It is provided in the amendment to Section 28 that the Shipping Board and the Interstate Commerce Commission have the power jointly to suspend the application of the provisions of this section when in their judgment it would operate to the prejudice of any particular port.

Commission and Court News

Interstate Commerce Commission

The commission has ordered oral argument before the full commission at Washington on July 6 in the investigation of the cost of locomotive repairs on the Central of New Jersey.

The commission has suspended until October 8, the operation of schedules which propose to reduce the charges of the Missouri Pacific on lumber held for reconignment at Dupon Ill., from \$7 a car to \$3.

The commission has suspended until October 8, the operation of certain schedules which propose to increase and reduce the rates on petroleum from Texas points to Colorado points on the Denver & Rio Grande Western.

The commission has issued a report finding justified reductions in the rates on grain and products from Illinois Central stations in northern Illinois to New Orleans for export to Europe. The order of suspension has been vacated.

The commission on petition filed by the Western railroads for a modification of its order, has reopened the western freight rate case involving grain, grain products and hay on the question of the relation of rates on wheat and other grains and their products between points in the western and the western and mountain-Pacific districts.

The commission has made public a tentative report by Examiner Bartel as a result of its investigation concerning the propriety of rates on bunker coal which are lower than rates on similar kinds of coal for local delivery. It recommends a finding that the railroads have justified the propriety of the application of the rates on coal for trans-shipment to vessels on bunker coal and that such rates do not contravene the fourth section of the commerce act.

Reduced Rates to Be Effective on Three Days' Notice

The commission has issued orders giving special permission to make the 10 per cent reduction in freight rates, to go into effect on July 1, on three days' notice. The original report had prescribed ten days' notice. These orders also waive various provisions of the tariff regulations to permit making the rates effective on short notice and in as inexpensive a manner as possible by the use of tariffs of reduced rates and special connecting link supplements referring to the tariff of reduced rates to be filed in the form shown in the exhibits attached to the orders.

Delivery of Perishable Freight at New York City

The commission has investigated the situation at the terminals of the Pennsylvania in New York City, in connection with the embargo on potatoes, which last week was suspended, at the request of the commission, and decides that no embargo is justified. The director of the Bureau of Service reports to the commission that the congestion of perishable freight has not been of sufficient extent or duration to warrant an embargo; that there is no congestion whatever at present; that the Pennsylvania pier facilities at New York where perishable freight is handled are inadequate to handle the arrivals during a 48-hour period in one day, but are adequate to care for each day's arrivals correctly, and that the receivers of perishable freight can overcome much of the congestion and delay by removing all of their freight from the piers during the first 24 hours after arrival.

The railroad company denies the claim of the merchants that to have the potatoes unloaded at Kearney, N. J., and truck them to New York would increase the ultimate cost of transportation; and claims that for some parts of Manhattan the cost would probably be reduced. The embargo was placed on potatoes as being the least perishable of the various fruits and vegetables which come to piers 28 and 29.

Equipment and Supplies

Locomotives

THE CHICAGO & EASTERN ILLINOIS, reported in the *Railway Age* of May 27 as inquiring for six Pacific and ten Mikado type locomotives, is expected to order same in about a week.

E. ATKINS & COMPANY (Cuba) have ordered 2 Mogul type locomotives from the American Locomotive Company. These locomotives will have 16 in. by 24 in. cylinders and a total weight in working order of 85,000 lb.

THE OSCEOLA CYPRESS COMPANY, Osceola, Fla., has ordered 1 Mogul type locomotive from the American Locomotive Company. This locomotive will have 18 in. by 24 in. cylinders and a total weight in working order of 111,000 lb.

THE SOUTH SAN FRANCISCO BELT LINE has ordered 1 six-wheel switching locomotive from the American Locomotive Company. This locomotive will have 20 in. by 26 in. cylinders and a total weight in working order of 141,000 lb.

THE HAMMERMILL PAPER COMPANY, Erie, Pa., has ordered 1 four wheel switching locomotive from the American Locomotive Company. This locomotive will have 16 in. by 24 in. cylinders and a total weight in working order of 99,000 lb.

NORTON GRIFFITH & Co. (Inspectoria Federal Brazil) have ordered 3 four-wheel switching locomotives from the American Locomotive Company. These locomotives will have 9 in. by 14 in. cylinders and a total weight in working order of 29,000 lb.

THE MANSFIELD SHEET & TIN PLATE COMPANY, Mansfield, Ohio, has ordered 1 four-wheel switching locomotive from the American Locomotive Company. This locomotive will have 14 in. by 22 in. cylinders and a total weight in working order of 79,000 lb.

Freight Cars

THE CHICAGO GREAT WESTERN is inquiring for repairs to 200 stock cars.

THE PHILADELPHIA & READING is inquiring for 1,000 gondola cars of 70-ton capacity.

THE NORFOLK & WESTERN is inquiring for 1,000 single-sheathed box cars of 50-ton capacity.

THE NEW YORK CENTRAL has ordered about 975, 55-ton all steel hopper car bodies from the American Car & Foundry Company.

THE BUFFALO & SUSQUEHANNA, reported in the *Railway Age* of June 1 as inquiring for 100 gondola car bodies is now inquiring for 200, 55-ton hopper car bodies.

THE CHICAGO & EASTERN ILLINOIS contemplates the purchase of a number of baggage cars. It has not been decided if or when bids will be sent out for this equipment.

THE NORTHERN PACIFIC, reported in the *Railway Age* of May 6 and 13 as inquiring for 1,750 cars of various types, is expected to order new equipment by the end of this week.

THE ILLINOIS CENTRAL, reported in the *Railway Age* of May 13 as inquiring for repairs to 4,000 cars, has contracted with the Pullman Company for repairs to 800 box cars and is expected to order repairs to the remainder late this week.

THE WESTERN PACIFIC, reported in the *Railway Age* of June 10, as contemplating the purchase of a large number of refrigerator cars is now figuring on 2,000 such cars, 150 of which are to be equipped for passenger train service.

THE ATLANTIC COAST LINE, reported in the *Railway Age* of May 6 as inquiring for 700 box cars of 40 tons' capacity has ordered this equipment from the Standard Tank Car Company, Sharon, Pa. The company will also have repairs made to about 750 cars.

Supply Trade News

R. A. Dennis has been appointed manager of the railroad department of the **Pierce Oil Corporation**, New York. Mr. Dennis' office is at 420 Olive street, St. Louis, Mo.

N. R. Seidle has resigned as assistant general manager of the Charles G. Heggie Company, Joliet, Ill., to become works manager of the **General Boilers Company**, Waukegan, Ill.

M. A. Evans has opened an office at 1416 Lytton bldg., Chicago, to act as a manufacturers agent in the handling of various railway supplies. Mr. Evans has been in the railway supply business for 12 years, the last six of which were spent in the service of the Buda Company.

The **Fibre Conduit Company**, Orangeburg, N. Y., has acquired the plant of the American Fibre Conduit Corporation, at Fulton, N. Y., and the conduit manufacturing business of the Johns-Mansville, Incorporated, at Lockport, N. Y., and has appointed **Johns-Mansville, Incorporated**, New York, as sales agent for its products.

The **E. H. Welker Company, Inc.**, 222 W. Larned street, Detroit, Mich., will in the future represent the **George Oldham & Son Company**, Baltimore, Md., in the state of Michigan and the city of Toledo, Ohio, and **J. A. Meredith** will represent this company in the Pittsburgh district with office at 2138 Oliver building. Both the Detroit and Pittsburgh offices will be factory branches and will carry in stock a complete line of the company's pneumatic equipment.

Elliott E. Nash, vice-president and general manager of the Minneapolis & St. Louis, with headquarters at Minneapolis, Minn., has resigned, effective June 15, to become western representative of the American Locomotive Company, with headquarters at Chicago. Mr. Nash was born on March 28, 1870, at Hudson, Wisconsin, and entered railway service in June, 1886, with the Chicago, St. Paul, Minneapolis & Omaha, where he served in various clerical capacities until November, 1888, when he became traveling auditor, with headquarters at St. Paul. He was appointed agent in March, 1892, and continued in this capacity at Ashland, Wis., at St. Paul, Minn., and at Minneapolis,

E. E. Nash

until January, 1905, when he was promoted to assistant superintendent at Itasca, Wis., being transferred later to Eau Claire. In May, 1910, he entered the service of the Chicago & North Western at Chicago with a special assignment in the president's office, where he remained until May, 1911, when he was promoted to superintendent at Winona, Minn., where he remained until April, 1912, when he was transferred to Raraboo, Wis. In November, 1913, he was promoted to assistant general superintendent of all lines east of the Missouri river except the Iowa, Minnesota and Dakota divisions, and in October, 1917, he was transferred to the Iowa territory, with headquarters at Boone, Ia., where he remained until July, 1918, when he was promoted to assistant to the federal manager, which position he held until March, 1920, when he became general manager of the Minneapolis & St. Louis with headquarters at Minneapolis, Minn. He was promoted to vice-president and general manager of this company on May 31, 1921.

Harry M. Wey has been appointed manager of the Chicago district for the **Pittsburgh Testing Laboratory**, Pittsburgh, Pa. Mr. Wey's office is at 1500 Monadnock block. He entered the service of the Pennsylvania Railroad in 1900 in the office of the superintendent of motive power at Columbus, Ohio. Later he served in the motive power departments of the Illinois Central and the Atchison, Topeka & Santa Fe. He was again employed in the mechanical department of the Pennsylvania, Lines west of Pittsburgh, from 1905 until 1909 when he entered the sales department of the U. S. Metallic Packing Company.

General Electric Elects Two New Vice-Presidents

J. G. Barry, sales manager of the General Electric Company since 1917, and manager of its railway department for many years, and **A. H. Jackson** of the law department, were recently elected vice-presidents of the company at a meeting of the board of directors.

J. G. Barry

Mr. Barry has been connected with the General Electric and **Thomson-Houston Companies** for 32 years and is 52 years old. He was first employed in the production department of the **Thomson-Houston Company** in Lynn, in 1890. A year later he was transferred to the construction department of the Boston office and in 1894 entered the railway department at Schenectady, following the organization of the

General Electric Company. Mr. Barry worked up to the position of assistant manager of this department in three years, and in 1907 was appointed manager in which position he exerted a marked influence on many aspects of the company's sales problems and policies. His success as manager of the railway department, one of the most important divisions of the G-E organization, led to his appointment in 1917 as general sales manager and his present promotion to vice-president.

A. H. Jackson

Mr. Jackson has been head of the law department of the General Electric Company for several years. He was born in Schenectady in 1864 and was educated in the public schools there. In 1886 he was graduated from Union College and two years later received the degree of LL.D. from

the Albany Law School. He first practiced law with his father, Judge Samuel W. Jackson, and remained with him until 1902, except for three years with the firm of Chanler, Maxwell and Philip in New York. Mr. Jackson was first employed at the General Electric Company in the law department in December, 1902.

THE GOVERNOR OF CONNECTICUT has appointed a commission of six to appear before the Interstate Commerce Commission to recommend the consolidation of the railroads of New England into a single system.

Railway Construction

ATCHISON, TOPEKA & SANTA FE.—This company, which was reported in the *Railway Age* of March 25, as having obtained authority to construct a 43-mile cut-off, extending from Eldorado, Kan., to Ellinor, and to include a 4-mile belt line east of Eldorado, is now receiving bids for this work. This company has also authorized the construction of the first unit of enlarged freight terminal facilities at Dallas, Tex., the work in immediate contemplation to involve an expenditure of approximately \$200,000.

CHICAGO & NORTH WESTERN.—This company which was reported in the *Railway Age* of May 20, as receiving bids for a 100-ton coaling station at Manitowoc, Wis., has awarded the contract for this work to the Roberts & Schaefer Company, Chicago.

CHICAGO UNION STATION.—This company has closed bids for the construction of a concrete and steel viaduct over its tracks at Madison street.

CENTRAL VERMONT.—This company has awarded a contract to the Roberts & Schaefer Company, Chicago, for the construction of a 150-ton coaling plant of frame construction at New London, Conn., and for "N & W" type electric cinder handling plants at Burlington, Vt., and White River Junction.

CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.—The Interstate Commerce Commission has issued a certificate authorizing the construction of a cut-off from a point on the Cincinnati division in Brown Township, Delaware County, Ohio, 3 1/2 miles, to a connection with its present main line track.

ELGIN, JOLIET & EASTERN.—This company has awarded a contract to the Roberts & Schaefer Company, Chicago, for the installation of automatic electric hoisting equipment in its East Joliet, Ill., and Waukegan coaling plants.

ILLINOIS CENTRAL.—This company receiving bids for the laying of water supply pipe lines at Kankakee, Ill., to cost approximately \$20,000.

MICHIGAN CENTRAL.—This company has awarded a contract to the Roberts & Schaefer Company, Chicago, for a 500-ton reinforced concrete coaling station and sanding plant at Michigan City, Ind., the structure to supply four tracks, and to cost approximately \$48,000.

MISSOURI, KANSAS & TEXAS.—This company, reported in the *Railway Age* of Jan. 14, as preparing plans for new terminal facilities at Denison, Texas, is now accepting bids for this work. It will include a 22 stall brick roundhouse, a shop, storhouse, power house, car repair shop and incidental buildings, including yard office, oil and tool houses a track scale and transfer platform.

SANTA FE & LOS ANGELES HARBOR.—This company has applied to the Interstate Commerce Commission for a certificate authorizing the construction of a line from a connection with the Atchison, Topeka & Santa Fe near El Segundo, Calif., to Torrance and Wilmington, all in Los Angeles County, Calif., 12.54 miles. The road is to be operated by the Santa Fe, which has also filed an application for authority to acquire the stock of the road and to operate it under a lease.

C. F. LOWETH, chief engineer of the Chicago, Milwaukee & St. Paul, has addressed a letter to the public service and the highway commissions of a number of the states in the middle-west, calling to their attention the division of responsibility between the railways and the highway authorities for the installation of adequate warning signs at grade crossings, and suggesting that the public authorities take the necessary steps to cause the removal of all unauthorized signs from public highways and prevent the placing of new signs of this character; so that the grade crossing warning signs will stand out as a real warning, thereby making them more effective.

Railway Financial News

CANADIAN PACIFIC—*New Director*.—W. N. Tilley, of Toronto, K. C., has been named a director to succeed Sir John Eaton, deceased.

CHICAGO & ALTON—*Annual Report*.—The annual report issued this week shows the following income account for the year ended December 31, 1921:

	1921	1920
Operating revenues.....	\$31,057,069	*\$25,785,052
Operating expenses.....	26,123,948	24,403,890
Revenues over expenses.....	4,933,121	1,381,162
Rental from U. S. R. A.	529,719
U. S. Government guaranty.....	3,105,524
U. S. Railway operating income.....	4,933,121	5,016,405
Taxes.....	1,031,435	657,144
Railway operating income over expenses and taxes.....	3,901,686	4,349,688
Total income from railroad properties.....	3,926,608	4,412,748
Net income from railroad properties.....	2,080,802	3,355,860
Total income from all sources.....	2,217,668	3,475,116
Interest on funded debt.....	3,333,256	3,287,564

Net deficit.....	2,059,532	634,647

*Covers period March 1 to December 31.

CHICAGO & ALTON—*Claim Katy-Alton Merger Certain*.—See Missouri, Kansas & Texas.

CHICAGO & NORTH WESTERN—*Authorized to Sell Bonds*.—This company has been authorized by the Interstate Commerce Commission to sell \$2,233,000 of general mortgage gold bonds of 1927 at an average price of not less than par.

CHICAGO, BURLINGTON & QUINCY—*Annual Report*.—This company's annual report for 1921 is reviewed in an article on another page of this issue entitled "Burlington Has Large Net After Extra Dividends." See also excerpts from annual report on adjacent pages.

CHICAGO, ROCK ISLAND & PACIFIC—*Inspects Kansas Line*.—This company recently conducted an inspection tour over the Wichita North-Western, a line extending from Pratt, Kan., to Vaughn, a distance of about 100 miles. This Kansas railroad has been incurring an annual deficit averaging approximately \$50,000 and is reported to be considering the cessation of operations. The Kansas Public Utilities Commission has asked the Rock Island to take over the smaller road because of its necessity to the farmers of that region.

CHICAGO, ST. PAUL, MINNEAPOLIS & OMAHA—*Authorized to Issue Bonds*.—The Interstate Commerce Commission has authorized an issue of \$2,700,000 of debenture gold bonds of 1930 to be sold at not less than 93% and the proceeds used for corporate purposes.

CLEVELAND UNION TERMINALS—*Authorize to Issue Securities*.—The Interstate Commerce Commission has authorized this company to issue \$10,000 of common stock to be delivered at par for cash to the proprietary companies, and \$12,000,000 of 5½ per cent first mortgage sinking fund gold bonds, to be sold at not less than 92½ and the proceeds to be applied to the acquisition of property for and the construction of the terminal station and facilities at Cleveland and the discharge of indebtedness on account of advances made by proprietary companies.

J. P. Morgan & Co., the First National Bank of New York, National City Company, New York, and the Union Trust Company of Cleveland are offering the \$12,000,000 first mortgage 5½ per cent sinking fund gold bonds, series A, at 60 and accrued interest. The bonds will yield 5.55 per cent and are unconditionally guaranteed both as to principal and interest by the New York Central, the Cleveland, Cincinnati, Chicago & St. Louis and the New York, Chicago & St. Louis Railroads. They are dated April 1, 1922 and are due April 1, 1927, with interest, payable April 1 and October 1. They are redeemable at 105 and accrued interest on 90 days' notice at the option of the company, in whole but not in part, on April 1, 1942, or any earlier date thereafter, and for sinking fund semi-annually, beginning October 1, 1927.

EL PASO & SOUTHWESTERN—*Annual Report*.—The income account for the year ended December 31, 1921, follows:

	1921	1920†
Railway operating income.....	\$10,868,799*	\$11,865,369
Railway operating expenses.....	8,439,019*	8,826,313
Net from railway operations.....	2,429,779*	3,039,057
Railway tax accruals.....	1,084,251	1,109,872
Total operating income.....	1,343,084	1,928,900
Total non-operating income.....	1,316,898	1,924,599
Net non-operating income.....	1,638,397	2,602,695
Gross income.....	2,981,481	4,527,295
Rent for leased roads.....	1,210,011	1,948,598
Total deductions from gross income.....	1,628,059	2,427,50
Net income.....	1,327,236	2,099,79
Dividend appropriation of income.....	1,327,236	2,000,000
Balance to profit and loss.....	99,793

*Do not include federal lap-overs.
†For comparative purposes figures for the year 1920 are corporate only.

ESCANABA & LAKE SUPERIOR—*Authorized to Abandon Branch*.—The Interstate Commerce Commission has issued a certificate authorizing the abandonment as to interstate and foreign commerce of the operation of the northwestern 6.1 miles of its Northland in Marquette and Dickinson Counties, Mich.

GREAT NORTHERN—*Annual Report*.—The income account for the year ended December 31, 1921, follows:

	1921	*1920
Operating revenues.....	\$101,317,204	\$106,801,583
Operating expenses.....	80,496,913	94,911,125
Net from railway operations.....	20,820,291	11,890,458
Railway tax accruals.....	8,291,224	8,673,402
Railway operating income.....	12,480,988	3,217,056
Net railway operating income.....	12,866,411

CAPITALIZATION	
CAPITAL STOCK:	
On December 31, 1920, the Capital Stock of the Company was.....	\$110,839,100
To which was added by a stock dividend of 54,1325 per cent declared out of Surplus accumulated prior to July 1, 1909, payable to Stockholders of record at the close of business on March 31, 1921.....	60,000,000
Making the total outstanding December 31, 1921.....	\$170,839,100
of which \$2,200.00 was represented by fractional stock scrip convertible in multiples of \$100. into full shares. This scrip is not entitled to vote or to receive dividends until so converted.	
Dividends paid during the year and charged to Income for the year were:	
March 25, 1921, 2% on \$110,839,100.....	\$2,216,782
June 25, 1921, 5% on \$170,835,100.....	8,541,755
December 27, 1921, 5% on \$170,836,900.....	8,541,845
Total charged to Income for the year.....	\$19,300,382
In addition there was paid and charged to Surplus accumulated prior to 1921:	
December 27, 1921, 15% on \$170,836,900.....	\$25,625,535
Total dividends paid during year.....	\$44,925,917
FUNDED DEBT:	
On December 31, 1920, the Funded Debt outstanding in the hands of the Public was.....	\$124,038,100
and on December 31, 1921.....	123,619,300
a reduction of.....	\$419,000
caused by the purchase of the \$15,000,000 Nebraska Extension Mortgage Sinking Fund Bonds and the retirement of \$404,000,000 Equipment Gold Notes which fell due on January 15, 1921.	
During the year the operation of the sinking funds, provided for retirement of the Sinking Fund Bonds of 1921 and the Denver Extension Bonds	

of 1922, were completed and the bonds were retired with the exception of \$10,300.00 of the Union Bonds to cover which funds have been placed in the hands of the Trustee under the Mortgage. The only sinking fund remaining in operation is under the Nebraska Extension Mortgage of 1927.

GENERAL OPERATIONS

REVENUES:	
Total Operating Revenues for 1921.....	\$168,712,268.15
Total Operating Revenues for 1920 (excluding Federal laps overs after March 1, 1920).....	185,270,768.39*

Decrease..... \$16,558,500.24 or 8.94%

This decrease was distributed as follows:

Freight Revenues.....	\$7,359,739.26	5.66%
Passenger Revenues.....	5,127,633.48	15.04%
Mail Revenues.....	2,200,796.28	33.68%
Miscellaneous Transportation Revenues.....	1,521,694.64	6.62%
Incidental Operating Revenues.....	1,408,638.58	31.67%
	\$16,558,500.24	8.94%

*Includes January and February Federal operations.

Generally speaking, these decreases were due to the business depression which prevailed during most of the year.

The decrease in revenues was due primarily to the fact that the 1920 mail revenues included \$3,000,000 back mail pay representing allowance for the years 1918 and 1919 under decision of the Interstate Commerce Commission handed down December 23rd, 1919, as mentioned in last year's report. The decrease in miscellaneous transportation revenues was largely in express revenue which decreased \$873,323.38 or 19.39 per cent.

All items under the caption Incidental Operating Revenues show decreases, the greatest being in Dining and Buffet Revenue, \$296,095.49 or 22.88 per cent. Hotel and Restaurant Revenue \$203,467.98 or 35.73 per cent. Portmanteau \$418,253.11 or 47.17 per cent; Telegraph and Telephone Revenue \$168,156.93 or 42.79 per cent, and Miscellaneous Revenue \$120,173.86 or 36.47 per cent.

Tonnage of Commodities compared with 1920 shows:		
Farm Products.....	Increased	310,675 tons—3.64%
Animals and Products.....	Decreased	466,518 tons—15.53%
Mine Products.....	Decreased	5,720,641 tons—27.78%
Forest Products.....	Decreased	1,292,277 tons—28.37%
Manufactured Products.....	Decreased	3,431,101 tons—35.76%
Less than Carload Tonnage.....	Decreased	450,305 tons—18.24%
Grand Total Tonnage.....	Decreased	11,117,167 tons—23.54%

There were the following increases in tonnage of Farm Products:
Wheat..... Increased 592,149 tons—24.10%
Corn..... Increased 431,169 tons—28.63%
Cotton..... Increased 16,840 tons—44.13%
Fruit..... Increased 17,875 tons—51.28%
Potatoes..... Increased 17,703 tons—5.92%
and these more than offset the decrease in all other classes of Farm Products.

All classes of Animals and Products tonnage decreased with the exception of: Poultry which increased..... 5,982 tons—15.30%
Butter and cheese which increased..... 3,874 tons—10.53%
Wool which increased..... 17,875 tons—51.28%
With the exception of increases in Base Bullion and Matte (4,249 tons or 8.78 per cent) and Crude Petroleum (136,216 tons or 44.37 per cent), all sub-classes of Products of Mines show decreases, principally Bituminous Coal (4,422,597 tons or 26.59 per cent), and Clay, Gravel, Sand and Stone (1,053,459 tons or 35.66 per cent).

Products of Forests show decreases in all sub-classes under this caption, the principal decrease being in Lumber, Timber, etc. (1,163,302 tons or 44.91 per cent).

EXPENDITURES (OPERATING):	
Total Operating Expenses, 1921.....	\$128,216,289.68
Total Operating Expenses, 1920 (excluding Federal laps overs after March 1, 1920).....	164,017,388.32

Decrease..... \$35,801,098.64 — 21.83%

The reduction in Operating Expenses as compared with previous year was possible because of the following:

Rigid economy in all departments.
More plentiful supply of labor, resulting in better quality with less turn-over and greater efficiency.
Reduction in cost of materials.
Reduction in rates of pay and changes in rules governing working conditions.

Reduction in percentage of overtime and rearrangement of forces to effect economical operation.
Reduction of approximately \$2,000,000.00 in freight claims due to reduction in volume of business, lower prices of commodities, and intensive campaign to reduce claims by more careful handling of freight. Special campaign was made for improvement in handling of refrigerator freight and also to effect on-time delivery of stock.

Reduction of approximately \$1,500,000 in injuries to persons account reduction in volume of business handled, less labor turn-over with greater proportion of experienced employees, and also to special "No Accident" campaign conducted throughout the year.

EXPENDITURES (CAPITAL):	
There was expended during the year, chargeable to Capital Accounts:	
For Exp.....	\$6,543,248.88
For Equipment.....	1,753,238.44
For General.....	7,886.12
Total.....	\$8,306,373.44

Work on the Chicago Union Station project and related facilities at Chicago by the Station Company was continued during the year and substantial progress made. The plans of the new station provide for construction of a modern office building above the station, thereby adding a substantial source of revenue and increasing the utility of the valuable ground space.

Development of new freight house at Harrison Street, Chicago, was carried forward, together with the necessary viaduct construction, track changes, etc. It is noted that the new inbound freight house will be placed in service this year, or early in 1923.

There was an in main track during the year 281 miles of new 90-pound iron rail, and 190 miles of second-hand rail in replacement. A large portion of this rail replaced lighter rail.

The usual program of rehabilitating existing tracks where required was carried out.

There was completed and placed in operation during the year on important lines of heavy traffic, with a view to promoting safety and efficiency in operation, 66 miles of automatic block signals.

INDUSTRIAL:

There were constructed and extended during the year, industrial tracks as follows:

	New Tracks	Extensions
In Lines East of the Missouri River	51	18
In Lines West of the Missouri River	13	5
Total	64	23

The number of new industrial leases made during the year reflects a gradual expansion in business throughout all our territory. Seventy-six new industrial plants were located upon the railroad during the year and seventeen existing industries made material additions to their plants.

The tonnage of crude oil and its products received by the company was about the same as during the preceding year, although some new developments are under way in the producing and refining region in Wyoming.

AGRICULTURAL:

During the year 1921, twenty-one hundred inquiries regarding lands were received. There were 595 carloads of settlers' effects received on the Alliance, Casper, McCook, Sheridan and Sterling Divisions, and it is estimated that 3,781 families were located. In the Douglas, Newcastle and Buffalo land districts in Wyoming, 1,800 persons filed on 915,000 acres of non-irrigated government homestead land, as compared with entries on 1,694,000 acres in the same districts during the year 1920. Two hundred and seventy-three irrigated homestead units, comprising about 19,000 acres on the North Platte and Shoshone Government projects were taken.

Two special exhibit cars were operated during the year on Lines West of the Missouri River, one in Wyoming during July to develop the dairy industry, and one during October and November in the potato growing sections of Colorado, Wyoming and Nebraska, to prevent losses in potatoes during storage and transit, improve market grades, and to secure better cooperation from shippers in ordering cars, handling, loading and storing potatoes. Approximately four thousand farmers and shippers attended these demonstrations. Five hundred and twenty head of high grade dairy cows were shipped from Wisconsin to points West of the Missouri River, and three hundred thousand pounds of miscellaneous farm seeds and forty-two carloads of feed stuffs were handled, through our marketing service. Improved varieties of winter wheat and rye were introduced in the semi-arid sections.

Seventy farmers' meetings were attended by a company representative. Four thousand copies of circular letters and ten thousand copies of bulletins giving information on land opportunities, dairying, silos, feeding, livestock, potato production and marketing, were distributed.

GENERAL:

Under the Federal Valuation Act of March 1st, 1913, subsequent orders of the Commission, the Company has been engaged in taking an inventory of its property and making the several returns to the Commission under

the requirements of the Act and orders above referred to. The date of Valuation, established by the Commission, is June 30th, 1917, and the Valuation to be found will be of that date. On December 31st, 1921, the work of taking and returning the physical inventory was substantially completed and the Government forces which had been on the property had practically completed the field work, in relation to examination of physical property and accounting records. The Company forces also have been continuously engaged in the development of unit costs and other necessary data to fully support its claim for proper valuation when the findings of the Commission are made. It is anticipated that within the coming year this work will have reached the point where further reduction will be made in forces, some of which already have been reduced.

The total expenditures on this work to December 31st, 1921, were \$2,772,227, a very large proportion of this expenditure has been for the purpose of complying with the requirements of the Commission as embodied in the various orders, and much of the information collected will constitute a valuable and permanent record of the company's property.

The annual compensation for use of the company's transportation system during the period of Federal control, under the contract dated October 8, 1918, between the Director General of Railroads and the Chicago, Burlington & Quincy, and the Quincy, Omaha & Kansas City Railroad Companies, was increased by negotiation with the Interstate Commerce Commission from \$33,390,079.61 to \$33,879,100.59.

Final adjustment of accounts between the United States Railroad Administration and the Chicago, Burlington & Quincy and the Quincy, Omaha & Kansas City Railroad Companies of matters of account for 1921 was made on September 10, 1921. Under this adjustment the company received \$8,000,000.00 in cash. The net credit remaining on the books of the Company was \$11,420,589.56, after disposition in full of all amounts due to the Railroad Administration for Addition and Betterments made to the property during Federal control, expenses and liabilities paid chargeable to the companies under the contract, working fund advances to proprietary lines and for all amounts due from the Director General for balance due on compensation, cash and other assets taken over or collected, by him, accrued depreciation, property retired and not replaced, deficiency in material and supplies, under-maintenance, etc.

Instructions from the Interstate Commerce Commission as to method of carrying the proceeds of this settlement into the accounts of the Company were issued on January 25, 1922, and in accordance therewith the amount will be transferred to Profit and Loss Account.

The Interstate Commerce Commission has definitely set December 31, 1921, as the date on which accounts for the Guaranty Period (six months ended August 31, 1920) must be closed and has prescribed form in which claim for that period must be presented, but settlement has not yet been reached. During the year your Board of Directors decided to create a Pension System and adopted Rules and Regulations governing the administration of the Pension Department, to become effective January 1, 1922.

This action was taken with the realization that the company during succeeding years will have numerous employees, including officers, who will have given many years of service before they reach an age when they are unequal to the further performance of their duties, and with the desire to give tangible recognition to long continued and faithful service. Following herewith is the report of the Comptroller.

By order of the Board of Directors.

HIALE HOLDEN, President.

GENERAL BALANCE SHEET

December 31, 1921

ASSETS		LIABILITIES	
Investments:		Capital stock:	
Investment in road and equipment:		Common Stock	\$170,839,100.00
Road	\$413,050,371.27	Bonds held by the public	\$173,619,300.00
Equipment	101,562,975.41	Bonds owned by the Company, unpledged	11,857,000.00

[ADVERTISEMENT]

Michigan Central Railroad Company—Seventy-sixth Annual Report

To the Stockholders of

THE MICHIGAN CENTRAL RAILROAD COMPANY

The Board of Directors herewith submits its report for the year ended December 31, 1921, with statements showing the income account for the year and the financial condition of the company.

Road operated

	The following is a comparative table of the mileage operated:		
	1921	1920	Decrease
	Miles	Miles	Miles
Main line and branches owned.....	1,184.69	1,186.80	2.11
Line jointly owned.....	.70	.71	.01
Leased lines.....	577.67	578.35	.68
Lines operated under trackage rights.....	98.96	100.03	1.07
Total road operated.....	1,862.02	1,865.89	3.87

The decrease in the mileage of the company's owned, jointly owned and leased lines, as compared with 1920, is the result of corrections in measurements. A change in the operation of passenger trains at South Bend, where they are run on the company's South Bend Branch instead of over the tracks of the New York Central Railroad, accounts for 1.03 miles of the decrease in line operated under trackage rights, the remainder being due to a correction in the measurement of New York Central Railroad tracks between Buffalo and Suspension Bridge.

Traffic conditions

The year 1921 was one of business depression, reflected in the decreased freight and passenger traffic of the company. The tonnage fell off approximately one-third in volume and the passenger traffic approximately one-fourth as compared with 1920. This situation was met by economies in operation.

In co-operation with the federal government in its effort to lower costs of foodstuffs, voluntary decrease in rates on certain agricultural products were put in effect during the year. There was no general reduction in other freight rates, but adjustments were made from time to time to remove inequalities. The company has co-operated with state authorities in a readjustment of rates on road-making material for the purpose of stimulating the building of good roads and to meet the unemployment situation.

There was no general readjustment of passenger rates, but the practice which obtained prior to federal control of putting into effect reduced excursion rates during the summer months was re-established to some extent.

Account with Railroad Administration

The company's account with the Railroad Administration covering the period of federal control will be completed in the early part of 1922.

Claim against the United States upon the guaranty

The company's claim against the United States based upon its guaranty for the period March-August, 1920, is approaching completion. It has been necessary to restate this claim several times in accordance with tentative formulas. It will be ready for presentation in the early part of 1922.

Wages

Effective July 1, 1921, the United States Labor Board issued its Decision No. 147, reducing the rates of pay of employees by an amount which aggregated approximately 11 per cent of the payroll. A revision of rules and working conditions for shop employees so modified the lines of demarcation between the various crafts that it is now possible to use a mechanic in one class to do incidental work of another craft. The Board also discontinued the requirement that time and one-half be paid for necessary Sunday service, thus permitting the use of engine terminal and car repair forces for such necessary Sunday work without the payment of a punitive rate. During the federal control period up to July 1, 1921, all overtime for maintenance of way employees was paid for at the rate of time and one-half, but, under the decision of the Labor Board, the ninth and tenth hours of service may now be paid for at the regular hourly rate. Pending final decision of the Board, certain other classes of employees for whom overtime rates were established by the Director General of Railroads are now receiving the pro rata hourly rate for such overtime. Notwithstanding the reductions in rates of pay and changes in rules above mentioned, the average earnings per employee for the six months from July 1, 1921, as compared with the average earnings per employee in 1920, indicate that wages are still much higher than prior to the federal control period. The company is negotiating with its employees looking to further reductions in pay and further changes in working rules and in some cases these matters have been referred to the Labor Board.

Capital stock

The capital stock of the company remained unchanged during the year.

Changes in funded debt

The changes in the funded debt of the company are shown in the following statement:

The funded debt outstanding on December 31, 1920, was.....	\$72,501,446.05
It has been increased as follows:	
Equipment Trust No. 48 of January 15, 1920, additional notes.....	72,800.00
	\$72,574,246.05

and has been reduced as follows:

Michigan Central, Jackson, Lansing and Saginaw 3½ per cent gold bond of 1921 purchased and cancelled by the Trustees of the Land Grant fund of the Jackson, Lansing and Saginaw Railroad Company.....	\$4,000.00
Serial note of the M. C. R. R. Co. dated December 23, 1920, due December 23, 1921.....	262,000.00
Payments falling due during the year and on January 1, 1922, on the company's liability for principal installments under equipment trust agreements as follows:	
N. Y. C. Lines Trust of 1907, due November 1, 1921.....	260,425.45
N. Y. C. Lines Trust of 1910, due January 1, 1922.....	393,960.44
N. Y. C. Lines Trust of 1912, due January 1, 1922.....	151,710.90
N. Y. C. Lines Trust of 1913, due January 1, 1922.....	300,060.00
M. C. R. R. Trust of 1915, due October 1, 1921.....	341,200.00
M. C. R. R. Trust of 1917, due March 1, 1921.....	600,200.00
Equipment Trust No. 48 of January 15, 1920, due January 15, 1921.....	341,200.00
M. C. R. R. Co. proportion of N. Y. C. R. R. Co. Trust of April 15, 1920, due April 15, 1921.....	467,664.75
	3,043,321.08
	\$69,530,924.97

The additional notes for \$72,800 issued under Equipment Trust No. 48 were given to the Director General of Railroads in connection with final settlement of the equipment allocated to the company during the period of federal control and described in the annual report for 1920. The total cost of the equipment was \$69,334,865.45, of which \$5,190,800 was financed by equipment notes.

Changes in property investment accounts

The changes in property investment accounts during the year, as shown in detail elsewhere in this report, were as follows:

Investment in road property owned, net increase.....	\$193,112.45
Investment in equipment, net increase.....	5,678,682.94
Improvements on leased railway property, net decrease.....	151,367.67
Miscellaneous physical property, increase.....	811,974.41
Total net increase in property investments.....	\$6,532,402.13

SUMMARY OF FINANCIAL OPERATIONS AFFECTING INCOME

	Year ended		Increase or Decrease
	Dec. 31, 1921	Dec. 31, 1920	
Operating income	1,862.03	1,865.89	3.87 miles
Railway operations:			
Railway operating revenues.....	\$72,911,852.36		
Railway operating expenses.....	52,551,944.57		
Net revenue from railway operations.....	\$20,359,907.79		
Percentage of expenses to revenues.....	(72.08)		comparable
Railway tax accruals.....	\$4,681,296.47		See Note A

Comparison of Revenues, Expenses and Freight and Passenger Statistics
The following comparisons of 1921 revenues, expenses and freight and passenger statistics are with those of 1920, including in the latter year similar items of the United States Railroad Administration for January and February.

Revenues, Tonnage and Passengers

The total operating revenues were \$72,911,852.36, a decrease of \$14,878,546.83. Freight revenue was \$45,728,134.99, a decrease of \$9,486,988.38. There was a decrease of 9,732,513 tons in freight traffic. The tonnage of bituminous coal and coke fell off 3,729,712 tons, the remainder of the decrease being well distributed among the other commodities.

Passenger revenue was \$20,016,897.06, a decrease of \$1,541,466.14. Total number of passengers carried was 5,234,397, a decrease of 1,700,588. The heavy falling off in tonnage and in passenger traffic during the year more than offset the benefit in earnings from increases in rates which went into effect August 26, 1920. The passenger revenues of the company's Canada division were also affected by decreases in rates effective January 1 and July 1, 1921.

The revenue from the transportation of mail was \$868,436.79, a decrease of \$589,569.06. The mail traffic of the company increased in 1921. The decrease in mail revenue is the result of the inclusion in 1920 of large amounts for adjustments covering additional compensation for the entire period of federal control.

The express revenues were \$2,771,111.49, a decrease of \$676,936.42, which was due not only to the business depression, but the operation of the new contract with the American Railway Express Company effective September 1, 1920.

Operating Expenses

In arriving at the net railway operating income for the guaranty period, the Transportation Act required that the maintenance allowance should be fixed with reference to the standards and price levels of the test period. The company worked out a tentative factor which resulted in charging for maintenance in excess of actual expenditures and the carrying forward of a reserve at the end of 1920. This factor, however, has proved to be larger than the government is likely to accept. Therefore, entries were made in December, 1921, closing out balances in the maintenance reserves which had been accumulated in 1920, and its operating expenses for that year had been over-accrued by the amount of the reserves, it was necessary to adjust operating expenses in 1921 to offset the overcharge and preserve the continuity of the accounts. In making this adjustment the amount tentatively charged against the government for guaranty period operations was reduced and a corresponding charge was made against non-operating income, as a result of which the net corporate income for 1921 was not affected.

The operating expenses for 1921, by groups, as compared with those for 1920, eliminating these adjustments, were as follows:

	Amount	Decrease
Maintenance of way and structures.....	\$9,686,491.02	\$2,452,507.73
Maintenance of equipment.....	14,385,253.42	5,797,599.81

[ADVERTISEMENT]

(Continued from page 1508)

in its issue of June 9: "From sources regarded here as semi-official, it is stated that there is practically no doubt as to the final success of the negotiations between the Missouri, Kansas & Texas and the Chicago & Alton for a merger of the two systems. It is said that the negotiations have reached the point where the equipment for the merger is being prepared. The higher officials of both systems are pushing the details in preparation for an early unification." Incidentally, it was pointed out by this paper that the Missouri, Kansas & Texas had announced its intention sometime ago of withdrawing from the Kansas City Union station. This is now considered significant in connection with the merger talk since the Katy could withdraw from the terminal company and still use the station under the Alton franchise. "If the merger is effected," this paper continued, "there will be a direct line from Chicago, Kansas City and St. Louis to points in Texas. Through business from Chicago to the southwest would probably be handled by way of Higbee, Mo., where the Katy's Sedalia-Hannibal line crosses the Alton's Chicago-Kansas City line. This route would obviate the necessity of hauling trains through the terminals at either in Kansas City or St. Louis, but would send them through Sedalia, Fort Scott and Parsons." Most newspapers predict that the Katy will be the dominating factor in the merger and that C. F. Schaff, now receiver for that system, and president of the new Missouri, Kansas & Texas organization, will probably be at the head of the combined system.

NEW YORK, CHICAGO & ST. LOUIS Asks Authority for Exchange of Materials.—This company and the Lake Erie & Western have filed an application with the Interstate Commerce Commission for authority to enter into an agreement providing for the exchange of materials, supplies and labor and the purchase or acquisition of materials and supplies on joint account and the exchange thereof. The object is to relieve the companies of the necessity of complying with section 10 of the Clayton law in so far as transactions between them are concerned, thereby avoiding inconvenience and delay. The agreement provides for the exchange of materials and supplies on the basis of cost plus 10 per cent and freight charges.

	Amount	Decrease
Traffic.....	1,125,580.92	49,670.19*
Transportation.....	29,535,983.20	8,265,118.47
Miscellaneous.....	96,030.72	326,899.37
General.....	1,778,962.20	16,957.51*
Transportation for investment—Cr.....	54,394.95	34,429.11

*Increase \$56,420,906.53 \$16,809,926.79

The substantial decrease in operating expenses reflect the falling off in traffic, the economies effected by the company during the year, and reduction in wages and in costs of material and fuel.

Railway Tax Accruals—Equipment and Joint Facility Rents
Separate tables setting forth the details of these accounts will be found in another part of this report.

Non-operating Income

Pursuant to the final certificate of the Interstate Commerce Commission, the annual compensation for the possession, use and control of the property of this company and its leased lines, under the contract with the Director (General of Railroads, is \$8,126,349.13. This is an increase of \$74,221.65 over the amount stated in the contract and accrued during federal control. This increase and additional compensation for completed additions and betterments put in service prior to February 29, 1920, account for the item of \$62,187,830 shown in the income account as additional compensation and adjustment of standard, return.

The decrease of \$1,471,894.27 in miscellaneous income is due in part to a rearrangement, for purposes of comparison, of the figures shown in the 1920 report and in part to adjustments in connection with the guaranty period, March-August, 1920.

Deductions from Gross Income

There was a decrease in the account "separately operated properties—loss" of \$131,541.76. This decrease is due to the fact that there was a surplus from the operation of the Indiana Harbor Belt Railroad in 1921 while this company was called upon to contribute its proportion of a deficit from the operation of that road in 1920.

Net Corporate Income

The net corporate income of the company was \$7,725,336.62, from which were declared dividends of 6 per cent, amounting to \$1,124,184.00, leaving a surplus for the year of \$6,601,152.62, an increase over the surplus for 1920 of \$2,544,823.38.

Elimination of Highway Grade Crossings at Detroit, Michigan

The separation of grades at various streets in Detroit under contracts with the city the first of which was made in 1900, was necessarily suspended during the war period. The city has grown very rapidly, especially in the southwesterly portion, and the highway traffic has become so heavy over certain streets as to render the separation of grades essential. During the year, grade separation work has progressed at Livernois, Dix and Waterman avenues. The city has undertaken to open Military Avenue under the company's tracks at its expense.

Changes in Organization

On May 5th, Mr. Edmond D. Bronner was elected a Director to fill the vacancy caused by the death of Mr. William K. Vanderbilt, and on the same date Mr. Henry M. Campbell was elected a Director to fill the vacancy caused by his resignation on February 9th of Mr. Samuel Mather.

Appreciative acknowledgment is made to all officers and employees of their loyal and efficient co-operation and service.

For the Board of Directors,

ALFRED H. SMITH, President.

NEW YORK CENTRAL.—Petition to Reopen Chicago Junction Case Denied.—The Interstate Commerce Commission has denied a petition of trunk lines entering Chicago for a modification of the order by which it authorized the New York Central to acquire control of the Chicago River & Indiana and the Chicago Junction.

PHILADELPHIA & READING.—Annual Report.—The incomes for the year ended December 31, 1921, compares with the previous year as follows:

	1921	1920

Railway Officers

Executive

W. L. Stanley, general attorney of the Seaboard Air Line, has been elected vice-president in charge of public relations and kindred matters.

M. H. Cahill, general manager of the Seaboard Air Line, has been elected vice-president in charge of operation with headquarters at Norfolk, Va.

Robert E. Ryan, superintendent of the western division of the Minneapolis & St. Louis, with headquarters at Minneapolis, Minn., has been promoted to vice-president and general manager with the same headquarters effective June 15, to succeed Elliott E. Nash, resigned to become western representative of the American Locomotive Company with headquarters at Chicago.

A. H. Smith, president of the New York Central, has had his jurisdiction extended to include the presidency of the Chicago River & Indiana, pursuant to the recent acquisition of this property by the New York Central interests and the consolidation with it of the leased property of the Chicago Junction; and George Hannauer, vice-president and general manager of the Indiana Harbor Belt, with headquarters at Gibson, Ind., has had his jurisdiction extended to include the vice-presidency of this property. Pursuant to the change in the administration of the Chicago Junction, R. Fitzgerald, president of the latter company, and H. E. Poronto, vice-president, both with headquarters at Chicago, have resigned.

Charles S. Lake, whose appointment as assistant to the president of the St. Louis Southwestern, with jurisdiction over all departments, effective June 5, was reported in the

C. S. Lake

Railway Age of June 10 (page 1368), was born on May 27, 1871, at Front Royal, Va., and entered railway service in May, 1885, as a telegraph operator on the Richmond & Allegheny (now a part of the Chesapeake & Ohio). Subsequently he served in yard and train service on the Chesapeake & Ohio and on the Norfolk & Western until September, 1888, when he was promoted to dispatcher on the latter road. A year later he became a dispatcher on the Chesapeake & Ohio, but reentered the service of the Norfolk & Western

in January, 1897, after which he served consecutively as night chief dispatcher, general yardmaster and assistant trainmaster at Norfolk, Va., and Bluefield, W. Va., until 1902, when he became a trainmaster on the Southern. During the next five years, he served as trainmaster and superintendent on the Danville & Western division of this road. He then became superintendent of the New York, New Haven & Hartford. He held this position, first at Hartford, Conn., and later at Waterbury, until 1912, when he was appointed general superintendent of the Minneapolis & St. Louis, which position he relinquished in May, 1914, to become general manager of the Seaboard Air Line. He continued with the latter company until June, 1917, when he left to perform special service for the president of the Erie, a position he held until the period of federal control. Consecutively thereafter he was engaged

as assistant director of the division of operation of the Railroad Administration, and as assistant to the director general of railroads until August, 1920, as general manager of the Norfolk & Southern until June 1, 1921, and as assistant to the president of the Chesapeake & Ohio and the Hocking Valley, with headquarters at Richmond, Va., until the date of his recent appointment.

Financial, Legal and Accounting

E. H. Bunnell, general auditor of the St. Louis-San Francisco, with headquarters at St. Louis, Mo., has been elected comptroller, a newly created office, effective May 17, and the title of general auditor has been abolished.

B. A. Little, assistant freight claim agent of the Chicago & North Western, has been promoted to freight claim agent, with headquarters at Chicago, to succeed H. C. Howe, whose death was reported in the *Railway Age* of June 3, page 1318.

Operating

N. D. Connolly, trainmaster, has been promoted to superintendent with headquarters at Gibson.

Lynne L. White, trainmaster of the Erie at Hammond, Ind., has been promoted to superintendent with the same headquarters, effective June 10.

James P. Carey, superintendent of the Nebraska division of the Union Pacific, with headquarters at Omaha, Neb., has been transferred to the Los Angeles division, with headquarters at Los Angeles, Cal., to succeed T. P. Cullen, retired.

Forrest W. Rosser, division superintendent of the Chicago region of the Erie, with headquarters at Chicago, has been promoted to the newly created office of superintendent of transportation of the Chicago region, with the same headquarters, effective June 10, and the office of superintendent at Chicago, has been abolished.

Mr. Rosser was born at Arcanum, Ohio, on April 19, 1874, and entered railway service on July 1, 1888, as a messenger in the telegraph office of the Cincinnati, Jackson & Mackinaw (now a part of the Cleveland, Cincinnati, Chicago & St. Louis), in which capacity he served until July 1, 1890, when he was promoted to operator, a position which he relinquished

October 1, 1891, to become an operator on the Pennsylvania. Subsequently from that time he served as operator, conductor and extra dispatcher on the Pennsylvania until December 1, 1898, when he became a dispatcher on the Baltimore & Ohio. In June of the following year he entered the employ of the Chicago, Milwaukee & St. Paul in a like capacity, and continued as dispatcher until January 1, 1903, when he became chief dispatcher on the Chicago, Rock Island & Pacific. Thereafter he served as chief dispatcher until February 29, 1904, as trainmaster on the Iowa and Illinois divisions until June 1, 1912, and as superintendent from that time until June 1, 1916, when he became connected with the Missouri, Kansas & Texas as trainmaster. In the service of this company, he was promoted to superintendent on January 15, 1917, and continued in this capacity until February 1, 1918, when he was appointed an assistant superintendent of the Erie. Thereafter he served as assistant superintendent until March 1, 1920, and as superintendent of the Chicago division until his recent promotion to superintendent of transportation.

F. W. Rosser

J. F. Lord, superintendent of safety and fire prevention of the Chicago Great Western, has been appointed to the newly created office of assistant to the general manager and the title of superintendent of safety and fire prevention has been abolished.

J. W. Smith, general superintendent of the Indiana Harbor Belt, with headquarters at Gibson, Indiana, has been promoted to general manager with the same headquarters to relieve George Hannauer, who retains the title of vice-president coincident with his election as vice-president and general manager of the Chicago River & Indiana which now controls the Chicago Junction. The office of general superintendent has been abolished.

Mechanical

M. L. Zyder, roundhouse foreman of the Indiana Harbor Belt, has been promoted to assistant master mechanic at Gibson, to succeed A. B. Fromm, promoted to master mechanic to succeed C. B. Nelson.

Engineering, Maintenance of Way and Signaling

R. A. Feldes, assistant to chief engineer at Gibson has been promoted to chief engineer to succeed O. H. Gersbach, transferred to chief engineer of the Chicago River & Indiana.

F. S. Purdy, roadmaster of the Los Angeles division of the Atchison, Topeka & Santa Fe, Coast Lines, has been promoted to inspector of track and roadway, to succeed J. E. McNeil, deceased.

Purchasing and Stores

A. H. Laret has been appointed assistant to the vice-president and chief purchasing officer of the St. Louis-San Francisco with headquarters at St. Louis, Mo.

Obituary

J. E. McNeil, inspector of track and roadway on the Atchison, Topeka & Santa Fe, Coast Lines, whose death on May 28 was reported in the *Railway Age* of June 3, page 1318, was born on March 16, 1847,

at Hamilton, Ont., and entered railway service in 1868 as a brakeman on the Illinois Central, where he served consecutively as brakeman, conductor and trainmaster until 1884, resigning at that time to become trainmaster of the Texas & Pacific. A year later he returned to the Illinois Central and was employed as trainmaster, first at Waterloo, Iowa, and later at Fort Dodge, until 1887, when ill health induced him to remove to California, where in December, 1887, he entered the service of

the California Southern, now a part of the Santa Fe. During his first year with this road he served as extra gang foreman and work train conductor and continued with the company from September, 1888, until October, as acting superintendent of construction and thereafter as conductor until November, 1888, when he became roadmaster on what is now known as the Los Angeles division of the Santa Fe, a position which he relinquished in December, 1906, to become inspector of track and roadway. While his death occurred suddenly, it is attributed largely to injuries received last November in a motor car accident which resulted in the death of several officers of the road, including W. H. Oliver, engineer of the Grand Division.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free; United States, Mexico and Canada \$6.00. Foreign Countries (excepting daily editions), \$8.00. Foreign subscriptions may be paid through our London office in £ s. d. Single copies, 25 cents each.

WE GUARANTEE that of this issue, 12,500 copies were printed; that of these 12,500 copies 10,300 were mailed to regular paid subscribers to the Railway Age and Railway Mechanical Engineer; 110 were mailed to advertisers; 490 were provided for counter and news companies sales, new subscriptions, bound volumes, samples, copies lost in the mail and office use; and 1,600 copies for distribution at Atlantic City.

THE RAILWAY AGE is a member of the Associated Business Papers (A. B. P.) and of the Audit Bureau of Circulations (A. B. C.)

Probably few men who are familiar with the evolution of the Rules of Interchange read the report of the Arbitration Committee without a feeling of surprise that the committee has again proposed a combination of defects constituting unfair usage. The general trend of the rules has been

to place more and more responsibility on the car owner. This naturally has the effect of enforcing a higher standard of construction and maintenance, which is admitted to be desirable. To include in the Interchange Rules any provision making the delivering line responsible for such items as the breakage of wooden sills or bending of steel center sills without cover plates, regardless of physical condition, would be an invitation to perpetuate weak construction and poor maintenance, particularly for non-operating companies or those handling light trains. There is more involved in this ruling than the mere question of responsibility for damage. It involves in addition the policy that is to be followed in the perpetuation of old cars, the design of new equipment and even the size of locomotives. The decision of the committee is in line with the progress of railroad operation and the members are to be commended for the change in their recommendations.

Continuing a Progressive Policy

The discussion of labor questions seems to be tabooed by the Mechanical Division. The American Railway Engineering Association, on the other hand, has a strong and live committee which reports each year on the economics of railway labor. Is it not a serious mistake for the Mechanical Association to ignore these questions? What would it not mean to the mechanical departments if their officers and foremen were thoroughly educated as to the simple economics of the labor problem? Could they not deal to far better advantage with the employees under them, and could they not work far more effectively to build up that *esprit de corps* which is necessary in any organization if it is to make good in a large way? It is fortunate that some railroads realize the force of this argument and that the officers and foremen enjoy the full confidence and support of the men in the ranks. Railroad mechanical officers at large, however, could do much better in this respect if they would discuss questions of this sort at their annual meetings and compare notes. It is vitally necessary for American railroad officers and particularly the foremen, thoroughly to understand the problems of dealing with and supervising men. Why not discuss these matters at the Atlantic City meetings?

Why Not Discuss Labor Questions?

There was a time when a person desiring to obtain the latest information on railroad mechanical subjects instinctively turned to the proceedings of the Master Car Builders' or the Master Mechanics' Association and it was more than probable that he would there find the data desired.

Automatic Train Connectors

Can this be truly said of current reports of the Mechanical Division? For example, suppose information is desired in regard to the present development and extent of application of automatic train connectors. If one turns to the report of the committee on Train Brake and Signal Equipment he finds in a few lines devoted to the subject that "one maker * * * reports having 15 locomotives, 12 passenger trains, 100 ore cars and 34 slag cars equipped" and "another maker claims to have five passenger trains in Canada and one in the United States equipped". One would infer that this was the full extent of the development at the present time. Even a casual investigation, however, would have disclosed the fact that there were more than two manufacturers and a larger number of connectors in service. The report is perfunctory and barely sufficient to be called a report. There is no intimation as to the character of the couplers, their defects or success. Had the subject been of no importance to the railroads the committee could not have shown any less interest. If it was thought that the whole proposition was valueless, why did not the committee come out and say so? This would have at least been action and would have brought the matter up for discussion on the convention floor.

Notable improvements have been made in the average standard of railroad refrigerator cars during recent years.

Many roads now have cars which are up to the standard of refrigerating efficiency that is necessary for carrying meat and similar products. Three desirable features are becoming practically standard in refrigerator car construction, basket bunkers, insulated bulkheads and floor racks. Insulation in the walls of the car is receiving careful attention and

Developments in the Refrigerator Cars

most of the recent designs provide low conductivity, although in some cases there seems to be room for further improvement. The importance of providing rigidity in the body and avoiding air circulation is generally recognized. When the body, because of weaving, is no longer tight and the insulation begins to sag down, the car will not maintain a low temperature and will be extravagant in the use of ice. Realizing these conditions, some roads have been experimenting with steel refrigerator cars, and others with insulation which has sufficient structural strength to stay in place indefinitely and add somewhat to the stiffness of the cars. Another recent innovation is the location of the refrigerating medium along the roof of the car instead of at the ends, to provide more satisfactory circulation of the cold air over the lading. The experimental work now underway holds promises of further increases in the efficiency with which refrigerated products are handled.

Most advocates of the gasoline engine driven motor car acknowledge that at the present time it is advisable to limit their use to such light weight cars as can be driven by gasoline engines which have already been developed for use on highway trucks. This distinctly limits the weight and carrying capacity of these cars and makes the problem at present one of finding the field where such cars will best fit and avoiding attempts to place them in service for which they are not well adapted. There is, however, a persistent demand for larger cars, which can not be ignored if this type of equipment is to be used as extensively as now appears probable. To develop thoroughly a large gasoline engine will take time, and while it may come in the next few years, the fact remains that nothing has yet been offered in which there is full confidence of assured success as regards economy and durability. In the discussion at a recent meeting of the New York Railroad Club, reference was made to a steam driven motor car of fair size which has given good service under severe conditions. As size limitations do not apply in the same manner to steam engines as to gasoline engines, it would seem as though there might be possibilities of development in this direction which should not be overlooked by builders and inventors. Moreover, equipment of this character would probably be well received by present railroad men who are accustomed to handle and maintain steam engines.

One of the most important uses of electric energy in railroad maintenance is that of electric welding. The process may be either spot, butt or arc welding—each has its uses and in the aggregate the possible applications reach an astounding total. The electrical engineer who has not investigated the possibilities of reclaiming worn and broken parts by arc welding has overlooked an opportunity for reducing maintenance costs which can scarcely be equalled in any other manner. Electric welding is not confined to iron and steel parts. It is conceded, of course, that ferrous metals form the great bulk of its applications in railroad work, but it does not follow that this is the limitation of the process. Brass, copper, bronze and aluminum have been successfully welded by the electric current. Welds made between two pieces of the same metal, or between different kinds of metal, have demon-

strated beyond question the practicability of the process. Moreover, with possibly a few exceptions, these non-ferrous metals can be welded to iron or steel with wonderful results. Non-corrosive metals, such as copper, for example, are frequently of greatest importance when they can be coupled with iron or steel to secure the necessary strength, and in such instances the electric welding of the two metals may prove of inestimable worth. It must be remembered that in all of the applications mentioned, the results that have been secured were obtained at the expense of no small amount of experimentation and study, but they indicate clearly what can be accomplished when care and thought are given to the electric welding art. A great opportunity is offered the electrical engineer, for on the great majority of roads there is no one in a better position to study the possibilities of electric welding.

The brake beam is one of the most important parts of the equipment on a freight car, both from considerations of safety and maintenance economy. It is subjected to severe loads in service and failure to withstand these loads is likely to result in disaster. It is an expensive piece of equipment to replace and frequent renewals are undesirable. After long and patient effort on the part of the Master Car Builders' Association, standard specifications for new beams have been established to which the roads are now required to adhere in interchange service. No limitations are placed on the condition of repaired beams, however, and anything which will hold together, provided its original construction indicates that it once passed the proof load requirements of the specifications, may be restored to service. This goes far toward destroying the effectiveness of the specifications and leaves the handling line without protection against weak brake beams. The committee on brake shoe and brake beam equipment has done well to formulate reclamation methods to overcome this situation. There may be differences of opinion with respect to the need for the facilities recommended by the committee in its 1921 report, but this is unessential. Any practice that will best meet local conditions may be followed provided the repaired beams are subjected to proof load tests and are not restored to service unless they meet the requirements of the standard specifications. The essential requirement, then, is that a testing machine be provided and used. If this is done the advantage of concentrating the reclamation work at central shops which can be provided with suitable facilities will soon become evident. Eventually the rules of interchange should prohibit the application of repaired brake beams unless they are known to have passed the specification tests.

A Break in the Brake Beam Defenses

The rolled center sill section recommended for adoption as standard for new cars by the Committee on Car Construction is worthy of most favorable consideration by the members of the Mechanical Division. It possesses at least two important advantages over a section built up of plates and angles, as is necessary in the case of the fish-belly type or of a channel and bottom angle flange in the case of sills of uniform section. Probably the most important advantage when comparing the proposed section with the fish-belly type is the greatly decreased opportunity for deterioration of the section through the development of corrosion. Every joint in built-up sills offers an opportunity

Advantages of a Unit Sill Section

and angles, as is necessary in the case of the fish-belly type or of a channel and bottom angle flange in the case of sills of uniform section. Probably the most important advantage when comparing the proposed section with the fish-belly type is the greatly decreased opportunity for deterioration of the section through the development of corrosion. Every joint in built-up sills offers an opportunity

for the accumulation of moisture, heavily laden with acid in the case of coal carrying cars, with the result that the effective area of the section is rapidly reduced. Not only does this increase the cost of maintenance during the life of the car, but the maximum period of service which can be obtained before the car is scrapped may be affected by as much as 25 or 30 per cent. In extreme cases cars with this type of sill have completely failed after a service of not more than 15 years. In the case of sills of the channel and angle type the extent to which corrosion affects the life of the sills is, of course, much less. In this case the greatest advantage of the proposed unit center sill section is in the more effective distribution of the metal. With the same sectional area this increases the strength by 10 to 13 per cent. There is also a decrease in the cost of construction because of the elimination of the bottom flange rivets. Such a section, once in general use, will become a tonnage production proposition and will, therefore, probably cost no more per ton than structural sections now in common use.

Even though the shop buildings provided may be adequate, well-lighted and modern in their design and the machine tools well selected, the cost of operation will depend to a considerable extent upon the utilization of the space and the arrangement of the machines.

Is Your Shop Properly Arranged?

Until an investigation is made, the needless expense frequently caused by unnecessary movements of material due to lack of consideration when planning the layout of machinery passes unnoticed. In manufacturing plants which were forced to know their operating costs in detail, there was long ago recognized the necessity of so planning the layout as to avoid every unnecessary move from the start to the finish of the manufacturing process. The ideal method is, of course, to receive the raw material at one end and so arrange that a job will pass through by the most direct route without backward movements, until it reaches the shipping department at the other end. While this is not always possible, the underlying principle is economically correct and has been followed as closely as possible by successful manufacturers. This same idea might well be more thoroughly kept in mind in connection with locomotive and car shops now that railroads are obliged to consider operating costs more carefully than they have had to in times past. Shops must be more economically operated. It is doubtful if a railroad shop exists anywhere in which it would not be possible to effect economies by rearrangements intelligently carried out after careful investigation. Time thus spent will produce results which will show good returns when the demand for output once more comes. The possibilities suggested apply not only to locomotive shops but to the blacksmith, boiler and car shops. It is to be regretted that no report is to be made this year by the committee on Car Repair Shop Layouts. There is some real work that this committee might do, and it is hoped that they will submit a report next year.

The logical thing to do after "spotting" power plant fuel wastes is to stop them and find some means of keeping them stopped. Fuel wastes can be stopped and maximum boiler efficiency obtained only by attention to many small details of apparently minor importance. These details include among others the careful lagging of boiler and steam pipes to prevent radiation loss; elimination of air leakage in furnace and boiler settings; checking up the loss due to in-

complete combustion from whatever cause; preventing the short circuiting of gases in boilers; removing soot and scale; calibrating the dampers; finding the draft which will provide the highest CO₂ without CO and still carry the load; equalizing the draft between the boilers; finding the right kind of coal; and determining whether it should be fired wet or dry. It is one thing to stop fuel wastes and another to keep them stopped. The latter result can be accomplished only by some effective method of checking the work of firemen or stoker attendants and giving them an incentive to fire the boilers as efficiently as possible. Automatic devices for recording variations in draft and the proportion of CO₂ for each boiler are available, and when properly interpreted afford a practical measure of the boiler efficiency attained. Firemen and stoker operators should be impressed, as is not often done, with the fact that coal is only another form of money; if shown how much coal can be saved each day by following correct firing methods, most of the men will try to apply those methods. By playing the different firemen and different shifts against each other and posting records of the individual performances another incentive is afforded. Perhaps the best method of all is to install some sort of bonus system whereby the firemen or boiler room attendants receive extra pay in proportion to the efficiency with which they fire the boilers. Where a bonus system, based on the proportion of CO₂ maintained during the day, has been used and given a fair trial it has almost invariably been successful.

No small part of the development of the modern automobile may be credited to modern machine operations, particularly grinding. These machines are now made of sufficient capacity to finish locomotive and car parts from the rough stock. In the speed of production, accuracy and smoothness of finish, grinding machines are unsurpassed. They are particularly adapted also for the truing of worn parts. These worn parts are usually surface hardened due to a rubbing or wire-drawing action and if a cutting tool were used to true the surface a considerable cut would necessarily be taken to get under this hard shell. With the grinding machine, however, just enough material is taken off to true up the surface and, because little material is removed, there is a considerable saving on the time required for the operation. Railroad shopmen have been a trifle slow in realizing the adaptability of grinding machines to their work. Now, however, plain cylindrical gap grinders for piston rods, valve stems and similar work have been quite generally installed; also surface grinders for guides and other flat surfaces. There are still some shops which do not utilize grinders to the greatest advantage and either get along without them or else use old grinders which, through lack of power and rigidity, are entirely unsatisfactory compared to the modern machines which are available. There is a big field for the more general introduction of grinding machines of various kinds and sizes for railroad work. Internal grinders should not be forgotten and surface grinders equipped with magnetic chucks are adaptable to a wide variety of work now performed on other types of machines. An interesting article on "Getting Results from Modern Grinding Machines in Railroad Shops," is published in the June *Railway Mechanical Engineer*, page 317, and another article showing what is being done along this line in English railway shops appears in the same issue, page 325. The time is coming, if it is not now here, when no railroad shop will be considered equipped for maximum production without a full compliment of modern grinding machines.

Program for Today and Sunday

Saturday, June 17.

Entire Day Set Aside by Mechanical Division V to View the Exhibits.

ENTERTAINMENT

10:30 a. m.—Orchestral Concert, Entrance Hall, Million Dollar Pier.

3:30 p. m.—Orchestral Concert with Impromptu Dancing, Entrance Hall, Million Dollar Pier.

9:00 p. m.—Informal Dance, Carnival Night with Special Features by H. T. McConnell of Chicago, Ball Room, Million Dollar Pier.

Sunday, June 18.

3:30 p. m.—Sacred Concert, Music Rooms of Marlborough-Blenheim. The Albert Taylor Orchestra, New York City, and the following artists: Emily Stokes Hagar, operatic soprano, and the Criterion Male Quartette of Philadelphia; Charles Stahl, first tenor; William H. Carmint, second tenor; Harold Simonds, first bass; John Vanderslott, second bass.

Enrollment Today and Sunday

THE ENROLLMENT BOOTH will be open today—Saturday—from 9 a. m. to 12 noon; 2 to 4 p. m.; and 7 to 9 p. m.

On Sunday it will be open from 11 a. m. to 12 noon and from 7 to 8 p. m.

Will You Get Any of This?

NEWSPAPER DISPATCHES STATE that India recently has floated in London a loan of £75,000,000 and that most of the money is to be spent in the improvement and expansion of the railroads of that country. Some American manufacturers of equipment and supplies have found India a very good market in the past, and doubtless will get busy trying to get their share of the new business coming.

Lost and Found

BADGE No. 15 belonging to Willard Kells, superintendent of motive power of the Atlantic Coast Line, has been lost. Anyone finding it is requested to return it to the headquarters of the enrollment committee.

LOST! The following lost items have been brought to our attention by Secretary Conway of the Railway Supply Manufacturers' Association:

Camera—by Mr. Carrigan of the International Machinery & Supply Company.

Badges Nos. 3695, 5672, 3803 and 8328.

Pair of gloves.

Will the finders please return these lost articles to Secretary Conway?

Movies of the "Prosperity Special"

THE "PROSPERITY SPECIAL" of the Baldwin Locomotive Works has attracted widespread attention throughout the country. Some excellent moving pictures have been obtained of its progress westward. These the Baldwin Locomotive Works have arranged to show in the Rose Room of the Hotel Traymore at 8:30 p. m., Sunday, June 18.

The train consisted of 20 locomotives recently shipped to the Southern Pacific Lines. These pictures are

markable in that they show not only the heaviest locomotive train ever moved, but also the scenic beauty of Pennsylvania between Philadelphia and Pittsburgh.

S. M. Vauclain, who was primarily responsible for the movement of this train and who clearly foresaw the stimulating effect which such a demonstration would have toward inspiring public confidence and aiding business improvement, will deliver an address.

Registration Figures

THE REGISTRATION FIGURES from four o'clock Thursday afternoon to four o'clock yesterday afternoon tell an interesting story and show an increase in the attendance of 758 people within this period of time. This increase was made up as follows: Railway men, 76; purchases and stores 10; special guests 96; supply men 544; railroad ladies 84; supply ladies 48.

The following figures show the registrations for 1922 and 1920. They show complete registrations up to four o'clock of the third day of the respective conventions:

	1922	1920
Members, Mechanical, A. R. A.....	554	666
Purchases and Stores.....	26	37
Special guests	276	285
Supply men	2,215	1,935
Railroad ladies	421	413
Supply ladies	432	649
Totals	3,924	3,985

Cars on Track Exhibit

THE NUMBER OF cars shown this year on the Philadelphia & Reading track at the boardwalk and Mississippi avenue, just below the pier, is not as extensive as usual but will well repay one for a visit.

The only passenger car is one of the new steel coaches which the Philadelphia & Reading has received lately from the Harlan Plant of the Bethlehem Shipbuilding Corporation at Wilmington, Del. This car seats 78 people and weighs 117,600 lb., the length over-all being 72 ft. 5½ in., the length inside is 63 ft. 0 in. The trucks are of the four-wheel type, equipped with clasp brakes and spaced 49 ft. between centers.

Five freight cars are shown. The first one is a Virginian 120-ton coal car weighing 78,700 lb. light, built by the Pressed Steel Car Company. This car has Buckeye six-wheel trucks with clasp brakes operated by the "empty and load" brake. The car has one end jacked up and the truck run out for inspection after making 10,600 miles in regular service.

Two of the new Philadelphia & Reading hopper bottom coal cars are on inspection. Their light-weight is 53,900 lb. The coupled length is 42 ft. 11 in. and the length inside 39 ft. They are equipped with four-wheel trucks, having forged steel wheels and American Steel Foundry Company's steel side frames. One of the cars was built by the Cambria Steel Company and the other by the Middletown Car Works. Both are equipped with the empty and load brake, while a Minich super-safety hand brake is applied to one of them.

Another hopper bottom coal car shown is one belonging to the Westmoreland Coal Company, which has a capacity of 110,000 lb. and weighs 42,200 lb. light. This car has trucks with Synnington wrought steel side frame trucks.

The remaining car is a Michigan Central box car with Stafford roller bearing trucks.

A Visitor From Sweden

BROR VIKTOR PETERSSON, mechanical engineer on the Swedish State Railways, located at Norrköping, Sweden, is visiting the convention as part of a carefully planned survey and study of American railway problems. He has been making a thorough tour throughout the country, having visited Washington, Altoona, Cleveland, Chicago, West Burlington and various points on the Great Northern and Chicago, Milwaukee & St. Paul since his arrival in this country on April 15.

Mr. Petersson is particularly interested in the use of pulverized fuel on locomotives and has expressed disappointment in not finding more locomotives equipped for burning this fuel in this country. In Sweden the question is being actively investigated, for something must be done to

lower locomotive fuel costs. There are 10 locomotives there equipped for burning powdered fuel and all of them are giving excellent results. The greatest handicap in making this process a commercial success in Sweden has been the high cost of pulverizing the coal. From his investigations Mr. Petersson believes that we in this country have been using too high a grade of coal for our powdered fuel installations. He believes that a low gas coal of not too high thermal value will give better results than a high gas coal of high thermal value and reduce the liability of explosion. In Sweden they have had no difficulty with explosions whatever. They use a 50-50 mixture of Swedish coal, having about 9,000 B. t. u. and good English coal of about 14,000 B. t. u., and they seek to keep the volatile below 25 per cent.

In commenting on the use of Diesel locomotives or Diesel-operated cars in Sweden, Mr. Petersson says that this is restricted almost entirely to the privately owned lines in Sweden, of which there are a number, the Swedish government operating only about 50 per cent of the standard-gage mileage of the country. A large number of Diesel locomotives have been built in Sweden for railroads in southern Europe.

As is well known, Sweden has been very much interested in the use of roller bearings for car equipment and several experiments have been conducted. It has been found that friction is very materially reduced by their use and the only reason why this type of bearing has not been more extensively adopted is because of the initial first cost, for, as Mr. Petersson says: "We in Sweden are not rich like you people in America." These roller bearing tests have been extended to locomotives and tenders, the trucks of the locomotives and all tender wheels being equipped with the bearings. The tests have been fully as successful as those made on the car equipment.

Mr. Petersson is to remain in this country until about September 15 and after the convention is to continue his tour of inspection and investigation throughout the country. He will return to Chicago and proceed to the Pacific

coast, thence back to New York through the south. He will visit the principal shops and railways in his travels, giving particular attention to the study of refrigerator car equipment.

He has been very much impressed and delighted with the reception he has received on the railways he has already visited and desires to take this opportunity of making his appreciation known to the railways.

Breaks in the Ranks

IN *The Daily* of June 15, page 1422, we recorded the deaths of 27 members of Division V, Mechanical, American Railway Association, who had passed away since the last convention in June, 1920.

The news of the death of Joseph Maycock at Buffalo on the opening day of this year's convention brings to mind the faces of a dozen other supply men well known as attendants at these gatherings, who have passed to the Great Beyond during that period. They are:

Albert C. Ashton, treasurer of the Ashton Valve Company, who died on January 31, 1922.

Robert A. Bole, vice-president and district manager of sales at Pittsburgh of Manning, Maxwell & Moore, Inc., who died April 2, 1921.

James C. Currie, eastern representative of the Nathan Manufacturing Company, who was killed in an elevator accident December 11, 1920.

Otis Cutler, chairman of the board of directors of the American Brake Shoe & Foundry Company and a director in a number of other concerns, who died March 4, 1922.

Charles A. Lindstrom, assistant to the president of the Pressed Steel Car Company, who died September 2, 1921.

James B. Rider, vice-president and general manager of the Pressed Steel Car Company, who died November 3, 1921.

Joseph S. Ralston, president of the Ralston Steel Car Company, who died September 11, 1920.

Clarence E. Rood, sales manager of the Gould Coupler Company, who died December 11, 1921.

Frank P. Smith, railway representative of Manning, Maxwell & Moore, Inc., who died November 3, 1921.

B. E. D. Stafford, general manager of the Flannery Bolt Company, who died November 30, 1921.

John G. Talmage, president of the Talmage Manufacturing Company, who died August 25, 1920.

Harry R. Warnock, appointed vice-president in charge of mechanical matters of the Standard Steel Car Company in July, 1920, and prior thereto general superintendent of motive power of the Chicago, Milwaukee & St. Paul, who died January 19, 1921.

Joseph Maycock, who died on Wednesday night, last, was the railroad representative of Pratt & Lambert, Inc., for some 25 years, and was a familiar figure at the M. M. and M. C. B. conventions for a considerable part of that time.

Albert C. Ashton not only attended the conventions regularly, but was active in the affairs of the Railway Supply Manufacturers' Association. Also, it seldom if ever happened that Mr. Ashton came to the meetings without his mother—"Mother Ashton," as she was reverently called, not only by her family, but by her many friends. She, too, passed away a month ago in the same delightfully peaceful way in which she had lived.

James C. Currie was a man much like Mr. Ashton in many ways. He, too, had much to do with the activities of the railway supply men at these conventions; but his time of service was longer and the contact much more intimate. For several years he acted as treasurer of the organization.

Bror Viktor Petersson

While a considerable number of the present generation of followers of the conventions will not recall Frank P. Smith well, if at all, it is not so many years ago, in the days of the Hancock Inspirator Company and for some time after that concern was absorbed by Manning, Maxwell & Moore, Inc., when he was well known not only to many railway supply men, but also by a host of railway men.

Then there is B. E. D. Stafford—"Staff" as he was called with not a little touch of affection by a large number of men in the railway field. He was typical of the many splendid men who have brought the Railway Supply Manufacturers' Association to its present high plane; and it was those same simple, honest qualities which carried him to success in the company he served from its infancy. At the time of the last convention Mr. Stafford was confined to his home at Millville, just a few miles from Atlantic City, through a paralytic stroke, the last of a series of which finally caused his death last November.

No two of the other eight men were quite alike. Mr. Cutler was, of course, in a class by himself, judged purely from the heights he had attained in the world's affairs. Yet withal he was the fine, approachable fellow that made the lives of others so worth while; and he always concerned himself with the smallest details which made for cleanliness and progress in the ranks of the railway supply men. Of the remainder, it would be hard to draw close parallels. They differed in dispositions, sometimes widely, much as do men as a whole; but each had achieved something and each contributed in like manner to the progressive success which has culminated in what we see here at Atlantic City this year.

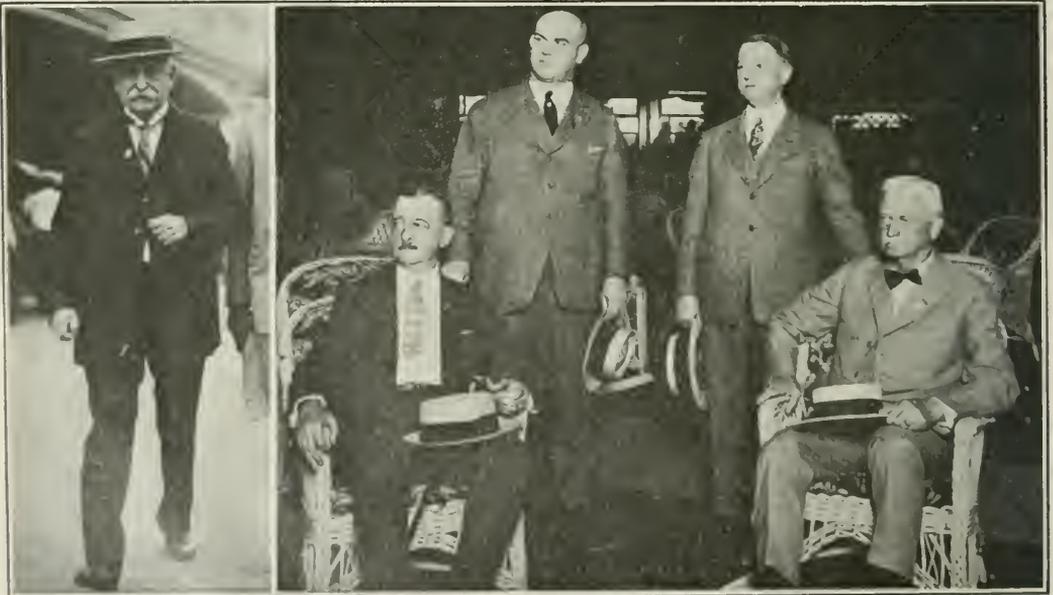

Canadian Night

IN HONOR of our Canadian members and the many Canadians who are attending the convention the Entertainment Committee put on a "Canadian Night" last night. The citizens of our neighboring country were there and they greatly enjoyed the attention given them and the evening's festivities, generally speaking. The ballroom on the pier was gaily decorated with the flags of their country and of ours. The dancing programs were also illuminated with the flags, in colors, of each country.

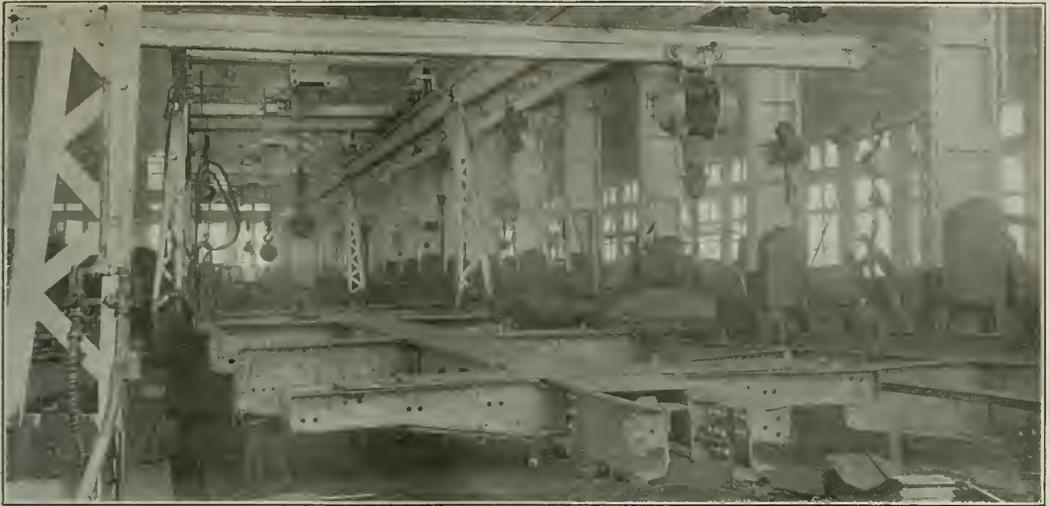

At 9:30 o'clock the dancing program, consisting of 16 numbers, commenced. In the intermissions refreshments were served and bits of vaudeville sketches given by artists from Montreal. They were here with the permission of Sergeant-Major R. J. Hiller, of the Fifth Royal Highlanders. They were Jack Hunter, Canada's Harry Lauder; James Robertson and Jean Thompson, juvenile dancers of considerable fame, and five members of the Royal Highlanders who were entitled "The Canadian Black Watch." Rhys Morgan, of New York, also sang. The night's entertainment was greatly enjoyed.

Those of the Entertainment Committee in charge of the evening were: W. J. Carrigan, chairman; Webb C. Krauser, assistant chairman; Oscar C. Hayward, A. R. Miller and W. A. McWhorter.

Mr. and Mrs. B. A. Clements are accompanied this year by their daughter and son. The son, Robert, has just finished a course at the Staunton Academy in Virginia.

Members of the Railroad Labor Board in attendance at the convention. Left to right: Judge R. M. Barton, Samuel Higgins, Walter L. McMenimen, G. W. W. Hanger and Horace Baker.

American Railway Association—Division V—Mechanical

The Committees Dealing With Construction and Important Details of Cars Reported Yesterday

Chairman Tollerton called the meeting to order at 10 a.m. and called for report of Committee on Car Construction.

Report of Committee on Car Construction

The work of this committee during the past 10 years has had a marked influence in bringing about a more general appreciation of the importance of correct fundamentals in the design of freight cars. This part of the committee's work, however, has been simple in comparison with the task of developing a set of standard car designs which will be generally acceptable to the members of the American Railway Association.

In 1915 the committee presented to the Master Car Builders' Association a design for an outside steel sheathed 40-ft., 6-in. box car. But the fur-

ther development of this or other designs was not pushed, owing to the action of a subcommittee of the old American Railway Association, under the chairmanship of the late E. P. Ripley, in taking up the same task. The war then intervened.

The committee has again actively taken up this work and hopes to present one or more complete designs next year. It now has 15 members who represent practically all sections and railroad interests in North America (except Mexico), and its greatest task is likely to be political rather than technical in its character.

Arrangement of Refrigerator Cars to Prevent Salt Water Dripping on Rails

THE VARIOUS REFRIGERATOR transportation companies have either developed a brine retaining valve of their own or favor some particular type of valve. So many of their cars are equipped with brine retaining valves of the type they favor that it will be difficult for them to agree on any other type of valve, unless it is something which is a great improvement over the one they now use.

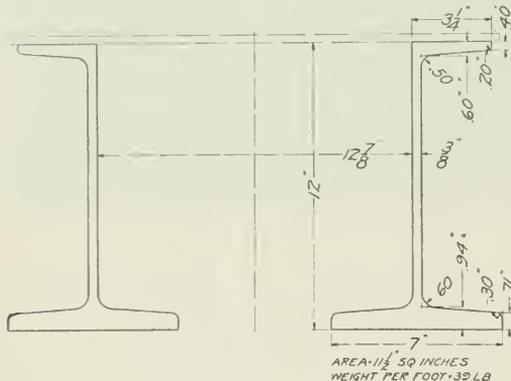

Such a device has not been called to the attention of the committee. It would, therefore, appear advisable to adopt a set of rules covering the design of valves and brine tank equipment, as well as for the inspection of this part of the refrigerator car.

A canvass of brine valve application to refrigerator cars shows that the cars of twelve railroads and car lines are either all equipped or will be, in all but one case, during the current year.

The following rules are suggested for adoption as a standard of the Association:

RULES FOR BRINE VALVE AND OPERATING RIGGING

1. Operating rods shall be solid and not less than $\frac{5}{8}$ -in. in diameter.
2. Operating lever at top shall be of wrought or malleable iron, with cross-section area not less than 1.5 sq. in.
3. Rubber seats shall be made of pure rubber, to resist the action of salt water.
4. Cast parts shall be of malleable iron, not less than $\frac{1}{4}$ -in. thick.
5. All parts of brine valves shall be heavily galvanized or sherardized.
6. All surfaces adjacent to rubber or other seats in the valves shall be machined and free from fins, blow holes or other defects.
7. Valve operating mechanism shall be so constructed that valve must be closed before plug can be put in place.

Proposed Standard Center Sill Section

8. Where possible, valves should be so arranged that weight of brine in tank will hold the valve closed.
9. The diameter of wearing pins and connecting bolts shall be not less than $\frac{1}{2}$ in.
10. All nuts shall be held in place by cotter pins at end or by lock nut.

RULES FOR CLEAN-OUT OR HAND-HOLE CASTINGS

1. Cast parts shall be of malleable iron, not less than $\frac{1}{4}$ -in. thick.
2. All parts of clean-out casting shall be heavily galvanized or sherardized.
3. Clean-out castings shall have a gasket between cover and clean-out frame.
4. The cover locking device should be simple in operation and easy to close.

RULES FOR BRINE TANK

1. The tank shall be made of heavily galvanized iron, not less than $\frac{1}{16}$ in. thick.
2. All joints shall be riveted and soldered.
3. Connection castings shall be made of heavily galvanized or sherardized malleable iron castings.
4. The brine tank shall be securely supported and fastened in end of car.

RULES FOR INSPECTION

1. See that rods, levers and other parts of the brine valves are connected, and that valves function properly.
2. Inspect the following parts for leaks: Clean-out castings, tanks, valves, and connections between tanks. All leaks shall be repaired before a car is loaded.
3. A card, reporting the brine tank equipment in serviceable condition, signed by the foreman in charge of the inspection, shall be filed before a car is loaded.

Standard Fundamentals for Cars

The committee desire to present the center sill section shown, for adoption as standard for all cars except those which, on account of insufficient side sill strength, require fish-belly center sills, such

as flat cars and gondola cars with very low sides. The section proposed presents the least surface for corrosion, with a maximum section modulus. Therefore, the loss in strength per year will be a minimum.

It is applicable to all cars, with few exceptions. It will reduce the number of rivets in center sills by an appreciable amount, and, therefore, will correspondingly reduce the cost of the car. Interchangeability of details will be very materially increased, reducing the amount of repair stock to be carried at the different shops.

We earnestly recommend that this section be adopted as the standard of the Association, for all cars which do not necessarily require fish-belly center sills, and that all railroads use this center sill section for all new construction.

Standardization of Marker Lamp Socket Brackets and Holders

The standard marker lamp socket and marker lamp bracket were brought to the attention of your committee, suggesting a standard marker bracket and socket to promote interchangeability. The committee proposes that a slight modification in the present standard socket be made by adding a bevel, and that a standard marker bracket foot be adopted, as shown in the illustration.

Care should be exercised to make the exterior of the bracket foot and the interior of the socket smooth and close to dimensions so that they will mesh properly.

Standard Box Car Body Designs

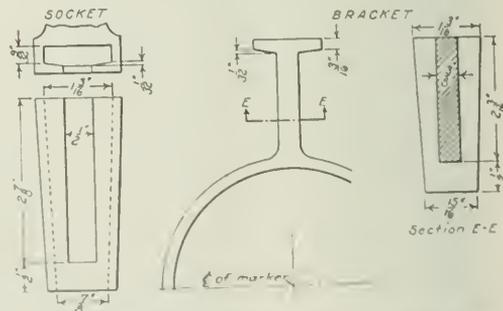

A number of meetings with the Committee on Car Design and Engineering, of the Car Manufacturers' Association of the United States, were held to go further into the question of fundamentals of car construction, which finally resulted in the submission of several preliminary designs by the Manufacturers' Committee, which are now under advisement by your committee, which hopes to submit one or more complete designs next year.

Equipment Classification to Facilitate Mileage Allowance on Private Cars

Under date of October 24, 1921, the Transportation Division issued a circular covering mileage rates, which led to requests for more definite and precise description of privately owned freight cars in the Equipment Register.

Representatives of the committee on car construction conferred with the subcommittee of the Committee on Records of the Transportation Division, who agreed that the value of mileage depends on whether or not the car is suitable for coal or coke. It was also agreed that a car which has sufficient strength and cubic capacity to carry its marked capacity of bituminous coal should be considered suitable for coal or coke. The Mechanical Division was, therefore, requested to provide two classifications instead of the present single classification "GB," with definition for each. The following is submitted for adoption:

"GB"—Gondola Car—A car open on top, with solid bottom, sides and ends, suitable for mill trade but not suitable for coal or coke.

Proposed Modified Standard Marker Socket and New Standard Bracket

"GK"—Gondola Car—A car open on top, with solid bottom, sides and ends, suitable for mill trade and for coal or coke.

The following modifications to definitions for "GB" and "GM" cars, to decrease ambiguity, are also recommended for adoption:

"GD"—*Gondola Car*—A car open on top, having side dump arrangement, and suitable for coal or coke.

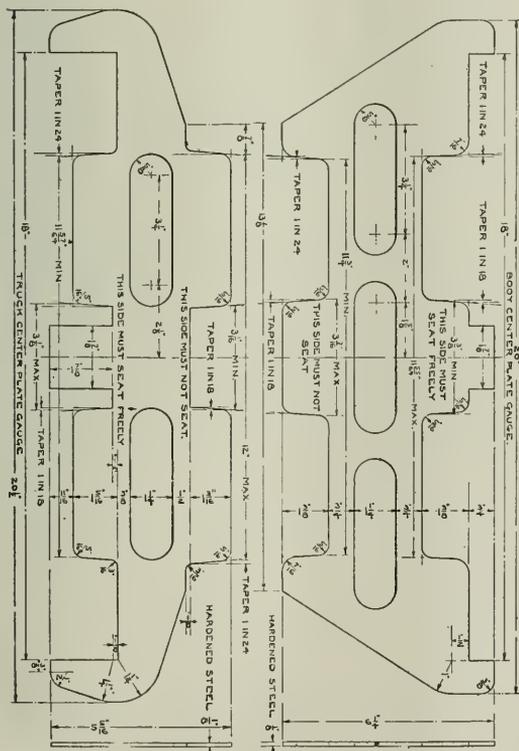

"GM"—*Gondola Car*—A car open on top, with solid bottom, low sides and drop ends, to facilitate twin shipments, suitable for mill trade, and not suitable for coal or coke.

On request for a classification, designation and description of the Virginian 109-ton gondola cars, the committee selected and submit the following for adoption:

"GT"—*Gondola Car*—A car open on top, with high sides, solid bottom, sides and ends, suitable for unloading coal on dumping machines, but not suitable for mill trade.

Gages for Center Plates

Communications from members indicated the desirability of adopting tolerance gages for standard center plates. It was stated that the absence of such gages permitted conditions where the body and truck center plates locked, causing derailments. The

Proposed Tolerance Gages for Standard Center Plates

gages shown in the drawing are submitted herewith for adoption as standard.

Standard Truck Designs

The Subcommittee on Car Trucks, in conference with the Cast Steel Manufacturers' Committee, has made considerable progress

toward producing one or more designs of trucks. Preliminaries on which agreements have been reached are:

Assumed method of loading; maximum stresses to be allowed; design of spring plank attachment to side frames applicable to all of the three existing types of side frames; designs of cast steel and pressed steel bolsters to be interchangeable; side frames, with their boxes, to be interchangeable; complete trucks to be interchangeable, and the use of standard wheels, axles, bearings, wedges, brake beams, brake shoes, hangers and springs.

It is expected that truck designs can be completed in the coming year, these designs to incorporate fixed conditions, facilitating interchangeability between details, singly or in groups, and so that preferred specialties can be substituted for standard detail construction.

Arch Bars for 80,000-lb. Capacity Cars

Our attention was called to frequent breakage of bottom arch bars of these trucks, with request for investigation of the stresses involved. It was found that the stresses were considerably higher than in the corresponding members of other trucks. To correct this, it is recommended that the bottom arch bar be increased in thickness from 1 3/8 in. to 1 1/2 in., and that the column and journal box bolts be increased in length by 1/2 in.

End Stake Pockets for Flat Cars

An ever recurrent suggestion is to provide all flat cars with end stake pockets. Their absence often necessitates considerable extra expense for end bracing of shipments, and sometimes loss of loading length. We submit, for adoption as recommended practice, that flat cars be provided with end stake pockets substantially attached to underframe members.

The report was signed by W. F. Kiesel, Jr. (Chairman), Penn. System; A. R. Ayers, N. Y. C. & St. L.; C. E. Fuller, Union Pacific System; J. C. Fritts, D. L. & W.; C. L. Meister, A. C. L.; J. McMullen, Erie; T. H. Goodnow, C. & N. W.; John Purcell, A. T. & S. F.; W. O. Moody, I. C.; J. A. Pilcher, N. & W.; H. L. Ingersoll, N. Y. C.; W. H. Wilson, N. P.; F. W. Mahl Southern Pacific Co.; W. H. Winterrowd, Canadian Pacific, and G. S. Goodwin, C. R. I. & P.

Discussion

After the tabulation showing brine value applications to refrigerator cars, Mr. Kiesel said: It will be noted that nearly all of the cars are equipped and the rest of them no doubt will be equipped this year. Therefore there is no necessity for further extending the time limit set by the Arbitration Committee.

With reference to the definition of gondola cars, early in the report, Mr. Kiesel said:

Since this report was written, our attention was called to the fact that if we simply put in the definition as we have given it here under "G B" and "G K," it will not include the description of a car suitable for coal and coke. Therefore, with your permission, after this meeting we will add to these descriptions a clause to complete it which will be about like this:

"G. B."—*Gondola Car*—A car open on top with solid bottom, sides and ends, suitable for mill trade, but not having either sufficient strength or cubic capacity to carry its marked capacity of bituminous coal.

That will make it clear, so there cannot be any misunderstanding.

[A similar change is to be made in the definitions of the "G D" and "G M" cars.]

I. S. Downing (Big Four): I think that the committee is right on this thickness of the arch bar. The trouble comes not only from breaking, but from sagging, and if we have 1 3/8 in. as standard, we should have something in the rules to provide for 1 3/8 in. on the other fellows' cars.

Prof. I. E. Endsley (University of Pittsburgh): With regard to the $1\frac{3}{8}$ in. bottom arch bar to replace the $1\frac{1}{4}$ in. arch bar, I do not believe that much gain will be made for the point where the arch bars are breaking is at the bend, and at this point a large proportion of the stress is secondary, induced through the bending. Increasing the arch bar from $1\frac{1}{4}$ in. to $1\frac{3}{8}$ in. increases these secondary stresses 20 per cent, while the primary stresses are reduced only 10 per cent. Adding 20 per cent and taking off 10 per cent does not seem to improve it very much. I think more gain could be made by widening the arch bar instead of increasing its thickness. These statements are not made from calculations, either, but from actual tests.

Mr. Kiesel: From what Prof. Endsley said, it would seem that we are wrong in allowing a 50-ton arch bar truck, because we would have more stress. The arch bar is supposed to be supported in the bend and everybody is trying to do that. If we are wrong in increasing the arch bar for the 80-ton car, we are certainly wrong in having arch bars under the 100,000-lb car. I do not think that the reasoning is correct.

Prof. Endsley: I would like to submit to the Car Construction Committee a full record of something like 21 arch bars which I have tested.

Mr. Kiesel: We will be glad to have anything you can submit, establishing what you have stated and if the figures support your contention I think we will agree with you.

Mr. Downing: In these figures I presume that the figures which have been used for the last fifteen years in the cast steel truck side will be covered.

Chairman Tollerton: It is extremely important that we have a complete discussion before this report is submitted to letter ballot.

George W. Rink (C. R. R. of N. J.): The committee recommends a special stress for center sills. They also report a number of meetings with the Committee on Car Design and Engineering of the Car Manufacturers' Association of the United States, and they expect to have a design of standard box car body ready to report to the next session.

I would like to know whether or not they have passed on this question of the section of the center sill construction, or whether they will come out with another section.

Mr. Kiesel: As we understand it, whatever design the Mechanical Division adopts as standard, that design must be observed by every manufacturer who makes designs for the division. It will be expected that the members will follow it in the construction of new cars.

C. H. Bilty (C. M. & St. P.): Our road is in favor of going to a special shape of center sill construction, but of course we are a little hesitant to use something that we have never used before. We also feel that 24 sq. in. is ample for all of our requirements, which we are using both in repair work and on the new cars, and hence we feel that it would be more or less of a hardship to be compelled to accept the committee's recommendation in this respect.

Mr. Kiesel: As I understand it, Mr. Bilty's idea is that they now have cars with 24 sq. in. center sills, and assumes that the section recommended by the committee would have to be used in the case of all repairs. That cannot be done in all cases. You cannot substitute a 12-in. center sill for a 10-in. sill. But I believe that if the railroad men it they will be glad to adopt it for repairs they will save money.

F. H. Hardin (N. Y. C.): I would like to ask if the

dimensions, shown in Fig. 1, are included as part of the committee's recommendation?

Mr. Kiesel: They are.

Mr. Hardin: May I ask what thickness of the cover plate is recommended?

Mr. Kiesel: That question has not yet been settled by the committee. Tentatively it has been agreed that for box cars in which the superstructure assists the center sills more than on flat cars, we will use $\frac{1}{4}$ -in. cover, and on all other cars, $\frac{3}{8}$ -in. covers; 28 sq. in. on box cars and 30 sq. in. for all other cars.

G. S. Goodwin (C. R. I & P.): With the proposed section of center sill, it will be necessary to cut off the inside lower flange where the draft rigging is applied. I would also like to inquire if it is proposed to recommend or apply any reinforcement behind the draft rigging to get greater area from the front stop back to the bolster.

There is also a question as to the stake pockets on flat cars. It seems to me that it would be desirable, if possible, to say whether those pockets should be inside or outside of the sill.

Mr. Kiesel: We did not intend to be specific in regard to this, but to make a general rule which would cover strength conditions. As long as we do not have a standard flat car design, we cannot give a specific design and say it has got to be used.

Mr. Giles: The arch bar question would be solved to some extent by the committee embodying in their report a recommendation to the railroads that the use of arch bar trucks under new equipment should be discontinued. The use of arch bar trucks should be confined to existing equipment.

Mr. Tatum: Would it be wise to consider the elimination of the arch bar truck? There have been vast changes in the development of the arch bar truck and I think it would be a drastic action at this time to consider its elimination unless you stipulate the design that you care to eliminate.

Mr. Kiesel: Some of the members of the committee are very much in favor of eliminating arch bar trucks from new designs, but others are not. Even if we did make a suggestion it would not pass. I believe that question should be left until the committee has developed and furnished truck designs to be adopted as a standard and those truck designs should be such that all the stresses are properly cared for.

R. D. Bryan (Santa Fe): The proposed center sill is a special section and after you cut out for the draft gear, I do not see where you have anything better than a pair of commercial channels. These special sections are hard to get sometimes.

Chairman Tollerton: If the report of this committee is adopted, manufacturers will make the section which will be a regular section for car construction.

Mr. Kiesel: The sill section must be balanced, and in addition to the channel center sill, an angle is united to the bottom and a cover plate at the top. A section of that nature will have a section modulus corresponding with a section area of 115 or perhaps 120, while the section modulus of this is over 130, and thus for the same area you get greater strength.

Of course, we cut out for the draft gear; we do not run the angles into the draft gear now, but our backstop is behind the draft gear, and the column action is from rear follower plate to rear follower plate. This section, therefore, as a column carrying member is stronger than the same area we have used heretofore.

(A motion that the report be accepted and the vote taken by letter ballot was carried.)

Report on Couplers and Draft Gear

The long task of this committee in developing the Type "D" coupler has now been brought to a conclusion and in the future matters pertaining to couplers will require but little of its time.

This year's report marks the interim between the completion of one task and the active prosecution of another equally as extensive. For its future work the committee is now taking up the testing of draft gears that have been subjected

to a period of actual service, to supplement the Rochester tests of the United States Railroad Administration on new gears. A special drop testing machine is being developed for this work, the purpose of which is to furnish information of the same character as that obtained in the Rochester car impact tests, but with closer control of variable conditions other than those in the gears themselves.

DURING THE PAST year the activities of the committee with respect to draft gear investigation have been limited on account of the depression in business through which the railroads have been passing. It is the purpose to pursue the draft gear work diligently during the coming year.

Following are a number of recommendations concerning the Standard "D" Coupler Specifications and gages, which are submitted for your approval at this time.

Standard "D" Coupler Specifications

It is proposed to revise paragraph 15-B to require 10 per cent of the complete couplers to be weighed, rather than all the couplers. The revised paragraph follows:

"15-B. When couplers are purchased complete and assembled, 10 per cent of the couplers in each lot of 100 or less shall be individually weighed and shall come within the limits as shown on Fig. 6. Upon the failure of a coupler to come within the limits as shown on Fig. 6, the weighing shall be extended to the entire lot. Failure of any coupler to come within the limits shall be sufficient

developed by the manufacturers since adoption of the Standard "D" Coupler Specifications in 1918, and take care of the bottom operating mechanism for the coupler.

Table of Weights for the Standard "D" Coupler

The table of weights shown is recommended for approval to replace the table of weights now appearing in the "D" coupler specifications. The weight table has been revised to conform with the weights obtained on a large number of couplers and a column has been added giving the normal weights.

The report is signed by R. L. Kleine (chairman), Penna. System; J. C. Fritts, D. L. & W.; J. R. Onderdonk, B. & O.; J. A. Pflüger, N. & W.; C. B. Young, C. B. & Q.; L. K. Silcox, C. M. & St. P.; Samuel Lynn, P. & L. E.; L. P. Michael, C. & N. W., and Prof. L. E. Endsley, University of Pittsburgh.

Discussion

Mr. Bilty: The report states that "Failure of any coupler to come within the limits shall be sufficient cause to reject the coupler unless the weight can be adjusted by

LIMITING WEIGHTS—"D" COUPLER

cause to reject the coupler unless the weight can be adjusted by the manufacturer. Detail parts shall come within the limits as shown on Fig. 6, one coupler being dismantled in each 100 and weighed."

Actual experience in carrying out the "D" coupler specifications developed that weighing 10 per cent of the complete couplers furnished sufficient check on the product.

Gages for Standard "D" Coupler

The following gages for the Standard "D" Coupler are recommended for your approval: 16529-1—Bottom Lock Lift Lever Gage; 16529-2—Bottom Lock Lift Toggle Gage, and 16529-3—Bottom Lock Lift Lever Gage Pin. These gages have been

the manufacturer." Just how would the manufacturer adjust the weight?

Mr. Kleine: If you could get all parts of minimum weight in a complete coupler, it might fall below the minimum requirements. You could then put in a heavier knuckle, bringing the total weight of the coupler within the minimum specification weight.

Mr. Bilty: Then if the bar is perhaps a little under weight, or the locking block and the knuckle a little light, will the coupler be accepted?

Mr. Kleine: The coupler will be accepted.

Mr. Rink: I would like to ask Mr. Kleine whether he

has received any complaints of the Type "D" coupler lock lifter dropping down behind the lock and wedging in such a manner that it is impossible to throw the coupler? We have had several cases of that kind with couplers applied to Railroad Administration coal cars. It may be due to a faulty core, but I am wondering how extensive that trouble is on other roads.

C. G. Juneau (C. M. & St. P.): As far as our line is concerned, we have not had any trouble with the Type "D" coupler.

J. A. Pilcher (N. & W.): On the Norfolk & Western we have some very large cars using these couplers and I mention this because there has been some tendency to go back to the lighter coupler. In examining a group of these cars, where it is necessary to remove the couplers right along, one of the car men asked me a day or two ago: "What shall we do with these couplers?" Out of sixteen examined, three had upset 1 in., two of them $\frac{7}{8}$ in., three $\frac{3}{4}$ in. and four $\frac{1}{2}$ in. The rest of them had upset from $\frac{1}{4}$ in. to $\frac{1}{2}$ in. The question is, what are we going to do next if we keep on hammering the cars? We must put some limit on the speed with which contact is made in switching.

Mr. Kleine: The Coupler Committee is glad to receive any information whatever in regard to defects which may develop in the Type "D" coupler. When it was designed we did not believe it was perfect, but we did take great care to get the coupler as near 100 per cent as possible. Mr. Goodnow called our attention to another case of the lift lever dropping back of the locking block and I think we had two cases of this kind on the Pennsylvania System. We ran those cases down, but could not find how the lifter could get back of the locking block. We cut sections out of the coupler and it was not possible to place the lifter so that it would drop down back of the locking block. We are convinced that somebody had taken the coupler apart

and had not placed the lifter back in the slot. If anybody else has experienced any similar trouble, the committee would be glad to hear from him now or by letter.

O. D. Buzzell (Santa Fe): We have had a number of complaints of the Type "D" coupler not coupling. At excessive speed they did not couple due to the locking device being slow to act. I think this is a good feature. We were always after our switchmen to couple up easy but there has been considerable complaint about rough handling on the part of the transportation department and switching yards.

Another thing I have noticed is the rapid wear of the pin holes in the coupler eyes. How we can increase that area I do not know, but a considerable amount of play appears at that point in a very short time.

Mr. Kleine: Of course, we all remember the trouble with the old standard coupler due to pin holes wearing rapidly in line with the lock pin, but there cannot be any such wear in the Type "D" coupler. Do you refer to that coupler, or to others?

Mr. Buzzell: I refer to the Standard "D" coupler.

J. J. Tatum (B. & O.): Some very enthusiastic things have been said about this type of coupler; however, there have also been some complaints about hard coupling, and I believe it would be a good idea for those who know of any cases of trouble to bring them to the attention of the Coupler Committee.

F. W. Brazier (N. Y. C.): It must be very gratifying to Mr. Kleine and the other members of the committee to know that there are so few complaints with reference to Type "D" couplers. I think that this will be handed down to posterity, as one of the greatest things you have ever done.

(A motion that the report be received and submitted to letter ballot was carried.)

Report on Brake Shoe and Brake Beam Equipment

Last year this committee gave particular attention to brake beam reclamation and recommended in detail a process to be followed in repairing brake beams the purpose of which was to insure that the repaired beams might fully measure up to the capacity required of new beams. The report presented drawings and photographs of a simple but comprehensive set of special devices to facilitate assembling and testing reclaimed beams systematically and cheaply. This equipment can be built largely of second-hand material. An ab-

stract of this report appeared in the *Railway Age* for August 20, 1921, page 369.

A further study of this subject prompts the committee again to emphasize the importance of having the repaired brake beam meet the requirements of the standard specifications, which can only be done effectively in properly organized central repair plants. The committee has under consideration the development of a standard brake beam design, in connection with which it will consider the advisability of adopting some form of brake head strength test.

The detailed work of the committee has been principally the further study and reclamation of subjects carried over from the previous year as follows:

Work of the 1st. Track Inspection Committee.—A careful analysis of the work of the 1st. year made, supplemented by reports from the general committee of the Eastern and Western Railroad Association, covered the subject. The first track brake shoe, illustrated, is a standard design, which has been able to develop not covered completely. This design is recommended to letter ballot as Recommended Practice.

Reclamation of Brake Shoes from Irreversible Stalls.—Including that on the subject and those suggested by different members,

have been considered from the standpoint of demand and practicality. The committee feels that none of the designs have sufficient merit to warrant recommending them as Standard or Recommended Practice. The subject will be continued for further consideration.

Brake Beam Reclamation.—Last year the committee submitted as a progress report a tentative Standard Practice for the consideration of the members and requested their consideration and criticism. No criticism or suggestions were offered. A further study of this subject emphasizes the importance of repaired brake beams meeting the capacity and other requirements of the standard specification. To handle this work most efficiently, properly organized

covered that many of the shops did not have the necessary facilities for accomplishing the work, which was not being done according to standard practice. We then centralized the work at the main shop and it was discovered that testing machines were needed in order to find out whether the reclaiming was all right before the brake beam was sent out into service. We had apparatus which indicated whether the brake beam had the proper camber before we gave it a test.

We demand a certain capacity beam from the manufacturer, as Mr. Fuller said, and I believe we should all watch that particular feature closely in reclaiming brake beams and see that we are meeting the requirements demanded from the manufacturer.

The specifications for brake beams should be just as rigid for the reclaimed beam as for the new beam, and should give the service that we can expect in the case of a new beam. I was surprised to find the tension members of some beams I recently tested were made of channels and angles that had reduced in thickness of metal 25 per cent and more in some instances. How can we expect that metal so much reduced to give the strength in the beam that we require and how can we expect such beams when reclaimed to meet our specifications?

I believe there are other things in connection with our trucks and brake beams and brake attachments that should be considered. I found a number of brake beams in which the recommendations of the A. R. A. with regard to attaching the beam to the truck had not been followed.

There are other parts that should be given consideration. For example, in the winter time when there is snow and ice between the tracks, we find that the cotter pin is pushed in, resulting in the brake connection dropping down; some method should be adopted to hold the brake

rod in position in case the cotter pin or connecting pin is worked off and lost from its position.

Mr. Bohan: As a matter of general information, I will say that the connections and attachments for brake beams are under consideration by the committee.

T. H. Goodnow (C. & N. W.): While the committee has called attention to the situation with respect to the reclaiming of brake beams, it has made no definite recommendation as to the cure, or rather the enforcement of it. We can hold a love feast here and then go home and continue to do about as we have done in the past. It seems to me that if the members of this Association are sincere in what they are expressing, a remedy can be found in the adoption of some rules similar to the rules with regard to the triple valve work. In other words, regulations could be embodied in the interchange rules providing that on and after a certain date brake beams failing to meet the specifications set up for the reclamation, and not having been tested on recognized testing machines, should not be applied to foreign cars.

If some regulation of that kind is set up, it will at least stop the application of reclaimed beams to other than owners' cars and that matter could be fully controlled because we would have the means of checking it as we now check triple valve work. I believe that if the Brake Beam Committee would take the matter into consideration and recommend something definite of that kind, the Arbitration Committee could take care of the framing of the rules. You can only bring it about by some regulation of that kind. If this is not done, in my opinion many of us will go along as we have done in the past.

(A motion to accept the report and submit it to letter ballot was carried.)

Report on Train Brake and Signal Equipment

Following the 1919 report the committee was requested to investigate and report on the question of standard capacity for retaining valves. A sub-committee was appointed to make tests and in 1920 the committee reported progress and asked for further time on the question of retaining valve capacity. This year's report recommends adopting as standard the present recommended practice which calls for a two-pressure spring type retaining valve without specifying the capacity.

The question of automatic connectors was likewise referred to the committee in 1919; the 1920

report stated that, owing to the magnitude of the subject, the committee had done little more than outline a plan to be followed in investigating it. This year's report indicates little progress has been made in the matter.

In addition the 1920 report recommended that the following subjects be included in the next year's work of this committee: Permissible Use of Brake Cylinder Packing Made of Leather Substitutes, Gages for Signal Hose Coupling, Adjustment of Brake Power on Freight Equipment Cars. No report has been submitted on these subjects.

THE committee on Train Brake and Signal Equipment submitted the following report on subjects which have been considered by the committee during the year.

PART I. AIRBRAKE: HOSE CONNECTIONS FOR FREIGHT AND PASSENGER EQUIPMENT

The subject of permissible hose connections for freight and passenger equipment has been further considered by a sub-committee and the report was made available to the committee as follows:

On account of a general committee report having 15 locomotives, 32 passenger (P.M.E. 100) coaches and 41 freight cars equipped with three pressure connectors, and that there are progressing heavily

Another making status to have 3 passenger trains in Canada and one in the United States equipped with this type of connector

and are working with certain railroad officials in the direction of developing a freight connector.

Further than this, the reports are in the general direction of development only.

It will be seen from the above that the trials in general now being made are in passenger service and the progress of development in automatic train connectors is not such as to put the committee in possession of information at this time that will enable it to make any definite recommendations on an acceptable design of connector for both passenger and freight service.

PART II. REVISION OF CODE OF AIR BRAKE AND TRAIN SIGNAL RULES

The present code of Air Brake and Train Signal Rules is in need of revision, and a sub-committee has been appointed from the

Train Brake and Signal Committee to work in conjunction with a committee from the Operating Division on revising the code.

PART III—STENCILING BRAKE CYLINDERS

Attention has been called to the fact that in many cases where the stenciling is above the transverse center line of the auxiliary reservoir it frequently becomes illegible through drippings from the car. Experiments have been made on at least one large railroad by stenciling below the center line, which indicates an improvement.

We believe the practice of applying the stencil approximately one inch below the center line should be followed, which can be done without conflicting with the present requirements from the fact that the location for the stencil is not specifically indicated.

PART IV—RETAINING VALVES FOR FREIGHT EQUIPMENT CARS

The committee recommends submitting to letter ballot for advancement to standard, the present recommended practice, two-pressure spring type retaining valve for freight equipment cars.

PART V—BRAKE BEAMS

At the request of the Car Construction Committee, the Committees on Train Brake and Signal Equipment and Brake Shoe and Brake Beam Equipment have held several joint meetings during the year in connection with the strength requirements of brake beams, and have submitted their recommendations to the Car Construction Committee on the proposed status of number two and two plus beams.

The report is signed by T. L. Burton (Chairman), New York Central; B. P. Flory, New York, Ontario & Western; J. M. Henry, Eastern Region, Pennsylvania System; L. P. Streeter, Illinois Central; R. B. Rasbridge, Philadelphia & Reading; G. H. Wood, Atchison, Topeka & Santa Fe; H. M. Curry, Northern Pacific; W. J. Hatch, Canadian Pacific and G. C. Bishop, Long Island.

Discussion

G. G. Jumeat (C. M. & St. P.): I would ask the chairman of the committee, referring to the automatic connector, whether they have actually seen a test of the connector. Did the committee actually see the train broken up and the cars recoupled by the use of the connector?

Mr. Burton: A sub-committee, composed of Mr. Bishop (Long Island) and Mr. Hatch (Canadian Pacific), have, as individuals but not in the capacity of members of the committee, made the observations referred to in our inquiry.

J. M. Ryan (C. St. P. M. & O.): We have had a little experience with the automatic connector in passenger car equipment. The Canadian Northern has been operating a train at a large terminal for a year satisfactorily, and while I do not know what trouble they have experienced on the other end of the line, as far as we were concerned we experienced no trouble in that year. Just recently, for some unknown reason, the connectors were taken off. I inquired as to why and was unable to get a definite reply, but as far as our experience went the connector was a success.

B. J. Fogg (Grand Trunk): We have three trains equipped with the automatic train connector for test purposes; two of these trains run between Detroit and Grand Haven, a distance of 186 miles, and another train works between Battle Creek and Port Huron, a distance of 159 miles. These trains are equipped at both ends of the road and they are working out splendidly. They have been in service under tests for pretty nearly two years.

Mr. Burton: I might state, in connection with the automatic hose connector, the committee feels that there has been no test made up to date that will have an important bearing on the performance of the connector when applied to freight cars.

Passenger train tests, covering a run in many cases of small mileage and switched at one or both ends of the road, mean little compared to the movement of coupling and uncoupling which would occur on freight train cars in classification yards. There have been several test trains with the connectors run in passenger service, but we get from these movements little information about how the connector would work in freight service.

Mr. Tatum: I agree with our committee that we have got to go very carefully in establishing a decision on the automatic connector. The trains which are made up for testing get very careful attention, careful switching, and as a rule these cars are handled together, but when these cars get into general use, there will be difficulties to contend with. We have three different connectors under test and it is difficult to say what we might expect if they were in general use. (*It was voted that the report of the committee be accepted and the various items recommended by the committee submitted to letter ballot.*)

Report of Committee on Car Wheels

The committee has had under consideration the possibility of mounting wheels having the same physical characteristics on the same axle as a means of increasing their service life. It has reached the conclusion that the only practicable way of mating wheels of equal hardness is in the case of solid wrought carbon steel wheels, to pair those with a carbon content varying by not more than .05 per cent and in the case of cast iron wheels to continue the selection by tape sizes now covered in the recommended practice.

A few roads have been experimenting for the purpose of developing a chemical specification for cast iron wheels. The committee now has this subject under consideration and tentative specification has been prepared for the consideration of the wheel manufacturers. Owing to the number of interests affected, this is a matter requiring a thorough survey before final recommendations can be formulated and presented to the Division.

IN ORDER to clarify the matter of condemning limits of steel and steel-tired wheels on account of wear, the committee recommends the following rule as Interchange Rule 79, under the freight car code and as a paragraph of Rule 7 of the Passenger car code:

"Thin tread: Steel and steel-tired wheels.—If tread is worn to within $\frac{3}{4}$ in. of the measuring line, which is the inside edge of the limit of wear groove."

There is recommended the introduction of an additional drawing in the code of rules to follow Fig. 4, now shown on page 220 of the 1921 revised code; also Fig. 4, M. C. B., sheet 16-A.

In 1920 the contour of the back of flange of steel and steel-tired wheels adopted in 1912 was withdrawn from the standards and the 1909 contour readopted as standard. With the 1912 contour the

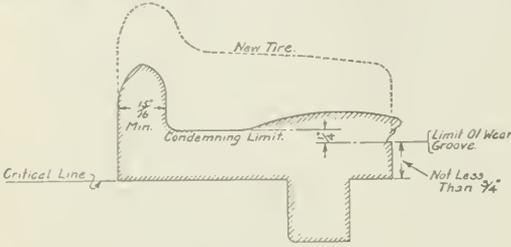

back of the flange of steel and steel-tired wheels was identical with that of cast-iron wheels between the base line and the top of flange. The 1909 contour reduced the width of the rim from 1 1/2 to 5 1/2 in., and the backs of the flanges of steel and steel-tired

tion of attempting to mate wheels of equal hardness, but it is their conclusion that the only practicable method of doing this is in the case of solid wrought carbon steel wheels to mate them within a .05 per cent carbon content range, and in the case of cast iron wheels to mate by tape sizes as already provided for in the recommended practice for mounting wheels. It is therefore recommended that the following section be added to paragraph 8 of the Recommended Practice for Mounting Wheels:

"In the case of new wrought steel wheels, those mounted on the same axle should not differ in the carbon content by more than .05 per cent."

Your committee has under consideration certain revisions in the specifications for wrought steel wheels and cast-iron wheels. However investigation has not yet progressed sufficiently that it is ready to submit recommendations at this time.

The report is signed by W. C. A. Henry (Chairman), Penn. System, W. H. Winterrowd, Can. Pac.; J. A. Pilcher, N. & W.; O. C. Cromwell, B. & O.; C. T. Ripley, A. T. & S. F.; H. Stillman, Sou. Pac.; L. K. Silcox, C. M. & St. P.; H. C. Manchester, D. L. & W., and P. H. Dudley, N. Y. C.

Steel Tire Recommended Practice.

Condemning Limit Drawing for Steel and Steel Tired Wheels Recommended for Insertion in the Interchange Rules

wheels are not now identical with those of cast-iron wheels between the base line and a point approximately 1/2 in. above it. Because of this change, the committee recommended that the drawing of the maximum and minimum flange thickness gages for cast-iron, solid steel and steel-tired wheels be changed to show the height of the

Discussion

Chairman Henry submitted the report and at its conclusion said: The committee wishes to refer to the saving that will result from changing the condemning limits for cast steel wheels under certain conditions.

The present location of the limits of wear groove for wrought steel wheels was adopted in 1909. At that time these wheels were in the early stages of development and but little was known of their performance in actual service. Prior to the issuance by the Bureau of Locomotive Inspection, of limits the same as adopted by the M. C. B. Association in 1909, various railroads throughout the country established their own limits, some of which permitted greater wear than those now in effect.

One railroad has also conducted laboratory tests which clearly indicate that wrought steel wheels are of ample strength to permit greater than the present limits allow.

It is the opinion of your committee that solid wrought steel wheels, confined to switching service, may with perfect safety be worn to the limit of wear groove instead of one-quarter inch above it which is the present condemning limit for all classes of service. If this change were made, a very substantial saving would result, due to the opportunity to wear out in switching service wheels that now have to be scrapped.

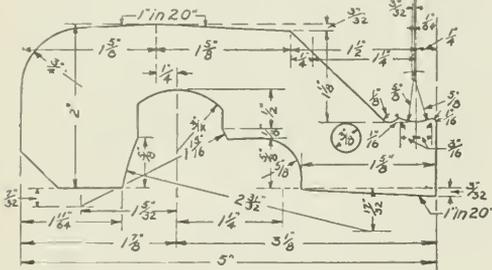

The matter is brought up at this time so that those present may have opportunity to discuss it and give their views on the subject.

Mr. Goodnow: In connection with Mr. Henry's remarks, I would like to raise the same question regarding the interchange rule. Are you making that recommendation entirely as an interchange feature, or are you making it a general one, condemning the wheels as a matter of safety?

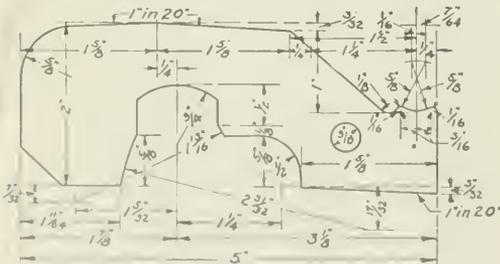

Mr. Henry: Questions that have been referred to the committee from time to time indicate that everyone does not understand just what the condemning limit is for a wrought steel wheel. This rule in no way changes the present standards but there seems to be some lack of understanding as to what the limit is. It can be readily determined by looking at the cuts and this recommendation is merely made with the idea of clarifying the situation.

Mr. Jenks: The committee recommends that a section be added to paragraph 8 of the recommended practice for mounting wheels. I would like to know what thought the committee had in mind in having the carbon content of the wheel given to the man mounting the wheel. In what way are you going to mark the wheel so that he will know what he is doing at the mounting press?

Mr. Henry: It is the practice of some roads either to have the wheels marked by actual figures showing the carbon content, or by some arbitrary series of letters, such

Maximum Flange Thickness Gage For Cast Iron Wheels and Maximum Flange Thickness, Height and Throat Radius Gage For Solid Steel and Steel Tired Wheels.

Minimum Flange Thickness Gage For Cast Iron Wheels and Minimum Flange Thickness, Height and Throat Radius Gage For Solid Steel and Steel Tired Wheels.

Recommended Change in Flange Thickness Gages to Conform to Present Standard Contour of Steel and Steel Tired Wheels

... will have no effect whatever on the life of wheels...

... Your Committee has considered the ques-

as A, B, C, and such roads are following the practice of making the wheels within this range with the thought that the carbon contents being close, the wheels are more nearly of the same hardness and that under those conditions better mileage is obtained.

Mr. Juneau: It would seem to me that the committee in recommending this change or addition to the paragraph should recommend some way of marking the wheels so that they will all work alike.

Mr. Henry: The committee felt, as this is merely a recommended practice, that if this recommendation met with the approval of the Association it might be desirable to go further in the matter. This is merely a recommendation.

Mr. Fuller: The wheel manufacturers at present furnish to each mill a statement showing the carbon content from which this information can be derived. The committee had not gone to the extent of including in the specifications for wrought steel wheels anything covering the subject.

J. E. Mehan (C. M. & St. P.): Supplementing the remarks of Mr. Juneau, I notice that new wrought steel wheels, when mounted, shall not have a carbon content of more than .05 per cent. It strikes me that is a good requirement for new wrought steel wheels and it ought to be equally good for re-turned wheels. The point of having a uniform marking, to my mind, is very essential for the reason that if we return wheels from other roads in order to get uniform wheels on the same axle, we ought to know the other fellow's method of determining the carbon content. For that reason it strikes me there should be some uniform method.

Mr. Fuller: I am inclined to believe that this recommendation is impractical. We are depending entirely on the manufacturers to know the carbon content of these wheels. Everybody understands that the committee could not mount a pair of wheels, both having the same carbon content, without due respect to the tape sizes. The wheels would have to be marked by the manufacturer, or you would get my wheels and not know whether they contained .05 per cent or what the amount of carbon was. I do not believe that you can live up to it, even if the wheels are marked.

Mr. Tatum: The limit groove, shown in Exhibit A, is $\frac{3}{4}$ in. from the bottom and the condemning limit shows $\frac{1}{4}$ in. above that limit groove. Suppose the metal was $\frac{1}{4}$ in. thick at that point and the car was offered for interchange; should it be accepted?

Mr. Henry: Yes, sir.

C. T. Ripley (Santa Fe): It has been found practicable to make wheels in accordance with the carbon content, varying not more than .05 per cent, and merely marking that group by letters. The results which can be secured are somewhat questionable, but we feel there is a chance of better wear. Inasmuch as we can take that chance with practically no extra expenditure either in first cost of the wheel or work in the repair shop, it is worth going after. As regards marking old wheels, the difficulty is that many of the roads (and they have a good argument for so doing) dismount wheels where but one wheel is worn. Therefore, the committee did not care to make any rule regarding worn wheels. When it comes to the scrapping limit of rolled steel wheels, I think this is a bigger subject than appears on the surface. For years we have been throwing away rolled steel wheels by hundreds and thousands with an inch of metal in the tread. The wisdom of this is somewhat questionable. We started with tires and had such a limit. The rolled steel wheel gradually developed and we followed the same practice for two reasons: First, we knew very little about what we could get out of the rolled steel wheel, and second, some of the

roads felt their coupler heights would be involved. Some roads have cars and locomotive tenders which could use wheels worn down $\frac{1}{4}$ in. further. If it is safe to use a rolled steel wheel with $\frac{1}{4}$ in. more wear in service, it would mean the saving of hundreds of thousands of dollars to our railroads. In order to find that out, some experiments have to be made. First, we can go into the laboratory and make drop tests with testing machines to determine the strength of the flanges. Second, we can observe our failures on the line. Indications from both these tests show that we have not gone as slow on rolled steel wheels as we should. The limit of wear on rolled steel wheels is governed by the distance from the throat to the underside of the rim on the back. We run into a sharp corner at this point which would tend to make breakage improbable. With a full radius at this point, we have a $1\frac{3}{8}$ -in. limit. This does not seem fair to the rolled steel wheel. I do not think anyone wishes to take any chances of accident but on the other hand we do not wish to throw away material which is really serviceable. In order to try this out in service, it was thought switch engine service might give us some figures before a further step was made or before recommending its general use. We hope some figures will be obtained in that way which will aid us in this study. The general feeling is that the failure of a flange on a rolled steel wheel is not due to the tread being thin or this dimension being down to $1\frac{3}{8}$ in. but due to a defect in the wheel.

James Hall (So. Pac.): The present method of gaging the service metal on rolled steel wheels is, in my opinion, far from satisfactory.

Our book of rules instructs us to measure the service metal from the base of the measuring line, this line to be not less than $\frac{3}{4}$ in. above the critical line, but it makes no provision for the measuring line being more than $\frac{3}{4}$ in. above, which is very frequently the case. It is my opinion that we are sustaining a loss of thousands of dollars yearly, in wheel service by this practice.

Our standard drawings show the measuring line as $\frac{3}{4}$ in. above the critical line, and the condemning limit or line of wear, $\frac{1}{4}$ in. above that, leaving a thickness of one inch of metal above the critical line, which no doubt, is ample for safety.

Our specifications for new wheels require a measuring line not less than $\frac{3}{4}$ in. above the critical line and not less than $1\frac{3}{4}$ in. of metal above the base of measuring line, thereby assuring us at least $1\frac{1}{2}$ in. of service metal or $2\frac{1}{2}$ in. total thickness of rim.

The manufacturers evidently do not confine themselves strictly to these dimensions, in many cases furnishing a wheel which exceeds $2\frac{1}{2}$ in. in thickness and instead of placing the measuring line $\frac{3}{4}$ in. above the critical line, they place it $1\frac{3}{4}$ in. below the base line at the top of the tread. This practice can not be objected to as it fulfills all requirements, but, when gaging worn wheels as to their scrap limit, or actual thickness of service metal, the extra metal below the measuring line should not be overlooked.

We often find wheels with the measuring line $\frac{7}{8}$ in. or 1 in. above the critical line and if we were to condemn such wheels by taking the measuring line as a basis, as we are instructed to do in the book of rules, we would then be throwing away from $\frac{1}{8}$ to $\frac{1}{4}$ in. of valuable service metal.

As the actual thickness of metal in the rim of the wheel determines its value and as one inch has been decided as the limit of wear, why not keep them in service until they have reached that limit, disregard the measuring line, and measure the actual thickness above the critical line? The measuring line is evidently placed there to aid wheel inspectors in determining the amount of metal in the rim but I can see no particular use for it. It is just as easy to measure the actual thickness if a proper gage is used, and,

with that end in view, I wish to submit for your consideration a service metal gage which we have been using for some time and which I feel, meets all requirements. The gage is simple in construction, easy to apply, and gives a direct reading of the actual amount of service metal above the condemning limit.

There is another point to be considered when gaging worn wheels. There is a condemning limit of 1-3/8 in. of metal through the throat of the flange taken at the back or inner face of the wheel. It has been found that the critical line at the front, or outside face of the wheel, and that at the back or inside face do not in all cases coincide, and while a wheel might have the required amount of metal at the outside, it may have reached the limit of wear of 1-3/8 in. at the back or inside, which might be overlooked.

The gage submitted provides for that, the tail of the gage which extends along the back of the wheel being graduated and a scrap limit mark provided. These graduations are not intended to give the exact amount of metal through the throat of the flange, but merely to act as a precaution against going below the 1-3/8 in. scrap limit. The gage is also provided with an attachment for determining the amount of metal necessary to remove from the tread in order to restore contour, the graduations indicating in sixteenths of an inch the depth of cut to be taken.

I would recommend abolishing the measuring line as now applied, as in my opinion it is misleading and of no practical use, and would recommend also the adoption of the gage submitted, or one similar to it as a substitute for the one shown on plate C. 1, Standards and Recommended Practice.

O. C. Cromwell (B. & O.): Several members of the wheel committee have paid considerable attention to the condition of the worn wheels, when removed for returning. Many times you have one pair of wheels worn to a thin flange, and the other a relatively thick flange or nearly new. When that condition prevails, you get only half the mileage that you should get if you wore the two flanges an equal amount. Uniformity of carbon content assists in giving wheels more nearly of the same hardness, and you get more even wear of the flange. The flanges of the rolled steel wheel before we remove it, we will cast iron wheel flanges, and in the cast iron wheel, we have a means for mounting wheels of extreme hardness, which we do not now have in the rolled steel wheels, that is the tape measurement, and this gives you more nearly an equal wear on the flanges of the wheel than you get with the rolled steel wheel. If we can increase the mileage of the rolled steel wheel before we remove it, we will effect considerable economy in operation. As regards reducing the limit of wear, in line with the limit of wear groove, the figure of 1 1/4 in. was established on the line of steel tired wheels, as the only one with which we could measure and in those cases the under side of the rim was cut or turned that gave you about 1/2 in. less metal than you have now with rolled steel wheels which are slightly tapered on the under side of the tread. In order to get some experience in actual service, the committee thought it would be a proper thing to try those wheels on a road service.

Mr. Purson: I feel satisfied that the committee is on the right road, in their recommendation so far as the carbon content is concerned, but I want to be satisfied as to how we are going to convey that information properly, to the road managers. We must have some means of doing this.

Mr. Ripley: I think that the carbon content numbers as given should be put on at the manufacturers' plant, preferably painted along with the heat number, etc., on the inside of the rim. Instructions could then be issued to the

wheel man as to what the symbol means. It should be understood that the number represents heat analysis and not an individual analysis of any kind, so there will be no variation in the wheels.

Mr. Pileher: I believe the mating of wheels by carbon content is a very desirable thing and if it can be accomplished with the classification under group letters (four or five in the range of carbon content) it would be very desirable. In regard to the question of wearing the wheels thinner than at present, the ruling we now have is a law and we are not allowed to go below the limit of wear. As I understand the proposition, the ruling was set upon the basis of recommended practice by the Master Car Builders' Association, based upon their experience. They were playing very safe. In the Norfolk & Western, we were conducting a series of experiments in regard to running wheels thinner so that we could operate the wheels with as much economy as possible. We had run the wheels safely 1/4 in. thinner than they had been set, and we feel that it would be safe if we could get a ruling at least locally in switching service, until we develop the experiments further. As pointed out very clearly by Mr. Ripley, the analogy for the thickness of the rims on rolled steel wheels was made by comparison with the steel tired wheels. But there is a very large fillet between the rim and the plate on the rolled steel wheels, which adds materially to the strength, the whole structure being tied together as one.

I do not know how we could get this thought impressed in such a way that we could get action from the Interstate Commerce Commission, permitting these experiments that we have in mind. We certainly hope their rulings may not be changed in the future, regarding experiments. There have been some laboratory tests, conducted particularly under the auspices of Prof. Hennessey. The test is so much in favor of the cast steel and wrought steel wheel, as compared with the cast iron wheel, that we could easily draw the analogy that these two wheels could be run safely with a very thin rim.

(A motion to accept the report was put to a vote and carried.)

(The meeting then adjourned.)

Sir Arthur Conan Doyle with wife and family after looking over the Exhibits—a Friend at the left.

R. S. M. A. Meeting and District Elections Today

THE DISTRICT MEETINGS for the election of members of the executive committee will be held in the executive committee room, next to Secretary Conway's office, from 10:00 to 11:30 o'clock this morning. Two new members must be elected to succeed Charles W. Beaver and H. G. Thompson in the second district, whose terms of office expire. One member must be elected in the fourth district to succeed George A. Cooper, whose term expires, and one must be elected for the same district to succeed Edward M. Savercool, who has moved out of the district.

The annual meeting of the Railway Supply Manufacturers' Association will be held in the Greek Temple of the pier at noon today.

Sunday Sacred Concert

A SACRED CONCERT will be given on Sunday at the Marlborough-Blenheim at 3.30 p. m. under the direction of a committee made up of Aden R. Miller, chairman, W. J. Carrigan, Oscar C. Hayward and W. R. Walsh. The following program has been arranged:

1. Indian Love Lyrics.....Woodford-Finden
Orchestra
2. "Soldiers Chorus"—Faust.....Gounod
Criterion Male Quartette
3. "The Pipes of Gordon's Men".....Hammond
Mr. Simonds
4. "Billa Nello".....Dell Acqua
Mrs. Emily Stokes Hagar
5. "Swing Along".....Cook
Criterion Male Quartette
6. Cello Solo
a—Elegie.....Massenet
b—Le Cygne.....Saint-Saens
Mr. Lucian Schmit
7. a—"The Star".....Rogers
b—"Song of the Open".....Laforge
Mrs. Emily Stokes Hagar
8. a—"Blue are Her Eyes".....Watts
b—"Until".....Sanderson
Mr. Carmint
9. "Italian Street Song"—"Naughty Marietta".....Herbert
Mrs. Hagar and Quartette
10. a—Prelude du DeLuge.....Saint-Saens
b—Hymn to the Sun.....Rimsky-Korsakoff
Orchestra

Conventionalities

J. E. Simons of the Joliet Railway Supply Company is attending his twenty-eighth convention.

Miss M. Olive Cromwell is accompanying her father, O. C., of the Baltimore & Ohio, to the convention this year. Mr. Cromwell is especially interested in gasoline motor cars just now.

Mr. and Mrs. John P. Landreth are accompanied to the convention this year by Mrs. A. L. Eustice, also of Chicago. Mrs. Eustice is a sister of United States Senator Arthur Capper of Kansas.

George N. DeGuire, assistant to the manager of the department of equipment of the United States Railroad Administration, drove over from Washington in his car with Mrs. DeGuire, arriving here Wednesday afternoon.

F. M. Whyte, formerly chief mechanical engineer of the New York Central, is back at the convention again this year, having returned recently from Australia where he served as a member of the Uniform Gage Mission of the Australian Railways.

Those who know Le Grand Parish and his organization, know Miss Lawton. She is here—for her first convention. Not as a buffer for her worthy chief, but as a "holder-on" to keep them happy while waiting to hear all about the new double arch.

Almost continuously for the past 40 odd years H. M. Perry has attended the mechanical conventions. He joined the M. C. B. Association at the first meeting in Chicago and is probably the only surviving member who attended that meeting. Thirty years ago Mr. Perry took out his first side bearing patents.

W. P. Borland, chief of the Bureau of Safety of the Interstate Commerce Commission, looks as if he had been having a strenuous time of it lately. No doubt he has, since it has been necessary for him to follow critically all of the proceedings in connection with the automatic train control and the power brake hearings.

A. L. Humphrey, without whom a convention would hardly seem complete, is able to make but a flying week-end visit this year. He arrives this morning but will be able to spend only Saturday and Sunday with his many old friends. Mr. Humphrey sails with his wife and son Fred on June 24 for a few months' tour of Europe.

It is with pleasure that we announce the election to the board of directors of the Murphy Varnish Company of Claude M. Baker. Mr. Baker is attending the convention this year, as has been his custom for many years. His connection with the Murphy interests has been one of long standing. During the past three years he has been sales manager at Chicago.

F. Ian I. Dodds got in a day late this year. He motored down from central valley, N. Y., and had to make a number of detours. This is not entirely responsible for his delay, however. His daughter Dorothy was married in the chapel at West Point at high-noon on Wednesday to Vera Carlton Spalding who was graduated from West Point on Tuesday.

J. W. Brahear, director and superintendent of manufacture of Dearborn Chemical Company, has been connected with the company continuously for 28 years and somehow has managed to stay away from the conventions

all that time. He finally visited Atlantic City this year and like most of those attending for the first time, was greatly impressed with the exhibits.

Le Roy Kramer comes to the conventions this year as vice-president of the Symington Company. Mr. Kramer left the vice-presidency of the Pullman Company during the war to become federal manager of the St. Louis-San Francisco Railroad. On the termination of government control he became vice-president of the Willys-Overland Company at Toledo, Ohio. He is happy to be back among his old associates in the railroad and railroad supply businesses.

Business is improving. Clyde P. Ross, contracting manager of the Roberts & Schaefer Company, is here and is wearing a smile. He reports that his company has recently secured contracts for four of the largest fireproof coaling and sanding plants ever built in the United States. The orders came from the Delaware & Hudson, Michigan Central, Chicago & North Western and Chesapeake & Ohio. Mr. Ross is accompanied by Mrs. Ross.

"Dan" Brady is looking fine, although he passed through a most severe illness during the latter part of the winter. Dan was given a testimonial dinner by a large group of his friends at the Commodore Hotel, New York, May 18, 1922. The toastmaster was H. H. Vreeland and the speakers were Judge Morgan J. O'Brien, Hon. Luke Stapleton, John A. Dwege of the New Haven; Col. Charles DeLans Hine, President Besler of the Central of New Jersey, and President Hustis of the Boston & Maine. President Hedley of the Interboro, presented Mr. Brady with a bronze statuette.

A delegation of well chosen convention attendants is here from a New England road—the Boston & Maine. There are 12 in all: L. G. Coleman, assistant general manager in charge of maintenance of equipment; C. H. Wiggin, superintendent of motive power; C. B. Smith, mechanical engineer; E. T. Millar, general car inspector; J. Craig and R. W. Band, general shop inspectors; Tom Jennings, D. E. Davis and F. H. Eddy, shop superintendents; C. S. Hall, master mechanic; H. A. Bliss, general air brake inspector; J. E. Gardiner, air brake instructor, and P. J. Callahan, supervisor of car and locomotive electric lighting.

L. K. Silcox, general superintendent motive power of the Chicago, Milwaukee & St. Paul, who has been nominated this year as a member of the general committee of the Mechanical Section, will not be able to come to the convention because of a number of important matters requiring attention at Chicago. The St. Paul has recently ordered both locomotives and cars. The road has also taken over the Chicago, Terre Haute & Southeastern, which serves the Illinois coal fields, and Mr. Silcox is giving special attention to getting the equipment on this road in condition for handling the heavy business that is anticipated when the coal strike is settled.

Among those attending the convention this year are three men who have played an important part in one of the latest developments in aerial transportation, the production of helium for lighter than air craft. M. H. Roberts, of the Franklin Railway Supply Company, is chairman of the Helium Board of Engineers of the United States Government. Associated with him are Harvey N. Davis, professor of Mechanical Engineering and Physics at Harvard University, best known as one of the authors of the Marks and Davis Steam Tables, and Professor W. DeLaure of the University of Nebraska, a specialist in heat transfer, who served during the war as a member of the research department of the navy at Annapolis.

One of the veteran visitors at the conventions who will be missed by many persons this year is Frank S. Dinsmore, who died last February. Mr. Dinsmore became connected with the *Railway Age* in 1897, and attended his first convention that year at Old Point Comfort. He attended the mechanical conventions every year that they were held from then until his death. He was one of the workers on the *Daily Railway Age* almost from its inception, and helped get it out in years when it was much smaller but when the difficulties of editing and publishing were even greater than now. No man ever lived who more universally commanded the affection and respect of those who knew him than Mr. Dinsmore, and his passing is a great loss to his many friends.

N. W. Storer of the Westinghouse Electric & Manufacturing Company is attending the convention. Mr. Storer is one of the most prominent railway electrification engineers in this country, having been for more than 30 years in the railway engineering department of the Westinghouse Company and in intimate touch with railway problems since 1891. He is a pioneer in early electrification development and an authority on high-voltage direct-current electrification. Mr. Storer was associated in the designing of the most powerful freight locomotive in the world, an experimental 4,000-hp. electric locomotive, operating in freight service on the Pennsylvania Railroad around Philadelphia, and also of the electrical equipment of the Paoli suburban electrification operation out of Broad street terminal.

The Northern Pacific has a representative party attending the conventions—men from all departments, well selected to absorb all phases of the business discussed during the convention. Eight representatives of that road have come from the great northwest and are registered as follows: J. P. Anderson, shop superintendent, Brainerd, Minn.; W. J. Bohan, assistant general mechanical superintendent, St. Paul; C. E. Emerson, master mechanic, Dilworth, Minn.; George F. Endicott, assistant master car builder, St. Paul; Charles J. Mitchell, roundhouse foreman, Missoula, Mont.; J. H. Remick, M. C. B. billing clerk, St. Paul; Joseph Zuber, roundhouse foreman, Mandan, N. D.; and Silas Zwright, mechanical superintendent, lines east, St. Paul. By such careful choosing of convention attendants it is possible for the railways to derive the greatest benefits from the convention.

B. B. Milner, formerly with the Pennsylvania Railroad and later chief mechanical engineer of the New York Central, who resigned two years ago to become associated with Fraser & Co., Japanese importers and exporters, and who is now consulting engineer to the Japanese Government Railways, writes that his headquarters are at the Government Railways office at Tokyo. Milner still "hits the trail", for he writes under date of May 21 that he has covered, since March 1, the lines north of Tokyo, including some 1,200 miles on the northern island of Hokkaido, and was just preparing for a quick trip over Korea and Manchuria which would lead him as far as Harbin on the Chinese Eastern. We miss Milner this year, but a good many of his friends are "sporting" the very handsome Japanese canes which were sent over in time for 1921 convention which failed to materialize. Milner will be glad to hear from his friends when the spirit moves.

J. H. Cooper, who represents the Dearborn Chemical Company, the Bradford Draft Gear Company, the Pilloid Company, Fairbanks, Morse & Co., and a few other concerns in Mexico, has come on from his home in Mexico City to attend the conventions. Mr. Cooper believes that

President Obregon of Mexico is a very able man and that if his government receives outside recognition, especially from the United States, he will be able to maintain peace and restore normal conditions. The general situation in the country, he says, is improving daily. Mr. Cooper states that much work and a large expenditure are still required to put the Mexican Railways in good shape. Much is being done to repair and improve the track. In the months January to April, inclusive, 1,452,000 ties were distributed to be put in track, although probably not all were actually laid. Little new rail has been laid recently, but the railways have arranged to get rail from the Monterey Steel Company. Mr. Cooper is optimistic regarding the future course of events in Mexico, provided President Obregon is given a fair chance by the governments of other countries.

Do you know Asheville Johnston? You may think you don't, but you probably do, or at least have heard of him. He has and deserves the reputation of possessing the most remarkable memory on the Boardwalk. Asheville is the hat boy at the entrance to the American dining room of the Marlborough-Blenheim Hotel, and, without knowing his name, you probably have marvelled at the fact that, without checking them at all he almost invariably returns promptly to the right persons the many hats and canes that are left with him. Asheville has been at the Marlborough-Blenheim since 1908. "How do you do it?" he was asked yesterday. "Well," he said, "I always did have a good memory, and I have cultivated it. When a man hands me a hat, I take a good look at him and the hat, and associate them in my mind. Then, when he comes back, I take a good look at his face, and that recalls the appearance of what he gave me and the place where I put it. It is easy, of course, to do this for many of the people coming to the conventions, because they have been coming here a long time, and their faces are familiar to me. That's all there is to it." That isn't all there is to it, though, as everybody who has seen Asheville in action will testify. Such memories as his are born, not made.

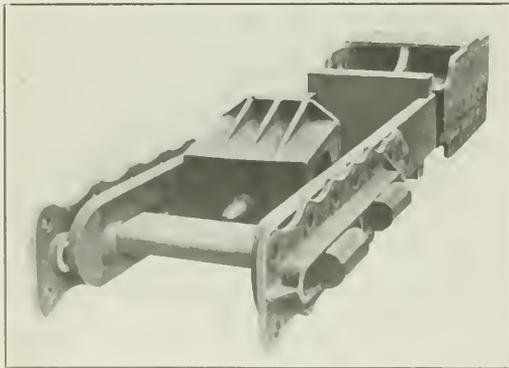

C. F. Fritz, manager of mines and South American properties of the Vanadium Corporation of America, is here at the convention after an absence of about four years. During that time he has been in Peru enlarging and developing the company's mines. Mr. Fritz has had a most interesting experience. The mines are located in an almost inaccessible part of the country, at an elevation of about 16,000 ft. above sea level. He has been called upon to avail himself of almost every mode of transportation known to man. In the first place it was necessary to get material for new construction at the mines in order to increase production. Mr. Fritz found it necessary to transport this material on men's backs, mules, horses, ox-carts, llamas, rafts and later by motor trucks. He has built a narrow-gage line about seven miles long with a drop in elevation of 1,200 ft. from the mine to the top of a bluff some 500 ft. above a lake some 10 miles long, and has established a system of barges for transporting the ore across the lakes, the barges being handled by motor boats. This lake is undoubtedly the highest regularly navigated body of water in the world, being at an elevation of some 14,000 ft. From the foot of the lake to the head of regular rail transportation the ore is handled by motor truck. Plans have been laid and the work begun for handling this material on another narrow-gage line. This road will be about 15 miles long. This is a fine example of what some of our American companies are doing to bring trade to this country and to give the United States supremacy in the use of alloy steels.

New Devices Among the Exhibits

Improvements in Farlow Draft Attachments

THE FARLOW ATTACHMENTS for connecting spring or friction draft gears to the car underframe, made by the T. H. Symington Company, New York, have been manufactured and sold for the past 18 years, the design having been improved from time to time to meet the requirements of increasingly heavier service. The original attachments were of the three-key type with separate side links. From this was developed the present form, having two draft keys and a horizontal forged yoke.

The present standard attachments, which meet all the A. R. A. requirements for strength are regularly furnished with a standard gear pocket length of $24\frac{5}{8}$ in. from the rear face of the follower block to the end of the horizontal draft yoke, thus accommodating any standard friction draft gear whose parts are contained within the pocket limits. The standard check plates provide for full A. R. A. travel of $2\frac{3}{4}$ in. so that any draft gear meeting

Latest Design of Farlow Attachments

the A. R. A. specifications may be later substituted, if desired, for that first used.

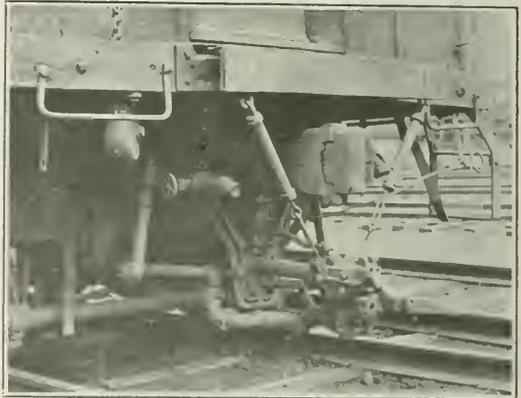

Recent improvements in the Farlow details include the use of A. R. A. standard 6 in. by $1\frac{1}{2}$ in. round edge horizontal keys, adequate reinforcement for strength and bearing area at the front end of the horizontal draft yoke, a box-section front follower block and a design of back-stop casting providing ample resistance to all possible service loads and distributing the latter to the underframe at the bolster over a sufficient sill area to prevent buckling or deformation of the draft sills or the loosening of rivets.

The follower block interposed between the coupler butt and the friction draft gear is designed to withstand the maximum load which the coupler slank is capable of delivering to it, this load often being far in excess of that required to close the draft gear. The malleable iron of which the block and check plates are manufactured is a high grade, uniform product whose minimum ultimate tensile strength and elongation are 50,000 lb per square inch and 10 per cent respectively. Malleable iron specifications of a few years ago required only 38,000 lb per square inch ultimate tensile strength and 5 per cent elongation, and a

comparison between these figures and those now regularly attained by the manufacturers of high-grade malleable castings demonstrates the marked improvements which have recently been made in a material which from its structure and treatment is peculiarly adapted to resist shocks without crystallization and which when overstressed gives ample warning by its slow deformation before fracture.

Improvements in Futrell Train Line Connector

THE AUTOMATIC TRAIN LINE connector which is being shown at the convention by the Futrell Coupler Company, Streeter, Ill., embodies several improvements that have been made since a description was given in the *Railway Age* of March 4, 1921. The gathering arms have been changed to increase their gathering capacity and to insure their coupling on the sharpest of yard curves. The connector body has been cored out to give an air opening between the lower portion containing the steam heat connection and the air ports. This keeps the air port gasket cool and prevents vulcanization even

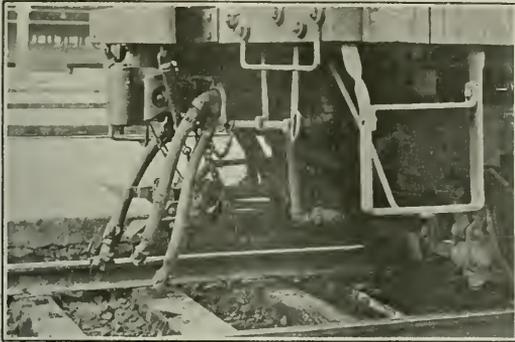

Connector in Position for Coupling.

when high pressure steam is used in the steam heating line. The steam heat gaskets have been changed to the standard type in common use where ordinary hose couplings are used.

Another important change has been made which will be of considerable advantage during a transition stage when cars equipped with the connector may be called upon to couple with other cars not so equipped. It consists in the method used for determining the position in which the coupler hangs. With this connector, the ordinary hose connections are not disturbed, but are left intact for use at any time, although where the connector is in regular use it is customary to remove the hose and their couplers. In the latest design of connector the bracket connected to the center sill, which acts as the spring seat

and from which the yoke holding the connector is hung, is provided with two pin holes. With the pin in the forward hole the connector will hang free in the position for coupling. By taking the pin out, pushing the head back and slipping the pin into a second hole, the con-

Connector Swung Back for Interchange.

ector is held 9 in. farther back than is ordinarily the case. In this position there is ample clearance between the connector and the regular hose, and consequently all chances of their being chafed and damaged are removed. It is only a few minutes' work to again shift the pin and restore the connector to its forward position when it is to be used.

Sessions-Standard Friction Draft Gears

TWO NEW MODELS of friction draft gears, known as types KD and Jumbo No. 2 are prominent features of the exhibit of the Standard Coupler Company, New York.

The type KD is designed to meet the ever-increasing demands of greater draft gear strength and efficiency so vital to a car or locomotive in train operation. The travel, closing capacity, dimensions and application with all standard attachments are the same as for the improved type K; the weight, however, is greater.

The friction elements and springs are the same as those in the older type, except that the spring barrel is not interchangeable. The strength of this gear, (Figs. 1 and 2) when solid is 35 per cent greater as a column than the

standard type D coupler. The great cross-sectional area of the spring barrel, 30 per cent more than type K, is made possible without encroaching on the spring space by its unique shape. The corrugations afford excellent guides for the springs and give the barrel a maximum strength as a column. The design of the spring barrel is such as to prevent any tendency to upset it in spots, but a still greater advantage is the large amount of support near the ends of the friction box keeping the friction surfaces from spreading and at the proper angle. The corrugations are so arranged that the friction box retaining lugs, made to fit them, will also encircle the cylindrical barrel used on the type K, making still greater interchangeability possible.

The Jumbo No. 2 gear, shown in Figs. 3, 4, is an exceptionally strong and high-capacity gear suitable for 70, 100 and 120-ton cars when fitted with standard heavy springs; it is ideal for lighter freight and all-passenger cars when equipped with lighter springs. It has a travel of $2\frac{3}{4}$ in., all of which is friction travel, and in addition is shipped and installed under $\frac{1}{4}$ -in. friction compression that prevents any accumulation of slack for a long period of service, thereby maintaining its original high capacity. The gear is built and assembled under a high initial spring compression that makes it very effective in the early part of the stroke and at the same time eliminates chafing and

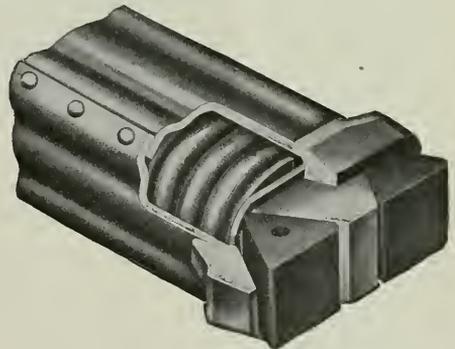

Fig. 1—The Type KD Gear Has a Stronger Barrel than the Old Type K

wear of the friction elements for minor impacts where the resiliency of the car construction is ample to absorb such impacts without damage or frictional movement of any part of the gear or car relative to any other part. This gear, self-contained, is shipped and applied as a

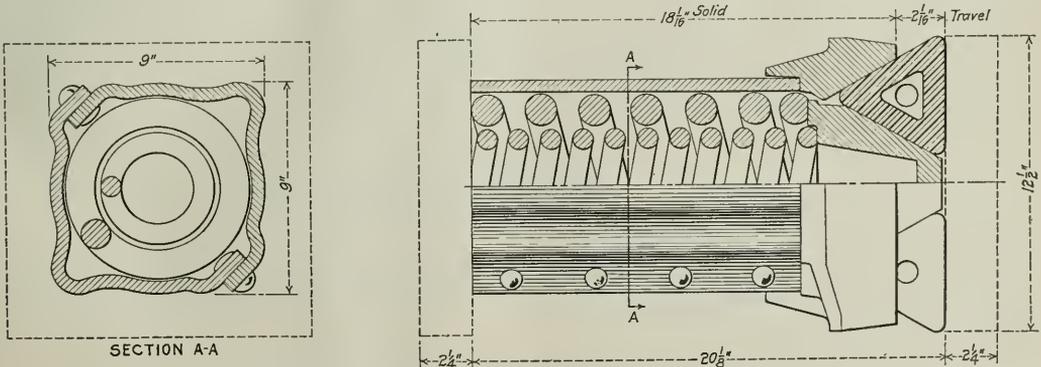

Fig. 2—Sessions-Standard Friction Draft Gear, Type KD

unit to cars with any type of attachments providing a standard draft gear pocket. No additional followers or yoke fillers are required, the barrel corners being rounded to accommodate the bend in forged yokes.

The gear is smooth in its action which makes it suitable for passenger equipment while the capacity may be lowered at will by the use of lighter springs, the over-solid strength remains high, higher in fact than any gear tested under the draft gear test of the U. S. R. A. and about 45 per cent stronger than the type D coupler. The drop capacity with a standard springs is 33 in. total fall under the 9,000 lb. drop, also exceeding anything in the

block, all friction travel, high initial spring and friction compression, round barrel corners.

Fig. 3—Jumbo No. 2 Gear for Passenger and High Capacity Freight Cars

U. S. R. A. test. It differs from the Jumbo gear in that test in the following respects: travel reduced to $2\frac{3}{4}$ in., made self-contained, improved design of spring barrel with re-inforced bottom, spring barrel made of cast-steel instead of malleable iron, elimination of spring plate and key, forged steel instead of cast-iron center friction

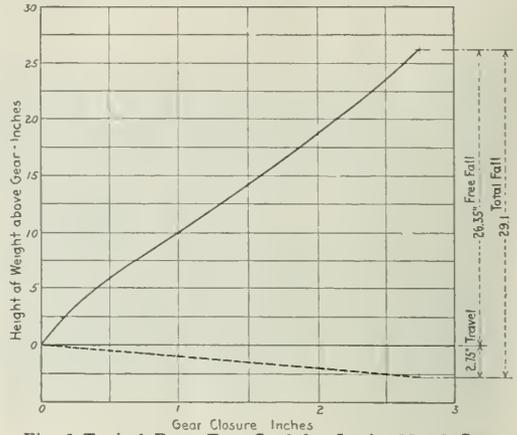

Fig. 5 Typical Drop Test Card for Jumbo No. 2 Gear

There are five double-coil springs arranged to take advantage of all available spring space and so located as to allow numerous re-inforcing webs or ribs immediately opposite the coupler butt thus preventing any possibility of piercing the bottom of the spring barrel. These ribs in part extend the length of the barrel, giving ample strength to the side walls. The per car weight of the gear, including followers, is 860 lb.

Four Jumbo No. 2 gears were submitted to capacity tests under 9,000-lb. drop. The average total fall required to close the gears was 29.1 in., or 21,825 ft. lb., as com-

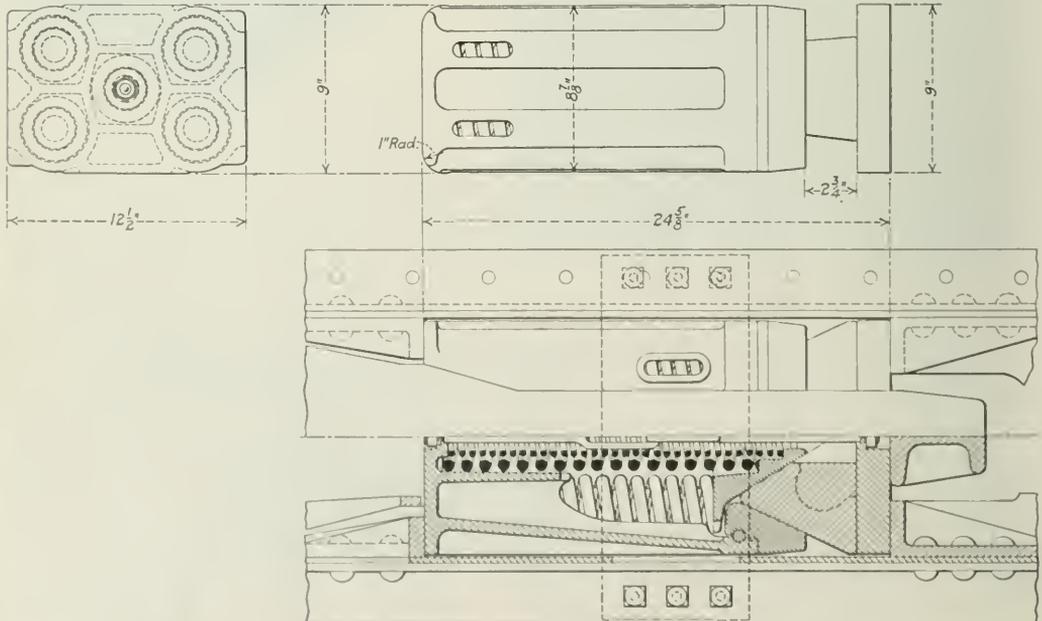

Fig. 4—Sessions-Standard Friction Draft Gear, Jumbo No. 2

pared to 28.1 in. for the older Jumbo gear in the U. S. R. A. tests. The average drop test card is shown in Fig. 5.

Two of the gears were subjected to car impact tests at the plant of the T. H. Symington Company, Rochester, N. Y. Although the tests were made in January during a light rain and snow, the gears required a closing speed of 4.83 m. p. h. on the 148,000-lb. test car as against 4.22 m. p. h. for the older Jumbo gear in the U. S. R. A. tests.

Two of the gears were subjected to destruction tests under the 9,000 lb. drop when supported upon a solid anvil. It required an average over-solid blow of 18-in. to produce noticeable distress in any part. Bulging was finally produced in the cast-steel barrel but after carrying the total free fall to 50 in. they were still in condition for service.

Service Metal Gage for Steel Wheels

AMONG THIS YEAR'S exhibits is a new device shown by Bernard Cook, Roanoke, Va., for gaging the amount of metal to be removed from worn-flange wheels to restore the standard contour and to indicate in advance of turning the final tape of the wheel so that re-mating may be done without loss. The A. R. A. interchange rules allow \$1.61 for each $\frac{1}{16}$ in. of service metal on a 33-in. wheel; hence no neglect should be countenanced in the handling of wrought steel wheels.

This gage, which is known as the I-D service metal wheel gage, gives accurate information in advance of returning, not only of the final tape of the wheel and of the amount of metal that will be removed, but it also indicates the amount of service metal that will remain on the wheel. This latter provision frequently foretells that the

scale on the long leg of the gage shows that before returning there are $1\frac{5}{16}$ in. of metal available above the condemning limit, so that after turning there will be $\frac{7}{16}$ in. of service metal remaining. Such a wheel would accordingly be allowed a credit of $\frac{7}{16}$ in. of service metal, amounting to \$11.27.

The gage is of equal value in handling car wheels and driving wheel tires in shops where they are turned. By its

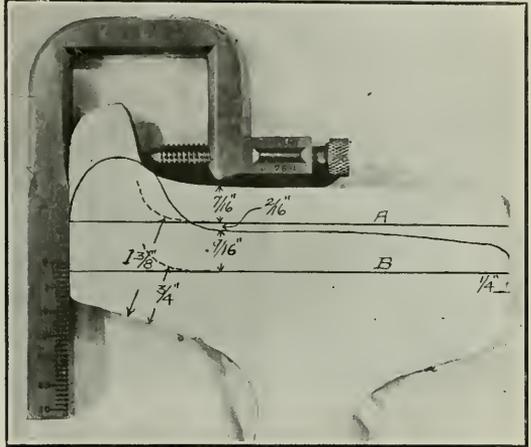

Fig. 2

use wheels can be selected and mated before turning with a minimum loss of service metal. A re-mating table accompanies the gage to show the tape of the wheel after turning.

Fig. 2 illustrates how the I-D gage prevents false credit being allowed for a wheel that should have been given scrap credit only. A. R. A. Rule 7, Fig. 4, allows a wheel to be turned down to within $\frac{1}{4}$ in. of the limit groove as indicated by line B, but also sets a limit of $1\frac{3}{8}$ in. above the "critical" line, this limit being indicated by line A. If the wheel in the illustration were settled for on the basis of the limit groove, the owning road would be given credit for $\frac{7}{16}$ in. of service metal remaining after turning the wheel to restore standard contour, or a credit of \$14.49 would be allowed for this wheel, plus an equal amount allowed under the rule for the mate wheel, or a total of \$28.98 for service metal in this case. The gage shows, however, that the wheel, in fact, will be $\frac{5}{8}$ in. under the minimum allowance from the critical line, so that no credit whatsoever should have been allowed for service metal in the above case.

The illustration is of a wheel actually detected by this gage and for which scrap value only was allowed, under Rule 7, Fig. 4, of the A. R. A. code.

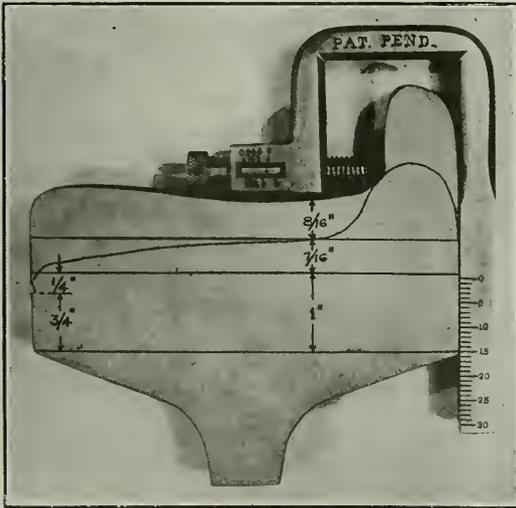

Fig. 1

wheel will fall within the scrapping limits after it has been re-turned and saves not only the labor of re-turning, but protects the handling road from allowing false credits to the owning road for wheels that should have been given scrap credits only.

The use of the gage is illustrated in Fig. 1. The micrometer screw indicates that $\frac{5}{16}$ in. of metal must be removed to restore the standard contour. The graduated

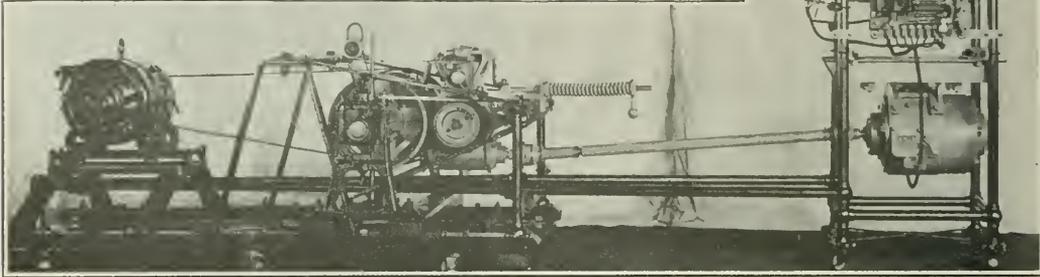

Pressure Filter for Dining Cars

ANEW PRESSURE filter for use in dining cars has been designed by the Henry Giesel Company, Chicago. The cover is opened and closed with a locking bolt operated by a handle in front. No clamps or bolts are used and as the bolt is attached to the handle it cannot be mislaid. After the cover has been taken off the filter stone may be easily removed by a wrench furnished with the filter.

Direct Drive for Car Lighting

A SHAFT DRIVE for axle-driven car-lighting generators has been developed and is being shown in operation by the U. S. Light & Heat Corporation, Niagara Falls, N. Y. The machine has been tried out in the shop with satisfactory results, and arrangements are now being made to make road tests under practical operating conditions.

The drive consists essentially of a double cast iron pulley which drives two rubber tired friction wheels mounted on either end of a shaft parallel with the car axle. This shaft carries a helical gear and drives another similar

The U. S. L. Shaft Drive Equipment Complete With Motor-Drive and Lamp Bank Load

gear at twice the speed and the axis of which is at right angles to the first gear. These gears run in oil. The shaft of the second gear is connected to the generator on the body of the car by a telescoping shaft and two universal joints, similar to the arrangement used for automobile shaft drives.

Self-Locking Brake Shoe Key

THE NUMBER of brake shoe keys which are lost from freight cars, particularly on those roads where cars are unloaded by dumping machines, is an item of considerable expense. To save this loss an improved type of key has been brought out by E. Emery, Pittsburgh, Pa. The key is of a rectangular section, the steel containing sufficient carbon to insure the proper spring and give good wearing qualities. The shoulders, *AA*, shown in the illustration, open out below the lower lug of the brake head and

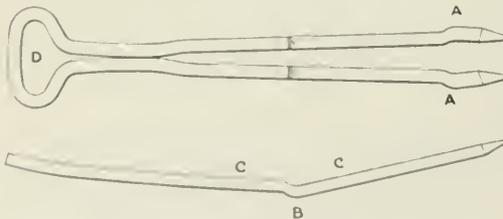

ards and pulls the shoe up tightly against the head. This gives a double bearing to the key on the head at *CC*, and a bearing against the shoe lug at *B*. The head of the key not only prevents the key from working down but is so shaped that by inserting a bar under the head at *D* it can be pried up until the shoulders, *AA*, are compressed into the slot in the brake head, when the key can be easily pulled out without damage and be ready for reapplication with a new shoe.

This key should not only reduce the losses of keys but also prevent the loss of brake shoes with the resulting further expense due to injury to brake beams, even if a derailment and wreck do not occur.

Automatic Slack Adjuster

A NEW DEVELOPMENT of its automatic brake slack adjuster which is especially adapted to freight and locomotive service is shown by the Gould Coupler Company, New York. It takes the place of the usual bottom rod connection and will maintain a uniform piston travel until the shoes are entirely worn out when it may be instantly shortened to permit the application of new shoes. This adjuster consists primarily of a bottom rod composed of two wrought steel bars with spacing pieces between to admit the ends of the live and dead levers. The live lever end of the rod is provided with a series of ratchet teeth which engage a pair of steel dogs attached to the brake lever. The function of the heavier of these two dogs is to transmit the brake pressure through the bottom rod to the brake shoes and of the smaller automatically to lengthen out the bottom rod as wear occurs in the shoes.

The only change required in the foundation brake rigging to apply this adjuster is the drilling of one hole in the lower part of the lever. Laboratory and service tests are reported to have been quite satisfactory.

