INDEX

Seventy-Second Quarto Volume—January 1, 1922, to June 30, 1922

AUTHORS

- Aht, S., 263
Acworth, Sir William M., 261, 558,
1051, 1716
Adler, Charles, Jr., 1269
Aishton, R. H., 598
Armstrong, W. R., 1270
Artaud, T. P., 337
Augur, R. C., 49
- Bailey, F. J., 461
Baldwin, L. W., 1233
Barnes, W. H., 1104
Barr, Wm. M., 364
Basford, G. M., 177, 1053, 1549
Beuwkees, R., 1053
Beyer, O. S., Jr., 1290
Binkerd, Robert S., 236
Brown, Nelson Courtlandt, 743
Buell, D. C., 1287
Burnett, W. S., 1285
- Cain, P., 413
Campbell, J. M., 1162
Caracristi, V. Z., 745
Carter, Charles Frederick, 581
Carter, F. W., 778
Castle, O. C., 811
Chamberlin, William F., 1061
Chorley, R. W., 412
Clagett, Brice, 1471
Clements, M. F., 1333
Cobb, Earl, 1289
Cole, J. E., 66
Colston, Col. W. A., 1745
Comstock, G. F., 1324
Cayler, Thomas De Witt, 5
- Davis, James C., 1169
Delano, Frederic A., 1004
Downs, L. A., 599, 626
Du Brul, Ernest P., 1559
Dudley, S. W., 1604
Dunn, J. H., 143
Dunn, Samuel O., 1105, 1163, 1211,
1271, 1743
Dyer, Gus M., 699
- Eldridge, J. L., 462
Emerson, Harrington, 1011
Ennes, S., 1746
- Farrell, H. E., 364
Fay, Thornwell, 75
Fish, F. P., 344
Fisher, Charles E., 953
Fisher, Walter L., 481
Ford, Robert H., 1009
Foss, Charles W., 47, 58, 133, 771,
829, 1055, 1119, 1347
French, D. K., 907
- Garwood, E. F., 1159
Gibson, Grant, 1160
Giordano, Antonio, 85
- Glazier, J. G., 1162
Glisson, Harry B., 873
Goldstein, Dr. J. M., 91
Gormley, M. J., 1007
Grande, Julian, 88
Gray, Willis E., 862
Green, W. H., 313
Grewe, H. F., 423
Griffin, M. T., 111
- Haggander, G. A., 730
Hanna, D. B., 1065
Hendricks, V. K., 270, 779
Hennessy, J. J., 487
Hershsberger, David C., 216
Hines, Walker D., 287
Hooper, S. U., 1236
Hoover, Herbert, 379
Howard, James E., 237
Howsou, E. T., 36
Huffman, J. T., 510
- Jackman, W. T., 567, 735
Johnson, A. C., 1161
Juneau, C. G., 223, 1270
- Kellenberger, K. E., 137
Kennicott, Cass, 1168
Koach, K. H., 55, 1341
Kraeger, Frank W., 124, 127, 131
Kruttschnitt, J., 6
- Lacher, W. S., 43, 53
Landon, W. G., 907
Lane, Harold F., 9, 15, 27, 39, 1227
Loughton, H. H., 1697
Lee, Elisha, 1593
Leighton, George B., 954
Leshner, C. E., 1284
Lewes, R. C., 954
Lisman, F. J., 477
Long, A. E., 312
Lyne, James G., 113, 115
- McAdoo, W. G., 327, 371
McFetridge, W. S., 1275
McKelligon, A. S., 1703
Markham, C. H., 7
Marks, G., 469
Marshall, R. C., Jr., 698
Mell, C. D., 744
Meyer, Eugene, 343
Milner, B. B., 101
Moore, Milburn, 147, 149
Morton, E. H., 812
Myers, A. C., 214
- Oehler, Alfred G., 61
- Parker, F. A., 362
Parkes, Charles E., 512
Parkes, Holcombe, 31
Parmelee, Julius H., 119
- Partington, James, 909
Payne, J. L., 70, 1297
Peabody, F. S., 1283
Peabody, J. A., 1053
Peck, C. B., 43, 471
Pershall, E. E., 269
Peschaud, M., 81
Phillips, W. C., 533
Porterfield, J. F., 976
Powell, T. C., 826
Pownall, W. A., 794
Pyeatt, J. S., 75
- Reder, G., 93
Rhoads, Stanley, 525
Robbins, Col. F. G., 1024
Roberts, J. W., 529
Roberts, M. S., 215
Robinson, A. F., 369
Robinson, Bird M., 1029
Robinson, Joseph, 906
Robinson, W. L., 1234
Rudd, A. H., 1345
Rusch, Frank, 833
- Sands, C. Radford, 953
Schwann, F. S., 1004
Scott, Prof. Charles F., 727
Shinn, Forrest S., 271
Slater, J. E., 341, 435
Smith, A. H., 7
Smith, Walter H., 1477
Sproule, William, 535
Stimson, Earl, 416
Stone, E. J., 861
Storey, W. B., 928
Stubbs, Linton W., 510
Stuebing, A. F., 51, 59
- Taylor, H. N., 1104
Thayer, Robert E., 76, 95, 105
Thompson, Slason, 811
Thornley, E. W., 1698
Titcomb, H. B., 74
Tobey, B. C., 1701
Tollerton, W. J., 1378, 1408
Tutan, G. W., 463
- Vissering, Harry, 1159
Voight, A. E., 579
- Walker, Roberts, 21
Watkins, T. H., 1283
Wendt, Edwin F., 1160
Weston, Edgar W., 417
Whitenton, W. M., 511
Whyte, F. M., 107
Wiebardt, A. J., 1051
Wintercrowd, W. H., 1173, 1229
Wise, Marion J., 1647
Wollner, William S., 583
Woodbridge, J. Lester, 1406
Woodward, E. L., 63
Wright, Paul, 312

GENERAL INDEX

[Illustrated articles are indicated thus*; Editorials thus†; Letters to Editor thus‡.]

A

- Abandoned Lines During 1921, 147*
 Ability of Cars to Pull, 460†
 Academy of Political Science; Meeting, 951†
 Accidents (See also Safety First):
 Atlanta, Birmingham & Atlantic at Union City, 751
 Atlanta, Birmingham & Atlantic near Manchester, 887
 Atchison, Topoka & Santa Fe Trains Collide, 1351
 Automobiles at Crossings, 1351, 1497, 1749
 Baltimore & Ohio near Noble, 347
 Chicago, Rock Island & Pacific near Plains, Kan., 1319†, 1332
 Frozen Signals in England, 1086
 I. C. C. Bulletin No. 80, 242; No. 81, 936 I, 1463†, 1483, 1721
 Lehigh Valley Black Diamond Express Derailed, 1176*, 1206†
 London & North Western, 450
 Louisville & Nashville near Flomanton, 1747
 New York Central at Painesville, 555†, 585
 Oregon-Washington Railroad & Navigation Company at Celilo, 1031*
 Pennsylvania near Hazlet, Pa., 887
 Pennsylvania Railroad Employees, 1033
 Pennsylvania Railroad Locomotive, 442
 Philadelphia & Reading near Woodmont (Bryn Athyn), 1687, 1733, 257, 490, 549, 840 (Conductor and Engineer Imprisoned), 1351 (Pardoned)
 Save Minutes Safety, 1319†
 Summary of Reports, 357†, 903†
 Texas & Pacific at Camps, 357†, 374
 Texas & Pacific near Mineola, 1747
- Accounting (See also Railway Accounting Officers Association):
 Auditor, Opportunities of the, 1746
 Classification of Material, 1575†, 1598
 Classification of Operating Expenses, Proposed Revision of, 1466†, 1473
 Cost of Treating Ties Charged to Maintenance, 416, 1003†, 1160†
 Depreciation, Charging, 1745
 Division; N. Y., N. H. & H., 341*, 435*
 Gasoline; Missouri Locomotive, 1600
 Knowledge, Importance of Your, 1711†
 Mandatory Rules, 58
 Material, 1652*
 Settlements with Railroad Administration, 378
 Traveling Auditor, Recognition of the, 239
 Accounts with the Railroad Administration, 39*, 191
- Acetylene Torch for Welding, 704*
 Activity in New Construction in 1921, 149*
 Acworth, Sir William M.: Can the Railroads Earn a Fair Return? 259†, 261, 558†, 811†, 1051†
- Additional Trackage Needed, 999†
 Adhesion and Kack Locomotive for Sumatra, 263†
- Adjuster, Automatic Brake Slack, 1540
 Adjustment Board (See Regional)
 Adjustment, Wage, A Much Needed, 307†
 Administration, Railroad (See United States)
 Administration, Trying to Prevent Labor Conflict, 196, 232, 243, 257†, 755
- Advertising:
 Central of Georgia, 857†, 889
 Illinois Central Advertisers Safety, 888
 Public Relations Work, 953†, 954†
 "Selling" the Railroads, 410†, 457†, 505†, 553†, 723†, 807†, 901†, 953†, 954†, 1155†, 1162†
 Space for Sale, Pennsylvania, 347
- Aeronautics, Legislation to Regulate, 491
 Africa, Railroad Notes, 449, 1251
 After Highways are Pondered to Pieces, 480
 Aftermath of Federal Control, The, 1169
 Agent, Station, How to Place for the, 1054†
 Agents as Railway Spokesmen, 725†
- Agricultural Conference:
 President Discusses Transportation, 276
 Rate Reduction Asked, 317
- Agricultural Inquiry, Report of Joint Commission of, 967, 1000†, 1015, 1112, 1346, 1480
 Agricultural Rate Reduction, Maine Roads Not Included in, 295
- Agriculture, Relation of Freight Rates to, 967
 Air Brake (See also Brake)
 Air Brake and Train Operation, The, 765†
 Air Brake Association; Annual Convention, 1544†, 1603*, 1681, 1685†, 1707*
 Air Brake Compound, Calenda, 1402*
 Air Brake Tests and English Vacuum Brake Tests Compared, 810†, 823*
 Air Brake Retaining Valve, Clark, 1428
 Air Brake Wastes, 604, 1685†
 Air Compressor, Dual Flow, 485*
 Air Compressor, Westinghouse 3 VS., 1682*
 Air Mail Service in 1921, 195, 929
 Air-Operated Auxiliary Devices, 1681
 Air Pump Strainer, 1623*
 Air Reduction Sales Company Acquires Davis-Bournonville Company, 849
 Air Separator, Thor, 1618
 Aishton, R. H.: Efficiency of Operation, 193
- Akron, Canton & Youngstown; Locomotives, Rebuilt—Operating Results, 407†, 423*
 Alarm, Low Water, 1618*, 1621*
 Alaska Railroad:
 American Railway Express Business, 1189
 Completing the Line, 813*
 All in a Day's Work, 656
 All That Glitters Is Not Gold, 212*
 Allegheny Steel Co.; Journal Box Lid, 1397*
 Allis-Chalmers Company; Annual Report, 1041
 Alloy Steels for Locomotives, 257†
 All-Steel or Composite Car, 1432†
 Amendment (See Transportation Act; also Valuation of Railways)
 American Aid for Foreign Railways, 766†
 American Arch Co.'s Double Sectional Arch, 1565*
 American Bankers' Association: Public Opinion, William Spruille can, 535*
 American Brake Shoe and Foundry Company: Annual Report, 894
 American Car & Foundry Company: Valves, Tank Car, 1429†
 American Connector, 361†, 375*, 906†, 1398
 American Engineering Council; Hoover, Herbert, on Electrification, 342
 American Engineering Standards Committee, 347, 796, 1345 (Highway Signals)
 American Farm Bureau Federation: Tractive Power and Car Capacity, 507†
 American Hose Connectors, Changes in, 375*
 American Iron and Steel Institute: Rail Production in 1921, 970*
 American Locomotive Company:
 Annual Report, 347
 Mountain and Santa Fe Types for Mania Railroad, 387*
 Mountain Types, Union Pacific, 1325*
 American Railway Association (See also Car Service Division):
 Automatic Stop Order, Objections to, 783, 859†
 Careful Crossing Campaign, 1302, 1464†
 Coal in Stock, 1748
 Directors, Additional, 394
 Division V—Mechanical:
 Canadian Night, 1404†
 Chairman W. J. Tollerton's Address, 1404†, 1405†, 1408*
 Chairman W. J. Tollerton on Work of the Mechanical Division, 1592
 Committees, A Suggestion to, 1577†
 Corrosion of Steel Cars, 1403†
 Death of Members, 1422
 Discussion of Reports, 1403†, 1431†
 Life Members, 1420
 Manual, 1303, 1586
 Mayor Bader's Address, 1407
 Next Year's Convention, 1578†
 Officers Elected, 1602
 Officers, One-Year Term for, 1683†
 Power Brake Investigation, I. C. C., 797
 Proceedings, 1403†, 1404†, 1407*, 1431†, 1435*, 1343†, 1575†, 1577†, 1581†, 1631*, 4687*
 Railroad Labor Board Members at Conventions, 1393, 1420, 1421, 1456, 1457, 1552, 1561, 1611, 1678, 1686, 1705
 Report of Arbitration Committee, 1437*
 1438, 1543†
 Report of General Committee, 1410
 Report on Design and Maintenance of Locomotive Boilers, 1687*
 Report on Feet, Water Heaters for Locomotives, 1639
 Report on Loading Rules, 1446*
 Report on Locomotive Construction, 1631
 Report on Locomotive Headlights and Classification Lamps, 1575†, 1581†, 1677
 Report on Manual, 1586
 Report on Modernization of Stationary Boiler Locomotives, 1624†, 1641*
 Report on Nominations, 1412
 Report on Prices for Labor and Materials, 1433†, 1435*
 Report on Safety Appliances, 1420
 Report on Scheduling Equipment Through Repair Shops, 1403†, 1412*
 Report on Specifications and Tests for Materials, 1576†, 1577*, 1586, 1686†
 Report on Tank Cars, 1441
 Report on Train Brake and Signal Equipment, 1543*
 Report on Train Lighting and Signal Equipment, 1432†, 1450*
 Rules of Interchange, Recommended Changes in, 1437*, 1438*
 Salinas, Leon, at Convention, 1457
 Subjects, Mechanical Department, 1543†
 Tank Car Specifications, Effective Date of, 981
 Tribute to A. W. Gibbs, 1410
 Tribute to F. F. Gaines, 1580
 Work of, 1545†, 1547, 1592
 Young Men, Make Room for the, 1431†, 1547, 1592
- Division VI—Purchases and Stores:
 Address by Elisha E. Rice, 1593
 Murphy, J. P., Resignation of, 1704
- American Railway Association (Continued):
 Officers, Election of, 1704
 Proceedings, 1575†, 1593*, 1647*, 1683†, 1697*
 Registration, 1613, 1678, 1686, 1705
 Report of Committee on Resolutions, 1704
 Report of Fuel Conservation Joint Committee, 1703
 Report of General Committee, 1596
 Report of Mechanical Committee, 1704
 Report on Classification of Material, 1575†, 1598
 Report on Distribution and Accounting for Gasoline, 1660*
 Report on Economics in the Stationery Store, 1701
 Report on Educating Employees, 1703
 Report on Fore Products, 1697
 Report on Inventory, 1654
 Report on Material Accounting, 1652*
 Report on Need of a Sinking Fund, 1697
 Report on Office Organization, 1698
 Report on Purchasing Agents' Office Records, 1674*
 Report on Reclamation of Material, 1657*
 Report on Scrap Classification, 1665*
 Report on Stores Department Book of Rules, 1596
 Report on Supply Train Operation, 1670*
 Report on Unit Piling of Materials and Numerical Numbering System, 1673
 Engineering Division—See American Railway Engineering Association)
 Freight Claim Division:
 Cut Loss and Damage in Half, 55*
 Live Suction, 348
 Payments for Three Months, 587; Year, 1921, 1034
 Interchange Practice, Recommends New, 985
 Opportunity for, An, 860†
 Perfect Track, 222, 295
 Rail, Study of Wear on, 1206†
 Safety Section Holds Meeting, 1131
 Signal Section:
 Committee on Conservation, 595†
 Meeting, Annual, 1479, 1733, 1754
 Meeting, March State, 595†, 600*, 646*
 Registration, 615, 663
 Report on Batteries, 609*
 Report on Contracts, 655*
 Report on D. C. Automatic Block Signaling, 606*
 Report on D. C. Relays, 612*
 Report on D. C. Track Circuits, 650*
 Report on Economics, 624*, 646
 Report on Electrical Testing, 623†, 647*
 Report on Highway Crossing Protection, 595†, 604*
 Report on Maintenance Rules, 601*
 Report on Mechanical Interlocking, 653*
 Report on Power Interlocking, 595†, 613*
 Report on Signaling Practice, 600*
 Report on Specifications for Oils, 610*
 Report on Standard Designs, 608*
 Report on Valuation, 645*
 Standard Highway Signals, 949†, 1345
 Telegraph and Telephone Section:
 March Meeting, 765†, 775
 Pole Lines, Permanency of, 951†
 Traffic Division—Standing Committees, 585
 Transportation Division:
 Gurnley, M. J., on Car Service Rules, 1000†, 1007
 Meeting in Chicago, 1033
 Robbins, Col. F. G., on Preparing for Heavier Business, 1024.
- American Railway Development Association: Annual Convention, 1177
- American Railway Engineering Association:
 Address of President Downs, 623†, 626*
 Aishton, R. H., on Responsibility of, 598, 624†
 Annual Convention (See also Proceedings under this head), 458†
 Annual Dinner, 698
 Bulletins, An Improvement in the, 668†
 Committee Personnel, 708†
 Downs, L. A., Presiding Officer, 707†
 Fairbairn, J. M. R., Presentation to, 645*
 Fritch, E. H., Letter from Russia to, 656
 Hotel Facilities for Convention, 667†, 707*
 Officers, New, 700*
 Proceedings, 623†, 626*, 677†, 668†, 670†, 707†, 708†, 709
 Registration, 659, 701, 708
 Report on Ballast, 631*
 Report on Buildings, 711*
 Report on Economics of Railway Labor, 642*
 Report on Economics of Railway Location, 688
 Report on Economics of Railway Operation, 709*
 Report on Electricity, 696*
 Report on Masonry, 715*
 Report on Rail, 712*, 808†, 828
 Report on Records and Accounts, 686*
 Report on Roadway, 682*
 Report on Rules and Organization, 721*

Bright Institute of Transport: Motor and Inland Water Versus Rail Transport, 266f, 1271
 Broad View of Locomotive Improvements, A, 807f
 Brotherhood of Locomotive Engineers: Coal Lands Bought, 1748
 Brotherhood of Locomotive Firemen and Engine-men Commends President Harding, 1497
 Brubaker Spiral Fluted Tap, 1623
 Bryn Athyn Collision, 1681, 173, 357f, 490, 549, 840, 1351
 Bucyrus Company:
 Annual Report, 760
 Shovel with Caterpillar Traction, 1430
 Buils Unit Power Plant, 703
 Buffalo & Susquehanna Cited to Appear Before Labor Board, 741
 Buffalo Forged Reversible Brake Beam Strut and Safety Brake Shoe Key, 1542
 Buffer, Type D Radial, 1620
 Buffing Mechanism, Top Vestibule, 1459*
 Buffalo, Rochester & Pittsburgh:
 Annual Report, 969, 996
 Cash Awards for Suggestions, 506f, 540
 Buildings (See Bridges and Buildings)
 Bull Ring, Rosgothar Piston, 1625*
 Buying Eye, for Locomotive, 1013*
 Bullseye Dust Guards, 1459
 Burchmore, J. S., Before Labor Board, 1079
 Bureau of Accounts, I. C. C.:
 Annual Report, 1020
 Revision of Operating Expense Classification, 1466f, 1473
 Bureau of Foreign and Domestic Commerce:
 Feiker, E. C., to Continue Head, 234
 Industrial Machinery Division's Services, 115*
 Bureau of Labor: Cost of Living, Wages and Rates, 321, 413
 Bureau of Locomotive Inspection, Report of, 331*
 Bureau of Railway Economics: Ratios of Operation,
 Bureau of Safety (See Interstate Commerce Commission—Accident)
 Bureau of Statistics, I. C. C.:
 Annual Report, 1020
 Seasonal Variation of Operating Income, 273*
 Trend of Freight Traffic, 226*
 Bureau of Traffic I. C. C.: Annual Report, 235
 Burma, I. C. C., Fuel Reports of, 234
 Burma, Meter Gage Mallets for, 847*
 Burnham Car Repair Company: Labor Board's Decision on Indiana Harbor Belt's Contracts, 1111, 1158*
 Business (See also Freight Car Loadings):
 Confidence in the Future, 1157*
 Government and Business, 699
 Locomotive Workship, 471
 Orders for Equipment in 1922, 1631, 211f, 357f, 506f, 857f, 905f, 1048f, 1267f (Five Months)
 Outlook Continues to Grow Brighter, 357*
 Prepares for Heavier Business, 1024
 R. B. A. Dinner, 343
 Revival, Car Loading Shows, 1206f
 Solicitation Campaign; A. T. & S. Fe, 751
 Business Handicaps of Railway Car Shop, 529*
 Buying Paint, 485, 924
 Buying Tools on Price Basis, 1266f
 Buying with Savings Produced, 707f
 Byram, H. E.: Rate Testimony, 228

C

Cab Signals, European Experience with, 926
 Cab Ventilating Unit, Sturtevant, 1074*
 Caille-Pototie Feedwater Heater, 263*
 California Electric Railway Association: "After Highways are Founded to Pieces—What?" 480
 Campbell, Commissioner, Before Senate Committee, 184
 Camps Collision, 357f, 374
 Canada:

The Worst Railway Year in History

THERE HAVE been bad years in the history of the railways of the United States before. In most respects 1921 was much the worst of all.

The declines of freight and passenger business were much the greatest ever known. The percentage of net return earned on the property investment shown by the companies' books was the smallest ever known except in 1919 and 1920, and of course in 1919 and most of 1920 their net returns were guaranteed by the government. For the twelve months ending with October 31, 1921, the net return earned on property investment was less than 2.75 per cent, and it is not probable the net return for the 12 months of the year 1921 will be found to have been any larger when the complete statistics are available. The smallest percentage of net return ever earned before in a year when net returns were not guaranteed was in 1894, when the largest slump in business previous to 1921 occurred, and when the net return earned on property investment was 3.2 per cent.

It is no exaggeration to say that throughout the year a large part of the companies were struggling to keep out of bankruptcy. The Bureau of Railway Economics estimates the year's net operating income of the Class I roads at \$616,000,000. This will not meet their fixed charges, which are: Interest, \$477,000,000; rentals, \$129,000,000; other charges, \$34,000,000; total, \$640,000,000. Many roads failed to earn enough to pay their interest.

Under such conditions it was impossible for most railways adequately to maintain their properties, much less make additions or improvements. The *Railway Age's* annual compilations of statistics, published elsewhere in this issue, show that the amount of new mileage built was the smallest in history since such records have been kept, except in 1920; that the mileage of railway lines abandoned was the largest in history, and that new low records were set for the acquisition of new equipment.

The number of new locomotives ordered for domestic service totaled only about 250, the number of freight cars ordered only slightly over 20,000, and the passenger car orders something over 200. With one or two exceptions the equipment ordered and built figures for 1921 are the lowest on record.

These statistics are very significant, but they acquire increased significance when compared with corresponding statistics for past periods of years. Prior to the adoption of government control in 1918 the number of freight cars scrapped annually had for some years been about 100,000, or almost five times as great as the number ordered in 1920. In the five years ending with 1917 the number of freight cars ordered was regarded as small compared with former years, but it averaged 108,000 a year, or more than five times

as great as it was in 1921. The number of locomotives ordered in the five years ending with 1917 was regarded as comparatively small at the time, but it averaged almost 2,400, or ten times as much as the orders placed in 1921.

One who judged entirely, or even mainly, by the foregoing facts would be obliged to conclude that railroad transportation in the United States is a dying industry. Fortunately, however, this cloud, like most clouds, has a silver lining. The conditions in the business were relatively at their worst in the early part of the year, and grew better as the year advanced. In January and February the railways as a whole not only did not earn any net return, but incurred operating deficits. Drastic retrenchments and the reduction in wages granted by the Railroad Labor Board caused the net operating income to improve, until in October it amounted to \$108,500,000. The operating ratio declined from 95 per cent in February, to 74 per cent in October. There was a sharp decline of freight business in November and December and these months will make bad showings, but throughout the entire year the tendency of operating costs was downward. Wages were reduced, improvements were made in the rules and working conditions of employees, and the prices of fuel and materials declined.

In consequence, the railways have entered the year 1922 on a lower basis of operating costs. The reduction of costs has been inadequate, but it is reasonable to assume that they will continue to decline. Under the conditions existing it is impossible to believe that the Railroad Labor Board will hesitate to grant further reductions of wages. Furthermore, it seems reasonable to assume that in 1922 there will be a gradual recovery of business from its present low level, and this is what the railways need more than anything else. Of course, however, whether there will be an increase of business is purely speculative, and will be determined mainly by developments and conditions entirely outside the control of the managements of the railways. It is evident, therefore, that the only road to safety for the railways is to continue to make the greatest efforts to secure further reductions in their operating costs, and especially in their labor and fuel costs.

If the darkest hour of all the night is just before the morning light, then the railways should soon begin to see the morning light. Certainly they never passed through a darker night than the year 1921.

While the year was marked by relatively the smallest amount of improvement work and the smallest volume of purchases ever known, there was a marked increase of orders for equipment and materials toward the close of the year, when the net earnings were becoming more favorable. This

showed that the managements were fully awake to the need for doing more improvement work and acquiring more equipment as rapidly as they became financially able. The country sorely needs a readjustment of conditions which will enable

the farmers to increase their purchases. Next to that the principal requisite for a revival of prosperity which will be real and lasting is the restoration of the earning power of the railways and of their ability to make normal purchases.

The Work of the Railroad Labor Board

PROCEEDINGS before the Railroad Labor Board were the center of interest in the railway field a large part of the time during 1921. The board has had presented to it for solution some of the most highly controversial, complicated and difficult problems ever submitted to any government body. It received much criticism from numerous sources regarding the way it dealt with these problems. Many of the criticisms made were directly contradictory to each other. In spite of the numerous criticisms passed on it, and even demands from influential interests for its abolition, it appears that on the whole the board's prestige was higher at the end than at the beginning of 1921.

It is only fair to recognize that the provisions of law under which the board acts, and the work of the board itself, must be appraised separately. The Transportation Act both specifies what the board must do and prescribes the conditions and fixes the limits of what it can do. The board should not be criticised for doing what the law requires it, or for refraining from doing what the law does not authorize it to do.

One of the most important controversies the board had to settle during the year was that over the national agreements. The board tried to act in accordance with the demands of the railways that rules and working conditions of employees should be made by direct negotiations between the individual railways and their own employees. When, however, it remanded the rules and working conditions to negotiation between the individual railways and their employees the heads of the labor unions made the negotiations almost fruitless by directing the general chairman of the unions on the individual lines to accept nothing less than the rules of the national agreements. The individual railways and their employees being unable to agree, the Labor Board was practically forced by the provisions of the Transportation Act to fix most of the rules and working conditions itself. It was impracticable for it to fix different rules and working conditions for every individual railway. As a practical matter it had to make rules of national application. In formulating these rules it seems on the whole to have done as well as it could in the circumstances. The rules made by it are a great improvement over those contained in the national agreements.

It is doubtful, however, if the board acted wisely, or even legally, in the case of the Pennsylvania. The management of the Pennsylvania and representatives of a majority of its employees at the Altoona shops reached an agreement. The board held this illegal on the ground that the road had not dealt with representatives of the labor unions concerned on the entire Pennsylvania System, who included in their membership a majority of all the shop employees. The question involved is one regarding the correct interpretation of the law. It has been taken to the courts and it is to be hoped the courts will settle it.

Another question of great importance upon which the board had to pass was that of a general reduction of wages. The railways, being in serious financial straits, asked it in substance to wipe out the entire advance in wages granted by it on July 20, 1920, and which was made effective from May 1, 1920. The board granted a reduction effective on July 1, 1921, which, however, did not seem then, and does not seem now, to have been as large as the conditions existing demanded and the provisions of the Transportation Act warranted. The cost of living in the United States, according to the best authorities, is now only about 52 per cent more than it was in 1916, while since the reduction in wages was made the average hourly earnings of railway employees working on an hourly basis are 121 per cent more than in 1916.

The failure of the board to make a larger reduction of wages has been harmful to almost everybody concerned, including many railway employees themselves. It has rendered it necessary for the railways to incur the odium of maintaining the present freight rates in spite of a general demand for reductions; it has helped to render it impossible for the railways adequately to increase their net income; it has helped to force them to continue a policy of the most drastic retrenchments in maintenance; and it has rendered it necessary for them to refrain from taking back into service many thousands of employees who otherwise would have been used in maintenance work. The railways intend to ask the board for further reductions in wages and it is difficult to see how, under existing conditions, it can refuse to grant them.

One of the most acute problems presented to the board for solution arose when the train service employees issued their order for a strike in October. It is difficult to say whether public sentiment, the attitude of the Department of Justice or the activities of the Railroad Labor Board contributed the most toward preventing the strike. At any rate, the board contributed largely. The board issued a statement at the time saying that the employees were crossing bridges long before they could get to them, since the board intended to dispose of all cases involving the rules and working conditions of any class of employees before it heard any case involving the wages of that class. This statement was generally interpreted to mean that the board would postpone for months hearing any case for reductions of wages. The *Railway Age* refused at the time to put any interpretation on the statement, saying that was for the board itself to do. Subsequently members of the board have announced that all cases involving rules and working conditions have been disposed of and called attention to the fact that no case involving wages on any large railway is before it.

It is almost two months since the railway executives met in Chicago and announced their intention to ask for further reductions of wages. It will take weeks, or even months, for

These are the only important declines of passenger business that have occurred. In 1919, when freight business fell off, passenger business substantially increased.

The decline in passenger business by months in 1921 is shown in Table II. The decline in passenger business steadily became relatively greater, month by month, until and including August.

There can be no question that these unprecedented declines of freight and passenger business were due mainly to general business conditions. A relatively small part of them may also have been due to the fact that large advances in both freight and passenger rates were made late in 1920, just when the greatest decline of commodity prices ever known was beginning. It is probable that the advances in passenger rates had more effect on traffic than the advances in freight rates. People ship freight for purely business reasons, and the rates are relatively so small a part of the prices of practically all commodities that if a market can be found for the commodities a comparatively small difference in freight rates will not prevent them from moving. On the other hand, a great deal of traveling is done for pleasure, and the fact that passenger rates are regarded as high doubtless has had a tendency in many cases to prevent people

from making trips which they otherwise would have made.

How long will it take to recover from this slump? This is a question which many are asking and which nobody can answer. Experience following past slumps may be interesting, however, even if it is not instructive. After the panic of 1893 the railways never handled a freight business equal to that year's until 1896. Each of the other declines of business was followed by a quicker recovery. The freight business of both 1908 and 1909 was less than that of 1907, but that of 1910 exceeded that of 1907. The small decline in 1911 was followed by large increases in 1912 and 1913. The business handled in both 1914 and 1915 was less than in 1913, but that of 1916 again set a new high record. The slump in 1919 lasted only a year, the business of 1920 being the largest up to the present time.

If one judged entirely by past experience he would be justified in expecting the business handled by the railroads in 1922 to be considerably larger than in 1921, but to be smaller than in 1920, and perhaps even smaller than in 1918. However, since the decline of business has been so much larger, both absolutely and relatively, than ever was known before, it would be most hazardous to venture a prediction as to how long it will take for a complete recovery to be made.

Entering Another Year of Struggle

THE YEAR 1921 was one of constant, and even desperate, struggle in the railroad business.

It was a year of struggle to reduce operating expenses.

In the first ten months of the year total expenses were reduced \$923,000,000 as compared with those of the same months of the preceding year. If the results for the entire year show a corresponding reduction it will amount to \$1,100,000,000.

Reductions of maintenance expenses may be real or merely nominal. Reductions of transportation expenses are always real. While total operating expenses were reduced 19 per cent in the first ten months of the year, transportation expenses were reduced more than 23 per cent, or relatively more than the decline of traffic. The railway managements made real progress in their struggle with expenses.

It was a year of struggle to prevent a hostile and unfair public sentiment regarding private management of railways from being formed. More misleading and downright false propaganda against the railways was disseminated than in many years. Most of it came from spokesmen and organs of the railway labor unions who were engaged in trying to blacken private management to promote the Plumb plan. Unfortunately, this propaganda had some effect on public sentiment. The necessity the railways were under of charging relatively high rates in a year of falling prices and profound business depression added greatly to the difficulties of keeping public sentiment reasonable and friendly.

Hard as was the struggle in 1921, it is to be feared it will be equally hard in 1922. The efforts to reduce operating costs will have to be continued without relaxation. It will be necessary to try to obtain further reductions of wages, and this will tend to have an unhappy effect upon the attitude and morale of employees. The agitation for general reductions of railway rates undoubtedly will be continued, and

the greatest efforts will have to be made to prevent premature and excessive reductions.

The year 1922 apparently will deal railway officers a bad hand. It is an old saying, however, that credit belongs not to the man who wins a game of cards, but to him who plays well the hand that is dealt him, whether good or bad. It is not whether a man wins a fight, but how fairly and how well he fights that counts to his credit or discredit.

Railway officers made a splendid and successful fight in 1920 to move the largest traffic ever offered. They made a splendid, efficient and courageous fight in 1921 to reduce operating expenses and prevent reductions of rates that would have been ruinous.

What the year 1922 will bring forth nobody can now foretell. That will depend very largely upon conditions beyond the control of railway officers. But railway officers can and will "carry on" with the same energy, loyalty and courage as in 1920 and 1921.

They will be fighting this year largely to determine the future of railway ownership and management in this country. They should spare no effort to make the operation of the railways as efficient and economical as possible. At the same time they should meet the selfish, malicious and misleading propaganda against private management which is coming from so many sources with redoubled courage and energy. If private management is to be made successful and to be perpetuated railway officers apparently will have to imitate the American pioneer who worked with one hand upon the plow and the other upon his rifle.

The year 1922 can be made the most memorable in railway history if railway officers will mightily resolve to run the railways as well as they can, and at the same time to return blow for blow to everybody who unfairly attacks them.

Executives Review Railway Prospects for 1922

The Background of Conditions During 1921

By Thomas DeWitt Cuyler
Chairman, Association of Railway Executives

DURING THE YEAR 1920, the chief effort of railway management was necessarily upon the improvement of the physical maintenance of the railroads and breaking up the congestion of traffic by intensive loading and movement. Hardly had the backbone of traffic congestion been broken, in October, before the general rate of business activity began to diminish and railroad traffic to decline.

So rapid was this decline that in January and February of 1921, the railroads could not even earn their operating expenses, and it became obvious that the great task before management in 1921 was to reduce the operating expenses of the railroads, and to restore their earning power, at least sufficiently to keep them out of bankruptcy.

This effort ran along two lines—one, to increase the productivity of employees by getting rid of the national agreements and other burdensome rules and working conditions, and the second consisted in a reduction of basic wages.

Wage and Freight Rate Reductions

The desire of railway management was to secure the first relief by an increase in the productivity of employees, postponing a reduction in basic wages until a later date. The relief which they actually secured came in just the reverse order. A reduction in basic wages, amounting to approximately 12 per cent, became effective on July 1, but it was late in 1921 before the railroads began to receive any relief from burdensome rules and working conditions.

Between the reduction in wages, effective July 1, and a very severe cutting of maintenance expenditures, the railroads will probably make for 1921 a net operating income between \$550,000,000 and \$600,000,000. This will mean that interest on funded and unfunded debt can be met, but that normal dividends will not be earned.

With the more or less rapid and unequal fall in commodity prices, the relation of freight rates to commodity values became of increasing importance as the year 1921 progressed, and led to widespread demands for reductions in rates. In meeting this situation the railroads, of course, had no wartime profits to fall back upon. They were at the same time operating under costs, nine-tenths of which had been set by governmental authority, directly or indirectly, and they had no ability to make rapid changes to meet changing economic conditions. It has been and is, however, the earnest intention of the railway executives to get railway transportation and railway rates as rapidly as possible back into a normal relation to the industry and agriculture of the country. They can do this, however, only step by step.

Some misunderstanding in the public mind may have been occasioned by the inability of the railroads to translate their wage reduction of July 1 into rate reductions. It must be remembered, however, that when the increase in rates was

made in 1920 it was expected to give the railroads a fair chance at a 6 per cent return, on the basis of a flow of traffic such as the railroads experienced at the end of 1919 and for the greater part of 1920. With the enormous decline in business activity, the rates established by the Interstate Commerce Commission did not produce the return contemplated, and many railroads would not have been able to earn even their fixed charges during 1921 had it not been for the wage reduction of July 1.

Under these circumstances it was, of course, impossible for the railroads to make general rate reductions predicated upon this wage reduction. As, however, their situation improved, during the second part of 1921, the railway executives attempted to find a method whereby the desire of the country for lower rates could be gradually met. They feel that they have found this method in the action adopted at their meeting of October 14, when they decided to request another reduction in basic wages, and undertook to turn over to the public in the shape of reduced rates the full benefit of this reduction. This policy recognizes that the cause of high rates is high operating expense, and that the chief item in excessive operating expense is excessive labor cost.

Earning Power Must Be Restored

Of the threatened railroad strike in October, little need be said. The reaction of public opinion to this threat was one of the most hopeful indications that this country is going to work its way back to normal conditions in accordance with fundamental American principles.

The chief danger in the present situation is that the great body of our people may overlook for the moment the importance to them of allowing the railroads to get back on their feet financially. Yet this in itself would make a very substantial contribution toward resumption of normal business. The railroads are the country's largest single industry; they consume about a third of the normal product of the coal and steel industries; and are large consumers in many other lines. There is a substantial deferred maintenance carried over from the period of federal control, and probably as much deferred maintenance accrued during the present year. In addition, by causes outside of the control of railway management, the railroads have practically been in a condition of arrested development now for some years past. Without in the least denying the desirability and ultimate necessity of substantial reductions in railroad rates, it is sincerely to be hoped that shippers will not demand, and that the Interstate Commerce Commission will not require, from the railroads rate reductions so great as to make it impossible for the railroads to restore their earning power during the coming year, and to assume their normal place as the greatest single consumer of the products of other industries.

How to Better Railroad Conditions

By J. Kruttschnitt

Chairman of the Southern Pacific Company

YOU ASK: 1. *What can and should be done by railroad managements to better existing railway conditions?*

Railroad managers will continue to exercise the close watch over expenses that in 30 years has resulted in handling *four times* the traffic units in 1920 that were handled in 1890, in *two-thirds less train miles* than 1890 operating conditions would have required. The annual savings each year compared with 1890 were large, the cost of handling the enormous traffic of 1920 being \$6,742,000,000 less than the cost of handling it by 1890 methods. This *saving* is \$633,000,000 *more than the entire operating expense* of the railroads in 1920 notwithstanding high cost of wages and materials. Without adequate revenues and improved credit, which the Transportation Act was designed to produce, but which it has not been allowed to do, little can be done to reduce operating costs by elimination of curves and reduction of grades and distances, but managers must seek to improve technical details of manufacture of rails, castings and other materials; and of locomotive design, so as to reduce consumption of fuel, and to convert more of the heat energy in fuels into useful work by the free use of appliances of merit, with such little control over operations as remains in their hands.

2. *What can and should be done by railroad regulating authorities to better the railroad situation?*

(a) The Transportation Act, 1920, passed after years of close study and bitter experience, was designed to nourish and restore the railroads that had been starved well nigh to dissolution by a generation of repressive and punitive regulation, and to enable them to provide adequate facilities for the public by constructing new and improving existing lines. The effect of the long period of punitive regulation is reflected in the construction of only 314 miles of new line in 1920 compared with 717 miles in 1841, *eighty years ago*; and the effect of preventing the Transportation Act from functioning is shown in the authority granted by the Commission to *abandon and scrap 764 miles of railroad* in 1920, and in the low income returns on the value of the properties since September 1, 1920.

Month	Net Income Earned (Annual Basis) Per Cent.
September, 1920	4.1
October, 1920	4.6
November, 1920	3.3
December, 1920	0.7
January, 1921	Def
February, 1921	Def
March, 1921	5.3
April, 1921	2.1
May, 1921	2.3
June, 1921	3.1
July, 1921	4.5
August, 1921	5.0
Average	2.9

(b) The Transportation Act concentrated rate regulation in the Interstate Commerce Commission and empowered it to prevent conflict of state with interstate rates. A bill is now before Congress to repeal this power; another seeks to reduce the 6 per cent rate of return.

(c) The Transportation Act created a board to control wages. Obviously there should be close co-ordination between the revenue and expense controlling bodies, the Interstate

Commerce Commission and the Labor Board, in order to insure the statutory net income of 6 per cent; but we have seen one of these agencies reduce freight rates regardless of labor costs fixed by the government and of material costs fixed by economic conditions, and another fix fictitious scales of wages, violating economic laws and regardless of the ability to pay them. The framers of the Transportation Act meant well, but their intentions are defeated by faulty administration. To insure perfect co-ordination it is imperative that the same agency that controls revenues should also control expenses.

(d) There should be an immutable rate-making policy. For many years when prosperity was rampant and all industries were making large profits, those of railroads alone were restricted by law; increases of rates were denied, while increasing costs were steadily reducing the margin between income and expense. Financial starvation was to be checked by the Transportation Act, but before its influence could be felt the depression in business had set in and the rate increases allowed September 1, 1920, at the end of the guarantee period, were offset, first, by many reductions made voluntarily by the carriers to correct inequalities in the horizontal increase of rates, and thereafter by others made by the Interstate Commerce Commission, notwithstanding the statutory return on the value of the railroads had never been enjoyed and they were physically and financially unable to stand the reductions. During the years when business could easily have stood them, the applications of the railroads for higher rates were repeatedly denied, and now when business can ill afford to pay existing rates and the railroads can still less afford to reduce them they nevertheless are reduced, and the owners of railroads are required to relieve those who feasted while they fasted. The enumeration of the troubles of the railroads indicates the remedies:

1. Place the regulation of wages and the regulation of income under the same agency.
2. Adopt a fixed policy of rate-making.
3. Protect the first and only constructive railroad legislation the Congress has ever passed; save it from being destroyed by amendments.

4. In their own interest the people should not permit the light traffic enjoyed by the railroads under stagnant business conditions to be further reduced by agencies created and nourished by taxes gathered from all the people, as is being done by government-owned ships using the Panama canal on ridiculously inadequate tolls; by government-owned and operated towboats and barges on the Mississippi and Warrior rivers quoting rates of 20 per cent below railroad rates; and by motor trucks on free highways paralleling the railroads, and provided by state and federal moneys. A bill has been introduced in Congress authorizing the government to lend money at 5 per cent to assist corporations in organizing highway motor transportation to compete with existing transportation lines, the obvious purpose being to destroy the value of railroad investments, as the loan is to be contingent on

the business of the proposed corporations offering "reasonable hope of success." In 1920 the people through their representatives pronounced overwhelmingly against government own-

ership; unless their policy towards the railroads is radically changed the people will defeat their own will and make private ownership and operation impossible.

Some of the Hopeful Signs

By A. H. Smith

President, New York Central Lines

THE present railway situation represents progress under the Cummins Act toward the restoration of the character and cost of service and railway credit formerly enjoyed, with the ultimate hope that the former record shall some day be surpassed and thus truly serve the general welfare.

If each factor—investor, official, employee, patron and regulator—will do tomorrow better than he has done today within the field of duty, it will be a splendid groundwork on which to expect fruition.

Why should the railway situation get worse when such a policy can be? Are there not many now imbued and working with this aim? Is not the burden of taxation and

public spending curtailed? Do we lack the normal yield of the earth's increase? Are there not hopeful signs to be read in current trend of international relations?

If these are grounds for faith—and I think they are—it is a good sign.

However, the country has been on a level of spending which it cannot long sustain. It is shaping its descent from these flights to return to a sound sense of normal value. Conditions, including rates, inherent to the evolution from the war state of affairs, will no doubt retard the rate at which we approach the aim.

It may well be so, because there is much to do that must be done well in order to be right and endure.

The Railroads' Hope Lies with the Public

By C. H. Markham

President, Illinois Central

I BELIEVE we should not be discouraged over the railway outlook for 1922. Some aspects of the situation are disheartening, but I have an impelling faith in the soundness of American business and the fairness of the American public, and that faith will not allow me to lose heart over the gloomy phases of the situation.

The railroads of the country, in common with all other business institutions, have had a most eventful year. The demands made upon the railroads by changing economic conditions have contributed to an unusual extent in making it impossible for the railroads to follow out carefully developed plans. More than ever before, the railroads have been forced to live from month to month, hoping, oftentimes in vain, for the clouds to clear away and disclose a brighter prospect. Many plans for development have had to be postponed; even the normal demands for maintenance of properties have had to be deferred by many roads. More than three years have elapsed since the signing of the armistice, and the railroads have not yet been freed from the incumbrances which the war placed upon them.

We should recognize frankly that the changes which have come in public opinion during the year have, in many cases, not been for the best. A year ago the public had accepted a great increase in railway rates and public sentiment was arrayed solidly behind the railroads in their efforts for a rehabilitation of their organizations and their plants, which had been devastated by the war. There are gaps in that array of public sentiment now. In many quarters active support has lapsed into indifference. The lessons taught by the transportation shortage of the latter part of 1920 seem to have been forgotten. The public has not actively concerned

itself with the news that railway earnings throughout the year have been insufficient. Economic changes have lent themselves to a widespread agitation for a lowering of rates in the face of insufficient earnings' and the lack of an adequate return has not permitted the roads to fortify themselves for the business revival which is certain to come.

A year ago government control of the railroads had lost almost its entire following. It has not regained many of its lost adherents during the past year, but its followers are awaiting the first sign of the railroads' inability to handle all the business offered to press their demands. Government ownership will not come as a carefully thought out and rationally adopted plan of action, but we should be on our guard lest it come as a possible way out of a situation into which we are fast drifting.

I said that I have an impelling faith in the fairness of the American public, and I believe that our hope lies with the public. We have a situation before us with which we should be acquainting the public. The railroads must be assured of earning a fair and reasonable return upon their valuation, not alone as a matter of simple justice to the millions who have directly and indirectly invested their savings in and made the railroads possible, but in protection of future railway development and progress. The public must be brought to realize its great stake in the railroads, and it lies with us to give the public that vision.

We are facing many pressing problems as we enter upon another year, but there is none more pressing than this duty to guide public thought into channels which will make possible a rail transportation system capable of serving the public efficiently and adequately.

General Railroad Developments During the Year

The Principal Events Center Around the Efforts to Reduce the Cost of Transportation

By Harold F. Lane

A REVIEW of the developments of 1920, published in the *Railway Age* of a year ago, began by saying that it consisted largely of an account of the measures that had been necessary "to enable the roads to recover from the effects of the war and 26 months of unified operation by the government and of the process of readjustment to the new conditions created by the Transportation Act." A similar review for 1921 can only report further progress, as the process of readjustment is taking longer than was generally considered would be necessary, and is still far from complete.

In the case of the railroad industry, this readjustment has been complicated by the fact that its adjustment to the war period conditions had been delayed to the last and had hardly been completed when the period of deflation for other industries set in. As a result the railroads have been subjected to a tremendous pressure and much criticism because of their inability to respond promptly to the forced deflation in many other lines. The principal events of the year have centered around the manifestations of this pressure and the efforts of the railroads to meet it.

Throughout the greater part of the year, the railroads, under high rates and with a volume of traffic which, although much below that of the last three years, would have seemed big before the war, and with large sums still owing them from the government, were engaged in a desperate struggle to keep out of bankruptcy. As their condition has gradually improved during the year, the struggle has been almost as desperate to retain that position until they could work out the readjustment of their operating expenses necessary to comply with the universal demand for rate reductions.

Rate Advance Too Long Delayed

One of the reasons for the commanding of the railroads by the government was to prevent the inflation in the transportation industry which had manifested itself in other lines.

Instead of allowing the railroads to increase their rates in proportion to the increase in cost caused by the inflation of prices and wages in the unregulated industries, an element in the administration allowed itself to be persuaded that in the case of the railroads it could arrest this tendency by operating the railroads itself much more cheaply, as well as more efficiently, under a unified management than they could be operated by their owners.

THE RAILROADS, in the face of falling traffic, were in no position to come to the assistance of other industries by reducing rates until their own costs could be adjusted. Only the most rigid economies enabled them to avert bankruptcy.

Plans for a new wage cut are under way and the Interstate Commerce Commission has begun an investigation as to what, if any, further rate reductions may be ordered.

The experiment failed, but as the Railroad Administration was not under the necessity for keeping itself on a self-sustaining basis, since any deficiency in the amount necessary to meet its guaranty to the roads could be met from Congressional appropriations, it failed to adjust the rates to the level of expenses that it found imposed upon it. After it had been decided that the experiment was to continue no longer, even the wage adjustment was postponed and passed along with the rate problem to the private managements. The cycle of wage increases was, therefore, not completed until July, 1920, although the wages then awarded were made retroactive to May 1 and the adjustment of the rates was not made until August 26. Even then there was little complaint of the high cost of transportation, because it was not high levels that had been reached by prices generally. The most representative shippers of the country had even urged a generous increase in the hope that it would give them the service they needed.

By the time the force of the post-war boom had spent itself, however—and it is now clear that this had begun to occur even before the date of the rate increase—the inflation of railroad costs and rates took on another aspect and many business men who had felt they could afford to be "generous" to the railroads in the summer of 1920, wanted to take it back by January, 1921. Although the high tide of traffic, to some extent retarded early in the year 1920 by the switchmen's strike and the car shortage, continued during

the last four months of 1920, the first weeks of 1921 showed that a period of depression had set in and the railroads were at once faced with a demand for readjustment at a time when their own condition least justified such a course and within only four months of the time when their rates had been placed on a sustaining basis.

For eight months of 1920 the railroads had been guaranteed, but the actual payment of much of the guaranty had been delayed. They had actually earned practically no net operating income for the entire year in which they had broken all records for the volume of freight and passenger business handled. Although they had a net of some \$225,000,000 for the four months after the rate increase, and after their guaranty had expired, the new rates had been in force such a short time as to afford the roads no elasticity to help meet the new conditions of low traffic and high wages. The earnings for the last four months were needed to offset the deficits of the earlier eight months for which they had not yet collected the guaranty and also, as it soon became apparent, the new deficits that they were to face in January and February, 1921.

The drop in the level of general business and in the wholesale prices of commodities came so rapidly that the high level of railroad rates stood out as a prominent target for those in search of a quick remedy for the general situation. The government having regulated freight rates for many years, but not having made much progress in other directions in repealing the fundamental laws of supply and demand, and other economic laws, it was exceedingly natural for many people to attribute the effect of the business depression, which they did not know how to relieve in any other way, to the cause of high freight rates which they could ask the government to reduce for them. It having become the custom to regulate rates more in accordance with the needs or wishes of the shippers than of the railroads, a demand for a reduction proportionate to the change in the condition of other industries seemed only natural and Congress and the commission began to be flooded with demands for action to reduce rates in order to revive business.

For a time the commission under the leadership of Chairman Clark stood firm against this onslaught and Mr. Clark wrote numerous letters to members of Congress and others pointing out that the railroads, far from having been guaranteed a specific return, were in most cases not even earning operating expenses and that the causes for the depression lay far deeper than rates.

Agitation for Repeal of Rate Law

The idea that the railroads had been guaranteed 6 per cent had been so sedulously spread, both by deliberate propaganda and by the careless statements of those who had not bothered to read the law, that a repeal of the rate-making provisions of the Transportation Act appeared to many as the easy solution of the difficulty, and it appealed with particular force to the average Congressman as the only way in which he could exert himself to comply with the demands of his constituents.

Because of the particularly rapid deflation of the prices of agricultural products, the idea of reducing rates by law was taken up by many members of what is now called the agricultural bloc and many bills were introduced, particularly in the Senate, to either repeal Section 15a of the law or to substitute a lower percentage of return, in spite of the fact that the railroads were earning as much as even the minimum rate allowed.

The action of the Interstate Commerce Commission in ordering increases in intrastate rates where the state authorities had refused to do so also added to the resentment in many quarters and the strength of the advocates of so-called "state rights" was added to that of those who merely desired lower rates.

Attempts of Railroads to Reduce Labor Cost

Meanwhile the railroads were being driven to the most drastic economies merely to meet their current running expenses, to say nothing of lowering rates. Acquiescing in the award of the Railroad Labor Board increasing wages in 1920, they had first turned their attention to the abrogation of the standard rules and working conditions—imposed by the national agreements entered into by the Railroad Administration shortly before it relinquished the railroads—before giving any consideration to the question of wage reductions.

The Labor Board was proceeding in a somewhat leisurely fashion to hear the voluminous evidence in this case when General Atterbury of the Pennsylvania, on behalf of the labor committee of the Association of Railway Executives, appeared before the board on January 31 and asked that the national agreements, which he estimated were costing the roads \$300,000,000 a year in increased expenses, be abrogated at once to save the roads from bankruptcy. He also asked that the board make a reduction in the wages of unskilled labor, promising that if these requests were complied with, his committee would recommend to the roads that they withhold for at least 90 days any action looking to a reduction in basic wages. The board declined to grant the request, and the railroads thereupon began to take the necessary steps toward a wage reduction.

Partial Payment of Guaranty Provided For

The roads had also taken up with Congress and secured an amendment to the Transportation Act to provide for partial payments on account of their six months guaranty which the comptroller of the treasury had held could not be made beyond the advances specifically provided for on applications filed prior to September 1, 1920, until the commission was in a position to certify the final adjustment of the total amounts due in each case. Congress was willing to extend this assistance to the railroads because it had been generally understood that the law as originally passed provided for partial payments.

Labor Charges Managements With Extravagance

The passage of the bill, however, brought out a good deal of discussion of the railroad rate situation and also of charges made by the railroad labor organizations that the railroads had been extravagant at government expense during the six-months guaranty period of 1920. The charges were based particularly on the contracts made by certain railroads for car and locomotive repairs in outside shops for which they paid some high prices to get the work done quickly, although the law specifically limited the amount of maintenance expenditures for which they should be guaranteed. The Interstate Commerce Commission in January ordered a general investigation of these charges and held several hearings upon them besides securing a mass of information on the subject through questionnaires and the work of its examiners. No report, however, has yet been issued.

President Harding Tries to Bring

About Rate Reductions

President Harding had joined in the demand for rate reductions in his address to Congress on April 12, in which he said that "railway rates and the cost of operation must be reduced," although he did not recommend any additional legislation to accomplish that result and he did not fall into the error of condemning the rates without recognition of the cause. While he said that "freight-carrying charges have mounted higher and higher until commerce is halted and production discouraged," and that no improvement in the general business situation can be permanent "until the railroads are operated efficiently at a cost within that which the traffic will bear," he also referred to the situation in a way

to indicate that the low tide of business was a cause rather than entirely the effect of the difficult transportation situation.

Following this the President held a conference with Chairman Clark of the Interstate Commerce Commission and Chairman Barton of the Labor Board, after which he called in one at a time various representatives of the railroads, the labor organizations, the shippers and the security owners' association for the purpose of informing himself. It became evident after these conferences that the President had been brought to a realization that it would require more time to straighten things out than he had perhaps at first appreciated and that the railroads could do little to assist business generally through the period of readjustment without some assistance for themselves.

General Public Misunderstanding

The railroads have been confronted throughout the year not only by the practical problem of reducing their expenses, but also by an important psychological problem which made the practical one even more difficult. The American people, having been led to believe that private management of the railroads would be more economical than government management, had reached the conclusion that results in this direction should be shown at once. When it appeared, therefore, that the operating expenses of the railroads for the year 1920 were some \$1,400,000,000 greater than they were in 1919, the situation called for an explanation that was difficult to make to those who were not sufficiently and directly interested in the problem to keep the figures in their heads. They had had their attention called to a wage advance of \$600,000,000 to \$700,000,000 in 1920 but not to the total of the various wage advances made in the latter part of 1919, which had their effect in 1920, and hardly at all to the effect of the national agreements made by the Railroad Administration in the latter part of 1919 and the early part of 1920, which the railroads estimated added \$300,000,000 a year to their cost of operation. Moreover, the effect on expenses of the handling of a greater volume of traffic in 1920 than had ever been known was not generally appreciated except among those whose direct business it was to notice it.

When added to all this was the fact that the railroads had been guaranteed for the first six months after the end of federal control—although a highly technical provision of the law carefully restricted this guaranty so as not to protect the railroads on any increase in maintenance—and the popular belief that the 6 per cent rate-making rule constituted a real guaranty, only a little demagoguery and a little propaganda were necessary to create a state of public opinion which caused a most difficult position for the railroads.

Neither the demagoguery nor the propaganda, however, were confined to "a little" and aside from the selfish propaganda, high authorities in the government were obtaining wide publicity for their opinions that rates were too high and must be reduced. Close and continued attention to the public utterances made on these subjects by President Harding and Secretary Hoover leaves no reason to believe that they ever had any particular idea of insisting upon large rate reductions until the foundation could first be laid by a reduction of operating costs, although at first they were apparently impressed with the popular idea that high rates were defeating their purpose and lower ones might produce more revenue, but any qualifications with which they expressed their opinions were not always emphasized and were soon lost sight of. Thus some very influential voices were raised to swell the volume of protest and as these gentlemen progressed in their understanding of the situation they were not always able to bring about a corresponding transition in the minds of the newspaper men who interpreted their views to the public.

President Harding discussed his views of the rate question on many occasions with the Washington correspondents but, as the President is not quoted, the main idea of his remarks, to the effect that rates must come down, was the feature that was made public. Even after he had personally visited the Interstate Commerce Commission and had caused a statement to be issued from the White House that he was surprised and gratified at the progress being made in the way of readjustment and voluntary reductions in rates, and after he had stated that he was not in favor of a general percentage reduction, the effect of the development of his ideas failed to "get across." This is not to deny the fact that the influence of both President Harding and Secretary Hoover has been on the side of a rate reduction, but it is also true that for several months they have also recognized that no extensive reduction in rates was practicable until there had been more of a reduction in the cost of performing the service and that the efforts of the roads to lower wages have had their moral support.

Senate Orders General Railroad Inquiry

The demand for lower rates and the charges against the railroads led to the introduction by Senator Cummins and the passage by the Senate on April 12 of a resolution authorizing the Interstate Commerce committee to conduct a general investigation of the railroad situation, to inquire among other things into "the reasons which led to the extraordinary cost of maintenance and operation from March 1, 1920, to March 1, 1921, the reasons which induced the diminished volume of traffic including the influence of the increased rates, the efficiency or inefficiency of railroad management and of labor," and "the best means of bringing about a condition that will warrant the Interstate Commerce Commission in reducing freight and passenger rates."

Before introducing the resolution Senator Cummins had made some investigation of his own and it is believed that one of the purposes was to head off some of the various amendments to the Transportation Act that were being proposed.

The Senate committee began its hearings on May 10 and the railway executives and their statisticians put before it a comprehensive explanation of the condition of the carriers, showing that it was an inheritance from the period of federal control which they must overcome before they could again demonstrate the economy of private management as compared with governmental operation. They were also able to show conclusively that the general business depression had numerous perfectly good causes entirely independent of freight rates.

Following the railroad testimony, witnesses were heard on behalf of the National Association of Owners of Railroad Securities, who were somewhat critical of the railroad managements but at least sustained their statements as to the principal elements in the situation. At any rate the railroads succeeded in making at least a prima facie case before the committee to demonstrate the main causes for the increase in expenses without leaving much room for faith in the charges of deliberate extravagance that had been made against them, and sufficient also to demonstrate to almost anyone who was willing to give attention to the subject that the Transportation Act was not at the root of the difficulty.

Comparatively few representatives of the shippers had asked to be heard by the committee and while the labor organizations had asked to be heard, they had postponed the date for their appearance so when hot weather came and Chairman Cummins' health demanded a rest, the hearings were adjourned and not resumed until fall.

The railroads had at least succeeded in convincing the committee that no change in the rate-making provisions in the law could help the rate situation and that little could be done by anyone pending a determination of the wage

question then before the Labor Board. The committee apparently came to the conclusion that there was practically nothing that Congress could do to remedy the situation of which the public was complaining. About the time the hearings were adjourned, the Labor Board made its 12 per cent reduction in wages and traffic was beginning to pick up and the adjournment gave an opportunity for time to demonstrate the results. Moreover, the railroads had shown that some very considerable rate reductions were being made by way of readjustment.

Efforts to Expedite Settlements

With Railroad Administration

One result of the Senate committee hearings, however, was to bring to the attention of Senator Cummins and other leading members of the committee the difficult position the railroads were in with relation to their accounts with the Railroad Administration. President Rea of the Pennsylvania stressed this point particularly, saying that the greatest immediate relief that could be given the roads was some way of expediting the payment of the large sums still owing to the roads for the period of federal control, and also the balance still due for the six months guaranty period. He showed that while the Railroad Administration owed the roads several hundred million dollars, it was attempting to offset against it the amounts due from the railroads to the government for capital improvements which the roads should finance by long term securities, and, moreover, that the payment of the sums due the roads was delayed by the complicated nature of the settlements and the undecided controversy over the basis of the maintenance claims.

While the committee itself took no action, Senator Cummins bestirred himself and assisted the roads in enlisting the interest of the President. Many conferences were held, which took in the director general of railroads, the Interstate Commerce Commission, Secretaries Hoover and Mellon, and the managing director of the War Finance Corporation. The result was that the administration took up the matter as a plan for improving general business conditions by assisting the railroads to obtain the cash with which to pay outstanding bills and undertake maintenance work which would put money into circulation and give employment to many men.

As a condition, however, to the funding of the railroad indebtedness, it was insisted that the railroads agree to waive their claims for reimbursement for undermaintenance based on the so-called "inefficiency of labor" factor, as far as settlements with the Railroad Administration were concerned, although they were to retain their right to go to the courts. When they had done this, thus relieving the government of a contingent liability estimated as high as \$800,000,000 which no one could be sure the courts would not allow, the President in July urged upon Congress the passage of a bill to authorize the War Finance Corporation to purchase railroad securities taken by the United States Railroad Administration in payment for the additions and betterments, thereby giving the Railroad Administration funds with which to pay its indebtedness to the railroads without an appropriation.

The President under the Transportation Act had the power to fund the capital expenditures but the Railroad Administration did not have funds sufficient to pay the roads what it would owe them without offsetting the capital expenditures. The purpose of the bill was to enable the government to convert into cash the obligations it had taken from the railroads, and would take in connection with the funding, by transferring the indebtedness of the railroads from the government to the investing public, but it was considered necessary at that time to have the War Finance Corporation carry some of the securities temporarily until market conditions improved so that it could sell them at par.

The bill was passed by the House in August, although

with a provision that would bar any road, even one that declined to settle with the Railroad Administration, from pursuing a claim for inefficiency of labor in the courts, but it struck a snag in the Senate in the agricultural bloc that was unwilling to do anything for the railroads without first obtaining a reduction in rates. Careless newspaper reporting, middle-headed demagoguery and deliberate propaganda largely instigated by the labor organizations soon created a general impression that the sole plan was to give or at least loan the railroads \$500,000,000 of new money and when the Senate committee finally reported the Winslow bill in a modified form it was promptly assailed with so many amendments designed to emasculate the Transportation Act that the efforts of its supporters to pass the bill were relaxed before the close of the extra session.

Meanwhile the War Finance Corporation in September, acting unofficially for the director general of railroads, made an offering of some of the car trust certificates which it had taken from the railroads in payment for the cars and locomotives bought during federal control and found it possible to sell some of the best of them at par and accrued interest. More sales were then made, which gave the Railroad Administration additional funds with which to make settlements with the railroads without the need of an additional appropriation and considerable progress has been made in settling with the roads that were either so needy as to desire a quick settlement without funding or could afford to allow their indebtedness on capital account to be subtracted from the sums due them on open account. When the regular session of Congress began on December 5 no efforts were made to push the passage of the bill.

Bills to Amend Transportation Act

All through the year various bills were introduced in Congress to repeal the provisions of the Transportation Act which direct the commission to try to make rates that would produce as nearly as may be an annual return of 5½ or 6 per cent and those under which the Interstate Commerce Commission had ordered increases in intrastate rates in those states which refused to increase rates by the amount which the commission had found necessary in its decision in Ex Parte 74 to enable the roads to earn the fair return prescribed by the act. Some of these bills were so drawn as to nullify every order ever issued by the Interstate Commerce Commission to correct state discrimination against interstate commerce, including those that had been sustained by the Supreme Court under the old law. These bills reposed quietly in committee during most of the session and while the Senate committee was conducting its general investigation, but after some of the western Congressmen had gone back home during the summer the pressure was renewed and the Senate committee on October 24 began a series of hearings on the Capper and Nicholson bills instead of resuming the general investigation.

For about two weeks the committee listened to the testimony of state railroad commissioners and such representatives of the shippers as Clifford Thorne and S. H. Cowan, who gave such a warped and biased view of what the commission had done to the rates that the committee seemed to be about to report a bill. An effort was made to hurry up the testimony on behalf of the railroads but they insisted on their right to present their case and with the assistance of several witnesses representing the National Association of Owners of Railroad Securities, including E. F. Clark, apparently soon succeeded in counteracting much of the effect of the previous testimony. Walker D. Hines, formerly director general of railroads, also appeared before the committee and made a strong defense of the various provisions of the Transportation Act, as did representatives of the Railway Business Association and the Chamber of Commerce of the United States.

Attitude of the I. C. C.

The demand for reduced rates was met by the Interstate Commerce Commission during the early part of the year by having its traffic bureau arrange various informal conferences between representatives of the railroads and the shippers for the purpose of seeing whether reductions could be agreed upon. In many cases where it was shown that a peculiar hardship was being caused by the rates, or that lower rates would make possible the movement of certain classes of traffic, these conferences resulted in reductions, but in several important cases the roads felt unable to grant the requests.

There was a general readjustment of grain rates made necessary in the first instance to restore relationships disrupted by the percentage advance, but before it was completed competition with the Canadian roads and between the roads serving Atlantic and Gulf ports led to some very extensive reductions, particularly in export rates. Before the end of the year it was estimated that reductions amounting to \$200,000,000 a year had been made.

The first formal case heard by the commission involving a request for extensive reductions in rates was the western live stock case, in which the commission did not issue an order. It did, however, issue a report on August 15 recommending a reduction to 80 per cent of the rates in effect in western territory which were higher than 50 cents as justified not by transportation conditions but by the economic condition of the industry. The railroads complied with this recommendation.

Then the commission, acting on petitions filed by the western state commissions and the American Farm Bureau Federation ordered an investigation of the rates on grain, hay and grain products in the western districts and after an expedited hearing issued a report saying it expected the roads to make reductions but did not issue an order until the railroads had failed to observe its recommendations.

The Threatened Strike

The question of rate reductions has been complicated by its dependence upon the wage question. During the early part of the year the roads were asking that wages be reduced and the rules of the national agreement be modified in order to save them from bankruptcy, as for several months a large proportion of the roads were not earning operating expenses. During this time many of the shippers were refraining from pressing for rate reductions, realizing that the high rates were largely due to the wage increases that had been made.

The National Industrial Traffic League went on record as deprecating the agitation for general rate reductions and it tried to intervene in the rate case with evidence on behalf of the shipping public but was denied a hearing by the board. As the condition of the railroads gradually improved, as a result of their drastic curtailment of maintenance and other expenses, including the laying off of several hundred thousand employees, and as a result of the gradual increase in traffic, the agitation for rate decreases became stronger, particularly after the Labor Board had made a reduction in wages estimated at \$300,000,000 to \$400,000,000 a year. The roads showed, however, that this was not sufficient to justify general rate reductions, and even when their net income began to approach the statutory rate of return, reaching 5 per cent in August, they pointed out that this had been done largely at the expense of maintenance and that it was necessary to make up for the deficits of the early part of the year to be able to pay fixed charges for the year.

Some of the more conservative elements among the shippers began to complain that the railroads were hiding behind the Labor Board and there was more or less agitation for the abolition of the board or its co-ordination with the Interstate Commerce Commission. After the decision of the com-

mission in the western livestock case, in which it became evident that the commission was not inclined to wait too long for a further reduction in wages, and after some correspondence with Chairman McChord of the Interstate Commerce Commission, who had urged the roads to make some voluntary reductions in rates, the Association of Railway Executives tried to adopt a general rate policy and its executive committee went to Washington where it held conferences with President Harding, Mr. McChord, Secretary Hoover and Chairmen Cummins and Winslow of the two Congressional committees on interstate commerce. All of these men told the railroad executives that they considered it highly important from a policy standpoint that the roads make some voluntary reductions.

The committee went to a general meeting of the member roads of the association at Chicago on October 14 with a recommendation that the roads make an immediate reduction of 10 per cent in the rates on agricultural products and then take steps to ask for another wage reduction with the understanding that it should be translated at once into rate reductions. At the meeting, however, a number of the roads, particularly those in the West, declared that they could not afford to make the 10 per cent cut proposed and only the latter part of the plan was adopted.

On the same day a committee representing the railroad brotherhoods asked for a conference to present a demand that the 12 per cent wage cut of July 1 be rescinded and that the roads make no further reductions for a year. This demand was backed up by a strike vote and when the roads met it by handing the brotherhood committee a copy of the resolutions adopted proposing a new wage cut, the strike orders were issued. The strike vote had been taken in protest against the wage reduction ordered by the board effective July 1, but it was commonly accepted as being intended merely to head off a new move in the direction of further reductions. The railroads had called the bluff, however, and the labor organizations were thus placed in the position of threatening to strike against the order of an impartial public tribunal.

When it was made clear that such a strike would have no support in public sentiment and that the government was proposing to put some teeth in the labor provisions of the law by seeking injunctions against a violation of the Labor Board's orders, the brotherhoods were given an opportunity to call off the strike without too much appearance of surrender by an announcement of the Labor Board that it could not take up a new wage case for any class of employees until it had cleared its docket of cases involving rules and working conditions for that class.

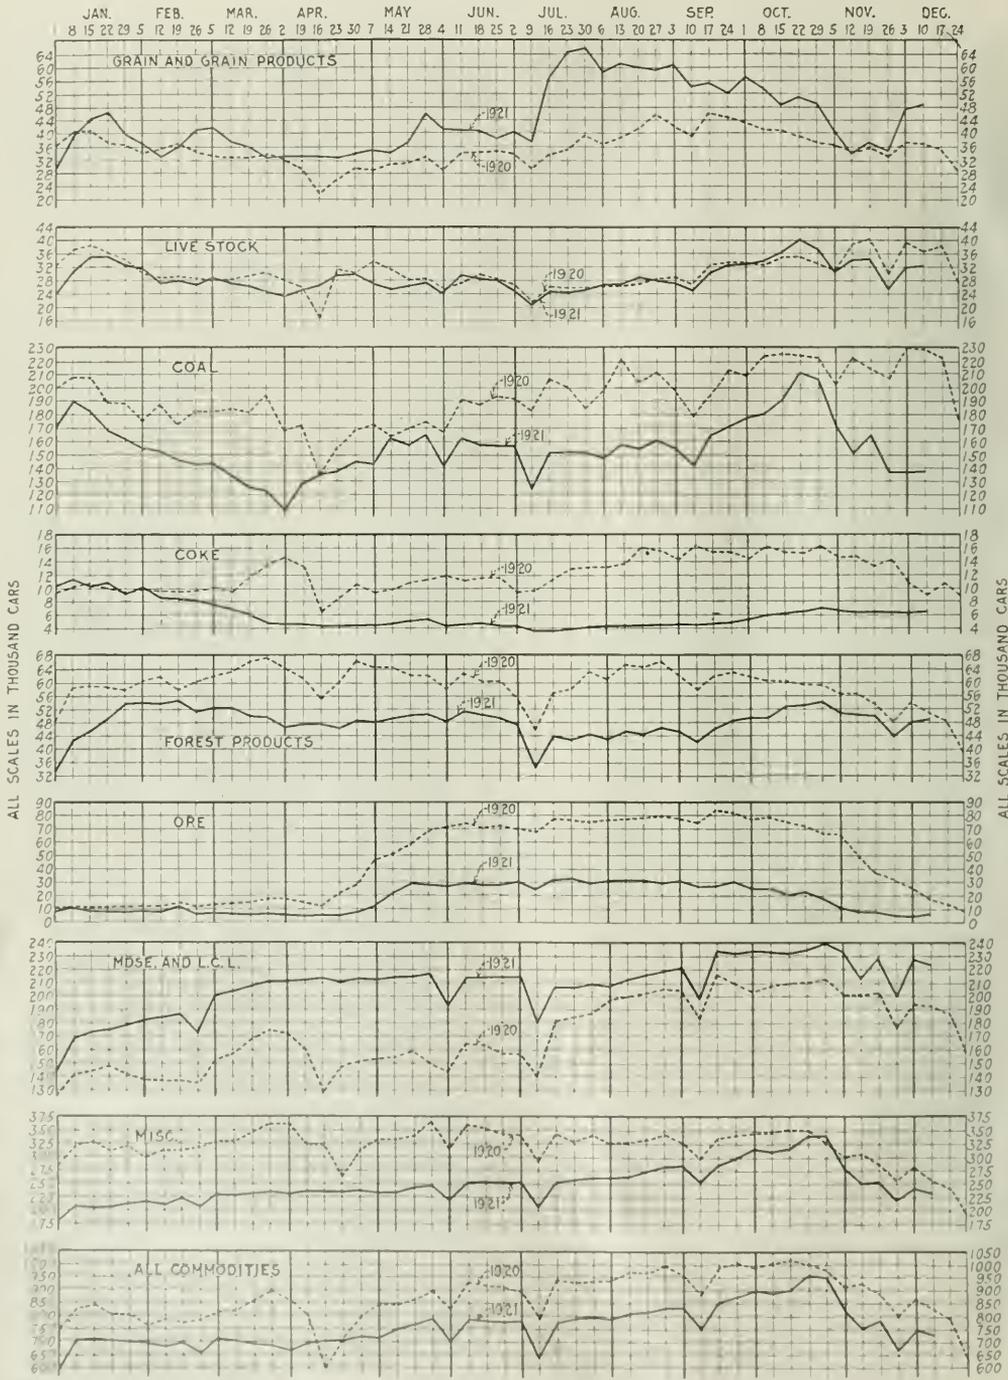

The settlement of the strike was made without any promises or concessions of any kind from the railroads. They had made it clear that they were proposing wage reductions as the only way of complying with the public demand for rate reductions and they began to proceed at once with the steps necessary to get a wage dispute before the Labor Board with a view to showing that if there was any delay the responsibility for it was not theirs.

This required the service of notice of a proposed reduction upon the employees of various classes and an effort to reach an agreement with them before application could be made to the board.

Meanwhile the Interstate Commerce Commission issued its report in the western grain case directing the roads to make on or before November 20 reductions by one-half of the 35 per cent and 25 per cent increases made in the Western and Mountain Pacific districts. The commission made no order, however, but said that one would be issued if necessary. In this decision the commission made little attempt to show that the reductions were justified from a transportation standpoint. The reduction was based on the economic condition of the agricultural industry and reconciled with Section 15a

Five Years of Freight Traffic Growth Is Lost

Railways in 1921 Carry Less Freight Than in Any Year Since 1915
—Passenger Traffic Exceeds 1916

By Harold F. Lane

WASHINGTON, D. C.

THE VOLUME of railroad freight and passenger traffic throughout 1921, with the important exception of grain, has naturally reflected the general business depression; the effect of the decreased traffic has also shown itself in many of the statistics which are commonly used to measure railway performance.

So far as freight traffic is concerned the railroads in 1921 lost five years of growth, the volume of freight business for the year having fallen below that for 1920, 1919, 1918, 1917 and 1916. In the case of passenger traffic 1921 was somewhat ahead of 1916. While the ton-mile statistics are available only for the ten months ending with October—except as it is possible to make estimates for November based on incomplete returns—a current index of the amount of freight business handled by the railroads is afforded by the weekly report compiled by the Car Service Division of the American Railway Association showing the number of cars loaded with revenue freight during the week subdivided into groups of the principal commodities. These reports are available in about 10 or 12 days from the close of the week, whereas ton-mile figures are not available for some weeks after the close of the month. Moreover, the weekly reports show fluctuations which are not shown in the monthly reports and the car loading figures give the division by commodities which is not otherwise available except in quarterly reports.

The car loading figures are, however, less exact than the tonnage and ton-mile statistics because the average carload

is subject to variations; during 1921 it has averaged between one and two tons less than in 1920. Measured by the number of cars loaded, freight traffic in 1921 has been only about 13 per cent less than in 1920, the record year. However, the ton-miles for the first ten months of the year show a decrease of 23 per cent as compared with 1920. Passenger traffic shows a reduction of about 20 per cent.

RAILROAD FREIGHT TRAFFIC fell about 23 per cent below that of the record year 1920; and was less than for any year since 1915.

Passenger traffic less than for any year since 1916; about 20 per cent less than in 1920.

Effect of reduced traffic is shown in reduced miles per car per day, car load and train load.

Car surplus existed throughout year, reaching record-breaking figure of 507,000 cars on April 8.

Car Loading and

Ton-Mile Statistics

Up to December 17 the number of cars loaded with revenue freight was 38,716,335, as compared with 44,613,864 for the corresponding period of 1920. The total for the year, therefore, may be estimated at approximately 40,000,000 as compared with 45,237,941 in 1920, 42,180,328 in 1919 and 44,655,041 in 1918. The car loading figures for the railroads as a whole were not compiled before 1918. The net ton-miles, which are shown in the accompanying charts and tables compiled by the Bureau of Railway Economics, show a greater decrease as compared with 1920 than is shown by the car loading figures. For the ten months, January to October, inclusive, the total net ton-miles for the current year were 289,634,000,000, as compared with 376,760,000,000 in the corresponding ten months of 1920, a decrease of 23 per cent. The reduction in traffic has been greater than that indicated by the car loading due to the fact that for varying reasons the average car load was less in 1921 than in 1920.

The revenue ton-miles and passenger miles by months for recent years have been as given in the following table:

The car loading by months, by the principal groups of commodities, is shown in the second table compiled by the Car Service Division:

Trend of Freight Traffic

On the chart showing the trend of the ton-mile figures the line for 1921 has been below that for each of the last five years throughout the year, and it crossed the 1916 line only at two points, representing May and October. The car-

loading was less than in the week of October 22, when the total was 962,292 cars, or about 5 per cent less than the 1920 peak of 1,011,666 cars. Since that time there has been a rapid decrease. Coal production per week, which heretofore has reached as high as 12,000,000 and 13,000,000 tons in the latter part of the year fell back to a little over 7,000,000 tons, which is about the average for April. For the week ending December 17 the total car loading had fallen to 727,332, which was 75,268 less than for the corresponding week of 1920 and 79,731 cars less than for 1919.

The deeper "valleys" shown in the car loading chart gen-

*Not available by months

loading chart shows, however, the 1921 line above that for 1919 at several points and during the week of October 22 it approached very closely to the 1920 line.

Traffic was considerably stimulated during October by the anticipation of a possible railroad strike which led to some stocking up, particularly of coal. The peak car loading

erally represent weeks which include holidays, although the one for April 16, 1920, indicates the low point of loading at the time of the switchmen's strike and the August 13, 1919, depression represents the loss of loading at the time of the shop crafts strike. The sharp falling off in the latter part of 1919 also represents to some extent the coal strike

*Detail for Michigan Central not shown, 23,186 and 10,776 included in totals—56,962 included in total for year. Figures compiled from weekly reports ending Saturday. Loading averaged for such days in weeks that occur in different months. Figures shown in italics under 1920 column are revised.

of that year, although the demand for transportation at that time was such that the shortage of coal tonnage gave an opportunity for an increased traffic of other kinds of freight.

The Car Service Division has recently been publishing a weekly information bulletin containing each week a number of charts and diagrams accompanied by text illustrating some phase of the transportation situation.

The series of charts showing the trend of the classified

the harvesting of the new crop began in July, and the regularly heavier loading of l.c.l. merchandise. The former is generally attributed to the rapid marketing of this year's crop by the farmers, and the latter to the tendency in 1921 to do business in smaller units than in the previous year. The other outstanding feature of these charts is the marked decline in 1921 of the loading of coal, coke and ore, none of which have at any time approached the totals reached

commodities in 1920 and 1921 displays, with the exception of the switchmen's strike period in April, 1920, a remarkable degree of uniformity in respect to the extent to which the total loading of all commodities in 1921 is below the figure for the same period of 1920. That uniformity of trend as to the total revenue freight loading does not obtain with respect to each classification, however.

Concerning these charts, the outstanding features are the heavier grain loading in the present year, particularly since

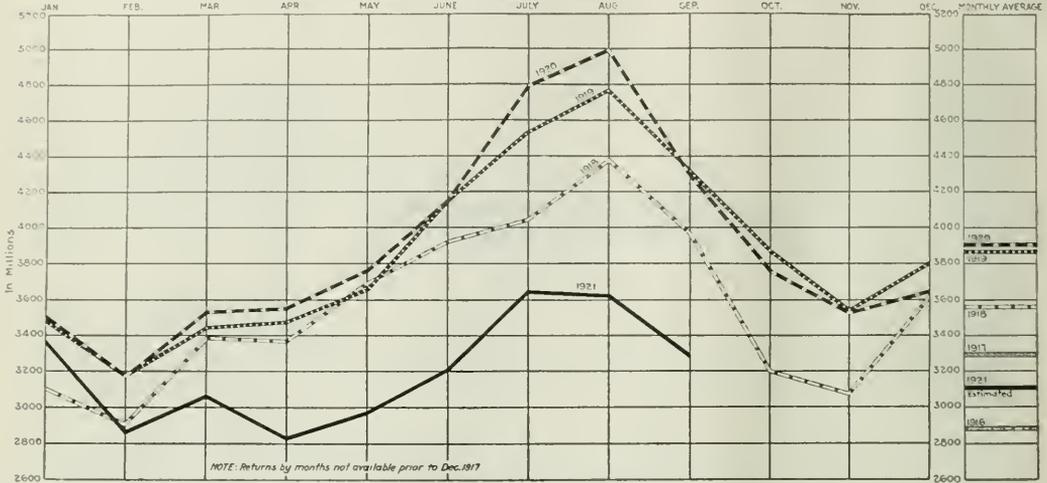

in the previous year. It will be noted that the grain loading has been above that for 1920 ever since the first of April and the loading for the year has broken previous records. The live stock movement follows closely that of 1920.

The maximum and minimum records of agricultural commodities reflect the usual seasonal variations. Extraordinary conditions have frequently contributed to these high and low records of other commodities. Thus, the records on coal loading reflect the periods of greatest demand in anticipation

of, and greatest loss of production during, the bituminous coal miners' strike of November and December, 1919. The maximum records of coke and ore, basic commodities in iron and steel manufacture, were reached when the industrial boom of 1920 was about at its climax; the minima of these commodities is in the period of great depression in the iron and steel industry during 1921. The heaviest loading of

1915-1921 (ending November) inclusive, shows in a very emphatic way the comparative stabilization of production in the anthracite industry and the lack of stabilization of production in the bituminous industry. The marked valley in bituminous production usually reached in April, or thereabouts, reflects the gradual discontinuance of winter demand, the termination of the coal contract year on March 31, and

REVENUE PASSENGER-MILES — UNITED STATES — CLASS I RAILWAYS

forest products was early in 1920 before the dislocation of transportation which resulted from the switchmen's strike of that year; the low figure occurred at the very beginning of 1921 before the rehabilitation of the building industries had fairly begun.

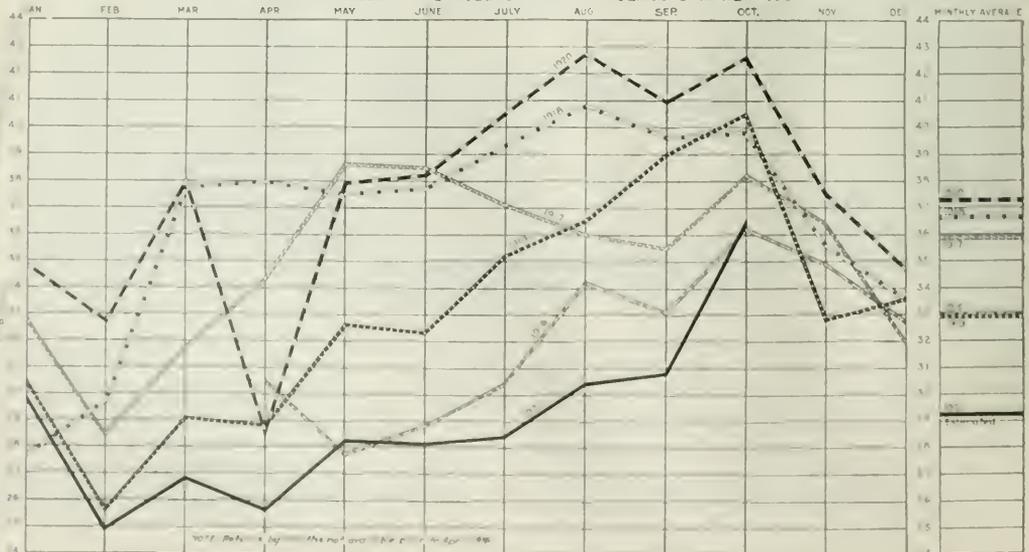

The chart showing monthly production of anthracite and bituminous coal and of beehive coke for the calendar years

the termination of the labor contract period on the same date with labor disturbances in consequence, at times.

Coal Production

The marked depression in the bituminous production in late 1919 was the result of the bituminous miners' strike beginning November 1 that year, while the marked depres-

NET TON-MILES — UNITED STATES — CLASS I RAILWAYS

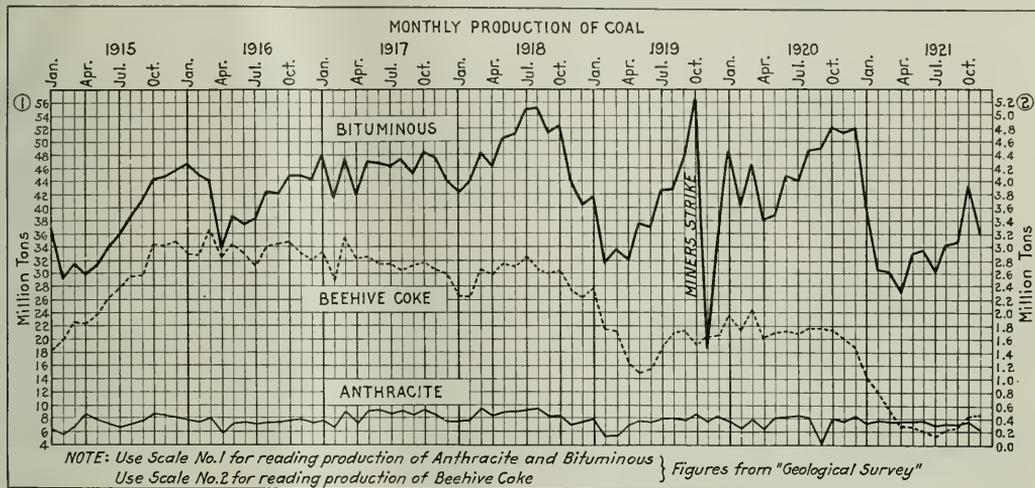

sion in anthracite production in August to October, 1920, was the result of the anthracite miners' strike during that period. The post-armistice depression of 1918-1919 accounts for the great falling off in bituminous production at that time and the existing industrial depression accounts for the low figure since December, 1920, which persisted throughout the year except when in October an increase resulted because of apprehension of labor disturbances on the railroads.

The outstanding feature of beehive coke production, as

of the current year, but the great loss of export coal trade is also a factor.

The relative increase of business in the southern district is accounted for by the fact that lumber loading in that territory has not suffered to as great an extent as in other districts, while contemporaneously certain of the non-union coal producing sections of the southern district have been working very regularly and in some weeks making record production, while in other districts coal loading has been

shown on the chart, is the gradual decline from 1916. This is, of course, most marked in the two periods of depression already noted, but the general trend results from the gradual displacement of the beehive coke by by-product coke which began during the war period and is quite naturally more pronounced during periods of industrial depression.

The circular diagrams show at a glance the extent of participation by the railroads in each of the seven specified districts in the revenue freight business of 1921 as compared with 1920. In a general way these statements reflect the

very severely depressed. The figures for the three western districts reflect the increased grain loading since mid-summer 1921, but the beneficial effects thereof have been considerably overcome in the northwestern district by the great decline in ore loading. These diagrams cover the year to November 19.

Ratios of Operation

The effect of the light traffic during 1921 is reflected in the various ratios of operation as shown in the table com-

Month	Car-miles per day										Percentage of unserviceable freight cars				Per cent loaded to total car-miles				Percentage of unserviceable locomotives

*Data for November to December, 1920, subject to change.

existence of conditions peculiar to the several districts. Thus, for instance, in the eastern district, merchandise, i.e., forms a very considerable portion of the total loading and the increase in the proportion of business handled in that district in 1921 results largely from this fact. In the Allegheny and Pocahontas districts the decline is accounted for by the depression in the coal and iron and steel trades, both of which have suffered considerably in the business depression

piled by the Bureau of Railway Economics. During 1920, when the railroad facilities were taxed to handle the business offered them, a campaign was made to increase the miles per car per day and the tons per car. The railway executives set as a mark to try to attain 30 miles per car per day and 30 tons per car and intensive efforts were made among the railroad forces and among shippers to try to reach those figures. The mark set for car mileage was not attained,

although an average of 28.5 was reached in October, but with the falling off in traffic these figures were naturally reduced, not only because of the lessening of the pressure but also because the number of idle cars tends to decrease the average.

The mark of 30 tons per car was attained in 1920 in September and again in November, 1920, and January, 1921, but since February the average has been less each month than it was in the corresponding month of 1920 and has remained between 27 and 28 most of the time. The great decrease in the coal traffic, which loads heavily, and the

Revenue Freight Loaded—Cumulative, January 1 to November 19, Inclusive

increase in the volume of l.c.l. freight this year have tended to reduce the average, although the unusually large volume of grain traffic would tend to increase it. The reduction in the average car load must be attributed primarily to the reduced pressure as the available supply of cars has increased.

For the ten months for which the Interstate Commerce Commission reports are available, the car miles per day averaged 22.4 as compared with 24.9 in 1920; the net tons per loaded car averaged 27.7 as compared with 29; the net ton miles per car day 393 as compared with 499 and the net tons per train 656 as compared with 715. The net ton miles per mile of road per day averaged 4,086 as compared with 5,320. With the lighter train loading the train speed has increased from 10.5 to 11.5 miles per hour. The average haul of freight has shown no appreciable change. This figure is available only for nine months. The average miles per revenue ton per road averaged 186.67 as compared with 186.48 in 1920.

Car Surplus

There has been a freight car surplus throughout the year. The car shortage of 1920 began to give way to a surplus of cars about the first of the year and by April 8 the surplus had reached a new high record at 507,000. From that time on the surplus was rapidly reduced, however, and by November 1 had fallen to 80,203 cars. Since then the surplus has been rapidly increasing each week and for the week ending December 15 was 371,221 cars, including 138,214 box cars and 186,508 coal cars.

The chart shows the surplus and shortage of freight cars, classified, during the calendar years 1919, 1920 and 1921 (to December 1) inclusive. Generally speaking, any consequential shortage or surplus of all freight cars during this period affected all classes of freight cars, but not, however, in the same degree. Thus, while the maximum shortage of all cars during this period was about 50 per cent of the maximum surplus of all cars, in the same period, the percentage relation in the case of box cars is about 40 per cent, and in the case of open top cars only about 20 per cent. In flat cars, on the other hand, the maximum shortage just about equalled the maximum surplus and it is also of interest to note that the shortage of flat cars persisted for a longer

period than was the case in any other class of freight equipment. The stock and refrigerator car shortages have seldom been sufficiently pronounced to produce any considerable net shortage of these classes of cars, while the surplus in both cases has been particularly marked.

The temporary surplus of all cars in the fall of 1919 and early 1920 is for the most part a reflection of the decreased demand for open top and refrigerator cars at that particular time. The decreased demand for open top cars was the result of the bituminous coal miners' strike. With respect to refrigerator cars it was the normal seasonal decline in movement.

The traffic of 1921 has been handled not only with less cars in existence than in previous years but also with a large percentage of the cars out of service awaiting repairs. According to the latest report of the Interstate Commerce Commission the number of freight cars owned was 2,341,757 as compared with 2,365,122 in 1920, and the percentage of bad order cars has reached as high as 16, although there has recently been some reduction.

Passenger Traffic

The passenger traffic in 1921 has been about 20 per cent less than in 1920 and has been less than in the four previous years for which the monthly figures are available, since about February 1, when the passenger miles fell below that for 1918. While many people have attributed the decrease in travel to the increase in passenger fares, railroad officers insist that it has merely been a natural accompaniment of the general business depression, since so large a proportion of railroad passenger traffic is for business purposes.

The average journey per passenger, during the nine months of 1921 for which the statistics are available, averaged 36.45 miles per road as compared with 38.29 in 1920. The number of revenue passengers per car fell from 20.28 to 16.84.

THE LOUISVILLE & NASHVILLE in the year 1920 and the first nine months of 1921—twenty-one months altogether—killed on its tracks enough live stock to supply a city of 25,000 population with meat for almost two years. The loss incurred was about \$750,000. These facts are stated in a circular which has been issued to employees.

The Regulation of Securities Under Section 20a

An Analysis of the Decisions in a Wide Variety of Cases—I. C. C.
to Be Commended

By Roberts Walker

TWO BILLION DOLLARS is the approximate principal amount of securities passed upon by the Interstate Commerce Commission to the present time. The commission's power to regulate securities began on June 28, 1920. At the time of writing, there has been less than 18 months of regulation. Thus the commission has dealt with an average of over \$100,000,000 of bonds and stocks per month. These figures alone indicate the magnitude of the commission's task.

But it is only when these aggregates have been subdivided among the various applicant carriers and among the infinite diversity of their applications that the staggering complexity of the commission's responsibilities becomes apparent. Nearly every carrier in the country, constructed, under construction or hoping to construct, has already been before the commission. Almost every phase of financing has been considered.

Division 4

These matters are dealt with in the first instance by Division 4 of the commission, comprising Commissioners Meyer, Daniels, Eastman and Potter. Their staff, which in June, 1920, embraced some five or six persons, has perforce grown to about 125. The ranking members of this force are: Col. William A. Colston, Director; J. F. Gray, office assistant; C. V. Burnside, legal assistant; G. J. Bunting, accounting assistant; and S. S. Roberts, engineering assistant.

Securities Section: A. Stuard Young, chief, and the following examiners: Pace Oberlin, George H. Gardner, Charles E. Boles, R. H. Jewell, Thos. F. Sullivan, A. Van Meter, A. C. De Voe, J. E. Snider, and Paul E. Loydy.

The staff of necessity includes accountants and other experts in various lines. No small part of the consideration of each case seems to be, judging from statements in the commission's reports and requirements in its orders, an examination of the commission's own files and accounting records, to see whether the applicant carrier has any matters, pending or decided, that might bear upon the application for securities. Besides this research, the commission has before it all the application papers called for by its regulations, and often calls for other data and, presumably, makes some separate examination of the authorities—legal, financial, market, or what not—pertinent to the application. Oral hearings before examiners of Division 4 itself swell the mass of material to be sifted. In view of all this study of each case, the commission's record for celerity in securities applications is wholly praiseworthy. Rate cases are not, perhaps, fairly comparable; there are usually pleadings to be filed and one or more hearings, on a crowded docket, to be held; and yet it may not be unfair to remark that the reports of rate cases show intervals of from two months to two years or more between submission and decision, while the

THE Interstate Commerce Commission in 18 months has passed on securities approximating two billion dollars. It has responded well to the heavy demands upon it.

Experience has shown that federal regulation of securities has not proven as dreadful as many feared it might. Commission regulation has cleared away the atmosphere of suspicion and distrust that has hung over railroad securities.

Relations with the states are still an uncompleted chapter.

average securities case has been decided within one month from its submission.

