone aware of the responsibility of an engineer or fireman running a high speed train, will agree that these men have no time to play tag around the boiler of a fast moving train.

"If we are to have automatic train control, let it be automatic. Do not install any device that will produce any degree of degradation on the engineer nor inconvenience his control while he elects to run safe. When a device is shown in operation to conform to these conditions, the railroads may be expected to be glad to accept it as a financial and humanitarian adjunct to their system. . . ."

The Simmen System

P. J. Simmen, of the Simmen Automatic Railway Signal Company, outlined his years of development work. His company has developed an automatic block system, a speed control device, and a remote control dispatching and recording system. He told of his agreement with the General Railway Signal Company, under which that company was licensed to use his speed control device, and by means of which train control has been carried beyond the experimental stage. He described his speed control and train dispatching system as installed on the Indianapolis & Cincinnati Traction Company's line. Mr. Simmen would make no provision to enable an engineman to prevent the automatic application of the brakes except by properly reducing speed. He would favor making a record every time the engineman permits the air brakes to be automatically applied, and discipline him for unnecessary operations. C. C. Paulding, attorney for the carriers' committee, asked Mr. Simmen some questions about the operation of cab signals. Mr. Simmen declared that on general principles cab signals are less costly than our fixed signal installations.

Edward Stegelmeyer, secretary of the Automatic Train Control Company, presented a brief describing his electrically controlled mechanical trip type of train control. It was tried on the Big Four in 1909. When asked by Mr. McChord why these tests were not continued, he said that he did not know. Regarding his attempt to get a test installation on the Monon road, Mr. Stegelmeyer said that the president had promised to allow a test to be made after the end of federal control, but up to the present time nothing had been done. Replying to Mr. Borland as to what facilities he had to make an installation, Mr. Stegelmeyer said that his company was prepared to handle its first order on a job lot basis.

A. J. Brookins, describing the Brookins-Burdette train control system, said that he had studied the subject for 10 years; and he entered into a long discussion of general principles.

M. T. Miller, attorney for the Simplex Train Control Company, presented a short brief and asked that the Commission's order be modified so that those railroads desiring to use types which have not as yet been developed could have opportunity to do so. Commissioner McChord stated that

no modification of the order was needed to do that; but Mr. Miller thought that if the order was issued as now drawn, there would be a rush of the railroads for the ramp type; an extension of time should be allowed.

Thomas C. Clark's Wireless Control

J. G. Dunn presented a brief for Mr. Clark. He deemed it essential to have an efficient method of putting the indication before the engineman at any time or at any point in the block. This problem has been solved by his system. Mr. Dunn gave a brief description of the development of the apparatus, which is of the continuous inductive type, controlling the train at any point in the block. The engineman may handle his train without interference so long as he does it properly. Mr. Dunn suggested that if the order is issued now the railroads will be so busy that proprietors having devices which have not been tested will have no opportunity to show what their devices can do; and he asked that the order be held in abeyance until this system can be developed. The Pere Marquette has given permission for a 10-mile section to be installed for test purposes.

Leslie M. Shaw, representing the Julian-Beggs system, told of tests which had been conducted on the Cincinnati, New Orleans & Texas Pacific. He asked that the Commission's order be issued substantially as it is drawn, with little extension of time. It would not be fair to his clients for the uncertainty to be continued.

C. C. Paulding, attorney for the carriers' committee, stated that it was the intention of the railroads to try out the various devices.

The Shadle Train Control.—A brief was presented in behalf of this system. It called attention to the large number of collisions and the large loss of life and the cost to the railroads for these; and the opinion was expressed that some action should be taken by the railroads. A comparison of the cost of automatic train control was made with the cost of couplers, brakes, fittings for mail cars, underframes, et cetera.

The International Signal Company

J. F. Webb, Jr., secretary-treasurer of International Signal Company, said that the arguments of the carriers against the installation of these safety devices fall naturally into two classes; (a) general objection to all such devices, and (b) specific objection to the ramp type. Mr. Webb discussed the objections in detail. "The fight of the carriers against automatic train control is in line with their fight against air brakes and automatic couplers. They lost those earlier fights, but they are now blessing the days of those defeats. The day will come when the carriers will also bless the installation of this newer safety device."

James P. Whissman stated that he had developed an intermittent contact overhead, or compression trip type, and in 1908 had applied to the New York Central for permission to test it.

Regan Safety Devices Company

This company presented a great mass of exhibits. The first was an analysis of the report of the carriers' committee on inspections. In another exhibit exception was taken to the request of the A. R. A. committee for the re-insertion in the proposed order of paragraph b, Section 1, under automatic stops, reading "Under control of enginemen, who may, if alert, forestall automatic brake application." The Regan Company "does not agree with the committee that a forestalling feature with the automatic stop only should be permitted. If one is permitted, then the engineman may cancel at will the automatic stop, when imposed or when about to be imposed; then it is a question of the engineman's judgment as to whether his train shall be brought to a stop, or whether he shall cancel the stop himself, expecting to control

the train when it proceeds in accordance with conditions ahead as he sees them."

The exhibits presented were, Exhibit A: A reply to carriers' sub-committee; defects pointed out. Exhibit B: A detail record of the performance of the Regan device on the Chicago Rock Island & Pacific from February 12, 1920, to date. Exhibit C: A cost analysis of the testimony of railroad witnesses. Exhibit D: A map of the United States showing location of collisions which have occurred in automatic block signal territory from September 4, 1911, to May 17, 1921. Exhibit E: A series of photographs showing the condition of the storage battery used on the locomotive, and pictures showing that ramps do not interfere with men getting on or off trains, and that other obstructions such as switch stands, switch movements for electric interlocking, lamps, etc., offer greater obstructions than do ramps. Exhibit F: Analysis of the committee report on specification. Exhibit G: A series of descriptive circulars showing installations of Regan apparatus in the United States, France and Great Britain.

A. G. Shaver, chief engineer of Regan Safety Devices Company, was the first witness for that company. He gave a description of the device and cited records of engine movements, both passenger and freight, over the equipped territory. Concerning induction apparatus, C. E. Denney interrupted to ask if this type was being developed by the Regan Company; and whether it had been brought to the attention of the railroads' committee; also whether the Bureau of Safety had passed on it. Mr. Shaver replied in the negative. Regarding installations in France and Great Britain, where the ramp rail was placed between the running rails, Mr. Denney asked Mr. Shaver if that was a good thing and whether it could be used in this country. Mr. Shaver believed that in some cases it could be done.

Mr. Shaver next discussed the objections cited by the carriers' sub-committee. Certain changes in engine circuits have recently been made, and when questioned about this by Mr. Peabody, Mr. Shaver said that the changes would provide for more economical operation. Mr. Shaver stated with reference to the speed control apparatus that it will run about 100,000 miles before needing attention.

Mr. Peabody wished to know what the introduction of speed control would do on heavy mountain grades, particularly with reference to the losing of the air by repeated applications by the speed control apparatus. Mr. Shaver said there were no heavy grades in Illinois in the territory equipped. He said that enginemens must conform to the caution signal indication. A penalty should be imposed if the signal is not observed. To support the committee's contention that speed control as applied on the Rock Island sometimes stopped instead of reduced the speed of trains, Mr. Denney asked if a speed control application was liable to produce this result if the engineman fails to take action. Mr. Shaver admitted this, but said that it was in the province of the engineman to reduce speed so that the speed control does not take effect.

Mr. Denney asked what an engineman must do, and, continuing, said, "You maintain that the speed control will in some cases reduce the speed of the train and in others stop the train. The device does not do what it is designed to do. It is recognized that there is more difficulty and greater hazard in managing the speed of freight trains than of passenger trains, and the sub-committee wishes to bring out its desire to have apparatus developed so that no hazard exists to the trains themselves or to adjacent tracks through accidents and for that reason any device developed should function at all times as it was designed to function."

At this point Mr. Shaver was replaced on the stand by C. A. Lyon to answer questions regarding the effect of speed control on freight train operation.

I. Beaumont, vice-president and sales manager for the

Regan Company, was called to the stand next and attempted to destroy the force of the carriers' committee report by cross examination. After setting forth the imposing array of engineering talent in the service of the Regan Company, and their qualifications, Mr. Beaumont went on to explain the purpose of speed control, and gave further details of the installations in Great Britain and France. He then discussed the cost analysis as presented in one of the briefs. Instead of reading the entire brief, he criticized the estimates of cost which were presented before the Commission by W. H. Elliott, J. A. Peabody, C. J. Kelloway, A. W. Trenholm, W. J. Eck, and others. Regarding facilities for manufacturing, his company could manufacture 100 units of automatic train control a week, having factories at Niagara Falls, in Great Britain and in France.

W. M. Camp, editor of the Railway Review, was expected to take the stand after the train control proprietors had finished, it being the understanding that he was to explain the elimination of paragraph *b* from the Commission's order; but Chairman McChord, after a conference with Commissioner Esch, said that they had decided it would not be necessary to call Mr. Camp to the stand, enough testimony having already been taken regarding this question.

B. & M. Valuation Exceeds Property Account and Capitalization

WASHINGTON, D. C.

THE INTERSTATE COMMERCE COMMISSION on April 14 made public its tentative valuation of the Boston & Maine, as of the valuation date of June 30, 1914, in which it reports the "final value" of the property owned and used for common carrier purposes, including 708.8 miles of first main track and 1,380 miles of all tracks, as \$101,712,972. The final value of the property owned and used is given as \$234,189,816. This covers 2,183 miles of first main track and 4,134 miles of all tracks.

The capital obligations of the Boston & Maine outstanding on valuation date were \$109,739,190, but this covers considerable property not included in the valuation report of the carrier property owned, including \$2,414,820 of improvements on leased property which the commission has readjusted to \$2,289,820. It also covers securities of other companies of a par value of \$20,029,769 recorded on the books at \$20,722,230, and also non-carrier lands which are reported at a present value of \$1,555,451. The final value of the used property includes \$132,476,845 for leased property, including 1,474 miles of first track and 2,752 miles of all tracks. It also includes \$58,016 of property leased to others. The total capital obligations of the companies that owned the leased properties, stated separately in the report, foot up to about \$110,000,000, or considerably less than the final value placed on them of \$132,476,845. This would make a total of capital obligations of \$220,000,000 roughly comparable to the \$234,189,816 final value of the used property, although the capitalization of the corporations cannot be exactly compared with the commission's valuations of the carriers as the former cover much property not represented in the valuation.

The investment in road and equipment of the Boston & Maine as of the valuation date is stated on its books as \$90,653,840, of which \$59,927,508 represents the investment in road and \$30,726,332 the investment in equipment. The commission's report says that if certain readjustments were made this would be reduced to \$88,090,755, of which \$27,142,464 represents the par value of securities issued and assumed and other liabilities of predecessor companies, the value of which at the time of entry cannot be determined.

The original cost of the property cannot be ascertained from the records, the commission reports, but it gives the "recorded outlay" for 548 miles of road, after the deduction of about 26 miles abandoned or sold, out of a total of approximately 707 miles owned on valuation date. This includes \$45,788,402 as the recorded money outlay including some short term notes, and \$5,843,405 as "recorded outlays for which the consideration is undetermined." The original cost of 20,764 units of equipment is given as \$30,450,035, with a statement that the carrier claims an additional \$5,187,004 based on estimates.

The cost of reproduction new of all common carrier property other than land reported is \$93,851,564 for the property owned and \$223,317,897 for the property used. The cost of reproduction less depreciation is given as \$72,174,404 for the property owned and \$170,629,869 for the property used.

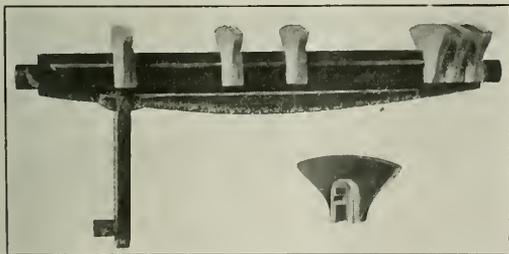

The present value (as of 1914) of carrier land owned and used is given as \$16,316,256 and of the land used for carrier purposes as \$44,130,611, while the excess cost of acquisition of the land is given as \$12,670,673 for the property owned and \$32,443,417 for the property used.

The value of materials and supplies on hand is stated as \$5,702,134.

In accordance with the usual practice, the company and the state authorities on whom the report is served are given 30 days within which to file any protest against the tentative valuation before it can be made final. Some of the valuations heretofore served in the case of short lines have become final by reason of no protest being filed, but most of the roads have protested the tentative valuations and the commission has announced a number of hearings on them for various dates in May.

Service of Hulson Grates on the Wabash

THE TYPES OF GRATES generally used in locomotive fire-boxes have probably been subject to less modification than any other part of the locomotive which has to do with combustion and heat absorption. The simplest form of finger bars or table castings still prevail although it is generally recognized that they have well defined limitations as

Hulson Grate Finger Bar and Fingers

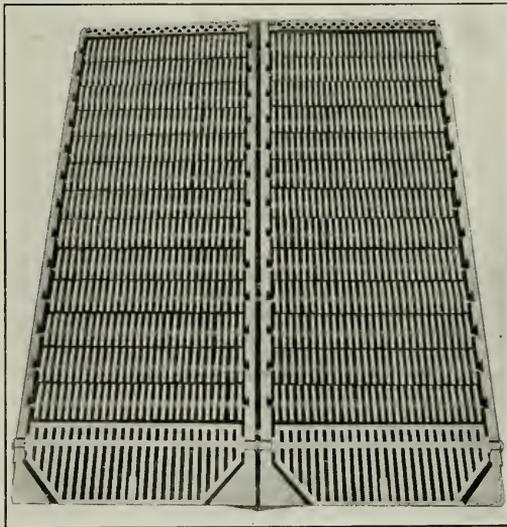

to economy of maintenance, percentage of air opening and restricted removal of ash from the firebox to the ash pan.

Several years ago the Hulson Grate Company, Keokuk, Ia., brought out a locomotive grate (see *Railway Age Gazette*, August 20, 1915) in the construction of which was embodied a number of novel features designed to remove or materially extend these limitations. This grate was an adaptation of a design which at that time had already met with considerable success in stationary service. This grate differs in construction from the ordinary finger grate in that each grate bar is built up of loose fingers of light sec-

tion fitted onto a finger bar which sets well below the surface of the grate, so that the openings between the fingers may extend entirely across the surface of each assembled grate instead of being interrupted at the center. This feature makes it possible to secure an air opening equal to 55 per cent of total grate area with $\frac{5}{8}$ -in. openings between fingers. This is considerably in excess of the maximum draft area obtainable with conventional locomotive grate designs, and tends toward fuel economy.

An equally important feature of the removable finger construction is the possibility of decreased maintenance which it offers. If a finger burns off in service it is replaced by a new one weighing two pounds whereas with ordinary grates it would be necessary to renew a grate bar weighing from 85 lb. to 150 lb.

Consideration of these features, together with a favorable report from another road that had its locomotives equipped with the Hulson grate, led the Wabash to equip a Ten-wheel passenger locomotive, having rather limited grate area for

A Full Set of Hulson Grates for a Wide Fire Box

the size of the boiler, in January, 1918. The service of the grates on this locomotive was quite satisfactory, and after about three years the maintenance cost was found to have been less than half that of the standard grates.

It was then decided to equip 10 Prairie type freight locomotives. These have 54.25 sq. ft. grate area, use Illinois and Missouri coal, and operate out of Moberly, Mo., principally between Moberly and St. Louis. The first of these locomotives was equipped in December, 1920; the others followed within a few months. Records have been kept of repair costs on these 10 locomotives and fuel records are available for all engines in the class.

The fuel records from May, 1921 to December, 1921, inclusive, show the following results:

Type of grate	Ave. tons per train	100 ton-miles	Tons coal	Lb. coal per 100-ton-miles	Decreased fuel consumption per 100 ton-miles, per cent
Standard	1,300	4,149,415	26,572	12.81	
Hulson	1,340	2,665,032	16,189	12.15	5.15

Fuel records of locomotives in local service were eliminated on account of the erratic performance in local freight on the ton-mile basis.

The maintenance costs are not here compared with other

grate costs but are presented for use where costs are already known or can be derived from existing records. These grates have only been in service a year, and after several years there may, of course, be a period of somewhat higher maintenance when finger bars need renewal. The repair costs were as follows:

Total repair cost (labor and material) to Jan., 1921...	\$116.27
Total grate area.....	542.5 sq. ft.
Cost of repairs per sq. ft. grate area per month.....	.0216
Cost repairs per engine per year.....	\$14.05

The Hulson grate fingers roll through the fire bed instead of tearing it, and they are in favor with the firemen because of the ease with which they can be shaken. The fire is kept in better condition on the road, and on long freight divisions the cleaning of fires half-way over the road has been eliminated on these engines. It has also been possible to increase the diameter of the nozzle tips by $\frac{1}{4}$ in.

The standard grate on this class of locomotives is of good design, with about 43 per cent air opening, and the additional air opening of the Hulson grate would probably not result in as much fuel saving as on grates with but 30 to 35 per cent air opening. The experience with these locomotives, however, has led to the conclusion that the reduced maintenance cost alone will make the Hulson grate worth while. At present 10 more of the Prairie type locomotives are being equipped and it is the intention to extend the application to those classes of locomotives most susceptible to reduced grate repair cost. The locomotive grates now in service include rocker grate bars only, and while there has been no difficulty in cleaning the fire the plans are to include the Hulson shaking dump grate* in future installations.

This type of grate has a wide use in stationary power plants and during 1921 the Wabash equipped six 250-hp. boilers in the power plants at Moberly, Mo., and Decatur, Ill. The grates have the good will of the stationary firemen, and there has been a noticeable decrease in fuel consumption and in black smoke. It is the intention to extend their application to all large stationary boilers.

Locomotive Types from a Transportation Viewpoint

By J. F. Porterfield

General Superintendent of Transportation, Illinois Central

LOCOMOTIVES should be designed so as best to meet varying conditions such as the grade line, the economical train load, which will vary according to the character and density of traffic, the acquired train schedules, etc.

The items going to make up the cost of freight train operation—except crew wages—do not materially decrease with the increase in locomotive capacity, as the decreased cost of ownership per unit of service is offset by a material increase in the expense of maintenance and by decreases in the time in service and the average mileage. From various estimates, I figure the increased cost of maintaining the large 2-10-2 type, compared with the cost of the 2-8-2 type, at about 20 per cent, with a decrease of about ten per cent in mileage. These items, with the increased cost of ownership, will about equal the saving in crew wages, particularly on lines with favorable grades where the traffic consists of average weight commodities requiring prompt movement.

On train districts with more than one-half per cent grades, especially where the preponderance of traffic is in the heavier commodities not requiring preferential movement, the 2-10-2 type locomotives will sufficiently reduce the freight train cost

per 1,000 gross ton-miles to justify the additional investment in locomotives, roadway, yard facilities, engine terminals, etc.

On train districts with grades of .5 per cent or less where the traffic is fairly well divided between the heavier and lighter commodities, I believe the Mikado type locomotive is the proper type to use. These locomotives will handle 75 to 90 loaded cars, which under average conditions is an economical train. While the larger capacity type will show a decrease in crew wage cost per 1,000 gross ton-miles, this saving will be more than offset by the increased cost of maintenance, investment in locomotives, roadway, yard facilities, engine terminals, etc. In addition to this there will be a loss in car efficiency incident to greater delay at terminals for full trains, and a loss in time on the road on account of the slower speed and delays incident to handling excessively long trains. These disadvantages will apply to even a greater extent on single track.

Take a train district with favorable grades where the density and character of traffic and train frequency prevent the train load from being increased. The cost per 1,000 gross ton-miles with 2-10-2 type locomotives would be about as follows:

Wages	\$.079
Locomotive maintenance113
Interest on investment058
Total	\$.25

The same items with a Mikado type locomotive would be about as follows:

Wages	\$.078
Locomotive maintenance093
Interest on investment039
Total	\$.21

This shows a loss of 19 per cent in the use of the larger locomotive.

On an Illinois Central train district with .8 per cent grades, where 60 per cent of the traffic is coal and other heavy commodities, the operation of the 2-10-2 type, with a tractive effort of 73,800 lb. shows a decrease in crew wage cost per 1,000 gross ton-miles from 41 cents to 25 cents, or 39 per cent, compared with the operation of the 2-8-2 type, with a tractive effort of only 51,630 lb.

On another train district, with grades and curvature equalling one per cent, on which 60 per cent of the traffic consists of high-class freight requiring fast time, the decrease in crew wage cost per 1,000 gross ton-miles is only 24 per cent. With a 43 per cent increase in tractive effort, the trainload increase is only 19 per cent, because the preponderance of high-class commodities requiring fast time prevents the accumulation of the tonnage for a maximum trainload. Where similar conditions prevail, I think a careful analysis will show that the increased cost of owning and operating the larger locomotive equals the crew-wage saving. However, even though there was no saving in operating cost, it might be necessary to adopt the larger locomotive to keep the train units within the road capacity.

Because of the increased cost of maintenance and of ownership and the decrease in efficiency of the extremely large types of locomotives, careful study and consideration should be given to the grade and traffic conditions, the train frequency or road capacity, the terminal expense required to reduce or increase trains, etc., before an investment is made in locomotives of the 2-10-2 and larger types. In offering these suggestions, I have assumed that, first of all, consideration will be given to grade reduction.

THE OLD DOMINION LINE (now the Old Dominion Transportation Company), after a vacation of two years, has resumed the running of passenger steamships between New York City and Norfolk, Va.

*From a paper presented before the Western Railway Club, Chicago, on April 17, 1922.

Thermic Syphons Save 19 Per Cent in Fuel

Improved Performance of Ten-Wheel Locomotive Enables Spokane International to Haul Heavier Trains

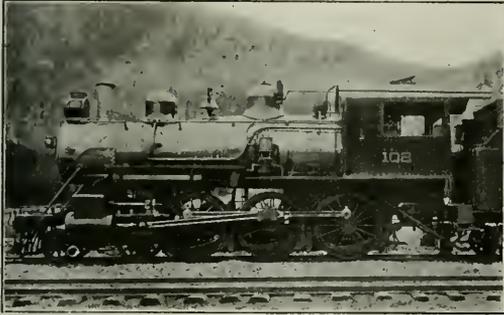

THE SPOKANE INTERNATIONAL operates through passenger trains over its main line from Spokane northward, a distance of 140 miles, to Eastport, Idaho, where connection is made with the Canadian Pacific. Ordinarily the trains consist of five cars, including standard sleepers and a dining car. While the time on this run is not fast, the trains do considerable local work and the grades encountered are severe so that the schedule has proved difficult to maintain with the locomotives now in service; these are of the Ten-wheel type with narrow fireboxes 19 in. by 24 in. cylinders, and 22,000 lb. tractive effort.

Another condition affecting the steaming capacity of these locomotives and limiting their ability to handle heavy trains over this road is the slow-burning character of the coal used; it contains approximately 75 per cent fixed carbon and averages 12,500 B.t.u. per lb. With this coal and the limited grate area of only 27 sq. ft., it is difficult to keep full steam pressure at all times and the fuel consumption

of a single thermic syphon made it possible to increase the diameter of the cylinder $\frac{1}{2}$ in. without reducing the ratio of boiler capacity to cylinder capacity.

In view of the character of fuel burned, it would not have been practicable to have increased the cylinder diameter without a corresponding increase in the capacity of the boiler and while this increase may seem small, it should be borne in mind that this change in cylinder size not only added more than 60 hp. to the capacity of the locomotive, but increased its maximum tractive effort by 1,160 lb. In addition to insuring an immediate increase in the capacity of the locomotive, it was thought that the application of thermic syphons would improve the efficiency of the locomotive, not only on account of the improved boiler circulation, but also because any considerable reduction in the rate of fuel consumption per square foot of grate surface on these locomotives would in itself tend to improve the fuel efficiency of the boiler. Factors in the selection of the thermic syphon were its adaptability to the locomotive without involving extensive alterations, and low maintenance charges.

The application of one Nicholson thermic syphon in the firebox of locomotive 102 on the Spokane International was made during the past summer and on September 27, 1921, a test of this locomotive was begun in comparison with a locomotive of the same class and operating in the same service but not equipped with this device. The principal dimensions of both locomotive 102, which is equipped with this device, and locomotive 104, without the syphon, are given in the table.

Installation of a Nicholson Thermic Syphon Enabled This Locomotive to Meet the Demands of Heavier Traffic

frequently exceeds 160 lb. of coal per square foot of grate surface per hour. Under these conditions not only is the capacity of the locomotives limited, but the fuel performance is not as economical as it should be. For that reason the officers of the Spokane International have recently been looking into the possibility of improving the efficiency of the locomotives and increasing their capacity so that they will be able to haul additional cars when necessary and still make the running time, thus obviating the necessity for purchasing heavier locomotives for the present.

Reasons for Installing Syphon

As a result of this investigation the road decided to apply a Nicholson thermic syphon with brick arch to one of these Ten-wheel type passenger locomotives and to test this locomotive in comparison with another locomotive of the same class which did not have the syphon but was equipped with a fire-brick arch supported on studs. In selecting the thermic syphon for this test in preference to other devices designed to improve locomotive capacity and efficiency, the railroad was governed largely by the fact that the application of a syphon would enable an immediate increase in the tractive effort by merely reboring the locomotive cylinders. As the weight on driving wheels was sufficient in this case to permit of an increase in the cylinder diameter without reducing the factor of adhesion too greatly, the application

LOCOMOTIVE DATA

Type	Non-Syphon Locomotive	Syphon Locomotive
	104	102
Type	Ten-Wheel	Ten-Wheel
Cylinders	19 in. by 24 in.	19½ in. by 24 in.
Boiler pressure	200 lb.	200 lb.
Firebox heating surface	153 sq. ft.	178 sq. ft.
Tractive effort	22,000 lb.	23,160 lb.
Grate area	27 sq. ft.	27 sq. ft.

In conducting these tests it was so arranged that both locomotives hauled the same equipment and weight of train during all trips. The same engineer and fireman operated both engines. Care was exercised to make all conditions uniform in every respect. The tender was carefully weighed at the beginning of the trip, the water in the tender being measured at the same time. At the end of the trip the tank was filled so that it contained the same amount of water as when starting. Then the tender was weighed to determine the total coal consumption. Two trips were made with each locomotive.

Results of Tests

Although the tractive effort and cylinder horsepower were increased in connection with the application of thermic syphons to locomotive 102, the results of these tests show clearly the decidedly better firebox conditions and boiler conditions on the syphon-equipped locomotive as indicated in the tabulated summary of results. The increased boiler and cylinder capacity of this locomotive made it possible to handle the same train with greater ease, while the additional heating surface and improved water circulation caused by the syphon made a marked improvement in the steaming capacity of the locomotive. Maximum steam pressure was maintained at all times and the boiler was fully supplied with water during all of the runs with the syphon-equipped locomotive while with the non-syphon locomotive, it was

necessary to trade water for steam in hard places. The general performance of the syphon locomotive was reported as being much better and the coal consumption per square foot of grate area was reduced to 133 lb.

The conditions under which the tests were conducted were favorable for securing accurate comparisons. As will be noted from the summary of the test results, the number of cars and the tonnage in each case was the same. It will be noted that the locomotive equipped with a syphon used 6.16 per cent less water per ton-mile than the locomotive with the ordinary firebox. This saving is attributed to the improved steaming of the syphon locomotive which results in drier steam supplied to the cylinders. Part of the saving is also due to the fact that the blower was used much more on the locomotive without the syphon. The pounds of coal per thousand gross ton-miles with the syphon locomotive was

Date of test	SUMMARY OF TEST RESULTS		Difference Favor 10.
	Non-Syphon Engine 104	Syphon Engine 102	
	October, 1921	September, 1921	
Tonnage—average per trip	269	269	
Mileage per trip	145	145	
Gross ton-miles—average per trip	39,030	39,020	
Number of cars—average per trip	5	5	
Car mileage—average per trip	725	725	
Total coal used, as fired, pounds; average per trip	22,190	17,980	19 per cent
Total water used, pounds, average per trip	82,942	77,833	6.16 per cent
Pounds coal (as fired) per 1,000 gross ton-miles	569	461	19 per cent
Pounds coal (as fired) per locomotive mile	153	124	19 per cent
Pounds coal (as fired) per car mile	30.6	24.8	19 per cent
Pounds water evaporated per pound of coal	3,738	4,329	15.81 per cent
Pounds water per 1,000 gross ton-miles	2,126	1,995	6.16 per cent

19 per cent less and the pounds of water evaporated per pound of coal, 15.81 per cent greater. Based on these figures, the locomotive with the Nicholson thermic syphon would save on this run approximately 770 tons of coal a year which, at \$5.70 per ton on the tender, would represent a decrease in the expenditure for fuel of \$4,390.

As a result of these tests, the Spokane International has ordered syphon equipment for a freight locomotive which will enable the railway to increase the diameter of the cylinders on this locomotive one inch, thus materially increasing the tractive effort and cylinder horsepower.

Wage Cuts for Clerical Forces Before Railroad Labor Board

HEARINGS in the present controversy over proposed reductions in the rates of pay of various classes of railway employees continued before the Railroad Labor Board during the past week, the majority of the time being consumed in the presentation of evidence bearing on the wages of clerical forces.

The character of the evidence presented by representatives of the railroads is illustrated in the testimony of J. H. Higgins, representing the western carriers, who, after pointing out the decreases which have taken place in the cost of living since the last wage reduction, summarized the results of an investigation of clerical wages in other industries in western states as follows:

Of 318,875 employees of all classes employed by other industries, 17,104 or 22 per cent are performing work comparable to that performed by clerical forces of the western roads. Of these employees 27,484 or 31 per cent would be rated as clerks if they were employed by the carriers, 31,132 or 44 per cent would be rated as unskilled employees in the clerical department, and the remaining 35 per cent would be rated as supervisory or miscellaneous office and station forces.

Of the 27,484 clerks in other industries, 19,701 or 72 per cent were found to be receiving lower wages than are paid by the railroads for like services. Of the 31,132 comparable unskilled employees in other industries, 25,982 or 83 per cent were found to be receiving lower wages than prevailed for comparable work for the carriers.

Of the employees in other industries in 26 of the principal cities in the western territory, 39,553 or 32 per cent were found to be performing work comparable to that performed by the clerical forces, covered in this hearing. Of these employees, 31,506 or 80 per cent were found to be receiving lower wages than prevailed for analogous work for the carriers.

In addition, Mr. Higgins pointed out the wide range in the rates prevailing in other industries as between various western states and cities.

J. G. Walber and W. A. Northcutt, representing respectively the eastern and the southeastern carriers, presented similar evidence for their respective territories.

E. H. Fitzgerald Presents Employees' Case

The employees' case was directed by E. H. Fitzgerald, president of the Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees. The gist of Mr. Fitzgerald's testimony was summarized by him as follows:

The evidence in this case on behalf of the clerical forces will attempt to show:

- (1) that the clerks' wages are now lower than those prevailing in other industries;
- (2) that the present wage rates for clerical forces fall far short of a "minimum health and decency level";
- (3) that a rise in prices and therefore in the cost of living is inevitable;
- (4) that the increase in wages of clerical forces are small when computed over a long period of years rather than from an arbitrary point selected by the carriers because of the relation at that time of wages to prices and other factors;
- (5) the relation between wages and rates;
- (6) the relation between rates and business conditions;
- (7) that wage reductions have always been accompanied by increases in dividends;
- (8) that wage reductions will not reduce the cost of living; and
- (9) that wage reductions at this time will tend to check the recovery of business.

Disputes involving proposed reductions in the rates of pay of signalmen and train dispatchers occupied all of the Board's sessions on April 18 and 19. J. G. Luhrsen, appearing on behalf of the train dispatchers, defended the present rates of these employees on the grounds of the skill and training required to perform the work properly and upon the grounds that a reduction in the rates of pay of train dispatchers would destroy differentials that have always existed between the wages of these employees and of train service employees.

Labor Board Considers Wage Cut for Signalmen

Hearings before the Labor Board on the rules for engineers and firemen scheduled for May 1 have been postponed indefinitely. The reasons given by the Board are, first, a conflict with the date of a convention of the Brotherhood of Locomotive Firemen and Enginemen, second, the work of the Board will not be expedited but may be confused and retarded by beginning lengthy hearings on the day following the close of the present wage hearing, and, third, eastern roads have asked for a separate hearing of disputes involving the rules of these employees. The Board in addition granted the eastern carriers the separate hearings referred to the date to be set later.

The controversy between the railroads and their signal

department employees was taken up by the board on April 17. Representatives of the carriers repeated their requests for reductions in the rates of pay of signal department employees ranging from 5½ to 14 cents per hour. D. W. Helt, president of the Brotherhood of Railroad Signalmen, presented the employees' case, citing in defense of the present rates of pay the responsibility of these employees, the skill and training required of them to perform their work prop-

erly and the value of their services to their employers.

The rate at which the hearings are now progressing indicates that the whole controversy over proposed wage reductions will be in the hands of the board for decision prior to May 1, the dead line recently set by the board. Several of the smaller organizations will present their testimony during the present week, but it is not expected that this will consume a great deal of time.

Contracting of Work by Railroads Not New

Maintenance of Way and of Equipment and Even Running of Trains Handled by Outsiders as Early as 1855

THAT THE HANDLING of railway work by contract is by no means a present day innovation is shown by old records and reports of the Philadelphia, Wilmington & Baltimore, now a part of the Pennsylvania System, which has been brought to our attention by Samuel M. Felton, president of the Chicago Great Western. These records show that the contracting of many railway operations were carried out at a very early period. The contracts which have been entered into recently by various railroads and which have attracted much attention have been confined principally to the repair of cars and locomotives and to the maintenance of tracks and structures. Those in the earlier days of the Philadelphia, Wilmington & Baltimore covered a much wider scope, amounting practically to entire operation and maintenance as well as some of the items of new construction.

The first mention of the contract system is in the annual report of the Philadelphia, Wilmington & Baltimore for 1854. Samuel M. Felton, Sr., then president of the company, said the plan had been "examined and discussed," and referred to it as being in his opinion adapted to secure the greatest economies, both in labor and materials. He predicted its general adoption throughout the country. In the report for the next year, 1855, Mr. Felton stated that the contract system had been placed in partial operation for the latter six months of the year and had effected a saving of \$33,070 in operating expenses, the expenses for the first half of the year when no contracts were in effect were \$209,083 and for the second half, \$176,013.

Contractors Given Broad Responsibilities

The broad scope of the contracts is indicated by an entry in the directors' minute book, showing that on June 17, 1856, President Felton reported that responsible parties had submitted offers for one year, to supply under contract all wood, oil and waste; to keep engines in repair and furnish men to run them; to furnish labor to keep the road in repair, to lay new track and turnouts not exceeding seven miles; to furnish all labor in the freight department and clerical hire; and to take all risk and damage to freight in transit, and all loss on freight in collection.

President Felton recommended the acceptance of this offer, which the board approved. In consequence on August 19 of that year he presented contracts, made under the authority conferred by the board, and described as follows:

1. Contract with A. J. Barrett, George Stearns, Jr., William Stearns and Henry F. McKinney, for operating the road for one year from August 1, 1856;
2. Contract with Andrew C. Gray for operating the road from Wilmington to any and all points on the Delaware Railroad and the New Castle & Wilmington and New Castle & Frenchtown for one year from August 1, 1856;
3. Contract with William Windle for taking care of the

Southwark depot and collecting tolls, etc., on the Southwark Railroad;

4. Contract with Charles P. Dare to perform the duties of depotmaster, to furnish watchmen and for work at the depot in Philadelphia.

In subsequent reports for a number of years, President Felton made enthusiastic references to the success of the contract system. A typical comment from the annual report of 1856 follows:

"All the trains are now run at a stipulated price per mile, including repairs and renewals of locomotives, fuel, oil and waste and wages of engineers and firemen. The labor on repairs of road is also furnished by contract. The freight business is paid for by the ton in all its details, including loss and damage, and wages of conductors and brakemen. The fuel for all the stations, shops, steamboats, cars and for the ferry, is furnished for a stipulated sum per year. This system, more effectually than any other, brings to bear upon the affairs of the company the element of individual responsibility, the true element of success in any business."

Again in the report for 1857, Mr. Felton said, "Nothing can more effectually secure promptness, energy and thoroughness than this system, properly carried out in the hands of faithful contractors." In the annual report for 1858, Mr. Felton attributed the regularity of train movements and practical freedom of accidents to the operation of the contract system. For the following year, substantially the same comment was made.

In the report for 1860, after referring to the fact that the system had been extended to details not previously embraced, Mr. Felton said, "The work is better and more cheaply done and with more regularity and safety than under the old system, and we feel confident that in our case it has largely contributed to the success of the road."

The contract system on the Philadelphia, Wilmington & Baltimore, proper, passed out of existence during the Civil War. The fiscal year 1862 was the last under which general operation and maintenance were performed by contract. In his report for that year, under the heading "The Contract System," President Felton said:

"This system, which has been in operation on this road for several years, and resulted in great saving in expenses, has been given up for the coming year in most of the departments, because the prices of the principal articles used in operating the road had so rapidly increased and were so uncertain as to the future, that it was deemed more for the interest of the company to take the risk of future prices, than to pay an amount for the service by contract which would cover all the risks that the contractors would be liable to."

In order to be sure of the quality of the materials purchased, the president of the company supervised all purchases and charged them to the contractor. The working of the contract system may be judged to some extent by the follow-

ing compilation of receipts and operating expenses for a series of years both before and after adoption of the plan. The figures are for the Philadelphia, Wilmington & Baltimore, proper, excluding the branch lines:

PHILADELPHIA, WILMINGTON & BALTIMORE
(Excluding affiliated branches)

Company's fiscal year	Method of operation	Earnings	Operating expenses	Operating ratio, per cent

(a) Report states this item is about \$25,000 too high, owing to a change in accounting during year.

It will be observed that during 1862 the operating ratio fell to the remarkably low figure of 29 per cent. This was evidently a very trying year for the contractors, as the old records state they sustained a heavy loss. In consideration of this the board of directors authorized the payment to them of the additional sum of \$13,000.

A specimen contract form accompanying files on this subject discloses the interesting character of the agreements entered into in connection with these railway contracts. Under the terms of this form the railroad turned over to the contractor all the locomotives with the stipulation that the contractor provide the entire force for their operation and upkeep, including not only the maintenance attending ordinary wear and tear, but also to make good all damage resulting from accidents. With certain exceptions the contractor was required to employ all the train crews and the entire station forces as well as the passenger and freight department employees, including even the general freight agent and the freight solicitors.

The contractor also took over the entire maintenance of the tracks, including the laying of certain lengths of new trackage specifically mentioned in the contract. The maintenance of bridges and the maintenance of all cars remained in the hands of the railroad company. Another stipulation required the contractor to undertake all emergency work, including the employment of all additional men required to make good damage done by storms, floods, etc. The railroad company provided insurance against fire damage, but the contractor was liable for any losses resulting from carelessness of any one in his organization. The contractor was also liable for loss and damage to freight or personal injuries to passengers or employees.

Expenditures and disbursements were handled through the treasury of the railroad company. All moneys received by the station agents or other persons were turned into the railroad's treasury, a certified payroll of the contractor was furnished the railway each month and necessary funds were turned over to the contractor to pay his men. The compensation to the contractor was provided on the basis of certain fixed amounts stipulated in the contract for carrying out the various services required of him.

SENATOR ARTHUR CAPPER of Kansas, who has recently succeeded to the leadership of the "agricultural bloc" formerly held by Senator Kuylen, in a speech in the Senate on April 13 stating the aims of the farm bloc and that it "believes railway freight rates are too high and must come down" and that it "would restore to state railway commission much of the power taken away from them by an unwarrantable interpretation of the transportation act by the Interstate Commerce Commission." This "unwarrantable interpretation" was recently upheld by the Supreme Court

Storage Battery Truck with Crane of Unusual Length

THE ELWELL-PARKER Electric Company, Cleveland, Ohio, has recently developed an electric truck with a carrying capacity of 3,000 lb. and a revolving counterbalanced crane of unusual length. The crane is a handy, portable device for hanging smokebox doors or air pumps on locomotives in shops or engine houses. It is also adaptable to use in storerooms to handle castings, lighting generators and other parts which can be safely and easily stacked, reducing the storage space usually required.

The heavy vertical steel column has a long bearing in a pedestal bolted to the steel platform on the truck, and supports a 12-ft. boom which may be racked in or out by the

Elwell-Parker Truck With 8-Ft. Power Crane

operator without leaving the driving position. The hoist is operated by a separate motor direct-connected to an enclosed hoist mechanism. It is mounted on a steel frame which houses the battery, the battery, hoist and motor all acting as a counterbalance. A special trip switch mounted on the front of the battery box stops the inward motion of the boom as set.

The crane is designed to pick up 1,000 lb. at an 8-ft. outreach, or with outriggers in position as shown 3,000 lb. at 6-ft. outreach. The boom may be lowered to permit entrance of doorways. The outriggers are quickly adjusted, folded and swung in beside the crane column when not in use.

The truck is equipped with 21½ in. by 3½ in. drive wheels and 15 in. by 3½ in. trailing wheels, all four of which steer. Large wheels permit use in yards. A coupler is furnished on the rear to permit using the unit for intermittent tractor service. Motors, differential worms, wheels and crane pillar column are all fitted with ball bearings. A single battery furnishes power to propel the truck as well as to operate the crane.

GEORGE E. MACE, of the transportation bureau of the Boston Chamber of Commerce, has resigned to become traffic manager of the Chamber of Commerce of Trenton, N. J.

General News Department

Fire at Pennsylvania Shops

The shops of the Pennsylvania Railroad at Meadows, N. J., were damaged by fire on the morning of April 16 to the extent of \$175,000. The erecting shop, cabinet shop, paint shop and tin shop were a total loss.

Preservation of Railroad Records

The Interstate Commerce Commission has issued an order that the period of federal control shall not be computed in determining the periods of time after which carriers are permitted to destroy their records, as provided for in regulations prescribed by the commission in 1914.

New York Central Shops on Piecework Basis

Three shops of the New York Central, which have been idle for six weeks or longer, were reopened on Monday of this week with about 775 men at work at piecework rates. These are the shops at West Albany, N. Y.; Avis, Pa., and Collinwood, Ohio. It is said that the rates of pay will be about 25 per cent higher than those which prevailed in 1917.

The Labor Board's New Quarters

On and after April 24, 1922, the Railroad Labor Board will be located in the Transportation building, 608 South Dearborn street, Chicago, and all communications intended for the Board should be addressed accordingly. Unless otherwise advised, all hearings will be conducted in the new hearing room on the twenty-second floor of the above-mentioned building.

Phillips Not to Quit Labor Board

Albert Phillips, member of the labor group on the Railroad Labor Board, whose resignation was tendered several weeks ago, will continue to be a member of that body, according to an announcement made by the Board on April 19. Mr. Phillips resigned because of continued ill-health, but it is stated that he will be able to complete his term, which expires in April, 1923.

Swindlers Collect Money Ostensibly for Mileage Book Campaign

Swindlers claiming to represent a movement to secure a law reducing rates for mileage tickets, and asking for money to promote such a law at Washington, are said to be unusually active just now, while a bill for such a law is under discussion in a Congressional committee. These "solicitors" usually carry a petition addressed to some territorial passenger association (which is never presented), and claim to represent the "Interstate Travelers' League" or some other imaginary association. All legitimate commercial organizations interested in railroad fares have repudiated these frauds.

Harris Bill on Steel Cars Amended

The Interstate Commerce Commission in a report on a bill introduced by Senator Harris of Georgia, to compel the use of steel passenger cars, has recommended that a year be allowed for study of the matter, and the bill has been modified accordingly.

The commission told the senators that the proposed bill would introduce many complications where existing roadbed and structure would not be heavy enough to support steel cars; also that the progress in recent years in the construction of steel cars and cars with steel under-frames, had been voluntary on the part of the railroads; and that to prevent shortage the retirement of the

remaining wooden cars would have to be extended over a period of years.

The opinion was also expressed that legislation at present should provide only that no wooden cars should be located in a passenger train between or ahead of steel or steel under-frame cars.

Effective Date of Tank Car Specifications Announced

The Mechanical Division of the American Railway Association has issued a circular announcing that the effective date of the requirements of Section 7c of the specifications for Class I and II tank cars, and the last paragraph of Section 7c of the specifications for Class III and IV tank cars is further extended to July 1, 1923. The sections of the Tank Car Specifications referred to provide that no nipples, valves or other attachments shall project below the bottom outlet cap except while the car is being unloaded.

Exhibits and Entertainment at Fuel Association Convention

Detail arrangements are being completed for the convention of the International Railway Fuel Association to be held at the Auditorium Hotel, Chicago, May 22-25. The International Railway Supply Men's Association is arranging for exhibits and space is being taken rapidly. Entertainments are planned for Monday, Tuesday and Wednesday evenings, including moving pictures of coal mining operations, an informal reception and dance and a dinner.

The Sciotoville Bridge of the Chesapeake & Ohio Northern

The continuous truss bridge of the Chesapeake & Ohio Northern over the Ohio river at Sciotoville, Ohio, was the subject of a paper presented by Gustav Lindenthal, consulting engineer, New York, before the regular meeting of the American Society of Civil Engineers at New York City on Wednesday, April 5. The Sciotoville bridge is the second largest continuous truss bridge in the world having two spans, 775 ft. center to center of bearings and presented a large number of unusual problems and difficulties. Mr. Lindenthal described in detail the major problems of design, the methods of erection, which had to be worked out in fine detail, and the results obtained, illustrating his talk by means of lantern slides.

Machinists' Union Asks Limitation on Contract Work

The International Association of Machinists has filed a petition with the Interstate Commerce Commission referring to the charges which it made before the commission last year regarding the practice of the railroads in sending locomotives to contract shops for repairs and asking the commission to extend its investigation of the "contracting out" practices of the railroads to cover also the practice of closing their own shops and farming out work to existing private companies or companies especially formed for this purpose.

The commission is asked further to investigate the relationship of financial control, if any, between the carriers and the companies to which the work is transferred and to issue an order forbidding the letting out or transfer of shop work which was not wholly or in substantial part performed by the carriers at the time of the passage of the transportation act, except after obtaining from the commission a permit authorizing such work, such permit to be issued only for specific cases and subject to the conditions that the work could not be done in the railroad shops, that the contract prices are not excessive, and that the labor standards established by the Railroad Labor Board shall be observed in full by the contracting shops.

Operating Statistics of Large Steam Railroads—Selected Items for the Month of February, 1927

Region, road and year	Average miles of road operated	Locomotive-miles			Car-miles		T-n miles (thousands)		Average number of locomotives on line daily					
		Principal and Light	Light	Light	Loaded (thousands)	Per cent loaded	Gross, Excluding locomotive	Net, Revenue and non-revenue	Service-able	Un-service-able	Per cent un-service-able	Stored

Tentative Valuation Hearings

The Interstate Commerce Commission has announced a series of hearings before examiners at Washington on protests which have been filed against tentative valuation reports. On May 18 the hearing will be on the St. Louis-Southwestern case and on May 25 there will be hearings on the Green Bay & Western and the Chicago, Rock Island & Pacific.

Railway Labor Disputes and the Federal Power

A discussion of the "use of federal power in railway labor disputes," by Clyde O. Fisher, assistant professor of economics at Wesleyan University, has been issued by the United States Department of Labor as Bulletin No. 303. It discusses the experience of this country in the development of governmental authority in the settlement of railway disputes. The law of 1888, providing for voluntary arbitration, the Erdman Act, the Newlands Act, the Adamson law, and the Esch-Cummins law are set forth, with the reactions of the different factions, that is, the unions, the railroad operators, and the public.

Cross Crossings Cautiously

The board of directors of the American Railway Association has decided to promote, from June 1 to September 30, a "Careful Crossing Campaign" with a view to impressing on everybody the thought expressed in the title of this paragraph.

Uniform colored posters have been designed and will be furnished at cost. The co-operation of the National Automobile Chamber of Commerce, the National Safety Council, and other organizations has been secured. The plan of campaign will be discussed at the annual meeting of the Safety Section in Chicago, on May 3, 4 and 5, and Safety officers of member railroads are urged to be present.

Twenty Thousand, Plus

The Pennsylvania Railroad Employees' general athletic exhibition takes place at Columbus, Ohio, April 22 and the number expected to attend is 20,000, besides women and children. There will be more than 1,500 contestants, including individuals and teams will compete at Columbus, Ohio, on April 22 in the Pennsylvania System indoor championships. Through the co-operation of the Columbus Chamber of Commerce, the Coliseum, which seats 7,000, and the Ohio State fair grounds will be placed at the disposal of the railroad men free of charge. Swimming events will be contested in the 60-foot pool of the Columbus Athletic Club. Women employees will compete in basket ball, volley ball, duck and ten pins, and 50 and 75 yard dashes. There will be indoor baseball, pocket billiards, trap shooting, boxing, wrestling, horse shoes, quoits, shuffle board, and rifle shooting.

H. A. Miller, sporting editor of "The Columbus Evening Dispatch" will give a loving cup to the individual scoring the most points in the track and field events, and "the Deshler trophy" offered by Dr. A. L. Wallicke, will be presented to the bowler who rolls the highest score in a single game. P. F. Neff will referee the meet, assisted by I. W. St. John, director of athletics of Ohio State University. E. J. Hughes is chairman of the local committee of Columbus employees in charge of arrangements.

President Markham Pays Tribute to Labor Board

That the United States Railroad Labor Board has done remarkably well in the face of the serious obstacles with which it is confronted is the opinion of C. H. Markham, president of the Illinois Central, as expressed in an address at a dinner of the St. Louis Association of Commerce, on April 14. Mr. Markham said, in part:

"The Railroad Labor Board, which was created by the Transportation Act, has been the object of considerable censure, and that censure has come alike from railway executives, railway workers and the public. Considering all the obstacles which the board has faced during the trying two years since it was created, I believe it has done remarkably well. Generally speaking, its decisions have been accepted and lived up to by the railroads and the employees, although questions of jurisdiction have made it appear that some of the roads have not accepted all its findings

in good faith, and there was a short period last fall when some groups of employees flaunted a decision of the board with a strike threat. However, the public members of the board were able to smooth out the difficulty, and the strike was averted. The three representatives of the public group hold the balance of power. I believe that they have tried to deal fairly with all questions brought before the board, and that they have had a wholesome influence in making the board a respected public body."

Canadian Pacific Memorial in New York

One of the massive bronze tablets recently made for the Canadian Pacific Railway to perpetuate the memory of the employees of the road who gave their lives in the great war has been put up on the company's building at 44th street and Madison avenue, New York city. The number of employees who made the supreme sacrifice was 1,100 and the wording of the inscription is given below. The tablet is 50 in. wide and 40 in. high, and weights 270 lb.

At the top of the tablet Britannia calls to her sons; at the left there is a battleship and a tank, at the right a Canadian Pacific locomotive and a steamship, and below these advancing artillery and infantry. At the bottom are the names of the battles in which the Canadians fought and died, from Ypres through the terrible years to Mons.

In all 11,062 Canadian Pacific men served "king and country"; 2,088 were wounded and about 19,000 former soldiers are now employed by the company. Replicas of this tablet are being placed in all the principal Canadian Pacific offices in Canada and in its offices in London, Liverpool and other cities. The tablet was designed by Archibald Pearce, of the railway's engineering department, and was engraved by the Bromsgrove Guild, Worcestershire, England.

THIS TABLET COMMEMORATES THOSE IN THE SERVICE OF THE CANADIAN PACIFIC RAILWAY COMPANY WHO AT THE CALL OF KING AND COUNTRY LEFT ALL THAT WAS DEAR TO THEM, ENDURED HARDSHIP, FACED DANGER AND FINALLY PASSED OUT OF SIGHT OF MEN BY THE PATH OF DUTY AND SELF SACRIFICE, GIVING UP THEIR OWN LIVES THAT OTHERS MIGHT LIVE IN FREEDOM. LET THOSE WHO COME AFTER SEE TO IT THAT THEIR NAMES BE NOT FORGOTTEN.

Air Brake Association Transfers Convention from Washington, May 9, to Atlantic City, June 19

The executive committee of the Air Brake Association after careful consideration has decided to transfer the twenty-ninth annual convention from Washington, D. C., May 9-12, to Atlantic City, June 19-21. This change is made at the eleventh hour because of the culmination at this time of plans which have been developing during the past two or three years for the closer affiliation of the Air Brake Association with the Mechanical Division of the American Railway Association.

This change of convention place and time is decidedly advantageous to the Air Brake Association in that it now makes possible a closer co-operation with the work of the Train Brake and Signal Committee of the American Railway Association. The identity and individuality of the Air Brake Association is to be retained. The officers, membership and activities will be the same as formerly with no change in constitution or by-laws. The association will continue to be a distinctly educational organization working for improvements in air brake practices and a higher standard of maintenance.

Convention headquarters will be at Haddon Hall, conveniently situated on the boardwalk, where a spacious convention hall and ample room for exhibits have been secured. In addition to accommodations at Haddon Hall, special rates on the American plan have been obtained at Hotel Rothwell, Hotel Wiltshire and Avon Inn.

The usual exhibits of the Air Brake Appliance Association will be displayed at Haddon Hall and are entirely distinct from the extensive Railway Supply Manufacturers' Association exhibit of railway machinery at Young's Million Dollar Pier, which will be

open to all members. Full participation in the entertainments of the A. R. A. Mechanical Division will be afforded members of the Air Brake Association and their families. This includes the grand carnival ball on the Pier, Monday, June 19, and the grand ball Tuesday evening. Free roller chairs will be available on the boardwalk for members from 9 a. m. to 5 p. m.

A. R. A. Recommends New Interchange Practice

The recommendation of the Joint Committee on Interchange of Equipment of the American Railway Association relative to joint interchange inspection of equipment, which was submitted to a letter ballot of the Association, has been approved by a vote of 303 to 14, with 81 not voting.

The recommendation, which follows, has been adopted by the A. R. A. as recommended practice.

It is the opinion of the Joint Committee that special rules of general application covering joint inspection of equipment at interchange cannot be formulated for the reason that local conditions must govern; that existing A. R. A. rules will enable interested roads to agree on inspection of equipment.

It is, therefore, suggested in the interest of economy in operation and to facilitate the movement of cars, that where inspection of equipment is involved at any point of interchange, that the interested roads arrange for conference to study conditions at that point. The following principles to govern any arrangements which may be adopted: 1.—Observance of A. R. A. rules. 2.—No backward movement of cars. 3.—No duplicate interchange inspection of cars. 4.—No delay to cars due to inspection in order to fix responsibility for damage to cars, adjustment or transfer of loading.

There are various forms of interchange inspection which can be adapted to the principle of some of which are outlined below:

A.—JOINT INSPECTION—Where all of the inspectors are joint men under a chief joint inspector.

B.—INSPECTION UNDER THE JURISDICTION OF AN ARBITRATOR—Where inspectors are in the employ of various railroads under the jurisdiction of an arbitrator, whose duty it is to harmonize and unify inspections and settle any disputes which may arise without holding cars or lading for this purpose.

C.—DELIVERING LINE INSPECTION—Where interested roads accept the delivering line inspection.

D.—RECEIVING LINE INSPECTION—Where interested roads accept the receiving line inspection and handle each other's defect cards.

E.—INSPECTION BY RECEIVING LINE'S INSPECTORS IN DELIVERING LINE'S YARD—Where receiving line inspectors make inspection in delivering line's yard.

F.—JOINT INSPECTION AND REPAIRS—Where a single organization in a joint terminal makes all inspections and repairs for the interested roads.

Value of Education in Railroadng

Samuel Rea, president of the Pennsylvania Railroad, replying to an inquirer, says that the man graduating from college and entering the railway business is likely to advance more rapidly than the man of his age who lacks college training. Other things being equal, the college man will go ahead faster and get farther than the man who lacks that great initial advantage.

"In the technical branches of railroadng we have reached the point where the preliminary training of a college or a university course is no longer looked upon merely as an advantage, but has become, practically speaking, a necessity for the young man who aims at a place in the executive forces. Of 163 principal officers and directors of the Pennsylvania System, 86 are college graduates and 77 not. Superficially, that does not look like a very striking preponderance in favor of the college men; but for every hundred men entering the railroad service with a college education, there are thousands who start without one.

"As to the best lines of training the statistics leave no doubt that they are civil and mechanical engineering, particularly the former. Out of the list of 163 men just mentioned, 81 are officers of the operating department, and, of the 81, no less than 54, or exactly two-thirds, are college-trained men; and out of the 54 college graduates, 38 are civil engineers, eleven are mechanical engineers, one is an electrical engineer, and four are graduates of the academic departments. If we confined our study to the younger operating officers, we should find that nearly 100 per cent are college graduates. For a number of years past it has been a rule of the company that graduates of recognized colleges or universities in civil, mechanical or electrical engineering, or their equivalents, be given preference for development into operating officers.

"In the other departments—traffic, accounting, purchasing, financial, insurance, real estate, legal, and the secretary's staff—the training received in a scientific course is not of direct advantage; but the training of an academic course gives young men entering those departments as much relative advantage as it would in the corresponding departments of any other large business. Ten of the Pennsylvania's leading traffic officers are graduates in academic courses.

"Comparatively few young men who have specialized in economics at college seem to have entered the railroad business,

but there should be a good field for them in the non-operating departments.

"I would not advise any young man whose principal conception of success was to become rich, or quickly to obtain a very large salary, to enter the railroad business. The period of adventure and pioneering in the railroad enterprise has now passed, and the firm establishment of public regulation as a definite policy tends to remove railroading almost wholly from the realm of speculative enterprise. As a result, the work of the railroad officer has become one of the most highly stabilized of the professions, from the viewpoint of remuneration and certainly of employment. To a young man of ability, about to graduate from college, and confronted with a choice of professions, I would, therefore, say that railroading offers a more certain career than most branches of commerce or industry, with less likelihood of suffering through the mistakes or wrongs of others and also with somewhat less probability of gaining the very highest monetary return."

Exhibitors at Atlantic City Conventions

The following list shows the names of the firms which have thus far been allotted space by the Railway Supply Manufacturers' Association for the exhibit which will be held on the Million Dollar Pier at Atlantic City during the meetings of Division V—Mechanical, and Division VI—Purchases and Stores, American Railway Association, June 14-21. This list compares favorably with similar lists published at this time for the exhibits of previous years.

Air Reduction Sales Co., New York.
 Ajax Manufacturing Co., Cleveland, Ohio.
 Allegheny Steel Co., Pittsburgh, Pa.
 American Abrasive Metals Co., New York.
 American Arch Co., Inc., New York.

Traffic News

A meeting to organize a National Association of Traffic Clubs will be held in the rooms of the Traffic Club of Chicago at the Hotel LaSalle in that city on May 15, 16 and 17. Present indications are that more than 60 national committeemen, representing 30 traffic clubs, will be present at this meeting.

In a recent hearing before the Railroad Commission of California on an application of the Marin Transportation Company for authority to operate automobile freight service between San Francisco and points in Marin county the commission held that the present carriers are able to provide full service and as a result rejected the application.

Paul Henderson, of Chicago, has been nominated by President Harding for appointment as second assistant postmaster general in charge of railway mail service, to succeed Col. E. H. Shaughnessy, deceased. Mr. Henderson is a son-in-law of Congressman Madden of Illinois and has been connected with the Brownell Improvement Company of Chicago.

The Chicago, Milwaukee & St. Paul has announced a reduction in its dining car prices. Club breakfasts will be served at prices ranging from 25 cents to \$1, and club luncheons and club dinners at 60 cents to \$1.25. There will be no change, however, in the price of the table d'hotel dinner served on the Pioneer Limited between Chicago and the Twin Cities, and the South-west Limited, between Chicago and Kansas City.

Reductions in freight rates between the United States and Mexico have been proposed through a tentative agreement of five American railroads serving the Mexican border territory and the National Railways of Mexico. Reductions will range from 25 to 50 per cent. Summer tourists' rates have already been put into effect in Mexico, and it is expected that the American roads will follow with like reductions to border points. The present round trip fare from border points to Mexico City is \$51.75, representing a reduction of about \$19.

The Federal District Court at Kansas City, Mo., on April 13, upon the application of the railroads, issued a broad injunction against ticket scalping. The restraining order heretofore issued by this court is continued in force, as a temporary injunction, and the defendants are restrained from engaging in the business of purchasing or selling railroad tickets of any kind, nature or character, and from doing any business as railroad ticket brokers or railroad ticket scalpers; and from advertising for or soliciting for the sale or purchase of railroad tickets of any kind, nature or character. The scalpers have removed all cut rate signs and it is believed that the railroads will be free from scalping in Kansas City. This application for injunction was evidently made in view of the reduced rate excursion tickets that are soon to go on sale.

Fifteen carloads of silk arrived in New York over the New York Central last week in less than five days from Vancouver, B. C., and in two weeks from Yokohama. The Canadian Pacific reports the run as follows:

"The consignment, 3,697 bales of raw silk (17 cars), was delivered at Vancouver from the "Empress of Asia" on April 10, nine days after leaving Yokohama. Fifteen of the 17 cars were destined to New York and reached there in 4 days, 16 hrs., 10 min. after the ship tied up in Vancouver harbor. Actual running time Yokohama to Victoria, 8 days, 19 hrs., 32 min.; Victoria to Vancouver, 6 hrs., 20 min.; transfer to cars at Vancouver, 5 hrs., 58 min.; Vancouver to Prescott, Ont., 3 days, 17 hrs., 57 min.; time at Prescott 1 hr., 30 min.; Prescott to Ogdensburg, N. Y., 3 hrs., 10 min.; Ogdensburg to New York, 11 hrs., 35 min.; Yokohama to New York, 13 days, 18 hrs., 2 min.

The Chicago & Alton announces homeseekers' fares from all points on its line to destinations in Alberta, Colorado, Idaho, Manitoba, Minnesota, Montana, New Mexico, North Dakota, South Dakota, Oregon, Saskatchewan, Utah and Washington. The tickets will be sold on the first and third Tuesdays of each month at a one way rate plus two dollars for the round trip.

\$200,000,000 of Government Payments to Railroads Postponed to 1923

Expenditures of the federal government on account of the railroads during the fiscal year ending June 30, 1923, are estimated at \$200,000,000 in a revised statement of the Treasury's latest estimates of receipts and expenditures sent by Secretary Mellon to committees of Congress on April 14. The estimates as to the fiscal year 1923 are based on estimates which appear in the budget submitted in December, 1921, after taking into account changes which have become apparent since that time. The budget for 1923 as submitted to Congress did not include any item of expenditure on account of the railroads, but Mr. Mellon says that the indications now are that owing to delayed settlements of matters arising out of federal control and under the guaranty for the six months following federal control, there will be payments of about \$100,000,000 under the Railroad Administration and about \$100,000,000 under the Interstate Commerce Commission during the fiscal year 1923. The postponement of these payments to 1923 is reflected in a corresponding reduction of railroad expenditures for the fiscal year 1922, and partly on this account and partly on account of the proceeds of the sale of about \$230,000,000 of equipment trust notes of carriers, the item of railroad expenditures in the statement shows an estimated credit of about \$56,000,000 as compared with estimated expenditures of about \$337,000,000 when the budget was submitted. The Secretary uses this figure of \$230,000,000 of equipment trust notes as of March 31, although the latest statement of the director general indicates a sale of \$249,000,000.

Railway Revenues and Expenses for February

The Interstate Commerce Commission summary of railway revenues and expenses of Class I roads for February and two months is as follows:

Item	February		Two months	
	1922	1921	1922	1921
Average number of miles operated...	235,696.53	235,326.75	235,709.82	235,327.29
Revenues:				
Freight	\$294,477,607	\$284,216,672	\$571,384,767	\$609,400,642
Passenger	73,585,326	88,462,552	\$157,314,702	\$193,720,099
Mail	6,986,554	7,913,642	14,364,298	16,136,847
Express	6,300,683	4,457,672	12,820,694	11,899,871
All other transportation	12,052,003	11,732,196	24,081,912	25,168,601
Incidental	7,426,180	9,314,845	15,819,132	19,915,069
Joint facility—Cr.	780,994	608,437	1,388,716	1,312,647
Joint facility—Dr.	177,675	210,437	350,962	395,506
Railway operating revenues	401,426,672	406,495,579	796,823,889	877,158,270
Expenses:				
Maintenance of way and structures	46,535,345	53,316,603	95,249,268	114,168,877
Maintenance of equipment	91,956,913	108,220,839	185,542,265	232,248,977
Traffic	6,790,020	7,400,577	13,964,980	14,390,621

the tickets good for 21 days from date of sale. This company will also place on sale daily between May 15 and September 30, reduced summer excursion fares from all points on its line. To destinations in the west these tickets will be sold at one and one-tenth fare for the round trip; to Michigan, Minnesota and Wisconsin, the rate will be one and one-half for the round trip; and to eastern and northeastern points, one and three-fifths rate for the round trip sales to Colorado, Wyoming and the national parks will not commence until June 1. There will also be 20 to 30-day excursion rates to points in Wisconsin, Michigan and Minnesota.

The United States Shipping Board is planning to begin hearings shortly in various parts of the country on Section 28 of the merchant marine act, which is intended to confine export and import rail rates to the traffic moved in American ships whenever the Shipping Board certifies to the Interstate Commerce Commission that adequate shipping facilities under the American flag exist to permit enforcement of the section. The announced intention of the Shipping Board to enforce this section had aroused numerous protests from chambers of commerce and other commercial organizations interested in export and import traffic and the board appointed a committee consisting of Commissioners Thompson, Benson and Chamberlin to conduct the hearings. The first will be held at Boston and a schedule of dates and places will be announced shortly. The board desires it made plain that the only question on which it desires evidence is as to whether there are adequate shipping facilities under the American flag.

Rate Decision Still Uncertain

Thus far no indications have appeared as to when the Interstate Commerce Commission will hand down its decision in the rate case, on which it held hearings for three months, although it is understood that the commissioners are working overtime in trying to reach a decision. Some time ago Commissioner Esch told the House committee on interstate and foreign commerce that the commission hoped to have the decision by the first week in April. It is understood that the 11 members of the commission are of many different minds as to whether and to what extent rates should be reduced. One rumor, which is probably only a guess based on the attitudes indicated by various members of the commission at different times, is that four members of the commission felt that under the law rates could not be reduced, while four were of the opinion that a small general percentage reduction should be made, while three were inclined to favor reductions on basic commodities.

Ticket Frauds Prohibited by New Law in New York

The Legislature of New York has passed a new law penalizing the misuse of railroad tickets, and the Long Island Railroad has issued a notice of it for the benefit of season ticket holders. The gist of the law is to the effect that

No person shall obtain transportation for himself, herself, or others, or shall avail himself, herself or others of any means of transportation at rates other than or different from those prescribed in the schedules of rates filed and published, or in violation of the conditions attached to any reduced rate ticket, provided such conditions are contained in the filed and published schedules.

This, says the circular, means that the misuse of commutation tickets, and family trip tickets, is a misdemeanor, punishable by imprisonment for not more than one year, or by a fine of not more than \$500, or by both. Commenting on the law, P. H. Woodward, general passenger agent of the Long Island, said that his road would expect the new law to be obeyed by persons who have been "innocently" lending their tickets on days not used by themselves. The regular scalpers, however, he intends to bring to justice. Persons who are not scalpers and not innocent seem not to be covered by Mr. Woodward's comment.

"Practical Permanent Pastures"

Saving two hundred years of the time that Nature would require to convert waste and uncared for lands in Georgia and Alabama into first-class feeding ground for cattle is the keynote of a pamphlet with the above title, which has been issued by the Agricultural Department of the Central of Georgia Railway describing the results of its activities during the past year, looking to the encouragement of farmers to introduce the best qualities of grass and thus promote the profitable raising of livestock. This

railroad company's hundred-dollar prizes, offered in 46 counties for the best pastures, were noticed in the *Railway Age* of June 10, 1921, page 1371.

During the past two months, the farmers in the territory adjacent to the railway have bought and sown 11 tons of seed, and much more could have been sold to them if it could have been obtained. The railroad company also has aided the farmers in the securing of several hundred head of registered cattle and has given 137 boars and 202 bulls as prizes in Boys' Club contests.

Every one of the 46 test pastures proved a success, and the pamphlet contains interesting letters from the farmers who made the improvements.

Joint Commission Report to Recommend Constructive Treatment of Transportation

The forthcoming report to Congress of the Joint Commission of Agricultural Inquiry will disclose a mass of valuable facts and figures bearing on the relation of transportation to agriculture and industry.

Chairman Sydney Anderson of Minnesota, speaking for the commission, says: "We are convinced that the inquiry concerning transportation has gone further than any such investigation heretofore made. The collecting and assembling of the data has required the combined efforts of more than 1,600 persons and the circulation of more than 250,000 questionnaires. Over 100 committees representing agriculture and industry were established, and those in turn appointed 200 sub-committees.

"Further, the joint commission has had the active and effective co-operation of the various governmental commissions, departments and bureaus and of farm and railway organizations, etc.

"The report will include a score or more of distinct recommendations to Congress, bearing chiefly on governmental contracts with transportation systems and an equal number of conclusions addressed to transportation management and to producers and shippers. The commission is convinced that transportation requires constructive and helpful governmental and public treatment rather than repressive or restrictive regulation."

Coal Production

Complete returns of coal loaded into cars at the mines, compiled by the Geological Survey, indicate that production during the first week of the strike was 3,784,000 net tons of bituminous coal, and a few cars of anthracite dredged from the rivers. The total production of all coal was 3,793,000 net tons.

Preliminary telegraphic returns for the week of April 10-15 indicate no change in anthracite, but a slight decrease in bituminous. It will be seen from the following table of cars of soft coal loaded daily that the output on Monday, Tuesday, and Wednesday was running consistently below that on the corresponding days of the week before. On Thursday, April 13, however, loadings increased to 11,480 cars, as high a figure as any recorded since the strike began.

First Week		Second Week	
Monday, April 3	11,445	Monday, April 10	10,732
Tuesday, April 4	11,019	Tuesday, April 11	10,671
Wednesday, April 5	11,437	Wednesday, April 12	10,973
Thursday, April 6	11,900	Thursday, April 13	11,480
Friday, April 7	11,307		
Saturday, April 8	9,028		

The current production is less than the districts now at work are able to produce when the demand for coal is active, the report says. It is true that a number of important non-union mines in the Connellsville coke region and in Central Pennsylvania have been closed by the strike, but the existing demand is not sufficient to call out full production in those districts remaining at work. From mines in many non-union fields reports of "no market," "dull demand," and "unbilled coal" continue to be received. The number of loaded cars unconsigned at the mines was very large when the strike began, and it is increasing rather than decreasing.

Production of anthracite ceased virtually during the first week of the strike 172 cars being shipped during the week ended April 8. Based on these loadings, the total output is estimated at 9,000 net tons.

Final reports of shipments of anthracite during March indicate a total production of 8,757,000 net tons. In comparison with February this was an increase of 27 per cent. The month's production exceeded that of any similar month during the past nine years, except in 1917 and 1918.

The government is still maintaining its policy of no interference

Commission and Court News

Interstate Commerce Commission

The commission has suspended until August 16 the operation of schedules published by the Erie which propose increases and reductions on brick from Corry, Pa., to New York rate points.

The commission has adopted a conference ruling that Section 208a of the Transportation Act, 1920, does not authorize the commission to award reparation, or consent to an award of reparation made by a state commission, on intrastate shipments which moved during the guaranty period.

The commission has suspended until August 13 the operation of certain schedules published by the Bessemer & Lake Erie which propose the cancellation of joint through rates on bituminous and cannel coal from B. & L. E. Group No. 1 points in Pennsylvania, to various destinations on the Buffalo, Rochester & Pittsburgh.

The commission has suspended until August 15 the operation of certain rates which propose to increase from 38.5 cents to 45.5 cents per 100 lb. existing rates on lumber from points in Mississippi on the Alabama & Mississippi, Jackson & Eastern, Mississippi & Western and Meridian & Memphis to destinations on the Chesapeake & Ohio, Ashland, Ky. to East Huntington, W. Va., inclusive.

Southeastern Sugar Investigation

The commission has ordered an investigation into the reasonableness of the rates on sugar from New Orleans and other producing points in Louisiana, and from Savannah, Ga., Boston, Mass., New York, N. Y., Philadelphia, Pa., Baltimore, Md., and other producing and distributing points on the Atlantic seaboard to points in Kentucky, Tennessee, Mississippi, Alabama, Georgia, Florida, North Carolina, South Carolina, and Louisiana east of the Mississippi river, including the east bank thereof, and the north bank of the Ohio river.

Court News

Telegraph Office Held Not Continuously Operated

A railroad, the International & Great Northern, kept a telegraph office open from 7 a. m. to 7 p. m. only, with one operator, who remained on duty from 7 a. m. to 6 p. m. and, when necessary, till 7 p. m. The company had an arrangement with another railroad, which had a telegraph office in a tower at some distance, continuously operated by three shifts, to receive and deliver its train orders when its own office was closed, for which service it paid. The Circuit Court of Appeals, Fifth Circuit, holds this did not make the office one continuously operated within section 2 of the Hours of Service Act. Judgment for the government was reversed (261 Fed. 703).—*Baker v. United States*, 276 Fed. 897.

Negligence in Kicking Coupler

The Georgia Court of Appeals holds that a car coupler who sees and knows that the drawhead and knuckle of the coupling are defective and will not act automatically, and who, while an engine with cars attached is backing rapidly to the point where the coupling is to be made, kicks against the drawhead and knuckle, to adjust them, just at the moment of impact, and thus gets his foot mashed, cannot hold the railroad liable, although a signal given by him was disregarded by the engineman in thus rapidly backing the engine and cars; it not appearing that the injured employee did not see and know the speed at which the engine and cars were moving. The rule of comparative damages under the Georgia Employers' Liability Act does not apply where the fault of the employee amounts to a lack of ordinary care, making him the author of his own injury.—*Green v. Flint River Northeastern* (Ga.) 110 S. E., 243.

Labor Board Decisions

Foremen Need Not All Be Paid the Same Rate

During the government control period the Portland division of the Southern Pacific was under a different regional director from the rest of the Southern Pacific System, and this regional director did not advance the wages of bridge and building and water service foremen and assistant foremen on the same basis that advances were made on the rest of the Southern Pacific System. Wage advances under Decision No. 2, being applied to the rates of pay in effect on March 1, 1920, perpetuated these differences. In answer to a complaint of the employees, requesting that this differential be removed, the railroad said that the provisions of Decision No. 2 had been applied legally; and this contention was sustained by the Labor Board. The board stated, however, that its decision does not prevent negotiations between the railroad and the employees with regard to the salaries paid these foremen.—*Decision No. 798*.

Seniority Retained While Filling Temporary Position

In February, 1920, a car repairman at the East Fitchburg shops of the Boston & Maine, with 19 years' seniority, applied for and was assigned to a temporary position as car inspector at the passenger station at Fitchburg. Later this job was advertised as a permanent vacancy and this man refused to bid on the permanent position, returning to the shops; and there he was informed that he had lost his seniority. The employees, through the American Federation of Railroad Workers, contended that in accepting the temporary assignment he did not lose his seniority at the shops. The Labor Board decides that in view of the fact that the position accepted by him was advertised as temporary, he should be restored to his seniority standing at the shops; and be compensated for any loss of wages which he later suffered by loss of seniority through a layoff on account of a reduction of forces at the shops.—*Decision No. 773*.

Brakeman May Act as Fireman in Emergency

L. C. Roth, a fireman on the Missouri, Kansas & Texas, became ill and was relieved in the middle of a trip at Cushing, Oklahoma, on August 13, 1920. H. G. Olmstead, a fireman regularly assigned to a switch engine at Cushing, who had been off duty about 12 hours at the time, claimed that he should have been called, instead of a brakeman, to relieve Roth for the remainder of the trip. The carrier contended that while Olmstead was assigned to the switch engine at Cushing he was not entitled to work outside of his regular assignment and, further, that there was no assurance that Roth's illness would improve sufficiently to justify putting him in Olmstead's place on the switch engine. The Labor Board decides that the claim of the train service brotherhoods that Olmstead is entitled to a minimum day's pay for not being called, is not supported by any rule of the agreement between the employees and the carrier; and the claim is denied.—*Decision No. 773*.

Board Sustains Managerial Function of Roads

The position of ticket agent on the Missouri, Kansas & Texas, at Sedalia, Mo., paying 713¢ per hr., was reclassified on February 28, 1921, as ticket clerk, paying a rate of 50¢ per hr. The Order of Railroad Telegraphers protested against this action, stating that prior to the change separate freight and ticket offices were maintained. No change was made in the duties or responsibilities of the position, the only difference being that reports were now made in the name of the agent instead of the ticket clerk. The road maintained that business conditions at Sedalia justified the reclassification of the position and the extension of the authority of the freight agent over the passenger station. The road contended further that the determination of the character of the service to be rendered in its relation to the public at its stations is purely a managerial function and that there is no rule in the agreement between the road and its employees to support the employees' contention that it shall confer with them prior to making changes of this character. The labor board denied the claim of the employees.—*Decision No. 837*.

Foreign Railway News

The First Locomotive Works in Poland

J. Dabrowski, Chrzanow, Poland.

One of the most important problems of the Independent Polish Government and of private industry has been to restore the railways and to increase the number of locomotives. This question became the more vital as the geographical situation of Poland makes it a natural mediator between west and east. For normal transport conditions there are necessary now about 3,000 addi-

General View of the First Polish Locomotive Works

tional new locomotives, the average number of locomotives needed for 1 km. of railway track being in Europe about 0.4.

The First Polish Locomotive Works Ltd., Chrzanow, Poland, are really the first step in the development of this industry in Poland and they have received a government order for 1,200 new locomotives. The works in question are advantageously situated near the coal mines and industrial districts of Upper Silesia.

In proportions and arrangement the buildings are unlike the

divided into seven parallel bays and provided with six cranes ranging from 5 to 15 tons. The position of the other buildings relative to the whole plant is shown in the general plan.

As to the internal equipment of the shops it was policy of the management to apply all technical improvements in both machine tools and working methods. Special machine tools, high speed steel, electric drive, interchangeability of parts, modern systems of shop management were taken into most careful consideration.

All electric current used in the shops is purchased from the neighboring electric power company being received as 22,000 volt 50 cycle, three phase alternating current, which is reduced by transformers to 380 volt three phase 50 cycle current. Rotary converters are also provided to supply 220 volt direct current which is used to operate the variable speed motors of machine tools. All cranes, except those of the cast iron foundry, are operated by alternating current.

The management of the works pays much attention to American industry and American methods of working and has active intercourse with many firms of this country. The present financial difficulties due to the low rate of exchange of Polish money do not permit the realization of many intentions. The first locomotives should be assembled this year.

The First Polish Locomotive Works is a private company with financial support of the Polish banks.

Proposed New Line from Llano Grande to Mazatlan

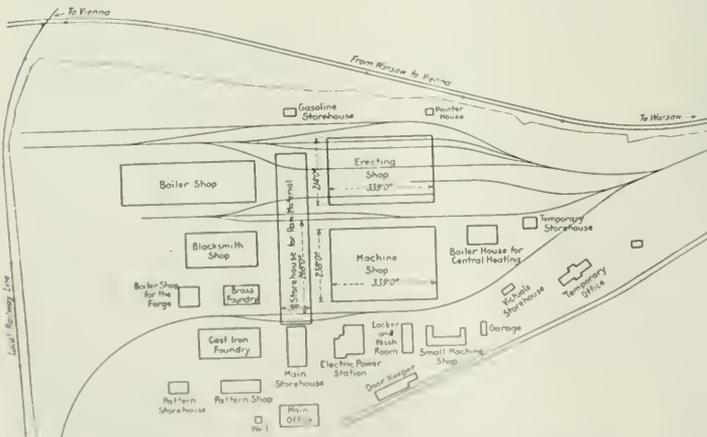

According to a report received from Durango, the financing of the construction of an extension of the line of National Railways of Mexico which now runs from Durango to Llano Grande, 75 miles, to the port of Mazatlan on the Pacific Coast, is proposed by a syndicate of California men who are said to own large bodies of land along the route of the proposed line. It is estimated by engineers that the cost of building the railroad from Llano Grande to Mazatlan would be about \$20,000,000. For much of the way the rough Sierra Madre range must be crossed at altitudes ranging from 7,000 to 8,000 feet. To get down to sea level on the Pacific side of the mountains the drop must be made within a distance

of 50 miles, it is stated. It was announced several months ago that the Mexican government had decided to build this extension and recently work was started on the grade out of Llano Grande, which is in the heart of one of the best timbered regions of Mexico.

The line from Durango to Llano Grande was built just before the revolutionary period for the purpose of affording a transportation outlet for a large body of commercial timber which at that time was being exploited. In connection with this railroad project the Mexican government plans to make extensive harbor and port improvements at Mazatlan at a cost of several million dollars. The construction of a railroad over the Sierra Madres to Mazatlan has been under consideration for many years. At the time the late Collis P. Huntington built the Mexican International Railroad from Eagle Pass, Texas, to Durango, it was his purpose to make Mazatlan the Pacific terminus of the line. He had engineers in the field for several years trying to find a feasible route over the mountains, but none was located. When the Mexican International passed out of the hands of the Southern Pacific interests the project of extending the line was dropped.

Begin Electrification in Chile

Work on the electrification of the Chilean State Railways between Valparaiso and Santiago was begun on April 12, according to press dispatches from Chile. The Westinghouse Electric & Manufacturing Company has this contract.

Plan of the Shops of the First Polish Locomotive Works

other plants completed during recent years in that country and they embody a number of features that warrant detailed consideration. The main buildings of reinforced concrete are spacious and secure an abundance of natural light by large windows and glass areas in the roof. The erecting shop has ground dimensions of 339 ft. 6 in. by 217 ft. 4 in., and consists of four parallel bays. The bay heights were determined very largely by the crane requirements. The main bay is equipped with a crane runway for two 50-ton cranes with top of rail 36 ft. 1 in. and two 10-ton cranes with top of rail 22 ft. 2 in. above the floor. The machine shop has ground dimensions of 339 ft. 6 in. by 238 ft. 2 in., is

Equipment and Supplies

Locomotives

THE ATLANTIC COAST LINE is inquiring for 20 Pacific type locomotives.

THE PACIFIC STATE LUMBER COMPANY, Tacoma, Wash., has ordered 1 Prairie type locomotive from the Baldwin Locomotive Works.

THE BOSTON & MAINE, reported in the *Railway Age* of April 15, as inquiring for 2 Mallet type locomotives and 20 switching locomotives, has ordered this equipment from the American Locomotive Company.

THE NEW YORK, NEW HAVEN & HARTFORD has ordered 15, 0-8-0 type locomotives from the American Locomotive Company. These locomotives will have 25 by 28 in. cylinders and total weight in working order of 216,000 lb.

THE CAMP MANUFACTURING COMPANY, Franklin, Va., has ordered one Prairie type locomotive from the American Locomotive Company. This locomotive will have 13 by 20 in. cylinders and a total weight in working order of 67,000 lbs.

THE CHICAGO & NORTH WESTERN is inquiring for 50 locomotives for which it will receive separate bids until noon, April 28. These include 20 Mikado type superheater freight locomotives, 20 six-wheel superheater switching locomotives and 10 Pacific type superheater passenger locomotives.

NORTON GRIFFITH & Co., Brazil, have ordered 5, 0-4-0 type locomotives and 3, 2-8-2 type from the American Locomotive Company. The switching locomotives will have 9 by 14 in. cylinders and a total weight in working order of 29,000 lb., the 2-8-2 type locomotives will have 15 by 20 in. cylinders and a total weight in working order of 84,000 lb.

Freight Cars

THE TOLEDO & WESTERN is inquiring for 10 to 20 box cars.

THE CENTRAL OF GEORGIA is inquiring for 50 to 200, 40-ton flat cars.

THE EL PASO AND SOUTHWESTERN is inquiring for 30 refrigerator cars.

THE ST. LOUIS SOUTHWESTERN is inquiring for from 200 to 1,000 box cars.

THE CINCINNATI, INDIANAPOLIS & WESTERN is inquiring for 300 freight cars.

THE CHICAGO GREAT WESTERN is inquiring for repairs to 100 refrigerator cars.

THE MISSOURI, KANSAS & TEXAS is inquiring for 300 flat cars of 40 tons' capacity.

THE NEW YORK, CHICAGO & ST. LOUIS contemplates asking for bids on 400 refrigerator cars.

THE ATLANTIC COAST LINE is in the market for 750 single sheathed box cars, of 40 tons' capacity.

THE TEXAS & PACIFIC will start immediately to repair a large number of freight cars in its shops at Marshall, Tex.

THE TOLEDO, ST. LOUIS & WESTERN is inquiring for 100 steel underframes, 50-ton flat car bodies and repairs to 300, 40-ton box cars.

THE SOUTHERN RAILWAY is asking for bids on 2,000, 36 ft. plain box cars, also on 500, 36 ft. automobile box cars. All these cars are to have steel center sills and steel ends and are to be of 40 tons capacity.

THE CHESAPEAKE & OHIO has given a contract to the Newport News Shipbuilding & Dry Dock Company for repairing 100 freight cars.

THE CHESAPEAKE & OHIO will receive bids until May 4 at Richmond, Va., for 1,500 hopper bottom gondola cars and for 1,500 flat bottom gondola cars, all to be of 57.5 tons capacity.

THE WABASH is inquiring for 250 all-steel coal car bodies of 55 tons' capacity. This is in addition to the inquiry for 250 car bodies of 50 tons' capacity, reported in the *Railway Age* of April 15.

Passenger Cars

THE SOUTHERN RAILWAY is inquiring for bids until April 25, at Washington, D. C., for passenger train cars as follows:

Twenty 69-ft. steel passenger coaches.

Fifteen 60-ft. steel combination baggage and express cars.

Ten 70-ft. steel combination passenger and baggage cars.

Fifteen 60-ft. steel postal cars.

THE NEW YORK, CHICAGO & ST. LOUIS is inquiring for 5 steel coaches and 2 steel baggage cars.

THE ANN ARBOR is inquiring for 2 coaches, 2 combination passenger and mail cars and 2 baggage cars.

THE CHICAGO, NORTH SHORE & MILWAUKEE will receive bids until May 22 for 10 passenger motor cars.

THE ATLANTIC COAST LINE, in the near future, contemplates inquiring for a number of passenger train cars.

THE FEDERAL RAILWAYS OF BRAZIL are inquiring through the car builders for 6 combination baggage and mail cars.

THE LOUISVILLE, HENDERSON & ST. LOUIS has ordered 5 passenger coaches from the American Car & Foundry Company.

THE ST. LOUIS-SAN FRANCISCO is inquiring for 6 chair cars. An unconfirmed report says that this road is also inquiring for 8 coaches.

THE BALTIMORE & OHIO has ordered a gasoline railway motor car and trailer from the Edwards Railway Motor Car Company, Sanford, N. C.

THE CHICAGO, BURLINGTON & QUINCY has ordered a gasoline railway motor car from the Edwards Railway Motor Car Company, Sanford, N. C.

THE FLORIDA EAST COAST, reported in the *Railway Age* of March 18, as inquiring for 10 baggage cars has ordered this equipment from the Pullman Company.

THE MISSOURI, KANSAS & TEXAS, noted in the *Railway Age* of March 25 as having renewed its inquiry for 30 passenger cars, has postponed action on this inquiry after May 1st.

THE WABASH, reported in the *Railway Age* of April 1 as inquiring for 8 coaches, 9 chair cars, 2 buffet chair cars, 2 cafe chair cars and 4 dining cars, has ordered this equipment from the American Car & Foundry Company. All these cars are to be of steel construction.

THE LOUISVILLE & NASHVILLE, reported in the *Railway Age* of March 18 as inquiring for 5 baggage cars, 5 combination baggage and horse cars, 6 coaches, 4 combination passenger and smoking cars and 5 combination passenger and baggage cars, has ordered this equipment from the American Car & Foundry Company.

Iron and Steel

THE WABASH is inquiring for 300, 36-in. wheels for passenger coaches.

THE CHICAGO GREAT WESTERN is inquiring for steel rails with joints and fastenings.

THE TENNESSEE CENTRAL is inquiring for 7,000 tons of 80-lb. steel rail with joints and fastenings.

THE CHICAGO, BURLINGTON & QUINCY has ordered 15,000 tons of rail from the Illinois Steel Company.

THE SOUTHERN RAILWAY has ordered 300 tons of bridge steel from the Virginia Bridge & Iron Company for use on a bridge over the Holston river.

THE PHILADELPHIA & READING has ordered 500 tons of bridge steel from the American Bridge Company. This is for the bridge at Norristown, Pa., over the Schuylkill river.

THE CHICAGO, BURLINGTON & QUINCY has ordered from the American Bridge Company 2,496 tons of steel for bridge work and 2,136 tons of steel from the Fort Pitt Bridge & Iron Works for shop buildings at Denver, Colo.

THE SIAM STATE RAILWAYS are asking for bids until 2 p. m., July 31, 1922, at Bangkok, Siam, for a supply of rails and permanent way accessories. Specifications and drawings may be obtained from C. P. Sandberg, 143 Liberty street, New York City.

Track Specialties

THE ERIE is reported to have let a large tie plate order.

THE MISSOURI PACIFIC is reported to have ordered 1,500 kegs of spikes and bolts.

THE SOUTHERN PACIFIC is reported as inquiring for 20,000 kegs of spikes and bolts.

THE NEW YORK, CHICAGO & ST. LOUIS is about to place orders for 30,000 rail joints.

THE MISSOURI PACIFIC is inquiring for 164,000 angle bars and 2,000 kegs of track spikes.

THE CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS will receive bids until noon April 28, for 198,000 tie plates, 30,000 pairs of 90-lb. angle bars, 7,000 kegs of track spikes and 4,500 kegs of track bolts.

Machinery and Tools

THE SOUTHERN PACIFIC has ordered one wheel press from the Niles-Bement-Pond Company.

THE NEW YORK CENTRAL has ordered one planer and one boring mill from the Niles-Bement-Pond Company.

THE EDWARDS RAILWAY MOTOR CAR COMPANY, Sanford, N. C., is in the market for one 18 in. and one 26 in. engine lathe and one 18 in. and one 24 in. shaper.

THE ATCHISON, TOPEKA & SANTA FE is inquiring for a 10-in. by 6-ft. heavy duty tool room lathe with relieving and draw-in attachments; a 16-in. by 6-ft., or 18-in. by 8-ft. engine lathe with taper attachment; a 20-in. by 12-ft., or 30-in. by 12-ft. engine lathe with taper attachment; a No. 60 or 61 Heald cylindrical grinder; a gear wheel boring machine; a 6-ft. plain radial drill; an upsetting machine; a motor driven shear; a swaging machine; a No. 4 Cincinnati horizontal universal milling machine; a 40-in. Bullard vertical turret lathe; a Ryerson or equivalent flue-testing machine; a 24-in. by 10-ft. motor-driven quick change gear tool room lathe; a Ryerson or equivalent pneumatic flue welding machine; a Ryerson or equivalent single pneumatic flue welding machine for superheater flues; A Morton, 36-in. draw cut slapper with one rotating head or slotting driving boxes; a hot saw and an expanding machine; a flue cutter for cutting safe ends; an automatic safe end cutting off machine, a superheater hot saw and tube expander; a sand blasting equipment; a No. 156 Day & Egan cabinet planer or equivalent; a No. 77 American or equivalent planer and matcher, and a 5-in. by 14-in. outside grinding machine.

SHORT LINE RAILROADS in Alabama (ten of them) operating over other 600 miles of line sustained a net loss in 1921 of \$1,792, or \$6.68 per mile. This statement was made by J. A. TRIVETT of Atlanta who appeared before the Alabama Public Service Commission last week to propose advances in freight rates. He said that the other roads would offer similar proposals.

Supply Trade News

G. Fred Collins is now associated with the sales department at Chicago of the Gould Coupler Company, New York.

THE PENNSYLVANIA PUMP & COMPRESSOR COMPANY has opened a Chicago office at 105 West Monroe street, under the management of H. M. Montgomery.

A. S. Merrill, formerly sales manager of the Chicago Fuse Manufacturing Company, has been appointed general sales manager of the Appleton Electric Company, Chicago.

THE AMERICAN AUTOMATIC CONNECTOR COMPANY, Chicago, has installed its connectors on cars of the Sells-Floto Circus, the Hagenbeck-Wallace Circus and the Gollmar Brothers Circus.

George W. Schalchlin, sales engineer for the Allen-Bradley Company, Milwaukee, Wis., has recently been appointed manager of that company's new district office in St. Louis, Mo.

G. W. Schalchlin

Mr. Schalchlin was born at Little Rock, Ark., in 1893. He was graduated from the electrical engineering department of the University of Arkansas in 1913 and served two years' apprenticeship at electrical testing in the factory of the General Electric Company, Schenectady, N. Y. In 1916 he was made manager of the Magnolia, Ark., plant of the Arkansas Light & Power Company, which position he later resigned to work for a year in electrical construction work on the Panama Canal.

During the war he served in France as a first lieutenant battalion adjutant of the 142nd Field Artillery. Upon his return from overseas he entered the service of the Allen-Bradley Company as controller engineer, which position he held until June, 1921, when he was placed on the sales force of that company.

C. J. Hamilton, Jr., assistant sales manager of the Chicago Fuse Manufacturing Company, Chicago, has been appointed manager of sales of that company, succeeding A. S. Merrill, resigned.

William E. Trubec, district representative of the Franklin Manufacturing Company, Franklin, Pa., has removed his office from 501 Fifth avenue, to room 1043 Grand Central Terminal, New York City.

THE POWER PLANT EQUIPMENT COMPANY, Kansas City, Mo., now represents the Combustion Engineering Corporation, New York City, in eastern Kansas, eastern Nebraska, western Arkansas and western Missouri.

W. W. Halsey, manager of the New York City office of the U. S. Light & Heat Corporation, Niagara Falls, N. Y., will, on May 1, remove his office from 30 East Forty-second street to room 5617, Grand Central Terminal.

Theodore L. Dodd, 80 F. Jackson street, Chicago, has been appointed western sales representative of the D. J. Crowley Company, Detroit, Mich. He will also supervise the sales of the Penn Seaboard Corporation, Philadelphia, and the Titusville Forge Company, Titusville, Pa.

T. W. Barnes, for many years factory representative of the Baker R & L Company in the Chicago district, and W. F. Hebard, national distributor of Buda industrial trucks, with

headquarters at Chicago, have formed an organization under the name of **W. F. Hebard & Co.** to handle a complete line of Baker industrial tractors, trucks, cranes and specialties in the Chicago territory.

J. B. White, president and general manager of the **Exchange Sawmills Sales Company**, has been appointed chairman of the board of directors with headquarters at Kansas City, Mo. **R. B. White**, assistant general manager, succeeds **J. B. White** as president and general manager and **F. R. Watkins**, central sales manager, has been appointed secretary, succeeding **A. T. Hemingway**.

Esherick & Hoyle, Otis building, Philadelphia, Pa., and **J. E. Perkins**, 113 East Franklin street, Baltimore, Md., will, in future, handle the **Roller-Smith Company's** line of electrical instruments, meters and circuit breakers in the territories of Philadelphia and Baltimore, respectively. The **Roller-Smith Company** was formerly represented in Philadelphia and Baltimore by the **Perkins-LeNoir Company**.

W. N. Fenley, sales engineer of the **Kerite Insulated Wire & Cable Company**, with headquarters at Chicago, has been promoted to western manager with the same headquarters, succeeding **B. L. Winchell**.

Jr., who has been appointed vice-president, with headquarters in New York. Mr. Fenley entered railroad service with the Cleveland, Cincinnati, Chicago & St. Louis in 1895, with which company he remained for three years; being yardmaster at Greengburg, Ind., during the latter two. In April, 1898, he entered the service of the **National Switch & Signal Company**, with which company he was engaged in construction and maintenance work until June, 1900, when he entered the employ of the **Chicago Great Western** at St. Paul, Minn. During the next 10 years, he was successively foreman, inspector, office engineer, supervisor and signal engineer of that road, having been promoted to the latter position on February 9, 1908. He also acted in the capacity of consulting engineer for the **McClintock Signal & Supply Company** during 1906 and 1907. He left in 1910 to become sales engineer of the **Union Switch & Signal Company**, with headquarters at Chicago, which position he held until August, 1911, when he resigned to become signal engineer of the **Panama Railroad**. On September 16, 1913, the telephone, telegraph and signal departments of this company were consolidated, and Mr. Fenley was appointed superintendent of the combined organization. He resigned on June 31, 1915, and was appointed sales agent of the **Kerite Insulated Wire & Cable Company**, which position he was holding at the time of his recent appointment.

Manuel Trucco, director general of the Chilean State Railways, has, according to press dispatches from Santiago, sailed for New York, where he expects to take charge of the purchases of railway equipment for the lines in his charge. He will also have charge of the inspection of equipment recently purchased in this country for the electrification of Chilean railways. His offices will be at 141 Broadway, New York. Mr. Trucco will arrive in this country about May 8.

Obituary

Charles F. Molley, vice-president and general manager of the **American Boron Products Company, Inc.**, Reading, Pa., died on April 7.

Railway Construction

ATCHISON, TOPEKA & SANTA FE.—This company has definitely authorized additions to its Harvey house at Gallup, N. M.

ATCHISON, TOPEKA & SANTA FE.—This company which was reported in the *Railway Age* of March 11 as contemplating, among other improvements, the construction of a new division office building at Newton, Kan., has definitely authorized the expenditure for this work along with incidental track changes to be made at that point.

BALTIMORE & OHIO.—This company has awarded a contract to the **Empire Engineering Company**, Baltimore, for the construction of a bridge at Brydon, W. Va., and for the preparation of roadbed for about two miles of second main track to be laid between Webster and Brydon.

CHESAPEAKE & OHIO.—This company has awarded a contract to the **Roberts & Schaefer Company**, Chicago, for the construction of a reinforced concrete, four-track, 500-ton capacity automatic electric coaling and sanding plant, with stoker coal crushing and screening facilities, for immediate erection at Peach Creek, near Logan, W. Va. This work will cost approximately \$45,000.

CHICAGO, BURLINGTON & QUINCY.—This company is now preparing plans and expects to call for bids in the near future for the construction of shop facilities at Denver, Colo., to involve the expenditure of approximately \$2,000,000.

CHICAGO & NORTH WESTERN.—This company, which was noted in the *Railway Age* of April 15 as receiving bids until April 20 for the construction of a 450-ton mechanical coaling station and ash handling facilities in Chicago, the construction of which will involve an expenditure of approximately \$100,000, has extended for another week the date for closing bids.

ELGIN, JOLIET & EASTERN.—This company contemplates the separation of the grade of its tracks and that of the **Illinois Central** at Matteson, Ill. It has also in contemplation the construction of new bridges over the **Grand Calumet river** at Gary, Ind., the authority for which has not yet been obtained.

GRAND NORTHERN.—This company, noted in the *Railway Age* of March 11 as receiving bids for the construction of a 500-ton reinforced concrete coaling station at **Minneapolis Junction**, Minn., has awarded a contract to the **Ogle Construction Company**, Chicago, for a station of steel construction.

ILLINOIS CENTRAL.—This company will close bids on April 25 for the construction of a joint passenger station at **Gilman, Ill.**, with the **Toledo, Peoria & Western** to cost approximately \$75,000.

INDUSTRIAL TERMINAL RAILWAY.—This company contemplates the construction of a switching and terminal railway 2 miles long, in **Los Angeles**, and to this end has obtained authority from the **Railroad Commission of California** to deliver to **L. E. Hanchett**, \$420,000 of its common stock in return for advances made in acquiring right of way, rails and other materials.

KANSAS CITY TERMINAL.—This company has authorized and begun the preparation of plans for a union passenger station at **Fifth street and Central avenue**, **Kansas City, Kans.**, to accommodate the **Missouri Pacific** and **Chicago Great Western**, the work to cost approximately \$100,000.

LEHIGH VALLEY.—This company, in connection with its work on the **Claremont (Jersey City) pier and terminal project**, has awarded a contract to the **Henry Steers Company**, New York, for a shop and electric substation.

MISSOURI PACIFIC.—This company contemplates the renewal of the draw span and sub-structure of its **Osage river bridge**, and the construction of two stations, one at **Washington, Mo.**, to cost approximately \$50,000 and a second at **Lake Village, Ark.**, to cost \$25,000.

W. N. Fenley

Railway Financial News

ATCHISON, TOPEKA & SANTA FE.—Annual Report.—The annual report issued this week shows an income statement for the year ended December 31, 1921, as follows:

	1921	1920
Operating revenues.....	\$229,925,070	
Operating expenses.....	173,217,915	
Net operating revenue.....	\$55,707,154

Total deductions from gross income.....	1,540,194	1,697,223
Net income.....	172,800	172,800
Dividend appropriation of income.....	172,800	172,800

BOSTON & MAINE.—To Form Equipment Trust.—At the annual meeting of the stockholders on April 12 steps were taken toward the formation of an equipment trust under which new equipment will be bought. In addition to the proceeds from the notes that are to be sold under this trust the Boston & Maine will receive a government loan of \$1,212,500 which has been authorized by the Interstate Commerce Commission under the provisions of the Transportation Act.

New Haven Representation on Board.—See New York, New Haven & Hartford.

BUFFALO, ROCHESTER & PITTSBURGH.—Annual Report.—This company's annual report for 1921 is reviewed in an article on another page of this issue, entitled "B. R. & P. Ton-Mileage Reduced 53.92 Per Cent." See also excerpts from annual report on adjacent pages.

CAROLINA, CLINCHFIELD & OHIO.—Equipment Notes Offered.—An issue of \$3,588,000 6 per cent equipment trust gold notes is being offered by the National City Company and Ladenburg, Thalmann & Co. The notes, which mature \$276,000 each on January 15, 1923, to 1935, inclusive, are offered at prices to yield from 5.30 to 5.70 per cent., according to maturity. The notes are redeemable as a whole but not in part upon any interest date on sixty days' notice at 103 and interest.

CENTRAL VERMONT.—Asks Authority for Equipment Trust Notes.—This company has applied to the Interstate Commerce Commission for authority to issue \$778,000 of equipment trust notes for 8 years at 6 per cent in be turned over to the American Car & Foundry Company for 700 freight cars which are to be rebuilt.

CHESAPEAKE & OHIO.—Authorized to Abandon Ferry.—The Interstate Commerce Commission has issued a certificate authorizing the abandonment of the ferry between Russell, Ky., and Ironton, Ohio.

CHICAGO & WESTERN INDIANA.—Annual Report.—The income

account for the year ended December 31, 1921, compares as follows:

	1921	1920
Total operating revenue.....	\$256,456	\$233,828
Operating expenses.....	463,649	418,223
Net operating loss.....	167,192	184,395
Other income:		
Joint facility rent income.....	2,652,267	1,930,586

Total deductions from gross income, inc. other.....	3,918,652	3,743,679
Net income for year.....	640,140	516,411

CHICAGO, MILWAUKEE & ST. PAUL.—Equipment Notes Offered.—A syndicate composed of Freeman & Co., Hayden, Stone & Co., New York Trust Company and the Equitable Trust Company are offering \$9,500,400 6 per cent equipment trust notes. The notes are offered at prices to yield from 5.35 to 5.75 per cent. They are dated January 15, 1920 and mature \$730,800 annually from 1923 to 1925, inclusive.

These notes are a direct obligation of the Chicago, Milwaukee & St. Paul Railway under an equipment trust agreement between the director general of railroads, the railroad company, and the trustee. Through supplemental agreements, 33½ per cent of the notes of each maturity, held by the director general, are to be stamped as subordinate to the above prior lien notes. Upon subordination, these \$9,500,400 of unstamped notes will be outstanding to the extent of only about 53 per cent of the original cost of the equipment on which they are secured.

COLORADO & SOUTHERN.—Asks Authority to Issue Equipment Trusts.—This company has applied to the Interstate Commerce Commission for authority for the issuance of \$1,425,000 of 5½ per cent equipment trust certificates.

Proposed Denial of Certificate to Abandon Branch.—The Interstate Commerce Commission has made public a tentative report of an examiner recommending that the commission deny the application of this company for a certificate authorizing it to abandon its branch line between Buena Vista and Romley, Colo., 29.42 miles, on the ground that it would deprive a large section of the benefits of rail transportation and that the record in the case affords some assurance that the future operation of this line will be more profitable than it has been in the past.

DELAWARE & HUDSON.—Annual Report.—The annual report issued this week shows the following income account for the year ending December 31, 1921:

	1921	1920
Railway operating revenues.....	\$45,776,859	\$45,354,299
Railway operating expenses.....	38,825,529	42,126,330
Net railway operating revenues.....	6,951,330	3,227,969
Gross railway operating income.....	8,218,225	3,486,238
Railway tax accruals.....	993,974	1,186,054
U. S. government compensation guarantee.....		5,621,164
Net railway operating income.....	6,759,117	7,439,730
Dividend income.....	1,327,617	1,038,041
Miscellaneous income.....	1,569,869	1,311,427
Total non-operating income.....	3,437,877	2,991,287
Gross income.....	10,191,904	10,431,017
Deductions from gross income:		
Rent for leased roads.....	1,271,929	1,944,157
Interest on funded debt.....	3,284,580	3,228,948
Total deductions.....	5,254,433	5,497,855
Net income carried to profit and loss.....	4,937,452	4,933,163

DETROIT, BAY CITY & WESTERN.—Six Months Guaranty Certified.—The Interstate Commerce Commission has certified the amount of this company's guaranty for the six months following the period of federal control at \$107,813, of which all but \$13,331 has been paid.

GEORGIA, ASHBURN, SYLVESTER & CAMILLE.—Asks Authority to Issue Securities.—This company has applied to the Interstate Commerce Commission for authority for the issuance of \$540,000 of capital stock, the proceeds to be used for the purchase of that part of the Hawkinsville & Florida Southern between Ashburn and Camille, Ga.

HAMPDEN RAILROAD.—Plea Dismissed.—Judge Jenney of the Supreme Court of Massachusetts has ordered dismissed the petition brought by Edmund D. Codman against District Attorney Saltonstall of Middlesex county, et al., in which the petitioner sought a mandatory order directing the Superior Court of Middlesex county to recall and vacate the nolle prosequis of certain indictments concerning the affairs of the Hampden Railroad.

The indictments charged members of the banking firm of F. S. Moseley & Co., Charles S. Mellen and the members of the investment boards of the Cambridge and East Cambridge Savings Banks with larceny and conspiracy, setting forth that money was fraudulently secured for the construction of the railroad.

LOS ANGELES & SALT LAKE.—*New Directors.*—W. A. Harrison, Charles A. Peabody, W. G. Rockefeller and Frank A. Vanderlip have been elected directors.

MIDLAND VALLEY.—*Asks Authority to Issue Bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue \$341,000 of first mortgage 5 per cent bonds to reimburse the treasury for expenditures for additions and betterments, to be sold at not less than 75.

MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE.—*Court Enjoins Dividend.*—Federal Judge Wilbur F. Booth has temporarily enjoined this road from paying \$840,000 dividends on the common and preferred stocks. The Continental Insurance and Phenix Fire Insurance companies, owning 1,300 shares of preferred stock, asked that payment of a semi-annual dividend of \$2 a share on the common be enjoined on the ground that the preferred stockholders must be paid at the full annual rate of 7 per cent before the common stock participated in earnings.

MISSOURI PACIFIC.—*Authorized to Issue Bonds.*—The Interstate Commerce Commission has authorized an issue of \$18,000,000 of first and refunding mortgage gold bonds to be sold at not less than 97½ and accrued interest. The proceeds are to be used to retire \$13,641,000 of first and refunding mortgage 5 per cent bonds which matured on January 1 and to reimburse the treasury for expenditures. Arrangements had been made for the sale to Kuhn, Loeb & Co.

MOBILE & OHIO.—*Asks Authority to Issue Notes.*—This company has applied to the Interstate Commerce Commission for authority to issue \$400,000 of 10 year, 6 per cent promissory notes to be used in payment for 10 Mikado locomotives.

NEW YORK CENTRAL.—*Bonds Offered.*—Harris, Forbes & Co. are offering \$1,000,000 New York Central 4 per cent gold bonds (now consolidated mortgage), due January 1, 1942, at 89 and interest to yield about 4.88 per cent. These bonds are legal investment for savings banks and trust funds in New York, New Jersey, Connecticut and Massachusetts, and are listed on the New York Stock Exchange.

NEW YORK, NEW HAVEN & HARTFORD.—*Annual Meeting of Stockholders.*—President E. J. Pearson in an address to the stockholders at their annual meeting at New Haven, Conn., on April 19, called particular attention to the information contained on the first few pages of the annual report for 1921, relating to the great value and large return of industry and business in the territory served by the New York, New Haven & Hartford, and of the small percentage of such returns represented by the revenues of the company. The remarks of the annual report in this regard, according to President Pearson, may also be applied to the Boston & Maine where in the interest of the stockholders as a whole a similar possibility and policy will undoubtedly be found advisable and of advantage.

Vice-President E. G. Buckland read the address, which was in part as follows:

It will interest you to know that for the past month of March the New Haven operated at a ratio of about 77.74 in comparison with a ratio of 93.37 during the same month a year ago. The net income after all expenses, rentals and charges is estimated at about \$72,000, compared to a deficit during the same month a year ago of \$1,600,221. The volume of freight showed an increase. While the expenditures for maintenance were not as much as they would normally have been, nevertheless they are in proportion to similar expenditures for the preceding year, so that the comparison of operating ratios indicates better results during recent months.

Your company has not yet succeeded in securing a dissolution of the federal decree which placed its investments in the trolleys and in Boston & Maine in the hands of trustees, but is hopeful the dissolution may be brought about. There seems to be no reason to doubt that your company may legally hold these securities and resume its interest in the trolleys, and (under the limitation imposed by Massachusetts) in the Boston & Maine, so as to benefit these properties, your investment and the New England public. While the date within which by the decree the trustees are required to dispose of your holdings has been postponed from time to time, there has never been any suggestion that the holdings are to be sold in Boston which would have been reasonable or in your interest. As your ownership of Boston & Maine stock represents since the reorganization of the Boston & Maine but a minority, slightly over 28 per cent, it is not intended that the New Haven will attempt to assume control of the Boston & Maine. With representation on the board, however, proportional to your company's holdings, your company would be admitted to its counsels as it is right ought to be, and would be in a position: first, to further the interests of Boston & Maine to the fullest extent; second, to co-operate with the Boston & Maine in promoting all of those matters which are to the advantage of both companies and to the disadvantage of neither; and, third, to assist in the solution of the important problems which will arise in respect to plans proposed by the Interstate Commerce Commission for consolidation of the railways under the provisions of the Transportation Act of 1920.

While the traffic of your company has decreased, incidental to the change from war-time to the present conditions of business, the reduction is less

marked than throughout the country as a whole. As a result, the management of your company looks forward with confidence to the continued importance and supremacy, commercially, of the territory which it serves.

Extends Time for Deposits.—The company has announced a further extension of the period in which the 4 per cent debentures may be deposited under the three-year plan approved by the Interstate Commerce Commission. The extended period is to be subject to termination by the directors without notice.

A statement issued by the company said that the plan can become effective only if it is accepted by the debenture holders with practical unanimity, as it has been impossible to make provision for the payment of any debentures, the holders of which do not accept the company's offer of extension.

NORFOLK & WESTERN.—*New Director.*—Samuel P. Bush, of Columbus, Ohio, has been elected a director to succeed Joseph Wood, of Pittsburgh, deceased.

PENNSYLVANIA.—*Stockholders Pass Confidence Resolution.*—The stockholders at their annual meeting on April 11 gave a vote of confidence to the officials of the company for their management during the business depression.

SOUTHERN.—*Asks Authority for Equipment Certificates.*—This company has applied to the Interstate Commerce Commission for authority to guarantee the payment of \$9,300,000 of 5½ per cent equipment trust certificates.

WEST JERSEY & SEASHORE.—*Stockholders Adopt Resolution.*—The stockholders at their annual meeting on April 13 adopted the following resolution:

Whereas, On April 30, 1913, the stockholders of this company voted to lease properties and franchises to the Pennsylvania Railroad Company for a term of 999 years, but on July 23, 1913, the New Jersey Public Service Commission disapproved the lease, and the decision of the commission was approved by the courts; that since that date the railroad situation of the country has undergone considerable changes through passage of the Transportation Act, etc., now be it

Resolved, That the board of directors appoint a committee of three stockholders to confer with the management of the Pennsylvania Railroad Company, with a view of reopening the offer to lease, said committee to review the matter from all angles, and report to the stockholders at an adjournment of this meeting, the date of which is to be fixed by the management.

WHEELING & LAKE ERIE.—*Equipment Notes Offered.*—Hemp-hill, Noyes & Co., Cassatt & Co. and Freeman & Co. are offering \$2,649,400 Wheeling & Lake Erie equipment trust 6 per cent gold notes, maturing in equal annual instalments, from January 13, 1923, to January 15, 1935, inclusive, at 5.40 per cent basis for 1923 maturity, 5.50 per cent basis for 1924 maturity, 5.60 per cent basis for 1925 maturity, 5.70 per cent basis for 1926 maturity, 5.80 per cent basis for 1927 to 1933 maturities and 5.75 per cent basis for 1934 and 1935 maturities.

Equipment Trusts Sold

The director general announces additional sales, at par plus accrued interest, of railroad equipment trust certificates maturing January 15, 1923 to January 15, 1935, inclusive, now held by the government, to:

- Edward Lowber Stokes & Co., Philadelphia, Pa.; Harrison, Smith & Co., Philadelphia, Pa.; Biddle & Henry, Philadelphia, Pa., and Commercial Trust Co., Texas & Pacific Railway, \$1,381,900.
- National City Co., New York; Lauenburg, Thalmann & Co., and Alfred Borden, Carolina, Clinchfield & Ohio, \$3,588,000.
- Riggs National Bank of Washington; Redmond & Co., New York; Cassatt & Co., and Lewis & Snyder, Philadelphia, Grand Trunk Railway of Canada, \$2,000,000.
- Freeman & Co., New York; Chicago, Milwaukee & St. Paul, \$9,500,400.
- Hemp-hill, Noyes & Co., New York; Wheeling & Lake Erie, \$2,649,400.
- Cassatt & Co., Philadelphia; Chicago & Western Indiana, \$161,200, and Rutland Railway, \$213,200.
- Redmond & Co., New York; Charleston & Western Carolina, \$481,000.

Sales comprise approximately two-thirds of all the maturities of these equipment trust issues. The balance of one-third of all maturities will be stamped as subordinated. The total amount of equipment trust certificates sold by the government to date, at par plus accrued interest, is \$249,210,300. This leaves a balance of only about \$23,000,000 yet to be sold.

Trend of Railway Stock and Bonds Prices

	April 18	Last Week	Last Year
Average price of 20 representative railway stocks, close of business.....	64.99	64.27	53.53
Average price of 20 representative railway bonds, close of business.....	85.82	84.54	73.63

PASSENGER REVENUES.

The corporate gross passenger revenue amounted to \$1,794,927.24. The average rate received per passenger per mile increased .332 cent, being 3.341 cents as compared with 2.949 the preceding year.

The average distance each passenger was carried decreased 1.1 miles, being 28.1 miles against 29.2 miles.

Passengers carried in 1921. 1,913,670
 Passengers carried in 1920. 2,232,013

A decrease of 14.26% or 318,343
 Passengers carried one mile in 1921. 3,400,659
 Passengers carried one mile in 1920. 65,085,159

A decrease of 17.45% or 11,354,460

FREIGHT REVENUES.

The corporate gross freight revenue amounted to \$11,928,151.87. Excepting minor reductions in rates of certain commodities, the general rate structure remained practically the same throughout the year, the last general increase (34%), having been made on September 1, 1920.

The average rate received per ton per mile increased .278 cent, being 1.049 cents as compared with .771 cent last year.

The average distance each ton was hauled decreased 13.6 miles, being 151.5 miles, against 165.1 miles a year ago.

The revenue tonnage moved was the smallest in the history of the Company since 1904, and is as follows:

	1921.	1920.	Decrease.
Bituminous coal	3,875,197	9,402,558	5,527,361
Coke	154,388	596,781	442,393
Iron ore	99,727	642,614	542,887
Pig and bloom iron	94,177	344,337	250,160
Other freight	3,300,670	3,954,892	654,222
Total	7,503,909	14,941,182	7,437,273

A decrease of 49.78% or 7,437,273
 Tons moved one mile in 1921. 1,136,943,603
 Tons moved one mile in 1920. 2,467,398,051

A decrease of 53.92% or 1,330,454,448

A decline of 23.3% was registered in railroad traffic of all lines in the United States during 1921, the greatest ever recorded in American transportation history. Your line suffered a much greater loss of tonnage, due to the extraordinary unfavorable conditions existing in the Central Pennsylvania bituminous coal fields, from which approximately 65% of your traffic is derived. Also, the abnormal conditions existing in the steel trade caused a severe shrinkage of coke and ore tonnage.

The average number of revenue tons carried one mile per revenue freight train mile, excluding the mileage of helping engines, decreased 188.43 tons, being 754.15 tons against 942.58 tons a year ago.

The average number of revenue tons carried one mile per revenue freight engine mile, including the mileage of helping engines, decreased 82.57 miles, being 519.57 miles against 602.14 miles a year ago.

The averages for the past ten years are as follows:

	Train load.	Engine load.
Year ending June 30, 1912.	710	462
1913.	679	454
1914.	707	477
1915.	786	502
Six months ending December 31, 1916.	810	510
Year ending December 31, 1917.	836	545
1918.	943	602
1919.	884	586
1920.	943	602
1921.	754	520
Increase over 1912	107	81
Per cent	16.5	18.5

The non-revenue freight traffic, not included in any of the other figures of this report, is as follows:

	1921.	1920.
Number of tons	655,524	1,105,887
Number of tons carried one mile	59,251,341	106,575,272

EXPENSES.

The total corporate operating expenses were as follows:

Maintenance of way	\$1,974,309.33
Maintenance of equipment	4,908,568.20
Traffic	215,078.93
Transportation	6,223,691.49
Miscellaneous operations	30,120.12
General	485,696.76
Transportation for investment, C. R.	1,259.77
Total	\$13,836,205.06

PROFIT AND LOSS ACCOUNT DECEMBER 31, 1921

CREDIT	DEBIT
Balance Surplus December 31, 1920.	\$5,434,542.67
Unfundable overcharges	6,244.56
Donations	1,344.52
Miscellaneous Credits—	
Discount on funded debt retired	\$7,749.99
Unclaimed wages, etc.	3,818.22
Transferred from Pension Fund	251,728.76
Transferred from Insurance Fund	425,868.82
Final settlement, U. S. R. R. Administration	2,374,295.94
Sundry items	1,096.77
Total	\$8,506,586.05

The additional expenses chargeable as lap-overs to the Federal Control and Guaranty Periods were 80,826.51

Grand total expenses \$13,917,031.57

The percentage of each group of operating expenses, all periods combined to the combined operating revenue for the past six years is as follows:

	1921.	1920.	1919.	1918.	1917.	1916.
Maint. of way	13.73	16.58	16.95	15.28	9.71	12.39
Maint. of equipment	34.31	31.65	37.73	32.29	27.00	23.95
Traffic	1.50	1.03	1.26	1.10	1.28	1.20
Transportation	43.56	45.98	48.73	44.26	38.82	33.74
Misc. operations21	.17	.20	.14	.14	.14
General	3.25	2.46	2.82	2.13	2.37	2.18
Transp. for Inv., Cr.01	.06
	96.65	97.21	107.69	95.12	79.32	73.60

The condition of the Company's equipment at the end of Federal control is causing an unusual outlay for repairs, still under way. 500 steel gondola cars were repaired outside of your Company's shops, and arrangements have been made for the repairs of 1,000 more, to be completed during the next three months.

The increase in wages and the changes in working conditions during and since Federal control; the reclassification of employes, and special allowances granted by the Director General or ordered by the Labor Board; have created a serious condition now affecting the economical operation of your road. Partial relief was obtained from an order of the Labor Board effective July 1, authorizing an average reduction in wages of approximately 10% and as far as possible further reductions and economies were made consistent with safety and reasonably adequate service, to offset the reduced income.

The average cost per ton per mile is 1.001 cents, an increase of .253 cent over last year.

FIRE INSURANCE FUND.

This fund, created July 1st, 1892, was discontinued on August 11th, 1921, and its surplus transferred to the following accounts:

Profit and loss	\$425,868.82
Operating reserve—Fire Insurance	29,717.45
Total	\$455,586.27

PENSION FUND.

This fund, created July 1, 1903, was discontinued on May 31, 1921, and its surplus of \$251,728.76 transferred to Profit and Loss account. In the future all expenditures for pensions will be made directly from available current assets.

There were 83 pensioners on the roll on December 31, 1921, a net decrease of 8 during the year.

GENERAL REMARKS.

The valuation of your lines by the Interstate Commerce Commission began July 1, 1917, and is about 90% completed. The amount expended to date on this account has reached \$194,607.33.

The balance of \$2,374,295.94 received from the Director General of Railroads in final settlement for the use and operation of your property during Federal control, after adjusting and closing the several accounts with the United States Railroad Administration, was by order of the Interstate Commerce Commission dated January 25th, 1922, transferred to Profit and Loss account.

On March 1, 1921, the agreement with the Western Union Telegraph Company was revised and renewed for a term of 15 years, and to continue thereafter until a year's notice in writing is given by either party.

In December, 1921, an agreement was made with the New York Central Railroad Company granting it further trackage rights over your line from C. & D. Junction, Pa., to Rossiter, Pa., a distance of 18.07 miles. The agreement extends over a period of 15 years from September 1, 1920, and is to continue thereafter until canceled by two years' notice from either party.

A "Fire Law" ostensibly to decrease accidents was enacted by the State of Pennsylvania in 1911. Its futility being realized, the law was repealed on May 5th, 1921, relieving your Company, under normal traffic conditions, of a needless expense of approximately \$96,000 per annum. A similar law, effective in New York State since 1910, still remains on the Statute Books.

The acknowledgments of the Board are renewed to its officers and employes for their faithful and efficient service.

By order of the Board,
 WILLIAM T. NOONAN,
 President.

Rochester, N. Y.,
 March 24, 1922.

Railway Officers

Financial, Legal and Accounting

A. M. Martin, assistant treasurer of the Nashville, Chattanooga & St. Louis, with headquarters at Nashville, Tenn., has also been elected assistant secretary and transfer agent, to succeed **J. B. Hill**, who has been elected treasurer and appointed assistant to the president to succeed **J. H. Ambrose**, who has retired. Mr. Ambrose will continue to serve as a director and as a member of the finance committee.

J. W. Broome, whose appointment as secretary and assistant treasurer of the Western Maryland with headquarters at New York was announced in the *Railway Age* of April 8, page 897, was born on July 11, 1890, in Brooklyn, N. Y., and attended high school and normal school in that city. He entered the service of the Western Maryland in 1907 as a clerk. In October, 1912, he became chief clerk to the secretary and treasurer and served in that position until September, 1921, with the exception of the period from June, 1918, to August, 1919, when he was with the army overseas. On September 20, 1921, he was appointed secretary and assistant treasurer and was serving in that position at the time of his recent promotion.

Operating

A. G. Mitchell, superintendent of the West Jersey & Seashore (Pennsylvania), has been promoted to secretary of the Association of Transportation officers of the Pennsylvania System with headquarters at Broad Street Station, Philadelphia. **H. H. Garrigues**, superintendent of the Delaware division of the Pennsylvania, succeeds Mr. Mitchell on the West Jersey & Seashore with headquarters at Camden, N. J. **I. B. Sinclair**, assistant superintendent of the Philadelphia division with headquarters at Harrisburg, Pa., has been promoted to superintendent of the Delaware division and has been succeeded at Harrisburg by **J. B. Phelan**, freight trainmaster of the Middle division with headquarters at Altoona, Pa. Mr. Phelan has been succeeded at Altoona by **C. E. Whitlock**, trainmaster of the Schuylkill division with headquarters at Reading, Pa., who in turn has been succeeded by **A. M. Seward**, assistant trainmaster of the Schuylkill division. These changes were effective April 15.

Traffic

Val Kuska has been appointed colonization agent of the Chicago, Burlington & Quincy, with headquarters at Omaha Neb., effective April 1, to succeed F. B. Howard, deceased.

H. W. Bonderat, freight traffic representative of the Southern, with headquarters at Nashville, Tenn., has been promoted to commercial agent, with the same headquarters to succeed **J. W. Frank**, who has been promoted to freight agent, with headquarters at Savannah, Ga.

G. R. McIntosh, general agent of the Pacific Fruit Express, with headquarters at Los Angeles, Cal., has been promoted to superintendent at San Francisco, with jurisdiction over the agencies at Sacramento, San Francisco, Los Angeles, Portland, Ore., and Houston, Tex., to succeed **H. Gidding**, who has been promoted to assistant general manager at San Francisco, with jurisdiction over the lines of the Southern Pacific, the Los Angeles & Salt Lake, and the Western Pacific. **R. J. Bailey**, superintendent of ice plants at San Francisco, has been appointed superintendent of refrigeration, with jurisdiction over the Southern Pacific, the Los Angeles & Salt Lake and the Western Pacific. **J. B. Crawford**, superintendent of transportation at Chicago, has been promoted to assistant general manager at Chicago, with jurisdiction over the lines of the Union Pacific, the Oregon Short Line, and the Oregon-Washington Railroad & Navigation Company. **C. E. Carner**, chief clerk to the superintendent of transportation at Chicago,

has been promoted to traffic manager to succeed **R. C. Dearborn**, resigned to become chairman of the National Perishable Freight Committee. **J. Van Rensseler**, superintendent of refrigeration, with headquarters at Omaha, has been promoted to superintendent in charge of traffic with jurisdiction over the Union Pacific. **C. F. Gunnell**, general agent at Ogden, Utah, has been promoted to superintendent of transportation with jurisdiction over the Oregon Short Line, with the same headquarters. **R. M. Whitehead**, general agent at Portland, Ore., has been appointed superintendent of traffic with jurisdiction over the Oregon-Washington Railroad & Navigation, with the same headquarters and **T. G. Wall**, assistant superintendent of ice plants, with headquarters at Omaha, Neb., has been promoted to superintendent of refrigeration on the lines of the Union Pacific, the Oregon Short Line and the O.-W. R. & N., with headquarters at Omaha.

Obituary

John Carstensen, vice-president of the New York Central Lines and for over 50 years connected with that system, died at his home in Scarsdale, New York, on April 14. Mr. Carstensen was born on

August 14, 1854, in New York City. He spent his early childhood on the island of Santa Cruz, then one of the Danish West Indies. His family returned to the United States when he was ten years old. Mr. Carstensen was educated at Cayuga Lake Academy, Aurora, N. Y., Alexander Military Institute, White Plains, N. Y., and the high school at Clinton, New York. On July 10, 1871, he entered the service of the New York Central & Hudson River Railroad, of which company he became successively assistant treasurer and comptroller and was later elected a vice-president of the New York Central System and a director of a number of its subsidiaries.

Frank J. Woulfe, assistant traffic manager of the Lehigh Valley, died suddenly in New York on April 15, as the result of heart trouble. Mr. Woulfe was born at Fort Wayne, Ind., on November 9, 1863, and was educated in the public schools. He began railroad work on April 1, 1879, as night bill clerk for the Washash. From then until 1890 he served as cashier and in various clerical capacities. In 1890 he was appointed traveling freight agent of the Lehigh & Washash Dispatch and the Lehigh Valley Transportation Company with headquarters at Decatur, Ill. In 1898 he became general agent of the Lehigh Valley at St. Louis, Mo., and was transferred to New York as city freight

agent in 1901. Later he became general eastern freight agent and on August 1, 1909, was appointed general freight agent. At the termination of federal control, Mr. Woulfe was appointed assistant traffic manager.

J. Carstensen

F. J. Woulfe

Railway Age

The Table of Contents Will Be Found on Page 5 of the Advertising Section

"Listening-in" on the radio has become one of the popular pleasures of a large and growing number of people, the latest estimates of the number of receiving sets in operation being about one million. Broadcasting is being carried on by stations located at the large cities both in the east and the west.

Publicity Possibilities of Radio

Practically the entire country is thus being served. A few days ago, a substantial proportion of the "listeners" were treated to a talk on railway transportation problems broadcasted from WGI, the American Radio and Research Corporation station at Medford Hillside, Mass. This talk, given by R. H. Newcomb, executives' assistant of the Boston & Maine, is the first time, to our knowledge, that the railroads have utilized this important medium to present to the public some of the facts about the railroad problem. The possibilities of the radiophone seem almost unlimited in this respect and this is especially true if the man who speaks confines himself to the broad side of the question and is as little of a propagandist as possible. Naturally, such talks must be non-technical, even more or less popular in nature, for all classes of people are reached. In a degree far greater than in public speaking, they must be made personal. There is something about radio reception that produces a feeling in the listener that he alone is being addressed, and thus the speaker can get closer to his audience than is possible, perhaps, in any other way. The time is opportune for such talks and a great amount of good can be done by them. From the standpoint of the broadcast stations, we believe that talks such as we have outlined here roughly would be welcomed by those in charge of the programs.

In many ways railroad shops never have been and never will be operated on a real production manufacturing basis since their primary work is the repair of equipment. This maintenance or repair work, however, involves the use of many small parts which are not obtainable from the manufacturers and which, if standardized and made at one point for use on each railroad system, will be required in large numbers. During the past few months the *Railway Age* has strongly emphasized the need of central production departments with specialized machines for manufacturing these parts in order that the time and labor cost per piece may be reduced to a minimum. Highly specialized machines have their limitations, however, and carrying charges will overbalance labor savings unless sufficient work can be found to keep the machines operating at capacity. For example, thread milling machines are particularly adapted to the higher class of threading work on worms, screws and nuts, but the average railroad shop would hardly have enough work of this character to keep a thread miller busy even a fair proportion of the time. The average shop, and the one with which we are most interested because it is an average shop, stands in great need of modern, wide-range machines which are flexible and easily adjusted to different operations. In the majority of cases a machine cannot be kept busy continuously on one type of work, as is often the case in industrial plants. As a result, a few minutes saved on each piece of work is not so essential as that a machine of capacity to handle the work

shall be available. This is particularly true in engine terminals where the lack of a machine of the required capacity often necessitates sending some locomotive part to the back shop for repairs and results in a bad motive power delay. There is an actual, if somewhat indeterminate, line between the fields of usefulness of specialized as opposed to general purpose machines and this line should be always kept in mind. It is a disadvantage to both the machine tool manufacturer and the railroad to install a high-priced, specialized machine at any point not having sufficient work to keep that machine busy.

That inadequate trackage rather than an insufficient number of cars is often the real cause of a car shortage has been stated so often as to make repetition monotonous. Yet it would seem that this simple truth is not always given as much consideration as it deserves.

Additional Trackage Needed

Since November 1, the railroads have ordered 42,651 freight cars, or nearly three times as many in five months as were ordered in the previous ten. Of course, a portion of these car orders must be allocated to renewals of wornout or obsolete equipment, but a certain part of the new cars are to be considered essentially as additions. While there can be no controversy whatever as to the necessity for a larger number of cars, a question does arise as to the possibility of the railroads securing full return for the capital invested in them without a corresponding or even greater expenditure for increased trackage, particularly in yards and sidings. The fact that the need of adequate terminal facilities is being recognized by the managements of some of the roads is evident by such items as the authorization of an \$8,000,000 expenditure by the Pennsylvania System in the Pittsburgh district. The inception of work on the Castleton cut-off of the New York Central, as a means of relieving congestion at Albany, is another project to the same end.

The railroads are offering more and more inducements in the form of excursion rates in the effort to increase their passenger traffic. The Central of New Jersey has recently announced a series of tours from the Wyoming Valley, Pennsylvania (the territory adjacent to Wilkes-Barre), to Boston. Passengers will use the Central's line to New York whence the remainder of the journey will be completed by steamer. The price of tickets for this excursion includes not only train and steamer accommodations, but hotel charges and meals as well. This company has conducted these "one-price" tours before with considerable success. Other companies, too, are offering similarly attractive tours. Manifestly reductions in rates which serve to bring into use idle passenger equipment and to fill up trains which cannot be discontinued, indicate good business judgment on the part of passenger traffic officers. This is especially true where business is attracted which would not move at all under regular rates. The railroads have gone a long way toward restoring the pre-war tourist and excursion rates, but the *Railway Age* is of the opinion that the subject is worthy of even more study

Tourist and Excursion Rates

by traffic officers. The railroads as a whole could handle 20 per cent more passengers than they do now with but slight additional expense. Tourist and excursion rates should be applied in every possible situation where they are likely to yield a profit, without affecting appreciably the volume of business moving at regular rates. Further than that, the roads should give whatever reduced rates they put into effect the widest publicity, not only to attract business but to counter the arguments advanced for general rate reductions.

The Joint Commission of Agricultural Inquiry is now making public the recommendations which it expects to present to Congress. An advance statement of

Commission of Agricultural Inquiry

the recommendations relative to railroad transportation and regulation will be found on another page of this issue. The analysis which the statement makes and the suggestions which are contained therein show that the Joint Commission under the guidance of its chairman, Sydney Anderson, member of the House of Representatives from Minnesota, has accomplished a commendable task in a commendable manner. Readers of the *Railway Age* will not necessarily agree with all the recommendations which are suggested; they will, however, agree with the larger part of them. It has been emphasized in these columns on numerous occasions that the welfare of the railways of this country depends in large measure on the good-will of the farmer. It has been a source of regret, however, that the gentlemen purporting to represent the agricultural interests have too often seemed to be too radical in their thoughts and expressions and that in general they have worked on the basis apparently that agriculture needs different theories of economics from those which apply to transportation or other industries. The Joint Commission of Agricultural Inquiry has not done its job this way. It has apparently studied transportation sufficiently to secure an adequate understanding of the subject. Its findings deal with railroad transportation as it is and they are not radical and theoretical but sensible and practical. All the recommendations will not receive unqualified approval but they at least are reasonable and represent honest differences of opinion. The report will have a standing entirely out of comparison with the radical effusions too frequently made in the past by many experts purporting to have a mandate from the farmers, who, in the last analysis, form one of the most important elements in this entire question.

Purchasing for a railroad is not fundamentally different from purchasing for individual needs. The same common sense

Common Sense in Buying Paint

principle of ultimate economy should be applied in both cases. A railroad purchasing agent certainly would not buy the cheapest paint that he could get for his home, but would insist on a product that would give satisfactory service. Too often when buying for a railroad, paint is just paint to the purchasing agent. It is a bulk commodity to be bought from the manufacturer who quotes the lowest price per gallon. It would be a good thing if the purchasing agent could have a talk with the master painter before placing his paint business with the lowest bidder. If he could do this, he would learn that the workman has trouble in applying paint that is not carefully made. Satisfactory working properties are obtained only by painstaking attention in the manufacture of paint; this the cheap product does not get and the higher labor costs of application offset the slight saving in the price of the material. Furthermore, cheap paint is certain to lack durability. To obtain a lasting paint film requires careful preparation, especially in the use of dryers. Paint

made to meet price competition on a quantity basis is not given the attention required and good results cannot be expected. Railroads that buy cheap paint are simply signing a bill for increased expenses in the future. One large railroad recently painted a large number of steel coal cars with a cheap paint having a mineral oil base. The paint failed in a short time and it became necessary to repaint the cars. The old coat adhered to the steel in spots and would have destroyed the value of any paint put on over it, so that it was necessary to sand blast the entire car before applying another coat. Probably this railroad will look for quality rather than price hereafter in buying paint, but other roads are constantly making the same mistake in buying on the basis of price alone. One large system recently bought paint at a price of 75 cents a gallon, freight prepaid. The freight from the manufacturer's plant cost 14 cents a gallon and barrels for the shipment, 5 cents a gallon, making the net price to the manufacturer 56 cents a gallon. At the same time a good grade of linseed oil was selling at 90 cents a gallon. It would be interesting to know what materials were actually used in this paint. The false economy of buying cheap paint is so evident it seems strange that railroads should ever follow such a policy. The trouble is that the purchasing department is usually too far removed from the user of the paint and does not have an opportunity to check the results obtained. The purchasing department would not be so proud of the saving of a few cents per gallon if it could see how cheap paint increases the costs of the department using it.

There has long been a feeling of more or less dissatisfaction with the effectiveness of the service obtained from the freight

Facts About Car Service

car equipment, to which expression has been given through frequently-recurring proposals for the formation of a general equipment pool. There has, however, never been an adequate basis of fact on which to form a sound conclusion as to the effectiveness of a pool to improve the unsatisfactory conditions, or as to the possibility of bringing about the desired improvement by much simpler measures. A notable contribution to this subject has been made by M. J. Gormley, chairman of the Car Service division, in his paper before the meeting of the Transportation division of the American Railway Association, at Chicago, April 19, an abstract of which appears elsewhere in this issue. As the result of a study over a period of three years, Mr. Gormley points out two factors which have been found to influence empty car mileage materially, both of which are inherent in traffic conditions beyond the control of the railroads and neither of which has ever been given sufficient consideration in discussions of this subject. These are the disproportionate decrease in the volume of traffic moving in the light direction during periods of light traffic and the effect of the light-loading of equipment in times of business depression, both of which inevitably increase the proportion of empty car mileage necessary to effect an equipment balance. Another fact brought out by Mr. Gormley, indicating that the volume of unnecessary empty car mileage has frequently been exaggerated, was developed by a check of over 20,000 cars moving in the direction of heavy traffic from which it was found that only 1.4 per cent of the cars were empty. The *Railway Age* does not assume that these facts prove the case for the present system of car service rules based on individual ownership. They do, however, emphasize the need for a detailed study of car movement on every division of every railroad to determine all of the causes for empty car movement and their relative importance. Only with such facts available will it be possible to settle the question of car service in such a manner that it is likely to stay

settled for any length of time. Without such a basis of fact, the railroads will continue to be placed on the defensive by constantly recurring proposals for car pooling in one form or another. What is worse, they will continue to be convicted of negligence in the management of their own business by public opinion because their failure to meet the question squarely, either by adopting the pool or by convincingly proving it to be a fallacy in terms which the public can understand.

Former Railroad Guaranty Payments Delayed Till 1923

MANY PEOPLE are confused into believing the statements so frequently made by critics of the Transportation Act that it constitutes a guaranty to the railroads. This is largely because they read so frequently in the newspapers about the delayed payments being made from time to time by the Treasury Department on account of the compensation which the government guaranteed the roads for the 26 months of the federal control period, which was also continued by the Transportation Act for the six months immediately following the termination of federal control to allow the Interstate Commerce Commission time to adjust railroad rates to meet the scale of expenditures established while the government was operating the roads.

This guaranty expired on August 31, 1920, yet the recent estimate made by Secretary of the Treasury Mellon to the Senate Finance Committee and the House Ways and Means Committee of the prospective receipts and expenditures of the federal government predicts that \$200,000,000 will still remain to be paid to the railroads on account of the old guaranties during the fiscal year ending on June 30, 1923, because many of the payments to railroads which it had previously been estimated would be made in 1922 had been postponed. During the period of federal control the government guaranteed the railroads a rental of approximately \$900,000,000 a year, but this amount has not all been paid. A considerable part was withheld pending final settlements with the various companies of their accounts with the government, including the capital expenditures of the Railroad Administration charged against the roads.

The Railroad Administration is announcing settlements with various companies almost every week but the Secretary of the Treasury estimates that \$100,000,000 will remain to be paid by the Railroad Administration during the fiscal year 1923 as well as \$100,000,000 on account of the six-months guaranty on which the railroads are still figuring with the Interstate Commerce Commission. The commission in its annual report estimated the amount of the six-months guaranty at about \$536,000,000, of which \$430,520,307 had then been paid, leaving an estimated amount still payable to the carriers of about \$105,500,000. Very little of this has been paid since the date of the annual report and the estimate of the Secretary of the Treasury apparently is not optimistic as to the prospect for the conclusion of the complicated process which the commission must go through in certifying the exact amounts due.

When the budget was submitted to Congress in December it was estimated that the Treasury would have to provide \$337,000,000 for payments to railroads during the present fiscal year, but partly because of the unexpected delay in reaching settlements, and partly because the Railroad Administration had derived \$230,000,000 in cash by selling the notes with which the railroads had paid for the cars and locomotives ordered by Director General McAdoo, Mr. Mellon's statement of April 14 shows a credit of about \$56,000,000 on railroad account instead of an estimated expenditure of \$337,000,000.

This would indicate that we are likely to hear a great deal more for another year or so about a guaranty to the railroads, although the only guaranty expired over a year and a half ago. Of course, most people who talk about a guaranty to the railroads do not refer to this real guaranty, some of which is still to be paid; they refer to the provision in the Transportation Act which directed the commission to try to so adjust rates as to allow them a 6 per cent return. This provision also expired on February 29, 1922, after having produced for the roads as a whole about 3 per cent, but we hear occasionally of some one who thinks that the delayed payments that are still being made on the old account represent payments from the Treasury to make good the so-called "guaranty" of 6 per cent. The Interstate Commerce Commission is to fix a percentage from time to time to represent a fair return to the railroads but of course this will entail no expense if the rates fail to produce the desired revenue.

There was also a loan fund of \$300,000,000, most of which has been loaned to railroads at 6 per cent. Of this \$74,003,570 had been repaid by March 31 and under the law no more loans may be made from it except on such applications as were filed before February 29.

Progress in Automatic Train Control

THIS COUNTRY now appears to be committed to "automatic train control." The Chicago & Eastern Illinois has used automatic stops extensively for eight years and evidently feels satisfied with the results. The Chicago, Rock Island & Pacific has used them two years and has decided to equip a whole division of the road. The New York Central is making elaborate experiments and evidently intends to make others. The Pennsylvania proposes to equip 50 miles of road, single track, to test an elaborate apparatus. The Erie is to enlarge its experimental operations on the Northern New Jersey line, and the Delaware, Lackawanna & Western is going to try George P. Finnigan's apparatus on a main line. The Chesapeake & Ohio has begun an extensive experiment from which it is not likely to back out.

So many important enterprises, not to mention the various smaller ones, indicate a widespread disposition to try out, with all necessary thoroughness, this method of abating the collision disgrace. The general use of cab signals as a simpler and much cheaper means of forestalling disasters due to engineers' mental lapses finds scarcely a friend in all America. It is a system which has proved so satisfactory in France, after 40 years' experience, that it is being extended, under governmental approval; but Americans seem determined to have the most refined perfection, or nothing. The idea is not merely to make the engineman more careful, but to make the train safe without any engineman at all.

The Boston & Albany is trying a roadside audible signal, which, doubtless, is cheaper and simpler than cab signals, and theoretically is about on an equality, as regards safety; but the officers of the Boston & Albany, with a very few others who look favorably on the audible signal principle, are still in a very small minority.

The present activity is due almost wholly to the prodding of the Interstate Commerce Commission; and the action of that body is interpreted as a mandate of public sentiment. But the activities of the Commission thus far leave much to be desired. The proposal that 49 experiments shall be made, at a cost of scores of millions of dollars, in a field where the wisest heads among both the progressives and the conservatives still find serious reasons for caution and still find their problems numerous and perplexing, cannot be classed as other than a very crude method of approach to a problem which calls for the best engineering talent.

With the leading parties disposed to evade or defer the

main issue—the financial issue—the question how to accomplish broad and friendly progress is still before us. The railroads cannot spend money until they get it, except as it is clear that borrowed money has a prospect of earning enough to pay for its use. The government tries to promise the railroads that they shall earn enough to bear new and unusual expenses; but after two years it is still unable to carry out its good intentions, on the basis of the *present scale of expenditures*—let alone additional refinements. The government cannot afford to build a railroad for experiments alone; nor can anybody, for the only satisfactory experiment must include a heavy regular traffic and scores of engineers. The hearty co-operation of a strong railroad organization is essential.

To meet the needs of the whole country and to satisfactorily settle the problem of uniformity, any plan must include, as a vital element, a board of supervising engineers of undoubted ability and independence. An ideal experiment would have to begin with the selection of such a board—say of three or five members—and its complete detachment from all railroad and commercial interests. And those three or five men would have to have the hearty co-operation of at least one strong railroad. In view of the financial and governmental—and other—obstacles to such a course, there will undoubtedly be practical men who will reject this suggestion as mere idealism; but what could be more absurd than the grandiose idealism of spreading a costly experiment over 10,000 miles of track and 5,000 locomotives, under 49 different and variously qualified experimenters and bosses, with no effective co-ordination of ideas and no financial regulation at all?

There would seem to be no way of avoiding a huge waste except by a pooling of interests; but nothing has yet been done toward broad and rational consultation, or toward discussion of means and methods of co-operation. The two important obstacles to wise and economical progress, the large initial cost of train control apparatus and the need of uniformity throughout the lines of connecting railroads, involve problems which can be reasonably solved only by co-operative study and approach: they are beyond the control of the individual railroad.

Coal Strike Situation Needs Some Publicity

IT IS TO BE PRESUMED that the coal strike is still on. We are reading but very little news about the affair in the daily papers—so little that it is not possible to feel absolutely certain that the difficulties may not have been peacefully settled, and not much said about it.

A situation of this sort is rather unusual for this year 1922 and it is particularly unusual to anyone familiar with the manner in which railway officers and the representatives of labor utilize every possible means to tell their respective stories to the world on every occasion when opportunity seems to permit. In the difficulty between the coal operators and the miners the opposite has been true. There was a great deal said in the daily papers prior to April 1 about the threatened strike. For a few days following April 1 the strike was front page news but since that time it has been relegated to the fourth or fifth page and information about it will be found in short items usually of relatively small importance. As a result the public is not interested in the strike. At the rate things are going it will continue to be disinterested until cold weather comes and finds the household coal bins empty, or until a fuel shortage results in a cessation of public utility operations, or in some other development equally serious in character. It may be regarded as settled beyond argument, however, that the public should be interested in a matter as vital as its fuel supply.

Neither the operators nor the miners are telling their case to the public. This may mean many things but to us it means only one of two things—either (a) that the parties involved in the dispute have no case, or (b) that they have failed utterly to realize the value of telling their case to the public.

It is possible that this assertion will be met with denial and statement to the contrary by both the operators and the miners. It is true that some small amount of publicity has been given out but it is nothing at all as compared with what presumably can be said by either side. The public has a very inadequate idea as to the points at issue in the strike. It may be presumed, we believe, that in the present state of thought in the country it would incline to be more favorable to the operators than to the unions. This feeling will not continue, however, unless the operators make some effort to meet the public half-way and take some steps to show that they deserve the public's good will. They should realize that there is a real necessity for taking the public into their confidence and of telling the public the facts as to the situation.

The coal consumers and the public in this United States have votes. The administration and Congress at Washington have a means of sounding and acting on public opinion. If the strike is continued too long and the operators show an offish attitude, the decision on the part of the public is too likely to be sudden and severe and there are too many chances that the ultimate result will be government regulation, or, at any rate, something somewhat distasteful to the coal industry.

The *Railway Age* has two reasons for commenting upon the situation. One is its general interest in the subject of publicity and the creating of good will through public relations work in the railway field. We believe the coal operators can learn a great deal from a study of what the railroads would do in similar circumstances. The other reason is our interest in the railroads.

It will be impossible to determine adequately the effect of the coal strike on railway revenues and expenses for at least another month or more, because the April reports will not be made public until that time. That the effect on the railway net will be severe there can be no question. This is unfortunate because earnings have only recently begun to show any relationship whatever to the standards required by the Transportation Act and the uncertainty of the situation is aggravated by our lack of knowledge as to what the Interstate Commerce Commission may do in the matter of decreasing freight rates.

Bituminous coal constitutes about 30 per cent. of the total tonnage of the railroads of this country, and anthracite an additional 6 per cent. In the week ending April 8, the coal loaded totaled 69,456 cars; in the week ending April 15, but 62,851 cars, or less than one-half as much as in the same weeks of last year. The bituminous loading, as compared with last year, has been reduced over 40 per cent.; the anthracite practically eliminated. Some roads, such as those in the Pocahontas district, are loading more coal than ever, due to their serving non-union mines. Other important coal carriers, both bituminous and anthracite, are loading no coal at all. It would take a true optimist to be unable to look upon this situation without apprehension. He might find some ground for optimism, of course, in the fact that there are large stocks of coal stored for locomotive fuel supply.

All this means that railway men should be taking a leading interest in the coal strike situation. To our way of thinking, however, the operators should formulate a case. If they have one now they should make it public and endeavor to "sell" it to the people of the country. Their present idea of sitting tight and waiting for the unexpected to happen will result in no good to their own industry or to any other industry with which they deal.

Letters to the Editor

[The RAILWAY AGE welcomes letters from its readers and especially those containing constructive suggestions for improvements in the railway field. Short letters—about 250 words—are particularly appreciated. The editors do not hold themselves responsible for facts or opinions expressed.]

The Cost of Treating Ties Should Not Be Charged to Maintenance

HOUSTON, TEX.

TO THE EDITOR:

In your issue of February 18, page 416, you published an abstract of a paper presented before the annual convention of the American Wood Preservers Association by Earl Stimson, chief engineer maintenance, Baltimore & Ohio, advocating the charging of the cost of treating ties to maintenance accounts. I desire to take issue with Mr. Stimson in this conclusion.

The railway maintenance engineer can no longer limit his horizon in considering the repairs and renewals necessary for the property in his charge, but must include in his consideration the viewpoints of the financier, the executive and the accountant. This requirement has been growing more imperative during the past 10 or 15 years—a period of rapidly increasing railway regulation by governmental bodies, which has been brought to a fitting climax by the passage of the Transportation Act of 1920. Railroads cannot be constructed or operated as institutions for the public benefit only. They must earn a fair return upon their value if they are to be expected to continue in existence and keep abreast of the development and progress of the territory they serve.

The primary need of a railroad is to earn money for operating expenses, fixed charges, improvements and, in order that it may prosper and fulfil its obligations to the investors in its securities, sufficient to pay a reasonable rate of return on those securities. The lack of sufficient earnings for all of these requirements is first felt by the maintenance departments and falls heaviest upon the maintenance engineer. Still, some of those most vitally interested continue to advocate the charging into operating expenses of amounts representing improvements to their property and go so far as to argue in favor of the most glaring inconsistency in the present accounting rules—that requiring the charging of the cost of treating ties to maintenance.

It is true that the Classification of Investment in Road and Equipment, Issue of 1914, as prescribed by the Interstate Commerce Commission, does not permit a charge to investment covering the cost of treating a tie used to replace an untreated tie, although it and the Classification of Operating Revenue and Operating Expenses, Issue of 1914, are both noticeably lacking as to specific instructions on this point. Betterments are defined in the Classification as improvements of existing facilities through the substitution of steel-tired wheels for cast wheels under equipment, the application of heavier rail in tracks, and the strengthening of bridges by the substitution of heavier members. We are led to infer that the excess cost of metal ties applied in the place of wooden ties over the current price of the wooden ties removed is the only betterment that can be obtained in a tie system. Are we to believe that a treated tie is no better than an untreated tie? If this could be a fact, then why do we use them?

The real facts have proven treated ties superior in overcoming decay to untreated ties. Their use results in economies of operation equally as important and probably even

greater than the economies secured from the application of heavier rails, ballasting of tracks, reductions of grades, or the development of terminal facilities. Improvements of the nature just mentioned are made with the intent of reducing operating expenses. The treatment of ties ordinarily will double their life and in this way will also reduce operating expenses. Can it be possible that this is not an improvement, or a betterment of the property under a proper definition of the word?

The carriers have, during the past eight years, been undergoing a valuation by the Valuation Bureau of the Interstate Commerce Commission. This bureau has not valued the untreated tie as highly as the treated tie because it recognizes the difference in worth. Very strenuous objections would have come from the carriers if the bureau had done otherwise. Now, the Interstate Commerce Commission is attempting to perpetuate this valuation by its Valuation Order No. 3, Second Revised Issue. But, under this order, a carrier which may have used one million treated ties in renewals replacing untreated since its valuation date, at an increased cost over the cost to replace in kind varying from 25 to probably as high as 75 cents per tie, and conservatively averaging 50 cents per tie, or \$500,000 total increased cost, cannot capitalize this half-million dollar improvement but must charge the value of the improvement into its operating accounts: Will such handling perpetuate the valuation work now almost complete? Is it not unfair when this carrier is deprived of its increased value, to give another carrier, constructed new in the past two or three years with, say one million treated ties in track, the privilege of capitalizing the full cost of those ties and earning a higher net operating income based on this higher capitalization?