Brake Shoe Key Designed to Prevent Loss of Key or Shoe

prevent any upward movement of the key. The offset in *A* allows for the maximum and minimum slot between shoe head and shoe provided for by the A. R. A. stand-

Double Automatic Control Vapor System for Passenger Cars

THE VAPOR CAR HEATING COMPANY, Inc., Chicago, has recently marketed a double automatic control vapor system, the purpose of which is to change from a constant temperature of 70 deg. while the car is in service to 50 deg. in yards and terminals without manually operating the cut-out valves.

On the average, passenger cars lay over in yards or terminals two-thirds of the time, and during such lay-over periods are excessively heated as the result of leaving all the heat turned on to prevent freezing of water pipes and to permit of washing and cleaning the cars. By auto-

Electro-Pneumatically Operated Control Valve

matically regulating the temperature to 50 deg. in cars laying over in the yards steam is used in the heating pipes less than one-fourth of the time. This means a large saving in coal consumption, conservatively estimated on the basis of actual tests to average from 15 to 20 tons per car per season.

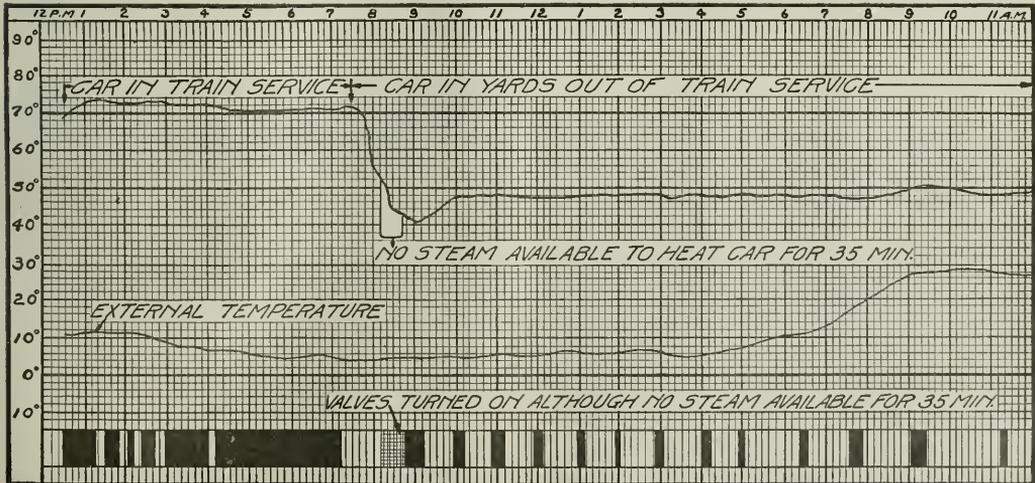

The new arrangement may readily be applied to cars already equipped with the "Vapor" system, as the only change involved is the substitution of the automatically

operated cut-out valves in place of the present hand-operated valves. In the case of an ordinary coach, chair or dining car, instead of the two hand-operated Vapor cut-out valves now used, one magnetically operated control valve is used on each side of car. This valve operates on the same short-circuit self-drawing principle as the manually operated Vapor cut-out valve, and therefore serves constantly to keep the outlet of the system warm at all times, positively preventing freezing of the system.

In addition to the magnetically operated control or cut-out valves, there is one double thermostat located at the center of the car near the basket rack. One of the elements of this thermostat is set for a permanent temperature of 70 deg. and the other for 50 deg. The thermostats never require adjustment or change. At the end of the car, near the electric light switchboard, is a control cabinet, which contains a combination air-pressure and electric device which automatically selects either the 70 deg. or the 50 deg. thermostat. When the car is attached to a locomotive for passenger service, the pressure from the air line operates this device, putting the 70 deg. thermostat in control and maintaining a temperature between 70 and 72 deg. at all times when steam is being supplied from the locomotive. When the car is removed from service and goes into the yards, the pressure on the air line is released and the combination air pressure and electric device then puts the 50 deg. thermostat in control.

This arrangement of the control system removes the necessity for train crews or yard men to operate the steam admission valves by hand at any time.

In cases where cars are placed under steam while occupied by passengers, in stations, or at lay-over points, while waiting for the locomotive to be attached, a 70 deg. temperature control may be obtained by lifting a button provided on top of the combination air and electric device in the control cabinet. After pulling up the button for this purpose, no further attention is necessary, as the system again becomes automatic as soon as air is applied. There is a snap switch in the control cabinet to be used only to cut off current in the summer months or for repairs. In case the electric current fails the magnetic

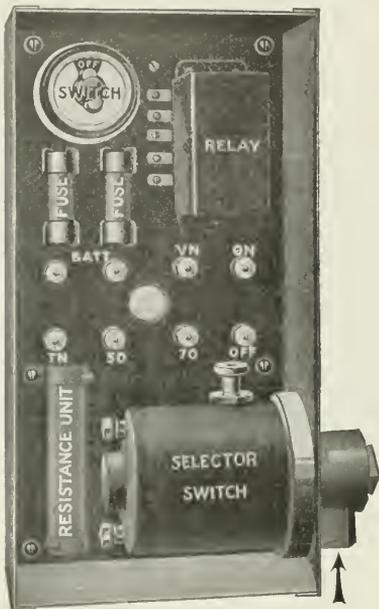

Black bars show the time steam was actually turned on.

Diagram Showing Results of Test of the Automatic Control Equipment

valves may be operated by hand the same as any Vapor cut-out valve.

The system is operated by electric current from the car lighting batteries and requires less than 0.1 ampere per hour, but the electrical mechanism of the cut-out valve

Control Cabinet Containing Electro-Pneumatic Selector Apparatus

is such that the current is automatically cut off from the magnets with the completion of the act of moving the valve from one position to the other. The electrical equipment is simple and of standard materials, and the entire system is constructed with the view of operating indefinitely at the minimum expense for maintenance.

Pneumatic Tools

TWO NEW DEVELOPMENTS in pneumatic tools made by the King Pneumatic Tool Company, Chicago, are a sleeve-type valve for riveting hammers and a "Progressive" lock for both chipping and riveting hammers which prevents the handles from coming loose on the cylinders.

The King sleeve valve for riveting hammers is designed to eliminate valve breakage and reduce the necessity of oversizing valves to a minimum. In the King riveting hammer valve the hard and fast hitting qualities of the hollow-valve type riveting hammer are maintained and the question of valve breakage is claimed to be solved. Formerly a riveting hammer piston in hollow-valve type hammers came in direct contact with the valve; the piston and the valve moved in opposite directions and the piston came in direct contact with the valve 1,050 to 1,720 times per minute, according to the length of stroke of the hammer. This constant contact between piston and valve resulted in fatigue of the metal in the valve itself, with resulting valve breakage.

In the King sleeve-type valve the sleeve is interposed

between the valve and the piston, making any contact between the two impossible. At the same time the sleeve provides a continuous bearing surface for the piston. An added advantage of the sleeve-type valve is that the sleeve serves as a guide to the valve in its travel, thus reducing the lateral wear to a minimum. This new device has been so successful in eliminating valve breakage that last year, out of 5,000 King sleeve valves placed in service, only 15 cases of breakage were reported.

King pneumatic tools are now made entirely of molybdenum steel, which has added to their strength and durability.

Forged Reversible Brake Beam Strut and Safety Brake Shoe Key

THE FORGED REVERSIBLE brake beam strut made by the Buffalo Brake Beam Company, New York, and shown in the illustration, was designed especially for quick repair work. It may be applied to any style of beam and, being made of forged steel, ample strength, durability, economy and safety are insured. A special feature of the

Buffalo Forged Reversible Brake Beam Strut

strut is the fact that it may be reversed so as to make either a right-hand or a left-hand beam without disturbing the nuts or tension on the beam.

The Buffalo safety brake shoe key is made to A. R. A. standards in all essential dimensions. Although it may be applied and removed practically as easily as an ordinary key, it cannot work out in service or when cars are being dumped on a machine. The principle of the key is apparent from the illustration. That portion which extends below the lug on the brake head is punched out and ex-

Buffalo Safety Brake Shoe Key

panded. The key is made of spring steel and when it is inserted the expanded lugs or cars close in and automatically open out when the key is in place, thus making a positive lock to prevent its coming out unless intentionally removed.

Weather Stripping

AMONG A NUMBER of new devices shown by Midgley & Borrowdale, Chicago, is included the Protecto metal-bound felt weather stripping for passenger car windows. This is made of all-wool, hand-pressed weather felt, cut to length as specified. This weather stripping has been adopted as a standard by the Canadian Northern.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free; United States, Mexico and Canada \$6.00. Foreign Countries (excepting daily editions), \$8.00. Foreign subscriptions may be paid through our London office in £ s. d. Single copies, 25 cents each.

WE GUARANTEE that of this issue, 12,400 copies were printed; that of these 12,400 copies, 10,300 were mailed to regular paid subscribers to the Railway Age and Railway Mechanical Engineer; 110 were mailed to advertisers; 490 were provided for counter and news companies sales, new subscriptions, bound volumes, samples, copies lost in the mail and office use; and 1,500 copies for distribution at Atlantic City.

THE RAILWAY AGE is a member of the Associated Business Papers (A. B. P.) and of the Audit Bureau of Circulations (A. B. C.)

Have you any idea as to just what extent electrical apparatus is used by the steam railroads? It is not easy to determine this quantitatively, but a careful examination of the exhibits will furnish some interesting information. There are 336 exhibits at the convention and out of this total, 98 exhibitors are showing apparatus which is in part at least electrical. Some of the exhibitors have reception booths only and others, such as publishers, cannot properly be classified. If these are subtracted, the number which include electrical equipment will become about a third of the total. This proportion as to the extent to which electrical apparatus is used on the railroads may or may not prevail in actual practice, but it is in a measure at least representative and indicates a trend of the times. Are you making adequate provisions for the maintenance and selection of all electrical apparatus? During the past 30 years or more, electrical men have been taken into steam railroad organizations and they are employed by several of the departments on many roads. A few

A Factor of Increasing Importance

roads have well-organized electrical departments that can handle all electrical matters thoroughly and efficiently. Is it not time that every other road should give consideration to organizing their electrical work in a similar manner?

roads have well-organized electrical departments that can handle all electrical matters thoroughly and efficiently. Is it not time that every other road should give consideration to organizing their electrical work in a similar manner?

A number of mechanical men whose interests center to a large extent around the operation of shops and terminals have expressed regrets that no reports were given this year by the committee on engine terminals, car repair shop layouts, or welding. To many these are matters of vital importance, and for that matter it is hard to see how such subjects could fail to be of interest to every man in the mechanical department. Neither is there any reason why the interest should stop at mechanical department lines, for when these subjects are approached from the broader economic viewpoint they present aspects that must be recognized and given attention by the highest operating and executive officers. Far too many subjects taken up at these conventions seem to be dealt with from a narrow and purely mechanical department viewpoint. If this department is to assume the importance that is its due, the outlook must be a much broader one.

Do Not Forget the Shop

There have been oceans of correspondence, an untold amount of controversy, hard feelings, accusations, charges and countercharges about "Wrong Repairs." Car Associations, Interchange Bureaus, Arbitration Committees, railroads and individuals have discussed this problem for years. The discussions and arguments are always the same. They are aptly summarized as follows:

!!!!*****XXXXXXXXX!!!!?????-----*****?????
XXXXXXXXX!!!!????????*****XXXXXXXXX!!!!????????

How to Eliminate Wrong Repair Controversies

Ad Infinitum

The best solution of this problem, as presented by T. H. Goodnow at the informal discussion of the Arbitration Committee's report on Wednesday afternoon, is:

BE SURE TO APPLY DEFECT CARDS WHEN YOU SHOULD.

Any one who reads the report of the Committee on Train Brake and Signal Equipment is likely to conclude that the question of automatic connectors is receiving little attention from the railroads. The list of equipment fitted with connectors in the report is far from complete. The committee fails to mention another significant fact—that such representative roads as the Baltimore & Ohio, the Monon, Chicago, Burlington & Quincy and Chicago, Milwaukee & St. Paul are now testing connectors. Where the most approved types of connectors have been applied even those who were skeptical at first have recognized the benefits in improved operation and reduced maintenance cost. Many mechanical officers agree with the opinion expressed by C. E. Fuller at the 1919 convention, that connectors are bound to come. At present the Mechanical Division is taking no active part in the development of connectors. At least five different types of heads are now in use. Most of the installations are confined to individual roads, but as the number of connectors increases, interchangeability will become a serious problem. Will

Will History Repeat Itself

Will History Repeat Itself

the roads face a condition similar to that which existed when automatic couplers were introduced, when some 50 different styles were in use? By guiding the development of connectors at this time, at least insofar as interchange is concerned, the association can save the railroads the trouble and expense that will result if many installations of non-interchangeable types are made.

Why do some foremen fail? Here is what one foreman has to say in reply to this question: "Superintendents call their foremen together and then call them *down*. Subjects discussed are bum work, not enough work, and look out for your jobs! Do you wonder that foremen get disinterested?" Let us hope that this sort of spirit does not exist on many roads, and yet, unfortunately observation leads us to believe that it is entirely too prevalent. It is true that railroad officers are harassed by all sorts of difficult problems and that they find little time to do as much constructive work as they should like to do. Officers who deal with their foremen, as above suggested, are standing in their own light, and sooner or later will have to step down and out to make room for better men. You cannot get the best work out of men by scolding them, continually finding fault with them, or by adopting a "please explain" attitude. A real leader does not find it necessary to drive his men. Rather does he show a spirit which enthuses and inspires them to put forth greater efforts and to do better work. A little commendation oft-times puts new spirit into a man. The foreman who made the statement at the head of this paragraph followed it up with this one: "Nowadays the superior officer is made to appear as an executioner and is about as popular, simply because many of the evils for which he blames the supervisors can be traced to the superior officers themselves."

Great advances have been made in stores department methods and practices in recent years, but unfortunately many railroads have been forced to continue the use of inadequate storehouses which were built from 25 to 40 years ago. The storekeepers in charge of these buildings are struggling along as best they can, "trying to do a 100 per cent. business with a 35 per cent. building and facilities." It speaks volumes for these men that they are doing as well as many of them are, but can the railroads afford to allow them to continue to operate under these handicaps any longer than is absolutely necessary? True, the railroads have great difficulty in raising new capital and must apply such money as is available where the greatest need exists. A good up-to-date building with adequate storage capacity, ample facilities in the way of yardage, scrap dock, etc., and such machinery and appliances as will conserve labor, can be shown to realize a good percentage of the investment. It is strictly up to the stores department of each, however, to assemble such data as will prove this conclusively to the men who must approve of the appropriation. The executives are confronted with a heavy demand for additions and improvements that they can only approve of those which are of the greatest importance and will show the greatest returns on the additional investment. It is up to the stores department to build up its reports with data and figures which will demonstrate the needs beyond question and which will result in being accepted from the proposed

It is a far too common error to assume that any old machine tool is good enough for an engine house. Even at the present time it is the policy on many roads to install modern machines in the back shops, transferring those which are displaced to enginehouses and outlying points.

This practice may be justified in certain specific cases but as a rule it is costly. In the first place machines are seldom displaced in railroad shops until they are 15 or 20 years old, having been designed in an earlier period when machines worked under comparatively light cutting feeds and speeds and when no special effort was made to have them easily operated. The labor cost of operating such machines in back shops is no greater than the cost of operating them in enginehouses. Looking at the question from another angle there are sound arguments why roundhouses should have just as good and in some cases better machinery than the backshops. The fundamental object of a roundhouse is to get engines turned and ready for service with the least possible delay. It is evident, therefore, that speed and accuracy are two qualifications of roundhouse machine operations even more urgent than when performed in backshops. For example, a main rod back end brass may need to be reduced and rebored for a certain engine which is going out immediately. If the machine operations on this brass are performed by filing and attempting to bore the brass on an old engine lathe there is obviously a great chance for the locomotive being delayed. Not only that but when the brass is rebored there is no certainty that the job will not be inaccurate and have to be done over again. Obviously rapid and accurate work and machines adapted to the different kinds of work handled are essential in roundhouses.

A new star appears this year in the convention firmament at Atlantic City—the Air Brake Association. Possibly it more properly should be classed as a comet among the other bodies of the A. R. A., since it is not so fixed in position as to make Atlantic City its permanent annual meeting place, but will meet in convention with the other associations periodically and with sufficient frequency to insure a closer affiliation in the co-operative work necessary to secure maximum efficiency in its efforts. The Air Brake Association is unique in character, being different from, yet closely related to, the other railway associations now convening in Atlantic City. It is primarily and fundamentally educational in nature, and incidentally uncovers much of practical operating and maintenance value which can be utilized advantageously by the other parental associations having the responsibility of railway direction. These features make closer and more effectual co-operation possible and desirable. The numerous problems of modern and complex train operation involve many air brake factors which must be recognized and dealt with. New employees entering the service must be instructed in the part which the air brake plays and old employees must be kept abreast of the times in new air brake developments. Casual and desultory attempts will not suffice. Specialization in this exceedingly important work is necessary, and the best results come only from constant and concerted effort; hence the necessity for the Air Brake Association and a suitable fitting of its work into the perfect co-ordination of the several associated railway organizations. This, of necessity, must bring about a closer affiliation with the Mechanical Division, yet permit the Air Brake Association ample freedom of action to follow effectually its educational work.

Machine Equipment for Engine Terminals

Why Foremen Fail

Needs of the Stores Department

A New Star—or Comet?

The Work of the Mechanical Division

THE OFFICERS of the mechanical departments are responsible for the disbursement of from 35 to 40 per cent of the operating expenses of American railroads; they determine the nature of the additions and improvements to facilities which in the aggregate account for more than 20 per cent of the total investment in railway property.

To be aware of these facts and the tremendous bearing they have on the welfare of our transportation system, the programs at recent meetings of the Mechanical Division seem inadequate. The Mechanical Division is dealing admirably with many problems. But has it been dealing with all the problems it should be dealing with, or that in view of the history of the organizations that preceded it, it is reasonable to assume its members would be disposed to deal with if they felt they had an entirely free hand? To be specific, it is time to raise a question as to whether the incorporation of the mechanical associations in the American Railway Association is having a good effect.

During the decade following the Civil War, when the unlimited exchange of products which railway transportation seemed to make possible was in danger of being throttled by the restrictive effects of chaotic equipment conditions, the Master Car Builders' Association was organized by a group of far-seeing car department officers. These men and the generations following them, functioning on their initiative as individuals, built up and secured the adoption of a system of standards and limiting requirements for freight cars which, though far from perfect in detail, effectively removed the barriers of interchange from the free circulation of the country's commerce—the life blood of its material civilization.

Bringing the record down to our own time, the development of the standard Type "D" coupler is a noteworthy addition to the list of its great accomplishments.

The American Railway Master Mechanics' Association, although dealing with matters on which little occasion has arisen for the development of universal standards, for a half century was a voluntary medium for the "advancement of knowledge concerning the principles, construction, repair and service of rolling stock." Its real accomplishments have been the crystallization of opinion on such important developments as, for instance, the superheater, by a free exchange of facts and personal experiences at its sessions. It was the medium through which the only extensive scientific study of the drafting of locomotives ever made, was given to the railway public. It was also instrumental in bringing together the injector manufacturers and the railroads in the development of standard flange pipe connections.

In 1918 the two parent associations were reorganized as a section of the American Railroad Association. By this move they passed definitely under the control of its executive committee, on which the Railroad Administration at that time had a dominating influence. This committee, following the reorganization of the American Railway Association at the close of Railroad Administration control, has become a committee of the Association of Railway Executives. Since these reorganizations, there has seemed to many to be a growing tendency for the programs of the mechanical conventions to omit subjects which ought to be included. No criticism is implied because certain important committees with well developed programs under way have found it necessary to present progress reports this year. It is the long list of subjects in which the members individually and the railroads they represent are vitally interested, but with which the Me-

chanical Division has not been dealing, that invites comment.

What is the most trying problem faced by mechanical department officers today? Every mechanical officer would make the same answer. It is the personnel problem, of course. In testifying before the Senate Committee on Interstate Commerce, A. H. Smith, president of the New York Central Lines, said that "the efficiency of a railroad depends principally upon its men. It is estimated that 95 per cent of railroading is human."

True, certain conditions affecting labor have been largely removed from the control of railroad officers, and it may not be desirable to have too free an expansion of opinion on these matters,—not in public, at least. But would it not be wise to discuss the training of foremen? Progressive railroad officers have come to a strong realization of the importance of these men to the effectiveness of an organization and are giving special attention to selecting, training and cultivating them.

Is the training of apprentices, to perpetuate the army of capable mechanics required by the railroads, a subject which must be discussed in whispers behind closed doors? Conditions affecting apprenticeship are constantly changing, and opportunity for organized constructive work is perennial.

Is it necessary to remain silent regarding the shortcomings often shown by the executives in relation to the maintenance and operation of equipment? Chairman Tollerton dwelt on it in his opening address. It is a point meriting more attention. Most shortcomings of this kind are caused by ignorance. How is ignorance to be dispelled by a policy of silence on the part of the only men qualified to give the executives the facts? Minor associations of railway officers discuss such matters constructively. Why should not the Mechanical Division?

The locomotive is the most important material factor in the operation of the railroads. Whether it be the selection of a new locomotive type to meet local requirements, the distribution of power to meet changing conditions, the best train loading, or the development of effective methods of train operation, an intimate knowledge of the limitations of the locomotive, as well as of other operating characteristics, is essential.

There are few operating officers who know the limitations of the locomotive; there are few mechanical officers who know the limitations imposed on the operating officer by the character of the traffic and of other facilities. What are the possibilities of long locomotive runs? What effect will they have on the cost of locomotive maintenance? Will the practical limitations on this development prevent the attainment of increased locomotive mileage? Can these limitations be made less restrictive by improvements in grates, drafting appliances and details of the running gear?

If the mechanical officer is to be a factor in answering these questions and in controlling the utilization of the locomotive, he must broaden his horizon to take the operating officer's problems into his perspective. What better medium is there for bringing this about than the Mechanical Division? If this organization does not take up these problems, some of other live organizations will do so.

In his addresses at three successive conventions, Chairman Tollerton has advocated the development of some means for co-operative research, and for joint testing of railway appliances. At the 1920 convention the report of a committee on the Establishment of a Co-operative Research Bureau outlined a wide range of work which

could suitably be handled by such a bureau and asked to be continued to study the relation of such a bureau to the development of policies of the association. Has the subject been buried in committee?

Are there no unsettled questions as to the proper ratio between the expenditures for running and back shop repairs? Is it not possible that the correct determination of this ratio might have a material influence on the aggregate cost of maintenance and the future expansion of back shops and division terminals? Members of the Mechanical Divisions are studying these problems. Would the association not benefit by taking them up for discussion?

What are the committees on Engine Terminals, Design and Operation and on Car Repair Shop Layouts doing? Are there no improvements in terminal and shop facilities, in their organization and in operating practices which could be discussed with profit by the members of the Mechanical Division?

None of these subjects is suitable for treatment by the strong arm methods of legislation, nor are many of them ready for the committee investigation. But every one of them has been the subject of close investigation and study by one or more of the members of this organization. The advanced work of leaders is considered worthy of the attention of the voluntary organizations in other fields. The by-laws of the American Railway Association set forth its object as "the discussion and recommendation of methods for the scientific and economical construction, maintenance and operation of American railroads." Is the failure of the Mechanical Division to deal with subjects such as those mentioned the fault of the Mechanical Division, or is it the outgrowth of repressive measures of control or to fear of possible executive displeasure?

The car committees, generally speaking, have well defined tasks, the objects of which are the development or modification of legislative measures for controlling the interchange of equipment. The work of these committees is now the principal work done by the Division. But if they confine their activities to the development of the recommendations only, and do not present fully the reasons for the recommendations and give opportunity for discussion of them, why hold a convention? If the committees are to confine themselves merely to making recommendations they had just as well report their findings to the General Committee, to be referred to the representative members for action by letter ballot. In any case the vote of each member will depend on how the interests of his road seem to be affected. Why come to Atlantic City unless the subjects are to be illuminated by a frank exchange of personal opinions, free from the fear of official displeasure? Plenty of opportunities are given in the sessions for such free interchanges of opinion, but few take advantage of them.

This leads up to a question as to the real effectiveness of the legislative work of the organization. The repeated extensions of time for the retirement of undesirable types of equipment, indicates the complete dependence of progress in these matters on the consensus of opinion as their value to the railroads individually. Obviously, unless this opinion can be changed by the work of these committees, just as rapid progress will be made without legislation as with it. The real work of these committees has only just begun when an agreement has been reached by the committee members. If the work is to be effective the committees must be able to present a convincing array of facts as to the economic effect of the changes or standards proposed. Unsupported opinions are not convincing and have little effect in changing the trend of a motion when the ballots are cast.

The work of the Mechanical Division should be highly educational as well as legislative. The list of subjects here suggested as suitable for consideration by no means exhausts the possibilities for future constructive work—they are limitless. Neither does it imply a belief that the organization should not have an official connection with the American Railway Association. There are well-defined advantages in this relationship, provided the Association encourages great freedom of development of the Division and does not attempt to pour it into a mold of its own making. But it is evident that wise guidance by the Association and courageous leadership in the Division will be required if the incorporation of the Division into the American Railway Association is to do more good than harm. The greatest possible good will be done only if the higher executives of the railways encourage the fullest investigation and free discussion of all important mechanical department matters, and if the members of the Mechanical Division take the fullest advantage of the opportunity thus afforded.

Programs for Today

Four railroad conventions will meet in Atlantic City today.

Division VI, Purchases and Stores, A. R. A.

The meetings of this association will be held in the Hotel Traymore. The session will open sharp at 9 a. m. and will adjourn at 1 p. m. The program is as follows:

	A. M.	A. M.
Meeting called to order by Chairman.....		9:00
Invocation	9:00 to	9:10
Address of Welcome by Mayor of Atlantic City.....	9:10 to	9:20
Response by J. H. Waterman.....	9:20 to	9:30
Address by R. H. Aishton, President, American Railway Association.....	9:30 to	9:45
Address by W. G. Besler, first vice-president, American Railway Association.....	9:45 to	10:00
Address by Elisha Lee, vice-president, Pennsylvania System, (Eastern Region).....	10:00 to	10:15
Opening of Meeting by Chairman.....	10:15 to	10:40
Recess	10:30 to	10:40
Communications.....	10:40 to	10:50
Appointment of Committees (Resolutions and Memorials).....	10:50 to	10:55
Action on Minutes of 1921 Business Meeting.....	10:55 to	11:00
New Business:		
Report of General Committee.....	11:00 to	11:15
Discussion of General Committee's Report.....	11:15 to	11:20
Discussion of reports on:		
Subject 1.—Stores Department Book of Rules.....	11:20 to	11:40
Subject 2.—Classification of Material.....	11:40 to	12:30
		P. M.
Special Subject: "Distributing and Accounting for Gasoline," by Mr. L. V. Hyatt.....	12:30 to	1:00

Division V, Mechanical, A. R. A.

The meeting of this organization will be held in the Greek Temple on the Million Dollar Pier. The meeting will be called to order sharp at 9:30 a. m. and will adjourn at 12:30 p. m. The program is as follows:

Discussion of Reports on:
Mammal.
Election of Officers
Discussion of reports on:
Specifications and Tests for Material.
Locomotive Headlights and Classification Lamps.

(Continued on Page 1551)

Picked Up On The Million Dollar Pier

A Few Comments, Critical and Otherwise, of the Work of the Mechanical Division

IT IS INTERESTING and oft-times exceedingly profitable to listen to and then weigh carefully some of the observations that are made by the railroad men and others at the conventions as to the present shortcomings of the Mechanical Division and how they may be overcome. *The Daily*, of course, assumes no responsibility for the following statements which have been made to its representatives but publishes them as a matter of news and with the idea that some of them may suggest means by which the work of the associations may be made more effective.

* * * * *

One member has suggested that it might be well to retain a specialist who is a good reader with a strong voice to present the reports at the meetings. The chairman of the committee could stand alongside of him and interrupt during the reading of the abstract of the report, if he wished to make special comments on any point. Much of the value of the presentation of the reports is lost because of the fact that the committee chairmen will not, or cannot, speak up loudly and plainly and make themselves heard throughout the room. Surely men who have charge of hundreds and sometimes thousands of other men, and who direct their energies, should be able to make a better presentation than some of them do. How can they be made to feel the importance and necessity of so doing? Is it necessary to provide a professional reader?

* * * * *

Another member has made the suggestion that the effectiveness of the presentation and discussion of the reports would be greatly increased if every member of each committee was present when the report was presented and if they all sat together in a body at or near the platform. This practice is followed by the American Railway Engineering Association. The members all sit behind a long table on the platform and the chairman of the committee frequently calls upon other members of the committee to present certain parts of the report; or if questions are asked from the floor, designates the member of the committee who is in the best position to give the answer. It is unfortunate that often only one or two members of an important committee are present to support their chairman; it has been suggested that prior to the meeting each year the General Committee should notify the executive officers on the different railroads of the names of the men on their roads who are on the committees, and ask that special efforts be made to see that they attend the convention and support their committees.

* * * * *

Someone has called it the "Amen Corner." The connection at first was not quite clear until it was explained by some of the members who have not been able to find seats near the front of the meeting room. It seems that several members who take part in the discussions of the reports have a habit of sitting near the front of the room and speaking direct to the chairman and in such an indifferent manner that most of the members present are deprived of the privilege of following their remarks in-

telligently. Courtesy, of course, demands that those members taking part in the discussion should address the chairman, but there is no good reason why they should not aim to at least partially face the audience and speak clearly, so as to get their remarks over.

If some of the younger members want to make a record for themselves they can do so by studying how effectively to address the meeting and then putting their strength and energy into making themselves heard. Not only is this necessary, but the men ought to aim to "get their personalities over." This is not always easy to do, but men who expect to make good as executives in these days have got to perfect themselves in public speaking. The man who made these comments, by the way, was not an agent for one of the correspondence school courses on public speaking, but was a hard-headed mechanical department officer who is trying to get as much good as he possibly can from the meetings, and would like to hear everything that is being said. We hesitate to refer to the comments made by the official reported, and he is located in a most advantageous position.

* * * * *

If it were possible to compute, on the basis of the salaries received by the people present at a given session, the total compensation for the group per minute, the size of the figure might be startling. If, then, each member were to realize that every minute he took to express himself cost this amount of money, the result might be interesting. It might lead many of the members to study the advance copies of the reports more critically before they try to discuss the reports and might make them look up the answers to obvious questions themselves before the meeting, rather than to waste the time of all the members present. It might inspire the different committees to complete their reports early enough so that they could be sent out to the membership and be thoroughly digested well in advance of the time of the meeting. It might force the presiding officer to bring down the gavel hard and shut off members who are wandering from the subjects under discussion, or who are not utilizing the time to the greatest advantage. It might, in the final analysis, tremendously add to the practical value of the proceedings and the prestige of the Mechanical Division.

* * * * *

Many comments have been received commending *The Daily* for its editorial on Friday morning on "Make Room for the Young Men." One member has suggested that this is entirely up to the young men themselves. "If they have the right sort of stuff in them they will force themselves to the front, even though they may not be encouraged." Men like C. G. Juneau, W. H. Winterrowd, W. J. Bohan, C. T. Ripley, M. H. Haig (not here this year) etc., have made themselves felt. Undoubtedly the older men in the organization would be delighted to have more of the younger men follow the leadership of this younger group. One member has suggested that live and progressive organizations always utilize the energy, ambition and vision of the younger men and that one of the principal functions of the older executives is to encourage these men and allow them plenty of room for the display of

unhappy. Unfortunately, what is everybody's business is nobody's business. If every superintendent of motive power would deliberately aim to encourage his more ambitious subordinates to get into the work of the Mechanical Division and get on their feet at the meetings and then back up these younger men in putting over some of the really big things that they want to do, there would be club and it is getting to be more important every day that little room for complaining about the programs or work of the Division.

* * * * *

One member suggests that when the mechanical department officers are at home they spend the greater part of their time in dealing with problems relating to the handling of men and to questions of operation. On the other hand, when they come to the convention, the great bulk of the reports and discussion are concerned with mechanical details, or as a member expressed it, "bolts and nuts." This man was quite enthusiastic over the editorial in Saturday morning's *Daily* entitled "Why Not Discuss Labor Questions?" He suggested in addition, however, that there are many operating questions, such as lengthening out the locomotive runs, possibilities of motor cars, etc., that ought to be reported upon and discussed at Atlantic City.

Another member suggested that developments during the past decade have shown that in proportion as the strength of the cars has been increased, so the carelessness of the train service men in handling the cars has increased. This, of course, cannot go on indefinitely. The dead weight per revenue ton must be kept to the lowest possible point if America is to lead in carrying freight and passengers expeditiously and safely at the lowest cost and still continue to pay its employees the highest wages. Mechanical department officers have got to do their part in educating operating officers and others to this truth and have got to stop trying to make equipment which will stand unlimited abuse. If train service men will not see this thing and operating officers continue to stand for the increasing abuse of the equipment, then in the last analysis the public will either be forced to pay exorbitant rates or the men will have to have their wages reduced.

* * * * *

A lively discussion developed among a group of mechanical department officers in one of the reception booths. The point blank statement was made that the Mechanical Division was not putting over as strong a program as it should and that unless it pulled itself together and did more effective work it would rapidly lose its prestige. Stories were told by some of the older men in the group of the remarkable accomplishments of the Master Car Builders' Association and the Master Mechanics' Association. Three reasons were advanced as to why the Mechanical Division was not doing as good work as should be expected of it.

One reason was that the discontinuance of conventions during the war and reconstruction period had interfered greatly with the carrying on of the committee work and this had restricted efforts largely to routine matters and had interfered with the consideration of new and more constructive work. The fuel was also developed that mechanical department officers had had some neglect of their problems to contend with during the reconstruction period and that those had prevented them from taking up many problems which otherwise would have received consideration. In reply to this however, others advised that never was there a time when the movement had been confronted with such growth and vital problems and that a serious mistake had been made

in not providing for a thorough study and discussion of these, in order that the proper leadership might be supplied in these difficult times.

The second reason advanced for the poor showing of the Mechanical Division was that the taking over of the M. C. B. and M. M. Associations by the A. R. A. had put the brakes on them, so to speak. There appeared to be two sides to this question also. Some contended that the higher executives were discouraging the mechanical department officers from taking up many of the larger subjects which should receive consideration, while others contended that the officers of the American Railway Association would be only too glad to see the mechanical men show more initiative, and place the Division on the basis of a Moses leading the mechanical departments out of the wilderness. Some thought that the situation is large by psychological or rather that the mechanical men are a bit too timid and have allowed themselves to get into a state of mind that is not productive of the best results.

It seemed to be agreed, however, that it is up to the mechanical department officers to get busy and start something; this would either demonstrate that the trouble is entirely a question of psychology or it would clearly develop what the limitations of the Mechanical Division are. The final suggestion was that it would be a bully good thing if the officers of the American Railway Association would put it right up to the mechanical department men to study, discuss and report upon some of the really big questions relating to personnel problems and operation which are now being overlooked, possibly for fear of criticism from above.

The third reason advanced for the somewhat unsatisfactory showing of the Mechanical Division is that the whole thing is largely a matter of personnel. You can't keep a good man down, and it was contended that if the leaders of the Mechanical Division would show the same initiative as has been shown by the American Railway Engineering Association, the Fuel Association, and the Railway Accounting Officers' Association, like results would follow.

It is a good thing occasionally, it was suggested, to have a drastic reorganization. One great international organization has found that it is necessary to more or less reorganize and revise its program periodically, say, once every 10 years. It was suggested that the Mechanical Division in the same way ought to put a "vacuum cleaner" at least on its subcommittees and see that each committee is headed by a "live wire" and that the men of the greatest vision, initiative and ability be selected to back them up.

It was suggested, also, that more individual papers should be presented on vital topics and that the Mechanical Division meetings could be very greatly improved, not only by doing this but by arranging for thorough and formal discussions of the reports or individual papers as is now being done to such great advantage by some of the more progressive railroad clubs.

* * * * *

One railroad man asked some of his friends just how the committees were appointed and as to whether they held frequent meetings in developing their reports. "It would appear," he said, "that some of the committee members hardly know that they are on a committee, or at least are not familiar with the report when it is finally developed." In supporting this statement he directed attention to the fact that a member criticised one of the committee reports from the floor last week and was invited by the chairman of the committee to submit to the committee certain data which he referred to. Investigation revealed

the fact that the member who criticised the report and was in a position to furnish additional data was included among the names of the members of the committee on the printed report that was under consideration. Are the committees working as committees or are some of them dominated by one man or a minority of the committee? When a man is appointed on a committee is the head of his department notified and does the railroad agree to back up the committee member by allowing him sufficient time to attend to the committee work and assisting him to secure information so far at least as the questions under consideration relate to the practices of his own road?

* * * * *

One critic handed in the following in writing:

"As one reads over the program of this year's convention of Division V—Mechanical, he finds many old friends both among the subjects and among the lists of men on the various committees. Some of the committees, with few or many changes in membership, have been doing duty for many years and reports from them are looked for just as one looks to see the waves come rolling in from the ocean onto the beach at Atlantic City. There are members on some committees who have done valiant work in the past on matters new and vital, and recognition and reward should justly be given if it has not already been done.

"There is a question, however, whether this should take the form of a life membership on a committee. It might be better to grant honorary degrees, as is the custom of our colleges at this time of the year, or following this example, start an emeritus list. Another way might be to have on some of the old committees a list of consulting members to include those whose services have been of so much value in the past. This would bring some of the younger men into position to assist the association to take new steps forward. It is even possible that as the committee list is gone over it will be found that some subjects have been so well covered that the committee which has been standing so long could be allowed to sit down, possibly to take a nap or even go to sleep. There certainly is a sufficient number of new and vital subjects that might be taken up at these conventions even though some of the good old standby subjects were not included."

The Power of the Railroad Club

GEORGE M. BASFORD has always been greatly interested in the work of the railway clubs and the various mechanical department associations. More-over no man in the railroad field has done more to encourage and help young men. He has urged the younger men to take part in the meetings and programs of these organizations, not only that the young men might help themselves, but also because of the energy and help that they could give to improving these organizations and making them more effective. Mr. Basford has been acting as chairman of the Committee on Subjects of the Central Railway Club during the past year and has done much through the improved programs to increase the interest and enthusiasm of the members in the work of the club.

We found George in a quiet corner on the pier a day or two ago and, knowing his hobby, started him to talking on the possibilities and power of the railroad clubs, and as to how they might be utilized by the younger men to the advantage of both the men and the clubs.

"A friend told me how, many years ago, he was hired as a specialist in an immense organization," said Mr.

Basford. The first one he talked with was the president, a very successful man. The president said this to him: "Young man you have come to the foot of our ladder. It is a long one. Remember that I am lonesome up here at the top and that you are in a big crowd at the bottom. But every rung in this ladder is a perfectly good one for climbing."

"My friend did climb out of the crowd to the presidency of a successful company in a business that he built up from the ground. This is mentioned because his success was due largely to railway clubs and other organizations of railroad men. He spent 20 years on railroads and not only joined but took active part in club work. He gives the clubs and the old Master Car Builders' Association credit for inspiring him and broadening his vision. In his office at his busy factory, he told me that nothing had ever helped him more than to write a paper or take part in a discussion which compelled him to prepare to tell somebody something that was worth telling.

"Urge the young men to join the railway clubs," he said. "I made a list a short time ago of 24 important, influential men who have used the railway clubs to their own advantage, to the advantage of the clubs and to the great advantage of their employers. But in doing so much for themselves they have done even more for many others who have been helped by their examples.

"One of these men is at the head of one of the world's greatest electric companies. For years he was an obscure young railroad man. He had no friends but the ones he made. He attended meetings. He made it a rule to prepare something to say and to say it at every technical meeting—something worth while. He wrote papers and they are classics, the last word to date on his subject. He inspired himself and inspired others by being in and a part of every new railroad development—operating, mechanical and signaling. He made friends and mixed in discussions in the corner of the room before and after the meeting when others told what they lacked courage to tell on the floor. When he started to write a paper he found how much he did not know of the subject and he fortified himself. No one could embarrass him by an attack on the floor because he was always sure of his ground. Speaking in public was distasteful to him but he overcame this. I am sure he would not be where he is today and in position to help the railroads as he is today, without the railway clubs. Get the young men to do as he did. Get them to put some valuable thought into the record of every meeting. They will take more thought away than they bring.

"Years ago one of my friends wrote three important papers. Within a short time after the presentation of each of them he received a promotion to a better job. Another friend definitely owes the acquaintance that made him successful to a paper he wrote for a railway club 25 years ago.

"The railway clubs are forums for railroad men that are needed as they never have been needed before. Operating officers, track officers, those in charge of cars, locomotives, signals, bridges and terminals, never, not even on their own roads, get together as they may in a railway these officers should mingle to study and to understand each other's problems.

"Do track officers generally appreciate the influence they may exert over locomotive fuel consumption? Do signal engineers realize how greatly their work affects the cost of maintenance of cars? Do operating officers see that much of the success of electric locomotives is due to the improved operating methods employed in every electric installation and that steam locomotives would yield remarkable results under similar methods?

"These suggest the possibilities of the railway clubs to

bring together these men who supply equipment, power and track and the men who use them. Most railway clubs have been unbalanced, one-sided, mostly mechanical. They may be broadened and will be broadened when a few young men from each road see what the railway club can do for them.

"Latent talent in great abundance among obscure, unknown young men crowding the foot of the railroad ladder may be brought out by these clubs. It is the privilege and duty of those of us who are older to get young men to see the light that railway clubs can throw into their futures—and the future of transportation is to be guided by these young men on whom the welfare of the country depends.

"Urge the young men to join the clubs; attend the meetings; suggest topics to the Committee on Subjects; write papers, no matter how short, but each must bring a message. Take part in the discussions. Bring out some good point for the benefit of others, some fact or constructive suggestion that will help the railroads even a little bit. This desperate railroad situation may be materially changed by inside team work."

"Our railway clubs," said Mr. Basford, "present a truly wonderful field of opportunity today and it is not by any means only young men who should take advantage of them. Older men may keep younger and may widen vision, improve usefulness and increase their measure of success by using the railway clubs as they should be used."

Force of Habit

"YES," SAID THE specialist, as he stood at the bedside of the sick purchasing agent, "I can cure you."

"What will it cost?" asked the sick man, faintly.

"Five hundred dollars."

"You'll have to shade your price a little," replied the purchasing agent. "I had a better bid from the undertaker."—*Adscript.*

Lost and Found

LOST—A platinum bar pin set with diamonds. Please return to Mrs. W. B. Leach, Hunt-Spiller Manufacturing Corporation, Booth 562.

LOST—A black Paradise feather in front of the Ambassador Hotel. Please return to J. R. Blakeslee, Ajax Manufacturing Company, Space 65.

FOUND—A string of beads, a bracelet, a key, a shoe buckle, a setting for a ring and a cuff link. These articles will be returned to their owners upon application to Secretary Conway at the Enrollment Booth, after making proper identification.

LOST—Badge No. 8243. Mrs. Jos. J. Edwards.

Prof. A. J. Wood Promoted

ARTUR J. WOOD, professor of railway mechanical engineering at Pennsylvania State College, has been appointed head of the Department of Mechanical Engineering.

Professor Wood was graduated in 1896 from Stevens Institute of Technology; his father, the eminent teacher and engineer DeVolson Wood, devoted twenty-five years of his life to that institution. After graduation, Professor Wood was on the editorial staff of the *Railroad Gazette*, combining practical engineering work with this

position. Later he was instructor in mechanical engineering at Worcester Polytechnic Institute, professor of mechanical and electrical engineering at Delaware College, and since 1904 a member of the mechanical engineering faculty at Pennsylvania State College, where he received his Master of Science degree in 1916. More recently he has been in direct charge of the engineering experiment station.

Since coming to Penn State, Professor Wood's work has been characterized by the organization and conduct of the course in railway mechanical engineering, the development of researches in heat transmission, the preparation of his text book on Locomotive Operation, and by a varied consulting practice chiefly in power plants and railroad work. He has also presented many papers before engineering and scientific societies, and is widely known for researches in heat transmission. He is a member of the Sigma Tau honorary engineering fraternity.

In reply to an inquiry as to the future of the course in railway mechanical engineering at Pennsylvania State College, Professor Wood says: "My appointment to the head of the Department of Mechanical Engineering will enable me to direct the work in railway mechanical engineering so as to insure a gradual and more permanent development of it in our course of study. I have never been favorable to over-specialization in railroad work and our course given in the Department of Mechanical Engineering has not been specialized to the exclusion of a good foundation in the fundamentals of straight mechanical engineering subjects.

"It may be of interest to note that five members of the present mechanical engineering faculty have had considerable railroad experience and during the past year three of these men have been giving instruction in railway mechanical subjects. We have had many requests for members of our graduating class to take up special apprenticeship courses, but can supply few of these calls. One of the items in the request for state appropriation which will be made during the coming year is for a transportation building. Altogether, I anticipate a strengthening and broadening of our course in railway mechanical engineering."

Mexican Railway President at Conventions—Left: Leon Salinas, Executive President, National Railways of Mexico; Right: F. P. De Hoyos, General Agent at New York

Programs for Today

(Continued from Page 1546)

Air Brake Association

The twenty-ninth annual convention of this association will be held at Haddon Hall, Vernon Room, and opens at 9:30 a.m.

Edwin F. Bader, mayor of Atlantic City, will deliver the address of welcome. The Reverend Newton W. Caldwell, pastor of the Olivet Presbyterian Church, will invoke divine blessing.

The first subject for discussion will be the committee paper on "Air-Operated Auxiliary Devices on Locomotives." This will be followed by a paper by Prof. S. W. Dudley of Yale University on "Wastes in Air Brake Service."

Association of Railway Electrical Engineers

The association will hold its semi-annual convention at the Hotel Dennis. The meeting will be called to order promptly at 9:30 a.m. This will be the first official get-together of the electrical men for two years and a large representation is expected. The order of business is as follows:

- Address of President.
- Report of Secretary-Treasurer.
- Unfinished Business.
- New Business.
- Progress of Committee Train Lighting Equipment and Practice.
- Progress Report of Committee on Locomotive Headlights.
- Progress Report of Committee on Data and Information.
- Progress Report of Committee on Electric Welding.
- Progress Report on Committee on Illumination.
- Progress Report of Committee on Electric Repair Shop Facilities and Equipment.
- Progress Report of Committee on Motor Specifications.
- Progress Report of Committee on Power Plants.
- Progress Report of Committee on Power Trucks and Tractors.
- Paper on Industrial Heating by B. F. Collins.

Entertainment Features

- 10:30 a.m.—Orchestral Concert, Entrance Hall, Million Dollar Pier.
- 3:30 p.m.—Orchestral Concert and Impromptu Dancing, Entrance Hall, Million Dollar Pier. Tea Will Be Served at 4:30 p.m.
- 9:00 p.m.—Informal Dance, Special Features, Ball Room, Million Dollar Pier.

Locomotives on Track Exhibit

THE PHILADELPHIA & READING is exhibiting on its track in Mississippi avenue, a little south of the pier near the boardwalk, two modern locomotives. One is of the Pacific type, built at its own shops and used on Atlantic City trains. The weight, exclusive of the tender, is 183,700 lb. and the rated tractive effort 39,046 lb.

The other is a new Consolidation locomotive, No. 1900, built by the Baldwin Locomotive Works. This has 25-in. by 32-in. cylinders, 55½-in. drivers, 94.5 sq. ft. grate area and 3,752 sq. ft. equivalent heating surface. It carries 210 lb. boiler pressure, weighs 286,000 lb., exclusive of the tender, and has a rated tractive force of 64,300 lb. It is equipped with a Duplex stoker and Worthington feedwater heater.

Then there is the oil-burning Santa Fe type locomotive built for the Southern Pacific by the Baldwin Locomotive Works and fully described elsewhere in this issue.

Official Registration Lists

The Official Registration Lists will be published today and Wednesday, June 21. No list will be issued on Tues-

The McBarmma Golf Tournament

THE MCBARMMA GOLF CLUB—"the most exclusive golf club in the world", as one of its members facetiously called it—had its annual tournament at the Seaview Golf Club on Saturday. The tournament was followed by the annual dinner and election of officers. The new officers elected are: president, B. F. Flory; Vice-president, George H. Sargent; directors, H. C. Manchester and W.L. Conwell; secretary-treasurer, Clement F. Street.

The golf play resulted in the awarding of the following prizes: championship and first prize in Class A, H. Gilliam, 86-4-82; Class A, second prize, W. L. Conwell, 88-2-86; Class B, first prize, Robert F. Carr, 94-10-84; Class B, second prize, A. H. Sisson, 95-9-86; Class C, first prize, F. H. Clark, 96-16-80.

The Carr cup for the low net score of the afternoon play went to F. H. Clark.

It was alleged that "pop" Sisson was disqualified because he did not play the nineteenth hole or smoke cigarettes, and Clement F. Street claimed the second prize in Class B. Mr. Sisson seems to be out of luck, since nobody has ever yet successfully contested any position taken by Clement regarding any feature of the club or proceeds thereof.

F. H. Clark on Chinese Railway Conditions

F. H. CLARK, formerly general superintendent of motive power of the Baltimore & Ohio, recently returned from China, where for over two years he was technical adviser of the Ministry of Communication of the Chinese government. Mr. and Mrs. Clark and their daughter are here attending the conventions. Regarding railway conditions in China, Mr. Clark said yesterday:

"The railways of China amount to about 7,000 miles, including concessional lines, provincial and private lines and the lines of the Chinese Government Railways. The latter have a total of something like 4,000 miles and include about 15 different lines built mainly by foreign capital but partially by the Chinese themselves. Railway construction was making some progress at the time of the outbreak of the war in 1914, but was soon afterward discontinued and has only recently been resumed in a relatively small way.

"China has made contracts or agreements covering approximately 1,000 miles of additional lines and will eventually need a great deal more to serve properly her area and population. She has an area greater than that of the United States, a population supposed to be three or four times as great and a railway mileage of less than three per cent of that of the United States.

"These figures should not be used as a basis for estimating the ultimate railway mileage of China, but only as an indication of her need for a considerable amount of additional mileage. With the inauguration of a stable government having the confidence of Chinese and foreign investors, the development of the country should proceed very rapidly.

"Manufacturing and mining are generally done on a small scale suited to local needs. This is largely due to a lack of transportation facilities and as these are provided and markets broadened we may expect to see production on a larger scale.

"Large cotton mills, flour mills and various other industries are already in successful operation in some parts of the country. Coal, iron, ore and other minerals seem to be widely distributed.

"China has always been an agricultural nation but seems to have the raw materials and the labor, which if properly directed, should make her a great manufacturing nation."

Enrollment Today

THE ENROLLMENT BOOTH at the entrance to the Million Dollar Pier will be open today from 9 a.m. to 1 p.m.; 2 p.m. to 6 p.m.; and from 8 p.m. to 9 p.m.

Santa Fe Dinner

JOHN PURCELL, assistant to the vice-president in charge of the mechanical department of the Atchison, Topeka & Santa Fe, tendered an informal shore dinner to the Santa Fe guests who are attending the conventions, including a number of old time Santa Fe men and their wives. About 18 were in attendance and the evening was enjoyed by all.

Registration Figures

THE COMPARATIVE REGISTRATION figures for 1922 and 1920 up to 1 o'clock Sunday noon are as follows:

	1922	1920
Div. V.—M. M. and M. C. B.	695	707
Div. VI.—Pur. and Stores	127	140
Special guests	477	441
Supply men	2,117	2,262
Railroad ladies	619	569
Supply ladies	564	634
Total	4,599	4,753

Equipment Orders Still Coming In

THE NASHVILLE, CHATTANOOGA & ST. LOUIS has ordered five Mikado locomotives from the Baldwin Locomotive Works and the Lehigh Valley is inquiring for five locomotives.

The Western Pacific expects to let contracts this week for 2,000 refrigerator cars; the New York, Chicago & St. Louis has ordered 1,000 freight cars from the Illinois Car & Manufacturing Company; and the Grand Trunk has ordered 250 refrigerator cars from the National Steel Car Corporation, Hamilton, Ont.

The Interborough Rapid Transit Company has ordered 100 new cars from the Pullman Company.

Ticket Office for Convention Attendants

THE PENNSYLVANIA RAILROAD will open a ticket office at 9 a.m. this morning for the convenience of the people in attendance at the conventions. The office will be located at the entrance to the pier, adjacent to the Enrollment booth. Reservations may be made for all trains on the Pennsylvania running to Philadelphia, Pittsburgh, New York, Chicago, etc., and tickets will be issued at any point on the Pennsylvania System. Extra fares are to be placed on all trains that will be used by attending convention visitors, but reservations should be made as early as possible in order that proper and sufficient accommodations may be provided.

News from South America

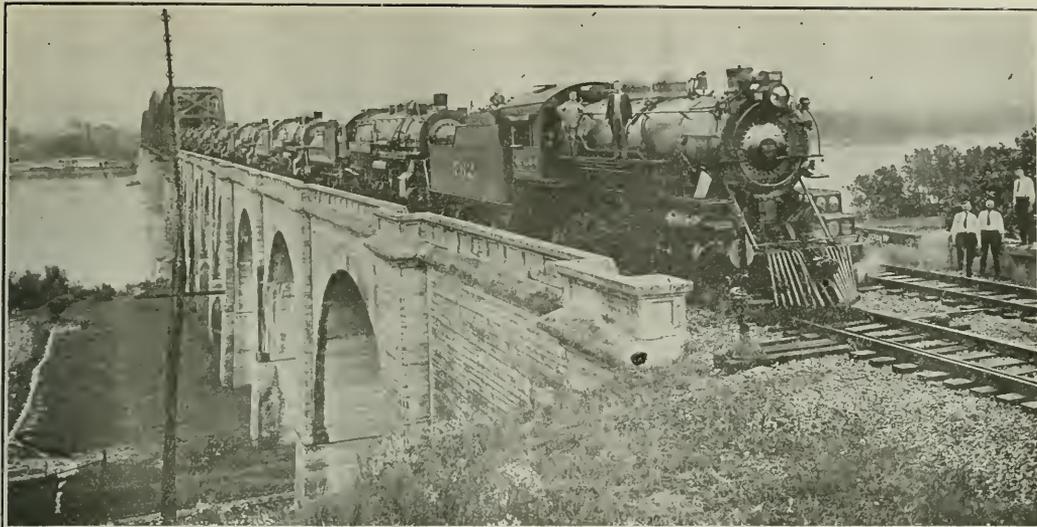

S. G. DOWN, general sales manager of the Westinghouse Air Brake Company, has but recently returned from a three-months' tour of South American countries, including Brazil, Argentina, Chile and Peru. In commenting on the conditions in South America, Mr. Down believes that there will be a good market for American railway material in the near future, particularly from the Government owned lines. As regards the privately owned roads, the possibilities of the United States for business are not as good, primarily because they are operated on English capital, which naturally means that purchases will be made in England where possible. In this connection Mr. Down pointed out that before America can hope to derive any great amount of business from privately owned railway companies, it must be ready to invest money in foreign enterprises, for it is financial that business will go to that country which has financial control of the properties in question.

Mr. Down also commented on the lack of proper American steamship connections with South American countries. Speaking of the general practices on the railways, Mr. Down said that on the national railways of Brazil, Argentina and Chile, the Westinghouse air brake is standard, and that a large number of the railways in Peru are using this brake. South American countries seem to favor the American type of equipment. This is logical, for with clearance limitations larger than those obtaining in many of the European countries, the South American roads are at liberty to develop more along the lines of larger and more powerful engines, as is the case in the United States.

Registration, American Railway Association, Div. V, Mechanical

- Aiken, Arthur, Chf. Clk. to P. A., Penn., Ambassador
- Albers, L. H., Supvr. of Air Brakes, N. Y. C., Haddon Hall.
- Anderson, H. A., Asst. P. A., Penn., Traymore
- Andreucci, J. A., Asst. Elec. Eng., C. & D., Penn., Traymore.
- Bardo, C. S., C. M., N. Y. N. H. & H.
- Beaumont, H. A., G. F., B. & O., Llewellyn.
- Bell, E. E., M. Insp., S. L. & S. F., Dennis.
- Berg, R., Supt. Loco. Shops, P. & E., Strand.
- Biam, W. L., Mech. Asst. to Pres., N. Y. N. H. & H., Shelburne.
- Billau, J. S., Ass. Elec. Eng., B. & O., Chalfonte.
- Bingaman, Chas. A., M. E., P. & R., Bothwell.
- Black, W. G., M. M., Nickel Plate, Haddon Hall.
- Boland, W. E., Sig. Engr., S. P., Shelburne.
- Boltwood, Harvey, M. E., Div. of Liquid, of Claims, Haddon Hall.
- Booth, J. K., M. M., B. & L. E., Chalfonte.

Prosperity Special Leaving Thebes Bridge, Illmo, Mo., June 7, 1922.

A Notable 2-10-2 Type for the Southern Pacific

Feedwater Heater and Booster are Features of Latest Design Which is Exhibited at the Conventions

DURING RECENT WEEKS the newspapers have been filled with accounts of the progress of the "Prosperity Special." A solid train of twenty 2-10-2 type locomotives, part of an order of 50 of this type for the Southern Pacific, left the Eddystone, Pa., plant of the Baldwin Locomotive Works on May 26 for California, where the equipment will be delivered to the railroad. Interest in this event among those attending the conventions has been increased by the fact that one of the locomotives included in the same order is the principal feature of the track exhibits this year.

Through the courtesy of the locomotive builders, members of the railway and supply associations and their guests were afforded an opportunity of seeing the moving pictures showing the progress of the train between Philadelphia and New York. On the occasion of this exhibit, which was held last evening in the Rose Room of the Hotel Traymore, Samuel M. Vauclain, president of the Baldwin Locomotive Works, who was primarily responsible for the movement of the train, delivered an address.

A solid train of locomotives is such an unusual sight that the "Prosperity Special" has attracted great crowds at all points along the route. The train was moved only during the day, giving all who were interested opportunity to inspect it at the points where it stopped. The route chosen was over the Pennsylvania System to East St. Louis, thence over the St. Louis-Southwestern to Corsicana, Texas, where connection is made with the Southern Pacific Lines.

One of the most remarkable events of the trip was the run around Horseshoe Curve, west of Altoona, Pa., where the train was moved with six locomotives, two in front,

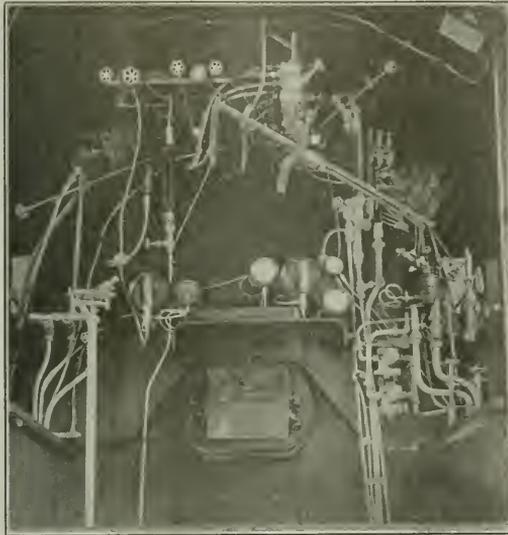

two in the center and two pushing. Moving pictures were taken of the train at various points on the curve; these were among the pictures shown last night.

Details of the Locomotives

Aside from the fact that this order is one of the largest that has been placed for locomotives of the 2-10-2 type, the equipment is notable because it marks the first extensive installation of feedwater heaters and of the locomotive booster. Although they are exceeded in total weight by other locomotives of similar types, the appliances mentioned probably increase boiler output and starting tractive effort beyond anything heretofore obtained.

The first Baldwin locomotives of the 2-10-2 type built for the Southern Pacific were constructed in 1917 and were designated as Class F-1. These locomotives weigh 348,000 lb. and develop a tractive effort of 65,300 lb., and have been successfully used not only in heavy freight service but also in passenger service on grades exceeding two per cent. They were followed in 1920 by a group of larger locomotives known as Class F-3, having a total weight of 385,900 lb. and developing a tractive effort of 75,150 lb. These locomotives were briefly described in the *Railway Age* of July 2, 1921. The new locomotives (Class F-4) are practically identical with the Class F-3, except for the addition of a feedwater heater and booster. The tractive effort of the main engines is the same as the Class F-3 locomotives. In addition the booster develops 9,500 lb. at starting, or 8,950 lb. at a piston speed of 250 ft. per min. The combined tractive effort at starting is therefore 84,650 lb. All the locomotives referred to above burn oil for fuel and are equipped with superheaters.

The boiler used on Class F-4 is of the straight top type with a slope on the bottom of the middle ring in order to provide a sufficiently deep water space under the combustion chamber. This increases the shell diameter from 90 in. at the first ring to 100 in. at the throat. On the second ring, which carries the dome, the longitudinal seam is placed on the top center line and is welded throughout its length, in addition to being reinforced by inside and

Interior of the Cab

outside welt-strips. The inside strip is wide enough to cover the entire area under the dome base. The auxiliary dome is on the third ring immediately ahead of the combustion chamber and is placed over a 15-in. manhole so that the boiler can be easily entered for inspection purposes.

In the construction of the boiler unusually large plates were used. The firebox crown sheets and side sheets are in one piece and the wrapper sheet is also made from a single plate. The dimensions of the plates for these parts were 247½ in. by 195½ in. by ¾ in. and 291 in. by 149 in. by ¾ in. respectively.

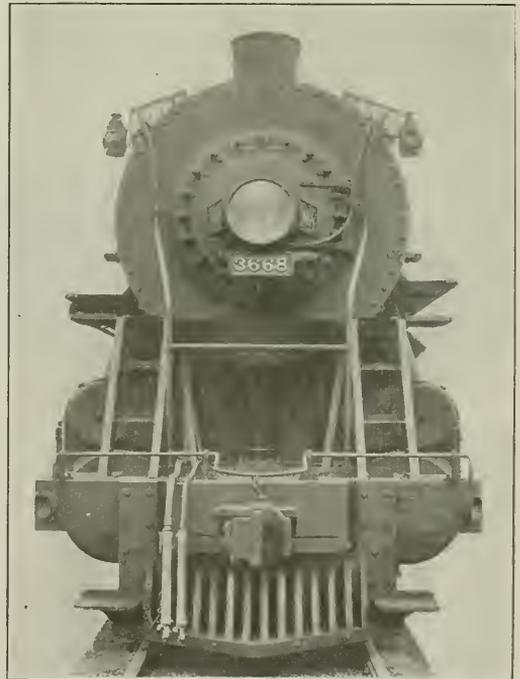

The combustion chamber is 64 in. long and has a complete installation of flexible bolts in the water space, while four rows of such bolts stay the front end of the crown. The throat is also stayed by flexible bolts and they are used in the breakage zones in the sides and back. Two fusible plugs are applied, one at the front end of the crown and the other over the outlet of the oil-burner. The oil-burning equipment is arranged in accordance with Southern Pacific standards.

The feedwater is supplied by one non-lifting injector placed on the right-hand side, and one combined open type feedwater heater and pump of 7,200 gal. capacity per hour, placed on the left side. The pump is supplied by a steam pipe leading from a valve in the turret. With the heater and pump and air reservoirs located on the left-hand side, it has been necessary to place the two cross-compound air compressors on the right-hand side. These are low down under the running board so that they do not obstruct the engineman's vision when looking ahead.

With limited space available, special attention had to be

given the arrangement of the piping in order to render it accessible and at the same time not exceed the limit of width. On the left side the feedwater heater requires a four-inch feed pipe which is placed under the running board and above one of the air reservoirs. The latter is hung on cast steel supports which are specially designed to provide room for the feed pipe. On the right-hand side there is no room to place the four-inch booster exhaust pipe outside the frames, and it is therefore placed between them. This pipe enters the smokebox and discharges into an annular opening surrounding the main exhaust nozzle.

The cylinders are fitted with cast iron bushings and the pistons have cast steel heads and cast iron bull rings. The piston rods, main crank pins and driving axles are heat treated and hollow bored. Flanged tires are used on all the wheels, notwithstanding the fact that the locomotives are designed to traverse 20 deg. curves. The lateral play between rails and flanges on the first, third and fifth pairs of drivers is 7/8 in. and on the second and fourth pairs and the truck wheels, 5/8 in. There is in addition a lateral play between wheel hubs and boxes, including shoe and wedge play, of 1-13/16 in. on the front drivers and 5/16 in. on the remaining pairs. Long main driving boxes are applied, the journals measuring 13 in. by 22 in., while the

The Head End Is Arranged for Convenience and Safety

lateral motion boxes on the first driving axle have journals 11 in. by 20 in.

The rear truck is of the Delta type and is equalized with the three rear pairs of driving wheels. In this design the back equalizing beams are fulcrumed on the truck frame and the main frames are supported on the truck center pin and also on two sliding supports placed wide apart back of the truck wheels. The load on the center pin is transferred through a spherical bearing. The booster is sup-

mounted on the rear transverse member of the truck frame which is depressed sufficiently to provide the necessary clearance.

The piston valves are 15 in. in diameter and are set with a maximum travel of 7 in. and a constant lead of $\frac{1}{4}$ in. Walschaert valve gear is applied and is controlled by the Ragonet power reverse mechanism.

The main frames are of massive construction with a uniform width of 6 in. and a maximum depth under the cylinder saddle of 14 in. A cast steel rear frame cradle is applied.

A comparatively short cab is used, but it has large window openings in the sides and special attention has been given the arrangement of the fittings. The steam turret is placed outside the cab and the various valves have extension handles which are clearly labeled. The lubricator has seven feeds, including those to the water pump and the booster engine.

The maximum width over the cab boards is 10 ft. 10 in. and the overall height of the locomotive is 16 ft. 4 in.

The tender is notable both because of its design and capacity. It is of the cylindrical type, carrying 4,000 gal. of fuel oil and 12,000 gal. of water. The water tank has a diameter of approximately 8 ft. 6 in. and an overall length of 36 ft. 7 $\frac{3}{4}$ in. It is carried on a cast steel frame made in one piece with the bumpers and the transverse bolsters which serve as tank supports. The transverse distance over the outside edges of the two longitudinal frame members is 51 in. and the ends of the front and back bumpers are braced by diagonal members which join these

Boiler	
Type	Straight-top
Steam pressure	200 lb. per sq. in.
Fuel	oil
Diameter, first row outside	90 in.
Firebox, length and width	132 in. by 91 in.
Combustion chamber, length	64 in.
Tubes, number and diameter	261—2½ in.
Flues, number and diameter	50—5½ in.
Tubes and flues, length	21 ft. 0 in.
Grate area	82.5 sq. ft.
Heating surfaces:	
Firebox, incl. comb. chamber	381 sq. ft.
Tubes and flues	4,722 sq. ft.
Total evaporative	5,103 sq. ft.
Superheating	1,299 sq. ft.
Comb. evaporative and superheating	6,432 sq. ft.
Tender:	
Water capacity	12,000 gal.
Fuel capacity	4,000 gal.

Visitors from Chile

ON SATURDAY AFTERNOON four representatives of the Chilean State Railways arrived at the pier for an inspection of the exhibits. The party included Manuel Trucco, director general; Carlos Schneider, assistant superintendent of motive power; Enrique Palma and Domingo Santa Maria, inspecting engineers. They were accompanied by Charles R. Cullen, manager of the Baldwin Locomotive Works at Santiago, Chile.

Messrs. Schneider, Palma and Santa Maria are in this country for the purpose of inspecting the consignment of

A Powerful, Efficient Locomotive for Freight and Passenger Service on Heavy Grades

longitudinal members at the frame truck bolsters. The trucks have cast steel frames with swing bolsters. They are of the equalized pedestal type, fitted with both helical and triple elliptic springs. The journals are 6½ in. by 12 in. Side bearings are used on the rear truck only. The weight of the tender loaded is about 223,000 lb.

The principal dimensions and weights are as follows:

Cylinder diameter and stroke	29½ in. by 32 in.
Valve gear	Walschaert
Valve, knee and gear	Piston, 15 in. diameter
Weights of working order	
Locomotive	306,000 lb.
On four axles	31,500 lb.
On six axles	69,500 lb.
Tender	308,000 lb.
Truck	23,000 lb.
Truck axle	71,150 lb.
Truck axle (incl. bearing)	84,650 lb.
Wheel base	
Driver	72 ft. 16 in.
Truck	42 ft. 4 in.
Total engine and tender	61 ft. 11 in.
Coupling and connecting rods	
Drivers	61 in.
Truck	54 in.
Truck axle	47 in.
Truck	49 in.

39 electric locomotives being built by the Baldwin-Westinghouse people for the Chilean electrification between Valparaiso and Santiago. These engines are to operate on 3,000 volts direct current and have a horsepower of 2,000. The section of track over which they are to operate is 150 miles in length, including branch lines, and there is a heavy grade for about 15 miles with a maximum grade of 2.4 per cent. It is anticipated that this line will be completely electrified by September, 1923.

The Chilean State Railways have entered upon a more or less extended program of electrification. After the Santiago-Valparaiso line is complete, a new district of 200 miles in length, including branch lines, will be electrified between Santiago and Talca. The electrification of the Chilean railways is an economic necessity, for the price of locomotive coal is almost prohibitive, averaging between eight and ten dollars per ton on a locomotive. There is an abundance of water power available in Chile for the railway electrification, and the electric locomotives are to be equipped for regenerative braking. Mr. Trucco, who is not assigned particularly to the inspection of the locomotives, is making a tour of inspection throughout the country visiting particularly the electrified railways. He has already spent some time on the Pennsylvania and the Norfolk & Western.

Welding Men Meet

AN UNOFFICIAL but highly successful meeting of railroad and supply men interested in welding was held on the pier at five o'clock on Saturday afternoon. About 50 men assembled at Booth No. 1 and then retired to the east balcony where the meeting was held. The meeting was suggested by the fact that there will be no report on welding presented during this convention and because of the large amount of welding apparatus on exhibit. C. A. McCune, president of the American Welding Society, was asked to explain the aims and activities of that society and of the American Bureau of Welding, after which the temporary chairman resigned in his favor.

The American Welding Society

With respect to the American Welding Society, Mr. McCune said: "When mention was made of the welding interests present at the convention this year we began checking them up. Besides the welding apparatus manufacturers and the railroad interests, there are also several companies which are exhibiting welded devices, such as the Locomotive Firebox Company, the Symington Company, the Flannery Bolt Company and a few others. Combined they represent about nine per cent of the total exhibits. These figures, I imagine, are rather startling.

"I have noted in the daily issues of the *Railway Age* the address of Mr. Tollerton on co-operative research. He said that the research should be conducted at some central bureau, but that it should not interfere with any individual interests, which was perfectly right; that is the object of the American Welding Society, to assist in co-operative research and at the same time not stand in the way of any individual research.

"The American Welding Society is a national body, whose object is to promote welding—that is, promote it by standard methods, standard specifications for material and generally the laying out of standard methods of handling the process, which will be of assistance to the entire welding industry. The American Bureau of Welding, which is affiliated with the National Research Council, Engineering Division, is the research body of the American Welding Society. All the information gathered and all the research accomplished through the American Bureau of Welding is published by the National Research Council, Division of Engineering, through the American Welding Society. Thus the object of the American Welding Society is to set forth all the valuable and authentic information that it can possibly gather as a result of co-operative research."

W. E. Symons, consulting engineer, supplemented Mr. McCune's statements by saying: "With respect to the number of exhibits and percentage or relation it bears to the whole, I think President McCune has been very conservative in his statement; in addition to those he mentioned—18 exhibitors of welding equipment—about six per cent, we might safely say that a larger percentage are interested in welding. They are interested because there are many concerns represented that do not make welding equipment in addition to those mentioned by Mr. McCune, but which use welding processes in their shops in the manufacture of other equipment. In fact, there are very few lines of manufacture today where welding is not used in some manner." Mr. Symons concluded his remarks by pointing out the benefits which members derive from the American Welding Society and showed the need for increasing its personnel. He spoke of the society as pure democracy.

Metal and Thermit Corporation

J. H. Deppeler, also enlarged on the needs and possibilities of the American Welding Society. He said:

"There is one thing which has appealed to me greatly during the past few years. When we first started this welding society we thought of the conflicting interests—the gas, electric and thermit welders. We in the Metal & Thermit Corporation and in the Westinghouse and General Electric Company, and in others, felt that if we would really co-operate as the society tried to make us—and our individual concerns were further advanced than some of the others—we might lose business. I think it is really essential that we should all know the other fellow's process and that we ought to help boost his work. We can all boost welding by boosting each of the processes instead of only our own."

C. J. Holslag, Electric Arc Cutting and Welding Company, enlarged on Mr. Deppeler's remarks by saying that after the members of the Welding Society got acquainted they all discovered that their competitors were normal human beings that did not wear horns as they had suspected.

W. A. Slack, Torchweld Equipment Company, enlarged on the explanation of the activities of the American Welding Society by telling of the journal published by it and describing its purpose.

Welding in Construction

C. M. Rogers (Locomotive Firebox Company) said in part: "Welding is quite an essential factor in the Nicholson thermic syphon, inasmuch as there is a large amount of welding and the practice is to weld instead of rivet sheets in the firebox. We are, like many others, entirely neutral with respect to the method of welding. In our travels about the country looking after the application of syphons, we see welding of great variety and there is an indication that we are still at a point where there is considerable development possible and very much needed. On the other hand, we find places where the art has been developed to a point of great efficiency and this is well proved in the service results that we get in the use of the syphon. It certainly is a splendid test if welding a device of this kind, as well as other devices, passes the requirements and comes through with success. The field is broad and I am glad to see the art recognized in just such a way as this at this convention." Mr. Rogers also spoke on the value of reclaiming equipment by welding.

Welding and Welding Materials

The principal address of the meeting was made by H. T. Bentley, superintendent of motive power and machinery, Chicago & Northwestern. He said:

"I don't know what the railroads of this country would have done during the times when we were hardly able to get material of any kind if it had not been for the welding apparatus and appliances brought into use in the last few years. Mr. Symons says there isn't any question but that there is a great need of an organization with just as much concern in the interests of autogenous welding as the Master Mechanics' Association has had for mechanical details and I am very glad to know that there is a national society that now has branches in a good many of the cities which are apparently doing very good work. I sincerely hope that any of you men who have the opportunity of lending your influence to join such an organization will do so, because I am certain it is going to be of benefit to your railroads and to yourselves. I have attended a few meetings at Chicago and I want to tell you that those I have attended have been full of interest. Of course, we go through the shops as officers and we see these things done, but when you go to meetings and find out from the men who are doing the things how they should be done so that failure can be overcome, it is an inspiration.

"It is a money making proposition for you and your

continue to further the interests of the American Welding Society by joining it, or by becoming members of the local sections that may be started in your town. The welding art has a future before it. It is in its infancy now, and some day five or six years hence we will be astounded to know what is being done and what can be done by the autogenous welding processes. I presume that certain jobs can be done better electrically and that for others the gas method of welding is superior. Each system has its uses and it is up to us to learn which will do the work the most economically and safely.

"There is one thing, however, I am a little bit worried about and that is welding wire and welding rods. Sometimes we seem to get a batch of welding material that is absolutely first-class, and then we will get it from the same place and it doesn't seem to answer the purpose at all. I presume in time it will mean specifications for all kinds of welding rods for the various processes. I realize that welding rods that may be first-class for a certain job may be absolutely improper for some other welding job, so that it seems to me that we have got to get together. We should have some sort of specifications so that when we are going to do a certain job, say on steel, we will know what kind of materials to use to give the best ductility, weld, etc.; similarly for cast iron welding.

"Great progress has been made, but once in a while I come across complaints that the welding wire in one batch did not seem to be uniform. That is the greatest thing to contend with. The apparatus is doing splendid work, the torches are good, gases are satisfactory, electric welders seem to be doing splendid work, but the material for welding seems to require a little bit more care in its standardization; if that can be done, I am satisfied that we are going ahead in fine shape."

Mr. McCune responded to Mr. Bentley as follows: "There is a welding wire specification committee which has been engaged in research for two years. There have been many difficulties but their aim is just what Mr. Bentley desires. A welding wire specification has been published by the society. There are certain specifications for gas and one for electric welding, including the various analyses of welding material which have proved satisfactory. We had a meeting in April of all the best minds we could get on welding wire—the wire manufacturers, railroad men, metallurgists and the like—and although our specifications have only been published and in force less than eight months in printed form, this committee could not find any way of improving the specifications.

"There is also a committee now working on specifications for material to be welded. Its purpose is to determine what kinds should be welded and when it should and should not be welded, and to distinguish between burnt metal and good metal, and we hope to be able some day to present such data. We believe the welding wire specifications as published so far are pretty well advanced, considering that autogenous welding or fusion welding has been a commercial process for only 10 or 12 years and that never before has any organized body, technical or otherwise, made any attempt to prepare specifications for welding material."

Edward Wray, publisher, Railway Purchases and Stores, was asked to present the impressions of an observer in the Stores department. Mr. Wray said:

"It does not take any amount of thought to appreciate the importance of welding when we see a large and important machine put out of commission by a broken part which may be repaired by welding for a few dollars. It does not require any argument to sell welding in that case. Welding is coming in on such work as the reclamation of materials. The railroads are beginning

now to use welding extensively in the reclamation of all manner of things, such as frogs, couplers, knuckles, crossings and a great many materials are now being repaired and put back into service through welding which were formerly thrown away.

"I am sure that this is going to develop to a far greater extent in the future than it is today. Next week, Tuesday, I believe, the Committee on Reclamation of Division VI—Purchases and Stores, will make its report and I am sure that that committee will consider what articles should be reclaimed and what should not. Without a doubt welding will occupy an important part of the discussion. I hope you gentlemen will be present at some of the meetings and I am sure that the chairman would be pleased to have you take part in the discussion. It is quite an important opportunity for manufacturers of welding equipment and accessories to take part in the advancement of the science in reclamation. Although I am not authorized to extend any invitation for Division VI, having no official standing whatever, except having the trade paper devoted to their interests. I feel sure that you gentlemen will be at least interested in what comes up at that time and that they will be interested in the information that you can give in that connection."

One Man's Gain—Another Man's Loss

W. L. Bliss, U. S. Light & Heat Corporation, related an unusually instructive and amusing incident: "I made a little trip not long ago to the middle west and looked at some interesting pieces of welding in some of the locomotive shops. I witnessed an incident that I think brings out the fact that great economy is possible with welding. The case was that of a couple of railroads that ran into St. Louis. Without mentioning any names, I will call these "Railroad A" and "Railroad B." It seems that Railroad A had on hand a large number of side trucks, say of the Andrews make, that had outlived their guarantee. The tension members were cracked underneath and they were ready for the scrap heap, as there was no possibility of getting any further settlement with the manufacturer. They had run as long as they had been expected to run. I heard that those truck sides cost, new, \$32 a piece and that Railroad A sold 5,000 of these to a junk man in St. Louis for \$4 a piece.

"The other railroad, Railroad B, had a storekeeper who was well acquainted with the junk men in St. Louis and who knew this particular junk man well. He found out the price paid to Railroad A for the side frame and reported it to his management and got permission to buy the 5,000 truck sides for \$5 a piece. These trucks were then transferred to one of the shops of Railroad B that was well equipped for reclaiming and storing this kind of salvage, and at an expense of \$8 they restored all side frames to perfectly good service."

W. C. Arp Dead

W. C. ARP, retired superintendent of motive power of the Pennsylvania Railroad, died at his home in Terra Haute, Ind., at 10.50 p. m. on Friday, the 16th, after a lingering illness. He was one of the oldest members of the association and had attended all conventions until this year. Mr. Arp was retired from service on the Pennsylvania because of pension requirements on July 1, 1918. He was succeeded by J. E. Meehling, who is now in attendance at the conventions. Mr. Arp was in the service of the Pennsylvania for 48 years, starting as an apprentice at Williamsport, Pa.

The Machine Tool Market

SPEAKING of the machine tool market and the present demand for machine tools, Ernest F. DuBrul, general manager, National Machine Tool Builders' Association, had the following to say:

"Many railroad master mechanics are telling the machine tool builders that they want a lot of tools for the railroad shops but that they are told by the purchasing authorities, that the purchases will be held up until machine tool prices come lower than they are. I believe the purchasing authorities are deceiving themselves as to the present situation. The machine tool builder may likewise be deceiving himself, if he does not keep his eye on the labor situation, particularly as affecting the larger types of machines that are not now in stock and never are built for stock.

"The labor situation is such that if the market had a lot of orders right now, the machine tool builder could not find a sufficient supply of skilled labor of the sort necessary to build these tools. During the war, and for the year after the war, the machine tool builder did not train any general workmen—skilled all-round mechanics—so that as compared to the supply of this sort of labor in 1914 we have a deficiency.

"The reason is very obvious. During the war machine tool orders came in in much larger quantities than ever before. This prompted the machine tool builder to take men in and train them in special operations. He had neither the time nor the disposition to train a more general class of workmen, as he had done before the war. Demand from now on, dropping back to the smaller quantities that are more normal to the machine tool business, will require the general workman rather than the specialist.

"During the war the general machinist moved up the scale. He became a tool maker or he became a foreman, either in the machine tool shop or in some war industry shop, his place in production being taken by the specialist. Then, after the slump, these specialists went back to the farms or they are now engaged in the building industries, or elsewhere, and machine tool builders who are putting on more men, or trying to, find difficulty in getting these men back into the machine tool industry, which has been so deeply depressed for so long a period.

"To coax them back much higher wages will have to be paid to make up for the irregularity of employment, and to overcome their preference for the jobs they may now be filling. Not only that, but the heavy tools of course require much more general men, because they cannot be produced in quantities, as in the case of the lighter tools. The railroads need the tools right now, and it is short-sighted policy to defer the purchasing any longer, because as business picks up the available mechanical labor will be absorbed by the other industries and the bid the machine tool builder will have to make will have to be much higher. Such a policy of delay will merely concentrate the demand for machine shop labor at a later date, with the usual consequences, instead of spreading it out and making it easier all around. It is the early bird that will get the worm, as usual. The wise buyer, who now gets in his orders will not suffer either from delays in delivery or higher prices that are sure to follow, according to the present outlook on the labor market.

"Another point that must not be forgotten is that the restriction of immigration since the beginning of the war, and the consequent shortage in common labor that is evident in all sections of the country, even with the present amount of activity, is sure to create a demand for labor saving machinery of all kinds; and this of course means a demand for more machinists. At a period of intense activity—if the machine tool buyer waits too long—he will have the privilege of paying extremely high

prices to induce production of machine tools, rather than in the present stage of the cycle.

Second Hand Tools

"The purchasing powers seem to imagine that there are a lot of bargains to be found among second-hand tools. As a matter of fact, these are very deceptive bargains. The machine tool builder selling new equipment has nothing to hide, whereas the second-hand dealer selling stuff that he bought "as is," would probably rather not have too close an inspection of what he is offering. Buyers of second-hand machinery should very carefully investigate the history of the machine in question—how long it has run, the class of work that was done on it, whether the long runs were on repetition work, so that the same gears were always used and worn out, whereas other gears might be in relatively good condition.

"This is very difficult information to secure, particularly as it has been whispered that certain serial numbers on machine tools bought by purchasers do not correspond to the numbers that the machines bore when they left the factory. Of course, legitimate dealers would not stoop to this, but it only shows how necessary it is for the purchaser to look carefully, not only into the tool, but also to be well posted on the methods of the dealer who is offering it."

Reductions in Railway Wages to Date

THE RAILROAD LABOR BOARD has announced reductions in the wages of the station and clerical forces, the stationary engine and boiler forces, and the signal department employees. The reductions in wages made by the Board in its recent decision are now estimated officially as follows:

Clerical and Station Forces.....	\$24,336,317.43
Maintenance of Way and Structural and Unskilled Forces.....	48,898,873.44
Shop Employees.....	59,669,347.32
Stationary Engine (steam) and Boiler Room Employees.....	551,954.76
Signal Department Employees.....	1,532,428.36
Total.....	\$134,988,921.31

The latest decision of the Board authorizes reductions in the wages of clerical and station forces, stationary engine and boiler room employees, signal department employees, floating equipment employees, train dispatchers, dining car and restaurant employees, and miscellaneous groups not specifically included in any of these classifications.

Reductions of three cents per hour in the rates of pay of storekeepers, assistant storekeepers, chief clerks, foremen, subforemen and other clerical supervisory forces, clerks with an experience of two or more years, train and engine crew callers, assistant station masters, train announcers, gatemen, and baggage and parcel room employees (other than clerks), are ordered by the decision to be effective July 1.

Reductions of four cents per hour are authorized in the rates of pay of clerks with an experience of one year and less than two years, clerks whose experience is less than one year, janitors, office, station and warehouse watchmen, employees engaged in assorting way-bills and tickets, operating appliances or machines for perforating, addressing envelopes, numbering claims and other papers, gathering and distributing mail, adjusting dictaphone cylinders, and other similar work, office boys, messengers,

clore boys, other employees under 18 years of age, filling similar positions, station attendants, station, platform, warehouse, transfer, dock, pier, storeroom, stockroom, and team track freight handlers or truckers, and others similarly employed, and all common laborers in and around stations, storehouses and warehouses, not otherwise provided for.

Clerks without previous experience hereafter entering the service will be paid a monthly salary of \$60 per month for the first six months, and \$70 a month for the second six months, instead of the old rate of \$67.50 and \$77.50.

Telephone switchboard operators under the new rates are guaranteed a minimum of \$85 a month, those now receiving higher wages not to be reduced.

The differential between truckers and sealers, sealers and fruit and perishable inspectors, stowers or stevedores, callers or loaders, locators and coopers, are to remain the same under the terms of this order.

In the group designated as "Stationary Engine and Boiler Room Employees" reductions of two cents an hour have been authorized in the wages of stationary engineers, stationary firemen and engine room oilers, and boiler room water tenders and coal passers.

In the signal department, leading maintainers, gang foremen and leading signalmen, signalmen, assistant signalmen, signal maintainers, and assistant signal maintainers, will receive reductions of five cents an hour and helpers six cents an hour. No reduction is authorized in the wages of signal foremen, assistant signal foremen and signal inspectors.

All of the disputes which were before the board relating to the wages of floating equipment employees are remanded for further negotiation.

The Board ruled that existing conditions do not testify any reduction at this time in the wages of train dispatchers.

In regard to miscellaneous employees, the Board ruled that "for miscellaneous classes of supervisors and employees in the hereinbefore named departments properly before the Board and named in connection with a carrier affected by this decision, deduct an amount equal to the decreases made for the respective classes to which the miscellaneous classes herein referred to our analysis."

A dissenting opinion by two labor members and an analysis of the dissenting opinion by the majority were appended to the decision. The text of the decision and the dissenting opinion and its answer will be described fully in the regular issue of the *Railway Age*.

Chamber of Commerce

Railroad Committee

ANNOUNCEMENT HAS JUST BEEN MADE OF THE appointment of the new Railroad Committee for the Chamber of Commerce of the United States. George A. Post, who has given so much of his time and energy to this work in the past, is continued as the chairman of the committee. The other members are: Harry A. Wheeler (Union Trust Company), Chicago; Carl R. Gray (Union Pacific), Omaha; W. W. Salmon (General Railway Signal Company), Rochester, N. Y.; Charles E. Lee, East Orange, N. J.; Emory R. Johnson (University of Pennsylvania), Philadelphia; F. C. Dillard, Sherman, Texas; Walter S. Drake, Kansas City, Mo.; Alexander W. Smith, Atlanta, Ga.; F. J. Frost, Boston, Mass.; John F. O'Brien, Boston, Mass.; W. J. Dean, Minneapolis,

Minn.; T. C. Powell (Erie Railroad), New York; and George W. Simmons (Simmons Hardware Company), St. Louis.

Cornell Dinner

THE CORNELL DINNER will be held this evening at the Traymore Hotel at 7 o'clock. Twelve Cornellians have registered up to the present time and in order that proper accommodations may be made, any further reservations should be made as early as possible.

Annual Meeting of the R. S. M. A.

THE ANNUAL MEETING of the Railway Supply Manufacturers' Association was held in the Greek Temple Saturday noon and officers were elected for the ensuing year. Charles W. Beaver, of the Yale & Towne Manufacturing Company, of New York, was elected president and L. S. Wright, of the National Malleable Castings Company, Chicago, was elected vice-president. They will take office on the first of September, 1922, the beginning of the fiscal year of the association. A past president's badge was tendered John F. Schurch, the retiring president.

District elections were also held for the members of the Executive Committee from District 2 (New York and New Jersey) and District 4 (Ohio, Indiana and Michigan). Charles C. Castle, of the National Railway Appliance Company and Gilbert E. Ryder of the Superheater Company, were elected executive committee members from District 2. L. D. Kingsley of S. F. Bowser & Co., Inc., Fort Wayne, Ind., and George T. Johnson, of the Buckeye Steel Castings Company, Columbus, Ohio, were elected executive committee members from District 4.

Consolidated Machine Tool Corporation of America

WE ARE ABLE definitely to announce the formation of the Consolidated Machine Tool Corporation of America rumors concerning which have been current for some time. The corporation is capitalized for, \$30,000,000 and includes the Betts Machine Company, the Colburn Machine Tool Company, Hilles & Jones Company, Modern Tool Company and Newton Machine Tool Works, Inc., all of which are represented here at Space 91-101 in Machinery Hall.

This new consolidation is one of particular importance to the railway field, for it brings under the head of a single corporation a wide variety of tools that are especially adapted to railway shop use. The new combination will handle heavy-duty and wheel and axle lathes; boring mills, slotters; planers; including crank and plate edge; heavy duty drilling machines; internal and external cylindrical grinding machines; horizontal and vertical milling machines; horizontal and vertical punches; shears of various types; cold saws; bending and straightening rolls; automatic die heads, and miscellaneous small tools, and a complete line of shop equipment.

The company has recently engaged offices at 17 East Forty second street, New York, and while the officers of the corporation have not yet been elected, it is anticipated that W. H. Marshall, formerly president of the American Locomotive Company, will be chairman of the board, and C. K. Lassiter, who is resigning his position of vice-president in charge of manufacture of the American Locomotive Company, will be president.

 Eisman, C. R., For. Car Shop, L. I., Shelburne.

Conventionalities

A party of prominent men arrived in Atlantic City on Saturday evening as the guests of John H. Hubbard of Hubbard & Co., Pittsburgh, having accompanied Mr. Hubbard from New York on his yacht, the Alicia. The Alicia was expected at about 5 p.m. Saturday, but high winds and a rough sea delayed her for some hours. Mr. Hubbard's guests included A. H. Smith, president of the New York Central; Charles M. Schwab, and W. W. Atterbury, vice-president of the Pennsylvania Railroad.

A. D. Prendergast, formerly with The Texas Company, is attending the convention this year in his new capacity as general mechanical inspector of the Central of Georgia.

A. R. Ayers, superintendent of motive power of the Nickel Plate, who arrived at the convention on Friday, is receiving congratulations on the birth of a daughter, Helen, now just two weeks old.

George R. Carr of the Dearborn Chemical Company found it necessary to hurry home to Chicago on the Broadway Limited yesterday because of the illness of his wife, who is in the Presbyterian Hospital.

B. T. Jellison, for many years at the head of the department of purchases and stores of the Chesapeake & Ohio, has just been made southeastern representative of the Pittsburgh Steel Products Company and is attending the convention this year in that capacity.

Among the Japanese guests at the convention this year is Kumeo Baba, inspector of electric locomotives for the Imperial Railways of Japan. He is making a two-day visit at Atlantic City and after a tour of inspection of the railways in the United States will proceed to England and the Continent for further investigation.

President E. J. Pearson and General Manager C. L. Bardo, of the New Haven, motored down from New Haven, arriving at Atlantic City early Saturday morning. They put in a busy day on the pier and left for home on Saturday afternoon.

S. Inglis Leslie, who for many years has been an active member of the Enrollment Committee, and J. J. Cizek, who is on the Entertainment Committee, have been called to New York to attend the funeral of Mr. Leslie's cousin, J. H. Legate, secretary of the Leslie Company.

David J. Champion, president of the Champion Rivet Company, of Cleveland, is not attending the conventions this year because of the death of his wife, who passed away on June 8. His many friends at the convention are deep in their sympathy for him.

J. G. Gunning, secretary-treasurer, Electric Arc Cutting & Welding Company, is attending the convention in charge of the exhibit of that company. It is his first convention here with this company; he was formerly with the Splittorf Company as assistant to the general manager.

Dave Redding, assistant superintendent of motive power, Pittsburgh & Lake Erie, accompanied by his shop superintendent, Karl Berg, and Mechanical Engineer Harry Courtney arrived on Sunday morning. Dave is looking fine, although, as many of his friends know, he was seriously ill during the winter and suffered also from

a fractured leg. He has fully recovered and is ready to get back into the game with his usual vim.

F. E. Russell, assistant mechanical engineer, Southern Pacific is here with his wife and daughter from San Francisco, coming all the way across the continent to attend the conventions. C. E. Peck, superintendent of motive power of the Oregon Railway & Navigation Company, is another far western member of the association who is attending the conventions.

Many of the Pacific coast members of the association are prevented from attending the conventions this year because of the heavy passenger traffic occasioned by the Shriners' convention. The Southern Pacific is to run 36 special trains between San Francisco and Portland to accommodate the jolly-Masons.

In the conventionality item concerning J. H. Cooper published in Saturday's Daily, we neglected to state that Mr. Cooper is the Mexican representative of the Barco Manufacturing Company. During the past year he has installed the Barco connections on most of the new locomotives purchased by the National Railways of Mexico and all of the new locomotives purchased by other Mexican railroads.

Taizo Hattori, a mechanical engineer of the Japanese Government Railways, arrived in New York a few days ago and expects to make his headquarters there for the next two years as a resident representative of the Government Railways of Japan. Mr. Hattori spent two days looking over the exhibits. He expressed great surprise at their extent and elaborateness and made many friends with the people with whom he will have to deal during his stay in this country.

G. Marks, assistant to the general manager of the New York, New Haven & Hartford at New Haven, Conn., who has been so successful in using electric trucks in handling freight at terminals, is attending the conventions this year. During the past year Mr. Marks presented an extremely interesting and instructive paper on this subject before the New England Railroad Club at Boston.

The "New Haven Twins" are here this year—the inseparable Joneses of the New York, New Haven & Hartford, V. L. and W. J., both in the executive department as assistants to W. L. Bean, mechanical assistant. The New Haven Twins, although of the same name are not of direct relationship. They began their Siamesian relations when they were both students of Columbia University. They are strong boosters for 100 per cent locomotive efficiency.

Guy M. Bean, the Pacific Coast representative of the American Arch Company brings reports of booming business in the Far West. From present indications the green fruit business will be very heavy; a bumper crop is promised. Conditions in general in California are booming and the depression in business was not felt nearly as much as in the East. The railways particularly are in good physical condition and are enjoying a good wholesome traffic.

Frank Hedley, president of the Interborough Rapid Transit Company, has at last come to the locomotive supply field seeking aid to relieve him of his transit problems in New York City. When told of a new order for 100 boosters to be applied to existing locomotives on the New York Central he promptly began negotiations for the entire booster output of the Franklin Railway Supply Company for an indefinite period. He wants to use this

large supply to counteract the effect of the overwhelming number of "Knockers" who ride on his road.

Steinmetz—Electrical Wizard. Yes, that's right, but watch your step. C. P. (Charles Proteus) Steinmetz is chief engineer of the General Electric Company, and W. R. Steinmetz is manager of the heavy traction division of the Westinghouse Electric & Manufacturing Company. Those who wish to avoid any possibility of confusion in the future may have the opportunity of meeting W. R. S. at booth 27.

Last night at the Marlborough a uniformed lad came down "peacock alley" crying "Hershey's, Hershey's," and people began digging for a dime to buy some milk chocolate. But that wasn't the game. It was only a page calling for the genial O. W. Hershey, of the Westinghouse Electric & Manufacturing Company. Mr. Hershey is the man who started in the Westinghouse apprenticeship course and in 15 months was on the road as an erecting engineer. That was some speed. He is now in the Pittsburgh office handling the relations of the Westinghouse Company with the steam railroads of that district.

If one wants to find out quickly who's here any member of the Enrollment Committee can tell you, almost in a jiffy. All this is due to the installation of a new filing system in the committee's office on the pier. Chairman Franklin H. Smith and his committee, whose names have previously appeared in the *Daily*, have moved quickly and efficiently during the past week and are entitled to credit marks of appreciation. Mr. Smith has now served on the Enrollment Committee for nine conventions. He has also served with credit the interests of his company, the Gold Car Heating & Lighting Company, for 13 years. Franklin is also proud of the record made by his nephew, Major E. H. Armstrong, who has been called America's foremost radio expert. This young wizard has so perfected radio apparatus that largely through his inventive genius radio broadcasting and wireless telephone communication have been greatly perfected, aeriels abolished and spark interference largely eliminated.

A hero among the younger generation and a man of "refined steel" among the older generation is Charles H. Hogan, the famous driver of engine 999. He it was who made the world's record for speed of 112½ miles per hour with the 999 at the time of the Chicago World's Fair. Mr. Hogan was formerly district superintendent of motive power of the New York Central at Albany and when the time for retirement came an exception was made in his particular case, for he is being retained in special work under the direction of Howard L. Angersoll, assistant to the president. This is considered a great honor on the New York Central, for the only other officer of the road accorded similar recognition was Chauncey M. Depew, who, in spite of his 89 years, is still retained as chairman of the board. Mr. Hogan may be readily identified on the pier by his badge, No. 999, which is granted him year after year in recognition of his famous performance many years ago.

Dr. J. Stumpf, of Berlin, Germany, inventor of the Anaflow steam engine which is handled in this country by the Stumpf Anaflow Steam Engine Company, Inc., is attending the convention. He is accompanied here by Charles C. Trapp, vice president of this company. Dr. Stumpf is a professor in the Technical High School of Charlottenburg. He said yesterday that the physical condition and service of the German state railways was rapidly being restored to normal. On the other hand, their operating expenses continue to be excessive, and they are operating at a large deficit. Dr. Stumpf attributes this

largely to the political influence exerted by the labor unions which are very powerful. They resist efforts to make needed reductions in the number of employees and other increases in efficiency and the government is afraid to force the issue. Hence losses continue to pile up, and, as under government control in the United States, the tax payers have to pay the bill. Before the war employees of the Prussian state railways were not allowed to belong to labor unions and were subject to a military discipline, and Dr. Stumpf attributes mainly to these conditions the much greater economy and efficiency of operation then obtained.

There has been a lot of talk this year among baseball fans about a revival of the annual ball game. In the event that the "talk" takes definite form, we have been served with notice that the old warhorse "Midge" (Captain Stanley W. Midgley) is still on the job and is prepared with a "full crew" to line up and "try" to trim the East as trimmed on a few occasions in years past. Midgley, by the way, started his unbroken attendance at the conventions just twenty years ago and, if our records are correct, lined up in the western team with Joe Taylor, son of the former secretary of the M. C. B. and M. M. Associations, in a battle royal with the eastern team. Midgley seems to be in good form this year, and the fact that he has become eligible to the membership of the Colorado Mountain Climbers Club as a result of an exceptional record established last year in climbing Long's Peak, 14,250 ft., in one day—a distance of 15 miles—would bear out this statement. Midgley is here with his partner in business, Barrowdale, and is prepared to make good in more ways than one.

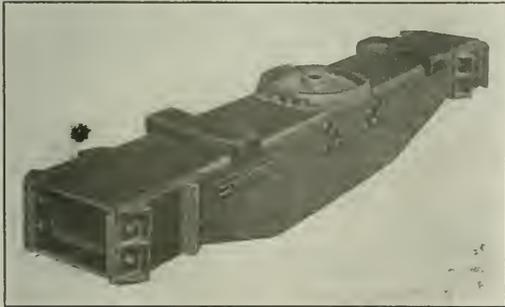

Mell Hatch, mechanical engineer of the Missouri, Kansas & Texas, comes to the convention this year with the reputation of a "star gazer," whatever that may mean. He is planning to hitch his wagon to a star and is making a very careful study of the wonders of the universe in order to learn which star to choose. This "star gazing", it must be understood, is very incidental to what is going on in the brain of the new mechanical engineer of the M. K. & T. His railway is traveling a rapid road to prosperity. With constantly increasing net revenues it is finding it possible to enlarge, develop and improve its facilities. Mr. Hatch is particularly interested at the present time in the purchase of machine tools for a 22-stall roundhouse which is to be built at Ray, Texas, just outside of Demmon, in connection with the hump yard being built at that point. This roundhouse will handle five Class 3 repairs per month and will be provided with a small, first-class power house. Plans have also been completed and the expenditure authorized for the construction of a 10-pit locomotive repair shop, which will be designed on the transverse principle and so constructed that it can be later enlarged to handle 40 locomotives per month. This shop will require practically all new tools and will be up to date in every respect. Mr. Hatch also reports the careful investigation of locomotive feedwater heating. The road will make comparative tests between the Elesco, the Worthington and the exhaust steam injector. Two each of the Elesco and Worthington heaters have been ordered for this purpose and one exhaust steam injector. In commenting upon the long passenger engine runs made by the Katy engines, Mr. Hatch points out the fact that they are all oil burners and that they run for 23 hours at a stretch covering distances of 650 to 700 miles. The Katy is one of those roads which has had a most healthy recovery from receivership difficulties and it is anticipated that its reorganization will be completed and put into operation within a few weeks.

New Devices Among the Exhibits

Wrought Steel Bolster

THE BOOTH of the T. H. Symington Company, New York, there is shown a very interesting wrought steel truck bolster flanged or forged in one piece from steel plate and following in its design and manufacture the principles so successfully used in the development of the wrought steel truck side frame which was described in an earlier issue of the *Daily*.

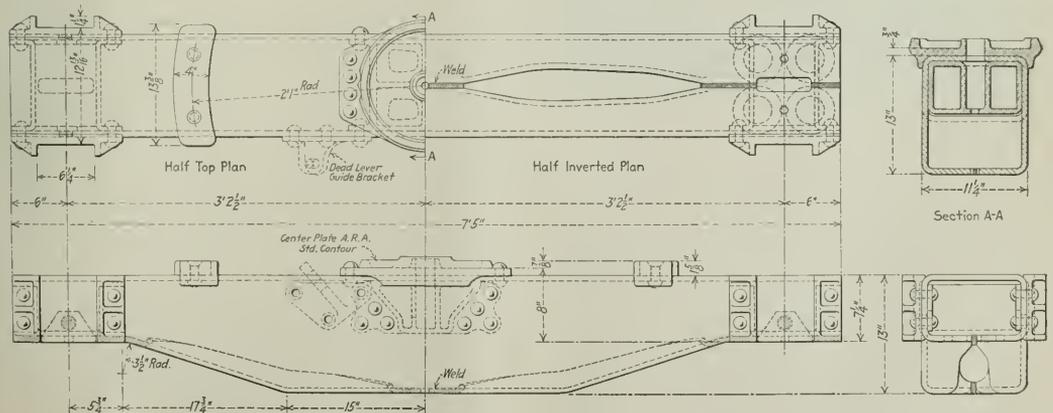

The bolster plate is first blanked out, then flanged and

Truck Bolster Pressed from Steel Plate

finally folded into a complete box section, the contacting flanges being welded together along lines not subject to service stress. Adequate reinforcement is provided under the center plate and over the truck springs and the bolster guides are of the usual standard design. The assembled bolster, being a complete box-section girder, has none of the defects inherent in all built up or riveted designs.

The bolster meets all the present A. R. A. requirements for interchangeable dimensions and strength and its designers consider it a step in advance beyond any bolster of its general type which has yet been developed.

Drawing Showing Details of Construction of the Bolster

Plug Valves for Tank Cars

AN ADAPTATION of the Merco-Nordstrom type of plug valve for use as a discharge valve for tank cars has been made recently by The Merrill Company, Chicago. Preliminary results obtained from a few valves that have been applied to tank cars are said to be quite satisfactory.

The peculiar feature of this valve, which has been used in other classes of service for a number of years, is the method of applying a lubricant to prevent sticking or leaking. The grease used to lubricate the valve is placed in a cavity in the center of the valve stem, the upper end of the cavity being closed by a screw. From this cavity passages extend to the outer surface of the plug near the top, thence along grooves to the chamber below the plug. Applying pressure to the lubricating screw forces the grease to lift the plug from its seat. The plug is thus free to turn and the lubricant is distributed from the grooves and grease chamber below the plug. An asbestos packing lined with anti-friction metal is inserted between the top of the plug and the upper cap. The asbestos has enough elasticity to allow the plug to be lifted sufficiently for the distribution of the lubricant.

Double Sectional Arch

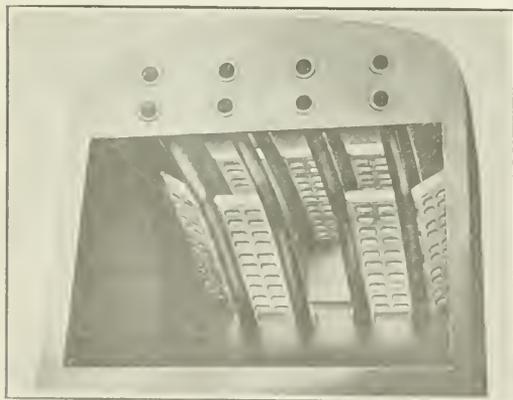

A SMALL MODEL firebox equipped with a double security arch is shown in the exhibit of the American Arch Company, New York. As will be noted from the illustration, this device consists of a double arch supported on two sets of arch tubes, the brick being arranged in such a way as to increase the effectiveness of gas mixing and distribution of the flame throughout the firebox. The use of an increased number of arch tubes materially increases the boiler circulation and evaporation.

To quote from a paper on the "Effect of Circulation on Locomotive Boiler Efficiency," read at the recent fuel

convention by F. G. Lister, mechanical engineer, El Paso & Southwestern: "The velocity at which the water and steam pass through the arch tube, approximate $V=8Vh$, in which V =velocity in feet per second and h =head in feet, or the difference between the vertical height of the upper and lower ends of the tube, the velocity of flow through the tube increasing until the water all becomes steam.

"The greatest quantity of water circulating through the tube, however, is when the column is half water and half steam. From the above rule the circulation through the tubes may be readily determined, provided they permit of the free flow of water so that the bends do not retard the flow. If we consider a locomotive boiler having four arch tubes, each 3 in. outside diameter No. 8 B. W. G., and 5.94 sq. in. cross sectional area, or a total area of 0.165 sq. ft. in the four tubes, and a head of four feet, we should have $8Vh=16$ ft. per sec., multiplied by 0.165 sq. ft. =2.64 cu. ft. of mingled steam and water discharged from the arch tubes per second, one-half of which (0.132 cu. ft.) would be steam. At 200-lb. gage pressure, the steam would weigh 0.47 lb. per cu. ft. Then 1.632 lb. of steam would be discharged from the tubes per hour. Water at the temperature of steam at 200 lb. pressure weighs 54 lb. per cu. ft. and the steam 0.47 lb., so that the steam forms but $\frac{1}{115}$ part of the mixture by weight; therefore, each particle of water will make 115 circuits before being evaporated when working at this capacity and circulating the maximum weight of water through the tubes.

"Four thousand, seven hundred and fifty-two cu. ft. of water will pass through the four arch tubes per hour, and as the average locomotive boiler of today contains about

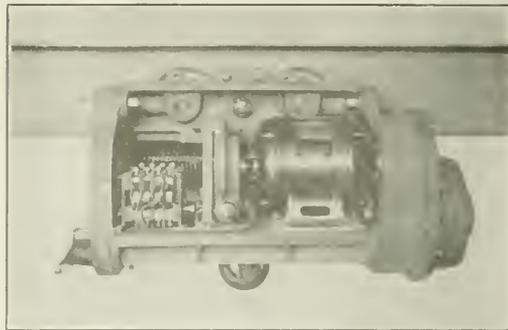

Model of Firebox Cut Away Showing Arrangement of Double Arch

600 cu. ft. the water would all pass through the arch tubes seven times per hour."

Increasing the number of tubes reduces the time required to circulate all the water. The use of eight arch tubes will reduce the time required to $3\frac{1}{2}$ min. These calculations clearly indicate the value of the arch tubes in retarding the circulation of the water in the boiler. The use of a double arch, such as shown, also insures a better taking of the combustible gases and oxygen, increases the combustion efficiency, reduces smoke and spreads and distributes the flame in such a manner as to completely fill the firebox—thereby increasing the heat absorption of the boiler and reducing fuel costs.

Electric Hoist with Short Headroom

THE PRINCIPAL FEATURE of a new hoist developed by the Standard Electric Crane & Hoist Company, Philadelphia, Pa., is the short headroom required for its operation. The three-ton hoist exhibited can be operated with a headroom as low as 14 in., this dimension

Standard Electric Hoist With Cover Plate Removed

being considerably less than needed for the usual electric or chain hoist.

The new standard hoist is of simple and rugged design, being entirely enclosed as a protection against dust and weather. A straight spur gear drive is used throughout. All gears and main bearings operate in an oil bath, other bearings being lubricated by the Alemite high pressure system. The arrangement of the hoisting motor, holding brake and controller are clearly shown in the illustration. The hoist is equipped throughout with high-duty Hyatt bearings and an efficiency of over 80 per cent is said to be obtained with a standard stock hoist. All track wheel pins are made of manganese axle steel.

Accessibility for inspection and repairs is a valuable feature of the standard hoist. It is possible to remove all working parts without disassembling the main frame or body of the machine. The hoist has been thoroughly tested under overload and regular shop conditions.

Sediment Measure for Storage Batteries

A MEANS FOR DETERMINING the exact amount of sediment in a car lighting battery jar without the necessity of removing the groups, has been devised and is being exhibited by the Electric Storage Battery Company, Philadelphia, Pa.

The device is a long thin strip of wood veneer. It is inserted through the vent of the front cell to the bottom of the jar through one of the spaces in the wood separator. After being allowed to remain in that position for a few moments, it is withdrawn and the discoloration, caused by the sediment, is noted.

This device will give the car lighting man in the yard a method of determining the time when the battery requires cleaning. Without any accurate and convenient method of determining the condition of sediment in the jar, there is undoubtedly a tendency to dismantle and wash batteries oftener than is necessary. The company announces that a supply of these probes is available with its compliments to any railroad which may request them.

Railroad Shop Equipment and Machine Tools

Descriptions of Most of the New Shop Equipment and Machinery on Exhibition
Appeared in the June "Railway Mechanical Engineer"

THE PRESENT IS an age of machinery and labor saving equipment, and railroads should take advantage to the fullest possible extent of this equipment to reduce to a minimum the cost of maintaining and operating cars and locomotives. If antiquated, inefficient shop machinery is still used, whether avoidably or unavoidably, with ensuing high labor costs and low production, it certainly will not be the fault of the manufacturers, who have developed some really remarkable machines during the past year in spite of adverse business conditions which would have discouraged any but the most resolute.

A glimpse of the exhibit in Machinery Hall can hardly fail to impress railroad men with the efficiency and value of the machines shown and the impression will be in exact proportion to the time spent in studying them. Most of the new equipment brought out during the past year, and now being exhibited, was described in the June *Railway Mechanical Engineer*, copies of which are available. Inasmuch as subscribers to this paper receive copies of the *Daily Railway Age*, detailed illustrated descriptions of the new equipment cannot consistently be repeated in this issue but the equipment is of special interest and value to railway men and attention is, therefore, called to it by means of the following brief comments:

Colburn Vertical Boring and Turning Mill

An improved Colburn 42 in. vertical boring and turning mill is being exhibited at the booth of the Dale Machinery Company, New York. This machine is one of a line of boring mills made by the Colburn Machine Tool Company, Cleveland, Ohio, incorporating many new features of design; it was described in detail on page 344 of the June *Railway Mechanical Engineer*. The Colburn boring mills are made in sizes from 36 to 84-in. swing, inclusive, the entire design being developed with the idea of securing high power and production together with easy and convenient control by the operator. The machines can be provided with two swivel heads or one turret head if preferred.

The drive consists of a primary and secondary speed unit, the latter being located within the bed of the machine and providing three speed changes. The primary unit provides four changes, thus affording a total of 12 speed variations ranging from $2\frac{1}{4}$ to 70 r. p. m. in geometrical progression. The heads are entirely independent both as to the direction and amount of feed. The turret is tilted to an angle of 8 deg., affording ample clearance for large tools when swung over the slide. Complete control for each head and ram, for both feed and rapid traverse, is obtained by a single lever, the lever being always thrown in the direction of the desired movement.

The rail-lifting device is of special interest, and consists of friction clutches and gears contained in one contact unit and controlled by a single lever. Another unusual feature of design is the spring counterweight for the ram which eliminates the use of weight, cables, sheaves, wheels, etc. Power rapid traverse permits the heads and rams to be moved in all directions by power at the rate of approximately 12 ft. per min. Special attention has been given to the proper lubrication of this machine, also to the provision of safety guards for both operator and mechanism. The machine is well adapted for the many

boring and turning operations performed in railroad shops.

Improved American Engine Lathe

Two features of special importance in the 24-in engine lathe exhibited by the American Tool Works Company, Cincinnati, Ohio, are the new geared head and the motor drive arrangement; details of these improvements are described on page 347 of the June *Railway Mechanical Engineer*.

The new head provides 12 speeds instead of 8 as formerly. The spindle is under instant control through either of two levers, one located on the right side of the apron and the other on the left side. A powerful external hand brake enables the spindle to be instantly stopped or allowed to drift when the driving friction is released. Another feature of the new head is the arrangement for removing one gear unit and operating lever so that four speeds are available instead of 12 when a two-to-one or three-to-one variable speed motor is being used. An automatic oiling system of special merit has also been devised for this lathe.

The new motor drive arrangement consists of three steel herringbone gears with a patented flexible coupling enabling the motor armature to float without crowding the gear. Noiseless, smooth running operation and long life are said to be secured by this construction.

Two New Hendey Machines

The Hendey Machine Company, Torrington, Conn., is exhibiting two machines described on pages 357 and 354 of the June *Railway Mechanical Engineer*, embodying many improved features of design. These machines include a 24-in. crank shaper and a 14-in. toolroom lathe. The shaper is self-contained and compact, being designed for durability, simplicity and convenience of operation. An extended table is provided, enabling work with a considerable overhang to be rapidly set up. The operating lever for starting and stopping the ram is conveniently located and the statement is made that the ram can be stopped at any point in the stroke within $\frac{1}{2}$ in. under the heaviest of cuts.

A point of special interest about the 14-in. toolroom lathe is the location of the driving motor under the oilpan. This arrangement is very compact, since no additional headroom or floor space is required for the driving motor. The motor is easily accessible and does not obstruct the light or vision. Reduction gears are placed between the motor and the feed box, which is in the left pedestal of the lathe. The usual Hendey construction of taper spindle and bearings is provided, with an additional distinctive feature in the method of taking up end play on the spindle. Other points of interest are the construction of the single pulley and pinion running on a sleeve, operation of the intermediate sliding feed gear by eccentric levers and 18 speed changes, nine being direct through a belt to the spindle and nine through the customary back gears. Motor control is by means of push buttons.

Niles-Bement-Pond Turret Tool Post

Speed of changing cutting tools in an important factor in wheel lathe operation and the Niles-Bement-Pond Company, New York, has for a long time made its wheel lathes with tool posts equipped to clamp the tools pneumatically.

Some railroad men prefer the turret type of tool post, however, and for the benefit of those holding this preference, the Niles-Bement-Pond Company has developed a special turret tool post which is described on page 368 of the June *Railway Mechanical Engineer*.

An unusual feature of this tool post is the arrangement for two positions, the turret turning in a vertical plane. The roughing tool is held in the solid part of the post enabling extremely heavy roughing cuts to be taken. The turret is a massive piece of forged hardened die steel, provision being made for a wide taper key to take the thrust on the turret after adjustment. This relieves the spindle of the turret from undue torsional or shaving strains. The levers and hand wheels for operating the turret are conveniently located and the turret can be indexed in a fraction of a minute. The taper key and turret are carefully protected from dust and chips by a hardened chip guard.

Clark Gasoline Power-Lift Truck

The Clark Tractor Company, Buchanan, Mich., is exhibiting a gasoline power-lift truck with power-elevating platform, which was described in detail on page 351 of the June *Railway Mechanical Engineer*. The special advantages claimed for this truck are low initial cost, ease of maintenance, flexibility and continuous 24 hr. service when necessary.

The lifting mechanism is operated by hydraulic pressure, the power for both locomotion and elevating the load being derived from the 15-hp. four-cylinder gasoline engine. A three-point suspension is used, the steering wheel forks being supported in a steel casting pivoted at the center of the frame. The driving and elevating controls, mounted on the rear of the engine compartment, are operated by the driver who drives standing. Arrangement is made so that the truck lift stops automatically if the operator steps off while the machine is running. This truck is designed to climb a 10 per cent grade with a 4,000 lb. load. It has two speeds in each direction. The total weight is 2,500 lbs.

Thor Pneumatic Rivet Buster

A pneumatic tool known as the Thor No. 90-S rivet buster, for cutting off and backing out rivets in all sizes is being exhibited by the Independent Pneumatic Tool Company, Chicago. This substantial tool is designed to be operated by one man instead of three and is therefore adaptable for use in close quarters where it will be impossible for three men to work at the same time. The tool delivers its blows with greater speed than usual with the result that rivet heads are sheared off smoothly on the surface of the sheet without disfiguring or spoiling the material. The blows, being rapid, are not so severe and do not buckle the plate at the rivet holes. Both chisel and backing out punches are provided with individual safety retainers and can be quickly changed when desired. This tool is described on page 347 of the June *Railway Mechanical Engineer*.

Laughlin-Barney Tube Shearing Machine

A machine of unique design has been developed by the Laughlin-Barney Machinery Company, Pittsburgh, Pa., for shearing pipe and tube rapidly without the loss of material and with a square cut free of fins, the pipe or tube not being revolved. The novelty of this machine consists in the shearing principle employed. The cutting mechanism includes an internal arbor and two shear knives made in the form of two hardened steel rings which are placed close together and through which the pipe or tube passes. On account of one shear knife being eccentric and the other carried in a head which follows

an eccentric path the pipe or tube is sheared off in one revolution of the machine. The action of shearing is said to have little wearing effect on the cutting edges of the knives and the machine is always under the accurate control of the operator through a positive clutch operated by a foot treadle. This machine is described in greater detail on page 365 of the June *Railway Mechanical Engineer*.

Gray Maximum Service Planer

Important improvements in the planer design are incorporated in the maximum service planer, exhibited by the G. A. Gray Company, Cincinnati, Ohio, and described in detail on page 777 of the December, 1921, *Railway Mechanical Engineer*. The new planer has many features of interest and value, the fundamental thought underlying the entire design being the necessity for reducing the cost of planer work by combining high productive capacity with maximum ease of operation.

The best way to appreciate the possibilities of this machine is by a personal inspection. Go and see it in operation. Among the features of special interest may be mentioned the rail-setter stirrup for conveniently setting the rail; the rail-lock for applying massive steel clamps which lock the rail to the inside edge of each housing; the single-shift, rapid-power traverse levers, controlling the rapid movement of both side and rail heads; the patented cant slip feed which is positive instead of being driven by band frictions and enables any feed from .001 in. to 1 in. to be instantly obtainable. The operator has full control of the planer without walking around it or using wrenches of any kind.

Involute helical gearing is used to produce a drive of unusual smoothness, durability and power. Since planer work is usually placed close to the operator's side of the machine the rack has been widened toward that side of the table so that the driving force is applied in direct line with the cutting tool. In design and construction the attempt has been made to produce a powerful, rigid planer which can handle the heaviest work and be so easily controlled that even an inexperienced operator can secure large production.

Universal Horizontal Boring Machine

A new boring machine of the horizontal type, known as the Original Tri-way universal machine, is being exhibited by the Universal Boring Machine Company, Hudson, Mass.; a detailed description appeared on page 44 of the January *Railway Mechanical Engineer*. The name of this machine is suggested by the fact that it has a three-way bed, reducing the overhang of the table to a minimum. The machine is designed to bore, mill, drill, face and tap work in one set-up; the proportions and construction are such as to produce accurate work under unusually heavy cutting feeds and speeds. The arrangement of the operating levers is worthy of special attention, the design enabling every operating lever to be reached by the operator's right-hand without changing the position of his feet. The operation of speed and feed levers are identical, thus greatly reducing the possibility of mistakes. All speeds and feeds on this machine are in geometrical progression.

Lassiter-Millholland Staybolt Machine

Two staybolt machines, known as the Lassiter-Millholland staybolt machine, are being exhibited by the Dale Machinery Company, New York. These machines, described in detail on page 285 of the May *Railway Mechanical Engineer*, are intended for reducing the centers, also turning and threading both straight and taper ends of staybolts in uniform pitch and continuous lead. The Model B machine for cutting and threading radial, button-head and crown stays is worthy of special attention. This

is an entirely new machine, rigid and well proportioned, with a special feed-box, apron and lead screw designed to prevent lagging or creeping of the die head when threading. This machine is equipped to turn the taper and straight diameters simultaneously, the taper and straight surfaces also being threaded simultaneously in uniform pitch and continuous lead. The turning and threading operations are done separately but on the same machine by replacing cutters by chasers. The heads of the machine for threading are held in constant relation on the slide, which is advanced by a nut and lead screw in the apron. In the case of button-head radial stays a cross slide is provided for facing the button-heads. This machine has a capacity to turn and thread bolts from $\frac{3}{4}$ in. to $1\frac{1}{2}$ in. in diameter and 14 in. to 36 in. long.

Hose Dismantling and Assembling Machine

A complete description of the hose dismantling and assembling machine exhibited by the Covington Machine Company, Covington, Va., is given on page 780 of the December, 1921, *Railway Mechanical Engineer*. This machine is self-contained, air-operated and designed for the sole purpose of dismantling and assembling air signal and steam hose. All of the operating levers, handwheels and various parts of this machine are designed for maximum convenience in handling this work. In an assembling test one operator is said to have taken new lengths of hose, put on clamps, forced the coupling and nipples into the hose, squeezed up the clamps, inserted clamp bolts and put on nuts, finishing 30 air hose ready for service in 60 min. In this particular case the time taken to assemble each hose ready for the clamp bolts averaged 30 seconds and the balance of the time, or $1\frac{1}{2}$ minutes for each hose, was required for squeezing up the clamps, putting in the bolts and running up the nuts. The dismantling operation can be speeded up where large quantities of hose are to be handled by having one operator on the shear end of the machine cutting clamp bolts while the other is stripping the hose. This machine should prove of great value especially in car shops and reclamation plants where large quantities of hose are reclaimed for further service.

Williams Receding Die Head

Among the exhibits of the Williams Tool Corporation, Erie, Pa., is a receding die head for pipe threading machines, which was described on page 721 of the November, 1921, *Railway Mechanical Engineer*. This die head cuts either standard or special threads of any degree or length, regardless of the width of the chaser. The important features of this device may be outlined as follows: Any length of taper may be cut, regardless of the width of the die. By changing the dies and the small taper guide plate, any thread or taper may be cut. More dies are used than previously, giving more bearing points on the pipe and making less work for each die to do. When starting the thread the dies remove the excessive metal in heavy chips, receding as the cut progresses. This means that the greatest power is used at the start, gradually easing up as the cut is finished. On the old type of head the greatest strain on the dies was just near the finish, when the full width of the die was cutting on the pipe. This is generally the time when the dies are hottest and most likely to pick up stickers. The dies on the new Williams head are designed for long life. Being narrow, they do not heat up like the wide chasers. The operation of the head is rapid and simple, being practically identical with the adjustments on the old type of standard head. Threads can be cut on pipe up to 16-in. in diameter.

Arc Welding Set and Electric Melting Pot

A portable electric welding device which controls the feeding of the electrode wire into the arc, and which can

be used in any place where welding current is available, has been developed by the General Electric Company, Schenectady, N. Y. The automatic or semi-automatic method increases the speed of welding and makes it possible for a comparatively inexperienced man to do good work consistently. A more detailed description of the device appears in the June issues of the *Railway Mechanical Engineer* (page 354) and the *Railway Electrical Engineer* (page 202).

Two electric melting pots for babbitt, solder and similar alloys or metals, which will hold as much as 1,000 lb. and will operate at temperatures up to 800 and 1100 deg. F., respectively, have also been developed by the General Electric Company. The heat is controlled automatically by thermostats. The devices are described more in detail in the June issues of the *Railway Mechanical Engineer* (page 360) and the *Railway Electrical Engineer* (page 202).

Racine Junior Power Hacksaw

AN ENTIRELY NEW addition to the line of machines made by the Racine Tool & Machine Company, Racine, Wis., has been developed in the Racine Junior power hacksaw. This machine has a normal capacity to cut 4 in. stock and its principal feature is the ability to operate at unusually high speed, using light gage blades. This insures quick cutting both on account of the increased number of strokes per minute and the small amount of metal which has to be cut away.

Another feature of the Racine Junior power hacksaw is the automatic listing device which is positive in action, raising the blade on the non-cutting stroke. The teeth do not drag back, no matter how great the pressure on the blade. The machine is designed for efficiency and economy, the use of the positive draw cut principle allowing light blades of 21 gage or heavy hand blades to be operated at high speed. The feed is by gravity thus applying an accurate pressure pre-determined for every class of material being cut. An automatic knock-out stops the saw when the cut is finished.

The saw frame guide holds itself automatically at any height which is a convenience when placing stock in the machine. Quick and easy adjustment for wear is provided, the frame sliding on V-ways giving maximum bearing surface. Provision is made so that if necessary to cut stock larger than 4 in. by 4 in., a simple adjustment will increase the capacity of the machine up to 6 in. by 6 in.

Huther Inserted Tooth Metal Saws

A NEW TYPE of metal-cutting saw blade, known as the Huther high speed inserted tooth blade, has been developed by the Cochrane-Bly Company, Rochester, N. Y. A feature of unusual interest is the use of a laminated body consisting of two tempered plates riveted together. High speed steel tooth segments, riveted and shouldered to one of these plates, are provided with side clearance front to back, thus overcoming in a practical way the tendency of the teeth to stick in the cut due to the abrasion of small particles of metal on the sides of the teeth. Because of this construction it is maintained that excellent alignment or trackage of the teeth is obtained without internal stress due to wedging action.

The Huther high-speed saw blade is designed to cut blanks up to 6 in. in diameter, both straight and smooth, at feeds up to $2\frac{1}{2}$ in. per min. Ordinarily the cuts do not

vary over .005 in. from parallel. All grades of mild machinery steel can be cut at feed from 2 in. to 2 $\frac{1}{4}$ in. per min. in sizes up to 6 in. in diameter with a production of 6,000 to 8,000 sectional inches per grinding of the blade. The teeth in these blades are alternately high and low, with the corners of the high tooth beveled. For the best results this blade is ground in an automatic saw-sharpening machine, also made by the Cochrane-Ply Company, a round blade being secured in which every tooth cuts its proper chip. The high beveled tooth cuts a groove in the center of the slot and breaks the chip into three parts. This assists not only in the clearance of chips from the slot, but contributions also to the more efficient lubrication of the cutting points.

Heavy Duty Crank Planer

TO MEET the requirements for a heavy duty tool for short stroke work, the Newton Machine Tool Works, Inc., Philadelphia, Pa., has brought out a new model crank planing machine, made with one or two heads on the crossrail as may be required. The rated capacity of the machine is 32 in. wide and 32 in. high,

View Showing Motor Drive Arrangement

with a maximum stroke of 34 in. The base is a one-piece box-type casting, in which all thrusts and cutting strains are concentrated. The motor is mounted on the off-side of the machine, variations in speed being controlled by the motor box. The speeds provided are 6, 8, 12 $\frac{1}{2}$, 17 $\frac{1}{2}$, 23 $\frac{1}{2}$ and 33 $\frac{1}{2}$ strokes per minute.

The construction of the drive is clearly illustrated. The motor driving gear is of the helical type, transmitting power to the toothed main shaft giving a relatively uniform cutting speed with the advantage of a slightly lower speed at the start of the cut. The quick return is 1 $\frac{1}{2}$ to 1 measure. The table is provided with an adjustment of 20 in. which can be made while the machine is running. After the table is positioned the driving element is fully clamped by the square end shaft shown at the end of the table. Table control is through a clutch

and brake, provision being made to lock the operating lever out of position so that it cannot re-engage and injure the operator. The feed motion is of the cycle type, operating on the return stroke of the table. This motion is transmitted to the cross-rail through a rack and pinion, giving cross, down and angular feed. The cross-rail is raised and lowered by power.

In operation cuts on forged steel $\frac{3}{8}$ in. deep with $\frac{1}{16}$ in. to $\frac{1}{8}$ in. feed are taken. The length of stroke is set from the operating side of the machine with an indicator to show the length is obtained. Providing, as it does,

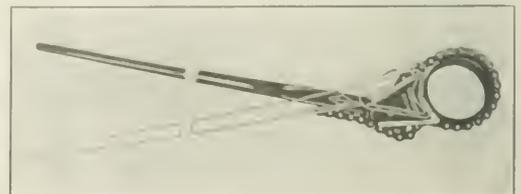

Newton Heavy-Duty Crank Planer

positive stroke with a fixed quick return and a wide range of speeds, the new Newton crank planer is an efficient tool for short stroke work, being particularly adapted to the machining of die blocks, forming dies, locomotive cross heads, shoes, wedges and many other similar parts.

Walworth-Bostong Pipe Wrench

AN IMPROVED PIPE wrench of the chain type, known as the Walworth-Bostong wrench, is being introduced to the railroad field by the Walworth Manufacturing Company, Boston, Mass. This wrench is designed to withstand the hardest service and contains some

Walworth-Bostong Reversible Pipe Wrench

novel features which should make it particularly valuable for locomotive and car work. In tools of this class strength is an important characteristic. Parts subjected to stress or wear are of generous size and to avoid excess weight special steels are employed for the chain, pins and bolts. The chain is proof tested up to two-thirds the breaking strain.

There is no lost motion in this wrench, the cam action being such as to insure a rapid positive grip and release. It is reversible and may be turned to the right or left practically without any adjustment in chain or jaws.

Improved Design of Locomotive Booster

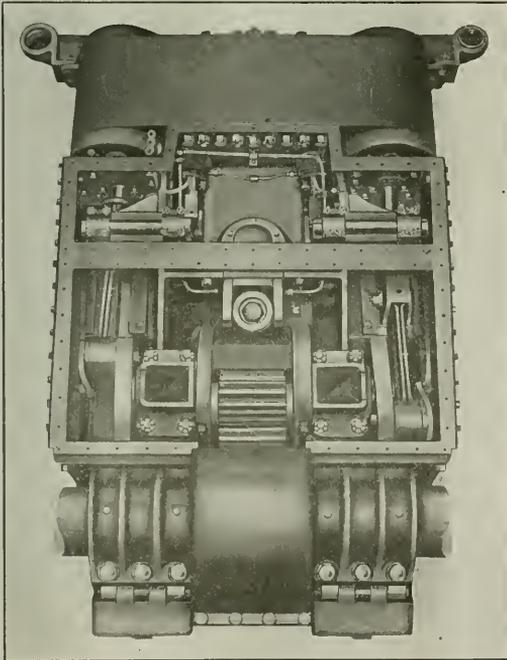

NUMEROUS CHANGES in details of design have been made in the latest type of booster exhibited at the booth of the Franklin Railway Supply Company, New York. The exhaust steam from the booster engine instead of going to the tender is now exhausted through the locomotive nozzle. The steam inlet and exhaust passages are combined in a manifold extending across the cylinder heads. All steam connections are now fitted with universal joints to care for both vertical and lateral movements instead of the slip joints formerly employed. The

instead of bronze bearings, and drop forgings have replaced steel castings in several important parts. The trailer box end has been changed to a unit construction so that the gears run in a bath of oil. A unique design of idler gear and support have been applied, which prevents any stress being transmitted to the mechanism which throws the gear in and out of mesh. The bedplate has been redesigned making it oil-tight and affording splash lubrication for the bearings. The booster has a spherical seat on the trailing truck and the design is so arranged that when the trailer axle housing is disconnected the booster can be taken out without disassembling other parts.

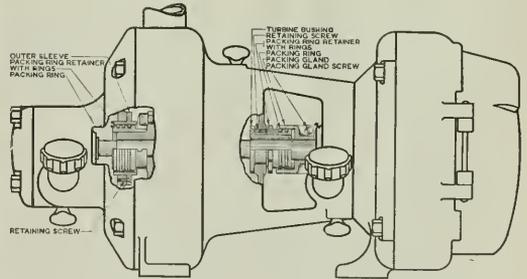

The control mechanism has been simplified and the cylinder cocks designed for either pneumatic or manual control. The connection between the reverse lever and the booster is now arranged so that the booster can be operated while the main engine is using steam expansively. The new design of booster, when operating with 200 lb. pressure and a 45-in. trailer wheel, delivers a drawbar pull of 11,000 lb. at starting and 6,000 lb. at 22 miles an hour.

Headlight Turbine Packing

SPRING RING packing for locomotive headlight turbines is being shown by the Pyle-National Company, Chicago. The rings are placed in glands on each side of the turbine in practically the same manner that piston rings are used in the cylinder of a gasoline engine. The fundamental difference is that the relative

Type C-1 Booster With Cover Removed

Side Elevation of Headlight Set With Sections Showing Construction of Packing Glands

motion in the glands is one of rotation instead of reciprocating motion.

Three rings are used on the turbine end and two in the generator end. The three rings are stationary, while the two on the generator end rotate with the outside collar of the gland. There is a clearance of about .05 in. between the ring grooves, so that there is practically no packing friction. The seal is effected by the water of condensation that finds its way into the grooves. This type of packing can be applied to all types of Pyle-National headlight turbines.

Motor Bearing With Provision for Emergencies

A SLEEVE BEARING for motors, which is designed to meet emergency conditions, is being shown by the Howell Electric Motors Company, Howell, Mich. The bearing is made in two parts and consists practi-

new booster engine is adapted for higher operating speeds, the maximum speed for which it is designed being 22 miles an hour.

The arrangement of the machinery parts has also undergone considerable modification. Outside valve motion has been substituted for the eccentrics and straps originally used. White metal lined bearings have been applied

ally of two bearings of a little more than half the usual length, placed side by side.

The inner half of the bearing is pressed tightly in the housing in the usual manner while the outer half is pushed into the housing with a light press fit. A set screw in each half keeps it from turning. If at any time the bearing should develop wear so that the motor rubs on the stator, or so that the motor does not function properly, the set screw in the outer half can be loosened and the outer half of the bearing turned through an angle of 180 deg., thus realigning the motor shaft. A screw driver is the only tool needed for this operation.

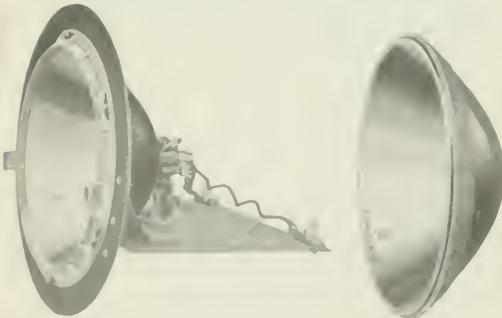

The particularly desirable feature of this type of bearing is that if the bearing should fail at a time when the motor is needed badly, only a few minutes are required to put the motor back in service and the service may be continued for a considerable time before a new bearing is required.

The bearing housing has an additional feature in the form of an oil well barrier so designated as to prevent oil being drawn into the motor by the ventilating air. This bearing is standard equipment with all sizes of the Howell Red Band motors.

Locomotive Lighting Equipment

SEVERAL NEWLY DEVELOPED lighting devices for use on locomotives are being exhibited by the Pyle-National Company, Chicago. These consist of a glass reflector mounting for locomotive headlights, a 14-inch glass reflector, a cast metal headlight case and a rear tender lamp. In addition to these, the company is also showing two new types of flood lighting units for general service.

The glass reflectors are made of a moulded heat-proof optical glass may be either of clear glass or of a colored glass known as "Nonglare." They are fire polished on the inside and are annealed to toughen the glass, after which the back of the reflector is ground to a parabolic curvature. They are polished by a special process, and then chemically silvered. The silver is covered with an electrolytically deposited coating of metallic copper. For further protection, an additional backing is placed over the copper, which has acid, gas and weather resisting

Glass Reflector Mounting for Sheet Metal Headlight Cases and a 14 Inch Glass Reflector

qualities. It is claimed that the "Nonglare" reflector reduces the glare from the light without materially affecting the beam or useful power. Either of the two reflectors can be substituted in 12 in. or 14 in. diameters with a focal length of 2 1/2 in.

The interior sheet metal reflector mounting has been de-

signed for the purpose of applying glass reflectors to the sheet metal headlight cases made by the Pyle-National Company. The reflector is encased in a drawn steel protector shell and is held in place by an aluminum ring. The mounting is interchangeable with the 18 in. copper reflector.

The cast headlight cases are made either of cast iron, or of an aluminum alloy, and are provided with a 14 in. glass reflector, and a 250-watt, 32-volt lamp. A machine taper fit is provided between the door frame and the body of the case to make the unit smoke, dust and gas-proof. A goggle door lock of improved design locks the door when closed. A weather-protected, accessible junction is provided between the case and the locomotive conduit system. There is a pre-assembled, electrical distribution with the case, so designed that it is only necessary to connect the main leads with the distribution block to provide constant numeral light with full, dim and extinguished headlamp. The standard 14 in. cast iron case

Headlight with Cast Metal Case

is 16 1/2 in. high, 14 1/2 in. deep, 18 in. wide and weighs about 85 lb. The cast aluminum alloy case is of the same dimensions and weighs something less than 45 lb. The body of both cases is cast in one piece.

The rear tender lamp is cast of a non-corrosive metal, is tapped at the top for 3/4 in. conduit and is provided with three supporting lugs. The front door, into which a standard 55-3/4 in. white signal lens is secured, is hinged, leaving the interior of the lamp accessible for lamp renewals and wire connections. The door is fastened with a spring latch. A receptacle with grips is used, and the connections to the receptacles are made in such a manner as to leave them accessible for testing the lamp circuit. A plate glass covers an opening in the bottom of the case through which a beam of light is thrown downward and outward, lighting the coupler and step. The beam light through the lens is augmented by mirrors. The lamp is 7 1/2 in. high, 8 in. wide and 5 1/2 in. deep. It is claimed to be water-tight and constructed throughout to meet the most severe locomotive service.

Simplex Reverse Gear

A NEW TYPE of locomotive reverse gear is being shown by J. M. Wideman, Norfolk, Va. This is a combined power and hand operated mechanism where-by power may be used to effect reversal and hand operation may then be used independent of the power operation to obtain suitable and accurate adjustments. An air operated cylinder controlled by a valve in the cab

serves to reverse the engine. Close adjustments are secured by a handwheel and screw. No air is used when the locomotive is running and the piston can not creep and affect the cut-off. Hand and power gears are entirely independent. The mechanism is simple and should be easily and cheaply maintained.

Locomotive Headlight

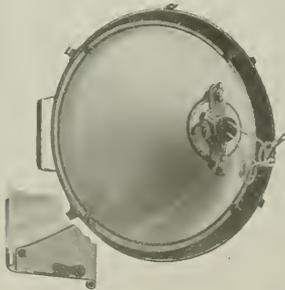

A LOCOMOTIVE HEADLIGHT has been developed by the Sunbeam Electric Manufacturing Co., Evans, Ind., which employs the principle used in the manufacture of automobile headlights of having the reflecting surface and front glass contained in a separate airtight unit or goggle. The airtight unit can be removed from the headlight case and is held in the case by heavy spring clamps; there are no hinges. The lamp is mounted in a universal focusing device which can be removed from the airtight unit without disturbing the position of the re-

Headlight With Number Door Open Showing Focusing Device and Terminal Connections

flector or front glass. The manner in which the reflector and front glass are held in place is shown in the sectional view.

In case it is necessary to renew the front glass, the four clamps holding the goggle are opened and the airtight unit removed. The unit is laid face downward on a bench, or

Rear View and Section of Air Tight Unit Showing Method of Holding Reflector

on some part of the locomotive, and the spring clamps shown in the detailed section are snapped open. This is done by inserting a screw driver or similar tool behind

the link which holds the spring. The spring and link form a toggle which swings entirely outside of the unit when it is loosened.

The reflector is made from heavy copper, spun to a parabolic curve and triple silver plated. It is 18 in. in diameter by 9 in. deep. The apex or filler ring which is removed with the focusing device and lamp is polished and has the same contour as the reflector, thus adding to the beam candle power of the headlight.

The case is made of 16-gage iron protected with baked automobile fender enamel. The weight of the headlight is 68 lb.

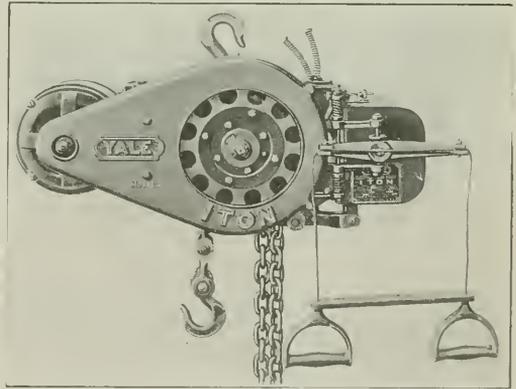

Industrial Truck and Chain Hoist

A NEW ELECTRIC CRANE model of industrial truck and a new and improved electric chain hoist are noticeable features of the exhibit of the Yale & Towne Manufacturing Company, Stamford, Conn.

A type of truck which is particularly well adapted for use in railroad shops and storehouses consists of a combination of an electric crane mounted on a Yale A-17 truck. It is intended for service where material is to be raised or lowered vertically and then transferred horizontally, the work being accomplished by a single mechanical and electrical unit.

This truck has two-wheel drive with two-wheel steer, and a turning radius of 7½ ft. at the center of the truck. It is particularly well adapted for inter-plant or yard service where heavy castings, structural shapes or bulky crated material must be handled safely and expeditiously.

The extreme flexibility of this mobile hoisting and conveying unit is unique. The crane mast is mounted on heavy-duty thrust ball-bearings, permitting the boom to be easily rotated through an arc of 180 deg. The operator has direct control of a two-speed hoisting mechanism, con-

Model 20 Electric Chain Hoist With Double Handle Control

sisting of a motor direct-connected to a worm-and-gear and a grooved hoisting drum. A single electrically welded hoisting chain interlocks with a load sheave located on the end of the hoisting boom; a ratchet mechanism permits the operator to spot the hoisting hook in any desired position and to either raise or lower the load and the boom singly or simultaneously.

The boom consists of two 4-in. steel channels and has

an outreach of from 24 in. to 69½ in. from the center of the mast. The height with boom in lowered position is 91 in. The weight complete with batteries ranges from 3175 lb. to 3285 lb., dependent upon the type of battery used. The hoisting speed varies from 12 ft. to 52 ft. per min., dependent upon the load. The capacity ranges from 1100 lb. at the maximum reach to 1900 lb. at 24 in.

The Yale Model 20 electric chain hoist is exhibited in two types—the ordinary method of control with two handles and a new method of remote control by means of push buttons. This model, made in units ranging from ¼ to 2 tons capacity, when used singly or in conjunction with hand cranes, occupies a position midway between the hand-block and the electric traveling crane. Wherever loads up to two tons must be lifted quickly, moved horizontally, and placed in position many times a day, as in serving automatic machines or furnaces, in loading cars, in storing material, the chain hoist meets every requirement. It is a quick-acting piece of apparatus that requires no particular skill to operate and uses a small quantity of power.

The roller ratchet mechanism is an important improvement. Where formerly the cast iron ratchet wheel and ratchet pawl have been used to prevent slippage of the load in hoisting, the Yale Model 20 embodies a distinctly different principle. A hardened steel ratchet wheel carries

A Crane Type Industrial Truck Is Exceedingly Useful in Railroad Shops and Storehouses

hardened steel rollers in a bath of oil within a closed compartment. All surfaces in contact are ground to an accurate finish so that frictional resistance is minimized during the lifting period.

The function of holding the load is accomplished by the advancement of the steel rollers along the evenly distributed inclined wedges of the ratchet wheel. Being applied gradually around the entire circumference of the wheel simultaneously, they effectively prevent any slippage of the load when the power is shut off.

Two asbestos friction discs, one on either side of the ratchet wheel, provide large surfaces for the dissipation of the heat developed in lowering the load.

The load is fitted with a drum brake positively operated by the controller handle. When the current is on, the brake arms are lifted clear of the drum, so that there is no dragging or friction during the hoisting operation.

Immediately the current is shut off, the brake arms clamp tightly around the hoisting drum, producing a powerful, quick-action brake.

Under certain conditions it is necessary for the hoist operator to watch his load carefully and at times to use one hand in guiding the load during the hoisting and lowering operations. The push button control model has been developed to give the operator the greatest amount of freedom under these conditions. The push buttons are set in a block that is suspended from the hoist on a flexible cable. The block fits easily in the hand and the buttons can be operated by the thumb or one finger. The raising and lowering circuits are mechanically interlocked so that it is impossible to operate in both directions at the same time, even when both buttons are accidentally pushed in together.

A solenoid brake is applied to the motor shaft and so arranged that the brake is immediately applied as soon as the circuit is opened either by removing the finger from the button, by the action of the limit switch, or by the loss of voltage from any cause.

On the push button model hoist the limit switch is arranged to open the circuit positively when the load reaches its maximum travel in either direction, so that the solenoid brake is immediately brought into play. When the limit switch functions, either for raising or lowering, the corresponding push button is thrown out of circuit so that it is not possible to operate the motor again until its direction of rotation has been reversed, thus relieving the limit switch.

A Large Capacity Welding Set

A PORTABLE WELDING outfit of increased capacity is being exhibited by the U. S. Light & Heat Corporation, Niagara Falls, N. Y. It consists of a motor-generator set and control apparatus mounted on a four-wheel hand truck.

The generator has a continuous capacity of 300 amperes, and for cutting and other work of an intermittent nature will develop 400 amperes. It is designed with

The 350-Ampere U. S. L. Welding Set

inherent regulation and has the same characteristics as the 200-ampere machine made by the same company. The generator is also furnished for belt or gas engine drive.

The set is supplied with either a direct or alternating current motor and weighs complete about 1,700 lb.

Entered at the Post Office of New York, N. Y., as mail matter of the second class.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free; United States, Mexico and Canada \$6.00. Foreign Countries (excepting daily editions), \$8.00. Foreign subscriptions may be paid through our London office in £ s. d. Single copies, 25 cents each.

WE GUARANTEE that of this issue, 12,400 copies were printed; that of these 12,400 copies, 10,300 were mailed to regular paid subscribers to the Railway Age and Railway Mechanical Engineer; 110 were mailed to advertisers; 490 were provided for counter and news companies sales, new subscriptions, bound volumes, samples, copies lost in the mail and office use; and 1,500 copies for distribution at Atlantic City.

THE RAILWAY AGE is a member of the Associated Business Papers (A. B. P.) and of the Audit Bureau of Circulations (A. B. C.)

In spite of any and all arguments for or against classification of material for accounting purposes, it is believed that the Interstate Commerce Commission will eventually demand it.

Classification of Material

That being the case, it is largely a waste of valuable time and energy to argue anything except the items in the classification. By acting well in advance of the I. C. C., the Purchases and Stores Division of the A. R. A., the members of which are the real experts in their line, can prepare a classification that will best meet the railways' needs and which will be acceptable to the Commission. The only really valuable discussion on this subject during yesterday's session consisted of the few remarks which questioned the classification in which certain items were placed. It is very clear that any classification at best is liable to be confusing. It is therefore necessary that the problem be given very careful consideration. The Purchases and Stores Division can well afford to pick a select committee to handle this important subject and this committee should call for and analyze carefully suggestions from the membership of the association. Above all things it should be ready with something concrete, definite, simple and logical when the time comes that the Interstate Commerce Commission asks for advice on this matter. It is by such service that our railway associations can serve the railways as a whole.

In considering the various systems of automatic train control that have been developed, there appears to be two distinct types—the ramp and contact shoe type, and the magnetic induction type. Either type requires more or less equipment on the locomotive and with some systems the electrical circuits are so complicated that they can only be properly tested and maintained by men skilled in such work. It is this feature which is certain to cause a division of responsibility between the electrical and the signal departments—at least, as they are organized at present. Heretofore, the signal men have had no association whatever with locomotives, nor have the electrical men had anything to do with signals. The electrical department, however, has charge of headlight equipment and it seems but logical that the same men should look after such electrical apparatus as is carried on the locomotive. Herein lies a new field for the electrical engineer, which he would do well to familiarize himself with, since it is likely to prove a considerable and interesting addition to his rapidly widening scope of activities.

Planers, like drills and engine lathes, are so commonly found in railroad shops as to be taken pretty much for granted. Yet these machines are employed in such large numbers that unless modern efficient types are used there is a big aggregate loss in their operation. Much has been said, and rightly so, about the need for milling machines and other production tools in railroad shops but this does not mean that the planer has in any sense of the word outlived its usefulness. In fact in the last analysis of railway machine shop work of which we are aware, 28 per cent of the machine operations were performed on lathes, drills handled 17 per cent, and planers 11 per cent of the total machine operations. As indicated by the 11 per cent proportion there is no lack of machine work to keep planers busy. There may be some overlapping of the fields for planing and milling work, but as a rule the fields are quite distinctly marked. In general for production work on similar parts the milling machine is best adapted, but for miscellaneous machine operations the planer is by far the more adaptable tool and does not involve the same expense for cutters. It would appear, therefore, there will always be enough planer work in railroad shops to warrant the installation of the best modern machines which it is possible to obtain.

Have Planers Outlived Their Usefulness?

There is a big aggregate loss in their operation. Much has been said, and rightly so, about the need for milling machines and other production tools in railroad shops but this does not mean that the planer has in any sense of the word outlived its usefulness. In fact in the last analysis of railway machine shop work of which we are aware, 28 per cent of the machine operations were performed on lathes, drills handled 17 per cent, and planers 11 per cent of the total machine operations. As indicated by the 11 per cent proportion there is no lack of machine work to keep planers busy. There may be some overlapping of the fields for planing and milling work, but as a rule the fields are quite distinctly marked. In general for production work on similar parts the milling machine is best adapted, but for miscellaneous machine operations the planer is by far the more adaptable tool and does not involve the same expense for cutters. It would appear, therefore, there will always be enough planer work in railroad shops to warrant the installation of the best modern machines which it is possible to obtain.

Anyone who was in attendance yesterday morning during the presentation and discussion of the report on Locomotive Headlights and Classification

Headlights a Live Subject

Lamps could not help being impressed by the manner in which it was done. The short but meaty report was read slowly and carefully by A. R. Ayers of the Nickel Plate, while all the members present paid close attention. Mr. Ayers elaborated on the report sufficiently to hold the interest of his listeners and the report was then discussed exhaustively for the better part of an hour, with eight different men taking part. The only unfortunate condition was the lack of electrical men present. When the discussion led to matters which were purely electrical, there was no one to an-

swer the questions raised. This was due to the fact that the Association of Railway Electrical Engineers was holding its semi-annual meeting at the same time at the Hotel Dennis, where the same report was being discussed. The headlight report was placed first on the program of the Mechanical Division so that electrical men could leave the Mechanical Division meeting and go to the Electrical Engineers' meeting, but because of a misunderstanding most of the electrical men were not able to attend both meetings. The two discussions if combined will contain all of the desired information. It is to be hoped that in the future such conflicts will be avoided and that provision for joint meetings will be made in such cases.

One of the best ways to prepare engine terminal forces for handling work with the greatest speed, accuracy and thoroughness is by the development of specialized gangs responsible for various phases of the work. The extent to which this specialization can be carried out will depend largely on the size of the terminal, but even at points turning only a comparatively few locomotives some degree of specialization can be employed profitably. It goes without saying that the men who clean fires and handle ashes are thoroughly familiar with this work and under the proper supervision accomplish it with the least expenditure of time and energy. Within the roundhouse, it will also be found a paying proposition to have certain men handle a definite class of repair work. As examples of the work which may be specialized, experience has shown that one man can look out for piston and valve packing, the adjustment of driving box wedges and the reseating of exhaust tips when they leak. It is a big advantage to have one man who is responsible for this work and to whom the foreman can look for thoroughness. Not only that, but the specialist on any job naturally becomes more familiar with it than the man who works at it only occasionally and the result is a better grade of work done in a shorter time. Box packers, rod cup men and mechanics working on truck bearings can also be trained for their particular work and make a specialty of it with resultant important savings.

Enginehouse Work Specialized

The commercial interest in electric headlights has apparently settled down to a steady replacement market. If the law has been complied with, the number of locomotives that are operated without electric headlights is comparatively small. This does not mean that the final chapter in locomotive head-lighting has been written, for it is altogether improbable that any great number of wiring systems now in use can be considered as perfect. Changes and revisions for the improvement of both headlights and cab lights are certain to be made from time to time in accordance with the ideas of the men in charge of this work on the different roads. As in all other operating problems, the electrical engineer's goal is a record of perfect performance and to achieve such a record he must look to the quality of materials used and manner of installing them. Good headlight equipment will function to just about the same degree of reliability as it receives careful maintenance. Several problems still remain unsolved, and this is not to be wondered at when one considers the wholesale application of electric headlights in a comparatively short time. Questions of ball bearing selection, lubrication and location of equipment are among

Headlights and Cab Wiring

those which have not yet been solved to everyone's satisfaction. It is easy enough to disapprove of certain practices and methods, but the man who performs his full duty is the one who by careful analysis of conditions is able to offer constructive suggestions, which if applied will manifest themselves in better service at a lower cost.

The following extract is taken from a letter written by a railroad shop foreman. "And personal loyalty! There

Support Your Foremen

is no such thing. The reason? Because when in a doubtful situation we cannot go to our superior with our problem. He no longer encourages and points out the way with wisdom and knowledge begot of long experience—he applies the goad; he is not an adviser, he is a driver! * * * This is not inspired by any feeling toward some particular officer, but is the result or conclusion reached by one who has met and compared experiences with many foremen on different roads and represents the average position on the subject. * * * I am sure that it is useless for us to attempt to keep up with progress by reading and observation, when all that is wanted is a good strong whip hand." We may question the logic of the writer and his peculiar conclusion. On the other hand, he clearly reflects conditions that are deplorable. Let us hope that they pertain to very few roads or shops. How can we, however, hope to develop a spirit of good-will and co-operation between the men and the managements if the key men, or the connecting links, feel as does this man? You may say that such conditions do not exist on your own road, but are you doing everything that you should to encourage loyalty on the part of the foremen and subordinate officers? Are you seeing that they are fully informed as to the best practices to follow? Are you coaching them in how to manage men and entuse them, and how to develop teamwork?

The discussion on the reference to the lumber specifications in the report of the Committee on Specifications and Tests for Materials, while not generally participated in, reflects a situation which is far from satisfactory and is attracting a growing amount of attention both from railroad men and the lumber industry. The customs of the lumber trade with respect to grading rules vary widely in different territories and the grades are so loosely defined that there is considerable latitude for variations in their interpretation. This has led to much misunderstanding between the purchaser on the one hand and the wholesaler and producer on the other. The producers claim that railway specifications are difficult to adhere to without considerable waste in production that the purchaser pays for, whether he knows it or not. When lumber is bought on price, which is quite generally the practice, the temptation is open to the bidder to make concessions in order to secure the business; for these he reimburses himself by a loose interpretation of the grading rules, the effect of which is to include as much material as possible that a strict interpretation would place in the next lower grade and exclude at the top of the grade material which might strictly be included. In other words, the railroad gets just what it pays for. This situation is in need of careful study, not only to promote better relations between the railroads and the lumber industry, but to provide for more economical use of the lumber resources of the country. While it is true that the user is in the better position to

Railroads and the Lumber Industry

decide the question as to what character of material is most satisfactory for his purposes, is it not possible that some concession as to patterns and sizes, in order that more liberal use of commercial patterns may be made, would result in better prices to the railroads without the sacrifice of quality that is a corollary of the present policy of buying on price? A movement is now under way to bring about a better understanding between the various lumber interests and the users of this material in which the American Railway Association is represented, and it is sincerely to be hoped that some very definite results may be accomplished.

Anyone who has watched a lively rally between professional tennis players is reminded of the way in which mechanical and stores department men sometimes "pass the buck" between each other. To see the way these departments often work one would never suspect that they are each a sub-division of the same transportation system whose sole duty is the provision of adequate transportation at a minimum cost. The mechanical department can help itself as well as the stores department by determining its material needs at the earliest possible time and notifying the stores department without delay. Comparatively large items like new cylinders, steel underframes, or deck castings are usually shown on work reports placed in the hands of shop men and storekeepers before an engine or car comes to the shop. It is the smaller items which often escape attention and which in the aggregate cause equipment delays due to inability of the stores department to furnish material promptly. As far as possible the needs for material should be anticipated. For example, it is becoming more and more customary to manufacture certain standard parts, such as cylinder and valve packing, at central plants, which may be at some distance from outlying terminals. Suppose that the cylinder bushings on a certain class of locomotives are worn almost to the limit. The stores department should be advised of this fact and arrangements made for the prompt shipping of smaller packing rings as soon as new bushing are applied, whereas, based on consumption records, the storekeeper would probably have on hand only rings which were too large. Making the storekeeper acquainted with the condition of these bushings will also give him a chance to see that new bushings are ordered and on hand for application to the locomotives as needed. This is simply one of hundreds of ways in which mechanical men can greatly assist the stores department, at the same time expediting repair work. The storekeepers should be advised of material needed for new power. They should know as soon as parts are superseded by new designs; otherwise these parts will continue to be ordered, based on consumption records, for a considerable time after they are obsolete. The stores and mechanical departments can often co-operate in at least partially using up obsolete material.

Although there was a lively discussion following the presentation of the report of the Committee on Specifications and Tests for Materials at yesterday morning's session, it was noticeable that almost none of the speakers referred in detail to the specifications proposed by the committee that were contained in the appendices to the report. In order to touch on the provisions of any of these specifications a thorough study of the text of the appendices would be

required and for any of the members except those whose work throws them in daily contact with material specifications, even this would give little insight into their exact purpose. Similarly, few of the members are able to discuss in detail on their merits the recommendations of other committees whose work is largely the formulation of standards. No doubt, all of these committees have well defined reasons why they believe that their recommendations should be adopted, and the development of these reasons has probably constituted no small part of the committee work. Would it not make possible a much more thorough consideration of the subjects if the committees were to set forth at some length the reasons why these recommendations are made and explain how they may be expected to operate? The subjects are all matters in which the members are interested and on the broader phases of which they are in a position to comment intelligently, not only with benefit to the committees in their future work, but also with the possibility of crystallizing much more intelligent opinions of the requirements of the situation among the members of the Mechanical Division before the recommendations are presented to them for letter ballot.

Many of the convention attendants probably read with interest and enthusiasm the interview published yesterday in which George M. Basford made some observations on the opportunities afforded by the railroad clubs. Most of these clubs started out under the leadership of mechanical department men and for a long time confined their discussions largely to mechanical subjects. Some clubs, like the New York, have always covered a wider field and have been railroad clubs in a large sense—in fact as well as in name. This is well, for no man, regardless of what department he is in, can afford to restrict his vision and activities to that one department. One great value of the railway clubs is that they have deliberately tried to carry on educational programs which would give all of their members a larger comprehension of the relation of the various departments to each other and of the necessity for teamwork between the departments. The railroad clubs, if properly conducted, should present a fertile field for cultivating closer relationships between the higher executive officers and the subordinate officers and foremen—in helping the railroads to cultivate a family spirit. If they can be only a partial factor in bringing this about they will repay many, many times over all the energy and effort which have been expended in developing them. Executives like Presidents Besler of the Central of New Jersey, Hedley of the Interborough, Pearson of the New Haven, Hustis of the Boston & Maine, and many others, will never know how much their friendly interests in the railroad clubs have done to encourage the subordinate officers and foremen. Just so far as this good work is continued, so much greater will be the opportunity for the development of the younger men and the opportunities for good as outlined in Mr. Basford's address.

Operated on a non-competitive basis and considered more or less an auxiliary of the transportation business, railroad shops often use obsolete and worn-out machinery which would not be tolerated in any other business—which could not, in fact, be tolerated if that business were to meet competitors' prices and survive. The need of modern machine tools in railroad shops has been demonstrated many times

Help The Stores Department

Railroad Clubs and Their Opportunities

Machinery Hall Teaches a Lesson

A Suggestion to the Committees

and is quite generally admitted. In size, diversity and labor-saving possibilities the exhibition in Machinery Hall this year is perhaps the most remarkable machinery exhibition yet held. Volumes would be required to explain in detail the merits of the lathes, planers, shapers, grinders, drilling, boring, forging and other machines exhibited. In general these tools embody the admirable features of design developed by modern manufacturers, including ample strength to push high-speed tools to the limit and maximum convenience of operation. The ease and speed with which operating adjustments to these machines can be made are truly wonderful. Railroads as well as other industries should benefit by the resulting high production. As one shop superintendent said, "It seems almost criminal that we should be struggling along with inefficient, old machines when tools are on the market able to do the work of four or more of the old ones." What is the answer? One live-wire master mechanic has supplied it as follows: "Find out if the new machines will show a net return of 15 per cent on the investment; put the facts up to the proper authorities and the necessary appropriations will be made." Of course, many railways continue to use obsolete machine tools because of difficulty in raising the new capital required to provide them as well as other improvements; but, really, is not this an explanation which is often overlooked?

Selection of Special Apprentices

THIS IS THE TIME of the year when the technical graduate completes his college course and is available for employment. The majority will be ready to report for work July 1. It is only in the spring of the year at the close of the second semester of college that this class of employe can be secured. Many of them have already been placed for this year. If selection has not yet been made, those roads which desire to train some of these young men as special apprentices must make arrangements within the next week or two, or the supply of available material will be exhausted, and the roads will be required to wait another year before receiving applications for these special apprenticeships.

In one way it is unfortunate that these men are on the market for employment at this particular time, when many roads are feeling the necessity for reductions in expenses, and consequently are slow to increase the number of any class of employes, or to increase the payroll by employment of a class of men not heretofore employed. On the other hand it is fortunate for the railroads that the present business depression throughout the country has lessened the opportunities open to these young men with engineering and manufacturing concerns and has made many more of the better type of the graduates in mechanical engineering available for railroad employment this spring. There never was a time when so many of these young men desired to enter railroad work. The railroads should take advantage of this opportunity to pick out some desirable college graduates and start them on a course of training.

Some roads have already made selections, having followed the practice of the commercial concerns by sending representatives to the engineering schools to explain the system of training offered, discuss the opportunities open, and to interview prospective applicants. This plan is most commendable. Railroads inspect materials and equipment purchased. It is equally important that brains purchased be likewise inspected. One reason the special apprentice has not been held in higher repute has been due to the fact that the industrial concerns went after and

secured the cream, those coming to the railroads being in many cases the left-overs—those with little initiative, who finding no other work available followed the line of least resistance and accepted the railroad employment with no particular liking or fitness for the work.

College graduates, like any other class of people, differ in ability, in make up, in fitness. You cannot make a purse out of sow's ear. College training merely develops the talents one possesses. It is not a guarantee of ability or fitness; it is merely a guarantee that the good man has been made better, has been developed and trained for greater usefulness. If railroads are to receive worth-while results from the training of technical graduates, care must be exercised in the selection of the men to be given the training, the most important qualifications to be considered being his liking for the work, his loyalty to his employer, his willingness to go through the routine and at times drudgery of training so essential if he is to fortify his scholastic acquirements with the practical realities and experience so necessary to fit him for useful railroad service.

Take a Broad View of it

THE GENERAL COMMITTEE of the Mechanical Division will soon have to determine how long next year's convention will last, what subjects shall be reported on and discussed and whether there shall be an exhibit. The question of confining the convention within a single week has been directly raised. It is believed by some that money could be saved in this way. It could be. The important point to consider is not merely what would be saved, but what might be lost.

Directly and indirectly the mechanical department officers determine whether expenditures for maintenance of equipment and for fuel which recently have exceeded \$2,000,000,000 a year shall be made to the best advantage. What is the total cost of the conventions and the exhibit compared with that huge sum? A slight decline in the efficiency of the mechanical departments would cost many times more than all the direct and indirect expenses of the conventions and exhibit, while a slight increase in the efficiency of the mechanical departments of the railroads would save a corresponding amount.

The real question is how best to promote the efficiency of the mechanical departments. The best way to promote it is to enlarge the opportunities, increase the knowledge, broaden the vision and stimulate the initiative of all officers of the mechanical department, from superintendents of motive power and master car builders down to foremen and assistant foremen. Will this be better done by reducing the length of the mechanical convention, and thereby restricting the number of subjects that can be considered, and the fullness with which they can be discussed, as well as the thoroughness with which the equipment and devices on exhibition can be studied; or will it be better done by continuing to have the convention extend over parts of two weeks, and increasing the number of subjects considered, encouraging full and free discussion of them and giving full opportunity to study the exhibits? When the conventions extend over two weeks more people can attend because they can come in two relays.

The railways should be developed, managed and operated with the greatest possible efficiency and economy. But the future as well as the present must be considered. They cannot be developed, managed and operated as efficiently in the future as they have been in the past without equally intelligent, broad and capable officers. Broad education as well as the best experience and training are necessary to the making of such officers. The technical

associations of the railways have done much to educate the past and present generations of officers. Are these associations to cease to be forums for the full, constructive discussion of technical problems and to be reduced to the mere role of registering standards regarding comparatively unimportant matters? If so, the technical officers of the next generation will not be equal to their duties and responsibilities, for they will lack the necessary education and breadth of vision.

We believe many men, including many executive officers, are thinking entirely too much about what association work costs the railways and much too little about what it has saved them in the past and can be made to save them in the future. As the *Daily Railway Age* said yesterday, the conventions should be highly educational as well as legislative. They should be used to make better officers as well as better methods and standards; in fact, without better officers the railways will never be able to develop and adopt better standards.

The giving of excessive attention to immediate and relatively small economies, largely in disregard of the effect they may have in the long run on the major expense accounts of railway operation, will save hundreds or thousands of dollars now, but cost millions of dollars later.

Today's Program

Three railroad associations will hold meetings in Atlantic City today.

Division VI, Purchases and Stores, A. R. A.

The meeting will be held in the Hotel Traymore, beginning sharp at 9 a.m.

	A.M.	A.M.
Discussion of Reports on:

The meeting will be held in the Greek Temple on the Million Dollar Pier, beginning sharp at 9:30 a.m.

Discussion of Report on:
Locomotive Construction.
Feed Water Heaters.
Modernization of Stationary Boiler Plants.

Air Brake Association

Lantern illustrated lecture by the Committee on Air Operated Auxiliary Locomotive Devices. Slides showing the graphic charts covering all phases of the maintenance of the various devices will be accompanied by a clearly explained use of the charts. A considerable number of railroads have already adopted and daily use the system proposed by the committee. The Air Brake Association also has on sale a hand-book covering in detail the committee's recommendations.

Following this illustrated lecture will be another lantern illustrated lecture on the universal passenger car

equipment, submitted by the Manhattan Air Brake Club, through J. C. McCune, the secretary of the club.

Recommended Practice will be the next subject taken up.

Entertainment Features

10:30 A. M.—Orchestral Concert, Entrance Hall, Million Dollar Pier.

3:30 P. M.—Orchestral Concert and Impromptu Dancing, Entrance Hall, Million Dollar Pier. Tea will be served at 4:30 P. M. in Entrance Hall.

9:30 P. M.—Grand Ball, Ball Room, Million Dollar Pier

Flight of the Prosperity Special

THE "PROSPERITY SPECIAL," with which everybody attending the conventions is familiar, was the most unique train ever run. Some of the railway men who saw the moving pictures and heard S. M. Vauclain's address at the Traymore on Sunday night were wondering whether the train had to be divided to go over bridges. The train ran as one section over the Pennsylvania Railroad from Philadelphia to Indianapolis. It was run in two sections from there to St. Louis, and in one section over the Cotton Belt from St. Louis to Corsicana, and over the Southern Pacific to El Paso. It is running between San Antonio and El Paso today. From there on it will be run in two sections, not because of any danger to bridges, but because of mountain grades.

The Baldwin Locomotive Works sent out circulars announcing the flight of the Prosperity Special, and there were demonstrations and celebrations in its honor at various points, most of them under the auspices of chambers of commerce, boards of trade, Rotary clubs, Kiwanis clubs, etc. The farmers along the way became especially interested at many points, and granges and other of their organizations were represented in the celebrations.

At Mansfield, Ohio, and several other places the schools were closed to give the children a chance to see the special.

At one point a farmer asked how much each locomotive cost and how much power it had. He was told the cost per engine was \$75,000 and the tractive power 3,000 horsepower. "That's an average of only \$25 a horse," computed the farmer. "I can't buy horses as cheap as that."

The total horsepower represented was 65,000. Every locomotive had on it an engineer who was charged with the duty of seeing that it was going along all right, and especially that the bearings did not get hot. The engineers on the fifth, eighth and thirteenth locomotives were captains, and it has been figured out that each of them had charge of the equivalent of 15,000 horses.

At Ft. Wayne the Chamber of Commerce took complete charge of the celebration, and had all the locomotives in the train strung with electric lights and a grand stand erected beside the tracks for viewing the train and for speech-making. At Indianapolis the principal speaker was former Senator Beveridge, who talked on "Permanent Prosperity for the people." At St. Louis the principal speaker was Mayor Kiel. The biggest celebration of all was at Houston, Tex., where a great crowd turned out to meet the train.

The Prosperity Special will be in Los Angeles on July 4, where it will be one of the big features of the Independence Day celebration.

A crowd so large that it had to be shown the pictures in installments attended the moving picture show illustrating the flight of the Prosperity Special, which was given by the Baldwin Locomotive Works at the Traymore. Sun-

Reports on Headlights and Material Specifications;
Much Interest in Axle Steels and
Lumber Specifications Evident

Chairman Tollerton called the meeting to order at 10 a.m.

Locomotive Headlights and Classification Lamps

In its report for 1920 this committee submitted recommended practices regarding the capacity and voltage of the turbo-generator and its location on the locomotive, wiring, lamps and dimmers. These were later adopted by letter ballot. The present report outlines the proposed extension of the recommended practice and covers bolt spacing of the generator base and headlight casing, sizes of steam, exhaust and drain pipes, sizes of ball bearings, brushes and screw threads and lubrication. Suggestions regarding design of generators are also made.