The Methods of Procedure

It is the commission's usual practice to render a "report" and docket an "order" in each case acted upon. These reports vary from formal perfunctory findings to long, carefully stated reasons for the order to be entered. In examining hundreds of these reports, one is struck by the

lack of stereotyped phrases and by the individual character of each report. These are indications of one excellent policy early adopted by the commission, viz.: to deal with each case by itself and on its own merits. This practice is not novel to bankers; but its prompt recognition by the commission as a rule in acting upon security issues is matter for congratulation. In the reports, however, one phrase is "standard," the substance of which is:

"We find that the proposed issue of bonds (or notes, or stock) is (a) for lawful objects within the corporate purposes of the Overland Railway and compatible with the public interest, which is necessary or appropriate for or consistent with the proper performance by the applicant of service to the public as a common carrier, and which will not impair its ability to perform that service; and (b) reasonably necessary and appropriate for such purpose."

This is the fundamental finding required by clause (2) of Section 20a. Two or three provisions are also common to practically all permissive orders, such as

(a) "Nothing herein shall be construed to imply any guaranty or obligation as to said bonds, or interest thereon, in the part of the United States."

This reflects the substance of clause (8) of Section 20a (Sec. 439, Transportation Act, 1920).

(b) "Except as herein authorized to be pledged, said bonds shall not be sold, pledged, repledged or otherwise disposed of by the applicant, unless and until so authorized by our future order."

This phraseology suitably adapted, occurs in authorities to pledge bonds under note issues or to take bonds into the corporate treasury. The obvious intent is to retain control of all securities up to the moment when the sale thereof to the public is finally authorized. Then, of course, they will become like umbrellas in Roswell Field's famous burlesque of Lord Ellenborough's opinion on property rights in same, and "join the world's great common store of securities, whither the Law will not attempt to pursue them."

(c) "The applicant shall, within ten days, report to us all pertinent facts relating to the issue and sale of said securities and the disposition of the proceeds thereof, etc., such report to be signed by applicant's designated officers and verified by their oaths."

We have not used the precise language of any particular order. The phraseology varies with the needs of the case. Sometimes periodical reports during the sale or exchange of securities are ordered. As may well be imagined, these requirements necessitate that the commission keep an elaborate diary and "tickler" system, so that reports may be called for if they do not come punctually to hand and that the commission's oversight may continue till each authority is exhausted.

The application papers in the various cases will probably never be printed in published volumes. It is a pity that not even the reports and orders thus far made have been printed so as to be available to railroad people, bankers and students, but evidently this division of the commission has been too much engrossed in doing its job to see a book through the press. It is understood that a volume will before long be issued, as part of I. C. C. reports, containing many if not all of the reports and orders in decided cases.

Relations with the States an Unfinished Chapter

Relations with the states form an unfinished chapter. No one can yet say where the clash with state regulation of securities will end. A case from Texas is in the U. S. Supreme Court, and a case in Michigan will soon be on its way thither. The New York state courts have thus far decided against the state. The language of the statute is clear: "the jurisdiction conferred upon the commission shall be exclusive and plenary, and a carrier may issue securities . . . without securing approval other than specified herein" (cl. 7); and provision is made for notice to state commissions, and a hearing, if deemed necessary (cl. 6). Yet the Interstate Commerce Commission's first set of regulations (circular letter June 26, 1920) com-

pletely enough contained a requirement that affirmative ap-

proval by state authorities be shown or that its absence be explained. Railroads betrayed a strange reluctance to go near their state commissions in the face of the words "exclusive and plenary," and railroad counsel disclosed an equally odd unwillingness to "opine" on that subject. So the definitive regulations (cir. let., revised), issued under date of September 22, 1920, but in actual practice prior thereto, omitted the troublesome reference to state control. Ever since, the commission has gone to the mat on this point with commendable spunk. For instance:

(a) In the New York Central \$25,000,000 10-yr. collat. bond case (Finance Docket No. 39), decided September 13, 1920, the commission's report noted that notice had been sent to the governors of all the states in which applicant operates. "No objection to the granting of the authority desired was offered on behalf of any of these states except the state of Michigan. Because of an understanding reached between authorities of that state and the applicant, this objection was not pressed before us." In other words, the "differences were accommodated," as President Wilson would say, and the matter was left for court action.

The Big Four Note Case

(b) In the Big Four note case (F. D. 1086; Dec. 22, 1920), the report shows that Ohio and Michigan asked for dismissal of the application, on the grounds that the commission has no jurisdiction because applicant is a creature of Ohio and Indiana, that the issue of securities does not involve a federal question, that the applicant, not being a federal corporation, is not amenable to the federal government as to its securities issues, and that (in Michigan) the state is financially interested because of fees payable to it on securities authorizations. Whereupon the commission dryly remarks:

"It is well settled that . . . carriers . . . in interstate commerce, although organized . . . as state corporations, are nevertheless subject to our jurisdiction. Section 20a . . . confers exclusive and plenary jurisdiction upon us to authorize the issue of securities. . . . A carrier may, under our authority, issue securities and assume obligations or liabilities . . . without securing other approval."

Section 20a provides that it shall be unlawful for a carrier . . . to issue securities, even though permitted by the authority creating it, unless and until, and then only to the extent that, we authorize such issue. Any security for the issue of which our authority is required, is void if issued without said authority having been first obtained. Upon consideration of the answers of the public utilities commissions of Ohio and Michigan, we are of the opinion that we have jurisdiction."

Then follows a statement, common in other reports, that no objection has been offered by the authorities of the other states concerned.

(c) The Chicago & North Western Equipment Trust report is an instance where a state seems not to have contested the commission's general power, but to have wished to manage a particular detail, to wit:

"The Nebraska State Railway Commission suggested that the authority for the issue of these securities be conditioned upon the payment of the trust certificates out of funds derived from the sale of securities and not out of operating revenues. This suggestion is intimately related to the question of proper provision for depreciation which we now have under investigation. It will receive consideration in that connection."

(Readers familiar with the struggles of the Commission, ever since 1906, to express rules on depreciation, will be forgiven if they smile at the thought that the state of Nebraska is to be added to those who are watchfully waiting for the determination of the depreciation policy of the commission.)

Other instances could be cited, all establishing that the commission now asserts and exercises its sole jurisdiction, in supersession of state commissions, over railroad securities.

The matter just discussed doubtless has sound legal foundation. Where the federal government has moved into an area which, by our Constitution, it has a right to control, it will usually be held to have taken entire authority over that area. As an element of the power "to regulate

commerce," this assumption of control of railroad securities should and probably will be held to have ousted the states from such control as they have previously exercised.

The Charter Powers of State Corporations

But there is another cognate matter that is not so clear, viz., whether the charter power of state corporations may be deemed to have been enlarged by Section 20a. The present regulations require that an attested copy of its charter be filed by each applicant carrier, and that carrier's counsel's opinion shall show that the issue "is or will be legally authorized and valid if approved by the commission. In such opinion specific reference should be made to any provisions of the charter . . . upon which special reliance is placed."

The carrier's fundamental law may provide that bonds may not be issued in excess of two-thirds of the outstanding stock, or may not bear more than a stated rate of interest; or may prohibit the issue of convertible bonds; or may otherwise restrict certain financial expedients. Can the commission in effect supplement the charter granted by the state, by permitting the carrier to do that which the state restricts or prohibits? The question has not been settled. From the commission's requirements just quoted, it can be deciphered that the authority granted and limited by the states is deemed of grave consequence (except only as to the exclusive and plenary power to authorize securities issues). But might not "plenary" power include the right to authorize financial programs not countenanced by a carrier's state? The question must some day be answered.

It was dealt with, in a negative way, in the Lackawanna's stock dividend case (where no state authority interposed objection). The commission went comprehensively into the Lackawanna's statutory power. "Whether or not applicant is prohibited from issuing stock dividends by its charters is not clear. Counsel stated that he knew of no provision which would permit such dividends." Relying upon Section 20a, the commission authorized the capitalization of part of the surplus through the declaration of a stock dividend. That is to say, the commission authorized the exercise of a power not expressly granted by state law. But whether, in an equally persuasive case, the commission would go counter to state law, seems not to have been conclusively settled.

The Matter of Valuation

One other general question is in an unsettled state: the matter of valuation. What part is it to play in the regulation of securities? Many have held the theory that valuation would disclose and limit the amount of securities that a carrier could sustain; and that such limitation would hold down rate increases, by minimizing the interest and dividends to earn which rates are, presumably, fixed. But here we are, with scarcely any valuations established, and the commission busily authorizing securities issues. Their reports disclose hardly any cases where valuation is a determining factor. On the other hand, it is plain from their reports that value of property is often taken into account. The lack of basic evidence of value must be a considerable handicap. Book value is sometimes taken into consideration: the Detroit & Toledo Shore Line application, to issue additional stock, was denied on the ground that the evidence did not show that the value of the road and equipment, plus working capital, materials and supplies, exceeded the then existing capital.

In the Lackawanna stock dividend case, the report contains much discussion of expenditures made from surplus. The prevailing opinion (for the case seems to have been heard before the whole commission) contains an express finding that "the evidence establishes . . . that the present capitalization is below the actual investment or fair

value of the property." The surplus on the books was about \$90,000,000, but the commission allowed a stock dividend of only \$45,000,000. Commissioners Daniels and Potter wrote opinions to the effect that, on the commission's own theory, a larger stock dividend and a smaller remaining surplus would have been permissible. (Commissioner Eastman's dissent was on the same ground as in the Burlington case, that capitalization of surplus ought not to be permitted). Thus the commission affirmatively found ample values for the stock dividend permitted or even for a larger dividend; value was conceded, and the real point was how much surplus ought to be left.

In a small application from Pennsylvania, the Williamsport & North Branch, the report recited that the investment of the foreclosed company, as shown by its books, was \$2,000,000, while the proposed securities aggregated \$900,000; and the purchasing committee was allowed to receive these \$900,000 new securities in exchange for the railroad bought by them at foreclosure sale. In the Chicago & Eastern Illinois reorganization (F. D. 1146), the commission virtually allowed the securities because they improved the financial set-up, their report stating:

"Under the plan of reorganization, the total capitalization will be \$91,321,150. The valuation of the property which will be taken over by applicant has not yet been completed, so that it is not practicable to compare this capitalization with underlying value. It is clear, however, that the proposed new capitalization will be relatively lower, even when allowance is made for the properties which are not to be taken over, than the outstanding capitalization of the old company, and that the fixed charges will very materially be reduced, with a subsequent improvement in credit. The evidence also indicates that the new capitalization will not be disproportionate to the earning power of applicant. Under these circumstances, in view of the manifest desirability of ending the long period of receivership, we think that approval ought not to be withheld because of lack of complete information as to the value of the property to be taken over by applicant."

The report in the Kansas, Oklahoma & Gulf reorganization matter states that no evidence was offered as to the value of the property and that it is not now practicable to determine such value, but that in this instance the commission was asked only to give effect to the reorganization plan devised by the late U. S. District Judge William C. Hook. Valuation and its corollary, earning power, have figured in one or two denials of applications for loans under Section 210 of the Transportation Act, 1920. A loan of \$42,250 to a short line railroad was refused because of deficits in net income and of the doubtful earning power and security of the carrier. In another such refusal, the same ground was stated, and the commission seems also to have taken judicial notice of the fact that a railroad built in 1913 would be confronted in 1920 with the period of its heaviest operating expenses.

Generally speaking, however, the commission refrains from mentioning valuation. Whether it will make more of the matter when valuations have more generally been determined, remains for the future to disclose.

Reorganizations

In considering valuation, the subject of reorganization naturally comes to mind. It is elementary, on the theory underlying Section 20a, that a new company should not embark upon business with securities in excess of demonstrable valuation; it is also clear that the effectiveness of the commission's control over railroad securities would be lessened if upon a reorganization securities should be authorized grossly in excess of fair valuation. The commission has had so few reorganization cases before it, that it is unsafe to generalize. The cases of the Williamsport & North Branch and the Kansas, Oklahoma & Gulf, above referred to, contain nothing of special interest, as neither had anything to do with priorities and liens. Those two and the Chicago & Eastern Illinois case, however, do indicate one practice that is of considerable comfort, viz., the focussing of the commission's attention upon the new company and its securities, and limiting its report and order

to the new company's issues. The foreclosed or reorganized company and its securities are left, where they belong, to the court in which the receivership or other proceeding is pending. Hence the commission passes upon the classes and aggregate of the new company's securities, and any special terms, if there be any, connected with the new issues; but has not thus far concerned itself with the basis upon which an old security-holder is to receive new securities under the reorganization plan.

In the Chicago & Eastern Illinois, the commission's report stated that "holders of small blocks of bonds have protested against the plan of exchanging bonds for stock. This is a matter properly to be brought before the court having jurisdiction in the premises, which have expressly reserved the determination of the equities in the receivership proceeding." In the same case, no other mention appears in the report of the basis on which the new securities are to issue. The questions of reorganization expenses, underwriting, etc., seem not to have been raised. The new securities and the assumption of certain old issues are the consideration for the purchase by the new company of most of the mileage of the old company. The commission finds that the aggregate of securities and the annual fixed charges will be less under the plan than they were with the old company's securities. The order requires the new company to file full reports of the issuance of securities, specimens of each type of security, copies of each indenture, etc. A time limit to the authority was fixed, which has been once or twice extended. The details of certain of the securities have been authorized to be changed. These matters are mentioned as indicating that the commission quite properly does not give authorities running too far into the future, but is flexible and reasonable about extensions and changes.

As to the other pending reorganizations of receivership properties, it is understood that the Missouri, Kansas & Texas authority has not yet been formally requested. The Denver & Rio Grande Western (purchaser at the D. & R. G. sale) has received authority to issue shares without par value, but appears to have received no authority as to bonds, nor as to assuming the bonds subject to which it took over the railroad. The report of the commission refers with considerable detail to the court proceedings, objections by stockholders, etc., and finds the Western Pacific holding company not within its jurisdiction under Par. 2 of Section 5 of the Interstate Commerce Act as amended.

Voluntary Refinancing of Roads Not in Receivership

There have been a few cases of voluntary refinancing of roads not in a receiver's hands. The Lehigh & Hudson River Railway Company was authorized to issue and sell \$2,987,000 stock, for the purpose of retiring all its bonded indebtedness. The El Paso & Southwestern Railroad Company was authorized to issue capital stock without par value, in exchange, three shares of new for one of old, for stock with par value then outstanding. The refinancing of the Burlington Joint 4 1/2% as is well known to the business world, was passed upon by the commission in the early months of 1921, and the reissue at Great Northern and Northern Pacific issues authorized to make the refunding possible.

Securities for New Enterprises

With railroad construction so nearly at a standstill, the possibilities for authority to issue the securities of a new enterprise have not been many. Doubtless the commission has had one or two such before it that have never reached the stage of report and order or have been withdrawn. In such cases it also involved a "certificate of public convenience and necessity" under Sec. 402 (I. C. C. Act, Sec. 1, new par. 18). The way in which new enterprises are dealt with will be watched with keen interest. States that have regulated securities have found one of their greatest

difficulties in liberalizing new issues so as to make the program inviting to capital. Texas created a state of affairs where practically all railroad building had to be done by foreign corporations—the very thing the statute sought to prevent—because no reward was in sight for local capital. The old problem of a suitable amount of bonus securities to represent earning power, promoter's profit, or whatever one may call it, seems to remain to be considered by the commission.

Discretion Exercised Upon

Strictly Business Questions

Some hopeful augury may, perhaps, be spelled out from the wide range of authority granted, and of discretion exercised upon strictly business questions. One of the early cases before the commission was the New York Central \$25,000,000 10-yr. 7 per cent bond issue (F. D. 39; Sept. 13, 1920). The Association of Railway Executives was represented by its counsel, and the banker also had such counsel. The commission in a way served notice that consummated trades should not be brought before it for mere ratification, by stating:

"It developed at the hearing that the proposed collateral trust bonds had been sold on August 20, 1920, subject to our authorization. While the law does not prohibit such a conditional sale in advance of approval of an issue of securities, carriers should realize that we shall not be controlled in our action by representations that failure to accord approval of issues conditionally sold will result in disturbance or disarrangement of plans based upon anticipated approval."

But this attitude does not seem to have meant that the commission desires to do any of the trading. It has been interpreted and acted upon as meaning that parties should trade subject to the commission's order, or after the authorization has been granted. Yet the commission is by no means unwilling to keep an eye on the market. In one or two reports, the authorized price is higher than the price stated in the application. This must mean that somebody made a better offer or that the commission ascertained that the price was too low and insisted on raising it. In the New York Central case above cited, the commission's remarks on price, underwriting, commissions, etc., are well worth citing *in toto*:

"The facts in regard to the sale are briefly these: It was made without competition. Applicant dealt only with J. P. Morgan & Company and accepted that firm's agreement to endeavor to form a syndicate to purchase from ourselves and associates at 97 per cent and accrued interest and offer for public subscription at par and accrued interest. If this endeavor proved successful, J. P. Morgan & Company agreed to buy the bonds at 96 5/8 per cent of par and accrued interest, or, in other words, upon a 7 1/8 per cent basis. The 'associates' mentioned in the agreement were eventually the National City Company and the First National Bank of New York. The evidence shows that on August 18, 1920, J. P. Morgan & Company, by wire and letter, invited various dealers in investment securities throughout the country to become members of the syndicate, notifying them of the amounts of their participation, to which they were to signify their assent by 10 o'clock of the morning of August 20 when the subscription books were to be formally opened. Out of 433 dealers to whom the invitation was sent, including J. P. Morgan & Company 433 accepted. The subscription books were closed within two hours of this opening, and there were 6,473 subscribers, 1,000 of whom had not yet paid \$2,333,500, an oversubscription of more than 50 per cent. The evidence shows that the contract of conditional sale between J. P. Morgan & Company and applicant was not consummated until after the formation of the syndicate on August 20. "The entire cost to the applicant of consummating the issue was the difference between the par value of the bonds and the sale price to J. P. Morgan & Company, this difference being \$4,825,000, less small amounts for excess subscriptions, and the earnings of the syndicate. J. P. Morgan & Company received as such its net amount of \$11,000,000, which was divided with its associates, and out of which it paid certain syndicate expenses, but none of the other expenses of the syndicate. The syndicate members who placed the bonds with investors received from the syndicate for such services a commission of 1 1/2 per cent on all sales, and on the amounts allowed to them and a commission of 2 per cent on the amounts of the placements. After deducting these commissions and the expenses of the syndicate, the portion of the \$50,000,000 remaining was distributed to members of the syndicate in proportion to their allotments. This profit amounted to about 1 1/2 per cent. Out of the 153 syndicate members 26 sold no bonds. The distribution of the \$3,000,000 is shown in the following table:

Gross profit of 1 1/2 per cent	\$7,650,000
One and one-half per cent straight selling commission on	
\$8,500,000	\$375,000
One-half per cent of the selling commission on \$10,000,000	50,130
	411,130
	\$34,870
Legal expenses, advertising, etc.	50,000
Net profit or 1.09948 per cent of \$25,000,000	\$274,870

"It appears that the main items of expense comprising the \$50,000 were approximately \$27,000 for advertising and \$15,000 for legal services.

"Conditions arising out of the war have radically changed the character of the investment market. Evidence was offered to the effect that owing to the heavy income tax the tendency of large individual buyers is to purchase tax-free securities. High returns promised in competing lines of investment deter some investors from investing freely in railroad securities. Higher margins on the placement of certain competing investments also incline distributors to prefer the placement of the latter. The banks, moreover, find it necessary to use their funds chiefly for commercial purposes. To a much greater extent than heretofore railroad securities must, therefore, be sold to small buyers, and this makes necessary more comprehensive and expensive machinery of distribution. Applicant testified that it had no means of effecting such distribution upon its own account, and that it resorted to J. P. Morgan & Company because of that firm's prestige and experience, and established connections with investment houses all over the country. In other words, Morgan & Company acted as middleman between the corporation and the distribution machinery necessary to place so large an issue of securities, and in the opinion of applicant the issue could not have been effected in any other way. Evidence was also offered by representatives of investment houses as to the greatly enhanced cost at the present time of distributing securities, because of increased salaries, higher rents, the necessity of appealing to a wider field of investors, and other factors entering into the conduct of the business.

"We have thought it necessary to set forth in detail the circumstances and cost attending the marketing of the proposed issue, because the assurance of reasonable terms afforded by competitive bids was not present. In saying this we realize that, under the conditions prevailing in the financial world, applicant probably could not have obtained the advantage of open competition; but this fact merely emphasizes the necessity of our considering in this and all similar cases the terms of sale which we are asked to approve. In the present instance, in view of the small financial risk and the apparent ease with which the subscriptions were obtained, we think the discount at which the bonds were sold was liberal. The evidence, however, is not sufficient to justify a conclusion that the cost of floating the issue was such that we ought, under all the circumstances, to withhold approval of the terms and conditions set forth in applicant's petition.

"The subject matter is plainly one deserving of attention, and it is desirable that carriers intending to present applications for the approval of security issues should appreciate that the proposed terms and conditions will be the subject of our careful consideration."

As specimens of prices actually authorized, there may be mentioned: Equipment notes, average maturity $7\frac{3}{4}$ years, at 8 per cent basis; mortgage bonds on a 7.75 per cent basis; 6 per cent bonds with 2 years to run at 90.

The Scope of Authority

As to the scope of its authority, the commission seems to act on the sound theory that if it doesn't assert jurisdiction over everything, it may miss something. This position has brought before the commission quite an assortment of oddments. For instance, the matter of dollar bonds in conversion of sterling bonds under a mortgage and bond issue preexisting federal control of securities. In an Oregon-Washington Railroad & Navigation application, the report said:

"While it is not our intent to find the proposed conversion in substance accomplishes anything more than a change in form of existing liabilities, we are of opinion that the delivery of dollar bonds in exchange for sterling bonds . . . involves an issue of securities within the meaning and purpose of Section 20a of the Interstate Commerce Act."

The same ruling was made in a Union Pacific case and in an Atchison, Topeka & Santa Fe case, the latter involving the feature that the fixed rate of exchange provided in the mortgage resulted, upon conversion, in an increase of obligation of \$26.70 per \$1,000 bond. Even bonds issued into the carrier's treasury, not sold or pledged, must obtain authorization (B. & O. Refunding & General Mortgage bonds, for example. A carrier that had issued, subsequent to June 28, 1920, without commission authority, \$50,000 of promissory notes was given authority to retrace its steps, cancel the guilty notes and issue innocent ones. Refusal to issue bonds to finance a purchase of another railroad has been denied where the purchase had first been made without obtaining the commission's approval. A subordinate refunding operation, the issuance of Rock Island General Mortgage bonds, which can be used only for pledge under and refund into the First and Refunding bonds, receives the commission's approval.

A more burdensome income tax provision was authorized to be inserted into some O-W R. R. & N. bonds; this was another instance of increase of obligation. The issue of stock upon conversion privileges has been permitted to the Southern

Pacific Company, the Atchison, the Norfolk & Western, the Wabash, the Delaware & Hudson and the Chesapeake & Ohio. Fractional bond scrip in such cases has also received formal sanction. The issuance of further preferred stock under a consolidation of corporations made in 1906 was withheld by the carrier until commission authorization had been granted (Chicago & Alton). The New Orleans, Texas & Mexico case may be taken to indicate that the commission does not deem the provisions of a mortgage beyond the scope of its authority. There the mortgage permitted bonds for betterments to be drawn down on the basis or price of not less than \$950 per \$1,000 bond. The commission, however, refused to allow a principal of bonds in excess of the cash actually expended, and cut the application from \$561,800 to \$533,700.

Pledge of Bonds for Short-Term Notes

Railroads with treasury bonds often wish to pledge them for short-term loans. The loans (if they do not overrun the two year and 5 per cent limitation of paragraph 9 of Section 20a) do not require commission authority. But the pledge does. The commission has granted a number of permissions of this sort, and has changed some of them from time to time to fit bond market conditions. In a Rock Island case, the authority first granted was to pledge not over a stated par amount of bonds per each \$100 of loan. Later this was changed to permit not over \$125 of bonds at market value to be pledged per \$100 of loan. This, as will be observed, is the wholly familiar rule of maintaining "margin."

With the recent improvement in the bond market, sensible provisions like these have resulted in lessening the amount of bonds to be pledged per \$100 of loan, but of course would operate the other way if the bond market were getting weaker. General permissions to pledge bonds have been given to the B. & O., the Frisco, the Illinois Central, the L. & N. and a number of other carriers, not to mention specific authorities to many carriers of issues of collateral notes.

We have seen the commission's attitude on stock dividends in the Lackawanna case where, roughly, half of the dividend asked for was allowed. The Burlington application for leave to declare a bond dividend had even harder sledding. Six opinions were written by as many commissioners, and the prevailing opinion was careful to limit the scope of the refusal of permission, in these words:

"No one questions the right of owners to compensation for sacrifices made in foregoing dividends. The denial in this case extends only to the issuance of a bond dividend by a railroad which has no need for the bonds, and which can advantageously issue all the stock reasonably required for its needs. The more adaptable form of mortgage which the applicant desires can be provided without the issuance of a bond dividend."

There is an echo here of the argument that the rule should be "fewer bonds and more shares." Commissioner Eastman, in both the Lackawanna and Burlington matters vigorously dissented. He believes that "undercapitalized railroad corporations are a source of strength to the nation, and they are all too few."

Stock Issued at Less Than Par

It is an interesting thing that Section 20a puts the emphasis on value, rather than on par value. There is nothing in the section to indicate that stock may not be issued, in a persuasive case, at less than par. No square instance has been found, but the commission has the right to consider the carrier's charter and, if it interpose no difficulties, to authorize stock to be sold below par. The treatment of an issuance of investment preferred stock, should such be brought before the commission, would demonstrate the commission's attitude, in case, as often happens, there were a sale price below par or a banker's commission that brought the net proceeds below par.

Other Activities

The scope of this article does not embrace the other activities of Division 4. Among such are the consideration of proposed abandonment of lines of railroad, applications for loans from the United States, applications for certificates of convenience and necessity to construct new lines, and leave to hold directorships on more than one board. As evincing the efforts of the commission to be helpful, however, attention is called to F. D. 2, decided Nov. 22, 1920, as to loans to carriers by the United States. The commission there held that inability to procure funds elsewhere, within the meaning of Sec. 210, does not mean an absolute inability, but a practical inability within the sound business discretion of the commission with a view to the public interests involved, and to determine on the facts of each case.

Two good illustrations of permission to trunk lines to acquire shorter lines are afforded by the Minneapolis, St. Paul & Sault Ste. Marie application to buy, with its bonds and some cash, the Wisconsin & Northern (F. D. 1288) and by the application of the Chicago, Milwaukee & St. Paul for leave to acquire control of the Chicago, Terre Haute & Southeastern by lease and purchase of capital stock (F. D. 1383).

Conclusion

The conclusion of the survey must be that on the whole, general regulation of securities is not so dreadful as many feared that it might be. It is fortunate that the power began to be exercised at a time when difficult financial conditions were not peculiar to this or that carrier, but were conceded almost universal. The commission has responded well to the demands upon it, and has done its best to facilitate financing.

In no carping spirit, we may be permitted to remark that some of the commission's past pronouncements gave no

promise of any such breadth of vision. Its earlier reports on investigations of the financial conditions of carriers might have been written by doctrinaire professors or by prosecuting attorneys, so little some of them contained of judicial poise and of appreciation of the other fellow's problems. Only those who have worked years endeavoring to carry along a handicapped enterprise can realize how nearly all the financing was done under stress of dire financial conditions and how little of it, if any, was done with any purpose to deceive investors or injure the public. Yet the latter theory was usually the underlying thought of the commission's old reports. In the Frisco investigation, for instance, there was criticism because bonds were sold in the face of known insolvency. Recently, on the other hand, the commission authorized the Central Vermont to renew obligations *for the purpose* of averting receivership. There may have been differences between the two cases, but their spirit is identical. Each carrier was seeking to patch a rent. Verily, responsibility does sober public men.

To cite the Frisco report again, it maintains throughout an attitude toward bond discounts that would lead any student to believe that the commission deemed them somehow heinous. Yet, since Section 20a went into effect, the commission has unblinkingly authorized many bond discounts, and prices of 90 and even 80 have not been unheard of. All these point to a great improvement in the public attitude toward railroad securities. The commission's regulation of them and of other carrier activities, may not make the securities intrinsically worth any more, but at least it has cleared away the atmosphere of suspicion and distrust that had hung over railroad securities, arising, no doubt, in some degree from the commission's own public attitude in securities matters passed upon by it. Let us hope the new attitude will work well for carrier finances.

General Railroad Developments During the Year

(Continued from page 13)

of the Transportation Act by a prediction that the condition of the railroads would be improved in the future.

Roads Propose Cut on Agricultural Products and Ask General Investigation

The railroads failed to file the new grain tariffs and the executive committee of the Association of Railroad Executives held a conference with the Interstate Commerce Commission on November 12, the nature of which was not disclosed. As a result, however, the roads at a meeting in New York on November 15 announced their intention of asking the commission to reopen the western grain case to allow them to substitute a general 10 per cent reduction for six months on agricultural products except in New England, and to make a general investigation as to whether any further reductions in rates could lawfully be ordered in view of the financial condition of the carriers.

Commission Orders Rate Investigation

Before the petition was actually filed the commission issued a formal order in the grain case that the reductions be made on or before December 27; on the day that it was filed, November 23, the commission issued an order for a general investigation to determine whether and to what extent, if any, further general reductions in rates can lawfully be recommended by order of the commission. The commission did not refer to the carriers' petition. It did issue a notice refer-

ring to various petitions that had been filed by various interests asking the institution of investigations more or less general in scope, with a view to effecting reductions in rates on various descriptions of traffic, and also to the proposal of the carriers for a 10 per cent reduction on agricultural products. It was also stated that the order was along lines under consideration by the commission for some time past. On November 29 it was modified to include the question as to what percentage will constitute a fair return after March 1, when the 5 1/2 per cent figure provided in the law expires.

On December 3 the commission responded to the request for permission to file the 10 per cent tariffs and on December 9 it announced that the petition for a rehearing in the grain case would be set for oral argument on December 14 at the opening of the hearing on the general investigation. At the hearing the railroads asked that the grain order be suspended for six months, but on December 16 the commission denied the petition for a rehearing which put it up to the roads to make both the 10 per cent general reduction and the still greater reduction on hay, grain and grain products west of the Mississippi river.

The hearings in the general investigation began on December 14, the first week being given over to the testimony on behalf of the railroads, after which an adjournment was taken to January 11. The prospects of the railroads for the new year, therefore, are largely dependent upon the conclusions which will be reached by the commission as a result of its investigation.

The I. C. C. Regulation of Security Issues

All Issues Since June 27, 1920, Have Been Subject to Approval by the Commission

By Harold F. Lane

ONE OF THE NUMEROUS new conditions created for the railroads by the passage of the Transportation Act of 1920, under which they were returned to private management, was that authority had been given to the Interstate Commerce Commission to regulate their issues of securities.

There had been much agitation for many years for some such regulation, arising mainly from the disclosures of some of the methods of high finance which were made in various investigations of financial scandals. In many cases these investigations merely resulted in additional publicity and an official location of the responsibility for transactions that had been carried on quite openly and without much criticism until they turned out badly. The demand for laws to make their recurrence impossible in the future led to the appointment of the Railroad Securities Commission in 1910 to make recommendations. At hearings before this commission, many representatives of the railroads welcomed the idea of federal regulation on the subject as a substitute for the regulation by various states which had attempted to deal with the subject with varying degrees of intelligence and a total absence of uniformity. The railroad officers, however, urged that the regulation or supervision to be undertaken should not attempt to go farther than necessary and pointed out how their financial operations would be hampered if opportunity for taking advantage of a favorable market were to be delayed by prolonged deliberation by a commission.

The Railroad Securities Commission accepted this point

of view and in its report submitted in 1911 it recommended against a system of regulation by the commission as not warranted at that time. It expressed a belief that accurate knowledge of the facts concerning issues of securities and the expenditures of the proceeds is of the most importance and recommended that railroads should be required by law to file detailed reports on these points with the commission.

These recommendations were hardly drastic enough to suit those who had been agitating for the regulation of financial transactions of the carriers and there was also much controversy over the question as to whether federal regulation should be made exclusive or merely superimposed upon that of the states.

The House of Representatives in 1914, and again in 1916, passed the Rayburn bill, but it was not passed by the Senate. There was a good deal of discussion on the subject during the hearings before the Newlands joint Congressional committee in 1916, in which the railroads went so far as to advocate federal supervision of security issues to escape from the vagaries of state regulation, but some doubts

were expressed in Congress as to whether the federal government could constitutionally assume exclusive jurisdiction over the security issues of state-chartered companies.

The discussion was dropped when the Newlands committee's investigation was interrupted by the war. After it had been decided that the roads were to be returned and a new law was being formulated in an effort to bring about some improvements over the pre-war system of railroad regulation, the provisions relating to security issues were adopted with

THE Interstate Commerce Commission during the year ending October 31, 1921, authorized railroad security issues in the following aggregate amounts:

Stocks	\$242,657,500.00
Bonds	1,276,761,616.39
Notes	98,402,194.79
Miscellaneous	97,780,313.24
Total	1,715,601,624.42

comparatively little new discussion, the Rayburn bill being taken as the basis, although many changes were made. No one was objecting to the regulation of security issues and there had been no recent scandals to cause any particular affirmative demand for action. There was a rather strong sentiment at the time, however, for concentrating the regulating authority more closely in the hands of the Interstate Commerce Commission and for treating the transportation system of the United States as a national system. While the state commissions opposed bitterly the idea of curtailing their authority over rates in any way, most of them were willing to give the Interstate Commerce Commission a jurisdiction which many of them had never attempted to exercise.

The commission's jurisdiction was made, therefore, "exclusive and plenary."

The Hadley securities commission had said that if securities were to be issued only after specific authorization by the commission it was difficult to see how the government could escape the moral, if not the legal, obligation to recognize them in regulating freight rates, but this objection was probably obviated by the provisions of the Transportation Act which based rate regulation on the value of the property rather than upon securities. The provisions of the act relating to security issues, which are included in Section 20-a, became effective on June 27, 1920.

Provisions of the Law

The law provides that after its effective date it shall be unlawful for any carrier to issue securities or assume obligation or liability in respect of the securities of any other person, even though permitted by the authority creating the carrier corporation, unless and until, and then only to the extent that, upon application by the carrier and after investigation by the commission of the purposes and uses of the proposed issue and the proceeds thereof or of the proposed assumption of obligation or liability, the commission by order authorizes such issue or assumption. The commission is to make such an order only if it finds that such issue or assumption, (a) is for some lawful object within its corporate purpose and compatible with the public interest, which is necessary or appropriate for or consistent with the proper performance by the carrier of service to the public as a common carrier, and which will not impair its ability to perform that service, and (b) is reasonably necessary and appropriate for such purpose.

The commission is authorized to grant or deny the application as made or in part or with such modifications and upon such terms and conditions as the commission may deem necessary or appropriate. It also may make supplemental orders modifying the provisions of the previous order. These provisions do not apply to notes maturing in not more than two years, aggregating, together with other then outstanding notes of maturity of two years or less, not more than five per cent of the par value of the securities then outstanding. A certificate of notification regarding such notes is to be filed with the commission within 10 days. The commission is directed to require periodical or special reports from such carrier, depending on the disposition made of securities and the qualifications of the applicant.

Bureau of Finance

To administer these and other related provisions of the act the commission created a Bureau of Finance under the supervision of Col. W. A. Colburn, formerly general advisor to the Louisville & Nashville, and this bureau soon grew to be part of the fabric of the commission's organization. Its other functions have to do with the administration of the \$5,000,000 cash loan fund, the determination of the six months guarantee of issuance of certificates of public convenience and necessity for construction or abandonment of lines, and enforcement of control of another carrier.

During the first months of its existence its time was largely occupied with matters pertaining to the loan fund and the guaranty. During the past year, however, its functions with relation to the authorizing of security issues have assumed a greater importance. On June 26, 1920, an order was issued by the commission which was revised on September 22, 1920, prescribing the form of application to be filed by a carrier for authority to issue securities and stating the character of supporting papers required to be filed therewith. It also prescribed the form of notification, when short term notes have been issued which do not require the authority of the commission. On September 2, 1920, an order was also issued prescribing "Special Report Series Circular No. 29" for use by carriers in reporting securities issued or assumed at the close of June 27, 1920.

In its annual report for the year ending October 31, 1920, the commission stated that 61 applications for authority to issue securities had been received, 28 had been granted, 1 had been withdrawn and 32 were pending. Forty-three certificates of notification had been filed under paragraph 9 of Section 20-a, representing the issuance of notes maturing in two years or less of an aggregate amount of \$28,542,764.

Securities Authorized

The annual report for the year ended October 31, 1921, showed that 283 additional applications had been received since the previous report, making a total of 344, and the issue of securities totaling \$1,715,601,624, largely for refunding purposes, has been authorized. Certificates of notification of the issuance of short-term notes to the amount of \$137,502,723 also were filed.

Most Applications Approved

As it is impossible to estimate how many financial crimes may have been prevented by the fact that the railroads have been required to obtain an official O. K. upon their plans before proceeding with them, it would be difficult to estimate how much good has been accomplished by the commission's supervision thus far. In most cases the commission has approved the applications, although in one or two conspicuous cases it has not. As to the instances in which the commission has substituted its own judgment for that of the railroad managements and their financial advisers there are probably varying opinions as to which was the more correct.

One feature of the situation that attracts attention is the delay and the amount of paper work required to obtain authorization of even simple transactions. Undoubtedly, however, much of the delay that has been experienced during the past year has arisen from the fact that both the commission itself and its finance bureau have been overwhelmed with work and have had to go through the usual experiences involved in administering a new statute. Many questions arising from differences of interpretation of the law have come up to cause delay which may be obviated in the future and the commission has also had to build up a new organization to deal with the financial matters. With each application a large amount of supporting data is required to be furnished and with many of the applications the material had been very voluminous. Many of the orders cases have been passed on very quickly, but naturally will require a considerable amount of checking with the organization of the bureau and what questions arise at that time necessary to conduct hearings. The number of cases in which there have been no hearings far exceeds those in which hearings have been held and the hearings, except as to a few applications, have been largely ex parte.

The decisions are usually rendered by Division 4 of the commission. Commissioners Meyer, Pitter, Daniels and Eastman, but in case of disagreement among them, cases are passed upon by the entire commission.

The Burlington Case

The most conspicuous example in which the commission declined to grant the application made by a railroad was that involving the refinancing by the Great Northern and Northern Pacific of their purchase of most of the stock of the Chicago, Burlington & Quincy, made by James J. Hill 20 years ago. The two companies had outstanding some \$215,000,000 of joint 4 per cent collateral trust bonds secured by the deposit of 97 per cent of the Burlington stock, which, paying an 8 per cent dividend, carried itself for the two roads. The bonds came due, however, on July 1 and it would obviously require a higher interest rate to refund them, while the two northern companies had no way of paying them off, except by selling or forfeiting the Burlington collateral and giving up their control.

After a great deal of planning and consultation with bankers, a plan was evolved by which the Burlington was to be made to pay in part for itself by the use of part of the large surplus it had built up by making extensions and improvements out of earnings without capitalizing them. The commission was asked to approve an issue of \$60,000,000 of Burlington stock to be used as a stock dividend, most of which would go to the two northern lines, and a new mortgage, which the Burlington needed anyway, and under which the commission was asked to authorize an issue of \$80,000,000 of bonds, against expenditures made out of income, to be also used as a dividend.

Both issues were designed to bring the Burlington capitalization nearer to its value and the proceeds of the bond issue were to be used to reduce the amount of bonds to be issued against the Burlington to approximately \$140,000,000. It was argued that this would result in a saving of interest charges for the three roads considered together as compared with the cost of refunding the entire issue of joint bonds, although it would increase the fixed charges of the Burlington. The application was filed with the commission about November 1, 1920. Extensive hearings were held, at which the plan was opposed vigorously by the state of Nebraska.

After long consideration within the commission's organization, during which several reports of various kinds were written by subordinates, the commission on February 28 issued its decision in which a majority approved the \$60,000,000 stock issue, which was of no particular value since it was not desired to sell the stock, but disapproved the bond issue for dividend purposes, which was the most important feature of the plan. The commission was much divided in opinion. Eight members approved the stock issue, but only four approved the bond issue, and there were several dissenting and partially concurring opinions.

This made it necessary for the railroads to work out a new plan and get it approved in time to meet the maturity of the bonds by July 1. On March 25 a new plan was proposed which the commission later approved, providing for a new joint bond issue of \$230,000,000 at 6½ per cent to refund the entire amount of the joint 4½, secured by both the Burlington collateral and in addition by \$33,000,000 of mortgage bonds of each of the two northern companies, but with provision for conversion of the joint bonds into the individual issues of the two companies. This was approved by the commission on April 21 and the exchange and sale of the new joint issue was successfully made, although at a considerable increase in interest charges as compared with the earlier plan.

Later on when the two northern companies needed additional funds with which to maintain their usual dividend disbursements, the Burlington went to their assistance with an increased cash dividend, which it was able to declare without obtaining the approval of the commission, and the Burlington is now before the commission with an applica-

tion for a bond issue to meet its own capital requirements. This entire transaction illustrates in an exaggerated degree the possibilities for delay which are inherent in a system of commission regulation of security issues, although on the other hand, no comparison is available as to the time that would have been required if it had been necessary to obtain approval for so complicated a plan from the various state authorities. The same observation applies to many other cases in which a considerable length of time has been taken by the commission to pass upon the carriers' applications.

For a transaction involving one of the largest corporate issues ever made the Burlington financing attracted very little public attention. The newspapers devoted little space to it and the public hearings were not reported in the daily press. As the commission was so closely divided as to the lawfulness and propriety of the original plan which was disapproved, its majority opinion presumably carried little, if any, more weight than did the opinion of the minority and there is probably as much room for argument now as existed before as to whether the Burlington should have been allowed to issue a bond dividend.

No public criticism of the commission's decision was made by representatives of the interested railroads and apparently they attached more importance to finding a feasible plan to which the commission would give its official approval than to any particular plan in detail.

The commission in the Burlington and one or two other cases did establish one principle as to which there has been much argument in the past, in authorizing the issue of stock for the purpose of capitalizing improvements made out of surplus earnings. This question was made an issue in the Burlington case both by the representatives of Nebraska, who opposed it, and in the opinion by Commissioner Eastman, the argument against the plan being that the surplus was rather held in trust for the public than the property of the stockholders.

The Lackawanna Case

The same point was involved in the application of the Delaware, Lackawanna & Western for authority to issue approximately \$90,000,000 of additional stock, representing the amount of its surplus, as a stock dividend. In the case of both the Lackawanna and Burlington, it had been common knowledge that the capitalization had been kept at a very low point, as compared with the value of the properties, which had been gradually built up out of earnings and in the Lackawanna case there was no real opposition to the application. The commission did not allow the full amount of the issue applied for but after having the case under consideration for about seven months, it finally on April 18 authorized an issue of \$45,000,000.

Louisville & Nashville

The Louisville & Nashville applied to the commission in August for authority to issue \$53,000,000 of stock as a stock dividend and also to issue some bonds. On December 17 the commission issued an order authorizing the bond issue but consideration of the stock issue was held in abeyance.

Three applications requesting authority to issue shares of capital stock without nominal or par value have been filed with the Commission. One of them, filed by the El Paso & Southwestern Company, involved the exchange of stock without par value for stock having a par value; authority upon this application was granted. The other two applications involved the issue of stock without par value under reorganization plans for railroads previously in receivership. Authority upon one of these, filed by the Denver & Rio Grande Western Railroad Company, was granted.

Bonds Sold Subject to Commission's Approval

In the discussion of the subject of security regulation before the law was passed railroad men have laid much stress upon the importance of being able to act promptly to take advantage of a favorable market in placing securities and upon the serious effect of the delay required by the necessity for obtaining governmental approval. In numerous cases, however, during the past year, they have got around this difficulty by making arrangements for the sale of bonds in advance, subject to the commission's approval. In many cases large bond issues have been advertised in the newspapers before the formal applications were filed with the commission and several weeks in advance of the issuance of the order of authorization. Undoubtedly in such cases the financial officers of the roads have been confident that their plans contained no objectionable features and in some cases they may have consulted informally with members of the commission's organization in advance, because the commission in administering the provisions of the law relating to security issues has adopted a policy of working in more close co-operation with the carriers than has been the usual practice in rate cases.

However, the commission took occasion to issue a warning in the first case of this kind that came to its attention that "while the law does not prohibit such a conditional sale in advance of an approval of an issue of securities, carriers should realize that we shall not be controlled in our action by representations that failure to accord approval of issues conditionally sold will result in disturbance or disarrangements of plans based upon anticipated approval."

The first application involving a large security issue to come to the commission was that of the New York Central for authority to issue \$25,000,000 of 7 per cent collateral trust bonds, and also \$25,000,000 of refunding and improvement mortgage bonds to be pledged as part of the security. The application was dated August 19, the day before the bonds had been conditionally sold, but it was not made public at the commission's office until the next day following the sale. The commission's decision was issued on September 13, containing the warning above quoted.

Some States Object to Commission's Jurisdiction

The New York Central case served to bring forward the question of state rights. The railroad, in filing its application with the federal commission, had ignored the state commissions and the Michigan Public Utilities Commission protested, denying the power of the Interstate Commerce Commission to supplant the state authorities. The commission met this by simply stating in its opinion that "we are of opinion that we have jurisdiction" and this remark has been repeated since in various cases in which state commissions have raised the jurisdiction question.

Publicity

When the Railroad Securities Commission referred to the importance of publicity in connection with security issues, it presumably was thinking particularly of the character of publicity involved in making matters pertaining to security issues a public record and subject to the scrutiny of public officials rather than the kind of publicity that reaches the public through the medium of the press.

As far as newspaper publicity goes, the public has received very little idea of what has been done either by the railroads or by the commission. Railroad financial scandals have largely faded into history and the public has become somewhat accustomed to large transactions. Therefore the application to the commission and its orders have been treated as routine and have been very inadequately reported in the daily press. Even the important Burlington and Lucka-

wanna cases were given little attention and the issues upon which the commission decided them required more space to explain than the newspapers were willing to give to the subject.

Probably the general impression that has been created by what publicity has been given the subject has been that the railroads were issuing a very large amount of bonds and that therefore the market conditions must have been favorable for the absorption of railroad securities, because although most of the bonds have been issued for refunding purposes and a large proportion of them for purposes of collateral, the news items have usually made no distinction between those that were to be sold and those which were merely to be exchanged for maturing issues bearing lower interest rates, or to be deposited with the Secretary of the Treasury as security for a loan from the government or with a trustee as collateral for another bond issue.

In many cases, where a railroad proposed to issue a series of bonds bearing a rate of interest at which they could not be marketed under favorable conditions as collateral for an issue bearing a higher rate, the news items have added the two amounts together. For example, when the New York Central applied for authority to issue \$25,000,000 of bonds and another \$25,000,000 as collateral for the first issue, it was generally reported that the New York Central was going to issue and presumably sell \$50,000,000 of bonds. In this way a very exaggerated idea has been conveyed of the extent of railroad financing during the past year.

In many of the applications the railroads have explained the arrangements made in advance for the sale of securities and the commission's order in stating the conditions on which authority is granted has usually referred to the price named as a minimum. In many cases the application explains that no arrangements have yet been made and none will be made until the commission has issued its decision.

The commission has scrutinized very closely the rate of interest proposed to be paid in connection with bond issues and has made many efforts to hold down the rate. In making loans from the revolving fund it has attempted to prevent the payment or the execution of what it considered an unduly high rate by making a condition that the company should meet a certain proportion of its requirements by private financing and often has prescribed a maximum rate of interest. In other cases where it has appeared that the best rate which the railroad was able to obtain was above what the commission considered reasonable, it has met the situation by allowing the road a loan from the revolving fund at 6 per cent and the application to issue guaranties has been withdrawn.

The R. F. & P.'s Richmond Terminal

Opening Session of the Labor Board's Investigation of Threatened Strike of Train Service Employees, G. A. Cook, Secretary of the Board's Bureau No. 3, (Standing Behind the Board), Is Reading the Call to the Meeting. Railway Executives and Brotherhood Leaders Are Grouped on the Left.

Progress Towards Normalcy In Railway Labor Field

Year 1921 One of Many Controversies Between Railways and Employees, But Situation Has Been Improved

By Holcombe Parkes

SLOW BUT SUBSTANTIAL progress toward normalcy in the railroad labor situation can be recorded for the past year. Contributions to post-war readjustment have been made both by the railroads and by railroad employees. The railroads have made some progress in their fight to bring about lower labor costs but in many respects they have lost their fight for principles. The employees have lost in actual wages and many working conditions which they valued, but they have won recognition of principles for which they contended. Both sides express dissatisfaction as a result.

This outcome is largely the result of the existence of a regulatory body, the Railroad Labor Board, the three public members of which, in whose hands is the balance of power, are flanked by six partisan members whose opposing influences tend to cause compromise decisions. It may be, however, that the very slowness of the progress which has been made will be recognized some day as having helped the nation to pass safely through a precarious reconstruction period. At any rate, real progress has been made and the serious industrial strife which many predicted has been avoided.

Three outstanding developments of major significance marked the past year. They were:

(1) The controversy over national agreements and the settlement of a large part of this dispute.

(2) The reduction of labor costs through wage reductions, the elimination of employees and the curtailment of overtime of the forces remaining on duty.

(3) The threat of a general strike of the train service

employees, which was averted by a strong public sentiment and the activities of the Labor Board and other government officials.

To appraise properly the labor developments of the last 12 months it is necessary to keep in mind that the year opened with widespread bankruptcy apparently threatening the railroads as the result of a maladjustment between revenues and expenses. In a period of less than four months the traffic of the railroads had fallen from the heaviest ever recorded to the lightest in some years. Earnings had declined correspondingly, and the higher freight and passenger rates, placed in effect August 26, 1920, had failed by ever increasing amounts to produce the net return fixed by Congress and the Interstate Commerce Commission as just and necessary.

Labor Board Begins Consideration of National Agreements

When the Labor Board handed down its wage increase award in July, 1920, it continued the national agreements in effect pending further hearings. These hearings began on January 10, 1921, when E. T. Whiter, chairman of the Conference Committee of Managers of the Association of Railway Executives, and B. M. Jewell, president of the Railway Employees Department of the American Federation of Labor, fired the opening guns in a four months' pitched battle. For 19 days Mr. Whiter attacked the rules in the various national agreements, showing in detail the inefficiency and waste caused by the universal application of rules regardless of widely varying local conditions.

THE PAST YEAR witnessed a continual struggle between railroads and labor leaders over national agreements and the readjustment of labor costs.

Slow but substantial progress has been made, however, in improving the labor situation.

The year 1922 will see a further struggle to reduce labor costs.

Mr. Jewell retaliated at intervals by "statements" aimed, not at the rules under discussion or at the board, but at the public in an attempt to influence public opinion, and divert attention from the real issues. Charges that the railroads were mismanaged, that they had broken faith with the public, violated the Transportation Act and defrauded the public out of millions of dollars were spread broadcast by Mr. Jewell.

Meantime the financial condition of the carriers became more precarious. The seriousness of the situation brought General W. W. Atterbury, vice-president of the Pennsylvania and chairman of the labor committee of the Association of Railway Executives, before the board on January 31 with requests for immediate abrogation of all national agreements, a return to the rules and working conditions of December 31, 1917, and the right to pay unskilled labor prevailing local rates. Assurances that the carriers would refrain from asking for wage revisions for 90 days if these requests were granted were made. A bitter battle of "statements" to the public and the board and telegrams to President Wilson ensued. The President declined to interfere, but the public was awakened to the seriousness of the situation.

Mr. Jewell, reinforced by Frank P. Walsh, counsel, W. Jett Lauck, "consulting economist," and a battery of publicity men, reopened the battle on February 10 after widely advertising that he intended to sidestep the national agreements issue temporarily to bring charges of a "huge conspiracy" on the part of Wall street banking interests and railway executives to "crush organized labor." The board, realizing that such testimony was irrelevant, ruled it out. At the same time the board denied General Atterbury's requests. The decks were cleared for consideration of the real issues involved.

Employees' Spokesmen Delay Hearings

The testimony on behalf of the carriers was completed on February 3. The opportunity to delay the hearings, thus continuing the national agreements in effect, was not overlooked by the labor leaders. Petitions for additional time in which to prepare replies to the carriers' testimony, offers of "settlements" involving the recognition of the principle of collective bargaining as defined by the labor leaders—bargaining solely on a national basis—and requests for the subpoenaing of officers of the Association of Railway Executives and railway executives who were members of the labor committee of that organization were utilized by Messrs. Jewell and Walsh to postpone the hearings.

Some of the petitions for delays were granted by the board. The insistent demand for the calling of railway executives as witnesses finally resulted in their being asked to appear on March 18. With the exception of seven days in which representatives of several of the smaller organizations presented testimony in favor of the continuation of their national agreements, the period from February 3 to March 18 represented the results of Mr. Jewell's efforts to prolong the life of these petitions.

Five days of cross-examination of railway executives at that time and five days of the same thing later, from April 4 to 8, but caused the railway to set forth with greater force that the universal application of rules regarding working conditions is impossible without a loss of economy and efficiency. A desperate attempt to bring out evidence in support of the "huge conspiracy" charges fell flat.

Mr. Jewell Presents Labor's "Bill of Rights"

Mr. Jewell presented a significant "bill of rights," outlining 11 basic principles for which the employees were fighting. These principles, "the irreducible minimum in labor's bill of rights," included the eight-hour day, punitive overtime and rules dealing with (1) the arrangement of the beginning and ending of working shifts "so as to permit

of reasonable living arrangements," (2) the safety of employees, (3) the delimitation of the work to be performed by each craft, (4) apprentices, (5) the requirements for employment, (6) the right of the majority of the employees of any craft to elect an organization to represent them, (7) the right of the majority to elect committees to handle grievances for all employees of the craft, (8) seniority, and (9) the right to organize and the protection of employees against discrimination.

On March 24, almost eight weeks after the carriers had closed their case, Mr. Jewell began his real reply. After another delay for the cross examination of more executives, interest in the national agreements controversy gradually dwindled. The hearings, however, did serve as an agency through which voluminous exhibits prepared by Mr. Lauck could be given wide circulation bearing the stamp of authentic testimony before a government body. Sometimes these exhibits dealt with national agreements. For the most part they consisted of alleged evidence of the "conspiracy" and mismanagement charges and loose allegations made by representatives of the employees.

Labor Board Abrogates, Then Continues, National Agreements

The first of a series of decisions in this dispute was handed down by the Board on April 14. It abrogated national agreements on July 1, remanded the negotiation of new agreements to the individual carriers and their own employees and upheld the railroad's interpretation of collective bargaining and their contention that varying local conditions should govern in fixing rules and working conditions. It also outlined 16 principles with which the new agreements should be consistent, thus awarding the employees one of the major points for which they had been contending.

The subsequent negotiations between the individual railways and their own employees were almost fruitless, mainly because the leaders of the national labor unions instructed their followers to accept nothing less than the rules in the national agreements. On June 28, therefore, the Board issued an order continuing all national agreements until such time as the board could pass on the rules and ending until further notice time-and-one-half for overtime.

Overtime and Piecework Disputes Decided by Board

The Board handed down the first of its final decisions in the controversy over the shopmen's agreement on August 11, almost six months later. Seven new rules, recognizing and continuing the principle of punitive pay for overtime work, were promulgated. The new rules sanctioned the principle of the eight-hour day, the policy of paying time-and-one-half for work performed on Sundays and holidays, except that which is absolutely essential to continuous operation, and the practice of paying an allowance to an employee called but not required to work. On the other hand, the new rules so changed the overtime provisions of the shop crafts' national agreement as to eliminate many wasteful and ridiculous efforts brought to the attention of the Board.

Drafts of 17 more rules for inclusion in the new agreements with the shopmen were announced on October 13. One of these rules removed the ban on piece-work and of the total of 17 rules, 10 were so worded as to obviate inefficiency and waste caused by the application of rules in the national agreement and seven were exact counterparts of rules of the national agreement.

Labor Board Announces New "National Agreement"

The Board handed down its final ruling, insofar as the shop crafts' agreement is concerned, in the form of a complete new set of rules on November 29. These new rules applied wherever disagreements had arisen over the points covered by any particular rule of the national agreement. In

other words, a new "national agreement" for the shops crafts was promulgated. Instead of having the rules incorporated in one agreement applicable to all carriers and shop employees, identical rules will, in the future, be incorporated in all the agreements between the carriers and their shopmen. The effect will be that against which the carriers have principally directed their whole fight—the universal application of rules regardless of varying local conditions. To this extent this final decision represents defeat for the railroads.

On the other hand, the revised rules will relieve the railroads of much of the waste caused by similar rules of the national agreement. These new rules made by the Board do not apply where agreements on rules regarding the same matters have been reached by the individual carriers and their shopmen. It is likely, however, that as opportunities present themselves either the employees or the carriers will ask for the establishment of the rules that are the most favorable to themselves. If disagreements ensue and cases come before the Labor Board, it is logical to assume that the Board, having already determined what it considers a just and reasonable rule upon the point in question, will simply order the application of its own rule. Thus, so long as the Labor Board regulates the working conditions of any class of employees, there will be a strong tendency for the working conditions of that class of employees to be made uniform throughout the country.

Financial Situation Forces Roads to Cut Forces, Overtime and Finally Wages

The extremely serious situation in which the carriers found themselves at the beginning of the year, together with the refusal of the Labor Board to grant immediate relief by authorizing the changes suggested by General Atterbury, forced the railways to ask reductions in the wages of all employees. The laying off of 655,000 employees between August, 1920, and April, 1921, and cutting the working time and the overtime of the employees remaining in service so that the average earnings dropped from \$162.25 a month in the third quarter of 1920 to \$149 a month in the second quarter of 1921, despite the fact that the wage rates in these two quarters were exactly the same, failed to solve the problem. So in March, while the national agreements controversy was still holding the spotlight, each railway, acting in accordance with a general policy of decentralization, brought disputes over proposed wage reductions to the Board.

The carriers' testimony was based entirely on (1) the decline in the cost of living and (2) the wage reductions in other industries. The employees replied with amplifications of the old charges of mismanagement, etc., their only relevant defense being predicated upon (1) the fact that there had been no decrease in the wages of workers in the coal and steel industries and (2) a denial that the decrease in the cost of living justified wage reductions. The Board's decision, announced on June 1, provided for a wage cut on July 1 averaging about 12 per cent. The average reduction represented almost exactly the halving of the opposing demands of the carriers and the employees.

Labor Leaders Try to Use Wage Cut to Ward Off Further Readjustments

The labor leaders immediately made preparations to use this moderate reduction as a means of warding off further readjustments of labor costs. United action by the various unions was desired, but factional differences made this impossible. The train service organizations finally agreed upon a plan of action which involved a referendum vote, and the association of the wage cut issue with protests against further wage reductions and the proposed abolition of punitive overtime. Subsequently, representatives of the brotherhoods asked the carriers to (1) wipe out the wage cut of July 1, (2) withdraw all demands for further wage reductions and

(3) withdraw all demands for the abolition of punitive overtime for a stated period. The demands were rejected by the carriers and the question of a strike was submitted to the men. Meantime, the other organizations had been taking strike votes against the wage cut, and talk of a general strike began to be widespread.

Brotherhoods Call Strike for October 30

The controversy came to a head on October 14. The union leaders had already completed the count of their strike ballots and found a large majority in favor of a walkout. A meeting of the Association of Railway Executives was being held in Chicago and the heads of the train service brotherhoods sought a conference and received a final rejection of their demands. At the same time the railway executives announced that further wage reductions were to be sought immediately as a means of meeting the insistent demand for reduced rates. As a result of this combination of circumstances the leaders of the train service organizations called a strike for October 30 to become effective on groups of carriers on succeeding days.

The heads of the other railway labor organizations meanwhile had had little to say. It developed later that the so-called "associated standard recognized railroad labor organizations" had broken into two groups, the train service organizations comprising one and the remaining unions the other. The cause of the break, which was expected for some time, was given as the inability of the two groups to agree upon the terms on which the impending strike would be terminated.

Labor Board as a Peace Maker

Here the Labor Board, gathering courage from the attitude of the government and the President, made its first energetic attempt to bring peace. The leaders of the brotherhoods were called into conference by it, but the meeting was a complete failure. The Board, realizing its existence probably depended upon averting the threatened tieup, immediately arranged for an investigation of the whole situation and called the chiefs, executive committees and general chairmen of the train service organizations and the chief executives of practically all of the larger railways together in Chicago. This investigation was the dramatic event of the year. B. W. Hooper, vice-chairman of the Board, developed the fact clearly through examination of the labor leaders, that the strike was called, technically as a protest against the wage reduction, but in reality as a "bluff" to ward off further wage reductions and changes in the working rules of the men involved. Nevertheless the brotherhood leaders stoutly maintained that nothing could stop the strike but a "satisfactory settlement."

Just previous to this investigation the Board had issued a memorandum in which it stated among other things, that further requests for reductions in wages of any class of employees would not be considered until all pending disputes regarding the rules and working conditions of that class were disposed of. This memorandum, however, was not presented to the brotherhood chiefs until later, when Mr. Hooper read and explained its provisions before a meeting of brotherhood leaders. The provisions of this memorandum, together with Mr. Hooper's explanation of its intent, constituted a "satisfactory settlement." The strike was called off on October 27. There followed a period of comparative calm.

Labor Board Fails to Bring "Peace"

In creating the Labor Board, Congress obviously had in mind the establishment of machinery which would make for peace between the carriers and their organized employees. Throughout the year, however, there has been constant dissension and several small strikes culminating in the threat

of a general strike. Real peace was not achieved, but at the same time nation-wide strikes were avoided.

The Atlanta, Birmingham & Atlantic Case

At the same time General Atterbury went before the Board with his request for immediate relief, there developed a situation on two small roads which later resulted in serious strikes. The Atlanta, Birmingham & Atlantic was losing \$100,000 a month and its financial position, therefore, became so precarious that it finally ordered wage reductions for February 1, and later petitioned the Board to sanction the cuts. After hearing the case on January 25, the Board ordered the carrier to rescind its wage reduction order and later, on February 21, ordered the dispute remanded to further negotiation, in accordance with the terms of the Transportation Act. On March 5, about 1,500 employees of the A., B. & A. went out on an "unauthorized" strike which completely tied up the road for some time. In the meantime, however, a receiver for the road had been appointed by the United States District Court and the wage reduction orders were re-issued to become effective on March 26. This raised an interesting issue as to superior jurisdiction as between the District Court and the Labor Board. The Board called representatives of the A., B. & A. before it on March 21, to determine whether or not the carrier, in reducing wages in accordance with a court order, had violated the Board's previous wage rulings.

The action of the carrier in reducing wages in compliance with the ruling of the District Court was adjudged a violation of the Transportation Act by the Labor Board in a ruling handed down on April 21. This ruling at the same time avoided demanding the recall of the wage cut order and suggested further conferences between the management and the employees. The controversy between the court and the Labor Board was never definitely decided, but the fact remains that the dispute resulted in a strike which was for some time a source of much trouble and inconvenience in the territory served by this road.

The Missouri & North Arkansas Controversy

Another case very similar to this and resulting in an even more serious situation first came before the Board on February 15, as a result of a wage reduction put into effect on February 1, on the Missouri & North Arkansas by order of the receiver of that road. Before the case came before the Board, the employees involved went on strike and their pleas were taken by new employees as rapidly as they could be obtained. At hearings before the Labor Board on February 15, this dispute was also remanded to negotiations in accordance with the terms of the Transportation Act. However, the Board's order also directed the employees to accept the reduced wages under protest because of "extenuating circumstances." Strenuous efforts were made to maintain service, but the belligerency of the strikers finally resulted in tying up the entire road. An attempt was made to resume operation, beginning on March 24, after repairs to the property had been made, but by July it became evident that further attempts to operate under the conditions were useless and on July 31, the road discontinued operation.

A strike occurred on the International & Great Northern immediately prior to the threatened strike of train service employees in October. The trainmen on this carrier walked out despite orders of the Labor Board although the interruption to traffic was not serious and the men returned to work on probation after the threatened general strike was called off.

Controversy Between Labor Board and Pennsylvania

There is one other significant dispute which should be briefly included in a review of the failure of the labor provisions of the Transportation Act to bring "peace," namely the dispute between the Board and the Pennsylvania. When

the Labor Board remanded the dispute over national agreements to negotiation between individual carriers and their own employees, the Pennsylvania immediately set out to determine who the majority of its employees desired to have represent them. It sought this information by means of a secret ballot, providing for the election of employees of the company and not organizations or men who were not in the employ of the company at the time. As a result of these elections, committees were appointed and negotiations conducted resulting in the formation of a new set of rules governing the working conditions of shopmen at the Altoona shops and later at other points.

The protests of the system organization of the Federated Shop Crafts brought the Pennsylvania before the Board on July 14 and 15, when it defended the elections and the subsequent negotiations, on the grounds that (1) the board exceeded its authority in extending the national agreements, (2) the rulings of the Board on this controversy will have the effect of perpetuating the national agreement, thus providing for the "closed shop," and (3) the Pennsylvania has carried out its understanding of the Board's purpose in remanding the dispute over national agreements.

The employee's arguments were based largely on the request for a ruling on (1) the right of the majority to determine what organization shall represent them, (2) the right of the organization to negotiate for all employees of a craft, through representatives of their own choosing, regardless of whether these representatives are employees of the carrier or not, and (3) the right of the organization to elect representatives in accord with its own laws. These three points, they claimed, were settled in favor of the unions by the 16 principles which the Labor Board said should govern in the negotiation of new agreements and were violated by the Pennsylvania in this case.

On August 1, the Labor Board ordered a new election on the Pennsylvania, finding both the carrier and the employees guilty of "illegal and unfair" actions. The Pennsylvania replied on August 24 by asserting that the new agreements already made were in full force and asking the Board to vacate its ruling calling for a new election. The Labor Board in turn defended its position in the case in a lengthy order, calling for further hearings. When these further hearings were scheduled, September 26, the Pennsylvania declined to appear before the Board because of restrictions on the testimony to be presented which automatically prohibited the Pennsylvania from clearly outlining its position.

However, on October 20, the Pennsylvania again came before the Board and outlined its previous stand. No further developments came, however, until December 9, when the Pennsylvania obtained a temporary injunction from the Federal Court at Chicago, restraining the Labor Board from publishing a decision which it had promulgated as a result of this controversy. Hearings on the carrier's plea to make this injunction permanent were subsequently set for December 26, leaving another important phase of the railroad labor problem as a legacy for the new year.

Regional Boards of Adjustment Formed

The question of the formation of boards of adjustment, a matter left to agreements between the carriers and their employees by the terms of the Transportation Act, has been partially solved during the past year through the creation of three regional boards on which are represented the four train service organizations and a number of the larger carriers. Immediately after the passage of the Transportation Act the labor organizations stood solidly for national boards of adjustment. However, the train service brotherhoods later receded from this position and suggested regional boards. The first results of this were seen in the establishment of a board of adjustment in September to handle disputes over personal grievances and the interpretation of schedules be-

tween the Baltimore & Ohio and the New York Central and the four train service organizations. This board is composed of eight members; four representing the two railroads and one representing each of the organizations involved. In October a similar board to handle disputes between the train service organizations and eight of the larger western carriers was created. Still another, to handle disputes between the train service organizations and 17 southeastern roads, was created in November. In the southwest, negotiations are still in progress looking to the creation of a board for that territory. The purpose and jurisdiction of all of these boards are substantially the same.

The Pennsylvania and its employees went even further, in the establishment in September of system and regional boards of adjustment for the following groups of its employees: (1) train and engine service; (2) maintenance-of-way and structures; (3) signal department; (4) mechanical helpers and apprentices, maintenance of equipment and telegraph and telephone, eastern region; (5) clerical forces, eastern region; and (6) miscellaneous station forces, eastern region. These boards, or "reviewing committees" as they are called, for the first three groups cover the entire system; for the last three the regions indicated.

Being created, as all of these boards were, during the last four months of the year, they did not materially change the course of events or affect the work of the Labor Board. They will tend, however, to relieve the Board of a number of disputes which that body has had to handle through the sub-division of its members into three bureaus and through examiners, leaving it more time in which to take up and consider more important controversies.

The Outlook for 1922

A year of constant wrangling has brought a decided improvement in the railroad labor situation, but the year 1922 promises to be another year of wrangling and struggle. The year opened with the vital question of national agreements undecided, with readjustments of wage scales in prospect and with the future of the Labor Board dependent upon its accomplishments. The year has passed and the national agreements are still "among those present" although in greatly modified form, a further readjustment of wage scales is imminent and the future of the Labor Board is still undecided.

Three developments of significance brought the year to a close. On December 20 the Labor Board announced its

decision in the several controversies resulting from the negotiation between individual carriers and their maintenance-of-way employees of new rules to supersede the national agreement. This decision contains specific rules to be applied in all cases where dispute had arisen on the points covered by these rules. In other words, the form and application of the decision are the same as those of the shop crafts decision. In this case, however, part of the old national agreement was not passed upon, namely the seniority and the promotion clauses, inasmuch as practically all of the carriers and their employees had agreed upon rules to cover these subjects. Other rules in the national agreement were written to eliminate the objectionable features of their counterpart in the national agreement. For instance, the overtime rules were changed so that punitive overtime for all workers in the maintenance-of-way department would start after the tenth hour, instead of the eighth hour as had been the case under provisions of the maintenance-of-way national agreement. In addition, many points covered specifically in the national agreement were expressly left open for local adjustment.

Year Closes With Three Significant Developments

On December 9 another chapter was added to the jurisdictional dispute between the Pennsylvania and the Board, when a temporary injunction restraining the Board from publishing a decision which was believed to be detrimental to the interests of the carrier, was issued by the Federal Court at Chicago, on the plea of representatives of the carrier. Arguments on a plea for a permanent restraining order were first scheduled for the following day, then postponed to December 21, and finally to January 3 of the present year, by mutual agreement.

The third development of significance was a ruling made by the Labor Board in which, for the first time, the "ability of the carrier to pay" was recognized by the Board as an element of "secondary consideration" in the fixing of just and reasonable wage scales. The decision came in a dispute between the New Orleans Great Northern and its train and engine service and maintenance-of-way employees, station agents, assistant station agents, and telegraph operators. This decision is interpreted as a recession from its former position in that it not only specifically states that testimony of this character is worthy of "secondary consideration" but it reduced the rates of pay of the employees involved, in compliance with the request of the carrier.

The Federal Valuation Is Entering New Stages

Tentative Reports Being Served on Carriers—Hearings on Protests Scheduled—Forces Reduced

By E. T. Howson

THE MOST IMPORTANT development in the work of valuing the properties of the railways during the year which has just closed has been the completion and serving on the roads by the Interstate Commerce Commission of a large number of tentative valuations, with figures for the first time of the Commission's estimate of tentative "final value." While 55 tentative valuations were served on the roads last year, they did not contain any figure purporting to show this "final value." The decision of the United States Supreme Court in the mandamus action brought by the Kansas City Southern, handed down on March 8, 1920, made it necessary for the Commission to prepare supplemental valuations, the first of which were not served until April 5 of this year. Since that time others have been issued at frequent intervals, with the result that a total of 177 tentative valuations have now been issued on roads with an aggregate of over 26,000 miles of line, or slightly over 10 per cent of the mileage of the country.

The valuation work received a severe blow in the death of C. A. Prouty on July 8. Mr. Prouty had been director of the Division of Valuation since its organization. In his passing the valuation work has lost more than its official head. Mr. Prouty had been a leading member of the Interstate Commerce Commission for 18 years and was its chairman for one year, prior to his connection with the valuation of the railways. As a commissioner he had gained

the confidence of the carriers and the public to a degree enjoyed by few in similar positions. In that capacity he had long advocated the making of a valuation for use in regulating the railways and, following the passage of the Valuation Act in 1913, he resigned from the Commission to organize and direct this newly created activity. In this capacity his sense of fairness and the confidence which he inspired did much to launch this work successfully in its early days when there were so many possible points of controversy between the Division of Valuation and the carriers on the one hand, and the state commissions on the other hand.

Another development which came unexpectedly late in 1921, was the closing of the five district offices of the Bureau of Valuation and the concentration of all work in Washington. Incident to this move, the forces were cut practically in half, the cut being especially drastic among the higher officers in these district offices, the large majority of whom severed their connection with the work. This consolidation of offices and reduction in forces was brought about by the program of retrenchment instituted by the administration. It has resulted in considerable temporary disorganization which is necessarily incident to a transfer of forces of this magnitude, but will probably not delay the ultimate date of completion of the work.

The valuation work is divided into three major groups, the engineering, the land, and the accounting departments.

REPORTS containing tentative "final value" were served on 177 carriers during the year. Carriers' book records of investment in road and equipment are being sustained as more valuations are being reported. Valuation work suffered severe loss in death of C. A. Prouty, director of the division since its organization.

All district offices were closed and forces were cut in half late in the year. Future of the work is being regarded with increasing uncertainty.

Shortly after the inauguration of this work in 1914, Director Prouty estimated that the inventory work of all of the railroads of the United States would be completed as of the average date of January 1, 1920. While the war interfered somewhat with that schedule, it was finished and the field parties disbanded during 1920 in all of the districts except the eastern where, because of the greater complications, this work was not finished until early in June. Since that time the engineering department has concentrated its attention on the completion of the engineering reports and on June 30, 1921, reports covering 111,682 miles, representing the properties of some 425 carriers, had been submitted to the director of the division. A total of 244 engineering reports had been tendered to the roads informally prior to November 30, 1921, in addition to those incorporated in the tentative valuations which had been served on the carriers by the Commission.

Present Status of the Work

The work of the land department has lagged somewhat behind that of the engineering section. Additional duties were also thrown upon this branch by the Kansas City Southern decision, which required the Commission to ascertain and report "the present cost of condemnation and damages or of purchase in excess of present value" of common carrier lands. However, this department is now making greater progress and the field work is practically complete, except for terminals in all except the eastern districts, where owing to the extreme density of the larger lines, work will continue for some time. The field forces in the land department were reduced to 25 per cent of their former personnel on July 1. Up to November 30 of this year, 199 land reports had been tendered to the railroads in addition to those included in the tentative valuations.

The work of the accounting department has progressed less rapidly. This branch was greatly handicapped by the impossibility of retaining adequate efficient forces during the war, resulting in a high turn-over and an almost constant shortage of employees. However, the increased salaries which were put into effect in 1920 and the change in employment conditions throughout the country, have resulted in alleviating this condition so that better progress is now being made, and it is expected that the field work will all be completed shortly after the first of the year and the field forces disbanded. On November 30, 1921, 109 accounting reports had been tendered to the carriers, beyond those incorporated in the tentative valuations which have been served to date.

The progress which has been made during the past year can best be stated in the words of the Commission itself, as contained in its annual report for the year ending October 31, 1921, as follows:

"Prior to November 1, 1920, 55 tentative valuation reports, representing the properties of 70 carriers, had been issued. The decision of the Supreme Court of the United States handed down March 8, 1920, required the Commission to investigate and report 'the present cost of condemnation and damages, or of purchase, in excess of present value' of common carrier lands. Having determined the excess cost of acquisition figures for the properties covered by the 55 tentative valuation reports, a supplemental tentative valuation has been issued and served, in each case, showing excess cost of acquisition of the lands and final value figures.

"In addition to the above mentioned, 96 tentative valuation reports upon the properties of 123 carriers have been completed and served on interested parties during this period, bringing to 193 the number of properties upon which tentative valuations have been issued to October 31, 1921. Every energy is now being directed to the work of completing tentative valuation reports.

"The work of the bureau of valuation divides itself, in

all sections, into two broad classifications, field and office. In the engineering section, which required a larger and more expensive organization than either the land or accounting sections, all field work has been completed and the parties have been disbanded. In the accounting section approximately 98 per cent of the field work has been completed and the balance will be finished in the current year. The work yet remaining to be done is largely on carriers of less than 500 miles, that is, below the importance of major properties. In the land section, on a basis of mileage, the field work is 98 per cent completed and the personnel reduced to about one-fifth of its quota at the beginning of the year. The force developed by the land section to comply with the Supreme Court decision above referred to, has covered a large part of the studies upon which its findings are based. It has completed reports on all properties upon which tentative valuations had already been issued and is keeping abreast of the other sections in covering current reports.

"The completion of the field inventory will mark an important step in the progress of the valuation work. There will then follow the analytical work of assembling the data accumulated through the inventory and compiling therefrom the underlying reports which form the bases for the tentative valuations, 193 of which have been issued as before stated. There will remain the work of hearing the carriers on their protests against the tentative valuations, which may result in modifications of the tentative valuations, and after this the publishing in final form of our reports on the properties of the individual carriers."

Since the termination of the year covered by this report, namely, October 31, 1921, 24 additional reports have been issued on 27 properties up to December 9, making a total of 177 reports on 220 properties which have been issued to that date.

The largest road on which a report fixing a tentative final value has yet been issued is the Chicago, Rock Island & Pacific which, with its subsidiaries which were also reported on, included 7,685 miles of line. Other large roads on which reports have been issued during the past year include the Atlanta, Birmingham & Atlantic; the Kansas City Southern; the Elgin, Joliet & Eastern; the Los Angeles & Salt Lake; the Norfolk Southern; the Central of Georgia; the Western Pacific; the St. Louis Southwestern; the Mobile & Ohio; the Florida East Coast and the Monon.

The roads are filing their protests on these valuations as fast as they can be prepared. The Commission has announced the first of the hearings on these protests on January 6, when the Los Angeles & Salt Lake will come before it; the Elgin, Joliet & Eastern and the Atlanta, Birmingham & Atlantic are scheduled to appear on January 9, the Evansville & Indianapolis on January 16, and the Central of Georgia and the Florida East Coast on January 23. Following the hearings on these and other protests, the Commission will revise or sustain its tentative valuations and issue them in final form. When this is done, the conclusion appears to be gaining ground that the roads have no recourse until this valuation is used, when, if not satisfactory, they can attack it in the courts. It would appear that the use of the figure of "final value" as a basis for the fixing of the rate of return and the division of earnings as provided for in the Transportation Act would constitute such a use.

As these valuations have been served on the roads, they have been scanned intently to ascertain wherein they have differed from the contentions of the carriers. In general there have been less discrepancies in quantities than might have been expected originally. It is to be expected that there would be wide disagreement as to many of the prices, but there has probably been less dissatisfaction as a whole than might be expected on so vital a point, the principal cause for complaint being the use of 1914 prices throughout.

The roads are, however, making strong objection to the failure of the Commission to include allowances for contingencies, for costs of preliminary and location surveys, for the removal of buildings or other structures from the right-of-way, and for trestles and other temporary construction actually used but not considered essential for new construction, assessments for public improvements, appreciation, going value, etc. There has also been considerable criticism regarding the period of construction which has been assumed for the computation of the allowance of interest during construction. Likewise, no allowance has been made for the excess cost of carrier lands over the acreage price of adjoining lands.

What the Valuations Show

The principal interest in the valuation results centers, of course, in the relation which these results bear to the capitalization of the corresponding properties. Unfortunately it is not possible to make any accurate comparison of the valuations which have been issued to date with the capitalization of the corresponding properties because of the difficulty of eliminating duplications in capitalization. The valuation placed on the "total owned" properties of the 77 carriers reported on to date aggregates \$1,091,986,543, while the corresponding records of the carriers' investment in road and equipment aggregates \$1,445,758,800. These are 1914, 1915 and 1916 figures which include the Atlanta, Birmingham & Atlantic, the Kansas City Southern, the Western Pacific and the Los Angeles & Salt Lake properties; the difference between whose valuations and book records accounts for over \$213,000,000 of this discrepancy. In making any comparison at this time, it should also be borne in mind that the first roads for which the government undertook its valuation work were either small lines selected for the purpose of testing out proper methods or were roads that were in the hands of the receivers or had been subject to reorganization. They have in general been the weak roads or those which will afford the least favorable comparison.

Furthermore it should be borne in mind that these comparisons are as of the date of valuation, which in the case of most of the larger roads reported on to date is June 30, 1914 or 1915. Since that time a number of these roads, such as the Western Pacific, the Atlanta, Birmingham & Atlantic and the Chicago, Rock Island & Pacific, have been reorganized and their capitalization reduced.

Insofar as the carriers' records of road and equipment are concerned, it is also instructive to note that the Commis-

sion has examined the records of carriers with a book record of investment aggregating \$8,679,181,721 and has certified to the correctness of \$3,401,670,282 or 92.7 per cent of this amount. Furthermore, a large part of the deduction is for excess of securities and discounts in the sale of these securities, the exclusion of which is at least debatable.

It is therefore becoming increasingly evident that the railroads have little to fear from the valuation. As reports are made upon the stronger and more conservatively financed roads, it is evident that the values of the properties found by the Commission will equal and in many cases exceed their capitalization by a considerable margin.

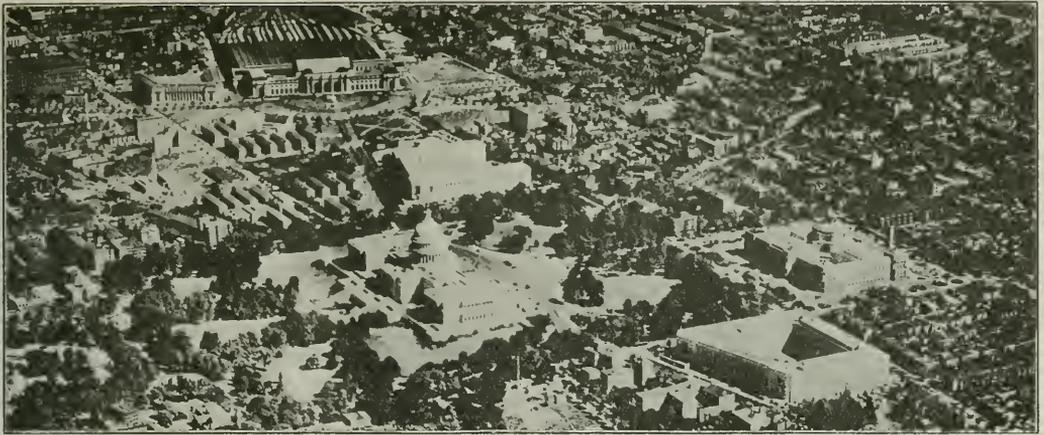

Future of Valuation

As the year came to a close it has become apparent that there is increasing uncertainty regarding the ultimate completion of the valuation work. This feeling is attributable to numerous influences. The failure of the Commission to appoint a successor to Director Prouty, although the vacancy has now existed for six months, indicates a lack of decision on its part. In the meantime various candidates, both within and without the Division of Valuation, have been offered more or less aggressively by their friends, which has not added to the efficiency of the organization. The drastic cut in forces during the fall as a measure of retrenchment in the enforcement of the Dawes program has added to this feeling of uncertainty.

More pronounced, however, is the fact that this work is rapidly losing its supporters in Congress, if indeed it has not already lost them. When the Valuation Act was passed in 1913, it was sponsored by those legislators who had been hostile to the railroads and who hoped by this measure to bolster up their claims that the roads were grossly over-capitalized. Now that sufficient valuations have been issued to prove the fallacy of this contention, they are no longer interested in it and some in fact are now believed to be opposed to it. This lack of support accounts even more than the nominal reduction in forces incident to the completion of certain portions of the work, for the reduction in the appropriation for the year ending June 30, 1923. This appropriation, which has just been recommended to Congress by President Harding, has been cut to \$1,500,000 or only slightly more than half of the appropriation of \$2,750,000 for the fiscal year which ended on June 30, 1921. As a matter of fact, the pressure for the completion of this valuation work is now coming from the railroads rather than from the regulatory bodies.

Status of Railroad Accounts With the Government

Large Amounts Still Due Carriers While Latter Owe for Additions and Betterments and Loans

By Harold F. Lane

ALTHOUGH it is now nearly two years since the railroads were relinquished from federal control, much remains yet to be done in the way of settling the accounts between the companies and the government covering the 26 months of federal operation and the six months' period following it, during which the guaranteed compensation was continued to allow time for the necessary readjustment of the rates.

Accounts with the Railroad Administration

Of the 241,194 miles of road that were taken over by the government, roads operating 107,063 miles have effected final settlements with the Railroad Administration, and according to the latest estimate made by the Railroad Administration (as of December 1) it still owes the remaining roads \$750,670,588 on account of compensation money taken over, maintenance, materials and supplies, depreciation and all other accounts, exclusive of additions and betterments. On the other hand the roads also owe the Railroad Administration a balance of \$507,628,508 as yet unadjusted on account of additions and betterments chargeable to capital account made by the government while it was operating the properties. This does not mean that all of the rest of the \$1,144,000,000 of additions and betterments has been actually paid for but it has been taken care of in some way, part having been paid in cash, part by 15-year equipment trust certificates and part

funded by giving the Railroad Administration negotiable promissory notes.

If the unadjusted indebtedness of the roads on capital account be offset against the indebtedness of the Railroad

INDEBTEDNESS of Railroad Administration to the railroads is estimated at \$750,670,588, while the unadjusted balance due the Railroad Administration for additions and betterments is placed at \$507,628,508, making a net balance of \$243,042,080.

Claims of 215 companies for \$436,145,307 have been settled for \$132,221,839.

I. C. C. estimates the six-months guaranty to railroads at \$536,000,000, of which \$105,000,000 has not yet been paid.

Railroads have received \$263,000,000 in loans from revolving fund and have repaid \$21,000,000.

Administration to them on open account, according to the estimate of the director general of railroads, it still owes the roads \$243,042,080. This estimate is made on the assumption that the remaining settlements will be made on the Railroad Administration's construction of the contracts between it and the roads. The claims of the railroads call for a larger sum.

Roads operating 208,721 miles have filed claims for \$940,587,256 in final settlement and on this basis the total claims for all the roads are estimated at about \$1,100,000,000. Claims to the amount of \$436,145,307, representing 215 roads and 107,063 miles, have been settled for \$132,221,839, which means that the carriers still have claims to the amount of approximately \$664,000,000 against the Railroad Administration's estimate of \$243,000,000. However, the roads are expected to waive a large part of these claims that is based on the so-called "inefficiency of labor" in accordance with an informal understanding

reached with the President in July in return for an agreement on his part to fund a part of the indebtedness of the roads.

In the settlements that have been made \$179,710,117 of additions and betterments (exclusive of equipment) were

charged to the carriers and \$33,443,000 was funded, while \$42,250,000 had been funded prior to final settlement. All of the \$381,000,000 of standard equipment was financed by the roads, while Mr. Hines was still director general of railroads, \$311,000,000 of the amount having been taken care of by equipment trust certificates.

Six-Months Guaranty

The Interstate Commerce Commission has also made an estimate as of November 30 that there is still payable to the carriers on account of the six-months guaranty about \$105,000,000. Its estimate of the total amount payable under the guaranty is about \$536,000,000, of which \$264,000,000 has been paid in the form of advances under section 209 of the law, \$166,000,000 as partial payments under section 212, and \$721,658 in final settlement with five companies. These are the Alabama & Mississippi, Ann Arbor, Electric Short Line, Electric Short Line Terminal Company and Norfolk Southern. The railroads had filed returns showing an aggregate amount due them under the guaranty provisions of the act of \$818,400,184 but the amount to be paid has been considerably reduced by differences between the interpretation placed on the provision of the law by the roads and by the commission.

Loan Fund

On the other hand, the roads also owe the government some \$240,000,000 on account of loans made from the revolving fund provided for by section 210 of the law on certificates of the Interstate Commerce Commission. As security for the loans and for the indebtedness of the roads to the Railroad Administration which has been funded in one form or another, the government holds over half a billion dollars of railroad securities, while it has sold to the investing public over \$135,000,000 of railroad equipment trust certificates. The Treasury, at the end of its fiscal year, according to its annual report to Congress, held railroad securities amounting to \$680,438,653. This consisted of obligations acquired by the director general of railroads, including equipment trust certificates to the amount of \$311,260,300 and \$215,574,603 of obligations of the carriers held as security for loans from the revolving fund. The holdings of railroad securities increased \$235,000,000 during the fiscal year, principally on account of the loan fund, but have since been reduced by the sale of equipment trusts.

The total loans authorized by the commission up to November 30, the date of the latest public report of the status of the revolving fund, amounted to \$263,407,717, which went to 70 companies. Of this, \$21,466,067 has already been repaid. The repayments and accrued interest had added \$27,525,000 to the fund, while \$40,000,000 of the fund has been tentatively reserved for claims, judgments, etc., against the Railroad Administration arising out of federal control, so that there was an uncertified balance at the date of the report of \$24,117,283; tentative approvals and commitments, had been made, however, to the amount of \$14,013,500, leaving an unencumbered balance of \$10,103,783.

Because of the general depression in business during the year and the resulting decline in the costs of materials and labor, some carriers, considering it sound business discretion to defer expenditures of the proceeds of loans certified to them, requested the commission to cancel its certificates and to consider their applications as withdrawn. Other carriers requested the commission to authorize them to expend a portion of the proceeds of their loans for purposes other than those for which the loans were originally made. The commission has generally approved this policy and has thus been able to extend the benefits of the revolving fund to other carriers more urgently in need of financial help, particularly in respect to maturing indebtedness.

National Railway Service Corporation

The amendment to section 210 effected by section 5 of the sundry civil appropriations act, approved June 5, 1920, authorized the commission to make loans for equipment to or through such organization, car trust or other agency as it might determine upon, approve or organize for the purpose "as most appropriate in the public interest," subject to the provisions of the act. The National Railway Service Corporation, organized under the auspices of the National Association of Owners of Railroad Securities, was approved as an agency for this purpose, and the commission certified to this corporation the following loans for the benefit of carriers named:

Baltimore & Ohio	\$5,200,000
New Orleans, Texas & Mexico.....	926,000
Bangor & Aroostook	53,100
Chicago, Rock Island & Pacific.....	1,568,540
Minneapolis & St. Louis.....	386,190
Wheeling & Lake Erie.....	3,304,000
Total.....	\$11,437,830

As a condition of the certification of these loans the National Railway Service Corporation and the carriers themselves were required to finance from outside sources \$18,409,765.

The law providing for the loan fund limits the time within which application for loans may be filed with the commission to two years from February 28, 1920. The commission in its annual report to Congress suggested that this period be extended, pointing out that in prescribing this limitation Congress apparently anticipated that the "transition period" would be of relatively short duration, but that "the progress of readjustment throughout the country has been slower than was generally anticipated." The commission estimated that repayments of principal of loans already made, which by their terms require early or serial repayments, and accretions to the fund from semi-annual interest payments during the two years, would aggregate \$93,000,000, making an approximate total of \$103,000,000 available for additional loans if the period for filing application should be extended.

A table on the following page shows the loans to the carriers which the Commission has certified from this fund.

The repayments have been: Ann Arbor, \$60,000; Atlanta, Birmingham & Atlantic, \$20,000; Bangor & Aroostook, \$4,000; Carolina, Clinchfield & Ohio, \$1,000,000; Chicago, Indianapolis & Louisville, \$45,000; Chicago & Western Indiana, \$89,000; Great Northern, \$15,134,000; Illinois Central, \$296,000; Missouri Pacific, \$4,362,000; National Railway Service Corporation, \$380,368.70; Salt Lake & Utah, \$15,700; Waterloo, Cedar Falls & Northern, \$60,000.

Railroad Administration Settlements

The Railroad Administration had effected some 20 final settlements with the smaller roads up to the end of 1920, but most of the larger roads had not filed their complete claims and some of them have not yet done so. The settlement of the claims is a complicated process at best, but it was made even more complicated by the controversy between the roads and the Railroad Administration over the claims for under-maintenance into which entered the question of the so-called "inefficiency of labor." While the Railroad Administration admitted some under-maintenance, the railroads claimed that even after materials and hours of labor had been estimated in proper relation to similar expenditures in the pre-war period the "inefficiency of labor," from one cause or another still left a wide difference between actual upkeep and the expenditures made during federal control, while the Railroad Administration took the position that its obligation had been fulfilled if it had expended the proper amount of money.

The Railroad Administration had consistently refused to settle except on its own interpretation of the contract unless

its position were reversed by the highest court. The same question, however, had been put up to the Interstate Commerce Commission by a provision in the law which made the maintenance provision of the standard contract its criterion in determining the amount of maintenance expenditures to be allowed the carriers in computing the six-months guaranty and there were some hopes that a decision on its

to exercise the discretion allowed him by the Transportation Act to fund indebtedness of the railroads, while the railroads agreed to waive their claims based on the inefficiency of labor in their negotiations with the Railroad Administration, in order to hasten complete and final settlements, without surrender of any rights in court in case of a failure to settle.

LOANS CERTIFIED BY THE COMMISSION TO THE SECRETARY OF THE TREASURY UNDER SECTION 210 OF THE TRANSPORTATION ACT, 1920, AS AMENDED

Name of carrier	Amount
Akron, Canton & Youngstown	\$212,000
Alabama & Vicksburg	1,394,000
Alabama, Tennessee & Northern	90,000
Ann Arbor	650,000
Arkansas Harbor Terminal	30,000
Atlanta, Birmingham & Atlantic	200,000
Baltimore & Ohio	8,200,000
Bangor & Aroostook	253,100
Boston & Maine	14,708,479
Buffalo, Rochester & Pittsburgh	1,000,000
Cambria & Indiana	250,000
Carolina, Clinchfield & Ohio	3,000,000
Central New England	300,000
Central of Georgia	237,900
Central Vermont	65,000
Charles City Western	140,000
Chesapeake & Ohio	9,079,000
Chicago & Western Indiana	8,000,000
Chicago Great Western	2,445,373
Chicago, Indianapolis & Louisville	315,000
Chicago, Milwaukee & St. Paul	35,450,000
Chicago, Rock Island & Pacific	11,430,000
Cumberland & Manchester	375,000
Erie	11,574,450
Evansville, Indianapolis & Terre Haute	400,000
Fernwood, Columbia & Gulf	33,000
Flemingsburg & Northern	7,250
Fert Dodge, Des Moines & Southern	200,000
Fort Smith & Western	15,000
Georgia & Florida	800,000
Great Northern	33,496,000
Greene County	60,000
Gulf, Mobile & Northern	515,000
Hocking Valley	1,665,000
Illinois Central	4,440,000
Indiana Harbor Belt	579,000
Inter-Urban	633,500
International Great Northern	194,300
Kansas City, Mexico & Orient	2,500,000
Kansas City Terminal	580,000
Lake Erie, Franklin & Clarion	25,000
Long Island	710,000
Louisville & Jeffersonville Bridge & R. R. Co.	162,000
Maine Central	2,373,000
Minneapolis & St. Louis	1,768,190
Missouri, Kansas & Texas	450,000
Missouri Pacific	10,071,860
New Orleans, Texas & Mexico	1,160,000
New York Central	26,775,000
New York, New Haven & Hartford	17,630,000
Norfolk Southern	311,000
Northern Pacific	6,000,000
Pennsylvania Railroad	12,480,000
Perris & Palmdale Union	1,770,000
Rutland	61,000
Salt Lake & Utah	1,008,000
Seaboard Air Line	8,698,000
Shearwood	29,000
Tampa Northern	100,000
Terminal R. R. Association of St. Louis	896,925
Toledo, St. Louis & Western	692,000
Trans-Mississippi Terminal	1,000,000
Virginia Blue Ridge	106,000
Virginia Southern	38,000
Virginian	2,000,000
Waterloo, Cedar Falls & Northern	145,000
Western Maryland	3,422,800
Wheeling & Lake Erie	6,264,000
Wichita Northwestern	381,750
Wilmington, Brunswick & Southern	90,000
Total loans certified	\$263,407,717

To fund the carriers' indebtedness, however, would increase the amount that would be needed by the Railroad Administration to make its settlements. The President on July 26 sent a message to Congress urging the passage of a bill to extend the authority of the War Finance Corporation so that it might purchase the railroad securities accepted by the director general. "No added expense, no added investment is required on the part of the government," he said; "there is no added liability, no added tax burden. It is merely the grant of authority necessary to enable a most useful and efficient government agency to use its available funds to purchase securities for which Congress has already authorized the issue, and turn them into the channels of finance ready to float them." The bill was passed by the House on August 22 but it was delayed in the Senate by the opposition of the agricultural bloc and finally, toward the close of the extra session, efforts to put it through were practically abandoned.

On August 6, the Interstate Commerce Commission issued its decision in which it held that differences in the "cost of labor," as those words are used in the upkeep section of the contract, do not include changes in the quality or effectiveness of labor but only changes in wages, and that in fixing the maximum amount to be included in operating expenses for maintenance, under the guaranty, the commission will use as the basic measure the expenditure during an average six months of the test period, adjusted to differences in the cost of labor and materials and in the amount and use of the property.