Under the Transportation Act of 1920 the commission has placed a value upon the carriers by groups and fixed rates designed to earn a fair return upon such value in the aggregate. Two years have passed and at no time have the rates been sufficient to allow even a fair sized minority of the carriers to earn this promised return upon their value. But, assuming that conditions had been normal during this period, and that the carriers as a whole had earned the maximum allowable return, then this return would have been short by the amount they should have earned on the increased value of their tie systems resulting from the betterment growing out of the practice of using treated ties in larger numbers each year. And likewise the operating expenses would have been and actually were greater than they properly should have been, to the extent that they included the increased values of the improved tie systems.

Should not the commission amend the present accounting rules as affecting treated ties? By so doing, it would not only allow the carriers to earn a larger net operating income, but would materially decrease the operating expenses of the carrier, which decrease would finally reflect itself in lowered rates. It has been suggested that it would not be practical to keep accurate account of treated ties. This can be done very simply by the use of a marker so that treated and untreated ties can be identified and classified when retired.

It is quite true that there are varying kinds of treatment, both as to cost and effectiveness. But this cannot be used as an argument against charging the increased cost due to treatment to capital account. The cost of the same kind and size of untreated ties varies in different portions of the country. The Valuation Bureau did not argue that a flat price should be used for each size and kind of tie regardless of the local conditions entering into its cost. Neither can the increasing ratio of the cost of the timber to the cost of treatment have any bearing upon the principle involved. The treated tie will always cost more than the untreated, and the excess cost due to treatment will always be an appreciable amount.

The more general treatment of hardwood, as well as soft-

wood ties, is being strongly advocated, and it will not be many years until practically all ties will have to be treated as an economic necessity. It has been the urge of this necessity which has caused carriers in the past to attempt, through treatment, to increase the tie life by from 75 to 100 percent., regardless of how the cost was accounted for. But, can they be expected to continue this practice with the accounting classification throwing the expense into operating accounts and the Transportation Act limiting their income? Railroad earnings are now low and have been for so long a time that the carriers have almost forgotten the meaning of prosperity, although the rates are now generally higher than at any time prior to 1920 or than they probably ever will be in the future. What better method of providing for the increased expense due to treatment of ties can be found than by capitalizing this increased cost?

The writer is an unqualified advocate of the use of treated ties and would regret being interpreted otherwise. But it is not merely desirable but very essential to the continued use of treated ties in annually increasing quantities, that the excess cost be properly accounted for as a betterment and that inconsistencies in the Classification of Investment in Road and Equipment be removed. The maintenance engineer cannot keep every dollar of the carrier's earnings for maintenance uses only, but must share them with other interests who, by virtue of their investment, have a right to a share. He must plan his expenditures in such a way as to make the earning of each succeeding dollar just a little bit easier than the one before, and in so doing he will not be paying tribute to capitalization but will merely be fulfilling his trust.

F. S. SCHWINN,
Chief Engineer, International & Great Northern

Fatal, If Not Corrected

ON THE LINE.

TO THE EDITOR:

A patient complaining to a doctor usually describes his illness by the effect it has upon his feelings, but the doctor looks beyond the effect and endeavors to locate the cause. When the disease is complicated it is quite probable that there is more than one cause. An instance recently brought to our attention which indicates one phase of the unhealthy condition of the transportation business is clearly shown in the experience of one old freight conductor who runs a way freight or "peddler." On every trip over the road he finds that shipments for points at the distant end of the line are nearest the door, while those for the nearer stations are often buried under masses of other material that must be moved before the delivery can be made. The cost of a train crew waiting while this sorting process is going on is high. It takes much longer to get a train over the road than it should. This same train crew works six days a week, but with the overtime the pay they receive is equivalent to much more.

Now here is a sick condition if there ever was one. The cause is likewise very evident. If a way freight must lay at a station 45 minutes instead of 10 minutes, while the crew overhauls everything in a car to uncover a certain shipment, it is evident that the cause is unsystematic loading. This can be remedied and ought to be with all possible dispatch. Not only is this particular condition exceedingly expensive, but it has a deadening effect upon the men who unload the car. Who can blame them if they think "nobody cares how they put this stuff in the cars—we should worry?" But they don't worry so long as they get well paid for their time.

Is it not high time some one else should worry, for such conditions as these are sapping the finances of the roads

TRAVELER.

Is This the Future Locomotive?

WASHINGTON, D. C.

TO THE EDITOR:

The steam locomotive has been coming in for some pretty severe censure lately, part of it justified and part of it certainly unjustified. Considering the problem with no interest to serve or hamper me, I believe that the locomotive, when actually at work, performs that work with surprising economy but that the reasonable grounds for criticism are: (a) the first cost is too high; (b) the cost of maintenance is high and depreciation rapid; (c) the machine as a whole is vulnerable at so many points that it is out of service too much of the time.

There are three reasons for these points of objection. (1) The locomotive combines in a single unit, three somewhat distinct functions. It is a steam generating plant, it converts steam into reciprocating motion, and it must transmit that reciprocating motion to the rotation of the driving wheels. (2) The difficulty in solving this problem has increased steadily as the demand for power has increased and the limitations of width and height and even of length have been reached. (3) While many important economies have been added from time to time, they usually necessitate new parts requiring skillful attention and adding to the vulnerability of the locomotive, not to mention its high first cost and cost of maintenance.

Many of the writers on the subject seem to think that the limit of the locomotive has already been reached, and some declare that we must turn to electric traction with central power house installation. The great advantages of electric traction are so manifest on main lines of heavy traffic as to be very alluring, but it must necessarily come slowly on account of the difficulties of financing. Furthermore, it is apparently not economically applicable to more than, say, three-fourths of the present railway mileage. Under all the circumstances it is not highly probable that there is an intermediate stage between the present steam locomotive and the ultimate central power installation with electric motors? May not that intermediate stage be the electric locomotive driven with its own power generator?

The development of the steam turbine and the electric drive in marine practice has demonstrated the great advantage arising from electric transmission of power and we may well foresee the introduction upon the platform of a car not excessive in length, of a tender for coal and water, a boiler of such design that it will be far less expensive in first cost and in maintenance than the present type of boiler and at the same time be more efficient, and a turbine-driven generator delivering its power to motors on the axles of, say, two eight-wheel trucks. On such a car platform, say 75 to 80 ft. in length, the separate units of the installation would stand in much the relation that they do in the ordinary power house of a factory, though naturally more compactly placed. The design of the boiler would follow the experience of the best stationary and marine practice, not confined to the limitations of the present locomotive frame and wheel arrangement. Many of the objections on account of first cost and high maintenance expense of present day firebox design would be eliminated. The turbine-generator needs no endorsement or explanation because in itself it is a unit thoroughly tried out and well understood. Lastly, the transmission of the electric power to the driving wheels becomes simply a question of a flexible cable connection.

Such a locomotive should be able to render fairly continuous service, making, say, 800 miles daily in passenger service and 400 to 500 miles in freight service. And why not? In stationary and marine practice, boilers and generators such as we propose to use are frequently in continuous service.

FREDERIC A. DELANO.

Electric Freight Locomotives for Chile*

Speed on Heaviest Grade Will Be Doubled and Train Weights Will Be Increased

WORK on the 15 electric road freight locomotives for the Chilean State Railways is nearing completion.

The cabs for the first eight of the road freight locomotives have been delivered by the Baldwin Locomotive Works to the Westinghouse Electric & Manufacturing Company for the installation of the equipment. There will also be seven switching locomotives.

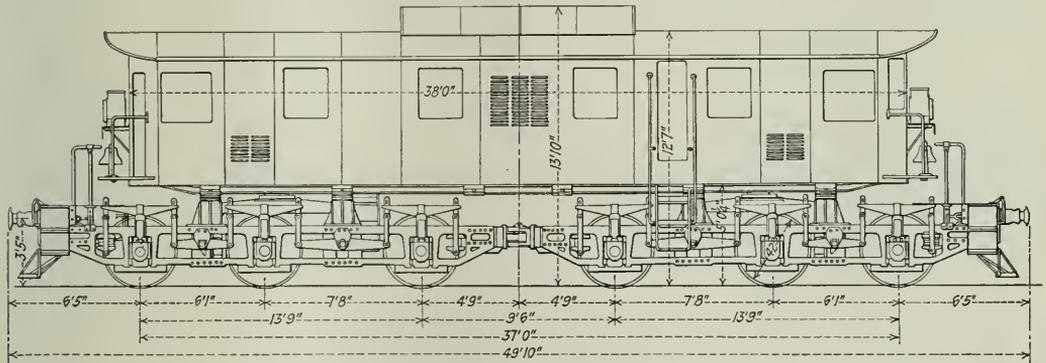

The road locomotive has a cab of the box type, carried on two articulated trucks, each having three driving axles with direct geared motors. The estimated weight is 226,000 lb. It will operate at 3,000 volts direct current.

This locomotive has a rating of 1,680 hp. at 3,000 volts and will be able to develop a maximum of 3,200 hp. for short periods. With natural ventilation the locomotive will deliver for one hour a tractive effort of 27,950 lb. at a speed of 22.6 miles an hour at 3,000 volts. The continuous capacity of the locomotive with forced ventilation is 20,880 lb.

tons. They are operated with a single steam locomotive, except on the heavy 12-mile grade southbound, and on a northbound grade of 6.8 miles. On these two sections a steam helper is now used to maintain speeds of from 10 to 14 miles an hour.

One electric locomotive will haul a trailing load of 770 short tons in either direction between Valparaiso and Santiago without assistance except on the Tabon grade. On level tangent track the speed with such a load will be 35 miles an hour. The average running speed on the Tabon grade will be approximately 24 miles an hour. The time saved by the elimination of delay to take fuel and water and by the higher running speed will shorten the time of a trip from four to five hours in each direction.

These locomotives are equipped with Continental spring buffers and M.C.B. couplers, arranged to take attachments for chain couplers temporarily. The two six-wheel trucks

Side Elevation of Road Freight Locomotive

tractive effort at 24.8 miles an hour. The maximum speed is 40 miles an hour.

The general dimensions and estimated weights of the locomotive are as follows:

Track gage	5 ft. 6 in.
Length over buffers	49 ft. 10 in.
Length over cab	38 ft. 0 in.
Total Wheelbase	37 ft. 0 in.
Rigid wheelbase	13 ft. 9 in.
Height, top of rail to cab roof	12 ft. 7 in.
Height, top of rail to clerestory	13 ft. 10 in.
Width over cab sheets	10 ft. 0 in.
Height of coupler	41 in.
Wheel diameter	42 in.
Weight of complete locomotive	226,000 lb.
Weight of mechanical parts	140,000 lb.
Weight of electrical equipment	86,000 lb.
Weight per driving axle	37,670 lb.

The road locomotives will operate over the 116-mile route between Santiago and Valparaiso and the 28-mile branch between Las Vegas and Los Andes. The heaviest grade is 22.5 per cent for 12 miles from Llai Llai to La Cumbre. This is known as the Tabon grade. The maximum curvature is 11 degrees. There are six tunnels in the electrified zone.

The present main line freight trains average 550 short

tons. They are connected at the inner ends by a mallet hinge. The bar-type cast steel side frames are located outside of the wheels and are connected by cast steel bumpers and cross-ties. The semi-elliptic driving springs over the journal boxes on each side are connected to one another by equalizer beams. The ends of each set of three driving springs connected thus are attached to the side frames through coil springs.

The 38-foot box-type cab, including an engineman's compartment in each end and a central equipment compartment, is carried on center pins located approximately over the midpoint of each rigid wheelbase. One center pin is restrained both longitudinally and laterally and the other in the lateral direction only, which permits free longitudinal movement of the cab relative to one truck.

The locomotives are equipped with Westinghouse air brakes, which are standard for the Chilean Railways. The air brake is interlocked with the regenerative brake so that the latter may be supplemented by service application of the train brakes, if desired, without applying the air brake to the locomotive drivers.

Current is collected by spring-raised, air-lowered pantographs, controlled by compressed air and arranged to be mechanically locked in the lowered position. Individual switches mounted in banks establish the main circuit connections. Each switch is a complete unit in itself and may

*The Chilean electrification problem was outlined in the January 21, 1922, issue of the *Railway Age*, page 216, and the passenger locomotives were described in the issue of March 4, 1922, page 527.

be removed without disturbing adjacent switches. Compressed air controlled by electro-magnetic valves is used to operate the switches. For certain circuits where no current is broken and for low voltages, cam switches are used. These also operate by compressed air controlled by electro-magnetic valves. The cam group comprises a number of switches mounted on a single shaft, connected through a rack and pinion to a double-acting air piston.

Each axle of the locomotive is driven by a motor, wound for 1,500 volts and insulated to operate two in series on 3,000 volts. The nominal rating of this motor on short field is 280 hp. at 155 amperes and 1,500 volts. Field control is secured by the use of two separate field windings on the main poles. The motors are geared directly to the axles with a ratio of 3.94 to 1. The gear used is of the flexible type.

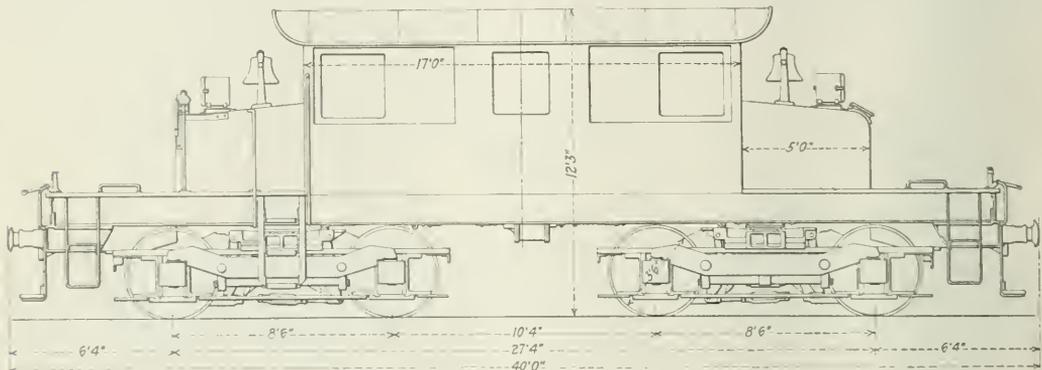

A motor-generator set provides low voltage power to compressors, blowers, control equipment and lights. This set has a single frame and two armatures carried by a common shaft. The 3,000-volt motor is a bi-polar double-commutator machine. The continuous rating of the generator is 35 kw. at 92 volts.

The following table gives the general dimensions and estimated weights of the locomotive:

TABLE II
DIMENSIONS AND WEIGHTS OF SWITCHING LOCOMOTIVES

Track gage	5 ft. 6 in.
Length over buffers	40 ft. 0 in.
Length over central cab	17 ft. 0 in.
Length over hods	27 ft. 0 in.
Total wheelbase	27 ft. 4 in.
Rigid wheelbase	8 ft. 6 in.
Height, top of rail to cab roof	12 ft. 3 in.
Width over cab sheets	10 ft. 0 in.
Height of coupler	36 $\frac{1}{2}$ in.
Wheel diameter	42 in.
Weight of complete locomotive	136,000 lb.
Weight of mechanical parts	86,000 lb.
Weight of electrical equipment	50,000 lb.
Weight per driving axle	34,000 lb.

The trucks are of the rigid bolster equalized type with rolled steel frames located outside of the wheels. A center pin is located at approximately mid-length of each rigid wheelbase. The central cab has an engineman's stand in each end and control apparatus centrally located and suitably protected. Buffers, couplers and air brake equipment are duplicates of those on the road locomotive. The control equipment also comprises apparatus similar to that already

Side Elevation of Electric Switching Locomotive

A master controller is located in each engineman's compartment to provide double-end operation, the same master controller being used for both motoring and regenerative braking. This controller provides 50 control notches in acceleration.

For regenerative braking, the main motor armatures are arranged for the same combinations as when motoring and the motor fields are separately excited by the motor-generator set. The range of speed in regenerative braking will be from 8 to 30 miles per hour.

Switching Locomotives

The switching locomotives will be the last ones built. The cab is of the steeple type and is carried on two swivel trucks. Two motors are mounted on each truck driving direct through helical gears. The estimated weight is 136,000 lb. The control is arranged for double-end operation.

The nominal rating of this locomotive is 560 hp. With 3,000 volts, and natural ventilation, the tractive effort for one hour is 19,600 lb. at a speed of 10.6 miles per hour and the continuous capacity is 11,400 lb. at 12.7 miles per hour. With 25 per cent nominal adhesion the starting tractive effort is 34,000 lb. The maximum speed is 35 miles an hour. For short periods the equipment is capable of developing 1,000 hp. In view of an expected increase in traffic these locomotives have been designed to handle trains of 1,200 short tons in yards with level tracks.

described for the road locomotives and the pantograph is of the same type.

The four motors are of the series type wound for 1,500 volts and insulated for operation two in series at 3,000 volts. Each motor has a one-hour rating of 140 hp. at 75 amperes and 1,500 volts.

The motor-generator set, to supply power for the compressor motor, lights and control circuits, has a two-part frame, each part containing two bearings in which runs a common shaft carrying two armatures, one a 1,500-volt motor (insulated for 3,000 volts) and the other a low voltage generator. With 3,000 volts applied to the motor, the generator will deliver 22.5 kilowatts at 92 volts.

The main control resistance, connected ahead of all motors, is designed with ample capacity for frequent, heavy accelerations and for a reasonable amount of emergency operation with one pair of motors cut out. The number of accelerating steps assures moderate changes in tractive effort in starting, which in turn tends to minimum wear and tear on the locomotive and rolling stock.

WHEAT SHIPMENTS from the port of Vancouver B. C. in March exceeded all previous records, a total of 11,850 tons having been shipped during the month to Great Britain, and 22,850 tons to China and Japan. The total quantity of wheat shipped through Vancouver during the winter season, November to March, 1921-1922 is in excess of 5,000,000 bushels.

Car Service Rules Improve Use of Equipment*

An Analysis of Empty Car Movement Shows Several Prevalent Impressions to Be Erroneous

By M. J. Gormley

Chairman, Car Service Division, American Railway Association

THE FOLLOWING CONCLUSIONS regarding the practical working out of the car service rules and the movement of equipment generally are based upon a study of the records we have compiled, supplemented by reports from 12 railroads on which 43 per cent of the traffic of the country was handled from January 1, 1919, to December 31, 1921. The more important aspects of this problem are: (1) Empty car mileage and its causes. (2) Car service rules in actual practice. (3) The importance of supervision of car movement.

The figures obtained from the 12 roads referred to show that the loaded car mileage east and north exceeded the loaded car mileage west and south from January 1, 1919, to December 31, 1921, from a minimum of 64,432,000 to a maximum of 152,698,000 miles per month. It is estimated that three-fifths of the population of this country reside east of the Mississippi and north of the Ohio and Potomac rivers. This explains the unbalanced traffic of the country. Even under normal conditions there is this greatly unbalanced traffic and it is accentuated in times of business depression and is due in a large measure to the greater fluctuations in the various classes of traffic.

As an example of what is meant by fluctuations in traffic we call your attention to the comparison between August, 1919, a period of low empty mileage and heavy traffic, and January, 1921, a period of very high empty mileage and greatly decreased traffic. In August, 1919, 5 per cent of the loading was live stock, 20 per cent coal and coke, 6 per cent forest products, 4 per cent ore, and 60 per cent merchandise and miscellaneous. In January, 1921, 7 per cent of the traffic was live stock, 2 per cent greater than it was in August, 1919; 26 per cent was coal and coke, 6 per cent greater than in August, 1919; 4 per cent was forest products, 2 per cent less than in August, 1919; 2 per cent was ore, a decrease of 2 per cent as compared with August, 1919; and 54 per cent was merchandise and miscellaneous, a decrease of 6 per cent as compared with August, 1919. This shows that the commodities moving largely in one direction increased while the traffic generally decreased, thereby creating a very unavoidable empty car mileage.

An important factor increasing empty car mileage in times of business depression is the light loading of equipment. We are now making an analysis of 1921 loading figures. The principal products of agriculture alone show a net total of nearly 130,000 cars used unnecessarily in 1921 on the assumption that the same average loading per car might have been attained as in 1920. These were long haul commodities and moved largely to the east and north in the direction of prevailing traffic, thereby adding just that many more cars to be handled back empty into the producing territories. These few commodities alone undoubtedly added from 40 to 70 million empty car miles to the year's total.

Obviously, there is no possible way to avoid empty car mileage that is due to unbalanced or fluctuating traffic or to light loading by shippers. Most certainly such empty mileage could not be avoided to any greater degree under a car pool than under the ownership principle. It is self-evident

that empty cars in excess of the requirements for west or south-bound loading must be moved empty to the producing territory and without any question it is most economical to return the equipment currently and automatically in accord with ownership rather than attempt to do it by the so-called fleet movements of miscellaneous cars without any regard to the character of cars required in the loading territories.

We further call your attention to the fact that the percent of home cars on home lines increased from 48 in January, 1921, to 74 in July of the same year with a concurrent decrease in the percentage of empty car mileage and in spite of a decrease in total car loading. That it has been an error to charge a considerable amount of empty car mileage to the relocating of cars to the owning line is, we believe, clearly proven by these facts. We believe transportation men generally are convinced that it is never economical to increase empty car mileage solely to save per diem expense for the reason that it will create a greater transportation expense than that would be the payment of the per diem.

To determine whether there was any parallel movement of empties in the direction of the preponderating loaded movement a check was made by our inspectors at the principal interior terminals on four of the larger eastern railroads. We checked 20,627 cars moving east and of that number only 290, or 1.4 per cent, were empty. We believe all railroads could make such checks profitably to determine whether there are unnecessary empty movements in the direction of the preponderating traffic. The above indicates a very good performance.

Car Service Rules in Actual Practice

We are frequently met with the statement that when there is a decided decrease in business with a consequent surplus of equipment there is an energetic effort on the part of all interested to move foreign cars off the line empty and load home cars to connections for the sole purpose of decreasing per diem expense. It is convincing from the studies made and from the reports of our inspectors that this conclusion generally is reached from off-hand opinions and without supporting data. The best evidence in our possession that the general views about this have been erroneous is the fact that an analysis of the reports of our inspectors covering a check of 82,156 cars over a three-months' period and including 142 railroads and 316 stations shows that the violations of Car Service Rule No. 1, which is the rule that says home cars shall not be used for the movement of traffic beyond the limit of the home road when the use of other suitable cars under these rules is practicable, has amounted to only 3.4 per cent, while violations of Rule No. 2 amounted to 7.8 per cent, and violations of Rule No. 3 amounted to 3.2 per cent, or a total violation of all the three rules of 14.5 per cent. In other words 96.6 per cent of these cars were handled in accordance with car service Rule No. 1 and 85.5 per cent in accordance with all the rules.

Of the 82,156 cars checked, 45,086 were loaded by the carriers with merchandise and of these cars only 1.7 per cent were loaded in violation of Car Service Rule No. 1. The investigations made by Car Service division into this phase of the subject have been very extensive. They show beyond any reasonable doubt that the carriers generally have ad-

*Abstracted from a paper presented before the annual session of the Transportation division of the American Railway Association at the Blackstone hotel, Chicago, on April 19, 1922.

hered to the rules and the integrity of the rules has been maintained. The natural consequence is that we in the Car Service division feel that the railroads individually may rely upon the integrity of each other in the maintenance of the general scheme of car service rules. We believe that another wrong impression has been created relative to the question of switching expense involved in the observance of the car service rules. It was our impression, as we assume it was the impression of most transportation men, that a considerable switching expense is involved in the observance of the car service rules. This question has been given special investigation at several important switching centers and competent local operating officers have reported that the observance of the rules has not caused any expense that could be eliminated if these rules were not in effect. It is undoubtedly true that some expense can be charged to this, but we are convinced from the analysis we have made and from observations made by our own inspectors that the extent of this cost has generally been greatly overestimated. The records of car loading at some industries where extra effort was made to observe the car service rules have shown very conclusively that it is possible to comply with them without adding anything to the switching expense. In the case of a particularly good sized industry we have in mind a very substantial improvement was made in the observance of car service rules, and a careful check demonstrated that not one cent of extra switching expense was incurred.

The enforcement of the car service rules involves establishing a proper relation with the shipping public. The lack of understanding by the shippers of the value from their own standpoint of loading the equipment in conformity with the car service rules is now more responsible than any other one cause for violating the rules. With a view to improving this condition our representatives have been devoting considerable time in conference with shippers and railroad officers and the Car Service division has recently issued a circular for distribution to shippers asking for their co-operation, in their own interest, in carrying out the car service rules. In the districts where the most intensive educational work has been done the records show that invariably when the shipper has a fair understanding of the purposes to be accomplished by the car service rules he has given unqualified support in carrying them out.

The Importance of Supervision of Car Movement

How many transportation men today realize that the car equipment of this country has a value of approximately five billion dollars and that it constitutes at least one-fourth of the value of railroad property? In order to secure the utmost efficiency from this vast investment intensive supervision of car handling is necessary. In our opinion there is no better field than this for the application of the old doctrine that intensive supervision pays one thousand per cent return. We believe that the ownership principle, under the present car service rules, all things taken into consideration, affords the most economical and workable method for car operation, distribution and maintenance.

It can be fairly stated that the present car service rules are a result of the gradual evolution in the handling of car equipment and are based on fundamentally sound principles from the standpoint of shippers and the railroads. We believe it unnecessary to look to new methods for greater economy in car handling in the future and it is our very firm belief that any additional economies which may develop in car handling will be entirely brought about by:

1. A more intensive supervision of the individual car loading and movement to the end that (a) car service rules will be observed; (b) cross-haul of empty equipment of the same class will be eliminated; (c) increased loading per car will be secured; (d) unjustifiable empty movement will be

avoided, especially in the direction of the preponderating loaded traffic; (e) terminal delays will be reduced to the minimum.

2. A system of recording car mileage by classes, by direction and by operating divisions, to provide a definite record to determine the cause, effect and remedy for empty mileage.

3. A well thought out plan of car maintenance with a view of avoiding empty car mileage due entirely to the condition of the car.

The last item does not mean that we recommend that all cars be maintained in condition suitable for all classes of traffic. A car fit for rough loading in one part of the country may serve the purpose in that territory just as well as a car that is in fit condition to handle high class traffic. To maintain all equipment in condition to handle any and every class of traffic would undoubtedly involve an unjustifiable expense.

The work that has been accomplished in the last year or two in the education of railroad officers and employees and of the shipping public in the merits of the car service rules and in their practical application is a foundation for the more difficult times ahead when business will be heavy, freight cars of all types in demand and the possible tendency to disregard ownership. The exceptionally heavy grain business handled last year in the west with a close adherence to these rules indicates what can be done even with heavy business. We firmly believe that a substantial adherence to the principle of these rules will accomplish the necessary distribution of equipment between different parts of the country in the most satisfactory and economical manner and will avoid the necessity for emergency orders for the movement of cars which are bound to be uneconomical in operation and unsatisfactory in results.

Gasoline Propelled Railway Coaches

AT A MEETING of the Society of Automotive Engineers held in Indianapolis, March 29, a paper was presented by Charles Guernsey, general manager, railroad division, Service Motor Truck Company, Wabash, Ind., on the subject of gasoline railway coaches.

Mr. Guernsey traced the early development of the gasoline propelled railway coach; the heavy, cumbersome type expensive to maintain, some driven by gas-electric motors, some with the gasoline engine mounted under the center of the car, all representing an attempt to use a gasoline motor in a car otherwise typical of steam train design.

Present day models are radically different. They have not lost the railroad point of view altogether but have chosen carefully from railroad practice those features which fit in with this new type of equipment.

The gasoline railroad motor coach will enable branch lines and short lines, which are now operated at an enormous loss, to convert passenger traffic to a money-making basis, due to the low cost of operation and maintenance. A 13-ton car can be operated for 25 to 35 cents per car mile, as against a cost of \$1 to \$2 per mile for steam operation. The initial cost is low. The railroad motor coach is primarily designed for service where steam operation is too expensive and where frequent service is desired.

An instance was cited where a branch line in the Blue Ridge mountains was only getting about \$30 per day in passenger revenue, while the operating cost with steam equipment was \$40 per day. With a gasoline propelled railway coach, this road is now running at a total operating cost of \$10 per day, making a profit of \$20 per day.

During the discussion of the paper an officer of the Illinois Central brought out the case of one railroad that had increased its income \$12,000 per year through the use of

gasoline propelled coaches on branch lines. His line, he stated, was investigating this type of car for use on its branch and short lines.

A representative from the Wabash made the assertion that the steam locomotive required nearly the same amount of fuel expenditure for one-half as for maximum load, a fact which makes branch lines so expensive. This is not true with light gasoline rail car equipment. It was his thought that the need is to build the gasoline propelled car as light as possible and as strong as possible.

The success of the motor coach, the speaker brought out, after all hinges primarily on the engine. The car must be designed with this thought uppermost. The engine must be one which will stand up under the severest kind of service, and it must be capable of operating continuously at high speed and under wide open throttle. It must operate with the minimum of vibration and every part must be accessible.

An interesting test was made by the Service Motor Truck

Company with the 434 in. by 6 in. Midwest engine which is standard in this company's railway coach. The results of the trials to determine acceleration in intermediate and high gear were as follows:

INTERMEDIATE TRANSMISSION				
0 to 21.72 m.p.h.	30 sec.	29 sec.		1,200 r.p.m.
0 to 25.34 "i.p.h.	42 sec.	42 sec.		1,400 r.p.m.
0 to 28.95 m.p.h.	55 sec.	59 sec.		1,600 r.p.m.
HIGH TRANSMISSION				
0 to 32.5 m.p.h.	1 min. 38 sec.	1 min. 32 sec.		1,400 r.p.m.
0 to 37.2 m.p.h.	1 min. 50 sec.	2 min. 6 sec.		1,600 r.p.m.

The detailed design of gasoline engines for use in railway motor coaches was discussed, considerable emphasis being placed on the necessity for high economy and efficiency. Some of the features advocated included large size crank shafts, special lubrication by oil forced to all bearings and lubrication controlled according to the load and not the speed of the engine. Large valves with high lifts are desirable to allow quick induction of fuel and scavenging.

Many Opportunities for Eliminating Hand Labor*

Great Savings to Be Made in Maintenance of Way Work Through the Use of Power Equipment

By Robert H. Ford,

Assistant Chief Engineer, Chicago, Rock Island & Pacific

TIME STUDIES of seasonal or extra-gang laborers engaged in similar classes of work made some years ago on various railroads, showed that their productivity ranged from 28 to 33 per cent. Although the regular section organization runs higher than this, the fact remains that on most railroads the productivity of maintenance labor has not been commensurate with that secured in other industries where other means have been used and some measure employed for gaging output.

While a great deal must yet be done in the selection, training and education of labor generally, the fact remains that before the railroads can lessen the cost of maintenance of their physical property devoted to transportation, means must be found that will permit them to take advantage of the most modern methods and facilities to decrease labor expenditures to a degree not heretofore considered possible. More attention will be paid ultimately to the design of railroad facilities to combine economical use with standardization of parts in conformity with recognized commercial practices. In place of specializing on the design of the composite, effort must be in the direction of interchangeability of parts as far as possible in order that they may be adapted to varied types and classes of facilities rather than to special classes as at present. This fact, of itself, will not only permit great reduction in maintenance costs but will also in turn affect the design and adaptability of labor-saving devices used in their up-keep. For example, locomotive cranes, motor cars and work equipment of all kinds should be so designed that their parts will be interchangeable with each other and with locomotive or car parts wherever possible and in conformity with M. C. B. standards.

Specialization in railroad maintenance has lagged behind nearly all other lines of industry. This is not due to a failure on the part of the railroads to appreciate the importance of such matters but because of the fact that for years the roads have been too poor to be economical, a fact that will as a rule be reflected in more or less expensive methods

of up-keep whether on a railroad, in a factory, or on a farm. The inability to keep pace with science and invention in providing proper appliances to replace obsolete methods and facilities prevails to a marked extent on our American railroads. Working conditions, legislation and higher costs of labor have served to accentuate this of late and as a result changes in methods of up-keep are sure to result. As evidence of this, more attention has been paid and more actual advance has been made in this direction in the last few years than in the previous 20 years and, from every economical and industrial standpoint, this development is bound to continue at an accelerated rate.

Last year about 460,000 men were required to maintain the roadways of the United States. This is equivalent to over 16 army divisions, which if marched in army formation, in columns of fours, would extend for 208 miles and require nearly nine eight-hour days to pass a given point. Approximately 360,000 of these men performed work that some day will be done either wholly or in part by mechanical means.

To maintain the railroads of the country, vast amounts of labor and material are consumed annually for which there is little or nothing to show at the end of the year. Three-hundred and fifty-four million dollars, or about 54 per cent of the maintenance outlay, was for roadway and track repairs, requiring a vast army of men.

Large Expenditures for Drainage

The roadway must be continually drained and ditched, approximately \$31,000,000 being expended annually for these purposes alone. Years ago such work could be done at a cost of from 10 to 25 cents per cu. yd., while to do the work today in the same manner costs from \$0.75 to \$2 per cu. yd. If performed by teams, the cost is from \$0.50 to \$1.75 per cu. yd.

The introduction, a few years ago, of the self-propelled steam ditcher working from a flat car, afforded great opportunities for labor reductions in this direction. One of these machines will perform the work of from 75 to 100 men and reduces the cost enormously. The flat cars have given way to

*Abstracted from a paper presented before the Western Society of Engineers, Chicago, April 20, 1922.

automatic air dump cars with a steam ditcher between them, the machine working from the track and loading and moving the material by a self-propelled device to the point of disposition.

A comparatively recent innovation in the list of ditching equipment is the ditcher-spreader, equipped with wings similar to ordinary spreaders but with the addition of a detachable cutting edge so shaped as to form the standard ballast section. This machine not only clears the ditches but it also shapes the sub-grade from the toe of the ballast to the shoulder of the roadbed and cuts and cleans the ditches beyond the roadbed in one operation, leaving a uniform and highly satisfactory appearance. The ditcher-spreader is pushed by a locomotive and will ditch complete from 10 to 25 miles of track per day, completing both sides of the roadbed where necessary. It does the work of several hundred men at a cost of from 2 to 6 cents per cu. yd. This machine will dig new ditches but its main advantage is to keep the sides clear of the annual accumulations while the steam ditcher, previously referred to, is most economical in long, heavy or sliding cuts. The steam ditcher costs about \$10,000 and the ditcher-spreader from \$15,000 to \$20,000, depending upon the size of the machine required.

For years it was customary to use flat cars with a work train, on which the material was loaded by hand or steam shovels and hauled out to the place of use, to be unloaded by means of unloading plows attached to the rear end of the train and drawn through the material by a Lidgerwood unloading machine. Changing conditions, have made this method, so expensive and cumbersome that it has now no place in economical maintenance and has been replaced by the automatic air dump car, operated direct from the locomotive and loaded by the locomotive crane, steam shovel or other appliances. These air dump cars cost approximately \$3,200 and there are several excellent types.

The Motor Car

Although the hand car is an obsolete and expensive factor in railway maintenance, it still continues to be used on a large part of the railway mileage. The section motor car replaces this and has now become an essential for track maintenance, both as a means of economizing labor and reducing expenditures. A section motor car costs about \$275, with an annual maintenance of about \$25, exclusive of fuel.

It has been customary for many years for all operations incident to replacing rail to be done by manual labor, but it is now entirely practical to do the greater part of this work by mechanical means, from the unloading to the final stage of the operation, until the released rail and fastenings are placed in cars ready for shipment. Pneumatic air machines for unloading, operated by two or three men in place of the 15 formerly required, gasoline or electric driven locomotive cranes or small hand-power machines operated by three or four men, will do the work that formerly required 5 to 10 times that number in laying rail, their cost ranging from \$400 to \$8,000 depending upon the size and type of the machine required.

Power driven pneumatic drills, power bonding machines and power track wrenches are some of the labor saving devices that operate to reduce the cost of this work and will permit increased efficiency and be productive of great economy in rail renewals. The labor cost of laying rail varies from \$700 to \$2,000 per mile, the large fluctuation being influenced largely by operating conditions and facilities. A fair cost today is probably about \$1,400 a mile. To my mind, the time is not far distant when it will be practical to do this work for about one-third this sum.

A pneumatic air machine, mounted or built on a flat car and equipped with two air derricks, one at either end and placed between two flat cars, will load the equivalent of two miles of rail at about one-tenth of the cost of former methods.

I do not believe that the average railroad man appreciates the wide-spread usage and great opportunity for savings from a properly designed locomotive crane. These machines will do about everything required in lifting, placing, transferring, pile driving, erecting, digging and in fact anything of this class where manual labor has been necessary heretofore. Their activities are predicated very largely upon the organization and method of control.

One of the expensive items of roadway maintenance is caused from the deteriorating effect of brine drippings and from salt air in the vicinity of the ocean on rail fastenings, spikes, bolts, tie plates, and even in some cases the rail itself. This requires that these metal parts shall be oiled periodically and the work is usually done by track labor. An oiling machine, introduced on the Delaware, Lackawanna, & Western by A. J. Neafe of that company has proven invaluable, both as a means of performing the work efficiently and decreasing labor costs.

Killing Weeds

The American railroads spend today about \$30,000,000 for clearing the weeds from their tracks, with about \$16,000,000 additional to keeping the right-of-way clear of brush and weeds. Track weeds give rise to one of the larger items of roadway maintenance. On important lines it is necessary that they be removed from the track in order that it may be properly maintained. It forms one of the principal jobs of section labor and requires the services of an average of over 100,000 men for five months of the year to clear the American railroad tracks of weeds. A weed burner, operating twice during the season, will remove the weeds at a cost of \$14 per mile per trip as compared with \$135 per mile for hand labor. This is only one of several devices that is entirely practical for the purpose.

On branch lines the ballast shoulders can be taken care of by the disc weed cutter which operates at a cost of about \$4.50 per mile as compared with \$25 per mile for hand labor. Track mowing machines which consists of a sickle bar attached to a heavy duty motor car can be used for this work. These machines operate at a speed of from four to six miles per hour, at a cost of \$5.50 per mile, as compared with \$40 per mile for both sides of the track by hand labor.

Destruction of weeds by chemicals is both possible and practical although the field is yet open for further development. Here again much remains for the inventive genius. The foundation for most chemical weed destroyers is arsenic in a soda solution. After a series of applications the interval between applications can be increased and the cost correspondingly reduced. It is possible by annual applications to sterilize the soil so that weeds will not grow.

Approximately 44 million dollars is annually expended for tamping ties, which is almost exclusively a labor item and is performed by the section and extra gang forces. There are now upon the market tie tamping machines, operated both electrically and by means of compressed air, in some cases the section motor being used to run the compressor. These machines cost about \$2,500 each, and reduce the cost of the work greatly. The tie-tamping machine is a practical, efficient tool. Its use, however, has not become as general as the circumstances warrant.

Ballast becomes foul by use and must be either shoveled out by hand and wasted on the adjoining slopes or cleaned by screening. It is customary for many roads to do the latter work by hand, using the old-fashioned screen (somewhat similar to a coal screen). Even at that they are enabled to show savings, principally because of the first cost of the ballast. While there is yet a great opportunity for an inventive genius to reduce costs of this nature there is now on the market a power-operated mechanical ballast screen that greatly decreases this cost over hand labor and conserves the ballast supply, a matter of special importance in certain localities.

A Simplified Analysis of the Railroad Problem*

The Goal Which All Roads Should Strive For and How They Are Failing to Attain It

By Harrington Emerson

I AM PRESENTING a theory which rests on a series of supports. Any one of these supports from the bottom up may be defective. The defects may be serious, in which case the next step should not be taken, or they may be unimportant and we can correct them without changing the higher steps. The theory is that we are striving for safety and that the safety of the whole is greater than the safety of any part.

Newton's first law of motion is: "Action and reaction are equal and opposite."

This is equally true of all industry that "revenues must equal expenses." Over a series of years there should not

world today is: How can railroad revenues be increased so as to cover expenses or how can we decrease expenses so as not to exceed revenues?

The revenues are not wisely levied. They are based on transportation and classification, omitting the ever-growing expenses of collection and of delivery. Terminal expenses increase much faster than population. This is evidenced by the increased number of switching locomotives compared to freight locomotives.

The public does not seem willing to permit the levying of fair rates. The Interborough Rapid Transit Company is an example, limited to a five-cent fare for what costs on lowest valuation nearly seven cents.

It is, however, within the power of railroad executives to lessen both perpetuation and operating expenses. It is pleasanter not to do in the present, even if it means ultimate ruin. The objections to reduction of expenses are not physical—they are psychological. They are of the nature of ex-President Wilson's plea when the Germans shot up our ships and sank visiting ships within sight of our shores, "We are too proud to fight!" Many railroads are too proud or too soft-hearted to reduce expenses.

When discussing this problem with the great president of a very great railroad I said to him, "There is only one reason why you do not operate at 60 per cent and that is because you do not want to."

He immediately gave me six excellent and valid reasons why he did not want to and not one of the six was a physical reason, and each one of the six was a psychological reason. Psychological reasons are the strongest reasons in all the world and the problem becomes one of changing the psychology of all concerned in order that the much easier physical changes may be made.

If revenues can not be increased, expenses can be lowered and in order to lower expenses with a minimum of antagonism and of delay, it becomes necessary to analyze expenses.

Operating and Perpetuation Expense

Railroads expenses are separated into those that perpetuate the railroads and those that operate the railroads. This can be better understood by considering the expenses of the little cousin of the railroads, the automobile. Any one who owns an automobile knows that certain expenses go on even if the automobile is in storage. These are the expenses I call perpetuation expenses. They are taxes, exactions, rentals, insurance, incollectible revenues, interest on debts, which have to be paid during the year in cash. There are six other classes of perpetuation expenses—the four shrink items, unpaid betterments and dividends—all of which can be deferred beyond the year. Operating expenses I limit to personnel and to materials for both operation and maintenance.

What is the relative proportion of perpetuation expenses and of operating expenses? They should be about 40 per cent and 60 per cent (respectively of gross revenues).

\$1,000 Gross for Each \$2,500 Invested

Let us take a newly projected road. The first question to ask is the projective volume of revenues. On the basis of the revenues how much can we afford to put into the railroad? Public opinion has something to say about it. I

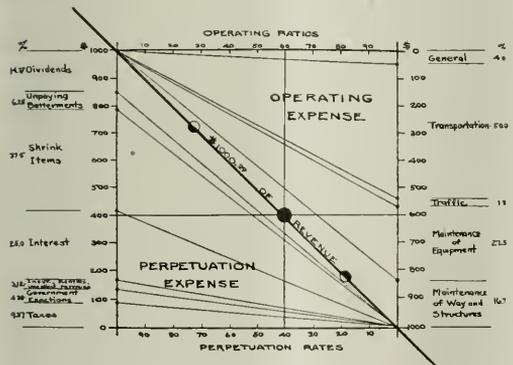

Chart I—Apportionment of Operating and Perpetuation Expenses

be any deficit nor any surplus. For all the railroads of the United States there was in 1921 a very large deficit and there was a greater deficit in 1920.

As far back as we go there has always been a deficit. Hitherto this deficit has been made up (1) by capitalizing

	1920	1921
Investment in billions	\$18.6	\$18.6
	Per cent	Per cent
Perpetuation ratio (to gross income)	47.8	53.5
Perpetuation ratio (to total expense)	34.8	40.5
Operating ratio (to gross income)	89.6	78.6
Operating ratio (to total expense)	65.2	59.5
Expenses to revenue 100	137.4	132.1
Revenues in billions	\$6.22	\$5.56
Perpetuation and operation	\$8.55	\$7.35
Deficit in billions	\$2.33	\$1.79

either perpetuation expenses or operating expenses or both, (2) by foreclosures and cancellations, (3) by assessments (4) by reduced dividends, (5) by deferred replacements, (6) by deferred depreciation, (7) by deferred obsolescence, or (8) in operating expenses by deferred maintenance.

As far back as we go there was always a deficit. The American people have always had their railroad transportation at less than cost. There have been other deficits caused by dishonesty. The question before the railroad

*From an address delivered before the New York Railroad Club on April 21, 1922.

assume that it would be difficult to get by with less than \$2,500 invested for each \$1,000 of gross revenues.

When we sum up the 12 different kinds of perpetuation expenses we find that they amount closely to \$160 for each \$1,000, (of gross revenue) or to \$400 yearly for an investment of \$2,500. This would leave only \$600 for operation. If you can whittle down your investment below \$2,500 you can get by with less than \$400 and there is more left for operation.

**Perpetuation Expense 16 Per Cent of Investment,
40 Per Cent of Revenue**

In order to have all the funds possible for operation, we should keep investment below \$2,500 and we should keep

The combination of rising perpetuation expenses and rising operating expenses, in spite of greatly increased revenues, has cost and will cost the United States railroads four billion dollars for the service of 1921.

Who received the unwarranted benefit? Partly the past and present rate payers and partly the wage and salary earners. Materials also cost too much, but the ratio to wages has remained constant. How can the recurring deficits be wiped out? By further rate increases of 30 to 35 per cent, which would suffice if tonnage and passenger miles kept up—of which I see scant prospect; or, by decreases in expenses—25 per cent in perpetuation expenses and also 25 per cent in operating expenses.

As I see it, if railroads are to live they must not have a

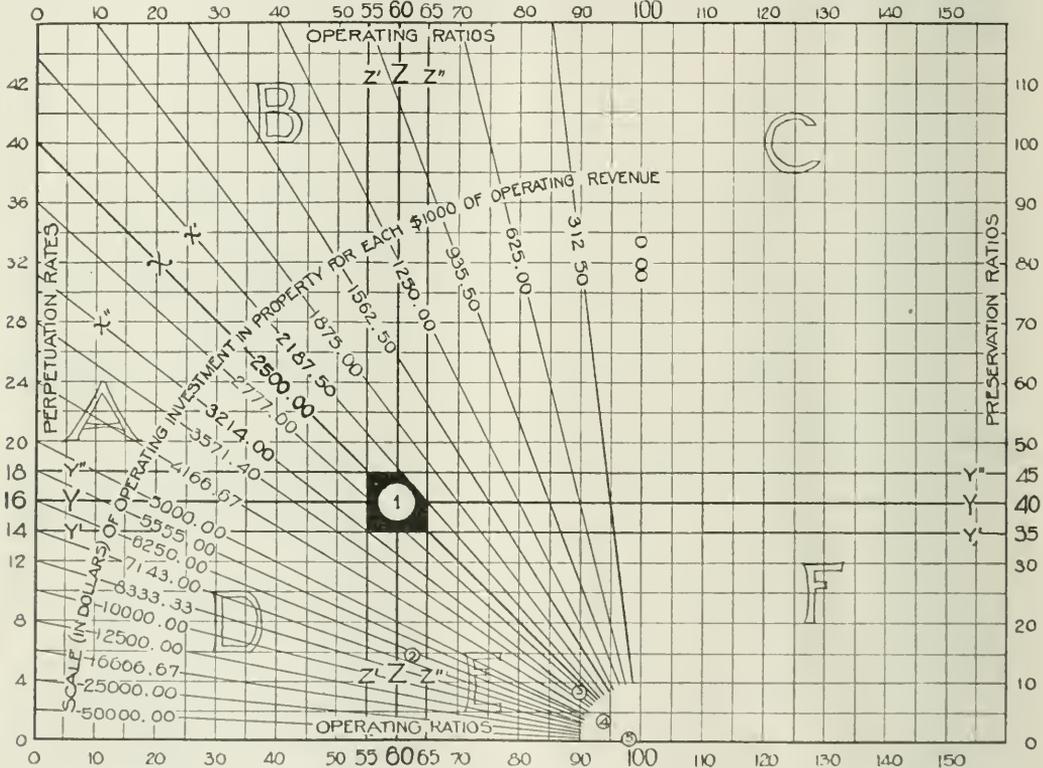

Chart II—The Target at Which Railroads Should Aim

- (1) The Goal the Railroads Should Attain. (2) U. S. Railroads in 1901. (3) U. S. Railroads in 1920. (4) Railroads of United Kingdom in 1920.
- (5) National Rys. of Mexico, First Half of 1921.

do the 16 per cent (of investment) ratio. It is difficult to do either.

On a new road the perpetuation rate is very low, can be as low as 8 per cent, but it steadily rises as the road grows older. The perpetuation rate based on physical investment is now about 16 per cent. It would require extraordinarily favorable conditions to be as low as 14 per cent, while an 18 per cent rate would be an evidence of unusually bad conditions. When the rate was down to 8 per cent one could get by with an investment of \$3,500 and an operating ratio of 65 per cent. Or in the days when operating ratios were down to 40 per cent and perpetuation rate at 10 per cent a railroad could carry an investment of \$6,000.

larger investment than two-and-a-half times their average gross revenues, provided they can operate at 60 per cent.

The Subdivision of Expenditures

Chart I, showing apportionment of operating and of perpetuation expenses, shows a graph of great practical value. All the expenses consist of perpetuation expenses and of operating expenses.

In railroad activities the perpetuation expenses are subdivided into 12 groups and there is closely normal percentage of perpetuation expenses for each group. This is not an apportionment of revenues; it is a sub-division of the perpetuation expenses which may be theoretically any part of

the revenues from zero to much more than 100 per cent.

The subdivision of operating expenses in the chart should also be noted. This means that transportation expenses will make up about 50 per cent of the total operating expenses whether they are more than all the revenues, or only 40 per cent of them.

In Chart I, which is separated into two parts by the heavy diagonal line, the perpetuation expenses are grouped on the left and the operating expenses on the right and the lighter lines radiating from the lower right corner enable us to read the normal perpetuation expense for any portion of \$1,000 of revenue; the light lines radiating from the upper left corner enable us to read the normal operating expenses from none up to 100 per cent of revenues, or dollars per \$1,000 of revenue. Operating expenses might be very high, 82 per cent of revenues, as indicated by the lower half-shaded circle. Perpetuation expenses might also be very high, 72 per cent of revenues, as indicated by the upper half-shaded circle. In such a case the total expenses would

annually to 16 per cent of the total operating investment. If the investment is \$6,000 for each \$1,000 of revenues, perpetuation would call for 16 per cent of \$6,000, or \$960, leaving practically nothing for operation. Not more than 40 per cent of revenues can be spared for perpetuation and if investment is \$2,500 and 16 per cent of this is required for preservation it amounts to \$400.

(3) The public will not willingly allow a railroad to operate for less than 60 per cent. The plea is again made that it would be difficult on less to give safe, decent, frequent, convenient and prompt operation. Managers would also agree that it would be difficult to operate as low as 60 per cent.

(4) The actual division between perpetuation and operation for all Class I roads in 1921 was 40.5 and 59.5, even if both summed to far more than actual revenues.

Therefore, all lines of argument agree in placing perpetuation at 40 per cent and operation at 60 per cent of gross revenues.

Assuming these as normal divisions we have \$1,000 of revenues apportioned closely as follows:

PERPETUATION EXPENSES		
Taxes		\$37.50
Exactions		17.50
Insurance, uncollectibles, rentals		12.50
Interest		100.00
Shrink Items:		
Deferred replacements, depreciation, obsolescence, amortization	150.00	
Unpaying betterments	25.00	
Dividends	57.50	
Total perpetuation	\$400.00	
OPERATING EXPENSES		
Maintenance of way and structure	100.00	
Maintenance of equipment	165.00	
Traffic	11.00	
Transportation	300.00	
General	24.00	
Total operation	\$600.00	

There is also a standard table of percentage on investment needed for preservation:

	Per cent	Per cent
Taxes	1.5	Shrink Items..... 6.
Exactions	7	Unpaying Betterments..... 1.
Insurance, uncollectibles, rentals	5	Dividends on One-third..... 2.3
Interest on Two-thirds..... 4.		
		16

An unrefutable criticism made is that taxes are not always levied solely on property; they are especially at present often levied on earnings, therefore on operation. In such a case part of the taxes might be considered an item of operating material expense and not of perpetuation, but with equal justification they could be considered an exaction and be placed under that head. Whatever the method adopted it is important that it should be uniform and comparative.

In 1921 the corrected operating ratio was 78.6 and the perpetuation ratio was 53.5. The salvation of the roads, their perpetuation as the property of their owners and their expansion, depends on reducing operation to 60 per cent and reducing perpetuation to 40 per cent, thus eliminating nearly \$1,800,000,000 of loss.

Either the public received too low rates, or wages and salaries absorbed too much. On the basis of present rates this excessive absorption of revenues in personnel and material expenditures has nothing whatever to do with the question of living wage.

The Railroad "Bull's Eye"

Chart II is in the form of a target. From the intersection of the zero line of perpetuation and the 100 per cent line of operation radiate the investments for each \$1,000 of revenues. The part of the target outside the bull's eye is divided into fields lettered A to F. Field A is forbidden because it is under an operating ratio of 55 per cent. Field B is forbidden for two reasons. It is under an operating ratio of 55 per cent and under an investment of less than \$2,187.50.

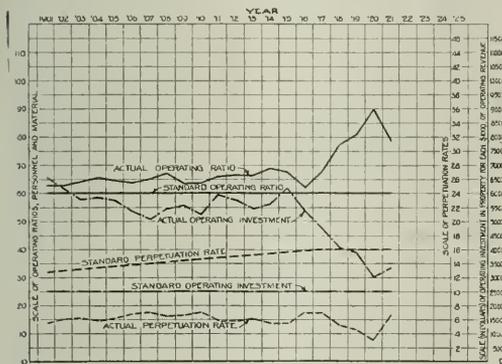

Chart III—Standard and Actual Attainments of Class I Railroads from 1901 to 1921

Standard Operating Ratio for Personnel and Materials, 60 Per Cent. Standard Perpetuation Rate Rises from 12.8 Per Cent in 1901 to 16 Per Cent in 1921. Standard Investment in Property \$2,500 for Each \$1,000 of Operating Revenues.

be 82 + 72 per cent of revenues, a total of 154 per cent, or \$820 for operation and \$720 for perpetuation, a total of \$1,540, registering a loss of \$540 above every \$1,000 of revenues.

On the other hand, in former days as to some new roads, it might have been that operating expenses were only \$280, perpetuation expenses only \$180—a total of \$460, leaving \$440 for surplus. Such conditions often exist in industrial plants or in commercial or producing activities, but never any more in railroads.

For a normal average railroad an approximate proportion of perpetuation expenses is 40 per cent of revenues and the approximate proportion of operating expenses 60 per cent of revenues.

Proportions of Operating and Perpetuation Expense Not Arbitrary

This is not an arbitrary or guessed at division. It rests on four facts, any one of which calls for the same division:

(1) Public opinion will not permit a lower investment in an operating railroad property than about \$2,500 for each \$1,000 of revenues. The plea, with some justification, is that a less investment will not provide adequately for safety, decency, frequency, convenience, promptness.

(2) The sums required for preservation amount closely

Field *C* is forbidden because the investment is less than \$2,187.50 for each \$1,000 of revenues. Field *D* is forbidden because the perpetuation rate is less than 14 per cent and the operating ratio is less than 55 per cent. Field *E* is forbidden because the perpetuation rate is less than 14 per cent. Field *F* is forbidden because the investment is less than \$2,187.50 and the perpetuation rate is less than 14 per cent.

There remains as a safe proposition as a bull's eye, only the irregular bull's eye, bounded by the operating ratios 55 to 65; the perpetuation ratios 14 to 18 and the investment ratios of \$3,214 to \$2,187.50. The advantage of this chart is that we can locate on it the actual condition of any road.

How Actual Conditions Compare With the Bull's Eye

Chart III gives the history of the United States railroads since 1901. There are three standard lines and the three corresponding actual attainments. The three standard lines are operating ratio 60 per cent; perpetuation rate gradually rising from 12.8 per cent in 1901 to 16 per cent in 1917; and standard operating investment of \$2,500 for each \$1,000 of revenues.

The actual operating ratio limped along under 70 per cent until 1916, then took a jump up to 89 per cent, dropping in 1921 to 78.6 per cent. Actual investment, which should not have exceeded \$2,500, was between \$5,000 and \$6,500 until passenger and freight rate increases brought it down to \$3,000 or \$3,500. The actual perpetuation rate which should have been from 12.8 to 16 has been between 3 and 7, and the difference is either already made up by bond and stockholders, or is yet to be made up by them.

Investment ratio should come down to \$2,500. There are some roads as to which this cannot be done. For most of them it is a possibility without strenuous action. The corrected operating ratio in 1921, 78.6 per cent, should come down to 60 per cent. It is a possibility for any road, not now over 80 per cent, if certain operating laws are applied. It can be done without ruction and need excite a minimum of antagonism.

The difficulties in the way of the return of the roads to normalcy, if complying with unescapable financial and operating laws, is not physical, it is psychical.

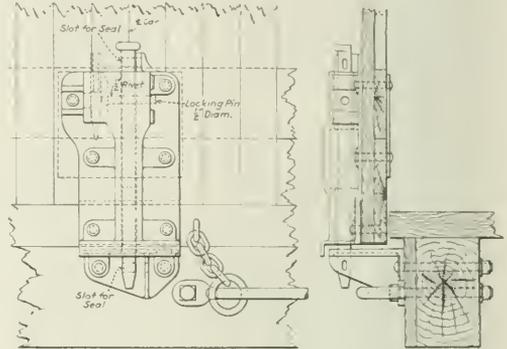

A New Type of Anti-Burglar Car Door Fastener

IMMENSE quantities of valuable freight are constantly being shipped on the railroads with no other protection from theft than a flimsy car seal. Occasionally padlocks are used to secure the doors, but these can usually be pried off with a small bar and offer little additional protection. Considerable losses are sustained from theft of valuable freight. Recently a freight train on an important main line was stopped by bandits who broke into every car and searched it for valuable shipments. It happened that the bandits topped the wrong train and the loss was small, but the incident emphasizes the fact that ordinary methods of securing car doors offer no obstacles to theft. Because of the frequent loss of valuable shipments, some railroads have placed armed guards on trains. Other roads have spiked with heavy nails the doors of cars containing valuable merchandise. If the nails are driven into the head, they cause delay in opening the cars and injury to the door. If allowed to protrude, they are easily removed and offer little resistance.

The Delaware, Lackawanna & Western for some time followed the practice of nailing doors on merchandise cars but because of the inconvenience and expense for repairs, J. C. Fritts, master car builder, designed a type of door lock which provides such effective protection that the railroads now dispense with the service of train riders.

This fixture which is both simple and effective is illustrated in the drawing. It takes the place of locks and handles and does away with the necessity for special opening and closing devices. The usual locking fixtures at the side of the doors are replaced by a special fixture placed at the center of the bottom edge of the door. The door guides and stops at the bottom of the door are eliminated and a short chain attached to a horizontal rod keeps the door from swinging out more than a limited distance.

The principal feature of the door is the bottom door fastening which is shown in detail in one of the drawings. The lock consists of a heavy locking bolt about one inch square working in a housing attached to the car door. The

A Simple Door Fixture Which Has Proved Effective in Preventing Theft

lower end of the locking bolt engages a bracket attached to the side sill and the bolt can be sealed either through the bracket or through a lug at the top of the housing. Near the top of the locking bolt is a 9/16 in. transverse hole which registers with corresponding holes in the housing. When it is desired to lock the door securely a 1/2 in. cold rivet is inserted through the housing and locking bolt. The head may be held in place by inserting a cold chisel, brake shoe key or any piece of iron of about the same size into the lugs on the housing while the opposite end of the rivet is upset with a hammer to prevent its removal. It is then necessary to cut the rivet with a chisel before the door can be opened.

Anyone attempting to remove the rivet would make so much disturbance as to attract attention and if an attempt was made to enter the car at night, it would be necessary to use a light which would betray the presence of the thief.

In addition to the anti-burglar feature, this fixture provides for locking the door in a slightly open position. This is useful for securing ventilation when handling certain commodities and is also a distinct advantage in facilitating checking empty cars in yards.

The chain door stop is advantageous in insuring that the door can be opened readily. In case the door posts are sprung or loads shifted against the door it can be swung out to clear the obstruction, preventing damage which results from forcing doors open.

An important advantage of this fastening is its simplicity and cheapness. It requires but 22 bolts per car while the ordinary fixtures require from 48 to 60. The total cost is considerably less than one-half of the usual type of door fixtures which include guides and corner brackets. Moreover, the whole door mechanism and side of the car are much less expensive to maintain after its application because there is no damage to either door or sheathing in forcing the doors open and closed as is in many instances the case with the ordinary door fixtures.

Joint Commission Reports on Transportation

Recommends Rate Reduction, Regulation of Highway Transport, Car Standardization and Central Control

WASHINGTON, D. C.

RECOMMENDATIONS as to government regulation of railroads to be made to Congress in the report of the Joint Commission of Agricultural Inquiry were outlined in an advance statement by the Chairman of the Commission, Sidney Anderson, who is obtaining publicity for the report by releasing its conclusions in sections.

"Rail transportation," he said, "is now operating under extensive and exacting regulation. The measure of good regulation is the minimum of laws necessary for the protection of the public, since the excessive interference of governmental agencies in the administration of our transportation system under private ownership and competitive operation results in restriction and curtailment of individual initiative and efficient management.

"Business and operating conditions on railroads, like business and operating conditions in other industries, are extremely sensitive to uncertainties and at the same time are often vitally restricted to the public injury by too drastic or too rigid public requirements. The governmental policy, therefore, should be as far as possible definite and permanent permitting at the same time sufficient flexibility of the administration to allow regulation to anticipate and conform to changed economic conditions. The basic legislation controlling transportation rates, facilities, service, security issues, wages and performances should, therefore, seek by definite policy to anticipate future operating conditions."

Regional Offices of I. C. C. Proposed

The commission, therefore, intends to recommend to Congress the establishment of regional offices of the Interstate Commerce Commission, whose duties it shall be to consider and adjudicate questions of regional application, and to co-operate with the state commissions with a view of minimizing conflicts between state and federal regulation as to rates, facilities and practices. In such regional agencies the state utilities commissions should have authoritative representation.

In explanation, the chairman said: "We have found that while a large part of the powers of the commission must be centralized in the capital, the practice of hearing cases in Washington involves great expenditure of time and money on the part of shippers and other interested parties who deem it necessary to come here to present their cases if the proper adjudication is to be had. This practice in general is to the advantage of more highly organized industries maintaining adequate traffic departments and able to pay for the preparation and presentation of cases in Washington, and militate against the adequate consideration of matters of less consequence from the standpoint of national concern but of equal importance to the interested parties. The need of such decentralization, especially in the matter of control of transportation rates, has become more and more apparent as the scope of the Interstate Commerce Commission's authority has been widened and the relation between intrastate and interstate rates more and more a matter of controversy."

This controversy between federal and state regulating authority is regarded by the Joint Commission as one of the important reasons for decentralization of the Interstate Commerce Commission. The report will also recommend that the Interstate Commerce Commission be directed by Congress as a continuing duty, to investigate the development and correlation of the various systems of transportation and their relation to agriculture, industry, trade, and

commerce, and report to the President and the Congress concerning this relation and its improvement.

It will be recommended that the Interstate Commerce Commission be exempted from the bill classifying civilian positions within the District of Columbia and field service and that otherwise due regard be had for the peculiar character of the commission's organization and of the classification and duties of its employees.

"We have found," the chairman said, "that the Interstate Commerce Commission appropriations have not been adequate. In this period of critical relationships between agriculture, industry and transportation, adequate appropriations for the work of the commission are peculiarly necessary. We believe that an agency should be created in the Interstate Commerce Commission to secure and correlate statistical and other information with reference to the related activities of transportation, trade industry and commerce and we shall offer to turn over to the Interstate Commerce Commission the charts and data which we have accumulated in the present inquiry."

The commission will find that wherever possible conflicts between persons, industries or localities and the railroads with respect to rates, facilities and practices should be settled by informal negotiation, thus reducing the necessity of resorting to formal complaint and adjudication before the Interstate Commerce Commission.

Should Give Greater Consideration

to Economic Conditions

"The Joint Commission will also recommend," said the chairman, "that in fixing the level of rates and class and commodity rates the federal and state regulatory bodies give greater consideration to the existing and prospective economic conditions and to the relationships existing between the price level of commodities and the level of transportation rates as well as to the relationship existing between the price of different commodities, the weight of such commodities and the space required for their transportation.

"The several horizontal advances in rates during recent years have in large measure distorted the relationship established by a long period of adjustment resulting from the experience of many years, and the effect of the application of rates upon movement, volume, and maintenance of competitive conditions. There has never been a satisfactory basis of rate adjustment or relationship between different commodities, because there was nowhere a sufficiently comprehensive basis of economic fact from which the relationships of commodity rates to each other could be determined.

"The commission has endeavored to establish as far as its limited time would permit the basic price relations between commodities and between the prices of commodities and freight rates. This basis should be amplified and should be kept up currently by the Interstate Commerce Commission or by some other agency with which it is co-ordinated in such a way as to make the information promptly and comprehensively available."

It has been found by the commission that the provisions of the transportation act with respect to recapture and consolidation have not been operating long enough to afford a basis of experience as to their effectiveness or to indicate how they should be modified. "No system has been or can be devised," the chairman said, "which will produce an identical rate on all railroads. No part of the earnings of

any railroad has so far been recovered by the commission under the recapture provision and the commission has no power to compel the consolidation provided for by the act. We believe, however, that the general plan of consolidation and recapture is sound in principle and in practice and should be given sufficient time for a fair test before an attempt is made to change the law or to provide for compulsory consolidation."

It has been found by the Joint Commission and will be reported that departures from the strict rule prohibiting a higher charge for a shorter haul than for a long haul over the same route in the same direction are necessary to provide for:

- (a) Water competition.
- (b) Market competition.
- (c) Circuitous route.
- (d) Competition as between ports on export and import traffic.
- (e) Competition between weak and strong lines.

"Citing the Wisconsin case, decided February 22, 1922, in which it was held that the Interstate Commerce Commission was authorized to require the general level of rates in a state to be equalized with the general increase in interstate rates," Chairman Anderson said, "we think it probable that no court will ever be able to lay down a rule defining the respective federal and state powers respecting transportation with sufficient exactness to avoid future conflicts in the exercise of their respective powers. The establishment of regional agencies of the Interstate Commerce Commission is in our opinion, a practicable means of securing co-operation between that commission and state authorities in the holding of joint hearings and removing conflicts of authority."

Greater Uniformity Desirable in State Regulation

"The commission will also report," said the chairman, "that greater uniformity is desirable in the requirements of state legislation and state regulatory bodies in regard to the length of trains, the number of men required to man trains of different lengths, and similar requirements affecting operation, which tend to impair the efficiency and operation of railroad systems.

"Efficient operation of steam lines at a minimum cost," the chairman said, "cannot be realized to the fullest extent under requirements as to operation which are different in different states and requires continual changes of operating methods, accentuating costly operating practice with resultant increase in operation expense."

Motor transportation, according to Chairman Anderson, will also figure conspicuously in the report. "Nothing since the advent of the railroads," he said, "has had so marked an economic and sociological effect upon the production life of the country as the motor vehicle. The commission will recommend that Congress continue to promote an adequate program of highway construction and maintenance, directed to the more effective correlation of highway transportation with rail and water transportation. Also that the program of highway construction and maintenance by states and counties be continued under the direction of qualified experts, with particular reference to the construction and maintenance of farm to market roads; that adequate funds should be appropriated for research and regulation of traffic based upon the facts so ascertained. Also that the several states co-operate in effecting a uniform basis for taxing motor trucks and other motor vehicles, which shall fairly represent the proportion of expense of highway construction and maintenance chargeable to such vehicles."

Revenue Return Should Be Sufficient

"The railroads are not self-sustaining and are therefore not on a sound credit basis. If this condition continues transportation service will be crippled, and the country will

suffer accordingly," the report will also find. "We intend to report," said Mr. Anderson, "that the revenue return to the railroads should be sufficient to enable them to sustain the value of their properties put to public use and to obtain the capital required for the expansion and improvement of property, facilities, and service; also that sound railroad finance requires that a larger part of the credit necessary for railway construction be secured by stock issues instead of by bond issues."

"We believe that the transportation facilities of the country must be placed upon a solid foundation. It will not do to make up deficits by appropriations of public funds. The railroad companies must be operated with the expectation that the gross revenues will be sufficient to cover operating expenses and leave a reasonable return upon the investment. It is of paramount importance to the public welfare that the transportation companies be made going concerns; that they be placed upon a substantial foundation in every respect; and that the operating expenses be reduced by careful and efficient management."

Figures in the report will show a progressive deterioration since 1916. In 1918, with an increase in gross revenue of 77.3 per cent over 1911, there was an increase of 109.3 per cent in total operating expenses, and an increase of only 5.8 per cent in the net operating revenue, while the net operating income decreased 11.9 per cent. In 1919 the gross revenue increased 86.9 per cent, but the steady upward trend of costs is reflected in an increase of 131.2 per cent in the total operating expense. The net revenue, therefore, shows a decrease of 12.3 per cent and the net operating income a decrease of 37.2 per cent. In 1920 the situation was still worse. The gross operating revenue shows an increase of 124.5 per cent over 1911, the total operating expense an increase of 206.4 per cent, net operating revenue a decrease of 59.2 per cent, while the net operating income shows a decrease of 97 per cent.

Money Should Not Be Raised Through

Constant Government Aid

In view of the present obligations upon the Congress and the country at large, and as a matter of economic policy, the commission believes that new money for railroad improvement should not be raised through constant government aid. "Our position," Mr. Anderson said, "is that the government should not be called upon to guarantee that the principal of railroad securities is safe and that the interest and dividends thereon will be regularly paid. In the public interest the railroad industry must rest upon its own foundations, and its revenues must be so constructively regulated that their operations will produce enough to pay fair wages, cost of materials, taxes, meet the fixed charges, pay a fair dividend, and leave a margin to attract investors of new capital. In other words, to obtain new railroad capital, the opportunities to earn and pay regular dividends must exist, and railroad managements must be encouraged to exercise the greatest initiative in improving and extending transportation facilities. Furthermore, conditions should be created whereby the sale of capital stock by the principal roads will become possible and the continued increase in funded debt will be minimized."

The report will also show that in the last few years most railroads have done little financing through the sale of stock, but have raised money through the sale of bonds or the issuance of other evidence of indebtedness. "This method of financing cannot be indefinitely continued," Mr. Anderson said. "When the investor thinks that too large a percentage of the value of the property of a given company is represented by debt and not enough by stock, he will decline to buy further bonds of that company, or if he takes them it will be only at an unduly high interest rate. Stock, being junior to debt and having no lien on the property or equip-

ment, naturally must bring a larger return in order to be attractive."

Taxes Increased 175.7 Per Cent Since 1911

Attention will be called by the report to the tax burden of the railroads. In 1911, railroad taxes amounted to \$98,026,848. In 1913 this had increased to \$118,386,859, of which \$113,660,997 was paid as state taxes and \$4,725,862 as federal taxes. In 1920 state taxes had risen to \$223,291,201, and federal taxes to \$48,619,308, a total of \$271,910,509, or an increase of 175.7 per cent over the total for the year 1911.

"New and varied forms of taxation are constantly being levied," said Mr. Anderson. "Some of them are intended to reach railroads to the exclusion of other forms of business. Railroads should, of course, pay a proper amount of taxes, but it should be remembered that whatever they pay is passed on to the public through rates.

"The capital fund of the country loaned by the investors and the banks is the surplus derived from the enterprise, thrift, and sacrifices of all hard-working, prudent citizens and conservatively managed corporations, and is a species of general reservoir from which all forms of industry must draw. It is important to the agricultural industry, which depends on that reservoir in the same way as the railroad industry, that the rate of interest should not be unduly raised to the railways because of reduced net earnings or because of large issues of tax-free securities. If the interest rate to the railways rises, the interest rate to the farmer will also increase, for the capital market is on a competitive basis, and what affects the interest rate for one industry affects the rate for all industries.

"The Joint Commission has, therefore, concluded that the issue of tax-free securities and large expenditures for non-productive purposes by the federal, state, and municipal governments be reduced to the smallest possible limits, so that taxation can be reduced and capital funds be allowed to increase for the use at fair interest rates by agriculture, industry, and the railroads, and thereby help to promote prosperity."

Another recommendation regarding management will be that the railroads establish regional traffic executives, and organize public relations departments, to bring about closer contact and a better understanding between themselves and the public.

Private Management More Efficient

The Joint Commission has agreed that the period of federal control was too short and the conditions then and since too abnormal to permit of a sound comparison of efficiency between government and private operation. "However," said the chairman, "an examination of the operation of government-owned railroads in foreign countries during the post war period affords some basis for estimating the relative efficiency of private management in this country and government management in foreign countries in meeting the dislocations and abnormal conditions which followed the war period. It may be said that, measured by the relative performance and cost of service, private management in this country shows greater efficiency than governmental management."

The Joint Commission will report that the increase in efficiency of transportation is shown by the fact that in 1890 for every \$100 investment in property 983 tons of freight were carried one mile and 163 passengers carried one mile; whereas in 1920 for every \$100 investment in property, 2,085 tons of freight were carried one mile and 239 passengers were carried one mile, an increase of 112 per cent in freight and 57 per cent in passenger traffic for each \$100 of property investment. Property investment has increased 185.82 per cent, the tons carried one mile 442.83

per cent, and the passengers carried one mile 300 per cent, in the same period.

Standardization of Cars Recommended

Complete standardization of freight cars and central control of distribution of all classes of freight cars will also be recommended to Congress in the forthcoming report as among the remedies for the constantly recurring car shortage evil.

In outlining this part of the report, Chairman Anderson said: "We have found that the number of locomotives operating and owned by some railroads is inadequate to meet the need during business activity and it should be augmented; that the supply of box cars, coal cars, stocks cars, and refrigerator cars is inadequate to meet the demand during normal periods of activity and should be rapidly augmented.

"If the carriers do not supply sufficient equipment to reasonably meet the demands, an artificial situation economically unsound is created. Failure to supply cars in adequate numbers during any considerable period usually results in an inflation of prices. The commission is of the opinion that a sufficient number of cars should be added to the supply to meet the demand for cars wherever ordered and in whatever quantity they may be required.

"The commission has therefore concluded to recommend to Congress complete standardization of all freight car equipment except with respect to cubical and weight carrying capacity in order to reduce initial cost, reduce the number of necessary repair parts, facilitate the repair of cars, to make possible economies in maintenance of freight equipment and to reduce unnecessary empty car mileage."

The report will show that the number of freight cars owned and operated by the railroads has increased 6.7 per cent over 1911. The aggregate capacity has increased 18.2 per cent and the net ton mileage for 1920 showed an increase of 62.4 per cent over 1911, the traffic handled during 1920 being greater than any previous year.

Central Control and Distribution of Freight Cars

The commission, according to the chairman, will recommend to Congress as a further remedy for car shortage, prompt consideration and adoption of a comprehensive plan for central control and distribution of freight cars: (a) To meet currently and in full the requirements of shippers in each and every section of the country, (b) To eliminate all empty-car mileage except that made necessary to protect originating territory, (c) To meet demands in originating territory currently by balancing movement of loaded and empty cars.

"When the volume of shipments of a commodity in strong demand is restricted by car shortage," said Mr. Anderson, "a stiffening of prices results, and when the restriction is removed by an ample supply of cars the market at once reacts. During each period of general car shortage it is found that in some portion of the country carriers report a surplus of equipment; conversely, during periods of largest car surplus a car shortage exists on lines of certain carriers and in certain districts. More efficient handling of equipment and the construction of additional equipment to the extent required to prevent car shortage will make action by governmental authority unnecessary.

"It is, however, clearly apparent that with respect to freight car control and distribution, and the co-ordination and unification of terminal facilities, the carriers have not progressed. In fact, there is a strong tendency toward reaction in this important matter, and unless prompt and adequate action is taken emergency conditions with all of the attendant harassments to business will certainly result."

The commission has convinced itself that in so far as adequate car supply is concerned all lines of transportation must be placed upon the same basis. "It will not do," the chairman said, "to take cars away from stronger lines and

turn them over to weaker lines, thus depriving shippers served by the stronger lines of the service which they could reasonably expect for the benefit of less fortunate shippers served by the weaker lines. This is a problem which must be considered in its nation-wide application. Some plan should be devised which will aid the weaker lines by enabling them to purchase and properly maintain sufficient equipment to supply the present reasonable needs of shippers, together with a margin to meet a normal development of business activity."

The commission has found that the American Railway Association, whose Car Service Division is empowered to order relocation of equipment between railroads, is not fitted to prevent emergency conditions and that any plan which may be adopted for the handling of equipment must contemplate current relocation of empty cars. It believes that no railroad or district should be permitted to become short of equipment before steps are taken to meet the situation.

"It might be," the chairman said, "that the only effective plan will be the pooling of equipment under a central control having sufficient power to require railroads to immediately execute any orders given. We feel certain that whatever plan is adopted, it must be based upon the premise that each individual shipper, each group of shippers, each of the several producing or originating districts throughout the country must be fully supplied with freight equipment at all times."

Refrigerator Car Supply

Discussing the dependence of shippers of fruits and vegetables and other perishables upon the refrigerator car supply, which has been found to be now seriously inadequate, Mr. Anderson said that the commission would recommend the following definite plan for improvement:

(a) Extensive and prompt additions to present refrigerator car equipment by each carrier in accordance with its needs or extension of the equipment and activities of private-line car companies handling fruits and vegetables.

(b) A central control of refrigerator-car supply.

(c) Progressive retirement of the older and inefficient equipment.

(d) Co-ordinated investigation by the United States Department of Agriculture, Interstate Commerce Commission, shippers, and the carriers.

It is intended by this plan to bring about the following results: Improved methods of harvesting, packing, handling, storing, and refrigeration in transit; development of a more efficient protective service against cold; co-operation between shippers and carriers; reduction of peak movement by adding to storage facilities when such additions are practicable and by such other methods as may be advisable and practicable; prompt loading and unloading and elimination of unnecessary delays in transportation; utilization of equipment to safe carrying capacity, securing maximum service.

Unification of Facilities

The commission will definitely recommend to Congress the unification and joint operation of facilities at terminals wherever such unification and joint operation will result in economy and better service. Since March 1, 1920, these unifications of terminal facilities and joint operation at terminals have been in large part abandoned. The chairman commented: "Many railroads do not desire to join with other railroads in the common use of terminals and their joint operation feeling that they will thereby lose some of their competitive advantages. We have found, however, that where consolidations have been made large sums of money are saved annually in operating expenses, with the added advantage of making possible the handling of a larger volume of traffic without additional expenditures for new tracks and other facilities."

The commission believes that the carriers should carry

out the spirit of the law and effect these consolidations wherever possible and it will recommend that the Interstate Commerce Commission investigate and point out to the carriers such consolidations as may be feasible.

Further recommendations to Congress will be made as follows:

That the railroad and shippers co-operate to secure the full utilization of the carrying capacity of cars wherever possible; that permanent joint railroad and shippers' committees, be organized to carry on a nation-wide campaign to reduce loss and damage to goods in transit; that freight-revenue divisions should be promptly revised to the basis of two-figure percentages; that regional clearing houses be established for the current settlement of debits and credits growing out of rate divisions; that the railroads should adopt universal through way-billing of interline freight; that the railroads maintain complete cost data covering each item of expense with particular reference to the maintenance of equipment; that the railroads adopt better systems for checking the extent and value of repairs to equipment when made by lines other than the line owning the car.

Labor Board Censures the Interstate

PUBLIC CENSURE—the most drastic sentence the Labor Board can impose—was recently invoked against the Interstate Railway. Some time ago a switchman and a fireman were dismissed by the carrier, according to the Labor Board's summary of the case, because "in response to the request of the chief executive of their organization, they had furnished certain information relative to the status of wage questions on that line, the chief executive having been previously asked for this information by the Labor Board."

"It appeared," the Labor Board's decision continues, "that the officials of the carrier obtained a copy of the message sent by these employees and thereupon called them to the offices of the carrier and informed them that Mr. Miller, president of the road, had ordered their discharge. On the following day the employees were again called to the office and an endeavor was made by the officers of the company to secure from them a pledge that they would not in the future take up any similar questions with the executives of their organizations. The men declined to make such promises and were thereupon discharged from the service.

"The carrier refused to appear before the board at the subsequent hearing and in a letter said 'we do not deal with our employees through representatives of labor organizations.'"

The board subsequently ordered the employees restored to service and compensated for the time lost. Later the board instituted proceedings under Section 313 of the Transportation Act and, as a result, rendered its decision.

In this proceeding the carrier again refused to appear before the Labor Board, and in a letter from its attorney, J. F. Bullitt, Philadelphia, made the following statement: "I beg to state that the Interstate Railroad Company is of the opinion that the Labor Board has only advisory powers in matters of this kind."

The question thus presented in this case is a most important one. Here is a carrier which arbitrarily and unfairly denies to its employees the simple right to perform their duties as members of their organizations, which is equivalent to a denial of their right to become members of such organizations. This action is taken in the teeth of the Transportation act passed by the Congress of the United States which expressly recognizes the right of employees to organize and to function as organizations.

The fact that this carrier is a small road down in the Virginia mountains makes its conduct none the less reprehensible. It connects with other carriers and the irritating effect of its disregard for the rights of its men and for the authority of the law extends to employees on other roads.

The Railroad Labor Board therefore decides that the Interstate Railroad Company and its responsible officials have violated Decision No. 528 of the Board as hereinbefore indicated.

Cedar Hill Yard of the New York, New Haven & Hartford

New Haven Should Soon Realize on Improvements

Result of New England Divisions Case an Important Factor—
Changed Methods of Operation

THE NEW YORK, NEW HAVEN & HARTFORD has realized only partly as yet on the extensive program of rehabilitation which it began a few years ago and which was substantially completed in 1920. Like other roads it has suffered in a general way from the many special circumstances of federal control, and to the increased costs during and following the war. Increased costs hit the New England carriers more severely than they did the railroads as a whole (as we have heard from the arguments in the New England divisions case). The factor of increased costs was intensified because of the large proportion of terminal expense, by the fuel costs and by the large per diem debit balances which now result, the New Haven contends, from the basis on which payments are made for cars at a rate relatively high for all days, both moving and standing, in comparison with relatively low mileage rates when the car was moving only, as was the case when the basis of divisions were established quite a number of years ago.

Any analysis of the New England railroad problem must take into consideration the fact that the New England carriers have several problems which are distinctly their own. These include the factors of terminal expense, fuel costs and per diem already mentioned and, in general, the fact that the New England lines are terminal carriers, which facts, of course, are not new to those who have followed the discussion which has taken place in connection with the matter of increased divisions.

The New England lines have an extremely high proportion of passenger business. This is the case with the New Haven in particular, for its revenues from passenger service actually exceed 50 per cent of its total operating receipts, and this proportion has been gradually increasing over a term of years.

The New Haven showed, in the New England divisions case, that it had a lower operating ratio in connection with its passenger than it did with its freight business, which is brought about by a density of travel. It is a question whether this argument will appeal particularly to western railroad men, some of whom are inclined

to pride themselves on the fact that because their passenger business is of small proportions, they are able to operate their freight service with considerably greater facility; but when the unusually large mileage of double, third and fourth tracks of the New Haven is taken under consideration, together with its splendid equipment of interlocking and block signals, the ability of the New Haven to now handle both freight and passenger to advantage, is realized.

At present, discussions of the New Haven resolve themselves into analyses of the effects of the pending New England divisions case (the Interstate Commerce Commission's decision in which is now threatened to be held up by injunction proceedings), or else the analyses devote a great deal of attention to the New Haven's financial structure which, when all is said and done, is a very serious problem. The result has been that a comparatively small amount of attention has been given to the large amount of work which the New Haven has been carrying on over a period of years to make it a more modern railroad and a more efficient freight carrying facility.

The New Haven, of course, has some main routes of extremely high traffic density, combined with which it has an extremely large proportion of branch line mileage, most of which is carrying a small traffic, but in nearly every case, sufficient traffic, so that abandonment would be entirely out of the question.

The density of traffic of the main lines is made particularly heavy because of the large proportion of fast passenger business. In former years the railroad had an entirely different scheme of freight operation than that which it has worked out more recently. The change which has taken place has given the railroad more modern operating methods and a brief analysis of what has been done may be of interest.

Improvement Program Begun in 1916

The rehabilitation program, if such is not too strong a term, was begun, in reality, in 1916. It included the acquisition of a larger power, the building, extension or remodeling of engine terminals, including the building and equipping

of more adequate shops in connection therewith, to take care of this power while in service. Large sums were spent on bridges as, for example, on the \$2,500,000 project over the Thames river at New London. Considerable was done in the way of extending and constructing new passing tracks at different points.

The projects which have probably received the most attention are the Cedar Hill yard near New Haven, which is to have an ultimate capacity for receiving, classifying and forwarding about 5,000 cars per day, the Northrup Avenue yard at Providence, R. I., which is to have a similar capacity of about 2,500 cars per day. New freight transfer facilities, improvement in freight house facilities and operation, etc., were also included.

The Use of Larger Power

One of the most distinctive changes in the method of operation which was made by the New Haven is in connection with motive power. Prior to the spring of 1916, the larger part of the New Haven freight traffic was handled by saturated steam engines of the K-1 or Mogul type, these locomotives having a tractive effort of 30,200 lb. The change which has taken place since that time can be best realized when it is pointed out that many of these locomotives today are in suburban service out of South Station, Boston, where they are handling local trains of 10 wooden cars and are considered capable of a speed of 50 miles an hour. There were also in service prior to the spring of 1916, 15 Consolidation locomotives with a tractive effort of 44,800 lb., and Pacifics of 37,000 lb. tractive effort were also occasionally used.

More recently the New Haven has secured a considerable number of Mikado, Mountain and Santa Fe type locomotives. In other words, whereas prior to 1916 it was entirely a small engine road, today it has adopted more modern methods of heavy train loading for its lines of large volume and has put itself more or less in the van of progress. Much of the side line, branch, and local service, is handled by what were the former heavy engines, that have been released by the new power.

The larger part of the New Haven's freight traffic on the New York Division is moved west of New Haven with electric engines. From New Haven, or Cedar Hill yard, to Providence or Boston, Mountain type locomotives are in service.

These have a tractive effort of 53,900 lb., and in summer are rated at 3,500 tons. Mikados of 58,372 lb. tractive effort are being used in the service to Bay Ridge over the New York Connecting Railway, the electrification of which is planned but not yet completed.

Between Hartford and Boston, New Haven and Northampton and on various lines of similar character, the power consists of Mikados of 45,535 lb. tractive effort. The Santa Fe type locomotives were secured in 1918. They are 50 in number, have a tractive effort of 72,000 lb. and are operated on the New Haven-Central New England route over the Poughkeepsie bridge route between New Haven and Maybrook and between Waterbury and Maybrook. These figures are given in detail because not a great deal has been said about the New Haven's motive power or about the important change which has been taking place under the guiding hand of President F. J. Pearson.

Engine Houses

A great deal might be said about the changes in engine house facilities which have taken place in connection with the acquisition of the larger power. The projects have been extensive. They have included the construction, extension, or modernization through the installation of more efficient equipment of engine houses at Cedar Hill, Midway, Providence, Boston, East Hartford, Waterbury, Danville, Maybrook etc.

Some of the Results

President Pearson in the annual report gives some interesting details concerning the improved results affected through the changes which have been made. "The property," he says, "now possesses a marked increase in capacity. The main arteries of heavy traffic eastward from New York and Maybrook, the Shore Line, and the other more important lines, are now adequate for the demands of the increased all-rail transportation which has been crowding these routes for many years. Congestion has been eliminated, through runs have been substituted for short runs, the movement of freight both carload and less-than-carload has been expedited, and the service as a whole in quantity and character has been

Photo by Kadel & Herbert

One of the Two Motor Cars Used by the New Haven in Branch Line Service

improved. The management confidently states that with reasonable promptness in loading and unloading on the part of the public, the requirements of southern New England for transportation will be met, not only in larger volume than is now moving but in a volume exceeding that of war times."

1921 and 1915 Compared

President Pearson also points out that the total ton-miles in 1921 were 10.20 per cent greater than in 1915, which traffic was handled with a reduction under 1915 of 21.15 per cent in freight train miles and 22.90 per cent in freight switching miles. A great deal more might be said concerning the actual details of the improvement which has taken place but this will require a more extensive treatment than space permits at this time. Enough has been said, it is believed, to bring out that the manner in which the New Haven is operated today is very much different from that in which it was operated before the extensive improvement program was begun.

These facts have great importance and must be taken into consideration in any analysis that is made of New Haven operations.

It is hardly necessary to enlarge considerably upon the peculiar traffic considerations with which the New Haven is confronted. These details were given considerably in detail in the New England divisions case and it is believed that readers of the *Railway Age* are familiar with the large proportion of passenger business, similarly the large proportion of manufactured products, the amount of l.c.l. and local traffic, the difficulties occasioned by the terminal character of the business, the short haul and other such factors. The amount of attention which has had to be given the situation because of the New England divisions case is an indication that the New Haven's problem is not a simple one. Because of the injunction proceedings brought to restrain the Interstate Commerce Commission's decision in favor of the New

England lines from becoming effective the case still remains to be decided. The decision naturally, in view of the amounts involved, will have a far-reaching effect upon the New Haven's operating and financial results.

A Deficit of \$14,121,623 in 1921

The New York, New Haven & Hartford Railroad in 1921 had a net corporate deficit of \$14,121,623. This looks extremely serious and is made all the more serious when it is realized that this deficit was \$9,500,117 greater than in 1920. The operating results of the road, however, did not reflect a drop quite as severe as is shown in the corporate income account because, of course, in 1920 the road was able to count on standard return for two months and the guaranty for six, which it was not able to count on in 1921. The actual figures of earnings and expenses as indicated by the figure of net after rentals show a very decided improvement which is quite a contrast with the result indicated by the corporate deficit. The net after rentals for the year, as reported in the December statement to the Interstate Commerce Commission, was \$740,034. This is very different from the standard of earnings (the New Haven's standard return was about \$17,000,000) prior to federal control, but it was a marked improvement over 1920, for in that year there was a deficit after rentals of \$12,575,137. There has been a marked improvement in recent months. The operating ratio in 1921 was 91.41. In 1920 the operating ratio was over 100. In November, 1921, the ratio was brought down to 77 per cent. The figures for the first two months of 1922 show a ratio of 80.40 per cent.

The New Haven did not have the great boom in traffic

in 1920 which many other railroads had, so any comparisons between 1921 and 1920 must be made with that in mind. However, the freight revenues for 1921 totaled \$53,593,929, a decrease of but 3.17 per cent from 1920. The decrease in revenue ton-miles was 11.23 per cent. Passenger revenues totaled \$50,934,294, a decrease of 2.56 per cent from the preceding year. The total operating revenues were \$116,405,232, which amounted to \$7,107,077 or 5.75 per cent less than in 1920. As compared with this decrease of about \$7,000,000 in operating revenues, there was a decrease of \$19,944,089 in operating expenses, the operating expenses for the year being \$106,402,295. Maintenance-of-way expenses were decreased 15.97 per cent, maintenance of equipment, 24.64 per cent and transportation, 19.19 per cent.

These changes tell us the familiar story of drastic economy which took place on all of the railroads in the country. It should be noted, however, that the New Haven's reductions in maintenance of equipment were rather severe and that the percentage of bad-order cars and unserviceable locomotives at the present time is high and very much above the average for all of the railroads of the country. The New Haven's percentage of bad-order cars on March 15, 1922, the latest available figure, was 26.5 per cent as compared with the country's average of 14.5 per cent. The percentage of unserviceable locomotives on the same date was 24.0 per cent, as against the country's average of 20.2 per cent.

At the close of 1921 the total number of employees on the railroad was 29,835, or 7,347 less than at the close of the preceding year. The wages paid during the year totaled \$59,305,824, a decrease of \$19,193,328 or 24.43 per cent as compared with the preceding year.

Pennsylvania Wins Verdict Against Labor Board

Court Sustains Carrier's Position and Upholds Constitutionality of Transportation Act

THE RAILROAD LABOR BOARD exceeded its authority in specifying the manner in which employees' representatives should be elected on the Pennsylvania Railroad and the manner in which conferences on rules and working conditions should be held, according to a decision by Judge George T. Page, of the United States District Court at Chicago. The ruling was made in the legal dispute between the Pennsylvania and the Labor Board, as a result of the motion of the latter to dismiss the temporary injunction issued to the carrier some time ago and restraining the board from publishing a decision which the carrier believed would be detrimental to its interests. Judge Page at the same time upheld the constitutionality of the Transportation Act under which the board was created.

One of the most interesting parts of Judge Page's decision holds that the only power in the Labor Board under Section 301 of the Act, is to hear and decide disputes that are jointly referred to the board by the interested parties.

The case was an outgrowth of an order by the Labor Board directing the Pennsylvania to hold an election of employees' representatives and prescribing the ballots to be used in this election. The railway did not comply with the order, insisting upon its right to deal directly with its employees. When it became apparent that the board was about to hand down a decision censuring the Pennsylvania publicly for its conduct, the carrier obtained a temporary injunction, restraining the board from publishing such a rebuke.

Representatives of the board and several of the members thereof, have publicly stated that if an adverse decision

was rendered in this case, the board would be shorn of all of its power inasmuch as the labor provisions of the Transportation Act contain no penalty clauses, enforcement of the board's decisions being possible only through the pressure of public opinion.

Judge Page's ruling said in part:

Two claims are urged: (1) that the act is unconstitutional if, and in so far as, it attempts to impose compulsory arbitration; (2) that the act gives the Board no right on ex parte submission, nor on its own motion, to do any act under Section 301.

Defendants move to dismiss the bill and urge: (1) that the Labor Board is an administrative arm of the government over which the courts have no jurisdiction; (2) that the Board had the power exercised by it under Decisions 119 and 218.

The Board Is Subject to the Jurisdiction of the Federal Courts

In my opinion the Labor Board is a body corporate, subject to the jurisdiction of the federal courts, and may sue and be sued. This does not mean, however, that the courts have any general authority over the exercise of a discretion vested in an administrative body or officer.

That law (the Adamson law) has been the subject of wide discussion, and it is not necessary to dwell upon it here, except to note that Congress there provided for an eight-hour day, and made other provisions that resulted in the actual raising of the wages of the employees of carriers. The Supreme Court sustained that act (Wilson v. New, 243 U.S. 332). The majority opinion was presented by the Chief Justice. Strong dissenting opinions were written, denying the constitutionality of the act.

Not only because of the diversity of opinion expressed in the New case, but because of its wide public discussion, Congress must have had clearly before it the question as to the conditions

under which it had the right, if at all, to establish machinery by which to compel the compulsory fixing of wages, rules, etc., as between carriers and their employees.

Board Has Authority Only in Disputes Jointly Submitted by Interested Parties

I am of the opinion that when Congress framed and adopted Section 301, it did so with the deliberate intention of imposing, as the plain language of the act indicates, the duty on all carriers and their officers, employees and agents, to exercise every reasonable effort and adopt every available means to avoid any interruption of the business of any carrier growing out of any dispute between the carriers and their employees, and that Congress intended that all such disputes should be considered, and, if possible, decided in conference solely between a carrier and representatives of its employees directly interested in the dispute, and that, as hereinafter noted, the only power given to the Labor Board under that section was to hear and decide a dispute which the conferees provided for in Section 301 were unable to decide, and then only in the event that the parties jointly referred the matter to the Board.

The further conclusion is inevitable that the Labor Board was without power to intervene in any way in the proceedings contemplated by Section 301 preceding a reference to it jointly by the parties, except that the Board might on its own motion suspend the operation of a decision by the parties if it was of the opinion that such decision as to salaries and wages would make a readjustment of the rates of any carrier necessary, and thereupon as soon as practicable affirm or modify such suspended decision (Section 307 b).

It is, in a general way, claimed that the Board has the right to direct or control the method of selecting the representatives of the employees under Section 301 under the provisions of Section 308 (4), which is as follows:

The Labor Board "may make regulations necessary for the efficient execution of the functions vested in it by this title."

The appointment or method of election of conferees under Section 301 not one of the functions delegated to the Board, and therefore, it had not the right to make the regulations provided for in Decision No. 218. I am of the opinion that the purpose of Section 301 was to leave to the carrier and its employees full liberty to get together in their own way.

Section 307 (b) authorizes the intervention of the Labor Board in precisely the same manner as provided in Section 307 (a) for the purpose of deciding "all disputes with respect to the wages or salaries of employees or subordinate officials of carriers, not decided as provided in Section 301."

Decisions of the Labor Board Are Only Advisory

In considering the intent of Congress as to the force of the Labor Board's decision as to other matters than those jointly submitted to them under Section 301, there are two views pressing upon the mind of the court for consideration.

(1) Do the provisions of the act authorize the Labor Board merely to hear, determine and publish in an advisory decision that which in its opinion would be a fair and just wage, or what would be a fair and just solution of disputes involving grievances, rules or working conditions, or:

(2) does the act authorize the Labor Board to make such findings, and to render such decisions and judgments as will make its determination upon those questions final and binding so that a rule, determined to be a fair and reasonable rule by the Board, shall thereafter be a governing rule between the parties, and so that a wage determined to be a fair and reasonable wage shall thereafter be the wage that shall be paid by the carrier and that shall be accepted by the employee, and that may be recovered in the courts?

There is no direct provision in the act that decisions by the Board shall be final and have the binding force of decrees to be performed. Nor is there any provision that that which is determined to be a just and reasonable wage or rule shall thereafter be the wage, or the rule, as between the carrier and its employees and upon which either may maintain an action in the courts. There is no provision for the enforcement of the terms of the decisions, nor any penalties for their violation, except the publication provided for in Section 313, if that may be considered a penalty.

All those matters seem to me to indicate that the decisions are only advisory.

On the other hand, Section 307 (d) provides that: "All decisions of the Labor Board . . . shall establish rates of wages and salaries and standards of working conditions which in the opinion of the Board are just and reasonable."

Nevertheless, I have reached the conclusion that it was the belief of Congress that the results desired by the legislation could be attained through the force of public opinion and that that public opinion would follow the publication made as provided in Sections 307 (c) and 313, and would support the decisions of a Board, composed of men each of whom would have special knowledge of

the difficulties within and the necessities of the group that he was chosen to represent. I am further of the opinion that, acting upon that belief, Congress provided in Section 307 (d) for a wide and searching investigation so that the Board would have before it all the facts necessary to enable it to reach just and reasonable decisions upon every dispute.

The Constitutionality of the Transportation Act

The remaining and of course fundamental, question in this case is whether or not the act is within the constitutional power of Congress to regulate commerce.

Undoubtedly some character of intercourse by transportation is involved in every completed commercial transaction. Boys trading upon the playground or men trading in the market places make and lay the basis for their transactions by discussion or correspondence, but the commercial transaction must somehow, somewhere be completed by delivery. It may be the mere passage of the commodity involved in the trade from the pocket of one by hand to the hand of another, or it may be the carrying across the continent of bulky commodities involving every kind and character of handling and transportation devices and of men engaged in many kinds of employment, but whatever be the character of the transaction, whether it is great or small, the instruments of intercourse and transportation are indispensable elements in every commercial transaction.

The commerce dealt with in the act in question involves the main transportation systems both for passengers and freight for the people of the whole United States. It reaches, touches and carries for every city, village and town and is the instrument by which food, clothing and fuel and every other commodity of commerce is carried for and between the people. There is nothing in existence that could be substituted for it, and it represents the growth of years. If its operation were to be discontinued for even a short space of time the loss and hardships necessarily consequent thereon would be almost incalculable; and if it were discontinued for any considerable length of time the whole fabric of the nation's commerce and the foundations of our manufactures which are the basis of the great growth and development of our country and of our business prosperity, would be almost irretrievably wrecked.

Neither bigness nor emergency can bestow or add to the constitutional power to regulate commerce, and I have set out the matters immediately foregoing for the sole purpose of illustrating the large place which the agreements and disagreements between carriers and their employees occupy in the transportation element of interstate commerce and how inadequate must be the regulation if Congress does not have the power to control such agreements and disagreements.

It is of the fundamentals of a common carrier system that it shall be as efficient as the conditions in business will permit, that it shall be continuous, that it shall give equal service to all of the people upon equal terms, that it shall have fair and reasonable compensation for the services rendered.

I can see no difference in character between those regulatory powers sustained and in operation under the Interstate Commerce Act for more than 40 years and the power to ascertain just and reasonable wages and working conditions as contemplated in Title III of the Transportation Act. If the power to regulate commerce is a power to prescribe rules by which commerce is to be governed, then Congress must have the power to prescribe every regulatory or governing measure necessary to keep the commerce of this country alive and the common carriers going concerns.

If the common carrier system of this country may lawfully be stopped for one hour by the carrier or by the employees, organized or unorganized, not by reason of any necessity in the business of common carrying, but because either party wills it, or through the disagreement of the parties, then it may be stopped for the same reason or for no reason at all for an indefinite time or perpetually, and the constitutional power of Congress would be as impotent and useless as a dead hand upon the ship's rudder in a storm.

In the case of *Wilson v. New*, the constitutionality of the Adamson Act was challenged by some of the dissenting justices upon the ground that it violated the Fifth Amendment, first, because an attempt to fix any wage is in violation of the right of private contract, and second, that the provision in the Adamson Act that only an eight-hours' service by an employee should be given for ten hours' pay was in violation of the inhibition in the constitution against taking property without due process of law. The argument there was that the act, without any investigation on the part of Congress or under its authority as to the conditions of pay and employment in the carrying trade, wrongfully and arbitrarily gave to the employees some \$400,000,000 of the carriers' money. The method that was there asserted to have been an arbitrary exercise of power is not present in this case. The act here, on the contrary, makes very careful provision, as hereinbefore shown, for the selection of a well qualified board, prescribes a wide field of investigation and a careful consideration of every

element involved, to the end that conclusions may and shall be reached by the Labor Board which shall be just and reasonable.

Upon the question of the right to prescribe compulsory arbitration or to fix wages, the majority opinion of the court in the case of *Wilson v. New*, determines that question, supports the power exercised by Congress and consequently sustains the constitutionality of the act.

There is, and can be, no conflict between the Fifth Amendment and the commerce regulation clause of the constitution because whenever men and property enter into and become a part of an interstate common carrier system, they so far lose their private character that they become wholly subject to all reasonable regulatory measures prescribed by Congress.

Members of the Labor Board have declined to comment on Judge Page's decision, the feeling being that the next move is up to the Department of Justice which handled the case for the Board.

Mississippi Supreme Court Upholds Labor Board

Another important court decision, bearing on the authority of the Labor Board and the constitutionality of the labor provisions of the Transportation Act, was handed down recently by the Supreme Court of Mississippi in a case involving a section laborer and the New Orleans Great Northern. In this case the section laborer sued the road for the difference between his rate of pay and the amount due him if a decision of the Labor Board had been applied. The case was appealed to the Supreme Court of Mississippi where it was contended that:

(1) The labor provisions of the Transportation Act, creating the Labor Board, are unconstitutional and in violation of the Fifth Amendment of the Constitution in that they deprive the carrier of its property without due process of law;

(2) That the Labor Board's order of July, 1920, fixing the wages of track laborers is contrary to the Fifth Amendment in that it would deprive the carrier of its property right to contract with its employees for services; and

(3) That the court has no jurisdiction inasmuch as the Transportation Act does not impose any penalty upon or authorize any suit against carriers for failure to obey or comply with any order of the Board and no jurisdiction, power or authority is conferred on any court to render judgment in any suit to enforce any order of the Labor Board.

Referring to the last contention the court's ruling decision said in part:

In our view the act creates a system of compulsory arbitration with notice to the parties and a right to produce evidence, and the finding of the Board in the cases provided for in the act has the effect of an award. The purpose of Congress was to prevent the possibility of tying up the transportation of the country during disputes as has been done heretofore in numerous cases and has been threatened in cases of such magnitude as to seriously jeopardize the business and welfare of the country. The living and business conditions of the great public are dependent upon the carriers for the transportation of the necessaries of life, as well as ordinary articles of utility. The legal effect of the action of the Board is to fix, for the time being, (a temporary period) the wages and salaries of the employees until the parties can agree upon such wages or salaries, or can make other arrangements with other men for the carrying on of the business of the carrier. It has the effect, in our opinion, of giving a right of action against the carrier by the employee or official for the salary so fixed under the provisions of the act if services are performed thereunder, and the courts are open for the enforcement of this obligation. The courts are open to the carriers also. Of course it is within the powers of Congress to fix the conditions upon which suits could be brought, or the courts in which the obligation could be enforced. But Congress having designated no tribunal to take cognizance of the matter, any court having jurisdiction of the parties and subject-matter may enforce the obligation as in the case of any other money obligation or contractual right.

After discussing the constitutionality of the labor provisions of the Transportation Act, the court's ruling says in part:

Congress has been given the power to regulate interstate commerce in broad and comprehensive terms. This power, being

given by the Constitution, is only limited by other provisions of the Constitution. The act in question seems to us to have been drawn under the decision of *Wilson vs. New* (U. S. Supreme Court), in which case the court considered the power of Congress under the Adamson act to legislate with reference to a grave situation, involving, among other things, the right to fix wages and hours for employees, and upheld the power of Congress so to do. The power conferred in the present act to fix wages is not a fixing of wages permanently, but a temporary fixing of wages with full power of the Labor Board to modify its orders as exigencies may arise.

We deem it unnecessary to go into an elaborate discussion of the subject but the power of Congress to regulate interstate commerce has been upheld and applied to many situations, and must, in the nature of things, be sufficient to meet the demands of the age and conditions with which Congress, from time to time, is called to deal. The powers conferred must be brought into exercise in many situations and conditions which the framers of the Constitution did not foresee. When dealing with a power of this kind we must remember that conditions change from age to age. The carriers of the country have been organized into huge transportation systems, employing hundreds of thousands of employees; and labor has been organized into organizations containing many hundreds of thousands and even millions of men. With the growth of commerce the public have become dependent in a large measure throughout the country and a strike or the up of the transportation systems would result in untold suffering and loss to the public.

The power of the government must be capable of meeting these changed conditions and is sufficient when called into power through appropriate legislation to protect commerce and transportation from suspension or interruption. The means by which the object is accomplished must be left to the judgment and discretion of the legislative branch of the government. The act here under review is adapted to this purpose and logically tends to the prevention of the suspension or interruption of interstate commerce.

We do not think the act here under review unconstitutionally abridges the freedom of contract, nor that it deprives the defendant of its property without due process of law. As pointed out in *Wilson vs. New*, and numerous other cases, the fact that a business is affected with the public use makes it different from, and its right of contract also different from, that of ordinary business. This is pointed out clearly in the majority opinion in *Wilson vs. New*; Mr. Justice McReynolds in his dissenting opinion closes his opinion with this language:

"But, considering the doctrine now affirmed by a majority of the court as established, it follows as of course that Congress has power to fix a minimum wage for trainmen; to require compulsory arbitration of labor disputes which may seriously and directly jeopardize the movement of interstate traffic; and to take measures effectively to protect the free flow of such commerce against any combination, whether of operatives, owners, or strangers."

Shopmen Again Threaten to Strike

Another strike threat, involving the members of the railway employees department of the American Federation of Labor, developed April 21, when representatives of these employees, in convention at Chicago, voted to send out strike ballots and took steps to launch a nation-wide strike of shop men.

B. M. Jewell, president of the railway employees department, said in commenting on the proposed strike:

If there is a strike—and I feel sure our men will vote solidly for it—it will be in protest of the action of railways in ignoring decisions of the Labor Board. The carriers have arbitrarily reduced wages, in defiance of the board, have restored the piece work system, and have resorted to the "farming out" system, which is a mere subterfuge by which they dodge labor board rulings.

A year ago our membership voted overwhelmingly in favor of a walkout in protest against the 12 per cent wage reduction already then announced and given effect last July. When the strike date, came, however, we favored peace, because of assurances given by the Labor Board that no further wage reduction would be considered for some time.

But this time, I am sure, the issue will come to a showdown. So far as we are concerned, it is a fight for existence. The precise wording of the strike ballots is yet to be determined, but the question will be: To strike or not to strike? The ballots probably will be sent out within a short time and the results should be known within 60 days.

The roads are dodging the board's rulings by letting out entire shops to contractors technically not within the jurisdiction of the labor board. But they have done not only this, but, in several instances, have pointedly refused to abide by the board's rulings, without so much as resorting to this obvious subterfuge.

The carriers have been "getting away with it" thus far. We

are going to find out whether they can continue to do so. The board, it must be remembered, has no real power to enforce its decisions. It must rely solely upon the influence of public opinion.

It was pointed out by some of the labor leaders that before the employees' strike referendum is completed, the Labor Board will probably hand down its ruling in the present controversy over proposed wage reductions and the coal strike will have reached an acute stage. These factors, together with Judge Page's decision in the Pennsylvania case, it is contended, indicate that trouble is, beyond any reasonable doubt, inevitable.

Hearings in the cases in which certain carriers have been charged with violating orders of the Labor Board by contracting the operation of shops, were held some time ago and later the whole question of the contracting of portions of the carriers' operations was re-opened, the board ordering a further investigation of recent contracts on the Erie. No decision has been rendered in any of these cases, probably because of the absence of Albert Phillips, the board desiring a full vote on this important question. Inasmuch as the board has not ruled in any case involving the contracting of shops or other work, the proposed strike of the shop employees is directed solely at the Labor Board.

It is also reported that the executive committee of the railway employees department has been authorized to arrange for a conference with the Labor Board, in regard to the question of contracting and that if this conference ends unsatisfactorily to the employees, to issue the strike ballot within 60 days after the close of the convention.

Wage Hearings Ended

Hearings before the Labor Board in the controversy over proposed reductions in wages, were completed on April 25, after several days of testimony for and against further cuts in the rates of pay of telegraphers. There were no closing statements by either representatives of the carriers or of the employees. While all of the evidence from the contending parties is now before the board, it is probable that some time will be allowed the National Industrial Traffic League and similar organizations to present their views on the proposed reductions before the case is definitely closed.

Now is the Time to Prepare for Heavier Business*

By Colonel F. G. Robbins,

Director, Bureau of Service, Interstate Commerce
Commission

STATISTICS SHOW that increased population requires increased transportation. There is a relation between the factors of population increase and transportation increase. For example, the population increased 20 per cent from 1890 to 1900 and the net tons moved one mile increased 86 per cent; the population increased 21 per cent from 1900 to 1910, and the net tons increased 80 per cent; the population increased 15.7 per cent from 1910 to 1920 and the net tons increased 61 per cent, which indicates that the two have kept increasing at pretty much the same ratio. In fact, it will be noted that by ten-year periods, the net tons moved one mile increased about four per cent for each one per cent increase in population.

I do not believe there is any doubt but that we are now over the worst of the business slump and that car loadings will increase gradually. We seem to have hit the low point in car movement the first week in January when the average loads moved per railroad per day were 6,300. This has gradually increased until March 12 when 8,800 loads per

day were being moved per railroad. Since then the movement has decreased owing to the coal strike, but excluding coal and coke, car loadings increased 6 per cent in January, 8 per cent in February, and 11.5 per cent in March this year over the same months last year.

Knowing this and also that when the coal strike is out of the way the car loading line will point steadily upward, we can well take stock at this time to make proper preparations to meet the increased transportation demands that will be made at no distant date. We know that during 1920 there were certain points of saturation and that these points were practically all confined to terminals. We know that little, if any, has been added to these facilities. With any increase in car units will come increased congestion and likewise decreased movement, which increases car shortage and simultaneously complaints from shippers become more caustic.

It is well, therefore, at this time, before we are actually in the thick of a congestion of traffic, to make such arrangements as will best promote the handling of the increased business with the least friction when it does come. With cars in bad order and without increased facilities, it is a foregone conclusion that the situation demands intensive and better use of that which we have. Have we developed to the extent that the situation demands proper supervision over each freight car? Does not such supervision begin with the yard clerk in assembling data for the use of transportation officers?

Is it not a fact that during periods of depression, the yard clerk is the first one to be laid off and among the last to be put on when business revives, and is this not usually done when all hands are too busy to see that such men are properly trained, thereby resulting in erroneous, unreliable and inadequate information being furnished transportation officers for the proper handling and distribution of equipment? Have you ever thought how much more supervision is given a passenger car as compared with a freight car?

Another method through which increased mileage can be made and delays decreased is by reducing the duplication of switching of trains at division terminals. This requires a scientific study of the through traffic movement in connection with the local movement and always meets with opposition by division forces. Every so often a campaign is launched on various railroads, but as a rule, it ends when each division begins requiring greater classification on the part of its neighboring division; such back-fire, as a general proposition, stopping the whole investigation. Some day, however, it will be found so necessary that an agency, independent of any division prejudices and limitations will be set up to see that through traffic is so arranged that it will be put in through trains and local traffic confined to local trains. The efficiency of division yards will be measured by the number of main trackers or trains that are put together to go through other terminals without a switch. This practice will increase car movement, decrease congestion, car shortage and loss and damage claims, but it will not be accomplished until divorced from division competition, unless, in the meantime, human nature is completely transformed. One railway executive, when testifying recently before the Interstate Commerce Commission, stated that last year four million dollars was saved on his railroad by reason of this improved method of handling cars alone.

What is being done towards reducing back-hauls at terminals, elimination of light switch engine mileage by joint arrangement with other lines, cutting out the duplication of switching and the establishing of joint interchange inspectors? Now is the time to correct these practices, when business is light, and to establish right habits before business gets heavy and the time is inadequate for the proper training of employees.

*Adapted from a paper read before the annual meeting of the Transporters' and Drivers' Association of the Black Line Hotel, Chicago, April 19.

I. C. C. Consolidation Hearing Postponed

Railroads Not Prepared to Submit Evidence Except by Way of Objections—Will Consider Procedure

WASHINGTON, D. C.

THE HEARING before Commissioner Hall of the Interstate Commerce Commission on April 24 on the commission's tentative plan for the consolidation of railroads was adjourned after a brief session because most of the railroads concerned were not prepared to submit evidence except as to points in the tentative plan to which some of them desired to offer objections or comment. The commission had expected the roads to furnish basic data to make up a record upon which it can formulate a definite consolidation plan. After some discussion it was decided to postpone hearings for approximately 30 days pending the appointment of committees representing the railroads to confer with the commission and formulate a program covering the character of the evidence to be presented by the carriers.

Most of the roads involved were represented by executives or counsel, while many representatives of roads in other parts of the country were present as observers, but those who spoke for individual roads had evidently expected that the tentative plan issued by the commission, based with some alternatives on the report prepared by Prof. W. Z. Ripley, was to be taken as the basis for discussion and that the commission would ask for such information as it desired. Their attitude suggested that they regarded the idea of consolidations as involving an element of trading in which neither a company contemplating the purchase of another line nor a company desiring to sell its property would be expected to reveal too keen an interest in the result, and the discussion indicated some obstacles in the way of making an artificial consolidation plan.

B. B. Cain, vice-president of the American Short Line Railroad Association, pointed out that the tentative plan makes no disposition of the short lines and asked if it was desired that they be heard. Mr. Hall replied that in his opinion it was essential that the short lines give their views as to where they should lodge in the general plan.

Forney Johnston, representing the National Association of Owners of Railroad Securities, asked permission to file a memorandum based on a report of its Board of Economics and Engineering, indicating the character of the basic data which it considered should be supplied by each railroad and without which, according to the association, it is not practicable to attempt to define specific plans for consolidation.

Florida Commission Opposed to Consolidation

J. E. Benton, general solicitor of the National Association of Railway and Utilities Commissioners, said he was uncertain as to the extent to which the state commissions will take part in the hearing, but asked that three copies of all exhibits be supplied for their information. He read statements which two commissions had asked him to put into the record. The Department of Public Works of the State of Washington expressed the opinion that any plan of consolidation which does not contemplate through service between the Atlantic and Pacific coasts will not be satisfactory and the Florida railroad commission stated its position as opposed to a consolidation plan on the ground that it believes no good purpose can be served, nor economies brought about by consolidation that will benefit the users of transportation. The merger of the express companies was cited as an example of the "bad effect of consolidation"; as having resulted in a less co-operative spirit toward the public and higher rates. The commission stated that it was just as much opposed to

centralization of railroad management in a few hands as to centralization of railroad regulation at Washington.

When Commissioner Hall asked for expressions relating to System No. 10 of the tentative plan, which includes the Southern and its subsidiaries and the New Orleans Great Northern and Alabama & Vicksburg, L. E. Jeffries, vice-president and general counsel of the Southern, said the company did not desire to offer any evidence, but would like the privilege of offering evidence or a statement in rebuttal if other testimony should make it appear necessary.

When Commissioner Hall said that this would leave a blank in the record he offered to submit any information the commission may desire, but said he had not understood just what form the proceeding would take and had nothing prepared.

Mr. Hall said the commission needs information as to the Southern and while it might dig it out of its own records, this would take a long time and it would prefer to have evidence furnished by the road.

Mr. Jeffries said he did not want to be shown as assenting to or opposing the proposed group, but that it would be groping in the dark to file information without knowing what was desired.

Mr. Hall said the question before the commission is not so much whether the plan is opposed or not, but one of information needed, including facts regarding the company's physical plant, traffic, etc., which would not get into the record unless the company put it there.

Forney Johnston, for the Seaboard Air Line, said, this company had some evidence to present but that time would be saved if its observations on System 10 were to be withheld until after evidence had been submitted as to System 12, which groups the Illinois Central and the Seaboard.

No one appeared for the New Orleans Great Northern, but L. A. Jones, president of the Alabama & Vicksburg, said that although he was not prepared to offer any definite evidence, he wished to oppose the idea of including this road in System 10 because it would break up a system which has always been under one management, including the Vicksburg, Shreveport & Pacific, which lies west of the Mississippi river. This separation he thought would be inadvisable and improper because as the two roads make a system operating both east and west of the river they have some effect in breaking down the "Chinese wall." When Mr. Hall asked if he were prepared to state the facts about his road and its traffic, he said it would be better to have that prepared and furnished later.

Commission Looks to Carriers for Basic Data

When it appeared that no one else desired to speak as to System 10, Commissioner Hall made a brief statement on behalf of the commission pointing out that it is not the inventor of the idea of consolidation but that it is required by statute to formulate a plan and that the carriers should furnish it with information to enable it to act wisely and not unwisely. It desires data as to the physical characteristics and the part each railroad performs in the work of the whole national system and for this information it looks to the carriers of the country who, if anything is to be done under this statute, will have to do it. He said the commission could ask for certain information, but does not know what is available as well as the carriers do and it does not desire to embarrass any carrier by asking for information

that might be involved in any negotiation which may now be under way. He pointed out that the law represents a change of policy as compared with the former restrictions and said the question involved is as to how shall it be permissible for carriers to come together as new entities through the consent and desire of the constituent parts.

Mr. Jones said that after hearing this statement he would furnish the information desired and that he had no intention of combating the commission's work, but he had no previous knowledge of the scope of the hearing. Mr. Hall said that he was not talking to Mr. Jones any more than to any one else, but that there is nothing in the record as to System 10, although the roads placed in that system might be profoundly affected.

E. C. Bailly, secretary of the Carolina, Clinchfield & Ohio, submitted a brief statement saying that as strong reasons exist for putting the Clinchfield in System 10 as in System 11 as proposed by the tentative plan, or in System 12, and he requested that the plan shall permit as an additional alternative that it may be included in System 10. It might also be advisable, he said, to include the road in System 8, the Chesapeake & Ohio, or System 9, the Norfolk & Western, with which roads it has considerable interchange of traffic.

When witnesses were called for as to System 11, including the Atlantic Coast Line and the Louisville & Nashville, George B. Elliott, vice-president and general counsel of the A. C. L., said he was not prepared to submit any evidence nor to protest against the plan nor the policy of the act. The tentative plan, he said, except as to two or three points, seems to be along logical lines.

W. L. Mapother, president of the Louisville & Nashville, said his road had no particular recommendations to make or evidence to present, although it would be glad to supply all available data. He read a brief statement saying that the desirability of further consolidations is very generally admitted, but there are many problems to be solved and difficulties to be overcome. The tentative plan for System 11 has much to commend it, but if it is to be made obligatory its success depends upon the terms and conditions. Any plan of consolidation involves the question of credit and the raising of capital, for which the present is an unpropitious time, because most of the carriers are not in a satisfactory financial condition. A permissive plan of consolidations, he said, is highly desirable as a reversal of the restrictions of the past which have hampered railway development and the Louisville & Nashville desires to offer to assist the commission in its study in any way.

W. R. Cole, president of the Nashville, Chattanooga & St. Louis, said that the proposed placing of this road in a system with the Atlantic Coast Line and the Louisville & Nashville is entirely logical, but he had not understood the scope of the inquiry and was not prepared to offer any evidence.

R. F. & P. Asks to Retain Present Status

Eppa Hunton, Jr., president of the Richmond, Fredericksburg & Potomac, asked that the original recommendations of Prof. Ripley be adhered to and this road be permitted to remain as at present and not be made a part of any system. He outlined the history and described the traffic conditions of the road, which is owned by the State of Virginia, four Southern and two Northern lines, saying that to leave it in its present situation would leave its competition freer and leave the business with the same lines as at present. He said that most of the roads which own its stock are also of the same opinion. The road now represents an absolutely important bridge line between four Southern roads and two Northern roads.

Prof. Ripley asked whether there would be any advantage or disadvantage in making this road a main stem for the Southern lines without any ownership by the Northern lines.

Mr. Hunton said that the professor's original suggestion represents a better plan, because the road is now a main stem in both directions. Prof. Ripley said it had been suggested that if the ownership of this road be confined to lines south of Washington the delimitation of the Southeastern region would be more distinct.

R. V. Fletcher, general solicitor of the Illinois Central, said his company was prepared to go ahead with some information along the lines indicated by Commissioner Hall, whereupon Mr. Hall asked if results could not be obtained by the appointment of a committee representing the railroads or an informal discussion of the record as to the kind of information that would be useful. He said the commission is not requesting anything, but merely obeying the statute and desires the aid of the judgment of the railroads as to what would be of value. Mr. Fletcher then suggested that Mr. Johnston be appointed chairman of a committee and the hearing was adjourned for a time for an informal conference among the representatives of the railroads.

Regional Committees to Meet

In the afternoon Mr. Fletcher reported that the conference had come to the conclusion that it would not be advisable to continue with the hearing at this time since the roads were not prepared but that five or more committees should be appointed to represent the roads in different sections, and that these should form a general or executive committee to meet with the commission and suggest the character of the evidence deemed most useful, etc. A committee representing the Southeastern roads had been appointed at the conference.

Mr. Hall said the plan would be agreeable to the commission and suggested that the hearing should be resumed as near to May 20 as possible, but not before that date, because of other engagements of the commission. He also said it was not proposed to have all the hearings at Washington, but that efforts would be made to arrange an itinerary so that communities affected or any one having a substantial interest might have an opportunity to be heard.

The Southeastern committee appointed consists of counsel for the Southern, Atlantic Coast Line, Louisville & Nashville, Seaboard Air Line, Norfolk Southern, Illinois Central, and a representative of the short lines.

Before adjournment the testimony on behalf of the R. F. & P. was continued. W. D. Duke, general manager, described its method of dividing unrouted traffic between the owner lines. Mason Manghum, representing the Virginia Corporation Commission, and John R. Saunders, attorney general of Virginia, expressed the opposition of the state authorities to a merger of the road with any other because the state owns about one-sixth of the stock of the road and its dividends are placed in a sinking fund to be used to retire bonds issued by the state. They said a merger would jeopardize the state's holdings, would not be necessary or desirable for any purpose of the Transportation Act, and might tend to destroy free competition. Mr. Manghum said the city government of Richmond and the Richmond Chamber of Commerce and other shippers' organizations had gone on record as opposed to consolidating the R. F. & P. with any other road.

Vice-President Elliott of the Atlantic Coast Line said his company had not changed its views since the time when it had practical control of the road, but thought the entire situation would be served better by a joint ownership of a properly equipped road between Richmond and Washington than by two roads between the same points.

Frank Gwathmey, appearing for the trustees of the Flagler estate now operating the Florida East Coast, said they felt they had no authority to present any evidence as to the future disposition of the road because the trust expires next year.

Great Western Suffers from Adverse Conditions

These Include High Joint Facility and Car Rentals. Deficit
in 1921 of \$592,601

THE CHICAGO GREAT WESTERN'S annual report for the year ended December 31, 1921, is to be commended for the frank manner in which the officers of the road admit the difficulties with which that road is at present confronted. The difficulties are evidenced in a deficit after fixed charges of \$592,601. This represents improvement of a sort, because in 1920 the road reported a deficit of \$1,548,375. In 1921 the company had larger freight revenues than in 1920; it made large reductions in expenses but the changes thus made were not sufficient to keep the final figures from being in red. The figure given above for 1921 is after the deduction of \$480,000, representing interest on the bonds of the Mason City & Fort Dodge accrued but not paid.

The Chicago Great Western's major difficulties are apparently three in number. One is a large per diem balance. Another is the large sums paid in rentals for joint facilities. The third results, according to President Felton, from the rerouting of traffic during the federal control period whereby the Great Western was deprived of lucrative traffic built up over a long term of years and which traffic it has thus far been unable to regain in its entirety. Increased wages and material costs are not numbered in the three factors given because they apply to all roads.

Rentals

The following quotation from President Felton's remarks in the annual report is characterized by its clean-cut statements and frank manner of expressing the situation as to rentals:

"Among the causes contributing to the deficit this year are the high wages and the heavy charges for equipment rents and payment for joint facilities. Reference is made hereinafter to the high wages and equipment rents. As to joint facilities: It is well-known your corporation uses the properties of other companies for entrance into Chicago, Minneapolis, Des Moines, Kansas City and Omaha. The rentals of these properties are constantly increasing and your company is obliged to pay them. The total net rents paid during the past year was \$792,496. This is equal to 4 per cent on approximately \$20,000,000; an amount only a little short of the bonds outstanding on the entire Great Western road. In other words, the company is required to pay for the use of about 85 miles of other companies' tracks and terminals an amount almost equal to the interest on the entire issue of Great Western bonds representing 1,035 miles of road. Thus it becomes plain why the Great Western road cannot make a more favorable showing."

The Great Western's freight revenues in 1921 totaled \$17,522,200, the largest in the company's history and 9.58 per cent in excess of 1920. The reason was the increased rates which applied during the year, the earnings per ton-mile in 1921 being 1.130 cents, as compared with 0.961 cents in 1920. The revenue tons totaled 5,427,973. This figure compared with 6,067,713 in 1920 and was the lowest of any year since 1912. The revenue ton-mileage was 1,550,484,653, the lowest since 1915. The passenger revenues for the year totaled \$4,884,562, a reduction of 14.19 per cent for 1920. The total railway operating revenues were \$24,219,937, an increase of .78 per cent over those of 1920.

Operating Ratio of 89.33

The road's figures show the usual drastic reductions in operating expenses. Expenses in 1921 totaled \$21,636,139. In 1920 the expenses were \$26,452,243. There was a reduction of 18.21 per cent in total operating expenses. Maintenance of way was reduced 37.64 per cent; of equipment, 21 per

cent and transportation, 11.03 per cent. In 1921 the road had an operating ratio of 89.33. This figure is too high to show favorable results in the corporate income account. It did, however, represent a considerable improvement over 1920 because in that year the ratio was 110.07 per cent. Prior to federal control the Great Western operated at about 75 per cent, a figure too high to overcome the disadvantages of the heavy joint facility rentals with which the road is confronted. In 1916, which was the one year in which the Great Western really began to show any signs of prosperity the ratio was brought down to 69.74 per cent.

Economies Effectuated

The economies secured in transportation expenses in 1921 were due to decreased traffic, to lower wage and material costs, to savings in fuel, etc. Operating expenses per revenue train mile were reduced from \$4.55 in 1920 to \$3.77 in 1921, or 17.14 per cent. The savings in fuel were evidenced in both quantity and cost. In 1921 the pounds of coal per 1,000 gross ton-miles were 196; in 1920, 228, a reduction of 14 per cent. The cost per ton of coal was reduced from \$4.28 in 1920 to \$4.17 in 1921. The road also shows savings in handling coal. To quote from the report: "The cost of handling coal at our mechanically operated coaling stations was reduced from 20.3 cents per ton in September, 1920, to 6.9 cents in December, 1920; a reduction of 13.4 cents per ton. This is equal to a saving of \$86,000 per annum, based on the total coal consumed by locomotives in 1921." The road also showed savings of \$136,678, or 27.5 per cent, in loss and damage and of \$153,149, or 42.6 per cent, in personal injury claims. Loss and damage claims in 1920 totaled 3.95 per cent of the freight earnings; in 1921 this was reduced to 2.83 per cent.

The Great Western has a serious bad order car situation, its percentage of bad order cars for the month of December averaging 28.7, which was too high. The road borrowed \$1,633,300 from the revolving fund to rebuild bad order cars, which amount proved insufficient. The large proportion of bad order cars, President Felton explains, required the road to use more foreign cars in place of those lying on side tracks in bad order. The result was a debit balance for car hire of \$776,908. In the year prior to federal control the receipts for car hire exceeded payments by \$307,281; the difference between the two periods being \$1,084,190. This seems a rather pointed explanation of another of the Great Western's difficulties.

The Mason City and Fort Dodge

Much might be said concerning the Mason City & Fort Dodge situation. This road is leased by the Great Western, and constitutes its lines from Oelwein, Iowa, to Omaha, Neb., from Hayfield, Minn., to Clarion, Ia., with a branch from Fort Dodge, Ia., to Lehigh. The M. C. & F. D. has bonds outstanding of \$12,000,000 paying four per cent or \$480,000 annually. The interest has not been paid since December 1, 1920, at which time the money was advanced by the Interstate Commerce Commission. The Great Western has refused to pay the interest since on the ground that the M. C. & F. D. has not earned it. "Although your company," says Mr. Felton, "has continued to operate the property, the bondholders have been advised that the Great Western will not advance in the future any funds to pay unearned interest on the Mason City bonds."

Freight Car Loading

WALTER P. S. D. C.

IN SPITE OF A DECREASE in coal loading of 71,195 cars as compared with the corresponding week of last year, the total number of cars loaded with revenue freight in the week ending April 15 was still somewhat greater than it was last year, 706,713 as compared with 702,116. It was also much greater than it was for the corresponding week of 1920, when, due to the switchmen's strike, the loading dropped to 601,695. To make up for the loss in coal loading, there was an increase as compared with the corresponding week of 1921 of 28,595 cars in the loading of merchandise and of 39,596 in miscellaneous freight. Increases in these were shown in all districts except the Southwestern. As compared with the previous week there was a slight decrease

in coal loading, from 69,456 to 62,851. In the Pocahontas district, however, as in the previous week, there was an increase in coal loading as compared with last year. As compared with last year there were decreases in the loading of grain and grain products, livestock and coal, but increases in all other classes. The summary as compiled by the Car Service Division of the American Railway Association is given in the table below.

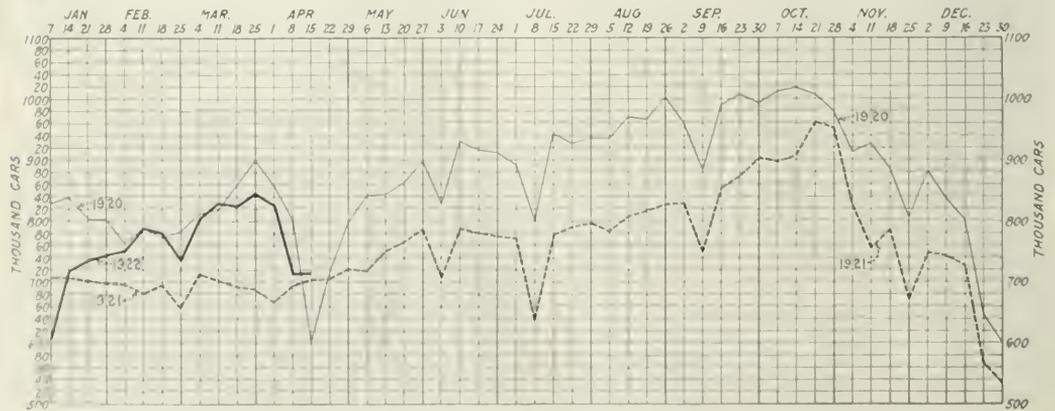

The freight car surplus during the week ending April 15 showed another large increase, due to the lack of demand for coal cars, to 333,393, of which 98,686 were box cars and 187,918 were coal cars. Of the surplus 88,351 were in the Allegheny district

The surplus during the week ended April 8 had increased from 206,746 to 259,605, of which 122,359 were coal cars and 92,393 were box cars.

REVENUE FREIGHT LOADED

SUMMARY—ALL DISTRICTS, COMPARISON OF TOTALS THIS YEAR, LAST YEAR, TWO YEAR AGO, WEEK ENDED SATURDAY, APRIL 15, 1922

Short Line Association Holds Annual Meeting

President Robinson Calls Attention to Attacks on Transportation
—Anderson Addresses Meeting

WASHINGTON, D. C.

THE ANNUAL MEETING of the American Short Line Railroad Association was held at Washington on April 25 and 26.

President Bird M. Robinson submitted his annual report, containing a general review of the railroad situation and the development of matters of particular interest to the short lines. He said in part:

"We are impressed with the belief that the present situation in Congress is fraught with difficulties and great danger for the public, as well as for the carriers. Great pressure is being brought upon Congress to induce it to reverse the constructive policy adopted in the Transportation Act. If Congress should yield to that demand, it would be incalculable injury to the public and to the carriers. It would greatly impair, if not make impossible, the successful operation of the roads by their owners, and as an inevitable result would force upon the government the necessity of acquiring railroads at a cost of many billions of dollars, and compel it to thereafter furnish transportation at an enormously increased cost, which, by the very force of circumstances, it could not avoid.

The Attack on the Transportation Act

"The attack upon the Transportation Act was prompt and vigorous. It was led by the radical element and was engineered by the former leaders who made their living fighting the carriers. They maligned that act as a crime and announced that they would use every means to defeat members of Congress who prepared it; and unfortunately they succeeded in defeating some of the strongest, most conscientious and upright men who had ever been in Congress. They have announced that they will defeat other members of Congress who supported the Transportation Act or who refused to vote to repeal most, if not all, of the fundamental principles incorporated therein. That condition is most serious, for it will—to the extent that it is successful—punish the faithful, intelligent, courageous public servants for daring to do their duty, and it may have the effect of intimidating others.

"The objective sought in the attack being made by a large part of the public, is to attain a reduction of rates, and to accomplish that result, bills have been introduced and are now pending in Congress to repeal Section 15a which provides that rates shall be sufficient to pay to the carriers a fair return upon their properties held for and used in the public service. Other bills are pending to repeal Section 13, which confers upon the Interstate Commerce Commission final jurisdiction as to both inter and intrastate rates, insofar as the latter may be found to result in placing upon interstate commerce an undue burden.

"Numerous other bills seeking to limit the rights of the carriers, or imposing additional burdens and restrictions, are pending, and in view of the strength and influence of the parties advocating these various bills, we are impressed with the belief that the situation is fraught with great danger.

"If Congress, in response to the great pressure now being brought to bear upon it, reverses the constructive policy adopted in the Transportation Act, it will in all probability result in a renewal and a continuation of the restrictive policy which was in effect prior to the federal control period. In my opinion there can, and will be, but one result of such a condition, and that is that the government

will be forced, within a comparatively short period, to acquire the railways and to furnish transportation.

"The Transportation Act is probably more misunderstood by the public than any important constructive act ever passed by Congress. The public has apparently but a very limited true knowledge of that act. On the contrary it has been saturated with misinformation as to its provisions. It is probably not to blame for that condition for the reason that there are a large number of active, unscrupulous individuals who are publicly and constantly misstating its provisions, while on the other hand many conscientious people misunderstand it. For example, certain members of Congress persistently proclaim that that act gives to the railroads a guaranty of a certain per cent of return, and that the taxpayers must meet that alleged obligation. The truth of the matter is just the reverse of what they assert.

"The mis-understanding of the act applies to a number of other important features, to approximately the same extent that it does as to the so-called guaranteed return.

"The attempt to obtain a reversal of the constructive policy of the Transportation Act is not limited to the radical or unscrupulous element, but is strongly supported by a large body of conscientious and reputable people, hence the great danger that now confronts the people with reference to their transportation problem. In view of that danger we have called you here for conference and for the purpose of enabling you to confer with your senators and representatives with the hope that you can give them necessary information and aid them in preventing the reversal of the helpful, constructive policy now in existence.

"It is true that the public at large, and the main lines, have a far greater interest in the situation than have the short lines, but it is apparent that the public has been misinformed, and is being misled, and that the main lines do not possess the strength and influence that you have. Speaking generally, we have the confidence and influence of a large part of the members of Congress, and we should not only do our full duty but we should do more, if and to the extent that we can.

Railways and Politics

"The railways are practically helpless in a political campaign. Public opinion is such that it will not permit them to participate in the election of officials and this notwithstanding it is a well known fact that labor and the radical organizations, in fact, almost any kind of interested organization, may publicly or privately participate. They not only disseminate misinformation, but they expend large sums of money, much of it in an illegal way, in their efforts to elect representatives that pledge themselves to vote for measures intended to either restrict the railways or impose additional burdens upon them.

"Some plan must be found to get the facts to the public so that they may know that the transportation problem is their own and that they must deal with it intelligently or suffer. It is quite apparent that the railway people have, from the very beginning, utterly failed to get the public to understand that great problem. The public, without doubt, does not understand it and it is apparent that the railway people have not and do not understand the public, and judging from the past, we are forced to conclude that present plans of procedure will continue to produce like results.

"To speak frankly, I may say that the ignorance of the

public with reference to the great transportation problem is far more dense than with reference to any other important problem with which it has to deal.

Proposes National Transportation Institute

"Recognizing that the public has, and will continue to exercise, almost unlimited control over the various transportation facilities of the country; that it greatly misunderstands that problem and fails to comprehend the ill effect that its antagonistic attitude is having upon itself; that it has a transportation system unequalled in the world, which has been provided by private capital and initiative, and that it is without any adequate educational facilities or impartial source of information on that subject, I have proposed the establishment in Washington, of a National Transportation Institute, under the supervision and control of some men of pre-eminent ability, standing and learning with reference to transportation, that there are in the country; that Institute to be based upon the broad and firm foundation that all parties interested, (a) the public, and (b) private enterprise, which furnished the transportation facilities and (c) the skill which renders the service, have equitable and legal rights, and that justice, equal and exact justice, must be accorded to all. The plan contemplates that the Institute shall conduct necessary research; and thereafter teach its students and the public, through its staff officers and the press.

"Present conditions demonstrate that the plans and work of the rail carriers, in their effort to educate the public to a full and clear understanding of that problem, have not succeeded. Viewed in the light of that long, varied and unproductive experience, I can see little on which to base a hope of real success if the efforts to accomplish that vitality necessary object are only to be continued along the same general lines.

"I am convinced that a complete change of plans is necessary. That the carriers should earnestly endeavor to take the public, through its leading men, into partnership with them, in the educational work to be done, and that all of such efforts ought to be based upon the highest and broadest plane, free from any propaganda or purely selfish motives.

"As a result of an extended investigation, I am convinced that the proposed Institute can now be established by and with the support of men who not only have the confidence of the public, but who are specially qualified to teach the principles of transportation in all of its aspects."

Consolidated Purchasing Agency

Regarding the consolidated purchasing agency Mr. Robinson said:

"The last annual meeting of the association adopted a resolution directing me to establish a consolidated purchasing agency for the use and benefit of the members, with instructions to obtain the necessary capital from private sources so that the association would not have to contribute any money or become responsible for the financial operation of such an agency. In due time I made an arrangement with certain individuals, myself included, whereby they contracted to furnish the necessary funds to establish the agency and maintain it under my general supervision, as president of the association.

"That agency was established and began business about June 1, 1921, and the money necessary to conduct the business has been advanced by the individuals so that the association has neither advanced a single dollar or become liable for any amount in connection therewith. That agency, when established, proceeded, in the most intelligent way, to make contracts and otherwise provide for the purchase of many of the articles used by practically all of our members, at substantially reduced prices. Notwithstanding

that fact, only a comparatively limited number of members have taken advantage of the opportunity thus afforded them.

"That agency adopted the plan of sending to members full information as to prices obtained and we have been astonished at some of the developments. It has been demonstrated that the purchasing agents of many of our members have taken advantage of the lower prices thus made possible, by using them to induce the concerns with whom they had formerly been dealing, to meet such lower prices, thereby ignoring the agency that had made such reduction possible. We are of the opinion and we feel that we can demonstrate the fact, that the agency has benefited the members of this association to the extent of saving to them a very large amount of money on supplies which they have purchased, and this notwithstanding they have not supported the agency itself with their patronage.

"The parties who have supplied the money, created the agency and have conducted the business, feel that they have not received the co-operation of the members to the extent that they should have and they will ask an opportunity to discuss that situation with the delegates at this meeting, with a view to ascertaining whether the members desire the continuance of that work, and whether they can rely upon real co-operation in the future."

Consolidation Plans

Mr. Robinson said he feared the owners of the short line railroads do not appreciate the importance of the plans to be adopted. "Short lines that have only one connection must, of course, be assigned to the system to which their connecting line becomes a part, hence they are interested in the composition of that proposed consolidation system," he said.

"Member lines that connect with two or more main lines are vitally interested in the assignment of their properties to one or the other of the systems, provided for, in the commission's permanent plan. The assignment of any road to a particular system at once limits the right of the owners of that property to sell or to merge it with some other system, and it would seem that the owners of all properties are vitally interested in the plans to be adopted by the commission.

"It is true that the law does not compel consolidation, but the powers of the commission over the roads are such that it can, if it so determines, practically force the consolidation of many if not most, of the carriers; hence the problem cannot now, with any degree of propriety, be ignored or neglected."

Traffic Department Report

Vice-President L. S. Cass presented the report of the Traffic Department which included the following:

"The success and prosperity of a short line primarily depends upon the revenue it receives from the volume of traffic which is available to it; and it is the conception of the Traffic Department that this is the key to the real solution of the problem of the short and weak roads; and its program, which is the program of the association, of course, may be summarized briefly as seeking—

First: To provide enough provender to so nourish all the "weak animals" in the nation's railroad barn lot, so they may haul the products of Uncle Sam's farms and factories to his nephews, nieces, kinfolks and customers in the most efficient and economical manner. (This means Section 15 A)

Second: To have such provender as is available, fed fairly and justly to the "animals" so that the yearlings may grow up strong and healthy, and not be starved and stunted by being trampled upon or thrust away from the feed racks by the older and stronger live stock. (This means the

Rule for Divisions, Paragraph 6 of Section 15; and also the Rule for Routing—Paragraph 10 of Section 15).

To succeed in this is to solve all our real problems; for if they can get adequate earnings, the short lines can get the money to buy equipment, make needed improvements, can keep up a proper degree of maintenance, can pay officers the salaries they earn and deserve for the devoted service and diverse duties they render; and it will give those patriotic investors who put their money into these enterprises, an opportunity to get some return on their savings; and to get a fair price for their holdings when consolidation eventuates.

So, in a broad way of speaking, from the viewpoint of the Traffic Department, the Interstate Commerce Commission may be said to be like the banker who has just two troubles, one to get his money out, and the other to get his money in; the Interstate Commerce Commission has but two troubles—first to promulgate rates that are fair to the shippers and travellers and at a level that will give the carriers in a given group a fair return upon the value of their property as a whole; and second to so divide the joint rate among the carriers that each shall receive the amount of revenue required to pay their respective operating expenses, taxes, and a fair return on their railway property held for and used in the service of transportation.

Even though the rates provided in Ex Parte No. 74 applied to the volume of business in 1921 failed to produce more than 45 per cent of a fair return on the value of the railroad property of the country as a whole, this does not change the duty of the commission to divide in a legal manner the income that is produced from interline traffic and it is now well conceded on the part of unbiased students of railway economics that Article 6 of Section 15 of the Transportation Act of 1920, which was prepared and introduced in Congress by the American Short Line Railroad Association, imposes upon the commission the duty and gives them the authority through which the weak railroads may and will ultimately be stabilized.

It is now the belief of the executive officers of the American Short Line Railroad Association that the trunk roads do not propose to voluntarily grant increased divisions to the short lines; therefore there would seem to be little or nothing for any line which needs relief to gain by any longer withholding filing their application with the Interstate Commerce Commission for increases in their divisions, especially as it is within the power of the commission to make its decision retroactive to the date on which your petition is filed. The controlling principles, and the yardstick for measuring divisions, are now fairly well defined so that you can see just about how your case will probably stand.

Vice-President B. B. Cain also presented a report outlining the work of the Law Department during the year.

Sydney Anderson Addresses Meeting

Representative Sydney Anderson, chairman of the Joint Commission on Agricultural Inquiry, addressed the association regarding the investigation which the commission has just conducted. He also endorsed President Robinson's recommendation for a transportation institute.

On motion of the committee on resolutions, the association adopted a resolution endorsing the proposal for the establishment of a national transportation institute at Washington and also a resolution opposing any change in the transportation act. On motion of the valuation committee a resolution was adopted urging the members to devote more attention to valuation matters to see that their protests against tentative valuations served by the Interstate Commerce Commission are properly filed. It was decided that the consolidated purchasing agency should be continued and the members were urged to induce their purchasing agents to

make use of the agency. A motion had been offered that the association pay the deficit incurred during the first year, but President Robinson, speaking for those who had provided the funds, stated that they did not want financial assistance but the co-operation and patronage of the membership. It was decided to establish an office for the traffic department in New York under the direction of R. A. Belting, regional traffic manager. On motion of the committee on electric lines, a resolution was adopted providing for a method of securing freight carrying electric lines as members. At the request of the membership committee, the members present pledged themselves to renew efforts to increase the membership of the association.

The present officers were re-elected for the ensuing year, as follows: President, Bird M. Robinson; vice-presidents, L. S. Cass, B. B. Cain, B. S. Barker and F. J. Lisman; secretary-treasurer, F. T. Whittlesey. Vice-president L. S. Cass in addressing the meeting, pointed out that \$18,000,000 has been distributed to short line railroads as the result of the efforts of the association and he predicted that the sum would amount to \$100,000,000 ultimately.

The Celilo Collision

THE COLLISION of passenger trains on the line of the Oregon-Washington Railroad & Navigation Company near Celilo, Oregon, on December 1 last (briefly reported in our issue of December 17, page 1217), was investigated by the Interstate Commerce Commission and also by the Public Service Commission of Oregon. The report of the Bureau of Safety, I. C. C., dated March 2, has just come to hand.

The trains were westbound No. 17 and eastbound No. 12, both far off their schedules. They met at about 12:30 a. m. The total of the killed was seven (including one trespasser) and of injured 73. Chief W. P. Borland, who signs the

Oregon Trunk Connection—Looking East.

Telephone Booth at the Right

report, finds four individuals immediately responsible, and condemns severely various irregular practices for which operating officers are responsible and of which they appear to have been fully cognizant. This report, carefully condensed, fills nine pages, nearly 5,000 words, and we can give only an abstract of the conclusions.

Referring to the sketch, the westbound train was running on the eastbound track, on an order which had not been sent to the eastbound train. The eastbound train, Conductor Allison and Engineman Allen, had been detoured over the Oregon Trunk Railway and re-entered its normal route at the telephone booth. It proceeded eastward expecting to get orders at Biggs, with no better authority for this than the opinion or assumption of Pilot Conductor Clark that it could do so, and the knowledge that such informal instructions had

on prior occasions been acted on in that way. Detouring had been of frequent occurrence.

Pilot Clark was conductor of a helper engine which assisted trains up to the Oregon Trunk road and he also acted as switch tender. He seems to have been the only person stationed at this telephone booth. There was no train register there. The dispatcher's office was temporarily established at The Dalles because of serious obstruction of the road west of there. Night chief dispatcher Walsh had issued the order to the westbound train, expecting the conductor of No. 12 to stop at the telephone booth and call for orders. He claimed also to have told Dispatcher Stiles to have Clark hold No. 12, but this was contradicted by Stiles. The westbound train was run on the south track to save time (the cross-overs at Celilo and west of there being inconvenient), and this practice had been common, though a standing rule forbids it, except when the normal track is obstructed.

Allison and Allen are held responsible for not calling the dispatcher before proceeding east from the booth, and Walsh for moving the westbound train without protecting the movement. Clark is held to share the responsibility, he having by his actions led Allison and Allen to believe that he had been authorized by the dispatcher to allow No. 12 to proceed. Further, Allison ought to have had a clearance card as this was his initial station on this subdivision.

Dispatcher Walsh is censured for other irregular practices, and in particular for moving the westbound train on

were not familiar with the forms; and even Walsh did not succeed in making a proper order. Moreover, he appears to have been on duty longer hours than is lawful.

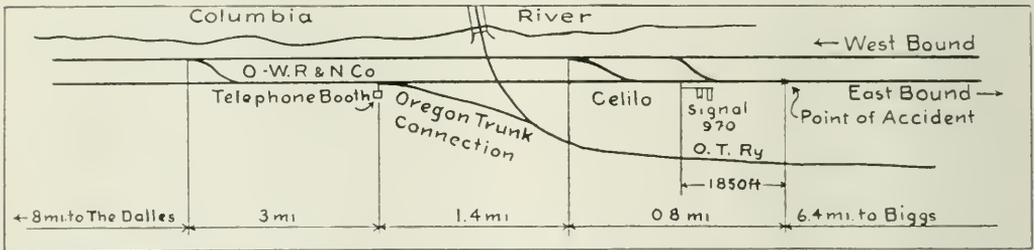

"The operating officials cannot be too severely criticized for their failure to provide a safe method of operating trains between Oregon Trunk connection and Biggs. . . . This is not an isolated case. . . ."

Action of Oregon Commission

The Public Service Commissioners of Oregon, F. A. Williams, H. H. Corey and F. G. Buchtel, following their investigation of this collision, which was made in conjunction with that of the inspectors from the Interstate Commerce Commission, made a report which ended with the following recommendations:

- "1. That the operating officers of this railway, through strict supervision, ascertain that all rules are fully and specifically complied with and that each executive and every employee should be held responsible for non-compliance therewith to the degree of the responsibility placed in them.
- "2. That the rules relating to single tracking in double track territory be absolutely adhered to, and that in cases of emergency requiring the detouring of trains, all orders should be transmitted by operators placed at the point of connection.
- "3. That there should be a cross-over established at the point known as Oregon Trunk Junction for the safe and convenient operation of trains."

This was followed by an order requiring that within 60 days the Oregon-Washington Railroad & Navigation Company should file a statement indicating such action as would be taken with reference to the foregoing recommendations. The company replied on February 2, in a letter signed by

Track Layout at and Near Oregon Trunk Junction, Oregon-Washington Railroad & Navigation Company

a 19 order when the rule requires the use of Form 31. This rule, requiring, in a case like this, signatures from all trains liable to use the eastbound track, is held by the inspector to be essential to safety.

Discussing general conditions, the report says that good railroad practice requires, when detouring trains, that every precaution should be taken; a competent operator should have been stationed at the Oregon Trunk connection to receive orders. But this was not done; neither were there any special instructions prescribing a method of procedure.

"The practice of requiring train employees to perform the exacting duties of an operator is dangerous and cannot be too strongly condemned. . . . As a rule, train employees are not fitted by training and the nature of their work does not adapt them to perform the duties of an operator. In this instance, there was no emergency; trains had been detoured for several days.

The practice of running trains against the current of traffic is dangerous. . . . but it was customary to run trains over the opposing tracks at this point for no other reason than to save time. The division officers must have been cognizant of this practice."

The dispatchers at The Dalles had incomplete facilities and had to send calls by telegraph while dispatching by telephone. Dispatcher Dolan, a new man, was technically on duty, but orders were being issued by Stiles, another new man, who was being broken in; and the order to the westbound train was issued by Walsh because the other men

C. E. Cochran (no title given), to the effect that (a) "the operating officers will in the future, as they have in the past, through strict supervision endeavor" to carry out the injunction of Paragraph 1; (b) that "positive instructions have been issued" to carry out the first clause of Paragraph 2; (c) that "where possible" an operator will be placed at junctions in detouring operations like that here under consideration but that (d) "it is not necessary that all orders [in such cases] should be transmitted by telegraph operators." A crossover has been put in at Oregon Trunk Junction.

IN THE FEDERAL DISTRICT COURT at Elkins, West Virginia, on April 22, a sweeping temporary injunction was issued, restraining striking shopmen and all citizens of West Virginia from acts of violence, picketing, interfering with the operation of the railroad, intimidation and threats in connection with the strike. The injunction was granted on petition of the railway company. The order also prohibits importuning, arguing with or threatening any person desiring to enter the shops to secure positions abandoned by the strikers. M. C. Byers, president of the Western Maryland, issued a statement to the effect that since the strike began on March 25, there have been many acts of violence and intimidation which have resulted in large numbers of men who were seeking employment being afraid to accept the positions made vacant by the strikers, particularly at Elkins, Thomas and Cumberland.