The cleaning of the silver-plated; copper type locomotive headlight reflectors has always been troublesome. The report for this year indicates that glass reflectors which require less attention probably meet the requirements of the Interstate Commerce Commission and it is to be expected that official tests will soon be available. Other work suggested for future reports includes the preparation of maintenance regulations which, it is thought, will be of assistance to the railroads in obtaining the best possible results from electric lighting equipment on locomotives.

APPROVAL of the plan to work jointly with manufacturers of headlight turbo generators and the Association of Railway Electrical Engineers in developing certain standard practices was given this committee at the 1920 convention, and in addition it was found advisable to include manufacturers of ball bearings.

The resulting recommendations for each of the subjects referred for development, with additional recommendations for brush holders and spacing of bolt holes in base of headlamp cases, are herein submitted for consideration, it being understood, where the recommendations necessitate redesigning, that they will apply to future construction only.

The lack of uniformity in number as well as location of supports or feet on the various makes and types of turbo generators, which is illustrated in Fig. 1, renders interchange difficult, and is detrimental to the best interests of manufacturers as well as objectionable to the railroads. The spacing recommended can be adapted to future designs without much difficulty, thus overcoming the present chaotic situation.

The recommendation for the location of the steam inlet may appear to allow the manufacturer more latitude than is desirable,

but to fix a definite location appeared to be an unnecessary handicap in the freedom of design. With the variation in location of steam inlet from the longitudinal and transverse center line of bolt spacing and vertically above the base plate in increments of $\frac{1}{2}$ in., any make of turbo generator can be applied without the necessity of changing the steam pipe from the boiler by using standard fittings and proper lengths of pipe nipples, standard lengths of which vary by $\frac{1}{2}$ in. increments.

The restriction of turbo generator manufacturers to one size of ball bearing was likewise considered as unnecessarily hampering future development, and particularly with reference to the design of the shaft. Much of the ball bearing trouble that is being experienced can be attributed to (1) rotating parts out of balance; (2) shaft running near the critical speed, producing excessive vibration; (3) shaft loose in bearings, which, existing, rapidly increases; (4) shaft too small, which, when attachments thereto are out of balance, springs out of line to seek its balance, thus throwing bearings out of alignment; (5) faulty design of bearing housing, which permits dirt to work into bearings. This condition is aggravated by centrifugal action of revolving parts,

creating a tendency to discharge air through all possible outside openings and draw in air near the center of the shaft, carrying dirt with it.

Shafts of larger diameter with a higher critical speed are less liable to distortion on account of parts out of balance, and with a range of the following three sizes of ball bearings (the principal dimensions being given in inches) which the ball bearing manufacturers agreed could be expected to give satisfactory results, a greater opportunity is afforded the designer to overcome the difficulties enumerated than would be the case if he were restricted to one size of bearing.

Bearing Number	Outside Diameter (Base of Housing)	Inside Diameter (Diam. of Shaft)	Width of Roll
306	2.8347	1.1811	.748
308	3.5433	1.5748	.9055
406	3.5433	1.1811	.9055

A method of overcoming the possibility of dirt working into bearings is a problem yet to be worked out by the designers of turbo generators, and in this connection the suggestion has been made that some form of air inlet near the center of the shaft be provided in such a way that the incoming air would not pass through the bearings; also that a pressed steel disc carried by the shaft running close to a pressed steel disc carried by the housing would soon fill with grease and form an effective dirt seal.

Experience has demonstrated that oil is best for lubrication. It should be as light as possible consistent with the conditions of heat under which it operates, but not so light that there will be excessive evaporation. The best results will be obtained if the oil is filtered and kept in a covered receptacle.

The bolt spacing for base of headlamp cases, while not one of the subjects originally referred to this committee, was considered advisable to standardize if possible, and it is believed that the recommended spacing, Fig. 2, can be readily adapted to all designs. Where a railroad's standard location for headlamp is on the top or near the top of smoke box, and the recommended bolt spacing will bring the top of the headlight casing above clearance limits, the transverse spacing of bolt holes can be changed to 14 in., but as there are so few railroads where this condition exists, it was not considered necessary to cover this addition in the recommendation, it being believed advisable to leave the matter to the railroads affected to arrange with the manufacturers.

In this committee's report to the 1920 convention, reference was made to headlight reflectors that were being developed which would not require as constant attention to keep clean as is the case with the silver-plated copper reflector. A large number of such reflectors of crystal and uranium glass with silvered backs and varying in diameter from 12 in. to 18 in., the size most commonly used being 14 in., have been in service a sufficient length of time to demonstrate the permanency of their reflecting value and the small expense required to keep clean.

From information received of tests that have been conducted, there seems to be no doubt that these reflectors, used in conjunction with lamps which have been adopted as standard, will produce ample illumination to meet the requirements of the Division of Locomotive Inspection of the Interstate Commerce Commission, but in the absence of what might be termed official tests, it is not considered advisable to present any recommendations at this time.

Consideration has been given to the advisability of using carb lamps of smaller dimensions, with the idea of reducing the size of lamp cases, and the lamp manufacturers are co-operating in an endeavor to produce a satisfactory 15-watt S-14, 33-volt lamp to be used in place of the present S-17 lamp, but the development has not advanced sufficiently to warrant other than mention. The S-14 lamp is approximately 1 $\frac{1}{16}$ -in. shorter and 3 $\frac{3}{8}$ -in. smaller in diameter than the S-17 lamp.

A number of new and commendable styles of headlamp cases have been developed by the manufacturers since the last convention, lightness of weight coupled with durability being the dominant features, although other noteworthy refinements have been accomplished. However, the committee has not thought it advisable to consider their standardization other than with respect to the bolt spacing of the base.

There will be found at the end of this report several recommendations for maintenance practice, and while the recommendations submitted at this time are few, it is hoped that the start that has been made will eventually result in the formulation of a set of maintenance regulations which will be of assistance to

the railroads in obtaining best possible results from the electric lighting equipment on locomotives.

The committee recommends that the following be submitted to letter ballot as recommended practice for future designs, and to be added to recommended practices previously adopted:

1. Turbo generators to have three feet for support and attachment to base plate, thickness of feet at bolt hole to be 3 $\frac{1}{2}$ -in. and ribbed on sides to engage head of bolt to prevent turning; ribs to extend to body of generator to strengthen the feet, holes in feet to be 1 $\frac{1}{8}$ -in. diameter for 5 $\frac{1}{2}$ -in. bolts, bolts to enter from the top, with nuts on underside of base plate. Bolt hole spacing to provide for one bolt at generator end on longitudinal center line of machine 5-in. from transverse center line and two holes at turbine end on opposite sides 5 $\frac{1}{2}$ -in. from longitudinal center line and 5-in. from transverse center line.

When clearance between foot and body of generator prevents entering bolt from top, foot may be slotted, but where it is necessary to slot all feet slot in foot at generator end should be parallel with longitudinal center line and slot in feet at turbine and parallel with transverse center line.

2. Steam inlet of turbo generator to be for 1 $\frac{1}{2}$ -in. iron pipe, exhaust outlet to be for 2-in. iron pipe and drain to be for 1 $\frac{1}{2}$ -in. iron pipe.

3. The variation in location of steam inlet from longitudinal and transverse center lines of bolt spacing and the distance above the base plate to be in increments of 1 $\frac{1}{2}$ -in. steam inlet to be on left side facing turbine end.

4. Ball bearings to be of any of the following numbers, which also designate the size:

No. 306	No. 308	No. 406
---------	---------	---------

5. Brushes to be 1-in. wide, 1 $\frac{1}{2}$ -in. thick and not less than 1 $\frac{1}{2}$ -in. long.

6. Brush holders to be equipped with springs so designed that no adjustment is necessary or possible during the full life of brush and commutator, and to provide uniform pressure during 1-in. wear of brush. Brush holders to be machined inside, set 3 $\frac{1}{2}$ -in. from commutator and at an angle of 10 deg.

7. Bolt spacing for base of headlight casings to be 12-in. by 12 $\frac{1}{2}$ in., the center line of back holes to be not more than 5 in. ahead of rear of case, bolt holes to be 1 $\frac{1}{8}$ -in. diameter for 3 $\frac{1}{2}$ -in. bolts, general design of casing to permit bolts to be applied from top with nuts on underside of bracket.

8. Screw sizes smaller than No. 12-28 thread not to be used, heads to be either fillister or flat and material to be brass or steel. For sizes larger than No. 12 use 1 $\frac{1}{2}$ -in., 1 $\frac{3}{16}$ -in., 3 $\frac{1}{8}$ -in., etc., bolt sizes, heads of 1 $\frac{1}{4}$ -in. and 3 $\frac{1}{8}$ -in. bolts to be slotted to permit use of screw driver.

9. Lubrication for turbo generators to be oil. The committee also recommends the following to be submitted to letter ballot as recommended practice for maintenance of turbo generators:

1. Oil for lubrication to be as light as possible consistent with the conditions of heat under which used, to be filtered before using and kept in a covered receptacle.

2. Oil reservoirs to be kept free from accumulation of grit and dirt.

3. Extensive repairs, and particularly repairs to rotating parts, to be done only at shops or designated points where adequate facilities are available.

The report is signed by W. H. Flynn (Chairman), Michigan Central; C. H. Rae, Louisville & Nashville; A. R. Ayers, New York, Chicago & St. Louis; H. M. Curry, Northern Pacific; J. L. Minick, Pennsylvania System; E. W. Jansen, Illinois Central; and R. W. Anderson, Chicago, Milwaukee & St. Paul.

Discussion

In the absence of the chairman, this report was read by Mr. Ayers, who said: "In connection with ball bearings I might call attention to the fact that bearings Nos. 306, 308 and 406 carry with them certain definite dimensions of the fit of the shaft in the bearing and the size of the bore in the housing. The size of the ball varies a little in different makes of bearings, so that the committee was not able to select the size of the ball that had to be covered by the shaft fit and the housing bore. By reference to the last column 'size of ball,' you will see that it works out fairly well."

During the reading of this report, Mr. Ayers further said: "I would call your particular attention to one dimension in that recommendation and that is the spacing of the two bolt holes at the turbine end. Since this report was agreed upon by the committee, it has developed that the resulting spread of bolts to eleven inches, in some cases, would be so wide that some of the boiler plate brackets now on locomotives would not take the new bolt spacing. The committee will be asked to consider changing their recommendation from 5½ in. from a longitudinal center line, to 4½ in. I think, for future designs, all of the manufacturers could meet the 9 in. dimension.

The committee thinks recommendation No. 3 is the most important of all.

C. T. Ripley (Santa Fe): I feel that the committee should be in a position to make definite recommendation as to the use of the glass reflector. These have now been in service for five years, and have proven so superior both in service and maintenance that there appears to be no reason for the application of silver reflectors—at least to new power. I do not know what is meant by official tests, but there are plenty of railroad tests which show that a glass reflector is the best now available.

As regards paragraph 5, your committee should discuss with the committee of the Railway Electrical Engineers, the question of the voltage of cab lamps. About two years ago this voltage was reduced from 34 to 33. We all know that we cannot hold the voltage of our generators constant. The change in voltage from 34 to 33 in the rating of the lamps means added life. Under the present conditions, we cannot buy 34-volt lamps. The 250-watt headlight lamp also needs attention, as a great many replacements are due to the bulbs becoming loose from the base. This can be overcome by lengthening the base, and I would like to see this new type lamp made standard.

H. B. Bohan (N. P.): I would like to concur with the gentleman's remarks on the glass reflectors. The experience of the Santa Fe has been the same as the Northern Pacific. I should also like to ask if any of the members have had any experience on the so-called illuminated dials and gages on cab lamps. We have been making quite a few experiments with illuminated gages for use in the caboose cupola and I just received a report at Atlantic City that the success of that type of gage has been uniformly good. The more we can keep off of the boiler, the better it is. If we could use an illuminated gage for the various gages in locomotive cabs, we would eliminate just so much wiring and conduits.

C. F. Giles (L. & N.): I would like to call attention to the development of the air-tight headlight casing that is being worked out by one of the manufacturers. I think it is worthy of the consideration of the committee in connection with their next year's report. We have made a test of one of them in a roundhouse for six or seven months, and it appears to be very satisfactory. The idea has been developed from the experience that people have had with the air-tight headlight on automobiles. The headlight reflector does not corrode nearly as readily when air is admitted to the casing.

H. H. Bentley (C. & N. W.): I am heartily in sympathy with what Mr. Ripley said about the glass headlight reflector, but it seems to me that we ought certainly to come to some conclusion as to what size reflector we want to use. It would not only help the manufacturers, but would help everybody else, and it seems to me that we ought to conduct a test to see which is the better size reflector for all purposes; that is, either 12, 14 or 16 in., as the case may be. I would recommend that the committee be authorized and instructed to make such tests as will conclusively determine the size of reflector that should be made standard.

There is one thing that our railroad copied from the Illinois Central in connection with headlights, and that is a shield over the headlight casing. I am just bringing it to your attention so that you may think about it. We heard from Mr. Bell that they were having very good results from a shield over the top of the headlight casing and the engineers were reported to be very much in favor of it. It kept the rays down and permitted them to see the signals much better than they could otherwise. We put a lot of them on our road and have now made it standard. I do not know whether any of you have seen it, but if you want a blueprint, I will be glad to furnish one. It certainly is working out very satisfactorily.

During the Railroad Administration there was some attempt made at standardization and, as I recall it, the committee at that time decided on a standard base for headlights. I am wondering how that standard conforms to or varies from the one that is now being recommended by the committee.

I am inclined to think that we ought to get away from the use of sheet steel for headlight casings. It seems to me that the development has been carried far enough so that some composition casing, which would be light in weight and not corrode, would be more satisfactory than the steel casing.

We had some trouble with the turbo-generator and it got so bad that finally we adopted a flexible connection which has apparently overcome all the trouble.

I am heartily in sympathy with recommendation No. 3 which reads: "Extensive repairs, and particularly repairs to rotating parts, to be done only at shops or designated points where adequate facilities are available." That is the practice we have had for a good many years. Before that we were having all sorts of improper repairs made to the air pumps with many failures on the road. Taking pumps to the place where we had the proper repair facilities reduced our air pump failures. I am satisfied in the case of a little turbo-generator which a man can carry around, that it should be taken to the repair shop for repairs instead of making them on the locomotive.

W. L. Bean (N. Y., N. H. & H.): I think that for road use the 16-in. glass reflector will be found sufficient and in comparison with the silvered steel reflector, we found that after it has been out for a while the 14-in. glass reflector will give higher illumination than the old style reflector.

As to keeping the diameter of the reflector down to just what may be necessary; I believe that to be particularly important in working out a desirable cast case because the weight is so much greater as compared with sheet iron. The cost of the reflector also increases rapidly with the increase in diameter. I think it will be found that 14-in. reflectors will be sufficient for road use and 12-in. reflectors for yard use. By the adoption of cast cases, the maintenance will be negligible to what it is now, especially in such locations as on the tenders of switching engines.

Mr. Ayers: Some of the electrical people can correct me if I am mistaken about the 33-volt and 34-volt lamp but my impression is that the voltage for a locomotive lamp should be the same as the car lighting lamp. If you put in a lamp with too high a voltage rating, the car-lighting battery will not supply it to its full illuminating power.

About spacing the headlight stand, I am not able to answer Mr. Bentley's question directly. The space recommended has little to do with any other spacing for the reason that almost no two of the stands are alike. We found different combinations. Some stands have bolts with a wide spread and others with a narrow spread; what the committee had to do was to get the generator manufacturers together to see what compromise could be made

which would not interfere with the operation of the equipment.

Mr. Ripley: It is true that that particular type of lamp (15-watt lamp) is used for car platforms and a different type of lamp is recommended for use in car lighting. Why cut down the lighting of all the headlight lamps to accommodate a few lamps on platforms.

Frank J. Hill (M. C.): In answer to Mr. Ripley's remarks; I do not think there is any difference in the illuminating value of a 33- and a 34-volt lamp. If you order a 33-volt lamp you will probably get a 34-volt lamp. That is something you will have to take up with the lamp manufacturer. If you get a 33-volt lamp you get a lamp that has a range of one volt either way.

Chairman Tollerton: In this discussion we would particularly like to hear from the electricians who have charge of this equipment and especially if they are having any troubles or difficulties in maintenance of the generators or other parts of the light equipment. This committee on electric headlights is seeking information. They have asked for certain instructions from the members of the convention and they cannot work intelligently unless they get some ideas of the troubles you are having.

C. E. Brooks (Canadian National): In connection with item No. 3, I believe that about 75 per cent of shaft renewals are due to the fact that the bearings are loose and this is generally due to the fact that the internal diameter of the bearing is too small. It seems to me that the committee could well cut down the number of choices that we have in the bearing and that we could get down to a bearing such as No. 308 which has the largest internal diameter.

Mr. Ayers: In selecting a size of bearings, the committee had to be careful not to place obstruction in the way of mechanical developments. There are several combinations of bearings for supporting generator shafting: One case in which the bearing is on the extreme edge of the shaft; another where both bearings are in the center, between the turbine and armature; another where the bearing is at the generator end; and another where the bearing is at the turbine end. Where there is a bearing in the center, it has to slip over any intermediate features and then to the bearing at the outer end of the shaft would nominally have a smaller bore. I think I am correct in saying that all three of the bearings recommended are larger than those commonly in use. The committee considered particularly the inside diameter, that is, the shaft diameter; there are bearings in use today that have a considerably smaller shaft diameter than the No. 306, which is the smallest one recommended by the committee. I believe it will be found that the construction is an improvement upon the previous method.

G. P. Kempf (P. & W. V.): Has the committee made any investigation as to lowering the generator with the shaft parallel with the center line of the boiler, or at right angles to it? I believe there have been some investigations as to decreasing the maintenance cost and insuring a longer life of the generator by making some rearrangement of this kind.

Mr. Castle (N. Y., N. H. & H.): In looking over the committee's recommendation there does not seem to be any reference to the consideration of lock nuts and lock washers. I think that matter should be considered in this connection. One other item is the size of pipe of the turbo-generator. On most roads the turbo-generator is located near the source of supply at the head of the cab and the 1/2 in. pipe will be found adequate, but it is a question where you carry the pipe up to the headlight near the stack, or even on the deck below the smoke box, whether the size of the pipe should be increased.

The last item that I wish to mention is the 3/8-in. bolts in

the headlight casing. If a smaller and more flexible casting is used it may be only a question of time when corrosion takes place and the bolts will be too small.

Chairman Tollerton: Mr. Ayers, will you state whether the committee has considered the question relative to generator location?

A. R. Ayers: There was considerable discussion about that and I think one road (Illinois Central) has made some experiments along that line. The question of the gyroscopic action was discussed; also the thrust of the bearings due to the sidewise oscillation of the locomotive but the jar on headlights, longitudinally due to a rough coupling, is probably a great deal more severe than side oscillation due to rolling. There are so many arguments on both sides of the question that the committee could not reach any conclusion. There did not seem to be any definite evidence that one method was better than another.

W. J. Bohan (N. P.): I would like to comment a little on what Mr. Giles had to say about the air-tight headlight casing. I do not believe that a headlight case could be continued on a locomotive indefinitely without developing leakage. We must not lose sight of the fact that the silvered reflector will corrode from gases which exist around a locomotive, while the glass headlight will not.

One more word about Mr. Bentley's remark as to the size of the headlight casing: I do not think that that matter should be taken too seriously, either. What we want on a locomotive is a headlight case that will give us the most returns for the expenditure and the handling of the headlight case is not a very serious matter. The tendency is to charge very nearly twice as much for the lighter alloy casings and I believe we could get the straight, cast iron case down to where it will be reasonable to handle and at a very much lower price.

Mr. Ripley: The location of the turbo-generator does make a difference. It has been found in actual service that it is considerably more difficult to maintain bearings on any turbine that is located longitudinally of the boiler. Our road is one of the earliest roads to use electric headlights and we have found to our entire satisfaction that the turbo-generator should be located transversely of the boiler.

Mr. Ayers: Defective bearings are probably responsible for more turbo-generator trouble than any other one thing because, as bearings wear, the armature gets down on the field. The ball bearing manufacturers told us that the bearings already in service were capable of higher speeds and far greater loads than anything they had to carry, which brings out the great importance of doing everything possible to keep the bearings in good shape.

I want to call your special attention to what is said about filtering the oil and keeping the oil channels clean. As time goes on and bearings with dirt shields and dust shields become more available, I believe that question should be considered. In other words, if we can keep the bearings on these machines in first-class condition, at all times, a great deal of our trouble will disappear.

The balancing of the rotating parts at the time of repair is very important. The chance is slight of being able to take off a carefully balanced turbine wheel and replace it with a turbine wheel out of stock and have that turbine wheel run at a good balance, three or four thousands revolutions per minute. In spite of this fact, I doubt if a great many people are rebalancing armatures or rotating parts after they make repairs. These are things we will have to give a great deal of attention to if we are going to keep these machines in good operating condition. *(It was voted that the report be accepted and submitted to letter ballot.)*

Chairman Tollerton: The chair regrets to announce the

death of W. C. Arp, one of our old and valued members. The death occurred at Terre Haute at 10.50 p.m., on

the night of June 16. A suitable resolution will be prepared at the proper time on Mr. Arp's death.

Report of the Committee on the Manual

The best evidence of the work of this committee lies not in the formal report, but in the Manual itself. This volume, bound in loose leaf form, contains the complete mass of standards and recommended practices of the Mechanical Division, not only conveniently arranged in section groups but thoroughly cross-indexed. For the first time in the history of the Division and of its predecessors, the Master Car Builders' Association and the American Railway Master Mechan-

ics' Association, the completed work of the organization is compiled in usable form so that it may readily be referred to as conditions require.

It is not at all improbable that much of the inertia in actually putting into effect many of the recommendations of the older associations arose from the great difficulty in determining just what were the latest developments as to standards or recommended practices on any particular subject. The loose leaf form permits the issuing of revisions with a minimum of delay.

AT THE DIRECTION of the General Committee, and with the assistance of the committees responsible for recommendations which have been adopted as Standard or Recommended Practice, your Committee on Manual has codified and published in one loose leaf volume the Standard and Recommended Practice of the Division; text and drawings. The adopted practices of the former American Railway Master Mechanics' and Master Car Builders' Associations have been carefully checked and harmonized and together with the practices since adopted by the Mechanical Division, American Railway Association, are included in this volume.

This book is designated as the Manual of Standard and Recommended Practice, Mechanical Division, American Railway Association.

For ready reference this Manual is divided into twelve Sections under the following headings:

- A—Specifications for Materials.
- B—Gages and Testing Devices.
- C—Car Construction—Fundamentals and Details.
- D—Car Construction—Trucks and Truck Details.
- E—Brakes and Brake Equipment.
- F—Locomotive Wheels, Tires and Miscellaneous Locomotive Standards.
- G—Safety Appliances for Cars and Locomotives.
- H—Train Lighting, Headlights and Classification Lamps.
- I—Rules for Fuel Economy on Locomotives.
- J—Inspection and Testing of Locomotive Boilers and Rules and Instructions for Inspection and Testing of Steam Locomotives and Tenders.
- K—Specifications for Tank Cars.
- L—Miscellaneous Standards and Recommended Practice.

K—Specifications for Tank Cars.

L—Miscellaneous Standards and Recommended Practice.

Each of the Sections is provided with an index and in addition there is a complete detailed index to the entire Manual.

The Rules of Interchange and Loading Rules are not included in this Manual even though adapted as standards. They are published in separate handy form and are revised and supplemented so frequently it would not, in the opinion of your committee, be practicable to include them.

Circular No. D. V. 231, dated May 16, 1922, has been issued to the members advising as to prices, etc. for this Manual.

The report is signed by W. E. Dunham (Chairman), C. & N. W.; A. R. Ayers, N. Y., C. & St. L.; W. F. Kiesel, Jr., Penn. System; A. R. Kipp, Soo Line; J. Hainen, Southern; J. T. Carroll B. & O., and J. McMullen, Erie.

Discussion

F. W. Brazier (N. Y. C.): I move the committee's report be accepted and the thanks of the association be extended to them for the splendid manner in which this manual is gotten up.

Mr. Kiesel: It should be stated that a large amount of the credit is due to our secretary, Mr. Hawthorne, who has worked very hard on this report.

(*The motion was duly seconded, put to a vote and carried.*)

Specifications and Tests for Materials

The committee submitted the following report on the subjects listed in our circular during the past year.

Sub-Committees

Sub-committees have been appointed and are now actively engaged in work on the subjects assigned.

- (a) Cooperation with the Rubber Association of America on the preparation of Specifications for Mechanical Rubber Goods.
- (b) Specifications for Welding Wire.
- (c) Recommendations for Water Gages and Lubricator Glasses.
- (d) Revision of present specifications for Galvanized Sheets.
- (e) Revision of specifications for Structural Steel.

MEMBERS DESIGNATED TO THE COMMITTEE BY THE GENERAL COMMITTEE

- (a) *Chairman*—W. E. Dunham, C. & N. W. Has the process

of heat treatment decreased the number of failures to any appreciable extent?

The committee felt that it did not have sufficient information among its members to satisfactorily answer this question and therefore requested the secretary of the association to circularize all members to secure the expression of opinion from those who have been using heat treated steel.

This circular was sent out and the original replies received have been tabulated in the following summary:

Total number of replies received, 77.

Number reporting no information, 52.

Of the remaining 25, four report that they consider heat treated axles and crank pins more satisfactory than untreated. Nine report that they are using heat treated material, but are doubtful as to the value of the heat treatment. Five report that they prefer annealed steel rather than the heat treated. Six report that their

experience with heat treated material has been unsatisfactory. One road reports that they consider heat treated axles satisfactory, but are using annealed steel for piston rods.

In some of the replies it is pointed out that a possible reason for some of the difficulties experienced with heat treated steel was due to an improper heat treatment and that it was possible that the same material, if properly heat treated, would have given satisfactory results. In some quarters there is a strong opinion that the best steel for locomotive forgings is that which has been given a proper annealing treatment to thoroughly refine the grain and relieve all stresses.

(b) *Revision of Specifications for Lumber, if such revision is needed. Representatives of the Purchases and Stores Division to be requested to co-operate with the Committee on Specifications and Tests.*

No action has been taken on this subject. The committee has not received any replies to the questions asked of the members in its report of 1921 regarding the value of the present lumber specifications and requesting suggestions for revision. This subject will be continued on the docket for future action.

CO-OPERATION WITH THE AMERICAN SOCIETY FOR TESTING MATERIALS ON THE SUBJECT OF SPECIFICATIONS FOR STEEL CASTINGS FOR RAILROADS

The Committee has had representatives serving with representatives of the American Society for Testing Materials on the Joint Committee on Specifications for Steel Castings for Railroads,

Comment and criticism of these specifications are requested from members of the association so that final action may be taken on them in the report for 1923.

Recommendations

REVISION OF STANDARD SPECIFICATIONS

Air Brake and Train Air Signal Hose. In order to take care of the provision of Rule 57 of the Rules of Interchange, it is recommended that Section 15, Label, be revised to permit the use of a rectangular label in addition to the band label, the wording of the paragraph to be as follows:

"15. Label. Each length of hose shall have vulcanized on it a label of red rubber, as shown in Fig. 2. This label shall be applied on the hose at a point 6 in. from the end (a variation of ½ in. either way will be permitted) and with the top of the lettering toward the center of the hose. The use of a rectangular label in addition to the band label is optical with any railroad, providing space, preferably 2 in., is allowed between the two labels."

The committee also submitted exhibits containing revisions of numerous recommended practice specifications and new specifications as shown below. These exhibits are voluminous and because of their specialized character, they are not reproduced here.

REVISION OF RECOMMENDED PRACTICE SPECIFICATIONS

- (a) Specifications for Turpentine.

Of the large number of subjects covered in the report, probably the most important is the specification prepared by the Joint Committee on Steel Castings for Railroads. The specification has still to be submitted to the membership of the American Society for Testing Materials and, as noted in the report, has not yet been considered jointly with the other mechanical division committees interested. The advantage of a single specification with one chemical content for all railroad steel castings is apparent, from the standpoint of the manufacturers as well as the railroads.

The question of revising the lumber specifications is also an important matter although no action has yet been taken. Some of the lumber associations have advocated more elastic grading rules claiming that the present requirements throw a large part of the log into the lower grades and increase the cost of supplying the quality of lumber which the railroads demand. It may be advisable to consider whether the disadvantages of slightly lower grade lumber would offset the reduction in the cost that might be effected.

which has been working for the past two years and which held a final meeting on March 24, 1922, and approved proposed specifications for submission by each of the representatives to their parent bodies.

The A. S. T. M. representatives have submitted their report to Committee A-1 on Steel, which has approved the specifications to be included in their report to the society in June, 1922, as a proposed tentative specification to be published in their proceedings in order that it may be available for comment and criticism.

The committee's representatives have made their report transmitting the proposed specifications to the secretary of the association. The committee feels that the specifications proposed by the joint committee are the best that have so far been produced and that they cover grades of cast steel suitable for all railroad purposes. The committee would unhesitatingly recommend these specifications to go to letter ballot of the association as Recommended Practice in place of both the tentative specifications for steel castings submitted with their report of 1921, and the present standard specifications for steel castings, were it not for the fact that the Car Construction Committee and the Coupler Committee were also represented on the Joint Steel Castings Committee, and there has been no time for joint consideration of the specifications by these committees. In view of this condition the specifications are included in this report (Exhibit A) for information only.

- (b) Specifications for Oxide of Iron Paste.
(c) Specifications for Black Paint.
(d) Specifications for Raw Linseed Oil.
(e) Specifications for Boiled Linseed Oil.
(f) Specifications for Red Lead.

NEW RECOMMENDED PRACTICE SPECIFICATIONS

- (a) Specifications for Mineral Spirits.
(b) Specifications for Red Lead and Oil.
(c) Specifications for Extended Red Lead Paste Paint.

The Committee recommended that the above revisions and new specifications be submitted to letter ballot of the association.

The report is signed by F. M. Waring (Chairman), Pennsylvania System; J. R. Onderdonk, Baltimore & Ohio; Frank Zeleny, Chicago, Burlington & Quincy; A. H. Fetters, Union Pacific; H. G. Burnham, Northern Pacific; J. C. Ramage, Southern Railway; J. H. Gibboney, Norfolk & Western; H. P. Hass, New York, New Haven & Hartford; T. D. Sedwick, Chicago, Rock Island & Pacific; G. N. Prentiss, Chicago, Milwaukee & St. Paul; G. E. Duke, New York Central and H. D. Browne, Engineer Tests, Chicago & Northwestern.

PROPOSED STANDARD SPECIFICATIONS FOR CARBON STEEL CASTINGS FOR RAILROADS

As Agreed Upon by

THE JOINT COMMITTEE ON STEEL CASTINGS FOR RAILROADS AT ITS MEETING HELD AT PHILADELPHIA, FRIDAY, MARCH 24, 1922.

1. **Scope.**—(a) These specifications cover all carbon steel castings for locomotive and car equipment, and for miscellaneous use, classified as Grade A and Grade B.

(b) Grade A castings shall be furnished annealed unless otherwise specified by the purchaser.

Grade B castings shall be furnished annealed.

(c) The purposes for which the two grades are generally used are:

Grade A, unannealed, covers only such special castings as may be approved by the purchaser. Grade A, annealed, covers such castings not covered by Grade A, unannealed.

Grade B, covers all castings for high stresses, such as truck side frames, bolsters, couplers and coupler parts, locomotive frames and locomotive drivin. and trailer wheel centers.

I. MANUFACTURE

2. **Process.**—The steel may be made by one or more of the following processes: open hearth, electric furnace, crucible or side blow converter.

3. **Annealing.**—(a) Castings shall be allowed to become cool. They shall then be uniformly heated to the proper temperature to refine the grain and allowed to cool uniformly.

(b) **Annealing Lugs.**—For the purpose of determining the quality of annealing at least two and not more than four annealing lugs shall be cast on all castings 150 lb. and over and on such castings less than 150 lb. as required by the purchaser or his representative. The location of the annealing lugs shall be such that when removed by the inspector they shall be indicative of the character of annealing. The standard annealing lug shall be 1 in. in height and 1 in. width and $\frac{5}{8}$ in. thickness where it joins the casting.

(c) If, in the opinion of the inspector, a casting is not properly annealed, he may at his option require the casting to be re-annealed.

II. CHEMICAL PROPERTIES AND TESTS

4. **Chemical Composition.**—The steel shall conform to the following requirements as to chemical composition:

	Grade A.	Grade B.
Manganese, not over.....	.85 per cent	.85 per cent
Phosphorus, not over.....	.05 per cent	.05 per cent
Sulphur, not over.....	.05 per cent	.05 per cent

5. **Ladle Analyses.**—An analysis of each melt of steel shall be made by the manufacturer to determine the percentage of carbon, manganese, phosphorus, sulphur and silicon. This analysis shall be made from drillings taken at least $\frac{1}{4}$ in. beneath the surface of a test ingot obtained during the pouring of the melt. The chemical composition thus determined shall be reported to the purchaser or his representative when requested, and shall conform to the requirements specified in Section 4.

6. **Check Analyses.**—An analysis may be made by the purchaser from the broken tension test specimen or from a casting representing each melt. The chemical composition thus determined shall conform to the requirements specified in Section 4. Drillings for analysis shall be taken not less than $\frac{1}{4}$ in. beneath the surface, and shall be taken in such a manner as not to impair the usefulness of a casting.

III. PHYSICAL PROPERTIES AND TESTS

7. **Tension Tests.**—(a) The steel shall conform to the following requirements as to tensile properties:

	Grade A.		Grade B.	
	Unannealed.	Annealed.	Unannealed.	Annealed.
Yield Point, per sq. in.	29,000 lb.	29,000 lb.	36,000 lb.	36,000 lb.
Elongation, per cent.	1,100,000	1,600,000	1,600,000	1,600,000
	Tens. Str.	Tens. Str.	Tens. Str.	Tens. Str.
Elongation, not under.	34 per cent	24 per cent	22 per cent	22 per cent
Reduction of Area, per cent.	2,400,000	2,400,000	2,400,000	2,400,000
	Tens. Str.	Tens. Str.	Tens. Str.	Tens. Str.
Reduction of Area, not under.	30 per cent	35 per cent.	30 per cent.	30 per cent.

(b) The tensile strength shall be reported as information.

(c) The yield point shall be determined by the drop of the beam or by the dividers, the method being optional with the purchaser, and at a crosshead speed not to exceed $\frac{1}{8}$ in. per minute. The tensile strength shall be determined at a speed not to exceed $\frac{1}{2}$ in. per minute.

8. **Test Specimens.**—(a) A sufficient number of test coupons, from which the required test specimen may be prepared, shall be cast attached in the neighborhood of each end of each locomotive frame, attached to each locomotive cylinder, to each wheel center, and to miscellaneous castings weighing over 150 lbs. These test coupons shall remain attached to the castings throughout the annealing and until the castings are presented for inspection. If the design of the casting is such that the test coupons cannot be attached they shall be cast in runners outside of the casting, but attached to it to represent each melt. The location of the test coupons, as well as the method of casting such coupons, shall be subject to mutual agreement by the inspector and the manufacturer. In the case of any orders for castings weighing under 150 lbs., the physical properties as required in Section 7 may be determined from an extra or spare test bar cast with and attached to some other casting from the same melt.

(b) When sufficient coupons have not been cast, a test specimen may be cut from a finished casting at a location mutually agreed upon by the inspector and the manufacturer.

(c) Tension test specimens shall conform to dimensions shown in Fig. 1. The ends shall be not less than $\frac{7}{8}$ in. in diameter and of a length and form to fit the holders of the test machine in such a manner that the load will be axial.

A. S. T. M. Standard Test Specimen
A. R. A. Standard Test Specimen

These are alike except diameter, which is: A. S. T. M. 0.5 in., A. R. A. 0.505 in.

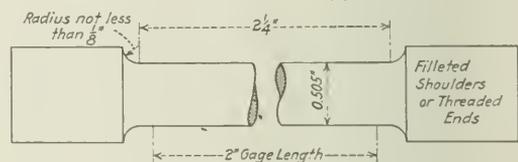

Fig. 1

9. **Number of Tests.**—(a) General Requirements. (1) One tensile test shall be made from the neighborhood of each end of each locomotive frame and both tests shall meet the requirements of the specifications. One tensile test may be made from each wheel center and each locomotive cylinder castings, but at least one of each kind of such castings in each melt shall be tested. For miscellaneous castings from melts which do not include frames, wheel centers or cylinders, one tensile test shall be made from each melt, except as provided in Section 9B-1.

(2) If the test specimen shows defective machining or develops flaws, it may be discarded and another specimen substituted.

(3) If the percentage of elongation of any tension test specimen is less than that specified in Section 7 and any part of the fracture is more than $\frac{3}{4}$ in. from the center of the gauge length, as indicated by scribe scratches marked on the specimen before testing, a retest shall be allowed.

(4) If the results of the physical test lot do not conform to the requirements specified, the manufacturer may re-anneal such lots, but not more than twice, and retest shall be made as specified in Section 7.

(5) No part of this specification shall operate to cause any one tensile test to apply to more than 40 tons of castings as offered for inspection.

(b) Special Requirements for Miscellaneous Castings.

(1) After 15 consecutive melts, which may contain any or all classes of castings (except frames, wheel centers and cylinders) covered by these specifications on one or more orders have been tested and accepted in accordance with the above requirements, the manufacturer may group the succeeding melts in lots of five melts each, but each lot not to exceed 40 tons, the entire group to be accepted if the test specimen selected from the lot fulfills the chemical and physical requirements herein specified. If this test fails, a reheating will be granted on the melt that the failed

bar represents, and the other four melts of the group shall be tested individually.

(2) If there is a period of more than six months between shipments of the class of castings covered by these specifications, then each melt shall be tested individually until 15 consecutive melts have been accepted, after which the melts may again be grouped as in paragraph 9b-1.

(3) If one or more melts are rejected, each succeeding melt shall be tested individually until 15 consecutive melts have been accepted, after which melts may again be grouped as in paragraph 9b-1.

(4) In case of small orders for bolsters, truck sides, draft arms, yokes or castings weighing over 150 lbs., where the size of the order and the available pattern and foundry equipment are such that not more than five castings can be cast in any one melt, the physical properties, as required in Section 7, will be determined from an extra or space test coupon cast with and attached to some other casting of the same melt.

10. **Alternative Tests to Destruction.**—In the case of orders including only castings not exceeding 150 lbs. in weight, the test to destruction of one casting from each 100 castings or smaller lot may be substituted for the tension tests at the option of the inspector. This test shall show the material to be ductile, free from injurious defects and suitable for the purpose intended.

IV. WORKMANSHIP AND FINISH

11. **Workmanship.**—(a) All castings shall substantially conform to the size and shape shown on purchaser's drawings, and shall be made in a workmanlike manner.

(b) The castings shall be free from injurious defects.

(c) Minor defects which do not impair the strength of the castings may be welded by an approved process with the approval of the inspector. The defects shall first be cleaned out to a solid metal, and after welding the castings shall be annealed, if required by the inspector.

V. MARKING

12. **Marking.**—The manufacturer's name or identification mark and the specified pattern number shall be cast on all castings. In addition the month and year when made shall be cast on all bolsters, truck sides, frames, wheel centers, cylinders and similar castings. The location and size of numbers shall be agreed upon by the manufacturer and the inspector. In accordance with the standard practice of the individual foundry to identify individual castings, a serial number may be cast or the melt number may be stamped on bolsters, truck sides, frames, wheel centers, cylinders and similar castings as agreed upon by the manufacturer and the inspector. The melt number shall be legibly stamped in all other castings weighing over 150 lbs.

VI. INSPECTION AND REJECTION

13. **Inspection.**—The inspector representing the purchaser shall have free entry at all times while work on the contract of the purchaser is being performed to all parts of the manufacturer's works which concern the manufacture of castings ordered. The manufacturer shall afford the inspector, free of charge, all reasonable facilities to satisfy him that the castings are being furnished in accordance with these specifications. Unless otherwise specified, all tests (except check analyses) and inspection shall be made at the place of manufacture prior to shipment.

14. **Rejection.**—(a) Unless otherwise specified, any rejection based on tests made in accordance with Section 6 shall be reported within five working days from the receipt of samples.

(b) Castings which show injurious defects subsequent to their acceptance at the manufacturer's works will be rejected and the manufacturer shall be notified.

15. **Rehearing.**—Samples tested in accordance with Section 6, which represents rejected castings, shall be preserved for two weeks from the date of test report. In case of dissatisfaction with the results of tests, the manufacturer may make claim for rehearing within that time.

Discussion

Mr. Ayers: Would it be practicable to have the letter ballot, in the case of these specifications, state briefly what the change was in the proposed specification from

the old specification, and why that change was proposed?

Mr. Waring: That will be taken care of in the letter ballot in the usual way, by printing the old specification along with the proposed revision, so that direct comparisons can be made.

Mr. Ayers: That takes a good deal of time and, to a person who has not made a study of the subject, the reason for the change is oftentimes not known. I was wondering whether it would not perhaps save some printing and clarify the subject, if the letter ballot should be confined particularly to the change from the old specification and that change was made.

Mr. Waring: There is no doubt that would be excellent information and if it meets with the approval of the members and they will authorize the committee to prepare that statement, we will be glad to do it.

Mr. Ayers: I make a motion that the committee be instructed to do that in submitting their report to letter ballot.

(The motion was duly seconded and carried.)

H. F. Bentley (C. & N. W.): I notice that the Rubber Association is co-operating with the committee in regard to specifications and I was wondering why the American Welding Society should not be called upon to do the same in working up specifications for welding wire. I had occasion to talk before some of the members of the American Welding Society the other day and brought up the question of specifications for welding wire. I would suggest that they be asked to co-operate with this Association.

A large number of driving axle failures have probably been charged up to the kind of steel in the axle. We were having so much trouble that we made a careful study and found, by etching the broken parts, an original check had been made in the bearing of the axle by a pointed, diamond-shaped tool. Subsequent operations on this bearing, consisting of rolling the bearing to a smooth finish, had covered up those grooves made by the pointed tool and to all appearance we had an excellent finish. We had the assistance of Dr. Howard, engineer physicist of the Interstate Commerce Commission who proved to us conclusively that the initial start of the fractures on the majority of these axles was not due to the quality of the steel but to the impression left by a sharp-pointed tool in the roughing cut.

E. E. Chapman (Santa Fe): With regard to the effect of sharp tools in causing fractures, we have found by a great many investigations that failures are directly chargeable to this cause rather than to defective material. Also on certain classes of engines we find that it is a question of the life of the axles. When they become from seven to nine years old, we have a good many failures.

G. W. Rink (C. of N. J.): The question of heat treated axles and crank pins has not been fully settled yet. We recently had 25 heavy Mikado locomotives built with heat treated axles, crank pins and so forth, and I was much surprised to learn that those engaged in doing the heat treating did not recommend heat treated material for that purpose. They predicted all kinds of calamities, stating that in the very near future, we would have broken axles. Personally, I am a believer in open hearth steel thoroughly annealed but this time we strayed from the beaten path and thought we would get something a little better. As I stated before, however, the people who were doing the heat treating did not think as much of heat treated steel for axles and crank pins as they did of the annealed steel.

Several of these axles broke during the hammer test and fractured clean through, similar to a chrome vanadium shaft that I saw on a big hoisting engine some years

This hoisting engine had a 17-in. shaft which was in service only about six months when it failed through the center. This shaft was made of chrome vanadium steel, but a 40-point carbon shaft, put in to replace it has been running for the last ten years without any signs of deterioration. I presume that is right in line with the argument that sooner or later we will experience trouble with these axles.

W. F. Kiesel: We have used a large number of heat-treated axles, crank pins, and other parts, and naturally, made a study to find where the difficulties lie. Segregating is very bad, and, as indicated before, if you have a nick or a sharp corner or anything of that kind you are almost certain to start a detailed fracture, but if your chemistry is right, you have no segregation. If you are careful to have nearly uniform sections with large radii at shoulders, the heat treated axle does very well and gives you the benefit of heat treatment. I remember one case where we had axles with the radius between the wheel seat and the body of the axle not clearly defined on the chart. Some of the radii seemed about $\frac{1}{4}$ -in. and fractures started at these points. After we increased the radius to an inch and a half the fractures ceased. Furthermore it is a good thing to be sure that all segregation is eliminated by drilling a hole through the center of the axle, or a crank pin whichever it may be. This will show if there are any internal checks, rolling imperfections, or checks in the billet, which will be accentuated by heat treatment.

Mr. Brazier: I would like to digress a little, if I might, from the report. There is nothing on a railroad that gives as much trouble today as bursting of airhose. You cannot judge a man's physical condition by the clothes he has on; he may have a very poor heart covered up with a nice suit of clothes. Neither can you judge the airhose by its outward appearance. Years ago we used to have a label showing the dates of application so as to give an idea how long hose had been in service. I have endeavored through the committee and through the secretary to have this question brought up because there are quite a number of railroad officials who think that we should have a time limit on hose. A hose that has been in service four or five years, deteriorates. When you put on the air pressure, you do not know what minute the hose will burst. We have a rule on our railroad that we take from passenger service all airbrake hose after it has been in service one year. It is then put in freight service, our rules used to be for two or three years) and finally scrapped. We dare not run the risk of longer service, but today I do not know how we are going to tell how long a hose has been in service, or what its condition is unless we go back to the use of a label, showing the date of application. Personally I can see no harm in going back to the old way of putting on the dates of application so you will have something to go by in judging how long an airhose has been in service.

Chairman Tollerton: I would like particularly to hear from the engineers of tests. They are vitally interested in these discussions. After specifications are adopted and after the work of this committee has finally received the approval of the railroads we do not want engineers of tests to tell the purchasing departments that the specifications are no good. If you have any criticisms now is the time to discuss them and we would like to hear from everyone.

Mr. Fuller: I do not know of any subject that is more important today than the subject of steel. My friend Brazier got off on hose. I think steel is more important.

We are using heat treated chrome vanadium and other grades of steel. We are buying the best that the steel

makers can make and we are having more trouble today than we had with iron. It seems to me that the steel makers should at least give the purchasers of steel some information as to how their steel should be handled. You buy billets in cold weather and in warm weather take them in the blacksmith's shop and work them, you get indifferent results. The manufacturers will tell you that you should not work certain steel until the frost is taken out of it—after you have had your trouble. Now, if it is true that certain alloys of steel cannot be stored outdoors in cold weather and should not be put in the blacksmith's shop furnace or fire without certain "decent" treatment as they call it, I think we should have the information. We are having, and so are other roads having, an epidemic of broken crank pins. We thought a goodly amount of it was due to punishment in the shop in turning the pins out and leaving toolmarks, but we found some that showed no indication of tool marks.

It seems to me that this Association, with the help of the steelmakers, can help the railroads and each other if what can be done with certain kinds of heat treated steel is made plain.

If we have any steel representatives here I would like to hear from them. We have a condition right now of billets that look like an oak plank, split on the ends and on the side with cracks $\frac{1}{2}$ in. in depth. They were not split when shipped because no steel maker would ship a carload of billets with the ends checked. I think that the steel maker should come to our rescue and tell us what we can do with their steel.

C. E. Chambers (C. of N. J.): Mr. Fuller is placing the steelmakers in a very embarrassing position. I will tell you how I would handle that matter if I had any trouble in regard to steel. I would get in touch with the manufacturer who made the steel and thresh it out with him. He might be more willing to talk across a desk than to get up and discuss the matter before the convention.

Mr. Fuller: I want to apologize to the steelmakers if I have been taken wrongly. I appreciate that the steelmakers are doing, possibly, all they can. We could take this matter up with them and see if some change could be made so that these conditions would be avoided. However, I still believe that if the steelmakers were here, they could tell us of certain abuses to be avoided in handling steel.

G. W. Rink (C. of N. J.): I would like to have an expression from the convention as to what is considered the best metal for Walschart valve gear links, wrought iron case hardened, or mild steel case hardened. No doubt some of our members have had experience with both metals and I would like to know what the percentages of failures are with the various kinds of metal.

Prof. Endsley (University of Pittsburgh): With regard to some comments by Mr. Brazier, I will say that some tests were run a few years ago at Purdue University which partly demonstrated, at least, that the age of the hose was worth more than its appearance in determining whether it was a good hose or not. Of course there were some exceptions to the rule in these tests, but the general average of the tests was in favor of the age of the hose determining its condition.

In regard to tool marks left in the rough turned axle, either from a sharp tool or a torn place due to a heavy cut, these can never be rolled out. Any rolling of the metal causes a compression longitudinally in the axle and this longitudinal compression causes a tension on the bottom of any of these checks, increasing the possibility of failure at that point.

In some vibratory tests which I have conducted, I found that a mere scratch upon the polished surface will influence the life in vibrating this metal. In reversal of stress,

and that is what an axle is subject to, these imperfections, whether rolled out or not, are bound to produce failures.

With regard to co-operation between the steel maker and the users of steel, I am confident, that this should be close. They should co-operate; the manufacturers should tell the temperature at which a given steel should be worked and the users should follow these instructions closely. It is a known fact that the temperature at which steel is worked has a large bearing upon the service which will be obtained.

Mr Waring: The standard label does show the date when the hose was made so that the age of the hose can be determined from the label.

The date of application, however, is not given.

Your committee will be glad to act on the suggestion that was made to co-operate, if possible, with the American Welding Society in connection with the specifications for welding wire.

Your committee also wanted to call attention to the fact that in presenting these specifications for paints, and paint materials your committee is of the same opinion that such specifications should not be standardized. They should be presented as recommended practice because conditions vary in different parts of the country on different railroads and it is nearly always necessary for the individual railroad to prepare specifications for paint. These specifications are submitted merely as a guide and recommended practice.

Your committee wishes you particularly to give careful attention to the proposed specifications for carbon steel castings for railroad use and the committee would be glad to have any comments or criticisms on these specifications sent in as soon as you can after the convention.

T. H. Goodnow (C. & N. W.): I wish to refer to the committee's report where they refer to a "revision of specifications for lumber" in connection with which they are apparently undecided as to whether any action is necessary at this time. I believe that the specifications need revision and my opinion is based on the recent experiences we have had in trying to harmonize the grade wording under the present specifications with the various lumber associations. If the committee does undertake the revision of the lumber specifications in connection with representatives of the purchases and stores department, I feel that there should be co-operation through some channel of the A. R. A. and the various lumber interests to bring about these revisions. In this way the wording of the grading that is used in our specifications will be such that we can buy lumber and buy it intelligently. At the same time there will not be this constant question arising as to what the wording means. No. 1 may mean one thing in the northern part of the country and may mean another thing in another section.

With regard to Mr. Brazier's remarks about the label, age is not to be depended upon entirely for the removal of rubber hose. Some very careful investigations and tests were made some years ago, showing that after all, you have to decide upon the removal of hose from its appearance at the time it is being inspected.

The secretary calls attention to the fact that at the time the badge was changed the Train Brake and Signal Committee set up the soap suds test to be used as the determining factor in the removal of hose.

Mr. Fuller: I do not want to do all the talking, but Mr. Goodnow, I think, is absolutely correct when he says that the specification for lumber should be worked out with the lumber dealer. We find it is almost impossible to buy lumber under car specifications, due to the fact that the lumber associations keep changing their grade of lumber. That is especially true on the western coast and there is no use in our getting up a set of specifications and then,

when we want to buy lumber, we cannot buy it without paying exorbitant prices. I think it will save time and help the railroads more if we will co-operate with the lumber associations in making up the specifications for lumber.

Chairman Tollerton: The secretary advises that Mr. Hoover, secretary of the Department of Commerce, is working with the American Railway Association along the lines suggested by Mr. Fuller and Mr. Goodnow.

Before calling for action on the committee's report, there is a motion before you, made by Mr. Ayres and duly seconded, that in sending out the letter ballot for the approval of the report, the changes made in the report be printed and issued with the letter ballot. Are you ready for the question?

(The question was duly put to a vote and carried.)

Chairman Tollerton: A motion is in order that the report be accepted, and the recommendations contained in the report submitted to letter ballot.

(This motion was duly put and carried.)

C. E. Chambers: The committee would like to submit for the approval of the Convention, the following telegram:

"Atlantic City, June 19, 1922.

Mrs. W. C. Arp,
Terre Haute, Indiana.

Word just received of death of Mr. Arp. Master Car Builders and Master Mechanics Division of American Railway Association in convention here extend to you their deepest sympathy in your sad bereavement.

W. J. Tollerton, Chairman,
Mechanical Division."

Mr. Fuller: I move that the message be sent.

(Motion seconded and carried.)

Mr. Chambers: The Committee on Resolutions will offer a resolution that the subject of wheels be reopened, as the particular part of the subject which we have in view is vital in the locomotive question. Also the further use of steel wheels when removed from engines in local service to be applied to yard service engines in order to get maximum wear before scrapping should be discussed.

O. C. Cromwell (B. & O.): The committee made a report last week relative to reducing the limited wear on steel tires for yard service. As you know now, the limit of wear is $\frac{1}{4}$ in. above the limit of the rail groove. That ordinarily gives $1\frac{1}{2}$ in. of metal between the spread and the nearest point of the critical line. That limit was established quite a number of years ago before we had much experience in the performance of rolled steel wheels. It was predicated largely upon experience gained through the use of steel tired wheels.

Many improvements have been made in railroad steel wheels and I think your present cuts show that you have a thickness of $1\frac{3}{8}$ in. on rolled steel wheels as against $1\frac{1}{2}$ in. on wheels with a straight bore. That figure was originally established because there was not a definite knowledge as to the inside contour under the rim, but we have established a standard section of tread and that has been used for some time. Your committee has had before it for some time the question of reducing this limit, bringing it down to $1\frac{1}{8}$ in for tenders in switching service.

Prior to these limits being incorporated in the I. C. C. rules some roads had had experience in running wheels in light service and found it could be done with safety. The committee would like to present this matter now to the association and would like to have some discussion as to the point of reducing that wear on tender wheels in switching service.

Chairman Tollerton: I do not believe there was any second to the motion.

Mr. Giles: I will second it.

(The motion was put and carried.)

H. C. Oviatt (N. Y. N. H. & H.): It does seem to me this is a question which ought to be given considerable thought before any final action is taken. The possibility and danger of getting such wheels mixed up and applied to the wrong class of equipment seems to me important. Where wheels of that description are turned down for switching service they are liable to get under passenger equipment, which might be dangerous. I want to inject that thought before any final action may be taken.

Mr. Giles: I will state for the benefit of Mr. Oviatt and the members of the association that this has been our practice for eight or ten years and we have had no trouble in keeping the wheels apart and we do not get them mixed. It is a perfectly feasible proposition.

Mr. Ripley: In further answer to Mr. Oviatt's question, I wish to state that the committee felt that the switching service should be used for the test inasmuch as it would be possible to observe the results more readily than in road service, as well as there being less chance of accident in case of flange failure. The switching engines operate over sharper curves and if there is any tendency to flange weakness it should develop in this service.

There is another feature in regard to comparing the scrapping limits of steel tired wheels and forged steel wheels not mentioned in the former discussion. That is the fact that the steel tires are shrunk on the center which means an initial strain tending to increase breakage. The best metal in the rolled steel wheel is that on the inside of the rim, as the pressure of the rolls comes directly at this point.

Mr. Chambers: I think that this is a vital question. Every railroad man is constantly being advised to adopt every means of bringing about economical operation. That is something that must be considered and if we can put a used wheel on some locomotive tender in the yard and get a year or eighteen months of additional service out of it we are not justified in scrapping it.

Mr. Giles: It appears to me that the secretary in calling attention to the consideration that was given this matter by the General Committee, should refer to the understanding that the committee had with Mr. Pack that the question would not be discussed at this meeting of the association.

Mr. Chambers: I might say that on our road for years, we put some of these wheels which had reached the limit for heavier passenger car service, in lighter passenger service and never had any accidents.

Mr. Ripley: I may mention that your committee wishes to be conservative on this entire question. They first ran laboratory tests and next studied flange failures. Both of these indicated distinct possibilities of reducing the scrapping limit on all railroad steel wheels they would first reduce the limit on switch engines in order to get a service test. They feel and hope that this test will prove beyond question that the limit can be reduced on all wheels. The railroads will then be able to make a great saving.

A. G. Pack (Chief Inspector, Bureau of Locomotive Inspection, I. C. C.): I do not know whether it is permissible for me to make any remarks on this matter, but I want to say that I have a very high regard for the opinion of this organization as an association and am perfectly willing to go along with this Association in its recommended and standard practices. I am also ready to meet and discuss matters with your representatives. I am, however, very much averse to adopting any standards in switching service and also road service wherein the parts are not easily interchangeable.

Again, I believe that stresses on the flanges in yard serv-

ice are equally as great, if not greater, due to rough track and heavy curves and many turn-outs, frogs, etc., than on road locomotives.

In comparing the locomotives on the railroads in the United States—more than 70,000—I find that it is practically impossible now to keep many of them legally within the requirements of the rules and I fear very seriously that if you adopt a standard for switching locomotives it will be put into use in connection with the road service. If it is an unsafe practice in road service that would certainly compel the Bureau of Locomotive Inspection to take action we are not desirous of taking; that is, in enforcing the punitive side of the law.

If after due consideration by this Association, you are willing to go on record in your usual careful way and say that the reduction of the metal on the forged steel wheel is perfectly safe, I will go along with you, but I do not want you to ask me to agree to something where life and limb is at stake and there is property that may be damaged. We find $\frac{3}{8}$ in. of lateral motion on cross-heads and $\frac{1}{4}$ in. of vertical motion. We have looked into many of these cases and that is our experience. I have no doubt you will admit that is too much. On the ground of safety to the public, of course, you will give this subject very careful consideration and I want to assure you again I am willing to go as far as this organization, as such, is willing to recommend. (On motion the subject was closed.)

(After the election of officers, noted elsewhere, the meeting adjourned.)

Chairman Tollerton on the Work of the Mechanical Division

CHAIRMAN TOLLERTON, in turning the meeting over to his successor yesterday, made the following comments:

"In turning over the gavel to my worthy successor, probably a few words based on observations I have made in the two years I have had the honor of presiding over this organization may not be out of the way. I offer them merely as a suggestion.

The heads of the car and locomotive departments come to these conventions for the benefits they receive from the discussions in the convention and the education from the exhibits. I have tried to encourage a free discussion of the papers to the best of my ability, particularly by the younger men of the Association. I am afraid that their failure to discuss the papers is due to the fact that they may think that the older officials know more about the subjects under discussion than they do, and they hesitate to enter the discussions. We appreciate that these younger men will be the older railroad officials in a few years from now, and therefore I would like to offer this suggestion to the motive power representatives here—that in future conventions when they send their staffs to the convention, that they charge them with familiarizing themselves with some of the subjects coming up for discussion.

These reports of the committees are invariably in the hands of the members from a month to six weeks ahead of the convention. You can all familiarize yourselves with the committee reports in that time, and the younger men can think of what they are going to say, and if they desire they can write it down if necessary. I would like to see very much more activity in the discussions by the younger members, because it is on their shoulders that the burden of carrying on the activities of this Association for years to come will fall. I want to thank you one and all for the assistance and the help you have always given me.

F. D. Reed
Vice-Chairman

H. E. Ray
Chairman

J. P. Murphy
Secretary

W. J. Farrell
Assistant Secretary

American Railroad Assn.—Section VI—Purchases and Stores

Inspiring Address by Elisha Lee; Reports on Stores Department Book of Rules and Classification of Material

CHAIRMAN H. B. RAY called the meeting to order at 9:15 a.m.

A letter of regret was read from R. H. Aishton, president of the American Railway Association, who was unable to attend the convention, and from W. G. Besler, president of the Central Railroad of New Jersey, who is vice-president of the American Railway Association and the member of the executive committee assigned to advise with Division VI.

The following committees were appointed:

Resolutions: J. H. Wallace, W. H. Deal, and J. A. Deary.

Memorials: H. A. Anderson, C. H. Thomas of the Southern Pacific, and J. A. Stewart of the N. Y. O. & W.

Address by Elisha Lee

Chairman Ray: There are many of us who have had the pleasure and the value of Mr. Lee's personal acquaintance, and those who have not been so lucky have known him by reputation—what he has done as a railroad builder and operator. So it is going to be like listening to an old friend, and one who talks a language we can understand.

I cannot refrain from recalling at this time the first time I ever heard of Mr. Lee. It was not so many years ago, either, and I confess it with some embarrassment; but it was in the dark days of railroading, when it was difficult to foresee what was going to happen to the railroads. Along with a lot of other small fry I was in a

certain office waiting for instructions from our superiors as to what to do under certain contingencies. We began to receive telegrams indicating that the entire matter was in the hands of Elisha Lee. He was in Washington carrying all of the burden of the railroads in the country and trying to bring order out of chaotic conditions and was thus holding my job and your job. As the matter progressed I could see in some small way at that distance just how ably the matter had been handled and I said "Surely I would like to see that man." But I never had the opportunity then. However, when we came to choosing a man to come here and talk to us, I felt I would like to have him. I take great pleasure in introducing Elisha Lee, vice-president of the Pennsylvania.

Elisha Lee: The work of Division VI since it started, has been watched by your officers from the highest down and I want to bring to you a word of congratulation and thanks for the work that you have done. In these days, you know, when a railroad man talks, he talks or should talk with a reasonable amount of discretion and I have found it of great help in keeping myself straight and not making remarks that were not intended, to stick pretty close to my notes.

Since receiving the highly appreciative invitation which brought me here today I have supplemented my previous general knowledge of the subject of purchasing and stores by reading a little more fully of the activities of that branch of a railroad which you represent. I can

... with the greatest sincerity, I have been deeply impressed. Statistics and figures of railroad purchasing read like the budget of a world power. They are truly stupendous and give a vivid idea of the immensity of the great enterprise in which we are all engaged. Normally, the railroads of America buy and consume about two billion dollars' worth of supplies annually, which exceeds the prewar cost of running our National Government. Current supplies on hand for all our railroads as shown in their reports to the Interstate Commerce Commission, represent upward of \$800,000,000 worth of property, the economical buying, time of delivery, and safekeeping of which are your particular duties and functions. These are, indeed, great responsibilities.

The general purchasing agent of the Pennsylvania, Samuel Porcher, recently analyzed the elements of ideal purchasing and stores work. Briefly he defined them to be first to obtain the right kind and quality of material for the specific purpose desired; second, to supply it at the right place, namely, where it is needed; third, to have it there at the right time when it is needed; fourth, to furnish it in the proper quantity; fifth, to have it accurately counted and receipted for; sixth, to have it properly stored and protected; seventh, to buy it for the least expenditure of money. What I wish to do, having brought Mr. Porcher's carefully thought-out definition to your attention, is to leave with you some further thoughts from the viewpoint of the executive officer responsible for the general results of operation.

In my position on the railroad as vice-president in charge of the Eastern Region, official responsibility embraces both the rendering of service satisfactory to the people and the production for the company's corporate purposes of a proper amount of net revenue. That net revenue, to be satisfactory, must be sufficient to meet my regional share of rentals and charges, the dividend upon our stock

and a proper margin for surplus. The purchasing and stores work of the Eastern Region and of the system as a whole has an important bearing upon the discharge of that responsibility. Railroadings is a public service. We all realize that fact and must keep it constantly before our eyes, but it is also a business carried on for the production of reasonable profits and the earning of a fair return upon invested capital.

In 1920 this country had the greatest boom in its history; in 1921 we had a smash that in its way was quite as spectacular. Thousands of mercantile and other business concerns went to the wall, and I venture to say that in at least 95 per cent of the cases the real trouble was some error in business judgment and management, namely, too big an inventory. Some of our railroads, too, were caught in 1921 with extremely undigested stocks of supplies. Therefore, I would say, from the viewpoint of the executive management responsible for general results, there is no more important duty resting upon the purchasing and stores officer of any railroad than that of keeping down stocks of all kinds to a minimum consistent with meeting proper and reasonable demands.

This necessity is threefold; first, to minimize the amount of capital at risk in stores; second, to reduce the interest loss on the idle capital; third, to keep the company in a position to cope promptly with changes in markets or general business conditions without incurring serious loss.

There may from time to time be a tendency on the part of officers in other departments than yours to order supplies without due consideration for the risk and waste in unnecessarily high stocks. This is not surprising, because quite often readily available supplies of material, which can be drawn on at any time that may be momentarily convenient, save a great deal of trouble to the man on the ground; sometimes it saves a great deal of hard thinking and planning. It then becomes your function and un-

doubted duty to step in and prevent such action and put back the responsibility for properly planning for the work of other departments where it belongs. Your responsibility, when further considered, is that of trustee for the public. Our railroads, in the trust and best sense, are owned by the people, both through the wide dissemination of stocks and bonds in the hands of individual holders and through that still broader distribution of ownership, which is brought about by the widespread holding of these securities on the part of the great fiduciary institutions of the people, notably the banks, savings funds, and insurance companies, in whose welfare and safety practically every citizen is directly or indirectly interested. We have in this way a genuine public ownership of the railroads in our country; that is, ownership by the public, a far better thing than ownership by the government, which in the end means by and for politics.

From the viewpoint of executive management it is helpful and clarifying to consider the materials and supplies of a railroad system as so much money in the process of being converted into transportation or facilities for service. Fuel and water are manufactured directly into service. Most other supplies go into facilities. Therefore, try to visualize to yourself the fact that what you are handling is money all the time, and couple this thought with the fundamental principle of business, that money should not ever be kept idle longer than is absolutely necessary. Therefore, other things being equal, the smaller the stocks that are carried and the shorter the time the material remains on hand, the better is the quality of the purchasing and stores work.

Let us consider just what this means. On our road as a whole, supplies on hand at any given time may be said to amount in value from \$60,000,000 upward. I am not prepared to express an opinion as to just what may be considered, an allowable maximum figure, that doubtless varies from time to time according to circumstances, but often the minimum of \$60,000,000 is equal to two years' dividends on our stock at our old rate of six per cent. A day's interest on that sum is \$10,000, enough to pay the wages of 2,000 or more men. The interest on the cost of material stocks of all railroads in the country would pay the wages of between 25,000 and 30,000 men. This item of inventory represents a large portion of our working capital and should be kept as nearly fluid as circumstances will permit, for the greater the turnover or the smaller working capital required to finance a year's purchases. There is of course, a word of caution due. If stocks are brought down too low, a point will be reached at which savings in the purchasing and stores work will begin to be overbalanced by added cost elsewhere, through inability to obtain material with reasonable promptness.

Besides your responsibility from the viewpoint of efficient operation, the influence of your work upon the prosperity of your country as a whole must not be forgotten. Railroads are the principal consumers of products of some of our most important basic industries, taking one-third or more of the country's steel production, some 30 per cent of its actual output. The list of articles, commodities and materials regularly bought by our purchasing department which is typical of the railroads in general, numbers about 200,000 separate items. Indeed there is scarcely any branch of production in which the railroads are not important consumers. Active buying by the railroads has always been one of the chief factors leading up to every period of prosperity which our country has experienced.

Perhaps you might be interested in a brief outline of the general organization of conducting purchasing and stores work for our system. Our organization is com-

paratively new, a little over two years old, and has had time to be tested. We have what we call a regional plan of operation. At system headquarters in Philadelphia, we have our staff of general executive and administrative officers with broad jurisdiction and responsibilities under the board of directors, for the production of results throughout the system as a whole and for the guidance of general policies in all departments. For the carrying out of the actual detail work of operation the system has been divided territorially into four regions, eastern, central, northwestern and southwestern with headquarters respectively at Philadelphia, Pittsburgh, Chicago and St. Louis. Each region is in charge of a vice-president generally responsible for the work of all departments in his territory. Regional vice-presidents are provided with staff officers, heading the various departments in the regions corresponding to the departmental organization of the systems administrative staff at Philadelphia. The latter may be likened in a military organization to the general headquarters of the Army, and the region to the sectors in which the actual work is subdivided for campaign purposes. The G. H. G. devises general plans and policies and secondly the regional staffs carry them out.

At Philadelphia we have two system officers, a general purchasing agent and a general supervisor of stores; each heading his own department and separately responsible for results, through working in the closest harmony with each other. Both report to the same system executive vice-president in charge of real estate purchases and stores.

In each region there are a purchasing agent and general storekeeper responsible to the regional vice-president for the performance of their duties and at the same time in constant touch with the general purchasing agent and general supervisor of stores for guidance as to policies and co-ordination of purchasing and stores work in all regions. Our Altoona Works, located at Altoona and Juniata, are also treated as a separate entity under the Chief of Motive Power, distinct from any of the four regions, with its own supply force.

We feel that our plan of organization of the purchasing and stores work provides that degree of decentralization of authority and responsibility which is so highly desirable in a large, complex business like our own, while at the same time, true co-operation between the region and general supervision exercised at system headquarters in Philadelphia, guard against such errors as competition between the regions for delivery, or inadvertent bidding against each other. The arrangement also gives us a valuable mechanism for distributing supplies between the four regions and the subdivisions, and provides a means for quickly equalizing conditions of surplus or scarcity which may arise at given points.

I am, indeed, happy to have had this opportunity of meeting so many officers of the stores and purchasing department of our great American railroads. The railroad management of the country think enough of the men in your branch of the service to trust you with the custody of not far from a billion dollars' worth of property, with an actual spending in active times of twice that sum. That is a pretty good guarantee of character for the men in charge of these very important departments of railroading. I wish to express to you my sincere thanks and appreciation for the honor which you have given me in permitting me to address you.

Chairman Ray: Mr. Lee, I wish I could adequately express my personal appreciation for your courtesy in coming here and giving us this wonderful talk. I know in doing so I voice the sentiments of all who have listened. Mr. Lee has told us what I think we all will appreciate

and that is the importance to railroad operation that purchases and stores bears to the general result, and it is our hope in this three-day session, which we propose to devote to real hard work, we will profit and go better prepared to handle business than we have been heretofore. I think that we ought to have a rising vote of thanks for Mr. Lee and if agreeable, I wish you would all rise.

Chairman Ray: I want to congratulate Mr. Farrell and the various committees for the good work they have done

this year. The percentage of attendance at the committee meetings was greater than ever before, and as a consequence the reports are exceptionally valuable.

Division VI is not so constituted that these reports are to be considered mandatory; they are recommendatory entirely, and should be handled and discussed as such.

Necessarily this discussion will bring out the real benefit which we are to derive, but that does not lessen the value of the reports.

Report of General Committee

The General Committee reviewed briefly the action taken since the meeting in June, 1921, which pertained mostly to the programs for 1921 and 1922. Practically all the reports approved by the Division at the business meeting in 1921 were approved in their entirety by the American Railway Association at its annual meeting. Objection was raised to the recommendation made in the report on material accounting that all material stocks should be carried in the accounts of the stores department, as it was felt that some roads would prefer to have a separate accounting

department. The Accounting Committee has included a further recommendation on this question in this year's report.

The Committee on Committees thought it advisable to extend the scope of the committee on Subject 4, Material Accounting, to include mechanical facilities; also Subject 15, Buildings and Structures, to include facilities. The committees on Subject 6, Cross-Ties, and Subject 13, Lumber, have been combined into one under Subject 13, the title of which has been changed to Forest Products.

IN ACCORDANCE WITH instructions from R. H. Aishton, president of the association, a meeting of all chairmen and secretaries of the various divisions and sections was held at New York on January 31, 1922. The purpose of the Advisory Council is to consider the elimination of duplication of effort among the various divisions and sections and ascertain in what subjects there may be contact, and a remedy for the situation.

The chairman and secretary attended this conference, and information is being compiled for submission at the next meeting of the Council. The chairman has appointed H. C. Pearce to represent Division VI—Purchases and Stores, on the Advisory Council.

In accordance with Section 4 (g) of the Rules of Order, the General Committee offers the names of the following members as candidates for the Committee on Nominations during the ensuing year:

F. A. Bushnell, Purchasing Agent, Great Northern Railway Co., St. Paul, Minn.

J. G. Stuart, General Storekeeper, Chicago, Burlington and Quincy Railroad, Chicago, Ill.

W. C. Bower, Assistant Manager, Purchases and Stores, New York Central Lines, New York City.

H. P. McQuilkin, General Storekeeper, Baltimore and Ohio Railroad, Baltimore, Md.

G. A. Secor, General Storekeeper, Chicago and Alton Railroad, Bloomington, Ill.

The report is signed by H. E. Ray (chairman), Atchison, Topeka & Santa Fe; F. D. Reed (vice-chairman), Chicago, Rock Island & Pacific; J. P. Murphy, New York Central; E. N. Bender, Canadian Pacific; F. A. Bushnell, Great Northern; H. H. Laughlin, Southern Railway; W. G. Phelps, Pennsylvania System; J. G. Stuart, Chicago, Burlington & Quincy; W. A. Summerhays, Illinois Central; U. K. Hall, Union Pacific; W. A. Hopkins, Missouri Pacific; S. B. Wight, New York Central; E. J. McVeigh, Grand Trunk; H. C. Pearce, Chesapeake & Ohio; E. W. Thornley, Baltimore & Ohio, and D. C. Curtis, Chicago, Milwaukee & St. Paul.

(The report was adopted as read.)

Stores Department Book of Rules

YOUR COMMITTEE RESPECTFULLY submits the following report: A questionnaire, as follows, was prepared and sent to the member railroads, from which 61 replies were received:

- (1) Use of a net ton of 2,000 lb. in all transactions.
- (2) Discontinue the use of dozen and gross in quotations and calculations, basing the quantities on ten or multiples of ten.
- (3) Avoid card system. What experience have you had in ordering material, receiving material, or in keeping a stock record by use of the card system? Stock book. Please submit sample of your stock records in use in the general storekeeper's office, general storekeepers and local depots.
- (4) Avoid the metric system of weight and measures in place of the present system.

Net Ton

To the question of the desirability of the use of the net ton of 2,000 lb. in all transactions, 56 of 61 replies were, as agreed to in the question, favorable. The committee points out the fact that the standard weight for the use of the net ton is the

basis of reporting and sales of scrap, whereas certain commodities, such as rails, fuel, etc., are requisitioned and purchased, and accounted for upon a gross ton basis of 2,240 lb. requiring adjustment of carrying or disbursing charges in the stores accounts.

Therefore, we recommend for favorable consideration of the proper division of the American Railway Association, that as the tariffs are revised, they be based upon the net ton of 2,000 lb. on all commodities purchased by the ton.

Unit of Dozen and Gross

To the question as to the discontinuance of the use of dozens and gross in quotations and calculations, basing the quantities on (10) or multiples of ten, the replies were 43 favorable and 18 unfavorable.

The committee is investigating this matter further in connection with the National Association of Purchasing Agents with a view of bringing about the use of ten or multiples of ten instead of dozen or gross.

The report brings up two important questions that affect all departments; the use of the metric system and of the net ton in all transactions. Closely related to these is another topic, the discontinuance of the dozen and gross as units and basing all quantities on multiples of ten.

There are many active advocates of the metric system in this country and bills which seek to make this system compulsory are continually being introduced in Congress. Some people believe that the most satisfactory results would be obtained with a compromise system of weights and measures, using a decimal system, but based on a new unit related to the English units. As for in-

stance, 40 in., which would be approximately the same as the meter.

It is interesting to note that while the proposal to use units of 10 is in accordance with metric practice, the net ton of 2,000 lb. is a move away from that system, the metric ton being approximately the same as the long ton, while pro-metric agitation in this country does not seem likely to succeed for some time, the railroads will be directly affected by any action that is taken regarding weights and measures, and it is a good thing to have the question brought before the association occasionally to determine the sentiment among the members.

Visible Card System

To the question as to what experience members of the association have had with the use of the visible card systems for stock records, replies were received from 60 railroads, of which 11 were "yes," and 49 reported no experience.

The expressions received from the railroads on this question would seem to strongly endorse the use of a stock book, rather than the use of a stock card.

The canvass of the railroads using the stock books develops that out of 57 replies received, 29 are using the A. R. A. standard stock record, or the standard stock record with slight modifications, and 28 using stock books other than American Railway Association.

The committee wishes to further emphasize the importance of the stock book and recommends the use of the American Railway Association stock book, which by reason of its simplicity can be adopted either in detail, or with slight modifications, to meet practically every condition in securing accurate knowledge of the stocks of material on hand.

Metric System

To the question with reference to the use of the metric system of weights and measures, replies from 61 railroads were received, of which 8 were favorable, 12 favorable if the system were adopted by the U. S. Government, and 41 opposed.

The committee would not recommend any definite action on this question at this time, but would suggest that inasmuch as the question of the use of the metric system of weights and measures in place of our present system is under consideration by a number of manufacturing and commercial organizations, and if approved by the United States Government, the members of the division give consideration to the question in order that they may be prepared to intelligently discuss the matter if any future action is deemed desirable.

Comparison of Stocks

It has come to the attention of the committee that there is no means of comparing the amount of stock on hand, or the cost of operation of the stores department of one road with another, and it is recommended that a special committee be appointed to investigate and report on this subject.

The report is signed by J. W. Gerber, (Chairman), Southern Railway; W. E. Brady, Aitchison, Topeka and Santa Fe; F. N. Dobbs, Southern Pacific; C. J. Irwin, Gu'l, Colorado and Santa Fe; R. D. Long, Chicago, Burlington and Quincy; H. P. McQuilkin, Baltimore and Ohio; W. S. Morehead, Illinois Central; C. D. Young, Pennsylvania System; J. G. Stuart (Chairman Ex-Officio), Chicago, Burlington and Quincy.

Discussion

J. W. Gerber, chairman of the committee, who presented the report, stated that the committee realized that the adoption of the short ton—2,000 lb.—will require some time. It is out of date to have two tons, one at 2,240 lb. and the other at 2,000. The same annoyance arises when

you consider the dozen and gross. Many quotations are based on these units; many of the articles are billed singly and packed singly instead of by dozens or grosses. The same is true of 100. Again, while railroads might buy by the dozen or by the gross, yet they never issue the material in that form. Requisitions from foremen are always for 10, 50, 20 or 1. As to the metric system, he believed the division should also take some decided action in the way of education.

J. G. Stuart, of the C. B. & Q., stated his experience was directly opposite to that of Mr. Gerber. He found too many orders using the dozen. The C. B. & Q. has gone a long way as suggested in the matter of prices. Generally speaking, the road is trying to get away from the dozen and gross units.

A. W. Munster (Boston & Maine) suggested that this matter be taken up through the Hardware Manufacturers' Committee as it is mostly in hardware that the dozen and gross are encountered.

W. A. Hopkins, of the Missouri Pacific, considered changing to multiples of 10 as satisfactory but advocated that the consideration of the metric system be left to the engineering and mechanical departments.

H. C. Pearce (C. & Q.) stated that he felt there is no reason whatever why railroads should not adopt 2000 lb. as a ton. As regards the units of dozen and gross the purchasing officer has only to make his contracts on the basis of 100. In the matter of the metric system, Mr. Pearce was not in favor of making any changes. He thought the question of the list discount arrangement is more important and should be taken up. Would like to see this committee instructed to investigate thoroughly the discontinuance of the list and discount method of price determination.

T. J. Frier (Wabash) thought the division should be a little slow about doing away with the dozen and the gross and that it would be well to go to the American Iron and Steel Institute and persuade them to co-operate in getting the 2,000-lb. ton adopted.

N. M. Rice (N. Y. N. H. & H.) stated that the use of the dozen and gross is a long established commercial practice. He did not believe the division should interfere.

F. D. Reed (C. R. I. & P.) expressed the opinion that the 2,000-lb. ton should be used as the unit and that that part of the committee's report should be accepted and adopted as Recommended Practice of Section VI. As to the dozen and gross, he thought that part of the report should be continued and the committee continued for an-

other year. With reference to the visible card system, he believed the division should adopt that section of the report and recommend as Standard Practice the use on all railroads of a standard stock book of the type which has been in use on many railroads and was adopted as Recommended Practice by the Railroad Administration. As to the metric system, he felt the division should not do any-

thing until the government comes out in favor of the metric system. Mr. Reed moved that the report of the committee be accepted and the committee continued with instructions to follow up with the National Association of Credit Men and other national organizations the question of units, dozens and gross. The motion of Mr. Reed was adopted.

Committee on Classification of Material

The report of the committee includes a complete revision of the standard material classification which lists practically every article used in all the departments of the railroads, and is so voluminous that it cannot be reproduced in full. The standard store department classification is in use on a very large number of roads, and for that reason changes in the system require the most careful consideration.

The principal change has been the elimination of the main or departmental subdivisions, thus

permitting each material to be placed in a single class, irrespective of where it is used. Many additions have been made to the classification, and with the very complete index it should be more useful than ever before.

Over 4,000 items are included in the classification, which gives some indication of the amount of work involved in the revision which the committee has made. It is a big job well done, and reflects credit on the men who carried it out and on the Purchases and Stores Division.

THE need for revision of the material classification to meet modern conditions is recognized. Many changes have been made in standards and additions of units to maintenance and operating materials not contemplated in the original report.

Replies to a canvass made indicated a general opinion that the work should be done at this time. Consideration was also given to the fact that there is a demand for a large number of copies, and that the original is now out of print.

In making the report—reclassifying and adding to the original, as indicated by asterisks in the detail—the committee was guided to a considerable extent by recommendations received from various members of the association.

The elimination of the four grand headings, indicating the kind of operation or maintenance for which the material classes listed thereunder were used, was for the purpose of providing a better arrangement. The following changes in classification are recommended by the committee:

PRESENT CLASS	PROPOSED CHANGE
Class No.	Class No.
1-A. Frogs, switches and crossings, and parts of same.	5-B. Cross ties, treated.
1-B. Track fastenings, track bolts, spikes, etc.	5-C. Cross ties, untreated.
1-C. Track tools, all kinds, miscellaneous track material and wire fencing.	6. Iron bridges, turntables and structural steel, all kinds.
1-D. Motor, hand, push and velocipede cars, and parts of same.	7. Ballast, all kinds, including rip-rap.
2-A. Interlocking and signal material.	8-A. Rail, new.
2-B. Telegraph and telephone material.	8-B. Rail, second hand, except scrap.
3. Building and paving brick, cement, lime, stone, cast iron water and sewer pipe, roofing tile and slate, prepared roofing, all kinds, for buildings, sewer and drain tile, etc.	9-A. Fuel and water station material, and scales and parts.
4-A. Bridge ties.	9-B. Elevators, and coal and ore handling and conveying machinery.
4-B. Lumber, bridge and line piling posts, shingles, and manufactured lumber for bridges and buildings.	9-C. Steam derricks, steam shovels, steam ditchers, pile drivers and other such portable equipment used in roadway work and special material for same.
5-A. Switch ties, treated or untreated.	10. Chemicals for timber treatment.
	11. Bolts, nuts, washers, rivets, lag screws, pins and studs.
	12. Springs, helical and elliptical, all kinds, for locomotives and cars.
	13-A. Flues for locomotive and stationary boilers, arch tubes, dry pipes, all kinds.
	13-B. Arch brick for locomotives.
	14. Brass, copper, and steel tubing, copper ferrules, soft metals in bars, pigs or sheets.
	15. Bar iron and steel, spring steel, tool steel, shaped steel, chain, except light coil, wire netting and sheet steel under 13 gauge.
	16. Boiler, firebox, tank and sheet steel. No. 13 gauge and heavier, all kinds.
	17. Heavy forgings for locomotives, such as crank pins, piston rods, quadrants and levers, motion links, valve yokes, etc.
	13-C. Steam derricks, steam shovels, steam ditchers, pile drivers and other such portable equipment used in roadway work and special material for same.
	10. Chemicals for timber treatment.
	11. No change.
	12. No change.
	13-A. Flues or tubes for locomotive and stationary boilers, dry pipes, all kinds, superheater material and firebox systems.
	13-B. No change.
	14. No change.
	15. Bar iron and steel, spring steel, tool steel, steel shapes, sheet iron and steel under $\frac{3}{16}$ " wire netting and chain, except light coil.
	16. Boiler, firebox, tank and sheet iron and steel $\frac{3}{16}$ " and heavier, all kinds.
	17. Forgings and pressed steel parts for locomotives, such as crank pins, piston rods, quadrants and levers, motion links, valve yokes, pressed steel gate side bars, front ends, cylinder and steam chest casing, etc.
	7. No change.
	8-A. No change.
	8-B. No change.
	9-A. No change.
	9-B. No change.
	9-C. No change.
	10. No change.
	11. No change.
	12. No change.
	13-A. Flues or tubes for locomotive and stationary boilers, dry pipes, all kinds, superheater material and firebox systems.
	13-B. No change.
	14. No change.
	15. Bar iron and steel, spring steel, tool steel, steel shapes, sheet iron and steel under $\frac{3}{16}$ " wire netting and chain, except light coil.
	16. Boiler, firebox, tank and sheet iron and steel $\frac{3}{16}$ " and heavier, all kinds.
	17. Forgings and pressed steel parts for locomotives, such as crank pins, piston rods, quadrants and levers, motion links, valve yokes, pressed steel gate side bars, front ends, cylinder and steam chest casing, etc.

PRESENT CLASS	PROPOSED CHANGE	PRESENT CLASS	PROPOSED CHANGE
Class No.	Class No.	Class No.	Class No.
18. Car forgings, iron and steel, for passenger and freight cars.	18. Car forgings, iron and steel, and fabricated or shaped steel, for passenger and freight cars.	33. Trucks for equipment, locomotives and cars.	33. No change.
19. Locomotive castings, including gray iron, malleable and steel, rough and finished; also cylinders, rough and finished.	19. Locomotive castings, including gray iron, malleable and steel, rough and finished; also cylinders and driving wheel centers, rough and finished.	34. Material in process of manufacture.	34. No change.
20. Car castings, including gray iron, malleable and steel, all kinds, brake beams and parts, couplers and parts, metal bolsters, side frames and metal car roofs.	20. No change.	35. Floating equipment material, all special material peculiar to floating equipment.	35. No change.
21. Rough and finished brass castings and journal bearings.	21. No change.	36-A. Locomotive, train and station supplies, including tinware, all kinds; lanterns, train, switch, and other signal lamps and parts; locomotive and caboose tool equipment, such as jacks, shovels, wrecking frogs, train chains, etc.; baggage and warehouse trucks, caboose and station stoves and parts, ticket cases, tool handles, and all kinds of woodenware.	36-A. Locomotive, train and station supplies, including tinware, all kinds; lanterns, train, switch, and other signal lamps and parts; locomotive and caboose tool equipment, such as shovels, wrecking frogs, train chains, etc.; baggage and warehouse truck, caboose and station stoves and parts, ticket cases, and all kinds of woodenware.
22. Air brake material, all kinds, for locomotives, passenger and freight cars, except hose, but including air pump and parts.	22. Air brake material, all kinds, for locomotives, passenger and freight cars.	36-B. Grain doors, grain and coal door lumber, and coopering material for grain and flour cars.	36-B. No change.
23. Mechanical appliances for locomotives, such as injectors, lubricators, bell ringers, sanders, pop valves, air and steam gauges, whistles, boiler checks and parts, water gauge and lubricator glasses, and speed recorders.	23-A. Standard mechanical appliances for locomotives, such as injectors, lubricators, bell ringers, sanders, pop valves, air and steam gauges, whistles, boiler checks and parts, water gauge and lubricator glasses, and speed recorders.	37. Oil house material, all kinds, including lubricating oils and grease, illuminating oils, boiler compound, all kinds, and waste, all kinds.	37. No change.
24. Passenger car trimmings, all kinds, including oil and gas lamps and fixtures, steam heat fixtures and fittings, except steam hose, mail car, coach and chair car seat fixtures, including upholstering material of all kinds, such as carpet, linoleum, rubber tiling and matting for cars and buildings.	23-B. Special mechanical appliances for locomotives, such as stokers, power reverse, patented valve gear, coal pushers, boosters, feed water heaters.	38. Ice, sawdust, hay and straw for ice houses.	38. No change.
25. Electric material for electric and steam locomotives.	24. Passenger car trimmings, all kinds, including oil and gas lamps and fixtures, steam heat fixtures and fittings, mail car, coach and chair car fixtures, including upholstering material of all kinds, such as carpet, linoleum, rubber tiling and matting for cars and buildings.	39. Fuel, locomotive, including coal and wood and fuel oil for locomotive use only.	39. No change.
26. Electric material peculiar to steam and traction line cars.	25-A. Electric material peculiar to electric locomotives.	40. Fuel for stations and cars; includes coal, coke and wood.	40. Fuel for stations, cars, ferries and power plants; includes coke and wood.
27. Shop fuel, smithing coal, coke, fuel oil for furnaces, gas-oil, charcoal, etc.	25-B. Electric material peculiar to steam locomotives.	41. Commissary supplies for dining cars and restaurants.	41. No change.
28. Foundry supplies, fire brick, fire clay, etc.	25-C. Electric material peculiar to steam and traction line cars.	42. Pipe, iron and steel, except boiler flues.	42. Pipe, iron and steel, and fittings, all kinds, for steam, air and water, valves and cocks for same.
29. Wheels, tires and axles for locomotives and cars, including driving wheel centers, cast iron, steel tired and rolled steel wheels.	25-D. Electric material for power plant equipment and generating stationary motors, and other electric equipment for operating shop machinery. (See Class 49.)	43. Pipe fittings, all kinds, for steam, air and water; valves and cocks for same.	43. (Blank—consolidated into Class No. 42.)
30. Lumber, locomotive and car, rough and finished, including manufactured articles.	25-E. Electric material and supplies not included in Classes 25-A, 25-B, 25-C, 25-D and 26.	44. Electric lighting material and supplies for buildings and grounds.	44. (Blank—see Class No. 25-D.)
31. Machinery and machine tools, including all power driven shop machinery.	26. Material peculiar to gasoline and electric passenger motor cars, automobiles, auto trucks, tractors, power trucks, etc.	45. Hardware, all kinds, including nails, jacks, small hand tools, emery wheels, wire and wire cloth.	45-A. Hardware, all kinds, including nails.
32. Locomotive boilers, fire boxes, locomotive tenders and frames.	27. No change.	46. Rubber and leather goods, including air, steam and water hose, packing, all kinds, including metallic packing, asbestos, rope, belting, pipe covering and boiler lagging.	45-B. Hand and small machine tools, such as drills, taps, reamers, dies, chasers, including air tools and parts.
	28. No change.	47. Glass, drugs, chemicals and painters' supplies, such as brushes, scrapers sand and emery paper and cloth; also paints, oil and varnishes; all kinds, for equipment and buildings.	46. Rubber and leather goods, including air, steam and water hose, all kinds, fibrous packing, asbestos, rope, belting, pipe covering and boiler lagging.
	29. Wheels, cast iron, steel tired and rolled steel, tires and axles, for locomotives and cars.	48. Stationery and printing.	47. No change.
	30. No change.	49. Power plant equipment including steam and electric power plants and generating stations, motors, and other electrical equipment for operating shop machinery.	48. No change.
	31. Machinery and repair parts, including all power driven shop machinery.	50. Scrap, all kinds, including scrap rail.	49. Power plant equipment other than electric materials. (See Class 25-D for Electric Material.)
	32. No change.		50. No change.

The report is signed by W. D. Stokes (Chairman), Illinois Central; J. E. Byron, Boston & Maine; E. Harty, Southern Pacific; E. H. Hughes, Kansas City Southern; W. L. Hunker, Chicago, Rock Island & Pacific; C. W. Kinnear, Pennsylvania System (Northwest Region); C. D. Longsdorf, New York Central; G. T. Richards, Chicago, Milwaukee & St. Paul; D. W. Roberts, Pere Marquette; C. L. Wright, Missouri, Kansas &

Texas; and U. K. Hall (Chairman Ex-Officio), Union Pacific System, Omaha, Neb.

Discussion

C. D. Young (Penna.): We have a classification built on 15 or 20 years practice, but we have watched the A. R. A. classification with interest. With the present tendency to go into steel equipment, I would suggest to the committee a closer survey of their classification as proposed in 15, 16, 17 and 18. These four classifications on a road having a large percentage of steel equipment, still represents a very large investment in money. Practically all of the motive power money is tied up in these four accounts, and with the classification as worded here, it is impossible to carry out the proposed practice of the A. R. A., namely to know how much money you have in stock as between the locomotive and freight equipment. I suggest that consideration be given to splitting numbers 15 and 16 so that it is possible to identify the raw material from which you are to make classifications 17 and 18.

I believe Classification No. 15 could be clarified. The material in No. 15 is designated as "steel shapes," meaning the unfabricated material such as channels, I-beams, etc. "Steel-shapes" does not clearly indicate that this includes the steel as it comes from the mill.

Mr. Hall: The committee believes that sooner or later the Interstate Commerce Commission will prescribe and require material classification, as they did with the operating classification and it is thought that all roads could use this classification.

The report of the previous committee had been acted on by the Railway Accounting Officers' Association. It had been adopted by this association as recommended practice, and by the Railway Accounting Officers' Association and if the Interstate Commerce Commission ever attempts to prescribe a classification, it is believed that they would give its careful attention to a classification which had been recommended by the two representative bodies dealing with this subject.

It was the idea of the committee that this report would bring about a revision that would make a practical accounting proposition, and a practical physical proposition. We all feel our stock books should be lined up with our accounting classification. I believe that this convention should appoint a committee to confer with the Railway Accounting Officers' Association, presenting to them the revised classification, the reasons therefor, and endeavor to have them accept the revision, so that we would then present a united front to the Interstate Commerce Commission in submitting a good and practicable and workable classification.

There is no snap judgment in this report. It was considered at various times from all angles and there are roads that are today waiting and expecting to change to the adopted classification when they feel it is stable enough to warrant them doing so. It is regrettable that a classification has to be changed. It involves a lot of labor and expense, and the committee feel that the classification prescribed here would meet the views of future committees.

Mr. Curtis (C. M. & St. P.): This classification is a good workable classification. I have worked under four or five classifications, and I have never yet seen a classification someone could not find fault with. This classi-

fication, made and adopted by the Association and which the Milwaukee is using, is a good, workable plan. I feel that this committee has made wonderful progress in the recommendations they have made. We must either go forward or backward. We cannot afford always to copy the same classification. In regard to the four major headings, I do not see why any railroad should not use them if they want them. All they have to do is to draw their totals under each existing sub-division and go ahead and use their statistics. There is no rule to prevent them.

Mr. Young: You have got to deal with material in the individual items from the storekeeper's standpoint, but you cannot present to your executives, nor to your Board of Directors individual items of material. They know only one thing and that is money. You must have a classification that reflects your material balance in money. It is the only common unit in the material account, and everything is equated.

Mr. Pierce: The Interstate Commerce Commission is going to require a classified statement of the assets of the railroads as represented by materials and supplies. There is no question that in the same manner they have prescribed a classified statement of expenditures. This statement is not of material issued to the storekeeper and the controller of stock. It is not intended to be. It is ridiculous to consider the material balance as a means of controlling stock that must be ordered from two, to three, four, five or six months in advance of its need. Its functions are not for that purpose. The stock book is a detailed classification balance which every storekeeper must have, and upon which is based the control of stock. A classified statement is for the purpose of general and executive officers having before them a resume of what has transpired, the same as other operating expenses, and for the further and more important purpose of putting a check where a check is needed.

Mr. Pierce: I desire to go on record as requesting a class for car steel, a separate class, I would call it 18-A, and segregate it from Class 17, and I also suggest that superheated material be eliminated from 13-A "flues and tubes," and placed in Class 23-B, "special mechanical appliances."

I am not in accord with the principal of the classification being the same as the physical vocation of the material. When your executive officer desires to know how many flues and tubes you have, he don't want to know how much superheating material you have.

Mr. Rice: I move that we adopt the report of the Committee as read, and continuing the Committee, who will investigate the suggestions offered from time to time by the various members.

(The motion was duly seconded, put to vote and carried.)

The Chairman: I might say that a number of railroads have written to the Secretary for copies of the classification. He has orders now for about 2,000 copies, and I will ask if it is the intention that we print a standard classification separately, for distribution to those railroads that may want it.

(The motion was put to vote and carried.)

Meeting adjourned at 1:10 p.m.

Distribution and Accounting for Gasoline

PROBABLY THE CONSUMPTION OF no one commodity used by the railroads has increased so much and advanced in price so rapidly in the last decade as gasoline.

With its uses greatly extended, with its consumption multiplied a thousand fold, with the old price quadrupled, the storage, dis-

tribution and accounting for this commodity becomes a subject well worth the serious consideration by those who carry the responsibility of the economical and accurate handling of railroad material and supplies.

The stores department of the Missouri Pacific has given this

Some enterprising mathematician recently figured out that the gasoline purchased by the Illinois Central in 1921 was enough to have run an automobile, at the rate of 20 miles to the gallon, more than 400 times around the earth. It would keep the car going continuously 24 hours a day at 20 miles an hour for more than 50 years. This is a striking illustration of the amount of gasoline used by the railroads and emphasizes the importance of the subject of Mr. Hyatt's paper.

The equipment which has been developed on the Missouri Pacific for handling gasoline includes transfer pumps at the main storage points, a special tank car fitted with a measuring pump and delivery hose to take care of distribution to roadside tanks and corrugated drums for underground storage. To prevent the misuse of gasoline for automobiles, a small proportion of lubricating oil is added to it as it is delivered from the supply cars.

commodity special study, and without having much in the way of precedent, we feel that during the last ten years we have worked out some satisfactory and economical methods and practices, especially in the storage, distribution and facilities for economical handling.

Ten years ago, we had gasoline storage capacity averaging from 1,500 to 9,000 gallons at each of our 16 different division stores. Today we have consolidated this storage to four central points and installed batteries of tanks giving any one of these central distributing stores a storage capacity of from 20,000 to 30,000 gal. from which gasoline is distributed to 16 operating divisions; 9 by supply tank cars, and 7 by drum shipments.

Four of our supply car outfits include with their equipment, one 10,000 gasoline tank car, which we specially constructed with reinforced frame and trucks, to avoid as far as we could the possibility of the car becoming bad order, and getting tied up out on the divisions, thus breaking our supply car schedule, which we all agree causes extra expense and crippled service. Each of these gasoline supply cars has a steel housing built and riveted to one end of the tank (3 ft. deep, 5 ft. 4 in. wide and 7 ft. high) which protects and incloses a five-gallon self-measuring pump.

This housing serves the double purpose of protecting the pump and its operator from the elements, from mechanical injury and also prevents tampering by unauthorized persons when the attendant is absent.

It is quite important that this steel housing and the pump be built and joined integral to the steel tank, so that a shock such as would cause the tank to shift on the trucks and frame will not damage either the pump, the housing, or piping. Broken pumps and damaged piping will be avoided by following this suggestion.

We also have built a boxed trough along full length of each side of the tank car, in which is kept a 50-ft. steel armored 1½-in. gasoline hose. One end of each of the two hose is connected to a pipe line, which extends from the pump to the running board of the car on each side, the object of this arrangement being to avoid the necessity of dragging the hose back and forth between the cars, to serve the underground storage tanks at tool houses which are located on either side of the track.

When supply cars are spotted at the tool house, one of the supply car men ascertains the contents remaining in the storage tank with a special measuring stick, so as to avoid running the tank over, as might happen, should he not know how much gasoline was in the tank, as quite likely the majority of the requisitions filled by supply cars are made out from 20 to 30 days in advance of delivery, and the quantity of gasoline ordered is more or less a guess on the part of the section foreman, censured by the roadmaster, who has the advantage of knowing the average quantity ordered by all his sections and should detect any abnormal order.

The quantity ordered on the requisition is governed by what is considered as full protection for 30 days at each given storage point, and in very few instances is it necessary to completely fill the 120-gal. storage.

On some roads the quantity of gasoline put in these roadway storage drums for a 30, 45 or 60-day supply rests entirely with the supply car man and his judgment which, in some cases is aided by providing him with a blue print table showing the average monthly mileage made by the motor car or cars obtaining fuel

from each given section storage tank, and the maximum quantity of gasoline required; the print also showing the number of oil lights operated on each section and an illuminating oil schedule.

Eight or ten years ago when the first great strides were beginning to be made on railroads to substitute and replace man-driven power with gasoline-driven power, the first problem confronting the stores department of the Missouri Pacific was to design and adopt a standard storage tank for roadway use, and after some time spent in experimenting and study we adopted an underground storage tank which has since proved entirely satisfactory.—this drum is a 120-gal. corrugated No. 18 galvanized iron drum, which we specify to be painted with rust resisting paint. The capacity of 120 gal. was chosen in order to insure sufficient storage at a time when gasoline was being shipped out in 55 or 110-gal. lots, giving a little storage leeway to avoid holding the shipping drum. The corrugated style was adopted not only to give strength but also to have a drum that would stay buried as we found that water would force smooth-sided tanks out of the ground in the swamp districts of the South.

These drums are buried at the end of the section tool house, usually about 15 or 20 ft. from the track, which is in easy range of our filling hose. They are set vertical and from six to ten inches below the surface, a 2½-in. nipple with chained cap extending above the surface, from which gasoline is drawn by use of a tin gasoline pump, which is kept locked up in the tool house.

This pump is manufactured by the store department, and its construction is not only simple but very durable. We consider that this complete outfit makes a very economical method of handling gasoline for sections and pump stations.

Bridge and building outfits, or in fact any unit of our forces who move from point to point, carry these same storage drums in their open outfit cars. We have 846 of these drums in service on our lines, or 120-gal. gasoline storage for every (9) miles of railroad.

Prior to the general adoption and installation of these underground storage drums, we either used ten-gallon oil cans, or held the oil companies' 55-gal. shipping drums to answer as storage, and there were times when we had as high as 2,000 drums on our lines, and the enormous volume of clerical work in recording their movement, length of time held, and tracing and obtaining the final return to the owners or paying for drums we lost entailed an expense which has been eliminated so far as gasoline is concerned, on the Missouri Pacific.

The Santa Fe, Union Pacific and several other roads have found it both expedient and economical to reclaim a variety of old drums, reservoirs and miscellaneous containers, which after being tested for leaks and painted with a good coat of preservative against rust are distributed as roadway storage with varied capacities at different locations.

One source from which they obtained a great many gasoline storage receptacles was by making use of all the Pintsch gas reservoirs which were removed from their passenger equipment at the time electrical lighting was installed, these gas drums being cut in two in the center, cleaned of all sediment and incrustations and each half made into a drum by being headed and provided with a uniform hole for the filling and withdrawal of gasoline.

One of 10,000 gal. gasoline supply tanks serves four divisions having 220 storage drums, to take care of this same territory by drum shipments would require at least 300 of the standard commercial 55-gal. drums, and considering that the average life of one

of these shipping drums cannot be figured as over four or five years, and their cost from \$5.50 to \$10.00 each; also figuring the loss and damage in transit, it is reasonable to assume that the circulation of one large tank car is more economical than the handling and circulation of 300 shipping drums.

At our main store points where we have our battery of gasoline storage tanks, we have installed small reciprocating transfer pumps which operate either by air or steam pressure, according to which is the most handy; these pumps quickly and economically transfer gasoline into our storage from line tanks, or from our storage to the supply tank cars.

The labor cost of filling a large line tank car by use of these transfer pumps at headquarters is practically nothing, while the unloading, filling, and reloading of 10,000 gal. gasoline in separate 55-gal. shipping drums will cost close to ten cents for each drum handled (based on actual test), even with the best facilities.

Accounting

In writing of the accounting we will deviate from the strict meaning of the word as used on railroads and instead dwell on the matter of controlling the issues and the stoppage of gasoline leaks or of gasoline being confiscated for purposes other than company or railroad use.

To control the issues and consumption of gasoline on the Missouri Pacific we are following the matter up on all divisions by

Railroad

* Examination should be made under "Remarks" what purpose used for.
 o Must have signed receipts to cover total amount of consumption under this item.

Exhibit A

requiring all section or extra gang foreman to furnish their superintendent a monthly report on which they show the total number of miles they have run their motor car during the month and the total gallons of gasoline they have used as well as the amount of

The report also shows how much if any of their stock of gaso-

line was furnished to itinerant motor cars so that proper charge can be made through the superintendents material distribution, officers or other employes taking this gasoline have instructions to leave a note in the section tool house advising the gasoline taken, or else tell the foreman along the road when they come across him.

The one railroad, requires a monthly statement from their gasoline users, that requires more detailed information and a monthly balance of the gasoline on hand, sample form submitted. (Exhibit A.)

Some of our superintendents have requested and are procuring from our storekeepers a monthly statement giving our record of the gasoline which our supply cars furnish each of his section and B. & B. foremen, and undoubtedly if this report is used in conjunction with the one he gets from his own men, all is being done so far as records and statistics are concerned as would be within the bounds of practicability to regulate issue.

Where a blue print schedule, as previously mentioned, is furnished the supply car men, giving the allowances of gasoline to each point, it would be questionable as to the necessity or value of such a statement.

To discourage or avoid theft there are many effective methods, practically all of our storage drums that are located along the line or in isolated places have some device to prevent access. Many of the underground storage drums have small platforms built on the surface fastened to driven posts to make them secure, these platforms having one plank hinged and by use of a hasp and staple are kept locked.

Another effective method of locking an underground tank is to have a slot cut through the gas pipe leading to the drum, then by using a flat tee shaped iron slide with a hole in one end for a padlock, it can be locked against the insertion of either a hose or pump.

However, the very design of our standard storage outfit practically precludes the use of any pump other than the pump furnished with the equipment.

On some of our divisions at the time the gasoline is delivered from the supply cars, it is doctored by the addition of lubricating oil. One pint of oil to sixteen pints of gasoline seems to be most generally used. This makes the fuel unfit for anything but the roadway types of motor cars, and as Mr. Hall stated in his article, "A person might try this mixture in his automobile once but never again."

The Santa Fe has gone very extensively into the proposition of the making and the use of a mixed fuel for railroad motor cars which cannot be successfully used for automobiles, and at the same time being a cheaper fuel than straight gasoline.

At their stores from which the supply cars operate, they have constructed a large mixing tank which is connected by pipes to their gasoline storage and to their kerosene or distillate storage.

The mixing tank is filled with 60 per cent gasoline and 40 per cent kerosene or distillate, and after the addition of the proper proportion of heavy lubricant, the contents are thoroughly mulsi-fied by agitation which is accomplished by the admission of compressed air into the tank through an arrangement of pipes, the mixture is then conveyed to storage tanks for use.

The writer does not know whether the above mixture gives satisfaction the year around or not, it may be that the percentage of gasoline is increased for winter use on their northern lines.

In the use of mixed motor car fuel, provision would have to be provided at terminals from which inspection or official cars having automobile engines could procure their supply of straight gasoline.

(The above report was prepared by L. V. Hyatt, Inspector of Stores, Missouri Pacific.)

Mechanical Division Elects Officers

THE ELECTION of officers of Division V, Mechanical, A. R. H., yesterday resulted as follows: Chairman, James Coleman; Vice-Chairman, John Purcell; Members of General Committee, C. F. Giles, T. H. Goodnow, A. Kearney, J. T. Wallis, W. H. Winterrowd, C. E. Chambers, and L. K. Silcox. To fill unexpired terms on General Committee ending June, 1923: W. J. Tollerton and H. C. Oviatt.

1922 Convention of the Air Brake Association

Large Gathering Listens to Paper by Prof. S. W. Dudley
on Wastes in Air Brake Service

THE TWENTY-NINTH annual convention of the Air Brake Association opened Monday, June 19, 1922, in the Vernon room of Haddon Hall hotel, with an attendance of over 350 people. This is the first time that the association has held a convention at Atlantic City and of course the first time that its meetings have been in conjunction with those of the Mechanical Division of the American Railway Association. No regular convention was held in 1921. The officers and executive committee held a meeting, however, at Hotel Sherman, Chicago, May 3, 1921. At that time such business was transacted as required attention and reports from the various committees were received, but were not discussed. Several of these, however, will be taken up for topical discussion at the present convention.

Some 225 registered before the convention started. This compares well with previous meetings, but somewhat delayed the opening, and the meeting was not called to order until 10:30 a.m. by the president, L. P. Streeter, air brake engineer of the Illinois Central. Doctor Newton W. Caldwell, pastor of the Olivet Presbyterian Church, then opened the convention by invoking the divine blessing. The address of welcome was delivered by Edwin F. Bader, mayor of Atlantic City. This was scheduled to

follow immediately after the opening prayer, but Mr. Bader was delayed on account of having to attend an important conference. He arrived a little later in the morning, however, and gave the association a most hearty welcome to Atlantic City and presented to the chairman a full-sized key to the city.

A past president's badge was given to L. H. Albers, New York Central, the presentation speech being made by B. J. Feeny, Illinois Central. One was also presented to T. F. Lyons, New York Central, the speech being made by E. F. O'Connor, Southern Railway.

President's Address

President L. P. Streeter then presented the following brief opening address:

It is with keen appreciation of the honor which the Association has conferred upon me that I extend a cordial welcome to you at this convention. I believe our convention will be productive of great benefit to all concerned, and there is every reason why it should be the best held so far.

This is the first time that many of our members have had the opportunity to see the extensive exhibits brought together annually by the railway supply men of America,

Otto Best
Treasurer

F. M. Nellis
Secretary

C. M. Kidd
Third Vice-Pres.

R. C. Burns
Ex. Com.

H. L. Sandhas

H. A. Clark

W. W. White

M. S. Belk

Members of Executive Committee, Air Brake Association

which draws railway men from all sections. The genius and mechanical ability of our country, especially in railway transportation, leads the world. Keeping this in mind, I trust you will all make careful study of the exhibits and take back to your respective managements the results of a study of means and ways to improve conditions, which can best be accomplished by men like you who know the situation from the practical point of view.

We have a right to be proud of achievements of our Association which during the twenty-nine years of its existence has stood for a higher development of the air brake art, and I believe is largely responsible for the safety and care of the traveling public and the safe movement of goods necessary to their comfort. The Air Brake Association has developed a body of men of which we have reason to be proud, and they can be classed with the most conscientious and hard-working part of our railway organization, many occupying positions of responsibility and honor.

Our organization is filling successfully a highly specialized field of work with increased responsibilities, and our cordial relations with the American Railway Association evidenced by our meeting here during its convention goes to show that we are a recognized factor in the railway world. Our work also has the hearty indorsement of the Bureau of Safety of the Interstate Commerce Commission.

I believe the future of our association is a bright one if we keep in mind the fact that we are primarily an educational body, endeavoring to encourage in every way the so-called "little fellow" who by our help may develop into a most useful member in the railway field, and if I

have helped toward this end in any way, I will feel well repaid for such efforts as I may have devoted to the cause.

Following the opening remarks by the president the report of the secretary was presented by F. M. Nellis. In the absence of Otto Best, Mr. Nellis then read the treasurer's report. These reports showed the association to be in a healthy financial condition.

Denver Secures Next Convention

In order that the educational work of the association may be of the greatest benefit to its members, many of whom attend at their own expense and who are scattered all over the country, it seemed best to the executive committee to continue the practice of holding some of the meetings in the West as well as in the East.

In announcing the decision of the executive committee to hold the next convention in Denver, the president also called attention to the fact that instead of a direct amalgamation with the American Railway Association which has been under consideration for some time, it had been decided best to maintain the present individuality of the Air Brake Association. A close affiliation and co-operation with the A. R. A., which the amalgamation question has brought about should, however, result in all the benefits which would have been obtained by affiliation.

The only paper presented at the first session was by Prof. S. W. Dudley, of Sheffield Scientific School, Yale University. The paper contained much that should prove an incentive to every member to carry out the aim of the association which is "to obtain a higher efficiency in air brake service."

Wastes in Air Brake Service

By S. W. Dudley

Waste Commission, W. W. R. Isn't this a country of unlimited resources? Most of us know better than to make any such claim. I don't but yet are we willing to face the problem of waste, conserve our energy and act according to the plan laid out by the Government? Waste is not new records of production and increasing our industrial industry and commerce have been successful products of our past results, making a new record. Efficiency is our motto. Under the conditions of our present time, the most important of a new industry, the establishment of a new industrial enterprise, the holding of a train in a limited number of minutes, or more, or less, had to produce a new record, not the most, but the best in view. But is there not a waste, a waste which we return to poverty, if not those wastes produced will surely, although perhaps not obviously,

diminish unless our natural resources—our capital funds—material and otherwise are conserved?

The Great War has brought home to thoughtful people here the cruel lesson of the European nations, who are, and have been for years, faced with the struggle for existence in what seems to us a hopelessly narrow margin between natural resources and national needs. Only recently have any of us become much impressed with the necessity for conserving our two vast natural resources. It has now become a common saying that some nations would live comfortably on what we, as a nation, waste.

Nature herself is, of course, a colossal wastrel—witness the multitudes of acorns which never become oaks. But nature is also a bountiful provider. Man, when he uses the resources pro-

vided by nature, wastefully and without replacement, is thoughtless, careless and ignorant, if not criminal. It is not the use, but the abuse, that is dangerous to the well being of ourselves and our children.

"There is that scattereth, and yet increaseth; and there is that withholdeth more than is meet, but it tendeth to poverty."

Material waste is only one side of the story. The waste of human time and effort, under our modern complex industrial systems is equally far reaching.

It is one of the encouraging signs of the times that these questions are being studied scientifically and earnestly by the best trained brains in this country and that their conclusions and recommendations are being listened to and acted upon by practical men, executives and financiers in all lines of industry.

Late in 1920 Herbert Hoover was elected the first president of the newly formed Federated American Engineering Societies and with characteristic practical vision he asked the question, "What can this Society do to benefit industry?" At the first meeting for organizing the Federation Mr. Hoover himself proposed an answer. "There is a vast amount of restriction and waste in the 288,376 industrial establishments listed by the census of 1919. Let us study this waste—see what it is, and what can be done about it."

It is well to stop a moment here and notice the standing and ideals of the organization proposing this study. The Federated American Engineering Societies is an inclusive national organization of over 75 national, regional and local engineering and allied technical societies, such as the A. S. M. E., the A. S. C. E., the A. I. E. E., the A. I. M. E. and so on. Their common ideals have been expressed as follows: "Engineering is the science of controlling the forces and of utilizing the materials of nature for the benefit of man, and the art of organizing and of directing human activities in connection therewith. As service to others is the expression of the highest motive to which men respond and as duty contribute to the public welfare demands the best efforts man can put forth, now, therefore, the engineering and allied technical societies of the United States of America, through the formation of The Federated American Engineering Societies, realize a long cherished ideal—a comprehensive organization dedicated to the service of the community, state and nation."

Waste in Industry

This organization accepted Mr. Hoover's suggestion with enthusiasm and a committee of 18 engineers of broad experience, clear vision and unbiased attitude toward industrial problems was named to make a study of the waste in industry.

The essence of the plan adopted by the committee was to gather quickly such concrete information as might be used to stimulate action, and lay a foundation for other studies. Within the remarkably short time of five months there had been completed an analysis of waste in six typical branches of industry. The complete report is included in the volume entitled "Waste in Industry," published in 1921.

This report has been discussed before engineering societies and clubs, industrial organizations and conventions of all sorts. It therefore seems to me most fitting that this Air Brake Association, which has been actively engaged in promoting a higher efficiency in air brake service for almost 30 years, should signify in a rather definite way, its hearty interest in and support of this nation-wide movement against avoidable wastes in industry.

We may feel justly proud of the many papers and committee reports on record in our proceedings dealing with various phases of this subject in our own field. Probably 50 per cent of the technical papers and reports presented at our conventions have dealt with ways and means of preventing waste of materials, labor, time or human effort and energy in air brake service.

Stopping Air Leaks

An excellent example is the magnificent work accomplished by the Committee on Air Consumption of Locomotive Auxiliary Devices, under Mr. Weaver's able leadership. His reports, at this and the two preceding conventions, are full of original and practical information and sound recommendations. They deserve to be studied and acted upon. The railroads will benefit directly as the sources of loss and efficiency mentioned are attended to. This Association and the railroads could show the appreciation which this thorough investigation merits in no better way than by

adopting its standards of performance and methods of testing as a part of their recommended or standard practices.

The conditions disclosed by the report of this committee certainly justify immediate and thorough action. Such action has already been taken on several railroads. Why should not the supervisor of air brakes have at least one man, possibly one at each terminal and division point, whose sole duty should be the finding and stopping of air leaks? He would be a busy man and might need several helpers, but would it not pay? A good live young fellow, interested in his job, would soon learn a lot about what should and could be done. Call him the air leakage inspector, if you choose. I believe the committee will back me up in saying that the results would astonish you.

What Kind of Wastes?

Wastes in air brake service are by no means only those direct losses due to leaky or inoperative devices, or to materials or supplies actually lost or damaged. In a foreword to the Engineering Societies' Committee report, Mr. Hoover said some things which apply to the air brake service, as well as to the general industrial situation which he had particularly in mind: "We have probably the highest ingenuity and efficiency in the operation of our industries of any nation. Yet our industrial machine is far from perfect. The wastes of unemployment during depressions; from speculation and over production in booms; from labor turnover; from labor conflicts; from intermittent failure of transportation of supplies or fuel or power; from excessive seasonal operation; from lack of standardization; from loss in our process and of materials—all combine to represent a huge deduction from the goods and services that we might all enjoy if we could do a better job of it."

In assigning responsibility, i. e., relative opportunity for knowing and doing better, the committee placed (roughly speaking) 50 per cent upon management and 25 per cent upon labor, the remainder being placed upon outside contacts, such as the public, trade relationships, etc.

Management has the greatest opportunity and hence responsibility for eliminating waste. But it must have the cooperation of labor in order to better the present record.

Do not overlook the fact that waste is a permanent impairment of our reserves. We are in large measure opportunists. We think only of the present, we live today;—let tomorrow take care of itself as we have had to do.

Time; energy, both human and mechanical; money, materials, and equipment must all be wisely directed and intelligently used. Many of our most serious losses arise from our failure to use the time and energies of past generations, as well as those of living men. Committees, rules and reports point the way but are powerless until translated into right action at the right time and place by the man on the job,—whether he be the general manager or the yard inspector.

What is a Good Organization?

The Federated American Engineering Society's Committee found that good organization was one of the best safeguards against waste in industry. What is a good organization? Suppose you had a crew made up of Charley Weaver, Otto Best, Mark Purcell, Frak Barry, Charley Kidd, George Wood and Pat Langan. That would be "some" organization, wouldn't it? But who would carry the stencil brush and the grease pot?

An organization is a good deal like a locomotive. You will find a few cranks and eccentrics. There are some very rigid and unyielding members, like the frames and the guides. There are some that make a lot of noise, like the bell and the exhaust. There are some that actually restrict and restrain, like the throttle and the yokes. But the cranks make the wheels go around. The eccentrics actuate the valves, the rigid and unyielding frames and guides keep the moving parts together—and also apart. Noise, in its proper place, means protection and safety. Restriction and restraint, properly exercised and in proper amount, mean adaptability to the task in hand and plenty of reserve for peak loads and unexpected emergencies.

So with an organization—"It ain't the star performer alone that makes the goal, but the everlasting teamwork of every bloomin' soul."

Weil, there are many causes, some evident and easy to cure, some not so evident and not so easy to overcome. Lack of vision,

faulty management, ignorance, carelessness, lack of team work, inadequate or improper equipment or installation, lack of proper or sufficient repair parts, materials or tools, the wrong man on the job and (perhaps the most serious of all) not enough trained men to do the work.

I want you to read again Mr. Frank McManamy's address before our 1920 convention particularly. Listen—"I have always felt that the air brake man was working under a rather strong handicap and that while he was a mighty good fellow, there were too few of him." "With the additional work the air brake man has to perform outside of organizing his departments and looking after the brakes, and looking after men that handle brakes, he is able to give entirely too small a proportion of his time to the actual maintenance and operation of the brakes. It seems to me that we shall never get the air brake conditions which are desirable, and which are in fact necessary under modern methods of railroad operation, until we increase the air brake departments on practically all the railroads."—"We must have first, men to plan the reorganization. We must have, second, the facilities to permit the work to go forward. To get both of these we must have support from the higher officials of the railroads, because while it will cost them a little money at the start, it will pay. It will be one of the biggest dividend payers that they have on their railroads."

Make no mistake about this. This is not an air brake man trying to land a job or get an increase in salary. It is the deliberate practical judgment of a good business man, an executive of wide experience, accustomed to look for the facts wherever they may be found and to face them squarely when found—A little further on he says: "If the rules and recommendations of this Air Brake Association were being observed on all the railroads in the country, we would not need any federal laws relative to the condition of air brakes." This is a compliment and a challenge. Gentlemen, it lies in your power today, more than ever before, to make these rules and recommendations effective through cooperation with the proper agencies of the greater Association with which you are now affiliated.

What Can We Individually Do to Improve Matters?

Keep right on, pegging away. Get and create in others, habits of foresight, analysis, thrift, efficiency and effectiveness. Look ahead a little, size up the job and make every move and everything count. Education is needed all along the line. Show the management the facts and what ought to be done. Perhaps they will not listen or understand at first—probably you didn't. But keep right on urging proper equipment, proper installation, proper and sufficient repair parts and tools, and above all better men and more of them.

Just a few concrete examples of what you men on the fring line see every day. And in this connection let no one miss the point that mere muck-raking as a pastime is no longer the fashion. The spirit of constructive criticism has taken its place. Today we look for the facts, favorable or otherwise, because we want to find out how to do better tomorrow. The times change rapidly and tremendously. What could and should be tolerated to help along the progress of yesterday needs curbing, perhaps elimination, today. Standards must advance with knowledge and facilities. Fault finding is profitless, but not to see and take advantage of an opportunity to improve conditions is a crime.

First a quotation from a letter from L. W. Wallace, the executive secretary of the Federated American Engineering Societies.

"I am very much interested in knowing that you are discussing the topic 'Waste in Air Brake Service.' This is an important subject.

"Perhaps you will be interested in knowing that the larger part of my professional experience has been in connection with railway mechanical engineering. While serving a special apprenticeship on the Santa Fe, I specialized somewhat in air brake work. At the time, I made a study of the waste of compressed air at the Cleburne Shops. It was found that there was a very large waste occurring through leaky valves, improper hose connections, faulty air drills and by workmen leaving the air turned on so long that while not using it, at noon hours and other times. In discussing these things, a *lack of air supply* was mentioned as a *handicap* and a *low pressure*, brought about by *leaky valves* and *leaky air supply* pressure. This made it necessary to *run large additional air compressors* which had

been contemplated. I am confident that this situation is duplicated in many of our railroad shops."

Without further mention by name, but with hearty thanks for their cooperation, I wish to quote or refer now to several suggestions received from active and influential members of this Association (most of them members of the Manhattan Air Brake Club) as to concrete cases which illustrate clearly what we have been thinking about. Excessive leakage is, of course, an old and an everpresent source of waste, delay and inadequate control.

First, therefore, a good suggestion regarding leakage:—"I do not feel that you can lay too much stress on the necessity of railroads providing a departure yard suitably equipped with air brake charging lines with a view of eliminating excessive leakage and correcting irregularities that may exist when there is adequate time, rather than performing this work after the hauling locomotive is attached to the train when the time is limited. This does not only mean assisting the life of the compressor and accessories but goes a long way towards assisting proper and economical functioning of the air brake equipment."

Insecure pipe clamps, use of the human instead of the soap brush to locate leaks and carelessness about retainer pipes and unions are well known but altogether too common sources of leakage. These and other short comings of installation and inspection are of much more consequence on a locomotive than on a car, because "a locomotive failure is a train failure."

Why Is Leakage Tolerated?

Do you know why this leakage is tolerated? As in most other cases, the answer has an economic flavor. It is because coal costs only \$400 per ton.

They don't know what leakage is in Europe. One of your best known members told me of riding on a French railway locomotive during the war and being almost paralyzed to see the engineer calmly reach over and shut the throttle valve in the air compressor steam pipe shortly after leaving the station. There was about 80 lbs. pressure in the system and there it stayed until the brakes were used to make the next stop, when the pump throttle was opened up and the pressure restored. There *were* no leaks—they were not tolerated. Why? Because at that time coal was \$64 per ton and the engineer received a bonus on every pound he could save. So it *can* be done.

We avoid the cost of a good tight pipe job, of close inspection and of competent repairing, but burn more coal. We need to do more than make rules about these things. We must have the right kind of men, enough of them and encourage them by giving them the tools, the materials and the proper places to do the work. No man can turn out a decent job with only a pipe wrench, a paint brush and a lack of proper material or conveniences.

The following describes conditions perhaps not entirely unfamiliar to some of you.

"Probably the greatest handicap suffered, in my experience, was and is due to the extreme poor quality of the men that we are provided with for air brake work, it seeming to be understood that any kind of a man will answer the purpose, which of course results in a great loss of time and material, as well as safety. To illustrate:

"While checking triple valve repairs not so long ago, it was found that paper wads had been used to fill the triple piston packing ring openings, which for the minute, permitted the valves to pass the test rack requirements and for the same purpose and in the same lot of valves, a very heavy grease had been used on the piston ring and cylinder.

"Improper tools is another cause for a waste of time and material. While watching one of our men cleaning the brake equipment on a car recently, it was noted that he was using a hammer and chisel for removing nuts from the bolts. On inquiry it was found that he had but a 12-in. pipe wrench for the purpose and this could not be used due to lack of space.

Waste in Air Brake Service

"Pipe wrenches are used also for removing valve chamber caps, reversing valve chamber caps, etc., resulting in spoiling the hexagon, so that the pieces have to be thrown into the scrap.

"Carelessness in the use of new material, instead of repairing the old, results in a great loss. This is especially serious where piece work is in vogue.

"At one time 26 steam heads for 9½-in. compressors were found hidden away in one of our shops instead of being repaired and used because it was much easier to apply new. Of course, these had been some time in collecting, but it illustrates the waste and nearly the same condition prevailed at the same shop in connection with slide valve feed valves for engineers' brake valves."

The savings in material and time which can be made possible by improvements in storerooms and repair yards would scarcely be credited. Here is a concrete case:

"For several years we were unable to have the stores department handle second-hand material. When surplus air brake material was repaired, they refused to allow us to place it in stores for filling orders to outside points, claiming that this put the burden of cost on them. At the same time requisitions were not submitted to me for approval. About four years ago I made a check of extra material on the system and found about \$35,000 worth of distributing valves, brake valves, feed valves, pump governors, cut-out cocks, etc., lying in engine houses, shops and repair tracks. This material was repaired and stored for less than \$600, including labor. In this lot there were 30 distributing valves that only required a piston packing ring, or an application piston packing, feed valves that only required cleaning, governor bodies requiring re boring, new portions of governors that had been stripped to make repairs to second-hand material and triple valves. This was the direct result of drawing on the stores department for new material without returning the old parts for repairs. While we furnish enginehouse inspectors with material that requires no work except application to the locomotive or tender, they do not clean feed valves or distributing valves, but draw new ones on the stores department. We found that the shop repairmen and pipe fitters were ordering material that did not move from the stores department in many instances for eight to ten months. The pipe fitters were going to the stores department for new material when the old material would have served the purpose just as well. As evidence of this we found 1,200 ¾-in. and ½-in. cutout cocks which were thrown in different places in the shops, all of which were made good by regrounding and placing them again in service.

"After noting the indifference of the men in regard to material, we checked all requisitions to prevent duplications of the above parts, and are satisfied that from our present system we are saving from \$10,000 to \$15,000 per year without in any manner diminishing the safety or efficiency of the service. We then checked all the storehouses on the system and found hundreds of parts of special retaining valves, feed valves, governors, etc., which we assembled and placed in stock for distribution. The result of this is we have not ordered any of these parts, including triple valves, for the past four years, and having a check of the number of whole parts on hand at the different points on the system, duplications can be made only through loss by accident.

"At our main car shops where heavy repairs are made which require taking down the entire brake apparatus, we found that the amount of pipe work was so great and the distance from the pipe and cutting machine so far, that six men were required to do the work which four men could do equally well.

"Where five foreign lines deliver to us, we found that the number of non-operating brakes were so great that it was necessary to add six men to the force, two on each eight-hour trick. In our fast freight trains we put in at least four to eight cylinder packings in each train. To save time we furnished pistons complete with packing leathers, so that when one was removed from the cylinder under the car, a complete piston was added and the work of re-applying the leather was done when there was no train work. The trains then departed with 100 per cent operative brakes, and nearly always on time. We have placed standard triple valve test racks at all terminals where air is supplied to repair tracks, 10 in number, and all cleaning of triple valves is done in the shops instead of on the car. A laborer carries the triples to and from the test racks to the cleaners. All triple valves are sent to one point for repairs.

"Lack of material was always an excuse for not doing work properly and efficiently. I found on visiting the different stations that they were always short of certain material, and that requisitions were not promptly filled. We appointed one man whose sole duty is to visit all repair stations, note requisitions and see

that no place suffers for want of material. This worked out perfectly as we find now that there are no delays in shipments of material, unless it is that for which we are waiting delivery from the manufacturer.

"It is a noteworthy fact that foremen at shops, enginehouses and repair tracks never check up the work of air brake men. This is probably due to the fact that they were never interested in the work and know very little about it. We, therefore, depend upon the men to honestly perform their work, and to do this they must be furnished with the necessary devices and material. The proper location of locomotive and car air devices is essential, as an improper location of such devices means neglect on the part of the workmen."

In your own Proceedings and in those of many of the railway clubs these truths have been emphasized over and over again. One of the most notable of these is a paper on "Freight Brake Maintenance" presented by F. B. Farmer before the Canadian Railway Club, April 1918. This paper should be studied and adopted as a standard text by every air brake instructor and inspector in the country.

The sole purpose of a railway is to save time. Therefore, the greatest possible waste is that of time. To operate the railways human energy and skill are necessary in the highest degree. Therefore, misdirected or unduly overloaded human energy is a source of avoidable waste. To permit human energy and skill to function effectively and efficiently, proper organization, policy and support must be provided. Therefore inadequate organization, lack of understanding and vision, and insufficient funds, materials and equipment cause lower efficiency, diminish effectiveness and result in far-reaching wastes. Expensive "economy" and wasteful "saving" must be guarded against. To paraphrase a well-known Arabian proverb:—

"He who wastes and *knows* that he wastes is a fool. Avoid him. He who wastes and *knows not* that he wastes is simple. Teach him.

He who wastes not and *knows not* that he wastes not is asleep. Wake him.

But he who wastes not and *knows* that he wastes not is a wise man. Follow him."

Efficiency of Enthusiasm

One of our friends has handed in the following tribute to the men who have set up and arranged the big exhibit:

"To the observer who has been present on the Pier during the last two days the transformation from a scene of absolute chaos to one of order and perfection must have made a deep and lasting impression. On Monday morning with the exception of a few large and elaborate exhibits, some of which require many days and even a week or more to set up, there was practically nothing but an indiscriminate mass of packing cases and debris of all kinds strewn over the pier. Apparent disorder seemed to reign supreme, but behind and underlying all was a definite well-thought out program which within a few hours would be put into effect.

"In the brief period between Monday morning and Tuesday night the entire pier has been converted into a glorious and beautiful display of the finest mechanical products of American skill and ingenuity. And when one contemplates the speed and almost magical swiftness with which these packing cases have been turned into magnificent exhibits arranged with artistic skill and in a manner best to educate and interest those for whom they

have been created. One cannot but be impressed with this remarkable transformation and he naturally wonders how is it all possible.

"How is it possible to accomplish all this work in so short a time as perhaps twenty-hours? There is only one answer and that is that this wonderful work is the result of interest and enthusiasm. No paid help could accomplish what has been done in twenty hours on the Pier in ten times the number of hours. Nay, it is safe to say that paid help could not have done it at all. Nor are the men who have set up these exhibits with few exceptions skilled workmen. Most of the work is done by salesmen, engineers, advertising men, clerks and office help. But what these men have lacked perhaps in skill as workmen, they have made up a thousand-fold in their interest and enthusiasm.

"Just look at these beautiful exhibits. As much the work of artists as any painting or statuary. Put up in absolutely perfect shape without blemish, not even a finger mark marring the finish of these really works of art. Such is the result of American resourcefulness, American energy, and that indomitable spirit of progress that pervades the entire railway supply fraternity. Who can help but admire that wonderful attribute of our American civilization so forcefully exemplified in this demonstration of the efficiency of enthusiasm."

Electrical Engineers Meet at Hotel Dennis

Lengthy but Interesting Program Draws Large Attendance
and Provokes Good Discussion

THE SEMI-ANNUAL MEETING of the Association of Railway Electrical Engineers, held at the Hotel Dennis, yesterday morning, was called to order at 10.10 a.m., by E. S. M. MacNab, first vice-president of the association, in the absence of the president, L. C. Hensel. In presenting the opening address Mr. MacNab spoke as follows:

"I am glad to welcome you to this semi-annual convention of the Association of Railway Electrical Engineers, and to see such a good attendance of members.

"I must first apologize for the absence of our president, L. C. Hensel. Those of us who know him, I am sure, agree that it is most urgent business which prevents him being with us today, as he has always been most attentive both at convention and executive committee meetings.

"This is the first semi-annual meeting which has been held for two years owing to depressed business conditions. However, I feel confident that we have passed the lowest point on the curve and that the near future will restore the normal flow of business which is essential for the prosperity of the railways and the country in general. The railway equipment purchases during the past five months, as shown in the *Railway Electrical Engineer*, were as follows: Passenger cars, 1195; freight cars, 77,053; locomotives, 400. These figures would bear out this contention.

"There will be presented for your consideration and discussion, progress reports from several committees, and I would ask that we have a very full discussion, and if any member has any data or information which he can bring out it will materially assist the several committees and at the same time make their reports more complete.

"We will also be favored by having a paper on 'Industrial Heating' read to us by B. F. Collins, of the General Electric Company, which I am sure will be both interesting and instructive. It is a subject that has come to the front of late and this paper will constitute a valuable addition to the proceedings of the association.

"In closing, it is hardly necessary to draw attention to the splendid collection of exhibits on the pier. I often think that we do not sufficiently appreciate the advantages we have by being able to inspect the latest additions in all the branches of the railway mechanical engineering field, and I am safe in saying that in no other part of the world,

would it be possible to duplicate this A. R. A. convention."

Data and Information

Immediately following the opening address the report of the Committee on Data and Information was presented by E. A. Lundy, *Railway Electrical Engineer*. Mr. Lundy spoke of the importance of securing authentic data and information and of the need of tabulating it so as to establish valuable records which will show just what is being done by the different roads. Along the same line, J. R. Sloan, Penn. R. R., suggested that it might be desirable to plot curves showing the increase or decrease of electrical equipment during the years.

E. Wanamaker, Rock Island Lines, said he believed it would be of much benefit to the electrical fraternity if some valuation were placed on electrical equipment. He drew attention to the primary importance of electrical apparatus in present day railroad operation and cited the growth of the investment in electrical material during the past 20 years from \$3,000 to \$3,000,000. Railroad operation is dependent upon electrical equipment to a far greater extent than is generally realized. Railroad managements should be shown the importance of building up an efficient electrical organization so that it can properly purchase, install and supervise electrical equipment.

It was stated by J. A. Andreucetti, Chicago & North Western, that roads did not have figures available which they could supply the committee, although conditions were getting better in this respect since the establishment of valuation departments. He further stated, however, that probably the heads of electrical departments could very likely approximate the value of materials under their jurisdiction.

L. D. Moore, Missouri Pacific, thought that while it might be difficult, that probably the members of the committee themselves could arrive at an approximate figure. It might not be possible to get definite costs, but they could develop a report that would show the relative value of the equipment used on the various roads. The fact is that there has been an increase of six or seven hundred per cent in electrical equipment on the Missouri Pacific during the past 10 years, and if the matter could be brought before the railroad managements the electrical departments would undoubtedly benefit by it.

F. Wanamaker significantly remarked that the tremendous growth of the importance of electrical equipment was not fully appreciated by the electrical men themselves and therefore it could hardly be expected that others would recognize how vital this apparatus had become in railroad operation.

Motor Specifications

The report of the committee on Motor Specifications was presented by Mr. Wanamaker, who stated that the report was at present a tentative specification. Contrary to expectations he said, the various motor manufacturers, as well as the Electric Power Club, had given the committee the heartiest co-operation in preparation of the material included in the report. The specifications as drawn cover alternating and direct current motors of the open type ranging from 1 hp., 1800 r.p.m., to 75 hp., r.p.m. Mr. Wanamaker further stated that if the committee was continued that it was its intention to take up the matter of specifications for mill type, motors, crane motors, control motors and protective devices.

He also emphasized the importance of bearing design in connection with motors, declaring that there never had been any standards for motor bearings. Two chief causes for motor failures he attributed to failure of insulation and to faulty bearings. Mr. Wanamaker commented upon the great amount of interest manifested in the meetings of the committee which was manifested in the large attendance at monthly meetings and in some cases semi-monthly meetings. He said it was surprising to find how little was actually known regarding the life of motors in service. When conflicting opinions were averaged it was found a life of ten years was the resulting figure.

Committee on Illumination

The report of the Committee on Illumination was presented by L. S. Billau, Baltimore & Ohio. He emphasized the necessity of reducing the number of standards for incandescent lamps as much as possible, stating that the committee had striven to do this. He further stated that the 100-watt lamp was being introduced into car lighting service. It is interesting to note that the increase of car illumination which was prophesied several years ago is now becoming a realization. He stated that the Mazda C gas-filled lamp was now available in the 25-watt sizes. One of the most important factors which electrical men should familiarize themselves with, Mr. Billau stated, was the industrial lighting codes which have been adopted in various localities. He said that the probability was that these codes would become more strict as time went on.

G. W. Bebout, Chesapeake & Ohio, introduced the subject of mill type Mazda C lamps for use on extension cords and stated that the C. & O. had adopted this type of lamp as a standard for this service. He said this type of lamp was giving complete satisfaction and had replaced the old carbon lamps entirely. Mr. Andreuetti held quite an opposite opinion, stating that while the efficiency of the Mazda mill type lamp was high, he could not get long enough life out of them to warrant their use. He stated that the renewals were five times as great as when the carbon lamps were used.

F. Jansen, Illinois Central, agreed with Mr. Andreuetti.

Mr. Wanamaker said the Rock Island had just begun using the Mazda lamps in portable service but that they were having good results and suggested that perhaps there was some difference in the type of lamp being used by the other men.

At this point the discussion swung over to the life of incandescent headlight lamps and cab lamps. It was clearly evident that incandescent lamp life and service life were two

quite different things. The discussion became very general and many took part.

A. L. Broc, Edison Lamp Works, gave some interesting facts on the subject of lamp manufacture. He stated that cab lamps and car lamps were made with two entirely different aims in view. The cab lamps, he said, were made rugged at the expense of efficiency while the car lighting lamps were manufactured with the idea of securing maximum efficiency. Referring back to the mill type lamp he stated that these should not be confused with the Mazda C, gas-filled lamp, for although they were similar in appearance the mill type lamp was not gas-filled.

T. P. McGinnis, Pyle National Co., gave some interesting information concerning lamp life tests which his company had conducted on 125 locomotives. He said that by considering the total headlight lamps purchased and dividing the number by the total number of hours burned by all lamps a value of approximately 320 hours of life was obtained. This did not compare favorably with individual test made which showed that 520 hours was frequently secured. The discrepancy shows clearly that many lamp were broken, lost or burned out.

Report on Electric Welding

The report of the Committee on Electric Welding was briefly presented by E. Wanamaker. He stated that it was exceedingly difficult to draw a set of specifications for the reason that there existed so many variable opinions and ideas. Five meetings of the committee had been held and it was expected that a number of additions would be made before the report was presented in its final form in the fall.

Report of Committee on Stationary Power Plants

The committee report on stationary power plants was presented by L. C. Bowes, Rock Island Lines. He emphasized the necessity of distributing the charges made for steam consumption for various railroad purposes. It was a matter which had never received proper attention and was of the greatest importance if any basis for comparison for charges could be arrived at.

Mr. Moore wanted to know if the committee contemplated including methods or a list of items to be used in arriving at power plant costs. He said it was very difficult to get accurate costs of power plant operation.

In reply Mr. Bowes said it was the intention to show what the cost should be so far as labor and materials were concerned, but that interest and depreciation of equipment were very difficult to obtain.

C. Quinn, Norfolk & Western, related his experience with steam flow meters, extending over 15 years. Steam flow meters he said served as an excellent check on steam consumption by various users. The amount of steam used by air compressors he said could be computed from the revolutions of the compressor.

Electric Repair Shop Facilities and Equipment

Mr. Bebout presented briefly the report of the Committee of Shop Facilities and Equipment. In connection with this report Mr. Quinn described the system in vogue on the Norfolk & Western regarding the record of motors. Each motor, he said, was given a number indicating the month and year that the equipment was purchased. A complete record was then available, no matter how many times the motor was transferred from one place to another.

Power Trucks and Tractors

The report of the committee on Power Trucks and Tractors was presented by Mr. Moore. He stated that considerable difficulty was encountered in securing cost data for the reason that many roads did not keep complete records. Industrial concerns using this equipment were very much better in this respect and most of his

cost data had been secured from them. The gasoline tractor, he said, should be included in the report of the committee, as the subject did not specifically state that electric tractors alone should be included. Some diversity of opinion developed as to the attitude of insurance companies relative to the gasoline equipment. It was found that in some cases this equipment was used in buildings and while not specifically prohibited was not recommended for interior use. For long hauls where a greater portion of the route was out-of-doors, it was felt that the gasoline tractor could be used to advantage.

Report of Committee on Train Lighting

The report of the Committee on Train Lighting was presented by Mr. Billau, who drew particular attention to the essentials for direct drive for car lighting generators, which formed a very important part of the report. It was evident from the interest manifested that the time had arrived when the subject of direct drive should receive the most careful consideration and thought. Although a number of devices have been developed by different companies, none has been tried a sufficient length of time to warrant its general adoption. There is obviously a pressing need for some reliable device especially in northern latitudes where belt trouble is excessive.

The barrel type axle pulley recently adopted by the Pullman Company was discussed at some length. Mr. Sloan related his experience with this type of pulley in some tests conducted on a curved track with radius of 247 ft. The pulley in question was 18 in. in diameter in the middle, 16 in. at the ends and was 28½ in. long. Under the most adverse conditions the belt did not come nearer than 1½ in. from the pulley flanges. To mount such a pulley he stated took 18 minutes, and five minutes were required to remove it.

Locomotive Headlights and Classification Lamps

The report of the committee on Locomotive Headlights and Classification Lamps was presented by L. C. Mulheim, supervisor of headlight equipment, Baltimore & Ohio. Mr Mulheim added to the report by speaking of the possibilities of alternating current headlight generators and also roller bearings for headlight sets. The matter of lamp voltage rating which stumped the A. R. A. discussion of the same report was threshed out by the A. R. E. E. members and the decision reached that the matter was a question of operation, governor adjustment and depended largely upon what was expected from the cab lamps with respect to life and candle power. C. H. Quinn, chief electrical engineer, Norfolk & Western, told how he has greatly reduced his cab lamp costs without any complaints regarding lack of illumination in the cab by using carbon lamps.

E. Wanamaker, electrical engineer, Chicago, Rock Island & Pacific, introduced the subject of automatic train control and showed why the A. R. E. E. should take part in activities relating to the subject. He stated that the A. R. E. E. could undoubtedly co-operate with the Air Brake Association on this subject.

After the presentation of reports, a very able paper on the subject of Electric Heating was read by B. F. Collins of the General Electric Company. Metallic resistor furnaces of all kinds and sizes can be supplied for purposes requiring temperatures up to 2000 deg. F. A vote of thanks was extended to Mr. Collins.

Chairman MacNab concluded the meeting by complimenting the association on its work and calling attention to the fact that it was the most successful and the largest semi-annual convention ever held by the A. R. E. E.

Lost and Found

Lost—Silver mesh bag by Mrs. B. V. H. Johnson of St. Louis. Kindly return to Secretary Conway's office.

Enrollment Today

THE ENROLLMENT booth at the entrance to the Million Dollar Pier will be open from 9 a. m. to 12 m.; 2 p. m. to 5 p. m. There will be no enrollment period in the evening today.

Registration Figures

THE COMPARATIVE registration figures for 1922 and 1920 up to 5 o'clock Monday afternoon are as follows:

	1922	1920
Div. V—M. M. and M. C. B.....	950	805
Div. VI—Pur. and Stores.....	333	406
Special guests.....	800	687
Supply men.....	2,285	2,465
Railroad ladies.....	924	746
Supply ladies.....	569	660
Totals	5,861	5,769

Last Registration Book

IT HAD BEEN planned to issue only two registration books this week—one on Monday and one Wednesday. The executive committee decided yesterday to publish a book this morning in place of the one scheduled for Wednesday morning. This will be much more serviceable to the exhibitors and others than if issued the last day of the meetings.

Pyle, Locomotive Firebox Company; W. M. Wilson, Flannery Bolt Company.)

Conventionalities

We would respectfully refer anyone who wishes to study African golf to Frank Hedley.

W. Harold Tyler, who is now connected with the traffic department of the Denver & Rio Grande Western at New York came down to visit his parents, Mr. and Mrs. W. T. Tyler, at the conventions for a few days.

F. N. Bard, who recently succeeded his father as president of the Barco Manufacturing Company, finds it impossible for the first time in many years to attend the convention owing to the pressure of business.

C. D. Young, general supervisor of stores, Pennsylvania Railroad, reached Atlantic City for the conventions Sunday, having stopped at Ithaca on his way here for a two-day celebration of the twentieth anniversary of his graduation from Cornell University.

Dave Pye tells us that he has gotten his golf score down to 125, but he doesn't say for how many holes. He has left with us a blue print showing graphically the functions of the arms and club and just how they move in the golf swing as outlined at certain periods.

I. H. Milliken, representative of the McConway & Torley Company, Pittsburgh, is not here and sends his regrets to inquiring friends. Milliken has been very active at these conventions for a great many years and it is to be hoped he will be on the job next year.

The double quartette from the Philadelphia & Reading shops at Reading, Pa., proved to be one of the best groups of entertainers that have attended the conventions. The singing and other specialties on the pier Wednesday night and Thursday afternoon were greatly enjoyed and appreciated.

Monday being Harry W. Finnell's birthday; and there being no way in which to celebrate it appropriately at Atlantic City, he left in the afternoon for New York to join Mrs. Finnell and some friends to eat and have a merry time there that evening. Mr. and Mrs. Finnell expect to get back to Columbus Saturday.

F. A. Bushnell, purchasing agent of the Great Northern, is accompanied to the Purchases and Stores convention, as in prior years, by his mother. Mrs. Bushnell is "Mother" to many of the members of the Purchases and Stores Division and is always a welcome visitor.

Allan E. Ostrander is missed by a host of friends. He is taking a needed vacation in Arizona, his present address being Prescott. We take this opportunity of congratulating him on his birthday, which occurs on the twenty-third.

Mr. Ostrander has wired the Daily as follows "Please give my regards to the fellows—see you all next year."

"Sid" Wight, manager of purchases and stores of the New York Central, is not attending the convention of the Purchases and Stores Division this year. He went to Europe a few weeks ago to take the first real vacation he has had in about 20 years. His daughter

has been living in Switzerland for some time, and he will spend most of his vacation there. He expects to return to the United States about the middle of July.

Among the arrivals Monday were A. Cooper, assistant chief mechanical engineer, and M. Pegg, assistant division superintendent of the United Railways of Havana. As the only representatives of the United Railways of Havana, they are finding much of interest to them at this, their first convention. After leaving Atlantic City Mr. Cooper intends to go to England for a few months rest.

Among the "old timers" and attendants this year is George S. Allen. Mr. Allen, who has reached the ripe old age of 86 years, is a retired master mechanic of the Philadelphia & Reading, having been on the retired list for the past 16 years. He has not missed a convention since 1892 and is a life member of the American Railway Master Mechanics' Association. He expects to meet many friends here this year.

Elisha Lee, vice-president of the Pennsylvania Railroad, Eastern Region, who addressed the Purchase & Stores convention, told *The Daily* yesterday that in spite of the coal strike the Pennsylvania recently has been handling 10 per cent more freight business than a year ago. Considering that the Pennsylvania is a very large coal carrier, this is a remarkable fact. "All indications are," said Mr. Lee, "that when the coal strike is ended and coal begins to move in normal volume, the railways of the country are going to have all the business they can handle, and probably many of them will have more than they can handle."

The carnival on the pier Saturday night proved to be one of the most popular entertainment features ever given at the conventions. It was attended by a big crowd, was entirely informal, and everybody had a jolly time. The "kiddy car" races furnished some excitement and a great deal of amusement, while the "Gypsy Trio" was welcome everywhere. The entire Entertainment Committee was on duty and participated in making the carnival a success. The committee especially in charge was composed of Fred W. Venton, chairman, J. Cizek, assistant chairman, W. G. Cook, R. P. Cooley, R. L. deArmond, George E. Haas, Arthur G. Johnson, C. R. Naylor, George A. Nicol, Jr., and H. A. Varney.

Speaking of "old timers" at these conventions reminds us of Stephen C. Mason, of The McConway & Torley Company. In the days of souvenirs Mr. Mason always gladdened the hearts of the editors of *The Daily* by leaving a box of cigars on the desk of the editor-in-chief. While those good old days are passed and gone and the editors now have to buy their own cigars, nevertheless it made our hearts glad to welcome Mr. Mason again this year. His perpetual youth is even more invigorating than were his cigars.

J. H. Waterman, superintendent timber preservation of the Burlington, is unable to attend the convention of Division V. this year because of the illness of his wife. The members of the association sent him the following telegram: "Your friends, which embrace all the members of Division VI. of the American Railway Association, at the opening of their third convention learn with deep sorrow that you cannot open our meeting with your benediction. Each of us individually and all collectively offer a silent prayer for helpfulness for your devoted wife's recovery, and with the knowledge that your thoughts are with us as ours are with you."

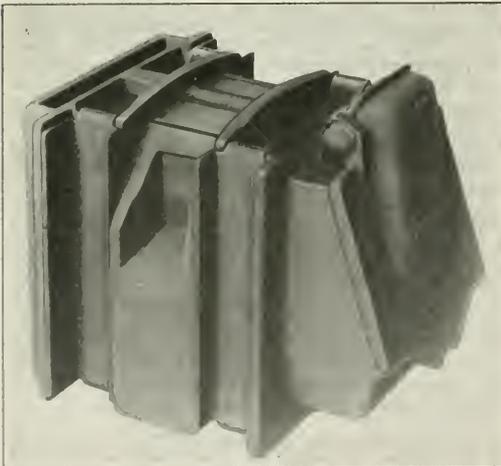

New Devices Among the Exhibits

Passenger Car Journal Box with Renewable Liners

SINCE THE LAST convention, the T. H. Symington Company, New York, has perfected a malleable iron passenger car journal box equipped with renewable pressed steel liners in the pedestal ways and equalizer seat. The grey iron journal box, which is still used extensively notwithstanding its excessive weight and liability to breakage, has been retained primarily because the material of which it is made has a reasonable amount of resistance to abrasion from the pedestal jaws and equalizer bar. The plain malleable iron box, while lighter and much stronger, shows wear in the pedestal ways and equalizer seat more rapidly than the cast iron box.

For many years designers have been endeavoring to develop a type of pedestal way reinforcement which would be economical and effective. This box is designed on the theory that wear is inevitable until there is either developed a type of pedestal which will provide for adequate and continuous lubrication or a combination of materials in contact which will greatly reduce the coefficient of friction.

The pedestal way liners are formed of mild or medium steel, of a degree of hardness which will not wear the more expensive pedestal jaws. The liners are heated before application to the box, forced into position and the top and bottom ends clamped securely around corresponding ribs on the box. The equalizer seat liner is either of cast steel or a drop forging case-hardened, fitted

Liners Are Provided in the Pedestal Ways and Equalizer Seat

neatly into a cored recess in the journal box roof and held in position by pressing over the surrounding metal.

The liners when sufficiently worn may be easily replaced and a journal box thus equipped should outlast from six to ten years of service. In cases where the liners wear especially at the plain journal box, the substantial economy of this method is obvious.

Annular Disc Boiler Check

THIS NOVEL FORM of boiler check valve, designed by Wm. Sellers & Company, Inc., Philadelphia, Pa., is intended especially for use in the feed-water line between the boiler and the pump of locomotive feed-water heaters and embodies certain new and interesting features.

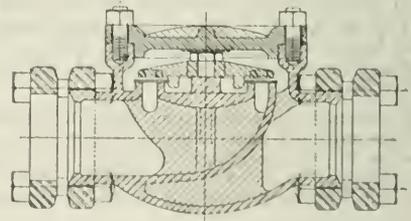

The usual type of locomotive boiler check is not adapted for steam actuated feed pumps on account of the intermittent flow of the water and rapid excessive variations of pressure in the pipe line. It is necessarily made heavy and with a lift sufficient to give the required area of flow; in this form of valve, the shock of closing is severe and soon tends to hammer the valve to pieces. It is, therefore, obvious that the lighter the valve and the shorter the lift, the lighter will be the blow on the seat, reducing the amount of repair and increasing the life of the valve.

The present design includes an annular discharge area with two large circumferences of outlet for the feed-

External View of Annular Disc Boiler Check

water; this annular area is controlled by a light, flexible, non-rusting disc valve, having a short lift. The seat on the body is also of a special form which gives the full area of contact when the disc valve is flexed under boiler pressure. An important advantage of this design is that there is less

Section Showing Construction of Annular Disc Check Valve

tendency to destroy the seat or the valve when foreign matter lodges between the two surfaces; a heavy valve, with its momentum proportional to the lift and boiler pressure, striking a heavy blow, tends to drive such material into the metal, destroying the surface and inducing further leakage. The disc valve, on the other hand, seats easily and gently without shock, causing no damage to either surface, so that both seats are cleaned off during the next flow of feed-water.

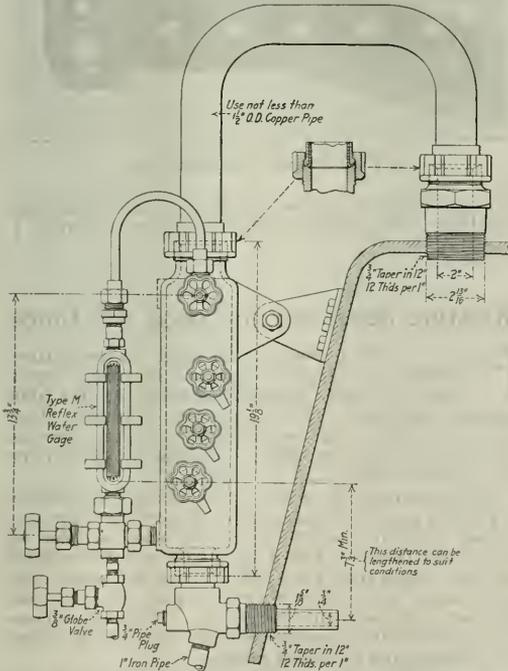

The valve is made at present in the 2 1/2-in. pipe size only. It is interchangeable with the U. S. Government standard locomotive check.

Catenary Hanger

THE WESTINGHOUSE ELECTRIC & MFG. CO., East Pittsburgh, Pa., has on exhibit a new catenary hanger especially designed for steam railroad electrification. This type of hanger is made of copper and is extremely light, the 12-inch hanger weighing but 8 ounces. The design is such that the hanger rods are not weakened where they are attached to the jaws. A pull of 1600 lb. is required to pull the hanger from the hanger rod and the force required to strip the trolley wire from the jaws is 2000 lb. It is claimed that the hanger will not kink the trolley wire when subjected to blows from the pantagraph running at high speed.

Edna Water Column

A WATER COLUMN for locomotive service which can be relied upon to indicate the actual water level in the boiler is being shown by The Edna Brass Manufacturing Company, Cincinnati, Ohio. As will be noted from the drawing, the upper part of the column is connected to the top of the boiler by a U-shaped piece of copper pipe, at least 1½ in. diameter, while the bottom of the column is connected to the water space. The distance from the lower gage cock and the bottom of the

Edna Water Column Insures Accurate Reading of Water Level

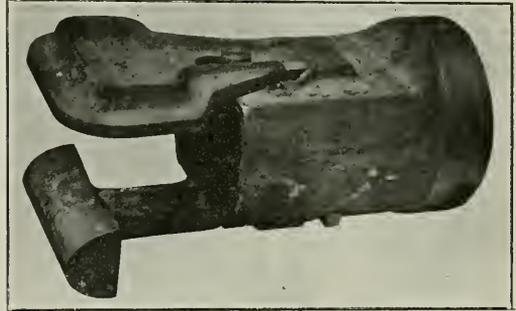

Reflex water gage glass is at least 7¼ in. and may be longer to suit conditions.

The bottom connection of the column is provided with a drain or blow-off cock and a ¾ in. plug, the removal of which permits inspection and cleaning of the water

connection. In addition to the three gage cocks the column is regularly fitted with a type M Reflex water gage although a tubular water glass may be substituted if desired. This column meets all of the safety requirements desired by the Bureau of Locomotive Inspection.

Stoker Distributor Tube

A NEW DESIGN of distributor tube for Duplex Stokers is being shown by the Locomotive Stoker Company, Pittsburgh, Pa. This tube, which is a notable improvement over the old style single-piece casting, is made in three pieces, the top and bottom portions being removable. Should the parts which extend into the firebox

The New Distributor Tube of the Duplex Stoker Is Made in Three Pieces

burn off they can be replaced at small expense and without the necessity of throwing away the tube itself and buying an entire new distributor.

In addition, changes have been made in the shape which give a better distribution of coal than was obtained with the old distributor.

Firebrax Cement

FOR SOME TIME furnace operators have felt the need of a refractory cement having super-refractory qualities to be used in the general repairing and patching of high temperature furnace linings and for laying up brick. The demand has been for a cement that would stand up under the highest temperatures encountered in commercial furnace work—a cement that would not melt, disintegrate or blister. To meet this demand The Carborundum Company, Niagara Falls, N. Y., has developed a new cement known as Firebrax.

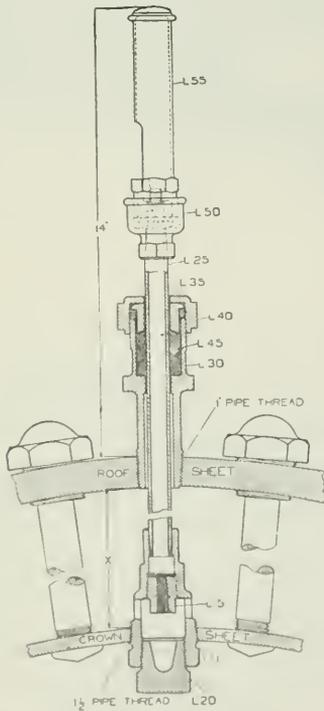

Firebrax cement is a mixture of alumino-silicate materials having extremely high refractory properties. Exhaustive tests have proved that it will stand up under the severe conditions of high temperature work without melting, cracking off or even blistering; and it shows such long life as to materially reduce repair costs and lessen the need of costly shutdowns.

Firebrax cement will quickly harden at room temperature. It lays smooth and it sticks, making it easy for the furnace builder to handle. It sets or hardens at 1472 deg. Fahr. Firebrax is shipped wet ready to use, there being no need of adding any refractory materials to it because it is in itself a super-refractory. This cement can be applied with a cement gun or by ordinary hand methods.

Cleveland Low Water Alarm

THE CLEVELAND low water alarm made by The Talmage Manufacturing Company, Cleveland, Ohio, is a simple fool-proof, reliable device which can be easily applied and cheaply maintained. It consists of a steel cage, ordinarily mounted on the highest point of the crown sheet, from which a copper pipe leads up through a roof sheet stuffing box to a whistle. The crown sheet cage carries the fusible plug which is suspended slightly above the crown sheet and removed from the intense heat and fire-box gases. A closing fire-box plug is screwed into the bottom of the crown sheet cage and furnishes a means for removing the fusible plug.

The fusible plug in the alarm device bears no relation to the fusible plug of common practice which upon melting allows a small jet of steam to blow into the fire-box. In the Cleveland low-water alarm the melting of the fusible plug opens a direct passage way only to the alarm whistle, thereby warning the engineers of the dangerous condition in the boiler in time for them to replace the

Construction of Cleveland Low Water Alarm

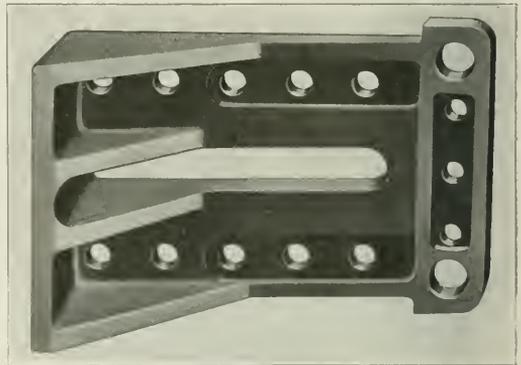

water without any damage to the boiler. After the water rises to a point above the openings in the crown sheet cage, the whistle will stop blowing but the water will continue to escape from the whistle. As the opening in the fusible plug is only 1/4 in. in diameter, the loss of water through the whistle does not necessitate killing the engine but acting as a tell-tale it at once fixes the responsibility for low water. The elimination of all levers, valves, springs and moving parts of any description, and the use of a suitable trap for the fused metal in the fire-box plug insures the proper operation of this device

while the government requirements concerning fusible plugs at the monthly washouts insures its proper maintenance.

The continual loss of life and great property damage resulting from crown sheet failures due to overheating emphasizes the need of a reliable low-water alarm which will give a warning, even though the present boiler appurtenances or the human element fails to function.

Drop Forged Draft Gear Lugs

THE ILLUSTRATION shows a drop forged draft gear stop of the type recently developed by the Standard Forging Company, Chicago, and one of which is being exhibited on the pier. Lugs of this and other de-

A Drop Forged Draft Gear Lug.

signs are forged from open hearth steel, after which the rivet holes are punched. The illustration shown is a front lug.

Moisture Separator for Shop Air Lines

FOR MANY OF THE purposes for which the use of compressed air is applied in car and locomotive repair shops it is highly essential that the air be free from moisture and dirt. The Independent Pneumatic Tool Company, Chicago, has on exhibition a device known as the Thor air separator, which is particularly adapted for use in railway shops.

The construction is simple. Inside of a steel cylinder is placed a pipe, the entrance to which is arranged for connection to an air main and the exits of which are slots so placed that the air is blown against the cylinder walls at an angle which creates a whirling action and causes foreign matter to be removed, leaving pure air to be discharged at the outlets of the cylinder. There are no moving parts and the apparatus requires no attention except for drainage and occasional cleaning.

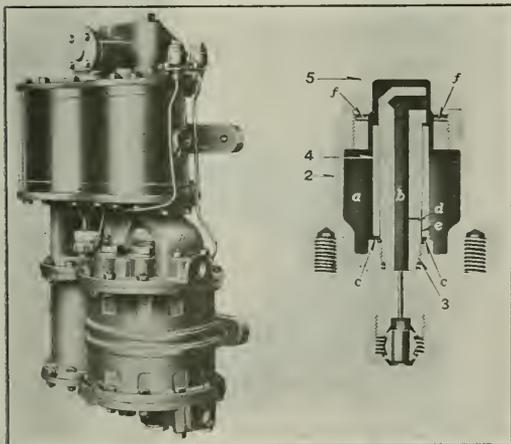

The use of this device is particularly desirable in connection with paint spraying operations and it is obvious that the efficiency of air hammers and motors is increased when clean, dry air is available. Freezing of air tools is positively prevented.

Two sizes are manufactured. A capacity of 150 cu. ft. of free air per minute is provided by No. 150 and 400 cu. ft. of free air per minute can be supplied by No. 400.

Automatic Lubricator for Steam-Driven Air Compressors

THE TYPE B AUTOMATIC LUBRICATOR for steam driven air compressors is a new device now being placed on the market by the Westinghouse Air Brake Company, Pittsburgh, Pa. One of the vital problems in the attainment of efficient air compressor operation is to provide means for supplying lubrication to the air cylinders in proper quantity and at regular intervals. Non-automatic methods may be employed and satisfactory results obtained as long as care and attention are exercised to provide just enough lubrication to keep the compressor in a properly lubricated condition, but experience has shown that this is very difficult to obtain. The ideal method is obviously that which involves feeding the proper amount of lubricating oil to the air cylinders during each cycle of the pistons and causing this feeding of oil to cease when the compressor stops operating. The *Type B lubricator* has been designed to meet these automatic requirements.

The construction and operation of this lubricator are simple, as will be evident from the illustration. There is an oil chamber *a* which is filled from the top when the cap nut 5 is removed. A stem 3 screwed into the body 2 has a central passage *b* communicating at the bottom with the pipe connection leading to the air cylinder, and at the top with chamber *a* through the cavity in the cap nut. An oil port *d* of definite size is located in the stem and connects passage *b* to an annular feeding cavity *e* which is formed by a recess in the stem and the neat-fitting sleeve, around it. This sleeve has two diametrically placed notches *c* at its lower end which connect chamber *a* with cavity *e*.

Type B Automatic Lubricator as Applied to 8½-in. Steam Driven Air Compressor

When the compressor makes its upward stroke, air is forced up through passage *b* and into the space above the oil in chamber *a*. This pressure forces the oil through notches *c* and into annular cavity *e* and from thence through port *d* into passage *b*. When the compressor makes its downward stroke, the air above the oil in chamber *a* is drawn back into the air cylinder of the compressor. As this action takes place, the oil which was forced into passage *b* on the upward stroke of the air piston is broken up into fine particles by the compressed air being drawn

back through this passage, and is carried into the air cylinder in the form of a fine spray. This small amount of oil supplied regularly and reliably is ample to adequately lubricate the air cylinder.

Due to the ability of this type of lubricator to supply minute particles of oil in uniform quantities to the air cylinder of the compressor during each cycle of operation, one filling of its oil chamber will supply sufficient lubrication to the compressor air cylinder for the average trip of a locomotive.

Water Treatment at Wayside Tanks

IN TREATING LOCOMOTIVE feedwater with chemicals, which act inside the boiler, two problems have always been hard to overcome successfully. First, the difficulty of getting the chemicals applied with regularity, and, second, the attempt to treat all waters on a road division or district with the same formula or compound of chemicals. This latter is manifestly unscientific and impracticable since waters generally vary considerably at different sources, some coming from surface streams and others from driven wells. The formula that is chemically suitable for one source is not proper for all—in fact, may have a detrimental effect on the others.

The wayside tank method used by the Paige & Jones Chemical Company, New York, was designed to overcome these two objections to chemical treatment of road engine feedwater. At the pumping plant a feeder made from a piece of pipe is connected with the discharge line of the pump at the bottom, and with the suction line at the top, thus permitting a small stream of water to flow through the chemicals and back into the main line. When water is taken from the city pressure, the feeding device is attached to the feed pipe of the wayside tank.

The compounds are made in hard form, ball shape, weighing one pound each and of such a constituency that they will dissolve in the desired time, 8, 12 or 24 hours, depending upon the amount of water that is allowed to pass through the chemicals. This is regulated by a valve on the intake pipe to the feeder. The required number of balls, depending on the amount of water used, is placed in the feeder at the proper intervals, and with the valve correctly adjusted, all the water that goes into the wayside tank is uniformly treated, and with a formula suitable for that particular water.

Force Feed Locomotive Lubricator

A FORCE-FEED locomotive lubricator, built on the Kipp valveless principle, is being shown by the Madison-Kipp Corporation, Madison, Wis. This lubricator is usually attached to the valve chamber head and, being driven from the valve gear, it starts and stops with the engine. It is consequently automatic in its action and feeds more or less oil according to the speed of the parts that it must lubricate. The oil pumping mechanism contains no ball or spring seated valves.

This lubricator will always furnish the same quantity of oil regardless of the differences in viscosity due to hot or cold weather. Being located outside of the cab, the lubricator is out of the hands of the engineman and the oil feed may be adjusted to a definite allowance with assurance that this allowance will be maintained. Another advantage claimed for force-feed lubrication is that the consumption of oil is somewhat reduced, while the steady supply is responsible for lowering the cost of locomotive maintenance.

Large Size Boiler Plates

PROBABLY COMPARATIVELY FEW realize the large size of the plates which are being used today in some of the latest designs of locomotive boilers. The fact that the largest plates in the world have been and are now being rolled in American mills has made it possible to use a single sheet for the crown and sides of fireboxes, a practice which has recently become quite common.

Among the large size boiler sheets which have been rolled by the Lukens Steel Company, Coatesville, Pa., for locomotive fireboxes are those for the Union Pacific which were 250 in. by 183 in. by $\frac{3}{8}$ in., some for the Atchison, Topeka & Santa Fe, 250 in. by $195\frac{1}{2}$ in. by $\frac{3}{8}$ in., others for the Union Pacific, 241 in. by 195 in. by $\frac{3}{8}$ in., and also the large sheets for the new Southern Pacific locomotives on exhibition, 223 in. by 150 in. by $\frac{3}{8}$ in.

Sheets of very large size and of greater thickness are used for marine boilers. For such boilers, shell sheets have been rolled which were $144\frac{1}{4}$ in. by 246 in. by 2 in. and weighed 21,000 lb. each; also flanged heads, 183 in. diameter, $1\frac{1}{4}$ in. thick and flanged 11 in. deep, the sheets before flanging being 199 in. diameter. For stationary boiler sheets have been used which were 280 in. by 196 in. by 23 32 in. and weighed 33,400 lb. each.

The mechanical difficulties of rolling such large sheets of only $\frac{3}{8}$ in. thickness have been considerable and the fact that they have been made is a real achievement. The use of such sheets is distinctively advantageous to the railroads, as the number of seams is reduced with a saving in rivets and labor; also the possibility of leakage is decreased.

Type D Radial Buffer

With the original Type C buffer made by the Franklin Railway Supply Company, New York, owing to the tension imposed on the adjustable chafing plate through the springs, it has always been necessary when connecting the locomotive to the tender to call in the services of another locomotive. This locomotive was generally backed against the rear end of the tender, forcing it up to its own locomotive against the spring tension so that the drawbar pin could be slipped into place. All this has been made unnecessary with the type D buffer.