The cash derived from the sale of equipment trust certificates is made available to the Railroad Administration for payment in final settlements and to that extent obviates the need of an appropriation. It had cash on hand on December 1 to the amount of \$152,000,000. Without the authority proposed by the Winslow bill to the War Finance Corporation to purchase railroad securities taken by the government in funding operations, the President is still at liberty to sell them direct if he can, but if market conditions improve so that he can do so on favorable terms it is probable that many of the railroads can market securities with which to settle their indebtedness to the Railroad Administration. A list of the roads and other transportation companies which have made final settlements with the Railroad Administration and the amounts they received is as follows:

Ahlene & Southern	\$150,000
Akron Union Passenger Depot Company	14,000
Alabama Great Southern	1,530,000
Albany Passenger Terminal	54,000
Alton & Southern	385,000
Ann Arbor	*600,000
Arkansas & Memphis Railway Bridge & Terminal Company	90,000
Asheville & Craggy Mountain	95,364
Atlantic Coast Line	5,500,000
Baltimore Steam Packet Company	820,000
Bangor & Aroostook	575,000
Belt Railway Company of Chicago	29,500
Bennettsville & Cheraw	29,500
Bessemer Lake Erie	3,050,000
Birmingham & Northwestern	10,000
Boston Terminal Company	1,000,000
Buffalo, Rochester & Pittsburgh	1,000,000
Cambria & Indiana	70,000
Carolina & Northeastern	15,000
Carolina & Tennessee	5,000
Carolina, Clinchfield & Ohio	550,000
Charleston Terminal Company	90,000
Chatanooga Station Company	19,623
Chesapeake Steamship Company	62,303
Chicago & Eastern Illinois	3,000,000
Chicago & North Western	6,500,000
Chicago & Western Indiana	450,000
Chicago, Burlington & Quincy	8,000,000
Chicago Junction	380,000
Chicago, Milwaukee & Gary	200,000

part in favor of the contention of the carriers would have some effect on the Railroad Administration. The Bureau of Finance of the Interstate Commerce Commission at one time took a position in favor of the roads on this point and it was reported that the commission had tentatively decided in the same way by a vote of 6 to 5 but if this were true it reversed itself before issuing its decision and sustained the contention of the Railroad Administration.

Legislation to Provide Funds for Railroad Administration Fails

Before this, however, the entire question became involved in a series of negotiations between the railroads and the administration, in which the President expressed a willingness

Chicago, Milwaukee & St. Paul	6,250,000
Chicago, New York & Boston Refrigerator Company	375,000

*Paid to Railroad Administration.

The general method employed in making settlements was described in a report submitted by Director General Davis to the Senate on December 10, which was abstracted in the *Railway Age* of December 19.

Partial Payments on Account of Guaranty

When the year began the railroads had received only about \$260,000,000 on account of their six-months guaranty, this having been advanced in accordance with the provisions of section 209 of the law, on application filed by the railroads up to September 1, 1920. After September 1, when the commission found that a long delay must necessarily ensue before final adjustment of the accounts could be made, it attempted to give the roads additional sums on account, which in its opinion would be clearly within the amount which would finally be payable. The certificates of the commission were, however, held up by a decision of the comptroller of the treasury and the efforts of the railroads to get this decision changed by a court order failed.

In its annual report for 1920, however, the commission recommended to Congress an amendment to the law, and effective on February 26 section 212 was added, which authorizes partial payments and permits the commission, in case of deferred debits and credits to railway operating income which cannot be definitely determined, to make a reasonable estimate, and when agreed to by the carrier, to use that estimate in certifying the amount due in final settlement of the guaranty. A total of 547 roads had filed returns with the commission asking for the guaranty and after \$263,935,874 had been advanced under section 209, there were 447 requests filed for partial payments under section 212. After making certain adjustments in the amounts as claimed by the carriers, the commission has certified partial payments to the amount of \$165,862,775.

Recently the commission issued an order that the guaranty accounts should be closed as of December 31, and all claims filed by March 1.

Reimbursement for Short Lines

The commission is also administering the provisions of section 204 of the act, providing for the reimbursement of short lines which were taken under federal control and then relinquished. A dispute has arisen between the roads and the commission as to the interpretation of this law, the commission taking the position that the reimbursement is limited to those roads which after the relinquishment earned actual operating deficits, while the short lines claim that the word "deficit" as used means a decrease or falling off in railway operating income for the federal control period as compared with that of the test period.

Of 279 claims for reimbursements filed with the commission under this section 93 had no actual deficits, but the claims of these which are entitled to reimbursement under the commission's interpretation aggregate \$14,128,455. The commission's estimate reduced this to \$11,079,799 after certain revisions. Final settlements under this section have been made with 20 carriers providing for the payment of \$761,649 after the deductions on account of traffic balances and other indebtedness to the Railroad Administration and partial payments have been certified for a net amount of \$1,357,305. The commission estimates the net total after deductions at \$6,825,512. The War Finance Corporation had also advanced to railroads \$204,794,520, of which \$160,561,310 had been repaid to November 30.

Railroads Profit From Lower Material Costs

Marked Reductions Have Been Made in the Price of Practically All Important Commodities

By W. S. Lacher and C. B. Peck

THE RAILROADS are now a preferred customer in a buyer's market. This is a most remarkable transition from the status in the summer of 1920, when a seller's market gave first consideration to the devotees of the buy-at-any-price hysteria which was then sweeping the country. Prices in nearly all lines have been greatly reduced, as is evident from the charts showing the range of manufacturers' quotations appearing throughout this article. The decline has also been fairly steady throughout the year with considerable evidences of an upturn in the later months following a more general resumption of railroad purchases. While reductions in the prices of finished products have lagged considerably behind those of raw materials, the readjustment as regards these has also been of a substantial nature.

Marked Readjustment in the Steel Industry

The story of the iron and steel market for 1921 is one of exceeding interest and insofar as the buyer is concerned one of satisfaction as well. This year saw the disappearance of the last vestige of priorities, established prices and other distasteful features that made up the market conditions with which the purchaser became all too well acquainted during the war period. What established prices there are today outside of those for rail and one or two other items have little bearing on the actual sales.

The story of a declining market is always a difficult one to tell accurately because the real prices are not disclosed. It is only when concessions become general that they are recognized in published quotations. For this reason the trend of prices over the past year or more has been given in several charts showing the general tendencies rather than tables of specific quotations.

To get a proper perspective of the decline in the market, it is necessary to go back to the fall of 1920, when the price schedule of the United States Steel Corporation was clearly below the ruling market. Thus, the corporation's price for open-hearth rail was \$47 per ton while the independents

were holding out for \$57 or even more and there was a great deal of uncertainty as to just what the price would be for rails delivered in 1921. All indications pointed to a readjustment upward of the United States Steel Corporation's schedules, including the rail price.

However, the softening influence of the incipient business depression was at work, and on November 19, 1920, Judge Gary announced that the established prices of the Corporation, with a few minor modifications, would remain effective in 1921. This served also to fix the price of rail at \$47, and although the independents clung to the higher figure for some time, they were eventually forced to recognize the lower price. In the meantime, the independent prices for other commodities came tumbling down and by February prices were pretty well established at the Corporation level.

The early months of 1921 witnessed an interesting reversal in market conditions. Whereas in the autumn of 1920 the Corporation's prices were below the current market, the drop of prices in the spring of 1921 saw the United States Steel quotations left on a level considerably above the actual selling prices. As this condition became more apparent rumor gained current that the United States Steel Corporation would announce a reduction in its schedule of prices and this finally took place on April 13. This reduction received publicity in the newspapers as a definite measure in the direction of readjustment, but those familiar with conditions in the market recognized at once that the new prices were still well above the active market quotations at the time and with further softening of the market the schedule quickly became a dead-letter.

On July 4 the Bethlehem Steel Company announced a new schedule of prices which was followed shortly by corresponding announcement from the United States Steel headquarters, but these schedules also fell short of the market. Since that time but limited attention has been given to established schedules, the market becoming more and more a matter of actual agreement between buyer and seller.

EIGHTEEN MONTHS have seen remarkable changes.

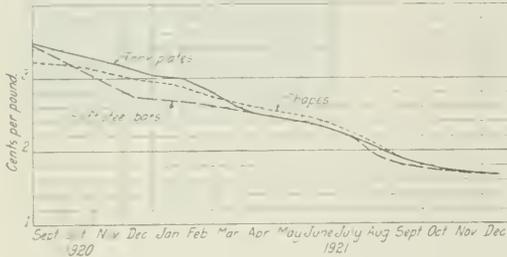

July, 1920, saw a seller's market. Buyers scrambled to buy where and when they could at any price and for any date for delivery. Today we have a buyer's market. Sellers are making every possible concession as to both price and delivery in an effort to get a share of the business offered. Some prices have fallen more than others. In many lines the readjustment seems well-nigh complete.

The United States Steel Corporation's price for open-hearth rails of \$47 remained the basis for deliveries during 1921, but many railroads failed to make requisitions to cover their full orders so that a considerable tonnage on old orders remained on the books. This no doubt was one influence which led to a reduction to \$40 announced on October 25, with a provision that it would apply alike to new contracts and unfilled tonnages on old orders. This change apparently provided the necessary stimulant to the rail market, for at least 500,000 tons of rails have been ordered subsequent to

The railroads, unlike small consumers, buy wholesale and in many cases f.o.b. mill. Therefore, they are realizing the full benefit of the price decline to a much greater extent than the small purchaser who must buy through a retailer or jobber.

Cars and Locomotives

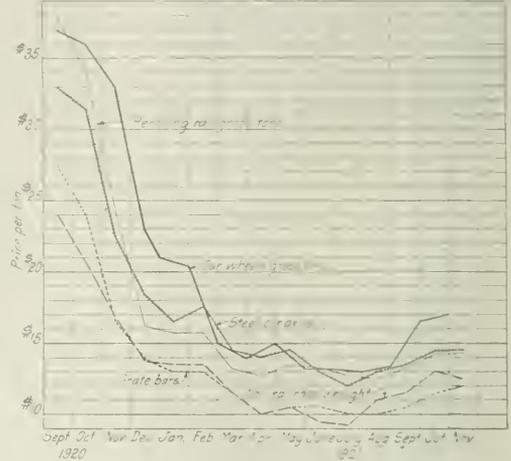

Last year in an article on locomotive and car prices (*Railway Age*, January 7, 1921, page 87), data were pre-

General Tendency of Structural Steel Prices

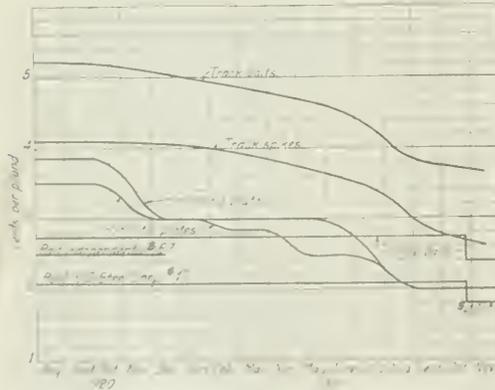

this announcement with inquiries current for an even larger tonnage.

The decline in structural steel has been more steady and with the fall in the price of the plain material, an even greater decline has taken place in the pound prices for fabricated structural steel. In an effort to keep their shop organizations together the fabricators have cut the spread between the plain material and the finished product to a minimum. As a consequence, the railways have been able to buy steel

The Range of Scrap Prices in the Last Fifteen Months

sented showing the trend of prices of the various classes of equipment since 1910. Using the average price of 1910 to 1914 as 100 per cent, the prices of freight cars were found to have increased at a comparatively uniform rate from 1915,

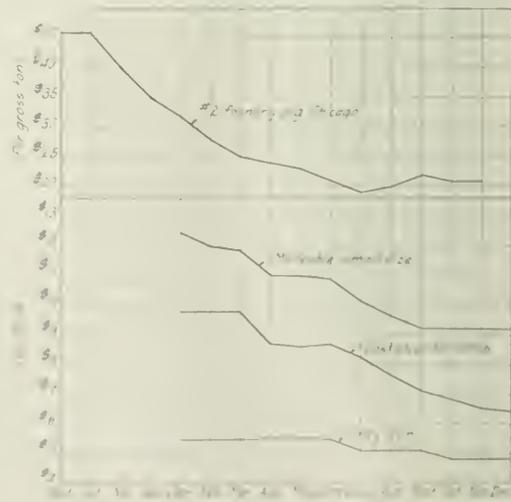

General Tendencies of Track Material Prices

broken during the latter part of the present year at reductions in price greater than that measured by the decline in the steel itself.

Lumber Market on a New Basis

The two to three months to month quotations on lumber items of domestic production to the railroad field show a steady decline of prices in the 12 months from June, 1920, to May, 1921, since which time the market has been practically stationary. In certain grades, as for example car material, there has been a well-defined upturn in recent months due no doubt to the influence of recent car orders.

Trend of Prices for Pig Iron and Iron and Steel Castings

reaching a maximum in 1920 of 300 in the case of all steel cars and 315 in the case of cars of composite construction. Passenger cars, starting in 1915 from 82 per cent of the

1910 to 1914 average, increased with like uniformity to 218 in 1920. In the case of locomotives the same uniformity in the rate of price increase was not observed. Starting at 100

of business done during the first six months, attention was called to the fact that very few equipment orders were placed during the last half of the year. What was true of the last

in 1915, the average price reached 210 in 1917 and after dropping back to 206 during the next year, recovered to 212

six months of 1920 was also true of the first ten months of 1921. Since November 1 there has been considerably more activity in cars and index prices for 1921 must be based on November and December conditions. Such data as are available clearly indicate a marked drop in the prices from the high levels of last year, varying from 30 to 35 per cent.

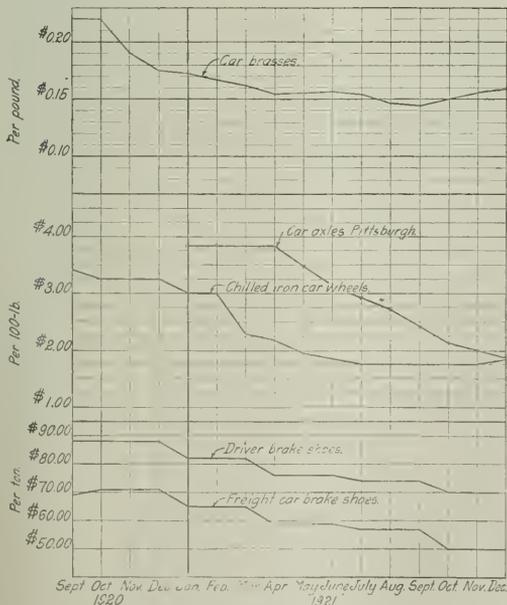

In the case of all-steel freight cars the average of this reduction has been from the 300 index number of 1920 to about 213.

Similarly, composite steel and wood equipment has dropped from 313 in 1920 to about 215.

What has been said with respect to cars applies with even greater force to the locomotive market. Indeed, it may be truthfully said that there has been no locomotive market during 1921. It is true that several sizeable orders have been placed during recent weeks, but the number of these orders has been entirely too limited to average out the effect of special provisions in the specifications even if complete data were available for use in calculating an index number for the year. Quotations on comparable specifications have been made in 1921, ranging from 25 to 50 per cent less than those of 1920, but it is doubtful whether these comparisons are at all indicative of the trend of the conditions which would fix prices if a reasonably steady volume of business were to be established.

Miscellaneous Car and Locomotive Material

Supplementing the diagram showing the trend of prices of several basic iron and steel commodities, which in a general way may be taken as an index of the trend of prices of finished materials into the manufacture of which they enter extensively, the trend of the prices of a number of finished products which are used extensively, not only in the construction of new equipment but in every-day running repairs and maintenance, are shown in one of the diagrams. Some of these materials are purchased under contract and are not quoted at uniform prices. In such cases the curves present averages of a number of quotations, and are sufficiently accurate to indicate the trend of the market.

Price Tendencies of Finished Materials Used in Maintenance of Equipment

in 1919. Then came an increase to 251 during the first half of 1920.

In establishing these index numbers for 1920 on the basis

Cost of Ties Greatly Reduced

The cross tie industry has undergone a process of severe readjustment. Prices have been greatly reduced, but owing to the wide range of conditions, variety of grades and, still more important, character of inspection, it is not practicable to present tabular data that would be representative of the entire country. The following statements are indicative of tendencies. Tie hackers in southeast Texas are now making 8-in. by 8-in., 8 ft. yellow pine ties for 25 cents and hardwood ties for 35 cents. In the north Atlantic states pine ties, delivered, now cost only about 35 cents more than they did before the war; oaks in the same territory are about 25 per cent higher than before the war. The price of yellow pine switch ties represents about the same advance over pre-war prices and is equal to about two-thirds of the price of a year ago.

One road in the middle west reports that prices for ties produced locally are now about 55 cents lower than last year and very close to the pre-war basis. The following table is also indicative of changes in the prices of cross ties although it is carried only to April whereas prices have decreased appreciably since that time:

NORTH ATLANTIC STATES		
	Season of 1920	April 1, 1921
White oak—7 by 9.....	\$1.85	\$1.50
Chestnut—7 by 9.....	1.50	0.95
Red Oak—7 by 9.....	1.75	1.25
Hard maple and gum—7 by 9.....	1.50	0.90
Elms, soft maple, etc.—7 by 9.....	1.50	0.90
Southern yellow heart pine.....	2.25	1.35
Southern yellow sap pine.....	2.00	0.90

SOUTH ATLANTIC STATES		
	Season of 1920	Fall of 1921
Yellow pine ties, various sizes	\$0.99 to \$1.50	\$0.40 to \$0.80

The present low prices are the results of one of the most remarkable gluts the tie market has ever known. As in the case of steel, the story goes back to 1920 when the transition from government to corporate purchases in March, 1920, caused a number of the roads to delay getting into the tie market. As a consequence the railroads, generally speaking, not only scrambled for their requirements but probably over-purchased, in many cases, to a considerable amount. Freight rates went up, labor was high, preservatives increased in price, so that the ties purchased in 1920 cost the railroads more than they have ever paid for ties before. When the lumber market broke in the fall of 1920, the situation was very quickly reversed. Saw mills turned to the manufacture of ties and the roads were soon offered a large supply at more favorable prices. The condition was also influenced by the change in the labor market and the decreased demand for cotton and other agricultural products, resulting in a great impetus in tie production for right-of-way delivery.

The railroads did not sense this condition at once and for a time took no steps to curtail production until they suddenly found themselves overwhelmed with the delivery of a much larger quantity of ties than they had expected to purchase. The result was that nearly all of the stronger roads, which were in a financial position to go into the tie market in the latter part of 1920 for large quantities of ties, were compelled to withdraw from the market early in 1921 and, notwithstanding drastic cancellations, some of them accumulated surpluses of ties which are sufficient to take care of all of 1922 and a part of 1923 requirements.

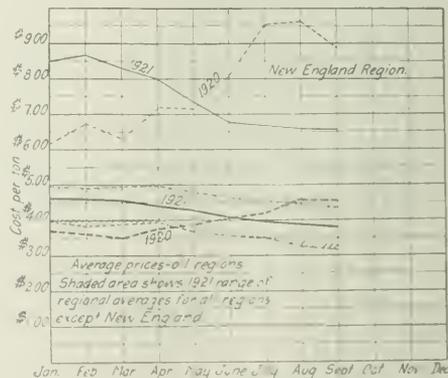

The greatly decreased demand has resulted in a very marked scaling down in the prices, but unfortunately many of the roads are now stocked up with ties bought at much higher figures. Consequently, participation in the low prices is restricted largely to the roads which had been compelled to limit their purchases during 1920. Another effect of the change in market conditions is the general use of a better grade of ties. The railroads have been in a position to demand them and are now securing more hardwood ties than they had been able to obtain for a number of years.

The report of the American Wood-Preservers' Association shows that 1920 was a banner year for timber treatment, the number of ties treated, 44,987,532, being larger than in any previous year, and indicating a complete recovery from the decline in treatment prevailing during the war period. There is every indication that the record for timber treatment in 1921 will also be very good, one inducement in this direction being a plentiful supply of creosote and other preservatives at much more favorable prices than have prevailed for a long time. The most important influence in this direction has been the resumption of creosote imports on a large scale from both England and Germany.

Generally speaking, the cost of railroad coal has shown a steady though not large decline during the first three-quarters of 1921. Data compiled by the Interstate Commerce Commission show a decline in the average cost of the coal used in road service by a large percentage of the Class I railroads of the United States from \$4.61 in January to \$3.80 in September, or about 17.5 per cent. The cost given by the Interstate Commerce Commission includes the invoice price plus freight charges and is a weighted average. A comparison of the cost by months for 1920 and 1921 for the United States as a whole and for each region is shown in Table III.

The greatest reduction within the year from a dollars and cents basis, took place in the New England region. From \$8.72 in February the price declined to \$6.57 in September, or 24.5 per cent. Although less in amount, reductions

Coal

Trend of Average Cost of Railroad Fuel—1921 and 1920

of 25.8 per cent and 24 per cent occurred in the Ohio-Indiana-Allegheny region and the Pocahontas region respectively, the Great Lakes region following with a decline of 20 per cent. The reductions in the western regions have been much less marked, particularly in the Northwestern region where the average cost in September was but five per cent below the price at the beginning of the year. In the Northwestern and Central regions, however, it should be noted that the trend has not been uniformly downward throughout the year. In the Northwestern region the cost of fuel increased gradually from January until April, at which time a maximum of \$4.96 a ton was reached. Since that time the decline has been uninterrupted. In the case of the Central Western region, although the maximum average for 1921 is shown for the month of January, with a well-marked decline in February, this was followed by increases in March and April, the average cost for the latter month being \$3.95 a ton, but two cents a ton less than the cost in January.

The significant fact brought out by the graphical presentation
(Continued on page 52)

Improved Service and Morale Features of 1921

Considerable Progress Made but Pre-War Standards Not Yet Restored

By Charles W. Foss

PRIMARILY because of the aching void that the absence of it left in railway operation during the larger part of the period of federal control and a few months succeeding, railway officers and students of railway affairs were given an entirely new appreciation of that factor in railway operation known as *morale*. During 1921 there was much in the way of labor difficulties; on the whole, however, perhaps not as much as might have been expected under the trying conditions. He would be a true pessimist who would not admit that the railways have succeeded in taking a long step in the direction of restoring that old time loyalty on the part of officers and men alike. The change in that respect as compared with 1920 and 1919 is one of the outstanding features of 1921. It is not necessary to produce facts to prove that the railroads have again restored, in large measure, the morale of their men. The fact has been noticed by travelers and shippers. There is no fair-minded railroad man who will not admit it.

It is interesting to observe in what manner the improvement in railway morale has accompanied or has been accompanied by a similar improvement in railway service.

Reasons for Improved Service

The railways today are moving freight over the road in much better shape than was the case either during the war or after the armistice. They are for the most part not producing quite the same sort of service, however, that they produced prior to the war. There are some who declare that the fact that the freight is being moved faster this year is due to the smaller amount of business that is being carried. While there can be no question that the lack of that congestion which resulted when the railroads were being worked practically beyond their capacity, is an important factor,

there is still room for belief that the improved morale has been the determining feature. This would seem to be borne out by the conditions of 1919. That year was not a peculiarly busy one. It represented, however, the low point insofar as railroad service to the shippers and the traveling public was concerned.

EVIDENCE of the past three or four years seems to indicate that good morale and high grade service are interrelated factors.

During the war neither service nor morale were as good as prior to the war. After the armistice both were exceedingly poor. At present both show much progress towards pre-war standards.

Competition of the right kind is one of the best assets the railroads can have.

Train Speed—Miles Per Hour

A factor that is of interest in connection with the speed with which the movement of freight is conducted may be gleaned from the operating statistics. The particular figure in mind is that of "train speed—miles per hour." The latest available figures are those for October issued recently by the Interstate Commerce Commission Bureau of Statistics. Taking the averages for the ten months ending October 31, we find that in the first ten months of 1921 the railroads of the United States moved their freight trains at an average speed of 11.4 miles an hour as against 10.3 miles an hour shown as the average for the first ten months of 1920. This indicates an improvement but for the fact that the net tons per train were but 702 in the first ten months of 1921, as against 737 in the same period of 1920. The increase in train speed does not therefore necessarily represent an improvement; it means rather that with lighter loads the trains can be moved faster, or that with less congestion on the division the trains are given a better opportunity to keep moving instead of being laid up frequently on sidings. We cannot, therefore, take the figure of "train speed—miles per hour" as our criterion.

Readers of the *Railway Age* have been hearing from time to time of rather spectacular fast movements of manifest or other freight made by different roads. Such performances as these are a somewhat better indication of improved freight train service. They point out at least that the railways

are again in a position to meet the unexpected. We can, however, hardly give too much importance to such runs. We may presume that the roads will be able to continue these performances even with traffic back to more nearly normal figures; but we can not so easily prove it to those who declare that improved freight service has been due to the fact that there is less business to handle and therefore less congestion.

Fast Freight Schedules Furnish Real Proof

The real proof, we believe, will be found in the fast freight schedules. These, as the name states, are "schedules." They are advertised and lived up to. During times of congestion, the difficulty may arise, and frequently does, of keeping them on time. They are lengthened, however, only as a last resort in times of grave difficulty. For the purpose of showing what has been happening in this direction, we reproduce in tabular form the details of the fast freight services from various important centers. There are shown the details of the services at New York, eastbound and westbound; from Boston, westbound; from New Orleans, northbound and westbound; from California to eastern points; certain details will also be given concerning the service applying on perishables from the south to the north.

Service from New York One Day Behind Pre-War

The table showing the details for New York indicates that prior to the war the carriers gave a third-morning delivery at Chicago. During the war, this was made fourth-morning. After the armistice—during that period when the railroads were in the doldrums—the service deteriorated so that fifth to eighth-morning delivery was the best the carriers could do. At present, the service is partly restored to its old time standard. On westbound traffic, fourth-morning delivery is offered as against pre-war third-morning. On eastbound traffic, however, a third morning delivery is available for live-stock and perishables.

From New York to Kansas City similar conditions applied. Pre-war westbound delivery was fifth-morning;

FAST FREIGHT DELIVERIES FROM NEW YORK
(Four's indicate morning delivered)

City westbound from N. Y.	Pre war	During war	After armistice	Present	Present eastbound live-stock and perishables
Chicago	3rd	4th	5th to 8th	4th	3rd

during the war it became seventh, if the railroads could make it; otherwise, frequently could not. After the armistice seventh-morning was promised; actually it was from ninth morning. At present the railroads have restored this service to sixth-morning delivery, one day behind pre-war performance. On eastbound live-stock and perishables, however, fourth-morning delivery is offered.

In general it will be found that in most of this service between New York and points to the west the service was not quite so good during the war as before the war, that following the armistice it was exceedingly poor, but that at present it is better than it was before the war.

Boston Service Restored to Pre-War Basis

The service out of Boston, it will be noted, has been restored to its pre-war basis. Boston now gets the same service to points west as New York. Prior to the war fast freight service from Boston was one day behind New York

There are many interesting features in connection with this fast freight service out of New York and in general from Atlantic seaboard points. One of them is Baltimore & Ohio Train 97. This train is making fourth-morning delivery at Chicago from New York, Philadelphia, and by

From Boston westbound	Pre-War	Present	Present eastbound live-stock and perishables
Chicago	4th	4th	4th
Cleveland	3rd	3rd	3rd

means of a connection with Train 93, from Baltimore. We are advised that it is keeping to its schedule. Prior to the war Train 97 was scheduled to make third-morning delivery at Chicago from Baltimore and Philadelphia.

Service North and West from New Orleans

The congestion during the war period was most severe on the lines serving the Atlantic ports, which explains in great measure the reason for the lengthening of the schedules during the war period, although not during the period following the armistice when such congestion as existed was due less to heavy traffic than to other factors. The lines serving New Orleans were not as seriously congested as those serving Boston, New York, Philadelphia or Baltimore. Nevertheless, the war schedules out of New Orleans were a trifle slower than pre-war standards. In some cases, the pre-war schedules have been restored, i. e., as to Los Angeles and San Francisco. In still other cases there has been a partial improvement without getting back to the pre-war standard, i. e., as to Chicago, St. Louis, St. Paul, etc.

In this connection it might be noted that some of the Southern lines work their schedules differently from the eastern carriers. Whereas the eastern lines operate symbol trains with stated times of departure and arrival, the practice on some of the southern lines is to offer a preferred service, whereby extras are started out when the train is ready and allowed a certain time to destination. The service is a special service distinguished in some cases from the regular fast freight service and is given provided the shipper supplies a certain minimum number of cars, 5, 7, 10, 15, etc., as the case may be. Trains operated in this way were given before the war 58 hours to Chicago. During the war, this was lengthened to 72 hr.; it has now been reduced to 67 hr. 30 min. St. Louis was given a time of 45 hr. before

PREFERRED SERVICE GIVEN PERISHABLE FREIGHT

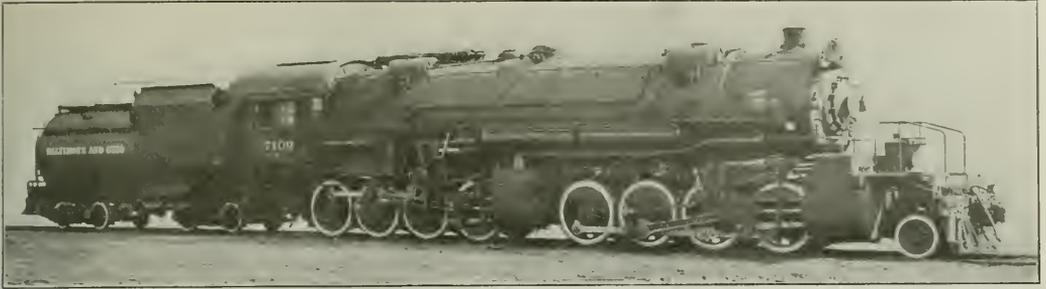

From northbound	Pre war	During war	Present
Chicago	58 hr.	72 hr.	67 hr. 30 min.
St. Louis	45 hr.	55 hr.	49 hr.
Kansas City	5 hr.	73 hr.	56 hr. 30 min.
St. Paul	89 hr.	99 hr.	9 hr.
Los Angeles	6 hr.	6 hr.	5 hr. 30 min.
San Francisco	69 hr. 45 min.	69 hr. 30 min.	64 hr.
Los Angeles	134 hr. 40 min.	133 hr.	133 hr. 40 min.
San Francisco	65 hr. 30 min.	65 hr.	1 5 hr.

Baltimore & Ohio Mallet 2-8-8-0 Freight Locomotive

Recent Tendencies in Locomotive Development

Demands for Efficiency Forcing Changes in Design—Capacity and Reliability Alone Not Sufficient

By R. C. Augur

IT IS WISE occasionally to stop and look back over the road that has been traveled before looking forward to see where the road is leading. If a comparison is made between typical freight, passenger or switch locomotives of the present day and those which were considered modern 20 or 30 years ago the differences are striking. The progress of the years has been marked by a steady increase in size, weight, power and efficiency. Every such increase has either been brought about by, or has been accompanied by, an advance in car weight and capacity and in average train tonnage. These changes have necessitated the introduction of such strong couplers, draft gears and car frames that there are serious dangers in an attempt to handle small old cars mixed in trains of heavier high-capacity cars. There are consequently many cars still in existence that are not safe to use in general traffic.

The increase in weights of rolling stock have also made necessary the rebuilding of bridges and the laying of heavier rails, followed by steadily greater outlays for track maintenance. These investments have unquestionably been well warranted and have proved profitable in places where there was a heavy traffic in ore, coal and low grade freight. It is possible, however, that the efforts to obtain an increase in train tonnage have caused the movement to go farther than was economically wise on some roads where the bulk of the traffic consists of general freight or which handle a large amount of such short seasonal freight as grain. Taking every item into consideration the price paid for the increase in train tonnage has been a large one. Would it not be advisable for the American Railway Association to undertake an investigation of the effect of the various factors which enter into the over-all cost of moving the traffic to determine definitely what are the most economical practices under different conditions?

Turning to passenger trains we note a tremendous increase in the weight of passenger cars; where an American type locomotive formerly hauled an express train, a Pacific type is now found to be unable to make the time and a Mountain type is being substituted. The amount of dead weight per

passenger would seem to be greater than necessary and it is hoped that the future will see an improvement in this respect.

What of the Future?

The evolution of the locomotive has been slow, but steady, as is true of the evolution of any piece of machinery. It is a case of the survival of the fittest, every modification having to meet the acid test of time. The development in the past has been noticeable mostly for the growth in size and capacity. Increase in capacity, however, has not been due entirely to changes in size and weight since the general adoption of improved designs and the introduction of desirable appliances has resulted in a marked gain in efficiency as well as capacity.

The trend of development in the immediate future will probably not be so much in the direction of size as along the lines of greater thermal efficiency together with an increase in the durability and reliability of the machinery. This will reduce the expenditures for maintenance, decrease the time required at terminals, make much longer runs practical and lengthen the mileage between shoppings for heavy repairs. Much more attention will unquestionably, and with advantage, be given to improvements in details of design, points which it has not been necessary seriously to consider when fuel was abundant and labor less expensive.

The Locomotive Boiler

The locomotive boiler in its present form is the result of the efforts of years to reach the maximum capacity with the

INCREASING ATTENTION is being given to points of design that affect the efficiency of boiler or engine. Such radical innovations as steam turbines and Diesel engine locomotives are being tested.

Locomotives have been rendered obsolete in the past because they did not have the power to haul heavy trains necessary for the economical movement of traffic. Many existing locomotives must be retired unless rendered more economical in fuel and maintenance costs.

minimum increase of weight and size. Efforts in the future will be directed toward obtaining a steadily increasing amount of steam for each pound of fuel consumed, without sacrificing any of the capacity that has been acquired by past exertions. With this object in view every detail of design will be subjected to a more critical scrutiny than has been customary hitherto.

The size and relative proportion of grate area, firebox volume, combustion chamber, length of tubes, distribution of heating and superheating surfaces, air openings through grates, air inlets to ash pan and circulation within the boiler, together with the purification and heating of feed-water by exhaust steam or waste gases, are some of the points that will be given greater consideration. At present far too much energy is lost in waste gases and in exhaust steam, losses which will probably be considered as inexcusable at no very distant date and characteristic of an extravagant past. Although efficiency will be given prime consideration, the question of a minimum maintenance expenditure and a minimum amount of attention and loss of time while in the shop will not be lost sight of.

The present arrangement of the front end and the means by which the necessary draft is secured is extremely simple and highly effective but no one would dream of calling it efficient. The defect has long been recognized and although it is not apparent that any other arrangement could be substituted without too much complication, the future will probably see a serious attempt to improve this method.

The Locomotive Engine

It is the function of the engine to produce the desired drawbar pull and furthermore, it should produce this drawbar pull with a minimum consumption of steam. The future will probably witness some marked developments in the direction of increased efficiency. Lower cylinder clearances, improved steam distribution, a reduction in exhaust pressure, and a better adjustment of the cut-off in relation to speed will demand increasing attention.

The use of a condenser has been proposed, but the added complication, the additional space required and the increase in cylinder size which would tend to exceed the clearance limits makes its adoption highly improbable unless other radical changes are made.

The day of the compound, at least in this country, ended with the advent of the superheater. It never was popular on American railroads but has been extensively used in Europe. It is interesting to note that even in those countries where it has been long and extensively employed the tendency towards its abandonment has been strongly marked, especially during the past year. Aside from Mallet locomotives, no compounds have been brought out in the United States and comparatively few new designs are being made in any other country.

In Europe, where crank axes and multiple cylinders are not considered as unwarranted complications, the present tendency is in the direction of four-cylinder or three-cylinder simples, with an increasing tendency toward the adoption of the latter, although the counterbalancing is not as perfect as in the four-cylinder type. This practice of using more than two cylinders is largely due to greater restriction in clearances than are common in this country. Despite the prevailing prejudice, it is by no means improbable that engines of the three cylinder type will in the near future be tried out for large size freight locomotives. The more uniform torque will make it possible to reduce the factor of adhesion while the smaller diameter of the pistons and the beveled over-all width will be favorably received. Counterbalancing will also be simplified.

With the increase in production of alloy steels, a better knowledge of the methods of working them, together with a widening appreciation of the necessity and advantage of heat

treating, it is probable that there will be a considerable extension of their use in locomotive construction.

During the last few years marked advancements have been made in the development of light non-ferrous alloys of high tensile strength. Some of these alloys may prove to be suitable for pistons or other reciprocating parts where a reduction in weight would be highly desirable.

Turbine Locomotives

The steam turbine years ago won recognition as the standard prime mover in large stationary power plants and also has been extensively used in the marine field. Its high efficiency, simplicity and large power for limited space and weight have forced locomotive designers to consider seriously the problem of its application to the locomotive. Thus far the pioneer work has been done in Europe, where the fuel costs are greater than in this country. In Switzerland, the Winterthur Locomotive Works has fitted up a locomotive with a Zoelly turbine. At Stockholm a Swedish State Railway locomotive has been equipped with apparatus furnished by the Ljungstroms Steam Turbine Company. Both of these locomotives are now being tested and according to reports are showing satisfactory results.

In general appearance the locomotives closely resemble old familiar designs. A high-speed turbine is coupled to the driving wheels through a reduction gear, the exhaust carried to a condenser and a fan provided for creating the draft. In England a turbine locomotive with electric transmission is being built by Sir W. G. Armstrong, Whitworth and Company. In Italy a small switching locomotive driven by a Belluzo turbine has been in service for a number of years. As a result of this experience a large Pacific type road locomotive is now being fitted up. A number of other turbine locomotives have been designed, or are under construction, although but little information is yet available in regard to them.

Diesel and Other Internal Combustion Locomotives

Internal combustion engines designed to use gasoline or a similar fuel have been employed to a considerable extent for driving small locomotives of the type required for mines, industrial plants and light switching purposes. Common sizes have varied from 50 hp. to 75 hp.; in some cases they have been made of 150 hp. The field for the use of such engines appears to be limited to small, special locomotives and to motor rail-cars hauling not more than one trailer.

The Diesel or heavy oil engine has been developed to a high degree of efficiency and reliability. It has not only been a success for submarines, but is now being used for merchant ships in all parts of the world. These engines are far more efficient than any type of steam apparatus, but unfortunately have been bulky, heavy, complicated and expensive to build. The efficiency has been so attractive, however, that several Diesel locomotives have been brought out in Europe. Some of these were of the Diesel-electric type and others had the engines direct-connected.

It is possible that the recent development of the compound Diesel engine in this country will go a long way toward solving the problem of the Diesel locomotive and that it will find a definite field in railroad work. At the present time it would appear that its greatest usefulness would be in those localities where fuel is expensive and the traffic not sufficiently dense to warrant the heavy expense of electrification. It may require years of work to perfect and bring into extensive use the Diesel locomotive, but a number of such machines undoubtedly will be constructed in the near future and the results obtained will be watched with interest.

As a transportation unit, the present steam locomotive is a highly developed specialized machine. Still it is probably only in its infancy and the future may see many unexpected, if not radical, developments.

A Train of Seventy 100-Ton Cars on the Norfolk & Western

Many Special Types of Cars Introduced in 1921

High Capacity Equipment Most Notable Development;
Concrete Cars in Europe

By A. F. Stuebing

DURING RECENT YEARS the design of cars has tended gradually toward the adoption of a few major types.

Few new methods of construction have been adopted and the principal variations were those dictated by local conditions. During the year just past, however, a new tendency has manifested itself. New types have been developed, some to meet special operating conditions, and others to handle special classes of traffic more efficiently. The resourcefulness of railroad officers and equipment builders is exemplified in several notable developments, the most important of which are the high capacity gondola cars, container cars and self-propelled motor cars.

High Capacity Coal Cars

Unquestionably the most important step in the development of freight car equipment during the year was the extensive introduction of cars of extremely high capacity for handling coal between the mines and the car dumpers at tidewater and at the lakes. The three roads handling export coal at Hampton Roads all adopted new and heavier car equipment during the year. The Virginian, after prolonged trials of four different designs, placed in service 1,000 cars of 120 tons capacity, the largest units in general service on any road. These cars have made it possible for the Virginian to increase the trainload to a point never before attained, the maximum train consisting of 110 cars weighing 17,250 tons.

Shortly after the 120-ton cars were placed in service on the Virginian, the Norfolk & Western received 500 cars of 100 tons capacity, which were likewise designed for hauling coal from the mines to the car dumpers at tidewater. The notable features of this equipment are the new design of six-

wheel truck which carries the load on side bearings instead of on the center plate and the high ratio of load to total weight—78.9 per cent.

The high capacity cars of the Chesapeake & Ohio, like those of the Norfolk & Western, are of 100 tons capacity.

They differ from either of the other designs in having drop doors, which adapt the cars for general service where dumpers are not available.

The three cars mentioned are all equipped with six-wheel trucks. Although the additional pair of wheels has been considered necessary on these high capacity cars to keep the load on the axle, journals and wheels within proper limits, the six-wheel truck has certain disadvantages. Trials are now being conducted to determine whether it is feasible to operate cars of 100 tons capacity with four-wheel trucks. This type of car would impose a load of about 65,000 lb. on each axle. There is a question whether the metal in the wheels and in the rails can bear such a heavy load without flowing and without rapid failures. If no difficulty is experienced due to the concentrated load, the four-wheel truck will probably become the prevailing type for cars up to 100 tons capacity. The

THREE HAVE BEEN THREE outstanding developments in car design. High capacity gondola cars have enabled coal carrying roads to increase the tonnage per train and reduce operating costs. Container cars have facilitated the handling of mail, express and less than carload freight. Self-propelled cars have practically solved the problem of passenger service on branch lines.

Concrete freight cars, container cars and a novel five-car dining unit have been built in Europe.

ratio of load to total weight could probably be made higher in such a car than in one with six-wheel trucks and the ease of maintaining the four-wheel truck would be a decided advantage.

The Container Car

Another important development of the past year was the container car. This type of equipment has been used by the New York Central for express, mail and less than carload freight service, and the Boston & Maine is planning to

introduce a slightly different design of car in local freight service. The general advantages of the container system were brought out in an article in the *Railway Age* of December 10 and further comment is unnecessary. There appears to be a wide field for container cars and as soon as the details of design are worked out and difficulties of handling at terminals are overcome, an extensive development is to be expected.

Self-Propelled Cars

The need for reliable and economical self-propelled cars for service on branch lines has resulted in the construction of many types of equipment in the past, few of which have remained in service for any considerable time. The problem of designing a satisfactory car for this service now seems well toward solution; in fact, three types having as the source of power steam engines, gasoline engines, and electric motors receiving current from storage batteries have now passed the experimental stage. At least one of these types should be suitable under almost any local conditions. The motor car, like the container car, gives promise of reducing the cost of handling a class of service which in the past has been a liability, rather than an asset, on many roads.

Car Construction in Foreign Countries

Economic, industrial and political conditions in European countries have all influenced the recent design of cars. For example, Poland is experimenting with a modified type of container car in which the bodies are interchangeable on several types of running gear in order to overcome the handicap of the three gages, the Russian 5 ft., the German standard gage and the narrow gage. In France, Germany and Austria concrete cars have been built and have apparently met with a fair degree of success. Only one concrete car has been built in this country but it is probably fair to say that under American conditions concrete is not satisfactory as a material for freight cars. In Germany, on the other hand, it is stated that concrete cars are technically and economically

feasible and the use of this material does not increase the weight of the equipment as compared with steel construction.

There are numerous reasons why concrete may be applicable abroad but not in this country. The European cars are smaller, trains are lighter and the screw coupling eliminates the severe shocks in road service due to slack between cars. It is still too early to judge the relative merits of wood, steel and concrete. The elimination of decay and corrosion would be an important advantage for the concrete car if not offset by abrasion and disintegration. At the present stage the concrete cars are of interest chiefly because of the possibilities of future development.

Articulated Dining Train

One of the interesting developments in Great Britain is the construction of a dining unit of five cars on the articulated principle. The passenger train cars on British roads are much lighter than in this country. Whereas six-wheel trucks are necessary in America, the cars in England do not even tax the capacity of four-wheel trucks. In certain classes of service where the cars can be kept together, the Great Northern Railway of England has joined several cars permanently and instead of placing two trucks under each car, has located a single truck under the abutting ends of two coaches. The advantages claimed for this arrangement are improved riding qualities, due to a reduction of oscillation, and reduced weight. The articulated dining unit of the Great Northern consists of one first-class and one third-class corridor coach, the first and third-class dining cars and a kitchen car. The five cars measure 246 ft. over buffers and are carried on six four-wheel trucks. In making up a train cars can be added at either end, but the five-car unit cannot be separated. The weight per passenger of this equipment is 27 per cent less than the ordinary cars formerly used. It is interesting to note that the kitchen in this car is fitted with electric ranges, the current being obtained from two axle generators under the car. So far as known this is the first application of electric cooking in dining car service.

Railroads Profit From Lower Material Costs

(Continued from page 46)

tion in the diagram is the steady upward trend of prices during the first eight months of 1920 for the United States as a whole and notably for the New England region, as compared with the general downward tendency during the past year.

The trend of railway fuel costs shows little relation to the conditions in the spot coal market. While there has been a steady decline in the average cost to the railroads as a whole

during the first nine months of 1921, there has been no marked change in the trend of spot coal prices from February to the end of the same period, either upward or downward from the average government price of 1918. During the months of October and November, however, spot prices have shown a marked downward tendency, which, it may be said, has probably had little influence on the trend of railway fuel costs during the same period.

Maintenance-of-Way Is Now on the Upgrade

Railroads Are Slowly Restoring Tracks to Normal Condition
—Renewals Still in Arrears

By W. S. Lacher

JUDGING FROM RELATIVE expenditures and rates of pay in 1920 and 1921, one would gain the impression that the year just past was one of greatly restricted performance. This would be the case without doubt if it were not for the fact that certain influences have served to compensate for the seeming disparity in outlays. Because of this it is conceded that most of the tracks are now in better condition than they have been for some time insofar as the line, surface and riding qualities are concerned, and that in consequence the roads have entered the winter season in a more favorable, though not entirely satisfactory condition.

Expenditures for maintenance-of-way work for the first ten months ending October 31, 1921, were \$651,551,597 as compared with \$878,074,290 and \$647,326,552 for the corresponding periods of 1920 and 1919, respectively. These figures are not subject to exact comparison because of the influence of the wage increase effective May 1, 1920, and the wage reduction of July 1, 1921, but in general the effect was to make the work more expensive as regards the rate per hour during 1921 than in either of the preceding years.

In the early months of the past year when the roads were confronted with operating deficits, maintenance-of-way work was restricted to bare necessities and the opening of the season for the active prosecution of the work was delayed until later than usual, much work being held up until July. However, active work during that month and the three months following was effective in accomplishing an appreciable improvement in conditions.

Other factors must also be taken into consideration. The winter of 1920 and 1921 was exceedingly mild so that the tracks came out of the frozen period in much better condition than usual. Following this the country generally had one of the longest and most satisfactory summer seasons that has been experienced for many years. Furthermore, the limited volume of traffic proved of considerable advantage, both in the reduced wear and tear on the fixed property and in the decreased interference with maintenance-of-way operations. However, the largest single factor which was favorable to the accomplishment of a good season's work was the increased efficiency of the men. This was by far the most encouraging phase of the maintenance-of-way situation

which has occurred on the railroads during the past year.

To accomplish the favorable showing in spite of the limited expenditure, attention was concentrated on necessary items of upkeep. Renewals received less attention, although lack of specific statistics makes it impossible to present any definite facts. Rail consumption in 1920 in the sections used in standard gage track averaged well up to the previous years. During 1921, however, production in the mills was somewhat slow because the roads did not specify fully on their orders. Although no statistics as to quantities are

available there is no question but that little progress was made in taking up the large accumulation of rail renewals which have been deferred from year to year since almost the beginning of the war period.

Evidence of further activity in the direction of corrective measures is noted in recent large orders and inquiries for rail by roads in both the United States and Canada. A plan for the purchase of 1,000 miles of 100 lb. rail by one large system is particularly emphatic on this point.

The condition also is not favorable in the case of cross ties. Renewals in 1920 were restricted because of inadequate supplies of ties. This situation as to supply was improved during 1921, but renewals were restricted because of a failure of the roads to prosecute the renewal program to the fullest extent.

Therefore, with ties, also, the bulk of the deferred renewals still remains to be made.

One item which has been largely neglected is painting. Many roads dispensed with their painting forces entirely. This means that enlarged programs must be undertaken eventually to make up the deficiency. Such items as weed cutting and general policing were also given less than normal attention.

Labor Efficiency Improved

The thought behind maintenance-of-way operations during the working season of 1921 was to improve the efficiency of labor by taking every advantage of the favorable condition of the labor market. In the early months of the season many of the subordinate officers were inclined toward the opinion that the growing differential in wages paid by the railroads and those generally prevailing outside were primarily responsible for the greater industry observed in the

EXPENDITURES for maintenance-of-way during 1921 will probably total only three-fourths as much as in 1920.

Concentration on essentials, decreased cost of materials and increased efficiency of labor have enabled the roads to put the tracks in reasonably good condition.

Marked improvement has been made in the spirit and industry of the forces but little progress has been made in reducing the accumulation of deferred renewals.

railway forces. These officers were, therefore, somewhat chagrined when they learned of the reduction in wages authorized by the Labor Board on June 1, 1921. However, it did not take them long to discover what others had realized all along, namely, that the rate of wage is a minor factor at times when the number of jobs is smaller than the demand—that men will exert themselves to hold a job whenever they know that another is not to be had.

The campaign for increased production was directed primarily at the supervisor and the foreman in impressing on them the fact that performance records of the past five years are in no sense a measure of the reasonable volume of work to be expected from the men; in other words, this was an abnormal period in which the average performance of men was far from satisfactory. This situation was also improved to an extent in industrial centers by enlisting the services of old foremen who had entered more profitable employment during the war period. With the current depression many of these men have been glad to get back into track work. The same is true in a large measure of the laborers. For example, many high-grade Italian trackmen who had obtained employment in more remunerative lines during the war period were reenlisted in railway work during the past season.

On the other hand, men of certain nationalities from southeastern Europe who have been found generally unfit for railway work have been very largely eliminated. These various measures have all served to raise the general tone of the forces; the men take more interest in the work and a larger output is accomplished. Some maintenance-of-way officers have gone so far as to say that the efficiency now is as high as at any time in the past.

But in spite of the notable improvement in the performance of the men, the roads have felt deeply the restrictions which prevent them from taking at least partial advantage of the prevailing low rate for common labor. Not only is there a great differential in favor of the railway employee as regards wages, but the standardization of wages is peculiarly unjust to the roads. The rate for trackmen, which is nearly the same the country over, is in some localities now nearly double the rate at which men could readily be obtained in adequate numbers.

Roads Turning to Contract Work

Partial relief was obtained by a number of the roads through the contracting of some of the major items of maintenance-of-way work, such as rail and tie renewals and ballasting. Cost plus and force account agreements have been applied in part to this work but growing favor is being evidenced for the contract form under which the work is awarded on the basis of unit price bids for the various items covered. This plan can only be put into effect where both the railways and the contractor are in possession of sufficient cost data to enable them to have a fair check on the reason-

ableness of the bids offered and taken. The railroads which have tried both systems are now inclined to favor the unit price arrangement as being most equitable and as offering the least opportunity for criticism.

An idea of the extent to which general interest has been manifested in the contracting of maintenance-of-way work is indicated by the fact that the Committee on Economics of Railway Labor of the American Railway Engineering Association has been at work during the past year on the development of specifications suitable for use in such contracts. The general interest in this subject is in no sense to be measured by the number of roads which have followed the practice during the past season and it is certain that unless some means are devised by which the railroads are enabled to secure track labor at a rate considerably below that prevailing at present, nearly all work other than routine policing by section forces will be conducted under some contract arrangement.

Tendencies of the Times

Certain influences and tendencies which have been manifest for a longer period than a single year have been given an added impetus during the past 12 months. Further progress has been made in the adoption of heavier sections of rail. Fifteen out of 25 of the larger roads are now buying rail weighing more than 100 lb. per yd. and at least two introduced these heavier sections in 1921. Similarly many roads using rail of less than 100 lb. section have the adoption of heavier sections under advisement. Some heavy designs of joint bars represent an accompanying development. The use of heat-treated, high-carbon or other special steels for tie plates, joints, bolts and spikes has been given further impetus, a more receptive attitude of manufacturers being a factor of importance.

One of the noteworthy tendencies during the past year has been the expression of a general need for improved methods of accounting in maintenance-of-way work. This is prompted by the feeling that the records made to satisfy the requirements of the Interstate Commerce Commission do not provide the maintenance-of-way officer with the information which he should have as a measure of the work done by the various forces under his direction and for the fixing of budgets for the monthly distribution of annual appropriations. Thus far only a very limited amount has been done in the actual development of such systems of performance records, but various associations and individuals have emphatically advocated this plan. The fact that the need of better records has been expressed by railway men in important official positions gives promise that this movement will be given a general impetus. When it has been accomplished the incentive for efficiency will be more nearly of the same measure as that now obtained in industrial plants conducted under the control of such systems.

Cutting Freight Loss and Damage in Half

Packages Properly Prepared for Shipment

What Happens to Freight Improperly Prepared for Shipment

Freight Claim Division of A. R. A. Has Developed Successful Campaign

By K. H. Koach

WITH THE SLOGAN "Cut Loss and Damage in Half—It Can Be Done," the freight claim division of the American Railway Association has conducted a vigorous campaign during the past year to reduce by at least 50 per cent the amount paid out in the settlement of freight claims. Figures relative to the work of this organization are now available for the year September 1, 1920, to September 1, 1921, to which period this article is confined except for a few of the more important matters handled by the division during the last four months of 1921.

The present operations of the division may be divided into three general phases. The first has for its object the minimizing of controversies in connection with freight claims, and the corresponding expenses incident to litigation brought against the carriers by the shipping public. This has been accomplished by conferences with the representatives of commercial organizations, and also by keeping current and effective the freight claim rules and rulings, which, in their operation, facilitate the investigation of freight claims and the adjustment with claimants.

The second objective is to make the freight claim rules and rulings more effective in order to maintain the least expensive methods of claim investigation and accounting by the carriers. Particular attention has been given to the claims filed in connection with freight moving over several lines in order to avoid the necessity of litigation and prolonged disputes between carriers; likewise controlling the expense of lawsuits for claims filed by one carrier for loss or damage which may have occurred on a connecting line.

The third phase of the work is that promoted by the claim prevention committee. This committee inaugurated an educational campaign through personal conferences with representatives of the various branches of transportation service,

FREIGHT CLAIM DIVISION

of A. R. A. has conducted a vigorous campaign to cut in half the freight claim payments, which exceeded \$120,000,000 in 1920. The number of claims filed has been reduced from 335,540 in November, 1920, to 208,404 in August, 1921.

The collection of statistics, dissemination of information, co-ordination of freight claim work on the various railroads, perfect package campaign and freight claim prevention congress are other activities of the division.

such as the freight claim, claim prevention, and operating departments, and followed it with a large amount of correspondence, supplemented by bulletin service, all of which outlined methods and suggestions for improved service. Much has also been gained by the co-ordination of the activities of sectional claim conferences, which conferences in turn co-ordinate the activities of the various carriers in each of the various sections of the country.

Claim prevention representatives have concentrated their efforts during the past year upon the following causes, which contributed approximately 80 per cent to the loss and damage account in 1920, namely: (1) robberies, (2) rough handling, (3) loss of entire packages, (4) defective equipment, and (5) delay.

Loss due to robberies averaged nearly \$2,000,000 per month in 1920, and was confined mainly to such commodities as clothing, dry goods, notions, boots and shoes, tobacco, cigarettes and cigars. "Rough handling" totaled almost \$1,000,000 per month, and was largely chargeable to improper switching in yards. "Loss of entire packages" was responsible for claims amounting to more than \$1,250,000 per month, and was due apparently to certain definite causes, the correction of which calls for uniform action in the handling of astray packages. "Defective equipment" cost nearly \$1,000,000 a month and was confined largely to grain, flour, mill products and coal. "Delay" caused payments of \$500,000 per month, affecting mainly fresh fruits, vegetables and live stock. The total freight loss and damage expenditure for the first six months of 1921, as compiled from the reports of 227 carriers, representing 90.4 per cent of the railroad mileage in this country, was \$55,707,753.

Largely through the efforts of the Freight Claim Division of the American Railway Association, a curtailment of this drain on freight earnings has been effected during the past

year. Realization of this fact has resulted in the rapidly growing interest which the carriers have shown in claim prevention work. The old method whereby each road handled its own claim problems has now become practically obsolete. In September, 1920, the number of carriers reporting to the Freight Claim Division was 165, while in July, 1921, the number had increased to 230. With last year's growing interest in the Freight Claim Division and its claim prevention work, the results so far have shown that the number of claims is gradually being lessened each month, and that the carriers are giving closer supervision to the problem than ever before. The total number of claims received by the carriers from claimants in November, 1920, was 335,540, which number was reduced to 208,404 by August, 1921. The number of claims paid to claimants in January, 1921, was 314,178, which number was reduced to 206,684 by the end of August. The number of unadjusted claims at the close of November, 1920, was 548,097, this number being reduced by August, 1921, to 290,275.

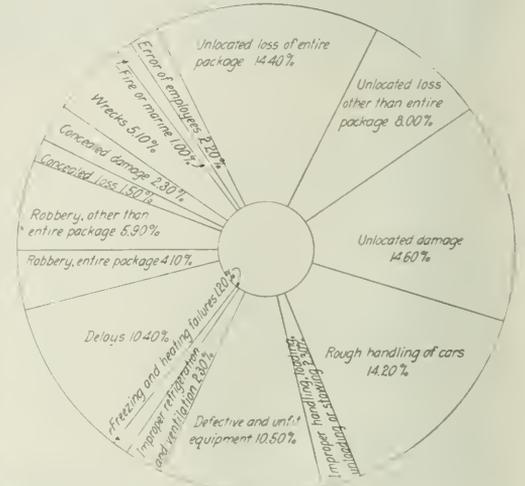

The outstanding feature of last year's work was the employment of three experienced men as special representatives to devote their entire time to claim prevention problems. Prior to this action, which was effective the first of last year, the most noteworthy feature of claim prevention work was the freight claim prevention congress which was held at Chicago, Ill., November 15-16, 1920, with an attendance of 309 representatives of the various member carriers. As the immediate result of this congress the usefulness of the claim prevention organizations on many of the lines was extended, while on others where no such organization had existed, one was established and its course of operation directed advantageously by the Freight Claim Division. It is expected that a similar congress will be held at Chicago during the first part of this year.

Statistics of Freight Claim Payments

With the need of complete statistics of claim payments upon which to base its investigations, the subject of "uniform

Form No. 1 came into existence and was made effective with the claim payments for the month of September, 1920, since which time the reports have been made monthly, and summaries thereof have been prepared and issued through the organization of the Committee on Cause and Prevention.

Prior to the inauguration of these reports the only compilation of claim statistics by causes and commodities was that prepared by the Interstate Commerce Commission on figures received from Class I railroads for 1914. With the exception of that period of one year, the carriers have not heretofore recorded their claim payments on any regular and uniform basis. The promptness, accuracy, and completeness with which these reports are now being rendered by the members are of the utmost assistance to the committee in directing its

Distribution of Freight Claim Payments According to Causes

work intelligently. Summaries of these reports, accompanied by brief analytical statements pointing out the causes and commodities chiefly involved, with suggestions for preventive

Nails Pulled from Floors and Sides of Freight Cars Set for Loading at the Union Pacific-Oregon Short Line Freight House at Salt Lake City, Utah, from May 1 to September 30, 1921

claim statistics" was among the first considered by the Freight Claim Division committee at the inauguration of the Freight Claim Association with the American Railway Association in 1919. Final and definite action was taken at the last annual session, when a special committee was created to prepare and promulgate to the membership a form for reporting monthly the claim payments of each carrier, separated according to the designated causes and commodities.

In accordance with this action the division's standard

TABLE OF FREIGHT LOSS AND DAMAGE CLAIMS PRESENTED, PAID AND UNADJUSTED, AS REPORTED TO THE FREIGHT CLAIM DIVISION OF THE AMERICAN RAILWAY ASSOCIATION

Month	Number of carriers reporting	Total number claims received from claimants	Average number of claims received per carrier	Per cent increase or decrease in column 4 over Sept., 1920	Number claims paid to claimants	Number claims unadjusted at close of month	Average number of claims unadjusted per carrier	Per cent increase or decrease in column 8 over Sept., 1920

* Embraces approximately 90 per cent of United States and 15 per cent of Canadian mileage represented in American Railway Association. Includes claims paid, but unadjusted, on other carriers.

measures, are prepared monthly and distributed to railway basis. The promptness, accuracy, and completeness with officers, as well as to classification committees, weighing and

inspection bureaus, and to interested divisions of the American Railway Association.

A claim prevention bulletin service was placed in operation the first of last year, the bulletins being sent to freight claim, freight claim prevention, transportation and traffic officers, chief special agents, freight agents, and others concerned in this work.

These bulletins serve to convey suggestions covering all phases of claim causes, and the methods for prevention as determined by existing practices developed through investigations of the Freight Claim Division. In addition to the bulletin service, separate action has been taken on a large number of important subjects which came up for immediate attention during the current year; circulars were issued to the membership covering such matters.

Public Not Neglected

The public has not been neglected in this claim reduction campaign. Those concerned in this work have been reached by conferences with commercial clubs, through special articles prepared for trade journals, associations and conventions, and by circulars to chambers of commerce and similar organizations. Definite ideas are presented to each individual group as to the best means of securing co-operation in the correct handling of freight.

The Freight Claim Division, in conjunction with the American Railway Express Company, inaugurated a "perfect package" campaign during the month of November, 1921. This was the first attempt for national co-operation between railroads, shippers, receivers and express people, for the purpose of studying the best ways of handling freight safely. The good spirit with which all concerned entered into this work, and the beneficial results which emanated from the campaign are considered by the division as a fair indication of the excellent outlook for co-operative claim prevention

work with respect to the various other organizations interested.

The Lost Package Evil

Among the most recent activities of the Freight Claim Division is the national plan for controlling the lost package evil which was placed in operation the early part of last month. An eight-page circular was sent to the member carriers under the title "Uniform Method of Handling Over and Astray Freight and Matching Against Shorts at Destination Points." The committee on Freight Claim Prevention stated in this circular that for the first six months ending June 30, 1921, the unlocated loss of entire packages cost the carriers \$8,039,572, or 14.4 per cent of the total claim payments. This sum added to the \$2,285,601, charged during this period to robbery of entire packages, entails a total expenditure of more than \$20,000,000 per year. The committee outlined in the bulletin detailed methods of making effective and uniform the present rules and practices, which to be successful, it believed, needed only the support of those in charge of supervision:

It is felt that the good results coming from the activity of the Freight Claim Division's prevention work are represented, not only by the increased number of committees formed on individual roads for the study of the causes of transportation failures, but also by the recent formation of a committee on freight claim prevention by the National Industrial Traffic League, which will be one of the means of bringing the organized shippers into an intensive study of the problem.

A plan to co-ordinate the activities of carriers to prevent damage to perishable freight, will also be placed in effect during 1922 with the co-operation of the National Perishable Freight Committee. Cut loss and damage in half—it can be done if the present enthusiasm and efforts may be taken as the indication of the future.

Improved Service and Morale Features of 1921

(Continued from page 48)

and to New York, 13 days. At present the schedule to Chicago is 8 days and to New York, 11 days.

Southern Lines

The Southern lines during the war were given considerably more traffic than previously because of the many training camps situated in the southern states. The southern lines, however, with few exceptions, made no changes in their fast freight schedules to northern points, although in many cases more time was taken to move the cars beyond the connecting points by connecting carriers in the north and east.

Morale and Service Interrelated

It is believed that this resumé of the changes that have taken place in connection with fast freight service show on the whole: (1) that service during the war was not up to pre-war standards; (2) that service after the armistice and during the latter part of the federal control period was exceedingly poor; (3) that the railroads in 1921 have made great strides towards returning to their former excellence and (4) that there is still some ground left to cover.

Somewhat the same thing has happened to morale. We will presume for the sake of argument that morale on the railways was good before the war. Following the same comparison as given for fast freight service, we may say: (1) that it was fair during the war, but not up to pre-war standard; (2) that after the armistice and during the second

year of federal control it was exceedingly poor; (3) that the railroads in 1921 have made great strides towards restoring their pre-war excellent morale and (4) that there is still some ground left to cover.

Morale and excellence of service go together. The excellence of service creates morale and excellent service can only be secured through morale. A thing which brings us back to that old argument: Is competition really worth while on the railways? While it is recognized that exceedingly fast schedules will do more harm than good, there can be no question that competitive service of the proper kind is one of the best assets the railroads can have. The experiences of the past three or four years apparently emphasize this fact.

THE RAILROAD PROBLEM is still confused. Messrs. Kruttschnitt and Hines give conflicting impressions. They agree, however, upon this one thing: criticism, whether directed against the railroads or in behalf of the railroads, is far from being what it ought to be. Mr. Kruttschnitt, for the railroad managers, welcomes criticism—"preferably fair criticism, if it shows a reasonable respect for the facts." Mr. Hines, by his reference to the national agreements, shows what he thinks of a good many "facts" that come from the other side. The public finds itself lost in this dizzy play of billions of dollars. It, too, would welcome facts from an unquestionably authoritative and impartial source. It is a problem for somebody at Washington.—New York Evening Post.

Mandatory Rules Feature 1921 Accounting Progress

Effective January 1, 1922, New Rules for Interline Work
Mark Taking of Important Step

By Charles W. Foss

THE LETTERS R. A. O. A. bear to railway accounting the same relationship that the letters M. C. B. bear to the railway mechanical department. In the past, this has been due to the position that has been held in the accounting field by the Railway Accounting Officers Association. Effective January 1, 1922, R. A. O. A. took on an additional meaning because on that date there went into effect the R. A. O. A. Mandatory Interline Accounting Rules and Forms.

These rules and forms are mandatory and binding upon all carriers operating in North America. The step to make them mandatory was taken at the annual meeting of the Railway Accounting Officers Association at Atlantic City last June. The recommendations that are made mandatory naturally include but a portion of all the recommendations or standard practices that have been formulated by the Association since its organization. Speaking generally, they include only rules or recommendations that have been established for some time, and have been tested out by several years of experience. Those rules not made mandatory still stand as recommendations only.

Prior to the action taken in June, or rather prior to the effective date of this action, namely, January 1, the rules of the Railway Accounting Officers Association relating to interline accounting—that is, accounting transactions affecting two or more carriers—were purely recommendatory. They, therefore, had no binding effect beyond the merit of the recommendation and the facility they gave to the transactions to which they related. Nevertheless, they had been generally adopted and had been generally in effect on all, or substantially all, carriers.

Provision for Arbitration

A feature of the mandatory rules is the provision for arbitration of disputes. This is a necessary part of the mandatory idea, but it has an additional importance in that the arbitration provisions fill a long felt want by establishing for the settlement of disputes, a procedure that is of a judicial nature.

The R. A. O. A. Mandatory Accounting Rules and Forms, as is to be expected, do not necessarily represent the final word. The rules take cognizance of the latitude essential for progress and the incentive necessary for the development of interline accounting. In other words, they have been arranged on a common sense basis of permitting further progress and development. Presumably various of the present rules that are now recommendatory only will be added to the mandatory group, so that as time goes on, an increasingly large proportion of all the R. A. O. A. rules and forms will be made mandatory.

It is the opinion of many people well informed on the subject that this step represents the most momentous advance ever made in the history of railway accounting. This seems to be a rather strong characterization in view of the importance of the various steps that in the past had to be taken to bring American railway accounting up to its present pre-eminence. Nevertheless, there can be no question that January 1—the date the mandatory rules become effective—does mark the beginning of a new era in railway accounting.

The principle is well-recognized that the railways should render their accounts relating to interline business in a uni-

form manner. Such uniformity promotes fairness and impartiality and is a necessity insofar as concerns efficient and economical accounting among the carriers. It is a natural step to say, then, that uniform standard rules, impartially applied, constitute an integral part of inter-road accounting. It is further evident that conditions should not be allowed to continue which may make it possible for a carrier to deviate from an interline accounting rule according to the whim of the moment, or according to its interests in an individual case, while, under other circumstances, the same carrier may insist on making a literal application of the same rule when its interests lie in that direction.

Carriers Should Render Interline Accounts in Uniform Manner

Carrying the idea further, it hardly seems proper that a carrier is warranted in sending to other carriers statements or reports of a size and arrangement that do not conform to a generally accepted standard. Reports, statements, or other interline forms—if lacking uniformity of size and standardization of arrangement—are the source of additional labor and inconvenience in filing and using such reports, statements, or other interline forms by carriers receiving them. Some idea of the significance of this can be gleaned from the fact that the accounting department of a large carrier receives—from all other carriers—in the neighborhood of a million such forms each month.

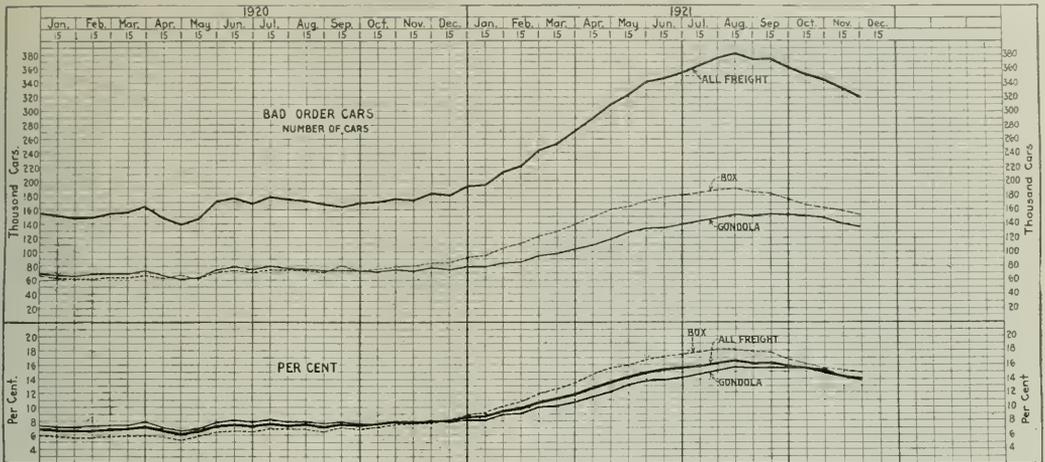

Standardization, as used in this connection, is synonymous with simplification. The saving of clerical work through standardization or simplification of forms will be obvious, to say nothing of the economy in printing usually attained by the use of standardized forms.

Relations With I. C. C.

The Interstate Commerce Commission has the power to prescribe railroad accounting in the most minute detail. The Commission has confined its accounting regulations principally to the accounting classifications, and the Commission has had the restraint, foresight and wisdom not to exercise its power in prescribing minute details of accounting, for the reason that action to that effect would bring irreparable damage to the railway industry by destroying the profession of railway accounting through reducing it to a mere matter of following minutely prescribed rules.

The accounting officer will probably express the opinion that the Commission is to be commended for having believed that carriers, individually and collectively, would voluntarily take adequate and effective action in respect to such matters, thus eliminating any necessity for action by the Commission. Whether it is the Commission that is to be commended or the Railway Accounting Officers Association, or both, is, of course, not the question. The fact is that the manner in which the two bodies have worked together and the excellent spirit of co-operation which has been shown on both sides are noteworthy.

Co-operation between the carriers is an equally important matter. To bring about uniformity in a matter such as these rules for interline accounting means sacrifices in individual cases, and it should be said—to the credit of the carriers—that they are making those sacrifices whole-heartedly and in ungrudging measure.

Bad Order Cars—Number and Per Cent

Equipment Conditions Show Dangerous Tendency

Low Earnings and High Prices Have Led to Small Purchases and Perpetuation of Old Rolling Stock

By A. F. Stuebing

IN ANY ANALYSIS of the equipment situation, there are two factors that at once command attention. The first is the large proportion of unserviceable equipment; the second, the small amount built. Both are unhealthy signs. In fact, the equipment record in 1921 is notable only as a horrible example.

Causes of the Bad Order Situation

So much has already been written concerning the abnormal number of bad order freight cars existing during the past year, that further comments might seem quite uncalled for. Nevertheless, it may be worth while to analyze the situation not as it concerns present problems, but rather with a view to its bearing on future conditions.

The year opened with bad order freight cars amounting to over eight per cent of the total. This was the greatest percentage ever recorded with the sole exception of the autumn of 1919 when it was over nine per cent. But these figures seem reasonable when compared with the record established during 1921 which was 16.6 per cent on August 15, as reported by the Car Service Section of the American Railway Association. Barring a recurrence of government control, it is doubtful whether this maximum will ever be exceeded, for the combination of circumstances that brought it about could hardly be duplicated. The majority of the bad order cars were a heritage from the policy of under-maintenance adopted by the Railroad Administration. At the beginning of last year the percentage of cars on the home lines was exceptionally small and as cars were returned to their owners many were found to be in defective condition and were set aside.

Even if the maximum repair forces had been employed, it would have been impossible to prevent a large increase in the bad orders under these circumstances. The condition

was aggravated by several other factors. Many roads were not meeting operating expenses and drastic retrenchment was imperative. The number of car repairers decreased almost 50 per cent from October, 1920, to June, 1921. A considerable amount of work was deferred in expectation of reduced expenses for wages through reductions in hourly rates and abrogation of the national agreement and also for materials, the prices of which were constantly falling.

It is probable, too, that the bad order statements were, and still are, inflated by a very considerable number of cars which the railroads hope can be retired but which under present conditions must be set on side tracks and kept on the books because their retirement would involve a considerable charge to operating expenses which the railroads are not able to take care of at present. The statement of the Car Service Division of the American Railway Association for six months of the year shows that only 27,087 freight cars were retired in that period, the retirement being at the rate of only 54,000 cars annually. This is a smaller number than has been retired in any year recorded with the exception of 1919 when the Railroad Administration had adopted its policy of perpetuating weak equipment.

Few Freight Cars Replaced in Recent Years

An analysis of the equipment acquired and retired shows that in recent years the railroads have been following a policy of expediency in this regard which will bring disastrous consequences if it is not soon checked. During the years 1910 to 1914, inclusive, the Class I roads added an average of 134,316 freight cars to their equipment annually; from 1915 to 1920 the average annual acquirement was only 82,900 cars. The number of cars retired annually in the former period was 81,474; in the latter period, 72,399.

Studies have shown that the normal average life of freight cars is approximately 20 years. Twenty years ago the railroads were adding to their stock about 120,000 cars each year so at the rate of retirement that prevailed from 1915 to 1919 there remained each year about 50,000 more cars that had exceeded the normal expectancy of life. Looking at it from another standpoint, the average number of cars in the period, 1915-1920, was about 2,300,000. At the annual rate of retirement of 72,000 the average life of the equipment would be 31.8 years.

While the small number of retirements shows the tendency with respect to the replacement of freight equipment very plainly this is brought out in a more striking manner by the net change in the number of cars. From 1910 to 1914 there was an average annual net increase of 62,842 cars; from 1915 to 1920, the average annual increase was only 10,501. From these figures it is apparent that even though the capacity of the cars installed exceeded that of the cars retired, the net increase was by no means adequate to take care of the normal growth of business. The figures for last year, while incomplete, indicate that there has been an actual decrease in the number of cars, the retirements for six months exceeding the number installed by 719. The showing will be even worse when complete figures for the year are available. The acquisitions are certain to be small for the report of September 30 showed only 2,142 freight cars on order.

There would be nothing alarming in the slight decrease in the number of cars that occurred last year if it were an isolated case. There have been periods of depression in the past when freight car equipment decreased, notably in 1909 when retirements exceeded acquisitions by 15,298. However, in the years 1907 and 1908 the net increase in the number of freight cars was 193,355 and 100,580, respectively, and 1910 again brought an increase of 60,000 cars. The figures for 1921 have an untoward significance because they indicate the continuance of the unfavorable tendency of the preceding five years.

Past experience has shown that whenever traffic recovers after a period of depression, the volume of business exceeds all previous records. For six years there has been practically no growth in the freight equipment of the railroads. Population has not ceased to grow and commerce has not received more than a temporary check. There is reason to question whether an increase in business will not cause serious embarrassment to the railroads because of lack of cars.

There are some who contend that the railroads should take care of increases in traffic by improved utilization of cars rather than by increasing the amount of equipment. This argument is refuted by the serious car shortage of 1920, when the railroads were using their equipment more effectively than ever before. Even granting for the sake of argument that additional equipment is not needed, there is cause for concern when the rate of replacement of equipment over a five-year period is only 11 percent a year.

New Equipment Would Effect Economies

The last report of the Interstate Commerce Commission for December 31, 1919, showed a total of 1,505,707 freight cars of all steel or steel underframe construction. Of the remaining 855,000, possibly at least 400,000 should be replaced with modern equipment to improve operation and reduce maintenance costs. The wages of car repairers have been increased more than almost any other class of employees and maintenance has gone up correspondingly. In 1920 the average cost of repairs per freight car was \$257. Considering the variations between weak cars and well-designed cars, the expenditure for repairs, transferring, switching, etc., the present cost of maintaining and operating the old equipment may be considerably more than the fixed costs on new cars.

The majority of railroad officers apparently believe it is advisable to purchase additional freight cars as promptly as possible. The reason for the small orders and few retirements during the past year is to be found in the unfavorable financial condition. Retirement of cars generally involves a considerable charge to operating expenses; therefore, when earnings are low cars are set aside but kept on the books. During the time the cars are standing idle the depreciation reserve accumulates and the charge that must be made to the retirement account when the car is scrapped is gradually reduced. On the other hand as time goes on more cars are constantly coming due for retirement and the situation becomes worse. Failure to retire cars at the end of their normal life merely postpones the day of reckoning.

Are Higher Depreciation Rates Needed?

If depreciation rates were sufficiently high to make the depreciation reserve at the end of the normal life equal to the cost of the car minus salvage, there would be no charge to the retirement account. This might seem the ideal arrangement, but in practice most roads find it desirable to use a lower rate because it enables them to adjust expenditures more nearly in proportion to the revenues. If low rates are used one fact must not be overlooked. Insofar as the depreciation reserve is less than is actually required to retire the cars when due, and if retirements are less than normal, operating charges are reduced and earnings are inflated thereby. The last six or seven years furnish an illustration of how retirements may be deferred almost indefinitely. The inevitable result of such a policy will be deterioration of equipment. Roads that carry low depreciation rates are always tempted to postpone retirements in periods of low net earnings. During recent years expenses have no doubt been decreased in this way to the detriment of the equipment.

Locomotive Situation Continues Unsatisfactory

The motive power situation has been similar to the freight car situation, although conditions have not been as bad. As regards acquisitions and retirements of equipment, the figures are also similar. From 1910 to 1914 the average number of locomotives installed was 3,451. From 1915 to 1920 it averaged only 1,939. This year the total number built was only 1,121. The net annual increase from 1910 to 1914 was 1,655 and from 1915 to 1920 only 488. For six months of 1921 the number of locomotives increased only 105.

Little Progress in Retiring

Wooden Passenger Equipment

The additions to passenger equipment have likewise shown a remarkable decrease in recent years. The number of passenger cars installed from 1910 to 1914 averaged 3,453 a year; from 1915 to 1920 it was 1,583. The net annual increase in the former period was 1,713; in the latter period it was 301. The Interstate Commerce Commission's report for December 31, 1919, shows 53,765 passenger train cars on the Class I roads. The report of the Car Service Division for June 30, 1921, shows 53,884. In the 18 months the number of all steel cars increased 1,059; the number with steel underframes increased 79. At this rate the remaining wooden cars will be replaced with steel or steel underframe equipment in about 41 years.

It is certain that the railroads made great progress toward putting their house in order during the past year. Many problems have demanded attention and equipment has been more or less neglected. Some of the other aspects of the railroad problem are becoming less menacing, but the equipment question is growing more serious. The solution cannot be put off until facilities are again taxed to the limit. Improvement can only come slowly; it should be started without delay.

Electrical Developments for the Year 1921

Definite Progress Has Been Made in Trac-
tion, Welding, Material Handling,
Power and Lighting

By Alfred G. Oehler

DEVELOPMENTS in the electrical field made during the year have not been in the form of large installations of electrical machinery, but existing equipment has been made to perform new services and many new devices were brought out to meet new and changing demands. Electrical apparatus has been used to effect large economies and it would appear that some of the new devices will revolutionize existing practices. The electrical departments of the railroads and the manufacturers have responded effectively to the demand for economy and increased efficiency.

A lively interest has been maintained throughout the year in the subject of heavy electric traction, in spite of the fact that there has been no new application in this country.

The reasons for the interest and for the lack of new applications are quite simple. Railroad expansion has become largely a matter of intensive, rather than extensive, development. The number of new lines built has decreased steadily since 1906, and the present tendency in construction is to so arrange track as to get most efficient operation and greatest capacity. Electric operation affords an excellent means for increasing track capacity and for relieving congestion.

Many roads have electrification programs in view. Practically any electrification program must be considered as a major improvement involving the expenditure of large sums of money; that is probably the only reason why some of the contemplated work was not started. Twice during the year the Lackawanna has asked for bids on electrification apparatus. The program for the Illinois Central is, of course, definitely launched and that road recently purchased 20 new steel suburban coaches for use in steam service, but so designed that they can be equipped with motors and multiple-unit control apparatus.

Electric Traction in Foreign Countries

Electric operation for 11 eastern railroads was proposed in the report of the Superpower Survey (*Railway Age*, November 5, 1921, page 881) and it is highly probable that some of the roads mentioned in the report will electrify certain sections at some time in the near future.

Electric Operation Is Most Suitable Where Grades Are Heavy and Traffic Is Congested

In Europe many large electrification programs are underway. The scarcity of coal and the abundance of water power in these countries has materially hastened the adoption of electric operation. The programs for the various countries, which will be put into effect as rapidly as possible, are outlined in the table:

RAILROAD ELECTRIFICATION IN EUROPE (ROUTE MILES)

	In operation	Under construction	Proposed
Sweden	300	125	1,000
Norway	60	50	500
Germany	400	100	1,500
Austria	200	1,000
Switzerland ...	250	275	1,000
Italy	600	3,000
France	50	5,000
England	200	1,000
Holland	50	600
Belgium	500

IN SPITE OF the business depression, more than the usual amount of new and improved electrical equipment has been placed on the market.

It exemplifies the old adage about necessity. When devices prove inadequate or uneconomical, new ones are promptly developed to meet the new or increased demands. A return to normal conditions should permit the railroads to take advantage of the improvements that have been devised, with resulting increased economy.

Two important electrification contracts were given to American companies during the past year. One of these, amounting to \$7,000,000, was let to the Westinghouse Electric International Company by the Chilean State Railways to cover equipment for 116 miles of main line and 144 miles of track. The other, amounting to more than \$1,000,000, was let to the International General Electric Company by the Spanish Northern Railway and include about 40 miles of line.

During the year both of these manufacturers have supplied equipment to the Central Railway of Paulista and a section of that road is now operated electrically. The same two companies have also supplied large amounts of electric railway material to Japan and to some of the European countries during the year.

Plans for electric operation have been made for railroads in the Philippines, Jamaica and Madagascar and it is expected that contracts will soon be awarded involving the electrification of about 90 miles of line in South Africa.

Notable development work has been done which has greatly improved the operation of automatic substations, and a number of such installations have been made during the

year. These have all been made for power and street railway companies. But it is highly probable that such substations will soon find a place in trunk line railroad service.

Electric Welding

Electric arc welding during the past year has been used successfully in repairing a considerably greater variety of parts than ever before. Some of the more recent applications are listed in the table:

APPLICATIONS OF ELECTRIC ARC WELDING

1. Cast Steel Wheel Centers.
2. Cast Iron Wheel Centers.
3. Application of Hub Liners.
4. Building up Tires on Wheels.
5. Couplers.
6. Coupler Knuckles.
7. Truck Castings and Bolters.
8. Draft Castings and Car Sills.
9. Side Plates and End Plates.
10. Building up Worn Crossings, Frogs and Switches.
11. Erecting Iron and Steel Structures, Including Tanks.

The table lists only a small part of recent applications and is presented to show the trend in the use of arc welding. Few roads use all of the practices listed, but it will probably be only a matter of time before they will be used generally.

Large savings can be made by the use of autogenous welding, both electric and gas, and that will, of course, cause its use to be extended as rapidly as the users can learn how to obtain dependable welds. It has been shown that an investment of \$150,000 in welding equipment on the Rock Island has in a few years saved three times its cost. After the practice of welding locomotive tires was established, no new tires were purchased for a period of three years, and the number now bought is only about one-third of the former average.

Electric resistance welding will probably come into much greater use than at present for safe-ending boiler tubes. The committee of the Master Boiler Makers' Association on Methods of Welding Safe Ends on Locomotive Boiler Tubes made the following statement in its last report: "Welding safe ends by the electrical welding machine, in the opinion of the committee, will eventually supersede the present method."

Rivet heating cannot be classified as welding, but as a closely allied work it should be said that electric rivet heaters have proved their economy and usefulness and are rapidly finding favor in boiler, tank and car shops.

Practically all of the manufacturers of welding machinery have made improvements in their equipment. Among the outstanding developments is the so-called semi-automatic welding lead which has been applied to the General Electric automatic welder. It consists of a 10-foot length of flexible steel tubing, equipped at one end with an adapter for attaching it to the automatic head; and at the other end with a guide nozzle to direct the electrode wire to the arc. This device combines the advantages of a steady supply of wire and constant arc length of the automatic welder with that obtained by allowing the operator to direct the arc manually.

Several new gas-engine-driven welding sets have been designed for use in places where electric power is unavailable or where it is inconvenient or costly to bring it to the work.

Marked progress has also been made in percussive welding and for certain purposes it has been shown to be the quickest and most efficient method.

Alloy steels have been welded successfully by the electric arc process, and with adequate mechanical and heat treatment tensile strengths of the weld of 130,000 lb. per square inch have been secured.

Electrical Devices for Handling Material

Two new types of electric crane trucks were developed during the year which will probably find a wide application. These have a capacity of 3,000 lb. and have a boom long

enough to lift an air pump or front end into position on a locomotive. They are designed for use in enginehouses and similar places where an overhead crane is not available and have the added advantage of being able to carry material from one building to another, as from the storage platform to the repair shop.

They are being used by the Western Maryland and the New York Central. In describing their usefulness, M. E. Townner, general purchasing agent, Western Maryland, writes:

"Electric crane trucks are being installed on a regular tour of duties, including routing through shops, with loading and unloading stations marked where material is unloaded or assembled. Air pumps are taken from the side of a locomotive; and in one instance the operation of taking down an air pump, delivering to repair point and bringing back an extra pump, consumed 21 minutes, as against one and one-half hours for the operation by former methods. Another operation was the handling of side rods and equally heavy material in 30 minutes as against previous four hours' operation. This tour of duties includes from a one-day ahead program to a 30-day ahead program in conjunction with the shop heavy repair program."

The successful operation of tractors and trailers in freight transfer service was particularly well demonstrated by an installation on the New Haven at the Cedar Hill transfer, where 14 tractors are used. One hundred and thirty-one distinct classifications are made daily and as many as 305 cars have been worked in one day, a normal daily performance being between 260 and 285 cars. The ability of the transfer to work this number of cars, with tractors and trailers, has resulted in the closing of the transfers at Westchester and Maybrook permanently. Furthermore, approximately 80 per cent of the transfers at Bridgeport and Hartford and 50 per cent of the transfers at Waterbury, Danbury and Poughkeepsie, have been eliminated through the concentration of the transfer business on the west end of the line.

Motors and Control Devices

A remarkably large number of switches and switch controls have been developed during the year. Most of these were designed principally for the sake of safety and convenience. The old open-type switches are being rapidly displaced by those which are fully enclosed. Automatic starters have been developed for synchronous motors.

In the application of electric motors to shop machines, there have been two developments of note. One is the application of "built in" high-speed induction motors to various wood-working machines, grinders and other machines which require high uniform speeds; and the other is a new form of direct-connected, reversing-motor drive for planers. The new planer drive was developed to overcome troubles caused by planers over-traveling from any one of several causes.

Lighting

The most notable developments in lighting for railroad service have been in yard and enginehouse lighting. Detailed methods have been worked out by the Lighting Service Department of the Edison Lamp Works of the General Electric Company for using flood lights for night illumination of classification yards, scale houses and turntables, and these methods have been applied with excellent results.

Enginehouses are now lighted on the Boston & Albany, the Lehigh & Hudson and Chicago & Northwestern by mounting two floodlights with crossed beams on the outer circle wall between each stall. This method does not solve all of the wiring difficulties of enginehouse lighting, but it simplifies them and supplies effective lighting. It represents a big step in the right direction.

Repair Shop and Enginehouse Developments

Few Additional Facilities—Contracted Work and Leased Shops—Future Possibilities

By E. L. Woodward

RELATIVELY FEW additional facilities either in new railroad shops and enginehouses, or more modern equipment for those already built, were provided during the year 1921. Repair work was some shops were leased and others closed, and yet there is reason to believe that railroad shops will come into their old position of importance again in 1922. The Labor Board has already abrogated most of the efficiency-destroying rules promulgated during the Railroad Administration and has removed the inhibition against piecework. Wages are being considered and will undoubtedly in the long run be adjusted to the level of those paid for similar work in adjoining territory, thus placing railroad shops on a more even basis with the contractors.

Difficulty in obtaining capital was one of the factors that retarded shop improvements in 1921. Now money is easier, net earnings are on the increase, and many railroads have already developed ambitious improvement programs. Eighty replies to a questionnaire recently sent out to Class I railroads showed that many individual shop and terminal projects, costing anywhere from \$200,000 to \$3,550,000, are contemplated. These projects each call for machine tools and shop equipment costing from \$20,000 to \$948,000, so it is plain that the majority of railroad men are awake to future needs, and improvement programs will be carried out in 1922 to an extent depending upon financial considerations and the rapidity with which business and traffic pick up.

No big shop construction programs were undertaken in 1921 and the general condition of the railroads as regards ability to maintain locomotives and cars in good repair and running condition is not better than it was a year ago. In fact, at many points the facilities for handling general and running repair work are naturally less effective than before because of depreciation and because the railroads have been unable, for financial reasons, to make needed replacements or additions and betterments.

It is true that there was little agitation for greater shop capacity during the past year because of the fact that the railroads were able to handle the reduced traffic with little or no difficulty. This does not prove that shop facilities are in any way adequate or up to the point which would be necessary to furnish power for even a normal traffic. One has but to visit any average shop and see the old, worn-out machinery and equipment which railroads are compelled to use through lack of funds, to be convinced of the imperative need not only of additional shops, but of more modern, productive machinery in those already built.

It is true that there was little agitation for greater shop capacity during the past year because of the fact that the railroads were able to handle the reduced traffic with little or no difficulty. This does not prove that shop facilities are in any way adequate or up to the point which would be necessary to furnish power for even a normal traffic. One has but to visit any average shop and see the old, worn-out machinery and equipment which railroads are compelled to use through lack of funds, to be convinced of the imperative need not only of additional shops, but of more modern, productive machinery in those already built.

No modern business would be able to meet a competitor's prices if it depended for production on machinery which had long since outlived its usefulness. Fifty years ago, for example, it was quite common to ornament the cross rail or housings of a planer with acorns or other artistic designs and yet these "acorn" planers are found all too frequently in railroad shops at the present time. The cost-

A QUESTIONNAIRE was recently sent to the Class I railroads; 80 replies received show that many individual shop and engine-house improvement projects, costing from \$200,000 to \$3,550,000, are contemplated.

Extensive lists of shop machinery and equipment are in the respective budgets and in some cases orders have already been placed against these lists.

The extent to which improvement programs are carried out in 1922 will depend upon how quickly business picks up.

liness of using antiquated machines has been pointed out times without number. No one acquainted with the facts will deny that many railroad shops were badly under-equipped as to modern machinery at the beginning of 1921 and that comparatively little was done during the year to relieve the situation.

Replies to the questionnaires indicated that in some cases 1921 programs, not fully carried out, will be completed in 1922. Certain railroads, for example, were unable to purchase necessary new boilers and air compressors for power houses and these will now be secured. It is also planned to install automatic stokers with a view to increasing power plant capacity and efficiency. Other roads reported that extensive programs of improvement are under way but not settled as to details. The questionnaires showed that railroads realize the necessity for greater shop and enginehouse facilities as a means of getting the maximum service from equipment and keeping the proper relation between rolling stock and shop capacity. The need for modernizing existing power was also strongly emphasized and it developed that modernizing programs are now being delayed for lack of shop facilities to carry them out. In view of the need for improvements in railroad shops and enginehouses and the reasonable ground for belief that at least some of these improvements are on the way, it will be interesting to note what is actually accomplished along this line in 1922.

Much Repair Work Done on Contract

One of the most noticeable developments in the past year was the increasing tendency to let out repair work to contractors and lease both shops and terminals to contractors or local companies organized for the purpose. In view of the importance of this step, it may be well to analyze the reasons for it and some of its advantages and disadvantages.

The contracting of repair work is by no means new and has been common to a greater or less extent on railroads for many years. It is only recently that objections to this practice have been taken by national labor leaders in an effort to discredit the managements in the eyes of the public by claiming that the real purpose was to disrupt labor organizations or secure graft. The railroads refused to be put on the defensive as to either of these two charges of which they must justly be considered innocent until proved guilty.

There are two sound reasons why it has been necessary for the railroads to have a considerable proportion of repair work, particularly on cars, done by outside contractors. The first of these reasons is lack of shop facilities to handle normal repair work and the second is the possibility of reduction in cost up to 25 per cent after allowing a reasonable profit for the contractor. Railroad men anticipated difficulty in handling traffic in the early months of 1921 due to a severe winter which did not develop and an increase of business which did not materialize. To insure that traffic would not be delayed it was felt that locomotives and cars should be placed in the best possible operating condition and inasmuch as existing railroad shops were not able to handle all this work, a great deal of it was given to contractors. Had the railroads foreseen the mild winter and rapid decrease in traffic it is probable that less repair work would have been contracted, but, as in many other cases, hindsight is always better than foresight. Had business returned to normal more quickly with the railroads unprepared to handle it, they would have been severely censured.

With present wages, and the working conditions in force up to December 1 in railroad shops, private contractors with plants in the same localities could handle repair work, pay the cost of moving equipment and needed material, add a profit of 10 per cent and yet repair the cars at approximately 25 per cent less than when the work was done in local shops. It is the duty of the management to operate the lines as efficiently and economically as possible and in ful-

filling this duty repair work must be done in a way which involves the least cost consistent with good quality of work. In line with this policy the railroads had no alternative but to give the work to outside contractors and this explains why so much car and locomotive maintenance work was contracted out in 1921.

The railroads were able to let contracts for car repair work to outside companies because there are many plants in the country equipped for the handling of this particular kind of work. These plants specialize in the building and repair of equipment and have both the facilities and organization to handle it efficiently. In maintaining locomotives on the contrary, except for the big locomotive builders, few shops are equipped with cranes and machinery for handling strictly locomotive repair work and the builders themselves, while physically equipped to handle the work, are more or less unfamiliar with the process of stripping and distributing locomotive parts to the various departments for repairs. In a test case, three or four locomotives were sent to each of three locomotive builders and it was maintained that they were repaired at a loss as contracted. There are a few small industrial locomotive repair shops in the country, but these are entirely inadequate in number and equipment to handle ordinary repair work.

Essential Reasons for Leased Shops

There are many reasons justifying the leasing of repair shops. In the first place, it is a question of relative costs, the advantage being in favor of the contractor or lessee who is not hampered by outside interference, settles local grievances quickly, pays prevailing rates of wages and increases production by installing piecework or some other method of paying men in proportion to output. Another fact to be considered is that an idle plant always deteriorates faster than one in operation which is properly cared for. It is therefore an advantage to have shops operated, even by outside parties, rather than to have them idle. In addition, the operation of these plants will keep repairmen of ability in the locality available for use when the shops are again operated by the railroads. It is estimated that 60 per cent of the men will thus be available for re-employment. In most cases the shops are leased under contracts terminable on comparatively short notice and the idea is that when the Labor Board removes the handicaps formerly placed on shop managements and adjusts wages to the level paid in other industries the railroads will again be able to take over their own plants and secure economical operation.