General News Department

Movies in St. Louis Union Station

A motion picture exhibition has been established at one end of the main waiting room in the St. Louis (Mo.) union station. It is in continuous operation from 10 a. m. until 10 p. m.; admittance 22 cents. The arrival and departure of all trains is announced in the show. Storekeepers in the vicinity of the station have protested against this amusement feature, claiming that it keeps railroad travelers off the streets, but so far their protests have been of no avail.

National Chamber to Discuss Transportation

The program for the annual meeting of the Chamber of Commerce of the United States, to be held at Washington, May 10 to 16, provides for the discussion of the following topics relating to transportation: experience under the Transportation Act in the regulation of railroad rates; railroad security issues and capital expenditures and railroad wages and working conditions; transportation and communication abroad; cost of transportation and the geography of distribution; and also highway transport.

The Pullman Porters' Chorus

The Pullman Company is preparing plans for the organization of a large chorus, with an orchestra and band auxiliaries, among its 1,000 porters. The company has divided the states into eight zones, in each of which there will be a picked chorus of 50 men, although in the Chicago and New York districts, it is probable that this number will be doubled. When the entire organization has been completed it is planned to hold a grand concert each year, similar to the annual Welsh festival. Major N. Clark Smith, one of the leading colored musicians of this country, will train the Pullman Porter Chorus.

Mr. Williams' Offices

The Interstate Commerce Commission has issued an order on the supplemental application filed by William H. Williams relating to holding positions with more than one carrier, in which Mr. Williams is authorized to retain his office as vice-president and member of the board of managers of the Delaware & Hudson and also offices and directorates with subsidiary companies; also chairman of the board of the New Jersey, Indiana & Illinois, and director of the Hudson & Manhattan; and either the positions of chairman of the board, director and chairman and member of the executive committee of the Wabash and director of the Missouri Pacific and of the Texas & Pacific, or director of the Kansas City Southern.

Transportation Division of A. R. A. Meets in Chicago

The Transportation Division of the American Railway Association met at the Blackstone Hotel, Chicago, on April 19, J. J. Bernet, president of the New York, Chicago & St. Louis, and chairman of the division, presiding. This was the first meeting of this division which has been held for two years. After a review of the problems of the Transportation division by R. H. Aishton, president of the Association, papers were presented by Colonel F. G. Robbins, chief of the Bureau of Service of the Interstate Commerce Commission, on the work of that organization, and by M. J. Gormley, chairman of the Car Service Division of the American Railway Association, on the results which have been secured by that division. Reports were also presented by the general committee and by the committees on Car Service; Demurrage, Storage, Reconsignment and Diversion; Freight Handling Service; Railroad Business, Mail and Records.

Valuation Hearings

The Interstate Commerce Commission has announced a number of hearings on valuation reports to be held in Washington during the month of May, in addition to those which were mentioned in last week's issue. The program includes the Western Pacific and Texas Midland cases on May 11; the Atlanta, Birmingham & Atlantic case on May 13 before the full commission; the Norfolk Southern and Mobile & Ohio on May 15; the St. Louis Southwestern on May 18; the Toledo, St. Louis & Western and Ann Arbor on May 22, and Chicago, Rock Island & Pacific and Green Bay Western on May 25.

Carefulness Among P. R. R. Employees

The Pennsylvania Railroad reports a reduction of 55 per cent in fatalities and 37 per cent in injuries among employees during 1921 as compared with 1920. After making allowance for a decrease of 25 per cent in the average number of employees in the service during 1921, the net reduction in the accident frequency was 40 per cent in fatalities and 15 per cent in injuries.

Nine operating divisions and five shops, with a total of 19,000 employees, passed through the year without a fatal accident to an employee. The divisions are Cresson, Delaware, Norfolk, Schuylkill, Wheeling, Logansport, Richmond, Zanesville and Peoria, and the shops are Trenton, Hoboken, Altoona Car Shop, South Altoona Foundry, and Juniata. The reduction was primarily due to dull times, a light labor turnover, and few inexperienced men in the service, and to the effect of the safety movement. Many dangerous conditions have been removed, safeguards for machines installed, and working conditions generally improved.

Number of Employees Decreases

The Interstate Commerce Commission's summary of wage statistics for January, 1922, shows a decrease of 85,137 in the number of employees compared with the number reported for December, 1921, and 252,808 less than for January, 1921. The reductions from December are principally as follows:

Professional, clerical, and general	5,627
Maintenance of way and structures	29,146
Maintenance of equipment and stores	34,311
Transportation (other than train, engine, and yard)	7,626
Transportation (yardmasters, switch tenders, and hostlers)	407
Transportation (train and engine service)	8,043

The number of employees, with their compensation, for six months (omitting the Detroit, Toledo & Ironton) was as follows:

Month	Number of employees	Total compensation
August, 1921	1,679,927	\$27,745,895
September, 1921	1,718,330	23,972,822
October, 1921	1,754,136	23,662,959
November, 1921	1,732,353	25,304,006
December, 1921	1,637,151	24,921,396
January, 1922	1,552,014	205,178,639

State Commissions Not Hopeful of Legislation

A gloomy view as to the prospects for action by Congress on any of the various bills being agitated by the state railroad commissions to repeal the rate-making provisions of the Transportation Act and to restore the former independent status of the state railroad commissions in relation to rate-making, is expressed in a bulletin which has been addressed to the state commissions by John E. Benton, general solicitor of the National Association of Railway and Utilities Commissioners. This reports that the House committee hearing on the Hoch and Sweet bills has not yet been resumed. It was interrupted by hearings on the interchangeable mileage book bills and the proposed purchase of the Cape Cod Canal, although witnesses in support of these bills were

desirous of being heard. Clifford Thorne, for the Farm Bureau, and Chairman Webster of the legislative committee of the state commissions were obliged to content themselves with filing statements to be printed in the Record; and the bulletin says that Chairman Webster "has started back to Iowa, saying things that would not look well printed in the Record." Mr. Benton also says that in the Senate "no observable progress toward a report on our amendments has been made since the end of the hearings on the Capper and Nicholson bills on January 5." It is also stated that the conference with the Interstate Commerce Commission on the subject of closer co-operation between the state and federal commissions was to be resumed on April 28.

A Sample Letter

[Sent March 23 to employees of the classes named by H. L. Hungerford, Superintendent of the Southern Railway at Greenville, S. C.]

A word to Cashiers, Assistant Cashiers, Receiving and Delivery Clerks and Yard Clerks:

Without customers there would be no business. Therefore, the most important thing, first, last and all the time, is the customer. About nine-tenths of any shipper's opinion of a Railroad is based on the way it is taken care of, at the freight office, warehouse or yard. Every shipper is your customer. The customer may be cranky, eccentric, peculiar and hard to get along with; but remember you are not here to change the customer's disposition or to find fault with it; you are here to serve the shippers for the reason that they have come into our place of business and have favored us with their patronage.

The cashier's or clerk's job is not an easy one. He has to be a diplomat and a gentleman; he has to have tact and patience and an easy working smile, if he is to be a good clerk. You have to remember that you are never doing people a favor to deliver the service they have paid for and are entitled to.

Shippers are invited to favor us with their business and they have every right to expect courteous and cordial interest in their wants. Every person who buys and transportation of us represents bread and butter to every one connected with our railroad.

You should meet and care for people in this spirit. Be courteous, and helpful, and gracious, and pleasant at every step of your work; and this with your fellow employees as well as with the public.

A Record Reduction of Freight Claims

The classified summary of the freight loss and damage expenditures for the year ended December 31, 1921, which has just been prepared and promulgated by the freight claim division of the American Railway Association, shows a marked reduction in claim payments over previous years. The total freight loss and damage account for 1920 exceeded \$120,000,000, while for 1921 the total fell to \$96,730,376. This is based on reports from 228 carriers, representing 95 per cent of the railroad mileage of the country. The amount paid out in claims in January, 1921, was \$10,375,196, while in January, 1922, it was only \$5,070,566. The number of claims presented decreased in eleven months 24.1 per cent or from 305,816 in January, 1921, to 232,233 in December of that year; and the number of claims paid decreased 32.1 per cent. The claims on hand, unadjusted were reduced in 12 months 53 per cent, or from 578,525 on January 1, to 273,018 on December 31, 1921.

Unlocated damage was charged with 36.1 per cent of the entire claim payment. The following table shows the number of claims paid monthly, and the number on hand at the close of each month for 1921, with the percentage of decrease, each month as compared with January.

	No. paid	Decrease from Jan.	Amount paid	Decrease from Jan.	On hand unadjusted	Decrease from Jan.
January	314,178		\$10,375,196		542,393	
February	222,867	29.1	9,112,574	12.2	425,286	21.6
March	241,939	1	6,776,394	5.7	408,629	24.7
April	244,189	2	7,790,873	5.6	380,909	29.7
May	229,115	-7.6	8,333,200	19.7	347,419	35.9
June	214,911	-11.0	8,130,657	21.7	317,680	43.1
July	199,864	-14.1	8,004,007	22.8	305,075	41.7
August	166,684	-31.4	7,723,170	25.5	290,275	46.4
September	195,558	-17.7	6,640,533	35.9	283,410	47.7
October	171,712	-33.9	6,641,911	35.9	281,068	48.1
November	204,581	-14.9	5,781,143	44.7	278,731	48.6
December	211,169	-18.1	6,438,476	38.0	273,018	49.7
Total	2,701,197		\$86,730,376			

Traffic News

The St. Louis-San Francisco has started its "Strawberry Special," and expects to move north during the season over 1,700 carloads of strawberries.

J. P. Haynes, commissioner of the Traffic Bureau of the Sioux City (Iowa) Chamber of Commerce, has been appointed traffic director of the Chicago Association of Commerce, effective June 1, to succeed H. C. Barlow, deceased.

The Louisville (Ky.) Board of Trade does not agree with the recent resolution of the Kentucky Railroad Commission that the people are unanimous in their request that Congress restore the pre-war authority of the state commissions. The Board of Trade's directors went on record as unanimously opposed to the transfer of authority from the Interstate Commerce Commission to the state railroad commissions and voted to call this matter to the attention of the Kentucky delegation in Congress.

City passenger agents of railroads from all over the United States and Canada met in St. Louis, Mo., on April 15, and organized the National Association of City Passenger Agents. The following officers were elected to serve during 1922: president, H. L. McCaughey, Canadian National and Grand Trunk, Chicago, Ill.; vice-president, J. C. Hamilton, Atchison, Topeka & Santa Fe., Pittsburgh, Pa.; secretary, White B. Owens, Atchison, Topeka & Santa Fe., St. Louis, Mo.; treasurer, E. M. Mattes, Union Pacific, Kansas City, Mo. The annual meeting of the association will be held at the Stalder Hotel, Buffalo, N. Y., on October 6 and 7, 1922.

The Northern Pacific has announced reduced fares between its Pacific coast points and eastern destinations, the tickets to be on sale from May 25 to September 1, good for the return trip until October 31. From Spokane, Wash., and related territory, the round-trip fare to Chicago will be \$81; to Denver, Colorado Springs, and Pueblo, \$64; St. Paul, Minn., Minneapolis, Duluth and Superior, \$67, and with corresponding reductions to cities east of Chicago. From Montana points the round trip rate to St. Paul and other Minnesota resort points will be \$62, and to Chicago, \$76, with corresponding reductions to points east.

Representatives of the sand and gravel interests appeared at a hearing before Chairman Cummins of the Senate Committee on Interstate Commerce on April 25, to advocate the passage of the bill introduced by Senator Calder, S. 690, to amend the transportation act to eliminate the emergency powers of the Interstate Commerce Commission under which it has issued car service and priority orders. Commissioner Eseh, for the legislative committee of the commission, had sent a letter to Chairman Cummins opposing the bill, on the ground that the emergency powers are necessary at times when there are not enough cars to go around.

Shippers in various lines of business, testifying before the shipping board committee, which is holding hearings in New York city, to determine the adequacy of American shipping facilities, declare that a disastrous ocean rate war would immediately follow an attempt to enforce Section 28 of the Jones act, providing preferential railroad rates for shipments destined for export in American ships. William Heyman, representing the Shippers' Conference of Greater New York, said a rate war would result from the efforts of foreign lines to overcome the rail rate differential, which would be \$2.13 a ton on steel shipped from the Pittsburgh district, or the difference between the domestic and export rate. He said that exporters of several hundred thousands of tons of steel yearly, gave preference to American vessels whenever possible. R. F. Bausman and others protested the section on behalf of flour exporters.

Witnesses representing chambers of commerce from various sections of the country who have been testifying at the hearing be-

fore Congressional committees on the proposed ship subsidy bill have expressed some concern because they have interpreted the language of the bill to amend present laws in such a way as to permit railroads to operate boat lines on the Great Lakes and inland waterways. Representatives of the Shipping Board, however, have stated that this was not their intention in drafting the bill, but that they intended only to make it possible for railroads to operate steamships in foreign commerce. Some representatives of shippers have also expressed concern that sections of the proposed bill would impair the authority of the Interstate Commerce Commission, but at the hearing on April 25 there was put into the record a letter from Commissioner Lissner of the Shipping Board to W. H. Chandler as president of the New England Traffic League, stating that the Shipping Board will be glad to support the amendment which the New England and other organizations were to propose, stating that sections 801 and 803 are not to be construed as in any way impairing the authority of the Interstate Commerce Commission to regulate rates, rules, regulations or practices as provided in the act to regulate commerce or the transportation act of 1920.

Northern Pacific to Spend \$1,000,000 in Montana

The Northern Pacific will spend in excess of \$1,000,000 on its Montana lines during the next few months, according to J. M. Rapalje, vice-president. This program will include the erection of a \$200,000 station and office building at Glendive, the replacing of the Yellowstone river bridge at Livingston with a \$125,000 double track structure, the construction of a \$25,000 storehouse at Butte, the erection of a 5-stall roundhouse addition at Billings, the construction of a \$35,000 boiler washout plant at Forsyth and the rebuilding of water stations at Pompeys Pillar, Sanders and Zero.

Proposed Reductions in Transcontinental Freight Rates Made Public

The Interstate Commerce Commission has made public a tentative report by Attorney Examiner Disque in the transcontinental rate cases covering a large number of fourth section applications. The report recommends the denial of authority to disregard the fourth section on rates from eastern defined territories to Pacific Coast terminals on iron and steel, linoleum and a long list of general commodities; also on sisal and ixtle from New Orleans and Galveston to the Pacific Coast. The examiner recommends relief from the fourth section as to rates on sulphur from Louisiana, coffee from New York, New Orleans and Galveston to the Pacific Coast, and also relief for the Southern Pacific as to rates on canned goods, asphalt, barley, beans, rice and dried fruit from Pacific Coast terminals to New York; also a continuation of rates on wool from the Pacific Coast terminals to the east without regard to the fourth section, provided existing disparities against intermediate points are not increased.

Coal Production, Second Week of Strike

A decrease in the production of bituminous coal marked the second week of the coal strike, according to the weekly bulletin of the Geological Survey. Anthracite production as before was practically zero.

The revised figures for the week of April 15 are 3,675,000 tons of bituminous coal and 6,000 tons of anthracite. Reports for the week of April 17-22 indicate again no change in anthracite, and a further decrease in the output of soft coal, as follows:

First week, April 3-8	Second week, Apr. 10-15	Third week, Apr. 17-20
Monday 11,445	Monday 10,772	Easter Monday, 7,917
Tuesday 11,019	Tuesday 10,658	Tuesday 9,967
Wednesday 11,437	Wednesday 10,961	Wednesday 11,053
Thursday 11,090	Thursday 11,482	Thursday 11,040
Friday 11,296	Good Friday 10,714	
Saturday 8,888	Saturday 8,501	

Lack of demand remains the limiting factor in most of the non-union fields. The number of loaded cars unconsigned at the mines is still large, though now decreasing. More coal could be produced if the demand increased. Consumption is being met largely from storage. At the present rate of output the draft upon consumers' stock piles is not less than 4,000,000 tons a week.

When the strike began, the accumulation at the mines of un-

consigned cars loaded with coal was large, the average daily number of loads unconsigned being as follows:

Week ended	Cars bituminous	Cars anthracite	Total cars
March 4	14,126	1,548	15,674
April 1	28,867	2,506	31,373
April 8	30,730	2,815	33,545
April 15 (preliminary) ..	26,790	1,655	28,445

Reports of railroad car loading for the first week of the strike show that the different roads were variously affected. In the New England group of the Eastern district, all roads except the Bangor & Aroostook had an increase in coal loading as compared with the corresponding week of the year before, the total for this group being 1,596 cars as against 1,141. In the balance of the Eastern district, practically all of the roads suffered heavy loss in loading, and the total for the Eastern district was 6,940 cars, as compared with 37,467 the year before. In the Allegheny district the total loading for that week was 19,955 cars as against 38,688 last year, the largest loss being shown by the Pennsylvania System, 10,614 cars as against 18,188 last year. The Baltimore & Ohio's coal loading was 6,234 as against 8,178. In the Pocahontas district, the Chesapeake & Ohio, the Norfolk & Western, and the Virginian show increases in loading, that of the Norfolk & Western being 11,446, as compared with 6,076. In the Southern district there was a reduction from 15,253 to 12,351, most of which was on the Illinois Central. The Southern handled 1,934 cars as against 1,737 the year before. In the Northwestern district there was little change. The Chicago & North Western, the Great Northern and the Minneapolis, St. Paul & Sault Ste. Marie and the Northern Pacific show increases. In the Central Western district there was a decrease from 12,900 to 3,856. The loading of the Chicago, Burlington & Quincy was only 250, as compared with 3,315, that of the Chicago & Eastern Illinois only 434 as compared with 1,744, that of the Chicago & Alton only 229 as compared with 1,105, and that of the Chicago, Terre Haute & Southeastern being nothing as compared with 1,588. In the Southwestern district the loading was 1,572 as compared with 3,531, the largest reduction being shown on the St. Louis-San Francisco.

Pennsylvania Refrigerator Traffic

The Pennsylvania Railroad has discontinued the operation of its separate refrigerator car lines, and is to merge all of its refrigerator cars, numbering 5,927, with those of the Fruit Growers' Express. This will more than double the number of refrigerator cars operated by the Fruit Growers' Express. These now number 5,209. The Fruit Growers' Express is a co-operative organization owned and managed by the leading railroads of the South and East.

It was organized two years ago and has made a particularly successful record in handling Southern products. The Pennsylvania established the first refrigerator lines through the South more than 30 years ago.

New York Central's Guide to Industries

The New York Central has issued a shippers' guide and index to the industries of the cities and towns that are reached by its 13,000 miles of railroad which apparently justifies the editor's claim that it is the largest book of its kind ever printed. Its pages, 8 in. x 10½ in., number about 1,000, and there are 20 maps and 400 half-tone illustrations. A part of the thousand pages is made up of advertisements, enough of them to pay for the paper and printing, no doubt. Copies of the book can be had on application to general or local freight agents.

It contains the names of more than 50,000 business concerns, all classified by commodities, localities and railroad facilities, with detailed information to enable shippers to direct their traffic and to aid new enterprises in locating their plants most advantageously. Cities and towns are described and pictured as in a general gazetteer, with special reference to advantages they offer for industries. The indexed lists include manufacturers, wholesalers, jobbers, contractors, retail merchants, grain elevators, electric light and power plants, coal dealers, agricultural producers, stock yards and packing plants; business organizations, with the names of their presidents and secretaries and all banking institutions.

Copies of the book are being sent to public libraries.

Commission and Court News

Interstate Commerce Commission

The commission has suspended from April 27 to August 25 the operation of schedules which propose revised class and commodity rates between Ruston and related points in Louisiana, on the one hand, and all points in Texas on the other.

The commission has suspended until August 22, the operation of schedules which propose restriction in routing on classes and commodities from points in the Pacific Northwest to points in Texas located on the Ft. Worth & Denver City and the Wichita Valley.

The commission has vacated its order as to intrastate rates in Illinois, the Illinois commission having set aside its order which authorized the railroads to make a smaller increase in rates than was allowed by Ex Parte 74. This abates the discrimination against interstate commerce against which the federal commission's order was directed.

The commission has suspended to August 20 the operation of schedules which propose to increase the rates on building stone, from various points in the state of Indiana to Beaumont, Galveston, Houston and Orange, Texas, and points taking the same rates, from 52 cents to 60 cents per 100 lb., and the rates on coal tar paving cement from Birmingham, Ala., to the same destinations from 37½ and 40½ cents to 43 cents.

The commission has suspended until August 22, the operation of schedules which propose the cancellation of the application via Virginia Cities in connection with the Chesapeake & Ohio, Norfolk & Western and Virginian, of through rates on apples from Pacific coast territory to points in Carolina territory and the Southeast. The effect of the proposed restriction will be the elimination of the application of through rates to points in the territory described via these lines, and the application instead, of combination of rates which will be considerably higher than present through rates.

Court News

Suits for Damages—Roads Under Federal Control

Following the decision of the Supreme Court of the United States in *Missouri Pacific v. Ault*, 41 Sup. Ct. 593, holding that no liability arising out of the operation of railroads by the Director General under the Federal Control Act is imposed by the common law upon the owner companies, the following rulings have since been made by state supreme courts.

A railroad company is not liable for an injury to a person at a station received during federal control.—*Masteller v. Rock Island (Iowa)*; 185 N. W. 107;

Or for loss of a mule shipped while the road was under federal control.—*Arkansas Central v. McClen (Ark.)*, 234 S. W., 617;

Or for failure of the Director General's agent to order a car for cattle, resulting in loss from delay.—*Arkansas Central v. Walker (Ark.)*, 234 S. W., 619;

Or for damages for a loss caused by fire through the operation of a railroad under federal control.—*St. Paul Fire & Marine Ins. Co. v. Hines (Kan.)*, 202 Pac. 582.

But an order of a Public Service Commission to compel the stopping of interstate trains at a certain station, if otherwise justifiable, in proceedings against the railroad and the Director General, was held by the Missouri Supreme Court to be a continuing one until lawfully changed, and to bind the company after termination of federal control.—*State ex rel. St. Louis San Francisco (Mo.)*, 235 S. W. 131.

The Texas Court of Civil Appeals holds that under the acts of Congress of August 29, 1916, and March 21, 1918, a rate filed by a railroad under government control, limiting the amount recoverable on passengers' baggage to \$100, superseded state statutes on the subject and an owner could not recover more on an

intrastate shipment under the state law (*Vernon Sayles' Ann. Civ. St. 1914, Art. 708*).—*Payne v. McConnell (Tex. Civ. App.)*, 234 S. W. 942.

United States Supreme Court

Free Transportation of Coast Guard as Troops

The Supreme Court of the United States holds that members of the Coast Guard are to be deemed troops within the meaning of the land-grant acts providing for free transportation of troops, when serving as part of the Navy, but not at other times, when the Coast Guard operates under, and at the expense of, the Treasury Department. Therefore transportation of coast guards furnished before the declaration of war on April 6, 1917, is not within such provisions.—Opinion by Mr. Justice Brandeis. *L. & N. v. U. S.* Decided April 10, 1922.

Presumption that Damage Occurred

on Delivering Carrier's Line

Affirming a judgment of the Nebraska Supreme Court, the Supreme Court of the United States holds that when goods moving in interstate commerce upon a through bill of lading are delivered in bad condition and the evidence shows that they were sound when received by the initial carrier, but does not affirmatively establish where the loss occurred, a presumption arises that the injury occurred on the delivering carrier's line. The action was against the delivering carrier for damages by frost to two carloads of apples transported from points in New York State to one in Nebraska. This holding is in accordance with the common law rule of liability, which the court holds does not conflict with the Carmack Amendment, requiring issuance of a through bill of lading by the initial carrier and declaring it liable for damage occurring anywhere along the route, as interpreted and applied by the Supreme Court, or with any other federal legislation.—Opinion by Mr. Justice McReynolds.—*C. & N. W. v. C. C. Mutnick Produce Co.* Decided April 10, 1922.

Terminal Carrier Not Liable—

Cummins Amendment Interpreted

Reversing a judgment of the Circuit Court of Appeals for the Ninth Circuit, the Supreme Court of the United States holds that a terminal carrier is not liable for injury to horses caused by the negligence of a prior and independent carrier from whom they were received. The suit was for damages against the delivering carrier, the allegation being that unwholesome food and water were given to the animals while in transit over the route of an intermediate carrier, at a station specified. The contract expressly declared that "no carrier shall be liable for damages for loss, death, injury or delay to said animals not caused by it."

The Circuit Court of Appeals construed *G. F. & A. v. Blish*, 241 U. S. 190, as holding that under the Carmack (now Cummins) amendment, the terminal carrier is bound by the contract precisely as the initial carrier is bound.

The Supreme Court holds this to be error and says: "The settled federal rule is that, in the absence of statute or special contract, each connecting carrier on a through route is bound only to safely carry over its own line and safely deliver . . ."

"The Cummins Amendment deals with and modifies the common law liability only of the initial carrier. It renders that carrier liable for loss or damage throughout the entire route by which the property is billed, but it leaves the relation of all connecting carriers to the shipper or consignee and to each other entirely unaffected. In the *Blish* case, above mentioned, the terminal carrier was liable for failure to make delivery because by the terms of the bill of lading each carrier was under obligation to make final delivery. The present suit was not for misdelivery, but for the alleged fault of a prior connecting carrier.

"The Carmack and Cummins Amendments were enacted to enable the holder of a bill of lading to sue the initial carrier and thereby to relieve him from the necessity of searching out and proving a case against a terminal or intermediate carrier. It may have been important to have given like rights against others of connecting carriers, but either from design or accident, the terms of the amendment limit its application to the initial carrier." Opinion by Mr. Justice Carke. *O. W. R. & N. Co. v. McGinn*. Decided April 10, 1922.

Labor Board Decisions

Second Shift Requires Overtime Pay

A case was recently presented to the Labor Board for its determination as to what is the proper compensation (under the rules of the National Agreement of the Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees) for a clerk, who, employed in a department where conditions require continuous service throughout the 24 hours, was requested to work an extra shift following the one he had just completed, to replace an absent employee. The employees contend that in such cases, men should be paid time and one half in accordance with rule 57 of the clerks' national agreement; whereas the road in question, the Gulf, Colorado & Santa Fe, maintains that such clerical help is temporarily assigned to another position and as such should be paid in accordance with rule 72 of the same agreement, which provides that employees temporarily assigned to lower rated positions shall not have their rates reduced. The Board decided that the service performed by the employee was not a temporary assignment and sustained the contention of the employees.—*Decision No. 839.*

Composite Mechanics and Signal Maintainers

A controversy arose on the Chicago & Alton with regard to the application of the minimum rate of composite mechanics to signal maintainers with less than four years' experience who were considered composite mechanics because of the ruling of the United States Railroad Administration. The carrier contended that the employees were men of less than four years service prior to the date of issuance of Supplement No. 4, to General Order No. 27. The employees claimed that no distinction was made in this supplement between electrical workers and signal maintainers and in view of the fact that the men involved in this dispute received the minimum rate of their craft prior to the date of issuance of the supplement, they should have been paid the minimum rate for composite mechanics with four years' experience. The Labor Board decided that employees receiving an amount equal to or in excess of the minimum rate paid prior to the issuance of Supplement No. 4 should be paid the minimum rate of the highest rate of craft represented in such composite service and that such employees receiving a lower rate than that paid any of the craft of which they were the composites should receive the step rate in accordance with their experience.—*Decision No. 795.*

Pay of Employees Required to Travel

A case was raised with respect to a water service repair gang on the Southern Pacific Lines in Texas and Louisiana which has no established headquarters but is moved from place to place as occasion requires and is not provided with boarding cars. These men have been paid in accordance with Section I, Article V, of the maintenance of way agreement which is as follows:

"Employees temporarily or permanently assigned to duties requiring variable hours, working on or traveling over an assigned territory and away from and out of reach of their regular boarding and lodging places or outfit cars, will provide board and lodging at their own expense and will be allowed time at the rate of 10 hours per day at pro-rata rates and in addition pay for actual time worked in excess of eight hours on the bases provided in these rules, excluding time traveling or waiting. When working at points accessible to regular boarding and lodging places or outfit cars, the provisions of this rule will not apply."

The employees contended they should be paid in accordance with section *m* of Article V which is as follows:

"Employees not in outfit cars will be allowed straight time for actual time traveling by train, by direction of the management, during or outside of regular work period or during overtime hours, either on or off assigned territory, except as otherwise provided for in these rules. Employees will not be allowed time while traveling, in the exercise of seniority rights or between their homes and designated assembling points or for other personal reasons." The Board sustained the railroad.—*Decision No. 794.*

Foreign Railway News

Rumanian Railway Repair Shops Increase Output

LONDON.

The Rumanian railway repair shops, it is reported, are daily increasing their locomotive repair output. At present they are turning out 100 to 120 locomotives a week and it is believed that this figure will soon be exceeded.

British Ordnance Works Built

100 Locomotives as Yet Unsold

British ordnance works built 100 locomotives following the armistice in order to prevent a complete shutdown and the sudden discharge of thousands of men, according to the Times (London). These locomotives are as yet unsold and until they can be disposed of represent an investment of some \$2,500,000 of the government's money on which there is no return.

Australia Delays Gage Unification

The unification of the gage of the various state railways of Australia is being delayed, according to the Times (London), because of the hesitance of the states of South Australia and Victoria in agreeing to meet their shares of the necessary expense. Plans for gage unification were made by a commission of which F. M. Whyte of this country was a member. It is not considered likely that the plan will be allowed to slumber indefinitely, since the government of the Commonwealth is thoroughly impressed with the importance of the project.

French Railways Authorized to

Issue \$930,200,000 of Bonds

The French railways are permitted under present legislation to issue \$930,200,000 (francs to dollars at par) of bonds during 1922, according to Commerce Reports. The maximum allotment to each road is as follows:

Railway	Allotment	Railway	Allotment
State	\$207,800,000	P. L. M.	\$122,000,000
Alsace-Lorraine	57,600,000	Orleans	216,800,000
Northern	150,000,000	Midi	100,000,000
Eastern	70,000,000	Belt Lines	6,000,000

Railway Extension and Electrification in Java

Steady progress is being made on the construction of the railway line between Martapoera and Banjoeberang, Java, according to Commerce Reports. One section of this line was opened to traffic in October, 1921. A new line is projected between Macassar and Boni Plain in Celebes, but this project has not yet taken definite form.

The estimates made in the Netherlands Indian budget for the electrification of the railways of Java have been accepted, but no time has been set for the beginning of the work. A German concern has recently sent a special representative to Java for the purpose of studying the plans and making competitive bids on machinery and supplies.

Government Investigation of Irish Railways

As a result of the conference held between the Ministers of Labor of the Irish Provisional Government and the Northern Parliament, the railway managers, and the representatives of the railwaymen's unions, an agreement was reached to set up a government commission to inquire into the entire working of the Irish railways, according to Commerce Reports. Finances, consolidation of the railways, wages, conditions of service, and steps looking toward the building and repair of rolling stock in Ireland will be considered.

The main features of the settlement so far arrived at are: An 8-hour guaranteed day and a 48-hour guaranteed week;

0.6 to 4.0 meters in width, were required, 1,850 cubic meters of concrete and reinforced concrete being used.

Exceptionally noteworthy were the low labor costs of the line. The pay of laborers for an 8-hour day varied during the period of construction from 160 to 800 marks, while during the same period the Polish mark-dollar exchange rate fell from 850 to 3,400. No appreciation in kind was furnished to these laborers. The extremely low wages are in part explained by the fact that the labor was drawn locally from an agricultural district where wage increases are very slow to follow currency depreciation.

The cost of the whole line, including the branch leading to the port amounted to 140,000,000 marks, or, at the average exchange rate for the period, \$67,000, a cost of \$2,630 per kilometer. About half of the expenses were for labor. The rail and plates were taken from old reserves and their value is not included in the cost of construction. All material used was of Polish manufacture. If the cost of new rails and plates were added to the figures given above the cost of this line would appear as approximately \$9,000 per mile.

The United Kingdom as a Market for American Ties

The present possibilities for selling American railway ties in the United Kingdom are not as good as they probably will be in the future, according to Commerce Reports. It is essentially a question of price. The factors which govern the situation are given below.

Nearly all ties used in the United Kingdom are imported. During the past two years importations amounted to about 8,644,976 railway ties. This is larger than the normal average consumption, and was due to the fact that during the war the railway beds had got in rather bad condition and repairs were not kept up. Ties were imported in the expectation that conditions would permit a large amount of repair work to be done. These repairs, however, were not made as rapidly as anticipated, and consequently rather large stocks of ties are still on hand. Most of those imported during the war and since have been American ties.

The competition which American ties have to meet is the importation of Baltic pine from Riga, Danzig, and Memel. It is reported that Finnish ties are also coming into the market. At present the price c. i. f. London of Baltic pine ties is about \$1.36 per tie; the price of longleaf yellow pine is \$1.58 and of Douglas fir \$1.41. This price is for a tie 9 feet by 10 by 5 inches. For many years the trade has been accustomed to the Baltic wood, and it is generally believed that, the price being equal, the railway companies prefer the Baltic wood. Opinions differ as to why this is so, but the following are some of the reasons given:

(a) It is stated that, under equal conditions and with 180 pounds pressure to the square inch, Baltic pine will absorb 8 to 10 pounds of creosote per cubic foot, longleaf yellow pine will absorb about 5 to 6 pounds per cubic foot, and Douglas fir about 4 pounds per cubic foot. Consequently Baltic pine is preferred on account of its greater power to absorb the creosote.

(b) Another objection brought forward against Douglas fir is that it splits more readily than the Baltic pine. It is the British practice not to drive a dog-eared spike in the tie, but to bore a hole one-thirty-second inch less in diameter than the trammel which is driven into the tie, it being claimed in England that the Douglas fir ties split when driving in the trammel. Usually railway specifications state that, if southern yellow pine is furnished, not more than 20 per cent shall be shortleaf pine and at least 80 per cent shall be longleaf pine.

Another factor influencing the possibilities for selling American ties is the Railways Act of August, 1921, according to which the railways must amalgamate into four principal groups. Owing to this act, the buying departments of the various railways hesitate to make any commitments, since each purchasing agent is not exactly sure as to what his status or powers will be when the amalgamation is completed. This will probably cause a restriction in buying for the next year or two, but at the end of that time it is expected that the railways will have to come into the market for rather large quantities of ties and that, while the supply of a Baltic wood might at that time be cheaper, it is believed that there will not be sufficient supplies of Baltic pine available to meet the demand.

American species, such as oak, beech, larch, southern yellow

pine, Douglas fir, California redwood, and western hemlock, are included in the official and semi-official tenders.

Due to the scarcity of timber during the war, the standard tie specifications have been 8 feet 6 inches by 9 by 4½ inches, and some railways are still taking these specifications. However, the general dimensions now are 9 feet by 10 by 5 inches.

All softwood ties are creosoted and all the larger railways have their own creosoting plants, although some of the smaller railways have their ties treated either by the importing timber merchants or in the plants of the larger railway companies. A small amount of imported and home-grown hardwood ties are not creosoted.

There are no peculiar conditions in the United Kingdom which affect the life of the tie beyond the fact that the climate is possibly slightly more humid than in the United States. The usual life of a well-creosoted tie is from 15 to 17 years. Some of the railways still import a certain amount of jarrah ties from Australia, which are laid down without creosoting and which are said to last about 30 years. American ties have not been down long enough to make a fair judgment as to their length of life in the United Kingdom.

Since the railways have been decontrolled each railway has its own specifications, which may vary slightly from those used by the central committee, although generally they still apply. It will be noted that formerly 8-foot 6-inch lengths were called for, whereas at present railways are calling for 9-foot lengths. In England ties are called "sleepers."

New Rail Regulatory Body in France

LONDON

The minister of public works, France, is at present organizing the "Conseil Supérieur des Chemins de Fer," which will in future be the governing body for the six great railway systems of France. Under the law of November 12, 1921, this council is made up of 18 members of the committee of management (three directors from each railway system), 12 delegates of the employees (two from each railway system) and 30 representatives of the general interests of the nation. A decree has been issued defining the last-named representatives as follows:

1. The senior permanent officials and, as such, members of the Conseil d'Etat, of the following ministries or sections of ministries: Public works, agriculture, commerce, industry, posts and telegraph, labor and public health.
2. Three delegates from the technical staff of the ministry of public works.
3. One delegate each from the ministries of finance, war, and commerce and industry, to be chosen on the advice of the ministries concerned.
4. A member of the Chamber of Commerce of Paris and six of other chambers, one of whom must represent exporting and colonial interests.
5. A representative from each of the regularly constituted associations for the following industries: Mines, metallurgy, electricity, railway construction, and local railways.
6. Four delegates from the regularly constituted agricultural associations.
7. Three representatives of the merchant marine and inland waterways.
8. Four representatives of regular organizations for the tourist traffic, the press and travellers, including a physician and a commercial traveller.

Lists of candidates for the four last mentioned categories are to be submitted to the minister of public works, three names being allowed for each seat and the minister making the final choice. Rules have also been drawn up and published for the election of the men's delegates.

M. Mahieur, general secretary of the ministry of public works, is to be president of the council. A technical and commercial committee, with two sections, has also been created by decree, to comprise 167 members, to help the president.

The first task of the council will probably be the revision of the rates, standardization of signalling devices on all lines, extension of electric lighting to all passenger coaches, and adoption of continuous brakes and automatic couplings for all freight trains. Electrification will not figure prominently, as the various lines have already drawn up their plans in this respect, and now only desire to be left free to carry them out.

Equipment and Supplies

Locomotives

THE MT. HOOD RAILROAD has ordered one Mikado type locomotive from the Baldwin Locomotive Works.

THE SAN ANTONIO & ARANSAS PASS has ordered 4, 0-8-0 type locomotives from the Baldwin Locomotive Works.

THE NORTHWESTERN PACIFIC has ordered 5, 10-wheel type locomotives from the Baldwin Locomotive Works.

THE BROOKS-SCANLON LUMBER Co., Bend, Oregon, has ordered one Mikado type locomotive from the Baldwin Locomotive Works.

THE AKRON, CANTON & YOUNGSTOWN, reported in the *Railway Age* of March 4 as inquiring for 5 Consolidation type locomotives. has renewed its inquiry for this equipment.

Freight Cars

THE PERE MARQUETTE is reported to be in the market for a number of cars.

THE CHICAGO, NORTH SHORE & MILWAUKEE is inquiring for 10 merchandise dispatch cars.

THE CENTRAL SAN ANTONIO, Cuba, has ordered 10 cane cars from the Magor Car Corporation.

THE HAMMOND LUMBER Co., San Francisco, Cal., is inquiring for 60 freight cars of 30 tons' capacity.

THE NORTHWESTERN RAILWAY OF BRAZIL has ordered 70 freight cars from the Standard Steel Car Company.

THE VOTH HARDWOOD COMPANY, Voth, Texas, is in the market for 100 all steel flat cars of 80,000 lb. capacity and 41 ft. long.

THE FEDERAL RAILWAYS OF BRAZIL are inquiring, through the car builders, for 46 single sheathed box cars, 131 freight cars and 32 gondola cars.

LEONARD KENNEDY & Co., Inc., 67 Wall Street, New York City, has ordered 40 air dump cars from the Magor Car Corporation. These cars are for export to Brazil.

THE UNITED FRUIT COMPANY has ordered 50 flat cars of 20 tons capacity from the Magor Car Corporation. These cars are for use on the Truxillo Railroad, Honduras.

THE CHICAGO & NORTH WESTERN, reported in the *Railway Age* of March 25 as inquiring for 300 ballast cars, has ordered this equipment from the Rodger Ballast Car Company.

THE MERRIMAC CHEMICAL COMPANY, Boston, Mass., has ordered one car of 40 tons' capacity for carrying muriatic acid tanks from the General American Tank Car Corporation.

THE VIRGINIAN RAILWAY is asking for prices on a number of 120-ton coal cars, for estimating purposes only. The company has several thousand coal cars now stored on account of the inactive coal market.

THE NEW YORK, CHICAGO & ST. LOUIS, reported in the *Railway Age* of April 22 as contemplating asking for bids on 400 refrigerator cars, is now inquiring for this equipment. The cars are to be of 40 tons capacity.

THE CHESAPEAKE & OHIO, reported in the *Railway Age* of April 8, as inquiring for 1,500 box cars and 200 stock cars, has ordered 1,400, 40-ton plain box cars; 100, 40-ton automobile cars; and 200, 40-ton stock cars from the American Car & Foundry Company.

THE CHICAGO & NORTH WESTERN has ordered new freight cars as follows: 625 box and 500 flat from the Western Car & Foundry Company; 625 box from the Standard Steel Car Company; 500

stock and 250 gondola from the Pullman Company; and 250 refrigerator from the American Car & Foundry Company.

PICKANDS, MATHER & COMPANY, Cleveland, Ohio, has ordered from the Kilbourn & Jacobs Manufacturing Company, Columbus, 22 all-steel automatic air dump cars for shipment to the Balkan Mining Company, Bovey, Minn., and 12 cars of the same type for shipment to the Bennett Mining Company, Keewatin, Minn.

THE SOUTHERN PACIFIC, reported in the *Railway Age* of March 26 as inquiring for 2,000 automobile box cars, has ordered this equipment from the General American Car Company. The cars will be 50 ft. long with side doors staggered, of a width of 10 ft., 5½ in., and with folding end doors of a width of 7 ft., 9¾ in., arranged to afford special facilities for handling automobile shipments. The inside measurement of the cars will be 50 ft. long, 9 ft., 2 in. wide and 10 ft., 5¼ in. high.

Passenger Cars

THE ILLINOIS CENTRAL is inquiring for 5 passenger cars, 72 ft. long.

THE EL PASO & SOUTHWESTERN is inquiring for 2 coaches and 2 combination baggage and express cars.

THE METROPOLITAN WEST SIDE ELEVATED, Chicago, is inquiring for 100 steel, double-end, passenger motor cars.

Iron and Steel

THE SOUTHERN PACIFIC is inquiring for 800 tons of pig iron.

THE PERE MARQUETTE is inquiring for 3,500 tons of steel rails.

THE TERMINAL RAILROAD ASSOCIATION of St. Louis has ordered 800 tons of steel rails from the Illinois Steel Company.

THE ATCHISON, TOPEKA & SANTA FE is in the market for 100 tons of reinforcing bars for miscellaneous bridge work.

THE TOLEDO, ST. LOUIS & WESTERN has ordered 4,000 tons of rails from the Carnegie Steel Company, and has an additional 1,000-ton inquiry pending.

THE JAPANESE GOVERNMENT RAILWAYS are inquiring through export houses in New York City for 10,000 tons of 75 lb. rail and for a small quantity of splice bars.

THE NEW YORK CENTRAL LINES will receive bids until 12 o'clock noon, May 10, for the requirements of these lines of steel wheels for locomotives and passenger car and tender repairs.

Machinery and Tools

THE NEW YORK, ONTARIO & WESTERN is inquiring for a 10 or 15-ton pillar type crane.

THE DELAWARE & HUDSON has renewed its inquiry for a 10-ton, 100 ft. span, overhead traveling crane.

THE DELAWARE & HUDSON has ordered a 600-ton wheel press from the Niles-Bement-Pond Company.

THE LAKE ERIE & WESTERN is inquiring for nine saws of miscellaneous type, two mortisers, one planing and matching machine, two 3-spindle boring machines and four motors, ranging from 5 to 15 h. p.

THE COLUMBIA TERMINALS COMPANY, St. Louis, Mo., will install freight-handling and conveying machinery, industrial trucks, etc., in its one-story terminal building to be erected at 400 South Broadway street, in that city.

Track Specialties

THE SOUTHERN PACIFIC is inquiring for 20,000 kegs of spikes and bolts.

THE MISSOURI, KANSAS & TEXAS is reported to have placed orders for 4,000 kegs of spikes and bolts.

Supply Trade News

The Chicago Bridge & Iron Works has removed its Chicago office from the Old Colony building to the Transportation building.

The Davis Brake Beam Company, Johnstown, Pa., has removed its sales office from the Frick Annex to 1619 Oliver building, Pittsburgh, Pa.

S. F. Bowser, founder and president of S. F. Bowser & Co., Fort Wayne, Ind., whose retirement from the presidency of the company to become chairman of the board has already

been noted in these columns, served for 37 years as the head of the business which was started by him in March, 1885. A change of organization was effected so that he could transfer to others some of the responsibilities he had carried for such a long time and he was made chairman of the board of directors and S. B. Bechtel was elected president. The company has its home plant at Fort Wayne, Ind., a Canadian plant at Toronto, Ont., and a third plant at Milwaukee, with tank assembly plants at Albany, N. Y., and Sydney, Australia. The company makes oil and gasoline tanks and pumps and other allied products including a high grade system of oil filtration. S. B. Bechtel, the new president, entered the employ of the company in 1899, in the collection department; two years later he was appointed assistant superintendent of salesmen and, the following year, manager of the mail order sales and advertising departments. In 1906 he was appointed assistant to the general manager and subsequently served consecutively as secretary, assistant general manager, general manager and since 1920, as vice-president and general manager until his election as president.

S. F. Bowser

Leslie G. Lamborn has been appointed manager of the Sheet Metal and Wire Works division of the Parker Rust-Proof Company, Detroit, Mich.

S. B. Bechtel

C. K. Lassiter, vice-president in charge of manufacturing of the American Locomotive Company, New York, has resigned, effective about May 1. Official announcement to this effect will appear later.

Newcomb Carlton, president of the Western Union Telegraph Company, has been elected a director of the United States Rubber Company, New York, to succeed Col. Samuel P. Colt, deceased.

W. F. Robinson, assistant sales manager of the Edward Hines Yellow Pine Trustees, Lumberton, Miss., has been promoted to general sales manager, effective May 1.

The National Tube Company will erect a tube mill at Gary, Ind., at an estimated cost of \$15,000,000, to be completed for operation by the end of 1923. The plant will manufacture lap and butt weld tubes and will have a capacity of 350,000 tons per year.

Wright Little Watchman, Inc., has received orders from the Southern Railway for 1,000 "Wright Little Watchman" to be installed on 500 passenger cars, and also from the Atlanta, Birmingham & Atlantic to equip all of its passenger cars, requiring 120 appliances.

A. W. Preikschat has been appointed western manager of the car hardware department of the National Lock Washer Company, Chicago. After graduating from high school, Mr. Preikschat received his technical training at Armour Institute of Technology. He then served with the Pullman Company for four years, in the drafting and template departments and then for five years as assistant to the engineer of tests in charge of physical inspecting and testing with the same company. He was with the Steel & Tube Company of America, for one year and a half, as mechanical representative in the purchasing department and then for two years with the Liberty Steel Products Company, Inc., as assistant mechanical engineer. He later served for one year and a half with Templeton, Kenly & Co., Ltd., Chicago, as special engineer in its railway sales department.

A. W. Preikschat

The financial results of the Allis-Chalmers Manufacturing Company for the year ended December 31, 1921, revealed net earnings, after federal taxes, of \$2,125,467. This was equal to 4.11 per cent on the common stock, and may be compared with \$3,564,248, or 9.39 per cent, earned in the previous year. This showing was made after the establishment of liberal reserves and writing off \$1,070,228 in inventories.

The Allis-Chalmers Company

The company entered the current year with its financial position materially strengthened. The balance sheet, as of December 31, 1921, shows cash on hand amounting to \$1,152,769, or an increase of more than 41 per cent in comparison with the previous year. In addition, investments in marketable securities amount to \$7,592,278, nearly three times those of 1920, and of this amount, \$6,518,018 was invested in Liberty bonds, Victory notes and treasury certificates. Current assets amounted to \$27,985,200 against current liabilities of only \$3,990,358, while the net working capital was \$23,994,842, the equivalent of more than 97 per cent of the total amount of sales billed in the last year. "The conditions which obtain at the commencement of 1922 make it extremely difficult to forecast the results for the current year," said Otto H. Falk, president. "In common with other industrial organizations this company has suffered a substantial contraction of business as a result of the prevailing general depression. The decrease in unfilled orders on hand December 31, 1921, as compared with those at the beginning of that year, for a period doubtless will be reflected in reduced billing and earnings. It is expected, however, that during 1922 there will be some increase in the volume of new business as compared with the preceding year."

The income account for 1921 and the balance sheet as of

December 31, 1921, together with comparisons with the figures of the previous year are as follows:

	INCOME ACCOUNT	
	1921	1920
Sales billed	\$24,685,257	\$31,516,309
*Production costs	19,996,810	24,315,809
Manufacturing profit	\$4,688,447	\$7,200,400
Net selling, admin. and general expenses	2,862,638	3,023,272
Operating profit	\$1,825,808	\$4,177,128
Other income	549,658	487,121
Gross income	\$2,375,467	\$4,664,249
Reserve for fed. tax and gen. contrib.	*100,000	1,000,000
Net income	\$2,275,467	\$3,564,249
Preferred dividends	1,145,641	1,143,919
Common dividends	1,040,000	723,123
Surplus	\$29,826	\$1,647,207
Excess surplus	11,936,795	10,289,588
Total surplus	\$11,966,622	\$11,936,795
Indicated Earnings—		
On av. pf. stk. on which divs paid	13.41%	21.81%
On \$25,770,750 common stock	4.11%	9.39%

*Including depreciation and development expenditures.

BALANCE SHEET—ASSETS	
Real estate, buildings, machinery etc., less depreciation	\$31,772,443
Other physical property	586,415
Patents, good will, etc.	19,287,753
Treasury securities	87,894
Current assets	\$27,985,200
Total assets	\$60,431,953
LIABILITIES	
Preferred stock	\$16,500,000
Common stock	26,000,000
Reserve for liabil. (Compen. act)	247,860
Contingency reserve	1,214,746
Profit and loss surplus	11,966,622

Total liabilities	\$60,431,953
Net working capital	\$23,994,482
Ratio net w. cap. to sales billed	97.2%

Fairbanks, Morse & Co.

The annual report of Fairbanks, Morse & Co., Chicago, for the year ended December 31, 1921, shows an operating deficit of \$1,330,417, as compared with a profit of \$4,144,921 for the previous year. After paying dividends on the preferred stock the total deficit for the year was \$4,349,371, as compared with net earnings amounting to \$1,110,983 in 1920. No dividends were paid on the common stock.

The sales for the year were \$16,525,920, as compared with \$34,549,718 for 1920, a reduction in money value of 52.17 per cent. Part of the reduction was, however, due to lower prices, the decrease in sales on the basis of units being about 46 per cent. Several plants were closed during the year and a loss was shown in the majority of the branch offices operating in foreign countries. Noteworthy is the fact that the Fairbanks, Morse Company (Australasia), Limited, was organized during the past year.

Details of the annual statement are as follows.

LIABILITIES	
By bank def. for y.	\$1,300,417
Dividends	61,437
Contingent liab. res. etc.	254,414
Reserve for liab.	73,142
Accum. fl. com. res. fund.	53,735
Contingency reserve	36,867
Income tax payable	1,870,470
Income tax paid in adv.	100,000
Prepaid ins. for y.	114,500
Prepaid ins. for next y.	100,000
Contingent liab.	1,417,214
Total	\$4,349,371
Preferred stock	19,411,967
Common stock	26,000,000
Total	\$11,668,836
ASSETS	
Real estate	\$9,110
Buildings	\$4,10,682
Plant and equip.	1,110
Other physical prop.	1,81,805
Patents, etc.	2,000,813
Goodwill	6,741
Investments	1,11,888
Current assets	614
Contingent liab. res. etc.	4,511
Income tax paid in adv.	1,000,000
Total	\$15,566,795

INCOME ACCOUNT	
Preferred stock	\$2,000,000
Common stock	6,619,890
Accounts payable	1,262,372
Accrued dividends	9,000
Notes payable	2,975,000
Contingent liabilities on notes	23,119
Accrued expenses	458,530
Reserve for taxes, etc.	1,053,067
Surplus	15,061,836
Total	\$26,264,696

General Electric Company

The report of the General Electric Company for the year ended December 31, 1921, shows a net income of \$28,155,667 as compared with \$35,420,616 for 1920. Cash dividends of 8 per cent on the stock aggregating \$13,409,522 in 1921 and \$10,651,306 in 1920 were paid. In addition, 4 per cent dividends were paid in stock in both years. The surplus for the year 1921, was \$8,243,290, as against \$11,476,065 for the previous year.

During the year 1921 the orders received by the General Electric Company were \$179,722,000 as compared with \$318,470,438 for 1920. For the first quarter of 1922, orders received have been at an annual rate in excess of \$200,000,000. Unfilled orders at the close of the year, after eliminating cancellations, were \$45,391,000 for large apparatus, as against \$111,778,000 at the end of 1920. Net sales billed were \$221,007,992 as compared with \$275,758,488 for 1920.

The balance sheet as of December 31, 1921, shows total current assets of \$190,344,634, and total current liabilities of \$23,760,949. Inventories at that date were marked at \$64,848,189, as against \$18,109,174 at the close of the previous year.

C. A. Coffin, chairman of the board, in his remarks to the stockholders said that the year 1921, with its contraction in business and the unavoidable processes of re-adjustment made necessary thereby, had been exceptionally trying and difficult.

Obituary

Robert H. Illingworth, whose service as a director and vice-president of the Crucible Steel Company of America, prior to April 1, when he resigned, died on April 23 at his home in Newark, N. J., at the age of 61.

Trade Publications

LIFTING JACKS.—The Templeton, Kenly & Co., Ltd., Chicago, has issued a 24-page booklet illustrating and describing its line of Simplex jacks for track and bridge work, car repairing, pulling and straightening poles, etc. Considerable space is also devoted to an explanation of the theory of jack operation.

ALUMINUM ROOFING. Aluminum roofing is the title of a 15-page booklet issued by the American Aluminum Architecture Company, Aurora, Ill., on aluminum as a roofing material. This booklet discusses the adaptability of aluminum for building purposes, and describes in detail the Ridgdown aluminum shingles and other roofing products which this company manufactures.

SHAY GEARED LOCOMOTIVE.—The Shay Locomotive Works, Inc., New York has issued an interesting comparison showing the characteristics of a Mallet and a Shay geared locomotive of equal tractive effort. This points out the advantages of the Shay type due to the fact that all the weight is concentrated on driving wheels and the dead weight is much smaller than for the Mallet type. It is pointed out that on a six per cent. grade the Shay type will haul 138 per cent more trailing load than a Mallet locomotive of the same rated tractive effort.

RAILROAD CROSSING ACCIDENTS have been included among the items broadcasted from the Chicago City radio headquarters, being the subject of an address made on April 14 by E. M. Saffler, chairman of the Safety Section of the American Railway Association, acting in connection with the publicity committee of the Chicago Safety Council. Some lessons on safety, including those related to railroads, were given also recently by William Ott, president of the Chicago Safety Council, in a radiophone address.

Railway Construction

CHESAPEAKE & OHIO.—This company recently opened for bids a project for the erection of a freight station at Norfolk, Va., to cost approximately \$125,000.

CHICAGO, ROCK ISLAND & PACIFIC.—This company has awarded to the Railway Water & Coal Handling Company, Chicago, a contract for an 18,000-gallon per hour water treating plant at Estherville, Ia.

DENVER & RIO GRANDE WESTERN.—This company is now erecting a temporary double-track steel bridge over the Arkansas river at Pueblo, Colo., to replace a pile structure until the city has decided between alternate plans of enlarging or relocating the present river channel, when a permanent steel structure will be erected.

GRAND TRUNK.—This company is engaged in negotiations with the city of Detroit in contemplation of the separation of grades along De Quindre street, involving about \$4,000,000. Plans have been agreed upon and it is expected that an agreement will be reached in the near future leading to a partial undertaking of the work this year.

ILLINOIS TRACTION.—This company has authorized the construction of about three miles of passing tracks including a number of new 30-car tracks and the extension of others as well as the construction of yard tracks at Springfield, Peoria and Granite City, Illinois. The cost of this work will be approximately \$83,000.

MICHIGAN CENTRAL.—This company has awarded a contract to the Dominion Construction Company, Toronto, Ont., for the construction of the greater part of the second unit of its freight terminal and classification yard at Niles, Mich., the first unit of which, comprising the locomotive terminal and westbound yard, was completed in December, 1919, and described in the *Railway Age* of January 23, 1920. A current authorization of \$500,000 has been made to cover principally 320,000 cu. yd. of excavation, the construction of the eastbound hump and eight 100-car receiving tracks, 400,000 cu. yd. of embankment and twelve 100-car tracks of a 25-track classification yard, together with a permanent connection with the South Bend division tracks. It is intended to complete the entire project in 1923.

PENNSYLVANIA RAILROAD.—This company is asking for bids on the construction of a reinforced concrete overhead highway bridge over the tracks of the Turtle Creek Branch extension to Saltsburg, Pa.

PHILADELPHIA & READING.—This company has awarded a contract to F. W. Van Loon, Philadelphia, for the construction of a passenger station at Fourteenth street, Ocean City, N. J.

UNION PACIFIC.—This company is preparing plans for a \$1,000,000 freight station at Denver, Colo., one half of which is contemplated for this year, and has let a contract for the grading for an extension to the present Whittier branch of the Los Angeles & Salt Lake through the towns of Lahabra and Fullerton to Anaheim, Cal. The company has also under consideration extensive harbor improvements in the vicinity of San Pedro, Cal., to be undertaken jointly with the public authorities and has acquired property for a freight classification yard at Los Angeles.

UNION PACIFIC.—This company is planning to construct this year a substructure of a \$1,000,000 bridge across the Columbia river near Attalia, Wash., and has obtained authority for the construction of a \$500,000 tie treating plant at The Dalles, Ore., to replace the existing plant near Wyeth, Ore. The company is also contemplating very considerable improvements to its store department facilities at Pocatello, Idaho, Rawlins, Wyoming, and Grand Island and Omaha, Nebraska.

YAZOO & MISSISSIPPI VALLEY.—This company, which was reported in the *Railway Age* of March 18 as accepting bids for the construction of the passenger station at Webb, Miss., has decided to do this work with company forces.

Railway Financial News

ANN ARBOR.—*Equipment Trust Notes Offered.*—Schibener, Boeming & Co., of Philadelphia, are offering \$456,000 6 per cent equipment trust notes at prices to yield from 5.60 to 5.75 per cent, according to maturity. The notes are dated January 15, 1920, and mature \$52,400 each January 15, 1923 to 1935, inclusive. They are the balance of an original issue amounting to \$786,000.

ATCHISON, TOPEKA & SANTA FE.—*Asks Authority to Acquire Line.*—This company has filed an application with the Interstate Commerce Commission for authority to acquire control of the Eldorado & Santa Fe by lease of its property and purchase of the capital stock.

BALTIMORE & OHIO.—*New Director.*—George M. Shriver, senior vice-president, has been elected a director to succeed Hugh L. Bond, Jr., deceased.

CAROLINA & YADKIN RIVER.—*Receiver.*—The Commercial & Financial Chronicle states that L. H. Hole, Jr., has been appointed receiver on petition of the North Carolina Public Service Commission. Mr. Hole was formerly secretary and treasurer of the company, with headquarters at High Point, N. C. The Carolina & Yadkin River operates between High Point and High Rock, N. C., 35 miles.

CHICAGO & WESTERN INDIANA.—*Application for Loan Denied.*—The Interstate Commerce Commission has denied that part of this company's application for a loan which applies to the request for \$2,000,000 for additions and betterments. The company originally applied for a loan of \$18,000,000. The commission allowed it \$8,000,000 for maturing indebtedness and the company requested that the application for \$2,000,000 for additions and betterments be withdrawn.

CHICAGO GREAT WESTERN.—*Annual Report.*—This company's annual report for 1921 is reviewed in an article on another page of this issue entitled "Great Western Suffers from Adverse Conditions."

CHICAGO, MILWAUKEE & ST. PAUL.—*Equipment Trust Notes Sold.*—Freeman & Co., Hayden, Stone & Co., the New York Trust Company and the Equitable Trust Company of New York have sold \$9,500,400 6 per cent equipment trust notes at prices to yield from 5.35 per cent to 5.75 per cent, according to maturity. The notes are dated January 15, 1920, and are part of an original issue of \$16,444,500.

CINCINNATI, INDIANAPOLIS & WESTERN.—*Authorized to Pledge Bonds.*—The Interstate Commerce Commission has authorized this company to pledge and repledge from time to time all or any part of \$400,000 of first mortgage 5 per cent gold bonds as collateral security for short term notes.

COLORADO & SOUTHERN.—*Equipment Trust Authorized.*—This company has been authorized by the Interstate Commerce Commission to assume obligation and liability in respect of \$1,425,000, 5½ per cent equipment trust certificates in connection with the procurement of 1,000 gondola cars and 200 refrigerator cars.

DELAWARE & HUDSON.—*Authorized to Issue Bonds.*—The Interstate Commerce Commission has authorized an issue of \$7,500,000 of 15-year, 5½ per cent gold bonds to be sold at not less than 95.

DENVER & RIO GRANDE.—*Deposit Date Extended.*—The Perkins Committee at the Farmers' Loan & Trust Company announces that the time has been extended for the deposit of the Denver & Rio Grande refunding 5 per cent bonds of 1955, under the plan of reorganization, to May 22, inclusive.

ERIE RAILROAD.—*Offers to Extend Coal Bonds.*—J. P. Morgan & Co. have mailed letters to holders of the New York, Lake Erie & Western Coal & Railroad Company first mortgage 6 per cent bonds, due May 1, announcing an offer to extend the issue until May 1, 1942, with interest at the annual rate of 5½ per cent. The offer also includes the payment of \$40 per \$1,000 bond to such holders as present their bonds for extension by April 28,

1922, thus making the net yield of the extended bonds about 5.84 per cent. When deposited, the coupon due May 1, 1922, will be cashed if presented with the proper tax certificate. On or prior to May 1, J. P. Morgan & Co. have agreed to buy at par and accrued interest the bonds of holders who do not desire to avail themselves of the extension privileges.

The bonds now outstanding in the hands of the public, aggregating \$1,100,000 face amount are to be extended as Series A bonds pursuant to the terms of a supplemental indenture to be made between New York, Lake Erie & Western Coal & Railroad Company, the Metropolitan Trust Company of New York, as trustee, and the Erie Railroad. Under the terms of the supplemental indenture, Erie Railroad will covenant to guarantee by endorsement the due and punctual payment of the principal and interest of said Series A bonds. The present mortgage security of the bonds is to remain unimpaired.

FORT WORTH & DENVER CITY.—Equipment Trust Authorized.—This company has been authorized by the Interstate Commerce Commission to assume obligation and liability in respect of \$750,000 of 5 1/2 per cent equipment trust certificates, in connection with the procurement of 500 box cars and 100 refrigerator cars.

GULF FLORIDA & ALABAMA.—Six Months Guaranty Certified.—The Interstate Commerce Commission has certified to the Treasury Department that the amount of this company's guaranty for the six months of 1920 is \$253,684, of which \$6,684 remained to be paid.

ILLINOIS CENTRAL.—Authorized to Issue Bonds.—The Interstate Commerce Commission has authorized the Illinois Central and the Chicago, St. Louis & New Orleans to issue \$1,924,400 of joint first and refunding mortgage 5 per cent bonds to be delivered by the trustee to the C. St. L. & N. O. to be by it delivered to the Illinois Central in reimbursement of advances and to be pledged and repledged from time to time as collateral security for short term notes. The Canton, Aberdeen & Nashville was authorized to assume obligation and liability in respect of the bonds.

Annual Report.—The annual report issued last week shows the following income account for the year ended December 31, 1921:

	1921	1920
Operating revenues	\$141,127,066	\$121,804,579
United States government guaranty period claim		19,499,887
Rental from United States Railroad Administration		3,399,635
Total operating revenues	141,127,066	144,704,101
Operating expenses	109,997,791	121,991,985
Excess of revenues over expenses	31,129,275	22,712,116
Taxes	8,119,935	7,172,262
Operating income	22,989,920	15,516,534
Equipment rents—net credit	1,614,027	3,196,849
Joint facility interest debit	203,178	191,297
Net operating income	4,396,770	18,522,085
Non-operating income	5,039,238	7,219,882
Gross income	29,436,008	25,741,967
Deductions from gross income	19,735,213	12,170,845
Net income	9,700,795	13,571,122
Total operations—Income	44,219	136,281
Income balance transferred to credit of profit and loss	9,656,275	13,434,841

*Includes operating expenses, car rate for the months of January and February, 1921, amounting to \$117,658 not assumed by the United States Railroad Administration, which was stated separately in the report for 1920.

New Directors.—R. A. Connelly, New York, and Stanley Field, Chicago, have been elected directors in place of J. Ogden Armour, resigned, and Walter Lutzgen, deceased.

INTERNATIONAL & GREAT NORTHERN.—Partial payment of Guaranty Certified.—The Interstate Commerce Commission has certified to the Treasury Department the partial payment on account of this company's guaranty for the six months following the termination of federal control of \$28,210.

LAKE ERIE & WESTERN.—Six Months Guaranty Certified.—The Interstate Commerce Commission has certified to the Treasury Department the amount of this company's guaranty for the six month period in 1920 as \$509,918, of which \$140,918 was still to be paid.

LONG ISLAND.—Annual Report.—The annual report issued last week shows the following income account for the year ended December 31, 1921:

	1921	1920
Operating revenues		
Freight	\$8,083,614	
Passenger	18,084,144	
Total, including other	26,167,758	
Operating expenses		
Maintenance of way and structures	3,170,691	
Transportation	4,939,878	
Taxes	731,478	
Transit	11,696,486	
General	737,996	
Total operating expense	20,716,989	
Net revenue from railway operations	5,450,769	

Railway tax accruals	1,535,276
Railway operating income	3,965,489
Net railway operating income	3,311,214
Total non-operating income	1,158,377
Gross income	4,469,591
Interest on funded debt	2,546,851
Total deductions from gross income	3,869,972
Net income	599,189

*Operation during 1920 having been for two months under federal control, for six months under the government's guaranty, and for four months without government relationship, no comparison of items of railway operating revenues, expenses, etc., are shown in this statement.

MISSOURI-ILLINOIS.—Authorized to Issue Bonds.—The Interstate Commerce Commission has authorized an issue of \$225,000 of first mortgage, 7 per cent gold bonds, to be sold at 92 1/2 and accrued interest, the proceeds to be used to pay for the construction, equipment and delivery of a steam car ferry across the Mississippi river between Kellogg Landing, Ill., and Little Rock Landing, Mo., and for the equipment and betterment of approaches to be used by the ferry when placed in service.

MISSOURI, KANSAS & TEXAS.—Payments Called For.—J. & W. Seligman & Co. and Hallgarten & Co., reorganization managers, have announced that a cash installment of \$5 a share on this company's common stock and \$4 a share on its preferred would be payable on or before May 10 on the stock deposited with the Equitable Trust Company of New York. At the time of payment of the cash installment participation warrants issued for the deposited stock must be presented for the necessary notation thereon.

MORGANTOWN & KINGWOOD.—Authorized to Issue Bonds.—This company has been authorized by the Interstate Commerce Commission to issue \$40,500 of first mortgage 5 per cent, 30-year bonds for the purpose of refunding a like amount of first mortgage 5 per cent, 20-year bonds which matured on January 1

NASHVILLE, CHATTANOOGA & ST. LOUIS.—Annual Report.—The annual report issued this week shows the following income account for the year ended December 31, 1921:

	1921	*1920
Operating revenues:		
Freight	\$14,323,243	\$16,873,107
Passenger	5,113,363	5,661,011
Total operating revenues	20,924,602	24,491,175
Operating expenses:		
Maintenance of way and structures	3,065,616	5,009,805
Maintenance of equipment	5,501,899	6,617,204
Traffic	833,828	711,819
Transportation	9,465,005	11,905,482
General	678,288	722,762
Total operating expenses	19,607,276	25,037,952
Railway tax accruals	550,000	625,500
Total operating income	758,338	Def. 1,173,169
Total non-operating income	882,933	1,066,735
Gross income	1,641,371	Def. 108,454
Interest on funded debt	832,894	837,012
Total deductions	1,901,373	1,848,389
Net deficit	**259,802	1,956,843

* Combined corporate and federal figures used for 1920 for comparison.
** The annual report to the Interstate Commerce Commission shows a net deficit of \$411,399. It includes revenues and expenses accruing prior to January 1, 1918, amounting to \$151,597, which in this report is entered in the profit and loss account.

NEW YORK, LACKAWANNA & WESTERN.—To Increase Capital.—The stockholders have voted to increase the authorized stock from \$10,000,000 to \$15,000,000 and to authorize a mortgage bond issue of \$25,000,000.

NEW YORK, LAKE ERIE & WESTERN COAL & RAILROAD.—Offers to Extend Bonds.—See Erie Railroad.

NEW YORK, NEW HAVEN & HARTFORD.—Annual Report.—This company's annual report for 1921 is reviewed in an article on another page of this issue entitled "New Haven Should Soon Realize on Improvements."

PAULISTA RAILWAY (BRAZIL)—Bonds Offered.—Lee, Higginson & Co., Ladenburg, Thalmann & Co., and Marshall Field, Gore, Ward & Co., have sold a new issue of \$4,000,000 Paulista Railway Company 20-year first and refunding mortgage 7 per cent sinking fund gold bonds, series A, due March 15, 1942. The bonds are offered at 99 and interest, yielding slightly more than 7 1/2 per cent. The principal and interest are repayable in United States gold coin. The loan is repayable through a sinking fund or at maturity at 102 and interest.

RICHMOND, FREDERICKSBURG & POTOMAC Annual Report.—The income statement for the year ended December 31, 1921, compares as follows:

	1921	*1920
Operating revenues	\$10,002,076	\$8,998,220
Operating expenses	7,859,005	7,125,686
Net revenue from railway operations	2,143,070	1,872,534
Railway tax accruals	401,566	359,445
Total operating income	1,740,504	1,513,089
Total non-operating income	382,962	407,063
Gross income	2,123,890	1,879,687
Interest on funded debt	390,077	330,822
Total deductions from gross income	1,138,401	1,002,578
Net income	985,489	877,109
Income applied to sinking and other reserve funds	885,489	62,964
Income balance	985,489	814,146

*Figures for ten months, March 1 to December 31.

The operating revenues and expenses in detail and the principal traffic statistics for 1921 compare as follows:

OPERATING REVENUES		
	1921	1920
Freight	\$5,069,361	\$5,239,368
Passenger	3,577,332	3,883,019
Total operating revenues	\$10,002,076	\$11,049,884
OPERATING EXPENSES		
	1921	1920
Maintenance of way and structures	1,505,957	1,209,078
Maintenance of equipment	1,686,962	1,838,339
Traffic	95,817	89,887
Transportation	4,057,651	4,815,523
General	539,808	334,211

	1921	1920
Number of revenue tons carried	3,337,874	3,809,511
Number of tons carried one mile	202,073,000	328,729,970
Average distance hauled of ton—miles	60.50	86.29
Average receipts per ton per mile—cents	1.678	1.330

NOTE.—Traffic statistics for 1920 are from March to December.

SEABOARD AIR LINE.—Authorized to Assume Obligations.—The Interstate Commerce Commission has authorized this company to assume obligations and liabilities in respect of equipment notes to be issued by the Seaboard-Bay Line Company and to guarantee by endorsement its obligations to the United States in the amount of \$4,400,000. The Baltimore Steam Packet Company not being a carrier within the meaning of section 20-a of the Interstate Commerce Act, its application for authority to assume obligations and liabilities was dismissed for want of jurisdiction.

SEABOARD-BAY LINE.—Loan Authorized.—The Interstate Commerce Commission has authorized a loan of \$4,400,000 to this company, together with its approval of the company as an organization or agency through which the loan may be made to enable it to provide equipment for sale or lease to the Seaboard Air Line. The security offered was the unconditional guaranty of the Seaboard Air Line and the Baltimore Steam Packet Company, full title to the equipment to be acquired and full title to two freight and passenger steamers to be acquired. The commission eliminated from the application \$90,000 for the purchase of three dining cars and it also imposes certain conditions, one of which is that the applicant shall provide \$200,000 in cash in addition to an investment of \$1,285,000 for the steamers and shall pay the cost of the rebuilt cars in excess of \$1,030,000. Commissioner Daniels wrote a vigorous dissenting opinion saying that to certify the loan is to give indirectly to the beneficiary, the Seaboard Air Line, that which it is conceded the commission could not grant to it directly and that the proposed loan, in addition to those already made to the Seaboard, \$8,698,400, seems to allot a wholly disproportionate amount of the revolving fund to this carrier. He also said that the condition heretofore insisted upon in the way of self-help from carriers is in this instance almost totally abandoned and that "the circuitous character of the financing involved" inclines him to doubt the wisdom of the plan apart from the objections as to the validity and merits of the loan itself. The equipment proposed to be acquired consists of 25 locomotives at \$40,000 each, 1,250 box cars at \$1,554.79; 300 flat cars at \$1,085.63; 200 phosphate cars at \$1,453.58 and 3,000 rebuilt freight cars to be purchased from the Chickasaw Shipbuilding & Car Company, which will acquire them from the carrier, thereby releasing them from the lien of its mortgages.

SILVERTON.—Abandonment of Line Recommended.—The Interstate Commerce Commission has made public a tentative report of one of its examiners recommending that the commission issue a certificate authorizing the abandonment of its narrow gauge line from Silverton to Joker Tunnel, Colo., 15½ miles.

TENNESSEE, ALABAMA & GEORGIA.—Sold.—This road was sold to C. E. James, of Chattanooga, on April 7, for \$130,000 by Special Commissioner D. L. Grayson. The Sage estate was the former owner of the road, which extends from Chattanooga, Tenn., to Gadsden, Ala., 92 miles. It has been in the hands of receivers since December 15, 1920, and has been offered for sale several times.

TOLDO TERMINAL.—Authorized to Draw Down Bonds.—The Interstate Commerce Commission has authorized this company to procure the authentication and delivery to the treasurer of \$400,000 of first mortgage gold bonds.

WINSTON-SALEM TERMINAL.—Asks Authority to Issue Securities.—This company has applied to the Interstate Commerce Commission for authority to issue \$3,000 of stock and \$700,000 of first mortgage 5 per cent gold bonds, the proceeds to be used for the construction of a union passenger station and other terminal facilities at Winston-Salem, S. C.

WABASH.—Annual Report.—The annual report issued this week shows the following income account for the year ended December 31, 1921:

	1921	1920
Operating revenues:		
Freight	\$45,688,528	\$43,324,700
Passenger	9,931,246	11,218,051

	2,017,576	1,983,943

*Subject to change when contract is executed definitely fixing the amount of annual compensation.

Equipment Trusts Sold

The director general has announced additional sales at par plus accrued interest, of railroad equipment trust certificates maturing January 15, 1923 to January 15, 1935, inclusive, held by the government, to:

Dillon, Read & Co., New York City, GRAND TRUNK WESTERN	\$1,790,100
Schibener, Boening & Co., Philadelphia, Pa., ANN ARBOR	3,000,000
Biddle & Henry, Philadelphia, Penna., WESTERN MARYLAND	494,000
	\$2,740,400

The sales comprise approximately two-thirds of all the maturities of these equipment trust issues. The balance of one-third of all maturities will be stamped as subordinated, in accordance with the agreement as amended under the plan recently announced. The total amount of equipment trust certificates sold by the government to date, at par plus accrued interest, is \$251,950,700.

Dividends Declared

Delaware & Hudson	2½ per cent, quarterly, payable June 20 to holders of record May 27.
Illinois Central	1¾ per cent, quarterly, payable June 1 to holders of record May 5.
Pennsylvania Railroad	—1 per cent, quarterly, payable May 31 to holders of record May 1.
Pullman Company	—\$2.00, quarterly, payable May 15, to holders of record April 29.
Reading Company	First preferred, 1 per cent, quarterly, payable June 8, to holders of record May 23.

Trend of Railway Stock and Bonds Prices

Railway Officers

Executive

S. A. Wilder, assistant to the general manager of the Northern Pacific with headquarters at St. Paul, Minn., has also assumed the duties of John Wynn, assistant to the general manager, whose death was reported in the *Railway Age* for March 11, and Mr. Wynn's position has been abolished.

Financial, Legal and Accounting

J. B. Hill, whose election as treasurer and appointment also as assistant to the president of the Nashville, Chattanooga & St. Louis with headquarters at Nashville, Tenn., were reported in the *Railway Age* of April 22, was born in Spencer, Tenn., on November 14, 1878. Immediately following his graduation from the George Peabody College for Teachers at Nashville, Tenn., in June, 1898, he entered the service of the Nashville, Chattanooga & St. Louis as a clerk at Sparta, Tenn. He continued as a clerk and operator at Sparta until January, 1900, when he entered the division superintendent's office at Tullahoma, Tenn., where he was employed first as a stenographer and operator and later as a clerk until June, 1901, when he was transferred to the office of the division superintendent at Nashville, Tenn. From June, 1901, to January, 1903, he served in the consecutive capacities of stenographer, clerk and assistant chief clerk at Nashville and in January, 1903, he became a clerk in the treasurer's office at Nashville and later served as private secretary to the secretary and treasurer until 1915. From 1915 to 1918 he was transfer agent and assistant secretary and from 1918 to March, 1920, was chief clerk in the office of the federal manager of the Nashville, Chattanooga & St. Louis, and the Tennessee Central at Nashville, Tenn., following which he served in the capacities of transfer agent, assistant secretary and chief clerk to the president which positions he held at the time of his recent promotion.

Operating

A. G. Mitchell, whose appointment as secretary of the Association of Transportation Officers of the Pennsylvania was announced in the *Railway Age* of April 22, was born at Madison, Me., on February 3, 1855. He was graduated from the University of Maine in 1875 and entered the service of the Somerset (now Maine Central). In February, 1880, he entered the employ of the Pennsylvania as a rodman. The following year he was promoted to transitman and, a few months later, to assistant engineer. In 1882 he went with the H. C. Frick Coke Company as assistant to the chief engineer. Mr. Mitchell re-entered the service of the Pennsylvania in 1884 as assistant engineer in the office of the engineer-in-charge of way. A few months later he was appointed constant supervisor at Huntingdon, Pa. He served in a similar capacity at Spruce Creek, Pa., and Philadelphia and was promoted to supervisor at Monongahela City, Pa., in 1887 and transferred to Gallitzin in 1888. In 1891 he was promoted to assistant engineer of the Monongahela division and was advanced to superintendent of the same

A. G. Mitchell

division in 1901. In 1918 he was transferred as superintendent of the West Jersey & Seashore Railroad and the Camden Terminal division, which position he held at the time of his recent promotion.

O. H. Frick, district engineer of the Middle district of the Chicago, Milwaukee & St. Paul with headquarters at Milwaukee, has been promoted to superintendent of the La Crosse division with headquarters at Portage, Wis., succeeding **W. H. Thurber** who has been transferred to the Dubuque division. Mr. Thurber succeeds A. J. Hasenbalg, resigned.

Traffic

S. C. Berghaus, chief clerk to the general passenger agent of the Chicago, Indianapolis & Louisville at Chicago, has been promoted to the newly created position of supervisor, mail, express and milk traffic, with the same headquarters.

Mechanical

Eldred Byron Hall, principal assistant superintendent of motive power and machinery of the Chicago & North Western, with headquarters at Chicago, has been promoted to superintendent of motive power and machinery, with the same headquarters, to succeed **Harry T. Bentley**, who has been promoted to general superintendent of motive power and machinery, with the same headquarters, succeeding **Robert Quayle**, who will retire April 30. The position of principal assistant superintendent of motive power and machinery has been abolished.

Engineering, Maintenance of Way and Signaling

C. U. Smith, assistant engineer of the Chicago, Milwaukee & St. Paul at Milwaukee, Wis., has been promoted to district engineer of the Middle district, with headquarters at Milwaukee, effective May 1, succeeding **O. H. Frick**, who has been promoted to Superintendent of the La Crosse division, with headquarters at Portage, Wis.

Purchasing and Stores

R. M. Nelson has been appointed purchasing agent of the Chesapeake & Ohio and **A. W. Hix** has been appointed assistant to the director of purchases and stores.

Obituary

Grant W. Taylor, assistant to the vice-president of the Southern Railway, died on April 18 at Washington, D. C. Mr. Taylor was born June 20, 1863, in Solon, Ohio. He entered railroad service in 1879, when he became telegraph operator on the Pennsylvania. He served in various capacities on that road. His first connection with the Southern Railway, with which he was connected at the time of his death, began November 12, 1885, when he entered the employ of the Richmond & Danville line, which was soon after absorbed by the Southern system. From that time on Mr. Taylor made his home in Washington. He served in many capacities, including traveling secretary to the general manager, chief clerk and general superintendent. In 1903 Mr. Taylor left the Southern, but returned to it again three years later, becoming superintendent of transportation. During his three years' absence he was connected with the Chicago & Alton. In 1917 he was appointed assistant to the vice-president of the Southern and was so employed up to the time of his death.

MODESTY IS A VIRTUE but bashfulness is a vice. This we quote from the last public circular of the Buffalo, Rochester & Pittsburgh, which railway has resolved not to be excessively modest in the future. Carrying out this resolve, the circular gives extracts from letters from a number of passengers and other patrons of the road telling of instances of exemplary courtesy manifested by the conductors, trainmen and other employees of the road.

The degree of efficiency with which a locomotive performs its work day after day is largely dependent upon the standard of maintenance which the management had set and to which the forces at the terminals are held. The selection of a general design and the working out of details which are capable of keeping down costs of operation is only the first step. Neither will it be possible to obtain adequate returns on the original capital investment if the management simply establishes a standard of maintenance and then fails adequately to see that this standard is consistently followed. Standards, like laws, are worse than useless if they are not enforced. In these days when it is necessary to make every saving possible and hold costs to a minimum, there is a strong tendency to consider a dollar not spent as a dollar saved. As a consequence many a locomotive in service today is in operation with the valve motion not properly adjusted, cylinder or valve packing leaking, draft appliances in the front end not in proper shape, engine not steaming freely; although it manages to take its train over the road, the coal consumed is considerably more than necessary. It is to be feared that quite a percentage of the savings which have been effected by reducing expenditures for locomotive maintenance have simply resulted in saving at the spigot and wasting at the bung hole. This false economy may not show as accounts are now kept but there are large and unnecessary bills for fuel and oil which have to be met even though they are buried out of sight.

Economies from Better Locomotive Maintenance

The Van Sweringen interests of Cleveland have purchased for \$3,000,000 the majority stock interest held by the New York Central in the Lake Erie & Western. They now control the New York, Chicago & St. Louis, the Toledo, St. Louis & Western and the Lake Erie & Western, three lines having a total mileage of approximately 1,700 miles. It is too early as yet to ascertain just what is behind the gathering in of these three lines under one control. The Lake Erie & Western operates 738 miles. Its main lines extend from Sandusky on Lake Erie to Peoria; and from Indianapolis to Michigan City, and from Fort Wayne, Ind., to Connersville, the latter two lines crossing the first at right angles. That the three roads should be brought under one control seems to be a consistent development. The Nickel Plate has made a place for itself in fast freight service between New York and Chicago over its own line and to St. Louis via connections, one of which is the Clover Leaf, connecting with the Nickel Plate at Continental, Ohio. The importance of the Lake Erie & Western in the group will presumably be because of its connections at Peoria and because of its being a feeder line for the group. The grouping, further, is in accordance with the tentative plan of consolidation proposed by Professor Ripley and by the Interstate Commerce Commission. Professor Ripley, for instance, suggested that the Lake Erie & Western might better be joined with the Nickel Plate rather than with the New York Central as it has been for several years. The I. C. C. plan included in its System No. 5, the Wheeling & Lake Erie, the Pittsburgh & West

Virginia, the Bessemer & Lake Erie, etc. Professor Ripley gave this group as its main stem the Lackawanna; the I. C. C. changed this in its tentative plan to the Lehigh Valley. The question now arises as to how much farther the Van Sweringen plan will be carried, if it is to be carried farther.

The police power of the state is constantly up against a task that is too much for it; the task of repressing innumerable offenses against the safety, the decency, or the comfort of the public, which offenses are too small to be punished; or, in more exact phrase, so small that society has found no practicable way of punishing them, except spasmodically. For example, playing ball in the streets; speeding (by automobiles), which is not bad enough to be susceptible of proof in court the next day; smoking in railroad waiting rooms, varied noise nuisances, and so forth. The crime of crossing a track carelessly must, usually, be included in this class; and this paragraph is written to call attention to a new law in Virginia, noticed on another page. This law requires every driver to stop before going over a track, with certain exceptions. It is a good law. But the exceptions weaken it; and exceptions conceived in the driver's mind will weaken it still further. At a track which is traversed by only a very few trains each day the majority of drivers may be expected to break the law. These obvious considerations will serve to remind us that the value of such a statute as this must be largely in its remote or indirect effect on the public mind. It must be posted, and be talked about; and its principle must be got into the people's minds in whatever ways may be found feasible. It deals with a very old problem; and to find new ways to settle old problems requires endless ingenuity. A good point for the well-disposed autoist to remember is that although the statute only mentions one thing for him to do, the courts will require him to take whatever precautions ought to be taken by a level-headed, intelligent, unexcited, unselfish citizen. That is to say, except where there is ample reason for suspending the rule, he must do three things:—

STOP, LOOK AND LISTEN

Under the influence of increased traffic Henry Ford's "model" railroad, the Detroit, Toledo & Ironton, is making a more satisfactory showing than it did last year. For the month of March it reported to the Interstate Commerce Commission a net operating income of \$176,659, an increase as compared with last March of \$116,889. For the three months of 1922 the net operating income was \$334,556, an increase of \$582,957 as compared with last year, when there were deficits in January and February. The report shows an increase in operating revenues of \$960,338 for the three months and an increase in expenses of \$240,340. Maintenance of way ex-

A Crossing Law in Virginia

Ford Railroad Shows Increased Net

penses were reduced but there was an increase in maintenance of equipment of \$104,530 and in transportation expenses of \$213,406. If the increase in traffic should continue at this rate Mr. Ford might be able to pay a dividend this year but last year there was a considerable slump toward the end of the year which wiped out the net for several months and left a balance for the entire year representing less than one good month's business, far short of enough to pay interest charges.

It is evident that for every car moving loaded in the direction of heavy traffic, a car must be moved, either empty or loaded, in the opposite direction. It is also evident that for every fully loaded train moving in the direction of heavy traffic, an engine and crew must be moved in the opposite direction, even though tonnage is not available. How, then, should these two balancing movements be combined to produce the most economical operation—by the accumulation of empty cars for fleet distribution from market to producing territories, or by the nearest possible approach to a car for car exchange? Since there can be no delay in balancing train movements, is not the latter likely to produce the best results? It is evident that every fleet movement must actually effect an increase in train mileage which would be avoided by the current movement of empty cars as a part of the light trains which must be run in either case. These are pertinent facts which should be kept clearly in mind in discussing the merits of any system of car service, whether it be founded on the principle of individual ownership or of central ownership and distribution control.

**Balancing
Car
Movement**

April saw the placing of more orders for cars and locomotives than has been the case for any month for an extended period of time. The number of locomotives ordered for domestic service totaled 272; of freight cars, 29,345 and of passenger cars, 540. There were ordered in April more freight cars and more passenger cars than were ordered in all twelve months of 1921. The April figure of 29,345 freight cars compared with total domestic orders placed in 1921 of 23,346. The April passenger car figure of 540 was double the entire 1921 total of 246. This shows the degree of contrast between the activity of the railway supply field at present and the lack of activity in 1921. It evidences a decided improvement—to put it mildly—and indicates that the equipment market has succeeded in climbing out of what in 1921 seemed to have all the aspects of a bottomless pit. But a more interesting feature is that the 1922 orders

**Equipment
Orders in
April**

in the first four months of 1922 have been 960, over half of which were ordered in April. This compares with a total of 683 in the first third of 1916 and shows the degree of effort which the railways have been using to make up for the lack of new passenger equipment acquisitions since the beginning of federal control. Locomotives do not show the same results as cars. The total for the first four months was 361, as compared with 1,315 in the first four months of 1916. But the outstanding factor in the case of locomotives is that of the 361 for January to April, 1922, 272 were ordered in April, which means that the locomotive orders are coming in at a rapid rate but have been slower in getting started than has been the case of cars. All these details confirm the opinion of those who have been preaching optimism about the industrial revival.

Statistics prepared by the United States Forest Service in co-operation with the American Wood Preservers' Association, show that 55,383,515 ties were given preservative treatment in 1921. This represents an increase of 26½ per cent over the number of ties treated in 1914, the high point in timber preservation before our entry into the war. Subsequent to 1914 the timber preserving industry suffered a marked decline so that ties subjected to preservative process in 1918 reached the low figure of 30,609,209. Since that date, however, there has been a steady recovery and the results for 1921 indicate not only a complete restoration of all the ground lost during the war period but also a marked extension in the use of treated ties by the railroads. The past year has seen considerable developments in this industry, including the construction of a number of new treating plants and a greater utilization of treated ties by roads which hitherto had not considered the treated tie with much favor. Unfortunately no figures are available for the total consumption of cross ties by the railroads. Consequently, it is impossible to give any accurate comparison between the number of treated and untreated ties used, but it is apparent that the volume of treated ties now represents close to one-half of the total consumption of cross ties.

The *Railway Age* is pleased to publish elsewhere in this issue the clearest, most succinct account of conditions as they are in Russia which has come to its notice. A considerable literature in the form of books and magazine and newspaper articles has grown up on this subject. Many of these articles and books absolutely condemn the present regime and just as many, or maybe more, concern themselves with the white-washing of the activities of the Soviets. The article we publish does not deal with politics as such. Instead it tells of the economic condition of the country—not only of the railways, but of agriculture and industry in general—and how the present government is absolutely powerless in improving conditions. Our correspondent, who has but recently returned from extensive travels in the country, believes that Russia is a land of opportunity for capitalists who are willing to take great risks in return for prospective gains enormous in proportion. Naturally America is the country where one looks not only for capital in sufficient amount but for financial leaders with sufficient daring to undertake such a venture. The writer, who must unfortunately remain nameless, will, we believe, leave our readers with the hope that American financial leadership will interest itself in Russia's problem, for the benefit of all concerned. According to recent news from Europe, British capital seems already to be interested

to date are back at their pre-war level, as indicated, for instance, in such a year as 1916. In the first four months of 1922 the total orders for domestic freight cars totaled 58,626, one-half of which orders were reported in April alone. The total for the first four months of 1916 was 45,397. The orders in April were double those of the best month in the first third of 1916. The total domestic passenger car orders

The station agent or conductor to whom is addressed a criticism of his railroad must reply to it; and the nature and tone of his reply may make or lose a friend. Indeed, the thousands of such replies that will be made within the next week, taken as a whole, will be a material element in the public sentiment which will rule the railroads of America for the next year, or series of years. This connection between a casual conversation and an imponderable thing like public sentiment, seems too vague to be dealt with seriously; every officer, station agent and conductor finds things more immediately practical with which to busy himself. But why not deal with it seriously? In fact we do, in lectures and circulars. But lectures and circulars are nothing but words; how can we get down to brass tacks? These thoughts arise on reading the last circular of W. A. Winburn, president of the Central of Georgia, which says in part:

"To render efficient service, should the anticipated revival in business mark the harvest season, will be no easy task. Alertness, energy, courtesy and a whole-hearted willingness to be of service must characterize our efforts to have the human equation supply any deficiencies that may appear in mechanical equipment. When business is dull the public is inclined to feel that transportation rates are burdensome and we of the Central of Georgia have not been able to prevent that feeling, or to offer a remedy. Should business become brisk, the demand will be for quick, sure and adequate service. This we can and must supply. A personnel that can 'weather a storm,' can likewise 'make hay while the sun shines.'"

Or, concretely, if the locomotives on your best trains are not equal to making time; or, because there are too few locomotives, the switching service at your station is half a day behind time, your explanation must be *adequate and sympathetic*. As the local representative, how will you word it? How can you meet these little emergencies unless you rehearse them over, in imagination, beforehand?

The Coal Strike and Railroad Earnings

THE coal loadings for the week ended April 8 were 69,456 cars; for the week ending April 15, 62,851 cars, and for the week ending April 22, 63,445 cars. These loadings are at a rate about one-half those for the corresponding period of 1921 when business was poor. They are about one-third those for the early part of 1920 when business was good, and about one-half those of the weeks in 1920 in which occurred the outlaw strike of the railroad switchmen. The March, 1922, loadings ran about 200,000 cars a week, due primarily to the heavy movement of coal in anticipation of the coal strike, which began according to schedule on April 1.

No one seems to be worried very much about the coal strike. One of the reasons is that a very large quantity of coal moved in anticipation of the cessation of work in the union districts. Another is the manner in which fuel supplies are being received from the non-union fields. There is another reason also in that the operators—and the same applies to the miners—have not seen fit to say much about the strike, which may be due to the fact either that they do not want to do so or do not know how.

Another interesting feature is that the stock market seems to have paid little or no heed to the strike. Although the financial centers were well aware that the elimination of a large share of the coal tonnage would have a somewhat unsatisfactory effect on railroad earnings, the trend in railway shares throughout the month of April was upward. The *Railway Age's* average of the prices of 20 representative railway stocks stood on March 28 at 60.60; on May 2, it had risen to 65.26.

It is, of course, true that the strike will not last forever. It is also presumably the fact that as soon as the strike is ended the movement of coal will be heavy, due to the continuing revival in industry and the need of catching up on depleted stocks of fuel. The situation as a whole resolves itself into a presumption that railway earnings will continue

to increase gradually throughout the year except as concerns the months in which the strike remains effective. The railway earnings now being reported for March are very favorable. However, it is necessary to bear in mind that these earnings do not paint a true picture. There will be those who will try to show that they indicate a return to normalcy. If this is done it will be far from the facts. The March earnings were affected by the increased coal tonnage anticipatory to the strike. The April earnings will be much poorer and may be very disappointing because of the importance which the coal traffic bears to the total, and particularly will these things be true in the case of the roads which derive a large part of their tonnage from coal.

It is interesting to examine the situation as it is affecting the leading coal railroads. The details show the practical elimination of coal traffic on many of them. The roads serving the non-union coal areas, fortunately offer a few exceptions, and presumably will have to be regarded as supplying the silver lining to the cloud in the situation. The roads in the Pocahontas district, including the Chesapeake & Ohio, the Norfolk & Western and the Virginian are loading more coal than ever. The Norfolk & Western, to take the leading example, is doing especially well, serving as it does the non-union Thacker, Tug River, Kenova, Pocahontas and Clinch Valley coal fields. In the week ended April 8 it loaded 11,446 cars, or more than one-sixth the total coal loadings for the entire country.

Another road which is doing well in the coal strike is the Louisville & Nashville, serving mines in Kentucky. In fact the roads in the south are, on the whole, not seriously affected by the strike. The figures for the district include those for the Illinois Central, the traffic of which has been seriously cut. Nevertheless, the coal loadings for the week ended April 22 in the southern district totaled 15,698 cars, as against 17,646 in the corresponding week of 1921.

The roads which are being most adversely affected are the anthracite carriers because no anthracite is being mined at all. The figures for these roads and those for the others shown—excepting possibly the Baltimore & Ohio and to a lesser extent, the Pennsylvania—are striking and show that the cessation of work in the coal mines is having a potent effect.

It is, of course, true that these figures do not give a complete story. The Hocking Valley, for example, is loading no coal on its own lines; it is, however, receiving business from the Chesapeake & Ohio. The Big Four similarly is loading no coal; it receives, however, a large tonnage in interchange from the Louisville & Nashville. However, it is evident that most of the roads mentioned other than those,

such as the Norfolk & Western, the Louisville & Nashville, etc., are going to show the results of decreased coal tonnage in their earnings statements. The tonnage involved is great, as is the gross revenue to be derived therefrom.

These facts indicate the railroad interest in the coal strike, and tend to make those interested in railway matters feel somewhat concerned that the strike is receiving so little attention or that little or no progress is being made towards its settlement.

Some Thoughts on Valuation

THE HISTORY of the discussion and legislation regarding valuation of railways might be made the subject of an amusing disquisition. It would be highly diverting if the question of valuation were not so serious. It is difficult to become facetious regarding a problem the solution of which may result in the recognition or in the confiscation of equities in property amounting to billions of dollars. The way this problem is solved is going to put to the test the intelligence and integrity of the American people. If some of the principles advocated should be adopted those who have invested in good faith in railways would be subjected to legalized robbery. If such a precedent were set in the case of the railways no kind of property in this country could be regarded as safe from seizure under the forms of law.

It is time to recall the developments which have produced the present situation with respect to valuation. Many seem to think the railways asked for it. They did not. Their spokesmen always contended that valuation was not the right basis for making rates. The agitation for legislation to require the Interstate Commerce Commission to make a valuation was carried on mainly by those who alleged that the railways were grossly overcapitalized. They contended that the railways charged excessive rates to earn a return on vast amounts of "water." They argued that a physical valuation would prove their charge of over-capitalization and that the valuation should be made in order that rates might be fixed which would yield only a "fair return." They seemed confident that a valuation would justify wholesale reductions of rates.

The valuation bill finally passed by Congress in 1913 was originally drafted by Senator LaFollette of Wisconsin. He had alleged over-capitalization against the railways oftener than any other man in the country. His original bill designated the Interstate Commerce Commission to make the valuation. The enemies of the railways both got the legislation passed and selected the body to do the work.

The sequel seems to show that they did not so much want to find the true value of the railways as to cause confiscation of a large part of them. When the Transportation Act of 1920 was passed the commission had been working on the valuation over six years. It had inventoried the physical properties of most of the railways and had the records in its office. The Transportation Act directed it in regulating rates to take into consideration the information it had gathered. The commission for the purpose of the rate case of 1920 placed upon the railways a tentative valuation of \$18,900,000,000. Its members repeatedly have told members of congressional committees that this was based mainly upon the results of their investigation under the valuation law.

Nevertheless, the very people who got the valuation law passed have been amongst the loudest and most active in disseminating propaganda to discredit the commission's tentative valuation as grossly excessive. It was to be expected that the railway labor leaders would attack it. They want to see the earning capacity of the railways destroyed as the shortest way of bringing about government ownership and employees' management under the Plumb plan, and they

have contributed to the discussion some remarkable impromptu valuations of their own. William H. Johnston, president of the International Association of Machinists, took a few minutes from other duties one day and made a valuation of \$8,610,000,000. President Markham of the Illinois Central showed that Mr. Johnston's valuation defied the ordinary rules of arithmetic and that if it had conformed to those rules it would have been \$4,640,000,000 bigger. Glenn E. Plumb then rushed to the rescue and offered for consideration one valuation of \$9,400,000,000 and another of \$10,100,000,000. Meantime an anonymous "eminent economist" contributed to the Firemen's Magazine a valuation of \$13,000,000,000. These labor leaders differed among themselves to the extent of \$4,400,000,000. But what are a few dollars between friends working for the same cause?

Most astonishing, however, has been the attitude of men such as Senator LaFollette and Clifford Thorne, who were among the most earnest advocates of the valuation legislation passed in 1913. They both advocated having the valuation made by the Interstate Commerce Commission and both now indignantly repudiate the commission's own findings. The man who repudiates the findings of an arbitrator selected by himself can hardly be called a good sportsman, whatever else he may be.

Mr. Thorne's inconsistencies are the most glaring of all. They cannot be ignored because he has been counsel of the American Farm Bureau Federation, and his views are widely circulated among the farmers.

Soon after the commission's tentative valuation was made he got the American Farm Bureau Federation to adopt a resolution setting forth that it was \$5,000,000,000 too large. This apparently was based upon computations, by which he had ascertained that the total value of railway securities measured by their market prices in 1920 was less than \$13,000,000,000. In the recent rate hearings he put an accountant on the stand before the Interstate Commerce Commission to present an estimate that, based on the valuations of individual railways already made public, the total valuation of all the railways should not exceed \$16,000,000,000.

Mr. Thorne seems to have forgotten, or to think other people have forgotten, that he began making valuations of railways some years ago. He made one in 1913, and some light may be thrown on his consistency and sincerity by comparing what he says now with what he said then. Over eight years ago, in a public address, he gave the results of a computation regarding the value of the railways which he had based upon the market prices of their securities as indicated by stock exchange quotations in October, 1913. His estimate of the valuation of the railways then was exactly \$13,969,173,383. Mr. Thorne is nothing if not exact in his figures. The new capital which has been invested in the railways since 1913 exceeds \$4,500,000,000. Therefore, if Mr. Thorne's estimate of the value of the railways was right in 1913 their value at present must be at least \$18,500,000,000, or less than one-third of a billion dollars less than the valuation placed upon them by the Interstate Commerce Commission. We shall only remark in passing that in the fall of 1913 the market prices of railway securities were the lowest that they had been for some years. Of course, this was not the reason Mr. Thorne used them as a basis for his computations.

The most notable fact regarding these ready-to-wear valuations which have been made by various persons not previously recognized as "experts" upon the subject is not that they differ from that of the Interstate Commerce Commission but that they differ so much among themselves. Mr. Thorne's accountant's valuation is \$7,400,000,000, or 86 per cent bigger than that of William H. Johnston, although both are based upon the valuations of individual railways already made public by the commission. It can hardly be expected that the commission will be much influenced by them.

But what about the effect upon public opinion? The labor leader's estimates are being widely disseminated among railway employees. Mr. Thorne's estimates—not his 1913 estimate, but the recent ones—are being widely disseminated among the farmers. They are all a part of the propaganda to discredit private ownership and management of railways. They are intended to prevent the railways from being allowed to earn sufficient net return to make adequate improvements and enlargements of their properties. They are intended to help not only to make the success of private management impossible, but to create a public sentiment which would cause confiscation of a large part of the investment in railways if government ownership should be adopted.

We do not expect the propaganda to be successful. We believe the public is gaining constantly a better understanding of its true character and purpose. But no reasonable effort should be spared to make sure that the public will understand its true character and purpose.

New Books

The Firing of Locomotives. By J. F. Cosgrove. 368 pages, illustrated. 6 in. by 9 in., one chart. Book Service Department, Simmons-Boardman Publishing Company, New York.

The railroads of this country use in locomotive service practically every kind, grade and size of coal produced. The characteristics of these fuels vary widely; some coke in burning, some clinker, some are very high in gaseous content others have excessive ash. The variations in the characteristics of the coals make it necessary to use different methods in firing them if the best results are to be obtained in each case. Because of the wide variety of conditions, it is extremely difficult to prepare a book that will deal satisfactorily with firing practice in various sections of the country. Mr. Cosgrove has had the benefit of long and varied experience and his book is undoubtedly the most authentic and comprehensive work of its kind that has been published.

The book treats the subject of firing in a logical manner. The composition of the various types of coal and their principal characteristics are first discussed. This is followed by a section on the principles of burning coal in locomotives. The general theory of combustion and the chemical processes involved in the burning of coal are explained in simple language. Thus the first section of the book gives the fundamental principles that underlie correct firing practice.

The remainder of the book is devoted to a detailed consideration of the various conditions met in actual service and the methods to be used under each condition to obtain the best results. The locomotive boiler and appliances are described with particular reference to their influence on firing methods. Several chapters are devoted to a detailed discussion of the proper methods of handling the fire—such subjects as the thickness of the fuel bed, shaking of grates and the prevention of clinkers are discussed fully. The proper practice when firing the various types of coal is treated and instructions are given for firing under adverse conditions. The last subject discussed is the operation of stoker locomotives. Detailed instructions are given for the operation of the stoker engine to obtain uniformly good results under various conditions of operation.

The coal chart accompanying the book lists the coals mined in every state, giving the principal characteristics, such as heating value, fusing temperature of ash, and the proportion of the various constituents.

The proper methods of firing are of the utmost importance in securing fuel economy irrespective of the equipment or the grade of coal used. Mr. Cosgrove's book is a valuable contribution to this important subject. It has a place in the library of everyone who is interested in saving coal, from the purchasing agent and superintendent of motive power to the engineer and fireman.

Letters to the Editor

[The RAILWAY AGE welcomes letters from its readers and especially those containing constructive suggestions for improvements in the railway field. Short letters—about 250 words—are particularly appreciated. The editors do not hold themselves responsible for facts or opinions expressed.]

Motor Truck Competition in New England

LONDON, England

TO THE EDITOR:

Slason Thompson's letter in your issue of April 1 demands from me the courtesy of an answer. It shall be very brief.

No conceivable reduction of wages can enable the railroads of New England to reduce their rates sufficiently to prevent motor trucks abstracting a considerable proportion of their traffic under present conditions. Motor truckage will always be cheaper in certain cases so long as the railway rate has to cover capital cost, maintenance cost and movement cost; while the truckage rate has to cover movement cost only. Sooner or later, the public will have to make up their minds to put a stop to the present unequal competition, either by charging the motor truck for the use of the road, or by assuming as a public charge some portion at least of the cost of provision and maintenance of the railroad. Possibly the "sooner" may come when the Interstate Commerce Commission is invited to sanction an increase in New England rates on traffic for which the motors cannot compete, because the railroads have been deprived of the profit which they formerly made on the traffic which the motor trucks have taken away.

W. M. ACWORTH.

Why Not Have a Joint Bureau of Research?

TUCSON, Ariz.

TO THE EDITOR:

Most of the larger industrial companies in the United States maintain departments of research for the purpose of improving their product, or of reducing its cost. We are also familiar with the reports of what Germany has done to commercialize the results of scientific investigation. These facts, together with the financial and competitive difficulties experienced by the railroads of late years, and which threaten to become worse rather than better, have suggested to my mind this question:

Why do not the railroads of the country club together and jointly maintain a department of research for their mutual benefit?

The object of such a department would be: To search out all possible ways of improving service and reducing costs of operation; to co-ordinate the work already being done by the roads independently; to co-operate with those roads already engaged in some special lines of investigation, and to seek aid and co-operation from the laboratories of the technical institutions and universities of the country. This last would appear to be a reasonable return for the taxes paid by the railroads, and would assuredly be welcomed by those in charge of such laboratories because of the practical contacts thereby afforded.

To illustrate the work of such a department of research one might consider these questions. What would be the net saving in operating expenses if the draw-bar pull for a

given train could be cut in half, or even reduced 25 per cent of its present amount? Might not a new type of car bearing be developed that would accomplish this without materially increasing the financial hazard of wrecks due to journal troubles? Or again since the present type of locomotive has about reached its maximum development in respect to size and economy, is it possible to evolve any other type that would be more desirable and satisfactory?

In order to stimulate the inventive thought of its employees and keep them actively alert for the betterment of this work it would be merely good business policy financially to reward those responsible for accepted improvements by a certain percentage of the savings effected during some period of time such as say ten years.

What do your readers think about this suggestion?

A. J. WIECHARDT,

Professor of Mechanical Engineering, University of Arizona.

Effects of Electric Power Used for Traction

SEATTLE, Wash.

TO THE EDITOR:

In the March 18, 1922, issue of the *Railway Age* there appears on page 727 an article entitled, "Effects of Electric Power Used for Traction" which deals with the question of inductive interference and electrolysis as related to railroad electrification. Various references were made in this article to the electrification of the Chicago, Milwaukee & St. Paul, and we feel it necessary, in order that there may be no misconceptions regarding the conditions actually experienced on this electrification with respect to the features discussed in the article, that the following statement be made; this as such alone and without reference to any question of the relative merits or demerits of the different systems of electrification.

The C. M. & St. P. has approximately 650 miles of main line electrification. This includes 550 miles of three-phase, sixty-cycle, 100,000-volt transmission line, which for the greater part of its length is located on the railroad right-of-way, in general about 100 ft. in width, opposite the pole line supporting the railway company's telegraph, telephone and secondary signal circuits. The latter are of the usual open wire construction and, of course, extend the full length of the railway, including the electrified zone. Between the telegraph, telephone and signal lines and the transmission line is the 3,000-volt direct current trolley system, on the poles supporting which are located 3,000-volt trolley feeders, a 4,400-volt single-phase, 60-cycle primary signal supply circuit, and the power indicating and limiting circuit. The latter is operated at 1,200 volts d.c. on the Rocky Mountain and Missoula divisions, and at about 3,000 volts alternating current on the Coast division, the current in both cases being very small.

The telephone and telegraph lines consist of metallic dispatcher's telephone and block circuits and the usual grounded railway telegraph circuits. The dispatcher's telephone circuit is regularly used for all train movements, the dispatcher's office on the Rocky Mountain and Missoula divisions being located at Deer Lodge, 226 miles from the eastern end of the electrification and 211 miles from the western end of the electrification. Before electrification the dispatcher's offices were located at about the middle points of the respective divisions and the length of railway controlled by one set of dispatchers was only about one-half the present length. On the Coast division the dispatcher's office is located at the extreme west end of the 209 miles of electrified line. Train orders are given over these dispatcher circuits the full length of the line. The dispatcher's circuit is transposed at intervals of about 200 ft. and telegraph and telephone wires where

they enter stations are fused and provided with simple standard protectors.

Electrical operation began on the Rocky Mountain division in December, 1915. At that time the feeders extending east and west from the respective substations, instead of being tapped directly at the latter to the trolley, were tapped a mile away from the substation so as to interpose a resistance which would diminish the liability of flash-over of substation motor-generator sets in case of short-circuit on the trolley. This arrangement existed pending the final development and manufacture of the so-called high speed circuit breakers which, during the year 1917, were installed in the various substations in the negative connection to the rail. The function of these breakers is, in case of short-circuit, to very rapidly interpose a small ohmic resistance in the trolley circuit, limiting the magnitude and duration of the short-circuit current to a value which will not cause flash-over of the generators and which can readily be handled by the regular feeder breaker.

Previous to the installation of these circuit breakers, flash-overs of the generators were of comparatively frequent occurrence. These resulted in very little if any damage to the generator, but at times produced a rather severe acoustic shock to those using the dispatcher's telephone circuit, so that a few of the telephones connected thereto were provided with a megaphone horn connected directly to the original receiver. No loud-speaking telephones have ever been installed on the electrified zone on account of inductive interference as stated in the article. The installation of the high speed circuit breakers, though not primarily installed for this purpose, resulted in the elimination of this trouble.

Any effects due to short-circuits on the 100,000-volt transmission system, which are of infrequent occurrence, have, as far as acoustic disturbances are concerned, been reduced to a point where they are considered negligible, largely as the secondary result of the installation of an improved relay system for high tension line, which provides a satisfactory selective action with respect to the rapid and positive isolation of the particular portion of line in trouble. Depending on the severity and location of the short-circuit, the fuses in the telegraph and telephone wires, as referred to above, will or will not blow, but they are found thoroughly to protect the apparatus.

The article in question also states that the noise conditions were such under normal operation as to require changes in the generator construction and the installation of resonant shunts. Under normal operation there has never been interference with the telegraph and telephone circuits of any magnitude sufficient to interfere with the operation of either the telegraph or telephone circuits. Under emergency conditions, such as those above referred to, the means described have taken care of the noise conditions by doing away with the acoustic shock and the undesired operation of the protective apparatus. No changes have ever been made in the generator construction, nor have such changes been considered or contemplated.

With respect to the installation of resonant shunts referred to in the article, three such shunts were installed in the substations on the Rocky Mountain and Missoula divisions at the instance of one of the telephone and telegraph companies, which found by tests the existence in some of their circuits of a harmonic of frequency corresponding to the tooth frequency of certain of the railway company's motor-generator sets supplying the trolley system. The shunts were found practically to eliminate this harmonic from the trolley circuit, and though those in charge of the railway telegraph and telephone circuits felt that the effect of the shunts in the operation of their own circuits was inappreciable, the railway company, in its desire to exercise such co-operation as it deemed reasonable and proper, and to take advantage where warranted of any means of possible improvement, per-

mitted the installation of these shunts and included them in the contracts for apparatus specifications for subsequent electrification of the Coast division. The request with respect to the installation of the shunts on the Rocky Mountain and Missoula divisions applies to those three of the 14 substations in which 1,500 kw. units were installed. In the case of certain of the 2,000 kw. sets of the other stations, the suggestion was made that the already comparatively minor effect of any harmonic due to these sets could be reduced to the very favorable average of the other sets by the simple expedient of shifting the generator couplings so as to secure the best relative position of the two respective generator armatures.

The article states that 60-cycle transmission lines, used in connection with the power supply to direct current trolley systems, give rise to inductive interference which is greater than that caused by transmission lines of 25 cycles serving the alternating current systems. Under exactly the same conditions, a 60-cycle, three-phase transmission line would, naturally, produce greater disturbance than a 25-cycle, three-phase line, but the actual facts with respect to the C. M. & St. P. are that inductive effects under normal operation are not such as to affect the practical operation of the telegraph and telephone circuits. In fact, when different sections of the transmission line were placed in operation, some of these sections being 100 or 200 miles in length, those listening in on the dispatcher's telephone circuit at the time were unable to tell when the current was switched on and off the line.

The writer of the article makes the statement that the conditions on the Chicago, Milwaukee & St. Paul are not comparable with those, for instance, on the New York, New Haven & Hartford electrification, but in what respect this is the case is not stated in sufficient detail to enable a definite idea of the conditions to be derived, either as to length, proximity, etc., of exposed circuits or the effect of conditions of traffic. It is not clear how the fact that fewer trains are run on the C. M. & St. P. than on the New Haven necessarily affects the question.

The simplicity of the interference problem in connection with the C. M. & St. P. electrification, both as regards the conditions to be met and their solution, is one upon which many visitors to our electrification have particularly and enthusiastically commented, both during their visits and in such subsequent reports as we have noted. In this connection it may be permissible for me to refer, as has been done before by others, to the following extract from a report prepared by the French commission which was sent to America in 1919 to study the principal electrified systems in this country:

"A considerable advantage of the direct current system is that it does not seem to have any but the slightest interference with the telegraph and telephone lines—in fact insignificant. We are well able to report that one may telephone very easily on the various lines of the railroad placed all along the tracks on an aerial wire without any protection.

"A multiplex printing apparatus for the telegraph service worked between Spokane and Helena with an earth return, was diverted especially for us in such a fashion as to use a wire placed on the poles of the electric railroad for a distance of 270 kilos. This operated perfectly during eight days without even being troubled by three short-circuits made very complete intentionally between the trolley wire and the rail in the course of the telegraph wire."

With respect to electrolysis, this is recognized to be a question which in the case of the d.c. system should receive careful consideration. Its practical importance, as determined on basis of the protective measures necessary, will depend on the circumstances surrounding the individual case.

In the case of the C. M. & St. P. electrification, the cases of electrolysis which have arisen have been of comparatively minor importance and have required only simple and inexpensive means of correction. For instance, regarding the

substation piping, particularly referred to in the article, it was found about one year after commencement of electrical operation, that at a few of the substations a small water pipe running parallel to the tracks between the substation building and the operators' bungalows was being attacked by electrolysis. As a result of tests, a copper leakage cable was installed and bonded to the pipe and the track rail, which construction was made standard at all stations. The small amount of pipe which had been severely attacked at three or four stations was removed and replaced by new pipe, with the result that it has been unnecessary to replace any pipe during the five years of service which has since elapsed.

Electrical Engineer, Chicago, Milwaukee & St. Paul.

The Future of the Steam Locomotive

NEW YORK.

TO THE EDITOR:

The communication by Frederick A. Delano, which appears on page 1,004 of the *Railway Age* of April 29, presents some tremendously important subjects which railroad officials will think about most carefully. Coming from him, every railroad official will take these suggestions most seriously.

In connection with the steam locomotive, however, such remarkable improvements are available, exactly to meet the requirements of the times, as to justify the suggestion that before going to electrification or to other forms of motive power, the steam locomotive should be developed to its logical limits. Being a rather close observer of locomotive progress, the subscriber holds the conviction that the steam locomotive has never yet been brought to anywhere near its logical limits.

To accomplish this, it is necessary to know what has happened to the steam locomotive during the past few years, to make use of the opportunities available for its improvement and to ask the operating officials to use the new locomotive to the best advantage as manufacturing managers use their expensive machinery.

This is simple enough when locomotive improvements are thoroughly understood. It is most important to recognize the fact that the steam locomotive can be made to be something that it has never been before and that it can be made to do things which it has never been made to do. When this fact is accepted we shall see instantly that the steam locomotive has not yet even approached the limit of its capacity, efficiency and economy.

No one can be in better position than is Mr. Delano to realize and point out the necessity for locomotive improvement. The object of these paragraphs is to show that we have overlooked factors in the steam locomotive problem which will answer the criticisms made of it. It is my belief that several efforts which are now being made in the improvement of both boiler and machinery of steam locomotives on a number of the most progressive railroads will in a short time answer the criticisms and lead to the attainment of the specifications briefly outlined by him. G. M. BASFORD.

Red Tail Lights on Automobiles

CHICAGO.

TO THE EDITOR:

Referring to the editorial in the *Railway Age* of January 14, page 166, and to the letter to the editor by "P.S.C." in your issue of February 11, page 362, relative to the use of red tail lights on automobiles: Many things have been accomplished that seemed to have less likelihood of success than has the substitution of another color for red on the rear of automobiles. The cost per machine is not more than 35 cents to an automobile driver who will do the work him-

self. Certainly each individual automobile driver should be willing to do that much because of the good which can be accomplished by the change.

"Red has always been recognized as an indication for "danger" and should be reserved for that purpose only; otherwise, what color have we left to use for protecting open ditches, material piled in the road and other things of like nature, to say nothing of our railroad crossings?"

Actual experience has shown that the placing of red lights at various heights and locations in the vicinity of crossings does not improve the situation. Red lights on the rear of automobiles and trucks vary in height from the axle to the top of the body and there are no laws or regulations, to my knowledge, which govern this height. Assuming for the purposes of discussion, that a height for the gate lights on highway crossing gates was determined on, different from that of tail lights on automobiles, there would still be no reference point from which to gage this height. If "P.S.C." will go out on the highway some dark night and observe the red lights going up and down hill he will be convinced that there is no elevation which cannot be duplicated in appearance with an automobile. There is therefore no distinctive height which could be selected to distinguish lights on gates from those on automobiles.

The restriction of the use of red to points of actual danger will certainly increase its value where it is used. The most dangerous part of an automobile is its front end but we are sufficiently warned by the white lights used, even when the low power parking lights used in cities are displayed. It is therefore clear that what is required on the rear end is not a danger signal but a marker so that a driver may know which way an automobile is going and where it is. Therefore the use of any other distinctive light will answer the purpose as well as red.

We have received complaints from enginemen relative to the red tail lights of automobiles on highways adjacent to the main line. These lights, moving back and forth, often appear like a red light being waved as a danger signal to an engineman, and this is particularly true on a curve. Under these conditions, enginemen may become so accustomed to this condition that they may overlook a flagman or other's danger signal.

The use of red, green and yellow and the meaning of each light is becoming familiar to automobile drivers, particularly in the cities where these three lights are being used to indicate "Stop," "Caution" and "Proceed." The use of red with the word "Stop" as installed on a good many automobiles and showing only when the automobile is stopping is not objectionable and could be continued.

Red should be reserved for "Danger Here—Stop."

J. A. PEABODY,

Signal Engineer, Chicago & North Western.

A Plea for the Station Agent

CHICAGO

TO THE EDITOR:

I have read with interest and amusement the article entitled "A Plea for Recognition of the Traveling Auditor" which appeared in the *Railway Age* of January 21, page 239. I don't believe that the average agent at an exclusive or supervisory station will agree with many of the arguments put forth by the traveling auditor. His article would indicate that it is customary, on his road, to secure traveling auditors from the employees in the clerical departments. To say that such men are qualified to pass upon the question of who shall, or shall not, be promoted to the agency position is rather far-fetched, and contrary to the well-established custom of promoting men from the ranks of the department in which they have served their apprenticeship.

The traveling auditor is well qualified, as a rule, to pass upon the question of accounts, but if he comes from the ranks of the clerical department, as stated by the writer referred to, he certainly is not capable of deciding who would make a competent agent. The accounting work to be done at a station is only one of the many phases of the business that an agent has to look after and while equally important with his other duties, is not more so. The soliciting of business, and the manner in which he meets the public are the most important features of his work; for the agent must be in close contact with the public in the community which his line serves, and he reflects the policy of his railway to a greater extent than any other employee in the service. Then, from an operating standpoint, the agent should be well qualified to handle men, have a certain amount of executive ability and be able to keep the operating costs down to the lowest possible minimum, and, at the same time, give the public the highest class of service that may reasonably be expected from a common carrier. The agents are as much a separate and distinct class of employees as are the dispatchers, yardmasters, roundhouse foremen, etc., and they have in most cases, or should have, gained their positions through successive promotion, after having served the necessary apprenticeship in their particular line of work.

It is true, as the writer referred to states, that some traveling auditors come into a station with an air of great importance (which deceives few old heads), and treat the average agent or cashier as if he were a criminal. However, after 40 years of service as an agent, I have never felt that his superior officers required him to do this. The traveling auditor is supposed to make a thorough and complete check of the station, seeing that every item is correct and calling the agent's and cashier's attention to anything that is not being handled according to the rules and regulations of the company. He is expected to co-operate with the station forces in bringing the work up to the highest possible point of efficiency. The station employees, and particularly the agent, should be glad to have the auditors check their station, for they are just as anxious to keep their accounts in proper shape as the auditing department and more so perhaps, for they are personally responsible for them. It is only the inexperienced traveling auditor who does some of the things that the writer referred to.

I have never been able to understand why the managements of our railways have given so little thought to their agents and why they do not place an old experienced agent in charge of the agents and the stations on their respective lines. It is probable that the managements have been so absorbed in their technical departments and so fully occupied with the apparently endless contentions of the more radical organizations that they have not given due consideration to their agents, whose department is the producing end of the railway and whose duty it is to see that every pound of traffic in the territory is secured for their line. Some few railways have realized the importance of the agents as a class to a certain extent and have appointed what are known as supervising agents, working directly under the superintendents. The supervising agent is appointed from the ranks of the agents and is generally a man of wide experience in that line of work. In selecting a man for this position, consideration is usually given to his years of service and experience, and to his standing with his fellow agents. The agents in his district report direct to him on all matters pertaining to the proper handling of their department. This is a step in the right direction.

AN AGENT.

THE NORTHERN PACIFIC will sell week-end excursion tickets, at one and one-tenth the one way fare, from Minneapolis, Minn., to Taylor Falls, Big Lake, St. Cloud, Chicago City, Pine City, Rush City, and Lindstrom beginning May 19.

Farm Scene in the State of Michoacan

Mexican Railways Prepared for Improved Business

Roadbed and Motive Power in Splendid Condition—Shortage of Rolling Stock a Handicap

By Charles W. Foss

Part I

THE MEXICAN RAILWAYS have returned to something like pre-revolution standards. The roadbed is in excellent shape—the National Railways are to be congratulated for the manner in which they have restored the lines destroyed during the revolution and for the excellent manner in which these lines are maintained.

Because of the acquisition of a large number of new

some new lines are being constructed. These details will be discussed later.

During 1921 the National Railways had severe labor troubles, the outstanding feature of which was a general railroad strike in February and the first half of March. This strike tied up the railways completely and the resulting congestion was indeed serious. It ended on March 19 in a victory for the men. Labor conditions are at present quiet.

Light Traffic

Referring again to the shortage of equipment, it should be stated that the lack of cars is at present not as serious a factor as might otherwise be the case. The reason is the lack of traffic. There is, in fact, much ground for the

A View in Mexico City

locomotives in 1921, the motive power situation is satisfactory. There is, however, a serious shortage of rolling stock. The Mexican railways lost some 10,000 cars because of the wide-spread activities of the various warring elements during the past few years, which cars they have not been able as yet to repair or to replace. The result for one thing has been a large per diem debit balance with the United States lines which, however, is gradually being reduced as the United States cars are returned across the border. The narrow gage lines are particularly short of cars and the statement was made to the writer that if these lines had more cars they could increase their traffic materially.

The rehabilitation of the Mexican lines has included great activity in the way of new stations and shops. At present

At Torreón

opinion that, if anything, the Mexican railways are in reality rehabilitated to a greater extent than the rest of Mexico. Business conditions in that country today are exceedingly poor; it is suffering from business depression in considerably greater degree than the United States. Whereas business in the States is everywhere showing signs of improvement and the optimist is coming into his own, this is not the case in Mexico. The result is that the railways, even with the

shortage of rolling stock, are prepared to handle a much greater business. If traffic increases, however, they are likely to suffer from car shortage acutely.

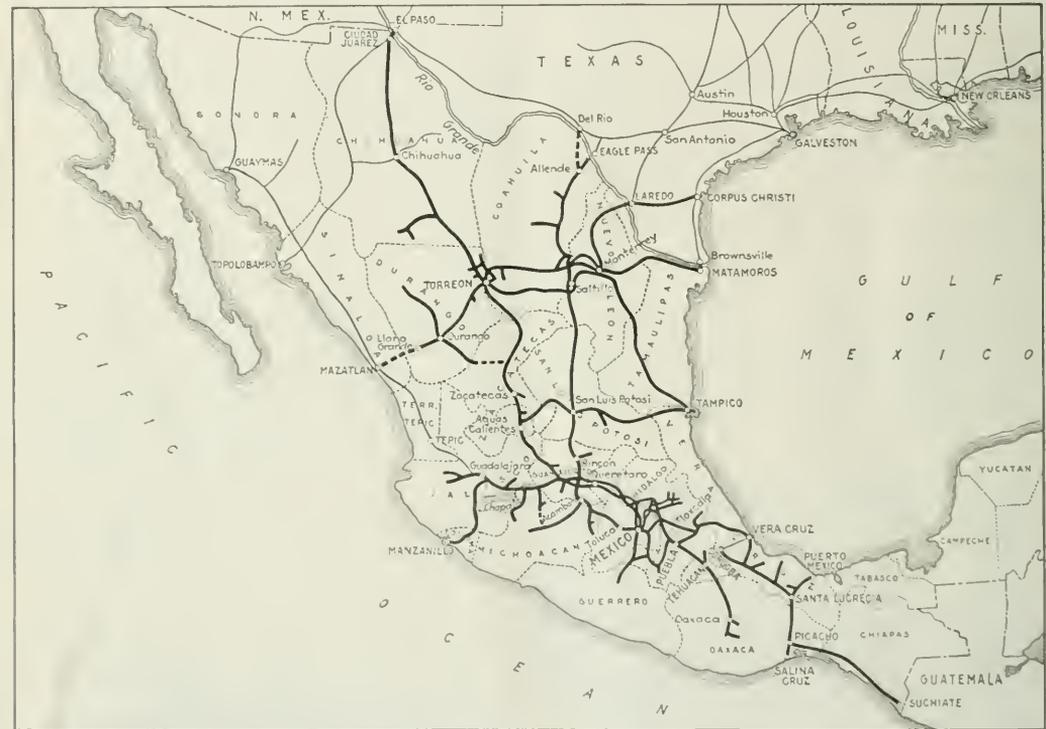

4½ or 5 Days to the Border

With their rehabilitated plant, the National Railways of Mexico are supplying at present excellent service. From the Rio Grande to Mexico City is about 800 miles. Freight is moving from the border to Mexico City in 4½ or 5 days. There has been a sizeable movement this year from the Lake Chapala district of perishable vegetable traffic destined to Kansas City, Chicago, etc. This traffic, moving in refrigerator or ventilated cars, is also reaching the border in 4½ or 5 days with the result that the growers have been

aggregated and made more alarming by all kinds of conflicting rumors. If President Obregon can gain and continue to hold the respect of the business classes improvement will come rapidly.

Mexico an Extremely Rich Country

Mexico is a rich country. It has extremely promising agricultural areas. Its advantages for the raising of stock are practically unexcelled. Its mineral resources are such that prior to the revolution it led the world in the production of silver and was among the leaders in the production of gold. It has large resources in copper, tin, platinum, lead, etc. In Coahuila there are large deposits of bituminous coal. Iron ore is found in several states of the republic, and

Map of the National Railways of Mexico

realizing handsomely on the advantage of having their crops ready about a month ahead of the growers in Florida and southern Texas.

Business Revival Depends Upon Government Stability

The acute business depression in Mexico today, is partly due to the fact that there is a world-wide depression, but it is also partly the result of the unsettled conditions in Mexico. The question, when all is said and done, resolves itself into one of the stability of the present government. It should be said also that a great deal depends upon whether the United States is going to recognize the present Mexican government or not. President Obregon in his term of office has succeeded in restoring in Mexico a more stable state of affairs than has existed at any time since the start of the revolution in 1910. In recent months there have been sporadic outbreaks here and there, which outbreaks have been duly ex-

Tampico is so famous that it is hardly necessary to speak of the resources in oil.

The Tropic of Cancer crosses Mexico about midway of its length, which at its greatest dimension is over 1,900 miles. The total area of the country is about 767,000 sq. miles, equivalent to that part of the United States east of the Mississippi and south of New York. The climate of the country is of many varieties as is to be expected from the fact that the republic extends through so many degrees of latitude, and because of the varying altitudes.

A large part of Mexico is included in the low lying areas adjacent to the coast and in the south. The central portion of the country is a plateau, while to the west of the center is the Sierra Madre range.

Inhabiting this vast area is a population of about 15,000,000 people. Mexico City, the capital and largest city—incidentally it is 7,349 ft. above sea level—has a population

of about 1,000,000. The second city is Guadalajara with about 120,000; the third, Puebla, with about 100,000. Other important cities are Monterrey, 85,000; Saltillo, 35,000; San Luis Potosi, 83,000; Queretaro, 40,000; Durango, 34,000; Chihuahua, 39,000; Torreon, 34,500; Aguascalientes, 45,000; Vera Cruz, 47,500; Oaxaca, 40,000, etc. It is interesting to observe that several of these cities are mile-high cities in the true sense of the term. San Luis Potosi is 6,123 ft. above sea level; Saltillo, 5,200 ft.; Queretaro, 6,000 ft.; Durango, 6,200 ft.; Torreon, 3,742 ft.; Chihuahua, 4,634 ft.; Aguascalientes, 6,181 ft.; Oaxaca, 5,069 ft., etc. A

Agricultural Resources

In referring to the relationships between the Mexican railways and the resources of the districts served by the various lines, one is impressed rather by the potential than by the actual. There is one instance, however, that is something of an exception and that is the Lake Chapala district, which, as will be noted from the map, lies west of Mexico City on the line to Guadalajara. This district is at present shipping perishables destined for markets in the United States, such as Chicago, Kansas City, etc. The movement has not been large. Up to the end of February some 22 cars had moved to points in the States and there were then about 20 or 25 more cars expected for similar movement. The traffic consisted of tomatoes and onions, the growers of which are able to reach their market about one month earlier than the growers in California or Texas. There has also been some movement of cantaloupes although not a large one. Next year a large early movement of cantaloupes is expected, to reach the market about one month or six weeks ahead of the California product.

This traffic in perishables from the Lake Chapala district to points outside of Mexico is being offered this year for the first time. In other words, it is not traffic which moved prior to the revolution and which is now being restored. Its possibilities look good because of its being so far ahead of the producing areas to the north. Refrigerator cars, ventilated but not iced, are used and the time required to Laredo averages 4½ or 5 days.

Formerly there was a movement of early vegetables and onions from the territory on the line between Tampico and Monterrey. There was no such traffic this year, but it is understood that arrangements are under way looking to the planting of a large acreage for next year.

Torreon is the center of another important agricultural district—in this case, the Laguna cotton district. This cotton has a staple 1 or 1¼ inches in length and the crop formerly

A View at Zacatecas

glance at the map showing the location of these various cities will give an adequate idea of how extensive is the central plateau.

The Railway System

The railway lines of Mexico center upon the City of Mexico. What are termed the main lines of the National Railways are the lines from Mexico City to Nuevo Laredo, 803 miles, and from Mexico City to Juarez, 1,223 miles. On the line to Nuevo Laredo are the cities of Queretaro, San Luis Potosi, Saltillo and Monterrey; on the line to Juarez, Zacatecas, Aguascalientes, Torreon and Chihuahua. A transverse line extends from San Luis Potosi to Tampico on the east and to Aguascalientes on the west. From Torreon, there are similar transverse lines to Saltillo and Monterrey to the east and to Durango on the west. Eagle Pass is served by a connecting line. From Monterrey there is a connecting line eastward to Matamoros opposite Brownsville, Tex., and also a line to Tampico.

The south is served by various subsidiary lines, some of standard and some of narrow gage. These include among others the Guadalajara division to the city of that name, to the Lake Chapala district, etc.; the Pacific division to Toluca, etc., and the Cuernavaca division to the south. The line to Vera Cruz is known as the Interocceanic branch. On this line are the important cities of Puebla and Jalapa. The Mexican Southern, operated also by the National Railways, is a narrow gage line between Puebla and Oaxaca. The Vera Cruz & Isthmus extends from Vera Cruz to Cordoba. From Santa Lucrecia on this line the Tehuantepec National extends to Puerto Mexico on the Gulf of Mexico and to Salina Cruz on the Pacific Ocean. The Pan-American Railroad extends from Gamboa, on the Tehuantepec National south-easterly to the Guatemala border. The lines mentioned are all operated by the government. The National Railways operate a total of 8,302 miles, including 6,885 miles of standard gage and 1,417 of narrow gage.

The privately operated lines in Mexico include the Southern Pacific of Mexico and the Mexican Railway. The latter extends from Mexico City to Vera Cruz and has only been returned to its owners for operation within a comparatively recent period.

One of the Parties Visiting Mexico at President Obregon's Invitation Assembled before the Colonia Station, City of Mexico

approximated 150,000 bales yearly. The crop this year is estimated at only 20,000 bales.

Mexico City itself is the center of an important truck garden area. The line to Guadalajara serves a corn and wheat country which, in recent years, has also seen a development with reference to vegetables. Around Puebla also there is a grain country. Iraquato is adjoined by a strawberry and cantaloupe district, but the products are used mainly in local consumption; no effort is made to ship strawberries to the States. Oranges are grown near La Barca, but these also are for local consumption only.

Considerable might be said concerning Mexico's agricultural prospects with irrigation in what is now desert country. The Rio Grande valley is an example, the possibilities of

which one can only appreciate by seeing what has been done through irrigation on the United States side of the river. At present there is a big irrigation project under way at Santa Rosalia in Chihuahua. Water from the Rio Conchos will be used and a large yield of wheat is expected.

Mexico has large lumber resources, including pine and fir in Chihuahua and Durango and the tropical woods in the south.

Grazing

Prior to the revolution Mexico was a grazing country of first importance. Because of revolutionary activities the herds were dispersed or destroyed. Although it formerly exported large quantities of cattle, it is now importing a sizeable proportion of its meat supply. The cattle country was constituted in a vast area in which are the cities of Chihuahua and Durango. Cattle were shipped out through El Paso to northern ranges for fattening, or south to the cattle country adjacent to the railway line between Tampico and San Luis Potosi.

The Mexican railways at one time relied on a large traffic in this connection and also on a sizeable business in cattle moving from the last named district and from the Isthmus of Tehuantepec to the packing houses at Mexico City, but the herds have been so depleted that this traffic has long since ceased. Cattle are now being brought into the northern ranges but not much is being done as yet with reference to restocking the ranges in the south.

Oil

Tampico is an important source of crude oil for refineries in the United States. In addition to the oil exported in tankers, there is also an important movement inland over the National Railways. Mexico's fuel is oil, a statement which applies both to the railroads and to industries in general. New sources of oil supply are being found as far north as the state of Nuevo Leon and in the extreme southeast in the state of Chiapas.

Mineral Resources

Mention has been made above of Mexico's enormous mineral resources. The majority of the states in the republic have extensive mineral deposits of one kind or another. There were many important mineral developments prior to the revolution but it seems to be the general impression that Mexico had hardly begun the exploitation of her vast natural wealth. At any rate, the mineral industries are generally idle today and the railroads are not carrying their former mineral traffic. The most important lines in this traffic were the main lines themselves. There was formerly a heavy movement of iron ore to smelters at Monterrey and Aguascalientes. Saltillo had smelters for silver, lead and copper and there were also such smelters at Aguascalientes, Torreon, Vallardenia, San Luis Potosi and Monterrey. Large mines also were worked at many points other than along or adjacent to the main lines. There were a large number of mines in the territory west of Guadalajara and around El Oro, Oaxaca, etc. The movement of the products of the smelters north to the border interchange points formerly represented a very considerable traffic, which at times reached the proportions of solid trainload lots.

Interchange With United States Lines

With further reference to Mexico's enormous oil resources, one must not fail to notice that Mexico also has enormous bituminous coal deposits in the state of Coahuila.

While what has been said concerning Mexico's resources is necessarily brief, it should give a good idea of the large traffic which the Mexican railways formerly had and of the present potentialities upon which these railways will be able to realize with a return to business confidence and stability.

The National Railways of Mexico interchange business with the railroads in the United States at Laredo, Juarez,

Eagle Pass and Matamoros. Laredo is the more important of these four and secures a considerably larger portion of the Mexican business than either of the other three. At Laredo connection is made with the International & Great Northern and via the Texas-Mexican, a property lying in Texas, operated independently but owned by the National Railways, with the Gulf Coast Lines, with the San Antonio & Aransas Pass and through the latter with the Missouri, Kansas & Texas, etc.

Eagle Pass is a Southern Pacific connection. At Juarez, or El Paso, connection is made with the Southern Pacific, the Santa Fe and the El Paso & Southwestern, etc. The connection at Matamoros or Brownsville is with the Gulf Coast Lines. Interchange and per diem arrangements with the United States lines have been effective since January 1, 1921, but through billing has not yet been restored nor have arrangements been made for the quotation of through rates.

Cars on Road 6 or 7 Months as Result of Strike

At the time the per diem arrangements were restored the Mexican railways were suffering from a severe shortage of

Main Offices of the National Railways of Mexico, City of Mexico

power, which situation was relieved by the loan to the Mexican lines of a large number of locomotives. The congestion at the border points at that time was acute and the situation was made much more severe by a general strike of the Mexican railway men which took place in February and March. The strike tied up the railways completely, although there were instances where shippers secured their own locomotives and crews and operated trains themselves.

At the end of the strike, which was finally settled in favor of the unions, the Mexican railways were in a condition so poor as to be almost beyond belief. This condition lasted for some time and at one period it was a familiar thing for cars to be on the road no less than six or seven months. The improvement which now provides a service of from 4½ to 5 days from Mexico City to the border represents the measure of recovery which has since taken place. One American railroad man said to the writer: "I have never seen a greater improvement in the same length of time in any country, such as that which has taken place in Mexican railway conditions since July 1, 1921."

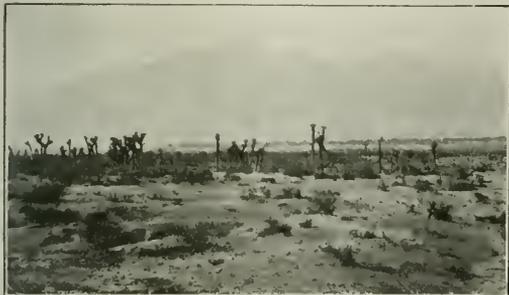

Private Operators

Besides the improvement in relieving the congestion of the early part of 1921 there was also an important factor of improvement in the elimination of the private operating companies. These had been operating trains for some time, although they did not succeed in getting very far during the strike. The scheme was for the private operator to secure his cars from the United States roads under a bonding ar-

rangement, the bond required varying with the type of car. Thus, for a steel underframe or all-steel car a larger bond was required than for a wooden car, etc. The private operator leased his locomotives and paid his own crews. His charges were from 25 to 50 per cent above the regular tariffs and for a time the operators did a thriving business. The extent of the business may be realized when it is noted that in July, 1921, private companies operated approximately 170 locomotives. At present few private individuals are operating in this manner and this part of Mexico's railway history is nearing its close.

Present Traffic

The difficulty of the Mexican railways at present is their lack of traffic. The figures show that in the month of Feb-

Desert Lands in Coahuila—Typical of Much of the Land Seen From the Train on the Central Plateau

ruary this year the northbound movement was 37,347 cars; the southbound, 53,527 cars, and the total, 90,874. The trade with the United States is normally of large proportions. In January, 1922, however, there were imported only 1,500 cars, the lading being principally of coke, lumber, lard, wheat, corn, cattle, coal and miscellaneous. It will be noted that the commodities mentioned include in great measure traffic that should originate in Mexico rather than from import trade. The exports were especially small and amounted in January only to about 150 cars, made up of bullion, fibre, tomatoes, hides and miscellaneous.

Reference has been made to the car situation. The figures relative to the number of cars in service are given in a table. On February 15 there were in service 924 foreign and 11,653 system cars, a total of 12,537 cars. This total number of cars is considerably smaller than the Mexican railways will need with reviving business. However, it is some improvement over July, 1921, when there were no less than 9,000 foreign cars on the Mexican lines.

198 Locomotives Purchased

The reasons for the improvement in operating conditions which gradually began to take place after July 1 were pri-

marily three—one, the improvement of morale of the officers and men; two, the acquisition of a large number of new locomotives, and, three, the smaller amount of traffic since presented for transportation. The Mexican railways leased from American lines about 40 locomotives, including 11 from the International & Great Northern, ten from the St. Louis Southwestern, nine from the Illinois Central, eight from the Katy and three from the Gulf Coast Lines.

The next step was to place large orders for locomotives, including 68 new standard gage and 20 narrow gage locomotives built by the Baldwin Locomotive Works; 27 standard and two narrow gage locomotives built by the American Locomotive Company and 110 second-hand standard gage locomotives purchased from the Illinois Central, the El Paso & Southwestern and the General Equipment Company. Thus, they acquired 95 new standard gage, 22 new narrow gage and 103 second-hand standard gage locomotives, which additions to the motive power put a very different aspect on the situation than had previously been the case. It is not meant to imply that the motive power situation at present is ideal. The latest figures show a total of 505 standard and 102 narrow gage locomotives in service and 510 in shops.

In Excellent Physical Shape

The Mexican railway lines are in excellent physical shape, which fact is all the more interesting when one is told about the manner in which the lines were torn up and destroyed during the revolution. The writer was advised that all of the track which had been torn up had been rebuilt and that the entire mileage of the National Railways was now in operation. It was further added that the lines had succeeded in rebuilding one-half of the section houses and stations which had been destroyed.

Track standards on the various lines vary considerably. There is much 56 and 60-lb. rail still in track on the standard gage lines. This was noted particularly on the line out of Matamoros where 56-lb. rail was found laid on mesquite ties. The main line from Mexico City to Laredo is now laid with 75 and 85-lb. rail for practically its entire length. Work is now proceeding in this respect on the line from Mexico City to El Paso. South of Aguascalientes is now generally provided with the heavy steel, but much of the lighter rail still exists north of that point. Pine ties are generally used on the lines on the central plateau, and hardwood ties on those nearer the coast. Tie plates are used on curves. But few treated ties have been used, although at Aguascalientes there is a tie-treating plant with a capacity of about 120,000 ties a month. The tie situation on the railways is not as good as the Mexican railway officers would like it to be. At present some 500,000 to 600,000 new ties are being put in monthly; on some stretches the tie replacements have run as high as 40 per cent. The ballast conditions vary widely; considerable of the main line is ballasted with rock, but this is not general. Because of the lack of water and of freezing maintenance conditions on the central plateau are favorable.

[The second and concluding part of this article will appear in an early issue of the *Railway Age*.]

Division Terminal at Vanegas

Freight Car Loading

WASHINGTON, D. C.

THE NUMBER OF CARS loaded with revenue freight during the week ended April 22 showed increases both as compared with the previous week and with the corresponding week of last year, in spite of the light coal loading on account of the strike. The total was 714,088 as compared with 704,632 in 1921 and 717,772 in 1920. In 1920 the loading was light on account of the switchmen's strike. Coal loading during the week of April 22 showed an increase of 594 as compared with the week before but a reduction of 74,944 as compared with last year. However, the increase in merchandise and miscellaneous as compared with last year was 69,807, or nearly enough to make up for the decreased coal movement. As compared with last year there were also increases in the loading of grain and grain products, coke, forest products and ore, but a decrease in livestock. Although the principal reductions in freight rates made since Ex Parte 74 have been on grain and grain products and livestock, larger increases in the loading have been shown on other commodities which have had little or no rate reduction. The summary for the week as compiled by the Car Service Division of the American Railway Association follows:

The decrease in coal production also accounts for a further increase in the freight car surplus during the period from April 15 to 23 from about 333,000 to 371,764, of which 229,892 were coal cars and 98,406 were box cars. The number of surplus box cars was about the same as the week before, most of the increase being in coal cars.

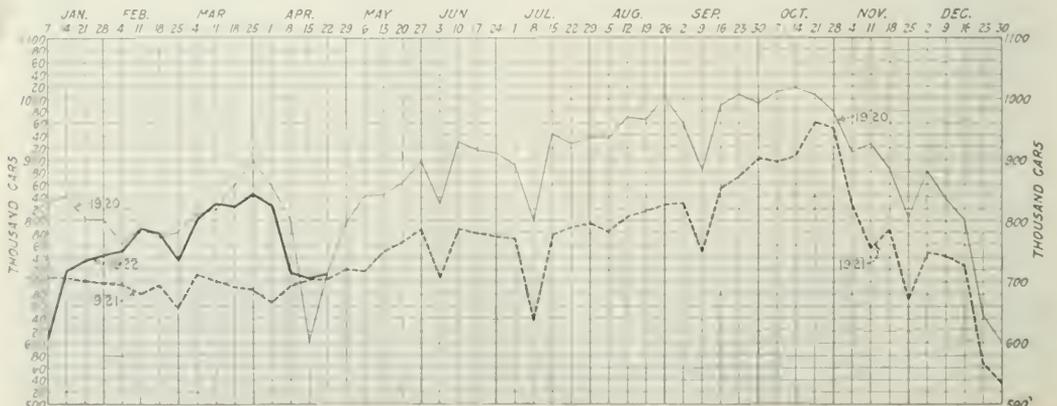

A TRAVELING ROPE, 23 miles long is one of the things boasted of in British Columbia. It is the "aerial tramway," 11½ miles in length, from the Premier Mine to the dock at Stewart. This tramway has a drop of 1,400 ft. from leading to discharge terminals, and it cost \$300,000. The rope is operated by a 60 h.p. electric motor; there are 153 towers in the line, 12 tension stations and 3 angle stations.

ONE OF THE AIRPLANES of the post office department was flown from Chicago, Ill., to Washington, D. C. on April 13 in six hours, two minutes. The distance is calculated at 715 miles, making the average speed 119 miles an hour. On April 17 a seaplane was flown from Palm Beach, Fla., to New York City, 1,210 miles, in 11 hours 16 minutes, including a stop of one hour 20 minutes. A part of this flight was made in a dense fog in which the aviator was obliged to steer by compass.

REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

Group Insurance as Applied to Railroads

A Brief Outline of Its Advantages and as to How Some of the Railroads Are Using It

By William F. Chamberlin

Superintendent, Group Department, the Travelers Insurance Company

A WIDE INTEREST prevails among railroad managers and employees in group insurance. One railroad after another is taking up the investigation of the subject with the result that there are now several cases of group insurance which have been adopted by railroads in one of the various possible forms best suited to the factors and circumstances within the particular organizations. Among the railroad companies that are carrying group insurance at the present time are: the Lehigh Valley; Union Pacific; Bangor & Aroostook; Delaware & Hudson; Delaware, Lackawanna & Western, and the Erie. Group insurance is so flexible that it may be made to reach with its protection every individual or any class of employees in an organization. Herein lies its chief appeal and satisfaction to organizations of railway employees.

The legal definition of group insurance states: "Group life insurance is that form of life insurance covering not less than 50 employees with or without medical examination, written under a policy issued to the employer, the premium on which is to be paid by the employer or by the employer and employee jointly, and insuring only all of his employees, or all of any class or classes thereof determined by conditions pertaining to the employment, for amounts of insurance based upon some plan which will preclude individual selection, for the benefit of persons other than the employer, provided, however, that when the premium is to be paid by the employer and employee jointly and the benefits of the policy are offered to all eligible employees not less than 75 per cent of such employees may be so insured."

Group life insurance must always be written according to some definite formula. The following plans have been found to be practical:

1. An unchanging amount of insurance such as \$1,000 or some other fixed amount for each employee.
2. An amount of insurance based upon wage or salary, such as 75 per cent or 100 per cent of salary.
3. A progressive amount depending upon length of service. For example:

At the end of 3 mo. service—\$500 of insurance
 At the end of 1 yr. service—750 of insurance
 At the end of 2 yr. service—1,000 of insurance
 and thereafter increasing by \$250 a year until a maximum of \$1,500 or \$2,000 has been attained.

A short waiting period, such as three months, six months or one year, serves to eliminate the class termed "floaters."

The amounts of group life insurance in force as reported by the various companies to the state insurance commissioners on January 1, 1922, were as follows:

The Travelers	\$424,443,627
Equitable	376,107,369
Ætna	318,085,180
Metropolitan	289,499,073
Connecticut General	73,106,346
Prudential	45,382,350
Missouri State	14,038,783

The larger amount of this total in excess of one billion and a half is written for employees in industrial enterprises.

Railroads Adopt Group Insurance

Group insurance is the cheapest form of indemnity for loss of life or for accident and sickness. There are several reasons for this. The life insurance is written on a one-year renewable term plan and has the wholesale nature of trans-

action. The premiums on each individual are collected as one. All records and correspondence go to and from the insurance company through one channel only—the employer. The elimination of all personal medical examination further reduces the cost of group insurance.

The amounts of group insurance for the various railroads carried in the insurance companies alluded to vary from \$500 to \$3,000 per individual. The amount of an individual's insurance may depend upon his classification as an employee, or the length of his time of service. Some railroad employers have paid 100 per cent of the premium; other roads have arranged for co-operation with their employees by furnishing the machinery for collecting the premiums and participating therein.

The Lehigh Valley has recently arranged a plan of life and accident insurance as follows:

	Amount of Life Insurance	Principal Sum of Accident Insurance	Total Insurance
Class A—Engineers, conductors, shop foremen and supervisory forces	\$2,000	\$2,000	\$4,000
Class B—Trainmen not included in Class A	\$1,500	\$1,500	\$3,000
Class C—Employees not included in Class A or Class B	\$1,000	\$1,000	\$2,000

In the Lehigh Valley plan the option was submitted to the employees as to whether or not they would be covered under the insurance. This required the solicitation of the entire 20,000 employees, and was successfully accomplished by the Travelers Insurance Company in 10 days.

The Union Pacific is insured under a plan of group life insurance with the Equitable Life Assurance Society of America and for group disability insurance with the Continental Casualty Company. The life insurance is based upon one-year's wage not to exceed \$2,500, or to be less than \$500. Premiums are paid entirely by the company.

Under the plan used by the Delaware & Hudson, insured by the Metropolitan Life Insurance Company, every employee with two years' length of service receives \$500 life and total disability insurance, the premium being paid for by the railroad. By co-operation with a sufficient number of his class and by contribution an employee of the Delaware & Hudson can have a total life insurance of from \$1,000 to \$5,000.

The Delaware, Lackawanna & Western has arranged for group life insurance on the co-operative basis for an amount of \$2,000. This insurance is understood to cover train dispatchers, yardmasters and other supervisory forces in all departments. The Lackawanna group policy is with the Ætna Life Insurance Company.

The Bangor & Aroostook carries group life insurance in the Travelers Insurance Company according to the following formula. The employer pays all of the premium.

	Class I Locomotive Engineers	Class II Locomotive Firemen
3 mo. and less than 6 mo.	\$1,000	\$500
6 mo. and less than 1 year	2,000	1,000
1 year and over	3,000	2,000

The Erie has a group insurance policy in the Travelers Insurance Company covering certain classes of office employees for \$1,000 and \$2,500, and with the Ætna covering shop employees. Announcement was made on January 1, 1922, of the coverage for operating employees, but it is

understood that this has not as yet been placed into effect.

Reasons Why Railroads Have

Adopted Group Insurance

There have been many cases of employee relief organizations that for one reason or another have not been wholly successful. One railroad president is reported to have said: "Another reason why a railroad company might well provide insurance to its employees is that they are constantly creating forms of co-operative insurance, which are not organized on a sound basis, which become insolvent or require the employee to pay abnormally high rates. The employee who is dependent upon co-operative insurance of this sort managed by his associate employees has lost in a large degree his independence and individuality. Such insurance may constitute the only provision for his family. To make that provision sure he is compelled to make his judgment and his views accord with the judgment and views of a majority of the co-operative associates. This may be very prejudicial to a railroad company as well as very prejudicial to an employee."

The group plan must automatically overcome any opposition. It is insurance at the lowest known rate with the most liberal terms, and in the case of death the claim is paid no matter what the cause or where the occurrence. There is no need for physical examination because one of the chief features of group insurance is that no employee shall be excluded because of an adverse condition of health. No man in any occupation carries a sufficient amount of insurance. A railroad employee should retain insurance that he has obtained from any source, and should take advantage of an opportunity to buy additional insurance at the lowest cost.

Group insurance is entirely distinct from workmen's compensation insurance and in no way affects it. In the usual group contract there is protection for death occurring at any time and covering any cause, even that of suicide. No existing legal rights are impaired as they now stand under the state and federal liability laws. Group insurance works independently of any other contract, and the fact that it will become part of the resources of an employee will have no influence on the strength of his claims to any other rights or indemnities.