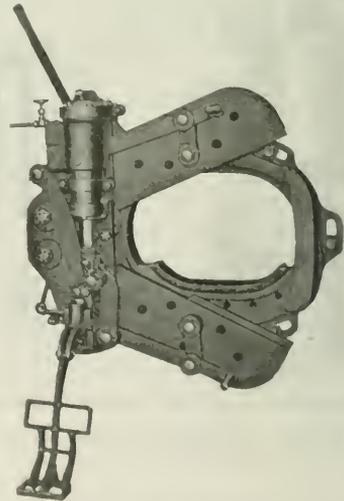

The adjustable chafing plate is equipped with a lug at each end through which a substantial bolt is passed. The chafing plate pocket in turn is also equipped with lugs supported by ribs which strengthen the slots by which the nuts are held from turning. The lug in addition to performing its regular work of drawing up the spring also compensates for the amount of metal which is necessary to cut out of the end of the main pocket. In connecting the locomotive and tender it is merely necessary first to insert the bolts in place and screw the nuts down by hand until the heads rest against the lugs on the adjustable chafing plate. In that position the springs will be at their free height. A wrench is then applied to the head of the bolt at each end and the adjustable chafing plate is drawn up against the spring tension a sufficient amount to enable the drawbar pin to be easily dropped through the eye of the bar. With this in place, the bolts are merely backed off and entirely removed, allowing the springs to force the adjustable chafing plate into position against the floating chafing plate in the regular manner.

When the engine and tender are connected and it is des-

sired to separate them temporarily, the bolts are applied in the same manner, drawing up the adjustable chafing plate against the spring tension until the blocks are entirely free. As this removes all binding, the pin can be very easily taken out. The bolts are then left in place so that when reconnecting engine and tender, it will be merely necessary to bring them together as above stated and drop the pin into place. On new equipment the lugs on the chafing plate pocket can be cast integral and on old power it is only necessary to cut out a portion of the end of the spring pocket, bolting and welding thereto a small separate lug. On both old and new power a new adjustable chafing plate embodying the lugs will be required.

Shoemaker Radial Fire Door

THE SHOEMAKER radial fire door is the especial feature of this year's exhibit of the National Railway Devices Company, Chicago. This new development from the older types of Shoemaker horizontal and vertical doors combines the feature of air operation with balanced arc-moving doors and results in an effective automatic fire door that is locked shut when not operating. The doors are air operated, the control valves being opened and closed by connection from a foot pedal. By using two pistons of different size combined with suitable ports, the doors are cushioned both in opening and in closing, so that they do not open with a jar or slam shut. Provision is also made for cracking the door when entering terminals or at other times when steam is shut off, this being accomplished by opening a pet cock and then

Shoemaker Radial Fire Door

throwing over the lever shown at the top of the illustration.

These doors insure protection against accidents from steam or gas blowing back through the fire opening, provide quick movement combined with quick action, are easy to operate, and give full width of opening for the shovel.

Ohio Low Water Alarm

AS AN EXTRA safeguard against the danger of explosions or burned crown sheets in locomotive boilers due to low water, the Ohio Injector Company, Chicago, has designed the automatic alarm shown in the illustration. This device includes a fusing chamber shell screwed into the crown sheet; and a fusing chamber plug which passes through this shell and extends 1 1/4 in. into the firebox and is held in position by a nut. The plug is insulated from shell and nut by an air space surrounding the plug and by two gaskets. The upper portion of the plug is provided with a chamber to receive the fusible material which consists of nothing but pure Banca tin.

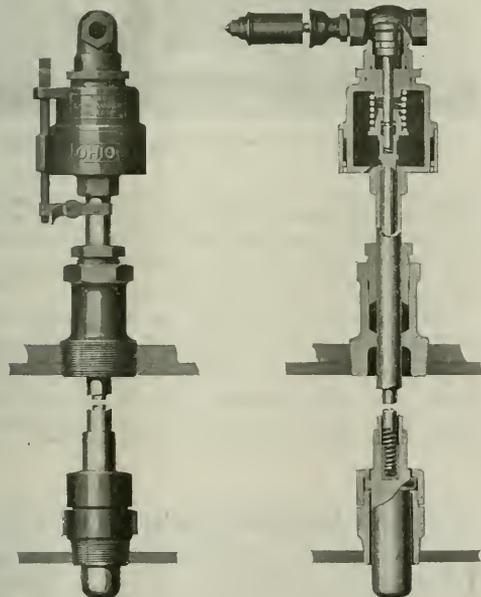

A tube is screwed into the plug, passing up through a stuffing box in the wrapper sheet and supporting a valve cage. Into this cage is screwed the complete valve assembly that controls communication between a steam supply pipe from the boiler to the whistle in the cab. This valve assembled consists of a body valve on the upper end of a stem with a retainer and an opening spring.

The operating rod is threaded at its lower extremity and these threads are in engagement with the fusible material in the plug. The upper end is provided with a hexagonal section to permit of its being rotated by a wrench, and is in contact with the valve stem through a small expansion

surrounds the upper portion of the plug and cannot absorb the heat. This results in a rapid rise of temperature in the upper portion of the plug, causing the fusible material to melt. The rod then no longer having any means of support drops in the molten tin to the bottom of the chamber; it is assisted in its downward movement by the large spring which opens the valve, causing the alarm whistle to give warning.

When the alarm whistle sounds, giving warning that the water is low, although the crown sheet is not uncovered, the engineman should proceed at once to start his injectors and bring the water to the proper level, which will again surround the upper portion of the plug with water and thereby cool the tin and solidify it. The lower extremity of the rod is threaded and having dropped to the bottom of the chamber in the plug will have the solidified tin cast around it somewhat in the form of a nut.

The engineman after making certain that he has 2 in. of water in the water glass, should break the seal and withdraw the wrench, which permits him to remove the cage sleeve and thereby gain access to the hexagonal portion of rod. He can not rotate the rod with a wrench, thereby shutting off the whistle, restoring the device to its initial position and placing it in readiness for another alarm. After replacing the cage sleeve and wrench the absence of the seal indicates that the device has operated.

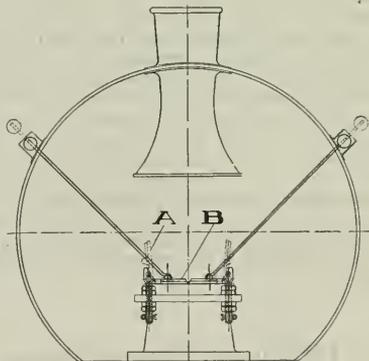

Ohio Alarm for Indicating Low Water

spring. A wrench passes through slots provided in the cage and cage sleeve, thereby closing access to the hexagonal portion of the rod. It is sealed in this position, as shown in the view at the left.

With the rod screwed up, the valve to the whistle is closed. As long as a proper level is maintained in the boiler, water will surround the upper portion of the plug and absorb the heat conducted by the extension into the firebox, thereby keeping the fusible material below its melting point and providing support for the rod. With the water lowered to a dangerous point it no longer

Automatic Exhaust Nozzle Cover

AMONG THIS YEAR'S EXHIBITS of the Detroit Lubricator Company, Detroit, Mich., is an automatic device for closing the exhaust nozzle openings when steam is shut off. The application shown is for a double low nozzle and consists of two covers or clack valves, hinged at the outer sides. The valves are held open by the escaping steam and are closed by gravity when the exhaust ceases. Attached to the valves are tell-tales which

Detroit Exhaust Nozzle Cover

may be used for demonstrating purposes, but have nothing to do with the operation.

A noticeable feature of the device is the hinge connection which is designed to eliminate the possibility of cinders and carbonization preventing positive action. The use of these exhaust nozzle covers will prevent smokebox gases and cinders from entering the cylinder and causing carbonization, thus increasing the life of cylinders, piston rods, valves, valve stems, piston rings, bushings and packing.

Sand Drier Stove

AN IMPROVED SAND DRIER stove of the cone type, known as the Perfection, has been placed on the market recently by the Princeton Foundry & Supply Company, Princeton, West Va. This stove has five or more downwardly sloping cones which set on top of the firebox, having an opening of 1½ in. between each other. This feature allows the draft of heated gasses going to the smoke pipe to pass out through the openings between the cones and draw a large portion of the steam and dampness out of the sand instead of forcing it out through the body of the sand as is done in the ordinary drier.

The sand hopper around the stove tapers more than 20 in. from top to bottom, leaving a space at the bottom of 6 in. to 8 in., the height of the firebox, where the remaining amount of dampness—left after the sand has passed the cones—is removed by the direct heat of the firebox. As it is necessary to carry only a small amount of fire to obtain full capacity, this stove is unusually economical in the use of fuel.

For general railroad service, where the stove is to be operated 24 hours a day, stoves with 6 or 7 cones and a hopper 50 in. to 56 in. high are commonly used. The capacity of such a stove is upwards of 425 tons per month. As a protection and aid to long life, the firebox is lined with a special fire brick lining.

Although the first stove was only made in 1918, they have been installed on a number of railroads which are said to report savings in fuel and labor with an increase in capacity.

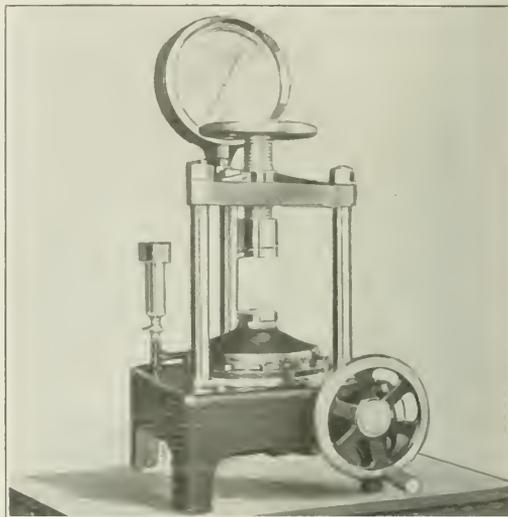

Hand Fire Extinguisher

THE FIRE GUN MANUFACTURING COMPANY, INC., New York, is exhibiting a new line of hand fire extinguishers, made in three sizes which range from 1 quart to 1½ quarts capacity. The double-action of this new device is designed to insure a steady stream of a special fluid which instantly vaporizes when it strikes the fire. The heavy gas so generated forms a blanket, excluding the oxygen and extinguishing the fire. The Fire Gun is easily operated and can be discharged in 20 seconds. It is made of brass and built to withstand rough usage. The liquid is said to be effective where water is useless, since it does not freeze at temperatures down to 50 deg. F. below zero. It is a non-conductor of electricity, does not deteriorate or evaporate in the gun and, it is said, will not injure the most delicate fabrics. A more recent addition to the Fire Gun Manufacturing Company's products is Fire Gun Type B, a 2½-gallon soda and acid fire extinguisher.

Pittsburgh Cement Tester

VARIOUS ENGINEERING bodies over the country have been giving the subject of testing cement in compression considerable attention for the past two or three years and have seriously considered the elimination of the tensile test and the substitution thereof of the compression test. This is due to the fact that concrete is considered good for compression only. To meet the demand for a compact, low-priced machine which would at the same time be of ample strength and yet simple and quickly operated by hand, the Pittsburgh Testing Laboratory, Pittsburgh, Pa., has designed and built at its own shop a cement-testing machine of the compression type.

The operation of the machine is simple. The 2-in. by 4-in. cylindrical specimen is placed on the ram in the center, the upper spherical head is brought down into contact by the handwheel on the square-threaded upper screw, and hydraulic pressure is applied on the ram by turning the handwheel in front in a clockwise direction. The

Simple Machine for Testing Cement in Compression

pressure is shown by the gage. After the specimen has been broken the handwheel in front is given a turn or two in a counter-clockwise direction, after which the ram is returned by the handwheel at the right side.

A dead-weight tester, shown at the left of the ram, may be used to test the accuracy of the gage.

The area of the ram is 50 sq. in., and a rubber diaphragm is used to keep the glycerine from leaking past the ram. The capacity of the machine is 15,000 lb., which is obtained at a pressure of 300 lb. per sq. in. on the liquid. The outer graduations on the dial show the total load, while the inner graduations show the load in pounds per sq. in. on the 2-in. diameter cylinder of cement.

Air Drills for Light Work

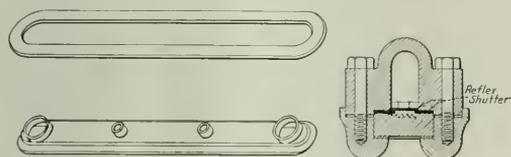

PNEUMATIC DRILLS which are remarkable for their convenience, small size, and lightness in relation to the capacities available, have been added to the Thor line of pneumatic tools and are being shown by the Independent Pneumatic Tool Co., Chicago.

These drills, known as the "Pigmy" type, are of 4-cylinder design, with an aluminum casing, and ball bearings throughout. Three sizes are available with drilling capacities up to ¼ in., ⅜ in., and ½ in., respectively. The weights range from 5 lb. to 6 lb. according to the capacities. In addition to their usefulness for light locomotive drilling such as tell-tale staybolt holes, these drills may be equipped with a brush or may be adapted in car work to light drilling, to wood boring, and driving screws. The construction throughout is of the durable type required in railway shops.

Reflex Water Gage Shutter

AN INTERESTING PROTECTOR or shutter for water gage glasses of the Reflex or Klinger types has been perfected by the Sargent Company, Chicago; after having been thoroughly tested out in locomotive service it is now being shown for the first time. This shutter consists of a thin, non-corrosive diaphragm which is located between the water space and the gage glass. Its use will prevent or very greatly reduce the three kinds of wear or erosion which reduces the life and effectiveness of Reflex gage glasses. Distilled water, constantly dropping from the condensation in the water gage top, has a strong affinity for glass. The shutter is, therefore, so shaped that such condensation is prevented from coming in contact with the exposed upper part of the glass.

Water gages must be frequently blown out and this rush of steam and water has an erosive effect on the inner Reflex glass face which the shutter also prevents. Moreover, the shutter is so fitted between the gasket and the glass as to give added tightness to that steam joint, consequently preventing leakage which quickly ruins the glass.

Sargent Reflex Water Gage Shutter

It will also be noticed from the illustration that the shutter is provided with holes which allow a free circulation and the clearances are such that there is no difference in the appearance of water and steam spaces from that of the gages not equipped with a shutter.

In addition to the water gage shutter, the Sargent Company is showing a locomotive water gage column.

Spiral Fluted Taps

AN ENTIRELY NEW FEATURE in staybolts is being exhibited this year by the W. L. Brubaker & Brothers Company, Millersburg, Pa., in their spiral fluted tap. Among the advantages claimed for the spiral flute is that in case a thread tooth becomes broken, the tap will still tap a hole of exact size. Also, with the spiral

Brubaker Spiral Fluted Tap

flute, the cutting action is at an angle to the work being performed; hence, metal is removed with less resistance, thus increasing the life of the tap to a noticeable extent.

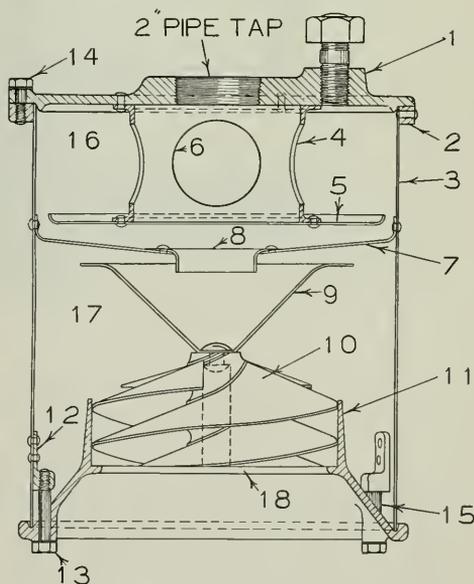

Special small tools adopted as standards by the American Railway Tool Foremen's Association, are included in the exhibit. These standards comprise the radial staybolt tap, spindle tap, button head radial staybolt tap, standard boiler head and wash-out tap.

Welding or closing in of old staybolt holes has placed a severe test on the threading tool and the spiral fluted staybolt tap was developed and tested out for this severe work. The results are so satisfactory on this difficult work that the spiral flute is being adopted for all classes of work.

Centrifugal Air Pump Strainer

AN AIR PUMP strainer of a distinctively novel and interesting type is being exhibited by the New York Air Brake Company, New York. This strainer as shown in the illustration, consists of a cast iron top plate 1, to which is attached a cylindrical shell or chamber 3 and a bottom cover 11. The chamber is divided into two parts by a partition 7 with a central opening 8. The bottom cover 11 holds a spiral 10, to the top of which is attached a bell-shaped deflector 9. In the upper chamber and attached to the top plate is a cylindrical sleeve 4, having four openings 6, the bottom of the sleeve being closed by a baffle plate 5.

In operation, air enters the bottom at 18 and in passing up through spiral 10 receives a rotary motion. After leaving the spiral the air comes in contact with deflector bell 9, which causes the particles of entrained dust to strike the outer wall and fall down into the lower portion 15, where they are deposited. The air flow is next reversed, passes inward between deflector 9 and partition 7, reverses again to flow up through opening 8 when it strikes the baffle plate 5. This diverts it to the outer wall of chamber 16,

A New Type of Strainer for Air Compressors

from which it flows through the openings 6 and through the pipe connection to the compressor. Any particles of dust which fall down from partition 7, baffle plate 5 or outer walls of the upper chamber, will be deposited in the bell-shaped deflector 9. By removing the bottom cover 11

any dirt which has accumulated around its outer edge or in the deflector ϕ may be quickly and completely removed.

This strainer not only has a high initial efficiency, but this efficiency will remain constant instead of being gradually decreased as is the case with strainers which depend upon curled hair or other substances which slowly fill up with dirt until removed and cleaned.

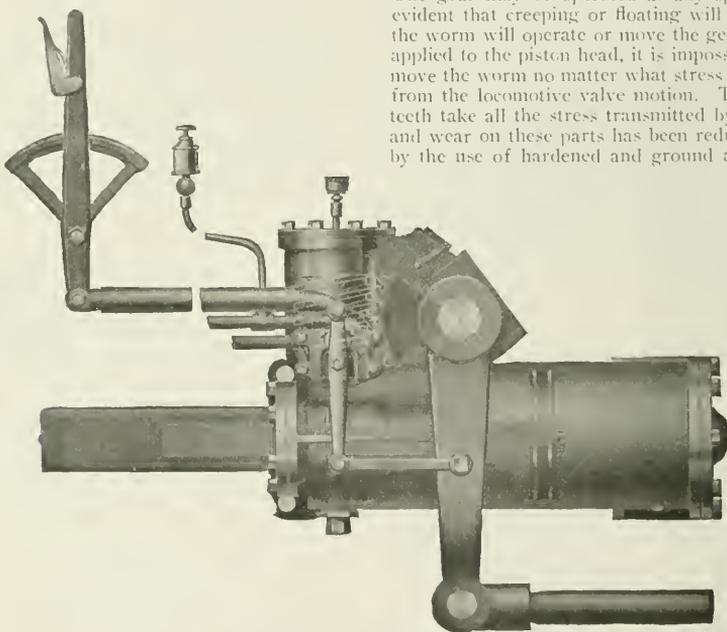

Changes in Barco Reverse Gear

THE POWER REVERSE GEAR shown this year by the Barco Manufacturing Company, Chicago, embodies a new idea in power reversing mechanisms. The gear does not depend upon the sensitiveness or tightness of the valve or piston to hold it in position, and eliminates the balancing feature.

It is designed to use either air or steam, which may be alternated without causing any dis-arrangement, or without requiring any adjustments. Air is used to operate the gear, and not to hold it in position. As soon as the gear has been moved to the required point of cut-off by means

the lever is in central or neutral position, both ends of the cylinder are open to the atmosphere through the exhaust ports in the valve. When the quadrant lever is moved either forward or backward, air is admitted to one end of the cylinder, immediately moving the piston in the direction desired. A vertical, one-piece steel pinion and worm is connected directly to the piston by the horizontal rack, which takes the place of a piston rod. The worm engages with a segment or gear, attached to the reach-rod arms through the shaft, which is in one piece with the gear or segment. A floating arrangement, connecting with the quadrant lever at one end, and the reach-rod arm at the other, with a central connection to the rotary valve, makes the operation of the link motion and the quadrant lever simultaneous. It will thus be seen that any movement of the quadrant lever will immediately produce a corresponding movement through the reach-rod arms on the link motion.

The combination of worm and gear insures positive and accurate adjustment, and produces a maximum amount of power with a minimum pressure and volume. The gear may be operated at any speed desired. It is evident that creeping or floating will not occur, as while the worm will operate or move the gear when pressure is applied to the piston head, it is impossible for the gear to move the worm no matter what stress may be transmitted from the locomotive valve motion. The worm and gear teeth take all the stress transmitted by the valve motion, and wear on these parts has been reduced to a minimum by the use of hardened and ground alloy steel forgings

Barco Improved Reverse Gear

of the quadrant lever in the cab, the air is exhausted and both ends of the cylinder remain open to the atmosphere through the exhaust ports in the valve until the position of the quadrant lever in the cab is again changed.

It can readily be seen that a leaky valve or leaky piston rings cannot cause the gear to creep or float, and that no air is admitted between the periods of adjustment. For instance, if the gear is hooked up to the proper cut off on a road engine, no further air will be required until such time as it is necessary to change the cut off, due to variation of speed or grade.

The operation of the Barco reverse gear is controlled by the usual quadrant lever located in the cab, connected by a reach-rod, attached to the body of the gear. When

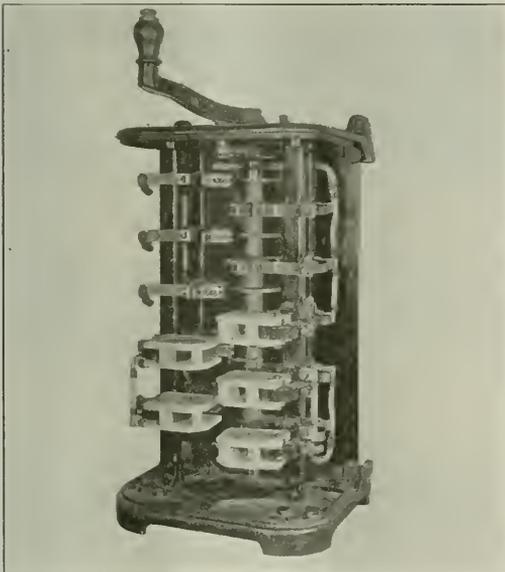

and castings, which operate in a bath of oil similar to the differential on an automobile.

It sometimes happens with all power reverse gears that the air or steam supply pipes are cracked or broken in service, thus causing an engine failure. In fact, a number of railroads have installed flexible joints in the supply pipes to eliminate breakage from expansion or vibration. An interesting feature of this gear is that the engineman or fireman may adjust the valve motion in any position desired, either forward or backward, by applying an ordinary 12 in. monkey wrench to the hexagon end on the bottom of the pinion, which extends below the body of the gear. This eliminates possibility of reverse gear failure, which might be caused by broken pipes, levers, etc.

Controller for Turntable Motors

ONE OF THE devices being exhibited by the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa., is a special form of drum controller for the wound-rotor induction motors used on turntables. The controller is designed to control two motors in cases where they required speed of turntable operation makes the use of two desirable.

The contacts are of the rolling type and are actuated by cams. The main line carrying contacts are protected

The Controller Has Rolling Contacts and Magnetic Blow-Outs

against burning by magnetic blow-outs of the same type that are used by magnetic contactors. It is claimed that this form of construction considerably lessens the burning and pitting of the contacts and that the controller is particularly suitable under conditions of hard and frequent service.

Rogatchoff Piston Bull Ring

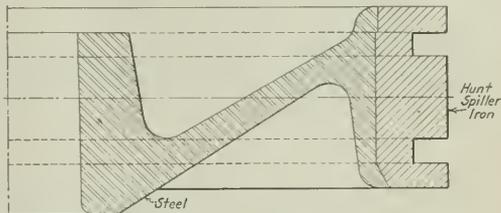

STEEL PISTONS have the bull rings attached in different ways: by bolts, rivets, pins, plugs, retaining rings, and electric welding. The application or removal of the bull rings is a time-consuming process and in many cases is responsible for breaking cylinder heads and cylinders, or bending piston rods and main rods.

The improved method of shrinking bull rings on pistons, as developed by the Rogatchoff Company, Baltimore, Md., eliminates all of the above mentioned attachments to hold the bull rings on the piston and there is nothing to become loose and cause damage.

The front end of the piston for a distance of $\frac{3}{4}$ in. is turned $\frac{1}{32}$ in. larger in diameter than the main portion. When putting on a bull ring it is expanded sufficiently to slide over this enlarged portion and when the ring has cooled this acts as an effective retainer. At the inner

end the bull ring comes into contact with an enlarged tapered shoulder.

The Rogatchoff method of shrinking the bull ring on the piston cuts down the labor to less than other methods

No Separate Retaining Devices Are Required With This Bull Ring

of application. Such a bull ring has been tested in heavy freight service, the mileage thus far obtained being from 35,000 to 40,000 miles.

Thermic Syphon Tests on Central of Georgia

TO DETERMINE the merits of the Nicholson thermic syphon the Central of Georgia decided to make a trial application. The test was made on a 1600 Class locomotive; these have never been considered free steamers and at times have given considerable trouble due to lack of steam.

Locomotive 1605 used in the test is a 10-wheel type saturated locomotive having cylinders 21 in. diameter by 26 in. stroke. The firebox is of narrow type, $40\frac{3}{4}$ in. wide by 108 in. long, with a grate area of 30.56 sq. ft. The steam pressure was 180 lb., and the tractive effort 28,250 lb. This size firebox is suitable for a single syphon, which was designed to present 31 sq. ft. of additional firebox heating surface. Two arch tubes were also used in this firebox to aid in supporting the arch brick. The complete firebox heating surface was 216 sq. ft.

Locomotive 1609, chosen to run opposite the 1605, came out of the shop with similar repairs about the same time as the 1605. The two locomotives were alike in every respect except the firebox, the 1609 having arch tubes but no syphon. The firebox heating surface was 185 sq. ft.

During the test care was exercised to hold all conditions as nearly uniform as possible. Three round trips on each locomotive were run and the data secured were used in compiling the results. Water was carefully measured and coal was as carefully weighed, an extra allowance being provided where necessary to build or maintain the fire when not in use on the road. Losses due to safety valve injectors, etc., were carefully recorded and considered. Feed-water temperature and temperature of the atmosphere averaged respectively the same for both locomotives. Coal analyses showed that the quality of fuel was practically the same.

The test was conducted on a division totaling 200 miles for the round trip and the average train load varied only 10 tons. The amount of coal used per thousand gross ton-miles was 335 lb. for the non-syphon locomotive 1609, as compared with 288 lb. for the syphon locomotive 1605, a difference of 14 per cent in favor of the 1605. In addition the syphon locomotive used nearly six per cent less water per thousand gross ton-miles than the opposite

locomotive. General results are shown in accompanying table.

As for maintenance costs, locomotive 1605 has been in service nearly a year and there has been no expense involved in connection with the syphon. It was only necessary to wash out the syphon when the remainder of the boiler was washed.

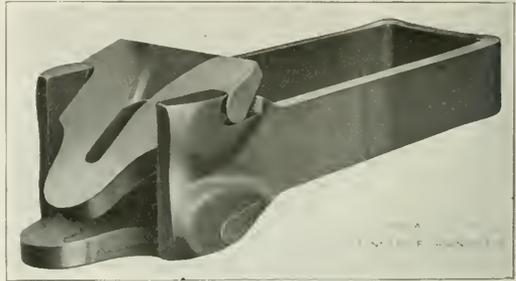

As a result of the test and of subsequent performance of locomotive 1605, the General of Georgia contemplates equipping the remainder of the 1600 Class locomotives and locomotives of other types.

SUMMARY OF RESULTS OF TEST

	Eng. 1609	Eng. 1605 favor	Eng. 1609	Eng. 1605 favor	Eng. 1609	Eng. 1605 favor	Eng. 1609	Eng. 1605 favor
	New Syphon	Syphon Difference	Non Syphon	Syphon Difference	per cent.	per cent.	per cent.	per cent.
Date of test	Dec. 1921	Dec. 1921	Dec. 1921	Dec. 1921

Annual cost at \$3.73 per ton on tender	\$11,522	\$10,287						
Annual saving per locomotive								\$1,235

is drawn out under a hammer and the ends are drop forged.

Two important features make the use of this yoke attractive on both tenders and cars. The process of forging eliminates any possibility of porosity and makes the sectional area a practically certain quantity. The three-part construction makes it possible to renew any part

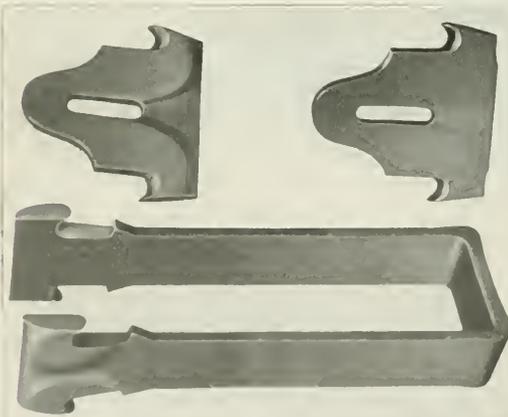

Yoke Partially Assembled

separately so that the entire yoke does not have to be scrapped in case the limit of wear at the key-way has been reached or other condemning causes exist. Should repairs become necessary, either the strap or the heads can be salvaged. The head members are interchangeable and can be replaced easily.

Key Connected Forged Coupler Yoke

THE SALIENT FEATURES of the key connected forged coupler yoke, which has been perfected recently by the Standard Forgings Company, Chicago, and is now ready for the inspection of those attending the conventions, have drawn much favorable comment.

The complete yoke consists of three parts which include two head members and a strap. The shapes of the

Head Members and Strap of Key-Connected Forged Coupler Yoke

parts are such that they can be assembled without difficulty and liberal surfaces and sectional areas are provided for meeting the severe service requirements.

The parts are forged from solid steel billets. The head members are drop forged and fitted so as to present a unit of strength and dependability. The body of the

Otis Train Control

THE OPERATION of a new train control device is being shown by the Otis Automatic Train Control, Inc., Spokane, Wash. It is operated by movable ramps placed alongside the track. The normal position of the ramps is at danger with the center peak four inches above the rail; it is held in this position by a weighted cam unless pulled down for a clear block by a solenoid in circuit with the track.

Attached to the locomotive are two plug type rotary brake setting valves with hollow shoes, one being used when running forward and the other when backing up. Connections to these valves are reversed by the engineer in accordance with the direction in which he is running. A speed control attachment is also included which consists of a mechanical governor driven by a belt from the track axle. When the speed at which the governor is set is exceeded, it acts to discharge air from the brake pipe, thus causing an application of the brakes, and when the speed has been reduced the exhaust is closed and air is again admitted to the brake pipe to cause a release.

Air Cooled Rod Packing

ONE OF THE MOST INTERESTING of recent developments in metallic packings for piston rods and valve stems is the one shown by Morris Brewster, Inc., Chicago. In this packing the ordinary arrangement of parts has been reversed, the sliding plate being placed at the bottom of the box and the spring at the outer end. The packing itself is of the well-known King type. Only the sliding plate and inner face of the packing are exposed to steam pressure. The spring and outer end of the gland box are open to the atmosphere and consequently remain relatively cool.

Entered at the Post Office of New York, N. Y., as mail matter of the second class.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free; United States, Mexico and Canada \$6.00. Foreign Countries (excluding daily editions), \$8.00. Foreign subscriptions may be paid through our London office in £ s. d. Single copies, 25 cents each.

WE GUARANTEE that of this issue, 12,400 copies were printed; that of these 12,400 copies, 10,300 were mailed to regular paid subscribers to the Railway Age and Railway Mechanical Engineer; 110 were mailed to advertisers; 490 were provided for counter and news companies sales, new subscriptions, bound volumes, samples, copies lost in the mail and office use; and 1,500 copies for distribution at Atlantic City.

THE RAILWAY AGE is a member of the Associated Business Papers (A. B. P.) and of the Audit Bureau of Circulations (A. B. C.)

We have commented several times in preceding *Dailies* upon the importance of the foremen and the subordinate

Importance of Personnel Problems

officers who come into direct contact with the men in the ranks. Some roads, many of them in fact, have secured excellent results by regularly holding foremen's meetings, discussing not only current detail problems, but often providing for the presentation of special subjects of a more general nature by different foremen. On some roads, for instance, the foremen are encouraged to read the current railway publications which make a special appeal to them, and to report at the meetings on those things which they believe should receive special consideration in their own shop or on their own road. One encouraging feature of some of these meetings is the fact that the discussion frequently gets away from detail shop practices and covers larger problems, such as the management of men and the recruiting and training of apprentices, etc. After all, it is these discussions relating to personnel that will be productive of the greatest results. There is no more important question in industry today. Fortunately an understanding of these problems does not require a college or university training. Pioneers have blazed the trail and the average

officer or foreman by well-directed reading and study, and the application of a reasonable amount of common sense, can go a long way in perfecting himself. A dull tool is a poor thing to work with and a little expenditure of energy in sharpening it will produce wonders when it comes to increased production for the expenditure of a given amount of energy. The same principle applies to studying your relationship to the men under you and applying the good things which industry and other departments and railroads have learned as to the management of men. Don't be a dull tool!

Much has been said, and justly so, in praise of the modern milling machine because of its accurate production work,

As a rule, this machine shows to the best advantage in making duplicate parts. Modern slab and vertical mill-machine operations are now on the market which would simply open the eyes of rail-

road men of former days if they could see the cutting feeds and speeds used in machining rods and other heavy locomotive parts. The fork ends of side rods, for example, are now milled with one roughing and two finishing cuts in a small fraction of the time formerly required to drill and slot. But milling is by no means confined to this relatively large work. Experience shows that for planing large numbers of driving boxes, cross-heads, shoes and wedges, and other work of a similar type, the milling machine is a most effective tool. An interesting example of what is actually being accomplished with a four-head planer-type milling machine, recently installed in the Beech Grove shops of the Big Four, is described in the December, 1921, *Railway Mechanical Engineer*, page 766. The machine referred to is used mostly for milling driving box shoe and wedge ways and crosshead shoes, assembled on the crossheads. Ten cross-heads or 40 driving boxes are machined in eight hours, and the driving box and crosshead requirements of Beech Grove are filled in three days a week, leaving the machine free the remainder of the time for other work. In sizing up a shop to determine what machine operations can best be performed on millers, the plain and vertical knee type milling machine should not be left out of account. These machines are now made rugged, and are accurate, easily-controlled and designed to operate consistently under the heaviest cutting feeds and speeds which high-speed milling cutters will stand.

The statement has been made that if the installation of any machine tool will show a return of 15 per cent on the investment and the facts can be pre-

**Must a Machine
Tool Be Operated
Continuously?**

sented before the proper authorities, necessary funds will be available for purchasing the machine. The question is how to determine exactly what saving will be effected by a machine and this involves some more or less careful calculations regarding the present cost of doing work and what the cost will be as done on the new machine. The time element is a direct factor in possible savings as it is evident that if a machine can perform a certain operation in 30 min. (including the time for setting up work, sharpening tools, etc.) at a saving of 25 cents, the total saving in an eight-hour day will be 16 times 25 cents, or \$4.00. There are many practical men who have a violent antipathy to machine tools standing idle and it is true that if they are idle either all or a large enough proportion of the time, interest charges on the investment and depreciation will represent an in-

creasingly heavy loss. While it is desirable to keep machines running all the time (in which case maximum savings are effected) there is no justification for arbitrarily refusing to install any machine simply on the ground of lack of work to keep busy all the time. It is simply a case of applying common horse sense and balancing relative costs. In the particular case cited, for example, it may develop that a saving of \$3.00 a day will provide the required 15 per cent return, in which case the machine would have to perform the operation 12 times (in six of the eight hours). If there is enough work to keep this machine busy for six hours a day, install it even if it has to stand idle the other two hours. Any work which is done in those two hours represents a net return over and above 15 per cent. There is another factor which should not be forgotten, namely, that almost any type of modern production tool after being installed is eventually utilized for other work besides that for which it was purchased. It is often found adaptable for unexpected uses and can then sometimes be run on two or more shifts, in which case the net return to the company is just so much greater.

The past two or three years has witnessed a wide variation in labor and material prices and unless careful checks have been made at some recent date, there is probably not a railroad reclamation plant in the country at which some parts are not now being reclaimed at a loss. It is important

Check Your Reclamation Work

that a continual check be kept on reclamation operations because, while there is a possibility of great saving, there is also a possibility of great loss when attempting to reclaim scrap at excessive labor or other cost. Every item should be subjected to critical examination in view of the changing labor and material prices. The determination of what it pays to reclaim and what is not worth reclaiming can be arrived at only by an accurate knowledge of prevailing material prices and the actual cost of reclamation work. Among other things a careful check should be made to see that no material is sent to central reclamation departments if not suitable for reclaiming. Failing to do this may result in unnecessary handling charges and transportation costs. The way this particular feature of reclamation work is handled on the Chesapeake & Ohio is described by E. A. Murray, shop superintendent at Huntingdon, W. Va., in an interesting article in the June *Railway Mechanical Engineer*. The inspectors on that road examine all scrap material, marking each piece which is suitable for reclamation with white paint and each piece which cannot be reclaimed with yellow paint. In this way all the material reaches its proper destination without back travel or rehandling in any way. Scrap reclamation is a highly important subject and one which must be watched closely, otherwise material will be reclaimed at a cost which is greater than required to buy the parts new.

Railroad shops are not as a rule provided with enough modern heat treating equipment, including suitable furnaces, pyrometers and quenching mediums. While heat-treating methods are primarily for tools, certain roads are heat-treating rods and other parts of the motion work. In both cases the best qualities of the steel cannot be brought out unless the proper heat treatment is given. Guess-work methods must be eliminated and replaced by modern methods to accomplish the results desired. High-speed

steel is entirely too expensive to be spoiled, and not only are tools spoiled when given improper treatment, but there is a big loss due to inefficient or spoiled work. A word may well be spoken, in this connection, for the tool makers who heat-treat railroad tools. Most of these men have read about and studied the heat treatment of steel, otherwise they would be unable to get the results desired; they should be encouraged by the managements as much as possible to extend their studies. The sectional and annual meetings of the American Society for Steel Treating afford a valuable opportunity for tool makers to broaden their knowledge of the art and the net return to the railroads will justify the expense necessary to send these men to the conventions. It is a short-sighted policy to place anything in the way of tool makers acquiring this additional information. In a specific case a young tool maker who had acquired considerable skill decided to attend the annual Steel Treaters' convention, being graciously accorded permission to go, with transportation afforded him. The traveling expenses, however, aside from transportation, had to be taken out of his own pocket and he was not paid for the two days he was away. If the rules of the railroads are so inflexible that no provision is made for a case of this kind it is certainly time for some radical action. Shop superintendents should have authority to send their men to such meetings with all expenses paid and wages continued, where the information gained may be worth to the railroads many times what it cost.

The necessity of keeping the percentage of turnover of material purchased by railroads as high as possible for a given period is self-evident and needs no supporting arguments. Each year the railroads spend an increasingly large proportion of their gross revenue for material, and in 1920 this proportion reached 17.3 per cent, or slightly over one billion dollars for Class 1 roads; this is exclusive of coal. On railroads having well organized and efficient stores departments the material turnover is in the neighborhood of 25 per cent a month, whereas the turnover on roads not giving the same attention to their service of supply may be only 12½ per cent a month, or lower. This means that if two roads in these respective classes are of the same size the latter road carries its material just twice as long as the former and therefore pays twice the interest on the investment to say nothing of depreciation, obsolescence and handling costs. These latter factors are all extremely important and furnish additional reasons for making the turnover percentage as high as possible. Material held in stock too long becomes obsolete and then is good only for the scrap bin. Many kinds of material depreciate rapidly even with the best of care. Costly as the practice is, metallic parts and bar stock are often stored outdoors where they rust and deteriorate rapidly when subjected to inclement weather conditions. For example, spring steel stock has been known to rust and corrode to such an extent that it was valueless. This condition is often accentuated by the fact that new stock is added to old piles and when a requisition is received for this class of material it is always taken from the top of the pile with the result that material at the bottom never gets used, or at least not for a long period. If this material is of a kind subject to corrosion or deterioration it eventually becomes valueless. Rubber hose and other rubber goods furnish an additional example of material which deteriorates rapidly even when stored with the greatest care and it is doubly important therefore to ob-

Stores Department Turnover

tain a quick turnover on this class of goods. In view of the amount of money involved and the possible savings it is practically impossible to place too much emphasis on the need for a high percentage of turnover of stores department stocks.

The modernization of the large power plant or the selection of suitable equipment for the new power plant is very largely an engineering problem and the benefits of wise planning are continuous as long as the plant remains in service. Even the supervision of the large plant to insure that the maximum efficiency of which the facilities are capable be continuously developed, is a comparatively simple matter. But the small boiler plants located at engine terminals and small shops, widely scattered over the railroad lines and operated by forces of indifferent ability, present a much more serious problem. In the aggregate it is not improbable that these plants consume more fuel than the comparatively small number of plants large enough to be equipped with adequate modern facilities. The need for some system of supervision over the operation of these plants was brought out forcefully in the discussion on stationary boiler plants during Tuesday's session of the Mechanical Division, by the experience of one railroad on which a careful check of the steam requirements of a small plant brought to light the fact that about 40 per cent of the total steam consumption was accounted for by radiation and leakage losses. The situation was one which no doubt would have justified a considerable expenditure for the improvement of facilities, but the pertinent fact is that means were found whereby the stand-by losses during the time when the shop was not operating could be very largely eliminated without the necessity of making any capital expenditure whatever. For roads of considerable mileage this situation is one which can best be handled by a staff supervisor whose duties require him not only to check the performance of the power plant operators, but also periodically to make a careful survey of the power requirements and the condition of all steam generating and power distribution facilities. The benefits to be derived from the work of such a supervisor will in large measure depend on the selection of a man with the right personality. His methods must be those of persuasion rather than of force and results will be measured by the extent to which he is able to secure the co-operation of local shop and division officers. The field of such a supervisor should include water service stations and plants under the jurisdiction of other departments as well as the mechanical department.

of Small
Boiler Plants**

**The College
and
the Railroad**

The problem of the college man in railroad service has been under discussion for many years and at the present time the results of the efforts to induct these men into the service of the mechanical departments, is even more unsatisfactory than ever before. A few roads continue to take a limited number of mechanical engineering graduates into their service as special apprentices. But, although it is beyond question that the railroads need recruits who have trained minds and a thorough grounding in the fundamentals of engineering, it is a fact that other industries continue to take the pick of the college men. Is it impossible to develop satisfactory methods of academic training or to find a practicable means of enlisting the product of the engi-

neering schools in railroad service? The instructors and executives of the engineering colleges of the country have organized the Society for the promotion of Engineering Education, and this body has a committee, the purpose of which is to consider this and other questions pertaining to special apprenticeship on the railroads. Here is an opportunity to remove the lack of understanding by the engineering schools and the railroads of each other's problems, by their joint consideration, if a committee representing the Mechanical Division were to act with the special apprenticeship committee of the society. The colleges are as much in need of this sort of co-operation as the railroads. It is essential for the development of effective academic work that the schools have a clear vision of the opportunities for college men in railroad work, to what extent specialization in railway mechanical engineering should be carried, and what schools should be encouraged to develop the special courses. Should these courses be confined to purely engineering subjects or ought they to include a groundwork in the economics of railway transportation? These are all problems in the solution of which the advice of the practical leaders in the railway field is needed. On the other hand, the railroads have much to learn as to the proper development of the special apprentice after he has entered the service. Is it not as essential that the special apprentice be required to follow a regular course of study to supplement the practical work to which he is assigned, as it is that the regular apprentice be required to apply himself in this manner? There are doubtless many other specific questions which would be developed by joint inquiry if representatives of the two organizations were to come together with a serious purpose to understand and help each other.

One of the radical forward steps in locomotive development taken during the past year has been the application of the steam turbine to the locomotive. To be sure, the suggestion is not really new and several early and poorly worked out attempts were made a number of years ago, but until last year little of consequence had been accomplished. The rapid increase in the cost of fuel as a result of the world war has brought out a demand for many changes in engineering practices which formerly were given only superficial attention. Economies in locomotive operation have assumed increasing importance and European designers have seriously attacked the problem of perfecting the turbine locomotive, with the result that locomotives of this type are now in regular operation in Sweden, England and Switzerland and are under construction in other countries. No detailed information in regard to the designs is yet available and only meager data concerning steam and coal consumption have been given out. There has been sufficient, however, to make it certain that the efficiency is far ahead of anything previously obtained from a steam locomotive. No one expects that these early applications will be perfect in design and it may take years before certain mechanical difficulties are overcome. We have in this country engineers who have done much to bring the locomotive to its present stage of development, also those who have aided greatly in perfecting the turbine. Instead of waiting for European engineers to develop the turbine locomotive and thereby losing several years' time as we did waiting for them to develop the superheater, feedwater heater, outside valve gear and many other locomotive features, why not undertake some of the real pioneer work in this country? The incentive is there and the returns from success are bound to be large.

Locomotive
Possibilities**

Program for Today

Three railroad conventions will be in session in Atlantic City this morning.

Division VI, Purchases and Stores, A. R. A.

This meeting will be held in the Hotel Traymore and will be called to order sharp at 9:00 a.m.

	A.M.	A.M.
Discussion of Reports on:		
Subject 13—Forest Products.....	9:00 to	9:30
Special Subject, "The Need of a Sinking Fund to Care for Deterioration, Obsolescence, and Other Losses Incidental to the Handling, Use and Distribution of Materials," by H. H. Laughton.....	9:30 to	9:50
Subject 15—Buildings and Structures and Facilities.....	9:50 to	10:00
Special Subject: "Office Routine in Purchasing and Stores Departments" by E. W. Thornley.....	10:00 to	10:15
Special Subject: "Stationery, Including Repairs to Typewriters," by C. B. Tobey.....	10:15 to	10:45
Special Subject: "Educating Employees of the Store Department for Their Duties," by A. S. McKeligion.....	10:45 to	11:15
Special Subject: "The Human Equation in Railway Service of Supply," by M. J. Wise.....	11:15 to	11:30
Subject 19—Fuel Conservation Joint-Committee.....	11:30 to	11:45
		M
Report of Memorials Committee.....	11:45 to	12:00
		P.M.
Report of Resolutions Committee.....	12:00 to	12:15
Report of Nominating Committee.....	12:15 to	12:30
Election of Officers.....	12:30 to	1:00

Division V, Mechanical, A. R. A.

The meeting will be held in the Greek Temple on the Million Dollar Pier, and will be called to order sharp at 9:30 a.m.

Discussion of Report on:
Design and Maintenance of Locomotive Boilers.
Subjects Referred for Discussion.
Closing Exercises.

Air Brake Association

The meeting will be held in the Vernon Room of Hadson Hall and will be called to order sharp at 9:00 a.m. This is done in order to permit of an early adjournment so that those who so desire can leave immediately after lunch.

The two papers which will be presented for consideration are the reports of the Committees on Recommended Practice and on Triple Valve Repairs.

The annual election of officers will follow the presentation of the papers.

Entertainment Features

10:30 a.m.—Orchestral Concert, Entrance Hall, Million Dollar Pier.

Lost and Found

Lost—An earring. Please return to Mrs. Argyle Campbell or to Secretary Conway's office.
Lost—A bridge #622. Return to John L. Nicholson, Locomotive Fire Box Company.

Lost—A round pearl, sapphire pin. Please return to Mrs. Mildred Tucker, Booth 21.

Lost—A silver watch, which has been his constant companion for many years. The finder is requested to deliver it at the *Daily Railway Age* booth.

Registration Book

So many people registered yesterday that the executive committee of the R. S. M. A. decided to issue another enrollment list this morning.

Appreciation of Good Work

THE EXECUTIVE COMMITTEE of the Railway Supply Manufacturers' Association yesterday showed its appreciation of the good work done by its retiring president, J. P. Schurch, and its secretary, John D. Conway, in a substantial manner. It presented Mr. Schurch with a pair of white gold cuff links set with diamonds, and Mr. Conway with an amber-headed cane.

Annual Purchases and Stores Ball

THE ANNUAL Purchases and Stores Division grand ball which was held on the Pier last night, was largely attended and every body had a good time. The committee in charge was composed of N. C. Naylor, chairman, Lewis C. Cameron, W. G. Cook, C. W. Floyd Coffin, W. J. Doherty, A. N. Dugan, Oscar C. Hayward, George A. Nichol, Jr., Leslie R. Pyle, W. R. Walsh and W. M. Wilson.

G. S. Edmonds Elected

President of Cornell Alumni

THIRTY ENTHUSIASTIC ALUMNI of Cornell University met at the Traymore on Monday evening for the dinner of the Cornell Association of Railway and Supply Men. Among those present were several who had attended class reunions at Ithaca last week and A. R. Ayers, president of the association, called on a number to tell of their experiences while visiting their alma mater. The officers elected for the ensuing year are: President, G. S. Edmonds, superintendent motive power, Delaware & Hudson; secretary, A. F. Stuebing; *Railway Age*.

Enrollment Today

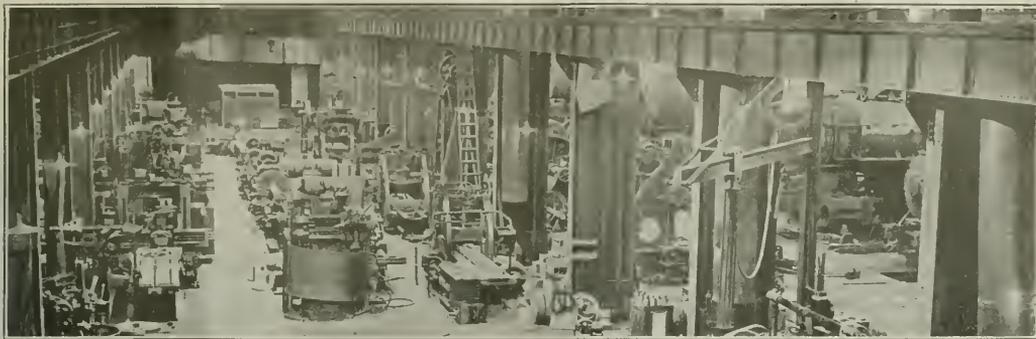

The enrollment booth at the entrance to the pier will be open from 9:00 a. m. to 11:00 a. m. this morning.

Invitation From E. S. B.

THE ELECTRIC STORAGE BATTERY COMPANY, Philadelphia, Pa., extends an invitation to convention attendants to visit its factory at Nineteenth street and Allegheny avenue, Philadelphia, Pa., on Thursday, June 22.

Additional Exhibitors

DuPont Valve Company, Philadelphia, Pa.—Automatic drain and relief cocks. Represented by R. A. Parkinson. Space 528.
Johnson Manufacturing Company, Urbana, Ohio.—American railway standards of tinware, including locomotive oilers, tallow pots, sprinkling cans, oil containers, signal guns, etc. Represented by Isaac T. Johnson and H. W. Jacques. Spaces 328-330.
National Graphite Lubricator Company, Scranton, Pa.—Type B National graphite lubricators. Represented by H. H. Brady and F. S. Watters. Space 24.

American Railway Association—Division V—Mechanical

Reports on Locomotive Construction, Feed Water Heaters,
and Boiler Plants on Tuesday's Program

Chairman Coleman called the meeting to order at 10 a.m.

Report on Locomotive Construction

The committee's report is in effect eleven separate reports on as many separate subjects, all pertaining to locomotive details or appliances, except one, which presents a comparison and summary of the various formulas for calculating the tractive effort of Mallet locomotives.

In few cases do the committee's investigations indicate the practicability of making definite recommendations. The definite conclusions are to

the effect that the life of the flanged bottom tank will be longer than that of the bottom riveted type; that an automatic drifting valve is desirable if one can be developed which will operate successfully both at high and low speeds, without undue maintenance costs; that the tank syphon is adapted for use with lifting injectors, and tank valves with non-lifting injectors; and that metallic feedwater connections between engine and tender need further development.

THE COMMITTEE this year has confined its report to the study of various details of locomotive design and construction which have been referred to it. Each of these subjects is reported upon separately under the following headings.

The tractive effort of Mallet locomotives working simple has been considered and it is not believed advisable to recommend a uniform formula. Mallet locomotives with an intercepting valve design to allow steam from the boiler to pass direct to the low pressure cylinders and the exhaust from the high pressure cylinders direct to the stack permit an increase of approximately 20 per cent in the tractive effort of the locomotive. This calculated increase is not available unless the factor of adhesion is high enough to prevent the wheels from slipping. Where the factor of adhesion is low, it would be more practical to divide the weight on the driving wheels by about 3.8 and determine the tractive effort in simple operation on this basis.

The railroads can best determine for themselves what tractive effort to choose in simple operation dependent upon the design and weights on drivers of the locomotive.

There are other variables that could enter into a formula such as the compounding system, travel and valve setting, kind of valve gear, but it does not appear advisable or necessary to take all of these into account.

The American Locomotive Company's formula for the tractive effort of Mallet locomotives working compound is based on a total M. E. P. of 91 per cent. of the boiler pressure. The Baldwin Locomotive Works' formula is based on a total M. E. P. of 85 per cent. of the boiler pressure. The I. C. C. formula for Mallet locomotives is based on a total M. E. P. of 94 per cent. of the boiler pressure.

To illustrate the difference in formulae for compound working, the tractive effort has been calculated for five different Mallet locomotives in the table, in which

C = diameter of high pressure cylinders in inches
c = diameter of low pressure cylinders in inches
S = stroke in inches
P = boiler pressure in pounds
D = diameter of driving wheels in inches
R = ratio of cylinder volumes
K = a constant
T = tractive effort working compound at maximum cut-off and low speed

Locomotive	Type	Cylinders C c S	P	D
A	2-6-6-2	20- $\frac{1}{2}$ -33 x 32	210	57
B	2-6-6-2	21- $\frac{1}{2}$ -34 x 32	200	57
C	0-8-8-0	26 -40 x 28	220	51
D	2-8-8-0	25 -39 x 32	240	57
E	2-6-6-2	23 -35 x 32	225	57

Locomotive	A. L. C.	B. L. W.	J. C. C.
	$T \frac{C^2 \times S}{K \times P} \times D$	$T \frac{C^2 \times S}{R + 1} \times D$	$T \frac{C^2 + C^2 \times S \times P}{4 \times C^2} \times D$
A	64,320	60,779	65,127
B	66,715	63,044	67,050
C	103,333	97,580	102,747
D	107,386	101,464	107,374
E	84,022	79,338	83,231

Broken Frames and Suggested Remedies

In but a few instances will it be found that the breaking of frames can be ascribed to method of attaching boilers to frames. Usually locomotives remain in service several years before frame failures occur, and possibly there will then be an epidemic, indicating that time is an element. Investigation of failures on different classes of locomotives on one railroad, indicated that the principal zone of failure was in the neighborhood of the main wheel, or ahead of the front pedestal, and little trouble occurred at the point where furnace is attached to the firebox.

If locomotives are designed with frames of proper strength to withstand stresses, little trouble should be experienced with broken frames, if a locomotive receive necessary running maintenance. Neglect of loose pedestal binders, loose wedges and worn rods, result in many frame failures.

Locomotives have been designed with insufficient frame cross-ties and cross-ties deficient in strength, or improperly located so that frames are not properly tied together. When many of the older locomotives were designed, the art had not advanced to a sufficient degree to clearly understand the varied stresses set up in locomotive frames, and undoubtedly there is much yet to be learned in this respect.

The vertical loads due to the dead weight carried, as well as the vertical, longitudinal and lateral loads caused by the piston thrust, brake equipment, etc., produce strains that cannot be completely analyzed. This, therefore, requires that the frames be designed with very low stresses per unit of section, or very liberal sectional areas, to allow for these unknown forces. The frame, frame bracing and boiler when fastened together, should form a rigidly connected structure, and in whatever direction the thrusts may be applied, it must retain a fixed relation of one part to another.

The springs and spring equalizer rigging must provide the necessary flexibility and absorb the stresses which are imposed on the locomotive laterally, due principally to centrifugal forces on curves, and the reaction of the guiding effect of the engine truck, which is concentrated at the first frame pedestal as a fulcrum, with its resulting lateral bending stresses in the frame, between the pedestal and the cylinder. The longitudinal flexibility, due to brake application, is likewise absorbed in the spring rigging, as well as the vertical pressure due to the dynamic augment resulting from the driving wheel counter-balance.

The pressure due to the piston thrust produces vertical pressure on the guides. This guide construction, must form a rigid framework in itself, as the fatal results from any flexibility in the working of these parts will be easily understood.

The bracing of the frames should be applied as closely as possible to the points of application of pressure in the various directions. It is most improper in designing frames simply to add metal to prevent breakage, instead of designing to absorb the stresses in the proper manner. The adding of weight to the frames would serve practically no purpose in remedying frame breakages. On certain existing locomotives, the addition of one or more waist sheets would have a beneficial effect. It must also be kept in mind that if a sliding bearing is used under the front and back of the furnace, it should be provided with brass bearings. Otherwise it is liable to become corroded and stuck, in which case broken frames are apt to result. When the top waist sheet angle is riveted to the boiler, and also to the waist sheet plate, there have been many instances where it was most difficult to keep either boiler or plate in the top or bottom of the waist sheet plates. This difficulty has been overcome by applying support that is flexible at the ends, so that the boiler merely rests upon a bearing, which is free to move when the boiler expands.

A very interesting method used by some railroads which claim admirable results is the use of this material. In 1914 the Committee on Use of Special Alloys and Heat-treated Steel, reported in a general way the various wire stresses as used by the locomotive engineer for frames, as well as other parts. So far as locomotive

frames are concerned, the practice is still in use, though more or less elaborated. The American Locomotive Company formula is:

$$S = \frac{T}{C} \text{ Where } S = \text{section area of frame}$$

$$C = \text{piston thrust}$$

$$T = \text{constant (see table below)}$$

	From cylinders to main pedestal, including top rail over main pedestal	Back of main pedestal
A—Top of Pedestals.....	2,500-2,700	2,900-3,200
B—Top rail between pedestals.....	3,000-3,200	3,500-3,800
C—Lower rail between pedestals.....	4,300-4,500	5,100-5,300
D—Integral single rail at back of cyl. keying lug.....	1,600-1,800

This method gives sectional areas back of main pedestal approximately 15 per cent. less than similar areas at or ahead of the main pedestal. The depth of the top rail ahead of the front pedestal must not be less than that of the top rail over the front pedestals. In general, these stresses are used regardless of whether the material is open hearth carbon steel or vanadium cast steel.

Some of the steel companies are at this time in position to furnish one piece cast steel locomotive bed, which does away with many of the undesirable features of present frame design. The main advantage, however, is stronger frame with less weight, and it would seem to be a very great improvement over what has heretofore been used.

Slide Valves On Mallet Locomotives

In early locomotives of the Mallet type the "D" slide valve was used on the low pressure cylinders. In the early service when used as pushing locomotives, there was no particular trouble experienced with the cutting of the low pressure slide valves and cylinders. As these locomotives were employed in road service, the cutting of the slide valves in the low pressure cylinders developed. The piston valve was then resorted to to overcome this trouble, and locomotives already built with slide valves, had brass valves applied on cast iron seats or brass false seats applied to the cylinders, on which the cast iron slide valves worked. This effected considerable improvement, and reduced the cutting of these parts, but trouble was still experienced with the low pressure cylinders cutting.

Attention was then directed to the system of lubrication employed with a view of overcoming the cutting.

The different methods of application of lubrication to the cylinders and valves which have been tried have not proved satisfactory, and the problem is yet to be solved.

There is being tried out a new lubricant recently placed on the market, to be delivered through a hydrostatic lubricator, in which graphite is employed, the graphite being broken up so fine that it is readily held and carried in suspension with the lubricating oil, the claim being that the graphite will adhere to the surfaces lubricated, thereby forming a coating, which prevents cutting of the metal. As graphite lubricant on bearing surfaces has proved to give good service, we may reasonably hope that the methods now being used will demonstrate that graphite is a satisfactory lubricant for steam surfaces, and the committee will follow this up with interest.

Extended Piston Rods

Extended piston rods have been tried out with more or less success on a large number of American roads as a means of reducing cylinder and piston wear. Any means employed for relieving the cylinder and piston from the weight, shock and consequent wear attendant upon a free piston, would seem to be a direct benefit. If it were always possible to preserve the alignment on both ends of the rod, the extended piston rod would be beneficial in preventing cylinder wear and would also permit the use of cast steel, thereby resulting in some reduction in weight. On the other hand, the extended rod itself results in considerable increase in weight, which seriously complicates the question of counter balancing.

Two general methods have been resorted to in treating the extended piston rod, one, the use of another metallic packing on the front cylinder head, while the other employs an extension sheath in which the piston rod is permitted to reciprocate the bronze or other suitable form of bearing at the inner end of this sheath to take the weight of the rod and piston. In the former

case the upkeep of an extra metallic packing is a serious objection, while in the latter case the steam clearance is considerably increased, and it is difficult to design a bushing of sufficient bearing to prevent rapid wear.

On one road at one time having a large number of Vaucain compounds, extended piston rods of sheath type were introduced, but the upkeep on bushings was estimated to be higher than the natural wear that would have taken place without the extended rods. On this same road several years ago the problem arose of equipping large locomotives with 29½-in. cylinders, and the question of extended rods was seriously considered. After looking up all data available at that time, it was decided that instead of using extended rods, to bronze the entire circumference of the cast steel Z-type piston. This was applied to a number of 2-10-2 type locomotives, and the results have been most satisfactory. These engines have been in service since 1917, and up to date have made an average of 112,000 miles each. These engines still have the original pistons, which require re-bronzing about every ten months. In no case has cylinder wear been excessive, and the problem of lubrication, or rather the problem of running pistons at times without lubrication, has been simplified.

On another road it is ascertained that the benefits depend to a large extent on maintenance, and the fact that if main cross-head and extended piston rod crossheads are properly maintained, the piston head will be carried in the cylinder without wear. On this road there appear to be records where the mileage has been as high as 137,000 miles without cylinders being bored. It is the judgment of officers of this road that cylinders of 25 in. and over in diameter should be equipped with extended piston rods.

Another prominent road reports that it has investigated extended piston rods, and it is a question whether they are of any material advantage. They have, therefore, arranged to remove them.

The committee believes finally that as there seems to be a diverse opinion as to the merits of extended piston rod, definite conclusions should be deferred and more investigation made on this subject.

Solid Bushed Front End Main Rods

For the purpose of securing data in connection with this subject, a number of Railroads and also the locomotive builders were asked to submit information on the following questions:

(1) What design of front end of main rod do you use, solid front end of main rod with bushing, or keys and two piece brass?

All replies but three state they are using the front end of main rod design of keys and two piece brass only, and that the service from this design is entirely satisfactory. Three of the roads use both designs.

The builders state that several years ago quite a number of roads had locomotives equipped with solid front end main rod and bushing, but have since gone back to the use of keys and two piece brass on account of the solid bushing not giving entirely satisfactory service.

(2) What kind of lubrication of oil or grease, or both, do you use?

All replies except one state that both oil and grease are used. On the lighter locomotives oil is used and on the more modern locomotives they are internally lubricated by grease through the wrist pin. One road uses oil on all classes of locomotives. Roads which are using grease are getting satisfactory service.

Flange vs. Riveted Tank Bottom

The sub-committee appointed to investigate the construction of locomotive tenders with flanged bottom tanks, compared with the usual method of construction by the use of the angle irons and lap joints, has collected from various railroads, and has also made personal investigation. It is the opinion that the flanged tank possesses certain features of distinct merit, as enumerated below:

(1) The top and bottom sheets of the tank are flanged so that rivets are horizontal. By this method the angle and tee irons are dispensed with.

(2) The design appears to prove more rigid construction and permits of better interior bracing. The interior parts are secured to the upturned edges of the sheets.

(3) There being no rivet holes through the bottom of the tank, the cost of repairs should be materially reduced, as it is unnecessary to lift the tank from the frame to repair leaks, which

is frequently required with tank bottoms constructed with flat seams vertically riveted.

(4) The claim is made by certain railroads that the construction of the flanged bottom tanks is less expensive by 6 per cent than construction of tanks with lap joints. Locomotive builders, however, consider it would cost more to build the flanged tank. Much depends upon the number of tanks to be constructed at one time, and the proper tools for forming sheets. It would appear from the design that there may be some saving in labor and material such as rivets, etc.

(5) There has been some question concerning the strength of the corners and difficulty in repairing them, if same become weakened by corrosion or cracking. Our best information, however, from the users of such tanks, indicates that corners are sufficiently strong and that no difficulty is experienced in repairs.

After careful consideration, your committee feels that the efficiency of the flanged tank should be equal to the old style of construction in every way. It is felt that ultimate life should be somewhat extended, and that the cost of construction should be no greater. Leaky tanks are Federal defects, and any design that will eliminate liability of such leaks is a desirable improvement.

Mikado vs. Consolidation Engine

The first locomotives of the Mikado type were built by The Baldwin Locomotive Works in 1897, for the Nippon Railway of Japan; in 1902 a locomotive of similar type was built for the Bismarck, Washburn and Great Falls Railway in the United States.

The Mikado type locomotive permits the use of a long boiler with a wide and deep firebox, which is placed back of the driving wheels and over the trailing truck. This form of firebox is especially suitable for burning high volatile coal, as there is sufficient furnace volume for the combustion of the gases before they enter the tubes. Cases are on record where Mikado type locomotives have successfully burned fuel of a quality too poor for use in Consolidation type engines of equivalent hauling capacity, but having smaller fireboxes.

With a given weight on driving wheels and equal ratios of adhesion, a Mikado type locomotive will show no superiority over a Consolidation type, as far as starting tractive effort is concerned. As the speed increases, however, the tractive effort of the Mikado type will fall off less rapidly than that of the Consolidation, because of the greater boiler power of the former locomotive. On some roads the Mikado type locomotive has made an excellent combined passenger and freight locomotive, being used interchangeably for either service as occasion requires.

The Mikado engine, on account of its wheel base arrangement, is somewhat easier on flange wear, and somewhat safer in high speed without danger of derailment.

On Consolidation type locomotives having wide fireboxes, and comparatively large driving wheels, the depth of the furnace throat is necessarily restricted, making it difficult to apply a satisfactory design of brick arch. This difficulty is avoided in the Mikado type, as there is ample space between the grate and bottom row of flues for an arch with its supporting tubes. The necessity of placing a driving wheel under the firebox makes it practically impossible to apply a satisfactory ash pan to the Consolidation type because the pocket over the driving wheel is so close to the underside of the grates.

Relative Advantages of Non-Lifting and Lifting Injectors

For the purposes of securing data on this subject a questionnaire was prepared and sent to sixteen railroads from which eleven replies have been received. The advantages of the non-lifting injectors are reported as follows: (1) Larger capacity for same size injector, injector pipes and connections; (2) grades closer, giving a wider range for each size of injector; (3) gives less trouble from restricted openings in the feed water supply pipe; (4) located on the outside of the cab, thus relieving congested conditions inside; (5) more reliable and dependable; (6) application and maintenance cost less; (7) more accessible for repairs and repairs can be made on the injector in place without disconnecting from the piping; (8) will work with less water in tank, also operate with feed water at a considerably higher temperature.

The disadvantages of this type injector are its greater liability

t) being knocked off by derailment, side swipe, etc., and the liability to freeze in extremely cold weather.

The advantages of the lifting injectors are stated as follows: (1) Mounted in cab where engineer can more easily see and observe its workings; (2) if trouble occurs on the road it is easier for the engineer to remedy it; (3) self contained and fewer parts to operate; (4) easier operated and controlled.

Its disadvantages are: (1) Less grading range than the non-lifter; (2) more readily affected by restricted feed water opening and length of lift; (3) must be taken down from pipe connections to repair the tubes; (4) tubes coat up more rapidly than in the non-lifters; (5) it is subject to failure from a leaky boiler check, worn steam nozzle or combining tube, leak in feed pipe, or if injectors become overheated they must be cooled off before they will operate.

It would appear from the replies received that:

(a) Little is known about the comparative efficiency of the two types of injectors with respect to steam consumption for a given quantity of water delivered; (b) The cost of repairs and maintenance is less with the non-lifting injector; (c) The non-lifting injector is more easily located and repaired; (d) The non-lifting injector is generally considered preferable and is gaining in favor, particularly on large locomotives.

Saturated Steam Drifting Devices For Superheater Locomotives

For the purpose of securing data on this subject a questionnaire was prepared and sent to 16 railroads from which 14 replies have been received. It would appear from replies received that: (a) Automatic drifting valves on superheater locomotives are not generally being used; (b) the common practice when drifting is to crack the throttle; (c) the use of the manually controlled steam line from cab to valves and cylinders has not proven satisfactory; (d) some roads are using home made devices for supplying air compressor exhaust steam to valves and cylinders with satisfactory results; (e) a few roads are using automatic drifting valves with apparent success; (f) a few roads are experimenting with various forms of automatic drifting valves; (g) an automatic drifting valve is desirable if one can be found or developed which will operate successfully both at high and at low speeds, and be simple and rugged enough to be reliable and stand the service requirements without undue maintenance cost.

Tank Syphons Versus Tank Valves

In order to determine modern practice of representative railroads, a questionnaire was prepared and sent to 24 railroads, from which 16 replies have been received. Summarizing the data submitted by the various railroads, it appears to your committee that the syphon is well adapted for use with lifting injectors, while the tank valve is more suitable for non-lifting injectors.

Tank Hose vs. Metallic Connections

To our inquiry regarding the subject, nine replies were received from railroads and one voluntary report from a manufacturer. All of these roads but one, were large systems. Five roads had no experience whatever with metallic tank connections. One road reported trying out one in 1909 without success. Another road has tried one on a switch engine for three years with no cost for repairs beyond three or four gaskets and their application. The Erie has one connection applied to engine No. 2509. This has been in service for the last 18 months. The test is to cover a period of two years. One large system reported having had "a little experience" with metallic tank connections, adding "We are not extending it."

From our study of this subject it appears that metallic connections for steam, air and signal lines are almost universally used. All of the roads but one reported unanimously in this regard. None of the present devices are heartily endorsed sufficiently to warrant your committee in making a recommendation.

The maintenance of tank hose amounts to very little if it is manufactured of first class material and properly applied. Tank hose suffers more from abuse than from use. It is put up wrong as often as it is put up right and is in many instances a badly neglected detail. If the hose connections are properly angled and the hose cut to proper lengths, the kinking will be reduced to the minimum and the maintenance likewise, as it is the kinking of this stiff wire-lined hose that destroys it. Standard diameters and lengths

are easily maintained, but in the application the drawing cannot be adhered to literally for the length—it has to be adjusted for existing conditions. When engine and tender are coupled up the water hose should hang in such a manner as to make one continuous easy curve from the point of the feed pipe connection on the engine to the tank well connection. Any other form is apt to kink the hose.

Your committee concludes that in the light of the information in hand we are not justified in discarding the hose. We feel assured that with a reasonable amount of attention to this detail the present maintenance may be considerably reduced.

The report is signed by H. T. Bentley (Chairman), C. & N. W.; H. C. Oviatt, N. Y., N. H. & H.; C. E. Fuller, Union Pacific; F. H. Hardin, N. Y. C.; H. M. Curry, Northern Pacific; E. C. Chenoweth, C. R. I. & P.; M. F. Cox, L. & N.; W. I. Cantley, Lehigh Valley; G. H. Emerson, B. & O.; P. F. Smith, Jr., Penn. System; and W. H. Winterrowd, Canadian Pacific.

Discussion

H. T. Bentley (C. & N. W.): As your committee was required to handle so many subjects, I would suggest that all of the members of this committee come forward and as each of the subjects come up the chairman, or if he is not here a member of that subcommittee, can read the paper and be in a position to discuss it more satisfactorily than perhaps I might be. If that is satisfactory I will call on the committees to come forward.

I would suggest that F. H. Hardin be asked to read the paper on Tractive Power of Locomotives.

F. H. Hardin (N. Y. C.) then presented Exhibit A and at its conclusion said: I was asked a few moments ago why this paper was submitted merely for discussion. The question was raised by someone for consideration by the Committee of Locomotive Construction. In looking into the matter, these differences, of course, soon appeared and the sub-committee thought that it might be advisable to recommend to the convention a uniform formula. On canvassing the situation we found that there was more or less opposition to that on account of the fact that the rating of practically all the Mallets, (I guess all of the Mallets in the United States,) would have to be changed. For that reason no definite recommendation was made. We also made inquiries to see whether there were any actual definite tests that would indicate which of these three formulae could be considered more accurate and we were not able to obtain any information along that line. As a result the committee thought that the paper should be submitted in this manner for discussion.

Exhibit A is now before you for discussion. This is a very important subject, and I suppose it will be necessary for the chair to call on some of you gentlemen. I would like to call on Mr. Pilcher of the Norfolk & Western.

J. A. Pilcher (N. & W.): The question of the accuracy of the formula, of course, is simply a question of how close it comes to the actual performance of the locomotives. The fact that the formula is calculated one way or another will not affect the pulling power of the locomotive. I was a little struck with the fact that in making the report the committee says it would have to change the rating. The rating is going to be made on what actually happened and not on the formula. As I understand it the test is being made simply to get some method of expression of what is actually taking place on the locomotive when it is in operation. A formula is a good thing to work to, but it will require some further test to show which of these is the most accurate. I am sorry I have not the information, but probably we will be able to develop it some time in connection with some test using the dynamometer car.

C. E. Brooks (C. N.): May I ask if the same heating surface values were used in the three different formulae, including the firebox and flue heating surface values.

Mr. Hardin: The heating surface values were not taken into consideration in the formulae at all. In other words, it is a question of boiler pressure, mean effective

boiler pressure in the cylinders, cylinder diameter, stroke and diameter of drivers. It is assumed that sufficient heating surface is available to provide the steam for the locomotive being built.

G. Greenough (Baldwin Locomotive Company): In the formulae, you will notice at first glance that there is a considerable difference in the actual tractive power as obtained with the three formulae. If the differences are analyzed you will notice that the Baldwin formula, in each instance, is approximately six per cent below that of the American Locomotive Company and the I.C.C.

Analyzing the matter a little further, you notice that the Baldwin Locomotive is based upon 85 per cent of the boiler pressure as a minimum effective pressure obtained in the cylinders at full stroke, whereas both of the others are 91 per cent of over. That difference, roughly speaking, is about seven per cent or a little more, which would indicate that when you eliminate the difference of opinion as to what the mean effective pressure is in the high pressure cylinders, you practically eliminate the difference within a matter of one or two per cent in the formulae.

Consequently it becomes a question if it is advisable to assume that we obtain 91 percent of the mean effective pressure, or 85 percent, or something in between these two.

The Baldwin Locomotive Works always endeavors to retain in their formula what may be termed average conditions. I have no doubt but that in some locomotives where the steam ports and the various exits from the throttle to the cylinder are large, 91 per cent, or even more, is possible at low speeds. We hold to the opinion, however, that 85 percent more nearly represents average conditions so it seems to me there is not much to choose between the formulae, aside from that matter of mean effective pressure.

I notice that the paper is entitled "Tractive Power of Mallet Locomotives," but these formulae, as has been intimated in the paper, only deal with the tractive power of Mallet locomotives at starting or at very low speeds. I will therefore ask if it is in order for me to say a word with regard to the tractive power of locomotives as they are running?

Chairman Coleman: Certainly. This, as I understand it, is a report on the Tractive Power of Mallet Locomotives but will include all the other locomotives.

Mr. Greenough: I would like to bring to your attention the fact that for years we have given a great deal of attention to the tractive power of Mallet locomotives when starting, but very little attention to the tractive power while running.

I do not know how many of you are aware that H. V. Willey, of the Baldwin Locomotive works, recently made a study of this matter and has developed a valve gear for bringing about or making possible a constant cut-off on the low pressure cylinders. It seems almost incredible that for years we have been operating Mallet locomotives in the present manner. We introduce steam in the high pressure cylinder; that in turn goes to the low pressure cylinder; and, as we hook the engine back and cut off the steam in the high pressure cylinder, we do the same thing with the low pressure cylinder, exhausting the steam from the low pressure cylinder into the air before it has done half its work.

The valve gear which I speak of is so designed that the low pressure cylinder does not exhaust the steam until the end of the stroke no matter how far back the high pressure cylinder may be cut off. I think this is something that is well worth considering. In the few experiments that have been made with this apparatus, a saving of from 20 to 30 percent in the coal bill has been effected.

W. F. Kiesel, Jr. (Penn.): It would be very desirable to have the committee give a formula as a basis on which

hereafter we could compare compound locomotives. There is very little difference in the formulae of the American Locomotive Company and the Baldwin Locomotive Company. The formulae are nearly the same, except for the efficiency factor of 85 per cent in one case and 91.7 in the other. We have a simple engine formula based on 85 percent efficiency. Therefore, it would seem desirable to use the same co-efficient .85 percent. None of the three formulae give exact results; they are merely indicative of what the engine might be and as Mr. Pilcher stated, they should have no effect whatever on the road rating. I would therefore suggest that we decide on a standard formula for Mallet engines.

Chairman Coleman: The committee will take that under advisement.

H. T. Bentley (C. & N. W.): In accordance with Mr. Kiesel's suggestion I move that the committee be continued and be asked to cooperate with the three locomotive builders so that a uniform formula may be developed.

Mr. Hardin: May I suggest that the Interstate Commerce Commission be called into that also?

Mr. Bentley: I will be very glad to include that in the motion.

(The motion was seconded, put to a vote and carried.)
H. C. Oviatt (N. Y., N. H. & H.) then presented Exhibit B.

C. E. Fuller (U. P.): I would like to ask the members what experience they have had with the waist sheet braces riveted to the shell of the boiler, as regards cracking of the shell. The committee reports trouble in keeping the bolts tight. I would like to know whether any of the members have had trouble with the waist sheets cracking due to the angle iron of T-iron being riveted to the boiler.

S. Zwight (N. P.): We have had a great deal of trouble on various classes of engines with the waist sheets working loose both at the top of waist sheet near the boiler and also at the bottom, but we have had very little trouble from cracking of the sheet, as referred to by Mr. Fuller. In looking into the cause of the continual working loose of waist sheets, we found that it was not due to the stress brought about by the frame, but invariably on account of the motion bearer. In some cases the boxes were fastened to the bottom portions of the braces. In looking for a way of overcoming this I examined locomotives on five or six different railroads running into Chicago and found that apparently they were all experiencing about the same difficulty. They all applied braces of various kinds, some from the motion bearer up to the boiler in a rigid brace, others with a sort of a knuckle joint in it, and some tied the frame together. We made a good, heavy, draw clamp, you might call it, to go over the top of the motion bearer, coming down under the frame and shrunk it on so as to tie the whole tightly together. We have not had any trouble on that class of locomotives where we have applied these braces so that the frame will carry the strain placed on the motion bearer and rocker boxes instead of transmitting it to the boiler brace.

S. Mullinix (R. I.): My personal observation proves to me that most of our frame breakages are due to improperly fitted binders or poor maintenance work in keeping them tight and I am inclined to believe that the lateral wear has considerable to do with broken frames. I am of the opinion that the railroads, as well as the locomotive builders, have in a great measure corrected the tendency towards broken frames by using heavier frames. I think that by watching the binders to see that they fit properly and are maintained, the frame breakages will be eliminated to a very great degree.

G. W. Rink: (C. of N. J.) We have had considerable

trouble with our locomotives in connection with attaching waist sheet braces to boilers. When we used the plain angle irons we got the waist sheet extended up inside of the angle. We had trouble with cracked boiler sheets, especially on locomotives with thin shells. We later developed a standard practice of using a heavy T-iron forming a shoulder on one side for the sheet to rest against, in order to take the sheer off the bolts. We riveted these T-irons to the boiler shells and we have had wonderful success. I really believe that is the only satisfactory way for securing waist sheets to boiler shells. In the one case the vertical pressure is off center, while with the T-iron the load is practically distributed along the vertical center line of the neutral axis of the T-iron; in that way movement of the angle iron on the boiler shell which causes that cracking effect is prevented.

W. J. Tollerton (C. R. I. & P.): This question of locomotive frames is a very important one and I think that the committee's suggestion of proper design and proper maintenance will cure the matter. We had locomotives built in 1911 with 57,000 lb. tractive power and heavy Mikado type locomotives since that time with not a single frame broken. All of our difficulties with frames were in the older type of locomotives. I am satisfied it was due to improper designing at that time, and possibly to improper maintenance.

T. F. Barton (D. L. & W.): Referring to Mr. Tollerton's remarks: Our experience has been that the principal frame breaks have occurred on locomotives that were in service some time before superheaters were applied and have broken since the superheaters were applied.

C. E. Chambers (C. R. R. of N. J.): I attribute broken frames to three distinct causes. First; the engineer in designing does not allow a large enough section. Second; material sometimes is not just what it ought to be. Third; I agree with Mr. Mullinix as to a great many broken frames being caused directly by binders working loose. If a binder is properly fitted so as to have sufficient draw and is so maintained I think at least 50 percent of frame breakages will be eliminated.

W. L. Bean (N. Y. N. H. & H.): The road with which I am connected has had trouble with several classes of older engines. The breakage was so general that it became necessary to apply new frames. The distribution of breakages was so extensive over the entire frame that there was only one conclusion to be reached and that was that too little allowance had been made at the time of designing in order to meet the weight requirements. We found, in comparing the area of the sections with what is now the accepted practice, that they were from 18 to 30 percent undersize. The breakages were so great that there was an average of three failures per locomotive per year, so we have undertaken a program of reframing.

I would like to speak of one thing in connection with this matter of frames on large modern power, particularly with reference to the boiler. It is very necessary to maintain a proper distance from the front of the mud ring to the top of the frame and if that is not done the boiler, being rigid, will cause unequal loading and bending of the frame under the front of the mud ring. Many difficulties have been experienced with breakages at that point and they have been taken care of by re-establishing that dimension and maintaining it.

C. L. Fuller (V. P.): One of the most vital points in this connection is maintaining the proper relation between the boiler and the frame. I will venture to say that a large number of shops in passing the engine through for repair have given very little attention to the original alignment of the boiler with the frames. Especially that true on roads whose practice it is, in applying a new firebox, to cut off the butt end and take it to the

boiler shop, reapplying the butt end after the firebox has been applied.

The use of flexible bolts for supporting the firebox to the frame, has been responsible for a large number of broken frames. It is almost impossible to maintain bolts of the height required and the bolt holes will wear. The result has been that the locomotives have been passed through the shop without taking the opportunity to raise the boiler up to the proper height.

Another thing which has happened, especially where the barrel-brace connected to the guide yoke and the angle iron or T-iron is riveted to the boiler, is that unless the proper distance is maintained between the front end of the mud ring, and the throat sheet of the frames, an undue strain is put on the guide yoke brace.

After having a great many barrel sheets separated from the holes we decided that it is better to leave it loose, and start the locomotive with probably 1-32 in. between the barrel and the front brace at the center, $\frac{1}{8}$ in. on the front end, and run the T-iron around the boiler in one piece, rather than two. Then, by maintaining the proper height at the rear end, a great many broken frames may be avoided. Cutting off the butt end and oftentimes letting the boiler be carried where it is bolted to the cylinders, on the front yoke or guide yoke causes sprung frames or fractured frames. If the alignment of the boiler under the frame is given the attention and all of the binders are kept up there will be less frame breakage.

Mr. Bentley: The member of the committee who was to have presented Exhibit C is not present. Most of the trouble appears to have been with the lubrication of Mallet low pressure slide valves and as the method of forced lubrication seems to be coming into general use I would like to ask if any of the members operating the Mallet locomotives have used the forced-feed lubrication instead of the hydrostatic lubricator? If so, with what results?

S. Zwight (N. P.): We have used the forced-feed lubricator on Mallet locomotives but I think there are only about a dozen places where we have used them to any extent. The others are the hydrostatic lubricators. The forced-feed lubricators have given entire satisfaction. We have changed them from time to time in the way of introducing the lubrication into the valves and cylinders, as explained in this paper, but we have secured good results and have no difficulty with forced-feed lubrication. That includes the use of the forced-feed lubrication on superheated Mallet locomotives.

C. E. Chambers: I note by this report that "old man graphite" is still alive. I will agree that if you could confine the graphite to the wearing surfaces it would be a wonderful thing, but my experience with graphite is that it goes to other places where you do not want it.

Mr. Fuller presented Exhibit D, Use of Extended Piston Rods on Locomotives; Minimum Size of Piston on which they shall be applied.

C. E. Brooks: I would like to ask the chairman of the committee what the recommended difference in diameter for the extended piston rod should be;—that is, the difference between the ordinary type of piston rod and the extended piston rod? How much smaller are you recommending the extended piston rod to be?

Mr. Fuller: The roads using the extended rod say that you can use an extended rod which is $\frac{1}{2}$ in. smaller than the diameter of the cylinder; in fact, the whole question depends on the extended piston rod being maintained in proper position. If you can keep the piston rod up where it belongs you can run the extended piston rod a good deal smaller, dependent upon the depth of the packing. From many of the replies to our inquiry we were led to believe that maintaining the piston rod in the center of the cylin-

der is a hard thing to do; therefore, if the piston drops down you cannot use a piston rod which is any smaller.

Mr. Brooks: There is a great variation in practice on this subject. Some roads are adopting a size of piston rod as accurate when used for the extension piston rods as they would for the main piston rods. The American Locomotive practice was originally $\frac{1}{4}$ in. less when the cylinder was new. That being the case, I do not see any reason why there should be any more difficulty or why there should be any more care taken in the alignment of the extension rods and guides than with the old type of piston.

If instead of attempting the use of large piston heads we should adopt the old practice of using a piston head considerably smaller than the diameter of the cylinder ($\frac{1}{4}$ in. smaller being the practice) there should be very little difficulty in maintaining conditions that would prevent wear on the cylinder when the extended piston rod is being used.

Mr. Fuller: I tried to make myself clear. In starting out an engine with an extended piston rod, you can start with a much smaller rod and it is just as satisfactory in its operation but if you do not maintain the support at the front and back fairly central, you cannot allow the rod to be worn down without trouble.

Mr. Chambers: I am against the extended piston rod all the time. In the first place, you have two fixed points, governed by a crosshead, and the bushing governing the extension rod. They are never kept in the same position. The idea of the extension piston rod is no doubt a good one, theoretically. If the bushing was maintained, the piston would float. I never saw one that would float longer than a week or two. I do not think anyone who has had extension piston rods has failed to find pistons riding on the cylinders. As to the advantage of having the piston $\frac{1}{4}$ in. smaller than the cylinder, I would like to know what there is in that. I maintain that the nearer you keep the piston head to the size of the cylinder, the better protection you get. The extended piston rod is absolutely a failure, in my opinion, and I have observed it for fifteen years.

Mr. Brooks: I think the advantage of the $\frac{1}{4}$ in. smaller piston which Mr. Fuller mentioned is that it will float.

Mr. Chambers: It never does.

Mr. Brooks: There is some chance of floating when you have it $\frac{1}{4}$ in. smaller but there is no chance of its floating when you endeavor to do what many roads are doing and that is to put in pistons of the same size as the regular piston head, and then depending on the round-house men to keep them floating. It cannot be done.

Mr. Fuller: Mr. Chambers hit the keynote of the whole thing. It is my opinion that if the piston can be maintained in the central position with the extended rod, all well and good. My experience has been the same as Mr. Chambers. You cannot do it and you do not do it and the result is that the piston head is riding on the bottom of the cylinder. There are few locomotives at present, judging by the information which the committee obtained, which are still equipped with the extended piston rod. I have never had satisfactory results with an extended piston rod.

S. Zwiatt: I want to say a word in favor of the extended piston rod. I think it all resolves itself into a matter of the design of the carrier and maintenance of the piston rod extension. We tried several different kinds of carriers for years. The first was merely a sling, with the piston rod operating through it, which would wear very rapidly and could not be maintained centrally. Later we got an extended piston rod, practically the same except for some kind of packing to hold it in

position, as in the regular piston rod. This, like the first method, was not successful and would not maintain the piston rod centrally; the result was that the packing immediately began to blow. In cold weather we could not maintain them and then we sawed the extended piston rods off. We do not recommend the use of the extended piston rod with a cylinder less than 24 in. in diameter. We have a carrier, known as the A. L. C., with a bored guide and a shoe on the end of the piston rod, sliding in this guide. It does not require much lubricant; there is practically no wear; and I see no reason why it cannot be maintained centrally. You maintain the crosshead within the limits of the piston body, with a carrier, or without a carrier, and we try to maintain it as close to those limits as we can. We have locomotives put into heavy freight service in December 1920 and in these we had not touched the cylinder packing up to 30 days ago. I do not think that could be done without an extended piston carrier but it will depend on operating conditions. If you have a level division where locomotives work steam continuously, there is no need of having the carrier, but where you are drifting down hills without enough pressure to hold the piston up, the carrier is essential and will reduce the piston wear and the cylinder wear.

Mr. Chambers. One more reason why I do not like the extended piston rod is that you have three distinct places where you are liable to get into difficulty. These are the steam gland joint, the packing, and the cap joint.

Mr. Fuller: I would like to call the attention of the members of the third paragraph in Exhibit D. The reason I am calling that to your attention is that this is taken from the practice on our railroad. Mr. Zwiatt said if you have a level road you possibly would not need any extension rod. In the case of the 2-10-2 class locomotive with $2\frac{1}{2}$ -in. cylinders, it was necessary to keep the weight down as much as possible and we went to the Z-shaped cast steel piston. On the part of the road on which these locomotives are running the grade is about 97 feet to the mile with sharp curves, and about 40 or 50 miles of it is downhill. We bronzed the piston heads, and made as high as 112,000 miles without the piston ever being taken off in order to rebronze the head. It is a practice which has proven eminently successful. We are running all the Mallet locomotives and others of our 2-10-2 type with bronzed piston heads. If you will investigate I believe you will find this a form of construction in which you have less weight and get as good service as with any extended piston rod ever put in.

I simply call attention to this because here are the facts in connection with a service which has been going on for several years. The wear of the bronze is amazing. If anybody wants to know how these heads are bronzed, a reference to the proceedings of the association about three years ago, will give the information.

Chairman Coleman: We will now pass on to Exhibit E, Use of Solid Front End Main Rod With Bushing Instead of Keys and Two-Piece Brass. We will call on Mr. Bentley to present that part of the report.

H. T. Bentley: The committee has not received enough information up to this time to make any definite recommendations in connection with Exhibit E.

Chairman Coleman: We will proceed to Exhibit F, Tender Tank Bottom—Flange Tank Bottom Compared with Riveted Joints.

(Mr. Orvatt presented the exhibit.)

Mr. G. Greenough: You will note in the committee's report a reference to the fact that the locomotive builders are inclined to believe that the type of tank under discussion will cost a little more than the ordinary tank with the angle iron seams at the lower corners. There are two reasons for that. I notice that one or two of the roads

using the flange bottom tanks have reported difficulties due to cracks in the corners. I would not be surprised to find that they had attempted to use too low a grade of steel in making the bottoms of those tanks. It is just as important to have a good quality of steel in the tank bottom as it is to have a good quality of steel in firebox or where any firing takes place. Consequently, tank steel cannot be used and the ordinary grades of boiler steel may not be used in certain grades of construction, but you will need the best quality of flange steel which costs more.

As to the cost of the construction itself, we have had occasion to discuss this matter with several roads which could not understand why we charged a little more for the flange construction than for the angle iron construction, basing their opinion upon the fact that in their own shop or in some railroad shops there was no difference in the cost. The reason is that the locomotive builders are equipped with the most modern methods of building tanks helled together by angle iron seams. The angle irons are punched by automatic machines; there is no laying out of rivet holes; the plates are treated likewise and the riveting is done by either hydraulic or pneumatic riveters especially designed for that work. Consequently, when you put a flange plate construction in that particular shop the cost of work on the flange tank is relatively greater than the cost of the old style construction, although, taking the matter in the abstract, the cost of building the flange construction tank is no more in any railroad shop and it is apt to be less than in some shops which are similarly equipped. Should the flange construction be determined upon, it will be necessary for not only locomotive builders but the railroads to devise methods of constructing flange bottom tanks by methods as improved as are now used for the angle iron construction.

Mr. Mullinix: We have on our road approximately 100 flange bottom locomotive tanks. We have had them in service the past 3 or 4 years and have experienced no trouble whatever. I have made personal inspection of those locomotives as they come to our shops and I never found any indication of leaking.

Chairman Coleman: If there is no further discussion, we will refer to Exhibit G, Mikado vs. Consolidation—Which is Preferable and Why?

(Mr. Fuller read Exhibit G.)

J. Snowden Bell: The conclusion of that report is so decidedly in favor of the Mikado type that I will not attempt to argue anything in favor of the Consolidation. Although I confess I am rather prejudiced. The Baldwin Locomotive Works recently built a number of large Consolidation engines, probably the largest built, for the Western Maryland and I would like Mr. Greenough to say in just a few words relative to those engines, as to what they did and what their performance has been on the road, in a general way.

Mr. Greenough: Mr. Bell has referred to Consolidation locomotives recently built for the Western Maryland. We could also refer to Consolidation locomotives recently built by the Pullman & Richmond, an exhibit of which is now on display. As you know, I think, however, I will [read] a few words relative to the heaviest Consolidation locomotives in our competition, the American Locomotive Company, 4-6-0 type, I think, a heavier engine for the Delaware & Hudson.

Chairman Coleman: I think you are mistaken as to that, Mr. Greenough. I investigated those weights and your engine is lighter.

Mr. Greenough: Well, I was told otherwise. I wanted to be sure I was right. However, the three sets of locomotives built by the Pullman & Richmond, in all three cases the locomotives were comparatively short runs; in all three cases the roads are not bound by the handicap as

to the cost of the fuel that some of our western lines are. They are all roads which tap the coal regions. The roads in all cases have very firm road beds and heavy rails and they are able to carry more per wheel than the majority of roads throughout the country. Consequently these three roads are in a peculiarly happy condition as to the loads they can carry on drivers, as to the amount of coal they can use, and as to the length of runs. Taking the items wherein the Mikado locomotive outclasses the Consolidation locomotive, you will find that in these particular cases the Consolidation locomotive is built to get by, because of the peculiar conditions under which they are running. If you eliminate those conditions, there is no question at all but that the report of this committee is absolutely correct that the Mikado is superior to the Consolidation locomotive as a type, where the maximum efficiency and locomotive design is necessary to meet road conditions.

Chairman Coleman: If there is no further discussion on Exhibit G we will refer to Exhibit H, Advantages and Disadvantages of (a) Non-Lifting Injectors, (b) Lifting Injectors.

(Mr. Bohan read Exhibit H.)

G. W. Rink: We have had a little experience with non-lifting injectors. Our first experience came about due to the purchase of administration design locomotives. These non-lifting injectors were screwed to the locomotive frame and we had considerable trouble on switching locomotives, due to side swiping, and the dislocation of injectors due to derailments. We also had trouble with the pipe connections. Then we hit upon the scheme of securing the injectors to the mud ring of the boiler and all our troubles, as far as the pipe joints are concerned, have ceased. It also gave us an opportunity to raise the injectors on these particular low wheel locomotives.

Chairman Coleman: If there is no further discussion of Exhibit H we will refer to Exhibit I, relating to Drifting Valves.

(Mr. Bohan read Exhibit I.)

A. H. Fetters (U. P.): I have not had much experience with drifting valves but I sincerely believe that a drifting valve is necessary for superheated locomotives. The practice of cracking the throttle is generally used on most roads but engineers are likely to indulge in abuses of this practice. I have observed many times that the last thing an engineer does in making a station stop is to close the throttle. The result is that the cylinders are left full of steam and the pressure kept on the throttle pipe will often show as high as 160 lb. when the engine first comes to rest. That is an abuse of the locomotive which it ought not to be required to stand. Drifting with a cracked throttle would be all right if it were scientifically carried out; that is to say, if the steam were used in drifting until within a train length or two of the station, then being entirely shut off and the brake used the rest of the distance. As a rule the brakes are used too much and the steam is in the cylinders to that extent. I think that a drifting valve, to be a success on a locomotive, should be entirely automatic and it should be removed entirely from access by the engineers or the roundhouse men. A pilot valve in the cab is likely to be overlooked; I have seen many locomotives go over the road with a drifting valve which was not operating because the pilot valve was not closed. Sometimes the valve is left open and may cause creeping which is serious and dangerous. Therefore, a drifting valve should be entirely automatic in its performance and should be so arranged that it will be as simple as possible in mechanical details and not subject to freezing. It should be reliable and always on the job.

I do not know that any such drifting valve exists at the

present time but there is a big field open for the inventive talent of the railroad men today in that line. I think ultimately something of that kind will be developed and it will be a great help on superheated locomotives.

Chairman Coleman: If there is no further discussion on this Exhibit, we will refer to Exhibit J, Tank Syphons vs. Tank Valves.

(Mr. Bentley read Exhibit J.)

H. H. Lanning (Santa Fe): The road with which I am connected formerly used tank syphons almost exclusively. We found two very serious drawbacks; probably the worst was this: that corrosion of the syphon pipe took place inside of the tender permitting air to leak into the syphon pipe and break the vacuum. We got along fairly well with these until we came to the non-lifting injector. The lifting injector would prime

the syphon each time, overcome the air leak, and operate with a fair measure of success so long as there was a reasonable amount of water in the tank. Coming to the non-lifting injector, which had a smaller lifting power, these air leaks in the syphons caused a great deal of trouble and practically forced us to use tank syphons.

Chairman Coleman: If there is no further discussion of this Exhibit, we will refer to Exhibit K, Tank Hose vs. Metallic Conditions.

(Mr. Bentley read Exhibit K.)

Chairman Coleman: This is a very creditable paper. It has been discussed very thoroughly and is a credit to the committee.

(A motion to accept the report was voted on and carried.)

Feed Water Heaters for Locomotives

The committee finds that there are 58 feed-water heaters in service and 139 on order for locomotives on the railroads of the United States and Canada. Test data quoted show feedwater temperature rises ranging from 145 deg. to 175 deg. F. and fuel savings of from 10.5 per cent to 16.5 per cent.

The committee concludes "that it is a generally accepted fact that the use of a feedwater heater will increase the efficiency of a locomotive. There is very little complaint in regard to their maintenance, but more information on this subject and

further improvements in design may be expected when feedwater heaters are applied in larger numbers, so that they are subjected to the same character of repair work and supervision as other parts of the locomotive.

"It is recommended that the work of this committee be continued and that additions be made to the rules covering locomotive tests, whereby standard methods may be introduced for testing the two types of heaters so that the results of heater tests made on different roads may be comparable."

THAT CONSIDERABLE INTEREST in the use of feed water heaters has developed during the last two years is evident from the number that have been applied. The committee's report for the year 1920 showed that there were 16 locomotives equipped at that time. There are now 186 feed water heaters in service or on order; 15 open type in service and 110 on order; 43 closed type in service and 29 on order.*

All new applications reported to the committee have been exhaust steam heaters, either of the open type, manufactured by the Worthington Company, or of the closed type, manufactured by the Superheater Company, with the exception of one, a Foster-Thompson exhaust gas heater.

*A table accompanying the report shows that 106 of the open type heaters on the order are for the Southern Pacific and 24 of the closed heaters on order are for the New York, New Haven and Hartford.

A questionnaire was again submitted to the members this year. The replies are summarized below.

Maintenance Cost

The cost of upkeep of either the open or closed type heaters as reported by the different roads varies from \$1.00 to \$9.00 per 1,000 locomotive miles. Such a range is to be expected, as development work is still in progress and we can not expect close agreement of the cost figures until a large number of heaters are in service and the supervision and repairs follow the general practice accorded other devices.

Tests at Inspection Pits

No railroad reports any systematic daily inspection of feed water heaters. The usual practice is to depend upon the engineer's report, and to supplement it by having the engine house inspector run the pump and note its action and any leaks in the pump or piping. Some roads report that at boiler wash periods they make a

systematic inspection which includes special examinations of valves, tubes and other parts.

Piping.—Some trouble has been experienced in maintaining the joints, but some of the roads advise that, by using iron pipe, bracing it thoroughly, and keeping the number of joints to a minimum, little trouble will occur. A majority of the replies report the use of iron pipe with flanged joints.

Boiler Check.—A number of the roads reported difficulty maintaining the boiler check, but have overcome it to a certain extent by reducing the lift of the valve. Where a small valve was in use, a larger valve was applied to compensate for the reduced lift.

Freezing of Heater.—In ordinary cold weather the heat radiated from the boiler has been sufficient to prevent freezing and where proper precaution is used no trouble should result. All roads are using suitable drain cocks where necessary and in addition some of them have applied a small steam supply line to the suction pipe, which is used when the pump is not working. Both the open and closed type heaters are thoroughly lagged.

Oil Separator.—The use of oil separators with heaters seems to be general. Only two roads report having found traces of oil in the boiler, and both state that it has not resulted in any damage to the boiler. One of these roads, which is located in bad water districts, attributes an increased amount of foaming to the presence of oil in the boiler.

The other road, which is located in a good water district, reports that they have had heaters in service for several years and that frequent chemical analyses of the boiler scale have never shown more than a trace of oil, although one heater was in service for one year with the oil drain from the separator closed.

Economy Tests

A number of the roads have made economy tests of the heater in comparison with the injector, and some very excellent results

have been obtained. The committee has no information as to how these tests were run and can not vouch for the accuracy of the results reported, but give them as information.

ROAD No. 1—CLOSED TYPE	
Increased evaporation per pound of coal.....	15.3 per cent
Coal saving per 1,000 gross ton miles.....	12.3 per cent
Increase in over-all boiler, furnace and grate efficiency.....	14.3 per cent
Type of locomotive tested (cylinders 27 in. by 30 in., drivers 69 in., 200 lb. boiler pressure).....	4-8-2
ROAD No. 2—OPEN TYPE	
Coal saving.....	12 per cent
ROAD No. 3—CLOSED TYPE	
Increased evaporation per pound of coal.....	24.1 per cent
Decrease in fuel consumption.....	10.5 per cent
Decrease in superheat.....	3.6 per cent
ROAD No. 4—OPEN TYPE	
Saving in coal per 1,000 ton miles.....	14.0 per cent
Increased boiler efficiency.....	16.1 per cent
Exhaust steam recovered from the cylinders, condensed and returned to the boiler.....	8.6 per cent
Decrease in superheat, deg. F.....	21.7
ROAD No. 5—CLOSED TYPE	
Saving in coal per 1,000 ton miles.....	8.9 per cent
ROAD No. 6—OPEN TYPE	
Saving in fuel oil.....	12.5 per cent
ROAD No. 7—CLOSED TYPE	
Saving in coal per trip.....	12.5 per cent
Increased evaporation per pound of coal fired.....	16.0 per cent
ROAD No. 8—CLOSED TYPE	
Saving in fuel.....	13.0 per cent
ROAD No. 9—CLOSED TYPE	
Saving in fuel.....	16.5 per cent
ROAD No. 10—CLOSED TYPE	
Saving in fuel.....	14.0 per cent

Temperature of Feed Water

The rise in temperature of the feed water is a very definite indication of the economy which is gained by the use of feed water heaters, and accordingly in the questionnaire temperatures obtained, with the locomotive working at or near maximum power and also with a light train, of the delivery water, suction water and exhaust steam, were requested in order to more fully bring out this feature. A digest of the replies shows that the rise in temperature for heavy trains ranged from 135 deg. to 185 deg. F., with an average of 156 deg. F. For light trains the rise ranged from 92 deg. F., to 175 deg. F., with an average of 144 deg. Many of the roads reported but small differences in the temperatures obtained for heavy trains and for light trains.

Cleaning of the Heaters

In good water districts no trouble has been experienced with the collection of mud or scale in the heaters, but in bad water districts such has been the case and consequently it has been necessary to clean them.

With the open type the usual method has been to scrape the scale and mud loose and then wash it out with a hose. With the closed type the inside of the tubes are usually cleaned by pumping through them a solution of muriatic acid and the outside of the tubes are cleaned by boiling them in a solution of washing soda for about twenty minutes and then washing them with hot water.

Exhaust Nozzle

There was no agreement as to the necessity or the advisability of changing the size of the exhaust nozzle. Four roads found it necessary to decrease the size of the nozzle and ten have made no change at all.

Indicating Device for Pump

Pressure gauges of various types have been the only device used to indicate the action of the pump. The opinion is general that there should be some device which will tell the engineer that the pump is running, but the results so far obtained with the gauges have not been entirely satisfactory due to their inability to stand the severe service.

Use of Heater When Locomotive Is Standing or Drifting

When the locomotive is standing or drifting the use of the heater is not recommended. Objection has been made to the application of feed water heaters on the ground that it would be impossible to prevent their use when there was no exhaust steam to heat the water and then cold water introduced into the boiler would have a bad effect on the flues and firebox.

The replies to the questionnaire indicate that there is no evidence that the use of the feed water heater has resulted in any damage to the boiler.

The use of exhaust steam from the auxiliaries, such as air pump, feedwater generator and stoker may be advisable in order to main-

tain the temperature of the feed water when the locomotive is not working. Several roads express the opinion that any damage from the introduction of cold water to the boiler would be reduced by the use of a top head check.

Capacity of Heater

The question with reference to the capacity of the heater developed the fact that a few of the roads were of the opinion that the capacity of the heater should be equivalent to that of one injector, while the majority desire an increased capacity ranging from 10 per cent to 100 per cent, with an average of about 33 per cent. Some additional capacity no doubt should be provided to compensate for the reduction in the capacity of the feed water heater due to worn packing, worn cylinders or leaky valves.

It is recommended that the work of this committee be continued and that additions be made to the rules covering locomotive tests, whereby standard methods may be introduced for testing the two types of heaters so that the results of heater tests made on different roads may be comparable.

The report is signed by F. M. Waring (Chairman), Penn. System; A. Kearney, N. & W.; W. Kelly, Great Northern; G. W. Rink, C. R. of N. Y.; L. P. Michael, C. & N. W.; G. S. Edmonds, D. & H., and H. C. Oviatt, N. Y., N. H. & H.

Discussion

F. M. Waring (Penn.): Your committee can only report progress and submit a short summary of replies that it has received to its inquiries made to the members regarding their experience with feed water heaters.

It is interesting and encouraging to note that the table giving the number of heaters in use is already out of date, before the report is presented. We have unofficial information that the number of open heaters should be increased by about 19 and the committee will endeavor to bring that table up to date before the report is printed.

J. Snowden Bell: Inasmuch as this report shows a fuel saving from 8 and 9 to 14 percent and averaging 12.6 on nine reported cases, there can be no question but that the feed water heater is a fuel saving device. It comes directly within the suggestion of the chairman for full and careful consideration and I earnestly hope that it will be discussed. The subject is by no means a new one. Feed water heaters were introduced in this country and put in service (I saw them in 1883) as early as 1836 and from time to time since that year various designs have been experimented with and used to some extent. The Pennsylvania has about ten. There were a very large number on the Reading but for some reason they were discontinued and it is only recently that they have been revived.

We have before us two types in the open and the closed heaters. They are not half-baked experiments, or any sort of theoretical scheme, but they are well developed, actual constructions which have stood the test of use. I do not think, Mr. Chairman, that the last word has been said as to either type, nor do I think that these will be the only types. These, however, come before us with well reported success and it seems to me that they certainly ought to have a very full and careful consideration and discussion.

In preparing the paper which I presented at the 1918 meeting on feed water heaters and their development, I sent inquiries to members and there were 51 favorable to feed water heaters and 11 who either expressed doubt or were unfavorable. The very material increase in favorable sentiment since then is evidenced by the fact that in 1920 there were only 16 locomotives equipped and now 197 heaters are in service or on order.

I recently saw a design of smokebox jacket heater which impressed me very favorably for its simplicity. I have never approved of the smokebox heater and it has failed for the reason that we have got too many things in the smokebox now. We do not want anything more in there and if we take out a few of the present parts it will be

of advantage. It always seemed to me that a smokebox jacket heater would get the benefit of the heat if it could be made in a simple manner. That was the design presented. I do not know how far it has been carried out but if Mr. Giles is here he probably can tell us because it emanated from his department. It was constructed very much on the style I described in the 1918 report, regarding which the superintendent of motive power on the road that was using it said: "This heater was in use for about two years, but on account of the application of a superheater it was taken out. The arrangement showed a good saving in coal and repairs to the boiler and the water entered the boiler at a temperature of 250 deg. I am of

the opinion that the device has merit both in economy in fuel and in repairs to the boiler, as the boiler has a more even temperature than when supplied by an injector."

Mr. Flory: I would like to make a suggestion that the work of this committee be extended to include an investigation of exhaust steam injectors. The exhaust steam injector, while new in this country, presents great opportunities for fuel saving, possibly as much as the feed water heater, and we should get all the information we have on that subject.

Mr. Waring: We will look into that.

(A motion that the report be accepted and the committee continued was carried.)

Modernization of Stationary Boiler Plants

There are two distinct types of committee work in an organization such as the Mechanical Division. One is what might be termed the legislative type, leading to the development of standards to which all are expected to adhere; the other is one of service, in which the committee labors to the end that each member of the organization may have available the fund of basic data required as a foundation on which to build his own structure.

The report of this committee is an example of

a real service well rendered. It has compiled a large fund of valuable comparative data which is digested and presented in a form for convenient use as a guide in the selections of (a) the most economical type of stack construction, (b) the kind of pipe joints to be used, (c) the most economical type of prime mover, and (d) the piping arrangement and setting for horizontal return tubular boilers. These are all problems encountered either in modernizing existing power houses or in planning for new ones.

Schutz Crushed Coal Furnace

THE SCHUTZ CRUSHED coal furnace is a coal-burning device using a coal that has been finely crushed but not pulverized, and without extracting the moisture. Some progress has been made with the development of this furnace, but it is as yet not a commercial proposition. Owing to general business conditions existing since last annual report, a great deal of experimental work has not been done that would otherwise have brought this furnace to a higher stage of development.

This furnace, however, was applied to a 500 hp. boiler in a commercial power generating station, and results obtained were very favorable. However, experimenters are not ready at this time to publish their findings and are waiting also for additional development before recommending this furnace for a commercial proposition.

Chain Grate Stokers

In districts where highly volatile coking coal is available, the chain grate stoker is a very popular form of coal-burning device. The coal is carried into the furnace, ignited, the combustible burned up, and the ash continuously dropped over the rear end of this stoker. This stoker operates with a minimum amount of labor and maintenance, due principally to the absence of handling clinkers and the continuous self-cleaning feature.

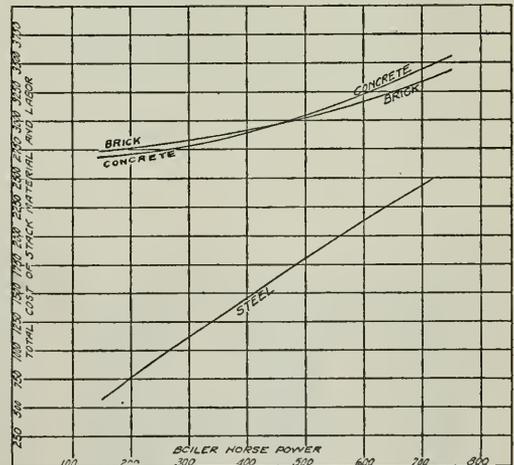

Over 60 per cent of all stokers west of Pittsburgh are of the chain grate type, with the exception of points where West Virginia coking coal is available. These sections are in the vicinity of Cincinnati, and also in the Wisconsin and Michigan regions.

Owing to the coking nature of coal generally found east of Pittsburgh, the chain grate type stoker has not proven very successful, probably less than 10 per cent of all stokers east of Pittsburgh being chain grate. This applies to the natural draft chain grate stoker.

In recent years there has been developed a traveling grate utilizing forced draft. While the method of feeding coal and disposing of ash is similar in this forced draft and natural draft stoker, there is a great difference in the kinds of coal that can be burned with these two stokers. The forced draft traveling grate has been very successful in burning coke breeze and certain eastern

coal such as anthracite culm. There are numerous installations of this forced draft traveling grate type of stoker, which according to all reports are giving very successful results.

Owing to the low maintenance cost of this type of grate, and the

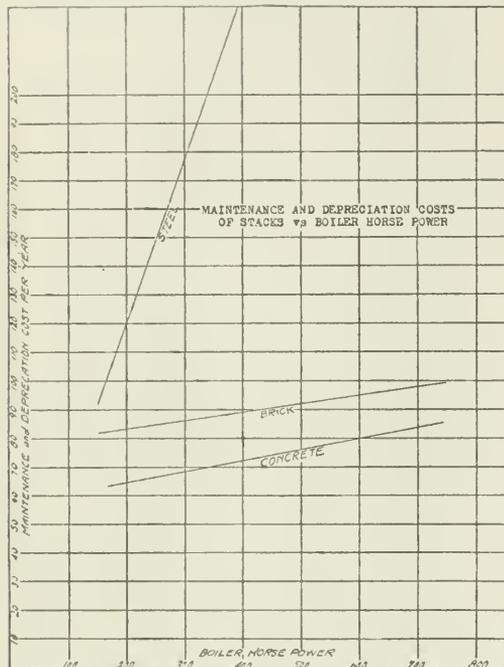

Relation of Stack Costs to Boiler Horsepower

minimum amount of labor required for its operation, and the fact that it provides a means of meeting fluctuating loads and burning fuels heretofore considered as waste, it has all the advantages of the natural draft chain grate stoker with very few of its disadvantages. It provides a means whereby boiler capacity can be

increased without the addition of new boilers and with a minimum expenditure in adapting or changing present natural chain grates for the forced draft type of traveling grate.

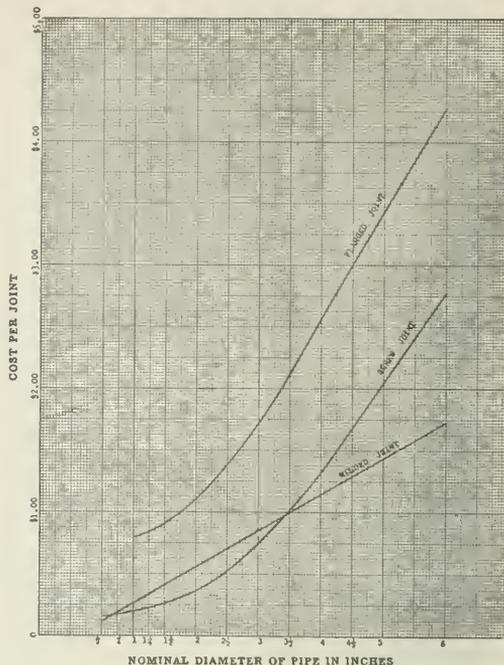

Relative Cost of Steel, Concrete and Brick Stacks

The curves of stack cost represent the average total cost taken from a number of steel, concrete and brick stack costs. While

Relation of Maintenance and Depreciation Costs of Various Types of Stacks to Boiler Horsepower

no allowance is made for a small variation in diameter and height of stack for plants of the same boiler horse-power, the result

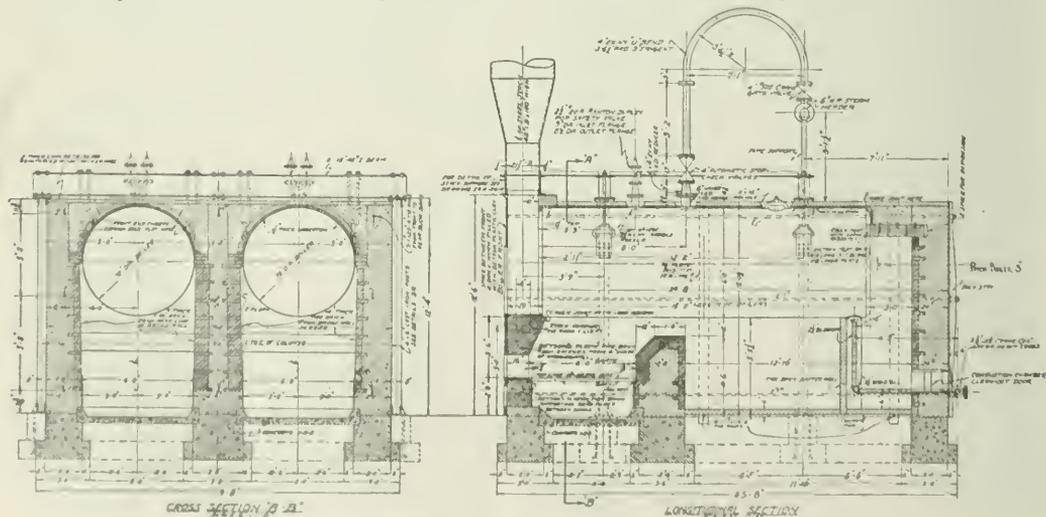

Relation of Maintenance and Depreciation Costs of Various

represents a fair comparison in the cost of stacks for plants of from 150 to 600 boiler hp, and may be considered fairly accurate.

Steel stacks increase in cost directly in proportion to the boiler horsepower of the plant, this being due to duplication of stacks for the larger plants. The cost is much lower for smaller plants, but gradually approaches the cost of concrete and brick as the size of plant increases. Concrete stacks decrease in cost per boiler horse-power as the size of the plant increases, the cost being slightly higher than the cost of brick for the same size of plant above 500 hp, and less for plants below 500 hp.

The maintenance curves are plotted on the basis of maintenance

Recommended Setting of Return Tubular Boilers in Double Units

and depreciation of 2½ per cent of total cost for concrete stacks per year, 3 per cent for brick stacks and 16 per cent for steel stacks. This, however, may be variable, depending upon local conditions, design and proper maintenance, but appears to represent a basis of comparison which is comparatively accurate. From this it is seen that the maintenance and depreciation is lowest for concrete stacks, as there is practically no appreciable upkeep to a concrete stack. Brick stacks require pointing up from time to time, while steel stacks require painting annually or bi-annually, with renewing of top sections frequently.

The Welding of Pipe Lines in Power Plants

The accompanying curves show cost of fitting pipes with flange fittings, screw fittings and welded joints, based on the cost per joint, which would include cutting two threads, fitting two flanges and bolts in case of the flanges fitting, or screwing and coupling in case of the screwed fittings

It will be noted that for sizes under 3½ in. the cost per joint in case of welded pipe is a little more than the cost of screwed fittings, until the smaller sizes are reached, where the two costs run about equal. For sizes 3½ in. and larger it will be noted that there is a material saving in cost in favor of welded joints. Comparing this with flange fittings, it will be noted that the saving is considerable for all sizes, averaging close to 50 per cent from 1-in. to 6-in. sizes. However, the saving is not all in the first cost of fitting, but by eliminating threaded joints much longer life and less maintenance can be expected. The weakest point of threaded pipe is at the threads so far as life is concerned. It is at this point that corrosion first takes place, which in a short time results in leakage.

Two methods of welding pipe are suggested: (1), a butt weld, in which the pipe is carefully faced on the end and in some cases scarfed, and (2), a lap weld, made by using a sleeve, similar to a coupler without threads, slipped over the joint and welded to the pipe at either end. Where the latter method is used special fittings such as "T's," "L's," etc., could be made up economically on a production basis when demand for such fittings becomes sufficiently large. When the butt weld is used great care must be taken to prevent possibility of fins forming inside and obstructing the pipes. This is eliminated where the sleeve type of weld is used and the latter also tends to give greater strength to the pipe at the weld.

No definite recommendations are made at this time for the welding of pipes, and merely a few suggestions are presented. However, the possibility of saving by use of welded instead of flanged or screwed joints is very great with the smaller size pipes, 6 in. and under, with pressures not to exceed, say, 150 lb. For power plant work where high pressure headers are used a different method of welding would have to be adopted.

In both the modernization of old stationary power plants and the design and installation of new plants, much study is required in determining the proper selection of the type of prime movers.

In late years the choice of prime movers for stationary power plants has been in favor of the reciprocating steam engine or turbine. General rules governing selections are without purpose, since each particular installation is a problem in itself. Floor space, capacity, cost of fuel, water rate, steam pressure, water supply, load characteristics, exhaust steam requirements, size of foundation, vibration, first cost, attendance, maintenance, depreciation, taxes and interest on the investment, all govern the selection of type. The principal factor governing the size of units is the station load curves; where these curves are known, the problem is a comparatively simple one, but when they must be assumed, as is generally the case with a new project, it is largely a matter of experience.

Recent developments in the perfection of the uniflow engine have resulted in remarkably low guaranteed water rates being offered by engine builders. This, with the mechanical efficiency of this type of engine being higher than other types of reciprocating engines, owing to the absence of complicated valve gears, has made the uniflow engine, running non-condensing or condensing, show superior economy over the turbine for sizes up to 600 kw.

In a general sense the piston engine is superior to the turbine for variable speed, slow rotative speeds and heavy starting torque; while the turbine has superseded the engine for large central station units and for auxiliaries requiring high rotative speed. The high-speed turbine, in connection with efficient reduction gearing, has many advantages over the piston engine for low-speed drives and is rapidly replacing the latter in this connection. Com-

pared with other prime movers, steam turbines have the following principal advantages: Low first cost, less floor space, lighter foundations and less attendance, better utilization of high vacuum and lower oil consumption, no reciprocating masses with their resulting vibrations, no rubbing parts outside of the bearings; they have extreme overload capacity, and freedom of the exhaust stream from oil, increased reliability due to simplicity of construction; excellent regulation and with favorable conditions as regards steam pressure, superheat and vacuum, economies as good as steam engines for moderate powers and much better economies for units of larger sizes.

A general comparison of the water rates of piston engines and steam turbines is very unsatisfactory because of the wide range in operating conditions. In a general sense, the piston engine is more economical in the use of steam than the turbine for non-condensing service and the reverse is true for high pressure, high-vacuum condensing service. Condensing engines of the uniflow or poppet-valve type have shown superior economy (under favorable conditions) to the turbines for sizes up to 3,000 hp. and, in some instances, up to 5,000 hp., but heat economy is only one of the many factors entering into the ultimate cost of power. For sizes over 3,000 hp. the turbine is in a class of its own.

The most efficient types and sizes of turbines are the impulse type for very small units, the reaction or impulse reaction type for medium and large size units and the reaction type for units of very large sizes.

Tables showing water rates of reciprocating steam engines and turbines at variable loads and conditions are given below. It should be remembered when referring to these tables that the water rates given do not hold good for all operating conditions. Water rates vary with superheat or moisture, and back pressure; therefore, no comparison of water rate alone can be fair, unless the steam conditions are known.

Table I gives the steam consumption per horse-power per hour which may be expected from various types of engines with different steam pressures, running at most economical load. The figures are believed to be fairly accurate in a relative sense.

TABLE I—STEAM CONSUMPTION OF DIFFERENT TYPES OF ENGINES

Type of Engine	Lb. of steam per hp. per hour	Steam pressure, lb. gage
High-speed simple non-condensing.....	32	80-100
High-speed compound non-condensing..	24.26	150-110
High-speed compound condensing.....	19.21	150-110
Corliss simple non-condensing.....	26	80-100
Corliss simple condensing.....	21	80-100
Corliss compound non-condensing.....	20.22	150-110
Corliss compound condensing.....	14.15	150-125
Triple-expansion condensing.....	13	150

Table II gives guaranteed performances of uniflow engines offered by various well-known engine builders.

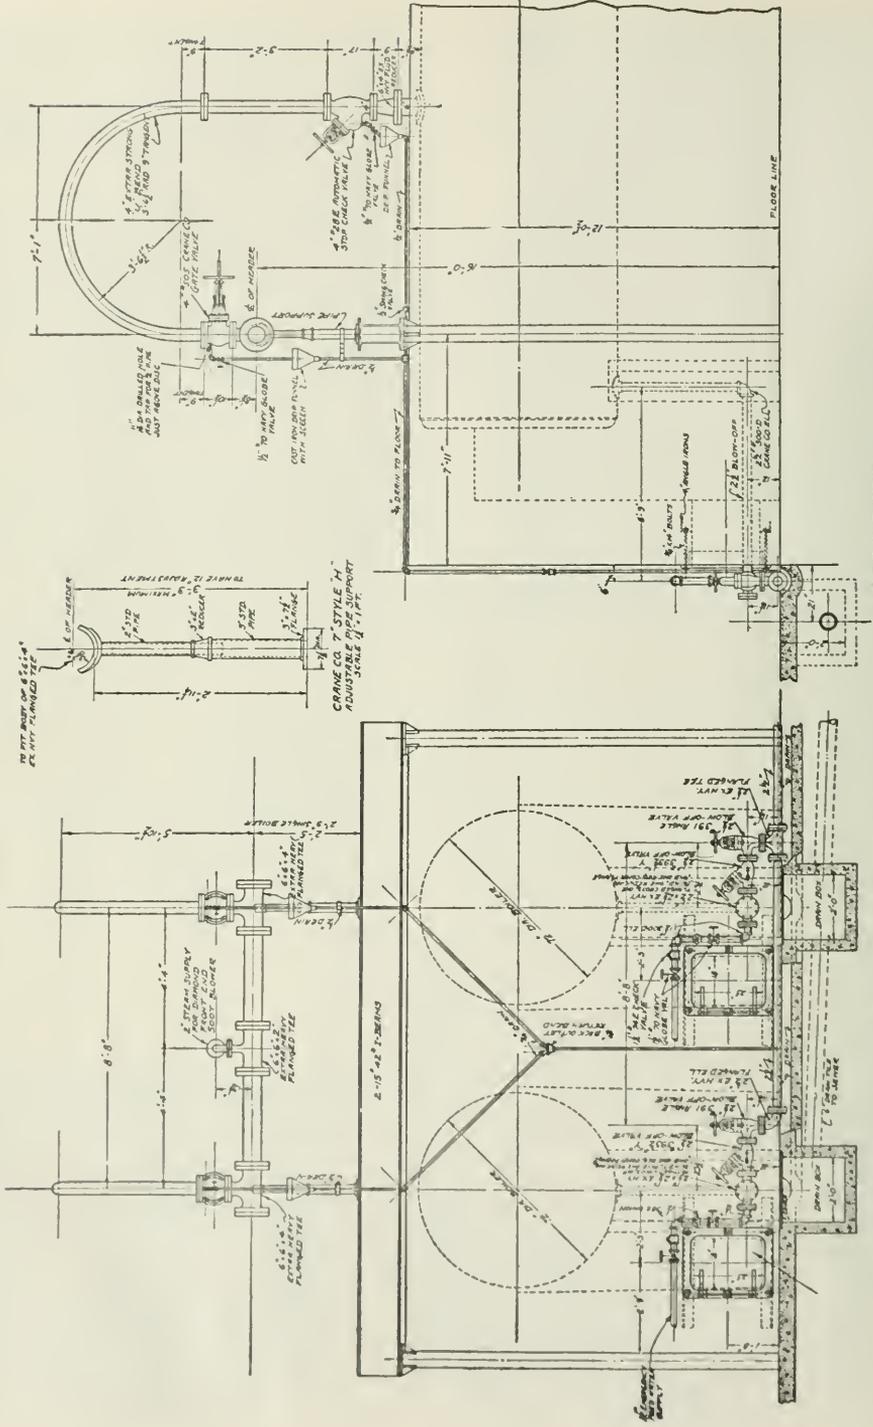

TABLE II—WATER RATES OF UNIFLOW ENGINES AT VARIABLE LOADS

Rated Capacity	R.P.M.	Initial Pressure lb. abs.	Back Pressure			Lb. steam per 1 hp. per cent load.				
			lb. or vacuum in.	deg. F.	25	50	75	100	125	
150 k.v.a.	257	110	2 lb.	0	22.5	21.9	21.5	21.7	22.1	23.1
150 k.v.a.	257	110	2 lb.	0	21.6	20.8	20.6	21.1	21.4	22.1
150 k.v.a.	225	110	2 lb.	0	24.8	22.4	21.8	21.9	22.5	23.1
150 k.v.a.	225	110	2 lb.	0	23.9	23.2	22.8	22.6	23.1	23.6
200 kw.	150	200	1.25 lb.	0
250 kw.	140	1 lb.	0	18.6	18.4	18.3	18.8
250 kw.	140	26 in. vac.	0	13.6	13.5	13.7	13.8
400 kw.	200	200	1.25 lb.	0
525 kw.	150	2 lb.	0
525 kw.	150	26 in. vac.	0
525 kw.	150	26 in. vac.	150

Table III gives approximately the limitations of water rates that can be expected for turbo-generators. The better figure is probably the best that can be obtained in general practice.

TABLE III—WATER RATES OF TURBO-GENERATORS

Condensing		Noncondensing	
Steam at 200 lb. gage, 150 deg. superheat,		Steam at 150 lb. gage, exhaust to atmosphere	
Water rate, lb. per hr. per kw. incl. excitation	Rating kw.	Water rates, lb. per hr. per kw. incl. excitation	Rating kw.
28 in. vacuum	28 in. vacuum	28 in. vacuum	28 in. vacuum
50	32.0 to 32.0	4,000	12.0 to 13.3
100	21.2 to 27.5	5,000	11.9 to 13.0
200	19.5 to 25.0	7,500	11.6 to 12.6
300	18.7 to 22.3	10,000	11.2 to 12.3
400	18.2 to 21.0	12,500	11.1 to 12.0
500	17.7 to 19.3	15,000	11.1 to 11.8
600	17.7 to 19.0	17,500	11.0 to 11.6
750	17.0 to 18.8	20,000	11.0 to 11.4
1,000	16.5 to 18.6	25,000	10.9 to 11.3
1,250	16.2 to 18.3	30,000	10.8 to 11.2
1,500	16.0 to 18.0	35,000	10.7 to 11.1
2,000	15.7 to 17.7	40,000	10.5 to 11.1
2,500	15.5 to 17.4	50,000	10.5 to 11.0
3,000	15.4 to 17.1	60,000	10.5 to 10.9
3,500	15.3 to 16.9	75,000	10.4 to 10.8

SCALE 1/2" = 1'-0"

General Layout of Piping for Return Tubular Boiler Installation

The information outlined above should be used as a general guide in the redesign of an old plant, or in the construction of a new one; however, it should be remembered that the water rates given are subject to continual improvement.

Settings for Stationary Boilers

At this time we are confining recommendations to H. R. T. type of boilers only, because water tube boilers usually require a different setting with each installation, and in the majority of cases are stoker fired.

The drawings show a recommended practice for the setting of return tubular boilers in double units. This setting shows a distance of 42 in. from the grates to the lowest heating surface of the boiler, which should be considered a minimum rather than a maximum, particularly with middle western coal.

The additional features to be recommended for this class of setting are that the boilers are suspended from the steel work, and set so that all columns are well outside of the brick work. This eliminates the trouble usually incurred with burnt out columns when columns are inserted between settings. The flat suspended type of arch is proving very satisfactory for rear arch with this type of setting.

Particular attention should be drawn to the drains on the non-return stop valve and header valve shown in the piping drawings. These valves are in full view of the operator and in compliance with the A. S. M. E. Boiler Code requirements.

It is of particular importance when setting return tubular boilers to make the boiler independent structurally from the brick work, and make stack independent from either boiler or brick work. This results in longer life of brick setting, better alignment of boilers and better opportunity for maintenance and repair work without undue expense and disturbing of such sections as are in good condition for the purpose of repairing sections in need of attention.

The report is signed by L. A. Richardson (Chairman), C. R. I. & P.; J. V. B. Duer, Penn. System; J. H. Davis, B. & O.; L. C. Bowes, C. R. I. & P.; J. F. Raps, Illinois Central, and D. W. Cross, Toledo, St. Louis & Western.

Discussion

Mr. Bohan: I have read this paper with a good deal of interest and I would like to make a few comments on the general situation. Probably there is no facility on railroads which has generally received less engineering attention than the stationary boiler plant. From the pump boiler at the outlying water station to the shop plant, the generation of steam has been too generally considered an expedient rather than a scientific business, the economical conducting of which means dollars and cents in the treasury.

The kind of boilers and other appliances and their installation has been left too much to the other fellow who either had equipment for sale, who was looking at the original cost, or who perhaps had an old locomotive boiler he did not know what to do with. Too little fundamental analysis has been made to determine the conditions to be met and the kind of a plant that would most economically meet them. Further, original mistakes have been augmented in many instances by too little attention to the selection of the men to operate the plants and their supervision. The result is that we now have many poorly designed, inefficient plants, badly maintained and wastefully operated. There are, of course, exceptions and numbers of plants exist which were installed in accordance with the best engineering practices of the time and which are operated as economically as possible. The rapid and material improvement in stationary plant equipment and its installation and operation has, however, made many of these plants obsolete.

Unfortunately, too little is done except under immediate economic stress and we are now confronted with the question of modernization of stationary boiler plants. The subject of modernization is one that should receive most careful consideration, particularly as to installing new

equipment or the application of new appliances to existing equipment.

To what extent is the addition of new appliances or changes to old plants justified and what should they be? When should old plants be scrapped and new ones provided and what kind of plants should be provided? There is no hard and fast rule and no "standard" or "recommended practice" that can be universally applied either to the design of the plant, the equipment used, or its installation. Each case requires its particular analysis and solution.

No expenditure is justified that will not result in increased betterment and returns over the existing condition. No wasteful operation is justified where it can be remedied by improved facilities or practices except as a temporary expedient in such instances as lack of funds or proper labor supply.

Assuming that funds are available, in considering the modernization of a stationary boiler plant such questions as the following should be conclusively answered:

1. What kind of service is demanded? Will it be of one kind, such as the generating of electric current, or will it be mixed, including generation of electric current, operation of air compressors, pumps, steam heating, and the like? Will any part or all of the service be intermittent or continuous during specific periods? What will be the minimum, maximum and average demands of the different kinds of service and the totals of each? A careful check and tests will be required to answer these questions.

2. What kind of a plant is at present installed? Is it of sufficient capacity? What is its condition? Is it maintained and operated as economically as possible? What does it cost to produce a horse power? What kind of fuel is used and what kind is available? What kind of labor is used and what is available? To what extent, considering the capacity and the service demand, should the plant be modernized? Is it mechanically practical to modernize the plant to the desired extent? What will it cost? What can power be produced for in the modernized plant? Can any or all of the service demands be supplied by Public Utilities and at what cost? Frequently such service can be supplied at lower cost than it can be produced for by the railway. Will the decreased cost of power production with the modernization justify the expenditure necessary?

The design of the plant, the kind and capacity of the boiler units and auxiliaries, whether water tube or return tubular and the installation, depend upon the character and importance of the service, minimum, maximum and average capacity demand, available fuel and water supply, labor supply, etc. As previously stated, there is no design that will meet all conditions. The best engineering both mechanical and electrical are necessary and well worth while.

There is one suggestion I would like to make in connection with boiler plant operation in the interest of economy and service: That the control of the personnel of power plant employees and their supervision be removed from the authority of local officers and placed in the hands of one qualified supervisor provided with the necessary corps of inspectors to enforce proper maintenance and operation of boiler plants, believing that by this means only can proper economies be effected.

E. R. Breaker (S. A. & A. P.): I want to speak a word in regard to the small shop or small terminal. The small shop is our problem and we have got to meet the question of reduction in shop fuel and to meet it without spending very much money. The small terminal of the large railroad has a similar problem to meet. They cannot afford to spend as much money on small terminals but there is an investigation which can be

made for very little expense and with very little trouble which oftentimes pays a big return on the investment.

I commenced to look into that in our own particular shop about 60 days ago, and in making the investigation I first listed the various uses which we were making of steam and then conducted some tests to see, first, how efficient our boiler plant was, and, second, just what we were doing with the steam after we had generated it. I found that the boiler plant, which was a water tubular boiler, was fairly efficient, but I found a big loss by radiation and evaporation. Relative to the radiation leakage from the steam line, I found that on account of the fact that that loss was going on for twenty-four hours in the day, that we were losing something like forty per cent of the total steam generated by the radiation from the steam lines and the loss through leakage, most of which were not leaks of any considerable moment, but were small leaks at various joints and connections which would be passed up, generally, in the operation of the plant; large leaks were being taken care of as they developed. I found that the roundhouse, for which we furnished steam 24 hours a day, consumed about 12 per cent. The roundhouse operation for getting out about 12 locomotives in the 24 hours, was scattered all through the 24 hours—together with the radiation losses and leakage through the valves this amounted to practically 50 per cent of the total steam used in the shops which includes small shops and car shops in addition. The air compressor used about 20 per cent of the total and the stationary engine and the tie treating plant, for which we furnished steam, about 25 per cent; small miscellaneous, about 8 per cent.

The big item is the reduction of roundhouse consumption. In small terminals where we have to get engines hot throughout the twenty-four hours, it has been assumed that we must have a steam plant, but in casting around for a way to avoid that, in our particular case, I have found a simple remedy. I can shut down the shop plant at the end of the 24 hours and save this loss 16 hours out of the 24, cutting the 50 per cent loss down to about 16 per cent from that cause.

Our plant is probably no better or worse than the general small plant. It grew up with the needs of the service and was not particularly designed as to the layout of the piping and I find that condition existing among most small terminals. I believe, by looking into that question, we can cut down the length of pipe lines and number of connections thereby materially reduce our losses.

I have found in investigating the air lines that probably every joint and every cock has a certain amount of leakage. These leaks are not always noticeable. They are not strong enough to hear and you cannot always see them, but by testing you will find that a cock which seems to be all right by the ordinary test is leaking 3 or 4 cu. ft. of air per min. If we can weld the joints of these pipes and reduce the number of openings to a minimum, I think we will solve that problem.

C. B. Smith (B. & M.): I notice on the figure dealing with horizontal return tubular boilers that they indicate a flush front setting. The original horizontal return tubular boilers used to be set with a flush front and for 15 years or more it has been our practice in the east to set boilers with overhanging front due to the trouble of burning on the dry sheet. I would like to ask, and it may be of interest to other, the reasons why the committee has shown the flush front and what provision is made for preventing the burning out of the dry sheet. From the experience of the committee and the roads which have been using that method, I suppose there is an advantage in having a hot head rest over the fire door.

Mr. Rink (C. & N. J.): In answer to the gentleman's question, it has been our experience on the Rony Island that

by using plastic brick work up to the arch over the dry sheet on the front we get excellent results and eliminate the burning out of the dry sheet. I do not think we have had a dry sheet burn out in the last six years. We find, however, that it is absolutely necessary to maintain all this plastic fire brick work in good condition and that the furnace lining should be maintained in good condition. I think our practice in the past has been to neglect the furnace linings until they got into such shape that they required expensive rebuilding. We do not have to rebuild a lining any more on our road because we maintain and perpetuate them by catching bad spots before they go too far.

G. W. Rink (C. of N. J.): I would like to make a few remarks in connection with B. & W. water tube boilers. Some members may have such boilers in their power houses and perhaps also the Rony stokers as we do, utilizing buckwheat No. 1 coal for developing steam. We were not getting the full capacity of our B. & W. boilers, due to the fact that the openings in the grate were not sufficiently large to admit sufficient air for perfect combustion. I think that is common with Rony stokers in general and we recently changed our patterns, cutting out the sides of the grate fingers in that way increasing the openings from 9 to about 18 per cent. It is surprising how much better combustion we then got within the firebox.

We have also found that our baffle walls, as a rule on B. & W. boilers, are not in good condition, resulting in high stack temperatures, as high as 750 degrees. After the baffle walls were repaired the temperatures dropped to about 550 degrees at the outlet of the stack. In the B. & W. boilers the baffle wall above the bridge wall runs at right angles to the tubes and also the baffle wall below the flame wall runs at right angles to the tubes. We find by taking out the baffle wall above the bridge wall and inclining it, the result is to restrict the opening on top to about 70 per cent of the grate area and as a result we get any desired flame through that pass. Also by restricting the opening at the bottom of the flame wall we get a great reduction in temperature.

Changes of that character provide for fuel economy in the power house, which is also obtained by the elimination of cracks in the walls. In the case of the bridge wall we make use of American fire brick and low temperature cement. We do not use the loose brick generally furnished for that purpose.

I might also add, in connection with steam piping, I also prefer the Van Stone type joint, either with the threaded flange, or even the solid flange, because it gives a chance to line up the pipes. We have never had any trouble in the way of leakage in any of our plants when we used corrugated copper gaskets all the way through.

In the case of steam and exhaust pipe which has been in service since 1913 we have never had occasion to repair the joint.

It is sometimes a difficult problem to get rid of the ashes, especially where they have to be hauled out by hand. We have introduced at one of our plants, where we have about 2,000 horsepower, a steam jet ash-handling system which gives entire satisfaction. Recent figures indicate that our two separate ash handling systems working 5 hours out of 24 hours, have a steam consumption of approximately 3,000 lb. per hour. We simply have a pit in front of the boilers, the ashes being pulled out and delivered by a steam jet to an overhead storage tank. When the tank is full it is unloaded into tender cars outside.

Mr. Giles: I move that the subject be closed, the report be received and the committee continued to handle this subject during the coming year.

(The motion was duly seconded, put to a vote and carried.) (The meeting then adjourned.)

Section VI—Purchases and Stores—American Railway Ass'n

Interesting Paper by M. J. Wise; Committee Reports Reclamation of Material, Scrap Classification, Inventories, Material Accounting, etc.

CHAIRMAN H. B. RAY called the meeting to order at 9.30 a. m.

After formally opening the meeting, Chairman Ray retired from the chair in favor of O. V. Daniels, Assistant General Storekeeper on the Pennsylvania, who introduced his honor, Mayor Edwin F. Bader of Atlantic City. Mayor Bader welcomed Division VI to the city and complimented the members by stating that of all the conventions that came to Atlantic City, this is the best.

Response to the mayor was made by Mr. U. K. Hall,

General Supervisor of Stores on the Union Pacific System.

U. K. Hall: We have met here for a very serious and definite purpose. Mr. Lee brought to us yesterday morning some figures that showed to the very largest extent the responsibility that rests upon the members.

After a brief response by Mayor Bader the chair was again taken by Mr. Ray who introduced M. J. Wise, Manager of the Dept. of Materials and Supplies, Division of Liquidation of Claims, U. S. R. A. who read the following paper:

Proper Organization in Service of Supply Real Basis for Successful Achievement

By MARION J. WISE

Manager, Department of Material and Supplies, United States Railroad Administration

MY work for the past two years has brought me more or less closely in touch with the activities of most of your individual members as well as, in a general way, the work you have been doing collectively as Division VI of the American Railway Association, and in this way I have acquired a rather clear insight as to your aims, difficulties and successes. The difficulties you have had to encounter, at times, have seemed almost insurmountable. Some of them have been overcome. There are, however, others of a most difficult nature still ahead of you, but with the courage that has characterized your past performances, I feel sure you will continue to push forward until you have reached that goal of recognition to which the service of supply is entitled.

My study of service of supply constantly brings to me the realization that an important basis factor for its highest achievement is organization. Having this strong conviction, I will endeavor to plainly give you my viewpoint with respect thereto, as well as other phases of its functions on our modern day railroads that may be closely related to the main subject.

While organization is the systematic union of individuals in a body whose officers, agents and members work together for a common end, the character of such organization for religious, political, governmental, economical, social or commercial purposes has for the ages been a most absorbing topic of study. The ravages of time and changed conditions have allowed none

created for the purposes named above to preserve their original form. Those which have survived are the ones having a worthy aim, a strong personnel and proper esprit de corps. It takes but little study of the pages of history to convince any one that proper organizations for the purposes described above are the foundation of progress in the various lines of human endeavor. It would seem to follow that this foundation, to be enduring and productive of the most good should be built on the solid rock of sound experience, and not the shifting sands of unproven theory. This does not mean, however, that any organization should be "hide bound" and not venture from the trodden path, because progress means a going ahead, and going ahead means a leaving behind. Cautious progress may set a foot forward but to draw back and try another route. If no foot is raised, however, for a step on the new way, excessive caution is holding the foot still, and a standing object is more easily toppled over than one moving forward.

Fundamental Principles of Good Organization

There are certain fundamental principles governing all movements that cannot be ignored with impunity, and these fundamental principles have been and must be established irrevocably by the teachings of experience.

Railroad operation is the production of transportation and the highest aim of its organization should be to safely handle

freight and passengers between more or less widely separated points with the greatest possible despatch at the lowest possible cost.

The service of supply is an integral part of this organization and to function with proper effectiveness must have a complete organization of its own, synchronizing with all the other parts.

When the responsibility as to operating expenses of the service of supply department is seriously considered and the fact that it is in charge of 35 to 40 per cent of such cost is given due weight, its importance should be at once proven. The value of a completely organized and adequate department of this kind has been rated too low in the past, and still is in some quarters. This is largely responsible for railway operation falling short of a higher achievement.

This bare statement, however, without amplification, would be misleading. There are some railroad companies that have placed face value on their service of supply and are earning commensurate returns therefrom. There are others, who, seeing only through a glass darkly, have partially viewed the economical results that could be obtained, given only mediocre recognition to the importance of this branch of their service, and are, therefore, securing only partial returns. There are still others which have failed to take even a faltering step forward, and this class is suffering from a lack of efficiency that is adversely affecting their balance sheet in a most pronounced way.

The Human Factor

Organization is primarily concerned with human factors. Let us then consider whether organization is really vital in economic operation, or are its component parts merely conductors of currents, i. e., are the members of the organization only mediums through which instructions are carried out, or is there not some dynamic force in and of itself which should emanate from them that is of the highest importance. While it occupies no place on a railroad company's balance sheet, it cannot be successfully denied that organization has a value in proportion to the channel into which its activities are diverted. That value cannot be accurately gaged in dollars and cents and yet it does have a bearing on the real value of the property as a going concern.

The importance of the personnel of a railroad's operating force is being recognized more clearly every day and is as essentially a factor in its successes or failure as its financial status, the character and volume of its traffic, its plant and its operating rules and policies. If this were not so, then why the campaigns for safety, prevention of loss and damage, heavier loading of equipment, fuel economy and reclamation and saving of material, all of which must fundamentally base their success or failure on the interest of the personnel of the organization? Is it a real live asset or is it an unrecognized liability? There can be no satisfactory middle ground. It must be one or the other. It seems essential that the head of each operating organization should have the courage fearlessly to study and face the situation on his own road, and if his service of supply department is not organized to produce the most effective results that can be obtained, at least honestly admit it to himself and take the necessary action.

Passing from the broader phases of organization to a more concrete study as affecting service of supply, I present for your careful thought the statement,—that performance of an organization is based, first, on its personnel and form or character; second, upon the facilities with which it has to work; third, upon the methods and practices it employs. If this statement is fundamentally sound, and I believe it is, then it may be helpful to discuss its component parts with a view of attempting to apply our best judgment to what constitutes the essentials in each and the coordination of all of them into a composite whole for the production of the most efficient results.

Personnel

With this end in view, let us first take up the subject of personnel.

Under the purchasing agent and the general storekeeper rests the major responsibility of the proper functioning of the service of supply and as they are the heads of the two branches of this important operating organization we may use them as type. They should be models in their respective departments, for every officer and employe therein. Under our form of gov-

ernment, as every American citizen that is born is a potential President of the United States, so under present operation of railroads every employe is a potential head of the department in which he serves, and as a natural corollary is a potential president of a railroad. If, therefore, we consider the degree of worth of the purchasing agent and general storekeeper to the operating organization, we at the same time in substance, apply like principles to each officer and employe under them.

Their value, as individuals, in the operation of service of supply, would seem to be dependent upon the following chief personal attributes in the following order:

- (a) Intelligence, integrity and industry.
- (b) Experience, courage and initiative.

I direct your particular attention to the three qualifications under heading "a," which I designate the three "I's." In every line of endeavor they stand out preeminently as essential characteristics for successful accomplishment. Any two of them linked together, without the other, no matter in what order arranged, fail to meet the full requirements for proper handling of duties connected with the service of supply. I commend to your especial consideration and thought these qualities in the personnel of your organization and I am sure if you will select, as well as train the men you now have, primarily thereon, you will eventually have an organization whose possibilities for effectual service are without limit. I am not unmindful of the difficulties surrounding the improvement of the personnel. It is a hard, laborious task and the peak of perfection can perhaps never be reached. This very fact, however, is an incentive to the man of intelligence, integrity and industry and the degree in which he accomplishes results is the barometer of his executive ability.

Experience, Courage and Initiative

We next come to experience, courage, and initiative. A great deal could be said about each one, but I will touch only the high spots of their value in the personnel of the service of supply department.

While experience in an executive is not absolutely essential, lack of it is a handicap,—not insurmountable, but difficult to overcome. There are positions, however, in service of supply where experience is an essential of the highest importance. We all know that the service of supply department has too many men in it fitted by neither experience nor training for the positions they hold. It is too often made the recipient of employes from other departments who are no more fitted for their positions than a non-railroad employe. The service of supply department is as essentially technical in its requirements as any other department of a railroad, but lack or faulty knowledge of its importance has led many executives to foist upon it for one reason or another inexperienced men, some of whom could never be properly fitted for the positions and others who were costly experiments during the time they were learning.

Courage is an often abused word and as often misapplied. The angle from which I desire to view it as used in this connection is that of conviction. Our opinions are our own,—no can take them from us, but it would be interesting to know how many officers and employes when asked for an opinion courageously voice their own convictions and how many hold them to the model they think their executive officers want. It is but natural to try and express an opinion that will fit in with a superior's view of the same thing and it is, therefore, all the more necessary to watch carefully that we be true to our own ideas and have the courage to express them. However, when that is done to the best of our ability, our responsibility ceases and if superior authority does not agree and instructs that the matter be handled contrary to our views, as good soldiers we should carry out our instructions. The man of honest conviction, however, who has the courage to express his own opinion can not help but inspire respect and has a quality that makes him valuable. This particular quality has done as much as any one thing to place some service of supply departments in the position they now occupy on their roads because the heads of that department had the courage continually and convincingly to present to their executive officers the necessities and importance of service of supply.

Initiative has had as much to do with the development of American railroads to their present standard as any one thing, and there is equally as much of it in the personnel of service of supply as any other branch of the service. That the results have not been fully developed as in some other branches is due not

to lack of it in the individual members compared with other departments, but because organized service of supply is younger and its limitations have been more circumscribed by lack of recognition of its importance by executive officers. The accomplishments of this body within the last few years as a testimonial of no mean importance to this quality of its members. Yet, have we developed it as far as we might and have we installed it into the rank and file in such a way as would improve our organizations? I think all will agree there is room for considerable improvement in this connection.

Let us now pass on to the form or character of reorganization. In discussing this phase of the question I am not unmindful of the fact that there are many divergent views with respect thereto.

Lack of Supervision

One of the points that stands out with extreme clearness in considering the organization of the service of supply department is the fact that it has been and still is, lacking in supervision. Did you ever stop to consider that it is responsible for 35 to 40 per cent of the operating expenses; that at all times it is responsible for material on hand representing approximately two-and-a-half times as much cash as there is in the treasuries of the railroads and measured by this responsibility the amount spent for supervision is not greater than one-sixth and often less than the amount spent for supervision in any other department? Has not the dollar spent for materials and supplies and tied up in them as many cents as the dollar spent for anything else, and if there is any merit in the generally accepted theory, and I for one believe there is great merit in it, that proper supervision is an important factor in securing satisfactory results, then it would seem not only logical but necessary, that a greater appreciation of this be extended the service of supply department.

It seems a natural sequence that this department on the large systems should have as its head an executive officer devoting his time exclusively thereto, with the heads of the immediate purchasing and stores departments reporting to him direct. It seems to me fundamentally wrong that either department should report to the other except in an advisory way, or that either or both of them should report to any other than an executive who could co-ordinate their respective activities. I cannot reconcile myself to seeing anything but a fundamental error in an organization for a large system where the purchaser of material has charge of its distribution and use or the user or distributor of material has charge of its purchase.

On smaller systems the heads of the Purchasing and Stores Department should report to the executive officer having charge of general operations.

Organization—Purchasing Department

The purchasing agent should have absolute charge of the purchase and sale of all material of every kind on a railroad. In addition to a well organized office force consisting of a full complement of experienced clerks for their particular duties, the purchasing agent should have directly assisting him, experts in the purchasing of steel, coal, lumber, cross ties and stationery where the size of the railroad is such as to justify it. If the purchasing agent is qualified for his position, no one can purchase material to better advantage than he; his value is discounted when he is not the ultimate authority on all matters involving the purchase and sale of material. If he is unfitted for the place, he should be relieved as proper results cannot be obtained by divided responsibility for the purchase of materials and supplies.

Organization—Stores Department

The general storekeeper should have charge of the handling and distribution of material and, under the supervision of the Accounting Department, the accounting for all unapplied and scrap material. A wide range of observation has given me a very decided opinion that all primary accounting for material should be under the jurisdiction of the stores department, subject only to the general supervision and check of the accounting department. Experience and operating conditions seem to make this branch of the service better fitted than any other to account for this phase of operation, just as the agency forces are best fitted for the accounting of freight and passenger business. There should, however, be the same close supervision and check of the accounting department made of the storehouse department records as is made on other departments.

The general storekeeper should have in his organization, where the size of the road justifies, sufficient traveling storekeepers to keep him in touch with the physical conditions at all major material distributing points. In addition, he should have a full complement of division storekeepers and district storekeepers so that the distribution and accounting for all material shall actually be under the jurisdiction of the stores department.

In the co-ordination of the two branches, there should be the widest exchange of views, reports and conditions, and it is in my opinion, essential in order to secure the best results, that the purchasing agent and general storekeeper should, in conjunction with the heads of other departments, make more frequent trips over the road. It is sad but true that there are some general storekeepers, and especially purchasing agents, who know less of the physical conditions surrounding the material that is under their charges than the heads of other departments. When inspection trips are made over the road, it is as necessary that the purchasing agent and general storekeeper accompany the executive officer as it is for the Chief Engineer and Superintendent of Motive Power to make it a complete success. The purchaser and distributor of material should see it on the ground and in conjunction with the heads of other departments many difficulties can be promptly overcome that would otherwise by correspondence take weeks and months. On these trips, methods and practices can be discussed and action taken to fit the local conditions. I need not recite many advantages that can be secured in the economical and efficient handling of material in close co-operation on the ground between the heads of the Service of Supply Department and the heads of the other departments of the operating organization; the closer the association, the closer the co-operation.

Department Facilities

We will now take up the question of facilities with which the organization has to work. This presents a very broad phase of discussion, and I can only touch on it in a most general way. The heads of every department of a railroad continually have their eyes open for savings in operating expenses that can be effected by capital expenditures, and the savings that can be effected in the material and supply department from this source are as great, relatively speaking, as in the other departments. Every general storekeeper knows the advantages of well-built, well-lighted, properly arranged and adequate storehouses for the care and distribution of material. They know the advantages of adequate lumber and tie yards, platforms, casting and bar iron racks and other facilities necessary in the proper storing of material, and in the distribution of capital expenditures their claims for a proper share therein should be so well presented to the management as to justify them.

The service of supply department should not be content with merely presenting a claim for capital for additional facilities and letting it go at that, but should have back of that claim evidence of a substantial character that the spending of the money is justifiable from an economical as well as every other standpoint. This, of course, requires resourcefulness, initiative, study and persistency of the highest character. I think all of us can remember times when we might have secured facilities had we presented our claim for same in a more explicit way.

There is also another feature to be considered in connection with the facilities. The resourceful storekeeper, by the employment of initiative and industry, can remodel and add to existing facilities in such a way as to increase their capacity to a remarkable degree. Another thought that occurs to me in connection with this particular subject is that care should always be exercised to suit the facilities to the conditions, and all permanent work should be done with a definite plan in view, although its ultimate consummation can be obtained only over an extended period of time.

The proper location of facilities is also of the highest importance. A facility, no matter how well adapted for the storing and care of material that is constructed in such a location as to make the expense of the distribution high is of no more advantage than a poor facility in a good location. This statement may seem axiomatic, but we all know of many instances when there has been construction of unsuitable and improperly located facilities, due to all factors in connection with the storing, handling and distribution of material not having been fully considered at the time the plans were made.

That the best results can be obtained by the closest co-operation between the maintenance, stores and engineering organ-

izations almost goes without saying, and the Service of Supply Department should impress its views upon the other departments with such intelligence, force and convictions that the plans may all be worked out and agreed upon in every essential detail before the application for the capital expenditure is made to executive officers. I believe this will have a tendency to aid in the securing of more and better facilities for the service of supply.

While I would like to discuss more in detail the question of facilities, I must pass on now to the latter phase of performance as modified by methods and practices. They play a most important part in the performance of the service of Supply Department. It would be strange indeed if opinions did not differ as to what constitute best methods and practices. I cannot discuss them except in the broadest way, calling your particular attention to some of the more important ones with respect to which I have, through a wide range of observation, been imbued with very decided personal opinions in regard thereto. For the sake of convenience and not because of their relative value, I will sub-divide them between purchasing and stores departments. The items thus selected are taken largely because of their close connection with the subject of organization, and the part it plays in the successful performance of its function.

Purchasing Department—Price Records

A proper price record is one of the most important tools with which the purchasing department has to work. Its value, however, is largely dependent upon the character of the record and the accuracy and up-to-dateness with which it is maintained. Every road maintains a price record of some character, even though that record may consist only in filed copies of invoices. The results in human achievement are largely determined by comparison or contrast, and when we consider that purchasing agents, in the ordinary course of business, purchase from twenty-five to one hundred thousand varieties of articles, dependent on the size of the road, the utter futility of his remembering the prices of the various items over any extended period of time, is easily visualized. He must, therefore, in determining whether a bid, received on 95 per cent. of the articles purchased, is reasonable, see how same compares with previous purchases. If, in doing so he is forced to examine files of invoices, the amount of valuable time thus consumed is very much in the aggregate and might have been profitably directed in other channels, whereas, with an up-to-date, complete price record, he can see at a glance what he had paid for the article over a series of months, and form his opinions and decide on a line of action promptly. My opinion of a record of this kind is that it should be a loose-leaf continuous monthly record covering all articles, where the amount purchased in a year involves a considerable sum of money. As an adjunct to the price record, it also seems advisable to keep a bid record. This can be maintained in conjunction with the price record, but I believe preferable on cards. This record enables the purchasing agent at any time to determine promptly what a manufacturer may have bid on particular articles of material and may influence and help him in securing lower prices. The value of these records, however, is in proportion to the degree of accuracy and up-to-dateness with which they are maintained. While on its face it would seem that the liberal help thus employed might be used to better advantage elsewhere, one complete item of information may be helpful in saving the salary of the clerk maintaining same for more than a year.

Identification Numbers

Experience and observation has led me to the decided opinion that all items of material purchased by a railroad company in considerable quantities should have distinctive corporation numbers or symbols. This practice is now being largely applied to engines, all locomotives and stationary. Many railroads have found that a most real relief of confusion has resulted from different descriptions of material of different points being applied to the same article of material. However, where a distinctive symbol is given to every item of material and this symbol is carried, in addition to the description on requisitions, order, manufacturers' invoices and receipts, the opportunities for mistakes are often greatly decreased. Many manufacturers as well as railroad purchases and other organizations, have local or abbreviated descriptions for identical articles of material, which are often not clearly recognized or are mistaken for something else by others handling the various documents pertaining thereto. If

it is advantageous for air brake material and casting to be given distinctive identification, then it would seem that the same principle could be applied with equal success to other items of material. The extent to which this should be carried, of course, depends largely upon local conditions peculiar to individual railroads. The effectiveness of the practice and the results obtained therefrom are, in the final analysis, greatly increased by the spirit and whole-hearted support which is given to it by all concerned.

Relationship With Manufacturers

This is a subject of vital importance to every purchasing officer and his company, and often upon it rests more than is realized, the results obtained in the purchase of material. I have known of cases where many purchasing officers have failed to receive important trade information and trade benefits because of their attitude towards the people from whom they buy. It is true that in a buyers' market that little consideration can be given the sellers of material and the purchasing officer can drive good bargains, but the relative condition of supply and demand frequently change, and the ability of the purchasing officer is put to the real test in a seller's market. Sellers of material are human and have the same feelings that are common to mankind, and slights and lack of proper consideration for "peddlars" have often resulted in purchasing officials failing to secure the best material at the lowest price at which it could be purchased. I have had representatives of supply concerns say to me, "Well, so-and-so did not give me a square deal, but it is a long lane that has no turning," or words to that effect. Of course, there are times when supply men imagine they are unjustly treated when such is not the case, but generally, my observation has been that they are good losers in fair competition.

It is well not to lose sight of the fact that representatives of supply companies, as a general proposition, are men particularly trained and experienced in their individual lines and usually have not only a general but a technical knowledge of their business, while the purchasing officer dealing with innumerable items of material and supplies, cannot possibly have a full knowledge of all. It is seldom that a genial wide-awake purchasing officer, by discussing with the representatives of supply houses in detail their particular line of business, cannot obtain some information that will be helpful to him in his work.

Stores Department

The supply train is a subject that has been discussed from many angles and in listing it as an item for special treatment I am not unmindful of the fact that there is a diversity of opinion in regard to its operation being a success or failure, but practical experience and a rather extended range of observation leads me to believe that fundamentally the supply train is an economic factor in the distribution of materials. The spirit with which the practice is carried out is the governing factor. To be successful in the proper degree, this train should be accompanied by representative division officials of the Maintenance of Way and Transportation Departments who should enter into the spirit of economy with the same zest that should and generally does actuate the storekeeper. The operation of a supply train gives an opportunity for closer co-operation between the division officers of the various departments, and if properly handled, cannot help but result in large economic returns.

The representative of the transportation department has an opportunity to visit stations on a mission distinctly different from the general routine. He can, on such a trip, carefully look into the use of stationery and other station supplies, with a view of securing their most economical use. Likewise, the representative of the roadway department has an opportunity to become acquainted with the economical use of tools and other material; both have the opportunity of picking up surplus material for transfer to other points or return to stock for future use and clearing up miscellaneous scrap at station and section houses. I have mentioned cleaning up scrap particularly because every supply train should make this a special function. If all these officers are thoroughly imbued with the thought that material represents actual money and that its proper care and conservation enters into the expense of operation to the same, if not a greater extent, than labor, then proper results will undoubtedly be secured.

The handling scrap and reclaim material is a feature of stores methods and practices that is exceptionally important and

upon its proper handling depends very large returns. All scrap, no matter where located, is the equivalent of its market value in actual money, and only in rare instances can there be failure to realize upon it. Furthermore, all scrap contains a large amount of actual and potential usable material, which can be applied to maintenance purposes rather than purchasing new material.

To secure the greatest returns from the sale of scrap, it should always be assorted into proper classes and sold monthly. It has been the practice on some roads to hold scrap in dull seasons, for a rising market, but a careful study of the subject over a series of years, taking into consideration all the factors that might enter into it, indicates that monthly sales bring the best general results. The money that would otherwise be tied up can always be used to advantage; the lost efficiency that always must occur in disbanding experienced scrap sorters; the lack of a systematic reclaiming of usable material; and the general slackening of interest in the matter, are all debits against the possibly greater amount of money that might be realized by holding the material for higher prices. Of course, such items as wheels, axles, old machinery and rails may at times be held to advantage.

Reclamation of material is always a subject that presents interesting features to purchasing and stores officials. It would seem that from an economic standpoint, there are four general principles of paramount importance:

1st—The cost of reclamation should not be prohibitive.

2nd—Material should be reclaimed only when the advantages derived therefrom are greater than can be obtained from the use of new material.

3rd—Reclamation of all material should be under the jurisdiction of the Storehouse Department.

4th—Use of modern machines and facilities for reclaiming material.

Discussing the foregoing paragraphs seriatim:

1st—Many stores organizations have deluded themselves into the belief that the reclamation of certain items of material was a paying proposition, when as a matter of fact, if all of the factors entering into the cost and use thereof were carefully examined, it would be apparent that it would be better to scrap the old material and buy new. To secure paying returns in this connection, it is well to be sure that every item of cost and all circumstances and conditions relative to its distribution and use are given careful and accurate consideration before reclamation is commenced.

2nd—Many items of material are reclaimed which, when put in actual service, are of such an inferior character that the amounts expended for labor in reclaiming and applying, more than offset the cost of new material. Of course, all mechanics prefer to use new material and in an excess of zeal, some reclamation plants have forced upon the Maintenance of Equipment and Roadway Department material that should never have been used. Every one of these and other phases of the question should be carefully threshed out before the reclamation work is started. It is also essential that a careful inspection should be made of all reclaimed material before it is distributed for application.

3rd—This is also an item upon which there has been difference of opinion, but my belief is that the best results can be obtained by having the reclamation of all material under the jurisdiction of the stores department. The main duty of the stores department is to furnish material, and the main duty of the maintenance department is to use it. Where reclamation of material is under the jurisdiction of the stores department, it is generally given special attention, whereas, if it is under the jurisdiction of the maintenance department it, by the very nature of their duties, it becomes of secondary importance. This would seem to present a fundamental argument of a rather convincing character, without elaborating on others, in justification of the statement made above.

4th—Where actual demonstration of economy has been made in reclaiming of certain items of material, it has been in many instances, nullified to a large extent by the use of obsolete machines and facilities. The old adage that "if a thing is worth doing at all it is worth doing well," applies with full force here. If a bolt threader is discarded by the mechanical department as being out of date, it is certainly out of date for use in the reclamation branch. Surely a triple header bolt, threader, in contradistinction to a single header, can take care of three times as many bolts with the same labor in the reclamation department

as it can in the mechanical department. The statement of this fact almost proves itself.

Distribution of Material

The prompt distribution of material and accurate accounting therefore is of major importance in proper operating efficiency. This, in my opinion, should be entirely under the jurisdiction of the stores department. While an increase in the stores department labor forces to distribute material is often looked upon as an item of expense that can be saved, as a matter of fact it is not. The hours wasted by highly paid mechanics in looking for material, when it should have been distributed to them by the stores department, can never be estimated.

The distribution of material by a department not directly interested in its use, is also a check against waste by the other departments. The argument could be presented, however, that there might be such lack of interest in the use as would result in delays in the maintenance departments, but this is seldom the case, as most stores men know, principally for the reason that the maintenance departments keep so constantly after the stores department for the material they have been authorized to use that the latter cannot afford to become dilatory in this respect.

Stock Books

The arguments in regard to the effectiveness and necessity for accurate and up-to-date stock books are almost time-worn, but this practice is not being given the attention to which its importance entitles it. Here again, the value of the practice is dependent largely upon the human equation. To be of the greatest value, the stock book should contain an accurate and up-to-the-minute record of all material on hand, all material on requisition, all material ordered, and the amount used. This knowledge is almost invaluable in ordering and in transferring material, as well as keeping the stock balances within reasonable limits. Imagine the confusion in any large supply house, with hundreds of salesmen on the road and branch stores throughout the country, not having an accurate and up-to-date stock book. A few minutes' reflection on this subject should convince any one, without any extended argument, how almost invaluable are stock books.

A Tribute

In conclusion permit me to pay a tribute to the large number of purchasing and store officials of this organization who have accomplished almost unbelievable results in spite of lack of proper recognition, antiquated facilities, and out-of-date or unsound methods and practices, many of which they were in no wise responsible for. The purchasing agent who faces bills long unpaid, unscientific ordering and urgent demand for immediate delivery, who is able to secure material at a reasonable cost, is not an unfamiliar figure. The general storekeeper, who by hard work, initiative and without adequate co-operative assistance keeps the operating department supplied at a low cost of handling and saving of waste, is not also unknown. Their value in thousands of instances can never be estimated and is often never appreciated. Then think how much greater would have been results had these same men had all that could be desired.

Discussion

I am particularly impressed with the compliment Mr. Wise has paid to the individual storekeeper, the general storekeeper, the purchasing agent, and the general purchasing agent. He is correct in his statement that the greatest handicap has been the lack of men who are primarily fitted for the work to which they are assigned and for which they are held responsible.

The organization which is recommended by Mr. Wise has been generally accepted during the last few years as being fundamentally sound. The need of facilities is of course equally well known. Passing tracks, depots, terminals, shop buildings, and any number of valuable improvements are needed; so that after all we must not be discouraged because we cannot get even the things which we know are so necessary for the economical and proper administration of our affairs. There is a tremendous amount of valuable facilities that can be obtained by pre-

sending constantly the need of these things in a way which will show in dollars and cents the actual savings which can be effected. Many valuable and necessary improvements have been lost because their need has not been shown in the forcible and direct method of measure in dollars and cents.

There can be no question about the needs of a stock book. It is absolutely essential, but in order to get the real benefits from it, it must be maintained. Neither is there any question about the supply train. It is one of the most valuable methods of distribution and control in the stores department. The next step, and a necessary part of it, is the stores delivery system, or what Mr. Wise calls the distribution of material, which means of course the delivery of material to the workman. However, the best of plans never can and never will produce results unless they are applied.

Chairman Ray called upon F. W. Brazier for a few remarks.

F. W. Brazier (N. Y. C.): I want to say that this association is doing a grand work. I am a member of that grand old M. C. B. Association. It is a legislative body, you are an educational body. But your work and our work go together and we want to show the officials of this country that by your work you are making conditions better for all the railroads of the country. Another thing, you come here and you hear something read. Assimilate it and apply it to your own conditions. Don't think you know it all. Get away from home once in a while and

learn what others are doing. That is the way to be successful and will help you to reduce the cost of production.

The Chairman: Those kind of talks put enthusiasm into us and we will take it home with us. I want to ask Mr. Yeomans to say a few words to us. He is an old friend of ours and he has fought our battles a good many years.

Geo. G. Yeomans: There is just one thought running through my mind and I do not know exactly how to put it into words. It is what these conventions mean to me and whether we all of us grasp the real significance of what we are here trying to do. We are here to try and profit by what the other fellow has done, not by what we have done ourselves, but get out of our own and into the other fellow's territory and grab away from him all the good ideas that he has. It also involves a sacrifice. In a body of men such as this it is not possible to make any advance toward the general good without giving a little, sacrificing a little, for the good of the whole. That is what these conventions are really for. It is for the general good of everybody, not for the particular good of someone individually, and I do think that if we can carry out this spirit throughout all these meetings that we are going to eventually come to a point where the weak as well as the strong are going to meet on a plane that will elevate all of us.

Upon the motion of F. D. Reed (C. R. I. & P.), a rising vote of thanks was given to Mr. Wise.

Material Accounting and Mechanical Facilities

Some criticism of the 1920 report of the committee, recommending that all material stocks be carried in stores department accounts, is answered in this year's report. The 1920 report in this respect seems to accord with recommendations of the Railway Accounting Officers' Association, and

three additional reasons are given why the 1920 report, as originally submitted and approved, should remain unchanged. Valuable recommendations regarding the use of mechanical devices, such as comptometers, adding machines, typewriters, calculating, listing and electric tabulating machines are included in this report.

OBJECTION was entered at the 1921 annual meeting of the American Railway Association to the recommendation made in the previous report of this committee, that all material stocks should be carried in the accounts of the stores department, which will have supervision and handle the accounting for same. It was felt sure that some roads would prefer to have a separate accounting department.

Your committee has given this question further consideration and reports as follows: (The following is an extract from the report of the Committee on General Accounts, Railway Accounting Officers' Association.)