Piecework and Shop Production

There must be an entire reversal of attitude on the part of many railroad shop employees regarding production and what constitutes a fair day's work if this tendency to contract repair work and lease shops is to be overcome. It is obvious that where costly rules and disproportionate wages are responsible for turning repair work over to contractors the rules must be changed and wages adjusted. Otherwise repair work will never be brought back to the railroad shops where it belongs. Under recent rulings of the Labor Board most of the objectionable rules have been changed, wage adjustments are being considered and it is therefore up to the shop workers to decide whether or not they will increase their efficiency to a point equal to or greater than that of workers for private contractors.

It is an unfortunate fact that every industrial organization harbors at least a few men who are determined to do as little as possible for the individual or company employing them. The only method to handle these men is to pay them in proportion to their output by the installation of piecework or some such wage payment system based on individual effort. Piecework systems have been used in practically all branches of repair shop work and have been

satisfactory to the majority of workers by affording increased pay, and to the railroads by increasing shop output. Many of the contractors have used the old piecework rates developed on the railroads and in certain cases railroad shops have reopened because of the piecework method of payment being adopted by a majority of the men. It seems probable that one answer to the present railroad shop problem to be worked out during 1922 will be the further and more general use of piecework systems.

A Good Time to Install Shop Schedules

The reasons why the expression "shop schedule" is synonymous with orderly work and good production have been explained many times in these columns and are well-known to railroad men. During the year, labor problems received almost the exclusive attention of mechanical department officers and the use of shop schedules or routing systems was not extended to any considerable number of shops. In fact, owing to the decreased need of maximum shop output, scheduling as a means to this end was not as necessary as formerly. It is safe to say that the time will come, however, when shops will again be taxed to their capacity and this time may be sooner than some expect. The present affords a splendid opportunity to develop shop scheduling systems in those shops not already benefiting by their operation. The result will be that work will be arranged in the order of its importance, detail repair parts kept moving and finished in time for assembly, material ordered in advance to be on hand when necessary, and locomotives and cars turned out in a minimum length of time with a resultant desirable effect on railroad earnings.

Engine Terminal Developments and Needs

Owing to reduced traffic during 1921, there was not the usual incentive to provide greater terminal facilities and increase the efficiency of terminal operations. Additions and improvements to existing terminals were made, in many cases, however, and several new terminals, built by the contractors, are now ready to be turned over to the railroads for operation.

It is interesting to note the greater attention being given to the machine tool equipment of enginehouses, and in spite of the difficulty in getting appropriations many antiquated machines have been replaced by new ones. This practice is in line with sound business policy because any expenditure which will speed up the handling of locomotives at terminals will show immediately in increased revenue tonnage movement per locomotive.

The old idea that any machine that will run is good enough for a roundhouse has long since been out of date and railroad men are coming to see that not only should roundhouses be equipped with modern productive tools, but these tools should be of sufficient number and capacity to handle heavy running repairs. With a roundhouse under-equipped, this work must be handled at the back shop where its injection into general repair work always results in a disorganized schedule and decreased production.

Cranes and Material Handling Devices

The range of work handled at big terminals varies almost as much in kind and quantity as that handled at back shops and many mechanical hoists have been installed for the handling of heavy locomotive parts. The modern tendency in every industry is to reduce the manual labor involved in handling either finished parts or raw material and in line with this policy is the growing feeling that terminals and large roundhouses should be equipped with traveling cranes, of probably not less than 15 tons capacity, to handle any locomotive part except the boiler. These cranes have already been installed at some terminals with good results.

Existing roundhouses could not be equipped with travel-

ing cranes without being practically redesigned, including in most cases strengthening the walls, and the result is that the cost probably would not warrant the installation of traveling cranes except in new, large roundhouses where much heavy running repair work is to be handled. The proper location of jib cranes, however, will do much to facilitate the handling of heavy parts and these cranes can be installed at a nominal cost.

Power-operated trucks are coming into much more common use not only in shops but roundhouses and there are many ways in which these trucks prove of value. They are used not only for the transportation of material either directly or on trailers, and with a great saving in labor, but often they can be jockeyed into position and used to push or pull heavy wheels and other parts which would require the efforts of several laborers to move. The power-operated truck, equipped with a swinging crane is particularly valuable in shops or roundhouses and saves many hard lifts.

Ash Pits and Coaling Stations

The problem of coaling locomotives and handling ashes is ever present at terminals where coal-burning locomotives are turned. While many of the smaller terminals especially are required to handle ashes, either in part or in whole by hand shoveling, this costly work is being eliminated as fast as appropriations can be obtained to finance improvements. Gantry cranes and grab buckets have demonstrated their superiority for performing this work and no modern terminal, turning any considerable number of locomotives, can be operated without these facilities. At many small terminals the installation of mono-rail pneumatic hoists and buckets has helped to relieve the situation.

It is essential that all coal and ash handling equipment be periodically inspected and kept in good repair so that locomotive delays due to break-downs may be avoided. The result, for example, when the hoisting machinery in a coaling plant goes out of commission, can well be imagined. Coal cars are brought up, either a crane or hand shovelers hunted up and, in spite of the most strenuous efforts, locomotives are usually delayed and trains tied up.

Enginehouse Personnel Most Important

As with other departments of railroading and all branches of industry, the human element is most important. Even with a modern plant and the best machinery and equipment that money can buy, no terminal can be operated efficiently or satisfactorily with incapable or discontented men. This attitude of the men is so largely dependent upon the character and ability of their immediate supervisory officers that the utmost care should be taken to develop and select able men for these positions. To their great credit be it said that many roundhouse foremen, while modestly and effectively performing daily duties during the past year were able to inspire their men with respect and confidence and never experienced difficulty in getting workmen to undertake tasks which they could legally have refused to do owing to technical rules. It was a case of leading and not driving, coupled with fairness in all relations between foremen and men.

One reason why certain terminals are more efficiently operated than others is because their foremen and supervising officers have recognized the need of trained forces, each workman being instructed in his particular task until he fully understands what should be done and knows how to do it. Responsibility for inspection and repair is fixed and this insures that locomotives have the proper, careful attention each time they come to the terminals. Defects are thus discovered in time before serious wear or accident has occurred. It is not maintained that all terminals, or even 25 per cent of them, are operated in this manner, but the few that are demonstrate the possibilities and present an example which can well be followed by others.

Chronological Review

A Resumé of the Outstanding Events of the Twelve Months,
Arranged for Ready Reference

By J. E. Cole

THE PAST YEAR has been marked by a constant effort for readjustment of railroad conditions by railway officers, the state and national commissions, the shippers and the general public. The railroad problem has, as never before, become the people's problem. But despite the widespread publicity given to railway conditions, the progress toward readjustment has been slow. The roads have experienced a year of decreased business, with the costs of materials and wages decreasing relatively little, while they have been fettered by prolonged investigations and hearings on rates and wages. However, the roads have demonstrated the economic advantages of private operation by the increased efficiency of operation and economy of management which they have been able to effect and they have come forward with a number of voluntary rate reductions which are in effect as the year closes. With these conditions in mind, the following list of the outstanding developments and decisions of the year has been compiled:

JANUARY

- January 1, 1921.—Section 10 of the Clayton act regulating dealings in railroad securities and supplies between companies having "interlocking relationship" became effective.
- January 5.—Hearings on the Frelinghuysen bill offered as a substitute for Section 10 of the Clayton act began before a sub-committee of the Senate Committee on Interstate Commerce.
- January 6.—Winslow bill introduced in Congress to provide for partial payments to railroads for deficits incurred during the guarantee period.
- January 6.—Interstate Commerce Commission announced that a formal investigation would be made of the charges made by representatives of railroad labor organizations that certain railroads were paying excessive prices for the repair of cars and locomotives.
- January 10.—Hearings on national agreements and working conditions began before Labor Board.
- January 28.—Interstate Commerce Commission rendered decision making interstate rates effective in Illinois for intrastate rates.
- January 28.—Atlanta, Birmingham & Atlantic petitioned Labor Board for authority to reduce wages.
- January 31.—Labor committee of the Association of Railway Executives suggested to Labor Board that it set aside at once all rules and working conditions imposed since December 31, 1917.
- January 31.—Winslow bill reported favorably to the Senate by the Senate Committee on Interstate Commerce

LABOR BOARD in almost continuous session on adjustment of wages and working conditions.

Congress gave much attention to railway problem.

Numerous reductions in rates put into effect late in year.

Labor difficulties culminated in threatened strike which was called off at the last minute.

FEBRUARY

- February 6.—President Wilson declined railroad employees' request that he interfere in the controversy over the abrogation of the national agreements.
- February 8.—Winslow bill passed by House.
- February 14.—Labor Board directed Erie to rescind wage cut and ruled that no change in wages or working conditions was to be made except by agreement between the parties, until the dispute was heard and opportunity given for the Board to pass upon it.
- February 17.—Labor Board rendered decision setting forth procedure to be followed in handling matters over which it has jurisdiction.
- February 21.—Labor Board remanded wage reduction disputes of the Atlanta, Birmingham & Atlantic and the Missouri & North Arkansas to parties involved.
- February 22.—Winslow bill passed by Senate.
- February 22.—Milton H. Smith president of the Louisville & Nashville, died at Louisville, Ky.
- February 25.—Atlanta, Birmingham & Atlantic thrown into receivership and B. L. Bugg, president of the road, appointed receiver.
- February 26.—President Wilson signed Winslow bill.
- February 27.—Missouri & North Arkansas employees struck following a reduction of wages by the receiver of the road.
- February 27.—New York Central-Michigan Central wreck at Porter, Ind.—37 killed.
- February 28.—Forty-two state commissions filed briefs with Supreme Court denying power of the Interstate Commerce Commission to fix intrastate rates.

MARCH

- March 3.—Treasury department made first payments under Winslow bill.
- March 4.—Labor committee of the Association of Railway Executives abolished, following decision that individual roads would henceforth handle labor questions directly with the employees.
- March 4.—John Barton Payne retired as Secretary of the Interior and Director General of Railroads.
- March 5.—Atlanta, Birmingham & Atlantic employees struck following wage reductions. Road came before Labor Board to justify reduction in wages.

March 14.—Railway executives summoned by Labor Board as witnesses in hearing on abrogation of national agreements.

March 15.—National Industrial Traffic League filed petition with Labor Board for a hearing in national agreements controversy.

March 15.—Hearings of the New England governors' committee started inquiring into the railroad situation.

March 17.—Wible L. Mapother elected president of the Louisville & Nashville.

March 19.—Chicago & North Western grain elevator at Chicago destroyed by dust explosion. Six people killed and loss estimated at \$4,000,000.

March 24.—President called conference with the chairman of the Interstate Commerce Commission and the chairman of the Labor Board on the wage and rate situation.

March 25.—Missouri & North Arkansas suspended operation.

March 25.—John J. Esch appointed recess member of the Interstate Commerce Commission.

March 25.—S. Davies Warfield filed a plan of railroad administration with Senate Committee on Interstate Commerce in behalf of the National Association of Owners of Railroad Securities.

March 26.—President Harding appointed James C. Davis director general of railroads.

March 29.—Labor Board denied petition of the National Industrial Traffic League for hearing in national agreements controversy.

APRIL

April 4.—National Association of Owners of Railroad Securities met with representatives of "Big Four" brotherhoods to discuss railroad situation.

April 4.—Final valuations served on the Kansas City Southern, the Los Angeles & Salt Lake, the Atlanta, Birmingham & Atlantic and the Winston-Salem Southbound.

April 12.—President Harding, before Congress, declared railway rates and the cost of operation must be reduced.

April 12.—Senator Cummins introduced resolution in Senate providing for investigation of railroad situation.

April 14.—Labor Board ruled national agreements were to end on July 1.

April 19.—Senate ordered investigation of railroad situation by the Senate Committee on Interstate Commerce.

April 19.—Joseph H. Young elected president of the Denver & Rio Grande Western.

April 21.—Labor Board ruled Atlanta, Birmingham & Atlantic wage cut was illegal.

April 25.—Senate confirmed appointment of B. W. Hooper, S. Higgins and W. L. McMenimen, as members of the Railroad Labor Board to succeed H. W. Hunt, W. L. Park and J. J. Forrester, respectively.

April 28.—Railroad employees began fight against the wage reductions asked for by the railroads.

April 29.—Governor's committee opposed rate raise in New England.

MAY

May 3.—Senate confirmed appointments of E. I. Lewis and J. B. Campbell to Interstate Commerce Commission.

May 7.—Railroads completed plea for first wage reduction before Labor Board.

May 10.—Senate committee began investigation of railroad situation.

May 12.—George R. Loyall elected president of the Norfolk Southern.

May 16.—Seasonal coal rate bill reported favorably by Senate committee on Interstate Commerce.

May 18.—Franklin K. Lane, former member of the Interstate Commerce Commission, died at Rochester, Minn.

May 22.—Edward L. Brown, formerly president of the Minneapolis & St. Louis, and the Denver & Rio Grande, died at St. Paul, Minn.

May 25.—Union Pacific acquired full control of Los Angeles & Salt Lake by purchase of holdings of Senator W. A. Clark and friends.

May 25.—Henry B. Ledyard, chairman of the board of directors and former president of the Michigan Central, died at Detroit, Mich.

JUNE

June 1.—Labor Board ordered wage reduction approximating 12 per cent, effective on July 1, in order No. 147.

June 3.—Pueblo, Colo., flood caused \$5,000,000 damage to railroads.

June 6.—National Association of Owners of Railroad Securities appointed committee to study railroad problems.

June 6.—Carriers asked Labor Board to reduce wages to the rates existing prior to Decision No. 2 of the Labor Board.

June 17.—Labor Board decided against Pullman Company which sought to bring a plea for wage reductions before Board. Ordered to go to employees and then to Board.

June 18.—Edgar E. Clark, re-elected chairman of the Interstate Commerce Commission.

June 27.—Labor Board extended scope of wage reductions, adding 92 carriers and one labor organization as parties to wage reduction order Decision No. 147.

June 28.—Labor Board continued national agreements until such time as rules are considered and decided by the Labor Board.

JULY

July 1.—Wage reductions totaling 12 per cent of pay roll became effective.

July 1.—Numerous changes in car service rules became effective.

July 1.—New classifications of railroad employees were made effective.

July 3.—John Findley Wallace, consulting engineer and chairman of the Chicago Railway Terminal Commission, died at Washington, D. C.

July 8.—Charles A. Prouty, director of valuation and former member of the Interstate Commerce Commission, died at Newport, Vt.

July 14.—Representatives of Pennsylvania Railroad appeared before Labor Board defending employee representation plan of the company.

July 16.—Charles F. Staples appointed acting director of valuation of the Interstate Commerce Commission.

July 22.—Railroad settlement plan providing for the

funding of the debt of the railroads to the Railroad Administration, announced by the President.

July 22.—Edgar E. Clark resigned as a member and chairman of the Interstate Commerce Commission. Frederick I. Cox succeeded Mr. Clark as a member of the commission.

July 28.—Interstate Commerce Commission declined to fix New England rate divisions.

AUGUST

August 1.—Reorganization of Car Service Commission of the American Railway Association became effective.

August 1.—Labor Board ordered new election of representatives of employees on the Pennsylvania to negotiate new rules and working conditions.

August 1.—U. S. Chamber of Commerce appointed two committees to deal with transportation.

August 6.—Interstate Commerce Commission prescribed method for fixing operating expenses for maintenance during the guarantee period.

August 9.—Hearings began before Senate Committee on the Townsend bill which would allow War Finance Corporation to purchase obligations of the carriers.

August 11.—Roads refused "Big Four" brotherhood's demand that wages be restored to the level of June 30.

August 15.—Interstate Commerce Commission decided that freight rates on live stock should be reduced in western territory.

August 16.—Overtime controversy settled by Labor Board with compromise decision containing seven new rules to govern punitive payments.

August 22.—Epes Randolph, president of the Southern Pacific of Mexico and the Arizona Eastern, died at Tucson, Ariz.

August 22.—House passed railroad funding bill.

August 24.—Pennsylvania Railroad denied right of Labor Board to regulate working conditions.

SEPTEMBER

September 12.—Sale of equipment trust certificates by the director general of railroads started.

September 24.—Labor Board defined its powers and legal status.

September 25.—H. P. Titcomb elected president of Southern Pacific of Mexico and the Arizona Eastern succeeding Epes Randolph, deceased.

September 28.—Interstate Commerce Commission presented tentative consolidation plan, proposing 19 competing systems.

OCTOBER

October 3.—Charles C. McChord elected chairman of the Interstate Commerce Commission.

October 11.—Unemployment conference urged railway rate revision.

October 11.—State commissioners at Atlanta, Ga., debated federal vs. state regulatory powers.

October 13.—Labor Board lifted piece-work ban.

October 14.—Association of Railway Executives decided to ask Labor Board for further wage reductions.

October 15.—Labor leaders called strike of train service employees for October 30.

October 15.—President conferred with public group of the Labor Board on strike situation.

October 22.—Trainmen of the International & Great Northern struck as "opening gun" despite instructions of Labor Board to await decision of October 26 conference.

October 22.—Interstate Commerce Commission ordered western grain and hay rates reduced.

October 26.—Labor Board held inquiry on the threatened strike.

October 27.—Threatened strike called off.

NOVEMBER

November 1.—Nation-wide "Perfect Package Month" campaign opened.

November 1.—Labor Board recognized "ability to pay" as "secondary" factor in fixing wages in determining wage scales.

November 3.—Erie freight piers at Weehawken, N. J., destroyed by fire with loss of \$2,000,000.

November 14.—Hearings on Capper bill which proposes amendment of Transportation Act began by Senate Committee.

November 16.—Association of Railway Executives passed a resolution providing for a petition to be filed with the Interstate Commerce Commission asking that the Commission announce its rate policy, and announcing a 10 per cent reduction in rates on all agricultural products which it was expected would be substituted for the reduction in western rates on grain and hay.

November 23.—Interstate Commerce Commission ordered general rate inquiry.

November 29.—Labor Board announced complete new rules to supersede the provisions of the Shop Craft's National Agreement, to be made effective December 1.

DECEMBER

December 1.—United States Shipping Board asked railroads to abrogate the foreign shipping line contracts at hearing before committee of that body.

December 5.—Arguments started before the United States Supreme Court on the bill filed by the state of Texas attacking the constitutionality of the Transportation Act.

December 5.—Collision on the Newton branch of the Philadelphia & Reading, at Bryn Athyn, Pa.—25 persons killed, 20 injured.

December 14.—Interstate Commerce Commission began general rate investigation, to determine whether and to what extent further rate reductions are justified.

December 14.—Labor Board announced new code of working rules for maintenance-of-way employees, providing that punitive overtime be allowed after ten hours instead of eight.

December 19.—Labor Board opened hearing on the right of the railroads to contract locomotive and car repair and maintenance of way work.

The Canadian Railways Are in a Bad Way

Public Is Awakening to Seriousness of the Situation, but No Solution Seems to Be in Sight

By J. L. Payne

FROM THE BEGINNING of 1914 to the end of 1919, the railways of Canada had a trying experience. In 1920 conditions grew worse. Bad, however, as things were during the years of the war, and acute as they became in 1920, they were still worse in 1921. They might be said to have passed during the past seven years from the positive to the comparative, and then to the superlative degree.

In all this one sees the close parallel between operating results on both sides of the line. While this has always been true in a measure, it has been peculiarly true during recent years, for a specific reason. The fundamental causes of trouble have come to be more and more identical. Washington and Ottawa have drawn closer together in regulative policy; so that if there had been no international boundary during the past ten years it would not have mattered seriously whether the railways of Canada and the United States had been controlled by either the Interstate Commerce Commission or the Board of Railway Commissioners at Ottawa. If these tribunals had agreed upon a plan of co-operation or joint action, they could scarcely have concurred more closely in their rulings and general scheme of administration, broadly of course that in all essential respects the general conditions of operation, as governed by state regulation, have been the same on both sides of the line.

No International Boundary for Brotherhoods

This coincidence as to regulative policy took very positive shape in 1918. When the McAdoo award was given in that

year it became as immediately effective in Canada as it did in the United States, barring only the national agreements. They could not specifically apply to Canada because of the nature of the agreements themselves; but Canadian railways were at once affected by many of their baneful features. The same thing occurred in 1920 when the Chicago award was given. The railways of Canada were as directly bound by the judgment of a foreign tribunal as if that tribunal had positive jurisdiction in the Dominion; and it is a strange thing the question of national solidarity was not raised. It was not, for the sufficient reason that it would have been futile. The National Railways Labor Board could not legislate for Canada any more than could Congress; but the brotherhoods could.

The international scope of the railway labor organizations explains the whole thing. The tightening troubles of the railways grew out of rising operating cost, and rising operating cost grew very distinctly out of the swollen payroll. The brotherhoods had no international boundary. What they gained in the United States was passed on to Canada. And this situation persists. The forces of labor have no flag. They

fight under a common banner.

Worst Year in Canadian Railway History

Let it be repeated, so as to return to the primary theme, that 1921 was the worst year in Canadian railway history. The situation in the first three months of the year had in it all the possibilities of general bankruptcy. In January the ratio of operating expenses to gross earnings was over 108

THE YEAR 1921 was the worst one in Canadian railway history. Labor situation and operating results have closely paralleled those in United States.

Increases in net have been made at the expense of maintenance; this is piling up and, of course, must be made up in the future. Labor demands arouse the public. A rate cut was made in November.

Will the Canadian Pacific be forced to take over the national group?

It might be said,

per cent for all the railways of Canada as a group. This meant that, while strong roads, like the Canadian Pacific and four or five others, were holding their heads above water, the government system was floundering under an adverse ratio of 125 per cent. But there was this vital difference. The state system had the treasury of the Dominion to fall back upon, and represented over 52 per cent of the total operating mileage of the country.

Obviously this could not long endure. Traffic was slumping month after month. Relief from burdensome operating cost was not in sight. Deflation was under way in all the countries of the world, causing trade to shrink alarmingly; and traffic and trade are always interchangeable terms. If the headlong plunge toward insolvency was to be arrested the initiative must come from within rather than from without. The logical remedy would have been to increase the earning power of the railways; but it was felt that would be a most unpopular move, and a doubtful expedient too. Past a certain point you cannot go in the matter of tolls, without defeating the end in view. The people of North America had become accustomed to the lowest freight rates in the world, and were fretting under the increases which had been imposed as a means of offsetting the additions made to operating cost. That these increases had not been sufficient was ignored by the public. It was believed the new rates were cramping business, and probably they were. So the railways resolved to save themselves by heroic and intensive, albeit not wholly sound, measures of retrenchment.

"Life or Death?"

In April began a slashing of expenses which has had no precedent in Canadian railroading. Maintenance was cut to a point hitherto regarded as inexpedient and unsafe. Train mileage was reduced in every possible direction. Men were let go from every department by the thousands. Then in July came the cut of 12 per cent in wages, and in September the movement of a bountiful harvest once more brought traffic to a temporarily buoyant state. While gross earnings steadily declined from the 1920 level, net earnings rose as the result of lowered operating expenses.

It is possible that unthinking and uninformed onlookers were deceived by this betterment on the side of net earnings; but not so the railways. They knew full well that such results had been won by methods both temporary and unsound. They did not delude themselves with the notion that maintenance could be cut without carrying with it the necessity of restoring to the property the money thus withheld; so that what was saved today would be lost tomorrow. Yet necessity is a cruel master. They had to do it. It was the only way of meeting an emergency which had in it the elements of life or death. Just how the experiment will turn out in the long run is in the lap of the gods; but those who are open-eyed and conservative are apprehensive about the results.

Official statistics for the full year are not available. The monthly reports at this time of writing come down to the end of August. For that period the gross earnings of Class I roads had an aggregate of \$277,478,122, as compared with \$282,841,087 for the corresponding eight months of 1920. Operating expenses, on the other hand, totalled \$268,266,928, as against \$285,592,109 for the preceding year. Thus, while income declined by 1.9 per cent, outgo shrank by 6.1 per cent. That tells the story of economy; and those who are familiar with the general situation in North America will see how closely this result corresponds with what happened coincidentally in the United States, and by precisely the same means. Collateral to the foregoing figures is the fact that ton-miles decreased from 18,855,679,998 to 14,739,895,867, or by 16.6 per cent.

This enforced policy of retrenchment struck directly at the payroll, which was the controlling factor in operating

expenses. This will be seen by a comparison of the wages bill by months:

	1920	1921
January	\$19,378,812	\$21,960,258
February	19,525,340	19,923,386
March	20,808,205	20,327,326
April	20,097,354	18,989,580
May	23,076,014	19,415,027
June	24,578,970	20,220,220
July	25,500,767	20,155,796
August	25,430,331	20,312,321

It will be observed that, while for the first three months of the year the increase over 1920 amounted to \$2,498,613, the decrease for the succeeding five months reached \$19,580,092. During this latter term there had been a cut of nearly 16.5 per cent, which will be conceded to have been drastic. And this occurred with only slight relief from the decision of the Labor Board, which was not made effective in Canada until toward the end of July. It was simply the result of reducing the maintenance and operating staffs to the lowest possible point under the pressure of circumstances.

Public Becomes Aroused

The tribulations of the railways were not, however, without some measure of compensation. They aroused public interest in the situation. People began to inquire why the railways were in such a desperate plight. About that time the long drawn-out hearing before the Labor Board in Chicago caught general attention. The press, for the first time, took up the matter, and, from the publication of the news dispatches, went on to editorial criticisms. This was all novel, and, stranger still, the comments were favorable to the railway side. Men of affairs were impressed by the facts, as disclosing the pinch of labor cost on the agencies of transportation. The greedy grip of the brotherhoods was recognized in the adversities of the railways. Everybody saw clearly the relationship between cause and effect. Obviously, the railways could not hold their own while operating expenses had been raised far beyond the earning power involved in higher rates. The question was too simple to admit of any other than one conclusion.

Back of this attitude on the part of the public was a wholly selfish consideration, as natural as it was logical. High tolls were positively unpopular. Everybody wanted them reduced; yet everybody realized that they could not be reduced, except at the expense of ruining the railways, while wages remained high. Under normal circumstances, actuated by a standing grudge against the transportation corporations, their sympathies would have been with the workers. It was something new, therefore, both to the railways and to the employees, to find public sentiment take this swing, and probably as surprising to one as to the other. The press, without an exception, voiced this disposition of the people. The wages problem came in for nearly as much consideration as did politics, and for the first time in more than half a century the cause of the railways did not lack for valiant champions. The papers teemed with examples of the scales of pay awarded to railway employees.

It would be pertinent at this juncture to tell succinctly what happened in Canada when the Labor Board ordered a 12 per cent cut in wages. It has already been made clear that when the McAdoo and the Chicago awards were given, the question of jurisdiction was not raised on the Canadian side of the line. Instead, instant effect was given to these judgments. When, however, the Labor Board gave a decision in May last adverse to labor, the Canadian unions at once fell back on their geographical position. They refused to recognize the jurisdiction of a foreign tribunal, and appealed for a board of arbitration under the Industrial Disputes Act. They got it. Meanwhile, however, the railways had given effect to the cut. And then, just as the arbitration proceedings had got well under way, the threat to strike in the United States was announced. Public feeling burst out afresh against the unions, and, when the strike order had

been withdrawn across the boundary, the struggle in Canada came to an abrupt termination with a verdict adverse to the appellants.

Rates Reduced 10 Per Cent

With the reduced wages scale in effect there has ensued an insistent demand for the lowering of freight tolls. Press and public are as united in this action as they were in opposing the demands of labor. There are not, however, the old allegations of greed, nor is there in this appeal the former spirit of cold hostility. The demand is based on public interests. Deflated freight rates are said to be as urgently needed for the revival of trade as are deflated prices in general, and the railways are being asked to take their share of the common losses incident to readjustment. The matter came to a focus about the middle of November, when the Railway Commission ordered a reduction in both freight and sleeping car tolls, the effect of which will work out at 10 per cent all round. In their efforts to meet this cut, which will involve a loss in revenues of something over \$40,000,000, the railways may have a hard time of it. They are not yet out of the woods. Far from it. At no later date than the early spring can they hold off on making up for the autumn skimp in maintenance. Meanwhile, a revival of traffic has not begun.

In this connection, a grave question is slowly but surely pushing its way to the front. Whence will the railways obtain capital for needed extensions and betterments? In view of the immediate situation as to net earnings, investors will be apt to be shy. With high class bonds selling at from six to eight per cent, the railways have very little chance to get in at lower rates. And it must be remembered that, so far as Canadian roads are concerned, 75 per cent of their financing was done at rates of five per cent and under. The matter has not been looked into for the purposes of this article; but it is definitely known that a considerable volume of liability will soon mature. To increase fixed charges will inevitably intensify the problem of making both ends meet, already acute. This is an aspect to which the onlooking public gives little or no consideration; but it is nevertheless very real and very serious. It applies to all those units within the national system whose liabilities were assumed by government as well as to corporate roads.

Enormous Deficit of Government Railways

This reference to the nationalized group brings to mind two significant happenings of the year. In the first place, the Grand Trunk was formally added to the state group on a basis, decreed by the arbitrators, which cuts the stockholders off without compensation. This has been all the more astounding because of the treatment accorded in 1918 to the Canadian Northern, which certainly was in a vastly worse position than was the Grand Trunk. The national system is now complete, and there is no indication that any further additions will be made. In the next place, a general election was announced in October, with polling fixed for December 6, and the campaign at this moment under way has, for the first time, brought the railway policy of government up for public discussion. The only constructive feature developed has been the stand of the Liberal party, led by Hon. Rodolphe Lemieux—who was prominent in the Quebec representation in the Laurier administration of 1896-1911—in favor of the plan of Lord Shaughnessy. That plan contemplates the taking over of the national system by the Canadian Pacific, but the time is not ripe for fair and unprejudiced consideration of such a measure. On the other hand alarm is freely expressed at the enormous annual deficit which attaches to the government group. Yet all this discussion is more academic than practical; for the Canadian National Railways, for good or ill, is an accomplished fact, and nothing that can be said at this stage will to the slightest degree alter it.

At the commencement of the campaign, Sir Joseph Flavelle issued a statement which put the case fairly before the people. He intimated that the deficit for the current year would probably be \$67,000,000, and that there was no hope for any more than a gradual reduction of that loss as time proceeded. Everything would depend on circumstances, with the settlement of the North West as a prime factor. Nevertheless, to everybody's surprise, Sir Joseph's announcement had scarcely been given out than the Canadian National reported an operating surplus of \$40,000 for August, and, a month later, a credit balance of \$500,000 for September. While this is purely a bookkeeping showing, and has not aroused any genuine hope, it should be explained that the Canadian National moved a much higher proportion of the western crop this year than it did last. This was the result of sustained propaganda in behalf of the government system, the basis of which was that the people should support their own road in the interest of their own pocket.

The situation has not been vitally altered as to the Canadian National. When the account in full has been made up for the year, it will be found that any temporary benefits realized by a spurt in traffic, and helped out by a favorable monthly pro-rating of expenses, will be wholly offset by the increase in fixed charges arising out of larger capital liability. It would not, in fact, be at all surprising if, when sound accounting has been applied to the system—which, by the way, has been wholly lacking in the past—the shortage for 1921 should exceed \$120,000,000. It might be nominally put down at somewhere around \$70,000,000; but that would leave out of the calculation a very large amount of fixed charges which, while hitherto ignored, are nevertheless just as genuine as those which are recognized.

Summing Up

Summing up the facts for the year in relation to all railways, it might be said that gross earnings will probably run slightly ahead of those of 1920, while operating expenses will show a decrease. Freight tonnage will reveal a considerable slump; but, on the other hand, passenger traffic may go beyond that of last year. There has not been any addition to operating mileage; for while there has been some construction in the west, there has at the same time been a reduction of parallel mileage on the government units. Substantial additions to equipment have been made, most of them from domestic sources of supply and for the Canadian National, which had been shockingly short. In one way and another, probably \$100,000,000 has been added to capital on the government lines. In the labor field the horizon for the time being is clear, although the Canadian roads will be impelled by their urgent needs to follow suit in whatever may be done by the American roads. In short, the year 1922 will open with intense anxiety on the part of all the railways of the Dominion.

A Typical Swiss Railway Station

Saddle Mountain, Monterey, Mexico.

Mexico Makes Progress in Railway Rehabilitation

Traffic Arrangements with United States Lines Restored—Large Additions to Motive Power

THE PROGRESS towards rehabilitation which characterized 1921 in the railway situation in Mexico approaches the remarkable. It is in sharp contrast with what took place on the railway lines of almost every other country. Suggestions that the railway situation in Mexico was showing considerable improvement were in evidence prior to the beginning of the year. The steps of real importance, insofar as concerns the relations between Mexico and the United States, took place in 1921.

The beginning of the year was signalized by the restoration, effective January 1, of the A. R. A. per diem rules and the resumption of interchange with the United States carriers. For a period there was considerable congestion at the border points. In February, however, Francisco Perez, then director-general of the Mexican railways, arranged for the loan of a considerable number of locomotives. He secured ten from the St. Louis Southwestern, nine from the Illinois Central, eight from the Missouri, Kansas & Texas, three from the Gulf Coast Lines and a number from the International & Great Northern. He also similarly secured 200 tank cars. The Mexican motive power situation was bad. Mr. Perez said at the time that there were 581 locomotives in service and 161 awaiting repairs. He also said that there were 13,262 cars in service as compared with 22,000 before the revolution. The borrowed locomotives and others, leased or purchased, promptly enabled the Mexican lines to make a better attempt to move their traffic and the congestion was greatly relieved.

Not satisfied with this alone, the National Railways shortly after placed sizeable orders for new locomotives. The orders for the year included 35 Mikado, 20 Pacific, 40 Con-

solidation and 22 narrow gage locomotives ordered from the Baldwin Locomotive Works and 20 heavy Consolidation and seven heavy Mikado locomotives ordered from the American Locomotive Company. The importance of the order is contained not only in the fact that it represented a restoration of Mexican purchases after a lapse of several years; it also represented the largest order for locomotives placed by any system in North America during 1920.

PER DIEM and interchange relations with United States lines have been restored, and traffic congestion at the border has been relieved.

The National Railways of Mexico placed the largest orders for new locomotives in 1921 of any system in North America. They built 102 miles of new line.

Officers of connecting roads in the United States express optimistic views regarding their relations with Mexican lines.

W. M. Whinton, assistant chief operating officer of the Missouri, Kansas & Texas, in an article in the *Railway Age* of January 7, 1920, entitled "The Present Railway Condition in Mexico," said, "As I view the situation, the crying need of the Mexican railways is capital for the rehabilitation of the rolling stock and motive power and the expansion of facilities in order to take care of what must necessarily follow a stable government—an increased volume of traffic." Mr. Whinton's statement points out the importance of the motive power situation. The placing of the orders for nearly 150 new locomotives shows, therefore, the courage with which the matter has been approached.

Another interesting factor during the year is shown in the construction of new lines. The National Railways of Mexico in 1921 built 102 miles of new line, as follows: From Llano Grande to El Salto, in the state of Durango, 24 miles; from Los Bancos to Cerro de la Cruz, also in Durango, 17 miles; from Zaragoza to Santo Tomas, in Coahuila, 32 miles, and from La Vibora to El Oro, also in Coahuila, 30 miles. There are also two lines under construction in Coahuila, from El Oro to Sierra Mojada, 9 miles, and from Santo Tomas to Villa Acuña, 28 miles. A line is projected and is

now being surveyed from El Salto to Mazatlan, 165 miles.

One of the several unusual methods of operation developed to meet the conditions of revolution and its aftermath was a scheme whereby private companies contracted to move freight in their own trains. The rate was 50 per cent above the regular rate and the contractors did a thriving business. With the restoration of the Mexican railway management, this idea was finally superseded by more ordinary methods of operation.

Relations With U. S. Lines

The Mexican railway situation is extremely interesting of itself. The American railway man will find even a more interesting aspect of the matter in the relationships between his own lines and the Mexican lines. With that idea in mind, the *Railway Age* has communicated with a number of the executives whose lines are handling Mexican business. It has received replies from J. S. Pyeatt, president of the Gulf Coast Lines; Thornwell Fay, executive officer for the receiver of the International & Great Northern and from H. B. Titcomb, president of the Southern Pacific of Mexico. Their communications are given below. The impression conveyed by them is most optimistic.

"The congestion of freight, and limited passenger service, which resulted from the destruction and disabling of locomotives and equipment during the revolution has now disappeared," says Mr. Pyeatt. He also says, "We operate through sleeping parlor and dining cars to Monterey, Tampico and Mexico City and the service, with few exceptions, is operated on schedule and I understand is quite satisfactory to the traveling public."

"There has been, since the early part of this year, a remarkable improvement in the operation of the National Railways of Mexico," says Mr. Fay. "They are giving most expeditious movement now to all traffic which is delivered to them." Mr. Fay comments, however, on the decreased volume of traffic. The International & Great Northern, he notes, has for some time been operating through sleeping cars from San Antonio to the city of Mexico. One of his most interesting comments is a statement concerning the main line between Nuevo Laredo and the city of Mexico. "The physical condition of this line," he says, "being as good as almost any road in the United States."

Mr. Titcomb's remarks relate to conditions in Mexico in general and outside of the railway situation. He has some interesting comments on the possibility of constructing a line of railway from La Quemada to Tepic which has been in contemplation for some time.

The letters follow:

Observations On a Trip in Mexico

By H. B. Titcomb

President, Southern Pacific of Mexico

We traveled over the National Railways of Mexico, from Nuevo Laredo, through Monterey and Victoria, to Tampico. The great steel mills at Monterey were active, and there is a considerable output of rail shipped from this plant.

At Tampico there was considerable activity and development work going on in the oil fields. True, this is not to the extent and magnitude of a few years past, but the improvement work on the Panuco river, such as dredging 200 meters in width and ten meters in depth, has been in continuous progress under the direction of the Mexican government for some time, thereby giving facilities to large tankers and making it possible to increase and facilitate the exportation of oil from this very rich field.

The city itself is suffering, however, from decrease in business and there are a great many unemployed there, but the bustle and activity on all sides portend the return of business in the very near future.

The question of the export tax on oil as covered by a decree of the government of June 7, 1921, has tended to retard development and exportation, but on every hand optimistic feeling was manifest that conditions would improve and that some satisfactory arrangement would be made with reference to this situation.

From Tampico to San Luis Potosi, and thence to Mexico City, was made without any particular incident. At San Luis Potosi, where the day was spent on inspection, I was impressed with the friendly feeling and respectful attitude of the Mexican citizens. This is really a beautiful city. The people seem to be contented even though not enjoying all the pleasures of this world. Merchants are optimistic, even to the small peddlars on the street, who were pleasant and happy.

From Mexico City to Guadalajara and Grendain, we traversed a very interesting part of the country. The state of Jalisco is particularly rich in its grain products, cattle and in the cultivation of the "maguey" plant, from which is extracted the famous "tequila" wine. My mission to Mexico City was to establish cordial relations with the government as representative of the large properties under my jurisdiction, and I am pleased to state that on every hand, I met a very pleasant reception. I was particularly impressed with the attitude of President Obregon, and his frankness in discussing the problems that confront him.

I conveyed to President Obregon the wish of the Southern Pacific Railroad of Mexico to complete the long-deferred construction of the railroad from La Quemada to Tepic, a distance of about 100 miles, which would give Mexico City a complete rail connection from the west coast of Mexico, and to this end suggested that if it were possible for the government of Mexico to recognize the claims of the railroad company, which amount to approximately 32,500,000 pesos, either by bonds or other negotiable paper of the federal government, the railroad company, in turn, would spend the amount in the construction of the 100-mile gap and in the reconstruction of its west coast properties, as fast as the government could liquidate these obligations. By these means the Republic of Mexico would be given a much needed rail transportation line, or it might be called transcontinental line, and at the same time liquidate its just obligation.

I was highly gratified at the interest shown by President Obregon in his statement that the matter would be given careful consideration. He was careful to make no promises that he could not fulfill, which is a trait to be admired. The completion of this line from Tepic to La Quemada will open up a stretch of territory for development and for the marketing of its products, that is beyond the dream of the ordinary individual.

There are 11 main streams that cross the state of Sinaloa alone, and there are upwards of 3,000,000 acres of land susceptible of cultivation of the highest degree. On one of the large holdings in the state of Nayarit, known as the Hacienda de Aguirre, are three textile mills and one sugar factory that has a large revenue yearly, even under the most primitive methods that are employed, and in spite of being separated from the tremendous markets of Mexico City and Guadalajara.

President Obregon and the chamber of deputies are now wrestling with the subject of the agrarian laws, and it is confidently hoped that in the near future security of land titles will be perfected, which will invite thousands of settlers and the investment of millions of dollars in development work on the west coast of Mexico.

In all my travel through Mexico I met with most courteous treatment and no foreigner need fear of traveling in Mexico as long as his mission is an honest one and he goes there not to exploit the country, but to develop it. I was particularly impressed with the patriotism of the Mexican and the love for his country, which is admirable.

Congestion Has Practically Disappeared

By J. S. Pyeatt

President, Gulf Coast Lines

Concerning conditions on the National Railways of Mexico, it is entirely fair to say that from a standpoint of service they are now quite satisfactory.

The congestion of freight and the limited passenger service which resulted from the destruction and disabling of locomotives and equipment during the revolution has practically disappeared. The Mexican railways now operate on their primary lines double daily passenger service, and sufficient freight service to transport without unusual delay all freight traffic offered. A considerable amount of new motive power has been purchased and delivered to the National lines during the past six months, which enables them to meet at least in a fair degree the transportation needs of the country. The heavy reduction in traffic has also contributed to this result.

The roadbed generally seems to be in good condition and disabled equipment, fit for further use, is rapidly being rehabilitated and put in service.

The Gulf Coast Lines operate through sleeping, parlor and dining cars to Monterey, Tampico and Mexico City, and the service with few exceptions is operated on schedule and I understand is quite satisfactory to the traveling public. Our principal interchange is through Brownsville and Laredo; at the former place we make direct connection over International Bridge, and at the latter through the Texas-Mexican Railway, a subsidiary of the National Railways of Mexico. Interchange relations have been entirely satisfactory. The National Railways comply strictly with the American Railway Association rules governing interchange, per diem, inspection, etc., and have always met promptly all of their obligations so far as our company is concerned.

Summing up, my opinion is that while we have no knowledge of the operating results of the National Railways, the service, both freight and passenger, is now ample to meet the normal requirements of the country and there are no unusual difficulties attending the use of the railways at the border by the public, or the interchange relations of the different roads forming junctions at the border.

Remarkable Improvement in Operation of Mexican Lines

By Thornwell Fay

Executive Officer for Receiver, I. & G. N.

There has been, since the early part of this year, a remarkable improvement in the operation of the National Railways of Mexico. In the months of January and February, 1921, there was quite an accumulation of freight at all Mexican border points, for Mexico, and the National Railways were short of power. At this time a number of private concerns, which either owned or managed to rent locomotives, had arrangements with the National lines for operating trains over their lines. They were handling freight for the public at 50 per cent above the regular rates, and for a while had all the business they could handle. The Mexican lines also rented a number of locomotives, principally from Texas railroads, and later placed a contract with locomotive builders for building new locomotives. With the assistance of this additional power the accumulation was gradually decreased and the operation of trains by private individuals was discontinued about September 1, 1921.

About this time also there was a marked decrease in the volume of traffic into Mexico, to a great extent in corn and other grain—the Mexican crops having been harvested. At the present time the Mexican roads are suffering from the decreased volume of traffic, the same as most of the railroads

in the United States and particularly those in Texas, and they are giving most expeditious movement now to all traffic which is delivered them. My information is that they are making regularly from four to five days from Laredo to the City of Mexico on car load shipments. Many of their new locomotives have been received and the congestion everywhere has been cleared up some time since.

The present management of the Mexican Lines is quite progressive. The lines are fast getting rid of the large number of American railroad cars that formerly went into the country. There is very little northbound traffic out of Mexico and unfortunately most of these cars come back to the American connections empty. The International & Great Northern for some time has been operating through sleepers from San Antonio to the City of Mexico, and return, and since October 15 a cafe dining car has been run on these through trains, which also goes through between San Antonio and the City of Mexico, making the trip exceedingly comfortable.

During a recent trip to the City of Mexico we noted, with great pleasure, the excellent physical condition of the track on the main line between Nuevo Laredo and the City of Mexico. The greater part of this line is laid with heavy rail and excellent stone ballast, and the physical condition of the line is as good as almost any road in the United States. The locomotive enginemen on the Mexican railroads seem to be exceedingly efficient and their handling of the air brakes was so skillfully done that never a jar or a jerk was experienced in stopping or starting from stations or water tanks. This is quite a contrast to the experience on some of the American railroads.

Our relationship with the Mexican National Lines and officials has been most cordial and agreeable. I feel sure that they are now in a position to handle promptly a largely increased volume of traffic.

Review of English Railways During 1921

A Year of Revolutionary Changes—Railway Act Becomes a Law
and Roads Returned to Private Owners

By Robert E. Thayer

THE YEAR 1921 will stand long as a momentous year in English railway history, with its Railway Act; the return of the railways, after seven years, to private control; a serious coal strike, and an abnormal slump in traffic. All these things have contributed to complicate the railway problem in Great Britain and so wide-reaching are their effects that no one is in a position to prognosticate as to the future. The situation is so fundamentally novel that there is no precedence upon which deductions can be based. This is particularly disconcerting to the British railway man who has in the past been able to prognosticate with a fair degree of accuracy future railway conditions. During the past 50 years Great Britain's railway developments have been gradual and along well preconceived lines so that now, with what might be termed a revolution in railway management and operation, the British railway men find themselves faced with a gigantic problem.

The British railways have not only got to face the more or less theoretical problems imposed upon them by the new Railway Act, which of itself is a great undertaking, but they have also to face practical problems such as an abnormal slump in traffic and an extraordinary increase in expense. Existing rates are conceded to be, both by the railway owner and the shippers, considerably higher than what the traffic will bear. At the same time wages are about 200 per cent higher than obtained before the war. The railways are thus in the unfortunate position of not having revenue enough even with the high rates which must be reduced, to meet the present wage scale and working conditions to which they are bound by an Act of Parliament. One great purpose of the Railway Act, with its grouping scheme, was to so consolidate railway affairs in Great Britain as to permit of economy of management, but it is well recognized that any economies possible from this consolidation will be a mere

drop in the bucket of the economy necessary to put the English railways on a sound financial basis.

The abnormal decrease in traffic which has and will upset the best calculations is, of course, the direct result of the economic conditions of the country and Europe. It is patent that railway prosperity depends upon the prosperity of the nation's industries. The reason for Great Britain's industries being in such bad shape is attributable to two factors: the high cost of production and the disparity in money values between England and the other manufacturing countries of Europe.

ENGLISH railways have been and are faced with the most serious and difficult problems they have ever been called upon to solve. Enforced by law to unite themselves into four distinct groups, and at the same time called upon to face the most unprecedented financial situation, with abnormal trade conditions, high wages and rates that must be reduced, their problems are stupendous. Old established English railway methods are destined to receive harsh and revolutionary treatment.

Great Britain is an exporting nation. It can only live by the trade it carries on with other countries. Europe is Great Britain's best customer, but Europe cannot afford to purchase British goods. Furthermore with the greatly decreased value of the currency in the Continental countries, those countries can produce cheaper to themselves than can England. Furthermore, the Continental countries are in a position, and have for the past two years, to undersell Great Britain in practically all foreign trade. These countries came out of the war in much worse condition than Great Britain to the

extent, poverty having become so keen, that the laboring classes are working for lower real wages (when the depreciated value of the currency is taken into account) than they did before the war. These trade conditions therefore will have a great deal to do in the next five years with the prosperity of the British railways, and the prospects as they appear today are poor.

The grouping of the railways as required by the Railway Act involves of itself a heavy task for the British railway companies. A scheme on such a grandiose scale is wholly foreign to previous railway policy, not because the British railways did not desire railway amalgamation, but because the people of the nation would not permit it. While there

may be railway systems in the United States which will approach in magnitude the size of the groups outlined by the Railway Bill, it must be remembered that these American problems have been developed gradually over a period of years and along economic lines. The English grouping on the other hand may be called a "paper amalgamation" based more upon theoretical and geographical lines than on practical and economic lines. Thus the British railways are called upon to perform overnight, as it were, what the United States has done over a period of years.

Furthermore, the managerial policy adopted by the British railways in the past does not lend itself to the management of a large group of railways. Thus almost an entirely new system of management must be installed to give, as Sir Henry W. Thornton expresses it, "a centralization of policy and a decentralization of detail." That the British railways will measure up to the task there is no question of a doubt, for there is yet to be recorded an economic problem which the good sense of the British nation, taken as a whole, has not solved.

It is thus apparent that the British railway situation is by no means a simple one. It will demand the best railway talent in Great Britain to solve it and the most searching inquiry into all phases of railway operation. Being blessed with a very low wage scale up until the war and being cursed by the lethargic tendencies of the seven years government control, the problem of making good under a 200 per cent increase in wages without being able to absorb that increase by an increase of rates, it is evident that the problem becomes a stupendous one.

The Financial Situation

Strange as it may seem, it is impossible to say definitely just what the financial situation of the railways is at the present time. In fact, the railways hardly know themselves. Being handed back to their private owners on August 16, last, there has been no opportunity of casting up figures to give any definite idea of the exact situation. During the seven years of government control a different system of accounting and of keeping records was installed than that which the railways generally followed. On the return to the owners the government's method was more or less scrapped and the old method followed by the railway companies before the war was replaced. This primarily accounts for the fact that sufficient information is not available at present to get a proper idea of the situation.

An indication of the situation, however, may be found in the fact that the British government found itself at the close of its operations last August with a deficit of \$250,000,000, even though it was anticipated that the increase in rates put into effect the latter part of 1919 and at the beginning of 1920 would allow the government to break even. The reason these plans did not materialize is attributable to the serious coal strike in the Spring of the past year, with the accompanying increase in railway expenses, and with the great decrease in business. It will be remembered that these increases in rates amounted to 75 per cent in passenger fares and about 112 per cent in freight rates.

In 1913 the operating ratio was 64 per cent. In 1919 it rose to 94 per cent, in 1920 to 98 per cent; between 1913 and 1920 there was an increase of 97 per cent in the receipts accompanied by an increase of 200 per cent in expenses. What the position is today it is not possible to say, but the railway companies are looking forward with great anticipation to the \$125,000,000 due them from the government on January 1, 1922, in accordance with the provisions of the Railway Act, to carry them over any difficulties in which they may find themselves.

While this \$125,000,000 will be available for dividends, Sir George Paish, in discussing the "Future of the British Railways" before a recent meeting of the Institute of Trans-

port, has cautioned the railways to think wisely before they part with this amount for dividend purposes. Sir George foresees difficult times ahead and recommends the utmost conservatism in order to forestall receiverships and loss of confidence in railway securities.

An indication of the degree of confidence the investing public now has in railway securities is indicated by Table 1, which compares the high stock values of 1913 with those obtaining on December 6, 1920, and December 13, 1921.

TABLE 1—COMPARISON OF STOCK VALUES

	High, 1913	December 6, 1920	December 13, 1921
Caledonian:			
Ordinary stock.....	79½	36½	29½
Preferred converted.....	59½	28¾	24½
Glasgow & South Western:			
Deferred ordinary.....	44½	21½	153¢
Great Central:			
Deferred ordinary.....	17¼	5½	4
Preferred ordinary.....	39½	10½	8
Great Eastern.....	63½	30	27½
Great Northern:			
Deferred.....	57¼	28¾	23¼
Preferred.....	88¾	44½	41¾
Great Western.....	119¾	74¾	70¼
Lancashire & Yorkshire.....	91½	53	49¾
London, Brighton & South Coast:			
Deferred ordinary.....	95	44½	38½
London & North Western.....	136¾	75¼	69¾
London & South Western.....	39¾	20¾	18¼
Midland:			
Deferred.....	77½	48	43¼
Preferred.....	60¾	33	34¾
North British.....	32¾	13	9¼
North Eastern.....	124	78½	71¾

It will be seen that there has been quite an appreciable decrease during the past year and a most decided decrease over the 1913 values.

Under the present circumstances the railways obviously would encounter difficulties if they went into the open market for funds for capital expenditures. As a matter of fact, while there are a number of opportunities for capital expenditures, particularly for electrification purposes, there is the tendency not to enter upon any such work until the grouping scheme has materialized. It is quite apparent that such a procedure would complicate the financial arrangements that must necessarily be made in forming groups and until they are formed there is not much liability of heavy new construction being undertaken. The largest project under consideration at present is the extension of the electrification of the London, Brighton & South Coast which will involve further electrification of the suburban lines around London and the electrifying of the line to Brighton. Detailed plans have been evolved but the manner in which this work is to be financed has not yet been decided.

The Ministry of Transport

The Ministry of Transport, having performed the particular function for which it was formed, namely, providing a solution of the British railway problem, is now more or less in the process of disintegration. Sir Eric Geddes resigned as Minister shortly after the roads were turned back to the private owners and is now chairman of a governmental committee known as the "super-axe" committee, which has been formed for the purpose of scrutinizing all government expenditures with the idea of eliminating those which can be dispensed with. There is now no Minister of Transport and the chief work of that department which will extend over a period of two or three years is the settling of the many claims arising from the government's control of the railways. While no definite governmental action has been taken as regards the Ministry of Transport it is anticipated that its functions will be absorbed by the Board of Trade and the Railway and Canal Commission. It is interesting to note in this connection the strong plea of labor for its continuance.

The outstanding work of the Ministry is, of course, the draft of a Railway Act and pushing it through Parliament. Sir Eric Geddes is deserving of considerable credit for his work, for he had to contend with much opposition. Whether

or not his work has been for the best remains to be seen. There were only two radical changes in the bill as it was presented to Parliament. These were in the rearrangement of the groups, whereby the Scottish railways instead of acting as an individual group were linked up with two English groups to form the North Eastern, Eastern & East Scottish group and the North Western, Midland & West Scottish group, and the elimination of the representatives of labor on the Board of Directors of the groups. These changes came about by agreement between the railways themselves in the first case and between the railways and labor in the second case and against the government's own judgment.

Labor argued that representation on the Board of Directors as outlined by the proposed law would be a mere farce and of no material benefit to the men. This change was made in the Act at the eleventh hour previous to which labor threatened dire results were their representation on the boards to be eliminated from the law. The real truth of the matter is that labor used this as a club over the railways to obtain further concessions as regards wages and working conditions.

Of the various important committees established during Sir Eric's administration only one has presented an official report. That is the Advisory Committee on the Electrification of Railways. This committee has established certain general regulations to be observed by the railway companies when electrifying their lines with a view towards standardization of methods and appliances. It advocates the direct-current system at 1,500 volts for those railways which have not as yet electrified any lines, as well as those which are using the direct-current system at present. Either overhead or third-rail system of power collection is permitted. Three-phase alternating-current is recommended for the power generating units at 50 cycles, except where other frequencies are used in a particular electrification district. A special ruling was made in the case of the London, Brighton & South Coast, which uses single-phase alternating-current, giving that road the privilege of using that system in the extension of its electrified lines.

No report has been rendered in the matter of standardization or automatic train control, nor is there any prospect of such reports being forthcoming. As regards standardization it is argued that by grouping the roads as outlined in the Act standardization will automatically take care of itself, particularly in the groups themselves.

The Rates Advisory Committee which has been working on a reclassification of traffic items is still in the midst of its work and the task is of such great proportions that a report is not expected in the near future.

As has been previously pointed out, the grouping proposed by the Minister of Transport and made into law is the most radical feature in the bill. Executives of the railways are now carefully considering the problem with a view of organizing the groups within the time specified by the law, namely, January 1, 1923. During the past year one large step has been taken in this direction in the amalgamation of the London & North Western with the Lancashire & Yorkshire, which goes into effect January 1, 1922. In previous years these two companies have been acting under various joint agreements.

Corollary to the proposed grouping, the manufacturers of locomotives, passenger coaches and freight cars have become more or less disturbed as to their future prospects for English business. The railways act empowers the railway groups to manufacture equipment for one another and the industries have made presentations to the Ministry of Transport with a view of securing that private enterprise have equal right of competing for railway supplies with the railway groups themselves. No action was taken in the matter, however, because any such competition would not be possible for some years.

In anticipation of a final formation of the groups, the

Eastern Group has entered upon an advertising campaign, both by bill posters distributed over the country and by circular matter, calling attention to the facilities offered the shippers by that particular group. This is indicative perhaps of the competition that will still obtain as regards through business, even after the groups have been formed.

Rates and Wages

Never before were rates and wages so much discussed on the British railways. The railways cannot get business under the present rates and they cannot pay wages without the present rates. Unfortunately the railways are bound by an Act of Parliament to maintain wages according to the schedule. There appears, however, to be a very conciliatory spirit on the part of the labor unions in this matter. Already a reduction of \$1,625,000 per week has resulted from the maximum wage in the conciliatory grades on account of the sliding scale which operates with the rise or fall in the cost of living. In 1913 railway wages amounted to \$3,862,500 per week. The maximum since that time was \$13,502,250 per week, or an increase of 250 per cent. At present the wage bill is \$11,877,250 per week, or slightly over 200 per cent of the prewar wage. The railway shopmen who come outside of what is known as the conciliatory grades are being reduced 12½ per cent, which was a government grant given them during the war to last until the termination of the war. A more detailed account of the manner in which wages have fluctuated is indicated in Table II for men other than those in shops, and Table III for the shop men.

TABLE II—WAR BONUS (NOW WAR WAGES) TO OTHER THAN SHOPMEN (ADULTS)

Date operative	Amount granted* (per week)	Total
February, 1915.....	50c or 75c war bonus	50c or 75c war bonus
October, 1915.....	75c or 50c war bonus	\$1.25 war bonus
September, 1916.....	\$1.25 war bonus	2.50 war bonus
April, 1917.....	1.25 war bonus	3.75 war bonus
August, 1917.....	War bonus converted into war wages	
November, 1917.....	\$1.50 war wages	\$5.25 war wages
April, 1918.....	1.00 war wages	6.25 war wages
August, 1918.....	1.25 war wages	7.50 war wages
November, 1918.....	.75 war wages	8.25 war wages
March, 1920.....	Wages and war wages were consolidated and the sliding scale agreement was put into effect.	
	\$1.25 (war wages not included in agreement)	\$9.50 war wages
April 1, 1920.....	Increase of \$0.25	9.75
April 12, 1920.....	Increase of .50	10.25
June 14, 1920.....	National Wages Board award gave increases ranging from:	
July 1, 1920.....	\$0.50 to \$2.12½	\$10.75 to \$12.37½
October 1, 1920.....	Increase of \$0.50	11.25 to 12.87½
July 1, 1920.....	Increase of .50	11.75 to 13.37½
January 1, 1921.....	Increase of .25	12.00 to 13.62½
April 1, 1921.....	Decrease of 1.00	11.00 to 12.62½
July 1, 1921.....	Decrease of 1.25	9.75 to 11.37½

*25 cents is taken as the equivalent of one shilling

TABLE III—WAGE INCREASE TO ADULT SHOPMEN (TIME WORKERS)

Date operative	Amount granted* (per week)	Total
February, 1915.....	\$0.50 or \$0.75 war bonus	\$0.50 or \$0.75
July, 1915.....	\$3.75 in lieu of \$0.50 or \$0.75 war bonus	\$4.25
April, 1916.....	\$0.25 increase in wages	\$1 wages
September, 1916.....	\$1.25 war bonus	\$1 wages, \$1.25 war bonus
April, 1917.....	\$1.25 war bonus	\$1 wages, \$2.50 war bonus
August, 1917.....	35 increase annualized to make—\$3.75 war wage	
October, 1917.....	12½ per cent bonus on earnings	
December, 1917.....	\$1.25 war wage	\$4.00 war wage + 12½%
September, 1918.....	\$1½ war wage	4.87½ war wage + 12½%
December, 1918.....	1.25 war wage	6.12½ war wage + 12½%
November, 1919.....	1.25 war wage	7.37½ war wage + 12½%
April, 1920.....	\$0.75 on basic rates	8.12½ war wage + 12½%
June, 1920.....	.75 on basic rates	8.87½ war wage + 12½%
August 15, 1921.....	\$0.50 decrease on basic rates	7.37½ war wage + 12½%
November 19, 1921.....	Decrease of 48 per cent on earnings	7.37½ war wage + 8½%
December 3, 1921.....	Decrease of 48 per cent on earnings	7.37½ war wage + 4½%
December 31, 1921.....	Decrease of 48 per cent on earnings	7.37½ war wage

*25 cents is taken as the equivalent of one shilling

The eight-hour day has been one of the most unreasonable and unjustifiable clauses in the new working conditions obtained on account of the war; particularly is this so in the outlying or branch line districts. There appears some hope

that a more rational view will be taken of this matter by the railwaymen themselves. In fact the number of men who have been discharged from some of the railways, which varies from 15 to 20 per cent, in an endeavor to cut down the wage bill has shown the men the impossibility of their position.

As has been previously pointed out in these columns, the machinery for handling all labor questions has been set up in the railway act and provides for a Central Wages Board with a National Wages Board as a last resort.

The railway labor unions have been particularly hard hit this past year. It is estimated that the National Union of Railwaymen will pay out approximately \$3,500,000 on unemployment alone during 1921. Furthermore, now that a law has been obtained for the handling of labor difficulties there is a strong disposition on the part of the men to allow their membership in the unions to lapse to the extent that it bids fair to embarrass them to a considerable degree.

The rates problem is now under consideration, conferences having but just begun. The shippers are insisting upon a reduction in order that they may do business. Assistance has already been given in the matter of raw materials for the manufacture of steel in a 25 per cent decrease on iron ore, limestone and ironstone. The coal operators are now after a reduction. That they need one is without question, for coal, the basic commodity of Great Britain, is being sold at prices which are altogether too high. The railways themselves are paying 100 per cent over prewar prices. It was anticipated that by the time the railways were turned back to the private

compensation) as against an expenditure of \$1,224,000,000, which gives an operating ratio of 98.8 per cent. The government compensation amounted to \$213,000,000. During 1920 important increases were made in rates and fares. The freight rates were increased by about 50 per cent on January 15, 1920, and again on September 1, 1920, bringing the average up to about 112 per cent over prewar rates. Passenger fares were increased on August 6, 1920, by 16 2/3 per cent, making an increase of 75 per cent over prewar rates. Season ticket rates were also advanced to 50 per cent above prewar level and for workmen's fares a mileage scale was adopted on September 1, 1920, with a maximum increase of 200 per cent, or 50 cents a week, whichever was less. During this time a high level of prices and wages prevailed throughout the country and the coal strike, during the autumn of 1920, together with the great depression in trade, have affected the results.

The total engine mileage of all railways in Great Britain in 1920 was 575,576,239 miles, or an increase of 8.03 per cent over that of the year 1919. Train mileage was 378-,070,430, as against 348,911,830 in the year 1919. The average receipts per train-mile from passenger train traffic fell from \$2.55 to \$2.40, but from freight train traffic they rose from \$2.48 to \$2.40.

The number of first-class passengers carried during the year 1920 was 37,675,085, or 15.62 per cent less than the previous year, but the average receipt per first-class passenger rose from 97 cents to \$1.09. There were 1,096,585,156 third-class passengers carried, or an increase of 1.21 per cent over

TABLE IV—MONTHLY RAILWAY STATISTICS FOR ENGLAND, SCOTLAND AND WALES

	Year	Sept. 12	Oct. 10	Nov. 7	Dec. 5									
		to	to	to	to	Jan.	Feb.	March,	April,	May,	June,	July,	Aug.

*1 Cent = 1/2 pence.

owners it would be possible to reduce the rates which were put into effect by the Ministry of Transport in an endeavor to wipe out the deficit, but as has been already stated the economic conditions and the coal strike made it impossible to accomplish this end.

Railway Statistics

The Ministry is to continue to compile the statistics in accordance with past practices. Table IV gives the twelve months from September, 1920, to September, 1921, the statistics for the current year being compared with 1920. The serious effect of the coal strike on railway traffic is clearly shown. Likewise the effect of the increased freight rates is shown in the receipts per ton-mile. Otherwise there is but little variation in the figures.

In addition to these monthly records the Ministry of Transport publishes yearly statistics, those for the year 1920 having recently been issued. These show gross receipts for Great Britain of \$1,240,000,000 (without the government

the year 1919, and the receipt per passenger was 30 cents as against 27.4 cents for the year 1919. In second-class passengers there was an increase of 6.90 per cent over the previous year. For all ordinary passenger journeys the average receipt increased from 30.22 cents to 32.74 cents.

Total tonnage carried was 323,971,117, or an increase of 4.21 per cent as compared with 1919. In coal, coke and patent fuel there was an increase of .65 per cent, and in other minerals an increase of 20.81 per cent. The total receipts per ton for all railways were \$1.89 as against \$1.05 in 1919.

Motor-Lorry Competition

In certain districts, particularly in the Midlands around Manchester, motor lorry competition has cut into railway earnings to some extent, although there is not much anxiety on the part of the railways as a whole on this account. In an endeavor to forestall any undue losses in this respect an attempt was made on the part of the railways to incorporate

in the Railway Act a section giving the railways power to operate and maintain motor transport in connection with the railway services. Owing to the opposition of the operators of motor transport lines, and to a certain extent shippers themselves, this was not allowed, the chief argument being that it would give the railways an undue monopoly of transport and perhaps entirely kill future development in road transport.

There are a few railway companies, however, which under previous Acts of Parliament are given authority to carry goods by motor lorry. Motor lorries can handle small parcels cheaper than the railways and they have a certain financial advantage over railways in that they are not subjected to the heavy property tax the railways have to pay. The whole problem of motor transport, however, is more or less in an embryotic state, for it has not been given the trial of years to determine whether or not it can be maintained as a paying proposition. After the war a large number of motor lorries used in connection with war transport were thrown on the market and purchased at a low figure. With the capital expenses thus small to start with, it has been possible to show satisfactory results, but whether or not this will continue is a question.

The motor char-a-banc for the conveyance of passengers, has during the past summer season proved remunerative. But there the conditions had a lot to do with it. England has never experienced such a stretch of settled and fair weather for 30 or 40 years. This gave the motor char-a-banc a wonderful opportunity of doing business. Furthermore, the novelty of this means of transport did much to swell the receipts. Except in long distance runs, such as from London to various seaside resorts, the motor char-a-banc should prove an asset rather than a liability to the railways for a large number of these services have sprung up in the pleasure resorts and have done much to attract visitors; to some extent the railways have benefited.

It is impossible to state definitely, due to the newness of this means of transport, as to just how much it will cut into the railways' business. The extraordinary growth of road transport for both freight and passengers has, however, been sufficiently large to cause some anxiety.

Railway Excursions

Perhaps the most outstanding feature from the public's point of view of the return of the railways to the private owners has been the large increase in the number of railway

excursions offered by the railways to attract traffic. Day excursions at the rate of a single fare for the double journey and cheap period excursions at the rate of a single fare and a third for the double journey were introduced in August. The general public has shown great appreciation of these facilities. Opportunities were given to travel to all holiday resorts and even the continent. The railways have been quick to take advantage at any occasion to give special excursion attractions such as football games, midsummer sales in the London stores, horse races, etc. The latest excursion is being offered to Irishmen in England desiring to go to Dublin to celebrate the settlement of the Irish question.

The Coal Strike

The three-months coal strike was a severe blow to the railways, but coming as it did before the roads were passed back to their private owners, the government was called upon to stand the heavy financial losses it entailed. The railways themselves, however, were not wholly freed from its disastrous results for it so crippled England's trade as to have made itself felt even up to the present time. The situation was such that coal had to be imported into Great Britain from France and even from America for the operation of trains.

Passenger traffic was greatly reduced much to the discomfort of travelers; of freight traffic there was practically none, for the strike was so all-inclusive in its effects that industries could not operate. One interesting development was the rapid and extended use of oil fired furnaces both on locomotives and in stationary plants.

During the strike the threat to call a general strike, including the railwaymen and transport workers, provided a very delicate and dangerous situation, and it was only the unreasonableness of the miners themselves that prevented such a possibility. The action of the railway workers at that time in refusing to join with the miners when the miners refused to meet the government halfway indicated an awakening of labor in general to the futility of maintaining a high-handed policy in endeavoring to extract from the nation that which economic conditions would not allow. If the more conciliatory spirit that has recently shown itself amongst the laboring classes is at all due to the lesson learned during the coal strike some benefit has resulted from it. It at any rate proved that unionism, no matter how strong it may be, cannot hope to win against economic conditions.

High Lights in the French Railway Situation

Devastated Lines Restored—Deficits Still Heavy But
Decreasing—New Railway Act

By M. Peschaud

Secretary, Paris-Orleans, Paris, France

THERE ARE, in round figures, about 24,855 miles of French railroads, divided into seven railway systems. Five of these railways (Paris-Orleans; Paris, Lyon & Mediterranean; Nord; Est, and Midi) are conceded to private companies by the state, which remains the owner.

These concessions expire between 1950 and 1960. The two other railways are the State Railway, founded in 1878 and enlarged in 1908 by the repurchase of the Ouest Company, and, since the end of the war, the Alsace-Lorraine railways, which are also operated by the state. The new convention for the reorganization of the railways, which was passed by parliament on October 29, 1921, provides that the Minister of Public Works may, at any time, decide that the Alsace-Lorraine railway shall join the joint organization.

Physical Condition

The war imposed a considerable strain upon the French railways. The wear and tear of the permanent way and equipment was considerable, and above all there had to be taken into account the havoc caused by the Germans on the Nord and Est railways. There were 1,802 miles of line destroyed or damaged, besides 3,480 miles of single line (namely a third of the total length worked by these two railways in 1913); also 1,510 bridges, 12 tunnels, 590 buildings and 150 water tanks were demolished. The shops at Hellemmes, Lens, Tergnier, Epernay, Roye, Mohon and all the engine houses in the zone of occupation had to be rebuilt. At present everything is restored and working as it did in 1914.

The other railways did not have such a heavy task in repairing their plants. They were obliged, nevertheless, to re-lay about 746 miles of track which had been taken up during the war so that the rails could be used at the front. It was necessary also to renovate the tracks whose upkeep

had been neglected on account of the war, renew the ballast, ties and rails. This work is now, at the end of the year 1921, almost complete. At the same time the railways have carried out certain improvements which experience has proved to be valuable. The dispatching system has been adopted in various places. In addition trials of new signal systems are being actively conducted.

The reconstruction of the rolling stock, which has been very rapid, is also nearly completed. As a result of purchases, and also delivery of equipment which the terms of the armistice required from Germany, the railways possess about 1,000 more locomotives than before the war (an average increase of 6 per cent). They have also

an addition of 50,000 freight cars (an average increase of 15 per cent). A great effort was made to repair the equipment. The railways went chiefly to private firms for their supplies, and in spite of the strikes of 1920 and the strict application of the eight-hour act, the situation can be regarded as fairly satisfactory.

For example, one of the principal French railways repaired, during the period from November 1, 1918, to June 30, 1921, both in its own workshops and those of private firms, 2,720 passenger cars and 863 baggage cars, and, in its own repair shops alone, nearly 200 passenger cars and

THE FRENCH RAILWAYS

are fast returning to normalcy. Their deficits are still large and wages high but with the new railway act in force and a modification of the eight-hour day it is anticipated a great improvement will be made in 1922. Wages are to be reduced with a reduction in the cost of living. The state under the new law will assist the railways with capital.

177 baggage cars. Over 200,000 freight cars have been repaired.

As for the locomotives, the percentage laid aside for repairs, which was 18.4 per cent on this line on December 1, 1918, is now 16.6. (It was 13.5 in 1913.)

The situation is thus normal again on almost all the French railways as regards freight cars; and will soon be so as regards passenger cars. If the locomotive situation is not quite so good, the reason is that private firms were not able to give the same help in this respect as in the case of the cars; also because the eight-hour act necessitated an increase of about 17 per cent in the number of locomotives. The locomotive situation is expected to become normal again by the end of 1922.

Traffic

Transport of Passengers. On the P. L. M., P. O. and Midi, the passenger train miles have increased from 87,611 miles in 1918 to 146,648 in 1921, being an increase of 67 per cent. At present they are 70 per cent of the pre-war runs. The trains are running regularly again, although the expresses, being fewer, are heavier than before the war. Mishaps en route have decreased in the following proportions:

	Breakdowns	Loss of time	Total	Average per 100,000 miles
July, 1913.....	29	138	164	4.45
Oct., 1918.....	72	259	361	13.60
May, 1921.....	19	48	67	2.48

The situation is therefore even better than in 1913. The same can be said as to train delays. In the matter of speed, it has not yet been possible to return to the pre-war standard, owing to inexperience on the part of the new staff, the bad quality of fuel and the condition of the tracks. But there has been an improvement over 1918, as the following examples show:

	Pre-war	At the armistice	In 1921
Paris-Bordeaux.....	8 hr. 35 min.	9 hr. 41 min.	9 hr. 3 min.
Paris-Nantes.....	6 hr. 7 min.	7 hr. 0 min.	6 hr. 58 min.
Paris-Montluçon.....	5 hr. 34 min.	6 hr. 55 min.	5 hr. 45 min.

It should be noted that these improvements have been attained in spite of the considerable increase in the number of passengers carried. On the five private lines this number rose, in spite of increased fares, from 334 million in 1919, to 380 million in 1920.

Freight Traffic.—The freight traffic has been normal again for a year, in spite of the terrible transport crisis which oppressed the country so heavily in 1919 and the first half of 1920. All restrictions on freight, the system of priorities in particular, have completely disappeared, and the railways now accept all freight.

The daily car shortage is normal. In consequence, the daily average car loadings have increased. On all the railways it was 27,000 in November, 1919, and it reached 37,000 in November, 1920. It would be higher at present if the amount of traffic had not decreased because of trade conditions. The number of freight trains in use is near the pre-war figure. On one of the principal railways, for instance, it is 852 (885 in 1913). These trains, moreover, run longer distances than in 1913 and draw more tonnage, which shows that the rolling stock is being more extensively used than before the war. On one railway, the daily mileage is 34,554 as against 29,827 in 1913, and the tonnage carried is 20 million tons as against 17 millions before the war.

The carrying of freight by express trains has proved very satisfactory. These trains run regularly and ensure the satisfactory transportation of early vegetables and fish, in spite of the very great increase of tonnage. On the P. L. M. the dispatches were particularly large in May, June and July, 1921, during which months the Paris station received 50,000 tons of goods for the markets, as compared with 45,000 in 1920 and 32,000 in 1913.

Electrification of New Lines

The problem of the electrification of the railways has been under consideration for a long time. The fuel crisis, resulting from the war, has hastened its consideration. The most extensive electrification program which has ever been prepared has been drawn up by the companies who were most favorably placed for using "white coal." It applies to about 5,592 miles of lines, distributed as follows: Orleans 2,082, Midi 1,988, and P. L. M. 1,429. The cost of equipment will be over \$500,000,000 at the normal rate of exchange. It will allow the traffic to be increased, and effect a saving of 1,500,000 tons of coal per year, compared with the 1913 traffic.

The Orleans Company, by a decree of March 11, 1921, was given permission to use the Haute-Dordogne and its two tributaries for water power. According to the terms of former agreements, the state is responsible for the hydraulic section and the company for the electrical section. Moreover, the company has drawn up a scheme by which it will be able to obtain on favorable terms electric power on the Paris-Orleans and Chateauroux line, and later, as far as Montauban. The company has already given orders for a large part of this program to be put into execution. Normally, electrification as far as Orleans will be completed in about five years.

As regards the Midi Company, the work which was commenced in 1920 is proceeding quickly. If the times stated for the execution of the work and the supply of equipment are adhered to, electric traction between Toulouse and Dax will commence at the end of 1922.

The P. L. M. will commence soon carrying out its program with the Culoz-Modane line and the Cevennes line.

The State Railway is continuing the electrification of the suburban lines west of Paris. The work has been put in hand and there is reason to expect that by 1923 the whole of this suburb will be served by electric lines.

New Construction

The following new ordinary lines are in course of construction:

- On the Midi: the trans-Pyrenees lines
- On the P. L. M.: the lines from Nice to the Italian frontier by Sospel (39 miles).
- On the Est: the line from Saint-Dié to Saales.

The latter is designed to give better connections between the Est railway and the Alsace-Lorraine railway. It is being carried out by the Est Company on behalf of the state. Part of the line will probably be open to traffic at the beginning of 1922.

Art. 10 of Section I of the new Agreement, ratified by parliament, states that a line not yet conceded cannot be constructed without the permission of the Higher Railway Council. The railways undertake to accept any concessions which may be made to them, beyond the maximum already fixed by previous agreements, up to the amount of:

310 miles in the case of the State railway.
112 miles in the case of the Est railway.
93 miles in the case of the Midi railway.
126 miles in the case of the Orleans railway.
64 miles in the case of the Nord railway.
319 miles in the case of the P. L. M. railway.

The exact amount is to be fixed by the Minister of Public Works after agreement with the railway concerned. Except in the case of special agreements, the state will bear 80 per cent of the cost of constructing new lines and the railway concerned 20 per cent.

The Deficit in Round Figures

The disastrous effects of the war on railway finances are still being felt. Nevertheless the situation has improved since last year and the forecast of the result of the 1921

statement of account, compared with the 1920 statement, is encouraging.

If the deficits on branch lines and capital charges are taken into account, the running of the lines in 1920 showed a total deficit of \$601,400,000, distributed as follows:

	Result of running	Capital charges	Total deficit
Private companies	\$263,420,000	\$183,780,000	\$447,200,000
State railway	119,080,000	35,220,000	154,300,000
General total	\$382,500,000	\$219,000,000	\$601,500,000

The exceptional war time indemnities were not included in this figure nor the bonuses for dependents paid by the state in accordance with the Act of January 10, 1919. If these expenses are taken into account, the 1920 deficit should be fixed at \$706,000,000.

The deficits expected in the 1921 statement of account are much less. They are valued, per railway, at the following amounts:

Nord	\$56,000,000
Est.	35,000,000
P. L. M.	58,200,000
P. O.	70,000,000
Midi	46,200,000
State	102,800,000
Total	\$368,200,000

In order to arrive at the exact situation of the railways, the amount of the cost of living allowances, namely, \$64,800,000 should be added to this figure. The exceptional allowances for dependents were paid in 1921 by the companies and are included in the \$368,200,000. There will, therefore, be a very definite reduction of the deficit compared with the preceding statement of account.

The approximate deficit for 1922 should be \$230,400,000, not including the allowances for cost of living which it has not yet been decided to continue.

Increases of Rates

The rates have not been increased since last year, and the railways have remained satisfied with the two increases of 1918 and 1920.

On March 31, 1918, the passenger and freight rates were raised 25 per cent. This increase was soon found to be quite inadequate because of the continual rise in the cost of wages and of raw materials. Therefore the government, in agreement with the companies, brought in a bill on December 23, 1919, to authorize a further increase. This Act

which came into force on February 15, 1920, sanctioned an increase which was to be added to the 25 per cent increase, without, however, affecting the latter. This increase was 45 per cent for the third class passengers, 50 per cent for second class passengers, 55 per cent for first class passengers, and 115 per cent for freight. Since then there has been no alteration in the rates, so that at the present time the increases above pre-war prices are in round figures:

140 per cent for freight (to an average maximum of 180 per cent if the unification of the rates resulting from the abolition of special rates is taken into account).

- 80 per cent for first class passengers.
- 75 per cent for second class passengers.
- 70 per cent for third class passengers.

There are reduced fares for large families, disabled soldiers and parents of soldiers who have been killed in defending their country. Families in which there are three or more children under 18, receive on a request from the head of the family, a strictly personal untransferable identity card for the father, mother and each child under 18, which entitles them to the following reduction of fares:

- 30 per cent for families of 3 children
- 40 per cent for families of 4 children
- 50 per cent for families of 5 children
- 60 per cent for families of 6 children
- 70 per cent for families of 7 children and upwards.

The companies and the State railway grant a second class pass to the widows, ancestors and descendants of the first and second degree, or in default of these, the brother or sister of a soldier who has died for his country, allowing them to make a journey free of cost from their home to the burial place provided by the military authorities.

Special season tickets, called workers' three class season tickets are given to every worker, employee or laborer who can show that he is obliged to travel backwards and forwards every day between his home and place of business.

Present Wage Situation

The increase in the wages which commenced in 1918 has continued during 1921. These have reached \$644,200,000 for the six railways (excluding \$104,600,000 of cost-of-living bonuses paid by the state), being an increase of 340 per cent compared with 1913. This increase is explained by the increase of staff, due principally to the application of the eight-hour Act, and to the introduction of a new scale of wages in 1920.

Photo by Kadel & Herbert

St. Lazare Station, Paris

For the whole of the railways, the cost of the eight-hour day has been rated by the Minister of Public Works at a total of \$220,000,000 a year. The financial burdens resulting from this Act are all the heavier because of the fact that the eight-hour act was applied on terms which do not sufficiently take into account the special nature of the employees' duties, which consist in the greater number of cases, more of attendance than of actual work. Owing to this new regulation, there has been a decrease of 30 to 40 per cent in the output of work, to make up for which the number of employees has had to be increased by 103,000.

Since 1920 new scales of salaries have been imposed on the company by an official commission. These scales fix the minimum wage at \$760, and have considerably raised, as regards the majority of the employees, the salaries they were drawing at the beginning of 1918. Various supplementary allowances are added to the actual salary (such as gratuities, work bonuses, residence indemnities, allowances for dependents), the rate of which has itself been considerably raised, without mentioning the cost-of-living indemnity of \$144 borne by the state. The results are, therefore, that the minimum salary of a new employee in the lowest grade of the service is \$1,144 if he has no children, \$1,276 if he has two children, or about $3\frac{1}{2}$ times the pre-war salary.

Therefore, the average expenditure per employee, which was \$434 in 1913 for the whole of the railways, is at the present time \$1,528, an increase of 205 per cent. The increase is much larger for new employees, reaching, according to the railway, 280 to 470 per cent for porters and 280 to 580 per cent for track-layers.

Here is, for example, a table of the salaries now being paid by the principal railways to certain classes of employees (married men with three children):

	Track Layer	Porter	Driver	Shop Laborer
Present salary (All railways)	\$1,372	\$1,372	\$1,902	\$1,477
Salaries by railways on June 30, 1914				
	Increase (per cent)	Increase (per cent)	Increase (per cent)	Increase (per cent)
Est.	\$260 426	\$360 281	\$670 281	\$345 183
State	360 281	360 281	696 173	360 316
Midi	202 579	252 444	624 204	267 453
Nord	340 303	360 281
P. L. M.	240 471	240 471	...	270 447
P. O.	242 466	280 386	630 201	267 445

The pensions were increased at the same time as the salaries were raised, in a proportion varying between 25 per cent and 100 per cent according to the amount of the pension, by an agreement arrived at on September 13, 1920, between the state and the railways. The financial burden

of the pensions has therefore increased, and is made still greater because of the liquidation of a large number of pensions which had been postponed during the war. Finally, the payments made by the railways to the pension funds have increased on account of the rises in salaries and the fact that these were retroactive in character.

Conclusion

The general railway situation has, therefore, definitely improved compared with last year, but it still leaves much to be desired. The deficit has been reduced, and in some directions expenses are beginning to decrease, particularly as regards construction work and fuel.

Apart from a reduction of wages, which has not yet been made on the French railways, but which the government has announced for the next statement of account, it seems possible that a saving of \$20,000,000 to \$40,000,000 can be made. This calculation is based on the somewhat optimistic forecasts of wages costs owing to the alterations which the railways, in agreement with the Minister of Public Works, have decided to make in the application of the eight-hour Act. Greater economy on this head can only be attained by a less strict observance of the Act and by reducing the wages of the staff in proportion to the fall in the cost of living. But this depends much more on the government than on the companies. It is possible to save on repairs because of the general fall in prices, and also because the number of machines to be repaired will shortly be at normal again.

There is reason to hope that the P. L. M. will soon be able to balance its receipts and expenditures again. The restoration of the devastated districts will provide increased traffic for the reconstructed Nord and Est lines.

But any improvement in the railway situation depends chiefly on the reorganization of the railways approved by parliament. The new agreement will enable the railways to obtain, on much better terms than at present, the large capital they require to improve their plant, increase their stock, carry out the electrification of their lines and secure financial stability until the return of normal conditions. The agreement is a conciliatory measure putting an end to all difficulties of a legal nature between the companies and the state, arising from the war. It strengthens the understanding between the railways and general interests of the country, and brings about a close co-ordination between the railways and their various departments. Further it ensures a certain amount of unity in management, and although the next financial statements will necessarily still present difficulties, the future can be confidently faced.

The Station at Rome

A Review of the Italian Railway Situation

Heavy Deficits—Poor Track—Dilapidated Equipment—
Ambitious Program for Electrification

By Antonio Giordano

THE TOTAL MILEAGE of the Italian railways was—in December, 1920, the last time when data on this subject were published—11,749 miles. In the recently annexed regions, Venesia Giulia and Venesia Tridentina, there are about 528 miles and 326 miles, respectively, which are owned by the Austrain Railway Company "Sudbahn Gesellschaft" but are operated by the Italian State Railway Administration. The question of transferring the shares owned by the Austrain capitalists to the Italian State Administration is under consideration. The Italian State in 1905 took over the railways in Italy and Sicily, with the exception of only very few secondary lines which are still under private ownership, the Sardinian railways being acquired in 1915.

Permanent Way and Equipment Situation

During the war practically no repairs were made to the track or the equipment. The large amount of equipment purchased in the United States was used almost entirely for war purposes and is practically ruined. The old equipment was used for passenger and freight services which were reduced to a minimum. Therefore, the track and equipment require a large amount of repair to bring them back to their pre-war physical condition. The Railway Administration has been so thoroughly occupied with the rehabilitation and repair of the railways in the de-

vastated regions in the north and in the recently annexed regions that it has not been able to give the attention required for the repair of the track in other parts of the state. Furthermore, it is severely handicapped by the lack of finances.

When the armistice was signed the conditions were such that the government found it more feasible to buy new equipment, than to repair the old, in order to meet its needs.

The following is the list of the new equipment ordered:

LOCOMOTIVES AND CARS ORDERED IN THE U. S. A.	
December 20, 1918..	150 locomotives (already delivered).
December 20, 1918..	10,000 cars (already delivered).
December 8, 1919..	150 locomotives (already delivered).

LOCOMOTIVES AND CARS ORDERED IN ITALY	
December 20, 1918..	24 electric locomotives.
August 30, 1919..	610 passenger cars.
August 30, 1919..	250 baggage cars.
August 30, 1919..	2,960 freight cars.
August 30, 1919..	486 locomotives (steam).
December 4, 1919..	78 locomotives (electric).
January 10, 1921..	59 tank cars.
April 12, 1921..	183 locomotives (steam).
April 23, 1921..	450 passenger cars.
April 23, 1921..	300 baggage cars.
April 23, 1921..	1,678 freight cars.
June 3, 1921..	100 tank cars.

A large number of old cars which were used in local services during the war are now lying idle in the repair shops awaiting repairs.

Financial Situation, Rates and Fares

The critical financial condition of the railways is the subject of examination by the government at the present moment. Since 1915 the balance sheet has been showing a loss and

THE ITALIAN railways came out of the war in a sad plight. Excessive labor troubles have not permitted a return to anywhere near pre-war conditions. Equipment is badly needed. There is no money to be spent there—in large amounts—for rehabilitation, extensions and in electrification.

Mr. Giordano's invitation to American capital to invest in the Italian railway supply industries is tempting when the potential market both in and around Italy is considered.

it is reported that for the year 1920-1921 the loss will be \$280,000,000, the revenues being about \$600,000,000 and the expenses \$880,000,000. The freight and passenger rates were increased with a view of reducing the 1920-1921 deficit and eliminating any possibility of a deficit in 1921-1922, but instead of accomplishing its purpose these increases caused a reduction in traffic. During January and February, 1921, the passenger traffic decreased from 23 to 58 per cent as compared to the traffic of November and December, 1920; during the same period freight traffic decreased by about 50 per cent.

Another factor responsible for the poor showing for the past year was the large increase in the number of employees. In round figures the number has increased from 150,000 on June 30, 1914, to 211,000 on March 31, 1921, or an increase of 41 per cent. At present the increase is about 67 per cent. In the year 1913-14 there were 1,243 employees per million train-kilometers and at the present time there are 1,878.

A special committee made up of members of the House of Representatives and members of the Senate, as well as representatives of the government employees, appointed by the government to reorganize the railway administration with a view to reducing expenses, is endeavoring to make a large reduction in the number of railway employees.

The freight rates have been increased by 400 per cent above the rates of 1915 while the passenger fares have been increased, for first-class, 350 per cent; second-class, 250 per cent; and third-class, 120 per cent. A law has just been passed for the reorganization of the freight railway tariff. The old tariff, approved in 1884, had 770 items for the classification of the freight, while the new tariff has only 77. The new schedule follows the Belgian system.

The commercial and industrial organizations of Italy have called the attention of the government several times to the fact that the increase of rates is not having the effect of increasing railway revenue, but on the other hand it does encourage the merchants not to ship by train and the people to restrict their traveling as much as possible. The shippers are using motor lorry routes, which sprang up after the armistice throughout the whole of the Italian peninsula to a large extent as their rates are some 50 per cent lower than those of the railways.

New Requirements of the Railways

The political and economic consequences of the war have changed the currents of traffic in Europe and these changes, as well as the importance the Italian peninsula has acquired on account of its geographical position as a trade link between the western and eastern countries of Europe, makes it imperative to improve Italy's railway facilities. Furthermore, the impetus given the wood, mining and general manufacturing industries as a result of the war can only be maintained and developed by improving the railway facilities. Then there are certain districts of Italy which on account of the increased population require the construction of new lines, additional tracks and facilities.

The Italian Parliament has voted \$400,000,000 for the improvement of railway facilities, but even this is not enough to carry on all the necessary work. To assist in the rehabilitation of the railways the government has decided that Germany be called upon to send to Italy, on the reparation account, as much railway materials as possible for these improvements and for the electrification of the most important lines. The Italian industries have strongly objected to this plan of the government and demand that Germany supply the raw materials only, allowing the Italian industries to manufacture the finished product. Otherwise, they say, the iron and the engineering industries will have to shut down.

The industrial organizations are now taking advantage of

the large deficit of the Italian railways to point out the necessity of denationalization of the railway system. They claim that if the railways are properly managed they will become the best customer of the Italian industries, and that under private management they will develop more rapidly and grow hand-in-hand with the industries. Furthermore, they claim the treasury cannot continue to meet the heavy railway deficits. By selling the railways to private companies, the national debt would be greatly reduced and the available railway securities would offer a splendid source of investment for the Italian banks and would thus strengthen their position. In the meantime steps should be taken to put both the banks and the treasury in a position to check the invasion of foreign capital which is taking possession of the great Italian firms and industries.

New Construction Needed

Italy is sadly in need of new lines, the most important of which are the following:

Northern Italy:

Cunco-San Dalmasso di Tenda-Ventimiglia
Aosta-Chamberg
Milan-Genoa (direct line)
Mals-St. Moritz (Switzerland)
Calabso-Cortina d'Ampezzo
Verona-Bologna (direct line)

This will total about 1,200 miles.

In the Venesia Giulia the changed political conditions render necessary the construction of a new line between Goivsia and Klagenfurth, avoiding the Yugoslav territory, and thus rendering the traffic between the port of Trieste and German Austria independent from eventual restrictions of the Yugoslav government. Furthermore, a new line will be built between Trieste and Fiume, as well as one between Fiume and Pola totaling about 310 miles in length.

During the recent conference of Portorose the attention of the governments of the countries of the former Austrian-Hungarian monarchy was drawn to the necessity of improving the communications between Dalmatia and Central Europe and it has been suggested to connect Fiume with Zara by a ferryboat service to the islands of Cherso-Veglia-Arbe and Pazo and with a line from Zara to Kuin. The cost of such project would amount to over \$100,000,000.

Central Italy.—The requirements in this section are a line between Rimini and Urbino; the construction of a faster line between Florence and Bologna and between Rome and Ancona and Rome and Naples, a total of 932 miles.

Southern Italy.—Here over 1,000 miles are required to connect the interior of the peninsular to the various ports, and the interior of the island of Sicily with the most important commercial centers, Messina and Catania.

Sardinia.—In a government report it is stated that the island of Sardinia has sufficient mineral wealth to cover most of the whole demand of Italy, but its development is rendered impossible by the lack of proper communications. The government plans to establish a new communication between Lombardy and Sardinia through Leghorn and Corsica, which will shorten the route between Italy and Sardinia by 93 miles. Moreover, 621 miles of roadways will be built in Sardinia to connect the interior of the country with the ports.

These are the projects which the government intends to carry out in connection with the construction of new lines and it is expected that they will cover the requirements.

Rolling Stock Requirements

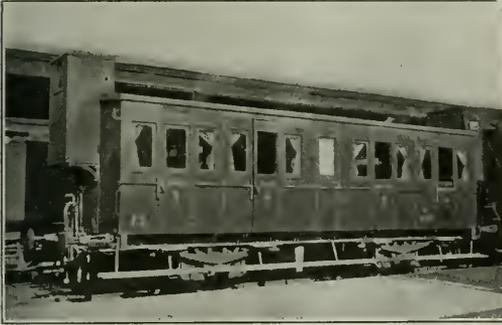

As regards double tracks, it is stated that the Railway Administration has been authorized to build about 3,169 miles of double track, although the needs of the country are estimated to be over 4,970 miles.

The railways are sadly in need of new equipment. The

following table indicates the requirements and the purchases authorized for 1922:

	Requirements	Purchases to be made
Steam locomotives.....	1,000	576
Electric locomotives.....	500	298
Passenger cars.....	1,000	640
Baggage cars.....	500	250
Freight cars.....	3,500	2,960

While the large amount of equipment purchased in the United States during the war has given satisfaction there is at the present time but little likelihood of further purchases being made in that country. In the first place, the Italian industries are seeking to obtain the monopoly for the supply of the railway rolling stock to the Italian railways, and in second place the cost of the home product is cheaper than the American equipment because of the rate of exchange. Furthermore, the industries developed during

An "Old Timer" for Second-Class Passengers Still in Service

the war need business to keep them going. While there is not a direct possibility for the sale of American railway rolling stock and supplies in Italy it may be stated that there is the possibility of Americans participating in this business by investing capital in the Italian enterprises.

American capital would be welcomed in the Italian industrial circles, particularly as it would mean Italo-American economic collaboration. With proper development Italian railway industrial plants would be in a position to supply all the countries of Central Europe and the Balkans without heavy transportation costs; at present this market has untold possibilities.

In consequence of the crisis in the shipping industry, especially in Venesia Giulia, the recently annexed regions of Italy, it has been suggested to transform certain of the large shipyards of Trieste (Cantieri di San Marco e San Rocco and the Cantiere of the Stabilimento Tecnico Triestino) into plants for the manufacture of locomotives and cars for exportation to Jugoslavia, Roumania, Austria, etc.

Electrification

A comprehensive electrification program is being developed for the purpose of relieving the fuel situation. Italy having no coal is dependent on foreign countries for her supply; this during the war was a great handicap. The present plans involve some 3,000 miles of line. This work is in a measure dependent upon the development of the hydro-electric power stations. In 1915 there were 329 hydro-electric plants of over 300 hp. each, which produced 935,000 hp. This number was increased to 383 in 1920, with a total capacity of 1,152,120 hp. There are now in process of construction 54 additional plants which will have a capacity of 359,210 hp. This, with the capacity of the smaller plants, will give Italy a total hydro-electric capacity of 1,811,330 hp. Plans have been developed for additional plants to the

extent of about 950,000 hp. The government has been delayed in developing the hydro-electric program because of the poor financial condition of the country.

In August, 1920, there were 235 miles of line under electric operation; in June, 1921, there were added 56 miles; it is expected that by June, 1922, another addition of 213 miles will be made, making a total of 504 miles. On January 1, 1922, work involving 521 miles of line will be started in northern Italy, connecting Genoa, Pisa, Florence, and Bologna; recently the electrification of the line between Bologna and Milan (134 miles) was authorized.

Plans are in process of completion for still further large electrification schemes. That which will be in operation by July, 1922, it is estimated, will effect a saving of 1,000 tons of coal per day.