It is evident to an insuring company that wherever group insurance makes its way, an organization is tempered throughout by good-will. A group insurance policy enlists the interest of the dependents and the family of the employee. The employee feels a connecting tie between the employer and his own nearest interests. Good-will is bound to result. There enters into the relationship between employer and employee the element of human interest over and above that of pay for work.

Group insurance is a measure of undeniable justice. Adequate insurance such as is provided under the group plan cannot be procured at the same low cost in any other way. It must be secured to employees through their employer—otherwise they forego its benefits.

The physical comfort of employees has for many years past been the concern of management. Not only healthful conditions, but comfortable—even restful and pleasing surroundings—are found in many places of employment of men and women. Quite as important as physical comfort is the peace of mind that comes with a sense of security created by protection and provision. More and more is economic security coming to be regarded as a necessity in the life of every individual—whether he possesses great wealth or depends entirely on a wage for the maintenance of life.

Group insurance, when it is carried by an insurance company equipped to render a highly developed service, cooperates with the assured in the attainment of the safest possible working conditions through a service of inspection. Very often a company, because of years of familiarity, is

blind to certain conditions of hazard that are immediately evident to an outside inspector. Unguarded transformers, switchboards and high tension apparatus; unguarded engine flywheels and belts; linemen working on high tension lines with only the inadequate protection of a pair of gloves—such conditions as these are frequently existent and do not seem to impress the people in continual contact with them with their great element of danger. Inspection should rightfully be given to conditions outside the plant, including poles and transmission lines and whether or not the linemen and other outside employees are equipped with the proper protective clothing and devices so that they may reasonably be protected against accident when working on the lines. A great source of danger lies in the carelessness of people who become accustomed to dangerous conditions, especially when such thoughtlessness admits, for instance, of the neglect of shutting off a current from lines when repair must be done on them.

A recent accident, although happening in England, well illustrates this point. Eight men out of a track gang of nine were killed while working on the line. In this case the foreman, a railroad man with 19 years' experience, depended upon hearing approaching trains when a train was passing the gang on an adjacent track. Group insurance is effective because it encourages safety effort along positive lines. It is found that men work with greater freedom and better accomplishment when assured of a thoughtful protection from such fatal danger.

Engineering inspection should be supplemented by sanitary inspection. Railroads have complied with the standards of the insurance company regarding toilet and washing facilities, the distribution of drinking water, the installation of a standard first aid kit and elementary instruction in resuscitation. It is a remarkable fact that at certain points on uninspected lines (uninspected when related to high standards of inspection) where there is the greatest danger of shock from electricity and where the cases are actually numerous, there is no provision made for resuscitation either through the personal efforts of some instructed co-worker or by the application of remedies and devices usually required in a first aid kit.

At the time of the award to the Pennsylvania Railroad of the Travelers insurance medal as the American employer who during the current year did the most for the protection of the lives and limbs of its workmen by the chairman of the jury of award of the American Museum of Safety, W. W. Atterbury of the Pennsylvania Railroad said:

"In accepting the Travelers medal for industrial safety, the Pennsylvania Railroad desires to express its earnest appreciation of the honor. Its great value is the incentive to our officers and employees to still further achievement. Industrial safety is an important branch in the broad humanitarian scheme that has characterized the policy of the Pennsylvania Railroad for many years in the conservation of human life and energy.

The Status of Group Insurance

No one has obliged any of the group insured railroads to extend to employees the opportunity of access to adequate life, accident and sickness insurance. There is no law requiring such a measure; there is but little precedent. The basis of this course of action is a desire to see simple justice done. Economic security is one of the principal needs of labor today. It ranks with those other questions which determine the temper of industry and cause the violence of its pulsations—wages, hours, industrial status and a fair share in profits.

Economic security is a condition of relief from the fear of an unprovided-for old age, unemployment, sudden unprovided-for death, illness or accident. To remove fear is to remove the first cause of human restlessness and discontent.

A Partial View of the Tie Treating Section of the Yard

A New Timber Treating Plant at Minneapolis

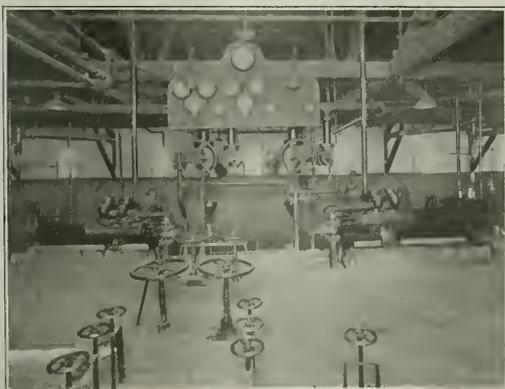

Advantageous Location and Substantial Construction Characterize
Project Completed Near That City

IN THE ERECTION of a new timber treating plant at Gilkey, near Minneapolis, Minn., lies one of the interesting timber treating developments of the past year. This plant is owned by the Walsh Tie Company of Minneapolis and is located $7\frac{1}{2}$ miles from that city. Here have been established

standard gage tracks connected at both ends with a track tributary to the Minnesota transfer yard. As a glance at the map will show, these tracks are parallel, the first six being spaced 112 ft. apart, the two serving the pole plant 66 ft. apart and the remaining 100 ft. and 120 ft. apart. These tracks are inter-connected at logical points to provide standard gage connections between the several plants, and in the tie treating section of the yard are supplemented by a system of five narrow gage tracks parallel to and between the standard gage tracks and connected at one end in such a way as to permit of their operation independently of the standard gage system.

The Tie Treating Plant

All of the buildings and structures entering into the project are situated in this yard with the exception of the living

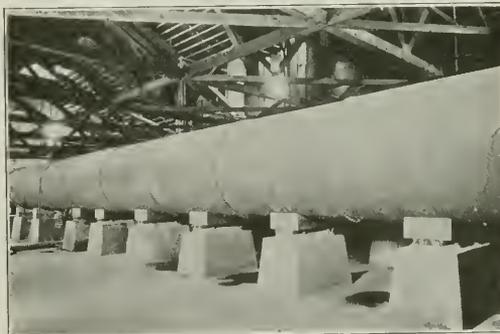

How the Operating Valves Are Arranged in the Retort House

facilities for the pressure treating of a million or more ties annually, with extensive facilities for treating telegraph and telephone poles, and a plant for sawing, splitting and trimming fence posts. The buildings are of unusually substantial construction, and are arranged and equipped in a way that shows close attention to detail. The project includes a sanitary sewage disposal system, comfortable housing facilities for employees, and aside from providing ample arrangements for future expansion, is so situated that the facilities are readily accessible to all railroads entering the "Twin Cities."

General Layout

At present the project occupies about 100 acres of a 284-acre tract owned by the company and available for timber treating use, and consists in general of a yard of 11

The Retorts Are Carried on Roller Bearings

quarters for the employees, which are just outside at the end nearest the tie and pole plants. All of the plants are connected by underground electric conduits extending from a transformer station near the tie plant, and the pole and tie plants are also connected with steam lines from a central power station.

The tie treating plant is located at the west end of the

yard and along the north side of that section devoted to the tie industry. It comprises a retort house, a 500-ft. loading platform for tram cars, a two-stall narrow gage engine house and machine shop, and a laboratory, storehouse and storage tanks for the preserving solutions. The loading platform is directly ahead of the retort house on the line of one of the narrow gage tracks, which upon reaching the platform, branches into three parallel tracks which extend throughout the length of the platform and thence directly to the retort house. The loading platform is elevated to the height of a flat car and is served on each side by a spur track extending from the nearest standard gage track; and the three narrow gage tracks, as they leave the platform in the direction of the retort house, accommodate a cross-over system whereby tram cars that are loaded on one side of the platform may be switched to the opposite side of the retort house.

The retort house is a frame structure with concrete foundation and floor, the roof of which is supported on trusses substantially cross-braced and carried on the sidewalls. The roof itself is shingled and the walls are finished in stucco. In this house are two retorts, each 6 ft. in diameter and 123 ft. long, with additional space for a third retort when needed. The retorts are supported on roller bearing iron saddles, each carried on one of 15 concrete piers. The anchors for holding the retorts are placed at the middle to provide for ample expansion and contraction in the cylinders.

There are two working tanks in the building, each 14 ft. in diameter and 21 ft. high, and two storage tanks situated just outside of the building to one side of the retort house tracks, one 20 ft. in diameter and 20 ft. high, the other 40 ft. in diameter and 40 ft. high. All of the pipes and valves connecting the retorts with these working and storage tanks

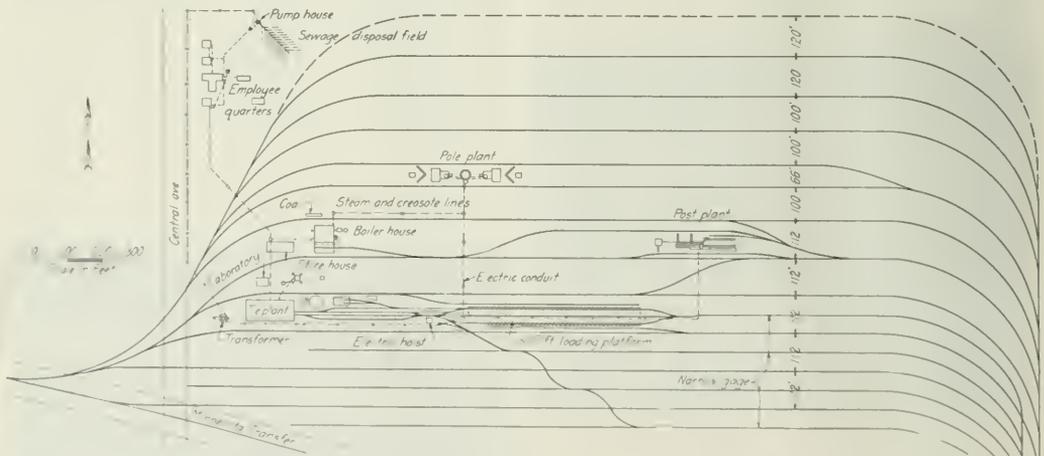

and about the tie storage yards. The machine shop for the narrow gage equipment is located within a short distance of the retort house and is reached by a turn-out from one of the narrow gage tracks leading to the retorts. This house is of frame construction finished in stucco, as are the laboratory and storehouse, which are also located near the retort house.

Steam for operating the pumps in the tie treating plant

A Side View of Half the Pole Treating Plant

and for heating the solutions at both the tie and pole plants, as well as for heating the buildings, is obtained from a nearby power house, while the water supply for the power house and for other purposes, especially for fire protection, is obtained from a 50,000 gal. elevated steel tank adjacent to the retort house. The power plant is a brick structure

The Ground Plan of the Timber Treating Plant

are carried in an open basement in the retort house and in concrete connecting conduits, the handles on all valves required in operating the retorts being extended above the floor. Two pressure pumps, two air compressors, one vacuum pump, two oil pumps, one fire pump, and one zinc chloride pump, all situated in the operating room of the retort house within easy reach of the operator, constitute the mechanical equipment for performing the tie treating operations; and one 21-ton steam locomotive and 150 tram cars, together with a stationary electric hoisting engine, itself situated at the narrow gage track cross-over between the loading platforms and the retort house, provide the equipment for hauling and otherwise handling the ties or other timbers in and out of

48 ft. wide, 54 ft. long and 42 ft. high in which are four 150 hp. boilers, which furnish ample capacity for all requirements at the tie and pole plants and at the employees' quarters. This plant is served by a spur from one of the standard gage tracks, this spur terminating in an elevated timber trestle in the rear of the building for the purpose of dumping the coal cars.

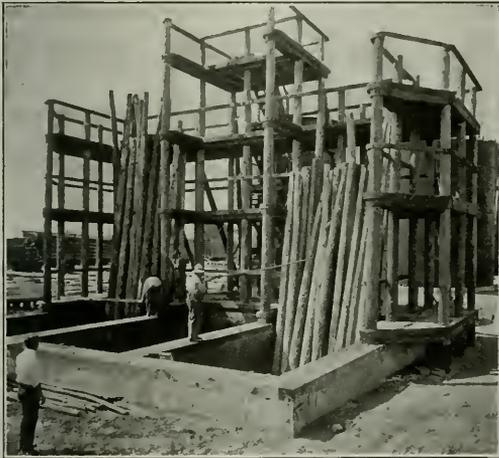

The source of the water supply from which the steel tank is filled is a well 453 ft. deep, situated some distance from the yard. From this well the water is pumped by an air lift system having a capacity of 750 gal. per minute, this equipment together with the fire pump in the retort house providing fire protection for all of the property within 200

ft. of the retort house as well as protection for the employee buildings.

The Pole Plant

The pole treating plant is situated between two standard gage tracks and is constructed in two units, having a common storage tank. Each unit consists of a 30,000 gal. working solution tank, 14 ft. in diameter and 20 ft. high; three depressed immersing pits equipped with heating coils on the bottoms and sides and, above the ground, with timber racks for supporting the poles in an upright position while the butts are being treated. It also includes an electrically-operated crane for loading and otherwise handling the poles. The storage tank, common to both units is 27 ft. in diameter and 30 ft. high with a capacity for 130,000 gal. of creosote oil. The three pits are each 10 ft. by 22 ft. in cross section and 11 ft. deep each with capacities for one carload of poles. The entire plant is thus capable of handling six carloads of poles at one time.

Each unit has its own operating equipment which is located in a concrete room under the pit and consists of two 250 r.p.m. centrifugal pumps operated by a 240-hp. motor, together with the necessary valves for controlling the flow

A Close-Up View of One of the Pole Treating Units

of the creosote. These pumps are large enough and the valves and piping arrangement are sufficiently flexible to enable a constant circulation of oil to be maintained in any one or all of the pits and to permit changing the oil from hot to cold within three minutes. For the purpose of handling the poles there is in addition to the electric hoists (the machinery for which is housed in a frame structure finished in stucco) a locomotive crane; and the plant is further equipped with a puncturing machine for making whatever holes are desired in the poles. Connected with this machine is a 500 ft. roll-way laid in such a manner that poles unloaded from cars at the puncturing machine may be transferred directly to the treating tanks.

The Post Plant

As shown on the map, the post plant is located at some distance from the tie and pole plants, whereby post manufacturing operations may be carried on independently of all other work in the yard. This unit, similarly to the pole plant, is located between two standard gage tracks, which in this case are only 66 ft. apart. It is constructed to handle

all sizes of fence posts and is operated entirely by electricity, three motors being installed for this purpose. The posts are loaded from the cars directly into a conveyor which carries them to the saws where the ends are trimmed. After trimming, the posts are inspected and separated into different sizes, then dropped into baskets which are handled by a locomotive crane and unloaded in the yard for storage or loaded into tram cars for treatment, a cross-over to the track in the vicinity of the treating plant having been provided for this purpose.

While not connected directly with the tie treating, one of the interesting features of the project lies in the facilities which have been provided for the employees. As stated elsewhere, a colony of houses has been established just outside of the yard at one end for this purpose. This colony consists of three stucco finished cottages, a combined kitchen and mess hall and a combined lavatory and bath house. The mess hall has a capacity for 125 persons and is provided with a combined refrigerator and ice storage house. The buildings are comfortably arranged, are equipped with steam heat and electric lights and hot and cold water, and are served by a sanitary system of sewage disposal, the latter terminating in a septic tank and tile drains distributed through a disposal field.

As mentioned at the outset, the project provides facilities for treating a million or more ties annually and may readily be expanded as the demand for its use increases. It is owned by the Walsh Tie Company.

Less Politics in Canadian Railways

"THERE ARE 100 BODIES for the regulation of the railroads on the North American continent. Only one of these is in Canada, the other 99 are in the United States." This fact was ascribed by D. B. Hanna, president of the Canadian National Railways as responsible for the success of government ownership under the plan effected by the Canadian government, in an address at a dinner given in his honor by the Mid-Day Luncheon Club at Springfield, Ill. on April 28. Mr. Hanna was followed on the program by Francisco P. de Hoyos, general agent of the National Railways of Mexico, New York City. The speakers were introduced by William H. Finley, president of the Chicago & North Western, who served as toastmaster.

An abstract of Mr. Hanna's address follows:

Address by President Hanna

There are six essential points of difference between the conditions under which government ownership is conducted in Canada and those under which government operation was tried in the United States during the period of federal control. These are as follows:

(1) In the United States the government took possession of the roads over night as a war measure. In Canada the government acquired the railways by construction and purchase, step by step for economic reasons. (2) In the United States the object was unified service, regardless of cost. In Canada the government's object was to insure adequate and efficient railway service. (3) In the United States, federal control was recognized as a temporary condition. In Canada the plan of a national railway system was designed to be permanent. (4) In the United States the method of management adopted was political with a cabinet minister in charge, whereas in Canada, on the creation of the National Railways, a corporate form of administration was established and the appointment of a new board for the Canadian National Railways on its acquisition by the dominion government in the fall of 1918 was made the occasion of taking away from ministerial or political control, those lines formerly administered by the Department of Railways and Canals.

These lines were also placed under the new board, composed of outstanding business men and railway officers. Thus the entire system owned at that time by the dominion government was placed under an organization of a corporate character. Subsequently the management of the Grand Trunk Pacific, of which the minister of railways and canals was appointed receiver, was also placed in the hands of what is known for convenience as the Canadian National Railways' Board.

The fifth difference is that under the United States plan competition was eliminated and a great monopoly was established. In Canada competition was preserved. The effect on the employees is a sixth point of difference, although actually the result of the first five. In the United States the indifference that generally accompanies monopolistic operation was definitely felt. Competition is the spur to endeavor and the result has been that our own employees have been "on their toes"—keen to advance the interests of the system for which they work—enjoying the contest for the nation's business.

There are many in Canada who were opposed to public ownership of railways; in fact, public ownership has not been adopted as a plank in the platform of any one of the large political parties. The form of public ownership adopted in Canada was one which followed logically the policy of assisting the construction of railways which successive governments had adopted. (Mr. Hanna then roughly sketched the history of the main sections of the national system).

This national system serves the nine provinces of Canada—and competes with the Canadian Pacific for the trans-continental and other business of the nation. In a few months the Grand Trunk is to be taken into this system and will add 4,776 miles and give the national system a total mileage of 22,375 miles.

I am not discouraged by the record of the nationally owned lines in the last three years. While the losses in operation had been large 1921's performance was 20¾ million dollars better than in the previous year, and during four months of 1921 there was an actual net return. Traffic was below normal and it was well known that a disproportion between expenses and earnings has existed since 1918 (and even before) and had most adversely affected the operation of the roads in the United States in 1919, 1920 and 1921. In 1921 the C. N. R. stood alone as a transcontinental line that had an increase in gross earnings. The increase was just over one million dollars; and during the same period the privately owned competitor experienced a shrinkage of 23½ million dollars in its gross revenues. While traffic density was light on the Canadian National, the train load was relatively good and steadily improved. Also a fine passenger service was maintained.

During the period of high prices and low rates the Canadian National had had to make large expenditures to take up deferred maintenance and was under the necessity of spending large sums of money for improvements and betterments and new equipment. The principal trains are now made up of modern steel cars.

Two consolidations of staff have been effected with an entire absence of friction, and four groups of lines, all more or less designed as competitors, have been made into a smooth working though complex transportation machine. A preponderance of main line mileage has increased the difficulties of the management. Much of the mileage was new—the main lines were completed in the second year of the war; in fact over 15 per cent of the national system's mileage has been taken over for operation since the outbreak of the war. Canada with a population of 8¼ millions added to its railway system in the 10 years ending with 1921 a total of 14,650 miles of railway, whereas the United States with a population of 108 million added in the same period but 10-

280 miles. In population Canada had only 2.3 persons per square mile of area. The United States had 40. To support each mile of railway Canada had 233 persons to the United States' 430. However, there is promised a growth of Canadian population such that Canada will soon provide enough business to support its entire railway mileage. Canada has all the basic materials in great quantities that have contributed to the great development of the United States; forests, fisheries and mines, as well as agricultural lands, and particularly the greatest hard wheat producing areas in the world.

Much has been said of politics interfering with efficient operation of government owned lines. That is ancient history. Under the present form of corporate administration I stand here and tell you that in the last three years there has been no political interference. During this period we passed through an election and quite an intense affair it was, and yet at no stage nor at any point on the system can anyone state that anything was done by the management to serve political ends. The directors have taken a firm stand that no one employed by the railways should take a greater interest in politics than to exercise his franchise. It was laid down as a rule that anyone who identified himself with a political party to the extent of accepting a nomination as a candidate automatically severs his connection with the system.

At the election referred to, the government changed and it is announced that it will continue the present plan. If this is done I can see no reason why the nationally owned lines in Canada should not prove to be self-supporting eventually under normally adjusted expenses and earnings. From the shippers and consignees' point of view the plan of dual competitive service to every important community is ideal. There is no competition in service and in principle of ownership—the one system is nationally owned while the other was at its inception nationally endowed—the two systems compete for the nation's business. Both systems are strong and in good physical condition; both have a capacity considerably beyond normal traffic movement—at present business is sub-normal.

Canada can therefore face a period of expansion with confidence that her railways are in a position to assist in the development work. In the past the railways have played a great part in the national progress and in the period immediately ahead I am confident that the Canadian National will be a big factor in the upbuilding of the country and will ultimately be recognized as one of Canada's greatest assets.

A Reply to Some of Frank J. Warne's Charges

Facts Were Neither Fairly Presented Nor Logically Interpreted
—Conclusions Therefore Not Valid

WASHINGTON, D. C.

C. S. DUNCAN, an economist who was statistician for the United States Shipping Board at the Paris Peace Conference, testified before the Senate Interstate Commerce Committee, on April 29, as a witness for the railroad executives that accusations made by Frank J. Warne, representing the train service employees, against the railroads, were not only unfounded but that Mr. Warne repeatedly misstated facts and drew illogical conclusions from his own arguments. Mr. Duncan quoted extensively from the decisions of the Interstate Commerce Commission and other official reports to show the falsity of certain of Mr. Warne's statements.

"The railway executives," said Mr. Duncan, "in asking that a reply be made to Mr. Warne's testimony, have naturally felt that the charges and accusations there made are not true, that the facts are neither fairly presented nor logically interpreted and that the conclusions are therefore not valid. Let me say at the outset that I agree in general with that statement, and because I agree I feel fully justified in coming before this committee as a disinterested witness. I have confidence that I can demonstrate to you that Mr. Warne is wrong in all of his major conclusions."

Taking up the policy of the Railroad Administration during federal control, Mr. Duncan said the witness misstated the facts when he said that "the governmental policy as to revenues was not based upon economic principles of having earnings exceed or even meet expenses and that general taxation out of the United States treasury was depended upon to meet any resulting deficits."

"That it was the policy," said Mr. Duncan, "of the Railroad Administration under Director General McAdoo and Director General Hines until far on into 1919, to make revenues pay expenses and rentals, and that Director General Hines relinquished the policy with reluctance and as a matter of expediency when it became clear that the roads were going back to private control, is proven by their own statement. The Railroad Administration attempted to operate the roads on the same economic principles as private management must do. It endeavored to make income equal outgo with 'a margin of safety.' It failed because its judgment was in error as to costs, the largest element of which was wages."

Mr. Duncan called attention to "the apparent desire of the witness" in an exhibit filed with the committee "to have the observer draw the conclusion that the railroads made one final grab into the treasury bag just before the so-called government guarantee period ended with the month of August, 1920."

"The striking increase in operating expenses in 1920 does not represent an orgy of expenditures at government expense, but an avalanche of wages at the railroads' expense," said Mr. Duncan. He added that two facts of outstanding importance have received no mention in the exhibit; namely, the increase in rates made on July 20, 1920, and retroactive to May 1 and the increase in rates effective August 26, 1920, but not retroactive. "These things the witness knew perfectly well when he constructed the exhibit and when he presented it for record." Continuing, Mr. Duncan said:

"The increase in rates failed to secure sufficient operating revenues to pay operating expenses and the rental agreed upon in the standard contract or the return provided for as to the roads not signing the contract. This deficit of \$711,947,242 had to be paid out of the federal treasury.

"This deficit does not include the tremendous sum necessary to liquidate the claims of the roads under the upkeep

section of the federal control act or the amount required for an adjustment with the so-called short lines, or the amount involved in the claims of 'third persons' against the Railroad Administration. These sums have been estimated by Director General Davis at \$1,100,000,000.

"The amount due the roads under the guarantee for six months, March to August, inclusive, 1920, now stands at \$653,539,001. The total appropriation made by Congress to the Railroad Administration to date has been \$1,750,000,000. The return on railroad property investment account under federal operation, disregarding the rental and guarantee was for 1918, 3.76 per cent; for 1919, 2.75 per cent and for 1920, 0.32 per cent. The percentages of return on property investment actually realized from rental and guarantee was for 1918, 5.05 per cent; for 1919, 5.05 per cent, and for 1920, 4.29 per cent. The return to the roads has been strictly limited for the period of unprecedented prosperity for industry generally, thus preventing the accumulation of reserves to meet the period of depression."

Replying to statements made by Mr. Warne challenging the accuracy of sworn information furnished the Interstate Commerce Commission by the railroads, Mr. Duncan quoted from the commission's decision in the 15 per cent rate case, as well as from other utterances of that body in which the commission said that it had checked the statistical reports of the carriers and that there was no question about their accuracy. Despite this record, Mr. Duncan said "the witness maintains his charge of duplicity and deception as a deliberate policy of the railroads."

Referring to "the charge of inordinate expenditures for maintenance, at least on certain roads by regional directors during federal control" made by Mr. Warne before the Senate committee, Mr. Duncan read for the purpose of disproving the accusation, statements made at various times by the Interstate Commerce Commission relative to maintenance. "The commission certainly had all the data available for anyone to use," said Mr. Duncan. "It had heard both sides without partisan interest. It had been made fully acquainted with the bad as well as the good in railway managements, the inefficiency as well as the efficiency. By a most searching investigation the Interstate Commerce Commission found no such excessive expenditures prior to federal control. There is nothing in the reports of the directors general for the period of federal control that indicates anything in their opinion but an inadequacy of transportation facilities when the roads were taken over.

"From all of these sources, certainly not biased in favor of the carriers, an analysis of the same data presented by Mr. Warne leads to the conclusion: The roads were not overmaintained, but rather undermaintained to meet the transportation needs of the country, prior to federal control, at the time of federal control, during federal control and when the roads were returned to private control. The charge, therefore, of expenditures running riot, of excess expenditures, of over maintenance will not hold against this evidence."

In reply to the accusations that the railroads during the first six months after their return to private control on March 1, 1920, had padded their operating expenses, particularly the maintenance accounts and attempted to secure money from the federal treasury for the purpose of building up their properties, Mr. Duncan charged that Mr. Warne "by deceptive charts and misleading, insinuating statements has sought to impute dishonesty to railroad managers."

While there was an increase in maintenance expenditures during that six months period, Mr. Duncan said that it was due to the condition in which the properties were returned at the end of federal control, and the fact that costs were abnormal. Mr. Duncan added that the Transportation Act of 1920 contains a specific provision to protect the federal treasury for the six months guaranty period and continued:

"The Interstate Commerce Commission is directed under that act to determine and has been busied at a determination of, the expenditures that in its opinion properly belong in operating expenses. The carriers were fully cognizant of this provision at the time expenses were being made. If there had been a temptation on their part to inflate expenditures unduly, the specific provision in this act would have restrained them. The carriers knew that all of their expenditures on maintenance would be fully and carefully reviewed. They have presented to this committee precisely the same data that they gave to the commission for review.

"It seems clear that the witness has again fallen into error by comparing varying money costs when he should have compared physical and service units. He can find no corroborative evidence for his charge either from the Railroad Administration or the Interstate Commerce Commission. The latter calls attention in its annual report for 1920 to a shortage in equipment; in its own words to an 'impaired transportation machine' with which to meet the abnormally heavy traffic requirements.

"When the roads came back," continued Mr. Duncan, "they were not being run on an economic basis. Expenditures were greater than receipts and expenditures had been much restricted by orders from Washington. For January and February, 1920, the net income ran below the standard return by \$153,000,000. Private management had set before it the stupendous task of restoring the economic equilibrium. The Railroad Administration and the government virtually said: 'Here, take this impaired machine; apply it effectively to the greatest volume of traffic on record; 75 per cent of your freight cars are on foreign roads; find them, repair them, but don't delay traffic; your employees are discontented but we have imposed upon you expensive rules and regulations and we expect to add over 618 million dollars annually to your payroll to satisfy them; there is no program for the year, make one; repair your locomotives and your roads; haul the biggest movement of grain known in history with box cars, 50 per cent of which are not fit for such service; get your cars on your own roads, send empties to areas needing them; haul coal and haul coal longer distances where industry needs it to forestall any possible shortage; you will pay more for your own coal and it will not be of as good quality; your fuel bill will be increased above ours in 1919, which was 396 million dollars, to more than 566 million dollars, an increase of 170 million dollars or 43 per cent on this one item; traffic will overload the impaired machine until you will be driven beyond the point of diminishing returns; sometime along we'll set a value on your property and attempt to increase your revenues to secure a fair return on it—but meanwhile your treasuries are empty because the government took away your ready cash at the same time with the control of the roads and has not returned it; you have not been permitted to share along with other industries the prosperity of the war period; you have no reserves with which to meet a business depression; you must face a public who will resent heavier freight and passenger rates; you will be compelled to ask higher rates and fares when the universal demand for the public is for lower rates and fares; we'll police your accounts and judge your expenditures by the test period. Go and justify yourselves."

"All of the economic distress of the world cannot be laid at the door of the railroads," said Mr. Duncan. "Mr. Warne claims that purchases of supplies and materials, especially in the six months' guarantee period, March-August,

1920,—created an artificial prosperity and the stoppage of such purchases brought on the business depression. But this does not surely account for the fact that a break in the rubber market came as early as February, 1920, followed quickly by distress throughout the automobile business. It does not account for the break in the silk market in May, 1920, followed within a few weeks by cotton and wool. It does not account for the indefinite 'vacation' given its employees by the American Woolen Company beginning July 1, 1920, when its mills were closed. It does not account for the break in the sugar market in July, 1920. It does not account for the rapidly rising tide of cancellations throughout the last four months of this guarantee period. It does not account for the slump in farm prices nor the break in wholesale and retail prices in 1920.

"The break in prices, the demoralization of markets, the beginning of liquidations, the advent of unemployment, the onset of business depression all took place either prior to or during this guarantee period. Purchases by the railroads of supplies and materials, not only did not cause artificial prosperity but also failed to prevent or even postpone deflation. The railroads were not, as asserted by Mr. Warne, the cause of inflation and the cause of depression, but, much more than other industries, because of government regulation and the consequent slow processes of adjustment, they were caught in the 'fell clutch of circumstances.'"

Mr. Duncan told the committee that the compensation paid general and division officers represents only 2½ per cent of the total wage bill of the railroads. The increase in compensation paid general officers from 1916 to 1920 inclusive was 42.1 per cent, Mr. Duncan said, while to division officers it was 125.3 per cent, of which, however, 60 per cent represented increases granted the lowest paid officials. Contrasted to this, however, the increase in the total wage bill paid all employees in 1920 over 1916 was 151.8 per cent. Eliminating the pay of general and division officers shows, however, according to the witness, that railroad employees, excluding general and division officers received an increase in pay of 154.9 per cent.

Statistics issued by the Interstate Commerce Commission show that the average annual compensation paid employees in 1920, including general and division officers, was \$1,820. Excluding these officers, Mr. Duncan said, the average annual compensation for employees was \$1,794 or a difference of \$26.

Mr. Duncan denied statements made originally before the Senate committee by Mr. Warne and subsequently reiterated by Samuel Gompers, president of the American Federation of Labor in a speech before the National Agricultural Conference in Washington, to the effect "that over \$1,250,000,000 has been placed to the cost in wages of the railroads and placed by them to the railroad workers more than is properly or ought to properly be charged."

"There is no overstatement of total compensation and he knew it," said Mr. Duncan, in referring to Mr. Warne's testimony. "As a matter of fact he has made no claims that the items were not actually correct or that the sums were not actually paid to the classes specified and in the years under review. For this witness to have stated his conclusions in such equivocal terms as to be generally misunderstood is reprehensible. The vast wage bill of \$3,698,216,351 was actually paid to railroad employees in 1920."

A witness for the National Association of Owners of Railroad Securities was to follow Mr. Duncan on Thursday. It is understood that Chairman Cummins hopes to be able to get out a report as a result of this investigation, which has been continuing for about a year, within about three weeks. It is hoped also to have a report within that time on the Capper and other bills to amend the transportation act. It is expected that the report of the committee will be unfavorable.

The Model 55 Service Coach Drives on All Four Wheels of the Leading Truck

New Features in Service Railway Motor Coach

Unique Type of Truck with Cushioned Wheels—High Seating
Capacity Combined with Light Weight

A MOTOR COACH especially designed to meet the requirements of railway service has been built by the Service Motor Truck Company, Wabash, Indiana, and is now being operated on demonstration trips over the lines of the Big Four between Wabash, Indiana, and Benton Harbor, Michigan. The power plant and details of the transmission follow regular motor truck practice, but the design of the running gear as well as of the car body is a complete departure from the motor bus type of construction.

Interior of the Passenger Compartment

A seating capacity of 38 passengers is provided in the body of the car and there are seats for 8 additional passengers in the baggage compartment, which may be folded up against the sides of the car.

Although the total weight of the car does not exceed 13 tons the body is of rugged construction built up on an underframe of four 6-in., 8-lb. channels and it is carried on two four-wheel trucks with power transmitted to both axles of the forward truck. The body is 42 ft. 5 in. long over the bumpers and 8 ft. 6 in. wide over the posts. The frame is of steel construction throughout and is finished on the outside with steel sheeting. The engine hood, with the ex-

ception of the radiator is included in the baggage compartment, which is 8 ft. long back of the hood, and is served by a sliding door on either side. The passenger compartment is entered through a vestibule at the rear end of the car which is fitted with trap and side doors in accordance with steam railroad practice. Each window has two sashes, the lower one of which can be raised, and is fitted with a Pantecote curtain. Suction ventilators are also provided in the roof. A saloon with a dry hopper and an alcove water cooler is located in the forward left hand corner of the passenger compartment. The car is heated by exhaust gases from the engine carried back through the passenger compartment in thin wall steel tubes, one on either side. The body was built by the J. G. Brill Co., Philadelphia, Pa.

The power plant is a four cylinder, four cycle, valve in head motor with $4\frac{1}{2}$ -in. by 6-in. cylinders. This motor has a safe constant operating speed of 1,500 rev. per min. at which it has a rating of 61 hp.; its maximum speed is 1,800 rev. per min. at which it has a power rating of 66 hp. The clutch and transmission are mounted in a unit with the engine and provide three speeds with gear ratios of 4.09 to 1, 1.76 to 1, and 1 to 1. The power plant is mounted between the channel sills at the front of the car and is removable as a unit. The fuel tank has a capacity of 50 gals.

Power is transmitted from the main transmission through an auxiliary transmission mounted in the cast steel swinging bolster of the forward truck, by means of a motor truck type propeller shaft having two universal joints. The auxiliary transmission provides two gear ratios for forward operation, one for 30 miles an hour maximum speed and the other for 40 miles an hour maximum speed. One ratio is provided in reverse, designed to give a maximum speed of 30 miles an hour. This makes a total of six speeds forward and three in reverse. From each end of the auxiliary transmission a motor truck propeller shaft provided with two universal joints transmits the power through a pinion and bevel gear drive to one of the axles of the forward truck.

The most unique feature of this car is the type of truck construction used. The trucks are of the four-wheel type, the axles having inside bearings of the Timken roller type.

The truck frames are built up of 6-in. I-beam side rails on which are placed the channel cross members that carry the swing motion bolster. The ends of the side rails are also joined by cross channels with gusset plate connections. The axles are of alloy steel, heat treated and are 3 in. in diameter. The ends are tapered to receive the wheels which are also secured by keys. The axle bearing housings carry the semi-elliptic springs the ends of which are shackled to and support the truck frames.

The wheels on both the driving and trailing truck are of unique construction. The centers are of cast steel with tires of rolled steel 30 in. in diameter over the treads. Between the center and the tire is placed a rubber cushioning element consisting of two rings of rectangular section one on either side of a metal web cast integral with and projecting outward from the middle of the wheel center face. The lateral thrust between the wheel center and the tire is taken by inwardly projecting flanges attached to both sides of the tire, which overlap the wheel center.

Each truck is provided with four brake shoes operated by a link arrangement similar in principle to that formerly employed on the driver brakes of American type locomotives. These brakes are operated by a hand wheel through an irreversible worm and gear, with a pawl for locking the wheel when the car is unoccupied. An independent emergency brake, operating on the propeller shaft drum is also provided. Although not included as regular equipment on the car, Westinghouse traction brake equipment can be installed.

The motorman's seat is located at the left of the engine hood. The controls consist of a foot operated clutch, a hand

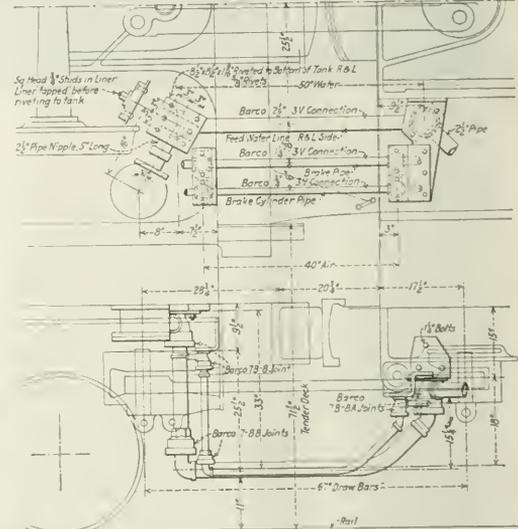

The Front End of the Service Coach

operated gear shift, hand operated spark and throttle controls with a foot operated auxiliary throttle, and the hand brake wheel, or brake valve if the car is equipped with air brakes.

On a recent run from Wabash to Elkhart, Indiana, a distance of 68.6 miles the trip was made with an average speed of 28.6 miles an hour and a maximum speed of 45 miles an hour, the total time of the run being 2 hours and 24 minutes. The average fuel consumption was at the rate of 5.3 miles per gallon of gasoline, while the total oil consumption was less than one quart for the round trip of 137 miles. From a standing start the car accelerated to 25 miles an hour in 30 seconds, 29 miles an hour in 1 minute, 35 miles an hour in 2 minutes and 41 miles an hour in 2 minutes and 40 seconds.

Flexible Pipe Feed Water Connections Between Engine and Tender

THE FIRST APPLICATIONS of flexible metallic connections to the feed water line between the engine and tender were applied in a single large pipe line on the center line of the locomotive, through which both injectors were fed. This type of connection met with some objection because of the possibility that a failure of this connection would entirely cut off the feed water supply and cause a complete engine failure. The drawing shows an application of Barco joints

Application of Barco Flexible Metallic Connections to the Feed Water Line Between Engine and Tender

to the feed water line which provides a separate connection for each injector.

At the tender end these connections are attached by two studs each to plates riveted to the bottom of the tank, and the upper joints are each connected by a short nipple to one of the tank wells. By thus applying the connections directly to the tank instead of to the tender frame the possibility of leakage developing as the result of any slight shifting of the tank is eliminated, and the connections are raised well above the rail. Similarly, the terminal joint on the locomotive end of the connection is secured to the deck, with a pipe connection leading from the joint to the strainer box at lower end of the injector feed water pipe.

As is indicated in the drawing, the feed water connection is carried well in toward the center of the locomotive.

Connections of this type, with feed lines 2 in. in diameter, have been in service on six Consolidation type locomotives on the Bangor & Aroostook for several months during the past winter during which time the locomotives have averaged about 30,000 miles with no maintenance required to the feed water line. The severe climatic conditions prevailing during the winter months on this line require almost constant use of the heaters when the injectors are not working, and it is estimated that the same service would have required at least one and probably two renewals of the ordinary hose connections. In addition to the reduction in the cost of maintenance the pipe connections also insure against injector failures through the collapse of loose hose linings.

Frisco Improves Financial and Physical Condition

Interest on Income Bonds Earned with Wide Margin.

Operating Ratio of Only 74.61

A YEAR AGO the question as to the St. Louis-San Francisco was as to whether the property operating on its own resources would be able, under the adverse conditions of 1921, to earn the interest charges on its cumulative adjustment mortgage bonds and its income bonds. The opinion at the time was optimistic. That this optimism was justified is now indicated in the Frisco's annual report, which shows sufficient net earnings to provide for payments of the interest on both issues of bonds and a balance after this interest of \$3,225,680. In 1920 the standard return and guaranty enabled the road to pay its interest in that year and to leave a balance of \$1,743,231. These figures, because of the inclusion of standard return and guaranty, do not indicate the degree of improvement which actually took place in the fortunes of the Frisco during the past year. The following analysis will give a better idea of the situation:

	1921	1920 Including std. return and guaranty	1920 Eliminating std. return and guaranty
Income available for interest.....	\$17,394,829	\$15,826,405	\$2,863,086
Interest on fixed charge obligations.....	9,665,879	9,630,761
Balance	\$7,728,950	\$6,195,644
Interest on adjustment mortgage bonds	2,391,750	2,340,893
Balance	\$5,337,200	\$3,854,751
Interest on income mortgage bonds..	2,111,520	2,111,520
Balance	\$3,225,680	\$1,743,231

These figures show that it was standard return and guaranty which enabled the Frisco to earn the interest charges on its income bonds in 1920. In 1921, because of the manner in which the Frisco improved its operating results, it earned sufficient net to rival its 1920 corporate result. The measure of improvement which took place is best shown in the income available for interest, \$2,863,086 in the third column, as compared with the figure in the first column of \$17,394,829, an increase of 507.6 per cent.

22.05 Per Cent Less Tonnage

The story is told in another way. The revenue freight carried by the property was 22.05 per cent less than in 1920. The total operating revenues were 12.6 per cent less. As against a decrease of \$12,430,455 in operating revenues, however, there was a decrease of \$25,500,838, or 28.4 per cent in operating expenses and a resulting increase in net operating revenue of \$13,070,883, or 147.9 per cent. The road had an operating ratio in 1921 of 74.61; in 1920 it operated at a ratio of 91.05 per cent. The reasons for the improvement in the balance available for interest should, therefore, be evident as well as the manner in which the property, operating on its own resources, was able to com-

pensate for the lack of the governmental guarantees in 1920.

The Frisco system operates a total of 5,256 miles of line. Included in this total is 93 miles of double track, notably on the sections between St. Louis and Oklahoma City and between Kansas City, Mo., and Arcadia, Kan. The system, as a whole, serves a wide area because of its having lines south from both St. Louis and Kansas City, including lines into Oklahoma and also to Fort Worth, Tex., and beyond, and also to the southeast or to Memphis, Tenn., and Birmingham, Ala. The road has a large branch line mileage and, incidentally, many grades, both of which factors must be reflected in the final operating results.

Diversified Traffic

Naturally, under the conditions, the system's traffic is quite diversified. The figures for 1921 show that products of agriculture made up 16.04 per cent of the total tonnage; products of animals, 2.78 per cent; products of mines, 37.45 per cent; products of forests, 11.17 per cent and manufactures and miscellaneous, 28.76 per cent. Some of the leading commodities carried are bituminous coal, petroleum, livestock, lumber, lead and zinc and wheat and perishables.

Bituminous coal in 1921 made up 4,176,715 tons—or 30.3 per cent less than in 1920—and constituted 24.24 per cent of the total tonnage. This coal is derived from three fields: the Oklahoma field near Henrietta; the Arkansas district and the Kansas district centering at Pittsburg. The Frisco also secures some coal from the Birmingham, Ala., district, but this coal moves mainly east. The Frisco has been hit by the coal strike but it is our understanding that in spite of the strike it is still loading coal in considerable quantity, although not as much as its pre-strike average.

Refined petroleum and its products constituted 13.39 per cent of the total tonnage in 1921; crude petroleum, 0.79 per cent. In 1921 the system suffered a loss of 65 per cent in its crude petroleum tonnage and 16 per cent in refined petroleum. Nevertheless, the Frisco derives some 20 per cent of its total freight revenues from oil or oil products in one form or another. The reason is that it taps some of the best oil fields in Oklahoma, notably the mid-continent field centering on Tulsa. This oil moves principally through the St. Louis gateway. The Frisco has a fast freight schedule by which the oil is carried from Tulsa to St. Louis, 414 miles, in about 26 or 28 hours, the trains being allowed a 35-mile an hour maximum speed.

The lead and zinc is secured from the Joplin, Mo., district, in which area the Frisco, because of its many branch lines and strategic location, is probably the best fixed of any carrier serving the district.

Lumber and its products, which in 1921 constituted 11.17

ST. LOUIS-SAN FRANCISCO OPERATING RESULTS, 1912-1921

Year ended June 30	Freight revenue	Total operating revenue	Operating expenses	Net operating revenue	Operating ratio	Revenue tons	Rate per ton per mile, cents	Revenue, ton miles	Average haul	Revenue train load	Revenue car load
1912	\$27,505,798	\$42,100,364	\$28,709,589	\$13,390,775	68.19	16,985,882	1.01	2,714,876,424	160	255	16.15
1913	31,272,807	46,050,290	30,711,094	15,339,196	66.69	19,739,790	1.00	3,126,717,306	158	281	17.13

Year ended Dec. 31											
1916	36,555,444	53,119,999	35,646,779	17,473,220	67.11	21,270,024	0.99	3,697,396,315	174	337	19.24
1917	39,421,538	59,676,657	39,610,818	20,065,839	66.38	23,011,162	0.99	3,963,259,492	172	382	21.58
1918	47,161,818	72,475,313	57,807,310	14,668,004	79.76	22,998,106	1.13	4,155,542,672	181	392	23.45
1919	53,558,494	82,202,919	64,069,624	18,133,295	77.94	21,419,266	1.33	4,036,818,931	188	380	21.77
1920	66,338,422	98,723,040	89,896,545	8,826,495	91.05	24,718,345	1.44	4,621,380,827	187	398	23.44
1921	59,088,309	86,292,584	64,385,707	21,906,879	74.61	19,266,914	1.69	3,502,727,271	182	363	21.62

per cent of the total tonnage, is secured primarily on the line paralleling the Red river and extending eastward to Hope, Ark. The road has a large livestock movement primarily to East St. Louis and originating in the territory in Texas beyond Fort Worth; this traffic, therefore, receives a long haul. From Kansas City, Wichita and Oklahoma City there is a considerable eastbound tonnage in dressed meats. Northeastern Arkansas and southeastern Missouri give the system a sizable and growing traffic in such commodities as cotton, grain, cantaloupes, watermelons, etc. These details give a rough idea of what the Frisco's business really is. The Frisco is noted for its fast freight service. From St. Louis to Fort Worth, 735 miles, this service gives a third morning delivery; from St. Louis to Oklahoma City, 542 miles, third day, and from Kansas City to Birmingham, 733 miles, 50 hours.

The revenue tonnage carried by the Frisco in 1921 totaled 19,266,914 as compared with 24,718,345 in 1920—in other words, a reduction of 22.05 per cent. The reductions were general. They were especially severe in lead and zinc. There were increases in wheat, in citrus fruits and in potatoes and also in products of animals. The freight revenues for 1921 totaled \$59,088,309 as compared with \$66,338,922 in 1920, a reduction of 10.9 per cent. The reason for the smaller proportionate decrease in revenues as compared with tonnage was an increased rate per ton-mile. The rate for 1921 was 1.69 cents as against 1.44 cents in 1920; there was a decrease in the average haul. Passenger revenues totaled \$21,360,570, a decrease from 1920 of 18.9 per cent. The total revenues of \$86,292,584 compared with \$98,723,040 in 1920, a decrease of \$12,430,455 or 12.6 per cent.

Operating Expenses Decreased 28.4 Per Cent

In 1921 operating expenses totaled \$64,385,707 as compared with \$89,886,545 in 1920, a decrease of \$25,500,838 or 28.4 per cent. There were decreases of 39.2 per cent in maintenance of way; of 33.5 per cent in maintenance of equipment, and of 24.4 per cent in transportation.

With reference to maintenance, President J. M. Kurn says in his remarks: "The property of the company has not only been adequately maintained during the year, but, in fact, its physical condition has been materially improved. The adequacy of maintenance expenditures cannot always be accurately gaged by the mere money amount thereof. Several factors have contributed in 1921 to the ability of the company to secure greater results from a given amount of money expended for maintenance. Wage rates were reduced as a result of the decision of the United States Labor Board, effective July 1, 1921. The price of some materials, of which there is a relatively large consumption in maintenance work, has receded from the peak which grew out of war conditions. The efficiency of labor has shown a decided improvement, as the weakening of morale and the generally disturbed conditions, which were the aftermath of the war and federal control, have been gradually disappearing. This is particularly true with respect to labor employed in maintenance of equipment. The excess of maintenance expenditures in 1920 over similar expenditures in 1921 was chargeable also, in a considerable measure, to the inclusion in the 1920 charges of large sums lapsing over from previous periods, which were incurred in connection with additions and betterments work during federal control, the accounting for which had not been properly closed out by the federal management of the property."

The figures show, with further reference to labor, that the average number of employees in 1921 was 24,459 and in 1920, 30,671, a decrease of 6,212. Of the decrease, 1,827 was in section men. The maintenance expenditures per mile in 1921 totaled \$2,126 as compared with \$3,501 in 1920. This was partly due to savings in wage and material costs; there was also less material applied. The tie renewals for

the year totaled 1,333,812 as against 1,785,099 in 1920. In the case of rail, 6,717 tons, or 47.49 miles of new 90-lb. rail, were laid as against 28,154 tons or 199.07 miles in 1920. Ballast was applied on 118.34 miles of track; in 1920, on 208.70 miles.

Equipment Rehabilitation and Repair Costs

The maintenance of equipment, in which there was a total reduction in 1921 as compared with 1920 of 33.5 per cent showed some interesting figures of costs per unit. Thus, freight car repairs per unit owned in 1921 were \$107.68 the lowest figure since 1917. In 1920 the cost per car was \$229.81; in 1919, \$168.93; in 1918, \$187.51 and in 1917, \$103.10. The number of cars rebuilt or overhauled in 1921 was not as great as in 1920; in 1921, 1,501 cars were rebuilt complete and in addition 1,680 were reinforced with steel ends, etc. In 1920, 2,337 cars were rebuilt complete; in both years a large amount of work was done on refrigerator cars. Of course, part of these charges were to addition and betterments. At any rate, the Frisco had on April 1, 1922, a percentage of bad order cars of 8.2, which figure is low comparatively and indicates a favorable equipment condition.

During the year 496 locomotives were given classified repairs as compared with 506 in 1920; in view of the 1921 falling off in traffic, this result looks good. Steam locomotive repairs per unit owned during the year averaged \$8,795. The savings as against the preceding year are indicated by a 1920 figure of \$11,380. The Frisco's percentage of un-serviceable locomotives at present is about the same as the average for the country as a whole. Concerning this matter of equipment maintenance, Mr. Kurn says: "Elsewhere . . . there is set forth the extensive accomplishment in renewal and rehabilitation of rolling stock equipment during the year. The large expenditures made therefore to capital account have had a direct effect in reducing the expenditures necessary for adequate maintenance."

Frisco improvements during 1921 were many. Some of the important work was the completion of the construction of 28 miles of double track, namely: Eureka, Mo., to Pacific, 6.89 miles; Sleeper, Mo., to Lebanon, 8.82 miles; Monett, Mo., to Globe, 1.37 miles; Spring Hill, Kans., to Olathe, 9.62 miles and between Amory, Miss., and Aberdeen Jct., 0.81 miles. The road at the end of the year had a total of 93 miles of double track. The total additions and betterments charged to capital account during the year were \$5,019,293, of which amount \$2,033,966 was in improvements to existing equipment and \$674,835 to additional main tracks. For power plants, machinery and tools there was expended \$489,812, which indicates a realization of the importance of this essential factor.

For 1922 the road has a program calling for the expenditure of an additional \$5,000,000. Some of the important items are: Completion of double track, Spring Hill, Kan., to Paola; double track, Webster Groves, Mo., to Valley Park, including a reduction in grade from 1.5 per cent to .85; grade revision work near St. Johns, Mo., reducing the grade from 1.25 to 0.6 per cent and a change of line at Garnsey, Mo., with a grade revision from 1.5 to 0.8 per cent. It is also proposed to lay 170 miles of 90-lb. rail in place of present 85-lb.; to spend \$250,000 for steel underframes, etc., for passenger equipment; \$350,000 for additions and betterments to locomotives and \$1,400,000 for additions and betterments on freight cars. Ten stalls were added to the roundhouse at Fort Smith and five at Fort Worth.

The evidence on the whole is that the St. Louis-San Francisco during 1921 improved both its financial and physical condition to a marked extent and that this improvement should be continued into 1922. The property is apparently prepared to handle a much larger volume of business than at present and should be able to realize on any improvement in its territory during the coming year.

Extent of Russia's Ruin and Chances of Recovery

Famine Ridden and Bankrupt, Her Only Hope Is in Aid From
Financiers Who Dare to Risk Fortunes

By a Special Correspondent

Moscow.

IS RUSSIA coming or going?

The answer to this question is not in the hands of the Russians but of the western world, and particularly of the business men of America. If they are bold enough and have the money to risk and want the big earnings that may result, the opportunity is there.

The Genoa Conference gathered to answer this question, but without Americans, Britain and France and all the other nations represented are powerless. They have neither the money nor the means to reconstruct Russia, nor have they the goodwill of the Russians in the sense that the Americans, not interested in internal politics, have it. The important facts about Russia, as gathered first hand by the writer, after traveling some 10,000 miles on her soil, are the following:

The Facts About Russia

First, *she is beset by an immense famine* that will, unchecked, last for another year at least, taking a toll of a million or two of lives. I have seen with my own eyes many hundreds of her dead, scattered here and there, and indicative of thousands and thousands of others to be seen if anyone took the trouble to seek them.

Second, *communism is dead* in Russia. The Soviet government has utterly failed in realizing one of the biggest and noblest and oldest dreams entertained by humanity. Her intellectuals, largely mixed with Jews, and influenced by Germans and socialists of every school, and helped by the great war, pulled down the reasonably good government of the Czar. In their turn they have shown themselves incapable of government. They floundered for three years, in an experiment so tragic that but for its tragedies it would be ludicrous. Now they have learned that water cannot be made to run uphill.

Third, *the present Soviet government is making an effort to hold on*, though its members are tired out and would, in many instances, welcome or consent to stepping down if a reasonably and sufficiently socialistic government could be found to succeed them and spare their lives. The notable exception in the government is probably Trotsky, who is an ambitious opportunist. But this government, like all others, is changing in personnel and in point of view, and is bound to go. Should Lenin die, it might go overnight, as he is its dictator and backbone. For this government to go out like a candle might mean a new revolution in Russia, and this few in Russia want. All they want is peace and a chance to live.

Fourth, *Russia's ruin is far more moral and social than material*. I have seen the majority of her cities, her business centers, and nowhere is to be encountered anything like the absolute destruction such as I have seen in France's war wrecked northern provinces. Her railways function reasonably well, all things considered, and within a year or so could be revived as have been those of Roumania, which two years ago were in an apparently hopeless condition.

Fifth, *there is no disposition to attempt to use the Red Army against Europe*. The best proof of this statement is that the Red Army is incapable of such an adventure. It is a fairly good police service, and could do some damage to the armies of such countries as Poland and Roumania, but not in any serious degree. From a military point of view, any such adventure would be pre-doomed to failure.

Sixth, *the Soviet government is virtually bankrupt*. It has

on hand in gold coin and in diamonds and odd bulks of gold and silver bullion a total value of possibly \$150,000,000. Against this it has issued to date upwards of ten trillions of paper roubles and by the end of the year will have printed double that amount. A dollar bill is worth today in Russia about two million of these roubles. The rate of depreciation may be judged by the fact that last September a dollar bill was worth fifty thousand roubles. Banking is in the hands of the government.

Seventh, hand in hand with the famine *there is a frantic and fantastic effort at trade in Russia*. As there is little real production, this trade takes the form of speculation. Everybody is doing it—men, women and children. Internal free trade was allowed last August by Moscow decree, and it has grown apace. External trade is in the hands of the government, and this stifles what little trade there might otherwise be with the outside world, through the Baltic and Black seas and over the Polish and Roumanian borders. As no one trusts the government banks, every man is his own banker, and as fast as he gets hold of roubles, in trade, he converts them into foreign paper moneys, especially dollars.

Eighth, *there is good order, at least so far as concerns the foreigner, throughout Russia*. His life and property are safe. Americans are treated with a peculiar deference, partly as a result of the Russian's general hospitable attitude toward a foreign visitor, partly due to the knowledge that the government will protect these people from whom they hope so much. This good order is also due to the presence of the American Relief Administration. Its offices and agents are in every city center and Soviet officials, under the eye of decent people on whom they are dependent for the precious daily bread, are loth to commit their former deeds.

Quo Vadis?

The above are the facts, looked at from the point of view of business. It may be that already the tide is turning in Russia, that she has hit the bottom of distress and disease and disaster, and is on the upward grade; that the mysterious forces of circumstances have relented.

If not, and if left to herself Russia may be doomed to disappear from the face of normal life as did in the third and fourth centuries A.D. the great lands of northern Mesopotamia, rich in agriculture and wonderful cities. It will be remembered that after the breaking of the Roman grip on these lands, a grip that guaranteed law and order and good highways, chaos came and has remained. It has long been one of the dreams of active minds to restore that ancient prosperity, but to this day the dream is unrealized.

As in those days the fields of Mesopotamia helped to feed the Roman Empire, so in modern days Russia helped to feed Europe. Other ways were found of getting food for the Romans and other peoples of the Mediterranean. Europe may have to find other ways of feeding herself without Russia.

Left to herself, at best, Russia, from a business point of view, will become for the next few years the prey of the small trader, carrying his goods in a grip, so to speak, exploiting his customers rather than improving their trade. Then, with no more gold and diamonds and second-hand furs with which to barter, she might well die out. Her cities might cease to serve any useful purpose, as seems already

the fate awaiting Petrograd and her imperial palaces, and the peasants remain to miserably till the soil, rid of the thin veneer of culture forced on them from the townfolk during the past 200 years. Through sheer fatigue and inertia, her railways might cease to function at all.

The Essentials of Reconstruction

If big business decides to take the plunge, it must wade in with boots, not slippers. It must not go in gingerly, grab a stake and make a getaway. It must not expect returns for five years. Also, it must arrange matters so it will make, if it does make anything, its hundreds of per cent in profits, to offset the risk. It must work through the government, so its hand will not be seen too publicly and increase its risks by stirring up a hostile sentiment.

The Russians are susceptible, ready to believe anything. This very winter, it was commonly stated by the crowd that the American Relief Administration was exploiting Russia. How? No one could say just how, in the face of the food shipped in, but the very people receiving the food were ready to believe this nonsense. Torn for years by civil war and murder, suspicion is the breath of life in Russia.

When Litvinoff, under-secretary of state, signed at Riga last summer an agreement making it possible for American charity to come into Russia, he did so with fear and trembling. He made a remark then that caused much good-humored comment among the Americans. "Food is a weapon," he argued, showing that he feared the food might in some way be used to undermine the Soviet government. Just how he could not explain to himself, yet he believed what he said. Working through the government involves making an agreement with it. Despite all that has been said, and of all of the facts, it is probable that any agreement the Soviet government makes it will keep, so far as it can. It kept its agreement to pay indemnity to Poland, for the war waged a couple of springs ago. It has so far as able kept its agreement with the American Relief Administration, which is patently an opening wedge for American business, if Americans care to take advantage of this fact. In the early months it was uphill work to help the Russians, due to an ignorant government, beset with internal politics and ambitions, and tied up, hard and fast, in its own reams of paper, of red stamps and tape, a machinery far more complicated and ridiculous than anything evolved by the Czar's old government, or any other government with which I am familiar. But this must be said of the Soviet government—it does not mind breaking its own laws. It, too, had a prohibition law, but when convenient it broke or changed the law and let its citizens do the same.

Those who go into Russia with fear and trembling will not travel far. There is the German bogey. The Germans so far have done little but try to make some highly profitable get-rich-quick speculations in Russia. They have not sufficient capital to exploit Russia, as is so commonly feared.

The first essential of reconstruction involves, on the part of Soviet Russia, the recognition of private property and the freedom of its citizens in foreign trade. Both these points have long since been settled in principle. As to recognition of its old debts, this too will be done, though it matters little to the present generation, as they are too huge to be paid now. Houses and lands may be sold to all comers and be used for government revenue.

When the brushwood is cleared away, it remains for big business to organize itself in some such manner as the old Vanderlip syndicate attempted to do.

The other essentials, in their order, are food, the restoration of agriculture, the repair of the railways and a better money. This is a large order, and will cover years, but the start and the end of the reconstruction will come far quicker than might be judged from the outside. One has not to consider that France today is accomplishing, how she is fighting

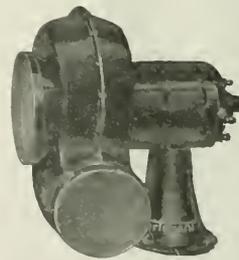

back to commercial independence despite her tremendous losses; how little Hungary is living, despite the treaty imposed by the Allies taking away two-thirds of her lands; what Serbia has done to get back to normal life, although her lands were occupied by the enemy and her people forced to evacuate during the general war.

"Our land is great and fruitful, but there is no order in it. Come and reign and rule over us." This was the message and invitation sent by the Slav republic of Novgorod to the invading Norsemen, in the ninth century.

Under Bolsheviks or Imperialists or New Democrats, Russia is now a country to be worked as a colony. It is a country comparable to our West of the post Civil War days, say in the late 'eighties or the early 'nineties, when the Cherokee strip was opened, a little later to become part of the great state of Oklahoma. Colonizing means work and money and time and patience and courage and hardship. Who will undertake this Russian job?

Locomotive Cab Ventilating Set

THE PROBLEM of locomotive cab ventilation is a more or less serious one, especially on roads where steam locomotives are required to operate in tunnels. An unusually interesting method of solving this problem has been developed by the B. F. Sturtevant Company, Boston, Mass., the essential part of the apparatus being the ventilating set illustrated. These sets have been applied in one case to the locomotive cabs of Mallet locomotives operating in districts where tunnel clearances are close and the grade adverse to the movement of trains. According to an officer on the road in question the transfer of Mallet locomotives to one of the branch lines where the conditions described above existed resulted in forcing attention to the problem of locomotive

Sturtevant Cab Ventilating Unit

cab ventilation. Experiments were conducted in an effort to provide better ventilation and it was found by using the Sturtevant electrically-driven ventilating sets, two units to the locomotive, the atmospheric conditions in the cab could be materially improved.

The ventilating sets were operated electrically by an electric headlight turbo-generator installed for the purpose. Two sets were applied to the locomotive, located under the boiler ahead of the firebox. The intake from the fan gathered the air at a point about 6 in. above the track. One fan delivered air to the right side of the locomotive immediately in front of the engineman and the other to the left side.

In order to get the best results, it was found necessary to make the cab nearly air tight so that the fresh air delivery inside the cab would create a pressure in excess of that surrounding the cab, preventing foul gases from entering.

Sturtevant portable ready-to-run ventilating sets are made in five sizes running at speeds up to 3,400 r.p.m. and delivering from 58 to 1,440 cu. ft. of free air per min.

Maintenance Reserve Items Hurt I. C.'s Showing

Net After Fixed Charges for 1921, \$9,656,275 as Compared
with 1920 Figure of \$13,434,841

THE ILLINOIS CENTRAL's figure of net after fixed charges in the corporate income account in the annual report was, for the year ended December 31, 1921, \$9,656,275. This was a reduction of \$3,778,567 from the figure for 1920—\$13,434,841. It does not, therefore, evidence the improvement for the year which was to have been expected from the favorable monthly reports of earnings and expenses. The Illinois Central did, however, show improvement in its net in 1921 as compared with 1920. This improvement was shown in the figure of net railway operating income which in 1921 was \$17,542,228 and in 1920, \$6,343,246, the increase as between the two years being \$11,198,982. The reason this improvement is not reflected in the corporate income account is the method of accounting followed, which factor it is advisable to point out so that incorrect impressions may not be gained.

Reserve for Maintenance

The outstanding changes in the corporate income account, other than those made necessary to show properly the standard return and guaranty, were a reduction of \$2,180,644 in non-operating income and an increase of \$7,564,368 in deductions from gross income. Non-operating income in 1921 was \$5,039,238, as against \$7,219,882 in 1920, the reduction being primarily due to the non-receipt of interest on Louisville, New Orleans & Texas second mortgage income bonds from which in 1920 there was received \$2,081,014. Deductions from gross income totaled \$19,735,213, an increase, as above noted, of \$7,564,368 over 1920. The important factor in this account was in "Miscellaneous Income Charges" which in 1921 increased \$7,788,083, of which \$6,851,542 was due to charging this account the amount named and crediting an account in the general balance sheet, "U. S. Government Guaranty under Section 209. . ." in reduction of the company's claim against the government, made necessary by the cancellation of a reserve for maintenance. In further explanation of this item, the annual report states:

"In explanation of this reserve it should be stated that last year there was in 'Maintenance of Way and Structures Expenses' \$2,744,698 and in 'Maintenance of Equipment Expenses' \$4,109,844, a total of \$6,854,542, to cover the additional amount which it was understood your company was entitled to expend for maintenance

. . . during the guaranty period and which it was necessary to state on the books in order that the amount would be available for these purposes. The amounts so charged to expenses were carried as a reserve to be expended in the future and were shown on the general balance sheet in the account, 'Other Unadjusted Credits' under the heading 'Unadjusted Credits.' The Interstate Commerce Commission, in an order dated December 15, 1921, entitled, 'In the matter of Final Settlement under Section 209 of the Transportation Act, 1920' prescribed a different method for adjusting maintenance expenses of the guaranty period. As a consequence the entries made on the books in the preceding year were reversed in the current year and 'Railway Operating Expenses' was credited and 'Other Unadjusted Credits' was debited a like amount. These entries necessitated an additional entry debiting 'Miscellaneous Income Charges' \$6,854,542, and crediting the same amount to the general balance sheet account 'U. S. Gov't Guaranty under Section 209'"

Santa Fe Showed Equalization Reserves Better

Because of the inclusion of the reserve items in the 1920 accounts, the total for maintenance of way in that year is shown in the 1920 annual report as \$29,034,954—this amount being corrected (because of the elimination of the reserve) in the 1921 report to \$25,870,907. Maintenance of equipment was given in the 1920 report as \$42,028,103, which item was corrected in the 1921 report's comparative statement to read \$37,344,277. The result of the inclusion of the reserves was shown further in total expenses which were given in 1920 as \$143,208,180, or 98.39 per cent of the operating revenues. This figure is corrected in the 1921 accounts to be \$134,181,514 which makes the 1920 operating ratio not 98.39 as previously stated but only 92.44. All this arrangement is a bit unfortunate particularly because the 1920 annual report did not make it clear that reserve items were included in the maintenance expenses as given in that report.

The Atchison, Topeka & Santa Fe, which similarly established maintenance reserves, made rather a better job of it in its annual reports for 1920 and 1921. In the Santa Fe annual report for 1920 the road showed a sum of \$13,374,976, representing what the Santa Fe called an equalization reserve "for the purpose of approximating the amount of the maintenance expenditures to which the company was entitled under the Transportation Act." "The setting up of these equalization accounts," the Santa Fe's 1920 report continued, "which has not heretofore been customary for this company

is reflected in the amount of \$14,030,036 in the decrease in the net railway operating income. . . for the year 1920." Further than that, in the statement of the primary accounts, there appeared, as there did not appear in the 1920 Illinois Central report, items as follows: Under maintenance of way, "Equalization,—way and structures, \$8,711,056" and under maintenance of equipment, "Equalization—Equipment, \$4,668,919." The final result was that when corrections had to be made in the Santa Fe's 1921 report, the accountant did not have to re-state but instead the equalization figures were shown as debits or credits and the matter in both the 1920 and 1921 reports was clear at all times.

The Illinois Central by its method of showing the reserve items suffered the unfortunate result—which the Santa Fe did not suffer—of making its 1920 accounts look actually poorer than they really were. A false impression might have been gained which would have been regrettable in the case of a carrier like the Illinois Central which has been so careful, fair and above-board in taking the public into its confidence. We doubt not that there may be misrepresentation of this situation in various quarters which explains why so much space is here devoted to keeping the record straight.

Illinois Central Leader in Public Relations Work

The attention which the Illinois Central has given to taking the public into its confidence is one of the most pleasant developments in modern railroading. A whole volume might be written about the methods followed by the road and about the success which it has been having. Generally speaking, one of the most important factors in the method followed is to publish in the form of paid advertising in every newspaper published in the territory served interesting and informative details about the railroad problem and the Illinois Central's activities. The result of this and the accompanying parts of the plan has been an extremely favorable public opinion towards Illinois Central in the communities through which it runs, in which respect the road is in a much better position than most other of the country's railroads. The Illinois Central is recognized for its efficiency in management and operation generally. Its success in its public relations work shows it to be efficient in this also and very much in the van of progress as regards its realization of the importance of this feature of its activities.

Revenues and Expenses

The Illinois Central in 1921 had freight revenues of \$107,092,091, an increase of \$913,205 over 1920. Its revenue ton- and ton-miles were less than in 1920 but its receipts per ton-mile were greater. The tonnage carried was 40,415,089 as compared with 49,233,079 in 1920. The ton miles in 1921 totaled 11,084,095,960, a reduction of 19.24 per cent from 1920. The heaviest decreases were in bituminous coal—coal constitutes about 40 to 45 per cent of the total traffic—in lumber and forest products, in manufactures and miscellaneous and in merchandise. The tonnage of grain was greatly increased and, to a lesser extent, that of perishables. With reference to the receipts per ton mile the figures show for 1921, 0.966 cents—which incidentally is a comparatively low figure—as against 0.771 in 1920.

Because of a reduction of 8.51 per cent in passenger revenue, the increase in freight revenues was not reflected in total railway operating revenues. These totaled \$141,127,066 as against \$145,154,372 in 1920 a reduction of \$4,027,306 or 2.77 per cent. As against this reduction of over \$4,000,000 in revenue, there was a reduction of \$17,229,181 or 12.91 per cent in operating expenses, the expenses in 1921 being \$116,852,851 as compared with \$134,181,114 (including the charge for maintenance reserve) in 1920. Maintenance of way and structures was decreased 15.37 per cent, maintenance of equipment, 7.37 per cent and transportation, 17.85 per cent. The savings were due to lessened

traffic, decreased wage costs, lower material and fuel costs, etc. There is no evidence of decreased maintenance. In 1921 there were 219 miles of track laid with 90-lb. rail.

Additions to Equipment

During the year the road made important changes in its motive power as is evidenced by the fact that the total number of locomotives increased 17, but the total tractive effort of all locomotives, 5,911,927 lb. The reason was the acquisition of 100 Mikado and 25 eight-wheel switching locomotives while 108 smaller locomotives were disposed of. As to passenger cars, the details show 55 new cars added and 10 disposed of. In the case of freight cars 3,620 cars were added and 3,161 dropped, a net increase of 459. It is interesting and important to note that in December the Illinois Central had an average percentage of bad-order cars of but 6.6 per cent. It is understood that the average is slightly higher at this time.

I. C. C. and State Commissions Adopt Plan of Co-operation

WASHINGTON, D. C.

A PLAN of co-operation between the Interstate Commerce Commission and the State commissions in cases involving conflicts of jurisdiction, which provides for joint conferences and in some cases joint hearings, was announced on May 3 by Chairman McChord of the Interstate Commerce Commission and President Jackson of the National Association of Railway and Utilities Commissioners in the form of a report of a joint committee of the federal and State commissions which has been holding conferences recently. The report of the joint committee follows in part:

Public regulation of our railroads is performed in part by a commission representing the federal government and in part by commissions representing the various states. Conflicts of jurisdiction between the two systems of public regulation have arisen from time to time, resulting in litigation and action by the courts; but the federal and state commissions were alike created in the public interest and have a common purpose, namely, the maintenance of a transportation system which will in all respects best meet the public needs. In view of this common purpose they should, and we believe they can, work together for its attainment without conflict or resort to litigation. Such co-operation is contemplated by the Interstate Commerce Act as interpreted by the Supreme Court and is highly desirable in the public interest.

The prime essential to such co-operation is realization of the nature and difficulties of the common problem. The state commissions realize that the railroads form a national transportation system which is not split into parts by state lines and that the public interest demands a rate structure, state and interstate, as simple and harmonious as practicable. The Interstate Commerce Commission realizes that there is danger in over-centralization of authority, that the field of regulation is vast, and that the state commissions are often better informed than itself in regard to local conditions and local needs.

Following the general rate increase of 1920 the Interstate Commerce Commission, in certain instances where corresponding increases did not become effective within the states issued orders affecting intrastate rates. Following the decision of the Supreme Court of the United States in the Wisconsin Passenger Fare case, action has been taken by several state commissions which has enabled the Interstate Commerce Commission to vacate certain of its orders affecting intrastate traffic within those states. It is anticipated that similar action will follow in other states.

In a yet more important aspect co-operation looks forward to and lies in view the avoidance, so far as the public interest will permit, of such orders in the future. Paragraph 3 of section 13 of the Interstate Commerce Act authorizes the Interstate Commerce Commission to avail itself of the co-operation, services, records, and facilities of state commissions, to confer with them with respect to the relationship between rate structures and practices of carriers, and to hold joint hearings with them "where the rate-making authority of a state is or may be affected by the action taken by the commission." Our common purpose is to give the utmost force and effect to this provision of the law.

It is appreciated that time and experience may be required for the full development of methods and rules of procedure. Pending

the establishment thereof, and for the purpose of making such co-operation immediately effective, it is the opinion of representatives of the Interstate Commerce Commission and of the state commissions that, except as in special cases it may be found desirable to deviate therefrom, the following procedure be followed:

Where petitions are filed with the Interstate Commerce Commission alleging that intrastate rates unjustly discriminate against interstate commerce, or persons or localities engaged therein and asking the Commission to remove such discrimination, if either a state commission having jurisdiction over rates thus attacked, or the federal commission, desires a conference it should notify the other without delay and thereupon such a conference should be arranged, likewise without delay. If the case goes to trial, a joint hearing by the Interstate Commerce Commission and the commission of the state affected should be held, provided a proceeding or proceedings be pending before the state commission in which action can be taken by it upon the common record. Such joint hearing should be followed by a conference to consider the facts developed of record so as to provide opportunity for the removal of the unlawful discrimination, if any, by agreement.

Joint conference should be held on complaints attacking interstate rates in those cases where the decision of the Interstate Commerce Commission appears likely to affect, in substantial and important respects, the relationship between state and interstate rate structures; likewise, conferences should be held in the case of complaints attacking intrastate rates in those cases where the decision of the state commission appears likely to affect, in substantial and important respects, the relationship between state and interstate rate structures. Participation in the ensuing hearings, or in conferences following submission, will be upon invitation of the Interstate Commerce Commission, if the complaint is filed with it, or of the state commission if the complaint is filed with it. Joint hearings will be appropriate where similar issues are pending before the Interstate Commerce Commission

and a state commission, or conferences pending the decision of cases where there has been no participation in the prior hearings.

In joint hearings involving interstate rates, the rules of practice prescribed by the Interstate Commerce Commission shall govern in so far as applicable.

The federal and state commissions should feel free to suggest to each other, and the state commissions to hold among themselves, conferences on matters arising under their respective jurisdictions, with a view to harmonizing in so far as practicable rates and practices in neighboring states by appropriate action of the commissions of those states without proceedings before the federal commission.

It is desirable that there be continued, in so far as practicable, the practice of the Interstate Commerce Commission of calling upon a state commission to hold hearings for it upon applications for certificates of public convenience and necessity, involving construction of new lines or abandonment of old lines. In such matters joint conferences between the Interstate Commerce Commission and a state commission may also be held upon request of either commission.

The interstate commerce act and the rules of the Interstate Commerce Commission provide for notice to the states in certain matters affecting them, and the Interstate Commerce Commission has been complying therewith. The state commissions should develop methods of keeping the Interstate Commerce Commission advised on matters before them in which it may have an interest such as is indicated by the foregoing text.

It is realized that the co-operative action here provided for will be productive of delay in disposing of important matters unless the federal and state commissions respectively act with the utmost promptitude compatible with the circumstances.

Applying the co-operative principle, conferences may be arranged for the development of car service, distribution and administration.

Wabash Shows Increases in Fast Freight Traffic

Net After Rentals in 1921 \$3,863,340, as Compared with Deficit of \$3,817,671 in 1920

THE WABASH reports for the year ended December 31, 1921, a net after fixed charges of \$2,017,576. This compares with a net in 1920 of \$1,983,943—an improvement of \$33,633 as between the two years. The 1921 income account, however, includes in non-operating income a credit of \$1,245,233 "to offset debit items in this statement pertaining to the guaranty period," of which amount \$509,018 "represents unaudited items which are included in accordance with order of Interstate Commerce Commission dated December 15, 1921, finance docket No. 1606." The net for 1921 is the best since 1917, in which year the Wabash reported a net after fixed charges of \$4,172,045; in 1916 it reported \$5,306,498. All these figures mean that the Wabash in 1921, operating on its own resources, did not restore its corporate earnings to their pre-federal-control or standard return level.

The revenue tonnage carried by the Wabash in 1921 was 13.44 per cent less than in 1920. In spite of this reduction in traffic, the road did show much better operating results than those of 1920, although this improvement is not reflected in the corporate income account because of the fact that comparisons with 1920 must take into consideration the factors of standard return and guaranty. The improvement in actual operating results is best shown in the figure of net railway operating income. In 1921 this figure was \$3,863,340. It compared with a figure in red in 1920 of \$3,817,671 which deficit, of course, was compensated for by the standard return and guaranty. The Wabash had a standard return of about \$5,800,000. In 1918 it earned for the government about \$3,700,000; in 1919, about \$800,000. Thus it appears that the 1921 result was the best since the commencement of federal control, but that it was not as good as the results prior thereto. The striking improvement as between 1921 and 1920, which changed a deficit of \$3,817,-

671 in 1920 to a net of \$3,863,340, is further evidenced in an operating ratio of 84.45 in 1921 as against a figure for 1920 of 98.18. In 1917 the ratio was 70.34; in 1916, but 65.94.

Perishables and Packing House Products Increase

The Wabash operates a total mileage of 2,473, of which it owns 2,034 and operates the remainder under trackage arrangements. Of the total owned mileage 322 is double track. The principal lines extend from St. Louis to Chicago and from Buffalo to Kansas City. In the case of the latter line the Wabash uses the Grand Trunk between the Niagara frontier and Delray, a distance of 228 miles. The Wabash also serves, among other important centers, Toledo, Omaha, Des Moines, etc., in some of which cities it has to use trackage rights to secure entrance. The Wabash tonnage is diversified. It serves a coal area in Illinois between St. Louis and Decatur, but bituminous makes up only 25 to 30 per cent of the total tonnage. There is also a sizeable business in anthracite coal received from the anthracite carriers at the Niagara frontier.

The Wabash has an enviable reputation for fast freight service. It receives from connecting carriers at the Niagara frontier a large tonnage of manufactures and miscellaneous freight for westbound movement. Eastbound it moves a heavy traffic in fresh fruits and perishables received from connections at Kansas City or St. Louis. It has a sizeable eastbound business in packing house products from Kansas City, this traffic receiving in the summer months a fourth morning delivery at New York. The road has the advantage on this Kansas City business, incidentally, that the traffic does not have to move through the terminals at St. Louis.

The Wabash is not a rich road. It has not been in a position to spend the money that it might like to have spent

for capital improvements to enable it to operate with utmost economy. It suffers, as will be noted below, from having a high debit per diem balance and from rentals. The road, however, seems to be well provided with motive power and its power is in good condition. It is using Santa Fe locomotives between East St. Louis and Chicago, these engines being rated at 5,500 tons from the coal district centering at Staunton and Mt. Olive, south of Decatur. From Kansas City to Hannibal, Mo., and also from Decatur east to Detroit, Mikados are used; between Hannibal and Decatur, Consolidations; and in Canada, east of Detroit, Prairie type locomotives. The main shops of the road are at Decatur. These were built in 1912 and 1913 and have a capacity of 60 classified repairs per month although they are not worked to that capacity. The shops at Moberly, Mo., have a capacity of 15 classified repairs.

The revenue tonnage carried by the Wabash in 1921 totaled 14,581,966, as noted above, 13.44 per cent less than in 1920. Of the 1921 tonnage, 21.61 per cent was in products of agriculture; 6.04 per cent products of animals; 35.22 per cent, products of mines; 6.68 per cent, products of forests and 25.49, manufactures and miscellaneous. It is interesting to observe in connection with what has been said above, that although the total tonnage decreased, there were increases of 6.99 per cent in products of agriculture and of 14.67 per cent in products of animals. The tonnage of fresh fruits and vegetables does not bulk large in the total but there were increases of 73.31 per cent in citrus fruits; of 24.20 per cent in other fresh fruits; of 69.40 per cent in potatoes and of 47.76 per cent in other fresh vegetables. Under products of animals there were increases of 18.42 per cent in packing house products; of 73.18 per cent in poultry; of 86.33 per cent in eggs, etc. These facts presumably represent the result of the efficiency with which the fast freight service is conducted and of the efforts of the traffic department in soliciting the business.

The Coal Tonnage

The bituminous coal carried by the Wabash in 1921 totaled 3,369,218 tons or 29.18 per cent less than in 1920. The anthracite tonnage totaled 498,950. The Wabash is one of the roads hit by the effects of the coal strike. Presumably it is at present moving practically no anthracite. Its bituminous loadings the week ending April 8 totaled only 92 cars. Its loadings in March and April, 1921, approximated about 500 to 600 cars weekly. Because of the relative unimportance of the coal traffic in the total tonnage, it is evident, however, that the Wabash will not be seriously hurt by the strike.

The freight revenues of the Wabash in 1921 totaled \$45,688,528, an increase of \$2,363,828, or 5.46 per cent over 1920. The increase, with a decrease in revenue tonnage, was partly due to the changed character of the tonnage whereby there was a greater quantity of manifest freight moved, both relatively to the total tonnage and actually. The revenue per ton mile in 1921 was 1.17 cents; in 1920, but 0.95 cents.

Savings in Expenses

The total revenues for the year were \$59,217,692, a reduction of \$764,590, or 1.27 per cent from 1920. As against this reduction in operating revenues there was a reduction of \$8,851,521 in operating expenses. The expenses in 1921 totaled \$50,007,874, in 1920, \$58,859,395. There were reductions of \$1,380,430 in maintenance of way; of \$2,923,716 in maintenance of equipment, and of \$4,714,637 in transportation, which reductions point out the drastic nature of the economies which were put into effect during the year.

The savings in maintenance of way totaled \$1,380,430, or 13.10 per cent, the largest savings being made in track laying and surfacing—namely in labor. The expenses for this purpose were reduced \$768,397. With reference to mate-

rial the figures show that the road laid in 1921, 10,788 tons of 90-lb. rail as compared with 21,178 tons in 1920, but double the amount laid each of the years immediately preceding 1920. Ties laid in main track totaled 831,237 as compared with 797,576 in 1920. Ties laid in side track totaled 281,606, or more than the average for 1920 and preceding years. There were 178 miles of track rebalasted as compared with 165 in 1920 and lesser amounts in preceding years. These figures, on the whole, do not show that maintenance was cut unduly.

Maintenance of equipment was reduced \$2,923,716, or 19.84 per cent. On April 1, 1922, the Wabash's percentage of bad order cars was 13.8 per cent. not as low as it should be, but about the country's average. The percentage of un-serviceable locomotives on the same date was 13.8, indicating an extremely good motive power condition; the country's average on the same date was 20.1 per cent. During the year 405 locomotives were given classified repairs as compared with 455 in 1920, but the condition of power based on mileage remaining in all engines before due for next classified repairs, was estimated to be on December 31, 1921, 49.93 per cent as compared with 44.52 per cent on December 31, 1920. The average cost of repairs per locomotive mile in 1921 was 33 cents as compared with 37 cents in 1920. During the year 1,419 cars were rebuilt entirely or given extensive repairs at contract shops.

Fuel Economy

The transportation ratio for 1921 was 42.74 per cent. In 1920 it was 50.06 per cent. The expenses for transportation in 1921 totaled \$25,726,606, or \$4,714,637 less than in 1920. The largest savings were naturally in fuel and labor due to the smaller business handled and to lessened wages and costs. There were also sizeable savings in freight loss and damage. The Wabash has been giving a great deal of attention to fuel economy. For one thing, there is an instruction school operated and maintained, not by the road but by the enginemen themselves. This school has two cars and the men are encouraged by their fellow employees to attend. Further than that the road encourages the men by means of talks and bulletins. Crews that do extra good work are complimented by a letter from the general manager, etc. In 1921 the pounds of coal consumed per 1,000 gross ton-miles was 184, a reduction of 15 pounds from 1920 in spite of the increased tonnage of manifest and light-weight freight and the reduced tonnage of such heavy freight as coal, etc. The average cost of coal on the tender in 1921 averaged \$3.24, as compared with \$3.52 in 1920. The coal consumed was 1,438,797 tons, a reduction of 236,356 tons from 1920.

Finances

The Wabash suffers from the standpoint of rentals. In 1921 it had a debit hire of freight car balance of \$1,349,405. This was \$362,582 less than in 1920 but still sufficiently large to be a handicap. Joint facility rents in 1920 totaled \$1,753,139, indicating the importance also of that item. The company has a compensating asset, however, in its low fixed charges. It has outstanding \$138,492,967 capital stock, but funded debt in the amount of only \$74,183,950. The interest on funded debt in 1921 totaled \$3,629,803. The stock is made up of profit-sharing preferred "A" stock, convertible preferred "B," and common. The "A" stock is entitled to five per cent non-cumulative dividends but none have been paid since April 30, 1918, and no dividends have been declared on the "B" or common. The preferred "B" is convertible into the other issues at the rate of \$50 par value of preferred "A" and \$50 par value of common for each \$100 par value of the "B" stock. During 1921, \$1,828,000 was so converted, making a total converted since August 1, 1918, of \$37,796,800. On December 31, 1921, there was outstanding \$62,463,125 of common, \$65,098,400 of preferred "A" and \$10,931,442 of preferred "B."

Labor Leaders Withdraw from Wage Cut Hearing

Heads of Sixteen Organizations Protest Against Testimony on Behalf of Shippers and Public

REPRESENTATIVES of the sixteen railroad labor organizations withdrew on April 28 from hearings before the Railroad Labor Board on proposed reductions in their rates of pay, after filing a protest against the appearance of the National Industrial Traffic League and the National Industrial Conference Board. Sometime ago the board announced that it would permit representatives of these organizations to appear before the board and present evidence as to their interest in the wage problem. Representatives of the labor organizations held a meeting at Chicago prior to the date set for this hearing and authorized Frank P. Walsh, Donald R. Richburg and J. H. Stevenson to file a brief of protest against the appearance of these organizations and authorizing them to withdraw from "further participation in such illegal proceedings" in event their protest was overruled. Before this protest could be registered, J. S. Burchmore, representing the National Industrial Traffic League, filed a brief which had been prepared. However, before representatives of the National Industrial Conference Board could begin their presentation, Mr. Walsh presented the employees' protest and after the chairman of the board ruled that, in accordance with a resolution adopted by the board, the parties would be heard, all of the labor leaders present withdrew.

Wage Cut Disputes Should Be Remanded

The board's hearings in the present controversy over the proposed reductions in the wages of railway employees have been so burdened with incompetent and irrelevant testimony that the whole question of readjustment of railway wages to meet present conditions should be remanded to the companies and their employees, Mr. Burchmore contended.

"The National Industrial Traffic League submits," he said, "that when the Labor Board fixes wages by an order entered otherwise than after a public hearing, at which competent testimony is offered under oath, and the scope of the hearing is confined to matters material to the controversy, it infringes upon the right of the public to receive an intelligent, unbiased and correct expression from the board as to the merits of the controversy."

Witnesses appearing before the board are not put under oath, nor is their testimony limited in any way, Mr. Burchmore pointed out. The relevancy or competency of much of the testimony has not been judged according to the ordinary standards as commonly applied by the Interstate Commerce Commission, boards of arbitration and judicial or quasi-judicial tribunals, he said. This failure is "prejudicial to the paramount right of the public as the silent third party in interest to every dispute before the Labor Board," he added.

"The National Industrial Traffic League does not suggest that the board should adopt the technical rules of evidence and practice applied in courts of law, but suggests that it should conform its practice to that commonly employed by state and federal bureaus and commissions, namely, to require all testimony to be given under the sanctity of the oath, and with reasonable formality to exclude matter clearly incompetent, irrelevant or immaterial."

N. I. T. League Favors Varying Wage Scales

In outlining the position of the National Industrial Traffic League on the question of wages, Mr. Burchmore said:

"It is the view of the league and of the shippers on whose

behalf it appears, that the railroads should not be required by any order of the Labor Board to pay or to continue paying a higher scale of wages to that general class of labor which is used alike in railroad and commercial industry than is paid currently in commercial industry for such comparative employment, and that the wages for such classes of labor vary so widely in different parts of the country and in different towns and cities that they do not lend themselves to uniform treatment.

"We do not contend that all railroad employees are receiving wages that are greater than paid by industries in the same section for comparable employment. Indeed, as against a considerable degree of uniformity in the wages of men employed by particular railroads, there is no such uniformity in the wages paid by industries along the lines of those railroads.

"It is a matter of common public knowledge that railroad labor in many instances has become a preferred class, receiving wages out of harmony to those paid to comparative employment in commercial industries, and this is neither right nor in the public interest."

"Hands Off" Policy Urged

In defending the right of the public to be heard in connection with wage disputes, Mr. Burchmore said:

"The public has a large interest in the outcome of any dispute involving the wages of railroad employees because of the effect thereof upon operating expenses, upon freight rates, passenger fares and transportation charges of the carriers, and finally upon industry throughout the nation. The public interest ought to be heard and considered by the board. The National Industrial Traffic League may fairly claim to speak for a substantial portion of the shipping public.

"As a result of orders entered by the director general during federal control, and former decisions of the railroad labor board," Mr. Burchmore said in discussing the present wage controversy, "the wages of many classes of railway employees have been so 'frozen' that a carrier which is unable in the opinion of its management to continue paying those wages or finds them higher than that class of labor commonly commands in that particular section could not effect a reduction, and could make no progress with its own men toward an agreement upon a reduction in wages. The practical result of this situation is that there has been no real opportunity for the management of the railroads to regulate the wages of their own men, and for those who desired to avoid any readjustment of the war-time wages such as already has occurred in industries, it has been simple to stand pat.

"In order to restore some semblance of freedom of action to the parties, it is necessary that the government take its hands off this situation. In other words, the so-called disputes now pending before the Railroad Labor Board are not bona fide disputes of the character which Congress intended should be the basis for the action of that board. It will not remedy any situation now existing for this board to enter into wages to be accepted by the carriers and the men for use throughout the country or on the lines of most of the principal either a blanket order or an elaborate detailed schedule, fix-carriers."

The employees' protest was summarized by them as follows:

No person other than carriers and employees should be permitted

to intervene 30 minutes before the Railroad Labor Board because:

First. Intervention is the act of proceeding by which one on his own motion becomes a party to a suit pending between others.

Second. To intervene a person must be competent to be a party.

Third. To be competent to intervene as a party a person must have a personal interest.

Fourth. Generally the right to intervene is purely statutory.

Fifth. The Transportation Act specifically limits those entitled to a hearing to parties to the dispute. (Section 309.)

Sixth. The disputes over which the board has jurisdiction are limited to disputes between carriers and employees and it is only of such disputes that the board has jurisdiction. In these disputes no other persons can be parties.

The organizations seeking to intervene cannot be given standing as witnesses, because witnesses must be individuals capable of being sworn.

The individual representatives of the organizations seeking to intervene cannot appear as witnesses in their own behalf because they cannot be made parties.

Therefore if such individuals are heard they must be called as witnesses by either:

(a) The carrier; or (b) The employees; or (c) The board.

The order of the board apparently permitting organizations to present witnesses is therefore improper and invalid and violative of the rights of the employees as parties to the proceedings before the board because:

First. The organizations are not parties and can not present witnesses.

Second. The individuals to be heard have not been called by any of the parties or by the board.

Third. The hearing of evidence to affect the rights of parties to a proceeding, volunteered by individuals having no standing in the proceeding, is contrary to such established orderly procedure as constitutes "due process of law" and in deprivation of the rights of the parties to the proceeding to a "hearing" such as authorized by statute.

The "hearing" which the board proposes to conduct is:

First. Outside the statutory powers of the board; and therefore an unlawful proceeding.

Second. If such a "hearing" affects in any way the rights of a party it will operate to invalidate as to such a party any decision of the board based in whole or in part upon such a hearing.

If it is the meaning of the board's ruling that evidence may be filed without a hearing, such evidence would be wholly inadmissible and the receiving of it by the board a violation of its obligations as an arbitrating body.

The board should not summon as its witnesses representatives of organizations not parties to the proceeding because:

1. Such organizations represent private partisan interests and are in no wise representatives of the public.

2. If the board permits one organization to be heard representing private or special interests there will be no reasonable basis for excluding any organization and the board will be required to hold extensive hearings of little value affording every organization, which desires to advance a special interest, or some general program of political or social reform, opportunity to be heard, thus imposing an unfair burden of time and expense on the parties and the board.

The purpose of referring disputes to the board is largely to crystallize and define issues between carriers and employees and to obtain an impartial judgment upon those issues. To clutter up the record with a mass of other issues and evidence will defeat the main purpose for which the board was created.

Statistics under partisan handling are notoriously unreliable and it is equally notorious that expert opinion follows a fee. Statistical information and expert opinion, if brought into the record by action of the board, should proceed from official representatives of the public and not from partisans masquerading as members of the public.

The Transportation Act specifically provides that officers and employees of the United States shall supply the board with any data or information necessary, and that specific provision for the production of such data by representatives of the public exclude the board from the right to receive information from private individuals who desire to present public opinion by means of statistics.

Also, an organization which is not a party is obviously not in the position to be sworn and to give testimony. The parties to a proceeding, however, are not so compelled to accept testimony from a non-party.

The order of the board as a government administrator is a public function and it is not the duty of the board to accept testimony from a non-party.

B. M. Jewell Assails Labor Board

Expressing the approval of the Labor men from the board, because B. M. Jewell, president of the Railway

Employees Department of the American Federation of Labor, issued a statement which said in part:

The refusal of labor organizations to continue in the hearing before the board was a protest against a long continued procedure by which the board has gradually deprived the employees of their right to have wages fixed as "just and reasonable" compensation, in accordance with the law and natural justice.

About a year ago the board violated an unbroken line of precedence of courts and arbitrators and allowed testimony of the ability of a railroad to pay wages to affect the fixing of a fair wage. Today the board went a step further in receiving testimony of the financial ability of the customers (shippers) of a railroad to pay.

Congress established the labor board to fix "just and reasonable" wages. The board has no authority to listen to evidence and to make its decisions on evidence which has nothing to do with what are "just and reasonable" wages.

The decisions of the board, if based on such evidence, will have little value, and hearings are merely a waste of time and money of the carriers and their employees.

Board Assumes Jurisdiction in Katy Dispute

Acting under the provisions of Section 307 of the Transportation Act, giving the board authority to assume jurisdiction over disputes that seem likely to interrupt commerce, the board, on April 27, dispatched the following telegram to the officers of the Missouri, Kansas & Texas and the representatives of the shop craft organizations on that road:

Credible information having come to the board that a dispute exists between the M. K. & T. and its shop craft employees, growing out of the alleged contracting by said carrier of its work in certain shops, the discharge of a large number of its employees and the placing of certain of its shop work on a piece-work basis, which action of the carrier, the employees contend is a violation of the law and the decisions of the board, but which the carrier contends is legal and not in violation of the rights of employees; and it appearing to the board that said dispute is likely substantially to interrupt commerce, and it further appearing that disputes involving this same question are now pending before the board and will be decided at an early date, the board, therefore, assumes jurisdiction of said dispute and sets same for hearing May 4, at 10 a. m. This action must not be construed as indicative of the board's position on the merits of this or similar controversies now pending before it. The parties will maintain the status quo, as of the date prior to the alleged contract, until the dispute is passed upon by the board.

The action of the board in assuming jurisdiction over this dispute, is especially significant because of the recent announcement of the shop crafts that it would take a strike vote primarily because of the action of the carriers in contracting certain portions of their operations. The labor leaders have already charged that this contracting is merely an attempt to evade the board's ruling as to wages and working conditions, but because of the absence of one member of the board and the importance of the question, the board has not ruled on this subject.

Reports from Sedalia, Mo., where the Katy shops had been "farmed out" to the A. S. Hecker Company of Cleveland, O., indicate that these shops have again been closed awaiting the board's ruling.

B. W. Hooper Elected Chairman of the Labor Board

Ben W. Hooper, a member of the public group on the board, and vice-chairman of that body, was unanimously elected as chairman on April 27, to succeed Judge R. M. Barton, who has held that position since the board was created. Mr. Hooper's name was placed in nomination by Judge Barton. G. W. W. Harger, also a member of the public group on the board, was elected to succeed Mr. Hooper as vice-chairman.

Prior to his appointment as a member of the labor board, Mr. Hooper served one term in the Tennessee House of Representatives and in 1910 was elected governor of Tennessee on a fusion ticket. He served two terms, devoting most of his time to problems of prison reform and the enforcement of 1901 prohibition laws. He was subsequently defeated for a third term and was given an honorary nomination for election to the United States Senate in 1916, but

was defeated. At the time of his appointment to the board, Mr. Hooper was practising law at Newport, Tenn.

Following his appointment as chairman, Mr. Hooper indicated that the Labor Board would immediately enter into two fights, one to repulse assaults upon its authority as a federal arbitration party and the other to forestall the threatened strike of shop craft employees announced in last week's *Railway Age*. He intimated that the legal battle between the Pennsylvania and the labor board over the authority of that body to prescribe the manner in which representatives of the men should be elected, would be a "finish fight." Later Chairman Hooper and Judge Barton conferred with Attorney General Daugherty and Solicitor General J. M. Beck at Washington, in regard to the next step in this legal controversy.

As a further sequel to this controversy, Judge C. B. Heiserman, general counsel of the Pennsylvania, speaking before the Academy of Political Science at New York on April 28, said that the Pennsylvania is willing at all times to abide by the decisions of the board "when its decisions are legal."

Testimony of J. H. Libby, Representing National Industrial Conference Board

J. H. Libby, representing the National Industrial Conference Board presented a series of charts to the board dealing with the actual earnings of railway employees, both hourly and weekly, their wages in relation to the cost of living and a comparison of railroad wages with the wages of employees performing the same or similar service in manufacturing industries. The first chart presented by Mr. Libby showed that between 1914 and the middle of the summer of 1920, the total payroll increased 271 per cent, the total operating expenses 237 per cent, the total operating revenues 251 per cent, the number of men employed 58 per cent and the number of men hours worked 41 per cent.

"After the business depression set in in 1920," Mr. Libby said, "and the wage decrease had been made by the labor board on July 1, 1921, the total payroll showed a net gain of 151 per cent over 1914, total operating expenses 136 per cent and total operating revenues 124 per cent, while the total number of men employed showed an increase of 26 per cent and the total number of men hours worked showed a net gain of only 10 per cent over the number in 1914."

Several other charts dealing with the "real" earnings of railway employees, defined by Mr. Libby as "the index of a man's wages divided by the index of the cost of living

representing his purchasing power over any given period. . . ." "On account of the rise in the cost of living," he said, "the 'real' earnings of all railroad wage earners fell below the 1914 level, until nearly the end of 1917. Then the increases that were awarded under the Adamson law and by the Director General of Railroads brought those earnings up, but in 1919 and in the early part of 1920, the 'real' earnings did not pay for the changes in the cost of living. Finally as the cost of living dropped after the middle of 1920, the 'real' earnings, based on the average hourly earnings, amounted to 144 per cent of the 1914 level, and the 'real' earnings, based on the average weekly wage, 120 per cent. That is a net gain of 20 per cent in the 'real' weekly earnings over 1914."

Mr. Libby also showed that the "real" earnings of skilled shop labor increased 63 per cent based on the average hourly earnings and 24 per cent based on the average weekly earnings adding that "the average employee at the end of the week January 1, 1921, was 24 per cent better off in purchasing power than he had been in 1914."

Similar testimony was introduced showing that the real earnings of machinists, boilermakers and blacksmiths had increased 25 per cent on the basis of their average hourly earnings and 9 per cent on the basis of their average weekly earnings.

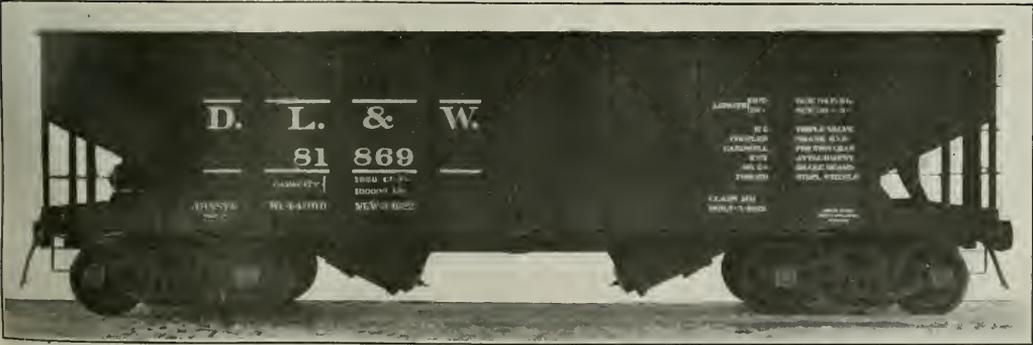

For car men, the "real" earnings were increased 76 per cent computed on their hourly earnings and 34 per cent computed on their weekly earnings.

The "real" earnings of unskilled labor, based on their average hourly earnings, show an increase of 46 per cent, and, based on the average weekly earnings, an increase of 17 per cent over 1914.

For clerks, the increase in "real" earnings based on the average hourly earnings showed an increase of 30 per cent and, based on the average weekly earnings, of 16 per cent over 1914.

For telegraphers, the increase in "real" wages was 41 per cent over 1914 based on the average hourly earnings and 35 per cent based on the average weekly earnings.

Mr. Libby also presented the results of an investigation covering 24 manufacturing industries employing approximately 700,000 men and showing that "until the middle of 1921, unskilled labor in the manufacturing industries was paid at a rate uniformly higher than paid railroad unskilled labor," but that in June, 1921, this situation was reversed, the unskilled labor in the manufacturing industries receiving average hourly earnings of but 38.3 cents while the unskilled labor in railroad service was receiving 44.8 cents.

New Hopper Cars for D. L. & W.

The 1,500 hopper bottom coal cars ordered by the Delaware, Lackawanna & Western in 1921 are being delivered. Order was equally divided between Cambria Steel Co., American Car & Foundry Co., and Standard Steel Car Co. These cars are of 100,000 lb. or 1,950 cu. ft. capacity; weight 44,000 lb.; are 33 ft. 3 in. long inside, and are equipped with forged steel wheels.

General News Department

The Western Railway Club will hold its annual meeting and dinner at the Drake hotel, Chicago, on the evening of May 15. United States Senator McKinley of Illinois and James C. Davis, director general of the United States Railroad Administration, will be the speakers.

The Illinois Central has furnished its employees in Mississippi with cards containing a statement of the road's annual operating costs in that state. The number of employees in the state is 9,424 and the amount paid out yearly in wages is given as \$13,645,052. Material and supplies purchased and taxes paid amounted to \$3,003,572. This statement will be, in the words of a prominent railroad president, a "talking point," for employees who come in contact with the public.

The Southern Railway System's new double track bridge across the Ohio river at Cincinnati designed to carry the heaviest locomotives and cars now in use was opened on May 1 for movement of heavy freight traffic. The restrictions as to the weight of cars which have been in effect during construction and previously have been modified so that the Southern can now handle into or out of Cincinnati any car moving in the course of normal business. This will greatly facilitate the movement of heavy loading freight through the Cincinnati gateway. The new bridge is 4,300 ft. long, consisting of 1,600 ft. of truss work, 1,600 ft. of plate girder work and 1,100 ft. of fill between concrete retaining walls. A draw span of the vertical lift type 365 ft. long with a clearance of 53 ft. above high water mark for river navigation, takes the place of an old fashioned swing span of the old bridge.

Another Brotherhood

The Union of Skilled Railway Maintenance of Way Employees has been organized at Macon, Ga., men of that class being present. It is said, from every important railroad in the southern states. J. O. Raley of Macon was elected president and E. N. Hutt of Enterprise, Miss., secretary. It is said that it is the purpose of this union to take in all employees of the maintenance of way department above common laborer.

Pennsylvania-Labor Board Case to be

Appealed to Supreme Court

Attorney General Daugherty has announced that the Department of Justice will support the position of the Railroad Labor Board in an appeal from the decision of Judge Page adverse to the board in the Pennsylvania case. Chairman Hooper and R. M. Barton of the Labor Board had conferred with the attorney general on May 1 on the subject.

New England Railroad Club Meeting

The New England Railroad Club will meet on Tuesday, May 9 at the Copley Plaza Hotel, Boston. Dinner will be served at 6.30 P. M. E. S. Jones, official photographer of the Boston & Maine, will deliver the address of the evening on "Maine, the Sportsman's Paradise." The lecture will be illustrated by colored lantern slides which Mr. Jones has been collecting for years. In addition to the lecture there will be an entertainment during the dinner.

Automobiles Must Stop

The General Assembly of Virginia has passed a law under which drivers of automobiles and other vehicles using the public high ways must stop to a full stop before crossing a railway track at grade. The law provides that drivers of all vehicles on approaching any track crossing of a main line railway track outside an incorporated town must stop at a point not less than 10 ft. for more than 10 ft. from the nearest rail, penalty for violation, ten dollars.

To Investigate Pacific Great Eastern

John G. Sullivan, formerly chief engineer of the Canadian Pacific, has been retained by the Province of British Columbia to investigate and report on the Pacific Great Eastern, which is owned and operated by that province, and which has for some time, been showing a deficit. He will advise the government as to the best methods of maintaining the line already constructed, and also recommend the route for the continuation of the railroad to Prince George. W. P. Hinton, formerly general manager of the Grand Trunk Pacific, is preparing a report on the operating and traffic conditions of this carrier.

Annual Meeting of Safety Section

The second annual meeting of the Safety Section of the American Railway Association was held in Chicago this week, Wednesday, Thursday and Friday, with an attendance of about 125.

Final steps were taken to launch the "Careful Crossing Campaign" which is to be conducted this summer for four months throughout the country. Among other subjects discussed were: goggles; the posting of accident and injury bulletins; control of injuries resulting from riding on locomotive footboards; injuries from motor cars; responsibility of supervisors for injuries sustained by their men.

A further report of the doings of this meeting will be given in a subsequent issue.

The International Locomotive Association

The International Locomotive Association is now being promoted, having for its object the history and development of the locomotive; and the preservation of records pertaining thereto. In carrying out these aims the co-operation of all interested will be welcomed.

Information in regard to the activities of the association will be made available to the members through the agency of a bulletin, in which articles of a suitable nature will also appear.

The Organization Committee consists of Arthur Curran, 16 Ballard street, Newton Center, Mass.; Charles B. Chancy, 97 Lafayette avenue, Brooklyn, N. Y.; and Norman Thompson, 340 Spence street, Winnipeg, Manitoba.

Signalmen of U. P. Sue for Back Pay

Alleging that approximately \$300,000 is due them as wages earned during federal control of the railroads, January, 1918, to February, 1920, signalmen on the Union Pacific System have filed suit in federal court against the director general of railroads and the Union Pacific for the recovery of this sum. The attorney for the Brotherhood of Railway Signalmen states that his clients were awarded 68 cents an hour for the first 16 months of federal control of the railroads and 72 cents an hour for the balance of federal control, but that the maximum amount paid to them during federal control was 58 cents an hour for the first 16 months and 62 cents an hour for the remaining period. The plaintiffs also allege that the director general on April 7, 1922, ordered the Union Pacific to pay their claims for back pay but that the road refused to do so.

Development Association at Denver, May 10

The fourteenth annual meeting of the American Railway Development Association, representing the industrial, immigration, real estate, agricultural, publicity and marketing agencies of the railroads will be held in the Brown Palace Hotel, Denver, Colorado May 10 11 and 12. The officers of this association are: President, G. E. Bates, assistant to the general manager of the Delaware & Hudson; vice-president, J. R. Lamson, agricultural development agent of the Chicago, Burlington & Quincy; second vice-president, I. F. Fox, teaching immigration agent of the

Northern Pacific, and secretary and treasurer, J. F. Jackson, agricultural agent of the Central of Georgia. A large attendance is expected. Arrangements have been made for addresses by J. H. Young, president of the Denver & Rio Grande Western; Oliver H. Shoup, governor of Colorado, and H. R. Safford, vice-president of the Chicago, Burlington & Quincy.

Refrigerator Cars to Be Discussed by American Society of Mechanical Engineers

A joint meeting on the subject of refrigerator cars will be held by the Railroad Division and the Metropolitan Section of the American Society of Mechanical Engineers with the American Society of Refrigerating Engineers in the Engineering Societies' Building, 29 West Thirty-ninth street, on the evening of May 16. Two papers will be presented; the first entitled, Some Notes on Railroad Refrigerator Cars, by W. H. Winterrowd, chief mechanical engineer of the Canadian Pacific; the second entitled, Mechanical Refrigeration Processes Applicable to Railway Cars, by W. H. Baxter of the Balsa Wood Company, Chicago. The data at present available regarding refrigerator cars is fragmentary and scattered. Mr. Winterrowd's paper brings together facts of interest, and importance to car designers, manufacturers and users. It contains a discussion of numerous factors affecting efficient refrigeration, including air circulation, method of loading, ice containers, insulation, car construction and maintenance. Tabular comparisons of numerous designs of refrigerator cars are included and methods of calculating heat transmission and relative values of insulation are given.

Net Return for March 5.83 Per Cent

The net railway operating income of the Class I railroads for the month of March was at the annual rate of 5.83 per cent on their valuation, according to a preliminary compilation of the returns made by the Bureau of Railway Economics. This is the largest percentage of return earned by the railroads in any single month since the passage of the transportation act. It reflects not only an improvement in general traffic conditions and reductions in expense, but particularly the increase in coal handled during the month of March for storage in anticipation of the coal strike in April, which will correspondingly reduce the earnings for April. The effect of the coal movement is particularly shown in the Eastern district, where the roads earned at the rate of 7.8 per cent. The net operating income for the Class I roads for the month was \$83,510,888 as compared with \$30,807,066 in March last year. For the three months of 1922 the net operating income was \$160,998,907 as compared with \$27,574,407 last year. For the three months the rate of return on an annual basis was 4.51. For the month operating revenues increased 3.4 per cent, in spite of an increase in traffic, but operating expenses were reduced 9.8 per cent. For the three months there was a decrease in revenues of 4.8 per cent, while expenses were reduced 16.6 per cent. The compilation is as follows:

Fuel Association Convention Program

The International Railway Fuel Association has announced details of the program for the sessions at the annual convention to be held in the Auditorium Hotel, Chicago, May 22-25. A comprehensive list of papers and addresses has been prepared and it is expected that there will be a large attendance of railroad men from all departments concerned with the economical purchase and use of fuel. Several subjects of joint interest to railroad officers and coal operators will be considered on the last two days of the convention and it is anticipated that there will be a good representation from the coal operators, especially since the annual meeting of the National Coal Association will be held at the Congress Hotel, Chicago, May 24-26. The complete program is as follows:

- Monday, May 22—10:30 a. m.*
 Invocation
 Opening Address L. W. Baldwin, vice-president, Illinois Central.
 Address by President W. L. Robinson, superintendent fuel and locomotive performance, Baltimore & Ohio.
 Report of secretary-treasurer J. G. Crawford, fuel engineer, Chicago, Burlington & Quincy.
 Appointment of committees, unfinished and new business
 Colloidal Fuel Linton W. Bates, Mt. Lebanon, N. Y.
 Report of Special Committee on Locomotive Feedwater Heating E. E. Chapman, chairman, engineer tests, Atchison, Topeka & Santa Fe.
 Report of Standing Committee on Firing Practice M. A. Daly, chairman, general fuel supervisor, Northern Pacific.

- Monday, May 22—2:00 p. m.*
 Lignite Carbonization Dr. E. J. Babcock, dean, Mining Engineering Department, University of North Dakota

- Fuel Conservation from the Standpoint of a Division Superintendent S. U. Hooper, superintendent, Baltimore & Ohio.

- Fuel Conservation from the Standpoint of Representatives of Department Operating Coaling Stations W. S. Burnett, district engineer, Cleveland, Cincinnati, Chicago & St. Louis.

- Fuel Conservation from the Standpoint of Locomotive Engineer C. J. Barnett, locomotive engineer, Illinois Central.

- Effect of Tonnage Rating and Speed on Fuel Economy J. E. Davenport, engineer dynamometer tests, New York Central.

- Tuesday, May 23—9:30 a. m.*
 The Economic Considerations Governing the Use of Oil as a Locomotive Fuel M. C. M. Hatch, mechanical engineer, Missouri, Kansas & Texas.

- Locomotive Fuel the Life Blood of Transportation G. M. Basford, consulting engineer, Lima Locomotive Works.

- Incentives for Promoting Fuel Economy—A survey of existing and proposed practices O. S. Bever, Jr., consulting engineer, New York.

- Report of Standing Committee on Front Ends, Grates and Ash Pans E. C. Schmidt, chairman, professor of railway engineering, University of Illinois.

- Report of Standing Committee on Fuel Accounting J. N. Clark, chairman, chief Fuel Bureau, Southern Pacific Lines.

- Educational Work Along Fuel Economy Lines D. C. Buell, director, Railway Educational Bureau.

d Denotes decrease.

Wednesday, May 24—9:30 a. m.

- The Government and the Coal Industry T. H. Watkins, president, Pennsylvania Coal & Coke Company.
- Effect of Circulation on Locomotive Boiler Efficiency F. G. Lister, mechanical engineer, El Paso & Southwestern System.
- The Various Items of Saving by Using a Better Quality of Coal Earl Cobb, president, Southwestern Coal Company.
- Assigned Cars for Railroad Fuel G. L. Hall, general manager, Walter Bede-Se & Co.

Thursday, May 24—2:00 p. m.

- Report of Standing Committee on Storage Coal H. H. Stock, chairman, professor mining engineering, University of Illinois.
- Comparative Practice—United States, United Kingdom, France and Germany Harrington Emerson
- Report of Standing Committee on Fuel Stations W. E. Dunham, chairman, assistant superintendent motive power and maintenance, Chicago & North Western.

Friday, May 25—9:30 a. m.

- The Relation of Overdevelopment of the Bituminous Coal Industry to Transportation C. E. Leshar, editor, Coal Age
- Standard Rail and Coal Contract W. J. Tapp, fuel supervisor, Denver & Rio Grande
- The Railroad Fuel Problem from the Standpoint of the Coal Operator F. S. Peabody, president, Peabody Coal Company.

Thursday, May 25—2:00 p. m.

- Business Session
- Report of Auditing Committee
- Report of Committee on Constitution and By-Laws T. Duff Smith, chairman, lake forwarding agent, Canadian National.
- Report of Committee on Thanks, election of officers, balloting for place of 1923 meeting.

Supplement to 1921 Rules of Interchange

A supplement to the 1921 Rules of Interchange has been prepared by the Arbitration Committee and the Committee on Prices for Labor and Materials of the Mechanical Division of the American Railway Association. This supplement includes several interpretations of the Rules of Interchange as rendered by the Arbitration Committee and the following modifications of the rules relative to prices for labor and materials:

- Rule 101.—Entirely revised on account of present market prices and labor per hour revised to \$1.10 per hour. Revision effective May 1, 1922.
- Rule 107.—Several items revised on account of revision of labor rate, effective May 1, 1922.
- Rule 112.—Reproduction cost per pound prices for settlement for cars destroyed reduced 30 per cent, effective May 1, 1922.
- Passenger Car Rule 22.—Material allowances revised on account of present market conditions.

Meetings and Conventions

The following list gives names of secretaries, dates of next or regular meetings and places of meetings.

- AIR BRAKE ASSOCIATION.—F. M. Nellis, 165 Broadway, New York City. Next convention, June 19, 1921, Haddon Hall Hotel, Atlantic City, N. J. Exhibit by Air Brake Appliance Association
- AIR BRAKE APPLIANCE ASSOCIATION.—J. F. Gettruff, The Ashion Valve Company, 318 W. Washington St., Chicago. Meeting with Air Brake Association.
- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pothoms, Superintendent of Demurrage and Storage, C & N W Ry., Chicago.
- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—J. A. Stone, C & F E. Ry., Chicago. Annual meeting, Oct. 15, 1921, San Francisco, Cal.
- AMERICAN ASSOCIATION OF ENGINEERS.—C. E. DeLoe, 63 E. Adams St., Chicago.
- AMERICAN ASSOCIATION OF GENERAL RAILWAY AGENTS.—J. L. Duffin, 33 S. Madison Ave., Chicago. Next meeting, June 1, 8, 9, 10, 11, 1922, Minneapolis, Minn.
- AMERICAN ASSOCIATION OF PASSENGER TRAVEL OFFICERS.—W. C. Howe, P. O. Box of N. J. 117, Liberty St., New York.
- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—J. Rothchild, Room 100, Union Station, St. Louis. Next convention, August 14-17, 1922, Kansas City, Mo.
- AMERICAN ELECTRIC RAILWAY ASSOCIATION.—J. W. Welch, 8 W. 40th St., New York.
- AMERICAN RAILROAD MASTER MECHANICS' ASSOCIATION AND PEEBODYS' ASSOCIATION.—H. H. Stock, 11 North Hudson Ave., Chicago, Ill.
- AMERICAN RAILWAY ASSOCIATION.—J. E. Fitch, General Secretary, 75 Central St., New York. N. Y. Ann. meeting, November, 1921.
- ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, Freight Agent, Illinois Central Railroad, Chicago, Ill.
- Medical and Surgical Section. J. C. Caviston, 75 Church St., New York.
- Protective Section (including former activities of the American Railway Chief Special Agents and Chiefs of Police Association). J. C. Caviston, 75 Church St., New York, N. Y.
- Telephone and Telegraph Section (including former activities of the Association of Railway Telegraph Superintendents). W. A. Fairbanks, 75 Church St., New York, N. Y. Annual meeting, September 20-22, 1922, Colorado Springs, Colo.
- Safety Section. J. C. Caviston, 75 Church St., New York.
- Division II—Transportation (including former activities of the Association of Transportation and Car Accounting Officers). G. W. Covert, 431 South Dearborn St., Chicago, Ill.
- Division III—Traffic. J. Gotschelsky, 317 North Dearborn St., Chicago, Ill.
- Division IV—Engineering. E. H. Fritch, 431 South Dearborn St., Chicago, Ill. Exhibit by National Railway Appliances Association, Construction and Maintenance Section. E. H. Fritch, Electrical Section. E. H. Fritch.
- Signal Section (including former activities of the Railway Signal Association). H. S. Ballet, 75 Church St., New York, N. Y. Next meeting, March 13 and 14, Drake Hotel, Chicago. Annual meeting, June 14-16, 1922, Monmouth Hotel, Spring Lake, N. J.
- Division V—Mechanical (including former activities of the Master Car Builders' Association and the American Railway Master Mechanics' Association). V. R. Hawthorne, 431 South Dearborn St., Chicago, Ill. Annual convention, June 14-21, 1922, Atlantic City, N. J. Exhibit by Railway Supply Manufacturers' Association.
- Equipment Painting Section (including former activities of the Master Car and Locomotive Painters' Association). V. R. Hawthorne, 431 South Dearborn St., Chicago, Ill.
- Division VI—Purchases and Stores (including former activities of the Railway Storekeepers' Association). L. P. Murphy, General Store Keeper, New York Central, Collinwood, Ohio. Annual meeting, June 19-21, 1922, Hotel Traymore, Atlantic City, N. J.
- Division VII—Freight Claims (including former activities of the Freight Claim Association). Lewis Pilcher, 431 South Dearborn St., Chicago, Ill.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C & N. W. Ry., 319 N. Waller Ave., Chicago. Next convention, October 17-19, 1922, Cincinnati, Ohio. Exhibit by Bridge and Building Supply Men's Association.
- AMERICAN RAILWAY DEVELOPMENT ASSOCIATION.—J. F. Jackson, C. of Ga. Ry., Savannah, Ga. Annual meeting, May 10-12, 1922, Denver, Colo.
- AMERICAN RAILWAY ENGINEER ASSOCIATION.—(Works in co-operation with the American Railway Association, Division IV.) E. H. Fritch, 431 South Dearborn St., Chicago. Exhibit by National Railway Appliances Association.
- AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—(See American Railway Association, Division V.)
- AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—R. D. Fletcher, 1145 East Marquette Road, Chicago. Exhibit by Supply Association of the American Railway Tool Foremen's Association.
- AMERICAN SHORT LINE RAILROAD ASSOCIATION.—T. F. Whittless, Union Trust Bldg., Washington, D. C. Annual meeting, May 10, Washington, D. C.
- AMERICAN SOCIETY FOR STEEL TREATING.—W. H. Eisman, 1600 Prospect Ave., Cleveland, Ohio. Sectional meeting, May 25-26, Bureau of Mines Auditorium, Pittsburgh, Pa. Annual convention, Oct. 2-7, 1922, General Motors Building, Detroit, Mich.
- AMERICAN SOCIETY FOR TESTING MATERIALS.—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa. Annual meeting, June 26-30, 1922, Chalfonte-Haddon Hall, Atlantic City, N. J.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—E. M. Chandler (acting secretary), 33 W. 39th St., New York. Regular meetings 1st and 3d Wednesdays in month, except July and August, 33 W. 39th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York. Next meeting, May 8-11, Atlanta, Ga.
- Railroad Division, A. F. Stuebeling, Managing Editor, Railway Mechanical Engineer, Woolworth Bldg., New York. Next meeting, May 16, 1922, 29 W. 39th St., New York.
- AMERICAN TRAIN DISPATCHERS ASSOCIATION.—C. L. Darling, 1310-1311 Mallers Bldg., Chicago, Ill. Next convention, June 18, 1923, Chicago.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.—S. D. Cooper, A. T. & S. Fe R. R., Topeka, Kan. Next meeting, January 23, 1923, New Orleans, La.
- ASSOCIATION OF RAILWAY CLAIM AGENTS.—H. D. Morris, Northern Pacific R. R., St. Paul, Minn. Next meeting, May 17-19, 1922, Montreal.
- ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—J. A. Andreacetti, C & N. W. Ry., Room 111, C & N. W. St., Chicago. Next meeting, June 19, Dennis Hotel, Atlantic City, N. J. Exhibit by Railway Electrical Supply Manufacturers' Association.
- ASSOCIATION OF RAILWAY EXECUTIVES.—Thomas De Witt Cuyler (chairman), 61 Broadway, New York, N. Y.
- ASSOCIATES OF RAILWAY SUPPLY MEN.—A. W. Clokey, 1658 McCormick Bldg., Chicago. Meeting with International Railway General Foremen's Association.
- ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—(See American Railway Association, Division I.)
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—(See American Railway Association, Division II.)
- BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—D. J. Higgins, American Valve & Meter Company, 332 S. Michigan Ave., Chicago. Meeting with convention of American Railway Bridge and Building Ass'n.
- CANADIAN RAILWAY CLUB.—W. A. Booth, 53 Rushbrook St., Montreal, Que.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—AYDEN KLINE, 676 North Pine Ave., Chicago. Regular meetings, 3d Monday in month, except June, July and August, New Morrison Hotel, Chicago.
- CAR FOREMEN'S ASSOCIATION OF ST. LOUIS, MO.—THOMAS B. KNEEKE, 604 Federal Reserve Bank Bldg., St. Louis, Mo. Meetings, first Tuesday in month at the American Hotel Annex, St. Louis.
- CENTRAL RAILWAY CLUB.—HARRY D. VOUGHT, 6 Cortlandt St., New York. Regular meetings, 3d Thursday in January, March, May, September and November, Hotel Trumbull, Buffalo, N. Y.

CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.—W. P. Elliott, Terminal Railroad Association of St. Louis, East St. Louis, Ill.

CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S SUPPLY MEN'S ASSOCIATION.—D. B. Wright, 34th St. and Artesan Ave., Chicago, Ill. Meeting with Chief Interchange Car Inspectors' and Car Foremen's Association.

CINCINNATI RAILROAD CLUB.—W. C. Cooder, Union Central Bldg., Cincinnati, Ohio. Meetings, 2d Tuesday in February, May, September and November.

EASTERN RAILROAD ASSOCIATION.—E. N. Bessling, 614 F St., N. W., Washington, D. C. Annual meeting May 11, 1922, Railroad Club of New York.

FREIGHT CLAIM ASSOCIATION.—(See American Railway Association, Division VII.)

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—C. H. Treichel, Grand Central Station, Chicago. Regular meetings, Wednesday preceding 3d Friday in month, Room 1414, Manhattan Bldg., Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—W. J. Mayer, Michigan Central R. R., Detroit, Mich. Annual convention, August 15-17, Hotel Sherman, Chicago. Exhibit by International Railroad Master Blacksmiths' Supply Men's Association.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' SUPPLY MEN'S ASSOCIATION.—George P. White, 747 Railway Exchange, Chicago. Meeting with International Railroad Master Blacksmiths' Association.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—J. C. Crawford, 702 E. 51st St., Chicago. Next annual meeting May 22-25, 1922, Auditorium Hotel, Chicago. Exhibit by International Railway Supply Men's Association.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1061 W. Wahasha Ave., Winona, Minn.

INTERNATIONAL RAILWAY SUPPLY MEN'S ASSOCIATION.—C. W. Sullivan, Garlock Packing Co., 326 W. Madison St., Chicago. Meeting with International Railway Fuel Association.

MAINTENANCE OF WAY MASTER PAINTERS' ASSOCIATION.—E. E. Martin, Union Pacific R. R., Room No. 19, Union Pacific Bldg., Kansas City, Mo. Annual convention, 1922, Buffalo, N. Y.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 26 Cortland St., New York. Next convention, May 23-26, 1922, Hotel Sherman, Chicago.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION.—(See A. R. A., Division V.)

MASTER CAR BUILDERS' ASSOCIATION.—(See A. R., Division V.)

NATIONAL ASSOCIATION OF RAILWAY TIE PRODUCERS.—Warren C. Nixon, Western Tie & Timber Co., 905 Syndicate Trust Bldg., St. Louis, Mo.

NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES COMMISSIONERS.—James B. Walker, 49 Lafayette St., New York. Next convention, September 26, 1922, Detroit, Mich.

NATIONAL FOREIGN TRADE COUNCIL.—O. K. Davis, 1 Hanover Square, New York. Next convention, May 10-12, Philadelphia, Pa.

NATIONAL RAILWAY APPLIANCE ASSOCIATION.—C. W. Kelly, People's Gas Bldg., Chicago. Annual exhibition at convention of American Railway Engineering Association.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, excepting June, July, August and September.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 26 Cortland St., New York. Regular meetings, 3d Friday in month, except June, July and August, at 29 W. 39th St., New York.

PACIFIC RAILWAY CLUB.—W. S. Wolner, 64 Pine St., San Francisco, Cal. Regular meetings, 2d Thursday in month, alternately in San Francisco and Oakland.

RAILWAY ACCOUNTING OFFICERS' ASSOCIATION.—E. R. Woodson, 1116 Woodward Building, Washington, D. C. Annual meeting, June 7, 1922, Hotel Cleveland, Cleveland, Ohio.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 600 Liberty Bldg., Broad and Market Sts., Philadelphia, Pa. Annual dinner, February 1, Waldorf-Astoria, New York.

RAILWAY CLUB OF PITTSBURGH.—J. D. Conway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month, except June, July and August, at Fort Pitt Hotel, Pittsburgh, Pa.

RAILWAY DEVELOPMENT ASSOCIATION.—(See Am. Ry. Development Assn.)

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, General Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.

RAILWAY EQUIPMENT MANUFACTURERS' ASSOCIATION.—R. J. Himmelright, 17 East 42nd St., New York. Meeting with Traveling Engineers' Association.

RAILWAY FIRE PROTECTION ASSOCIATION.—R. R. Hackett, Baltimore & Ohio R. R., Baltimore, Md.

RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrison, C. & O. Ry., Richmond, Va. Next meeting October 10-13, 1922, Pittsburgh, Pa.

RAILWAY SIGN ASSOCIATION.—(See A. R. A., Division IV., Signal Section.)

RAILWAY STOREKEEPERS' ASSOCIATION.—(See A. R. A., Division VI.)

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 1841 Oliver Bldg., Pittsburgh, Pa. Meeting with A. R. A., Division V.

RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 30 Church St., New York.

RAILWAY TREASURY OFFICERS' ASSOCIATION.—L. W. Cox, Commercial Trust Bldg., Philadelphia, Pa.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrews, C. & N. W. Ry., Sterling, Ill. Annual convention, September 19-21, 1922, Hotel Staller, Cleveland, Ohio. Exhibit by Track Supply Association.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, Sunbeam Electric Manufacturing Company, New York City. Meeting with American Railway Association, Signal Section.

SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, P. O. Box 1205, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, West 4th Ry. of Atl., Atlanta, Ga.

SUPPLY ASSOCIATION OF AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—H. S. White, 9 N. Jefferson St., Chicago.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Rampapo Iron Works, Hillburn, N. Y. Meets with Roadmasters' and Maintenance of Way Association.

TRAVELING ENGINEERS ASSOCIATION.—W. O. Thompson, Marine Trust Building, Buffalo, N. Y. Annual convention, September 12-15, Hotel Sherman, Chicago. Exhibit by Railway Equipment Manufacturers' Association.

WESTERN RAILWAY CLUB.—Bruce V. Crabbell, 14 E. Jackson Boulevard, Chicago. Annual dinner, May 15, Drake Hotel, Chicago. Regular meetings, 3d Monday each month except June, July and August.

Traffic News

The Transportation Club of Louisville, Ky., has moved its club-rooms to 630 South Fourth street in that city.

The Gulf, Mobile & Northern has inaugurated a new through freight service between Jackson, Tenn., Mobile, Ala., and New Orleans, La.

The House committee on interstate and foreign commerce has postponed consideration of the mileage book bills, on which it recently held hearings, for an indefinite period.

The Northern Pacific, to accommodate travelers to the Yellowstone National Park, will establish new sleeping car service on June 19, between St. Paul and Gardiner, Mont., on its Pacific Express, trains 3 and 4.

The Chicago & Alton has announced the inauguration of a new solid Pullman no-stop passenger train between Chicago and St. Louis, Mo. A feature of this train is a sleeper exclusively for men and another for women only.

The Illinois Central has announced the opening of a freight and passenger traffic office at 2946 East Ninety-second street, Chicago, to serve South Chicago, Calumet and Gary, including also East Chicago, Hammond, Hegewisch, Indiana Harbor and Whiting. This is said to be the first city freight and passenger office to be opened by any railroad in the "South Chicago" business district.

The concrete fireproof grain elevator of the Pennsylvania Railroad at Baltimore, Md., is to be enlarged this summer to a total capacity of 4,250,000 bushels. The work remaining to be done consists of the construction of bins to add 1,300,000 bushels to the present storage capacity. This portion of the construction was unavoidably suspended during the war. The old wooden Elevator No. 1 is to be torn down. When finished the new elevator will represent a total investment of \$5,500,000. The plant is electrically operated throughout. The elevator has accommodation for loading four of the largest ships simultaneously. It has four mechanical unloading machines which empty the grain from box cars by turning them on their sides and rocking them from end to end. The unloading capacity of the four machines, operating together, is 40 cars an hour. The elevator's working capacity for loading grain into ships exceeds 120,000 bushels an hour.

Coal Production Increases

In the fourth week of the coal strike (April 24-29) production has turned upward, according to the weekly bulletin of the Geological Survey. The output of bituminous coal is expected to pass the 4,000,000-ton mark. Production of anthracite, however, remains practically zero.

The revised figures for the third week (April 17-22) are 3,560,000 tons of soft coal and 6,000 tons of anthracite, a total for all coal of 3,566,000 net tons. The same week of the 1919 strike saw 5,344,000 tons of bituminous and 2,055,000 tons of anthracite produced, a total of 7,399,000 tons. The current output of hard and soft coal combined is therefore some 3,800,000 tons short of that in the corresponding period of the 1919 strike.

Telegraphic reports indicate a definite increase in production of soft coal during the week of April 24-29. Loadings on Monday, April 24, were 12,131 cars. This was the highest since the strike began, yet it was exceeded on Tuesday and again on Wednesday, when 12,520 cars were loaded.

The increase of last week has come largely from the non-union districts of the Middle and Southern Appalachians, the bulletin says. It is not due to the return to work of striking miners, either union or non-union, but rather to increased demand resulting in greater activity in those districts which have remained at work.

The quickening of the market has not yet absorbed the accumulation of unbilled cars, but the number of these unconsigned loads is steadily decreasing. Consumption is still being met largely from storage.

There is no change in the anthracite situation.

Commission and Court News

Interstate Commerce Commission

The commission has suspended until August 31 the operation of schedules published by the Denver & Salt Lake, which propose increases in rates of 13½ cents a ton on soft coal from Curtis Mine, Colo., to points in Colorado, Iowa, Kansas, Missouri, Nebraska, South Dakota and Wyoming.

The commission has suspended from May 1 until August 29 the operation of certain schedules which propose a reduction from 10 cents to 7 cents per 100 lb. in the rate on cement from cement producing points in Pennsylvania and New Jersey to New Jersey tidewater terminals, applicable on shipments destined beyond by water to points in the lighterage limits of New York Harbor.

The commission has suspended, until August 29, the operation of certain schedules which propose increases in rates on lumber from producing points in California to destinations in Minnesota and Wisconsin. The present rate from the so-called Coast Group is 66½ cents, and from the Truckee and Hawley Groups, 62½ cents per 100 lb., and it is proposed to establish a rate of 73 cents from the Coast Group and 70 cents from the Truckee and Hawley Groups.

The commission has suspended until August 30 the operation of schedules published in supplements to Agent F. A. Leland's tariff which propose new rates on petroleum from Cushing, Muskogee and Vinita, Okla., to destinations in Kansas. There are at present no through rates between the points involved, except in a few cases, and it appears that the proposed rates are being established partly in anticipation of the proposed cancellation of the rules for constructing combination rates from the tariffs of individual carriers and partly because this rule has already been cancelled from some tariffs, which tariffs are used in figuring the factors used in constructing combinations as a basis for through rates.

The commission has issued a decision finding the Brimstone Railroad & Canal Company to be a common carrier of property subject to the Interstate Commerce act and that it may lawfully participate in joint rates with other common carriers or have its charges on interstate shipments absorbed under appropriate tariff provisions. The divisions received by the company are found to be unjust, and, to the extent that they exceed the cost of the service and a fair return upon the property, to be excessive and in fact a rebate to the Union Sulphur Company. The respondents are required to make a study of the cost of the service performed by this railroad, after which the case will be set for further hearing.

Court News

Excessive Demand Will Bar Recovery of Double Damages

The Iowa Supreme Court holds that a railroad's right to resist payment of double damages, under Code sec. 2055, for killing cows, is not conditioned on its ability to show bad faith in the plaintiff. It is enough if the demand made is clearly excessive.—*Lister v. Chicago, M. & St. Paul (Iowa)*, 186 N. W. 8.

I. C. C., Approving Issuance of New Securities, Not Pass Upon Reorganization Plan

The Federal District Court for the Southern District of New York, dismissing a petition to set aside an order of the Interstate Commerce Commission approving the issuance of new securities by the Chicago & Eastern Illinois, holds that the commission, before making such an order on reorganization, does not pass upon the reorganization plan, but upon the propriety of exchanging new securities for old property; if the property be adequate, it is unnecessary to go into the validity of its acquisition by the railroad company.—*Miller v. United States* 277 Fed. 95.

Foreign Railway News

Frozen Signals Cause Collision in England

A railroad system of 20,000 miles is pretty sure to have weak spots, howsoever great the skill and faithfulness of the men who work it; and Great Britain, with its unsurpassed record for railroad safety, appears to be no exception. One of the latest government accident reports received from London, signed by Major G. L. Hall, tells of a rear collision in a tunnel, due to two signals being frozen in the proceed position!

It was near Littleborough, a short distance from Rochdale, on the London & North Western on February 6, a passenger train running into a freight which had broken in two. It was at about 5 o'clock on a Monday morning. The passenger train was nearly empty, and no person was killed, though the train was moving at 30 to 40 miles an hour. The signals had been left in the proceed position over Sunday, the block station being closed; and the signalman who came on duty at 4:50 a. m. began operations in disregard of the rule to see that all of his signals were in working condition. He pulled the levers all right, but the blades remained fast in the horizontal position. How he could do this without breaking the wires (or rods) is not explained.

The inspector also passes silently over other features of the case, a thing which was very rare in the days before the war, when the accident investigations were made under the auspices of the Board of Trade. All that we are told about the weather at Littleborough on February 6 is that there was a severe frost. Whether it was snow, or ice or sleet, or mere frozen fog, is left to conjecture. The track foreman came on duty at 3 a. m. and he loosened these signals as soon as he got to them; but not in season to prevent the collision.

Plan for Private Ownership in Germany

The opponents of government ownership of the railways in Germany have made a further move towards the denationalizing of the railways by bringing forward a definite plan for their acquisition and reconstruction as a corporation, according to the Times (London).

The new scheme proposes a company, the principal shareholders in which would be associations of agriculture, trade (including banks), industry, trade unions, and communes. The central government is to have the right of inspection and a share in the profits, the right of inspection being limited to seeing that the railways are kept up to the standard of public needs and that the commercial policy of the company is not in opposition to the interests of the government. The railways are then to be reorganized into four departments, each with its own separate accounts.

As the problem of making the railways pay is one which the government has failed to solve, the deciding influence in financial matters is to rest with the leading personages of German industry. It is proposed to divide profits up to 6 per cent among the shareholders, profits in excess of this amount to go one-half to the shareholders and the other half to the government. The initial share capital is to be as small as possible; 5,000,000,000 marks is suggested.

In the difficult question of personnel the scheme proposes that existing contracts between employees and the government shall be engaged on conditions similar to those obtaining in private industrial undertakings. In other words, the privileged position of the servant is to be abolished. Whether he would continue to work at his present low pay when his status has disappeared is not discussed.

Railway Electrification in Holland

The proposal to electrify the Dutch railway system is meeting with considerable opposition, according to the Economic Review (London) and M. J. J. W. van Loenen Martinet, who was a member of the commission appointed in July, 1918, to study the question, lecturing before the Dutch Royal Institute of Engineers, argued against immediate electrification of the system as a whole. In countries possessed of ample water power,

like Switzerland, Sweden and Austria, which moreover suffered severely from a shortage of coal during the war, it was a reasonable proposition, but not in a flat country like Holland, which had no water power.

The coal consumption of the two Dutch railway companies in 1913 amounted to about 800,000 tons. Had the entire system been electrified there would have been a saving of 40 per cent, as against which there would have been the cost of construction and the purchase of rolling stock, also the cost of central power stations and the loss on scrapped locomotives.

Judged by this data the proposition was an absurd one. If a careful selection were made of lines to be electrified, there might possibly be a saving of from 50 to 60 per cent on the coal consumption, but even that would not justify the scheme. Only in Germany and in Switzerland were they carrying out a complete electrification of the railway system on a uniform principle, the one-phase alternating current system. After considering the various systems of the different countries, the Dutch Commission had pronounced against the rotary current system as wholly unsuited to Holland. The main question to be considered was the possibility of obtaining from the central power stations a sufficient constant tension, and the likelihood of the high tension system on the railways admitting of a regular supply of electric current. The commission also contemplated the possibility of a portion of the electric plant eventually being manufactured in Holland, but, to begin with, they would require foreign supervision in the starting of their motor industry.

Comparative Costs of Repairs in New

South Wales and the United States

Comparative statistics have their limitations even when applied only to railroads of this country and railway officers have learned the futility of drawing conclusions from them without complete knowledge of the circumstances. It is doubtful whether any fair comparison of repair costs in New South Wales and the United States can be drawn. Nevertheless the statistics recently given out by A. D. J. Forster, assistant chief mechanical engineer of the New South Wales Government Railways, are of interest. Mr. Forster quoted figures for a leading American railroad company and similar figures for the New South Wales System, as follows:

"In 1910 the total cost of repairing 1,686 locomotives owned by the American company was \$2,831,230; the total cost of repairing the 891 locomotives owned by the New South Wales Railways in that year, expressed in dollars, was \$1,824,830. In 1920, however, the American company owned 1,866, which cost \$17,468,777 to repair, while the total cost of repairing 1,299 locomotives owned by the New South Wales Railways was \$6,115,600.

"Thus the cost of repairing double the number of locomotives in America in 1910 was \$1,000,000 more than was spent in New South Wales while in 1920 the added cost in America was about \$14,500,000, including 180 additional locomotives; whereas in New South Wales we had increased our number by 408 locomotives and the total additional cost of repairs for the year was about \$4,250,000.

"In 1910 the locomotives in New South Wales traveled an average of 21,992 miles each, as against 28,084 miles of service rendered by the American locomotives. In 1920 the American locomotives' average fell to 26,696 miles, whereas the New South Wales locomotives' average increased to 22,022 miles.

"Again, with regard to the repairs, the cost per locomotive mile in America in 1910 was 5.98 cents. In New South Wales, reduced to the same coinage, it was 9.313 cents. By 1920, however, the cost in America had risen from 5.98 cents to 34.38 cents; whereas in New South Wales it had risen from 9.313 cents to 21.727 cents."

Belgian Market for American Railway Ties

If railway tie exporters in the United States can make proper selling connections, they should be able to supply a fairly good portion of the annual consumption of oak ties in Belgium, according to Commerce Reports. Since the armistice oak ties have been difficult to procure, and most of the offers received by the government railways have been from speculators who have not been able to deliver the goods when called upon. At present the railroad administration, before passing a contract, requires a statement from a government official in the country of origin that

a stock of ties actually exists and is in the possession of the party or parties submitting bids.

Under pre-war conditions Belgium consumed from 700,000 to 800,000 ties annually, 100,000 of which were secured in the country. For the next two or three years it is to be expected that the annual consumption of ties will amount to little under 1,000,000, as much tie renewal is becoming necessary on the state railroads. The internal production can not help to balance this increased consumption, as the Belgian forest reserves in oak are limited and have been drawn on to the limit since the armistice. The severest competition will be encountered from France, which now furnishes most of the oak ties imported by Belgium. Poland also ships small quantities to this country. Exact figures are not available on tie imports, as Belgian trade statistics do not consider railway ties separately.

White oak is practically the only kind of railway tie now accepted by the Belgian state railroads, the one exception being German deliveries of beech and pine ties (the latter in very small quantities), in accordance with the Versailles treaty. The annual consumption of ties is limited by Belgian facilities for creosoting. Government and private creosoting installations combined can not handle more than 1,000,000 ties yearly. The state railroads formerly employed oak, beech, southern yellow pine, and jarrah (Australian), but at present only white-oak ties are being accepted. The standard Belgian dimensions for ties are: Half round, 2.60 meters long, 0.28 meter wide, 0.14 meter thick; and squared, 2.60 meters long, 0.26 meter wide, 0.13 to 0.14 meter thick. [A rough sketch showing other dimensions (French standards) which are accepted by the Belgian Railroad Administration may be obtained from the Lumber Division of the Bureau of Foreign and Domestic Commerce, Washington, D. C.]

American exporters can deal directly with the Belgian government, but for large orders, especially when the American exporter wishes to obtain an entire or the greater part of a tender, it is better to go through a Belgian house. The government pays within 30 days after receipt of merchandise. In case of delay after this period, the furnisher can claim interest on the amount of money involved.

Further Consolidations in England

The directors of the London & North Western and Midland Railway companies have, subject to the approval of the stockholders of the two companies, entered into a provisional agreement under which the two companies will be amalgamated as from January 1, 1923, into a new company, the name of which will be subsequently decided upon, according to Modern Transport (London). During the current year, the two companies will continue under separate management, but will work in the closest co-operation with a view to economy, and with the object of facilitating the complete amalgamation as from the date named. The provisional agreement will be carried out by a preliminary scheme of amalgamation as provided in the Railways Act.

The terms on which the several stocks of the two companies will be exchanged for stocks in the new company are as follows:

1. The debenture, guaranteed and preference stocks of the two companies existing at the date of amalgamation shall be converted *pari passu* into similar stocks of the new company, such amount to be issued as will give the stockholders the same income as they receive at present.
2. The preferred ordinary stock of the Midland Company shall be converted into a new preference stock to be known as the 1923 preference stock of the new company, such amount to be issued as will give the holders of the Midland stock the same income as they receive at present.
3. Ordinary stock of the new company to be issued in exchange for the existing Midland preferred ordinary stock at the rate of £68 for each £100 Midland preferred stock.
4. Ordinary stock of the new company to be issued in exchange for the existing London & North Western ordinary stock at the rate of £100 for each £100 London & North Western stock.

It is proposed that the new board shall consist of twelve directors of the London & North Western and eight of the Midland. Meetings of the proprietors and debenture stockholders will be summoned at a later date, when the proposed scheme will be submitted for their approval.

It will be remembered by readers of these columns that the Lancashire & Yorkshire was amalgamated with the L. & N. W. on January 1 of this year.

Equipment and Supplies

Locomotives

THE PEORIA & PULASKI UNION is asking for prices on 6, 6-wheel switching locomotives.

THE MISSOURI & NORTH ARKANSAS will spend approximately \$185,000 for repairs to its locomotives.

THE PATAGONIAN RAILWAY has ordered 25 Mikado type locomotives from the Baldwin Locomotive Works.

THE ATLANTIC COAST LINE, reported in the *Railway Age* of April 22 as inquiring for 20 Pacific type locomotives, has ordered this equipment from the Baldwin Locomotive Works.

THE NORFOLK SOUTHERN, reported in the *Railway Age* of April 15 as contemplating buying 5 locomotives, is asking for bids until 12 o'clock noon, May 10, at Norfolk, Va., for 5 consolidation type locomotives.

THE SOCARANA RAILWAY (Brazil) has ordered 10 Mikado type locomotives from the American Locomotive Company. These locomotives will have 19 in. by 20 in. cylinders and a total weight in working order of 129,000 lb.

THE MORGANA RAILWAY (Brazil) has ordered one Pacific type locomotive from the American Locomotive Company. This locomotive will have 17½ in. by 20 in. cylinders and a total weight in working order of 113,000 lb.

THE BOSTON & MAINE has ordered 2 switching locomotives from the American Locomotive Company. This is in addition to the order for 2 Mallet type and 20 switching locomotives reported in the *Railway Age* of April 22.

THE WAYNE COAL COMPANY, Pittsburgh, Pa., has ordered two 4-wheel switching locomotives from the American Locomotive Company. These locomotives will have 11 in. by 16 in. cylinders and a total weight in working order of 43,000 lb.

THE BUFFALO SLAG COMPANY, Buffalo, N. Y., has ordered one 4-wheel switching locomotive from the American Locomotive Company. This locomotive will have 16 in. by 24 in. cylinders and a total weight in working order of 99,000 lb.

THE STANDARD SLAG COMPANY, Youngstown, Ohio, has ordered one 4-wheel switching locomotive from the American Locomotive Company. This locomotive will have 16 in. by 24 in. cylinders and a total weight in working order of 99,000 lb.

THE NEW YORK, NEW HAVEN & HARTFORD, reported in the *Railway Age* of April 22 as having ordered 15, 0-8-0 type locomotives from the American Locomotive Company, has ordered 5 additional 0-8-0 type locomotives from the same company. These locomotives will be used in the joint service of the Central New England and the New Haven.

THE CHICAGO & NORTH WESTERN, reported in the *Railway Age* of April 22 as inquiring for 20 Mikado type locomotives, 20, 6-wheel switching locomotives and 10 Pacific type locomotives has ordered this equipment from the American Locomotive Company. The Mikado locomotives will have 27 in. by 32 in. cylinders and a total weight in working order of 304,000 lb. The switching locomotives will have 21 in. by 28 in. cylinders and a total weight in working order of 171,000 lb. The Pacific locomotives will have 25 in. by 28 in. cylinders and a total weight in working order of 209,000 lb. All these locomotives will be equipped with six axles.

Freight Cars

THE SOUTHERN SOUTHERN is inquiring for 30 70-ton open-top 7000 M-class coaches, is inquiring for 2,000 automobile cars.

THE BURLINGTON (in Chicago) is inquiring for 450 gondola cars.

THE UNITED VERDE COPPER Co., Jerome, Ariz., is inquiring for 24 ore cars.

THE ERIE contemplates having repairs made to a large number of freight cars.

THE ELGIN, JOilet & EASTERN is inquiring for steel reinforcements for 80 gondola cars.

THE PENNSYLVANIA ENGINEERING WORKS, Newcastle, Pa., is inquiring for 8 pairs of arch bar trucks.

THE EMPIRE REFINERIES, INC. have awarded a contract to the North American Car Company for repairs to 600 steel tank cars.

THE MISSOURI & NORTH ARKANSAS will spend \$277,600 on either, or both, new equipment and repairs to the old.

THE NORTHERN PACIFIC will purchase 1,000 box cars, 250 convertible work and coal cars, 250 steel coal cars, and 250 stock cars.

THE ATLANTIC COAST LINE reported in the *Railway Age* of April 22, as inquiring for 750 single-sheathed box cars, is now inquiring for 700 box cars of 40 tons' capacity.

THE NEW YORK CENTRAL will have 1,000 refrigerator cars of 35 tons' capacity for its own lines and 500 for the Michigan Central built in the shops of the Merchants Despatch at East Rochester, N. Y. Mention was made in the *Railway Age* of April 8 that these cars would be built by the Merchants Despatch.

Passenger Cars

THE NORTHERN PACIFIC will purchase 70 passenger refrigerator cars.

THE MISSOURI & NORTH ARKANSAS will spend \$22,000 on its passenger equipment.

THE FRANKFORD ELEVATED RAILWAY, Philadelphia, Pa., is asking for bids until 12 o'clock noon, May 25, for 50 steel passenger cars.

THE NORFOLK & WESTERN reported in the *Railway Age* of March 11 as inquiring for 7 dining cars, has ordered this equipment from the Pullman Company.

THE ATLANTIC COAST LINE, reported in the *Railway Age* of April 22 as contemplating buying a number of cars for passenger service, is now asking for 20 all-steel express cars 70 ft. long, and 10 all-steel coaches 74 ft. long.

THE INTERBORO RAPID TRANSIT Co. has been directed by the Transit Commission, New York, to buy 350 new subway cars. The order calls for the purchase of 100 cars at once, for 50 cars on Aug. 1, and for 200 cars within 6 months after approval of contracts for necessary storage yard.

THE CHESAPEAKE & OHIO, reported in the *Railway Age* of March 25 as inquiring for 63 cars for passenger service, has ordered 22 undivided coaches, 8 divided coaches, 8 combination passenger and baggage, 5 express with automobile doors and 20 straight express cars, from the Pressed Steel Car Company.

Iron and Steel

THE KANSAS CITY SOUTHERN has ordered 6,000 tons of rail from the Illinois Steel Company.

THE CHICAGO, INDIANAPOLIS & LOUISVILLE has ordered 3,000 cars of rail from the Illinois Steel Company.

THE SOUTHERN SAN FRANCISCO has placed an order with the Wisconsin Bridge Company for four deck girder spans totaling 123 tons of structural steel.

THE LEHIGH VALLEY is reported as having ordered about 400 tons of bridge steel from the American Bridge Company, about 800 tons from the Phoenix Bridge Company, and 500 tons from the Bethlehem Steel Bridge Company, for use at various places on its lines.

THE IMPERIAL GOVERNMENT RAILWAYS of Japan, reported in the *Railway Age* of April 29, as inquiring for 10,000 tons of 75-lb. rail and a small quantity of splice bars, has ordered, through Mitsubishi Shoji Kaisha, Ltd., New York City, 10,000 tons of 75-lb. rail and 830 tons of splice bars from the United States Steel Products Company.

Track Specialties

THE CHESAPEAKE & OHIO is reported to have ordered 2,200 tons of tie plates.

THE NORTHERN PACIFIC has ordered 2,400 continuous insulated joints from the Rail Joint Company.

THE CHICAGO & NORTH WESTERN is reported to have ordered 8,000 to 10,000 kegs of bolts and spikes.