3. *Accounting for Materials and Supplies.*—The chief accounting officer shall have general supervision and prescribe the accounting for all material.

4. The officer in whose account the value of the material is carried shall keep such accounts and records, and render such reports to the audit office as prescribed by the accounting department.

The following is an extract from the report of the Committee on Material Accounts, made at 1920 annual meeting of Division VI. A. E. A.

"The present organization it follows that in addition to the movements recorded by the ordering and physical handling of such materials it is necessary within the province of this organization, now known as the stores department, also to supervise and direct

the accounting for material as it affects its distribution under the direction of the auditor."

1. Your committee finds, therefore, that its report is in accord with the recommendations of the Railway Accounting Officer's Association.

2. The stores department should handle the primary accounting as a matter of convenience, economy and efficiency.

3. Where the department using material is billed by the stores department and afterwards charged to primary accounts, it makes a duplication of effort and often results in not charging out material in the month's account in which used.

4. There is some merit in having a special department do all the accounting, but this is much more than offset by more accurate results with reduced cost when having the work done by the stores department with its detailed knowledge of material and its value.

It is therefore recommended by your committee that no change be made in the report as originally submitted and approved at our 1920 annual meeting.

Mechanical Devices Used in Stores Accounting

Your committee has made investigation as to mechanical devices in use on a great many railroads and finds that practically all are equipped with such devices as comptometers, adding machines, typewriters, calculating and listing machines.

In addition, we have found that several railroads are using an electric tabulating machine.

While these machines have been in use for a number of years in the commercial world and are now in use on numerous railroads in the freight accounting department, they were not adapted to stores department material accounting until 1919. The results obtained since that time justify the use of these machines, due to their accuracy and economy, and they are, therefore, recommended by your committee.

Inasmuch as the system followed in the use of the tabulating machine is a radical departure from the conventional methods in stores accounting, a detailed explanation of the forms and mechanical units of these tabulators is deemed advisable.

Either a blank or a dual card may be used. The dual card, Exhibit A, is preferable, as it entirely replaces the ordinary shop foreman's material requisitions.

The blank card can be used if desired, and by its use the information shown on the shop foreman's ticket is transferred by punching to a separate card.

The dual card is used by the shop foreman in the same manner as the ordinary shop material requisition. The card is then priced and extended by comptometer operator in the usual manner, and is later punched out by a machine, known as the key punch, to indicate the same information in a mechanical way.

There is practically no limit to the number of different punchings that can be made on one card in a single operation, the location of the punchings governing the mechanical action of the machines. The only restriction in the use of these cards is that they must be of uniform size, 3 1/2 in. by 7 3/8 in.

The key punch is operated similarly to the typewriter, with

accounting situation, including material issues, invoices, vouchers, shop orders and freight charges.

Pay-roll information and analysis can also be handled on these machines.

There is practically no limit to the detailed information which can be secured mechanically through the use of these machines, either daily, weekly or monthly, providing proper provision is made on the cards originally. Their use eliminates the possibility of mistakes due to their mechanical accuracy.

Another important feature in favor of their use is the saving, which can be effected under the old style hand system. On a railroad where monthly detailed accounting averages \$500,000.00, a saving of 15 percent in clerical work has been effected over and above the costs of operating the machines.

The greater the volume of the accounting, the more pronounced is the saving.

No special training is required for operation of the machines, outside of a few days' instructions. Speed in punching, of course, is acquired by practice.

There are bookkeeping machines that can be used where the volume of work will justify their expense. The individual railroad of necessity must work out the information as to the advisability of their purchase.

Comparison of Stocks

This committee recommends that some uniform method of comparing stock balance of the various railroads be adopted, and offers the suggestion that such comparisons be on the basis of the

Discussion

H. H. Loughton (Southern): The report as it is presented is very complete with the exception that there has been left out that portion which relates to Fuel Accounting. I find that at the 14th Annual Convention of the International Railway & Fuel Association, which was held in Chicago on May 22 to 25 inclusive, the committee report on fuel accounting, as shown in page 1288, Volume 72, No. 22, of the *Railway Age*, has adopted the recommendation of the Purchases and Stores Division of the American Railway Association on Fuel Accounting. It seems that they have adopted something that we have never adopted, therefore, I suggest that the committee be instructed to submit a report on this subject.

Not only is this Fuel Association looking to us for

recommendations, but the Association of American Railway Accounting Officers is desirous of the same thing.

W. F. Jones (N. Y. C.): This committee is not to determine who is to do the accounting so much as to determine the method of accounting. We have been trying for many years to get a distinct method of accounting for educational purposes, whether we adopt it or not. Therefore, it would be well to appoint a special committee to consider and report here next year on Fuel Accounting alone, keeping it separate from all Material and Stock questions.

It was moved and seconded that the report of the committee be adopted and that the subject be continued and that a special committee be appointed to consider fuel accounting.

Inventory—Special Subject

Preparation for the taking of inventory and the instruction of employees concerned with the work are concisely described in a special report. The methods employed on one railroad serve as a basis for recommendations for carrying on inventory work in a logical manner.

Office records and listing of materials in transit are provided for; the form of requisitions, stock transfers, invoice records, store orders, price books, etc., are outlined. Listing of new and reclaimed stock; material stripped from equipment and many other items heretofore too difficult to handle in inventories are definitely classified and records provided for.

Methods of recording weights, prices, and accounting are outlined and the accurate tabulation of material values is made possible through a system of computation which provides for price changes.

The recommendation includes listing and classifying of track materials and provides for the utilization of the regular employees at outlying points to handle the inventory of isolated stocks. The report also comments on the inadequate provisions made for inventory in past years and indicates wherein modern methods of accounting may be made to increase the efficiency of the stores department.

ON MANY RAILROADS the taking of inventory is now reduced to a system where it is easily taken care of at each point with the regular Store Department forces.

Preparation for the inventory is the governing factor and a proper inventory can be made only by proper preparation. A good inventory must begin weeks in advance a definite system for preparation must be made and definite instructions sent to all officials and all employees; all must be familiar with the instructions. For our guidance we used the following instructions:

GENERAL

1. *Instructions.* Every member of the Store Department organization must be familiar with these rules.

2. *Date of Inventory.*—Inventory will be taken on dates specified by the General Storekeeper.

3. *Object of Inventory.*—In accordance with instructions issued by the Interstate Commerce Commission, an inventory will be taken of all material and supplies in store stock on the railroad as of midnight of date specified. The taking of this inventory will not only give the Interstate Commerce Commission the total value of material in the railroad, but it will also be the basis of an adjustment of the book balance to the actual inventory. The inventory must be accurately taken.

4. *Scope and Jurisdiction.* The inventory of all materials and supplies, including commissary supplies, telegraph material and locomotive fuel will be under the jurisdiction of the General Storekeeper. Inventories of the Commissary Department, Telegraph Department and Fuel Department will be taken by members of these departments as directed by the Store Department.

5. *Help Required.* Necessary help for the proper taking of the inventory will be arranged for by the Storekeeper with the Superintendents or others interested.

6. *Inventory Forms.*—Inventory of all material, excepting track material, will be taken on Form 500. Track material on sections will be inventoried in memorandum books and will be transcribed to Form 500, as described hereinafter.

7. *Preparation for Inventory.*—Preparations for inventory must be started several weeks in advance of the actual taking of the inventory.

All scrap must be sold to the scrap dock. All usable material must be in storehouses or racks neatly piled in units.

Storekeepers must be thoroughly familiar with relation of all material to the stock balance; they must know the location of every piece of material on the division. Places to be given particular attention are, B. & B. tools cars, water service department, work shops, fire department material, racks, points where there are no store department representatives such as small roundhouses and car departments, carpenter shops, blacksmith shops and B. & B. material yards, also bridges, culverts, depots and other buildings and places where material is distributed to be charged out when used, including emergency stocks.

8. *Material with Outside Companies.*—Material purchased and paid for and charged to the stock of material of some division which is being held at the plant of some outside company or manufacturer, shall be included in the inventory of the division to which it stands charged.

If such material has not been charged to stock of material it shall not be inventoried. The value of such material is carried in suspense account by the Auditor of Expenditure, and the General Storekeeper will arrange for necessary record for inventory purposes.

9. *Rejected Material.*—Separate lists on Form 500 will be made of all rejected material and each case will be handled on its merits.

10. *Consignment Stocks*.—Material on consignment will be listed on separate sheets and so marked. Proper care must be exercised to see that consignment is properly segregated and plainly marked. The inventory of consignment material is for record purposes only, its value will not be included in the inventory; the sheets on which such material is listed should not be priced, classified or extended.

11. *Shipping During Inventory*.—Shipments of material between stores should be discontinued one week before date of listing, being confined to shipment of materials necessary to fill emergency requirements only. Each store keeper should arrange with users of material in his territory to see that no material is shipped within three days prior to the actual taking of inventory, except in emergency cases.

12. *Counting and Weighing*.—Material that will cause delay in listing on day of inventory will be counted and weighed in advance. Each person in charge of the counting and weighing shall mark the result of the count on a slip of paper and securely fasten it to the material counted. Parties issuing or receiving any of this material must deduct from or add to the quantities shown on the count any material taken out or any material added. Two bins or shelves containing the same kind of material must be counted and marked separately. The Storekeeper and foreman should make test checks of all counts and weights, as they will be held responsible for accurate results.

13. *Scales*.—All scales must be balanced and put in good working order. Where it is impracticable to use scales, figured weights may be used on such items as bar iron, using Kent, Ryerson or Scully's table of weights.

14. *Inventory of Sections*.—Two weeks before actual listing, storekeepers will sectionalize by definite lines their stocks of materials by buildings, locations and sections, so that callers and listers may be assigned to definite territories of sufficient size to enable them to complete the inventory of each section in one day. Each section should be given a permanent number or letter.

15. *Callers and Listers*.—A list of callers and listers will be made up by the storekeeper and mailed to the general storekeeper, at least two weeks before date of inventory. Each team will be given a card on which space will be provided to show their names, the section they are assigned to, the time they start and the time they complete the work. The card will be filled out as called for and turned in with the inventory, to be used as a permanent record and guide for sectionalizing in future inventories.

OFFICE RECORD

16. *Office Records*.—All office records and correspondence relating to material affecting inventory must be up to date and in proper shape for reference.

17. *Requisition*.—All charge requisitions, credit requisitions, stock transfers and AFE requisitions covering issues or transfers of material filled prior to midnight of inventory date must be handled to be included in the month account prior to taking of inventory. Storekeepers will see that requisitions for all material used from emergency stock are prepared and accounted for in the month preceding the inventory.

18. *Stock Transfers*.—Form 1722 and 1722-A covering shipments of material made one week subsequent to inventory must be plainly marked on the face of same to show whether or not the material shown thereon has been taken into the inventory of the shipping storekeeper. Rubber stamps reading "Included in Inventory" and "Not Included in Inventory" have been provided for and must be used for this purpose. Storekeepers must review all Form 1722 received and any material shown thereon as having been shipped prior to date of inventory and not received by them, or material shipped subsequent to inventory not included in the inventory of the receiving storekeeper, shall be listed on separate sheets headed "Material in Transit." Care must be exercised to see that material which may be in transit between stores on any division is listed in the inventory.

19. *Invoice Record*.—Invoice records will be divided into live and dead files which should be carefully checked. Receiving sheets must be checked with the invoice records and receiving brought up to date. All material received for which invoices have not been taken into account of the month ending on the day on which the inventory is taken shall be listed direct from Invoice Record to Form 500 and on separate sheets. The amount of these items shall be treated as a deduction from the inventory. Invoices covering material not yet received shall be listed on separate sheets and treated as an addition to the inventory.

Shipments of purchased material on hand at destination pending unloading or in transit shall not be considered as received and therefore shall not be included in the inventory, but shall be taken into receipts of subsequent month on the basis of actual unloading date.

Consignment material which has been used and charged out, but for which stock of material has not yet been charged, shall be treated as purchase material for which invoice has not been taken into account. Such items shall be listed on separate sheets to be deducted from inventory. Particular attention is called to Locomotive Arch Brick, an important item which requires handling in accordance with the provisions of this paragraph.

20. *Store Orders*.—Store orders should be given special attention. All unfinished orders should be completed prior to the taking of the inventory, those which can not be completed should be cancelled as of the date the inventory is taken and new orders issued if necessary. Storekeepers will see that no material is delivered for use on store orders that will not be used up before the inventory is taken. Accountants will see that all completed or cancelled store orders are figured up and necessary charges made in the current month. Where it is not possible to cancel uncompleted store orders a list of charges to such store orders will be made on Form 500 by the accountant and furnished to the storekeeper to be treated by him as an addition to the inventory, it being understood that charges to store orders are carried in stock of material Class 34.

Labor which may have been charged to uncompleted store orders shall be included in such lists. Storekeepers will confer with accountants in regard to the handling of store orders to see that proper cut-off is made.

Partial deliveries to storekeepers of material manufactured on store orders will be reflected in the regular inventories and accountants must see that proper deductions for such deliveries are made from the lists of charges to uncompleted store orders which they submit to storekeepers.

21. *Price Books*.—Price Books must be kept up to date, showing source of price and all necessary information. New weighted average prices must be figured for all items on which weighted average prices are kept.

22. *Sold Bills*.—At all points where material is sold care should be taken to insure the inclusion in the previous month's account of all sale bills for material shipped prior to inventory.

23. *Scrap*.—Scrap which may be on hand but which has not been credited to the work from which released must be covered by credit requisition, Form 1728, and taken into the accounts of the month preceding the inventory before it is inventoried.

LISTING

24. *Store Stock*.—All store stock must be listed in the inventory. Store stock includes all unapplied material and supplies on the railroad, including commissary supplies, telegraph material and locomotive fuel. Such materials and supplies as are in use and such as have been charged to the proper account or AFE although not yet applied or in use are to be considered store stock and should be inventoried.

Air pumps, injectors, lubricators, engineers' brake valves and other appliances of this nature when not applied or assigned to equipment must be considered store stock. Repaired and needing repair triple valves will not be considered store stock.

25. *Equipment Material*.—Care must be taken not to list or include in the inventory, side rods, locomotive frames, appliances or parts of locomotives or cars, stationary boilers, motor cars, machinery, steam shovels, coal sheds, etc., removed from equipment temporarily while equipment is out of service and undergoing repairs.

26. *Following Material*.—The callers in taking inventory will follow the physical arrangement of the material, i. e., material in racks will be taken as each item is reached, starting at the top and going across, then dropping down one tier, etc., until the entire case is taken. Material piled on floor will be taken in rotation. In no case will the caller follow any alphabetical or numerical arrangement.

27. *Number Copies of Inventory*.—The inventory will be taken in duplicate; an original and one carbon will be made.

28. *Separate Sheets for Each Location*.—Separate sheets must be used for each separate location.

29. *Showing Information Called for*.—All information called for in the heading of each sheet, such as lister's sheet number, lister's name, caller's name, location, division, etc., must be shown.

30. *Erasures.*—Listers must not make erasures on inventory sheets. In case errors are made, lines should be drawn through the wrong items and correct listing done on the following lines.

31. *Numbering Sheets.*—Listers will number their sheets numerically beginning with No. 1 in the space provided. Upon completion of each sheet all unused lines should be diagonally ruled. The last sheet of each lister's inventory must be numbered and marked "Final" in large letters. In case listers move from one location to another they should not begin a new series of numbers, but should continue numbering with the next number following that given to the last sheet of the location that was finished. There should be only one "Final" sheet for each lister.

32. *Calling.*—The caller will call the name of the material first, then the size of pattern number and finally the quantity. The lister will repeat his call as given in each case to the caller.

33. *Checking Sheets.*—At the completion of the sheet the caller will examine the sheet to see that it has been properly filled out by the lister.

34. *Weights, etc.*—Each item shall be listed according to actual kind, weight and measurement at the time listing is done. In cases of large quantities of any kind of small castings, bar iron, etc., which require weighing, a sufficient number of each kind or pattern shall be weighed and the quantity and weight shall be shown on the inventory sheet in the column headed "Lot Weight." The number of pieces weighed shall be shown under the heading "Pieces" and the weight under the heading "Pounds." The total weight will be figured from the lot weighed. In the case of large castings or other material requiring weight, one piece only need be weighed of such kind or pattern and the weight shown on the inventory sheet in the pound column under the heading "Lot Weight." The total number of such pieces on hand shall be indicated in the column headed "Quantity or Number."

35. *Territory.*—In no case should a set of callers or listers go outside the territory assigned to them for taking inventory, without instructions.

36. *Separate Piles.*—When listing material of which there are several distinct bins or piles of one item, the quantity in each pile or bin must be listed separately.

37. *Ice.*—The inventory of stock of ice shall be made on the actual measurement, regardless of any book balance or report. The actual measurement of ice as to height, width and length shall be reduced to tons on a basis of 50 pounds per cubic foot of ice.

38. *Emergency Stocks.*—Actual inventory must be taken of all so-called "Emergency Stocks." In no case should inventory of such stock be made from book records.

39. *Signal Material.*—Stocks of Signal Material carried in maintainers' shanties must be listed in the inventory, as these materials are carried in store stock until reported by the maintainers as having been sold. Storekeepers should arrange with maintainers for them to take the necessary inventory.

40. *Legibility.*—The original inventory will not be rewritten and effort must be made to have it neat and legible. A No. 3 lead pencil should be used.

41. *Castings.*—In listing castings the terms "CI" shall be used for cast iron, "MI" for malleable iron and "CS" for cast steel.

42. *Kind of Material.*—Material will be listed as new, S. H. (second-hand) or Scrap.

43. *Needling-Repairs Material.*—Needling-repair material will be listed on separate sheets priced and classified as directed by the storekeeper.

44. *Side Notes.*—All computations and notes in connection with counting or listing must be made on the face of Form 500. In listing material where it is necessary for the caller to count and make computations as, so many high, so many wide and so many on top, listing shall be done as follows:

Bolts, Sq Hd, Machine $\frac{3}{8}$ by 18
18 wide by 12 high
10 on top

45. *Proper Description.*—In listing material sufficient description should be given to enable proper pricing and classifying, using a sufficient number of lines for this purpose.

46. *Locomotive Fuel.*—Locomotive Fuel will be inventoried by the Operating and Mechanical Department forces as directed by the Store Department. The fuel inventory shall include all compressed coal, fuel oil and wood for use in locomotives and shall be listed on separate sheets.

47. *Shop Fuel, Engine Sand, Acetylene, etc.*—Where acetylene,

oxygen, shop fuel, engine sand, etc., are charged out when received, they must not be included in inventory.

48. *Marking.*—White chalk will be used for marking material inventoried and where practical the marks should be made on the material itself. As each row or line of material is completed a white chalk mark (X) will be put on the floor where possible to do so to designate that such section has been taken. Care must be taken not to disfigure cases.

49. *Care of Forms.*—As fast as listing is completed, listers shall turn over to the storekeeper both original and duplicate copies of Form 500. When all sheets have been turned in they will be verified to see that each lister's sheets are complete. The storekeeper will then number consecutively in the upper right hand corner the original and duplicate of all sheets, beginning with No. 1 and numbering and marking the last sheet "Final."

PRICING, ACCOUNTING, ETC.

50. *Pricing.*—Pricing and classifying, wherever possible, will be done at the time of listing, where not possible as soon as inventory sheets are received and numbered by the storekeeper they will be priced and classified. Both sheets of the inventory will be priced. Stock prices will be applied to all items of new material. Weighted average prices will be used on items where weighted averages have been established, otherwise last prices will be used. Material inventoried as second-hand will be priced in accordance with existing instructions governing pricing of second-hand material. Prices for scrap will be provided by the general storekeeper.

51. *Extensions and Totals.*—For checking, the original copies will be separated from the duplicate and the extensions checked by different persons. As fast as sheets are priced they will be extended and totaled, and errors or differences corrected. The sheets will next be totaled according to buildings and locations, as for example, main storehouse, oil house, iron rack, lumber yard, casting platform, etc. Such subdivisions should be maintained from inventory to inventory for comparative purposes.

A recapitulation of all material showing the value in dollars and cents by classes, which shall include all additions and deductions account material on hand and not charged for, material charged for and not received, etc., shall then be made and furnished to the accountant and this will be the figure shown on the new stock report as representing the value of material on hand as of the date inventory was taken. Copies of this recapitulation shall be sent to the General Storekeeper and District Storekeeper.

52. *Requisitions Filled Before and After Inventory.*—All requisitions covering the issue or transfer of material not listed, which were filled during the week prior to actual listing of the material, shall be included in the accounts for the month prior thereto and shall be stamped or plainly marked "Before Inventory," and shall not be added to the inventory as listed by the Store Department.

Requisition covering material issued or transferred, filled subsequent to midnight of inventory date, but prior to the date that the actual listing is completed, the material not having been included in the inventory by the Store Department, shall be stamped or plainly marked "After Inventory" for the purpose of indicating it is included in the Inventory.

Such material shall be listed by the Storekeeper, including the prices and extensions as shown on the requisition and considered as an addition to the inventory.

Requisitions covering material issued or transferred, filled subsequent to night of inventory date, but after material has been listed on inventory sheets by the Store Department shall be stamped or plainly marked "After Inventory" for the purpose of indicating that the material covered by such requisitions has been properly included in the inventory, and no further accounting is necessary for such material with respect to the inventory.

53. *Rails and Ties.*—As all unapplied rails and ties will be included in the inventory by the Store Department, Division Accountants are instructed to exert special care to insure the inclusion in previous month's account of all rail and tie transactions.

TRACK MATERIAL

54. *Listing Track Material.*—Inventory of track material on sections will be taken in memorandum books of size convenient to handle. Material on each section must be listed separately, showing exact location, so inventory figures may be used to show quantities on hand in Section Foremen's material report books, Form 2574.

55. *Classification of material.*—Listing shall show complete description, the same as is necessary when ordering material. Blue prints and date showing necessary description should be referred to so that proper listing may be done. Rail should be listed separately as between new, usable and scrap, and the class of track (No. 1 MT, No. 2 MT, No. 1 ST or No. 2 ST), in which the usable rail should be used, classified in accordance with specifications covering classifying rail as issued by the Engineer of Maintenance of Way. The storekeeper or his representative must go over the division to take the track material inventory.

56. *Help.*—The Superintendent will furnish a motor car and instruct either the Roadmaster or an experienced track man to accompany the Storekeeper.

57. *Listing Direct.*—Track material inventory only may be listed in memo. book as described above. All other inventories must be listed direct on Form 500.

58. *Recapitulation.*—A transcription in duplicate of all material listed in memorandum book shall be made on Form 500, and shall be considered the original inventory. The memorandum book from which the transcription is made shall be filed as supporting the inventory.

59 and 60. *Special Recapitulation of Track Material.*—After listing has been completed a special recapitulation of track material shall be made as follows:

On Form 500-A. Covering all new rail, new angle bars and new patented joints.

On Form 500-B. Covering all usable rail, usable angle bars and usable patented joints.

On Form 500-C. Covering all scrap rail, scrap angle bars, scrap patented joints, scrap tie plates and scrap rail anchors.

On Form 500-D. Covering all new tie plates and new rail anchors.

On Form 500-E. Covering all usable tie plates and usable rail anchors.

The recapitulation shall be by Roadmasters Divisions, and shall be made in duplicate, the original shall be sent to the general storekeeper, and the carbon copy to the roadmaster, so that he may have information to make his form 46 reports of rail and track fastenings on hand with actual figures.

61. *Rail and Fastenings.*—Stock of rail and fastenings carried by storekeepers at points other than Savanna Rail Mill, Miles City Rail Yard and Tacoma Rail Yard will be included in the inventory of the roadmaster having jurisdiction over that territory.

The rail and fastenings at Savanna Rail Mill, Miles City Rail Yard and Tacoma Rail Yard now carried by the storekeeper will be inventoried separately from that of roadmasters and reported separately.

Track fastenings carried in storehouses will not be listed in Roadmasters inventories but will be listed by the storekeeper direct on Form 500 along with other material.

TIES

62. *Forms.*—The inventory of ties will be taken in the memorandum book along with other track material.

63. *Classification and Listing.*—Cross ties will be listed to show separately treated and untreated ties, each of which classes shall be subdivided as between kinds of woods, as white oak, red oak, hard maple, cedar, beech, fir, etc.

64. *Switch and Bridge Ties, Crossing Timbers and Head Blocks.*—Switch ties, crossing timbers and head blocks shall be listed in the same manner as cross ties, but shall in addition show the size, length, width, thickness of each tie, timber or block.

65. *Ties at Treating Plants.*—The inventory of ties at treating plants will be arranged for by the general storekeeper.

66. *Ties Produced on Division.*—On divisions which produce ties, care should be taken not to include in the inventory any ties which have not been inspected and accepted by the tie inspector.

67. *Ties in Transit.*—Ties in transit from one division to another or from one point on a division to another point on the same division shall be inventoried as provided for in Section 18 of these instructions.

68. *Ties Distributed Along the Right-of-Way.*—All ties distributed along the right-of-way ready to put into track must be included in the inventory.

FINAL

69. *Disposition of Inventory.*—The original inventory complete with recapitulation by classes shall be sent to the accountant. The duplicate will be retained by the storekeeper.

Paragraph 15 provided for the callers and listers. It is the practice to use all the clerks from the office, girls as well as the men, for the listers, using experienced help in the sections for the caller.

The line material should be taken thirty days in advance of the Store Department material. This enables the Store Department forces to go out on the line, property list and check all line material and then work the figures forward for that month and include them with the regular inventory.

A tag should be provided for each material item. This tag should show proper description, class, line and page in the stock book, and on the C. M. & St. P., we also show the price. The pricing and classifying are done at the same time as listing of the inventory. All work of listing, pricing, extending and drawing up summary by classes ready for the accountant to make adjustment should be done by the Storekeepers' forces.

The forces should be so organized that the inventory at the store point is listed in one day and the extending, summarizing, etc., should be closed up in one week. Listing of an inventory in one day, the extending and summarizing in one week is not only possible but very practicable. If work on the inventory is allowed to drag and is done intermittently, it interferes with the regular routine to such an extent that the inventory becomes a secondary consideration with consequent errors.

To have good inventories not only must proper preparation be made, proper rules and regulations given, but sectional stockmen must be educated as to the value of material in their charge, the value of proper accounting and their responsibility for the proper ordering, distributing and care of the millions of material dollars that come out of the treasuries of the railroad and for which storekeepers, assume the responsibility.

The report is signed by D. C. Curtis, General Storekeeper of the Chicago, Milwaukee and St. Paul.

(The report as read by D. C. Curtis was accepted as Recommended Practice.)

Report on Reclamation of Material

THIS SUBJECT is of vital importance, as past experiences have very clearly demonstrated that large savings can be effected by giving this work proper co-operation and attention, and we therefore reiterate and urge that this principle be followed out to fullest extent in our future activities.

We have given consideration to previous reports on this subject, all of which have covered the work thoroughly from various viewpoints, but it was realized that we should endeavor to submit something in the nature of constructive work that could be formed as a basis for future activities and decided, therefore, to recommend the following:

1. General Reclamation Plant Layout (Exhibit A).
2. Classified List of Material and Supplies to Be Reclaimed, Showing Operation and Facilities Necessary (Exhibit B).

3. General Suggestions Pertaining to Reclamation of Material and Supplies (Exhibit C).

4. Progress Made in Reclaiming Chipped Rail Ends, Frogs and Switches in Track.

5. Additional Forms (Exhibit D).

1. General Reclamation Plant Layout (Exhibit A)

The drawing submitted of a general reclamation plant layout is so arranged as to be sufficiently elastic to take care of the needs and requirements of the large, as well as the small, railroads. On this print is shown the general layout of the entire plant, including the following: Scrap yard, reclamation yard, trackage, paved driveways, machinery and appliances, buildings and structures, location of each department, class of work and function to be performed by each department, and proposed organization.

This year's report of the Committee on Reclamation is considerably more extensive than the one presented in 1920. The report is marked by commendable thoroughness in detail, making it valuable for reference on questions of standard practice.

Exhibit B shows a classified list of material to be reclaimed, together with the operations and equipment required, and the suggestion that Exhibit B be printed in pamphlet form for distribution to members of the association is a good one. Special attention is given to the reclamation of rails with chipped ends, frogs and switches in the track by building up with welding. This process saves not only rails, frogs and switches, but

also the labor involved in replacing them. Further investigation along this line should provide additional information on the relative advantages of gas and electric welding for this work, together with a comparison of costs and wearing qualities.

As indicated in the opening statement of the committee, reclamation is a subject of vital importance, presenting the possibility of great saving. There is also a possibility of serious loss, or at least failure to realize maximum savings, unless the railroads co-operate in comparing practices and checking the cost of reclamation work against continually varying labor and material costs.

The layout contemplates the handling of scrap by cranes equipped with magnets. The material to be reclaimed is to be handled in and out of plant by tractors.

2. Classified List of Material and Supplies to Be Reclaimed, Showing Operation and Facilities Necessary (Exhibit B)

There is also submitted a revised list showing operation and equipment required for various kinds of material and supplies, which has been arranged in classified order, as it is the belief of the committee that this arrangement will better suit the purpose than alphabetical arrangement of items.

be beneficial and should be placed in the hands of employees whose duty is to handle scrap.

We recommend this list be revised from time to time in the same manner as the list showing material to be reclaimed, and that this form a supplement to said reclamation list and that it be kept up to date and finally become a valuable source of information.

4. Progress Made in Reclaiming Rails with Chipped Ends, Frogs and Switches in Track

The committee has made a study of this line of reclamation and finds that several roads have made considerable progress. It is

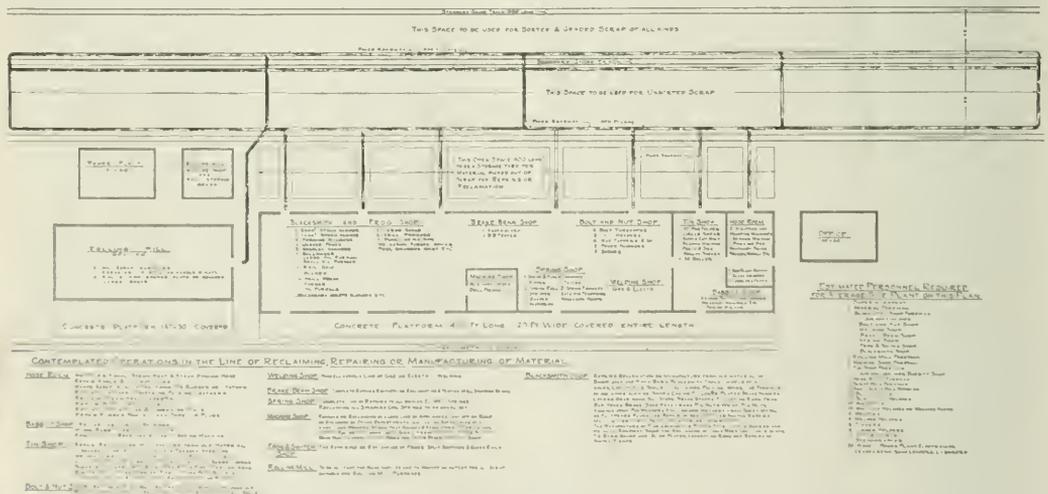

Exhibit A—Plan of General Reclamation Plant Predicated on the Use of Self-Propelling Magnet Cranes

While this list includes all items reported at the 1920 annual meeting of the division, there has also been added a number of new items.

In submitting the list referred to the committee has in mind that it will be revised from year to year as new ideas develop, so that it will be maintained at all times.

It is suggested that this list be printed in separate pamphlet form so members of the association can obtain as many copies as desired for distribution among their employees.

3. General Suggestions Pertaining to Reclamation of Material and Supplies (Exhibit C)

We have presented a statement showing general suggestions for reclamation work, which it is believed should

felt that this process of reclamation work is still in its infancy, but in view of what has so far been accomplished, the committee urgently recommends that it be further advocated, inasmuch as there are great possibilities of saving to the railroads.

It may be of interest to know that our investigations have determined an estimated saving of 72 per cent in the building up of a worn frog in track in lieu of replacing with a new frog; also a saving of 60 per cent in building up switch points in track.

Consideration should also be given to the labor consumed in replacing a worn-out frog with a new one or a set of switch points with new as well as the capital investment of stocks of new frogs and switches, which can be materially reduced by rigidly following the reclamation practices referred to.

The building up of chipped rails in track by means of weld-

ing is a reclamation feature of recent innovation and brings about substantial saving, which is self-evident when it is considered that if rails were not so reclaimed it would mean they would have to be taken out of track, replaced with similar kinds, either new or first-class second-hand, respacing of ties, building up the road bed, picking up of all rail from track and transporting this and the new rail to and from the job, as well as investment in large sums in new rail.

5. Additional Forms (Exhibit D)

Previous committees have covered this field quite thoroughly, and we therefore have but one form to recommend, entitled "Suggestions for Reclamation," copy of which is appended hereto.

The object of this form is to obtain suggestions, not alone from reclamation plant, but from various shops and other institutions and employees of the railroad, and in this manner have the widest field possible for the increase in reclamation work.

Another object of the form is to clearly demonstrate whether the process suggested is economical, which should at all times be definitely settled before adopting or following out any particular line of reclamation work.

This form also to be used in obtaining the approval of the head of the using department when desired, and when approved becomes a standard item of reclamation.

General Remarks

The subject of conservation of railroad material and supplies is featured more and more on various railroads and it is therefore expedient that this all-important subject be recognized by this

Exhibit B

RECLAMATION CLASSIFICATION and

RECOMMENDED PRACTICES IN CONNECTION WITH RECOVERY OR RECLAMATION OF VARIOUS ARTICLES, APPLIANCES, MATERIAL AND SUPPLIES.

Item No.	CLASSIFICATION AND DESCRIPTION	OPERATION	EQUIPMENT REQUIRED
Class 1-A			
1	Bars, head	Worn holes—upset or welding and refile.	Welding or smith shop equipment
2	Bars, tie	Worn holes—upset or welding and refile.	Welding or smith shop equipment
3	Clips, transit, for split switches	Can be made from old boiler plate. Also remove serviceable clips from scrap switch points.	Smith shop equipment
4	Cranks, switch stand	When bent, not cracked—straighten and put back into service.	Nothing special
5	Crossings, railroad	When battered or worn—build up in track by welding process.	Welding apparatus
6	Frogs, rail	Build up by welding process.	Welding equipment
7	Frogs, rail	Repair by utilizing second hand parts as far as possible.	Frog shop equipment
8	Plates, switch slide	When bent, heat and straighten. Swedge to standard height and redress on plates.	Smith shop equipment, etc.
9	Points, switch, worn	Build up by welding process and dress by emery grinder.	Welding equipment
10	Points, switch, worn	Build up by welding process and dress by emery grinder.	Welding equipment
11	Rails, guard	Can be made from second hand rail.	Frog shop equipment
12	Rods, connecting	Worn holes—upset or welding and refile.	Welding or smith shop equipment
13	Stand, switch	Make standard repairs.	No special equipment
14	Tables, switch stand	When cracked or broken—repair by welding process.	Welding equipment
Class 1-B			
1	Bars, angle	Worn holes—plug and drill new holes.	Smith shop equipment
2	Bars, angle	Straighten and reform.	Smith shop equipment
3	Bolts, track	If not too badly rusted, use circular steel wire brush to clean threads and dip in test smaller size and fit with standard U. S. thread nut.	Stand and circular steel wire brush
4	Bolts, track	If not too badly rusted, use circular steel wire brush to clean threads and dip in test smaller size and fit with standard U. S. thread nut.	Bolt cutter and threader nut
5	Joints, continuous	If cracked, or with uneven surface on top repair by welding process.	Welding apparatus
6	Joints, continuous	When worn on shoulder or top surface heat and reshape.	Furnace and dies
7	Plates, tie	If worn, wear on straighten.	Smith shop equipment
8	Plates, tie	Repair for other sections of rail.	Power punch and dies
9	Spikes, track	Straighten if not too badly cut under throat.	Quick acting power hammer
Class 1-C			
1	Bars, claw	Redress and straighten. Apply new ends if needed.	Furnace and power hammer
2	Bars, claw	Manufacture into lining bars.	Furnace and power hammer
3	Bars, lining	Redress and straighten.	Furnace and power hammer

lamation work; in other words, the committee desires to amplify the importance of thoroughly advertising the subject of conservation and reclamation.

The report is signed by O. Nelson (Chairman), Union Pacific, Omaha, Neb.; Wm. Davidson, Illinois Central, Chicago, Ill.; R. J. Elliott, Northern Pacific, St. Paul, Minn.; W. J. Diehl, Mobile & Ohio, St. Louis, Mo.; R. C. Harris, Pennsylvania System (Central Region), Pittsburgh, Pa.; B. W. Griffith, New York Central,

4	Bars, tapping	Redress and straighten. Apply new ends if needed.	Furnace and power hammer
5	Bits, round shank track drill	Flatten far use with Rich Spindie and Chuck.	Nothing special
6	Bits, flat track drill	Can be made to advantage from old files.	Smith shop equipment
7	Chisels, track	Change from convex to concave obtaining necessary length for repairs.	Smith shop equipment
8	Chisels, track	Redress and straighten.	Smith shop equipment
9	Cutters, weed	Manufacture from old track shovel blades.	Nothing special
10	Cylinders, motor car	When over-size, scored or worn, bore out and bush.	Machine shop
11	Drills, track	Repair using old serviceable parts cut down to smaller lengths and use for tool handling.	Nothing special
12	Hulls, old wood	Repair using old serviceable parts cut down to smaller lengths and use for tool handling.	Nothing special
13	Jacks, track	Repair, using old parts as far as practicable.	Nothing special
14	Picks, all kinds	Refile. Apply new ends made from scrap tire steel.	Smith shop equipment
15	Punches, track	Can be made from short spike tools.	Nothing special
16	Plugs, spark	Refile by using second hand parts "as is possible."	Nothing special
17	Shafts, motor car crank	When worn, turn and bush.	Small lathe or Marriott Machine
18	Shovels and scoops	Utilize serviceable blades on scrap handles or vice-versa.	Machinery's vice, hammers chisels, punches, etc.
19	Shovels and scoops	Cracked in blade or split in strap on shank can be welded.	Welding apparatus
20	Tools, various, such as nail pullers, bars, etc.	Manufacture from scrap coil springs.	Nothing special
21	Wheels, pressed steel motor, hand or push car	Build up worn flange or worn tread by welding process.	Welding apparatus
22	Wrenches, track	Jaws redressed.	Small furnace and power hammer
Class 2-A			
1	Cases, battery carrying	Remove serviceable parts before placing in the scrap.	Nothing special
2	Elevators, battery	Remove serviceable parts before placing in the scrap.	Nothing special
3	Poles, metallic signal	Cut down and use for bell posts, rick posts, etc.	Nothing special
4	Roundels, colored	Broken or unbroken have a market value.	Nothing special
5	Straps, fibre side	Manufacture from second hand slide plates.	Hand saw and drill
6	Wire, copper insulated	Subject to slight heat only, in removing insulation.	Nothing special
Class 2-B			
1	Cells, standard 2 1/2 x 6	Strip and utilize zinc, carbon, sealing wax.	Stripping machine
Class 3			
1	Bases, smoke jacket	Manufacture from old metallic roofing.	Tin shop
2	Fishing, gutter	Manufacture from old metallic roofing.	Tin shop
3	Sacks, cement	Clean in revolving rattler made of second hand lumber and poultry netting, or other home-made device.	Power driven rattler

(West) Collinwood, Ohio; K. R. Stewart, Atchison, Topeka & Santa Fe, San Bernardino, Calif.; E. A. Workman, Baltimore & Ohio, Baltimore, Md., and W. A. Summerhays (Chairman Ex-Officio), Illinois Central, Chicago, Ill.

EXHIBIT C

GENERAL SUGGESTIONS IN CONNECTION WITH RECOVERY, REPAIRS OR RECLAMATION OF VARIOUS MATERIALS AND SUPPLIES

CLASS 1-A

1. Tie bars, head bars, connecting rods and similar parts should not be disposed of as scrap unless they are beyond repairs or beyond upsetting or welding and grilling.
2. Care should be used in disposing of any frogs or split switches in the scrap. In case of doubt, hold up the article, awaiting further inspection.
3. Old type switch stands need not necessarily be scrapped. They can be repaired by using parts of other stands and used in back tracks.
4. Switch stand cranks which are bent but not cracked can be straightened and put back into service.
5. Cracked or broken switch stand tables can be safely Oxwelded and used in repairs to switch stand for back track service.
6. Scrap frogs should not be cut apart by track men or others merely to facilitate loading.
7. Railroad crossings can be built up in track or Oxweld process with obvious saving.
8. Trans clips for split switches can be manufactured if desired out of old boiler plate.
9. Switch stands on other parts of same should not get away in the scrap.
10. Gauge plates, slide plates, and similar switch parts can be repaired by one process or another and put back into service.
11. Split switch points, worn or broken, can safely be built up by welding process and put back into service.

CLASS 1-B

1. Old track bolts larger than 1 1/2 inch can be cut down to smaller diameter and used with standard machine bolt nuts, also can be upset and rethreaded.
2. Old continuous joints should not be disposed of as scrap unless they are cracked or broken or worn to thin edge on the base.
3. Slow moving tie plates can be replanched to other sections and gotten into service.
4. Track spikes not excessively throat worn can be strengthened and reissued.

Association, and in view of its close relation to reclamation work we recommend that future committees on Subject III, Section VI, A. R. A., be also entrusted with this subject and that the heading of the subject be revised to read "Conservation and Reclamation."

We further wish to reiterate what has already been recommended to this Division in past years; namely, the essential necessity of all employees on railroads co-operating to the fullest extent so as to bring about the best and most complete results in rec-

- 5. Tie plates should not be scrapped unless they are cracked or broken or worn to knife edge.
- 6. Old continuous joints with uneven top surface caused by low joint action can be reshaped.

CLASS 1-C

- 1. Old wooden handles can be cut down to smaller lengths and used economically for tool handles.
- 2. Shovels or scoops with slight cracks in blade or slight splits in strap or shank can be welded. "P" shovels and scoops should not be put through the fire in order to burn the wood, as it destroys the temper in the steel.
- 3. Malleable "D" grips or serviceable wooden handles should be properly taken care of.
- 4. Satisfactory flat track drill bits can be manufactured from old files.
- 5. The contour on track chisels can be changed from convex to concave and thus obtain additional length in repairs.
- 6. A satisfactory weed cutter can be made from short track shovel blades.
- 7. Track racks can be repaired in many ways, lost motion in the standard being taken up by inserting a plate of iron or steel, or by building up by oxweld.
- 8. Track punches can be manufactured out of short spike mauls.
- 9. Round shank track drill bits can be flattened so as to fit Rich spindle and chuck.
- 10. A number of roadway tools such as nail pullers, bars, etc., can be made from scrap coil springs.
- 11. Pressed steel motor car, hand car or push car wheels should never get in the scrap unless absolutely worn, broken or beyond repairs. There are different methods of reclaiming these.

- 5. Insulated scrap copper wire should be subjected to only slight heat to remove the insulation.

CLASS 2-B

- 1. Standard dry cells, 2 1/2 by 6, can easily be stripped and the zinc, carbons and sealing wax utilized in proper way.
- 2. Old wire, in addition to being used for stripping open cars, is also valuable for tying up material of various kinds for shipment.

CLASS 3

- 1. The question of cast iron pipe in dead water lines should be periodically looked into.
- 2. The matter of using surplus cast iron elbows for culvert work is open to debate.
- 3. The matter of finding use for sludge from water softeners is open for comment.
- 4. Empty sacks of every description should be properly taken care of, as they have a return value.
- 5. Smoke jack boxes, flashing, guttering, down spout, etc., should be manufactured from old material so far as practicable.
- 6. A cement rattler for cleaning cement sacks can be fitted up at nominal expense.
- 7. Old burlap sacks have a value and should not be thrown on the dump.

CLASS 12

- 1. No unbroken coil or elliptic springs should be thrown away in the scrap without the most rigid inspection.
- 2. "S" wrenches can be manufactured from broken leaves of elliptic springs.
- 3. Coil springs can be retempered and brought up to standard set.
- 4. Nail pullers, chisels and similar tools can be manufactured from scrap coil springs.
- 5. Packing books and irons can be manufactured from brake cylinder springs.

CLASS 13

- 1. All flues turned over as scrap should be properly passed on by M. P. & C. Department. No flues should be disposed of as scrap unless the scale has been removed, indicating proper inspection.
- 2. Snow fence stakes can be made from scrap flues.
- 3. Scrap superheater flues should be kept separate from other flues, as they bring higher price.
- 4. Fence posts can be made from old locomotive flues.

CLASS 14

- 1. Scrap zinc can be used for acid cutting purposes in preference to new zinc.

ITEM No.	CLASSIFICATION AND DESCRIPTION	OPERATION	EQUIPMENT REQUIRED
Class 4			
1	Butts, pile	If long enough, split and use for stock yard or fence posts	Nothing special
2	Butts, pile	Resaw and use for box culverts	Circular saw
3	Signs, metallic roadway	Manufacture from old material	Smith and tin shop
4	Timber, old bridges	Resaw to make standard size lumber	Circular saw
Class 5-A			
1	Tire, switch, oak	Saw up to take care of temporary shortage of car and locomotive oak	Mill equipment
Class 6			
1	Bridges, iron	Such as held for use. Paint periodically and mark date thereon	Nothing special
3	Turntable parts, rollers and bearings	If worn out of round, bore and bush	Nothing special
Class 8			
1	Rails	Battered ends. Saw off and redrill	Rail mill
2	Rails	Clipped ends. Build up in track by welding	Welding equipment
Class 9-A			
1	Scales	When broken or in bad order repair and put back into service	Scale shop equipment
2	Tanks, air or gas	When out fit for original purpose use for storage of liquids by necessary alterations	
Class 9-B			
1	Coal chute or coal conveyor parts	Repair and put back into service	Machine or smith shop equipment
Class 11			
1	Bolt ends with nuts	Remove nuts for rewrapping	Bolt and nut shop equipment
2	Bolts, large diameter	Where long lengths are needed, weld two bolts together to make necessary length	Smith shop equipment
3	Bolts, car	Sort to size, straighten and re-thread	Power hammer, shear and bolt threads
4	Bolts, engine	Cut down large size to smaller, either in length or diameter	Machine and bolt shop equipment
5	Bolts, stay	Rattle and hammer into slab and use for locomotive forgings	Rattler and power hammer
6	Nuts	Sort to size, strap and place in stock	Sorting table, rattler and nut tapper
7	Washers	Sort to size and clean in rattler. Can be made from old sheet metal or from scrap flues flattened	Rattler and sorting table Washer punch
Class 12			
1	Spring, elliptic	"S" wrenches can be made from broken leaves	Smith shop equipment
2	Spring, coil	Rebagger and bring up to original set	Spring shop equipment
3	Spring, coil	Manufacture nail pullers, chisels and similar tools	Smith shop equipment
4	Spring, brake cylinder	Manufacture packing books and irons	Smith shop equipment

12 It is not proper to Oxweld sledges or similar tools subject to strenuous service.

13 In cutting rivets from track chisels, a cold chisel seems to be preferable to using hot rivets.

14 Old saw bars beyond repairs as such can be manufactured into iron rods.

15 The end track chisels should be dipped in the blade in black paint before being put out on the line.

16 Malleable iron shank chisels which are worn can be turned, bushed and made more serviceable than before.

17 The process of boring out motor car cylinders and applying a lining is not a permanent or indefinite.

18 Any motor which can be economically repaired and use found for it should be repaired, should so be handled.

CLASS 2 A

- 1. Scrap wire can be manufactured from second hand fiber sole plates.
- 2. Old metallic signal poles can be cut down and used for hell posts, relay posts, etc.
- 3. Old battery elevators or carrying cases should not be disposed of without re-using scrap metal parts.
- 4. Broken or colored roundfiles have a value and should not be thrown away on the dump.

ITEM No.	CLASSIFICATION AND DESCRIPTION	OPERATION	EQUIPMENT REQUIRED
Class 13			
1	Flues, scrap	Manufacture sign posts	Smith shop equipment
2	Flues, scrap	Manufacture snow fence stakes	Smith shop equipment
3	Flues, scrap	Cut to suitable length and use for fence posts	Usual shop equipment

CLASS 14

ITEM No.	CLASSIFICATION AND DESCRIPTION	OPERATION	EQUIPMENT REQUIRED
Class 14			
1	Babbitt	Manufacture from various metals accumulating in scrap yard or reclamation plant	Babbitt shop equipment
2	Ferrous, copper	Remove from scrap flues	Nothing special
4	Zinc, scrap	Use for acid cutting in preference to new	

CLASS 15

ITEM No.	CLASSIFICATION AND DESCRIPTION	OPERATION	EQUIPMENT REQUIRED
Class 15			
1	Cable, second hand steel	Splice and make into switch ropes	Nothing special
2	Iron, round	Short pieces of new iron accumulating at shear can be made into bolts	Bolt shop equipment

CLASS 16

ITEM No.	CLASSIFICATION AND DESCRIPTION	OPERATION	EQUIPMENT REQUIRED
Class 16			
1	Iron, welding	Use scrap or second hand in preference to new welding iron	Welding apparatus
2	Steel sheets, second hand	From coal chutes and similar places. Use in manufacture of ash pans, steel car work, etc.	Regular shop equipment

CLASS 17

ITEM No.	CLASSIFICATION AND DESCRIPTION	OPERATION	EQUIPMENT REQUIRED
Class 17			
1	Axles, car	Manufacture into knuckle joint pins, wrist pins, etc.	Smith shop equipment
2	Axles, locomotive driving	Manufacture into locomotive crank pins, piston rods and similar forgings	Smith and machine shop equipment
3	Pins, worn draw bar	Use for driver brake pins, trailer equalizers and spring hanger pins	Smith and machine shop equipment
4	Rods, locomotive piston	Hammer out and use for brake levers and similar forgings	Smith and machine shop equipment
		Manufacture into pins of various kinds	

CLASS 18

ITEM No.	CLASSIFICATION AND DESCRIPTION	OPERATION	EQUIPMENT REQUIRED
Class 18			
1	Beams, brake	Repair all standard beams using second hand parts so far as practicable	Brake beam shop
3	Hammers, track-side	Repair by welding grooves when permissible under A. S. C. rules	Welding apparatus
3	Forgings, car	Manufacture large variety out of second hand or scrap material	Smith shop equipment
4	Keys, brake shoe	Manufacture from over accumulation of short length machine bolts	Brading hammers
5	Levers, brake	Straighten and return to service, welding or reworking bolts and re-drilling	Smith shop equipment
6	Members, running beam	Repair by welding process or straightening	Welding and smith shop equipment
7	Pins, old axle	Can be used for making hand chisels	Smith shop equipment
8	Flues, broken car-wheel, copper and knuckle	Splice if practicable	Smith shop equipment

- 2 Brass foundry cleanups should be carefully watched and under no circumstances thrown on the dump.
- 3 Copper ferrules should be removed from scrap flues before being turned over to the State Department.
- 4 A satisfactory babbitt can be manufactured from various metals accumulated in scrap yards or reclamation plants.
- 5 Aluminum letters or figures should not be permitted to get away in the scrap, but used for local consumption.

CLASS 15

- High speed chips, borings, etc., should be properly taken care of, as this scrap brings high prices.
- New galvanized iron should not be used where old metallic car roofing will answer as well.
- Short pieces of rounds accumulated at shear or elsewhere should be periodically cleaned up and made into bolts.

CLASS 16

- Secondhand sheets from coal chutes and similar places can be used in manufacture of ash pans, steel car work, etc.
- Old material should be used as far as possible for rough welding work in preference to new welding iron or new rods.

CLASS 17

- Old axles or piston rods can be manufactured into crank pins, knuckle joint pins, wrist pins, etc.
- Old locomotive driving axles can be manufactured into locomotive piston rods and similar forgings.

- Complete trucks should not be permitted to accumulate. They should be dismantled and component parts utilized when no other use can be found for them.

- Keys, brake shoe, can be manufactured to advantage from over accumulation of short length machine bolts, with the use of the hammer.

CLASS 19

- Locomotive brake shoes, either new or secondhand, with broken end lugs, should not be picked out of the scrap.
- Standard dope cup plugs should be kept out of the scrap. Those picked up by supply train should not be placed in the scrap car.
- Solid piston heads can be reclaimed by building up with bronze.
- Steel crank pin collars with worn threads can be turned down, built up again and threads turned to original size.
- Pressed steel cylinder head casings, valves, head casings, cylinder heads and stem parts as are sometimes lost on road to be picked up by supply train should be kept out of the scrap.
- Serviceable or repairable parts of driving box lubricators should be kept out of the scrap.

CLASS 20

- Scrap accumulation should be carefully watched for serviceable oil boxes.
- The matter of overwelding oil boxes or pedestals should be carefully watched, as the works is liable to be done at a considerable loss.
- Thick car brake shoes with steel backs with broken eyes should be kept out of the scrap with the view of welding on eyes.
- Thimbles or packing blocks should be promptly removed from broken yokes and placed in stock.
- See Class 50 for tentative definition for serviceable car or locomotive brake shoes.
- Couplers or knuckles can not be overwelded for cracks or fractures, but no standard articles should be scrapped on account of being worn.
- Broken knuckle pins, 1 1/2 inch and 1 3/4 inch, not shorter than 5 1/2 inches, can be used for spring hanger pins.
- Steel knuckle pins can be used in the manufacture of chisels.
- The question of increasing size of shank and butt on couplers by welding on plates or pieces of iron is for comment.
- Coupler parts other than knuckles should be picked out of the scrap with the idea of welding worn parts.
- Iron knuckle pins, 1 1/4 inch, 1 3/8 inch, 1 1/2 inch, 1 5/8 inch, can be manufactured from old rods or bolts.

ITEM NO.	CLASSIFICATION AND DESCRIPTION	OPERATION	EQUIPMENT REQUIRED
Class 18 -Continued-			
10	Rods, brake, with serviceable jaws	Weld on rods	Smith shop equipment
11	Rod, bottom connection	Straighten if bent	Smith shop equipment
12	Steps, sill	Can be manufactured out of round iron in preference to flat if surplus round iron on hand	Smith shop equipment
13	Trucks, complete	Dismantle and utilize component parts when can be used for no other purpose	Nothing special
Class 19			
1	Casing, crank pin head	When bent, straighten	Smith shop equipment
2	Collars, crank pin	When threads are worn, turn down, build up by welding process and turn to original size	Welding and machine shop equipment
3	Heads, piston	Half sole with bronze mixture	Welding apparatus
Class 30			
1	Bases, oil or pedestal	When worn, build up by welding process if practicable	Welding apparatus
2	Couplers	Straighten bent shanks	Smith shop equipment
3	Couplers	Change size of butt by adding plates or slabs	Welding apparatus
4	Coupler parts—other than knuckle	Build up worn parts by welding process	Welding apparatus
5	Knuckles, couplers	Build up worn surface by welding process	Welding apparatus
6	Lever, release rigging	If bent, straighten	Smith shop equipment
7	Pins, broken knuckle	If long enough, use for spring hanger pins	Smith shop equipment
8	Pins, carbon steel knuckle	Use in manufacture of chisels	Smith shop equipment
9	Roofing, old car	Reshape and use as roofs	Tin shop equipment
10	Roofing, brick car	Use for various buckets, oil cans, down spout, flashing, decking on bridges, building roofs and similar purposes	Tin shop equipment
11	Shoes, brake, with steel back	If of considerable thickness, save and weld on broken eye	Welding apparatus
Class 31			
1	Bearings, journal	Reline	Rabbit shop equipment
2	Bearings, journal	Slight boring in patent boring machine	Boring machine
3	Bells, locomotive	When cracked, repair by welding	Welding apparatus
Class 32			
1	Cocks, angle and cut-out	Repair and regind	Grinding machine and lathe
2	Gaskets, steam valve and brake cylinder	Reclaim	Wire brush, castor oil, fallow and beeswax, or similar process
3	Glasses, air pump lubricator	Clean and repolish	Vat and buffing wheel
4	Heads, air and steam piston	Turn down to smaller diameter	Machine shop equipment
Class 33			
1	Bases, sand hose strainer	Build up stripped threads by welding and re-thread	Welding apparatus
2	Caps, sand blast	Fill worn holes by welding process	Welding apparatus
3	Discs, bulleye lubricator or hanger	Clean and repolish	Vat and buffing wheel
4	Glasses, water gauge	Clean and regind	Vat and grinding machine
5	Stoker material	Reclaim or repair	Nothing special

- Locomotive piston rods should never be disposed of as scrap, as they can be used to advantage in the manufacturing of pins and similar items.
- Any practicable scheme for reclaiming knuckle joint pins is a subject for debate.
- Sufficient scrap knuckle joint pins should always be retained for the manufacture of smaller pins and avoid unnecessary labor in turning down axle or piston rod steel.
- Worn locomotive draw bar pins can be used for driver brake pins, trailer equalizer and spring hanger pins; can also be hammered out and used in the manufacture of brake levers and similar forgings.

CLASS 18

- Care should be used before scrapping any brake levers if they can be repunched to standard size.
- Sill steps can be manufactured out of round iron if desired, to use up old material in preference to new flat iron.
- Brake rods with serviceable jaws should not get away in the scrap.
- Brake staffs of standard dimensions should not be disposed of as scrap.
- Broken draw bar yokes with thimbles attached should not get away in the scrap until the thimbles have been removed.
- A large variety of car forgings in this class can be manufactured from scrap or secondhand material.
- Polsters, truck side frames and similar parts which can be properly welded should not be disposed of as scrap.
- The various M. C. B. brake means should be kept out of the scrap with the idea of repairing and putting back into service.
- Care should be used to not scrap any serviceable carlines.
- Bottom connection rods should not be scrapped unless broken, as these can be straightened.
- Running board members should not be scrapped unless beyond welding or splicing.
- Passenger brake beams for repairs and serviceable or repairable parts should be kept out of the scrap.

ITEM NO.	CLASSIFICATION AND DESCRIPTION	OPERATION	EQUIPMENT REQUIRED
Class 34			
1	Canvas	Old pieces can be used for patching Carpets, old	Upholstering shop
2	Curtains, old vestibule	Use in manufacture of engine cushions and engine cushions	Upholstering shop
4	Hair, second hand	Clean and use over again in cushion seats, etc.	Nothing special
5	Linoleum, old	Use for patching	Nothing special
6	Moss, second hand	Clean and use over again in cushion seats, etc.	Nothing special
7	Flush, old	Use for patching	Upholstering shop
8	Springs, seat, old	Use in manufacture of cushions, seats, etc.	Nothing special
9	Strip, metallic weather	Purpose of asbestos material. Do not throw on the dump	Nothing special
10	Tail gates, passenger car	Repair	Nothing special
Class 35			
1	Bearings, ball	Electric headlight or train lighting	Done by manufacturer
2	Electric headlight paste	Regrind	Nothing special
Class 37			
1	Sacks, charcoal	Have a return value and should be reclaimed	
Class 38			
1	Brick, fire	When removed from stationary boilers, use for patching in blacksmith shop. Can also be used as fire clay.	
2	Crucibles, old	Have a market value. Save and report for sale.	
Class 39			
1	Axle, scrap	Upset and use for smaller size	Smith shop equipment
2	Axle, scrap	Turn down larger axles to smaller sizes	Lathe
3	Axle, worn outside collars	Build up by welding process	Welding apparatus
4	Axle, scrap	Work over and use in large variety of forgings, principal items being piston rods, crank pins, knuckle joint pins, follower plates, etc.	Smith shop equipment
5	Wheels, cast iron	Sid flat. Grind to standard dimensions	Wheel grinding machine
6	Wheels, rolled steel	Build up by electric weld	Electric welder
Class 30			
1	Doors, grain	Ordinary repairs	Nothing special
2	Siding, old car	Utilize for inside of engine houses or on home cars or in manufacture of temporary coal doors	Nothing special
Class 51			
1	Tools, cutting	Weld high speed steel on carbon steel for cutting edge	Smith shop equipment

- Lever for patent release rigging can be straightened and nothing but broken levers should remain in the scrap.
- Old metallic roofs should never be disposed of as scrap or thrown on the dump.
- Care should be used to recover all usable oil box lids and parts.
- Miscellaneous parts of friction draft gears easily find their way to the scrap dock, and should be recovered.

CLASS 21

- Many journal bearings arriving in scrap yards could go back into service by slight skinning on proper machine.
- Numbers of brass washout plugs can easily get into the iron scrap and should be watched.
- Cracked locomotive bells can easily be welded.

CLASS 25

1. Air power and leather gaskets not fit for reclamation should be kept at hand for their original value.
2. Tire valves and brake cylinder gaskets or leathers can be reclaimed by the use of castor oil, tallow and beeswax.
3. Any feasible scheme for reclaiming burnt air hose is open for comment.
4. Air and steam piston heads can be turned down to smaller diameters.
5. Small air pump piston rods made of high grade steel should be kept at hand for scrap.
6. Tire valves should always be removed from broken or scrap cylinders and reservoirs.

12. Old vestibule curtains should not be thrown in the scrap. They can be used in the manufacture of engine cushions and caboose curtains.
13. Couplings on Pintsch gas filling hose should not be scrapped with the hose.
14. Care should be used in scrapping any coach hardware. Parts of a broken article will often work in with another article requiring repairs.
15. Metallic bunks are always repairable and should not be scrapped for minor defects.
16. Any canvas fit for patching or for use in cushions should not be disposed as scrap.
17. Tin shades should be used on caboose lamps in preference to opal.

CLASS 25

1. Old style steam and water glass lamps should be changed over to electric instead of ordering electric lamps.
2. Ball bearings for electric headlights or train lighting should be taken care of with the idea that they can be reground.
3. Exchange arrangements should be enforced on incandescent lamps, and inspection made of lamps turned back in exchange.
4. Electric headlight parts should not be left in the scrap unless obviously useless; headlight shafts can be welded.

CLASS 27

1. Charcoal sacks have a return value and should be properly taken care of.

CLASS 28

1. Old crucibles should never be thrown on the dump, but kept with scrap accumulation and reported for sale in regular manner.
2. Standard fire brick removed from stationary boiler locomotives can be used for patching purposes in blacksmith shops and ground for use as fire clay.

Item No.	Classification and Description	Operation	Equipment Required
Class 36			
1	Base, smoke jack	Manufacture from old car roofing	Tin shop equipment.
2	Curfins, caboose	Renovate and reuse	Nothing special
3	Flare, signal	Renovate, oil on flange and reuse	Ordinary laundry
4	Glass, colored	Has a market value. Hold and report for sale	..
5	Goggles, safety	Repaired. Apply new parts needed	Nothing special
6	Lamps, various	Repaired	Tin shop equipment
7	Lanterns, hand	Repaired and re-stained	Tin shop equipment
8	Lenses, wind	Has a market value. Hold and report for sale	..
9	Replacers, car	If too low, build up by welding process to standard height	Welding apparatus
10	Tinware	Manufacture large variety from old metallic roofing. Tin and powder cans make good drop buckets	Tin shop equipment
Class 37			
1	Babbitt, from old reduced, waste packing	Burn old packing in order to reclaim babbitt	Nothing special
2	Compu-rod, driving journal	Clean by boiling. Add necessary ingredients and re-lap	Ordinary press
3	Compu-rod, driving journal	Clean by scraping or other process	Ordinary press
4	Oil, lubricating	Re-claim by filtering process	Necessary filters
5	Packing, journal box	Renovate and reuse	Steam heated tank, necessary filters, etc.
Class 43			
1	Fittings, pipe	Remove all serviceable fittings from old pipe, and protect with coat of oil	Vise, vat, etc.
2	Nipples, pipe	Cut from second hand pipe	Simple cutting machine
3	Flanges, air and joint	Pick out various parts and re-assemble	..
4	Valves, globe and angle	Repair	Nothing special
Class 45			
1	Checks, door	Repair by using parts of old checks	..
2	Files, over finish	Save for recutting	..
3	Hammers, engineers	Manufacture out of scrap locomotive tire steel	Smith shop equipment
4	Wrenches, alligator	Recut teeth and temper	Nothing special
5	Wrenches, screw	Repair by using old parts so far as practicable	Nothing special
Class 46			
1	Belling, old rubber or leather	Use in manufacture of gaskets	Punch and die
2	Boots, rubber	Repair	Cobbler outfit
3	Couplings, steam and dynamo	When worn, build up by welding process	Welding apparatus
4	Gaskets, air hose	Unless broken or chipped, repair and apply gasket to make original height	Nothing special
5	Gaskets, tank hose	Manufacture from scrap air brake hose	Punch and die
6	Hose, air, steam and signal	Strip and re-emit.	Stripping and re-emitting machine
7	Lagging, M & G boiler	Break or grind up, form into slabs or use to mortar shape	Grinding machine, forms, dry kiln, etc.

7. Scrap valve stems made of high grade steel, pointed and equipped with wooden handle, make a very good screw driver.
8. Very few articles of air brake material should finally land in the scrap. Parts of broken articles can always be utilized in repairs of others.
9. Parts of air valves fit for repairs of other gauges should never reach the scrap dock.
10. Air pump lubricator glasses not cracked, chipped or broken, can be washed and used over again.

CLASS 23

1. Dies from ball's eye lubricators or flange oilers, not badly chipped or cracked, should be picked out and re-sharpened.
2. Old water gauge glasses or discs can be reground.
3. Small light cases with small seal holes should be picked out of the scrap, as they can be easily welded.
4. Non-ferrous stoker material of any description should be disposed of for the scrap. Press absolutely beyond repairs or reclamation.

CLASS 4

1. Old scrap should not be disposed of as scrap. It can be used for bolts, patches, nuts and similar purposes.
2. Scrap should be used in wrapping any steam heat parts, as there is a saving in re-lamination and reaming of such items.
3. Old cast tanks not fit for use with gas should be held out for storage for use in the future.
4. Worn out parts should always be repaired and reissued.
5. Scrap should never be thrown on the dump.
6. Cast iron to be used in scrapping lighting material of any kind, as well as for repairs or reclamation of such parts.
7. Scrap and mill-iron in pieces large enough for patching should not be thrown on the dump.
8. Scrapable mass from castings should be saved for cleaning and re-issuing.
9. Cast iron rollers should not be thrown in the scrap.
10. Second and plush should never be sold as scrap, but can be used for other purposes.
11. Second hand coil seat springs should invariably be saved for use over again.
12. Old metal weather strap, if beyond use, should be disposed of as scrap and thrown on the dump.

Class 47			
1	Cans, empty carbide	Make various receptacles	Tin shop equipment
2	Kegs white lead, metal	Manufacture into paint buckets and similar containers	Tin shop equipment
3	Paint, old	Scrapping from barrels and other containers	Boiling vat
4	Glass, colored	Broken or unbroken, has a market value. Report for sale	..

CLASS 48

1	Paper, scrap	Baled and sold	Paper baler
---	--------------	----------------	-------------

CLASS 50

1	Forizes and turnings, brass	Remove parts of iron, steel or babbitt	Magnetic separator or screen
2	Firebox or boiler steel scrap	Use for running boards at stations	..
3	Iron, scrap, various	Use for large number of miscellaneous forgings	Smith shop equipment
4	Staybolts, old, lined	Retain, patle and clean, pile in turn and use for forgings of various kinds	Smith shop equipment

CLASS 29

1. Small car axles can be provided by utilizing large axles, either by upsetting or turning down.
2. Worn outside collar on car axle can be built up by welding.
3. Flat spots can be welded on rolled steel wheels and tires.

CLASS 30

1. Attention should be paid to cuttings, etc., from planing mills and other accumulations or short pieces of lumber.
2. Ordinarily car stakes should never be manufactured out of new material.
3. It is possible in many cases to use secondhand siding for inside roofing.
4. Grain doors fit for repairs and use with grain should be properly taken care of.

CLASS 31

1. It is a recognized practice to weld a small piece of high speed steel on carbon steel for various cutting tools.

CLASS 36

1. Smoke jack bases and similar parts should as a general proposition be manufactured out of old metal car roofing.
2. Scrap burlap fit for the use in grain cars should never be disposed of as scrap.
3. Exchange arrangement should be enforced on caboose curtains, as these can be renovated and used over again.
4. Old brooms turned like in exchange should not be burned or thrown on the dump. They can be issued for use on locomotives.
5. No tinware of any kind should get on the dump unless absolutely beyond repairs or reclaiming.
6. Exchange arrangement should be enforced on signal flags of all colors. Cotton flags can be renovated and used over again.
7. Welded ware can best be reclaimed by the old soldering process.
8. A large line of tinware can be manufactured from old car roofing.
9. No burners of any kind should be sold as scrap, as practically all can be reclaimed.
10. Cast steel replacers which are too low for standard rail can be built up by the oxwell process.
11. Cooler hose for hot boxes should be supplied from scrap hose reclaimed from welding equipment.
12. Fire hose couplings should invariably be cut from fire hose and not permitted to get in the scrap with the hose.
13. Colored lenses and colored glasses should never be thrown on the dump, as it has a scrap value whether broken or unbroken.
14. Old pressed steel working frogs should not be scrapped unless badly broken or distorted.
15. No lamps of any kind should be thrown on the dump or disposed of as scrap unless beyond repair. The serviceable parts should be removed.
16. Cab arm rest should not be thrown on the dump.
17. Large numbers of train indicator numbers are blown out and picked up on the right of way. These should be properly taken care of.
18. Wooden flag staffs fit for further use should not be improperly disposed of.
19. No hot box cooler parts which are fit for repairs of other coolers should get in the scrap.
20. Link washers, slash bars and clinker hooks should, if practicable, be repaired at local shops to save handling.

21. No serviceable switch chains or parts of same should get away in the scrap.
22. Effort should be made to recover as many paper car lines as practicable. Likewise such coverage paper as is not torn or soiled.
23. Old bottles and jugs have a value and should not be thrown on the dump.
24. Buckets and dope cans can be made from empty powder cans.
25. Old cushions should be preserved and sent back to the upholstering shop.

CLASS 37

1. Old oil shipping drums beyond repairs and not fit for water barrels can be used for trash burner by removing the head and cutting a draft door at the base.
2. The matter of local reclamation of old waste calls for constant attention on the part of all concerned.
3. Wrappings from waste bales can be used in grain cars.
4. Waste used for wiping should not be mixed with journal box waste.
5. Wiping waste although not reclaimable, should not be thrown on the dump. It can be taken care of and used for lighting fires.
6. Empty carboys should be carefully handled, as they have a return value.
7. Driving journal compound should not be thrown on the dump. It can be cleaned and reused.
8. Car oil sediment can in many cases be used in place of car oil.
9. Use of oil filters is an important proposition and should receive attention of all concerned.
10. The use of agitators in oil storage tanks is a subject for comment.

CLASS 43

1. Serviceable fittings should invariably be removed from scrap pipe.
2. Globe and angle valves should never get into the scrap, as they can be easily repaired.
3. Nipples should invariably be cut from old pipe.
4. Kewanee unions or similar unions or parts should not be scrapped until properly inspected, with the idea of reassembling and returning to stock.

CLASS 44

1. Wire reels have a return value and should be properly taken care of.
2. Carbon filament lamps should always be used where possible in places not requiring a higher priced lamp.

CLASS 45

1. No files fit for recutting should get in the scrap.
2. Steel knuckle pins should not be disposed of as scrap. They can be used in the manufacture of chisels.
3. Old files over six inches should not be saved for recutting.
4. Alligator wrenches, except when broken in the jaw, should be kept out of the scrap.
5. Engineers' hammers can be manufactured out of scrap tire steel. Door checks, unless absolutely beyond repairs, should not be put in the scrap. Parts of same fit for repairs of other checks should be retained.
7. Care should be used in scrapping latches or locks of any kind as quite often the lock or latch has parts which can be used in repairs of other articles.
8. Cellar keys should be kept out of the scrap.

CLASS 46

1. Steam hose gaskets, unless broken or badly chipped, can be refaced and by the application of a thin gasket can go back into service.
2. Worn steam and dynamo hose couplings can be built up by oxweld process.
3. Old asbestos removed from locomotives should never be thrown on the dump. It can be ground or broken up and used over again, either by forming into slabs or by using in mortar form.
4. Old rubber or leather belting and rubber cloth in pieces large enough for manufacture of gaskets should not be disposed of as scrap.
5. Scrap rubber gaskets of all kinds should be kept picked up for their scrap value.
6. Second-hand hose should invariably be used in place of new where there is no pressure involved.
7. No old rubber matting should be disposed of as scrap. It can be used on scale form.
8. Scrap rope can be used for tying up bundles, etc.
9. Tank hose gaskets can be manufactured from scrap air brake hose and the same machine used for punching rubber and leather gaskets.
10. Rubber boots should not be disposed of as scrap, as they can be reclaimed by cobblers' outfit.

CLASS 47

1. Paint buckets can be manufactured from old white lead containers.
2. Colored glass, broken or unbroken, has a value and should not be thrown away.
3. Soda ash sacks have a return value and should be properly taken care of.
4. At points where acetylene gas is manufactured the refuse can be used to advantage in painting around the plant where white is desired.

CLASS 50

1. Fire box or boiler steel suitable for running boards should not be sold as scrap.
2. Hoops from waste bales will grade as Light sheet No. 1.
3. Balbit from old waste should be properly taken care of by burning the waste and saving the metal.
4. Old rubber belting should not be disposed of as scrap, as it can be used in the manufacture of gaskets or for platforms on scales or runways of elevators.
5. Old style rubber fire hose should not be disposed of as scrap; it can be used in the manufacture of gaskets.
6. Brass foundry ashes have a value and should never be thrown on the dump.
7. No. 2 sheet scrap should be considered in connection with rip-rap purposes, particularly at times when this scrap is very low in price.
8. Destroyed steel cars should be disposed of without excessive cutting.
9. Do not scrap engine brake shoes unless the lug is broken or more than 50 per cent of the flangeway is worn off, for if the shoe is less than 1/2 inch thick in its thinnest part or if it is badly shelled out on the braking face or shows irregular wear, which would interfere with the hang on the wheel.
10. Balbit should never be sold in the open market.
11. Do not scrap any car brake shoes which are 3/8 inch or over in thinnest part, providing that the eye and the steel back are intact, that there are no cracks on the braking face running lengthwise on the shoe and no large shelled out on the braking face.
12. Lined iron such as staybolts, regardless of length, braces, sling stays and similar lined iron can be piled and hammered into billets for forging work.

13. Waste paper should be watched as to cost of bailing, etc., as it sometimes does not pay to expend much labor on this article.

Discussion

J. C. Kirk (C. R. I. & P.):—If all of the railroads would reclaim all the different items that the committee has listed, the subject of reclamation would be very well taken care of. The cost of these different items should be watched constantly and the material should be tested. Then we can be sure that we are not wasting money by reclaiming material which should be scrapped.

I would like to refer also to the subject of welding frogs without removing them from the tracks. Do you weld before they are worn out, or do you simply weld when they are worn only slightly?

O. Nelson (U. P.):—This is determined largely by the roadmaster and the district roadmaster. The work has been very gratifying; in fact, we have run across cases where the claim is made that a built-up frog stands up better than new ones. On some roads they are regular floating gangs which cover the various divisions all the year around.

Mr. McGilligan (S. P.):—The Maintenance of Way Department on the S. P. builds up frogs, tracks and switch points. Where the rail is being superseded and we supply our requirements by reclamation.

R. M. Blackburn (C. & N. W.):—On the North-western track welding is done by the maintenance of way forces. On this reclamation work, I should like to ask if you take credit for the savings effected.

O. Nelson (U. P.):—It is handled differently on different railroads. On the Union Pacific we do. The information I have from the Southern Pacific shows their average cost for building up switch points was \$5.15, and building up a 75-lb. frog, \$24.46. The figures reached on the various roads on this work, running from \$5 to \$8 on the switch joints and \$20 to \$25 on the frogs, will give some idea of costs and savings.

Enough care cannot be taken to see that all material reclaimed is absolutely in serviceable condition before it is used. In regard to the cost of reclaiming, we have recommended for adoption this blank, which should be carried out rigidly and studied very thoroughly as to whether you are saving or losing money.

Mr. Wilton (B. & O.):—We have built up frog and switch points only on branch lines, but at Martinsburg we also repair motor cars, switch lamps, and all that class of material.

O. Nelson (U. P.):—Built-up frogs are standing up well. When we first started some difficulty was experienced in getting the right sort of steel. After six months of experimenting the right temper was obtained, and since then our frogs have been standing up splendidly. We are not, however, building up frog and switch points on our high speed main line tracks; the practice is confined to our branch roads.

J. G. Stuart (C. B. & Q.):—The real value of these frogs and rails after they are repaired has not been emphasized duly. On the Burlington we have a unique position in our stores department, inasmuch as we have charge of the frog and switch points as well as the rail end of it.

Mr. Mack (C. B. & Q.):—We have tested built-up frogs against new frogs under similar traffic conditions, with the result that the properly repaired or properly welded frog stands up in service fully as well as a new frog. We are of the opinion that in the majority of cases it is more economical to repair the frog out of the track. Better work is obtained when it is not done under traffic conditions. We also believe that not only is the quality of the work better when a frog is repaired out of the track, as compared with work done while in

the track. There are also certain costs incident to making the repairs in the track that are saved by repairing out of the track. We do not attempt to bring all frogs into a certain central point; we have established track repair shops at certain strategic points on the line; at our larger terminals. So far as possible we make them one-man shops. The welder, with a simple overhead hoist, can unload a frog from a car and also lift it back. That avoids the expense of a gang of men going to the shop to load or unload a frog. It seems to me that the big thing about reclaiming track frogs is keeping the frog in serviceable shape and condition while it is in the track. If bolts are permitted to become loose or to remain loose while the frog is in service, or if broken bolts are not renewed, the filler of the frog soon eats out and it cannot be repaired or tightened again so that it will remain tight. A beginning should be made with track forces, to keep the tracks and the frogs in the tracks in the proper condition. The frogs should be repaired before the points are beaten down and demolished and the rails cut to pieces. If that is done, enough will be made on repair of tracks, to make a good return on the investment.

A. W. Munster (B. & M.)—Except as a matter of education and information, I do not see where the service of supply has anything to do with the repair of frogs and tracks.

H. H. Loughton (Southern)—Some years ago, when we adopted oxyacetylene welding, we sent our switches and frogs to two points on the road for repair. The work was satisfactory except for the switch points. We have been using reclaimed switches and frogs on branch lines and in terminals for 10 years. About three or four years ago the engineering department and the maintenance of way department analyzed their costs and our costs, and they convinced me that 75 per cent of this repairing could be done in the track, and money saved, so we assigned them an operator and a car equipped with all the necessary tools and facilities. Each division now has a helper and an operator, who in most cases, were taken from the store department or shop, the expense being carried by the above departments. Each superintendent feels satisfied greater economy is obtained by not sending the work to the stores department.

J. G. Stuart (C. B. & Q.)—The stores department should not be sent out on the line. We have been doing this work at our reclamation plants. As soon as the practice is really developed, I think it should be sent to the department concerned. We have the talent for developing, and after that the work belongs to the maintenance of way department.

A. A. Goodchild (C. P. R.)—One item which to me has been a rather important one is the matter of cast iron wheels. I have corresponded with three or four of our general storekeepers, and the amount of money involved seems to me well worthy of our consideration. We used about 75,000 wheels on the Canadian Pacific and an estimate was made that 10 per cent or 20 per cent of the wheels removed could be reground and put into service again. Can we not have a special committee on reclamation work. I believe the subject is well worth the work of a special committee acting in conjunction with the mechanical department. Some of the roads doing this work, include the Chesapeake & Ohio, the Northern Pacific, and the Southern Pacific. The amount of money involved, should command our attention.

O. Nelson (U. P.)—Several roads are making it a regular practice to reground wheels. It is simply a matter of opinion among the mechanical men as to the saving feature of doing the work. Those who have

been doing it claim that large savings have been effected and that a wheel is better after it has been reground. They even claim that the ground wheel is less liable to cause hot-box than a new wheel, as it is truer and runs more smoothly.

C. D. Young (Penna.)—Of all our material in stores, 25 per cent is reclaimed material. I am of the opinion that in reclaiming material better results will be obtained by having all reclamation work done in a shop which has the proper equipment to do the work, that is, in the regular manufacturing shop. The independent reclaiming shops are not generally as well equipped as the regular shops. Therefore, although the committee has offered an exhibit of what might be possible in the way of reclamation plants, I believe that better results and lower costs will be had if we center all our manufacturing at our manufacturing plants. It is the duty of the stores department to select from the scrap, that which is to be reclaimed, and they then should turn it over to the process shops for remaking.

Section 29, offers three suggestions: Small car axles can be provided by utilizing large axles either by upsetting or turning down. I think before we offer suggestions of this kind to our Stores people, they should be referred to the proper committee of the Mechanical Section. The practical suggestion in No. 1 is not approved by the Mechanical Section. It is similarly the case with sections 2 and 3, namely: (2) Worn outside collar on car axles can be built up by welding; and (3) Flat spots can be welded on rolled steel wheels and tiers.

These two subjects are still mooted in the Mechanical Section. The principal of welding collars has been done by some roads and they have had trouble with it, and, therefore, I think we should go slow in offering to our stores people the suggestion that this should be done.

Vice President Reed—Early in my Railroad experience I worked for a man whom I came to revere. He said to me one day: "Frank in going through life, don't fool the other fellow unless it becomes absolutely necessary; but under no circumstances fool yourself." We should not do what the mechanical or engineering departments are not posted on or we may be doing something that is wrong. I believe a large number of railroads today are dismantling and disposing of a lot of old equipment; some of them are turning them over to wrecking companies, to wreck them at a certain price per car, or they turn it over at a certain price per car. Some of those cars moved a long distance to get to these scrap yards and I understand that there is no effect being made on the part of the railroads that sell those cars to get the good material back. We can accomplish a great deal in that direction and save a lot of money for our company by watching this carefully.

Mr. Jones—On page five, classification I-B, article 9, track spikes, quick acting power hammer. We have discarded the hammer on the New York Central and have developed a machine for straightening track spikes. We are saving \$20 a ton, actual figures, after adding one hundred percent overhead. We are actually doing the work.

Mr. Hyatt—The one advantage of reclaiming by the stores department is that they are in a position to know what there is a demand for. There are a great many items mentioned here that it is possible to reclaim, but it may not be to a particular road's profit to reclaim. I think the man at the head of the reclamation should know the requirements, what is needed and take that into consideration for the entire railroad

The report was adopted and the subject continued. (The following is the discussion of the Report on Purchasing Agents' Office Records, which report will be found at the end of this article.)

C. E. Walsh, chairman, presented the report and said: The National Association of Purchasing Agents, at Rochester, N. Y., approved the seventh tentative standard invoice form shown in the report.

Discussion

A. W. Munster (B. & M.):—I think it would be instructive if Mr. Walsh could tell us some of the principal factors that made up the Seventh Tentative Form.

Mr. Walsh:—The adoption of the invoice form was started by the National Association of Purchasing Agents and our committee heard about it and got in touch with them. They had several meetings and took it up with various manufacturers, had samples submitted and drew up this proposed form. Our committee felt it can be used by the railroad and that you can get anything you really want on that form. If we want to go along with the National Association we must give and take a little. The National Association of Purchasing Agents are going to put this over and if it is adopted it will save considerable money to the railroads. *The report was accepted.*

Scrap Classification—Handling and Sales

In view of the large amount of scrap material which must be handled and disposed of annually by the railroads, this work is of great importance and the committee report on the subject warrants the closest study. Particular emphasis is placed on problems of handling as related to scrap classification, and a plan of the Rock Island scrap dock at Silvis, Ill., included in the report, should have suggestive value for laying out new scrap docks or remodeling older ones. Durable and cheap docks are made from old car timbers prop-

erly tied together and filled with cinders. Labor is saved by locating storage bins adjacent to the sorting bins.

The committee report also includes a diagram of a smaller scrap dock of the Kansas City Southern, with the idea that a dock of these proportions will be better adapted to the majority of roads. In this case the unloading and sorting is done in a 42-ft. space reserved for that purpose at the center of the dock.

THE COMMITTEE on Scrap Classification, Handling and Sales submits the following report in which the problems of handling are considered under two heads. The first is the necessity for gathering and disposing of scrap as governed by:

- a. Cleaning the system from unsightly piles of old material.
- b. Returning to use any serviceable material that may inadvertently have been scrapped.
- c. Obtaining refund for or replacement of defective material before its guarantee has expired.

and shops, and by frequent inspections of these places, particularly under platforms, runways and inclines, at the rear of buildings, in lofts and attics, etc., scrap should be kept constantly moving towards the scrap yard or reclamation plant.

Section houses should be provided with bins about 8 ft. by 8 ft., made from old planking or second-hand ties, and as the accumulation is brought in, the serviceable items may be picked out and the small scrap placed in the bins. The larger pieces are placed beside in a pile, there to await the supply car or work train.

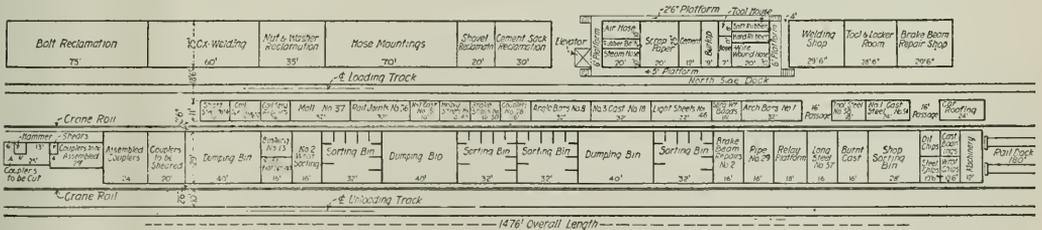

Exhibit A—Plan of Rock Island Scrap Dock at Silvis, Illinois, Showing Storage Bins Adjacent to Sorting Bins

d. Placing in the treasury the funds obtained for the sale of such material as may not be reclaimed or replaced.

To this end the efforts of all employees should be directed and periodical meetings arranged for at various points to call attention to the facts that:

- a. A clean shop, storehouse and right of way make for safety.
 - b. The use of material until it is worn out is economy that reflects itself in a lower cost of operation.
 - c. The prompt movement of scrap into the terminals for disposal insures a movement of funds into the treasury.
- The scrap movement begins at the section house, storehouse

Considerable material is turned in to the storehouse in exchange for new material issued; brass and other valuable metals are also sent back. This scrap other than metals should be taken care of on the storehouse platform convenient for loading; the metals should be placed in a locked box built for that purpose until such time as a box car can be loaded and properly locked, or, if at an outlying store, delivered to the supply car.

Bins should be built to meet the requirements at the different points. Borings and turnings should have a separate bin located conveniently to the shop so as to save labor in wheeling.

Bins should also be built to take care of the small scrap usually

made in the shops, and a space nearby such bins should be reserved for the heavy pieces. In each case the bins should be located as near as possible to the loading track in order to save extra handling. By the use of the bins inspection can readily be made by the men designated to look over the so-called scrap, in order to take therefrom good serviceable material or material that could be made serviceable with little labor or expense.

At the larger shops a tractor or power truck, with trailers, when not busy otherwise may be used to pick up the old material, and by having a loading platform with incline the gathered loads may be delivered to a car for shipment to the scrap yard. Where the accumulation is great enough the material may be partly sorted as it is being loaded without great expense, and the heavier scrap be kept together, as should also the borings and turnings.

Where the scrap yard and large shops are located at the same point, cars not suitable for road use could be properly placarded and placed in service between the loading platforms and scrap yard.

Material that is being returned for inspection and possible reclamation should be marked plainly with paint, and the consignor

imum tonnage and foreign line cars traveling in the direction of home should be given preference in this loading, care being taken also that there is no unnecessary delay in handling the equipment, as the per diem charge is a very large item of expense.

The largest tonnage is eventually sold as scrap (unless the reclamation plant is very extensive) and consequently the yard should be located at an advantageous point for disposal through sale, to avoid back haul.

The yard should have facilities for handling scrap and preparing it for the various classifications. Shears of proper size should be provided, and if impossible to have more than one, it should be large enough to cut a 6-in. axle and thus be able to care for what scrap may come in.

Docks are recommended, and to equip them properly a gantry-type crane is superior to the locomotive crane. A sketch of the dock at Silvis, Illinois (Chicago, Rock Island & Pacific), is shown (Exhibit A), and it will be noted that the storage bins are adjacent to the sorting bins. The docks are made of old car timbers tied together and filled in with cinders, and when properly constructed, should last for years. If any trucking is contemplated or

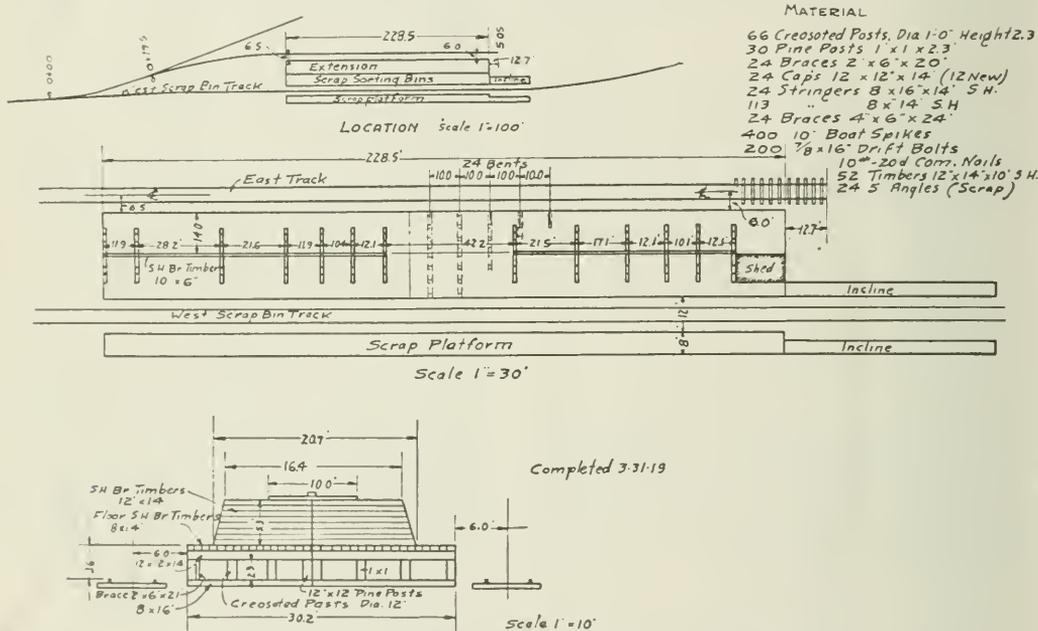

Exhibit B—Plan of Relatively Smaller Kansas City Southern Scrap Dock

should write the officer in charge of the scrap dock giving the car number, waybill reference and approximate location of the material in the car so it will not be overlooked, getting the information to destination before car arrives. Any items that have been inspected at the point of origin and adjustment allowed should be plainly marked or painted "Scrap" so there will be no delay or double handling at the scrap yard.

It often happens that machinery is scrapped that may be placed in working condition and either used in the reclamation plant or sold to second-hand machinery dealers. All parts should be carefully inspected and missing or broken parts reported so that it may be replaced for inspection at destination with a minimum of delay.

The best method of gathering scrap from points that do not accumulate in earload lots is by means of the supply train, as the trip are periodical and the crew members familiar with the scrap on the different divisions and is thus able partly to sort it. When necessary care for old material any defects can be noted and the scrap held for inspection at the general store. When a car is loaded it should be returned and forwarded direct, and after empty being returned to the supply train, thus not delaying a load.

At every point, especially scrap yard should be loaded to a max-

wheelbarrows used, old boiler plate will make a smooth platform so that heavier loads may be handled.

The general scrap dock is equipped with three gantry-type cranes, two of ten-ton capacity and one of four-ton capacity. These cranes are equipped with electric magnets 52 in., 60 in. and 62 in. The claims for superiority over the locomotive crane are greater speed, larger loads and elimination of delays incident to switching. The docks are 1,476 ft. long and the cranes can reach every part of the dock, so if necessary to move a car the magnet can be dropped on its floor and the crane can then haul it to the new position.

The crane magnet unloads the scrap, the sorting is done by hand, and from the sorting bins the crane again picks up the sorted scrap for transfer to the storage bin. These are so located that cars can be spotted without conflicting with the unloading.

The work by hand has been reduced to actual sorting only and the movement of scrap by truck or wheelbarrow has been entirely eliminated.

The scrap rail is handled in the maintenance of way yard by a five-ton gantry crane equipped with magnet and controlled by one crane operator and one crane director. The magnet is 18 in. in

diameter, which permits the handling of one rail at a time, allowing inspection by the director as the unloading is being done.

Rail can be sorted by spotting cars for No. 1 and No. 3 rail at each end of the unloading car, and the No. 2 and No. 4 rail can be handled to the bins, the serviceable rail being placed at one side for inspection. At the Santa Fe yard, where the rail is handled almost entirely by a locomotive crane, one man in the car sorts the different classes before it is unloaded.

A smaller scrap dock is shown (Exhibit B) of the Kansas City Southern, approximately 228 ft. long and 30 ft. wide.

The center of the dock, about 42 ft., is reserved for an unloading and sorting bin. The dock approaches and platforms are equipped with rails set to standard gauge and an electric motor and hoist of sufficient capacity to pull a loaded push car of from two to four tons in weight is properly located, and as scrap is delivered from the shops it is pulled up and sorted into the bins directly from the cars as loaded by the shops, thus saving double handling. At the sorting bins there are two No. 5 electrically driven Canton alligator shears for disposing of larger pieces.

Material fit for reclaiming is placed on the second-hand material platform just west of the scrap dock, thus removing it from the scrap handling crew.

The two methods of gathering scrap are by means of push cars heavily built to hold about four tons, and "yard cars," old equipment stripped and fitted with 18-in. side boards to facilitate loading, these latter cars being placed at repair tracks, etc.

At this plant all scrap is handled by hand labor on docks, except bolsters, steel underframes, boilers, etc., this heavier material being handled on the ground by the use of a wrecking crane. There has been no difficulty in handling scrap in this manner, though the work may be delayed if the wrecker is being operated elsewhere.

The Oregon Short Line has two scrap docks, one at Pocatello, Idaho, fully equipped, the other at Salt Lake City, this latter limited to certain grades of scrap, all other grades being moved to the central sorting dock; this to accommodate market conditions.

The Denver & Rio Grande Western has two main docks also, one at Salt Lake City, the other at Pueblo. Where the tonnage warrants, loaded cars are shipped direct from shops to the customer, i. e., the Colorado Fuel & Iron Company, and their classification is greatly simplified in so doing.

Special bins are provided for borings and turnings, and considerable saving is claimed through the use of old fire boxes cut down and conveniently placed, which, when filled with scrap, are picked up by locomotive cranes and moved direct to the scrap docks.

The Santa Fe has one Brown hoist and four Industrial cranes, steam driven and equipped with electric generator and magnet, size 42 in., and is not now using docks. Its officials prefer the locomotive cranes to the gantry, as at the reclamation plant there is coal storage space and the locomotive cranes are equipped with buckets which unload or reload promptly and at a minimum expense. Twenty-five thousand tons of coal were handled during 1921. When not handling coal, cinders or sand, these cranes are used for unloading heavy material with chains, and they also do the switching when a switch engine is not handy, and have been used in construction work and in setting machinery.

The reclamation plant yard (about 250 acres) is wired and has water plugs conveniently placed so that the cranes can recharge and take water with very little delay. Coal bins are placed at loading and unloading tracks so that no time is lost in getting coal.

The scrap passes over a track scale on entering the yard, and is placed just south of the rolling mill and unloaded on the ground. The cars are then cleaned as they are being moved to the scale, and are again weighed light and if improperly stenciled this is corrected, an American Railway Association charge being made for this service where time limit has expired. This time limit is shorter on Santa Fe equipment than allowed under American Railway Association rules, and is covered by Transportation Light Weight Circular No. 29, as issued by the superintendent of transportation. No claims for shortage are allowed.

The sorters handle the pile from all sides, the serviceable material men who are experts in their line working with the scrap handlers to see that nothing goes in the scrap for sale that can be used or made useful. The scrap is wheeled to the various classified piles on old boiler plate runways by laborers.

All flat and round bar is sorted and kept separately to be sent to the rolling mill, where it is rolled into finished iron, which process gives a much better finished bar than if all No. 1 and No. 2

wrought were used, as was the custom formerly at outside mills.

The sorted piles are placed beside the loading track and loaded as the tonnage accumulates, so they are never high enough to cause extra labor. The tracks for unloading and for loading are parallel and are 500 ft. apart.

The scrap for sale is reported to the purchasing agent twice a month. By this method the accumulation is kept down and handling cost reduced. Certain classes of scrap, such as cast iron, brake shoes, and rail, are sold in the West. Wheels are handled direct from the shops, and the movement of empty home-bound foreign cars is used to carry the scrap to Chicago.

A portable overhead crane, known as the Aveling unloader, is claimed to have many advantages, as it moves on a track by its own power, and the magnet or clam shell passes through the framework, covering four tracks. It may be used for handling scrap, loading and storing coal, transferring loads from bad order cars, etc., and it does not require coal or water.

While gantry or locomotive cranes are not available the docks are still preferable, as heavy loads are more easily handled when they are level with the car platform.

Scrap as received from the line should be weighed in over the track scale, set on the unloading track, and immediately released. Where the car is clean and needs no repairs it may be reloaded immediately, thus making the service continuous.

Cars should not be loaded until they have been cleaned and light weighed, this to avoid possible claims for shortages, as stencil tare weights are not sufficiently accurate on which to base a refusal of short weight claims.

It is well to call attention to:

The practice of light loading cars. A maximum load tends toward economy in operation.

Proper repairs to cars to prevent loss.

Proper blocking of rail, wheels, etc., to prevent damage to equipment, shifting of loads, and consequent switching back to the yard for rehandling.

Thorough cleaning and light weighing of cars to prevent loss through claims.

Periodical inspection, cleaning and test of scales for the same reason.

Continuous movement of scrap in its destination.

Sale in advance on estimate of accumulation to keep the yard clear of material.

Immediate report of car numbers, weights, class of material, and forwarding of waybill to enable prompt collection for and disposal of loaded cars.

Prompt release of empty cars to avoid per diem charges.

Proper inspection of facilities so that needed overhauling may prevent a breakdown at an inopportune time.

A co-operation throughout all departments, from the section foreman and track gang up, to the end that a thorough knowledge that the main intention of scrap clean-up "Saving is earning" is understood.

CLASSIFICATION

In regard to the scrap iron and steel classifications, the committee's report at the last annual meeting held in Chicago, June 9 to 11, 1921, was further modified during the past year through discussion of several items that apparently conflicted and attention was called by members of the committee to the fact that while in general the classification as presented could be adopted, local conditions must govern various items.

It was proposed to include an item of shoveling steel, a classification that would take care of all small pieces of steel scrap such as tools and tool-steel, tie plates, number two wrought (when a road could not accumulate a carload), etc.

Prices were checked on tools and tool-steel, and it was found that there were times when this item commanded a premium.

Attention was called to the inclusion of punchings and clippings in Item 14, Bustling No. 1, and Item 31, heavy melting steel, and it was shown that the eastern mills would accept Item 31, heavy melting steel, with this material, whereas the western mills would reject cars containing it, and also that the inclusion of the clause, "No piece-weighing less than ten pounds," in Item 31 would eliminate this trouble for the western shipments and that the classification of shoveling steel would cover the small steel.

Item 28, flues and pipe. It was suggested that the words, "Free from galvanized material" be included.

Item 33, iron rail. The dealers present at the meeting reported that the consumers' classification called for 50 pounds and heavier,

and it was suggested that the matter be taken up with the rolling mills and an endeavor made to have them agree to lower their weight to 40 pounds.

Item 35, rail steel. Question of inserting a clause, "Badly worn flanges," was not passed on.

The question of inserting Items 42A, "Sheets from steel cars cut apart," and 43A, "Car roof sheets," is covered by the insertion of a note after Item 60 as follows:

"Where a full carload of a special item that is included or could be included or mixed with other scrap is accumulated it should be reported separately and sold separately."

A suggested correction in the terms of sale was discussed and this clause was proposed:

"Shipment will ordinarily be made within thirty days after receipt of shipping directions unless prevented by causes beyond our control. If shipment is not made within thirty days, prevented by causes beyond our control, notification of our inability to make shipment and the reasons for same should be communicated to the buyer, when he may, at his option, cancel the balance due. If the buyer does not immediately exercise this option, the contract remains binding to both parties."

No action was taken as to adoption of this clause as the old terms of sale specified forty-five days. The dealers at the meeting favored its adoption.

The Committee report is signed by: M. J. Collins (Chairman), Atchison, Topeka & Santa Fe, Chicago; L. V. Guild, Oregon Short Line, Salt Lake City, Utah; W. B. Hall, Denver & Rio Grande, Burnham, Denver, Col.; J. R. Haynes, Chicago, Burlington & Quincy, Chicago; C. H. Hoainville, Atchison, Topeka & Santa Fe, Chicago; W. F. Huncke, Chicago, Burlington & Quincy, Platts-mouth, Neb.; W. F. Jones, New York Central (East), West Albany, N. Y.; J. C. Kirk, Chicago, Rock Island & Pacific, Silvis, Ill.; A. W. Munster, Boston & Maine, Boston, Mass.; C. B. Hall, Pennsylvania System, Philadelphia, Pa. and S. B. Wight (chairman ex-officio), New York Central Lines, New York, N. Y.

APPENDIX

SCRAP CLASSIFICATION

Terms of Sale

Please quote on this sheet price per unit specified on the following scrap materials. This scrap will be sold f. o. b. any point on our lines. Show in your bid tonnage and delivery point desired.

Sealed bids for this scrap, to receive consideration, must be in this office by 12 o'clock noon on..... and remain in effect until 12 o'clock noon on.....

Envelopes containing bids should be marked in lower left-hand corner "Bid on Scrap," and no change in your quotation will be permitted after that time.

The right to accept or reject part or all of your bid is reserved. If accepted, the following terms and conditions will govern, and will be made a part of the transaction.

Shipment

Final shipping directions must be furnished within five (5) days from date of award. When shipping directions for material are not furnished within five (5) days from date of award, it shall be optional with this company to cancel the sale at any time thereafter.

Shipment will ordinarily be made within thirty days (30) days after receipt of shipping directions unless prevented by causes beyond our control. If shipment is not made within forty-five (45) days, prevented by causes beyond our control, it will be optional with either party to cancel balance due, within ten days thereafter.

Current tariff switching charges will be made for delivery to connecting line.

Terms

Sight draft attached to bill of lading, or certified check before cars delivered. Our classification and track scale weights at point of loading to govern.

Please send your shipping directions to conform with above terms of sale.

Classification of Scrap Iron and Steel

(Quote price per net ton of 2,000 lb.)

Item No.

1. Arch Bars and Transoms, Iron
2. Arch Bars and Transoms, Steel
3. Axles, Steel—Car and locomotive, 6 in. dia. and over at center
4. Axles, Steel—Car and locomotive, under 6 in. dia. at center.
5. Axles, Steel, Hollow Bored
6. Axles, Iron—Car and locomotive, all sizes.
7. Angle and Splice Bars—Steel angle bars and splice bars.
8. Angle and Splice Bars, Patented Joints Only
9. Angle Bars, Splices and Fish Plates, Iron
10. Boilers, Fire Boxes and Tanks, Uncut—All kinds, attached or separate. Specify whether with or without flues.
11. Boilers, Fire Boxes and Tanks, Cut Up—Iron or steel boiler or tank plate cut into sheets and rings (with or without stay bolts.)
12. Brake Beams, Uncut
13. Built Up Bolsters
14. Busheling, No. 1—Iron and soft steel pipes and flues (free from scales); tank and bands No. 12 and heavier, boiler plate punchings and clippings, and soft steel and iron drop forgings and trimmings; nothing to be over 8 in. long or wide, free from galvanized or tinned stock.
15. Cast, Railroad No. 1—Pieces weighing 150 lb. or less, includes new grates, new stove plate and clean cast-iron culvert, soil and water pipe, to be free from brake shoes and burnt grate frames, burnt stove plate and all other burnt castings.
16. Cast, Railroad, No. 2—Pieces weighing over 150 lb. but not more than 500 lb., otherwise same specifications as class No. 15.
17. Cast, Railroad No. 3—Pieces weighing over 500 lb.; includes cylinders and driving wheel centers, and all other castings; otherwise same specifications as Class No. 15.
18. Cast, Railroad No. 4—All kinds of burnt castings, including grate bars, grate frames and stove plate.
19. Cast, Iron Brake Shoes—All shoes with steel back or with steel or wrought-iron inserts, both driving and car. Excludes composition filled shoes.
20. Cast Iron Borings—Clean and free from all other metals, dirt and lumps.
21. Cast Steel, No. 1—Charging box size, 5 ft. and under, 18 in. wide; no piece weighing less than 10 lb. to be included.
22. Cast Steel, No. 2—Steel castings over 18 in. wide and over 5 ft. long, may include cast steel truck or body bolsters and cast steel locomotive frames.
23. Cast Steel Truck and Body Bolsters
24. Couplers and Knuckles, Steel and Steel nuckle Locks
25. Tools and Tool Steel—Worn out steel tools, tool steel, files, including old claw bars, pinch bars, spike mauls, track wrenches, picks, adzes, axes, chisels, drills, hammers, knuckle pins, punches, finger pins, bits, draft keys, bar steel, weighing under 10 lb. per piece.
26. Frogs and Switches, Uncut—Steel and iron frogs and switches, that have not been cut apart, exclusive of manganese material.
27. Flues, Tubes and Pipes, Wrought Iron and Steel No. 1—1-inch dia. and over, 2 ft. long and over, free from fittings, paint, galvanized or enameled, coiled or bent material.
28. Flues, Tubes and Pipes, Wrought Iron and Steel No. 2—Ungraded wrought-iron and steel flues, tubes and pipes, including fittings attached. Free from galvanized material.
29. Lined Iron and Steel—All kinds of material from interior of boilers (except flues which are encrusted with lime or corroded by the action of water) such as crown bars, crown bar bolts, stay bolts, etc.
30. Malleable—All malleable castings.
31. Melting Steel, Heavy No. 1—Charging box size, ¼-in. thick and over, and not over 18 in. wide, or over 5 ft. long, free of all attachments, may include chain, carbon tool steel, files, punchings and all other steel scrap that will come within the above dimensions, unless otherwise specified. No piece weighing less than ten lb.
32. Melting Steel, Heavy No. 2—All steel over 5 ft. long or over 18 in. wide.
33. Rail—Iron No. 1—Iron tee rail 3 ft. long and over, tee section 40 lb. per yard and over, free from frog, switch guard or crooked rail
34. Rail—Iron—Miscellaneous—All iron rail not otherwise speci-

- Item No.
- fied, including guard rails, switch points and frogs, when cut apart. Does not include frog fillers or plates.
35. *Rail—Steel No. 1*—Standard section steel tee rails, 50 lb. per yard and over, 5 ft. long and over. Free from badly bent and twisted rails, frog, switch and guard rails and rails with split heads and broken flanges.
- NOTE.—All rail suitable for relaying must be classified as Relaying Rail separate from all scrap rail.
36. *Rail—Steel No. 2*—Cropped rail ends under 3 ft. long, 50 lb. and over standard section.
37. *Rail—Steel No. 3*—3 ft. long and over, 50 lb. and over, standard section having split heads or ball of rail worn with wheel flanges, curved and bent rails free from frog, switch and guard rails.
38. *Rail Steel No. 4*—All sections of rail not coming under specifications of No. 1, 2 or 3 rail, including frogs, cut apart, guard rails and switch points. Does not include frog fillers or plates.
39. *Structural Wrought Iron—Cut Apart*—Wrought-iron, structural, and shapes from bridges, buildings and equipment cut apart and free from riveted material.
40. *Structural Wrought Iron—Uncut*—Wrought-iron, from bridges, structures and equipment, which has not been cut apart.
41. *Structural Steel—Uncut*—All steel, or steel mixed with iron, from bridges, structures and equipment that has not been cut apart; may include uncut bolsters, brake beams, steel trucks, underframes, channel bars, steel bridge plates, frog and crossing plates and other steel or similar character not included in No. 2 Heavy Melting Steel Class 32.
42. *Sheet Scrap No. 1*—Under $\frac{1}{4}$ -in. thick, consisting of cut stacks and stack netting, hoops, band iron and steel, pressed steel hand car wheels, scoops and shovels (free of wood), and wire rope; must be free from galvanized iron or tin, cushion and other similar springs and lime encrusted pipe and flues from boilers.
43. *Sheet Scrap No. 2 and Miscellaneous*—Includes netting, other than stack wire, all galvanized or tinned material, composition brake shoes and gas retorts, and any other iron or steel material not otherwise classified.
44. *Spring Steel No. 1*—Flat spring steel, including elliptical springs from which bands have been removed.
45. *Spring Steel No. 2*—All coils springs, made from steel $\frac{3}{16}$ -in. and over.
46. *Steel, Maganese*—To include all kinds of manganese; rail, frogs and switch points, cut or uncut.
47. *Steel, High Speed*—High speed steel turnings (butts and ends report separately).
48. *Tires No. 1*—All locomotive or car tires 36 in. and over inside diameter, smooth inside, not grooved for retaining rings or lipped.
49. *Tires No. 2*—All tires not included in Tires No. 1.
50. *Turnings and Drillings No. 1*—Wrought-iron and soft steel, clean, free from cast borings, brass, hard steel or other foreign metals, dirt or lumps.
51. *Turnings and Drillings No. 2*—From tires and other similar steel, including hard steel; clean, free from other metals, dirt and lumps.
52. *Turnings and Drillings—Mixed No. 1*—Wrought, cast and steel mixed, free from other metals, dirt and lumps.
53. *Turnings and Drillings—Mixed No. 2*—Wrought, cast and steel, mixed with brass and other metals, free from dirt and lumps.
54. *Wheels No. 1*—Includes all solid cast-iron car and locomotive wheels, no allowance for grease and dirt.
55. *Wheels No. 2*—Includes all kinds of built up or steel tired wheels. (Specify kind in offering.)
56. *Wheels No. 3*—Includes all solid rolled, forged or cast steel car and locomotive wheels. (Specify kind in offering.)
57. *Wrought—Railroad No. 1*—Clean wrought, pieces 6 in. long and over, flats to be $\frac{1}{4}$ -in. thick and over; rounds or squares $\frac{3}{4}$ -in. thick and over; to include bars, rods, chain; all to be free from riveted material.
- Item No.
58. *Wrought—Railroad No. 2*—All wrought, under 6 in. long, not specified under No. 1 Railroad Wrought; to include track spikes, bolts, nuts, rivets and lag screws.
59. *Wrought Iron Locomotive Frames or Mud Rings*—Includes all other large wrought-iron forgings.
60. *Destroyed Steel Cars and Locomotive Tenders*—Includes underframes and bodies of steel cars cut apart sufficiently to load—excludes trucks and cast steel underframes.
- NOTE.—Where a full carload of a special item that is included or could be included or mixed with other scrap is accumulated, it should be reported separately and sold separately.
- MISCELLANEOUS
61. *Aluminum*
62. *White Metal No. 1*—Including various mixtures of clean bearing or lining metals, such as babbitt, metallic packing, etc.
63. *White Metal No. 2*—All non-bearing white metals, such as lavatory basins, exclusive of aluminum.
64. *Barrels*—Specify kind and with or without heads. (Standard Classification.)
65. *Bags and Burlap*—Bagging, sacking and waste covering.
66. *Brass, No. 1*—Locomotive bearings metals, such as driving, crown and rod brass, free from white metals, excluding car and tender bearings.
67. *Brass, No. 2*—Steam metal brass, including valves and fittings—injector and lubricating bodies and parts, and check valves.
68. *Brass, No. 3*—Journal bearings free from babbitt.
69. *Brass, No. 4*—Brass or bronze borings, drillings and turnings.
70. *Brass, No. 5*—Yellow brass castings, to include coach trimmings, light brass, hose couplings, pipe tubes, etc.
71. *Copper Cable, Insulated*—Specify kind.
72. *Copper, No. 1*—Wire free from insulation, flue ferrules, pipe and tubes.
73. *Copper, No. 2*—Sheet copper, sheathing and roofing, free from paint and nails.
74. *Copper, No. 3*—Sheathing and roofing copper, with paint and nails.
75. *Copper, No. 4*—Battery copper.
76. *Copper, No. 5*—Dross and oxide. (Report separately.)
77. *Canvas*—(Specify whether new or old.)
78. *Carpet, Linoleum, Plush and Rags*—(Specify kind.)
79. *Lead*—Sheet, pipe, etc.
80. *Lead, Battery*.
81. *Lead, Battery Mud or Sediment*—(Specify wet or dry.)
82. *Leather Belting*—No. 1 leather belting, 6 in. wide and over; No. 2 leather belting, under 6 in. punchings and trimmings; No. 3 rubber belting, all kinds; No. 4, composition belting.
83. *Rubber, No. 1*—Air brake and signal hose, free from wire and fittings; rubber boots and shoes without leather soles, rubber aprons.
84. *Rubber, No. 2*—All other hose, such as steam, water, tank, pneumatic tool, and washout hose, free from wire and fittings.
85. *Rubber, No. 3*—Rubber lined fire hose.
86. *Rubber, No. 4*—All wire found and wire inserted hose, including oil and paint hose.
87. *Rubber, No. 5*—Rubber packing, gaskets, diaphragms, mating, step trades, etc.
88. *Rubber, No. 6*—Auto tires, solid and pneumatic, including tubes, free of fittings. (Specify material.)
89. *Rope—Manila* rope free from bow fenders.
90. *Tarrel Rope and Marlin*—Manila bow fenders, tarred rope and marlin. (Specify kind in offering.)
91. *Zinc, Battery or Sheet*—(Specify kind.)

The report was received and accepted as recommended practice.

STATEMENT SHOWING COST OF OPERATING SUPPLY TRAINS

	Monthly
Labor at Stores in loading Supply Train.....	\$500.00
Wages of Supply Train Storekeepers and Helpers.....	1,085.00
Personal expenses of Supply Train Storekeepers and Helpers and Store Department proportion of expense incident to performance of cook and living cars oper- ated in connection with Supply Trains.....	550.00
Charges from Transportation Department for wages of train and engine crews, round house expenses, and other incidental expenses; also fuel.....	4,700.00
Track laborers accompanying Supply Train.....	600.00
Total	\$7,435.00

STATEMENT SHOWING ESTIMATED COST OF HANDLING BY LOCAL FREIGHT MATERIAL NOT DELIVERED BY SUPPLY TRAIN

Estimated cost of overtime to local trains and engine crews if material was handled by local freight.....	\$3,280.00
Estimated cost of Local Freight Houses of handling, transferring and billing (on basis of 50 per cent of material passing through Freight Houses), at 57c. ton.....	1,681.00
Estimated loss account material damaged or lost in transit, etc. (using as a basis 3 per cent of material delivered)	420.00
Estimated cost of picking up scrap and cost of handling, sorting, etc., at Division Stores, before shipping to General Scrap Headquarters, also overtime to local Freight Train and Engine Crews.....	2,500.00
Approximate cost of packing, tagging, loading, way bill- ing, etc., at shipping stores.....	5,040.00
Stock on hand would have to be increased at all Division Stores approximately \$160,000, if each had to provide for their Division requirements. Interest on invest- ment at rate of 5 per cent per annum).....	800.00
Estimated value of additional track tools, hand, push and and velocipede cars, which would be required on Line if no regular exchange system was in effect, \$64,000. (Interest on investment at rate of 5 per cent per annum)	320.00
Estimated cost of motor car maintenance and operator for use of Watch Inspectors on monthly trip of watch inspection	255.00
Estimated cost of doing work by work train, such as distribution of ties, gravel, ice, sprinkling right-of-way with fuel oil, etc., which is now handled by Supply Train	1,125.00
Estimated cost of labor necessary to deliver material from Freight House to Section and Signal Tool Houses, B. & B. and Extra Gangs on Line, etc.....	3,600.00
Total	\$19,021.00

Appended hereto is recommended practice for the operation of Supply Trains.

15. A copy of this report has been sent to the Transportation Division of the American Railway Association, calling particular attention to the possibility of increasing car supply through the proposed methods of handling Company material.

16. In addition to the previous recommendations as to the operation of supply trains, it should be understood that on branches, or in territory where conditions do not warrant the operation of a train, the service should be modified and a regular supply car substituted—local supervision to determine frequency. Such car to be accompanied by proper stores officer.

17. It is recommended that the attached form, showing Service Performed by Supply Train, be made standard practice where supply train service is inaugurated.

18. It has been demonstrated that the supply train can be operated successfully in congested territory and is being effectively operated on an eight track railroad.

19. One of the important results of the supply train is the reduction of stocks on line: Rail (new and second-hand) and scrap; switch ties; track fittings; frogs; cattle guards; emergency stocks; charged out stocks; all unapplied material; scrap. Also results in better care of material; consolidation of all material; joints; tie plates, etc., on each section at tool houses for monthly inventory and check by supply train.

20. The supply train makes for good housekeeping on the property.

21. The Committee feels that figures should be produced showing comparison on various railroads between the cost of distributing supplies under the former system, with supply train.

but have not been successful in obtaining complete data on this feature.

22. The operation of the supply train is flexible, so that it can readily be adjusted to meet the requirements of a congested main line division, or a branch line with light traffic. As conditions change and demand for material falls off, the organization on a supply train can be reduced to one man, if necessary, and the disbursements reduced to such essential items as oil, switch and signal lamp supplies, etc. The saving in the distribution of oil alone by supply train as compared with the old method of distributing by local freight is worth the operation of a supply train regularly each month, and when business is light and purchases restricted there is even greater necessity of knowing what is disbursed along the road and gathering up surplus.

23. During the past year we have knowledge of three railroads that have installed supply trains, based on report of this Committee at our First Annual Meeting. The Committee has in its possession letters commenting on the efficiency and desirability of the service of the supply train for the information of any one desiring to review them.

Your Committee unanimously recommended the adoption of the following additional paragraphs to be added to our previous reports.

24. *Regular Schedule.*—To obtain the best results supply trains should be operated on a regular schedule each month or at other stated periods so that the men in the field will know positively when they will receive materials. During business depression when trains are curtailed and the men out on the line do not know when they are going to receive supplies, consequently they carry a considerable quantity in excess of requirements which leads to ex-

Exhibit B

STATEMENT SHOWING SERVICE PERFORMED BY SUPPLY TRAIN

	New Material Picked Up Account Work Discontinued or No Longer Needed	Tools, Equipment and Serviceable Material Picked Up and Brought In for Repairs.	Value of Scrap Material Recovered.	Total.
Year—1920.....	\$45,401.31	\$23,079.71	\$181,696.33	\$430,087.35
Year—1921.....	73,950.84	284,008.22	137,887.76	495,846.82
Year—1922—2 months' period, Jan. 1 to Feb. 28.....	5,028.66	25,620.90	17,266.51	47,916.07

	Value of Material Delivered to Stores, Car Shops and Bank Houses	Value of Material Delivered to Others.	Total Value of Material Delivered by Supply Train.
Year—1920.....	\$321,713.72	\$1,255,173.08	\$1,577,056.80
Year—1921.....	484,933.62	1,388,405.31	1,873,338.93
Year—1922—2 months' period, Jan. 1 to Feb. 28.....	45,966.75	226,838.19	272,804.94

travagant use of materials. This illustrates the necessity of regular operation of supply trains throughout the year and delivery of only the exact amount required for a stipulated period.

On railroads where a Supply Train is run in accordance with the plan outlined by the Committee, the use of such items as gasoline, lubricating oil for gasoline motor cars, spark plugs, axes and similar tools, coal for heating purposes, ice, electric light globes and stationary has been reduced so considerably as to cause lively interest of operating officials. It also often permits substitution of many items, thus avoiding the purchase of new materials.

25. *Elimination of Extra Switching and Overtime.*—Operating officials must soon give consideration to the delay to freight or peddler trains due to shipping materials by this method instead of by supply trains. When supplies are delivered by local freight, extra switching of cars is necessary for setting cars out at station. The delay incidental thereto means overtime to the train crews and must be taken into consideration in the cost of handling material by local freight service; overtime on locals means overtime for a crew of 6 men.

It is an everyday occurrence for a freight conductor to find shipments for points at the distant end of the line nearest the door, while those for the nearest stations are buried under masses of other materials that must be moved before delivery can be made.

The cost of a train crew waiting while this sorting process is going on is high. If a way-freight must lay at a station 45 minutes instead of ten minutes it is exceedingly expensive. This calls for systematic loading, but when company shipments are handled through two or three freight houses a condition like this will invariably follow.

Local train schedules are made primarily for commercial service, and in many instances, early morning, late afternoon, and night schedules are in effect. One purchasing agent, who formerly operated supply cars in local freight, stated to the committee that he knew of several stations and sections on the end of districts where agents and section foreman seldom ever saw the supply car, as invariably the local train handling the supply car was running all work so as to get in to a terminal and keep within the 16-hour limit. Material was thrown off by them on the run at night or carried in to the terminal and shipped back.

Cognizance must soon be taken of the waste and expenses not only of materials, but of other angles in the handling, shipping and delivering of material, which are sapping the finances of the railroads.

There is no reason why the supply train cannot eliminate all freight shipments except transfers between stores and emergency shipments. The entire demands of the Maintenance of Way Department can generally be taken care of by the supply train by 30-day delivery.

It is desired here to bring out the fact that the supply train, to get full economy, must get full utility—keep shipments off freight trains. This refers to switch ties, assembled jobs, tie plates, joints, bolts, spikes for rail laying jobs, frogs, switches and all the items incorporated in our previous report; work trains are thereby eliminated. This train must not be considered a supply outfit, consisting of an oil and tool car for light supplies. The committee has knowledge of one delivery by supply train of six cars of signal line poles, thus saving the expense of delivery by special work train.

26. Inspection.—The supply train facilitates inspections by officers who of necessity desire to keep in touch with matters on the line; such officers as Safety Agents, Claim Agents, Watch Inspectors, Water Service Foremen, Motor Car Repairmen, Scale Inspectors, Inspector Bureau of Explosives, Traveling Agents, Fire Inspectors, Sanitary Inspectors, Signal Engineers, Roadmasters, Trainmasters, Division Engineers, Assistant Superintendents and Superintendents.

27. Approval of Requisitions.—The supply train further abolishes the automatic approval of requisitions, which is a very important point, resulting in the heads of the various departments dictating to the individual what material is necessary to do his job, as compared with the old procedure of indiscriminately signing requisitions at headquarters for what the individual may assume he needs.

28. Investment in Unnecessary Stocks on Line.—Where supply trains do not operate, large mileage of the railroad is unsupervised from material sense, therefore unnecessary stocks are accumulated. It is suggested that comparison be made between the value of material carried in section houses, tool houses, roadmasters' headquarters, etc., on roads that do not operate supply train versus roads which do operate them. It will be found that value of such material on hand will be greater by far on the aforementioned roads.

29. Care of Article to be Repaired. The rough handling and frequent breakage and loss of articles handled by other methods than supply train is apparent—such items as markers, lanterns, tinware, etc. On supply train these articles are handled by experienced men, like articles are loaded together in specified cars and delivered to the actual shop where repaired, with a minimum of handling. It has been said with some truth that such material is more damaged by carelessness in handling than in actual use. When articles for repairs are shipped in pick-up cars they are often, if not always, destroyed by coming in contact with heavier material, lantern frames are broken, costly lenses in roadster and signal lamps destroyed.

Special appliances such as skids, unloading mats and air crane are parts of the equipment of an up-to-date supply train, which insure delivery of material to the user in good condition.

30. Safety First.—The picking up of all dangerous tools at section tool houses and carefully inspecting all tools in use and carrying out of same, whether requested or not is a safety first measure which is made possible by the regular trip of supply train

Many a workman has lost an eye due to mashed head on a track chisel or maul. By lessening the number of handlings of material to get it to the point of use lessens the chances of hazard to the men, particularly in the handling of such heavy items as frogs, switches, switch ties, etc.

On some railroads safety meetings are held at terminals where supply trains tie up and safety supervisors and officers have an opportunity to meet the employees of that district. These meetings are bulletined in connection with supply train movements at terminals.

31. Picking Up of Scrap.—Another feature of unlooked for benefit and incentive in picking up scrap every 30 days was brought out recently where the railroad's maintenance expenditures are governed by monthly allowances. The roadmaster who turns in \$10,000.00 worth of scrap gets credit for that amount, and can therefore use it in labor or materials, whereas if this material laid on the line he would lose that much, which in fact amounts to additional appropriation for maintenance for that particular month.

32. Reducing of Correspondence.—Frequently material is shipped by local freight, baggage, etc., and considerable correspondence is necessary, particularly when material is delayed and it is necessary to trace the shipment by letter or telegram, or oftentimes wrong material is requisitioned or shipped. This is avoided when material is handled by a supply train.

33. Saving in Car Days.—The necessity of eliminating car days is vital, particularly in times of car shortage and when perishable and other commodities are to be moved within a short period of time. The supply train reduces the use of such equipment to the lowest possible minimum. The same applies on car days on scrap picked up by cars drifting from section to section when these are handled by local trains, because two car days are necessary in each section and the switching incidental thereto.

Car day saved in drifting cars of supplies, etc., when handled in Local Freight versus Supply Trains. The committee has actual knowledge of the following delays:

On one railroad it was found necessary to cancel the trip of the supply train over a certain division after the train was loaded. The material to be delivered was shipped by freight, which resulted in 19 extra car days on one carload alone. In another instance 23 days were lost on a single shipment made by local freight.

General

There are so many savings possible to the supply train and so many costs largely concealed in the movement of material by other methods, that this committee has not had time or opportunity as yet to develop all of these costs in such a way as to satisfactorily present them, but we have in mind the following—for instance, a railroad may accumulate on the line 15,000 tons of scrap per year; has it occurred to General Storekeepers, Purchasing Agents and executive officers that the reclaimable material lying out on the line, if at hand, repaired and reconditioned, would save the purchase of similar new material at double or possibly triple the cost? This undoubtedly amounts to a large sum when we consider that on a railroad now following reclamation methods, reclamation and salvage has been shown to be close to \$1,000,000 per year.

A question for this committee to consider is what percentage of the scrap material on the line is reclaimable; we must produce these figures to show concrete savings. The supply train covers the road every thirty days; under the old pick-up, catch-as-catch-can there must be double the amount of scrap and reclaimable material idle, which is not available or does not get the rapid turnover as with a supply train. Consequently it means greater deterioration and loss; in other words, the reclamation feature is retarded and in the meantime funds are expended for new material, when otherwise the money would be available for other uses.

In connection with the comparison of distributing material and supplies, by the old system of local freight, etc., vs. supply train, as recommended in paragraph 21 of Exhibit A, the Committee wishes to offer a suggestion for the benefit of roads not at present operating supply trains; in order to form comparison of cost between operating supply trains and delivering material by local freight, that each and every item entering into the cost of local freight delivery be enumerated, and cost compiled; for instance: cost of dravage of material to freight house; cost of handling; cost of billing; cost of unloading at destination; time expended in calling at freight station for material; cost of transporting scrap and old material back to headquarters, etc.

When local freight deliveries are made the investment in containers, drums, etc., for oils and other materials should be considered. *The supply train eliminates this investment.*

Attention is called to paragraph 17 in Exhibit A, recommending a form for service performed by supply train; as a matter of information we quote figures showing service performed by supply train on one railroad in accordance with that form—Exhibit B.

Recommended Practice For Operation Of Supply Trains

Accompanied by. The Supply Train should be accompanied by the Division Superintendents, Division Engineer, Signal or Assistant Signal Supervisor, Roadmasters, over their respective Districts, and Division Storekeeper.

The Division Officials use this train as a means of making regular inspection.

Requisitions. Requisitions for ordinary supply to be made up by the Roadmaster and others, and sent direct to the division Storekeeper for scrutiny as to proper description, etc., and they are then sent to the General Store from which Supply Trains operate.

It is not considered necessary to have Superintendent or Division Engineer's approval on these requisitions, inasmuch as they accompany the Supply Train, and the matter of what is to be furnished is investigated on the ground.

Requisitions for other Departments to be handled in a similar manner.

Any special requisitions, of course, should be properly approved.

Stocking of Trains. Supply Trains should be fully stocked to cover requirements, and carry some surplus to take care of such emergency requirements as have become necessary since the making of requisitions.

Filling of Requisitions on the Line. The night before starting each day's work, the Supply Train Storekeeper makes up unloading list by stations for the next day. This is made in triplicate, he retaining the original, one copy to his Helper, and the other copy to Division Storekeeper.

Between stations, Division Storekeeper checks over his copy of unloading list, determines the number and class of tools, etc., to be exchanged as well as the material which has been ordered.

On arrival at tool house, he immediately checks the amount of stock on hand, in most cases with the Roadmaster and quite frequently with the Division Superintendent and Division Engineer, and it is then determined whether or not the quantity ordered is over and above what is actually needed for 30-day period, or if the amount ordered should be increased. In either case the material decided upon is delivered and requisition is changed accordingly.

Exchange of Tools, etc. The exchange of tools and other exchangeable material to be watched very closely.

Track tools, in fact everything that can be exchanged, should be exchanged.

This system no doubt saves the railroad considerable money, as it eliminates abuses, also losses through theft, etc.

Oil Requirements. Schedules should be prepared whereby Division Storekeepers and Supply Train Storekeepers are in position to know just the quantity of illuminating and lubricating oils that will be required at the various points and by various departments, and no more than the schedule calls for to be delivered.

Picking Up of Scrap. All of the M. of W. Scrap accumulation to be collected and held at Section Headquarters for the Supply Train. The Signal, B. & B. Dept., Pumping Plant, Station Agencies, and others to handle scrap, obsolete, surplus and second-hand material in a similar manner.

Tools for Repairs. Tools for repairs are picked up by Supply Trains and brought into the Central Points, where all tools for the System are repaired.

The report is signed by: A. S. McKelligon, (Chairman), Southern Pacific Co., R. J. Elliot, Northern Pacific Ry.; J. E. Mahaney, Chesapeake & Ohio; J. P. Murphy, New York Central; J. L. Irish, Oregon-Washington R. R. & Navigation Co.; R. R. Jackson, Baltimore & Ohio; Wm. Shaw, Atchison, Topeka & Santa Fe; I. G. Morrison, Chicago, Burlington & Quincy; D. C. Curtis, (Chairman Ex Officio), Chicago, Milwaukee & St. Paul.

Moving pictures were shown in connection with this report there being no discussion.

Unit Piling of Materials and Numerical Numbering System

The action of this committee in making two distinct divisions of the subject under consideration will do much to prevent misunderstanding of just what is meant by Unit Piling of Materials and by a Numerical Numbering System. As clearly pointed out in the report, the first of these

factors is vital in the control of stores department stocks so as to maintain a minimum investment in all classes of material. The numerical numbering system greatly aids in grouping, readily locating, and accurately accounting for individual items.

FROM the large number of replies received in response to questionnaire, it is evident that the title of the subject is misunderstood, and it was therefore decided by the Committee to consider the same in two sections:

Section 1. Unit piling of materials, dealing strictly with a system of uniform piling, and storing of materials, including the application of markers, showing the individual or accumulative count in each tray, bin or pile.

Section 2. Numerical numbering system, dealing with the subject of a standard designation or numerical symbol for each item carried in stock.

Section 1—Unit Piling of Materials

The paramount idea in railroad storekeeping today should be the control of stocks and a minimum investment in all classes of material. To carry this idea to a successful conclusion, a standard practice of storing and caring for material and supplies must be adopted.

Control of stocks is based on accurate stock book records, governed entirely by proper count and correct averages of monthly consumption. To obtain an absolute inventory of each and

every item in stock, material must be piled to afford a ready count and also to bring about creditable decreases in cost of operation.

The committee therefore recommends the adoption of trays for the storing of material handled in shelving, which system permits the items to be piled in a neat, orderly and economical manner, provides a perpetual inventory and allows a ready inspection of such materials at all times. The trays to be equipped with numerical markers, showing the total number of items in a tray and the accumulative amounts in each tier of trays, these markers to be placed on all but the top or working tray.

It is further recommended that unit piling be followed out with every class of material. Lumber, castings, bars, sheets, pipe, flues, angle bars, tie plates, rail, etc., can be cared for in units, following as nearly as consistent tiers based on multiples of ten, placing between each tier a metal indicator showing the same accumulative count as used on trays in shelving.

The trays and markers can be made up entirely from scrap metal car roofing. The sheets are trimmed to size as needed, and layed out an inch or more longer and wider than the size required, to allow sufficient turn-up on all four sides.

The cost is negligible when compared with the labor previously used each month in removing and returning material to shelves, etc., in order to obtain a correct check and the expense of installation is many times offset by its advantages.

Conservation of storage space thereby reducing investment in additional racks and build ngs.

The only system whereby material can be accurately and quickly inventoried for requisitioning purposes.

It induces better care of material and will unquestionably bring about better control and is no small factor in prevention of damage and deterioration.

It saves time to those delivering material on account of being readily available, and obviates the necessity of digging out the items as is often the case with material improperly arranged.

It eliminates unnecessary rehandling, and the cost of unit piling is not as great as the promiscuous handling or piling of material in some other manner.

Finally, for the psychological effect material well-cared for has upon store employees and users.

Section 2—Numerical Numbering System

The committee wishes to submit for study and consideration the numerical numbering system of marking materials. The basis to be a standard designation or symbol number for each item carried in stock.

Nearly all railroads arrange material under different groups, and each group carries a designating number.

However, there are thousands of items under each group that could be identified in some manner to avoid confusion. Section storekeepers handling one line of material become specialists, but they can not be expected to personally supervise the loading, unloading and storing of each item as it is received or forwarded, and it is for this purpose that the numbering system is offered for thought.

Two numbers are shown, the first represents the section or group, and the second, the item or symbol number. Articles large enough to carry a number have the same stencilled on each

piece, small articles not large enough to carry a number are placed on shelving under labels showing description and symbol number. Price books and stock books show these numbers, and the same information is shown on all shop tickets, department invoices; and, in fact, on all documents handled through the store department pertaining to material issues and accounting.

The advantages to be derived are:

1. The prefix number enables the store forces to know under what group or section the material is carried.

2. The item or symbol number locates the record of the material and its proper place for storage.

3. The item or symbol number can be shown on shipping tickets so that helpers and truckers, who may not be familiar with the material, can select the correct material for filling a shipment and avoid delay.

4. The item or symbol number can be shown on shop tickets and when they are received in the office, the price clerk can readily locate the correct price shown by number, in price book.

While recognizing many good features in connection with this method, your committee does not feel justified in recommending it for adoption as a standard practice. We do feel, however, that it has sufficient merit to be worthy of further serious detail study, and it would be our recommendation, therefore, that the subject of numerical numbering system be referred to committee next year for further consideration.

The report is signed by J. L. Sullivan (chairman), Union Pacific, Omaha, Neb.; E. H. Landers, Cleveland, Cincinnati, Chicago and St. Louis, Beech Grove, Ind.; T. J. Hegeman, Chicago, Burlington and Quincy, Chicago; A. A. Taylor, Missouri Pacific, Little Rock, Ark.; F. E. Cragin, Los Angeles and Salt Lake, Los Angeles, Cal.; C. H. Thompson, Southern Pacific Co., Los Angeles, Cal.; V. N. Dawson, Baltimore & Ohio, Chicago Terminal, Chicago, and J. P. Murphy (chairman ex-officio), New York Central (West), Collinwood, Ohio.

This report was presented with lantern slides illustrating the different phases of the report.

Purchasing Agents' Office Records

The great number of transactions involved in buying the thousands of items which railroads use make it necessary to provide records which are as simple as possible and at the same time complete. Evidently it is sometimes difficult to harmonize these requirements, and the committee performs an important service in preparing forms for office records which represent the best practice based on the extensive experience of the members.

The work of the committee is complicated by the differences in methods used on various roads.

In view of these differences, the recommended forms are not always applicable, but they are valuable as a basis from which each road can develop records to suit its individual requirements.

One important form in which standardization is very desirable is the invoice furnished when supplies are shipped. Such a form has been prepared by this committee working with other organizations interested, both on the railroads and the manufacturers, and is submitted with the report.

ADDITIONAL by the title, the committee on Subject 12, Purchasing Agents' Office Records, is supposed to recommend forms in which data in purchasing agents' offices is to be prepared or assembled and consequently it is necessary, in some cases, to show wording or instructions. As it would be difficult to recommend wording that would be applicable to all railroad purchasing agent offices—because of different systems and methods of usage—all should understand that the wording as shown on these recommended forms is a suggestion to be used as a basis only.

It is the unanimous recommendation of this committee that the forms, copies of which are shown, be considered standard, in addition to the forms already recommended:

(The forms are numbered to indicate the number of the subject, viz.: American Railway Association, Division VI—Purchases and Stores, Subject No. 12, Form No. 1, etc.)

Form No. 12-10-1—Request for Bids on Scrap;

Form No. 12-10-3—Award for Scrap;

Form No. 12-4-a, 4-b and 4-c—Scrap Sale Order.

Description of Forms

Form No. 12-10-1—Request for Bids on Scrap: Size 8-in. by 10½-in. The terms of sale to be the same as recommended by the Committee on Subject 10, Scrap Classification, Handling and Sales.

Form No. 12-10-3—Award for Scrap: Size 8-in. by 10½-in. The terms of sale to be same as recommended by the Committee on Subject 10, Scrap Classification—Handling and Sales.

Form No. 12-4-a, 4-b and 4-c—Scrap Sale Order: Size 8-in. by 10½-in. It is recommended that the triplicate copy be retained

Form 12-10-3—Award for Scrap

in the purchasing agent's office, instead of the duplicate, although this may be handled by various railroads to suit their conditions.

It is also recommended that on railroads where the purchasing agent's office requires the information in column showing gross, tare and net weight, the copy retained by the purchasing agent's office be changed to suit the requirements.

Suggestions on Forms Previously Recommended

Form 12-7 and 7-a—Record of Purchases: (Adopted June, 1920.) Consideration was given to this form by the committee, and it was found that some roads were using a card form instead of the sheet, and it is recommended that it be left optional, with the railroads to use either a card or sheet form. It is also suggested that the sheets be numbered according to commodity, when additional sheets are necessary for the same commodity. Also that sheets be printed on both sides, if necessary. Size recommended 14-in. by 17-in.

General

The committee considered the advisability of recommending a requisition form, using as a basis the form adopted by Division VI, appearing in the Book of Rules for Railroad Stores Department Operation. Several representative general storekeepers were consulted, and the following result of the committee's investigations is given for information:

"1. The principal objection of the general storekeepers is to showing the quantity on hand, due and used monthly, claiming that this responsibility is theirs and that they are so closely in touch with the material requirements that they only should be held responsible.

"2. That if such information is shown it would likely be checked by some clerk in the purchasing agent's office who would have no knowledge of the use of material and might make changes in the quantities to be ordered that would result in serious delays to important work.

"3. That the information shown on the second sheet, or the storekeeper's sheet, is not sufficient and that additional records would have to be maintained, causing duplication of work.

"4. That the requisition form adopted by the American Railway Association, which is explained in the Book of Rules, known as Form No. 26, and the carbon copy, No. 26-A—retained by the storekeeper—carries a complete invoice record as desired by most roads.

"5. That instead of the committee adopting a new requisition form, its efforts should be confined to amending the present form, provided it is found revision is necessary."

Having given the matter considerable time and consideration, the committee recommends that the form adopted by the association be followed, because it is realized that this form carries all the information any railroad would desire, and that it is elastic as to its use; railroads not desiring all information could eliminate any portion not required.

The great trouble in arriving at a definite standard is because we have not all arrived at a uniform standard of storekeeping, and until the majority of railroads have reached this stage, it will be difficult to recommend a form that will be used extensively; the railroads are going to use a form that will meet their method of operations, regardless of the form the association might approve, and after going over Forms 26 and 26-A very carefully, keeping in mind the conditions as stated above, it is believed that nothing will be gained by recommending changes at this time.

For information, the reference relating to data on the requisition form, as shown in Part 2, Section 4 (h), American Railway Association Standard Book of Rules for Railroad Stores Department Operation, follows:

"(h) 'Data 1 to 5'

"1. On hand.—This to be filled in by taking actual inventory of the item at the time the inventory is taken. Broken packages

(Address)

Form 12-10-1—Request for Bids on Scrap

or small amounts of loose material may be estimated and such other material estimated as instructed by the general storekeeper.

"2. Quantity Due.—This is the sum of all unfilled requisitions and of the balances due on partially filled requisitions.

"3. Holding Requisitions for.—Will include all unfilled items on all requisitions for issue or transfer to other stores.

"4. Used Last.....Days.—(The number of days desired as a working basis can be filled in to suit the conditions the store

to work under.) This will be obtained from stock book by adding to the quantity ON HAND and DUE for the month... days before the date of the inventory the sum of all orders on the purchasing agent, other stores, mechanical or other departments, and from the total deduct the amount on hand and due at date; the result to be entered in space provided.

"5. Surplus.—On this line is to be shown the amount of material on hand which is in excess of the amount ordinarily carried for stock or any material which is in excess of the number of days supply instructed to be kept on hand by the general store-keeper."

Also Part 3, Section 2 (i), follows:

"(i) Data.—Such data as desired by the purchasing agent, such as 1 to 4, part 2, section 4 (h), may be shown. If it is desired to show estimated cost, this column may be divided and space provided for the estimated cost. In case it is desired to show date wanted, if this column is not used for other purposes, this information may be shown here. In case this column is used for other

06121 would be a requisition prepared in the month of June, account 12, first requisition. The second requisition for that account would be 06122. Ciphers are used where there are less than two numerals, for example, for the month of June, in account 6, the number would be 06061, and the second requisition would be 06062, etc. The first two numerals (or digits) indicate the month, the second two the account or classification, and after that the number of the requisition as prepared.

In addition to this, some of the railroads use letters, as symbols before the requisition number to indicate the store or requisitioning point. This system has been found to work very satisfactorily with purchasing agents' offices that file their orders by accounts rather than numerically or alphabetically; also where the requisitions are filed by accounts rather than numerically or by requisitioning points. Some of the railroads have even gone so far as to use the same number for their purchasing agent's order number.

Form 12-5 Invoice Form

As instructed at the 1921 business meeting, the committee has considered a standard invoice form, to be furnished by the sellers, in conjunction with the Railway Accounting Officers' Association and the National Association of Purchasing Agents. Representatives from these associations attended one of the committee's meetings and the form was thoroughly discussed, and it was de-

purposes, this information may be shown in the 'Description of Material' column. Where purchasing department requires requisition reference on which material is due, additional space may be left in data No. 2."

Numbering of Requisitions

While the committee understands thoroughly that they are supposed to confine their work to purchasing agents' office records, they did not think it out of order to call attention to the method of numbering requisitions used on some of the railroads whereby the classification or account number is shown so that when an inquiry is made of a purchasing agent's office for information in connection with a certain requisition, the classification or account being included by the number facilitates the location of papers, etc., in connection with same. As an illustration, requisition No.

decided that a joint conference should be held with a number of representative dealers, the Cost Accountants' Association, the National Association of Purchasing Agents, Railway Accounting Officers' Association, National Lumber Manufacturers' Association, Window Envelope Manufacturers and others interested, in order to obtain a broad view of this important form and to arrive at a standard suitable for use by all concerned, and one which the railroads could adopt.

The chairman and assistant secretary attended this conference and a copy of the proposed form, marked "Seventh Tentative

Conventionalities

Harry W. Finnell comes to the conventions this year with a new title—that of general sales manager of the Kilbourne & Jacobs Manufacturing Company.

Jim Anthony, of the American Arch Company, had considerable difficulty navigating the pier on Tuesday, owing to the low visibility caused by the "fog."

F. L. Norton and R. C. Ferguson, New York; George L. Davis, St. Louis; E. S. Wortham, Chicago, and W. L. Jeffries, Jr., Richmond, compose the Scullin Steel Company delegates to the conventions this year.

Andrew C. Loudon, of The Superheater Company, is here from Montreal and attended the dance last evening in his own clothes. Fortunately Harry Oatley, his present room-mate, is considerably larger than Andrew.

The rain yesterday made the duties of H. E. Daniels, chairman, and the other members of the Transportation Committee heavy, but they saw that all convention visitors were just as well taken care of as circumstances permitted.

Speaking of coincidences, J. A. Droege, general superintendent of the New York division of the New York, New Haven & Hartford, drew badge No. 567 this year and in 1920. This is attested to by H. V. McKedy, who issued the badges.

The young ladies at the convention are having difficulty identifying A. W. Clokey, of the American Arch Company, on account of the presence of his double here this year. If they will pick the better dressed of the two they will be safe.

John Draney, crack engineer of the Lackawanna, is here for the M. M. program of the Mechanical Division. He has just been re-elected president of the Veterans' Association of the Lackawanna. Incidentally he will celebrate his 37th wedding anniversary while here.

T. H. Beacom, vice-president of the Rock Island, and Mrs. Beacom, joined the Rock Island crowd and spent the week-end at the conventions. Mr. Beacom reports crops and other business prospects in Rock Island territory excellent, and is getting ready for a busy fall and winter.

C. W. Galloway, vice-president of the Baltimore & Ohio, accompanied by Mrs. Galloway, spent the week-end in Atlantic City visiting with friends and looking over the exhibit. Mr. Galloway is enthusiastic over the large amount of business the Baltimore & Ohio is handling in spite of the coal strike.

H. C. Pearce, who came to the conventions in Atlantic City two years ago as general purchasing agent of the Seaboard Air Line, comes this year as director of purchases and stores of the Chesapeake & Ohio. Mr. Pearce is accompanied by Mrs. Pearce and their daughters, Misses Katherine and Marie.

S. B. Cooper, general engineer in charge of project work for the Westinghouse Electric & Manufacturing Company arrived last Monday. He has been with the Westinghouse Company since 1910 and has taken an active part in most of the railroad electrification projects handled by his company since that time.

James B. Regan, president of the Regan Safety Devices Company, came down from New York the latter part of the week for a visit at the convention and exhibit. J. Beaumont, vice-president and sales manager of the company, has been dividing his time between the conventions in Atlantic City and the Signal Division Convention at Spring Lake.

A great booster for 100 per cent. locomotive efficiency is H. F. Grewe, master mechanic of the Akron, Canton & Youngstown. Mr. Grewe is always on the lookout for anything new which will increase efficiency and recently placed an order with the Baldwin Locomotive Works for two Consolidation locomotives, fully equipped with all modern devices.

E. G. Gross, formerly master mechanic of the Central of Georgia, is looking over the exhibits this year in his new capacity as master mechanic and master car builder of the Western Railway of Alabama, Montgomery, Ala. Mr. Gross is president of the Southern & Southwestern Railroad Club, which has grown wonderfully under his skilful guidance.

F. I. Sivyer, formerly president of the Joliet Railway Supply Company, has arrived for a few days at the conventions. While he has retired from its presidency, Mr. Sivyer, in addition to extensive business interests of other kinds, still has a large interest in the Joliet Company. He is president of the Northwestern Malleable Company, and of the Sivyer Steel Castings Company.

The spirit of the "Times" is reflected in the act of Joseph Robinson, of Robinson Connector fame, in having caused a New York daily newspaper of that name to be laid at the hotel room doors of a considerable number of railway and railway supply men each morning during the convention. One of the splendid qualities that commend Mr. Robinson to his fellow man is his thoughtfulness for others.

E. E. Nash, who has resigned as vice-president and general manager of the Minneapolis & St. Louis to become western sales manager of the American Locomotive Company, with an office in Chicago, has arrived to attend the convention. Mr. Nash was in the railroad business for thirty-six years. He was on the Chicago & North Western until 1920, when he went to the Minneapolis & St. Louis.

J. D. Purcell, vice-president of the Dearborn Chemical Company, and president of the Boss Nut Company, has just returned from a visit of some weeks to England. While in London he held a meeting of all the representatives of the Dearborn Company in the various English colonies throughout the world. He arrived in New York late last week and came direct to the convention.

George L. Bourne, America's long distance commuter to England and the Continent, did manage to be on this side of the pond for the conventions. His travels have not been in vain, as may be observed from that little red contraption in the Superheater Company's booth—the exhaust injector. This device is in extensive use in foreign countries and the Superheater Company is introducing it to the American railways.

M. J. Powers, who has been superintendent of motive power of the Colorado Midland for the past four years, is attending the conventions this year. Mr. Powers is in the unique position of having found himself out of a job because of the fact that the railway has suspended operation. Before he went with the Colorado Midland Mr.

Powers was master mechanic of the Denver & Rio Grande at Denver for a period of 10 years.

When F. H. Clark and Robert F. Carr were becoming life-long friends as students together at the University of Illinois over thirty years ago, the "Carr Cup" had not been thought of. A few years ago Robert donated the cup to the McBarma Golf Club to go to the member making the best net score of the afternoon play, and last Saturday afternoon Frank won it. When Mr. Clark looks at it on the mantel at home it will revive many pleasant memories.

Rhys Morgan, who sang during the entertainment on Friday evening, is a pupil of Madame Del Vallera of New York and is one of the coming American tenors. He is well known to a number of Chicago railway supplymen and their friends. He was formerly a tenor soloist at the Central Church in Chicago, but is now studying exclusively for the grand opera. His production was very much appreciated and the convention was fortunate in this choice.

F. W. Edmunds, known to his friends as "Buckie" Edmunds, arrived with his wife Saturday from Spring Lake, where they attended the Railway Signal Association convention. Mr. Edmunds is secretary of the Signal Appliance Association and is attending the A. R. A. convention this year as a representative of the Sunbeam Electric Manufacturing Company. This is the 39th annual meeting which Mr. Edmunds has attended, and judging from his "pep" he is good for many more.

L. B. Sherman, usually one of the "old reliables" of *The Daily* staff, and Mrs. Sherman were unable to stay throughout the conventions. They went to Hanover, N. H., to attend the commencement exercises at Dartmouth College, from which their son, Booth, graduates this week. "Lu" is a convention veteran in more ways than one. He has been attending thirty years, and was secretary of the Railway Supply Manufacturers' Association in 1906, when the conventions were first held in Atlantic City.

Jack Schurch, of Manning, Maxwell & Moore, brings to the conventions this year an interesting story of a crane installation on Mr. Ford's railway, the Detroit, Toledo & Ironton. At the road's shops in Detroit it was desired to turn the locomotives in the shop, and due to the lack of space the crane department of Manning, Maxwell & Moore devised a rotating crane. It is of the traveling type with the trolley so arranged that it can be turned 90 degrees while under load, the capacity of the crane being 150 tons.

W. L. Robinson, president of the International Railway Fuel Association and superintendent of fuel and locomotive performance of the Baltimore & Ohio, arrived at the conventions Saturday evening with Mrs. Robinson and their eight-year old son, W. L. Robinson, Jr. Mr. Robinson in speaking of the coal situation, stated that the Baltimore & Ohio had not, up to the present time, confiscated a single carload of coal. Their storage piles are just about depleted and the Baltimore & Ohio is purchasing coal where it can obtain it, although it is of an inferior quality.

F. L. Wynne, manager railway equipment engineering department of the Westinghouse Electric & Manufacturing Company, well known to railroaders because of the active part he has taken in the electrification of the Chicago, Milwaukee & St. Paul, the Norfolk and Western,

the Pennsylvania and the Chilean State Railways, arrived Sunday to remain until the end of the convention. Mr. Wynne is a graduate of Bethany College and Ohio State University and since 1902 has been continuously connected with the electrification work done by the Westinghouse Company.

As a rule the heads of the mechanical department of all the important railroads are familiar figures at the conventions. One of the exceptions is F. H. Hardin, chief engineer of motive power of the New York Central, who had hardly been heard on the floor until yesterday, when he presented the reports of two of the sub-committees on locomotive construction. Mr. Hardin's railroad experience has been gained entirely on the New York Central Lines, his first position being that of machinist. He recently took an important part in the hearings on repair contracts before the Interstate Commerce Commission.

Le Grand Parish has one big hobby at the convention this year—the new Michigan Central locomotive 8000 which was delivered to that road by the Lima Locomotive Works about three weeks ago. This engine is one of the greatest advances in locomotive design and construction that has taken place for many years. It is equipped with all of the tried efficiency devices; all of the auxiliaries operate on superheated steam and there are many other features entirely new to American locomotive practice. Mr. Parish has several photographs showing all manner of views of the engine and he has been kept fully occupied showing them to his many curious friends.

We all miss the genial smile and glad hand of Scott H. Blewett, of the American Car & Foundry Company, king of the "old timers." Those of us whose memories go back to the conventions of 25 years or more ago recall the splendid work he did in helping to form the present Railway Supply Manufacturer's Association, of which he was the fourth president, and in helping to guide it for several years thereafter. As a matter of fact, up to and including the last convention his counsel was sought much as the young man goes to his daddy for advice at critical stages of his career. Fortunately, however, Mr. Blewett is not ill; but he recently suffered a severe loss through the death of his brother Ben and did not feel equal to making the trip from St. Louis to Atlantic City. With the thoughtfulness that is so characteristic of the man, Mr. Blewett sends his greetings to all those here with whom he is acquainted, and expresses the wish and hope that there may be an old time reunion a year hence.

W. H. Fetner, superintendent motive power of the Central of Georgia, reports some extraordinary savings in fuel consumption on his road. During the month of May, last, all divisions made a saving of 43.9 per cent. in freight service, based on the pounds of coal per 1,000 gross ton-miles; 5.7 per cent. in passenger service, based on pounds of coal per passenger train-mile; and 30.8 per cent. in switching service, based on pounds of coal per switching locomotive-mile, as compared with the same month in 1920, making a general average saving in all classes of service of 22.4 per cent., which in money meant \$32,678 to that road. The firemen on the switching engines keep a record of the number of scoops used per hour and they are anxious to improve their service. Local firemen's fuel saving committees hold meetings at every roundhouse terminal to discuss ways and means of saving coal. Frequently the brakemen are invited to these meetings, and discuss methods by which they too may assist in promoting fuel economy. It is by such co-operation that real fuel economy can be obtained.

Second Session of the Air Brake Association

Illustrated Papers on Auxiliary Devices and U-C Brake Were Presented

THE SECOND SESSION of the Air Brake Association was convened at Haddon Hall on Tuesday, June 20, 1922, at 10.00 a.m., with a large attendance. After the opening notices and usual routine business had been attended to, F. W. Brazier, assistant to the general superintendent of rolling stock, New York Central, made a brief address. Mr. Brazier has for years taken a keen interest in the Air Brake Association and has rendered considerable assistance in carrying on its committee work and investigations.

Remarks by F. M. Brazier

Mr. Brazier called attention to the fact that he had come up through the ranks to the highest position in the car department of the New York Central. This he attributed to always doing more work than he was actually paid for and not devoting his main attention to seeking for a promotion.

Attention was directed to the valuable educational work of the Air Brake Association, work that can be carried out in no other way. In this respect the association differs from the M. C. B. Association, whose work has been largely of a legislative character. Unfortunately many railroads do not yet maintain their air brakes in the effective condition that they should, which indicates the need of a continuance of the good work which the association has always carried on. By greater co-operation and support of higher officers, far more might be accomplished to the great advantage of all railroads. The interest and sacrifice which many members of the association show by attending the annual meetings on their own time and at their own expense is something that they would not be called upon to do, if the importance of these meetings was better understood and the great savings which could be secured by putting into effect the practices brought out in the association meetings, were realized.

Air-Operated Auxiliary Devices

The first subject taken up was the committee report on auxiliary devices, presented to the executive committee in 1921. The report, in the absence of C. H. Weaver (New York Central), chairman, was read by C. B. Miles (Big Four), following which R. E. Miller (Westinghouse Air Brake Company), showed and explained lantern slides of the various diagrams and charts used in the report.

This committee, which was appointed subsequent to the meeting of the association in Cleveland, May, 1918, presented preliminary reports in 1919 and 1920 and a complete report to the executive committee in 1921. An abstract of this report was given in the *Railway Mechanical Engineer*, August, 1921, page 484.

The object of the work done by the committee was to obtain information concerning the air consumption of various locomotive auxiliary devices other than those belonging to the air brake, such as air-operated fire doors, bell ringers, cylinder cocks, reverse gears, sanders, water cocks, coal pushers, etc.; to establish and follow up a code of tests for such devices; to devise a convenient system for recording and reporting a maintenance program from the standpoint of cost and benefits received; and to obtain data as to costs and factors involved in such a maintenance program. In the work

carried on; auxiliary devices for both steam and electric locomotives were given consideration.

Several forms for test reports were presented and instructions given relative to their use. Information was given in regard to the number of various auxiliary devices in service, the average number of times each are used per day, the length of time in service, the quantity of air consumed and the money value of this air. The value of the savings which might be effected by reducing the air consumption to the limits established by the code was calculated, and the possibilities were shown to be vastly greater than commonly realized. A convenient method for applying condemning limits to tests of auxiliary devices was described, together with a test code. The report closed with conclusions and recommendations which were clearly stated.

The maintenance programs which were reported according to the plan show results that would be hard to credit if it were not possible to check up the records by comparison. The tremendous margin for economy is more evident than it has been in any of the data submitted previously by this committee. The yearly saving of more than \$45,000 for a railroad system that uses less than 1,000 locomotives is remarkable. Of course, this value is based on cost of testing and repairing all auxiliary devices at least once a year. It might be possible that the average need of repairs would prove to be more than once a year for each device. In such event, the savings figures would be reduced by the increased cost of repairs, but this reduction would not seriously affect the margin of saving. The figures show that the frequency of repairs could be increased to four times a year or once every three months for each device and still permit a saving of more than \$36,000. It should be borne in mind that this saving does not take into account the large benefits derived in the way of more reliable and efficient auxiliary device operation. Locomotive failures and expensive delays are frequently chargeable to auxiliary devices when the latter are poorly maintained.

Standing tests show that the average condition of auxiliary devices on steam locomotives is far below the standard that should and can be maintained. Figures obtained from tests made last year are not much different from those presented in previous reports and they confirm all the original conclusions.

The electric locomotive auxiliary device tests indicate that many of these devices use much more air than should be required for the functions they perform. The consistently low minimum values of the air consumption rate found on most types of devices show that their condition is about on a par with that of auxiliary devices on steam locomotives. It will be noted that very high rates of air consumption were observed for some of the devices; in fact, the larger of these values is much in excess of anything experienced in tests made on steam locomotives. The average rate for alarm whistles is more than 500 cu. ft. per minute, and the maximum on one whistle was as high as 1,180 cu. ft. per minute, or about 25 times the nominal capacity of the C-60 compressor commonly used on electric locomotives. This rate is equivalent to an orifice $\frac{3}{4}$ in. in diameter and no doubt this whistle is like the one made famous by Mark Twain.

The report, which is one of the most valuable ever presented before the association, was signed by C. H. Weaver (New York Central); C. B. Miles (Big Four); W. W. White (Michigan Central) and R. E. Miller (Westinghouse Air Brake Company).

Address by Frank McManamy

The convention was addressed by Frank McManamy, manager department of equipment, United States Railroad Administration. Mr. McManamy spoke of the especial interest which he had always taken in the affairs of the Air Brake Association, referring particularly to the relations which had existed during the period of federal control. He dwelt on the importance of the air brake to railroads, the one device of which every one having to do with railroad operation must have a reasonable working knowledge. This fact, he stated, placed the air brake on a par with the standard operating rules. It was his opinion that the Air Brake Association should be held responsible for the standard rules governing the maintenance and operation of air brakes.

The opinion was expressed that the air brake man was not aggressive enough in the matter of bringing his needs to the attention of operating officials. He reminded the men present of the fact that although chronic kicking was not the best thing either for a man or for an organization, it was the "squeaking wheel that got the grease."

The air brake man must have the faculty of successfully dealing with men, not only men who are under him, but with men who are above him in rank.

U-C Brake

An interesting illustrated, descriptive talk on the U-C brake was presented by J. C. McCune on behalf of the Manhattan Air Brake Club. In addition to the use of lantern slides, moving picture films showing the operation of the U-12 universal valve were also displayed. The talk took up the steps which led to the development and design of the U-C valve, not only the steps immediately following the Lake Shore tests in 1919, but also the earlier progress in air brake evolution. The operation of the valve was well covered, as would not have been possible without the use of lantern slides.

Following this a number of slides and moving pictures were thrown on the screen by P. O. Warren, of the Picture Service Corporation, Chicago. The pictures shown were of gasoline engines, carburetors, refrigerating machines, etc. They were first prepared and used effectively during the war in educating men undertaking new lines of work. Since then they have been found useful by a number of manufacturing concerns in the training of apprentices and workmen.

Air Brake Appliance Association

The following members of the Air Brake Appliance Association have exhibits at Hadlon Hall. This is in addition to space on the pier occupied by them and by various other firms manufacturing air brake appliances.

Ashton Valve Company, Barco Manufacturing Company, Clark Company, Crane Company, Joseph Dixon Crucible Company, J. B. Ford Company, Johns-Manville, Inc., The Leslie Company, Harry A. Montgomery, New York & New Jersey Lubricating Company, Pilot Packing Company, Railway Review, Simmons-Boardman Publishing Company (*Railway Age*, Railway Mechanical Engineer, Railway Electrical Engineer, Railway Signal Engineer and Railway Maintenance Engineer) and Westinghouse Air Brake Company.

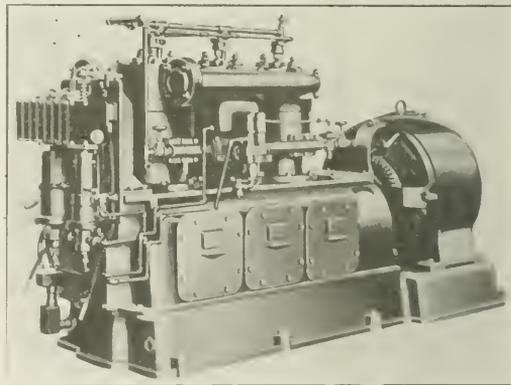

New Devices Among the Exhibits

Westinghouse 3VS Motor-Driven Air Compressors

THE WESTINGHOUSE-NATIONAL 3VS motor-driven air compressor, exhibited by the Westinghouse Air Brake Company, Pittsburgh, Pa., is especially suited for railroad work—to supply air for yard charging plants, signal operation, and for general shop use. It is designed for continuous operation, having water jacketed cylinders and cylinder heads, with forced water circulation. Various sizes are available to suit the volume of air and pressure desired. The compressor is driven by a direct or alternating current motor which may be wound to suit a great variety of voltage and current conditions.

The outfit is very compact, as the compressor, motor, and control system form one complete self-contained unit. It is of the single stage, single-acting type with three vertical air cylinders. Placing the cylinders vertically eliminates uneven wear on the piston and cylinder walls, reduces vibration to a minimum and assures quiet operation. All parts are carefully made of the best materials, and liberally proportioned to withstand long usage. Adequate and positive lubrication for all working parts is provided automatically.

The automatic control is a distinctive feature of importance. It starts and stops the compressor when the minimum and maximum pressures have been reached in the storage reservoir, so that the current consumed is in proportion to the air used, and the outfit does not require

3VS Direct Current Motor-Driven Air Compressor

constant attention by an operator; it unloads the compressor during the accelerating period; it restricts the flow of current to that actually required to accelerate the compressor (unloaded) in the shortest time possible without exceeding full load running current; it restricts the use of cooling water to the operating period; it protects poly-phase motors from single-phase operation by means of an underspeed release device; it obviates the necessity for the use of a circuit breaker or any protective device other than fuses; it prevents starting of the compressor if there is insufficient oil supply in the crank case. By virtue of the complete automatic control, the most satisfactory and economical operation of the compressor is assured.

Entered at the Post Office of New York, N. Y., as mail matter of the second class.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free; United States, Mexico and Canada \$6.00. Foreign Countries (excepting daily editions), \$8.00. Foreign subscriptions may be paid through our London office in £ s. d. Single copies, 25 cents each.

WE GUARANTEE that of this issue, 11,000 copies were printed; that of these 11,000 copies, 10,300 were mailed to regular paid subscribers to the Railway Age and Railway Mechanical Engineer; 110 were mailed to advertisers; 490 were provided for counter and news companies sales, new subscriptions, bound volumes, samples, copies lost in the mail and office use; and 100 copies for distribution at Atlantic City.

THE RAILWAY AGE is a member of the Associated Business Papers (A. B. P.) and of the Audit Bureau of Circulations (A. B. C.)

Only a few years ago pulverized coal was hailed as the solution of the railroad fuel problem. A number of tests were made, some of which were fairly successful, but the main fact brought out was that existing designs of locomotives are not adapted for satisfactory operation with such fuel. At present pulverized coal is practically a dead issue insofar as the railroads are concerned. It is quite possible that the initial failure of the system will retard its adoption where it might effect considerable economies. Recent investigations have developed improved methods of burning powdered coal and the highest boiler efficiency ever recorded was obtained in a plant using such fuel. Railroads should certainly consider its use in stationary plants; in one case that was investigated not long ago it was found that by using pulverized fuel in a railroad power house, the cost of operation

could be reduced with a saving of about \$30,000 in the initial expenditure as compared with hand or stoker firing. Pulverized coal is not a specific, but it is no doubt the cheapest fuel under certain conditions. Its use in stationary plants may develop further improvements and point the way for further applications in locomotive service.

Both F. W. Brazier and C. D. Young made some excellent suggestions in their discussions at the Purchases and Stores meeting Tuesday morning. Both referred in particular to Liaison Sections Between A. R. A. consultations which would prove profitable between Division V and Division VI. Take for instance the recommended practices for the Reclamation of Material as developed by Division VI. Mr. Young pointed out items in the committee report which were at variance with ideas that have already been expressed by Division V. Would it not be advisable in developing any such reports to confer with either the secretaries or specially appointed representatives of the various sections of the A. R. A. on matters in which there is community of interest? By doing so far more workable practices would be evolved and the greatest good would result from the expert work performed by all divisions of the American Railway Association.

It is plain, everyday economics to insure that no expenditures be made unless the result obtained from that expenditure is a return in excess of the cost. Furthermore, it is false economy to do things yourself which can be done more cheaply by others. These principles hold in the reclamation of material, as in everything else. They are perhaps more difficult of application because of the innumerable phases of the work that must be considered. The reclamation department must not do work which can be done better and more cheaply by other departments, simply for the sake of making a showing. The most careful scrutiny should be given to every article reclaimed. This not only applies to the cost of doing the work, but also to the service that is to be rendered after the work is done. We have heard stories told by railway men of how they "put it over" another department. Anything of this sort shows that a man has not a broad vision, or real appreciation of the responsibility to the railway by which he is employed.

There are 16 officers and executive committee members of the Mechanical Division. The terms of the officers run for two years. In the normal course of events, after a motive power department officer has reached a position of sufficient influence in the field to be a suitable candidate for membership on the General Committee, he must pass through 32 years of service before he is advanced to the position of chairman, except as breaks in the ranks of the committee through death or retirement from the service operate in his favor. Thus, the younger and more active members of the Division have very restricted opportunity to exert a real influence in its affairs. The action of the Resolutions Committee in presenting, and the members in adopting, a resolution at the closing session of the convention on Wednesday, recommending a change

One-Year Term for Officers

in the tenure of office of the chairman and vice-chairman from two years to one year, is likely to have an important bearing on the future welfare of the Division. The proposed change will have no detrimental effect on the continuity of policy of the Division, while the enlarged opportunity for active influence in the affairs of the organization by the younger men will tend to keep it in step with progress in the motive power and equipment field.

In the discussion of reclamation at the convention of the Purchases and Stores Division the recommendation was repeated several times that all the work of reclaiming material be under the jurisdiction of the stores department. The principal arguments in favor of this arrangement are that

Should Reclamation Be Centralized?

the stores department knows what material is required and that reclamation work is given special attention if it is concentrated in that department. In general, the conclusion reached by the purchasing and stores officers is sound. The advantages of a general reclamation plant for all classes of material is evident, but under certain conditions there may be considerable saving by doing the work in the mechanical or maintenance departments. Oftentimes facilities are available in the shops to handle the same work that would be done in a special reclamation plant. In such a case centralizing the reclamation work would involve a duplication that would not be economical. Spring reclamation is a typical example. The remaking of springs is an important part of the blacksmith work in locomotive shops and there seems no valid reason why the shop equipment and the experienced shop forces should not be utilized for spring reclamation, which requires considerable skill and technical knowledge if it is to be handled properly.

While overhead traveling cranes have been installed in a few enginehouses and while the Whiting hoist has achieved a well deserved popularity handling heavy repairs, in others it is essential that all enginehouses be provided with an adequate number of drop pits, especially engine truck and tender wheel drop pits. These are relatively inexpensive and save a large amount of time. As a rule, engine truck drop pits are placed near the end of the pit furthest from the turntable. This means that if a pair of tender wheels must be changed it is necessary to turn the locomotive. Even then only the No. 3 and 4 wheels can be changed since the engine will not back in far enough to get No. 1 and 2 wheels over the drop pit. The result is that the tender must be entirely disconnected from the locomotive when a defect develops involving a change of tender wheels No. 1 or 2. The same argument also applies to trailer wheels; the relatively small investment required for tender drop pits properly located is justified by the reduced locomotive delays. In passing, a word may also be said in favor of depressed rails with inserted rail sections. A depression of 4 or 5 in. in a length of 5 ft. is usually sufficient and is a great time-saver for changing springs and spring rigging on any part of a locomotive without using jacks. In changing tires also, blocks can be put between the binders and driving boxes holding the wheels clear of the rail when over the depression. It is easy to heat the tires and shim them. It is said that with a proper understanding of how to do the job an engine truck spring can be changed, using the depressed track without jacks, in about 15 min.