In Northern Italy the system to be used is three-phase at 16 cycles, whereas in Central Italy the system will be three-phase at 46 cycles. In Southern Italy, on the other hand, continuous current will be used.

Competition Between Railways and

Other Means of Transport

The government is planning to establish mail and passenger air services but seeks to avoid, as much as possible, the competition with the railway services. These plans for the present are restricted to services between Naples and Sicily and Tripoli and between Brindisi and Corfu.

Competition between sea transportation and railway transportation is limited only to certain Adriatic lines of local importance which do not materially affect the traffic of the railways.

What has hurt the railway traffic most is the automobile services established after the armistice, especially in connection with the transportation of freight. In the Italian peninsula there are 600 automobile lines for passenger service and 200 lines for freight service. The Fiat Auto Company has requested the permission of the government to establish 410 additional automobile lines for passenger service.

The passenger services compete especially with the secondary railway lines connecting large centers, such as Turin, Bologna, Trieste, Rome, and Naples, with the small villages of the respective districts, while the freight services connect the large cities, such as Turin through Milan to Trieste, Milan and Trieste to Rome, Naples with Rome, etc. Being fast and less expensive than the railway services they are preferred by the shippers.

Labor Organization

There are three organizations of railway workmen in Italy—namely, the Socialist Workmen Organization (Sindacato Italiano dei Ferrovieri) with headquarters in Bologna, the Catholic Workmen Organization (Sindacato Bianco dei Ferrovieri Italiani) with headquarters in Milan, and the National Association of Railway Workmen (Associazione Nazionale dei Ferrovieri Italiani) with headquarters in Milan.

In consequence of the strikes of last year the parliament passed a law authorizing the increase of the wages 400 per cent, establishing a new base between the salaries of the clerks and the wages of the workmen which cut down the great disparity between the two which existed previously.

Railway labor has found the futility of continuously striking and is beginning to realize the true economic condition of the country. At the recent strike in Rome members of the Socialist Workmen Organization remained at work and operated the trains. The government has also taken strong measures against the agitators so that now the labor situation is far better than it was immediately following the war. The government will reduce the number of employees instead of salaries in the endeavor to economize.

The Beautiful Station at Lausanne, Switzerland

The Swiss Railways in the Year 1921

Loss of Traffic Brings Deficits—Complete Electrification Planned—Effect of High Exchange Rate

By Julian Grande

ALTHOUGH Switzerland's population, according to the census of last May, is only 3,883,700, including foreigners, her state or federal railways at the end of 1920 had a total working length of 1,895 miles. Besides the federal railways, Switzerland has the following company-owned lines:

Nature of Railway	Miles
35 standard-gage lines (mainly electric).....	549
67 narrow-gage lines—total working length.....	945
17 cogwheel lines—total working length.....	73
37 tramways—total working length.....	303
49 cable railways—total working length.....	31

The total amount of capital, share and bond, invested in all these different non-state Swiss railways and in tramways amounts this year to \$154,860,000. On the federal railways alone last year 39,410 persons were employed—a figure which has just been reduced, for economy's sake, to 35,832, which will mean a saving of \$2,000,000 in wages and salaries—a reduction from \$45,600,000 to \$43,600,000.

The financial situation of both the federal and private lines in Switzerland is serious. For the federal railways the deficits are as follows:

Deficit remaining over from the war and the period immediately succeeding it.....	\$18,747,600
Estimated deficit for 1921.....	16,000,000
(The original estimate was \$9,777,658.)	
Estimated deficit for 1922.....	6,071,000
Probable total deficit at the end of 1922.....	40,818,600

Rate Increases Do Not Bring Increased Earnings

The Swiss railway receipts for the first seven months of 1921 compared with those for the corresponding period of 1920, show that the passenger traffic receipts, despite greatly increased fares, which have driven more than 90 per cent of passengers to travel third-class, rose only about 3 per cent (from \$26,780,000 to \$27,600,000). This increase applies

to all lines: the increase for the federal railways is still less. The following figures show the position of the Swiss federal railways from January to the end of October in 1920 and 1921:

	1921	1920
Passenger receipts (January-October).....	\$21,361,285	\$21,139,959
Freight receipts (January-October).....	34,833,968	43,542,240
Total receipts (January-October).....	\$56,195,253	\$64,682,199
Total operating receipts (January-October).....	\$58,397,800	\$66,670,143
Total operating expenses (January-October).....	55,945,863	57,154,564
Net operating revenue (January-October).....	\$2,451,937	\$9,515,579

BECAUSE of the high rate of exchange for Swiss money neighboring countries route traffic around that country to escape paying rates in Swiss currency. For the same reason the tourist travel, which before the war was a large source of revenue, is greatly reduced. Swiss rolling stock and road bed are in excellent condition compared with the neighboring countries. Electrification is progressing despite the difficult financial condition.

The results, therefore of the first ten months' working of the Swiss federal railways in 1921 are worse than those of the corresponding period of 1920, which was considered such an unfavorable year from the railway receipts standpoint. The returns of the federal railways per mile are less up to October, 1921, than they were during 1920.

Bad as is the financial situation of the Swiss federal railways, however, it is not relatively so bad as that of many other European railways. Indeed, it is better, as the following table will show:

Railway	Mileage	Deficit at end of 1920
Paris, Lyon & Mediterranean (France).....	6,027	\$120,000,000
State railway (France).....	5,592	154,000,000
State railways (Italy).....	9,371	210,000,000
State railways (Belgium).....	2,734	36,000,000
German railways.....	54,175	3,250,000,000

The Privately Operated Lines

As regards the private-owned lines in Switzerland the situation is not much more satisfactory. The following were

the decreases or increases in receipts during the first eight months of 1921 as compared with the corresponding period of 1920:

PRIVATELY-OWNED LINES	
Standard-gage lines, decrease.....	4.8 per cent
Narrow-gage lines, decrease.....	.6 per cent
12 cogwheel lines, increase.....	34.5 per cent
40 tramways, increase.....	.1 per cent
46 cable lines, increase.....	5.8 per cent

The main reasons for the general decrease in the receipts of Swiss railways are, besides the high cost of materials, and especially coal, the increases in wages and salaries found necessary because of the rise in the cost of living, the unsettled state of Europe, and the introduction of the eight-hour working-day. Rails, for instance, rose greatly in price, making it harder to keep the lines in good working order. Rails cost \$34 per ton, f. o. b. Basel, in 1913, but during the war the cost increased to \$100 and even \$120. During the war Switzerland had to carry her own freight from Mediterranean ports, and consequently had to add considerably to the number of her freight cars. These numbered 19,300 in 1913, and 25,000 in 1920. Before the war a steam locomotive cost 14.5 cents per pound. During the war this rose to 72.5 cents. Coal and railway material generally are now falling considerably in price here, but are still much dearer than before the war.

Decrease in International Traffic

What, however, has really caused the Swiss railways in general so much loss is the enormous decrease of international traffic, due to unsettled conditions. Switzerland is a natural European railway junction, and, under normal conditions, a highway of trade across Europe in all directions. Freight between Belgium and Italy, Germany and Italy, and to a great extent also between Northern France and Italy used to be carried over the St. Gotthard line. Now, with the decrease of commerce and the abnormally low value of the money of Germany, France, Belgium and Italy, these countries find it more advantageous to transport their merchandise by a much more circuitous route, or even by sea, thus avoiding having to pay Swiss railway freights in Swiss francs.

Again, a very large amount of passenger traffic used to pass through Switzerland, besides which the Swiss inland trains used, especially in summer, to carry very considerable numbers of passengers. It is estimated that, before the war, some 4,000,000 tourists annually visited Switzerland. Now only a very small proportion of this number are able to visit the country, mainly because of the high exchange.

Motor Car Competition Serious

Before the war the average American visitor to Switzerland traveled first-class, and he could, and often did, buy a fortnight's first-class ticket, available on all the Swiss federal railways and on the lake steamers, for only \$20, and a monthly ticket for \$30. During the war these general season tickets, as they were called, were abolished, and they have not since been reintroduced, except for a minimum period of three months, and at a cost of \$120, which is almost exactly double the pre-war price.

The result of the greatly increased fares and the much reduced and much less convenient train services is that Americans travelling three or four together have lately often found it cheaper and far pleasanter to buy a motor car in France and tour through Switzerland in it, thus avoid using the railways.

But it is not in passenger traffic alone that the results of the war have affected the receipts of Swiss railways. The competition of motor vans and motor lorries with the railways for the conveyance of heavy freight in Switzerland has become very serious. In 1914 there were only 751 such vans in the country; at the end of 1920 there were 3,331, and the number of motor vehicles of all sorts is greatly and con-

stantly increasing. Most of the railways and nearly all the lines of commercial importance being state-owned, it has not been so easy for them to introduce their own railway motor van services as it would have been in the case of privately-owned lines because of the red-tape involved. Consequently, private companies have introduced motor van transport into Switzerland, and these companies are already of considerable importance, with much capital behind them.

All that the State Railways Department has done hitherto is to ask the government to prevent motor van companies from competing with them, but it naturally can hardly do that. At present the railways cannot compete with the motor van transport companies if only because they have to maintain, not merely freight offices at every railway station of any size, but also because they have to keep the permanent way in order, and motor vans do not have to keep the roads in order nor maintain such a large staff of clerks, etc. Finally, they are not, as are the railways, bound by the eight-hour working day law.

The Swiss postoffice is also inaugurating a motor van service for the transport of mails and parcels within certain areas formerly served by the railways. An aerial mail service has been tried in Switzerland, but it was abandoned as being too expensive. On the other hand a passenger and mail service between Paris and Lausanne has just begun. Finally, petroleum was during the war and until a few weeks ago a Swiss government monopoly, which made it much more expensive than it would have been if sold privately. This will also cheapen transport by motor vans, motor cars and aeroplanes.

Electrification

The Swiss federal railways hope electrification will enable them to put their finances upon a sounder basis. Switzerland has no coal mines, and has always bought coal from her immediate neighbors, mainly Germany and Belgium, although during the war she perforce bought it often from England and even from the United States, but at prices which rose from \$5.40 a ton in 1913 to \$38 per ton in 1920. The 1913 federal railway coal bill was \$3,507,400, but the estimated expenditure on coal (which has almost certainly been exceeded) for 1921 amounted to \$21,060,000, and yet coal has greatly fallen in price.

For this electrification work Switzerland was obliged, in 1920, to raise a loan in the United States of \$60,000,000 at 9 per cent interest. At the time of raising the loan it was stated that this sum was to be spent solely on the purchase of electric plant in the United States, on building electric power stations, and generally on continuing the work of electrification of the Swiss federal lines. A good deal of copper wire and certain electric cables were bought in the States, but since the German mark has fallen so much in value Switzerland has naturally turned to Germany to purchase there such of her railway requisites as she cannot produce herself.

The first of the federal railways to be electrified was the St. Gotthard line, 139 miles long, running from Lucerne to Chiasso, on the Swiss-Italian frontier, and traversing the St. Gotthard tunnel, 9¼ miles long. This line, it is expected, will be entirely electrified by April next, and already trains with electric traction are running from Erstfeld to Bellinzona. The locomotives, which have been built in Switzerland, cost \$200,000, or exactly twice as much as they would have cost before the war.

At present about 33 per cent of the entire network of the Swiss railways, federal and other, is electrified, or about 1,200 miles altogether. Single-phase alternating current is used in most every case. The cost of transforming a railway from steam to electric traction, however, is very considerable. The original estimate for the cost of electrifying the St. Gotthard line from Erstfeld to Bellinzona, through the tun-

nel, was \$7,700,000, plus about \$400,000 for repair shops; but the sum hitherto expended can hardly be less than \$20,000,000. It is difficult to estimate what the electrification of the entire St. Gotthard line will ultimately cost because the iron bridges have all proved too weak for the heavy electric locomotive and trains, and 60 of the smaller bridges have accordingly been reinforced by reinforced concrete, with a layer of ballast; the large iron bridges have to be either strengthened by arches underneath or be replaced by stone bridges, as has already been done in the case of nearly 20 bridges.

The number of electric locomotives at present used on all the electrified Swiss railways is about 50, but there are still 1,100 steam locomotives in use. The electrification of all the Swiss railways, broad and narrow gage, is expected to be completed within 12 years.

What it will mean to the federal railways alone to be able to use electric traction on all other lines may be gaged from the fact that in 1919 about \$13,800,000 out of the total expenditure of \$58,178,400 (or about 24 per cent) was for coal alone, and that with a still reduced train service. The total capital required for the electrification of the entire Swiss railway system, including power generating stations, is difficult to estimate, and will depend very much upon the waterfalls selected for the production of electric current; an outside estimate is \$100,000,000.

The question whether it will be cheaper to run the Swiss railways electrically than by steam is somewhat disputed; but since 1911 it has been proved that the cost of the electric energy used by the Lötschberg line was about two-thirds of what steam power would have cost.

Private Lines in Difficulties

The Lötschberg line, a privately-owned company, is also in financial straits, due to the war. On December 31, 1920, its total debit balance was \$4,349,514. Although a link between Eastern France and Italy, via the Simplon Tunnel, it depends much on local business and tourists. The original capital for its construction was mainly subscribed by France, but the Swiss government took advantage of the low-value of the French franc in 1920 to buy back 40 out of 44 million francs worth of Lötschberg bonds to Learer from the French. The ordinary share has been reduced 50 per cent and the preference share capital 20. Very badly hit by the war, this line began again in October, 1920, to pay some interest on its bonds. A misfortune with which it has to contend is that on the south side traffic has been frequently disturbed by avalanches and landslides. Experts consulted could only advise constructing two additional tunnels, one nearly two miles long, the other about 1,180 yards long, besides which a number of barriers and other constructions are necessary to hold up stones and rocks from the slopes above and generally prevent the line being blocked.

One of the Tragedies of Railway History

As for Swiss private mountain railways, the Bernese Oberland lines, which come largely within the category of tourist lines, have been electrified since 1914. The story of the Jungfrau Railway, the highest mountain railway in Europe, is one of the tragedies of railway history. Before the war it paid 5 or 6 per cent, but now it has become so deeply involved in financial difficulties that the share capital of \$900,000 is being reduced to \$460,000 by writing off, and various proposals are being made to the bondholders (bond capital \$1,400,000)—proposals which may perhaps save the railway from bankruptcy but will not fill the bondholders' pockets.

Another semi-tourist line which is virtually bankrupt this year is the Furka Line, with debts exceeding \$6,000,000, and share capital amounting to \$1,600,000.

A privately-owned line, the Rhaetian railways, which runs

to St. Moritz and Davos and the Engadine generally, is already partly electrified, and it is hoped that by June 1, 1922, the entire line of 173 miles will be in electric operation. The total cost of the electrification of this line will probably be about \$1,800,000.

The development of electrification work in Switzerland is hindered by the increased cost of material and labor. Before the war all the canalization and blasting as well as masonry work were done by Italians, who used really to be the tunnel builders of the Alps; but now the emigration of foreign labor into Switzerland is severely restricted, and instead of Italians, Swiss have to be employed, who are less skilful at this kind of work.

Nationalization Does Not Pay

The construction of most of the power stations intended to supply electric current to railways has to be done by the federal railways, and experience has shown, at any rate in this country, that government management is the most expensive management. The war has revealed to the Swiss—what they were already suspecting—that nationalization does not pay. No country has given nationalization so thorough a test as Switzerland, and nowhere is there now so powerful a movement on foot towards denationalization. At the beginning of 1921 Switzerland actually had 171,623 federal and federal railway officials. In other words, almost exactly one in every 22 of the country's population, including foreigners, was either a civil servant or a state railway official.

Campaign Launched

So profoundly disgusted have the Swiss public become with the results of state railway management, that a campaign was recently launched, asking Parliament to hand back the state railways to a private company. A special parliamentary committee has been appointed to consider Swiss federal railway re-organization. It was not long before it decided to reduce the number of members of the Board of Management of the federal railways from 55 to 11, and the number of railway districts and district managerial offices from five to three. The result will be that Switzerland will be rid of a great many superfluous officials, and it is estimated that salaries amounting to no less than \$1,000,000 will be saved.

New Work

It is doubtless owing to Swiss federal railway indebtedness that the 1922 estimates, just published, include only \$230,000 for new lines, of which about \$200,000 is for the second Simplon tunnel. The following are the other principal items on the 1922 federal railway estimates:

New rolling stock	\$5,277,800
(Nearly \$2,500,000 less than in 1921)	
Electric locomotives	4,182,000
Six motor vans	60,000
Sixty third-class passenger cars	518,800
170 freight cars	391,000
Constructions account generally	22,547,168
(About \$1,400,000 less than in 1921)	

Despite the general outcry about lack of capital for embarking on any new enterprises, engineers have been studying the question of piercing yet another great Alpine tunnel through the Splügen, which would greatly shorten the distance between Central Europe and the Adriatic and Italy. Naturally those interested in the Simplon and Gotthard lines are much alarmed at this new project, especially as the second Simplon tunnel is now completely masoned over and the electric installations are being fitted up.

Although the Swiss railways were severely tried financially by the war, nevertheless in one sense they have not come out of it badly. The rolling stock, generally speaking, has deteriorated little, if at all, and the permanent way is in good condition. The Swiss railways, however, cannot fully recover financially until Europe recovers.

Soviets Demoralize Already Inadequate System

Russia's Railway Mileage Has Decreased Since Revolution
—Equipment in Sorry Condition

By Dr. J. M. Goldstein

Professor of Economics, Institute of Industry and Trade and University of Moscow

UP TO THE BEGINNING of 1890 the railroad mileage of Russia developed slowly, as can be seen from the fact that up to the middle of 1890 the whole mileage of European Russia, including the Caucasus, hardly reached 26,700 versts (17,800 miles). By comparing the mileage of Russia of those days with the mileage of the United States at the same period we find that the mileage of Russia was hardly equal to one-ninth of the railroad mileage of the United States, notwithstanding the fact that Russia's area was about two and one-half times greater than the area of the United States.

Show Growth in Mileage

Because of a change in the financial and economic policy of Russia, chiefly due to S. V. Witte's taking charge of the finances, the country's mileage quickly rose, as can be seen from the fact that at the end of 1907, i. e., during a period of 17 years, the railways of European Russia, including the Caucasus, increased 85 per cent—to 49,000 versts. The amount of railroad freight traffic had increased still more by that time, as can be seen from the following computations:

Years	Railway mileage	Metric tons carried one mile (billions)	Tons carried one mile per mile of line (millions)	Tons carried one mile per inhabitant
1880	14,070	5.0	0.36	60
1890	17,800	9.3	0.52	92
1895	21,000	14.0	0.66	130
1906	31,870	26.7	0.84	200
1913	35,000	41.9	1.20	283

The density of traffic thus increased from the beginning of the eighties by 3½ times, and the number of ton-miles

per inhabitant increased approximately 5 times in 17 years.

Still faster grew the mileage for that period in Asiatic Russia, as may be seen from the fact that the mileage increased there from about 900 in 1890 to about 10,000 miles in 1914 (not including Russian Chinese Railway).

For the whole of Russia (excluding Finland) the increase in mileage during the following five years' period amounted to:

Years	Total increase of mileage, miles	Annual average increase, miles
1860-64	1,378	276
1865-69	4,445	889
1870-74	4,962	992
1875-79	2,290	458
1880-84	2,028	406
1885-89	2,874	575
1890-94	3,892	778
1895-99	9,924	1,985
1900-04	5,482	1,096
1905-09	4,156	821
1910-14	2,310*	462

*Approximately.

The railroad construction reached its maximum during the decade from 1895 to 1904. During that period about one-third of all the mileage existing in European and Asiatic Russia at the beginning of the World War was built and opened for traffic. How relatively small these maximum figures were in comparison with the railroad building in the United States, or even Canada,

is sufficiently shown by the fact that in the United States in the single year 1887 there were 12,800 miles of new railroads opened for traffic, and in Canada in the single year 1915, about 4,800 miles of new railroads.

The Situation When the War Began

At the beginning of the war, of the total of 46,600 miles of railroads existing in Russia (excluding Finland), the state owned about two-thirds and private companies about

one-third. Besides this, at the beginning of 1915 there were under construction about 9,400 miles of private and state trunk lines, 3,800 miles of which were in Asiatic Russia. At that time there were further outstanding franchises for the building of 6,200 miles of new roads. Most of these were to have been built immediately. Furthermore, there were under construction more than 310 miles of feeders and about 40 miles of small local lines.

Thus, had there been no war and revolution the mileage of Russia's railways, including those of the new formed border states, would have reached at the end of 1921 at least the 60,000 or 65,000 mark.

Formation of Border States Has Decreased Mileage

The formation of a series of independent border states, such as Latvia, Esthonia, Lithuania, Poland, etc., has greatly diminished the mileage of Soviet Russia, because in these areas the density of railroads was greatest. No wonder therefore that, according to official figures of the Soviet government, the mileage of European Russia comprised only about 32,000 miles in 1920, i. e., it had *decreased* 25 per cent since the beginning of the war. At the end of 1921, in view of the fact that there was no new construction, the mileage remained probably, at least nominally, the same. However, not having replaced the old worn-out rails by new ones, the mileage actually in working condition should be much smaller.

The Equipment Situation

Still worse is the situation of the railroad equipment. The American Relief Administration having sent railroad experts to Russia in connection with shipping of foodstuffs to the famine stricken areas, has received a report to the effect that water transportation is used wherever available for shipping food supplies to points in the famine districts, particularly along the Volga and Kama rivers. In the same report the American Relief Administration, quoting official papers of the Soviet government, states the following about the railroad equipment:

"Out of a total of 19,106 locomotives in Russia in good condition before the war, there were last August from 5,500 to 7,650 reported in working order by different authorities, or a decrease in motive power of from 60 to 75 per cent. Of that number about 1,000 were idle owing to lack of fuel. Serviceable cars were reported at from 150,000 to 286,000, a decrease of from 48 to 70 per cent of the pre-war number.

"The roadbeds were stated to be in very bad condition, necessitating extensive repairs if large sections were not to be closed to traffic. According to one estimate at least 25,000,000 ties had to be replaced with a program that called for only 5,000,000 replacements. Considerable mileage of branch lines had been removed and used for repair material.

"A decrease in production of coal by 80 per cent and the deterioration of the mines rendered the fuel situation serious and forced the railways to depend much more upon wood. This wood comes from the forests of northern Russia—a long haul to supply southern railways. An effort was made to change locomotives on the southern railways into oil burners, but the gradual decline of oil production retarded this.

"On August 10 last," according to Economic Life, official paper of the Soviet government, "out of 437,152 freight cars listed, 122,007 were 'sick' cars, i. e., utterly unfit for any use, and only 195,595 cars registered as in working order.

"But of this latter number," it is explained, "no more than 30,000 were really first-class cars, i. e., in a condition to carry loose grain and potatoes. At the most conservative estimate, at least 60,000 such cars would be required for transport during the ensuing season."

"The situation had been growing worse up to August, 1921. It was shown that in January, 1921, there were 463,397 cars registered, of which 96,960 were 'sick' and 294,124 in working order.

Later communications in the Economic Life of September 25, 1921, do not picture the situation in brighter colors:

The results of repair work completed on railway engines during August, states the official paper, fell considerably short of the program; the quality of the work done and the speed of production at the railway workshops has been constantly going from bad to worse. This decrease in production was caused by the same usual reasons: Lack of food supplies, materials, tools, and machinery, etc. The laborers because of lack of food fail to come to workshops, and the number of absentees has increased to such an extent that the problem is becoming more complex every day. To judge by the data furnished by 12 railways for the month of July, this absenteeism reaches only the average 30 per cent. This tendency has been more manifest on the South-Eastern Rail-

One of the 500 Tank Cars Built by the Canadian Car and Foundry Company for the Russian Soviet Government

way, where non-attendance of workmen amounted to 57 per cent; on the Tashkent Railway, 40 per cent; on the Syzran-Vjazma Railway, 39 per cent; Moscow-Kursk Railway, 32 per cent; Northern, 31 per cent; Moscow Baltic, 30 per cent.

Antique Locomotives the Rule

Speaking of the causes which make the efficient functioning of the railroads of Russia difficult, it is necessary to mention here the following important facts. The majority of locomotives existing in Russia in 1921 were very old, as may be seen from the following data. According to age, all locomotives in Russia can be divided in the following groups:

Over 45 years..	10 per cent
30 to 45 years..	11 per cent
15 to 30 years..	50 per cent
Less than 15 years	30 per cent

About 50 per cent have thus been in use for 25 years or more. It is not strange, therefore, that at the beginning of 1921 about 61 per cent of the locomotives needed more or less extensive repairs, which could not be fully realized due to the insufficient number of workers, as well as to the lack of supplies.

Rehabilitation and the Opportunity

for American Enterprise

The complete breakdown of the railroad system of Russia outlined above and the Soviet government's lack of means or credits shows clearly that the restoration of the functioning of railroads can take place only after the appearance in Russia of a more stable government, which, having obtained through an election the support of the whole nation, will be able to secure recognition and financial aid from foreign governments. Splendid prospects will then be opened to American manufacturers of locomotives, cars, rails and other supplies, as well as for American capital in general.

German Railways Operating Under Difficulty

Heavy Deficits Still Obtain—Physical Conditions Are Improving,
Although Far from Pre-war Standards

By G. Reder

WITH FEW EXCEPTIONS all German railways are owned by the state. Till April 1, 1920, they were operated by the different federal states of the former empire but they are now operated as one unit by the state and are known as the "Reichsbahn." This includes 92.2 per cent of the mileage of the country. Of the important companies only the Luebeck-Beuchen Railway, which operates the double track from Hamburg to Luebeck and Beuchen and which owns about 85.75 miles of line, retains its old form. The smaller railways are to a great extent in the hands of private companies, but the state, municipalities and districts are also strongly interested in them.

The state railways are controlled by a Ministry of Transport which is under the direction of the former general manager of the military railways during the war. The ministry is divided into ten sections: Administration, personnel, transport, exploitation, rates, finances, rolling stock and maintenance, machinery and electrification, construction and inspection of other railways.

The total length of the German railways is about 36,000 miles, of which 69.5 per cent have double tracks or multiple tracks. As in all the countries of Central Europe, a great increase in this mileage is not to be expected. The loss of territories through the peace treaty led to a reduction of 2,500 miles in the pre-war mileage.

The latest figures available (1919) show that the total capital investment was 21,320,000,000 marks (\$5,330,000,000). The total revenues and expenses (in millions of dollars) for the seven years ending with 1919 are given in the table.

Before the war the net receipts from the railways were an important item in the state budget. Although the revenues fell in 1914, due to the diminution of traffic following the mobilization, in the following years they increased with the reopening of the train service. But the deficits came with 1918 and have continued ever since.

GERMAN railways have experienced most astounding deficits since 1918. Some believe that private ownership is the only solution of the present problem. It is argued that whereas they were successful under an iron-clad monarchy that in a democratic government, such as now obtains, they are doomed to failure.

The railways have all been grouped under one head and considerable progress has been made in improving their physical condition.

The greater part of the locomotives and freight cars were turned over to war purposes. The conquered railway material did not begin to meet the needs of the traffic behind the front. Economical operation was impossible with the reduction in the number of locomotives for home use because of the demands from the front. The quality of coal decreased and where only 7 to 10 per cent ash in the coal obtained before the war it was necessary to accept coal with 25 to 30 per cent ash. Steel fireboxes were used in place of copper, which is foreign to German practice. Shut off from the mineral oil fields it was necessary to use inferior lubricating oil made from tar which increased the number of hot boxes to over 20,000 per month at the beginning of 1920. In 1920, 60 per cent of freight cars were in need of repair.

The labor troubles at the time of the revolution in 1919 and the beginning of 1920 had also

REVENUES AND EXPENSES IN MILLIONS OF DOLLARS				
Year	Revenues	Expenses	Surplus	Deficit
1913	712.64	499.48	213.16
1914	638.04	503.16	134.88
1915	688.18	497.04	191.14
1916	802.3	578.66	223.64
1917	938.22	778.28	159.94
1918	941.48	1,203.14	261.66
1919	1,602.62	2,413.34	810.72
1921 (estimated)	3,750.00
1922 (estimated)	2,700.00

serious effects on the condition of the equipment. After the war the number of employees on the railways increased to a marked degree. In 1913 there were 740,000 employees and in 1919 this had been increased to 1,121,000; it was reduced to 1,091,000 in 1920. Of course the eight-hour day is responsible for some of this increase. However, with the great reduction in traffic there are far more employees than are necessary.

The depreciation of the mark has had its influence on the increase in expenses, increasing the cost of raw materials from 39 per cent of the total expenses in 1913 to 47 per cent in 1920. One ton of coal cost 13 marks in 1912 and

introduced. Standard rolling stock has been designed to permit of greater production and there has been no hesitancy in the application of improved devices such as superheaters, feedwater heaters, etc., which will reduce the cost of operation.

Present Conditions

The situation at present is improving. The trains are running more regularly and the passenger service has materially improved as compared with two years ago. The speeds have increased but are still under what they were in 1913. For instance from Berlin to Frankfort the express-train time in January, 1921, was 10 hr. 37 min. instead of 11 hr. 26 min. as in 1919, and which corresponded to an average speed, including stops, of 33 m. p. h. and 30.5 m. p. h., respectively. In 1913 it was 7 hr. 8 min. (corresponding to 49 m. p. h.).

Future Development

There has been considerable talk concerning a return to private management for the German railways because of the huge deficits that have been experienced and Hugo Stinnes, it is rumored, is seeking control. There is not much likelihood of this being done, however, for it is believed that the new railway finance law now in preparation, which will separate the railway affairs from the general state budget and the influence of parliament, will produce results comparable to those secured under private-ownership.

Photo by Keystone

Station at Cologne, Germany

330 marks in October, 1921, or 26 times more; one ton of rails cost 118 marks in 1913 and 2,277 marks in October, 1921, or 20 times more. One ten-wheel locomotive cost 94,000 marks in 1913 and 1,580,000 marks, in the summer of 1921, or 17 times more.

Restoration of German Railways

The first step taken to replenish the depleted rolling stock after the war was to place orders for repairs with the idle industries and ship yards to keep the workmen busy. The amount of work involved cost some 20,000,000,000 marks (\$4,000,000,000 at the normal rate of exchange) and included more than 2,800 locomotives, 3,600 passenger cars and 54,500 freight cars in 1920. This year (1921) there will be delivered about 1,870 locomotives, 3,300 passenger cars and 45,600 freight cars.

To cover the rapid increase in operating expenses several increases in freight rates have been made, the averages being shown below.

Date	Percentage Increase
October 1, 1918, cumulative increase of	4 per cent
April 1, 1919, cumulative increase of	7 per cent
October 1, 1919, cumulative increase of	195 per cent
March 1, 1920, cumulative increase of	301 per cent
December 1, 1920, cumulative increase of	380 per cent
April 1, 1921, cumulative increase of	532 per cent
December 1, 1921, cumulative increase of	571 per cent

Regardless of this increase it has not been possible to meet expenses and endeavors are being made to reduce expenses by increasing the capacity of shops. To this end time studies are being made and detailed cost accounting

Railway Situation in Other European Countries

Comments on the Problems and Present Conditions of the Railways in Norway, Sweden, Spain and Belgium

By Robert E. Thayer

THE RAILWAYS of the smaller European nations, whether they be state-owned or not and even though they were not involved in the war, have been severely hit by the war. The following brief notes will give an idea of the situation in Scandinavia, Belgium and Spain.

Norway and Sweden

The principal railways of Norway and Sweden are of 4 ft. 8½ in. gage. In Norway practically all of the standard gage lines and 80 per cent of all lines (1,850 miles) are operated by the state, whereas in Sweden the state operates 3,425 miles of line which is about one-half of the standard gage mileage and 38 per cent of the total mileage of the country. In both of these countries railway expenses have increased to an abnormal degree even though they were not direct participants in the war. The following figures give the net results (surpluses or deficits) of gross revenues and expenses for a period of eight years from 1914 to 1921, inclusive.

In Sweden the freight rates are now from 100 per cent to 250 per cent (according to the nature of the commodity) higher than the 1913 rates

and are some 50 to 100 per cent (of the pre-war rates) lower than the rates in effect during 1920. It is believed that the present rates, with the general decrease in the cost of materials and labor, will be adequate to meet the expenses for the coming year. The passenger rates have been increased (above the 1913 rates) some 238 to 330 per cent, according to the distance traveled, for first-class passengers; 181 to 260 per cent for second-class passengers, and 141 to 207 per cent for third-class passengers. These are the maximum rates since 1913 but a reduction is expected early in 1922.

In Norway the freight rates have been increased twice since 1913 and are now 200 per cent higher for all merchandise, with the exception of certain foodstuffs, fodder, manure and fuel, for which the increase is 160 per cent. An attempt has been made by the shippers to obtain a decrease because of the depressed business conditions but the government would not permit it as the railways are still operating with a deficit. The passenger rates are 180 to 190 per cent (first-class) and 140 to 150 per cent (second- and third-class) above the 1913 rates and are at a maximum

except for the second-class rates, which have been as much as 180 to 190 per cent above the 1913 rates.

The wages in Sweden are about 200 per cent higher than in 1913, the maximum increase since that time having averaged about 290 per cent. The present wages are subject to a reduction with the cost of living. The eight-hour day is in effect which, with the increase in wages, has been largely responsible for the great increase in operating expenses. A

THE RAILWAYS of Europe, whether or not they are in the countries which participated in the recent war, have not been immune from the serious effects of the war. Deficits are the rule, with increased wages and shortened working hours as the principal causes. Nowhere has the economic balance been struck—the high transportation charges required to meet the greatly increased wage bill and material costs threaten to stifle industrial development.

NET FINANCIAL RESULTS OF GROSS EARNINGS FOR THE RAILWAYS OF NORWAY AND SWEDEN

Year	Norway	Sweden
1914	\$8,180,000	\$6,290,000
1915	10,780,000	7,380,000
1916	12,100,000	6,610,000
1917	5,630,000	2,155,000
1918	-25,710,000	-14,770,000
1919	-14,570,000	1,370,000
1920	-14,080,000	7,930,000
1921	1,500,000

similar condition exists in Norway, where wages have advanced by 200 to 250 per cent.

The equipment of both countries has increased as shown in the following table; as regards maintenance the condition is on the whole about the same as in 1913. Sweden has purchased some of its new equipment from foreign countries.

EQUIPMENT SITUATION ON THE STATE RAILWAYS OF NORWAY AND SWEDEN

Year	Norway			Sweden		
	1913	1921	Per cent increase	1913	1921	Per cent increase
Locomotives (steam)	385	530	38	890	1,083	22
Passenger cars	855	1,041	22	1,697	2,003	18
Freight cars	8,714	11,685	34	22,943	27,556	12

In view of the general shortness of money and also because of the poor business conditions throughout the world there are no heavy railway capital expenditures to be made in either of these two countries.

Spanish Railways

That the Spanish railways are in a precarious condition is evident to anyone who has traveled in that country. Passenger trains are consistently late and because of the depressed finances of the country and the great amount of work to be done the companies themselves find it financially impossible to undertake the necessary work. There is a movement in government circles to nationalize the railways but the government finances will not permit of even this being done at present. The rates are not high enough to meet the increase in expenses and it has been proposed to increase them by an additional 35 per cent—the one and only increase of 15 per cent was made on January 1, 1919—making a total of 50 per cent above pre-war rates. The Spanish senate has approved this increase but the government has not seen fit to put it into effect because of the critical condition of the nation's business.

There are four principal lines in Spain; the Northern; the Madrid, Zaragoza & Alicante; the Madrid, Caceres & Portugal, and the Andalusian, all of which serve individual territories with practically no competition. The total mileage of the railways is 9,430 miles, most of which has a gage of 5 ft. 5¾ in. The lines are operated under concessions similar to the French railways and these will expire within some 25 years.

The latest figures available (1920) show an operating ratio of 77.5 per cent but this must be discounted by the poor physical condition of the track and equipment. While there were some 200 more locomotives in the year 1920, as compared with the year 1913 (2,100 in 1913 and 2,300 in 1920), the condition of these locomotives was such as to render the

number of available locomotives much less than in 1913. In January, 1921, the Spanish government ordered over 100 locomotives from Germany at prices some 40 per cent lower than those of any other foreign country, including England and the United States. Spain imports most of its railway material and the United States has always had a large share of the car wheel and axle business, but with the depreciation of European currencies the real prices of European products are much lower than those from the United States.

The labor situation is by no means settled. Wages have increased to a large degree but even with the high rates strikes are not uncommon.

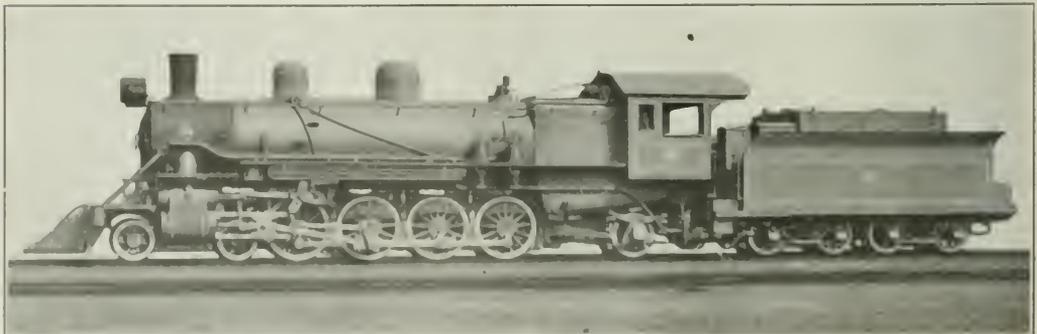

Belgium

The railways of Belgium have been occupied, chiefly, since the war, in the rehabilitation of their lines, equipment and structures. The manner in which they have entered upon this great task has already been discussed in these columns and while it cannot be said that they are back to pre-war conditions they have made very marked progress. Belgium has taken advantage of the great amount of reconstruction work that was required to rebuild their lines with a view to greater transportation efficiency and to ultimate electrification. The signaling system has been entirely renovated and a new system, which is a combination of American and English practice, has been installed under the direction of the late L. P. A. Weissenbruch.

Complete plans for electrification have been evolved and are ready for execution as soon as the financial conditions of the state permit (all of the main line railways are state-owned and operated). For this electrification the direct-current system at 1,500 volts with the third-rail has been adopted with three-phase power at 45,000 or 50,000 volts at power stations.

Belgium has found it necessary to go outside of the country for locomotives, orders for which have been placed in the United States and England. In addition there is a very marked determination to improve the operating efficiency of the locomotives. Extended tests are now in progress with feedwater heaters and exhaust injectors particularly. Much has been accomplished in improved fuel economy (Belgium imports most of its locomotive coal) by an excellent system of locomotive operation supervision with premiums or bonuses for the best performances.

Naturally the financial situation is and has been very bad and due to the fact that a large amount of reconstruction work has had to be done it is not possible to give accurately a proper idea of the finances. Suffice it to say, there have been heavy deficits.

Built by the Baldwin Locomotive Works for the Argentine State Railways

Railway Chaos Central Europe's Greatest Problem

Petty Jealousies and

Endless Custom-House Formalities

an

Effectual Barrier to Prosperity

CENTRAL EUROPE, by which is meant primarily those countries which were carved out of the old Austro-Hungarian empire, has a greater distance to travel toward restoring pre-war efficiency on its railways than any other part of the continent, with the exception of Russia. The extent of the disorganization of the railroads in that part of Europe was described in considerable detail in two articles by Colonel W. B. Causey, American Technical Adviser to Austria, which appeared in the *Railway Age* of October 15 and November 12. In view of the thoroughness with which the situation has been treated by Colonel Causey and the fact that there have been few developments of any special significance since that date, the present article will be restricted to a brief summary of the principal points brought out by Colonel Causey.

The economic standstill of Central Europe, with that of Russia, is admittedly one of the principal factors delaying the return of normal business conditions in the rest of the world. Furthermore, the breakdown of the railways in Central Europe is the primary cause of the productive inefficiency of these countries. The first step toward reviving prosperity in Central Europe must be the restoration of the effective functioning of the rail carriers.

The inability of the railways to perform their work properly, while partly due to the undermaintenance of the physical property, such as roadway and equipment, is chargeable principally to unwarranted political restrictions. Before the war traffic moved with freedom through the whole Austro-Hungarian empire and, with only few hindrances, over international boundaries. With the breaking up of the old empire into a number of independent states all this freedom has gone.

The nations are for the most part intensely jealous of each other and are chary of permitting the movement of traffic over their borders. The principal railway line between Vienna and Budapest passes through what is now Czecho-Slovakia. This line formerly handled an extremely heavy business. When the empire was dissolved this was changed. The Czecho-Slovaks would not permit the movement of Austrian and Hungarian trains through their territory. Consequently this main line fell into disuse except for local trains in Czecho-Slovakia and traffic between the two great cities, Vienna and Budapest, was restricted to a roundabout single-track line which led through the mountains.

Vienna is a great railroad center. Through it all main

Bratislava (Pressburg), the Czecho-Slovak Port on the Danube—Photo from *Underwood & Underwood*

routes from the west to the east and south of Europe pass. After the war some of the secession states found all their railroads centering in Vienna, a foreign city which could be reached only by undergoing troublesome customs formalities.

PROSPERITY throughout the world lingers, to some extent at least, because of Central Europe's economic breakdown. Renewed productive activity in Central Europe awaits a return by the railways to pre-war efficiency. These railways must be freed from the artificial barriers to the free movement of traffic which the new Central European states have set up. The problem is to secure co-operation between the various states and bring about physical rehabilitation of the roads.

Let us think an analogous situation in terms of our own country. Suppose that each of our states was an independent nation, intensely jealous of all the rest. Let us imagine, if we can, how traffic on the Lackawanna would be affected if there were customs boundaries between New York and New Jersey, New Jersey and Pennsylvania and Pennsylvania and New York, and if none of the states desired to admit traffic from another. The situation would be further aggravated if the Lackawanna were the only through line to the west. Yet exactly such a situation prevails in some parts of Central Europe. Under such conditions in this country Kansas could get few of the products of Chicago's factories and Chicago would suffer for lack of Kansas wheat. Production would be at a standstill as far as all practical purposes are concerned. A part of the nation would starve and the other would freeze. Disaster would be general. The world at large would suffer from the lack of those goods which it is accustomed to purchase from us and we would suffer from the lack of the commodities which the rest of the world could not afford to send to us without payment in kind. Thus economic conditions not only in this country, but in the entire world, would be affected.

Similarly the whole world is waiting for a revival of business; for Central Europe this means first of all a return of railway efficiency. The return of efficiency means that co-operation must replace the petty jealousies on the part of the new nations.

Central Europe is bound by universal economic laws. If transportation and the free interchange of goods is needlessly hindered, then business and prosperity must languish—particularly where the transportation tie-up takes place, but also in the rest of the world insofar as its productive activity depends upon exchanging commodities with the country affected.

Chinese Railways Experience Normal Year In 1921

New Construction Greatest Since 1916—Railways in
General Earning Substantial Returns

By Railway Age's Correspondent in China

PEKING, China.

RAILWAYS IN CHINA are classified under three categories: government, private, and "concessioned." Of the last named there are 2,294 miles, consisting of the Chinese Eastern, the South Manchurian, the Shantung, the Yunnan, and the British portion of the Canton-Kowloon lines. Private lines aggregate 477 miles and, except for two or three provincial efforts, are mostly mining auxiliaries. The government lines comprise about 4,030 miles.

None of the "concessioned" or private lines publishes statistics to an extent sufficient to yield an intelligent impression of their operations. It is known, however, that the chaos on the Chinese Eastern has been considerably reduced, and that under the guidance of John Stevens improved operating methods are gradually being introduced. The South Manchurian has felt the general slump in business sufficient to induce sweeping reductions in forces, and common report has it that a large American loan is being sought. The Shantung Railway is believed to be prosperous, but it is a fact that the strawbraid industry has been dead, the hair net industry has shifted its capital from Tsing Tau to Chefoo, and that there has been little doing in the peanut trade. The line is being boycotted as much as possible by the Chinese and it is difficult to see how a line can be prosperous when the principal industries in the territory served are stagnant and the natural patrons are hostile. Mining developments

under Japanese direction, however, may be sufficient to overcome the handicap.

The only effect of the war on Chinese railways was to bring about a shortage of rolling stock, a reduction in interest charges and higher costs of operating supplies. The road-bed suffered no change. During the years of 1920 and 1921 the shortage of rolling stock has been quite adequately corrected. The favorable rates of exchange by which Chinese railways paid interest charges and loan instalments to foreign creditors swung back to about normal in 1921, and will mean an increase in annual requirements of about six or seven millions of dollars, Chinese currency, compared with 1919. Materials in stock during the war were charged out of expenses at pre-war prices largely, although they had to be replaced at war prices. This left apparently large net revenue funds, when as a matter of fact the managements were not particularly flush with money. Now that the stores are stocked with the higher-priced materials, their gradual consumption will swell operating expenses and create an impression of hard times on the lines, when the lines will actually have larger free supplies of cash than they have had in recent years.

It is difficult to predict any "free supplies of cash," however, for the treasury of the Ministry of Communications has been "raided" several times during the past year. The first to get public recognition were the school teachers, who went

CHINA with a population of 300,000,000 has but 6,800 miles of railways. Manifestly this country offers a fertile field—offset somewhat by political conditions, it is true—for railway expansion. Steps have been taken toward standardization during the past year—in specifications for equipment, in rates and in accounting.

Keen competition by various foreign manufacturers for the equipment and supply business. Track and bridge materials should constitute major purchases in immediate future.

out on strike because of non-payment of salaries. The Ministry of Communications put the teachers back in the schools. The military chieftains, also, have undoubtedly had their share. During the latter half of the year Wu Pei-fu, in command of the armies about Hankow, placed his representatives in the stations on the southern half of the Peking-

Courtesy American Locomotive Company

The Peking-Kalgan, China, Traverses a Rugged Country

Hankow line, and these have remitted the station receipts direct to his headquarters. Care has been taken to keep clear accounts and to give receipts, so that these earnings will enter the statistics of the line and proper credit can be claimed by the line from the Ministry of Communications and by it from the Ministry of Finance, which in turn will

credit the Ministry of War. Thus does China progress in junction of the Cheng-tai and the Peking-Hankow railways, cutting "red tape" to a minimum.

of service, the usual advancement in the standardization program, and the usual increase in revenues. There has been an unusual amount of new construction. The year began with north China in the grip of the worst famine in 45 years. In the spring came an area of pneumonic plague, in the summer Wu Pei-fu's military movements around Hankow, and in the fall the floods along the southern end of the Tientsin-Pukow. The official figures for 1920 have not been published yet, due, it is said, to the "unscrambling" of the Peking-Hankow and Peking-Suiyuan lines, causing a delay in closing the accounts of those lines, but it is pretty well known that the operating revenues for 1920 were about \$90,000,000. If remaining months keep up the record of these earlier months, 1921 will overtop 1920 by fully five million. From the standpoint of railway revenue, the famine was not as disastrous as expected. Due in considerable part to funds contributed from America, no great loss of life occurred. Although famine grain was carried free and other grain at 75 per cent of normal rates, the increased tonnage of grain and the longer average haul actually increased railway revenue from grain.

Increasing New Construction

The year 1921 saw more construction work underway in China than any year since 1916, when the war interrupted all foreign activities. The most important single piece was the completion of the section from Fengchen to Suiyuan, on the Mongolian border, and the immediate beginning of a further extension to Paotow, on the northern bend of the Yellow river. A beginning has been made also on a branch line of 80 miles extending from Chinchow on the Peking-Mukden to Chaoyang, a coal mining region.

The Japanese have under active construction the extension of the Ssipingkai-Chenchiatun to Taonan. With famine sufferers as laborers paid out of surcharges on the various railway revenues, the Ministry of Communications has constructed the earthwork of a line from Shihchiachuang, the

Track Laborers on the Peking-Kalgan, China

debit the Ministry of War. Thus does China progress in junction of the Cheng-tai and the Peking-Hankow railways, cutting "red tape" to a minimum.

1921 a Normal Year

The year 1921 may be summarized as being typical of general conditions during a series of years. There have been the inevitable military manoeuvres, the usual pests and calamities, and the usual changes in administrative chiefs of the highest grades. There have been also the usual exten-

sion of the Cheng-tai and the Peking-Hankow railways, together with the earthwork and culverts of a branch to the Shantung Railway, extending from Weihsien to Cheefoo via Lungkow.

Deliveries of Equipment

The Lung-Hai has work underway at its western end, and the American Red Cross, as a means of famine relief, has constructed 850 miles of highway, much of which can be

easily converted into roadbed for desirable branch lines or extensions when it is desired to do so. The preliminary work has been undertaken for the double-tracking of the Peking-Mukden line from Tongshan to Chingwantao.

A considerable number of locomotives and cars have been delivered during the year. English firms secured the orders from the Shanghai-Nanking and Belgian makers part of the order on the Peking-Hankow. But all of the remainder, the Peking-Hankow, the Peking-Suiyuan, the Tientsin-Pukow and the Peking-Mukden, received their deliveries from American sources. With the conclusion of a contract with American interests for a large order of locomotives and goods wagons by the Peking-Suiyuan a few weeks ago, it would seem that the Chinese requirements along this line would be nearly met. At least the great shortage which accumulated during the war will be relieved. On the other hand, not much has been done toward an addition or replenishment of passenger cars, except on the Tientsin-Pukow, which has ordered five complete all-steel Pullman trains for the Shanghai-Peking run.

Progress Toward Uniformity

The standardization program of the government railways has continued. A uniform classification of goods, with weights and distances reckoned in the metric system, has been put in force on the contiguous lines, together with through-billing of freight. The clearing house in the Ministry of Communications has charge of the auditing. A uniform system of car reports and standard rules for car distribution has also been put in force. Perhaps the most drastic step yet taken in the improvement of the service, however, was the assumption of risk of damage to goods in transit by the government railways, beginning February 1. Railway risk rates are 10 per cent higher than owner's risk rates, and

any of the other pieces of earthwork which could be converted into rail lines. The line just mentioned is the connecting link between the Shansi coal fields and the port of Tientsin. The traffic of the Cheng Tai railway pays a re-

Courtesy American Locomotive Company

High Standards of Track Maintenance on the Peking-Kalgan, China

turn of nearly 9 per cent on that line, and the bulk of this traffic would be immediately turned over to the new line. It would seem, therefore, that the producers would be justified in offering very liberal terms of security to the management in return for a contract to equip the line. If negotiations

A Junction on the Peking-Kalgan, China

the shipper has his option as to which plan he wishes to use. Uniform stores accounts also went into effect during the year and uniform rules to govern public tenders for materials were promulgated a few weeks ago.

Opportunities for Exporters of Track Material

Perhaps the most promising field for American manufacture in connection with Chinese railways is to be found for track and bridge material. Undoubtedly the requirements of the Peking-Mukden line are covered already, but at this writing nothing has been done towards the rail and bridges of the Shih-chuachuang-Tangchow line of 170 miles, nor

were successful on the first line, the others would be worth looking into.

The "spiciest" event of the year was the opening of tenders for the Yellow river bridge. A jury of five had been selected to make the award and it soon developed into a quarrel between the French, English and Belgian members on the one hand, and the American member, supported by the Japanese member, on the other. After a series of charges and counter-charges from these members, the Chinese management concluded to hold up the award which had been made to a Belgian firm. The latest rumor is that new tenders will be called for, to be opened by a new jury.

A Recent Session of the Japanese Imperial Railway Association

Some Observations on the Japanese Railroads

2000 Miles of Private Lines Operated in Close Harmony with
6000 Miles of Nationalized Lines

By B. B. Milner

THE NATIONALIZATION of the railway lines in Japan effected in 1906-7 did not represent so much a change in the plan of administration in the nation's railways as it did an expansion of a nucleus already state-owned by incorporating therewith a large number of important privately-owned and operated lines. At that time, to the state-owned nucleus of 1,500 mi. were added 3,000 mi. of previously privately-owned and operated lines. To this combination of 4,500 mi., there have been subsequently added some 1,500 mi. of lines, built or purchased, so that the present nationalized mileage approximates 6,000 mi. This, with 2,000 mi. remaining in the hands of private owners and operators, constitutes the connected lines of the Island Empire.

A Japanese government loan built the first railroad lines in Japan and, as in the case of many other large enterprises, the state has always played a large role in the development of transportation. The co-operation of private capital and enterprise was encouraged from time to time, essentially because no other means could be commanded for providing promptly the mileage for which urgent demands had rapidly developed. The right of state purchase has been always reserved in case of any grant of permission for private construction.

The first lines, Tokyo to Yokohama and Osaka to Kobe, 18 and 20 mi. respectively, were completed in 1870 by a

British engineering corps to 3 ft. 6 in. gage, which was made, and has remained, standard upon the islands. The widening of this gage to 4 ft. 8½ in. has been advocated

NATIONALIZATION represents a prearranged development logically following state encouragement afforded the construction and operation of private lines.

Unified operation incident to nationalization carried with it standardization in all phases of operation, service, equipment and maintenance practice. The introduction of employees' welfare, insurance and relief benefit work began promptly.

Natural and economic conditions, cheap hydro-electric current, expensive and limited coal supply stimulates the replacement of steam by electric operation.

from time to time but the probability of this being undertaken within any reasonable period, if indeed at all, is very remote. The matter, it seems, was espoused by one of the political parties but has recently suffered defeat in the Diet. It is generally believed that the probable cost was greatly underestimated for those who advocated the change and that greater returns may be obtained for the Japanese shippers and travelers in the cost and character of service, by the expenditure of smaller sums and effort in other channels, particularly those bearing directly upon increases in the capacity of existing lines of the present gage. For the 700-mi. dense traffic line between Tokyo and Shimonoseki, one estimate of the cost of the gage change, \$110,000,000, was certainly a very low figure.

From State Aid to Nationalization

State encouragement—in some cases financial aid—stimulated private line construction and gave to Japan from this source more than 1,000 mi. of line within one ten-year period.

Mileage having been provided, the question next demanding attention was how these private lines, mostly short, disconnected and scattered about the country might be extended and organized into a single through-line system

insuring uniformly efficient service. This question was answered by the large nationalization project under which the purchase of 17 private lines was accomplished in 1906-7 by the issue of five per cent domestic loan bonds. In the case of nine properties, the price of purchase was determined upon the basis of previous operating profits. With the eight properties remaining the price was amicably arranged between the contracting parties so that in not one case was it necessary to make use of the arbitration committee provided for in the law authorizing the purchases.

The work of 1906-7, and consequent removal of many and various difficulties incident to the previous independent management of the many lines, indeed marked an epoch in the history of Japanese railroad operation. The Imperial Government Railway accounts are maintained separate and apart from other branches of governmental activities and all disbursements, construction, operation, and improvement costs are met from the profits accruing from traffic and a few closely related activities.

From the standpoint of utility, the results of government ownership and operation have been satisfactory. The service has been greatly improved, lines have been extended to remote quarters wherein private lines could not hope to succeed, passenger and freight rates have been lowered in spite of the general advances in the cost of labor and materials. The capitalization of the lines was in 1918, \$594,956,867, and the profits from operation amounted to 5.8 per cent over a term of years including the years ending in 1914, 15, 16, 17 and 18, within which years the profits amounted to

been divided into six grand divisions having headquarters at Sapporo, Sendai, Tokyo, Nagoya, Kobe and Moji respectively.

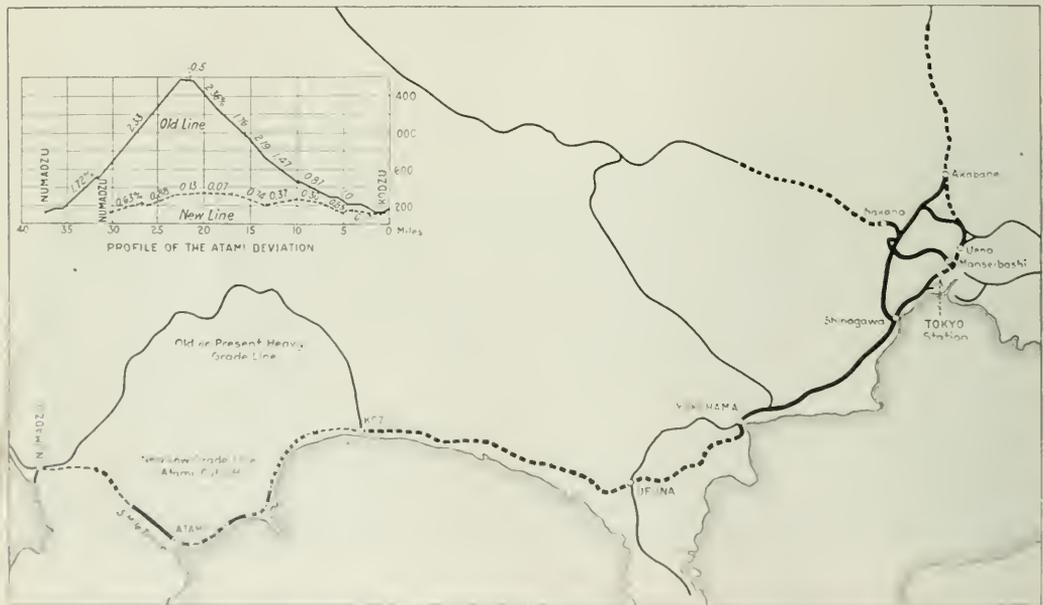

Tracks and Construction Work

The excellent condition of tracks, grade, alinement and ballast, is striking, particularly in view of the heavy rainfall

Typical Railroad Shop Bath House

and the amount of water to be contended with generally; it is only fair, however, to call attention to the maintenance advantages enjoyed by reason of the relatively low wheel loads and speeds. The latter average, for passenger trains,

Japanese Government Electrified Lines Near Tokyo and Projected Extensions

0.1, 5.5, 6.2, 7.2 and 8.3 per cent respectively. During the ten-year period following 1906-7, earnings per train mile increased \$0.13 while corresponding expenses fell \$0.0115. The proportion of freight traffic has increased to the point of exceeding passenger traffic since 1915, though by quite small margins.

With the consolidations effected, the organization was changed from departmental to divisional and the lines have

from 25 to 30 m. p. h. and for freight trains, from 15 to 20 m. p. h. on the more level sections. The excellent character of the large amount of retaining wall and other masonry to be found upon all the lines is very noteworthy.

On the main line, south of Tokyo and Yokohama, very important reconstruction work, known as the Atami low grade short line between Kozu and Numazu, is under way. This includes a five-mile tunnel, work upon which has pene-

trated a distance of one mi. from each end. This undertaking was originally estimated to cost \$12,000,000, but some \$17,500,000 has already been expended and a further like sum will be required for its completion. This increased cost is practically all due to the increased cost of labor and materials and therefore does not affect the ratio value of savings and operating advantages over those of the old line. By the time this new line is ready for use, the replacement of steam with electric operation will have been extended south and west from Tokyo and Yokohama to Numazu (79 mi.) or further.

Development of Electrified Lines

The line between Manseibashi station in Tokyo to Nakanō in the suburbs (8 mi.) was electrified in 1905 before

Japanese State Railway System

the Kōbu Railway, of which this section formed a part, was taken over by the government in 1906-7 and is now known as the Central Line. Then came the electrification of the Yamate Line from Shinagawa around through the suburbs of Tokyo to Ueno station and Akabane which was completed in 1910. The crossing of Usui pass west of Tokyo presented great engineering difficulties and on what continues to be the best location possible there is a vertical lift of 1,817 ft. in the 6.9 mi. from Yokogawa to Karuizawa and a total of 26 tunnels of length aggregating 2.8 mi. The obvious discomforts and difficulties incident to steam operation were eliminated in 1912 by the use of electric locomotives. On 5.2 mi. of this line the grade amounts to 1 in 15 or 6.7 per cent. Rack rails continue to be used and such an operation as part of a through line railroad remains unparalleled in the world.

The operation of a new double track electric suburban passenger service line between Tokyo and Yokohama (18 mi.) followed in 1915. This line, except for a short section between Tokyo station and Shinagawa, is operated at 1,200 volts instead of 600 volts, in view of contemplated extension of electric service over the present steam lines to Yokosuka,

and the extension of suburban electric service from Sakuragicho (present terminus of suburban service within the city of Yokohama) to Ofuna, thence to Kōzu and ultimately to Numazu and beyond over the Atami low grade cut-off.

The power sources provided for all of these electric operations were steam plants but more recently much attention has been given to possibilities of hydro-electric development in Japan generally, which is naturally suggested by the available water power and the economic necessity of conserving Japan's limited coal supply for such industrial purposes as cannot be served by electricity. In the *Railway Age* of December 10, reference was made to large orders for hydro-electric apparatus recently placed in this country. The Government Railways have now on order with three builders six electric locomotives for experimental use in lieu of steam locomotives on the lower grade lines about Tokyo as an initial step in an electrification program which spreads over three five-year periods and contemplates the replacement of steam on some 500 mi. of the more dense traffic sections of the lines around and south of Tokyo.

Standardization of Equipment

The extension of government ownership and operation brought with it standardization in many particulars and

Imperial Railway Association Club House at Tokyo

extensive investigations of various subjects and phases of railroad operation along broad lines, many of which have become the foundation of definite policy. The standardization of passenger car equipment was accomplished by the end of 1910. In the meantime little equipment was built save that possible with the materials on hand and taken over with the old private lines by the government. The lengths of the new standard cars became 55½ feet for four-wheel truck cars and 66 feet for six-wheel truck cars, against the prevailing 26 feet for the ordinary four-wheel cars replaced. The passenger car equipment of Japan is now electrically

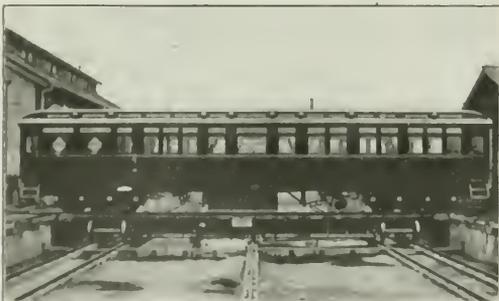

lighted (axle generator system), steam heated (pressure system) and equipped with vacuum or air brakes and English hook couplers. The latter are scheduled for replacement with automatic couplers as used in America in accordance with a carefully arranged program which will be pursued more or less rapidly as funds become available.

Corresponding organized standardization work was undertaken with regard to freight car equipment. The capacity of the larger cars at the time was seven tons and 1911-12 saw the completion of designs for standard nine-ton cars and standardization of two-axle designs for seven and ten-ton capacities respectively, which replaced more than 100 designs then on hand and in use. The link and pin couplers found in the northern island (Hokaido) lines were promptly replaced with American automatic couplers. By 1915 the capacity of standard cars on the main and southern islands became 15 tons, that of the Hokaido lines, handling a large coal business, 25 tons, and within ten years this capacity and 30 tons will doubtless be standard upon all the lines.

Economic factors and the preservation of a proper ratio between the weight of carload shipments offered by Japanese shippers and the capacity of cars supplied therefor, renders inexpedient too rapid introduction of high capacity cars such as currently used in America. The progressive disposition of the Japanese will push these capacities ahead just as promptly as operating conditions will warrant. Complete replacement of the hook coupler is programmed along with the introduction of the compressed air brake, there having been already shipped from America some 200 locomotive sets, 250 passenger car sets and 350 freight car sets.

Four types of locomotives were promptly standardized; a heavy grade 0-10-0 type, a Consolidation, an American (4-4-0) and a Mogul. A Pacific type passenger locomotive has subsequently been developed. All locomotive equipment has for some eight or nine years, been manufactured at plants developed at Osaka and Kobe.

A complete reorganization of repair shops was planned and undertaken. Ten leading plants were closed, eight developed and some 25 are now operated, 15 of which handle both car and locomotive work, one exclusively locomotive work, and nine exclusively car work. As in the case of

Exterior of Formosa Government Railway Private Car

locomotives all new car equipment is now being built in the Empire, the higher class passenger cars, viz., diners, sleepers and first-class coaches, in the government railroad shops at Omiya and Oi, the third-class coaches generally and a part of the new freight car equipment, as well as a part of the new second-class coaches, at an outside car building plant located at Nagoya.

Imperial Railway Association

The Imperial Railway Association, constituted of railroad officers from all over the Empire, is a thriving institution which holds annual meetings at varying points such as does

the American Railway Association and its branches. The association occupies the unique position, however, of having provided itself with a well appointed club house at Tokyo, which constitutes a most convenient and comfortable rendezvous for members living in and visiting the capital.

Research Bureau

The testing and research work of the lines was organized in a railway research bureau well equipped with physical and chemical laboratory facilities, a locomotive testing plant and a most complete dynamometer car which was purchased in the States. The reports of the bureau's work are issued in printed form from time to time in a manner suggesting the

Tracks and Signals Near Yokohama

practice of those lines in the United States which have spent the most time and funds on the matter of tests and reports.

Railway Institute

The Railway Institute, which was organized in 1909, for training railway men, is especially noteworthy. At the Central Institute, located in Tokyo, about 200 students are quartered, much as in a boarding school, for two years of training in either a railway business, mechanical or an electrical course. The students are selected from the ranks of young employees in accordance with aptitude and fitness developed in their service, and their regular compensation is continued during the term of their schooling. A special language course covering English and the elements of Russian is provided for those who elect it. The 1,000 students who have been graduated since the opening of the Institute in 1909 are scattered in railroad service all over the Empire. Of these about 150 have availed themselves of a training in the language course referred to. There have been also established upon each grand division, district institutes providing less complete business and technical courses, also special training courses for conductors, stationmen, enginemen, firemen, car inspectors, telegraph operators, etc.

Welfare Work

Employee's welfare work has been given a prominent place in the activities of the administration. Four hospitals have been established besides some 15 dressing rooms and dispensaries at shops and some 20 at other points. Treatment includes internal as well as injury and other surgical cases. All expenses are paid from the railroad treasury. A large corps of railroad physicians covering the entire lines has been organized and these attend to the physical examinations now required for employment and the medical treatment of employees, their families and passengers in the sections individually assigned them. An insurance institution designed to furnish sickness and death benefit relief to members and families affords such relief under three classifications to about 125,000 employees. The subscriptions from members have been amounting to about three-fifths of the cost.

The Circuitous Darjeeling Himalayan Railway, India

The Indian Railways Face a Serious Problem

New Equipment and Plant Needed—Country Hampered by the Lack of Facilities

By Robert E. Thayer

THE PRESENT PROBLEM of the Indian railways is physical rather than financial. For the past 45 years the net earnings of the capital invested in the railways has never been below four per cent and for the past 20 years it has been below five per cent only three times. Notwithstanding this favorable showing, the railways have been allowed to deteriorate so that at present there are scores of bridges which are unfit to carry the modern train loads and there are many miles of rails, hundreds of engines and thousands of freight cars in service that should have been replaced some time ago.

Government Starves Railroads

It has been the policy of the government in the past to appropriate the bulk of the railway's earnings for general governmental expenses with the result that the development of the railways has been sadly neglected.

For the fiscal year ending March 31, 1920, the revenue receipts from the railways was \$266,500,000 as against \$585,000,000 of other receipts, or nearly half as large as all the other receipts in the budget put together. The money that should have been available for improved railway facilities was appropriated to relieve the taxpayer. In 1907 the Mackey Committee, which was investigating Indian railway conditions, recommended a yearly capital expenditure of some \$60,000,000 as necessary for keeping the railways up to the proper standard of development and improvement. It is interesting to note that for the eight fiscal years (1908-

1916) an average of only about \$50,000,000 was spent and for the three following years only \$17,500,000. During the last three years—1919-1922—the capital appropriations have averaged about \$72,000,000. The time has come when it is

impossible to restrict further capital expenditures for improvements, for maintenance and renewals are sadly in arrears.

Not only has the lack of sufficient capital appropriations hampered the development of the Indian railways but the fact that these appropriations are only good for one year with no assurances of renewal has made it impossible, in many cases, to use the sums appropriated to the best possible advantages.

General Business Suffers

This lack of proper maintenance and development has had a serious effect on Indian business. Large new coal areas remain undeveloped and new industries are being held up because of the lack of railway facilities. There has been a serious shortage of freight cars, and passenger travel, particularly the third-class, has been crowded.

Frequent embargoes have resulted from insufficient track capacity at classification junctions. Shippers have been forced to use road transport both by truck and camel trains. In one case the European oil seed market was lost owing to lack of railway transport. The situation has become so bad that the Associated Chambers of Commerce of India and Ceylon has gone on record for drastic revision in the present railway policy.

INDIAN railways are financially prosperous, but under control of the state and having their finances mixed in with the general budget, the surplus earnings are taken for general state expenses, thus reducing taxation.

Their physical condition is such that they cannot properly take care of the present traffic requirements, to say nothing of the anticipated requirements.

Heavy expenditures must be made to improve the railway plant.

The opportunities of development in India are well indicated by the fact that with an area of 1,800,000 square miles—almost as large as the United States—and a population of 300,000,000—three times as large as the United States—there are only 36,735 route miles of railways. Coupled with this is the very apparent prospects in the improvement of trade. Of the 36,735 miles of railroad about 49 per cent is of 5 ft. 6 in. gage and 41 per cent 3 ft. 3 $\frac{3}{8}$ in.; the rest is 2 ft. 6 in. and 2 ft. gage.

The Indian railways may be divided into five general classes:

1. State lines worked by the state.
2. State lines worked by guaranteed or independent companies.
3. Company lines worked by companies.
4. Lines belonging to Indian states.
5. Miscellaneous.

The first two classes comprise about two-thirds of the entire mileage in India.

TABLE I.

Route Mileage of Principal Indian Railways (March 31, 1920)

	5 ft. 6 in. gage	3 ft. 3 $\frac{3}{8}$ in. gage	2 ft. 6 in. gage	2 ft. gage
State lines worked by state	5,863	1,141	333	7,369
State lines worked by companies	9,741	8,306	927	46
Branch line companies under rebate terms and worked by main lines	1,160	122	298	108
Companies lines subsidized by the government of India	206	1,729	234
Indian state lines worked by Indian states	2,123	171	302
Indian state lines worked by main lines	632	804	386
Companies lines guaranteed by Indian states	330	391	39

Note—The grand total route mileage of all railways in India is 36,735 miles.

Table I gives an idea of the distribution of the mileage as between the different gages. The broad gage (5 ft. 6 in.) was chosen in 1851 when the railways were first built in India for the greater stability it offered as compared to the 4 ft. 8 $\frac{1}{2}$ in. gage. The 3 ft. 3 $\frac{3}{8}$ in. gage was adopted for auxiliary lines to the broad gage lines but they have expanded to such an extent that they now serve large areas, as indicated by the mileage figures. Even the real narrow gage lines, which are only feeder lines, have developed rapidly in the past ten years.

At the close of the fiscal year 1919-1920, the open mileage increased to 36,735 from 32,099 of ten years ago; it is now made up as follows:

Gage	Present Mileage	Increase in 10 Years Per Cent
5 ft. 6 in.	17,990	7.71
3 ft. 3 $\frac{3}{8}$ in.	15,181	12.2
2 ft. 6 in.	2,926	10.4
2 ft.	638	47.6

At the close of the year there were 1,822 miles under construction, or sanctioned for construction, of which there was 665 miles of 5 ft. 6 in. gage and 805 miles of 3 ft. 3 $\frac{3}{8}$ in. gage.

Revenue and Expenses

As has already been stated, the Indian railways are in a good financial position. At the end of the financial year in 1920 there was a capital of some \$2,000,000,000 invested in the Indian railways and even in that year the return on that capital was 6.8 per cent.

TABLE II
Earnings, Expenses and Mileage of All Indian Railways (Five Years)
Fiscal Year Ending March 31

	1916	1917	1918	1919	1920
Open route mileage	35,833	36,286	36,333	36,616	36,735
Total capital (millions)	\$1,722	\$1,741	\$1,765	\$1,785	\$1,840
Gross earnings (millions)	\$210	\$230	\$251.5	\$280.5	\$290
Total working expenses (millions)	\$107	\$108.5	\$114.8	\$136	\$164.8
Operating ratio (per cent)	50.91	47.26	45.72	48.45	56.81
Return on capital (per cent)	5.99	6.96	7.75	8.09	6.80
Tram mileage (millions)	159	163.6	157	158.6	162.2
Gross earnings per train mile	\$1.32	\$1.40	\$1.60	\$1.77	\$1.79
Working expenses per train mile	\$.67	\$.66	\$.73	\$.86	\$1.02
Net earnings per train mile	\$.65	\$.74	\$.87	\$.91	\$.77
Freight ton-miles (millions)	17,158	19,826	21,015	22,141	20,402
Passenger miles (millions)	16,529	17,846	16,204	18,040	20,615
Average miles one ton was carried	307.98	230.08	245.87	242.88	232.33
Average rate per ton-mile (cents)	.735	.68	.691	.721	.75
Average passenger journey (miles)	35.59	36.82	37.66	39.24	39.64
Average rate per passenger mile:					
First-class (cents)	2.315	2.255	2.8	2.585	2.715
Second-class (cents)	.931	.858	1.145	1.21	1.351
Intermediate class (cents)	.535	.531	.68	.705	.713
Third-class (cents)	.388	.392	.47	.484	.48
Season or commutation (cents)	.24	.242	.254	.252	.26
Total (cents)	.412	.419	.505	.516	.519

Table II gives an excellent idea of the financial performance of these roads for the past five years. It will be noted that even through the war the operating ratio was very low and the last year it was only 56.81 per cent. And with it all the rates were exceedingly low. It seems a pity, therefore, that with this excellent showing as an operating unit the railways should be in such a poor physical condition.

Reorganization Planned

Such has been the service rendered by the Indian railways to the public. Because of the large number of complaints received from the shippers the British government through the Secretary of State for India caused a searching inquiry to be made by a special committee, headed by Sir William M. Acworth, into the administration and working of the Indian railways. This committee has recently made its report and while it was unanimous in its decision that the railway budget should be kept separate from the state budget, it was divided in its opinion as to the administrative policy.

Sir William headed the group favoring state management, as opposed to the recommendation of the other group recommending private companies with a board of directors. In commenting on his discussion in the matter Sir William has said that although he has been and is a thorough believer in private management he was forced in this particular instance, by the facts as he found them, to recommend the state management. No definite decision has yet been made, but one thing is sure—something must be done immediately.

Unifying the Railway Gages of Australia

Exchange of Traffic Between the Different States of the Commonwealth Now Greatly Hampered

By F. M. Whyte

IN FEBRUARY, 1921, a commission was appointed by the Commonwealth Government of Australia, in agreement with the five continental states of the Commonwealth, to recommend a standard gage of track for the railways on the continent; to give the reasons for such recommendation; to estimate the cost of providing between the capital cities the gage of track recommended and any new lines necessary to accomplish this desire; the estimated cost of converting all lines to the gage recommended; the methods by which the work should be executed and controlled; and whether any third-rail or other mechanical device should be used, if so, what one. In order to give to the commission plenary powers, it was made a Royal Commission. Its personnel was to be an Australian outside of the railway service (John J. Gavan, of Sydney, was appointed as such and was also appointed chairman); a civil engineer from England (Rustat Blake, of London, was appointed); and a mechanical engineer from America (for this assignment the writer was appointed).

The railways of the sixth state, the Island of Tasmania, were not included in the investigation; these have no physical connection with those on the continent.

It will be noted that the questions submitted to the Commission refer in no way to improvement of present tracks,

structures, and equipment, nor to taking up deferred maintenance.

It is desirable, before considering the report of the commission to present some data and general information about Australia because a great many persons in America have rather hazy ideas of that distant country and there seems to be a general desire to know more about it.

The area of the continent of Australia, disregarding Tasmania, is greater, by an area of that of New Hampshire and New Jersey combined, than the land area of the continental United States. This area of Australia had in 1921 a population, aside from aboriginals, of, roundly, 5,200,000, and about 44½ per cent of these were in the capital cities of Sydney, Melbourne, Adelaide, Brisbane and Perth. The maps will indicate that these are sea-port cities or have sea-ports nearby.

In the year 1920-1921, the imports, for the continent and Tasmania, were valued at £163,000,000; the exports were valued at £132,000,000; and the total trade at £295,000,000. The

value of the imports from the United States was £23,826,000, or 24 per cent of the total and the value of the exports to the United States was £11,130,000, or 7.4 per cent of the total exports.

The Commonwealth was proclaimed in 1901; for various

THE five continental states of Australia built their railroads independently and without regard to interchange of traffic. Several different track gages were used.

Recommendations of a special commission were accepted early in November last, and work will doubtless be started shortly, looking toward the final standardization to a 4 ft. 8½ in. gage. The more important changes can be made by 1930 if work is started promptly.

periods of time previous to that year the different states had been separate colonies of the Crown. It is now a Dominion within the British Empire.

Different States Build Railways Independently

The first railway built in Australia extended west from Sydney, New South Wales, and the gage approved for it was 4 ft. 8½ in. At about the same time the same gage was approved for a short line at Melbourne, Victoria. Soon after this, New South Wales changed to 5 ft. 3 in., possibly because locomotives with inside cylinders were considered to be desirable at that time. The then colony of Victoria also changed to 5 ft. 3 in., but not by agreement with New South

that gage. The Commonwealth built the Trans-Australian Railway from Kalgoorlie, in Western Australia, to Port Augusta, in South Australia, to connect the western state with the eastern states. This road, 1,051 miles long, was opened for traffic in October, 1917. It is thoroughly up-to-date in its equipment.

There is a small mileage of gages of less than 3 ft. 6 in., but these railways are not of importance.

There is considerable mileage of privately-owned railways and these are generally of the same gage as the state-owned railways with which they connect. These were not considered in the scheme of unification of gages.

The policy of the Commonwealth and the states of con-

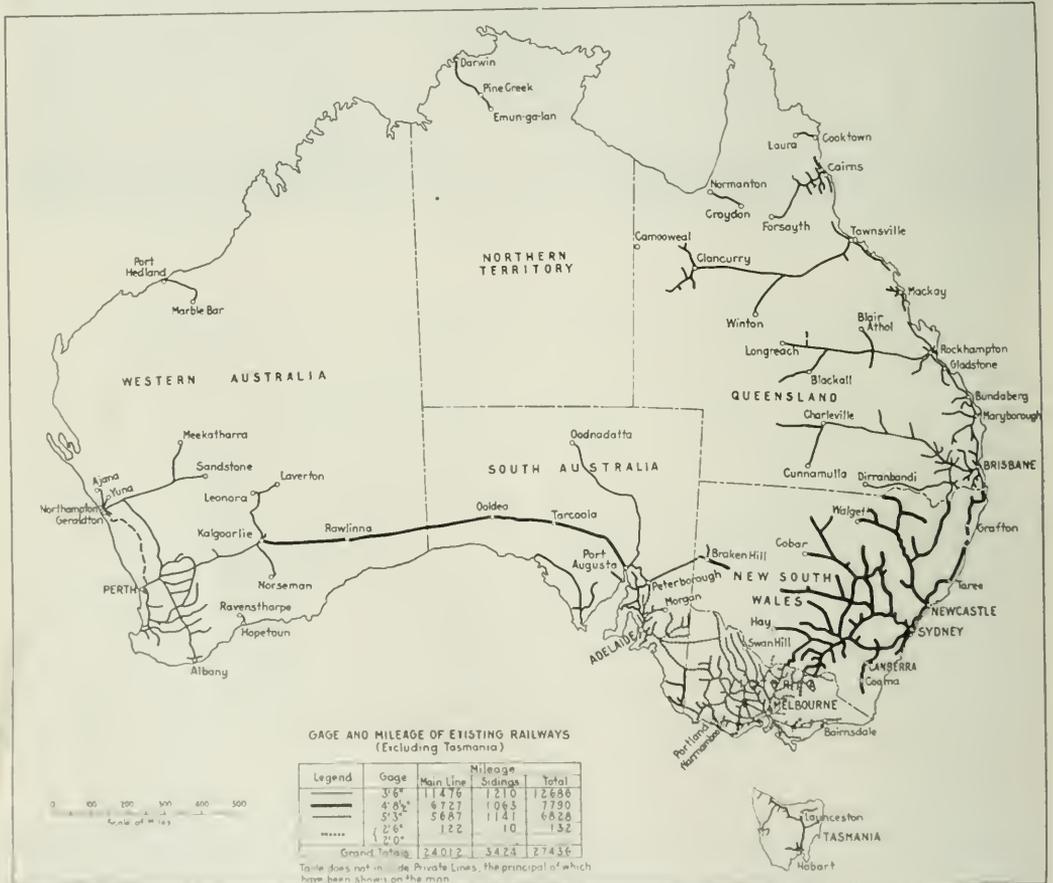

Fig. 1. Map of Australia, Showing Present Railway Systems

Wales. Still later, New South Wales returned to the 4 ft. 8½ in. gage, but this time Victoria did not follow, and the two states continued to the present time to build railways of the respective different gages.

South Australia, joining Victoria on the west, adopted 3 ft. 6 in. for the important south-eastern portion of the state and connecting with Victoria. But used 3 ft. 6 in. gage for the northern line because this gage was considered to be ample for the needs and cheaper to construct. Queensland and Western Australia used the 3 ft. 6 in. gage from the beginning for the same reason that South Australia used

structing and operating railways independently of each other had resulted, to the time of the investigation, in the building of 23,890 miles of main line, 3,414 miles of siding, a total of 27,304 miles, of three different gages, distributed as follows:

Gage	Mileage		Total
	Main Line	Sidings	
ft. 6 in.	11,476	1,210	12,686
ft. 8 in.	6,727	1,063	7,790
ft. 3 in.	5,687	1,141	6,828
Total	23,890	3,414	27,304

These totals indicate that, on a population basis, Australia has about 2½ times the railway mileage of the United States. Compared on the basis of area, the situation is quite different.

It is apparent from the maps, that the railway development in Australia has been carried out by the separate colonies and, later, by the respective states, with the main idea of developing the particular colony or state irrespective of any other colony or state and while the state jealousies still exist, there are indubitable evidences that these jealousies are disappearing gradually.

The harbors which have been developed most extensively are at the state capitals, and it will be noted how the railways of each state radiate from the respective capitals. Such an arrangement will certainly burden the transcontinental and a considerable part of the interstate traffic. The proper solution of this condition seems to be that, if private enterprise is to be barred, the Commonwealth should take an interest in the railway development of the states to the extent, at least, of determining locations of lines to meet, and to develop, interstate communication.

The Present Gages

The railways as they are at present are shown in Fig. 1; the track gages are indicated by the forms of the lines. It

clearly the possibilities of the continent and who have been interested in its development have agitated for some years the desirability of unifying the gages of the railways, and since the Commonwealth was proclaimed in 1901, various estimates of the cost for doing the work have been made by railway officials of the Commonwealth and the states, but without, apparently, mutual understanding as to what improvements and deferred maintenance costs should be included in the cost of unifying the gages. The Commonwealth officials thought that many items, not directly chargeable to unification, had been included in the estimates, therefore the Commonwealth and the states agreed to the appointment of a disinterested commission and to abide by the recommendations of such commission.

It was further agreed that when the work was done, one-fifth of the cost should be borne by the Commonwealth and the remainder to be apportioned to the five states on a population basis.

Changes Recommended

The commission recommended the adoption of the 4 ft. 8½ in. gage as standard. It was considered that any gage greater than 5 ft. 3 in., the maximum in Australia, would not be justified and that any difference in the results to be obtained with the 5 ft. 3 in. over the 4 ft. 8½ in. would

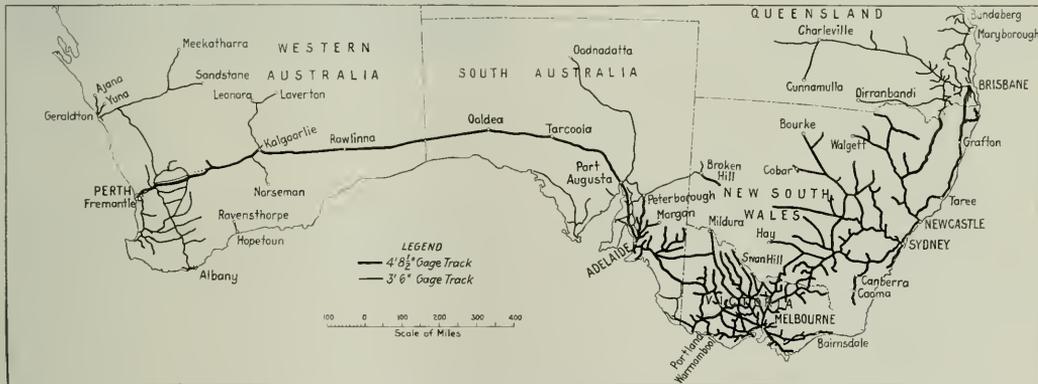

Fig. 2. Showing Changes in Gage Recommended by the Royal Commission

will be seen that the entire railway mileage of the extreme northeast state, Queensland, and of the extreme western state, Western Australia, are of 3 ft. 6 in. gage; and about one-half the mileage in South Australia is of the same gage. All the lines in Victoria and about one-half of those in South Australia are 5 ft. 3 in. gage and these are located between the 4 ft. 8½ in. lines of New South Wales and the Trans-Australian Railway of the same gage, except that for 130 miles east of the latter railway the gage is 3 ft. 6 in., connecting with the 5 ft. 3 in. gage of South Australia. In the present line connecting Brisbane and Perth there are five breaks of gage, the distance by the present route being 3,488 miles. Under the present system of operating there are three other places where passengers must transfer and where mail, baggage and express are generally transferred, these being Sydney, Melbourne and Adelaide.

At present the heaviest transfer of traffic is between Victoria and New South Wales. Such traffic is passengers, baggage, mail and express at all times; coal from New South Wales to Victoria and beyond, when there is difficulty with the coastwise shipping; and livestock fodder in the reverse direction, when conditions demand.

Those persons in Australia who have understood more

not justify any materially greater cost for the former. It will cost considerably less to install the 4 ft. 8½ in. gage because a very large percentage of the axles of locomotives and rolling stock can be saved, as can the 7 ft. ties now in place on a large mileage of the 3 ft. 6 in. gage track.

The Prime Minister and the premiers of the five states interested met in early November last and agreed upon the 4 ft. 8½ in. gage as standard. They are to meet early in 1922 to decide what part of the work is to be undertaken and when it should be begun.

Distance to Be Cut Between Brisbane and Sydney

The commission recommended for the main trunk line connecting Brisbane and Perth that a new line be constructed from Brisbane to the Queensland-New South Wales border; the north coast line of the latter state be extended northward to meet the new line, thus shortening the distance between Brisbane and Sydney by 101 miles and obtaining decidedly more favorable gradients; that all of the 5 ft. 3 in. lines in Victoria and in South Australia be converted and the new line along Spencer's Gulf from Adelaide to Port Augusta be constructed, thus reducing the distance 70 miles and providing much more favorable gradients; and the converting of

about 510 miles of 3 ft. 6 in. track, some of it to be changed in location, and the construction of about 70 miles of new track in Western Australia. The estimate for doing this work and providing the necessary locomotives and rolling stock, some of it to be new and some to be converted, was £21,600,000 or, at normal exchange, about \$105,000,000.

This expenditure would provide from Brisbane to Fremantle (Perth) by the revised route, rails weighing not less than 80 lb. per yard and roadbed, including bridges, in keeping with that weight of rail, together with the necessary high-grade locomotives and rolling stock. A considerable part of the present mileage making up the revised route is laid with 80 lb. rails and in some places there are 90 lb. and 100 lb. rail.

Can Be Completed by 1930

The map, Fig. 2, shows what the situation will be with respect to the gages when such main trunk line is provided; practically 54 per cent of the present total main line and sidings will then be 4 ft. 8½ in. gage. The work can be completed by 1930 if started promptly, and present indications are that it will be started soon. The necessary financing can be provided and the labor and materials can be procured in Australia.

The remaining 46 per cent of the trackage is 3 ft. 6 in. gage and the commission recommended that these lines be changed less rapidly, that 25 or 30 years might be a reasonable time in which to accomplish the entire undertaking, so that rolling equipment may be worn out without being converted, that wider bridges may be provided when renewals are necessary, that fills and cuts may be widened as conditions permit, and that new alignments may be provided through rugged country where the radii of curves are too short for the broader gage. The more important lines should be converted first and the others to be converted in sections of such length and at such times as conditions may justify.

The commission recommends that, in changing the 5 ft. 3 in. lines, one rail be moved in 6½ in., the total difference in the gages; at station platforms, which are very generally elevated, at tunnels and other structures the rails and ties be slewed ¾ in. so as to maintain the present location of track center. Also, that the rail be moved in long lengths, possibly 100 miles, or more, in two or three days after necessary preparatory work has been done. The rails are T-section, very similar to the sections used in America, and rest directly upon the ties, or tie plates, and a complication in connection with moving one rail on these lines is the fact that the rails are now canted inwardly, nominally 1 in 20 and 1 in 26; however, actual measuring of the canting disclosed that the canting varied from 1 in 12 to 1 in 40. Similar checking of rails laid, normally, flat on the ties, disclosed the fact that these varied from 1 in 60 outwardly to 1 in 70 inwardly. No effort was made to find the extremes of canting and it is probable that the foregoing data do not show the extremes.

With such facts in mind, it was considered to be entirely safe to move one rail in and place it flat on the ties, even where the opposite rail was canted. Eventually, the canted rail can be straightened up by degrees. However, to convince the responsible officials who might doubt the wisdom of this, it was suggested that 25 miles of track, subject to heavy and fast traffic be arranged with a flat and a canted rail and observation be made.

None of the 5 ft. 3 in. gage locomotives having inside cylinders will be converted, for the others which are suitable for conversion the main frames will be moved inwardly, thus making necessary narrower fireboxes, front end spacing castings and cross-frame connection; the wheels spaced on present axles, new journals machined and, when outside collars are necessary, the welding on of these collars. For locomotives and rolling stock having trucks the axles will

be treated similarly and the cross members of the trucks shortened. A very large percentage of the freight equipment is of the four-wheel type, without trucks, and the axles for these will be treated as the other axles and the location of the pedestal attachments to the body will be changed to give the desired spacing crosswise. It will be a rather easy undertaking to change a large percentage of the equipment.

7 ft. Ties May Be Retained

It was recommended that, when the 3 ft. 6 in. gage is changed, each rail be moved outwardly 7¼ in., one-half the difference in the gages. A large mileage of the narrow gage

Uniform Gage Commission of Australia

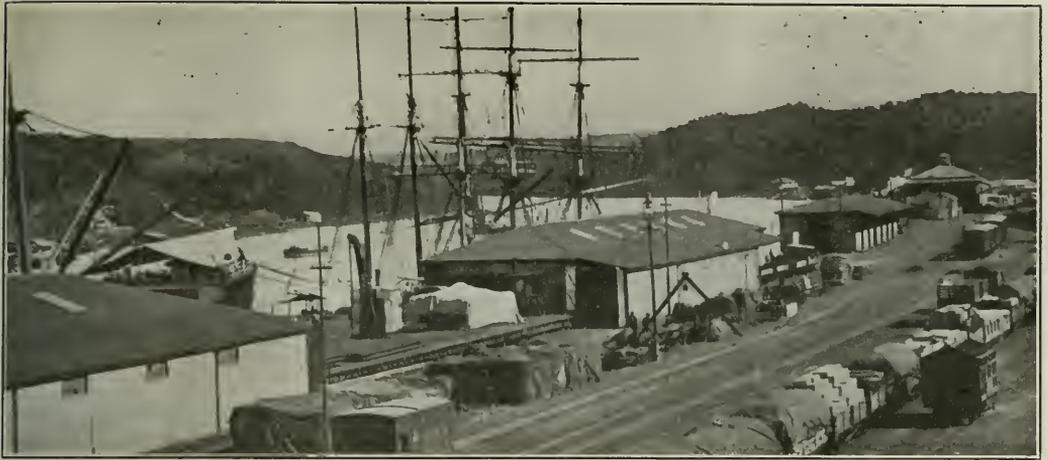

Left to Right: F. M. White and Eustat Blake, Members of the Uniform Gage Commission, Littleton E. Groom, Federal Minister for Works and Railways, and N. G. Bell, Commissioner of the Commonwealth Railways

is on ties 7 ft. long, and for the present wheel loads these ties are sufficiently long for the 4 ft. 8½ in. gage, but it was recommended that ties 8 ft. long be placed two at each rail joint and two intermediate where joints are opposite, or two at each rail joint where joints are staggered. If wheel loads are to be increased to such an extent as to make necessary ties longer than 7 ft., then improvement is involved and makes necessary an adjustment in costs between the owning state and the other parties, the Commonwealth and states, to the agreement. It was the possible saving of these 7 ft. ties which determined, to a great extent, the recommendation of the 4 ft. 8½ in. gage. Under the plan proposed, none of the 3 ft. 6 in. rolling equipment would be converted for use on the broader gage.

It was recommended that the work in each state should be executed under the supervision of the same offices as have charge of the corresponding work now, but that there be placed in general control of the entire undertaking a director who will have almost absolute authority in determining what shall be done, and when, and in the accounting.

Positive recommendations were made against the use of a third rail or a mechanical device and emphasis was placed upon the desirability of centering attention upon the problem of actually changing the gage of track and rolling equipment.

IN NOVA SCOTIA AND NEW BRUNSWICK the railroads celebrated New Year's day by a big snowstorm. On Sunday night five Canadian National trains were reported snow-bound in the Folleige mountains section. There was a complete tie-up of traffic between Springhill Junction and Truro. One train was covered with huge snowbanks. Four were stalled near Londonderry. Crews of snow shovellers were sent out from Moncton and Truro to dig out the trains. The night expresses out of St. John and Halifax were blockaded

South African Railways Progress Despite Deficits

Electrification and Other Projects Advancing Regardless of Unfortunate Earnings Position

By M. T. Griffin

THE PRESENT unfortunate position of the South African Railways, the government lines, was epitomized recently in a statement by the famous South African statesman, General Jan C. Smuts. He said:

"The railway situation is most grave, revenue having fallen approximately £500,000 during the past six months below the amount estimated. During the past year £28,348,000 was the total railway expenditure, being an increase of £13,800,000, or 95 per cent, over (the fiscal year) 1913-14. Of this increased expenditure over £10,000,000 was accounted for in increased salaries, wages, allowances and war bonus. At the present time depression is weighing like an intolerable load on this country—but I do not despair of the future. The conditions in South Africa are sound, the country not being handicapped, as so many others are, by huge war debts."

Extent of the Railways

The government of the Union of South Africa owns and controls practically all of the railroads of the country. These government lines have a total mileage of 9,559, of which there are 4,254 miles in the Cape of Good Hope, 1,319 miles in the province of Natal, 2,644 miles in the Transvaal and 1,342 miles in the Orange Free State. There is also a mileage of 1,292 in Southwest Africa which is being operated at present by the South African Railways. There are 651 miles

additional of privately owned railways throughout the Union. Railway construction in South Africa began in 1859, when a two-mile line was built at Durban on the east coast. Progress was slow. In 1873 the railways in Natal, totaling 63 miles, were taken over by the government. After the Boer War the state railways of the various states which make up the Union of South Africa were consolidated but it was not until 1910 that they all came under unified control. The earlier railways were built to standard gage, i. e., 4 ft. 8½ in., but this gage was reduced later to 3 ft. 6 in., which is now the standard gage for South Africa. There is also a considerable mileage of narrow gage, 2 ft. 6 in. and 2 ft. lines.

THE GOVERNMENT of the Union of South Africa operates 11,478 miles of railways. These lines connect with other lines to the north and, because of the extent of their development, set the standards as to gage, equipment and practices for the future railway development of the southern part of the continent.

They are suffering from the unfortunately too well-known malady, deficits. High costs, largely wages, and inadequate income are the outstanding causes.

The Effect of the War

During the war the South African Railways were fairly well maintained and, indeed, a considerable mileage was relaid with heavier steel imported from the United States. Freight rates were advanced considerably during the war and now in the period of depression, when the railways are losing heavily, shipping interests are much agitated on the subject of high freight rates and are clamoring for reductions. Passenger rates were increased only by the application of a 2½ per cent surcharge on regular and suburban fares and 5 per cent on trip, bearer, mileage, coupon and season tickets. Wage payments were increased tremendously, as shown by

the statement of General Smuts. These increases were due not only to increases in actual money payments to individual employees but also to the larger numbers of workers made necessary by the application of the eight-hour day. The eight-hour day has, however, recently been modified to include only those employed continuously and does not apply to workers whose work-day may include periods of idleness. Some saving will doubtless be effected by this change.