THE PERE MARQUETTE has ordered 5,000 "100-per cent" joints from the Rail Joint Company for 85-lb. rails.

THE MICHIGAN CENTRAL has placed an order with the Rail Joint Company for 10,000 "100-per cent" joints for 100-lb. rails.

Machinery and Tools

THE CHICAGO, INDIANAPOLIS & LOUISVILLE is inquiring for a five-foot radial drill.

THE WESTERN MARYLAND is inquiring for a number of machine tools including lathes and punches.

THE CHICAGO, MILWAUKEE & ST. PAUL is inquiring for a 44-in. vertical boring mill, and a 36-in. lathe.

THE PENNSYLVANIA RAILROAD is inquiring for a number of tools for repair work, including hydraulic riveters.

THE GULF & SHIP ISLAND is reported to have ordered a number of machine tools, including a driving wheel lathe, wheel press, radial drill and a car wheel borer.

THE ATCHISON, TOPEKA & SANTA FE is inquiring for a car wheel lathe, a 6-ft. radial drill, a single-end angle-iron shears, a single-end punch and shear, a 20-ft. plate bending roll, two single-end punches, a double-end punch and shear, a splitting shear, and an angle-iron bending roll.

Miscellaneous

THE NEW YORK CENTRAL will receive bids until 12 o'clock noon, May 16, for its requirements of steel bars, steel shapes, steel plates and track materials.

THE CHICAGO & NORTH WESTERN will accept bids until May 6, for requirements for the year ending March 31, 1923, of incandescent electric lamps of the following types: carbon filament; tungsten filament-vacuum; tungsten filament-gas filled; and miniature.

On the Wheeling & Lake Erie

Supply Trade News

R. S. Wensley has been elected a vice-president of the G. M. Basford Company, New York.

Daniel M. Brady has removed his office from 95 Liberty street to 90 West street, New York City.

The Allen-Bradley Company, Milwaukee, Wis., has established a branch office in 1318 Chemical building, St. Louis, Mo.

A. H. Hudson has been appointed district manager of the railroad division, Service Motor Truck Company, with eastern headquarters.

The Sharon Pressed Steel Company has removed its office from 66 Broadway to its new warehouse at 47 West Broadway, New York City.

The Chicago-Cleveland Car Roofing Company has moved its general offices from the Railway Exchange building, Chicago, to the Kimball building.

A. G. Shaver, chief engineer of the Regan Safety Devices Company, New York, with headquarters at Chicago, has resigned effective May 1.

Howard Yeomans has been elected president of the Bishop & Babcock Company, Cleveland, Ohio, succeeding E. S. Griffiths, who has resigned due to ill health. F. R. Pleasanton has been elected vice-president and general manager.

W. T. Tyler, formerly director of the Division of Operation of the Railroad Administration and more recently vice-president of the Northern Pacific, has been appointed director, vice-president and general manager of the National Safety Appliance Company, San Francisco. Mr. Tyler will be located in Chicago with temporary offices in the People's Gas building. A photograph and biographical sketch of Mr. Tyler were published in the *Railway Age* in the issue of February 13, 1920.

The Walsh Tie Company has just completed a new timber treating plant at Gilkey, near Minneapolis, Minn., a description of which appears in this week's *Railway Age*. P. R. Walsh, St. Louis, Mo., is president of this company; J. C. Kirkpatrick, Escanaba, Mich., vice-president; and H. S. Gilkey, Minneapolis, secretary and treasurer. A. Meyer, formerly superintendent of the Chicago, Burlington & Quincy's lumber treating plant at Galesburg, Ill., is superintendent of the tie and post plants, F. G. Moore is assistant superintendent of these plants, and L. A. Furlong is superintendent of the pole treating plant.

E. A. Langenbach was elected president of the Alloy Steel Corporation, Canton, Ohio, at the annual meeting held on April 18, succeeding H. R. Jones, resigned; Mr. Langenbach also being re-elected chairman of the board of directors. John McConnell, who recently returned to the company, and Elton Hoyt, of Pickands, Mather & Co., Cleveland, Ohio, were elected directors, succeeding E. L. Hang and J. A. Buell, while George H. Clark was elected vice-president and general manager, and C. W. Kreig, vice-president, secretary and treasurer, succeeding Mr. Hang as treasurer. Mr. McConnell was elected vice-president in charge of operations at the meeting.

Obituary

William A. Greaves, a retired machine tool manufacturer, Cincinnati, Ohio, died in that city on April 18. He was the organizer of Greaves-Klusman & Co., lathe manufacturers.

William S. Reid, manager of the railroad department of the Minneapolis, Minn., branch of the Dearborn Chemical Company, Chicago, died at St. Barnabas hospital, Minneapolis, on April 25, from the effects of blood poisoning.

Railway Construction

CANADIAN PACIFIC.—This company has obtained appropriations of \$331,000 and \$410,000, respectively, from the province of Alberta to construct a 13-mile extension of the Peace river branch and a 15-mile extension of the Grand Prairie branch of the Edmonton, Dunvegan & British Columbia, a line which it now operates under a five-year agreement with the Province of Alberta. Negotiations are being made at the present time for the proposed extension and it is expected that an agreement will be reached permitting the undertaking of this work in the near future.

CHICAGO & NORTH WESTERN.—This company, which was noted in the *Railway Age* of April 15, and April 22, as receiving bids for the construction of a 450-ton coaling station and ash handling facilities in Chicago, to cost \$100,000, has awarded a contract for this work to the Roberts & Schaefer Company, Chicago.

CHICAGO & NORTH WESTERN.—This company has awarded a contract to the White Construction Company, Milwaukee, Wis., for the construction of two subways in connection with track depression work in that city, the cost of which will approximate \$60,000.

CHICAGO, BURLINGTON & QUINCY.—This company has awarded contracts to the Ogle Construction Company, Chicago, for the construction of a 150-ton coaling station at Bridgeport, Neb., and for the construction of 100-ton coaling stations at Fairmont, Neb., and Benkleman.

CHICAGO, MILWAUKEE & ST. PAUL.—This company has resumed work on its Chicago and Evanston division track elevation between Irving Park boulevard and Howard street and contemplates finishing the balance of the program comprising the construction of a fourth track with necessary bridge slabs and seven stations to cost \$700,000.

DODGE CITY & CIMARRON.—This company, which was reported in the *Railway Age* of February 11 as applying to the Inter-state Commerce Commission for authority to construct a 56-mile extension to its line from Satanta, Kan., through Haskell, Grant and Stanton counties, has obtained this authority and awarded the contract for the work to the Scott, White Company, St. Louis, Mo., which is now undertaking this work.

GULF, COLORADO & SANTA FE.—This company has awarded a contract to H. D. McCoy, Cleburne, Tex., for the construction of a freight station at Brenham, Tex., to consist of a two-story head house, 32 by 36 ft., and a 32 by 80-ft. warehouse, together with covered and uncovered platforms.

GULF & SHIP ISLAND.—This company is now building with company forces at Gulfport, Miss., an all-steel combined engine house, boiler shop and blacksmith shop and a masonry and steel machine shop, together with cinder handling facilities and new track, the construction of which will involve an expenditure of \$250,000.

ILLINOIS CENTRAL.—This company, which was reported in the *Railway Age* of July 16, 1921, as having closed bids for the construction of a 20,000 gal. per hour capacity pumping station at Ramsey, Ill., and which decided later to postpone the work, has awarded the contract to Joseph E. Nelson & Sons, Chicago.

ILLINOIS CENTRAL.—This company will close bids early in May for the construction of a \$75,000 brick freight station at Baton Rouge, La.

KETTLE VALLEY.—This company has now under way the construction of approximately 17 miles of line from Okanagan Falls to Oliver, in the southern district of British Columbia. This work constitutes the third link of a rail and lake system to connect the town of Pentton with irrigated land which the provincial government of British Columbia has prepared for settlement by ex-soldiers. The work is being performed by A. E. Griffin & Company Vancouver, B. C.

LACOMBE & NORTHWESTERN.—This railroad, which was acquired by the Province of Alberta, Canada, a few years ago, will be extended this season for a distance of about twelve miles. A sum of \$265,000 has been authorized for the purpose and all work will be carried out by contract, bids for which will be called in the near future.

LEHIGH & NEW ENGLAND.—This company has awarded a contract to F. H. Clement & Company for labor and materials for concrete masonry required for four bridge replacements in the state of New York and two in New Jersey and for the temporary support of tracks during construction. The estimated cost of this work is \$58,000.

LOS ANGELES & SALT LAKE.—This company has applied to the Interstate Commerce Commission for a certificate authorizing the construction of a branch from Delta to Fillmore, Utah, 35 miles.

MICHIGAN CENTRAL.—This company, which was reported in the *Railway Age* of March 25 as having closed bids for the construction of a \$35,000 brick passenger station at Hastings, Mich., has awarded a contract to the Ehle Construction Company for this work.

MISSOURI PACIFIC.—This company, which was reported in the *Railway Age* of April 1 as receiving bids for the replacing of 10 wooden trestles with concrete structures and earth embankments near Aurora, Mo., has awarded contracts for this work to Jerome Moss, Chicago; Roach & Stansel, Memphis, Tenn.; and Walter Denison, Cushman, Ark., who will handle the work jointly.

MISSOURI & NORTH ARKANSAS.—This company has appropriated \$750,000 of a \$3,500,000 loan recently secured from the government for placing its property in normal condition. Of this amount, it is estimated that approximately \$9,000 will be expended for renewals of water stations and \$82,000 for bridge renewals. The major portion, if not all of this work, is to be done by company forces.

NASHVILLE, CHATTANOOGA & ST. LOUIS.—This company is undertaking with company forces the construction of two bridges over the Harpeth river, each bridge to consist of three 96-ft. deck plate girders, with crossoted timber ballast decks supported on concrete piers and abutments, which work will cost approximately \$160,000. The contract for the steel work was let to the American Bridge Company.

NEW YORK CENTRAL.—This company has awarded a contract to the Walsh Construction Company, Davenport, Iowa, for the Garrison tunnel improvement work near Garrison, N. Y. The estimated cost is about \$500,000 and will consist of the excavation for an open cut in rock for two tracks to the east of the existing tracks and on line for a permanent four-track development.

NORTHERN PACIFIC.—This company has awarded a contract to Grant Smith & Co., St. Paul, Minn., for a new bridge over the Mississippi river at Minneapolis, Minn., to cost \$400,000 and has awarded a contract to the Campbell Construction Company, St. Paul, Minn., for a permanent bridge at Maryland street, St. Paul, to cost approximately \$60,000, and has closed bids on construction work on dock No. 6, Duluth, Minn., to cost \$77,000.

OKLAHOMA NORTHERN.—This company has applied to the Interstate Commerce Commission for a certificate authorizing the construction of a line from Vinita, Okla., to Coffeyville, Kans., 42 miles.

PENNSYLVANIA.—This company will this summer build an addition to its concrete, fireproof grain elevator at Baltimore, Md., to take care of an additional 1,300,000 bu. of grain.

SOUTHERN PACIFIC.—This company has entered into an agreement with the city of Houston, Tex., for the construction of a subway in that city, the contract for which has been awarded to Walling-Haralson & Adams Company, Houston, Tex.

WESTERN PACIFIC.—This company has placed an order with the McClintock-Mitchell Company for structural steel for one 210-ft. through riveted electrically operated draw span, one 100-ft. through plate girder, and one 80 ft. through-plate girder for the renewal of a bridge crossing the San Joaquin river near Stockton, Cal., this work to be undertaken by company forces during the latter part of July.

Railway Financial News

CHESAPEAKE & OHIO.—Asks Authority for Equipment Trust Certificates.—This company has applied to the Interstate Commerce Commission for authority to issue \$7,635,000 of 5½ per cent, 15-year equipment trust certificates which have been sold to Kuhn, Loeb & Co., at 98.

CHICAGO & ALTON.—New Directors.—E. M. Richards connected with the Boston office of Hayden, Stone & Co., and Samuel W. Moore, general counsel for the Kansas City Southern, have been elected directors of the Chicago & Alton to succeed Charles Hayden and M. L. Bell, chairman of the board and vice-president, respectively, of the Chicago, Rock Island & Pacific. The latter resigned in compliance with the decision of the Interstate Commerce Commission that the Rock Island and the Chicago & Alton are competing roads.

CHICAGO & EASTERN ILLINOIS.—New Director.—Will H. Hays, former postmaster general, has been elected a director.

CHICAGO, MILWAUKEE & ST. PAUL.—Annual Report.—The annual report issued this week shows the following income account for the year ended December 31, 1921:

	1921	1920
Railway operating revenues.....	\$146,765,766	\$141,643,202
Railway operating expenses.....	127,957,002	134,087,532

Gross income.....	3,003,655	1,899,621
Interest on funded debt.....	1,114,390	1,060,582
Total deductions from gross income.....	1,190,387	1,161,571
Net income.....	1,813,268	738,050
Dividend appropriations of income (dividend on capital stock).....	890,848	297,370
Income appropriated for investment in physical property.....	323,107	694,210
Balance transferred to profit and loss.....	599,312	Def. 253,531

ILLINOIS CENTRAL.—To Issue Stock.—The directors have authorized the issuance of \$10,929,600 6 per cent convertible preferred stock, subject to the approval of the Interstate Commerce Commission. It will be offered for subscription at par to stockholders of record at the close of business May 16 to the amount of 10 per cent of the common stock registered in their name as of that date, and fractions of shares in like proportion.

One-third of the outstanding common stock of the Illinois Central is owned by the Union Pacific and that road has agreed to take its proportion of the new issue. The remainder will be underwritten by Kuhn, Loeb & Co. Payment for the stock will be required before June 26, 1922.

This issue by the Illinois Central is part of the \$50,000,000 issue authorized by stockholders at the annual meeting held on April 19. It is preferred both as to dividends and to assets and is entitled to receive non-cumulative dividends at the rate of 6 per cent a year from June 26, 1922, payable semi-annually, on March 1 and September 1. The stock will be convertible into common stock at the holder's option after September 1 next, share for share, and will be subject to redemption as a whole on any semi-annual dividend date after September 1, 1927, on 60 days' notice at a premium of 15 per cent and accrued dividends. Stock called for redemption shall continue to be convertible up to 30 days prior to the redemption date.

Annual Report.—This company's annual report for 1921 is reviewed in an article on another page of this issue entitled "Maintenance Reserve Items Hurt I. C.'s 1921 Showing." See also excerpts from annual report on adjacent pages.

LAKE ERIE & WESTERN.—Van Sweringen Interests Buy Control.—The New York Central has sold its majority interest in the Lake Erie & Western to the Van Sweringen interests of Cleveland for \$3,000,000. Albert H. Harris, vice-president of the New York Central, stated that \$35 a share, or \$2,075,500, was received for its 59,300 shares of preferred stock. The balance of \$924,500 is at the rate of \$15.57 a share for the 59,400 shares of common.

The Lake Erie & Western had an operating mileage on December 31, 1920, of 738 miles. Its main line runs from Sandusky, Ohio, to Peoria, Ill.

The Van Sweringen interests last March purchased the control of the Toledo, St. Louis & Western. These interests also control the New York, Chicago & St. Louis. See editorial in this issue entitled "The Van Sweringen Group."

MATTAWAMKEAG & EASTERN.—Asks Authority to Issue Securities.—This company, which proposes to build a line in Maine as an extension of the proposed line of the Eastern Maine, has filed application with the Interstate Commerce Commission for authority to issue \$80,000 of stock and \$500,000 of 30-year 7 per cent gold bonds.

MISSOURI PACIFIC.—To Pay Bonds.—This company has announced that in accordance with the terms of the mortgage securing its first and refunding 5 per cent bonds, all of the Series B bonds under that mortgage will be paid on August 1, next. Payments will be made at the Guaranty Trust Company, New York City.

NEW ORLEANS, TEXAS & MEXICO.—Authorized to Issue Bonds.—This company has been authorized by the Interstate Commerce Commission to procure authentication and delivery to its treasurer of \$457,400 of first mortgage bonds and to issue \$991,100 of such bonds to be sold at not less than 98 or to be pledged as security.

NEW YORK, LAKE ERIE & WESTERN.—Authorized to Extend Bonds.—The Interstate Commerce Commission has approved a

joint application of this company and the Erie for an order authorizing the extension of the date of maturity of \$3,000,000 of first mortgage bonds of the New York, Lake Erie & Western from May 1, 1922, to May 1, 1942, and to reduce the interest rate from 6 to 5½ per cent. The Erie is authorized to assume liability as a guarantor in respect of the bonds.

PERE MARQUETTE.—Annual Report.—The annual report issued this week shows a corporate income account for the year ended December 31, 1921, as follows:

	1911	1920
Operating revenues	\$38,303,029	\$35,032,787
Operating expenses	30,036,300	30,350,542
Net operating revenue	8,266,729	4,672,245
Non operating income	690,654	1,761,120
Gross income	8,957,383	6,433,365
Taxes	1,408,481	768,407
Interest on bonds	1,987,754	1,687,760
Total deductions	5,191,502	5,039,392
Surplus	3,765,880	1,393,973

*Operating revenues and expenses, March 1 to December 31.

RAPID CITY, BLACK HILLS & WESTERN.—Six Months' Guaranty Certified.—The Interstate Commerce Commission has certified the amount of this company's guaranty for 1920 as \$23,685, of which \$8,685 was still to be paid.

SAN ANTONIO & ARANSAS PASS.—Bonds Offered.—P. W. Chapman & Co., New York, are offering a block of first mortgage 4 per cent bonds, dated December 20, 1892, and due on January 1, 1943, to yield more than 5.70 per cent. They are non-callable and their principal and interest are guaranteed by the Southern Pacific Company's indorsement.

ST. LOUIS-SAN FRANCISCO.—Annual Report.—This company's annual report for 1921 is reviewed in an article on another page of this issue entitled "Frisco Improves Financial and Physical Condition." See also excerpts from annual report on adjacent pages.

Bonds Offered.—A syndicate composed of Lee, Higginson & Co., Guaranty Company of New York, Speyer & Co., and J. & W. Seligman & Co., are offering a new issue of \$6,932,000 St. Louis-San Francisco Railway Company prior lien mortgage 5½ per cent gold bonds, series D. The bonds are dated January 1, 1922, due January 1, 1942, and are offered at 95, to yield 5.95 per cent.

These bonds are part of an issue of \$10,932,000, authorized by the Interstate Commerce Commission, in substitution for an equal amount of 6 per cent bonds now in its treasury. The remainder are to be pledged and repledged from time to time as collateral security for short-term notes.

VIRGINIA RAILWAY.—New Director.—James H. Perkins, president of the Farmers' Loan & Trust Company of New York, has been elected a director.

WESTERN MARYLAND.—Annual Report.—The corporate income account for the year ended December 31, 1921, compares as follows:

	1911	1920
Operating revenues	\$7,619,977	\$17,310,764
Operating expenses	11,820,664	16,863,404
Net operating revenue	3,799,308	447,360
Tax accruals	777,462	533,600
Total operating income	3,021,846	Dec 498,764
Gross income	8,142,628	3,136,247
Interest on funded debt	3,843,814	3,744,463
Total deductions	2,500,370	2,412,812
Net income	3,371,188	3,196,899
Dividends of 1921 paid to January 1, 1921	474,338	77,565
made by I. S. & R. A.	54,204	19,830
Unpaid income balance	471,96	87,735

*Includes standard return for months of January and February 1920, less partial payments in account of claim for guaranty.

Railroad Administration Settlements

The United States Railroad Administration reports the following final settlements and has paid out to the several roads the following amounts:

Western	\$1,860,000
Intermountain & Great Northern	100,000
Rehoboth, Philadelphia & Potomac	94,000
United L. & P. Ry. & P. Co., Railroad Co.,	
Washington Southern, Rockwell	

Lexington Union Station	67,800
Wool River Branch	1

Tentative Valuations

The Interstate Commerce Commission has issued additional tentative valuations giving the final value as of the valuation dates, as follows:

	Owned	Used
Danville & Western	\$1,978,347	\$1,979,127
Lake Champlain & Moriah	853,020
Augusta Southern	140,376
Bay Point & Clayton	136,000	138,800
Troy Union	1,084,045	1,082,305
Elkin & Allegheny	335,046	335,080
North Western Coal Railway	775,000
Tallulah Falls	1,808,832	1,808,954
Middletown & Unionville	389,847
Hill City	301,104	343,104
Augusta Belt	55,000
Williamson & Pond Creek	1,222,044

Treasury Payments to Railroads

The treasury department announced on May 1 that since last announcement, dated April 1, payments under Sections 204, 209, 210 and 212 of the Transportation Act of 1920, as amended, have been made by the Treasury as follows:

Section 204:	
Elwood, Anderson & Lapelle	\$ 15,693.35
Kenwood & Eastern	8,764.96
Kenwood Greensburg & Southwestern	52,423.22
Ursina & North Fork	3,094.98
Section 209:	
Buffalo, Rochester & Pittsburgh	61,093.21
Deering Southwestern	3,623.67
Detroit, Bay City & Western	13,313.36
Gulf, Florida & Alabama, Receiver	6,684.92
Lake Erie & Western	140,918.65
Lufkin, Hemphill & Gulf	10,851.76
Rapid City, Black Hills & Western	8,685.30
The Ulster & Delaware	69,450.00
Western Allegheny	39,226.17
Section 210:	
Missouri & North Arkansas	3,500,000.00
The Seaboard-Bay Line	1,100,000.00
Section 212:	
International & Great Northern, Receiver	5,801.15
Total	\$5,561,833.70

The total payments to April 30, 1922, have been:

(a) Under Section 204, as amended by Section 212 for reimbursement of deficits during Federal Control:	
(1) Final payments, including partial payments previously made	\$13,344.33
(2) Partial payments to carriers as to which a certificate for final payment has not been received by the Treasury from the Interstate Commerce Commission	1,771,841.37
Total payments as reimbursement of deficits	3,774,186.50
(b) Under Section 209, as amended by Section 212, for guaranty in respect to railway operating income for first six months after Federal Control:	
(1) Final payments, including advances and partial payments previously made	\$ 612,321.17
(2) Advances to carriers as to which a certificate for final payment has not been received by the Treasury from the Interstate Commerce Commission	25,570,874.00
(3) Partial payments to carriers as to which a certificate for final payment has not been received, as stated above	164,510,485.27
Total payments account of said guaranty	433,168,376.37
(c) Under Section 210, for loans from the revolving fund of \$300,000,000 thereon repaid:	
Total	\$3,709,646,583.87

Dividends Declared

Canadian Pacific—Common, 2½ per cent, quarterly, payable June 30 to holders of record June 1.
 Central Railroad of New Jersey—\$, quarterly, payable May 15 to holders of record May 10.
 Cleveland & Pittsburgh—Regular guaranteed, \$0.87½, quarterly, special guaranteed, \$1.50 quarterly both payable June 1 to holders of record May 10.
 Norfolk & Western—Common, 1 per cent, quarterly, payable June 19 to holders of record May 11.

Trend of Railway Stock and Bonds Prices

	Last	Last
	May 2	Week
Average price of 20 representative railway stocks	65.2	65.96
Average price of 20 representative railway bonds	86.58	86.62

Annual Report

Illinois Central Railroad Company—Seventy-Second Annual Report

To the Stockholders of the Illinois Central Railroad Company:

The Board of Directors herewith submits the following report of the operations and affairs of your company for the year ended December 31, 1921. The number of miles of road operated as of December 31, 1920, was 4,799.40. There was a decrease in miles of road due to the construction of a new bridge in a new location over the Chicago River on the St. Charles Air Line and to the reconstruction of the South Chicago Branch at 67th Street, Chicago, of 0.03

The average number of miles of road operated during the year, and the number of miles operated December 31, 1921, was 4,799.37

INCOME.

A summary of the income for the year ended December 31, 1921, as compared with the previous year is stated below.

	1921	1920	INCREASE— DECREASE+
Average Miles Operated During Year	4,799.37	4,799.44	— 0.07
Operating Revenues	\$141,127,065.71	\$121,804,579.25	+\$19,322,486.46
United States Government—Guaranty Period Claim		19,499,886.56	— 19,499,886.56
Rental from United States Railroad Administration		3,399,634.99	— 3,399,634.99
Total, Operating Revenues	141,127,065.71	144,704,100.80	— 3,577,035.09
Operating Expenses	109,997,791.08	*121,991,985.37	— 11,994,194.29
Excess of Revenues over Expenses	31,129,274.63	22,712,115.43	+ 8,417,159.20
Taxes	8,119,035.43	7,172,261.96	+ 946,773.49
Uncollectible Railway Revenues	24,318.81	23,319.80	+ 999.01
Operating Income	22,985,920.37	15,516,533.67	+ 7,469,386.70
Equipment Rents—Net Credit	1,614,026.69	3,196,849.02	— 1,582,822.33
Joint Facility Rents—Net Debit	203,177.54	191,297.36	+ 11,880.18
Net Operating Income	24,396,769.52	18,523,085.33	+ 5,874,684.19
Nonoperating Income	5,039,238.05	7,219,881.91	— 2,180,643.86
Gross Income	29,436,007.57	25,741,967.24	+ 3,694,040.33
Deductions from Gross Income	19,735,213.43	12,170,844.96	+ 7,564,368.47
Net Income	9,700,794.14	13,571,122.28	— 3,870,328.14

	1921	1920	INCREASE— DECREASE+
Disposition of Net Income: Income Applied to Sinking and Other Reserve Funds		118,200.00	— 118,200.00
Income Appropriated for Investment in Physical Property	44,519.31	18,080.85	+ 26,438.46
Total Appropriations of Income	44,519.31	136,380.85	— 91,761.54
Income Balance Transferred to Credit of Profit and Loss	9,656,274.83	13,434,841.43	— 3,778,566.60

*Includes operating expenses, corporate, for the months of January and February, 1920, amounting to \$117,657.90, not assumed by the United States Railroad Administration, which was stated separately in the report for 1920.

During the current year your railroad was operated under corporate management, and the preceding year the property was under Federal control the first two months, under corporate management with a Federal guaranty the following six months, and under corporate management without guaranty the remaining four months. As a consequence the only items which are comparable are Net Operating Income and Deductions from Gross Income as during the first two months of 1920 when the properties were under Federal control all "Net Railway Operating Income" items were borne by the Government and your company received a rental which, in the income account, is shown opposite "Rental from United States Railroad Administration" and, therefore, the operating accounts comprising "Net Railway Operating Income" include the results for ten months only, while the figures for 1921 are the totals for the year.

To afford a proper comparison of operating results for the two years the figures have been prepared and will be found below a table headed "Transportation Operations," which for 1920 combines the Federal operations for the first two months of the year and the corporate operations for the balance of the year; and in which the charges to "Maintenance of Way and Structures" and "Maintenance of Equipment" in connection with a reserve for maintenance in 1920 and its cancellation in the year 1921 have been omitted, as explained below.

NONOPERATING INCOME

"Nonoperating Income" this year amounted to \$5,039,238.05 as against \$7,219,881.91 last year, a decrease of \$2,180,643.86. The decrease was due to a reduction of \$100,000.00 in dividends received on Madison Coal Corporation stock; to the nonreceipt this year of interest on Louisville, New Orleans & Texas Railway Company Second Mortgage Income Bonds, whereas in the previous year there was received from this source \$2,081,014.38; and to a decrease in other interest received from the Yazoo and Mississippi Valley Railroad Company of \$447,115.26. As against these decreases there was found to be due and included in this amount for 1921 \$113,270.44 for rental for the Federal control period not previously included in your company's income. There was an increase in other items entering into "Nonoperating Income" amounting to \$334,215.34, consisting largely of increases in interest on funds on deposit with bankers and others, miscellaneous rent income and minor miscellaneous income items.

DEDUCTIONS FROM GROSS INCOME

"Deductions from Gross Income" amounted to \$19,735,213.43, an increase of \$7,564,368.47 over the previous year. There was an increase of \$966,487.11 in "Interest on Funded Debt." This increase was due to the

inclusion of interest for an entire year on securities issued last year, in addition to interest for portions of the year on securities issued during the current year, less interest on equipment trust and other securities retired, as compared with a part year's interest on securities issued during 1920, a comparison of which may be made from Table 8 of this year's report and Table 9 of last year's report. "Interest on Unfunded Debt" decreased \$1,313,795.12. This decrease was due to including in this account for the previous year an adjustment in favor of the Director General of Railroads of interest accrued on open accounts, etc., estimated at \$809,496.39, and, in addition, including \$217,333.88 covering interest on loans principally from banks and trust companies, making a total of \$1,026,850.27. In the current year the adjustment of interest due the Government was found to have been over-estimated, and "Interest on Unfunded Debt" was credited \$406,902.00; and, as miscellaneous interest on loans from banks and trust companies was \$119,957.15, this resulted in a net credit to the account named of \$286,944.85. "Miscellaneous Income Charges" increased \$7,788,082.72, of which \$6,854,541.96 was due to charging this account the amount named and crediting an account shown on the general balance sheet, Table No. 5, "United States Government—Guaranty under Section 209 of Transportation Act, 1920," in reduction of your company's claim against the Government, made necessary by the cancellation of charges to "Maintenance of Way and Structures" and "Maintenance of Equipment" referred to under the head of "Railway Operating Expenses" below. In addition to the amount named, \$63,288.02 was due to an adjustment further reducing the deficit in "Net Railway Operating Income" for the guaranty period and \$370,252.74 to loss in operation of the Dubuque & Sioux City Railroad for the current year. Less minor miscellaneous adjustments.

TRANSPORTATION OPERATIONS

The results of transportation operations this year, compared with last year, referred to above, are as follows:

	1921	1920	INCREASE + DECREASE —
Freight (including bridge tolls and miscellaneous freight)	\$107,092,090.55	\$106,178,885.96	— \$913,204.59
Passenger (including bridge tolls and miscellaneous passenger)	24,740,350.62	27,041,377.53	— 2,300,927.11
Mail	2,505,671.37	3,976,419.71	— 1,470,748.34
Express	2,326,832.50	3,057,446.68	— 730,614.18
Other passenger train	864,517.13	864,654.58	+ 15,862.55
Other transportation	1,413,524.02	1,359,123.41	+ 54,400.61
Incidental and joint facility	2,676,079.52	2,666,465.74	+ 508,384.22
Total railway operating revenues	141,127,065.71	145,154,271.81	— 4,027,206.10
Railway operating expenses: Maintenance of way and structures	22,437,587.08	25,870,907.11	— 3,433,320.03
Maintenance of equipment	34,591,449.68	37,344,276.57	— 2,752,826.89
Traffic	1,887,711.35	1,848,463.91	+ 39,247.44
Transportation	53,603,439.42	65,017,065.61	— 11,413,626.19
Miscellaneous operations	1,009,049.13	1,217,729.61	— 208,680.48
General	3,679,022.93	3,560,290.35	+ 118,732.60
Transportation for investment—Cr.	Cr. 355,929.52	Cr. 177,219.28	— 178,709.29
Total railway operating expenses	116,852,333.04	134,181,513.88	— 17,329,180.84
Net revenue from railway operations	24,274,732.67	10,972,757.93	— 13,301,974.74
Railway tax accruals	8,119,035.43	8,183,911.96	— 64,876.53
Uncollectible railway revenues	24,318.81	31,179.51	— 6,860.70
Railway operating income	16,131,378.41	2,757,666.46	+ 13,373,711.95
Equipment rents—net credit	1,614,026.69	3,772,201.89	— 2,158,175.20
Joint facility rents—net debit	203,177.54	186,622.69	+ 16,554.85
Net railway operating income	17,542,227.56	6,343,245.66	— 11,198,981.90

RAILWAY OPERATING REVENUES

"Railway Operating Revenues" amounted to \$141,127,065.71 this year as compared with \$145,154,271.81 last year, a decrease of \$4,027,206.10, or 2.77 per cent.

The increase of \$913,204.59, or .86 per cent, in "Freight Revenue" is due to the higher freight rates during the current year, largely offset by the decline in the volume of traffic handled as a result of the prevailing business conditions. The increase in business existing throughout the year. The revenue passengers carried one mile decreased 12,665,685, or 17.57 per cent. The decline in the volume of traffic was offset in part by increased rates which were in effect during the year as against only four months of the previous year, the average revenue per passenger per mile being 3.053 cents, an increase compared with last year of .203 cent, or 11.02 per cent. The decrease of \$1,470,748.34, or 36.99 per cent, in "Mail Revenue" is due principally to the inclusion in mail revenue for 1920 of \$1,711,715.58, which was a portion of the amount of back mail pay for the years 1916 to 1919, inclusive, of \$1,862.35, or 1.83 per cent, of the Interstate Commerce Commission in December, 1919; as against this amount there was included from the same source in the mail revenue for the current year \$248,418.64, resulting in a decrease in mail revenue from this source for the current year of \$1,463,292.94.

The decrease of \$2,300,927.11, or 8.51 per cent, in "Passenger Revenue" is due to the substantial falling off in passenger travel which was affected by the general decline in business existing throughout the year. The revenue passengers carried one mile decreased 12,665,685, or 17.57 per cent. The decline in the volume of traffic was offset in part by increased rates which were in effect during the year as against only four months of the previous year, the average revenue per passenger per mile being 3.053 cents, an increase compared with last year of .203 cent, or 11.02 per cent.

The decrease of \$730,614.18, or 23.90 per cent, in "Express Revenue" is due in part to a smaller volume of express traffic handled, but more largely to the inadequate rates received for the transportation of express.

The increase of \$864,517.13, or 1.83 per cent, in "Other Passenger Train Revenue" is due to the higher rates in effect for transportation of milk

and to a slight decrease in the volume transported during the current year, partly offset by a decrease in the amount received from the operation of Pullman facilities.

The increase of \$54,100.61, or 4 per cent, in "Other Transportation Revenue" is due to higher rates for switching service during the current year, partly offset by a decrease in the volume of switching performed and a decrease in "Special Service Train Revenue."

The decrease of \$58,358.72, or 18.6 per cent, in "Incidental and Joint Facility Revenue" is largely due to a decrease in "Dining and Buffet Revenue," "Hotel and Restaurant Revenue," "Station, Train, and Boat Privileges," "Hotel Room Receipts" and "Storage—Baggage," all of which were affected by the falling off in passenger travel, and to a decrease in "Storage—Freight" "Demurrage" due to a decrease in the volume of freight traffic handled, partly offset by slight increases in "Rents of Buildings and Other Facilities" and "Miscellaneous Revenues."

A comparative statement of "Railway Operating Revenues" in detail is contained in Table No. 1.

RAILWAY OPERATING EXPENSES

"Railway Operating Expenses" amounted to \$116,852,553.04 this year as compared with \$134,813,513.88 last year, a decrease of \$17,960,960.84, or 12.91 per cent.

The expenses for each year represent the total railway operating expenses after cancelling the reserve for maintenance referred to above. In explanation of this reserve it should be stated that last year there was included in "Maintenance of Way and Structures Expenses" \$2,744,697.84, and in "Maintenance of Equipment Expenses" \$419,844.12, a total of \$3,164,541.96, to cover the additional amount which it was understood your company was entitled to expend for "Maintenance of Way and Structures" and "Maintenance of Equipment" during the guaranty period and which it was necessary to state on the books in order that the amount would be available as a reserve to be expended in the future and were shown on the general balance sheet in the account "Other Unadjusted Credits," under the heading "Unadjusted Credits," December 31, 1921, entitled "In the Matter of Final Settlement of the Matter of the Transportation Act, 1920," prescribed a different method for adjusting maintenance expenses of the guaranty period. As a result of the entries made in the books in the preceding year were reversed in the current year, and "Railway Operating Expenses" was credited in the current year with the amount of \$3,164,541.96, and debited "Miscellaneous Income Charges" \$6,554,541.66, and crediting the same amount to the general balance sheet account, "United States Government Guaranty under Section 209 of Street Railway Act, 1916," referred to above under the heading "Deductions from Gross Income."

The decrease of \$5,433,336.65, or 13.27 per cent, in "Maintenance of Way and Structures Expenses" is due to decreased outlays for repairs to tracks and extensions, and to the depreciation of stations and other buildings, accounted for by the decrease in wages, decreased number ofvertime hours worked, and reductions in the cost of materials.

The decrease of \$5,822,268.05, or 37 per cent, in "Maintenance of Equipment Expenses" is due to decreased expenditures for repairs to freight train cars and locomotives, partly offset by increased depreciation charges because of a larger equipment and an increase in charges to equipment requirements. The decrease charges for repairs were offset by reductions in the cost of materials and supplies used.

The increase of \$539,477.44, or 3.90 per cent, in "Traffic Expenses" is due in part to the reorganization of the Traffic Department and reestablishing outside agencies after the termination of Federal control and partly to increased freight expenses in account of the numerous changes in rates and the necessary increase of minor tariffs in connection therewith.

The increase of \$11,417,029.14, or 17.58 per cent, in "Transportation Expenses" is due in part to a reduction in freight service on account of the losses of the previous year and the benefit received from placing in service a number of larger new freight locomotives during the year. Other factors contributing to the increase were a reduction in the cost of fuel, coal economies effected in station, plant, and engine, and the maintenance of train schedules. There were fuel economies, and the maintenance of train schedules. There were fuel economies, and the maintenance of train schedules. There were fuel economies, and the maintenance of train schedules.

The decrease of \$2,000,448, or 17.4 per cent, in "Miscellaneous Operating Expenses" is due to the falling off in passenger travel and in the volume of mail and express work, and to the decrease in the cost of fuel, coal, and other materials.

The decrease of \$18,731.60, or 3.33 per cent, in "General Expenses" is due to a decrease in "Salaries and Expenses of Clerks and Attendants" and "Salaries and Expenses of Engineers and Conductors" and "General Operating Expenses" and to the decrease in the cost of fuel, coal, and other materials.

The decrease of \$1,000,000, or 10 per cent, in "Depreciation" is due to the decrease in the volume of work and to the decrease in the cost of materials and supplies used.

RAILWAY TAX ACCOUNTS

"Railway Tax Accounts" totaled \$5,111,648.54 this year, as compared with \$5,917,100.00 last year, a decrease of \$805,451.46, or 13.61 per cent. There was a decrease in the amount of Federal income tax paid of \$1,000,000.00, or 100 per cent, and a decrease in the amount of State and local taxes paid of \$1,000,000.00, or 100 per cent.

RAILWAY RECEIPTS

"Railway Receipts" totaled \$134,813,513.88 this year as compared with \$134,813,513.88 last year, a decrease of \$17,960,960.84, or 12.91 per cent.

EQUIPMENT RENTS—NET CREDIT

"Equipment Rents—Net Credit" totaled \$1,141,702.94 this year as compared with \$1,141,702.94 last year, a decrease of \$17,960,960.84, or 12.91 per cent.

JOINT FACILITY RENTS—NET DEBIT

"Joint Facility Rents—Net Debit" amounted to \$203,177.54, an increase of \$16,554.85 as compared with last year.

PHYSICAL CHANGES

The following is a summary of the more important improvements during the year, the cost of which was charged wholly or in part to "Road and Equipment":

ADDITIONS AND BETTERMENTS—ROAD

There were 218.65 miles of track laid with 90 pound steel rail and 84.05 miles of track relaid with second hand steel rail, all of which replaced rail of lighter section.

Two hundred sixty-one new industrial sidings were built or extended. A net addition of 43.26 miles. Included therein were additions to yard facilities of 24.25 miles at Clinton, Ill., and 0.67 miles at Paducah, Ky. A track was built from north of Zeigler, Ill., to Royaltown Mine No. 2 at Royaltown, Ill., a distance of 4.85 miles. A track was also built from a point on the main line south of Zeigler, Ill., to the Lake Creek Mine near Johnston City, Ill., a distance of 8.76 miles, with connections to Old Ben Mine and No. 18 Mines, a distance of 1.95 miles. Work was started on tracks from Providence, Ky., to Shamrock Mine, a distance of 2.52 miles; and from a point on the main line north of Central City, Ky., to Holt Mine, a distance of 3.56 miles.

The grading for Main Line Yard, located between Harvey, Ill., and Homewood, Ill., referred to in the report of the previous year, was continued.

A new subway eliminating a grade crossing with the Hawkeye highway near Earlyville, Ia., was built, and the subways at Washington Street, Boston, Mass., and at 14th and 14th Streets, Fort Dodge, Ia., referred to in the report of last year, were completed.

Work was started on the erection of a reinforced concrete viaduct to carry McLeMORE Avenue over the tracks of the Illinois Central and Yazoo and Mississippi Valley railroads at Memphis, Tenn.

Combination passenger and freight stations were completed at Dowell, Ill., and Speedway, Ill. Work was started on the construction of a brick freight house and driveways, and the conversion of a freight and passenger station into a passenger station at Frankfort, Ill.

Improvements were made in the icing facilities at Paducah, Ky., and Louisville, Ky.

A new interlocking plant was constructed at the crossing with the Toledo, St. Louis and Western Railroad at Ramsey, Ill., and work was started on the construction of an interlocking plant at the crossing with the Waterloo, Cedar Falls and Northern Railway at Waterloo, Ia.

Work was started on the erection of a steel car repair shed at McComb, Miss. New mechanical facilities were constructed at Hermit, Ill., and improvements were made in the mechanical facilities at Havana, Ill., Freeport, Ill., Waterloo, Ia., Dubuque, Ia., and Paducah, Ky. New 100-foot turntables, replacing 85-foot turntables, were installed at Champaign, Ill., Waterloo, Ia., and Dubuque, Ia., and a 54-foot turntable, to replace a 66-foot turntable, was installed at Dubuque, Ia.

Water facility improvements included the installation of 100,000-gallon creosoted water tanks at Kinmundy, Ill., Clinton, Ill., Caneyville, Ky., Canton, Miss., and a 50,000-gallon tank at Ferris, Ky.

The extension of block signals between Sney, Ky., and Princeton, Ky., was completed. At Kensington, Ill., block signals were installed at the Knickerbocker Ice Company's crossovers. The extension of automatic block signals south through Paducah, Ky., a distance of 3.6 miles, was begun. At the close of the year 2,451 miles of track were equipped with block signals.

Three thousand eight hundred eighty-two lineal feet of permanent bridges and trestles were constructed, replacing pile and timber bridges and trestles 1,616 lineal feet. Permanent bridges and trestles and 2,674 lineal feet of pile and timber bridges and trestles were rebuilt or replaced by embankment. Twenty-eight miles of track were ballasted or reballasted and brought up to the present standard.

ADDITIONS AND BETTERMENTS—EQUIPMENT

One hundred Central type freight locomotives and twenty-five 8-wheel switching locomotives were added. A total of 558 locomotives of various types were disposed of, resulting in an increase of seventeen locomotives. Three Consolidation type freight locomotives were converted into Mikado type freight locomotives, and eight Mocal type freight locomotives were converted into Suburban type passenger locomotives. Thirty-seven of various classes were re-equipment. The increase in tractive power of locomotives for the year was 5,911,927 pounds.

Fifty-five new passenger cars were added, and ten cars were condemned, destroyed or sold, making a net increase of forty-five cars. Three thousand six hundred twenty-two freight cars were added and 3,161 cars were condemned, destroyed, sold or transferred to other classes, resulting in a net increase of 461 cars.

GENERAL REMARKS

Of the 10 Central type freight locomotives referred to under the head of "Additions and Betterments—Equipment," seven were purchased during the year, and also the twenty-five switching locomotives, at a total cost of approximately \$5,940,000.00. In order to finance this purchase there was issued during the year Illinois Central Equipment Trust Series "A" amounting to \$5,940,000.00. The balance of the purchase price was paid in cash by the company.

In connection with Government Equipment Trust No. 33, referred to in the report of last year, there were issued and delivered to the Government 1,653 cars at a total cost in the amount of \$58,200,000.00 to cover the purchase price of the cars, and also the twenty-five switching locomotives, at a total cost of approximately \$5,940,000.00. In order to finance this purchase there was issued during the year Illinois Central Equipment Trust Series "A" amounting to \$5,940,000.00. The balance of the purchase price was paid in cash by the company.

In connection with Government Equipment Trust No. 33, referred to in the report of last year, there were issued and delivered to the Government 1,653 cars at a total cost in the amount of \$58,200,000.00 to cover the purchase price of the cars, and also the twenty-five switching locomotives, at a total cost of approximately \$5,940,000.00. In order to finance this purchase there was issued during the year Illinois Central Equipment Trust Series "A" amounting to \$5,940,000.00. The balance of the purchase price was paid in cash by the company.

The Illinois Central Railroad Company Fifteenth Year Six Month Report, the Cent Second Grid Rents, were issued and sold for \$1,141,702.94, and the Illinois Central Railroad Company Fifteenth Year Six Month Report, the Cent Second Grid Rents, were issued and sold for \$1,141,702.94, and the Illinois Central Railroad Company Fifteenth Year Six Month Report, the Cent Second Grid Rents, were issued and sold for \$1,141,702.94.

The Illinois Central Railroad Company Fifteenth Year Six Month Report, the Cent Second Grid Rents, were issued and sold for \$1,141,702.94, and the Illinois Central Railroad Company Fifteenth Year Six Month Report, the Cent Second Grid Rents, were issued and sold for \$1,141,702.94, and the Illinois Central Railroad Company Fifteenth Year Six Month Report, the Cent Second Grid Rents, were issued and sold for \$1,141,702.94.

H. MARKHAM, President.

(AUGUST 1922)

St. Louis-San Francisco Railway Company

TO THE STOCKHOLDERS

Your Directors submit herewith the annual report for the year ended December 31, 1921.

The average mileage operated during the year was 5,256.07 miles, an increase over the previous year of 3.39 miles, due to additional track laid between Tyronea, Ark., and Track 40.

RESULTS FOR THE YEAR

Operating Revenues were.....	\$86,292,584.22
Operating Expenses were.....	64,385,706.61
Net Operating Revenue was.....	\$21,906,877.61
Taxes were.....	3,672,703.08
Operating Income, Taxes deducted, was.....	\$18,234,174.53
Miscellaneous Income was.....	397,980.31
Rentals and Other Payments were.....	\$18,632,154.84
	1,237,326.16
Income for the year available for interest was.....	\$17,394,828.68
Interest on Fixed Charge Obligations was.....	9,665,878.62
Balance.....	\$7,728,950.06
Interest on Cumulative Adjustment Mortgage Bonds was.....	2,391,749.71
Balance.....	\$5,337,200.35
Interest on Income Mortgage Bonds was.....	2,111,520.20
Balance.....	\$3,225,680.35

In the report for the year ended December 31, 1920, you were advised of the status of the Company's negotiations with the United States Government looking to the settlement with the United States Railroad Administration of matters growing out of the operation of the property during Federal control and also with the Interstate Commerce Commission on account of claims filed by the Company, for itself and its affiliated and subsidiary Companies, under the guaranty provisions of Section 209 of the Transportation Act, 1920.

During the year final settlement of the account with the United States Railroad Administration was effected. This settlement embraces all of the System Lines parties to the Standard Form of Contract with the Director General of Railroads, as well as the Omaha, Aene & Pacific Railway Company and the Kansas City, Clinton and Springfield Railway Company. The account with the Director General was somewhat complicated, involving many entries of both debits and credits of varied character. However, a summary of the final settlement may be briefly stated as follows:

As the beginning of Federal control on January 1, 1918, the Director General took over current cash and collected outstanding accounts receivable of the Company, thus receiving funds of the Company amounting to.....	\$10,004,480.49
The Director General assumed all the Company's current obligations on said date, amounting to.....	13,975,624.15

The Company therefore owed the Director General, as a result of the foregoing cash transactions, a net balance of.....	\$3,971,143.66
Its amount on account of the operation of "Standard" return for the 26 months of Federal control: total \$29,537,987.24, of which the Director General paid \$26,229,569.32, leaving due.....	3,298,417.72

Net amount owed by Company to Director General.....	\$672,725.94
The Director General continued to prosecute the addition and betterment work in progress on Jan. 1, 1918, and the work done and paid for by the Director General amounted to.....	6,020,432.03

Amount owed by Company to Director General, not disputed by either party, except for certain improvement charges to which the Company objected..... \$6,693,157.97

Against which the Company set up claims, which were disputed in whole or in part by the Director General, amounting to \$7,123,212.28 for maintenance and \$6,897,493.15 for various items such as depreciation, property retired, etc., totalling \$14,020,705.43. The Director General allowed in respect of these claims \$7,243,157.97, offset in part by \$6,693,157.97 owed by the Company as above stated, and paid the balance of \$550,000 to the Company in cash.

Settlement has not yet been effected with the Interstate Commerce Commission of the claims filed by the Company under the guaranty provisions of Section 209 of the Transportation Act, 1920, as amended by Section 212 thereof, but a final claim has been prepared, which was filed with the Commission March 1, 1922.

SECURITIES ISSUED, SOLD OR PLEDGED

In the Annual Report for the year ended December 31, 1920, you were advised that the Company had issued at par to the Director General of Railroads \$14,029,500.00, principal amount, Equipment Notes, dated January 15, 1920, to meet the cost, as tentatively certified, at the time of such issue, of the following equipment purchased from the United States Railroad Administration:

- 33 Light Mikado Locomotives,
- Light Switcher Locomotives,
- 3,500 Double Sheathed 49 Ton Box Cars,
- 1,000 Composite 50 Ton Gondola Cars.

During the year the Company issued to the Director General of Railroads an additional \$354,000 principal amount, Equipment Notes, dated January 15, 1921, bearing interest at the rate of six per cent per annum, payable semi-annually and maturing serially from January 15, 1921, to January 15, 1935, inclusive. These notes were issued at par in payment of the difference between the tentatively certified cost (\$14,029,500.00) of the equipment referred to, and the actual cost thereof as finally agreed upon.

During the year the Company issued to the Director General of Railroads Series C, were authenticated and delivered under the Prior Lien Mortgage, as follows:

Account Equipment Notes Retired.....	\$901,000
Account Additions and Betterments.....	5,785,500
Account Terminals and Terminal Facilities.....	13,500
.....	\$6,700,000

Prior Lien Mortgage Six Per Cent Bonds, Series C, in the face amount of \$2,664,000, were pledged during the year to secure temporary bank loans aggregating \$2,000,000, which since the close of the year have been paid off and the bonds returned to the Company's treasury. In addition to the above the Company held free in its treasury, at the close of the year, \$9,268,000 Prior Lien Mortgage Six Per Cent Bonds, Series C, as shown in the Condensed General Balance Sheet and included in the classification "Unadjusted debits."

Of the \$15,000,000 St. Louis and San Francisco Railroad Company Stock

Trust Certificates for The Kansas City, Fort Scott and Memphis Railway Company Preferred Stock, which in accordance with their terms, maturing October 1, 1921, holders of \$13,962,800 accepted the offer of exchange made under the plan of reorganization and received from the Reorganization Managers in accordance with the reorganization plan, \$10,472,100 of this Company's First Lien Mortgage Six Per Cent Bonds and \$3,490,700 of its Adjustment Mortgage 6% Bonds. \$34,300 par value of said Stock Trust Certificates have been exchanged for a like amount of the Preferred Stock of The Kansas City, Fort Scott and Memphis Railway Company.

EQUIPMENT

The Company during the year accounted for a total of 2,355 freight cars rebuilt, the appraised value of which as rebuilt is \$4,013,065.49.

The reconditioning program during this period has been a very active one involving a large number of cars which, as result of the neglect of repairs during Federal control, had either been standing idle, or been kept in service at a high current repair cost.

ADDITIONS AND BETTERMENTS

The amounts charged to Capital Account during the year for additional main track, described in detail under the head of "Double Track," other improvements of roadway and structures, shop buildings, etc., in the purchase of new equipment and for improvements to existing equipment, were as follows:

ROAD	
Widening cuts and fills.....	\$160,705.52
Ballasting.....	21,195.27
Rail and other track material.....	20,586,222.22
Bridges, trestles and culverts.....	75,257.28
Tunnels and subways.....	30,921.12
Elimination of grade crossings.....	441.49
Grade crossings and signals.....	518,826.22
Additional main track.....	674,835.18
Additional yard and industry tracks.....	8,590.50
Changes of grade and alignments.....	56,780.90
Roadway buildings.....	28,702.22
Fences.....	11,524.50
Freight and passenger stations.....	301,891.43
Shop buildings, engine houses, etc.....	114,218.26
Power plants, shop machinery and tools.....	589,811.52
Assessments for public improvements.....	100,300.65
Miscellaneous.....	36,577.15
EQUIPMENT	
New Equipment.....	12,329.42
Additional charges on new equipment purchased in prior years.....	503,432.26
Improvements to existing equipment.....	2,033,966.27
.....	\$5,019,293.19

DOUBLE TRACK

During the year the Company completed the construction of 27.51 miles of additional main track to provide double track in heavy traffic territory, including 20.55 miles between Eureka, Missouri, to Pacific, Missouri, 8.82 miles from Sleeper, Missouri, to Lebanon, Missouri; 1.37 miles from Monett, Missouri, to Globe, Missouri; 9.62 miles from Spring Hill, Kansas, to Olathe, Kansas; and 0.81 miles between Amory, Mississippi, and Abertole Junction, Mississippi. There is now in service a total of 93.03 miles of second main track.

MAINTENANCE

The property of the Company has not only been adequately maintained during the year, but, in fact, its physical condition has been materially improved. The extent of maintenance expenditures cannot always be accurately gauged by the mere money amount thereof. Several factors have contributed in 1921 to the ability of the Company to secure greater results from a given amount of money expended for maintenance. Wage rates were reduced as result of decision of the United States Railroad Labor Board, effective July 1, 1921. The price of some materials, of which there is a relatively large consumption in maintenance work, has receded from the peak which grew out of war conditions. The efficiency of labor has improved to the extent that the "weakening" morale and the generally disturbed conditions which were the aftermath of the war and Federal control have been gradually disappearing. This is particularly true with respect to labor employed in maintenance of equipment.

The excess of maintenance expenditures in 1920 over similar expenditures in 1921 was chargeable also, in a considerable measure, to the inclusion in the 1920 charges of large sums lapsing over from previous periods, which were incurred in connection with Additions and Betterments work during Federal control, the accounting for which had not been properly closed by the Director General's Management.

Elsewhere in the report there is set forth the extensive accomplishment in renewal and rehabilitation of rolling stock equipment during the year. The large expenditures made therefor and charged to Capital Account have had a direct effect in reducing the expenditures necessary for adequate maintenance.

INCOME ACCOUNT FOR YEAR ENDED JUNE 30, 1921

At the time of Reorganization, and the preparation of the Adjustment Mortgage and the Income Mortgage of the Company, the fiscal year for the making of the Annual Report to the Interstate Commerce Commission ended June 30. The same fiscal year was adopted in both the Adjustment Mortgage and the Income Mortgage.

This has since been changed by the Interstate Commerce Commission so that the period for making the Annual Reports is now the calendar year instead of the year ending June 30, and as a consequence the Annual Report filed with the Commission does not show income for the fiscal year ending June 30.

The following statement shows the income account for the fiscal year ended June 30, 1921, as certified by Messrs. Deloitte, Plender, Griffiths & Company, Certified Public Accountants.

Two months (July and August) Guaranteed under the Reconditioning Standard Return on the Standard Return as finally certified by the Interstate Commerce Commission.....	\$2,340,676.90
Increased Compensation on account of equipment purchased and improvements, Additions and Betterments (Net) completed at March 1, 1920, and during Guaranty Period.....	229,104.61
Difference between Reconditioning Standard Return taken into account and Standard Return as finally certified Jan. 1, 1918-Feb. 29, 1920.....	453,953.29

Railway Officers

Executive

George W. Lupton, whose promotion to assistant to the vice-president in charge of operation of the Atchison, Topeka & Santa Fe, with headquarters at Chicago, effective April 1,

George W. Lupton

to succeed W. K. Etter, promoted, was announced in the *Railway Age* of April 8, was born in England, August 12, 1870. After attending a business college at Los Angeles, Cal., he entered railway service in 1887 as a telegraph operator on the Ohio & Mississippi (now the Baltimore & Ohio Southwestern). With which road he remained for four years as a telegraph operator and as an agent at various places on the St. Louis division. He entered the service of the Northern Pacific in 1891 as an operator and agent on the Yellowstone division. The following year he entered the employ of the Atchison, Topeka & Santa Fe where he worked consecutively as operator, station cashier and agent on the Los Angeles Division, stenographer in the treasury department on the same division, and agent and yardmaster on the Valley division until 1905. From that time until 1907 he was trainmaster on the Arizona and Albuquerque divisions, first at Barstow, Cal., and later at Winslow, Ariz. From 1907 to 1914, he was terminal agent at San Francisco and from 1914 to the date of his recent promotion, was superintendent of the terminal division, with headquarters at San Francisco.

William A. Colston, whose resignation as director of the Bureau of Finance of the Interstate Commerce Commission, and election as vice-president and general counsel of the

W. A. Colston

New York, Chicago & St. Louis, with headquarters at Cleveland, Ohio, effective May 1, was reported in the *Railway Age* of April 8, was born in Louisville, Ky., on November 3, 1873. He entered railway service July, 1891, as a mail messenger in the general office of the Louisville & Nashville at Louisville, Ky., and consecutively thereafter held various positions in the accounting department up to and including assistant controller in active charge of accounts and statistics. After the completion of law studies at the Jefferson School of Law (from which he was graduated in 1907, and in which he was afterwards an instructor in interstate commerce law) he was transferred to the law department as commerce attorney. He served in this capacity and later as a general solicitor until May 10, 1920, representing a continuous service with the Louisville & Nashville of 29

years, except for the period from 1898-1899, when he saw military service in Porto Rico as captain in the First Kentucky Infantry, U. S. Volunteers, and for the period from 1916 to 1919, during which he served first as colonel of the First Kentucky Infantry in Mexican border service and later as colonel commanding the 138th Field Artillery and the 63rd field artillery brigade in France. From May 10, 1920, until his election he was director of finance of the Interstate Commerce Commission.

Financial, Legal and Accounting

G. H. Nero has been appointed auditor in charge of all revenue, disbursement and general accounting matters of the New England Steamship Company, the Hartford & New York Transportation Company and the New Bedford, Martha's Vineyard & Nantucket Steamboat Company, with headquarters at New Haven, Conn.

J. J. Ward has been appointed assistant to the general auditor of the New York, New Haven & Hartford and the Central New England with jurisdictions over the general bookkeeping and statistical departments. **J. E. Baldwin** has been appointed auditor of disbursements and **H. V. Clemens** auditor of freight receipts. These changes were effective May 1 and the headquarters of all is New Haven, Conn.

J. H. Ambrose, treasurer of the Nashville, Chattanooga & St. Louis, whose retirement was reported in the *Railway Age* of April 22, was born at Wilton, England, January 22, 1850, and entered railway service in 1875 as a clerk in the superintendent's office of the Nashville, Chattanooga & St. Louis. After serving three years in this capacity he became secretary to the president, which position he occupied until 1880, when he was made chief clerk to the general manager. He served in this capacity and that of purchasing agent from 1880 to 1886. On March 17 of the latter year he was elected secretary and treasurer of the corporation, which position he occupied until his recent retirement, except from July 9, 1918, to January, 1920, during the period of federal control, when he was federal treasurer of the Nashville, Chattanooga & St. Louis, the Tennessee Central and the Birmingham & Northwestern. Mr. Ambrose will continue as a director and a member of the finance committee.

Operating

J. R. Folsom, chief dispatcher of the Erie at Marion, O., has been appointed acting trainmaster succeeding **C. P. Shaughnessy**, furloughed. **M. C. Murphy** has been appointed acting chief dispatcher succeeding Mr. Folsom.

Traffic

H. W. Bondurant has been appointed commercial agent of the Southern with headquarters at Nashville, Tenn., effective May 1.

John T. Stinson, director of agricultural development of the Missouri Pacific, with headquarters at St. Louis, Mo., has been appointed agricultural and colonization agent, with the same headquarters, the office of director of agricultural development having been abolished.

Albert W. Noyes, whose promotion to assistant general passenger agent on the Chicago Great Western, with headquarters at Chicago, was reported in the *Railway Age* of April 15, was born at Lebanon, Conn., June 15, 1866, and entered railway service in 1885 as a telegraph operator for the New York, New Haven & Hartford. He continued in this position and as agent until 1888, when he entered the service of the St. Paul & Duluth in a similar capacity. After a year with the latter company he entered the service of the Chicago Great Western where he remained until 1892, first as agent operator and later as secretary to the general traffic manager, when he became assistant ticket agent of the Chicago Great Western at Des Moines, Iowa. A few years later he was promoted to traveling passenger agent on the same road and in 1907 became general traveling passenger agent in charge of

field offices, which position he held until his promotion on April 1, to assistant general passenger agent.

Mechanical

Robert Quayle, general superintendent of motive power and machinery of the Chicago & North Western, whose retirement effective May 1, after 54 years of service with this road, was reported in the *Railway Age* of April 29, page 1046, was born on the Isle of Man November 23, 1853, and entered railway service in 1868, as a machinist's apprentice on the Chicago & North Western in its Chicago Avenue shops. In 1872 he was transferred to the shops at Fortieth street, Chicago, where in October, 1877, he was promoted to assistant foreman. Three years later he was made foreman of the car and machine shops. On June 15, 1885, he was promoted to master mechanic with jurisdiction over all lines in Iowa. On April 1, 1891, he was promoted to general master mechanic of the Milwaukee, Lake Shore & Western, where he remained until December 1, 1894, when, following the absorption of this road by the Chicago & North Western, he was promoted to superintendent of motive power and machinery, with headquarters at Chicago. On November 1, 1913, he was promoted to general superintendent, motive power and car department and on March 1, 1920, he became general superintendent, motive power and machinery.

Robert Quayle

Harry T. Bentley, whose promotion to general superintendent of motive power and machinery of the Chicago & North Western, effective May 1, succeeding **Robert Quayle**, retired, was reported in the *Railway Age* of April 29, page 1046, was born in London, England, on June 4, 1862, and was educated at Dulwich College in that country. He entered railway service in 1877 as a machinist's apprentice on the London & Northwestern (England). After 10 years' service he became foreman of the enginehouse of the same road at Chester, England, where he remained until 1892, when he came to America and entered the service of the Chicago & North Western as a machinist in its Chicago shops. Shortly thereafter he was promoted to foreman in the shops at Boone, Iowa, and in 1895 he was transferred to Belle Plaine, Iowa, where he remained until 1898 when he became general foreman of the shops at Clinton, Iowa. Seven months later he was promoted to master mechanic of the Madison division and on December 30, 1899 he was transferred to the Iowa division. On August 31, 1902, he was promoted to assistant superintendent of motive power and machinery, with headquarters at Chicago and on October 31, 1913, he was promoted to superintendent of motive power and machinery, with the same headquarters, in which capacity he served until the time of his promotion to general

H. T. Bentley

superintendent, except for the period from February 2, 1918, to June 19, 1918, when he was assistant director of transportation of the United States Railroad Administration, in charge of mechanical matters, with headquarters at Washington, D. C., in which capacity he served as chairman of the committee organized to prepare plans and specifications for standard locomotives and cars. Mr. Bentley was president of the American Railway Master Mechanics' Association in 1911-1912; and president of the International Railway Fuel Association during the following year.

Elred Byron Hall, whose promotion to superintendent of motive power and machinery of the Chicago & North Western, effective May 1, succeeding **H. T. Bentley**, promoted, was reported in the *Railway Age* of April 29, page 1046, was born at Parkersburg, Iowa, December 31, 1870, and entered railway service on September 23, 1889, as an engine caretaker for the Chicago & North Western at Eagle Grove, Iowa. He served in that capacity and later as a machinist's helper until 1892, when he became a shopman at Hawarden, Iowa, where he served until 1898, when he became a locomotive fireman. After nine years' service as a locomotive fireman and three years' service as a locomotive engineer on the Sioux City and the Northern Iowa divisions he became road foreman of engines of the Sioux City division, in which capacity he continued until 1912, when he was promoted to master mechanic of the Wisconsin division, being transferred to the Sioux City and Northern Iowa divisions in 1914. In 1917 he became assistant to the general superintendent of motive power at Chicago, the duties of which office had to do chiefly with labor matters. In 1917 he was appointed assistant superintendent of the Wisconsin division, with headquarters at Milwaukee, Wis., and in 1919 he was promoted to assistant superintendent of motive power at Chicago, with jurisdiction over lines west of the Missouri river. A year later he was promoted to principal assistant superintendent of motive power and machinery with jurisdiction over the entire system.

E. B. Hall

Engineering, Maintenance of Way and Signaling

J. H. Snyder, roadmaster on the Michigan Central, with headquarters at Jackson, Mich., has been promoted to division engineer, with headquarters at Detroit, Mich., effective May 1, to succeed **John Evans**, who will assume jurisdiction over the Detroit-Jackson and the Detroit-Bay City divisions to succeed **E. C. Wurzer**, resigned to enter the firm of **F. Palma & Co.**, contractors, Detroit, Mich.

L. E. Nordholm, assistant signal supervisor on the Chicago, Rock Island & Pacific, with headquarters at Des Moines, Iowa, has been promoted to office engineer in the signal engineer's office at Chicago, to succeed **J. H. Molloy**, who has been promoted to assistant engineer, with the same headquarters. **F. E. Kinney**, assistant signal supervisor, with headquarters at Joliet, Ill., has been promoted to signal supervisor, with headquarters at Cedar Rapids, Iowa, to succeed **J. T. Zahnen**, who has been transferred to Chicago, to succeed **R. R. Baker**, resigned to engage in other business.

Purchasing and Stores

J. E. Bollinger, secretary to the manager of purchases of the American Short Line Railroad Association, has been appointed assistant to the manager of purchases with headquarters at Washington, D. C., effective May 1.

1093

In spite of the extensive accommodations for employees provided by some roads at Y. M. C. A.'s and company bunk-houses, there are still entirely too many terminals where train and engine employees are forced to sleep in cabooses on the away-from-home lay-over. This situation is far from satisfactory and merits the attention of all railroad officers under whom it exists. With the advent of summer the caboose becomes even less desirable as a place to sleep. Caboose tracks are not as a rule located in the coolest spot available. The heat, flies (and perhaps even less desirable visitors from the insect world) and constant switching make for a minimum amount of rest away from home for train and engine men. Undesirable as a caboose is as a place of repose, however, it is only slightly worse than a noisy, dirty bunk-house. Bunk-houses should, without doubt, be provided wherever crews are required to lay-over, but they should be located where there is a minimum of noise and where the sun's rays may not beat down upon them with all their summer fury. Furthermore it costs no more to operate a clean sleeping place than a vermin-infested one. Some roads—we could mention several—provide their train and engine men with clean beds in private rooms and ample bathing facilities at a nominal charge. The *Railway Age* is of the opinion that if this practice were general the demands of the men for a quick return to the home terminal would be less insistent.

Sleeping in Cabooses

Signaling Single Tracks

The installation of automatic block signals is, in many cases, the most economical way of increasing the track capacity of important single track lines. Comprehensive data have been compiled to show the economies produced by certain installations. A certain road is now preparing to make a single track signal installation at a cost of not over \$3,400 a mile that, according to careful calculations based on actual results of the installation of automatics under similar conditions, should increase the average speed of freight trains over the division by 25 per cent, thereby producing a saving that will pay for the signal installation in a few years. On another road it is estimated that the construction of a second track over a certain division will cost approximately \$3,000,000 as compared with \$725,000 for a signal installation, which latter expenditure is calculated to show a saving of 18 per cent on the investment. However, "the proof of the pudding is in the eating," which is evidenced by the recent action of the Northern Pacific in authorizing the installation of signals on 151 miles of single track, which will practically complete the signaling of the main line of that road from the Great Lakes to the Pacific Coast. The Great Northern has also let contracts for 165 miles of automatic signaling on single track in Montana and Washington. The reconstruction program of the Missouri, Kansas & Texas has included some 251 miles of single track signaling with satisfactory results and other installations are proposed. Operating and engineering officers not familiar with the possibilities of signaling are sometimes inclined to consider double tracking as the only solution of the problem of increasing track capacity.

However, before plans are completed the railroads cannot afford to overlook the possible economies derived from signaling.

Railroad Pole Lines and Sleet Storms

Sleet storms have been the cause of serious delays to trains and occasionally during the past season have halted the transaction of general railroad business on the northern roads because of the damage caused to pole lines. Although it may not be economical to build pole lines to withstand ice loads as exceptional as three pounds per lineal foot of wire, certain roads have taken precautions that have limited the damage so that communication has not been entirely cut off even during the heaviest sleet storms in history. The standard for new construction on one such road requires the use of 53 poles per mile as compared with 41 poles ordinarily considered as sufficient. Further, every sixth pole is side-guyed and special-fixture poles are located at intervals of a half-mile. Another road, which had 200 miles of signal department pole line loaded with heavy sleet recently, did not have a single pole broken by the load and attributed the strength of the line to the fact that not only were 52 poles used to the mile but that the line was also well guyed at frequent intervals. In the same state another road lost 370 poles in 190 miles of signal line. One fact noted concerning the line breaks, was that the iron wire broke at the insulators while the copper wire broke between spans. It was also noted that fewer breaks occurred at the insulators if smaller wire was used for tying. Railroads are vitally interested in the continuity of the service of their communication and signal pole lines and when estimating for new lines or renewals, they cannot afford to ignore the lessons learned by others.

"Waiting for Someone to Die"

The expression "Waiting for Someone to Die" is not a particularly pleasant one, yet it is often heard among railway men in reference to the possibilities of promotion. It is not, however, with the advancement of individuals that this expression has been most strongly impressed upon us but rather with the advancement of railroading itself. Now and then there are railway officers who, because of their beliefs, prejudices, misinformation, personal animosities and other reasons, are blocking the adoption of something of proved benefit—either an article or a method or a plan. Many of us can recall instances where certain methods were adopted and certain changes were made which had long been attempted by junior officers, but these were not made until after "someone had died." We recall a recent talk with a manufacturer of a product used by many roads to advantage, in which he stated that, although the department head and the latter's subordinates on a certain railroad desired to install it, he could not sell to that road. "We," he stated, meaning the railway officers concerned and himself, "have agreed that it is simply a matter of waiting until So-and-So dies." Speaking exactly it is *not* truthfully a case of waiting until someone dies, the man or men may resign or they may be trans-

ferred or even promoted—many are—to where they are no longer actively in charge of the details and where they see only the results. Some have learned that their pet beliefs have been dropped since they relinquished the details, yet can find no criticism with the results. Others have this experience yet to come.

The proceedings of the American Society of Civil Engineers for April contain discussions by a large number of bridge engineers and others on the specifications for steel railway bridges submitted as a progress report by a special committee of that association. In general, the tone of these discussions is one of criticism of the committee for presenting what is to all purposes a duplication of the specifications adopted by the American Railway Engineering Association in 1920. The general consensus of opinion corresponds to that expressed in these columns sometime ago, namely, that the adoption of these specifications by the A. S. C. E. would serve only to introduce a confusing duplication. It is clear from these discussions that there is little likelihood of the adoption of the specification in its present form by the association. However, a number of constructive suggestions are offered pointing to work which can be done with profit by the special committee of the A. S. C. E. on steel bridges. Attention is called to the fact that the A. R. E. A. specification is in reality a detailed set of rules covering almost every contingency that can possibly arise in the design of the usual types of railway bridges for spans under 300 ft. Therefore, rather than duplicate this work, it is suggested that the special committee formulate a set of specifications covering general considerations or principles relating to the design of steel bridges which would be applicable to all bridge construction. There would seem to be considerable merit in this suggestion as it offers a legitimate field for the work of the special committee which would in no way duplicate the detailed specifications of the A. R. E. A.

Railroad men are coming to appreciate more and more the power of an aroused public sentiment and the necessity of making that sentiment a friendly one. Somewhat limited attempts to broadcast the magnitude of railroad problems and needs have borne rich fruit in recent months, and the good work should be extended and intensified in all departments. Owing to the lack of any direct contact with shippers or the traveling public it is not commonly supposed that the mechanical department can influence public opinion, but let us see if this supposition is based on fact. In the first place the mechanical department employees, with their families and friends, form no inconsiderable portion of the public, and the opinions of all these people regarding the railroads are largely determined by the treatment accorded them as employees through their foremen. Here is a fine opportunity to start educational work and some railroads have already taken advantage of it. For example, Elisha Lee, vice-president of the Pennsylvania, recently talked before the Shop Foremen's Club at Pittsburgh, explaining (1) the vital relation between prosperous railroads and a prosperous country; (2) the functions and equal importance of railroad investors, workers and managements; (3) the economic necessity for reduced railway rates and wages, and (4) the important role that foremen play in representing the management, treating their men always with the most scrupulous fairness, and explaining personally as far as possible the reasons for policies which appear objectionable. In addition to this work the mechanical department can help

make friends with the general public by improving the quality and increasing the quantity of its work. If enough cars, properly maintained as to wheels, springs and upholstery, are available it is evident that each passenger will have a clean, comfortable seat. If locomotives are kept in good repair, with drawbars of the right length to eliminate unnecessary slack, and brake rigging properly maintained throughout, operation will be smooth, resulting in fewer shocks to equipment and passengers' nerves. If enough locomotives are available none need be overloaded, with resultant delayed shipments and rapid deterioration of motive power. These are but a few of the ways in which the mechanical department can help bring about a favorable and friendly public sentiment towards the railroads.

There is no doubt that advantage should be taken of the present opportunity to equip shops and enginehouses as completely as possible with new machinery and tools needed for efficient operation. That certain of the railroads are working along this line is evident from the growing number of requests for bids on machine tool lists recently issued. As a rule, the roads have been slow in accepting bids and definitely placing orders, and there is a general feeling that the delay may be caused by belief that machine tool prices have not yet reached rock bottom. In fact, in more than one case a road has definitely stated that it will not buy until prices are lower. There could be no justification for the railroads paying unnecessarily high prices for machine tools, or prices which were higher than those determined by a competitive market. On the other hand, certain standard makes of machines were not advanced in price during the war period proportionately to other products and what advances were made have now been offset by reductions until many present prices show little if any profit. Any attempt to take advantage of the extremity of manufacturers and force machine tool prices below a point representing a reasonable profit will be a boomerang and react to the disadvantage of the roads. Let us suppose that a railroad now in need of certain machines decides to hold out in the hope of further price reductions and is successful to the extent of saving a few hundred dollars after a wait of six months. Besides delivering what may be a severe blow to the relatively small machine tool manufacturer (who is incidentally a shipper), the railroad loses for a period of six months the increased efficiency which would have been possible by purchasing the machines in the first place. The total cost of this lost efficiency will undoubtedly equal, if not exceed, the saving in price. Moreover, the effective life of machine tools varies from 10 to 20 years and the entire first cost when spread over such a long period is relatively unimportant compared to the increased machine efficiency. In the long run more will probably be lost than gained by waiting for further reductions in the price of standard, high-grade machine tools.

How Low Should Machine Tool Prices Go?

The International Railway Congress at Rome began on April 18, and on another page of this issue is the first of a series of articles on the proceedings of the Congress and European railway affairs generally. These articles are being written for the *Railway Age* by its editor Samuel O. Dunn, who attended the Congress at Rome as a delegate of the American Railway Association and who presented to the Congress a report on Cost of Service in Relation to Rates. From the report of the opening of the Congress, which is published elsewhere in this issue, it seems that the meeting was a very successful one and the proceedings and recom-

Reports on the Rome Congress

mentations can well be followed with interest by American railway men. We do not have to admit that our railways are inferior in order to benefit from European experience. Since the convention, Mr. Dunn has been traveling in Europe. His observations on this tour will likewise be published in issues following those which contain the reports on the activities of the Congress. The *Railway Age* is confident that its readers will find much of interest and value in these articles.

Railroad Traffic and Earnings

STATISTICS of railroad earnings and traffic which are now available for the first quarter of 1922 tend to support the contention of railroad officers that what they needed was a reduction of wages and other expenses and more freight to move, rather than a reduction of rates. These statistics are attracting attention just now because the roads in March came closer to a 6 per cent return than they have in any month since the passage over two years ago of the Cummins-Esch law, which we are still solemnly assured in some quarters constituted a "guarantee" of 6 per cent, but those who notice the effect do not always give careful consideration to an analysis of the causes. As a matter of fact, the reason why the roads attained so near a 6 per cent return in March as 5.83 was that they carried a large tonnage of coal in that month that would not have been moved until April had it not been for the prospective strike to begin on April 1, and that was offset by the reduction in coal traffic in April.

However, most classes of traffic other than coal have recently been showing considerable gains as compared with last year, without any general reduction in rates, and expenses have been reduced both by the part-way reduction in wages made last July and by reductions in the prices of fuel, materials and supplies, so that the roads are making a much more satisfactory showing than they did last year. Important reductions have been made in the rates on livestock and agricultural products, but the number of carloads of livestock loaded thus far this year has shown a slight decrease as compared with last year, and the increase in the loading of grain and grain products accounts for less of the increase in the total traffic than other commodities on which there has been little or no reduction in rates.

It has been constantly claimed that reductions in rates would so stimulate traffic as to increase railroad revenues and in a recent issue of the Farm Bureau Weekly News Letter an attempt was made to attribute the increase in traffic already experienced this year to the reductions made in rates on agricultural products. But whatever has been the result of those reductions in rates, the effect has not been to increase earnings because for the first three months of this year total operating revenues were 4.8 per cent less than in the corresponding months of 1921, although the number of carloads of freight handled increased about 10 per cent, from 9,015,824 to 9,996,184.

The improvement in net railway operating income, which increased from \$27,574,407 to \$160,998,907 and represents an annual rate of return for the quarter of 4.51 per cent, was entirely due to the reduction in operating expenses of 16.6 per cent, which resulted both from such reductions as have been made in wages and in prices of materials necessary to railway operation and from the necessity for the most rigid economy.

An analysis of the increase in traffic up to April 1 this year as compared with last year shows that the loading of grain and grain products, on which rates were reduced from 10 to 17½ per cent about the first of the year, increased from 503,682 to 607,418 cars. There had also been an increase in 1921 over 1920 in spite of an increase in rates. The loading of livestock, however, was only 379,587 cars as

compared with 379,679 last year, in spite of a 20 per cent cut in rates made last summer. Coal loading was 2,173,291 cars as compared with 1,815,776 last year. The loading of forest products was 596,003 as compared with 594,140 last year. Merchandise l. c. l. loading was 2,608,377 cars this year as compared with 2,304,220 last year and miscellaneous freight amounted to 2,698,489 cars as compared with 2,593,535 last year. On the other hand, coke loading was less this year than last year, 96,375 cars as compared with 103,442, but it has recently been increasing, and ore loading was only 54,321 as compared with 92,911 last year, but has also been going up lately. Earnings reports for April will not be available for some time but the car loading reports show a considerable decrease as compared with March, due to the coal strike, which will, of course, be reflected in the revenues. As compared with last year, however, it is a noteworthy fact that increases in traffic other than coal have more than offset the reduction in coal loading.

At this writing the Interstate Commerce Commission has not yet announced its decision as the result of its investigation as to whether it may lawfully order further reductions in rates, and it is said that there is much difference of opinion among its members. In view of the improvement in traffic and in general business conditions that has already taken place, we believe the commission might well hold that no very general reductions in rates should be ordered until a longer time has been afforded to observe the effect of the present rates under an improved condition of general business, or until lower rates shall be warranted by further wage reductions. If the commission should find any considerable reduction in rates warranted under present conditions on the ground that it would tend to increase revenues, there would always be room for doubt as to whether the general increase in business which everyone is now looking for represented the result of lower rates or whether it would have come anyway.

Buying Paint on Specification

SPECIFICATIONS for various kinds of paint have been highly developed in recent years and they have been adopted by many railroads as the most satisfactory basis for the purchase of paint. This practice has many apparent advantages. Paint specifications allow free competition among paint manufacturers. If the composition and properties can be definitely determined, specifications insure uniform quality and a paint that meets the requirements of the railroads. The object of the paint specification is to eliminate every variable except price and to reduce the problem of buying paint to its simplest terms.

There are strong arguments in favor of buying paint on specification, but it should be recognized that this method also has its disadvantages. The physical condition of the paint is as important as the chemical composition and satisfactory working properties are not always obtained when ingredients are mixed in the same proportions. The oils used in paint are complex organic products and are not of uniform quality. For this reason experienced paint makers use formulas merely as guides and modify the composition to obtain the combination of properties desirable in a paint. There is always a question whether the particular formula adopted for a paint specification is the best that can be prepared, for the foremost authorities do not always agree as to the relative merits of various mixtures of oils or even as to the most satisfactory pigment. Paint specifications restrict the manufacturer and take away from him the opportunity to use various ingredients, forcing him to make paint of a certain analysis rather than allowing him to apply the skill gained through long experience to prepare a paint of the composition which has been found to give most satisfactory

results. Paint made to a specification must be limited to materials that can be readily analyzed and this eliminates the use of blended oils which are the basis of some of the most successful paints.

In one respect paint specifications unquestionably are successful. They result in extremely low prices for the standard grades of paint. In fact, it is often difficult to understand how the paint makers can offer the products at the prices quoted. A short time ago bids were requested on several specification paints and an estimate was prepared showing the cost of making these paints with reasonably good material and reasonable care in manufacture at the prevailing prices for labor and material. To this was added overhead plus ten per cent to represent a fair selling price.

A comparison of the price thus determined with the lowest bids received is of interest. On one paint the cost was 28 cents and the lowest bid was 16 cents. On another the estimated cost was 11 1/4 cents and the lowest bid 6 cents. Still another, estimated to cost 22 cents, was offered at 11 cents. In other cases the estimated figures and the actual figures were more nearly in agreement. Some of these paints were offered to the railroads for less than the ingredients would have cost if bought in large quantities in the open market. Why did the manufacturer not sell his raw material and take a profit rather than expend labor on the manufacture of the paint to sell at a lower price? There are only two explanations. Either the paint did not contain the ingredients called for in the specification or the manufacturer was anxious to give the railroad something for nothing. Which is the more likely, that paint makers are philanthropists or that they are able to get by with paint that is not up to the standard the specification is intended to insure? There is considerable evidence which indicates that paint specifications do not prevent substitution of inferior goods. If this is the case what reason is there for having a specification for paint?

Railway Age Not Represented at Foreign Trade Convention

THE *Railway Age* did not have a representative at the Ninth National Foreign Trade Convention at Philadelphia this week. The decision not to report the meeting was made after a careful study of the program which revealed that no matters relating to railroad transportation or to the railway supply business were to be considered.

Those responsible for the preparation of the plans for this convention seem to have a very hazy idea of the great importance of the railways in foreign trade. They do not seem to realize that an American financed railway abroad is a constant market for American goods and that its successful working is a perpetual advertisement for American goods in general. They fail to consider that the greater part of our export tonnage moves a great many miles by rail. They apparently do not give heed to the fact that one of the most acceptable methods of restoring exchange to normal levels is by extending loans for railroad development abroad. Instead they ask the delegates to spend their time listening to addresses on the public's interest in foreign trade and reasons why we should have foreign trade. As if a large number of exporting manufacturers had to be "sold" on the importance of this feature of their work!

But the convention did not only completely ignore the problems of the railways and the railway supply business. It did more than that. It turned the floor over to their competitors. One of the principal speakers was one W. H. Steven, "president of the Lake Erie and Ohio River Canal Board of Pennsylvania"—whatever that is. Let us examine for a moment some of the statements of this man,

whose message was thought more important than anything which could have been said about the railways or the railway supply business.

We quote from an advance copy of his address, which is headed "Transportation Costs Must Be Lowered."

"The railroads thus being unable to adequately supply the cheap and prompt transportation from the interior to the coasts so requisite for the securing of our proper share of the foreign trade, to what other agency must we look? The one great and feasible means of relieving our transportation facilities is by properly improving our rivers and harbors and building necessary canals, a policy which France, Germany and other European war-burdened nations are steadily pursuing. Now it is possible to provide within the next five years a complete connected system of internal waterways covering the whole nation for the small expenditure of \$100,000,000 a year.

"Such a system would carry 500,000,000 tons of freight annually at a saving of at least \$350,000,000 in direct freight charges alone. But it would also save the people many billions of dollars, for it would keep our farms and factories busy and would supply their products much cheaper to all our people. The one great vital connecting link in this nation-wide system of waterways is the Lake Erie and Ohio River Canal. This will connect the Ohio River with Lake Erie."

This convention, which had no time to give to the discussion of the interest of the railways in export trade, did, however, have time to listen to the arguments of a man whose thesis was that railroad transportation was inadequate and not sufficiently cheap.

Someone may perhaps desire to call to our attention the fact that railway equipment manufacturers were represented in the program of the convention. That is true—C. M. Muehnic of the American Locomotive Company, and F. D. St. Phalle of the Baldwin Locomotive Works were on the program, but to neither of these gentlemen was assigned a subject in any way related to the railway supply business as such. Moreover it is not our contention that a railway supply manufacturer or a railroad traffic man might not have profited from attending the convention. Quite the contrary. The consideration of credits and other financial matters relating to foreign trade was quite thorough and, it is probable, valuable. This does not vitiate our contention, however, that in omitting a consideration of railway transportation and its allied industries the convention fell far short of the value which it might have attained.

It is the hope of the *Railway Age* that those in charge of preparing the program for the convention next year will not suffer from the inability to appreciate the railroad viewpoint and the bias in favor of inland waterways as have those who planned the Philadelphia convention.

New Books

Saward's Annual, by Frederick W. Saward. 6 in by 8 in in size. Bound in cloth. 256 pages. Published by *Saward's Journal*, 15 Park Row, New York. Price \$2.50.

This book has a sub title announcing it to be "A standard statistical review of the coal trade." The title page further says that the book embraces details relative to output, prices, freight and wage rates, transportation, exports, trade conditions, computing tables, and other details of importance to the coal man, wholesale and retail.

The book contains a wealth of information of considerably diversified character relative to coal production. It should be of value to railroad men and those interested in railroads because of the information it gives about shipments, classified by months for 1921 and previous years on

various selected roads; about exports through the important ports; production in various districts; commercial conditions in various markets; prices and various other details of like character. The book, of course, has a special value at this time because of the strike. It suffers, somewhat, however, for lack of orderly and consistent arrangement, although there is a good index which partly overcomes this fault.

E. H. Harriman. A Biography. By George Kennan. In two volumes, 6 in. by 9 in. in size. Illustrated, Bound in Cloth. Published by Houghton Mifflin Company, Boston and New York.

E. H. Harriman was born in 1848. He began his business career as a messenger boy at a wage of \$5 a week in a Wall Street brokerage house. From messenger boy he became what was then termed a "pad-shover," then a clerk and eventually managing clerk. In 1870 he opened a brokerage office of his own. It was with this kind of a start that Mr. Harriman rose to a position where he became one of the leading and most remarkable figures in American railroad history. Not the least of the many characteristics which made him remarkable was that to his skill as a financier he added a clear insight into railroad operating and traffic conditions. That he should have been able to obtain this insight without ever having been engaged in actual railway operation emphasizes the capabilities of the brain with which he worked.

"Harriman's phenomenal success in the field of transportation is attributable," says Mr. Kennan in his book, "not only to his extraordinary intellectual ability, which would doubtless have made him distinguished in any field, but also to his intimate acquaintance with both practical railroading and finance. 'If I were asked what is the key to Harriman's success,' said one of the greatest bankers in New York ten or twelve years ago. 'I should say it is a fact that he is the only man I have ever known who is just as familiar with the physical as the financial side of his properties. Morgan is a great banker, but he knows nothing about the physical side of a railroad. Hill is a great traffic man and railroad builder, but he is a baby when he gets into Wall Street. Harriman knows both ends of the game and knows them well. He started in life as a floor trader and developed into a banker, and when he took hold of the railroad business he put aside the banking and financial end and spent long, hard and patient years in learning the traffic and operating side. Then he took the two and counter-balanced them. Now he is his own banker and his own traffic manager, and the combination is irresistible.'"

Mr. Kennan, in his book, *E. H. Harriman, a Biography*, presents a story of absorbing interest written in a most readable manner. It is a complete and well-rounded story. The author sketches Mr. Harriman's career as a railroad man, as a citizen, and as a loving father of his family. He discusses Mr. Harriman's connection as a director of the Illinois Central, his entrance later into the Union Pacific, his acquisition of the Southern Pacific, his rehabilitation of these lines; his fight with Hill over the control of the Northern Pacific and the developments of the Northern Securities Company; the Alton episode; the saving of the Erie from receivership, etc. Interesting chapters deal with the development of the Imperial Valley, the work of the Southern Pacific at the time of the San Francisco earthquake, the saving of the Imperial Valley through the control of the Colorado river, etc. An especially interesting phase is the plan advanced by Harriman for the control of a line across Manchuria and Siberia—a line around the world. On the other hand, Mr. Kennan also tells of the Boys' Club on the East Side of New York, in which club Mr. Harriman took a special interest; of the home at Arden in the Ramapo mountains and the family life there. There is a combined picture of the financier and the man and the story is well worked in and co-ordinated.

Mr. Harriman was the subject of much criticism and

censure. His work was not always understood and at times it was regarded with ill-will in many quarters. The analysis made by Mr. Kennan of Harriman's character explains the reasons for these things.

For instance, in the preface to the book, he says: "Mr. Harriman was temperamentally disinclined to engage in personal disputes and controversies. He did not like the newspaper notoriety that accompanies quarrels carried on publicly, and he often refrained from making replies to injurious charges, even when he had a perfect and convincing defense. Then, too, he regarded public controversy as a waste of time. The work in which he happened at the moment to be engaged seemed to him more important than anything else, and he would not allow himself to be diverted from it by harsh criticism of his methods, or even by unjustified attacks upon his character and personal integrity. . . . This unwillingness to engage in controversies, however, was often misinterpreted. Some people, who did not know him personally, thought that it indicated callous indifference to public opinion, while others regarded it as evidence that no convincing reply to damaging accusations could be made. Neither of these suppositions, however, had any foundation. In fact, Mr. Harriman was not indifferent to public opinion, nor did he ignore attacks because he was unable to meet them. He simply did not care to spend in controversy time that he could employ more profitably in work. When an intimate friend once said to him that he certainly would be misjudged if he did not defend himself with the weapons that lay in his hand, he replied: 'The people will always find out what's what in the end, and I can wait. I need all my time and energy to do things.'"

The suggestion must be advanced, however, that the book suffers in the respect that in his explanations of many of the things done and in his answers to the accusations made against Mr. Harriman, Mr. Kennan tends in many instances to go too far. He seems, that is to say, at times, if anything, too laudatory to make his story sound convincing in all its aspects. The reader is inclined to feel that there is too much of this vindication and that the author must have been governed by the underlying idea that "the king can do no wrong." Harriman unquestionably made mistakes and serious ones, but no acknowledgment of this fact will be found in either of the two volumes. Some of the vindications go a trifle too far in their statements concerning Mr. Harriman's accusers. In one case he speaks of the Interstate Commerce Commission as an "incompetent commission" which, to say the least, is hardly in good taste. His comments about the late Theodore Roosevelt and about Professor Ripley of Harvard are similarly stated in extreme terms. One would suggest in the latter connection that there are two sides to the matters referred to. The other side of the Roosevelt episode will be found, for example, in J. B. Bishop's "Theodore Roosevelt and His Time, Shown in His Own Letters," notably in chapter II of volume II dealing with the panic of 1907. What Mr. Kennan would term Professor Ripley's "accusations" will be found in Ripley's "Railroads: Finance and Organization."

Nevertheless, whether or not the story is too laudatory of Harriman or too caustic in the criticism of those who took issue with Harriman, the fact remains that Mr. Kennan's work does prove Harriman a great man and it does explain the reasons for the financier's remarkable career. The story of the driving power behind the man, of the will power that secured the accomplishment of the impossible, of the success secured in getting others to work for and with him, of the manner in which the man remained in harness until his death in 1909, of the human characteristics shown in his family life, etc., is well told. The book is a real contribution to the history of American railroad finance and operation and will be read with profit by anyone, whether interested in railroads or otherwise.

Letters to the Editor

[The RAILWAY AGE welcomes letters from its readers and especially those containing constructive suggestions for improvements in the railway field. Short letters—about 250 words—are particularly appreciated. The editors do not hold themselves responsible for facts or opinions expressed.]

“Locomotive Engineer” Is Challenged

CHICAGO

TO THE EDITOR:

I am a poor dub train dispatcher, seeking knowledge whereby I may better serve my employer.

I refer to the letter by “Locomotive Engineer” in your issue dated April 8. Will you kindly have “Locomotive Engineer” advise the railroad and division, and when, they ran the 75 trains each way daily over the 95-mile single track division? I would like to brush up a bit and possibly they could give me some pointers out that way; also would like to shake hands with those train dispatchers; that is, if they have any left.

TRAIN DISPATCHER.

The Coal Strike and Publicity

KANSAS CITY, MO.

TO THE EDITOR:

In your publication of April 29, in an article “The Coal Strike Situation Needs Some Publicity,” I was interested in your statement that the operators should make their case, if they had one, and tell it to the public. Many efforts along this line, with a plain statement of facts, have been furnished to the daily press, but for reasons best known to them this has not been considered news and has had only scant, if any, publication. The public does not seem to realize the great importance of the present struggle or its ultimate effect on the industrial welfare of the country.

Briefly, coal and railroads were the only basic industries completely controlled by the government during the war. Five times during such control the wage scale contracts made between the miners and operators by collective bargaining were readjusted; and the amounts added to the cost of coal by such adjustments over and above the original contract have aggregated \$2,720,000,000 up to January 1, 1922. The last government award, in effect until April 1, 1922, will bring these war bonuses up to nearly three billion dollars.

The miners have refused to consider any readjustment back to a peace basis and have called a nation-wide strike in their effort to retain the war premiums. The operators are determined, in the interest of industrial welfare, to eliminate these war bonuses.

A fair adjustment of the present situation would be for the miners to accept the last contract made mutually by collective bargaining, plus any advance in the cost of living as it now appears compared to the cost of living at the time the contract was made. This would work out and justify the wage scale in effect as of May, 1917. If the miners would accept this and return to work, coal prices would be lowered to a point where industry could function. The railroads, having cheaper fuel, could more reasonably be asked to adjust freight rates on coal, which would in turn further cheapen the cost of coal to the ultimate consumer.

These are the facts the public ought to know, and I hope you, through your valued publication, will help along in the good work

H. N. TAYLOR,
 Vice-President, Central Coal & Coke Co.

Common Sense in Branch Passenger Service

WASHINGTON, D. C.

TO THE EDITOR:

I have been in railroad service since 1898, both in the east and the west, and I see branch passenger runs losing money which used to make money before the days of the automobile.

Now, why are the steam roads losing money on these runs when they can stop losing money? Because they are too slow to adopt the tactics, the tools, of the automobile people. I mean by that (1) the gasoline traction, (2) the light cars, and (3) the more frequent service.

As to the first, the traction, I have seen the roads stick to the little old steam locomotives of 30 up to 50 tons, just because they want to wear them out and the work of dragging a light branch train is all that can be found for them to do. And to wear them out it is necessary to pay an engineer and fireman instead of a chauffeur, and some tons of coal instead of some gallons of gasoline.

As to the second, the cars, I have seen the roads stick to the old coaches, not because they best serve the purpose but because, like the old engines, the coaches must be worn out somewhere and this is where, even if a 90-ton train has to be run a hundred miles or so a day to give poorer service than would be given on the highways by a baggage truck and driver and a passenger bus and its driver against a five-man crew on the corresponding steam unit.

As to the third, the frequency of service, I have seen the roads stick to one train a day on branches because that train costs \$50 or more a day to run and who wants to run more trains just to lose more money?

And what have the roads done to better the existing way of doing it? So far as my travels have led me, mainly in the west, the Harriman lines built, some ten years ago, a number of McKean motor cars and put them in service pretty widely (three or four runs in each state) on branch lines. These identical motors seem to be still in service with no improvements visible to the eye of the people not directly concerned. Why no improvements on these? Are they satisfactory as they run today? They seem to me to be too heavy and they require, or their power requires, too much shopping.

Why are no more attempts being made to run light equipment on branch lines? Is now not a time when every road is seeking less operating expense? Do not a few objections loom up too large—what to do with old motive power and old passenger coaches, and “we can not run equipment that is too light to be hauled in road freight trains if necessary.”

But can not these objections be reasoned with? If it can be proved that it costs more to wear out the old equipment than to scrap it and buy and operate new, would not that end the first objection?

And why must new branch equipment be heavy enough to be hauled in freights? Haven't we seen light equipment run on the branches in France? If there, why can we not do it here? I have seen the Hetch Hetchy R. R. in California running the light 20-passenger busses with crew of one man among freight trains on mountain grades. Stopping a light bus at every crossing to get the business is as easy as stopping to pick up your neighbor on the way to the office in the morning. And freights would still continue to clear the time of this passenger train and protect against it.

Then, as business required, a baggage truck and a second or third passenger bus can be added, with operating cost not greater than the present cost of the one steam train.

These are the natural comments of a civil engineer in railroad service, without reference to detailed operating cost, but—are they not common sense?

W. H. BARNES.

Permanent Commission at Opening of Congress—Mr. Riccio, Minister of Public Works of Italy, Speaking

International Congress Considers Many Subjects

Numerous Countries Represented in Great Railway Meeting
at Rome—King of Italy at Opening

By Samuel O. Dunn
Editor of the *Railway Age*

ROME, Italy, April 24,

THE NINTH CONGRESS of the International Railway Association has now been in session in Rome for four days. The last congress was held at Berne, Switzerland, in 1910. The association ordinarily, since its organization 25 years ago, has met at five-year intervals. It was to

affair. The King of Italy paid the compliment of being present. The convention hall was decorated with a portrait of the king back of the president's chair and flags of practically all the nations having railways which belong to the congress. The ladies were admitted, and all the seats in the large hall were taken, and many stood during the session.

The first address was made by Mr. Riccio, Minister of Public Works of Italy, under whose department the state railways of the country are operated. Mr. Riccio recalled that the second session of the association, at which its permanent organization was really formed, was held at Milan a quarter of a century ago, and was opened with an address by the Italian Minister of Public Works of that time. He presented some statistical data regarding the development of the Italian railways since then, showing, among other things, that the mileage has increased from about 7,000 miles, including secondary lines, to about 13,000 miles. Over 10,200 miles are owned and operated by the state. There are now under construction by the state 437 miles of standard gage and 118 miles of narrow gage lines, and 680 miles of line are being built by private companies. In addition, the construction of about 842 miles is projected.

Mr. V. Tondelier, of the Belgian Railways, president of the Permanent Commission of the Association, replied to the address of Mr. Riccio. He referred briefly to the history of the association and to the program of this congress. He was followed by Mr. Crova, Director-General of the Italian State Railways.

Electrification Progress in Italy

Some of the most interesting statements made by Mr. Crova were in reference to the electrification of the Italian lines. "The problem of electric traction," he said, "has been the subject of our most profound study. After the experiments on the Milan-Sondrio-Tirano lines and the Milan-Varese line, the first worked by an overhead wire at a tension of 3,000 volts, and the second by a third rail, experiments made by the former railway companies, the administration of the state railways decided definitely to adopt the system

Party of Delegates Visiting Hydro-Electric Works at Terni

have met in Berlin in 1915, but the war prevented this. In the 12 years that have elapsed since the last congress more important things affecting the welfare of mankind have occurred than in any equal previous period in history.

For one thing, the importance of railroad transportation as a factor in modern warfare has been strikingly exemplified. It is an illustration of the desire felt all over the world to forget about the war and return to "normalcy" that the program of the International Railway Association, which is meeting in Europe, where the effects of the war are seen and felt on every side, does not say a word about the use of railways in war.

The formal opening of the congress was at the Exposition Palace on Tuesday afternoon, April 18. It was quite a gala

of overhead wires even on the steepest gradients. They began with the two lines of the Giovi, which have become insufficient to carry the enormous traffic of the port of Genoa.

"The benefits obtained by this first application suggested the study of the vast problem of electrification. The difficulties of the war obliged us to delay the work already commenced. When hostilities ceased, these experiments were actively renewed; a vast plan of accurately organized work gives us the certainty that six or seven years hence it will be possible to work by electricity about 3,125 miles of heavy traffic lines in our country. Today the lines Bologna-Forlence, Faenza-Bologna, Genoa-Pisa, Rome-Tivoli, Rome-Anzio-Nettuno, are being electrified. The work on the Ronco-Trofarello line has recently been completed."

Because of its many mountains and the extremely high cost of coal, conditions in Italy are very favorable to electrification.

Following the opening session, the congress was divided into five sections. Each section has its own president, vice-president and secretaries. The subjects considered by the different sections are classified under the following general headings:

1. Way and Works.
2. Locomotives and Rolling Stock.
3. Operation.
4. General.
5. Light Railways.

The various reports which have been prepared are first submitted and discussed in the sectional meetings. Con-

"Special Steels," W. C. Cushing, Engineer of Standards, Pennsylvania System.

"Reinforced Concrete," G. A. Haggander, Chicago, Burlington & Quincy.

"Passenger Carriages," W. J. Tollerton, Chief Mechanical Superintendent, Chicago, Rock Island & Pacific, and Chairman of the Mechanical Section of the American Railway Association.

"Electrical Traction on Lines of Heavy Traffic," George Gibbs, Chief Engineer of Electric Traction, Long Island Railroad.

"Terminal Stations for Passengers," A. S. Baldwin, Vice-President, Illinois Central Railroad.

"Freight Stations," H. G. Kelley, President Grand Trunk Railway.

"Slow Freight Traffic," W. H. Williams, Vice-President Delaware & Hudson Company.

"Cost of Service in Relation to Rates," Samuel O. Dunn, Editor of the *Railway Age*.

"Interchange of Rolling Stock," C. W. Crawford, Chairman of the General Committee Section V (Transportation) American Railway Association.

"Workmen's Dwellings," A. F. Banks, president of the Elgin, Joliet & Eastern.

"Special Methods of Traction on Light Railways," H. B. Spencer, formerly director of purchases, United States Railroad Administration.

Of the American reporters mentioned, Messrs. Tollerton, Gibbs, Baldwin and Dunn are attending the Congress.

Section I—Way and Works

clusions regarding each question submitted for consideration are drawn up and adopted in the sections. Each set of conclusions will be reported next week to the general meeting and modified, rejected, or accepted by it.

George Gibbs, chief engineer of Electric Traction of the Long Island Railroad, was elected president of Section 2. General W. W. Atterbury, vice-president of the Pennsylvania Railroad, was elected vice-president of Section 4. These are the only officers of American railways who have been elected officers of the sections.

Participation of American Delegates

As might be expected, the railways of some countries which have had strong delegations in past congresses, are not represented in this one. For example, there are no delegations from the railways of Germany and Russia. The meetings of the sections have been well attended, and there have been some very animated discussions, especially on the subjects of electrification and light railways.

Among the Americans who prepared reports especially for this congress, and their subjects, are the following.

"Construction of Roadbed and Track," C. H. Ewing, Vice-President, Philadelphia & Reading.

"Maintenance and Supervision of the Track," Earl Stimson, Chief Engineer of Maintenance, Baltimore & Ohio.

Other American railway men here are J. E. Fairbanks, general secretary of the American Railway Association; Dr. D. Z. Dunott, of the Western Maryland, chairman of the Medical and Surgical Section of the American Railway Association; Hugh Pattison, electrical engineer, and Donald Rose, European traffic manager of the Illinois Central; Rollin H. Wilbur, vice-president and general manager, Lehigh & New England Railroad; J. V. B. Duer, electrical engineer; W. B. Wood, general superintendent, Illinois Division, Col. R. C. Morse, Jr., superintendent of freight transportation, Eastern Region, and J. O. Hackenberg, superintendent Schuylkill Division, all of the Pennsylvania System.

President A. T. Dice and General Manager F. M. Falck of the Philadelphian & Reading, who were here last week for part of the session, have departed.

General Atterbury has not come yet, but is expected this week. The same is true of L. A. Downs, vice-president and general manager of the Central of Georgia, who is chairman of the Engineering Section of the A. R. A.

D. I. Crawford, vice-president of the Locomotive Stoker Co. and president of the Westinghouse Union Battery Co., Walter F. Schleiter of Pittsburg, and John William Lieb, vice-president of the New York Edison Company, are attending as delegates of the United States government, appointed by the Secretary of State. Col. E. A. Simmons, president

of the *Railway Age*, also was appointed as a delegate of the United States government, but found it impossible to attend. Among the other Americans here are Andrew Fletcher, president of the American Locomotive Company; W. H. Woodin, president of the American Car & Foundry Co.; F. A. Poor, president of the P. & M. Company; George L. Bourne, president, and Fred Schaff, vice-president of the Superheater Company; H. P. Austin, Baldwin Locomotive Works; Messrs. Drysdale, Sullivan and Cullerton of the Worthington Pump

then been the recognized rendezvous of all the American railway men and railway supply men in Europe.

Entertainment Features

The Italian section of the congress has provided several forms of entertainment for the delegates and their ladies. One of the most remarkable was the dinner given on Wednesday evening, April 19, by the Italian government. This dinner occurred in the Baths of Diocletian, a vast structure

Section II—Locomotives and Rolling Stock, George Gibbs Presiding

Company; Walter J. Plogsted, General Railway Signal Company; F. K. Vial, consulting engineer Association of Manufacturers of chilled car wheels.

Important Men from Other Countries

While the attendance from the United States is small, the delegations from other countries are important and highly representative. For example, among the British railway officers here are Sir Herbert A. Walker, general manager of the London & South Western, who was the active chairman of the Railway Executive Committee during the War; Major General Sir Henry W. Thornton, formerly an American railway officer, now general manager of the Great Eastern, who has won a place in the foremost rank of British railway officers; F. J. C. Pole, general manager of the Great Western; Charles Booth, Chairman of the Midland; C. H. Dent, general manager of the Great Northern, and numerous others.

near the railway station which was built early in the fourth century A. D., and which is still in a fair state of preservation. The dinner was attended by about 2,500 persons, and considering the size of the crowd and the place where it was held was well handled. Short speeches were made by Messrs. Tondelier, Riccio and others, but the band insisted on playing during the speaking, and the acoustics were so bad and the crowd so big that the addresses could not be heard ten feet from the speakers.

A reception was given the visitors at the Capital on Thursday; and there have been several motor rides about the ancient monuments of Rome; and on Saturday, April 22, a large party went to Terni to visit the steel works, hydroelectric plants, and so on.

It would be entirely impossible even to summarize in a few short articles the proceedings of a congress that is working daily in five sections. All that can be done is to

Section IV—General

The French delegation is similarly constituted. The congress fully lives up to its title of "International," since the following is but a partial list of the countries whose railways are represented by delegates actually here and participating: Sweden, Italy, Great Britain, France, Norway, United States, Spain, Brazil, Mexico, Peru, Belgium, China, India, Greece, Portugal, Denmark, Uruguay, Siam, Switzerland, Belgian Congo, Nigeria, Argentina, Czecho-Slovakia, Luxembourg, Tunis, Algeria, Japan, Poland. Needless to say, the discussions frequently recall the tower of Babel.

Mr. Fairbanks, the ever efficient general secretary of the American Railway Association, arrived a few days before the congress began, and opened headquarters for the American delegation at the Grand Hotel; and this hotel has since

mention very briefly some of the high points brought out in the reports and discussions.

Construction of Roadbed and Track

There were five reports on construction of track and roadbed, two for America (by the late H. U. Mudge and by C. H. Ewing) one for Great Britain, one for Denmark, Norway and Sweden, and one for all other countries. These included reports prepared for the Congress that was to have been held in Berlin as well as especially for this congress.

The reports agreed that the maximum speeds of trains have not increased appreciably within the last ten years, the present maximum speeds being the greatest that are compatible with safety under the existing conditions of con-

struction of the lines. In Great Britain and America 80 miles an hour appears to be the maximum attained; in France, 74½ miles; in Denmark and Sweden, 56 miles, and in Norway, 37½ miles. There has been a substantial increase in the weight of passenger trains. The maximum loads on driving axles were found to be: America, 27.6 tons (passenger) and 30 to 34.3 tons (freight); Great Britain, 20 tons; France, 18 tons; Scandinavia, 17½ tons. In all countries efforts have been directed toward strengthening the track. Some of the most interesting facts given are those about the weight of rails. The unanimous opinion of the European reporters is that there is no advantage in increasing the weight of rail beyond 95 to 100 lb. per yard. On the other hand, it was shown that in America many important railways within the last five years have put into service sections weighing as much as 130 lb. per yard.

All the reports on the maintenance of track dwell especially on the increase in cost due mainly to advances in the wages of labor, and to the consequent necessity for better supervision of labor and the use of more labor saving machinery.

The adoption of gasoline motor cars for section work and of cars especially designed to handle ballast was emphasized in the American report. All the reports made more or less mention of applying the contract system to maintenance work. The recent adoption of the contract system was reported by

the other hand, in the United States the axle load approaches 30 tons, and under present day conditions of superheating, this is sufficient to utilize the output of the largest boiler that the loading gage allows. Thus it is that in America the tendency is to carry the superheat to a higher temperature and use higher pressures. This is notably the case on the Pennsylvania Railroad in its latest experimental locomotives constructed by the American Locomotive Company, which are fitted with the Locomotive Superheater Company's type F. superheater."

A large number of railways, M. Lacoïn points out, have found it desirable to superheat old saturated locomotives. One of the principal difficulties met with is the fact that many old engines have flat slide valves. Attention is particularly called, in this connection, to the very interesting application of superheating carried out by the Swiss Federal railways which have been successful in applying the superheater to engines with flat slide valves by providing oil ducts across the surface of the valve face.

The report mentions that feed water heating apparatuses have been much modified and improved since the last congress.

It says the types of apparatus in which a pump and surface feed water are used are the most numerous. Another variety mentioned is the pump in connection with the type of heater in which steam mixes with the feed water, as in the

Section V—Light Railways

some railways in Great Britain, India, France, Belgium, Italy and Portugal. The Italian state railways have made experiments with the contract system on a large scale. In some cases they have contracted with co-operative societies of workmen; in others with small and in still others with large contractors. It seems to be the general opinion that contractors can get better results from labor than the managements of either state railways or large private railways. The reports are a unit in favoring the introduction of more labor saving devices, and more extensive employment of those already in use.

Improvements in Locomotives

There were two interesting reports on the "Economic Production and Use of Steam on Locomotives." M. Lacoïn (Paris-Orleans Railway), summarizing these reports, said they show the superheater apparatus has now been brought to such a degree of perfection that locomotives thus equipped can be employed as easily and with practically the same amount of maintenance as saturated engines, and that "a superheater allows a considerable degree of improvement to be realized both as regards fuel consumption and loads handled." He called attention to the fact that "the position of the problem of superheating does not appear to be identical in Europe and America. In Europe the maximum axle load being as a rule not greater than 20 tons, it is not possible to increase the power of the boiler without increasing the number of coupled wheels. Thus it is that the European Pacific class engines are as much limited by the adhesion necessary when starting as by their boiler capacity. On

Worthington heater. "The economics claimed by the various railways," says M. Lacoïn, "range from 10 to 20 per cent, but it is very difficult accurately to measure the results obtained. The time appears to have arrived for the use of feed water heaters to become general; but the trials carried out on numerous railways have not yet afforded sufficient information to allow definite opinions to be favored as to the superiority of one or the other types of apparatus."

Passenger Cars

The reports on passenger cars brought out rather strikingly some differences between the practice of American and other railways. W. J. Tollerton, the American reporter, noted that in the last eight years 19,900 passenger coaches have been built by American railways which answered his questionnaire, and that of these 90 per cent were entirely of steel, and the rest of mixed construction with steel frames. On January 1, 1921, about 60 per cent of American passenger cars were of wood, 10 per cent of wood with steel underframes and 30 per cent entirely of steel. Mr. Tollerton expressed the opinion that the time is not distant when all passenger cars (in America) will be built entirely or almost entirely of metal.

The other reports showed that passenger cars built entirely or even largely of metal are almost unknown outside of America.

Slow Freight Traffic

The four reports on "Slow Freight Traffic" dealt with the problems presented particularly in the United States, Bel-

gium, Great Britain and Italy. They showed that the general tendency, in the interest of maximum economy of operation, is "toward increasing the tonnage and capacity of wagons, with the object of increasing the useful load in relation to the tare." On the continent of Europe the capacity of freight cars seldom exceeds 20 tons. On the other hand, in America it always exceeds this. All the reports recognize the economy of using large cars where the conditions make it practicable to get large loads. There is also a tendency in Europe as in America, toward increasing the number of cars in a train, the figure of 80 cars being attained.

Costs of Service in Relation to Rates

The reports on "Costs of Service in Relation to Rates" caused an animated discussion in Section IV. Especial interest is being taken in several European countries now in the relationship of railway costs to rate-making—a subject which has long been under study and discussion in the United States. It is probably significant that the three reporters—M. Henry-Greard of the Orleans Railway (France), Fairfax Harrison, president of the Southern Railway, who dealt with conditions in the United States prior to 1915, and Samuel O. Dunn, who dealt with developments since 1915—all approached the subject in much the same way and reached practically identical conclusions. These conclusions were in substance: first, that operating expenses may be divided with approximate accuracy between freight and passenger service; second, that the allocation of capital charges between the two services offers far greater difficulties, and cannot be carried out at all except by resort to arbitrary hypotheses; third, that cost is not and cannot be made the determining factor in rate-making, although such knowledge of it as can be obtained is a useful aid. When the question is that of a modification of rates to develop new business, the cost that should be considered is not the average cost of handling the existing business, but the additional cost that will be caused by handling the extra business.

Views on Locomotive Cab Signals

The reports of M. Verdeyen of the Belgian State railways and M. Villa of the Italian State railways on "Locomotive Cab Signals" should be of unusual interest at the present time in the United States, where the subject of automatic train control is under consideration. M. Verdeyen recalls that the principle of the automatic train stop was condemned in France in 1913, and he still upholds this view. He argues against automatic train control on the ground that it will reduce the carefulness of the engine driver, "whose vigilance must always be the first factor of safety." He does, however, favor audible cab signals to warn the driver of the position of distant signals. There is some difference of opinion among the reporters as to whether the cab signals should be audible or visible. They agree in emphasizing that in no case should they be accepted as a substitute for visual signals beside the track. They favor speed recording devices on locomotives as measures of safety and aids to the drivers in accurately maintaining their running schedules.

The foregoing briefly summarizes only a part of the reports and discussions. The writer hopes later to send further information regarding the reports and discussions, and the formal conclusions reached by the congress.

A BETTER BULL TRAIN is the latest railroad device to aid the farmers. It is to be run by the Canadian Pacific this month over the company's lines in the province of Saskatchewan. It is to be operated in co-operation with the provincial government. In Manitoba, which is farther east and more conservative in its terminology, there is to be a similar excursion under the name of the "Livestock Improvement Special."

Intrastate and Interstate Rates Being Harmonized

WASHINGTON, D. C.

THE INTERSTATE COMMERCE COMMISSION has issued a statement calling attention to the fact that its order issued on May 4 vacating its orders affecting Texas intrastate rates discontinues all outstanding orders in the Shreveport case and with the consent of all parties closes the proceeding which was initiated on March 7, 1911, more than 11 years ago, when the Railroad Commission of Louisiana filed a complaint with the Interstate Commerce Commission alleging that rates from Shreveport, La., to points in Eastern Texas were unreasonable and unduly prejudicial as compared with rates on like traffic from competing points in Texas to destinations in that state. This closes a case, the first of this kind, in which the Supreme Court has held that in regulating the rates of interstate carriers where their interstate and intrastate operations are so interwoven that the control over the one necessarily involves control of the other, it is the nation and not the state which is supreme within the national field.

The commission's statement says that under the present interstate commerce act provision is made for co-operation between the federal and state authorities and steps are being taken to minimize, if not eliminate, the occasions for conflict between state and interstate rates and gratifying progress has been made. This refers in part to the plan for co-operation between state and federal authorities made public in the report of a joint committee of state and federal commissioners published in last week's issue of the *Railway Age*. This report is the result of a number of conferences between the Interstate Commerce Commissioners and representatives of the National Association of Railway and Utilities Commissioners, which had also led to results prior to the announcement of the plan of co-operation which have been made manifest from time to time recently in the vacation by the Interstate Commerce Commission of its orders increasing intrastate rates by the amounts of the increases applied to interstate rates in Ex Parte 74.

The Supreme Court in the Wisconsin case having sustained the Interstate Commerce Commission's orders, a number of the state commissions have withdrawn or modified their orders which were intended to prevent the railroads from applying the Ex Parte 74 increases to state traffic or have issued other orders leaving the increased rates in effect by state authority. Following this action by state commissions, the Interstate Commerce Commission has withdrawn its orders applying to intrastate rates, thereby relieving the cause of complaint by the state authorities that their entire rate structure had been "frozen" because no adjustment in local rates could be made without application to the Interstate Commerce Commission. The state and interstate rates in these cases are now harmonized, but the state authorities are left free to make local adjustments providing they are such as not to discriminate against interstate commerce.

The notice issued by the commission reviews briefly the history of the Shreveport case and its various orders therein, the result of which was that a large part of the intrastate traffic in Texas has since November 1, 1916, moved on rates corresponding to the interstate rates found reasonable by the federal tribunal. Following the Supreme Court's decision in the Wisconsin case, the Texas commission on April 26 made an order prescribing intrastate rates for use within the state of Texas on the basis now in effect under previous orders of the Interstate Commerce Commission. The rates were those brought into harmony by the action of both commissions, and it was no longer necessary to restrain the Texas carriers by exercise of the federal authority in respect of these intrastate rates. The Interstate Commerce Com-

mission accordingly vacated on Thursday of last week its outstanding orders in the Shreveport case and discontinued the proceeding with the consent of all parties. The commission also has vacated its orders applying to Missouri intrastate rates, and it recently took the same action in the Illinois and Indiana cases.

Railroad Executives Asked to Confer With President

WASHINGTON, D. C.

IMPORTANT QUESTIONS of policy concerning railroad freight rates are to be discussed at a conference of some fifteen leading railroad executives with President Harding at a dinner at the White House on May 20, it was officially stated at the White House on Tuesday, although the exact nature of the questions to be discussed was not explained. The announcement that the President had invited the railroad men for a conference was called forth by a question regarding rumors that the Interstate Commerce Commission, having thus far failed to announce a decision as to whether and to what extent rates may be reduced under the law and in the present circumstances, had referred to the President in some way for an indication of policy. This was denied and it was pointed out that the commission is governed by a law on the subject and not by the wishes of the Executive. It is understood that the ideas to be discussed at the dinner emanate from Secretary Hoover rather than from the commission, but that the railroad men themselves were not informed of the purpose of the conference. No list of the executives was given out.

The indefiniteness of the information given to newspaper men, however, at once led to newspaper speculation as to whether, in view of the delay on the part of the commission in issuing a report as the result of its recent rate investigation, the commission had not become deadlocked and the railroads were to be asked voluntarily to reduce rates in the same way they were strongly urged to do last fall before the commission had reached the point where it was willing to order some reductions.

Another suggestion was that the railroad executives were to be asked to discuss the wisdom of an amendment of the revenue provisions of the transportation act to meet the views of those who feel that the intent of the law to provide "as nearly as may be" to a given percentage of return does not allow either the railroads or the commission sufficient flexibility in the adjustment of rates to meet general business conditions and the changes in the value of commodities. Secretary Wallace of the Department of Agriculture has publicly objected on several occasions because freight rates are so high in proportion to the value of agricultural products and Secretary Hoover of the Department of Commerce, who is understood to be particularly influential in the formation of administration policies relating to transportation, has also suggested the desirability of readjusting rates in more direct relation to commodity values even to the extent of advancing rates on high class articles if necessary in order to get lower rates on basic commodities or raw materials. One of his objections is that under the law the tendency is for rates to be higher in times of depression when traffic can less afford to pay them and lower in times of prosperity when people are less inclined to be critical of the amount of the rates.

In his statement before the commission on February 3, Mr. Hoover said:

"During the past eight months the railways have made many thousand readjustments of local rates in endeavoring to heal local distortions, but I am convinced that the whole railway rate structure needs a most systematic overhaul in the light of these new economic forces that have been brought

into play. We obviously must maintain the average rate that will support our transportation systems adequately and such an overhauling of rates might well mean the advancement of rates in certain commodities in order that compensation can be given to others where there is undue duress."

No intimation has come from the commission as to how soon a rate decision may be expected but there has been no indication that one would not be forthcoming soon. The commission has had the case under consideration for two months since the arguments were concluded on March 13 after three months of hearings. It has been understood that there was for a time a wide divergence of opinion among the eleven commissioners, some of whom it is said favored reductions on certain commodities, others of whom thought that any reduction ought to be general, while others insisted that the railroads should be allowed to get on their feet before rates are reduced. Those who favor reductions presumably have convinced themselves that lower rates will make it possible for the roads to earn a fair return sooner than will the present rates, but it is understood that there has been great difficulty in getting six of the eleven commissioners to agree on a list of commodities as to which they were prepared to say that lower rates would stimulate traffic. This does not mean, however, that the commissioners have not been able to reach any agreement.

There has been a widespread general assumption that the commission would order reductions on coal and other basic commodities such as possibly ore, iron and steel, lumber and building materials. Of the shippers who testified at the hearings, a large number preferred lower rates on coal to reductions even on their own commodities, but it is considered probable that some of the commissioners found difficulty in convincing themselves that lower rates would move more coal than the railroads would be called upon to move anyway after the strike and the recent large increases in the loading of miscellaneous freight and other commodities on which little or no reductions in rates have been made, tended to strengthen the arguments of those who believe that freight rates were a comparatively unimportant factor in causing the business depression.

The agitation in Congress for lower freight rates has died down to a considerable extent recently, whether because of the improvement in business conditions or because of the expectation of an early decision by the commission. Similarly there has been much less discussion of proposed amendments to the transportation act, although many bills for that purpose were introduced last year. The state railroad commissioners have kept the subject alive by pressing for amendments particularly intended to eliminate the enlarged jurisdiction of the Interstate Commerce Commission over their rates but the House committee on interstate and foreign commerce has displayed little interest in them and has repeatedly postponed its hearings on the Hoch and Sweet bills. The hearing was resumed on May 9 for the questioning of John E. Benton, general solicitor of the National Association of Railway and Utilities Commissioners' and Representative Hawes proposed that the subject be postponed until December, but the committee finally voted to continue hearings and representatives of the railroads are to be heard next Tuesday. Chairman Cummins of the Senate committee on interstate commerce has been trying to get a meeting of his committee to agree on a report on the Capper and similar bills on which hearings were concluded several weeks ago.

THE HOBOKEN MANUFACTURERS' RAILROAD, an industrial line operated by the War Department, is offering for sale some of its real estate holdings in Hoboken, N. J. This line was acquired by the government in connection with the army transport pier services during the war. With the end of the war, land acquired for expansion of the line was found superfluous and an attempt is being made to dispose of it.

Labor Board Disapproves Contracting of Repairs

Decision in Case of Indiana Harbor Belt Indicates Attitude Regarding Many Similar Cases

THE CONTRACTS made by the Indiana Harbor Belt for the operation of its shops are in violation of the Transportation Act and of decisions No. 119 and No. 147 of the Railroad Labor Board according to a decision adopted unanimously by the board and handed down on May 11. The decision also holds that the shop employees of the contractor in this case are under the jurisdiction of the Board and subject to the application of the Transportation Act and decision No. 147. The carrier is directed to take up the matter of reinstatement with any employee upon the latter's application.

The Board's Decision

"The Labor Board decides," the decision reads, "that the various contracts entered into between the Indiana Harbor Belt Railroad Company and the Burnham Car Repair Company for the operation of its shops are in violation of the Transportation Act insofar as they purport or are construed by the carrier to remove said employees from the application of said act, and that those provisions of the contracts affecting the wages and working rules of said employees are in violation of decisions No. 2, No. 119 and No. 147 of this Board."

After citing the history of this dispute the Board's decision says:

"The Board is of the opinion that the employees failed to substantiate their contention that the contracts are actually fraudulent and that they are mere subterfuges contrived to evade the act but the carrier contends that it is lawful evasion.

"This contract system is not an innovation recently born of the desire to circumvent the Transportation Act. It existed long before the Transportation Act was ever dreamed of. In fact it was practiced as far back as 1855 on the Philadelphia, Wilmington & Baltimore and it is pertinent to note that the actual operation of the trains on this road was let by contract.

"This leads up to the remaining and principal issue in this case; namely, had the carrier the right to enter into such contracts as takes this class of employees from under the application of the Transportation Act and the jurisdiction of the Railroad Labor Board. No more important dispute has ever come before this Board for adjudication. It goes to the vitals of the Transportation Act. If the carrier can legally do the thing which has been done under these contracts then the entire Transportation Act can be nullified and the will of the Congress of the United States set at naught. If one class of employees can thus be taken from under the application of the act there is no sound reason why each and every railroad employee in the United States cannot be given like treatment. One class of employment lends itself as readily to this method as another. Contracts have been recently entered into by various carriers purporting to turn over to so-called independent contractors the work of the following classes of employees. The six shop crafts, the maintenance of way, certain employees embraced in the clerks' organization, the firemen and oilers, the hostlers embraced in the engine service and signal department employees.

The Carrier's Argument

"It is intimated by the carrier that perhaps the actual operation of the trains could not be let to an independent contractor because that would be a violation of the carrier's charter, that it would not be permitted to transfer the very power for the exercise of which it had been created unless it delegated it to another common carrier. This is not a clear

distinction for the carrier in such case would still be answerable to the public for the performance of its functions as a common carrier and would not have contracted away this responsibility. It would merely have changed its method of paying its transportation employees as it has its shop employees in the case under consideration.

"When Congress in this act speaks of railroad employees it undoubtedly contemplates those engaged in the customary work directly contributory to the operation of the railroads. It is absurd to say the carriers and their employees would not be permitted to interrupt commerce by labor controversies unless the operation of the roads was turned over to contractors in which event the so-called contractors and the railway workers might engage in industrial warfare ad libitum. In other words, Congress did not say to the carriers 'you must not precipitate trouble by the adoption of arbitrary measures with your employees but you may delegate to a contractor the power to violate and annul all your agreements and if it happens to result in an interruption of traffic the public will be deprived of such protection as the Transportation Act could give.' As a matter of fact that is practically the sole effect of the contracts involved in this case. A strike by the employees of a contractor or contractor agent of a carrier would as effectually result in the interruption of traffic as if the men were the direct employees of the carrier."

The Function of the Contractor

The decision then cites the manner in which "the car repair department of this carrier has undergone no real change so far as the public is concerned."

"There need be no misunderstanding of this situation," the decision continues, "the contractor performs only one useful function in this operation. He is the medium or channel through which the piece work system was substituted for the lawfully established wage scale. The contractor's compensation for this is five per cent of the amount of the payroll and the rate of pay is carefully limited by the piece work provisions in the contract. The contractor takes absolutely no risk.

"In the able brief of the carrier's counsel several decisions of federal courts are cited which construe contracts more or less similar to those involved herein and which define and construe the relationship of the railroad company, the contractor and those who work for the contractor. These cases involve the question of the railroad company's liability for injuries incurred by the contractor's employees usually under the federal employers liability act. None of these cases are in point here because a different principle and a different statute are involved. The principle involved in all those cases is the duty and responsibility of the employer to the employee. The Federal Employer's Liability Act has for its purpose the compensation of employees injured in the service of the employer. That statute affected only the private relations between the employer and the employee. Naturally, it sought no purpose and contained no provision that could be construed as a denial of the carrier's right to contract its work and relieve itself of liability for injury to employees and others. On the other hand, the Transportation Act was not enacted primarily for the protection of the rights of either carrier or employee except insofar as such protection was involved in the paramount purpose of the act; that is, to insure to the public as far as possible efficient and uninterrupted railway transportation by protecting the people from the loss and suffering incident to the interruption of

traffic growing out of controversies between the carriers and the employees who do their work. This act is the Congressional assertion of a public right.

"It may seem immaterial to the public what method or arrangement the carrier adopts to secure the performance of the work essential to its operation. But it is immensely important to the public that this work be carried on in a peaceful and orderly manner. It may seem immaterial to the public for the carrier to contract out any of its work. But it is important if by such contract the carrier seeks to remove its employees from under the application of a law which the people have enacted for the purpose of maintaining industrial peace on the railways. There is a public interest in the carrier's methods greater than may appear on the surface. The contracts herein involved violate the spirit and purpose of the Transportation Act and in effect set aside the wage decisions of the Railroad Labor Board to which the carrier was a party and which the carrier put into effect.

"To all intents and purposes the contractor's operations constitute a department of the carrier with a piece work system which has been forced upon the men by the discharge of some and the dread of discharge and unemployment of others and which has never been submitted to the Railroad Labor Board in the form of a dispute as a compliance which the statute requires. The contractor is in effect merely an agent of the carrier.

"The Board can understand how the carrier reached the conclusion that it had the right to make such contracts because somewhat similar ones had been made through a long course of years; but those precedents have been robbed of their potency by the enactment of the Transportation Act which the courts of the country without exception so far have declared to be constitutional.

"This decision rests upon the facts of this particular case," the decision said in conclusion, "and the decision of each of the other contract cases pending before the Board will rest upon its own facts and the general principles herein declared."

Railway Wages Discussed by Agricultural Commission

WASHINGTON, D. C.

ONE OF THE FINDINGS to be made by the Joint Commission of Agricultural Inquiry to Congress in its forthcoming report will have reference to the railroad labor situation. Chairman Sydney Anderson, outlining the commission's conclusions on this subject, said: "We have found that the compensation paid to railroad employees increased 151 per cent in 1920 over 1916, and to 105 per cent in 1921 over 1916; that the increase in the number of employees in 1920 over 1916 was 384,830, and that in most cases the number of hours' work increased in much lower ratio than the number of employees.

"The price of transportation is necessarily governed by its cost of transportation. There is, therefore, a very definite relation between the price which the public pays for transportation and the cost which the railroad pays for labor, material and equipment.

"Certain elements which enter into this cost are now subject to regulation by the Interstate Commerce Commission or by other public bodies. The Interstate Commerce Commission now controls the issuance of railroad securities, and, to some extent the capital charges arising from them. It controls expenditures for new lines and extensions. In general, however, expenditures for material and equipment are within the province of management, subject to the same economic rules which apply in other industries. Wages paid by railroads are subject to initiation, determination, and

control by the Labor Board. Wages constituted 66.4 per cent of railway operating expenses in 1916, and 63.4 per cent in 1920, and are therefore the largest single factor in the cost of transportation.

"We thus have, therefore, the anomalous condition of one governmental body controlling the price of transportation and another governmental body controlling the major element of cost of transportation.

Adjustments Boards Not Created

"It has been found by the commission that adjustment boards have not been created by the carriers and the employees in all cases, and that where created they have not always functioned in the final settlement of disputes between carriers and their employees. They have not functioned to settle disputes finally because both employees and employers, having the right to resort to an appellate tribunal, almost invariably exercise the right on the chance that an appeal will result in a reversal and a determination of the adjustment board in their favor. In many cases the Labor Board has taken jurisdiction of disputes which have not previously been the subject of determination by adjustment boards.

"This has resulted in bringing before it a large number of disputes with respect to wages and working conditions applicable to individuals or small groups of individuals, which by their number tend to overburden the board and keep it from promptly considering the settling questions of larger aspect.

"The commission believes that in the settlement of ordinary disputes as to wages or working conditions the carriers and their employees stand upon an equal footing, and their disagreements should be settled by the ordinary process of adjustment applying in other industries. It is only where such disputes threaten to interrupt commerce that the paramount public interest justifies the interference of a governmental body.

"There is also a distinction between the general wage levels on railroads and those of other industries, and there are further distinctions between wage scales for classes of railroad labor and those applying to the same or comparable labor in other industries. These distinctions cannot well be preserved by rigid public regulation. Control over the details of the process of operation is essentially the province of management, while control over transportation rates is essentially governmental.

"The function of government is not to enter the field of transportation wherever it can, but only wherever it is needed to protect the paramount public interest in uninterrupted service efficiently performed at reasonable rates.

"Subject to the restrictions which flow from this principle, railroad management should be as free to exercise individual initiative and judgment in the determination of operating conditions as management in any other enterprise. Employees likewise should be as free to resort to the measure of organization or action necessary for their full protection as labor in other industries.

"Therefore the employment relations of carriers and their employees, whether individual or collective, should be primarily established on each road between man and management on terms mutually satisfactory, and they should be left free to reconcile their differences by adjustment methods of their own selection. Experience demonstrates that a continued arbitration body to which either party may refer these disagreements multiplies rather than minimizes these disputes."

Figures will be presented in the report showing the relation of wages paid several classes of railroad employees, industrial workers, and farm labor, together with indices of the wholesale commodity prices and the cost of living.

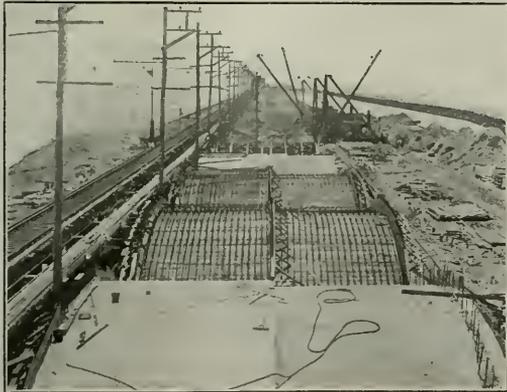

Putting the Finishing Touches on the New Causeway

Rebuilding of Galveston Causeway Nearly Complete

Railroads Bear Large Portion of the Expense of Restoring the City's Mainland Connection

WITH THE COMPLETION of the construction now in progress on the causeway at Galveston, Tex., another chapter will have been completed in the dramatic history of that city's connection with the mainland. As the sole means of rail and highway communication between Galves-

View of the Arch Construction in the First Stage. Railway Trestle on the Left and Highway Trestle on the Right

ton island and the Texas mainland this causeway has borne a vital relation to the city's welfare. Completed in 1912 as one feature of the city's program for restoration from the disaster of 1900, the causeway was severely damaged by a storm in August, 1915, and now, after nearly five years' work, is being completed a second time with such modifications in the original structure that its security against future storms is assured beyond reasonable question.

At the time of the storm in 1900, there were three railway trestles and a highway bridge across West bay and these were so badly damaged that only one, the Gulf, Colorado & Santa Fe structure, was restored. It was this trestle, 10,680 ft. in length, which was replaced by the causeway completed in 1912 after nearly three years of work at a total cost of \$1,750,000. The term causeway was applied because the struc-

ture comprised both a bridge and a sheathed embankment. There were 28, 70-ft. concrete arches and a 109-ft. Scherzer rolling lift span making up the bridge length of 2,455 ft., and two approach embankments having a total length of 8,220 ft. The arch structure was given a width sufficient to accommodate three railway tracks and a 19-ft. highway.

The embankment forming the approach at each end was for the most part 154 ft. wide and was capable of accommodating five railway tracks and a 38-ft. roadway. It was bordered at each side by a bulkhead composed of reinforced concrete piles 18 ft. long driven so as to project 3 ft. above water at mean tide and finished with a cap of concrete. The two bulkheads were tied together at intervals by 1 1/4-in. tie rods adjusted with turn-buckles. In addition to this, the side slopes were covered with a blanket of concrete six inches

Filling on Portion of the Arches First Completed Was Held by a Temporary Retaining While Remaining Section Was Being Built

thick, cast in place after the filling had been given an opportunity to settle. This projected embankment proved to be the vulnerable feature of the causeway.

On August 16 and 17, 1915, the Texas Gulf coast was

visited by a storm of greater magnitude than that of 1900, but the Galveston seawall measured fully up to expectations and the city was saved from disaster. The causeway was not so fortunate; 2,000 ft. of the embankment at the Galveston end and all of the embankment at the Virginia Point or mainland end was destroyed.

Severe storms on the Gulf Coast are accompanied by high tides at levels far exceeding the normal maximum. The water is virtually piled up against the coast. At such times a corresponding rise in the level of the water in the land locked bays behind Galveston island and the Bolivar peninsula can be effected only by an enormous inrush of water through the relatively narrow channels. The recession of the water at the close of the storm causes corresponding flows in the opposite direction. Flows of this nature occur in West bay with the changes in water level in that narrow channel which has connections with the main body of the gulf only at the two ends of Galveston island 25 miles apart.

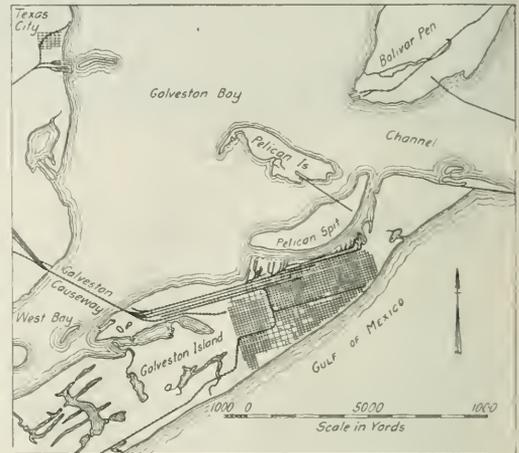

The terrific current that occurred here on the occasion of the 1915 storm demonstrates that the waterways afforded by the 28 arches were inadequate, with the result that the water piled up behind the causeway until it was several feet higher than on the opposite side. The result is well known. The embankment filling was washed away, allowing the concrete slope covering to collapse. It also resulted in the destruction of a 30-in. water main embedded in the embankment and of a similar main in the bed of West bay, the only sources of fresh water supply to the city. The concrete pile bulkheads, which enclose the embankment along each side were not injured. The arch spans also escaped harm, although subsequent soundings disclosed some scouring which for the time resulted in exposing some of the foundation piles to the attack of the marine borers, and it is believed that the scour might have been more serious had not the failure of the embankment served to reduce the discharge velocity through the arches.

Through heroic efforts on the part of the Santa Fe and Southern Pacific forces a temporary pile trestle was completed across the bay in 12 days, thereby restoring rail communication on September 1, 1915. At about the same time a temporary 8-in. water line was connected up across the damaged portions of the causeway to provide the much

needed water supply, but this was later replaced by a submarine pipe line. The 30 in pipe line in the causeway was restored also at a later date. A few months after the storm a pile trestle for a highway was also completed.

Restored Structure Provides Greater Waterway

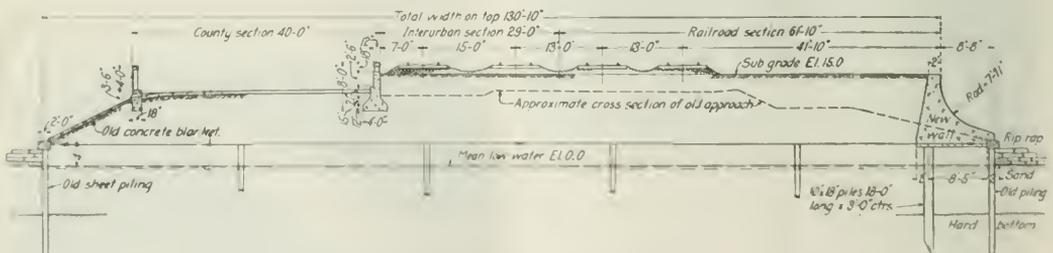

Swain and Lincoln Bush, who were called upon to select one of two competing designs for reconstruction and pass on the adequacy of the waterway which they provided. The design approved by this board provided that the existing arch bridge should be extended each way by providing additional waterways in the form of 51 new arches of 60-ft. span on the Virginia Point end and 28 new arches at the island end.

Galveston Causeway in Relation to Its Surroundings

This left about 100 ft. of approach embankment at the west end and 2,600 ft. at the east end to be repaired or rebuilt.

The work of restoration has proceeded on this basis. The additions to the arch structure have been built to a width accommodating two railway tracks, an interurban track and a 21-ft. driveway, making an overall width of 63 ft. 3 in. to outside of parapets. The arches have a span of 60 ft. and a rise of 12 ft. and the piers have a thickness of 10 ft. The

Typical Section of the East Approach

needed water supply, but this was later replaced by a submarine pipe line. The 30 in pipe line in the causeway was restored also at a later date. A few months after the storm a pile trestle for a highway was also completed.

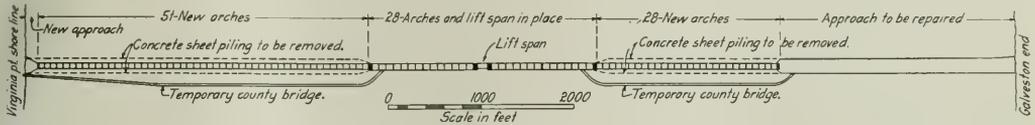

highway and railway arches are separated by a smooth joint, the former having a crown thickness of 14 in. and the latter one of 20 in. Each pier was designed to be stable in event of the destruction of either of the adjoining arches. The footings are supported on reinforced concrete piles with the bottom of footing about 10 ft. below low water level. The foundation piles are carried well into clay and the depth of each footing is also varied to some extent to avoid too great a distance between the bottom of the footing and the top of the clay stratum, which is covered by a variable depth of sand. The arches are of the filled spandrel type with a spandrel wall on the two other faces. The highway portion

is paved and the railway part is ballasted and laid with three tracks, two of them for the use of steam railroads and one for the electric line.

The embankment reconstruction at the Galveston end involves the restoration of the old concrete protection along the highway side and of the construction of an entirely new form of protection on the railway side, namely, a sea wall of mass construction with a curved face and wide base. The toe of the wall is supported on the existing concrete sheet piling,

conditions by utilizing the space between the two bulkhead walls as a dry working area.

A large part of the operations were conducted by three stiff-leg derricks, mounted on wheels and operated on a gantry track with rails spaced 40 ft. center to center, thus occupying practically all of the space between the bulkhead wall and the face of the arch structure. The first derrick was used to handle a clam shell bucket for excavating the pier sites, all soil being dumped either inside or outside the

How the Original Bridge Was Extended with Additional Arches

while the heel is carried on a row of concrete piles spaced 3 ft. center to center. For this purpose sheet piling taken from the old bulkheads were used, as soon as sufficient of these were removed from the length of causeway occupied by the new arches.

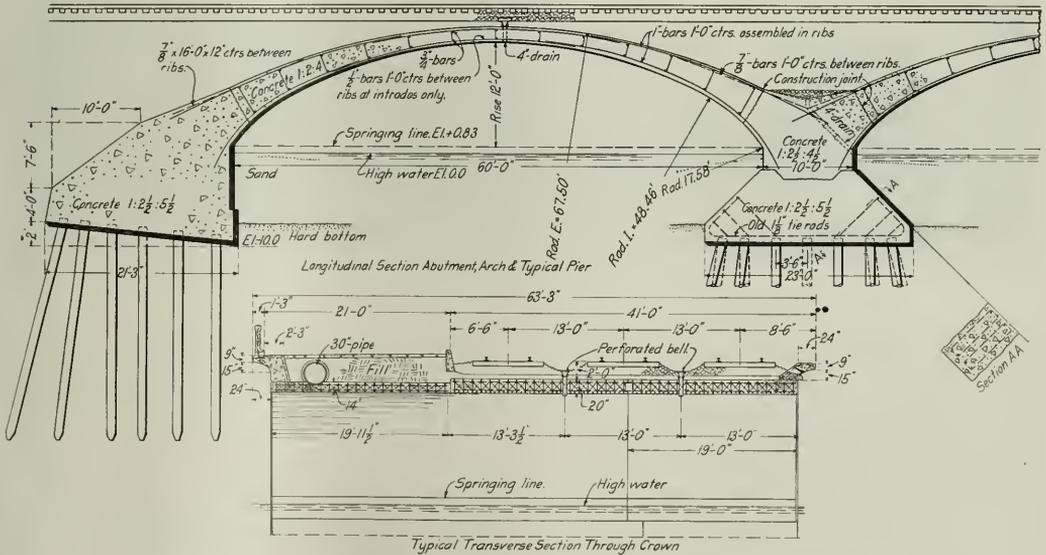

Construction

Construction was begun September 15, 1917. The program adopted for the work provided for the construction of two-thirds of the arch structure first, namely, all of the high-

bulkhead; the second was used to support a pair of pile driving leads for driving the foundation piles; and the third handled the forms and other operations of the concreting.

Pile Driving

The concreting was conducted from plants located at the extreme ends of the causeway with a third plant north of the tracks at the Virginia Point end for casting the concrete piles. The length of piles required to give the required penetration into the clay was determined by at least three

Details of the Arch Construction

way portion and sufficient of the railway portion to carry one track (the interurban track). This was followed by the construction of the remaining portion of the arch structure, after which release of the sheet piling in the flanking bulkheads permitted work to proceed on the restoration of the embankment, the only portion of the work now not completed. The additional arches being in two groups, separated by nearly half a mile of the existing arches, naturally divided the work into two units which have been handled by independent plants. The contractor also adapted the work to the local

soundings taken at the site of each pier. The pile casting yard occupied a space large enough to accommodate 200 piles at one time, the piles being allowed to cure not less than 45 days before driving. The mixing plant was located at one end with an elevating tower to deliver the concrete to a traveling hopper which operated over an elevated track placed at a sufficient height so that the concrete could be spouted from the hopper to any form in the yard. A traveler, equipped with two stiff-leg derricks, handled the forms and the concrete piles. The work of manufacturing the concrete

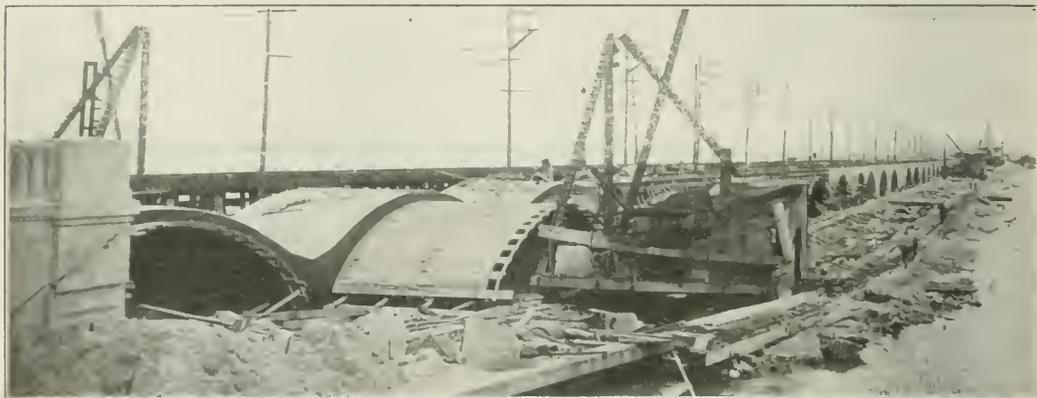

work was conducted at intervals during the course of the construction whenever the force could be spared for this work, although most of the piles were finished well in advance of the other work. Stone and cement was delivered to the concrete plant in cars for which sidings were provided. The sand was delivered on barges.

At the two concrete plants for the structure proper the concrete was delivered through a spout into cars which hauled it out to the point of placing in the bridge on narrow-gauge tracks. The concrete going into the piers was hauled over a track supported on brackets attached to the side of the railroad trestle, from which it could be spouted to any point in the piers. Concrete for the arches and spandrel walls was hauled out in buckets placed on cars moving over a track laid outside the derrick track to a stiff-leg derrick opposite the point of placing, where the buckets were hoisted over and dumped into the forms.

The arch forms consisted of wooden lagging supported by steel centering. The forms, of which 18 sets were provided, were built only wide enough for one-half of the width of the first unit of the bridge constructed. In concreting the arch, the first operation was to pour the pier footing and haunch and follow this with a second run for the arch ring complete

22 per cent; and Galveston County, 33 per cent. The Board of Managers is responsible for the management and financing and the Board of Engineers for the design and construction. The chairmanship of these boards has been vested in turn with the representatives of the various interests, the present chairman of the Board of Managers being G. S. Waid, vice-president and general manager, Southern Pacific Lines, and of the engineering board, H. M. Lull, chief engineer of the Texas and Louisiana Lines of the Southern Pacific. F. G. Pettibone, vice-president and general manager of the Gulf, Colorado & Santa Fe, was chairman of the Board of Managers, and F. Merritt, chief engineer of the same road, was chairman of the board of engineers until May, 1917. A. F. Robinson, bridge engineer of the Santa Fe System, is consulting engineer for the Board of Engineers.

The original estimate for the restoration work was about \$1,500,000, but during the time that the work was in progress the cost of labor increased in such large proportion that the final cost will be much larger. Larkin & Sangster, of Buffalo, N. Y., were the contractors, the contract being awarded on a cost plus basis with an upset price, but the contractors were unable to complete the work within the limit set and it was necessary for the board to take the work out

Moving Out Arch Centers Preparatory to Using Them in a New Position

between the haunches. This required 116 cu. yd. of concrete for the rail section and 75 cu. yd. for the highway portion. After completing the work at one set of arches, the centers were moved out, cut in two at the crown and shifted ahead for use at other arches without removing the lagging.

After the completion of the first unit of work on the arches, a temporary spandrel wall was built along the incomplete side of the railroad arches, the spandrel filling was placed and one track was laid over the new arches and the county highway portion paved with brick on a concrete foundation. As soon as this was placed in service the railway trestle was removed, thereby clearing the space along the Galveston bay side of the bridge so that the arches could be completed. To carry out this portion of the work the plant was transferred over to the other side of the structure and the work prosecuted in much the same way as it was for the first portion.

The work of restoration of the Galveston causeway is conducted by a Board of Managers and a Board of Engineers, representing the interests which bear the expense. These are the Galveston, Harrisburg & San Antonio (Southern Pacific) which bears 15 per cent, the Gulf, Colorado & Santa Fe (Santa Fe), 15 per cent, the Galveston, Houston & Henderson, 15 per cent, the Galveston Houston Electric Railway,

of their hands, and it was turned over to H. F. Jonas for completion, Mr. Jonas having previously served as supervising engineer representing the board on the ground. William Mueser, consulting engineer of the Concrete Steel Engineering Company, New York City, designed the causeway and prepared the plans and specifications.

NUMEROUS VIOLATIONS of the car service and interchange rules intended to protect freight cars against the attachment of advertisements, having been reported to the American Railway Association, R. H. Ashton, president of the association, has issued a letter to members urging the railroads to enforce these rules. This matter is covered by Car Service Rule 12 (recommended practice) which reads as follows: "The placing of advertisements or placards of any kind by the shippers upon freight cars is prohibited." Interchange Rule 36, which is mandatory by agreement, reads as follows: "Rule 36. Delivering company responsible. Temporary advertisements tacked, glued, pasted, varnished or secured to cars by screws, wire, or any other manner." The penalty is a defect card against the delivering line which permits a charge of one-half hour for the advertisements tacked, screwed or wired to car, and one hour for the advertisements pasted, glued or varnished on cars, the rate per hour being \$1 20.

Duncan Replies to Charges of Lauck and Warne

A. G. Hagerty, a Washington Lawyer and Former Examiner for
I. C. C., Also Speaks for Executives

WASHINGTON, D. C.

IN CLOSING his statement on May 4 before the Senate Interstate Committee, C. S. Duncan replied to charges made before the committee and elsewhere by W. Jett Lauck, that large financial interests control the railroads and that they deflated the farmers and undertook to deflate labor.

Farmers Blame Reserve Bank

"There is no contention," said Mr. Duncan, "that the Federal Reserve Bank is controlled by this financial group and yet it is a well-known fact that it is blamed by the farmers for 'deflating' them. It is to be remembered that the automobile industry suffered no less than cotton growers or wool growers or raisers of cattle and grain. Of course, the record is clear that the farmers were not free from the mad spirit of riotous spending and wild speculating of recent years. No financial coterie of bankers saved the most powerful meat packers from tremendous losses through deflation, as shown by their annual reports. And if general reports have a foundation in fact, there was no financial power strong enough to save the large banks themselves from very heavy losses.

The farmers, according to the Joint Commission of Agricultural Inquiry, buy over 30 per cent of the steel products produced and used in this country. Would financiers wantonly kill the goose that lays this golden egg? It is not reasonable to believe so.

"The statement has been made that Wall Street bankers control the policies of the roads, financial and otherwise. But no facts have been advanced to prove it. A more pertinent inquiry is as to the effect upon public welfare of what has been and is being done.

"Mr. Lauck has employed charts and graphs which picture a situation of inter-relationship through directorship between railroads and banks. He has given no concrete facts to prove his conclusions. There remains, therefore, in his argument this broad hiatus between his chart and his conclusion. He has nowhere shown that bankers as directors have exerted a dominant control over politics. He argues solely by inference. I submit that such an argument is neither valid nor conclusive.

Fictitious Securities and Fixed Charges

"Another witness for railway employees contended that fictitious securities had been made a fixed charge upon the net operating income of the railroads and thus the public was compelled to pay sufficiently high rates to meet such unfair charges. The reply to this contention was, that these charges were not against net railway operating income at all and that rates were based upon two factors unaffected by such charges; namely, the valuation of railroad property for rate making purposes by the Interstate Commerce Commission and the net railway operating income.