It is obvious that one of the most important functions of the engine terminal is to provide adequate inspection of locomotives. Wherever space is available and other conditions do not interfere inspection pits should be provided ahead of the ash pits, water standpipes and coaling station. These

Locomotive Inspection at Terminals

pits should be covered so that the inspectors will be protected from the weather in localities subject to severe weather conditions. The difficulty of making a careful inspection of any piece of machinery in a snow, rain, or sleet storm is self-evident. It has been found expedient to provide one or more helpers to accompany the inspector and perform certain minor repair jobs, such as tightening nuts, applying cotters, etc., as this work is discovered. This method assures that the work is done promptly and in addition the paper work of reporting the defect is eliminated and the time of some roundhouse man, who would ordinarily take the report and look up the job, is saved. The inspector reports what he finds and this work is in addition to that reported by the engineman. It is essential that the inspector make a note of any defective or broken parts which will need removal and renewal so that the storekeeper can be notified at once and have this material on hand promptly, thus reducing locomotive delays. The condition of a boiler front end is of vital importance and at the time of the monthly washout it has been found good practice to have an inspector examine carefully the spark arrester, steam pipes, exhaust base, nozzle tip, blower connection, etc. The roundhouse foreman is therefore safe in assuming that the front end of that particular locomotive, if reported in good condition, will be good for at least 30 days. Violation of I. C. C. safety regulations should also be watched for by an inspector responsible for this part of the work.

A foreman who had been a railroader all his life recently went into an entirely different business. Incidentally, his progress in this new line of work indicates that he has ability as an executive, as well as a thorough understanding of up-to-date shop practices and methods. Asked why he had left railroad service, he said that he was tired of being "bawled out;" indeed he felt that he could not continue to maintain his self-respect and remain as a foreman in a large shop on an important railroad. When our country was forced to speed up production under war conditions it was necessary to recruit many foremen in the industries. It was quickly found that not only these new men, but the older foreman in the service, could not meet the new conditions without additional instruction and training. Foremanship courses were developed and put into operation in a considerable number of industrial plants. In a report made by the Committee on Foremen at the 1921 meeting of the National Association of Corporation Training, the statement was made that certain definite results were obtained from these foremanship courses in some of the plants; these were enumerated as follows: Improvement in the morale of the foremen and workmen; more efficient handling of standard practice and the development of better production methods; increased quantity and improved quality of production; latent capabilities of men were discovered that aided in solving more intelligently the plant personnel problems; increased intelligence in the supervisory force by personal development. The report specifically states that these are not estimated results, but ones which were actually secured. Railroad organizations generally have not promoted courses of this type. Here is one place where

Stop "Bawling Them Out"

distinct economies are possible without an unreasonable expenditure—and moreover an appreciation of these things will stop the “bawling out” process and hold the better class of men in railroad service.

When a new device for use on railroads is conceived there is often great difficulty in finding opportunities for testing it out and developing it. Inventors,

A Co-operative Laboratory

railway supply concerns and the railroads themselves have expended millions upon millions of dollars in developing and improving such devices and appliances. In some cases devices have been tried out which were essentially wrong in principle and could never be made commercially practicable; often, if there had been a central clearing house or laboratory, the inventors or developers of these devices could have been saved from the useless expenditure of much energy and money. Then, again, a meritorious device is sometimes conceived but is finally discarded because it is not put into the right hands and has not had any real opportunity for development or demonstration. These “lost” devices form a monument to the lack of a clearing house or laboratory which should have been established long ago by the railroads, strictly in their own selfish interests. It has been suggested that if such a laboratory were established under the direction of the American Railway Association, or failing that, under a group of strong roads, meritorious devices could be developed and approved and inferior ones could be discarded and the railroads would pay out only a small percentage of the amount of money that they are paying today in testing out and improving these appliances in a haphazard fashion. Unfortunately, the larger number of roads, including practically all of the small ones, today have no facilities for investigating these matters thoroughly and many of them in their efforts to improve themselves are trying out devices that will never make good. This comment is presented to strengthen, not to detract from, the editorial comment in Friday's *Daily*, entitled “How to Successfully Avoid Progress.” It is not the intention to discourage the developing and testing out of new appliances, but rather to put the whole thing on a reasonable and scientific basis so that devices of merit can be developed quickly and thoroughly with the least expenditure to the railroads at large.

During the period of federal control and that immediately following the railroads had no opportunity of employing or training special apprentices. The doors of the railroads, so far as the locomotive or car departments were concerned, were practically closed against the college man.

Special Apprentices

The absence of any provision for the employment or training of these men acted as effectively as a bar against them as though a definite ban had been placed against them. This ban has now been lifted. While it is not clear why the age limits of 18 to 26 were set, or why the course was made of four instead of three years' duration, still the rule of the Railroad Labor Board is on the whole a good one and permits those railroads who so desire to give these men a thorough practical training. For three years they may be assigned to any work the management desires, may be moved from one class of work to another, from the work of one trade to that of another at the discretion of the management without any of the restrictions of the classification of work of the different shop crafts. This permits of a wide and varied training for these men suffi-

cient to broaden them out and give them a general knowledge of the various classes of work with which a foreman or other executive should be familiar. At the close of the three-year course he must work another year at some one trade of his choosing, after which he is eligible for employment as a craftsman in that trade and may work as a mechanic in that craft until such time as he proves his fitness for promotion and the management feels justified in placing him in a position of minor foremanship. Meanwhile he will be found to be a very valuable man for staff duties or other special work. No special favors are asked for him over the regular apprentice or other shop employe. He is not to take any man's place or deprive any one else of the right to promotion. All that is asked is that he be given suitable training and the right of fair and just competition wherein he may prove his worth. It would seem an opportune time for the railroads to try out a number of these technical graduates, but it will be useless to go into the matter unless arrangements are made to give them proper training.

The paper entitled “Wastes in Air Brake Service” presented by Prof. S. W. Dudley before the Air Brake Association and printed in the *Daily Railway Age*, June 20, 1922, contained much that might be read with interest and profit by railroad men who are not directly connected with air brake

Avoidable Air Brake Wastes

work. One of the most easily detected wastes in air brake service is that due to unnecessary leakage of compressed air from pipe joints, hose and couplings, unions, valve sets, brake cylinder packing, etc. This can be avoided, or at least greatly reduced, provided those responsible are willing to pay the price—and the returns will be large. As an example of what may be done if there is a sufficient and well recognized incentive, examples were cited of conditions found in Europe, where practically no leakage was tolerated. This was brought about largely by the high cost of locomotive coal and a recognition of the fact that it takes considerable coal to generate the steam used by an air compressor. It is doubtful if a single instance of such a high degree of tightness could be found on any American railroad. Possibly the balance between costs for labor and coal would not warrant the general adoption of quite so high a standard. The tendency of Americans, whether railway mechanical men or not, is to maintain an attitude of blindness in regard to things that do not personally annoy them. We therefore overlook and fail to take any steps to overcome wastes which could be easily recognized and corrected if we were so disposed. As an illustration, we notice the hiss caused by an air leak and although it may be our business to attend to maintenance matters, it does not annoy us sufficiently to cause us to have it stopped, despite the fact that we well know—if we but stop to think—that air in the compressed state is far from being inexpensive. Another source of waste, by no means confined to air brake work, is caused by the lack of proper facilities for doing work economically. A good man equipped with a hammer, cold chisel, file, and a monkey wrench or pipe tongs, can do considerable work in a day, but in far too many cases no other facilities are provided, although labor costs could be reduced greatly by a small investment in equipment. Other wastes are the careless use of material, drawing out more material than necessary, or drawing new spare parts when the old ones could be repaired at small expense and be used again. A spirit of indifference to the wastes which are going on all around us results in an extravagance that is typical of the spirit of the past and not of the future.

The ability to use the large locomotives now commonly employed for handling high tonnage freight trains was made possible largely by the development of the mechanical stoker, for until stokers were applied it was not possible to realize the full capacity of such power. In the development of the stoker, attention was at first directed toward the increase in capacity that might be obtained for stoker fired locomotives, irrespective of the relative efficiency of the stoker and the hand fireman. Several types of mechanical stokers have now been brought to such a high degree of development that there is no question about their reliability. The thought was commonly entertained at first that with stokers mechanically perfected they could be operated easily by anyone. However, it is now quite generally recognized that just as much intelligence on the part of both the fireman and the engineman is required to operate a stoker fired locomotive as was ever required for a hand fired locomotive. The manual labor is lessened but the results obtained will still depend upon the amount of skill and judgment displayed by the operator. The tonnage hauling capacity of a locomotive is easily determined but the efficiency of the boiler in the production of steam is not so readily ascertained and there is a feeling among some railroad men that capacity has been secured at the expense of efficiency. No report was submitted this year by the committee on mechanical stokers, but it is hoped that it will be able to carry on a series of tests in the near future which will enable it to submit at the next convention facts in regard to the relative efficiency of hand and stoker firing. This would be an important and welcome addition to previous reports.

The report of the Committee on Specifications and Tests for Materials reflects considerable reluctance on the part of the railroads to make extensive use of heat treated steels. There are at least two good reasons for the slow progress which has so far been made in the use of this class of materials for locomotive forgings. First it has been found that these steels are very sensitive to slight variations in the physical treatment to which they are subjected in the shops. The slight localization of stress resulting from a tool mark or surface scratch has been sufficient to start the development of detail fractures. Changes of section with sharp corners or fillets of small radius have had similar results. This sensitiveness to slight variations in the physical condition of the metal and a similar tendency of heat treatment to exaggerate the effects of segregation in the chemical composition of the metal tend to reduce the life of heat treated parts which are subjected to vibrations and heavy reversals of stress, if full advantage is taken of the increased elastic limit in proportioning the parts. Considerable doubt, therefore, remains in the minds of many railroad officers as to the safety of reducing the weight of parts as far as the physical properties of the material would seem to make possible. Second, few railroads are equipped with the facilities necessary to work heat treated material and restore it to its original condition. This does not apply to so great an extent in the case of axles and crank pins as in the case of rods, which frequently require straightening. But axles and crank pins, after they have been removed from service, are usually worked up into some other usable form. Here it becomes necessary to subject the material to heat in the shop and there are not many railroad forge shops equipped with the facilities or with the knowledge of the materials they are dealing with, necessary properly to control the temperatures in such operations. These considerations

The Use of Heat Treated Steel

Efficiency of Stoker Fired Locomotives
 opment of the mechanical stoker, for until stokers were applied it was not possible to realize the full capacity of such power. In the development of the stoker, attention was at first directed toward the increase in capacity that might be obtained for stoker fired locomotives, irrespective of the relative efficiency of the stoker and the hand fireman. Several types of mechanical stokers have now been brought to such a high degree of development that there is no question about their reliability. The thought was commonly entertained at first that with stokers mechanically perfected they could be operated easily by anyone. However, it is now quite generally recognized that just as much intelligence on the part of both the fireman and the engineman is required to operate a stoker fired locomotive as was ever required for a hand fired locomotive. The manual labor is lessened but the results obtained will still depend upon the amount of skill and judgment displayed by the operator. The tonnage hauling capacity of a locomotive is easily determined but the efficiency of the boiler in the production of steam is not so readily ascertained and there is a feeling among some railroad men that capacity has been secured at the expense of efficiency. No report was submitted this year by the committee on mechanical stokers, but it is hoped that it will be able to carry on a series of tests in the near future which will enable it to submit at the next convention facts in regard to the relative efficiency of hand and stoker firing. This would be an important and welcome addition to previous reports.

suggest that the possibilities are greater for any alloy steel, the working properties of which are developed by a simple annealing process, than for those steels which require treatment by the quenching and tempering process.

R. S. M. A. Committee Appointments

CHARLES W. BEAVER, the newly elected president of the Railway Supply Manufacturers' Association, announced the following committee appointments before leaving Atlantic City:

- Exhibit Committee: W. H. S. Bateman, chairman, The Parkesburg Iron Company; S. H. Campbell, Western Railway Equipment Company; George W. Denyven, George W. Denyven & Co.; G. E. Ryder, The Superheater Company; and George T. Johnson, Buckeye Steel Castings Company.
- Finance Committee: John M. Gillespie, chairman, Lockhart Iron & Steel Company.
- By-Laws Committee: George L. Morton, chairman, Galena Signal Oil Company; L. B. Sherman, *Railway Age*; and Charles C. Castle, National Railway Appliance Company.
- Hotel Committee: W. K. Krepps, chairman, Crucible Steel Company; and Charles C. Castle.
- Badge Committee: L. B. Sherman, chairman; and T. D. Kingsley, S. F. Bowser & Co.
- Entertainment Committee: C. W. Floyd Coffin, chairman, Franklin Railway Supply Company.
- Enrollment Committee: F. H. Smith, chairman, Gold Car Heating & Lighting Company.
- Transportation Committee: H. E. Daniels, chairman, West Disinfecting Company.

Canadian Representative on R. S. M. A. Executive Committee

THE RAILWAY Supply Manufacturers' Association has decided to add another member to its executive committee representing what will be known as the Eighth District, including all of Canada. That country has never been officially represented on the executive committee, although the supply interests from that country have always participated cordially and heartily in the work of the organization.

Arthur Allen, vice-president of the Holden Company, Ltd., has been elected as the Canadian representative for a term of three years.

Record-Breaking Registration

THE FINAL comparative figures for the registration at the 1922 and 1920 conventions are surprising in many respects. The total registration is considerably larger this year than two years ago. There were fewer supply men and supply ladies at the meetings this year, but this decrease was more than offset by the increase in the number of railroad men and their families who were registered. There were 2,339 railroad men registered this year as against 2,024 last year. It is interesting to note that the total number of railroad men and the total number of supply men were almost identical this year.

Div. V—M. and M. C. R.	1,222	1,920
Div. VI—Pur. and Stores	1,008	875
Special guests	381	364
Supply men	947	785
Railroad men	2,304	2,578
Railroad ladies	1036	798
Supply ladies	575	676
Total	6,254	6,073

American Railway Association—Division V—Mechanical

Report on Design and Maintenance of Locomotive Boilers Brought Lengthy Discussion

Chairman Coleman called the meeting to order at 10 a.m.

Design and Maintenance of Locomotive Boilers

In an interesting comparison of the radial stay and Belpaire types of boiler construction, the committee draws the conclusion that for a given diameter of boiler shell the Belpaire type has the following advantages: (1) greater steam storage space; (2) greater steam disengaging surface; (3) greater firebox heating surface; (4) greater number of tubes, and (5) all vertical stays of uniform length.

The committee has done considerable work in canvassing the dry pipe situation with a view to determining the possibility of substituting commercial pipe sections for the special sections now frequently specified and presents a table of proposed commercial sizes to meet this condition.

The committee makes the following definite recommendations: 1. Buttonhead staybolts be adopted as recommended practice for crown sheets in other than oil-fired boilers; 2. The proposed pipe sizes be adopted as recommended practice for dry pipes in designing new boilers; 3. The practice of autogenous cutting and welding be further developed; 4. Hot water washout systems be adopted as recommended practice in washing and testing of locomotive boilers; 5. The installation of water treating plants be generally adopted in the bad water districts; 6. Improvement be made in the usual form of tapered screw washout plugs.

Design

THERE ARE TWO general styles of locomotive boilers at present being applied to locomotives in this country, the Belpaire and the radial stay.

The radial stay type of boiler was preceded in use by the crown bar type. As the demand for larger boilers and higher pressure took place, the weight of bracing necessary to support the crown sheet became excessive, increasing the difficulty in washing out and keeping the crown clear of sediment, due to the obstruction of crown bars.

In the earlier style of radial type the crown sheets were so much arched that it was possible to apply only two center rows of radial stays with buttonheads to bear squarely against the under side of the crown sheet, and the angle of the stays was such that the heads of the outer rows would not bear squarely against the under side of the crown; the end through the outer shell was at such an angle

that it was impossible to get a continuous full thread fit within the thickness of the shell sheet, resulting in leaky staybolts.

In the later designs of radial stay fireboxes the crown sheet was very much flattened, permitting the application of buttonhead stays to approximately the full width of the crown. In the first design of radial stay fireboxes, in order to get the number of flues to correspond with those used in equal size crown bar boilers, the crown was carried higher than in the crown bar boiler, resulting in restricted steam space. In flattening the crown sheet, the steam storage space was increased, but the firebox heating surface reduced as compared with the earlier designs.

In the Belpaire type, the outside and inside firebox sheets are arranged with the surfaces of sheets practically parallel, permitting the application of braces at right angles to the plate supported, thus giving maximum fit for the threads of the stays or sleeves in the sheets and enabling the use of buttonhead stays through the full width of the crown.

TABLE II—PIPE AND CASING SIZES

Pipe size in.	Pipe		Casing	
	Outside diameter in.	Thickness in.	Casing size, outside diameter, in.	Thickness in.
4½	5	.247	5	.152
5	5.563	.258	5½	.154
6	6.625	.280	6	.164
7	7.625	.301	7	.174
8	8.625	.227 or .332	8	.186
9	9.625	.342	9	.196

The casing diameters of standard weights approaching the heaviest demand for 5-in., 6-in., 8-in. and 9-in. outside diameter dry pipes are shown in Table III.

TABLE III—CASING SIZES MOST NEARLY APPROACHING DRY PIPE SIZES

Outside diameter, in.	Thickness, in.		Outside diameter, in.	Thickness in.
	5	6		
5	.241 or .301		7	.231 or .275
6	.224 or .275		8	.236

In the 9-in. outside diameter the lightest standard casing is .196 in. thick, and, therefore, it would be better to have pipe size adopted in either 8½-in. or 9½-in. diameter. The 8½-in. would be either .277 in. or .322 in. and the 9½-in. outside diameter .342 in. thick.

We recommend that the sizes in Table IV be used for dry pipe and that they be adopted as recommended practice.

TABLE IV—PIPE SIZES RECOMMENDED FOR DRY PIPE

Present Pipe		Proposed Pipe		Thickness in.	Outside diameter in.
Inside diameter, in.	Thickness, in.	Nominal inside diameter, in.	Actual inside diameter, in.		
5	¼	5½	No corresponding size		
5½	¼	6	5	5.047	.258
6	¼	6½	6	6.065	.280
6½	¼	7	7	7.023	.301
7	¼	8	8	8.171	.227
8	5/16	8½	9	8.941	.342
9	5/16	9½	No corresponding size.		

Consideration should be given to the design of cast iron dry pipes, in view of the present usual practice.

Boiler Maintenance

The renewal of firebox sheets is the principal expense in boiler maintenance. There has come into use the last few years, the gas cutting torch for cutting out, for removing defective parts, and autogenous welding for uniting plates.

The autogenous welding process is used for the application of patches to firebox inside sheets, of half and full side sheets, of crown sheets, of whole and part back flue sheets, of whole and part door sheets, of door collars and door hole patches, of mud ring corner patches, and of welded fireboxes complete; for reinforcing mud ring corners and rivet seams, and for welding broken mud rings. For other than fireboxes is used for welding outside side sheets, electric welding flues, welding cracks and holes and fastening studs.

The use of the autogenous system of welding brings with it so many advantages from the standpoint of decreased thickness of material and decreased cost of maintenance that it should be developed to the fullest extent possible, but at the present time the state of the art is not sufficiently developed to warrant the committee making definite detailed recommendations. Attention is called to the practices of the Baltimore & Ohio, Chicago, Rock Island & Pacific, Atchison, Topeka & Santa Fe, Union Pacific System and other leading railroads in the country, all of which have established practices well worthy of consideration which doubtless will be further developed.

Tools and accessories required in electric welding work are as follows: Electrode holders for metallic arc welding, Fig. 3, and welding cable. As far as possible portable welding cable over 50 ft. in length should not be used. Additional outlets should be provided when necessary to use longer cables. The condition of the insulation of portable cable should be watched and repairs made when insulation shows signs of breaking through. Bare spots in the cable may cause short circuits that will result in considerable damage. In welding, the surface should be kept clean, operators using brush for this purpose.

In the majority of shops and roundhouses the track rail is used as a part of the circuit for welding current. When welding work on un wheeled locomotives, tanks, boilers or other metal parts supported on wooden blocks, the electric circuit between the work and the rail is to be made by the use of "ground" cables, as shown on Fig. 4. In attaching these cables for work on which welding is to be done care must be taken to see that a good electrical contact is secured between the end of the cable and the work, the

connection to be made as near as practicable to the point at which welding is to be done. Where carbon arc welding is to be done at least three No. 2 A. W. G. ground cables should be used. Poor electrical contact can be detected by excessive heating and should be corrected when found. For these ground cables welding cable on which the insulation has badly worn may be used.

Welding operators should be fully familiar with starting and stopping of welding motor generator sets, regulating voltage or adjusting current to give the desired amount of heat, etc. The welding electrode is to be connected to the negative side of the circuit which is taken care of in the permanent wiring where a ground rail return circuit is used. A short steady arc should be held, maintaining approximately ¼ in. between end of electrode and the work and with sufficient current to insure a uniform flow of metal and producing at least ¼ in. penetration. With clean

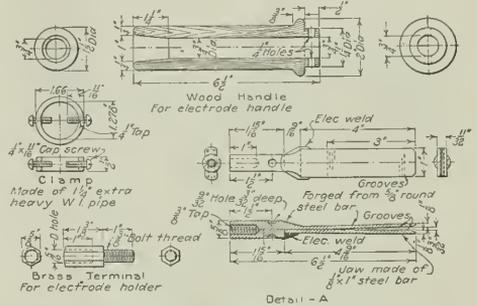

Fig. 3—Electrode Holder and Cable for Use in Welding

surface and other conditions correct, if the current is too low the electrode will melt slowly and quietly and will not unite properly with the work, while if the current is too great the electrode will melt rapidly, the arc biting deep into the work, producing a hissing sound and the deposited metal tending to boil, giving a porous appearance.

When a welding operator is through working he should disconnect all cables, return them to their proper place and open those switches governing his work.

Carbon arc welding can be done only with welding generator sets of 600 ampere capacity or larger. Where 600 ampere capacity set is used for carbon work, only the operator doing this work can use the machine at one time. Welding circuits, panels, welding cables, electrode holders, etc., must also be of sufficient capacity and suitable for this character of work. In this connection sufficient capacity in the welding panels and permanent wiring can be secured by operating two panels and circuits in parallel. Portable welding cable of the size specified on Fig. 3, for carbon arc welding, should be used, but where this is not available, two cables connected in parallel of the size used for metallic arc welding can be used.

In electric welding there are certain general rules which should be observed. For welding, the pieces are to be kept thoroughly clean and free from grease, rust, scale and other foreign substances. Places that are not chipped clean in beveling should be cleaned at least one-half inch on each side of the bevel.

Never apply a weld to the barrel of the boiler. Never weld studs

to the barrel of the boiler. Autogenous welding should not be permitted on any part of a locomotive boiler that is wholly in tension under working conditions; this includes arch and water bar tubes.

Water Treatment

An important factor in the cost of boiler maintenance is the quality of water used, and we can not emphasize too strongly the desirability of furnishing the best possible, by which we mean water free from suspended matter, corrosive and scale-forming substances and as low as may be in alkaline salts.

Scale and corrosion greatly diminish the life of a boiler, which with the expense of repairs is largely dependent on the amount of impurities in the feed water. In districts where good water is available, flues and sheets readily last the legal limit, but when water high in scale-forming substances is used the life of the flues is reduced to less than one year. In this latter case frequent

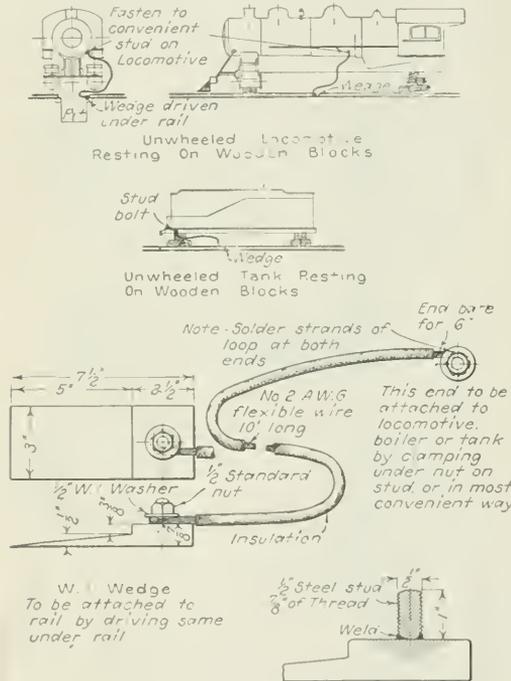

Fig. 4—Ground Cable and Its Use

work is necessary, sheets leak around flues and bolts and the repeated working and caulking and the hammering in the effort to remove scale, keep the locomotives in shop a large part of the time and result in premature failure and relocation to the back shop for delayed repairs.

When natural waters of good quality are not available, those of poorer quality should be given treatment to improve them and expense should be given to the conclusion that the effectual way to prevent the deterioration of rails is to remove the impurities in the feed water and treated plants, before the water is introduced into the boiler. The results of such pre-treatment are well known and it is not necessary to quote figures here, but it may be noted that the installation of treating plants in hard water districts, costs an investment that will show a big return in reducing the cost, not only of boiler maintenance, but also of general operation.

The committee strongly urges the serious consideration by the railroad management, the installation of water treating plants.

Circulation

The committee urges the careful consideration of the design of boilers to the end of perfecting circulation of water.

Feed Water Heaters

The Committee is of the opinion that attention should be given to the further development of feed water heaters in order to effect more economical operation of locomotives.

Boiler Wash-Out and Fill Systems

The cost of boiler maintenance can be very materially kept down and the maximum efficiency of the boiler more nearly obtained by the consistent use of hot water washout and fill systems. In the use of hot water, in order to be effective for the loosening of scale and washing out mud from the interior of the boiler, it should be under a pressure of about 120 lb. per sq. in., and at a temperature of about 150 deg. F. This force and temperature will quite effectively remove scale and clean the boiler.

There are three general types of washout and fill systems in use

1. The ejector type, in which washout water is slightly heated and placed under pressure by injecting steam into it through a suitably designed nozzle. This is the simplest and least expensive type, but appears to be the least desirable.

2. The pump and heater system, where the water is heated in an open or closed heater, distributed through a pipe line in the engine house and forced under a pressure of about 130 lb. into the locomotive through a hose and nozzle. This type is fairly effective and can be installed without violating any patent rights. For a medium sized terminal, such a system with two water tanks, one washout and one filling pump and two pipe lines into the engine house, will afford washout water at 150 deg., and filling water at 200 deg. F. at a small operating expense. Where exhaust steam is available for heating water, this type is an excellent one for a medium sized terminal.

3. The blow-back type, where the steam blown off the locomotive is utilized to heat the wash and filling water. Such systems which also provide for the automatic tempering of the water used in washing out and the use of a circulating line to keep the water always hot in the engine house lines, are protected by patents. This system is the most effective one, and provides washout water at all times of the proper temperature, and reused water and steam blown off from the locomotive instead of wasting it.

The committee earnestly urges upon the management of the railroads the importance of installing hot water washout and fill systems, thereby effecting economies and efficiency with little expenditure of capital.

The report is signed by: G. H. Emerson (Chairman), B. & O.; C. B. Young, C. B. & Q.; A. W. Gibbs, Penn. System; J. Chitley, N. Y. C.; R. W. Bell, Illinois Central; W. H. Wilson, Northern Pacific; W. W. Lemen, D. & R. G. W.; R. J. Williams, Pere Marquette; J. Snowden Bell, and Gen. L. Bourne, Superheater Company.

Discussion

In the absence of Mr. Emerson, the report was presented by O. C. Cromwell (B. & O.), who said at the conclusion: Since the preparation of the report there have been some improvements made in the design of locomotives along the lines brought out by the committee. Locomotive No. 8000 has been recently put in operation on the Michigan Central with quite a number of the features mentioned. The circulation is improved by introducing a large radius corner in the back mud ring. This allows a free entry of the water and should increase the circulation.

The throttle valve is located in the smoke box, so as to control the steam after it has left the superheater. By that means you keep the superheater units under steam at all times which should afford protection and give a short steam area between the throttle and the cylinder. The outside air-pass is fully under control.

These features show that the mechanical world is interesting the railroads in the matter of boiler design. The railroads realize the importance of bringing about improved circulation and steam generating qualities; also more economical use of the steam.

As to circulation you know that there are a number of

circulating devices in the market but as they are patented, no specific mention is made of them in the report. They all tend to improve the circulation and I believe there are going to be further improvements in that direction. Feed water heaters are coming to the fore quite rapidly, a number of different designs having been tried out which no doubt in a short time will indicate the direction in which this very much sought-for device will be developed.

H. H. Lanning (Santa Fe): The committee has recommended that button-head staybolts be adopted as standard practice for crown sheets of other than oil fired boilers. On railroads which operate both coal and oil burning locomotives, it is desirable to equip all locomotives with a type of crown stay that will give satisfactory service with either of these fuels, as it is inconvenient and expensive to renew all of the crown stays in a firebox when the locomotive is changed from coal to oil or vice versa. This change is frequently necessary as a result of transfer of locomotives or changes in the relative prices of oil and coal.

The service conditions on an oil burner are more severe than on a coal burner and it is to be expected that a railroad which has both coal and oil burning locomotives should adopt for all locomotives the type of crown stay which gives best service with oil; namely, one having an upset taper threaded head on the firebox end. These bolts are applied with the small end of the taper toward the water side of the crown sheet. The taper is usually about 1 1/2 in. in 12 in. and, after being screwed into place the firebox ends of the bolts are cut off and riveted over.

Radial stays and crown bar bolts of this type were developed on oil burning locomotives in bad water territory as a means of overcoming very serious trouble experienced with crown sheets of the button head type. They have been in successful and extensive use under these severe conditions for 15 years or more.

When subjected to the extreme heat of an oil fire or to a very hot coal fire in a locomotive using bad scale forming water, the round heads of the button head bolts became overheated and gave trouble. The head of the bolt presents an enlarged area to absorb heat from the fire and a large part of the heat thus absorbed must be transmitted to the crown sheet through an intervening layer of dirt and scale and to the water, through an accumulation of mud or scale adhering to the bolt and to the sheet. The result is that, in an oil burning engine and sometimes in the hottest part of the firebox on a coal burner, the button heads become overheated and leak.

The taper head type of crown stay presents a smaller area to the fire and does not absorb so much heat. The contact between the bolt and the sheet is more intimate and the transference of heat from the bolt through the sheet to the water takes place with less interference. The taper head bolt has a further advantage that in case it does show a tendency to leak, it can be restored to a perfectly tight condition by a small amount of hammering.

On coal burning locomotives using certain kinds of coal the taper head radial stay accumulates practically no honeycomb or clinker, while under the same conditions crown stays of the button head type would collect considerable quantities of this material.

Fifteen years or more experience with crown stays of the taper head type in oil burning service and about seven years experience with this type of stay bolt in coal burning service on a railroad, having over 2100 locomotives, has demonstrated that the taper head crown is fully as safe under favorable conditions and is safer under conditions of extreme firebox temperatures than the button head type of crown stay. Taper head bolts have also been found to give better and more satisfactory

service than button head stays on coal burning locomotives as well as on oil burners.

I feel that the committee should be requested to give consideration to crown stays of the taper head type for both oil and coal burning locomotives and include this type of stay among those recommended for adoption by this body.

C. A. Sely: I was under the impression that the success of the taper head radial as developed for oil burners would set the pace for its use in coal burners as well, because of its manifest advantages in cost, application and maintenance. The great difficulty in making the thread of a buttonhead bolt fit tight in the sheet simultaneously with a fit of the button against the sheet leads to much imperfect work and subsequent leakage and caulking that strains the section under the head. The heating of the projecting head tends to break the caulking joint and has an affinity for some products of combustion that form clinker.

That I am not alone in my opinion was shown by the 1921 report of the Master Boiler Makers' Association which strongly endorsed the taper head radial for all classes of service after making tests and comparing results of service. The Boiler Makers at their recent convention of 1922 supported the report of the committee.

In the interest of economy of material and reduction of boiler weight at the most advantageous point I would question the body diameters as shown in this report. The I. C. C. rule for 7,500 lb. maximum stress of stays applies to radials as well as water space stays and this figure is supported in the Boiler Code of the A. S. M. E. With 4 in. by 4 in. spacing the diameters named would carry 281.8 lb. for 15/16 in.; 323.5 lb. for 7/8 in. and 368 lb. for the 1 in. body, all of which seems excessive.

In his opening address at this convention, Chairman Tollerton forcefully urged consideration of fuel savings and other economies in operation, and in line with this the committee urges careful consideration of the design of boilers to the end of perfecting circulation of water. Just what and why is this circulation? A brief definition would be the movement of boiler water in its conversion to steam, and the perfecting called for is an implication that the present designs and state of the art not perfect and need further consideration.

It is obvious that the circulation should be sufficient to do two things; to serve as a wiper-off and carrier of the steam bubbles as formed on the heating surfaces for prompt discharge into the steam space, so that the full value of these surfaces may be realized; also to so mingle and mix the boiler water as to have no extremes of temperature. The maintenance of a relatively large volume of highly and uniformly heated water will promote reduction in maintenance and increase the effectiveness in operation.

The arch tube came as a life saver when boilers were assuming lengths to accommodate wheel arrangements necessary for development of increased traction, and wonderfully stimulated the circulation of the increased volume of water. Its very extended use has certified to the correctness of the theory that getting close to the source, taking advantage of initial conditions, is the proper method of solving this important problem. What might have been regarded as an incidental advantage, aside from the use of the tubes as brick arch supports was, in my belief, the most important factor, not only in the use of the tube but due to the tube being in the firebox and directly subject to the only motive power which can promote circulation aside from outside mechanical means.

For the actual production of steam, the firebox of the locomotive is a very vital feature in its arrangement and proportions. Each square foot of its surface is five or

more times as valuable as flue heating surface, for the simple reason that there is conduction and radiation of heat from the combustion of the fuel imparted to all parts of the firebox, but these combustible gases are extinguished on entering the flues with a reduction of temperature below the point of ignition. There is now no radiant heat, simply that of convection or rubbing of the flue surfaces by hot gases, and notwithstanding the short travel through thin walls of the tubes as compared with firebox plate thicknesses, the results are not high in evaporative efficiency, particularly at the forward ends of long flues.

To obtain a further increase of circulation, as desired by this committee, let me call your attention to a device which has been through some years of development;—an American invention, of which mention was made at the recent convention of the International Railway Fuel Association as follows:

"Results of tests conducted during the last four years on a number of railroads demonstrate that this device has passed the experimental stage and will probably be one of the standard fixtures in the locomotive of the future, as is the arch tube at the present time."

The Thermic Syphon is fulfilling the requirement of the committee for a circulating medium of adequate promise. It is a further development of the arch tube principle, serving as an arch support and its capacity for increasing the water circulation is shown by the fact that the throat connection of two syphons has a waterway approximately three times as large as four 3 in. tubes; that the upper or discharge openings in the crown sheet are 3 in. wide by such a length as to give approximately ten times the areas of the lower connections, providing a quiet release of the upward circulation, and a direct upward path for steam bubbles, without chance for pocketing which would permit incrustation. The entire outer surface of the syphons are additional heating surface of highest value, due to their location in the hottest zone of the firebox, and by the generally increased water circulation effect of the syphon, the heating surfaces of the fireboxes and flues will be further stimulated to higher evaporative effect, facilitating deposit of boiler feed impurities to convenient washout points. Each syphon is in effect a double plate girder, longitudinally strengthening the crown sheet, dividing the stream of gases for more favorable absorption of radiant heat and subdividing crown sheet into limited zones, and preventing boiler explosions. This is proved in two cases of extreme low water.

Tests of syphon engines as against like engines not so equipped show coal savings running from 14 to 25 per cent per thousand ton miles; on oil burners 8 to 10 per cent.

J. A. Pilcher (N. & W.): I wish to speak simply with reference to Fig. 8, referring to crown stays and heads, reinforcing what has been said by the two previous speakers. We have eliminated the button head stay bolts in favor of stays with a large taper. Our boiler repair people have found it entirely advantageous and I was wondering just how far the committee investigated this particular feature of boiler construction before making their recommendation for the use of the button head stay throughout the firebox crown. I also notice the very decided recommendation of the crown sheet of the Belpaire type. On the road with which I was connected in the early days they used the Belpaire, but for some reason they deserted it. I wonder why? They have found many good points. I wonder if there are any bad points explaining why this type has not been more generally used.

I. Snowden Bell. Mr. Seley has given us a very interesting statement and a valuable one. I think there is nothing to be had for from in the least degree. There

are one or two questions, however, I would like to ask. One is a good deal a matter of personal curiosity, I may say. He has referred to this device called the thermic syphon. I would like to know why they call that thing a syphon. As far as I understand it, it has not any syphonic action whatever. There is nothing resembling a syphon present there. I have no doubt that the results of tests will show that the advantages derived from an increase of firebox heating surface secure probably a better circulation with that device, but I do not know why that should happen any more than it would with the old style water legs that were introduced in 1837 in the British practice by McConnell and others. This, as I understand it, is simply a water leg or rather two water legs. They get an increase of fire box surface, the value of which we all know but you would get it with any longitudinal water wall in your firebox and so far as the circulation is concerned, I cannot see why the circulation of that device would be better than the improved circulation obtained by an ordinary mid-felloe or longitudinal water wall in the firebox. (That is what I would like to hear from Mr. Seley, if he can explain.)

H. T. Bentley: I was very surprised when I read the report of the Committee on this button-head staybolt, because I thought it was a thing of the past. For years we were having lots of trouble in oil burning service with button-head staybolts and we looked around to see what could be done to overcome that trouble. By going to the taper head our difficulties were entirely overcome and we thought if it was a good thing in oil-burning locomotives, it was not a bad thing in any other service. About 5 or 6 years ago we made it our standard and since then we have been entirely satisfied with the results obtained. The conclusions of the committee generally are in accordance with my idea of things, particularly in regard to the hot water washing out. It is unfortunate that financial conditions have prevented the extension of hot water washout plants, but apparently very little has been done in the last few years. I am also in favor of the installation of water treating plants. I think everybody will agree that there is always a difficulty, when business is good, in getting boiler makers. If you can get a supply of water that overcomes the necessity of using so many boiler makers, it is certainly a move in the right direction and I am sorry that conditions have been such that little has been done in treating water to save work in the boiler shop.

I know of some railroads which, unless something is done and done very quickly, will have to enlarge their boiler shops and put in more machinery and tools for handling boilers. It seems to me that we are a little short-sighted when we do not prevent the disease rather than to try to cure it after it has developed.

C. F. Giles (L. & N.): I note in the committee's report under the caption of water treatment that they strongly urge the serious consideration by the railroad managements of the installation of water treating plants. They make no mention of a practice in effect on a number of railroads of using the internal treatment. We all know that the installation of a water treating plant is a very expensive proposition and must necessarily be confined to a point where they are troubled with bad water. If they have bad water at more than one point on a division, they must necessarily install water treating plants at every point where the water is bad.

It is a well known fact that the water on a division, or a series of divisions running out of a given terminal, can be analyzed and proper chemical preparations will take care of the water as a whole, avoiding treatment of the water at each particular point. The internal

treatment is being practiced on a great many railroads. We have made some experiments with it ourselves with splendid results. It is a much less expensive way of taking care of bad water in some cases than the wayside treating plants. Besides that, at times when the water is exceedingly bad resulting in foaming, you may necessarily have to resort to the internal treatment to overcome the external treatment of water. In my opinion the committee should during the next year give some consideration to the internal treatment of water.

J. Snoden Bell: I would like to ask whether there is anyone present, who knows about the application to the Lima locomotive of a throttle valve between the superheater and the cylinders. It was the consensus of opinion of the Committee that that was a proper location for the throttle valve, but I would like to know if any other road has made a similar application, and if so, with what results.

C. E. Fuller (V. P.): There seems to be a difference of opinion here this morning. It is said that doctors never agree and I think in this case we are not agreeing.

The committee has recommended the adoption of button-head stays and I can fully endorse the Committee's recommendation from the results actually gained through experience in operating locomotives with button head stays. I have not had experience operating locomotives with oil and I appreciate the difficulties that might be encountered in such cases, but it is my opinion that the question of button-head stays, versus tapered, driven stays for the crown sheet is a matter of local conditions more than anything else.

We have had no trouble with button-head stays; that is, our standard form of stay. We have used them for years and if they are properly applied and maintained there is no trouble.

We do not have to resort to any caulking of the button-head stays. I am inclined to the opinion that those who have had trouble with the button-head stay have not arrived at the cause of the trouble by a proper inspection.

Mention is made of the button-head stay collecting scale and mud. It will do this. The committee, of which I am not a member, states that the bombarding of sheets to loosen the scale puts the locomotive into the shops for repairs quite frequently. I do not believe that there is any road which has done more bombarding than we have; I think that we were the original bombardiers of crown sheets. We have many locomotives in certain sections, where we would otherwise burn the crown sheet out in less than a year, but if they are bombarded, properly and frequently, there will not be any trouble. We have been doing it for years but with the proper tools and in the proper way and have been able to keep staybolts fairly free from mud even in a bad water district.

The committee in this report also mentions the treating of water. Before water is treated, it should be very carefully analyzed and an effort made to determine what is wrong with it; we have waters which are of such a character that they will not stand treatment; that is, in the tank. The condition of water requires careful study and I do not believe that the experience of any one railroad will be of much value with regard to treating of water on another road.

If I were selling water treating plants, I would probably tell you to treat your water but what I would personally advise is to investigate the matter and discover what is really the difficulty. There is no cure for all ills. When you find out what is the matter, you are in a better position to proceed to the question of water treatment. Then you can handle the subject of water treatment in the most intelligent way.

We can afford to spend a large amount of money to

get good water and if we can get it, with or without any kind of treatment, we can close up our boiler shops to a very large extent and will have successful locomotive operation.

In the case of certain waters on our road, we have to put castor oil compounds in the water in order to keep the water down. We have our troubles keeping it in the boiler. We could not treat that water if we wanted to.

W. F. Kiesel, Jr. (Pcon.): I would like to add something in connection with the button-head stays. We have used them for many years and we find them the safest stay to use. An engineer may at times disregard the condition of the water in his boiler and there will actually be low water in the boiler. The button-head stay, under such conditions, is the safest.

In the case of wagon-top boilers, objection is made to the use of the button-head stay because the stays will not go in at an angle and you cannot make a square seat very readily, but even in the wagon-top boilers the 3 or 4 rows in the center may be made of button-head stays to good advantage.

Mr. Pilcher asked what the advantages of the Belpaire boiler are: The committee recommended a Belpaire boiler and although I am not on the committee, I can readily see why—because the stays are normal to the sheet. You can use a stay with a head or you can use a stay such as proposed by some of these other members; furthermore, it is a more flexible job and expansion and contraction will put less stress in the sheets. Also you know more definitely what the stresses in the sheets are. It, of course, requires more time and the builders will be opposed to it on account of the increased cost of dies, but the Belpaire boiler is considered the safest both in Europe and in this country.

R. D. Hawkins: (A. C. L.): The button-head staybolt does not seem to have very many friends here. While on the Atlantic Coast Line where we have used the taper head stay for many years I had experience with the Belpaire type of firebox. It is very easy to apply button-head stays and I must say that I favor button-head staybolts in this class of boiler. We are having some very satisfactory results with a taper stay but I do not like to see the committee turned down entirely on its recommendations of the button head. I have also had some experience with button-head staybolts in oil burning engines. We had some difficulty where we used large heads and the heads started to burn. In this case we made a hollow tool and kept the button heads smoothed off thus getting very satisfactory results, even with oil.

C. E. Chambers: I have had experience for 20 years, at least, with button-head staybolts or crown bolts. With locomotives built recently we went to the use of the taper-head crown bolt, but not because of any trouble of leakage or being unable to keep button-head bolts tight. There was one reason that prompted me to do this. Possibly somebody else in the room has had a similar experience. We had a great many crown sheets equipped with button-head crown bolts which, while the sheets looked perfectly good, were badly grooved around the head of the bolt. Water conditions could not be blamed so I thought perhaps the heads of the bolts became overheated, or that the circulation from the water did not protect the sheet at that point as thoroughly as it would without the button-heads. That was really what prompted me to go to the taper crown bolts.

A. W. Kelly (National Tube Company): I just want to say a few words in connection with the dry pipes. We have had a great deal of trouble with the railroads because of filling orders for dry pipes as mentioned in No. 1 and No. 2. Many different orders come in and that

means we have to change rolls, causing delays. Often-times we have had to substitute seamless dry pipe which costs more money. I think the committee's recommendations are right. They will allow the tube manufacturers to carry standard sizes of pipes in stock, so there won't be any delayed deliveries.

Mr. Seley: I would like to answer Mr. Bell's objection to the term "syphon." I rather think there is a syphon there. It may be inverted from the ordinary syphon; it may be upside down, but it seems to me there is a distinct analogy in that term. The water from the boiler barrel being drawn there by its greater weight displaces the lighter water forms a syphon and assists in the circulation.

As regards the water leg idea, I haven't any reason to doubt that any water leg of the same heating surface measurement would be just as effective, but in the design which is under discussion, these are most advantageously arranged for meeting the direction of the flow. I think that the failure of most of these devices formerly used have been in the manner of making the connection to the sheets.

W. L. Robinson (B. & O.): It is very pleasing to note in the committee's conclusions that they have included items No. 4 and No. 5, which will bring about some fruitful results for something besides reduction of maintenance of equipment expenses. We ought to think about the C. T. saving obtained through carrying out recommendations No. 4 and 5, and increase the boiler washing periods from two or three days in certain districts to 10 or 20 days; also holding the fires longer, instead of knocking them out every trip for boiler wash or boiler work. The cost of fuel is a C. T. expense and so is roundhouse labor, boiler washing, etc. Your C. T. ratio may be affected two or three points by possible saving in fuel. If you have hot water washout systems and water treatment it means a saving in C. T. expenses. I want to bring out the possibility of making savings in the C. T. expenses as well as the M. of E. expenses.

J. Krutt-schnitt (So. P.): Apropos of feed water purification, there is a piece of apparatus in use on the government railroads in Hungary which is located on top of the boiler and its purpose is to purify the water. If there is anybody here who is informed respecting that I think the rest of us would like to hear him tell what he knows about it.

Mr. Greenough: I am very sorry I haven't anything on that of an official nature at all, but it is probable that the location of those feed water heaters has had some influence on some of the feed water heaters recently applied by the Locomotive Feed Water Company. The apparatus referred to is, I understand, a purifier and the apparatus made in this country is a feed water heater. I have not heard what the results of the purifier in Hungary amounted to.

Chairman Coleman: This is a very important paper, gentlemen, and in order for the committee to make some standard recommendation to you they must have the experience of all of the railways in the country. You are all operating your boilers under different conditions and the number of conditions change the committee must get an expression from each one of you. There is a great responsibility before you now in trying to economize in the operation of locomotives. The slogan is economy and efficiency and in order for your committee to draw up these papers and present them to you in an intelligent manner, covering the entire continent, they must have your assistance.

Mr. Brooks: You are operating locomotives in the Canadian West coast in the most extreme climatic conditions. (The committee would like to know your experience.

C. E. Brooks: I hesitated to say anything about our experiences because they are evidently so diametrically opposite to the experiences of many others who have spoken here today. The first two speakers indicated that the button-head crown bolts had been abandoned for the reason that it could not be used with oil and that in order to standardize with one type of crown bolt for both coal and oil burning locomotives, it would be advisable to go to the sharp tapered type of crown bolt, which was mentioned. When we started oil burning about 8 years ago, we had the idea, gathered from various oil burning roads in the southern part of the country, that we had to have the tapered type of crown bolt. We installed this type of crown bolt in a large number of locomotives and our intention was to spread the use of this type of bolt throughout the coal-burning areas as well. The net result of the thing is that two years ago we had to abandon the tapered crown bolt and we are now using from coast to coast button-head bolts; not button-head, unfortunately, as per the recommendation of the committee, but with parallel thread button-heads. The reason we went to the use of parallel thread button-head bolt was that a tapered crown bolt of any kind can be made test proof without really being a good job; that is, it will meet a water test, whereas the parallel-thread crown bolt must be a fit in the thread in order to pass the water test of either the railroad shops or the manufacturers.

The second disadvantage that we found in the quick tapered crown bolt was the mechanical features in connection with the application of the bolt. That is the different type and sizes of taps required and the difficulties of aligning the thread in any way between the inner and the outer sheet. The next disadvantage that we found was that the large water area of the quick tapered crown bolt gave much greater possibilities for scale accumulation than the smaller diameter button-head type bolt.

The next disadvantage that we found was in cases of low water. We have some very remarkable photographs of cases of low water in the bad water districts of Saskatchewan where an entire firebox had pulled off the quick tapered bolts and simply turned the backs down in the form of a little ring, pulling off without destroying the bolt and without even rupturing the sheet, for the simple reason that, as the sheet started to corrugate, it lifted the thread. It got no support from the thread whatever and had nothing but the back. The photograph even showed the perfect thread on the quick taper. The reason for this is, we think, a succession of overheating of these bolts, due to what might be called ordinary low water conditions. That is, a condition where a man was working with water very low, as we do in certain areas, and was possibly caught a little. The bolt consequently was hammered up a little and in hammering on the back of a quick tapered bolt, your whole action is not an up-setting action. It is an action that destroys the thread in the sheet; that is, loosens it up and you depend upon nothing but the taper of the bolt to hold your sheet.

Now, with regard to two or three of the other items which have been mentioned here. We are not a Belpaire boiler road, but we are very much interested in the recommendations of this committee. We intend to be a Belpaire boiler road, as far as the big power is concerned, for the simple reason that the radial stay boiler, when we get into the large diameters and near our clearance limits, does not have the steam space for handling our light water. We figure we can get this from the Belpaire type of boiler and I believe it is going to be our standard throughout.

Regarding hot water washout systems, we are opposed to ordinary practice, to such an extent that I do not like

to mention it at this late hour. We are a cold water wash-out road, and furthermore we intend to be, in the bad water districts, cold water absolutely. The reason for that is that we believe the hot water washout system is, very often, hot water in name only. We cool our boilers down and know that they are cool; then wash them with water that the men can handle and wash them under conditions that give our men a possibility to inspect the boiler. At the same time, we figure that in reducing the temperature of the boiler we have some chance of keeping the scale accumulation in a condition where water pressure will remove it.

I have heard it mentioned today that item No. 5 is probably the greatest improvement that could be made. We are opposed to that, too, and for this reason: We believe that the solution of boiler trouble is by not using bad water. I can tell you of one case (and probably our friends south of the line can tell you of a great many more) where we were using terminal water in one of our busiest terminals than ran 25 grains of encrusted solids to the gallon. We abandoned that water which was well water, and by heavy expenditure it is true, we have impounded storage of 300,000,000 gallons of surface water, reducing our encrusting solids to probably 15 per cent of what they were in the well water. We intend to follow that principle of impounding water absolutely, abandoning wells and figuring on well water supply as a last resort.

Chairman Coleman: Mr. Wanamaker?

E. Wanamaker (Rock Island): I do not think I am in a position to make any remarks but I have been a very interested listener. Some years ago we began to study the water supply on the Rock Island and water treatment in connection with our fire box maintenance work. I am inclined to agree with Mr. Brooks and with the gentleman who spoke preceding him. If it is possible to secure a good water supply you have reached the ideal solution. In a few instances, at a considerable expenditure, we were able to do that; in others it was practically impossible. Then it became a question of treatment and we found then that we had mistreated more water than we had treated. Furthermore, when we treated the water situation at one water point, it made more trouble with the water supply at some other point, due to the fact that you take your water supply from various points. We have started a progressive or systematic method of handling our locomotive feed water supply in an endeavor to secure uniformity. By so doing, we have greatly decreased our M. of E. in many instances, and at the same time, reduced the C. T. charges, making an indirect saving in that respect.

As regards the hot water washout and fill up system, no doubt Mr. Brooks' statement is very true. If you have sufficient motive power to permit such practice in times of heavy business. In our case we have been able so to do and we feel that the hot water washout and fill up systems, when properly used and supervised, results in a tremendous saving in C. T. charges as well as M. of E. Occasionally we get a letter from somebody wanting to know how much money we have saved in our boiler washing practice. Of course our boiler washing increased the cost of washing boilers. The biggest saving that we made was in the increased number of engine hours in the service.

With regard to the locomotive syphon, we have had very good success. I think that the reserve factor, at least on a railroad such as the Rock Island where we have many short hills, has enabled us to take a heavier train over the divisions, and not only keep up our schedule, but make up time that was lost. Sometimes on a division run of 165 miles, we could make up 24 or 30 minutes with heavy trains. It seems that our savings have to be predicated on the efficient and economic handling of the train,

rather than based on the locomotive alone. I believe that one reason for our fair success with the locomotive syphon has been that we spent a great deal of time and effort designing the method for welding or attaching syphons in the firebox.

Chairman Coleman: Mr. Oatley, will you please come forward?

H. B. Oatley (Superheater Company): The question has been raised as to the Hungarian Railway locomotive with a purifier. I happen to have a little information on that. I do not know that it will supplement a great deal the article that appeared recently in the *Railway Age*. It is merely a large chamber (barrel-shaped) on top of the boiler, into which the water is forced from a feed water heater. In the event there is no feed water heater the water is forced there and allowed to settle. In other words, the velocity is decreased and any precipitant is allowed to settle in this purifier and be blown off. In other words it is an adjunct to a feed water heating system and a protection to the boiler. I think that purifier is little if any different from one developed in this country some years ago by two of the locomotive builders. You recall that a good many boilers of the large Mallet engines were built in what might be called two parts. Water was forced into the forward portion and from there into the main portion of the boiler. The heating of the water in that forward section where the circulation was relatively slow permitted settling of the precipitant. The water going from there to the boiler was relatively clean. In other words, it localized whatever harmful action there was from the solids and, to a large extent, saved the boiler.

The other form to which I refer was where a partition tube plate, a third tube plate if you please, was located about six feet back from the forward tube plate in the boiler, the water from the injector being delivered into this forward section. A similar action took place there and the relatively clean water was allowed to pass through or over the plates into the main portion of the boiler. I believe there will be further developments of the idea.

Mr. Fuller: I move that the report be accepted, the committee continued, and the recommendations referred to letter ballot. (*The motion was carried.*)

Chairman Coleman: Next will be the report of the Committee on Resolutions.

Mr. Chambers: Mr. Chairman and members: "RESOLVED, That the officers of the Mechanical Division of the American Railway Association should be elected annually instead of every two years, in order that a greater number of members may enjoy the honor of being officers of the Division."

I might say that this resolution was offered two years ago and passed on the floor, and possibly by reason of our not being entirely out of war yet, it was not put into effect. I am offering this resolution, not without the knowledge of the chairman, but fully with his assent. There are other reasons. The duties are numerous, and for any one road to spare its head officer, which he usually is, for a continuous period of two years, to take care of this work is many times a hardship.

Chairman Coleman: I hope you will pass the resolution. There are a lot of men who are deserving of the honor of being your executive officer and in order to give the younger men an opportunity to come to the front, I would like to have you pass this resolution.

(*The resolution was adopted.*)

Mr. Chambers also presented the following resolution: WHEREAS, the Railway Supplymen's Association have this year brought to us the largest and best display of exhibits ever presented, and have carried to a successful

conclusion a splendid program of entertainment for the members of the Division, their families and friends, and enrollment has been carried out in a very satisfactory manner;

WHEREAS, the Atlantic City Hotel Men's Association has, as usual, provided for our welfare and comfort in a manner that is without criticism;

WHEREAS, we have been inspired by the action of the Executive Committee of the American Railway Association, which has done so much to spur us on to better things;

WHEREAS, The Committee in charge of the various reports have done careful and painstaking work in the preparation and presentation of their papers;

WHEREAS, the meetings have been ably planned and guided by the officers and special thanks are due to the indefatigable secretary for the manner in which he has carried out the arduous duties of his office to the entire satisfaction of the members of the Association,

BE IT RESOLVED, that the appreciation of the members of the Mechanical Division be extended to the Railway Supply Men's Association, for preparing the wonderfully educational exhibits, taking care of the enrollment and providing for our entertainment. Also to the Atlantic City Hotel Men's Association, the management of Young's Million Dollar Pier, the Executive Committee of the American Railway Association, the officers of the Mechanical Division, the members of the various committees preparing the reports, the retiring officers, the Secretary, to the mechanical press, and particularly to the *Railway Age* for the prompt reports and issuance of that periodical.

The report was signed by C. E. Chambers (Chairman), H. T. Bentley and F. W. Brazier.

Mr. Tollerton I move its adoption.

(On motion, the resolution was adopted.)

Chairman Coleman: We would like to call on S. O. Dunn, Editor of the *Railway Age*.

Mr. Dunn: Mr. Chairman, gentlemen, and the retiring Chairman, Mr. Tollerton. It is a great pleasure and honor to be invited to present to the retiring chairman, his Past Chairman's badge. We have been acquainted for a good many years. We have met on many different occasions, and I have had occasion to ask many favors of him in his official railway capacity, and I have never asked one yet which was not most readily granted; not only granted, but granted in a manner that made it a pleasure to accept the favor.

We have worked together in times and periods which were very trying, not only to the country, but particularly to those who were serving on or connected with certain committees. I shall not soon forget the time spent in those negotiations. I had the opportunity to observe your retiring chairman under most trying conditions, and I have no doubt I shall always find him as he has always been here—courteous, self-contained, and ready for work.

Mr. Tollerton and I have been very good friends for a long time. I know something about his career. You gentlemen also know that his career has been one of those typical American careers, which always have been and always should be a great inspiration to the youth of this country. He began his railway career as a machinist apprentice when he was a very young man. He was a fireman and a foreman. At 26 years of age he was a master mechanic, and at 42 years of age he was the mechanical superintendent of a railroad system of 8,000 miles.

A man's achievements should be judged, not merely by how he goes, but by how far he goes. No man has risen in that short period to all the ranks of the mechanical department of a great railroad system, without having those essential qualities of energy, of courage, of fidelity to

duty, and ability that are essential to a really successful career. But in addition to this he has been honored by his associates in this organization—the greatest organization of its kind in the world—by the bestowal upon him of the highest offices in its power to grant. I believe he has directed your work and presided over your deliberations for a longer period than any other man. He has been your chairman during one of the most remarkable and trying periods in the history of the railroads of the United States and I am sure that there is no one here who will question the tact, the energy, the courage, and the ability with which he has performed his duties under these trying conditions.

Now he passes into the ranks of the elder statesmen. There is an old saying, "Old men for counsel and young men for war." I think that the reference to old men here means not so much years, as it does experience. It means experienced men for counsel and young men for war, because young men have more energy and courage than old men and a want of caution which, perhaps in some cases, is a good quality. But youth always needs guidance and encouragement and I am sure as one of the elder statesmen of this association, sir, that you will in the future, as you have in the past, use your influence to help in the education of the younger men. You will encourage them to participate in the active proceedings of this organization, to do their work as you have done yours, in order that the next generation of railway officers may be equal to that of which you are a member.

It is a great pleasure and honor for me to have the opportunity to pin upon you this past president's badge which has been presented to so many of your predecessors and which is an insignia of a higher honor than many we saw when we were traveling together on the other side.

Mr. Tollerton: It is always very pleasant to hear nice things said about us. It is a great honor and I appreciate it fully, but it has also been a great pleasure to preside over this wonderful organization.

I want to wish for it all the prosperity in the world, and for each and every individual member, long life, good health and happiness. I thank you.

(On motion the meeting then adjourned.)

Brakes on Track Exhibit

ONE OF THE track exhibits this year is the 120-ton capacity car taken from regular service on the Virginian Railway. This car is one of a lot of 1,000 built about two years ago and is equipped with the Westinghouse "empty and load brake" which, when operated in load position, develops a braking ratio of 40 per cent of the total gross weight of the loaded car. This car has been in regular everyday service since it was built and the original brake shoes applied by the car builders are still in service after making 10,000 miles. As yet they show little wear, notwithstanding the heavy braking required under the severe traffic conditions. This small brake shoe wear is no doubt largely contributed to by the use of the elasp brake, which distributes the heavy brake shoe load. It is anticipated that the life of the brake shoes on these cars will be at least 40,000 car miles, which will contribute to a very material saving in brake shoes and in the labor of their replacement and piston travel adjustment. One of the trucks, which is of the six-wheel type, has been run out from under the car in order that it may be inspected easily.

Another device which will be of interest to air brake men is the Minich super-safety hand brake applied to one of the Philadelphia & Reading hopper bottom coal cars.

Division VI—Purchases and Stores—American Railway Ass'n

Reports on Special Subjects Covering Sinking Fund for Deterioration, Obsolescence, etc.;
Office Routine; Stationery and Educating Employees

The chairman called the meeting to order at 9:30.

Report on Forest Products

W. A. Summerhays (Ill. Cent.), chairman, made a report of progress saying: The committee had three meetings during the year and engaged in general discussion of the conditions as pertaining to its work and reviewed the work of the past committees. It desires to report progress in this connection, with the addition of the following:

The committee having in mind conservation of lumber and the need of procuring and furnishing the right quality and size of Forest Products for the right use has given study to the question of specifications. The present lumber specifications in effect in the Engineering and Mechanical Divisions are not adequate and the work of revising them is underway. This will be handled by a joint committee appointed by the Board of Directors, representing the Engineering, Mechanical and Purchases and Stores Divisions.

That this work is timely is evidenced by the work recently

undertaken at the invitation of the Secretary of Commerce, Mr. Hoover, by the Lumber Manufacturing & Distributing Associations. Representatives of all the leading associations of producers, wholesalers and consumers of lumber met at Washington May 22 to 25 of this year for a discussion as to the standardization and simplification of names and descriptions of grades and in the sizes of the forest products.

It is the intention to invite the manufacturers, dealers and users of forest products to co-operate in this matter. It is expected that the American Railway Association committee, above referred to, will follow the general plan as outlined; arrive at a standard of grades and sizes suitable for all kinds of lumber and all railroad purposes. The members of Division VI are urged to support this movement in the lumber trade.

(The report of the committee was accepted and the committee was continued.)

The Need of a Sinking Fund to Care for Losses Incidental to the Handling, Use and Distribution of Materials

By H. H. Laughton

Assistant to Vice-President (Operation) Southern Railway.

FOR MANY YEARS it has been known by most experienced and practical supply officers that there should be some definite, systematic and approved plan provided for currently disposing of losses that are incidental to the handling of materials and supplies such as, shortages, deterioration, obsolescence, variation in prices, etc. It is fully recognized and thoroughly understood that shortages are inevitable, if inventories are correctly and honestly taken, for the following reasons:

1. All material received on a railroad must be charged, either directly to stock or to some other specific account.

2. A certain percentage of material becomes obsolete each year, due to various causes, the chief of which are changes in equipment or designs, discontinuance or restriction in the use of certain classes of equipment and appliances.

3. A proportion of all material carried as stock deteriorates annually due to a considerable quantity, particularly lumber, cast-

ings, etc., being carried in the open and exposed to climatic conditions.

4. When material is used and not reported by the using departments it necessarily creates a shortage.

5. Failure periodically to revise the price book to actual price conditions.

We believe the above few, (but not by any means all) examples are convincing of the necessity for the creation of a fund or suspense account to take care of the depreciation and losses in assets as reflected by materials and supplies, and to dispose of such losses currently. The plan we offer is to first establish a fixed percentage at which all second hand usable material, with such exceptions as are always necessary to properly make effective any plan, shall be taken into the assets of the company at a fixed percentage of the current market price, which percentage should produce a low minimum value for all such second hand material.

When such material is issued, it should be charged out at current market prices applicable. The difference between the second hand price, as agreed, and the new price applied, will provide a credit balance for such a fund to be known as "Suspense-Inventory Adjustment." Against this fund should be charged as developed:

1. The difference between the value of material as represented by the book or ledger value, either for sale or salvage.

2. The difference between the book value of any item and its value for actual use by the railroad.

3. All shortages due to material having been issued and not reported.

Each one of these items should be separately investigated from time to time and all of the actual facts developed.

After approval by the proper authority, the fund should be

charged by the chief accounting officer (who should have control of the account) and the stock account duly credited, with all such shortages or differences.

This method will permit the comptroller to close and distribute periodically these balances whenever desired, instead of making adjustments through operating expenses at various inventory periods.

The entire plan has for its purpose the establishment of a means by which the supply officer can handle his business in a systematic business-like way, with the knowledge that his purpose is to, as accurately as he can, provide, distribute and account for all materials, with the means of honestly, openly and clearly setting forth all losses incidental to the proper conduct of the business.

Discussion

The Chairman: Is it your idea, Mr. Pearce, that you should have an account against which you should write off depreciation?

Mr. Pearce: Yes.

The Chairman: In other words, instead of having the inventory adjusted or charged direct to primary account you want the Obsolescence Account to take care of that offered by the management.

Mr. Pearce: Every item adjusted on its merits.

The Chairman: You will support that?

Mr. Pearce: Precisely. I move that the recommendation be accepted and a committee appointed to further examine and develop it.

(The motion was seconded and carried.)

Office Organization in Purchasing and Stores Departments

By E. W. Thornley

Assistant Purchasing Agent, Baltimore & Ohio.

The activities of the purchasing and stores Departments involve a great amount of clerical work which is burdensome unless thoroughly systematized. In his paper Mr. Thornley has considered the importance of the subdivision of the office organization of these departments into bureaus, each covering one of the major sections of the work.

The greater part of the paper deals with the

purchasing department. The organization is outlined in a concise and logical manner and the duties of each of the bureaus are defined. While the plan outlined may not be applicable under all circumstances, it is sufficiently flexible to meet the requirements of the store and purchasing department officers of the larger railroads and the same general scheme should give good results on any road whether large or small.

THE STORES DEPARTMENT should be in charge of a general storekeeper who should be responsible for the custody, care and distribution of all materials not actually in use, as well as for the quantities of materials on hand, including scrap and second-hand material.

The office organization of the general storekeeper must depend entirely upon the practices pursued by the individual roads. On some of the smaller roads practically all of the accounting for materials is handled in the office of the general storekeeper. On the larger roads the practice generally in effect is to have the accounting handled by division or district stores. For this reason the office organization of a small road sometimes exceeds the organization of a much larger road. The general storekeeper's office organization on a trunk line system, which has worked out satisfactorily for a number of years, is divided as follows: Accounting Bureau, Requisition Bureau, Scrap Sales Bureau, Mail Bureau and Filing Bureau.

The employees of these bureaus all report to the chief clerk. The chief clerk handles the ordinary run of correspondence of the stores department while the assistant chief clerk handles

routine correspondence and the following defined subjects: The return of and credit for empty containers. Material for repairs to cars on foreign lines. Miscellaneous orders for material from outside concerns—excluding scrap.

It has been found desirable to maintain a complete record of all oil drums, cement sacks, gas and oxygen cylinders and containers of like character belonging to shippers, this to insure their prompt return, thereby avoiding rental charges and charges for losses owing to inability to return. Such a record will, if installed on any road handling a very large number of empty containers, result in a considerable saving.

Accounting Bureau

This bureau prepares cost data sheets, statements showing the cost of handling, audits pay rolls of the division store, prepares the consolidated stock balance sheet and answers inquiries pertaining to accounting matters. The preparation of the consolidated stock balance sheet in the office of the general storekeeper insures a prompt handling and keeps the general storekeeper in touch with all current stock balances. While the consolidated stock

book may enable the general storekeeper to determine the units of the various classes of materials on hand, he is also responsible for the money investment, and should, therefore, be equally well posted on this feature.

The practice in connection with the methods above referred to is followed on a road where the charges to primary accounts are handled on the division and the work of the accounting bureau in question deals with the accounting for physical units.

Requisition Bureau

This bureau handles all requisitions, makes transfers of surplus stocks, verifies blue prints and specification references, maintains a blue print and specification file and handles the standard stock book. All changes in blue prints or specifications are reported to the general storekeeper promptly; this enables the requisition bureau to issue corrections to the division storekeeper, thereby avoiding the possibility of purchasing materials about to become obsolete. All instructions issued by other departments affecting the distribution of material or changes in designs or blue prints, are referred to the general storekeeper for his comments and approval and when the instructions are issued they are issued as joint mechanical or maintenance of way and stores department circulars of instructions. On some roads all surplus is transferred from a consolidated stock book while other roads use a regular form provided for reporting surplus material. Either form may be handled successfully, local conditions must necessarily govern.

One advantageous practice that has been pursued for a number of years is to have the storekeeper forward to the general storekeeper a copy of every requisition prepared. In many instances it is found material is required before the original requisition reaches the general storekeeper and, owing to the fact that a copy is on file in his office, orders may be placed in advance of the receipt of the original requisition without fear of duplication or the placing of orders for improper material. Another purpose to which this copy of the requisition has been put is to make all changes necessary in connection with cancellations, reductions, transfers, changes in blue prints or specification reference on the duplicate as well as the original copy. When the original requisition is forwarded to the purchasing department or to the general storehouse from which the material is to be transferred, the copy is returned to the originating storekeeper so that his records may be changed to agree with the original requisition. This system, if pursued, will eliminate much correspondence. Another time saving feature is to take a record of all requisitions. By referring to this record, the general storekeeper is enabled at all times to locate any requisition from any station on the road.

Scrap Sales Bureau

The practice of having shipping orders, sales bills and correspondence pertaining to the sales of scrap handled by one desk has been found advantageous. As all correspondence regarding shortages in weights, improper grading, changes in shipping instructions, etc., usually reach the general storekeeper he must maintain a record of such shipments, and special card index forms have been provided for that purpose. These forms show all information as to dates of shipments, weights, etc., and claims allowed or refused, thereby insuring against duplication of claims. The general storekeeper can at any time by examination of the open cars determine the amount of scrap unshipped on sales certificates and takes the necessary action to close out. The closed cars are filed in numerical order and provide a ready reference for his information. Copies of all sales bills are kept on file in the office of the general storekeeper, thereby avoiding much unnecessary correspondence in connection with the collection, etc., on materials shipped to outside concerns and individuals.

Mailing Bureau

The mailing bureau takes care of all incoming and outgoing mail, telegrams and requisitions to be forwarded to various parties for whom intended.

Filing Bureau

The filing bureau takes care of all filing of correspondence, as well as statements.

Purchasing Department

The purchasing department should be in charge of a general purchasing agent or purchasing agent who should buy all materials and supplies of every description required for use by the railroad,

including new equipment, and should sell all scrap, obsolete and surplus materials, including retired equipment. That officer may be assisted by a buying corps, generally referred to as assistant purchasing agent, lumber agent, stationery agent, etc., to whom the purchase of certain material subjects are assigned. The general purchasing agent, or purchasing agent, decides upon the buying policies, and has general supervision over the work of the organization; individual buyers purchasing certain classes of materials as selected by him, the subjects assigned to each being, as far as practical, according to stores department material classification accounts.

Office Organization of the Purchasing Department

The purchasing department office organization may be divided into bureaus, under the supervision of chief clerk, the bureaus being designated as follows: Order Bureau, Price Record Bureau, Voucher Bureau, Correspondent Bureau, Statistical Bureau, Filing Bureau, Miscellaneous Sales Bureau, Mailing Bureau and Freight Sales Agency.

The detail of the organization should, of course, be regulated to meet the requirements of individual railroads, but one as outlined above has proven particularly efficient on a trunk line system.

Receipt of Requisition

The routine of the office begins with the receipt of a properly approved requisition transmitted through the office of the general storekeeper. To facilitate the handling in both the stores and purchasing departments, individual requisitions are so prepared as to contain only such items of material as are properly grouped under one material classification account. Requisitions of each classification account are originated on specified dates, so that all such requisitions for one kind of material are received in the office of the general storekeeper on approximately the same day. In this way, the requisitions may all be checked at the same time with the master stock books or surplus reports and, after transferring any material available in stock, they are then forwarded to the purchasing department. By so handling, requisitions from all stations, for the requirements of one class of material reach the purchasing department at the same time, so that negotiations may be opened for the purchase of a month's supply or more of material in a given class, thereby minimizing the work of this department and making it possible to take advantage of quantity purchases, etc. Upon receipt of the requisitions in the purchasing department, and after record has been taken of their numbers, date of receipt, etc., in a form provided for that purpose, they are distributed to the respective buyers, who, in turn, indicate in the column provided, the name of the firm on whom the order is to be drawn, terms of purchase, etc., for such items that price arrangements permit, marking the remain of items "B" (for blank) and then forward to the order bureau where orders are prepared. The order numbers are marked on the requisitions, which are then filed in station and numerical order in a loose leaf binder, and thereby become an index to the orders.

Preparation of Purchase Orders

After the requisitions are properly disposed of, the next form handled is that of "purchase orders." Orders are prepared in triplicate for distribution at the proper time, as follows:

- 1—The original to the seller.
 - 2—The duplicate for the information of the engineer of tests. This is used by him in arranging the work of his department in following up the tests which are to be made at point of manufacture or destination, as the case may be.
 - 3—The triplicate for the division storekeeper originating the requisition. This is used by him in the hurrying of material, that is, where the order has been placed. In urging delivery, reference is made to the order number as well as the requisition number. The storekeeper is not permitted to hurry material direct on the shipper.
 - 4—The quadruplicate for the purchasing department's statistical bureau. This is used for compiling information as to the value of materials ordered for the information of the general purchasing agent or purchasing agent.
 - 5—The quintuplicate for the purchasing department's price record bureau.
- The orders, after proper preparation, are distributed to the respective buyers. Orders which are complete in all details are checked as to accuracy, and, after being approved by the general

purchasing agent or purchasing agent, are dated by the means of a rubber dater, and distributed as previously outlined. Inquiries are then gotten out on the orders which have been prepared in blank covering material on which no price agreement is effective and which is to be purchased on competitive bids. The order is then placed with the inquiry in the open file until the closing date, when the quotations are tabulated and at which time the order is completed by entry of name of firm with whom the business is to be placed, on what terms, etc., and then released through the regular routine. The quintuplicate, or office copy of the order, is placed numerically in a loose leaf binder as an open file, and, as invoices are received shipments are recorded thereon. After all of the material, appearing on the individual order, has been shipped, it is removed from the "open file" and placed in another loose leaf book, commonly referred to as the "completed file," where it is retained until one thousand orders are accumulated in successive numerical order at which time they are removed and are bound as a permanent record.

Price Bureau

Closely connected with orders, in fact, a direct outcome thereof, are the duties assigned to those employed in the price bureau. The work in this department is sub-divided along material classification lines, i. e., the individual price clerk handles only certain accounts, and thereby becomes more or less of a specialist in the class assigned to him. The duties incumbent upon positions in this bureau, are:

1—Tabulation of the quotations received in response to inquiries.

2—Posting of invoices received on the quintuplicate copy of the original purchase order, showing the date of shipments and quantities forwarded. This permits of knowledge at all times of the status of orders placed.

3—Checking of invoices for correctness of price, terms of purchase, etc., and the recording of them in what are termed the price books. The price books are loose leaf ledgers in which are two distinctive styles of sheets. The one form is used for recording accepted prices taken from contracts and tabulations from which awards have been made. On the other form an entry is made of the material bought showing date of order; date of invoice; quantity of material covered by the invoice; unit price; total amount of invoice, etc. These books are arranged in alphabetical order, and permit of records being taken of separate items or groups of materials purchased. For example if space were provided for boiler tubes, the first sheet of this subject would be for prices, following which would be pages necessary for entering a complete record of shipments of boiler tubes.

4—Where incorrect information is given on the invoice by the shipper, such as to the price, terms, etc., they are returned to him by the price clerk for correction. This is handled through the means of a printed form of circular letter in order to expedite the handling. A record of this transaction is kept to insure that discounts or delayed payments brought about by these errors on the part of the firm, are not charged against the railroad.

Voucher Bureau

The voucher bureau next handles the purchase invoice after same has passed from the price bureau into the voucher bureau, it is recorded in the "voucher ledger" according to firm's name, and is then listed to the division storkeeper for approval as to the receipt of materials, etc. The original purchase invoice, in most cases, can be handled promptly upon receipt in the office of the division storkeeper, due to the fact that the shipper forwards a duplicate copy thereof to him on the date that the original is mailed to the purchasing department, and this permits the division storkeeper to have all verifications ready on his duplicate copy for comparison with the original when received. After the division storkeeper makes proper certification on the face of the original invoice as to the receipt of the materials, and supports same with freight bills, and, where necessary, with copies of inspection reports of the test bureau, he re-lists same to the purchasing department and transmits them thru the office of the general storkeeper. Upon their arrival in the voucher bureau, they are again checked with the ledger as to their return, and are then filed in alphabetical and firm order. At regular intervals throughout the month vouchers are prepared in duplicate to cover their payment. Invoices carrying cash discounts are, of course, vouchered in time to avail of the discount, while those carrying discounts are vouchered at stated intervals through

out the month. All vouchers are transmitted to the treasurer through the office of the auditor. Another duty assigned to the voucher bureau is that of handling all correspondence pertaining to accounts, such as, delayed payments; verifications of the correctness of the monthly statements submitted by the shippers, etc.

Correspondence Bureau

The work assigned to this bureau consists of:

1—Hurry delivery of materials.

2—Following up orders for shipments that are not made within the specified time agreed to when orders are placed.

3—Tracing shipments delayed enroute.

4—Supplying additional information on orders placed.

5—Furnishing blue prints, specifications, etc.

The greater portion or the time of the employees in this bureau is devoted to the hurrying of shipments and following up of the orders on which shipments are delinquent. The subjects assigned are according to the store department material classification, and, generally speaking, are in the same order as are handled by the individual buyers, that is, each individual buyer is supported with a correspondence clerk, this being done to insure greater efficiency. Where there is any marked trouble or delay experienced in the making of shipments, or, where a concern is generally slow in making deliveries, the information is transmitted to the respective buyers which enables them to take necessary action to insure that the terms of purchase are complied with, and, as a guidance in the award of future business.

Statistical Bureau

All office statistics are compiled in this bureau. They consist of:

1—Preparation of information as to the quantities of the more important items purchased, together with the total and unit cost thereof.

2—Preparation of reports for the Interstate Commerce Commission and other governmental bodies.

3—Recording of time of the employees in the department and the preparation of pay-rolls.

4—Following up of contracts to insure that all provisions thereof are met.

Filing Bureau

The work assigned to this bureau is similar to that found in all well regulated offices, and, generally speaking, consists of the proper filing of correspondence, reports, etc., in which the "cross index" system is used.

Miscellaneous Sales Bureau

This bureau handles all matters pertaining to the disposition of scrap, obsolete and surplus materials. In it is handled the preparation of the form soliciting bids; the tabulation of offers received, the preparation of sales certificates and the proper recording of all transactions from that date.

Mailing Bureau

The duties of the employees of this bureau are self-explanatory. They receive all incoming mail, as well as telegrams, mailgrams, etc., and distribute same to the proper recipients. It is also their duty to look after the forwarding of all outgoing mail, orders, etc.

It is to the representatives of this bureau that commercial salesmen, etc., present themselves when desirous of interviewing the general purchasing agent or purchasing agent, as well as the members of his buying staff, and it is felt that these employees can go a long way towards creating a friendly feeling between buyers and sellers. It is commonly known that, where friendly relations exist between the railroad buyers and members of commercial houses, the former are given the advantage of special opportunities whenever the commercial representatives have them to offer. If the reception clerk can greet a visitor by name it tends to create a friendly feeling and it is thought that such employees should be impressed with the desirability of remembering faces to the greatest possible extent in order that they may so greet representatives who, in turn, generally live up to the cordial greeting.

Freight Sales Agency

A freight sales agency, in charge of a freight sales agent, under the supervision of the general purchasing agent, has been found to be the best means of disposing of all over, damaged and refused

freight shipments, except perishable freight. This material is disposed of, in the majority of cases, through competitive bidding. The old practice of accumulating freight at warehouses at various points on the railroad, and selling at public auction at stated intervals throughout the year, is not nearly so satisfactory as concentrating the freight and selling it through the medium of an agency. The principal advantages obtained are three-fold. They are:

- 1—Better accounting for refused and unclaimed freight.
- 2—Greater returns are received due to the higher prices obtained.
- 3—Increased efficiency in handling to prevent further damage and deterioration.

When the shipments are received at the freight sales agency, each individual item is numbered and a record taken in a loose leaf book, giving a general description of the commodity and its condition, way-bill reference, forwarding station, and where possible, the name of the consignor and consignee, and the town or city from which originally shipped. A copy of this report is forwarded to the general freight claim agent for his information and record, and, in a great many instances he is enabled to reconcile claims and have shipments returned to the owner, and cancel the claim. The shipments, when received, are unpacked, put in presentable shelves to permit of a ready examination. This arrangement is carried out along lines similar to the sectional arrangements at our storehouses, in that certain places are assigned for handling freight of particular classes. When over-shipments are received, and especially when the freight is in good condition, such as household goods, etc., for which a large number of claims are usually filed, the same are withheld from sale until every effort is exhausted by the general freight claim agent to locate the owner. A card index file is kept showing the names and addresses of purchasers of various commodities, and when shipments are ready to be sold, a notice is sent them showing the sales number and description of the items, inviting inspection and their best offer. When bids have been received, they are tabulated and award made to the highest bidder. By this method of handling, the possibility of forming pools for buying at ridiculously low prices, as is often done at public auction sales, can be reduced to a minimum.

Discussion

W. F. Jones (N. Y. C.): In numbering requisitions, we supplement the Purchasing Agent's numbers with classification numbers. In other words, when ordering material under classification 45, the number of the requisition would be "6-45-1," "6" being the Purchasing Agent's number; "45" the classification number; and "1" the page number. All invoices are filed in my office according to classification number; and when the requisitions are finally filed in the purchasing agent's department they are filed according to classification number. Then when the purchasing agent calls for them, to get up statistics in regard to any particular item, he has the requisitions all to-

gether under that classification. In regard to "Separation of Purchase Orders," Item No. 3, those are delivered every two or three days, or every week. The purchasing department has prepared blanks which are signed by the purchasing agent. Every division storekeeper has a supply of these blanks and when he gets material he traces it directly on the number which he gave to the order and sends a copy to the purchasing agent. The reply goes direct to the purchasing agent, and when he makes any comments he sends copies to the general storekeeper.

Vice-President Reed: Is the organization based on the governmental organization at Washington?

E. W. Thornley (B. & O.): No; the form, or 90 per cent of it, is being used on the Baltimore and Ohio today.

Vice-Chairman Reed: About two years ago we made an investigation on the Rock Island with reference to the heavy losses incident to the leakage of paint, which is shipped in wooden barrels. We found the amount to be between \$15,000 and \$18,000 per year. The Rock Island runs from Oklahoma and Texas to Minneapolis and St. Paul. We found that while we would not lose much paint in Minnesota, considerable quantities would be lost in Texas. At the suggestion of the paint manufacturers, we adopted the "one-time" shipping container. This is a steel drum, made of light gage sheets, costs about \$3.00 or \$3.50, and does not break open when handled. The head of the drum is about 12 or 14 in. in diameter and is put on with set screws and a gasket, which can be taken off. After the paint is taken out the drum can be used as a water barrel or fire barrel and for the shipment of crude oil, fuel oil, and items of that kind on the railroad.

H. H. Loughton (Southern): Is this loss and damage taken into the stock account?

E. W. Thornley (B. & O.): No. The records are turned over to the general freight claim agent; we act as his agent.

The Chairman: Approximately how many clerks would be required in the purchasing office of a large road to handle an organization the size you outlined?

Mr. Thornley: I think we have approximately 37 clerks in our organization. That includes purchasing organization, lumber agent's office, and freight sales agent.

J. C. Kirk (C. R. I. & P.): Some of our paint comes in five gallon cans which have a pressed lid. We are able to reclaim these cans and make dope pails out of them.

A. A. Goodchild (C. P.): We make all shipments in five-gallon oil cans.

Possible Economies in the Stationery Store

By B. C. Tobey

General Storekeeper, Lehigh Valley.

THE WHOLE PRODUCT of the stores department is economy. It can produce nothing else. It is absolutely essential that we all, both individually and collectively, show that we are interested in this question.

It is generally conceded that stationery should be handled as a part of the general stores organization and be placed under the direct jurisdiction of the general storekeeper, and that handling of stationery as a separate stock, with a stationery storekeeper in charge, should be done at general storehouses wherever they are centrally or conveniently located, as when so arranged there is a complete organization on the ground for ordering, receiving, storing, distributing and accounting for material and supplies that can be utilized to the best advantage from day to day, as the work demands, at a minimum of expense.

All railroads should have a stationery committee and have as

its chairman a direct representative of the chief executive officer, the balance of the committee to include the stationery storekeeper and representatives of using departments.

The first and most important thing to do, is to adopt "standards"—whether it be pencils, ink, pens, books or blanks—and one of the most important of these is quality of paper to be used. Impress upon all concerned that paper "grows" in standard sizes only and that all reports, blanks and books should be made of a size to cut without waste from these sizes. This committee should designate the kinds and quality of all standard stationery, office supplies and mechanical appliances. No changes in existing forms or no new forms should be introduced without the approval of this committee. Standardization of forms permits ordering in quantity with the consequent reductions in costs.

In ordering a new form, the paper, weight and quality ought

ways to be considered. Unless a form is of an important character requiring a high grade of paper, cheap white chemical manila stock should be used, and it will be found that light weight stock serves in most cases. Colored paper should never be used unless absolutely required for some specific purpose, it being more expensive and difficult to get.

Whenever possible to do so, forms should be printed on the back of printed forms which have become obsolete. Black ink should be used, as it is the cheapest kind obtained.

Probably the largest saving to be made in the operation of a stationery store is by printing a large portion of the small and simple forms locally. It will be found that fully 80 per cent of the forms used on a railroad can be printed "at home" at a saving. I do not consider that it would be economical to operate a complete equipped printing plant, or one that would be of sufficient capacity to print all the forms used, for usually a certain class of work is required, which can only be accomplished by the highest grade of skilled printers and machines. In operating a printing plant the main object is to have such facilities and labor as to keep it busy continually and let the overflow go out.

It is estimated by most roads that they are saving anywhere from 20 per cent to 50 per cent over printers' costs by doing this work themselves. The printing organization, whether it consists of one or a half dozen machines, should be given the same opportunity to bid on work to be done as commercial printers and no partiality should be shown. It will be found that there is plenty of work that can be handled by your own printing establishment at a saving to keep it running all of the time. You can also better control and keep your stationery stock balance at a minimum and give better service when printing a part of your own forms.

Multigraph equipment is being used by most of the roads and it is my personal opinion that there is room for from one to four or five such machines on every road where it is not found desirable to install complete printing plants. It can be purchased complete for about \$1,000. It has a normal capacity of 4,800 impressions per hour, size 8½ in. by 14 in. and under, and can be operated by comparatively cheap help, while a job press of a similar size would cost about \$3,000, having a normal capacity of but 2,400 impressions per hour and requiring skilled pressmen or compositors at union labor rates. Beyond runs of 100,000 it will undoubtedly be cheaper to give the work to a printer.

Every up-to-date stationery store should have a power paper cutter and a padding machine so as to be able to cut up all the obsolete forms and other blanks for figuring tabs and second sheets. There is a large amount of plain paper used on a railroad and if you buy it cut the printer will charge at least one-half cent per pound and possibly more for the cutting. With your own cutter you can cut it for one-quarter of that. This paper cutter can also be used in cutting carbon paper, cardboard, blotters, oilboards, mimeograph cloths, etc.

A few roads also make a practice of furnishing plates to printers, but do not believe there is much money saved in following this plan, as the printing market is always highly competitive and regular printers figure to distribute the cost of the plates over a period of a year or more. We are always, therefore, assured of the best prices on account of the competitive feature involved.

On one or two large systems "Duplicating Bureaus" have been established which have been very successful. The idea is to have all of the duplicating machines in the various offices placed in one office and the work consolidated. It was found that machines released were of all sizes and makes and a large number could be disposed of by sale or turned in for new up-to-date machines so that the initial cost was but very little. It would be difficult to determine the amount of labor saved since part time work was employed in all of the different offices in doing duplicating work and the operators doing this part time work expended a great deal more time than was necessary, due to the fact that the work always has to make ready the machine for a little run and then lock it up and set aside when the little job was completed.

I have also found that some ten railroads are maintaining their own typewriter repairmen or shops and are apparently saving considerable money. The equipment necessary consists of but a few benches or working tables on which the typewriters are placed so they can be worked on from all sides to good advantage, so that the repair man, a two-part laundry tray, one part for holding the water and the other for holding the cleaning solution, and a brush for cleaning the machines and

parts and the other part for washing—some shelving and drawers for machines and parts, and a kit of tools, all of which will cost not much over one hundred dollars. The full kit of tools should be bought from the typewriter company, as they have the best tools adapted for that purpose. Most roads figure that they are saving from 20 per cent to 35 per cent over the cost of having this work done by typewriter companies. In addition, machines are kept in much better condition than when the work was done outside.

One railroad company reports that during the year 1920, as many as 8,095 typewriters were overhauled, repaired or inspected at an average cost of \$6.99 for overhauling, \$2.60 for light repairs and \$1.31 for adjusting and inspecting. Another road reports they repaired 456 machines at an average cost of \$9.53 as compared with \$15 per machine formerly repaired by the dealers or a saving of \$5.47 per machine repaired, a total of \$2,494.32. Still another company reports that during the year 1921, with one repairman, who is paid \$150 per month and an outfit costing \$184, they repaired and adjusted 1,244 typewriters at an average cost of \$2.10 each, or a saving of \$1,702.04 over the estimated cost of having the work done outside.

One road reports that it is making its own typewriter ribbons at a cost of less than half what good ribbons can be bought for. It is not economy to buy poor ribbons at any price. The equipment costs about \$150. The tape, best English imported, costs about \$2 per roll of approximately 150 yards and the ink costs \$2.50 per tube for record ink and \$3 per tube for black copying blue.

You can make ribbons light inked, medium light, medium heavy and heavy. The spools and boxes can be used over and over again, thus saving the purchase of any new spools or boxes.

Where the consumption of typewriter oil warrants the ordering of large quantities it will be found that quite a saving can be made by purchasing it in five gallon lots and bottling at the stationery store instead of sending out in can containers. Bottles used in shipping are Edison Battery Oil Bottles.

A majority of the roads canvassed report that they are using ink tablets or powders instead of fluid ink and thus saving anywhere from 40 per cent to 80 per cent on their ink bills. This ink is equal to fluid ink and is just as permanent. It overcomes the bad feature of shipping ink in bottles to the different offices on the road by train service, where they are frequently broken and quite likely to cause damage suits by spoiling baggage.

One road reports that they are saving \$450 per year by making their own supply of mucilage. The mucilage is made of Gum Arabic and Benzoate of Soda. The Gum Arabic is purchased in twenty-five pound lots together with one pound of Benzoate of Soda. The Gum Arabic is powdered at the Storehouse and Benzoate of Soda mixed with it and sent out in envelopes. One of these envelopes costs about seven cents and makes a quart of mucilage.

Another road reports that for the past year or two they have been maintaining a stock of carbon paper which they have been aging, that is, drying it out somewhat so that it will not be green when shipped out for use. They found that in nearly all cases companies that furnish this commodity ship it green and if used in that condition it is practically impossible to obtain maximum service.

One Stationery Storekeeper reports that on his road stamp pads are manufactured at an annual saving of \$172. On the same road mimeograph cloths are manufactured at an annual saving of \$70.

Stencil paper liquid moistener is also manufactured at a saving of \$153 per year.

Binders received at the stationery store with old scrap paper to be sold, reused or destroyed should be salvaged. One road reports saving \$3,852 on this one item in 1921.

Where stationery is not delivered by supply train or car it will pay to ship in specially constructed cases of two sizes, the larger case measuring about 30 in. by 48 in. by 24 in., and the smaller case just one-half as long.

Some of the possible economies mentioned represent but little money but, in the aggregate they amount to considerable and they have a tendency to keep everyone on the alert or lookout for waste and it is surprising how much moral effect it has on the employees.

(The report was accepted.)

Educating Employees of the Stores Department

By A. S. McKelligon

General Storekeeper, Southern Pacific.

IT is often stated that an executive or administrative officer need know little about the details of the business. This does not apply to the stores department. Officers or department heads should be selected from men who have gone through the mill and obtained their experience first hand, and who have shown zeal, loyalty and proficiency. The absence of this practice has been the cause of unnecessary investments in materials and enormous losses in obsolescence.

It was once considered in some quarters, and happily that day is now past, that anyone could be a storekeeper or run the stores; that it did not take any particular talent or experience.

Our help usually comes to us through recommendations of employees already in the service or from sons or daughters of employees at present in the service. Such young men and women after having the necessary school education are the best of raw material. Unfortunately in the past too many boys have wanted to immediately tackle white collar jobs; it is well and important that they have office experience, but the actual handling of the material should come first. They should start as laborers, truckers, helpers or in the stores delivery. It is important that we show interest in the work of those in the organization; we should make repeated inspections and make this in every detail. Those whom we are training soon learn whether or not the one in charge passes over certain things; it is simply a matter of continual supervision, and if supervision lets down slackness creeps in.

These employees on entering the service, no matter what the job may be, how small, should be given a general talk by the foreman in charge, or by the storekeeper, and impress upon him the importance of the work that is being carried on; the value of material stored within the storehouse and that which he comes in contact with, and in which he has a certain responsibility.

An important thing to impress upon them is to stick to the job if they once make a start. The prime essential is that one must like his work. If he does not, it is best that he choose some other line before he has gone too far. No man can hope to succeed if he takes just a passing interest in his work. Arouse their enthusiasm and once you get this aroused, never let it flag. This is done by paying proper interest to the employee's work. When you have promotions make them from your own organization; beware of importations; it is the quickest way to play hob with your organization. In saying this, it is assumed, that you have a trained man at hand. One must always know and feel that he is preparing himself for something better. Success cannot be developed in any man who has only a blank wall to look forward to; he must see an avenue of opportunity open ahead. It is the clear open road that leads to success—the blocked pathway to discouragement. Consider merit and efficiency, together, of course, with loyalty. Arouse this by frequent meetings, local as well as general; encourage suggestions; dictatorial arbitrary methods fail to bring out the best in the men. Encouragement and a friendly pat on the back will do more for most boys than a lecture, and above all, beware of the condition of waiting for some one to die. In touch-

ing on this, will quote in part from an editorial on this subject in the *Railway Age* dated May 13, 1922, entitled "Waiting for Someone to Die."

"The expression 'Waiting for Someone to Die' is not a particularly pleasant one, yet it is often heard among railway men in reference to the possibilities of promotion. It is not, however, with the advancement of individuals that this expression has been most strongly impressed upon us, but rather with the advancement of railroading itself. Now and then there are railway officers who, because of their beliefs, prejudices, misinformation, personal animosities and other reasons, are blocking the adoption of something of proved benefit."

To adapt this principle to our business we must be ready to adopt modern storekeeping methods as advocated by this section. Go back home from the conventions and really put some of the recommended practices to work, and while educating our employees be ready to learn yourself. We must visit the other fellow and see what he is doing, and just because it is someone else's idea or because it does not conform to the methods in vogue on our railroad, or of some old practice in effect for years, do not condemn the plan; give it your concern, and if you do adopt it when the occasion arises and in fairness to your neighbor's railroad, give the credit where it is due.

The initiative of the employee should be allowed to roam. Take the check rein off, but hold them up to the bit; train them to be thorough; there is no more satisfaction than having a man who is thorough. Employees should know the why and wherefore of instructions, or why a certain thing is done. You will have the aid of those down the line in carrying out an order that is intelligent to them and they know the reason therefore. It is well in the education of our employees and ourselves to compile analytical statements for comparison purposes. Make them compete, or at least get in step with the other fellow. Fair and honest team competition means progress. I have said "team" competition as individual competition breaks up the team and disrupts the family.

Fair and just treatment must be accorded to all, but our pupils must be made to understand that just treatment and fairness is due the company and department. There is a happy medium between the strict martinet style and the indulgent one. They must be taught and it must be reiterated that the various departments are organized only to carry on efficiently the different work assigned to them so that the railroad as a whole will function with the least friction—department lines must be broken down at any time and anywhere for the good of the railroad. There is only one ultimate object for which we are striving—to produce the best transportation and service at the least cost. If you train men along these lines, when stress comes to your department or railroad, when you as one unit must surmount some obstacle, you will be surrounded by a band of loyal co-workers who will fight with you and for you in such perplexities and hardship. When you must drive to get as nearly as possible something out of nothing, you will have a team and team work which will bring this as nearly to an accomplishment as possible so to do.

Fuel Conservation Joint Committee

THE Joint Committee on Fuel Conservation, consisting of seven representatives each from the Operating, Mechanical and Purchases and Stores Divisions, held its first meeting at New York City, January 6, 1921.

Wm. Schlafe, mechanical manager, Erie Railroad, was elected chairman. The representatives of the three Divisions constituting the Joint Committee elected Vice-Chairmen as follows: Operating Division, W. M. Jeffers, General Manager, Union Pacific; Mechanical Division, Wm. Schlafe, Mechanical Manager, Erie; Purchases and Stores Division, Saml. Porcher, General Purchasing Agent, Pennsylvania System.

Under the plan of organization as adopted for the Joint Com-

mittee, the Chairman and Vice-Chairman constitute a Committee of Direction. The office of the Secretary of the Mechanical Division, at Chicago, was designated as official headquarters of the Joint Committee.

The Joint Committee decided for the present to confine its activities to the following subjects:

1. Organization for Fuel Conservation, having in mind cooperation of various departments and employees.
2. Inspection of Fuel at source of supply and preparation of a fuel schedule or specification.
3. Statistics.
4. Methods of Conservation—Mechanical and Otherwise.

Meetings of the Committee were held January 6, 1921; March 29 to 30, 1921; September 7, 1921.

Discussion

The above report was read by Samuel Porcher (General Storekeeper, Penna.), chairman of the committee, who also added the following comments: Some explanation is necessary. Fuel is a very important item of railroad expense, perhaps 30 or 35 per cent. In addition to the A. R. A. many other associations give the question of fuel consumption a great deal of attention. The American Society for Testing Materials and the Association of International Railway Fuel Associations have been concerned with this subject for a number of years. From the standpoint of Purchases and Stores, and in my connection with this Joint Committee of the A. R. A., I have done what I could to bring forward the conservation of fuel. I presented to the Joint Committee at one time, in March, 1921, what I call some aspects of the Purchase of Fuel which relates closely to, or determine altogether, its conservation. They are as follows:

1. There should be a clear statement of the kinds and grades and the qualities of coal or oil to be purchased so as to insure the acquisition and receipt of fuel which is best suited for the purpose.

2. There should be a definition of the standard of quality—specifications—B. t. u., ash, preparation, size, inspection, and for oil, the gravity, etc.

3. There should be careful selection of the sources of supply. The mines or wells should be examined by competent persons to determine whether their product, the coal itself or its preparation, or the oil will be delivered in conformity with the standard of quality.

4. The product of a designated mine or oil field should be purchased rather than a commercial or pool grade.

5. There should be the stocking or storing of a certain part of the annual requirements when prices are favorable and delivery abundant or easy, and the use of that stored fuel when conditions are reversed.

6. If the coal supply is derived from mines on the line of the road and is used at many different points and if a large supply is not carried in storage at a few points, orders should be placed with the producers so that distribution can be done with the shortest haul and the most easily maintained communication.

7. An ample supply of cars should be furnished.

8. The management of purchases should be put in hands of a capable purchasing agent or fuel agent with a competent organization.

9. There should be co-ordination of that buying organization and the operating, traffic and transportation branches.

10. Conservation is understood to relate to the kinds of fuel and their proper and most economical use rather than to the price at which fuel may be had; the lowest priced fuel per ton or barrel for oil might not bring the best return per dollar expended, and therefore, in this analysis prices are not taken into consideration beyond the making them a factor in the determination of the problem commensurate with the other factors consequent upon them.

(It was moved and seconded that the report of the committee be accepted as read and that Mr. Porcher be continued as representative of Division VI on the Joint Committee.)

Report of Memorial Committee

It is with deep regret we have to announce the death of the following members of this association since our last meeting:

- 1. H. Collins, Southern Pacific Co., Los Angeles, Cal.
- Chas. P. Jennings, Bingham & Garfield, San Francisco, Cal.
- O. C. Wakefield, Northern Pacific, St. Paul, Minn.
- V. J. Angier, Baltimore & Ohio, Balt., Md.

Realizing the loss to the Association and to the families and friends, *Be it resolved* that we, the members of the American Railway Association, Division VI, Purchases and Stores, express our sympathy with the families of each member and their friends: *And further resolved*, that this resolution be printed in the minutes of the Association and the Secretary be instructed to forward a copy to the relatives of each of the departed.

Report of the Committee on Resolutions

After an absence of two years from Atlantic City, we return and receive the same cordial welcome from her citizens, through their distinguished Mayor, Mr. Edward Bader.

We are also honored with the presence of the representatives of the Railway Age, Railway Purchase and Stores, and other prominent guests and distinguished visitors.

In acknowledgement of such, it is the desire that a public expression of our appreciation be tendered.

Therefore, be it resolved—That a vote of thanks be extended to these gentlemen, and to our President and his staff, together with the members of our executive committee, together with the various standing committees, for their very able and efficient services in our behalf; and that the same vote be extended to cover the efforts of the New York Central and Southern Pacific representatives for their portrayal of Supply Train and Unit System of Filing:

And be it further resolved: That we are highly honored by the presence of Vice-President Elisha Lee of the Pennsylvania Railroad and Mr. Wise from Washington, and that a vote of thanks be extended to them for their very instructive addresses; and

Be it further resolved: That we express our appreciation to the management of the Traymore Hotel for their reception and cordial treatment extended to our Division while in their midst.

Resignation of J. P. Murphy

J. G. Stewart: The general committee has received the resignation of J. P. Murphy, as secretary. Mr. Murphy has been to our association almost as a father. I believe at every meeting we have had Mr. Murphy has been present and in every way getting into it and working. I am almost certain, although not entirely so, that he was the leading spirit in suggestion in an association of this kind. I am almost certain that, except for the efforts Mr. Murphy put forth, not always pleasant ones, but nevertheless always enthusiastically given by him, this organization would never have existed.

I would like to offer this resolution to our meeting today:

"It is with sincere regret that we received the resignation of J. P. Murphy, as secretary of Division No. VI, Purchases and Stores, and in accepting this resignation, we are not unmindful of the valued service and great sacrifice Mr. Murphy has rendered for the success of the Railway Storekeeper's Association and Division VI of the Purchases and Stores of the A. R. A., and it is only at his own request and urgent desire that this association accepts his resignation."

(A standing vote was taken and the secretary directed to see that Mr. Murphy received a copy of the resolution, and also to send copies to the N. Y. Central officials.)

Election of Officers

The following members to the General Committee were elected for 1923.

General Committee for two-year term, expiring June, 1924.

Chairman—F. D. Reed, Vice-Pres. C. R. I & P.

Vice-Chairman—U. K. Hall, Supv. of Stores U. P.

Exp. 1924.

R. C. Vaughan, Vice-Pres. Canadian National Railways.

R. J. Elliott, Pur. Agent Northern Pacific.

H. H. Loughton, Asst. to Vice-Pres. Southern.

W. G. Phelps, Pur. Agent Pennsylvania.

Wm. Davidson*, General Storekeeper Illinois Central.

C. D. Young, general supervisor of Stores Penna.

J. G. W. Stewart, General Storekeeper C. B. & Q. Expiring 1923.

J. F. Marshall, Pur. Agent C. & A.

*Mr. Davidson—J. F. Marshall to fill out the unexpired term of U. K. Hall.

Nominating Committee

In accordance with Section 4 (g) of the Rules of Order, the following members were elected members of the Committee on Nominations during the ensuing year:

F. A. Bushnell, Purchasing Agent Great Northern.

J. G. Stuart, General Storekeeper Chicago, Burlington & Quincy.

O. Nelson, General Storekeeper Union Pacific.

H. P. McQuilkin, General Storekeeper Baltimore & Ohio.

G. A. Secor, General Storekeeper Chicago & Alton.

(The Division VI was adjourned.)

Third Session Of The Air Brake Association

Presentation and Discussion of Report on Standard Practices Followed by Election

THE CLOSING SESSION of the Air Brake Association convention was held in Haddon Hall on Wednesday, June 21, 1922, President L. P. Streeter in the chair. After the meeting was opened, the president announced the appointment of the following Nominating Committee: T. W. Dow (Erie), William Clegg (Canadian National) and C. H. Knowlton (*Railway Age*).

Standard Practice

H. A. Clark (Soo Line), chairman of the committee on standard practice, presented the following changes and additions for consideration; these were taken up and acted upon paragraph by paragraph. All were accepted with little or no discussion except a few which were referred back to the committee for further consideration as noted.

Under heading "Air compressors," subheading "Repairs to air compressors," paragraph 2 changed to read: "Air compressors returned to the shop for repairs should be thoroughly cleaned in boiling lye or some other suitable chemical."

Under heading "Air compressors," subheading "Repairing and condemning," paragraphs 1 and 2 replaced by the following: "The caliper of the air and steam cylinders should be determined, and if worn $\frac{1}{16}$ in. or more from the diameters shown in the following table they must be rebored. When cylinders have been rebored to the sizes given in table, new piston heads and rings of increased diameter must be applied.

Kind of compressor	Cylinders to be rebored	Diameter new	Diameter after first rebore	Diameter after second or final rebore
		inches	inches	inches
$9\frac{1}{2}$ -in.	Steam cylinder	$9\frac{1}{2}$	$9\frac{5}{8}$	$9\frac{3}{4}$
$9\frac{1}{2}$ -in.	Air cylinder	$9\frac{1}{2}$	$9\frac{5}{8}$	$9\frac{3}{4}$
$8\frac{1}{2}$ -in. C C	High pressure steam cylinder	$8\frac{1}{2}$	$8\frac{5}{8}$	$8\frac{3}{4}$
$8\frac{1}{2}$ -in. C C	Low pressure air cylinder	$14\frac{1}{2}$	$14\frac{3}{8}$	$14\frac{3}{4}$
$8\frac{1}{2}$ -in. C C	Low pressure steam cylinder	$14\frac{1}{2}$	$14\frac{3}{8}$	$14\frac{3}{4}$
$8\frac{1}{2}$ -in. C C	High pressure air cylinder	9	$9\frac{1}{8}$	$9\frac{1}{4}$

Paragraph 4 changed to read as follows: "Piston rods with taper fit should be so arranged as to provide the standard draw, as follows, for different sizes of air compressors:"

Kind of compressor	Draw inches	Standard dimension between heads inches	Minimum dimension between heads inches
$9\frac{1}{2}$ -in.	$\frac{7}{64}$	$18\frac{11}{16}$	$18\frac{47}{64}$
11-in.	$\frac{7}{32}$	$21\frac{7}{16}$	$21\frac{21}{64}$
$8\frac{1}{2}$ -in.	$\frac{7}{32}$	$22\frac{11}{16}$	$22\frac{43}{64}$
$10\frac{1}{2}$ -in.	$\frac{7}{32}$	$22\frac{11}{16}$	$22\frac{43}{64}$
No. 2	$\frac{7}{64}$	$16\frac{5}{16}$	$16\frac{9}{32}$
No. 3	$\frac{7}{32}$	$21\frac{11}{32}$	$21\frac{9}{16}$
No. 6	$\frac{7}{32}$	$18\frac{29}{32}$	$18\frac{11}{16}$

Paragraph 5, top of page 231 to be changed to No. 6 and read as follows: "Piston packing rings for air cylinders to be condemned when ring ends will not come together when placed in smallest part of cylinder."

Paragraph 14 changed to read: "All air valves, valve seats and cages to be of steel in all compressors."

Paragraph 15, first sentence changed to read: "In removing piston rod nuts, except castle nuts, they should be split off in line with the rod, to prevent wear and damage to rod threads and replaced with new beveled nuts that snugly fit threads on rod."

Paragraph 20 changed to read: "Piston packing rings for main valve to be condemned when ring ends do not come together when placed in their respective bushings."

Under heading "Brake valves," subheading "Cut-out cocks" to be changed to "Double heading cut-out cocks."

Heading "Distributing valves" to be changed to "Distributing valve and control valves."

Under heading "Gages," subheading "Type" to be changed to "Specifications."

Under heading "Retaining valves," paragraph 8. It is suggested that all retaining valves on vestibule passenger equipment cars be placed inside of the vestibule. (Referred back to committee for further consideration.)

Under heading "Triple valves," subheading "Cleaning and repairing," paragraph 5 changed to read: "Particular attention should be given the piston packing ring. It should have a neat fit in its groove in the piston and also in the triple piston bushing. Once removed from the piston, if distorted in any manner, it should be condemned. The fit of the packing ring in its groove and bushing and the condition of the bushing should be such as to insure the valve passing the prescribed test. New rings should be applied to the piston groove from the slide valve side and the opening should be placed in the top of cylinder while testing. When cleaning triple valves the

opening should be placed on the bottom cylinder. (The reference to application of piston ring to groove from slide valve side is added.)"

Paragraph 10 changed to read: "The cylinder cap gasket and check valve case gasket must be carefully examined and cleaned with a cloth but should not be scraped. In cleaning emergency valve seats no sharp instrument should be used that would possibly scratch or mar it. All flat seats should be re-machined to the standard half-round bearing. In re-machining emergency valve brass seats, they shall be parallel to and not to exceed $\frac{1}{64}$ in. below the finished outer surface as illustrated in drawing." (Drawing is added to make meaning more clear.)

Paragraph 15 changed to read: "Lubricate the seat and face of slide valve graduating valve with very fine high grade dry graphite prepared especially for the purpose, rubbing it thoroughly on the slide valve seat and slide valve face; also upper portion of bushing where slide valve spring bears. Endeavor to have as much as possible adhere to and fill up the pores of the brass, leaving a very thin coating of free graphite. The parts lubricated with dry graphite must be free from oil or grease." (First sentence changed by adding "very fine" and "prepared especially for the purpose" to bring out more clearly the grade of graphite to be used.)

Under heading "Brake cylinders," subheading "Cleaning and lubricating" paragraph 8 to be omitted. (This is covered in paragraph 7.)

Subheading "Brake pipe" part of paragraph 1 and paragraph 2 to be put in proper place.

Paragraph 7 changed to read: "Brake pipe on the rear of tender should be as per A. R. A. standards for cars. Brake pipe hose connection on engine should be on the left side of pilot when facing the front of engine, except where recessed pilot is used. Print shows recommended location for this type of pilot. (M. C. B. changed to A. R. A. and last sentence added.)" (In connection with this suggestion there was some discussion relating to A. R. A. standard locations and while some advocated adding a copy of the A. R. A. drawing it was not considered advisable to do so.)

Subheading "Retaining valve pipe" paragraph 4 changed to read: "All pipe used in connection with retaining valve should be wrought iron. (This eliminates the recommendation for using galvanized pipe and fittings on coal and refrigerator cars.)" (Referred back to committee.)

Paragraph 5, last word to be "pipe" instead of "type." Under heading "Foundation brake gear," subheading "brake power" paragraph 2 to be omitted. This is covered in paragraph 3 and table.

Table under paragraph 3 to have eighth item under brake cylinder pressure changed from 60 lb. to 50 lb.

Paragraph 11 to have "60 pounds" changed to "70 lb." in connection with empty and load brake.

Paragraph 12 to read: "Length and location of brake lever guides to be such as to provide for full take-up of slack by automatic slack adjuster and with 12-in. piston travel, without permitting levers to strike." (Eleven inch piston travel changed to twelve inch.)

Under heading "Air hose" paragraph 4. In connection with air brake hose coupling gages, it has been suggested that the Air Brake Association recommend to the A. R. A. that standard gages be designed for use with signal hose couplings. (Announcement made that this has already been taken up and adopted.)

Paragraph 5 to be added. "Gaskets should be purchased in accord with A. R. A. standards."

Under heading "Dummy couplings," paragraph 1 changed to read: "Passenger equipment cars, also coal and locomotives to be equipped with dummy couplings for the brake pipe and signal pipe hose; they to

be suspended with a chain of liberal length to prevent kinking of the hose and not to exceed 15 inches from center line of car on opposite side to that of brake pipe. (The change consists in limiting the distance away from center line of draw-bar to prevent going to the extreme in location that will necessitate an excessive length of chain.)"

Under heading "Hand brake power" paragraph 1 changed to read: "With the foundation brake so arranged as to give a braking power of not less than 80 per cent based on a 50 lb. cylinder pressure, the hand brake shall be so proportioned that a force of 125 lb. applied 3 in. from outer end of hand brake ratchet lever will develop the equivalent at the brake cylinder piston, of the cylinder value at 30 lb. pressure per square inch."

Paragraph 4 changed to read: "With the body and truck levers properly proportioned for 60 per cent braking power based on a 50 lb. cylinder pressure, the hand brake leverage between brake staff and cylinder shall be so proportioned that a force of 125 lb. at the rim of the brake wheel or 3 in. from outer end of hand brake ratchet lever will develop a pull at the brake cylinder piston of not less than 2,500 lb. and 3,950 lb. respectively for cars having 8 in. and 10 in. cylinders. This will insure a minimum hand brake power at the shoes of 60 per cent of the empty car weight." (This is the A. R. A. requirement for tank cars, and the suggestion was made in order to extend this to cover all cars. Referred back to committee as the subject is now under consideration by A. R. A.)

All places where M. C. B. rules are referred to should be changed to A. R. A.

The report was signed by the following committee: H. A. Clark (Soo Line), chairman; C. N. Remfry (Duluth, Missabe & Northern); F. J. Barry (New York, Ontario & Western); T. W. Dow (Erie); R. C. Burns (Pennsylvania), Committee.

Business and Election of Officers

The committee previously appointed presented the following nominations. The election which followed was unanimous. President, Mark Purcell (Northern Pacific); first vice-president, George H. Wood (Atchison, Topeka & Santa Fe); second vice-president, Charles M. Kidd (Norfolk & Western); third vice-president, R. C. Burns (Pennsylvania); secretary, F. M. Nellis (Westinghouse Air Brake Company); treasurer, Otto Best (Nathan Manufacturing Company).

The election of Mr. Burns to the office of third vice-president left a vacancy on the executive committee, which was filled by the selection of Harry Flynn (Delaware & Hudson).

Following the election speeches were made by the incoming officers. Secretary Nellis spoke of the increase in interest which followed the announcement of the decision to hold a convention this year. He told the members that steps toward amalgamation of the Air Brake Association with the A. R. A. had been given up but that the suggestion had resulted in a hearty co-operation which would be of help to the association. It is not the desire or intention to establish a regular practice of holding the annual conventions at Atlantic City in conjunction with the Mechanical Division, although this will probably be done from time to time. Other conventions will be held in different sections of the country as has been the practice in the past. There has also been considerable agitation on the part of some looking toward the selection of Chicago as a permanent place of meeting, but that also has been given up. There is a growing realization on the part of mechanical officers of the importance of the work of the Air Brake Association which is very encouraging.

After a number of resolutions had been passed, the twenty-ninth convention was adjourned at 12.30 p.m., to meet at Denver, the first Tuesday in May, 1923.

Conventionalities

E. B. Leigh, president of the Chicago Railway Equipment Company, has been attending the conventions as usual. As all who know him are aware, Mr. Leigh takes a very active interest in the work of organizations which are trying to improve industrial conditions, and especially railway conditions. Besides having always been one of the leaders in the Railway Business Association, he represents the National Association of Manufacturers on the National Industrial Conference Board, whose research work regarding labor matters especially, has been among the most important ever done in this country.

The Santa Fe crowd are surely a hard working bunch. Mr. Purcell hardly allows them time to eat their noon-day lunches. Sharp at 2:30 they assemble at the entrance to the pier and for the next four or five hours they are kept busy studying the merits of the various devices in the exhibit and comparing notes. In addition to Mr. Purcell, who has just been elected vice-chairman of the General Committee of Division V, there are present this year J. E. McQuillen, mechanical superintendent, Galveston, Tex.; J. H. McGroff, mechanical superintendent, Ft. Madison, Iowa; C. T. Ripley, general mechanical engineer, Chicago; E. E. Chapman, engineer of tests, Topeka; H. H. Lanning, mechanical engineer, Topeka, Kan.; J. K. Nimmo, master mechanic, Arkansas City, Kan.; W. R. Harrison, master mechanic, Chanute, Kan.; M. J. Drury, supervisor of packing, Topeka, Kan., and F. W. Thomas, supervisor of apprentices, Topeka.

W. D. Duke, general manager of the Richmond, Fredericksburg & Potomac, announces that his railway made an appropriation last week of \$1,250,000 for a program of additions and betterments to be carried out during the next year and a half. Almost \$1,000,000 of this amount will be used in constructing a new engine terminal at Richmond. Most of the rest will be spent on a coaling station and a hold yard for the reconsignment of cars in connection with the Potomac yard at Washington, D. C. The R. F. & P. handles a very large perishable business and needs more yard room at Washington for cars of this freight that are reconsigned. The road is moving an extraordinarily large business. Its freight traffic in May was the largest in any month of its entire history. Mr. Duke is accompanied to the conventions by Mrs. Duke and their little daughter, Jane, who yesterday celebrated her sixth birthday. They expect to meet here their son, who is on his way to the Pacific Coast.

Mr. and Mrs. Walter B. Leach were joined in Atlantic City yesterday by their two sons, Barton (W. B., Jr.) and Gordon. Mr. Leach must leave on business at once, but the young men will spend a few days here with their mother. They will then go to New York and sail for Europe, where Barton will spend some time studying at the University of Grenoble and at the Sorbonne. Barton is a Harvard graduate and is now studying law at the Harvard Law School. He has had an unusually brilliant college career and during the last year, in addition to carrying on studies which would have given an ordinary young man plenty to do, he taught a class in international law. Barton has studied in France before, but this will be Gordon's first trip to Europe. His friends will follow his future career with great interest and high expectations.

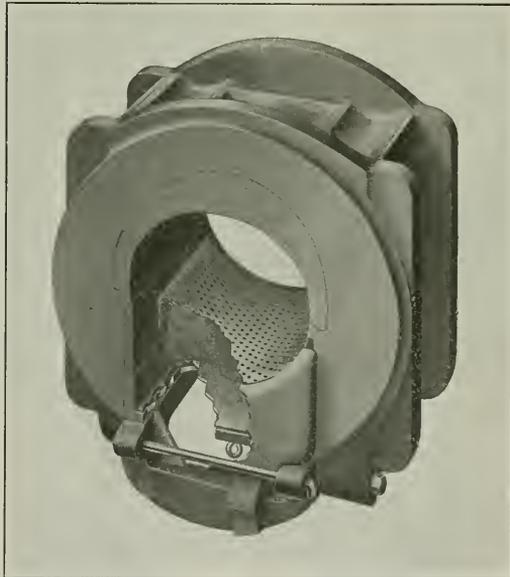

New Devices Among the Exhibits

A Spreader for Driving Boxes

THE ORDINARY DESIGN of locomotive driving box often causes trouble in the roundhouse because the lower ends close in and clamp the cellar so tightly that it is difficult to remove. In order to overcome this drawback, the Franklin Railway Supply Company, New York, has developed a driving box spreader which keeps the cellar free at all times and also secures several other advantages.

The arrangement of a box equipped with the spreader is shown in the photograph. It comprises a steel casting between the lugs of the box, on which the cellar rests, a plate closing the opening at the end of the box, and a pin holding the end plate in position.

To repack the box it is only necessary to take out the pin and remove the end plate, and the cellar being free

Driving Box Fitted with Spreader

can easily be withdrawn. When a new grease cake has been applied, the pin which normally holds the end plate in position is inserted through the indicators to pull the cake and the perforated plate to the bottom of the cellar. After the cellar has been inserted, this pin is withdrawn and again applied to the end plate. The fact that this pin is used for both purposes insures that it will not be left in the cellar and prevent the grease cake from feeding when the locomotive is in operation.

The end plate is held in position vertically by lugs resting on the spreader. The lugs on the two sides of the plate are placed at different heights so that by reversing the plate can be raised to compensate for wear in the

driving box crown brass. The end plate also performs an important function in preventing the weight of the wheel and axle coming on the grease cellar when the locomotive is jacked up.

Train Lighting Equipment

THE GREATER PART of the equipment being exhibited by the Safety Car Heating & Lighting Company consists of new products. Among them are a lead storage battery for car lighting, an electric water heater, an improved electric water cooler, a fan motor which can be used interchangeably on all fans made by the Safety Company, an improved belt fastener of the Walker type, a line of fractional horsepower motors and several new types of lighting units.

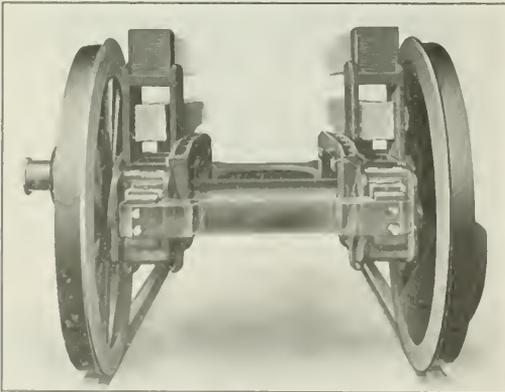

The form of plate construction used in the battery is an innovation, and provision is made for flushing batteries and taking specific gravity readings without removing the crates from the battery boxes. Car lighting units are mounted in a trellis over the booth which is built according to dimensions used for Pennsylvania coaches.

New Design of Woodward

Lateral Motion Box

ONE OF THE SERIOUS disadvantages of locomotives with long, rigid wheel base is the rapid wear of tires which occurs when such equipment is operated on tracks with sharp curves. The Woodward driving box, which permits lateral motion against a constant resistance, has overcome this difficulty and has been an important factor in making the 2-10-2 type locomotive a practical operating unit. The original design of this device added considerably to the weight of the wheels to which it was applied. This disadvantage has been eliminated in the latest design, which is illustrated in the phantom view.

The new design of lateral motion box utilizes a unique principle for obtaining the constant resistance. The shoe and wedge fits in the boxes have lateral freedom, each

Phantom View of Lateral Motion Driving Box

moving independently. Spanning the inside top edge of the box is a bell crank which is fulcrumed on the box. The inner member of the spring saddle rests on one arm of the bell crank, while the other arms extend downward and engage flanges on transverse braces between the frames. When the driving wheel is moved inward the

force coming on the driving box is transmitted to the arms of the bell crank and as these arms are brought closer to the driving box the saddle is raised, thus causing a constant force to be exerted on the bell crank, tending to restore the box to its normal condition. This design has the advantage of extreme simplicity and also effects an important saving in weight.

Change in Unit Safety Bar

A DESIGN OF Unit safety bar shown this year by the Franklin Railway Supply Company, New York, embodies some changes which experience has shown to be of marked advantage and which have so reduced the space occupied that sufficient clearance has been secured to permit the installation of the locomotive booster without interference. Instead of using the pin itself for the connection to the Unit bar, the auxiliary pocket in the engine draw-casting has been modified so that it forms a boss around the pin, while the eye of the Unit bar has been enlarged to pass over this boss instead of being drilled out only to the pin size. This has materially shortened the pin and resulted in a neat compact and durable arrangement.

Street Locomotive Starter

CLEMENT F. STREET has been working for the past two or three years on a locomotive starter, and although the machine is still in an experimental stage he has one on exhibition. The machine consists essentially of a heavy cast steel ratchet wheel keyed on the trailer truck or tender axle and driven through a spring ratchet by a steam cylinder which is carried on the truck frame. The machine is designed to act as a starter only and to be cut out as soon as the locomotive is under way. It is believed that its use will enable a locomotive to start, without taking slack, any train it can haul and therefore reduce to a minimum break-in-tows on freight trains and eliminate starting shocks to passenger trains.

Trap Door Spring Testing Device

THE O. M. EDWARDS CO., INC., Syracuse, N. Y., is showing a vestibule trap door spring testing machine which is in regular use at its factory. The first spring broke after 93,928 operations which is equivalent to operating a trap door 20 times a day for approximately 13 years. The second spring now being tested was placed in the testing machine on Friday, June 16, and has run over 112,000 operations without breaking.

Flanged Locomotive Tank

A DEVICE that is attracting considerable interest in Space 628 is the Ralo-Aemie flanged locomotive tank. Among the distinctive features of this tank are the elimination of the rectangular tank, with a proportional reduction in the liability of leakage; also the bottom flanges are vertical and the rivets used are readily accessible from the inside of the tank and therefore it is not necessary to jack up the cistern from the frame when they need attention. This flanged bottom construction is also a factor in reinforcing the bottom plates as contrasted with the overlapping seams. Further there is a considerable saving in the abolishment of angle iron bars as well as the rivets mentioned.

UNRETOUCHED PHOTO OF THE PILLAR OF DELHI

A 10" Armco Ingot Iron Culvert, in place under a highway 15 years ago.

Enduring—because made of PURE Iron

For sixteen centuries the iron pillar at Delhi has looked down unchanged on changing civilizations.

Torrential rains and scorching Indian suns have failed to mar this age-old structure. The material is *pure* iron—the impurities hammered out laboriously, minute quantities at a time, by the ancient Hindus.

The modern counterpart of this ancient iron is Armco Ingot Iron, possessing the same purity, and promising equal permanence. Already hundreds of

ARMCO CULVERTS

like the one pictured have been under our highways and railroads for a generation and show scarcely a sign of use.

There is a manufacturer in nearly every state, and in Canada, making genuine rust-resisting ARMCO CULVERTS and other products of Armco Ingot Iron such as flumes, siphons, tanks, road signs, roofing. Write for full information and nearest shipping point on products in which you are interested.

The Railway Age is a member of the Associated Business Papers (A. B. P.) and of the Audit Bureau of Circulations (A. B. C.)

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free; United States, Mexico and Canada \$6.00. Foreign Countries (excepting daily editions), \$8.00. Foreign subscriptions may be paid through our London office in £ s. d. Single copies, 25 cents cash.

WE GUARANTEE, that of this issue 9,100 copies were printed; that of these 9,100 copies 8,133 were mailed to regular paid subscribers, 57 were provided for counter and news company sales, 305 were mailed to advertisers, 22 were mailed to employees and correspondents and 583 were provided for new subscriptions, samples, copies lost in the mail and office use; that the total copies printed this year to date were 227,920, an average of 9,117 copies a week.

“We Halved the Time With This Radial”

“In several instances, the Ryerson-Conradson Radial has cut our previous drilling time in half.” —*General Foreman.*

Such remarkable performance is made possible by concentrating in this radial the most modern developments of machine tool design.

Twin motor drive, absence of troublesome bevel gearing, box construction of the drilling arm, and handy location of controls throughout are a few of the special features that permit driving the drill without damage to the machine or fatigue to the workman.

The Ryerson-Conradson Radial is particularly suited to help those railroad shops laboring under the handicap of limited machine tool capacity.

Our Bulletin 4,001 tells how bevel gears were eliminated. Ask for your copy.

Whiting Four-Jack Locomotive Hoist, Capacity 200 tons. View shows hoist in operation removing a single pair of drivers. In shops of Baltimore & Ohio R. R., Garrett, Ind.

Install a Whiting Locomotive Hoist^{*}

for Economy:

It is possible to save from \$14,000 to \$36,000 per year in unwheeling and re-wheeling locomotives, depending on the number handled.

for Safety:

Locomotive is squarely supported on steel beams and held perfectly level in raising or lowering. Wheels remain on track level—no dropping.

for Convenience:

Hoist is always ready and is adjustable to different sizes of locomotives.

for Speed:

The Whiting Hoist will do in a half hour what takes many hours on a drop pit.

Send for our new Catalog No. 160

WHITING CRANES
FOUNDRY EQUIPMENT
RAILWAY SPECIALTIES

From Start to Finish

From its initial installation, through such maintenance as may be required to preserve it in perfect working condition, to the operation which insures the safety of trains while at the same time it expedites traffic, the absence of complication is an outstanding feature of the Miller Train Control.

Installation—One mechanic and a helper install the system in 8 hours. Locomotive need not be held out of service.

Maintenance—No specially trained forces are required for maintenance of engine or track equipment. Actual figures from railroad records covering costs of maintenance for five years are obtainable.

Expedition of Traffic—Undesirable stops at undetermined points due to the action of the train control system are impossible.

SERVICE

THE illustration shows the first car turned out in the Cambria car shops that is equipped with the new Symington wrought steel side frames.

The new Symington wrought steel side frame is made from a single piece of steel plate in the car shops of the Cambria Steel Company. It has all of the good points of the cast steel frame and at the same time is lighter and stronger. There is also a marked superiority to other types of pressed steel side frames because it is made in one piece and there are no parts to work loose.

A Camera Shows Why Great Railroads Measure Pipe Value in Terms of Endurance

These unretouched photographs prove conclusively why Reading Wrought Iron Pipe saves thousands of dollars annually for many of America's most highly organized and efficiently conducted railway systems.

Both shipments of pipe *looked* the same when the order was placed. Both were installed with a like amount of labor at the same wage rate, and both were used under similar conditions. Yet the steel pipe is ready for the scrap heap at the end of the eighth year, while the original condition of the Reading Wrought Iron Pipe is practically unchanged after *twenty-two years* of continuous, unfailing service.

Genuine Reading Wrought Iron Pipe with a life two to three times that of steel—represents the utmost in conservation, safety and operating efficiency in steam, heat, air and ammonia lines. The siliceous slag content keeps it in service years after corrosion has ended the usefulness of pipe which was bought on a basis of price alone. The fibrous structure ensures successful resistance to sudden shocks and strenuous strains that steel cannot withstand. And superior threading qualities mean tight, trustworthy joints.

Sixty-four years ago, the Reading Iron Company began the manufacture of genuine hand-puddled wrought iron pipe and tubing. Since 1849 Reading Wrought Iron Pipe has been the logical choice of those who test pipe side by side and make careful comparisons.

CAST IRON PIPE

Within the Memory of Man Cast Iron has Never been Destroyed by Rust

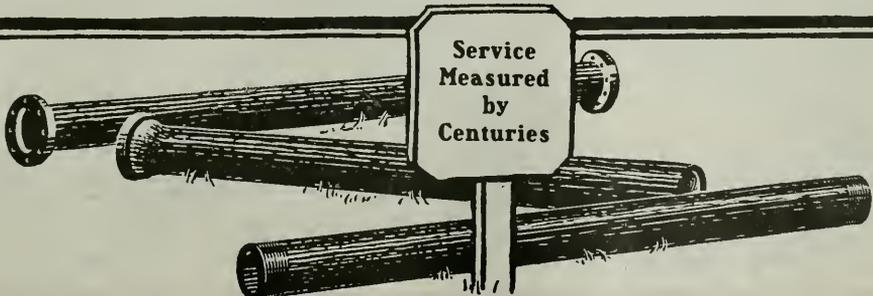

Cast Iron rusts only on the surface. It thus seals itself against further deterioration.

Because the first cost of cast iron pipe is the last, it is the standard pipe for water and gas mains. And its wonderful record in the solution of unusual industrial problems—its resistance to various acids, alkalis, etc.—makes it important for any business executive to know its value.

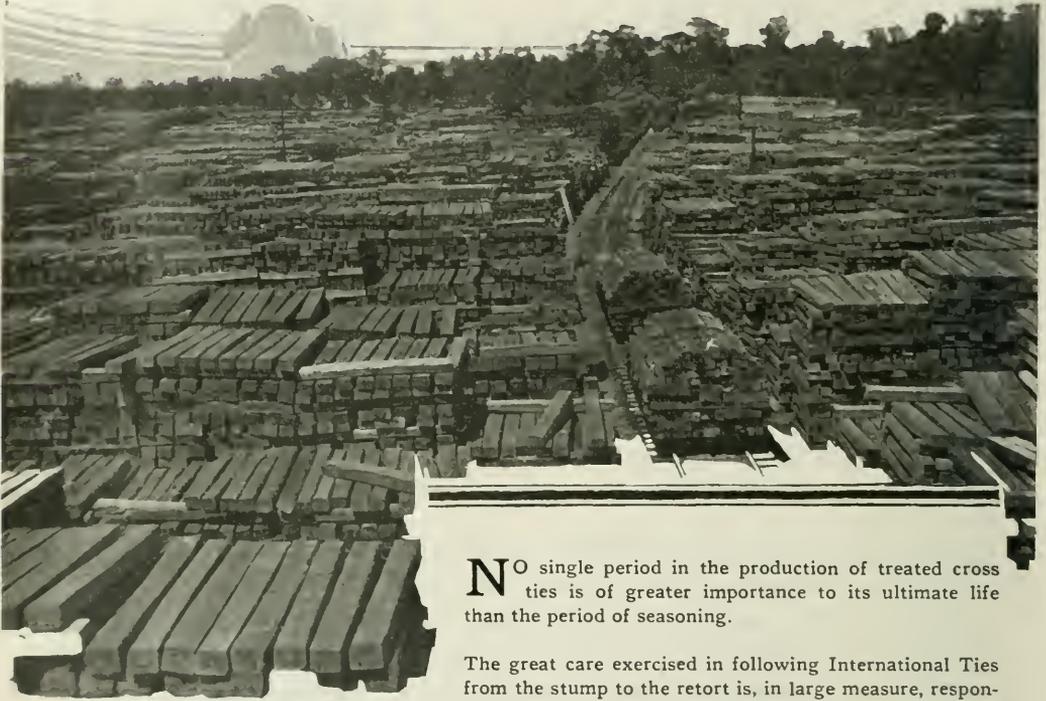

If you have children, remember that their safety depends on the pipes that carry your water. If you are a taxpayer, remember that when cast iron mains are laid in your street, you will never see them torn up for repairs; and if you use pipe in your business, remember that “the service of cast iron pipe is measured by *centuries*.”

Acres of Graded Ties

*Every International Tie is a
Sound Tie*

*The tie that lasts
longest
is least expensive*

NO single period in the production of treated cross ties is of greater importance to its ultimate life than the period of seasoning.

The great care exercised in following International Ties from the stump to the retort is, in large measure, responsible for the soundness, uniformity, and high quality of International Products. The ties are removed quickly from the decay producing conditions of the woods, transported to the railway right of way where they are inspected, graded and shipped quickly to the plant for seasoning.

The one hundred twenty acres of ground, free from all vegetation, and a seasoning capacity of two and a half million ties of our Texarkana Plant is representative of International tie service.

Our methods are adapted to promote early seasoning with minimum danger of decay. All International ties are seasoned under the immediate supervision of trained men who are thoroughly familiar with the characteristics of the timber in this territory.

Car Building and Repair

In one car shop a man drove an average of 1500 rivets a day for a period of one month with a "Little David" No. 60 Hammer.

"Little David" riveting hammers drive rivets at a fast rate and there are no delays. They do the work more quickly, require little air and have 20% lower average maintenance costs.

"Little David" hammers stand up under hard continuous service.

"Little David" Air Drills for reaming, drilling, etc., are just as durable and efficient. They have 30% less parts in their construction than any similar tool. The simplicity of design avoids complicated parts which would cause troubles and costly repairs.

Ingersoll-Rand

A flood of oil

Reports issued by the U. S. Geological Survey show that approximately 200 million barrels of crude oil are now stored in the United States. But of this vast storage less than 3 per cent consists of the oil classified as "high grade."

The tests and experiments of many years have shown that only the lubricants secured from the high grade crudes are suited by basic strength and vitality to lubricate successfully the rolling stock of railroads. The ordinary grades invariably break down under the strains of the work required.

For over fifty years Galena Oils have given proof of their exceptional quality—of their ability to outwear any other lubricants. They show superior lubricating power by greater mileage and in the protection and preservation of bearing parts. The lessened friction noticeable with their use results in conservation of power—fuel saving.

Galena Oils are the products of specialists, the perfection of exhaustive study and wide experience. Every gallon carries the guarantee of this company to deliver faithful and satisfactory service. Their exceptional records of efficiency on the representative railroads of the United States, Canada, Europe and South America have made them the accepted standard for railway lubrication throughout the world.

The Romance of Cement

This is the Age of Cement.

Towering skyscrapers, impossible without Cement, house hundreds of thousands of workers.

Great bridges and viaducts of Concrete span rivers and valleys.

Miles and miles of Concrete Highways are flung across the land.

Huge Concrete Dams harness mountain torrents, supplying millions of horse-power to industry.

Portland Cement is not merely pulverized rock; it is a manufactured product requiring numerous distinct and varied mechanical and chemical operations for its production.

Safety requires that it be made properly and put upon the market in perfect condition.

Cement, an almost impalpable powder, when mixed with sand, broken stone, and water, quickly causes the combined materials to become solid Concrete with a hardness like native granite.

Portland Cement manufacturers not only maintain their own laboratories, but through the Portland Cement Association cooperate for the conduct of research and tests requiring extensive laboratories. The results of these studies are placed at the disposal of the public.

Individual companies have their trained staffs of chemists and engineers.

In addition, the industry as represented by these individual companies cooperatively maintains 200 trained engineers in different parts of the country, to show the public how to use Cement most economically and efficiently.

The aim of the industry is to provide a product meeting the highest possible requirements, and to place at the service of the public its nation-wide facilities for furthering building and industrial activities.

RAILROAD LUBRICATION

Who lubricates this road?

On the "A" Division of 489 miles, 170 Red Ball Fast Perishable trains were handled during May, 1922, of which number 168 were on time, or 98%.

On the "B" Division of 422 miles, they had two hot boxes in May, both of which were on foreign cars.

On the "A" Division they handled 28,771 loads and 14,104 empties, total 42,875 cars during month of May—no hot boxes.

On the "A" Division 622 passenger trains were operated during May, 94.4% of which were on time.

Gasoline-Driven Railway Equipment

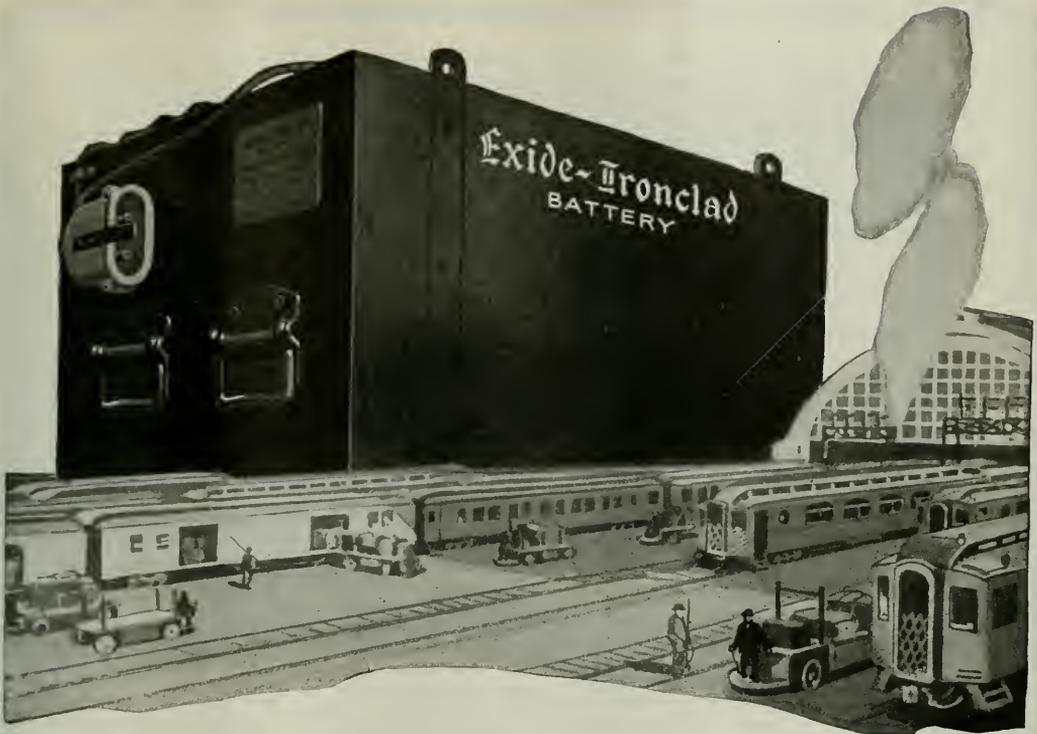

PERFORMANCE, not theory, is what counts in the final analysis.

THE results secured by the combination of standard railway construction, with proven units of the automotive field, are amazing. When driving on all eight wheels our equipment has 100% of its weight on the driving wheels. This gives extraordinary traction. When using but four wheels as drivers our equipment can exert over twice the tractive effort, in proportion to weight of the average steam locomotive — plenty of surplus to pull one or more trailer coaches.

THE RUSSELL COMPANY

AUTOMOTIVE RAILWAY EQUIPMENT

KENOSHA, WISCONSIN

More tonnage with the same equipment

How much your industrial trucks and tractors save you is after all a matter of tonnage. You move so many tons at such and such a cost.

But without increasing your cost, you may be able to increase your tonnage. With the Exide-Ironclad Battery, trucks move heavier loads and move them more rapidly. Note the four qualities of the Exide-Ironclad which are essential for freight-handling service:

- 1—**Reserve Power.** Exide-Ironclads deliver increasing power up to twenty times the normal rate of discharge, giving reserve power for steep grades and heavy loads.
- 2—**Sustained Power.** Voltage remains high throughout the entire discharge, which means power and high speed all day long.
- 3—**Ruggedness.** The Exide-Ironclad, built to stand severe service, is a brute for rough work.
- 4—**Low cost per ton.** First cost plus upkeep, divided by tons hauled, gives a surprisingly low cost per ton.

Tear out this page, give it to your stenographer, and tell her to write today for a copy of our *free* booklet, "Facts for Consideration in *Selecting a Battery* for Industrial Truck and Tractor Service."

IRONCLAD BATTERIES

Where do Maintenance Costs Originate?

Except for the purchase price, few buyers know what they pay for a shipment of nuts.

Yet in locomotive maintenance, the purchase price of a nut may be only a fractional part of its cost. You keep on paying for it long after it has gone to the scrap heap.

Count the number of times in a year an engine is laid up for repairs—and note how frequently you can trace the trouble to a worn or defective nut.

It is then that you begin to get a real line on what these little pieces of metal are costing you.

You may save a small sum on the original price, only to pay it out many times over in premature breakdown, labor, time—a locomotive out of service.

That is hardly the sort of "economy" you reckon on when you decide in favor of hot pressed nuts. That such nuts represent a "saving" is a delusion that is costing a

hundredfold their price in multiplied maintenance charges.

When you buy nuts you buy a certain amount of utility. And when hot pressed nuts, with their inevitable burrs, scale-filled threads, inaccurate fit and irregular shape, give nothing but a short and troubled career in return for your investment, they do more than rob you of the service you pay for—they run up a recurring overhaul and replacement charge by their unflinching tendency to work loose and wear out.

These things never happen with Empire Cold Punched Nuts. Once an Empire Nut is put in place it stays there for the life of the engine, or for the life of the part it is on.

Empire Nuts are made by the originators of the cold punching and cold heading processes for the manufacture of steel nuts and steel bolts. They are produced on a new type

of automatic nut machine that cold punches, chamfers, trims, retrims and burnishes in one operation—steps that in any other plant require five separate machines. By this method a uniformity of precision is attained that is not possible with any other process—for tolerances are not disturbed by a multiplicity of set-ups and constant handling.

Empire Nuts are guaranteed free from flaws. They are guaranteed to fit. They are guaranteed never to strip their threads or fracture. They have no burrs. They have no scale. They are semi-finished to insure flush, smooth, clean contact. Their threads gauge to within .003 in.

Empire Nuts reduce maintenance charges to so low a level, as contrasted with the cost arising from the use of hot pressed nuts, that the net saving repays you a hundred times over for their slightly higher purchase price.

Santa Fe Buys Stefco

Ready-to-Erect Structural Steel Buildings

RAILROADS are fast turning to the use of STEFCO ready-built steel buildings because of their economy and adaptability as has already been demonstrated in other fields. The recent purchase of nine STEFCO buildings by the Santa Fe for use at various points on its system from Chicago to California is a recognition of the merits of this type of industrial building.

Designed along strict engineering lines, adaptable to every industrial use to which one story factory construction is suited, built in the largest units possible for convenient handling, easily and quickly expanded to meet future growth, STEFCO buildings are recognized by their hundreds of users throughout this country and abroad as a permanent, substantial, fire resisting and satisfactory substitute for all other forms of building construction.

Strength and Simplicity

STEFCO buildings are designed around their two

outstanding features, strength and simplicity. The Fink type truss and sidewall frames are of structural steel angles, hot riveted throughout. The roof and sidewall covering are corrugated sheet steel galvanized to resist rust. STEFCO buildings throughout are composed of standardized units, which, in case of damage, can be replaced at once from the average railway storehouse stock without having to send away for some special design peculiar to a single manufacturer.

Ease of Erection

STEFCO buildings are thoroughly standardized and are 90% finished leaving the STEFCO factory. The other 10%, erection, is so simple that the ordinary section foreman and crew can do the work. Trusses up to 40 ft. single span are shipped complete and the other sections are built in the largest units possible for convenient handling. The only field work above the founda-

tion is to bolt the wall sections together, on top of which the trusses are also bolted, apply the roof sheets and the building is ready for use.

40% Cost Saving

STEFCO buildings show a saving of 40% or more over similar buildings of brick or concrete, relieve the purchaser of all engineering costs and delays and eliminate entirely the fire hazards of wood construction.

Free Advisory Service

The STEFCO engineering department is composed of recognized experts in building design and manufacture. Their experience and advice are at your disposal without charge. Utilize this service in securing an estimate on such buildings as you may need. Just indicate the purpose for which the building is to be used, the length, width, height and door and window arrangement and a comprehensive quotation will follow.

U-LOY STEELS

From the Electric Furnace

A heavy switch is thrown,—electricity of enormous power is released. An arc forms between the electrodes and the charge. Soon melting takes place.

So intense is this arc that it refines steel to a higher degree of purity than any other method. The injurious effects of sulphur and phosphorus are reduced to a minimum. Impurities are removed. Greatest freedom from surface and sub-surface defects is insured. In purity, uniformity and homogeneity, U-LOY Electric Furnace Steels are far superior to even the best open hearth steels.

Perhaps U-LOY Electric Furnace Steels would improve *your* product,—no matter what it may be.

Material Handling Cyclopedia

"Speeds Up" Freight Handling

Manual labor at your terminals, warehouses and transfer points can be greatly reduced and freight handling speeded up by letting machinery do the work. Before you decide you will want to know what devices are available for the purpose—how they operate and where they can be gotten. That's the reason for the Cyclopedia. It contains exactly the information you need.

Eighteen leading Consulting Engineers joined in planning the contents of the volume. Ten editors, headed by Roy V. Wright, Managing Editor, and John G. Little, Associate Editor of the Railway Age wrote the text to indicate clearly those methods and devices that would eliminate waste—multiply labor—power—save time and cut costs.

Pages of Vital Importance

The resulting pages show where up-to-the-minute equipment can supplant antiquated tools with tremendous gains in efficiency and lowered costs. Cranes, hoists, winches, derricks, excavators, buckets, steam shovels, scoops, magnets, car load and unloading machinery, tiering machines, industrial trucks, tractors and trailers—these are but a few of the devices described and illustrated—their functions fully explained and all arranged in easy-reference form.

Nation Wide Survey

Consider what a substantial saving per ton means to your road. Then look into the possibilities as shown in this nation-wide survey of mechanical handling equipment. Do this with the book before you at our expense.

You can have the Cyclopedia on your desk for 10 days' examination by having the coupon mailed to us—after proving its worth to you, either have your Purchasing Agent send us confirming order or let us have your check.

Definition Section—150 Pages

Terse, clear-cut definitions of the principal terms used in connection with material handling methods and equipment and unusually full and complete de-

scriptions of the mechanisms of the various devices are given.

Technical Section—550 Pages

Principal types of material handling machines are taken up under classified headings. Transferation principles are discussed at length showing the advantages of the various types of machines for specific lines of work. Carefully chosen photographs, together with line drawings, charts, curves, etc., render the text easily understood.

Catalog Section—150 Pages

Enlarges and completes the other two sections. Leading manufacturers illustrate and describe their own products, pointing out the particular advantages of their devices for certain branches of industrial service. These pages are grouped according to the nature of service the devices perform. All three sections are cross referenced so that you can find any information you need in a moment.

Important Features

A *Directory of Products*, a *Trade Name Index* and an *Alphabetical Index of Manufacturers* are included for ready reference.

RAILWAY CARS ~ EVERY TYPE

Put Them In Good Order with Certified Malleables

The same superior qualities that commend Certified Malleables for new construction of locomotives, freight cars, passenger cars and track parts make them indispensable for the extensive railway repair work now in progress.

Repair parts of Certified Malleable meet the most severe and exacting requirements of railroading. They have great tensile strength, high elastic limit and toughness to resist shocks, strains and the wear and tear always present in railway service.

They have greater rust resistance than other ferrous metals and are better adapted to the constant exposure of railway equipment than parts of pressed or cast steel.

Certified Malleables possess great strength and endurance that insure years of safe, continuous service and obviate the expense of frequently tearing cars apart to replace vital parts destroyed by breakage or corrosion.

Certificate holders listed here are manufacturers whose product for the quarter indicated has regularly met the requirements of the Association. In the judgment of the Association's Consulting Engineer, their plant practice is such as to produce uniform material of high character and integrity.

Close-Fitting Shirts

"Close is my shirt, but closer is my skin."

An old proverb, but it fits the case of a box car roof as if it were made for it.

The shirt, in its primary use, is for weather protection.

The closer it adheres to the body, the more work the movements of the body make for shirtmakers and the sooner it loses its protective integrity.

The car roof weatherproof covering rigidly attached to the body of the car soon loses its protective value because of car movements. This makes work for car repairers.

HUTCHINS ALL-STEEL FLEXIBLE ROOFS

(Dry Lading Roofs)

are like a comfortably fitting shirt; yielding to the movements of the body and not liable to be torn by them.

Railway Age

The Table of Contents Will Be Found on Page 5 of the Advertising Section

The recent appointment of a man whose training had been primarily in engineering as auditor of capital expenditures points definitely to the closer relation between engineering and accounting at the present time. This situation has been brought about by the greater attention which is being given to accounting on the railroads, and particularly by the employment of large forces of engineers on the federal valuation, but whether the work at hand concerns valuation or routine construction or maintenance, we find that the engineer must learn more about accounting, while the accountant has need of a better knowledge of engineering. The work of neither can be done without some knowledge of the other's problems.

Improve Your Knowledge of Accounting

This fact was first driven home in connection with valuation and this led to the creation of such positions as engineer accountant. To advance an engineer to higher accounting positions is but another step. However, whether or not an engineer has any ambitions in the direction of the accounting department, he owes it to himself to extend his knowledge of accounting because of the intimate relation it has to the administration of the work under his direction, no matter what that may be.

The new bureaus created by the Interstate Commerce Commission after the enlargement of its duties by the transportation act have proved stepping stones to higher positions lately for three former railroad officials who had left their roads to serve with the commission during the organization period of the commission's new activities. Col. F. G. Robbins, formerly general superintendent of the Erie, who was appointed director of the commission's new Bureau of Service in 1920, has recently resigned and been elected a vice-president of the Chicago & Erie at Chicago. Col. W. A. Colston, who was formerly general solicitor of the Louisville & Nashville, and was made director of the Bureau of Finance, organized by the commission in 1920, to handle matters pertaining to the commission's regulation of security issues, the six months' guaranty and similar matters, also resigned recently to become vice-president and general counsel of the Nickel Plate. Also, Guy J. Bunting, who left the Chicago, Milwaukee & St. Paul as assistant general auditor in 1920 to become assistant director of the Bureau of Finance, has now left the commission's service and has been appointed comptroller of the Illinois Central.

I. C. C. Bureaus Stepping-Stones to Advancement

The drastic readjustments in service which the railways are frequently called upon to make with little or no warning are illustrated by the almost complete rerouting of coal traffic following the closing of the union mines on April 1, and the greatly increased activity of the non-union mines which have continued to operate principally in West Virginia and Kentucky. It has been the experience of practically all of

Meeting a Rerouting of Traffic

the roads serving these areas that all records for the shipment of coal have been broken. As an instance the Louisville & Nashville, which serves the mines in eastern Kentucky, has been called upon to handle 50 per cent more coal than ever before. Similarly the Cincinnati-Toledo line of the Baltimore & Ohio, which carries much of this coal to Lake Erie ports, is now handling more traffic than during the period of the heaviest traffic of the war. Probably more interesting is the experience of the Illinois Central's Evansville, Ind., branch. This line normally operates a couple of freight trains in each direction daily; with the advent of the coal strike it was called upon suddenly to handle ten times that traffic. That no complaints are being heard regarding congestion and lack of service indicates that the railways are meeting this sudden dislocation and rearrangement of traffic satisfactorily. In fact, difficult as this situation has been, it is typical of the constant shifting in traffic which the roads face almost daily.

The A.R.A. freight car loading report for the week ended on June 10 is again an interesting one, showing a total of 846,002 cars or only 33 less than were loaded in the last week before the coal strike, which showed the heaviest figures for any week this year. In spite of the decrease in coal loading the report shows an increase of 58,719 cars as compared with the corresponding week a year ago, although a reduction of 84,974 as compared with 1920, but a normal amount of coal traffic would have brought the total loading above that reported for the corresponding week of the record year 1920, which was 930,000. This figure was not attained in any week of 1921 until the middle of October. In spite of the coal strike the curve showing the loading this year is running about halfway between those for 1920 and 1921. There seems to have been little of the expected scramble for coal during the period of the strike thus far but it is certain that there will be a heavy demand for it before long and a settlement of the strike would soon create a need for the cars which are now included in the surplus reports as well as for many of those in the bad order list, which numbered 340,000 on June 1, or 15 per cent, as compared with 14.7 per cent only 15 days before.

Large Increase in Freight Car Loading

The entrance of the Pennsylvania into Detroit, described elsewhere in this issue, has been accomplished by methods that bear little similarity to those which prevailed in the old days of cut-throat competition. There is little resemblance to such projects as the Pennsylvania's entrance into New York, the Canadian Northern tunnel under Mt. Royal at Montreal or the ill-fated Pittsburgh project of the Wabash. In each of these cases the plan was projected independent of any other carrier. At New York, it is true, that the obstacles were primarily physical, but at Pittsburgh and at Montreal inability to secure running rights over one of the natural routes already occupied by other railroads led to the

Development by Co-operation

Development by Co-operation

development of less favorable locations at enormous expenditures. At Detroit the Pennsylvania has avoided the enormous outlay for an independent route by securing trackage rights from other roads and thereby restricting its capital expenditures to the development of independent terminal facilities and a 20-mile cutoff in open country. This manner of approaching the terminal problem is in keeping with the tendencies of the times—the joint operation of terminal routings to the end of a more effective utilization of the available facilities. It is true that in the case in point the roads involved are essentially non-competing so that the negotiations were greatly simplified. Nevertheless, the public is demanding that the development of railway properties in large cities shall gradually tend toward a more co-operative utilization as a means of reducing the capital charge against every ton of freight and every passenger carried.

A complete block system is one in which there are automatic signals for all main line movements, with every switch operated from a tower. (Manual

Different Kinds of Block Systems

Signals are, theoretically, as safe as automatic, but extended comparisons have shown fewer false clear indications under the automatic system.)

“Nearly complete” would be a fair description of an automatic system with all hand-thrown switches properly equipped with indicators. A system without indicators at switches would constitute another class. The manual system with the hand-thrown switches protected by distant signals constitutes still another. The reports on the recent collisions at Camps, Tex.; Woodmont, Pa.; Warner, Tex., and Welch, Mont., suggest other classifications, with varying degrees of part-way protection, down to no space interval at all, as at Plains, Kansas, (*Railway Age*, June 10, page 1332). The term “complete block system” is a misnomer to the extent that permissive signaling is allowed, except in clear weather, on short sections, where there are few curves in the line. Of the 63,000 miles of road reported to the Interstate Commerce Commission as operated by the manual block system (with presumably a small proportion of sections less than three miles long) a total length of only 5,121 miles appears in the column “permissive signaling for bidden”; and on a length of 46,326 miles the rule to stop absolutely at a stop signal is relaxed at passenger stations. On 16,909 miles (single track) the block signal rules are depended on for rear-end protection only. These facts concerning our country-wide practice should tend to make everybody cautious in boasting about mileage figures. Every enterprising operating officer aims, of course, to have a complete block system as soon as he can find the necessary money; but pending that millennial accomplishment the lessons of the last seven collisions reported by Mr. Borland call for strenuous efforts, in innumerable directions, looking to the cure of the weaknesses which the lessons expose.

The railroad news-gatherer or editor has to be on his guard against involuntary self-deception. Things new and good in the railroad field are brought to his

Neatness in Handling Oil

attention, without effort on his part; but to see the old and bad he must go out and survey the field; and he must not present a distorted picture,

showing the general situation better than it actually is. A new locomotive or signal tower is the subject of a special invitation to inspect, but if there is a slovenly back-shop or a disgraceful freight house that would afford him the topic for a useful lecture, which would be good for his readers, he

must go and hunt it up. This thought has been suggested by reading the rules for the care of oil lamps which are printed in this issue, in the report of the annual meeting of the signal engineers. A second thought is that careful attention to these rules is needed in other places than signal cabins—and that is the reason that they are published here. A dirty oil room is a far too familiar sight at passenger and freight stations, yard offices, crossing shanties, section houses, and other places. Where such conditions are very bad the fire insurance inspectors can be depended on to call attention to them; and if the inspectors do their full duty they will see to necessary corrections; but the point is mentioned here as a plea for the enforcement of neatness at such places regardless of the insurance inspector. Do not wait for him; nor for the safety-first committee to make a “suggestion.” Ask the general passenger agent to “suggest” how many times he has had to apologize to passengers for the existence of offensive sights, greeting their eyes at many places, which are due to shiftlessness and laziness in handling oil. When it comes to details, these lamp rules may be open to criticism here and there. The first rule, No. 1601, is printed on page 44; is repeated on page 46 as a question in an examination paper and again, on page 47 as an answer to the question. That amount of paper and ink might well have been spent on something to give a little “punch” to so important a rule.

Because of the numerous differences of opinion which prevail between the producers and the consumers of lumber

The Railways Should Be Represented

products, a conference of representatives of both parties was called by Herbert Hoover, secretary of the Department of Commerce, at Washington during the week of May 22. At this

conference plans were formulated for the more general standardization of grades and dimensions to promote economy of manufacture and particularly to insure to the consumer that he secures the material which he desires. The railways have not escaped participation in the controversies which have led up to this conference, for they are among the largest consumers of timber products and they have long been criticized by the lumber producers for their manner of purchasing this material. The roads were therefore invited to participate in this conference and to present their position in this special controversy as well as in those common to the lumber industry. Railway uses for timber fall into three general classes: construction timbers, tie and switch timbers and car materials. It is to be regretted that the railways did not arrange for adequate representation at this conference by a sufficient number of men to insure familiarity with all of these uses. The result is that the needs of the railways were not presented in the thorough manner in which they should have been. Since it is the expressed intention of Secretary Hoover that this work shall proceed to a conclusion, it is to be hoped that the railways will realize the importance of the subject sufficiently to study their lumber requirements in sufficient detail so that they can defend their standards or revise them to agree with American manufacturing conditions as their investigation warrants. Timber purchases constitute so large a drain upon railway revenues and the roads have been subjected to criticism regarding their purchasing methods for so long that they owe it to themselves to investigate the subject in detail in order to satisfy themselves that they are buying the materials most suited to their needs; that they are buying these materials in the sizes which are most economical in the light of their requirements and present manufacturing conditions and that they are getting the materials of the grades and sizes that they specify. As a large consumer of lumber the railways have much to gain from taking part in these conferences,

and it is to be hoped that they will organize promptly to participate with lumber producers and others in the investigations which are now being inaugurated.

It is related in an old fable that an ingenious driver hastened the motion of his not overly ambitious steed by dangling a wisp of hay ahead of the animal. By this simple expedient he was able to accomplish what he could not attain by club or whip. Some operating officers are now applying the moral of this story to the employees under their direction with equally satisfactory results. The tendency of the labor organizations in negotiating agreements with the roads in recent years has been to extend the work by introducing complications which in effect add to the number of men employed. As an illustration, the present agreement with the men in train service provides an incentive for the crews to loiter on the road to the point where overtime is earned, thereby increasing their income. Such a condition cannot be expected to do other than to slow down the movement of traffic, the result of which is reflected not only in the added wage cost but to an even greater extent in the decreased capacity of the line and the reduced use of equipment and other facilities. To overcome this by discipline and supervision is difficult and to a large extent impossible, for much of the responsibility for the movement of trains must be left to the crews in charge. However, a way out of the dilemma is to offer a counter incentive which is stronger than the first one. Such an expedient was referred to editorially in these columns a few weeks ago where reference was made to an arrangement which has been perfected on several divisions of one road for return trains to be made ready for crews who have made runs to the away-from-home terminal in less than eight hours so that they can avoid being tied up at this terminal and have double the normal layover at home. This simple expedient reduced the average time of trains over one division from 11 hours to approximately 7 hours. This same result was accomplished in a large classification yard by offering to allow the switching crews to go home after they had completed work which formerly required 10 or 11 hours, the men speeding up their work to the point where the trains were made up and started on their way three hours earlier than formerly. The application of measures such as these will enlist the co-operation of the men in many instances and secure results which are mutually beneficial without additional expense.

Will They Strike for an "Economic Impossibility?"

THE STATEMENTS which are being issued by labor leaders regarding the wage reductions recently authorized by the Railroad Labor Board are extraordinary examples of brazen impudence. We refer to the dissenting opinions signed by Messrs. Wharton and Phillips, labor members of the board, as well as to the utterances of B. M. Jewell and other heads of the labor organizations. They are attempting to mislead the public and incite their followers to strike by as bold misrepresentations as ever were put in circulation.

For the employees whose wages are to be reduced to strike would not be a technical violation of the Transportation Act, but it would constitute a complete disregard of the Labor Board's findings of fact and principle and an open defiance of it. To shift from themselves the odium that they would incur by bringing on a strike, if the public understood the facts, the labor leaders, including the two labor members of

the board mentioned, are brazenly attempting to make the public and employees believe the majority of the board themselves have violated the provisions of the Transportation Act.

The law requires the board, in fixing wages, to consider, among other things, the cost of living. The labor leaders, in the hearings before the board, contended that the board should establish an average wage on which an "average family of five" could live in comfort and decency. They contended that this average wage is \$2,637. Because the board did not give this average wage they now denounce it as having violated the law by disregarding the provision regarding the cost of living and as having ignored the "claims of humanity."

This reasoning could be properly branded as approaching the idiotic if it did not constitute propaganda dangerous to the peace of the country. What are the facts? The law provides that the board, in fixing railway wages, shall consider *the wages paid in other industries for similar work* as well as the cost of living and other relevant considerations.

For the board to fix in the railroad industry such wages as the labor leaders demand would be to fix wages averaging probably three times as much as those being paid for similar work in other industries. The labor leaders answer that as high wages ought to be paid in other industries as they demand for railway employees. *But they are not*; and it is as plain as a pikestaff that for the Labor Board in fixing railway wages to disregard the fact that they are not would be for it really to violate the provisions of the law. Furthermore, the labor leaders, in demanding the payment of an average wage of \$2,637 in all industries are, as the majority of the board well said, "propounding an economic impossibility." The payment of such an average wage in all the industries of the United States would cost at least one-half more than the largest total amount that all the industries of the United States ever produced in any year. It is very unfortunate that industry never has been able, and never will be able without a great increase in the efficiency of management and of employees, to produce enough to pay the labor leaders' "minimum average comfort and decency wage," but it is a fact which never has been disputed and which is indisputable that industry never has been able to; and therefore it is just as sane for the labor leaders now to cry aloud for such a wage as for a child to cry for the moon.

The cold fact is that, under the plain provisions of the Transportation Act, interpreted in accordance with its obvious intent, the labor leaders knew that they could not make a case against the reduction of railway wages. They knew they could not show that, measured by the wages paid in other industries, the "cost of living," as that standard always has been understood and applied, and the other standards set up by the Transportation Act, the existing wages of railway employees should be maintained. Therefore, for purposes of propaganda, and probably with no expectation of gaining anything for their followers by doing so, they set up as the standard of reasonableness of wages, a purely fictitious and economically impossible standard of their own; and now they are trying to provoke a strike by appealing from the standard established by the law to the standard invented by themselves and which, by childishly sophistical reasoning they are trying to read into the law. They are threatening the people of the United States with, and are trying to lead their followers into, a great strike that would be equally disastrous to employees and public, to vindicate a theory of wages which they themselves know as well as anybody, is, under present conditions, merely the baseless fabric of a vision.

The situation strikingly illustrates the fact that the main trouble with many railway labor unions, as well as many other labor unions, is their reckless, irresponsible and incompetent leadership. Their leaders did not in the recent wage case present their case to the Labor Board on its merits

properly supported by evidence which was relevant and material under the actual provisions of the Transportation Act, and now they are trying to discredit the Labor Board and bring about a strike because they lost a case which they never reasonably and adequately presented. Such labor leadership is a menace to the peace and welfare of the country, but it is a still worse menace to the welfare of the members of the labor unions.

Is a "Car Shortage" Coming?

IT IS TIME to raise very seriously the question whether the railways are not approaching another period of congestion of traffic and "shortage of cars."

On May 31 the number of idle freight cars was 504,702. Of these 305,198 were cars in serviceable condition. These statistics do not indicate any danger of a shortage of equipment. But let us consider some other facts. The number of cars loaded with freight in the week ended May 28 was 821,121. The number of cars loaded with coal was 74,241 less than in the same week of 1921 and 83,242 less than in the same week of 1920. If coal loadings had been normal the total number of cars loaded would have been approximately 900,000.

With the small number of cars of coal moved, the railways handled their freight business in the week mentioned without any difficulty. If, however, the roads had had to handle, say, 100,000 car loads more, the conditions would have been quite different. The movement of these additional cars would have greatly increased the demands upon their locomotive power and their terminals, and would have tended to slow down the movement of all cars handled under load. Whatever slows down the average movement of cars actually in service reduces the supply of cars in proportion to the demand. It is much easier to handle 800,000 loads a week without delays and congestions than to handle 900,000 without delays and congestions.

It is but a matter of time until the coal strike will be settled, after which, owing to the depletion of coal stocks, the railways undoubtedly will be called on to move at least 100,000 loads of coal weekly more than they are moving. Experience in the fall of 1919 and again in 1920 showed that with the facilities then available it was extremely difficult for them to handle more than 1,000,000 carloads of all freight weekly. Doubtless they can handle a larger amount of freight now than they could then; but the increase in their capacity has been relatively small.

It is evident, therefore, that a large increase of coal shipments and a continuance of the increase of other traffic would soon tax them to their capacity. But will other traffic continue to increase?

There are strong reasons for believing it will. First, crop prospects, especially in the west, are unusually good. Second, building operations are growing throughout the country. Third, there are many signs that the stocks that most manufacturers and merchants have on hand are low, and that as the signs of returning prosperity become more numerous and convincing the demand for the raw materials of manufacture, as well as for finished products, will grow rapidly.

All these conditions indicate that traffic other than coal will continue to increase. In other words, it would appear that the only thing needed to give the railways a business that will break all records is a settlement of the coal strike.

If this is the case, the only possible way to avoid car shortages and congestions within a few months are, first, to speed up the repairs of all equipment that is not in serviceable condition; secondly, to speed up the construction of new equipment and railway improvement work already ordered; and, third, to begin an effective campaign to secure the most efficient utilization possible of all available railway facilities.

During the period of business depression shippers have been allowed to reduce the tonnage loaded per car. Efforts should be begun at once to secure heavier loading of cars and to reduce the time used in loading and unloading. The railway managements should prepare to intensify supervision of the movement of cars to prevent all unnecessary delays at stations or in yards. Every feasible plan for increasing the average mileage traveled daily by locomotives should be put into effect.

In 1920 the greatest transportation difficulties in history were met and overcome by the co-operation of the railways through the American Railway Association and by the efforts of the individual managements. The lessons learned then should be remembered and the methods used then should be revived. It may be the heavy business that now seems probable will not develop. It would be far better to make preparations for it and not have it come than to have it come and catch the railways unprepared.

The Automatic Train Control Order

THE INTERSTATE Commerce Commission has confirmed its train control order substantially as it was first published, last January. The date is made six months later, but otherwise it is left in about the original terms; the desired clause permitting engineers to prevent the operation of an automatic stop while the train is in motion is not included.

The order is dated June 13; order No. 13,413. It requires 49 railroads to make installations of automatic train control "on at least one full passenger-locomotive division," between the cities named in the order, the work to be completed by January 1, 1925.

Some of the outstanding features of the order are (1) its extensive and drastic application; (2) the short extension of time allowed for testing devices not yet developed; (3) the elimination of the permissive release feature of the automatic stop; (4) the provision whereby roads so desiring may make installations of train control without the use of visual roadside signals; and (5) the lack of consideration for roads which are planning to install visual signals extensively. This last comment might be broadened to include costly improvements of all kinds, for a main issue with the railroad manager is the distribution, over a practicable period of time, of his heavy expenditures, of which signaling constitutes only one feature. To put in a single class the road which is now spending a million dollars for signals and those roads which have no large work of that kind in hand seems a very crude arrangement, to say the least.

The specifications are identical with those of the tentative order, as are the carriers listed, except that for the St. Louis-San Francisco the tentative order specified the line from St. Louis, Mo., to Springfield, while the final order says between Springfield, Mo., and Tulsa, Okla.

The Commission says that the Transportation Act, 1920, places upon it "the duty, after investigation, of ordering the roads, or any of them, to install automatic train stops or train control devices or other safety devices." The law does not use the word "duty;" it is permissive; but the commissioners evidently predicate their interpretation (that a duty is imposed) on their statement that the result of investigations and the recognized need constituted the reason why Congress inserted section 26 in the Transportation Act. In other words, Congress says that they may order automatic stops; and they change this to *will order* automatic stops on the strength of their finding that there is a need. There would be far greater satisfaction with the present situation if this finding—involving expenditures of many millions—had been based on a well-reasoned and scientific report, prepared by eminent engineers, instead of on a series of compromises and half-truths backed by no names except those

of eleven commissioners, no one of whom is an engineer.

The principle of automatic train control—at least on lines of heavy traffic—should be valuable, properly used; for the subway lines have proved it; and as passenger lines become more congested it is an element in increasing capacity, if complete safety is to be attained. But train control, like any other development, should grow gradually, and an order as drastic as this one is not reasonably calculated to serve the purpose intended which, as we view it, is the putting an end to the period of discussion. It is questionable whether this order will serve the purpose aimed at by the Commission. Apparently some roads will actually defer intended installations of automatic signals because of the probable cost of complying with the present order. The extension of time allowed to test out new devices is entirely inadequate, as may be seen by the time which has been taken by prominent experimenters. A road which, for example, desires to await the final reports of the experiments now being made on the New York Central, the Delaware, Lackawanna & Western, the Pere Marquette, the Rock Island and the Pennsylvania, and which wishes to decide its course before next January, is in a perplexing quandary.