Employees of the South African Railway at the end of the last fiscal year totaled 89,858, something less than half of whom were of European extraction. During the war a cost of living bonus was added to the wage payments of employees. This bonus was first applied to native workmen and, naturally, it is from them that it was first removed. This bonus was, therefore, reduced in the case of native employees by 25 per cent on April 1 and further similar reductions each three months thereafter.

Union labor on the South African Railway is mostly European and it is said that, while they oppose wage reductions to some extent, they nevertheless realize the position of the railways and the necessity for reducing operating costs.

The Financial Situation

The financial position of the railways is unhappy. The deficit for the fiscal year ended March 31 was \$6,186,644. The accumulated deficit of the government railways, harbors and steamships on that date was \$12,630,576. During the first six months of the present fiscal year a further deficit of \$4,860,000 was piled up by the railways.

All this looks rather discouraging, but there are one or two matters that make the outlook less unpleasant. One is that the monthly deficit of the railways has shown a tendency to decrease of late months and, furthermore, that operating expenses in the first five months of the current fiscal year showed a decrease of 29 per cent over the same period of last year.

Other Railways of South Africa

North of the Union of South Africa lies Rhodesia, which is also British. Its principal railway, which has a mileage of 1,406, is also of 3 ft. 6 in. gage and connects with the South African Railways, working in close co-operation with them.

The South African railway authorities are exercising jurisdiction for the time being over the railway lines of what was German Southwest Africa. These lines have direct connections with the South African Railways and total some 1,400 miles, of which about 1,000 miles is of the standard 3 ft. 6 in. gage. They will probably, now that the German yoke has been shaken off, be brought into increasingly close co-operation with the South African Railways.

British South Africa has roughly the shape of an inverted V. At the apex is the Belgian Congo; to the west is Portuguese West Africa and to the east is Portuguese East Africa. Through Portuguese East Africa there are two railways which connect the railways of the British territory with the

east coast: One of these lines terminates at the port of Laurenço Marques and the other at Beira. A railway beginning at the seaport of Benguela, in Portuguese West Africa, is being pushed eastward to a connection with the Rhodesia Railway in the southern part of the Belgian Congo.

Thus is the Dark Continent being opened up. There is yet a considerable distance between the rail head on the upper Nile and that in the Belgian Congo. A part of this intervening country can be crossed in steamers on the lakes, but the completion of a through all-rail Cape-to-Cairo route probably still lies some distance in the future.

Railway Activity in the Union

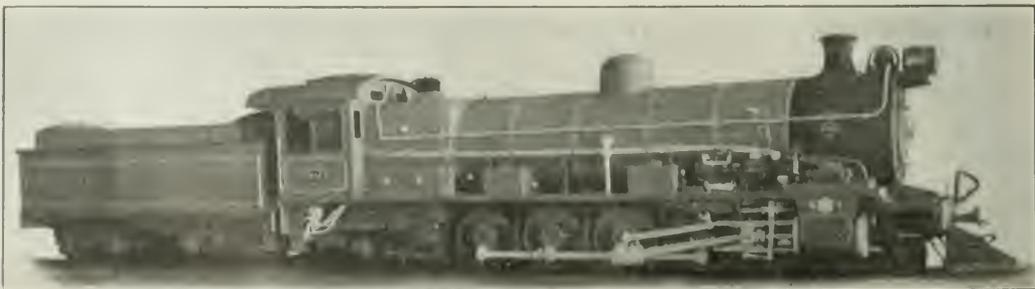

The South African Railways have of late entered rather extensively into the construction of grain elevators. At the end of the last fiscal year contracts had been let for the erection of large terminal elevators at Durban and Capetown and for 34 at various interior points. The purpose of this construction is, naturally, to encourage the raising of wheat and to increase the traffic of the railways. The railway administration has installed a few road motor lines to supplement the activities of the railways.

The government has recently floated successfully an issue of \$24,300,000 six per cent bonds in the London market the proceeds of which are to be used for rivers, harbors and irrigation. The most important project in the way of capital expenditures on foot is the electrification of two sections of the railway—one between Glencoe Junction and Pietermaritzburg and the other from Capetown to Simonstown. The former is a single-track line 171 miles long with heavy gradients. The latter is a suburban passenger proposition exclusively. The cost of this work is estimated at \$21,313,044.

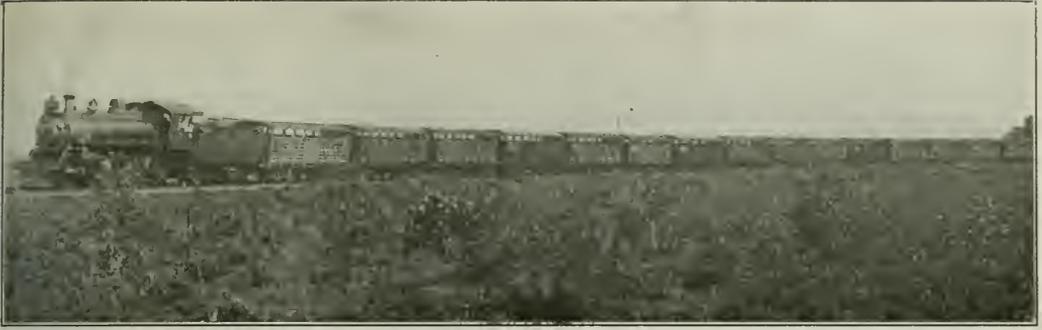

There has been considerable agitation recently about extending the railways and linking them up to a greater extent with other roads in South Africa, but the general manager in a recent conference expressed the opinion that in the present state of the money market and conditions generally, any considerable activity along these lines is financially impracticable and commercially unwarranted.

Opportunities for American Goods

South Africa is primarily British insofar as its railways are concerned even in those sections under control of another foreign power. Consequently as long as British manufacturers are able to compete in point of price and speed of delivery with American concerns, British goods are likely to be favored. There have, however, been a number of purchases made in recent years in this country. The surest way for America to secure a foothold on the continent as an exporter of railway equipment and supplies would seem to be by financing and building some of the railway lines which are projected or which naturally suggest themselves in some of the relatively undeveloped country lying between Rhodesia on the south and the mouth of the Nile on the north.

Nor Do South America's Roads Escape Adversity

High Costs and Inadequate Revenue Seemingly a World-wide Epidemic—Future's Outlook Bright

By James G. Lyne

IN EXAMINING the railway situation in South America attention will naturally focus on the three countries having the greatest mileage, and railway systems comparable to our own in length and importance, viz., Argentina, Brazil and Chile. In these countries the situation of most of the carriers will be found in most cases to be the same as of the railways the world over, viz., unhappy, because of high costs, low rates, business depression and resultant decreased earnings. The physical aspects of South America's railways were described in considerable detail in a series of articles by John P. Risque, which appeared in the *Railway Age* during the last part of 1920 and the early months of 1921. The present article will be limited to a general discussion of the situation that has arisen since the publication of these articles.

Argentina

Argentina's railways, which total some 23,000 miles, are owned, for the most part, in England and are operated by Britons. There is one state-owned line of considerable importance and one line owned in France. These roads vary greatly in gage and in standards generally. None of the companies has improved its financial position of late. In their annual reports for the fiscal year ended June 30, two of the British companies, the Buenos Ayres Great Southern and the Buenos Ayres Western, declared that the year was the most unsatisfactory in their history. Both had to dip into reserve to pay 4 per cent dividends on their common stock. The Central Argentine, one of the strongest systems in the country, paid no dividends on its deferred common stock, whereas it paid 6 per cent the previous year.

Perhaps the most noteworthy development during the

year in Argentina, however, was the clash between the British railways and the government over increases in freight rates. Because of high wages and high cost of materials combined with a heavy slump in traffic, several of the companies during the early part of the year sought government

TROUBLE in the form of high wages, low rates, scanty traffic and limited credit be-sets South America's carriers. Where new railways are needed so urgently, however, starvation of existing roads cannot conceivably be long permitted. Additional effort on our part toward supplying these countries with their urgent requirements of capital for additional railway development, railway equipment, trained personnel and assistance in adopting more efficient methods would redound to their benefit and ours as well.

sanction for increased rates. Anticipating the granting of this authority they advanced their rates. After months of delay the government on August 21 refused to sanction the increase and forced the companies to return to shippers the amounts collected in excess of the prescribed rates. This action came as a complete surprise. Ten days later, however, on August 31, a new decree was issued allowing an increase of some 30 per cent. Then, on October 4, the government again reversed its decision and suspended the increases. Here the matter stands. The question will probably come before the Supreme Court of Justice before it is finally settled.

The companies are basing their case on what is known as the Ley Mitre (Mitre Law) which limits the net returns of foreign owned railways to 6.8 per cent of invested capital. The companies hold that, since they are not earning this 6.8 per cent, they have a right to raise their rates. They are

offering ample evidence of their precarious financial situation.

As a Market for Railway Equipment

The government, on the other hand, takes the view that prevailing economic conditions are a burden on the whole community and that the railways should assume their losses as the agricultural interests and business generally are assuming theirs.

There is but one important market in Argentina for

American railway equipment and supplies and that is the State Railways. These railways are for the most part in the northern section of the country and do not run into Buenos Ayres. In fact, traffic from the State Railways has to pass over the rails of two private lines to reach the capital. The State Railways have 3,226 miles of line and are of meter gage. That they offer an excellent market for American equipment is proved by the order for 85 locomotives and some 2,000 cars, which was placed in this country recently in the face of strong foreign competition. The bulk of the railways, however, as has been noted before, are British, and inclined to do all their purchasing in the mother country regardless of any consideration.

Argentina lends itself to railway development because of its freedom, speaking generally, from physical barriers and its rich agricultural lands. A number of projects toward further expansion are contemplated or under-way, two of them to connect up with the Chilean State Railways and one with the railways of Bolivia. The great obstacle toward a really comprehensive system is the diversity in gage and other standards, and in the rather intense competition of the several railways which makes co-ordination difficult.

Fuel presents a perplexing problem to the railways of Argentina, as it does to those of practically the whole continent. Wood is at present the principal fuel used, but with the development of the country's oil fields, oil will probably come into more general use.

British railways, of course, dominate in the design of equipment and the methods of operation—this in spite of the fact that Argentina is strikingly like the United States from a railroad point of view. The conclusion is inescapable, therefore, that any opportunity which may exist for American enterprise to enter the field and show the relative superiority under such conditions of American practices and American equipment should be taken advantage of. Unless some such action is taken the great bulk of Argentina's railway purchases will in the future, probably, as they have in the past, be made in England.

Chile

From a railway point of view Chile is unique. It occupies a strip along the Pacific almost 3,000 miles in length and of an average width of 90 miles. The railways are state-owned, with the exception of some British lines serving the nitrate fields of the desert north. A north and south line is provided for practically the entire length of the country, but mainly for strategic reasons—sections of this line to the north and south, particularly to the north, of the population center around Santiago and Valparaiso are practically without traffic.

The railways of Chile, and indeed the whole continent, have suffered from the general economic depression. The state, which finances the railways, has been particularly hard hit because of the decline in value of nitrate, the country's chief stock in trade. Wages and other expenses are higher proportionately.

Owing to the scarcity of fuel and, in many cases, water, and to the mountainous character of the country, the Chilean railways naturally lend themselves to electrification. The outstanding action taken in this direction was the granting of a contract to the Westinghouse Electric & Manufacturing Company for the electrification of the line from Valparaiso to Santiago and of the branch to Los Andes (connecting with the Trans-Andine Railway). If this installation proves successful other work along the same line will doubtless be undertaken which will provide further opportunities for American enterprise. An order for 20 steam locomotives placed in this country during the year bears additional proof of the satisfaction which former purchases in this country have given. The Nitrate Railway (the British railway in the North) also plans some work along this line. Chile's

railways, like those of Argentina, also suffer to some extent from lack of uniform gage, large capacity cars and anything approaching uniformity.

Brazil

Brazil, with a territory larger than that of the United States, has only some 17,000 miles of railway and this is largely concentrated relatively near the coast in the southern part of the country. A large portion of this mileage is foreign-owned, although there seems to be a tendency in the direction of greater activity on the part of the federal and state governments in railway building and extension; in view of the tremendous field for further development it would not seem strange if the state-owned lines some day completely dominated the situation. At any rate a country so grossly underdeveloped from a point of view of transportation offers a prospective field of tremendous importance to railway genius as well as to manufacturers of the things that go to make up railways.

The capacity of many of the country's railways has been heavily taxed in the past by inadequate facilities. These roads suffered from under-maintenance during the war, as did the railways throughout the world. Now necessary additions to rolling stock and other facilities cannot be undertaken because of inadequate returns resulting from a decline in traffic caused by the slump in foreign trade and from rates not sufficiently high to provide for increased costs, and because of the decline in exchange value of the country's currency in terms of those countries from which suitable railway equipment can be obtained.

In such times government railways are practically the only ones which, because of no obligation to earn a profit and because of more extensive credit, can afford to bring about improvements. Consequently the Paulista (owned by the state of Sao Paulo), which brought some 28 miles under electrical operation during the year, was one of the few roads which was able to progress greatly.

There are any number of projects on foot in the country for the extension of railway lines. The return of favorable times alone is awaited. Brazil is another country like Argentina where American extensive methods of railroading would probably be more effective than European intensive practices. Furthermore there is not the same extent of European domination in railway ownership in Brazil that there is in Argentina and the present development of transportation facilities is much less extensive. It would seem, consequently, that by a sincere attempt to help Brazil solve her railway problems both by advancing capital and by lending our technical skill, our opportunities for supplying equipment and trained men to the railways of the country should tend to increase greatly.

Bolivia

Bolivia is interesting from a railroad point of view not so much because of her present railway facilities but because of developments during the past year which point to the importance of the railways of that country in the development of the southern part of the continent. Bolivia is connected with the Pacific by three rail routes but these are not at present of any great importance because traffic between the interior and the coast is relatively light.

The significant development of the past year has been the awarding of a contract by the Bolivian government to an American company for the construction of a line 126 miles in length connecting the Bolivian railways with those of Argentina. When this line is completed, Buenos Ayres will be connected with the Pacific coast through Bolivia by a railway system of uniform meter gage. The distance between New York and Buenos Ayres will be reduced materially and Bolivia thus placed on a transportation route which is

Commerce Bureau Improves Service to Exporters

Many Valuable Services Offered Exporters of Railway Supplies—
Work in Hands of Experts

By James G. Lyne

“WE ARE ONLY BREAKING into the exporting business and without your help we should not have known how to start.” Thus an American manufacturing concern wrote to the Bureau of Foreign and Domestic Commerce. With some 900 consuls and other representatives scattered over the face of the earth in every important city and country, this Bureau has a foreign organization which is greater than that of any private industry. This great body of men, with the home organization at Washington, is today offering to American exporters a foreign service which no single industry could afford to maintain.

For a number of years the Bureau has been of great service to American exporters in giving them information of value regarding foreign markets for their products. During 1921, however, under the stewardship of Secretary Hoover, the Bureau has been reorganized in a manner which should increase its service many fold.

Commodity Divisions With Experts in Charge

Prior to the reorganization the activities of the Bureau were subdivided on a territorial basis—that is to say, the Latin American division collected and co-ordinated reports from representatives in Latin America, the Far Eastern division performed a similar service insofar as the Far East was concerned, and so on. Now superimposed upon these geographical divisions are commodity divisions. In charge of each commodity division is an expert in the marketing of that commodity.

A man, expert in, say, commercial geography, may be in a position to assemble some information of value to an exporter of railway equipment and supplies, but an engineer with experience in car manufacturing and in foreign marketing will be in most cases of infinitely more service to the business. A man with such training and with foreign experience knows the nature, the advantages and disadvantages and the possible foreign market for American equipment and he also knows something of the peculiarities of railroad practice abroad which affects design and business methods. Just such a man is in charge of the Bureau's Industrial Machinery Division, which is looking after the exports of railway supplies.

An investigation has disclosed the fact that 17 per cent of America's production of industrial machinery, including railway supplies, is normally exported. This 17 per cent is sufficient to represent profit or loss in the industry and would seem well worthy of being maintained and increased even at the expense of considerable effort. It is the business of the Industrial Machinery Division of the Bureau to assist in directing this effort along the most intelligent channels.

Service of Value to Large and Small Companies Alike

Some of the important car and locomotive companies of the country are today pretty well organized in the foreign field and they, speaking generally, do not have as great a need of the services of the Bureau as some of the smaller companies or houses which are new in the foreign field. It

A NEWLY ORGANIZED division of the Bureau of Foreign and Domestic Commerce at Washington has as one of its particular duties the fostering of America's foreign trade in railway equipment and supplies. This division is headed by men who know the supply business and who have traveled widely abroad investigating markets for American goods. Nine hundred representatives of the Bureau throughout the world will make any reasonable investigation requested by the division.

must not be supposed, however, that the Division cannot be of service even to the largest companies. An officer of an American concern manufacturing railway equipment, coming from Australia not long ago, met in China a repre-

Photo from Underwood & Underwood, N. Y.

American Supplies for Russia at Riga

sentative of the Bureau of Foreign and Domestic Commerce. While in Australia, the manufacturer said, he had happened upon a publication called Markets for American Railway Supplies and Equipment in Australia, a report by Trade Commissioner Frank Rhea, which report, had he seen it before, would have saved him his trip to Australia.

Two conclusions naturally suggest themselves after hearing this anecdote—one is that the Bureau is in possession of some information of the greatest value to manufacturers of railway equipment and the other is that there must be the closest contact on the part of these manufacturers with the representatives of the Bureau in this country in order to make sure that the government's free service is utilized to the utmost.

Expert Advice From Those Who

Have Studied Foreign Railroads

One of the Bureau's trade commissioners traveling in Java recently found a railway there busily engaged in breaking

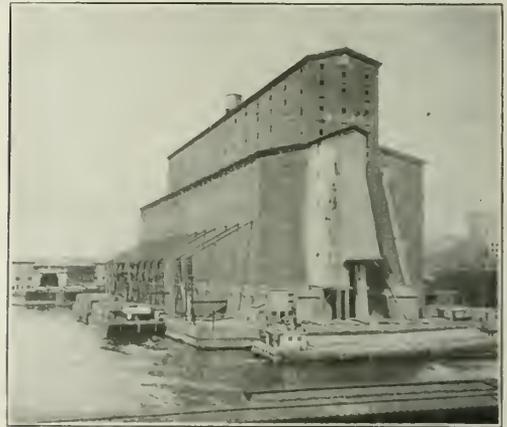

Loading Freight from Train to Steamer at N. Y. C. Piers, Weehawken, N. J.

up American chilled cast iron wheels which had been purchased during the war. Upon investigation it developed that the country was extremely mountainous and that there were no airbrakes. The method of braking on mountain grades

was to set the brakes on four or five cars as tightly as possible and to slide the wheels all the way down. Chilled cast iron wheels are not meant for such service and naturally were unsatisfactory. This representative who has traveled widely and knows of the peculiarities of many countries and their railways is in a position to advise American concerns just what matters must be considered in designing and selling railway equipment abroad. Only by being so informed can American houses export equipment and supplies designed to meet the operating conditions in foreign countries and only by sending abroad equipment so designed can American goods hope to compete favorably with European equipment built by those who have studied local conditions.

The Bureau's representative who told of Java's experience with chilled iron wheels has traveled extensively in the Far East investigating the markets for industrial machinery. Prior to that time he spent a number of years in China. He is well acquainted with American and foreign railway supplies. His opinions on foreign markets for our equipment are those of an expert and yet he has an office in Washington where at any time he is prepared to meet American manufacturers and help them solve their export problems—and these services are given free of charge. Further than that he can call upon any or all of 900 commercial attachés,

Huge Grain Elevator at New York for Loading Direct to Ocean-Going Vessels; Sixtieth Street Yards, New York Central

trade commissioners and consuls to furnish information which he cannot give himself.

Reference Material at Washington

The Bureau has also a vast amount of information on hand at Washington which is ready for instant reference. An example of such material is an up-to-date report from all foreign representatives on railway conditions in their countries which is now being compiled. This report will contain the following information concerning the railways of every country: Mileage; number of locomotives, number of each kind of cars; capacity of cars and trains; clearances; signal systems used; shop facilities, freight and passenger traffic during a recent given period; revenues and expenses; number of each class of employees; proposed additions, extensions, improvements and new construction, and an estimate by the representative on the ground as to what the chances are that American houses may be able to obtain a share of this business and how they should proceed to do so.

Will Make Special Investigation When Desired

If any American concern requests it, the Bureau will instruct one of its experts to make any reasonable investigation along the lines of its business in the country for which the information is desired. An instance of this has come to our notice in the form of a copy of a long letter describing the requirements as to signals of a Chinese railway which was on the point of asking for bids. This letter was written by the American trade commissioner at Peking and addressed to a signal company in this country. It goes into such matters as: The method of operating trains in China, wherein it differs from our train dispatching system and why it is probably better suited to Chinese conditions than is the American system; the fact that the saving of a few employees by the adoption of certain methods of signaling would not be a deciding factor because of the relatively low wages; the physical condition of the railway; the probabilities of the adoption of the most modern signals as opposed to older forms. In fine, the company could not have expected to have received a more comprehensive and helpful report from a paid representative—yet this and similar services the Bureau is offering to American business without charge.

Reference is made above to an extensive survey of the potential markets for American machinery (including railway supplies) in the Far East. Studies of a like nature have been made before. When there is a demand by business for additional investigations, they will be made again. If—merely for example and not as a suggestion or a report of fact—a number of American concerns manufacturing draft gear should require detailed information prior to launching a sales campaign in South America the Bureau would, if it were satisfied of the advisability of such action, detail an expert to make an exhaustive study of the probabilities for the success of such a campaign and the course of action which would likely bring the desired results.

Advice on Tariff and Legal Matters

Further than giving information concerning design and related matters the Bureau also offers the experience of its expert staff regarding sales problems, customs duties, legal difficulties, matters of financing and shipping. Through co-operation with the Department of State difficulties with customs authorities are being straightened out with a celerity which would be impossible for an agency not directly connected with the government.

One or two instances of what the bureau is doing for other industries, but which it would just as readily do for railway equipment manufacturers, may be of interest to show in how many ways it may be of service:

An American concern manufacturing a measuring device was endeavoring to do business in Sweden. Efforts to obtain a sale for its product were well-nigh frustrated by a competing German concern which, in true German style, circulated propaganda to the effect that the American device had not been approved by our Bureau of Standards. Now it happens that in this country approval by the Bureau of Standards is not required. This authority is vested in the sealer of weights and measures of the several states. The manufacturer appealed to the Bureau of Foreign and Domestic Commerce. A statement was obtained from the Bureau of Standards to the effect that its approval was not required and from the sealer of weights and measures of the state of New York to show that the device in reality did have official approval. Thus the Bureau enabled the American manufacturer to set at naught the unworthy efforts of his German competitor.

Forced to Do \$20,000,000 of Business

Representatives of the Bureau in China several years ago saw what they believed to be a vast field for the sale of a certain line of machinery. They endeavored to interest American manufacturers, but to no avail. They persisted. Finally one concern which they had been trying to interest in the matter consented to try the Chinese market to avoid the continual importuning of the Bureau's representatives. To date more than \$20,000,000 of this machinery has been sold in China.

An American coal salesman in Madrid recently was introduced to local business men by the American commercial attaché. He secured orders totaling \$200,000.

Specifications which were furnished through the activity of the Bureau's representative resulted recently in the sale of \$2,500,000 of electric equipment in Australia. Countless cases of this kind could be instanced.

Personal Contact With Manufacturers Necessary

No one familiar with the work of the Bureau can fail to realize the importance of its work to America's foreign trade. The Bureau's potentialities as a builder of trade, however, are utilized in very small proportion. The Bureau needs contact with business. It needs this contact not only that it may impart information it already has but, in addition, that it may have a broader conception of what information business needs. It must know from the manufacturers themselves that they are interested in selling their products abroad if there is a promising market. Its agents must know more about the qualities of American products with which their past experience has not familiarized them.

Nor Do South America's Roads Escape Adversity

(Continued from page 114)

practically assured of popularity, should benefit materially. A railway connection with the Brazilian coast to the east, moreover, seems a not far distant probability.

In Conclusion

Detailed reports concerning the present situation of the railways in all the South American republics would be a task beyond the scope of our present limitations. The railways in the northern part of the continent, with the exception of Peru, are relatively unimportant and afford no proper basis for comparison with the railways of the south. Many of them are narrow gage lines of light traffic which belong in the category of tramways rather than railways. Others are

little more than industrial lines. Doubtless in a few instances there have been developments worthy of notice which have escaped attention here. Most of these can be covered, however, by the following general statement: As a whole the railways of South America are meeting with difficulties because of high costs and low rates; by-and-large they are at present in need of increased maintenance allowances, new equipment and new facilities; they need a greater degree of standardization; they could probably adopt in larger measure American methods and American equipment and could employ larger numbers of American railroad men to their advantage as well as ours; and, when all is said and done, the opening up of South America by railroad has only begun.

An Analysis of the Railway Statistics for 1921

Extent of General Business Depression Reflected in the Decline in Traffic for the Year

By Julius H. Parmelee

Director of the Bureau of Railway Economics

DECLINE IN TRAFFIC was the outstanding feature of the railway year 1921. It was perhaps the most important of several features of the year which were a distinct disappointment. Following upon the heels of a year in which the railways of the United States broke all records for service rendered, the fact that in 1921 they were called upon to furnish a much lessened service is a matter of serious regret not only to them, but to the nation as a whole. No criticism rests upon them, however, for the level of railway service in any year is gaged solely by the amount of freight and passenger traffic offered.

As to the financial results of operation, the railways fared much better than in 1920. During eight months of 1920, however, they had the United States government to fall back upon, in the form of a guaranteed net income, whereas in 1921 they were upon their own resources; that is, their earnings were limited to their actual receipts from operation. Adding the government guarantee of 1920 to the net operating income of that year, the total net income for 1920 was greater than in 1921 by more than \$200,000,600.

In brief, the railways in 1921 handled a freight traffic about 22 per cent less than in 1920, and a passenger traffic about 19 per cent less. Their gross revenues declined \$600,000,000 from the high point reached in 1920, in spite of the fact that in 1921 the increased rates were in effect the whole year, compared with only four months in 1920. By exercising the strictest economy, however, the railways reduced their operating expenses nearly \$1,200,000,000. Net operating income was thus increased from a bare \$62,000,000 in 1920 to approximately \$616,000,000 in 1921. This represented a rate of return on railway value of 3.3 per cent.

Statistics Up-to-Date

In looking over the results of railway operation in 1921, from the statistician's point of view, it is interesting to note how much more completely and currently the statistical record of railway activity is now maintained than in the past.

Every year during the past few years has represented an advance in this direction, so that today it is possible to secure statistics as to weekly freight car loadings within 15 days, as to monthly financial results within 30 days, as to the number of employees, wages, and general statistics of physical operation within from 30 to 60 days, and as to commodity movements every quarter. Contrast this situation

with that existing as little as five years ago, when no statistics were reported for less than annual periods except financial results only, and six months to a year elapsed after the close of any annual period before the results of that period were in hand. In other words, the statistical record of railway operation, as spread out before the present-day student of railway activity, offers him a most interesting and significant series of pictures which portray both the level and the trend of railway affairs, and keeps him supplied with current information.

Financial Results

The year 1921 was the first complete calendar year, since the United States entered the war in 1917, during which railway operation was in the hands of the companies. It was the first year, since 1917, of operation without government guarantee of any kind. It was, furthermore, the first complete year since the passage of the Transportation Act, since the establishment of the Railroad Labor Board, and since the present freight and passenger rate levels became effective. For the first

THE FREIGHT TRAFFIC in 1921 was about 22 per cent less than in 1920; passenger traffic about 19 per cent less.

The gross revenues declined \$600,000,000 from the high point in 1920. Operating expenses, by strictest economy, were reduced nearly \$1,200,000,000, compared to 1920. Net operating income increased from \$62,000,000 in 1920 to about \$616,000,000 in 1921—a rate of return on railway value of 3.3 per cent.

TABLE I

	1921	1920
Total operating revenues.....	\$5,625,000,000	\$6,225,403,000
Total operating expenses.....	4,650,000,000	5,826,197,000
Taxes	288,000,000	281,350,000
Net operating income.....	616,000,000	62,254,000

time in several years, no general changes in the rates occurred, although many local and regional rate adjustments were made throughout the year.

All the statistics contained in the several tables here presented apply to railways of Class I. Table I is a condensed

comparison of the financial results for 1921 with those for 1920. As this article is necessarily prepared before the end of December, the entries for 1921 are partially estimated and are, therefore, subject to revision.

Operating Revenues

Operating revenues in 1921 stood at \$5,625,000,000. This was a decline of \$600,000,000, or 9.6 per cent, from 1920, but was some \$441,000,000 greater than in 1919. With the single exception of 1920, railway revenues in 1921 were the greatest in American railway history.

In comparing the revenues of 1921 with those of 1920, it should always be borne in mind that the present increased level of rates was in effect during the whole of 1921, while in 1920 it was effective only from August 26, or a little more than four months. This fact emphasizes the decline in the revenues of 1921. The general freight and passenger rate increases, made effective by the Interstate Commerce Commission on August 26, 1920, was estimated at about 33 1/3 per cent for freight, and something over 20 per cent for passengers, allowance being made in the latter case for the Pullman surcharge of 50 per cent. Had the traffic of 1921 been maintained at the level of 1920, the operating revenues would have been greater than in 1920 by some \$700,000,000, instead of being \$600,000,000, less. The difference between the actual revenues of 1921 and what those revenues would have been on the basis of the 1920 traffic is the sum of these two amounts, or \$1,300,000,000. The great bulk of this decline of \$1,300,000,000, from what might have been to what actually was, resulted from the decline in traffic, only a small proportion—probably not more than \$100,000,000—being due to the rate readjustments, many of which were not in effect for the whole of the year.

This \$1,300,000,000 strikingly represents the cost to the railways of a poor, as compared with a good, traffic year. It furnishes also a dim idea of what the country at large loses—potentially, of course—in a period of business depression. If the railways lose \$1,300,000,000 in revenues, how many times greater are the losses of the farmers, the manufacturers, and other producers of consumption goods?

Table II gives the comparative statistics for 1921 and 1920 of the several classes of railway revenue, freight, passenger, etc., the entries for 1921 being partially estimated.

TABLE II

	1921 (millions)	1920 (millions)
Freight revenue	\$3,940	\$4,325
Passenger revenue	1,185	1,289
Mail revenue	95	150
Express revenue	105	143
All other revenue	300	318
Total	\$5,625	\$6,225

It will be seen that freight revenues declined \$385,000,000, or 9 per cent. Passenger revenue fell off \$104,000,000, or about 8 per cent. The decline of \$55,000,000 in mail revenue is more than accounted for by the fact that that revenue in 1920 was inflated by approximately \$60,000,000 of back mail pay, actually earned in earlier years but not taken into the accounts until 1920. Deducting this inflation in 1920, the mail revenue for 1921 was slightly greater than for 1920, indicating an increase in the amount of mail handled for the government. Incidentally, it was the only revenue item to show an increase in 1921.

Express revenue declined \$38,000,000, or about 26 per cent, whereas "all other" revenue fell off \$18,000,000.

Operating Expenses

Operating expenses in 1921 amounted to \$4,650,000,000. This was a reduction of \$1,176,000,000, or 20 per cent, below the expenses of 1920. They were greater than in 1919 by \$231,000,000, and like the revenues were the greatest on record save only for the year 1920.

Table III shows how the operating expenses of 1921 and 1920 were distributed as between the general classes of expense. The entries for 1921 are, of course, subject to revision.

TABLE III

	1921 (millions)	1920 (millions)
Maintenance of way	\$780	\$1,034
Maintenance of equipment	1,280	1,584
Traffic	85	74
Transportation	2,300	2,907
General	165	171
All other expenses	40	56
Total	\$4,650	\$5,826

The expense of maintaining way and structures was reduced by \$254,000,000 in 1921, or 25 per cent. Maintenance of equipment expenses were cut \$304,000,000, or 19

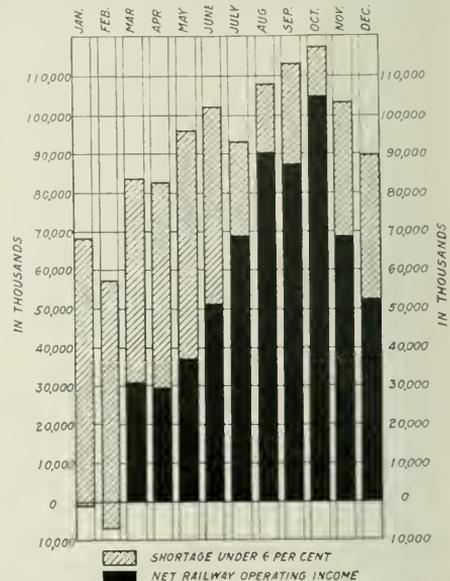

Chart A—Net Railway Operating Income in 1921, By Months. Compared With Six Per Cent On Valuation

per cent. The total maintenance cost—roadway and equipment—was reduced from \$2,618,000,000 in 1920 to \$2,060,000,000 in 1921, a decrease of \$558,000,000 or 21 per cent.

Transportation expenses, the cost of operating trains and carrying on the activities collateral thereto, were reduced \$607,000,000, or 21 per cent. General and "all other" expenses showed declines, while traffic expenses increased \$11,000,000.

Net Operating Income

The first important stopping place in the railway income account is net operating income. This is what is left of revenues after operating expenses have been met, taxes have been paid, and the net balances of equipment and joint facility rentals have been settled. Net operating income is the gage by which the success of railway operation, speaking financially, must be measured. If in amount it proves insufficient to cover fixed charges, necessary reserves, and a margin for moderate dividends and surplus, railway operation has not been successful, and the credit and financial future of the railways are seriously threatened.

Net operating income formed the basis of the compensation paid the railways by the government during the 26

months of federal control. It was the basis of the guarantee, provided in the Transportation Act for the six months of the guaranty period in 1920. Further, and far more important for the present discussion, the relation of net operating income to railway value determines the rate of return as defined in the Transportation Act, indicates whether or not the railways are earning the 5½ per cent, 6 per cent, or other percentage that may be fixed as a fair and reasonable rate, and finally fixes the point at which the government steps in to share the net earnings of the individual companies, if the rate rises above 6 per cent. Net operating income is, therefore, the most important item in the income account, and the showing it makes is eagerly watched from month to month, and from year to year.

The net operating income of 1921 is estimated at \$616,-

poses. For the year 1921, this 6 per cent was equivalent to \$1,116,000,000. The net operating income actually earned was \$616,000,000, or \$500,000,000 less than the amount anticipated under the rate decision. Instead of earning 6 per cent in 1921, the railways actually earned 3.3 per cent. This was sufficient to meet their interest requirements by a comparatively narrow margin, but was inadequate to meet all their fixed charges (including rentals), leaving nothing for reserves and dividends. Here again the effect of the decline in traffic on railway results stands out as perhaps the most significant element in the railway record of 1921.

The Story by Months

The story by months in 1921 is most interesting. Beginning with operating deficits in January and February, there was a slight improvement, to June, then a considerable improvement from July to October, and finally a recession in November and December. The improvement following the midyear was due partly to an improvement in traffic, and partly to decreased costs of operation, growing out of the wage reduction effected by the Railroad Labor Board on July 1, and also the declining costs of material and supplies. The effect of the drive of the railways for economy and efficiency, combined with a cut in maintenance work and consequent reduction in force and utilization of materials, was also apparent.

Table IV gives the rate of return in 1921, distributed by months. The rate earned in each month is reduced to an annual basis, representing what the annual rate would have been had the net operating income for a period of one year been proportioned to the net operating income of the particular month. In arriving at the proper proportion for each month, due allowance was made for seasonal fluctuations in traffic and earnings; that is, October is expected to earn more than February, and the rate for that month has been computed with an eye to such expectation. The entries for November and December are estimated in part.

TABLE IV

	Rate of return— per cent (Annual basis)
January, 1921	Deficit
February	Deficit
March	2.2
April	2.1
May	2.3
June	3.0
July	4.5
August	5.0

October	5.4
November	4.0
December	3.5
The year	3.3

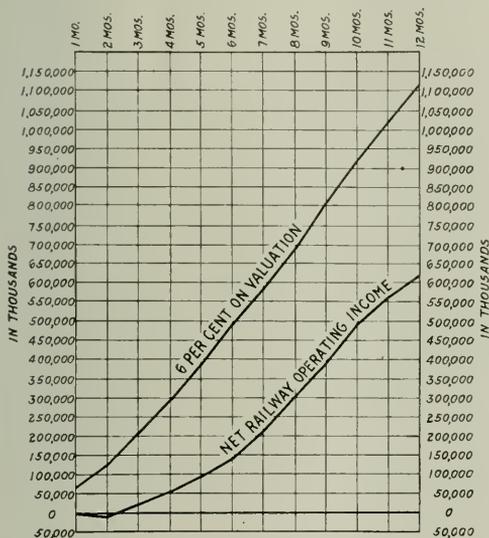

Chart B—Cumulative Net Railway Operating Income in 1921, Compared With Six Per Cent Valuation

000,000, or almost exactly 10 times what it was in 1920. It was greater in 1921, too, than in the second year of the federal control period, namely, 1919. It was smaller in amount, however, than in any year of private operation prior to 1918 back to the fiscal year 1908. In other words, net operating income was smaller in 1921 than in 13 years, not counting the period when the government was either operating the railways or guaranteeing their net income. During this period of government operation or guaranty, little effort was made to adjust the revenues to the expenses by raising rates sufficiently to meet the increase in operating costs, and to the railway corporations it was of no immediate concern whether the policy was to keep revenues even with expenses or not, as they were held safe against loss by the government guarantee. For the years preceding 1918, however, and again in 1921, it was a matter of very grave concern to the railways whether their net operating income was adequate or not, for inadequacy spelled financial stress and continued inadequacy meant impending disaster.

With this point in mind, let us see what the results in 1921 really mean. Under the increased rate decision of the Interstate Commerce Commission in 1920, the railways as a whole were expected to earn 6 per cent on their tentative valuation as fixed by the Commission for rate-making pur-

Charts A and B show these monthly rates of return in graphic form. Chart A consists of upright bars for each month in 1921, the black portion of which represents the net operating income actually earned, and the shaded portion the shortage as compared with six per cent on the tentative valuation. As the results for January and February were net deficits, the shaded portion extends below the zero line. It will be noted that the bars as a whole are of varying length, due to the seasonal fluctuations already referred to.

Chart B shows the same thing cumulatively, the trend from month to month being compared by two lines, the upper one of which indicates six per cent on valuation, while the lower one shows the actual net operating income. The spread between the two lines is, of course, the shortage under six per cent.

Receipts Per Traffic Unit

Interesting comparisons are afforded by the showing of average receipts per ton-mile and per passenger-mile in 1921 and 1920. These are given in Table V, for each month of

1920 and for the months of 1921 to the latest available date.

TABLE V

Month	Average receipts per ton-mile (cents)		Average receipts per passenger-mile (cents)	
	1921	1920	1921	1920
January	1,210	0,969	3,116	2,614
February	1,254	0,985	3,089	2,594
March	1,335	0,986	3,175	2,613
April	1,334	0,981	3,190	2,608
May	1,251	0,954	3,139	2,614
June	1,278	0,970	3,093	2,575
July	1,254	0,960	2,987	2,561
August	1,288	0,936	3,006	2,643
September	1,288	1,154	3,070	2,949
October	1,276	1,276	3,002	3,002
November	1,263	1,263	3,019	3,019
December	1,209	1,209	3,142	3,142

In studying the comparative figures of Table V, it should be noted that a considerable increase in freight and passenger rates became effective toward the close of August, 1920. The effect of such increase was barely discernible in the passenger-mile average for August, 1920, and not at all discernible in the ton-mile average. Not even in September, 1920, did the rate increases seem to have full effect, partly because much traffic was on the rails in that month that had been billed (or passenger tickets purchased, as the case might be) at the lower rates, also because state commissions had not in some cases made effective intrastate rates to correspond to the increased interstate rates. Beginning with October, 1920, however, the effect of the rate increases on the average receipts per ton-mile and passenger-mile, respectively, can be traced from the record shown in Table V. In making comparisons of 1921 with 1920, only corresponding months should be compared, because the seasonal changes in traffic cause the average receipts to vary considerably from month to month. Thus January should be compared with January, February with February, and so on.

Employees and Their Wages

Beginning with 1920, the Interstate Commerce Commission required railways of Class I to file their reports of number and compensation of employees quarterly, instead of annually as theretofore. In these quarterly reports the number of employees at the middle of each month was reported, but compensation for the quarter as a whole. The classification consisted of the 68 groups into which the Commission classified the employees, beginning in 1915.

Although this was a distinct advance in railway labor statistics, the data secured from these quarterly reports did not prove sufficiently detailed and were not available at sufficiently frequent intervals to satisfy either the Interstate Commerce Commission or the Railroad Labor Board, the latter being a new entry in the field of labor statistics. Accordingly, beginning with July, 1921, the Commission and the Labor Board jointly inaugurated a new system of railway labor reports, the principal features of which are a classification into 148 groups—instead of 68—and the requirement that the returns be made monthly instead of quarterly.

At the date of this writing the Commission has made public only two monthly summaries based on the new reports—those for the months of July and August, 1921—although individual returns are wholly or largely in hand for the months of September and October. From preliminary summaries by the Bureau of Railway Economics, however, a fairly accurate picture of labor conditions may be set forth down to and including October.

First, as to the number of employees on the payrolls of the railways of Class I. This has been subjected to such great fluctuations that it is worth while to turn back to 1920 and trace the story down to October, 1921. This is done in Table VI. The entries for September and October, 1921, are based on preliminary tabulations, and are subject to revision. This is especially true of October.

It will be noted from Table VI that railway employees numbered 2,000,105 and 1,970,525, respectively, during January and February, 1920, the final months of federal control. The railways came back to their owners in March with 2,009,948 employees. From April the number gradually rose to a maximum of 2,197,824 in August, 1920, which was the largest number of railway employees ever recorded. At that time it will be recalled, the railways of

TABLE VI

	Number of employees	
	1921	1920
January	1,804,822	2,000,105
February	1,676,543	1,970,525
March	1,593,068	2,009,948
April	1,542,716	1,952,446
May	1,575,509	2,005,483
June	1,586,143	2,056,381
July	1,634,872	2,111,280
August	1,679,927	2,197,824
September	1,721,000	2,164,880
October	1,745,000	2,136,259
November	2,068,454
December	1,976,429

the United States were handling the largest traffic in their history, the traffic of the respective months from August to December being heavier than in any previous corresponding months.

From October, 1920, and more or less paralleling the sharp decline in traffic after the middle of December, the number of railway employees showed a consistent decline to April, 1921, when the lowest point was reached since 1915. After April, when the trend again turned upward, there was a steady, although rather gradual recovery, so that in October of 1921 there were 200,000 more railway employees at work than in April. Even making full allowance for the seasonal difference between April and October, the record shows partial recovery.

The second consideration is wages. Here a clear distinction must be made between wages (used in the sense of rates of pay) and earnings, or compensation. One represents the rate at which a man works, per hour, day, month, or mile, while the other is the total amount of money he earns in a given period, being the result of multiplying the rate of pay into the number of hours, days, months, or miles with which he is credited.

As to the rates of pay, or wages, a general decrease was authorized by the Railroad Labor Board on July 1, 1921, which has been estimated as averaging from 11 to 12 per cent. This cut off about half of the increase granted by the Railroad Labor Board in 1920.

Looking at the average wage throughout 1920 and 1921, the curious fact develops from a mathematical calculation that the average for each year was virtually the same. That is, assuming that a man was on duty the same number of hours in the two years, his total compensation would be virtually the same for each year. This is speaking of the average man, and would not hold true of any of the individuals actually at work. For example, assume that a man received \$100 a month at the beginning of 1920, and was given the same increase on May 1 of that year as the average for all employees, or 21 per cent. He received \$100 a month for four months (January to April) and \$121 a month for the remaining eight months, a total for the year of \$400 plus \$968, or \$1,368. In 1921 he received his \$121 for six months (January to June), and was then cut 11 per cent to \$107.69, which was his rate during the remaining six months. His total for the year 1921 was therefore \$726 plus \$646.20, or \$1,372.20, or within \$4.20 of his 1920 earnings.

This is a purely hypothetical case, of course, and the figure of \$100 per month with which we started is not offered as typical, but merely as an easy figure to handle mathematically. Furthermore, it was assumed that hours on

duty remained constant throughout the two-year period, whereas the truth is that they declined somewhat in 1921, in sympathy with the decline in traffic.

The bearing of the example is this: If average wage rates were the same in 1921 as in 1920, then any reduction in the total payroll in 1921 must be due chiefly to one or both of two factors, namely, reduction in force or reduction in hours per man, especially the hours of overtime. Investigation of the facts indicates that both forces were at work in 1921.

Let us look first at aggregate compensation in the two years. In 1920 the railways paid their employees more than \$3,700,000,000, or more than 2½ times as much as in 1916. There was some increase in force between 1916 and 1920, it is true, but the bulk of the increase in compensation was the result of increased wage rates.

In 1921 the payroll was approximately \$2,718,000,000, a reduction of over a billion dollars from the very high level of 1920. The reduction in total payroll was more than 25 per cent, while the reduction in average number of employees was nearly 20 per cent. The average wage rate in the two years being practically the same, as we have seen, the remaining proportion of the reduction in payroll must have been due largely to reduction in overtime and other hours.

The average annual compensation per employee has shown considerable variation during the past two years. In 1919, the final year of federal control, it was \$1,486 (annual basis). For the first quarter of 1920 it was \$1,596. For the second quarter of 1920, which contained one month under the old and two months under the increased wage rates, the annual average was \$1,812. During the final two quarters of 1920 the annual averages were \$1,952 and \$1,908, respectively. The average of \$1,952 for the third quarter represented the peak of earnings for railway employees. The fourth quarter began to show the effect of the decline in traffic, which reduced overtime work and affected the average in other ways as well.

For the year 1920 as a whole, two-thirds of which was under the increased wage scale, the annual average compensation was \$1,820. The first quarter of 1921 dropped to \$1,792, and to \$1,784 for the second quarter. This brings the record to July 1, when the 11 per cent reduction in average wage rates became effective. Complete wage statistics are available only for two months since the reduction, the records for which show an annual average of \$1,573 in July and \$1,627 in August.

Traffic in 1921

Emphasis has already been laid upon the serious decline in railway traffic in 1921, as compared with 1920. Net ton-miles (revenue and non-revenue ton-miles) broke all records in 1920, being as much as seven billions greater than the previous record year, the strenuous war year of 1918. The total for 1920 was 447 billions. Indications are that for 1921 the corresponding total did not exceed 350 billions, a decline of approximately 100 billions, or 22 per cent.

This is one of the most remarkable traffic declines in American railway history. Every month of the year showed a falling off of from three to twelve billions. The level for the year as a whole is below that for any of the six years next preceding; that is, we must go back to the year 1915 to find a traffic situation that was even approximately as poor as in 1921.

The story by months in 1921, compared with 1920, is presented in Table VII. Entries for the final two months of 1921 are estimated in part.

Revenue passenger-miles had progressively broken the record in every year from 1915 to 1920. In 1921, however, there was a recession of 19 per cent from the 1920 total, bringing the level for the year below that for 1917. In

other words, we must go back to 1916 to find a smaller amount of passenger travel than in 1921. The total for 1920 was 46.8 billions, but fell in 1921 to 38.0 billions, every month in the year showing a recession. In fact, the percentage of decrease seemed to grow as the year wore on,

TABLE VII

	Net ton-miles (millions)	
	1921	1920
January	29,824	34,765
February	24,913	32,695

December	31,600	34,722
The year	350,000	447,278

the worst months being July and August, with decreases of 24.0 and 27.4 per cent, respectively, whereas January declined only 4.1 per cent and February 10.0 per cent.

The comparative monthly statistics for 1921, compared with the months of 1920, are shown in Table VIII. The entries for October, November, and December, 1921, are partially estimated.

The reason for these declines in freight and passenger traffic is not far to seek. All business activities in 1921 were in the throes of a revolutionary transition period, the inevitable aftermath of a war so prolonged and so extensive as that waged from 1914 to 1918. The railways create

TABLE VIII

	Revenue passenger-miles (millions)	
	1921	1920

The year	38,000	46,848

little traffic of their own; they handle the traffic that is produced for them by the economic activities of the country. As a barometer of business conditions, the level of railway freight traffic is almost unexcelled. When business is good, freight moves in large volume; when it is depressed, freight suffers accordingly. The recession in railway traffic indicates in most significant fashion the extent to which business in general was on the rack in 1921.

It has already been pointed out that the financial results in October showed decided improvement, followed by a slump in November and December. Temporary influences were at work in these last two months, which it is hoped will not long continue in 1922. In the first place, the threatened coal and railway strikes hurried much traffic onto the rails in October which would normally have been spread over one, or even two, succeeding months, with the result that October was above normal and November and December below normal. Second, the knowledge, in November and December, that the transportation tax would be abolished at the end of the year, under the new revenue act, probably held back some traffic and travel in those months that will be released after January 1. Third, and in some respects most important, the uncertainty as to the level of

(Continued on page 146)

100 of These Locomotives Were Built by the Lima Locomotive Works for The Illinois Central

Locomotive Market in Quiescent State During 1921

Domestic Orders Make New Low Record—Largest Buyer Is National Railways of Mexico

By Frank W. Kraeger

THE ORDERS placed for locomotives for domestic service in the United States in 1921 totaled, according to the compilations of the *Railway Age*, 239. This compared with 1,998 in 1920. In other words, it was but one-eighth the business of that year. In 1919, the second year of federal control, the locomotives ordered for domestic service in the United States totaled 214; the 1921 figure, poor as it was, luckily succeeded in bettering slightly that ignominious record.

Orders placed by railroads in Canada with Canadian builders totaled 35, as compared with 189 in 1920 and 58 in 1919.

The export locomotive orders for 1921 aggregated 546, inclusive of the orders placed by lines in Mexico. This compared with 718 in 1920 and 898 in 1919. The Mexican lines signalized their rehabilitation and return to normalcy by placing in 1921 the largest order for any system in North America, the National Railways of Mexico having ordered a total of 142 locomotives.

Production in 1921 totaled 1,121 locomotives for domestic service and 587 for export. The 1,121, although it was sev-

numbers of serviceable locomotives stored and a high percentage of unserviceable locomotives.

On December 1, according to the A. R. A. Car Service Division reports, there were 5,308 serviceable locomotives stored and 12,170, or 18.8 per cent, held for repairs requiring over 24 hours. At various times during the year the "bad order" locomotives approached 20 per cent. It is an interesting fact that this is a matter which received but small attention during the year. The contrast as between the publicity given the bad order car figure and that given the unserviceable locomotive per cent is especially striking. The reason for the failure to pay attention to the locomotive condition situation is quite evident. In a period when expenses

eral times the number of new locomotives ordered during 1921, was the lowest total the American locomotive manufacturers have experienced for many years. It compared with 1,857 (exclusive of Canada) in 1920. One has to go back to 1897 to find a lower figure than the 1921 performance.

With these facts at hand, it must be admitted that 1921 found the locomotive market in a quiescent state. It is true that a fair number of locomotives were sent to the builders for heavy repairs or rebuilding and that this helped the situation to some extent. The reason for the poor business done, insofar as concerns domestic orders, was, of course, the sharp decline in traffic and the weak and anemic character of the figures of net railway operating income. During a large part of the year the reports showed considerable

had to be cut to the bone, one would hardly have expected the operating officer to over exert himself about his per cent of unserviceable locomotives while he had a sizable number of serviceable locomotives in white lead. It was hardly to be expected either that a period which was characterized by that sort of thing would be productive of large orders for new locomotives. However, even at that, the 1921 total is rather disappointing. One can find consolation at least in the fact that this condition cannot last. The American railroads have got to make up their deferred motive power requirements some time.

With further reference to the domestic orders, the only

systems which placed contracts of any size—and even their orders were not large—were the Atchison, Topeka & Santa Fe, the Southern Pacific, the Seaboard Air Line, the Central of New Jersey and the Rock Island. All the additional orders were of small size, being only of from one to eight locomotives. In the small total there is noticeable a comparatively large proportion of Santa Fe and Mountain type locomotives, which is what one would naturally expect. Brick arches and superheaters have now been so generally

tions were at times below those of the successful American bidder. In such cases the American reputation for prompt deliveries was frequently a deciding factor.

The orders from Argentina were principally from the State Railways. The Japanese business is of interest because Japan has a considerable locomotive production of its own. The Chilean State Railways, which ordered 30 steam locomotives, merit attention because they placed the largest electric locomotive order of the year—35 locomotives for the new electrification out of Santiago.

In looking over the foreign specifications it is evident that the railroads in other countries are appreciating the economic advantages to be obtained from the use of considerably heavier power than that which they have hitherto purchased, although naturally the locomotives are lighter than those used on American roads. It is interesting to note that whereas only one Mallet locomotive was ordered in 1921 by an American railroad, a number were ordered for use in China, these being the heaviest locomotives built for use on any road outside of the United States. The tabulated data indicate that the American locomotive builders did well in China in 1921.

An interesting point in connection with the export trade is the paucity of orders from European countries this year and the absence of Cuba—due to the ill-fortunes of the sugar industry—from the list of purchasers. In the foreign field, as well as in the domestic field, the controlling factor was the difficulty, at times insurmountable, of obtaining either the necessary capital or credit. In a number of instances the locomotive builders were obliged to arrange for the necessary financing.

Production

As previously noted, the number of locomotives built during 1921, as distinguished from orders, was record-breaking—very small. The domestic production was the lowest since 1897—the foreign is back to pre-war records.

The locomotive orders which are listed in the accompanying tables are compiled from official sources. Some few omissions of small unimportant orders doubtless occur. The data presented were supplied by the railways and the industrial companies in response to inquiries from the *Railway Age*. They were checked against similar lists furnished through the co-operation of the builders and with the weekly reports in the Equipment and Supplies column of the *Railway Age*.

†Includes Canadian output and equipment built in railroad shops.

adopted that it is a rare thing for a new locomotive to be built without them. Stokers and power reverse gear also are usually applied to all heavier power and the past year has evidenced a growing tendency to the more extended use of feedwater heaters and boosters.

Foreign Business

The number of locomotives ordered in 1921 for export was small, even if it was double the domestic orders. The largest order, as already noted, was from Mexico—that is, if it is proper to include in the foreign orders, locomotives to be delivered to a road which subscribes to the A. R. A. Code of Interchange Rules, as do the National Railways of Mexico. The other countries which furnish sizable business were Argentina, Chile, China, Brazil and Japan. Much of this business was obtained in spite of the keenest competition, considerable of it from German builders whose quota-

Freight Car Orders During 1921 Lowest on Record

Attributed to Small Net Income, Decreased Traffic, Large Car Surplus and Bad Order Situation

By Frank W. Kraeger

FREIGHT CARS ordered for domestic service in the United States during 1921 totaled 23,346, the lowest except 1919. The orders compared with 84,207 in 1920; in other words, they were one-fourth the 1920 totals. During the second year of federal control, 1919, practically the only orders placed in North America were those for private car lines and industrials; the total including Canada was 25,899 cars; the 1921 figure succeeded in lowering that unenviable record.

Export orders in 1921 totaled 4,982; this is half the total for 1920, in excess of the figure for 1919, but less than one-third the averages for the years 1917 and 1918.

The number of freight cars ordered in 1920 was not large. It did, however, permit the car builders to start 1921 with a fair amount of uncompleted business on their books. The 1921 orders were so few that the year was primarily spent in cleaning up the hold-over 1920 business. The result was minimum production—the totals for the year reaching 40,292 cars built for domestic service and 6,412 for export. For all the fact that the production for freight cars for the past several years has been at a low average, the 1921 total

1921 succeeded in making 1921 a record-breaker of the wrong sort.

It is hardly necessary to discuss the factor of net railway operating income inasmuch as it is receiving considerable attention in various other articles in this issue.

Concerning net ton-miles, attention is directed to the article entitled, "Five Years of Freight Traffic Growth Is

TABLE II—ORDERS FOR FREIGHT CARS SINCE 1901

succeeded in being less than that for any other year for an indefinite period. Fortunately, there was a reasonable amount of work in the form of freight car repairs to alleviate the situation; but it can hardly be said that repair business went very far in that direction.

The reason for the small quantity of new orders for domestic service in 1921 is due to several factors—the abbreviated net railway operating income; the decreased net ton-miles; the large proportion of idle cars; and the percentage of bad order cars. These factors were more or less interrelated. In a poor year of rather more ordinary poorness, the existence of any one of them could have been blamed for acting as a drag on freight car business. The combination of them in

Lost," wherein appears a chart showing net ton-miles on the Class I carriers by months from 1916 to October, 1921. The point plotted for 1921 in nearly every month is the lowest for that month. Large orders for new freight cars are naturally not to be expected under such conditions.

The net freight car surplus varied during the year between 68,984 on October 31 to 507,274 on April 8. On December 15 it was 371,044. The year 1921 is the only year on record in which idle cars climbed over the 500,000 mark. The years during which at any time the surplus has gone over even 300,000 are very few. They include 1908, when the highest figure was 413,338; possibly 1914, during a portion of which the total got so large that the compilation of figures was abandoned; in 1915, when 327,084 was reported; and in 1919, when the peak was reached of 448,864.

Large car surpluses and declining totals of net ton-miles are not unusual. Such a large percentage of bad order cars, however, was a feature more or less singular to 1921. The

bad order cars on January 1 totaled 191,254, or 8.5 per cent. They increased during the early part of the year, until on August 15 they totaled 382,440, or 16.6 per cent. On December 1 this had been reduced to 320,292, or 14 per cent. This is not the place to discuss the reasons for the high bad order totals—it is the place, however, to indicate that the effect on new freight car business was potent, to say the least. A railroad worrying each month whether its net railway operating income would be shown in black or in red figures could hardly be expected to buy new cars at high,

showing improvement. This is said with due recognition of the decreased business which is a natural factor at this time of the year.

Sizable orders were reported in 1921 by but few roads. The Atchison, Topeka & Santa Fe ordered 1,300 gondola and 2,500 refrigerator cars. The Baltimore & Ohio contracted for 3,000 hopper and box car bodies to be used for replacements. The Chicago, Milwaukee & St. Paul placed orders for 2,500 gondola cars. The Lackawanna reported 1,500 hopper and 500 box cars. The Illinois Central secured 1,000 refrigerator cars. Other large orders are reported for the Louisville & Nashville, 2,800 cars, and the Minneapolis, St. Paul & Sault St. Marie, 1,300. The absence of the New York Central and Pennsylvania from the lists is noticeable; these roads, however, received large allocations of U. S. R. A. standard equipment, and the former also placed large orders in 1920.

Another interesting but disappointing factor was the small amount of orders for private car lines and industrials. Canadian orders were likewise conspicuous by their absence.

The export orders for the year were not large. Such business, however, has apparently been brought to a more stable basis than was the case when the larger part of the business was placed by European countries which had car-building plants of their own but which were used for other purposes during the war. The Argentine State Railways purchased 2,000 cars; the Chilean State Railways, 320; China also purchased a fairly large number. The order given a Canadian company for 500 tank cars for the Russian Soviet Government merits more than passing attention. The Chinese orders and those from South America—in the latter case from the state owned railways—prove the contentions made in the recent past that it was among such purchasers that our foreign business was most likely to be found.

The list of orders which follows is compiled from information furnished the *Railway Age* by railroads, private car lines and car manufacturers. It was checked and amplified by comparison with the items appearing each week in the Equipment and Supplies column of the *Railway Age*. The railways, private car lines and manufacturers gave us their usual co-operation not only as to new orders but as to production and it is with pleasure that the editors of the *Railway Age* draw the reader's attention to that fact. The *Railway Age* is especially indebted to Dr. W. F. M. Goss, president of the Railway Car Manufacturers Association, for the courteous and valuable assistance given us in securing the reports from the members of that association.

even if not at peak prices, while it had large numbers of both unserviceable and idle serviceable cars. There was, of course, a fair amount of repair business but, as noted, not exactly a large amount of it.

Fortunately, the gradually declining percentage of bad order cars indicates an improvement in the situation. In fact, all four of the factors which we blamed for the disappointing 1921 business are, looking at it in the larger way,

FROM 1873, when the first two Washington navel trees were imported into the State of California, the citrus fruit industry has grown in size and importance until today approximately 180,000 acres in California are devoted to the growing of oranges, and 50,000 acres to lemons. The fruit which is shipped annually from the state averages from 25,000 to 30,000 carloads of navel oranges, 10,000 to 15,000 carloads of Valencias and about 9,000 carloads of lemons and grapefruit. In recent years, owing to the growing demand for Valencias, the fruit is shipped during the entire year, navel oranges moving from November to May, and Valencias from May to November. It is predicted that when the acreage now planted comes into full bearing, approximately 20,000 more cars of citrus fruit will be shipped annually.

During the season of 1919, 42,443 cars, loaded with citrus fruit,

were moved from California. This is equivalent to 849 trains of 50 cars each.

Further, taking an average of 448 boxes per car for the oranges, and 392 boxes per car for the lemons, there was a total of 14,822,528 boxes of fruit or 746,804 tons.

The rate to Eastern points during 1919 was \$1.44 per 100 lb. on oranges and \$1.25 on lemons. This would yield a total of \$17,492,290 in freight earnings. The shipper fared well during the 1919 season, receiving \$3.75 a box for oranges and \$3.50 a box for lemons or a total revenue of \$68,422,283. The by-products are important. The factories are now annually producing approximately 50,000 lb. of lemon oil, 1,500,000 lb. of citric acid and orange marmalade, citrate of lime and vinegar in large quantities.

Built by the Pressed Steel Car Co. for the Wheeling & Lake Erie

Built by the American Car & Foundry for the New York Central Lines

Passenger Car Purchases Small During 1921

Fewest Orders in Any Year on Record Except 1918—Sizeable Foreign Buying

By Frank W. Kraeger

THE PASSENGER CARS ordered for service in the United States totaled in 1921 but 246. This is the smallest number in any year on record for at least 20 years, with the exception of the year 1918, when every energy was bent towards war-time activities. Foreign orders in 1921 totaled 155. Several important orders were included. The figure compares with 38 cars ordered for export in 1920 and 143 in 1919.

continue into 1921. The reason can only be laid at the door of decreased net railway operating income. In the article on locomotive business during 1920, which appears elsewhere in this issue, evidence is presented that orders for new locomotives could hardly have been expected while the roads were not in a position and did not find it necessary, while they had engines in white lead, to reduce their percentage of unserviceable locomotives. This is not the case with passenger equipment. The railroads need passenger cars. They

	United States	Canada	Total
Domestic.....	1,275	361	1,636
Foreign.....	39	...	39
	1,314	361	1,675

The passenger car production, as distinguished from orders, was 1,275, as compared with 1,272 in 1920. Cars built for export totaled only 39.

The review of the orders for passenger cars in 1920, which appeared in the *Railway Age* of January 7, 1921, page 141, said: "The totals for orders of passenger cars during the past year give proof of the upward trend which was noted in the statistical report on passenger car orders last year." Unfortunately the upward trend did not con-

have purchased but few in the last five years in spite of the greatly increased business developed during these years. The result is shown in the statistics of passengers carried per car or per train and in the fact that passenger service at present,

even with its improvement over war and after-armistice federal control conditions, is by no means as satisfactory as railroad men would like to see it.

The tendency for many years has been towards steel passenger train equipment. The Interstate Commerce Commission in its latest annual report repeats its previous recommendation that the use of steel cars in passenger service be required. The progress in the direction of replacing wooden cars in the past few years has been disappointing. The lack of such progress will only increase the difficulties of the carriers, should the Commission's recommendation ever be adopted and put in the form of an act of Congress.

Only two roads placed fair-sized orders for passenger

train equipment during 1921. The New York, Ontario & Western ordered 32 cars and the Reading, 50. The latter is expected shortly to order additional cars. The Missouri, Kansas & Texas ordered 54 cars, but 50 of these were express refrigerator cars and are included in the passenger car list only because they will presumably be operated in passenger trains.

South America and China were the largest foreign buyers. The Argentine Government ordered 53, the Chilean State Railways ordered ten, and railways in Colombia, 28. The Tientsin-Pukow of China gave us an order for 45. It is noteworthy that in the case of the Chilean and Tientsin-Pukow cars, all-steel construction was specified.

C. H. MARKHAM, PRESIDENT OF THE ILLINOIS CENTRAL, replying to an open letter of W. H. Johnston, president of the International Association of Machinists, exposes the misleading nature of statements issued by Johnston concerning the valuation of the railroads made by the Interstate Commerce Commission. "Since you use miles of track in arriving at your estimated value per mile, of the 24 railroads, you should also have used miles of track, instead of miles of line in making your estimate of the value of all the railroads

If you had used the correct figures your estimate of the total valuation in the United States would have been \$4,640,000,000 (over 50 per cent) more than the estimate you actually made which shows the utter fallacy of the comparison. The railroads whose tentative valuations you and Mr. Plumb cite have only about seven per cent of the total trackage in the country. These are not representative roads. The valuation of all the railroads cannot be fairly or intelligently estimated upon any such unrepresentative basis."

Dividend Changes on Railroad Stocks in 1921

Apprehension of Early Months Not Borne Out— Lackawanna and Burlington Increase Rate

By Charles W. Foss

APPREHENSION as to whether the railroad boards of directors would or would not declare the regular dividends of their respective companies was an ever-present feature in financial centers throughout the better part of 1921. The apprehension at times was directed at good roads and bad, because during the early part of the year even the more fortunate roads were unable to show promising figures of net railway operating income.

The year is now behind us. It develops that the apprehensions, while they were amply justified by the contemporaneous conditions, were by-and-large not borne out in the final results. Realizing the manner in which nerves were kept on edge during the earlier and middle parts of the year, it is somewhat surprising to see how few changes really did take place during 1921 in the matter of dividend payments or changes in the rates of dividends declared. The record of the year was not good, but it was much better than many of the most optimistic would have hoped for, say, eight months ago.

The outstanding feature, of course, was the reduction in the Pennsylvania Railroad dividends from 1½ per cent quarterly to 1 per cent. Next we may put the deferring of the Southern Railway 2½ per cent semi-annual dividend on the preferred. The action of the Chesapeake & Ohio directors in deferring the 2 per cent semi-annual dividend on the common was also serious, but the C. & O. has since restored its former rate.

On the other hand, there were the Chicago, Burlington & Quincy and Lackawanna. The former declared a 54 per cent stock dividend and has since paid 25 per cent dividends on the increased capitalization. The Delaware, Lackawanna & Western, which formerly paid 5 per cent quarterly dividends, declared a 100 per cent stock dividend and is now paying at the rate of 3 per cent quarterly on the doubled capitalization and has recently declared an extra of 5 per cent.

The Interstate Commerce Commission, in its annual report issued recently, has a table covering dividend payments for the past ten years. The table shows that whereas in 1911 67.65 per cent of the stock of the railroads was paying dividends, but 57.24 per cent paid dividends in 1920. The amount paid in dividends in 1911 was \$460,195,376; in 1920, but \$328,989,492. The average rate on dividend paying stock declined from 8.03 per cent in 1911 to 6.51 in 1920; the rate on all stock from 5.42 to only 3.72. It would be difficult to indicate what has taken place with railway stocks in these years in a more striking manner. The figures given in the report follow:

CAPITAL STOCK AND DIVIDENDS, 1911-1920

Steam Roads, Excluding Switching and Terminal Companies

Year ended	Proportion of stock paying dividends, per cent	Amount of dividends	Average rate on:	
			Dividend paying stock per cent	All stock per cent
June 30, 1911	67.65	\$460,195,376	8.03	5.42
June 30, 1912	64.73	400,315,313	7.17	4.64
June 30, 1913	66.14	369,077,546	6.37	4.22
June 30, 1914	64.39	451,653,346	7.97	5.13
June 30, 1915	60.45	328,477,938	6.29	3.80
June 30, 1916	60.38	342,109,396	6.48	3.91
Dec. 31, 1916	62.02	366,561,494	6.75	4.19
Dec. 31, 1917	63.32	381,851,548	6.81	4.24
Dec. 31, 1918	58.09	339,185,658	6.60	3.83
Dec. 31, 1919	59.64	335,241,935	6.33	3.77
Dec. 31, 1920	57.24	328,989,492	6.51	3.72

The important changes in dividend rates which took place in 1921 are shown in the following table:

Name of road	Per cent declared 1921	Per cent declared 1920	Per cent rate at present	Annual rate 1920
Chesapeake & Ohio, common	2	4	4	4
Colorado & Southern, common	3	4	4	4
Chicago, Burl. & Quincy, old capitalization	2	8	10	8
Chicago, Burl. & Quincy, new	25	10	10	10
Chicago, St. Paul, Minn. & Omaha, preferred	6	7	5	7
Del., Lack. & Western, old capitalization	10	20	20	20
Del., Lack. & Western, new	11	12	12	12
Hocking Valley, common	2	4	4	4
New York, Ont. & Western	2	1	1	1
Pennsylvania Railroad	4½	6	4	6
Pittsburgh, Cincinnati, Chicago & St. Louis	4	4	4	4
Southern Railway, preferred	5	5	5	5
West Jersey & Seashore	5	5	5	5

Pennsylvania Railroad. The Pennsylvania's action in reducing the dividend rate from 1½ per cent quarterly to 1 per cent was taken on April 27. This was the first time in 22 years that the Pennsylvania had reduced the annual dividend rate below 6 per cent. Since 1899 it has paid 6 per cent annually with the exception of 1906 when the rate was 6½ per cent and 1907 when it was 7 per cent. All of the stock of the Pittsburgh, Cincinnati, Chicago & St. Louis with the exception of about 1 per cent is owned by the Pennsylvania Company; the road had been paying 2 per cent semi-annually but action on this dividend was deferred at a meeting held June 22. The Pennsylvania owns \$6,747,900 of the \$11,586,250 stock of the West Jersey & Seashore. The latter deferred its semi-annual dividend of 2½ per cent in March. The road had been paying dividends since 1896, most of the time at 5 per cent. In 1906 the rate was raised to 8 per cent; in 1908, reduced to 4 and has been 5 per cent since 1910.

Southern Railway. The directors at a meeting on May 12 failed to take action on the regular semi-annual dividend of 2½ per cent on the preferred stock, usually paid June 30. The dividends on the preferred stock have varied considerably, ranging since 1897 from none to 5 per cent. In 1915 and 1916 no dividends were paid; on November 20, 1917, 2½ per cent was declared; April 30, 1918, 2½ per cent; November, 1918, 2½ per cent; 1919, 5 per cent, and 1920, 5 per cent.

Chesapeake & Ohio. On May 20, 1921, the directors of the Chesapeake & Ohio deferred action on the regular semi-annual dividend of 2 per cent due June 30, 1921. In November, however, a dividend of 2 per cent was declared payable January 3 to stockholders of record December 2. The Chesapeake & Ohio from 1899 to 1908 paid 1 per cent annually. In 1909 it paid 3 per cent; from June, 1910, to June, 1913, at the rate of 1¼ quarterly. In 1914, 3 per cent was paid. No dividends were paid between December, 1914, and December, 1916, at which time a rate of 2 per cent semi-annually was established.

The Hocking Valley's rate of 2 per cent semi-annually on the common goes back to December, 1915. As in the case of the C. & O., the dividend was deferred in June but restored in November.

Chicago, Burlington & Quincy. This company declared a stock dividend of 600,000 shares, or 54.132 per cent, to stockholders of record March 31. Inasmuch as the details were given prominence in the *Railway Age* at the time, it is not necessary to repeat them. The Burlington, on its former capitalization, paid quarterly dividends at the rate of 8 per

cent annually; this rate began in 1908 and was paid to March this year, except in September, 1917, when an extra dividend of 10 per cent was paid. Following the declaration of the stock dividend, or on May 26, a dividend of 5 per cent was declared without reference to any annual rate. On December 1 additional dividends were declared, including a semi-annual dividend of 5 per cent and an extra dividend of 15 per cent. The proceeds nearly all go to the Northern Pacific and Great Northern and will assist the two latter roads materially in maintaining their own dividends, which in 1921 were paid from surplus rather than from current earnings. The Burlington dividends in 1921 included 2 per cent on its old capitalization and 25 per cent on the new capitalization.

The Colorado & Southern paid a dividend of 3 per cent on its common stock in December. This was the first divi-

dend on this issue since 1912, when 1 per cent was paid. The Burlington owns \$23,667,500 of the C. & S. \$31,000,000 common stock.

Delaware, Lackawanna & Western. The Lackawanna stock dividend of 100 per cent, or about \$45,000,000, represented a capitalization of about one-half the company's surplus. The company has been paying dividends of 20 per cent annually since 1910. The 100 per cent stock dividend was declared July 28, payable August 20. The directors, on September 29, declared a quarterly dividend of 3 per cent payable October 20. This is at the rate of 12 per cent annually on the new capitalization, or 24 per cent on the former capitalization. On December 29, in addition to declaring the regular quarterly dividend of 3 per cent, they declared an extra dividend of 5 per cent, to be paid out of surplus, payable January 20 to stock of record January 7.

Receiverships and Foreclosure Sales During 1921

Mileage Operated by Receivers Now Totals 14,324, as Compared with 17,197 Miles at End of 1920

THE MILEAGE OF ROADS in the hands of receivers at the end of 1921 was, according to the compilations of the *Railway Age*, 14,502. This represents the smallest mileage in the hands of receivers since 1912. It compares with 17,197 miles in receivership at the end of 1920 or with the total of 37,353 on June 30, 1916. During the year two large roads were reorganized and taken out of receiver's hands. One of these was the Denver & Rio Grande, operating 2,485 miles of line, and the other was the Chicago & Eastern Illinois, operating 1,131 miles.

The Missouri, Kansas & Texas Lines, operating a total of 3,807 miles, are about to be taken from the receivership lists. The plan of reorganization was announced in November and will presumably be made effective within a short time. The road must be shown in the 1921 totals of roads in the hands of receivers, but it must be borne in mind that the 1921 total mileage of 14,380 is about to be reduced in the amount of the Katy system mileage of 3,807.

The roads that went into the hands of receivers during 1921 totaled 14 with a mileage of 1,744. But one important road was included, the Atlanta, Birmingham & Atlantic, which has been in receivership on various previous occasions. The 1921 figure compares with 10 roads having 541 miles of line which went into the hands of receivers during 1920.

The year 1921—until recent months at least—was an exceedingly poor year from the standpoint of both gross and net earnings. Under former conditions it might have been expected that more roads would have gone into the hands of receivers than did so. The Transportation Act, however, has given an entirely different aspect to the situation as it has in the case of many other things. The new feature, insofar as the matter of receiverships is concerned, is the loan fund administered by the Interstate Commerce Commission. The commission, in both 1920 and 1921, has

made loans to several carriers for the purpose of assisting them in meeting maturities. Presumably, in the majority of cases, other methods of meeting these maturities would have been worked out, had this method not been available, but there can be little question that in a few cases, at least, receivership was made considerably less of a possibility.

It is fortunate that the money markets are much easier than they were, but it must be realized that during much of the period we have just passed through the financial

RECEIVERSHIPS ESTABLISHED IN 1921

Name of road	Mileage	Funded debt outstanding	Capital stock outstanding
Alabama & Mississippi	78	\$184,000	\$10,000
Atlanta, Birmingham & Atlantic	640	9,592,407	30,000,000
Colorado, Wyoming & Eastern	111	2,390,000	4,300,000

Wichita Falls, Ranger & Fort Worth	67	67,500	150,000
	1,744	\$11,662,413	\$42,209,700

centers were in far from a receptive mood. There is also a new element in the situation in that the country now has an entirely new attitude towards receiverships from what it used to have. It can hardly be denied that with our new regulation and the increased amount of it, to put a railroad company into the hands of receivers is a much more serious matter than it used to be. This deterring influence is a potent one.

Another entirely different angle of the situation is the matter of abandoned lines. As is pointed out in an article on that subject which appears elsewhere in this issue, the

FORECLOSURE SALES IN 1921

Name of road	Mileage	Funded debt outstanding	Capital stock outstanding	Remarks
Chicago & Eastern Illinois	1,131	\$55,419,150	\$18,267,800	Turned over to new company Jan. 1, 1922
Chicago & North Western	37	To be dismantled
Denver & Rio Grande	2,485	33,738,000	87,775,670	Sale in Nov., 1920, confirmed March 28, 1921.

1921.....	11	4,173	306,123,942

to abandon 67 miles of line. The Missouri & North Arkansas—in the hands of receivers since 1912—has had, primarily because of labor troubles, to cease the operation of its 365-mile line. The Louisiana & Northwest—in receivership since 1912—has already taken up 22 miles.

Several of the roads which went through the experience of a foreclosure sale during the year were bought up by the dealer in second-hand material. The Collins & Ludowici is one. The Tennessee, Alabama & Georgia, owning 95 miles of line, has asked permission of the court to scrap the line. The fate of the Valdosta, Moultrie & Western, 42 miles, is, according to latest reports, still in the balance. At one time it was destined to be taken up but more recently some interests have proposed the possibility of restoring operations. Some of the line, however, has already been taken up.

Railroads shown in the lists of receiverships in former years have for the most part been removed from that list by reorganization. The increasing proportion of those elimi-

ROADS GOING INTO RECEIVERSHIP, 1876 TO 1921

Year	Number of roads	Miles	Bonds and stocks
1876.....	42	6,662	\$467,000,000
1877.....	38	3,637	220,294,000

nated because of their being dismantled is a factor which naturally will be watched with great interest.

The three most important roads involved in the receiverships and foreclosure sales during 1921 were the Denver & Rio Grande, the Chicago & Eastern Illinois and the Missouri, Kansas & Texas.

The Denver & Rio Grande is shown in the list of foreclosure sales during 1921. That road was actually sold in November, 1920, but was not included in the 1920 foreclosures, because of the litigation pending at the time, and because the sale had not been confirmed at the time the list was made up. The sale was finally confirmed in the federal court in Denver on March 28, 1921. J. H. Young was elected president of the new Denver & Rio Grande Western in April. The formal transfer to the new company was to have taken place May 30 but further difficulties intervened and the transfer was not completed until about July 31.

The Chicago & Eastern Illinois reorganization plan was dated March 31, 1921. The plan reduced the fixed charges of the old company from \$3,759,996 to \$2,327,051 for the new. Two portions of the old company's line—the Chicago & Indiana Coal Railway and the Evansville & Indianapolis—were not acquired by the new company. The foreclosure

sale took place at Danville, Ill., on April 5. Announcement was made in November by Kuhn, Loeb & Co. reorganization managers that the plan and agreement were operative. Further announcement was made in December that the new securities would be ready for distribution on and after

December 27. The Chicago & Eastern Illinois was turned over to the newly reorganized company on January 1, 1922.

The Missouri Kansas & Texas reorganization plan was announced November 23. Details concerning it were given in the *Railway Age* of November 26, pages 1043 and 1044.

St. Paul Wants to Acquire C. M. & C.

The Chicago, Milwaukee & St. Paul has applied to the Interstate Commerce Commission for authority to purchase the Chicago, Milwaukee & Gary and thus gain a direct connection with the Chicago, Terre Haute & Southeastern, which road has been operated by the St. Paul since July, 1921, when it was acquired by lease, and purchase of its capital stock. The Chicago, Milwaukee & Gary has a total mileage of 141.86 miles, 96.83 miles of which are main line between Rockford, Ill., and Aurora, and between Joliet and Delmar. It also has trackage rights over the Elgin, Joliet & Eastern between Aurora and Joliet, a distance of 22.49 miles, and recently applied to the Interstate Commerce Commission for authority to build between these points. The St. Paul will make connections with the Gary line at Delmar, Ill., and Rockford. Should the St. Paul acquire the line it will be able to transport coal and other freight originating on the Chicago, Terre Haute & Southeastern to its own lines and the northwest on its own tracks. The purchase would also give the St. Paul the ad-

vantage of an outer belt line around the Chicago terminal district.

The Chicago, Milwaukee & Gary was incorporated March 3, 1908, in Illinois, to acquire by purchase and construction a line of road from Milwaukee, Wis., to Gary, Ind. The company acquired the railroad and property of the Illinois, Iowa & Minnesota, with its subsidiary lines and the Illinois, Indiana & Gary. Extensions were projected from Delmar to La Crosse, Ind., 36 miles, and from Rockford, Ill., to Milwaukee, Wis. The assets of the company in 1920 were \$10,381,869, as against a capital stock of \$1,000,000, a funded debt of \$5,798,000, current liabilities of \$2,718,540, and unadjusted credits and deferred liabilities of \$865,329.

During the year 1920 the road operated with a combined federal and corporate deficit of \$278,078.

The St. Paul plans to acquire from the St. Louis Trust Company, \$1,000,000 par value in stock and \$5,700,000 par value in first mortgage bonds, the entire securities issue of the road and to return to the trust company, \$3,000,000 of bonds after guaranteeing their payment, interest and principal.

Signal and Interlocking Work Shows Slight Gain

On the Santa Fe in Texas

Construction Activities Show
a Little Improvement Over
1920, Which Was the
Lowest Since 1905

By K. E. Kellenberger

In the California Mountains

SIGNAL CONSTRUCTION has been spoken of as the barometer of the railroad field because authorizations for such work generally are the last to be approved and the signal budgets are among the first to be cut. Thus, the financial conditions of the railroads are reflected through this department's activities. On this basis it is interesting to note that the block signal mileage (manual and automatic) installed, increased rapidly from 1906 to 1915. The construction curve flattened out materially during 1908 and again, although not to the same extent, in 1913. Construction work was carried on actively in 1914 but has slumped decidedly from that date to the present. In 1919 statistics indicated that railway signaling was on the decline, while in 1920 construction activities were lighter than during any period since 1905. Conditions improved but slightly during 1921.

Taking the progress in automatic signal construction for the 10 years preceding 1915 as normal and comparing it with that for the seven years from January 1, 1915, to January 1, 1922, we find that the progress in the latter years has been far from satisfactory. The average mileage installed for the 10-year period preceding 1915 was 2448.4, while for the seven-year period to date the average has been 1291.1 miles. The difference between the two leaves a net deficiency per year of 1157.3 miles, or a total for the seven years of 8101 miles. In order to get back to what we have taken as the normal rate of installation it would be necessary in a period of five years for the roads to install a total of 4068 miles each year. The diagram illustrates the tendencies in signal construction since 1906.

Block Signaling Completed in 1921

A total of 824 miles of road in the United States and Canada was equipped with block signals during the past year. Part of the mileage represents new construction, a portion represents reconstruction and a part consists of automatic block signals installed in place of the manual system. Where automatic signaling was in use previously, the

changes were due largely to signaling certain tracks for running trains in either direction on the same track. Other changes consisted of replacing one type of signals with another or new signals for additional main tracks. One notable feature about our tables is the very short stretches of automatic signals installed. Station and curve protection, shortening of block sections, better facilities for approaches to yards, and small sections of dense traffic territory were the occasions for the majority of the signals installed; which naturally means a small mileage at each location.

Thirty roads built new interlocking plants or made changes in existing ones, affecting a total of 59 plants. Canada is represented by six plants.

ONLY 824 miles of road in the United States and Canada were equipped with block signals during the past year; 174.9 miles under construction in the two countries and 613.6 miles are known to be proposed for 1922.

Fifty-nine interlocking plants are completed; 24 are under construction; 30 are proposed for 1922.

The tendency is toward the operation of trains by signal indication without written train orders.

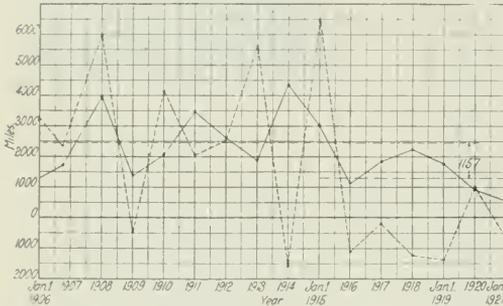

Comparing the figures for 1921 with those for 1920, published in the January 7, 1921, issue of the *Railway Age*, it is seen that there has been a slight increase in construction work of this character, as the total block signal mileage completed in the United States and Canada during 1921 was 824 as compared to 523.5 miles of road in 1920. Of this 824 miles, 209.8 represents manual blocking installed, which leaves 614.2 miles of road on which automatic block signals were placed. This figure, however, is likely higher than the actual additional mileage installed because in some cases additions have been made to installations already in service. A slight increase is thus noted in the additional mileage of automatic signaling constructed, as this is 90 miles more than in 1920. Comparing this mileage with that reported by the Interstate Commerce Commission as of January 1, 1921, and which is recorded in the table showing block signals installed in the United States since January 1, 1907, there appears to have been 10.8 miles more automatic block signaling completed during 1921 than in 1920. In each year shown in that table the mileage of automatic block signals installed was more than double that reported for the years 1920 and 1921.

In comparing the total mileage of block signals under construction in the United States and Canada on December 31, 1921, with that under construction on the same date in

1920, it is seen that there is now a decrease of 42.2 miles. The total mileage under construction on December 21, 1921, was entirely in the United States, no Canadian roads having reported any work in progress. The work in progress consisted of automatic block signaling exclusively, there being no manual block under construction at the end of the year. Some of the work going in replaces manual blocking, while in other cases it consists of the replacement of one type of apparatus with another.

Work Proposed for 1922

The proposed block signal work for next year represents 613.6 miles of road to be equipped with automatic block signals. It will be noted that this is but half a mile less than was installed during 1921. The plans of many of the

Signal Construction Since 1905. Dotted Line, Manual Block; Solid Line, Automatic. Average Deficiency in Automatic Block Signal Mileage Installed Is 1,157 Miles a Year Under That for Period, 1905-1914

roads, however, are very indefinite as they have not as yet decided on their budgets. Expressions received from a number of the roads tend to indicate that at least twice this mileage is to be installed unless there is a decided change in the conditions affecting the finances of the railroads. In making a comparison of the block signal mileage proposed for next year with that proposed one year ago it is seen that there is an increase over that of a year ago of 103.8 miles of road. The proposed new work reported is for 577.6 miles of automatic block signals in the United States and 36 miles of the same type in Canada. No manual block signaling is proposed at the present time.

Interlocking Construction in 1921

There has been a slight increase in the number of interlocking plants built or rebuilt, as compared with 1920, when a total of 43 were built or rebuilt in the United States, and two in Canada as compared to 53 in United States this year, and six in Canada. The number of plants under construction in the United States on December 31, 1920, was 18 and one in Canada as compared to 24 this year, none of which are in Canada. A total of 22 plants was proposed a year ago none being in Canada, in comparison with a total of 21 for the coming year in the United States and nine in Canada.

Signal Construction Data

The figures so far available, together with the data covering the work now under construction and in respect to plans for 1922, are shown in the accompanying tables under nine heads as follows:

- F—Manual Block Signaling Proposed for 1922 (None).
- G—Interlocking Completed in 1921.
- H—Interlocking Under Construction.
- I—Interlocking Proposed for 1922.

1919	979.4	-1,007.1	1,986.5
1920	575.1	-575.7	-0.6

From the reports received, the largest mileage of automatic signals installed on any one road was on the Missouri,

Kansas & Texas, which put in service 153.75 miles of single track, using 253 signals. The next largest installations were made on the Cleveland, Cincinnati, Chicago & St. Louis, which put in service 68.1 miles of double track, using 121 signals, and the Great Northern which installed 58 miles of single track, using 111 signals. The Canadian National Railways installed 52 miles of single track and 4.5 miles

A—Automatic Block Signaling Completed in 1921
 B—Automatic Block Signaling Under Construction.
 C—Automatic Block Signaling Proposed for 1922
 D—Manual Block Signaling Completed in 1921
 E—Manual Block Signaling Under Construction (None).

of double track automatic block signaling, using a total of 111 signals. Signals installed on other roads consisted mostly in the protection of short stretches of track or new multiple tracks or for curve and station protection purposes.

But nine roads report automatic block signals under construction at the end of the year, the greatest mileage reported being by the Missouri, Kansas & Texas, which has 63.5 miles of single track signaling under way, using 98 signals. The Chesapeake & Ohio has under construction 40 miles of single track, A. P. B. color-light automatic signals, using 88 signals, while the Pennsylvania is installing 19.4 miles of double track and 15 miles of four-track position-light automatic signals, using a total of 96 signals for this purpose.

Of the 10 roads reporting work proposed for 1922, the Northern Pacific contemplates the construction of 155 miles of single track and 48 miles of double track signaling, using 378 signals. This road also contemplates replacing d. c. track circuits with a. c. track circuits on 68 miles of road. The Great Northern has in view the construction of 165 miles of single track automatic signaling, while the Atchison, Topeka & Santa Fe contemplates 6.8 miles of single track and 57.6 miles of double track automatic block signaling, using 80 signals. The reports from the various roads on proposed work are rather incomplete as many have not as yet prepared their programs or had their budgets approved for 1922. The Canadian National Railways propose to install 30 miles of single track and six miles of double track automatic block signaling during the coming year.

The manual block signaling installed during 1921 consisted of 204.6 miles of single track, 141 miles of which was on the Fort Worth & Denver City, a total of 16 two-arm signals being used. The Chicago & North Western installed 61 miles, using 9 two-arm signals, while the Los Angeles & Salt Lake put in service 2.6 miles of controlled manual block, using the staff system. No manual signaling was under construction at the end of the year, or proposed for the coming year.

Automatic Train Control

An installation of automatic train control is under construction on the Chesapeake & Ohio, between Charlottesville, Va., and Staunton, a distance of 40 miles. An a. c. power transmission line is being built over this territory and color-light signals are to be used in connection with the train control. This installation is in single track territory. The Chicago, Lake Shore & South Bend reports 1½ miles of automatic train control placed in service.

Interlocking Construction Data

Thirty roads report interlocking plants as completed or reconstructed during the past year. Table G gives this list in detail. It is necessary that this be considered more as an exhibit of the work done than as showing the precise amount of the increase of such apparatus in use in the country as some of the figures represent reconstruction or enlargements; and, also, some duplications necessarily occur as a plant may be reported by two or more roads. The same remarks apply also to Tables H and I.

Aside from the small amount of work completed, under construction or contemplated, it is interesting to note that the plants are all of comparatively small size. A number of electro-mechanical plants appear in the tables as do additions of electric units to existing plants, thus obviating the necessity of enlarging existing towers. Considerable work has been done in replacing mechanical detector bars with detector locking.

An analysis of the plants shows that the largest electric plant completed during the year is one of 57 working levers at Carlton, Minn., on the Great Northern, while the next largest is one of 44 working levers at Richmond, Ind., on the Pennsylvania. The third largest plant of this type had 23

working levers and was installed at Myerstown, Pa., on the Philadelphia & Reading. The largest electro-pneumatic machine completed was one of 45 levers at Phillipsburg, N. J., on the Central of New Jersey.

Two electro-pneumatic push-button machines were reported as completed in 1921, both on the New York, New Haven & Hartford. These are for hump yard operation, one (36 push buttons) at New Haven, Conn., and the other (23 push buttons) at Providence, R. I.

Seven electro-mechanical plants were reported as completed; one on the Cleveland, Cincinnati, Chicago & St. Louis having 50 mechanical and 12 electric working levers and another on the same road having 41 mechanical and 10 electric working levers.

The largest mechanical plant installed was on the Baltimore & Ohio at Tates Point, Ohio; it had 34 working levers. The next largest plant consisted of 29 working levers and is on the Illinois Central at Ramsey, Ill. Other plants range in size from one of three levers up to the largest mentioned above. One plant is of the cabin-door lock type, while others are equipped with a. c. track circuits, time locks, electric and detector locking; power distant signals and position light signals.

Interlocking Plants Under Construction

The largest electric interlocking plant under construction on December 31, 1921, was at Schoharie Junction, N. Y., on the Delaware & Hudson and consists of 25 working levers. The next in size is one having 21 working levers at Altamont, Wyo., on the Union Pacific.

The Interborough Rapid Transit, New York City, has under construction two electro-pneumatic plants, one of 44 working levers at 180th street and the other with 10 working levers at New Lots avenue, on the East Parkway line (Brooklyn).

The largest electro-mechanical plant under construction, as of the above date, is one of 43 working levers at Mountain Lake Park on the Baltimore & Ohio, while the Chesapeake & Ohio is building one having nine mechanical and 11 electric working levers at Hinton, W. Va.

The largest mechanical plant under construction is one having 24 working levers at Pontiac, Mich., on the Grand Trunk; the next largest being one of 20 working levers at Finch, N. Y., on the New York Central.

Proposed Interlocking Work

Of the plants proposed for 1921, the largest electric plant is one of 56 working levers to be located at Sierra Vista, Calif., on the Pacific Electric; the next largest being one of 22 working levers at Charlotte, Mich., on the Grand Trunk.

The Interborough Rapid Transit, the Chesapeake & Ohio and the Philadelphia & Reading report proposed installations of electro-pneumatic plants during the present year. The first named road is planning on three plants of 52, 50 and 32 working levers, respectively; the second road proposes to build a 28-lever machine, while the P. & R. contemplates installing one of 53 working levers and one of 42 working levers.

The largest electro-mechanical plant in prospect is one of 10 mechanical and 19 electric working levers at Atlantic City, N. J., on the P. & R. The second largest will consist of eight mechanical and 19 electric working levers at St. Albans, W. Va., on the C. & O.

The Philadelphia & Reading proposes to install a 35-working lever mechanical interlocking at Schuylkill Haven, Pa., while the Missouri, Kansas & Texas contemplates one of 18 working levers at Mound City, Kan.

The General Outlook

The general outlook a year ago appeared favorable for increased signal construction, but instead work during 1921

has been largely in a state of coma as compared to that during normal periods. For the coming year, returns indicate that prospects in general are not bright for signal construction work in the eastern and southeastern sections of the country, while in the central, northwestern and southwestern sections, indications point to a renewal of signal work. Returns indicate that 8000 miles of automatic block signals and 95 interlocking plants should be installed to meet the traffic conditions adequately. The extent to which these needs will be met in 1922 depends on business conditions.

The maintenance work in practically all cases is up to standard and it is the expectation to keep it in this condition, although a few roads report maintenance as being from six months to three years behind.

One condition which appears to have influenced signal construction to a certain extent is the price of signal materials. On the one hand the railroads are waiting until a more extensive reduction is made in the prices of such equipment, while the manufacturers find that their actual costs are as high or higher than during the war, because the small volume of business is not sufficient to pay for the labor and material and to take care of the overhead; and the actual cost of production is greater than the selling price in many instances. When production takes place on an extensive scale to fill increased orders prices should descend accordingly.

Developments of the Past Year

A review of the conditions during the past year shows that the tendency is towards better train operation by signaling selected stretches of double-track lines for movements in either direction on either track. The movement of tonnage trains has also been facilitated in some localities by the installation of grade signal aspects. Railway men in general have shown a keener appreciation of the value of automatic signaling with reference to its use in effecting economies in train operation. In this connection, the elimination in automatic signal territory of the train order form requiring conductors' signatures has been put into effect to a limited extent on some roads, while others are considering such a step. Studies have been made looking toward operating trains on single track by signal indication without written train orders.

The elimination of the derail is a subject which has also been receiving serious consideration, as has the development

of automatic signaling at railway grade crossings with a view of eliminating the use of an interlocking tower and the necessary attendants. The use of low voltage switch movements for the remote operation and control of switches at passing sidings, junction points, etc., is a live question and installations are being made.

Automatic train control is being given serious consideration, not only by well-informed and progressive railroad officers but by the Interstate Commerce Commission and by the Joint Committee on Train Control of the American Railway Association. An extension of automatic train control is being made on one road, while arrangements have been made for testing several devices under actual railway service on other roads.

In the engineering end, the electric lighting of signals has proved economical and has made rapid advances in the past year; and there is a greater use of the primary battery. A study of track-circuit conditions has pointed out ways of effecting other economies in signal maintenance. The color-light and position-light signals (for daylight signaling) are being used more extensively than ever before. The use of the mechanical rectifier for charging storage batteries for operating automatic signals and highway crossing warnings is receiving careful consideration and some installations already have been made. The use of portable power units for operating tools and for signal bonding has been another development of interest. At interlocking plants, many mechanical detector bars have been eliminated and replaced by electric detector locking. The reason for this is explained largely by the use of heavier rails. Highway crossing protection has received careful study by signal department officers.