"There is no proof given of the further statement that the coterie of financiers had marked labor as its next victim. As to the 'open shop' drive, it is a question of fact and requires proof, not assertion. But it would seem a common sense thing for the banks to desire good business.

"The witness is in error when he says that issues of fictitious securities have imposed a perpetual drain on railroad operating revenues because the securities of the roads do not under the law influence or in any way affect the amount either of operating revenues or net operating income. Unwise financing may continue to be unfortunate for a given railroad cor-

poration but it does not affect the public through rates or the employees through wages."

In concluding the part of his statement in which he replied to Frank J. Warne, statistician for the train service employees, Mr. Duncan said:

"I am convinced that this testimony not only does not prove the contention set forth but also was presented with a view to the effect it would have elsewhere than upon the minds of this committee. That it has been misused in the public forum has been shown. That it does not meet the purpose of the Senate resolution under which the railroad inquiry was instituted is also apparent. That it is not helpful in meeting the present railroad problem has also been made clear. That it tends to engender bad feeling where harmony should prevail, that it is an attempt to discredit railway management and to harm railway credit is likewise evident. It is neither constructive or fair, neither sound nor judicially considered, neither wise nor just. The witness has used his ability as an economist and statistician for the purposes of a partisan and an advocate, and not as a scientist and serious student of business problems."

The Railway Business Risk

Few, if any, industries face as great a business risk as the railroads of the country under existing conditions, Mr. Duncan, told the committee. Under governmental regulations the carriers as a whole, he said, are restricted in prosperous times from making profits in excess of six per cent on their tentative valuation by which they would be enabled to provide a surplus for lean years, while they have no guarantee of revenue and no protection against financial losses.

"From an economic point of view," said Mr. Duncan, "this is a consideration which ultimately must be given due weight. There are now many regulations and restrictions to prevent the railroads from making high profits, but there is no guarantee of revenue and no protection against losses. In the great uncertainties of traffic revenues, there is a business risk that the railroads are compelled to assume without protection. Investors in railroad property can shoulder the burden of this risk, as compared with other investment opportunities, only if they are given a chance to share in higher return when there is prosperity, as is the case in other industries.

"The time-consuming method of adjustment of rates and expenses in operation today makes quick reaction impossible. It would seem a fair principle that just as regulations restrict the free exercise of managerial judgment, to that extent responsibility must be shared by the powers promulgating the restrictive regulation.

Capitalization of Social Values

"Farmers, manufacturers, merchants, owners of mines and real estate are permitted to capitalize their exceptional opportunities, such as advantages of location, fundamental human needs for their products—all the so-called social values. Many, however, want to deny all these things to the carriers. To this extent their position is ill-defined and anomalous.

"There has been a great deal of talk about watered stock in connection with the railroads. It should be clearly understood in regard to this subject: first, that railway property is being valued on a basis wholly independent of security issues; second, that this value when arrived at will be used

for rate making purposes; third, that the public will not be made to carry the burden of rates to secure revenues for the realization of a return on any inflated value; fourth, that since 1907 all additions and betterments have gone into the capital account at the value actually expended; fifth, that all issues of securities have been for nearly two years and will for the future be under the supervision of the Interstate Commerce Commission. The public and the investor are thus thoroughly safe-guarded. So far as the railroads' relations to the public are concerned, the 'watered stock' issue has been met."

Says Warne's Charges Should Be Stricken from Record

Another analysis of the Warne brand of statistics, which were characterized as "fairly screaming with misconceptions," was given the committee on May 6 by Alfred G. Hagerty, a Washington lawyer who was for 12 years an examiner of the Interstate Commerce Commission and who said he had been asked by the railway executives to testify before the committee because of his close association with the development of the uniform system of railroad accounts established by the Interstate Commerce Commission. As so large a part of Mr. Warne's testimony before the committee had been based on the assertion that the statistics based on compilation of railroad reports to the Interstate Commerce Commission are useless and worse because of manipulation and fraudulent accounting, Mr. Hagerty went into a detailed explanation of the accounts and reports and the commission's methods of using and checking them, in relation to the charges made by Mr. Warne.

"The accusations by Mr. Warne that the railroad executives and their statistical staffs have misrepresented the results of railroad operation to the committee, I find to be without foundation," he said.

In reply to general charges of manipulation made by Mr. Warne, Mr. Hagerty cited the fact that in checking the returns of the companies for 1915, 1916 and 1917 for the purpose of certifying the amount of the standard return, the commission had examined the accounts of 478 carriers which resulted in corrections increasing the total standard return by only \$155,766, a difference of less than 2/100 per cent as compared with the reports, and in favor of the railroads rather than in favor of the government. "Bearing in mind that the accounts covered three years," he said, "it seems to me that in the net result we have quite conclusive proof that the railroads of this country are not making false returns to the commission. As a result of these examinations, which were most sweeping and comprehensive, the commission did not find a single instance of manipulation, falsification or fraud on the part of the railway accounting officers. Most of the errors were errors of judgment in the interpretation of the commission's accounting regulations or purely clerical errors."

Mr. Hagerty said that "the most pernicious of Mr. Warne's many unjust accusations" was the alleged manipulation of maintenance charges to conceal the true earnings from the public and that "he bases these accusations upon a statistical compilation of dollars expended from month to month and from year to year without regard to the quantity of maintenance applied or to increases in prices of both labor and materials."

No Manipulation of Maintenance Accounts

"The same charge was made and almost in the same language," Mr. Hagerty said, "by counsel for certain shippers in the 5 per cent rate case and as the truth or falsity of these charges had an important bearing on the question of the revenue requirements of the carriers the subject was thoroughly investigated and given serious consideration by the commission. In both the 5 per cent and 15 per cent cases the evidence disclosed a tendency toward insufficient

maintenance rather than too much maintenance and in neither case did the commission, after exhaustive investigation, find either overmaintenance or manipulation of maintenance accounts.

"The most unjust and misleading part of Mr. Warne's statement," Mr. Hagerty said, "has general reference to the alleged padding of expenses during federal control and more especially during the six months' guaranty period." Regarding this he said: "His graphic charts are dangerous in deception and likely to influence the uninformed to accept his deductions, inferences and accusations as facts when they fairly scream with misconceptions.

"No such misunderstanding should be left in the minds of the members of this committee," he said, referring to a part of Warne's statement regarding the accounts for the six months' period, "because padding or inflation was neither the intention nor the result."

He pointed out that the commission's officers and the railroad officers had co-operated in working out a method of stating the accounts for this period and added that "to avoid confusion Mr. Warne's statement should be earmarked and stricken from the record."

"If the railway operating returns presented to this committee by the carriers—including revenues, expenses, net revenues and railway operating income—for any given time, are inaccurate, then the reports of the Interstate Commerce Commission to Congress also are inaccurate, which means that the commission is open to the same charges of misrepresentation as that laid by Mr. Warne against railroad officials.

"I say this because, as a whole, the data presented by the railroads are identical with those reported by the commission to Congress."

Mr. Hagerty testified that not only are the various accounts of the carriers "carefully policed and kept free from misuse" by the Interstate Commerce Commission but that their annual reports each year are compared with those of previous years, and if any wide or disproportional difference in any of the items are found an immediate explanation is demanded by the commission.

"Where the situation justifies it, accounting examiners are put to work on the carriers' books," the witness said, "this leaves little or no room for manipulation or falsification, even if the carriers were disposed towards such evil.

"Nothing was done in the dark," said the witness. "There was no purpose or intention on the part of the railway accounting officers to manipulate, falsify or misrepresent. If there has been any misrepresentation to this committee of the operating results, or the ratio of railway operating income to investment, it has been in the efforts of Mr. Warne to confuse and mislead."

Senator Cummins announced during the hearings of Mr. Duncan's testimony that he proposed to insist that the director general of railroads furnish the committee with information showing the amounts allowed, in the various settlements made with railroad companies for the federal control period, on account of under-maintenance. He said it was understood that allowances were being made on this account and that no railroads had thus far been required to pay anything for over-maintenance, although the former director general had estimated that over-maintenance would about balance any under-maintenance. The Railroad Administration had thus far steadfastly declined to furnish such information not only on the ground of policy but also on the ground that when lump sum settlements are agreed upon it is impossible to state definitely the exact items involved.

The hearing was again temporarily postponed with probably four witnesses yet to be heard, including R. S. Lovett of the Union Pacific, L. F. Loree, of the Delaware & Hudson, and one or two representing the National Association of Owners of Railroad Securities.

Mexican Railways Prepared for Improved Business

Improvements Now Under Way—Labor Conditions—Relations
With U. S. Lines

Part II*

By Charles W. Foss

IN ADDITION to their acquisitions of new motive power the National Railways of Mexico are also effecting other important improvements, notably with respect to the construction of new lines, the building of new stations, shops, etc.

A new branch line under construction from Allende, Coahuila to Las Vacas (opposite Del Rio, Texas), has just been completed and is in operation as far as San Carlos, which is 18 miles from Del Rio, Texas—a total distance of approximately 40 miles. This is rather an important feature, as its extension to the United States border, when the trunk line is completed to Las Vacas, means the establishment of a connection of the National Railways of Mexico with the Southern Pacific which passes through Del Rio, and eventually with the Kansas City, Mexico & Orient.

Stations and Shops

When traveling on the main line one is impressed by the large number of new stone stations and groups of section houses. The small stations are simple in design. The section houses which lie along the right-of-way on each side of such stations are usually cubical in shape and of a type of architecture, so lacking in the ordinary trimmings which an American is accustomed to, as to look most unusual. One notices also a considerable number of stone water tanks, although at many points the water facilities are rather crude.

per cent and at Tampico about 20 per cent. The project at Saltillo is estimated to cost about 1,000,000 pesos or \$500,-

In connection with the larger stations, attention should be drawn to the new stations and terminals now being built at Saltillo, Durango and Tampico. The facilities at Saltillo are now about 75 per cent completed; at Durango, about 90

location and capacity of the less important divisional shops. The shops at Aguascalientes are considered the most important on the system. These are at present rebuilding locomotives. In January, 12 locomotives were given general repairs and complete rehabilitation. The executive board of the National Railways has made extensive plans for the improve-

*Part I of this article was published in the *Railway Age* of May 6, page 1055.

ment of shop facilities. It proposes to enlarge the shops at San Luis Potosi, Saltillo, Aguascalientes, Acambaro and Puebla—adding new buildings and machinery and tools—and to make these the main shops and use the others for division shops. The statement is made with reference to the other shops that they are sufficiently supplied with machinery and tools to care for present requirements.

Organization

The National Railways of Mexico are headed by an executive board. The actual operation of the railways is in the

of rates in the States. The United States Labor Board scale is paid, however, to train and engine crews, dispatchers, station agents, operators and shop mechanics. That is, where the rate in the States is 50 cents an hour, the Mexican rate would be one peso an hour. The National Railways are now endeavoring to readjust wages to the same extent as in the United States. With reference to section labor rates per day run about as follows in pesos (one peso is equivalent to about 50 cents U. S.): At the border, \$2.50 to \$3.00; coast,

hands of a general manager to whom all departments report except the traffic, accounting, treasury and express. These report directly to the executive board of directors.

Labor Conditions

Much might be said concerning labor conditions. Prior to the revolution the larger part of the enginemen and con-

\$3.00 to \$4.00; central plateau, \$1.50 to \$2.25 and in the tropics, \$2.50 to \$3.00. With the high rates in effect for railway labor, it is quite natural that railroading in Mexico should be regarded as a very desirable occupation by the average citizen.

Opinions vary regarding the efficiency of the Mexican workman. It is fairly generally stated that the Mexican

ductors were Americans; train orders were issued in English. This is not the case today. The operating rank and file is entirely Mexican. The employees are strongly unionized and their power is evidenced by what has already been said about the strike which took place last spring and which ended with a complete victory for the employees, and with complete recognition of the unions and the entire granting of their demands.

Salaries and wages in general run about 75 to 90 per cent

shop mechanic is painstaking and careful, but slow. It is difficult to measure the comparative efficiency of the train and engine crews; it is a fact, however, that Mexican trainloads are much less than ours. The Mexicans do not get the service out of a locomotive that a United States road would secure.

Passenger Service

The Mexican passenger service, like the freight service, is at present running rather light. Mexico has two classes of passenger traffic, first and second. First-class fares are at a rate of about 3.75 cents (United States currency) per mile and second-class at a rate of about 1.5 cents. As has been noted in the *Railway Age*, through Pullman cars are run over the International & Great Northern from San Antonio to Mexico City and over the Gulf Coast Lines from Houston to Mexico City and Tampico via Matamoros and Monterrey. Dining car service is in the form of a cafe club car run in the one case from San Antonio to Mexico City (the Houston sleeping car is picked up at Monterrey), and in the other from Houston to Tampico.

The service is satisfactory. An American will always find himself in the company of other Americans. No passports are required and almost the only difficulty presented is the inability to secure through tickets across the border. From Nuevo Laredo to Mexico City, 803 miles, requires 36 hours; from Matamoros, slightly longer. An interesting feature is the coach full of soldiers which is carried on every train.

The Mexican railways are endeavoring to encourage the travel of Americans in Mexico. Plans are under way looking

A Scene on the Main Line Between Mexico and Nuevo Laredo

to the publishing of booklets on Mexico for distribution in the United States. President Obregon is understood to be taking a great interest in the matter of relationships with United States business men and several parties have been made up in the southwestern states and carried as the guests of the Mexican government to Mexico City and other parts of the Republic.

Through Billing Under Consideration

It is the testimony of the American railroad men whose lines connect with the National Railways of Mexico that their relations with the Mexican railway officers have been cordial and satisfactory. The difficulty with interchange business at present is that there is no through billing across the border and that through rates are not quoted. These matters are now being given consideration, although it is too early, as yet, to say what success will attend the negotiations, or how far they will be carried. The American lines have a good realization of the possibilities of Mexican traffic. For example, traffic representatives are maintained in Mexico City by the International & Great Northern (which office also acts for the Missouri Pacific and Texas & Pacific) by the Gulf Coast Lines, by the Missouri, Kansas & Texas, by the Southern Pacific and by the Atchison, Topeka & Santa Fe.

The writer, in conclusion, desires to say that he found the Mexican railway officers whom he met cordial and helpful. They were frank and did not act as if they had anything

to conceal. They talked enthusiastically concerning the good things about their railways, but did not play the part of the censor with the bad. Naturally, things are not done in Mexico in the same manner as they would be done on a railroad in the United States, but one could not help but feel that the Mexican railways are prepared for the revival which we all hope is about to come about in Mexican business conditions.

Freight Car Loading

WASHINGTON, D. C.

THE NUMBER OF CARS loaded with revenue freight showed a large increase during the week ended April 29 both as compared with the week before and as compared with the corresponding week of the previous year, in spite of the light loading of coal. The total was 758,286 as compared with 721,084 in 1921 and 800,960 in 1920. The previous week the total was 714,088. All classes of commodities except coal showed increases in loading as compared with the corresponding week of the previous year, especially large increases being shown in miscellaneous freight and merchandise l.c.l.

Coal loading also showed an increase of 12,000 cars as compared with the preceding week. If coal loading had been normal, the total loading would have been considerably in excess of that of 1920 at the time when the roads were just recovering from the switchmen's strike. The summary as compiled by the Car Service Division of the American Railway Association is given in the table appearing in the middle of the next page.

In a series of charts issued by the Car Service Division there is shown by circular diagrams a comparison of revenue freight loading by totals, by detailed classifications, and by districts, of the entire United States for the period January 1 to April 8, 1922 and 1921. The outstanding fact of the total loading is the comparative increase in the Eastern, Allegheny and Pocahontas Districts in 1922 compared with the previous years, with a converse situation in the Southern and Western Districts. A survey of the various charts for each of the different commodities displays some interesting facts contributing to the comparative result of the total. Thus, in the great grain originating districts (the Northwestern, Central Western and Southwestern) the 1922 loading is comparatively less of grain and grain products than the loading of the same commodities in 1921. The other large item of agricultural tonnage, livestock, shows a similar situation in the Central Western District, which loads the largest proportion of this commodity, although in the Northwestern and Southwestern Districts, slight gains were made.

Peculiarly, despite the increase of total loading in the Eastern and Allegheny Districts, coal and coke loading was relatively lighter in 1922 than in the previous year. To the contrary, there is a heavy relative increase in the Pocahontas District. To a considerable extent, the coal loading in the Eastern and Allegheny Districts is competitive with that loaded in the Pocahontas District, and the conclusion would therefore seem to be that the increase in Pocahontas production was at the expense of production in the Eastern and Allegheny Districts. This is accentuated by the fact that the period covered includes the first week of the present bituminous and anthracite miners' strike during which relatively greater coal production has been lost in the Eastern and Allegheny regions than in the Pocahontas region, where loading has continued much more nearly normal.

The outstanding feature of the forest products loading is a very heavy increase in the Southern District and a somewhat lighter increase in the Central Western and Southwestern Districts. These include the entire Southern and Southwestern lumber loading lines, and the figures would seem to indicate a relatively heavier movement of this lumber

in 1922 than in 1921. Contemporaneously the Northwestern District, a heavy producer, and also the Eastern, Allegheny and Pocahontas Districts, all suffered a relative decrease.

The record of ore loading is of particular note because of the extraordinarily heavy decline in 1922 compared with 1921. Ore loading as a whole, however, is usually at a very low ebb during this particular period, and the movement is not of sufficient volume to permit deductions from the relative showing of the different districts in the two years.

The loading of merchandise l.c.l. and miscellaneous revenue freight shows a very significant upward trend in the Eastern, Allegheny and Pocahontas Districts. In these three, which originate much of this class of freight the 1922 per-

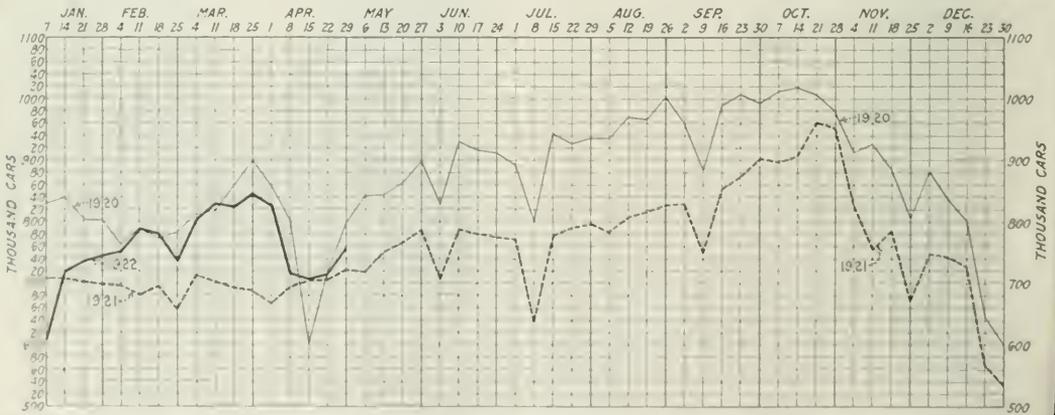

The number of surplus freight cars during the week ending April 30 showed a decrease of 126 to 371,538. This included 235,077 surplus coal cars, an increase of 5,185 within the week and 94,653 surplus box cars, a decrease of 3,753. There is also a decrease in the surplus of stock and miscellaneous freight cars.

A SERIES OF LECTURES on the electrification of the Chicago, Milwaukee & St. Paul is being conducted by the mechanical department of that railroad at a number of colleges and universities throughout the country. The lectures are illustrated by lantern slides and also by over 2,000 ft. of moving picture film, and,

Revenue Freight Car Loadings Up to April 29, 1922

centage of the entire country's loading, was 50.9 against 46.9 the year before. Contemporaneously, all other districts suffered a decline, this being particularly marked in Central Western territory.

while given primarily for engineering students and faculty, they are open to all who are interested in the subject. Supplementary dates are also being arranged, on application, for addresses before other organizations in the vicinity of the schools.

Delaware & Hudson Earns 11.62 Per Cent on Stock

Gross in 1921 Exceeds 1920 Figure in Spite of Sharp Reduction in Tonnage—More Coal Carried

THE DELAWARE & HUDSON'S net income available for dividends for the year ended December 31, 1921, was \$4,937,452 as compared with \$4,933,163 in 1920. The 1921 net income was equal to 11.62 per cent on the capital stock; the 1920 net to 11.61 per cent. In 1920 the carrier's corporate income account included standard return for two months and guaranty for six. In 1921, operating on its own, the road was able to obtain approximately the same net income because of an increase, as compared with 1920, of \$422,561 in operating revenues, a decrease of \$3,300,801 in operating expenses, a marked increase in receipts for car hire and increases also in dividend and miscellaneous income.

The Delaware & Hudson was fortunate in 1921 in being able to secure an increase in operating revenues over 1920. It is one of the small list of roads which will show a similar result. Its being able to secure that result permitted it to realize on its economies in the way of reduced expenses, which reductions were due to decreased wages costs, improved efficiency in operation, etc.; there is no evidence, however, that the reduction in expenses was due to cuts in maintenance.

Freight Revenues Increased 1.08 Per Cent.

The total operating revenues in 1921 were \$45,776,859 as compared with \$45,354,299 in 1920. There was an increase of 1.08 per cent in freight receipts. This was due to an increased rate per ton-mile, the ton-mile earnings in 1921 being 1.236 cents, or 0.318 cents more than in 1920. There was an actual reduction in ton-miles of 24.90 per cent, the 1921 figure being 3,203,759,305 as compared with the 1920 total of 4,265,734,874. The decrease in freight movement was most marked in bituminous coal, iron ore and its products, clay, gravel, sandstone, pulpwood, lumber and general manufactures. There was, however, a substantial increase in the tonnage of anthracite coal. The Delaware & Hudson shows separately its revenues derived from the transportation of merchandise and those from coal. These figures show that in 1921 the revenues from merchandise were \$2,779,608 less than in 1920, but that in the case of coal there was an increase over 1920 of \$3,201,912. Coal transportation revenues in 1921 totaled \$24,876,089, or 54.93 per cent of the total transportation revenues. This percentage in 1920 was 48.38 per cent.

Largest Anthracite Tonnage in History

This improvement in coal transportation revenues was partly due to an increase in earnings per ton-mile. There

was, however, an actual increase in coal tonnage. This can be put on a mined basis, or on a carried basis. The anthracite coal produced by companies affiliated with the Delaware & Hudson Company during 1921, including the product of washeries, totaled 9,122,408 long tons, an increase of 1,033,226 tons or 12.77 per cent above 1920. This output was 13.01 per cent of the year's total production of all Pennsylvania anthracite mines and washeries, estimated at 70,117,000. The real news in these figures is that the total anthracite production in the state of Pennsylvania was 1.5 per cent below 1920, but that the D. & H. production was 12.77 per cent over its 1920 figure.

The favorable circumstances which enabled the D. & H. affiliated companies to increase their production, while the other collieries suffered a reduction in production, are further shown in the coal transportation figures. The anthracite coal carried by the D. & H. in 1921 totaled 13,007,505 net tons as compared with 12,388,943 net tons in 1920. There was an increase of 618,562 net tons in 1921 as compared with 1920; but there was an increase of 2,527,352 tons as compared with the annual average for the test period, or the three years ended June 30, 1917.

The Delaware & Hudson annual report gives some extremely interesting and useful comparisons of one kind and another with previous years. One of these is in the form of a table showing the classified commodity tonnage for the years 1912 to 1921. This table shows that the total tonnage of all commodities in 1912 was 20,824,568; in 1921, 25,310,664, an increase in these years of 4,486,096 tons. The coal tonnage in 1912 was 8,009,596, in 1921, as above noted, 13,007,505, an increase of 4,997,909. The 1921 tonnage of all commodities has been exceeded in various former years, notably 1920, 1918 and 1917. The anthracite coal tonnage carried in 1921 was the greatest in the company's history; in fact, each succeeding year in this period has shown an increase over the preceding year with a single exception—1916. The result, therefore, is that the increase in total tonnage for 1921 over 1920 is entirely in anthracite coal.

We believe these facts to be important for a number of reasons. They indicate, first, a growing relative importance of the D. & H. in the anthracite coal carrying business. Second, they serve to emphasize that the D. & H., in a measure, lacks that trunk line character of such roads as the Lackawanna or Lehigh Valley, which is natural in view of the fact that the D. & H. does not have one of the through routes between New York and the Niagara frontier. Third, they

FREIGHT TRAFFIC STATISTICS—YEAR 1921 COMPARED WITH 1920 AND AVERAGE PER ANNUM FOR TEST PERIOD

show how important is anthracite coal to the D. & H. and indicate that the road is likely to be hit rather severely by the present 100 per cent tie-up in anthracite coal mining.

Operating Expenses Reduced \$3,300,801, Principally in Transportation

The Delaware & Hudson's operating expenses in 1921 totaled \$38,825,529 as compared with \$42,126,330 in 1920; in other words, there was a reduction of \$3,300,801. The way in which this was accomplished is of special interest. There was not a decrease in maintenance expenses but an increase. Maintenance of way and structures increased in 1921 over 1920, \$395,082, and maintenance of equipment, \$64,216. The savings were made in transportation expenses, which totaled \$17,880,423, representing a reduction from 1920 of \$3,789,245.

The expenses for maintenance of way in 1921 were 7.72 per cent over 1920. The principal reason for the increase was the putting in track of 2,866 tons more rail and 112,418 more ties than were put in in 1920, the expenses relative to ties and rail being increased \$806,505; other track materials and maintenance of interlockers and signals added \$322,063. There were, of course, decreases in labor and material costs which partly balanced these increases.

Expenses for maintenance of equipment were \$64,216, or 0.5 per cent over 1920. The Delaware & Hudson reported on April 15, 1922, had order cars totaling 7.1 per cent of its cars on line as compared with the country's average of 13.9 per cent. Unserviceable locomotives totaled on the same date 10.4 per cent, one of the lowest percentages of any road. During the year the road broke up 900 cars, resulting in an increase in \$757,757 in the item of retirements of freight cars.

17.49 Per Cent Decrease in Transportation

The reduction in transportation expenses was, as noted, \$3,789,245—17.49 per cent. This decrease was due to lower wages and fuel costs, etc., and to improved operation. The revenue train load in 1921 was 752.74 tons, or 88.85 tons more than in 1920. The annual report points out that there were increases in the gross freight train loads northbound in the heavy tonnage districts. We quote from the report: "The average gross freight train load from Carbondale was 3,765 tons, an increase of 486 tons or 12.9 per cent, and from Oneonta it was 3,601 tons, an increase of 413 tons or 11.5 per cent. The average delay to cars passing through yards was reduced from 11 hr. 42 min. in 1920 to 8 hr. 35 min. in 1921, or 26.5 per cent."

Although not a matter reflected in the operating expenses, attention should be drawn to the improvement in the D. & H.'s per diem situation which took place during the year. In 1920 the road had a debit hire of freight car balance of \$79,556; in 1921 it had a credit balance of \$915,595, an improvement of \$955,151. This evidently reflects in large measure the success of the efforts this road has been devoting to this most important factor.

Additions and Betterments

The annual report shows a sizable list of additions and betterments made during the year. The most important item is the new third track between Schenevus and Richmondville Summit, an important link in the Susquehanna division grade revision work. This was completed for operation on December 7, 1921; the total amount charged to capital was \$1,500,574. Other items included grade changes and track realignment between Cobleshill and Barnerville Summit, the remodelled and enlarged roundhouse at Oneonta now completed, etc.

The Delaware & Hudson annual report is to be commended because of the wealth of figures it gives relative to previous years' operations. Times change so rapidly that comparisons

between one year and the preceding year too often give only a distorted and wholly incomplete picture. The Delaware & Hudson report overcomes this factor by giving in a readily comparable form the complete figures for the preceding year and also for the test period from July 1, 1914, to June 30, 1917. As an illustration the freight traffic statistics are reproduced in this review. They give some interesting comparisons.

Labor Board Appeals Adverse Court Decision

THE DECISION of Judge George T. Page of the United States District Court at Chicago, upholding the Pennsylvania in its controversy with the Railroad Labor Board, and abstracted in the *Railway Age* of April 29, page 1021, has been appealed by the board and hearings in the Circuit Court of Appeals at Chicago have been set for June 2. This action follows the conference recently held at Washington between Attorney General Daugherty and Solicitor General J. S. Beck and Chairman W. E. Hooper and Judge R. M. Barton of the board and indicates that the controversy will be settled in the courts rather than by changes in the Transportation Act itself.

Court Makes Pennsylvania Injunction Permanent

The court order issued by Judge Page following hearings in this case, which have been described in previous issues of the *Railway Age*, perpetually enjoins the board from:

"(1) Assuming any authority or taking any action of any kind or character under Section 301 of the Transportation Act, unless and until there has been a joint submission of the dispute by the carrier and the employees, which has been the subject matter of conference between them. Upon such joint submission the board may proceed to hear and determine disputes only under and in accordance with the general provisions of Title III of the Transportation Act.

"(2) From making publication of any matter based on action taken by the board not in harmony with Item 1 hereof."

Chairman Hooper Discusses Federal Court's Ruling

The attitude of the Labor Board toward Judge Page's decision is outlined in a memorandum prepared by Chairman Hooper. This memorandum says in part:

The judge held, in substance, as follows:

1. That Congress had the constitutional right to confer upon the board the power to render decisions that would have the binding force of decrees, and to fix wages and working conditions that would be enforceable.

2. That Congress had not, in fact, conferred such power in the Transportation Act, but had only empowered the board to render decisions that are merely advisory and with no provision for their enforcement, except the persuasive power of public opinion.

3. The court did not hold, as has been stated in a portion of the press, that no dispute could be brought before the board, except by the joint submission of the parties.

The court did hold, however, that some disputes could be brought before the board only by joint submission, and that certain other disputes might be brought to the board by either party upon an *ex parte* submission.

The court held that the Pennsylvania dispute as to how the representatives of the shop crafts should be selected to negotiate with the carrier a revision of rules was a dispute that could be brought before the board only by joint submission, and that it was not properly before the board on the *ex parte* submission of the employees. The court held that the board's decision was invalid, that the board would not be permitted to issue a decision censuring the carrier for violating said invalid decision and that the board's motion to dismiss the carrier's bill must be denied.

Of course, the practical result of this holding is that when a conference is sought to be held in regard to a disputed rule or other question, either party may bring about a preliminary dispute that will prevent a conference; that this preliminary dispute

may be withheld from submission to the board by the refusal of one party to join in the submission; and that the original dispute as to rules or wages will thus be kept from the board.

It may be truly said that this would not often happen, but the fact remains that, in the present case, it has happened and that in connection with a question affecting the entire schedule of rules for an army of employees.

This decision permits the Pennsylvania to set up a schedule of rules negotiated with a minority of its shop craft employees, contrary to the letter and spirit of the Transportation Act.

With all due respect to the learned court, the construction of the statute to the effect that the submission to the board of the dispute in this case or any other dispute between the carrier and its employees growing out of their relationship as such, must be a joint submission is strained and unnatural.

Section 301 provides for the conferences to be held between the representatives of the carrier and the representatives of the employees for the adjustment of any dispute that may arise.

Sections 307 (a) and 307 (b) provide the methods of submitting disputes to the Labor Board, after the conference has failed to effect an agreement.

These two sections must be considered together.

Section 301 does not prescribe the manner or method of submitting disputes to the board. It does say that "if any dispute is not decided in such conference it shall be referred by the parties thereto to the board," etc.

This is a mandatory provision. It directs that any dispute not decided in such conference shall be submitted to the board. No choice or discretion is left to the carrier and the employees as to whether any dispute shall be taken before the board. The taking of any dispute not decided in conference to the board is imperative and is not made subject to defeat by the whim of either party by requiring a joint submission. The mere fact that Section 301 says that the dispute shall be referred to the board "by the parties thereto" should not be strained to mean a joint reference by the parties, in view of the fact that Section 301 is dealing with conferences between the parties and that Section 307-a and Section 307-b specifically prescribed the manner of making submissions to the board.

Sections 307 (a) and 307 (b) provide the methods of submitting disputes involving grievances, rules and working conditions.

Section 307 (b) defines the method of bringing before the board disputes with respect to wages and salaries.

It is evident that these two sections are intended to cover any and every dispute that may arise between carriers and their employees and all that are covered by Section 301.

It is quite unreasonable to suppose that the act intends to exclude from Sections 307 (a) and 307 (b) any manner of dispute whatever, when no such intimation is given by its language and when no provision is anywhere made for a joint submission of a dispute.

There can be no dispute growing out of the contract relations of a carrier and its employees that does not arise either from rules, wages or grievances. The dispute in question arose from the general dispute in regard to the revision of rules and it directly involved the particular rule as to the conduct of conferences and negotiations. The Transportation Act guaranteed to the employees the right to select their representatives to negotiate for them in the proposed conference, and it became necessary to have a rule of some sort prescribing a method for the selection of such representatives. It was upon this rule that the dispute arose which came to the board. Before and since the passage of the Transportation Act, it has been customary for the schedules of rules agreed upon between carriers and their various classes of employees to contain rules regulating the manner and procedure for changing or revising the rules. It is also a matter of common knowledge that serious disputes sometimes arise in regard to rules that do not directly, but only, incidentally, affect a question of wages or working conditions.

The present docket of the Labor Board is comparatively clear and it is planned to go into executive session for some time to dispose of the important contract cases and wage reduction disputes, hearings on all of which have been completed.

Repair Shop Contracts on the Katy

Hearing on the question of contracts entered into by the Missouri, Kansas & Texas, for the repair of equipment in shops at Sedalia, Mo., Parsons, Kan., and Dennison, Tex., was held before the Labor Board on May 4. The board took jurisdiction over the dispute as one likely to interrupt commerce, on the prayer of the railway employees' department of the American Federation of Labor. A repetition of the argument made at the time the board consented to review

the affair constituted the case of the union at the hearing.

The M. K. & T., it was alleged, contracted for work in its own shops with the A. S. Hecker Co. of Cleveland, the new arrangement to begin April 24. All men hitherto employed by the carrier in those shops were to be discharged and rehired, so far as possible, by the contracting company. The employees pointed out that that would mean the loss of seniority, free transportation and hospital benefits, all of which the carrier admitted, saying only that those things were beyond its control.

W. E. Williams, assistant to the chief operating officer for the M. K. & T., asked that the board dismiss the case. He said the dispute could not be called one likely to interrupt commerce because the shops in question had been closed since January 1, 1922, and because, in spite of that fact, the railroad had been rendering satisfactory service. It could not be supposed, he said, that the few days necessary for the contractor to hire men to fill the places of those who might strike would cause the railroad any major inconvenience. Over 400 men, he said, which were all that were needed, had already signed with the contractors for employment at the Sedalia shops.

White Gasoline Rail Car

A NEW DESIGN of gasoline propelled motor passenger car, having a seating capacity for 41 persons and a baggage compartment, has been developed by the White Company, Cleveland, Ohio. The first car of this type, built for the Union Transportation Company, recently made a demonstration trip over the Pennsylvania Railroad from Philadelphia to Washington, where it was on exhibition during the annual meeting of the American Short Line Railroad Association. The car made daily runs during the

Interior of the Passenger Compartment

convention over the tracks of the Washington & Old Dominion Railway, carrying as passengers representatives of the various short line roads.

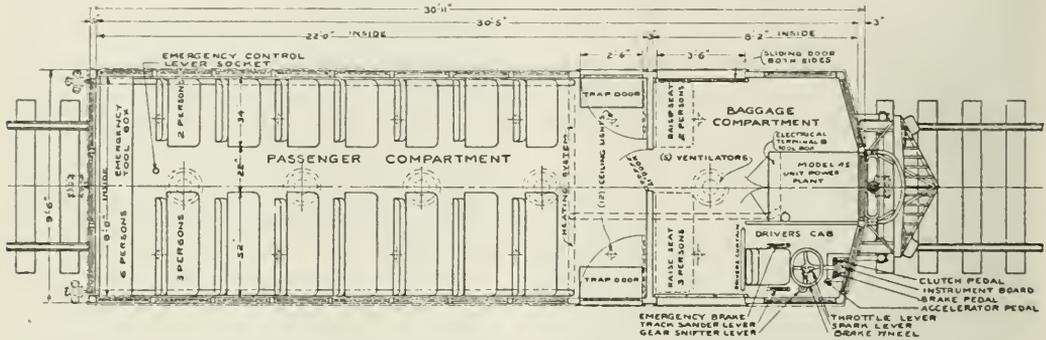

The trips over the Great Falls division of the Washington & Old Dominion were considered a severe test for the car as the road is a succession of grades and curves, the grades running as high as $3\frac{1}{2}$ to 4 per cent and the curves up to 10 deg. The car ascended the grades with ease and a fair speed was maintained even under the most severe conditions. To demonstrate its reserve power the car was brought to a stop on some of the heaviest grades and again started. Under these conditions it accelerated readily and continued to the top of the grades without difficulty.

The new White gasoline rail car has a seating capacity

of 41, with a baggage compartment directly in the rear of the driver who controls the car from the right hand side. The body is of semi-steel construction built by the J. G. Brill Company, Philadelphia. It is mounted on a specially designed White rail car chassis with an I-beam frame. The car has a four-wheel pivotal truck in front and two driving wheels in the rear. It is designed for a speed of 33 miles an hour. This speed was maintained with ease on the

After being exhibited at Washington, the rail car was placed in operation on the line of the Union Transportation Company on a 25-mile run between Pemberton, N. J., and Hightstown.

This same company placed a 29-passenger rail car in service several months ago and its successful operation led to the purchase of the second car of larger capacity. The experience of the Union Transportation Company shows that

Floor Plan of the Car, Showing Arrangement of Compartments and Controls

demonstration run. The speed in reverse is 9 miles an hour.

The motor and transmission are identical with those used in the White motor truck, the engine, clutch and transmission being embodied in a unit power plant. The engine has four cylinders, cast "en bloc," with a 4 1/4-in. bore and a 5 3/4-in. stroke. The transmission is of the selective type with three speeds forward and one in reverse. The operating controls are located on the extreme forward right hand side of the coach. The foot throttle, clutch and drive shaft brakes are operated by pedals. The rear wheel brake and sander mechanism are controlled by levers and the brakes

passengers prefer to ride in gasoline rail cars rather than in steam trains. For this reason the gasoline rail car has been adopted because it offers an opportunity of giving more frequent service at a cost far below that resulting from the operation of short steam trains.

VERY VARIED VALUES.—Interesting examples of unusual sources from which scrap can be reclaimed are furnished by the practice of the Southern Pacific at its central reclamation plant. Sealing wax is obtained from worn-out dry cells; tin drinking cups

Exterior View of the White Rail Coach

on the pivotal truck by a hand wheel. Means are provided in the rear of the coach to disengage the clutch and apply the brakes in emergency. The rear axle has double reduction gear drive. The gears are entirely enclosed and run in oil. The rear wheels are of cast steel with locomotive type steel flanges and annular ball bearings. The seating arrangement and general dimensions of the body are shown in the drawing

and grease cans are made from coffee cans, scrap boiler tubes are threaded or welded and used for water dram lines, air lines and conduits, old shovel blades are made into washers, parline, a by-product of Phisich gas plants, is used for painting the underframes of cars; scrap rope is unwound and used for binding company shipments instead of twine, sediment from acetylene generators is used in place of lime for whitewashing and in the company's steel foundry

C. M. & St. P. Deficit After Charges \$11,070,609

Improves Position Nevertheless by Acquisition of New Lines and Large Amount of Equipment

THE YEAR 1922 PROVED an extremely arduous one for the Chicago, Milwaukee & St. Paul. The final result was a deficit after fixed charges of \$11,070,609. In 1920 the system had a net after fixed charges of \$4,366,071, but in 1920 the road had the advantage of standard return for two months and guaranty for six.

The St. Paul's troubles in recent years have been many. They were evidenced in striking fashion during federal control as is shown by the fact that whereas the property had a standard return of about \$28,000,000, it earned for the government in 1918 a net railway operating income of not quite \$4,000,000, and in 1919 only slightly over \$3,000,000. For 1920 it reported a deficit of \$15,000,000, which had to be made up partly by standard return and guaranty. For 1921 it reported in its December statement to the Interstate Commerce Commission a net railway operating income, or net after rentals, of \$5,117,329, an improvement over 1920, but by no means a sufficient one to keep the corporate net after fixed charges from showing a figure in red of \$11,070,609, as noted above.

Readers of the *Railway Age* are familiar with the St. Paul's outstanding difficulties. They have resulted in great measure from its former policy of over-expansion, the two most important factors of which were its building of the Chicago, Milwaukee & Puget Sound line to the Pacific Coast, and its electrification. It is now generally admitted that both of these projects were carried out away ahead of the demands of traffic. On the other hand, it is also now beginning to be realized that the St. Paul will probably be able to realize on its Puget Sound extension and its electrification as business increases sufficiently. The Puget Sound extension puts the road in a position to handle more business, and gives it an outlet to the west. Electrification will presumably put it in a position to handle this business more efficiently, and the savings in fuel costs will be considerable and important. It still remains the fact, nevertheless, that the St. Paul has thus far not had this increase in traffic, or, to be more exact, the desired increase in traffic density. The increased costs under federal control and the period immediately following, and also the falling off in business in 1921, which for the St. Paul was very severe, therefore, had to be met while the property was still handicapped by having to carry the costs of its greatly increased investment. The result we have seen in the figures which have been given above. Nor is it yet evident that conditions have changed sufficiently in the St. Paul's territory to put an especially favorable aspect on the St. Paul's present operating results.

Showing for 1921

The showing for 1921 was, in brief, as follows: By way of introduction, it should be noted that the St. Paul leased effective July 1, 1921, the lines of the Chicago, Terre Haute & Southeastern, owning 361 miles of line and operating 48 under trackage rights. The earnings and tonnage of this property are included in the St. Paul figures from July 1, 1921.

The St. Paul, in 1921, had freight revenues of \$104,894,848 as compared with \$117,183,815 in 1920, a reduction of \$12,288,968. This reduction was in spite of an increase in the rate per ton mile from 1.029 cents in 1920 to 1.266 cents in 1921; the reduction in tonnage, in other words, was in greater proportion than the reduction in freight earnings.

The passenger earnings totaled \$26,915,456, a reduction of \$4,118,138. The total operating revenues totaled \$146,765,766 as compared with \$168,156,734, or \$21,392,968 less than in 1920. As compared with this reduction in revenues, there was a reduction of \$36,740,119 in operating expenses. The 1921 expenses totaled \$127,957,002 as compared with \$164,697,212 in 1920. The 1921 operating ratio was 87.18. Although too high to indicate a favorable state of affairs, it compared with a ratio in 1920 of 97.64. In connection with the reduction in operating expenses of about \$37,000,000, it should be noted that the reduction in maintenance of way was \$10,823,341; in maintenance of equipment, \$6,013,301, and in transportation, \$19,396,821. The St. Paul does not show figures in its annual report as to the amount of new rail, ballast or ties laid or put in track, so comparisons of this nature must be omitted. With reference to equipment maintenance, it may be said that the condition, as shown by the figures of bad-order cars or unserviceable locomotives, is about average with the rest of the country in the case of cars, and better than average in the case of locomotives.

Reduction in Tonnage

The St. Paul's total revenue tonnage in 1921 was 34,067,136 as compared with 45,041,277 in 1920. The 1921 figures show that the St. Paul's traffic was divided in that year as follows: Products of agriculture, 19.8 per cent; products of animals, 6.1 per cent; products of mines, 33.7 per cent; products of forests, 17.9 per cent, and manufactures and miscellaneous, 17.4 per cent. The most pronounced reductions in tonnage were in products of mines, including particularly bituminous coal and iron ore, in "other ores and concentrates," in lumber, in pig iron and in building materials of one kind or another. The bituminous coal tonnage, which constituted in 1921 19.4 per cent of the total tonnage totaled 6,594,041 as compared with 8,196,798 tons in 1920. The item of "other ores and concentrates" in 1920 showed 3,265,895 tons, or 7.2 per cent of the total. In 1921 this traffic had decreased to but 875,401 tons, or to only 2.6 per cent of the total tonnage. Products of forests showed a reduction from 9,010,252 tons to 6,086,767 in 1921.

It is evident that what the St. Paul needs is tonnage. It did not have this tonnage in 1921. The question next arises as to whether the road's tonnage may have begun to pick up recently. The answer is that it has—slightly. The St. Paul's car loadings are reported separately for the St. Paul and for the Chicago, Terre Haute & Southeastern. The St. Paul's weekly loadings have shown increases in nearly every week of the past few months over the corresponding weeks of last year. The C., T. H. & S. E. is predominantly a coal road and it has been affected by the strike. It showed increased loadings up to April 1, but in the week ending April 15 it loaded only 2 cars of coal as against last year's corresponding figure of 1,411 cars. Insofar as concerns the St. Paul's own increased loadings, the increase in lumber loadings has been especially noticeable—running about 50 per cent. There have also been increases in manufactures and miscellaneous. There is no particular conclusion that can be drawn from all these figures except that it is apparent that conditions at present look better than they were a year ago, although not strikingly better. It may be further noted that the St. Paul had a deficit after rentals in the first three months of 1922, although its March earn-

ings were good. In March there was a net of \$1,055,902, for the three months a deficit of \$287,903. In the first three months of 1921 there was a deficit after rentals of \$2,473,-236.

Acquisition of New Lines

The picture that has been painted of St. Paul conditions is by no means a favorable one. There are, however, some favorable aspects of its activities. These include primarily the lease of the Chicago, Terre Haute & South-eastern, the acquisition of the Chicago, Milwaukee & Gary and the large acquisitions of equipment, all of which should have a favorable effect on the fortunes of the property. As noted above, the Chicago, Terre Haute & Southeastern was leased effective July 1, 1921. This company's lines extend from Chicago Heights south to Terre Haute, Ind., and thence east to Westport. Trackage rights give the line its entrance into Chicago and to Franklin Park, Ill., where connection is made with the Illinois division of the parent company. The line is a coal carrier and gives the St. Paul a traffic in that commodity as well as helping it secure a more favorable fuel supply. To supplement the acquisition of the C., T. H. & S. E., the St. Paul has also acquired by stock ownership the Chicago, Milwaukee & Gary, a line about 100 miles in length. This property is in the nature of an outer belt line around Chicago. It connects with the C., T. H. & S. E. at Delmar and with the St. Paul itself at Kirkland on the Illinois division and at Rockford on the Racine and Southwestern division. Besides permitting the movement of coal from the C., T. H. & S. E. without its going through the congested Chicago terminals, the road is also of value because it connects at Delmar and Mokenca, Ill. with the New York Central and Chicago & Eastern Illinois, thus facilitating the interchange business between these two carriers and the St. Paul.

New Equipment

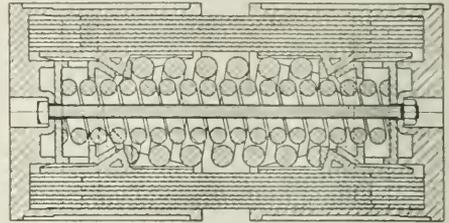

The St. Paul's acquisitions of new equipment have been one of the striking developments of their kind. It is not generally realized just how much the road has done in this connection. The system was allocated by the Railroad Administration 100 Mikado locomotives and 4,000 box cars. In 1920 it ordered from the Baldwin Locomotive Works an additional 100 Mikado locomotives, of which 71 were received that year and 29 early in 1921. There were also received in 1920, 15 electric locomotives. The road then supplemented all these acquisitions with orders placed, in 1921, with the Haskell & Barker Car Company for 1,500 and the Bettendorf Company for 1,000 50-ton steel under-frame gondola cars. It has recently placed additional orders for 25 Mikado locomotives and 4,000 box cars for 1922 delivery. Except for the electrical equipment the new cars and locomotives so far delivered have represented in large measure not so much additions to the former equipment as replacements of old small or weak locomotives or cars. This is shown by the fact that in 1920—in which year the road received 171 steam locomotives, 15 electric locomotives and 4,000 box cars—it eliminated 5 steam locomotives and 3,103 cars. In 1921 it retired 46 steam locomotives and 1,512 cars. The road has also been converting a number of compound to simple type superheated locomotives. It has been devoting considerable attention to improved water stations. The system should be able to make all these things show in reduced operating expenses.

THE CAR-REPAIR SHOPS of the Missouri, Kansas & Texas at Sedalia, Mo., have been reopened under a contract with A. S. Hecker Company, of Cleveland, Ohio. The workmen are to be paid on a piece-work basis. Not many former employees reported for duty.

Hall Multiplate Friction Draft Gear

AFTER MANY experiments and tests to develop a draft gear with the maximum resistance to wear, high capacity, a moderate and positive release, sturdy in construction, simple to manufacture, and easily handled on application and repairs to rolling stock, the Hall Draft Gear Corporation has placed on the market the Hall multiplate friction draft gear.

A friction draft gear of proper design and manufacture

Cross Section Showing Working Parts of the Gear

should meet the following conditions: The resistance to wear should exceed the life of the equipment to which the draft gear is applied. The high resistance should build up uniformly without sticking and jumping so as to keep the sill stresses at a minimum for the shocks absorbed. The release should be moderate and positive so as not to return more shock than necessary to the rolling stock, but at the

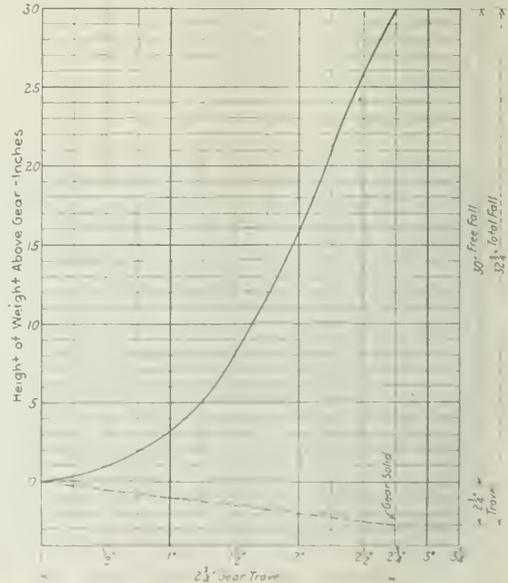

Diagram of Drop Tests of Hall H-2 Gear

same time insure a positive release in order that the draft gear will be ready for operation at any position of the coupler. Sturdy construction is necessary if the draft gear is to give continuous service without repairs, as there is always more or less liability of rough handling of rolling stock. The first cost should be kept down to the minimum; this likewise applies to application and repairs. The draft gear

should be a self-contained unit, as application is much simplified if there are no bothersome loose pieces.

It is a well-established fact that friction tends to increase uniformly with the pressure up to the point at which the surfaces in contact begin to seize and abrasion starts. If the friction pressure is low enough there will be practically no wear and if any occurs, the surfaces will be smooth and uniform.

If the friction pressure is too high, scoring, irregular wearing and rapid breaking down of the friction surfaces takes place, which greatly reduces the capacity and life of the draft gear.

Steel in sliding contact without lubrication will show abraded surfaces at approximately 800 lb. per sq. in. frictional pressure. This will be more or less depending on the hardness of the surfaces; therefore, in order to obtain a high capacity draft gear, using low friction pressure per square inch, it is necessary to have an extremely large friction area. This has been accomplished in the Hall multiplate gear by using soft spring steel plates in multiple.

The Class H draft gear, 9 in. by 12¾ in. by 2½ in., illustrated, has 2,300 sq. in. of friction surface and a maxi-

um amount of this pressure being determined by the pressure of the friction spring, which compresses as the draft gear is closed. The inner spring shown is the release spring, while the outer spring is the friction spring.

As soon as the buffing or pulling load on the housing terminates, the release spring forces the wedges out of contact with the wedge plates, thereby relieving the pressure on the friction plates. The friction spring then moves the housings, friction plates, draft gear attachments and coupler back to position. The release spring is also arranged to work in unison with the friction spring on release.

Due to both ends of the friction spring acting against a pair of wedge plates at each end of the draft gear, and both pairs of wedge plates being forced against the same friction plates, the arrangement allows a comparatively small capacity friction spring to be used in order to obtain a high friction resistance in this draft gear. The lateral pressure, tending to burst the housing, is comparatively small, due to the multiplicity of the friction plates and the small wedging pressures necessary for a high capacity.

In buffing or in pulling, the force is transmitted to the draft gear housings, tending to force one housing against the other. The resistance to this movement is offered by the internal or frictional parts of the draft gear up to the resistance capacity of the gear. With a force beyond this capacity the draft gear housings come in contact and resist further applied forces. The general design of these housings permits making the parts of sufficient strength to protect the frictional elements of the draft gear from damage, and at the same time to resist high buffing or pulling forces which may occur in the handling of rolling stock. The cross-sectional area of the casing is 23 sq. in. and the solid contact area 30 sq. in.

The draft gear is practically weather proof with all wedge arrangements well away from the central opening and can be applied to cars or locomotives with any design of draft yoke or draft attachments that provides a draft gear pocket of the standard dimensions or various existing draft gear pocket dimensions.

The results of tests of the H-2 gear under the A.R.A. 9,000 lb. drop test machine are shown in one of the drawings. A free fall of 30 in. or a total fall of 32¾ in. was required to close the gear. The work done was 24,500 ft. lb. and the work absorbed 23,000 ft. lb.

Car impact tests of the H-2 gear were also made on the Synnington test plant at Rochester, N. Y., using the same 143,000 lb. cars and equipment used by the United States Railroad Administration, so that comparison could be made with published data. The closing speed was found to be 5.23 m.p.h. Slow speed, solid speed and over-solid speed trials were made to study the draft gear action under various conditions. The gear showed favorable results as regards car movements, velocities, energy absorbed, smoothness of action and sill stresses set up.

A Self-Supporting Corrugated Steel Freight Car Roof

A NEW DESIGN of freight car roof of the heavy gage, all-metal type, has been placed on the market by the Sharon Pressed Steel Company, Sharon, Pa. The roof is made of pressed sheets, continuous for the entire width of the car. The sheets are of 14 gage steel, black or galvanized, and 20 to 40 in. wide, the length being made to suit the distance over the eaves. Each sheet has corrugations 1¼ in. deep and 5 in. between centers, extending transversely across the car. These corrugations act as stiffeners and give sufficient strength to support the roof without the use of ridge poles, carlines or purlines, so these

The Hall Multiplate Friction Draft Gear Is a Self-Contained Unit

mum pressure of 250 lb. per sq. in. setting up friction. This gives a mechanical combination which shows very little wear, high capacity and smooth action.

The cross-sectional drawing of the draft gear shows the arrangement of the wedges, wedge plates, springs, friction plates and housings. This draft gear is a self-contained unit without followers or loose pieces. It is symmetrical with respect to all axes and cannot be applied improperly. The standard draft gear is 9 in. by 12¾ in. by 2½ in.; special draft gears 9 in. by 12¾ in. by 18½ in., 8½ in. by 12¾ in. by 15½ in. and 12¾ in. by 15 in. by 2½ in., are built to interchange with existing sill pockets. The latter size is for 100 ton and heavier equipment, the spring capacity having been doubled and the friction area greatly increased in order to give approximately double the capacity of the standard draft gear.

The draft gear casing may be described as two identical cast steel housings with open ends towards each other, separated 2¾ in., or whatever travel the draft gear is designed and set up for. The friction plates are rolled steel of 0.60 to 0.70 per cent carbon content, alternately arranged to move in unison with the housings due to contact at one end of each plate. The weight of the standard gear is 470 lb.

Frictional resistance is created by pressure applied on these friction plates when the draft gear housings are forced towards each other. This pressure is applied by a wedge at each end of the draft gear which moves with the housing, forcing a pair of wedge plates against the friction plates,

parts are omitted except for one carline at each side of the door opening to stiffen the car frame.

The pressed steel sheets are laid with an overlap of one corrugation at each end. They are attached at the sides of the car to a pressed side plate, being riveted with short

length. Each 40 in. sheet of 14 gage steel when securely fastened at the side plate will carry the following loads concentrated at the center or eaves: for cars 9 ft. wide, 940 lb.; for cars 9 ft. 6 in. wide, 890 lb., and for cars 10 ft. wide, 845 lb. The tensile strength to resist spreading at the sides is 40,000 lb. per sheet. The roof has sufficient play to take care of weaving of the car frame due to uneven track or unbalanced loading. The surface provides a firm foothold in case it is necessary for trainmen to walk at the side of the roof. The overlapping sheets make a watertight construction. No leakage was found even when the roof was tested with a heavy stream from a hose. In case a sheet needs to be replaced, it is only necessary to remove the rivets along each side, cut four rivets in the overlapping sheet and four in the clips.

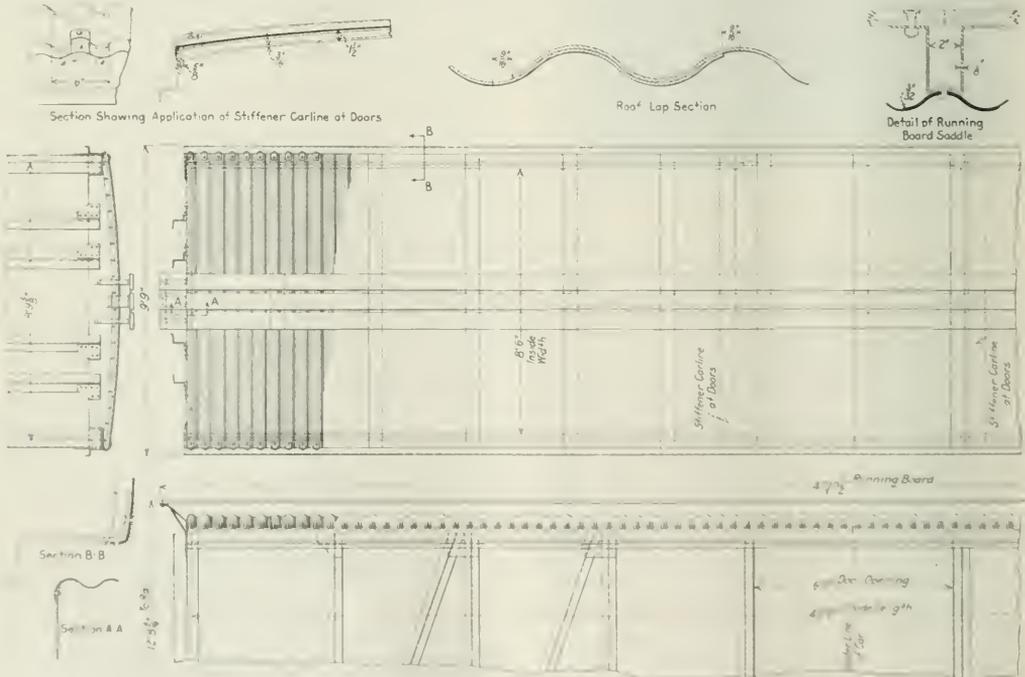

For new cars this roof can be assembled at the manufacturer's plant and shipped as one piece ready for application to the car frame. When used for repairs the roof is applied in sections and, if desired, can be furnished with sheets of 22 gage steel to be put on over the existing carlines and purlines.

Sharon Pressed Steel Roof as Applied to the Car

angle clips outside the sheet, as shown in the drawing. The side plate is of 3/16 in. or 1/4 in. material and is made continuous from end to end of the car. The design can be adapted to any type of car construction. A side plate of this type is approximately four times as strong as the 5/16

TRANSPORTATION WILL HAVE a prominent place in discussions at the tenth annual meeting of the Chamber of Commerce of the United States to be held in Washington May 15-19. The railroad group session will be held on the afternoon of Tuesday, May 16, and experience under the transportation act, with special ref-

General Arrangement and Sections of the Sharon Roof

in by 4 in by 4 in angle commonly used for this part, and is also lighter by about 120 lb. per car. The special end flange used with the roof is of one piece, pressed to engage the end roof sheet, and riveted to the side plates. The running board is supported by light pressed steel saddles.

The roof complete weighs about 70 lb. per foot of car

erence to the rate-making provisions and the financial provisions of the act, will be the topic. On the same day two other groups will discuss transportation, one dealing with highways and the other the merchant marine. All of these three groups will combine on the second day to talk of the international phases of the transportation situation.

Safety Section of A. R. A. Holds Meeting in Chicago

Large Attendance Discusses Plans Preparatory to Launching Nation-Wide Crossing Campaign

WITH THE INAUGURATION of a four months' campaign of nation-wide scope for the prevention of deaths and injuries at highway crossings as its chief topic, the Safety Section of the American Railway Association met at the Congress Hotel, Chicago, on May 3, 4 and 5. This was the second convention of this section, it having been established on June 27, 1921. E. M. Switzer (C. B. & Q.), chairman of the section, presided and J. C. Caviston, New York City, secretary of the section, acted as secretary. There were about 200 members and guests in attendance. W. M. Jeffers, general manager of the Union Pacific, addressed the meeting on the first day and C. H. Markham, president of the Illinois Central, on the second day. Two hundred twenty-three roads, operating 289,546 miles of line, are members of the section.

The Committee of Direction is to adopt a standard design of a proper end guard for gang motor cars and has endorsed the recommendation of the Mechanical Division Committee, to the effect that freight cars with drawbar yokes not equipped with lips should be rejected in interchange; this in view of accidents resulting from the bolts or rivets holding the yoke to the drawbar shearing off and permitting the coupler to fall to the track. The committee is making a canvass of the injuries sustained by employees in handling uncrated disk harrows, with a view to recommending that the crating of such shipments be required. The committee approved the proposal to provide proper means to permit men to pass over open top cars loaded with boxed automobiles, or similar freight.

This last point aroused considerable discussion. R. C. Richards (C. & N. W.) contended that little climbing over cars is done when a train is in motion; that the proposed rule was impracticable and that few accidents are attributable to such causes. R. J. Clancy (S. P.) and M. A. Dow (N. Y. C.), coincided in this view; and, after further discussion, the proposal was disapproved.

The Goggle Question

Secretary Caviston presented the report of the sub-committee on goggles, which had sent out a questionnaire. It appears that 74 of the 75 roads making replies require or request employees to wear goggles when doing work dangerous to the eyes. Of these, 27 reported the enforcement of the requirement through discipline. The majority of the 74 roads furnish goggles to each workman for his exclusive use. About 15 different makes of goggles are in use, there usually being three styles, one for welders, one for boiler-makers and one for other crafts. The committee concludes that general provisions for education and compulsion are not entirely successful; it is necessary to remove the objections to goggles in each individual case.

Discussing experiences, L. F. Shedd (C. R. I. & P.) said that while some injuries have been sustained on his road when goggles were worn, no eyes have been lost. J. W. Kreitter (D. M. & N.) said that among the 1,200 men engaged in hazardous occupations on his road, of whom 99 per cent wear goggles, no eye accidents have occurred in five years. On some roads trainmen are required to wear goggles. L. G. Bentley (B. & O.) strongly advocated providing individual goggles and grinding of lenses to suit the eye as determined by optical tests. E. S. Chapin (Penn.) explained how the objections of men could be met by modifications in the goggle. C. O. Cott (H. V.) said that the change from

the ear type fastening to the elastic headband fastening had removed the main objections.

Report on Statistics

In presenting the statistical report, T. H. Carrow (Penn.) stated that this committee is working in close touch with the Bureau of Statistics, I. C. C., and has already obtained a number of desired modifications of the government requirements; accidents in maintenance of way work are to be separated from others. The committee has compared the accident reports of different roads and has taken measures to overcome what appears to be a lack of uniformity in reporting.

R. C. Richards (C. & N. W.) cited a record where, in 1920, fourteen of the employees killed and 1,840 of the injured were new men. Accident reports should show the number of accidents to such men.

Mr. Carrow said that such figures will be valuable in explaining the increase in casualties which will probably occur when traffic revives.

F. N. Metcalfe (N. P.) suggested that statistical information should show in detail what accidents cost; but this did not find favor.

The Committee on Publicity and Education made a report. Its chief activities have been the preparation of bulletins from time to time pertaining to particularly dangerous practices. Articles for employees' magazines and for newspapers have been prepared. Progress has been made in establishing a motion picture library as recommended at the first convention. These films will be obtained from a number of roads, from manufacturers of railway supplies and by purchase. It is planned to obtain 30 films as a nucleus for the library. M. A. Dow (N. Y. C.) presented this report.

C. H. Markham Addresses the Section

One of the most interesting features of the convention was the address, at the opening of the second day's session, by C. H. Markham, president of the Illinois Central. He opened with the statement that no branch of railway organization has been more successful in its work than the safety section and emphasized the fact that there were fewer accidents on American railroads in 1921 than in any previous twelve-month in 32 years, notwithstanding an increase in the number of employees of 130 per cent, in passenger traffic of 223 per cent, and in freight traffic of 346 per cent. This is one of the most helpful things being said about railways at the present time. Referring to accidents at highway crossings, "the weakest spot," Mr. Markham showed that in 30 years fatal injuries occurring at railroad crossings have increased 345 per cent and injuries, 632 per cent. Of the 1,907 persons killed and the 4,961 injured in crossing accidents in 1920, about 70 per cent resulted from automobile accidents. Records kept by the Illinois Central for several years disclosed the fact that more than half of the automobile accidents originated on the fireman's side of the train. Mr. Markham pointed out the small amount of improvement possible by the construction of bridges; it would take over 600 years to complete the work if it were conducted on the basis of the 339 crossings eliminated in 1919. The public must cooperate in bringing pressure to bear upon all drivers of motor cars. In the crossing campaign conducted by the Illinois Central in 1916, seventeen towns and cities passed crossing ordinances and one state enacted a law. It is astonishing, said Mr. Markham, that "Stop, Look and Listen"

laws, with teeth in them, have not been passed by all states, towns and cities. He expressed the hope that this organization would accomplish important results along these lines.

The Careful Crossing Campaign

Following Mr. Markham's address the section spent the greater part of the remainder of the day in the discussion of plans for the campaign to prevent accidents at highway crossings. H. A. Rowe (D. L. & W.) presented the report of the committee, submitting a complete plan of organization. "Cross Crossings Cautiously" will be the campaign slogan for use on all bulletins, circulars and posters. The conspicuous feature of the campaign will be a universal three-color poster bearing a picture of an impending crossing disaster. Four sub-committees are provided for, one of which will co-operate with all national organizations. A second one will prepare all matter for printing, including the obtaining of articles from prominent persons throughout the country, while a third will arrange for the distribution of all the printed matter. A fourth will receive and handle all suggestions relative to the physical condition of crossings and movements over them. It is the plan also to make frequent observations at important crossings, to direct personal notices to all persons found careless at such points, and to receive and disseminate statistics on the progress of the campaign.

Mr. Rowe contended that the success of accident prevention at crossings cannot be looked for from legislation exclusively; the railroads must try to enlist the personal interest of every citizen.

The discussion was devoted chiefly to the details of the proposed work and contained little for record, aside from certain remarks made by T. H. Carrow (Penn.), who reviewed interesting studies made on his road relative to the speed of trains in crossing accidents. Of 366 accidents, two-thirds happened where trains were running at speeds of less than 30 miles an hour.

The Foreman's Responsibility

The last day's program was devoted to a general discussion of several prearranged subjects relating to safety work, the first being the question of the responsibility of foremen and others in supervisory positions for injuries to men working under them. In opening the discussion, F. H. Babcock (P & L E.) contended that the foremen must be relied upon to set the example for the others in safety work. It is only proper, in holding foremen responsible for the regular work in their department, to hold them also responsible for safety supervision. E. S. Chapin (Penn.) cited instances wherein insurance companies definitely asserted themselves with respect to proposed changes of foremen; and A. V. Rohweder (D. M. & N.) told of the results obtained on his road when responsibility was fixed upon foremen for safety results. While endorsing these opinions, M. A. Dow (N. Y. C.) cautioned against fixing responsibility upon foremen without at the same time arousing in them a personal interest in the safety work; a sentiment which was warmly applauded.

Motor Car Accidents

The second subject presented for discussion was that of controlling injuries arising in the use of motor cars. A. O. Ridgway (D & R G W.) told how an extended study on his road had disclosed that most accidents occurred at the starting of cars. This problem was largely met by equipping every car with a sufficient number of grab irons. Other steps which proved effective were the supplying of suitable hand holds for use while riding, and guards at the edge to prevent tools from falling off while the cars are in motion, also the placing of restrictions on speed. At this point Chairman Switzer stated that as a result of the section's recommendation last year concerning the use of end guards on cars, 1,000 cars had already been so equipped, to his knowledge. Fol-

lowing Mr. Switzer, F. C. Hunter (U. P.) told how, after an unusually large number of accidents on a certain division, personal visits were made to every motor car driver; each was given to understand that he was to be held strictly accountable for accidents arising from his car; and the trouble was completely overcome. Also, all motor cars were equipped with safety devices, including wheel guards; and for a time all cars were required to be brought to a full stop at grade crossings. The latter order was amended three months later to require stops only at obscure crossings, while requiring speed to be controlled at all others.

L. F. Shedd stated that the Rock Island had put railings upon all of its 1,800 cars, since which there has been a marked reduction in motor car accidents. He suggested that the Interstate Commerce Commission be requested to segregate motor car accidents from others.

Miscellaneous Topics

The remaining subjects discussed by the section pertained to the control of injuries arising from riding leading foot-boards on locomotives, the advisability of posting names in accident bulletins, the control of injuries to car repairers, and the control of injuries in handling rails. Some were opposed to a rigid rule against riding on foot-boards, but there was a general agreement that there should be some restriction. A poll disclosed that a dozen or more roads have rules, more or less strict, regarding this practice.

No disagreement was expressed regarding the claim that names of the injured should not be bulletined unless in peculiar instances and with the injured man's permission, but some controversy arose in regard to the protection of car repair men while at work. Attacking the statement of Robert Scott (A. C. L.) that the adherence to the blue flag rule causes a loss of time, L. G. Bentley (C. & O.) insisted that its rigid observance should be adhered to. W. D. Lending (B. & O.) contended that the blue flag rule was not sufficient in itself; all repair tracks should be kept locked. Enlarging upon this, S. J. Campbell (C. G. W.) pointed out the value of guarding against faulty jacks and of making regular inspection of carmen's tools.

The discussion of the subject of handling rails concluded the proceedings of the convention. Team work among the men in any task of this kind is of the first importance; also constant watchfulness on the part of the foreman and close co-operation on the part of the power operator. J. F. Grodzki (O-W. R. & N.) emphasized the importance of instructing green men and of holding meetings for this purpose immediately after receiving a report of an accident.

The following officers were chosen to serve during the coming year: Chairman, J. T. Broderick, superintendent, safety department, Baltimore and Ohio; first vice-chairman, Isaiah Hale, safety superintendent, Atchison, Topeka & Santa Fe; second vice-chairman, D. H. Beatty, superintendent of safety, Southern Railway System, and secretary, J. C. Caviston, 30 Vesey street, New York City.

THE CITY OF BUFFALO proposes to take action in the courts to compel the New York Central to install gates at four grade crossings; those at Genesee, Church, Erie and Seneca streets. These are now guarded by flagmen.

F. F. GRABLE, president of the United Brotherhood of Maintenance of Way employees and railway shop workers, has called a conference, to be held at Atlanta on May 16, to discuss the withdrawal of the skilled men in that branch of the service in the south-east. The invitation has gone to all general chairmen and vice presidents on the different railroads in the southeastern and Pocatamos districts. J. O. Raley, formerly an international vice president of this organization, who was chosen president of the order of skilled railway maintenance of way employees at a meeting held in Atlanta a few weeks ago, is looked upon as an outlaw.

General News Department

J. E. Fairbanks, general secretary, announces, on behalf of the Committee on Relation of Railway Operation to Legislation, of the American Railway Association, that the law of Maryland which repeals the full-crew law of that state, will go into effect on June 1, and that the similar law in New Jersey goes into effect on July 4.

The House committee on interstate and foreign commerce on May 3 reported favorably without amendment the bill recently passed by the Senate, S. 539, to strike out of the valuation act the requirement that the Interstate Commerce Commission shall ascertain and report the so-called excess cost of acquisition of railroad lands.

The New York Sectional Committee of the signal section of the American Railway Association will meet at Hotel McAlpin, Broadway and 34th street, New York City, on Thursday evening, May 18, to listen to an address by Robert C. Johnson, signal engineer, Brooklyn Rapid Transit Company, on "A Scientific Method of Locating Automatic Block Signals for a Railroad of Heavy Traffic."

An Assistant Railroad Engineer is one of the positions named by the Civil Service Commission of the State of New York in announcing examinations for candidates, to be given on June 3. An appointment to this position is to be made by the Public Service Commission; salary \$3,200. Candidates must have had six years' experience in connection with the maintenance and construction of steam railroads, or equivalent qualification. Graduation from a civil engineering course of a school of the highest standing will be counted as two years of experience. Applications should be sent to the Civil Service Commission, at Albany, before May 22.

May Meeting of New York Railroad Club

W. L. Bean, mechanical assistant of the New York, New Haven & Hartford, will deliver a lecture on Some Recent Developments in Gasoline Driven Passenger Rail Cars before the New York Railroad Club on May 19. The meeting will be held at the Engineering Societies' Building, New York, at 8 p. m. Mr. Bean's lecture will be illustrated by slides and motion pictures.

Special Train from Chicago for June Convention

For the convenience of persons going to Atlantic City to attend the convention of the Mechanical Division of the American Railway Association, which meets from June 14 to 21, inclusive, the Pennsylvania System will run a special train leaving Chicago at 1 p. m., central time, on June 12 and arriving at Atlantic City at 10:45 a. m., eastern time, on the following day. The train will consist of club, open section, drawing room and compartment cars, and a dining car.

Stone and Shepard Urge Election of

Right Men to Avert Walkouts

Strike at the ballot box and you will not have to strike in your employment was, in substance, the advice given to the Order of Railway Conductors at their annual convention held in Cleveland, Ohio, last week, by L. E. Shepard, president of that organization, and Warren S. Stone, president of the Brotherhood of Locomotive Engineers. Both speakers also urged the members of the Ladies' Auxiliary to enter politics.

"I warn politicians, I warn any administration, state or national, that attempts by legislation to tie the hands of the workers is fraught with dangerous possibilities," President Shepard said, while Mr. Stone stated: "The place to strike and the time to strike is on election day at the ballot box. When you do that and send men to Washington to represent you and not misrepresent you, you will not need to strike."

Former Secretary of War. Newton D. Baker, said the "civiliza-

tion of America is a railroad civilization." He complimented railroad workers for their service within the firing zone during the war.

Fuel Association Convention

The International Railway Fuel Association has adopted a novel plan for the sessions of the annual convention to be held at the Auditorium Hotel, Chicago, May 22-25, which it is thought will add to the value of the meeting. Following the presentation of the papers, written discussions will be read after which an open forum will be conducted giving all who are present at the meeting an opportunity to speak. No stenographic report of the informal discussion will be made but opportunity will be given to submit written discussions to the secretary of the association which must be sent in not later than June 15. The officers of the association anticipate that this plan will call forth freer discussion, speed up the program and expedite the issuing of proceedings.

"Summer Time"

Changes in the time of passenger trains made on April 30, to accommodate the large number of cities and towns that adopted "Summer Time" on that day, were so numerous that the Official Guide was obliged to reset about 25 per cent of its time-table pages for the May issue; but the book came out on May 10, nevertheless. The total number of time-tables received for correction in that issue of the Guide was about 500, something less than 400 of these taking effect on April 30. Most of the changes in the United States were east of the Mississippi river, but in Canada the change took effect from ocean to ocean.

On the Long Island Railroad and on the eastern division of the Erie, time-tables were not changed on account of daylight saving time, the clocks being set to the Sixtieth meridian, to correspond with the clocks used by citizens generally.

A Look Ahead

The people rule the railroads; if they appreciate their responsibility they will take up this duty seriously at its primary stage, the ballot, by which must be selected the right agents to carry out the people's wishes. This was the burden of an address by Elisha Lee, vice-president of the Pennsylvania Railroad, before the Transportation Club of New York city, on May 5.

Mr. Lee presented a hopeful view of the future of American railroads. Motor and air transport competition is more likely to be beneficial than harmful. He believes the people will retain private ownership and will learn how to regulate constructively. He sees a trend away from paternalism and in the direction of restoring the initiative of management. In closing, he said: "The neglect of the ballot is the peril of Americanism. How is it that we have permitted ourselves to be dragged so far into communistic and socialistic experiments in the last few years? Why do we permit thrift, industry, enterprise, and intelligence to be robbed of their fruits? . . . A large proportion of the people who ought to be our most solid and substantial citizens fail in the primary obligation of citizenship—that of exercising the right and the duty of the ballot. And we particularly need to exercise jealous care in the place where so many of us fail—at the primary elections. Often barely one voter in four or five takes part in them. Yet it is at the primaries that the office-holders are really chosen. If we get good Americans on all tickets the country cannot very well go far astray in the final elections. We must preach everywhere the importance of getting substantial thinking people to go to the polls at every election and to pay especial attention to the primaries. . . . I do not think Providence intended this great country of ours to be run by, or chiefly in the interest of, the disgruntled, the envious, the failures, the incompetents, the lazy, the indifferent, the culls, the resentful, the inefficient, or the visionary. . . ."

*Deficit due to adjustment.

Wage Statistics for February

The Interstate Commerce Commission reports that the number of employees reported by Class I roads for the month of February, 1922, compared with January returns, shows a decrease of 6,974. Compensation decreased \$10,655,212. Compared with the same month last year the employment shows a decrease of 131,503. A comparison of the number of employees and their compensation, by months, for the period covered by the new classification follows:

CLASS I STEAM ROADS

Month	Number of employees	Total compensation
July, 1921	1,634,872	\$214,339,385
August, 1921	1,679,927	227,745,895
September, 1921	1,718,330	223,972,822
October, 1921	1,754,136	237,602,959
November, 1921	1,732,353	225,394,006
December, 1921	1,637,151	214,921,396
January, 1922	1,552,014	205,178,639
February, 1922	1,545,040	194,523,427

*Excludes Detroit, Toledo & Ironton Railroad.

Two Years' Work of the Labor Board

During the first two years of its existence the United States Railroad Labor Board passed upon 632 questions, according to a report which it has just prepared. In the calendar year 1920 it issued 42 decisions, 14 interpretations, and 6 addenda, while in 1921 it prepared 539 decisions, 17 interpretations, and 14 addenda. During the latter year the board issued two major decisions applicable to rules governing the working conditions of employees, Nos. 222 and 501, the first covering shop craft employees and the latter maintenance of way workers. Since the first of the present year the board has rendered additional decisions governing the working conditions of clerical workers, signalmen, train dispatchers, express employees, trainmen and oilers, supervisors of mechanics and telegraphers.

Decision No. 2 of the board, which was issued on July 20, 1920, and was retroactive to May 1 of that year, covered 140 parent companies and their subsidiaries, and several terminal companies, the exact number not being known. Decision No. 33 (electric lines decision) affected 11 companies, while Decision No. 108 (short line decision) was applied to 67 companies, the three decisions enumerated above totaling 235 companies in all. It is estimated by the board that the annual increase in payrolls due to Decision No. 2 amounted to \$558,180,134.56, this figure covering straight time earnings for all employees except those engaged in train and engine service for whom all time was taken into consideration. The estimated annual decrease in the payrolls due to Decision No. 147 amounted to \$378,004,675.80, this figure also covering straight time earnings for all employees with the exception of those in train and engine service as mentioned above.

The number of employees in the service of the companies has fluctuated widely. The compensation report compiled by the Interstate Commerce Commission for the month of December, 1921 shows that there were then 1,372,151 men in service, while the report for August, 1920, gives the number as 2,197,784, these figures indicating the minimum and maximum employment. The decisions rendered by the board during 1920 and 1921 involved 45 employees' organizations.

Wage Statistics for Last Half of 1921

The Interstate Commerce Commission has issued a consolidated statement of its wage statistics of American railroads for the six months July-December, 1921, during which its new classification of railroad employees was in effect, as well as the reduction of wages ordered by the Railroad Labor Board effective on July 1. The average number of persons in the employ of the railroads for this period shows a decrease of 416,384, or 19.7 per cent, as compared with the same period of 1920. Compensation decreased \$60,829,775 or 33.9 per cent. The average number employed at the middle of the month was 1,692,794 and the average number of full-time positions was 1,592,755, while the total compensation for the six months was \$1,343,886,463, of which \$70,478,076 represented overtime and \$55,487,464 "other compensation." In the next column a table is shown giving a recapitulation, to which has been added a column showing the average earnings per employee per month

COMPENSATION OF RAILROAD EMPLOYEES, HALF YEAR

Group	Straight time actually worked	Per cent of total compensation earnings	Overtime paid for	Per cent of total compensation earnings	Daily or hourly earnings	Other compensation	Average earnings per employee per month
I. Executives, officials, and staff assistants..	Daily basis \$37,994,940	99.62	\$1,959	\$8.99	\$142,791	\$38,139,690
Daily basis	48,741,518	6.73	258,405	1.69	5.13	1,396,263	50,139,846
Hourly basis	153,962,347	93.20	3,110,484	1.69	58	9,256,614	167,299,445

Total number of employees and compensation.....	1,592,755	70,478,076	1,692,794

Railroad Committee Makes Recommendations Regarding Consolidation Hearings

Railroad counsel from all parts of the country met at Washington on Tuesday to consider recommendations to the Interstate Commerce Commission as to the character of the basic data which should be furnished by the railroads in the hearings on the commission's tentative consolidation plan. The recommendations of the roads were then presented on Wednesday to Commissioner Hall by a sub-committee of six, headed by R. V. Fletcher, general solicitor of the Illinois Central, and including S. T. Bledsoe, general counsel of the Atchison, Topeka & Santa Fe; J. P. Blair, general counsel of the Southern Pacific; L. E. Jeffries, vice-president and general counsel of the Southern; E. S. Jonett, vice-president and general counsel of the Louisville & Nashville, and B. B. Cain, vice-president of the American Short Line Railroad Association. The date for the resumption of hearings was also considered. The hearing on April 24 on that part of the tentative consolidation plan applying to the Southeast was adjourned because the railroads had not understood what information the commission desired and most of them had nothing to offer except as they had objections to point out to the tentative plan.

Bureau of Mines Investigating Coal Storage

The obvious importance of a clear understanding today of all elements involved in the storage of coal, for industrial and other purposes, has led the Bureau of Mines, in conjunction with the Department of Commerce to undertake an investigation of the question in which co-operation and advice of the railroads is earnestly requested.

While there has been much agitation of the possibilities of coal storage in the way of giving more regular mining and movement of coal, but little exact information is available especially regarding costs of handling and transportation in and out of storage, as well as of the investment, fixed charges, etc., involved.

The bureau requests therefore that the railroads give it the benefit of their views and conclusions on the various items listed below, calling attention particularly to the value of exact data and actual working costs. The various items to be covered are as follows:

Method of storage.

- Under water or not—
- Closed sheds or in the open—
- Kind of floor or ground.

Location of storage with reference to point where coal is to be used.

Quantity stored, maximum—average.

Spontaneous combustion, methods of preventing.

Handling fires, method of

Devices used for observing temperature and inspection.

Danger point as regards temperature.

Deterioration in sizes and also in heating value in stored coal.

In your practice what tonnage can be stored per acre of available space.

Depth of pile, maximum allowed.

Kinds of coal stored.

District from or trade name.

Size stored.

Is coal screened before storing.

How long coal must be stored.

Best time of year to store.

Cost of storage plant and cost of maintenance.

Cost of handling in and out of storage.

Transportation to pile.

Transportation from pile to point of use.

Effect of climate on stored coal, if any.

Costs of unloading and reloading.

Method of handling in and out of storage.

Cost of investment and fixed charges.

Compliance with this request will be greatly appreciated and any data furnished will be treated as confidential, if so desired. All communications should be addressed to F. R. Wadleigh, commercial engineer, Bureau of Mines, Chief, Coal and Coke Section, Fuel Division, Department of Commerce, Washington, D. C.

E. F. GRABLE, president of the United Brotherhood of Maintenance of Way Employees and Railway Shop Laborers, has called a conference, to be held at Atlanta on May 16, to discuss the withdrawal of the skilled men in that branch of the service in the southeast. The invitation has gone to all general chairmen and vice presidents on the different railroads in the southeastern and Pocahontas districts. J. O. Raley, formerly an international vice president of this organization, who was chosen president of the Order of Skilled Railway Maintenance of Way Employees at a meeting held in Atlanta, Georgia, a few weeks ago, is looked upon as an outlaw.

Traffic News

The Chicago & North Western and the Union Pacific announce that the Denver Special, between Chicago, Ill., and Denver, Colo., will be restored on May 28.

The Marion (Ohio) Traffic Club elected the following officers at its annual meeting on April 13: President, D. R. Biggert, Marion National Mill; vice-president, M. B. Lindsay, Ohio Locomotive Crane Company; secretary, W. R. Ankland, Marion Steam Shovel Company, and treasurer, S. D. Ross, Huber Manufacturing Company.

The New York, Chicago & St. Louis has put on a new through daily passenger train each way between Chicago and Buffalo, with sleepers to and from New York over the Delaware, Lackawanna & Western. The eastbound train (No. 6) leaves Chicago at 2:40 p. m. and the westbound train connects with Lackawanna train No. 7, leaving New York at 6:30 p. m.

The Wisconsin State department of markets, Madison, has begun a movement to organize shippers for the purpose of "shipping intelligently," and incorporation papers of the "Wisconsin Agricultural Traffic Association" have been made out and filed. A campaign has been started to enlist the shippers of the state, especially farmers, as members. The state railroad commission, the federation of cheese-producers, the state branch of the American Society of Equity, the Wisconsin Farm Bureau Federation and other agricultural organizations are co-operating with the marketing department. W. P. Jones is in charge of organization. Memberships are being sold to individuals and corporations engaged in shipping farm products for \$25 a year. It is proposed to furnish members with complete information as to routes, tariffs and other transportation essentials; to provide for the adjustment and collection of overcharges in transportation of freight, baggage, express, or passengers; adjustment of claims for loss or damage, and prosecution of proceedings before rate committees or commissions.

Cheaper Sleeping Car Privileges

The railroads west of Chicago have modified their tariffs so that now only one railroad ticket is required from a passenger desiring to hold a section in a sleeping car; and two fares will be sufficient for a drawing room. Hitherto a passenger occupying a section had to have one and a half railroad tickets. The eastern lines have filed tariffs making the same change which, it is expected, will be allowed to go into effect on May 15.

Coal Production

Production of coal has struck a temporary level a little above the 4-million-ton mark, according to the weekly bulletin of the Geological Survey. The output for the week of April 29 was 4,150,000 tons, and early reports indicate that the week of May 1-6 will show a like amount. Production of anthracite remains practically zero.

The total output of all coal—anthracite and bituminous—in the fourth week of the strike (April 24-25) was 4,156,000 tons. In the fourth week of the 1919 strike 5,334,000 tons of bituminous coal, and 1,759,000 tons of anthracite were produced, a total of 7,093,000 tons. Current weekly output of all coal is therefore running some 3,000,000 tons short of the 1919 experience.

Much the same rate of production obtained last week (May 1-6), the fifth of the strike. No significant break in the ranks of striking miners has occurred, although a small number of men have gone back to work in Texas. The number of non-union men on strike has not changed materially. The accumulation of unbilled cars of coal is slowly decreasing, but is still above normal. Demand is stiffening, and the latest district to report improvement is the Middle West, but the market is still not active enough to call out full production from mines remaining at work.

Day	1st week	2d week	3rd week	4th week	5th week
Monday	11,445	10,772	7,898	12,131	11,919
Tuesday	11,019	10,658	10,041	12,377	12,120
Wednesday	11,437	10,961	11,088	12,622	12,810
Thursday	11,090	11,462	11,193	11,981	12,460

Saturday	8,888	8,501	10,194	11,295	

Commission and Court News

Interstate Commerce Commission

The commission has suspended until September 7, the operation of schedules which propose to reduce the rate on cement from Leeds, Ala., to Richmond, Va., from 20 cents per 100 lbs. to 21½ cents.

The commission has suspended until September 7, the operation of schedules published in a supplement to Agent F. A. Leland's tariff which propose to increase and reduce rates on cottonseed oil from various Oklahoma producing points to various Louisiana points.

The commission has suspended until September 7, the operation of certain schedules published by the Merchants & Miners Transportation Company, which propose increases in the rates on leather boots and shoes of 9½ cents per 100 lbs. from Boston, Mass., and Providence, R. I., to Petersburg, Richmond and South Richmond, Va.

The Interstate Commerce Commission has set aside its orders making increases in intrastate rates within the state of Texas to correspond to the interstate increases ordered by the commission in Ex Parte 74, because the Texas commission by an order entered April 26 has itself prescribed for observance after May 15 the increased rates ordered by the federal commission. The commission has also denied a petition for a re-hearing of the Texas case filed by the railroads.

The Interstate Commerce Commission

Now Working on Daylight Saving Schedule

Because the government departments at Washington are going on a daylight saving schedule on May 15 the Interstate Commerce Commission has announced that its hearings at Washington, which usually begin at 10:00 a. m., will begin at 9:00, and arguments, which usually begin at 10:30 will begin at 9:30. The hands of the clock are not to be changed but the government offices and business institutions of the city are to go to work an hour earlier and close an hour earlier.

Certificates of Public Convenience

Not Confined to New Lines

The Interstate Commerce Commission in conference on May 8, 1922, rescinded the following conference ruling which was adopted on April 8, 1921:

That the applications which must be made to the commission for certificates of public convenience and necessity under paragraph (18) of section 1 of the Interstate Commerce Act are confined to new lines of railroad and extensions of lines of railroad to be constructed, or put in operation in interstate or foreign commerce, by carriers subject to the act, subsequent to the effective date of the paragraph, and to lines of railroad in interstate or foreign commerce, except that the term "abandon," as used in the paragraph applies to any line of railroad or portion thereof owned or operated by a common carrier subject to said act, and means entire cessation of operation thereof in interstate or foreign commerce; and that any such certificate granted by the commission applies to the property covered thereby, regardless of any change in the owner or operator of the property which may take place after the certificate is granted.

That it is not necessary to secure from the commission a certificate of convenience and necessity for the acquisition of an ordinary trackage right, or for the discontinuance of the use of such trackage right, provided such discontinuance does not result in withdrawal of all service to the public upon the road or part of road over which such trackage right is exercised.

It is understood that this withdrawal will remove some questions which have arisen on applications for approval of the acquisition and operation of existing lines.

State Commissions

The Memphis, Dallas & Gulf has petitioned the Arkansas Railroad Commission for permission to take up its track between Nashville, Ark., and Hot Springs, 86 miles. Hearings were held on April 26 and 27 and the records have been forwarded to the Interstate Commerce Commission for further action.

The Arizona Corporation Commission has denied the application of the Arizona & Swansea for leave to dismantle and abandon its line. The road extends from Bouse, Ariz., to Swansea, a distance of 21 miles, connecting with the Atchison, Topeka & Santa Fe at the former point. It was constructed in 1910 to serve the Clara Consolidated Gold & Copper Mining Company, located at Swansea. The commission decided that inasmuch as the scrap value of the road was small, and, that there is a better outlook for business within that territory, it would be to the interest of all parties concerned to maintain the line.

Court News

Abandonment of Branch Not Special Injury to Shipper

The Montana Supreme Court holds that a mining company situated on a branch railroad cannot, in the absence of an express contract, claim damages for the abandonment of the branch because it has constructed and maintained a track at its own expense, though the branch was constructed specially to serve the mining company.—Helen & Livingston I. & R. Co. v. Northern Pacific (Mont.), 204 Pac. 370.

Employee, Denied Passage on Pass,

Has No Right to Become Blind Passenger

The Wisconsin Supreme Court holds that a railroad employee, denied passage on a train on which he is entitled to ride on a pass given him, must abide by the orders of the trainmen and seek redress, if he has any, otherwise than by endeavoring unlawfully to become a blind passenger on the train.—Herschman v. Chicago, M. & St. P. (Wis.), 186 N. W. 613.

Liability for Loss of Shipments to Foreign Countries

In an action for damages for loss of a carload of vegetables, delivered to the defendant, Southern Pacific, for shipment to a point in Canada, the California Supreme Court holds that the Carmack Amendment, making initial carriers liable for loss caused by them or by connecting carriers, did not apply to a shipment to a foreign country, and the Cummins Act, extending the liability, does not apply to such a shipment before its adoption in March, 1915.—McCaslin v. Southern Pacific (Cal.), 203 Pac. 742.

Not Liable for Loss When No Tariff Was Filed

The Texas Court of Civil Appeals holds that, under U. S. Comp. St., sec. 8569, par. 7, providing that no carrier shall engage in the transportation of passengers or property without filing and publishing a tariff, where a carrier has made no rate for solid silverware, it is not authorized to receive such property for shipment by freight, and as a contract therefor would be illegal under the statute, the carrier is not liable for the loss of such property taken as freight.—Payne v. Bassett (Tex. Civ. App.), 235 S. W. 917.

Excessive Damages

The Missouri Supreme Court holds that, in an action for compensation under the Federal Employers' Liability Act for the death of a switchman, 29 years old, earning \$115 a month, leaving a wife, 28 years old, and a daughter 2 years old, a verdict for \$15,000 was excessive by \$3,000.—Burch v. Wabash (Mo.), 236 S. W. 338.

Compensation for death under the federal Employers' Liability Act is limited to the present value of the pecuniary loss to the defendant for whose benefit the action is brought; and the Kentucky Court of Appeals holds that where the utmost the deceased contributed to the plaintiff, his father, whose life expectancy was 11.68 years, was \$20 a month for board and \$60 a year for the plaintiff's clothing, a verdict for \$4,000 was excessive, and a new trial was granted.—C. & O. v. Haggard's Admr. (Ky.), 235 S. W. 756.

Foreign Railway News

American Firms Win Bridge Contracts in Argentina

During the past few months American fabricators have been successful in securing some attractive bridge construction contracts from the Argentine State Railways, in keen competition with German and Belgian concerns, according to Commerce Reports. It appears that the local officials are not satisfied with the workmanship turned out by European shops, and preference was given to American bidders at prices which are really higher, considering that it is the practice of nearly all domestic companies to provide for payment in United States gold.

American bridge shop practice has been developed to a far higher degree than in the case of European manufacturers of like materials. This has been necessary because of the higher grade labor used in the United States. Multiple punch machines and spacing tables, such as are common in first-class shops in the United States, are almost unknown in Europe, where practically all work is drilled at a much higher cost of production, in spite of the lower wages paid to labor. American exporters, realizing that there is attractive business to be had in Argentina, are pursuing this market with a willingness to conform to local requirements, which, they state, are by no means unreasonable.

London & North Western Adopts Council System for Dealing With Labor Matters

The London & North Western has announced its plan for the establishment of councils of employees and officers to bring about closer contact with the management, according to Modern Transport (London). The plan is in accordance with the Railways Act of 1921.

The plan provides for the formation of a council composed of not more than four members representing the employees and an equal number representing the management at every shop or station where 75 or more persons are employed. At places where fewer men are employed, a council of four representing the employees will confer with local officers. The purpose of these councils is to provide a recognized method of communicating with the employees and to give them a wider interest in the conditions under which their work is performed. The matters to be considered by the local committees are:

- (1) Suggestions for the satisfactory arrangement of working hours, etc.
- (2) Questions of physical welfare (safety appliances, first aid, accommodations for comfort, etc.)
- (3) Holiday arrangements
- (4) Publicity regarding rules.
- (5) Suggestions as to improving efficiency.
- (6) Investigation of conditions tending to reduce efficiency.
- (7) Correct loading of freight.

Employee representatives are to be elected from among their number, each employee over 18 years of age being privileged to vote. Representatives must have been in service at least a year. Complaints by employees must be made directly to the company as heretofore and will then be referred by the company to the council.

Matters relating to the local application of the national agreements as to wages, working conditions, etc.; suggestions as to improved operation; points in which employees and management are mutually interested, such as increasing business and promoting economy; and subjects submitted by the local council—all these matters will be handled by sectional councils (likewise representing both employees and management), of which there are five, each covering the entire railway. These councils may not propose any changes inconsistent with rulings of the Central Wages Board or the National Wages Board.

The employee representation, Sectional Council No. 1, will be made up of stationmasters, agents, yard masters and traffic controllers (2 representatives); clerks (7 representatives); operating and freight traffic inspectors and foremen and dock supervisory staff (2 representatives); and inspectors and foremen in the locomotive, car engineering, signal, telegraph and tugboat departments (1 representative). Sectional Council No. 2 will be made up of

enginemen and motormen (12 representatives); No. 3 of signalmen, trainmen, porters, switchmen, car cleaners and car inspectors (12 representatives); No. 4 of freight house, delivery and dock forces (12 representatives); and No. 5 of maintenance of way and signal department employees and linemen (10 representatives).

The company will choose its representatives on each council from among its various officers. The plan provides for a railway council for the whole railway to deal with any matters which can properly come before a sectional council but which affect employees belonging to two or more sectional groups.

When agreements are arrived at by councils they are to be posted for the information of employees. Disagreements are referred to the trade unions, who confer with the railway managements, and, in the end if agreement is not reached, to the Central Wages Board.

South African Electrification

A report has been issued by British consulting engineers concerning the electrification of a portion of the railroad from Durban to Glencoe Junction, South Africa. The work now in hand will cost approximately \$20,000,000, and will consist of electrifying the line from Pietermaritzburg to Glencoe Junction. The total length of line from Durban to Glencoe Junction is 249 miles and the section which will be electrified includes a little more than two-thirds of the total length of line. Traffic has increased to such an extent as to make electrification urgent on the line from Pietermaritzburg to Glencoe Junction in order to increase the capacity of the line. The line from Durban to Pietermaritzburg, however, is double tracked and electrification of that section is largely an economic question.

It is considered that double tracking from Pietermaritzburg to Glencoe Junction would enormously increase the capacity of the line, but that it is not a remedy for the existing difficulties. Electrification, it is thought, would give practically the same relief as double tracking and in as short a time as if the latter remedy were chosen, and electrification offers additional advantages of improved working conditions and reduced operating costs. By providing for an industrial load at the power station, the administration, or the electricity authority, when appointed, will be able to supply current along the route of the railway for municipal and industrial purposes. The site of the power station has not yet been definitely determined.

Sir William Hoy, general manager of railways and harbors, thinks that the section from Glencoe Junction to Tendega and from Durban to Pietermaritzburg should also be electrified. These sections would entail heavy expenditure in the near future on track improvements if electrification is not adopted. Sir William states also that the electrification will open up great possibilities for by-product production at the power stations from waste coal. The best grade of coal now used for locomotive purposes will, with electrification, be available for shipment, and the coal now regarded as waste will be used for the power stations.

Sleeping Car Service in Europe

Before the war there was but one big international sleeping car line in continental Europe, a Belgian company known as the Compagnie Internationale des Wagons-Lits, according to the Railway Gazette (London). This company was organized in 1872 and owned and operated sleeping cars throughout Europe until the time of the war. There was of late years no competition anywhere except in Prussia and that only within the boundaries of the state. Wagons-Lits was always very progressive in the adoption of new devices for the safety and comfort of passengers.

When the war broke out many of the company's cars were confiscated and, of course, service was badly disrupted. After the war a competitor appeared in the field, a German company subsidized by the government and known as the Mitteleuropäische Schlaf- und Speisewagen Gesellschaft. This name was abbreviated to "Mitropa." Prior to the end of the war this company operated with equipment confiscated from the Wagons-Lits company.

Lately, however, the German company has been forced to return much of this equipment and it now operates only locally in Germany and into the Netherlands. Furthermore

Germany is being forced to allow the Wagons-Lits company to operate through services across its territories. The Wagons-Lits service, however, has not yet been restored in full.

Meantime the Mitropa company has been trying to get into the international business, but it is pointed out that its chances are not particularly good, inasmuch as the Wagons-Lits company already has long term contracts in most places and furthermore that, to do business on a large scale, Mitropa would have to build cars at present high prices whereas the Wagons-Lits cars were built under pre-war conditions.

Mexican Government Proposes to Rehabilitate the National Tehuantepec

In an effort to revive the freight traffic over the National Tehuantepec Railroad the Mexican government will make extensive improvements to the ports of Salina Cruz and Puerto Mexico, the respective Pacific and Atlantic terminus of the trans-isthmian line. The contract for the first of these improvements at Salina Cruz has already been let, an initial appropriation of \$250,000 having been made by the government for the construction of warehouses and wharves. The channel also is to be dredged and the old loading equipment is to be replaced by modern devices, including electric cranes and carriers, it is stated. Similar improvements will be made at Puerto Mexico, which was formerly called Coatzacoalcos. During the latter years of the administration of the late President Porfirio Diaz the government spent several million dollars in the construction of breakwaters and other harbor and port works both at Salina Cruz and at Puerto Mexico. At Salina Cruz a large dry dock also was installed. This dry dock has been in practically an abandoned condition for several years. It is to be rehabilitated and brought into use.

Before the construction of the Panama Canal the National Tehuantepec Railroad handled heavy traffic and its facilities were so taxed at times that there was serious thought on the part of the Mexican government of double-tracking the line between the two terminals, 180 miles. In those days among the freight handled each year was approximately 500,000 tons of raw sugar from the Hawaiian Islands. With the diverting of practically all of the trans-isthmian traffic to the Panama Canal the National Tehuantepec fell into hard times. Then came the protracted revolutionary period which caused a suspension of what little coastwise traffic the road had been handling as well as a complete falling off of local shipments. For months at a time the road was out of commission. The rolling stock went from bad to worse. Just in the midst of these unfortunate days a decree was issued by the late President Venustiano Carranza canceling the 51-year lease which S. Pearson & Son, Ltd., held from the government for operating the line. Lord Cowdrey and associates who compose this firm welcomed the action of Carranza, arbitrary as it was, as it relieved them of the burden of rehabilitating and attempting to operate a railway which offered little possibilities for the future.

It is the announced purpose of the Obregon administration to develop its deep water ports to the greatest possible extent. Steps have been taken to enlarge the coastwise shipping service on both the Pacific and Gulf sides. It is even asserted by government authorities that the National Tehuantepec can be made to compete with the Panama Canal in the handling of certain kinds of products, and by a reduction of port charges and freight rates.

No trans-isthmian transportation project ever had a more troublesome history than that which finally resulted in the building of the National Tehuantepec Railroad. Spanning the Isthmus of Tehuantepec was the dream of engineers for more than a century. Many men of money and other claims to greatness were interested in the project from time to time. Many millions of dollars of American money were wasted in different enterprises that had for their object the connecting of the two oceans by some facility of quick and cheap transportation. At one time it was proposed to build a great ship railway. This was to consist of several parallel tracks across the isthmus. The ocean-going vessels, when they arrived at the port would be hauled out of the water upon a large platform placed upon wheels and in this way it would be pulled across the 180 miles of land and dumped into the ocean on the other side. This project received the approval of many engineers of distinction. The Mexican government granted a concession for its fulfillment, but the promoters failed to finish it and it went by the board.

Equipment and Supplies

Locomotives

THE MINARETS & WESTERN will, within the next few months, send out inquiries for seven or eight locomotives.

THE MAGOR CAR CORPORATION, New York, has ordered one saddle tank locomotive from the Baldwin Locomotive Works.

THE ALABAMA & VICKSBURG has ordered one 10-wheel switching locomotive from the Baldwin Locomotive Works. This is in addition to the 3 locomotives ordered from the same builder reported in the *Railway Age* of April 8.

Freight Cars

THE WABASH is inquiring for repairs to 700 box cars.

THE GREAT NORTHERN is inquiring for 300 steel log car bodies.

THE ST. LOUIS-SAN FRANCISCO will repair 1,800 or more freight cars in its own shops.

THE CHESAPEAKE & OHIO will receive bids until June 1 for 500 box cars of 40 tons' capacity.

THE ILLINOIS CENTRAL will soon send out inquiries, it is reported, for repairs to 4,000 coal cars.

THE CHICAGO, NORTH SHORE & MILWAUKEE has ordered 15 merchandise cars from the Cincinnati Car Company.

THE CANADA CROSBOTING COMPANY has ordered 120 standard tie cars from the Canadian Car & Foundry Company.

THE CUBAN-AMERICAN SUGAR COMPANY has ordered 50 cane cars of 15 tons' capacity from the Magor Car Company.

THE CHICAGO, ST. PAUL, MINNEAPOLIS & OMAHA has purchased 100 ballast cars from the Rodger Ballast Car Company.

THE PENNSYLVANIA SALT MANUFACTURING COMPANY, Philadelphia, Pa., is inquiring for 3 or 6 tank cars for transporting liquid chlorine.

THE PIER MARQUETTE, reported in the *Railway Age* of April 29 as being in the market for a number of cars, is inquiring for 500 box cars.

THE GOODWIN-GALLAGHER SAND & GRAVEL Co., New York, has ordered 6 hopper cars of 20 tons' capacity from the Magor Car Corporation.

THE CHICAGO & NORTH WESTERN, in addition to its recent car order, has purchased 20 box cars and 10 flat cars from the Western Steel Car & Foundry Company.

THE PACIFIC ELECTRIC is reported to have ordered 200 gondola dump cars, 40 ft. by 8 ft., 9 in., with steel underframes, from the National Safety Car & Equipment Company.

THE MISSOURI, KANSAS & TEXAS, which was noted in the *Railway Age* of April 15 as inquiring for 2,000 automobile cars, has issued an alternative inquiry for 1,500 box cars.

THE NORTHERN PACIFIC is inquiring for 250 gondola cars of 50 tons' capacity. As reported in the *Railway Age* of May 6, this company will buy a total of 1,750 cars of various types.

THE BELT RAILWAY OF CHICAGO, noted in the *Railway Age* of May 6 as inquiring for 450 gondola cars, has under consideration the purchase of 125 second-hand gondolas instead.

THE FLORIDA EAST COAST, reported in the *Railway Age* of March 11 as inquiring for 10 caboose cars, has ordered this equipment from the Mt. Vernon Car Manufacturing Company.

THE BANGOR & BROOKS is rebuilding 250 freight cars in its shops at Derby, Me., which work was authorized last year, and is contemplating the rebuilding of 250 more. The company has recently purchased two Russel snow plows.

THE ATCHISON, TOPEKA & SANTA FE is asking for bids on 2,000 steel underframe double-sheathed box cars of 40 tons' capacity and is also asking for alternate bids on 2,000 steel underframe double sheathed box cars of 40 tons' capacity, similar to the U. S. R. A. design.

THE CHESAPEAKE & OHIO reported in the *Railway Age* of April 22 as inquiring for 1,500 hopper bottom gondola cars and 1,500 flat bottom gondola cars, has ordered 1,500 hopper cars from the Newport News Shipbuilding & Dry Dock Co., and 1,500 gondola cars from the Pullman Company.

THE SOUTHERN RAILWAY, reported in the *Railway Age* of April 22 as inquiring for 2,000 plain box cars of 40 tons' capacity, has divided an order for 5390 box cars as follows: American Car & Foundry Company, 3,000, with an option on 1,000 cars additional; Mt. Vernon Car Manufacturing Company, 1,390; and Standard Steel Car Company, 1,000.

Passenger Cars

THE WESTERN OHIO has purchased ten 45-ft. combination passenger and baggage cars from the J. G. Brill Company.

THE SOUTHERN RAILWAY, reported in the *Railway Age* of April 22 as inquiring for 60 cars for passenger service, has ordered 75 cars from the Pullman Company and 25 cars from the American Car & Foundry Company.

Iron and Steel

THE PERE MARQUETTE, noted in the *Railway Age* of April 29 as inquiring for 3,500 tons of steel rails, has ordered this from the Inland Steel Company.

THE LONG ISLAND, reported in the *Railway Age* of April 15 as asking for bids on 2,500 tons of rail, has ordered from the Bethlehem Steel Company 2,500 tons of 100-lb. Pennsylvania Railroad standard sections.

THE NEW YORK CENTRAL, reported in the *Railway Age* of April 8 as asking for bids on 32,000 tons of rail, has placed orders for 24,800 tons with options on 7,200 tons additional as follows: Inland Steel Company, 2,000 tons, and Illinois Steel Company, 5,400 tons of 105-lb. sections for the New York Central, Lines West, with an option on 2,000 tons additional from the Illinois Steel Company if taken on or before July 1; Cambria Steel Company, 3,000 tons of 80-lb. sections for the Cincinnati Northern; Carnegie Steel Company, 3,000 tons of 105-lb. sections for the Cleveland, Cincinnati, Chicago & St. Louis; Bethlehem Steel Company, 1,300 tons of 105-lb. sections for the New York Central, Lines East, and to another company, 9,500 tons of 105-lb. sections for the New York Central, Lines East, with an option of 3,200 additional tons to be taken on or before July 1; also to the same company, 600 tons of 90-lb. sections for the Rutland Railroad.

Machinery and Tools

THE BANGOR & AROOSTOOK will install a considerable amount of new machinery in its shops at Derby, Me.

THE CUBA RAILROAD is inquiring for a number of machine tools for its new shops at Camaguey, Cuba.

THE CHICAGO, BURLINGTON & QUINCY is inquiring for 17 lathes of various types, 11 crank shapers, 8 drills of various types, 4 boring mills, a wheel press, 2 bolt threaders, a pipe threading machine 3 shears, 3 punches, 2 combination punches and shears, 5 bending rolls, 15 grinders of various types, 5 hack saws, and a plate bending machine.

THE WESTERN MARYLAND, reported in the *Railway Age* of May 6 as inquiring for a number of machine tools, is asking for the following machines: A punch and shear; rod boring machine; 14-in., 26-in., 36-in., and 48-in. lathes; 6-in. pipe threading machine; 2-in. bolt cutting machine; 20-in. and 28-in. vertical drilling machines; 5-ft. radial drill; 52-in. and 62-in. boring and turning mills; 36-in. and 42-in. planers; driving wheel lathes; 6-in. power hack saw; 300-ton wheel press; 20-in. slotter; 5-spindle centering machine; also a bushing press.

Supply Trade News

The Lundie Engineering Corporation has moved its Chicago office from 30 North LaSalle street, to 166 West Jackson boulevard.

Frank B. Stone has removed his office from the Railway Exchange building, to 1620 Mallers' building, 5 South Wabash avenue, Chicago.

W. B. Mallette has been appointed agent of the Track Specialties Company, New York, with office at 3883 Wyoming street, St. Louis, Mo.

The Austin Company, Cleveland, Ohio, has been given a contract to put up a one-story building, 120 ft. by 400 ft. at Hammond, Ind., for the Standard Steel Car Company.

W. T. Tyler, whose selection as director, vice-president and general manager of the National Safety Appliance Company, San Francisco, with temporary headquarters in the

W. T. Tyler

Peoples Gas building, Chicago, was announced in the *Railway Age* of May 6 (page 1089), was born in Janesville, Wis., on July 29, 1870. He entered railway service in June, 1883, as a messenger on the Wisconsin Central and was later an operator and dispatcher on the same road. In 1889 he was employed as a brakeman on the Milwaukee, Lake Shore & Western, now a part of the Chicago & North Western. From that time until 1891 he was a brakeman and conductor on the Northern Pacific, and from 1891

to 1900 he was consecutively, yardmaster, trainmaster and a superintendent of the Great Northern. He was appointed a superintendent of the St. Louis, Iron Mountain & Southern in 1900, and was promoted to general superintendent the following year. He was later successively general superintendent and general manager of the St. Louis-San Francisco. In 1915 he became a superintendent of the Northern Pacific, with headquarters at Pasco, Wash., and on February 1, 1917, was appointed general manager of the St. Louis-Southwestern. On May 15, 1917, he was elected first vice-president of this road, and on November 1, 1917, he resigned to become assistant to the vice-president in charge of operation of the Northern Pacific. On January 22, 1918, Mr. Tyler was appointed assistant to the director of the Division of Operation, with headquarters at Washington, D. C., and he was appointed senior assistant director on July 1, 1918. He was appointed director of the division of operation on January 15, 1919, in which capacity he served until March 1, 1920, when he became vice-president in charge of operation of the Northern Pacific. He later resigned and, as mentioned above, has now entered the railway supply field.

The Metal & Thermit Corporation, New York, has removed its Pittsburgh branch office from 1427 Western avenue to 801-807 Hillsboro street, Corliss Station, Pittsburgh, Pa.

W. H. Saunders, district sales representative of the National Cast Iron Pipe Company, with headquarters at Dallas, Tex., has been transferred to Kansas City, Mo. He will be succeeded at Dallas by B. L. Hendershot.

The War Finance Corporation has announced that the advance of \$5,000,000 to the Baldwin Locomotive Works, made

on January 15, 1920, for the purpose of financing the exportation of locomotives, has been repaid in full eight and one-half months in advance of the date of maturity.

Dwight P. Robinson & Co., New York, has been given a contract for the construction of a building to accommodate American commercial exhibits at the Brazilian Centennial Exposition to be held in Rio de Janeiro beginning September 7. The building, which will be the unofficial exhibit building, will be constructed of American materials as far as possible. It will be purely a commercial proposition, having no direct connection with the exhibition plans of the American government under the appropriation of \$1,000,000 made by Congress recently.

The Paige & Jones Chemical Company, New York, manufacturers of materials for treating boiler feed water, has opened a general sales office at 417 South Dearborn street, Chicago. Lucius A. Fritz, until recently vice-president and general sales manager of the Borromite Company, who is a practical chemist and has had an extended experience with various phases of feed water treatment, has become associated with the Paige & Jones Chemical Company as vice-president and general sales manager, with headquarters at Chicago, and Robert O. Friend, formerly water and mechanical engineer of the Borromite Company, who is experienced in designing and building water softening plants, has been appointed vice-president and supervising engineer with headquarters at Hammond, Ind., of the Paige & Jones Chemical Company. The other officers of the company are: Fred O. Paige, president; Charles P. Wolfe, vice-president and treasurer, both at New York; Fred O. Paige, Jr., secretary and works manager, Hammond, Ind. The executive offices of the company are at 248 Fulton street, New York and the technical department works are at Hammond. C. B. Flint will continue as sales manager of the railroad department, with headquarters at New York.

"No Pullman Merger," Carry Says

E. F. Carry, president of the Pullman Company, has declared that there is no foundation for various rumors connecting the Pullman Company with mergers with other concerns. "There has been no official talk or thought of buying any concern excepting our purchase of Haskell & Barker," he said. "With regard to the reported plan to segregate the operating and building functions of the company through separate organizations, I am told that such a suggestion has been made to the Pullman board of directors at least once annually for the past 10 or 12 years, and at intervals the directors have discussed it to some extent, but with no result. This year is no exception, and the matter will again be duly discussed, but whether anything will be done about it remains to be seen."

Railway Construction

ATCHISON, TOPEKA & SANTA FE.—This company has awarded a contract to Joseph E. Nelson & Sons, Chicago, for additions to its machine shop at Topeka, Kan., to cost approximately \$60,000, and has closed bids for the construction of bunkhouses at Galesburg, Ill., Shopton, Iowa, Lexington Junction, Mo., Ottawa Junction, Strong City and Cheryvale, Kan., and Newkirk, Okla., which work will cost approximately \$50,000.

BANGOR & AROOSTOOK.—This company's 1922 budget includes the ballasting of 65 miles of road, the contract for which has been let to the Eyre-Johnson Company, Philadelphia; the relaying of 24 miles of track with 80 and 90-lb. rails; installing 200,000 new ties, 80,000 tie plates and 14,000 rail anchors; relaying a number of side-tracks with heavier steel; replacing 140 wooden culverts with cast-iron or concrete; the painting of seventeen stations and fifteen steel bridges, including the large international bridge between Van Buren, Me., and St. Leonards, N. B.; extensive repairs to wire fences; the rebuilding of the engine house at Caribou, Me., probably with reinforced concrete, and the installation of a larger turntable; the construction of a new station, engine house and coaling plant at Squa Pan, Me.; repairing wharves at the company's tide-water terminal at Stockton Harbor; and extensive improvements to buildings at Derby, Me.

CHICAGO & NORTH WESTERN.—This company contemplates rebuilding in the near future its 12-stall engine house at Ashland, Wis., destroyed by fire on May 4.

CHICAGO ROCK ISLAND & PACIFIC.—This company will soon call for bids for the construction of a reinforced concrete undercrossing in connection with the separation of grades at Nora Springs, Iowa. This company and the New York Central have each ordered approximately 370 tons of steel from the King Bridge Company, Cleveland, Ohio, for the renewal of track elevation bridges between Eighteenth and Sixtieth streets, Chicago. The Rock Island will soon order an equivalent amount of steel for like purposes for installation between Sixtieth and Seventy-second streets in that city.

CISCO & NORTHEASTERN.—This company has awarded a contract to J. H. Lison, Cisco, Tex., for the construction of a 40-ft. by 200-ft. brick locomotive repair shop in that city, to cost \$12,500.

ILLINOIS CENTRAL.—This company has awarded a contract to the Water & Coal Handling Company, Chicago, for the construction of a 75-ton coaling station at Levy yard, New Orleans, La.

NORTHERN PACIFIC.—This company has closed bids for the construction of a \$182,000 double track bridge over the Yellowstone river at Huntley, Mont., to replace its single track structure at that point. It has also awarded a contract for the construction of a passenger station and office at Glendive, Mont., to cost \$200,000, and has authorized the construction of a tunnel and other work on its Phileman line change to cost approximately \$107,000, as well as the construction of a second main track at Duluth, Minn., to cost approximately \$38,000. Authority has also been given for the building of settling basins and other water supply facilities at Zero, Mont., to cost approximately \$16,000.

NORTHERN PACIFIC TERMINAL CO.—This company, pursuant to admitting the Great Northern and the Spokane, Portland & Seattle as tenants to the union station at Portland, is increasing the track layout in the station and for this and other reasons is now undertaking the construction of a new yard upon property recently acquired 2 or 3 miles from Portland. In connection with this work a petition has been filed with the city of Portland for extensive street vacations required to provide for increased trackage within the city limits.

OREGON SHORT LINE.—The Interstate Commerce Commission has issued a certificate authorizing the construction of an extension of the Homedale branch from its present terminus at Homedale, Idaho, in a southeasterly direction, a distance of 7½ miles.

PACIFIC FRUIT EXPRESS.—This company is accepting bids for the construction of an artificial icing plant on the Southern Pacific at Bakersfield, Calif. to cost approximately \$400,000.

Express Train Plunges Into a Swollen River in Vermont

Railway Finance News

ATLANTA, BIRMINGHAM & ATLANTIC.—*State Ownership Favored.*—A meeting is to be held on May 16 at Moultrie, Ga., in behalf of saving this railroad from being junked. Mayor Key, of Atlanta, who is president of the association for state ownership of the road, will preside. The Atlanta Chamber of Commerce has indorsed the movement to prevent the junking of the Atlanta, Birmingham & Atlantic.

BANGOR & AROOSTOOK.—*Annual Report.*—The corporate income account for the year ended December 31, 1921, compares as follows:

	1921	1920
Operating revenues	\$7,353,938	\$5,786,756
Operating expenses	5,975,464	5,030,406
Net from railway operations	1,577,474	756,350
Railway tax accruals	422,709	286,561
Railway operating income	1,173,211	469,789
Total non-operating income	243,684	1,077,828

Total non-operating income	308,629	13,785,649
Gross income	2,373,978	5,075,879
Interest on funded debt	2,478,531	2,405,763
Total deductions	2,659,656	2,488,209
Net income	Def. 285,677	2,587,670
Dividends:		
Preferred stock, 7 per cent	788,151	788,151
Common stock, 5 per cent	927,835	927,835
Balance income for the year	Def. 2,001,663	871,684

*March 1-Dec. 31.

†Includes compensation and guaranty from U. S. Govt.

DELAWARE & HUDSON.—*Annual Report.*—This company's annual report for 1921 is reviewed in an article on another page of this issue entitled "Delaware & Hudson Earns 11.62 Per Cent on Stock." See also excerpts from annual report on adjacent pages.

EL DORADO & SANTA FE.—*Asks Authority to Issue Stock.*—This company has applied to the Interstate Commerce Commission for authority to issue \$50,000 of capital stock.

GEORGIA NORTHERN.—*Six Months' Guaranty Certified.*—The Interstate Commerce Commission has certified the amount of this company's guaranty in 1920 as \$7,132, of which \$1,632 was still to be paid.

HAWKINSVILLE & FLORIDA SOUTHERN.—*Seek to Halt Sale.*—Charging that the entire proceeding, which resulted in an order from the court for the sale of the Hawkinsville & Florida Southern, was an act of collusion between the officials of that road and the Georgia Southern & Florida, the Union Savings Bank & Trust Company, of Macon, Ga., bondholders, has petitioned for an injunction restraining the sale of the road set for May 9. Judge J. A. Matthews has signed an order calling on the representatives of the two railroads to show cause why the petition should not be granted, an injunction issued and a new receiver appointed.

ILLINOIS CENTRAL.—*Asks Authority to Issue Stock.*—This company has applied to the Interstate Commerce Commission for authority to issue \$10,929,600 of its preferred stock in accordance with its intention, as previously announced, to provide funds for electrification and enlargement of its terminal facilities at Chicago.

KANSAS CITY SOUTHERN.—*New Directors.*—Moritz Rosenthal, Macon B. Staring and Pierpont V. Davis, all of New York, have been elected directors to succeed B. S. Guinness, John F. Harris and W. H. Williams. The resignations of Mr. Harris and Mr. Williams resulted from the decision ruling of the Interstate Commerce Commission regarding interlocking directorates.

LEHIGH & HUDSON RIVER.—*Annual Report.*—The income account for the year 1921 compares with the previous year as follows:

	1921	*1920
Railway operating revenue	\$3,242,291	\$2,780,302
Railway operating expenses	2,429,843	2,378,244
Net from railway operation	812,448	402,058
Gross income	676,876	646,574
Total deductions from gross income	339,920	291,101
Net income transferred to profit and loss	336,956	355,473
Dividend appropriations	395,306	103,170
Profit and loss, December 31st, credit	2,044,006	2,117,314

*March 1 to Dec. 31.

(Continued on page 1152)

Annual Report

Fifty-Seventh Annual Report of the Chicago, Milwaukee & St. Paul Railway Company

The Directors submit to the Stockholders the following report of the operations of the Company for the year ended December 31, 1921.

INCOME ACCOUNT.

RAILWAY OPERATING INCOME:	
Railway operating revenues	\$146,765,766.04
Railway operating expenses	127,957,001.87
Net railway operating revenue	\$18,808,764.17
Railway tax accruals	8,762,089.33
Uncollectible railway revenues	283,545.53
Railway operating income	\$9,763,129.31
NON OPERATING INCOME:	
Rents received—Equipment	\$218,995.34
Rents received—Other	180,424.29
Income from lease of road	710,574.54
Dividends on stocks	74,496.83

ACQUISITION OF CONTROL OF THE CHICAGO, MILWAUKEE & GARY RAILWAY COMPANY.	

January 1, 1922, your Company acquired the control of the Chicago, Milwaukee & Gary Railway Company, a corporation of the State of Illinois. This control was acquired pursuant to the terms and provisions of an agreement dated December 1, 1921, between your Company and the St. Louis Union Trust Company the owner and holder of all of the securities of the Chicago, Milwaukee & Gary Railway Company, consisting of the capital stock of that company of the par value of \$1,000,000 and of First Mortgage Five Year Gold Bonds of that Company of the par value of \$5,700,000. By the terms of that Agreement, the St. Louis Union Trust Company has delivered to your Company all of said capital stock and \$2,700,000 of said bonds, in consideration of your Company guaranteeing the payment of the principal of \$3,000,000 of said bonds and the interest thereon accruing after January 1st, 1924. The principal of these bonds does not mature until April 1st, 1948. The Interstate Commerce Commission, pursuant to the provisions of the Transportation Act, 1920, has approved the acquisition of the principal of said bonds and the interest thereon accruing after January 1st, 1924.

The Agreement of December 1st, 1921, provides that the Chicago, Milwaukee & Gary Railway Company comprises 96.84 miles of main track and 9.74 miles of branch lines, which connects with the railway of the Terre Haute Division of your Company at Delmar, Illinois, and with the railway of the Illinois Division of your Company at Kirkland, Illinois, and with the railway of the Racine & Southwestern Division of your Company at Rockford, Illinois. It has direct connections at Delmar and Momence, Illinois, with the New York Central and Chicago & Eastern Illinois lines, and forms an outer belt line around Chicago.

The control of the Chicago, Milwaukee & Gary Railway Company by your Company, enables it to transport Company and commercial coal originating on the Terre Haute Division, as well as on the lines of the Chicago & Eastern Illinois, with the railway of the Chicago, Milwaukee & Gary, north, without hauling the same through the expensive terminals of Chicago, and with shorter haulage. This not only expedites movement, but greatly reduces the cost of transportation.

ACQUISITION BY LEASE OF THE CHICAGO, TERRE HAUTE & SOUTHEASTERN RAILWAY

The Stockholders having given their approval of the transaction at the 41st annual meeting on May 14th, 1921, the lease of the railway property and franchises of the Chicago, Terre Haute and Southeastern Ry. Co. to the Chicago, Milwaukee & St. Paul Ry. Co. for a term of nine hundred and ninety-nine years became effective on July 1st, 1921. These leases, with the railway of Chicago Heights, Illinois, a point about twenty-seven miles south of Chicago, to Westport, Indiana, and consist of 361.41 miles of main track, 764 miles of second main track, 544 miles of connection tracks, and 196.41 miles of yard tracks, sidings and spur tracks, a total of 1,766.02 miles of track.

Under this lease valuable track rights are acquired over about 48 miles of other railway lines, of which about 35 miles has second main track, making direct connections with the lines of this company near Frankfort, Illinois, on the Illinois Division.

The revenues and expenses of the lines mentioned above have been included since July 1st, 1921, with the revenues and expenses of this company's lines.

ADDITIONS AND BETTERMENTS.

EQUIPMENT.
A contract has been given for the purchase of 2500, fifty-ton, steel underframe gondola cars, 1900 to be purchased from the Haskell & Barker Company, and 600 from the Beneficial Company. Authority was also granted for the purchase of 12 Class A-1 compound locomotives to simple type, of which 8 were completed during the year, the remainder will be completed early in 1922.

BRIDGES.
Restriction of Bridge FF114 over the Elroy Slough and FF1018 over the Snake River, near Everett, Washington, on the Coast Division, was practically completed during the year. Both structures span navigable waterways and are of movable spans to permit the passage of commercial traffic.

WATER TREATING.
The following water treating plants, referred to in last year's report as being under construction, were completed and placed in operation during the year: One at Le Roy, Illinois; one at Le Roy, Iowa; one at Marion, Iowa; one at Redgewater, S. D.; one at Elk City and Dakota Division—Ethan, Iowa; one at Tyndall, S. D.; a water treating plant at Sealand, S. D.; one at Elk City and Dakota Division, was constructed during the year and placed in service in January, 1922.

The new water station at Tyndall and the work necessary to increase the quantity and improve the quality of the present supplies at Yankton and Platte, S. D., on the St. Louis City and Dakota Division, and at Plankinton, S. D., on the Iowa and Dakota Division, commenced in 1920, was completed before the close of the year 1921. Similar work at Lennox, S. D., on the Iowa and Dakota Division, mentioned in last year's report, has been temporarily deferred, but its completion is expected in 1922. During the year work was commenced at Sibley, Iowa, for new water station facilities to increase the quantity over that obtained with the present facilities.

PALLAST.
On the Trans-Missouri Division Branch Line, Trail City to Faith, S. D., approximately 2,000 yards of cinders were placed in parts of 20 miles of Chicago, North Shore & Milwaukee R. R. trains to and from that company's INTERLOCKING PLANTS.

An interlocking plant was constructed and placed in operation at University Place, Evanston, Illinois. This plant controls the movement of Chicago, North Shore & Milwaukee R. R. trains to and from that company's Church Street Station.

GRADE SEPARATION.
The elevation of tracks on the Evanston Line of the Chicago Terminal Division between Main Street Avenue and Howard Street, a distance of 4.4 miles, was continued. At the end of the year approximately 90% of the work was completed, 5% having been done during the year.

The new stations at Loyola and Morse Avenues and Howard Street, on which work was started in 1920, were completed and placed in operation. Approximately 80,000 cubic yards of filling was placed, completing the filling for the third and fourth tracks.

The work remaining to be done consists of the completion of unfinished bridge floors, the laying of the fourth main track and the construction of six permanent stations located at Argyle Street and Berwyn, Bryn Mawr, Thornedale, Granville and Jarvis Avenues.

CHICAGO, TERRE HAUTE & SOUTHEASTERN RAILWAY.

ADDITIONAL TRACKS.
Trackage of 9,097 lineal feet to serve the I. W. Hamilton and the Baker Mines was constructed at Ilwaco, Indiana, completing a system of tracks at these mines—9,602 lineal feet having been laid prior to July 1, 1921.

Construction of an additional loading track, 811 feet long and of 2,466 feet of storage tracks serving the Talleydale Mine at Clayville, and the Fayette, Talleydale and Bardsley Mines at Bridge Junction, Indiana, respectively, was commenced and has been completed since the close of the year.

Crossovers were constructed at Posen and Blue Island, Illinois, providing permanent connections with the Indiana Harbor Belt R. R. at Posen and the Baltimore and Ohio Chicago Terminal Railroad, at Blue Island, to accommodate freight service between Faithorn and Bensenville, Illinois.

Construction of a passenger track, 253 ft. long at Bell Junction, Indiana, to expedite train movement, was commenced and since the close of the year the work has been completed.

TURNABLES.
Work was commenced in the replacement of a 62-ft. steel turntable at Terre Haute, Indiana, with a 70-ft. steel turntable and incidental changes, including rearrangement of tracks and turnouts. The work has been completed since the close of the year.

GUARANTY PERIOD.

As stated in a report last year, the Company filed with the Interstate Commerce Commission a statement of its operations during the guaranty period under the provisions of the Transportation Act, 1920. In addition to the amount of \$14,292,702.00 reported received in last year's report, further advances were made during the year 1921, amounting to \$8,137,190.05, which were used in payment of interest on funded debt and other miscellaneous or current obligations.

The claim for the balance of the Interstate Commerce Commission for the balance of the amount due under the guaranty.

FEDERAL VALUATION.

Satisfactory progress was made on the Federal Valuation of the Company's property during the year. All field work was completed. All maps were completed and delivered to the Bureau of Valuation and final certificate of completion was filed. Joint work was continued with the Bureau of Valuation on the final collection and adjustment of quantities. Final collections are 20% completed and the Bureau is now applying prices to the inventory. Considerable progress has been made in the development of original costs and reproduction prices to be used in the application of prices to the inventory. During the latter part of the year the District offices of the Bureau of Valuation were consolidated at Washington, D. C., thereby somewhat delaying the progress of the work, and it is now probable that the Tentative Valuation will not be served upon the Company until some time during the year 1923.

MILES OF TRACK, DECEMBER 31, 1921

Owned solely by this Company			
Main track	10,150.83		
Second main track	1,050.12		
Third main track	2,230.30		
Fourth main track	15.47		
Connection tracks	42.64

Second main track	123.34		
Third main track	11.14	531.64	
Used by this Company under lease			
Main track	361.41		
Second main track	7.64		
Connection tracks	5.44		
Yard tracks, sidings and spur tracks	196.41	570.90	
Total miles of track			16,106.84

Average miles of main track in operation during the year:	
Owned solely	10,152.16 miles
Owned jointly	108.95 "
Used under contracts and under lease	547.52 "
Total average miles operated	10,808.63 miles

The lines of road of this Company owned solely and jointly are located in the following States:	
Wisconsin	1,793.12 miles
Illinois	418.75 "
Iowa	1,865.40 "
Minnesota	1,230.85 "
North Dakota	379.81 "
South Dakota	1,795.95 "
Missouri	140.25 "
Michigan	199.22 "
Montana	1,235.29 "
Idaho	230.67 "
Washington	979.54 "
Total main track owned solely and jointly	10,268.85 miles

EQUIPMENT CHANGES.

During the year the remaining twenty-nine of the one hundred Mikado Steam Locomotives mentioned in the 1920 report as being constructed under contract were received. Equipment rebuilt during the year consisted of 44 steam locomotives, 150 coal cars, 2 express refrigerator cars and 1 Company service car. One locomotive was converted for use as a shop switching locomotive, 4 open top observation cars and 7 Company service cars were converted from other passenger and freight equipment and 28 freight train cars and one Company service car previously reported as taken out of service were reinstated, as follows:

73 Locomotives—steam	4 Ore cars
76 Box cars	3 Express refrigerator cars
151 Coal cars	4 Open top observation cars
4 Flat cars	9 Work train cars
2 Refrigerator cars	1 Company service locomotive

During the year 46 steam locomotives and 1512 cars were destroyed by wreck or fire, sold or taken down on account of small capacity, converted or rebuilt, as follows:

46 Locomotives—steam	10 Ore cars
76 Box cars	3 Gas-electric motor cars
134 Flat cars	1 Sleeping car
132 Stock cars	2 Parlor cars
231 Coal cars	1 Observation car
91 Refrigerator cars	1 Passenger and baggage car
14 Caboose cars	104 Work train cars
22 Ballast cars	

RESERVE FOR ACCRUED DEPRECIATION.

At the close of the fiscal year, ending December 31, 1920, there was at the credit of reserve for accrued depreciation the sum of \$17,863,662.62. A certain percentage of the total cost of equipment has been credited to this reserve for the estimated depreciation of locomotives, passenger train cars, freight train cars and work equipment, accrued during the year, which, together with other adjustments, aggregates \$3,237,496.29. There has been charged to this reserve an amount of \$373,411.97 representing the accrued depreciation, previously credited, on locomotives and cars destroyed, sold or taken down during the year, which results in a net increase in this reserve of \$2,864,084.32 for the year. The balance of this reserve, December 31, 1921, as shown in the balance sheet is \$20,727,746.94, which represents the estimated depreciation of rolling stock from June 30, 1907, to December 31, 1921.

CAPITAL STOCK.

At the close of the last fiscal year (December 31, 1920), the share capital of the Company amounted to \$233,636,200.00 and consisted of \$117,411,300.00 of Common Stock and \$116,224,900.00 of Preferred Stock, of which \$429,100.00 Preferred Stock and \$5,300.00 Common Stock are held by the Company. Of the Preferred Stock held by the Company, \$343,000.00 is in the Treasury and \$86,100.00 is in the Insurance Reserve Fund. All of the \$5,300.00 of Common Stock held by the Company is in the Insurance Reserve Fund. No Capital Stock has been issued during the year ended December 31, 1921.

FUNDED DEBT.

At the close of the last fiscal year the Funded Debt of the Company was \$529,562,654.66. It has been decreased during this fiscal year by \$25,340,000.00 Chicago and Pacific Western Division 5% Bonds matured January 1st, 1921; by \$4,755,000.00 Wisconsin and Minnesota Division 5% Bonds matured July 1st, 1921; by \$1,360,000.00 Chicago and Lake Superior Division 5% Bonds matured July 1st, 1921; by \$2,192,600.00 6% Equipment Gold Notes matured January 15th, 1921, and January 15th, 1922; by \$15,000.00 Bellingham and Northern Railway 5% Bonds retired and \$57,981.96 European Loan 4% Bonds of 1910 retired.

It has been increased during this fiscal year by \$57,981.96 Four Per Cent Gold Bonds of 1925 issued in place of European Loan 4% Bonds of 1910 retired. There have been issued during the year \$43,000,000.00 General Mortgage 5% Bonds maturing May 1st, 1929 in place of underlying bonds, which have been retired and cancelled during this and previous years, and these bonds have been used by the company for collateral purposes.

There have been issued during the year notes in favor of the United States Government bearing interest at 6% for \$25,340,000.00, maturing March 1st, 1922, and \$10,000,090.00 maturing January 1st, 1923. The first mentioned note will be extended by the Government at \$25,000,000.00 to mature March 1st, 1927. The amount of Bonds and Notes at the close of this fiscal year is \$574,240,054.66 of which \$160,257,358.24 are in the treasury of the Company, and \$413,982,696.42 have been issued and are outstanding.

Mortgage Bonds of the Company known as the Wisconsin and Minnesota Division Bonds in the principal amount of \$4,755,000.00 and the Chicago and Lake Superior Division Bonds in the principal amount of \$1,360,000.00, matured July 1, 1921.

On account of the prevailing high rates of interest, it was not deemed advisable to issue, at this time, either General Mortgage Bonds or General and Refunding Mortgage Bonds of the Company for the purpose of meeting this maturity and other obligations.

Accordingly, an application was made to the Interstate Commerce Commission under the Transportation Act, 1920 for the loan of \$10,000,000.00. The application was granted, and this amount was loaned to the Company on its note which matures January 1st, 1923, bearing interest at the rate of six per cent per annum. Substantially all of the bonds have been paid, and the remainder will be paid when presented.

TREASURY BONDS.

At the close of the year ending December 31st, 1920, there were in the Treasury bonds to the amount of:		
There have been added during the year, bonds as follows:		
General Mortgage 5% Bonds	43,000,000.00	
Tacoma Eastern R. Co. 5% Bonds	10,000.00	
Four per cent Gold Scrip of 1925	158.24	
Treasury Bonds December 31st, 1921	\$160,257,358.24	

Composed of the following:	
General and Refunding Mortgage bonds certified for the acquisition of additional property or additions and betterments and other lawful corporate purposes	\$73,495,200.00
General and Refunding Mortgage bonds certified by the Trustee against expenditures for additional properties or additions and betterments, and available for sale at any time: Pledged with the United States Government	43,722,000.00
General Mortgage 5% Bonds Pledged with United States Government	\$117,217,200.00
Tacoma Eastern R. R. Co. First Mortgage 5% Bonds	43,000,000.00
Four per cent Gold Scrip of 1925	40,000.00
	158.24
Total	\$160,257,358.24

General balance sheet, income, profit and loss and other tables relating to corporate affairs and statements showing results of operation are appended hereto.

By order of the Board of Directors.
 April, 1922. H. E. BYRAM, President.

Ninety-Second Annual Report of the Delaware & Hudson Company

GENERAL OFFICE

New York, N. Y., April 1, 1922.

To the Stockholders of The Delaware & Hudson Company:

The following presents the income account of your company for the year 1921, arranged in accordance with the rules promulgated by the Interstate Commerce Commission, with comparative results for the year 1920:

	1921	1920	Increase or Decrease
Railway operating revenues	\$45,776,859.41	\$45,354,298.72	\$422,560.69

Total debits	\$2,568,751.21	\$6,998,952.80	-4,430,201.59
Net income	\$7,627,652.46	\$3,432,064.65	4,195,587.81

FINANCIAL

The assets of the Delaware & Hudson Company in December 1921, was \$12,340,000, the liability being \$10,907,937. During the year ending December 31, 1921, was \$67,894,600 a reduction

of \$201,400, as compared with December 31, 1920. First lien equipment bonds in the amount of \$5,000,000 were purchased through the sinking fund established in connection with their issue. The issue of six per cent gold notes under the equipment trust provided to pay for 1,500 freight cars allocated to your company by the United States Railroad Administration increased \$196,000 by the payment of \$1,000,000 of maturing bonds on January 15, 1921, and the issue of 69,000 additional to complete the settlement in accordance with the contract. The total issue was \$3,981,000.

The sum of \$322,040, being one per cent of the par value of the first lien refunding mortgage gold bonds outstanding on June 1, 1921, was paid during the year to the trustee under the first and second refunding mortgage, making the total paid in December 31, 1921, \$4,058,070. The sum paid was expended in additions and betterments to the mortgaged property in accordance with the trust agreement.

There was accumulated in the Coal Department sinking fund during the year, in the amount of \$5,000,000, which was paid on May 1, 1899, and amended on May 10, 1910, \$398,086.50, which has been used in the acquisition of coal lands and mined coal in Pennsylvania.

The amount paid to the trustee under the first lien equipment trust indebted during the year was \$650,000. The total paid to date is \$9,100,000 which has been increased by accumulations of interest on balances and investments. Complying with the agreement, bonds issued thereunder having a value of \$3,976,000 have been purchased at a cost, including accrued interest, of \$3,930,445, and retired; \$4,439,126.55 has been expended for equipment which has been made subject to the indenture, and securities and cash to the amount of \$1,755,017.13 are now held by the trustee.

There was received during the year from the United States, on account of the guarantee of net earnings provided for by the Transportation Act of 1920, the guarantee period extending through August 31, 1920, the sum of \$515,000, which with the amounts received during the year 1920, aggregating \$2,195,000, makes a total of \$2,710,000 received from the United States during the year for compensation for the taking over of the company's property in December, 1917, and its subsequent occupation and use until the close of business on February 29, 1920. The final settlements of both these accounts with the United States are still pending.

COAL DEPARTMENT

The anthracite produced by your affiliated corporations during the year 1921, including the product of washeries, aggregated 9,122,408 long tons, an increase of 1,033,226 tons, or 12.77 per cent above 1920. This output was 13.01 per cent of the year's total production of all Pennsylvania anthracite mines and washeries, estimated at 70,117,000 long tons, or 1.5 per cent below 1920.

The new Marvite breaker, located in Scranton, began late in 1920, was completed during the year. It is of steel construction, with the least practicable inflammable material, and equipped with the most modern machinery for the preparation of anthracite.

Several statutes adverse to the anthracite industry of the State were enacted by the Legislature of Pennsylvania during the year. A taxing statute, effective on July 1, 1921, established a new and special tax of one and one-half per cent on the value of all anthracite prepared for market. Both in substance and in form, this statute seems to be the equivalent of the "Rooney" act which was declared unconstitutional by the Supreme Court of Pennsylvania in 1915. Although there have been subsequent changes in the personnel of the Supreme Court, there has been no relevant change in the fundamental law of the Commonwealth. Upon the advice of counsel, a suit was brought to test the power of the Legislature to reenact this form of taxation and the Dauphin County Court has sustained the enactment. Appeal to the Supreme Court of the State has been taken. Other enactments, known respectively as the "Kohler" and "Fowler" acts, impose penalties for mining operations that cause subsidence of surface resulting in injuries to persons or property, giving to municipal authorities extensive control over mining operations within the limits of their municipalities and exempting from punitive processes all operators that are approved by the legislature and thereby agree to pay to the State, the fund thus constituted to be first available to reimburse those damaged by mine caves, including both natural and artificial persons and the expenses of a commission charged with the enforcement of these laws and, second, for all public purposes. These acts became effective in August 27, 1921, and all but a few anthracite operators have exercised their statutory option by declining to accept. Counsel have advised that these statutes are unconstitutional and the outcome can be held in the case of the "Kohler" act. Appeal to the Supreme Court on the part of the State is anticipated.

As stated in the report for last year, the wages of the employees of the anthracite industry were fixed at approximately seventeen per cent above the market rate on March 31, 1922, by a contract, resulting from an award made by the Anthracite Coal Commission, appointed by the President of the United States, and this contract bound the operators until the agreed date of its expiration. Negotiations for a new contract, to take effect on April 1, 1922, are now in progress and the outcome cannot be predicted. The employees have demanded an increase of twenty per cent over the war rates of wages and numerous changes in conditions of employment that would further increase the labor cost of anthracite. The operators consider that some reduction in wages corresponding at least with corresponding reduction in the cost of living, should be made and the anthracite industry thus brought reasonably in line with the other great industries of the nation, all which are as rapidly as possible adjusting themselves to the conditions of war, and are being protected in its market position against the competition of bituminous coal.

RAILROAD DEPARTMENT

This is the first annual report since that for the year 1917 to cover a full year's operation of your railway for your corporate account. During the intervening years your railway has been operated as a trust, and with February 29, 1920, operated by the United States Railroad Administration and from March 1, 1920, to August 31, 1920, inclusive its revenues were guaranteed under the Transportation Act of 1920.

During this first year of operation for your corporate account the gross operating revenues of your railway amounted to \$45,776,859, which is 1.66 per cent more than that resulting from the operations of 1920. Operating expenses amounted to \$38,825,529, a decrease from 1920 of \$2,400,801, or 7.84 per cent. The resulting operating income, before deduction of taxes, was \$6,951,330, an increase of \$3,723,361, or 53.55 per cent, as compared with 1920. The operating averages for the three years from July 1, 1914, to June 30, 1917, the "test period" adopted by Congress in the basis of compensation for possession and use of the property being Federal control are operating revenues, \$25,474,214, operating expenses, \$24,000,000, and the resulting operating income, \$1,474,214. These comparisons show that the increase in gross revenues has been more

then absorbed by increases in operating expenses, due to advances in the prices of materials, changes in working conditions, and increases in wages, so that while considerably more money has passed through the accounts of your railway, in the net result its actual earnings have been less than upon the former gross receipts of the pre-war period.

Freight receipts during the year exceeded those of 1920 by \$422,304, or 1.08 per cent, although the total freight movement declined 24.90 per cent from 4,265,734,874 ton-miles in the earlier to 3,203,759,205 in the latter year. Compared with the revenues of the test period, freight receipts increased 87.47 per cent, while freight movement declined somewhat less than one per cent. The average rate per ton-mile was 2.36 cents. The decrease in freight movement is wholly attributable to the prevailing industrial depression and was most marked in respect of bituminous coal, iron ore and cement, gravel, sandstone, pulp-wood, lumber and general manufactures and merchandise.

Passenger receipts exceeded 1920 by \$259,287.09 or 6.88 per cent. The total movement of passengers was 119,696,843 passenger-miles as against 130,971,551 passenger-miles in 1920, a decrease of 8.61 per cent. Passenger-train mileage was 10 per cent less than in 1920, but passenger-car miles increased by a fractional per cent. Per mile travelled the average passenger paid 3.37 cents in 1921, as compared with 2.88 in 1920. Gross receipts per passenger-train mile averaged \$1.72 in 1921, and \$1.58 in 1920, an increase of 8.86 per cent. The average per passenger-car mile was 6.84 per cent greater in 1921 than in 1920.

Receipts for mail transportation amounted to \$235,596, an apparent decrease of \$131,754 or 35.87 per cent, but substantially all this is accounted for by the fact that the figure for 1920 includes \$130,000 received in adjustment for under-payments in prior years.

Miscellaneous revenues decreased 12.05 per cent, principally on account of the general business depression.

The increased passenger and freight rates authorized by the Interstate Commerce Commission in 1920, pursuant to the new requirements of the Transportation Act, took effect on August 26, 1920, and were in force throughout the whole of 1921. This accounts for the increase in revenues that have been noted in operating conditions. The increase in revenues, somewhat more favorable prices for materials and supplies, adjustments in wages and conditions of employment and closer approximation to normal operating conditions as the abnormalities of war and Federal Control become more remote, have resulted in a net increase of 111.34, or three-fifths of one per cent. Maintenance of way expenditures increased \$395,082, of 7.72 per cent over 1920. The application of 2,866 tons more rails and 112,418 more ties than were applied in the maintenance of 1920 are represented by an increase in their cost of \$1,059,305, or 10.3 per cent. The maintenance of other track materials and in maintenance of interlockers and signals added \$322,063, but these increases were largely offset by reductions in other items. Maintenance of equipment charges increased \$64,216, or one-half of 1 per cent. The net increase in the cost of maintenance of way items hith of increase and reduction; an increase of \$757,757 represents retirements of freight-train cars. Traffic expenses increased \$107,177, or 27.73 per cent, chiefly on account of the re-establishment of traffic agencies for the development of business which has been abolished under Federal Control. The reduction of \$3,789,245, or 17.49 per cent in transportation expenses is explained by the reduced public demand for transportation with its entailed expense, adjustments in wages and improved operation. The factor here indicated is illustrated by increases in the gross freight-train loads northbound, in the heavy tonnage districts. The average gross freight-train load from Carbondale was 3,765 tons, an increase of 486 tons, or 12.9 per cent, and from Oneonta it was 3,601 tons, an increase of 413 tons, or 11.5 per cent. The average delay to cars passing through yards was reduced from 16 hours and 42 minutes in 1920, to 10 hours and 35 minutes in 1921, or 26.5 per cent.

On June 25, 1921, the Railroad Labor Board ordered certain reductions in wages to take effect on July 1, 1921. The resulting saving to your company during the last six months of 1921, was \$1,030,000, or 8.77 per cent of its operating expenses. This amount, however, is not the net amount paid out by reason of the advances required by the same authority on July 20, 1920, the increase then ordered having augmented your expenditures for wages approximately twenty-one per cent. The Railroad Labor Board has also made several orders during the year, the effect of which is affecting working conditions, but without very materially mitigating the severely restrictive and grossly extravagant rules that resulted from unilateral negotiations during Federal Control. Extravagant estimates of the savings resulting from changes in the rates of wages, in view of the persistence of the working rules have been widely circulated, but these potentialities are far more evident in the daily press than they are possible of realization in railway practice—the sole point at which they could benefit the railway industry or the public.

The Transportation Act of 1920 required the Interstate Commerce Commission to provide for a schedule of rates that would admit of a return of not less than five and one-half per cent or more than six per cent upon the fair value of the properties, from March 1, 1920, to February 28, 1921. The rate schedule then provided for a further consolidation of rates subsequent to the later date was left to determination by the Commission. An inquiry intended to supply information on which to establish the basic rate of return for the next period and covering the same level of service, and the relation between the rates of return for rates to industrial and traffic conditions was begun by the Commission on December 14, 1921. Many witnesses, including shippers, representatives of State railroad commissions and railway officers, were heard and the Commission has concluded, by a majority, that the future policy of the Commission, in the matters covered by this investigation, has been made. Under existing rates, the railways of the nation, as a whole, earned in 1921 about half the income provided for by the Transportation Act, and probably below the real value as compared with other properties. If the railways are to be required to write off the deficiency as a permanent loss and to accept a lower average return than that earned by investments in United States bonds, they will not, while the average rates are substantially below the real value as compared with other properties, be able to obtain the additional capital needed for their expansion.

The proceeding brought by the principal New England railroads, except the Boston and Albany as noted in the report for last year, against their connections, including your company, and substantially all carriers in the country, have resulted in a settlement by the Interstate Commerce Commission. The Interstate Commerce Commission undertook to increase the annual revenues of the New England railroads by about \$7,500,000, to be diverted from the earnings of other railroads by means of modifications in the bases used in dividing the total revenues, and the result was a settlement of eight interchanged between New England and other sections of the country. This order was entered as of January 30, 1922, and made to take effect on March 1, 1922, but the effective date has been changed, by amendment, on April 1, 1922. On February 6, 1921 the first decision in this proceeding was rendered by the Commission, a majority holding that the New England railroads had not established their complaint and refusing to grant the relief asked, although recommending to the carriers in interest a general revision of the divisions, which were considered as inconsistent and in

some cases to be unfair to one side, while in others unfair to the other side. Commissioners were appointed to undertake these revisions, as suggested by the Commission, but before these committees had been in existence long enough to present any definite results, certain changes in the personnel of the Commission took place and were followed by the filing, on behalf of the New England railroads, of a petition for a re-argument. This re-argument was heard and with no additional changes of any kind in the record of testimony, the Commission, again by a majority and by a majority that included all the members appointed after the earlier decision, reversed its former conclusion and decided that the New England complainants had established the changes which they sought. The order issued in accordance with this second opinion required the defendants to shrink their division by fifteen per cent of the present divisions accruing to complainants, in cases in which the complainants now receive not more than granted of 1920, and with no additional changes of their own present divisions, in cases in which the existing contracts allow more than one-half of the total charge to the complainants. From this result, Commissioners Hall, Daniels and Esch (the latter, as a member of Congress and Chairman of the Committee on Interstate and Foreign Commerce of the House of Representatives having been most influential in determining the character of the present law under which the Commission acts) dissented. Upon advice of counsel your company has joined the defendant carriers in a suit, instituted in the District Court of the United States for the Southern District of New York, to set aside this order and enjoin its enforcement. The hearing upon the motion for an interlocutory injunction has been set for April 22, 1922.

FEDERAL VALUATION

Preliminary statements of proposed reports to the Commission concerning the valuation of your industrial side were furnished to your officers during 1920 and exceptions were filed with the Bureau of Valuation covering necessary corrections of errors and in unit prices. Subsequently, a preliminary accounting report was received and examined by your Accounting Department. This examination disclosing numerous errors and omissions which were also covered by the proposed action has been taken by the Commission with regard to these exceptions, although through conferences with representatives of your Valuation and Accounting Departments and representatives of the Bureau of Valuation many corrections have been made and many errors have been admitted. As a result of these conferences it is expected that the Tentative Valuation will be substantially more accurate and favorable to your company than the original compilations. No opportunity has been afforded for conferences with the Commission on the proposed accounting report, although they have been in the hands of the Bureau of Valuation since February 1, 1921. The cost of valuation work to the end of 1921, amounted to \$563,523.98, of which \$426,961.38 was charged to corporate operating charges and \$136,571.60 to the operating expenses of the Railroad Administration.