Forty-nine—or even 29—costly experiments to test less than a dozen systems cannot be called other than reckless extravagance. It has to be admitted, however, that unless the government were to build or buy several hundred miles of railroad on which to make experiments, the establishment and execution of a workable plan, in place of the 49-fold scheme, would call for constructive engineering and constructive statesmanship of a high order. But these are two qualities which the commissioners seem not to appreciate in this connection.

The Valuation Amendment

COMPARATIVELY LITTLE attention has been devoted in the press to the fact that Congress has just passed and the President now has before him for signature bill, S. 539, amending the railroad valuation act of 1913 so that the Interstate Commerce Commission will not be required to include in its valuation reports a figure representing what it would cost a railroad to reacquire its right of way and other lands if the railroad were to be reproduced under present conditions. What has been published has generally been of the erroneous character displayed in campaign statements of Congressmen seeking re-election that the bill will reduce the valuation of the roads on which freight rates are to be based by amounts ranging from three to six billions. Many of the Congressmen who voted for the bill were doubtless as ignorant of its purpose as was Representative Campbell, chairman of the rules committee of the House, who in introducing a rule for the debate on the bill said that it “provides in substance that in the re-valuation of the railways the value of the real estate used by the roads for depot and other purposes may not be taken into consideration.”

Many of them would have been willing to vote even for that kind of bill and we hope their constituents may in some way be able to call them to account when they learn that the billions to be saved had long ago been left in the discard by the commission.

As a matter of fact, all that has happened is that Congress has directed the commission that it need not even go to the trouble of finding one of the evidentiary facts which represents part of the cost of building a railroad and that having reported that fact in the case of over 200 roads and collected most of the data referring to it for the other roads during the past year and a half, it may throw it away or file it away against the time when some court may order it used again.

The bill amends the valuation law by inserting, in the paragraph directing the commission to report as to each piece of property the original cost, the cost of reproduction new and the cost of reproduction less depreciation, the words “other than land,” so that it need not report the cost of reproduction of land. Then it strikes out of the paragraph directing a report on the original cost and present value of land the words “and separately the original and present cost of condemnation and damages or of purchase in excess of such original cost or present value.”

Until directed to do so by the Supreme Court in its decision in the mandamus proceeding brought by the Kansas City Southern in May, 1920, the commission had declined to comply with this direction of the law on the ground that it involved a consideration by it of matters beyond the possibility of “rational determination,” calling for “inadmissible assumptions” and “impossible hypotheses,” and that under the Supreme Court’s decision in the Minnesota rate case the information was of no value if collected. The assumption and hypothesis which the commission was so reluctant to accept was that if the railroads were to be reproduced today, or even if a new railroad were to be built under present conditions, it would in most cases cost to acquire the necessary land a sum so enormous as to be difficult of conservative estimate. The court held, however, that the conclusion of the commission was erroneous and directed it to comply with the statute as written. The commission then asked Congress to change the law but during the delay in getting action on the bill it has gone ahead and done what it had previously declared impossible. The late director of the valuation bureau, C. A. Prouty, said on February 7, 1921, that “the result in the very nature of things is an average estimate, but within the limitations fixed by those terms it will be accurate;” and that the work was then about one-half done and should be completed in from a year to a year and one-half.

The commission issued supplemental reports as to the roads on which tentative valuations had already been served and in the reports since issued it has inserted an item for what it calls the “excess cost” of land, arrived at by applying to the value of adjacent land, according to a zone system, a multiple ranging from 55 per cent for highly developed residential property to 200 per cent for low grade land. In 198 tentative valuations the total present value of lands amounted to \$156,345,283 and the total excess cost of acquisition to \$121,167,073, or 77½ per cent of the present value; but analysis indicates that in taking into consideration the various factors from which it evolves a so-called “final value” little or no weight has been attributed to the cost of acquisition.

One of the principal grounds on which the commission urged that this requirement be omitted from the act was that it would save the expense, estimated by Judge Prouty at approximately \$300,000 a year, of doing a “vain thing,” but a large part of the work has now been done and apparently the commission has made no practical use of it.

The railroads, in opposing the bill, urged that even though the commission disregarded this item of evidence the amendment was an attempt to settle a judicial question by legislation because it would strike out an element of value in the property of common carriers which always has been recognized in the common law; and that if the commission makes a valuation without considering that element much delay might be caused by a court order requiring that it be taken into account.

The chief appeal to members of Congress in the proposed legislation doubtless lay in the argument advanced on behalf of the state railroad commissioners that approximately 12½ per cent, or \$2,000,000,000, of the \$18,900,000,000 adopted as a tentative valuation by the commission in 1920, represents land and that the railroads might succeed in getting a

multiple of 2 or 3 applied to this and thereby add \$4,000,000,000 to \$6,000,000,000 to the value used as a basis for the rate of return.

Of course, if the courts decide that something should be included in the value to represent what it would cost to acquire land it will eventually be included whether or not Congress or the commission thinks it should be; but as long as the commission and Congress may fix the rate of return (above the limit of confiscation) and as long as the commission may estimate the rates, traffic and expenses that will produce a given return for the future, it would seem that the only practical benefit of the bill just passed will be that derived from its possibilities as a source of campaign literature.

New Books

Railway Accounting Procedure, 1922 Edition. Edited by E. R. Woodson. Published by the Railway Accounting Officers' Association, 1116 Woodward Building, Washington, D. C. 6 by 9 in.; 468 pages. Bound in cloth. Price \$1.00.

This is the 1922 edition of the book published formerly under the name of the R. A. O. A. Synopsis. It does not differ materially from the editions of other years with the exception that it is larger and covers a considerably increased number of subjects. The editing has been changed also to some extent so that the publication has somewhat more the character of a book on the subject with which it deals rather than that of a synopsis only. The present book contains 468 pages; the 1921 R. A. O. A. Synopsis contained 400; that of 1920 but 228. In these years there has been no change in the plan; the increase in size results from the amount of work which this busy association has succeeded in accomplishing. Under these conditions and considering in general that the association has discussed so many subjects and its activities have been so extensive, the word "Synopsis" is no longer sufficiently broad or inclusive to cover the amount of material presented. The new name, "Railway Accounting Procedure," is more appropriate.

The Railway Accounting Officers' Association does its work largely through committees. A subject, when it is presented on the floor of the annual meeting, has therefore received a large amount of discussion in the committee and whatever action the association may take, is taken with that in mind. The book, under whatever name it may be known, "Railway Accounting Procedure," or "R. A. O. A. Synopsis," is a compendium of the findings of these committees as they have been discussed and accepted by the association for a period of years. Every subject in the book, therefore, is authoritative and represents the best thought of the association as to what should be considered standard practice in railway accounting. The book makes no presumption to be a treatise on the theory of railway accounting but deals only, as the name indicates, with matters of procedure. The value of a book of this kind hardly needs comment, particularly in view of the great amount of detail which is embodied in the work of compiling the accounts of a railway system. The best comment that can be made is that the book is indispensable.

The book is well arranged. It is divided into sections, these being headed as follows: freight, overcharge claim rules, passenger and disbursement. In the freight, passenger and disbursement sections there are presented first the mandatory rules, the rules that are recommendatory only, and finally, the standard forms, to which the R. A. O. A. has given a great amount of attention. The overcharge and agency relief claim rules are mandatory. There is also a section devoted to terminal accounting. Each section is carefully indexed.

Letters to the Editor

Outside Locomotive Repairs

LONDON, Eng.

TO THE EDITOR:

I submit that no one should be surprised that a majority of the Interstate Commerce Commission has censured the Pennsylvania and the New York Central for their failure to forecast the future when they employed outside agencies to repair their locomotive equipment.

It is true, though the commission does not in the report that I have seen notice the fact, that the railways erred in company with most of the great business firms, not only in America but in England, who laid in large stocks and increased their output capacity at top prices under the impression that the boom would last longer than in fact it did. It is true, too, that in coming to their decision the companies postponed the interest of their shareholders in economy to the interest of the public in efficient transport, and that if they had taken the cautious line and events had turned out differently, the Interstate Commerce Commission would have been prompt to rebuke them for failing to live up to their responsibility as a public utility undertaking. But the fact remains that the railway men did guess wrong.

Heretofore the railroads have guessed right, and the Interstate Commerce Commission wrong. I well remember, for I was in Washington at the time, the rates advance cases in 1911. It was then up to the commission to do the guessing. It prophesied that the cost of supplies would not much advance, and that wages would not much increase. Three years later it admitted in effect that they had been wrong in 1911. It said that the price of coal had increased 7.7 per cent and transportation wages 9.02 per cent. But again it refused to permit any substantial increase in rates. It thought the country was recovering from another period of depression. It said, in answer to the claim of the railroad officers who had testified, that they "would encounter great difficulty in renewing their maturing short term notes and other obligations"; that "subsequent developments have shown that there was little evidence for any such view With the growing ease in the money markets this difficulty has largely disappeared." This decision was given on July 29, 1914. Three days afterwards the Great War began.

As the result of these two erroneous forecasts of the Interstate Commerce Commission the railroads had to face the tremendous strain of the war period with plant and equipment barely adequate for normal needs. According to the commission report, the Pennsylvania and the New York Central spent unnecessarily, owing to this erroneous forecast, some \$6,000,000 of their shareholders' money. It would be interesting if someone would estimate what the erroneous forecasts of the commission in 1911 and 1914 cost the American shipper in the years from 1915 to 1920.

Again, a year ago, the commission was required by Congress to make a forecast. It was instructed to fix such rates as would produce for the railroads a net return of not less than 5½ per cent. The rates it actually fixed produced about three per cent. Not a very accurate forecast! But for this, of course, no fair-minded man will blame the commission. The sudden and unexpected slump upset its calculations, just as it has upset those of the executives of the Pennsylvania and the New York Central. But I think it was only human nature that a majority of the commissioners should have felt that the commission's record as a prophet being what it was, it could not afford to neglect an opportunity of pointing out that even the railroads do not always guess right.

W. M. ACWORTH.

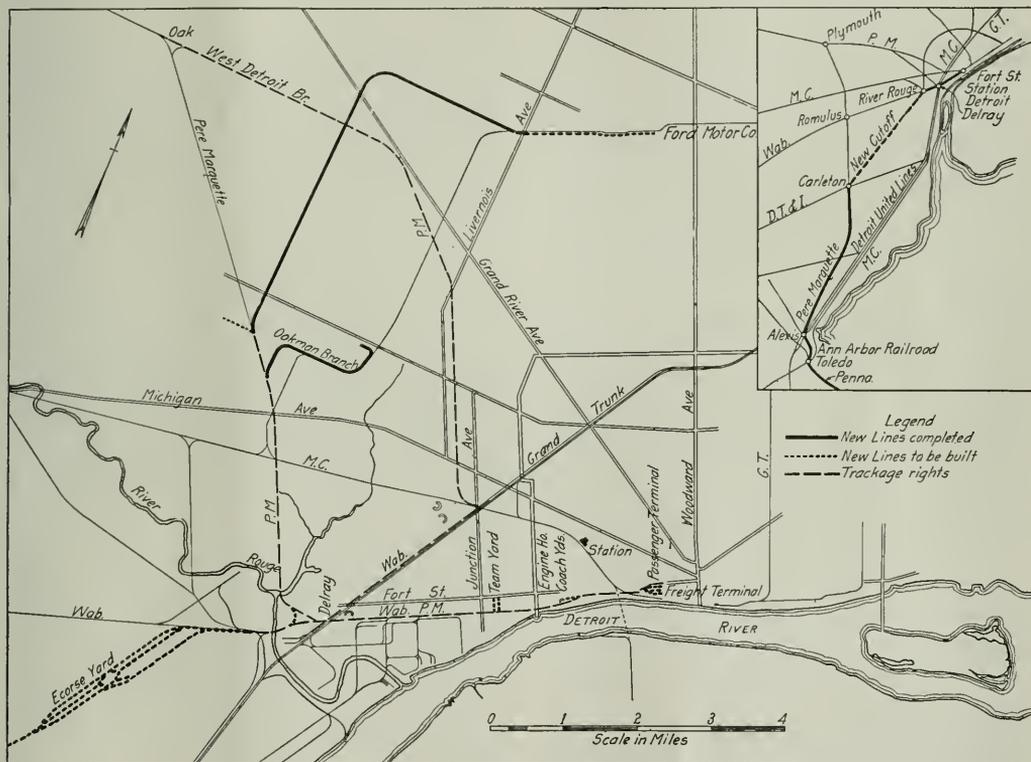

Pennsylvania to Complete Entrance Into Detroit

Project Includes a Local Freight Terminal, Classification Yard and 25 Miles of New Line

IT IS NOT OFTEN in these days that a railroad secures entrance into a great city where it has had no previous connections, yet a project of this kind is now being carried out by the Pennsylvania System with respect to the city of Detroit. Construction work completed or authorized, together with arrangements for using the facilities of other roads will afford the Pennsylvania convenient access to passenger and freight terminals in the heart of that city with switching connections to a large portion of the principal in-

troit Railroad. Of the total distance of 54 miles from the end of the Pennsylvania tracks in Toledo to the Fort Street station at Detroit, 20 miles will be new line, the rest of the distance will be covered on tracks of other roads.

The route of the Pennsylvania-Detroit Railroad begins at Toledo with the use of the Ann Arbor tracks from a junction with the Pennsylvania to a connection with the Pere Marquette at Alexis, a distance of 4.37 miles. The Ann Arbor will build a second track for this distance and reduce the

Map of the Detroit Terminals with Small Insert of the Toledo-Detroit Routing

industries. The plans for the Pennsylvania's entrance to Detroit and preliminary negotiations were undertaken several years ago, but the project remained dormant during the period of government control and the depression which followed its close. Work has been resumed within the last few weeks following an announcement made recently by President Samuel Rea before the Detroit Board of Commerce in which he outlined the present status of the project and the plans for the immediate future.

Physically, the Detroit entrance comprises an extension of the Toledo division of the Northwestern region of the Pennsylvania from Toledo to Detroit, but the project is being conducted by a separate corporation, the Pennsylvania-De-

troit Railroad. From Alexis, the Pennsylvania has acquired trackage rights over the Pere Marquette's double-track line for a distance of 25.33 miles to Carleton. From this point to a junction with the Wabash at River Rouge, the Pennsylvania has purchased right of way and is now constructing a new single-track line, 20 miles long on which it will provide a second track as soon as the traffic requires. The contract with the Pere Marquette provides that the latter road will have the privilege of using this new line under the same terms as the Pennsylvania will use the Pere Marquette facilities between Alexis and Carleton. From River Rouge, the Pennsylvania has running rights over the double-track line of the Wabash for a mile to Delray,

the junction with the tracks of the Detroit Union Railroad Depot & Station Company, leased jointly by the Pere Marquette and the Wabash. The Pennsylvania has acquired joint running and industrial rights over this line for a distance of 3.22 miles to a connection with the tracks of the Fort Street Union Depot Company. Joint use of this property has also been acquired by the Pennsylvania for entrance to and joint use of the passenger terminal at the corner of Third and Fort streets, within one-half mile of the Detroit city hall.

The route above described comprises the main entrance of the Pennsylvania into the city. Traffic over this line will be developed primarily through the operation of local freight houses and a team yard, on a location immediately adjacent to the Fort street passenger station. The Pennsylvania has acquired all the property bounded by Congress, Larned, Third and Eighth streets, as a site for inbound and outbound freight houses and team tracks. The inbound house will be placed along Congress street, with a width of 80 ft. and a length of 1,080 ft. while the outbound house will be constructed along Larned street, with a width of 67 ft. and a length of 650 ft. The freight houses will be of a two level type with street vehicle space on the street level and tracks on the second floor for a convenient connection with the elevated viaduct entrance to the station. The plans for the inbound freight house also provide for three storage floors above the track floor. Four team tracks will be laid between the two freight houses on the second floor level with a capacity of 90 cars and an inclined approach from Second avenue, across Third avenue. It is expected to build the outbound house this year and use it for both inbound and outbound freight until the traffic warrants the construction of the second building.

The proper handling of the freight business to be developed in Detroit will require facilities for the adequate classification of freight entering and leaving the city. For this purpose, the Pennsylvania has purchased a 300 acre tract just south of the connection with the Wabash at River Rouge for the construction of a large classification yard to be known as the "Ecorse" yard. Plans have been prepared for the development of this area with a yard having an ultimate capacity of 12,000 cars. The immediate construction on this area will be adequate for about 1,100 cars. It is also expected to provide space in this tract for a modern engine terminal but for the present only a temporary wooden house of about three stalls will be provided, it being the intention to run locomotives from Toledo to Detroit and return without the necessity for housing them at Detroit.

The increased utilization of the Fort Street station incident to the inclusion of the Pennsylvania calls for more elaborate round house and coach yard facilities than are now available near the station. To take care of this deficiency the Pennsylvania has purchased 4.6 acres of land adjacent to the present Pere Marquette round house and coach yard, with arrangements whereby the present facilities will be replaced by a new plant to be constructed by the Pere Marquette for the joint use of that road and the Pennsylvania.

In addition to provision for an entrance line and terminals other developments have been made within the city for the purpose of securing ready access to the more important industrial districts. To this end, the Pennsylvania has acquired joint use of all of the Pere Marquette and Wabash tracks within the Detroit industrial terminal area east of the River Rouge, including the Pere Marquette tracks from Delray to a point 1.14 miles north of Michigan avenue, a total distance of 4.57 miles and also of the West Detroit branch of the Pere Marquette from Oak to a junction with the Grand Trunk at Junction avenue, a distance of 8.47 miles. Joint use has also been acquired of the Wabash tracks from Delray to Junction avenue, a distance of 2.63 miles.

Perhaps the most comprehensive feature of the plan has been the development of a belt line, partly by the use of Pere Marquette tracks and partly by the construction of a new line to the north and west, largely through undeveloped industrial property to Livernois avenue, a distance of 6 miles from the junction with the Pere Marquette.

A number of new industries have already located on this line in the vicinity of the Grand River avenue crossing. The Pennsylvania has also constructed a 1½-mile branch from the Pere Marquette to the new plants of the Paige Detroit Motor Company, the Detroit Seamless Tube Company, and other industries. The Pennsylvania has also acquired the right of way for some other branches and has agreed with the Wabash and the Pere Marquette to construct such extensions and improvements for the joint use of the three railroads until expenditures for this purpose are equal to one-half the valuation placed on all the Pere Marquette and Wabash Terminal tracks on which the Pennsylvania has acquired joint use.

Another local development is the provision for a supplementary team yard, on property adjacent to the Detroit Union Depot and Station Company tracks. The Pennsylvania has obtained joint use of all industrial connections on this line and also the yard of the Wabash at Ferdinand street, but supplementing this, purchase has been made of 10 acres along Fort street between Summit and McKinstry street, to be used for the construction of team tracks with an ultimate capacity of 250 cars. Immediate construction on this site will provide for 95 cars.

Development in Progress for Some Time

The Pennsylvania's entrance into Detroit was started several years ago and considerable progress has already been made. In addition to the construction of the belt line to Livernois avenue, referred to above, considerable work was done on the construction of the Carleton-River Rouge line. In 1918 construction was carried for a distance of 4½ miles from the south end to a bridge over the Huron river which is the largest structure on the line. Some work was also done on the construction of the bridge over this stream which, when completed will consist of four 40-ft. arches. The masonry work was also completed for a bridge under the hump of the Ecorse yard and for a culvert under the tracks at the same point.

This work has now been resumed. A contract has been awarded to Illif Brothers of London, Ohio, for the completion of the grading from the south end of the line to the Huron River bridge, about 15,000 cu. yd. and for the completion of the bridge. A second contract has been awarded to Ferguson & Edmundson of Pittsburgh, Pa., for the remaining portion of the grading to River Rouge and for the completion of the yard. This will involve a total of 350,000 cu. yds. of earth work. The American Bridge Company has been awarded the contract for the steel bridge required at the hump which will carry five tracks.

Following the end of government control, and pending the completion of the Carleton-River Rouge line, the Pennsylvania entered into a supplementary agreement with the Pere Marquette and the Wabash for the use of the tracks of these two roads for passenger service from Toledo to Detroit and this service is now being maintained. The present routing for the Pennsylvania trains is as outlined above under the permanent agreements except that instead of running over the cutoff line now being constructed, the trains run over the Pere Marquette to a junction with the Wabash at Romulus and thence over the latter road to Delray. This arrangement will terminate as soon as the new line is completed.

The various construction projects involved in the general plan for the Detroit Terminal of the Pennsylvania are being developed under the direction of B. V. Somerville, chief engineer of the Pennsylvania Detroit Railroad, Detroit, Mich.

Wage Cut Order Induces Bitter Controversy

Dissenting and Supporting Opinions in Labor Board's Latest Decision Indicate Trouble Ahead

REDUCTIONS IN the rates of pay of clerical and station forces, stationary engine and boiler room employees, signal department employees and miscellaneous employees not specifically included in any one of these groups were ordered by the Railroad Labor Board on June 17, to become effective July 1. The schedule of decreases as promulgated by the Board was given in last week's *Railway Age*, page 1504. New rates for telephone switchboard operators of \$85 a month with provisions for the maintenance of existing higher rates were also announced by the Board, but inadvertently omitted in the schedule given in the *Railway Age* last week.

In discussing the new rates of pay the Board, in its decision, said in part:

After careful consideration of the evidence submitted, the Labor Board is of the opinion that the nature of the work and the responsibility of train dispatchers to the carriers and to the public, coupled with due consideration of the other factors set out in the Transportation Act, are such as to warrant the maintenance of the present rates. Of the 134 carriers covered by this decision only 26 are asking reductions in pay for the train dispatchers.

There are only four carriers asking for a reduction in the compensation of dining car stewards, and, after full consideration of the law and the evidence bearing on the matter, the Board has concluded that the present rate on these carriers should not be reduced.

For similar reasons, no reduction is made in the pay of the employees represented by the Marine Culinary Workers' Association of California.

In the case of the floating equipment employees, disputes are before the Labor Board from only four carriers, and these affect only a portion of the entire class. Presumably, the other carriers which have employees of this class have reached a satisfactory wage agreement with such employees. The Board has, therefore, remanded these disputes to the four carriers and the employees in question in order that further negotiations may be had and, if possible, an agreement reached.

It will be noted that telephone switchboard operators, previously shown in Section 5 of Article II (Decisions Nos. 2 and 147), are now placed in a separate section. It was the continuation of a mistake originating during Federal control which placed these employees in said section. As this mistaken location of telephone switchboard operators gave them a smaller increase under Decision No. 2 and a larger decrease under Decision No. 147 than many of the clerks received, the Board has, to a certain extent, created an offset by fixing the minimum wage at \$85 per month, with the understanding that the wages of switchboard operators that may be higher than that amount are not to be reduced.

The reduction made for clerical employees is lighter than for some other classes, because this class suffered considerable loss as a result of certain changes in their rules and because they have never been highly paid compared with other classes. It will be noted that a greater reduction has been fixed by the Board for clerks with experience of one year and less than two, than for clerks with experience of two years or more. The reason for this is that the majority of junior clerks are beginners and apprentices and have not as yet assumed family responsibilities, and many of them are still living with their parents.

Common labor in and around stations, storehouses and warehouses was reduced one cent less than similar labor in the maintenance of way department because a much greater percentage of this class live in large towns and cities, and consequently incur a higher cost of living. Moreover, many of the common laborers in the maintenance of way department are furnished living quarters by the carriers free of charge or at a low rate.

In the light of all the facts the Labor Board is of the opinion that there should be no reduction in the rates of the supervisory forces of the signal department employees, but that their duties and responsibilities are of such character as to warrant the present rates.

In deciding upon the reductions of employees of the signal department covered by Sections 2, 3 and 4, Article IX of Decision No. 147, due consideration was given to the similarity of these employees and the shop crafts, but a smaller reduction was con-

sidered advisable in the case of the signal department employees because their rule as to the payment of punitive overtime is much less favorable than that of the shop employees.

Labor Board Discusses the Problem of Wage Fixing

Under the heading of "General Observations" the Board appended a discussion of the present labor situation and the conditions under which wage fixing must, of necessity, be carried on. After citing Section 307 of the Transportation Act, containing the seven relevant factors which should be considered in fixing just and reasonable wage scales for railway employees, the Board said in part:

Besides the specific elements or factors mentioned, the Act provides that the Board in determining wages shall consider "other relevant circumstances." Referring to this language, "other relevant circumstances," the Board in Decision No. 2 said:

"This, it understands, comprehends, among other things, the effect the action of this Board may have on other wages and industries, on production generally, the relation of railroad wages to the aggregate of transportation costs and requirements for betterments, together with the burden on the entire people of railroad transportation charges."

The consideration of all these matters presents, and has presented ever since the Government handed the roads back to private management, the most complex labor problem ever imposed upon a public tribunal.

The artificial conditions that had been built up during the war around every business and industry in this country were particularly accentuated in the case of the railroads by reason of their tremendous importance in the conduct of our country's military operations, which resulted in federal control. The difficult problems inherited from the war period by every industry were enormously multiplied and magnified in connection with railway transportation. The labor problems of this industry were more complicated than those of any other industry and involved vastly more to the public.

In this post-war period of readjustment, with its fluctuating conditions, its inflated and profiteering prices, its high cost of living, and its extravagance and wastefulness, the readjustment of wages for two million men in the country's most essential industry has been a task of appalling magnitude.

Add to these conditions the pressure of an unsettled, discontented, and sometimes misinformed public sentiment, harassed by high freight rates, the vigorous and insistent appeals of the railroads for financial help, and the zealous desire of powerful labor organizations to protect what they conceived to be the rightful interests of the employees, and the task has not been diminished.

Surrounded by such abnormal conditions, the Labor Board has not been permitted to deal with the question of what constitutes just and reasonable wages and working conditions in the same undisturbed and uncomplicated manner as would have been possible in normal times. And, yet, the wisdom and justice of settling these questions by adjudication rather than by industrial war have been demonstrated, both from the standpoint of the parties and the public. While it can not be said that no mistakes have been made in the awards handed down by the Labor Board, a substantial degree of social and economic justice has been attained and that without the enormous loss and suffering to the carriers, the employees, and the people at large, necessarily resultant from settlements by force.

The extreme utterance of partisan bias to the effect that the Board does not give full consideration to the evidence submitted to it would be discouraging were it not for knowledge of the fact that such utterances evince merely a spasmodic relapse into the old system of bluff and bluster that entered so largely into the adjustment of railway labor disputes before adjudication supplanted force.

The Labor Board cannot venture too far into the realms of economic prophecy, but it is generally conceded to be fairly plain and certain that our country has entered upon an era of gradually increasing business prosperity which will be liberally shared by the carriers. That the carriers shall have a fair opportunity to profit by the revival of business in order that they may expand their facilities is absolutely indispensable to their efficient service to the American public. Their unpreparedness now to cope with any greatly increased traffic is notorious. Every facility of rail-

way transportation has been skimmed for the last several years, and, as to mileage, there has been an actual decrease instead of an increase.

This statement, in the connection used, must not be misconstrued to mean that the employees should be called upon to bear the cost of railway rehabilitation, improved service and reduced rates. It simply means that it is only patriotic common sense and justice that every citizen, including the railway employee, should co-operate in a cordial spirit, should bear and forbear, until the carriers are back on their feet.

When this accomplishment is safely under way, it will then be possible for the Railroad Labor Board to give increased consideration to all the intricate details incident to the scientific adjustment of the living and saving wage, with enlarged freedom from the complications of the "relevant circumstances" of the abnormal period which is now approaching its end.

Labor Is Not a Commodity

In this connection it should be said that the Labor Board has never adopted the theory that human labor is a commodity to be bought and sold upon the market, and, consequently, to be reduced to starvation wages during periods of depression and unemployment. On the other hand, it is idle to contend that labor can be completely freed from the economic laws which likewise affect the earnings of capital.

That the Board has never fixed wages upon a commodity basis has been amply demonstrated during the past year by the ease with which the carriers have obtained labor under the contract system for less than the wage established by Decision No. 147.

In this connection it must be remembered that the carriers are at liberty to pay to any class of employees a higher wage than that fixed by this Board whenever the so-called labor market compels, provided, as the Act states, that such wage does not result in increased rates to the public.

The Purchasing Power of Railway Employee's Wages

The average hourly earnings and their purchasing power as applied to certain classes of employees covered by this decision, are shown in the following tables:

Table headings	Time for which figures are shown or comparisons made.	Clerks (Group 1, Secs. 1 and 2).	Common labor, station stores (Group 1, Sec. 9).	Signalmen, maintainers and assistants (Group III, Sec. 3).	Stationary firemen and oilers (Group II, Sec. 2).
Average hourly rates..	Dec., 1917.....	34.5c.	22.3c.	32.8c.	21.8c.
	Jan., 1920.....	54.5c.	43.6c.	64.3c.	46.6c.
	May, 1920.....	67.5c.	52.1c.	77.3c.	59.6c.
	July, 1921.....	61.5c.	43.6c.	69.3c.	51.6c.
	Under this Dn.	58.5c.	39.6c.	64.3c.	49.6c.
Percentage increase in average hourly rates over Dec., 1917.....	Jan., 1920.....	58.0%	95.5%	96.0%	113.8%
	May, 1920.....	95.7%	133.6%	135.7%	173.4%
	July, 1921.....	78.3%	95.5%	111.3%	136.7%
	Under this Dn.	69.6%	77.6%	96.0%	127.5%
Increase in cost of living over Dec., 1917.....	Jan., 1920.....		40.0%		
	May, 1920.....		52.0%		
	July, 1921.....		26.7%		
	Mar., 1922*.....		17.2%		
Percentage increase in purchasing power of earnings of subsequent dates compared with Dec., 1917.....	Jan., 1920.....	12.9%	39.6%	40.0%	52.7%
	May, 1920.....	28.8%	53.7%	55.1%	79.9%

* Latest available Government data.

Owing to the manner in which the carriers were required to render their reports to the Interstate Commerce Commission during December, 1917, in which wage data covering heterogeneous classes of employees were grouped rather than separated in accordance with their duties, responsibilities, experience, et cetera, it is impossible to obtain actual figures from which average hourly rates for the above classes could be computed. The figures shown above for December, 1917 are therefore approximations, although assumed to be very close approximations. For this same reason it is impossible to separate the average rates of clerks between those in Section 1 and Section 2 (a), and the rates shown above are the averages for all clerks in these two classes.

The average rate for common labor for December, 1917, is per-

haps a little high due to the fact that the carriers reported all station service employees in one group, and the rate shown herein for December, 1917, is the average for the group.

The foregoing table prepared by the statistical force of the Labor Board is based on the cost-of-living figures issued by the United States Department of Labor.

These figures show that applying the wages fixed by this decision to the present cost of living, the purchasing power of the hourly wage of the respective classes here named has increased over the purchasing power of the hourly wage of December, 1917 (prior to federal control), as follows:

	Per cent
Clerks	44.7
Common labor, around stations, etc.....	51.5
Signalmen (maintainers and assistants).....	67.2
Stationary firemen and engine room oilers.....	94.1

The table also shows that with one slight exception the purchasing power of the hourly wage of each class of these employees is greater under the present decision than it was under Decision No. 2 which granted the 22 per cent increase.

The Attitude of the Board Toward Budgets

The Labor Board has given careful consideration to the testimony bearing upon family budgets and standards of living. That existing standards will not be lowered by this decision is shown with substantial satisfaction by the above statistics.

This matter of living standards constitutes an interesting and important study, but much that is said on the subject is highly theoretical and of but little value.

When the Railway Employees' Department presents figures to show that the sum of \$2,636.97 is necessary for the minimum comfort budget of the average family, it has propounded an economic impossibility.

It is stated upon authority that the total income of the people of the United States is now but little more than \$40,000,000,000. If the 25,000,000 families of this country were expending for living costs the sum of \$2,600 each, it would total \$65,000,000,000 which would be \$25,000,000,000 in excess of the country's total income.

Of course, living costs can not be standardized any more than men can be standardized. One man will consume his income and find himself continually in debt while another man with the same income and under identical conditions will live in equal comfort and accumulate savings. In this connection, it can hardly be considered a digression or a gratuitous preaching to say that one of the principal troubles with the people of this country today is the abandonment of the old-fashioned ideas of thrift and economy and the indulgence in wastefulness and extravagance. These loose habits of living were acquired during the inflated period engendered by the war and, like many other ills of similar origin, are slow to depart. Increased expenses do not always mean a higher standard of living nor do diminished expenses necessarily mean a lower standard of living.

In the settlement of these questions, it is the profound desire of the Labor Board to do justice to the parties directly concerned, placing the human and social consideration above the purely economic, and, finally, to establish wages and conditions that will largely meet the hopes and aspirations of the employees, that will prove satisfactory to the carriers, and that will impose no unnecessary burdens on the public. This is not a Utopian conception in America.

Two Labor Members Append

Bitter Dissenting Opinion

A dissenting opinion signed by A. O. Wharton and Albert Phillips, two of the three labor representatives on the Board was attached to the decision and contained a bitter denunciation of the majority's decision.

Unlike previous dissenting opinions in the recent controversy over wage reductions, this opinion was not signed by W. L. McMenimen, the third member of the labor group on the Board. The reason given at the Board's headquarters in Chicago is that Mr. McMenimen left for the east on official business prior to the time this dissenting opinion was written.

Mr. Wharton and Mr. Phillips outlined five specific reasons for their dissent as follows:

1. The bases upon which the decision rests are not in themselves sufficient to justify the action taken. The Labor Board has gone into considerations which affect the issues only indirectly, if at all, and has ventured upon ground which indicates a very free interpretation of the "other relevant circumstances" provision in the Transportation Act. It has considered the effect of its decisions upon wages in other industries, extending its own "sphere

of influence" beyond the transportation industry. It has taken into consideration that part of the duties of the Interstate Commerce Commission which has to do with railway profits, and the need for railway expansion. It has considered the effect of rates charged shippers, and then decided what wages should be paid the railway workers.

2. The reasons offered for the decisions not only go far beyond the provisions of the Transportation Act, but they also deny the validity of one of the specific provisions contained in the Act. The cost of living is brushed aside, because the only basis upon which it can be computed is a more or less hypothetical budget. If the introduction of external considerations is difficult to justify, then the exclusion of a vital section of the law under which the Board operates is a matter calling for most expert casuistry. The condemnation of the use of cost-of-living budgets amounts to a rejection of a method found practical by other governmental agencies, and a fundamental disagreement with the United States Department of Labor.

3. The wages as now fixed do not insure the continuance of previous standards of living. The statement that the wages constitute an improvement over 1917 does not take into account the very low standards then prevailing, nor the much higher standards of earlier and later periods. It selects the year which, of all those for which data is available, puts the workers' standard at the lowest point. The use of 1917 figures to justify new reductions is neither just nor reasonable.

4. The basing of wages upon rates paid in outside industries, one of the "relevant circumstances" referred to in the Transportation Act, does not provide reason for the reductions made by the Board at this time. Insofar as any evidence was introduced into the hearings upon this point, especially with reference to employees covered in Group I of Article I, it seemed rather to call for a wage increase than a decrease.

5. The wages fixed by the majority decision are such as to condemn these railway workers to lives of extreme poverty. It is too much, perhaps, to expect that the full meaning of this action should be clear to men not in close contact with the workers. It may be asking too much to urge that human life is in a class by itself, not to be listed indifferently among the costs of transportation. But certainly it may be fairly and rightfully expected that the social cost of poverty is enough to induce a public body to proceed most cautiously in reducing the standards by which the workers must live. The wages most recently determined are in some cases less than 50 per cent of the amount needed for a fair standard of living. Maintenance and expansion costs of the railways must be paid, and with the "cordial" and "patriotic" co-operation of the workers; the "maintenance costs" of the workers are considered "theoretical," when they are considered at all. Such is the basis for the series of wage decisions now being made.

The Case Against the Majority Decision

There followed a 35-page argument in support of these contentions, the extreme length of this material making its reproduction here impossible. However, the character of the statements made and the tone of the whole opinion is illustrated in the following excerpts which have been taken from it:

The lack of any statement which might indicate that human beings are to live narrower lives by virtue of the decision handed down, is a clear indication that the majority has taken over the typical employer's approach to the problems of the working man. Despite the magnanimous statement that human labor is not a commodity, there seems to be very little basis for saying that it has not been so considered. Lengthy statements dealing with transportation costs, economic laws, "the vastness of the problem," and "fair opportunity to profit," can mean but little to the worker faced with the necessity of providing food and clothing for his family. If American workers are entitled to "life, liberty and the pursuit of happiness," it should surely be part of the responsibility of government to patriotically insure that the pursuit shall not be carried on at a hopelessly long distance.

It is said that "every facility of railway transportation has been skimmed for the last several years," and it should not be thought facetious to remark here that if the railway workers had been given the generous consideration accorded those facilities, something of the skimming going on under thousands of American roofs might have been eliminated.

We have already pointed out, in the dissenting opinions in the maintenance of way and shop crafts cases, that by any standard ever set up the wages fixed by the Railroad Labor Board are insufficient; that is as true of the rates set in the latest decision. The workers will be forced, in the event that these decisions stand, to exist on a level even lower than the "slave-owners' standard." When human beings were considered chattels, they were cared for well enough to prevent physical deterioration. The food and clothing now allowed to the workers will not pro-

vide enough of the basic necessities of life to keep up health and strength. The slave-owner had an investment, and his business judgment urged the advisability of preventing its depreciation. There is no such limit to the employer today; now workers are always available to take the place of those broken by the combined pressure of over-work and under-nourishment. Human depreciation does not find its way into the railroad balance sheet.

Human Factors in Wage Decisions

The vital question in wage determination has again been ignored in the decisions now rendered. The Railroad Labor Board is not a profit-regulating body, nor a tariff-fixing body; it has not to deal with abstract considerations of commodity schedules or the earning power of an over-capitalized road. Wage-fixing has to deal with human values, with the lives of men, women and children. The power to set wages is the power to shape the life of the worker affected.

No other "relevant circumstance" can be greater than this. Human life must be given precedence over every other consideration. A body charged by the government with the responsibility of wage fixing should have as its primary standard the relation of its action to the lives of the workers concerned.

To explain a wage cut on the plea that workers in other, and unregulated, industries are as poverty stricken, is matched only by the excuse that at one time in the past the workers concerned have led a more precarious existence than that now prescribed. Neither of these reasons can even partially absolve the Board for its failure to consider the living conditions it has set for the railway employees.

The decision of the Labor Board has not only these humanitarian aspects; it is not only the demands of justice and humanity, sufficient though they should be, that condemn the utterly inadequate standards set for the workers. If a proper respect for human life were not in itself enough to motivate the fixing of a living wage for the railway employees, then, at least, a wise public policy, based on the measurable effects of poverty, should have dictated a standard higher than the one established. Some public officials are passing laws to punish and restrain criminals; other public officials are fixing wages that must multiply crime. Public health organizations try to eliminate disease; wage fixing bodies lay down living conditions that mean overcrowding, under-nourishment, inadequate clothing—breaking down the power of the worker and his family to resist disease, and inevitably raising the mortality rate among the thousands of people affected. Clergymen, philanthropists, lawmakers and sociologists work with every means at hand to lessen child labor; the Railroad Labor Board fixes the wage of the parents at a point where the children must be taken from school and must themselves seek employment. One section of society works through every available agency to remedy social conditions; another, supposedly responsible to the same influence, compounds the evils growing out of the poverty of the wage earners.

Majority Admit Inability to Give Just Wage

As pointed out by President Willard of the Baltimore & Ohio in the words which we embodied in our previous minority opinion, the Transportation Act aimed to substitute for the strike such just and reasonable wages as would render resort to a strike unnecessary. If this tribunal, created to determine such wages, admits that under existing circumstances it cannot fulfill this function, obviously, the employees must use such power as they have to influence the labor market, which is henceforth to be the determining factor in their wages. The majority state clearly that—

"... the Labor Board has not been permitted to deal with the question of what constitutes just and reasonable wages and working conditions in the same undisturbed and uncomplicated manner as would have been possible in normal times."

Such statement is an admission on the part of the majority that they have been unable to separate themselves from the partisan struggle long enough to perform the function for which they were appointed and consequently it tends to absolve the employees from any limitations which the existence of a judicial board was intended to impose. As a matter of fact, the Labor Board has had nearly two years in which to make such studies as we feel to be essential to the establishment of the just and reasonable wages required by the Transportation Act.

The correctness or incorrectness of the deduction of the majority as to the present conditions of the carriers or as to their crying need for profits is unimportant because the whole matter is irrelevant to the consideration of just and reasonable human standards, which, according to Senator Cummins, is the special function of the Labor Board.

The majority attempt to avoid the implication of their announced basic consideration by the comment:

"This statement, in the connection used, must not be misunderstood to mean that the employees should be called upon to bear the cost of railway rehabilitation, et cetera."

In order to harmonize the statement just quoted with the rates

if pay which will result from these decisions, the majority are forced to add a hasty qualification which amounts to a contradiction of the assertion. It is to the effect that the railway employees must—"bear and forbear, until the carriers are back on their feet."

Interpreted in terms of rates of pay awarded, this can mean nothing unless it means that railway employees must bear with unjust wages until the carriers are willing to admit they have secured the rehabilitation which they demanded.

The meaning of the majority is clarified by the statement which follows:

"When this accomplishment (the rehabilitation of the carrier) is safely under way, it will then be possible for the Railroad Labor Board to give increased consideration to all the intricate details incident to the scientific adjustment of the living and saving wage"

The employees may well consider this an ultimatum to the effect that justice to them and their families, a real consideration of their human needs, must await complete satisfaction to ownership. In their assertion the majority admit all that we have pointed out in our former opinions; they admit that they have not considered the matter on its merits, but have been driven along by the necessities of the carriers. And they have taken as the measure of those necessities, not a balanced view of the evidence offered by the parties to the case, but the extreme statements of one party in its propaganda.

At least, the vagueness is cleared. The public and the employees know that a full consideration of the merits of the case from the employees' standpoint must await the prior claim of increased profits demanded by the railroad owners. Any one viewing the rates of pay established for the great army of labor knows that such rates are practically the same as those paid in industries where labor is treated as a commodity. So the majority hasten to assert that "the Labor Board has never adopted the theory that human labor is a commodity." The majority, however, in the next sentence admits the influence of the market value of labor upon its decision by the statement that—"It is idle to contend that labor can be completely freed from the economic laws which likewise affect the earnings of capital."

This in the opinion of the minority, is a very important qualification, for, in the first place, it places the livelihood of human families, the provisions for children who will form the coming generation, in the same impersonal category as profits. And in the second place it immediately sweeps away all the sentiment about identity of interest between employers and employees. This, the decision does, not only here, but throughout its entire text.

In other words, the employee will ask "what is it that is preventing me from receiving enough to support my family in decency?" He will look to the decision and answer "profits—the need of the railroad for profits." The economic laws which the majority feel to be so unchangeable are neither God-given nor man-made. They are simply a description of the way in which business and industry has worked to date, and it has worked out very badly for human life. The results appear in the high infant mortality rates in the majority of centers of industry.

These so-called economic laws create a situation in which the lowest wages for which the requisite skill and industry can be bought are considered good for capital and bad for labor. Hence, the struggle, which the majority decries, has been a mere expression of the so-called economic law, and it will continue unless adjudication by a scientific tribunal can adopt methods which will amount to establishing new laws. These new laws must mean a response to something other than manipulation by interests with varying degrees of control in the market.

Board Charged With Being Tool of Railroads

The majority give the carriers specific permission to adjust rates, as follows:

"In the opinion it must be remembered that the carriers are at liberty to pay an unlimited higher wage than that fixed by this Board, whenever the so-called labor market compels, provided, as the Act states, that such wage does not result in increased rates to the public."

Employees will take this as a permission to go out and get such wages as they can command. If they feel that they can command higher wages by withholding their services, either separately or in numbers, that will not be a strike against the order of the Board, it will merely be the carrying out of the Board's suggestion as to the method of wage adjustment about to come.

But the real conclusion from this statement, coming at the beginning of a new period of prosperity, will naturally be that the carriers had the Labor Board created to regulate labor during the critical period just coming to an end. Under its cover, they were able to carry through a program which would have been impossible without the practical prohibition of striking. Whenever the Board decided in favor of the employees, the roads either defied the Board or found some method of evasion.

The majority of the Board are then, in a thoroughly insecure position, when they must depend for justification of their decisions upon principles which either contradict the clear purpose of the Act under which the Labor Board is created or upon misin-

terpretation of fact. It is the opinion of the minority that such pitfalls could be avoided by a clear, sincere attempt to approach the problem of wages from the point of view of the humble worker who must spend his wages to support his family. Wage adjustment will be theoretical until statesmen appear with enough human sympathy to place themselves in the other fellow's position.

Majority Reply to Dissenting Opinion

A reply to the statement of the minority in the dissenting opinion was also appended to the decision. An abstract of this reply follows:

It is not incumbent upon the six members of the Board concurring in this decision to follow the minority into a partisan controversy which partakes more of the characteristics of impassioned advocacy than of calm adjudication.

Insofar as the dissenting opinion distorts the sentiments of the majority, misquotes their language and reflects upon their desire and disposition to do justice, we will refrain from comment. We prefer to believe that these improprieties crept into that part of the document which was drafted by the employees in the headquarters of the Railway Employees' Department of the American Federation of Labor, and that they were overlooked by the dissenting members. As an example of the looseness with which the statements of the decision were handled in the dissenting opinion, reference might be made to the following quotation from the dissent:

"In this decision, as in the preceding ones, the Labor Board announces that 'in its opinion' wages are still above those paid in outside industries."

As a matter of fact, the statement in question is not contained in this decision.

There is one feature of the dissenting argument, however, which is so unusual that it should not be passed over without notice, and that is the portion wherein the two dissenting members advise the employees to strike against the decision of the Board.

It is quite natural for the representatives of labor on the Board to resist all reductions in wages. This course is in harmony with the reductions in the year 1921, as well as those of the present year.

It is something new, however, for labor members of the Board to issue incendiary arguments to employees in favor of striking against a decision of the Board. The giving of advice of this kind has heretofore been left to outsiders, who were not under the official obligations imposed by the Transportation Act, the main purpose of which is to prevent railway strikes and protect the public from their dire effects.

One of the passages referred to is as follows:

"The Transportation Act aimed to substitute for the strike such just and reasonable wages as would render resort to a strike unnecessary. If this tribunal created to determine such wages admits that under existing circumstances it cannot fulfill this function, obviously, the employees must use such power as they have to influence the labor market, which is henceforth to be the determining factor in their wages."

That is to say, if the Board makes such admission, the employees must strike.

Then the dissenting members proceed to remove the "if" and to assert that the Board has made the admission which renders a strike necessary. After quoting a statement from the decision of the majority, which was separated from the context for the purpose, the dissenting opinion proceeds as follows:

"Such statement is an admission on the part of the majority that they have been unable to separate themselves from the partisan struggle long enough to perform the functions for which they were appointed, and consequently it tends to absolve the employees from any limitations which the existence of a judicial board was intended to impose."

Not only do the minority step down from the judicial position, which they occupy, to advise a strike, but they obviously distort and misconstrue the language of the majority in order to provide the condition which they pronounce a justification.

This is not the only place in the dissenting opinion where the suggestion is made to the employees to strike.

No Injustice to Employees

As a matter of fact, the entire dissenting opinion constitutes a strained and exaggerated effort to inflame the employees by the belief that they have been grossly outraged by this decision.

A fair statement of the facts will convince any disinterested man that no injustice has been done to these employees by the present decision, and that the decrease in their wages is conservative and is based upon the law and the evidence.

The Relevant Circumstances

In the decision, the majority quoted from Decision No. 2 what the Board there said in regard to the "relevant circumstances" referred to in the Transportation Act. No detailed comment was made on the quoted matter. The minority in their dissent savagely attack the statements so quoted from Decision No. 2, and, in effect, over-estimate any consideration that the majority may have

given any portion of it. And yet, the records of the Board show that the dissenting members voted for the adoption of the decision containing the language in regard to "relevant circumstances," and they did not seek to exclude it. This, be it remembered, was a decision increasing wages 22 per cent and the present minority were then of the majority. It would, therefore, appear that the relevant circumstances mentioned were to be considered by the present dissenting members in relation only to wage increases but not decreases.

The Purchasing Power of Wages

The dissenting members criticize the tables offered by the majority to show the trend of the purchasing power of the wages of the employees covered by this decision, on the ground that the year 1917, is an unfair year to adopt as a basis or starting point. The inference is rather plainly drawn that the selection of said year was the result of a deep and sinister design on the part of the majority. This suggestion is far-fetched, as the dissenters are well aware that the wage reports of this Board have begun with the year 1917, and both of them have twice concurred in this arrangement. It was therefore a natural course for the Board to make use of the wage series which it had prepared and published.

The minority suggest that either the year 1914 or 1915 should have been adopted as the basic year for these tables.

The year 1914 can not be safely adopted, because the carriers then reported their clerical forces in groups and classes different from the method since used, beginning with 1915. The use of the year 1914 as the basic year would admittedly require the making of an estimate, the accuracy of which would necessarily be doubtful. If the figures for the basic year were doubtful, then those for all subsequent years would be of uncertain accuracy and value. We will therefore adopt 1915, the other year pronounced satisfactory by the minority, and will demonstrate indisputably the changes that have taken place in the wages of these employees and in the purchasing power thereof, based upon the Bureau of Labor Statistics as to living costs.

The following table was prepared by the statistical force of this Board at the request of the minority and furnished to them, but does not seem to have suited their purpose, as it was not used. The increases in purchasing power of earnings under the present decision over 1915 are as follows:

PERCENTAGE OF INCREASE IN PURCHASING POWER OF EARNINGS UNDER PRESENT DECISION OVER 1915

(a) EMPLOYEES IN GROUP I.		Per cent
Supervisory clerks and clerks with experience of two years or more.....		4.1
Clerks with experience of one year and less than two years.....		4.2
Clerks with less than one year experience.....		1.1
Train and engine crew clerks, train announcers, gatemen, baggage and parcel room employees.....	15.0	
Office boys, messengers, chore boys and others under eighteen years.....	2.0	
Janitors, elevator operators, watchmen, employes assorting waybills etc.....	1.4	
Freight handlers and truckers.....	17.3	
Scalers, sealers and fruit and perishable inspectors.....	20.2	
Stowers, stevedores, callers or loaders, locators or coopers.....	22.9	

(b) EMPLOYEES IN GROUP II.		Per cent
Stationary engineers (steam).....	70.0	
Stationary firemen (steam).....	42.1	
Boiler room water tenders.....	25.9	
Engine room oilers.....	42.1	
Coal passers, boiler room.....	25.9	

(c) EMPLOYEES IN GROUP III.		Per cent
Leading maintainers, gang foremen and leading signalmen.....	5.0	
Signalmen, signal maintainers, assistant signal men and assistant signal maintainers.....	6.5	
Helpers.....	12.7	

The foregoing table is based on the flat daily rate.

The statistician of the Board has worked out a table based upon the Interstate Commerce Commission's reports of the average monthly earnings of all clerks from the year 1915 to the last six months of 1921 and has used hours worked by this class in the last six months of 1921 to determine a rate under the present decision. This table is given below. It is also tied up with the cost of living index number in order to reflect a trend of standard of living. From these figures it will be seen that the standard of living for all clerks under the rates prescribed by the present decision is 12.1 per cent above 1915:

COMPARISON OF LIVING COSTS AND WAGES OF RAILWAY CLERKS, 1915-1921, SHOWING CHANGES IN STANDARD OF LIVING.

Period	Average monthly earnings	Index number average earnings	Cost of living index number	Standard of living index number
Year 1915.....	69.36	100.0	100.0	100.0
Year 1916.....	73.55	106.0	112.5	94.2
Year 1917.....	77.65	111.9	135.5	82.6
Year 1918.....	102.60	147.9	165.9	89.1
Dec., 1919.....	114.59	165.2	189.6	87.1
Fourth quarter, 1920.....	145.91	210.4	190.7	110.3
Last 6 months, 1921.....	131.38	189.7	165.8	114.4
Last 6 months at new decision rates.....	123.45	178.0	*158.8	112.1

*March, 1922.

This 12.1 per cent increase in the standard of living of clerks in the last seven years, based on an increase in wages of 78 per cent and an increase in living costs of 58.8 per cent indicates remarkable progress. This class of employees should feel that their official representatives have rendered them notable service in the effectuation of this result. It certainly affords grounds for satisfaction and encouragement rather than for inflammatory appeals for strikes.

There is no class of labor covered by this decision to which the dissenting discussion of pauperized labor with its physical and social deterioration and its propagation of crime has any application.

Theoretical Living Standards

It appears that a portion of the employees covered herein have presented a family budget of \$2,636.97, and others have offered a family budget of \$2,133. The latter is presumably based on the budget set out in the December, 1919, Monthly Labor Review, published by the U. S. Bureau of Labor Statistics, as the dissenting opinion quotes at length from that publication the Bureau of Labor's explanation of the budget. This quotation is prefaced by the statement: "It (the budget) is described by the Bureau of Labor Statistics as follows." With this identification of the budget used, we desire to quote another passage from the same article as follows:

"This report presents the results of a study made by the United States Bureau of Labor Statistics to determine the cost of maintaining the family of a government employe in Washington at a level of health and decency."

Let the significant fact be noted that the budget is for a government employe in Washington and that, when Washington was the most conceded city in the United States with an abnormally high cost of living, as a result of the great temporary increase in population resulting from the war expansion of all governmental departments.

Whether the budget of \$2,133 is identical with that set out in said government publication as it purports on its face to be or whether it is one of the several other budgets heretofore submitted to the Board, the figures are practically the same as those in the government publication, the latter being \$2,288.25.

The dissenting members seem to have temporarily abandoned their budgets of \$2,636.97.

In the decision in this case, it was shown that this budget of \$2,636.97 if given to every family impartially would require a sum twenty-five billion dollars in excess of the total income of all the individuals and industries in the United States.

The budget of \$2,133 now relied upon is open to the same fatal criticism.

If the country's 25,000,000 families were guaranteed an income of \$2,133, the total income of the entire country would be exceeded by the sum of \$13,225,000,000.

In the fact of this absurdity, page after page of the dissenting opinion is devoted to an attack on the Board's decision upon the ground that the wages fixed for some of the employes do not reach the amount of this mythical, visionary budget. The advanced purchasing power of the railway employe's wage, the relative great increase of that wage, the improved social and economic condition of the employe are all ignored, and a vitriolic denunciation of the Board's decision is indulged in because every individual employe is not granted this impossible sum of money.

Let us see what would be the result of adopting either of these budget theories on the railroads and requiring that no employe should receive less than \$2,133, according to one contention, or less than \$2,636.97, according to the other. The following table throws light on this question:

Total revenue of roads, 1921.....	\$5,509,035,259
Increase in aggregate pay of employes if minimum wage, \$2,636.97, were paid on basis of Decision No. 147.....	1,834,778,865
Increase in aggregate pay of employes if minimum wage, \$2,133, were paid on basis of Decision No. 147.....	1,063,081,640

The net income of the carriers for two other years prior to the war was as follows:

1914.....	\$673,611,198
1915.....	697,185,309

It is quite obvious, that the net income of the roads for the years named, and, it may be added, for any other year in history, would have been consumed by the recognition of either of the above budgets, and the carriers would have shown a loss of hundreds of millions of dollars each year. The shortage would have had to be paid by some form of taxation on the public, presumably, freight rates, which would have added to the burdens of every individual in the country, rich and poor.

In this connection, it is interesting to note that the dissenting opinion finds fault with the majority decision, because it states that "it is idle to contend that labor can be completely freed from the economic laws which likewise affect the earnings of capital."

The soundness of this axiomatic proposition is right well exemplified by the theory of the minority above discussed that no wage can be made so high as to constitute an unbearable burden on an industry. Because those concurring in the decision recog-

nize the existence of some of the old-fashioned economic laws quite familiar to the ordinary business man, those dissenting affect to believe that the majority place the consideration of profits above the welfare of the workers. This is a gratuitous assumption. This Board has never taken the position that the claims of the employees for a just and reasonable wage must await the prior demands for increased profits, nor does it take such position in this decision. It is a waste of time to make detailed defense to all these overdrawn and imaginative assertions.

It is well enough to remember, however, that the time will never come in this country or any other country when the ordinary rules of common sense and business, call them economic laws, if you wish, can be absolutely ignored in the conduct of any industry. The latest instance in which these laws have been thrown overboard and replaced by fine-spun socialistic theories, both in railway and other industries, is found in Russia, and the result there is not one that this country desires to emulate.

The minority are sowing some of the tiny seeds that have germinated and blossomed into industrial anarchy in Russia, when they make such statements as this: "They (the economic laws) are simply a description of the way in which business and industry has worked to date, and it has worked out very badly for human life."

It will be readily conceded that our social and industrial system has not invariably produced perfect results, but, upon the whole, it has demonstrated its superiority to every experimental substitute that has been offered. And the fact must not be overlooked that this great industrial republic has rewarded labor with its largest degree of liberty, prosperity and happiness. It will not to hold its minor imperfections so close to the eye as to obscure its benefits.

Permission to Adjust Rates

The dissenting opinion stated that the decision gives the carriers specific permission to adjust rates, because it says that the carriers are at liberty to pay higher wages than those fixed by the Labor Board.

The Board did nothing of the kind. It gave the carriers no permission to adjust rates. There is nothing in the Transportation Act that prevents a carrier from paying higher rates, unless such higher rates would result in increased rates to the public. The statute contemplates that the carrier would not have to coerce the employee into the acceptance of a higher rate. This does not mean that the Labor Board construes the Transportation Act to mean that the carrier may impose a lower rate on the employees or the employees impose a higher rate on the carrier.

The suggestion by the minority that the employees will take this as permission to "go out and get" such wages as they can command is entirely absurd. If they should do so, it would be the result of the minority's suggestion and not of the language of the decision.

Finally, let it be reiterated that the majority, in arriving at this decision, considered every phase of the evidence and provision of the Transportation Act, and that their minds rest easily upon the reasonableness and justice of their conclusions, in the light of all the circumstances and conditions shown to exist at this time.

Recent Developments Put Damper on Strike Talk

Although talk of a strike of those classes of railway employees whose wages have been reduced by the last three orders of the Labor Board still continues, several recent developments have tended to allay the enthusiasm for a strike at this time. The first of these developments came in the form of an announcement by E. H. Fitzgerald, president of the Brotherhood of Railway & Steamship Freight Handlers, Express and Station Employees that there would probably not be a general strike of the members of his organization. "We are not going to put out any general strike ballot," Mr. Fitzgerald was quoted as saying. "We have agreements with the Southern; the Chicago, Burlington & Quincy; the Chicago & Alton and a number of other roads regarding wages. They are that wages will be left to the Labor Board. There can be no strike on these roads. There will be no general strike ballot issued covering all of the remaining roads. Instead, the general committee of each road will ballot its road and the vote will be taken whether or not to strike on that particular road."

Such an attitude on the part of this organization, if consistently maintained, would greatly weaken the threatened strike of the employees covered by the Board's recent decision.

The second development of this character came in the form of a compilation of statements made by the leaders of the four train service brotherhoods each of whom declined to attend the meeting of rail and mine union chiefs at Cincinnati, Ohio, on June 20, to consider a "coalition" in line with the agreement adopted several months ago.

Another development of a similar nature comes in reports from Washington as to the government's attitude toward the threatened strike and which is covered more fully elsewhere in this issue.

B. M. Jewell, president of the railway employees' department of the American Federation of Labor, in a statement issued on June 17, charged that the Labor Board had assisted the railroads of the country in perfecting an anti-strike machine and that its recent decisions were "cleverly handed down to create a split between the employees essential to the daily operation of the railroads and the workers in less essential branches of railroad service.

"This was made plain through the fact that the decisions of the Board did not cut the pay of telegraphers, train dispatchers, signal foremen and foremen in some of the shop crafts," Mr. Jewell continued. "Not any of the employees required in the running of trains received a wage cut. The train service unions have not received a cut and cannot receive one before next fall if at all. Train dispatchers and telegraphers are needed for the running of trains. Certain classifications of clerks also escaped cuts. These clerks are needed in the running of trains.

"This makes it possible for the railroads to build an anti-strike machine to fight the unions, which are now balloting on the question of calling a strike. The railroads will be able to run their trains if a strike should be called by bringing about this split between the unions. The men who have received no wage cut cannot go out on a wage strike because they have no reason.

"The Board has arranged to take a vacation July 1, and will not be in a position to stop this fight as it did the strike threatened by the train service men last fall.

"More than anything else, the railroad men affected by wage cuts object to the line of reasoning advanced by the Board that the wage reductions were made necessary because the railroads cannot pay any more. Somebody is trying to force a walk out."

Mr. Jewell said he did not believe any power could intervene to stop the strike if it should be called because the unions have complied with all provisions of the law.

The situation pointed out by Mr. Jewell is acting as a damper on the enthusiasm of the men for a strike. However, the reasons given by Mr. Jewell for this situation, are obviously untrue and unfounded.

Labor Leaders Send Ultimatum to Labor Board

On April 18, the labor leaders attempted to justify their threatened strike in a letter addressed to the Labor Board. This letter charges that the Board has failed to meet the requirements of the Transportation Act, that it has invariably opposed labor in its decisions and that it has put railway employees on less than a "living wage."

After following very closely the arguments made in the dissenting opinion, quoted in part above, this ultimatum says:

"As the matter now stands there is no provision in the law providing for an appeal of any kind against a decision of your body however mistaken or unfair it may be. When, therefore, there occurs a miscarriage of justice of such colossal and permanent injury to railway labor as your decisions will bring about, the only means of remedy which the injured parties have is to reject your decisions.

"This procedure is perfectly legal. While it should only be used as a last resort our membership may decide it to be fully justified by your denial of elementary and long estab-

lished rights and by the seriousness of the situation which you have created.

"Your decisions have been submitted to a strike vote of our members and we are awaiting the result of their action. Should our members decide not to accept your decision, or in other words to strike, we shall sanction their action and advise you accordingly.

"We have therefore exhausted every possible way to secure a remedy for the unjust conditions which have resulted from the refusal of the railroads to comply to the law and from the failure of the Labor Board to safeguard and guarantee our rights under the law."

B. W. Hooper Predicts Peaceful

Settlement of Strike Crisis

Simultaneously with this ultimatum B. W. Hooper, chairman of the Board, issued a statement declaring that he was confident the present strike crisis could be bridged without a strike. He said in part:

The present situation is hopeful. There is no occasion for impatience upon the part of anybody. Neither rates nor wages are permanent, because the conditions upon which they are based are not permanent. I believe that the situation will be gradually cleared up, and that there is good reason to also believe that the railroads will remove one impediment to good feeling on the part of their employees by discontinuing the contract system regardless of their convictions as to its legality. This will go a long way toward the restoration of cordial relations.

Only Saturday the Board received a communication from the Southern Pacific giving notice that the labor contracts complained of by its employees had been done away with, and that the road had no intention to again resorting to the farming out of its labor. There are reasons to believe that this example will be speedily followed by other railroads. It is the unanimous judgment of the Wage Board that it should be. If the men are expected to respect the decisions of the Board, the managements must do the same thing. A fair-minded public will not stand for anything else.

Labor Board Replies to Labor Leaders' Ultimatum

Chairman Hooper of the Board, on June 20 replied to the ultimatum of the labor leaders, abstracted above, in part as follows:

It is to be presumed that you do not desire that the members of your organizations shall vote for a proposition that contains such possibilities of loss and detriment to themselves, upon a misunderstanding of the action and attitude of this Board. It is a fact, however, that your letter does manifest a strikingly distorted conception of what the Board has done and why it did it.

Let me call attention to a few statements in your letter.
1. Your statement that the Board's last decision "states openly that pressure of circumstances was such that the Board was unable to determine just and reasonable wages" is not correct. The decision contains no such statement and none that can be fairly so construed.

The decision recites at length the abnormal economic and industrial conditions of the post-war period, and then says:

Surrounded by such abnormal conditions, the Labor Board has not been permitted to deal with the question of what constitutes just and reasonable wages and working conditions in the same undisturbed and uncomplicated manner as would have been possible in normal times.

This simple recognition of difficulties experienced by the whole world should not be twisted into an interpretation designed to mislead the men whose interests are most directly involved.

2. Your statement that this Board says that "the establishment of just wages for railway workers must await the complete satisfaction of ownership in the matter of rehabilitation and profits" is an inexcusable perversion of both the language and meaning of what the Board in fact said. A strike of railway employees, involving their wages, their employment and their welfare, based upon such misleading statements of this Board's sentiments and declarations would be unjust to the men and to the public.

3. The statement in the Board's decision "that labor can not be completely freed from the economic laws which likewise affect the earnings of capital" is so obviously sound that it will not be questioned any where this side of the kingdom of the Bolsheviks. And yet, you mention this as an occasion of offense.

Your construction of this as meaning "the treatment of labor as a commodity" is strained, especially so, in view of the fact that the Board, in the same paragraph, said:

It should be said that the Labor Board has never adopted the theory that human labor is a commodity, to be bought and sold upon the market, and, consequently to be reduced to starvation wages during periods of depression and unemployment.

4. Your statement that the Board "failed to take into consideration the principle that even the lowest paid railway employees, such as section men and laborers, should receive at least a living wage," is utterly baseless.

Your continual isolation and accentuation of the fact that a minimum rate of 23 cents an hour, \$1.84 a day, was established for section men, is entirely misleading, because it overlooks or suppresses so many connected facts, among which are the following:

1. The rate for section men ranges from 23 to 35 cents per hour.
2. A comparatively small number of them receive 23 cents per hour. A vast majority of them receive the higher rates. This is shown by the fact that the average rate per hour is 32.7 cents.
3. The 23 cent rate is found on a comparatively small number of divisions on a few roads in the South and Southwest. It is not even found on the Southern and Illinois Central which cut completely through the South.

4. Where this minimum rate is found, the cost of living is usually low, and the men, in many instances, are furnished free living quarters.

5. In 1915, this class of labor received an average hourly rate of 15 cents, and in 1917, an average hourly rate of 19.3 cents.

6. The hourly rate of this class of employees has therefore increased under the present decision, 69.4 per cent over 1917, and 118 per cent over 1915.

7. Based upon the cost of living, the purchasing power of the hourly wage of section men under the present decision is 44.5 per cent greater than it was in 1917, and 37.3 per cent over 1915.

8. If it be said that the 10 hour day prevailed in 1915, and the 8 hour day now, it may likewise be said that the man either gets the benefit of the extra two hours for his own purposes or, in many instances, he will now be permitted to work the two hours, since punitive overtime has been abolished for this class of employees for the ninth and tenth hour.

9. Even comparing the present 8 hour wage with the 10 hour wage of 1915, the purchasing power of the new wage is 9.8 per cent greater than that of 1915, and the man has, on top of this, the gift of two hours' time for other activities.

10. It must also be clearly understood that the 23 cent rate will exist only in a territory where the Railroad Administration after careful investigation, found a justification for and did establish a lesser rate than paid the same classes in the balance of the country, which condition has not been disturbed by decision of this Board.

In view of these facts, not one of which you can yourself dispute, there is no ground for the fierce assaults which you make upon the action of the Board in this matter.

For your information, I will say that I recently made some limited investigation, personally and on the ground, of the wages of common labor in one Southern state, and I found the new rate for section men appreciably higher than the rates being paid to similar labor in other employments.

It may also be noted just here that the average pay of section foremen under the new decision is 119.7 per cent higher than it was in 1915, and that the purchasing power of the section foreman's wage is 38.3 per cent greater than it was in 1915. His average hourly rate in 1915 was 23.3 cents, and, under the new decision it is 51.2 cents.

You do not enter into any discussion of the wages fixed by the Board for other classes of employees, but I reiterate here the statement demonstrated in the decisions of the Board that the purchasing power of these rates is very considerably larger than it was in 1917, just before Federal control, or than it was in the year you prefer to use as a base, 1915.

Surely the leaders of these railway labor organizations can not expect to win the approval of the people of the United States by a rigid, unyielding resistance to the inevitable process of re-adjustment which has been in progress for the past year. If the public is satisfied that the railway employees have been even more than fairly dealt with, by comparison with similar labor and in view of the conditions surrounding their work, there will be no demand that they shall be treated as absolutely immune from the operation of the economic processes through which everybody else must pass.

The fact can not be overlooked that the policy of the leaders of the employees seems to be to accept no reduction, however slight. For example, a strike vote is being submitted to the stationary engineers, firemen and oilers, whose wage under the new decision show an enormous increase over the compensation they received before the war. Notwithstanding the increased cost of living, the increase in the pay of these employees has been so great as to result in the following percentage of increase in the purchasing power of their wages under the present decision over 1915:

Stationary engineers	70%
Stationary firemen	42.1%
Engine room oilers	42.1%
Boiler room water tenders.....	25%
And coal passers, boiler room.....	25.9%

The increase of their actual daily wage under the new decision

over 1915 ranges from 100 per cent to 169.9 per cent. And yet there is submitted to them a strike ballot.

It is scarcely worth while to multiply these examples of the real meaning and effect of the Board's decisions of which you complain.

Let me say, before concluding, that the members of your organization have no occasion to reflect upon their official representatives in connection with the conduct of those wage disputes before our Board. The employees have been ably and loyally represented, and, in my humble judgment, have secured results that should be satisfactory to them. With the degree of friendly interest that I feel in these organizations and with the recognition that I accord to their great service to their membership, I am hopeful that they will not adopt a course that will surely prove disastrous to the organizations and unfortunate to the men composing them. It is regrettable that such a step is contemplated at a time when the country is just entering upon an era of more stable industrial conditions, that gives promise of an enlarged degree of prosperity to railway employees.

Loree Denies Lauck Charges

WASHINGTON, D. C.

TESTIFYING BEFORE THE Senate Interstate Commerce Committee on July 19, in connection with the railroad inquiry, L. F. Loree, president of the Delaware & Hudson, denied charges made before that committee by W. Jett Lauck, representing the railway unions, that there is an interlocking combination that controls the management, financing and operation of the principal railroads of the United States.

"In general," said Mr. Loree, "Mr. Lauck's testimony appears to me to be misleading, to contain many errors of fact and erroneous deductions, to be self-contradictory at many points and abundantly to contain intrinsic evidence that it is not worthy to be considered as a serious contribution to the elucidation of any railway problem."

Mr. Loree referred specifically to an exhibit filed by Mr. Lauck containing a list of 25 men, one of whom was Mr. Loree, who are alleged to link together 99 Class I railroads operating 211,280 miles, or 82 per cent of the country's steam transportation systems. The men designated in the list, Mr. Lauck testified, are, or have been, directors in the railroad corporations named in the exhibit.

"I most emphatically deny that I am a party, or ever have been a party, to any combination or understanding of any sort, express or implied, which tends or is intended to secure uniformity or concert in managing, financing or operating the railroads of the United States or any group of such railroads, unless the word 'group' is understood to mean a number of interrelated corporations, constituting one of the many separate and independent railway systems which are now frankly and openly under the control of a single interest. I am not, and never have been, the agent or representative of any such combination or understanding. I do not know of the existence of any such combination or understanding, now or in the past, and I believe that nothing of the kind exists or ever has existed in these United States. If this denial is not as comprehensive and categorical as it can be made, I should like to have the language necessary to perfect it brought to my attention, for it is my purpose, once and for all, to deny every statement, implication, suggestion and innuendo contained in the exhibit referred to and in the accompanying testimony or statement, except that the persons therein named are or have been officially connected with certain separate and independent railroads or systems of railroads.

"Considering the list of 25 men, I find that they are not men with joint or even common interests or financial or political or social affiliations. Intrinsicly considered, to those who know anything of their activities, it is absurd to suggest that the men in this list are bound together for any purpose whatever, or that their endeavors are united in any common purpose or project. They are all men who

have attained positions of responsibility in their vocations and who possess the confidence, each of them, separately and in his own rights, and by title of experience and things accomplished, of greater or smaller bodies of free Americans who are railroad stockholders."

Mr. Loree called attention to the fact that, under the transportation act, every individual who is willing to hold more than one position as either an officer or director of a railroad must first obtain the express sanction of the Interstate Commerce Commission, while the Clayton act also imposes further restrictions upon such railroad officials.

"I call attention to this merely to show that if the exhibit filed by Mr. Lauck represents the facts of today and if those facts are in any way subject to criticism, the situation is fully within the control of public authorities and no one can doubt that the constituted authority desires fully to meet its obligations," said Mr. Loree.

The witness said that the list of railroads contained in the exhibits is "misleading and made up in such a way as to lend itself to the illusory and false suggestion apparently to be conveyed." As an example, he called attention to the names appearing in the list of the Southern Railway, the Alabama Great Northern; Cincinnati, New Orleans & Texas Pacific; Mobile & Ohio; Georgia, Southern & Florida, and the New Orleans & Northeastern Railroad; all, he said, make up the Southern Railway's system, but the names are so widely scattered that their identity as a part of that system is obscured.

Only 52 Systems, Not 99

This is also true, Mr. Loree said, of many others in the list, with the result that instead of there being 99 separate railroads, there are only 52 actual systems represented in the exhibit.

Regarding the charge made by Mr. Lauck that because of "banker-management," the railroads have issued securities with par values in excess of the moneys realized and sold them for more than par, but for smaller premiums than might have been obtained, Mr. Loree said:

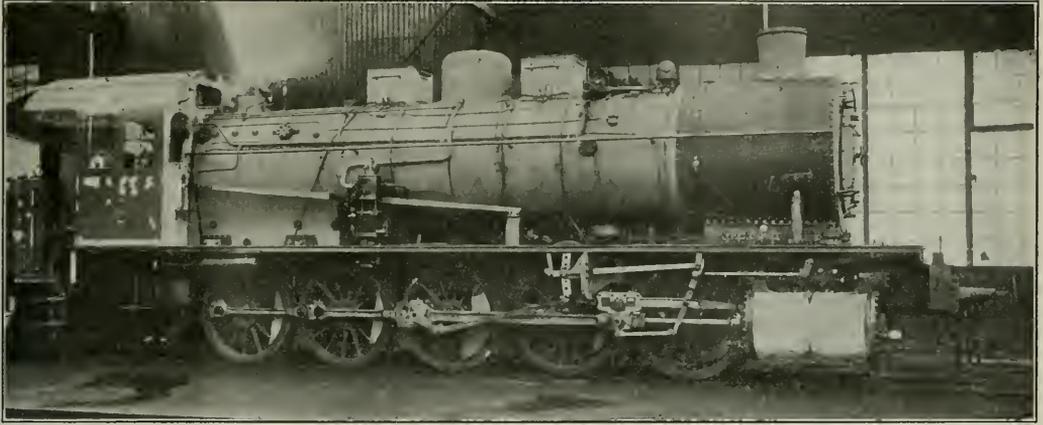

"There is no basis for the charge that securities are improvidently issued or that less is realized from their sale than should be realized. But if the charge is insisted upon, it may well be that the defense should be left to the public authorities who possess the power to regulate these matters. If the charge is warranted, these authorities are, in this respect inadequate for their duties or derelict in their performance. I do not concede they are vulnerable to either complaint."

Mr. Loree told the committee that the savings to be effected, as alleged by Mr. Lauck, from the installation of super-heaters and similar improvements on locomotives are very much overstated.

"In the hands of a careless engineman, the super-heater is little more than a supplementary and relatively inefficient boiler," said Mr. Loree. "To say the least, we must look to discipline and supervision quite as much as to the appliance itself for economic results."

"The sinister suggestions in regard to prices for equipment and other supplies, made by the witness, are without specifications or evidence," said Mr. Loree, referring to charges made by Mr. Lauck that the roads have paid excessive prices for supplies and equipment. "They consist of bald acquisitions or more cautious implications, and might very properly be dismissed without other response than a demand for evidence—names, places and dates.

"If anyone has been guilty as charged, he has violated his obligations to the owners of the property and can be compelled to make restitution. If such scandalous conduct is known to the person who made the charge, it is his duty to present the facts in such a way that proper action can be taken; if he does not know of such conduct, he should withdraw his charges."

Unaflow Freight Locomotive Built by A. Borsig, of Berlin, for the German State Railways

Recent Developments in the Unaflow Locomotive

Exhaust Ejector Effect Overcomes Handicap of High Compression and Reduces Size of Cylinders

THE RECIPROCATING steam engine has been freely criticized as an inefficient machine. During recent years turbines and internal combustion engines have displaced steam engines for many purposes, principally where economy of fuel is an important factor. In spite of the trend toward other types of prime movers, the reciprocating engine, with certain improvements, has retained its place in locomotive service due to the advantages of simplicity, reliability and large power output in relation to its size and weight. The steam engine has not been neglected by scientists and engineers and constant progress is still being made which will probably result in that type of engine holding its place for many years to come.

Characteristics of the Unaflow Engine

One of the recent developments in reciprocating steam engines which promises to add to the efficiency of the locomotive is the Stumpf unaflow cylinder arrangement. Briefly,

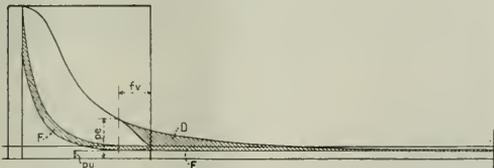

Fig. 1.—Effect of Exhaust Ejector Action on Indicator Card

the unaflow engine consists of a piston of a length somewhat less than the stroke of the engine working in a cylinder of nearly twice the usual length. At the center of the cylinder is a row of exhaust ports which are uncovered by the piston at each end of the stroke. The admission of steam takes place as usual through valves and ports at the end of the cylinder. Thus the steam flows through each end of the cylinder in one direction only, which results in a considerable reduction in the losses due to heat transfer between the

steam and cylinder walls and a considerable economy in the use of steam.

Professor Stumpf, inventor of the Stumpf unaflow engine, has recently given attention to the design of locomotives and about 200 locomotives of this type are now operating in Europe. The Stumpf Unaflow Engine Company, Syracuse, N. Y., is now arranging for installations in this country.

The unaflow cylinder as ordinarily designed is best adapted to condensing engines. Compression occurs early in the stroke and the large amount of negative work is a disadvantage in getting the high mean effective pressure desired in locomotive service. This difficulty can be overcome by supplementary exhaust valves with some sacrifice of economy. Very short cut-off is desirable in a unaflow engine and this involves a large cylinder if the engine is to deliver an average piston thrust equivalent to that of the counterflow engine with its longer cut-off. The unusual length of the cylinder also complicates its application to the locomotive.

From the features already mentioned it is apparent that the design of the unaflow locomotive presents numerous difficulties but experience with locomotives of this type now in service indicates that the handicaps have been overcome and the unaflow now offers an opportunity for eliminating some of the losses which are common to the operation of other types of reciprocating engines.

The Exhaust Ejector Principle

One of the most important improvements in the latest design of unaflow locomotives lies in the application of the exhaust ejector principle. The method by which this is utilized to overcome the difficulties met in the design of the unaflow locomotive is illustrated in Fig. 1. A loss of area in the indicator diagram begins within the limits of the piston stroke due to the fact that the exhaust commences with a certain exhaust lead before the dead center is reached as shown at fv in Fig. 1, this loss increasing as the exhaust lead and terminal expansion pressure pe increase. For small exhaust lead and low terminal pressure, this loss is neg-

ligible and it is almost always insignificant when compared with the loss represented by the toe of the diagram, shown shaded at *D*. In the uniflow locomotive the energy represented by the area *D* has been utilized to reduce the pressure *p*₁ at which compression begins, with a consequent lowering of pressure throughout compression.

A smaller clearance volume may therefore be used thus diminishing the volume loss. The area regained on compression, shown shaded at *F*, is proportional to the shaded area *D*, or in other words, the higher the terminal expansion pressure, or the longer the cut-off, the lower will be the terminal compression pressure. This makes the use of a longer exhaust lead *f*₀ permissible since the loss area within the limits of the piston stroke now form a part of the toe of the diagram and cooperates in lowering the back pressure at the time compression begins. There is, therefore, no objection to making the exhaust lead large since by increasing

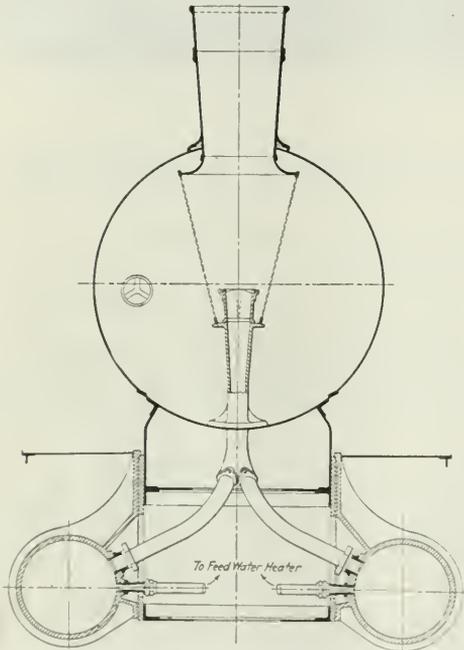

Fig. 2—Arrangement of Exhaust Passages and Nozzle

the duration of the exhaust the compression is shortened and the exhaust puffs are softened. If this is done the number of the exhaust ports at the center of the cylinder will be so far reduced that the exhaust belt ordinarily used in uniflow cylinders may be dispensed with and only one port remains which connects directly to the exhaust pipe. This also enables the piston and cylinder to be made considerably shorter.

The utilization of the energy represented in the toe of the diagram is based upon its conversion into kinetic energy by means of conical nozzles such as are commonly used in steam turbines. The general arrangement of the nozzles and passages is shown in Fig. 2. An engine having two cranks at right angles with an exhaust lead of 25 per cent will produce sufficient overlap of the exhaust period so that the exhaust of one cylinder begins before the other has ceased. If now the exhaust pipes are joined at acute angles, a jet ejector action is obtained. In order to obtain as high efficiency of ejector action as is practicable, friction losses must be

kept at a minimum. This necessitates careful proportioning of the exhaust passages, the exhaust nozzle and the stack.

A theoretical analysis of the ejector action indicates that 28 per cent of the energy ordinarily lost may be converted into useful work. The steam consumption also is improved, the saving varying from 12 per cent at 43 per cent cut-off to 0 at 14 per cent cut-off. The exhaust ejector effect also permits a considerable reduction of clearance volume, the decrease in a typical case being from 17 per cent to 11 per cent.

The reduction in back pressure obtained in actual service by the exhaust ejector action is clearly shown by the indicator cards in Fig. 3 and the diagram in Fig. 4 which shows the variation in the pressure in the exhaust pipe between the cylinder and junction during a complete revolution of the crank. It will be noted that the cylinder card shows the exhaust coinciding with the atmospheric line for a considerable distance and the card taken from the exhaust pipe shows that a vacuum as high as 7 lb. per sq. in. was formed at certain positions.

The extent to which the increase of the exhaust lead shortens the cylinder and piston is clearly shown in Fig. 5.

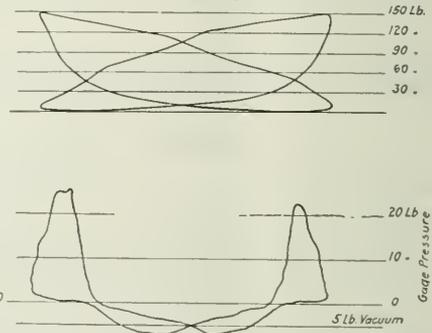

Fig. 3—Indicator Cards from Two Cylinder Uniflow Locomotive; Upper Card from Cylinder, Lower Card from Exhaust Pipe Between Cylinder and Junction. Cut Off 55 Percent, Speed 14 M.p.h. Steam Pressure 170 Lb. per Sq. In.

The long exhaust lead shortens the compression from 90 per cent to 70 per cent and reduces the clearance volume from 16.2 per cent to 13.6 per cent.

A German Uniflow Locomotive

The first locomotive in which the exhaust ejector principle was applied was a superheater freight locomotive of the German State Railways, built in 1920 by A. Borsig of Berlin, and illustrated at the beginning of this article. The main dimensions of the locomotive are as follows:

Cylinder bore.....	630 mm.	(24.8 in.)
Stroke.....	660 mm.	(26.0 in.)
Driving wheel diameter.....	1,400 mm.	(55.1 in.)
Maximum speed.....	60 km. per hour	(37.2 m.p.h.)
Steam pressure.....	12 at. gage	(177 lb. per sq. in.)
Grate area.....	2.62 sq. m.	(28.2 sq. ft.)
Boiler heating surface.....	149.65 sq. m.	(1,610 sq. ft.)
Superheater heating surface.....	53.00 sq. m.	(571 sq. ft.)
Total heating surface.....	202.65 sq. m.	(2,181 sq. ft.)
Feedwater heater surface.....	15.0 sq. m.	(162 sq. ft.)
Weight empty.....	65.5 tons	(144,200 lb.)
Service weight.....	72.0 tons	(158,700 lb.)

The cylinder of this locomotive is illustrated in Fig. 6. It is notable for its compactness, lightness and simplicity. This is in part due to the use of horizontal single-beat poppet valves which were employed for the first time on this locomotive. Piston valves have been used on some uniflow locomotives while others have double-beat poppet valves. The single-beat type of valve, although simple and perfectly steam tight, has so far not been favorably received because it requires a high lift and a large force to raise it. With the

high compression of the unaflow engine, however, the pressure on the valve is balanced to a large extent and the high lift is obtained by arranging the cam roller between the valve and the fulcrum of the valve lever as shown in Fig. 7. The lift of the cam, which is 14 mm. (0.55 in.) radially, is thus increased to 24 mm. (0.95 in.) at the valve. For cut-offs up to 50 per cent, the effective inlet areas of the single-beat valve are equivalent to the areas of a standard piston valve of 220 mm. (8.67 in.) diameter. The fact that beyond this cut-off the valve area remains constant must be considered a further advantage. The small cam lift permits of a cam profile of very gentle curvature, thus insuring smooth lifting and seating of the valve. The whole cam mechanism is very substantially constructed and swinging

ent of the cam mechanism except for the tappet contact, and is free to follow any slight distortion of the cylinder casting.

When coasting, the valves may be lifted off their seats by compressed air admitted between small pistons formed on the valve tappets so that the rollers clear the cam. Special means for connecting the cylinder ends are therefore not required, and the relief valves ordinarily used to prevent high compression may be omitted, since the inlet valves act as such. They also relieve the high compression which may occur when the throttle is nearly closed. The automatic compression release device also may become superfluous since the late cut-offs at starting produce a strong exhaust ejector effect and the compression is therefore considerably shortened.

Attention may be drawn to the accessibility of the valves; for their renewal it is only necessary to take off the valve chest cover and disconnect the valve spring, the spring cap lock being a split spherical washer. Comparing this with the procedure of taking out an ordinary piston valve, the great simplification due to the single beat valve will be appreciated.

The driving parts and the Walschaert gear are the same as those used on counterflow locomotives. On account of its greater length the cylinder was moved forward 180 mm. (17.1 in.). The unaflow cylinder is not heavier than the corresponding counterflow cylinder, since the piston valve chest with its large exhaust chamber as well as the tail rod and its guide are omitted. This allows the piston rod of 95 mm. (3.74 in.) diameter to be bored out to a diameter of 60 mm. (2.36 in.), thus also saving weight. The forged steel piston heads, which are only slightly dished, hold between them a cast iron supporting drum cast from a special

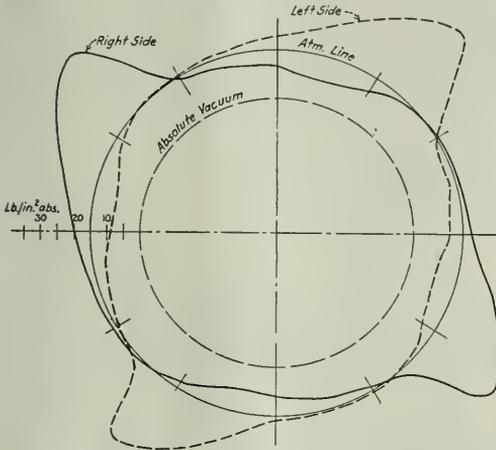

Fig. 4—Diagram Showing Pressure in Exhaust Pipe Through a Complete Revolution

levers were used instead of sliding parts wherever possible. It should therefore stand up well in service.

Details of Poppet Valves

The single beat valve is made of chrome-nickel steel and works on a removable steel seat expanded into the cylinder casting. If this seat should become damaged by scale or other foreign matter it can be easily resurfaced or renewed.

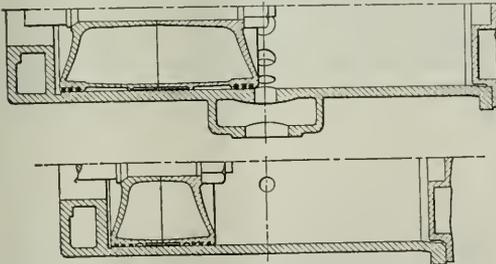

Fig. 5—Comparative Lengths of Cylinders for Exhaust Lead of 10 Percent and 30 Percent

The valve stem has a diameter of 25 mm. (0.99 in.) and is supplied with oil under pressure. The common center of gravity of the valve head and spring retainer is located at about the center of the guide so that good working conditions are assured. The valve stem, furthermore, is not exposed to the live steam, but to the varying pressure and temperature of the cylinder steam. It is entirely independ-

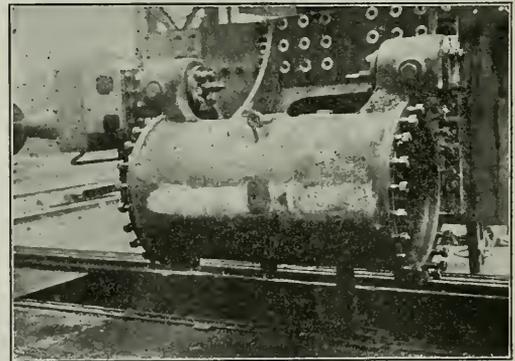

Fig. 6—The Unaflow Cylinder with Poppet Valves Is Light and Simple

soft mixture, while the cylinder is made of a hard quality of cast iron. The supporting drum is turned smaller than the cylinder bore by 2.2 mm. (0.087 in.) on a length of 140 mm. (5.5 in.) at its middle, which allowance increases to 5 mm. (0.197 in.) towards the ends. Each piston head carries three rings. The greater part of the total clearance volume of 12 per cent is taken up by a linear clearance of 40 mm. (1.57 in.) between the piston and cylinder head, and this also results in very small harmful surfaces. The pressure oil feeds are arranged at the middle of the cylinder, where the temperature is lowest and little possibility of carbonizing exists. One feed is placed on top and one on each side of 45 deg. below the horizontal center line.

Steam Consumption of Unaflow Locomotive

It is hoped that tests of these locomotives will soon be available and it is expected that they will show unusually high economy in the use of steam. The result of tests of

earlier type unaflow locomotives are available and justify the following conclusions: The unaflow locomotive shows better economy than the compound for small loads, while at higher loads its fuel consumption is higher than that of the latter. This can be easily explained by the effect of the long constant compression and the large clearance volume. The unaflow locomotive working with saturated steam shows in general a higher economy than the compound except for long cut-offs. Larger cylinders would be of advantage in this case. The superheater unaflow locomotive is at least on a par with the superheater compound, although even here the former has a slightly higher fuel consumption for heavy loads. Larger cylinders are, of course, more feasible with the unaflow system than with the compound engine.

Future Locomotive Development

In concluding the discussion of the locomotive in his recent book on the unaflow engine, Professor Stumpf makes the following observations on the probable future trend of locomotive design: "With the customary design of firebox,

to 4.75 at. (69.8 lb.) abs. and during a considerable part of the expansion moisture is therefore formed in the cylinder. This does not have much effect upon the economy of the unaflow engine, but is very detrimental to that of the counterflow cylinder where the moisture causes large surface losses.

"The practice with counterflow locomotives is therefore to use higher superheat with higher initial pressure. The increase in temperature, however, is the cause of many difficulties with piston valves and piston rod packings. Furthermore, the superheater elements must be shortened so that the flue gases do not exert a cooling effect upon the superheated steam. This in turn leads to a great number of superheater elements and inefficient utilization of space. The unaflow engine can of course be adapted to meet this condition in a better manner, since its design makes it more suitable for high temperatures than the customary counterflow cylinder with piston valves. On the other hand there is no necessity for using these high temperatures in the high pressure unaflow locomotive, since the unaflow action corrects the bad influence of moisture in the steam.

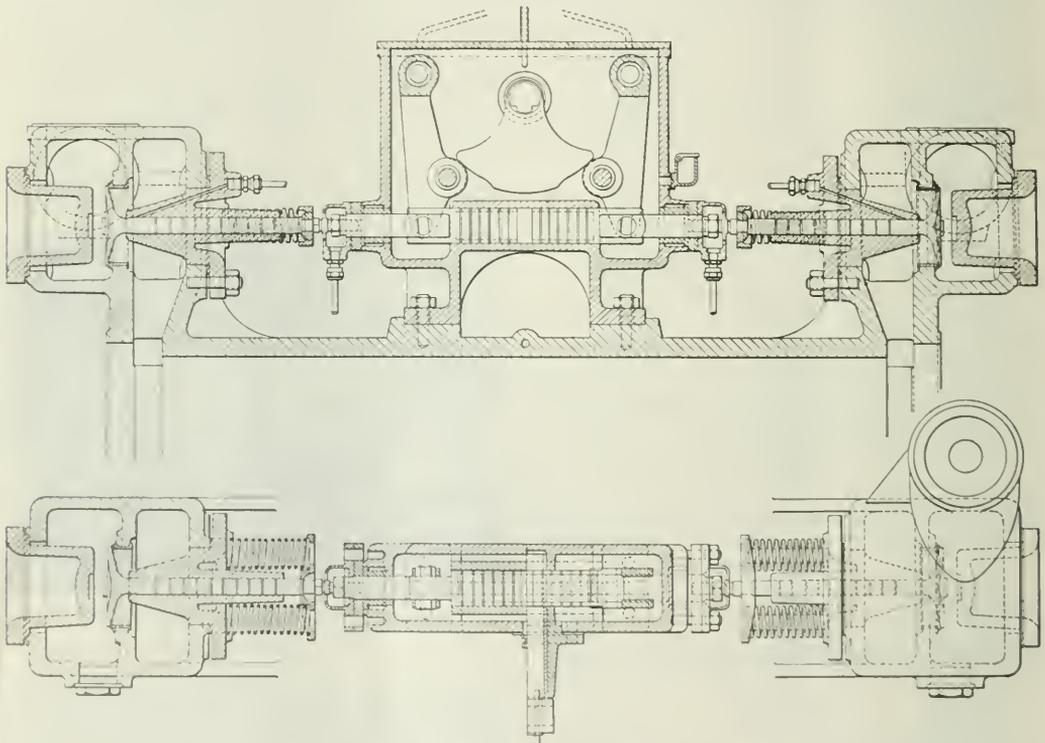

Fig. 7—Details of Poppet Valves and Lifting Mechanism

steam pressures up to 16 at. (235 lb.) gage are possible, although the number and size of the stays becomes excessive. For still higher pressures a different design of firebox would be necessary, such as for instance a box of the Brotan type, which permits of steam pressures of 20 at. (294 lb.) gage. By raising the steam pressure from 12 at. to 20 at. gage (176 lb. to 294 lb.), the amount of heat which can be converted into work increases from 116 to 146 cal. per 1 kg. steam. This represents a gain of about 26 per cent.

This remarkable result can only be attained by employing the unaflow principle, since the pressure at which the steam becomes saturated increases from 2.2 at. (32.4 lb.)

"The calculated gain of 26 per cent of the high pressure unaflow locomotive with exhaust ejector action will probably be exceeded in practice, since it does not include the benefit due to the single beat poppet valves, the reduction of the clearance volume to seven per cent, nor even the gain due to the unaflow principle itself.

"The future line of progress of the locomotive is therefore clear. It leads naturally from the two-cylinder to the three-cylinder engine with unaflow cylinders having small clearance volumes, to the use of single-beat poppet valves and the utilization of the ejector action of the exhaust, in combination with high pressures and modern superheat."

Hearing on Tentative Consolidation Plan

Railroads File Basic Information and Express Some Criticisms of Proposed Grouping

WASHINGTON, D. C.

THE HEARING on the Interstate Commerce Commission's tentative plan for the consolidation of the railroads into a limited number of systems, as it applies to the southeastern territory, was resumed before Commissioner Hall and Examiner Healy on June 15 after having been adjourned from April 24. It is to be followed by other hearings in various parts of the country. As a result of conferences between Commissioner Hall and a committee of railroad counsel appointed at the former hearing the roads were prepared with basic statistical data and information regarding the finances, traffic and operations of their properties which the commission desired as the foundation for its record and the work of preparing a complete consolidation plan, but there was evident some of the same reluctance on the part of many of the railroad officers who testified to make suggestions as to what roads they should be combined with, except as they had objections to offer to the grouping proposed in the tentative plan or as the tentative plan follows their present affiliations, as in the case of the Atlantic Coast line, Louisville & Nashville and Nashville, Chattanooga & St. Louis.

Illinois Central—Seaboard Air Line

SYSTEM No. 12—ILLINOIS CENTRAL-SEABOARD

Illinois Central
Yazoo & Mississippi Valley
Central of Georgia
Seaboard Air Line
Lynchburg, Va., to Durham, N. C., branch of Norfolk & Western
Gulf & Ship Island
Tennessee Central
Carolina, Clinchfield & Ohio

NOTES—Prof. Ripley recommends that a separate system be built around the Seaboard Air Line.

The Gulf & Ship Island is not included in any system by Prof. Ripley. The Carolina, Clinchfield & Ohio may be included in system No. 11, Atlantic Coast Line-Louisville & Nashville.

The first day of the hearing developed that the Illinois Central does not want to have the Seaboard Air Line combined with its system as proposed and the Seaboard also failed to see any advantage in the plan but expressed a preference to be let alone. C. H. Markham, president of the Illinois Central, was the first witness and began by filing and explaining to some extent 25 exhibits consisting of maps, charts and tables giving the basic information as to the plant and facilities of the Illinois Central and Central of Georgia, their traffic and interchange with other lines and their financial structure. Prof. W. Z. Ripley, of Harvard University, who prepared a report on which the commission's tentative plan was based, assisted the commissioner and examiner in bringing out facts for the record by questioning witnesses. He asked Mr. Markham whether the Illinois Central and the Frisco lines into Birmingham compete for Kansas City business. Mr. Markham replied that they do to some extent but he would rather not express an opinion as to whether the Frisco line should be given to the I. C.

After presenting the general data Mr. Markham took up a discussion of the tentative plan for System No. 12, taking into the Illinois Central, Yazoo & Mississippi Valley, Central of Georgia and Ocean Steamship Company of Savannah, Seaboard Air Line, the Lynchburg-Durham branch of the Norfolk & Western, the Carolina, Clinchfield & Ohio, the Gulf & Ship Island and the Tennessee Central. He said the Illinois Central does not favor the inclusion of the Seaboard Air Line and the Tennessee Central in its system and that it follows that it would exclude the Norfolk & Western branch and the C. C. & O. He then outlined the history of the development of the Illinois Central system, saying it is the only one of any size following the lines of longitude and

broadly speaking the only north and south trunk line in the country. It serves the great central valley and it has prospered by rigidly confining its activities to its natural territory, thereby contributing to the development of the territory, and the lines it has taken on have added strength to the main lines. The Yazoo & Mississippi Valley, he said, is an integral part of the Illinois Central and itself owns practically no freight cars, using those of the Illinois Central. The officers above general superintendent have jurisdiction over both. The Illinois Central has aided the development of the Yazoo & Mississippi Valley and consequently of western Mississippi and that road constitutes a second main track of favorable grade for the Illinois Central through business south of Memphis, practically a water grade level, while the Illinois Central runs through the foothills.

A separation of these two lines would lower the standard of service and increase the cost of operation of both lines. The Yazoo & Mississippi Valley has been brought to its present strength by the Illinois Central and they are so closely knit together that their separation would be detrimental to the public interest. Referring to the Tennessee Central, Mr. Markham said that the only thing that the Illinois Central could do with it would be to use it for an entrance to Nashville and the Illinois Central now has all the benefits of such an entrance through divisional arrangements without the responsibility of ownership. It had once given some consideration to the Tennessee Central and had decided it would not take it as a gift.

Seaboard Air Line Competitive

with Central of Georgia

Referring to the proposed consolidation with the Seaboard Air Line, Mr. Markham said that the latter forms a north and south line along the Atlantic coast, while the Illinois Central is 700 miles away. There is absolutely no identity of interest or opportunity to form new traffic routes that would benefit the railroads or the public and there seems no way of bringing these two properties any closer together than is now afforded by the connection at Birmingham. The Seaboard is very highly competitive with the Central of Georgia, which reaches every important point in the state except in the extreme southeast. The Atlantic Coast Line and the Southern are traffic connections on eastern business. Therefore, the Seaboard Air Line would add practically nothing to the Illinois Central or the Central of Georgia nor would benefits accrue to the Seaboard by combination with the Illinois Central. Such a consolidation would have the effect of abolishing competition and would not be in harmony with the law. In response to questions by Prof. Ripley, Mr. Markham said the Illinois Central is not looking for more lines, but if the Gulf & Ship Island is to be placed somewhere, probably the Illinois Central is a logical place for it, but he could not conceive of any possible conditions under which the Illinois Central and the Seaboard could profitably be put together. The Mississippi Central and the Gulf, Mobile & Northern, he said, belong together and if one should go to the Illinois Central, the other ought to. Commissioner Hall expressed an appreciation of the very clear form in which the Illinois Central exhibits had been prepared and said they would be very helpful.

Carolina, Clinchfield & Ohio

J. J. Champion, vice-president of the Carolina, Clinchfield & Ohio, filed statements containing the basic information

for his road, but declined to discuss where the road should be put in any consolidation scheme. He said it occupies a unique position and might fit into a number of other systems, such as the proposed systems Nos. 10, 11 or 12, or one of the systems north of the Ohio river. Commissioner Hall pressed him for an expression of opinion as to what should be done, assuming that some plan has to be made and that unless it were placed in the same system, the road could not be consolidated at all, but Mr. Campion would give no expression. He said the road's heaviest interchange is with the Southern Railway.

Vice-President Capps of Seaboard Air Line Testifies

C. R. Capps, vice-president in charge of traffic of the Seaboard Air Line, filed basic statements and in addition discussed the traffic situation to show that a combination of the Seaboard and the Illinois Central would not be beneficial. It would shorten no through routes, he said, except the mileage between Chicago and Atlanta, and it would lengthen the mileage of several existing routes. The Illinois Central would not give the Seaboard any more northern connections and the connections from the Virginia cities north might or might not be friendly. The two roads have not found it necessary to establish through traffic arrangements and there is no connection with the Illinois Central except at Birmingham, where the interchange amounted to less than 37,000 tons in 1921. Mr. Capps said the Seaboard is generally the short line in its territory and is less dependent on any one article of traffic than other southern lines. The effect of his statement was that the road feels it is sufficient unto itself and should be left alone. In reply to questions, he said that if the Georgia Southern & Florida were placed in System No. 10, the Southern, and the Atlanta, Birmingham & Atlantic placed in System No. 11, the Atlantic Coast Line, the result would be to give those two systems each two routes between Atlanta and Jacksonville and the Seaboard no route. Prof. Ripley said that it had been proposed to give the Atlanta, Birmingham & Atlantic to the Atlantic Coast Line because its present route to Jacksonville is very indirect.

Norfolk & Western Does Not Want to Lose Branch

N. D. Maher, president of the Norfolk & Western, made a brief statement regarding the proposal to cut off its line from Lynchburg to Durham and place it in the Illinois Central-Seaboard system and also its line from Roanoke to Winston-Salem and the Winston-Salem Southbound to be placed in the Atlantic Coast Line system. He said this would disrupt the route from Hagerstown to Winston-Salem, which had proved very valuable during the period of congestion when the routes through Potomac Yard were crowded, and that the result would be to limit competition and change the channels of traffic in this territory.

The Durham line, he said, is of great future importance to the Norfolk & Western.

Mr. Maher also submitted general information covering the Norfolk & Western, although the system which the tentative plan proposed to build up around the Norfolk & Western is not included in the southeastern territory. Prof. Ripley asked if it is not the disposition of the Hampton Roads lines to hold western traffic as far east as possible before turning it south and whether it would not be better to turn this traffic south at an earlier point. Mr. Maher said that the plan would require the Norfolk & Southern to interchange with the Southern at Lynchburg.

G. E. Butler, general freight agent of the Norfolk & Western, supplementing Mr. Maher's testimony, said that the proposed plan would have just the opposite effect of that suggested by Prof. Ripley in some instances. He said the public interest would be affected by closing the route from Hagerstown to Winston-Salem.

Atlantic Coast Line—Louisville & Nashville

SYSTEM NO. 11—ATLANTIC COAST LINE—LOUISVILLE & NASHVILLE

Atlantic Coast Line

Atlanta & West Point
Charleston & Western Carolina
Louisville & Nashville
Nashville, Chattanooga & St. Louis
Louisville, Henderson & St. Louis
Western Railway of Alabama
Richmond, Fredericksburg & Potomac
Norfolk Southern
Atlanta, Birmingham & Atlantic
Winston-Salem Southbound
Roanoke to Winston-Salem branch of Norfolk & Western
Florida East Coast
Carolina, Clinchfield & Ohio
Georgia & Florida
Gulf, Mobile & Northern
Mississippi Central

NOTES—Prof. Ripley recommends that the Richmond, Fredericksburg & Potomac and Florida East Coast retain their present status without inclusion in any system.

The Carolina, Clinchfield & Ohio may be included in system No. 12, Illinois Central-Seaboard. Prof. Ripley recommends inclusion in system No. 10, Southern.

The Gulf, Mobile & Northern and Mississippi Central are not specifically included in any system under Prof. Ripley's report.

George B. Elliott, vice-president and general counsel of the Atlantic Coast Line; W. L. Mapother, president of the Louisville & Nashville, and W. R. Cole, president of the Nashville, Chattanooga & St. Louis, expressed general approval of the plan which combined these roads in System No. 11, Atlantic Coast Line—Louisville & Nashville, including the Western Railway of Alabama; Richmond, Fredericksburg & Potomac; Norfolk Southern; Atlanta, Birmingham & Atlantic; Winston-Salem Southbound; Roanoke to Winston-Salem branch of the Norfolk & Western; Florida East Coast; Carolina, Clinchfield & Ohio; Georgia & Florida; Gulf, Mobile & Northern, and Mississippi Central. Mr. Elliott said that the attitude of the Atlantic Coast Line toward System No. 11 is that if these consolidations are going through and the proposed Systems Nos. 10 and 12 are to be made, the grouping for the Atlantic Coast Line is in the main satisfactory and what it would have suggested. He felt that the Richmond, Fredericksburg & Potomac should perhaps remain neutral, but if assigned to one system, it should properly go to the A. C. L. The A. C. L. would also be willing to accept the right to consolidate with the Norfolk Southern and it feels that the Carolina, Clinchfield & Ohio is properly allocated if given to the coast line. This would give access to coal over its own rails. Regarding the A. B. & A., he said that the Coast Line business to that section is largely over the Central of Georgia but if the Central of Georgia is to be linked up with the Seaboard Air Line, the A. B. & A. would aid the Coast Line in getting to Jacksonville. He also felt that the Florida East Coast is properly allocated to this system. This attitude, he said, is predicated on the possibility of making these consolidations on satisfactory terms. Probably, he said, the other roads and the public would demand that the Richmond, Fredericksburg & Potomac be kept open as a bridge line.

Mr. Cole said that if there is to be any consolidation, the Nashville, Chattanooga & St. Louis has been properly allocated in the plan. Prof. Ripley asked Mr. Mapother his opinion regarding the disposition of the A. B. & A., if the Seaboard Air Line and the Illinois Central remain separate. In that case "it ought to be scrapped," replied Mr. Mapother.

Do Not Need Independent Chicago Entrance

Prof. Ripley also brought out an expression from Mr. Mapother that the southeastern lines do not need an independent entrance to Chicago. A complete plan, he said, might wisely stop these lines with the Ohio river and he would have no objection to including the Chicago, Indianapolis & Louisville, now owned half by the Southern and half by the Louisville & Nashville, in the Baltimore & Ohio system, as proposed in the tentative plan.

George R. Loyall, president of the Norfolk Southern, expressed the opinion that the proposed consolidation of his

road with the Atlantic Coast Line would eliminate competition in a large part of the territory. He felt that the line has a function to perform and it is its desire to continue to develop along its own lines. Therefore, it would ask to be let alone for the present. Commissioner Hall asked whether he would propose that the Norfolk Southern be made a system by itself, to which Mr. Loyall replied only that he was not prepared to say where it properly belongs. He said perhaps it is more of a feeder to the Southern Railway than to any other system and its principal competitor is the Atlantic Coast Line.

Mr. Mapother took the stand again to discuss the Carolina, Clinchfield & Ohio, saying he thought its inclusion in System No. 11 is entirely proper and that it would prove highly desirable if the plan were carried out. It could be connected with the Louisville & Nashville by the construction of only 12 miles of new road and would afford an outlet to the Seaboard for coal from eastern Kentucky and a desirable route to the central west from Carolina territory. The management of the Louisville & Nashville has had such a plan in mind for several years.

Basic information for the Florida East Coast was submitted by W. G. Brown, roadway engineer, and T. W. Pomar, comptroller, but in response to requests for an expression regarding the allocation of this line, S. M. Loftin, general counsel, said that the road is now being operated by trustees under the will of the late H. M. Flagler, which expires next year, and the present trustees do not feel that they ought to express any opinion. The president and vice-president are among the trustees.

J. L. Edwards, assistant to the receiver of the Atlanta, Birmingham & Atlantic, submitted the general information for this road, and pointed out that the increase in population in this territory has been greater than that in the balance of the state. He said that under the Railroad Administration it was used in connection with the Louisville & Nashville and Nashville, Chattanooga & St. Louis as one of the routes for northbound fruits and vegetables.

H. H. Dean, general counsel of the Gainesville Midland, said that this road should be allocated to the Atlantic Coast Line or the Central of Georgia, but not to the Seaboard or the Southern. It connects with four systems which go into Georgia, but to link it with the Seaboard or Southern would eliminate competition.

Southern System

Data on behalf of the Southern Railway was submitted by L. E. Jeffries, vice-president and general counsel, and A. H. Plant, assistant to the president, but they declined to give any expression of opinion regarding the tentative plan. At the conclusion of their testimony, Frank Roberson, attorney general of Mississippi, asked Mr. Plant whether the commission should cut the Alabama & Vicksburg-Vicksburg, Shreveport & Pacific system at the Mississippi river. Mr. Plant said he had no opinion on this.

Mr. Roberson then introduced as a witness S. A. Witherpoon, special counsel for the state of Mississippi in the anti-trust suit against the Southern, who presented an alternative plan for a consolidation of the Seaboard Air Line, Nashville, Chattanooga & St. Louis, Mobile & Ohio, the Memphis-Birmingham division of the St. Louis-San Francisco, and the Chicago & Eastern Illinois or the Chicago, Burlington & Quincy, in order to afford a line to Chicago, as a competitor for the Illinois Central system. He also proposed to take away some of the east and west lines of the Southern system. He said that the Southern and the Illinois Central now have a monopoly in the state which it would be desirable to break up.

The basic information furnished by each road in response to a questionnaire sent out by the committee of counsel after conference with Commissioner Hall, calls for maps, a classi-

fication of the road and tracks, equipment and terminals, also detailed statements regarding the traffic, bases of fuel supply, results of operation, capital obligations, interest and other charges. At the request of Commissioner Hall there was added to this list maps and charts showing in detail inter-corporate relationships of the companies comprising the existing systems.

A. J. Maxwell and W. G. Womble of the North Carolina railroad commission and a number of shippers of that state objected to the proposed plan of cutting off the Lynchburg-Durham branch of the Norfolk & Western and placing it in the Illinois Central system. They also proposed that the Toledo & Ohio Central be added to the Norfolk & Western to give a line to the lakes. The hearing on the Southeastern district was concluded on June 20.

Annual Meeting of Signal Section at Spring Lake

THE SIGNAL SECTION of the American Railway Association held its annual meeting at Spring Lake, N. J., on June 14, 15 and 16; and a partial report of the doings of the meeting was given in last week's *Railway Age*, page 1479. The attendance, by the final day, rose to above 400.

The officers elected for the ensuing year were C. A. Christofferson (N. P.), chairman; B. T. Anderson (D. L. & W.), first vice-chairman; W. M. Vandersluis, engineering secretary, Illinois Central electrification committee, second vice-chairman. The secretary is H. S. Balliet, Grand Central Terminal, New York. Those elected to serve on the Committee of Direction for the three year term were A. H. Rudd (Pennsylvania), C. F. Stolz (C. C. C. & St. L.), C. H. Tillett (Grand Trunk), and F. B. Wiegand (N. Y. C.). T. S. Stevens (A. T. & S. F.), was elected to serve for two years. Those elected to the Committee on Nominations for next year were W. J. Eck (Southern), A. H. McKeen (U. P.), F. H. Buchanan (Pennsylvania), F. P. Patenall (B. & O.), and F. C. Stuart (E. J. & E.).

Economics of Railway Signaling

A special committee on this subject, B. T. Anderson, chairman, made a progress report on its assigned subject, the determination of the relative economic value of block signaling as a means of protecting and directing the movement of trains and for reducing the cost of train operation. The report gave an outline of the plan which the committee proposes to follow, which outline follows:

The purpose in making these studies is mainly to determine to what extent train operation can be improved by installing up-to-date systems of automatic block signals and interlocking on roads that are not now equipped with a block system and also on roads equipped with manual block.

The method to be followed in making a study is to prepare a statement comparing the results of train operation under the method in use with the results to be attained under the improved method.

Data sheets with explanatory notes for use in making this comparison accompany this report.

The following illustrates a typical case:

The road to be studied is assumed to be a single track division, 100 miles between terminals, operated under the manual block system; switches at passing sidings all hand operated. The block sections vary greatly in length as the block stations are located so that station agents also act as block signalmen. This arrangement of the block sections which is more or less typical of the manual block system is one of the causes of delay. Another cause of delay is the stops that trains must make entering and leaving passing sidings, over hand-operated switches.

The first step in the study is to tabulate one year's results under this method of operation. The figures to be entered on data sheet under present method. The next step is to prepare a plan for equipping this piece of road with an up-to-date system of

automatic block signals and interlocking. Block section lengths to be laid out for maximum operation, the important passing sidings to be equipped with interlocking with low voltage switch machines for the outlying switches. Where necessary, the passing sidings are to be re-arranged and re-located so as to avoid the delays due to badly arranged siding or sidings located without regard to the required time interval between them.

The test of the efficiency of the proposed plan will be the extent to which the plan will eliminate avoidable delays, and thereby increase the average speed of trains without increasing their maximum speed.

As the increase in average speed is the key to the situation, the improved facilities must be so planned that the avoidable delays of the present method of operation will be eliminated. When the average speed of freight trains under the proposed plan has been determined, it will then be possible to arrive at the figures for the proposed plan. If the average speed of freight trains under the proposed plan shows a marked increase over the present plan of operation, the improvement in train operation will, it is believed, be large enough to fully justify the cost of the improved facilities.

Care of Oil Lamps

Committee V—Maintenance Rules and Instructions, submitted a report covering rules for signal maintenance; examination papers on signal maintenance and rules for the care of switch and signal oil lamps. These were accepted for submission to letter ballot for inclusion in the Manual. The rules for the care of oil lamps follow:

- 1601. Cleanliness is of the most importance in the care of lamps.
- 1602. Lamp bodies must be kept clean and in repair; soot or dirt must be removed and all vents must be kept open so that draught will not be impaired.
- 1603. Lamp founts must be drained at least once a month to remove sediment or water.
- 1604. Oil drained from founts must be retained and may be used for cleaning purposes or for thinning black oil.
- 1605. Filler caps must be kept in place to prevent dirt from getting in the oil.
- 1606. Burners must be scraped, wiped clean and vents opened each time the lamps are filled. When fouled with oil, soot or incrustations, they may be dipped or boiled in a solution of lye, rinsed in clean water and thoroughly dried.
- 1607. Chimneys of long life burner lamps should be cleaned with dry waste or paper only. They should never be washed. Broken chimneys should be replaced promptly.
- 1608. Long time burners should be renewed every sixty days, as they accumulate dirt and gum oil which prevents the oil from flowing freely through them. Wicks must be of such length that at least 1 in. rests on bottom of fount.
- 1609. Lenses must be kept clean and bright, and if any are found cracked or broken they must be replaced promptly.
- 1610. Illuminating oils specified by the Company must be used. No attempt must be made to improve the quality by adding other oils. If unsatisfactory, make prompt report to.....
- 1611. Under no circumstances shall any other than illuminating oil be placed in receptacles provided for that purpose. Receptacles must be kept clean, closed against the entrance of dirt and moisture, and, unless designed for outside use, kept under cover.
- 1612. A space of $\frac{1}{8}$ in. must be left unfilled in founts for expansion and ventilation.
- 1613. When filling lamps in rainy weather, care must be taken to keep water out of the oil and from the wicks.
- 1614. Lamps equipped with long time burners must be inspected semi-weekly, or as instructed by..... crust removed from wicks and flame properly adjusted.
- 1615. Lamps equipped with one day burners must be cleaned, filled and flame adjusted daily.
- 1616. When lamps are lighted, the flame should be turned up to about one-half the height required to give full light and be allowed to burn until all parts become thoroughly warm, after which the flame may be adjusted to the proper height.
- 1617. Lamps must be placed and brackets so adjusted as to insure proper alignment with respect to spectacle and track.
- 1618. Lamps should be replaced on the same brackets to assure that proper alignment is maintained.

Joint Occupancy of Buildings

Committee III—Power Interlocking, presented a report on the joint occupancy of buildings for telegraph, telephone and signal apparatus. A survey has disclosed that in many cases where telegraph or telephone and signal apparatus is to be housed in the same tower or building, adequate provision has not been made for equally efficient installation, layout and location of the different classes of apparatus. The committee recommended that before plans are made for any new structure or alteration to an existing structure, due notice be given to the respective officers having charge of the installation, operation and maintenance of the different classes of apparatus, they to furnish full information as to the requirements.

The completed plans showing the location of telegraph, telephone and signal apparatus, pipes, ducts, outlets, en-

trances, doors, windows, etc., shall be submitted to the respective officers having charge of the installation, operation and maintenance of telegraph, telephone and signal apparatus for their approval. The provisions of this paragraph shall also apply where standard plans are used. Where plans submitted are not satisfactory the proper officers should confer and reach an agreement, if practicable.

This report elicited considerable discussion and finally was referred back to the committee. This committee also presented a specification for electric wiring for interlocking plants and one for the construction of underground conduit systems.

Reports of Other Committees

Committee XII—Contracts, submitted as its report a table of interlocking units and values which was accepted for submission to letter ballot.

Committee XI—Valuation, submitted forms for reporting material used and labor performed in construction, for submission to letter ballot and inclusion in the Manual. These forms have been prepared to meet the requirements of Valuation Order No. 3 of the Interstate Commerce Commission and also to provide for the allocation of costs for statistical purposes. These were ordered to letter ballot. The committee also submitted a table of average service life in years of the important units of the different types of signal installations and a construction program for signaling.

Committee VI—Standard Designs, submitted drawings for one-inch signal pipe and coupling; grooved trunking; built-up trunking; switch point drilling; switch adjustment-insulated; and highway crossing gate lamp. This committee also made a report regarding the best types of electric lamp for signal work.

Committee XVIII—D.C. Track Circuits, submitted methods of making d.c. track circuit tests for rail and ballast resistance with a form for a record and a report on the minimum limiting resistance allowable in series with track batteries which were accepted for submission to letter ballot.

Committee X—Signaling Practice, reported recent improvements in light signals, particularly the change in form of those on the Pennsylvania from four lights in a row to three. The Hall color light signal was described.

Committee IV—D.C. Automatic Block Signaling, submitted a report on requisites for circuits which after considerable discussion and some alteration was ordered submitted to letter ballot for inclusion in the Manual.

Committee II—Mechanical Interlocking, presented a long report made up of a number of specifications and drawings. The report contained the following specifications: concrete trunking; capping and support; compensation of pipe line; mechanical interlocking and paint and painting. An index for mechanical interlocking specifications was also presented as were three drawings, pertaining to instructions for applying compensation; a compensation chart and a crank chart, respectively. After brief discussion this report was accepted to be sent to letter ballot.

Committee VIII—A.C. Automatic Block Signaling, presented lists of requisites for the impregnation of coils applicable for coils for a.c. and d.c. signal systems; impregnating compound treatment for non-oil-proof electrical windings; impregnating compound treatment for partially oil-proof electrical windings; impregnating compound treatment of oil-proof electrical windings; and varnish treatment of electrical windings. All were accepted to be sent to letter ballot.

Curtailement of Activities

It was announced at the close of the meeting that by order of the board of directors the practice of holding sectional (district) meetings of the Section would be at once discontinued.

Chesapeake & Ohio Not Hurt by Coal Strike

Coal in 1921 75 Per Cent of Total Tonnage. Year's Result is 6.68 Per Cent on Stock

NORMALLY about 70 per cent of the tonnage of the Chesapeake & Ohio is bituminous coal. In 1921, because the decline in coal traffic was not as great proportionately as the decline in traffic generally, the percentage of bituminous coal to the total tonnage was 75 per cent. It would appear, therefore, that one of the most interesting factors in connection with the Chesapeake & Ohio at the present time is the effect that the coal strike may be having upon the road's welfare. The Chesapeake & Ohio serves both union and non-union fields. The total result, therefore, has been that the decline in traffic from the cessation of mining in the union mines has been balanced by an increase in the production of the non-union mines. The road, therefore, has not been hurt particularly by the coal strike but it has not had the expansion in coal traffic such as its neighbor carrier, the Norfolk & Western, has had the good fortune to experience. Putting this in the form of figures we find that the road's traffic in recent months has been running considerably ahead of its traffic in the corresponding months of 1921. Of course, it must be borne in mind that the early part of last year was a rather barren period for the Chesapeake & Ohio. Its coal loadings in March, 1921, averaged only about 6,000 weekly. In April they had improved so that they averaged slightly over 8,000, and in May, slightly over 10,000. The effect of the coal strike was first shown this year by the increased loadings in March, when the mines were rushing production in anticipation of the strike; in March the coal loadings averaged about 11,000 weekly. After the beginning of the strike there was a decline in traffic so that the loadings averaged only about 8,000 to 9,000 weekly. Since that time, however, they have gradually begun to increase to the extent that during the week ending May 27, the figure was 12,271. This shows what has been noted above that the coal strike has not severely hurt the C. & O., and it is apparent from the figures given that it is gradually bettering its position as the strike proceeds.

Great Improvement Over Last Year

The condition of the Chesapeake & Ohio today is very much different from what it was a year ago. In May last year the directors felt that conditions were so poor and the outlook so uncertain that it was best to defer action on the two per cent semi-annual dividend payable in June. There has been much comment about this action. The fact was, nevertheless, that the road at the time was producing some very poor earning statements. In the first four months of 1921 it had a net after rentals of only \$1,509,402. It improved its position materially in the later months of 1921 with the final result that for the year it earned a net on its stock of 6.68 per cent, but that this would be the case was not in evidence in May. To bring the thing up to date it should be noted that in the first four months of 1922 the road had a net after rentals of \$5,618,682, or that its poorest month this year, namely January, was considerably better than its best month in the first third of 1921. In fact, in February, 1921, the road reported a deficit.

The Chesapeake & Ohio's corporate net income for 1921 totaled \$4,192,601, or, as above noted, 6.68 per cent on its capital stock. This fact combined with what has been said about the 1922 earnings to date, would seem to indicate that the road has succeeded in overcoming the situation which confronted it in the early part of 1921, and this fact one would suggest to be the outstanding characteristic of the road's position at the present time. This, nevertheless, does

not change the fact that conditions in the early part of 1921 were bad. The annual report gives considerable attention to this and to the reasons why the dividend was deferred in May. It gives the additional fact that during May, 1921, the company had on hand over \$7,000,000 in unpaid vouchers past due for 60 days or more. The report says that under the circumstances the directors deemed it advisable to conserve the cash resources. Following a statement concerning the manner in which business picked up during the latter part of the year and concerning also the savings in operating expenses due to economies of one kind or another, it continues: "The directors of your company are keenly alive to the hardship to many of its stockholders resulting from any interruption in the regular payment of dividends, and the deferring of the dividend which would ordinarily have been paid in June was due only to their conviction that its payment at that time would have interfered with the ability of your company to meet promptly and adequately its obligations to its creditors and to the public. The period of deflation through which your company, in common with the industries of the country generally has been passing, has involved the necessity of substantial sacrifice by many, including the employees and the officers as well as the stockholders of your company."

The 1921 Results

The transportation operations of the Chesapeake & Ohio gave it in 1921 a net railway operating income, or net after rentals, of \$13,660,926 as compared with \$11,158,326 in 1920. In 1921 it had a decrease of freight revenues of 7 per cent, a decrease in total operating revenues of 7.2 per cent, and the expenses were decreased 14.3 per cent. The road operated at a ratio of 79.6 in 1921 as against 86.2 in 1920. The increase in net operating revenue (operating revenues less expenses) was 37.3 per cent.

The actual revenue tonnage carried in 1921 was 31,493,087 as compared with 40,838,116 in 1920, a decrease of 9,345,029 or 22.9 per cent. The bituminous coal tonnage in 1921 was 23,724,147 as compared with 28,625,615 tons in 1920; a decrease of 4,901,468, which, it will be noticed, was proportionately a much smaller decrease than was the case of the tonnage as a whole. The result was that bituminous coal tonnage which in 1920 made up 70.1 per cent of the total, in 1921 made up 75.33 per cent.

The operating revenues totaled in 1921 \$83,687,958 as compared with \$90,190,745 in 1920, a decrease of \$6,502,787. It is interesting in this connection to note that the ton-mile revenue in 1921 was 0.737 cents, an increase of 19.3 per cent over 1920. This explains the proportionately smaller decrease in revenues than in tonnage. The operating expenses for the year totaled \$66,603,077. This compared with \$77,744,521 in 1920, the reduction being \$11,141,444, or, as above noted, 14.3 per cent. The reduction in operating expenses included reductions of 5.3 per cent in maintenance of way, 18.5 per cent in maintenance of equipment, and 15.9 per cent in transportation.

Maintenance

Insofar as concerns the reduction in maintenance of way, it should be brought out that there were increases in the total charged to the primary accounts of ties, rails and other track material which partly compensated for the decreases in the other accounts. The Chesapeake & Ohio gives detailed information concerning the amount of material used in main-

tenance. It showed that in 1921 there were put in track for maintenance 1,085,047 ties as compared with 1,052,369 in 1920, an increase of 32,678. Not quite one-half of the new ties put in track were of white oak untreated, and most of the remainder were of mixed oak, crossotated. The rail used in renewals in 1921 totaled 33,725 tons as compared with 12,814 tons in 1920, an increase of 20,911 tons. The larger part of the rail laid in 1921 was of 100-lb. section, the total being 21,197 tons. There were, however, also 8,050 tons of 130-lb. rail. At the end of the year, of the road's total main track mileage of 2,774, 1,325 was laid with 100-lb. rail and 58 miles with 130-lb. rail. These details concerning ties and rail will help give some idea of the Chesapeake & Ohio maintenance standards. With reference to ballast, the fact is brought out that the ballast used in existing tracks in 1921 totaled 626,034 yds. as compared with 891,058 yds. in 1920, a decrease of 265,024 yds. Considerably over half the ballast used in 1921 was of broken stone. With reference to the decrease in the amount of ballast used, the annual report points out that "Beginning 1921 careful survey was made of the ballast needed on the entire line, and while there was a decrease in the number of yards of ballast applied as compared with the previous year, our track has been fully maintained in equally as good condition as last year insofar as ballast is concerned." The general opinion would be that the reduction in expenses in 1921 was not due to any deviation from the maintenance standards of the road. One cannot, however, be so optimistic concerning the equipment maintenance. The total reduction in maintenance of equipment in 1921 as against 1920 was \$4,556,439, or 18.5 per cent. The larger part of this decrease was in freight car repairs, the actual reduction in that account being \$3,638,367. The result is shown in a percentage of bad-order cars as of May 15 of 16.3 per cent, which seems very much too high to be entirely satisfactory.

With reference to transportation, the interesting fact is brought out that in spite of the falling off in traffic which was experienced during the year, the average train load was decreased only from 1,131 tons to 1,090 and the revenue car load showed an actual increase from 39.1 to 39.3. This, of course, was partly due to the larger proportion of coal, but the final result was that the road did not suffer as sharp a decline in its train load as most other roads. The transportation ratio in 1921 was only 37.6, which seems unusually favorable for the conditions which were met in that year.

Big Improvement Program

It has been noted in these pages in previous reviews of this kind that one of the Chesapeake & Ohio's principal difficulties is the fact that it has expanded its feeders into the coal fields, somewhat faster, if anything, than its operating conditions could take care of to best advantage. This expansion was continued in 1921 and the mileage shows a slight increase over 1920. However, the road has been taking important measures to remedy the situation with which its expansion in recent years has caused it to be confronted. The list as given in the report concerning the improvements to terminals, etc., is an imposing one. With reference to this matter the report says, "The officers of your company have also prepared a comprehensive budget of additions, betterments and improvements which should be made during the next four years in order to adequately and economically accommodate the present day maximum volume of traffic, provide for anticipated growth and render its facilities more nearly equal to those of your principal competitors. The estimated capital charge for the work contemplated by this budget is about \$17,000,000, the expenditure of which will be spread over the next four years. Conditions at the present time are reasonably favorable for railroad financing and plans are now under consideration for providing at least a part of the total capital expenditure involved, announcement respecting

which will be made in due course." During 1921 the road carried out the following work: Line and grade revision on the Coal River district between St. Albans, W. Va., and Ferrell, 4.2 miles, including the elimination of a tunnel which work will permit the use of the road's heaviest equipment on this district; 9½ miles of second track on the Logan division; yard extensions at Gladstone, Va., Hinton, W. Va., St. Albans, W. Va., Ashland, Ky., etc.; new shop buildings, roundhouse and other terminal facilities at Clifton Forge, Va.; several 100-ft. turntables at various points. The report also says that work is now under construction and should be completed in 1922 of new yard tracks at Peach Creek, W. Va., and of the addition of seven 100-car tracks at Gladstone, Va. It also says that automatic train control is being installed between Charlottesville, Va., and Staunton, 40 miles, which work should be completed this year, and when completed, will give a continual section from Gordonsville, Va., to Staunton, about 61 miles. The Chesapeake & Ohio has also recently placed orders for a large number of freight and passenger cars.

The Hocking Valley's Place in the C. & O. System

THE HOCKING VALLEY, which the Chesapeake & Ohio controls through majority stock ownership, is in large measure a main line division of the parent company and as such it constitutes its western outlet to the lakes at Toledo. The importance of its position can be indicated in no better way than by pointing out that in 1921 the Hocking Valley dumped into vessels at Toledo 4,540,000 tons of coal, which total was considerably more than that dumped at any other railroad pier on Lake Erie; in fact, there was no other pier that dumped over 3,000,000 tons. By way of comparison it might be further noted that the Chesapeake & Ohio in 1921 dumped at Newport News 4,312,619 tons of coal.

The Hocking Valley's main line extends from Valley Crossing, just south of Columbus, to Toledo. The road has a number of branches serving mines in southern Ohio, but the larger part of this tonnage is received from connections, notably, from the parent company. Connection with the latter is made by means of the Chesapeake & Ohio Northern to Waverly, from which trackage rights are used over the Norfolk & Western to Valley Crossing. The Hocking Valley is a modern railroad equipped with facilities of a somewhat unusual sort. Its main line is laid with 100-lb. rail and plans are under way for the use of some rail of 130-lb. section. The line is entirely rock ballasted and tie plates are used on all soft wood ties. The road has large yards at each end of its main line and at Toledo it has two car dumping machines of a modern type. The road's traffic is primarily coal, in 1920 the percentage of coal to the total tonnage being 76 per cent and in 1921, 84 per cent. Taking advantage of these conditions, it uses heavy engines and its average train load which in 1921 was 1,471 revenue tons, is one of the highest in the country.

Manner of Operation

Coal from the Chesapeake & Ohio reaches the Hocking Valley rails at Columbus, or, to be more exact, at Parsons yard just south of Columbus. This yard is a joint yard with the Chesapeake & Ohio and the trains of that road run through from Huntington, W. Va. The yard at Parsons has a capacity of about 5,000 cars. From Parsons to Toledo is 128 miles and is operated as one engine district. Mallet and Santa Fe type locomotives are used, both types being given a summer rating of 5,500 tons. The grade northbound or against traffic is 0.3 per cent except for the helper grade from Ackerman to Powell, 7 miles, of 0.5 per cent, which

grade is operated by the use of helpers from Parsons yard for a total of 20 miles. The main yard at Toledo is Walbridge yard having a capacity of 5,000 cars in addition to which there is a dock yard of 2,000 cars. The piers have two dumping machines capable of handling the 70-ton and 100-ton cars which the Chesapeake & Ohio is at present using to considerable extent in its coal traffic. These piers compare very favorably with the facilities at Newport News and in fact they can be operated at higher speed because they work with the lake ore boats with wide hatches, which boats can be loaded with much greater ease than the ocean going vessels which are loaded at Hampton Roads. On this line there is some double track, the mileage of which is gradually being extended. Further, there are a number of sidings of 80 cars which have not yet been extended to hold 100 car trains.

The road is also confronted with the necessity of increasing its yard capacity at Toledo. During the war, or when the method of pooling coal was followed, there were 19 classifications. Now that the pooling has been abandoned the number of classifications has been increased to 81 with the result that the road has had to put in new tracks at both Walbridge and Toledo itself to take care of the additional work required.

Larger Part of Traffic Received from Connections

It was noted above that the Hocking Valley dumped at Toledo in 1921, 4,340,000 tons of coal. By way of showing the percentage of this tonnage which is received from connections it may be pointed out that of the total, 2,975,000 tons were received from the Chesapeake & Ohio, 800,000 tons from the Norfolk & Western and a sizable quantity from the Kanawha & Michigan. During 1921 the mines on the Hocking Valley did not play a heavy part in the lake traffic. All of these facts are of present interest because the Hocking Valley mines have been hit very severely by the coal strike. The loadings in April and May have been at a minimum whereas in the corresponding weeks of last year they averaged about 800 cars weekly. This, however, should not hurt the Hocking Valley as much as might otherwise be the case because of the fact that it is presumably receiving a heavy tonnage of coal from the Chesapeake & Ohio and Norfolk & Western.

The 1921 Results

The results of the Hocking Valley's operations in 1921 were very similar to those of its parent company. It also had a severe falling off in traffic in the first few months of 1921 and in May the directors of the company deferred the semi-annual dividend of two per cent just as it was deferred in the case of the parent company, the result, of course, being reflected in the corporate income account of the Chesapeake & Ohio because the larger share of the dividends would accrue to the parent company. The Hocking Valley's net railway operating income in 1921 was \$1,560,741 as compared with \$1,577,963 in 1920. Its corporate income was only \$14,306 as compared with \$345,796 in 1920; in other words, the dividend of two per cent which was paid towards the end of the year and which amounted to \$219,990 was paid from surplus and not from the year's results. By way of bringing the facts up to date it should be pointed out that the Hocking Valley at present is, like the parent company, in a very much better position than it was this time last year. For the first four months of 1922 it had a net after rentals of \$967,674 as compared with a deficit in the first four months of last year of \$635,225. For the first four months of this year it operated at a ratio of 68.5. The improvement this year over last year is further shown by the fact that the net ton-miles of freight (revenue and non-revenue) in the first three months of 1922 totaled 357,189,000 as compared with 223,249,000 in the first three months of 1921.

In 1921 as compared with 1920 the Hocking Valley had a decrease of 18.4 per cent in its freight revenues, a decrease of 17.6 in its total revenues, and it cut its operating expenses 27.4 per cent. For the year it operated at a ratio of 82.1 per cent, thereby reflecting the poor results of the first few months of the year. However, even this figure was an improvement over 1920 because in that year the operating ratio was 93.2. The improvement which the Hocking Valley carried out in 1921 was almost entirely due to its bituminous coal traffic. In 1920 it carried 11,567,594 tons of coal, which constituted 75.67 per cent of its total tonnage. The coal tonnage carried in 1921 was 10,781,334, a decrease of 786,260 tons from 1920. Because of the fact that the reduction in the tonnage of coal and coke was only 7.6 per cent whereas the reduction of other freight tonnage was 44.5 per cent, the percentage of coal tonnage in 1921 was 84.28 per cent. It is interesting in connection with what has been said above, that of the total coal tonnage carried in 1921—namely 10,781,334—8,209,614 was received from connections and only 2,571,720 originated on the Hocking Valley. The total tonnage of all commodities carried in 1921 was 12,793,175, of which 73.17 per cent was received from connections. The reduction from 1920 was 2,492,687, which figures out to 16.3 per cent. The freight revenues in 1921 were \$11,924,979 as compared with \$14,616,677 in 1920, a decrease of \$2,691,698. The total operating revenues were \$14,093,001 as compared with \$17,101,493 in 1920, a decrease of \$3,008,492. The total operating expenses in 1921 were \$11,572,394 as compared with \$15,941,435 in 1920, a reduction of \$4,369,040, or as above noted, 27.4 per cent. The reduction in maintenance of way expenses was 16.8 per cent; in maintenance of equipment, 24 per cent, and in transportation, 25.7. The road put in track approximately the same number of ties in 1921 as in 1920, the 1921 figure being 277,868. The new rail laid in 1921 totaled 7,024 tons (nearly all of 100-lb. weight), as compared with 3,596 tons in 1920. The ballast used, 14,179 yards, approximately all stone, compared with 23,777 yards in 1920. The reduction of 34.1 per cent in maintenance of equipment produced a similar result as that which was produced in the case of the parent company. The Hocking Valley had a bad-order car percentage on May 15 of 24 per cent, which is several times normal and which indicates that Hocking Valley operating expenses will have to include a considerable sum for car repairs.

At the end of 1921 the Hocking Valley reported 8.8 additional miles of second track, the additions this year being between Marion and Morral. There were also additional yard tracks at Toledo dock, Walbridge and Parsons, the mileage of trackage at Walbridge being increased 3.02. The road reported that its revenue train load in 1921 was 1,471 tons, a decrease of three per cent from 1920. The revenue tons per loaded car were reported at 45.5 tons which, like the average train load, is unusually high. The figure, however, was a decrease of 1.9 per cent from 1920. Some idea of the Hocking Valley operations will further be gained by the statement that its revenue tons one mile per mile of road, or traffic density, was in 1921, 4,485,562 and that even this high figure was a decrease of 20.4 per cent from 1920.

J. E. FAIRBANKS, general secretary of the American Railway Association, announces that, by a vote of the members of the association, the proposition, recently promulgated, to cancel car service rule 17 has been approved, to take effect July 1, 1922; also that the rule adopted May 17, 1911, relative to penalty payments for delay or diversion to private car lines, has been cancelled, effective July 1; also that changes in per diem rule 6, recommended in circular 2260, May 25, are approved, the amended rule to become effective on July 1. A change in per diem rule 15, paragraph c, also promulgated on May 25, has likewise been approved, to become effective on July 1.

Rail and Water Transportation Provisions in Ship Subsidy Bill

THE REVISED SHIP subsidy bill, as reported to the House on June 16, contains the following provisions relating to rail and water transportation:

SEC. 602. (a) It is hereby declared to be the policy of Congress to promote, encourage, and develop water transportation, service, and facilities in connection with the commerce of the United States, and to foster and preserve in full vigor both rail and water transportation, and the board and the commission are hereby severally authorized, empowered, and directed to co-operate to that end.

(b) The (Shipping) board and the (Interstate Commerce) commission are authorized and directed to create a joint board, selected from among their members, officers, and employees, to study the conditions and interrelations of rail and water traffic, and the principles and methods essential to accomplishing the policy declared in subdivision (a).

(c) The joint board shall appoint a secretary who shall keep minutes of its meetings, which minutes shall be furnished to the members of the board and of the commission. The joint board shall hold regular semimonthly and such additional meetings as may be necessary to transact properly its business.

(d) The joint board shall formulate and make such recommendations to the board and the commission, not inconsistent with law, pertaining to the interrelations of rail and water traffic, as it deems necessary to accomplish the policy declared in subdivision (a). The board shall make effective, by such means as are granted it by law, any such recommendation upon any matter within its jurisdiction, if such recommendation is approved by the board. The commission shall have a like duty as to any such recommendation upon any matter within its jurisdiction.

(e) None of the provisions of this section shall be construed to affect the power or jurisdiction of the commission, or to confer upon the board concurrent power or jurisdiction over any matter within the power or jurisdiction of the commission.

SEC. 603. Paragraph (4) of section 25 of the Interstate Commerce Act, as amended, is amended by adding at the end thereof a new sentence to read as follows: "In making rules and regulations prescribing the form of such through bills of lading, the commission shall adopt as the portion thereof governing the carriage of goods by water in foreign commerce such form as may be certified to the commission by the United States Shipping Board for such purpose."

SEC. 604. Paragraph (9) of section 5 of the Interstate Commerce Act, as amended, is amended by striking out the period at the end thereof and inserting in lieu thereof a colon and the following: "Provided, That the foregoing provisions of this paragraph shall not apply in any case where such common carrier by water or such vessel is engaged exclusively (a) in trade (other than with foreign contiguous territory) not included in the coastwise trade, or (b) in trade between ports in the United States and ports in the Philippine Islands."

SEC. 605. Section 15 of the Shipping Act, 1916, is amended to read as follows:

"Sec. 15. (a) That every common carrier by water, or other person subject to this act, shall file immediately with the board a true copy, or, if oral, a true and complete memorandum, of every agreement with another such carrier or other person subject to this act, or modification or cancellation thereof, to which it may be a party or conform in whole or in part, fixing or regulating transportation rates or fares; giving or receiving special rates, accommodations, or other special privileges or advantages; controlling, regulating, preventing, or destroying competition; pooling or apportioning earnings, losses, or traffic; allotting ports or restricting or otherwise regulating the number and character of sailings between ports; limiting or regulating in any way the volume or character of freight or passenger traffic to be carried; providing warehousing, docking, or other terminal facilities; providing that the one carrier shall act in any manner as agent or representative of the other carrier; or in any manner providing for an exclusive, preferential, or co-operative working arrangement.

"(b) Every common carrier by water shall file immediately with the board a true copy, or, if oral, a true and complete memorandum, of every agreement with a common carrier by railroad subject to the provisions of the Interstate Commerce Act, as amended, or modification or cancellation thereof, to which it may be a party or conform in whole or in part, relating to the interchange of freight or passengers, or the making of joint or through rates, or providing warehousing, docking, or other terminal facilities, or providing that the one carrier shall act in any manner as agent or representative of the other carrier, or in any manner providing for a preferential or working arrangement between the two carriers. In

all such cases the common carrier by railroad shall also have a like duty. The provisions of this subdivision shall apply only to agreements relating to passengers or property transported or to be transported to or from a foreign country or the Philippine Islands from or to a port or other place in the United States.

"(c) The term 'agreement' as used in this section includes understandings, conferences, and other arrangements.

"(d) The board may by order disapprove, cancel, or modify any agreement, or any modification or cancellation thereof, whether or not previously approved by it, that it finds to be unjustly discriminatory or unfair as between carriers, shippers, exporters, importers, or ports, or between exporters from the United States and their foreign competitors, or to operate to the detriment of the commerce of the United States, or to be in violation of law, or to be otherwise detrimental to the interest and welfare of the United States, and shall approve all other agreements, modifications, or cancellations.

"(e) Agreements existing at the time of the enactment of the Merchant Marine Act, 1922, shall be lawful until disapproved by the board. ***

"(f) All agreements, modifications, or cancellations, made after the enactment of the Merchant Marine Act, 1922, shall be lawful only when and as long as approved by the board, and before approval or after disapproval it shall be unlawful to carry out in whole or in part, directly or indirectly, any such agreement. ***

"(h) Whoever violates any provision of this section shall be liable to a penalty of \$1,000 for each day such violation continues, to be recovered by the United States in a civil action."

SEC. 606. Paragraph (d) of paragraph (13) of section 6 of the Interstate Commerce Act, as amended, is amended to read as follows:

"(d) If any carrier by railroad subject to this act enters into arrangements lawful under section 15 of the Shipping Act, 1916, as amended, with any carrier by water operating from a port in the United States to a foreign country, for the handling of through business between interior points of the United States and such foreign country, the commission may require such carrier by railroad to enter into similar arrangements with any or all other carriers by water operating from such port to the same foreign country, but such arrangements shall be subject to the provisions of section 15 of the Shipping Act, 1916, as amended."

SEC. 607. Section 28 of the Merchant Marine Act, 1920, is amended to read as follows:

"Sec. 28. (a) That no common carrier shall charge, collect, or receive, for transportation subject to the Interstate Commerce Act, as amended, of passengers or property, under any joint rate, fare, or charge, or under any export, import, or other proportional rate, fare, or charge, which is based in whole or in part on the fact that the passengers or property affected thereby are to be transported to, or have been transported from, any port in a possession or dependency of the United States, or in a foreign country, by a carrier by water in foreign commerce, any lower rate, fare, or charge than charged, collected, or received by it for the transportation of passengers, or of a like kind of property, for the same distance, in the same direction, and over the same route, in connection with commerce wholly within the United States, unless the vessel so transporting such passengers or property is, or unless it was at the time of such transportation by water, documented under the laws of the United States.

"(b) Whenever the board is of the opinion, however, that adequate shipping facilities to or from any port in a possession or dependency of the United States or a foreign country are not afforded by vessels so documented, it shall certify this fact to the Interstate Commerce Commission, and the commission shall, by order, suspend temporarily the operation of the provisions of this section with respect to the rates, fares, and charges for the transportation by rail of passengers and property transported from, or to be transported to, such ports.

"(c) Such suspension of operation of the provisions of this section shall be terminated upon 30 days' notice, given in accordance with the requirements of section 6 of the Interstate Commerce Act, as amended, by order of the commission whenever the board is of the opinion that adequate shipping facilities by such vessels to or from such ports are afforded and so certifies to the commission.

"(d) Whenever the board and the commission are both of opinion, and certify, that putting into effect or keeping in effect the provisions of this section will result in unjust discrimination between ports of the United States on commerce accustomed to move through such ports, or in materially changing the channels of transportation within the United States, or in unduly congesting one or more of the ports of the United States, the commission shall, by order, suspend the operation of said provisions until such time as it and the board reach a contrary conclusion in the premises, whereupon such suspension shall, by order, be terminated by the commission upon 30 days' notice as hereinbefore provided for the termination of other suspensions."

Train Control Ordered on Forty-Nine Roads

Tentative Order of January 10, to Which Roads Objected,
Made Permanent Without Important Change

WASHINGTON, D. C.

THE INTERSTATE COMMERCE COMMISSION on June 15 made public an order, dated June 13, that the tentative order of January 10 directing the 49 railroads named therein to install automatic train stop or train control devices upon designated portions of their roads, should be entered, and that the installations prescribed should be completed by January 1, 1925. The list of railroads and, with two exceptions, the portions of road designated are the same as published in connection with the tentative order in the *Railway Age* of January 14, 1922, page 189. The points between which the Cincinnati, New Orleans & Texas Pacific is required to make the installation have been changed to Cincinnati and Chattanooga instead of Cincinnati and Knoxville; and in the case of the St. Louis-San Francisco Springfield, Mo., and Tulsa, Okla., are substituted for St. Louis and Springfield. The railroads are those having annual gross revenues of \$25,000,000 or over. It is required that the train control device be operated in connection with all road engines running on or over at least one full passenger locomotive division between the points designated.

The roads are required to submit to the commission complete and detailed plans and specifications for the installation of the devices prior to the installation, and each installation when completed will be subject to inspection by and the approval of the commission or any division thereof to which the matter may be referred.

The date for the completion of the installation is set six months beyond that named in the tentative order; and the time within which the roads are required to furnish plans of their block signal systems and lists showing the number and types of their locomotives is extended six months, or until January 1, 1923. The roads are directed to proceed without unnecessary delay to select and install the devices, and to file with the commission, on or before January 1, 1923, and on the first day of each month thereafter, full and complete reports of progress. However, the Pennsylvania and its controlled lines, and the Norfolk & Western, for good cause shown, are allowed until July 1, 1923. The Pennsylvania, however, will be required to file plans and reports beginning July 1, 1922, for the installation (now being made) upon its Lewistown division between Lewistown and Sunbury, Pa.

The specifications and requirements for the installation of automatic train stop or train control devices adopted by the commission and prescribed in its order are the same as those in the tentative order, omitting the permissive feature which was in the specifications of the A. R. A. committee. The order itself is substantially in the form of the tentative order, as to which the roads were given an opportunity to show cause at the hearings (in March) why it should not be put into effect.

For the benefit of systems including two or more of the roads specified the report says that those which may desire to adopt a device as standard on each of their roads may test the device on one road and during such test will not be expected to make the additional installations.

An abstract of the commission's report follows:

Report of the Commission

This is a proceeding under Section 26 of the interstate commerce act which authorizes us, after investigation, to prescribe the installation of automatic train-stop or train-control devices or other safety devices, upon the whole or any part of the railroad of any carrier by railroad subject to the act.

On January 10, 1922, we entered an order under which certain

specified carriers, were given an opportunity to show cause, if any, why an order should not be entered requiring the installation of automatic train-stop or train-control devices upon designated portions of their lines. Hearings have been had at which all the respondents, except nine, were represented by a general committee [C. E. Denney, chairman], and at which carriers individually presented data and arguments.

Respondents represented by the committee opposed generally the entry of an order at this time upon the grounds—*First*, that there has not been any automatic train-stop or train-control device developed to an extent which would justify the issuance of an order. *Second*, that the carriers have not had opportunity to make adequate service tests of devices which differ fundamentally in their principles of operation from those now installed and in operation under service conditions, which were referred to in our report. *Third*, that every reasonable effort is being made by the carriers to co-operate with the commission for the purpose of testing and developing devices which will best meet operating requirements. *Fourth*, that the order requires a much greater number of and more extensive installations than are warranted, in view of the present state of the art. *Fifth*, the costs of installation and maintenance of automatic train-stop or train-control devices are high and not within the present financial abilities of the roads. In connection with this objection it is contended that it should first be determined whether automatic train-stop or train-control devices will provide equal or greater additional safety for a specified expenditure than a like expenditure for automatic block signals, double track extensions, interlocking plants, additional steel equipment, under crossing and grade separation; most of which, it is urged, not only increase safety but increase the capacity of a railroad and produce economies in operation.

Supplementing the general objections special objections were raised by many carriers to the entry of an order requiring installations upon their respective lines. Proprietors and manufacturers of automatic train-control devices were also heard.

[Here follows a history of what the commission has done in this field since 1906, concluding with the opinions formed by the Block Signal and Train Control Board and the Bureau of Safety.] The conclusions reached as a result of the investigations conducted from 1906 to 1920 were that automatic control of trains is practicable; that the use of such devices is desirable as a means of increasing safety, and that the development of devices had reached a stage warranting the installation and use of such devices on a more extended scale. The results of these investigations, which had been reported by us year by year to the Congress, and the recognized need for some such device resulted in the inclusion in the transportation act, 1920, of a section which places upon us the duty, after investigation, of ordering the carriers or any of them to install upon the whole or any part of their lines automatic train-stop or train-control devices or other safety devices, which comply with specifications and requirements prescribed by us.

Following the enactment of that section we were urged to order the installation of various automatic train-control devices. * * * In order to carry out the provisions of Section 26 in the most effective and expeditious manner, we invited the co-operation of the American Railway Association. A joint committee on automatic train control consisting of representatives of the signal section and the operating, engineering and mechanical divisions of that association was appointed in November, 1920. * * *

The essential safety function of any automatic train-stop device is to stop a train where a dangerous condition exists ahead of the train, when the engineer for any cause fails to take proper action to stop. Several types of apparatus have been designed to do this. Additional features have been introduced so as to afford speed control, whereby a train may be brought down automatically to a predetermined safe speed at certain fixed locations which are established with relation to the fixed signals of a block system.

In the most recent development of automatic train-control devices, continuous control is obtained whereby the engineer is not dependent upon indications received at fixed locations, but is immediately made aware of a change in condition ahead of his train and may act promptly to govern his train accordingly. * * *

Various Types Available

To secure the latest data pertaining to actual operations a questionnaire was sent in December, 1920, to all carriers request-

ing detailed information; and replies were received from the following eleven carriers upon the lines of which such devices are installed: Chicago & Eastern Illinois; Chicago, Rock Island & Pacific; Chesapeake & Ohio; Pennsylvania; Hudson & Manhattan; San Francisco-Oakland Terminal; Washington Water Power Company; Brooklyn Rapid Transit Company; Philadelphia Rapid Transit Company; Boston Elevated Railway; and Northwestern Elevated Railroad.

Observations have been made by the joint (A. R. A.) committee, in connection with our Bureau of Safety, of the performances of devices of the ramp type upon portions of the Chicago & Eastern Illinois in May, June and July, 1921, and for the months of February and March, 1922; upon the Chesapeake & Ohio from August 16, 1921, to March 31, 1922, and upon the Chicago, Rock Island & Pacific from May, 1921, to March 1, 1922. The joint committee has co-operated with us in making the observations and has rendered valuable aid.

Each road stated, in response to the questionnaire, that the device adequately met the operating requirements in the location where installed. As it was desired, however, to obtain more complete data, inspectors of the Bureau of Safety and of the joint committee were detailed to observe and report upon the operation of the devices. Data have been gathered upon the effect of the devices upon railroad operating conditions, upon problems of installation and maintenance upon an extended scale, upon installation and maintenance costs, and upon the revisions made or required in the devices.

The installation upon the Chicago & Eastern Illinois is upon 105.4 miles of double track from Danville to Yard Center, Ill. There are 174 signals and 175 ramps; 85 engines equipped, 47 passenger and 38 freight. The device has been in continuous service since November 1, 1914.

The installation upon the Chesapeake & Ohio is upon 21 miles of single track from Gordonsville to Charlottesville, Va. There are 67 signals, and 67 ramps; 37 engines equipped. The device was placed in service upon 7 miles of road in March, 1917, and upon 14 additional miles in June, 1919. An extension of this installation 40 miles, to Staunton, Va., is under construction and will probably be completed by August, 1922.

The installation upon the Chicago, Rock Island & Pacific is upon 22.4 miles of double track from Blue Island to Joliet, Ill. There are 34 signals and 34 ramps; 20 engines equipped. The device has been in service since March, 1920. This installation will be extended to Rock Island, Ill., a distance of 142 miles.

Record of Three Installations

The following is a summary of the facts observed, tallied for the three installations observed (The Rock Island, the C. & E. I. and the C. & O.):

Miles of road equipped.....	148.8
Miles of track equipped.....	276.6
Total engines equipped.....	142
Total indication points.....	276
Total signals.....	275
Total mileage of engines in equipped zone.....	721,581
Total operations of train-control device (passage of equipped engine, with device in service, over an indication point counted as one operation).....	659,875
Proper operations—Clear.....	656,045
Caution.....	2,053
Stop.....	945
	659,043

Failures—	
False clear.....	15
Other causes resulting in stops to the number of.....	341
Undesirable stops.....	
Due to train-control device.....	73
Due to signal failure.....	418

An undesirable stop is one which occurs when there is no operating or traffic condition which requires the stop to be made. Where the train-control device causes a stop under such conditions the action is upon the side of safety. It is undesirable, however, from an operating point of view. A false clear failure on the other hand is one in which the train-control device indicates by its action or lack of action, that no danger exists, when as a matter of fact, the contrary is true. Failure in this case is a dangerous one.

These three installations which have been under close observation are of the ramp type and the record indicates that automatic train-control devices of this type are practicable under actual service conditions, that they properly perform the functions for which they are designed, and that when properly installed and maintained they unquestionably increase the safety of train operation. The record holds out expectation of satisfactory tests and operation of the other types of train-control devices.

Undesirable Features May Be Corrected

The respondents called attention to many features of construction and operation of ramp type devices which they classed as undesirable and which, they urge, should be eliminated before the devices may reasonably be said to operate to a degree of

efficiency warranting the issuance of an order requiring their installation as safety measures. From the close and detailed observations which have been made we are convinced that the features claimed to be undesirable are not such as cannot be corrected, as the systems are utilized extensively. In fact, some of them have already been corrected. The discovery and the elimination of undesirable features is a natural growth, inevitable in the development of the art, such has been the history of the development of the automatic block signals, of the air brake and of the automatic coupler.

Carriers who have stressed the difficulties of the ramp type urge that more time should be allowed in which to test induction devices. Two devices of the magnetic induction type are now installed for test purposes, one upon the Southern Pacific [the National] and the other upon the New York Central [the Sprague]. Arrangements have been completed for a test installation of another device of the induction type upon the Delaware, Lackawanna & Western [the Finnigan]. One device of the continuous control induction type is now being installed upon the Pennsylvania [the Union] upon 52 miles of track between Lewistown and Sunbury, Pa., and arrangements have been made by the Pere Marquette Railway for a test installation of another continuous control device of the induction type [Clark's].

Effect on Track Capacity

Respondents, through their committee, state that the installation of automatic train control devices upon lines handling heavy traffic will tend to slow up train movements, decrease track capacity, and, therefore, may require the addition of more running tracks to accommodate the same volume of traffic. * * * It is obvious that this difficulty arises only upon roads and portions of roads now operating to full capacity, or nearly so. The problem is one not generally confronting all the respondent carriers. * * * In some locations a simple automatic stop will be adequate, in others speed control may be necessary or desirable or automatic stops on part of the line and speed control on other parts where traffic is heavy may be needed. * * *

Cost of Installation

The cost per mile of road and per mile of track can not be stated generally. The cost for locomotive apparatus and for roadside or track apparatus will therefore be given together with the cost of the installations which have been under observation.

From the various figures submitted by respondents and by proprietors and manufacturers, it appears that the cost of locomotive apparatus for an intermittent control device of the ramp type ranges from \$400 to \$1,000; for an intermittent control device of the induction type, from \$375 to \$2,100, and for a continuous control device, induction type, from \$1,000 to \$3,000. Assuming one indication point per block the cost of track equipment of the ramp type is from \$200 to \$550 per block; of the induction type, intermittent control, from \$400 to \$2,000 per block, and of the induction type, continuous control, from \$300 to \$1,000 per block. These prices cover installation costs and are stated to be the maximum prices for each unit of the particular device. They may be reduced when the apparatus is manufactured and installed upon a large scale. * * *

Maintenance Costs

Maintenance costs have been ascertained in connection with the installations that have been under observation as follows:

On the Chicago & Eastern Illinois installation the average maintenance cost per locomotive, per month, over a three months' period was \$13.02; per ramp, per month, over same period, \$2.74; per mile of track, per month, \$2.27. On the Chesapeake & Ohio installation the average per locomotive per month over a six months' period was \$12.23; per ramp per month over same period, \$5.68; per mile of track per month, \$18.12. On the Rock Island installation average per locomotive per month over a nine months' period was \$10.33; per ramp per month, \$12.43; per mile of track per month, \$9.44.

The above figures were compiled from monthly statements furnished to the joint inspectors by the railroad companies and the train-control companies. The maintenance figures for the Rock Island installation represent much higher maintenance costs than would be required under normal operating conditions, because of the nature and extent of the tests conducted during the observation period. The proprietors of this device state that, based upon their experience, the average annual cost of maintenance per mile of track on a double track division, consisting of 165 miles of road with 120 equipped engines and 273 ramps, will be \$54.09, or a total cost per annum of \$18,047.88.

Many of the respondents have filed estimates of the cost of installation upon selected portions of their roads, comprising passenger locomotive divisions, which show a much higher cost than those indicated in the foregoing figures. The estimated figures show a wide variation both for engine equipment and roadway equipment. The differences are due in part to the type

of device selected and the measure of control to be secured and in part to the varying number of locomotives to be equipped and the number of indication points upon the road.

With these figures as bases, they urge that a greater degree of safety might be secured by spending the money to eliminate grade crossings, to extend their automatic block signal systems, and interlocking plants, and to construct additional tracks. All of these are unquestionably desirable. Automatic train control, however, will still be a necessary safety measure when all of these things shall have been completed. The compensation from a financial standpoint which will result from securing added safety should not be overlooked, however, when costs are being considered.

Cost of Collisions

The accident reports made by the railroads to us show that from January 1, 1936, to December 31, 1921, there were 26,297 lead-on and rear-end collisions. These resulted in death to 4,326 persons and injury to 60,682. The damage to railway property alone amounted to \$40,969,663. The annual average of these collisions amounted to 1,643, the average number killed, 270, and the average number injured, 3,792. The average damage to railroad property amounted to \$2,560,603 per year. Losses due to damage to lading are not included in these figures but they are no doubt considerable. If to the large property losses there be added the death losses and the damages paid for persons injured, the total amount will be very great. As an indication of what these latter losses are, a number of carriers have furnished us with the death and personal injury claims paid by them as a result of a number of accidents.

New York, New Haven & Hartford, for example, paid \$412,210 upon death and injury claims as a result of a collision at North Haven, Conn., on September 2, 1913, in which 21 persons were killed and 42 injured; \$131,543 for like claims from a collision at Milford, Conn., on February 22, 1916, in which 10 persons were killed and 152 injured; and \$29,580 for like claims from a collision at Norwood Junction, Mass., on March 17, 1921, in which 4 were killed and 11 injured. The total claims paid for these three accidents amount to \$573,335.

The Delaware, Lackawanna & Western as a result of a collision at Corning, N. Y., in 1912, which caused the death of 39 persons and injury to many others, paid out in death and injury claims \$326,133; for a similar accident at Ackerman, Pa., in 1919, in which 3 persons were killed and 2 injured, it paid for death and injury claims \$10,469. In ten years from 1912 to 1922 it paid for death and injury losses a total of \$367,360, for 12 collisions, including the two mentioned. These, it is admitted, might have been prevented by an automatic train control device.

The New York Central paid death and personal injury claims in the amount of \$226,616 as a result of a collision at Amherst, Ohio, in March, 1916, in which 23 persons were killed and 125 injured; \$356,478 for like claims from a collision at South Byron, N. Y., in January, 1919, in which 22 persons were killed and 183 persons were injured; \$201,119 as a result of a collision at Schenectady, N. Y., in June, 1920, in which 15 were killed and 47 injured. As a result of a collision at Porter, Ind., in February, 1921, in which 37 were killed and 124 injured, the cost for death and personal injury claims is estimated at \$175,000. Thus in these four accidents such payments amounted to \$959,214.

We are convinced that the carriers can, if they are determined to do so, readily install upon their roads devices which will meet the requirements of safety and which at the same time will not unduly interfere with operating requirements. Had the railroads taken prompt action when the Block Signal and Train Control Board pointed the way in 1911, the art would have been far advanced today. Many of the operating problems, such as interchangeability, effect on track capacity, and others which respondents have stressed in this proceeding, would have been solved. The development of the automatic block signal system to its present state of efficiency is evidence of what can be accomplished.

It is evident from the record that automatic block signals were primarily installed as a means of increasing the capacity of existing lines. This very fact, however, increases the possibility of accidents. Much has been done to furnish the engineman with reliable information, by means of wayside signals, of the conditions of the track ahead but progress has been slow in providing means to automatically compel obedience to the signal indications. The fact remains that the correct operation of trains in compliance with the signals still depends entirely upon the knowledge, alertness and skill of the engine crew. The danger is ever present that the engineman may fail to observe, correctly interpret and obey the signals. * * *

Experimental Stage Passed

Our investigations have shown that the art of automatic train control has long since passed the experimental stage. The 15 years of investigation and study and the results obtained in the actual employment of these devices over periods of years upon

some of the railroads have clearly demonstrated the practicability of and the necessity for automatic train-stops or train-control. The time has now arrived when the carriers should be required to select and install such device or devices as will meet our specifications and requirements.

Time for Compliance

* * * The fixing of a time limit should be based upon a consideration of the time which has already run since the passage of the act and the progress and present state of the art. There should be considered also the time reasonably required to enable the carriers to select suitable devices from among those available, to develop them to meet their operating conditions and requirements in the designated locations and to provide for the manufacture and installation of the apparatus.

Some of the respondents contend that devices of the ramp type are unsuited to their needs and hence undesirable. They state that devices employing the induction principle will better meet their requirements and therefore desire more time in which to test such devices. This is necessary, they believe, because there has been relatively less development of the induction type as compared with the ramp type. Proprietors and manufacturers of devices of the induction type support, in some measure, this request, because they are of the opinion that unless more time is allowed, respondents will perform be limited to the employment of devices of the ramp type. The request for additional time was made by respondents in their answers and at the hearing. Although the proposed order was issued on January 10 of this year, it appeared at the close of the hearings on April 15 that only a few of the respondents had made arrangements or were contemplating making arrangements to make the tests which they consider to be necessary.

We do not desire to force any carrier to adopt a particular type which it believes is not entirely suitable to its peculiar needs, if there are others available which, within a reasonable time, may be shown to be more suitable. In view, however, of the investigations which have already been made and the time which has elapsed, we are of the opinion that a six months' period will give sufficient time for any road to decide upon the device it should select. Within this time, provided a sufficient installation is made and intensive tests of the device are conducted, it can be determined whether or not the device will be suitable.

Respondents will be required to make monthly reports to us, during the six months' period beginning July 1, 1922, of their arrangements for such tests and of the progress made.

Requirements and Specifications

The definitions, functions, requirements and specifications which we have adopted are set forth in the appendix. They are based upon the facts developed in our investigations and upon the requisites laid down by the Block Signal and Train Control Board in its report in 1910, the requisites of the Railway Signal Association reported in 1914, the requisites of the American Railway Association adopted in 1914, and of the automatic train control committee of the United States Railroad Administration adopted in 1919, together with those adopted by the joint committee on automatic train-control of the American Railway Association in March, 1921.

Permissive Feature Eliminated

We have eliminated the provision in the specifications of the joint committee under which the engineman would be permitted, if alert, to forestall the automatic brake application and proceed. Some of the respondents object to the elimination of this provision. They contend that, in many instances, it is proper for a train to pass an automatic block signal in the stop position, and that there are so many such conditions that the elimination of the manual control provision practically eliminates the simple automatic stop from consideration. * * * Where the device is made subject to the manual control of the engineman so that he may prevent the automatic brake application according to his own judgment of the conditions, the automatic safety feature of the device is, to that extent, nullified. It is assumed, by the proponents of manual control, that no engineman, if alert to a dangerous situation, will deliberately cut out the automatic stop device. The proper use of the manual control would depend, therefore, upon the judgment of the engineman. His judgment would be the determining factor in situations of known or unknown danger. This factor of human judgment is the factor which an automatic train-stop device is designed to eliminate. The manual control feature is, in our opinion, a dangerous one which will permit the judgment of the engineman to intervene and thus may prevent the essential function of the train-stop device, namely, its automatic operation in cases of emergency.

The respondents, required to install upon designated portions of their respective roads, automatic train-control devices in accordance with our specifications and requirements, have been selected with regard to the measure of the risk of accident in

connection with traffic conditions thereon. Some of the respondents called attention to their records of operation to show that there have been relatively few accidents of the character which automatic train-control devices are intended to prevent, and that the possibility of such accidents is relatively remote. These respondents therefore request that they be excluded from the provisions of our order. The reasons advanced do not, however, appear to be sufficient justification for such action.

We have decided not to limit by our order the installation of automatic train-control devices to roads or portions of roads already equipped with automatic block signals, because we have no desire to discourage efforts to automatically control trains without the aid of fixed wayside signals. The statement, therefore, of the primary function of automatic train-stop or train-control devices recognizes the possibility of installing such a device without the use of automatic block signals.

Freight Car Loading

WASHINGTON, D. C.

LOADING of revenue freight during the week ended June 10 totaled 846,002 cars compared with 750,645 cars during the previous week, or an increase of 95,357 cars, according to reports received by the Car Service Division of the American Railway Association. A large amount of the increase was due to the fact that the previous week had included the Decoration Day holiday but there was an increase of 24,871 as compared with the week before the holiday. The loading for the week of June 10 also came within 33 cars of the largest loading for any week this year preceding the coal strike, the week of March 25.

Compared with the corresponding week of last year, there was an increase of 58,719 cars, but as compared with the corresponding week of 1920, the total for the week of June 10 represented a decrease of 84,974 cars. If the same amount of coal had been loaded as in 1920, the loading would have exceeded that of 1920.

Increases as compared with the corresponding week of last year were shown in the loading of all classes of commodities except grain and grain products and coal. The coal loading, 94,824, was larger than for any previous week during the strike, but represented a decrease of 67,074 as compared with the corresponding week of 1921 and of 96,670 as compared with 1920. This was an increase, however, of 8,000 cars as compared with the preceding week.

Merchandise and miscellaneous freight combined, which includes manufactured products, totaled 563,640 cars, an increase compared with the corresponding week of last year, of 93,988, and an increase of 35,702 as compared with the corresponding week two years ago.

Grain and grain products loading amounted to 40,035, a decrease of 905 cars as compared with last year. Livestock loading totaled 29,765, an increase of 794 cars.

The loading of coke, 9,008 cars, represented an increase of 4,124 cars as compared with last year and the loading of forest products, 62,355, was an increase of 11,329 cars, while ore loading, 46,372, showed an increase of 16,463.

Compared by districts, increases as compared with the corresponding week of last year were shown in all districts except the Allegheny and the Eastern. In the Pocahontas and Southern districts there are increases as compared with 1920.

The Car Service Division has compiled charts indicating the extent to which the average loading in tons of selected manufactures and miscellaneous commodities utilized car capacity in 1920 and 1921. The first chart shows the average tons per car loaded, by quarterly periods, separated as to eight selected commodities. Sewer pipe and drain tile, fertilizer, chemicals and explosives, and canned goods all made a very much poorer showing from a tonnage standing in 1921 than in the previous year. Paper, printed matter and books, with the exception of the first quarter, also loaded considerably less tons per car, the last quarter making an especially low record. On the other hand, it is encouraging to note that automobiles and trucks, a high class commodity, and ice, a low class commodity, both being bulky freight, made a very much better record on the average than in 1920. Freight not otherwise classified, and coming under the heading "other manufactures and miscellaneous" also shows an improvement in 1921.

Car Surplus Decreases

The freight car surplus for the period from June 1 to 8 was 284,189, a decrease in approximately a week of 21,009. Of the total 65,161 were box cars and 180,831 were coal cars.