Future developments of signaling will continue along the line of expediting train movements. Means will be provided for controlling the movement of trains by signal indication and greater use will be made of remote controlled switches which will be operated from the nearest interlocking tower or station. Greater use will be made of light signals and the installation of light signals, with automatic train control as an adjunct, with the elimination of the derail promises to be a development of the near future. Train operation by signal indication without the use of written train orders should make rapid progress, while automatic signals for controlling train movements at outlying crossings will likely be installed at certain locations during the present year.

TABLE A—AUTOMATIC BLOCK SIGNALS INSTALLED IN 1921

Name of road	Miles of road		From	To	No. of signals	Type of signals	Control system	Remarks

THE GREAT NORTHERN has tendered to the department of public works of the state of Washington, its right of way from Northport, Wash. to the Canadian line, a distance of about 10 miles, for conversion into a public highway. The line includes a bridge across the Columbia river, which cost about a half million dollars.

Railroad Telegraph and Telephone Activities

Construction a Minimum in 1921—Considerable Increased Use of Composite Circuits

By J. H. Dunn

A Heavy Wire Lead

PRELIMINARY to making this second annual survey of the activities in the railroad telegraph and telephone field, the *Railway Age* sent questionnaires to 214 representative roads asking for certain data with reference to their outside plant equipment. As this feature of our annual review number was only inaugurated last year it is difficult to draw any comparisons with the amounts of work done in previous years. However, it is evident that construction has been at a minimum during 1921.

Small Amount of Work Completed in 1921

Thirty-one of 115 roads replying reported telegraph and telephone construction work completed during 1921. Of the 393 miles of railroad-owned pole line built in the United States, the Louisville & Nashville constructed 237 miles, and the Nashville, Chattanooga & St. Louis 135 miles, both installations being replacements of equipment removed because of the termination of contracts with the Western Union. The Canadian National installed 158.4 miles of pole line, 1,637.2 miles of iron wire and 2,998 miles of copper. The reports show that 1,190.4 miles of iron wire was installed and 1,104.9 miles of copper was added to existing plant equipment in the United States.

Some 913 miles of road was equipped with telephone train dispatching circuits, the largest installation being that of 489 miles on the Western Pacific Railroad. A total of 244 miles of metallic telephone circuits for block signaling was placed in service and 1,689 miles of metallic message and conversation circuits was installed; the largest installation was 518 miles on the Lehigh & New England and the second largest, 454 miles on the Chicago, Burlington & Quincy.

It is interesting to note that only 24.4 miles of telegraph dispatching circuits have been reported as installed during 1921, whereas telephone train dispatching circuits were placed in service on 913 miles of road during this period. The tendency to utilize existing wires to the limit is shown by the installation of 1,269.6 miles of simplex circuits, 336.6 miles of duplex and 842 miles of phantom.

Some Work Under Construction

The amount of cable construction was limited, the largest installation of overhead cable for telegraph purposes being 10 miles on the Chicago, Burlington & Quincy. Twenty-two miles of overhead cable was installed for electrical trans-

mission on the New York Central. Eighty-two telephone booths or boxes were reported placed in service during the year 1921.

Thirteen roads reported work under construction as of December 31, 1921. Only 68 miles of pole line is reported as under way, 33.2 miles of this being on the Western Pacific and 18 miles on the Canadian National. The installation of 531.4 miles of iron wire and 2,506.4 miles of copper is now under way. Construction work under way also includes 49.3 road miles of telegraph dispatching circuits and 183 miles of telephone dispatching.

The total of circuit miles of telephone equipment reported under construction includes 131 miles of metallic dispatching, 128.8 miles of metallic block, and 70 miles of message and conversation circuits. A total of 2.9 miles of overhead cable and 3 miles of underground cable is under construction at this time.

Work Contemplated for 1922

As budgets have been held up or cancelled so often in the past few years a number of roads refuse to offer an estimate of the future construction activities. However, it is illuminating to note that in spite of adverse conditions considerable telegraph and telephone work is planned, and authority for commencement of work has been granted in several cases.

Only 60 miles of pole line is contemplated on the 25 roads reporting new work. However, it is the intention to add 700 miles of iron wire and 7,409 miles of copper. Definite plans are under way for the addition of telegraph train dispatching circuits on nine different roads, the largest proposed installation being that of 453 miles on the Ft. Worth & Denver City. Metallic conversation circuits to the extent of 2,798 miles are contemplated, 1,418 miles of which is on the Pennsylvania, southwestern region.

General Outlook

The amount of telegraph and telephone construction on the railroads during 1921 will no doubt stand as one of the lowest records. In contrast to this, it is interesting to note that over 50 per cent of the officers in charge of the telegraph departments indicated in their reports that the prospect for new work in 1922 is hopeful; and some few have definite authority to proceed.

On many railroads the maintenance of pole lines has been, of necessity, somewhat neglected during the past few

MINIMUM amount of construction in recent years, thus taxing existing facilities to the limit. Many important developments have been made in apparatus, placing the roads in a position to expand their facilities to better advantage at this time. Pole line maintenance is from two to five years behind schedule.

Widespread application of telephones for train dispatching and long distance conversation circuits is an important part of contemplated construction program.

years. Of the 22 roads estimating the status of their maintenance programs four roads consider that this work is from four to five years behind schedule, ten roads are from six months to two years back and eight roads report their maintenance up to date. Evidently there must be considerable reconstruction of pole lines in the near future in order to maintain satisfactory service. About 26,000 miles of wire is

considered as a minimum to meet the requirements of these 22 roads within the near future. Several roads evidently prefer automatic printers for long distance message service with the telephone for block and local work. Of the 32 roads reporting on the item, 17 indicate that telephone train dispatching circuits are to be installed as soon as conditions permit.

Recent developments of the telephone repeater have removed the limit from long distance telephone communication. Late experiments on electrified roads have demonstrated the success of the carrier current system of communication over the trolley wire to or from a moving train. In certain con-

gested districts or in localities where the physical conditions prevent the economical construction of a pole line, it is evident that wireless telegraph and telephone apparatus will produce economies, and railroad installations of this nature are being watched with interest.

An Analysis of the Railway Statistics for 1921

(Continued from page 123)

rates in the near future undoubtedly dammed up the current of traffic to some extent near the close of 1921—a condition which in the public interest should not be allowed to extend many weeks into the year.

The Coming Year

Three elements of uncertainty exist in the railway situation as it will project itself into the 12 months of 1922, namely, the level of rates, the level of wages, and the level of traffic.

The rate question is now under investigation by the Interstate Commerce Commission in the form of a general inquiry into the subject. That the Commission appreciates the vital importance—not only to the railways themselves, but to the whole business world as well—of moving promptly in this matter is clear from the record already made in the inquiry, and a speedy decision in the matter may be expected with confidence.

The wage question will shortly come before the Railroad Labor Board, on appeal from virtually all the railways and in respect to virtually all classes of employees. The complexity of the issues involved is so great that a decision may not be reached so promptly as in the matter of rates, but that the question will be thoroughly examined in 1922, and that a determination of some sort will be reached, seems beyond doubt.

What the traffic will be in 1922 is a matter of conjecture, of course, but I feel that we may expect an improvement over 1921 much more confidently than we may anticipate a reduction either in rates or wages. A tone of optimism pervades

the business world which is not wholly psychological, but is based on actualities, and in any general improvement in business the railways are bound to share. The effect of even a 10 per cent increase in traffic would be most heartening, and would translate itself into a real improvement in the financial position of the railways.

Without venturing even a guess as to the rate and wage probabilities, therefore, I strongly believe in a better railway year for 1922 than we experienced in 1921.

Engine House and Water Tower at Lausanne, Switzerland

Some Typical Views of Abandoned Lines

Railway Lines Abandoned During the Year 1921

Difficulties Facing Roads Through the Year Clearly Indicated by
Mileage Discontinued

By Milburn Moore

THE YEAR 1921 was one of the most difficult, from practically every angle, that the railways of the United States have had to face in, perhaps, their entire history. By the first of the year it had become fairly evident that many of the roads were going to have a serious struggle if they were to come through without disturbing financial troubles, if not bankruptcy. It is not surprising, then, that operation was suspended or discontinued on 1,626.38 miles of line. To this amount there should be added 51 miles of line upon which operation was suspended or discontinued altogether during the latter part of 1920, notice of which was received too late to be included in the last annual compilation of statistics. This brings the total up to 1,677.38 miles, or over a thousand miles more than were constructed in about the same period.

Of the total mileage abandoned for operation, 217.09 miles, or slightly less than the corresponding figure for 1920, were abandoned entirely, the track being taken up and the equipment sold. A large part of the remaining 1,460.29 miles consisted of lines upon which operation was discontinued because of conditions peculiar to the year, such as light traffic and heavy operating expenses. It is not unlikely that some of this mileage will again be placed in service when conditions become more favorable.

The past year is the first full year in which it has been necessary for the Interstate Commerce Commission to decide whether the "present and future public convenience and necessity permit the abandonment" of railway lines. It has reported upon a large number of cases during the year. This introduces another point of interest in connection with lines abandoned which helps to give a clearer picture of the year's changes. It concerns the applications for abandonment presented to the commission, which are not included in the main compilation of miles abandoned, etc. In addition to the 1,677.38 miles mentioned, there were authorizations by the commission for the discontinuance of 191.01 miles and applications for the abandonment of 575.17 miles, regarding which no action has as yet been reported publicly.

With the exception of a few states, the major portion of the mileage upon which operation has been discontinued,

plus the mileage included in the applications before the commission, lies in the southern states from coast to coast, with Arkansas outstanding, with about 223 miles upon which track was taken up or operation discontinued.

Of the entire country, the state of Colorado suffered the most, including, as it did, practically one-fourth of the total miles abandoned for the country. Some of the more important roads of this state which are no longer operating are the Colorado Midland and the Colorado Springs & Cripple Creek District.

The mileage for Michigan was high also and is represented almost entirely by short sections and small branches of the Pere Marquette of which only a small part has been abandoned to date, the remainder being covered by applications before the commission and not yet authorized.

The largest of the roads which found it impossible to keep its wheels turning was the Missouri & North Arkansas and the experience of this road and the cause for the cessation of operation is but a repetition of the story of light traffic and heavy operating expenses.

Some of the smaller lines which have ceased operation because of their unprofitableness and their ability to run up large deficits as common carriers, and which show little justification for resumption of operation as common carriers, do contain some possibilities as private lines or plant facilities. An example of this is the Sugar Pine Railway, which was released during 1921 by both the California Railroad Commission and the Interstate Commerce Commission as a common carrier but which is now being operated under lease by a large lumber company as a plant facility.

While there is a reasonable possibility that some of these roads will again resume operation under more favorable circumstances, there is considerable mileage which is more likely to be discontinued permanently and the lines junked. It is an interesting fact that much of the mileage abandoned, or to be abandoned for operation shortly, was constructed primarily for logging purposes and, so long as the timber held out and the market was good, they were a profitable investment. With the removal of most of the timber, there has not been sufficient traffic to justify the continuation of

the lines or branches as common carriers. For instance, on one southern road only three carloads of other than lumber traffic originated on the line during the entire year. It has only taken the severity of a year like 1921 to hasten to a conclusion what would have been the outcome anyway.

The permanent abandonments of the past few years have, in a way, been indicative of the gradual tightening up of the country's railway lines and the consequent elimination of the lines that are poorly and uneconomically located, without any particular hardship to the surrounding territory. Although 1921 was the fifth year that the miles of line abandoned exceeded the miles of new line constructed, this fact cannot be construed as meaning that the country is overbuilt with railways. In fact, there is still need for much railway construction and the clearing away of these lines should in the end prove beneficial, if not even stimulating, when there is more money available and the subject of extensions to existing lines and the building of new ones is once again under consideration.

The Claremont Terminal of the Lehigh Valley

Not Much Activity in New Construction in 1921

Mileage of New Lines Shows Increase Over 1920, but Other Projects Were Small and Restricted

By Milburn Moore

ONE ENCOURAGING FEATURE of a most difficult year for the railroads was the greater activity in the building of new lines in the United States. During 1921 there were completed 475.10 miles of new line, which in comparison to the low record for 1920 of 313.71 miles is an increase of about 45 per cent. It is, however, far below the mileages built previous to the World War and from about two-thirds to one-half of that built each year during the four years previous to 1920.

Total mileage (first, second and other multiple main track) also increased, reaching 642.22 miles, of which 143.07 and 25.26 miles were second and third track respectively. This multiple track construction is an encouraging increase over 1920 when but 414.35 miles of all track were completed, of which 90.87 and 1.89 miles were second and third track. Other railway construction was concerned almost entirely with the completion of a few large projects and a number of small ones started in previous years. Little new work of any size was inaugurated during 1921.

In Canada there was a considerable decrease in total mileage constructed as compared with 1920 and almost no building of second and other multiple track work. With 251.48 miles of first track and 6.57 miles of second, Canadian mileage came close to its low record of 1918. Since 1914 the building of new lines in Canada has been at a low point and it is doubtful whether there will be much done in the future until Canada gets nearer a solution of her railway problem.

The longest stretch of line was that constructed by the Government Railroad of Alaska—81.95 miles. This marks the completion of the building program of the Alaskan project as it now stands and no new construction in the way of additional mileage is in progress. It is expected that the Government Railroad of Alaska will be formally opened to operation with elaborate ceremonies at Anchorage early in February. The remaining first track mileage was, in the

main, divided approximately among seven states, with Texas leading with 63.60 miles and Florida next with 59.90 miles. The other states which had any considerable mileage of first track, comparatively speaking, were North Carolina with 48 miles, Oklahoma with 44.92 miles and West Virginia with 44.90 miles. West Virginia also had 21.52 miles of second track or a total of 66.42 miles, the greatest mileage of all track constructed within any one state.

The most important reason for West Virginia's track expansion is the development of that state's coal territories much of which has not, as yet, even been tapped. The growth of coal traffic has in some instances been far greater than the expansion of railway facilities to handle it. This is particularly true of the Chesapeake & Ohio during the past few years and, of the 21.52 miles of new second track, 18.8 miles are the work of that road in carrying out its plan of double-tracking the line up the Guyandot river into the Logan coal fields. The completion of these 18.8 miles in addition to what has already been finished makes this line 50 per cent double track.

The development in Texas, with a total mileage of 65.77 is, in a manner, similar, if oil be considered instead of coal. Each year sees an expansion of the oil field activities in that state with an accompanying need for more railway facilities.

Florida with 59.90 miles, all first track as stated previously, is the result of entirely different needs, which are presumably not that of expansion because of commercial necessity in a direct sense, but rather an expansion to fill pioneering agricultural needs. Florida for its size is one of the least, if not the least, developed of the states from a railway standpoint. Immense tracts of land are as yet idle and unsettled. The drainage work in and around the Everglades made available a considerable acreage of rich land, with a consequent growth of towns and settlements, the further growth of which was dependent upon transportation. It is only a few years ago when the principal and, in fact,

practically the only product from this section of lower Florida, was catfish, caught in Lake Okeechobee, brought out by boat and shipped to St. Louis, Mo. With the opening up of this section of the state, a variety of important agricultural products were produced, the quantity increasing each year as more land was developed and more settlers came in.

of the roads which were able financially, in comparison to the average, to carry forward projects of magnitude did little beyond what was absolutely necessary to tide them over.

Many roads which previous to government control had commenced work on large projects designed to effect future rather than immediate operating economies have been forced

This Florida work, like that in Alaska, resembles somewhat the railway development in the pioneer days of the past.

In general, the year's construction has but emphasized what was indicated strongly last year, namely, that intensive development was more imperative than extensive and that any money to be spent must necessarily be spent along those lines. That has kept such building as there was strictly to projects which would improve the operation of trains at a minimum of expense. The marked decrease in traffic at the beginning of 1921, the heavy operating expenses, the state of general business, and numerous other factors created undoubtedly an uncertainty as to the outcome of the railway year financially that caused much needed work to be held up pending the return of more stable conditions. Even many

either to curtail the work greatly or to abandon temporarily all work. A notable example of this case is the Pennsylvania, which during the past three or four years has had a large number of projects under way involving the expenditure of millions of dollars, yet only a small part of it has ever been completed and nothing was carried forward during 1921 except the building of one line in West Virginia to be about 12.66 miles long when completed.

A substantial proportion of the projects listed this year under the different roads are small ones covering improvements to engine terminal and yard facilities, an indication, in itself, of the direction which construction took for the year. Among the few large projects upon which work was performed in 1921 there is only one which may be said to have

Curves of Mileage Built in the United States and Canada Since 1893

been started during that period. This project is the grade separation work of the Delaware, Lackawanna & Western through East Orange, N. J. The remainder consists of work carried over or continued, examples of which are the Claremont terminal of the Lehigh Valley, and the St. Paul, Minn., union passenger station. In general, good progress has been made on these and the other few large items.

At the close of the year there are some factors which look encouraging for 1922. One of these is the apparent revival of the building of branch lines, extensions and even new short lines. Many of the items show references to lines either

under survey or projected and, in other instances, under construction. Traffic is tending to increase and expenses have decreased; general business is on the upgrade and the prices of materials and labor are tending to grow less, all of which are important and controlling influences on the amount of construction which can be done in the future. Nearly all the roads have much work in prospect, which is vital to their future—how much of it will be done is, of course, practically dependent altogether on 1922 earnings. As the prospects for increased net returns look brighter, there are hopes for a healthier construction year in 1922.

Railroad Construction in the United States in 1921

Abukini Terminal & Railway

First Track: From Abukini, Kanaii, to Kealia, Kanaii, in territory of Hawaii, 10 miles.

Other Important Work Under Construction: New line under survey from Kealia to Molokai, 10 miles. Construction of breakwater across mouth of Bay at Abukini, cost \$100,000, 50 per cent completed. Building reinforced concrete wharf at Abukini, cost \$150,000, completed.

Americus & Atlantic

First Track: In Georgia, not specified, 2 miles.

Other Important Work Under Construction: Surveys made for new lines from Horns Siding, Ga., to Americus, 11 miles.

Ashley, Drew & Northern

First Track: In Arkansas, not specified, 2.23 miles.

Other Important Work Under Construction: Building in the vicinity of Ozmont and Fountain Prairie, Ark., 2.31 miles.

Atchison, Topeka & Santa Fe

Second Track: At San Bernadino, Calif., 2.91 miles.

Other Work Under Construction: New power house at Albuquerque, N. Mex., cost \$100,000, 15 per cent completed. Machine shop and facilities at Albuquerque, \$1,200,000, 98 per cent completed. Extension to Alvasado hotel, Albuquerque, cost \$400,000, contract awarded.

Atlantic & Carolina

First Track: From Kenansville, N. C., to Chiquapin, 13 miles.

Atlantic Coast Line

First Track: From Goodno, Fla., to Immokalee, 25.8 miles.

Baltimore & Ohio

Other Important Work Under Construction: Renewal of tunnel work at Philadelphia, Pa., cost \$275,000, completed. Construction of two joint industrial tracks in Philadelphia, Pa., cost \$260,000, 65 per cent completed. Track elevation through South Philadelphia, and east side yard to the Delaware river, \$1,000,000 initial appropriation, 20 per cent completed. Extension of this track and connection, etc., at Bay View Junction, Md., cost \$113,000, 50 per cent completed. Revision of Locust Point, Md., branch and yard, cost \$795,000, completed. Building new yard at Mt. Winans, Md., cost \$700,000, completed. Renewal of bridges at Savage and College, Md., cost \$118,000, 50 per cent completed. New shop facilities, Cumberland, Md., cost \$120,000, completed. Bridge renewals at Mt. Savage Junction to Ellerlie, Pa., cost \$308,900, completed. Renewal of bridge at Pittsburgh, Pa., over Allegheny river, cost \$3,475,350, completed. Extension of this track and connection, etc., at Bay View Junction, Md., cost \$117,000, 40 per cent completed. Bridge renewal at Foxburg, Pa., cost \$125,000, completed. Bridge renewal at W. Alexander to Elm Grove, W. Va., cost \$126,000, 50 per cent completed. Construction of branch industrial line and revision of branch line, Norton, W. Va., cost \$235,000, completed. Track revision from Grafton to Fairmont, W. Va., cost \$135,000, completed. Renewal of bridge over Hocking river at Guysville, Ohio, cost \$253,200, completed. Rebuilding bridge over Great Miami river at Lawrenceburg, Ind., cost \$2,197,000, completed. Renewal of bridge at Rossford, Ohio, cost \$110,000, completed. Side track for industrial development at Defiance, Ohio, cost \$238,000, 55 per cent completed.

Bartlett Western

Other Important Work Under Construction: Survey of new line from Bartlett, Tex., to Cameron, 32 miles.

Bessemer & Lake Erie

Other Important Work Under Construction: Conversion of Culmerville tunnel into an open cut, with relocation of highways and bridges, Culmerville, Pa., cost \$300,000, 15 per cent completed.

Boston & Maine

Other Important Work Under Construction: New 28-stall engine house and other engine terminal facilities at Concord, N. H., \$1,065,000, 50 per cent completed. Strengthening bridge over Merrimack river, Newburyport, Mass., cost \$405,200. Additional tracks and extension of existing tracks at Rotterdam, N. Y., cost \$261,000, 90 per cent completed. Renewal of messenger wires in electric zone at Hoosac Tunnel, Mass., cost \$120,000, completed.

Central of Georgia

Other Important Work Under Construction: Building from McCombs, Ala., to Overtown, 6.78 miles; new engine terminal, including concrete engine house and repair shop, turntable, etc., at Columbus, Ga., cost \$500,000, completed.

Central of New Jersey

First Track: From Bridgeton Junction, N. J., to Seabrook Farms, 1.9 miles.

Other Important Work Under Construction: Renewal of bridge 214, East Rahway, N. J., cost \$450,000, 99 per cent completed; bridge 217, Maurer, N. J., cost \$312,000, 99 per cent completed. Construction of a new bridge over Delaware river at Easton, Pa., and the widening of another bridge including track changes and interlocking, cost \$1,118,647, 99 per cent completed. Renewal of bridge 58 at Coalport, Pa., cost \$500,000, 99 per cent completed.

Central Pacific

Other Important Work Under Construction: General store building and oil storehouse at Sacramento, Calif., cost \$210,000, completed. Additional ferry slip and roadway for additional ferry service between Oakland Pier and San Francisco, cost \$121,700, completed.

Chesapeake & Ohio

First Track: From Mud Junction, W. Va., to Argonne, 3.3 miles. From Whitman Junction, W. Va., to Whitman, 0.8 mile; from Edwight, W. Va., to end of line, 1.8 miles. From Cow Creek, W. Va., to Conley Creek, 2 miles. From Strirt, W. Va., to Little Creek, 1 mile.

Second Track: From Clover Valley, W. Va., to Salt Rock, 10.1 miles. From Big Creek, W. Va., to Pecks Mills, 8.7 miles.

Third Track: From Big Sandy Junction, Ky., to Russell, 10.6 miles. *Other Important Work Under Construction:* Building new line from Wylo, W. Va., up Elk Creek, 3 miles. New line under survey from Olive Hill to Russell, Ky., 40 miles. Extension of 11 tracks in east-bound yard and new westbound yard at Gladstone, Va., cost \$400,936, completed. Installation of automatic train control, Charlottesville to Staunton, Va., cost \$248,649, 26 per cent completed. Improvements to shops, etc., at Clifton Forge, Va., cost \$837,600, 95 per cent completed. New east-bound yard at Hinton, W. Va., cost \$342,300, completed. Change of grade and line at St. Albans to Ferrell, W. Va., cost \$1,402,325, 99 per cent completed. New engine-dispatching and yard tracks at Peach Creek, W. Va., cost \$368,580, 86 per cent completed. New water station at Stevens, Ky., cost \$173,000, completed. New freight station at Logan, W. Va., cost \$150,000, completed. Renewal of bridge over Licking river at Covington, Ky., cost \$296,500, sub-structure 99 per cent completed. New engine house, boiler washing plant, etc., at Ashland, Ky., cost \$170,000, installation of turntable only completed.

Chicago & Alton

Second Track: Nilwood, Ill., to Bied, 3.3 miles.

Other Important Work Under Construction: Large freight terminal and office building at Chicago, cost \$3,000,000, 98 per cent completed.

Chicago, Burlington & Quincy

Other Important Work Under Construction: Elevation and realignment of main tracks through Aurora, Ill., to Montgomery, cost \$5,000,000, 80 per cent completed. Additional yard tracks, roundhouse, power plants, etc., at Centralia, Ill., cost \$600,000, completed.

Chicago, Indianapolis & Louisville

Other Important Work Under Construction: Freight car repair shop at Lafayette, Ind., cost \$160,000, completed.

Chicago, Milwaukee & St. Paul

Other Important Work Under Construction: Renewal of Skykomish river crossing, Monroe, Wash., cost \$141,780, completed. Renewal of Ebey Slough draw near Everett, Wash., cost \$102,639, 40 per cent completed. Renewal of Snohomish river draw, near Everett, Wash., cost \$191,169, 80 per cent completed.

Chicago, Rock Island & Pacific

Second Track: Little Rock, Ark., to Biddle, 2 miles.

Other Important Work Under Construction: Three-story brick office building at Chicago, cost \$100,000, completed.

Cleveland, Cincinnati, Chicago & St. Louis

First Track: In vicinity of Zionsville, Ind., 4.5 miles.

Second Track: Augusta, Ind., to Whitestown, 10.2 miles; Briar, Ind., to Beech Grove, 9 miles; Winchester, Ind., to Farmland, 8.6 miles; Templeton, Ind., to Swannington, 6 miles.

Other Important Work Under Construction: Engine terminal and facilities at Ansonia, Ohio, cost \$177,000, 30 per cent completed. Engine terminal at Sheff, Ind., cost \$198,000, 30 per cent completed. Grade reduction from Templeton to Swannington, Ind., cost \$635,000, 90 per cent completed.

Cowlitz, Chehalis & Cascade

First Track: From Lacamas, Wash., east, 3.5 miles.

Delaware & Hudson

Third Track: From Schenevus, N. Y., to Summit, 13.3 miles.

Delaware, Lackawanna & Western

Other Important Work Under Construction: Track elevation and grade separation work at East Orange, N. J., including the enlargement of two passenger stations and the construction of two new ones, cost \$4,000,000, 35 per cent completed. The elimination of two grade crossings at Paterson, N. J., cost \$100,000, 60 per cent completed. Elimination of one grade crossing at Mountain Lakes, N. J., \$125,000, 50 per cent completed. Changing present third track in Hackensack meadows from slow freight to high-speed passenger track in connection with substitution of color signals for semaphore signals on lines between Harrison, Newark and Hackensack river, cost \$483,479, 95 per cent completed. Elimination of grade crossings, near Cortland, N. Y., cost \$104,000, 75 per cent completed.

De Queen & Eastern

First Track: From Oklahoma-Arkansas state line to De Queen, Ark., 8.86 miles.

East Erie Commercial

Other Important Work Under Construction: Building connection in Pennsylvania, 0.65 mile; grade separation work, cost \$125,000, 99 per cent completed.

East Texas & Gulf

First Track: Hyatt, Tex., to Wurtsbaugh, 9.6 miles.

Other Important Work Under Construction: A line projected from Hyatt, Tex., to Hicks, 7.8 miles.

Erie Railroad

Other Important Work Under Construction: Renewal of drawbridge over Passaic river at Newark, N. J., 98 per cent completed.

Galesburg, Rockford & Northern

Other Important Work Under Construction: New lines from Hoopole, Ill., to Geneseo, 15.98 miles under survey; 85 per cent of the right-of-way secured.

Galveston, Harrisburg & San Antonio

Second Track: In Texas, from mile post 829.26 to 832.03, 2.17 miles.

Genesee & Wyoming

Other Important Work Under Construction: New classification yard and track at Retsof, N. Y., cost \$200,000, 30 per cent completed.

Georgia & Florida

First Track: In Georgia, mile post 224 to 226 1/4—2.25 miles; mile post 234 1/2 to 234.3—0.55 mile.

Other Important Work Under Construction: Building from mile post 227 to mile post 237—10 miles. From Padgett, Ga., to Allene, 2.08 miles. New line under survey, 2.75 miles.

Goshen Valley

First Track: Dividend, Utah, to Pearl Junction, 11 miles.

Government Railroad of Alaska

First Track: In Alaska, 81.95 miles.

Other Important Work Under Construction: Construction of a modern coal washing plant at Sutton, Alaska, cost \$600,000, 65 per cent completed.

Great Northern Railway

Other Important Work Under Construction: The construction of outer half of ore dock and renewal of pile and trestle approach to another ore dock at Alhough, Wis., cost \$1,558,000, completed. Construction of new highways on each side of Grand View cut to eliminate several bridges at Vancouver, B. C., cost \$156,800, 50 per cent completed. Removal of draw span over Snochmish river and new foundations, cost \$260,000, to be completed in 1922. Widening under-crossings and renewal of steel bridge at Como and Tenth avenue, Minneapolis, Minn., cost \$160,400, completed. Grade separation and construction of steel and concrete bridge at East Hennepin avenue, Minneapolis, Minn., cost \$411,700, completed.

Gulf Coast Lines

First Track: From Albert, La., to Jefferson Island, 7.81 miles.

Other Important Work Under Construction: Rebuilding and enlarging shops, etc., at Kingsville, Tex., cost \$100,000, completed.

Hocking Valley

Second Track: Marion, Ohio, to Mineral, 8.85 miles.

Indianapolis Union Railway

Other Important Work Under Construction: Grade separation work at Indianapolis, Ind., cost \$4,000,000, 90 per cent completed.

Interstate Railroad

Other Important Work Under Construction: Building new tracks from Norton, Va., south of Gooch river, 16 miles, and from mouth of Gooch river to Miller yard in Virginia, 19 miles. Machine shop and laundry at Andover, Va., cost \$1,000,000, completed.

Jackson & Eastern

First Track: From Southeast, Miss., to Harshehoe, 5.5 miles.

Other Important Work Under Construction: Building from Harshehoe, Miss., to Walnut Grove, 19 miles. Surveyed and under project from Walnut Grove to Jackson, 17 miles.

Jonesboro, Lake City & Eastern

First Track: Victoria, Ark., to Golden Lake, 2.5 miles.

Kanawha & Michigan

Other Important Work Under Construction: Building low grade north-bound line for through freight service from Hobson, Ohio, to Meigs, 5.5 miles, cost \$677,000, 66 per cent completed.

Kansas & Oklahoma

First Track: In Oklahoma, near Forgan, 1 mile. In Kansas, near Liberal, 0.75 mile.

Kansas City Terminal

Third Track: In Kansas City, Mo., 0.06 mile.

Fourth Track: In Kansas City, Mo., 0.11 mile.

Other Important Work Under Construction: Steel and concrete viaduct at Holmes street, cost \$261,000, 60 per cent completed. Structural steel and reinforced concrete viaduct at Seventh street, over yards and tracks, cost \$400,000.

Kentucky & Tennessee

First Track: Stearns, Ky., to Gregory, 1.57 miles.

Lehigh Valley

Other Important Work Under Construction: Building of first unit of a new rail and deep-water terminal, also dredging a 35-ft. channel to deep water at Claremont, Jersey City, N. J., 65 per cent completed. One-story pier and bulkhead for merchandise freight on East river, New York City, completed.

Lewistown, Nezperce & Eastern

Other Important Work Under Construction: Building from Tammany, Ida., to Waha, 11 miles.

Liveoak, Perry & Gulf

First Track: In Florida, not specified, 4 miles.

Los Angeles & Salt Lake

Other Important Work Under Construction: Building machine shop and equipment at Provo, Utah, \$27,110, completed. Construction of reinforced concrete addition to tank car repair shop with necessary machinery and trackage at Los Angeles, Calif., cost \$315,198, completed. Building new freight terminal at Long Beach, Calif., cost \$195,000, 38 per cent completed. Construction new freight terminal at Los Angeles, Calif., cost \$431,000, 23 per cent completed.

Louisville & Nashville

Second Track: In Kentucky, from Ravenna to Millers Creek, 3 miles; from Typo to Domino, 1.6 miles; from North Hazard to Hazard, 0.9 mile.

Other Important Work Under Construction: Second track and grade reduction on Cumberland Valley division including elimination of 725 ft. of tunnel, cost \$1,255,000, 90 per cent completed. Construction of yard, 9-stall enginehouse, machine shops, coaling station, other facilities, etc., at Loyal, Ky., cost \$593,000, 98 per cent completed. Storage yard at Typo, Ky., cost \$407,000, 85 per cent completed. Construction of 9-stall enginehouse, machine shop and other facilities at Hazard, Ky., cost \$478,000, 80 per cent completed. Construction of new freight facilities and passenger station, second track, etc., at Hazard, Ky., cost \$157,000, 40 per cent completed; 2,500,000-gallon pumping plant and piping, etc., at Dortha, Ky., cost \$275,000, 95 per cent completed. Renewal of Alabama bridge at Montgomery, Ala., cost \$600,000, 90 per cent completed.

Maine Central

Other Important Work Under Construction: Reconstruction of bridge and abutments at Norridgecock, Me., cost \$176,500, completed.

Michigan Central

Other Important Work Under Construction: Grade separation at Detroit, Mich., cost \$200,000, completed.

Midland Valley

Other Important Work Under Construction: Enlargement of terminal facilities at Pawhuska, Okla., cost \$110,000, completed.

Missouri, Kansas & Texas

First Track: Oklahoma City, Okla., cut-off, 1.26 miles.

Other Important Work Under Construction: New engine terminal and yard extension at Oklahoma City, cost \$630,000, completed. New inbound freight house and yard rearrangement at Dallas, Tex., cost \$358,000, completed. Raise of grade across San Gabriel river bottom, Circleville, Tex., cost \$105,000, 40 per cent completed. Renewal of three bridges and strengthening of others on Neesho division, cost \$150,000, 60 per cent completed. Installation of fuel oil storage and delivery facilities on Kansas and Oklahoma lines, cost \$333,000, 80 per cent completed.

Missouri Pacific

Other Important Work Under Construction: Building new concrete and reservoir pipe line and other facilities at Wagstaff, Kan., cost \$128,000, completed. Reconstruction of yard tracks to replace those destroyed by flood at Pueblo, Colo., cost \$112,000, completed. Filling in of bridge 160 at Yellville, Ark., cost \$225,500, completed. Filling in bridge 138 at Trickett, Ark., \$158,000, 60 per cent completed. Construction of a 100-ft. turntable, addition of two stalls and extension to eight in roundhouse, and other facilities at Coffeyville, Kans., cost \$112,000, 50 per cent completed. Construction of river bank protection at Myrick, Mo., cost \$10,000, completed.

Mobile & Ohio

Other Important Work Under Construction: New freight office and warehouse at East St. Louis, Ill., cost \$151,898, completed.

Moore Haven & Clewiston

First Track: Moore Haven, Fla., to Clewiston, 14.5 miles.

Nashville, Chattanooga & St. Louis

Other Important Work Under Construction: Engine terminals, improved passenger and freight facilities at Hollow Rock Junction, Tenn., cost \$580,000, 90 per cent completed.

Newburgh & South Shore

Third Track: In Ohio out of Cleveland, 0.95 mile.
Fourth Track: In Ohio out of Cleveland, 0.68 mile.
Other Important Work Under Construction: Car repair shops and facilities at Cleveland, cost \$275,000, completed.

New Holland, Higginsport & Mt. Vernon

First Track: Wenona, N. C., to New Holland, 35 miles.

New York Central

Other Important Work Under Construction: Renewal of stokers at Yonkers power station, Glenwood, N. Y., cost \$125,000, completed. Mail service and office building at New York, cost \$4,144,190, 93 per cent completed. Coaling plant and ash conveyor at Wayneport, N. Y., cost \$177,000, completed. Thirty-stall engine house and terminal facilities at Solvay, N. Y., cost \$1,700,000, completed. Reinforced concrete arch highway under crossing at Marston, N. Y., cost \$136,000, completed. Depot road subway at Harter Creek, Pa., cost \$110,000, 75 per cent completed. Subway at Water street, Wesleyville, Pa., cost \$225,285, 90 per cent completed. Grade separation at Detroit, Mich., cost \$263,621, 60 per cent completed.

New York, New Haven & Hartford

Other Important Work Under Construction: Installation of pipe flume at power house at Cos Ceb, Conn., cost \$100,000, completed. Westbound running track from Bradford to Westerly, R. I., cost \$120,000, 93 per cent completed. Relocation of track, East Providence, R. I., cost \$108,985, 90 per cent completed. Rearrangement of yard tracks at Hartford, Conn., cost \$132,403, 46 per cent completed. Construction of 3-mile telephone line, yard offices, signal towers, miscellaneous buildings and yard tracks, etc., in Cedar Hill freight terminal, New Haven, Conn., cost \$309,228, completed. Enlargement of machine shop, rearrangement and installation of machinery at Cedar Hill, cost \$152,700, completed. Miscellaneous yard track and other facility extensions, including land requirements for Northrup avenue terminal, Providence, R. I., cost \$394,015, completed.

Norfolk Southern

Other Important Work Under Construction: Grade and line revision at various points along the line, cost \$400,000, completed.

Northeast Oklahoma

First Track: Near Picher, Okla., 3 miles.

Norfolk & Western

First Track: From Lenore, W. Va., to terminus, 18 miles.

Other Important Work Under Construction: Installation of 2,000,000-gallon water supply, reservoir and pumping unit at Roanoke, Va., completed. Construction of timber preserving plant at Radford, Va., completed. Additional passing tracks at Bluefield, W. Va., completed. Renewal of bridge across Pennsylvania yards at Columbus, Ohio, completed. Improvement and betterments to coal property for fuel purposes near Williamson, W. Va., cost \$262,000, work now under way.

Northern Pacific

Second Track: Helena, Mont., to Great Northern crossing, 2.9 miles.

Northern Pacific Terminal of Oregon

Other Important Work Under Construction: New engine terminal and other necessary facilities at Portland, Ore., cost \$400,000, 15 per cent completed.

Oklahoma-Southwestern

First Track: Bristow, Okla., to Nuyaka, 24 miles.
Other Important Work Under Construction: Building from Nuyaka, Okla., to Okmulgee, 12 miles; projected, Okmulgee to Shawnee, 50 miles.

Omaha, Lincoln & Beatrice

Other Important Work Under Construction: New lines projected from Lincoln, Nebr., to Beatrice, 40 miles, cost \$2,000,000, and from Lincoln, Nebr., to Omaha, 55 miles, cost \$2,500,000, 20 per cent completed.

Oneida & Western

First Track: From Stockton, Tenn., to Doss Spur, 6 miles.

Oregon & California

Other Important Work Under Construction: Construction of single track tunnel to eliminate curves and trestle near Willamette river at Elk Rock, Oregon, cost \$219,000, completed.

Oregon Short Line

First Track: From Strachan, Idaho, to Conda, 7.54 miles.
Other Important Work Under Construction: Installation of tie and timber treating plant at Pocatello, Idaho, cost \$326,000, 80 per cent completed.

Oregon-Washington Railroad & Navigation

Other Important Work Under Construction: Extension of Albina yard at Portland, Ore., cost \$168,000, 99 per cent completed. Renewal of bridge at Chatcolet, Idaho, cost \$136,800, 99 per cent completed. Reconstruction of yard tracks and building of new depot yard office and other facilities at Reith, Ore., cost \$167,000, completed. Building new yard tracks and office at Huntington, Ore., cost \$113,000, completed. Renewal of main line bridges between Gibbon and Cayuse, Ore., cost \$110,000, completed.

Pacific Electric

First Track: In Long Beach, Calif., 1.53 miles.

Pearl River Valley

First Track: In Mississippi, between mile posts 14 to 17, 2.4 miles.

Pennsylvania Railroad

Other Important Work Under Construction: Building from Chester, W. Va. to Raccoon Creek, Pa. (Central region), 12.66 miles.

Perce Marquette

Other Important Work Under Construction: Building Flint Belt railroad in Michigan, 8.2 miles. Engine terminal and yard facilities at New Buffalo, Mich., cost \$700,000, completed. Engine terminal at Plymouth, Mich., cost \$400,000, completed. Engine terminal at Saginaw, Mich., cost \$980,000, completed. Storehouse at Grand Rapids, Mich., cost \$125,000, 90 per cent completed.

Philadelphia & Reading

Third Track: East of Womelsdorf, Pa. 0.35 mile.
Other Important Work Under Construction: Concrete arch bridge over Schuylkill river at Philadelphia, Pa., cost \$1,100,000, completed. New county bridge at Cnshohocken, Pa., cost \$240,000, completed. Double track bridge over Susquehanna river at Harrisburg, Pa., cost \$1,703,000, 52 per cent completed. Opening Tulip and Emerald streets in Philadelphia, under tracks of Richmond Branch, cost \$350,000, 97 per cent completed. Installation of double track bascule bridge at Darby Creek, \$222,000, 55 per cent completed. Construction of 11 bridges at Harrisburg, Pa., cost \$1,107,000, contracts awarded. Grade elimination and new station facilities at Swatara, Pa., cost \$169,000, work started. Double track through truss draw span with 5 deck plate girder approaches at Atlantic City, N. J., cost \$328,100, contract awarded.

Pittsburgh & Lake Erie

First Track: Shaw Junction, Pa., to Walford, 3.29 miles.

Pittsburgh & West Virginia

Other Important Work Under Construction: Building new branch line into coal field from Virginia, W. Va., to Bellfield, Pa., 3.2 miles, cost \$382,000, 50 per cent completed.

Port Bolivar Iron Ore

Other Important Work Under Construction: New line under survey from Ero, Tex., to junction with the Missouri, Kansas & Texas, 8 miles.

Potato Creek

First Track: Keystone, Pa., to Hamlin, 2.23 miles.

Richmond Belt

First Track: In Richmond, Calif., 0.83 mile.

Roaring Fork

Other Important Work Under Construction: Building from Blackwood, Va., to Black Creek mines, 0.5 mile.

St. Louis, Kennett & Southeastern

First Track: From Kennett, Mo., east, 3.5 miles.
Other Important Work Under Construction: Building new line from Kennett, Mo., to Dearing, 9 miles.

St. Louis-San Francisco

Second Track: Sleeper, Mo., to Lehanon, 8.7 miles; Olathe, Kans., to Spring Hill, 9.65; Amory, Miss., to Aberdeen Junction, 0.8 mile.

St. Louis Southwestern

Other Important Work Under Construction: New yard and engine terminal at Hodge, Tex., cost \$235,000, completed.

St. Paul Union Station

First Track: In St. Paul, Minn., 3 miles.
Other Important Work Under Construction: New union station in St. Paul, Minn., cost \$15,000,000, 50 per cent completed.

San Francisco Oakland Terminal

Second Track: In California, not specified, 1.19 miles.

Sewell Valley

First Track: From Rainelle Junction, W. Va., to Rupert, 8 miles.
Other Important Work Under Construction: Building from Rupert, W. Va., to Glencoe, 4 miles. New line under survey from Rupert, W. Va., to Duo, 11 miles.

Sierra Company of California

Other Important Work Under Construction: Completion of connecting lines in the Turlock and Modesto irrigation districts, California, of 7.75 miles at one location, and 2 miles on another now operated by this road, and ultimately to be taken over.

Southern Pacific

Other Important Work Under Construction: Renewal of bridge over Willamette river, Albany, Ore., cost \$198,000, completed. Construction of concrete reinforced warehouse and tracks to serve at San Francisco, Calif., cost \$1,620,000, completed. Line changed near Tehachapi Pass in the Coast Range mountains to eliminate two tunnels between Marcel and Cable, Calif., cost \$115,000, completed. Enlarging and lining with concrete, 16 tunnels under Tehachapi mountains between Bakersfield and Tehachapi, Calif., cost \$1,000,000, completed. Texas lines: New coach and paint shop at Houston, Tex., and extension to transfer table, cost \$217,700, completed. Rein-

forced concrete storehouse and office building at Houston, Tex., cost \$150,000, completed. Reconstruction of Pier A and part of Pier B, conveyor gallery and sheds at Galveston, Tex., cost \$150,000, 85 per cent completed. Replacing wooden floor and wooden bulkhead on Pier B with concrete floor and retaining walls, also replacing water mains in bay at Galveston, Tex., cost \$150,000, completed.

Tampa Southern

First Track: From Ellenton Belt Line in Florida, 15.6 miles.

Terminal Association of St. Louis

First Track: At Big Bend Quarry, Mo., 0.59 mile.

Texas & Pacific

Other Important Work Under Construction: Renewal of draw span over Bayou Plaquemine with double track single leaf lift span, cost \$225,000, 25 per cent completed.

Texas Midland

First Track: From Commerce, Tex., to Greenville, 14 miles.

Texas, Oklahoma & Eastern

First Track: From Broken Bow, Okla., to Oklahoma—Arkansas state line, 15.66 miles.

Uintah Railway

Other Important Work Under Construction: New line under survey from Watson, Utah, to Bonanza and Cowboy, 24.96 miles.

Union Pacific

First Track: From Haij, Nebr., to Nebraska—Wyoming state line 14.06 miles. From Nebraska—Wyoming state line to near Yoder, Wyo., 13.57 miles. From Evanston, Wyo., to Wyoming—Utah state line, 3.37 miles. From Wyoming—Utah state line to Wahsatch, Utah, 1.82 miles.

Second Track: LeRoy, Wyo., to Wyoming—Utah state line, 29.13 miles. From Wyoming—Utah state line to Wahsatch, Utah, 7.69 miles.

Other Important Work Under Construction: Building new road from near Yoder, Wyo., to end of track, 2.75 miles, and from near Yoder, down Cherry Creek Valley, 13.2 miles. Installing concrete lining and extending concrete portals at Hermosa tunnel, Wyo., cost \$372,500, completed. Additional yard tracks at Council Bluffs, Iowa, cost \$324,515, completed.

Union Traction

First Track: At Muncie, Ind., 0.27 mile.

Virginian Railway

First Track: From Mabon, W. Va., to Polk Gap, 5 miles.

Second Track: In West Virginia, 2.72 miles.

Other Important Work Under Construction: Building new line from Polk Gap, W. Va., to Glen Rogers, 9.45 miles. Extensions and alterations to engine house at Elmore, W. Va., cost \$133,000, completed.

Washington, Brandywine & Point Lookout

Other Important Work Under Construction: Building from Mechanicsville, Md., to Hollywood, 12 miles.

Waterloo, Cedar Falls & Northern

Other Important Work Under Construction: Building new concrete arch bridge and relocation of track at Waterloo, Iowa, terminals, cost \$100,000, 85 per cent completed.

Western Maryland

Second Track: Charlton, Md., to Clearspring, 2.3 miles.

Other Important Work Under Construction: Dredging 32 ft. channel to new government channel at Port Covington, Md., cost \$160,000, 70 per cent completed. Extension and improvements to grain elevator at Port Covington, Md., cost \$1,000,000, 35 per cent completed. Conveyor loading equipment at Port Covington, cost \$432,000, 98 per cent completed. Reconstruction of coal pier at Port Covington, cost \$700,000, completed.

Wheeling & Lake Erie

Other Important Work Under Construction: New yards, roundhouse and flatstalls, etc., including steel and frame viaduct at Gambrians, Ohio, cost \$540,750, 81 per cent completed. New yards, roundhouse, turntable and other facilities, etc., including highway change at Jewett, Ohio, cost \$494,800, 80 per cent completed.

Wichita Falls, Ranger & Ft. Worth

Other Important Work Under Construction: Building from Breckenridge, Tex., to Jenks, 9.3 miles.

Wichita Falls & Southern

First Track: Newcastle, Tex., to Jenks, 40 miles.

Winchester & Western

First Track: Between Intermediate and Wardsville, W. Va., 5 miles.

Other Important Work Under Construction: Building from Wardsville, W. Va., to Baker, 12 miles.

Railroad Construction in Canada in 1921

Alberta & Great Waterways

First Track: In Alberta, under mile post 272.1 to 282.8, 10.7 miles.

Other Important Work Under Construction: Reconditioning of track, right-of-way and drainage; new water supplies, etc., \$2,000,000, 90 per cent completed.

British Columbia Electric

First Track: In Vancouver, B. C., 0.55 mile.

Canadian National Railways

First Track: In Manitoba, Amaranth north, 17.7 miles. In Saskatchewan, Thunderhill extension, 13.9 miles; Milfort northeast, 23.7 miles; Luck Lake, 15.02 miles; Jackfish Lake, 15.06 miles. In Alberta, Onoway branch, 11.9 miles and in British Columbia, Vancouver Island, 3.1 miles.

Second Track: In Alberta, between Munson and Wayne, 6.57 miles.

Other Important Work Under Construction: Canadian Northern: New terminal facilities and buildings at Nutana, Saskatchewan, \$411,050, completed; steel bridge at Saskatoon, Saskatchewan, six 157-ft. spans, cost \$330,000, completed; steel bridge across Red Deer river, in Alberta on Medicine Hat branch, cost \$326,000, sub-structure, completed; steel bridge across Assiniboine river at Pleasant Point, Manitoba, cost \$160,000, 15 per cent completed. Grand Trunk Pacific: new reservoir, dam and pipe line at Melville, Saskatchewan, cost \$320,000, completed; salmon wharf and warehouse at Prince Rupert, B. C., cost \$750,000, wharf completed, warehouse 15 per cent completed.

Canadian Pacific

First Track: Langdon, Alberta, north (Acme-Empress), 17.3 miles; Weyburn, Alberta (Altawan West), 17 miles.

Other Important Work Under Construction: Building from Russell, Manitoba, northerly, 5.5 miles; Langdon, Saskatchewan, northeasterly, 0.5 miles; Bassano, easterly, 56 miles, of which 35 miles are graded; Rosetown, southeasterly, 45 miles, of which 41 miles are graded; Archie-Weymark, 25 miles, of which 21 miles are graded; Moose Jaw, southwest (Consul East), 60 miles, of which 31 miles are graded; Leader, southeasterly, 29.5 miles.

Central Canada

First Track: In Alberta, 23 miles.

Dominion Atlantic

First Track: Near Weymouth Mills, Nova Scotia, 2.5 miles.

Esquimalt & Nanaimo

First Track: In Province of British Columbia, 4 miles.

Other Important Work Under Construction: New line under survey from Courtenay to Campbell river, 30 miles; renewal of railway and highway bridge at Victoria, B. C., a joint bridge with the city of Victoria, cost \$750,000, foundations about completed.

Grand Trunk—Lines East

Other Important Work Under Construction: Renewal and widening of overhead bridge at Main Street, Toronto, cost \$120,000, 80 per cent completed.

Kettle Valley

First Track: South Penticton, B. C., to Dog Lake, 2.4 miles.

Other Important Work Under Construction: Building from Dog Lake to government experimental farm, 16.7 miles.

Pacific Great Eastern

First Track: In British Columbia, from Australian creek to Cottonwood river, 35 miles. From Ft. George to Red Rock creek, 18 miles.

Other Important Work Under Construction: Building new road from Red Rock creek to Cottonwood river, 46 miles. Also projected new lines from Ft. George to Provincial boundary, Peach river district, 426 miles. Main line of this road is now under operation from Squamish to Quesnel, 348 miles, with steel laid to mile post 304, and line graded to mile post 428. Steel has also been laid for 18 miles south of Ft. George, cost of all work, \$40,000,000, 90 per cent completed.

Quebec Central

First Track: From Scott Junction, in Province of Quebec, to Diamond Junction, 19.33 miles.

Reid-Newfoundland

First Track: Irvine, N. F., to Topsail, 13 miles.

Temiskaming & Northern Ontario

Other Important Work Under Construction: Building new line from Torchre to Abitibi Canon, 70 miles.

Railroad Construction in Mexico in 1921

First Track: In the state of Durango, from Llano Grande to El Salto, 23.61 miles, and from Los Baños to Cerro de la Cruz, 17 miles; in the state of Coahuila, from Zaragoza to Santo Tomas, 31.67 miles, and from La Vibora to El Oro, 30.14.

Other Important Work Under Construction: Building new line from El Oro to Sierra Mojada, Coahuila, 9.32 miles; and from Santo Tomas to Villa Arana, Coahuila, 28 miles, new line under survey from El Salto to Maratlan, 165 miles; reinforced concrete passenger station at Durango, cost \$330,000, 85 per cent completed, reinforced concrete passenger station at Saltillo; reduction of grade between Saltillo and Carreones, in the line between Mexico City, Mex., and Laredo, Tex., old grade 2 per cent, new grade 1.05 per cent, cost \$860,470, 35 per cent completed.

Concerning the Contributors in This Number

Co-operation Required From Many Sources to Cover Railway Activities Throughout the World

THIS NUMBER of the *Railway Age* contains several times the amount of material which would be included in the average size technical book. Besides discussing the important developments of an important year on our own railways, the Annual Review Number, this year, for the first time covers practically all of the important countries throughout the world. Articles in a number of this nature require the most extended and painstaking preparation and study.

This year for the first time, also, practically all of the articles are signed. Most of the articles were prepared by the members of the *Railway Age* editorial staff. In not a few cases, however, especially as concerns the foreign railways, it was necessary to go outside of the staff. A few words may not be out of place, therefore, as to why the respective special contributors were selected as being best fitted to discuss the subjects which were assigned to them.

Railway Executives

It would be superfluous to say anything about the four chief executives who have contributed to the opening article entitled, "Railway Executives Review Prospects for 1922" (page 5), **Thomas DeWitt Cuyler**, chairman of the Association of Railway Executives; **Julius Kruttschnitt**, chairman of the Southern Pacific Company; **C. H. Markham**, president of the Illinois Central, and **A. H. Smith**, president of the New York Central, need no introduction to our readers in this country or abroad.

Roberts Walker, in his article on "The Regulation of Security Issues Under Section 20-a" (page 21), has taken what might otherwise be a somewhat heavy subject and has treated it in an unusually interesting manner. Mr. Walker is familiar with the subject because of his relations in a legal capacity with the trust company field. He is also vice-president and a director of the Chicago & Alton. For the purposes of the present study he engaged in a careful investigation of the dockets and procedure in many of the important or typical decisions which have been rendered by the Interstate Commerce Commission in this important new work.

Railway Economists

Dr. Julius H. Parmelee has been a regular contributor to the Annual Review Numbers of the *Railway Age* for several years. Last year his article was entitled "Railway Revenues and Expenses in the Year 1920." This year it is headed "An Analysis of the Railway Statistics for 1921" (page 119). The change in title is significant, for one of the many interesting points brought out in the present article is that relating to the increased and improved railway statistical data which have become available in recent years. Dr. Parmelee, as the director of the Bureau of Railway Economics, is doubtless as close a student of railway economics as any man in the country. For three years after his graduation from Yale he was an instructor in economics at

Yale, and since that time he has been engaged in work closely related to that subject.

J. L. Payne, who writes under the head "The Canadian Railways Are in a Bad Way" (page 70), may be presumed to know whereof he speaks. Mr. Payne has his office at Ottawa, Canada, and was formerly comptroller of statistics, Department of Railways and Canals for the Dominion of Canada. He has been a keen student of railway affairs in Canada. For several years he has furnished special articles for our Annual Review Number and on other occasions he has discussed in the columns of the paper the performance of the Canadian railways and the tendencies in the Canadian railway situation. Mr. Payne has a happy way of developing the salient features and presenting them in a most readable manner.

Opinions About Mexico

Our plans for an article on Mexico were slightly upset at almost the last minute, but with the aid of Messrs. Titcomb, Pyeatt and Fay we were able to make up the deficiency—in a commendable manner, we should say, if we thought our readers would pardon such a departure from editorial modesty. The article entitled "Mexico Makes Progress Toward Rehabilitation" (page 73), discusses less the actual conditions within Mexico than the restored relationships between the Mexican and United States lines. This very important angle of the situation is "covered" with the assistance of the three railway executives above named who are closely in touch with the Mexican roads.

H. B. Titcomb recently succeeded the late Epes Randolph as president of the Southern Pacific of Mexico and the Arizona Eastern. He is naturally much interested in the Mexican situation and has made a study of it as a part of his new work.

J. S. Pyeatt has been at the head of the Gulf Coast lines for many years. During the period of federal control, he was federal manager of the St. Louis-San Francisco and also various lines in Texas.

Thornwell Fay, executive officer for the receiver of the International & Great Northern may, like Mr. Pyeatt, be expected to be informed concerning our Mexican railway relationships, because his line, like the Gulf Coast Lines, interchanges freight with the National Railways of Mexico and operates a through passenger service in connection with the Mexican system.

Our European Writers

M. Peschaud, who points out the "High Lights on the French Railway Situation" (page 81), is secretary of the Paris-Orleans Railway. He has had a broad experience in railway affairs and has written a number of articles for French, English and American papers on the French railways. He has also written a book on the French railways during the war which has been very well received.

The article on Italy, "A Review of the Italian Railway Situation" (page 85), is written by **A. Giordano**, the *Railway Age's* special news correspondent at Rome, Italy. He follows railway and industrial conditions closely.

Julian Grande, who discusses "The Swiss Railways in the Year 1921" (page 88), is a railway news specialist with headquarters at Geneva, Switzerland. He is a correspondent for several very important newspapers and publications, among them the *Railway Age*.

Dr. J. M. Goldstein, who says that the "Soviets Demoralize Already Inadequate Systems" (page 91), was formerly professor of economics at the Institute of Industry and Trade at the University of Moscow. Before the war he served as an economic adviser to various branches of his government. He was a member of Kerensky's railway mission to the United States. Since the triumph of the Bolsheviki he has devoted himself continuously to a study of American railways. In the *Railway Age* of November 5 was published an article by him showing the important part played by the railways in increasing the population and wealth of the United States.

G. Reder, whose article is entitled "German Railways Operating Under Great Difficulties" (page 93), is associated with the Verein Deutscher Ingenieure, the principal engineering society of Germany, with headquarters at Berlin. His work keeps him in close touch with the railway and engineering conditions in Germany.

American Ideas About Japan's Railways

B. B. Milner, who makes "Some observations on the Japanese Railways" (page 101), received his early training on the Pennsylvania Railroad. He later went with the New York Central, finally becoming chief mechanical engineer of that system. On the Pennsylvania Railroad, in particular, he received an experience covering not only mechanical but engineering and operating matters; he also gave considerable attention to questions of operation while he was with the New York Central. A little more than a year ago he went Tokyo, Japan, to become associated with the Frazar im-

porting and exporting interests. Recently he returned to this country for a few months, but expects shortly to again return to Japan. Mr. Milner is a keen observer. He is not satisfied with noting practices and performances which differ from our own but insists upon determining the reasons for the difference, and in a country like Japan this feature of an observer's attitude is of no slight importance.

Writers on Australia and South Africa

F. M. Whyte, who writes the article on "Unifying the Railway Gages of Australia" (page 107), was for many years connected with the New York Central as chief mechanical engineer and later with the Hutchins Car Roofing Company as vice-president. He went to Australia about a year ago to act as a member of the Uniform Gage Commission, the function of which was to study conditions on the Australian railroads and to make recommendations for a plan looking to the standardization of gages. This is a very important problem in Australia and a solution of it is desired that traffic might be interchanged more efficiently and economically across the boundary lines of the several states of Australia. The findings of the Commission were approved and work will undoubtedly be started shortly to make them effective. Mr. Whyte has only recently returned to this country.

M. T. Griffin, who covers the subject "South African Railways Progress Despite Deficits" (page 111), is one of the staff of the National Bank of South Africa. His headquarters are in New York. His time is devoted to the study of economic conditions in this country and in South Africa, in connection with which he has paid particular attention to railway problems.

Many Furnished Statistical Material

The *Railway Age* must also take this opportunity to thank hundreds of others of its friends in the railway and railway supply fields who have assisted it in furnishing material in order to make its statistics for the year complete. It is only through such co-operation that an issue of this kind is made possible.

General News Department

The Savannah (Ga.) Local Committee of the Signal Section of the American Railway Association will hold its next meeting on January 19, 1922, at which it is expected that the principal speaker will be H. S. Balliet (N. Y. C.), New York City, secretary of the Signal Section.

L. A. Downs, vice-president and general manager of the Central of Georgia, and chairman of Division IV of the American Railway Association, has been appointed a delegate of that association to attend the Congress of the International Railway Association at Rome, Italy, in April next.

A preliminary compilation of the reports of 193 Class I railroads to the Interstate Commerce Commission of revenues and expenses for the month of November shows a net railway operating income for these roads of \$65,741,000, as compared with \$50,502,000 for November, 1920. The operating revenues were \$462,000,000, as compared with \$589,000,000, while the operating expenses were \$366,000,000, as compared with \$511,000,000.

A rear collision of southbound local passenger trains on the Ninth Avenue Elevated line of the Interborough Rapid Transit Company, New York City, near Fortieth street, Manhattan, on the evening of December 30, resulted in the fatal injury of one passenger and less serious injury to 35 passengers and two employees. The leading train was at a standstill; and two cars of the following train were badly crushed.

Labor Board Files Motion to Dismiss

Pennsylvania Injunction

Hearings in the jurisdictional dispute between the Pennsylvania and the Railroad Labor Board, scheduled for January 3 in the United States District Court at Chicago, were again postponed by mutual agreement until January 18. The progress of this dispute was described in the *Railway Age* of December 17, page 1216, and December 24, page 1267. On January 3, John V. Clininn, assistant United States district attorney, acting as counsel for the Board, filed a motion to dismiss the case, and the arguments on this plea will be heard on January 18.

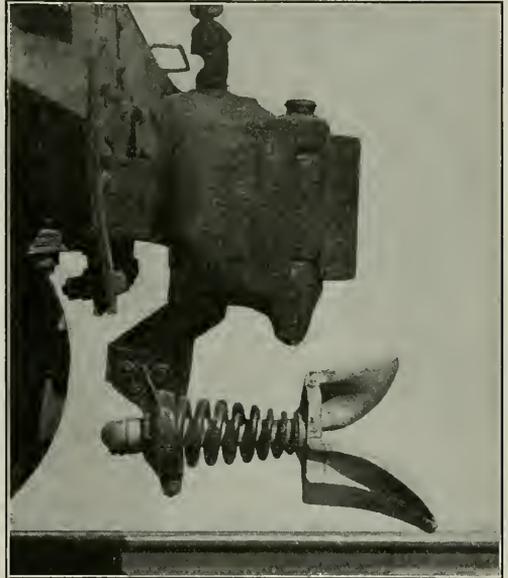

I. C. C. Authorizes Common Officers

and Directors Temporarily

Because it has not been able to act by the last day of the year on all the applications filed with it under paragraph 12 of section 20-a of the interstate commerce act, by officers and directors of more than one railroad for authority to retain their positions, the Interstate Commerce Commission on December 31 issued a blanket order applying to the applications filed, but on which no order had been issued by the commission, authorizing the persons involved to hold their positions as described in the applications until the further order of the commission, on the ground that it appears that neither public nor private interests will be adversely affected thereby. The law provides that no person shall hold positions as officer or director of more than one railroad after December 31, 1921, except upon the authorization by the commission. The commission has already issued orders in a large number of cases, in most of which it has given the authority asked for, but a very large number of applications were received during the last days of the year. The orders heretofore issued have specifically authorized common officers and directors among subsidiary and affiliated companies, but in a few cases of directors of a number of competing roads, the commission has required them to elect which directorships they will retain. The commission also made public on December 31 an order authorizing common officers and directors among the subsidiary and affiliated companies of the Chicago, Burlington & Quincy system.

The Robinson Connector

Our attention has been called to an error in the article entitled "The Development of the Robinson Connector" which was published in the *Railway Age* of December 24, 1921, page 1259. This article referred to the pin and funnel type as the first design of the Robinson connector. In

The First Design of the Robinson Connector, Type A

reality the first design was the type A with wing type gathering arrangement, as illustrated. This was applied on the lines of the Washington Terminal Company and was also tested by the Interstate Commerce Commission on the Great Northern, the trial of the pin and funnel design being incidental thereto. The conclusions in the report of the commission referred to the type A and not to the pin and funnel type as the article indicated.

Meetings and Conventions

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

- AIR BRAKE ASSOCIATION.—F. M. Nellis, 165 Broadway, New York City. Next meeting, May 9-12, 1922, Hotel Washington, Washington, D. C. Exhibit by Air Brake Appliance Association.
- AIR BRAKE APPLIANCE ASSOCIATION.—Fred W. Venton, 836 So. Michigan Ave., Chicago. Meeting with Air Brake Association.
- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontius, Supervisor of Demurrage and Storage, C. & N. W. Ry., Chicago.
- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—L. A. Stone, C. & E. I. Ry., Chicago.
- AMERICAN ASSOCIATION OF ENGINEERS.—C. E. Drayer, 63 E. Adams St., Chicago.
- AMERICAN ASSOCIATION OF GENERAL BAGGAGE AGENTS.—E. L. Duncan, 332 So. Michigan Ave., Chicago. Next meeting, June 28 and 29, Minneapolis, Minn.
- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.
- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—J. Rothschild, Room 400, Union Station, St. Louis, Mo. Next convention, August 23-25, 1922, Kansas City, Mo.

- AMERICAN ELECTRIC RAILWAY ASSOCIATION.—J. W. Welsh, 8 W. 40th St., New York.
- AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPE FITTERS' ASSOCIATION.—C. Borchardt, 202 North Hamlin Ave., Chicago, Ill.
- AMERICAN RAILWAY ASSOCIATION.—J. E. Fairbanks, General Secretary, 75 Church St., New York, N. Y. Annual meeting, November, 1922.
- Division I—Freighting.
- Freight Station Section (including former activities of American Association of Freight Agents). R. O. Wells, Freight Agent, Illinois Central Railroad, Chicago, Ill.
- Medical and Surgical Section. J. C. Caviston, 75 Church St., New York.
- Protective Section (including former activities of the American Railway Chief Special Agents and Chiefs of Police Association). J. C. Caviston, 75 Church St., New York, N. Y.
- Telegraph and Telephone Section (including former activities of the Association of Railway Telegraph Superintendents). W. A. Fairbanks, 75 Church St., New York, N. Y. Next meeting, March 21-23, Richmond, Va. Annual meeting, September 20-22, 1922, Colorado Springs, Colo.
- Safety Section. J. C. Caviston, 75 Church St., New York.
- Division II—Transportation (including former activities of the Association of Transportation and Car Accounting Officers). G. W. Covert, 431 South Dearborn St., Chicago, Ill.
- Division III—Traffic. J. Gottschalk, 143 Liberty St., New York.
- Division IV—Engineering. E. H. Fritch, 431 South Dearborn St., Chicago, Ill. Next convention, March 14-16, Chicago. Exhibit of National Railway Appliances Association, March 13-16.
- Construction and Maintenance Section. E. H. Fritch.
- Electrical Section. E. H. Fritch.
- Signal Section (including former activities of the Railway Signal Association). H. S. Baller, 75 Church St., New York, N. Y. Annual meeting, June 14-16, 1922, Monmouth Hotel, Spring Lake, N. J.
- Division V—Mechanical (including former activities of the Master Car Builders' Association and the American Railway Master Mechanics' Association). J. H. Hawthorne, 431 South Dearborn St., Chicago, Ill. Annual convention, June 14-21, 1922, Atlantic City, N. J. Exhibit by Railway Supply Manufacturers' Association.
- Equipment Painting Section (including former activities of the Master Car and Equipment Painters' Association). V. R. Hawthorne, 431 South Dearborn St., Chicago, Ill.
- Division VI—Purchases and Stores (including former activities of the Railway Storekeepers' Association). J. P. Murphy, General Store Keeper, New York Central, Collingwood, Ohio.
- Division VII—Freight Claims (including former activities of the Freight Claim Association). Lewis Pilcher, 431 South Dearborn St., Chicago, Ill.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichten, C. & N. W. Ry., 200 S. Baller, 75 Church St., New York, N. Y. Next convention, October 17-19, 1922, Cincinnati, Ohio. Exhibit by Bridge and Building Supply Men's Association.
- AMERICAN RAILWAY DEVELOPMENT ASSOCIATION.—J. F. Jackson, Central of Georgia, Savannah, Ga. Annual meeting, May 10-12, 1922, Denver, Colo.
- AMERICAN RAILWAY ENGINEERING ASSOCIATION.—(Works in cooperation with the American Railway Association, Division IV.) E. H. Fritch, 431 South Dearborn St., Chicago. Next convention, March 14-16, Chicago. Exhibit by National Railway Appliances Association, March 13-16.
- AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—(See American Railway Association, Division 5.)
- AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—R. D. Fletcher, 1145 East Marquette Road, Chicago. Exhibit by Supply Association of the American Railway Tool Foremen's Association.
- AMERICAN SHORT LINE RAILROAD ASSOCIATION.—T. F. Whittlesey, Union Trust Bldg., Washington, D. C.
- AMERICAN SOCIETY FOR STEEL TREATING.—W. H. Eisman, 4600 Prospect Ave., Cleveland, Ohio. Annual convention, September 25-30, 1922, Detroit, Mich.
- AMERICAN SOCIETY FOR TESTING MATERIALS.—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa. Annual meeting, June, 1922, Atlantic City, N. J.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—E. M. Chandler (acting secretary), 33 W. 39th St., New York. Regular meetings 1st and 3d Wednesdays in month, except July and August, 33 W. 39th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.
- Railroad Division, James Partington, American Locomotive Co., 30 Church St., New York.
- AMERICAN TRAIN DISPATCHERS' ASSOCIATION.—L. Darling, Northern Pacific Ry., Spokane, Wash.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.—George M. Hunt, Chemist, Forest Products Laboratory, Madison, Wis. Next meeting, January 24-26, Hotel Sherman, Chicago.
- ASSOCIATION OF RAILWAY CLAIM AGENTS.—H. D. Morley, Northern Pacific R. Ry., St. Paul, Minn. Next meeting, May 17-19, 1922, Montreal.
- ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucci, C. & N. W. Ry. 411, C. & N. W. Sta. Chicago. Exhibit by Railway Electrical Supply Manufacturers' Association.
- ASSOCIATION OF RAILWAY EXECUTIVES.—Thomas De Witt Cusler (chairman), 61 Broadway, New York, N. Y.
- ASSOCIATION OF RAILWAY SUPPLY MEN.—A. W. Clokey, 165R McCormick Bldg., Chicago. Meeting with International Railway General Foremen's Association.
- ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—(See American Railway Association, Division I.)
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—(See American Railway Association, Division II.)
- BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—D. J. Higgins, American Valve & Meter Company, 11 S. Michigan Ave., Chicago. Meeting with convention of American Railway Bridge and Building Association.
- CANADIAN RAILWAY CLUB.—W. A. Poole, 54 Riverside St., Montreal, Que. Car Foremen's Association.
- CAR FOREMEN'S ASSOCIATION.—Charles W. Kline, 616 North Pine Ave., Chicago. Regular meetings, 2d Friday in month, except June, July and August, New Market Hotel, Chicago.
- CAR FOREMEN'S ASSOCIATION OF ST. LOUIS.—H. M. Dumas, P. Koenke, 604 Federal Reserve Bank Bldg., St. Louis, Mo. Meetings, first Tuesday in month at the American Hotel Annex, St. Louis.
- CENTRAL RAILWAY CLUB.—Harry D. Vought, 26 Cortlandt St., New York. Regular meetings, 2d Thursday in January, March, May, September and November, Hotel Iroquois, Buffalo, N. Y.
- CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.—W. P. Elliott, Terminal Railroad Association of St. Louis, East St. Louis, Ill.
- CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S SUPPLY MEN'S ASSOCIATION.—D. B. Wright, 34th St. and Artesian Ave., Chicago, Ill. Meeting with Chief Interchange Car Inspectors' and Car Foremen's Association.
- CINCINNATI RAILROAD CLUB.—W. C. Cooder, Union Central Bldg., Cincinnati, Ohio. Meetings, 2d Tuesday in February, May, September and November.
- EASTERN RAILROAD ASSOCIATION.—E. N. Bessling, 614 F St., N. W., Washington, D. C. Annual meeting May 11, 1922, Railroad Club of New York.
- FREIGHT CLAIM ASSOCIATION.—(See American Railway Association, Division VII.)
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—C. H. Treichel, Grand Central Station, Chicago. Regular meetings, Wednesday preceding 3d Friday in month, Room 1414, Manhattan Bldg., Chicago.
- INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—W. J. Mayer, Michigan Central R. R., Detroit, Mich. Exhibit by International Railroad Master Blacksmiths' Supply Men's Association.
- INTERNATIONAL RAILROAD MASTER BLACKSMITHS' SUPPLY MEN'S ASSOCIATION.—George P. White, 747 Radway Exchange, Chicago. Meeting with International Railroad Master Blacksmiths' Association.
- INTERNATIONAL RAILWAY FUEL ASSOCIATION.—J. G. Crawford, 702 E. 51st St., Chicago. Next annual meeting, May, 1922, Chicago. Exhibit by International Railway Supply Men's Association.
- INTERNATIONAL RAILWAY TOOL FOREMEN'S ASSOCIATION.—Wm. Hall, 1061 W. Wabasha Ave., Winona, Minn.
- INTERNATIONAL RAILWAY SUPPLY MEN'S ASSOCIATION.—C. W. Sullivan, Garlock Packing Co., 326 W. Madison St., Chicago. Meeting with International Association of Railway and Utilities Commissioners.
- MAINTENANCE OF WAY MASTER PAINTERS' ASSOCIATION.—E. E. Martin, Union Pacific R. R. Room No. 19, Union Pacific Bldg., Kansas City, Mo. Annual convention, 1922, Buffalo, N. Y.
- MASTER BODY MARKING ASSOCIATION.—Harry D. Vought, 26 Cortlandt St., New York. Next convention, May 23-26, 1922, Hotel Sherman, Chicago.
- MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION.—(See A. R. A., Division 5.)
- MASTER CAR BUILDERS' ASSOCIATION.—(See A. R. A., Division V.)
- NATIONAL ASSOCIATION OF RAILWAY TIE PRODUCERS.—Warren C. Nixon, Western Tie & Timber Co., 905 Syndicate Trust Bldg., St. Louis, Mo. Annual meeting, January 26 and 27, Hotel Sherman, Chicago.
- NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES COMMISSIONERS.—James B. Walker, 49 Lafayette St., New York.
- NATIONAL FOREIGN TRADE COUNCIL.—O. K. Davis, 1 Hanover Square, New York. Next convention, May 10-12, Philadelphia, Pa.
- NATIONAL RAILWAY APPLIANCE ASSOCIATION.—C. W. Kelly, People's Gas Bldg., Chicago. Annual exhibition, March 13-16, Chicago, at convention of American Railway Engineering Association.
- NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 26 Cortlandt St., New York. Regular meetings, 3d Friday in month, except June, July and August, at 29 W. 39th St., New York.
- PACIFIC RAILWAY CLUB.—W. S. Wollner, 64 Pine St., San Francisco, Cal. Regular meetings, 2d Thursday in month, alternately in San Francisco and Oakland.
- RAILWAY ACCOUNTING OFFICERS' ASSOCIATION.—E. R. Woodson, 1116 Woodward Building, Washington, D. C.
- RAILWAY BUSINESS ASSOCIATION.—Frank W. Nixon, 600 Liberty Bldg., Head and Chestnut Sts., Philadelphia, Pa. Annual dinner, February 1, Waldorf-Astoria Hotel, New York.
- RAILWAY CLUB OF PITTSBURGH.—J. D. Corway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month, except June, July and August, Fort Pitt Hotel, Pittsburgh, Pa.
- RAILWAY DEVELOPMENT ASSOCIATION.—(See Am. Ry. Development Assn.)
- RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—F. Scribner, General Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.
- RAILWAY EQUIPMENT MANUFACTURERS' ASSOCIATION.—R. J. Himmelright, 17 East 42nd St., New York. Meeting with Traveling Engineers Association.
- RAILWAY FIRE PROTECTION ASSOCIATION.—R. R. Hackett, Baltimore & Ohio R. R., Baltimore, Md.
- RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrison, C. & O. Ry., Richmond, Va. Next meeting, October 10-13, 1922, Pittsburgh, Pa.
- RAILWAY SIGNAL ASSOCIATION.—(See A. R. A., Division IV, Signal Section.)
- RAILWAY STOREKEEPERS' ASSOCIATION.—(See A. R. A., Division VI.)
- RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Corway, 1864 Oliver Bldg., Pittsburgh, Pa. Meeting with A. R. A., Division V.
- RAILWAY TELEGRAPH AND TELEPHONE ATTILIANE ASSOCIATION.—G. A. Nelson, 301 Church St., New York.
- RAILWAY TRAFFIC AND FREIGHT ASSOCIATION.—L. W. Con, Commercial Trust Bldg., Philadelphia, Pa.
- ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrews, C. & N. W. Ry., Sterling, Ill. Annual convention, September 12-14, 1922, Cleveland, Ohio. Exhibit by Track Supply Association.
- ST. LOUIS RAILWAY CLUB.—H. W. Frauenthal, Union National Ry., St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August.
- SIGNAL APPLIANCE ASSOCIATION.—P. W. Edmunds, Sunbeam Electric Manufacturing Company, New York City. Meeting with American Railway Association, Signal Section.
- SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.—A. J. Mettall, P. O. Box 15, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.
- SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, West City Ry. of Ala., Atlanta, Ga.
- SUPPLY ASSOCIATION OF AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—H. S. White, 9 N. Jefferson St., Chicago.
- TRACK SFLA ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meets with Roadmasters' and Maintenance of Way Association.
- TRAINING ENGINEERS' ASSOCIATION.—W. O. Thompson, Marine Trust Building, Buffalo, N. Y. Exhibit by Railway Equipment Manufacturers' Association.
- WESTERN RAILWAY CLUB.—Bruce V. Crandall, 14 E. Jackson Boulevard, Chicago. Regular meetings, 3d Monday each month except June, July and August.

Traffic News

The Chicago, Rock Island & Gulf will open an office in the Central Trust Building, San Antonio, Tex., with D. O'Leary in charge as general agent.

The San Antonio Traffic Club has been organized at San Antonio, Tex., and the following officers have been elected: President, R. H. Schultz, traffic manager, San Antonio, Uvalde & Gulf; vice-president, Wallace Carnahan; and secretary and treasurer, R. L. Gohmert; directors: S. B. Weller, F. L. Orr, J. E. Pennington, Fred E. Jones, and U. S. Pawkett.

At the annual meeting of the Traffic Club of Lansing, Mich., held on December 14, the following officers were elected: President, H. E. McGiverson, traffic manager, Motor Wheel Corporation; vice-president, E. L. Jennings, agent, Michigan Central; secretary-treasurer, J. I. Ross, traffic commissioner, Lansing Chamber of Commerce; executive committee, W. G. Davis, traffic manager, Anto Body Company; W. K. Andrews, agent, Pere Marquette; C. R. Morris, secretary, Michigan Screw Company; and J. T. Van Nordstrand, agent, American Railway Express Company.

Coal Production

A feeble increase during the week of December 24 failed to lift production of soft coal out of the state of profound depression which has persisted since mid-November, says the weekly bulletin of the Geological Survey. The total output is estimated at 7,468,000 net tons, an increase of 5 per cent over the week preceding. The average daily output for December has been 1,210,000 tons, barely 60 per cent of that in December, 1920. It is even 12 per cent below the daily average in December, 1914, the lowest in any winter of the eight years over which records of current output extend.

Differential Fares, New York-Chicago

The Erie Railroad announces that the Interstate Commerce Commission has accepted tariffs filed by it, and already in effect, establishing differential fares of \$2 between New York and Chicago, Cincinnati and Indianapolis; between New York and St. Louis, \$2.50, and between New York and Cleveland \$1 less than the fares over the Pennsylvania, the New York Central, and other roads. This reduction, added to that resulting from the elimination of the transportation tax, brings these fares down from \$2.61 to \$5.51 below those charged before January 1.

National Conference on Agricultural Problems

At the request of President Harding, Secretary Wallace, of the Department of Agriculture, is to call a national conference to consider the agricultural problems of the American people, to be held probably in Washington at an early date as yet to be fixed. The President said he was convinced that such a conference may be made a very helpful agency in suggesting practical ways of improvement, particularly if brought into co-ordination with the investigation which has been begun by the Congressional committee committed to a related work. He said that such a conference might divide itself into two parts, one to give consideration to present day difficulties, and the other part a survey of the future in an effort to determine upon general policies, having in view the maintenance of production, the greatest possible use, and at the same time the conservation of agricultural resources, and the more complete co-ordination of agricultural, manufacturing and general business interests. The President suggested that those invited to the conference shall not only include the ablest representatives of agricultural production, but also those who are engaged in industry most intimately associated with agriculture. It is understood that the relations of transportation to agriculture will constitute an important topic to be discussed and that representatives of the railroads will be invited to attend.

Equipment and Supplies

Freight Cars

THE NATIONAL RAILWAYS OF MEXICO are inquiring for 1,000 narrow gage box cars of 30-ton capacity.

THE CENTRAL VERMONT, in the near future, expects to have repairs made to 1,000 box cars and 200 coal cars.

THE PACIFIC FRUIT EXPRESS, in the near future, expects to ask for prices on from 2,500 to 3,000 refrigerator cars.

THE SEABOARD AIR LINE reported in the *Railway Age* of December 17, as inquiring for prices on 1,500 ventilated box cars of 40 tons capacity; 200 flat cars with steel underframes of 40 tons capacity, and 300 steel phosphate cars of 50 tons capacity, has given an order to the Chickasaw Shipbuilding Company for some of these cars, the exact number to be determined later.

THE ILLINOIS CENTRAL is expected to place contracts for 2,000 gondola cars during the first part of the week of January 8, and the Great Northern and the Chicago, Burlington & Quincy, it is expected, will let contracts for other equipment during the latter part of the month. The Burlington is in the market for 7,300 freight cars of various types, but it is anticipated that orders will not be placed for all of them at once. The Great Northern is expected to award contracts for 3,500 cars about the middle of the month.

Passenger Cars

THE STATEN ISLAND RAPID TRANSIT RAILWAY, in the near future, expects to ask for prices on 50 steel cars for passenger service.

Iron and Steel

THE NEW YORK CENTRAL LINES' order for 125,000 tons of rail, reported in the *Railway Age* of December 10, was distributed as follows: Illinois Steel Company, 34,000 tons; Carnegie Steel Company, 16,500 tons; Lackawanna Steel Company, 51,500 tons; Inland Steel Company, 8,000 tons; Bethlehem Steel Company, 6,000 tons, and Algoma Steel Corporation, 9,000 tons.

THE PENNSYLVANIA RAILROAD has placed orders for 80,000 tons of rail, most of which will be in 130 lb. sections, for 1922 delivery as follows: Carnegie Steel Company, 40,000 tons; Bethlehem Steel Company, 18,000 tons; Cambria Steel Company, 18,000 tons; Lackawanna Steel Company, 4,000 tons. In addition the company has unfilled orders from 1921 and rail on hand totaling 74,000 tons and this with the new orders gives the company a total of 154,000 tons available for use in 1922. The company also has some used rail which will be available for branch line or for less important track service.

Signaling

THE MISSOURI, KANSAS & TEXAS has ordered the materials required for the installation of automatic block signaling between Vinita, Okla., and Wybark, 60 miles, consisting of 80 style "S" and 2 style "T2" signals, with the necessary relays, circuit controllers, etc., for a complete system of block signaling within this territory. Installation will be made by the railway company's forces.

Machinery and Tools

THE WESTERN MARYLAND is inquiring for machine tools for a rail reclaiming plant.

THE GREAT NORTHERN is inquiring for 1 Niagara (or similar) 12 ft. squaring shears, motor driven and 1 Chicago (or similar) 12 ft. break, motor driven.

Supply Trade News

Charles R. Robinson, until about a year ago vice-president in charge of sales of the Lackawanna Steel Company, Buffalo, N. Y., has been elected vice-president in charge of sales of the rail division of the **Inland Steel Company, Chicago**. Mr. Robinson was formerly with the Inland Steel Company in a sales capacity but resigned 15 years ago to join the Lackawanna company as division manager of sales at Chicago. **Edward M. Adams**, vice-president of the Inland Steel Company, Chicago, has been appointed first vice-president and general manager of sales succeeding G. H. Jones who retired on December 31, and **Walter C. Carroll** has been appointed vice-president in charge of sales' sheet division.

Burton Mudge, president of Mudge & Co., Chicago, dealers in railway specialties, Chicago, has been elected vice-president and a director of the **Pilliod Company, New York City**, manufacturer of Baker locomotive valve gear, which duties he will assume in addition to those with Mudge & Co. Mr. Mudge was formerly connected with the operating departments of the Atchison, Topeka & Santa Fe, the Chicago & North Western, the Fort Worth & Denver City, and the Rock Island. He resigned as assistant to the general manager of the last named road in 1908, to enter the railway supply business and in September of that year organized the firm of Burton W. Mudge & Bro., representing the Commonwealth Steel Co., this company later becoming Mudge & Co.

David T. Hallberg, assistant general sales agent of the **P. & M. Company**, with headquarters at Chicago, has been promoted to general sales agent, effective January 1, 1922. The

duties of general sales agent of the company heretofore had been handled by Fred N. Bayles, vice-president of the company. Mr. Hallberg was born at Ottumwa, Ia., on September 11, 1885. After completing his education in the public schools, he went to Chicago in 1901, and was there employed in the printing industry until he entered the passenger and advertising department of the Santa Fe, in 1905. Later he was appointed western representative of the Santa Fe Employees' Magazine and remained in that position until he entered the service of the P. & M. Company as material inspector in May, 1910, shortly afterward becoming western representative. In January, 1918, he came to Chicago as sales representative, and in June, 1918, he was promoted to assistant general sales agent

B. Mudge

D. T. Hallberg

Railway Construction

CENTRAL BUILDING COMPANY.—This company will construct two additional stories to its office building in Seattle, Wash., at an estimated cost of \$175,000. This construction work is to be undertaken in connection with the arrangement made by this company and the Northern Pacific which intends to move its western headquarters from Tacoma, Wash., to Seattle, as soon as the additional office space is provided for.

IBERIA & VERMILLION.—This company has been ordered by the Louisiana Public Service Commission to enlarge its station at Abbeville, La., to repair the same structure, and to construct a passenger waiting shed of not less than 30 ft. in length by the width of the present station, all of which must be commenced by the middle of March, 1922.

ILLINOIS CENTRAL.—This company, which was noted in the *Railway Age* of December 24 (page 1286), as receiving bids for the construction of a car repair shed at McComb, Miss., has awarded the contract for this work to Ellington-Miller Company, Chicago. The building will be 600 ft. by 176 ft., with concrete foundation and steel superstructure, and with a cement tile roof. The entire cost is estimated at \$140,000. The same company, also noted in the above-mentioned issue as accepting bids for the construction of a frame viaduct over its tracks at Fulton, Ky., estimated to cost \$15,000, awarded the contract for the work to Ellington-Miller Company.

ILLINOIS TERMINAL.—This company has been granted permission by the Interstate Commerce Commission to extend its line from Formosa, Ill., to O'Fallon, a distance of 14 miles. The work is estimated to cost \$641,964.

MISSOURI, KANSAS & TEXAS.—This company has given a contract to the Graver Corporation, Chicago, for the construction of a type "K" ground operated water treating plant at Parsons, Kan. The plant will have a treating capacity of 50,000 gal. of water each hour and a storage capacity at top of main settling tank capable of holding 200,000 gal. of treated water.

PACIFIC FRUIT EXPRESS.—This company has awarded a contract to D. W. Wagner, San Francisco, for the construction of a reinforced concrete addition to its ice plant at Calwa, Cal.

TAMPA SOUTHERN.—This company contemplates the extension of its line from Bradentown, Fla., to Sarasota, a distance of approximately 12 miles. It is expected that work will be started as soon as financial conditions warrant the construction.

TEXAS-MEXICAN.—This company contemplates the construction of a station at Mirando City, Tex., to take care of the recently developed oil traffic at that point.

UNION PACIFIC.—This company, in conjunction with the United States Department of Agriculture and the State of Utah will soon construct a large viaduct over its tracks and the Weber river at Riverside (Ordgen), Utah, at an estimated cost of \$200,000. The structure will be of reinforced concrete, except over the tracks and the Weber river where through truss spans will be built. The cost of the work will be divided among the three parties, the railroad paying one-half of the entire cost of the viaduct, excluding the span across the Weber river. It is expected that bids for this work will be called for during the first part of the coming year, and that the construction will be completed during the summer.

WABASH.—This company contemplates the construction of a station at Centralia, Mo. No definite building plans have as yet been prepared.

INSTRUCTION IN TRAFFIC MANAGEMENT for the benefit of large shippers and their traffic men, or clerks, is offered in the "Vocational Department" of the H. G. Williams Company, 25 Beaver street New York City. One evening a week, for eight months, is the course advertised and the cost is \$41; with a cheaper course for \$45 for junior employees. Mr. Williams is editor of the Freight Traffic Red Book.

Railway Financial News

ARIZONA & NEW MEXICO.—Acquisition.—See El Paso & Southwestern.

CAROLINA, CLINCHFIELD & OHIO.—Loan Authorized.—The Interstate Commerce Commission has approved a loan to this company of \$6,000,000 to enable it to pay off a loan of \$1,000,000 from the United States and \$5,000,000 of its Elkhorn first mortgage gold notes which mature on January 1, 1922. The commission has also authorized the extension of the maturity date of \$6,000,000 of the Elkhorn first mortgage gold notes from January 1, 1922, to January 1, 1923, and to pledge them, together with \$1,000,000 of first mortgage 5 per cent, 30-year gold bonds with the Secretary of the Treasury as collateral security for the loan. In order to make the Elkhorn gold notes available as collateral it was necessary to extend the maturity date.

CHICAGO & EASTERN ILLINOIS.—Election for Reorganized Company.—At a meeting of the provisional board of directors of the Chicago & Eastern Illinois Railway Company in Chicago the following directors were elected for the newly organized company: Gordon Abbott, William H. Coverdale, Frederick H. Ecker, Henry Evans, T. D. Heed, William J. Jackson, F. J. Lisman, William H. McCurdy, George Welwood Murray, John W. Platten, H. H. Porter, John J. Pulley, John W. Stedman, Melvin A. Traylor and Edwin W. Winter.

On January 1, 1922, W. J. Jackson, as receiver of the property of the old Chicago & Eastern Illinois Railroad, turned the same over to the new Chicago & Eastern Illinois Railway Company, except the Chicago & Indiana Coal Railway Company, which was not acquired by the reorganized corporation. Mr. Jackson is president of the new corporation.

For the convenience of participants in the reorganization of the Chicago & Eastern Illinois Railroad Company, arrangements have been made whereby the United States Mortgage & Trust Company will purchase and sell scrip certificates for Chicago & Eastern Illinois Railway Company general mortgage 5 per cent bonds, preferred stock and common stock.

CHICAGO, MILWAUKEE & ST. PAUL.—Asks Authority for Acquisition of Chicago, Milwaukee & Gary.—This company has applied to the Interstate Commerce Commission for an order approving the acquisition of the Chicago, Milwaukee & Gary by the purchase of its capital stock, also an order authorizing the purchase of the stock and the assumption of liability as guarantor of its bonds, and a certificate of public convenience and necessity for the acquisition of control of the road. The St. Paul is to take over the stock, amounting to \$1,000,000, and to guarantee the principal of \$5,700,000 first mortgage 5 per cent gold bonds and the interest after January, 1924.

CINCINNATI, INDIANAPOLIS & WESTERN.—To Operate Part of C. & E. I. Division.—Beginning January 1, 1922, the Cincinnati, Indianapolis & Western will operate that part of the former Chicago & Eastern Illinois, Brazil branch, between West Union and Brazil, about 29 miles, until January 16, the date set for the sale of the entire Brazil branch at Danville, Ill.

DELAWARE, LACKAWANNA & WESTERN.—Declares Extra Dividend of 5 Per Cent.—The directors have declared an extra dividend of 5 per cent and the regular quarterly dividend of 3 per cent, both payable January 20, to stock of record January 7.

See also article in this issue entitled "Dividend Changes on Railroad Stocks in 1921."

EL PASO & SOUTHWESTERN.—Authorized to Acquire Control.—The Interstate Commerce Commission has authorized the acquisition of the Arizona & New Mexico by purchase of its capital stock. It has also authorized the El Paso & Southwestern to issue \$3,500,000 of promissory notes for two years at 6 per cent, to be delivered directly at par or to be sold at par and the proceeds used in part payment for the stock and bonds of the Arizona & New Mexico. The purchase price is \$4,500,000, of which \$1,000,000 is to be paid in cash. Acquisition of control of the road by lease is also authorized.

GRAND TRUNK.—May Appeal Award.—The Judicial Committee of the Privy Council has granted Sir John Simon, on behalf of the Grand Trunk Railway of Canada, leave to appeal from the recent decision of the Board of Arbitration as to the value of the railroad's property. The Board of Arbitration, of which Chief Justice William Howard Taft was a member, declared in its findings that the common and preferred stocks of the company were valueless. The award was noted in the *Railway Age* of September 10, 1921, page 511.

NORTHERN PACIFIC.—Asks Authority to Abandon Line.—This company has applied to the Interstate Commerce Commission for authority to take up and abandon its Boulder-Elkhorn branch in Montana, 19.6 miles.

NORFOLK SOUTHERN.—Authorized to Abandon Line.—The Interstate Commerce Commission has issued a certificate authorizing the abandonment of the line of the Carthage & Pinehurst from Pinehurst to Carthage, N. C., 12.22 miles.

ST. LOUIS SOUTHWESTERN.—To Pay Bond Interest.—Interest amounting to 2 per cent will be paid on January 1, 1922, on the second mortgage 4 per cent gold income bond certificates, due 1989, for the six months ending December 31, 1921, on presentation of coupons. The Committee on Securities of the New York Stock Exchange has ruled that said certificates be quoted ex-interest 2 per cent on Tuesday, January 3, 1922, and that thereafter said certificates, to be a delivery, must carry the July 1, 1922, and subsequent coupons.

SUSQUEHANNA RIVER & WESTERN.—Proposed Acquisition.—The Interstate Commerce Commission has issued a decision holding that the proposed acquisition and operation by this company of a line of narrow gage railroad extending from its main line at Bloomfield Junction to Blain, Pa., a distance of 17 miles, is not within the scope of paragraph 18 of section 1 of the Interstate Commerce Act, and the proceeding has been dismissed. No application was filed under section 5 of the act relating to consolidations. The property is now operated by the Susquehanna River & Western.

TENNESSEE CENTRAL.—Proposed Reorganization.—See Tennessee Midland.

TENNESSEE MIDLAND.—Investigation of Reorganization Ordered.—The Interstate Commerce Commission has ordered an investigation for the purpose of inquiring into all matters involved in the petition filed by Caldwell & Co., reorganization managers, in behalf of the Tennessee Midland, a corporation about to be formed for the purpose of acquiring the Tennessee Central, for approval of a proposed plan of reorganization, a proposed loan from the government and other things. A hearing is to be held at Washington before Examiner J. F. Gray on January 16. Notice of the hearing was ordered sent to the receivers of the Tennessee Central, the officers of various railroads interested in its affairs, attorneys for junior stockholders, the director general of railroads, the chairman of a special committee of the Nashville Transportation Board of Trustees, the mayor of Nashville and the Association of Railway Executives.

WATERLOO, CEDAR FALLS & NORTHERN.—Asks Loan From Revolving Fund.—This company has applied to the Interstate Commerce Commission for a loan of \$381,347 for 10 years to enable it to meet maturing indebtedness.

WICHITA FALLS, RANGER & FORT WORTH.—Receivership.—Frank L. Ketch, of Ardmore, Tex., president of the road and executor of the Hamon estate, and J. W. Mitchell, of Fort Worth, were on December 26 appointed receivers by Judge James C. Wilson, of the United States District Court of the Northern District of Texas, on the application of J. W. Meany, who is seeking a foreclosure of a contractor's lien on the railroad.

Dividends Declared

Achison, Topeka & Sante Fe.—Common, 1½ per cent, quarterly, payable March 1 to holders of record January 31.
Atlanta & West Point.—Common, 2 per cent, quarterly; preferred, 1½ per cent, quarterly; both payable January 1.
Delaware, Lackawanna & Western.—3 per cent, quarterly; extra, 5 per cent; both payable January 20 to holders of record January 7.
Pittsburgh & West Virginia.—1½ per cent, quarterly, payable February 28 to holders of record February 1.
Western of Alabama.—5 per cent, payable December 31 to holders of record December 19.
Woodstock Railway.—2 per cent.