INDUSTRIAL DEPARTMENT

Ninety-four new industries were located on the tracks of your company during 1921, as compared with 115 in 1920. Thirty extensions to old industries were made and 115 new industrial side tracks were constructed and five industrial side tracks were extended. The total number of tracks for 1920 were sixty-three, twenty and eight. The cost of new industrial side tracks and of extensions to such tracks in 1921, was \$95,620, of which \$18,524 was borne by your company and \$77,096 by the industries served. The Federal Bureau of Investigation has maintained a close relationship by your railway and representatives of your industrial department have continued to work with them and with all other Federal, State and co-operative agencies which are endeavoring to promote agricultural progress in the regions adjacent to your line. Efforts to advance the work of local commercial organizations has also been continued.

ALLIED TROLLEY LINES

The Union Traction Company strike which began on January 29, 1921, as stated in the last annual report resulted, as was anticipated, in serious losses to the public and an extraordinary expense in respect of operating per unit. Additional revenue losses resulted from the illegal operation of "jitneys" which affected every street-vanway route and the failure of the public authorities to maintain the public peace. The strike was finally abandoned on November 24, 1921, although it was practically at an end long before that date, and the subsequent resumption of the use of these lines by the general public has been rapid, so that traffic is now nearly at the normal level. Continuous efforts by the legal department of this company have greatly reduced the competition of illegally operated motor vehicles. No difficulty has been experienced in obtaining a sufficient number of qualified men to operate the cars at the rates of wages fixed when the former Public Service Commission for the Second District declined to authorize the rates of fare necessary to support the rates of wages then in force and took its position in favor of liquidation of wages, saying in part:

"The Commission in the order about to be made is dealing with wages of the employees. It is not the duty of the Commission to set the general cost list in the present point when the general cost list is being made. We must assume that the trend of wages will be downward."

The services supplied by the United Traction Company can be most satisfactorily rendered by one-man cars, the design and operation of which have been admirably developed to meet the requirements of surface transit in urban communities. The first car of this type was put in service during June, 1921; about ninety such cars are now in use in Albany and Troy and by July 1, 1922, it is expected that this type of equipment will be in operation for all regular basic schedules, possibly excepting the lines between Albany and Troy and between Albany and Cohoes.

Since January 28, 1921, under the order of the former Public Service Commission, this company has received eight cents as its standard fare (four tickets being sold for thirty cents) in Albany and but six cents in Troy. Waterbury, Cohoes, Green Island, Waterford and Colonie and five in Rensselaer County. The standard fare in Albany and Troy, under authority to be required by the then-existing law. A statutory change having been made, by which the new Commission is empowered to authorize reasonable rates in such cases, application for an equalization of rates was presented to the Commission on November, 1921. Testimony was taken and the case submitted upon briefs, and it is now awaiting decision. With properly equalized fares, one-man cars and the improved operation now possible, the income account of this property should become substantially self-sustaining.

The operating revenues of the Hudson Valley Railway Company amounted to \$970,779, operating expenses to \$921,320, taxes to \$64,066 and the net operating deficit to \$14,607. The data show a decrease in operating revenues of 11.67 per cent and in operating expenses of 6.65 per cent

with an increase in taxes of 16.43 per cent and a decrease in net operating income of 125.60 per cent. Operating revenues were considerably reduced by the strike on the United Traction Company, as the employees refused to operate cars south of Waterford and into Troy from January 29 to August 17, 1921. By reductions made in October and November, 1921, and in January, 1922, the wages paid by this company were equalized with those paid by the United Traction Company.

On August 9, 1921, the Public Service Commission allowed an increased fare on the interurban lines, representing an increase of one cent in each zone on the Glens Falls and Waterford divisions, with the exception of the line between Mechanicville and Waterford. The urban fares in Glens Falls, Hudson Falls, Fort Edward and Saratoga remain the same as formerly, that is, seven cents. Full benefit from the new rates has not been obtained on account of labor troubles in and near Glens Falls and Fort Edward, the employees of the International Paper Company and other companies having been on strike since early last spring.

GENERAL REMARKS

The serious business depression existing at the date of the report for last year was not relieved during 1921. The movement of prices toward lower levels continued, with some interruptions and exceptions, and there were some readjustments in wages, but in this field the movement was sporadic and commonly insufficient. Revision of Federal taxation, the proclaimed object of which was the relief of industry, raised the tax on corporate income twenty-five per cent, from the rate of ten to that of twelve and one-half per cent of the taxable income, while the slight mitigation of the surtax rates on individual incomes has not materi-

ally reduced the advantage of tax-free securities compared with those that can be issued by railways and other privately-owned enterprises. The elimination of taxes on so-called excess-profits has, of course, had no beneficial effect upon railways and other industries subject to public regulation. The Transportation Act of 1920, extravagantly heralded as the great charter of an era of reconciliation between the purpose of reformed regulative system and the inscapable requirements of efficient industry, has failed to provide the railways with the adequate revenues recognized on all sides as necessary to restore confidence on the part of investors. Under these conditions the rate of interest has declined, not because of an abundant supply of investment capital, measured by the opportunities for its utilization in desirable expansion of productive enterprise, but because of a general absence of confidence that such expansion is commercially warranted. With the capital invested in existing enterprises as idle as cars lying empty on railway side tracks and in their yards, and labor largely idle, because of lack of demand for the products of their employment at prices sufficient to pay wages and for raw materials, there is little incentive to seek capital for new undertakings or to apply it in the expansion of those already in existence. While in a country so rich in natural resources, industry will develop recurrent periods of more or less satisfactory activity, the sources of genuine improvement are more profound than any yet invoked. They suggest a clear recognition of the great truths that industry and prosperity are inseparable and that enterprise to be productive in any maximum degree must be unshackled.

By order of the Board of Managers,
L. F. LOREE,
President.

(Continued from page 1147)

The revenues and expenses in detail and the principal freight statistics for 1921 compare as follows:

	1921	1920
Operating revenues		
Freight	\$3,076,756	\$2,984,251
Passenger	50,113	52,240
Milk	88,722	72,531
Total, including other	\$3,242,291	\$3,146,209
Operating expenses:		
Maintenance of way and structures	\$381,911	\$394,109
Maintenance of equipment	607,376	602,442
Traffic expenses	21,328	23,711
Transportation	1,326,640	1,651,475
General	92,587	98,325
Total	\$2,429,843	\$2,775,062
Net revenue from railway operation	\$812,448	\$371,147
Freight traffic:		
Miles operated	497	97
Number of revenue tons	4,639,163	5,927,454
Number of revenue ton-miles	321,459,650	409,680,013
Average distance each ton carried—miles	69.3	69.2
Average revenue per ton	\$6.6	\$5.0
Passenger traffic:		
Miles operated passenger service	87	88
Number of passengers	121,600	149,984
Number of passenger-miles	1,463,147	1,705,329
Average distance each passenger carried—miles	12.0	11.7
Average revenue per passenger per mile	\$4.1	\$3.7

LEHIGH & NEW ENGLAND.—Annual Report.—The comparative income account for the years ended December 31, 1921 and 1920, follows:

	1921	1920*
Railway operating revenues:		
Anthracite coal	\$2,410,883	\$2,659,033
Bituminous coal	21,487	479,701
Merchandise	1,443,775	1,478,193
Passenger	25,241	23,572
Total, including other	4,775,737	4,830,406
Railway operating expenses:		
Maintenance of way and structures	734,885	789,497
Maintenance of equipment	1,186,865	1,048,207
Traffic	80,160	70,381
Transportation	1,617,195	1,836,042
General	193,984	179,466
Total railway operating expenses	3,795,741	3,923,114
Net revenue from railway operations	979,997	892,265
Railway tax accruals	226,437	227,775
Total railway operating income	753,560	671,497
Total non-operating income	364,610	609,739
Gross income	1,118,170	1,281,236
Interest on funded debt	316,413	325,638
Total deductions from gross income	415,765	415,701
Net income	702,405	865,526
Income applied to sinking and other reserve fund	6,489	83,251
Less federal income for 1920		18,776
Balance transferred to profit and loss	695,916	843,698

*Federal and company operations for the year 1920 are combined in this statement.

The principal freight statistics for the year ended December 31, 1921, compare as follows:

	1921	1920
Operating mileage operated	218	217
Total revenue tonnage	5,943,780	6,881,496
Average ton-miles revenue freight per mile of road	1,066,194	1,082,624
Ton-miles revenue freight per train-mile	589	560
Ton-miles revenue freight per loaded freight car-mile	45.51	43.71
Miles based revenue freight	43,665	37,225
Average revenue per ton-mile of freight (cents)	1.81	1.80

MICHIGAN CENTRAL.—New Director.—Warren S. Hayden has been elected a director to succeed T. A. Harden, deceased.

MIDLAND VALLEY.—Authorized to Issue Bonds.—This company has been authorized by the Interstate Commerce Commission to issue \$541,000 of first mortgage 5 per cent gold bonds to be sold at not less than 75 or to be pledged as security for short term notes.

MINNEAPOLIS & ST. LOUIS.—Annual Report.—The annual report issued this week shows the following corporate income for the year 1921:

	1921	1920
Gross income	\$16,185,129	\$14,352,998
Expenses, taxes, etc.	15,341,011	15,491,931
Operating income	\$644,118	*\$1,138,933
Standard return		451,438
Government guaranty		3,362,818
Other income	*171,426	241,549
Total income	\$472,624	\$3,916,872
Interest, etc.	2,308,914	2,316,696
Deficit	\$1,836,222	\$1600,176

*Deficit †Surplus.

MINERAL RANGE.—Annual Report.—The income account for the year ended December 31, 1921, compares as follows:

	1921	1920
Operating revenues	\$281,735	\$562,590
Operating expenses	407,495	717,801
Net operating deficit	(125,760)	(155,212)
Railway tax accruals	60,309	43,336
Operating deficit	186,091	196,570
Total non-operating income	21,536	249,363
Gross income	Def. 164,555	50,793
Total deductions from gross income	87,374	90,047
Net deficit	251,939	39,253

MISSOURI & NORTH ARKANSAS.—Authorized to Issue Securities.—The Interstate Commerce Commission has authorized the Missouri & North Arkansas Railway to issue \$3,000,000 of common stock for the purpose of taking over the Missouri & North Arkansas Railroad and also a \$5,000,000 first mortgage 15-year gold bond to be pledged with the Secretary of the Treasury as collateral security for a loan of \$3,500,000.

MISSOURI PACIFIC.—Annual Report.—The annual report issued this week shows a corporate income account for the year ended December 31, 1921, as follows:

	1921	1920
Operating revenues	\$109,785,950	\$98,194,271
Operating expenses	11,693,856	94,009,509
Net from railway operations	18,092,094	3,284,762
Railway taxes and noncollectible railway revenue	4,166,570	3,802,709
Railway operating income	11,695,565	Def. 536,036
Other operating income	799,174	660,230
Total operating income	14,494,739	124,194
Deductions from operating income	4,257,891	4,741,202
Net railway operating income	10,236,848	Def. 4,617,009
Non-operating income	3,061,557	1,274,902
Government guaranty	1,972,081	15,638,890
Gross income	15,270,487	14,168,823
Deductions from gross income	11,733,471	11,135,448
Balance—net income	3,537,016	3,033,075

NATIONAL LINE.—Certificate to Construct Line Declined.—The Interstate Commerce Commission has declined to issue a certificate authorizing this company to construct a 12-mile railroad from a point on the Columbus & Greenville in Webster County, Miss., paralleling the main line of the Gulf, Mobile & Northern. It

is stated that the record indicates that applicant has not given sufficient attention to an estimate of construction costs and of operating expenses and has estimated revenues erroneously.

NEW YORK, CHICAGO & ST. LOUIS.—Annual Report.—The annual report issued this week shows the following corporate income account for the year ended December 31, 1921:

	1921	1920
Operating revenues	\$27,030,663	\$23,953,824
Operating expenses	20,613,594	19,112,850
Net from railway operations	6,417,069	4,840,974
Railway tax accruals	1,820,862	1,020,000
Railway operating income	4,596,207	3,816,117
Total non-operating income	3,962,030	691,357
Gross income	8,554,745	4,507,474
Interest on funded debt	1,633,492	1,640,640
Miscellaneous income charges	2,191,491	92,408
Total deductions	4,232,041	2,258,623
Net income	4,322,705	2,248,851
Total sinking fund and dividend appropriations	1,597,555	1,597,966
Income balance	2,725,149	650,885

NORFOLK SOUTHERN.—Annual Report.—The annual report issued this week shows the following income account for the year ended December 31, 1921:

	1921	1920*
Operating revenues	\$8,056,795	\$6,610,402
Operating expenses	6,752,509	6,959,365
Net railway operating income	1,304,286	Def. 348,963
Railway tax accruals	366,095	219,416
Railway operating income	937,852	Def. 569,079
Total non-operating income	106,882	Def. 1,684,258†
Gross income	1,020,259	Def. 1,115,178
Total deductions	1,343,933	1,168,739
Net income	Def. 323,674	Def. 53,561
Profit and loss account:		
Net credit for the year from redemption of bonds, sale of securities owned, etc.	313,953	273,729
Net result for the year	Def. 9,720	220,168

*Under government control two months, and operated by owners balance of year.
†Includes rental and operating deficit paid by government on account of operations during guaranty period.

NORFOLK & WESTERN.—Asks Authority to Guarantee Equipment Trust Certificates.—This company has applied to the Interstate Commerce Commission for authority to guarantee \$6,700,000 of ten-year, 5½ per cent equipment trust certificates to be issued by the Virginia Holding Company for equipment to be leased to the Norfolk & Western. The certificates are to be sold at 97.75.

NORTHERN PACIFIC.—Authorized to Issue Bonds.—The Interstate Commerce Commission has authorized an issue of \$115,534,300 of refunding and improvement mortgage bonds, 5 per cent, to be sold at not less than 90 and the proceeds used to redeem at 103½ outstanding joint 6½ per cent bonds of the Northern Pacific and the Great Northern.

PERE MARQUETTE.—Asks Authority to Abandon Branches.—This company has applied to the Interstate Commerce Commission for authority to abandon its Remus and Mecosta branches, 13.38

and 11.23 miles, respectively, in Mecosta County, Mich., on the ground that the traffic is insufficient.

PITTSBURGH & WEST VIRGINIA.—Annual Report.—The income account for the year ended December 31, 1921, compares as follows:

	*1921	1920
Operating revenues	\$2,808,939	\$2,254,048
Operating expenses	3,660,192†	2,273,966
Net revenue from railway operations	Def. 851,252	Def. 19,919
Railway tax accruals	321,891	169,322
Total operating income	Def. 1,173,230	Def. 190,367
Total non-operating income	2,185,612	661,123
Gross income	1,012,382	470,755
Total deductions from gross income	62,384	37,076
Net income	949,998	433,679
Dividend appropriations of income	544,242	433,679
Income balance	405,756

*Includes operating results of West Side Belt Railroad.
†Includes \$810,917 for rehabilitation of road and equipment.

SHREVEPORT & NORTH EASTERN.—Certificate for Construction Denied.—The Interstate Commerce Commission has denied this company's application for a certificate authorizing the construction of a line from Minden, La., to a point near Junction City on the Arkansas state line, 36 miles, on the ground that the facts presented are not sufficient to enable it to form a reasonably accurate judgment of the possibilities of the proposed line or to indicate a reasonable prospect of success for the enterprise.

ST. LOUIS-SAN FRANCISCO.—New Directors.—B. F. Yoakum, of San Antonio, Texas, and A. G. Becker, of Chicago, have been elected directors to succeed Lorezo Semple and T. D. Heed.

TEXAS MIDLAND.—Guaranty Certified.—The Interstate Commerce Commission has certified the amount of this company's guaranty for the six months period of 1920 as \$158,367, of which \$58,367 was still to be paid.

Railroad Administration Settlements

The United States Railroad Administration has this week announced final settlements for the federal control period with the Winston-Salem Southbound to which it paid \$72,000 and with the Missouri & North Arkansas which paid director general \$292,000.

Trend of Railway Stock and Bonds Prices

	May 9	Last Week	Last Year
Average price of 20 representative railway stocks	64.95	65.26	57.41
Average price of 20 representative railway bonds	86.07	86.58	74.89

Lethbridge Viaduct on the Canadian Pacific

Railway Officers

Executive

William A. Colston, whose election as vice-president and general counsel of the New York, Chicago & St. Louis, with headquarters at Cleveland, Ohio, effective May 1, was reported in the *Railway Age* of April 8, and whose sketch of his railway experience was published in the issue of May 6, has also been elected a director of this company, effective May 3, and vice-president and general counsel and a director of the Lake Erie & Western and a director of the Fort Wayne, Cincinnati & Louisville, effective May 10.

James B. Sheehan, who was elected vice-president and general counsel of the Chicago & North Western and the Chicago, St. Paul, Minneapolis & Omaha, effective April 18, with headquarters at Chicago, was born in Anamosa, Iowa, August 24, 1863, attended Beloit College from 1881 to 1883, was graduated from the University of Michigan in 1885, and was admitted to the bar in 1888. Thereafter he engaged in general law practice at Omaha, Neb., until September 1, 1892, when he entered railway service as an attorney for the Fremont, Elkhorn & Missouri Valley (now a part of the Chicago & North Western) at Omaha, Neb. On February 28, 1903, he was appointed assistant general attorney of the Chicago & North Western, with headquarters at Omaha, and continued in this capacity until March 1, 1905, when he became general attorney of the Chicago, St. Paul, Minneapolis & Omaha, with headquarters at St. Paul, Minn. On March 1, 1910, he was promoted to general solicitor of that company and on October 1, 1918, was elected general counsel of both the Chicago, St. Paul, Minneapolis & Omaha, and the Chicago & North Western, with headquarters at Chicago, which position he held until his recent election to vice-president and general counsel of these companies.

J. B. Sheehan

Financial, Legal and Accounting

J. F. Fairlamb has been appointed auditor of revenue of the New York Central and the Ottawa & New York, succeeding **W. T. McCulloch**, deceased. **J. S. Conover** and **J. McKendrick** have been appointed assistant auditors of revenue. These changes were effective May 1. The office of auditor of miscellaneous accounts has been discontinued and jurisdiction over its affairs has been assumed by auditor of revenue

Operating

Charles F. Thomas has been promoted to superintendent in charge of traffic and operation of the Nezperce & Idaho, with headquarters at Nezperce, Idaho, to succeed **J. M. Mitchell**, resigned.

Traffic

P. M. Snyder has been appointed division passenger agent of the Buffalo, Rochester & Pittsburgh with headquarters at Pittsburgh, Pa.

H. D. Guy has been appointed commercial agent of the Norfolk & Western with headquarters at Roanoke, Va., effective April 24.

P. W. Clarkin has been appointed division freight agent of the Canadian National with headquarters at Charlottetown, P. E. I., succeeding **A. McDonald**, retired.

G. W. Curtis has been appointed industrial commissioner of the Canadian Pacific, Eastern Lines, with headquarters at Montreal, succeeding **H. P. Timmerman**, retired.

C. S. Blackman has been promoted to general freight agent of the Tennessee Central, with headquarters at Nashville, Tenn., effective May 4, to succeed **M. E. Newell**, promoted to the newly created position of freight traffic manager. Effective the same date, **J. A. McNeill**, has been promoted to the newly created position of assistant freight traffic manager, with headquarters at Nashville, Tenn.

Engineering, Maintenance of Way and Signaling

H. A. Hampton, assistant division engineer of the Portland division of the Southern Pacific, with headquarters at Portland, Ore., was promoted to division engineer, with the same headquarters, effective May 1, to succeed **E. E. Mayo**, who has been transferred to Sacramento, Cal., to succeed **F. M. Siefer**.

Clarence U. Smith, whose promotion to district engineer of the Chicago, Milwaukee & St. Paul, with headquarters at Milwaukee, Wis., effective May 1, was reported in the *Railway Age* of April 29 (page 1046), was born at Philadelphia on June 20, 1883, and was graduated from Armour Institute of Technology, Chicago, in 1907. He entered railway service in June, 1907, as an instrumentman on location of the Chicago, Milwaukee & St. Paul at Taft, Mont., in the Bitter Root mountains. For the next seven years he served consecutively as instrumentman on location, as engineer in charge of concrete work on several bridge and terminal projects on the Pacific Coast extension, as resident engineer on the Cannon Ball River line in South Dakota, and on double track work in Minnesota. He was promoted to assistant engineer in charge of concrete work on the Middle district with headquarters at Milwaukee in 1914. In 1917 he entered military service as a captain in the 107th Engineers, 32nd Division, with which he served throughout the operations of this division overseas, until his discharge in May, 1919, when he returned to the Chicago, Milwaukee & St. Paul, as assistant engineer on the Middle district, where he remained until December, 1920, when he was promoted to assistant engineer of the Chicago and Milwaukee and the Northern divisions, the position he held at the time of his recent promotion.

C. U. Smith

Purchasing and Stores

G. H. Pinion has been appointed purchasing agent of the Trans-Mississippi Terminal with headquarters at Dallas, Texas, succeeding **L. M. Sullivan**, deceased.

Obituary

William B. Sears, one of the builders of the Flint & Pere Marquette, now a part of the Pere Marquette System, died at Saginaw, Mich., May 2, at the age of 90 years.

More About Public Relations Work

THE RAILWAYS are fully and admirably equipped to present their case to law makers, commissions and courts. But law makers, commissions and courts are not going to settle the future of the railways. They are merely agents—the public is their principal. In this, as in other affairs, the principal will in the long run determine the policies carried out by the agents.

The Transportation Act is in most respects a good law. The Interstate Commerce Commission used its provisions to force advances in certain state rates. The Supreme Court of the United States upheld both these provisions and the action of the commission. But the commission would never have had a chance to set aside these state rates, or the courts to uphold its action, if the Transportation Act had not been passed by Congress. It would not have been passed by Congress if public sentiment had not been favorable to the railways at the time.

Bills to repeal every provision of the act that is intended to help the railways already have been introduced in Congress. They will be passed if public sentiment favors them. They will be defeated if public sentiment opposes them. No amount of money and ability which may be spent in presenting the case of the railroads to Congressional committees, commissions and courts will avail to secure fair and wholesome regulation unless the facts and arguments presented reach and influence the public. The railroad problem will not be solved in Washington. How can anybody think it will be after the experience of the last 15 years? It will be solved in every single city, town and rural district of the United States.

Is it not a curious thing that so many railways—practically every railway in fact—should recognize the need for employing men of great ability to represent them before legislative committees, commissions and courts, and that so few should recognize the need for employing men of equal rank and ability to represent them before the public? Let us be frank about it. Is it not a fact that most railway managements so greatly underestimate the importance of effective public relations work that they would think a man was a little crazy who should suggest that each large road should have in charge of its public relations work a man as highly paid and as able as those at the head of its legal, operating,

traffic and accounting departments? But has not the problem of establishing satisfactory relations between the railways and the public been proved by the experience of many years to be quite as difficult as any other problem confronting railroad managements? Is it not at least as far from solution as any other big problem of railroad management? The answers to these questions are obvious. If the problem presented by public relations is so big, so difficult and so far from solution, how can it be expected it will ever be solved unless by men who are able in proportion to the bigness of the problem and who can devote their time to it.

It may be said that the problem of public relations is the problem of each of the railroad departments which come in contact with the public. There is something in that view. But if so, the departments which already come in contact with the public have not done their work right. Otherwise the railroad situation could hardly be what it is today, and what it has been for years past.

The present railroad situation has one important feature which never existed prior to government control. The railway labor organizations are strongly in favor of government ownership. They would prefer to have coupled with it the Plumb Plan of employees' management, but if they cannot get that they want government management. Government control and agitation carried on by labor leaders have made a large part, and we fear a majority, of the railways' own employees active critics and enemies of private management. They are spreading propaganda against private management in every part of the country. Employees need education, and the public needs education to nullify the propaganda of the labor unions.

It may be that adequate and effective public relations work could be done through the existing departments of the railways. One thing is certain, however, and this is that it never has been done through them, and is not being adequately and effectively done through them now. Past experience may be misleading, but it indicates that adequate public relations work never will be done on most railways until a special department closely co-ordinated with the other departments, and especially with the president's office, is established on each large railway system. The president gets his information and recommendations regarding traffic,

operating, engineering and other matters from specialists on those subjects in the existing departments. He bases his policy largely on this information and these recommendations. Past experience makes it doubtful if he will get the information and recommendations regarding public relations that he needs until he has high grade specialists on public relations to give them to him.

In view of all that has happened to the railroads within the last 15 years owing to an uninformed and hostile public sentiment, it is surprising how much has been done to nullify the effect of this public sentiment and how little has been done to change the public sentiment itself, which is the cause producing the effects. Why devote so much energy and ability to defeating proposed adverse legislation after it has been introduced in the legislatures and Congress, and to fighting it in the courts after it has been passed, and so little energy and ability to changing the public sentiment which causes the legislation to be introduced and passed? Why, in other words, so often abandon the front line trench almost without a struggle, with the result that most of the fighting is done in the last trench, the loss of which means that all is lost? Or, to use a specific illustration from very recent experience, why let hostile sentiment regarding the Transportation Act be created among the farmers by false and unfair propaganda, which in many parts of the country was allowed to go almost unanswered for months, and then make a strenuous effort in Washington to defeat legislation to emasculate the Transportation Act which has been introduced by leaders of the agricultural bloc to cater to the sentiment among farmers thus created?

Under present conditions it would be a good thing if every high railway officer would place where he would have to read it every day a sentiment attributed to Abraham Lincoln: that with public sentiment everything is possible; without it, nothing can be done.

The railways are among the largest users of lumber and as such they have much in common with the producers of this commodity. Yet there has long

Railways Should existed a controversy between the manu-
Participate in facturers and the railway users of lum-
Lumber Conference ber, particularly regarding sizes and grades. The saw mill operators have complained of the insistence of railway purchasers for certain sizes not in common use elsewhere preventing orders for such materials from being filled from stock and requiring that they be cut special. Furthermore the producers have maintained that the manner in which the railways place their orders prevent them from utilizing the entire tree to the best advantage. The railways on the other hand object to being forced to accept standard sizes not adapted to their uses and feel that the volume of their purchases entitles them to secure these sizes and grades which are adapted especially to their needs. They also insist that they are in a better position to know their needs than the manufacturers and that

if they do not use the entire tree it is the problem of the manufacturer as a merchandiser to develop other demands for the surplus material as the packer has done so successfully with his various meat products. In view of these conflicts of opinion it is important to note that Herbert Hoover, secretary of commerce, has called a conference of lumber manufacturers and users at Washington during the week of May 22, and that the railway users of lumber are invited to participate in this conference on Thursday of that week when attention will be given to the railway phases of this problem. The large volume of lumber and lumber products purchased annually by the railways warrants the roads in seeing that they are properly represented at this conference in order that their interests may be protected in any standards which may be developed, while at the same time promoting the maximum economy in the cutting and use of lumber products.

The second article on the International Railway Congress at Rome appears on another page of this issue. In addition

English the Railway Language

to summing up the reports of the various sections, Mr. Dunn has written rather informally his opinions of the value of the Congress. The diversity which exists between European and American railway practices does not, he feels, make it improbable that the two continents can learn from each other, but rather the contrary—the very fact that methods and equipment differ so widely makes any effort to exchange knowledge the more likely to be fruitful. Unfortunately, however, delegates from English-speaking countries were not able to profit by the sessions of the Congress as much as could be desired because the French and Italian languages were used almost exclusively while English, the language of those who operate by far the greater part of the world's railway mileage, was used but slightly. Whatever the reason for this, there can be no question but that the English-speaking delegates did not and cannot secure the greatest benefit from a convention conducted in an unfamiliar tongue. "Modern Transport," a British contemporary of ours, in speaking of a convention to be held shortly in London, expresses the thought that it will be of more value than the International Railway Congress because English only will be used. The next International Railway Congress will be held at Madrid, Spain, in 1927—a long time off. But now, while the Rome convention is fresh in mind, is the time for action. Sessions in English to run concurrently with those in other tongues do not seem too much to ask, in view of the predominance of English-speaking peoples in the operation of the railways of the world.

Millions of chilled cast-iron car wheels are in service on American railroads and, owing to the large number involved,

Car Wheel Grinding Effects Savings

any improved method of maintenance or securing greater wheel mileage is of importance. Railroad men of wide experience advocate the grinding of cast-iron car wheels, both new and those with flat spots, maintaining that increased wheel mileage and economy are effected. In view of the possible savings, the subject of car wheel grinding is highly important and of vital interest to higher mechanical department officers. Regarding this practice E. A. Murray, shop superintendent of the Chesapeake & Ohio at Huntington, W. Va., says, "During the year 1921, 466 pairs of cast-iron car wheels were ground at Huntington at a saving of \$13.80 per pair, or a total saving of about \$6,400. It requires on an average

45 min. to grind out the flat spots on one pair of wheels. Experience has shown that the investment for the grinding machine pays a good dividend, in addition to improving the condition of the wheels. With the great number of car wheels ground at this point, we have never had one that has been through the process of grinding returned on account of sliding flat." This testimony strengthens the argument of those who favor car wheel grinding. Apparently a car wheel which is once ground true and concentric with the journal is far less likely to be gripped by the brake shoe and develop another flat spot. The evidence seems to show that there is also less danger of hot boxes with ground wheels owing to the fact that hammer blows, tending to cause the journal box packing to leave the journals, are eliminated. There are several well-founded arguments in favor of grinding new wheels before they are placed in service and this practice is being followed on another large eastern road in the case of chilled cast-iron wheels under local passenger equipment, the advantages claimed being easier riding wheels and coaches and less danger of the subsequent development of flat spots.

It has been distinctly encouraging to note in recent months the growing number of construction items of magnitude, indicating that the most progressive railroads are taking real steps not only to remedy existing inadequacies but to provide some measure of expansion for the future. The past year or year-and-a-half has been rife with pessimism and it has not been easy to shake loose from it. Business today needs some sort of a pace-maker and the railways are taking that position. Naturally any business they stimulate reacts to their own advantage; in their potential purchasing possibilities they have a powerful and tremendously effective influence for the quicker betterment of general business. Many roads have large budgets for construction and equipment needs which for good reasons they have not as yet felt that they could start. Others, perhaps more able financially or more willing to gamble on the future, have started programs which will shortly run into large expenditures. The most recent item is that of the New York Central's Castleton bridge project calling for an ultimate expenditure of about \$20,000,000, of which probably about twelve million will be spent in the next two years. It is only a short time ago that this road ordered new equipment and materials involving an expenditure in the neighborhood of forty million dollars. The stimulus to general business from these two expenditures cannot help but be felt. Certainly that system will be better prepared to handle the traffic which is bound to come and to profit from it. One distinct need today—and one clearly emphasized by the recent activities of such roads as the New York Central, the Santa Fe and a small number of others—is a thorough confidence in the future and a determination to go ahead.

The 1921 annual report of the Lehigh Valley, a review of which appears on another page, is a document of only 22 pages. It is, however, one of the most satisfactory annual reports which it has been our pleasure to examine. The reason for this is that the report presents to the Lehigh Valley stockholders a picture of the company's operations as adequate and complete as many other railroad companies succeed in giving in two or three times that number of pages. The report is also characterized by a new and interesting feature. In addition

Confidence in the Future

to the usual remarks of the executive there appears at the end of the report a statement to security holders which unquestionably will be read by them with interest and value. The remarks at the end of the report present an analysis of the present railroad problem, the attempt being made to bring home to the stockholder and bondholder his or her particular interest in the welfare of the railroads. The annual report may be regarded as a necessary presentation of the year's statistics or it may be regarded as a means of informing the security holders of what the railroad is doing or what it is trying to do to meet its particular conditions. It can easily be, and too often is, the first without the second, for it is not an easy task, even for those required to do it, to analyze a complicated mass of statistical data. It is the modern idea, however, that the security holder should be told the facts and told equally what the facts mean. The fact that a stockholder is a stockholder shows him to be in a receptive attitude to hear the executive's story and the railroad should be fair to him and tell him that story. The Lehigh Valley has taken a progressive step that we hope will be followed by such of the other railroads as have not as yet realized the value of taking their stockholders fully into their confidence.

Radio Legislation and the Railroads

FURTHER LEGISLATION for the control of radio communication is expected to be passed at this session of Congress, which will authorize the President to appoint a permanent board to control all radio communication in the United States. The bill, which will be an amendment to the radio act of 1912, under which radio communication is at present regulated, will be introduced by Representative Wallace H. White of Maine and is designed to give the Department of Commerce greater control and regulation over this new form of communication. The powers, however, will not be absolute. It is proposed that the permanent board of control will have a member each from the army, navy, commerce, post office and agriculture departments and five civilian members representing the public, skilled amateurs, manufacturers, scientific and other civilian interests.

The possibilities for the use of radio in the railroad field should not be overlooked by the government or by the railroads, for its application to railroad service is already receiving careful study by a committee of the Telegraph and Telephone section of the American Railway Association, while a number of railroads are conducting researches to ascertain its applicability to varying conditions of service. There is a large field for the use of short range sets to meet emergency requirements occasioned by the loss of pole lines because of floods, sleet storms, etc.; for trains marooned by storms or other reasons; for construction gangs and wrecking crews, etc. Other possibilities for the use of radio are for communication between the head and rear ends of trains, for long range operation between general headquarters and division points, and for automatic train control. It is also conceivable that it may find use in the signal field. While it is evident that these applications will create numerous complications the importance of radio to railroad work is so great that the railroads should receive consideration in the administration of any legislation relating to it.

Herbert Hoover, as secretary of commerce, under whose jurisdiction it is contemplated that the control and regulation of radio will come, has repeatedly pointed out the importance of the railroads to the welfare of the country and it is to be presumed that if the roads desire to be represented on the board of control he will give careful consideration to such a request. The railroads should be repre-

Annual Reports and Publicity

sented on this board in order that all avenues of communication may be available for their use, because the railroads, unlike the commercial telephone and telegraph companies, have no cross country lines on which they can maintain communication when something happens to their lines of communication along the right-of-way. Action should be taken for the protection of their own interests.

An Excess of Well Intentioned Zeal

THE Railroad Labor Board has decided that the contracts entered into between the Indiana Harbor Belt and the Burnham Car Repair Company for the operation of its shops "are in violation of the Transportation Act insofar as they purport or are construed by the carrier to remove said employees from the application of said act, and that those provisions of the contracts affecting the wages and working rules of said employees are in violation of decisions No. 2, No. 119 and No. 147 of this Board."

This decision, particularly as it is the first of some 36 similar cases, must be regarded as one of the most important and far-reaching which has yet been made by the Board. It may be regarded from two angles. On the one hand, it must be admitted that it was the natural one for the Board to make in the light of its previous policy and activity. On the other hand, it must be considered as the latest step in a long series of decisions, in all of which the Labor Board assumes the right to judge whether or not it has been exceeding the authority granted to it in the Transportation Act. *The Railway Age* believes that in the activities of the Board culminating in this decision the Board has gone too far. The railroads will be very much remiss in their duty if they do not fight the decision and carry the matter, if necessary, to the highest courts.

It is natural for an ambitious man, or a group of men, to try to secure all in the way of position and power that circumstances permit them to attain. This doctrine is the very definition of the word ambition. It is one of the most important elements in the theory of evolution or the survival of the fittest, or whatever else one may call it. The Constitution of the United States gives due regard to it because the basic principle of our form of government is that it shall function as a system of checks and balances. The creators of our government feared that there might some day arise a power which in those days, of course, they personified in King George III of England. They, therefore, worked out a theory that there should be three departments of government, the executive, the legislative and the judicial, each of which was to serve as a check or balance on the other two.

This theory is a far reaching one. It was applied to the Interstate Commerce Commission and that body went through a long period of trying and testing in the courts and in Congress before its powers were determined to the extent that they are today. The Labor Board thus far has had no such trying and testing. The railroads—with the single important exception of the Pennsylvania—have been content to sit back and permit the Labor Board to gain more and more power and more and more authority day by day. The result is that the Board has taken unto itself administrative functions and has been allowed to wield a power which, in our belief, was not granted to it by the Transportation Act.

The Labor Board thus far, therefore, has been primarily its own judge of where its power extended or did not extend—except as always in the Pennsylvania case. This is not as it should be. It is not best for the welfare of the Labor Board, for the railroads for the public or for the basic principles of our form of government that it should be worked out in this way.

There are those who believe that the most important factor in deciding the labor disputes in a public utility is the force of public opinion. The Labor provisions of the Trans-

portation Act were purposely framed with that idea uppermost. There seems, however, too much of an attitude on the part of the railway managements to forget this important aspect of the situation. The Labor Board should not be the arbiter of its own activity.

Realizing as we must that the Railroad Labor Board is an ambitious body seeking to secure all the power and rights that it can ethically secure and that it is properly doing its utmost to justify its existence as a part of our government, we may go further. Taking the decision itself in the Indiana Harbor Belt case, we find these words: "On the other hand, the Transportation Act was not enacted primarily for the protection of the rights of either carrier or employee except insofar as such protection was involved in the paramount purpose of the act; that is, to insure to the public, as far as possible, efficiency and uninterrupted railway transportation by protecting the people from the loss and suffering incident to the interruption of traffic growing out of controversies between the carriers and the employees who do their work. This act is the congressional assertion of a public right."

There is also a statement that "it is important if by such contract the carrier seeks to remove its employees from under the application of a law which the people have enacted for the purpose of maintaining industrial peace upon the railways." Of course, in this case, there was no question of the interruption of transportation that is apparent on the surface. The employees of the Burnham Car Repair Company were not threatening a strike. But the point is that the Labor Board has, if anything, given an exalted importance to the fear of interruptions to transportation. The Transportation Act, however, also requires the Interstate Commerce Commission to establish a level of rates which will yield a certain rate of return "under honest, efficient and economical management and reasonable expenditures for maintenance of way, structures and equipment."

Why have the railroads contracted for the repair of equipment? One of the best reasons we have seen is given in a report recently issued by the National Industrial Conference Board—Research Report No. 46 dated February, 1922, and entitled, "Railroad Wages and Working Conditions." This report contains on page 97, Chart 9: Hourly earnings, skilled shop labor, Class I railroads, compared with skilled labor in foundries and machine shops. The chart shows, among other things, this rather pertinent fact that whereas in July, 1914, skilled labor in railroad shops and in foundries and machine shops outside the railroad field hourly wages were nearly on a parity, in October, 1921, skilled railroad shop labor was receiving an hourly rate of 75.4 cents but in other shops a rate of slightly over 60 cents, a difference of say 15 cents. For December a figure is given for labor in foundries and machine shops of 57.3 cents or 18.1 cents less than the October railroad shop figure. The report contains also many other interesting details concerning the rules and working conditions in railroad shops—notably the effects of the national agreements as modified by the Labor Board decisions. Among other things it is pointed out that in railroad shops much work is carried out by men classified as machinists which in other shops would be done by helpers or handymen.

President A. H. Smith, of the New York Central and of the Indiana Harbor Belt has added some further interesting data. He is quoted as saying: "The facts in the case are that the men employed in these shops notified the Labor Board that they were satisfied with their wages and working conditions and protested against any interference on the part of the Labor Board. Furthermore, the average wages which they are now receiving are in excess of the wages prescribed by the Labor Board as just and reasonable. The striking point, however, is that the results show an increase of 40 per cent in efficiency as compared with the operations of these shops by the railroad company under the rules and regulations presented by the Labor Board."

The underlying reasons, then, for the contracting of the shops are: (1) that the Labor Board's scale is considerably in excess of that paid similar labor elsewhere; or (2) that when not working under the provisions still remaining from the national agreements the labor was 40 per cent more efficient.

It must be remembered that in paragraph (d) of section 307, the Transportation Act says: "In determining the justness and reasonableness of such wages and salaries or working conditions the Board shall, as far as applicable, take into consideration, among other relevant circumstances, (1) The scale of wages paid for similar kinds of work in other industries. . . ." This, quite apparently, the Labor Board has not done. The railroads, in contracting out their shops, did attempt to do so. It would appear that the Labor Board is in a position where in altogether too great a degree it is trying to subsidize railroad shop labor at the expense of the farmer and the consumer who, in the long run, pay the additional wages or who pay for the reduced efficiency under the railroad shop rules.

The Labor Board's decision in the Indiana Harbor Belt case is in line with its previous decisions in the matters of the wages and working conditions of railway shop labor. The Board, in establishing the wages, should seek to insure, if it can, the maintenance of these wages and working conditions in all railway shops. From its own point of view, the Board is correct in believing that the contracting of the shop is an evasion of its previous decisions. But, the carrier must be regarded as being between two fires—the necessity of operating efficiently and economically, and the Labor Board's decisions which in effect prevent it from doing so as far as its shops are concerned.

Matters should not be allowed to go on in this way. The question should not be allowed to go by default. That is why we maintain that the railroads should come out fairly and squarely for their rights. They should go to the courts or to the public for an ascertainment of how far the Board's power extends, or was intended by the Transportation Act to extend. There is no precedent under the Constitution of this country which permits the Labor Board as a governmental body to be allowed to gather in authority in all directions without control or as it, in its own mind, sees fit.

New Books

Index-Digest of Decisions of United States Labor Board; Compiled by Bureau of Information of the Southern Railways; Published and Distributed by Railway Accounting Officers' Association, 1116 Woodward Building, Washington, D. C. Bound in paper. 6 in. by 9 in. size, 332 pages. Price 50 cents. In lots of 100 or more, 25 cents.

The present edition of the Index-Digest succeeds the first edition gotten out last September. The book gives the gist of every decision rendered by the Labor Board up to May 1, 1922. References are given so that the full text may be obtained. Experience has demonstrated, however, that the use of this Index-Digest eliminates the time and labor of reading through the full text of the decisions.

Under alphabetical subject headings it gives a summary of every decision relating to each subject—containing all the necessary practical information that anyone would ordinarily have occasion to use. This arrangement enables one readily to obtain desired data regarding decisions.

The new edition has the added feature of two sections, respectively showing by roads and by labor organizations the decisions to which each has been a party. These two additions should prove useful in cases where the particular decision or principle involved is remembered by the name of the labor organization or the name of the railroad. In other words, the publication is indexed and cross-indexed in almost every conceivable way.

Letters to the Editor

[The RAILWAY AGE welcomes letters from its readers and especially those containing constructive suggestions for improvements in the railway field. Short letters—about 250 words—are particularly appreciated. The editors do not hold themselves responsible for facts or opinions expressed.]

"Our Road"

NEW YORK

TO THE EDITOR:

We all recall that before the days of Mr. McAdoo's reign as autocrat of the railroads, there was what we often call "high morale" among railroad men—in the train service particularly; meaning that there was a company spirit and every man took pride in his road, its equipment, etc.

Coming down on the Lackawanna last Sunday I ran across a flagman that took me back to those by-gone days. He took personal pride in pointing out the improvements this railroad had made in the past few years, the location of the old abandoned line, the drop after passing Pocono Summit, the Gap as seen from the distance, and many other things that might interest a weary traveler. After passing a dairy plant he went on to tell how many cars the Lackawanna carried to New York daily as its share in supplying milk to the great city, and then stated that within 15 minutes we would pass the empty milk trains returning; in less than 20 minutes three empty milk trains passed going up the mountain.

All this was not overlooked by the usual traveler, but what impressed me most was he always referred to the Lackawanna as "our road," "our line," "we," "us" and similar personal terms; all of which leads me to hope that some day the men will have the same interest in their road as they had before the days of federal control.

E. F. GARWOOD.

A Permanent Railway Supply Exhibit in Chicago

CHICAGO.

TO THE EDITOR:

Chicago is universally recognized as the railway supply center of the United States. This, together with the fact that more railroads have general offices in that city than at any other point in the country, makes Chicago the ideal location for a permanent railway supply exhibit. If a census could be taken of all of the railway supply concerns which maintain headquarters in Chicago and also of those with branch offices in that city, I feel sure that one would be surprised at the magnitude of the industry centered there. Furthermore, the amount of money spent annually for office rent by these companies would pay the interest on a very large investment to provide a building to house this exhibit.

My idea is that this building should be located on the lake front and have track connection. The ground floor should be arranged for the exhibition of cars, locomotives, snow plows, wreckers and other heavy railway equipment standing on its own wheels. The second and possibly the third floors might well be adapted for the exhibition of even the heaviest of shop tools with a crane or other hoisting equipment to raise these tools from the first or track floor to the second or third floor. Permanent exhibits of railway supplies, light machine tools, pneumatic tools and other devices now being sold to the railways could be presented on three or four additional floors. Above these exhibition floors

office space could be provided to accommodate at least most of the railway supply companies now scattered throughout the city. Above the offices there should, if possible, be a number of sleeping rooms with baths and on the very top of the building a suitable club.

Chicago is the central point to which all railway and railway supply men come or through which they pass at intervals. The establishment of a large exhibit of a wide variety of railway tools and equipment in one building will afford an educational opportunity for these men which they will not fail to take advantage of. It will also conserve the time and traveling of the men interested in these devices.

HARRY VISSERING.

The Committee Plan

CHICAGO

TO THE EDITOR:

The railroads have numerous associations—the American Railway Association with its various divisions, the General Foremen's, Traveling Engineers' Associations and others. In our industrial plants we have safety committees and our labor organizations have shop crafts committees. Why? For the fundamental reason that two heads are better than one; that a group of men can evolve ideas, make suggestions and consolidate operations quicker and make fewer mistakes than if one individual attempted to dictate and rule.

Now, knowing these things, why is it that in railroad circles we fail in this collaboration? Why is it we admit that we must co-operate with other railroads in certain respects and ignore the committee idea in our inter-departmental workings? Why is it that the average superintendent of motive power or shop superintendent arrogates to himself the full power of dictatorship—"You must do that in this way," instead of "Let's get together and decide which is the better way?"

What happens in a shop staff meeting? The shop superintendent or master mechanic starts in with one department, asks questions as to progress of work, tells his foreman what to do, passes on down to the next foreman, etc.

Does the superintendent of motive power call in his master mechanics and shop superintendent to get their views when he is getting up specifications for a new lot of locomotives? He does not; he calls in his mechanical engineer and instructs him to specify this and that. And so on all the way through the mechanical department organization.

This is a weakness in railroad work; a failure to get the best there is out of the organization and a careless handling of the company's money. Why not adopt the committee plan on these matters of new equipment; why not work it out in the plants and why not say, "We did this," instead of "I did this?" On the other hand it could be said, "We failed to do this," instead of, "I failed to do it."

The committee plan is not a medium for "passing the buck" or shifting of responsibility. To the contrary, it is a spreading of responsibility, a feature that will bring to you the undivided interest of several to focus on the object, not one.

Were I a shop superintendent, a staff meeting would be a committee meeting. I would consider that my highly trained locomotive men could make many good suggestions to the car department and while my car department organization may not be as technical as the locomotive, nevertheless some of these car men could make able recommendations to the other side.

I would select the weakest link in my departmental organization and in open meeting would lay the difficulty before my committee. As an example: "The boiler shop is way behind on the work and as a result we are losing output. Now this affects all of us; the tin shop, blacksmith shop, and principally the back shop. A loss of output reflects

on our management, not mine. What have you to suggest, Mr. Back Shop Foreman? Your remarks are not a criticism on the boiler shop but, to the contrary, they will be a help."

This back shop man, who has been worrying about the tie-up in his work, will immediately say what particular work is holding him up. If it's flues, your machine shop man will probably make a recommendation pertaining to the equipment in the boiler shop for handling flues. Your blacksmith foreman will have some ideas and the committee will regularly pass on the suggestions and without doubt some excellent thoughts will be brought out that make for speed and economy.

Instead of this method of handling having an adverse effect on the boiler shop man, it would put new heart into him; he would feel that his burden has been distributed and all are interested in him and through him in his department.

GRANT GIBSON.

Capitalizing the Cost of Tie Treatment

WASHINGTON, D. C.

TO THE EDITOR:

In your issue of February 18, page 416, you published an abstract of a paper by Earl Stimson, chief engineer maintenance, Baltimore & Ohio System, and in your issue of April 29, page 1003, there appeared a letter by F. S. Schwinn, chief engineer, International & Great Northern, on the cost of treating ties. Mr. Stimson and Mr. Schwinn seem to take opposite views as to the proper classification of this cost.

The Engineering Board of the Bureau of Valuation, Interstate Commerce Commission, during its life of 8½ years inventoried and priced ties exactly as found in the track on the date of valuation. A treated tie was "valued" as such and an untreated tie was appraised at a lower price.

The classification of investment in road and equipment of steam roads, page 18, account 8, states: "This account shall include the cost of cross, switch, bridge, and other track ties used in the construction of tracks for the movement or storage of locomotives and cars, and the cost of additional ties subsequently laid in such tracks; also the excess cost of metal ties used in repairs of track over the cost to replace in kind wooden ties removed." The classification of operating expenses, page 42, account 212, states: "This account shall include the cost of cross, switch, bridge, and other track ties used in the repairs of tracks." There is no specific reference to the cost of treating ties in any of the classifications. However, the economic principle to be followed is to charge "renewals in kind" to operating expenses. Assuming for the purpose of argument that untreated ties (costing one dollar each) are renewed with treated ties costing \$1.50 each, there should be a charge of 50 cents to the investment account according to the general principle of economics.

It is understood that the Bureau of Accounts of the Interstate Commerce Commission does not approve charging the cost of treatment to investment where a few ties are used on each track section, for example, but where a whole division has been renewed with treated ties it is possible that the Bureau would carefully consider any case presented by a carrier and approve a charge to investment after the actual cost of treatment had been checked by a representative of the Bureau, provided that this cost was clearly in excess of the original investment.

The practice of carriers has been to charge the cost of treatment from month to month to expenses as ties are used in miscellaneous renewals and after a district, a division or the whole road has been renewed with treated ties, to take up the question of charges to investment on its merits if the case warrants further consideration.

Consulting Engineer.

The Revision of the Transportation Act

CHICAGO

TO THE EDITOR:

In view of the present agitation for the amending of the Transportation Act, it has occurred to me that there should be a wider dissemination of information with regard to the present law and its provisions. I am therefore suggesting several reasons why this act should not be amended at the present time. These reasons are as follows:

1. If the Transportation Act is amended as proposed it will prevent the establishment of a reasonably uniform system of rates which can be worked out only through a single regulatory body having ultimate responsibility for the establishment of fair rates and adequate service. These amendments will throw the rate situation back into the confused state that existed prior to the passage of the Transportation Act, when 48 different state commissions were regulating their intrastate rates with little restraint or control. It will be remembered that at that time each state was attempting to secure an advantage over every other state by maintaining lower intrastate rates, thus reducing those rates to such an abnormally low level that it was necessary to establish much higher interstate rates to enable the roads to exist and maintain adequate service.

2. In the latter part of the nineteenth century when the regulation of interstate commerce was first given serious consideration, it was claimed that every state had the right to regulate all transportation upon the waters within its boundaries. New Jersey granted exclusive franchises upon the waters of New Jersey, and other states did likewise. The result was confusion and chaos. The only thing that made commerce between the states possible was the adoption of a uniform scheme of regulation, without which no system of transportation can succeed.

3. In the western country the farmers especially are interested in reaching the large markets. This means that 90 per cent of their traffic must move on interstate rates. If every state is to be permitted to lower intrastate rates at its will or pleasure, it means such a breaking down of the rate structure and such an inroad upon the earnings of the carriers that higher interstate rates will be necessary to make up the deficiency. These higher interstate rates will be a greater burden upon the shippers and will more than offset any advantage that may be obtained by pounding down the intrastate rates.

4. The necessity of uniform supervisory control is illustrated by the recent action of the state commissions with reference to increases in intrastate rates corresponding with the increases in interstate rates authorized by the Interstate Commerce Commission. Thirty-one states complied with the request of the Interstate Commerce Commission and granted increases in intrastate rates, while 17 states refused to grant these increases. It is only fair to the states that granted the increases that there should be some supervisory authority which would require the other states to stand their just proportion of the burden.

5. The proposed legislation will injure the credit of the roads and thereby increase the cost of securing money for capital improvements, which will of itself necessitate a higher structure of rates than now exists.

6. There is no more reason why geographical lines should determine the right to fix rates as between states than there is why geographical lines should be used to fix rates as between counties. Indeed, in many western states there are counties that are as large or larger than some of the New England states, and if each New England state is to be permitted to fix its own rates, regardless of the effect upon the country as a whole, then many of the counties in the west should be granted the same privilege.

7. Rates should be fixed in relation to industrial rather than geographical lines. If Illinois, Wisconsin, Iowa and Minnesota, for instance, insist upon fixing intrastate rates

as they please, regardless of the effect upon interstate rates, they must then grant this same privilege to every other state. The result means chaos, for undoubtedly they must be uniform, and this can be secured only through the federal government.

8. An illustration of the confusion that will arise by the decentralization of authority is indicated by the recent action of the state commission of Arkansas. The Interstate Commerce Commission recently prescribed and promulgated a uniform bill of lading. The Arkansas commission has suspended this bill of lading and has ordered that it shall not apply in that state. Likewise there was a time when each state introduced its own safety appliance laws, and headlights that could be used in one state were illegal in others. The statutes are full of regulations with reference to the equipment of trains, the size of crews, etc. This resulted in such unnecessary and wasteful expenditures that Congress finally took over the whole matter and now regulates all safety appliance, train equipment, etc., with the result that standardization and uniformity have been brought about.

9. There should be no demand for a return to the old method of regulation unless the people are ready at the same time to eliminate all provisions relative to the control of capitalization and security issues, and unless the states are ready to take over and assume the financial obligations now carried by the federal government on behalf of the railroads. The federal government now fixes wages, it controls the so-called interlocking directorates, security issues, and extensions and improvements. It is fixing the physical value of the properties of the railroads, whether devoted to interstate or intrastate commerce. Certainly the states ought not to be permitted to fix the income of the railroads by the regulation of intrastate rates when the largest proportion of the expense of the railroads is left in the hands of the federal government.

10. The present law gives to the federal government only a general supervisory power over the complete structure of rates, looking to the maintenance of such revenue as is necessary to meet the expenses fixed by the federal government and necessary for the continued and successful operation and improvement of the railroads. As pointed out in the opinion of Chief Justice Taft in the Wisconsin rate case, the state commissions under the law as it now stands, have all the regulatory power over rates reasonably necessary for state purposes, and it is only when the entire general structure is such as to materially break down, burden, or obstruct the financial capacity of the carriers that the Interstate Commerce Commission may interfere.

11. There has not yet been time for the law to be given a fair trial, for the roads, the state commissions, and the Interstate Commerce Commission are only now beginning to become adjusted to the new plan.

A. C. JOHNSON,
Vice-President, Chicago & North Western.

The Locomotive Engineer as the Dispatcher Sees Him

MINNEAPOLIS, MINN.

TO THE EDITOR:

In your April 8 issue there is a locomotive engineer's letter telling us how to improve operation. His adverse criticisms reach for everyone, except the engine men. Evidently he would have the reader think that the locomotive engineer is a "Model of Perfection" and the "Czar Supreme" on a railroad. While it is true that we now have some "poor timber" as yardmasters and train dispatchers, if this engineer has had wide experience in his line of business he must realize that a very large percentage of his engineer comrades are "poor sticks."

Let one of these "would-be" engineers lose an eccentric bolt, nut, or meet with the most minor mechanical mishap;

instead of hitting the ball and squaring up to the emergency, what does he do? He tells the dispatcher he is in trouble and winds up his message with "Please advise." Many times he is unable to intelligently explain his trouble, and, when urged will send out an "S. O. S." for another engine. Too frequently it is found that had he but used his head this unnecessary expense could have been avoided.

The ambition of the young locomotive engineer of today is not to be an expert student of mechanics, but rather to be proficient in brotherhood schedules, with their many technical possibilities, that he may be in a position to draw the biggest check with the least exertion.

I would like to see the western road which he speaks of running daily 75 trains each way, on single track. I am sure this is only a pipe dream of his, or a vision that came to him in an enginehouse discussion with his associates. It is admitted by best authority that 40 trains are about single track limit—and not 40 each way, either.

I agree with the brother that there is better feeling existing all around and that there are weak sisters in the several departments he names, but he must remember that conditions are, and have been, changing. There is no question as to his preferring old methods, when he got 30 minutes preparatory time, then used 30 minutes to eat, 30 minutes to adjust his suspenders, etc., which the company paid for—in fact, using so much preliminary time that the dispatcher would begin figuring on an engine watchman for fear the 16-hour law would catch him before he started.

If this old time loyal engineer, together with the other loyal old timers, would start an educational campaign and endeavor to instill into the minds of the coming generation of engineers the great need of most loyal and ardent support to his company, there would be less computation of punitive methods and more real railroading.

TRAIN DISPATCHER.

Some Ways to Create Favorable Public Opinion

DALLAS, ORE.

TO THE EDITOR:

Much has been printed in your columns recently concerning the attitude of the public towards the railroads and measures which might be taken to create a more favorable public opinion. I have been a station agent for many years and have been surprised that railway managements have not taken more practical and effective means to put their roads in the proper light before the public. Efforts seem to be directed primarily towards the education of the employees who come in contact with the public in the essentials of courtesy, while but little thought has been given to the removal of the handicaps under which these employees labor.

Roll tape has been so increased in recent years that almost any dealing with the railroads is irritating to the public. We have storage charges for L. E. freight, parcel checks, stamps to cover excess value of baggage, and every sort of a method to add an extra ten cents. Charges for storage in parcel checking perhaps may be all right at large stations where every passenger is a stranger, but I do not understand why it is necessary to inflict such handicaps on the country agent. It is the practice on many roads to require those who check baggage to sign their names on a slip stating its value. This measure provides little revenue, but works injury to the roads through loss of prestige. Charges for storing L. E. freight at small stations have also made many enemies at home there for checking parcels.

It happens not infrequently that contracts, leases, bonds or other legal papers are sent to local agents for the patron to sign, affix revenue stamps and secure the signatures of

guarantors and several outside parties as witnesses, only to discover that they are made out on the wrong form; that a new contract must be provided, new bondsmen's signatures secured and new revenue stamps provided, always at the expense of the patron. I believe that the railways should rise above these tactics and provide the revenue stamps themselves, being sure that papers are on the proper form at the first or take the consequences. Make the checking of baggage the simple operation it really is, allow their agents to look after a traveling man's grip for an hour without charging him and in many other ways remove the handicaps under which their local agents work. These agents are the best publicity mediums which a railway can have and their contact with the public should be such as to enable their dealings to be as simple and direct as possible.

J. M. CAMPBELL.

Selling the Railroads to the Public

EDgewater, N. Y.

TO THE EDITOR:

In your discussion on "Selling the Railroads to the Public" you have overlooked the one fundamental on which rests success or failure; I refer to the employee, who is the "salesman" of any road, no matter in what capacity he is employed. True, an employee may not be engaged in actively soliciting freight or passenger business; but there are opportunities when any employee may speak a timely word in explanation of the service rendered by his road with the result that added business will be secured.

In the commercial world it is a well established fact that a salesman to be successful must be "sold" in his own product first. How many employees (salesman in the making) on our vast railway systems are sold on the merits of their own road?

As a regular reader of one railroad employees' magazine, I believe it is both possible and practical for the railways to do constructive work on public relationships through the pages of the monthly magazines or leaflets issued to their employees. It is here that the ground work should be started in the coming movement of selling the railroads to the public.

From the viewpoint of a reader, my idea of what a typical railroad magazine should contain, is to divide the reading matter by departments, offering some constructive suggestions on how to better each department. Develop and expand certain ideas which will add to the service of the road, or effect economy of operation. As a worker in the yard service, what do I care if Bill Smith of the machine shop is visiting friends in New York? But I am anxious to know how my yard work compares with that of other yards on the line. The switchmen in my yard may be careless. It is possible that I feel I am handling more cars per day per man than other yards. But what would be the result if I read that the other fellow's damages costs were one per cent of my cost. And when any employee causes damage, who pays the bill?

When John Jones is promoted to yardmaster, don't insult him by making a simple statement of his promotion. Give him due credit by publishing his picture and an outline of his services. This makes promotion worthy of effort and inspires confidence in other workers. A foreman in any department is an important official. He has a direct bearing on net income, hence it is worth the effort to show him how to avoid wasteful methods, to make each dollar earn a dollar's return and to co-operate with other departments by a broader knowledge of general conditions, rather than a selfish desire to lighten his own load through sacrificing other departments.

The regular employees' magazine can do this work and it is the first step in selling a railroad to the road's employees so that they, in turn, will produce "teamwork."

J. G. GLAZIER.

Rome Congress Adopts Interesting Conclusions

Next Meeting at Madrid in 1927—Reports Adopted on Electric Traction, Locomotive Improvements, etc.

By Samuel O. Dunn
Editor of the *Railway Age*

THE NINTH CONGRESS of the International Railway Association adjourned today, after having been in session since April 18. Many of the delegates have left for their homes in countries throughout the world. A large party, however, has gone to Naples. There its members will be entertained by Thomas Cook & Sons, and by the municipality and civic organizations of Naples, with excursions to Pompeii and Mount Vesuvius and by a dinner on one evening and a special performance at the great San Carlo theater on another evening. After that most of the members of the party will proceed by ship to Genoa, whence they will go on an excursion to the electric traction installations at Modane.

The next Congress of the association will be held at Madrid, Spain, in 1927.

More Americans Participate

The closing session was presided over by Mr. Raffaele de Corne, President of the Council of Public Works of Italy, who made a farewell address to the delegates. The deliberations of the various sections in the latter half of the Congress were enlivened by the participation of an increased number of Americans. These included Gen. W. W. Atterbury, vice-president of the Pennsylvania System; L. A. Downs, vice-president and general manager of the Central of Georgia; and Col. W. B. Casey, technical adviser to the government of Australia, all of whom were delegates appointed by the American Railway Association. Other Americans who have been here include Colonel Barber, who is serving as technical

ROME, Italy, April 28.

adviser to the government of Poland, and W. L. Tedford, assistant to the president of the Commonwealth Steel Co.

In French and Italian

American railway men who have not attended the Congress will naturally be curious regarding the opinion of those who have been here as to the value of attendance upon it. If they ask those who have been here, they will get a variety of opinions. In the first place, the great diversity of conditions existing in the many countries of the world necessarily has caused corresponding differences in railway practice. In carrying on discussion and framing conclusions regarding what is desirable practice, so much allowance often has to be made for differences of conditions and of history that the conclusions reached are likely to be general, indefinite and hesitating and, therefore, practically valueless. But the most salient feature of the Congress from the standpoint of Americans—and many of the English have not been in much happier case—is that much the greater part of the discussion has been carried on in French and Italian, of which most Americans could not understand a word. French is the official language of the association; and courtesy required that the language of the country in which the Congress was held should also be used; but certainly all the English-speaking delegates felt that English should have been used more. The simple fact is that much more of the world's railway mileage is operated and more of its railway traffic is handled in countries using English than in countries using

any other language. If the association is to be made of real value to railways throughout the world, it must be made truly international; and if it is to be made truly international, enough of its proceedings must be carried on in English to render its sectional sessions intelligible and interesting to English-speaking railway officers. It cannot be said that this was true of the Ninth Congress.

Differences Between American and European Practice

The differences between the practice of American and European railways are very numerous and great. In the writer's opinion, however, this should be a help, not a hindrance, to railway men of different countries in teaching each other. There is altogether too much disposition on both sides of the Atlantic to assume that because of differences of conditions American and European railways have little or nothing to learn from each other. The International Railway Association could be made the most efficient medium of communication between them; but the association will never be an important factor in this respect unless the interest in it of all the railways of the world is secured and maintained; and their interest cannot be secured and held unless the proceedings are more largely carried on in a language which the representatives of the largest single group of railways in the world can understand.

Interchange of Rolling Stock in Europe

There were two interesting reports on "Interchange of Rolling Stock." The one prepared by C. W. Crawford, Chairman of General Committee, Division II—Transportation, of the American Railway Association, dealt entirely with the interchange of freight cars by the railways of the United States. The other, which was by Mr. Charron, of the Midi (Southern) Railway of France, dealt with the interchange of rolling stock in other countries, and especially in Europe.

It is not necessary to summarize here the contents of Mr. Crawford's very interesting report, as it was intended chiefly for the information of foreign readers.

Mr. Charron's report shows that there are in effect a number of different systems of interchanging cars in Europe. One is a "convention" which went into operation on January 1, 1922, and which is known as the "R. I. V."—Regulations for the Reciprocal Use of Wagons in International Traffic. It provides that the receiving railway must after unloading, return cars without delay and, as far as possible, reload to the owning railway. Stations authorized to reload are restricted, the object being to insure the return of the car to the company owning it as quickly as possible. Any failure to comply with the conditions is subject to a penalty of 40 francs (at present about \$4) from the defaulting company to the owner. Furthermore, the using company is required to pay the owning company demurrage which varies from 2½ francs a day for the first three days up to 6 francs a day beyond the fifteenth day. This agreement is in effect between the railways which use the standard gage on the continent of Europe.

There is another international convention, known by the initials "V. W. U.," which governs the interchange of cars between the railways of Germany, Austria, Hungary and the Netherlands. It differs from the R. I. V. mainly in regard to the amount of demurrage charged. It is expected that the interchange of cars between the continental railways using the standard gage will soon be subject nearly or quite universally to the R. I. V.

It will be noted that the interchange rules in Europe differ from those in the United States chiefly in attempting to compel the return of the car to the owning company as soon as possible, whereas in the United States the purpose is merely, after the car has been unloaded, to cause it to be sent toward the home line. The per diem rate is the same

for each day in the United States, while in Europe it is graduated upward.

The French railways have a "convention" among themselves which went into effect in April, 1920. In order to allow each railway to exercise its recognized right to the benefit of the equivalent of the cars it owns, this agreement requires that when for a period of eight consecutive days the number of cars upon a railway's lines is less than the number it owns, it may partially annul the restrictions imposed on the utilization of cars belonging to other companies in order to replenish its supply of cars. It may start home a smaller number of cars than the regulations ordinarily require, and also has the right to demand and receive a pecuniary indemnity which is made up from penalties from railways whose accounts show that they have had upon their lines more cars than they own.

Repairs to Foreign Cars

With regard to repairs to foreign cars, the principle of both the R. I. V. and V. W. U. regulations is that repairs to damaged cars must be made only by the owning company, with the exception of slight repairs necessary to make the car safe for immediate use or to enable it to be run home empty. These slight repairs are made without charge by the company which makes them.

The report also dealt with the rules covering the relations between the railways and consignors and consignees. In some countries, as in Belgium and Switzerland, the railways must comply with a demand for cars within a given time, counting from the date when the demand is made. The time allowed consignors and consignees for loading and unloading is much less than in the United States; in some countries, as short as eight hours. The French railways pay a bonus to those who load or unload cars in less than the period allowed. In Europe the proportion of freight cars furnished by consignors and consignees is much larger than in the United States. The owner of the private car is usually given compensation for its use, either in the form of a rebate per mile or by the application of lower freight rates. The railways in Belgium, the Netherlands, Switzerland and South Africa, do not, however, pay any compensation for the use of private cars.

Employees' Dwellings

There were two reports on "Workmen's Dwellings," one by A. F. Banks, president of the Elgin, Joliet & Eastern, for America, and the other by Fausto Lolli, of the Italian State Railways, for other countries. These reports disclosed a marked difference between conditions in the United States and in Europe. As Mr. Banks pointed out, American railways provide dwellings for their employees only in rather exceptional cases—usually only for section foremen or track laborers. Private enterprise usually has been sufficient to provide the houses required. In Europe this has not been the case and employees have been quite willing to have their dwellings provided by the companies. The proportion of employees of European railways lodged in buildings provided by the companies varies from 5 per cent to 17 per cent of the total number.

At the end of the year 1920 the Eastern Railway of France, which has 3,124 miles of line, owned 2,800 dwellings occupied by families of its employees, and 1,000 rooms for unmarried men, which represented an investment on the part of the company of 30 million francs. The Paris-Lyons-Mediterranean of France (6,086 miles) had spent 22 million francs on employees' dwellings. The London & South Western (1,105 miles) had 1,850 houses and cottages representing an investment of £796,000. The Italian State Railways (9,375 miles of standard gage) owned 4,677 dwellings, representing an investment of 85 million lire. As a general rule the companies assume direct responsibility for the

management and maintenance of these houses. They usually fix the rentals on the basis of actual cost, although sometimes on the basis of the average price of rents in the locality. The employees, therefore, usually get their houses for less than their neighbors. In some cases the European railways have lent financial assistance to buildings and loan associations of their employees to enable them to buy houses for themselves. Among the railways which have done this are the Norwegian State Railways, the Italian State Railways, the Paris-Orleans and the Midi of France and the Great Western of England.

Reports on Electric Traction

There were five reports on "Electric Traction." That for America was made by George Gibbs, chief engineer of electric traction of the Long Island. The other countries for which special reports were made were Holland and Great Britain, Belgium, Denmark, Sweden and Norway, Italy and Switzerland. It is somewhat gratifying to Americans to read in the report of Ernest Gerard, of Belgium, the statement that the United States "is still in the forefront for bold experiment in all directions of progress." The reports emphasize the fact that in countries or districts such as Italy and Switzerland, having numerous large waterfalls the problem of the production and transmission of the energy for electrification differs from that in other countries. It is found that in these and in the Scandinavian countries the managements of the railways are especially concerned that the energy from the hydro-electric generating stations shall be supplied under conditions which allow of its being used for general purposes as well as for traction on the railway itself. In other European countries, particularly Belgium, England, France and Holland, it has not been found desirable to adopt close interdependence between the production of current for electric traction and for other purposes.

The reporters agreed that the kind of current should be reduced to three types which can be recommended in practice for the electrification of large railway systems, viz., three phase at voltages exceeding 3,000 volts; single phase at voltages of 10,000 to 16,000 volts, and direct current at 1,500, 2,400 or 3,000 volts. It appears that single phase current at about 15,000 volts is preferred to all other types for economy in transmission, particularly when, as in Switzerland, it is carried direct in this form from the original source to the contact wire. The advantage of this diminishes where, as in Scandinavian countries, the energy must first be carried a great distance at very high voltage and reduced at sub-stations.

Mr. Gerard's summary says: "So few are the financial figures supplied and so impossible is it to compare them, that it will be sufficient to state that there has been a unanimous wish expressed in favor of the adoption of a standard form of accounts referring the different factors to the same unit. . . . The economic advantages of electric traction are not, and perhaps will never be, sufficiently evident to justify its universal substitution for steam traction."

Bonuses

In many places in the reports and the formal conclusions reached there are references to the desirability of paying bonuses to railway employees to increase their efficiency, which are of interest to the railway men of the United States where the payment of any kind of bonus to employees is so severely discountenanced by the labor unions. For example, one of the conclusions on the subject of "Slow Freight Traffic" is that "payment of bonuses to the men employed in switching is of advantage in getting the best output from yards, and consequently a better turnover of cars."

Congress in Five Sections

The method of working followed in the Congress is to divide into five sections, each of which considers certain

specific questions which are assigned to it. The section adopts definite conclusions which are referred to a general meeting that is held in the last days of the Congress, and at which the conclusions reached in the sections are finally passed upon.

No Action on Automatic Train Control

One notable instance in which Section III and the general meeting took somewhat unexpected action was in reference to the question of "Locomotive Cab Signals." There was a strong disposition among the French and some of the Italians, apparently, to adopt conclusions favoring audible cab signals to repeat visual roadside signals. Some delegates favored automatic train control. The report finally adopted states, "It was apparent that no conclusions could be recorded beyond the fact that the matter is in the experimental stage, and any result would have to be reported at a subsequent Congress."

Conclusions on Electric Traction

The following conclusions on electric traction were adopted:

"The Congress recognizes that at present no more than in the past, a single system could be recommended for all cases. Nor is it possible to choose between several systems, all of which have proved their value under most severe conditions of operation; the Congress recognizes, however, that these systems are all susceptible of considerable further improvements.

"The Congress agrees on the uselessness of standardization of the current in the contact wire on account of the ease with which locomotives may be changed at the frontiers of the different countries.

"It is desirable that the methods of keeping and supplying technical and economic information on electric traction should be defined and standardized, and with this in view the section suggests that this point be referred to a special committee of the association. This committee should draw up very fully the details governing each point, so that in the future as full a comparison as possible may be made by means of figures absolutely comparable."

Economical Production and Use of Steam

Superheated steam.—Superheating is universally adopted in the construction of locomotives for passenger and freight trains. It has not yet been extensively applied to suburban traffic, but the results obtained in these services have been satisfactory, especially when the smoke-box dampers, which cut off superheating when the regulator is closed, are removed. The application of superheat to saturated steam engines may be advantageously done when these are in the shops for repairs, especially to powerful engines of recent types. With the introduction of superheat, the use of two-cylinder single-expansion locomotives has increased. For powerful engines the preferences of the railways are divided between two-cylinder single-expansion with superheater, the four-cylinder compound with superheater and the three or four-cylinder expansion with superheater.

The fuel economy obtained by the application of superheat to the single expansion engines may be estimated on the average, in ordinary working conditions, to be about 10 to 20 per cent. This economy, however, is quite variable, according to the work done and the condition in which the parts are kept, and it is necessary to be more particular in this upkeep than with saturated steam engines. The special arrangements of valves and pistons of superheated engines have a tendency to become more uniform and simpler and more like those used on saturated steam locomotives. On new locomotives piston valves are exclusively used for the high pressure cylinders and packings, with sliding joints and outside cooling for rods acted on by live steam. The

area of the cylinder relief valves has also been increased. These are the only special arrangements the necessity for which has been universally recognized.

Some administrations use at the same time both inlet and air valves and by-pass. The usefulness of this double action does not appear to be yet completely established. Corliss and similar type valves and the uniflow arrangement have made no progress.

Feed water heater.—Some railways have introduced feed water exhaust steam injectors on a large scale. The results which have been obtained justify the extension of the use of these devices.

Various devices.—The trial of water-tube boilers in competition with those of ordinary type has made no progress. Those thus far made have not enabled any definite conclusions to be arrived at. Even in the most favorable cases the advantages found or anticipated in coal consumption or cost of maintenance appear to be small. There is an advantage in washing out boilers with hot water, particularly when it is necessary that they should be out of service for so short a time as possible. These washing plants with auxiliary boiler and fixed water and steam piping allowing the recuperation of the steam and water for locomotives are used to advantage in certain particular cases, especially where the cost of water is very high; but their cost and complication seem to be against their extensive use on systems where the engines have fixed bookings. Brick arches improve combustion and their use has become general.

Special Steels

The following conclusions on "Special Steels" were adopted:

Cast manganese steel with 12 per cent of manganese and 1.3 per cent of carbon gives excellent results and is economical for use in frogs. It is especially so in crossings cast in one piece. It is also advantageous for rails on curves of small radius in cases where the speed is low and the trains frequent.

Opinion is not unanimous with regard to the use of other special steels. The superiority of none of these is universally acknowledged.

Tempering rails is favored by a few engineers; the majority are against this practice except in cases where a sorbitic structure is desired.

It is desirable that experiments be continued to ascertain what are the best conditions for the use of manganese steel; to determine the actual value of other special steels and the best conditions for their use, as well as to determine the causes of the failure of rails in service.

Reinforced Concrete

The use of ordinary concrete and ferroconcrete has found a most extended field of application in all classes of railway structures. Reinforced concrete forms a more economical material than masonry or steel for many works. Works of this class include particularly bridges, foot bridges, water tanks, buildings, workshops, locomotive sheds, freight houses and overhung or extended roofs for passenger and freight platforms.

When properly designed with suitable materials reinforced concrete structures in most cases cause no greater expense of maintenance than masonry, and considerably less than steel structures. For railway underbridges which are subject to dynamic forces there appeared to be no technical reason against the use of reinforced concrete, which seems also advantageous in most cases but it requires a very close supervision in construction. It is always advantageous to lay a bed of ballast or an elastic woodplate between the track and the concrete, and it is necessary that the surface of the superstructure should be maintained in a thoroughly watertight condition.

It is desirable that the trials which are being carried out by various administrations of the use of reinforced concrete ties should be recorded.

Passenger Cars

The following summarizes the report adopted on "Passenger Carriages:—"

The truck type of carriage is used exclusively in America. Its use is increasing in other countries and tends to become general for express and long-distance train service. The four-wheel truck is usually considered adequate, so long as the weight carried is not so great that the six-wheel truck becomes necessary. In England experiment has been made on articulated trains, one truck being common to two cars. This is generally applied to sections and not to whole trains. Vestibule coaches with through connections are extensively used in the U. S. A.; and are finding favor in other countries for long-distance trains. On many trains, however, coaches with side doors and corridors in some cases communicating throughout the train are used.

The use of all-metal, or nearly all-metal, carriages has developed rapidly in North America. This method of construction is now generally adopted there and is considered to reduce to a minimum the risks attendant on derailments, collisions and fire.

In Europe metal construction has not been applied to any appreciable extent, except in the case of electrified lines. On certain lines, however, steel construction is being considered with a view of reducing fire risk. It is not intended, however, to approach the weights of the American cars which have recently been incurred partly to provide additional comfort for passengers.

Lighting.—Notwithstanding the safety devices introduced into its use, gas is now, in some countries, considered to be dangerous and to be liable, if not to cause, at least to aggravate fire following a collision. Electricity, particularly for this reason, tends to replace gas completely.

Heating.—The method of heating by steam from the locomotive is becoming more and more widespread. Recent improvements have been made with the object of better insuring the flow of the steam to the last carriages of the longest trains and to allow regulating the heat in the carriages or in the compartments.

Brakes.—The use of continuous quick-acting brakes has been extended on nearly all the railway systems; trials have been carried out to increase the rapidity of action and effectiveness of the brakes on trains which run at very high speeds, and which have become of increased length and increased weight.

Oil Fuel

The following report on the use of liquid fuel was adopted:

There are no mechanical difficulties in the adoption and use of liquid fuel for locomotives. The question of cost both of the fuel and maintenance makes its use, however, prohibitive at present except in certain localities and these are so restricted that the subject is not recommended for discussion immediately. If prices should vary, it might, however, be desirable that it should receive consideration later. The question of the use of liquid fuel in conjunction with internal combustion engines on locomotives is, however, one of more general interest, and might be considered later.

Customs Examinations

In view of the vexations to which the delegates were subjected in connection with customs examinations at the frontiers of all countries (in spite of the fact that unusual courtesies were extended to them by the Italian government), it is not surprising that the Congress adopted a report upon this subject. Nobody who has not traveled in Europe since

the war can have any conception of the inconveniences, discomforts and indignities which the customs examinations of the numerous countries into which the continent is now broken up cause to be inflicted upon travelers.

The Congress recorded its opinion that "it is quite necessary to simplify customs and passport examination and also shorten the delay of the international train service at the various frontiers." It advocated the examination of baggage on trains, where possible, or at least in the immediate neighborhood of trains; that where it must be examined at stations, this should be done at the same stations for the two adjacent countries instead of at different stations.

Freight Car Loading

WASHINGTON, D. C.

THE NUMBER of cars loaded with revenue freight during the week ended May 6 showed a slight reduction as compared with the week before, to 755,749 from 758,286. This represented an increase as compared with the corresponding week of last year, when the loading was 721,722, in spite of the continuance of the coal strike, but was far below the loading for the corresponding week of 1920, which was 843,184. The principal decreases as compared with the preceding week were in forest products and ore but there was also a decrease in miscellaneous, which has been steadily gaining heretofore. Coal loading was about the same as the week before. Increases as compared with last year were shown in all districts except the Allegheny and South Western. The summary as compiled by the Car Service Division of the American Railway Association follows:

was about the same both years until the last quarter, when the loading did not reach the average attained in 1920. Corn was loaded heavier in each quarter of 1921; while oats—a comparatively light loading grain—averaged less and less each quarter of 1921, and during the last half of the year (when the seasonal demand for grain cars is greatest) dropped to a figure considerably below 1920. Other grain consistently loaded lighter in 1921 than in 1920. Flour, meal and other mill products show for the entire year a heavy loss in average tons per car loaded, and the average was lowest during the period of maximum demand for grain and flour cars. While the cause, no doubt, was primarily trade conditions, the depressed state of business inducing demand for minimum car load shipments, the resulting effect on car supply and operating costs was unfortunate. Neither potatoes nor cotton loaded at any time in 1921 as high an average per car as in 1920.

The effect of this loss in loading efficiency on railroad operating results is clearly set forth. The cars used in 1921 which need not have been used had the average loading in 1920 been maintained, run as high as 18.6 per cent of the entire movement in the case of flour and meal in the third quarter, and in the second and fourth quarters the percentage is almost as high. There was also a high percentage of cars used unnecessarily on the same basis in loading other mill products. The losses in other agricultural commodities do not run as heavy but are considerable in the aggregate.

The actual addition to operating expenses of the railroads by such reduced loading per car cannot be definitely determined, it is stated, but obviously is an important factor. All of the commodities named average a relatively long haul and the general movement is from the west and south to the east and north. That is to say, this traffic moves largely in the

REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

The Car Service Division has issued charts giving a graphic picture of the extent to which car capacity was utilized in 1921 and in 1920 in loading the principal products of agriculture. These show that grain loads heavily and substantially utilizes the full carrying capacity of the cars; that flour, meal and other mill products, while physically capable of similar heavy loading, in actual practice load much below the carrying capacity; that potatoes, although susceptible to heavy loading, actually average a very light load, and that cotton, largely on account of the volume of low-density shipments, loads very light.

Particular attention is drawn to the comparison between the two years in average tons per car loaded. Wheat loading

direction of the prevailing loaded traffic movement of the country. Such conditions inevitably involve an empty car movement in the reverse direction to return equipment to producing territory. Therefore, every car of agricultural products loaded to less than full carrying capacity increases the unproductive return empty mileage expense to the railroads. Estimating as accurately as possible the average loaded haul of the 129,413 cars that—on the basis of the previous year's performance—were wastefully used, it may safely be said, according to the bulletin, that over three million dollars were added to railroad operating expenses in 1921 by reason of these commodities alone being loaded lighter than in 1920.

A Water Analysis for the Non-Technical Man

By Cass Kennicott
Consulting Engineer, Chicago

FIGURES are of little value unless one is able to visualize their meaning easily. It is the purpose of this article to suggest a method for classifying boiler waters according to their mineral content so that the figures will have a definite and immediate meaning, fully as clear as the methods we now use for classifying locomotives.

If a railroad officer should ask about the quality of Lake Michigan water as a locomotive boiler supply he would receive the following:

MINERAL ANALYSIS OF LAKE MICHIGAN WATER

	Grains per gallon
Silica	.572
Oxides of iron and aluminum	.116
Carbonate of lime	3.913
Carbonate of magnesia	2.119
Sulphate of lime	1.051
Sodium and potassium sulphates	Trace
Sodium and potassium chlorides	.759
Total solids	8.878
Total incrusting solids	7.571
Non-incrusting solids	.759

But an analysis in this form, while perfectly clear to the analyst, usually means little to the officer requesting the information. It would be as illogical as for a master mechanic to reply to his superintendent's inquiry as to what power he had available for drag freight service by producing a certificate of analysis about as follows:

	Engine Number		
	800	810	1600
Bore of cylinders	25.141	25.270	26.081
Stroke	28.003	28.000	32.000
Steam pressure	200.000	200.000	200.000
Diameter drivers	62.731	63.051	62.880
Tractive effort	44,218.801	48,209.601	58,544.000
Etc.	Etc.	Etc.	Etc.

This instead of saying, "We have two Class-800 engines rated at 1,400 tons and one Class-1600 engine rated at 2,000 tons."

There are 58,349 grains in a United States gallon. But even in this knowledge the writer has never been able to visualize a grain per gallon. Some chemists call for analyses in parts per million, or in parts per 100,000. This is very convenient for the analyst because he usually conducts his operations in the laboratory under the metric system, which gives him results in a decimal system, but it is no easier to visualize parts per million or parts per 100,000 than it is grains in a gallon. However, we are more or less familiar with the appearance and size of a pound of any given material. The average mechanical officer will make a very close estimate of the weight of ordinary bulk material and will give that weight in pounds. In other words, he is able to visualize a pound. Railroad men are also familiar with 1,000 gal. as a unit of water measure in that they have a very clear conception of the bulk of water in a 50,000 gal. or in a 100,000 gal. railroad tank, or the amount of water in a 5,000 gal. or 10,000 gal. locomotive tender. Considering that an analysis expressed in grains per gallon may be converted into one expressed in pounds per 1,000 gal. simply by dividing the number of grains given by seven, why not, for the sake of clearness, adopt this very practice?

Under this plan the Lake Michigan water presents itself as a water containing one pound of scale-forming solids in each 1,000 gal. instead of seven grains in each gallon and from this it is easy for us to see that a 100,000 gal. roadside storage tank filled with Lake Michigan water holds 100 lb. of scale-forming material and that if 8,000 gal. of this water are drawn into a locomotive tender, we shall then take into the tender of the locomotive 8 lb. of scale-forming solid. In the same manner, if we are operating with water considerably harder than Lake Michigan water, say a water showing incrusting or scale-forming solids of 21 or 22 grains,

we are then handling a water with 3 lb. of incrusting solids in each thousand gallons and a 100,000 gal. roadside tank will have in solution 300 lb. of scale-forming or incrusting solids. When a locomotive draws 8,000 gal. of this water it takes into the tender 24 lb. of scale-forming material.

The same logic applies to the foaming solids in the water. Statements giving pounds of solids per thousand are now frequently added as a footnote to regular chemical analyses and this is a step in the right direction, but let us go a step further and adopt the practice of expressing the analysis in pounds per 1,000 gal. in the first place and classify the information so that the railroad man can use it.

As to a suitable classification of the information, consider the following analyses showing waters which may be found in use by railroads in the middle west:

	A	B	C	D
Silica	.247	.951	Trace	1.214
Oxides of iron and aluminum	.490	.222	.164	.047
Carbonate of lime	8.971	11.875	15.344	10.465
Carbonate of magnesia	8.299	4.155	2.179	8.654
Sulphate of lime	2.047	.608	15.712	12.241
Sodium sulphate	1.329	1.616	1.869	4.265
Sodium chloride	.510	2.040	6.484	17.243
Incrusting solids	20.054	17.841	33.096	32.621
Non-incrusting solids	1.839	3.656	8.353	21.508
Total solids	21.893	21.497	41.449	54.129

Figured in pounds per thousand gallons, the incrusting and non-incrusting solids would be as follows:

	A	B	C	D
Incrusting solids	2.865	2.550	4.730	4.660
Non-incrusting solids	.263	.522	1.193	3.072

Having proceeded this far it is suggested that the analyses be expressed in a still more practical form as follows:

	A	B	C	D
Incrusting solids	2.8	2.5	4.7	4.7
Non-incrusting solids	0.3	0.5	1.2	3.1

Here the upper figures represent pounds of scale in each 1,000 gal., figured to the nearest 1/10 lb. The lower figures represent pounds of foam-causing solids in each 1,000 gal., figured to the nearest 1/10 lb.

The question now arises as to how the information in this form can be used. An example will bring this out. Consider an imaginary short engine division with the water stations, A, B, C and D as above and assume that the locomotive draws water from each as follows:

Water station	A	B	C	D
Rating of water	2.8	2.5	4.7	4.7
	0.3	0.5	1.2	3.1
Amount taken	5,000 gal.	3,000 gal.	4,000 gal.	4,000 gal.

Now bearing in mind that the upper figure gives pounds of scale-forming solids in each thousand gallons and the lower figure, pounds of foam-causing solids in each thousand gallons, the following simple multiplication and addition may be made:

Scaling Solids	Foam Causing Solids
A - 5 x 2.8 = 14.0 lb.	A - 5 x .3 = 1.5 lb.
B - 3 x 2.5 = 7.5 lb.	B - 3 x .5 = 1.5 lb.
C - 4 x 4.7 = 18.8 lb.	C - 4 x 1.2 = 4.8 lb.
D - 4 x 4.7 = 18.8 lb.	D - 4 x 3.1 = 12.4 lb.
59.1 lb.	20.2 lb.

Thus we find that on a one-way trip over the division the locomotive has taken 59.1 lb. of scale and 20.2 lb. of foaming solids.

Knowing the water holding capacity of the boiler it is thus a simple matter to figure the concentration of soluble solids under any definite set of conditions and the man responsible for the care and operation of locomotives is enabled to figure blow-down, wash-out, the amount of boiler compounds to use, and in fact any other calculation except the actual conduct of a roadside water treating plant. It is not contended that the chemist should keep no other record of a water than this classification. He should keep a careful record of all analyses, but the report given an operating or mechanical man need go no further. If a complete analysis is requested the classification figures should be given first and the analysis follow as a detail.

The Aftermath of the Federal Control Period

Director General Davis Tells of Administration Liquidation Problems at Western Railway Club Dinner

THAT A GOOD FAITH effort was made by the Railroad Administration to return the properties of the railroads to their owners in as good repair as when they were taken over by the government was the conclusion drawn from the record by James C. Davis, director general of railroads, in his address before the first annual dinner of the Western Railway Club, held at the Drake Hotel, Chicago, on May 15. Mr. Davis expressed the opinion that the difficulties of the carriers attributable to federal control are economic rather than physical and suggested that the greatest need of the railroads in working out of the difficulties of their present situation is a period of legislative repose with an opportunity for a thorough trial of the present transportation act.

The meeting, which was attended by about 650 railroad and railway supply men, was also addressed by Samuel M. Felton, president of the Chicago Great Western, who briefly sketched the history of the development and accomplishments of the Western Railway Club as an organization of men interested primarily in the mechanical department, and said that the future opportunity of the club lay in the broader field of discussion of inter-departmental problems.

Address of Director General Davis

The winding up of the many and varied obligations of the government, as the result of 26 months of federal possession and operation of the railroads, presents perhaps the greatest liquidation proposition the world has ever seen. More than two years have elapsed during which this great adjustment has been in progress, and the time has now arrived when some definite opinions may be ventured not only as to when the settlement of these claims will be completed, and the amount of money that will be required to complete the adjustment, but the problems which federal control left the carriers to solve.

Up to May 1, 1922, claims had been filed by the carriers on final settlement aggregating \$1,011,251,598.42. This represents, exclusive of short lines, about 95.5 per cent of the mileage under federal control. Up to the same date claims aggregating \$519,798,985.18 had been settled. These settlements represent 61.22 per cent of the aggregate amount of mileage under federal control. The cash paid out by the government in making these settlements totals \$146,127,692.55.

If future adjustments proceed upon the same lines as those that have heretofore been made, the final settlements should be practically concluded by about July 1, 1923.

The Maintenance Controversy

Naturally the proposition over which the greatest difference of opinion has arisen as between the representatives of the carriers and the Railroad Administration is the question of maintenance, especially as to freight car equipment and motive power, the carriers contending that at the end of federal control their properties were returned in a greatly undermaintained condition, while the Railroad Administration contends that during federal control the individual properties were operated and maintained by the same persons who had possession of the property and who operated and maintained it during private control; that the government kept the federal managers quite liberally in funds for proper maintenance, and that, so far as was humanly possible under the abnormal conditions of a great war, the properties were as well maintained physically during federal control as they were under private operation.

In my judgment, the transportation companies suffered, as a result of war conditions, to a greater extent than any other one class of commercial property in this country, but I do not believe that this damage was the result of neglect to fairly well maintain the property.

Maintenance of Way

There was some 232,694 miles of Class I railroads taken over by the government. During the 26 months of the test period corresponding to the 26 months of federal control these carriers, under private control, expended in maintenance of way and structures \$859,393,403, or \$3,726 per mile of road. During the 26 months of federal control the government expended on this same property \$1,533,615,734, or \$6,616 per mile; that is, the government, in the maintenance of way and structures, expended \$674,222,331 in excess of similar expenditures made by the carriers during the test period, and, in concluding final settlements with the individual carriers, the Railroad Administration is making just allowance for undermaintenance when the facts presented justify same. When the final settlements are concluded the government will have expended more than twice as much on account of maintenance of way and structures during federal control as the carriers expended during the test period.

Motive Power

The total number of locomotives in service December 31, 1917, was 61,890. On February 29, 1920, at the end of federal control, the number of locomotives in service was 64,983, or an increase of 3,093 units. The total number of locomotives added to the equipment during federal control was 4,226. From the best available information, during 26 months of the test period the carriers expended in the maintenance of motive power \$422,244,108. During the period of federal control the government expended for the same purpose \$996,877,227, or an excess expenditure during federal control over the same time of the test period of \$574,633,119, the expenditure by the government in the maintenance of motive power being largely in excess of twice the amount expended during private operation.

The total number of locomotives out of service for repairs requiring more than 24 hours, on January 4, 1918, was 18.5 per cent. On February 28, 1920, at the end of federal control, the total percentage of locomotives requiring the same character of repairs was only 17.8 per cent. These records indicate a greater number of units and a higher state of efficiency at the end than at the commencement of federal control.

Freight Cars

There is much greater difficulty in comparing the condition of the freight car equipment as between the commencement and the end of federal control, largely because of the fact that in the consolidation, from an operating standpoint, of all the transportation lines the freight cars were pooled, and a large percentage of the freight equipment was during the period of federal control continuously on foreign lines.

No criticism should attach to this plan of pooling freight equipment. It was one of the necessary results arising out of the exigencies of war conditions, and was inaugurated by the Railroad War Board prior to the beginning of federal control. As a matter of fact, there was only about 44 per cent of the cars on home lines January 1, 1918, and the chairman of the Railroad War Board reported on December 22, 1917, that in the War Board's efforts at efficiency freight

cars were made to "circulate as freely over the United States as bank notes." This action was altogether commendable, and is evidence of a great desire on the part of the carriers while under private operation to meet the rising and increased responsibilities growing out of a state of war.

The total number of freight cars on line January 1, 1918, amounted to 2,374,566. The total number of freight cars on line February 28, 1920, amounted to 2,486,507. This shows an increase in the number of freight cars, as between the beginning and end of federal control, of 111,941 cars. As a matter of fact, there were built and put in service during the period of federal control 159,076 freight cars.

During the 26 months of the test period corresponding to the 26 months of federal control the total expenditure by the carriers for freight car maintenance was \$391,327,170, or an average of \$79.38 per car per annum. The total expenditure for freight car maintenance by the government during the period of federal control was \$907,227,045, or an average of \$178.40 per car per annum. At the commencement of federal control the percentage of bad order cars was 5.3, amounting to some 126,650 cars. At the end of federal control the same records indicate 5.7 per cent of bad order cars, amounting to 143,425.

I am not unmindful of the marked difference in the price or cost of labor and materials as between the test period and the period of federal control. I am fully aware of the difficulty during the time of federal control to procure at all times efficient labor and proper material. I also appreciate the insistent demands for the transportation of men and war materials, entailing in many instances unusual requirements from freight equipment, but I do submit that the expenditure by the government of these vast sums of money shows a conscientious, good faith effort to maintain and keep the carriers' property up to the same standards of efficiency as when the property was taken over.

Railroads Returned With a Deficit

It requires no profound knowledge of railroad finances to diagnose the present trouble. The serious injury to the railroad properties as the result of federal control is found in the fact that when returned to their owners the properties were being operated at a deficit, this as a result of a policy that at least a part of the increased cost of transportation should be borne by the general public as a war expense. I am not criticising the adoption of that policy; I am only suggesting its present effect.

Again, during federal control working rules and conditions were changed, labor was much more thoroughly organized; the general rule of an eight-hour day more effectively enforced, and standardized wage contracts were entered into that had not existed prior to federal control, and many other operating changes were effected in which the owners of the properties had no voice. In 1917 the average earnings per annum of each employee were \$1,003.01, and a large number of employees at that time were giving ten hours per day service. In 1920 the average earnings were \$1,819.71, and the average hours of service a small fraction over eight. Please understand I am not assailing the justness of these advances at the time they were made. The radical changes in living conditions and the abnormal conditions of war perhaps justified them. I am calling attention to the record and suggesting that time increments were made at a time when the carriers had no voice in the matter.

Now the railroads, upon the return of their properties, have been confronted by two very disagreeable and unpopular propositions—the raising of rates and the reducing of wages. One of the leading Senators in the United States has said, "It was just as much the duty of the government to return these roads with rates that would sustain them in their operation as it was to return them in an excellent condition generally and to back them."

Initiative Taken From Carriers

In solving these very controlling questions, the carriers find themselves confronted by other conditions that had not existed prior to federal control. I doubt if the general public recognizes the largely increased powers of the government as the result of the present Transportation Act, and with these increased governmental powers must go a correspondingly increased governmental responsibility.

In the matter of rates, the power to reduce charges as well as increase them is taken from the carriers. The commission is given very wide authority in the matter of permitting pooling of earnings, distribution of freight equipment, consolidation of companies, and joint use of terminals; in fact, control in the most minute details of operation is granted to the commission under this law.

The law also creates a national Railroad Labor Board. This board is given general authority to hear "and with diligence decide" disputes growing out of rules or working conditions, and is further authorized to hear "and with diligence decide" all disputes with reference to the wages and salaries of employees and subordinate officials. The Labor Board has construed its power under this act to extend to the control of all changes in wages, and that no changes in existing contracts or rules can be made by the individual carriers under its jurisdiction except upon approval of the board.

As a result of this legislation in these vital matters of rates and wages the government has definitely taken from the carriers the power and initiative to control either the income or the outgo in the operation of these properties. Much opposition to present conditions arises from a failure on the part of the people generally to understand the limited authority which the carriers have over these important matters, and also a failure on the part of the public to appreciate the vast difference between the operation of a common carrier and the operation of an ordinary private business.

Private enterprise has the benefit of the full scope of individual initiative and the exercise of discretionary judgment. Railroad operation is limited by the hard and fast rules not only of congressional legislation but of legislation of 48 states, acting independently, and supreme within their respective jurisdictions.

Private enterprises can reduce operation or altogether quit if the venture is losing money. Railroads must operate, and give the public reasonably efficient service, whether they make or lose money, and if the corporation is not able to do this a receiver, under the direction of a court, will ordinarily arrange the situation. Receiverships mean exhaustion of the resources of the property—a slow death by attrition.

Who Pays the Bill?

Another proposition that cannot be too greatly emphasized is this: Whenever the transportation systems of this country fail to function with efficiency it is the shipping public which must ultimately bear the results of inefficient and ineffective service. The commercial and agricultural interests in the end are the great sufferers from indifferent or inadequate railroad transportation service.

Again, permanent plans for capital investment, or expenditures to any large extent for deferred maintenance, require definite arrangements that consume some years of consecutive construction with reliable assurances that the necessary funds will be available as the work progresses. If the new investment in railroad capital account most urgently demanded by the commercial and agricultural interests of the country is to be furnished the credit of the railroads must be reasonably stabilized and the investment in railroad securities made sufficiently attractive to invite the enlistment of new capital.

If the conditions following federal control resulted in economic injury to the railroad transportation properties as a whole, they are damages which existing laws contain no

provisions for adjusting; they are the direct result of the war, for which there would seem to be no way that money damages can be demanded or paid, being largely remote, contingent, and speculative, but they do represent conditions which the public and the law-making bodies should consider in their present and future treatment of this great business, next to agriculture the most important in this land.

A Period of Legislative Repose Needed

What the railroad interests need at this time is a period of legislative repose, a fair opportunity to work out under normal conditions permanent plans for rehabilitation, a definite time to make necessary improvements, and a reasonable opportunity, under fairly normal surroundings, to determine the merits of the Transportation Act, especially by giving the Interstate Commerce Commission an opportunity to exercise its new authority in the matter of rates, and the Railroad Labor Board a chance to exercise its new authority in the adjustment of wages.

The carriers of the United States, if given a fair chance under normal conditions, should be able to give efficient and adequate service at reasonable rates, lower than those that are to be found in any other country in the world. The people must remember that there is no legislative panacea for a situation like the present. You cannot make bricks without straw. The destroying and far-reaching effects of the greatest calamity in the history of civilization cannot be restored overnight. The painful struggle back to anything like normal times calls for patience, patriotism and forbearance, the exercise of conservative judgment, and an abiding courage.

There is one service that the transportation companies rendered in the winning of the war which should not be forgotten. At the time when the civilization of the world seemed hanging in the balance, the men operating the transportation system of America, with a wonderful and generous patriotism, responded to every call in that great movement of men, food and materials necessary to keep the armies of the Allies carrying on. America was, at the end of the conflict, the great and controlling factor. It was the railroad transportation system of this country that enabled the nation to respond so effectively. In helping that system back to a condition of commercial solvency, some generous and considerate remembrance should be had of this great achievement.

Mr. Felton Tells of Work of Western Railway Club

After briefly sketching the history of the club from its inception in 1884 as a purely mechanical department organization, Mr. Felton called attention to the broadening of the scope of the club to include officers and men of every department. This took place a little over a year ago, in recognition of the need to show the relationship existing between the various departments of the railroads as a whole, as well as the relations existing between steam railroad transportation and the public which it serves. Mr. Felton continued in part as follows:

While the Western Railway Club has been working but a short time under its more ambitious program of including all departments of railroading, the beneficial effects of its work have already been seen and felt. Every department in railroading has its place, its work to perform in connection with other departments. While very naturally every man should be thoroughly conversant with the work in which he is immediately engaged, it is necessary that those who are engaged in railroading should know in a broad and general way all that pertains to railroading and its effect upon the nation as a whole.

Railroading stands unique in its position as an industry which has practically all of its rate of return determined by the government and nearly all of its outgo similarly controlled. Without entering into any lengthy discussion as to the correctness of the theory which is super-regulating our

railroads, attention should be called to the conditions under which we are operating, and railroad men should familiarize themselves with these conditions in order that the general public may learn through personal contact with the railroad man the true facts in regard to the situation.

The Problems of the Executive

Many of the members of the Western Railway Club have to do with the details of railway equipment. They appreciate very keenly the need for improvements and understand the economies that can be worked out through such improvements. It is entirely proper in their papers and discussions that they should emphasize the need of new and better equipment and show the savings which would result from such improvement.

Possibly not grasping in its entirety the problems of the executive, they may be inclined to feel that they do not always get from the management due consideration in the way of appropriations for things most evidently needed. It must be borne in mind that the railroad manager is in quite a different position from the manager of an industrial concern who is not limited by governmental action as to his rate of return or his cost of outgo. Through private initiative and resourcefulness the independent industrial manager is able to obtain not only a fair price for what he sells, but further to obtain credit so that he can install methods and equipment which lead to immediate and far-reaching economies. With the artificial limiting of the rate of return, and with the further artificially controlled expenditures of railroads, the railroad manager finds himself in a position where the control of the situation is absolutely out of his hands. The resulting effect of these conditions has left the railroad managements in a position where they are too poor to be economical. While we may see and feel the dire necessity for the purchasing of many things which would lead to more efficient operation of our railroads, those directly in charge of matters of equipment should remember that railway executives are confronted at all times with the pressing necessity of finding money enough to keep going, and the problem becomes one not only of efficient operation but one of super-management to keep operating at all.

While the railroad executives would not for a moment discourage the discussion at meetings of such organizations as the Western Railway Club of matters which would show possibilities of economy and efficiency through large expenditures for more modern equipment, it must be constantly borne in mind that our first problem is to secure a sufficiently fair rate of return so that we can get beyond the condition of a hand to mouth existence which at the present time confronts the railroads as a whole.

U. S. Chamber of Commerce Discusses Transportation

WASHINGTON, D. C.

A LARGE NUMBER of speeches relating to various aspects of transportation were presented at the various group sessions of the annual meeting of the Chamber of Commerce of the United States at Washington, May 15 to 18. At a meeting of the railroad group on May 16 presided over by George A. Post, president of the Hudson River Bridge & Terminal Corporation, addresses were made by Howard Elliott, chairman of the board of the Northern Pacific, on the regulation of railroad rates under the transportation act and by Dr. Julius H. Parmelee, director of the Bureau of Railway Economics, on the transportation act as a stage in the development of railroad regulation. At a general meeting on May 17 presided over by Mr. Elliott, F. A. Delano, former president of the Wabash and former member of the Federal Reserve Board, discussed general railroad conditions here and abroad. There were also ad-

dresses on waterway, highway and ocean transportation at other sessions and on railroad transportation in connection with meetings of other groups. At a meeting of the domestic distribution group on May 16, Charles E. Elnquist, former president of the National Association of Railway and Utilities Commissioners, discussed the effect of distribution of changes in freight rates, and at a meeting of the coal industry group, E. M. Poston, president of the New York Coal Company, discussed the relations of the transportation problem to the coal industry. Eugene McAuliffe, president of the Union Colliery Company of St. Louis, in discussing the coal strike, said that when the full importance of the relation that exists between the coal industry and the railroads is understood by the public, the proposition to regulate the development of the coal mines by withholding transportation facilities will be recognized as the only adequate and proper way that this necessary work can be done.

"As the matter now stands," he said, "a two billion dollar coal dog is wagging a twenty billion railroad dog. To put the coal industry on a sound basis, thereafter improving the railroad problem, would reflect enormously to our national advantage."

He recommended that the Transportation Act should be so amended as to require every railroad desirous of rendering transportation service to a coal mine to secure from the Interstate Commerce Commission a certificate of convenience and necessity before doing so. He also recommended a reduction in coal freight rates during the storage season.

Mr. Delano said in part:

In Europe, as here, railway builders have chafed under government regulation. There, as here, the complaint has been of "red tape." They say, as our men do, that one of the greatest objections to government regulation is not that decisions are *wrong*, but that they are so *tardy*. Because the railway is manufacturing service, which can only be used at the moment it is supplied, it follows that most railway questions must be settled immediately, and it does not always matter so much how a question is decided as that it should be decided one way or the other instantly. A fair definition of a competent railway man might be stated as "a man who could decide the questions which arise from day to day promptly, with fairness and wisdom, and with as small a percentage of error as any other man."

If our railways are suffering because decisions are tardy, the remedy lies not in abuse of these grossly overworked federal and state commissions, but in co-operation with them by railway men and by business organizations in order to determine a solution.

Some experience with government methods here and abroad, and my observations since I have lived in Washington, lead me to think that it is not fair to call on commissions to do administrative work. If they have executive and administrative functions to perform, they ought to be authorized to act as it were "in loco parentis," or as a board of directors employing an executive to attend to those functions under their direction and guidance on questions of policy. A commission may be well qualified to act as a court in judicial or semi-judicial matters or in dealing with questions of policy; but even then, if promptness of decision is an important desideratum, much could be gained by reducing, rather than increasing, its size. I may be expressing a novel thought, but it is one I have long entertained that our boards and commissions in Washington do better work if they were not so overlaid with routine matters and were more familiar with what was going on in the country. Although Washington is the center of our national universe, it is more detached from business and less intimate with what is going on in the country than any place I know of. And so it happens that Senators and Congressmen become professional legislators, unacquainted with what goes on in their constituencies and communities and board members who are appointed with a view of bringing outside knowledge to their work, are here at a center with home and become bureaucrats.

The interesting fact about the development of transportation in this country is that the demand for transportation increases at a rate which is more rapid than that of the population. The railway handles the passenger travel, the transportation of freight, although with a certain growth, at a rate far in excess of the population. This was true when our population has doubled in the last 40 years, our passenger travel has increased six fold, and freight transportation ten fold.

It may be said that this cannot be putative burden upon the country, but it is largely borne by the future development of internal waterways on the one hand and highways for motor

trucks on the other. That railways have little to expect from such competition except in a temporary way (as happened with interurban electric roads some years ago), may be shown without digressing far. Internal waterways have for a long time possessed no economic merit except in a very few favored localities. They are usually urged by special interests in order to reduce freight rates which of course means that the many are taxed for the benefit of the few. On the other hand, such natural waterways as the Great Lakes or the Hudson River are economically of great value; but so far from being a relief to the railways, they are a conspicuous failure, because navigation is closed in the months when the cost of rail transportation is greatest and the relief would be most welcome. Our southern rivers, while free from ice, are handicapped by conditions of current or by low water stages. In brief, it may be said that a means of transportation which fails to take the peak of the load off the railways is valueless as an economic measure; and inasmuch as water transportation is never self-supporting, but an expense of the general taxpayer for upkeep and many expenses of river and harbor or improvement, it cannot be looked upon as a valued adjunct.

Dr. Parmelee said in part:

The amount which it was estimated the railways would receive from the government in lieu of net income during the six months of the guaranty period, represented about a 5 per cent return on their valuation, computed, of course, to an annual basis. The Interstate Commerce Commission has recently stated an amount which will make the rate of return less than 4 per cent instead of 5 per cent as has been usually estimated.

Since the first of September, 1920, the railways have been on a basis of rates, which, it was expected, or at least hoped, would produce a return of 6 per cent on the tentative valuation of their properties as fixed by the Interstate Commerce Commission. This provision has now been in effect for 20 months. Complete records are available for 19 of the 20 months, or through March, 1922, which show that during the four months from September 1 to December 31, 1921, the carriers as a whole earned a rate of return on their tentative valuation equivalent to 3.03 per cent when reduced to annual basis; that during the calendar year 1921 they earned 3.26 per cent; and that during the three months from January 1, to March 31, 1922, they earned at an annual rate of 4.51 per cent. Their average annual rate over the whole 19 months has been 3.35 per cent. During the 19 months they fell \$784,000,000 short of earning 6 per cent on the tentative valuation fixed by the commission. In fact, the railways earned barely enough during this period to meet fixed charges.

The effect on railway credit and their ability to finance need not be emphasized here. What financing the railways have been able to do has been accomplished either through the help of the government, or through the medium of ordinary banking facilities at unusually high rates, although the situation has been improving in recent months.

What the financial situation may be during the next few months under the gradually tightening effect of the coal strike on industry, and under the modified levels of transportation rates and railways wages which may within the next few weeks, days, or even hours be put into effect by the Interstate Commerce Commission and the Railroad Labor Board, respectively, it is difficult to foresee; but an industry that even under government guaranty earns less than 4 per cent, and during a period of more than a year and a half at the highest level of rates ever experienced earns only 3½ per cent per year, cannot look for great improvement unless reductions in expenses can be brought about commensurate with reductions in revenue through rate cuts.

There have been many adjustments in rates during this period, most of which have been voluntary on the part of the carriers and the great bulk of which have been downward. These adjustments have covered a wide variety of commodities, including a 10 per cent reduction in agricultural products. In addition, the Interstate Commerce Commission directed the carriers in Western District to reduce the rates on grain, grain products, and hay by from 15 to 20 per cent. It has been estimated that the total annual freight revenue represented by these various rate adjustments approximates an average of about 5 per cent of the total rate level.

In the meantime, the deflation of labor in other industries has been proceeding at a more rapid pace than in the railway industry, due to the fact that a level of wages regulated by government supervision changes more slowly than wages subject to competition in the open market. This in turn has tended to postpone or delay rate reductions which might otherwise have been made, in sympathy with the general deflation in the price levels of agricultural commodities and manufactured products.

It will be perceived from this brief summary that our experience with the Transportation Act of 1920 has not yet been sufficiently extensive to offer a conclusive test of the effectiveness or the wisdom of its several provisions.

Some Notes on Railway Refrigerator Cars*

Requirements for Efficient Refrigeration; Importance of Air Circulation and Insulation

By W. H. Winterrowd
Chief Mechanical Engineer, Canadian Pacific

THE SUBJECT of railway refrigerator cars has been, and is still one of growing importance, a growth that has been contemporaneous and proportional to the development of the United States and Canada and their communities, and to the resultant demand and necessity of transporting increasing quantities of perishable commodities greater and greater distances. When hauls were short and the variety of perishable commodities few, the problem of transporting and protecting the commodities from heat or cold was comparatively simple. Increasing distances and a greater variety of perishables not only made necessary greater numbers of, and more efficient cars, but involved the establishment of railway-divisional and terminal facilities, upon

the lading is piled or stacked, a slatted wooden structure known as a floor rack is of very great value. These racks, on the top of which the lading may be placed, consist of longitudinal runners 3 or 4 in. high, with cross slats fastened to the top of them. They are hinged to the side walls of the car and are divided in the middle so that they can be turned up to make the floor accessible. These racks permit the cold air which flows beneath the bulkhead to circulate freely toward the center of the car and up through the lading.

Illustrations of Effect of Design

The *A* end of the car, Fig. 1, shows the relative arrangement of bunkers, bulkheads and floor racks, and the resultant trend of air circulation.

It is highly desirable that there be no obstruction to the flow of cold air where it passes beneath the bulkheads. The *B* end of the car, Fig. 1, shows how an obstruction at that point can act as a dam or deflector of the air currents, and partially or entirely defeat the object of the floor racks, and

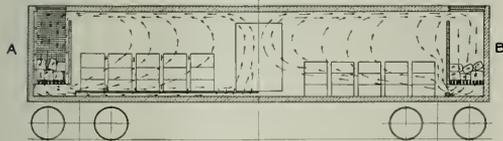

Fig. 1—Diagram of Air Circulation

which the successful operation of this type of equipment is contingent.

Comparatively speaking, literature upon the subject is not vast, although exceedingly valuable. Finding the sources of information to some extent scattered, the writer has attempted to include under one heading some of the most interesting and important facts regarding principles and methods involved, as well as to present some information regarding the type of cars and methods of construction used by various railways and private-car owners.

Refrigeration of Commodities in

Transit Involves Many Factors

The prevailing method of obtaining refrigeration is by means of naturally-circulated air, cooled by contact with ice, or ice and salt, placed in suitable receptacles called bunkers located at each end of an insulated car. Some modifications of this system will be touched upon very briefly later.

Circulation is assisted and made most efficient by means of insulated partitions, called bulkheads, placed in front of the containers and so constructed that the relatively warm air must pass over the top of them to reach the ice, or ice containers. The air becoming chilled, and therefore heavier, sinks toward the floor and reaches the body of the car by passing through a space beneath the bulkheads.

These insulated partitions also assist in protecting the lading nearest the ice containers. Without bulkheads, and when salt is used with the ice to hasten and increase refrigeration, that part of the lading nearest the ice frequently freezes, an undesirable and disastrous occurrence with some commodities. At the same time, that portion of the load near the center and top of the car may remain at too high a temperature, an equally undesirable condition.

As a further aid to circulation, particularly in cars where

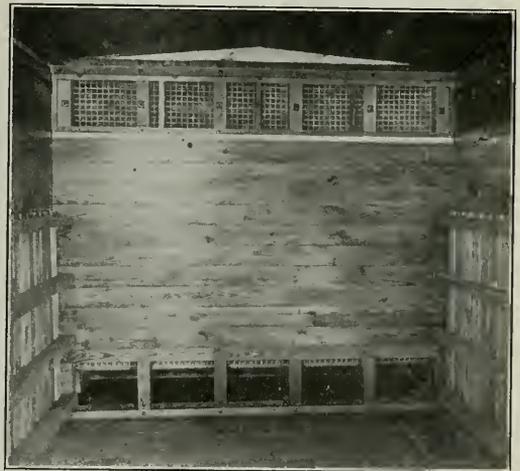

Fig. 2—Car with Fixed Bulkhead and Basket Bunker, Floor Racks Raised

even cause frosting of the lading against the insulated bulkhead. If floor, bunker or splash-board construction necessitates a ledge beneath the bulkhead, it should be kept as low as possible and the floor rack and bulkhead so designed to provide sufficient area for a free flow of air.

At the *B* end the lading is shown piled directly on the floor and the air currents indirectly indicate the advantage of floor racks. Fig. 2 illustrates these racks, showing their appearance when turned up against the side walls.

The method of loading various commodities is an important factor in their proper refrigeration in transit. To obtain the greatest advantage from circulation, the contents of the car should be loaded so that the air can come in contact with

*From a paper presented before the American Society of Mechanical Engineers at New York, May 16, 1922.

a maximum surface with a minimum of restricted circulation. It is easy to understand that boxes or containers, placed closely against each other and against the walls of the car cannot be cooled quickly or properly preserved at as uniform a temperature as when placed so that air can flow between them, or generally speaking, throughout the entire load.

The temperature of the circulating air is affected by the type and size of ice containers or bunkers. The chief considerations in the construction and capacity of the bunkers are the refrigeration required to replace the loss due to transmission and the refrigeration required to cool the car quickly and maintain its contents at the required temperature. The loss in transmission in turn depends upon insulation, car construction and maintenance; factors which will be more fully discussed later.

A basket bunker is shown in the *A* end of the car in Fig. 1, and a box bunker in the *B* end. Brine tanks are shown in Fig. 3.

The sides of the basket bunker are constructed of wire mesh. The bottom consists of a slatted wooden structure. The bunker is placed in position so that air space exists around the outer surfaces, this construction permitting the air behind the bulkhead to come in contact with a maximum ice area, while the open spaces around the bunkers facilitate circulation.

The bottom of the box bunker shown at the *B* end of the car in Fig. 1 is also slatted. The walls are formed by the bulkhead and by the sides and end of the car. In an endeavor to make the refrigerator car more productive and useful for general purposes, some builders have applied collapsible box bunkers. In this design, the bulkhead is

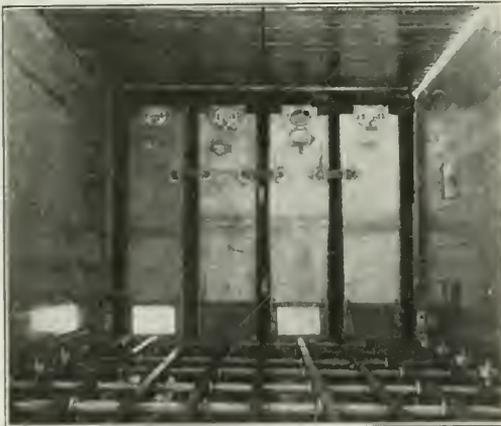

Fig. 3—Brine Tanks in Refrigerator Car, Bulkhead Swung to Side

swung up, or to one side, and fastened. The slatted rack is swung or folded back against the end of the car. In this way the space occupied by the bunker is made available for general lading.

Another very important factor is the size of the car and its proportions, particularly with reference to the distance between the bulkheads. The cold air passing out beneath these insulated partitions flows toward the center of the car. In doing its work it gathers heat and grows warmer. If the distance between bulkheads is too great, the air may not be at a low enough temperature when it reaches the center of the car to properly refrigerate the load at that point, particularly near the top of the car. Under such conditions a portion of the load near the bulkheads may be sufficiently

chilled while the upper and center part of the load may be too warm. The chief factors generally considered in this connection are type and capacity of car, type of bunkers, amount of commodities and size of containers, and temperature required for efficient refrigeration.

Importance of Temperature of Entering Load

The temperature of the entering load is a very important factor. If heat is not removed from certain commodities prior to loading it is highly desirable to remove it as quickly as possible after loading. Tests and general experience show that if the heat is not promptly reduced, the commodities either spoil en route or reach their destination in such condition that their market value is greatly reduced. Quick cooling after loading is generally attempted by pre-cooling

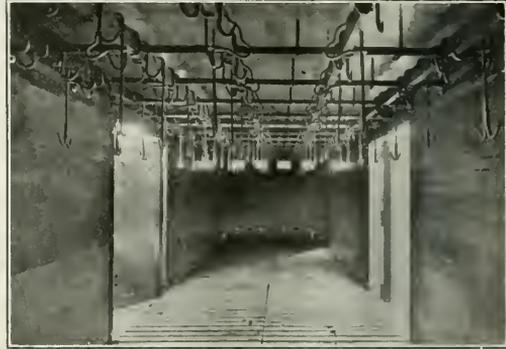

Fig. 4—Meat Rack and Hook Installation

the car, by the use of cars in which maximum and most efficient air circulation can be obtained and by mixing a proper amount of salt with the ice or by placing coarse rock salt on top of the ice.

When salt is mixed with the ice, the greatest amount is used at the first icing, the time when the greatest quantity of heat is in the lading. At the second icing the amount is generally reduced, while at the third and successive icings a stipulated minimum amount is used.

Pre-cooling the car may be accomplished by the use of ice and salt, but at many points where a large tonnage of fruit or meat originate, the cars as well as the lading are often pre-cooled by mechanical means.

Pre-cooling means less ice in transit, a matter of economy to shippers and railways alike. Some commodities can be frozen hard and therefore require little or no icing en route, the lading itself supplying the necessary refrigeration. This not only insures better condition in transit but is an added economy.

Humidity or moisture content of the air in the car is almost as important as temperature. Generally speaking, if refrigeration is effective and a high initial rate of cooling obtained, the air is kept sufficiently dry due to condensation taking place on the surface of the ice, or ice containers. In this way the moisture given off by some classes of lading is also deposited. Excess of humidity, if not fatal, is highly injurious to many commodities.

Insulation Is the Most Important Consideration

Finally we come to the matter of insulation, the most important factor in connection with efficient and economical refrigeration. The function of the insulation is to afford protection to the lading by minimizing heat transmission through the walls, roof, and floor of the car. To do its work properly it must be by nature a poor conductor of heat.

Other desirable qualifications are reasonable cost, strength, adaptability, durability, light weight, and imperviousness to moisture.

This subject might well be divided into two parts, insulating materials and insulation, because the general subject involves methods of car construction and maintenance in addition to the consideration of materials and principles of heat transmission.

The whole subject is capable of analysis but that the principles involved are not broadly known is indicated by the fact that in very recent years cars have been built without proper or sufficient insulation. These cars which do not properly protect their lading are huge consumers of ice and

expensive to operate and require a great deal of maintenance to keep them in service.

Summation of Requirements for Efficient Refrigeration

It is evident that an efficient and economical railway refrigerator car is one which provides adequate air circulation, adequate protection to the lading, adequate quantity and degree of refrigeration, quick initial cooling, uniform temperatures, dry air, space to permit proper methods of loading, and good car construction to minimize maintenance and increase time in service.

(An abstract of the remainder of Mr. Winterrowd's paper will be published in the next issue.—EDITOR.)

New Cantilever Bridge Replaces Famous Old Span

Canadian Pacific Completes a New Structure Over the St. John River in New Brunswick

ONE OF THE MOST IMPORTANT railway bridge projects completed during the last year was the new cantilever bridge over the St. John river at St. John, New Brunswick. This is a single-track structure with a main span of 450 ft., center to center of piers. No little interest is attached to this structure because of the unique character of the site at the narrowest portion of the St. John river gorge, a short distance from the point where the river flows

ara cantilever completed in December, 1883, the original St. John Bridge having a span about seven feet longer than the Niagara bridge.

The crossing of the St. John river carries the Canadian Pacific to its eastern terminus in the city of St. John, New Brunswick. The original bridge was built by the St. John Bridge & Railway Extension Company and served to connect the Intercolonial with the St. John & Maine Railway at

Three Interesting Bridges Span the Gorge at Its Narrowest Point

into the Bay of Fundy. With a tide variation of 22 ft. at the site of the bridge, terrific tidal flows are set up which have resulted in the phenomenon, known as the "Reversing Falls." This condition precluded the use of any form of construction requiring falsework. The completion of the new bridge marked the passing of one of the famous bridges on the American continent, which excited a great deal of comment at the time of its construction in 1884 and 1885, owing to the fact that it was very much similar to the Niag-

Fairville, N. B. The bridge and railway were purchased by the Canadian Pacific and incorporated into that system in 1905. The construction of the original bridge was a matter of great importance since it afforded the first direct rail connection between the New England states and Nova Scotia, the current condition in the river making the use of car floats out of the question.

The new bridge comprises the cantilever bridge proper and a viaduct composed of eight 70-ft. deck plate girder

spans on concrete piers, forming an approach from the west. The cantilever structure consists of two anchor arms, 125 ft. each, two cantilever arms of 150 ft. each, and a suspended span of 150 ft.

The anchorage at the east and required excavation in solid rock, while a concrete pier was built for the west anchorage. This west anchorage pier was designed with two pre-moulded shafts, into which the steel anchors were entered and later sealed up with concrete.

The two main or river piers are founded on the rock below low water level on which a satisfactory foundation was

for more than a mile; and the engineman saw the automobile half a mile away and sounded the whistle continuously to the crossing; and there was a visual and audible highway signal at the crossing. This was in good working order after the accident; and, moreover, a brakeman of a westbound freight which had just passed the crossing testified that he heard it ringing after his caboose had cleared the crossing. The highway crosses the tracks at a right angle.

All the cars of the train were of steel.

The immediate cause of the derailment appears to have been the entanglement of the engine of the automobile in

The New Bridge Is Flanked on the West by a Viaduct of Eight Deck Girder Spans

obtained. These piers are constructed of concrete, faced with granite from the base up to high water elevation and finish about 43 ft. over the surface of slack water. All four piers of the cantilever bridge have rock foundations while of the approach piers, two are founded on rock and the remainder on hard pan.

The photographs bring out the essential difference between the new and the old cantilevers. Both structures are of the through type, but whereas the bottom chord of the old cantilever was horizontal and the variation in the depth of trusses was taken up entirely in the top chord, the arrangement is entirely reversed in the new cantilever structure. In this the top chord is level and the bottom chord is on a parabolic curve each way from the main piers. However, the suspended spans in both structures have parallel bottom and top chords. The third structure seen is a 565-ft. highway arch.

The sub-structure was commenced in April, 1920, and completed in the following December. The steelwork was erected between June and October, 1921, and the bridge was opened for traffic on November 24, 1921.

The work was done under the general supervision of J. M. R. Fairbairn, chief engineer for the Canadian Pacific, P. B. Motley being engineer of bridges and C. F. Draper, resident engineer on the work. The contractors for the sub-structure were the Foundation Company, Limited, and for the steelwork the Dominion Bridge Company, Limited.

Black Diamond Express Derailed by an Automobile

THREE MEN were and an employee riding as a passenger were killed and 55 passengers injured, on train No. 10, the eastbound Black Diamond Express, of the Lehigh Valley, on Saturday morning, May 13, at North Leroy, N. Y., 47 miles east of Buffalo, when the train struck an automobile at a highway crossing and was derailed. The train was running at about 65 miles an hour and three coaches fell down a high bank and were overturned, but the locomotive and mail car kept to the roadbed. The occupant of the automobile was killed. He was traveling northward. The region is level, there was a clear view from the highway

the pilot of the locomotive, the mass being pushed along on the rails for about 300 ft. to a crossover track, where it caught in the frog and was forced under the wheels of the locomotive.

The man in the automobile, said to have been a farmer, 65 years of age, appears to have stopped a little distance short of the crossing to wait until the freight train should have cleared the highway; and but for the fact that the freight was north of the passenger train the explanation of his negligence would be expected to be found in the circumstance, often reported in crossing accidents, that the passenger train was hidden from him, but as a matter of fact he

Derailment on the Lehigh Valley

to have had both a visual warning and an audible warning—a plain view of the passenger train for a mile to the west of the crossing, and the long continued sounding of the whistle (assuming that he was not deaf); and the five crossing signals (the well known Hall enclosed-disk) to each side, one on the south side of the tracks and one on the north side.

Railroads Have Profited from Development Work in Nebraska.

Development Association Holds Annual Convention

Addresses by Distinguished Guests and Lively Discussions Are
Features of Denver Session

THE fourteenth annual convention of the American Railway Development Association, comprising representatives of the agricultural, colonization and industrial interests of the railroads of the United States and Canada, met at the Brown Palace Hotel, Denver, Colorado, on May 10, 11 and 12, with President Geo. E. Bates (Delaware & Hudson) in the chair. An address of welcome was tendered the association by Hon. Oliver H. Shoup, governor of Colorado. Addresses were also made by H. R. Safford, vice-president, Chicago, Burlington & Quincy; C. A. Lowry, president, Colorado Agricultural College; A. A. Reid, chairman, Colorado Committee, War Finance Corporation; Prof. James Underhill, Colorado School of Mines, and others.

Mr. Safford Discusses New Railway Era

"While railway development work has been valuable to a large degree in past years, I believe you are entering upon the period of greater possibilities," said Mr. Safford. "We are entering upon a period which is both reactionary and progressive—reactionary because of the rebound from a violent and destructive action beginning in 1914, and progressive because of the many new and unsolved problems suddenly developed. Conspicuous among the new conditions affecting the railroads are the greatly disturbed rates of exchange in foreign countries, causing cross-currents and reversals of the accustomed flow of traffic, the Panama Canal as a strong competitor of inland railway routes, the encouragement given to the establishment of inland lake and river routes, and the development of highway motor traffic facilities. Such conditions, coupled with the fact that railway expansion in terms of transcontinental mileage is practically at an end, makes the present problem one of developing and protecting the present mileage rather than one of enlarging it. The problem of meeting waterway and motor car competition is largely one of developing more traffic which can be handled only by rail. Your principal duty is to help find resources and to help show how to develop the maximum possibilities in them.

Mr. Safford pointed out the great opportunity of the association in the establishment of a better understanding of the railway situation by the public.

The agricultural section was opened by the presentation of an illustrated lecture by E. O. Fippin, general manager, National Lime Association, Washington, D. C., on agricul-

tural limestone and its relation to agricultural production and railway traffic. In the discussion of this paper emphasis was placed on the value of this promotion work from a railroad viewpoint. Traffic had been appreciably increased through the use of lime along the lines of the New York Central; the effect of its use for agricultural purposes is not only to provide an increased traffic from enlarged crop yields, but also by the shipment of the limestone itself.

The Interest of Railways in Reclamation

Taking as his subject the status of national reclamation legislation in the United States, R. E. Shepherd, chairman, Western Reclamation Association, Jerome, Idaho, presented figures to show that in 1921, 242,000 tons of freight were shipped out of the Boise, Idaho, development region and 261,054 tons of freight received. Mr. Shepherd also showed how studies had developed the fact that traffic between the east and the irrigated west, amounted to more than the entire trade with any foreign country except Great Britain.

Jesse Jones (S. A. L.), led the discussion on this subject by presenting a paper in which he outlined the progress in reclamation from its inception in 1890, down to the present time, giving particular attention to the character of the various bills presented to Congress and the problems encountered in securing proper legislation. Mr. Jones supported the Bankhead-Borah bill now awaiting final action by Congress. There are yet unreserved he showed, 200,000,000 acres in the public domain of which 20,000,000 acres are known to be susceptible to reclamation by irrigation; and in all there are over 350,000,000 acres of drainable and cutover lands which are reclaimable. As against this, approximately 58 per cent of the country's population does not own real estate of any character, a condition which has a tendency to make for irresponsibility on the part of citizens.

Advertising in Development Work

The importance and value of general and specific advertising in development work was set forth in an address by F. D. Zimmerman, vice-president, Eleventh District Associated Advertising Clubs of the World, Denver. After tracing the development of advertising from its origin to the present time, Mr. Zimmerman stated, "that advertising is today the mightiest factor in the business world, including the railroads." As to the interests of the railroads in this

matter, public relations, he said, is one of the most important subjects to be considered at the present time. In the same way that laws can be made or unmade by moulding public sentiment. So advertising should receive immediate and close attention by the railroads by reason of the possibility presented to overcome unfavorable public sentiment. In supporting any policy of advertising, however, Mr. Zimmerman pointed out the necessity and advisability of its continued application.

Correct Practice in Colonization Work

A paper on the subject of immigration and colonization was presented by J. H. Jasberg (D. S. S. & A.).

"My experience," Mr. Jasberg said, "has been that the bona fide settler is a strong and sturdy laborer and wage earner with a large family, such as are to be found in mines, factories and other industries. The interest of the wife is essential to the success of the colonization venture on the part of such men. The northern European is best suited to become a settler in the northern countries. The land should be suited to the kind of farming that the prospective settler intends to practice and should be advantageously located as to roads and schools. The land should also be reasonably priced, with attractive terms of payment, and when extraordinary difficulties arise, the agent should be ready to assist the settler in surmounting it.

Proceedings of the Industrial Section

The industrial section of the association, except when in joint session with the agricultural and marketing section, devoted its time to the consideration of the various details involved in connection with sidetrack contracts, the practices of the roads regarding the maintenance of private tracks, the effect of the proper handling of maintenance charges where team tracks or other railroad owned tracks are extended for private industrial use, the effect of fire indemnity clauses on insurance rates, and a detailed discussion of shippers guides. In order to obtain information as to the practices of the various railroads relative to shippers' guides a questionnaire was sent to 65 railroads and of the 32 replies received, 17 of the lines have shippers guides. Three of these roads issue annual guides. Two issue guides every three or four years and others at irregular periods. On eleven roads, the work of issuing and preparing the directory is carried out under the direct charge of industrial or development departments, while on nine, the work is under the traffic department. The returns also show that seven of the roads compile and issue the directory with their own forces, while eleven others leave the work to advertising companies and two handle it jointly with advertising companies. Twelve roads secured the data by sending questionnaires to their local agents, while two leave the matter entirely to advertising companies handling the work and one handles the entire matter with its own forces. As the result of this study, the committee recommended that all roads should issue industrial directories to promote closer relations between shippers and receivers of freight, also that the directory contain only actual receivers and such other information of value to them as the list of railway officers, schedules of manifest freight trains, location of stock pens, track scales, and stations and a general map of the territory. He recommended also that no advertising should be displayed in the directory and that the loose leaf form of directory is not practicable.

St. Louis, Mo., was selected as the location for the next convention. The following officers were elected for the year: President, J. B. Lamson, agricultural development agent, Chicago, Burlington & Quincy; first vice-president, John F. Fox, traveling immigration agent, Northern Pacific; second vice-president, J. F. Jackson, agricultural agent, Central of Georgia; secretary, A. Lockie, industrial agent, Kansas City Southern.

Rate Decision Still Uncertain

WASHINGTON, D. C.

ALTHOUGH the Interstate Commerce Commission was supposed to have reached or practically reached a decision in the rate case several days ago, it had not been made public by Wednesday evening and it was reported and believed in some quarters that it had been held up at the request of the President until after his conference with railroad executives at dinner at the White House on Saturday, May 20.

The commission had a conference on the rate case on Saturday afternoon, May 13, and it was expected around its offices that the report would be made public at any time, but, according to reports, the President sent word from Atlantic City, where he was spending the week-end, asking that it be withheld until after his return. On Monday, Chairman McChord was at the White House twice but declined to comment on the purpose of his call and the President, at his conference with newspaper men on Tuesday, declined to shed any further light on the purpose of his invitation to the railroad executives to discuss the railroad situation. Commissioners Esch and Cox were also at the White House on Monday and it is understood the commissioners have had further conferences among themselves during the week.

While nothing authoritative has been given out, the story generally believed in Washington is that the President, anxious to have his administration do something big to improve economic conditions, and having been informed that the commission was unlikely to agree on a very pronounced program of rate reductions in view of the fact that the railroads have not yet attained what could be called a fair return, determined to call upon the railroad executives to do voluntarily, with public credit to themselves and to himself, more than they could be forced to legally by the commission. It is suggested in connection with this story that the President believes he can accomplish more with the railroads by giving them an opportunity to reduce rates without an order but there is also another theory that he would not be able to talk very strongly without a decision before him and that the delay is merely due to many differences of opinion among the commissioners in putting the finishing touches upon a report.

In view of the well known position of the railroads that rates should not be reduced until expenses have been reduced by a further reduction of wages by the Railroad Labor Board, there has been some curiosity as to what the President may have up his sleeve and what kind of arguments could be put up to them to reduce rates voluntarily by a greater amount than the commission could find warrant for ordering.

A Well-Maintained Tangent on the W. & L. E.

A New Plan for Unified Terminals at Chicago

Report Made for National Association of Security Owners Favors Joint Operation

A NEW PLAN for the joint operation of railway properties in the Chicago terminal district has just been made public in the form of a report by the Board of Economics and Engineering of the National Association of Owners of Railroad Securities. It comprises one feature of a general plan on the part of the association for a study of railway operation, having in mind the possibilities for increased economy and efficiency. Chicago was selected for this study as being fairly representative of the situation found in inland terminals throughout the country and the plans proposed for its improvement are submitted as being applicable elsewhere. An abstract of the report follows:

It is the purpose of this report to suggest plans and methods whereby the fundamental principles that should cover the operation of terminals in large cities can be applied so as to reduce the cost to the carriers of moving a revenue ton and improve the service to the shippers. The recommendations of the Chicago Terminal Commission, generally referred to as the "Wallace Plan," have been accepted by the board for the section of the downtown district to which they apply and as the basis for the extension of the same principles to the entire Chicago district.

Traffic Handled Is Large

The freight traffic in and out of Chicago each day consists of about 27,000 cars. Of these, 54 per cent, or about 14,600 cars, is through business; that is, freight merely passing through Chicago on its way to other points. The remainder, about 13,400 cars, less than half of the total, is local business; that is, freight of Chicago origin or destination.

The tracks required to handle this heavy volume of traffic constitute a network that has come to interfere seriously with commercial and industrial growth, to impede street traffic, and even to restrict the expansion of railway facilities. While some of the trackage is operated in common by several roads, each line has its own yards and terminals, and receives and interchanges freight on an individual basis.

Competitive methods increase the train miles necessary to handle the business, for when deliveries are made at interchange points, the road to which a car is destined must send a locomotive and crew to make the transfer to its own road, frequently requiring an all-day run to make the transfer of a single car. While this is an extreme case, nevertheless the number of light movements and the duplication of effort result in short trains and heavy train mileage.

The principles on which the roads now operate are:

1. Individual competition with the temptation of adding unnecessary train mileage to obtain special business that is of temporary advantage to that particular road.
2. Interchanging at stated points of which there are at least 80 on and inside the Indiana Harbor Belt.
3. Transfer of c. l. and l. c. l. cars from one road to another by means of transfer and connecting railroads.
4. Transfer of through l. c. l. shipments through downtown freight houses and the city streets.
5. Capital expenditures made to suit individual roads without reference to co-ordination.

The total average business in and out of Chicago daily is:

Freight houses	4,580 cars
Team tracks	1,636 cars
Industries	6,027 cars
Through business	14,488 cars
Total	26,731 cars

In the area bounded by the Indiana Harbor Belt and the

cities of Gary and Evanston, there are 12,982 tracks with a total strength of 4,389 miles, of which 871 miles are elevated. During the federal administration a "co-ordinating committee" of railroad officers was appointed, whose duty it was to co-ordinate the traffic in Chicago, particularly the through business, in such a manner as to make the best use of the facilities available and to divert as much traffic as possible away from the congested districts. As a result the Indiana Harbor Belt began to function as a "belt line" and facilities were developed along that line. After the roads were turned back to the owners, this operation was continued, in a modified way, with the result that at the present time part of the business is going around the city and at some points l.c.l. business for points outside the city is being consolidated for movement around the city instead of transporting it from one downtown freight house to another through the city streets. About 25 per cent of the through business is being handled around the city at the present time.

Proposed Improvements and Method of Operation

The plan of the board is to divert all through business around the city. All cars into and out of Chicago are to be collected in group yards along the Elgin, Joliet & Eastern, which is to be used as an outer belt. It is proposed to eliminate all interchange points; to eliminate transfer and connecting railways; to eliminate all freight yard and equipment facilities not needed for switching and passenger service. All through cars are to be transferred from group yard to group yard, and all improvements are to be made along this outer belt where they may be considered permanent until, after many years, the city's growth again requires a rearrangement.

It is proposed to use the Indiana Harbor Belt as a temporary belt line for transferring from the southeasterly group to the northerly group until it becomes necessary to devote it to other purposes on account of the growth of the city. Normally the movement between group yards will be in full trains, and generally cars will be made up in full trains for the receiving road. So also will the city business leave a group yard in full trains for distribution after delivery to an industrial switching yard, and the makeup of trains leaving an industrial yard can readily be made so as to require the minimum of switching after delivery to the group yard.

Less Than Carload Freight

Each group yard will have transfer platforms where all l.c.l. cars may be consolidated for the city and for foreign lines. By this means about one-third of the l.c.l. cars can be released in the group yard and the balance taken into the city in ordinary or specially designed cars in full trains.

Less than carload freight for Chicago and points beyond the city is now delivered in cars loaded to an average of about seven tons each. Of the l.c.l. cars going downtown approximately 600 cars containing over 4,000 tons are for out-of-town points. At present part of this is being transferred around the city but the greater part of it still goes through the city streets.

There are at present about 28,000 tons per day, or about 10,000,000 tons per year of l.c.l. freight coming in and going out of the city which costs the railroads:

For operation	Per ton
For property value—fixed charges	\$1.77
	1.08
Total present cost	\$2.85

The plan herein contemplates a reduction of this figure as follows:

	Per ton
Reduction of fixed charges under Wallace plan (\$40,000,000 at 6 per cent. divided by 10,000,000 tons).....	\$0.24
Reduction in operating cost under Group plan.....	.37
Total reduction	\$0.61

Notwithstanding this substantial reduction, it will still cost \$2.24 per ton to handle l.c.l. freight into and out of Chicago. No estimate has been made of the probable saving by consolidation of the city terminals, though a saving is no doubt possible.

Expansion of existing freight-house facilities with a continuation of methods now in use serves only to increase the unit terminal cost, which at present absorbs a large percentage of the revenue from line haul. For example, on l.c.l. shipments yielding an average revenue of two cents per ton-mile, these terminal costs are equivalent to a line haul of 112 miles on through business or a maximum of 224 miles on local business in and out of Chicago.

It is proposed to consolidate all city l.c.l. freight into cars carrying 11 tons each instead of seven as at present; to use cars of special design in which heavy loadings are practicable

and possibly flats to carry containers. The latter should be loaded, insofar as possible, for firms and individuals, in order to avoid rehandling through downtown freight-houses. The question of containers for store door delivery is one that should have further study. If they are used from group yard to the city a greater saving may be effected.

Passenger Traffic

It is proposed to consolidate the traffic of the six existing passenger terminals into three, viz., the North Western station, the Union station and the Illinois Central station. In selecting the roads that are to use stations in common, consideration has been given to the tentative plan of the Interstate Commerce Commission for consolidating the railroads into 19 systems, and the roads using these passenger terminals have been grouped accordingly. (Under this arrangement, all roads now using the Grand Central, La Salle and Dearborn stations would use the Illinois Central station at Twelfth street with the exception of the Santa Fe and the Chicago Great Western, which are placed in the Union station.)

This plan has a distinct advantage in that the roads are

How Freight Traffic Could Be Routed—Plan for Proposed Rearrangement of Both Local and Through Operation—Showing Traffic Densities

grouped together at outlying points and consolidated still more as they come in, which helps to reduce the number of crossings to a minimum and will tend to develop good trunk lines for passenger business only. Another distinct advantage is the mileage saved by some of the roads which otherwise would reach their respective stations by very circuitous routes, in some cases from three to nine miles longer than the proposed routes.

Advantages Outweigh Disadvantages

The proposed plan can be made effective only through unified control and operation, but such control does not necessarily involve disturbance of existing ownership. Single administrative control is required and we believe may be secured by lease or operating agreement.

Consideration must be given to the business advantages accruing to certain roads by reason of superior location and industrial connections, but these are of relatively little moment in comparison with the operating advantages to be gained under the proposed plan and can no doubt be readily adjusted in the common interest. The improved operating methods indicated can be put into effect immediately upon

the completion of the group yards, the proposed improvements along the Elgin, Joliet & Eastern and the addition of the required connections.

The Cost

The total cost of additional facilities necessary to accomplish the unified operation is estimated at \$90,000,000 but as in the case of the other reports for joint terminal operation a large part of this cost is covered by estimated savings and the value of air rights which may be leased for commercial or industrial purposes. A summary of the cost is as follows:

Estimated cost of rearrangement of freight facilities between State street and proposed river channel, south of Polk street to Sixteenth, including change of Chicago river—as outlined and estimated in the Wallace plan.....	\$43,000,000
Estimated cost of changing methods of operating freight terminals by elimination of interchange points, transfers and connecting railroads as per group plan proposed by Board of Economics and Engineering—\$46,550,000—or say.....	47,000,000
Total	\$90,000,000
Less—Value of ground space released as estimated by John F. Wallace.....	\$60,000,000
Value of air rights on property retained under Wallace plan.....	25,000,000
Estimated net cost of combined improvements	\$85,000,000
Estimated net annual saving in operation cost and fixed charges under group plan alone (\$16,155,259).....	16,000,000

Pere Marquette's Surplus After Charges \$3,765,880

Reorganization in 1917 and Increased Prosperity of Territory Put Road in Strong Position

THE PERE MARQUETTE in its recently issued annual report shows a surplus after fixed charges of \$3,765,880 for the year ended December 31, 1921, as compared with \$1,393,973 in 1920. The increase in net was due not to increased business, but to the result of improved conditions of railroading as evidenced in lower wage, fuel and material costs. There were also savings in the line of equipment. In ten months of 1920 the road had a debit balance in this item of \$1,761,120. In 1921, all twelve months, the debit balance was only \$690,654.

A comparison with 1920 must take into consideration that in that year the road was one of the few which did not accept the provisions of the guaranty covering the period from March 1 to August 30. Because of the peculiar conditions governing at that time, this proved to be unwise, because costs increased in greater proportion than could possibly have been foreseen. In other words, the road did not secure as great a net for the six months operating on its own account as it would have secured had it accepted the guaranty.

The Pere Marquette, as we know it today, is a very different property from what it was prior to the reorganization in 1917. There are two reasons for this. One is the drastic character of the reorganization; the other, the increased prosperity of the territory served due primarily to the development of the automobile industry.

The reorganization in 1917 brought to a close a very checkered career, because receiverships and reorganizations have been familiar episodes in the history of the Pere Marquette and its predecessors. The character of the reorganization is best shown by the fact that it reduced the company's funded debt from \$78,000,000 to \$36,000,000 and changed the proportion of funded debt from 73 per cent of the total capitalization to but 35 per cent. The company's funded debt at the end of 1917 was \$36,325,000. At the end of 1921 this figure had been increased to \$45,750,000, the reason being the inclusion, started in 1920, of the equipment trust notes covering the standard equipment allocated by the Railroad Administration. The amount of the notes on December 31, 1921, was \$9,426,200. The equipment in-

cluded 30 Mikado and 20 switching locomotives and 2,000 box and 1,000 hopper cars. With the inclusion of these notes the funded debt approximates 40 per cent of the total capitalization.

Dividends on Stock

The outstanding capital stock totaled on December 31, 1921, \$68,675,000. It was increased to this figure from \$28,500,000 in the reorganization. The stock includes \$45,-046,000 common; \$11,200,000 cumulative 5 per cent prior preference stock and \$12,429,000 5 per cent preferred, cumulative after January 1, 1919. Dividends on the prior preference stock have been paid regularly. The first dividends on the preferred were declared December 7, 1921, and totaled 10 per cent, covering the period to December 31, 1920. In April, 1922, the preferred dividend was put on a regular quarterly basis and at that time one per cent was declared on the cumulative dividends, leaving 4 per cent still in arrears.

With this more conservative financial structure the road is in a position to derive full advantage of the improved conditions in its territory. The nature of the expansion from which it will secure benefit is evidenced by the fact that the road earned for the government a slight margin in 1918 over its approximately \$3,700,000 standard return and in 1919 nearly \$3,000,000 more than its standard return. In 1920 it did not accept the guaranty and in that year it had a net after rentals of only \$260,530. In 1921, however, it had changed this figure with considerably less traffic to a net after rentals of \$5,106,442. Under the conditions it would appear that the Pere Marquette's traffic position is much improved over that of the period on which its standard return was based.

The Pere Marquette's corporate surplus after fixed charges in 1921 was \$3,765,880. In 1920 it earned \$1,393,973, as noted in the first paragraph. In 1918 and 1919 the net was \$1,896,931 and \$1,894,125, respectively. The prior preference dividends total \$560,000 and the regular preferred dividends will be \$621,450. This indicates that on the basis

of the earnings in 1921 there would be a considerable margin after payment of the prior preference and preferred dividends. The point, however, is that 1921 was not a good year, which further emphasizes that with normal business the road should be in an extremely favorable position—rather better than is readily realized by those not familiar with the new and improved financial and business conditions of the road.

Diversified Traffic

The Pere Marquette operates 2,223 miles of line. It has a line from Chicago to Buffalo and Suspension Bridge using trackage rights out of Chicago and over the Michigan Central east of St. Thomas, Ont. There is also another east and west line from Ludington to Port Huron and various north and south lines, such as the one from Grand Rapids north towards the tip of the Michigan peninsula and the line from Toledo to Saginaw. Two car ferries are operated across Lake Michigan from Ludington to Milwaukee and Manitowoc, respectively, and two across Lake Erie to Conneaut Harbor.

The road's traffic is diversified. Products of agriculture in 1921 made up 15.25 per cent; of animals, 1.56 per cent; of mines, 30.22 per cent; of forests, 6.76 per cent, and manufactures and miscellaneous, 20.46 per cent. Bituminous coal constituted 25.80 per cent of the total tonnage. In 1921 the total tonnage carried was 12,786,731. This compared with 14,855,393 tons in 1920, that year being the best in the company's history. The revenue ton-miles in 1921 were 2,172,802,065 as compared with 2,606,903,408 in 1920. In 1921 the average haul was 170 miles; in 1920 it was 175 miles.

The actual freight revenues in 1921 totaled \$29,291,665 as compared with \$29,754,566 in 1920, a decrease of \$462,901. The average revenue per ton was 1.348 cents as against 1.141 cents in 1920. The passenger revenues were \$5,940,618, or \$997,887 less than in 1920. The total revenues were \$38,161,241 as compared with \$40,372,814 in 1920, or \$2,211,574 less. The decrease in operating expenses as between the two years was \$6,452,382. The operating expenses in 1921 totaled \$30,279,374 as compared with \$36,731,955 in 1920. The result of the greater proportionate decrease in expense was shown in a figure of net operating revenue of \$7,881,667 in 1921 as compared with \$3,640,859 in 1920 and in a 1921 operating ratio of 79.35 as against 90.98 in 1920.

Maintenance

The decrease in maintenance of way expenses was \$730,449, or 13.76 per cent. The reduction was due partly to lower wage and material costs and partly to lesser work being done. The road put in track 621,748 cross-ties as against 862,343 in 1920. It laid 6,561 tons of rail as compared with 14,646 laid in 10 months of 1920. On the other hand, 115 miles were ballasted as compared with 84 in 10 months of 1920. The reduction in maintenance of equipment expenses was \$1,614,230, or 16.51 per cent. The road's equipment condition at present, however, is about the same as the country's railroads as a whole.

The transportation expenses were reduced \$4,073,679, or 20.71 per cent. The expenses per revenue train mile decreased from \$2.55 in 1920 to \$2.12 in 1921, or 16.21 per cent. "The chief factors contributing to the decreased cost," says the report, "were the reduction in forces, the decrease in rates of pay and decrease in price and consumption of fuel." There was a further decrease because of the increased cost of operation in the year 1920 due to the railway switchmen's strike." Referring to fuel, the report continues: "The competitive condition of the fuel market allowed a wider purchase range and, for the first time in several years, a choice of fuel, resulting in a lower purchase price and a marked improvement in quality. A large portion of coal

used in 1921 came from the West Virginia coal fields. The decrease in price resulted in a decrease of \$143,501 in the cost of fuel for locomotive use; and as a result of the improvement in the quality of coal, increased efficiency and a decrease in the number of locomotive miles run, the number of tons of fuel consumed by locomotives in this service decreased 234,786, which, at the average rate of \$4.85 per ton, resulted in a decreased cost of \$1,138,712."

Because of the decreased traffic it is to be expected that the operating statistics would not be as favorable as in 1920. The average train load in 1921 was 539; in 1920, 588. The revenue car load was 22.79 tons; in 1920, 24.22 tons.

New Engine Terminals

The Pere Marquette in 1921 purchased 12 passenger and baggage cars. It completed new engine terminals and accompanying facilities at New Buffalo, Mich., including a 16-stall brick engine house, a 250-ton coaling station, a 100,000-gal. water tank, etc., costing \$718,000; at Saginaw, a 30-stall house, a 100-ft. turntable, etc., costing \$1,000,000; at Plymouth, Mich., a 15-stall house, 100-ft. turntable, 100,000-gal. tank, etc., costing \$400,000. A three-story warehouse costing \$125,000 was completed at Wyoming, Mich., and a new station at Belding, Mich. Another important project is that embodied in the Flint Belt Railroad giving the Pere Marquette a new freight line around Flint, Mich. About \$70,000 was spent on this line in 1921, this being about 10 per cent of the total estimated cost of the project.

Low Platform Electric Truck

AN ELECTRIC TRUCK with an especially low loading platform has been designed by the Elwell-Parker Electric Company for handling barrels, bales, bags or heavy rolls. The truck is made up of about 95 per cent of standard parts on a special frame, and is designed for use where hauls are so long that a man with a hand chisel truck is too slow and expensive a means for the movement of material.

There is a storage battery over the driving wheels on the

The Truck Is a Drop-Frame Truck of Special Design

upper deck. The motor and worm drive axle are located under the upper deck. All four wheels steer and the raised portion near the end of the platform, known as the "kick-up," houses the rear wheels. The driving wheels are fitted with 21½ in. by 3½ in. rubber tires, and in the trailing wheels with 10½ in. by 5 in. tires. The truck will run from 15 to 20 miles on a single battery charge.