The percentage of bad-order freight cars in June 1 was 15 as compared with 14.7 on May 15.

REVENUE FREIGHT LOADED

SUMMARY—ALL DISTRICTS, COMPARISON OF TOTALS THIS YEAR, LAST YEAR, TWO YEARS AGO, WEEK ENDED SATURDAY, JUNE 10, 1922

District	Year	Grain and grain products	Live stock	Coal	Coke	Forest products	Ore	Mdsc. L.C.L.	Miscellaneous	Total revenue freight loaded		
										This year 1922	Corresponding year 1921	Corresponding year 1920
Eastern	1922	8,999	3,132	7,666	1,463	5,835	3,354	70,834	89,925	191,205

Addresses at the Accounting Officers' Meeting

Speakers Analyze Present Railway Conditions and Requirements from Accounting Viewpoint

THE ANNUAL MEETING of the Railway Accounting Officers' Association, held at Cleveland, Ohio, June 7 to 9, was addressed by Samuel O. Dunn, editor of the *Railway Age*, by Col. W. A. Colston, formerly director of the I. C. C. Bureau of Finance and now vice-president and general counsel of the New York, Chicago & St. Louis, and by S. Ennes, vice-president and general manager of the Wheeling & Lake Erie. Abstracts of the addresses follow:

The Railway Situation

By Samuel O. Dunn
Editor of the *Railway Age*

It seems to me that on the whole we may reasonably anticipate that throughout the present year the financial results of railway operation will be somewhat better than they were last year. There does seem ground for hoping that we have entered or soon will enter a period when shippers will desist for a while from constantly attacking rates, when wages and working conditions will cease for a while to be the subjects of acute and dangerous controversy, and when, if the railways do not enjoy a period of real calm, they will at least not constantly be tossed about by a tempest which threatens to engulf them. Looking farther ahead, if we could reasonably hope that railway officers would be accorded some measure of that freedom to conduct their business which men are accorded in other lines of commerce and industry, we might anticipate a period of real prosperity for the railroads.

Probably it is not far from the truth to say that the future of the railroads can and will be mainly determined by their own officers. Summarizing the matter roughly, there are two things that their officers must do if they are to do their part in bringing about a solution of the problem which will be fair and beneficial to all concerned. First, they must manage the properties honestly and efficiently and give the public good service at the lowest rates compatible with the rendering of good service. Secondly, they must build up an intelligent, healthy and friendly sentiment on the part of railway employees and the public toward the railways.

The Recent Rate Case

The opinion rendered by the Interstate Commerce Commission in the recent reduced rate case is a remarkable and historic document in some respects. In the first place, it is a high tribute to the honesty and efficiency with which the railroads are being managed. The commission is an arbiter between those who own and manage the railways, on the one side, and those who use and pay for their service on the other side. Now, the railroads for years have been criticized and attacked upon the grounds, among others, that their accounts have not been correctly kept; that their capitalization greatly exceeds their value, and that they have not been efficiently managed. Criticisms and attacks upon all these grounds were made against them in the recent rate case. Having heard both the attack and the defense and having weighed all the evidence presented by both sides, the Interstate Commerce Commission has held that all the major attacks have been without sufficient justification. To the credit and vindication of the accounting officers it found that the books and accounts have been correctly kept, and show the facts. In spite of all that has been alleged to the contrary, it has found that the present value of the railways

as a whole is approximately \$19,700,000,000. It has expressly held that there is no evidence of general inefficiency of management.

The commission, by prescribing the way in which the accounts of the railways have been kept for years, by requiring them to make detailed reports regarding all their operations and transactions, by having its examiners check their accounts and reports to see that they have been correctly made up, and by holding extended hearings in which their managers and officers have been subjected to the severest examination by members of the commission and by representatives and attorneys of adverse interests, has got for itself and given to the public more complete and reliable information regarding the way the railways have been managed than has ever been obtained and made public by any government body regarding any other class of business concerns. The findings of the commission in its opinion, therefore, constitute a remarkable vindication of the railways.

Of course, the commission does not say, and nobody would say, that they have been or are now managed with complete honesty or perfect efficiency. Many offenses have been committed and many mistakes have been made in their management in the past. There are still abuses which ought to be abolished. There still remain many ways in which efficiency can and should be increased. But this is true of concerns of every kind. On the whole it is very doubtful if any class of business men in America could have had all their work studied and all their transactions scrutinized as those of the managers of the railways have been and established a cleaner and more defensible record than the railway managers have.

The findings made by the commission should be very gratifying to the railway officers. They should have a great effect upon public sentiment. There are, however, some other things in the decision of the commission which are not only not gratifying, but disquieting.

The Rate of Return

Undoubtedly the most unsatisfactory feature of the decision is its ruling that in future $5\frac{3}{4}$ per cent will be treated as a fair average return upon their valuation as a whole. Of course, such a return would be a great improvement over the average of less than four per cent which the railways received during the time when under the commission's ruling in the 1920 rate case they were entitled to six per cent. But during the dismal period of struggle in which very few roads earned six per cent and many were trying merely to avert bankruptcy, their officers were at least stimulated by the expectation that if they ever did earn an average of six per cent they would be allowed to have it. Now, before they have even been able in a single month to earn that much they find what is held to be a fair return cut down from six per cent to $5\frac{3}{4}$ per cent.

The difference may seem small. It means, however, a reduction in the amount the railways may earn for interest, dividends and improvements of about \$50,000,000 a year. It means a reduction in the amount of capital on which they will be able to pay a return at six per cent of about \$800,000,000. It means that they have been deprived of the ability to raise this much new capital and to provide the public with the additional transportation facilities which the investment of it would have provided. And how much of a saving in rates can it mean to the American public?

About 45 cents per year per person, or less than one cent a week per inhabitant. Which does the American public need more—this less than one cent a week per capita, or the \$800,000,000 investment in railway facilities which the commission's ruling makes impossible?

It is worth while to speculate upon the reason or reasons which caused the commission to make this reduction in the "fair return." The experience of the last 15 years does not indicate that after the recapture of one-half of all net return exceeding six per cent earned by individual railways the amount of return which would be left out of the 5¾ per cent would be sufficient to enable the railways as a whole to raise adequate amounts of new capital. Furthermore, past experience would be rather a dangerous guide to follow under present conditions in the money market of the world. It is true that interest rates are now lower and that in consequence all security prices are higher than a few months ago. In spite of this, however, the present market prices of American railway securities do not support the view that an average return of 5¾ per cent will be sufficient.

Probably the best test of whether it will be sufficient is afforded by the prices at which the bonds and stocks of the stronger companies are selling. All but their best secured bonds are selling at prices which yield five per cent or more, while the best dividend paying stocks are selling at prices which yield six per cent or more. Now, new bonds which may be sold will necessarily be less well secured than most of those now outstanding and will have to be sold for relatively lower prices than are commanded by those now outstanding. Furthermore, new issues of stock would have to be sold for less than the market prices now commanded by the present stocks of the companies issuing them.

The estimates of the amount of new capital which ought to be invested in railways annually vary widely, but probably the annual investment for some years to come should be at least one billion dollars. President Storey of the Santa Fe in a recent address estimated at one and one-half billion dollars for three years the new investment which ought to be made to bring the railways up to date. Can the railways, with the prospect of an average annual return of only 5¾ per cent on their valuation, reasonably hope to raise one and one-half billion, or even one billion, dollars of new capital annually?

If there is anything in the past experience of the railways to show that they can, there certainly is not in the past experience of any other industry. The average return earned in the banking business is at least twice that large. The banking like the railroad business is under government supervision, and yet nobody has proposed that it should be restricted to any such average return as the commission has held will be fair and sufficient for the railways. No other large industry would be satisfied with 5¾ per cent. In fact, the courts in many cases have held that to restrict public service concerns to less than six per cent was confiscatory.

It is remarkable that this ruling of the commission was received with little comment and almost no criticism by the press and general public. They took it as a matter of course that railways should be restricted to a rate of return which would not be considered sufficient in any other business. We should frankly recognize that this is because the commission's ruling was in accordance with the prevailing public sentiment. The public knows the courts have held that the net returns of railways and public utilities may be reduced and limited to any basis which is not confiscatory. It has been led to believe that because this can be done it is to the public's interest that it shall be done. There are very few who have ever considered the matter enough to have perceived that the least return to which the railways can constitutionally be restricted is not necessarily the return to which, in the public interest, they ought to be restricted. Perhaps, although it is doubtful, the courts would

rule that the commission could restrict the railways to an average return of 5¾ per cent without violating the constitutional prohibition of confiscation. Suppose, however, that the public welfare demanded a large expansion of railway facilities and that the railways could not, unless they earned an average return of at least say, 6½ per cent, raise the necessary capital. Clearly, it would then be to the public interest not to restrict the railways to less than 6 per cent, but to let them earn at least 6½ per cent.

The fact that the press and public accept with little comment and virtually no criticism the ruling of the commission that the railways shall be restricted to an average return which is much less than is earned in other lines of business and which closely approaches, or actually crosses, the line of confiscation, strikingly illustrates the fact that the railroad problem never will be solved by the most honest and efficient management, essential as that is to its solution. It is also essential to the solution of the problem that the public shall be given a better understanding of railway matters, and especially that public sentiment more friendly to the railways shall be secured. The public must be made to understand that it is contrary to its own interest to have the railways regulated, as they have been in the past, on the principle that their average return should be restricted just as much as it can be without confiscating their properties. It must be made to understand that a prosperous railroad industry is just as essential to the welfare of the public as a prosperous agricultural or mining or manufacturing industry.

Public Opinion

The public, however, will never see and admit this, because it will be unwilling to see and admit it, until the suspicion and hostility which a large part of the people now feel toward the managements of the railways have been eliminated. Many of you may doubt if this suspicion and hostility still prevail. Unfortunately, one who reads all kinds of newspapers and magazines, and comes in contact with all classes of people, cannot fail to be convinced that in spite of the proof to the contrary which has been accepted by the Interstate Commerce Commission, there are still many millions of people who do believe that the railways are inefficiently operated; that they are grossly overcapitalized; that graft prevails extensively in the relations between their officers and outside concerns, and that excessive amounts of the rates they collect from the public find their way through some channel or other into the pockets of the "malefactors of great wealth" in Wall Street. The policies adopted by all of the regulating bodies are strongly influenced by this widely prevalent public sentiment, and the railways will never be able to get the regulation which they ought to have, in justice to the owners of their securities and to enable them properly and adequately to serve the public, until this public sentiment has been changed.

How is this atmosphere of suspicion and hostility to be cleared away? I think the first thing that must be done is to awaken the managers and officers of the railways to a vivid realization of the fact that the future of these properties does not lie in the hands of legislatures, commissions and courts, but in the hands of the public. Almost any railway officer to whom you make that statement will assent to it. It is so obviously true that nobody can dispute it. But while most railway officers accept the theory, it is a remarkable fact how comparatively few of them actually act in accordance with it. A great deal of work has been done to improve public sentiment, but the fact that public sentiment is still what it is today, demonstrates that this work has not been sufficiently effective either because there has not been enough of it, or because it has not been well done, or for both reasons. Too many unjust criticisms of the railways which for years have constantly been made throughout the

country have not been answered promptly, clearly and conclusively enough. In consequence the minds of many people have been filled with misinformation and prejudice. The good things the railroads have done and are doing to develop the country and to increase its prosperity by improving their service, making it more safe, and increasing the economy with which it is rendered, have not been told often and well enough.

This good side of the railroad business should be presented to the public through every available channel until the misconceptions and prejudices which prevail in the minds of so many people are destroyed.

Public Relations Work

I believe it is possible for the railways by carrying on extensive and perfectly legitimate public relations work to change the atmosphere of public sentiment in which the railroad business is conducted and in which the railroad problem is discussed. There are many persons in the railroad business who are skeptical about the value of public relations work. They live in terror lest the railways may be criticized for carrying on what has come to be stigmatized by the odious word "propaganda." It may be that it is impossible to create an intelligent and friendly public sentiment regarding the railways. If that is the case, then it follows that private ownership and management in this country is doomed. Nothing could be more certain than that unless a great effort to create a more healthy public sentiment is made that sentiment will not be created. Since unless such a sentiment is created it is a foregone conclusion that private ownership is doomed, there is to my mind no escape from the conclusion that the railway managements should see that more intelligent and comprehensive public relations work is done. It is just as vital to the future of the railways that this be done as that the properties be developed and operated efficiently.

Why is it that after so many years of struggle over government regulation of railways it is still necessary frankly to recognize the fact that public sentiment regarding railway matters is not what it ought to be? You have all heard the old story of the Arkansas man, the roof of whose house long needed repairing, but who never repaired it. He did not repair it when it was raining because he couldn't, and he did not repair it when it was not raining because he didn't need to. A very large part of our railway executives have assumed a similar attitude toward public relations work. When earnings have been bad they have considered that they could not afford to do it, and when earnings have been good they have considered it unnecessary.

In view of past experience, if it is true that we have reached or are approaching a pause in the storm, it is probable we are entering a period of danger to the railways. The only time that most railway managers have recognized the need for extensive and effective public relations work has been in periods of emergency when they have been engaged in great struggles with shippers over rates, or with labor over wages, or with unfriendly public men over legislation. It is in those periods, however, that public relations work is likely to be the least effective, because in those periods there already prevails a spirit of antagonism on the part of employees, or of shippers, or of public men which it is extremely difficult to allay. The best time to do effective public relations work is in the periods of calm when no large parts of the public are up in arms against the railways and when people are more disposed to listen to reason.

"In time of peace prepare for war." The periods when no great contentions or struggles are going on are the best times to present to the public the facts about the great increases in the safety and economy of operation which are being secured, the relative lowness of our railway capitalization and rates, and what the railways need to enable them

to provide the public with the service that will be required in future months and years.

Valuation—Recapture—Depreciation Reserves

By Col. W. A. Colston

Vice-President and General Counsel, New York, Chicago & St. Louis Ry. Co.

Good times are coming on. Heretofore we haven't realized that there is such a thing as excess earnings, but some of us are coming along pretty close to the line now, some of us have passed it, and we have got to see that in this respect we will do fairness to the government and see that there is fairness done to the railroads. We must look to it that we play the game according to the rules of the game, and those rules should be announced before the game is started.

Prior to 1907 or thereabouts we could charge what we wished to, within reason, to operating expenses for improvements. There was no thought of depreciation.

After 1907 we began to have refinements in accounting, and we were required to charge depreciation on equipment, and we were permitted to charge it or not charge it on way and structures. So far as I know, there is only one large railroad in the country that did charge depreciation to any substantial degree on way and structures. You were permitted to charge or not charge in accordance with your judgment. Why? Accounting to be of any value must afford a true exhibit of the facts of the company's business. It is not a mere question of putting down columns of figures and making stereotyped statistical reports. The purpose of keeping accounts is to show the condition of the company's business, and so that the people who are responsible for managing that business may know how to proceed. Nobody knew then, and nobody knows now, any generally applicable rule for depreciation of way and structures, and the commission very sensibly left it to the judgment of the roads. In other words, the rule was that each road should determine for itself the facts and should account upon the facts so determined. Now, the railroads having been given that as the rule and having adopted that as the method and having said, as the roads of the country generally have said, "there is no depreciation of way and structures"; that, I submit, should be accepted as a fact. However much some of us may disagree with the majority or with individual roads in that respect, the convention has been established. However willingly we may all admit that as to the individual item, the separate rail, the separate tie, the separate bridge, or the separate other structure, there is depreciation, yet the consensus of opinion of the railroad accountants and engineers of this country is that combining appreciation and depreciation, taking the whole road as a complete tool, or working machine, there is no net depreciation of way and structures. Consequently, you have charged nothing to operating expenses for such depreciation. You have lived up to the rule and when you have had your rate investigations, when you have paid your taxes, when you have had all the troubles that the railroad man has, you have not fallen back on the defense that you had to make good depreciation of way and structures, or that the government or the people of the country had to pay for it.

Recapture

We had a valuation act. We had no misgivings. Nobody knew what the valuation act would amount to. We went along swimmingly. Then came the transportation act, which says that there shall be a recapture of earnings and that the recapture of earnings under Section 15a of the Interstate Commerce Act shall be based upon the value of property devoted to the transportation service, and that when the

values required to be found under Section 19a, or the valuation act, shall have been determined, those values shall be taken as the values upon which recapture shall be based.

Now, what is the situation? You have come along with, say, a \$100,000,000 property. Omitting equipment, your way and structures cost and stand on your books at \$100,000,000. You have not charged any depreciation on this account. You have not collected anything from the public for such depreciation. Your franchises have been computed and your taxes have been paid without any allowance for such depreciation. Your rates in the past have been fixed; your rates for the future under Section 15a have been fixed; your reductions in charges as recommended by the commission have been made; your reparations have been paid; all without any allowance for depreciation of way and structures, but when the time comes to value the property, you receive an engineer's report which says, "The cost of reproducing this property is \$100,000,000, just as its investment shows, but we find its condition is only 80 per cent of its cost new, and therefore we take 20 per cent off for depreciation, and you get \$80,000,000 as your value." Now, if you are allowed before recapture only 6 per cent on that cost of reproduction less depreciation, you are allowed before recapture only \$4,800,000, and if you actually earn \$6,000,000, or 6 per cent, on your real investment of \$100,000,000, you have to split \$1,200,000 up with Uncle Sam and give him \$600,000, although you have not collected anything from anybody for this used-up value of property devoted to the public service, and your accounting, with the approval of public authority, has been based upon a determination that such shrinkage of value, or depreciation, does not exist.

I think this little illustration will emphasize the necessity for our making an earnest effort to harmonize and co-ordinate the accounting practices under the accounting rules of the Commission, and the engineering practices under the valuation act. I think we may expect the full and fair co-operation of all of the bureaus of the Commission in such an effort at harmonious adjustment.

The Rules of the Game

Now, I don't say whether it is better to charge depreciation or not to charge depreciation. I am not bringing that into the question. But, I say, let us get the rules of the game at the start and play it throughout one way or the other way, and don't let us work both ends against the middle. If we are to continue our old methods and are not to charge income for depreciation of way and structures, then obviously we must treat such depreciation as non-existent in determining valuations or capital accounts. If, on the other hand, we are now to admit depreciation in way and structures for valuations or capital accounts we must recognize that our income accounts have been over-stated in the past and just as we raise reserves to cover overcharges and loss and damage, failure to acknowledge which has occasioned over-statement of income in the past, so should we now raise reserves by periodical charges to income until we have provided for that depreciation which was, but was not admitted, as well as for that depreciation which evermore shall be.

The Opportunities of the Auditor

By S. Ennes

Vice-President and General Manager, Wheeling & Lake Erie

For years we operating men have, in some degree, charged a large part of our trouble to inadequate rates, adverse legislation, labor unions, government control, but a man now on the Supreme Bench is reported to have said a great many years ago that a million dollars was wasted every day on the railroads of the United States. As I grow older, I am less inclined to take issue with him.

Many here represent roads with a gross business in excess

of \$100,000,000 a year, and some of you represent roads with a much larger gross income. Most of your roads are spending for operation 75 cents out of every dollar taken in over the counter. As we say, your operating ratio is 75 per cent or greater. Now one per cent of \$100,000,000 is \$1,000,000; and if the operating ratio can be reduced one per cent, the latter amount can be left in the treasury at the end of the year, and \$1,000,000 is a lot of money, particularly when available at the end of the year.

Who is there about a railroad that has a better opportunity to find leaks, both of outgo and income, than the man who, from day to day, is recording the income and the outgo? Who has a better opportunity to know when the revenue for handling a car is too small, or the expense of handling too great, than the auditor? And who can question that it is not only his duty and responsibility but his opportunity to bring to the attention of his executives the costly irregularity?

It is possible, and I regard it as the auditor's duty, to make these important figures impressive and striking and to make them show up like the tail light on an overland passenger train, and it can be done. For example, not long ago we found we were handling some carloads approximately 50 miles for \$3. When that was brought to the attention of the traffic manager, he at least promised himself that he would not get caught in that way again. Again, a year ago, we found it was costing us \$10 every time we put an engine over the turntable. It has now been cut to five, largely by analyzing the costs which showed where reductions could be made.

Comparison affords the auditor an opening to introduce information regarding irregularities that will receive attention even if it is not always sympathetic. Give this a trial. When you get back home, some of you take your major accounts, and also the principal accounts that go to make up these major accounts, and compare them with neighboring roads of the same general characteristics, and I warrant you that you will find some very happy and some equally disappointing situations. For example, after comparing maintenance and transportation expense as a whole, see how your track laying and surfacing, account No. 220, compares in cost per mile and per 1,000 gross ton miles, with your neighbor's. In your maintenance of equipment see how your repairs to steam locomotives, account No. 308, compare. On this account there are three ways of comparison, one being per engine mile, another per 1,000 gross ton miles, and another for 100 tons of tractive effort. Also see how the amount your railroad is spending on repairs per freight car, account No. 314, compares with your neighbor's.

In transportation, yard service usually carries the leaks, and it is well to compare accounts 377 to 382, inclusive, and, with the results obtained, I want to again say that unless the road you are connected with is an unusual one, you will develop some figures that will get very earnest attention.

Now that you have developed the leaks, the question is how to stop them, how to correct the irregularity, and, in my judgment, the remedy is simple—expose it; advertise it.

Begin by tabulating costs down to the last cent and setting up one unit against another, and it has been my experience, based on a number of trials, that just the minute you begin to do this, you begin to get satisfying results. You have all of this information in your offices, and in actual practice you will find the cost of assembling it in a manner necessary to get results very much less than expected. As stated before, we cut our cost of handling engines in two in less than a year, and it was done by separating the expenses in accordance with I. C. C. classification, and showing the man in charge of each unit not only what it was costing him for washing boilers, cleaning fires, coaling engines, etc., but the number of men he was using on each job, and alongside of it we placed the figures of what was being done at other engine terminals—with the result they all got busy and the cost came down, and I never have known it to fail.

General News Department

The Sunshine Special of the Texas & Pacific was derailed nine miles east of Mineola, Tex., on June 14, and two coaches fell down a bank and were overturned. Eighteen passengers were reported injured.

Passenger Train No. 4 of the Louisville & Nashville was derailed at a switch near Flomaton, Ala., on June 15, and the engine and first three cars were overturned. The wreck fell against a warehouse at the side of the railroad and two workmen therein were killed. A number of passengers were injured.

Citizens of Palestine, Tex., are agitated over the expected removal of the International & Great Northern's shops from that city, and several heated conferences have been held between citizens and officers of the city, the citizens being determined to contest the contemplated removal. In behalf of bondholders a suit has been filed in the federal district court against the city of Palestine and the citizens, to enjoin them from interfering with the road's removal plans.

A train robbery which was committed near Webster, Pa., on the Pittsburgh & Lake Erie, last Saturday, was begun and finished, and the robbers escaped, all within about five minutes. It was on the Fairmont express about 10 a. m. After passing Monessen, two men passed from the smoking car to the baggage car, putting on masks as they went, and, intimidating the baggageman and the express messenger with pistols, they gagged them, took the messenger's keys and rifled the safe. When the train stopped at Webster, the robbers jumped off and entered a waiting automobile. The station agent, finding the baggage car door closed, went in and found that the baggageman had just succeeded in freeing himself.

O. C. Fairfield, a former flagman of the Atlanta, Birmingham & Atlantic, one of the employees who went out on strike in March, 1921, has been convicted of bridge burning, in a Georgia court, and sentenced to imprisonment for life. Under the law of Georgia, burning a railroad bridge is a capital offense; and the solicitor general, in the trial of Fairfield, asked that the accused be hanged; but the jury had added to its verdict of guilty a recommendation for mercy. Fairfield was one of five men charged with burning a bridge near Musselwhite, Crisp County, Georgia, on May 30, 1921. Fairfield is, we believe, also one of those who were indicted on a charge of murder in connection with a derailment at Fitzgerald, Ga., in July, 1921, when the engineman of the train was killed in the wreck.

Radio on Shriners Excursion Train

Radio messages were lately received on an excursion train of the Southern Pacific (while it was moving at regular speed) from distances of 2,000 to 3,000 miles, according to a statement issued by that company; and it was in the day time. The train was a special carrying the Syrian Temple of Shriners from Cincinnati over the Southern Pacific. Receiving record of 2,000 miles for radiophone was established, and a 3,000 mile record for telegraph reception. Aerials were strung 8 inches above the roof of one of the cars and were 160 ft. in total length. A rail ground was used. The receiving equipment included honeycomb coils and a two-step-audio-frequency amplifier. The train left Cincinnati in radio touch with both coasts. At Denver, music programs were copied from the radio stations at Pittsburg and Chicago. At Colorado Springs the Cincinnati station was heard. The long distance record was made at Santa Barbara when the radio, while the train was in motion, picked up the United States Government station NSS at Annapolis, 3,000 miles away. This is claimed to be a record for daylight reception under any conditions.

For Safety at Crossings

The highway commission of Indiana is preparing to issue an order requiring that all advertising signs shall be removed (by the owners) from the right-of-way of the State Highway Commission and that no signs of any kind shall be erected on the public highways without the permission of the highway commission. It is anticipated that this order will eliminate much of the confusion with warning signs at railroad crossings. The state authorities of Illinois have already taken similar action.

No Dust on the Long Island

The Long Island Railroad is now oiling its roadbed, a special train having been assigned to that work for the next four weeks. C. D. Baker, general superintendent, announces that the oiling program for 1922 will be the most extensive ever carried out by the company. In 1921 they used 30,000 gallons of oil; this year 150,000 gallons. Last year about \$2,200 was spent for oil and labor; this year about \$10,000. The oil tank car holds about 8,000 gallons and the perforated pipes extending from each side extend out about three feet.

C. F. Loweth Leads in A. S. C. E. Nominations

In the first ballot for official nominees of the American Society of Civil Engineers, C. F. Loweth, chief engineer of the Chicago, Milwaukee & St. Paul, received 1,423 votes for president out of a total of 2,309 cast. Among the candidates for vice-president in zone 2 is S. T. Wagner, chief engineer of the Philadelphia & Reading, and in zone 3, F. G. Jonah, chief engineer of the St. Louis-San Francisco. Among the candidates for directors are J. E. Crawford, chief engineer of the Norfolk & Western (District 5); H. W. Hudson, chief engineer of the Interstate Railroad (District 5); H. A. Lane, chief engineer of the Baltimore & Ohio Lines East (District 5); A. S. Baldwin, vice-president of the Illinois Central (District 8) and R. N. Begien, general manager of the Baltimore & Ohio (District 9).

To Form New Hardwood Association

Organization of a national hardwood lumber association to create an inspection service, form a statistical bureau and carry on trade extension work will be effected at a meeting of hardwood manufacturers at Louisville, Ky., now in session. The purposes of the new association are outlined as follows:

1. To have inspection rules and service in conformity with the ideas expressed by Secretary of Commerce Hoover, setting up technical and engineering service to co-operate with the National Lumber Manufacturer's Association.
2. To establish a statistical bureau providing such information as may be of benefit to the industry and within the legal rights of association activities.
3. To carry on such trade extension work as may be deemed wise by the convention to promulgate.

M. & N. A. To Begin Passenger Service

The Missouri & North Arkansas restored through passenger service between Neosho, Mo., and Kensett, Ark., on June 18. A mixed train had been operating daily between those points since the first of June, but, there has been a large increase in freight traffic, and a separation of the freight and passenger service was deemed necessary. Following a meeting of the Boone County Protective League, held in Harrison, Ark., on June 6, many Harrison business houses placed signs in their shop windows stating: "We are for open shop; show your card." The meeting and the decision to place business houses on record for or against the open shop idea is the result of increasing bitterness between striking railroad men and their sympathizers and the residents

of Harrison, who blame the unions for much of the trouble which caused a nine months' suspension of operations of the road. Officers of the Protective League declare that not only do the majority of the residents of Harrison favor the open shop plan of operating the road, but that the farmers generally are incensed at tactics adopted by union labor to prevent operation of that territory's only railroad. Another meeting was held on June 17, at which there was a large attendance of farmers. The Protective League is seeking through these meetings and other methods to defeat the strikers through the pressure of public opinion.

New England Governors' Committees

The commission which has been appointed by the Governor of Connecticut to represent the state at Washington in connection with the proposal to favor the organization of a consolidated railroad company for all New England, consists of E. Kent Hubbard, chairman; E. O. Goss; C. G. Woodward; F. L. Ford; D. S. Day and S. H. Bullard.

The Governor of Massachusetts has appointed a similar committee. It is said that the six New England states are planning to establish a combined committee. The Massachusetts committee consists of James J. Storrow; A. W. Gilbert, F. H. Willard, Philip Dexter and Carl Dreyfus.

The Governor of Rhode Island has appointed a committee of five members, namely, G. L. Crooker, E. E. Salisbury, William Trafton, H. W. Fitz and W. F. Morse.

Pennsylvania Women's Aid

The Women's Aid of the Pennsylvania Railroad System is conducting a campaign to increase its membership among the families of the 17,000 employees in the Northwestern Region. The Women's Aid was described in the *Railway Age* of April 15 last. It aims to organize the women of the families connected with the Pennsylvania System in order that they may know one another and, when occasion arises, render aid and sympathy in such manner as may be most helpful. It has already more than 50,000 members. The wives, mothers, sisters and daughters of Pennsylvania employees and all women employees are eligible for membership. The dues are uniformly 25 cents a year. The badge is a small pin inscribed "P. S. Women's Aid." Mrs. W. W. Atterbury is director of the Aid for the System, and Mrs. J. G. Rodgers is associate director for the Northwestern Region. The six operating divisions in the Northwestern Region have been organized under the following superintendents: Chicago Terminal, Mrs. W. H. Scriven; Fort Wayne, Mrs. T. A. Roberts; Logansport, Mrs. B. H. Hudson; Toledo, Mrs. J. B. Hutchinson, Jr.; Grand Rapids, Miss Hilda Jones; Mackinaw, Mrs. R. E. Casey.

The Pennsylvania Railroad's Insurance Fund

The Pennsylvania Railroad began to insure its own property against loss by fire, in a small way, over 40 years ago—in 1879. From time to time the plan has been expanded until it now includes the assumption of marine losses, payments on account of injuries to persons and damage to freight and other insurable risks and losses. The average fire loss cost on the Pennsylvania System during 43 years has been only 14 cents per \$100 at risk. As the result of the development of systematic inspections the cost of the road's fire protection has been substantially less than the premiums generally charged by insurance companies for railroad risks. In addition the unknown element is eliminated from the cost of operation. The properties are regularly inspected by the Insurance Department and reports are forwarded to the operating officers interested. Plans for fire protection and contracts for the construction of structures and vessels are referred to the Insurance Department so that the most suitable type of fire protection may be recommended. The excellent fire fighting record of the road is attributed principally to the installation of adequate fire equipment and the maintenance of fire brigades regularly drilled at all points where the valuations warrant and sufficient employees are available to form a fire brigade. There are approximately 400 fire brigades organized on the Pennsylvania System.

B. L. E. Buys Coal Lands

The Brotherhood of Locomotive Engineers has entered the wholesale and retail coal business, according to a statement by Albert F. Coyle, editor of the *Brotherhood of Locomotive Engineers' Journal*. "The locomotive engineers are making a \$2,000,000 investment in the West Virginia and Kentucky coal mines," said Mr. Coyle; and he promises a "fair deal for the miners, and better and cheaper coal for the consuming public." The purchase covers more than 6,000 acres of "the best coal land in the United States," situated on the Coal river, in Boone County, West Virginia, and in Floyd county, the heart of the Big Sandy coal district, near Prestonburg, Ky. The Coal river Collieries is the name of the new company. Locomotive engineers throughout the country have subscribed in small amounts to the capital stock of \$2,000,000. It is planned to establish retail yards in the large cities. Locomotive engineers and their friends have already organized some of these local yards in Ohio and Michigan.

Coal Car Distribution to be Investigated

The Interstate Commerce Commission has instituted an investigation into the matter of the justness, reasonableness and lawfulness of the rules and practices governing the distribution of cars to coal mines, other than anthracite, for coal loadings, and as to the ratings for such mines as the basis for the distribution of cars. A just and reasonable basis of mine ratings will tend to make effective a just and reasonable distribution of cars to coal mines. The Car Service Division of the American Railway Association, after collaboration with the important bituminous coal loading railroads and the National Coal Association, has submitted to the commission a proposed revision of the rules now incorporated in what is known as Circular CS 31 (revised). A copy of the rules as proposed was attached to the commission's announcement, marked exhibits A and B. Exhibit A shows the changes proposed in the uniform rating and car distribution rules governing tippie mines. Exhibit B shows suggested rules governing the rating of and car distribution to other than tippie mines. While representatives of the National Coal Association do not agree in every instance that the rules proposed embody all that they might desire, they join with the Car Service Division in recommending the revision for early promulgation, except as to Rule 8.

The initial hearing will be at Washington on July 17.

Nearly Eleven Million Tons of Coal in Stock

The American Railway Association has just issued a report showing that all railroads in the United States had on June 1 in stock piles or in cars 10,847,000 tons of bituminous coal. The average daily consumption of coal for the month of May was about 284,000 tons, of which 145,000 tons a day, on average, was being taken from stock on hand.

Based upon the total average daily consumption, including the product of operating mines, the railroad's position showed that they had on hand on the first of May, 94 days' supply and a month later, 75 days' supply, on the average.

The following statements showing the information as to the railroads as a whole are self-explanatory:

Month	Total Consumption	Consumed from Current Coal Received	Consumed from Stock
April	8,350,000	3,550,000	4,800,000
May	8,520,000	4,320,000	4,200,000

Day	Stocks on Hand	Total Daily Average Consumption	Daily Average Consumption from Stock	Day's Supply on Hand (*)
April 1	19,843,813	271,000	145,000	136
May 1	15,057,268	278,000	160,000	94
June 1	10,816,567	284,000	145,000	75

(*) Based only upon that portion being actually taken from stock piles at the rate established during April and May, respectively.

Rock Island Anniversary Program Announced

The Chicago, Rock Island & Pacific has announced plans for the celebration of its 70th anniversary on October 10. Employees on all divisions will co-operate to make the observance a success. A general program has been prepared which will be supplemented later by features to be developed by employees on the various

divisions. The general program, as agreed upon by the executive officers at a staff meeting held recently in Chicago, is as follows:

(1) Co-operation by the Rock Island Employees' Clubs to the end that meetings be held by these organizations on the evening of October 10, at which time programs will be rendered appropriate to the anniversary and in accordance with the desires of the individual clubs. (2) An address to be delivered by President Gorman at the radiophone studio of the Westinghouse company, K Y W Chicago on the evening of October 10. Each employees' club throughout the system will be asked to equip with a radiophone receiving set so that the address can be heard by all those attending these club meetings. (3) At points where there are no employees' clubs, the local commercial clubs or chambers of commerce will be asked to co-operate and hold meetings at which a representative of the Rock Island will attend to deliver a special message. Commercial clubs will also be asked to provide themselves with radiophone receiving instruments. (4) The Rock Island is to issue a special historical booklet for general distribution.

The Rock Island Magazine will issue a special Seventieth Anniversary number. (5) The planting at various suitable points on the system of anniversary trees as a means of further beautifying company property and station grounds. Similar planting of "honor trees" to retired employes was also suggested. (6) Special menu cards to be issued on all Rock Island dining cars on October 10. (7) The suitable decoration of all passenger engines on the system, likewise passenger stations. It is proposed to adopt a uniform Seventieth Anniversary design which design will be used on buttons to be issued to all employees. (8) The installation of a permanent historical exhibit of the Rock Island in the La Salle Station (Chicago) waiting room. (9) The launching of a campaign before October 10 for a general "cleaning up" working up to Anniversary Day, the campaign to include painting of buildings. (10) A dinner to be given by the management to all pensioners.

Automobile Wrecks

Eastbound passenger train No. 804, of the Pennsylvania Railroad, was derailed near Allaire, N. J., on June 16, by striking an automobile which had been stalled on a crossing. The locomotive and two cars were ditched and the locomotive was overturned. It had run about 500 ft. beyond the crossing before it tipped over, the wrecked automobile being pushed that distance when a switch was encountered.

The engineman and fireman were not injured. Seven passengers were injured, none seriously. Of the two persons in the automobile, one, the driver, was killed.

A track walker was an eye witness. The day previous he had noted a narrow escape at the same crossing and was on the alert for something similar. He saw Train 804 approaching and at the same time observed the automobile approaching the crossing at 15 or 20 miles an hour. He stepped out into the road and held out his hand as a warning but the automobile continued on to the crossing and finally stopped with the rear wheels between the rails, evidently stalled.

The regulation whistle signal was blown for this crossing and the crossing bell was ringing. There is a plain view of an approaching train on the roadway 138 ft. from the crossing for a distance up the track of 1,300 ft.

The automobile was driven by a West Point cadet who was not authorized to operate an automobile under the laws of the State of New Jersey. He was accompanied by a young lady, 17 years old, who also was without a license to drive an automobile in New Jersey. It is said that the brakes of the automobile would not work.

The damage to locomotive, cars and track amounted to about \$6,000.

The investigation of the automobile disaster near Atlantic City, N. J., on June 10, reported in the *Railway Age* of June 17, page 1497, developed the fact that the engineman of the train did not know that there had been any trouble at the crossing; and the conclusion is that the automobile must have struck the locomotive on the side. The driver of the automobile, with the five members of his family accompanying him, were all killed.

New York City papers of Monday morning, June 19, reported accidents causing the deaths of 14 persons at grade crossings; five at Carman, N. Y.; four at Peabody, Mass., and five at Royal Center, Ind.

Traffic News

The Philadelphia & Reading has increased its train service to Atlantic City and now runs each week day between that city and Philadelphia 18 expresses each way; besides regular daily excursion trains on which the fare is \$1.50.

Freight rates are to be reduced in Indiana on July 1, to correspond with the reductions which are to be made in interstate rates. On coal for distances of less than 30 miles, and on cement, the rates, it is understood, will not be changed.

The Chicago & North Western re-established its Northern Lakes Special on June 16. This train leaves Chicago every evening except Sunday at 7:00 for northern Wisconsin and Michigan. It carries passengers to the fishing districts of Manitowish, Cisco, Eagle and Turtle.

The Southern Pacific announces reductions in the freight rates on cotton by steamship from Galveston and other Gulf ports to New York, Boston and other points, to take effect on July 1. To New York the reduction is from 50 cents per 100 lb. to 35 cents; to Fall River and New Bedford the present rate is 88.5 cents; new rate 55.5 cents.

The National Automobile Chamber of Commerce reports that in the month of May manufacturers shipped 252,000 automobile passenger cars and trucks, an increase of 53 per cent over May of last year. There is increasing demand for motors in practically every part of the country except Maine and Georgia. In April the exports of passenger cars and trucks gained more than 40 per cent over March. These cars went to 114 different countries.

The Southern Pacific's carloading record for 1921, with an average load of 26.2 tons per car, was the best in the history of that company. Prior to last year, the best carloading record was made in 1918 when the railroad administration was in a position to deal more or less arbitrarily with patrons who were not inclined to load cars heavily, the average load for that year being 25.6 tons. For the first four months of this year the average car load has been 26.5 tons as compared with 24.7 tons last year.

W. H. Quigg, traffic assistant, in the office of the United States Railroad Administration, Washington, has been assigned to duty with the Federal Traffic Board, in a similar capacity. This Board deals with the traffic problems of the different departments and establishments of the United States Government, co-ordinating their relations with the carriers. Mr. Quigg has served as a railroad traffic officer on lines in the southwest and southeast and in Eastern Trunk Line and Central Freight Association territories. He was a member of the Uniform Freight Classification Committee at Chicago for several years, and just prior to his connection with the United States Railroad Administration, was secretary of the traffic division of the American Railway Association.

Coal Production

Production of soft coal in the tenth week of the strike was 5,078,000 net tons, but the eleventh week (June 12-17) is expected to show a decrease, according to the Geological Survey. Production of anthracite remains practically zero.

Complete returns confirm the forecast of output in the tenth week of the strike (June 5-10). Including the 13,000 tons of anthracite dredged from the rivers, the total output of all coal was 5,091,000 tons. In the corresponding week of 1921, a year of acute business depression, production (including anthracite) was 9,974,000 tons. In the active year, 1920, it was 12,315,000 tons.

There has been little change during the week in the number of men on strike. The accumulation of unbilled loads is still declining. How great is the draft upon stocks can not be accurately stated, because the rate of consumption is not known. There are evidences that business is reviving and the consumption of coal increasing.

Commission and Court News

Interstate Commerce Commission

The commission has suspended to October 13 the operation of schedules which propose reductions in the rates on coffee from New Orleans, La., and sub-ports to points in Texas.

The commission has suspended until October 13 the operation of schedules contained in Northern Pacific tariffs which proposed to increase from 5 to 7 cents per gross ton present storage charges on iron ore at Lake Superior docks.

The commission has vacated its order requiring an increase in Florida intrastate freight rates, the Florida commission having vacated its order which allowed less of an increase in state rates than was applied to the interstate rates by the federal commission.

The commission has suspended until October 13 the operation of schedules which propose to establish import commodity rates on paper stock from New York and other North Atlantic ports to points in Central Freight Association territory which are higher than present domestic rates.

The commission has suspended from June 21 until October 19 the operation of schedules which propose to increase commodity rates on butter in straight carloads, and on butter, eggs and dressed poultry in mixed carloads, from points in Texas to various eastern and northern destinations.

The commission has suspended until October 13 the operation of schedules published by the Chicago, Milwaukee & St. Paul, which propose to reduce the rates on hogs from Mitchell, S. D., to Kansas City, Mo., St. Joseph, Mo., Atchison, Kans., and Leavenworth, Kans., from 52 cents per 100 lb. to 47½ cents.

The commission has suspended until October 17 the operation of schedules which propose to modify existing regulations in connection with proportional rates on grain between the Twin Cities and Lake Superior Ports by removing the requirements for surrendering inbound billing as a condition precedent to application of proportional rates.

Ore Rates to Upper Lake Ports to Be Reduced

The commission has issued a supplemental report in the general rate case in which it finds that the rates on iron ore from ranges in Minnesota, Wisconsin and Michigan to Lake Superior and upper Lake Michigan ports will be unjust and unreasonable after July 1 to the extent that they exceed 90 per cent of the existing rates, thereby including them in the general 10 per cent reduction. These rates were not advanced in Ex Parte 74 because they had been advanced by the director general in 1918 without corresponding advances in the rates from the lower lake ports. Since August 26, 1920, none of the rates on iron ore to upper lake ports have been reduced, while some have been increased. All are still on or higher than the level found reasonable in Ex Parte 74. Commissioner Hall dissented from the finding.

Southern Freight Rates Investigation

Commissioner Joseph B. Eastman has announced the dates for future hearings in the above-entitled proceeding as follows: Atlanta, beginning September 14, to September 23; Asheville, October 2, to October 21; New Orleans, October 23, to November 4; Chicago, November 6, to November 18; New York, beginning November 20. The hearings at Atlanta, Asheville, and New Orleans will be confined to the presentation of evidence with respect to rates applying within southern classification territory, and the hearings at Chicago and New York will be confined to the presentation of evidence with respect to interterritorial rates. There are two exceptions to this program. It appears that the rates between St. Louis and points within southern territory are closely allied with

the rates in southern territory, and have been included in that category in the presentation of the carriers' evidence. So the rates to and from St. Louis will be covered at the hearings at Atlanta, Asheville, or New Orleans. The same is true as to any evidence that may be offered with respect to the rates from the group including Portsmouth, Ohio, Iron-ton, Ohio, Ashland, Kenova and Huntington, W. Va., which are closely allied with the rates within southern classification territory.

Federal Valley Case

The application of the Federal Valley for increase of its divisions has been denied by the Interstate Commerce Commission on the ground that the record fails to show that the divisions are unjust, unreasonable, inequitable or otherwise unlawful. The commission says: "The record is not sufficient to enable us to compare the amount and cost of the service rendered in the joint traffic by the complainant and by the defendant respectively, to say nothing of other participating carriers; nor can we determine whether or not an increase in the Federal Valley's divisions would compel the defendant to carry the traffic at less than the actual out-of-pocket cost. The information which has been furnished does not, in short, make possible adequate consideration of the various factors which Paragraph (6) of Section 15 of the Interstate Commerce Act requires us to consider in fixing divisions."

Chairman McChord filed a dissenting opinion, in which he declares: "The situation of this road as shown in the majority report is one which calls for remedial action upon our part in the exercise of our comprehensive power to prescribe just, reasonable, and equitable divisions. * * * We have power under Paragraph (6) of Section 15 of the Interstate Commerce Act to make at least a temporary adjustment in the divisions of the joint rates so as to make the compensation allowed the Federal Valley more nearly equal to the cost of rendering the service."

State Commissions

The Corporation Commission of Virginia has ordered a general reduction of freight rates, July 1, to correspond with the reductions to be made on that date in interstate rates.

The Railroad Commission of Georgia has issued an order authorizing a general reduction of 10 per cent in intrastate freight rates to correspond with the reduction which has been ordered in interstate rates, to go into effect on July 1.

The Louisiana Public Service Commission has issued an order, order No. 48, dated June 15, calling for a general reduction of freight rates on July 1, corresponding to the reduction taking effect on that day in interstate rates. The order contains exceptions to allow for cases where rates have already been reduced.

The Public Service Commission of Alabama has sent a notice to each of the railroads in the state calling their attention to the law, passed in 1919, requiring the windows of all passenger trains to be fitted with screens. Complaints have been received that some railroads never have complied with the law.

The Public Service Commission of New York has authorized a general reduction of 10 per cent in freight rates on July 1, but the order does not apply to grain and certain articles which already are carried at rates lower than the proposed basis. On iron ore, gravel, and certain other articles, no reduction is to be made as the rates on these were not advanced in August, 1920. The reduction now ordered will not include the minimum charge of fifty cents per shipment for less than carload traffic; the minimum charge of \$15 on carload traffic; the minimum scale for class rates when published as such; the charges for special service other than those for switching, transit, reconsignment, etc.

The California Railroad Commission has invited the public utility commissions of Oregon, Washington, Nevada, Utah, Arizona, New Mexico and Texas to a conference to be held in San Francisco on June 19, to discuss possible joint action by these states with reference to the separation of the Southern

Pacific and Central Pacific railroads as was ordered by the United States Supreme Court in its recent decision. It is expected that this conference will also consider whether an appeal should be made to the Interstate Commerce Commission, to exercise the powers conferred upon it by the Transportation Act of 1920, for the consolidation of the railroads of the country into regional systems.

United States Supreme Court

Service Letter Laws Upheld

The Supreme Court of the United States holds valid and not in violation of the Fourteenth Amendment, the Service Letter Law of Oklahoma, of April 24, 1908, applicable to public service corporations and the like, in a case in which the plaintiff, a switchman on the Rock Island, averred that he had received personal injuries; the railroad acknowledged liability, settled with him on the basis of its responsibility, furnished him with hospital treatment, and then refused to re-employ him on the ground of physical incapacity; that, two years afterwards the road gave him a service letter certifying (correctly) that he had been employed as switchman for a period named, and (contrary to the fact) that he had been dismissed on account of his responsibility in a case of personal injury to himself June 30, 1913, his service being otherwise satisfactory. Plaintiff also averred that because of this letter he had been unable to secure employment although competent, able and willing. The railroad, besides a general denial, averred that the statute upon which the action was based was void because it deprived defendant of the due process of law and denied to it the equal protection of the laws; and also because it violated a section of the state Constitution in denying to defendant freedom of speech, including the right to remain silent. A trial by jury resulted in a verdict and judgment for plaintiff, which on appeal was affirmed by the State Supreme Court (*Dickinson v. Perry*, 75 Okla., 25).

The United States Supreme Court sustained the statute as not inconsistent with the guaranty of "due process of law." Except for the particular requirements contained in the proviso, the Oklahoma Service Letter Law does not differ substantially from the Missouri statute sustained in the *Cheek* case. "The right to conduct business in the form of a corporation, and as such to enter into relations of employment with individuals, is not a natural or fundamental right. It is a creature of the law; and a State in authorizing corporations to carry on business and employ men may qualify the privilege by imposing reasonable conditions. . . ."

The proviso in the Oklahoma statute requires that the service letter shall be written entirely upon a plain sheet of white paper to be selected by the employee and no printed blank to be used; with other details. On this point the Supreme Court says: "Manifestly these provisions are designed to insure the authenticity of the document and to make sure that it shall not only be fair and plain upon its face but shall exclude any cryptic meaning. They are contrived to prevent the purpose of the act from being set at naught by fraudulent service letters, which while bearing one meaning to the employee might bear another and very different one to the prospective employer to whom they might be presented. The act being valid in its main purpose, these provisions intended to carry it into effect must be sustained."

The opinion concludes: "The contention that the Service Letter Law denies to plaintiff the equal protection of the laws is rested upon the fact that it is made to apply to public service corporations to the exclusion of others, but it may have been that the public had a greater interest in the personnel of the public service corporations, or that the legislature deemed it expedient to begin with them as an experiment. It was peculiarly a matter for the legislature to decide, and we feel safe in relying upon the general presumption that they 'knew what they were about.'"—C. R. I. & P. v. *Perry*. Decided June 5, 1922. Opinion in this and *Prudential Ins. Co. v. Cheek*, both by Justice Pitney. In both cases the Chief Justice, with Justices Van Devanter and McReynolds dissented, but without separate opinion.

Other states having somewhat similar statutes are Indiana, Montana, Nebraska and Texas.

Foreign Railway News

Columbian Executive Comes to

U. S. to Buy Equipment

General Vassauze Cobo, president of the Pacific & Atlantic Railroad of Columbia, which is now in course of construction, has arrived in New York with the announced intention of purchasing some \$2,500,000 in equipment for his company.

Revenue from Platform Tickets

LONDON.

The Midland Railway of England at about 30 of its largest stations will not allow anyone without a ticket to go on the platforms. People who are not passengers and wish to get on to the platforms must purchase "platform tickets", the cost of which is one penny (approximately 2 cents at the normal rate of exchange). During last year the income earned from this source amounted to £6,708 (about \$32,600 at the normal rate of exchange).

Argentina Buys German Locomotives

The Argentine State Railways have ordered 50 locomotives from Germany, according to the *Wall Street Journal*. The Argentine Port Zones Authority has, according to the same publication, opened bids for 130 cars and 10 locomotives. Ninety concerns in the United States, England, Germany and Belgium bid on this business and, since the American bids were the lowest, it is thought that the contracts will come to this country.

Long Tunnel in New Zealand Nearly Finished

The Arthur's Pass Tunnel to facilitate communication between the east and west coasts of South Island, New Zealand, is nearing completion, according to the *Times* (London). Work on the tunnel was begun in 1908 but was seriously delayed by the failure of the original contractor to go through with the work. The tunnel will be electrified. Its dimensions are: Length, 5 mi. 545 yds.; height, 15 ft. 6 in.; width at rail, 14 ft., at widest point, 15 ft.; grade, 1 in 33. The approximate cost of the work is £800,000 and £382,000 for the electrification.

Large Expenditures for Rolling Stock

Disapproved in Italy

ROME, Italy

With regard to the credit of 1,750 millions of lire granted with a decree of the Italian Council of Ministers to the Italian State Railway Administration for the purchase of rolling stock and other supplies it is now learned that the parliamentary committee for public works has not approved the above mentioned decree and that it has observed that at least one part of such material could be obtained from Germany on account of reparations.

It is known in this connection that it had been decided to grant such credit in order to aid industry, and that manufacturers are urging that the government refuse to accept from Germany machinery and manufactured products on account of reparations. Up until the present time Italy has received from Germany on the reparation's account only 50 locomotives.

Italian Railways Deficit

ROME, Italy

Mr. Riccio, Italian minister of public works, has submitted to parliament the budget for the Italian Railway Administration for the fiscal year 1922-1923 and took the opportunity to point out that during the first eight months of the present fiscal year the loss of the administration amounts to 709 millions of lire. He believes that such loss is not due to an increase of expenses but to a decrease of revenues during January and February, 1922.

"However," said Mr. Riccio in the speech delivered to the parliament, "There is no doubt that one of the causes of the

loss is also the inflated personnel which, with the hurried application of the law regarding the eight-hour day and compelling the employment of former soldiers, has reached 212,852 persons." He does not believe that the loss has any connection with the increased quantity of fuel used.

Other causes of the loss are, according to Mr. Riccio, the necessity of heavy repairs to locomotives and low rates. He pointed out that he does not believe in the right to strike in the public service and that he hopes strikes will be avoided.

The High Speed of British Passenger Trains

The announcement by a number of British railway companies of accelerations of train services to take effect next month directs attention to the subject of train speeds for which British railways have long held a high reputation, according to the Times (London).

The number of trains traveling at high speeds has undergone a material increase during recent years but the maximum speed attained by main line trains is little in excess of the best speeds recorded many years ago. It is the case, however, that the locomotives haul much heavier loads, which calls for the employment of much greater power. This in turn has raised the whole question of permissible weights on bridges, and has involved railway companies in considerable expenditure.

Excluding "slip-coach" (whereby a car is detached from a local station without stopping the train) records, the London & North Western heads the speed table for 1922 with the run between Birmingham and Coventry at an average speed of 60 miles per hour. The Great Western's achievement of running the 107 miles between Paddington Station, London, and Bath, where a slip-coach is detached, in one hour forty-five minutes, giving an average speed of 61 miles per hour, is in some respects a finer performance, and the same company has an excellent achievement standing to its credit in the two-hour train to Bristol via Box, which represents an average speed of 59.1 miles per hour. The two-hour trains to Birmingham on both the London & North Western and the Great Western, are slower by comparison, but the average speed of these trains (about 55 miles per hour) is greater than it was, as the run is now performed in two hours by both routes with an intermediate stop.

The Great Central occupies a high place among high-speed runs. The best trains of this company are those running in the London and Manchester service over a road which is very severe in comparison with those of the North Western and Great Western. The best average speed of the Great Central London and Manchester services is 50.29 miles per hour, and the highest scheduled speed attained by the same train is for the 58.75 miles between Quainton Road and Leicester, which is covered in 56 minutes, giving an average speed of 62.89 miles per hour. This is not, of course, a start-to-stop run, as the train does not stop at Quainton Road. The highest speed run on the Caledonian Railway is that from Forfar to Perth, 32.5 miles in 34 minutes; of the Midland Railway, Kettering to St. Pancras Station, London, 72 miles in 77 minutes, giving an average speed of 56.1 miles per hour; of the North Eastern Railway, York to Darlington, 44.25 miles in 48 minutes, which works out at 53.3 miles per hour; and of the Great Northern Railway, Grantham to Doncaster, 50 miles at an average of over 54 miles per hour. The best Great Northern long-distance trains are the Scottish express, London to York, 188 miles at an average speed of nearly 52 miles an hour, including one stop, and to Peterborough, including stops, 76 miles at an average speed of nearly 52 miles per hour. The fastest North British trains are those between Glasgow and Edinburgh with an average of 40 miles.

Nor do the Southern lines, in spite of the handicap in some instances of heavy gradients and speed restrictions on account of bridges, fall far short of the records set up by the trunk railways serving the Midlands and the North. The South Western Company has in service trains which cover the 108 miles from Waterloo to Bournemouth at an average speed of 54 miles an hour; the Brighton and London services, 51 miles in 60 minutes, are known to most people; and the boat trains of the South Eastern Company to Dover and Folkestone are, considering the character of the road, as good as can be expected. The Dover trains make the trip at an average speed of 45 miles per hour, which is not however, quite so good as that of a limited train in the pre-war period, which had an average speed of 51 miles

and ran to Dover in an hour and a half. The new train to Folkestone Harbor, which is coming into the time-table next month and will make the trip in one hour and thirty-five minutes, is almost as good, as the train has to stop and reverse at Folkestone Junction. This represents an average speed of 52.4 miles. The best performance of the Great Eastern Railway is the London and Cromer express, which makes the journey of 138 miles at a speed of 47.5 miles per hour.

Notable Irish train speeds are the Great Northern, Dublin to Dundalk, 51 miles per hour, and the Great Southern & Western 48.5 miles per hour.

The most famous of the long runs on British railways is that between Paddington Station, London, and Plymouth, a distance of 225.75 miles for which 247 minutes are allowed, giving an average speed of 54.8 miles per hour. Second place was formerly occupied by the non-stop Marylebone Station, London, to Sheffield Great Central train on a timing for 165 miles of 177 minutes, but there is apparently no immediate intention of reinstating this train. Second place is now held by the Euston Station, London to Crewe non-stop trains, which for 158 miles show an average speed of 53.5 miles per hour, this being followed by the North-Eastern, Newcastle to Edingburgh, 124.5 miles at 50.8 miles per hour.

It is improbable that anything beyond small improvements in average speed will be made by British main-line railways while steam operation remains the rule. For higher speeds it will be necessary to await the advent of electric traction on main lines. It is known that the Brighton Railway Company has plans well advanced for the conversion of its main line from steam to electric traction, and it has been suggested that when this reform is carried out it would be possible to run a service every fifteen minutes between London and Brighton and to make the trip by non-stop trains in 45 minutes. The fact has also been made public that a passenger locomotive is being built by the North-Eastern Railway Company, which will be designed for a maximum speed of 90 miles per hour.

The Significance of Oil to the Argentine Railways

BUENOS AIRES.

The Argentine government controls most of the petroleum measures in Patagonia in the coastal region about Comodoro Rivadavia, as well as those in the North of the republic, in the province of Jujuy. The national petroleum administration works in close co-operation with the government railway administration and the latter itself has charge of the drilling in the northern fields. Excellent results have been obtained by the drilling at Morro Quemado (province of Jujuy) and at many other places in this province.

At the present time the State Railways are using about one million tons of wood per annum as fuel, which involves the felling of some three million trees annually. Most of the Argentine trees are hardwoods such as "quebracho," "algorrobo" and "ombu" which have a high heat value. Their use is hard on fire-boxes and makes continual repairs necessary and, naturally, greatly increases operating expenses. Consequently the railway administration expects to effect considerable savings by the use of oil.

It is planned, however, to do away with wood fuel by degrees in order to allow the forest owners to adapt themselves to new conditions and locate other outlets for their product. It is estimated that the State Railways will need altogether about 250,000 cubic meters of petroleum per annum. They will, however, use but 60,000 cubic meters the first year, 120,000 the second and so on, so that four years will elapse before wood will be abandoned altogether.

The government is now building 620 miles of narrow gauge railways in Patagonia and these will be extended as the region develops. Oil from Comodoro Rivadavia will be used as fuel. The State Railways have erected tanks at the ports of Rosario and Santa Fe on the Parana river and are now putting up 70 distribution tanks.

It is estimated that if the destruction of the forests continues at the present rate, 50,000,000 trees a year, the country will be without trees in 30 years. The government oil is now sold at the current market price and not at a fixed price as formerly; naturally this has led to a decrease in the price of fuel.

Equipment and Supplies

Locomotives

THE LEHIGH VALLEY is inquiring for 5 locomotives.

THE SOUTHERN PACIFIC has ordered 55 locomotive boosters from the Franklin Railway Supply Company.

THE NEW YORK CENTRAL has ordered 100 locomotive boosters from the Franklin Railway Supply Company.

THE NASHVILLE, CHATTANOOGA & ST. LOUIS, reported in the *Railway Age* of June 3 as inquiring for 5 Mountain and 5 Mikado locomotives, has ordered the 5 Mikado locomotives from the Baldwin Locomotives Works.

Freight Cars

MIDLAND TERMINAL.—This company is inquiring for 10 dump cars.

THE PENNSYLVANIA has ordered 16,000 continuous joints from the Rail Joint Company.

THE ST. LOUIS SOUTHWESTERN is considering the purchase of 100 automobile cars.

MISSOURI, KANSAS & TEXAS.—This company is inquiring for 25 dump cars of 20 yd. capacity.

THE DETROIT & MACKINAC has ordered 2,000 continuous joints from the Rail Joint Company.

THE CHICAGO, MILWAUKEE & ST. PAUL is asking prices for repairs to 300 all steel hopper cars.

THE MICHIGAN CENTRAL has ordered 20,000, 100 per cent joints from the Rail Joint Company.

THE WABASH has placed an order with the Decatur Bridge Company for 689 tons of steel to be used for 500 car underframes.

THE MISSOURI, KANSAS & TEXAS has placed an order with the General American Car Company for 200 refrigerator cars of 40 tons capacity.

THE TENNESSEE CENTRAL, reported in the *Railway Age* of April 15 as inquiring for 350 gondola cars, has ordered this equipment from the Western Steel Car & Foundry Co.

THE GRAND TRUNK, reported in the *Railway Age* of May 20 as inquiring for 250 refrigerator cars, has ordered this equipment from the National Steel Car Corporation, Hamilton, Ont.

THE NEW YORK, CHICAGO & ST. LOUIS, reported in the *Railway Age* of June 10 as inquiring for 1,000 automobile box cars, has ordered this equipment from the Illinois Car & Manufacturing Company.

THE FLORIDA EAST COAST, reported in the *Railway Age* of May 27, as inquiring for 30 tank cars of 10,000 gal. capacity, has ordered this equipment from the General American Tank Car Corporation.

THE NORTHERN PACIFIC, reported in the *Railway Age* of May 13 as inquiring for a large number of cars, has ordered 250 ballast cars, included in that number from the Rodger Ballast Car Company.

WESTERN PACIFIC.—This company, reported in the *Railway Age* of June 10, as considering the purchase of a large number of refrigerator cars, has received prices on 2,000 of these cars. It is expected that an order will be placed late this week or early next.

THE ERIE, reported in the *Railway Age* of June 10 as having let repairs to 1,500 freight cars, has contracted for the following additional repair work: 1,000 cars to the Buffalo Steel Car Company; 1,000 to the Youngstown Steel Car Company; 1,000

to the Illinois Car & Manufacturing Company and 500 to the Western Steel Car & Foundry Company.

THE WABASH, reported in the *Railway Age* of June 10, as inquiring for 2050 composite gondola car bodies of 50 tons capacity and 1,500 steel underframe automobile cars, 40 ft. in length and of 40 tons capacity, has ordered the former from the General American Car Company, and 750 of the latter from the American Car & Foundry Company and 750 from the Pullman Company.

THE ILLINOIS CENTRAL, reported in the *Railway Age* of May 13 as inquiring for repairs to 4,000 cars, has contracted with the Streater Car Company for repairs to 1,300 automobile box cars, with the Interstate Car Company for 500 box cars, with the Illinois Car Company for 300 steel general service cars, and the Ryan Car Company for 600 steel general service cars. These orders are in addition to the one given to the Pullman Company for repairs to 800 box cars reported in last week's issue. The company will also repair 500 cars in its Burnside shops.

Passenger Cars

THE NEW YORK, CHICAGO & ST. LOUIS is inquiring for one business car.

THE CHICAGO, INDIANAPOLIS & LOUISVILLE is reported to be considering the purchase of five passenger coaches.

THE INTERBOROUGH RAPID TRANSIT COMPANY, reported in the *Railway Age* of May 20, as inquiring for 100 new cars, has ordered this equipment from the Pullman Company with an option on some additional cars.

Iron and Steel

THE SEABOARD AIR LINE has ordered 3,000 tons of rail from the Tennessee Coal, Iron & Railroad Co.

ALABAMA & VICKSBURG has ordered 150 tons of steel from the American Bridge Company for a bridge at Vicksburg, Miss.

THE MICHIGAN CENTRAL is inquiring for 8,000 tons of structural steel for a bridge across the gorge at Niagara Falls, N. Y.

THE SIAM STATE RAILWAYS are asking for bids at Bangkok, Siam, until 2 p. m. October 1, 1922, for superstructures of steel railway bridges. General Purachatra is commissioner general of the state railways. Specifications and plans may be obtained from C. B. Sandberg, 143 Liberty street, New York City.

THE MICHIGAN CENTRAL will receive bids until June 30 for the fabrication, delivery and erection of the necessary structural steel, including castings, rollers, railings, etc., for its proposed 640 ft. steel arch and approaches aggregating approximately 7,500 tons. to be constructed over the Niagara river between the city of Niagara Falls, Ont., and Niagara Falls, N. Y.

Track Specialties

THE NORFOLK & WESTERN is inquiring for about 3,000 tons of plates, shapes and bats.

THE MISSOURI, KANSAS & TEXAS, reported in the *Railway Age* of June 10, as inquiring for 800,000 tie plates, 300,000 of which were to be for 66-lb. rail and 500,000 for 85 to 90-lb. rail, has ordered this material from the Railroad Supply Company, Chicago.

Machinery and Tools

THE CHICAGO, ROCK ISLAND & PACIFIC is preparing to send out inquiries for a large list of machine tools.

THE ATCHISON, TOPEKA & SANTA FE is expected to place orders within the next week against its large outstanding machine tool inquiry.

THE SOUTHERN PACIFIC has ordered a 200-ton locomotive lifting crane of 77 ft. span, and a 15-ton overhead crane of 75 ft. span, from the Niles-Bement-Pond Company.

Supply Trade News

J. S. O'Connor, Standard Supply Company, 315 Beatty Building, Houston, Texas, has been appointed Texas agent for the Track Specialties Company.

F. S. Wilcoxon, formerly system fuel supervisor of the Chicago Great Western, has joined the service department of the Edna Brass Mfg. Company, Cincinnati, Ohio.

The Carborundum Company, Niagara Falls, N. Y., has appointed the American Abrasive Metals Company, 50 Church street, New York, to act as United States sales representative for the Carborundum anti-slip tile.

The Northwest Engineering Company, Green Bay, Wis., manufacturers of crawler trains and draglines, has moved its general sales offices to 1220 Steger building, Chicago. W. W. Mutter, vice-president, is in charge of this office.

Orton & Steinbrenner Company, manufacturers of locomotives' cranes, grab buckets and coal crushers, have moved their offices from the 11th to the 19th floor of the Transportation Building, 608 South Dearborn street, Chicago.

J. W. McCabe has been appointed manager of the St. Louis branch of the Chicago Pneumatic Tool Company. Mr. McCabe has been connected with that company for 20 years and has recently returned from a three years' business trip around the world.

H. B. Thurston, whose appointment as sales manager of the Talmadge Manufacturing Company, Cleveland, Ohio, was noted in the *Railway Age* of April 8, has for the past ten years been inspector for the Interstate Commerce Commission with headquarters at Pittsburgh, Pa. While with the commission and during the strike and congestion period of 1920 he was appointed chairman of the Pittsburgh Terminal Committee, working in that office until the trouble was over. Later he worked in conjunction with the Bureau of Accounting through the guaranty period. Mr. Thurston served about 23 years with various railroads in the capacity of general foreman of boilers and general inspector. He was for 13 years with the Pennsylvania Railroad as division inspector and for a number of years with the Pittsburgh, Shawmut & Northern and the Philadelphia & Reading. He also served as railroad inspector at locomotive builders' plants; also as a Pennsylvania State inspector.

H. B. Thurston

On June 24 the American Bridge Company, New York, will move its vice-president's, chief engineer's, eastern division contracting, and treasury departments to 71 Broadway. The eastern division engineering, traffic department and eastern division sub-contract departments will remain at 30 Church street.

The Black & Decker Manufacturing Company, Baltimore, Md., has established a new Detroit office in the General Motors building in that city. C. G. Odell, assistant to the president of this company will make this office his headquarters, in addition to which it will provide headquarters for the local Detroit representative.

James I. Vincent has been appointed eastern representative of the Chicago Bascule Bridge Company with offices at 30

Church street, New York. Mr. Vincent, who was graduated from the University of Michigan in 1896, spent several years with bridge fabricating companies and railroads. In 1903 he joined the Scherzer Rolling Lift Bridge Company where, from 1905 to 1912, he was in charge of its New York office except during 1908, which year he spent abroad in charge of the construction of a bridge in Burma, and in obtaining orders in Europe. From 1912 until very recently Mr. Vincent was eastern representative of the Strauss Bascule Bridge Company in charge of the New York office.

W. Woodward Williams has been appointed vice-president of the Titan Iron & Steel Company, Newark, N. J. Mr. Williams' experience in the iron and steel industry began immediately upon his graduation from Harvard University in 1905. After six years in the mills of the Carnegie Steel Company at Pittsburgh, Duquesne, Pa., and Youngstown, Ohio, he entered the sales department of the Bourn-Fuller Company of Cleveland, Ohio, and was later appointed manager of its Pittsburgh office. In January, 1914, he became general manager of sales of the A. M. Byers Company, Pittsburgh, and subsequently was made general manager. In August, 1919, he became general manager of the Reading Iron Company, being later elected vice-president in charge of sales and operations. In September, 1920, he became associated with the Pittsburgh Gage & Supply Company, jobbers of wrought iron merchant pipe. He resigned the vice-presidency of this company on May 31 of this year, entering immediately upon his present office of vice-president of the Titan Iron & Steel Company.

W. W. Williams

Signal Appliance Association Officers

The Signal Appliance Association held its annual meeting and election of officers at Spring Lake, N. J., on June 16, in connection with the annual meeting of the Signal Section of the American Railway Association. The officers elected for the following year are G. A. Blackmore, vice-president, Union Switch & Signal Company, chairman; E. A. Condit, Jr., The Rail Joint Company, vice-chairman; F. W. Edmunds, Sunbeam Electric Company, New York, secretary. The board of directors for the ensuing year are J. Warren Young, Kerite Insulated Wire & Cable Company; L. Thomas, General Railway Signal Company; W. J. Gillingham, Hall Switch & Signal Company; J. S. Hobson, Massey Concrete Products Corporation; R. E. Trout, Thomas A. Edison, Inc.; S. G. Johnson, Okonite Company; M. R. Brincey, Federal Signal Company; G. A. Nelson, Waterbury Battery Company, and Henry Lee, *Railway Age*.

Obituary

Joseph Maycock, for more than 20 years a railway representative of Pratt & Lambert, Inc., Buffalo, N. Y., died at his home in that city on June 15. Mr. Maycock was formerly master painter of the Erie.

Trade Publications

"G-R-S AUTOMATIC TRAIN CONTROL" is the title of Bulletin No. 138, which has been issued by the General Railway Signal Company, Rochester, N. Y., describing its apparatus for automatic train speed control and also auto-manual train control. Accounts of the experiments recently made with this apparatus were given in the *Railway Age* of October 29, 1921, and March 4, 1922.

Railway Construction

ATCHISON, TOPEKA & SANTA FE.—This company has authorized extensive repairs to the crossing over the San Gabriel river near Los Angeles, Cal. This is to include the construction of a 32 by 704 ft. spillway and the rebuilding of a pier destroyed by a flood.

CANADIAN PACIFIC.—This company, reported in the *Railway Age* of March 18, as about to construct coaling plants at Swift Current, Sask., Medicine Hat, Alta., La Riviere, Man., and Eagle River, Ont., has awarded contracts to the Clayton Company, for the plants at Eagle River, Ont., and La Riviere, Man., and a contract to D. E. Hughes, Calgary, Alta., for the plant at Medicine Hat, Alta. The Swift Current plant will be built by company forces.

This company, which was reported in the *Railway Age* of March 25 as calling for bids for the construction of a new bridge over the Coquitlam river, Vancouver, B. C., to replace the structure washed away during the November flood, has ordered the steel from the Canadian Bridge Company and has awarded the contract to W. D. Grant, Vancouver, for the construction of the concrete abutments necessary for the new structure.

CHESAPEAKE & OHIO.—This company which was reported in the *Railway Age* of June 10, as calling for bids for the construction of terminal facilities at Peach Creek, W. Va., involving a five-stall engine house addition, a shop, storehouse and power house, and for the construction of a five-stall addition to its roundhouse and shop at Peru, Ind., has awarded the contract for this work to Joseph E. Nelson & Sons, Chicago, the work at Peru and Peach Creek to involve expenditures of approximately \$125,000 and \$350,000, respectively.

CHICAGO & ALTON.—The Interstate Commerce Commission has issued a certificate authorizing the construction of an extension from Titus, Ill., south about 3¼ miles, and a branch from a point about two miles south of Titus and extending westerly approximately two miles.

CHICAGO, BURLINGTON & QUINCY.—This company is calling for bids for a new five stall roundhouse at Council Bluffs, Iowa, a combination freight and passenger station at West Frankfort, Ill., and for the construction of a power house addition at Plattsmouth, Neb.

CHICAGO, BURLINGTON & QUINCY.—This company, which was reported in the *Railway Age* of June 3, as about to close bids for the construction of a passenger station at Mitchell, Neb., has awarded the contract for this work to G. A. Johnson, Chicago; and has awarded a contract to Frank Jacoby, Billings, Mont., for the construction of station extensions at Thermopolis, Wyo., which were first awarded to B. J. Martin, Billings, Mont., as reported in the *Railway Age* of June 10.

CHICAGO, INDIANAPOLIS & LOUISVILLE.—This company is calling for bids for the construction of a passenger station at 38th street, Indianapolis, Ind.

CHICAGO, ROCK ISLAND & PACIFIC.—This company has awarded a contract for the construction of a water softening plant at Council Bluffs, Iowa, to Joseph E. Nelson & Sons, Chicago.

CHICAGO UNION STATION.—This company, reported in the *Railway Age* of March 20 as calling for bids for the widening of Canal street between Madison and Washington streets, a distance of about 600 ft., has awarded the contract to George P. Cullen, Chicago, and has awarded a contract to Paschen Bros. Co., Chicago, for the superstructure for the Union Station power house reported in the *Railway Age* of June 10 as the subject of bids. A contract has also been awarded to the Mellon Stewart Company, Chicago, for the construction of a concrete and steel viaduct over the tracks at Madison street, as noted in the *Railway Age* of June 17.

CINCINNATI NORTHERN.—This company will accept bids until July 3 for eight bridge spans.

ILLINOIS CENTRAL.—This company which was reported in the *Railway Age* of April 22, as accepting bids for the construction of a joint passenger station with the Toledo, Peoria & Western at Gilman, Ill., has awarded the contract for this work to the Ellington-Miller Company, Chicago, the work to cost approximately \$48,000.

ILLINOIS CENTRAL.—This company, which was reported in the *Railway Age* of June 10, as calling for bids for the installation of a mechanical hump and track scale at Centralia, Ill., has awarded the contract for this work to Joseph E. Nelson & Sons, Chicago.

KANSAS CITY SOUTHERN.—This company is now preparing plans for and expects to undertake in the near future with its own forces, improvements to its shop at Pittsburg, Kan., which will consist principally of erecting 160-ft. and 110-ft. extensions to the present structure to provide facilities respectively for additional erecting space and for a blacksmith shop, and a 64-ft. extension to the present transfer table. The building will have a concrete foundation, brick walls with wire glass in metal sash, and composition roofing supported on steel trusses. Each of the six bays in the extensions to the erecting shop will be provided with engine pits to be served by a 10-ton and a 250-ton traveling crane. The work will cost approximately \$200,000.

MICHIGAN NORTHERN.—The Interstate Commerce Commission, after a rehearing has denied this company's application for authority to construct a new line out of Lansing, Mich., on the ground that public convenience and necessity are not shown to require it.

MISSOURI PACIFIC.—This company is calling for bids for the construction of an interlocking tower at Kenneth, Kan.

UNION PACIFIC.—This company, which was reported in the *Railway Age* of April 29, as planning to construct the substructure of a bridge across the Columbia river near Atlatia, Wash., this season, has awarded the contract for this work to the Missouri Valley Bridge & Iron Works, Kansas City, Mo.

UNION PACIFIC.—This company is calling for bids for extensions to the eating house at Cheyenne, Wyoming, to exceed \$50,000 and for the lining of two tunnels in Wyoming.

WABASH.—This company is calling for bids for the construction of the reclamation plant at Decatur, Ill.

WESTERN PACIFIC.—This company has obtained authority from the War Department to reconstruct its drawbridge across the San Joaquin river about 14 miles south of Stockton, Cal., and has notified the public of its intention to close navigation some time during the period from July 15 to January 1 for the purpose of undertaking this work.

ILLINOIS CENTRAL RULES FOR STORING COAL.—The Illinois Central has issued rules governing the unloading and caring for storage coal. The ground upon which coal is to be stored must be firm, level, clean and properly drained, although no drainage should pass through or under the storage coal piles. Coal, which is unloaded into storage should not be placed on loose cinders, against woden posts, wooden trestle bents or hot or warm pipes or flues; nor should it be placed in piles to exceed 12 ft. in height and 36 ft. in width at ground level, with the piles limited to 1,500 tons, and spaced with intervening distances of at least 5 ft. The piles must not be ventilated by artificial methods. Coal of different sizes should be placed in separate units and this same practice of segregation holds true when unloading coal of same size from different mines. Coal should not be dropped from the grab buckets more than 3 ft. The coal should not be moved after once being placed in storage, unless absolutely necessary. The temperature of the coal should be taken at least once each week, and oftener if possible, using either the thermometer or rod method; and when coal is stored under cover, the structure should be well ventilated to afford outlet for gases. Under no circumstances should water be applied to a heated coal pile. Heated or burning coal should be removed and used, or extinguished by scattering and then applying water.

Railway Financial News

ANN ARBOR.—Annual Report.—The corporate income account for the year 1921 and the consolidated income account for the year 1920 follow:

	1921	1920
Operating revenues	\$5,122,112	\$5,385,992
Operating expenses	4,209,106	4,953,662
Net from railway operations	913,006	432,330
Railway tax accruals	257,278	250,027
Railway operating income	655,820	181,966
Total non-railway income	56,161	63,957
Gross income	711,781	245,923
Interest on funded debt	266,417	358,080
Total deductions from gross income	632,732	772,417
Net income	79,049	Def. 526,494

BALTIMORE & OHIO.—Equipment Notes Offered.—J. S. Wilson & Co., of Baltimore, Freeman & Co., and Hayden, Stone & Co., are offering \$1,502,800 Baltimore & Ohio System, Morgantown & Kingwood Railroad Company, 6 per cent equipment gold notes, maturing \$115,000 annually, January 15, 1923, to January 15, 1935, inclusive, at prices to yield from 5 per cent to 5.75 per cent. The notes are redeemable as a whole, but not in part, on 60 days' notice at 103. They are guaranteed, principal and interest, by the Baltimore & Ohio Railroad. The notes are a first lien on 1,000 55-ton hopper coal cars.

CAMBRIA & INDIANA.—Authorized to Issue Bonds.—The Interstate Commerce Commission has authorized an issue of \$1,000,000 of general mortgage 6 per cent bonds to be sold at not less than 97½, the proceeds to be used to pay notes and to reimburse the treasury for expenditures for additions and betterments.

CENTRAL OF NEW JERSEY.—Authorized to Issue Equipment Bonds.—The Interstate Commerce Commission has authorized the sale or pledge of \$2,000,000 of 6 per cent equipment trust bonds at not less than 98.

CHESAPEAKE & OHIO.—Annual Report.—This company's annual report for 1921 is reviewed in an article on another page of this issue entitled "Chesapeake & Ohio Not Hurt by Coal Strike." See also excerpts from annual report on adjacent pages.

CHICAGO & EASTERN ILLINOIS.—Guaranty Certified.—The Interstate Commerce Commission has certified the amount of this company's guaranty for the six months' period of 1920 as \$2,223,982, of which \$723,982 remained to be paid.

CHICAGO & NORTH WESTERN.—Guaranty Certified.—The Interstate Commerce Commission has issued a final certificate certifying the amount of this company's guaranty for the six months' period of 1920 as \$15,533,520 of which \$3,733,520 was still to be paid.

CHICAGO MILWAUKEE & ST. PAUL.—Equipment Trusts Offered.—White, Weld & Co. are offering a new issue of \$8,085,000 equipment trust 5 per cent gold certificates, series "A." The certificates are dated July 15, 1922. They are due \$39,000 annually from July 15, 1923, to 1937, inclusive, and are offered at prices to yield from 5 per cent to 5.40 per cent, according to maturity.

CHICAGO, ROCK ISLAND & PACIFIC.—Payment on Account of Loan.—The War Finance Corporation announces that it has received a repayment of \$5,500,000 on account of loans aggregating \$10,430,000 made to this company in 1918 and 1919. It is expected the balance will be repaid in the near future.

DULUTH & NORTHERN MINNESOTA.—Report Approving Abandonment Reaffirmed.—The Interstate Commerce Commission, after a rehearing on the petition of the attorney general of Minnesota, has reaffirmed the conclusions of its former report authorizing the abandonment of this company's line from Knife River to Cascade, Minn., 99.25 miles. Chairman M. Cherdron dissented on the ground that greater consideration should have been given to an offer of the Minnesota Forest Products Company's offer to purchase the property. Commissioners Cox and Lewis also dissented.

EASTERN MAINE.—Certificate for Construction Denied.—The Interstate Commerce Commission has denied the application of

this company and the Mattawamkeag & Eastern for a certificate authorizing the construction of new lines of railroad between Houlton and Bangor, Me.

GREAT NORTHERN.—Dividend Declared.—This company has declared a semi-annual dividend of 3½ per cent on the preferred stock. Although at the regular 7 per cent rate, this declaration is the first to be made on a semi-annual payment basis instead of quarterly. Total dividend payment for the year will be 5¼ per cent. The first quarter dividend was 1¾ per cent; the next semi-annual payment will not be due until February 1, 1923.

New Director.—A. C. Loring, president of the Pillsbury Milling Company, has been elected a director to succeed E. C. Lindley, vice-president and general counsel, resigned.

HOCKING VALLEY.—Annual Report.—This company's annual report for 1921 is reviewed in an article on another page of this issue entitled "The Hocking Valley's Place in the C. & O. System." See also excerpts from annual report on adjacent pages.

KANSAS CITY, MEXICO & ORIENT.—Employees to Decide Fate of Road.—Receiver W. T. Kemper met the employees of this road in conference at Wichita, Kan., on June 17, for the purpose of discussing the road's financial condition and outlining a plan under which service may be continued. He stated that for the first five months of this year the road has incurred a deficit of \$450,000, that it has a bank account of only \$46,000 remaining, and that unless financial assistance is obtained immediately the property will have to be sold at auction after July 1. Mr. Kemper called upon employees of the road to accept a wage cut as the only means of allowing the road to reduce its operating expenses. He sketched the history of the line and said the road, if completed, would be 1,687 miles in length, extending from Kansas City, Mo., to Topolobampo, Mexico, on the Gulf of California. Governors Allen, of Kansas and J. B. A. Robertson, of Oklahoma, were present at the conference as were a number of the members of the railroad and public utilities commissions of the three states in which the road operates. Previous attempts have been made by the local management of the railroad to interest the employees in a proposition whereby they would voluntarily accept slightly reduced wages scale in order to enable the road to continue operations, but to date none have been effective. The K. M. & O. went into receivership on April 16, 1917. It operates 273 miles of road in Kansas and Oklahoma, while the Kansas City, Mexico & Orient of Texas operates 464 miles of line in the Lone Star state.

NEW YORK CENTRAL.—Equipment Trusts Offered.—J. P. Morgan & Co. and associates are offering an issue of \$27,645,000 5 per cent New York Central Lines equipment trust certificates at prices to yield from 5 per cent to 5.30 per cent. The certificates mature \$1,843,000 per year from June 1, 1923, to June 1, 1937, both inclusive. They are to be sold subject to the approval of the Interstate Commerce Commission.

NEW YORK, LACKAWANNA & WESTERN.—Asks Authority to Issue Securities.—This company has applied to the Interstate Commerce Commission for authority to issue \$30,000,000 of first and refunding mortgage bonds and \$5,000,000 of additional capital stock. The Delaware, Lackawanna & Western also asks authority to guarantee the bonds. It is proposed to issue at this time \$12,000,000 of the bonds at 5 per cent to reimburse the lessee for expenditure, \$1,639,000 to retire a note of the lessor to the lessee, also \$10,000,000 to retire consolidated mortgage bonds and terminal and improvement mortgage bonds maturing next year.

NEW YORK, NEW HAVEN & HARTFORD.—Asks Authority to Issue Bonds.—This company has applied to the Interstate Commerce Commission for authority to issue \$5,900,000 of first and refunding mortgage bonds to be deposited as collateral security for loans from the United States.

President Pearson on R. & M. Control Reports.—In a statement given out on June 21 President E. J. Pearson, of the New York, New Haven & Hartford, stated that the New Haven is making no attempt to control the Boston & Maine or interfere in any manner in the handling of matters between the Boston & Maine and those in the territory which it serves. He added that the only interest of the New Haven is to promote policies and practices that are of mutual interest toward such co-operation

within New England with respect to its transportation as is brought about from time to time by the New England states and the public in regard to other matters of important but common interest.

Concerning the rumored attempt at control of the New Haven or of the New England situation by the Pennsylvania Railroad, Mr. Pearson quoted the statement of President Rea of the Pennsylvania that there has been no change during the past ten years in the holdings of New Haven stock by the Pennsylvania which approximates but three per cent of the total, and that no attempt or arrangements have been or are being made for securing control of the New Haven, or purchasing its capital stock. The only purpose of the Pennsylvania is to be helpful to the New England railroads and their patrons by increasing the traffic exchange facilities, which is indicated by the large expenditure for the construction of the New York Connecting Railroad for the unloading of the New York gateway, and the operation of joint through trains where required by the New England traffic. This means the continuance and expansion of the long established friendly business and traffic relations of about 50 years between the New England states and the populous territory served by the Pennsylvania Railroad System and the railroads west and south with which it exchanges traffic.

NEW ORLEANS-GREAT NORTHERN.—Guaranty Certified.—The Interstate Commerce Commission has issued a final certificate certifying the amount of this company's guaranty for the six months of 1920 at \$366,555, of which \$131,055 was still to be paid.

NORFOLK SOUTHERN.—Asks Authority for Equipment Notes.—This company has applied to the Interstate Commerce Commission for authority to issue \$375,000 of 10-year equipment trust or conditional sales agreement notes at 6 per cent for the purchase of 397 rebuilt freight cars. The notes are to be pledged as collateral for a loan from the government.

PITTSBURGH & WEST VIRGINIA.—To Vote on Stock Increase.—A special meeting of stockholders will be held at Pittsburgh on July 27 to vote upon the proposed increase of authorized capital stock from \$47,000,000 to \$51,900,000, increase to consist of 49,000 shares (par \$100). Holders will also be asked to vote on issuance of the new shares as preferred stock.

In regard to the proposed stock increase President H. E. Farrell says:

Since April 1, 1917, the company has expended for additions and betterments over \$2,000,000, and the total will reach nearly \$3,000,000 by the end of this year. Reason for issuing \$4,900,000 of additional stock instead of \$3,000,000 is to provide for future improvements and obviate the necessity of calling on stockholders and going to Court. Interstate Commerce Commission for authorization again in a year or so. Following favorable action on July 27, 1922, application will be made to the Commission for authority to issue \$4,900,000 preferred stock, to remain in the treasury available for future corporate needs.

The \$7,400,000 authorized by stockholders November 15, 1920, has not been issued, as we are awaiting the approval of the Interstate Commerce Commission, which we hope shortly. This \$7,400,000 is to take the place of the \$1,080,000 capital stock of, and \$6,320,000 of advances to, West Side Belt Railroad, the property of that corporation. The issuance of \$7,400,000 stock is to remain in the company's treasury available for future corporate needs.

Present and proposed situation of the issuance of stock is as follows:

	Common	Preferred	Total
Outstanding	\$30,500,000	\$9,100,000	\$39,600,000
Authorized by stockholders and awaiting approval of I. C. C.	4,400,000	3,000,000	7,400,000
Present authorization	\$34,900,000	\$12,100,000	\$47,000,000
Proposed issues to reimburse treasury for expenditures made and to be made for additions, improvements and betterments.		4,900,000	4,900,000
Total proposed.....	\$34,900,000	\$17,000,000	\$51,900,000

READING COMPANY.—Bondholders' Protective Committee.—A protective committee for the Reading Company general mortgage 4 per cent bonds, due January 1, 1927, has been organized by holders of approximately \$12,000,000 of the bonds. The total amount of the issue outstanding is about \$94,000,000. James M. Wilcox, vice-president of the Philadelphia Saving Fund Society, is chairman, and A. S. Fenimore, assistant secretary of that institution, is secretary of the committee. Other members are:

George W. Davison, president Central Union Trust Company, New York; William A. Day, president Equitable Life Assurance Society, New York; Edward B. Duffield, vice-president Prudential Life Insurance Company, Newark, N. J.; William P. Gest, president Fidelity Trust Company; Efnegham B. Morris, president Girard Trust Company; C. S. W. Packard, president Pennsylvania Company, and Asa S. Wing, president Provident Life Insurance and the Provident Trust companies. Henry Pepper, Bodine & Stokes, of this city, are counsel.

The organization of the committee is a result of the recent decision of the United States Supreme Court in ordering modifications in the contract provisions of the mortgage under the segregation plan.

The Reading Company has filed a petition in the United States District Court at Philadelphia asking permission to consult with the bondholders' protective committee for presentation of a modified dissolution plan in the Reading case in conformity

with the recent decision of the Supreme Court. The court directed that the petition be filed and it will be acted on later. A petition also was filed by members of the bondholders' committee to intervene in the case because of the Supreme Court decision. The petition was allowed by the court.

SEABOARD AIR LINE.—Annual Report.—The income account for the year ended December 31, 1921, compares with the previous year as follows:

	1921	1920
Gross revenue	\$4,844,933
Operating expenses, taxes, uncollectible railway revenues and equipment and joint facility rents—net.	40,782,562
Net railway operating income.....	2,062,372	\$2,481,981
Compensation accrued—federal control.....	11,473,279	1,153,337
Government guaranty, six months.....	3,460,012
Other income	1,433,689	423,884
Gross income	4,989,340	7,519,215
Applicable to interest.....	4,768,759	7,226,772
Fixed interest charges.....	5,201,299	5,745,705
Balance.....	Dr. 432,540	1,481,067
Interest adjustment (income bonds).....	Cr. 4,208,333	1,250,000
Net income	Dr. 224,207	231,067

*Includes the same accounts that were used in determining the standard return; 1920 figures are for period Sept. 1-Dec. 31.

†1921 figures are an accrual of estimated additional compensation for the entire period of federal control; 1920 figures are an accrual for January and February.

‡Reversal of November and December, 1920, accrual.

TUCKASEEGEE & SOUTHEASTERN.—Authorized to Issue Stock.—This company has been authorized by the Interstate Commerce Commission to issue \$300,000 of capital stock at par for the purpose of acquiring the railroad from Sylva to Blackwood, N. C., 12.26 miles.

VIRGINIAN TERMINAL.—Authorized to Issue Bonds.—This company has been authorized by the Interstate Commerce Commission to issue \$509,000 of first mortgage 50-year gold bonds to be delivered to the Virginian in reimbursement of advances. The Virginian is also authorized to guarantee the bonds and to issue a similar amount of like bonds to be pledged with the director general of railroads in connection with the funding of indebtedness.

Railroad Administration Settlements

The Administration reports the following final settlements, and has paid out to or received from the several roads the following amounts:

Wiggins Ferry Company.....	\$145,000
Terminal Railroad Association of St. Louis.....	60,000
St. Louis Merchants Bridge Terminal paid Director General.....	205,000
Little Kanawha paid Director General.....	1,160
Belington & Northern paid Director General.....	495

Dividends Declared

Atlantic Coast Line.—3½ per cent, semi-annually, payable July 10 to holders of record June 24.
 Canada Southern.—1½ per cent, payable August 1 to holders of record June 30.
 Chicago, Burlington & Quincy.—5 per cent, semi-annually, payable June 26 to holders of record June 19.
 Cincinnati, New Orleans & Texas Pacific.—Common, 3½ per cent, semi-annually; extra, 3 per cent; both payable June 26 to holders of record June 16.
 Colorado & Southern.—1st preferred, 2 per cent, semi-annually, payable June 30 to holders of record June 19.
 El Paso & Southwestern.—1½ per cent, quarterly, payable July 1 to holders of record June 28.
 Great Northern.—Preferred 3½ per cent semi-annually, payable August 1 to holders of record June 30.
 Illinois & Chicago.—\$1.75, quarterly, payable July 3 to holders of record June 20.
 Kansas City Southern.—Preferred, 1 per cent, payable July 15 to holders of record June 30.
 Lehigh Valley.—Preferred, 2½ per cent, quarterly; common, 1¼ per cent, quarterly; both payable July 1 to holders of record June 17.
 Louisville & Nashville.—3½ per cent, semi-annually, payable August 10 to holders of record July 17.
 Reading Company.—Common, 2 per cent, quarterly, payable August 10 to holders of record July 18; 1st preferred, 1 per cent, quarterly, payable September 14 to holders of record August 29.
 Western Pacific.—Preferred, 1½ per cent, quarterly, payable July 1 to holders of record June 19.
 Northern Pacific.—1¼ per cent, quarterly, payable August 1 to holders of record June 30.

Trend of Railway Stock and Bonds Prices

	Last June 20	Week	Last Year
Average price of 20 representative railway stocks	64.42	64.18	51.56
Average price of 20 representative railway bonds	85.47	85.62	72.65

Annual Reports

Forty-fourth Annual Report of The Chesapeake and Ohio Railway Company

RICHMOND, Va., April 17, 1922.

To THE STOCKHOLDERS:

The Forty-fourth Annual Report of the Board of Directors, for the fiscal year ended December 31, 1921, is herewith submitted.

The average mileage operated during the year was 2,545.9 miles, an increase over the previous year of 26.7 miles. The mileage at the end of the year was 2,548.0 miles, an increase of 8.8 miles over mileage on December 31, 1920.

THE CHESAPEAKE AND OHIO RAILWAY COMPANY

RESULTS FOR THE YEAR.

Operating Revenues	\$83,687,957.92
(Decrease \$6,502,787.22, or 7.21%)	
Operating Expenses	66,603,076.81
(Decrease \$11,141,444.37, or 14.33%)	
Net Operating Revenue	\$17,084,881.11
(Increase \$4,638,657.15, or 37.27%)	
Taxes and Uncollected Railway Revenue	2,702,869.27
(Decrease \$297,050.43, or 9.90%)	
Railway Operating Income	\$14,382,011.84
(Increase \$4,925,747.60, or 32.25%)	
Net Equipment and Joint Facility Retns.	Dr. 721,085.64
(Decrease \$2,433,147.88, or 142.12%)	
Net Railway Operating Income	\$13,660,926.20
(Decrease \$598,263.00, or 4.19%)	
Miscellaneous Income	1,120,750.48
(Decrease \$780,832.76, or 41.06%)	
Total Gross Income	\$14,781,676.68
(Decrease \$1,379,095.82, or 8.53%)	
Rentals and Other Payments	897,673.69
(Increase \$676,756.05, or 24.60%)	
Income for the year available for interest	\$13,884,002.99
(Decrease \$2,055,861.91, or 12.90%)	
Interest (69.81% of amount available) amounted to	9,691,401.51
(Decrease \$262,005.18, or 2.63%)	
Net Income for the year, equivalent to 6.68% of capital stock outstanding, amounted in	\$4,192,601.48
(Decrease \$1,793,856.73, or 29.96%)	
2% Dividend declared during year payable January 3, 1922.	1,255,632.00
Remainder, devoted to improvement of physical and other assets	\$2,936,969.48

RETURN ON PROPERTY.

The following table shows the amount of return to your Company, including subsidiary companies, from transportation operations only, upon its investment in road and equipment at the termination of each year of the five year period ended December 31, 1921, and the average for the five years.

	Property Investment.	Total Operating Income.	Percentage of Return.
Year ended December 31, 1921.	\$304,485,230.91	\$12,924,848.76	4.24%
*Year ended December 31, 1920.	291,179,583.14	14,410,821.80	4.95%
*Year ended December 31, 1919.	287,864,838.63	13,725,866.83	4.77%
*Year ended December 31, 1918.	269,914,419.76	12,871,539.79	4.77%
*Year ended December 31, 1917.	263,397,068.67	14,871,459.45	5.64%
Yearly average for five years ended December 31, 1921.	\$283,368,228.22	\$13,760,907.32	4.85%

*The road having been operated in 1918, 1919 and during January and February, 1920, by the United States Railroad Administration, the compensation payable during the period mentioned has been used in lieu of operating, and other items making up the return from transportation operations. In these computations, interest payable by way of compensation for additions and betterments completed during Federal control has been excluded.

FINANCIAL.

During 1921 the issue of six per cent. Equipment Trust Notes, Series 13 and 13-A, referred to in the Annual Report for 1920, was completed, the total amount of the notes being fixed at an aggregate of \$11,367,000, for the two issues. Of this amount the annual maturities due January 15, 1921, and January 15, 1922, have been paid, the aggregate amount of said payments being \$1,515,600. The equipment contracted for and subject to "Chesapeake and Ohio Equipment Trust, Series S," referred to in the Annual Report for 1921, has all been delivered and is now in service. Your Company at the date of this Report has received on account of the loan from the United States of \$5,318,000 under the provisions of Section 16 of the Trust Instrument, A. T. 1921, to be applied toward additions and betterments the sum of \$4,073,500. It is noted that the balance of the loan will be received before July 1st, and that the additions and betterments to be completed or contracted for by that date.

Your Company is now endeavoring to secure satisfactory bids for the following new equipment:

- 30 All Steel Passenger Coaches.
- 8 All Steel Combination Passenger and Baggage Cars.
- 2 All Steel Baggage, Express and Mail Cars.
- All Steel Door Cars.
- 150 40-ton Steel underframe Box Cars.
- 50 40-ton Steel underframe Ventilated Box Cars.
- 20 40-ton Steel underframe Stock Cars.
- 60 40-ton Steel underframe Refrigerator Cars.
- 16-ton 57-in. All Steel Flat Bottom Gondola Cars.
- 14-ton 57-in. All Steel Hopper Bottom Gondola Cars.

Your Company expects to obtain approximately 80% of the cost of this equipment through an Equipment Trust, which it is believed can be placed in a more advantageous year.

The officers of your Company have also prepared a comprehensive budget of additions, betterments and improvements which should be made during the next four years in order to adequately and economically maintain

the present-day maximum volume of traffic, provide for anticipated growth, and provide its facilities most nearly equal to those of your principal competitors. The estimated capital charge for the work contemplated by this budget is about \$17,000,000, the expenditure of which will be spread over the next four years. Conditions at the present time are reasonably favorable for railroad financing and plans are now under consideration for providing at least a part of the total capital expenditure involved, announcement respecting which will be made in due course.

The changes in funded debt in the hands of the public during the year were as follows:

4 per cent. Big Sandy Ry. First Mortgage Bonds	Retired \$33,000.00
4 per cent. Cal River Railway First Mortgage Bonds	37,000.00
4 per cent. Greenbrier Ry. First Mortgage Bonds	22,000.00
5 per cent. Kanawha Bridge and Terminal Co. First Mortgage Bonds	7,000.00
Equipment Trust Obligations	1,871,800.00
Decrease	\$1,970,800.00

Other changes in obligations shown under funded debt on balance sheet of December 31, 1921, were as follows:

	Increase.
First Lien and Improvement 5 per cent. Mortgage Bonds	\$8,541,000.00
6 per cent. Equipment Trust Certificates Series "13" (Additional)	162,000.00
Secured Obligations to United States Government	7,762,500.00
5 per cent. Chesapeake & Ohio Northern Ry. Co. First Mortgage 5 per cent. Bonds (Assumed)	1,000,000.00
Increase	\$17,465,500.00

GENERAL REMARKS.

Branch Line Extensions during the year have been as follows: Guyandot Division-Main Island Creek, Barnabas to End of Line. 1.98 Miles Guyandot Division-Little Creek Branch, Sistratt to End of Line. 1.00 Miles Island Creek Railroad-Mud Fork Branch, Mud Junction to Argonne, W. Va. 3.25 Miles Island Creek Railroad-Whitman Creek Branch, Whitman Junction to Whisman, W. Va. .79 Miles Hazy Creek Branch-Edwight to End of Line. 1.80 Miles Huntington Division-Adjustment of Mileage. .05 Miles

making total increase in Branch Lines put into operation during the year 8.87 Miles Additional third track mileage put into operation during the year is as follows:

Cincinnati Division-Edgington-Passing Track converted into third track	1.00 Miles
Extension of Third Track	1.73 Miles
making total increase in third track	2.73 Miles

The equipment inventory as of December 31, 1921, was as follows:

	Increase	Decrease
Locomotives owned	675	10
Locomotives leased	271
Total	946	10
Passenger train cars owned	348	7
Passenger train cars leased	62
Total	410	7
Freight train and miscellaneous cars owned	34,251	694
Freight train cars leased	18,000
Total	52,251	694

The changes during the year in the accrued depreciation of equipment were as follows:

Balance to credit of account December 31, 1920	\$12,430,963.54
Amount credited during year ended December 31, 1921, by charges to Operating Expenses	\$2,047,384.78
Charges to account for:	
Accrued depreciation on equipment retired during year—891 freight train and work cars; 1 passenger train car; 2 locomotives; 2 float ing equipment	\$185,436.86
1,861,947.92	
Balance to credit of account December 31, 1921	\$14,292,911.46

Operating Revenues were	\$83,687,957.92	\$90,190,745.14	Dec. \$6,502,787.22
Net Operating Revenues were	17,084,881.11	12,446,233.96	Inc. 4,638,657.15
Operating Ratio	79.6%	86.2%	Dec. 6.6%
Tons of Revenue Freight carried one mile	9,136,050.51	11,720,030.89	Dec. 2,583,980.37
Revenue train loads tons	1,090	1,131	Dec. 41
Revenue tons per loaded car	39.3	39.1	Inc. .2

The revenue coal and coke tonnage was 24,074,459, a decrease of 18.0 per cent; other freight tonnage was 7,418,628, a decrease of 35.4 per cent. Total revenue tonnage was 31,493,087 tons, a decrease of 22.9 per cent. Freight revenue was \$67,367,982.78, a decrease of 7.0 per cent. Freight train mileage was 3,382,284 miles, a decrease of 19.1 per cent. Revenue ton miles were 9,136,050.51, a decrease of 22.9 per cent. Ton mile revenue was 2.77 mills, an increase of 19.3 per cent. Revenue per freight train mile was \$8.07, an increase of 14.9 per cent. Revenue tonnage per train mile was 1,090 tons, a decrease of 3.6 per cent; including Company's freight, the tonnage per train mile was 1,131 tons, a decrease of 4.4 per cent. Tonnage per locomotive, including Company's freight, was 1,026 tons, a decrease of 1.9 per cent. Revenue tonnage per loaded car was 39.3 tons, an increase of .5 per cent. Tons of revenue freight carried one mile per mile of road were 1,388.535, a decrease of 22 per cent.

It will be observed that freight train mileage did not decrease in the same ratio as revenue tonnage and revenue ton miles, which is occasioned by the

fact that in times of decreased business it is not possible to dispense with the running of many local freights and other necessarily lightly loaded trains, which must result in lesser loading of tons per train and, consequently, more train mileage proportionately.

There were 7,590,673 passengers carried, a decrease of 9.3 per cent. The number carried one mile was 331,513,000, a decrease of 13.7 per cent. Passenger revenue was \$11,739,627.10, a decrease of .6 per cent. Revenue per passenger per mile was 3,544 cents, an increase of 15.1 per cent. Number of passenger miles per train mile was 1,151.7, an increase of 14.6 per cent. Passenger train mileage was 5,284,065, an increase of 1.9 per cent. Passenger revenue per train mile was \$2,223, a decrease of 2.5 per cent, including mail and express it was \$2,502, a decrease of 6.9 per cent. Passenger service train revenue per train mile was \$2,577, a decrease of 5.7 per cent.

There were 337,249 tons of new rail (80,501 tons of 130 lb., 211,956 tons of 105 lb., 3517.9 tons of 90 lb., 956.3 tons of 80 lb., and 4.1 tons 67½ lb.) added to 206,707 tons of old track, used in renewal of existing track.

There were 1,085,047 cross ties used in maintaining existing tracks, an increase of 32.678.

There were 626,034 yards of ballast (390,854 yards stone) used in maintaining existing tracks, a decrease of 265,024 yards. Beginning 1921 careful survey was made of the ballast on the entire line, and while there was a decrease in the number of yards of ballast applied as compared with previous year, cur track has been fully maintained in equally as good condition as last year insofar as ballast is concerned.

The average cost of repair of a locomotive was \$6,469.27; per passenger train car, \$1,705.05; per freight train car \$183.65.

Due to the complexity of the accounts involved and the necessity of carefully checking an enormous number of items, it has not yet been practicable for your Company to make a final settlement with the Director General of Railroads for the period of Federal control with the Interstate Commerce Commission for the so-called Guaranty Period, March 1 to September 1, 1920. Your directors and officers are making every effort to reach a conclusion of these matters as promptly as possible and are receiving the cordial cooperation of the Interstate Commerce Commission. Your Company received from the Secretary of the Treasury an additional payment of \$600,000 on account of the guaranty under Section 209 of the Transportation Act, 1920, based upon a partial payment certificate of the Interstate Commerce Commission. As the amount of any further settlement on either of these accounts is still impossible of ascertainment no accrual in respect thereof has as yet been included in your income account.

In the Annual Report for 1920 reference was made to the substantial falling off in the volume of business subsequent to January 1, 1921, and the probability of a resulting unsatisfactory showing for the year 1921. The condition forecasted in the Annual Report continued during the early part of the year with the result that, notwithstanding the increase of about 33% of your Company's average freight rates effective in the summer of 1920, the gross earnings of your Company during the first six months of the year were actually less than during the corresponding period of 1920. Meantime the heavy operating costs resulting from war conditions, particularly those due to the high wages and the working rules established by Governmental authorities, and the fact that your Company has had to incur a drastic reduction of working forces and curtailing of purchases wherever possible, to reduce expenses immediately to anything like the extent to which business fell off.

These conditions resulted in an income deficit for the first five months of 1921 of approximately \$1,650,000, as against a surplus (taking into consideration only the comparable items) of about \$1,000,000 for the corresponding period of 1920. The actual net income of your Company for this period of 1921 was a net contribution payable to you or your Company with the Director General of Railroads was only \$1,400,000, so that your Company was actually at least \$3,000,000 worse off during these five months than it was in the corresponding period of the previous year. This represented nearly 5% on the total outstanding capital stock. During May, 1921, your Company had on hand over \$7,000,000 in unpaid vouchers past due for sixty days or more. Under these circumstances your directors deemed it advisable at their May meeting, in order to conserve your cash resources, to omit the declaration of a dividend payable in June. As a result of these efforts made to reduce expenditures to a minimum, and the substantial reduction in the salaries of the higher officials) and increased efficiency of employees resulting from a better labor supply due to depression in general business, together with reduction in wages ordered by the United States Railroad Board, your Company was able notwithstanding the reduction in expenditures for Additions and Betterments to the lowest point consistent with safety of operation and reasonably satisfactory service, accompanied by some improvement in the volume of traffic, a better showing was made during the last six months of the year and the customary dividend of 2% was declared in November payable January 3rd, 1922. The directors of your Company are keenly alive to the hardship to many of its stockholders resulting from any interruption in the regular payment of dividends, and the deferring of the dividend which would ordinarily have been paid in June was due only to their conviction that its payment at that time would have interfered with the ability of the Company to meet promptly and adequately its obligations to its creditors and to the public. The period of deflation through which your Company, in common with the other carriers of the country, has been passing has had, as a result of the necessity of substantial sacrifice by many, including the employees and the officers as well as the stockholders of your Company.

Your directors think it proper to point out the fact that there is sometimes a misapprehension as to the significance of the dividend which indicates a given percentage earned upon outstanding capital stock. The balance of income after payment of fixed charges of your Company, for example, constitutes a fund out of which must be paid not only dividends to the stockholders but also to retain other obligations, notably sinking funds on outstanding bond issues and other payments accruing on maturing equipment trusts. Payments of this character by your Company during 1921 aggregated \$1,968,270, an amount equal to approximately 3% upon your Company's capital stock. Provision must also be made out of income for certain of the other directors' personal obligations. The amount of time required to be made. Amounts thus expended accrue to the benefit of the stockholders in the form of additions to the Company's permanent investment, but the portion of the surplus of the Company that is so invested is, of course, not available for dividends.

In common with other companies your Company is seeking further readjustments in its labor costs where these are out of line with those prevailing in other industries. Reductions in wages, however, are naturally not accepted readily by your employees and the matter must ultimately be settled by decision of the United States Railroad Labor Board, which cannot be expected for some months. On the other hand there is insistent pressure by shippers for a reduction in freight and passenger rates, many of which have already become effective as a result of orders of the Interstate Commerce Commission. Should the Commission be forced by pressure brought to bear upon it to order such reductions, before we were effective your Company can reduce its present operating costs, the improvement now in progress in your Company's financial condition is likely to be considerably interfered with.

Pursuant to authority previously given by the stockholders and after approval by the Interstate Commerce Commission upon due application, the properties of The Chesapeake and Ohio Northern Railway Company were, effective December 1, 1921, conveyed to your Company and the properties of the Chesapeake and Ohio Railway Company, which were acquired January 1, 1922, leased to your Company for nine hundred and ninety-nine years. As a condition of the conveyance by The Chesapeake and Ohio Northern Railway Company your Company assumed direct liability for \$1,000,000 first mortgage 5% bonds of that Company, and these bonds appear upon the balance sheet, page 17.

During the year the line and grade revision on the Coal River District between St. Albans and Ferrell, a distance of 4.2 miles, was completed and put in operation. This revision gives a maximum of .2 per cent compensated grade against eastbound or empty traffic and a .5 per cent compensated grade against westbound or empty traffic and permits of the use of heaviest equipment on this District, due to the elimination of a tunnel of small section.

Second track on the Logan Division was completed and put in operation between Clover Valley and Salt Rock, a distance of 9.6 miles, and between Big Creek and Pecks Mill, a distance of 9.7 miles, which makes a continuous stretch of second track on this Division between Barboursville and West Hamlin, 18 miles, and between Big Spring and Peach Creek, 14.4 miles, leaving a single track section between West Hamlin and Big Creek of 3.1 miles.

The Hazy Creek Branch extending from Edwight up Hazy Creek of Coal River about 2.2 miles, was constructed by the Rowland Land Company, taken over by the Railway Company and put in operation. At Gladstone, Va., the eastbound yard, consisting of 14 tracks, was extended to hold 90 car trains, and at Hinten, W. Va., the eastbound yard, consisting of 10 tracks, was extended to hold 80 car trains; two additional tracks to hold 100 car trains or locomotives were constructed at St. Albans to hold 80 car trains were constructed at Tram, Ky., three tracks were added to the yard at Ashland, Ky., two tracks were added to the yard at Shelby, Ky., and two tracks were added to the yard at Paintsville, Ky.

Model shop buildings, consisting of new power plant, 10 stall round-house, storeroom, oil house, icehouse and toilet buildings, were constructed at Clifton Forge, Va., rectangular frame engine house to hold two engines was constructed at Raleigh, W. Va., and the frame engine house at Thurmond, W. Va., was extended during the year.

100 foot Turntables at Russell, Ky., and Peach Creek, W. Va., 85 foot turntables at Stevens, Ky., and 70 foot turntables at Netherland, Ky., and Clifton Forge, Va., were replaced with new 100 foot twin span turntables, new 100 foot twin span turntable was built at Ashland, Ky., second hand 70 foot turntable was installed at Paint Creek Junction, W. Va., in addition to which the existing 100 foot turntables at Fulton, Va., Ronceverte, W. Va., and Cheviot, Ohio, were strengthened.

Interlocking plant was constructed during the year at Big Sandy Junction, Ky., the junction of Big Sandy Division with the main line.

During the year bridge O2 at Brems, Va., was replaced with heavier bridge; at Bridgetown, Ohio, trestle over Cleves and Bridgetown Pike was renewed with steel bridge, and three trestles on Chicago Division were filled.

Water Softening Plants were constructed at Russell, Ky., Concord, Ky., and Stevens, Ky.

New Freight Depot was built at Logan, W. Va., and small depots were constructed during the year at Hilton Village, Va., Atlee, Va., and Sweetser, Va.

Additional fire protection was installed at 17th Street, Richmond, Va., for protection of shop properties.

There are now under construction at Peach Creek, W. Va., 5 additional yard tracks and building dispatching tracks, which work should be completed during the year of 1922.

The three channel spans of Licking River Bridge at Covington, Ky., are being replaced with heavier span, which work should be completed during the year of 1922.

New Passenger Stations are now in process of construction at Covington, Ky., and Logan, W. Va., which should be completed during the year of 1922. New Westbound Yard, consisting of seven 100 car tracks, is now under construction at Gladstone, Va., which work should be completed during the year of 1922.

Automatic Train Control System is being installed between Charlottesville, Va., and Staunton, Va., a distance of about 40 miles, which work should be completed this year, and when completed will give a continuous section of automatic control from Gordonsville, Va., to Staunton, Va., a distance of about 61 miles.

Among the new local industries were the following:
 25 manufacturers of farm implements and farm products.
 13 lumber producers.
 31 manufacturers of mineral, metal and other products.
 42 new coal mines.

Your directors again acknowledge with appreciation the faithful and efficient service of the directors of your Company, since 1909, and Vice-President from July 1, 1915, to the time of his death. Appropriate resolutions of regret and appreciation were adopted by your directors with reference to his death. Effective June 17th, 1921, Mr. W. J. Luderbach was elected a director of your Company to succeed Mr. Davis.

Your directors again acknowledge with appreciation the faithful and efficient service of your officers and employees.

By order of the Board of Directors,
 H. E. HUNTINGTON, Chairman.
 W. J. HARAHAN, President.

[ADVERTISEMENT]

Twenty-third Annual Report of The Hocking Valley Railway Company

Columbus, Ohio, May 18, 1922.

To the Stockholders:

The Twenty-third Annual Report of the Board of Directors, for the fiscal year ended December 31, 1921, is herewith submitted.

The average mileage operated during the year was 350.1 miles, a decrease compared with previous year of 1.1 miles. The mileage at end of the year was 350.1 miles.

RESULTS FOR THE YEAR.	
Operating Revenues	\$14,093,001.38
(Decrease \$3,008,491.78 or 17.59%)	
Operating Expenses	11,572,394.38
(Decrease \$4,369,040.19 or 27.41%)	
Net Operating Revenue	\$2,520,607.00
(Increase \$1,360,548.41 or 117.28%)	

Operating Revenue	\$11,062.36
Operating Expenses	(Decrease \$124,996.87 or 16.4%)
Operating Income	\$1,085,544.64
Net Income	(Increase \$1,519,745.28 or 80.9%)
Net Income	(Decrease \$1,530,967.11 or 110.6%)
Operating Income	\$1,560,741.26
Operating Expenses	(Decrease \$777,284.45 or 15.1%)
Net Income	256,018.59
Operating Income	\$1,816,809.85
Operating Expenses	(Decrease \$224,050.40 or 15.1%)
Net Income	79,700.91
Operating Income	\$1,737,628.91
Operating Expenses	(Decrease \$341,812.92 or 16.4%)
Net Income	1,724,326.63
Operating Income	(Increase \$10,323.39 or 0.6%)
Net Income for the year	\$14,306.29
Operating Expenses	(Decrease \$331,489.53 or 95.8%)

RETURN ON PROPERTY

The following table shows the amount of return to your Company, from transportation operations only, upon its investment in road and equipment at the termination of each year for the five year period ended December 31, 1921. The road having been operated in 1918, 1919 and January and February, 1920, by the United States Railroad Administration, the Compensation payable by the Government has been used for those years and for January and February, 1920, in lieu of the operating and other items corresponding therewith:

YEAR ENDED	PROPERTY INVESTMENT	TOTAL OPERATING INCOME	PER CENT. OF RETURN
1921	\$54,329,923.35	\$1,532,557.63	2.82
1920	53,556,347.92	1,802,110.54	3.38
1919	49,426,318.18	2,425,609.11	4.95
1918	48,057,539.03	2,598,474.64	5.41
1917	46,237,820.24	3,060,174.97	6.62
Average	\$50,203,521.74	\$2,283,801.78	4.55

FINANCIAL

The changes in funded debt shown by balance sheet of December 31, 1921, as compared with December 31, 1920, consisted in the payment of \$369,000 on equipment trusts; and in the addition of (a) the issue of \$24,000 additional face amount of equipment obligations under Equipment Trust No. 32, and (b) \$1,053,000 face amount of Ten Year Six Per Cent. Postal Notes (secured by \$1,404,000 face amount of Six Per Cent. General Mortgage Bonds, Series A, held by the Secretary of the Treasury as collateral), being the portion received this year of the loan of \$1,665,000 authorized by the Interstate Commerce Commission under the provisions of Section 210 of the Federal Railways Act, to which reference was made in the Annual Report for 1920. It is expected that the balance of the latter loan, \$612,000, will be received before July 1, 1922, and that the additions and betterments toward the cost of which the proceeds of the loan have been appropriated will be completed or contracted for by that date.

Additions and betterments were made during the year to the net amount of \$970,959.75 of which \$770,641.87 was added to cost of road, and \$200,317.88 was added to cost of equipment.

During the year thirteen cars your Company's net addition to property accounts has been as follows:	
Equipment	\$7,976,513.59
Additions and Betterments	8,663,489.59
	\$16,940,003.18

GENERAL REMARKS.

The equipment in service December 31, 1921, consisted of:

Locomotives owned	123	No change
Locomotives leased under equipment trusts	28	No change
Locomotives held under other form of title	10	No change
Total	161	No change
Passenger train cars owned	72	No change
Freight train and miscellaneous cars owned	12,267	Decrease 52
Freight train cars leased under equipment trusts	2,498	No change
Freight train cars under special trusts	47	No change
Total freight train and miscellaneous cars	15,312	Decrease 52

The changes during the year in accrued depreciation of equipment account was as follows:

Balance at credit of account December 31, 1920	\$3,557,857.08
Amount credited during year ended December 31, 1921, by charges to Government	\$87.37
Amount credited by charges to operating expenses	482,168.54
	\$182,255.91
Charges to account for	
Accrued depreciation on equipment retired during year	9,441.80
Accrued depreciation on cars changed in class during year	340.27
	9,822.07
	472,433.84
Balance at credit of account December 31, 1921	\$4,010,280.92

The second track between Marion and Mehal, which was completed as well under way in 1920, was completed during the year. The new track consisted, together with the sidings abolished, added 8.64 miles to the second track in operation. The section of second track between Columbus and Allerman was extended 3.1 miles. As a result 1.2 miles of 72 ton trucks at Toledo Dock, 3.02 miles of 72 ton trucks at Wallbridge and 1.05 miles of 74 ton trucks at Parsons were retired and placed in service. The tracks constructed in Parsons Vail

included extension of North inbound engine tracks to facilitate movement between enginehouse and fuel station. A new lead to Parsons enginehouse from Model, a distance of approximately one mile, was under way in 1920. Approximately 1.99 miles additional siding at Marion, 1.4 miles at Upper Sandusky, and 1.05 miles at Marion, and a second interchange track with the N. Y. C. & St. L. R. at Estoria were completed and placed in service. An old wooden trestle 162 feet long, at Carroll, which was of insufficient length for the altered adequate roadway, was replaced by a new steel girder bridge, 33 feet long, with ballast floor.

The coal crushing plants in connection with the fuel stations at Wallbridge, Carroll, Parsons and Nelsonville, and the new track scales at Nelsonville and New Straitsville, which were reported in the Annual Report, 1920, were completed. The 60 ft. turntable at Pomeroy, which was inadequate for handling the heavy locomotives now used on the River Division, was replaced by a 75 ft. table released at Wallbridge several years ago when a 70-ton capacity was installed. A new wooden water tank 70,000 gallons capacity, with steel supports, was constructed at Dundas. The revenue coal and coke tonnage was 10,798,493 tons, a decrease of 7.8%; the revenue freight tonnage was 1,994,682 tons, a decrease of 4.4%. Total revenue tonnage was 12,993,175 tons, a decrease of 6.2%. Freight revenue was \$11,924,979.21, a decrease of 18.4%. Freight train mileage was 1,067,487 miles, a decrease of 18.0%. Revenue ton miles were 1,570,895,171, a decrease of 20.4%. Ton mile revenue was 7.39 mills, an increase of 2.6%. Revenue per train mile was \$11.17, a decrease of .5%. Revenue tonnage per train mile was 1,471 tons, a decrease of 3.0%; including Company's freight, the tonnage per train mile was 1,502 tons, a decrease of 2.7%. Tonnage per locomotive, including Company's freight, was 1,767 tons, a decrease of 1.8%. Revenue tonnage per loaded car was 45 tons, a decrease of 1.5%. Tons of revenue freight carried one mile per mile of road were 4,485,562, a decrease of 20.4%.

There were 1,022,177 passengers carried, a decrease of 26.0%. The number of passengers carried one mile was 37,370,739, a decrease of 21.6%. Passenger revenue was \$1,702,021.29, a decrease of 16.8%. Revenue per passenger per mile was 3.898 cents, an increase of 19.1%. The number of passengers carried one mile per mile of road was 106,743, a decrease of 21.5%. Passenger train mileage was 620,394, a decrease of 0.4%. Passenger revenue per train mile was \$2,044.71, a decrease of 1.0%. Freight mail and express tonnage was 1,924,321 tons, a decrease of 9.0%. Passenger service train revenue per train mile was \$2,39.8, a decrease of 9.6%.

There were 7,021 tons of new 100-lb. rails and 3 tons of new 90-lb. rails, equal to 44.7 track miles, used in the renewal of existing main tracks. The average amount for repairs for repaired locomotives was \$68.73, a decrease of 35.4%; per passenger train car \$1,099.89, a decrease of 45.9%; per freight train car \$176.85, a decrease of 39.0%.

Due to the complexity of the accounts involved and the necessity of carefully checking over the number of entries, the Annual Report was not practically for your Company to secure a final settlement with the Director General of Railroads for the period of Federal control or with the Interstate Commerce Commission for the so-called Guaranty Period, March 1 to September 30, 1920. Your directors and officers are making every effort to reach a conclusion in these matters as promptly as possible and are receiving the cordial cooperation of the Government authorities. As the amount of any settlement in either of these accounts is still impossible of ascertainment no accrual in respect thereof has as yet been included in your income account.

In the Annual Report for 1920 reference was made to the substantial falling off in the volume of business subsequent to January 1, 1921, and the probability of a resulting unsatisfactory showing for the year 1921. The conditions presented in the Annual Report for 1921 throughout the year with the result that, notwithstanding the increase of about 40% in your Company's average freight rates effective in the summer of 1920, the gross earnings of your property were less by more than \$3,000,000 than during the year 1920. Meanwhile, though some reductions in rates were effected as a result of decisions of the United States Labor Board, most of the heavy operating costs resulting from war conditions including the working rates established by Governmental authority and a still excessive labor cost, continued, and your Company was unable, notwithstanding drastic reduction of working in official service, to avoid the effect of curtailing of purchases wherever possible, to wholly avoid the effect of the falling off of business.

These conditions, together with the fact that your Company enjoyed for the first two months of 1920 a compensation payable on your contract with the Director General of Railroads, resulted in the reduction of the net income of your Company revealed on page 3 of this report. Under these circumstances your directors deemed it advisable at their May meeting, in order to conserve your resources, not to declare a dividend payable in June. The customary dividend of two per cent, payable December 31, 1921, was declared in November, and was substantially all paid out of the accumulated surplus of your Company, the income for the year being insufficient therefor. The directors of your Company are keenly alive to the hardship to many of its stockholders resulting from an interruption in the regular payment of dividends, and the deferring of the dividend which would ordinarily have been paid in June was due only to their conviction that its payment at that time would have interfered with the ability of the Company to meet promptly its obligations to its stockholders, creditors, and the public. The period of deflation through which your Company, in common with the industries of the country generally has been passing, has involved the necessity of substantial sacrifices by many, including the employees and the officers of the stockholders of your Company.

In common with other companies your Company is seeking further readjustments in its labor costs where these are out of line with those prevailing in other industries. Reductions in wages, however, are naturally not accepted readily by your employees and the matter will ultimately be settled by decision of the United States Railroad Labor Board, which cannot be expected for some months. On the other hand there is insistent pressure by shippers and patrons for a reduction in freight and passenger rates, some of which have already become effective as a result of orders of the Interstate Commerce Commission. Should the Commission be forced by pressure brought to bear upon it to order further substantial reductions, before your Company can reduce its present operating costs, improvement in your Company's financial condition is likely to be considerably interfered with.

Your directors regret to announce the death, on May 2, 1921, of Mr. Frank H. Davis, a director of your Company since 1909, and Vice-President from July 1, 1918, in the time of his death. Appropriate resolutions of regret and appreciation were adopted by your directors and accepted by his death. On June 16, 1921, Mr. Garrett B. Wall, Vice-President of your Company, was elected director to succeed Mr. Davis.

During the year Messrs. Samuel P. Bush and Frederick J. Reynolds, directors of your Company, resigned. The resignations were accepted with regret by Messrs. John Galvin and William N. Cott were elected to succeed them.

Appreciative acknowledgment is hereby made to officers and employees for their efficient service during the year. By order of the Board of Directors: H. E. HUNTINGTON, Chairman. W. J. HARAHAN, President.

Railway Officers

Executive

R. S. Marshall, has been appointed assistant to the president of the Chesapeake & Ohio and the Hocking Valley, with headquarters at Richmond, Va., effective June 15, succeeding C. S. Lake, resigned.

Winfield S. Haines, master mechanic of the Hornell Region of the Erie at Dunmore, Pa., has been appointed assistant to the vice-president in charge of operation, with headquarters at New York, effective June 15.

Operating

E. Stroud has been appointed trainmaster of the Southern Pacific, Portland division, with headquarters at Eugene, Ore., effective June 13.

R. E. Titus has been promoted to assistant superintendent of the Idaho division of the Oregon Short Line, with headquarters at Nampa, Idaho, effective June 25, to succeed **R. A. Brooks** promoted to superintendent of the Montana division, with headquarters at Pocatello, Idaho. He succeeds **C. E. Brooks** transferred to the Utah division with the same headquarters in place of **R. A. Pierce**.

Lynne L. White, whose promotion to superintendent of the Chicago division of the Erie, with headquarters at Chicago, effective June 10, was reported in the *Railway Age*

of June 17, page 1514, was born on July 2, 1889, at Kenwood Park, Iowa, and entered railway service on March 10, 1904, as a file clerk in the office of the division passenger agent of the Chicago, Rock Island & Pacific at Cedar Rapids, Iowa. Thereafter, excepting for the period from December 1, 1905, to April 1, 1906, when he attended business college, he was employed in various stenographic and clerical capacities in passenger and division operating offices on the Chicago, Rock Island & Pacific at

Cedar Rapids, Iowa, and Esterville, until June 1, 1907, when he entered the employ of the St. Louis-San Francisco, as stenographer and clerk for the division superintendent at Enid, Okla. He re-entered the service of the Chicago, Rock Island & Pacific, on November 5, 1907, as stenographer and clerk in the division superintendent's office at Cedar Rapids, Iowa, and from that time served consecutively as stenographer and clerk at Cedar Rapids, Iowa, from November 5, 1907, to March 1, 1909; as secretary to the division superintendent and later to the general superintendent at Cedar Rapids from March 1, 1909, to November 20, 1911; as clerk in the office of the general superintendent at Davenport, Iowa, from November 20, 1911, to May 15, 1912; as secretary to the general manager at Des Moines, Iowa, thereafter until February 28, 1913, and as chief clerk in the division office, and for a portion of the time night chief dispatcher at Manly, Iowa, thereafter until February 16, 1918, when he entered the employ of the Erie, holding the position of chief of the several regional offices in Chicago until October 1, 1920, when he was promoted to trainmaster of the Hammond division, with headquarters at Hammond, Ind., the position he held at the time of his recent promotion.

Robert E. Ryan, whose promotion to general manager of the Minneapolis & St. Louis with headquarters at Minneapolis, Minn., effective June 15, to succeed **Elliot E. Nash** resigned

to accept service with another company, was reported in the *Railway Age* of June 17, page 51, was born September 18, 1872, in Newbern, N. C., and commenced his business career as a telegraph operator in the employ of the Western Union, serving in that position at St. Louis, Kansas City, Mobile and New Orleans for eight years thereafter. He entered railway service in 1894 as an operator on the St. Louis, Iron Mountain & Southern. He continued with that road as operator and agent at various stations on the Arkansas division for several years, following which he served as trainmaster at Poplar Bluff, Mo., and Little Rock, Ark. On November 1, 1908, he became trainmaster on the Iowa Central, now part of the Minneapolis & St. Louis, at Marshalltown, Ia. Two years later, he was promoted to assistant superintendent of the Minneapolis & St. Louis at Watertown, S. D., and on September 1, 1917, was advanced to superintendent of the Central and Western divisions with headquarters at Minneapolis, holding this position until his recent promotion to general manager.

R. E. Ryan

Financial, Legal and Accounting

D. J. Bond, assistant comptroller, has been appointed comptroller of the Minneapolis, St. Paul & Sault Ste. Marie, effective June 15, succeeding **C. W. Gardner**, retired.

Lewis A. Bell, whose promotion to comptroller of the New York, Chicago & St. Louis, with headquarters at Cleveland, Ohio, effective May 23, was reported in the *Railway Age* of June 3, page 1317, was born on September 20, 1875, at Toledo, Ohio, and entered railway service September, 1891, as telegraph operator on the New York, Chicago & St. Louis. After serving as telegraph operator and station agent from September, 1891, to August, 1899, he entered the employ of the Chicago Junction, where he served consecutively as freight claim investigator, traveling auditor and chief clerk to the auditor until November, 1908, when he was appointed examiner of accounts for the Interstate Commerce Commission. A few years later he was placed in charge of the Chicago office of this department of the commission where he also completed a course of study in law at Chicago Kent College in 1913 and was admitted to law practice in 1916. He was subsequently advanced to assistant chief examiner of accounts, a position he held at Chicago and later at Washington until October, 1918, when he was placed in charge of the Washington office and the several branch offices throughout the country, giving attention to the commission's certification of the carriers standard returns and

L. A. Bell

L. L. White

acting also as referee in the merchants' and miners' and the Ulster & Delaware cases. He re-entered railway service June 15, 1920, as auditor on the New York, Chicago & St. Louis and continued in this capacity until May 10, 1922, when he was appointed comptroller of the Lake Erie & Western, with headquarters at Cleveland, Ohio, the position he held at the time of his recent promotion.

T. Broom, secretary of the Chicago Junction, has resigned to become treasurer of the syndicate, which is to construct the new Union Stock Yards in Los Angeles, Cal., of which J. A. Spoor, A. J. Leonard and H. E. Poronto will constitute the managing board.

Henry S. Mitchell, whose election as general counsel of the Minneapolis, St. Paul & Sault Ste Marie, with headquarters at Minneapolis, Minn., to succeed H. B. Dike retired, was reported in the *Railway Age* of June 10, page 1326, was born at Milwaukee, Wis., in 1882, studied at the University of Minnesota, from 1901 to 1905, and was educated in law at Oxford University, England, from which he was graduated in 1908. Subsequently, he was employed as an instructor in the law school of the University of Minnesota until 1910, when he engaged upon the practice of law in Minneapolis. He relinquished this work four years later to become special assistant to the attorney general of the United States at Washington, D. C., where he remained until 1921, when he was appointed advisory counsel with headquarters in New York city, in which capacity he represented the government during the following year. He entered railway service on January 19, 1922, as assistant general counsel of the Minneapolis, St. Paul & Sault Ste Marie, with headquarters at Minneapolis, Minn., and continued in this capacity until June 1, 1922, the date of his election as general counsel to succeed Mr. Dike.

H. S. Mitchell

Engineering, Maintenance of Way and Signaling

G. W. Hegel, chief engineer of the Chicago Junction, with headquarters at Chicago, has resigned to go to Los Angeles, Cal., where he will have charge of an important construction enterprise in connection with new stock yards, connected with the Union Pacific.

H. N. Huntsman, assistant engineer of the Wabash with headquarters at Montpelier, Ohio, has been promoted to division engineer of the St. Louis Terminals, with headquarters at St. Louis, Mo., effective June 15, to succeed J. T. Vitt, who is transferred to the Springfield division with headquarters at Springfield, Ill., to succeed Edward Shelah, promoted to the newly-created position of inspector of maintenance.

Traffic

S. A. Campbell has been appointed division freight agent of the Norfolk & Western, with headquarters at Winston Salem, N. C., succeeding F. W. Jones, promoted.

F. D. Hammer, assistant general passenger agent of the Wabash, with headquarters at St. Louis, Mo., has been transferred temporarily to Detroit, Mich., effective June 5.

R. A. Bishop, general agent, freight traffic, of the Chicago Great Western, has been appointed division freight and passenger agent at Red Wing, Minn., effective June 1.

A. W. Nelson, traveling freight agent on the Chicago Great Western, with headquarters at St. Louis, Mo., has been promoted to general agent to take charge of the newly established agency at St. Louis, Mo.

Paul P. Hastings, whose appointment to the newly created position of general freight agent of the Atchison, Topeka & Santa Fe, with headquarters at San Francisco, Cal., was reported in the *Railway Age* of May 27, page 1263, was born at Farmington, Kan., October 22, 1872, and attended the National Business College at Kansas City, Mo. He entered railway service in August, 1891, as an employee on the Atchison, Topeka & Santa Fe and served as freight clerk at Phoenix, Ariz., from April 1, 1895, to December 1, 1898, when he left railway service to become traffic manager of the United Verde Copper Company at Jerome, Ariz., where he remained until September 1, 1900. Beginning October 1, 1900, he was engaged as auditor and general freight and passenger agent of the United Verde & Pacific Railway with headquarters at Jerome, Ariz., until December, 1902, when he became associated with mining interests in southern Arizona and Mexico. He re-entered railway service as auditor on the Atchison, Topeka & Santa Fe at Prescott, Ariz., in April, 1903, following which he served as auditor at Prescott until March, 1907, as general freight and passenger agent with the same headquarters until June, 1912, and thereafter as assistant general freight agent with headquarters at San Francisco, until February, 1908, when he became assistant to director of traffic of the United States Railroad Administration with headquarters at Washington, D. C., in charge of the freight rate department. Thereafter he continued as assistant to the director of traffic until February, 1920, and thence as special traffic assistant, division of law, until January, 1921, when he relinquished his connection with the United States Railroad Administration to become a member of the Standing Rate Committee of the trans-continental freight bureau, with headquarters at Chicago, the position he held at the time of his recent appointment as general freight agent.

Paul Hastings

Purchasing and Stores

W. McMaster, purchasing agent of the Indiana Harbor Belt, with headquarters at Chicago, has been appointed purchasing agent also of the Chicago River & Indiana and the Chicago Junction, with headquarters at Chicago, in which capacity he succeeds S. Salter, heretofore purchasing agent of the Chicago Junction.

Obituary

James Franklin Ingram, retired bridge engineer of the Louisville & Nashville and an employee of that company for 57 years, died in Louisville, Ky., June 9, at the age of 87 years.

C. P. Torrey, superintendent of transportation of the Hocking Valley, with headquarters at Columbus, Ohio, died at his home in that city, June 9, after having been in the service of that company for a period of 30 years.

THE MISSOURI, KANSAS & TEXAS burns approximately 10,000 bbl. of fuel oil a day in its locomotives. It is the third largest consumer of fuel oil in Texas.

Another Way To Save— And Earn

ON a number of roads, passenger engines are running from 400 to over 700 continuous miles.

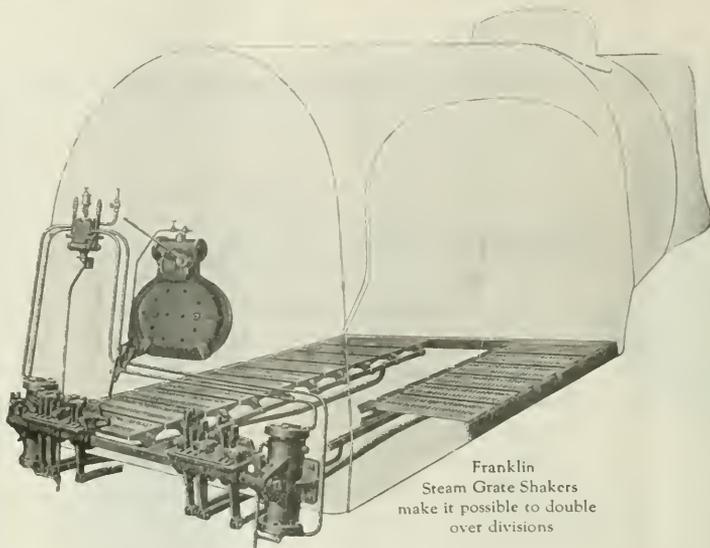

These long runs are making money for the railroads. They reduce the number of engines in use; they eliminate a great deal of maintenance, and they save an immense amount of stand-by loss in coal.

The better your locomotives, the more you can save by lengthening your runs. The Vitalizing Factors, on new or old locomotives, collectively add 30 to 80 per cent more power per pound of fuel, according to speed.

Vitalize a locomotive and it will pull more tons a greater distance than it ever did before.

G. M. Basford Company

We will gladly answer any questions concerning vitalizing factors and their uses. Write us at 17 East 42nd Street, New York City.

Franklin
Steam Grate Shakers
make it possible to double
over divisions

Full Steam Pressure All the Way

LONGER locomotive runs are logical to secure greater service from the locomotive investment.

But keeping locomotives longer on the road involves keeping their fires clean. Here is where the Franklin Steam Grate Shaker fits in.

When a fire becomes over 8 inches deep, little air gets through the grates to assist combustion.

A man firing heavily has no time to stir the fire by hand; so coal impurities collect on the grates to form clinkers and the fire grows steadily worse.

But with grate shaking made easy by the Franklin Steam Grate Shaker, just a touch of a lever shakes the grates by power and keeps the fire free and clean.

Limiting locks prevent any possibility of the grates dumping when the fireman only wants to stir the fire.

When you try longer locomotive runs, as you will, use a Steam Grate Shaker engine.

This will help keep full steam pressure all the way.

ROME SUPERIOR STAYBOLT IRON

The Big Moment

There are many big moments in the life of a staybolt.

Every time the fire-door is opened the fire-box breathes — and staybolts must bend.

When the throttle is moved, when the fire is cleaned — staybolts must bend with the movement of the fire-box sheets.

Only a well-made, puddled pig iron will stand up in staybolt service.

Such an iron is Rome Superior.

These boilers, removed because of a recently enacted state law prohibiting the use of boilers after 30 years' service, were fitted with boiler tubes made of Parkesburg Charcoal Iron. After 40 years of service, these tubes of Parkesburg Charcoal Iron are in almost perfect condition.

The Longer They Last, The Less They Cost

THE discriminating motorist buys a 12,000 or 10,000 mile tire in preference to the one guaranteed for 5,000 miles. He willingly pays the higher price because he knows the tire of longest mileage is really the cheapest.

Unfortunately, operating, mechanical and geographical conditions make it impracticable to guarantee the service life of any boiler tube.

But this much we know: On road after road, Parkesburg Charcoal Iron Boiler Tubes are giving much longer service than that previously received from tubes of other material.

Retube a few of your locomotives with Parkesburg Charcoal Iron Boiler Tubes. Select your most troublesome district for the test. Compare the service and figure the comparative cost.

A little folder with an interesting story of the Charcoal Iron Boiler Tube. Send for a copy.

"V" Pilot Packing

In Spiral Form

"V" Pilot Packing in spiral form comes in 10 ft. lengths from one quarter inch in diameter up, including all one sixteenth sizes.

In ordering specify whether for steam, air or water service.

"V" Pilot Packing combines the wear resisting features of solid metal packing with the easy adaptability of the soft, fibrous packing.

It presents a continuous metal bearing surface to the rod; backed by a resilient fabric of asbestos.

Service results on "V" Pilot Packing have proven an increase in packing life of several hundred per cent.

FLANNERY F. B. C. WELDED FLEXIBLE STAYBOLTS

Flannery F. B. C. Welded Flexible Staybolts

The shorter sleeve projection in the sheet and around the bolt body under the head of F. B. C. Flexible Staybolts not only permits greater range of flexibility, but is particularly advantageous in renewing fireboxes or sheets.

Slight errors in hole alignment, after sleeve is secured, are also readily accommodated because of this feature.

If you are not familiar with all the features of F. B. C. Welded Flexible Staybolts—let us send complete information today as to how you can advantageously standardize on the F. B. C. Staybolt.

FLANNERY BOLT CO.

PITTSBURGH, PA.

FAITH JUSTIFIED

On May 30th a special silk train on the Lackawanna, consisting of one coach and six refrigerators, left Black Rock, N. Y., at 1:30 a. m., arriving at Hoboken, N. J., at 9:18 a. m.—a distance of 401 miles in 468 minutes. This time includes five stops for water and change of engines. The train was hauled by three Alco designed and built locomotives, one of which is shown above.

The importance of this shipment dictated the necessity for locomotives of unusual stamina—faith in Alco influenced their selection, which the gratifying results abundantly justified.

This performance must impress those who seek the utmost in design and construction, with the desirability of Alco qualities, and you may profitably consider whether or not you can afford to invest in locomotives that do not embody them.

A BALDWIN MIKADO WHICH DEVELOPS A TRACTIVE FORCE OF 54,700 POUNDS
 Cylinders, 26x30". Driving wheels, diameter, 63". Total weight, 290,800 pounds. Weight on drivers, 221,500 pounds

More Than 500 Baldwin Mikados Built for The Baltimore & Ohio

THE Baltimore and Ohio was among the first of the great railroad systems in the United States to introduce the Mikado type on a large scale.

The first Baltimore & Ohio Mikados were built by these Works in 1911, and due to their success, orders for additional locomotives of this type soon fol-

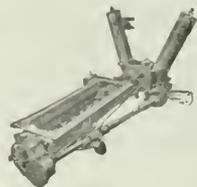

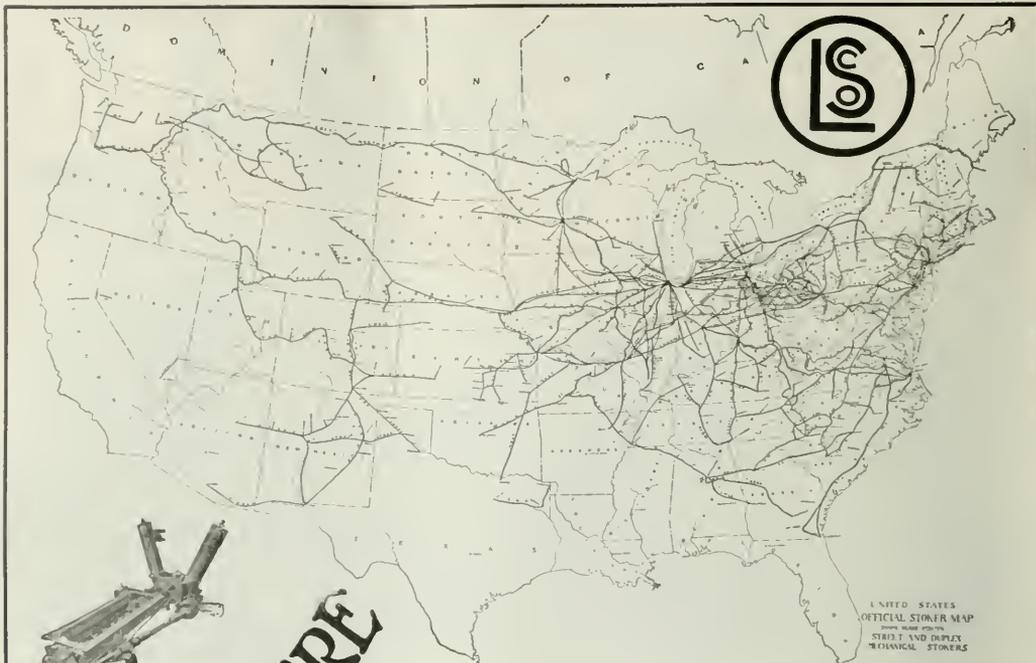

lowed. The total number of Baldwin Mikados thus far built for this railroad is 520.

These locomotives have been generally distributed over the system and are now working the greater part of the through freight traffic, excepting on certain mountain divisions where Mallet and Ten-Coupled locomotives are used.

The illustration shows Engine 4507, a Class Q-3 Mikado, hauling 4343 adjusted tons, in 57 loaded cars, on the run from Wilsmere, near Wilmington, Del., to Jersey City. The full rating for Class Q-3 on this division is 4400 adjusted tons.

WABCO

A TYPICAL WABCO performance. A number of switching locomotives on hard 24-hour shifts were requiring new Driver Brake Cylinder Packings every few weeks. Then WABCO Cups were given a trial, with this result:

After two years the WABCO Cups were still in service—and still air-tight. These locomotives average 160 miles a day, 10 months a year, 96,000 miles in two years—nearly four times around the World!

The marvelous durability of WABCO Brake Cylinder Packing Cups has been established beyond dispute. They are not affected by any brake cylinder temperature encountered under actual operating conditions, will not deteriorate in oil or water, and permit of free cylinder lubrication with any standard grease.

"In Use Since Eighteen Forty-Four"

How Many "Frame Failures" Have You Had in Six Years ?

ON one large road, on which Vanadium Steel Frames have long been standard, there were only three frame failures in six years. Two of these were caused by the failure of other parts of the locomotives.

Vanadium steel is stronger and tougher than plain carbon steel. It has a much higher elastic limit or useful strength. Its Vanadium content gives it a greater resistance to shocks and dynamic stresses.

We have some interesting data on the service life of Vanadium Steel Frames on many of the largest roads. May we submit them to you?

Hamilton, Ont.

A New ZAPON Vestibule Curtain Material of great tensile STRENGTH

This new material has been developed especially for vestibule curtains. It is made in full width of $63\frac{1}{2}$ — $64\frac{1}{2}$ inches, the selvedge edges running parallel with the pull. This eliminates the necessity of binding cut edges and insures greatest strength where the severest strain occurs.

The usual high-grade Zapon coating on a heavy duck backing gives a tensile strength that will withstand service under the severest conditions. The material is so constructed that it will not stretch nor become baggy.

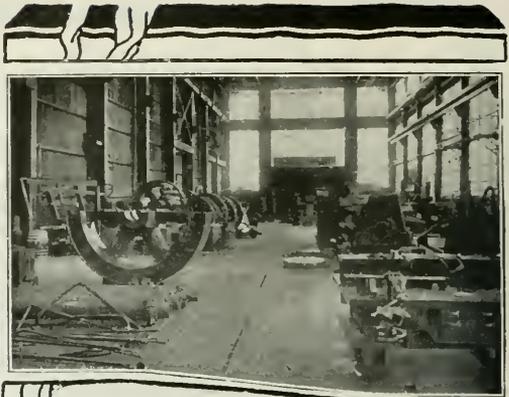

Zapon Special Vestibule Curtain Material has been adopted as standard by one of the largest makers of Railroad Cars. Complete information at your request.

Choosing a Floor To Fit the Service

Johns-Manville Industrial Flooring is made to exactly the right degree of hardness needed for the service to be met. It can be laid hard and rugged so as to stand up under the rough, heavy work in locomotive and machine shops, as well as roundhouses and freight stations, or it can be made suitable for passenger platforms—resilient, and easy under foot, yet practically wearproof. In addition it is dustless, sanitary and quiet.

Johns-Manville Industrial Flooring

will also meet temperature extremes far better than any other monolithic floor. It retains its qualities indefinitely and resists longest the marks of time and wear. Whether it undergoes the mildest or most severe usage its maintenance cost is always lowest.

G-W MATERIAL HANDLING EQUIPMENT

Gifford-Wood coaling station for the New York Central Railroad at White Plains, N. Y.

Do Your Coaling Stations Possess the Three Essentials?

Do they facilitate speedy unloading of coal from cars, keeping the tracks clean, and at the same time deliver coal to locomotive tenders? Are they absolutely dependable and reliable under all conditions of weather and work? Do they give full, lasting service maintaining their initial efficiency year after year?

If your equipment is Gifford - Wood you can answer, yes, without hesitation. If it is not, our engineers will be glad to consult with you to achieve that end.

Exhaustive studies and hundreds of installations have determined our types of machinery and methods of construction.

The continued addition of G - W coaling stations on representative lines attests to a degree of service and efficiency which is above the usual.

The Gifford-Wood Company specializes in elevating and conveying machinery for all lines of industry. These products include coal pockets, screens, elevators, conveyors, hoppers, locomotive coaling stations, railroad icing stations, elevating and conveying equipment for ashes, stone, sand, gravel, ice (manufactured and natural); wagon loaders, portable belt conveyors, pivoted bucket carriers, warehouse conveyors, car unloaders, friction clutches, hoists, ice tools, etc.

Cools Off Hot Boxes Instantly

MOHAWK COOLING COMPOUND

Gentlemen:—

I received the sample of Mohawk Cooling Compound for cooling hot journals on cars and used the entire sample on one of my thru freight runs.

I take pleasure in telling you that it "does the job." I asked the Conductor on this run to give it a good try-out and personally investigated the results. They were satisfactory in every respect, frequently saving this train delays on line of road by allowing us to run a bad "hot box" to a terminal instead of setting it out on line of road or delaying the train while the train crew brassed the car.

Twice the Work—Half the Men

Western

**Western Wheeled Scraper Co.
Earth and Stone Handling Equipment
AURORA, ILLINOIS**

3

The most efficient and economical ditching equipment is a ditching machine coupled between two Western 20-yard air dump cars. Thus equipped a crew can dodge traffic and do twice the work with half the men, as compared with flatcar and unloading plow equipment. Make your dump car requisitions read "Western." Made in all practical sizes. A. R. A. construction throughout. Illustrated catalog on request.

Patented April 23, 1918

Schaefer Truck Lever Connections

For Freight, Passenger and Engine Tender Equipment

Used by the Largest Railroads in the Country

Made from one-piece open-hearth steel, drop forged jaws, no welds. Lighter in weight, greater strength. Made in styles and sizes to suit all conditions.

SUPER SAFETY HAND BRAKE

(Patented)

"Named by Service — Praised by all"

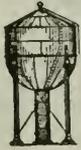

It insures safety to men, lading and cars: It has 3 times more power; It maintains "wise-like" every pound used on brake wheel: It cannot kick when releasing: the use of "club" is unnecessary.

Minimum charge \$1.00 for each insertion. For Sale advertisements, \$3.00 a column inch (1" deep x 1 3/8" wide). Any number of inches may be used. Copy must be in this office by Saturday noon to insure insertion in the following week's issue.

POSITION OPEN

A LEADING organization desiring to fill an important position for obvious ethical and other reasons, cannot invite directly the candidacy of any particular man. Similarly, no well connected man will exploit personally his own qualifications, no matter how receptive he may be to overtures. The undersigned has been retained by a national clientele for many years, as a medium for negotiating preliminaries in such cases. Your permission to send booklet discussing this problem and describing the service, will in no degree obligate or compromise you. Strictly confidential. R. W. Bixby, Inc., 302 Lockwood Bldg., Buffalo, N. Y.

POSITION OPEN

WANTED: High grade man to take charge of foundries of large chilled iron railroad car wheel producer in middle west. Prefer combination of executive and technical man. Write fully, stating present employment, past experience, age, etc. Also state salary expected, although the right man will be paid the right salary. Unless your capabilities and experience are of high grade, do not write, as even if employed then the position would prove only temporary, because this is a job that must sooner or later be occupied only by first class man. Address Box 373 Railway Age, 608 S. Dearborn street, Chicago.

POSITION OPEN

WANTED: Experienced locomotive elevation and detail draftsmen. Apply to H. K. Porter Co., 49th St., Pittsburgh, Pa., giving full details, including age, education, experience and salary expected.

POSITION WANTED

WANTED position as superintendent or trainmaster by young man who is qualified. Can furnish excellent reference. Address Box 377, Railway Age, Woolworth Building, New York City.

EDUCATIONAL

SEND for Free Special Bulletin and learn how to increase your knowledge of practical railroad work and fit yourself for promotion. The Railway Educational Bureau, Omaha, Nebr.

Space on this page is a result getter. Use it.

WANTED

To represent two old established concerns manufacturing standard railway equipment, and doing business in the South. Car specialties preferred. We cover regularly, and have good connections in the states of Florida, Georgia, Tenn., Alabama, Mississippi, Louisiana and Texas. Address Victory Equipment Co., 414 Maison Blanche Annex, New Orleans, La.

CANADIAN FACTORY DESIRES TO MANUFACTURE RAILWAY SPECIALTIES FOR AMERICAN FIRMS

We have a small, well equipped factory in Canada, now engaged in manufacturing Railway specialties for our own use. We are in a position to take on additional work, suitable for our machines, and would like to hear from manufacturers who desire to have their material made in Canada. Address

W. F. DONALDSON
1801 Winnemac Ave.
Chicago Illinois

Second-hand Equipment
to Sell?**

The Get-Together Department is the proper place to put your advertisement. Your sales message goes direct to the men interested in the purchase of second-hand equipment.

7,554 NEW RAILROAD CARS

(European Types)

For sale by the **WAR DEPARTMENT**

By sealed bids closing **JULY 6, 1922**
at 3 P. M. (Eastern Standard Time), at

WASHINGTON, D. C.

*Types, Locations and
Quantities of Cars
Offered in This Sale*

At Norfolk, Va.

(Quartermaster Intermediate Depot)

75 Box Cars

529 Flat Cars

1,550 Low Side Gondolas

3,650 High Side Gondolas

(No tarp, rigging)

1,450 High Side Gondolas

(With tarp, rigging)

At Brooklyn, N. Y.

(General Intermediate Depot)

1st Ave. and 59th St.

300 Low Side Gondolas

*The Government reserves
the right to reject any or
all bids.*

The cars offered in this sale were built by American manufacturers for military service in France. They are unused, but the government does not guarantee their condition.

Component parts of these cars are stored in lots of 50 cars each at Norfolk, Va., with one or two exceptions, where lots include a smaller number of cars.

Contents of the various lots of cars are listed in the standard packing list on file in the office, Chief of Engineers. The War Department does not guarantee that all parts necessary are contained in each lot. Bids must be for lots as they now exist. One car has been assembled at Norfolk Q. M. Intermediate Depot for inspection by prospective bidders.

No proposal will be considered unless accompanied by certified check of 10% of bid. Bids must be made in duplicate upon special form sent upon request.

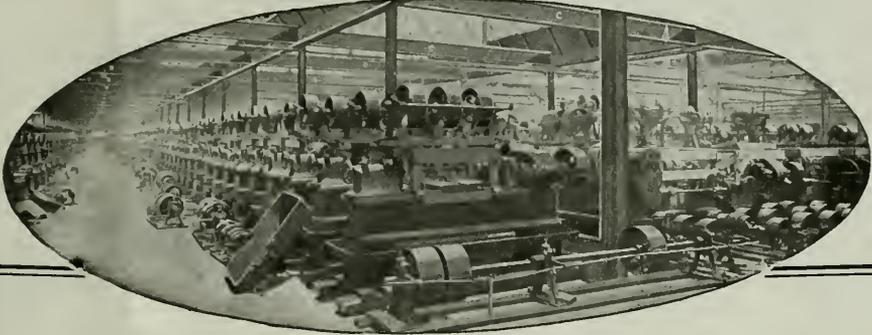

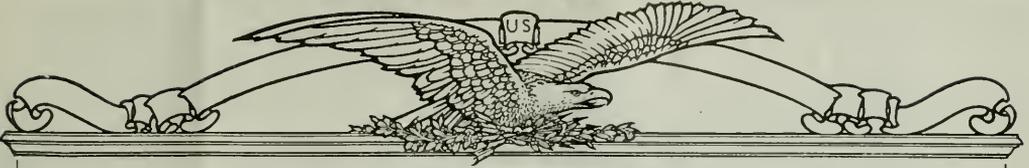

Send for Proposal Blank and full information, which is necessary before making inspection and filing bid. Address:

Chief of Engineers

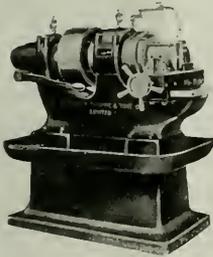

2828 Munitions Bldg.
WASHINGTON, D. C.

WAR DEPARTMENT

Get Your Shop Equipped to the last needed machine

You can't afford to miss a trip through the War Department's great warehouse full of machinery. It will be a revelation. Your own equipment needs will spring into instant response to the possibilities revealed. Send a man or go yourself to

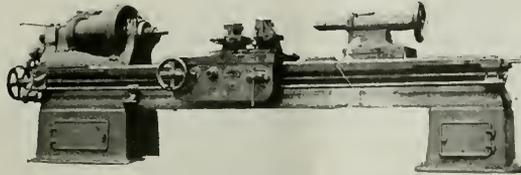

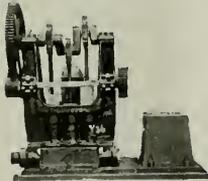

CHICAGO, During JUNE or JULY

There are:—

Lathes up to 26 in. swing by 16 ft. bed; Grinders; Pumps (Hydraulic); Accumulators; Hydraulic Fittings; Forging Presses; Steam Hammers; Power Presses; Blowers; Furnaces; Air Compressors; Magnets; Jib Cranes; Roller Conveyor; Miscellaneous Shop Maintenance Supplies. The sale is by negotiation, and you may easily complete your purchase at once. The Government will accept any price it considers reasonable, but reserves the right to reject any or all bids.

Write to Chairman,

**Chicago District Ordnance Salvage Board,
7400 South Ashland Avenue, Chicago, Ill.**

BUYERS INDEX

Roller Bearings—(See Bearings, Roller)
Roofing, Asbestos.
 Johns-Manville, Inc.
 Robertson Co., H. H.
Roofing, Car.
 American Sheet & Tin Plate Co.
 Chicago-Cleveland C a r Roofing Co.
 Hutchins Car Roofing Co.
 Lebon Co., The
 Sharon Pressed Steel Co.
 Standard Railway Equipment Co.
 United Alloy Steel Corp.
Roofing, Corrugated.
 American Sheet & Tin Plate Co.
 Robertson Co., H. H.
Roofing for Buildings.
 Texas Co.
Roofing, Gypsum.
 Robertson Co., H. H.
Roofing, Tin.
 American Sheet & Tin Plate Co.
Roofing, Wood.
 Exchange Sawmills Sales Co.
Rope, Wire—(See Wire Rope)
Running Boards, Car.
 Standard Ry. Equipment Co.
Railroad Structures—(See Engineers and Contractors; Also Buildings)
Saddles, Running Board.
 Miter, W. H.
Sand Drying Plants.
 Roberts and Schaefer Co.
Sand Rammers.
 Oldham & Son Co., Geo.
Saws, High Speed Friction.
 Ryerson & Son, Joseph T.
Saws, Portable, Rail.
 Fairbanks Morse & Co.
 Industrial Works, Q. & C. Co., The
Scrapers, Wheel and Drag.
 Western Wheeled Scraper Co.
Screws, Lag.
 Boss Nut Co.
Seats, Car.
 Hale & Kilburn Corp.
 Heywood-Wakefield Co.
Shafting.
 Falls Hollow Staybolt Co.
 Ryerson & Son, Joseph T.
Shapes, Pressed Steel.
 Greenville Steel Car Co.
 Merton Mfg. Co.
 Sharon Pressed Steel Co.
 Ryan Car Co.
Shapes, Structural.
 Illinois Steel Co.
 Interstate Iron & Steel Co.
 Ryerson & Son, Joseph T.
Shapers.
 Niles-Bement-Pond Co.
 Ryerson & Son, Joseph T.
 Sellers & Co., Inc., Wm.
Shed Trains.
 American Bridge Co.
 Arnold Co.
Sheets, Black and Galvanized.
 American Sheet & Tin Plate Co.
Sheets, Corrugated.
 American Sheet & Tin Plate Co.
 Robertson Co., H. H.
Sheets, Electrical.
 American Sheet & Tin Plate Co.
Sheets, Locomotive Jacket.
 American Sheet & Tin Plate Co.
Sheets, Polished or Platinized Iron.
 American Sheet & Tin Plate Co.
Sheets, Steel.
 Ryerson & Son, Joseph T.
Shops, Railroad—(See Buildings, Iron, Steel and Steel Concrete)

Siding, Corrugated and Plain.
 American Sheet & Tin Plate Co.
 Robertson Co., H. H.
 United Alloy Steel Corp.
Signal, Accessories.
 Electric Storage Battery Co.
Signal, Federal.
 Federal Signal Co.
 General Ry. Signal Co.
 Hall Switch & Signal Co.
 Union Switch & Signal Co.
Signals, Automatic Cab.
 Miller Train Control Corp.
 Union Switch & Signal Co.
Signals, Railway.
 Federal Signal Co.
 General Ry. Signal Co.
 Hall Switch & Signal Co.
 Union Switch & Signal Co.
Skylights.
 Robertson Co., H. H.
Solder.
 More-Jones Brass & Metal Co.
Spikes.
 American Steel & Wire Co.
 Illinois Steel Co.
Splice Bars, Angle.
 Illinois Steel Co.
Spring Plates or Seats.
 Allegheny Steel Co.
 National Malleable Castings Co.
Springs.
 American Steel Foundries.
 American Steel & Wire Co.
 Railway Steel Spring Co.
 Standard Steel Works.
 Union Spring & Mfg. Co.
Springs, Machinery For Repairing.
 Ryerson & Son, Joseph T.
Stacks, Steel.
 American Bridge Co.
 Graver Corp.
 Pittsburgh - Des Moines Steel Co.
Staybolts.
 American Locomotive Co.
 Ewald Iron Co.
 Falls Hollow Staybolt Co.
 Flannery Bst Co.
 Rome Iron Mills, Inc.
 Ryerson & Son, Joseph T.
Staybolts, Hollow.
 Falls Hollow Staybolt Co.
 Ryerson & Son, Joseph T.
Steam Chests.
 Franklin Railway Supply Co., Inc.
Steam Shovels.
 Orton & Steinbrenner.
Steel, Alloy.
 United Alloy Steel Corp.
Steel, Fabricated.
 Steel Fabricating Corp., The
Steel, Firebox.
 Illinois Steel Co.
Steel, Heat Treated.
 United Alloy Steel Corp.
Steel Plate Construction.
 Blaw-Knox Co.
 Graver Corp.
 Pittsburgh - Des Moines Steel Co.
Steel, Pressed Specialties.
 Hale & Kilburn, Corp.
Steel, Structural.
 American Bridge Co.
 Blaw-Knox Co.
 Gifford-Wood Co.
 Graver Corp.
 Illinois Steel Co.
 Pittsburgh - Des Moines Steel Co.
Steel, Structural.
 Ryerson & Son, Joseph T.
 Steel Fabricating Corp., The
Steel, Tool.
 Illinois Steel Co.
 Midvale Steel & Ordnance Co.
 Ryerson & Son, Joseph T.
 United Alloy Steel Corp.
Stokers, Locomotive.
 Birn Mechanical Stoker Co.
 Locomotive Stoker Co.

Stringers, Bridge.
 American Lumber Co.
 Mummet Lumber & Tie Co.
Superheaters.
 Babcock & Wilcox.
 Superheater Co., The
Switches and Switch Stands.
 Ramapo Iron Works.
Tacks.
 Interstate Iron & Steel Co.
Tamping Machines, Die.
 Ingersoll Rand Co.
Tanks, Air, Gas and Oil.
 American Bridge Co.
 American Locomotive Co.
 Babcock & Wilcox.
 Graver Corp.
 Tokheim Oil Tank & Pump Co.
Westinghouse Air Brake Co.
Tanks, Storage, Cast Iron.
 Conveyors Corp. of America
Tanks, Water.
 American Locomotive Co.
 Babcock & Wilcox.
 Graver Corp.
 Pittsburgh-Des Moines Steel Co.
Tape, Insulating.
 Johns-Manville, Inc.
 Westinghouse Elec. & Mfg. Co.
Taps, Machinists.
 Greenfield Tap & Die Corp.
Taps, Staybolt.
 Ryerson & Son, Joseph T.
Terminals, Freight.
 Ferguson Co., H. K.
Terminals, Railroad.
 Bush, Roberts & Schaefer.
 McClelland & Junkersfeld, Inc.
 Robinson Co., Dwight P.
Testers, Gage.
 Ashton Valve Co.
Testing Machines, Drop.
 Whiting Corp.
Ties, Crossed.
 American Crosscutting Co., Inc.
 The Century Wood Preserving Co.
 International Crosscutting & Constr. Co.
 Mummet Lumber & Tie Co.
Ties, Steel.
 American Bridge Co.
Ties, Wood.
 American Crosscutting Co., Inc.
 The Century Wood Preserving Co.
 Duncan Lumber Co.
 Exchange Sawmills Sales Co.
 Mummet Lumber & Tie Co.
Timber, Railway.
 American Crosscutting Co., Inc.
 The Century Wood Preserving Co.
 Duncan Lumber Co.
 International Crosscutting & Constr. Co.
 Exchange Sawmills Sales Co.
 Mummet Lumber & Tie Co.
Tires, Steel.
 Edgewater Steel Co.
 Railway Steel Spring Co.
 Standard Steel Works.
Torches, Welding and Cutting.
 Air Reduction Sales Co.
Track Tools.
 Verona Tool Works.
Tractors, Industrial.
 Elwell Parker Electric Co.
Tractors, Turntable.
 Nichols & Bros., Geo. P.
 Whiting Corp.
Trailers, Industrial.
 Sharon Pressed Steel Co.
Train Control Systems.
 Federal Signal Co.
 Miller Train Control Corp.
 National Safety Appliance Co.
 Union Switch & Signal Co.
Tramways (Wire Rope).
 American Steel & Wire Co.

Transfer Tables.
 American Bridge Co.
 Blaw-Knox Co.
 Brown Hoisting Mch. Co.
 Industrial Works.
 Whiting Corp.
Transmission Towers.
 Blaw-Knox Co.
Traps, Steam.
 Crane Co.
Treads, Safety.
 American Abrasive Metals Co., Inc.
 American Mason Safety Tread Co.
 Merton Mfg. Co.
Treatment, Water—(See Water Softening and Purifying)
Truck Frames—(See Frames, Truck)
Trucks, Car and Locomotive.
 American Bridge Co.
 American Steel Foundries.
 Baldwin Locomotive Works.
 Franklin Railway Supply Co., Inc.
 Standard Car Truck Co.
Trucks, Electric Storage Battery.
 Elwell Parker Electric Co.
Trucks, Industrial.
 Elwell Parker Electric Co.
 Sharon Pressed Steel Co.
 Whiting Corp.
Trucks, Trailer.
 Franklin Railway Supply Co., Inc.
Tubes, Arch.
 Parkersburg Iron Co.
Tubes, Boiler.
 Allegheny Steel Co.
 Parkersburg Iron Co.
 Ryerson & Son, Joseph T.
Tubes, Boiler, Charcoal, Iron.
 Parkersburg Iron Co.
Tubes, Stay.
 Falls Hollow Staybolt Co.
Tungsten, Metal.
 Vanadium Corp. of America.
Turntables.
 American Bridge Co.
 Edgewater Steel Co.
Turnbuckles.
 American Bridge Co.
 Industrial Works.
 Whiting Corp.
Underframes, Steel.
 Greenville Steel Car Co.
 Reiston Steel Car Co.
 Ryan Car Co.
Upholstery, Car.
 Mass. Mohair Plush Co.
 Zapon Leather Cloth Co.
Valves, Balanced Slids.
 Young, C. C.
Valves, Blower and Blow Off.
 Crane Co.
Valves, Cab.
 Crane Co.
Valves, Drifting.
 Franklin Railway Supply Co., Inc.
Valves, Globe.
 Crane Co.
Valves, Piston.
 Franklin Railway Supply Co., Inc.
Valves, Pop, Safety and Relief.
 Ashton Valve Co.
 Crane Co.
 Westinghouse Air Brake Co.
Valves, Pressure Regulating.
 Train Control Systems.
 Varnishes.
 Murphy Varnish Co.
Ventilators, Car.
 Mudge & Co.
Vapor Car Heating Co., Inc.
 Wine Railway Appliance

Ventilators, Shop and Round-house.
 Dickinson, Inc., Paul
 Johns-Manville, Inc.
 Robertson Co., H. H.
Washers.
 National Malleable Castings Co.
 Wine Railway Appliance Co.
Washing Systems, Boiler.
 National Boiler Washing Co.
Water Columns—(See Columns, Water)
Water Cooling Equipment.
 Giessele Co., Henry
Waterproofing Materials.
 Lebon Co., Thas.
Water Purifying Materials and Compounds.
 Dearborn Chemical Co.
Water Softening and Purifying.
 Dearborn Chemical Co.
 Graver Corp.
Wedges, Automatic.
 Franklin Ry. Supply Co., Inc.
Wedges, Journal Box.
 American Steel Foundries.
 National Malleable Castings Co.
 Steel Car Forge Co.
Welding Machines, Flue.
 Ryerson & Son, Joseph T.
Welding and Cutting Apparatus—(See Outfitting and Welding Apparatus)
Welding Rods and Wire.
 Air Reduction Sales Co.
Wheels, Car and Locomotive.
 American Locomotive Co.
 American Steel Foundries.
 Baldwin Locomotive Works.
 Edgewater Steel Co.
 Illinois Steel Co.
 Railway Steel Spring Co.
 Standard Steel Works.
Wheels, Mine Car.
 Edgewater Steel Co.
Wheels, Pressed Steel Motor Car.
 Fairbanks Morse & Co.
 Mudge & Co.
Wheels, Steel and Steel Tread.
 Edgewater Steel Co.
 Illinois Steel Co.
Wheel Centers, Driving.
 American Locomotive Co.
 American Steel Foundries.
 Baldwin Locomotive Works.
 Edgewater Steel Co.
 Standard Steel Works.
Whistles, Locomotive.
 Ashton Valve Company.
 Westinghouse Air Brake Co.
Windows, Weatherproofing.
 Merton Mfg. Co.
Wire.
 American Steel & Wire Co.
 Kerite Insulated Wire & Cables
Wire, Barb.
 American Steel & Wire Co.
Wire, Fence.
 American Steel & Wire Co.
 Interstate Iron & Steel Co.
Wire, Insulated.
 American Steel & Wire Co.
 Kerite Insulated Wire & Cable.
Wire, Rail Bond—(See Rail Bonds)
Wire, Rope.
 American Steel & Wire Co.
Wire, Telephone and Telegraph.
 American Steel & Wire Co.
Wood Preservatives—(See Preservatives, Wood)
Wrecking Cranes—(See Cranes, Wrecking)
Wrenches.
 Coes Wrench Co.