Swedish Diesel-Electric Motor Car of 250 Horsepower

Diesel-Electric Motor Cars for Railway Service

Successful Operation in Sweden Has Led to the Introduction of 250-Horsepower Cars

SWEDEN is one of the countries which is obliged to import its supply of locomotive fuel and consequently the greatly increasing cost of coal is a serious factor in operating expenses. An abundance of water power has made electrification practical on a number of lines where the traffic is heavy but this change is not feasible on a large amount of mileage where the traffic is relatively light. Both improvements in steam locomotives and the substitution of other sources of power are receiving thoughtful attention. Considerable pioneer work in the application of Diesel engines for railroad motive power has already been carried on in Sweden. The system favored uses a Diesel engine to drive an electric generator which furnishes power to motors mounted on the trucks. The first car, built in 1913, had a 75-hp. engine. This was followed by several other cars with the same sized engine and later by others of 120 hp. These cars were built and equipped by the Swedish General Electric Company and the Atlas Diesel Company working in conjunction.

These early motor cars proved to be so satisfactory in operation that a separate company, the Diesel-Electric Car Company, Vasteras, Sweden, was organized to carry on further development work. The new company has turned out several cars of the smaller sizes and in addition built cars of 160 hp. and 250 hp. which are now in regular service. At the present time 12 Diesel-electric motor cars are in service on seven Swedish railroads. That none of the cars delivered has been taken out of service, except when impossible to obtain oil during the war, and that all orders recently received have been from roads that already had at least one car in operation is indicative of the success of the general design.

The cars with 75-hp. or 120-hp. engines were provided with compartments having seating capacity for a number of passengers or with space for baggage and mail. One or more

small trailers were commonly hauled. The larger capacity cars lately built are not provided with accommodations for passengers but compartments for baggage and mail have been retained, passengers being accommodated in regular coaches hauled by the motor car.

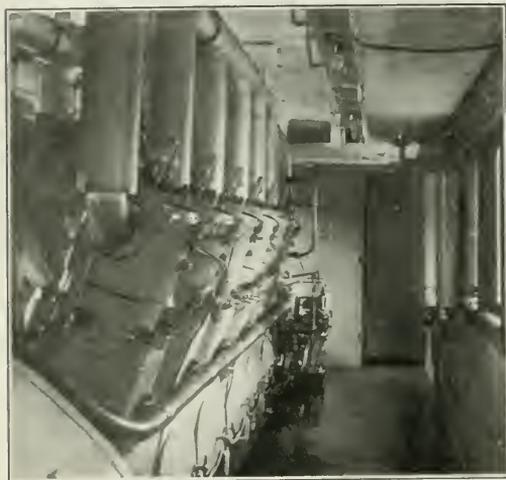

Cars of 160 hp. weigh 37,500 kg. (82,500 lb.) and, when grades do not exceed one per cent, are capable of hauling a trailing load of $67\frac{1}{2}$ metric tons ($74\frac{3}{4}$ short tons) at ordinary speeds. This is a total train weight of 105 metric tons ($115\frac{1}{2}$ short tons). Cars of 250 hp. weigh 50,000 kg. (110,000 lb.) and under the same conditions can haul a trailing load of 115 metric tons ($126\frac{1}{2}$ short tons) which corresponds to a train of 165 metric tons ($181\frac{1}{2}$ short tons) including the motor car. Plain trucks are used on the engine compartment end of these cars and motor trucks, one motor for each axle, under the other end. The cars can be operated equally well from either end. With the passenger cars used in Sweden, which are much lighter than are customary on American roads, the 160-hp. car can haul a train with about 225 passengers while the 250-hp. car can haul a train holding 375 passengers.

When hauling full trains the fuel oil consumption for the 160-hp. engine should average about 0.7 kg. per train kilometer or 2.5 lb. per train mile, while the consumption for the 250-hp. engine should average about 1.0 kg. per train kilometer or 3.5 lb. per train mile. Oil records of a 160-hp. motor car for an extended period in regular service handling a train of 90 metric tons (99 short tons) showed a fuel oil consumption of about 0.5 kg. per kilometer or 1.8 lb. per train mile. By weight, the fuel oil consumption of the Diesel engines averages about six per cent of that of the coal used by steam locomotives of the same power.

The 160-hp. engine has eight cylinders and the 250-hp. twelve cylinders but otherwise they are similar in general design to the smaller engines. A number of improvements

have, however, been introduced in the later designs of motor cars. The cooling water for the Diesel engines is now recooled in a number of radiators similar to those used for gasoline motor trucks, mounted on the roof of the car as shown in one of the illustrations. Cooling is effected by means of a fan-blower driven directly from the main engine and is thus independent of speed. The motors are now arranged to be connected either in series or in parallel.

In addition to low fuel costs, one man operation and little time or attention required at terminals, experience has shown that Diesel-electric motor cars can make a greater mileage

Engine Room of 250 Horsepower Diesel-Electric Motor Car

per day, spend less time in the shop and run for much longer periods without a general overhauling than steam locomotives. They are capable of making 50,000 to 60,000 miles per annum. Even after being taken in for overhauling after some 60,000 miles it has been found that the largest item of expense is for dismantling and reassembling.

While the Diesel motor car or locomotive will undoubtedly be still farther perfected and adapted to a wider railroad field of usefulness, indications point to a much more general employment of this general type of motor in the near future.

The Co-Operative Switching of Joint Tracks Succeeds at Seattle

EARLY IN 1918 PLANS were formulated by the operating officers of the United States Railroad Administration on the Pacific Coast for the unification of the terminals of the railways entering Seattle, Tacoma and Everett, Wash. These plans were put into effect about September 1, 1918, and remained in operation until the termination of federal control. (See *Railway Age*, September 1, 1918, page 203.)

On March 1, 1920, the various facilities were returned to their respective owners and independent operation of both freight and passenger terminals was resumed, with the exception that a so-called zone plan of switching was developed by the Northern Pacific, the Chicago, Milwaukee & St. Paul, the Oregon-Washington Railroad & Navigation Company, and the Great Northern, to apply to certain districts where these roads were jointly interested or where two or more of them had private tracks serving the same industry. The thought underlying this zone plan was that

one locomotive could perform the switching service for all of the interested roads at such points. Seven such zones were created, two of which were assigned to each road with the exception of the St. Paul, which assumed charge of one.

The arrangement which has been perfected provides that the line handling the switching within this zone shall furnish the locomotives and crews and assume all of the expense incident to the joint operation, the cost being divided on the basis of the number of cars handled. A daily report is made to the officer in charge of the zone, showing the time that each locomotive enters and leaves the zone, the time spent in it and the number of cars moved into and out of the zone for each of the participating companies. The intra-zone switching revenue collected is credited to each zone separately, while locomotive expense is charged at a flat rate varying from \$9 to \$10.50 per engine hour according to the class of locomotives used.

Joint interchange tracks have been established convenient to most of the lines entering the city. Certain tracks have been set aside for receipt and delivery of cars to each line. The arrangement requires that direct interchange be made with the railroads operating each zone. The usual interchange reports are submitted to cover the movement of all cars. Joint car inspectors have supervision over the equipment moving in interchange and when necessary make light repairs for all lines, this expense being divided on a car basis as is the cost of joint yard checkers working on the interchange tracks. The maintenance of the interchange tracks is distributed on the basis of ownership.

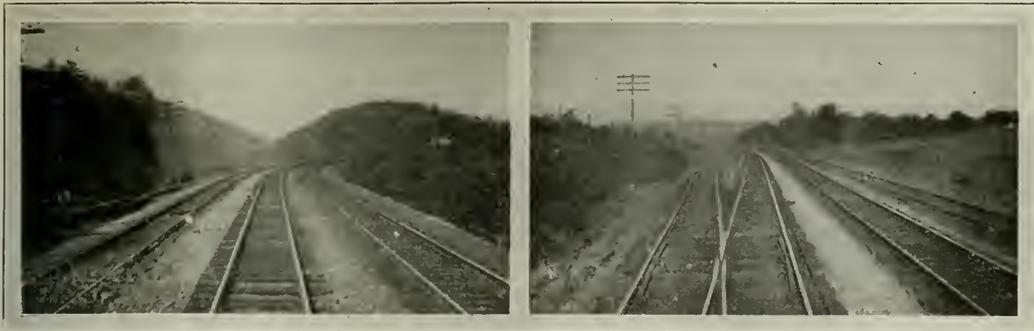

Enginemen and switchmen engaged in zone switching are considered joint employees, when within the limits of the zone, for the purpose of determining liability. All expense incurred on account of loss or damage to engines or tracks, or because of the injury or death of a joint employee or third person is considered part of the zone switching expense, while the loss or damage to cars or contents is assumed by the road for whom the car is being handled.

The carding system for cars is in force throughout the terminals and all cars are returned to the delivering line, loaded or empty. When cars are switched to or from a track belonging exclusively to one road within the zone the tariff rate is charged and such cars are not counted as zone expense, nor is the time of the locomotive or crew engaged in switching upon such a track charged to the zone. Reclaim is allowed on cars switched to tracks jointly owned or used.

It has been found desirable to make interchange reports of all cars moving to or from zones in order to maintain proper car records. A copy of the daily yard check is furnished by each zone to all of the lines interested. The agents and general yardmasters of the lines operating the various zones are held jointly responsible for these records and for the proper performance of the switching service. The maintenance of tracks within a zone which belong exclusively to one road is handled by the owner, while the maintenance of tracks owned or used jointly is divided on a car basis. Each road looks after its own demurrage.

Under the unified plan of terminal operation put in effect during federal control, the switching cost of handling cars in the Seattle terminal varied from a minimum of \$2.09 in June, 1919, to a maximum of \$3.56 in January, 1919, whereas the zone cost per car to all lines during 1921 was approximately \$1.61. While the figures covering the cost of switching all cars, including those handled by non-zone engines for all lines are not available, the average cost per car for two of these lines was approximately \$1.68. In comparing these figures due allowance should be made for the fact that the yards were not as congested in 1921 as they were during the war. However, the cost of switching has been greatly reduced and the service improved by the plan.

We are indebted for this information to J. H. O'Neill, general manager of the Western lines of the Great Northern.

Lehigh Valley Car Repairs Big Factor in 1921

Corporate Income Account Shows Balance After Charges of
\$10,050,798—Surplus Now \$43,531,330

THE LEHIGH VALLEY'S corporate income account for the year ended December 31, 1921, shows a net after fixed charges of \$10,050,798. The property pays dividends of seven per cent on its \$50 par value stock. These dividends in 1921 amounted to \$4,245,749; in other words, they were earned considerably more than twice over. Although the 1921 net after charges compared with \$13,511,917 in 1920, it was much in excess of the figure of \$4,977,213 in 1919 and of \$6,592,834 in 1918. The principal reason for the decrease from 1920 and the expansion over 1919 and 1918 was due to the item of other income, or, to be more explicit, to dividends and interest receipts on securities of affiliated companies, notably the coal properties. In 1918 the Lehigh Valley received such dividends and interest amounting to \$2,601,543; in 1919 to \$1,302,834. In 1920, however, these dividends totaled \$15,661,525 and in 1921 \$10,616,311.

The company's profit and loss account showed on December 31, 1921, a surplus of \$43,531,330. This indicates the strong financial position of the company. It is further of interest to point out that in 1921 the company retired \$1,300,000 unmaturing equipment trust certificates. At the end of 1920 the road reported that it had no such trusts in the hands of the public. In the present case it reports that it now has no equipment trust certificates at all.

Equipment Maintenance

The distinguishing feature of the Lehigh Valley's operations in 1921 was the attention given to the matter of equipment maintenance. The maintenance of equipment account for the year totaled \$25,138,717, or 34 per cent of the total operating revenues. This amount compared with \$23,641,002 in 1920; in other words, it was \$1,497,715 in excess of the record figures for that year. The road's standards of both way and equipment maintenance are high. The increased expenditure for equipment maintenance in 1921 was the result of its effort to maintain these standards and to overcome the harmful results of the manner in which cars failed to be repaired during the period of federal control when the larger portion of the equipment was off-line and failed to receive proper attention. Since April, 1920, the road has rebuilt or rehabilitated 16,575 cars, inclusive of 2,000 recently scheduled for that treatment. The road's total owner-

ship of freight cars is about 40,000, so the measure of what has been done is evident.

"Approximately \$8,037,400 More"

President E. E. Loomis, in the annual report, speaks of the situation in part as follows: "Because of the high rates of pay and expensive restrictions governing working conditions for railroad employees, prescribed by the United States Railroad Labor Board, but which do not apply in other industries, favorable contracts were made with several outside concerns for part of the work. A total of 9,975 cars were delivered to various car builders for general repairs during the year, on which your company saved \$690,275 as compared with the cost of making these repairs at its own shops which, in the past, under normal conditions, have been able to take care of this work. As an illustration of the deplorable condition of equipment at the termination of federal control, your company expended . . . for the maintenance of engines, cars and floating equipment during 1921 . . . approximately \$8,037,400 more than would have been disbursed had expenditures been limited for this purpose to the same ratio as applied on other railroads during the year, according to Interstate Commerce Commission records."

Anthracite Coal Supplied 37 Per Cent of Operating Revenues

The Lehigh Valley's operating revenues in 1921 totaled \$74,929,913 as compared with \$75,223,862 in 1920. There was a decrease of but \$293,948. The company shows its coal revenues separately. Anthracite coal revenue in 1921 totaled \$27,951,609, or \$4,174,126 more than in 1920. Reductions in revenues on other traffic, however, over-balanced this increase. The revenue tonnage carried in 1921 totaled 26,377,743, as compared with 32,103,897 in 1920. The reductions in the various classifications of commodities were fairly general. Anthracite coal tonnage, however, held up rather well. It totaled in 1921 13,028,065 tons, constituting 49.39 per cent of the total tonnage and supplying 37 per cent of the total revenues. In 1920 it totaled 13,485,191 tons, 42 per cent of the total tonnage and supplying 32 per cent of the total revenues. There were increases in wheat, in flour and, in fact, in products of agriculture and of animals generally, which would apparently emphasize the grow-

ing importance and success of the Lehigh Valley's fast freight service concerning which, incidentally, favorable reports are being heard on all sides.

As against a decrease of not quite \$300,000 in operating revenues, there was a decrease of \$12,785,083, or 16 per cent, in operating expenses. In 1920 the road operated at a ratio of 107, which figure was reduced in 1921 to 90. This figure is high but is apparently explained by what has already been said about maintenance expenses. The operating expenses in 1921 were \$67,530,014, as compared with \$80,315,096 in 1920. There was a reduction of \$4,010,423 in maintenance of way expenses, an increase as already noted of \$1,497,715 in equipment expenses and a reduction of \$10,090,279 in transportation. In 1921 the Lehigh Valley had a transportation ratio of 42, which compared with 55 in 1920. In August, 1921, the road showed a transportation ratio of but 37.

Preparation for the Future

The Lehigh Valley's net operating revenue—revenues less expenses—in 1921 was \$7,399,899, which compared with a deficit in 1920 of \$5,091,235. In other words, there was an increase in this item of \$12,785,083. The net after rentals gave a figure for 1921 of \$5,582,216, as compared with a deficit after rentals in 1920 of \$6,779,615. For purposes of comparison, it may be noted that the company's standard return based on its average of net railway operating income or net after rentals for the three years ended June 30, 1917, was \$11,318,714. The year 1921 did, therefore, not bring the road back to this average. The reason apparently was the decreased traffic, but more particularly the high expenses for equipment maintenance.

In view of what has been said concerning the latter factor, the general conclusion would be that the Lehigh Valley devoted 1921 to putting its house in order for the future, or in making up, in other words, for the difficulties occasioned by federal control and the peculiar railway conditions since. The road has, therefore, strengthened its position generally in the competitive territory between New York and the Niagara frontier. The company's large surplus and its strong financial position generally, relieved it, insofar as concerned 1921, of the necessity of making as favorable a paper showing as it might under more difficult conditions have found it necessary or advisable to make. The road, when all is said and done, should be able to show excellent results in 1922 although, of course, the fact that 37 per cent of its earnings come from the carriage of anthracite coal, will have to be borne in mind because of the present cessation of anthracite coal mining.

Progress on New Terminals

The Lehigh Valley has made much progress in recent years in the matter of terminals. This included in 1921 the work on the Claremont Terminal in New York harbor. President Loomis gives these details: "The first unit of this development, which will be ready for service during the year 1922, is a pier more than two-thirds of a mile long, with 35 ft. of water alongside, at which the largest ship afloat can be berthed. Its facilities include a two-story warehouse with a capacity of 500 cars of freight, an open dock served by a 50-ton traveling gantry crane capable of handling 100 cars of freight a day, and two electrically operated unloaders to handle ore and coal from vessels to cars, with a capacity of 20,000 tons per 24 hours. As increased traffic warrants, two additional piers will be built. When completed in its entirety, the terminal will afford docking facilities of approximately 3½ miles, capable of berthing the largest ocean-going craft."

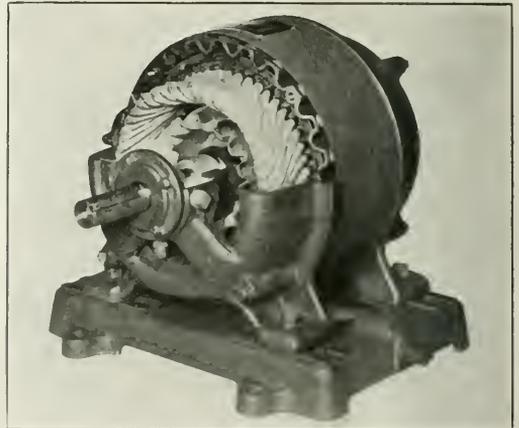

THE NEW YORK CENTRAL'S MOTION PICTURE designed for the elimination of shippers by the proper methods of packing merchandise, is being shown along the line of the Boston & Albany

Polyphase Motor With Unique Ventilating System

A LINE of polyphase induction motors has been brought out recently by the S. A. Woods Machine Company, Boston, Mass., which are so designed as to prevent the accumulation of oil on the motor winding and the resulting collection of dirt. The new Woods semi-enclosed 40-deg. induction motor, as it is known, is so built as to screen the ventilating air before it enters the windings and to direct this air so that it opposes the entrance of oil into the windings from the waste-packed bearings.

While the motors are ventilated or air-cooled, they are virtually enclosed from a mechanical standpoint. Air enters at the periphery of the machine and is discharged at both ends, the direction of the air flow being opposite to that found in most motors. It is claimed that oil leakage caused by careless filling of bearings cannot occasion bad results, because such oil is expelled from the ends of the motor instead of being driven into it.

The motor frame or casing is made from a single piece of corrugated sheet steel. The corrugations are equally spaced and in mechanical contact with the stator core, so that much

Ventilating Air Is Reversed to Keep Oil Out of Windings

of the heat generated in the core and its windings is conducted to the casing, which therefore forms a large surface for the radiation of heat to the ventilating air.

Air entering at any point along the surface of the screen travels over the outside of the corrugations through holes provided at the center of these corrugations, then through the lateral ducts between the casing and core, then over the windings at the end, and finally is discharged at each end of the motor.

Fans are provided at the ends of the rotor for the purpose of drawing the cooling air through the machine. They are of unique design and it is claimed that a stream of air is drawn directly over the bearing housing and immediately expelled without entering the motor, while another stream is drawn through the machine and expelled at the same points. These fans are made of a single piece of sheet steel welded to the thrust collars. Rotor windings are used which have bars and end rings made of one piece of metal, entirely eliminating mechanical or electrical joints, the windings being molded or cast on the magnetic core. The motors are built in sizes up to 30 h.p. at 1,800 r.m.p. for 60-cycle polyphase circuits with corresponding capacities at other standard speeds and frequencies.

Operating and Maintaining Oil Burning Locomotives*

Oil Tanks; Piping; Location of Burners; Drafting; Preventing Air Leaks; Cleaning Soot from Flues; Maintaining Oil Temperatures

THE FIRST ATTEMPT in the United States to burn crude oil in the firebox of a locomotive was made at Santa Paula, California, in October, 1894. The subsequent study of combustion soon led to a better understanding of the firebox and boiler design and realizing the many advantages to be gained by the use of oil as fuel, every effort was made to develop the most efficient burner and drafting arrangement. Most obstacles were overcome and in a comparatively short time a high degree of efficiency was attained.

Crude oil possesses many advantages over other fuels and in the west its use soon became widespread. At no time during the past few years has the production of crude oil in the United States been sufficient to meet requirements, and records for June, 1921, show the consumption of 81,000 barrels per day in excess of production, which deficit was and is being supplied from the Mexican fields.

Daily production, United States, June, 1921.....	1,446,833 bbls.
Imports from Mexico.....	340,175 bbls.
Total.....	1,687,008 bbls.
Daily consumption.....	1,427,367 bbls.
Amount placed in storage daily.....	259,641 bbls.

At the present rate of consumption we are told by geologists that the crude oil supply in the United States will be exhausted within a few years as there now remains but about 60 per cent of the original supply underground. With this prospect in sight it is small wonder that strenuous efforts are being exerted to conserve the remaining supply by maintaining and operating oil burning locomotives as economically as possible. At the present time there are about 41 railroads operating in 21 states which burn oil for fuel, some, however, on a very small part of their power.

The maintenance of the locomotive rests largely with the enginemen. The medium through which the maintenance is accomplished is the work report and its correct rendition. This means that if the locomotive is to perform economically at its maximum capacity specific information must be given to the roundhouse force as to just what defects were noted under actual operation. Maintaining an oil burning locomotive would be a very simple task if a thorough and accurate report of defects noted by engine crews were reported at the end of each trip. "Don't Steam" covers a multitude of sins but the worst sinner of all is the man who writes it on his work report, with no further detail, and then has writer's paralysis.

Generally speaking there are but few points of difference in maintaining an oil burning locomotive as compared with a coal burner and these points of difference affect the design of tender, oil piping and firebox arrangement. The fuel oil tank is constructed of $\frac{3}{8}$ -in. material and the capacity is approximately 3,000 gallons—a coal equivalent of about 17 tons on the basis of 42 gallons per barrel and 4 barrels of oil equal to a ton of coal. On filling the square tank a 2-in. space is left in the top and on semi-cylindrical 6 in., to allow for expansion when the oil is heated. The ratio of expansion is one per cent for each 25 deg. F. increase in temperature. Fuel tanks are provided with a measuring rod designed to show inches on one side and gallons on the other so that accurate measurements may be obtained at all times.

Oil flows to the burner by gravity on all types of locomotives except the Mallet, in the tender of which is used six

pounds air pressure. The oil piping arrangement conveys the oil from the tank to the burner, from which it is sprayed into firebox by steam. This conduit is two inches in diameter and passes through a superheater four inches in diameter which is used, in addition to the tank heater, to heat the oil before it reaches the firebox. The tank heater should be so constructed and maintained as to keep the oil at the proper temperature, the oil feed line should be free from leaks, with as few elbow joints as possible; metal with flexible joints is preferable to rubber. The cut-out or safety valve on the tender, the blow-back valve, superheater and firing valve should all be in perfect working condition. Burner should be of suitable size, varying from one inch to three inches according to size of firebox, clean and lined up about 60 in. from the flash wall to insure perfect combustion. The correct distance from burner to fire pan floor is 6 in. to $9\frac{1}{2}$ in., depending on the draft arrangement, and particular attention should be given to see that the burner is so placed that the oil strikes the flash wall in the center. Care must also be exercised to see that fire pan is free from air leaks with no obstruction on the floor and that all damper controls are in perfect working order.

There are two ways of drafting an oil burning engine; one, the horizontal draft and the other the vertical. Both are in general use on oil burning roads. The arrangement of the brick work on both drafts is practically the same. The horizontal draft, by which air is admitted through the fire door, is the most economical, but in poor water districts, from the standpoint of boiler maintenance, the vertical draft arrangement with the flat door, by which air passes to the rear of the firebox, prevents cold air from reaching the staybolts and thus reduces boiler maintenance. The horizontal draft in good water districts has proved very successful both from the standpoint of maintenance and fuel.

Air openings through the fire pan should vary, depending on the size of the firebox—from 16 sq. in. air admission around the burner and 85 sq. in. at the rear of the firebox, to 225 sq. in. around the burner and 224 sq. in. at the rear. It has been found that the best results are obtained on an oil burning engine with the use of an extension stack extending down to the center line of the boiler, 12 to 16 in. in diameter.

To secure the best results the fire pan should be welded to the mud ring and rigidly secured so as to obviate all possibility of air leaks at sides and front or behind the brick work. Too much attention cannot be given to the maintenance of fire pans on oil burning locomotives.

Front end air leaks and outside steam leaks should not be tolerated. In the roundhouse one man should be assigned to make torch tests and repair all air leaks into the front end and around outside steam pipes. There are many recommended practices for the elimination of air leaks around outside steam pipes. The best one in use is the application of a casing of $\frac{1}{4}$ -in. steel plate with a welded seam. This casing is riveted permanently to the smoke box and then caulked or welded around the edge to make it airtight. It is large enough in diameter to allow removal of the steam pipes without disturbing it. The lower end of the casing is flanged outward and to it is riveted a wrought iron ring. A cast iron flange made in halves is fitted together and bolted snugly around the steam pipe, which is machined true at this point. This flange is secured to the wrought iron ring with eight studs and a copper wire gasket is used between them to

*Abstract of a report presented at the meeting of the Traveling Engineers' Association, at Chicago, September 3, 1921.

obtain an airtight joint. A copper gasket is then caulked into a dovetail groove in the cast iron flange around the steam pipe.

Operation of oil burning locomotives call for the same attention from the engineer as on a coal burner but the fireman has no manual labor to perform in delivering fuel to firebox. But he has to be alert at all times for there is no bank of burning coal to aid him in keeping an even firebox temperature when the engineman is working a light throttle or drifting after having forced the locomotive to its capacity. A supply of clean, gritty sand should be used in the sand box of the locomotive with a sand scoop so the fireman can clean the soot from the flues. Flues should be sanded while running by placing a small quantity of sand in the scoop and by inserting through an opening in the fire door while the engine is working hard, allowing the exhaust to draw the sand through the flues. It is good practice to sand frequently in order to keep the soot removed. It is a non-conductor of heat and causes the steam pressure to drop rapidly. Enginemen should take care to give the valve sufficient travel and open the throttle far enough so that the exhaust will carry sand through the flues and do the work for which it is intended. The sand scoop should be held as far in the fire door as possible in order to prevent sand from falling on brickwork or flash wall.

Firemen should watch the temperature of oil and endeavor to keep it just warm enough to insure an even flow to the burner. This temperature will vary from 100 deg. F. for light California or Texas oil to 180 deg. for heavy Mexican oil. The fireman has direct control of the amount of steam used to heat the oil in the tender and unless he is careful he may not only damage the oil by overheating it so that it loses its lighter gases, but also increase the danger of explosions from the escaping gas. Where excessive steam is turned into the tender there is excessive condensation and unless this water is drained off it will go to the burner and often puts the fire out. Heating the oil in the tender is not for the purpose of aiding in burning it but to cause it to flow in a steady, even stream from the tender to the oil feed line, where it passes through a superheater box before it reaches the burner. The purpose of the superheater is to raise the oil to a temperature at which it will be easily broken up by the atomizer as it goes from the burner tip into the firebox. Since it takes less than one-fifth of a second for a particle of burning oil to travel from the burner tip to the flue sheet, it is of the utmost importance to have oil so atomized that no time is lost in burning it. The use of the blower is to create sufficient draft to keep the firebox clear of smoke and gases and to produce artificial draft. The misuse of the blower causes waste of fuel and damage to the boiler. Very light applications should be indulged in under all conditions. The strong use of blower draws cold air into the firebox, damaging the flues and flue sheets, and causing them to leak.

A slight color of smoke at the stack is better than no smoke at all for a clear stack indicates too great an amount of air. Lesses from too much air are frequently three times as great as from insufficient supply. Firemen should avoid black smoke at all times if possible; it indicates a loss of fuel and should not be tolerated. Black smoke is either the result of faulty firing or the condition of the engine. The firing valve by which the flow of oil to the burner is regulated requires constant attention. Lost motion frequently occurs in this apparatus. Much fuel is wasted when the fireman loses the correct adjustment of this valve because of too much play either in the rods or in the valve itself.

When an engine is worked to full capacity on long grades and has been fired heavily it requires very careful attention to prevent flues from leaking as the small tongue of flame does not fill firebox sufficiently to keep out the cold air. Enginemen cannot be too careful at such times; they should

start gradually to ease off on the throttle, allowing the fireman plenty of time to adjust his firing valve. Injectors should be shut off at once, if only for a short time, and then worked at short intervals. In most cases engines start leaking while descending grades after having been worked hard. Careful team-work between engineer and fireman will prevent black smoke when shutting off or pulling out of stations.

The report was signed by J. N. Clark (Chairman), Sou. Pac. Co.; J. C. Harris, G. H. & S. A.; H. H. Kane Gulf Coast Lines; E. F. Boyle; E. E. Cornish, M. K. & T., and W. G. Tawse, Locomotive Superheater Company.

Discussion

In answer to a number of questions relative to the terminal handling of oil burning locomotives, J. N. Clark (Southern Pacific) stated in closing that from 50 gallons to 175 gallons of oil are required to fire up engines at terminals, requiring from 30 min. to 1 hr. 50 min. before leaving time. A test made with a 2-8-2 type locomotive weighing 207,000 lb. on drivers, was fired up with $\frac{1}{3}$ glass of water at 120 deg. in a total time of 108 min. to 200 lb. gage pressure, with a consumption of 119 gallons of oil. In comparison with 15 per cent to 25 per cent of the fuel consumed at terminals on an eastern coal burning road, the terminal oil consumption was estimated at about 8 per cent of the total fuel.

Mr. Clark referred to a test made under the supervision of the fuel conservation committee of the Southern Pacific in which the fuel consumption per 1,000 ton-miles was measured for a 1,000-ton train hauled by a 2-10-2 type superheated locomotive. At 5 miles an hour the oil consumption was .3 gal.; at 10 miles an hour, 1.1 gal.; at 15 miles an hour, 2.5 gal.; at 20 miles an hour, 4.5 gal.; at 25 miles an hour, 7 gal.; at 30 miles an hour, 10 gal.; at 35 miles an hour, 13.7 gal.; at 40 miles an hour, 18 gal.; at 45 miles an hour, 22.7 gal., and at 50 miles an hour, 28 gal. A test to show stand-by fuel consumption showed that 45 gal. of oil per hour was refined to hold train and run the air pump, while 37 gal. an hour was burned by a light engine standing.

Missouri Pacific Continues to Show Large Savings from Water Treatment

THE CARE with which the Missouri Pacific has compiled records of the economies in operation resulting from water treatment has caused the reports of this road to be watched with interest from year to year. In the report for 1921, which has recently been compiled, it is shown that the 77 treating plants on the system, including ten placed in service last year, treated 1,781,560,000 gal. of water from which 4,916,247 lb. of scaling solids were removed. Using 13 cents as the conservative estimate of the savings per pound of scaling solids removed, there was a total saving of \$643,964, from which should be deducted \$170,575 for the cost of treatment, supervision and depreciation of plants, leaving a net saving of \$473,369, or a return of 143 per cent on the \$309,611 invested in treating facilities.

The total consumption of water on the system during 1921 was 5,948,117,000 gal., of which 5,153,024,000 gal. was used for making steam. Of this latter amount 34.6 per cent was treated. The average cost of treatment in 1921, including operation, supervision and ten per cent depreciation, was 9.8 cents per 1,000 gal. It is estimated that the removal of these solids from the water resulted in a saving of approximately five per cent or 62,000 tons in coal consumption, while the records show that the life of flues and fireboxes has been more than doubled in many districts since treating plants were installed and that delays to traffic from engine failures due to boiler troubles have been reduced from 30 to 60 per cent.

General News Department

Oral Argument on A. B. & A. Valuation

Oral arguments were presented before the Interstate Commerce Commission on May 13 on the motion of the Atlanta, Birmingham & Atlantic to correct and amend the supplemental tentative valuation of its property issued by the commission. W. G. Brantley argued on behalf of the road and C. W. Needham for the commission. Whereas the tentative report assigned as the final value of the used property \$25,630,000, the carrier claimed that it should be not less than \$36,000,000. Hearings were also held before Examiner Marchand on May 15 in the cases of the Norfolk Southern and the Mobile & Ohio.

Government Attempts to Prevent Increased Coal Prices

While the administration has no plan for settling the coal strike, it was announced at the White House on Tuesday that it was interested in preventing undue increases in the price of coal, such as have appeared in some districts. Later Secretary Hoover announced that he would call a conference of coal operators for this purpose in the near future. He has also requested the American Railway Association and the public utilities associations to create buying committees to handle their coal purchases and will also ask other large consuming industries to take similar measures to avoid the danger of buyers bidding against each other.

American Express to Operate on Alaska Railroad

The American Railway Express Company has contracted with the Alaskan Engineering Commission to do express business on the United States Government Railroad in Alaska, beginning on May 15. The length of road operated is 537 miles. Express service has been carried on in Alaska and in the Yukon territory for more than 25 years, the American Railway Express having succeeded to the business of the Wells-Fargo Company in that region. According to the Official Guide the Alaska Railroad operates passenger train twice a week each way, except for one section, of 64 miles, where there are three trains a week. Trains are run only in the day-time, and a passenger traveling by railroad from Seward to Fairbanks must stop over night at Anchorage, at Curry and at McKinley Park.

Messenger Foils Daring Hold-Up

An attempt was made early in the morning of May 15 by eight masked men to rob the westbound Golden State Limited (a C. R. I. & P., E. P. & S. W. and S. P. train) at a lonely spot between Jaynes, Ariz., and Cortaro, on the line of the Southern Pacific about 10 miles west of Tucson. Forcing a tramp who had been riding blind baggage to uncouple the mail and express cars, they forced the engineer to pull the cars about 300 yards ahead and then opened up with their guns.

But Express Messenger Harry Stewart opened the door of his car and shot and killed one of the bandits; and soon after wounded another. The robbers then became scared and took to their waiting automobile and fled. The dead bandit was identified as a rancher resident in the vicinity.

The Pullman Hotels at New Orleans

During the triennial convale of the Knights Templar in New Orleans, La., on April 24-27, the three principal railroads provided sleeping and eating accommodations for visitors by parking Pullman cars in their yards. The Pullman Company reports that 175 cars were run on a per diem basis, and 109 according to berth rate; a total of 284 cars. In the Poydras yard of the Illinois Central, 124 cars were parked and 2,500 guests taken care of. A total of 3,211 meals were served by

this road in its dining cars in this yard. A laundry company with headquarters in warehouse No. 3 (converted into a clubhouse), handled more than 500 bundles of laundry. The road also installed 24 shower baths in this clubhouse.

The Southern Railway, which also parked a number of cars in its yards, lighted its thoroughfare with electric lights of 1,000 watts and erected signs indicating the exact location of all commanderies. Two freight cars were converted into shower bath compartments, one car for men and one for women. The Louisville & Nashville parked 72 cars adjacent to Elysian Fields avenue, between Tonti and Decatur streets, and likewise provided the necessary features for the comfort of its patrons.

Federal Trade Commission Investigates

Proposed Steel Merger

Upon receipt of the resolution adopted by the Senate on May 12, introduced by Senator La Follette, directing the Federal Trade Commission and the attorney general to inform the Senate as soon as possible what steps have been taken or what steps will be taken to ascertain the purposes and probable effects of the proposed merger of seven of the largest iron and steel corporations, the Federal Trade Commission, on May 13, sent a demand in a telegram to the presidents of the Midvale Steel & Ordnance Company, Republic Iron & Steel Company, Lackawanna Steel Company, Inland Steel Company, Youngstown Sheet & Tube Company, Steel & Tube Company of America, Brier Hill Steel Company, and the Bethlehem Steel Corporation, asking them to submit to the Federal Trade Commission full and specific information as to the plan of the proposed merger before the plan is consummated or actual transfers made.

In this connection the commission states that the proposed merger was called formally to its attention on December 27, 1921, and that the matter has been under investigation since that time.

Railroad Officers Before House Committee

Howard Elliott, chairman of the Northern Pacific, was the first witness on behalf of the railroads at Washington on May 16 at the hearing before the House committee on interstate and foreign commerce on the Hoch and Sweet bills which, like the Capper bill in the Senate, propose to amend the transportation act to restore the powers of the state railroad commissions, whose representatives had previously appeared in support of the bill. Mr. Elliott urged the importance of dealing with the railroads as a national system and pointed out that the Interstate Commerce Commission and the state commissions have recently adopted a plan of co-operation in cases of conflicting jurisdiction.

The committee had postponed consideration of the mileage book bill for two weeks in the hope that the Interstate Commerce Commission would issue its rate decision. Before taking up the Hoch and Sweet bills there was an argument among the members of the committee on a motion to postpone consideration of the mileage book, subject to the call of the chairman. It was finally decided to postpone the discussion until Wednesday.

The hearing in the general railroad investigation before the Senate committee, at which L. F. Loree and R. S. Lovett were to appear on Thursday and Friday, has been postponed because Chairman Cummins has gone to Hot Springs for his health.

Safety at Highway Crossings

Using cards furnished by the railroads of the State, the Department of Highways of Tennessee has this year sent out with each automobile license a warning notice designed to inculcate the habit of caution at railroad crossings. The warning, copied below, is on a tag, 2½ in. by 5 in., which is provided with a string, like a tag for a bag, enabling the recipient to conveniently fasten it in front of his seat in the automobile.

It appears that a law requiring automobiles to be stopped before crossing a track has been on the statute book in Tennessee since March 12, 1917, and this law is printed on the back side of this tag. It prescribes a penalty of from \$1 to \$10 for violation. Unlike the Virginia law, recently noticed, this Act applies only to motor vehicles, but it applies to all railroad tracks except at crossings where a watchman is in attendance.

So far as can be learned, this statute has been little more than a dead letter; this action in 1922 full five years since the law was passed, appears to have been the first important step that has been taken looking to its observance.

AUTO DRIVERS

In the interest of human safety and in the prevention of needless waste of human lives and the unnecessary destruction of property, you are earnestly urged to be in your guard at all times and under all circumstances, when approaching railroad crossings at grade. The toll of human lives and bodily injuries on account of careless and inattentive drivers of automobiles, is alarming. Through the momentous hours when your attention is distracted or when you take a short cut.

Should you be served by a citizen
Department of Highways, State of Tennessee

ATTACH THIS TAG TO THE FRONT OF YOUR CAR WHERE IT WILL BE SEEN

Action looking to greater safety at crossings has been taken in the State of Pennsylvania and New York, the Public Service Commission having issued orders requiring common carriers by automobiles to establish rules requiring a stop before passing over a railroad. In Pennsylvania the rule applies to "carriers of passengers or property," and the stop is to be made within 75 ft. The driver must look carefully in each direction. The order does not apply to electric street railways within cities and boroughs. In New York the order may be considered by the Commission as a condition precedent for receiving the certificate of public convenience under which the automobile is operated.

The New York order issued on April 13 is of similar intent, but may be construed to be made in less than 20 ft. and not more than 70 ft. from the crossing. In both of these States the operation of automobiles at railroad crossings is lawful only after authorization by the Public Service Commission of a certificate of public convenience and necessity.

Traffic News

The St. Louis-San Francisco and the Chicago, Rock Island & Pacific will on May 27 put on through sleeping cars between Memphis, Tenn., and Denver, Colo.

Associated Traffic Clubs of America

This is the name of an organization formed at Chicago on May 17, by 50 delegates representing 35 of the principal traffic clubs of the country. The following officers were elected for the ensuing year: President, W. J. L. Ianham, general traffic manager, Otis Elevator Company, New York City; first vice-president, S. S. Butler, freight traffic manager, St. Louis-San Francisco; second vice-president, T. T. Webster, general traffic manager, of G. H. Mead Company, Dayton, Ohio; third vice-president, George S. Harlan, assistant general freight agent, Baltimore & Ohio; fourth vice-president, R. H. Schultz, traffic manager, San Antonio, Uvalde & Gulf; secretary, B. L. Birkholz, general agent El Paso & Southwestern, New York City. Four directors were elected to serve for one year, the same number for two years and likewise for three years.

From communications received it was stated at this meeting that a large majority of the city traffic clubs have signified their willingness to become members of the national organization.

Coal Production

Production of soft coal increased at the beginning of the sixth week of the strike (May 8-13), according to the weekly bulletin of the Geological Survey, probably to about 4½ million tons. Production of anthracite, however, remains practically zero.

The revised figures for the fifth week (May 1-6) show 4,161,000 tons of bituminous coal, and 6,000 tons of anthracite, or some 3,000,000 tons a week (both kinds) short of the 1919 experience. The table of cars loaded shows:

	First week	Third week	Fifth week	Sixth week
Monday	11,445	7,598	11,598	13,045
Tuesday	11,019	10,041	12,164	13,260
Wednesday	11,437	11,488	12,861	13,384
Thursday	11,090	11,193	12,487	13,234
Friday	11,296	11,596	12,776	
Saturday	8,888	10,194	11,275	

The increase has been general in those districts not affected by the strike. It is especially marked in the Southern and Middle Appalachians and in Western Kentucky. It is due less to resumption of work at mines hitherto closed by the strike than to an increase of activity caused by quickening demand in those fields not affected by the strike order.

Preliminary estimates place the total output of soft coal in April at 15,780,000 tons, much below that of any April in recent years. In fact, the output for the month fell some 3,000,000 tons short of that in November, 1919, when, as now, a general strike of bituminous miners was in progress.

Heavy Shipments of Automobiles

The National Automobile Chamber of Commerce reports very heavy shipments of automobiles for the first four months of this year, compared with last year. Its totals are as follows:

	TOTAL AUTOMOBILES SHIPPED BY MANUFACTURERS			
	City	Driveways	Heat	
1922	13,571	19,111	19,111	19,111
1921	15,457	6,485	7,479	7,185
1920	17,616	9,098	10,173	7,537
March	17,380	16,381	16,766	17,919
April	16,380	16,187	12,750	14,111

*Figures omitted.

On this basis it is estimated that 213,000 passenger cars and trucks were produced by all makers in April. This would be an increase of 35 per cent over April, 1921, and 24 per cent over March, 1922. The heaviest shipping previously recorded was in March, 1920, when 29,326 carloads and 57,273 driveways

and boat shipments were made, and approximately 220,000 cars and trucks produced. Thus April appears to have set a record for rail shipping, due to more adequate car supply, and it is second in number of machines produced in one month.

Calling attention to these figures the Car Service Division of the American Railway Association, in a circular addressed to the railroad, says that in order that continued heavy production at automotive plants may be fully supplied with rail transportation it is highly important that:

- (1) Automobile cars be moved promptly, loaded or empty, to owners or nearest automotive producing territory.
- (2) Cars be not loaded with freight which takes them out of route.
- (3) Automobile cars be not loaded with cement, lime, plaster or other freight that leaves a residue of dust in the car. Many hundreds of automobile cars have been rejected at automobile plants because of dust.
- (4) Owners give special attention to the repair of automobile cars.

Increase in Parcel Post Rates Foreshadowed

The necessity for an increase in the rates for parcel post is indicated in a letter written by Postmaster General Work to the Interstate Commerce Commission, stating that the department is proceeding in conjunction with the joint commission on postal service to secure the necessary data and to make an estimate as to the revenue derived from the several classes of mail matter, the cost of carrying and handling them, and the profit or loss per pound. When these results are known the postmaster general proposes to present them to the commission so far as parcel post matter is concerned with appropriate recommendation for changes in rates of postage, as contemplated by the act of 1912. The law establishing the parcel post system was passed in 1912 and provided rates based in a measure upon the estimated cost of carrying and handling such matter in the mails. These rates, the letter says, were based upon estimated cost of transporting and handling fourth class mail matter under conditions existing during 1908-1911. As most of the expenses for conducting the postal service are common to all classes of mail matter estimates for individual classes must be based upon apportionments of such common expenses; and these largely upon the relative weights of the several classes.

In 1907 fourth class matter was 4.79 per cent (estimated) of the total weight of all mail matter. It is estimated that at present fourth class, or parcel post matter, is approximately 60 per cent of the weight of the entire mails.

Not only have conditions changed, the rates per unit of service for railroad transportation and for all other transportation and the salaries of the postal employees in the field, including those in the post offices, the railway mail service, and the rural delivery service, have all been greatly increased in recent years and since the inauguration of the parcel post system under the rates above mentioned.

In the case of the pay for railroad mail transportation, the Interstate Commerce Commission's order of 1919 increased those rates approximately 60 per cent. The salary legislation of Congress, including the acts passed during the war-period and the reclassification act, increased salaries very materially. As the revenues received from parcel post matter are produced by rates fixed by the act of 1912, then estimated to be little more than sufficient to cover the cost of performing the service, it is obvious that the revenue now received on such matter must be far below the actual and apportioned cost for that service under the conditions now existing.

THE 1,540 PASSENGER TRAINS that were run by the Monongahela division of the Pennsylvania Railroad in the seventeen days ending with Thursday, May 4, made their running time, without exception. In the month of April, altogether, this record was made on 21 days; and on 13 days all trains arrived at destination on time. This record is considered so fine that the superintendent has issued a special bulletin congratulating the employees who made it. The principal lines of the Monongahela division are those from Pittsburgh to West Brownsville, Pa., 54 miles, with 14 regular passenger trains southbound, and 10 northbound; and the Southwest Branch, 60 miles long, with five trains southbound and four northbound.

Foreign Railway News

South African Railway Employees

Help to Suppress Revolt

The recent Rand mine strike in South Africa which became a small revolution was suppressed largely through the efforts of the South African Railways and Harbors Brigade, a military organization of employees of the South African Railways. This body was recently publicly thanked for the part it played in restoring law and order by the prime minister, General Jan C. Smuts.

"Windfall for Egyptian Railways"

Under the above heading the Times (London) Trade Supplement publishes a dispatch from Cairo to the effect that the Egyptian State Railways, which are badly in need of money for maintenance and improvements, have received a check from the British government for 900,000 Egyptian pounds (approximately \$4,500,000 at the normal rate of exchange) on account of the part played by this railway in transporting soldiers and supplies during the war. The Times expects this check to result in increased orders for railway equipment and supplies.

Revival of Mexican Railway Project

Plans for building a railroad from Agua Prieta, Sonora, along the northern boundary of Mexico to Guzman, Chihuahua—a distance of 180 miles—have been revived by influential Mexicans, according to Consul F. J. Dyer, Nogales, Mexico. The estimated cost is about \$3,250,000, and it is thought that the line can be completed in one year of actual construction work. It is understood that the Mexican government desires to have the road built and may offer a substantial subsidy for its completion. American railway builders will probably take the contract.

British Railways in Argentina Have Bad Year

Labor troubles and a decline in traffic resulting from the worldwide business depression combined to keep the British railways in Argentina from making a particularly good showing during the fiscal year ended June 30, 1921, according to the Railway Gazette (London).

Gross receipts of the more important lines were as follows:

Buenos Aires Great Southern	£8,733,000
Buenos Aires Western	4,145,000
Buenos Aires & Pacific	6,854,000
Central Argentine	9,747,000
Cordoba Central	1,180,000

Gross receipts of all these companies were considerably under those of the previous year. Operating ratios compared with the previous year were:

	1920-21	1919-20
Buenos Aires Great Southern	84.33	69.19
Buenos Aires Western	90.88	69.49
Buenos Aires Pacific	85.68	69.66
Central Argentine	79.82	67.61
Cordoba Central	89.62	78.06
Entre Rios	89.38	80.03

Passenger traffic increased considerably in spite of the falling off in freight business.

To Build New Line in Mexico

Through the financial aid of the government of the state of Durango the Compania del Ferrocarril del Rosario y El Oro will build a railroad which will connect the Durango-Tepehuanes branch of the National Railways of Mexico and the Parral & Durango Railroad. The proposed line will be 60 miles long. Its importance lies in the fact that it will traverse one of the richest mineral and heaviest timbered regions of Mexico; also that it will afford a new and direct rail route between Parral and Durango. The branch line which runs from Durango to Tepehuanes is 136 miles long. The Parral & Durango Railroad has a length of 68 miles. It is asserted that there has been an urgent need for this proposed railroad for many years. Several years ago a

syndicate of mine owners along the route of the line offered a bonus of \$150,000 in aid of the project. The concession for building the road has been held by two or more persons at different times but through failure to finance its building the concessions were forfeited. It is stated that several thousand laborers will be employed in the grading and other work connected with the project. The headquarters of the company that has been formed to build the line are at Durango.

Large Expenditures by Indian Railways

An expenditure of \$85,000,000 annually for five years was recently recommended by the Indian railway finance committee as a minimum requirement. The estimate calls for 437 locomotives during each of the five years and 62,000 passenger and freight cars over the entire period, according to Consul North Winship, Bombay.

The shortage of cars has checked the coal mining and other industries, and it is proposed to double track many lines, strengthen bridges, remodel yards, and generally make the system equal to the needs of the country's growing traffic.

Danzig Railway Repair Shops and Shipyards to Be Internationalized

The "Danziger Werit" which engages in shipbuilding and car repairing was formerly the property of the German government. Since the war the city government of Danzig has been conducting the enterprise but it is now proposed to turn it over to private capital to be subscribed in several countries, according to Commerce Reports. About 5,000 men are at present employed in the works.

It is proposed to have the railway shops and the shipyards taken over by separate companies, each with a capital of 20 million German paper marks; the stock is to be taken by four groups, the first being the Société des Betignolles, Paris; the second, Cravens & Company, Ltd., Sheffield, England; the third, a group of eight Warsaw banks; and the fourth, not yet formed, a group of Danzig banks and capitalists. Danzig and Polish interests are each to have 20 per cent of the capital stock in each of the companies; in the shipyards company the English group is to have 60 per cent; and the French company is to have 60 per cent of the railway shop stock.

The title to the property, grounds, buildings and equipment is to rest in common with Danzig and Poland. Both states shall, however, be obligated to leave operation of the plants to the companies for a minimum of 45 years and a maximum of 60 years. In order not to displace the majority relationship through the participation of the various groups the shares are to be "blocked."

Both companies shall maintain, under one director general, a community of interest in operations, credits, and profits. The operating community shall consist of a uniform system of book-keeping, inventory, and balance; valuation of materials when transferred from one plant to the other; exchange of information and patents; placing of building and equipment at disposal; and exchange of personnel. The credit community is based on a bond issue of £300,000, which the English and French participants in the scheme have agreed to underwrite, the bonds to be secured by a mortgage on the buildings and lands of the company.

The profits go first to the establishment of the legal reserve fund, next to the amounts necessary for interest and amortization of the loan; then to the funds for depreciation and replacements. In case a loss instead of a profit is shown by either of the companies a special common reserve fund must then be created to cover possible losses in the future. Any profits remaining after the above charges have been covered are then divided equally between the two companies which are authorized to dispose of their respective shares of these profits according to the following schedule: the stockholders are to be paid a 10 per cent dividend; 40 per cent of the remainder is paid to the owners, Danzig and Poland; in lieu of rent, each country receiving half.

The entire plan is subject to the final action of the distribution committee of the Council of Ambassadors, which action must be approved by the Council itself.

The contracts in hand and the business in sight apparently give the new companies good prospects for earnings, and it seems likely that they will be profitable from the start.

Equipment and Supplies

Locomotives

THE CHICAGO & EASTERN ILLINOIS expects to send out inquiries this week for six Pacific type locomotives.

RICHMOND, FREDERICKSBURG & POTOMAC is having repairs made to 8 locomotives at the shops of the American Locomotive Company, Richmond, Va.

THE ERIE has ordered 15 Decapod locomotives from the United States Government. These are part of the locomotives originally built for the Russian government.

PICKANDS MATHER & Co., Cleveland, Ohio, has ordered five 0-6-0 type locomotives from the Lima Locomotive Works, Inc. These locomotives will have 21 in. by 26 in. cylinders; 51 in. driving wheels and a total weight in working order of 160,000 lb.

THE WESTERN MARYLAND is having repairs made at the shops of the Baldwin Locomotive Works to about 20 locomotives, including Pacific, Mallet and Consolidation types and is having 8 locomotives repaired at the shops of the American Locomotive Company, Richmond, Va.

THE SIAM STATE RAILWAYS will receive bids until 2 p. m., September 15 at Bangkok, Siam, for the supply of locomotives and tenders. General Purachatra is commissioner-general, Department of State Railways, Bangkok. Specifications and drawings may be obtained from C. P. Sandberg, 143 Liberty street, New York City.

Freight Cars

THE GRAND TRUNK is inquiring for 250 refrigerator cars.

THE GREAT NORTHERN contemplates buying some additional refrigerator cars.

THE CHILE EXPLORATION COMPANY, New York City, is inquiring for 50, 70-ton ore cars.

THE WABASH will accept bids until May 22 for repairs to 500, 40-ft. box cars and 200, 36-ft box cars.

THE COWLITZ, CHEHALIS & CASCADE has ordered 10 logging cars from the Pacific Car & Foundry Company.

THE MIDLAND TERMINAL RAILWAY COMPANY is inquiring for from 15 to 20 side dump cars of 70 tons' capacity.

THE SAN DIEGO & ARIZONA is inquiring for 10 all-steel, drop-bottom gondolas, 10 all-steel, tight bottom gondolas and 4 steel-underframe stock cars.

THE KANSAS, OKLAHOMA & GULF contemplates buying 100 composite gondola car bodies, 150 composite flat bottom gondola cars and 250 general service gondola cars.

THE AMERICAN REFRIGERATOR TRNSIT COMPANY, noted in the *Railway Age* of April 8 as inquiring for 2,000 refrigerator cars, has ordered this equipment from the American Car & Foundry Co.

THE SOUTHERN has ordered 500, 40-ton automobile box cars from the Standard Steel Car Company and 250 caboose cars from the Lenoir Car Works. This is in addition to the 5,300 cars ordered by this company and reported in the *Railway Age* of May 13.

THE MISSOURI, KANSAS & TEXAS, noted in the *Railway Age* of April 22 as inquiring for 300 flat cars of 40 tons capacity and in the issue of May 13 as inquiring for 1,500 box cars, has ordered the former from the General American Car Company and the latter from the American Car & Foundry Company. The same company also ordered 500 automobile cars from the Mt. Vernon Car Manufacturing Company.

Passenger Cars

THE AURORA, ELGIN & CHICAGO has reopened an inquiry for 20 passenger cars.

THE SAN DIEGO & ARIZONA is inquiring for one combination passenger and baggage car.

THE BOSTON ELEVATED, reported in the *Railway Age* of April 1 as inquiring for 100 cars, has ordered this equipment from the J. G. Brill Company.

THE INTERBORO RAPID TRANSIT COMPANY, reported in the *Railway Age* of May 6 as about to place inquiries for new cars, is now inquiring for 100 cars.

THE COWLITZ, CHEHALIS & CASCADE, noted in the *Railway Age* of April 8 as inquiring for a gasoline propelled motor passenger car, 28 ft. 7½ in. in length, with seating capacity for 41 people and a compartment for baggage, has ordered this equipment from the Skagit Steel & Iron Works of Sedro-Woolley, Wash., the chassis to be furnished by the White Motor Car Company.

THE SOUTHERN RAILWAY was reported in the *Railway Age* of May 13 as having placed orders for 75 cars with the Pullman Company and 25 cars with the American Car & Foundry Company. These include 40 steel passenger coaches, 10 steel combination passenger and baggage cars and 25 steel baggage express cars to be built by the Pullman Company and 25 steel postal cars to be built by the American Car & Foundry Company.

Iron and Steel

THE MOBILE & OHIO has ordered 40,000 pairs of angle bars from the Illinois Steel Company.

THE MISSOURI, KANSAS & TEXAS will accept bids until May 20 for 200, 40-ft. steel underframes for refrigerator cars.

THE SOUTH MANCHURIAN RAILWAY is inquiring through export houses in New York City for 88 boiler and fire-box plates.

THE ILLINOIS CENTRAL has ordered 150 tons of reinforcing bars for grade reduction work at Matteson, Ill., from the Corrugated Bar Company.

THE ALASKAN ENGINEERING COMMISSION has awarded a contract to the United States Steel Products Company for 2,700 tons of steel for the Tenana River bridge.

THE MISSOURI PACIFIC has ordered 26 water tanks and standpipes, involving 700 tons of plates and 300 tons of structural shapes, from the Pittsburg-Des Moines Steel Company.

THE NORFOLK & WESTERN will receive bids until 12 o'clock noon, May 24, at Roanoke, Va., for its requirements of locomotive steel tires July to December, 1922; requirements of wire fencing from May 24, to December 31, 1922; for 400 cast steel truck side frames; also for 200 cast steel side frames.

Track Specialties

THE ATLANTIC COAST LINE is inquiring for 3,000 tons of tie plates.

THE WABASH is inquiring for 500 to 1,000 kegs of spikes and bolts.

THE CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS will accept bids for 3,250 kegs of track bolts until May 23.

THE MISSOURI, KANSAS & TEXAS has placed an order for 4,000 kegs of spikes and bolts with the Illinois Steel Company.

THE ERIE has divided an order for 6,000 kegs of railroad spikes between the Jones & Laughlin Steel Company, Pittsburgh, Pa., and another company.

THE PENNSYLVANIA has divided an order for 2,000 kegs of railroad spikes between the Jones & Laughlin Steel Company and Dilworth, Porter & Co., Pittsburgh, Pa. The company also ordered 70,000 track bolts from the Oliver Iron & Steel Co., Pittsburgh.

THE CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS, noted in the *Railway Age* of April 22 as inquiring for 198,000 tie plates, has ordered 148,000 from the Inland Steel Company and 50,000 from the Railroad Supply Company.

Machinery and Tools

THE NORFOLK & WESTERN is inquiring for tools for its rail reclaiming plant at Roanoke, Va., including a 6-spindle upright drill; 2 rail drills; a draw cut shaper and a rail bender.

THE CUBA RAILROAD, reported in the *Railway Age* of May 13 as inquiring for machine tools for its new shops at Camaguey, Cuba, has ordered a number of heavy machine tools for use in these shops.

THE WESTERN MARYLAND, reported in the *Railway Age* of May 13 as inquiring for a number of machine tools, has placed orders for the following machines: 36 in. and 48 in. lathes; 6 in. pipe threading machine; 2 in. bolt cutting machine; two 28-in. vertical drilling machines; 5 ft. radial drill; 84 in. boring and turning mill; 36 in. and 42 in. planers; 6 in. car hack saw; 300-ton wheel press and a bushing press.

Miscellaneous

THE ATCHISON, TOPEKA & SANTA FE, it is reported, is in the market for a large quantity of fuel oil.

THE MICHIGAN CENTRAL will accept bids until July 1 for sheets, bars, shapes and plates, billets, springs, axles, tubes, crank pins and piston rods, steel rope and various types of wire.

THE ST. LOUIS-SAN FRANCISCO has contracted with Cosden & Company, the Indianola Refining Company, the Producers & Refiners Corporation and the Empire Refiners for supplying 100,000 barrels of fuel oil monthly.

THE WABASH, noted in the *Railway Age* of April 22 as inquiring for 300, 36-in. wheels for passenger coaches, has divided an order for this equipment between the Illinois Steel Company and the Edgewater Steel Company.

THE NEW YORK CENTRAL LINES will receive bids until 12 o'clock noon, May 24, for the requirements of these lines for one year, commencing June 1, 1922, of incandescent lamp bulbs, aggregating \$300,000 or more in net value.

Signaling

THE CHICAGO UNION STATION has awarded a contract to the Union Switch & Signal Company for two interlocking plants and complete signal equipment. See item under Railway Construction News.

THE CHICAGO, BURLINGTON & QUINCY is installing automatic signals on 55 miles of line between Napier, Mo., and Pawnee, Nebr., and has ordered the equipment for this work from the Federal Signal Company, Albany, N. Y.

AUTOMOBILE TRUCKING SERVICE, in cities, can be done with electric cars more efficiently than with either gasoline cars or horse-drawn vehicles. This was the declaration of Robert E. M. Cowie, vice-president of the American Railway Express Company, addressing the convention of the National Electric Light Association at Atlantic City, N. J., on May 15. He says that the electric vehicle has not been used much for long distances but is showing the gas car out into that service and reserving for itself the "infield." His company recently took fifty gas cars out of one city and replaced them with fifty electric. It uses large numbers of all three types of transportation. The American Railway Express Company is the largest user of electric trucks in the world; of which 123 have been purchased this year. There has not been a year since 1911 in which some electric were not purchased. The company now operates 1,194 electric street trucks and 250 electric industrial trucks. Mr. Cowie regards the express business as the best business barometer in the country, and he believes he can see the upward trend; that the period of stagnation has passed.

Supply Trade News

The **Foamite Firefoam Company** has removed its office from 200 Fifth avenue to 151 Fifth avenue, New York City.

The **McClellan Products Company**, Chicago, has recently been organized to handle the McClellan refrigerating machine for installation on railroad cars.

W. E. Mathews has joined the sales organization of the **Lima Locomotive Works, Inc.**, Lima, Ohio. He will devote his entire time to the sale of Shay geared locomotives.

I. L. AuWerter, sales representative of the Carnegie Steel Company in the Michigan territory, has been appointed Michigan district sales manager of the **Apollo Steel Company**, with headquarters at Detroit, Mich.

J. Martin Duncan, follow-up engineer of the **Detroit Steel Casting Company**, Detroit, Mich., has been promoted to general sales manager and **E. R. Young** has been appointed follow-up engineer to succeed Mr. Duncan.

E. P. Waller, assistant manager of the railway department of the **General Electric Company**, Schenectady, N. Y., has been appointed manager of the railway department. **J. G. Barry**, who has heretofore held the positions of general sales manager of the company and manager of the railway department, will in the future devote his entire time and attention to the work of the sales managership. Mr. Waller was born in Martinsville, Va., and was graduated from the Virginia Polytechnic Institute in the class of 1900. Following his graduation he entered the testing department of the General Electric Company at its Schenectady Works. After two years in that department he joined the staff of its publication bureau and later served as associate editor of the *General Electric Review*. In the fall of 1903 Mr. Waller took up commercial railway work under Mr. Barry and in 1912 he was appointed assistant manager of the railway department, which position he held at the time of his recent appointment as manager of that department.

E. P. Waller

C. E. Allen, manager of the central station division of the **Westinghouse Electric & Manufacturing Company**, with headquarters at Chicago, has been promoted to manager of the St. Louis, Mo., office, with headquarters in the latter city.

Louis F. Vonier, formerly sales engineer of the **Federal Bridge & Structural Company**, with headquarters at Waukesha, Wis., has been appointed district representative of the **Lyon Metallic Manufacturing Company**, Aurora, Ill., with headquarters at Milwaukee, Wis.

The **Illinois Zinc Company**, Peru, Ill., has opened a sales office in the McCormick building, 332 So. Michigan avenue, Chicago. The company also has sales offices at 280 Broadway, New York City, and 1331 Filbert street, Philadelphia, Pa. The smelters and rolling mills are located at Peru.

Louis W. Siple, formerly sales engineer with the Electric Storage Battery Company, Philadelphia, Pa., has been appointed sales engineer for the **Safety Car Heating & Lighting Company**, New York. Mr. Siple's headquarters are in the Commercial Trust building Philadelphia. He is a graduate of Drexel University, holding degrees in both mechanical

and electrical engineering. While with the Electric Storage Battery Company, his duties included handling the power plant and railway sales.

The **Bucyrus Company**, South Milwaukee, Wis., has under way extensive enlargements to its plants at South Milwaukee and at Evansville, Ind. In the South Milwaukee plant, where all the larger machinery is built, a new gray iron foundry is now under construction, 276 ft. in length. The old gray iron foundry is being converted into a cleaning room with annealing ovens, sand blast rooms and a welding room. A large addition is also being made to the steel foundry molding floor, and an electric furnace is being installed. At the Evansville plant which specializes in the manufacture of small revolving shovels the machine and erecting shops are being considerably enlarged.

Charles A. Coffin, of the **General Electric Company**, Schenectady, N. Y., and the **Thomson-Houston Company**, one of its predecessors, and who for 40 years took an active part in the development of these corporations, resigned as chairman of the board on May 16. Mr. Coffin will continue as a director. **Owen D. Young**, vice-president, succeeds Mr. Coffin as chairman, and **Gerard Swope**, president of the International General Electric Company, an affiliated organization, has been elected president. **Anson W. Burchard**, a vice-president of the company, has been elected vice-chairman of the board. The title of honorary chairman has been created for **E. W. Rice, Jr.**, who was president for eight years. The board was increased by the election of **J. R. Lovejoy** and **George F. Morrison**, both long associated with the company as vice-presidents.

Bethlehem Steel Corporation's Purchase of Lackawanna Steel Company

President Grace announced after the meeting of the board of directors of the Bethlehem Steel Corporation on May 16 that the directors had unanimously approved all terms and conditions agreed to in respect to the purchase of the properties and assets of the Lackawanna Steel Company, and took the necessary steps for placing the matter before the stockholders for their consideration.

The purchase price agreed to be paid by Bethlehem is an aggregate par amount of its seven per cent preferred stock and class B common stock equal to the par amount of the stock of Lackawanna outstanding (\$35,108,500), consisting of 40 per cent in the seven per cent preferred stock and 60 per cent in the class B common stock of Bethlehem, with an option in Bethlehem to reduce the par amount of the preferred stock and increase the par amount of the class B common stock thus to be delivered by \$1,543,400 upon payment of approximately \$300,000 in cash. Bethlehem is also to assume the debts and obligations of the Lackawanna.

The Bethlehem stockholders will be requested to authorize the additional stock required for the consummation of the purchase.

No financing is required as a part of the transaction but consideration is being given to providing the monies for the improvement and extension of the consolidated properties to the extent of from \$15,000,000 to \$25,000,000. Provisions may also be made simultaneously with this financing to provide for the 1923 \$11,000,000 Lackawanna bond maturity.

Without reference to the consummation of any public financing it will be the policy at once to authorize the expenditure of \$10,000,000 mainly for approving and developing the Lackawanna property which the present management in Lackawanna recognizes should be done.

Although the transaction takes the form of the outright purchase of the Lackawanna properties, the Bethlehem Company announces that Mr. Taylor and other important interests associated with him in the control of the Lackawanna Company will become closely associated with the direction of the consolidated properties and it is expected that they will be liberally represented on the Bethlehem board.

A fine of \$250 was imposed on the proprietor of a shoe shop, at Freeport, Long Island, N. Y., on May 13, for unlawfully renting a commutation ticket of the Long Island Railroad. This is the first conviction secured by the railroad company in its efforts to prevent violations of this new New York law.

Railway Construction

ATCHISON, TOPEKA & SANTA FE.—This company, which was reported in the *Railway Age* of March 11 as contemplating the construction of a new power plant at San Bernardino, California, has authorized the erection of an 80 ft. by 100 ft. structure and has authorized the construction of 75 miles of second track between Yampai, Ariz., and Griffith, reported as contemplated in the *Railway Age* of February 11. The company has also applied to the Interstate Commerce Commission for authority to build a 12-mile line from El Segundo, on the Redondo Branch of the Los Angeles division, to Los Angeles Harbor.

BALTIMORE & OHIO.—During the opening week of May, this company placed contracts for two important pieces of bridgework. One of these involves the structure carrying the tracks of the railroad across East Maiden street, Washington, Penna. This bridge consists of three plate girder spans, with solid floor, total weight of steel about 90 tons. Contract covering the erection, concreting and waterproofing of the new structure was placed with the Seaboard Construction Company, Philadelphia. This railroad has also placed an order with the McClintic-Marshall Company for the fabrication of superstructure steel work for four plate-girder bridges to be installed on its Parkersburg branch, Monongah division, between Grafton and Parkersburg, W. Va. The new structures consist of plate girder spans, ranging in length from 64 to 112 ft., total weight of steel involved about 350 tons. Delivery will be made during July, and the replacement of these structures will be pushed to completion during the present working season.

CHICAGO & NORTH WESTERN.—This company is accepting bids for a 100-ton steel coaling station at Manitowoc, Wisconsin.

CHICAGO, BURLINGTON & QUINCY.—This company, which was reported in the *Railway Age* of April 15 as having closed bids for the construction of a 20 ft. by 60 ft. frame passenger station at Pattensburg, Mo., has awarded the contract for this work to G. A. Johnson, Chicago.

CHICAGO UNION STATION.—This company is calling for bids for the widening of Canal street between Madison and Washington streets, a distance of about 600 ft. It will also call for bids in the near future for the excavating of Canal street between Adams and Jackson. It has awarded a contract to the Union Switch & Signal Company for two interlocking plants and complete signal equipment with the exception of wire, which work will cost approximately \$900,000.

CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.—This company, reported in the *Railway Age* of February 18, as contemplating the construction of approximately 12 miles of second main track from Farmland, Ind., to a point about 2 miles east of Muncie, has awarded the contract for the grading work to the Walsh Construction Company, Davenport, Iowa, and for the concrete bridge and culvert work to the Read Construction Company, Indianapolis, Ind. This company has also under way the replacing of its bridge over the White river on its Evansville, Indianapolis & Terre Haute line, a few miles south of Bloomfield, Ind., with a modern structure consisting of four 100-ft. plate girder spans, a 60-ft. flanking span and 400-ft. of trestle approach, the girders for which have been secured and the masonry work and grading for which are also being done under a contract with the Walsh Construction Company. This company is now securing right of way for and expects to complete the grading and track work this summer by local contract for a 3½-mile cut-off on its Cleveland division between Columbus and Galion, Ohio. It will also replace four steel bridges at various points on its Evansville, Indianapolis & Terre Haute line, other than the White river crossing referred to above.

GREAT NORTHERN.—This company will soon call for bids for the construction of an 84-ft. by 300-ft. frame car repair shed at Minot, N. D. This road has awarded a contract to the National Boiler Washing Company, Chicago, for the construction of a hot water washout and refill system at Wenatchee, Wash., and to

the F. W. Miller Heating Company, Chicago, for a similar system at Minneapolis Junction, Minn.

NORTHERN PACIFIC.—This company has authorized the raising of tracks in Seattle, Wash., incident to improving Ninth avenue south, to cost about \$60,000; the replacing of a timber bridge over Olegua Creek near Winslock, Wash., with deck girder spans to cost approximately \$50,000; the replacing of a timber trestle over Wilson Creek, near Indio, Wash., with two 100-ft. plate girder spans to cost approximately \$41,000; the replacing of a turntable at Livingston, Mont., to cost approximately \$41,000; the construction of an 80-ft. extension to the inbound freight house office at Seattle, Wash., including a new heating plant to cost approximately \$22,000; the replacing of the dry kiln at Brainerd, Wash., with a modern kiln of larger capacity, to cost approximately \$37,000; the construction of a car repair shed at Auburn, Wash., to cost approximately \$20,000; and the placing of rippapping on the Seattle and Tacoma divisions to the amount of approximately \$200,000.

NORTHERN PACIFIC.—This company, which was reported in the *Railway Age* of May 6 as having closed bids for repairs and improvements to dock No. 6, Duluth, Minnesota, has awarded contracts for the work to Barnett & Record and W. N. Hill, Duluth, and to Grant Smith & Company, St. Paul, Minnesota. The company has also awarded a contract to Winston Brothers & Grant, Minneapolis, for the construction of a \$250,000 passenger station and office building at Glendive, Montana.

OKLAHOMA-SOUTHWESTERN.—This company has awarded a contract to the Allhands & Davis Construction Company, Joplin, Mo., for the construction of a 10-mile extension from Nuyaka to Okmulgee, Okla., and contemplates further extensions in the near future. It is expected that the grading for the Nuyaka-Okmulgee extension will begin within the next 30 days.

TEXAS & PANHANDLE.—This company, representing local business interests, has had under consideration for several years and is now about to petition the Interstate Commerce Commission for authority to construct a 300-mile line from Seymour, Tex., in the Wichita Valley, northeasterly to Tucumcari, N. M., on the Chicago, Rock Island & Pacific. The proposed line will cross the Kansas City, Mexico & Orient at about Crowell, also the St. Louis-San Francisco and the Atchison, Topeka & Santa Fe, with the possibility of passing through Farwell, on the latter road. The main shop will probably be located at Turkey, Tex. Preliminary surveys have been made by Wallace & Noonan, Chicago, and local committees are now being organized to enlist the support of land owners along the line. The section to be traversed by the line is now partially developed but considerably removed from transportation facilities.

New York Central to Build Castleton Bridge

The New York Central has authorized the immediate commencement of the Castleton bridge and cut-off calling for the ultimate expenditure of approximately \$20,000,000, the expenditure in the next two years being about \$12,000,000. The improvement work included in the above includes a high-level steel bridge across the Hudson river about 12 miles south of Albany, N. Y., a large freight classification yard in the vicinity of Feura Bush, N. Y., and about 20 miles of double-track connections linking up the railroad with the West Shore and the Boston & Albany by easy grades. This improvement will increase the freight and passenger carrying capacity of the road while it may make possible a reduction in time of transit of fast freight between the North Atlantic ports and the Middle West.

The order for the fabrication of the 23,000 tons of structural steel for the bridge was noted in a recent issue of the *Railway Age*. Invitations for bids on the erection, masonry, grading, dredging and other work have been sent out and everything is being done to facilitate the quick completion of the bridge, the yard and the more important parts of the rail connections. All grade crossings in connection with the project will be eliminated. The bridge will be double track with provision for two additional tracks at some future date. It will have one 600-ft. and one 400-ft. main truss spans over the channel flanked by steel viaduct approaches, the total length being about one mile. It is expected that this work will be completed and in operation by early in 1924.

Railway Financial News

ATLANTIC COAST LINE.—Annual Report.—The annual report issued this week shows the following corporate income account for 1921:

	1921	1920
Gross	\$66,730,768	*\$25,304,074
Operating expenses, taxes, etc.	61,150,483	*22,417,740
Operating income	\$5,580,285	*\$2,886,334
Standard return (12 months)		1,684,197
Government guaranty (6 months)		5,478,458
Other income	4,423,110	5,203,804
Total income	\$10,003,395	\$15,252,783
Interest, rentals, etc.	8,212,826	7,568,627
Net income	\$1,790,569	\$7,684,156
Preferred dividends	9,835	9,835
Common dividends	4,801,034	4,801,034
Deficit	\$3,200,300	\$2,873,287

* For four months, 1920

BOSTON & MAINE.—Injunction Halts Annual Meeting.—The annual meeting at Boston on May 16 was suddenly adjourned to May 31 when it became known that injunction proceedings had been brought in the Supreme Court to prevent the New Haven's holdings from being voted. Edmund D. Codman filed the petition, the effect of which would be to restrain the counting of ballots for the election of directors, five of whom, according to a federal court decree given on May 12 by Judge Mayer in New York, were to be representatives of the New York, New Haven & Hartford.

CANADIAN PACIFIC.—Address of President Beatty.—At the annual meeting in Montreal on May 3, President E. W. Beatty said, in part:

The forty-first annual report indicates in a vivid way the effect on your company's operations of the acute depression through which the business of the country passed during 1921, and it is a matter of gratification that, notwithstanding the decrease in gross earnings of \$33,619,000, the economies which were effected resulted in somewhat increased net earnings, and, of course, a slightly larger surplus, after paying fixed charges and usual dividends on the preferred and common stocks. The results reflect great credit upon the ability of the officers and men of the company, and are also a tribute to the physical condition of the property.

Sales of agricultural lands were, as indicated in the report, small, due to the general depression and the absence of the immigration of agriculturists during the year. In my opinion, Canada cannot afford to be without a definite and forward immigration policy much longer. While it is urged that the depression both in agriculture and in general industry, with consequent unemployment during the past winter, is a reason why active immigration measures should not be taken, it must not be forgotten that there are types of immigrants that can be readily obtained and brought to Canada without the possibility of adding to the burdens of the country.

As forecast in the address at the last annual meeting, reductions took place during the year in both rates of wages and in freight and passenger rates. The former, which became effective July 16, last, was equivalent to a reduction of 9.03 per cent on their existing payrolls of the company. The demand for further freight rate reductions is still persistent throughout Canada, and to the existing scale of rates is attributed much of the present weakness in business. It is, in my opinion, an entirely erroneous impression that the existing freight rates are the cause, rather than the result, of the present economic conditions, the most important of which, from a transportation standpoint, is the present scale of wages and working conditions which the railways were compelled by government action to accept during the war.

It is the view of your directors, and it has been their view for some time, that the coming upward of freight rates should be begun with reductions in labor costs, especially in those industries which have the most general depression most severely. Notwithstanding the weakness of the country, it is a gratifying fact that the help that will come from a more sane and businesslike wage policy in the long run is being felt. It is, however, to be regretted that no agreement on a definite basis because of the approaching expiration, on July 7, next, of the present rate of the railway act allowing the railway companies to make any arrangement of wages, salaries or other.

I feel that it is to be hoped that the present year would see a resumption of at least normal activity in maintenance and construction works, the necessity for which always prevails on a system the size of the Canadian Pacific. Appropriations of money on these accounts during the period at which we are now are, therefore, well warranted, especially in view of the freight rate situation.

Gross earnings on all Canadian roads still show substantial decreases over those of the corresponding period of 1921. Crop conditions, however, so far as they can be judged at this late, are very favorable, and there is a returning spirit of optimism and activity which should grow in volume if the agricultural prospects are realized.

The company's taxation is not unattractively increasing from year to year and, while only \$10,000,000 having accrued in federal taxes during the last five and one-half years. As indicated in the annual report, the

finances of the company are in splendid condition, and the credit of the company has been well maintained and is extremely high. While there are some serious and difficult problems yet to be solved, the general sentiment of the country shows a distinct improvement over that prevailing at the end of last year and the beginning of 1921.

CENTRAL OF GEORGIA.—Authorized to Issue Bonds.—The Interstate Commerce Commission has authorized an issue of \$1,313,000 of refunding and general mortgage 6 per cent bonds to be pledged from time to time as security for short term notes.

CHICAGO, MILWAUKEE & ST. PAUL.—Six Months' Guaranty Certified.—The Interstate Commerce Commission on May 11 announced its first final settlement of the amount of the six months' guaranty for 1920 in the case of one of the larger railroad systems when it certified the amount for the Chicago, Milwaukee & St. Paul as \$23,111,528, of which all but \$673,636 had been paid in the form of advances and partial payments.

CLEVELAND UNION TERMINALS COMPANY.—Hearing on Application to Issue Securities.—The Interstate Commerce Commission has assigned this company's application for authority to issue stock and bonds for a hearing before Examiner Agate at Cleveland on May 23.

GEORGIA, ASHBURN, SYLVESTER & CAMILLA.—The Interstate Commerce Commission has issued a certificate authorizing the acquisition and operation by this company of the railroad extending from Ashburn to Camilla, Ga., a distance of 51 miles, formerly operated as a part of the Hawkinsville & Florida Southern. The applicant company has been organized to purchase this section, the receiver having fixed \$125,000 as an upset price for that portion of the property.

GRAND TRUNK RAILWAY OF CANADA.—Annual Report.—The income account for the year ended December 31, 1921, compares as follows:

	1921	1920
Operating revenues:		
Freight	\$54,239,904	\$58,102,754
Passenger	15,510,164	16,948,183
Total	76,858,032	81,444,647
Operating expenses:		
Maintenance of way and structures	12,862,797	12,005,384
Maintenance of equipment	17,809,497	21,103,432
Traffic	1,533,830	3,894,107
Transportation—rail line	35,574,298	38,518,233
General	2,904,024	2,787,700
Total operating expenses	71,179,293	76,213,815
Net revenue from railway operations	5,678,739	5,228,832
Railway tax accruals	1,155,577	1,280,003
Railway operating income	4,344,254	3,925,765
Total non-operating income	8,634,102	7,706,273
Gross income	12,978,356	11,632,038
Interest on fund of debt	16,412,615	10,054,583
Total deduction from gross income	27,042,797	16,231,142
Income balance	Def. 14,064,442	Def. 4,599,105

INTERNATIONAL & GREAT NORTHERN.—Valuation.—Following a valuation of the property of the International & Great Northern by the Texas State Railroad Commission that body has officially announced the amount to be \$38,748,469 and holds in abeyance claim for an additional \$376,046 represented in a 6 per cent value of franchise. The commission will issue a supplemental order if it recognizes the franchise valuation. Against the valuation allowed, the International & Great Northern has outstanding indebtedness as of December 31, 1920, of \$33,267,000, making a difference in favor of the railroad company of a little more than \$5,000,000. This difference it is understood, represents additional receiver's certificates and equipment obligations issued since December 31, 1920, as well as to give the company a working fund to meet current expenses immediately following the proposed reorganization to terminate the receivership.

LAKE ERIE & WESTERN.—New Directors.—The following new directors have been elected: O. P. Van Swearingen, M. J. Van Swearingen, J. J. Bernet, Otto Miller, W. A. Culston, J. R. Nutt, John Sherwin, H. Van Vechten and C. L. Bradley.

LEHIGH VALLEY.—Annual Report.—This company's annual report for 1921 is reviewed in an article on another page of this issue entitled "Lehigh Valley Car Repairs Big Factor in 1921." See also excerpts from annual report on adjacent pages; also editorial entitled "Annual Reports and Publicity."

LONG ISLAND.—Asks Authority for Equipment Trust Obligations.—This company has applied to the Interstate Commerce Commission for authority to issue \$980,000 of ten-year, 6 per

cent equipment trust obligations to be taken by the American Car & Foundry Company in payment for 40 passenger motor cars costing \$1,078,440 and 10 steel passenger cars the cost of which totals \$147,735.

MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE.—*Annual Report*.—The income account for the year ended December 31, 1921, compares as follows:

	1921	1920*
Total operating revenue	\$26,185,804	\$34,270,691
Total operating expenses	24,325,913	30,847,709
Net operating revenue	1,859,888	3,399,260
Railway tax accruals	1,899,069	2,513,934
Operating income	Def. 45,214	826,246
Total non-operating income	1,616,018	18,923,523
Gross income	1,572,804	9,749,769
Interest on mortgage bonds	3,188,945	2,913,850
Total deductions from gross income	5,044,962	6,665,156
Net income	Def. 3,473,158	3,084,613

*Operating revenues and expenses, March 1 to Dec. 31. Includes income from lease of road.

Chairman Elected.—Edmund Pennington, former president, has been elected chairman of the company, a newly-created position.

MISSOURI, KANSAS & TEXAS.—*Branch Line Sold*.—William Edenborn, of New Orleans, president and principal owner of the Louisiana Railway & Navigation Company, has concluded arrangements to purchase that part of the Missouri, Kansas & Texas system extending from McKinney, Texas, to Shreveport, La., about 220 miles. The purchase price has not been announced, but it is said to be close to \$30,000,000.

NEW YORK, CHICAGO & ST. LOUIS.—*Annual Report*.—See excerpts from annual report on an adjacent page.

NORFOLK & WESTERN.—*Asks Authority to Guarantee Equipment Trust Certificates*.—This company has applied to the Interstate Commerce Commission for authority to guarantee \$6,700,000 of ten-year 5 per cent equipment trust certificates, instead of 5½ per cent certificates as was incorrectly stated in these columns last week. The certificates are to be issued by the Virginia Holding Company for equipment to be leased to the Norfolk & Western and are to be sold at not less than 97.75.

PERE MARQUETTE.—*Annual Report*.—This company's annual report for 1921 is reviewed in an article on another page of this issue entitled "Pere Marquette Surplus After Charges, \$3,765,880." See also excerpts from annual report on adjacent pages.

Abandonment of Lines Recommended.—The Interstate Commerce Commission has made public tentative reports by an examiner recommending that certificates be issued authorizing the abandonment of the Freeport branch, 6.23 miles, and the line from a point near White Cloud to Big Rapids, Mich., 19.67 miles.

TOLEDO, PEORIA & WESTERN.—*Annual Report*.—The corporate income account for the year ended December 31, 1921, is as follows:

	1921	1920*
Operating revenues:		
Freight	\$996,984	\$1,285,608
Passenger	568,635	630,174
Total, including other	1,692,420	2,090,667
Operating expenses:		
Maintenance of way and structures	366,595	382,554
Maintenance of equipment	530,007	676,494
Traffic	37,233	36,154
Transportation	874,686	1,249,355
General	95,192	97,024
Total	1,903,532	2,441,420
Net revenue from railway operations	Def. 211,112	Def. 350,753
Railway tax accruals	117,542	122,000
Railway operating income	Def. 328,654	Def. 472,753
Total non-operating income	106,094	634,962
Gross income	222,650	162,209
Total deduction from gross income	285,005	350,249
Net income	Def. 507,654	Def. 188,040

*Corporate and federal operations combined.

UNION PACIFIC.—*Annual Report*.—The income for the calendar year 1921, compared with the calendar year 1920, after excluding all offsetting accounts between the Union Pacific Railroad Company, the Oregon Short Line Railroad Company and the Oregon-Washington Railroad & Navigation Company, was as follows:

	1921	1920	Increase or decrease
Operating revenues	\$181,445,913	\$175,260,837
Rental from United States Railroad Administration (two months)	7,099,453
Total receipts	181,445,913	182,360,290
Operating expenses	131,601,749	135,303,242
Receipts over expenses	49,844,164	47,057,048	\$2,787,117

Taxes	11,720,856	*10,754,015	966,840
Operating income	38,123,309	36,303,032	1,820,276
Other income, representing rents received and incidental operations:			
Total income from railroad properties	1,795,054	*1,492,885	302,169
39,918,362	37,795,917	2,122,446	
Deductions, representing rents paid, hire of equipment and incidental operations:			
Net income from railroad properties	5,692,195	*1,833,655	3,858,540
Income from investments and miscellaneous income	34,226,167	35,962,262	—1,736,094
Total income from all sources	13,138,088	12,298,597	839,131
47,364,255	48,261,218	896,963	
Deduct: Interest on funded debt and miscellaneous charges	16,063,180	15,586,987	476,193
Dividends on stock of Union Pacific Railroad Company:			
Preferred stock at 4 per cent	3,981,740	3,981,740
Common stock at 10 per cent	22,229,160	22,229,160
Sinking fund requirements	10,173	10,877	—703
Total appropriations of net income	26,221,073	26,221,777	—703
Surplus, transferred to profit and loss	5,080,002	6,452,454	—1,372,453

*For ten months, March to December, 1920, with a few minor exceptions, the Railroad Administration having operated the properties during the two months, January and February, 1920.

WESTERN PACIFIC.—*Annual Report*.—The corporate income account for the year ended December 31, 1921, compares as follows:

	1921	1920
Operating revenue:		
Freight	\$8,974,264	\$10,499,725
Passenger	2,324,507	2,365,166
Total, including other	12,104,155	13,595,790
Operating expenses:		
Maintenance of way and structures	2,157,574	2,232,282
Maintenance of equipment	3,378,689	2,073,740
Traffic	2,387,728	308,852
Transportation	4,593,023	4,973,462
General	716,855	446,281
Total operating expenses	10,391,343	10,311,410
Net revenue from railway operations	1,712,812	3,284,380
Railway tax accruals	*1,231,081	670,079
Total operating income	481,024	2,613,487
Non-operating income	4,445,463	2,050,685
Gross income	4,926,487	4,664,171
Interest on funded debt	1,225,560	1,202,755
Total deductions from gross income	2,067,953	2,247,960
Net income	2,858,533	2,416,212
Income applied to sinking fund	50,000	50,000
Income balance	2,808,533	2,366,212

*Includes \$205,173 income taxes for years 1918 and 1919 paid in 1921 on account of compensation received as rental of property for 1918-1919 in excess of compensation on which taxes had been paid for the year in question.

More Equipment Trusts Sold

The director general has announced additional sales of railroad equipment trust certificates maturing January 15, 1923, to January 15, 1935, inclusive, now held by the government, to:

Hornblower & Weeks, New York City	
Chicago & Alton	\$1,049,100
Cassatt & Co., Philadelphia, Pa.	
Chicago Great Western	375,700
	\$1,424,800

The total amount of equipment trust certificates sold by the government to date, at par plus accrued interest, is \$253,375,500.

Dividends Declared

Alabama Great Southern.—Common, ¾ per cent, semi-annually, payable June 29 to holders of record May 31; preferred, ¾ per cent, semi-annually, payable August 17 to holders of record July 13.

Chicago & North Western.—Common, 2½ per cent, semi-annually; preferred, 3½ per cent, semi-annually; both payable July 15 to holders of record June 15.

Eric & Pittsburgh.—1¼ per cent, quarterly payable June 10 to holders of record May 31.

North Pennsylvania.—\$1, quarterly, payable May 25 to holders of record May 11.

Pittsburgh, Bessemer & Lake Erie.—Preferred, 3 per cent, semi-annually, payable June 1 to holders of record May 15.

Pittsburgh, Youngstown & Ashabuda.—Preferred, 1¼ per cent, quarterly, payable June 1 to holders of record May 20.

Southern Pacific.—1½ per cent, quarterly, payable July 1 to holders of record May 31.

Union Pacific.—Common, 2½ per cent, quarterly, payable July 1 to holders of record June 1.

Trend of Railway Stock and Bonds Prices

	Last May 16	Last Week	Last Year
Average price of 20 representative rail way stocks	64.31	64.95	56.38
Average price of 20 representative rail-way bonds	85.87	86.07	74.05

Annual Reports

Lehigh Valley Railroad Company—Sixty-Eighth Report

PHILADELPHIA, Pa., April 3, 1922.

To the Stockholders of the Lehigh Valley Railroad Company:
The Board of Directors submits herewith a report of the business and condition of your company for the calendar year ended December 31, 1921.

INCOME

The Corporate Income Account for the year was as follows:

Total Operating Revenue.....	\$74,997,799.15
Total Operating Expenses.....	67,238,067.77
Net Operating Revenue.....	\$7,759,731.38
Railway Tax Accruals.....	\$2,026,088.03
Uncollectible Railway Revenues.....	40,683.80
	2,066,771.83

Operating Income.....	\$5,692,959.55
Other Income.....	12,839,774.08
Total Income.....	\$18,532,733.63
Deductions from Income.....	8,481,936.12
Net Income.....	\$10,050,797.51

PROFIT AND LOSS

Balance December 31, 1920.....	\$36,126,576.04
Transferred from Income.....	10,050,797.51
Miscellaneous Items—Net.....	1,399,705.37
Dividends.....	\$47,777,078.92
	4,245,749.00
Balance December 31, 1921.....	\$43,531,329.92

The Income Statement is not comparable with that for the previous year, because of the fact that the corporation operated its property during only 10 months of 1920. A consolidated income account showing revenues and expenses in detail for both years, on a comparable basis, including both Federal and Corporate operations, will be found on page 15 of the report. Operating Revenues for the year were practically the same as for the previous year, there being a decrease of slightly less than \$300,000. Operating expenses, however, decreased 16%, or \$12,785,082.62.

FINANCIAL

The following obligations matured and were paid and cancelled during the year:

Collateral Trust 4% Bonds.....	\$1,000,000.00
Equipment Trust Series "M" Certificates.....	200,000.00
Equipment Trust Series "O" Certificates.....	500,000.00
Equipment Trust Series "R" Certificates.....	400,000.00
	\$2,100,000.00

In addition to the above, the following unmatured Equipment Trust Certificates, all of which were owned by your company, were paid and cancelled during the year and the Equipment Trusts terminated:

Equipment Trust Series "M" Certificates.....	\$400,000.00
Equipment Trust Series "O" Certificates.....	500,000.00
Equipment Trust Series "R" Certificates.....	400,000.00
	\$1,300,000.00

This leaves your company without any Equipment Trust Obligations. At the close of the year the company held in its treasury the following securities of its own issue, amounting to \$13,742,000.00, which are not included in the pledged securities, amounting to \$30,131,172.48, shown on page 10.

Consolidated Mortgage 4½% Bonds.....	\$66,000.00
Consolidated Mortgage 6% Bonds.....	108,000.00
Collateral Trust 4% Bonds.....	1,088,000.00
General Consolidated Mortgage Bonds.....	12,480,000.00
	\$13,742,000.00

In addition, \$3,806,000.00 General Consolidated Mortgage Bonds are temporarily held by the United States Government, as collateral, pending settlement of Federal Control and Guaranty Terminal accounts. It is expected that during the year 1922 a substantial sum will be received from the Government in final settlement of these matters and the collateral released.

Since 1903, the date of the General Consolidated Mortgage, expenditures have been made for additional bonds and betterments to the company's properties and for other capital purposes of approximately \$26,050,000.00 against which no securities have been issued.

An issue of \$6,000,000.00 Easton & Amboy Railroad First Mortgage 5% Bonds, the principal and interest of which are guaranteed by your company, will mature during 1922. This will require no new financing, as provision has been made for the payment of these bonds out of available funds. This payment will entitle the Lehigh Valley Railroad Company to receive \$6,413,016.10 in addition to the General Consolidated Mortgage of September 30, 1903, which bonds the company in due course will secure from the trustee and place in its treasury for future use.

ROAD AND EQUIPMENT

Expenditures for additions and betterments to road and equipment, including expenditures for subsidiary properties, during the year amounted to \$6,413,016.10, against which there were credits representing the sales or retirement of property of \$1,156,480.67, leaving a net expenditure of \$5,256,535.43.

The most important items the cost of which was charged wholly or in part to Investment in Road and Equipment are as follows:
We was annexed to Clarendon Terminal, the water and rail terminal your company is building on New York Bay, Jersey City. The first unit of this development, which will be ready for service during the year 1922, is a pier more than two thirds of a mile long, with 15 feet of water along side at which the largest ships afloat can be berthed. Its facilities will include a two-story warehouse with a capacity of 500 cars of freight, an open dock served by a 36-ton traveling gantry crane capable of handling

100 cars of freight a day, and two electrically operated unloaders to handle ore and coal from vessels to cars, with a capacity of 20,000 tons per 24 hours. As increased traffic warrants, two additional piers will be built. When completed in its entirety, the terminal will afford docking facilities of approximately five and one-half miles, capable of berthing the largest ocean-going craft.

The new freight pier station, erected by your company at the foot of East 47th and East 48th Streets, New York City, was completed and placed in service.

New passenger and freight stations were erected at Ulster and Midlesex. At Hillside, formerly known as West Elizabeth, the freight house was relocated and a new platform for handling milk constructed. Three passing sidings on the Seneca Division at Laceyville, Rummelsheld and Tunkhannock, were extended a total of approximately two and one-half miles.

To expedite the handling of automobiles at Wilkes-Barre and 149th Street Terminal, New York City, existing facilities were enlarged and improved.

Twenty-one new motor cars for use in maintenance of way work, etc., were placed in service.

Thirty automatic signals between South Somerville and Stanton were equipped with electric lights, replacing acetylene gas light equipment.

Interlocking plants at Easton, Packerton and Laurel Junction were re-wired and upper quadrant signals installed. Few new audible-visible crossing alarms were installed.

Two new tugs, nine lighters and three covered barges for use in New York harbor were added to your company's floating equipment.

GENERAL REMARKS

Your company is offering for industrial development a 230-acre tract at Buffalo, following the clearing of certain long-disputed titles. The property has a frontage on Lake Erie of over a mile, amply protected by breakwater, and lies less than two miles from the center of Buffalo, adjoining the 500-acre freight terminal of your company, with which it has direct track connections. It offers special advantages as sites for grain elevators, or industries desiring lake and rail transportation facilities.

Stockholders now number 19,122, with an average holding of 63 shares. Of this number, 10,000 are women and 615 banks, insurance companies, fiduciaries and charitable organizations, of the latter one hundred and seventy-three of the company's employees have invested their savings in the stock.

In connection with the order of the United States Supreme Court, directing your company to sever its connection with The Lehigh Valley Coal Company and Coxie Brothers & Co., Inc., careful study was devoted to formulating a plan to carry out the Court's order. In seeking a solution of this problem, the management has kept constantly in mind the necessity of complying fully with the letter and spirit of the Court's decision, and at the same time protecting the interests of its many stockholders and owners of its General Consolidated Mortgage Bonds. To accomplish the desired result, the management has presented a plan to the District Court for the Southern District of New York, which has been entered and certain objections to the plan and it is now awaiting argument.

The had order freight car situation, which has been mentioned in previous reports, continued serious. Many of your company's cars, which had been away from the yard for a considerable period, were returned during the year in a crippled condition, lack of proper maintenance during Government operation being largely responsible. To be prepared to meet a business revival prompt repair of these cars was necessary. Because of the high rates for pay and expense restrictions governing working conditions for railroad employees, prescribed by the United States Railroad Labor Board, but which do not apply in other industries, favorable contracts were made with several outside concerns for part of this work. A total of 9,975 cars were delivered to your yards for general repairs during the year, on which your company saved \$690,274.50, as compared with the cost of making these repairs at its own shops, which, in the past, under normal conditions, have been able to take care of this work.

As an illustration of the deplorable condition of equipment at the termination of Federal control, your company expended and charged to operating expenses for the maintenance of engines, cars and floating equipment during 1921 a total of \$25,138,217.00, an increase of practically \$1,500,000.00 over the previous year and approximately \$8,037,400.00 more than would have been disbursed had expenditures been limited for this purpose to the same ratio as applied on other railroads during the year, according to Interstate Commerce Commission records.

The severe business depression resulted in a decrease in revenue producing tonnage of the railroads in the United States in 1921 of 25.18% as compared with 1920. On the Lehigh Valley the decrease was 19.26%. In meeting the business depression the management sought to make every possible economy in operation. As a result, on December 31, 1921, there was a 18% reduction in employees, as compared with December 31, 1920. On the other hand, there was a notable gain in efficiency over the previous twelve months.

As a result of the policy of recent years of putting only creosoted ties into the roadbed, it was necessary to place but 456,789 ties in tracks during 1921, as compared with an average of 838,627 for the five-year period prior to Federal control. It is anticipated that the annual requirements will continue to show a reduction as the number of creosoted ties in the track is reduced. The cost of ties in this time 5,707,979 creosoted ties, which is approximately 62% of the total number of ties in service. The policy of purchasing only rail weighing 136 pounds to the yard also was continued. There are now 380 miles of track laid with this heavier rail. The cost of this year's additional ties and rails amounted to \$1,262,290.60, a decrease of \$1,092,256.78 as compared with the year 1920.

Taxes accrued during the year amounted to \$2,196,959.42, which is an increase of 36% over the average annual tax accruals for the five-year period prior to Federal control. This situation has become a serious one for all railroads, due largely to the issue by different communities of bonds for highway improvements, resulting in enormous increases in taxes to meet the interest and sinking fund payments on such bonds. In effect, the taxpayers are being compelled to contribute a part of the benefit of their motor-track competitors whose ironroads upon railroad traffic are continuously increasing.

While 1921 was hardly to be regarded as a year for business expansion, the Industrial Department has developed new industries in the territory served by your railroad. Of this number 44 have direct sidetrack connections.

Mr. Arthur W. Sewall, a director of your Company, resigned during the year, and General Harry C. Trexler was elected to fill the vacancy. In effect, the officers are continuing to carry on a grandly spirited co-operation in the performance of their duties, for which the management is deeply grateful.

Respectfully,
E. E. LOOMIS, President.

NOTE—The item, Investment in Road, represents only road property of Lehigh Valley Railroad Company property (Phillipsburg, N. J., to Wilkes-Barre, Pa.). The total road and equipment Investments of the system, including transportation subsidiaries, owned by your Company, is \$222,000,764.57.

GENERAL REMARKS TO OWNERS OF RAILROAD SECURITIES

The general situation affecting the transportation interests of the United States is worthy of the attention and careful study of all owners of railroad securities. The year just closed was one of upset and disturbed conditions, and 1922, while promising better things, offers serious and difficult problems, particularly from a railroad point of view.

During 1921 the situation was complicated, so far as the railroad companies were concerned, by difficulties with organized labor, the leaders of which were ill-disposed to accept the deflation of wages brought about in almost every other industry, and by demands for reduced freight rates from commercial interests pressed by a horizontal reduction in rates.

After an exhaustive investigation, the United States Railroad Labor Board in July announced a reduction in wages of approximately 11½% for all classes of employes, and later during the year it promulgated new rates governing their working conditions—the latter taking the place of the National Agreements made with various unions during Federal control. While the National Agreements have been abrogated, National rules laid down by the Labor Board have been substituted. These are not as onerous as the National Agreements, but prove a handicap to economical and efficient operation because they are standardized for the country as a whole and make no allowance for local conditions. Neither the wage reduction nor the new rules made it possible for the railroads to reduce their operating expenses sufficiently to consider any horizontal reduction in rates. The railroads agreed, however, to seek further reductions in wages, with a view to harmonizing them with the prevailing rates of pay in other industries, with the understanding that all savings effected should be passed along to the public in the form of reduced rates, and the matter is now before the Labor Board.

In the meanwhile, numerous voluntary adjustments in freight rates were made by the railroads, correcting obvious cases of injustice, and, late in the year, all the railroads of the country agreed to reduce, on January 1, 1922, to make a reduction of 10% in rates on farm products, while on December 27, 1921, a 16½% reduction in the rates on grain and grain products, ordered by the Interstate Commerce Commission, became effective in western territory.

RATE REDUCTIONS SOUGHT AS AID TO OTHER INDUSTRIES

Despite these reductions, the demand for further concessions in rates continued unabated, and such action offers a serious menace for prevailing business difficulties apparently was widespread. The railroads as a whole went far less on their properties during the last year than normally required. Their return to the market as purchasers to any important degree is possible only by permitting them to carry a fair return on their investment, but there was little disposition to give this opportunity to the country's largest buyer. Instead, it was argued that rate reductions must be made that this or that industry might be rescued from the unsatisfactory conditions into which it has fallen as a result of the worldwide depression. Because of this insistent demand for further reductions, the Interstate Commerce Commission, on its own motion, decided upon a general inquiry into the whole question of transportation charges.

The Committee on Interstate Commerce of the United States Senate is now conducting an exhaustive inquiry into all phases of the transportation problem. While no important changes have been made in the Transportation Act of 1920, special attack has been made upon the provision of the law requiring the Interstate Commerce Commission to make rates which will provide the railroad companies with a fair return upon their properties

used in railroad operation, and upon the section under which the Interstate Commerce Commission is given authority over intrastate rates where they affect interstate rates.

It will be recalled that the Transportation Act specifically required the Interstate Commerce Commission to make rates which would bring to the carriers revenue representing a reasonable return upon their investment in property used for railroad purposes and provided particularly that for the period between the passage of the Act and February 28, 1922, this reasonable rate should be 6 per cent. In 1921 the carriers, as a whole, earned only 3.3% on their investment, despite this provision, so frequently incorrectly called a guarantee.

RAILROAD'S CREDIT SITUATION IS AID TO MALCONTENTS

Advocates of some form of Government ownership of railroads, a question which it was thought had been eliminated as an issue in the railroad situation following experiences during the war and immediately afterward, continued to urge their ideas. The most active were officials of various labor organizations, pressing the so-called Plumb Plan, which provides for Government ownership with operation by the unions, and the theorists who see in the socialization of all public utilities the solution of all the ills to which the world is subject. Another element, and one which invites careful consideration, bids fair to become more important in the future. In recent years there has been a serious decline in railroad development. Not only have lines not been extended, but terminal facilities, additional trackage, etc., have not been constructed to keep pace with the Nation's commercial growth, and many railroad companies have not been in a financial position which would enable them to purchase new engines and cars in numbers calculated to meet the situation. When business revives, the demand for transportation probably will be greater than the capacity of existing facilities, and the railroads as a whole will have difficulty in supplying the service required. Past experience indicates that the unthinking immediately will start a clamor for Government ownership.

It should be a matter of concern to all, and particularly to those whose business is dependent upon adequate and efficient transportation. Experiences with Government owned railroads in other countries, without exception, has demonstrated the impossibility of their performing service of a character approaching our standards and such railroad systems, instead, are the mere cat's-paw of politics with the burden of making up deficits in the cost of operation falling upon the people in the form of taxation.

To meet this threatened condition requires an attitude on the part of the Government and a people which will permit American railroads to re-establish their credit, that they may be able to finance needed improvements to their properties.

It is necessary that those who would be fair in regard to such matters, and particularly those who have even more interest because of their investments, should not only themselves recognize the situation which has been forced upon the railroads, but also that they should make it a point to bring all others to a realization of the fact that this condition is not one of the railroads making but the outcome of a policy of regulation which mistakenly has been carried too far. Likewise it is incumbent upon them to let their representatives in State and National legislative and regulatory bodies know where the owners of railroad securities stand regarding this problem, that there may be an end to the hampering and well-nigh stranglehold of the carriers which has prevailed for the last two decades.

E. E. LOOMIS, President.

New York, Chicago & St. Louis Railroad Company — Thirty-fifth Annual Report

To the Stockholders of

THE NEW YORK, CHICAGO AND ST. LOUIS RAILROAD COMPANY:
The Board of Directors herewith submit its report for the year ended December 31, 1921:

The capital stock authorized and issued to December 31, 1921, was	\$30,000,000.00
being the same as at the close of the previous year	
The funded debt outstanding as of December 31, 1920, was \$37,320,000.00	
It was decreased during the calendar year:	
By the retirement of Equipment Trust Certificates of 1916	\$110,000.00
By the retirement of Engine Trust Certificates of 1916	30,000.00
By the retirement of Equipment Trust Certificates of 1917	135,000.00
By the retirement of First Mortgage Bonds	115,000.00
	390,000.00

Funded debt outstanding as of December 31, 1921, was \$36,930,000.00

You were advised in my letter of September 8, 1921, that final settlement had been effected with the United States Railroad Administration for all claims and accounts arising out of the period of Federal control. In accordance with the requirements of the Interstate Commerce Commission, the accounting for that settlement was accomplished during the year 1921. As a result of the settlement, the income of the company applicable to the years 1918, 1919, 1920 and 1921, has been finally determined and a statement of the income actually applicable to the years mentioned is set forth on page 11 of this report.

The usual financial and statistical statements are appended. The Board takes pleasure in acknowledging the fidelity, efficiency, and united efforts displayed by your officers and employes in the discharge of their duties during the year.

For the Board of Directors, J. J. BERNET, President.

INCOME ACCOUNT

Operating Income:	
Railway operating revenues	\$27,030,663.44

Ratio of operating expenses to operating revenues.....	78.42	86.66	*
Ratio of taxes to operating revenues.....	3.67	2.19	*
Total.....	82.09	88.85	*

*Note—The figures shown for the year 1920, represent results of ten months' operation by the Pere Marquette Railway Company, and two months' "Standard Return" received from the United States Railroad Administration covering Federal Control operations for January and February, 1920, which latter is included with "Non-Operating Income." As the operating revenues, expenses, etc., for the two months ended February 29, 1920, are not included in the above tabulation, the results from operation during the year 1921 are not comparable with the ten months period during which the road was operated by the Company in 1920.

FUNDED DEBT

During the year ended December 31, 1921, additional temporary Equipment Gold Notes aggregating \$907,200.00 were issued in connection with the purchase of 40 locomotives and 3,000 freight cars allocated to the Pere Marquette Railway Company by the United States Railroad Administration, covered by Equipment Trust Agreement No. 63, dated January 15, 1920, between Walkers D. Hines, Director General of Railroads, Pere Marquette Railway Company and the Guaranty Trust Company of New York, Trustee. These notes are numbered 17 to 30, inclusive, and amount to \$64,800.00 each, being dated January 15, 1920, and mature serially January 15th of each year, beginning with 1922 and ending with 1935. They bear interest at the rate of 6% per annum, payable semi-annually on the 15th day of January and July in each year, and are subject to redemption at the election of the Railway Company at their face value and accrued interest, together with premium of 3% of the principal, in the manner and upon the terms and conditions provided for in said Equipment Trust Agreement.

The final agreed purchase price of all equipment covered by Equipment Trust Agreement No. 63, as certified by the Director General, was \$10,121,167.28, which was satisfied by the Railway Company as follows:

Notes Nos. 1 to 15, inclusive, at \$608,500.00 each, dated January 15, 1920, due annually, January 15, 1921, to January 15, 1935, inclusive, executed during the year ended December 31, 1920.....	\$9,127,500.00
Notes Nos. 17 to 30, inclusive, at \$64,800.00 each, dated January 15, 1920, due annually, January 15, 1922, to January 15, 1935, inclusive, executed during the year ended December 31, 1921.....	907,200.00
Cash payments made by the Railway Company to the Guaranty Trust Company of New York, Trustee, and to the Director General.....	*86,467.28

Total, representing final agreed purchase price..... \$10,121,167.28

*Note No. 16 for \$64,800.00, representing a portion of principal due January 15, 1921, was not issued, but in lieu thereof this amount was included in the cash payment on June 16, 1921.

During the year, Note No. 1, maturing January 15, 1921, amount \$608,500.00, was retired by cash payment made to the Guaranty Trust Company of New York.

Mention was made on page 10 of the Stockholders' Report for the year ended December 31, 1920, that First Mortgage 5% Series "A" Bonds of the Pere Marquette Railway Company, amounting to \$3,231,000.00, were authenticated by the Bankers Trust Company as Trustee under the First Mortgage and Deed of Trust, dated July 1, 1916, to cover 80% of expenditures made by the Railway Company for additions and betterments during the period July 1, 1918, to December 31, 1919. These bonds are held for safekeeping

by the Central Union Trust Company of New York, New York, N. Y., subject to the order of the Pere Marquette Railway Company.

During the year ended December 31, 1921, application was made to the Interstate Commerce Commission for authority to use these bonds as collateral, and this was authorized by order of the Commission dated May 31, 1921, Finance Docket No. 1397.

During the year ended December 31, 1921, Pere Marquette Railroad Collateral Trust Indenture 4% Bond No. 13, maturing January 1, 1923, par value \$1,000.00 was purchased by the Railway Company on account of being defaulted and not being good for delivery under the rules of the New York Stock Exchange. This bond was purchased at \$930.00 and accrued interest from July 1, 1921, to November 8, 1921, the purchase being authorized by action of the Board of Directors at meeting held on November 2, 1921. This bond, with coupons maturing January 1, 1922, July 1, 1922, and January 1, 1923, is in the possession of the Treasurer at Detroit, Mich., for safekeeping.

On July 15, 1921, the Pere Marquette Railway Company issued its promissory note to the Standard Steel Car Company for \$645,000, payable June 13, 1922, without interest. This note was issued in connection with an agreement made on May 2, 1921, between the Standard Steel Car Company and the Pere Marquette Railway Company, covering the purchase of 12 passenger coaches and 12 baggage cars.

There were no other changes in the amount of the Company's funded debt or capital stock outstanding during the year ended December 31, 1921.

SECURITIES ACQUIRED

During the year ended December 31, 1921, the Pere Marquette Railway Company purchased at par 50 shares of stock of the Flint Belt Railroad Company, for which it paid \$5,000.00 cash.

During the year, the Pere Marquette Railway Company advanced \$60,000.00 to the Flint Belt Railroad Company to be used for construction work.

DIVIDENDS

During the year ended December 31, 1921, quarterly dividends at the rate of 1¼% were regularly paid on the Prior Preference Stock. These payments were made out of surplus as of December 31, 1920, and amounted to \$560,000.00.

On December 7, 1921, a dividend of 10% was declared on the Company's 5% Preferred Stock, payable on January 3, 1922, to stockholders of record December 15, 1921. This dividend, amounting to \$1,242,900.00, was declared out of surplus as of December 31, 1920. Dividends on the 5% Preferred Stock are cumulative after January 1, 1919, and the declaration of 10% covered the prior years, 1920, 1919, 1918, 1917, 1916, 1915, 1914, 1913, 1912, 1911, 1910, 1909, 1908, 1907, 1906, 1905, 1904, 1903, 1902, 1901, 1900, 1999, 1998, 1997, 1996, 1995, 1994, 1993, 1992, 1991, 1990, 1989, 1988, 1987, 1986, 1985, 1984, 1983, 1982, 1981, 1980, 1979, 1978, 1977, 1976, 1975, 1974, 1973, 1972, 1971, 1970, 1969, 1968, 1967, 1966, 1965, 1964, 1963, 1962, 1961, 1960, 1959, 1958, 1957, 1956, 1955, 1954, 1953, 1952, 1951, 1950, 1949, 1948, 1947, 1946, 1945, 1944, 1943, 1942, 1941, 1940, 1939, 1938, 1937, 1936, 1935, 1934, 1933, 1932, 1931, 1930, 1929, 1928, 1927, 1926, 1925, 1924, 1923, 1922, 1921, 1920, 1919, 1918, 1917, 1916, 1915, 1914, 1913, 1912, 1911, 1910, 1909, 1908, 1907, 1906, 1905, 1904, 1903, 1902, 1901, 1900, 1999, 1998, 1997, 1996, 1995, 1994, 1993, 1992, 1991, 1990, 1989, 1988, 1987, 1986, 1985, 1984, 1983, 1982, 1981, 1980, 1979, 1978, 1977, 1976, 1975, 1974, 1973, 1972, 1971, 1970, 1969, 1968, 1967, 1966, 1965, 1964, 1963, 1962, 1961, 1960, 1959, 1958, 1957, 1956, 1955, 1954, 1953, 1952, 1951, 1950, 1949, 1948, 1947, 1946, 1945, 1944, 1943, 1942, 1941, 1940, 1939, 1938, 1937, 1936, 1935, 1934, 1933, 1932, 1931, 1930, 1929, 1928, 1927, 1926, 1925, 1924, 1923, 1922, 1921, 1920, 1919, 1918, 1917, 1916, 1915, 1914, 1913, 1912, 1911, 1920, 1919, 1918, 1917, 1916, 1915, 1914, 1913, 1912, 1911, 1910, 1909, 1908, 1907, 1906, 1905, 1904, 1903, 1902, 1901, 1900, 1999, 1998, 1997, 1996, 1995, 1994, 1993, 1992, 1991, 1990, 1989, 1988, 1987, 1986, 1985, 1984, 1983, 1982, 1981, 1980, 1979, 1978, 1977, 1976, 1975, 1974, 1973, 1972, 1971, 1970, 1969, 1968, 1967, 1966, 1965, 1964, 1963, 1962, 1961, 1960, 1959, 1958, 1957, 1956, 1955, 1954, 1953, 1952, 1951, 1950, 1949, 1948, 1947, 1946, 1945, 1944, 1943, 1942, 1941, 1940, 1939, 1938, 1937, 1936, 1935, 193

Railway Officers

Executive

G. R. Huntington, vice-president of the Minneapolis, St. Paul & Sault Ste. Marie, has been elected president, succeeding **Edward Pennington** who has been elected to the newly created position of chairman. **G. W. Webster**, secretary and assistant to the president, has been appointed vice-president, succeeding Mr. Huntington. These changes were effective May 16.

Financial, Legal and Accounting

W. D. Beymer, controller of the Illinois Central with headquarters at Chicago, has been appointed assistant to the vice-president in charge of accounting with the same headquarters, effective May 1.

Edward W. Wheeler has been appointed general counsel of the Maine Central with headquarters at Portland, Me. In addition to his legal duties Mr. Wheeler will also exercise jurisdiction over matters of public relations, legislative action and leased lines.

Sydney Smith, valuation counsel of the Louisville & Nashville, with headquarters at Louisville, Ky., has been promoted to general attorney, with the same headquarters, effective May 10, to succeed **Ernest Woodworth**, resigned to engage in general practice. Effective the same date, **J. H. McChord**, counsel, has been promoted to assistant to the general counsel, **Ashby M. Warren**, assistant district attorney for the district of Kentucky, has been promoted to assistant general claims attorney, and the jurisdiction of **James J. Donohue**, general claims attorney, has been extended to cover litigation over personal injuries and damages to property.

J. F. Fairlamb, whose appointment as auditor of revenue of the New York Central was announced in the *Railway Age* of May 13, was born in Pennsylvania, in 1855. After his graduation from high school he entered the service of the Pennsylvania as a clerk. In 1884 he went with the New York, West Shore & Buffalo (New York Central) in a similar capacity. In 1886 he went with the New York Central as a clerk. Two years later he became assistant auditor of passenger accounts and, in 1890, auditor of passenger accounts. On March 1, 1906, he was appointed general passenger agent and on February 1, 1910, auditor of miscellaneous accounts, which position he held at the time of his recent appointment.

Operating

C. E. Carson, manager of the Chicago Traffic Club, has been appointed superintendent of the Southern division of the Chicago Great Western, with headquarters at Des Moines, Iowa, effective May 15, to succeed **C. A. Shoemaker**, who has been granted a leave of absence.

W. H. Bevans has been promoted to superintendent of the Western division of the St. Louis San Francisco, with headquarters at Find. Okla., effective May 10, to succeed **C. H. Claiborne**, who has been transferred to the Southern division, with headquarters at Memphis, Tenn., to succeed **J. F. Liston**, deceased.

H. W. Purvis has been appointed general manager of the Georgia & Florida with headquarters at Augusta, Ga., succeeding **D. F. Kirkland**, who has resigned to become vice-president of the Southern States Development Company. Mr. Kirkland will also serve as director of development of the Georgia & Florida. Mr. Purvis started what was to become a railroad career when he entered the employ of the Western Union Telegraph Company as an operator at Charlottesville, Va. in 1865. In 1897 he entered the service of the Norfolk & Western and served that company as an operator and agent operator at a number of places until 1900 when he

became an operator-yard clerk for the Seaboard Air Line at Hamlet, N. C. The following year he became a clerk in the office of the chief dispatcher at Raleigh, N. C., and, in 1902, was promoted to dispatcher in the same office. Four years later he was promoted to chief dispatcher at Jacksonville, Fla., and, in 1907, was transferred to Hamlet, N. C. In 1909 he was appointed trainmaster at Hamlet and, in 1912, was transferred to Americus, Ga. In November of the same year he was promoted to superintendent with headquarters at Jacksonville. From August, 1918, to July, 1919, he served as terminal manager under the Railroad Administration of all lines entering Jacksonville and then served for a time as superintendent at Jacksonville. In August, 1920, he was promoted to general superintendent with headquarters at Savannah, Ga., and Norfolk, Va., and in September of the following year was appointed general agent on the general manager's staff, in which position he was serving at the time of his recent appointment.

Traffic

W. R. Graham has been appointed commercial agent of the Southern with headquarters at Hattiesburg, Miss.

H. W. Stigler has been appointed general agent of the Kansas, Oklahoma & Gulf, with headquarters at Memphis, Tenn., effective May 1.

C. M. Shaftoe has been appointed New England passenger agent of the New York, New Haven & Hartford and the New England Steamship Company with headquarters at South Station, Boston.

Mechanical

James E. Goodwin has returned to the Northern Pacific as master mechanic at Duluth, Minn., after a five months' leave of absence and **John A. Marshall**, acting master mechanic, has been appointed road foreman of engines at Duluth.

Engineering, Maintenance of Way and Signaling

L. J. Hughes, assistant engineer on the Chicago, Rock Island & Pacific, with headquarters at Chicago, has been promoted to division engineer, with headquarters at Chicago, effective May 15, to succeed **A. C. Bradley**, who has been transferred to Fairbury, Neb., to succeed **J. G. Bloom**, who has been promoted to engineer maintenance of way of the system, with headquarters at Chicago.

Purchasing and Stores

A. W. Hix, whose appointment as assistant to the director of purchases of the Chesapeake & Ohio was announced in the *Railway Age* of April 29, page 1040, was born at Bramwell, W. Va., on December 10, 1892, and was educated in the public schools and at Massey's Business College at Richmond, Va. On November 24, 1908, he entered the service of the Chesapeake & Ohio in the office of the storekeeper at Richmond. Two years later he was transferred to the purchasing department as stenographer to the assistant chief clerk. From that time on he worked in various positions including those of file clerk, invoice clerk, trace clerk, tabulation clerk and order clerk, in which position he was serving at the time of his recent promotion as noted above.

The Table of Contents Will Be Found on Page 5 of the Advertising Section

The third of the series of articles by Samuel O. Dunn, editor of the *Railway Age*, dealing with European Railways appears on another page of this issue. The first two articles had to do primarily

Poor Passenger Service in Europe

with the activities of the International Railway Congress at Rome. The present article, however, is made up entirely of Mr. Dunn's observations of railway service in Italy, France and Switzerland. His portrayal of conditions there does not give a particularly happy picture. The war, of course, retarded railway development more in Europe than in this country. The building of equipment for high-class passenger service suffered particularly and it is the difficulty of securing accommodations and the overcrowding of trains which is most trying to the traveler in Continental Europe at the present time. Other conditions exist which are less excusable. The customs and passport formalities at international borders, of which there are many more since the war, are made needlessly uncomfortable for the traveler. Customs examinations are, of course, necessary but there is little excuse for the passport nuisance, especially between the countries allied in the war. Europe might learn much from the ease of traveling between the United States and Canada. There are, to be sure, many things to admire about these foreign railways. The speed of express trains in France has been restored to the high rate of pre-war days. Another point deserving favorable comment is the greater comfort of the seats in these trains as compared with our own. This, Mr. Dunn says, is especially noticeable in the seats provided for daytime use by making up the berths in the sleeping cars. All in all, however, it seems likely that the American tourists who are now "invading" Continental Europe will come back with a much higher appreciation of the adequacy, comfort and speed of American passenger service.

Few provisions in the working agreements with the train service organizations are more unsatisfactory to the managements or more demoralizing to the employees than that regarding overtime. The heavy penalty constitutes a severe tax on operation, while it offers an incentive to the crews to loiter on the road rather than to get their trains into the terminal. The local operating officers on one road have set out to reduce this overtime by offering a counter attraction to the men. On one division they found that it was possible for a crew to take a tonnage train over the road in approximately seven hours. As an incentive to a crew to make a good run they offered to provide a return train on arrival so that the men could get home without a long tie-up at the away-from-home terminal and then have 24 hours or more at home while making the same mileage as before. On another division where a slightly longer time was required to make the run with a tonnage train, it was found possible to provide time freight trains for the return trip so that the crews could make the round trip well within 16 hours. On another division where it was not possible to perfect such an arrangement, the engine districts were rearranged to require approximately 14 hours for the run, with the result that a crew which began to earn overtime

One Way to Reduce Overtime

ran the danger of being tied up on the road. In each of these instances overtime became a dead issue because the men were offered an incentive to avoid rather than to earn it. If the managements will offer the men equally favorable inducements to move their trains over the road as the rules now offer for delays en route, the overtime provision can be made very largely a dead letter.

Few Americans knew the meaning of the word "propaganda" until the activities of Germany in this country prior to our entrance into the war became known. Quite naturally, then, the Germans, who were the first to engage in propaganda on a large scale, have not forgotten that there is such a thing. They are still using it against the welfare of the American people. The most recent example of such activity has been brought to our attention by a letter from E. St. J. Greble, Jr., manager of the Baldwin Locomotive Works' office at Bucharest, Roumania, to a New York newspaper. This letter was in protest to Berlin dispatches which had appeared in that paper alleging that American locomotives in service in Roumania were proving unsatisfactory. Now it happens that just the contrary is true; the American locomotives are proving entirely satisfactory and are being used to bring in trains which German locomotives can not handle. Last year we had the privilege of translating and publishing an official statement denying similar scurrilous reports about American locomotives in service in Belgium. Indications were that this propaganda, too, emanated from Germany. If this is the manner in which Germany is attempting to reinstate her industry in the world's markets, then let our manufacturers know with what unscrupulous competitors they have to deal! Moreover, prospective buyers of German goods should learn the character of those who are attempting to gain their goodwill and take their promises and representations with the necessary grain of salt.

More German Propaganda

It is a regrettable fact, becoming more generally appreciated, that the majority of railroad shops are not equipped with machinery sufficiently powerful to work high speed steel tools to any where near their capacity. A longer time than necessary, therefore, is required to repair cars and locomotives and labor costs are correspondingly higher. This condition could hardly be otherwise since a large proportion of present shop machinery is ten or more years old. Even a few years ago it was the problem of tool experts to develop cutting tools which would utilize the full power of machines. Today the problem is reversed. The extent to which modern manufacturers have been successful in developing both accurate, high production machines and cutting tools which stress them to the limit is little short of astounding. The development of modern automobiles would have been an absolute impossibility without modern machine tools. The supremacy of America both industrially and mechanically is also dependent on such tools. It is an inescapable conclusion that the railroad industry, holding as it does sec-

ondary importance, is not equipped with machinery sufficiently powerful to work high speed steel tools to any where near their capacity. ondary importance, is not equipped with machinery sufficiently powerful to work high speed steel tools to any where near their capacity. A longer time than necessary, therefore, is required to repair cars and locomotives and labor costs are correspondingly higher. This condition could hardly be otherwise since a large proportion of present shop machinery is ten or more years old. Even a few years ago it was the problem of tool experts to develop cutting tools which would utilize the full power of machines. Today the problem is reversed. The extent to which modern manufacturers have been successful in developing both accurate, high production machines and cutting tools which stress them to the limit is little short of astounding. The development of modern automobiles would have been an absolute impossibility without modern machine tools. The supremacy of America both industrially and mechanically is also dependent on such tools. It is an inescapable conclusion that the railroad industry, holding as it does sec-

and place among the industries of the country, should not be satisfied until obsolete, inefficient shop machinery and tools are replaced by modern equipment. Is there any inherent reason why the average railroad shop should always be considered the last place to look for productive machinery and efficient methods?

The most obvious thing to say about the wrecking of the Lehigh Valley fast passenger train at a highway crossing,

Automobiles reported in the *Railway Age*, May 20, 1922, page 1176, is that this is a rare occurrence; that, usually, the person or **Wreckers of** persons in the automobile will be the only sufferers from defying a hundred-ton locomotive, running at a mile a minute; but when it is remembered that automobile freight trucks, the use of which is constantly increasing, sometimes weigh as much as ten tons, truck and load together, one realizes that derailments at crossings are likely to become less rare. Heavy automobile trucks, requiring perfect braking apparatus, seem to be entrusted to inexperienced or untrained drivers as freely as were the smaller vehicles of former days. A ten-ton obstacle is not so easily thrown aside. Solely as an element in self-preservation, railroads will be obliged to take a hand, as citizens, in the regulation of automobiles. In the light of such a case as this last one, the idea of improving the situation by calling on the owner of the automobile to pay for the damage he has done to railroad property seems almost ridiculous. By the way, what rule of law or reason would justify a court in requiring the railroad company to pay damages to the passengers injured in the North Leroy derailment?

The news items from Tennessee, Pennsylvania and New York printed in the *Railway Age*, May 20, 1922, page 1192,

How Can We Educate the Auto Driver?

afford encouraging evidence that the enforcement of the stop-look-listen rule at highway crossings is making progress—though the progress is extremely slow. It seems that in Tennessee a period of five years has been required to bring about a realization that there is on the statute books a law requiring automobiles to stop; five years to bring about a realization of the well-known fact that printing a regulative law in the statute book frequently has no effect at all in actual regulation. A correspondent in Tennessee, commenting on the fact that in his state (as in every other) the majority of motorists seem to drive regardless of all warnings, including plainly lettered boards set up at the side of the road, calls for the improvement of such roadside signs by freeing them from the confusing influence of other roadside signs which do not conduce to safety; as, for example, advertisements. This is one more feature of highway regulation in which railroads will be obliged, for their own protection, to take an active part. The approved warning sign, the 24-inch round disk, on a post, set up 300 ft. short of each railroad crossing, has been subjected to some criticism as not sufficiently large and conspicuous. It would help to make it conspicuous if all unnecessary roadside signs were required to be taken down. Massachusetts has passed a law to regulate bill-boards, under which action has been taken in at least one city, looking to the removal of all bill-boards that are within 300 ft. of important highways. This is a very necessary improvement, for which thoughtful citizens have long waited. The law, however, has a local option feature; it is wholly permissive except as cities and towns pass ordinances, and active stimulation of local public sentiment will be necessary before there can be any marked benefit from it. Massachusetts, however,

has made a good start, which should be imitated elsewhere. High speeds are now permitted freely on highways all over the country. To keep up this practice with any reasonable degree of safety there ought to be a complete scientific and uniform system of roadside signals, to cover all dangerous points. It may seem fanciful to propose the actual carrying out of such an idea, for the obstacles to anything of the kind would be great; but the need is very plain. And it is plain that public spirited railroad officers have a duty in the matter; are not they, by reason of their long experience in signaling for high speeds, better qualified than any other citizens to formulate a correct plan?

Surprising as it may seem there is relatively little information available regarding the amount of traffic which rail should normally carry before it is worn to the point that requires renewal.

Promising Field for Investigation

Such limited data as have been collected indicate that the tonnage carried increases in a much greater ratio than the weight of the section. In other words, the experience of those roads which have adopted the heavier sections in recent years indicates that the investment in the added metal has been amply justified by the increased service, without considering the reduction in the cost of maintenance and the better riding qualities of the stiffer rail. Not enough information has, however, been collected up to the present time to enable this statement to be made conclusively. For this reason a plan of co-operative action which the Rail committee of the American Railway Association has perfected recently with two universities holds much of promise. Through arrangements made with Professor Herman Diederichs, director of Sibley School of Engineering of Cornell University, 10 senior students of that institution are now making a detailed investigation of the rate of wear of rails of sections ranging from 90-lb. to 136-lb. per yard on tangent tracks of the Delaware, Lackawanna & Western and the Lehigh Valley. Measurements are being taken on rails which have carried traffic ranging from 10,000,000 tons to 300,000,000 tons. Similar arrangements are also being perfected with the University of Arizona for studies on tracks of the El Paso & Southwestern and the Southern Pacific. The results of a large number of observations of wear on rails of varying section and service on different railways in various parts of the country should go far in establishing the life which may reasonably be expected from rail of various sections and promoting uniformity in renewals. This plan will also bring the students in contact with the practical problems of railway operation which should result to the future benefit of those who enter railway service. It is to be hoped that the Rail committee may be able to interest other universities in this work to the mutual benefit of the students and the railways.

Striking proof that the business of the country is not being seriously retarded by freight rates is afforded by recent reports of freight car loading which show

Car Loading Shows Business Revival

that general business, exclusive of coal, is moving over the railroads at a heavier rate than it was even in 1920, the peak year of railroad traffic and before the latest advance in rates. For the week ending May 13, the number of cars loaded with revenue freight was 777,359, an increase of 26,173 as compared with the corresponding week of last year, in spite of the fact that less than half of the normal amount of coal is now moving. The coal traffic for that week, 79,170 cars, was 82,109 cars less than the movement for the corresponding week last year. If this amount

of coal were added the total loading would have been 859,000, as compared with 843,000 cars loaded in the corresponding week of 1920. A similar statement may be made of the other weeks since the coal strike began. President Harding, in his address before the United States Chamber of Commerce last week, expressed in a way that attracts more public attention than the weekly reports of railroad car loadings a fact to which they have been steadily pointing for several weeks, namely, that "business is reviving" and "our country is finding itself again." When reports of the Car Service Division of the American Railway Association for April and the first part of May show more cars loaded than in the corresponding weeks of last year, in spite of the loss of coal traffic, it cannot be denied that business is not only improving but it has improved. As practically all business involves transportation it would be difficult to find a better rough index of the general activity of the country than is afforded by these weekly car loading figures. The President not only called attention to what has happened, but he declared that: "Undoubtedly there is more than a mere business revival in sight. We are on the threshold of a new era. We do not intend ever to be discouraged for a long time." Supplementing this address, it was announced on the following day that reports to the White House indicate a shortage of labor already in many localities, a highly gratifying improvement in agriculture as well as in most branches of industry, and even the possibility of a distressing shortage of common labor within 90 days. The reports have convinced President Harding that we are on the eve of a wholesome revival which he expects to continue. To all of which the *Railway Age* may properly add that these statements were made prior to the decision of the Interstate Commerce Commission reducing freight rates and also before the dinner at which the President urged the railroads voluntarily to reduce rates.

The Rate Decision

THE OPINIONS which will be expressed with reference to the rate decision announced on Wednesday will vary in direct ratio with the degree of optimism felt by the one expressing the opinion as to the present general business situation. The Commission's findings in favor of an approximate 10 per cent decrease in freight rates are made in the face of the fact that in 1921, at the higher rates, the carriers earned only 3.3 per cent on their property investment. They are similarly made in spite of the fact that the rate of 5.83 per cent earned in March, 1922, was largely due to the heavy coal movement in anticipation of the coal strike. Business, however, is picking up. Those of us who are optimists are hoping that it is going to pick up soon enough and sufficiently enough so that increases in tonnage will overcome the reduction in receipts per ton or per ton-mile. The Commission declares its business judgment to be to that effect. We hope that it has decided correctly.

One question that arises in connection with the rate decision is as to whether the reductions suggested should have been general or should have been confined to the basic commodities and we shall probably hear more about this. That some reductions should have been expected is hardly in question. General sentiment throughout the country was in favor of it and that is always a powerful factor. The public has felt for some time that rates were too high and that the result of the high rates was to act as a check on business. That theory is not holeproof. The depression of 1921 was due to many causes and would have occurred with high freight rates or low freight rates, and, at present, business is picking up in excellent fashion at the present high rates. Nevertheless, the high rates have been a detriment, particularly because they have upset commercial relationships and

have borne severely on certain commodities and on certain producing centers. The tenor of the times was in favor of some reductions.

Nor were the reductions unexpected. The manner in which surrounding circumstances accompanied—whether intentionally or otherwise—the announcement of the Commission's decision is worthy of comment. The calling of the conference with President Harding last Saturday evening indicated that things were about to happen. The decision followed the press reports of what was done at the White House sufficiently close so that the favorable effect of the one were carried over to the other. Business psychology is more or less of an inexplicable sort of thing. It has a manner when the general trend of affairs is optimistic of emphasizing anything that has a trace of optimism. It is to be expected, therefore, that the action which has been embodied in the rate decision will accelerate the present business revival.

The administration has had a great deal to do towards encouraging public opinion to believe that a reduction in freight rates would assist the revival of business upon which the Administration is placing so much hope. It seems only fair that the Administration should now supplement its efforts and exert itself in the coal situation. It can do more towards settling the affair than any other parties in the present mix-up. The roads are at present losing at least 80,000 cars of coal traffic weekly or in other words this amount of coal traffic is being deferred until after the end of the strike. The unbalancing of the coal traffic will be a handicap in many ways taking the year as a whole. The Administration, it would seem, would do the wise thing, if it now directed its efforts towards restoring the traffic supplied by the mines.

The Interstate Commerce Commission has shown itself in pleasing contrast to the Railroad Labor Board. The Commission has accepted the view that it can do something towards bringing about or assisting the revival of business. The Board seems to have no such attitude and the unfortunate part of the Commission's decision is that conditions are such that the actions on one body are not more closely correlated with those of the other. The Labor Board is willing to go on subsidizing railroad shop labor by permitting it a rate of wages much above that for similar work in other industries, and to permit this class of labor to thrive at the expense of the farmer and the consumer who pay the freight rates.

Further, the revival of business is now on. Does not the Labor Board know that when business picks up to a gradually greater extent the carriers will need all the cars and locomotives they can secure? Has it not been advised that the percentages of bad-order cars and unserviceable locomotives are almost hopelessly high and that repairs are being postponed for lack of funds with which to pay the present high wage scales? There is some talk that the Labor Board's decision is to be handed down July 1—the day on which the present rate decision will presumably become effective. One hopes that this belief is correct. The Board's decision cannot be made public too soon in view of the present conditions.

It is difficult to see how the railroads can do otherwise than accept the Commission's decision to reduce rates. They should, however, make their assent of greatest value to themselves and the public. There is no reason, for example, why, in making it, they cannot point out that their coal traffic is conspicuous by its absence and that the Administration should take a hand in adjusting the situation. They should certainly express themselves about the activities—or rather the lack of activity—of the Labor Board with reference to the shop wages decision.

There has, of course, been a very considerable amount of comment and guesswork about the purpose of the President

in calling the chief executives together at dinner to talk over the rate question. Because of the announced intention of the Administration to put more business in government and less government in business, it has appeared to many that the President was using this opportunity of cultivating better relations between the government and the railroads. He was undoubtedly informed of the decision of the Interstate Commerce Commission to bring about a reduction in rates, and it is quite possible that his action and the general attitude of the Administration were such as to induce the Commission to seek to have the railroads make a voluntary reduction, rather than have the Commission issue a formal order. If this is true, then it would seem wise for the railroad executives to accept it in this spirit and to take such action as will strengthen the roads with the public and the Administration and insure more cordial relations in the future.

Analyzing the rate decision as a whole, one is inclined to feel optimistic about it. The decision calls for reductions of about 10 per cent, but it includes those reductions which have already gone into effect through previous formal orders. The public was asking for lower rates and its getting them should have a salutary effect on business. It seems a sane guess that business will revive sufficiently to make up in tonnage what will be lost in revenue per ton. A "sane guess," of course, is not a certainty, but it will be more of a certainty if the coal and labor situations are ironed out with some degree of promptitude.

It is difficult to understand why the Commission should have determined upon a rate of return of 5 $\frac{3}{4}$ per cent. The Act established a rate of 5 $\frac{1}{2}$ per cent with the proviso that $\frac{1}{2}$ per cent might be added for improvements chargeable to capital account. The carriers need these improvements as much as ever. Presumably the figure of 5 $\frac{3}{4}$ was chosen because of its psychological effect, on the ground that it might look better to the public than 6 per cent. Public bodies frequently have a way of doing things in this manner. Perhaps we should be satisfied that the rate was not reduced more than $\frac{1}{4}$ per cent. We are not overly impressed by what the decision says about federal taxation.

Enlarging the Ananias Class

"LABOR" is the name of a weekly paper published in Washington by the railway labor unions to disseminate propaganda among railway employees to discredit private management and promote the Plumb plan.

In its issue for April 1 this paper published an editorial entitled "Dunn in Ananias Class." It quoted the following statement made by Samuel O. Dunn, editor of the *Railway Age*, in an address before the Citizens' Alliance of Minneapolis on March 22: "The main reason for existing rates is that the average wage per hour of railway employees is 120 per cent higher than five years ago." It then said: "The Associated Press accepted Dunn's statement as gospel truth, sent it out over its wires and it was given a position of prominence in practically every daily paper." "Labor" charged that "Dunn's statement is false," and added: "The average wage of railway employees has increased 59.2 per cent during the last five years, not 120 per cent as claimed by Dunn. That's the finding of the United States Railway Labor Board from data gathered exclusively from railroad sources. The supporting figures may be found in 'Report No. 3—Wage Series' compiled by the board in October 1921."

What are the facts?

First, Mr. Dunn compared the average wage *per hour* in 1916 with the present average wage per hour. In 1916, as shown by the statistics of the Interstate Commerce Commission, the average hourly earnings of the 90 per cent of railway employees paid by the hour were 27.8 cents. In Novem-

ber, 1921, the latest month for which statistics of the Interstate Commerce Commission are available, the average earnings per hour of railway employees paid by the hour were 61.8 cents. This was an increase per hour of 34 cents, or 122 per cent.

Second, the Labor Board in October, 1921, issued "Report No. 3—Wage Series." This did not give any statistics regarding wages *per hour*. It did not give statistics for any date earlier than December, 1917, which was only four years, and not five years prior to the date of the wage figures given by the board for 1921. The board's report showed that the average *monthly* rate in December, 1917, was \$78.06, and that after the reduction in wages on July 1, 1921, it was \$124.27, or 59.2 per cent more.

In other words, Mr. Dunn gave average *hourly* earnings for two periods approximately five years apart and "Labor" attempted to refute them by giving *monthly* rates of pay for two periods only four years apart.

Why is there such a wide difference between the relative increases shown by the hourly earnings and the monthly rates? One reason is, of course, that one of the comparisons made was between statistics for 1916 and 1921, and the other between statistics for December, 1917, and the latter part of 1921; and there were substantial increases of wages in 1916 and 1917. Another and the most important reason is that the eight-hour day has been established, that employees as a result now work fewer hours per month for their monthly rate of pay than they did in 1916 and that, of course, in consequence their hourly earnings show a correspondingly greater increase than their monthly earnings. Finally, the monthly rate given by the Labor Board included no earnings for overtime work.

But why use the hourly earnings instead of the monthly rates? First, because the employees demanded and have obtained reductions in their hours of work as a benefit to themselves. Secondly, because the increase in the hourly earnings is the true measure of the increase in the operating expenses of the railways which has been caused by both the reduction in hours of work and the advances in wages which have been made. The reduction in hours of work has made it necessary for the railways to employ more men to do a given amount of work. This, as well as the increase in the average wage per hour, has increased the payroll, and it is the increase in the total payroll which has contributed most to the increase in operating expenses which has made necessary the present rates.

How accurately under normal conditions the increase in the hourly rate of pay conforms to the increase in the total payroll is illustrated by the following facts: Between 1917 and 1920 the average earnings per hour of employees paid on an hourly basis increased from 31.8 cents to 66.5 cents, or 109 per cent. Between the same years the total increase in the payroll was from \$1,740,000,000 to \$3,698,000,000, or 112 per cent. The freight business handled in 1920 was only 4 $\frac{1}{2}$ per cent greater than in 1917.

If railway employees were working as many hours per day, or month, now as in 1916 they would be earning approximately 120 per cent more than in 1916 per day and per month. That the daily and monthly earnings per employee have not increased as much in proportion as the hourly earnings or the total payroll is due to the fact that they have chosen to have their hours of work per day and per month reduced.

We are not unaware that the Plumb plan agitators who edit "Labor" will not be influenced by the foregoing statement of facts to accept for themselves the membership in the Ananias Club which they have offered to the editor of the *Railway Age*.

We have stated the facts so fully for the information of railway employees and other persons who really want to know them.

Is the Engineer to Blame?

FEW INDOOR SPORTS are more popular today than that of diagnosing the railroad ills, and the cures which are offered in consequence are nearly as varied as the number of diagnosticians. A new remedy comes from Roger W. Babson, who finds that among other ills the railroads are suffering from too many civil engineers in high places. We feel that an indictment of those railway executives who fall within this class cannot go unchallenged.

"The construction period of railroading is gone by," says Mr. Babson, "there is no more reason why a civil engineer should run a railroad today than that he should run the Woolworth business or the Sears-Roebuck business." Apparently Mr. Babson's conception of railway engineering and construction conforms to the popular impression which pictures a man behind a transit fitting curves to a mountain canyon. Such railroad construction, of course, is a matter of the past, but is there no work for the engineer in the design and construction of the Cedar Hill yard of the New York, New Haven & Hartford, in the building of the new Union passenger terminal at Chicago, or in the direction of maintenance of way work on an enormous property like the Pennsylvania? But the field of the engineer in railway service is by no means limited to construction and maintenance of way, *per se*. Ample testimony as to the usefulness of the engineer in the gradually increasing complication of railway operation is to be had daily, and no better evidence is to be found than the increasing reliance which the American Railway Association is placing on the American Railway Engineering Association for the study of technical problems of railway operation.

But to turn to the question of executives—civil engineers have been chosen as railway executives not because they were civil engineers but because some of them have developed into efficient operating officers, and surely such names as Rea, Kruttschnitt, Loree, Storey, Kelly, Dice and Pearson are received with exactly as much confidence when signed to an annual report as those of other railway presidents whose early training was along somewhat different lines.

The Needs of Water Transportation

ONE OF THE PRINCIPAL objections to "government in business" must be ascribed to the fact that it frequently places the spending of other people's money in the hands of men who consider all too lightly the responsibility thus placed upon them. This attitude is frequently manifested by the War department in its control over railway crossings of navigable streams. The building of new bridges, or the reconstruction of old ones, usually calls for extravagant requirements as to the clear width and height of channel openings with apparently no effort to balance the pecuniary advantage to be derived by the existing or potential river transportation with the enormous burden placed upon actual and thoroughly established rail transportation.

This subject has been given attention previously in these columns but merits further reference because of the particularly illuminating demonstration of the mental processes of the War department in spending the railroads' money. The Cincinnati Southern's bridge over the Ohio river which was recently reconstructed, as described elsewhere in this issue, provides a waterway opening that is 500 ft. wide and has a clear height of about 40 ft. above maximum high water and 81 ft. above average low water. The high water clearance was not considered sufficient, so provision was made in the original bridge for an auxiliary high water channel along the Kentucky shore in the form of a draw span having a total length of 370 ft. and providing two channel openings of approximately 150 ft. each.

When plans for reconstructing the bridge were submitted to the War department, the requirements imposed for the high water channel in replacing the old swing span were such as to make it necessary to provide a clear span for the entire distance between the two rest piers of the swing bridge. That is, a 365-ft. lift span was provided so that the old pivot pier might be removed. This requirement was made in spite of the fact that there is no record of the swing span ever having been turned following the test made at the time of its completion 45 years ago.

The reconstruction of the bridge was carried out in accordance with these requirements and when the work was completed, and the costly lift span was ready for use except for the razing of the old pivot pier, the river steamer interests petitioned to have this pier left in place so that it could continue to serve as an ice breaker for the protection of steamers moored down stream from it during times when the ice was running. The cost of the real or fancied requirements of a visionary inland water transportation cannot be scrutinized too carefully in these times when a reduction in the cost of rail transportation is the topic of the hour.

Trying to Hold Down Coal Prices

RAILROADS should find considerable of interest in the announcements from Washington of the efforts being made by Secretary Hoover to bring about a plan of co-operation among the coal mine operators to prevent a runaway coal market and incidental high prices as a result of the curtailment of coal production by the strike. This plan is being tried as a substitute for the system of price regulation which proved so unsatisfactory during the war.

As indicated by the dinners at the White House attended by steel and railroad executives last week, the President is a firm believer that much can be accomplished by calling men together around a table for a frank discussion of important problems. The coal operators are rather too numerous to be invited to dinner together, but Mr. Hoover got about 50 of them, representing over half of the output of the mines now in production, into a conference, at which it was proposed to call a general conference of coal operators to consider plans for the better co-ordination of coal distribution and the prevention of profiteering by the formation of central and district committees to take measures to assure the direct progress of coal to the consumer in proportion to his need and on the basis of the Garfield prices adjusted to meet changed conditions. Although the conference was open to the press and although it was proposed that representatives of the government be members of the central committee, it was regarded as necessary to submit this plan to the attorney general to see if it is in violation of the laws intended to prevent combinations and agreements to raise prices.

Mr. Hoover does not express complete confidence in the success of the plan but says it is worth trying and as large consumers of coal the railroads will doubtless wish him well. He called attention to the fact that in 1920, following the 1919 strike, nothing was done until the price of coal had mounted to from \$9 to \$15 a ton. Coal is now selling at from \$2.25 to \$4 a ton, but although there has not yet been sufficient demand for coal to take the full output of the non-union mines, scarcity and competitive buying in some districts have caused advances in some quarters. On the present basis of production the Washington authorities do not anticipate any serious situation at least until June, but Mr. Hoover is taking warning from previous experience in trying to interest the operators in the prevention of high prices—which in many instances were enjoyed by the coal dealers rather than by the operators—and at the same time in trying to avoid excessive competition among buyers by suggesting the formation of buying committees.

New Books

Railroads and Government: Their Relations in the United States, 1910-1921. By Frank Haight Dixon. 5½ in. by 8¼ in. 384 pages. Bound in cloth. Published by Charles Scribner's Sons, New York.

In one of the early chapters of this book Professor Dixon quotes the Interstate Commerce Commission in 1910 as saying:

"We must not regard too seriously, however, the effort of railroad counsel to establish this Commission *in loco parentis* towards the railroads. . . . This country cannot afford to have poor railroads, insufficiently equipped, unsubstantially built, carelessly operated. . . . Nevertheless, it is likewise to be remembered that the government has not undertaken to become the directing mind in railroad management. We are not the managers of the railroads. And no matter what the revenue they may receive, there can be no control placed by us upon its expenditure, no improvements directed, no economies enforced."

To anyone who knows to what extent the Commission is now doing the very things that in 1910 it said it had no power to do, the importance of the subject matter of Professor Dixon's book will be at once evident. Railway regulation by the federal government has progressed farther during the period since 1910 than for all the years prior to that date. The Adamson Law, federal control, the Transportation Act, the Labor Board—all these terms reflect the importance of the period.

Yet, until the appearance of this book, the happenings during these years have been concealed from those not actually engaged in matters having to do with railroad policy in its broader, country-wide aspects. Concealed—not in the sense that the actual happenings from day to day and week to week have not been published and read, but in that no story of happenings day by day or week by week can emphasize and minimize various events according to their true importance—consequently the significance of the achievement of recent history is lost to everyone but the student who makes it his business to connect events into a well-balanced whole. Not many people, with the exception of the numerically few railway executives, legislators, economists and writers who have by the nature of their callings been kept in close touch with the minute developments in Washington, have had even the approximation of a correct perspective of the developments of the past decade. And to acquire this perspective without this book would require weeks of toil—studying the files of magazines and newspapers, reports of Congressional hearings, decisions of the Interstate Commerce Commission, etc.

With the appearance of this book, however, all this has changed. Anyone with a fundamental knowledge of railroading can, with a few hours of reading, acquire an accurate knowledge of recent events in sufficient detail for ordinary purposes.

The Transportation Act has so many aspects that it is difficult to single out any one feature and call it the most important. The increased power which it gave to the Interstate Commerce Commission over rates can safely, however be called one of its more important provisions. These rates are to be fixed according to the law which will provide, "under honest, efficient and economical management," a reasonable return to the railroads. A knowledge of the development in rate-making which preceded this enactment and the power which the Commission now has over interstate rates makes an interesting background now when existing rates, which have never provided the legal returns, are under fire from many sources. Surely no railroad officer ought to be without a rather complete knowledge of these things which affect so closely the welfare of his company.

Professor Dixon's treatment of the federal control period

is thorough and adequate. He agrees with most railway economists that it served a useful purpose during the war but that government ownership offers no solution for peacetime transportation problems. His criticisms of the shortcomings of the Railroad Administration may seem inadequate to some, but the whole book is characterized by an absence of partisan feeling and gains in power thereby.

Another recent development which Professor Dixon emphasizes is the increasing interest which bondholders are taking in the management and control of the railroads. It is, of course, well known that a large part of the capital invested in the railroads is represented by bonds which carry no voting power with them. These bonds are, for the most part, not met at maturity out of earnings but by refunding. The National Association of Owners of Railroad Securities, representing large holders of bonds, has made itself heard in many ways of late and this seems to be one of the really significant results which the past few years have brought forth.

The consolidation provisions of the Transportation Act have not meant much as yet. Ultimately, however, consolidations may be brought about which will have a profound effect upon the art of railroading in this country. Hearings soon to be held before the Interstate Commerce Commission will bring the problem to the front and those familiar with Professor Dixon's chapter on the subject will be at a decided advantage in following these hearings, whether or not they agree with his rather sympathetic leaning toward the proposal.

The regulation of wages and working conditions is ever a problem. The strange method of raising wages which the Railroad Administration followed, *i. e.*, the rapid advancement of the wage scales of lower-paid employees and a much lower increase for the higher grades, did away with differentials which had proved their value by long years of use. All classes of labor profited by federal control in securing improved working conditions. All but a few, notably the train and engine service men, profited by wage increases (by the Railroad Administration and the Labor Board) which increased greatly their standard of living. A return to normal conditions in this respect seems difficult of attainment.

The authority of the Labor Board is being questioned and probably not until the Supreme Court has decided several cases will it be able to go forward in the course it has laid out for itself or confine its activities as the court may direct. Last autumn the Board secured a point in its favor by its masterful leadership in bringing to naught an impending strike. Only an unthinking optimist, however, could assume that the Labor problem on the railroads is solved for all time. It will come up time and time again and challenge the best minds that can be brought to deal with it. Professor Dixon is of the opinion that the Labor Board is a "valuable laboratory" for the study of this problem and is "entitled to a thorough test." With this position most of our readers will be in hearty accord.

Professional railroad-baiters attack the roads generally with carefully chosen statistics and plausible sounding economic theories. Most railroad men are occupied with the technical and operating problems of their own particular property and concern themselves little with the broad field of railway economics as applied to all the railroads. If the thousands of railway officers in the country were to inform themselves a little more thoroughly about the railroad problem in its broader aspects, fallacious theories advanced by anti-railroad "economists" would be checked before they could do much damage. For railroad men who desire to increase their ability to serve their employers this book is unhesitatingly recommended. Students and others who make it a business to keep abreast of modern thought along these lines will read the book as a matter of course.

Some Observations on European Railway Service

Traveling Is Difficult—Sleeping Car Service Inadequate— Trains Crowded and Rates High

By Samuel O. Dunn
Editor of the *Railway Age*

PARIS, FRANCE, May 9.

THE NEWSPAPERS report that American tourists are coming to Europe in unprecedented numbers. Anybody who has been traveling in Europe within recent weeks knows that thousands of Americans are here already. It is not indulging a facetious spirit to say that it is doubtful if this "American invasion" will tend to increase the good feeling between Europe and the United States.

There are some reasons, however, why it should, and undoubtedly will, increase the popularity of the passenger service of the railways of the United States among our own people. After an American who travels much at home has had an experience of a few weeks traveling on the continent of Europe under present conditions, he will be a strange person if he does not recall with longing the adequacy, cleanliness, convenience, comfort and speed of American passenger service.

It is not the purpose of this letter to criticize the railways of Europe or their management. The criticisms passed by the people of different countries upon each others' institutions, methods and customs very commonly are based on vanity, jealousy, ignorance or misunderstanding, and almost always tend to cause friction and antagonisms that often have serious results. But no reasonable person can take offense at a plain narrative of actual experiences given for a good purpose.