Railway Officers

Executive

John D. McCartney, assistant general passenger agent of the Central of Georgia, with headquarters at Savannah, Ga., has been promoted to assistant to the president, with the same headquarters. He will have charge of all work connected with public relations and such other duties as may be assigned to him. A photograph and sketch of Mr. McCartney were published in the *Railway Age* of March 18, 1921 (page 741).

John W. Platten, president of the United States Mortgage & Trust Co., New York, has been elected chairman of the board of directors of the Chicago & Eastern Illinois, with headquarters at New York. This action became effective following a meeting held by the board on December 31, 1921, for the purpose of completing the reorganization of the railroad. Other officers elected were: **William J. Jackson**, president; **Will. H. Lyford**, vice-president and general counsel; **Frank G. Nicholson**, vice-president and general manager; **Thomas D. Heed**, vice-president; **Frank Austin**, secretary, and **Jonathan P. Reeves**, treasurer. The board also appointed three additional officers, namely, **Robert F. Brown** and **William A. Ragel**, assistant secretaries, and **Frederick W. Krohn**, assistant treasurer. With the exception of Mr. Platten, all the officers will have their headquarters at Chicago.

Financial, Legal and Accounting

A. J. Raynes, whose appointment as comptroller of the Maine Central was announced in the *Railway Age* of December 24, (page 1291), was born on November 18, 1873, at Yarmouth, Maine. He was educated at high school and business college and entered railway service in December, 1888, as a freight clerk and telegraph operator for the Maine Central. In August of the following year he became a clerk in the office of the auditor of freight accounts. In July, 1904, he was promoted to accountant in the office of the comptroller. Six years later he became chief clerk to the auditor of disbursements. The following year he was appointed auditor of disbursements and, in 1913, to auditor in charge of disbursements and traffic accounts. He served as federal auditor under the Railroad Administration and in March, 1920, became assistant comptroller, in which position he was serving at the time of his recent appointment.

Operating

J. G. June has been appointed superintendent of the Marion division of the Erie, effective January 1.

E. I. Bowen has been appointed superintendent of the Buffalo division of the Erie succeeding J. G. June, transferred, effective January 1.

Traffic

W. W. Schoff has been appointed general agent of the El Paso & Southwestern with headquarters at Cleveland, O.

E. M. Rebard has been appointed assistant traffic manager of the Tonopah & Goldfield with headquarters at Goldfield, Nevada.

E. C. Hoag has been appointed industrial agent of the Union Pacific with headquarters at Omaha, Nebr., effective January 1, 1922.

C. E. Jefferson has been appointed general freight agent of the Canadian Pacific, Western Lines, succeeding W. C. Bowles, promoted.

J. D. Prewett has been appointed commercial agent of the Seaboard Air Line with headquarters at Oklahoma City, effective January 1.

S. G. Reed, whose appointment as assistant to the traffic manager of the Southern Pacific, Texas lines, with headquarters at Houston, Tex., was announced in the *Railway Age* of December 17 (page 1234), was born at Franklin Parish, La., on March 26, 1867. He completed two years work at Colgate University in 1886, and on January 1, 1889, entered railroad service in a local freight office of the New York, Texas & Mexican (Southern Pacific, Atlantic System). On January 1, 1892, he was appointed chief clerk to the general freight and passenger agent at Victoria, Tex., which position he held until November 1, 1905, when he was promoted to division freight and passenger agent of the Louisiana division, with headquarters at Lake Charles, La. He was transferred to Dallas, Tex., on October 1, 1906, and on September 1, 1912, he was promoted to assistant general freight and passenger agent, with the same headquarters. He was appointed land and tax agent on September 1, 1918, with headquarters at Houston, Tex., and on March 1, 1920, he became assistant general freight agent, with the same headquarters, which position he was holding at the time of his recent promotion.

Mechanical

J. E. Stevens has been appointed master mechanic of the Mobile & Ohio, with headquarters at Murphysboro, Ill., succeeding B. A. Orland, assigned to other duties.

Engineering, Maintenance of Way and Signaling

J. B. Emerson, assistant engineer of tests of the rail committee of the American Railway Association, with headquarters at Chicago, has been promoted to engineer of tests, with the same headquarters, succeeding M. H. Wickhorst, resigned.

Alvin Chase Harvey, whose appointment as assistant chief engineer of the New York, Chicago & St. Louis, with headquarters at Cleveland, Ohio, was announced in the *Railway Age* of December 24 (page 1292), was born at Mansfield, New York, on December 24, 1883. After graduating from Purdue University in June, 1908, he entered the service of the New York, Chicago & St. Louis as a rodman on station ground surveys between Cleveland, Ohio and Buffalo, N. Y. In March, 1909, he was promoted to assistant engineer in charge of the east side grade crossing elimination work at Cleveland. One year later he was given charge of double track survey between Brocton, N. Y., and Erie, Pa., and in May, two months later, he was put in charge of the track elevation work at Grand Crossing, Chicago, Ill. In June, 1916, he was appointed assistant engineer in charge of the field work on the Ivanhoe Road grade crossing elimination at Cleveland. In January, 1917, he was made field engineer in charge of the field work on the west side grade crossing elimination at Cleveland. He was promoted to engineer of grade crossing elimination, with headquarters at Cleveland, in September, 1918, having charge of both the field and office work, which position he was holding up to the time of his recent promotion.

Purchasing and Stores

W. A. Summerhays, purchasing agent of the Illinois Central, with headquarters at Chicago, has been promoted to lumber and tie agent, with the same headquarters, and he will be succeeded by **J. J. Bennett**, assistant purchasing agent, with the same headquarters.

E. Griffiths, division storekeeper of the Chicago, Milwaukee & St. Paul, with headquarters at Perry, Iowa, has been transferred to Moberly, S. D., succeeding **G. L. Juel**, who has been transferred to Malden, Wash., succeeding **H. R. Meyer**, who has been transferred to Perry to succeed Mr. Griffiths.

Obituary

F. E. Haff, assistant treasurer of the Long Island, died in New York City on January 2 at the age of 59.

Business is looking up in the supply field. The railways have greeted the arrival of the new year with an order placed

**An Order
for
4,500 Cars**

by the Seaboard Air Line for some 1,500 to 2,000 cars. The Union Pacific, not to be outdone, has gone on record for 4,500 cars, the orders for which were placed the latter part of

last week. The Illinois Central has ordered 2,000 gondola cars in addition to the refrigerator cars recently placed. Orders for additional freight cars are expected to be placed in the near future by the Burlington, which is talking about 7,000 cars, by the Great Northern, which is expected to contract for 3,500 cars, etc. Passenger car optimism is represented in the consideration being given new equipment by the Long Island, 50 cars; the Philadelphia & Reading, 50 additional to orders already placed; Burlington, 127; Union Pacific, 63, etc. The Staten Island Rapid Transit is talking about 50 cars. The Pennsylvania has issued inquiries for 20 dining cars and later may come in the market for a much larger quantity of passenger train cars. A long period has elapsed since the last occasion when there was so much prospective business in sight in either freight or passenger cars as there is at this moment. The situation, to put it mildly, looks good. It may be said, moreover, that there is a special significance in the placing of the Union Pacific order at this time outside of the size of the order. The Union Pacific has a reputation of being a good buyer of cars and locomotives. Its orders are usually placed at opportune times. In other words, we apparently have it on the Union Pacific's authority, as indicated by the placing of an order for 4,500 cars, that the present is an opportune time for equipment purchases.

The English railways are showing real appreciation of the advantage to them of promoting passenger business in every possible way. Their method is an old

**Excursion
Rates Build
Traffic**

one—the sale of tickets at reduced rates when and where such reductions are likely to attract passengers who otherwise would not travel. At the same

time care is taken to assure that most of the ordinary traffic will be carried at the full legal rate. The extent to which these reduced rates are applied is remarkable—for example: "shopping" tickets good on suburban trains in non-rush hours; special excursion rates and special trains to athletic contests, fairs and industrial shows; special rates to seaside resorts; daily excursion rates available only on certain trains to and from all large industrial centers; reduced rates for round-trip tickets good over the week-end; special excursions to France and Belgium allowing passengers a few hours in either country. One company runs an excursion to a seaside resort, tickets for which include not only the rail trip but also food and hotel accommodations. By arranging for this service for a large number of excursionists the railway is enabled to secure for them satisfactory accommodations at reduced rates and at the same time assure a profit to itself. In sum, reduced rates are offered in practically every quarter where they would tend to bring additional passengers to the railways. Professor W. J. Cunningham in an article appearing recently in the New York Evening Post called attention

to the relatively higher profit of passenger business now in comparison with pre-war days. This, coupled with the obvious fact that additional traffic would entail nothing like proportionate expense, suggests the advisability of some study of these activities in England by our railroad traffic men. Many well advertised excursions not only bring revenues to the railways, but they tend to create a favorable attitude in the minds of the public as well.

The railroads are today depending more and more on their communication systems to expedite train movements, to

**The
Communication
Situation**

facilitate business between their various offices and to handle transactions with the public. During the past few years the demand for communication, especially by telephone, has increased

rapidly, while during this same period the construction of new facilities has been, of necessity, held down to the minimum. These circumstances have, in many cases, resulted to the advantage of the railroads by forcing them to make message traffic studies and to develop priority systems of filing messages and the extensive superimposing of line circuits; all of which has tended to utilize the existing outside plant equipment more intensively. It is interesting to note that during this same period marked improvements in telegraph, telephone and wireless apparatus have been made, not only by the manufacturers and the commercial communication companies, but also by the army and navy. Several improvements have been made in telephone train dispatching selectors and loud-speaking apparatus, while the telephone repeater has been developed with such success as to remove the limit for long distance telephone conversation. For long-haul heavy message traffic the printer telegraph has proved economical. Using the trolley on an electrified road, the carrier-current system was recently demonstrated successfully as a means of communication with a moving train or between a locomotive and a caboose. Where physical conditions prevent the construction of a pole line, the wireless telephone will no doubt find a field. A summary of the situation brings out the fact that the railroads in many cases have urgent need for increased communication facilities and that as various newly-developed apparatus become available it would seem advisable that they should investigate the application of this equipment to determine its advantages for their service.

When Kipling penned the lines of his immortal "Recessional," it was a timely moment for the thought the verses

**"Lest
We
Forget"**

bore. From that time on the three words, "Lest We Forget," though tempered in meaning by the varied circumstances calling them forth, however, when expressed, exercised a sobering influence upon thought; drawing the attention, as it were, to the importance of things likely to be or actually forgotten. This being so they might well be reiterated now. A new year has come. Whatever "tumult and shouting" attended the event is past, and in automatic conformity with

the established order of things men have taken up their work as though from a starting point. And there is much to be done—and undone. As usual, trains must be run—in sufficient numbers, at sufficient speeds, and according to a sufficiently flexible system to accommodate the country's varied pleasures and fluctuating business, yet economically enough to pay. The intricate system of tracks which binds us so effectively into a national entity must be altered here and there and maintained everywhere. Locomotives and cars must not suffer from inattention. Records must be kept, and among a thousand other things equipment must be bought and repaired. Thus, there is much to be done. But let us remember, in doing it, that the railway business after all is very much a human one. Let us remember that the passing of nearly a century of amazing development in equipment and system still finds intelligent co-operation of the worker and loyalty of the man among the indispensable of railway economic assets. And in keeping with this, let those men having charge over other men remember particularly that loyalty, while it may often be found under such conditions, does not thrive in an environment characterized by arrogance and conceit on the part of officers which cause them seldom or never to proffer the praise they are so ready to receive; that loyalty and enthusiastic service do not flourish where officers show want of that appreciation of commendable work which spurs men on to better work; and that criticisms wrongly made but establish more securely the unfortunate condition of a "house divided against itself." Let them remember rather, that in general, men of all classes are responsive to kindness and consideration, and that fair play on one side usually begets fair play on the other. How much better must the new year be, if only this much we do not forget?

"Propaganda" Regarding the Railroads

THE *Railway Age* recently published an editorial, entitled "The Railroads Must Defend Themselves Better." We asserted that an extensive propaganda of misrepresentation is being carried on, chiefly by leaders and spokesmen of the railway labor unions; that its purpose is to poison the minds of railway employees and the public regarding private management, and that it will have this effect unless more vigorously combated.

This editorial has been commented on by several newspapers. The Springfield (Mass.) Republican, which comes as near to being always intelligent and fair in its editorial comment as any newspaper published, has deprecated what we said. It states that there is little evidence of propaganda against the railways in New England. It raises the question "whether the propaganda already employed in behalf of the railroads is convincing," and concludes, "The railroads had better meet hostile propaganda not with propaganda but with full and authentic information." The Des Moines Register, a very able paper, which, however, shows bias against the railways in every comment it makes on them, says "if there were not something behind the propaganda of the men it names, these men would not create a ripple on the surface of public opinion." It implies that the trouble is with the railroads themselves, they having "been negligent in not facing the railroad situation honestly as it is."

That two such newspapers can thus express themselves indicates how little appreciation there is among even well informed men of what is going on in the railroad field. The leaders of the railway labor unions and their various spokesmen are energetically carrying on a nation-wide propaganda to mislead employees and the public regarding railway matters which has all the appearance of being the expression of a deliberate and well-conceived conspiracy to promote the Plumb plan by destroying confidence in private management. The Springfield Republican very properly calls for facts

We shall give some, and let it draw its own conclusions. We have a right, of course, to draw our own conclusions also.

Ever since the Plumb plan was launched by its author the heads of the railway labor unions and other spokesmen of these unions, including especially Glenn E. Plumb, W. Jett Lauck and Frank J. Warne, have been disseminating among railway employees throughout the country, and, so far as they have been able among the public, numerous gross perversions of the facts regarding railway matters. All of them have been worked up in the same way. The method invariably used is to take some of the facts regarding a particular phase of the railroad business, disregard all of the other facts bearing upon that phase of it, and then build upon the small foundation of facts used a gigantic superstructure of propaganda which is false because based upon only a small part of the pertinent facts.

The Firemen's Magazine, published by the Brotherhood of Locomotive Firemen and Enginemen, recently published statistics compiled by an anonymous "leading economist" in which it was sought to show by market quotations published in the New York *Analist* of October 17, 1921, that the "maximum estimate of the market value of railroad securities" was \$14,000,000,000. It drew from this estimate the conclusion that the valuation placed on the railroads by the Interstate Commerce Commission was \$5,000,000,000 too large. Slason Thompson gave the answer at once. He made similar computations based on the market quotations of railway securities on June 30, 1916, and showed that the total market value of railroad securities at that time was \$17,830,000,000. The investment made in railroad properties since then has been \$2,800,000,000, which, added to the market value of securities in 1916, would give a valuation of over \$20,600,000,000. If this method of valuation is fair, why was it not used in 1916? The enormous depreciation of the prices of railway securities since 1916 has been largely due to government operation, which increased the expenses out of all proportion to the earnings, and to the aftermath of government operation and of the war. The article in the Firemen's Magazine was propaganda deliberately intended to deceive railway employees as to the valuation the railways were entitled to have made.

A more astounding example of the same kind of misrepresentation is afforded by a recent performance of Glenn E. Plumb and William H. Johnston, president of the International Association of Machinists. Plumb and Johnston found that the tentative valuation of 24 railroads made by the Interstate Commerce Commission averaged \$32,700 per mile of track. They took this average valuation of these railroads' per mile of track, applied it to the 265,000 miles of line of all the railroads, and reached the remarkable conclusion that the valuation of all the railroads should be only \$8,610,000,000. This was \$5,400,000,000 less than the "valuation" in the Firemen's Magazine, which shows how widely the labor "experts" disagree.

Messrs. Plumb and Johnston gave their "valuation" to the press and disseminated it among railway employees. It was entirely false in its implication for two reasons, as has been pointed out by President Markham of the Illinois Central in an open letter to Mr. Johnston. First, a mile of line may consist of several tracks, and the present trackage of all the railroads of the country is estimated at about 405,000 miles. They had used miles of track in computing the average valuation of the 24 railroads, and if they had used miles of track for all the railroads they would have got on their own basis of computation a valuation \$4,640,000,000 more than the one that they spread broadcast. Second, their estimate was based on only seven per cent of the country's total trackage, while the Interstate Commerce Commission's valuation in the rate case in 1920 was based on information it had gathered regarding all the railroads. In other words, Plumb and Johnston had the effrontery to use information the commission

had reported regarding seven per cent of the trackage of the country to discredit a valuation made by the commission itself which was based upon information it had gathered regarding all the railways.

On November 27, 1921, Glenn E. Plumb made a characteristic public address in St. Louis to an audience composed largely of railway employees. Among other things he said the railways were physically bankrupt and unsafe for travel. The public, he added, should know that they were so run down as to jeopardize the lives of all who rode over them. The Interstate Commerce Commission had just made public its statistics of accidents for the year 1920; and they showed there has been a steady decline in railway accidents, and that the total number of persons killed on the railways in 1920 was the smallest since 1898, or for 22 years, although in these years the number of men employed by them increased over 400,000, the passenger business handled by them over 44 per cent, and the freight carried by them 64 per cent.

In testimony before the Railroad Labor Board and in recent public statements W. Jett Lauck, "consulting economist" of the Railway Employees' Department of the American Federation of Labor, has sought to convince railway employees and the public that by economies in operation which are practicable the railways could reduce their operating expenses \$2,000,000,000 a year without reducing wages. The method used by him is that already described as being used by the leaders and spokesmen of the labor unions. He went through the files of the *Railway Age* and the Railway Mechanical Engineer for a long period and extracted hundreds of pages of material which they had published regarding means which it is desirable to adopt to promote efficiency and economy. In getting his material he necessarily passed in review a great many times more material published in the same papers describing improvements in equipment and methods, and increases in the efficiency of operation which actually had been made, and also showing why the inadequate earnings of the railroads had rendered it impracticable for most of them to do more along these lines than they had done.

All this voluminous material regarding what had been done he left out of his exhibits and based all his argument and conclusions on what had not been done. The record he thus made up was almost as false as if there had not been a word of truth in it. When, a short time ago, the propaganda being carried on by him and others was attacked by President C. H. Markham in a letter to employees of the Illinois Central Railroad, Mr. Lauck hypocritically replied by censuring Mr. Markham and his colleagues because, as he said, they did not "sincerely attempt to answer the facts which were submitted against them!" He knew better than any one else how he had misused and perverted the facts and the enormous exaggerations to which he had resorted. Furthermore, he knew that Daniel Willard, president of the Baltimore & Ohio, in testimony a few months ago before a Senate committee had presented detailed facts in reply to him which have never been answered.

The Transportation Act directs the Interstate Commerce Commission as nearly as it can to so fix railway rates until March 1, 1922, that the railways will be able to earn an average return of 5½ to 6 per cent. The labor leaders are chiefly responsible for the dissemination among railway employees and the public of the statement that this constitutes a "guarantee" to the railways; and they continue to disseminate it, although the authors of the Transportation Act and the Interstate Commerce Commission itself have expressly stated that it does not constitute a guarantee. If the railways had had a six per cent guarantee their net operating income in 1921 would have exceeded \$1,100,000,000. It actually amounted to about \$600,000,000, or about \$500,000,000 less. This is all they got. The labor leaders know this, and yet they continue in their addresses and public

statements to assert that the railways are "guaranteed" six per cent.

There are a few railway officers who are paid high salaries. Every man of sense knows that able men would not enter or stay in the railroad business if they could not earn incomes in it somewhere near as large as those paid in other businesses for work requiring equal ability and involving equal responsibility. The salaries of railway officers are, however, only an extremely small part of total railway earnings and expenses. In 1920 the salaries of all the general and division officers were only 2.5 per cent of the total pay roll, only 1.7 per cent of operating expenses, and only 1.5 per cent of total earnings. The salaries of the general officers, including all the so-called "fancy" salaries, were only three-fourths of one per cent of the total earnings, while the salaries of all officers paid over \$20,000 a year were only one-fourth of one per cent of the total earnings. Nevertheless, labor leaders and other spokesmen of the unions incessantly represent to employees and the public that vast salaries paid to officers prevent employees from getting reasonable wages, and make it necessary for the public to pay unreasonable rates.

These are but a few examples of the misrepresentations constantly being made by spokesmen of the unions. The purpose of all this propaganda is to create unjustified sentiment among employees and the public against the railways. The creation of this sentiment increases the difficulty met by the railways in maintaining adequate freight and passenger rates. All the wages of the employees must be paid out of the earnings of the railways. Therefore, whatever tends to cause reductions of their rates and earnings necessarily tends to reduce the amount of wages they can pay. From this point of view the propaganda seems directly contrary to the interests of the employees. Why, then, is it carried on?

The labor leaders want the Plumb plan of government ownership and employees' management. If they cannot get that they want government ownership and government management because they believe that under government ownership they can get easier conditions of work and higher wages than under private ownership. They are not saying much about the Plumb plan now because they know it is unpopular. What they are trying to do is to make private management so unpopular that the public will revolt against it, and they hope that then the Plumb plan will have a chance.

What are the managements of the railways to do in the face of this widespread, selfish and deliberately misleading propaganda? The Des Moines Register says, in effect, that they should ignore it and run their business right and then all will be well. And yet the Des Moines Register itself recently made a statement in an editorial which showed that it had been misled by this propaganda. It stated Clifford Thorne had said that the market value of the railways never exceeded \$13,000,000,000. What Mr. Thorne did was to present figures to the Interstate Commerce Commission in the rate advance hearing in July, 1920, in an attempt to show that the market value of railway securities at that time was only \$12,300,000,000. He knew as well as anybody that the prices of securities in previous years were much higher than when he made his calculation. It should be noted that the commission had all his figures before it when it made its valuation. The Springfield Republican says the railways should present the facts and let the public draw its own conclusions. With that the *Railway Age* agrees. But suppose the labor leaders present their misrepresentations in a highly sensational way, as they did in the hearings on national agreements, and spokesmen of the railways reply merely by calmly presenting the truth. The Springfield Republican well knows whether the sensational charges of the labor leaders or the cold facts as presented by the railways are likely to receive the wider dissemination.

The problem presented by this labor union propaganda is

not merely that of the railways. It is that of the public. It is being carried on deliberately to destroy all possibility of the prosperity and credit of the railways being re-established under private management. If it is allowed to attain its object those who have invested in railway securities will lose heavily. But the public will be a very much larger loser, because the break-down of private management will force government ownership on the nation.

The *Railway Age* urged the railways to defend themselves better because it believes this is necessary not only in the interest of the railways, but of the public. We shall continue to urge them to do so. And, meantime, we urge the press of the country as a duty to itself and to the public to investigate thoroughly who is making the greater efforts, even in the excitement and under the temptations of partisan controversy, always to tell the truth about railway matters—the spokesmen of the labor unions, or the spokesmen of the railways. We know what the press will find if it will investigate.

If private ownership and management cannot stand the test of having the truth told about it, it ought to be destroyed; but private management should not be allowed to be overthrown and some Soviet scheme such as the Plumb plan erected in its place by such a campaign of wholesale misrepresentation and downright, deliberate falsification as is being carried on by the labor leaders.

Red Automobile Tail-Lights

AT FIRST GLANCE it would appear that the use of red for tail-lights on automobiles would be of slight interest to railroad officers and that this is the logical color to use as a marker. But it is of interest to railway managements and it is questionable if red is the logical color. Red is the universal color for danger, consequently it would appear logical to use it as a rear light. However, unlike the Missouri mule, there is nothing dangerous about the rear end of an automobile, provided the driver behind knows its location, and it would appear that some other light, as for example, a yellow light having the same photometric value as that used for a "caution" warning in railway signaling would be the logical color to use.

One riding on a boulevard at night is impressed with the confusing vista of red lights presented to an automobile driver. The result cannot do otherwise than to depreciate the value of this color as a danger indication. There is a certain psychological effect on a driver following a vista of red lights mile after mile, which tends to nullify its use as a danger signal. Illustrative of this, an accident occurred recently in which an automobile was struck by a train at a railroad crossing. The driver, who escaped, said that he had been following the red lights of cars ahead for some distance, and that on approaching the railroad crossing where the gates were down, he took for granted that the red lights on the gates were on the rear of a car ahead. He turned out to pass the supposed car, ran through the gates and was struck by a train. Had yellow or white been in use as a tail-light, instead of red, the driver would have realized immediately that he was approaching a dangerous location.

It is, of course, necessary that a driver be warned of his approach to a preceding machine, but it is even more important that he be warned of his approach to an opposing one and this latter is adequately arranged without the use of this color. From a safety first standpoint it would appear that this is a question which should well receive the serious consideration, not only of the railroads, but of automotive clubs, automotive manufacturers, state public service commissions and the public. There may be laws in some states requiring a red tail light on automobiles, and if so, it might be well to consider a change. As long as other colors can be

used to as good advantage for markers, it would appear well to retain the red for use at extra dangerous locations, such as railroad crossings, boulevard crossings, and at places where material is piled in the streets. With the number of automobiles increasing rapidly, the value of red as a danger signal decreases accordingly.

Standardizing Grain Doors by Law

A BILL HAS RECENTLY been introduced in the United States Senate by Senator Lenroot of Wisconsin, authorizing the Interstate Commerce Commission to investigate existing types of grain doors and empowering it to order the type or types approved to be installed in freight cars on or before a fixed date, provided it is not earlier than December 31, 1926. The bill, known as S. 2691, it is understood, was introduced at the request of the proprietor of a patented grain door who, having received some commendation for his device but little encouragement to hope for its adoption by the railroads, has joined the ranks of the reformers who believe that anyone is more competent to manage the affairs of the railroads than railroad men themselves.

A number of patented grain doors have been developed that are undoubtedly superior in themselves to the usual type of loose grain door which is really only a part of the cooping of cars placed for grain loading. Most of these doors are designed to be permanent fixtures of the cars to which they are applied, and, indeed, unless they are permanent, would have not even the shadow of justification in seeking compulsory standardization. Although permanent doors might not be inconvenient for the shipper, their advantages, if any, would be largely of benefit to the railroad.

But let us see whether the railroads are so blind to their own interests as the reformers would have us believe. More than 50 per cent of all loading of grain and grain products originates on 11 western railroads. Add to these 11 roads 12 roads in the central, eastern and southern parts of the United States and more than three-quarters of all grain loadings are accounted for. On the 11 heaviest grain shipping roads in the west grain loading probably does not constitute an average of more than one-third of the demand for box cars and during the heaviest movement following the harvest in few cases does it exceed half of the box car demand.

It is evident, then, that even on the roads most vitally interested there might be some hesitation about going to the expense of providing their own cars with complete permanent grain door equipment subject to abuse and perhaps destruction while in other than grain service, even if all grain were loaded in home cars. But it is doubtful if more than 50 per cent of the grain loading is handled by cars owned by the loading lines, and if permanent doors were provided to care for the movement of grain it is evident that every box car in the country suitably designed for grain loading would have to be equipped. With the heavy grain movement originating on a comparatively few lines it is evident that a heavy burden of expense of equipping box cars for grain loading would fall on many roads whose interest in grain traffic is slight. The total annual grain loadings probably do not require an average of more than three loads per car per year and it is not probable that more than 50 per cent of all the box car equipment is ever in condition for grain loading at one time.

The maintenance of permanent grain doors on all of the equipment, therefore, involves an expenditure much of which is of doubtful utility, and the cost of maintaining such doors on cars only occasionally placed for grain loading, as compared with the cost of maintaining temporary grain doors, is problematical. Furthermore, the responsibility of providing temporary grain doors rests on the loading lines where it justly belongs, these roads having recourse to a pro-rata

distribution of the expense with intermediate and delivering lines by mutual agreement. Just what excuse Congress will find to justify itself in being used to serve the individual ends of any inventor or group of inventors, by the passage of this bill is difficult to see. Indeed, the wonder is that it has been introduced at all.

Ford's November Net Approaches Vanishing Point

HENRY FORD, famous among other things as the owner and press agent of the Detroit, Toledo & Ironton, it will perhaps be remembered was the gentleman who recently had some correspondence with the Interstate Commerce Commission relative to a possible simplification of the commission's accounting requirements. While the discussion was under way, he temporarily postponed the filing of the monthly reports of revenues and expenses and the operating statistics for his road. He finally softened his heart, however. He relented and filed his September and October figures. He filed them late. The September figures were particularly late.

According to the impression which had been given the press, and through the press to the public, Mr. Ford had been holding up his figures because of the discussion he had been carrying on with the commission relative to the simplified accounting requirements. The figures, when they were finally filed, gave a somewhat different impression, however. They seemed to indicate that Mr. Ford took first rank as a publicity man when he had something good to say but that he excelled as a censor when he had something poor to admit.

Apparently Mr. Ford or else the Interstate Commerce Commission has decided that the discussion as to simplified accounting requirements has now been brought to a close. The Detroit, Toledo & Ironton figures for November have been filed on time. They do not look sufficiently favorable to indicate that Mr. Ford can have filed them with any great degree of pleasure or satisfaction. Whereas, in April, the road's best month in 1921, the D. T. & I. had a net railway operating income of \$276,452, and whereas in June the operating ratio was 52.75 per cent, in November, the net railway operating income was only \$5,335 and the operating ratio was 82.3. The figures for November and the 11 months follow:

REVENUES AND EXPENSES, NOVEMBER, 1921, AND 11 MONTHS	November	11 months
	1921	1921
Operating revenues		
Freight	\$658,290	\$6,360,024
Passenger	10,292	149,185
Total (inc. misc.)	681,052	6,634,658
Operating (inc.)		
Maintenance-of-way and structures	165,438	1,307,161
Maintenance-of-equipment	98,340	982,041
Traffic	6,831	79,115
Transportation	270,877	2,272,154
General	19,343	213,485
Total	560,829	4,852,796
Operating ratio	82.3	73.1
Net from railway operations	120,686	1,781,874
Operating income	104,088	1,637,821
Net after rentals	5,335	892,931
Net after rentals, November, 1920	def. 212,136	
Net after rentals, 11 months, 1920	def. 1,309,401	

It will have to be granted that the Detroit, Toledo & Ironton has come far from making a failure of 1921. The fact that it has had in the first 11 months of 1921 a net operating income of \$892,931 as contrasted with a deficit of \$1,309,401 in the same period of 1920, indicates no small measure of improvement. Nor does an operating ratio of 73.1 for the 11 months look so bad. But, Mr. Ford's road when its publicity was at its best, was showing a net railway operating income of over \$260,000 monthly—in April, May and June—and an operating ratio of from 52.75 to 56.75. In August the net railway operating income was but \$70,643 and the operating ratio had risen to 71.77, which change was so marked that Henry decided to quit filing such evidence. His judgment was justified by the September results, which showed a net after rentals of but \$46,749 and a ratio of 75.3 per cent, and still more by the October returns with a net after rentals of but \$15,191 and an operating ratio of 78.9. Mr. Ford had in mind the deleterious effect such figures would have upon his publicity when they were examined by the eagle-eyed students of railway affairs. Unfortunately he forgot that the Interstate Commerce Commission was also interested, but interested less in Mr. Ford's publicity than in the legal requirements of giving the facts to the public.

The attention which, because of the previous favorable and wide-spread publicity, will be given the November net of only \$5,335 and the November operating ratio of 82.3 is even more unfortunate. There are other factors of interest such as the gross earnings or the operating expenses. Most of us have been expecting that if Mr. Ford shipped fewer automobiles his road's earnings would suffer accordingly. They have actually suffered much worse than "accordingly." The sad details are given in the table.

The months in 1921 in which Mr. Ford's road had the greatest net railway operating income were April, May and June in each of which months the figure was over \$260,000. The gross earnings in these months were respectively \$697,490, \$774,405 and \$713,527. In July, he increased the gross earnings to \$744,498; the net was reduced to \$187,395. A further increase took place in gross in August to \$763,840; the net was reduced to \$70,643. September gross earnings were not quite so good, but they were still good—\$759,757; the net after rentals had become \$46,749. In October there was a real slump in gross—due to lessening flivver production; gross earnings were \$652,438; net fell to but \$15,191 and the operating ratio climbed to 78.9. The November gross was greater than that for October. It was \$681,052; the net after rentals narrowly escaped being put in red figures. It was but \$5,335 and the operating ratio continued on its climb to 82.3 per cent.

Now a very interesting fact develops as to the reason for the decreasing net and the progressively poorer operating ratio. There have been sizable increases in the past several months in maintenance expenses both for maintenance of way and for equipment. But the place where the real increase have come has been in the transportation expenses. Whereas in April, May and June the transportation expenses averaged in the neighborhood of \$185,000, in November they were \$270,877.

OPERATING RESULTS OF THE D. T. & I. TO NOV., 1921

Month	Revenues	Maint. of way	Maint. of equip.	Trans.	Total expenses	Op. ratio	Net from railway operation	Net after rentals	Net ton miles
Jan.	\$248,425	\$103,589	\$80,932	\$159,225	\$370,006	\$148.94	def. \$121,580	def. \$183,519	16,543

*Figures not yet available.

There were those who smiled when Mr. Ford first began making his broad claims about what he was going to do with his D. T. & I. Where are these skeptics today? An easy query to answer, they are everywhere and what is worse, they are smiling. Mr. Ford may be expected, because of his tremendous capital and because of the business which he has to ship, to make a real railroad out of the D. T. & I. We shall be disappointed if he does not do so. So far, however, his ability as a publicity man has somewhat exceeded his ability as a railroad owner.

Mr. Ford, in fact, is a wonderful—we use the word advisedly—publicity man. He really ought, however, to have been a wee bit surer that his facts were going to stay with him, especially when his facts were railway earnings. Any railroad executive could have told him that.

Lesson of the Last Collision

THE GOVERNMENT REPORT on the Woodmont (Bryn Athyn) collision, noticed on another page, exposes bad practice in a half-dozen different features, and it ought to be widely read; for similar weaknesses exist, no doubt, on many roads. This may seem a harsh thing to say, but the Bureau of Safety during the past five years has, in numerous reports, set forth many and varied weaknesses in block signal practice and other vital features of safe train operation, and *nothing is known* as to how far and how intelligently the salutary advice given in these reports has been followed. The time seems opportune to renew the demand that the Bureau of Safety prepare to make its recommendations more constructive by finding out the true condition of things, generally, throughout the United States, as regards safe train operation, and making a comprehensive report thereon. Reporting the faults in specific cases—perhaps one per cent of the cases in which radical reform is called for—and publishing these reports month after month with nothing to tie them together but a perfunctory annual report to Congress, which congressmen do not comprehend, holds little promise of working any real improvement.

Government intervention in railroad operation is not a thing to be lightly recommended; it has, during the past 30 years, done much harm as well as much good, and leading public-spirited citizens are by no means agreed as to how far it is wise to go; but surely the point which we now stress is one of the least controversial in this field. The securing and publishing of information is one of the most legitimate functions of government (this is not to be taken as approval of dividing bodily injuries in the accident records into 183 classes for the statistical bureau and 100 other and equally unnecessary classes for the surgeons), and a strong and business-like policy in this direction would doubtless prove economical. A thousand superintendents, working through 2,000 trainmasters, might be expected to leave a percentage of loose threads in their discipline; and the government reports are reminding us constantly that this is fact, not mere theory. To what extent the weakness exists, only the government can find out.

All of the foregoing can be said without in the least ignoring the records which show a remarkable decrease in deaths and injuries of passengers, employes and trespassers during the past ten years. Train accident records can be looked at from two viewpoints. We can concentrate attention on the totals for a year, or a series of years, which include tens of myriads of casualties, mild or severe, that seem to be almost inevitable, or we can make prominent the spectacular disasters. *Neither viewpoint can be neglected.* Great wrecks always agitate the public, and all concerned, whatever may have been our success in reducing annual totals.

Again, the present problem must not be confused with the gains or the work or the triumphs of the "Safety First"

committees. That great work deals primarily with the problem of the workman who desires to keep his own skin whole and to avoid doing anything to injure his comrade. It has branched out somewhat from that simple scheme, but the fact remains that it cannot do much that is definite toward the prevention of collisions. Prevention of collisions was an important feature of safety-first long before the so-called safety-first movement was started; though it must be confessed that in collision prevention the actual practice has frequently belied the ideals most sadly.

The lessons of this latest collision are all too familiar to experienced railroad officers. We shall not repeat them in this place. The only thing any competent superintendent or manager needs to do is to read the facts and then search his own organization. Shall we say search his own heart? Some critics have a feeling that there is such a need. The report is a severe indictment of all concerned—officers, sub-officers, trainmen and station men—and a study of it will not only suggest important inquiries that ought to be made on almost every road, but will explode some false notions; for example the notion, much too prevalent, that old conductors and enginemen, with good records, need no supervision.

New Books

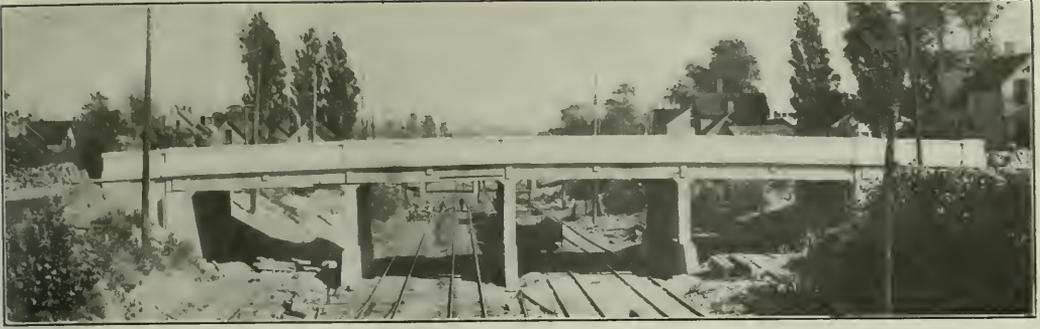

Bullinger's Postal & Shippers' Guide 1240 pages, 7½ in. by 10¼ in. Published by New England Railway Publishing Company, 67 Federal street, Boston, Mass. Issued annually, in January at \$5 a copy.

This is the fifty-first number of this well-known handbook and, as will be noted from the foregoing paragraph, it is now published in Boston. E. W. Bullinger, the veteran publisher, who began this book in 1872 and who has published it in New York City these 48 years, announces that he is now 79 years old and that he has deemed it proper to retire. The New England concern, of which N. E. Weeks is president, has been a publisher of guides for 70 years and has been agent for Bullinger's Guide for 30 years.

This guide, which contains every post office and railroad station in the United States, with shipping directions for either freight or express; and which now covers Canada and New Foundland, as well as the United States, including Hawaii, scarcely needs an introduction to any railroad man, certainly not to any up-to-date freight agent; and to those who are not acquainted with the book we may say that it is as nearly perfect as a book of that kind can be made. In fact, it is perhaps open to criticism as giving information in too much detail. For example, the list of railroads gives the terminal points of every little branch; the Louisville & Nashville, for example, being entered under 102 items. The Boston & Albany, operating less than 400 miles, is divided into 16 items.

The book now weighs over four pounds. We cannot say that it has increased in merit at the same rate that it has increased in size, for it was too good in the beginning to admit of any such rate of progress. The editor prints prominently a request for advice of errors found by users of the book, and intimates that the people in the tombs along the banks of the Nile are the only people in the world who are able to beat him, year after year, in making a record free from mistakes. He is doing everything within his power to equal those Egyptians' records.

FREIGHT RATES on road-building material have been reduced in Texas by order of the railroad commission 15 per cent, but the decrease applies only on the Southern Pacific, Gulf, Colorado & Santa Fe, Missouri, Kansas & Texas, Panhandle & Santa Fe; Houston & Brazos Valley and the Texas Midland, and only when the county or state pays the freight charges. The reduction is not applicable for private contractors or for municipal work.

A Typical Street Viaduct Over the Cut

Nickel Plate Is Completing Grade Separation Work

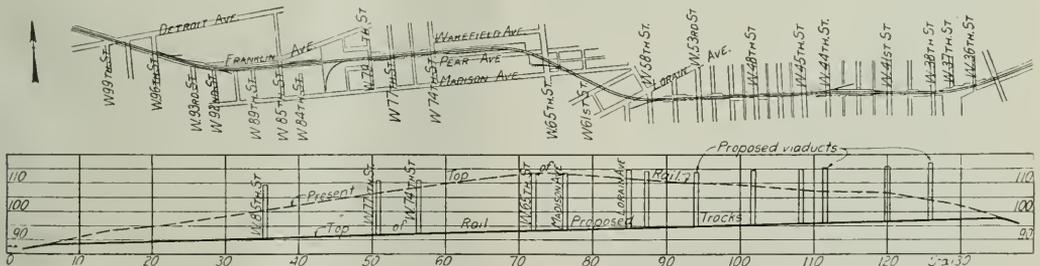

Large Cut Requires Special Drainage—Concrete Viaducts Being Built by Company Forces

ONE OF THE FEW large grade separation projects now under way in this country is being carried through the last stages by the New York, Chicago & St. Louis at Cleveland, Ohio. This is a depression project, involving 800,000 cu. yd. of excavation on a relatively flat gradient, and presented a formidable problem in the disposal of the drainage; in fact, provision for drainage entailed an expenditure even greater than that required for the work of excavation and also exerted a pronounced influence on the manner in which the other features of the work were carried out.

Another feature of no little interest in connection with this project is the fact that the street viaducts are designed to

eastern portion of the city of Cleveland, created a demand for considerable filling material. As a consequence, it was deemed advisable to excavate the track depression cut in the dry in order that the material thus obtained might be used in embankments on the other projects.

This track depression work is known as the "west side grade crossing elimination" and extends from Fulton road, where the Nickel Plate tracks leave the valley of the Cuyahoga river and enter a closely built-up resident section in which the railroad is crossed by two important street car lines. The present work extends to the vicinity of Detroit avenue, a busy thoroughfare on which grade separation was

Layout and Profile of the Grade Separation District

provide space underneath them for eight tracks, although the excavation now completed gives room for only four tracks. Later, if it is deemed desirable, the four-track layout may be expanded for eight-track construction.

The inception of this project in 1915 excited much interest because of the daring plan proposed by the late A. J. Himes, who was originally in charge of this work, for the disposal of the excavation by the hydraulic process, using the material from the cut to fill a large gully near the east limit of the track depression. Authority was actually granted for the prosecution of the work according to this plan and considerable equipment was purchased and delivered, but a change in ownership of the Nickel Plate resulting in the development of plans for yard construction and extension in the

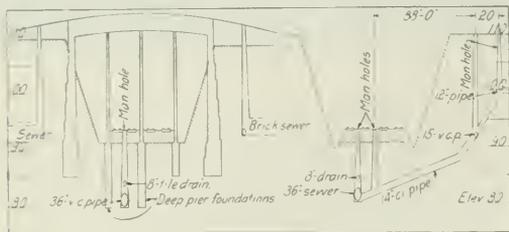

effected in an independent project completed in 1905 by partial depression of the tracks and partial elevation of the street. This partial depression at Detroit avenue and the descent of the tracks into the Cuyahoga valley at the east end definitely pointed to depression as the only practical solution of the new project.

Actual work on the excavation, which represented about 7½ per cent of the total expenditure for this project, was started in January, 1917, and completed in December of the same year, the Walsh Construction Company of Davenport, Iowa, being the contractor. The earlier stages of this project were described in the *Railway Age Gazette* of October 12, 1917, page 653, and were of particular interest because the dragline method was largely used for excavation.

No masonry work was carried on in connection with this part of the project except as required for retaining walls at a few points to protect the buildings of adjacent property holders. The street crossings were taken care of as the work progressed by the construction of temporary trestle viaducts across the depression prism and the principal work on this project subsequent to the completion of the excavation has been that of replacing the temporary structures with permanent concrete and steel viaducts.

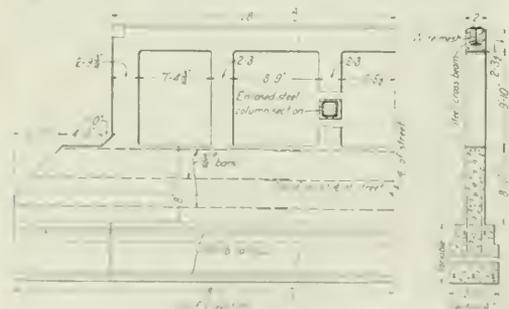

Serious Drainage Problem

Any cut $2\frac{1}{2}$ miles long, 15 to 20 ft. deep and with an average grade of only 0.075 per cent, in a country of average

Two Sections (Distorted) of the Track Depression Cut Illustrating the Drainage System

rainfall and in a sandy soil will impose a serious problem on those who undertake its excavation. If in addition it becomes necessary to intercept sewers at each street, carrying both sanitary and surface flows, the problem assumes much greater magnitude. These were the conditions imposed on the engineers of the Nickel Plate and called for the construction of a large sewer for nearly the whole length of the cut, supplemented by a system of sub-soil drains. The main sewer varies from 15 in. to 36 in. in diameter and was constructed of vitrified sewer pipe. It was located on the center line between two of the tracks, but in certain places where it was necessary to pass directly under one of the tracks, cast iron pipe was used. Manholes were constructed at intervals of about 300 ft. for the junction of sub-soil drains and

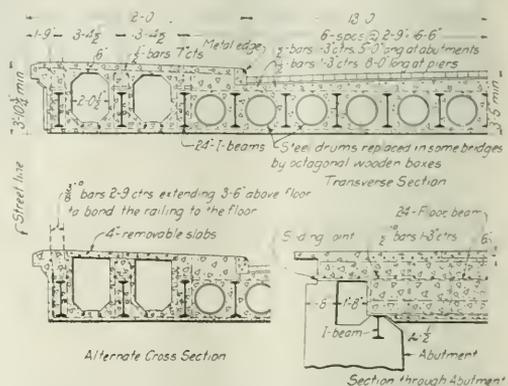

Typical Details of a Pier for the Street Viaducts

the interception of the city sewers. Fortunately, it was possible to secure an outfall for this sewer at West Fifty-fifth street, or not far from the midlength of the cut, and thus drain the water both ways toward the center. But even with this arrangement it was necessary to place the sewer at a maximum depth of 18 ft. below grade in order that a sufficient gradient might be obtained.

The outfall consisted of a brick sewer four feet wide by five feet high, built by tunneling and open cut along West

Fifty-fifth street to a main sewer in Walworth avenue, this portion of the work being done by the city of Cleveland. At West Fortieth, West Seventy-fourth and West Eighty-fifth streets, the sewers were very large and deep, and to have constructed the intercepting sewer large and deep enough to care for the drainage from these streets adequately would have involved an excessive expenditure. It was therefore deemed advisable and economical to construct concrete sewers in West Fortieth and West Eighty-fifth streets to care

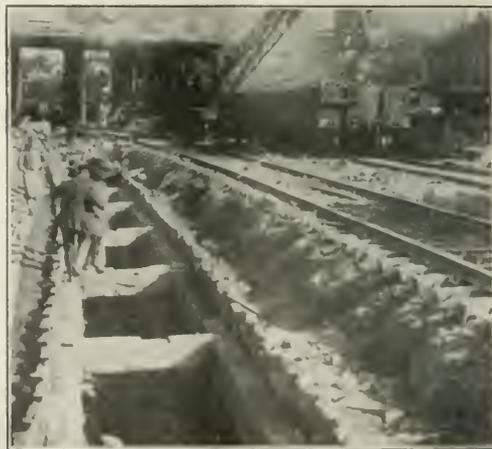

The Weight of the Bridge Floors Was Reduced by Introducing Steel or Wooden Drums Between the I-Beams

for the drainage from these two streets. At West Seventy-fourth street the drainage was carried under the roadbed in the cut by means of an inverted syphon.

Street Viaducts All One Type

A standard plan of viaduct construction was developed and applied to all of the streets where it was possible to do

Deep Excavation for Pier Footings Required Sheet Pilings

so. Of the 13 bridges to be placed, 9 will follow the one type of construction, with slight variations to conform to the angles of the crossings. In addition to the 13 concrete overhead bridges, two of which carry street railway tracks, there

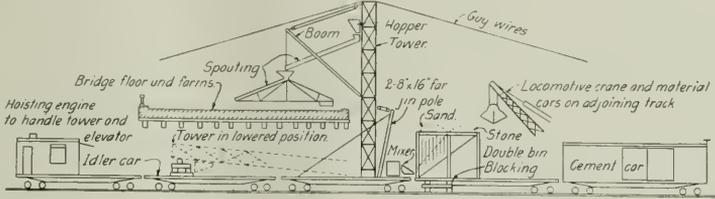

will be foot bridges, not to exceed five in number, erected at streets designated by the city of Cleveland.

The design of the concrete bridge structures is simple, being comprised of a four-span structural steel bridge encased in concrete, each span opening being wide enough for two tracks. The substructure consists of mass abutments with piers of concrete encasing steel columns. The superstructure comprises longitudinal I-beams encased in concrete to form the floor. In the sidewalk structure the I-beams are encased separately with reinforced concrete slabs at both the top and

amount to avoid any appreciable changes in the street grades, but at a number of the crossings it was necessary to provide elevated approaches to the viaducts. This was done by building embankments supported by concrete retaining walls along the street lines.

Concrete Work Handled by Company Forces

The construction of the permanent viaducts was started in 1919 and has been carried on almost continually since that time. All of the work has been done with company forces

Layout of the Concrete Plant in Operation

bottom to provide public utility galleries. A concrete banister on each side of suitable design completes the viaduct. Under the original plan, at five of the bridges, viz., West Forty-first, West Fifty-third, West Sixty-fifth, West Seventy-fourth and West Eighty-fifth streets, steel drums were introduced into the

except the erection of the structural steel for the viaducts which was done under contract by the King Bridge Company of Cleveland, Ohio. The most troublesome feature of the work was the construction of the footings for the viaduct piers on either side of the sewer since it was necessary to carry these down below the bottom of the sewer, or about 17 ft. below subgrade. The footings for the other portions of the substructure were placed on natural foundations about 6 ft. below subgrade, but danger of undermining in close proximity to the sewer made the deeper foundations for the piers necessary.

Pile foundations were impractical owing to the fact that the running sand encountered precluded the driving of piles.

The Mixer Plant at Work, Vacant Track on the Right Reserved for Material Cars and Locomotive Crane

floor between the beams. These drums reduced the volume of concrete and thus not only aided in relieving the weight of the floor, but they also effected a decided decrease in cost. Later developments, however, showed that drums constructed of wood, which, needless to say, would be less expensive than the steel drums, could be used with just as good an effect as the steel drums. Consequently, this type of drum is being used on the additional eight bridges.

Most of the structures cross the tracks at an angle of nearly 90 deg., thus affording opportunity for standardization of design, but four of the streets cross the cut at considerable skews and two of them, West Fifty-eighth street and Lorain avenue, intersect within the limits of the excavation prism. As a consequence, the structures for these particular crossings involve some interesting departures from the standard design.

For the most part the tracks were depressed a sufficient

Industrial Building Supported by Timber Cribbing with Service Track Carried on the Old Grade by a Trestle

The deep excavation in sandy soil containing large quantities of water necessitated the use of steel sheet piling heavily timbered. The conditions which precluded the use of pile foundation also militated against the ready driving of the sheet piles. In fact, it was necessary to jet some of the sheet piling into place. This work was facilitated to a certain extent, however, by the development of a ready means for pull-

ing the piles which effected a considerable saving and made it possible to use some of the piling as many as 20 times. This pile-pulling rig consisted of a gin pole or strut composed of two 18-in. by 9-in. stringers, bolted together and fastened to the end of the boom of a locomotive crane, with two independent drums, so that the reaction of pulling was transferred directly to the top of an adjacent sheet pile instead of to the crane boom.

As the masonry work on this project entailed the mixing and placing of 36,000 cu. yd. of concrete, considerable thought was given to the development of a concrete plant that would be thoroughly adapted to the conditions imposed. As the track depression prism is wide enough so that it was possible to provide two tracks for the operating department and still leave space for two tracks for the construction equipment, the concreting plant was designed to take full advantage of two tracks and the fact that it would not often be disturbed by the operation of trains. As a consequence, the concreting plant is, in effect, a fixed plant except that it is mounted on cars so that it may be moved readily from one

Industrial Building Underpinned by a Retaining Wall. Service Track Provided on the Depressed Level

viaduct to the next one. The arrangement of the plant will be readily understood from the drawing and consists essentially of an Insley tower and spouting outfit mounted on a flat car adjacent to a concrete mixer with a gallows frame arrangement to permit of lowering the tower on an adjacent idler car whenever a shift is being made. The fine and coarse aggregates are supplied to a double material hopper by a locomotive crane from material cars standing on the adjacent track. Cement is wheeled from the cement car to the mixer over a temporary runway erected alongside. The car containing the hoisting engine for elevating the concrete is set far enough away from the tower car so that the smokestack will clear the edge of the viaduct.

This concreting outfit will deliver concrete to any part of the viaducts crossing the tracks at right angles from a single position of the plant. In the case of the longer structures required at some of the skew crossings, it is necessary to supplement the spouting delivery with the use of concrete buggies to reach the more remote portions of the structures. This concrete plant can be dismantled readily, moved to another structure and again set up ready for use in a day's time.

One of the interesting features of this work is the arrangement made to take care of service tracks. The grade separation area includes two team yards which have been constructed on a level generally coincident with the streets with

access to the track depression level by means of decline tracks. There are only a limited number of industrial developments within the grade separation territory, but several different methods were devised in supplying trackage to these industries under the new grade arrangement. Two photographs illustrate two methods in which this has been accomplished. In one case the building walls have been underpinned and an industry track provided on the new grade line. In the other case, an incline trestle has been provided so that the industry is afforded trackage on essentially the old level.

This work has been handled under the direction of A. C. Harvey, until recently engineer of grade crossing elimination, now assistant chief engineer, and under the general direction of E. E. Hart, chief engineer, Cleveland, Ohio. The grade crossing elimination work has been handled by a complete organization for both field and office work, all roadway and structural drawings being handled under the direction of a chief draftsman and all construction work under a field engineer who has direct supervision over the various construction foremen.

The estimated cost of the project is \$4,400,000. The city of Cleveland pays 35 per cent of all that portion of the total expense of this work, including property damage, that is required in providing the railway company the same facilities on the new level as it had before the work was undertaken. All expense entailed in providing additional facilities is borne entirely by the railroad company. The total outlay for this project is subdivided approximately as given in the table below:

Land and property damage	\$1,000,000
Excavation	323,000
Drainage, sewers and water pipes.....	480,000
Viaducts and streets	1,270,000
Tracks	227,000
Miscellaneous	600,000

Some Further Data on Federal Valuation

SINCE THE PUBLICATION of the résumé of the work of Federal valuation, which appeared in the issue of January 7, page 36, the following data have been received, showing the amount of this work now completed.

ENGINEERING SECTION		
	Mileage	Percentage
Road mileage assigned.....	247,882	100.0
Field work entirely completed	247,882	100.0
Field notes collected.....	224,800	90.5
Prices applied	168,959	68.2
Reports assembled	149,700	60.4
Reports completed on 635 corporations covering..	143,879	58.1
LAND SECTION		
Road mileage assigned.....	247,882	100.0
Mileage appraised	245,752	99.2
Mileage computed	222,948	90.0
Mileage compiled	133,294	53.8
Reports completed on 591 corporations covering..	131,857	53.2
ACCOUNTING SECTION		
Road mileage assigned	247,882	100.0
Field work completed except verification of returns to valuation orders.....	245,394	99.0
Verification of returns to valuation orders	242,841	98.0
Reports rough drafted	153,275	62.1
Reports completed on 471 corporations covering ..	84,091	33.9

The commission itself has published final value figures on 230 corporations, representing approximately 25,700 miles of road.

Due to the centralization of the work the personnel of the bureau has been greatly reduced, particularly in the overhead organizations. The higher officials are now as follows:

- Acting Director, C. F. Staples.
- Executive Assistant and Supervisor of Land Appraisals, T. P. Artaud.
- Solicitor, Dr. Charles W. Needham.
- Supervising Engineer, Howard M. Jones.
- Supervisor of Accounts, J. M. Willey.

Government Reports Promptly on Reading Collision

Conductor Believed Train Order Gave Authority to Disregard the Manual Block Signal

THE INTERSTATE COMMERCE COMMISSION has issued a report, dated December 23, and signed by W. P. Borland, chief of the Bureau of Safety, on the collision between eastbound and westbound passenger trains on the Philadelphia & Reading near Woodmont (near Bryn Athyn), Pa., on December 5 last, when 27 persons—20 passengers, 5 employees on duty and five off duty—were killed, and 35 passengers and five employees were injured.

The main facts are substantially as given in the *Railway Age* of December 10, page 1163. The eastbound train (No. 51) was superior by direction. The first manual block section is from Bryn Athyn to Churchville, 5.7 miles, but there is an intermediate non-block station, Southampton, where trains frequently meet. The switch at Bryn Athyn is 515 ft. east of the semaphore signal; and 175 ft. farther east is automatic block signal No. 716, governing westbound trains. Automatic signal No. 713, for eastbound trains, is at Huntingdon Valley, nearly a mile west of Bryn Athyn, and is controlled by a track circuit extending to a point 1,500 ft. east of signal 716. Westbound train 154 stopped at signal 716 because there was not time to go to Huntingdon Valley to clear train 151, and also because signal 716 was in the stop position. The flagman was sent ahead and, after a few minutes, the train moved forward to the station, where it received an order to "disregard signal 716 and run carefully." The train was then set back to wait for train 151, the side track not being long enough for 154.

Eastbound train 151 was in charge of Conductor Evans and Engineman Yeakel. At Huntingdon Valley this train passed automatic signal 713 in the stop position and sent a flagman ahead; and after waiting a few minutes the train followed him to Bryn Athyn, arriving there, according to the record, at 7:42 a. m. Conductor Evans sent word to the engineman to move the train forward and back in on the siding (train 154 being at rest on the main track beyond the switch), but the engineman insisted that to do so he must first have a dispatcher's order. The conductor soon after received the order to meet No. 156 at Bryn Athyn and gave a copy of it to the engineman; and the train was then started. A stop was made at Paper Mills, 0.7 mile east of Bryn Athyn, and the train then proceeded about half a mile farther before colliding with train 156. The employees on duty who were killed were the fireman of each train.

Conductor Evans, at the hearing, said that he received order No. 11 (to meet No. 156), read it in a low tone of voice and "was under the impression that it was an order to meet train 154." He walked to the engine and delivered a copy of the order to the engineman, neither of them reading it to the other, or making any comment whatever. He claimed that a train order was sufficient authority for a train to pass a block signal or a train order signal in the stop position, without a clearance card. He did not show his copy of the train order to the trainmen. He put the order under the baggage master's box in the baggage car, as was his custom, so that the baggage master might see it.

Engineman Yeakel said that he glanced at the order and got the impression that it was to meet train 154.

Operator Clayton, at Bryn Athyn, made conflicting and vacillating statements. The conductor read the train order to himself, but Clayton said that he overheard the reading and that it was read correctly. He said that he gave Churchville permission to send forward train 156, considering that the block for westbound trains ended at automatic signal 716 which was east of train 151, standing on the side track.

If he had waited until train 154 had passed his station before giving a clear block to Churchville, he probably would have discovered that train 151 had departed contrary to orders.

The entries on the block record at Bryn Athyn were found to have been altered, and Clayton explained that, being busy selling tickets, he made the entries an hour after the train had left; and at that time he was very much excited and disturbed.

Operator Tomlinson, at Churchville, also made conflicting statements and the record produced by him, purporting to be the original block record at the station, proved to have been made by him probably on the following day. Operator Tomlinson said that he seldom received standard time, his office being closed at the hour when time is transmitted.

Train dispatcher Rich, on receiving the report from train 154 that signal 716 was in the stop position, assumed that the circuit was out of order; and he directed the train to disregard that signal so as to obviate the necessity of flagging to Huntingdon Valley.

The report, in conclusion, lays the main responsibility on Conductor Evans and Engineman Yeakel for disobeying the train order and for leaving Bryn Athyn with the block signal in the stop position without securing a clearance card; but the failure of the operators contributed to the disaster. The inspector believes that the conductor and engineman at fault anticipated the contents of the order, and thus acted upon an impression. Engineman Yeakel, having said that he would not move the train forward until he received an order, evidently assumed, when he did receive an order, that it was the one which he had asked for. Going away without a clearance card, when the block signal was at stop, was not an oversight, says the report; it was due to a wrong understanding of the rules.

The inspector feels sure that 156 left Churchville under a clear block signal while train 154 still stood on the main track at signal 716. Statements of the operators are so conflicting and their records so faulty that their statements are held to be of little value; and it cannot be determined whether or not Tomlinson, operator at Churchville, allowed 156 to go before he had authority from Bryn Athyn.

The investigation disclosed a general laxity in the observance of block signal rules. The block system is regularly suspended at Churchville from 2:35 p. m. to 3:35 p. m. There was no uniform understanding as to whether the siding at Bryn Athyn was within the limits of the station or whether it was in the block section between Bryn Athyn and Churchville; or whether it was necessary for 151 to have a clearance or caution card before being moved forward to be set back into the siding. Employees are not regularly re-examined on the rules and some of them have not been examined since 1914. The train dispatcher had never been examined. Trains appear to be authorized frequently to disregard automatic block signal indications on trivial occasions, merely to prevent delay.

The report recommends that measures be taken promptly to insure that employees understand and obey the rules and that "the carrier be required to install on this line a complete automatic train control system."

The report discusses the fire, aggravated possibly by the illuminating gas in the cars, and observes that with steel cars the casualties would no doubt have been fewer; but the Reading has not bought any wooden cars for a number of years. At the present time the road has 205 steel passenger

cars, 90 with steel underframes and 289 wooden coaches in service.

Conductor Evans had been a passenger conductor since 1912 and was examined on the rules in 1919; Engineman Yeakel had run passenger trains since 1904. There is no record of his last examination on the rules. Both these men had been on duty more than nine hours (at 7:45 a. m.). Operator Clayton had been station agent since 1902 and Tomlinson since 1907.

Labor Board Considers

New Rules for Clerks

AFTER A SHORT HOLIDAY vacation the Railroad Labor Board has again swung into action, taking up consideration of new rules to govern the working conditions of railway clerks and to supersede provisions of the clerks' national agreement over which the carriers and their employees cannot agree. In addition the board has been hearing several disputes between individual carriers and various classes of their employees, particularly a group of disputes over wage scales between a number of short lines and their employees.

The board, in taking up consideration of the disputes between various carriers and their clerical forces resulting from the attempt to negotiate new rules to govern the working conditions of these employees, has summarized the principal points on which an appreciable number of the carriers have been unable to agree with representatives of the employees. This summary indicates that the disagreements, in general, have been confined to 25 rules of the old national agreement. On all other points the carriers and their employees have either reached agreements or the submissions to the board indicate that the points can easily be settled between the carriers and the employees. Seven of the rules, according to the board's summary of the submissions, involve vital points on which agreements could not be reached by a large number of carriers. The board's summary of the more important rules follows:

Rule 48. Disagreed to by 29 carriers, agreed to by 25. The present rule provides for an eight-hour day. The carriers seek to have exception from the eight-hour day made for employees in light employment and also at stations where but few employees are employed and the train service is infrequent. Other carriers seek a nine-hour and some a ten-hour day.

Rule 49. Disagreed to by 35 carriers, agreed to by 13. This rule provides for paying a monthly salary to cover all services rendered to employees whose work is of an intermittent character, and not requiring continuous application. This would eliminate the payment of overtime to employees covered by the rule. It is sought to apply to such classes as baggage men, train crew callers, gatemen, announcers, etc.

Rule 57. Provides for time and one-half after eight hours. Agreed to by only 8 carriers and disagreed to by 44. The eight which have agreed in this instance have not agreed to pay time and one-half, but some of them have agreed with the employees to pay pro-rata for the ninth and tenth hours. The carriers are asking in some cases for no overtime until after ninth hour, and then pro-rata until the tenth hour has expired and time and one-half thereafter. Other carriers seek to have pro-rata time paid for the ninth and tenth hours and time and one-half thereafter.

Rule 58. Disagreed to by 25 and agreed to by 25 carriers. Provides for three hours pay for two hours work performed on call also time and one-half for time prior to and after the regular work period. Carriers seek pro-rata pay for calls and time up to ten hours. Other carriers seek a rule providing for time and one-half for calls, but object to time and one-half for overtime premiums with the work period.

Rule 64. Disagreed to by 36 carriers, agreed to by 18. This rule provides for paying time and one-half for service performed on Sundays and holidays when the entire number of hours constituting the regular week-day assignment are worked. The carriers seek to have all time and one-half payments for Sundays and holidays eliminated, except work over ten hours.

Rule 65. Disagreed to by 24 carriers, agreed to by 16. This

rule provides for the payment of three hours pay for two hours work for calls and time and one-half thereafter where the hours constituting the regular weekly assignment have not been worked. The carriers seek the elimination of punitive payments in this rule.

Rule 66—Disagreed to by 32 carriers, agreed to by 17. This rule provides for all employees being paid on a daily basis. Some carriers seek a monthly basis of payment, others weekly and still others object to the method of computing the daily rate as outlined in this rule. Decision 426 of the board removes considerable objection to this rule.

Other points on which there have been disagreements on an appreciable number of carriers include seniority and promotion, seniority districts, the payment of laborers and others around freight houses on an hourly basis, arbitrary payments for reporting, etc., and meal periods.

Short Lines Deferred Wage Reductions

Hearings were held on January 9, in a number of disputes between several short line railroads and various classes of their employees regarding wages. The employees in practically all of these cases charged that the carriers in question had reduced wages without the authority of the Board or in compliance with the provisions of the Transportation Act. Representatives of the carriers involved either denied that they had violated the Transportation Act in putting into effect reduced wages comparable to the reductions made in the wages of the larger carriers last July, or contended that the Labor Board had no jurisdiction.

The carriers involved in these hearings were the Tremont & Gulf, the Litchfield & Madison, the Peoria Railway Terminal Company, the Detroit, Bay City & Western, the Susquehanna & New York, the Toledo, St. Louis & Western, the St. Joseph Union Depot Company, the Mobile & Ohio, the Mississippi River & Bonne Terre, and the Interstate Railroad. The organizations involved include the train service brotherhoods, the dispatchers' association and the maintenance of way, clerks and telegraphers' organization.

In many cases the inability of the carriers to pay the standard rates of pay fixed for larger and more prosperous carriers was cited. In one dispute, that between the Mississippi River & Bonne Terre and the Order of Railroad Telegraphers, in which the carrier was charged with reducing wages without complying with the formalities of the Transportation Act, it developed that while this carrier was not included in the proceedings which ended in the wage increase of July, 1920, it had later granted these increases and that when the decreases of July, 1921, were announced it had made reductions, although not to the same extent as was ordered by the Labor Board at that time. The wage scales for employees of this carrier are still above the level ordered in the Board's decision No. 147 last July.

Shopmen Consider New Rules

A committee of 100 representatives of shop employees met in Chicago on January 9, to consider and pass upon the new rules governing the working conditions of shop employees, announced several weeks ago by the Labor Board. This committee is to take up each of the 180 rules to consider its relation to other rules and its effect on the individual worker. On the decision of this committee will depend whether the shop crafts will again threaten to strike in protest over both the rules and wage reduction of last July. It will be recalled in this connection that a strike vote, taken immediately after the wage reduction last July, authorized the general council, composed of the international presidents of the shop crafts organizations and B. M. Jewell, president of the Railway Employees Department of the American Federation of Labor, to call a strike. The call was deferred, however, until the rules controversy, which had been before the Labor Board for many months, was acted upon. Union leaders declared that a more effective fight could be made on the rules and wage questions together than on the wage cut alone.

The Webb Automatic Train Stop Tested on the Erie

Mechanical Contact Train-Stop Which Checks Its Own Integrity

—Interesting Tests on the Erie

AS HERETOFORE noted in the *Railway Age* (July 2, 1921), experiments have been going on for some time on the Erie Railroad with an automatic train stop; and these have now been completed to the extent that arrangements have been made by the manufacturer of the apparatus, the International Signal Company, of New York City, for testing the stops extensively between Englewood,

the lifting of the shoe is to exhaust enough air to sound a blast of about one second on a whistle in the cab. In other words, there is a proceed indication at each ramp approaching a clear signal. If no electric current is received from the roadway (indicating that the road is not clear to proceed), the exhaust of air sounds a blast on the cab whistle, which continues until the brakes are set, or until the engineman closes the valve, as he may do when he sees that his speed is sufficiently reduced.

There have been but few changes made in the detail of this apparatus since the description given in the issue of April 13, 1917. The cam shaft 1 and the main cam, 2, have been made hollow and connected with the train line air. The plunger head, 3, with its contacting projection, 4, have also been made hollow and connected with the train line air so that now each portion of the apparatus that is used in the valve-opening operation is so designed that its breakage

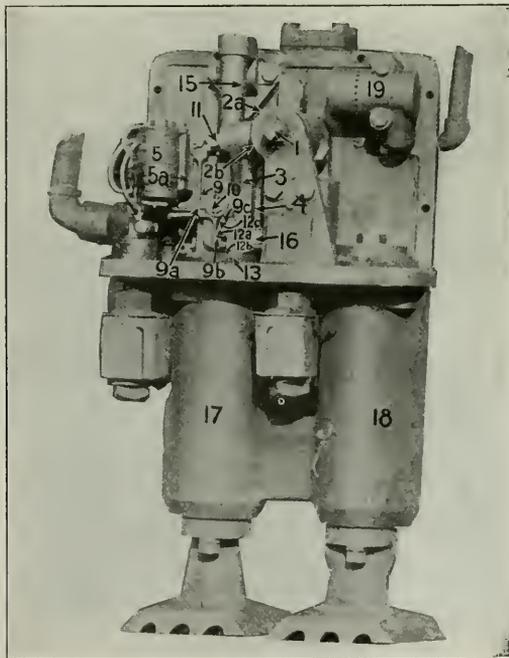

Automatic Stop Apparatus on Locomotive 955

N. J., and Fairview. This is on the Northern Railroad division, about 10 miles from New York City.

Under this arrangement with the railroad company, the signal company is installing additional fixtures on both the eastbound and westbound tracks and has equipped locomotives No. 955 and No. 957, which are used on local passenger trains regularly between Nyack, N. Y., and Jersey City, N. J.

Preparatory to equipping the additional locomotives and additional block sections, an exhibition of the operation of the stop was made recently for the benefit of a party of officers of the road; and a summary of these runs is given below.

This apparatus, which was described, with illustrations in the *Railway Age Gazette* (April 13, 1917), after it was tested on the New York, New Haven & Hartford, is of the intermittent contact type, the ramp, 34 ft. long, being fixed 17 in. outside the running rail. The shoe on the locomotive, supported on the frame behind the driving wheels (or on the trailing truck if there be one) is lifted, and causes the opening of the air brake train line, at every ramp, but if the block section to be entered is clear and its track relay closed, an electric circuit, controlled by this relay, and extending through the ramp and the shoe, actuates an electro-magnet on the locomotive which immediately closes the air valve, before the triple valves have been affected; and the only effect of

Webb Automatic Brake-Setting Machine

or removal would exhaust the train line air to the atmosphere. The armored hose has been superseded by a stationary piston, 15, for connecting the train line air with the plunger head, plunger and shoe. The magnet bracket 5a, is now made an integral part of plunger head 3. The path-clearing plunger 18 has now been made an integral part of the box design. The manual reclosing operation is now accomplished through cylinder 19 and its piston, instead of the slide formerly used.

As the train-carried fixture passes over the ramp, the

operating plunger is lifted vertically and projection *d* engages cam projection *e*—*d* oscillating the main cam, *z*, with its shaft, *1*; opening the air valve by means of the valve cam which is also fixed on shaft *1*, so that the train line is vented to the atmosphere. If the track relay is in the stop position no further action takes place; and as the plunger resumes its normal position, after passing the ramp, the air valve remains open and the train is brought to a stop in the usual manner.

If, however, the indication is clear, the electric current controlled by the track relay energizes magnet *5* and causes the bolt lever, *9*, to project the bolt, *11*, so that in the downward movement of the plunger the bolt restores the main cam and air valve to their normal positions and no braking action takes place. Both the opening and closing of the air valve are direct mechanical operations.

In this installation on the Erie Railroad, there is no distant signal or line relay. The circuit to the ramp, which is located approximately 1,600 ft. in the rear of the signal, is controlled by the track relay and a circuit breaker operated by the signal itself.

Details of Tests

The tests referred to were nine in number, eight as scheduled and the ninth to take the place of the fourth, as explained below. They were made with locomotive No. 955

Local Passenger Train, Erie Railroad

and eight steel coaches, some of the runs being made, however, with a five-car train.

Test No. 1—Semaphore at stop; ramp passed at full speed as if the engineman were dead. Speed at ramp 40 miles an hour; train stopped, against steam, 1,113 ft. after passing ramp and 493 ft. short of the semaphore.

Test No. 2—Semaphore at stop; ramp passed at full speed. Brakes automatically applied, but before the train came to a stop the engineman, with the optional release, re-closed the air valve, this to save time and to avoid unnecessary stopping and starting, as would be the case with a long freight train. The engineman closed the valve about 800 ft

from the ramp and coasted to the semaphore, where he stopped by using his brake valve.

Test No. 3—Eight-car trains; speed at ramp 37 miles an hour; train stopped automatically 419 ft. short of the signal.

Test No. 4—Semaphore at stop; ramp passed at full speed. As soon as the audible indication in the cab showed that brakes were being applied, the engineman made an emergency application with the engineer's valve.

Speed of train at ramp 40 miles an hour; train stopped automatically 974 ft. from the ramp and 632 ft. short of the semaphore. In this test both of the contact shoes were broken off when they came in contact with the ramp rail, evidently because of imperfections in the castings and their worn condition due to previous use. On account of the shoes breaking before they had reached a point on the ramp rail sufficiently high to raise the operating plunger, no audible signal was given in the cab. The train, however, came to rest automatically, as stated above, the breaking of the casting serving to exhaust the air from the train line. New shoes were put on and the tests continued. During the preparation of the program for the tests, the advisability of interposing an obstruction that would break the contact shoes was freely discussed, but it was finally decided to omit such a test, because of the possibility that the obstruction might result in damage other than the breaking of contact shoes. Therefore, this breaking of the shoes under normal service conditions provided a specially interesting demonstration.

Test No. 5—This was simply to demonstrate the audible "proceed" indication.

Test No. 6—In this the semaphore was left at proceed, but the roadside battery was disconnected; speed at ramp 45 miles an hour; train stopped automatically 448 ft. short of semaphore.

Test No. 7—Semaphore set in proceed position; magnet wire disconnected from binding post on plunger-head of engine apparatus. Speed of train at ramp 45 miles an hour; train stopped automatically 431 ft. short of semaphore.

Test No. 8—Semaphore held in the proceed position by mechanical means, and track relays de-energized. This was to illustrate the case of a false clear visual signal.

Test No. 9—Repetition of test No. 4 as originally planned.

All of the tests were satisfactory. Both the railroad and the manufacturers had special inspectors on the train, and on the ground to make detailed written notes of each test.

Essentials of Progressive Motive Power Policy*

Recent Improvements in Locomotives Afford Opportunities for Reducing Transportation Costs

By G. M. Basford

LOOK BACK a bit. Only a short time ago—only a lifetime—people were 20 days on the road from New York to Buffalo if lucky, if wheels lasted and oxen or horses did not break legs and if food held out. It is different today, when a few hours of luxurious comfort brings us over these few miles with speed and security.

But I am going to say that we do not use our transportation blessings as well as those pioneers used theirs. We have the wonderful steam locomotive. It was here when those pioneers really began to build our great West. But now we have a new steam locomotive. It has been made new in our time, but we are not taking advantage of it. From an efficiency and economy standpoint the new one is as far ahead of that of 1835 as the one of that date was ahead of oxen and horses. If this appears to you to be an exaggeration you must lose no time to learn what has happened in our generation.

Those pioneers had "engine failures" with their Prairie Schooners; they were family tragedies. We have them now. We should not. The Prairie Schooner was not "bought on price." Quality and performance was the thing. When you place performance ahead of price you may have locomotives that will save the railroads.

How often important contributions to the solution of problems, if not the actual solutions, lie so near us that they are overlooked. How often we seek a panacea when what we need is something we already have but do not appreciate! Of this there is no better example than that of the steam locomotive of this wonderful, resourceful country. One of our most vital needs today is the application of good American common sense in allowing the locomotive to play the part it is completely ready to play in the reduction of the cost of transportation, providing we establish suitable locomotive policies.

With respect to the locomotive "policy" means a charted course using all established and safe aids to bring the craft to its logical destination. That destination is "the most tons moved for the least money." After "policy" there must be a plan based upon the fundamental principles of the policy and then a program to execute the plan.

Engineering Improvements Should Be Utilized to Cut Costs

No matter what else we do ours will be a sorry sort of railroading if we fail to find in the treasurer's office the results of the efforts of those who have spent the past 20 years in showing how to increase locomotive power per pound of metal and per pound of coal and who have proven their ability to do it. I say 20 years but it is more than 30 years since this work began. Some of the men who inaugurated this development builded better than they knew. I am thinking particularly of David L. Barnes, George S. Strong, M. N. Forney and H. F. Shaw.

They have many able successors who have worked with factors unknown or undeveloped in the days of engineers who lived a generation ahead of the rest of us and two generations ahead of their own contemporaries. These successors have produced big powerful locomotives, both freight and passenger, that surpass the highest flights of imagination of the men mentioned. For example, a passenger locomotive

that will produce at the rate of a cylinder horse power per hour from 16.5 lb. of water and 2.20 lb. of coal and that weighs 121 lb. per cylinder horse power. This was done ten years ago. Lots of engines have been built since that time that cannot do as well. Another example is a magnificent big freight engine with 90,000 lb. tractive effort that will produce one cylinder horse power from 15.4 lb. of water and 2.00 lb. of coal and that weighs 90 lb. per cylinder horse power. This has been done. Do those to whom they mean most know these facts? Do they make full use of them? These are isolated cases showing possibilities, but, current practice is far behind them. Every new engine on every railroad ought to be designed and built to equal and surpass the records just referred to.

It is most important to all of us to know the reason why the locomotive on most of our railroads falls so far short of what it may be, should be and must be if American railroads are to "make good" in the present emergency.

Locomotive Improvements Have Far Reaching Effects

Right now railroad officials are striving to increase efficiency and reduce cost as they never did before. Results in car loading and train loading have been great. But no matter what else is done to increase efficiency and reduce cost, bear in mind that improvement of the locomotive augments the effect of every other improvement that can be made. Everything done to make an engine pull more tons per ton of its own weight and per pound of fuel burned helps everything else you do to improve the efficiency of transportation. These facts are not as prominent in the minds of operating officials and of executives as they should be. Why? The locomotive today at its best is not understood by those officials as it should be. Why? Locomotives in everyday service may be made to produce at the rate of less than three pounds of coal per indicated horsepower. Why are so few of them doing this? Can they be made to do it? By co-operation, yes!

Motive power matters must be presented, discussed and decided on a new and appropriate basis. A man of wide experience has said "Whatever the locomotive can do, the railroad can do." As the business of the road is moving trains, that business will be most successful when the mover of trains, the locomotive, is what it should be, is designed, built, operated and maintained to the best advantage.

One of our difficulties is that we are so close to the locomotive as to tend to regard it as we always have regarded it—as a machine that we know all about. We did know all about it as it was in our boyhood but unless we have kept step with the improvements of recent years in locomotive matters we are far behind the times.

We are slow in taking advantage of money making improvements. Forney used to say "The human mind resents the intrusion of a new idea." This is true. The slow progress of locomotive improvements in this country proves that he was right. Europe and Canada led us in the introduction of the greatest improvement that the locomotive ever enjoyed. Europe has 14,000 applications of another improvement that is only just starting in this country, and what country needs these things more than we do?

We need to bring our locomotive problem to the front. We need to elevate it to its proper place in railroading. We need

* A paper presented before the Central Railway Club, January 12, 1922.

to give it the attention it deserves. We need to discuss it and decide the questions it presents by and with men who know and who should and must be heard. Let me ask a few simple but important policy questions that call for answer on every railroad, that are being answered in part by some roads but not as a whole by any road.

Pertinent Questions Concerning Motive Power Policy

What is your policy with respect to locomotive improvements, those factors that collectively give you, according to speeds, from 30 to 80 per cent more power per pound of fuel than you can get from a plain engine? What are you doing about these things when you order new engines and what are you doing about applying them to old ones?

What is your policy with respect to locomotives that for the next 20 or 30 years will be in these services: heavy freight, fast freight, way freight, fast passenger, slower passenger, branch line passenger and freight, yard switching, transfer?

What is your policy and plan with respect to the design of new engines for these widely varying duties? Who decides their earning ability for their working life of 20 or 30 years?

What is your policy with respect to assignment of locomotive power to meet varying conditions of traffic, seasonal or emergency conditions? If this is not done by those who ought to know most about power matters there must be a reason for it.

How do you know just how many new engines to order and what type and capacity to order? Is there a plan for this that looks ahead to that which is coming and is framed on experience of the past?

How do you know that the latest new engines are making good? Do you test them and keep records to show whether your locomotive engineering policy is correct and whether you are making the money from your new engines that you ought to make?

What is your attitude toward locomotive improvements as to application to older engines? Are the applications scheduled after careful, complete surveys of the power and are the improvements applied by program, systematically? Then do you organize to educate the men in the best use of the modernized engines to get the utmost returns for the investment? When you apply a locomotive improvement that is good for 25 per cent greater economy are you sure that you get that economy?

What is your policy with respect to scrapping old power and also obsolete shop machinery? Is it done systematically to take advantage of improvements as Andrew Carnegie did? Did it pay Carnegie to do it?

Do you have and follow an engineering or business policy with respect to your locomotives as a manufacturer does with respect to his investment in his expensive machinery?

How do you know that the enormous investment in locomotives themselves and in the facilities for repairing them are employed to the best advantage? Do you, as one railroad official does, hire a man, a specialist, to organize the use of every locomotive item on which he spends \$100,000 a year or more?

Do you know that the mileage engines are making is what it should be and may be? Are you hampering operations by the old time idea that each division is a separate railroad? A passenger engine recently made a run of 1,000 continuous miles without uncoupling from the train. Regular continuous runs of 400 to 600 miles are being made. Are your engines making above the average of 60 miles per day? Herein lies a gold mine.

Are you sure that shops, shop equipment locomotive terminals and terminal equipment are adequate to get the power back into service promptly and keep it in service continuously until time for the next shipping.

Do you know whether the internal friction of the 2-10-2 type locomotive is greater than the formulae of the locomotive designers indicate?

Do you know that new locomotives can be built with improvements in design that will permit of safely deferring increases in weight of rail and strength of bridges for years to come?

Are you aware of the fact that the biggest, most powerful passenger engines in the country can be replaced by others that will stress the track and bridges less than the present engines and yet give enough increase in pulling power to reduce double heading and that improved engines will start and pull heavier trains than have ever been put behind any engine yet constructed? I refer to usual main line traffic.

What policy are you following with respect to signaling in relation to locomotive improvements that permit of more rapid acceleration in starting out of sidings, out of yards and across-crossovers? The entire question of block signaling, siding locations and location of water and coal stations is opened up anew by the ability to accelerate trains faster and to make longer runs for coal and water. Our railroads were built for the saturated steam locomotive without the vitalizing factors of today. Is your road coming up to date in its use of these epoch making operating factors? If you consider these as mechanical matters and if you regard signaling as a safety measure alone you are missing something. Operating officers—ask signal engineers and mechanical officials to help you operate the road. They are in position to help as they never have been before.

Do you establish a definite plan covering the next three or five years with respect to your locomotive program? Do you keep in mind the fact that new locomotives will last 25 or 30 years and that your record of intelligent grasp of railroading is to be read by others after you are gone?

In the matter of water stops—have you thought of the effect on operating cost of the capacity of tender tanks on freight engines? Do you realize that applying new design tender tanks carrying 15,000 gallons of water would beyond question save more money in direct operating results on some railroads than anything of equal cost that you can do to a freight engine on congested track today with the possible exception of the application of a booster?

Of all these questions the most important today in long range results are the ones that involve the locomotive in its relation to track and bridges and the locomotive in its relation to the use of fuel, but all of these items are important. They are not referred to critically but constructively. There is a way to answer all of them. Some of them already have been answered on some roads. There are men who know the answers. The thing to do is to make it easier for these men to be heard.

Improved Locomotives Demand

Changes in Operating Methods

Our railroads were built for the locomotive of the past. They were and are operated in accordance with the locomotive of the past. But the locomotive has changed faster than the methods of using it. A new, refined, efficient power plant is available to take the place of the one that was merely big and heavy. Those who operate our railroads must learn what has happened. For their own sake, the sake of the properties and of the people they serve they must take advantage of the locomotive as it may be, not as it is, to solve the greatest problem they ever faced.

Mechanical men must prepare the case of the improved locomotive and that of the refined locomotive that is ready but has not yet been built. They must be ready to recommend improvements on the new basis—that of their effect on operation and operating costs. They must be ready to present the possibilities of the new locomotive in helping solve track and operating problems. This is merely a matter of preparing for presentation facts that they know thoroughly, but have not been encouraged to present. Mechanical men—perhaps a change in status of the locomotive is coming. Be

prepared. Your part in it is vital. Your preparation for it will hasten the change.

Then a way to insure not only the presentation but consideration, discussion and decision of the power problem must be found. The locomotive must be viewed from a new angle. We have been deficient in our conception of it, and of its proper place in operation of the road and in the transportation of the country. Some of us have considered it from the standpoint of a mere pulling unit, not thinking deeply as to anything but drawbar pull. Some regard it merely as a machine that they must take care of and have ready for call. Others have considered it from the standpoint of a power plant very much like any other power plant, as a unit by itself, built and therefore fixed as to improvements. To others the first expense involved seems to be most important. Some look at the expense of maintenance, and these are prone to regard the bookkeeping of the locomotive as satisfactory without a real bookkeeping balance that shows maintenance in terms of the tons the engine hauls. Its effect on track and bridges is the vital matter in the minds of others.

Many Cost Factors Affect Locomotive Policies

We must get people together to talk these things over and show that not one of these opinions taken alone is correct. When engines were small, rates high and wages low these various points of view were natural and were not dangerous, they are nothing less than dangerous now. We must wake up to the great necessity of a locomotive policy that will bring all views into line to permit the use of the best possible transportation machines, because the locomotive pulls everything that goes over the railroad. It must be designed, operated and maintained in accordance with broader business, engineering principles in view of the requirements and the known possibilities of achievement.

Coal formerly cost 90 cents and now costs \$4.00. Rails formerly cost \$21.00 per ton and recently \$47.00 was the price. An engine "simple as a grindstone" is a mighty expensive article to operate today but thousands of them are running that may and should be made efficient by improvements that everybody knows about and everybody accepts as satisfactory. Why don't we use these to the limit?

These improvements have revolutionized the locomotive art. They will revolutionize locomotive operation. Let us hasten the day when the locomotive is considered as a real part of the great transportation machine. It is a big part of the transportation machine. Above all other things every part of a machine must fit each other part. Otherwise a machine is impossible. The locomotive must fit track, tunnels, terminals and other factors, the least change in which means prohibitive cost where bigness and weight and the increased power that go therewith must give place to improvements and refinement that render greater weights unnecessary. It is time to disregard first cost and think of ultimate cost, to forget the limitations of the past and to build anew for the future. It is time to build every new engine on a new plan—to build it for high power with efficiency. Nothing that is known to be worth while and that increases real efficiency should be omitted from a new engine.

An improvement costing \$10,000 to buy and even as much as that to maintain each year is a good investment if it nets a saving of \$50,000.00 a year. You know what it costs. You do not know what it saves. It is good policy to double the first cost and the cost of maintenance if thereby locomotives will haul enough more tons or make enough more miles to show figures on the right side. This is one way to cut out red figures. How really absurd it is to live as we do in "comparative" figures instead of in constructive figures.

How Shall Recent Improvements Be Utilized?

In its 50,000th locomotive the American Locomotive Company in 1911, over ten years ago, set a pace for Pacific type

passenger engines. That engine has proved the success of careful design, use of improvements then available and incidentally of cast steel cylinders and light parts that saved nearly nine tons of weight. But this engine, today among the very best of its class, can be given 25 per cent more power in starting and at high speeds without excessive weight addition.

In its class IIs the Pennsylvania Railroad set a pace for heavy freight engines. Those railroads which have applied capacity increasing factors to their older engines have set a swift pace toward reducing the cost of pulling trains.

How shall the improvements that rendered these two efficient designs possible and also vitalized so many older engines be used to bring the locomotive to "its own" in the possibilities of the future?

To answer—Put the officials who know most about these matters, those who are closest to their progress, those who know most about the difference between the best locomotives of today and those of only a few years ago, put them in position to be heard. Let them understand that they will be heard and tell them to prepare their case accordingly. Today they are on the defensive. Change their status. Let the operating officers who depend upon the roadway and the power, present their problems that relate to both of these factors and then the great operating factors—power, signaling and operation—may be considered as a whole. Nothing new is needed, but a new way of tying these together is imperative.

Power matters are not the only ones that call for new methods. Operating, purchasing, mechanical, accounting, legal, traffic, track and personnel questions, all would benefit by a new deal in organization. If each of these broad divisions of policy on a large road were presided over by a vice president, if these vice presidents or on a small road the equivalent worked regularly and consistently together as a cabinet of highly trained specialists, if every important matter affecting operation were discussed by all these men—leaving to a senior vice president final decision, the thing now lacking would be supplied. The cabinet form of working together is the essential thing.

For example—one official is convinced that heavier rail sections are needed, or that certain bridges need reinforcement. He is probably of the opinion that locomotives will become heavier and heavier and that he must keep pace with the increase in weight. The officer in charge of power will show that for the immediate future increase in locomotive weight is not necessary, in fact, is wrong, and that he can build new engines more powerful but lighter and less destructive to the track than present ones. Operating men want more drawbar pull. To appreciate the possibilities of more power without excessive weight they should take part in discussions that reveal these possibilities. Some officers believe that with a certain amount of money to spend, the largest possible number of new engines should be bought. They may be shown that a smaller number of more efficient engines is the better and financially safer plan. Some officers find it difficult to see the necessity for investing liberally in shop tools, labor saving cranes and hoists, in ash pits and coal handling equipment. They would be quick to see the need and would give their support if they were shown how these factors affect operation. No officer considers first cost when "safety" is at stake. No officer would consider first cost as the real cost if he was a member of the cabinet, whose deliberations formed the basis for the broad policies for the future.

Factors That Will Improve the

Economy of Locomotives

To be specific here are some of the factors that will come into the plan that a policy will compel:

Improved cylinder operation, higher superheat and improvements in cut off such as cut off control. Ask the officials

of the Big Four about their cut off control as a factor in operation and in saving. Are we to wait years before getting the benefit of what they have done? Why not get it now when we need it most?

Increased boiler efficiency through feed water heating using waste heat and by improvements that compel greater boiler power through improved boiler circulation.

Increased starting power by means of the booster applied to trailing wheels.

Increased starting power and higher power at speeds by means of increased weights on drivers made possible by reduced dynamic augment. Alloy steel parts and refined design render this improvement available.

Improved conditions of combustion by application of the latest developments of the locomotive firebox as a furnace. This means improved fireboxes, more extended use of firebrick arches and mechanical stokers.

Weight per cylinder horsepower may be materially reduced by locomotive designers who are given the order to do their best in this direction. Up to this time they have never had a chance to show what they can do. They have much to offer.

The time has come for these refinements and for many others that are very important but which are not specifically mentioned for lack of space. The time has come for the "free hand" to bring prevailing locomotive practice up to the economically high plane that a few isolated cases have shown to be easily attained.

Savings Will Justify Increased First Cost

The able engineers of the electrical companies long ago learned that the electric locomotive required facilities for its operation and its maintenance that however needed had never been given to the steam locomotive. They spoke. Operating officers and executives listened. They listened because electrification was new, interesting and mysterious. Furthermore, the necessary words had power behind them to compel attention. When trains were stopped by fuses blowing, the fuses being located in a signal tower with no night attendant, the president of the electric company called the president of the railroad on the phone next morning and the thing was fixed. Does the steam locomotive have such attention?

At present the electrical people are making good use of the prevailing oversight of the possibilities of steam. Is this to continue? Is the country to pay the price of this oversight? Are the electrical propagandists to be allowed to get away with even misrepresentations of the efficiency of the steam locomotive?

Consider the high regard in which marine men and manufacturers hold their power plants. They know their dependence upon the power that drives their business. They understand that the power plant that is driving all the time or most of the time must be of the highest type and the most economical, that it is a big investment and must be used accordingly, that ultimate cost, not first cost, is the real cost.

Recent years have brought to the steam locomotive improvements that are comparable with those in marine and stationary development. Marine and manufacturing operations have been rebuilt because of power plant and power distribution improvements. New operating methods must come as a result of the locomotive improvements we are talking about.

It remains to do on railroads the thing manufacturers have done—to build better locomotives, improve old ones and to operate them according to the new conditions these improvements themselves have created. In short, to save fuel and lots of money.

Our locomotive builders are the best in the world. They are building and will build what you want. Why not wake up to what you need and get it? Not only our builders but the engineers that have developed locomotive improvements that are so important have engineers at home and abroad preparing the best, the latest, and more than that, the practical

plans needed for the future. One of the builders sent its highest engineering authority to Europe where he spent more than a year in the study of locomotive design and operation under high priced fuel conditions. Then he designed No. 50000, which ten years ago was a milestone in locomotive progress and for ten years has been a leader in locomotive practice in several ways. But nobody wanted it. That cornerstone has been allowed to be obscured by bushes. Other cornerstones have been laid. Are they to go the same way?

Let it no longer be said with truth that there is not a single steam locomotive today on the rails of our country that embodies and represents the best, and all the best locomotive improvements that are available and that have proved their ability to reduce the cost of American railroad operation, of which we are so proud.

Its expense is the most prominent feature of the locomotive. The cost of everything about it is the thing that counts. This is the reason why it is impossible today to build the most economical engine. Of course it costs more to build and to maintain an economical machine than a crude or wasteful one. But cost is only one side of the question. The performance is the real side. Ton miles per locomotive dollar is wanted and no one is getting that figure. "What does it cost?" is the question asked. Change this question. Ask—"What will it do?"

If I were a railroad man I would put on my engines every single improvement I could find that would net a clear 25 per cent on the investment, and there are lots of them that I believe will double that return. Then I would make sure that all concerned understood the construction, maintenance and operation of the locomotive under the new conditions. Next I would see that the improved locomotive was loaded up to and operated to the limit of its economy and saving capacity. Remember that locomotive improvements give the best returns the harder they are worked. I would ask the operating officer how fast he wanted to go and then tell him how much load to give the engine. It would be all the engine could handle in order to pile up ton miles per ton of coal.

Supervision Needed to Get Results

This improved locomotive is different from the old "plain" ones. It will do more work or it will save fuel. To get these results requires more care, better handling by engineers, better supervision and better operation. A few active young men could accomplish all this on any railroad and make every trip an engine runs a fuel test.

Talking "costs" without considering performance is a monumental mistake. It is my opinion that if the performance, in capacity and economy, of locomotive improvements were known, if individual locomotive fuel records were kept in parallel with ton-mile records, also for individual engines, the entire railroad organization would see a great light. "Acres of diamonds" lie at your feet.

Latent, potent, completely developed and successful but too little understood possibilities for the solution of one of our great problems lie at our very feet. To solve the problem of more tons moved for less money a policy is called for. Then there is no escape from the necessity for a plan followed by a program for its execution.

OBSERVERS at BUFFALO predict a heavy eastward freight movement this month, believing that an enormous amount of freight was held back until after the end of the year to avoid payment of the federal tax. Certain shops of the Erie resume work this week.

SWEDISH RAILWAYS are using peat briquettes as fuel for locomotives. The Railway Board has acquired plant at Hlathagen bog, near Vislanda with a capacity of 30,000 tons per annum, and a new method for treating peat on a large scale has been adopted. The Times (London) Trade Supplement

Chicago & Eastern Illinois Ends Receivership

Reorganized Property Left Hands of the Court on December 31,
with W. J. Jackson as President

DECEMBER 31, 1921, witnessed the end of an 8½-year receivership for the Chicago & Eastern Illinois, thus marking the close of the interesting chapter in the history which began 20 years ago when it was brought under the domination of the St. Louis & San Francisco. The Frisco regime was one of expansion. An entrance into St. Louis was obtained through construction and lease, the Evansville, Indianapolis & Terre Haute was purchased, the 62-mile Villa Grove-Woodland cut-off was constructed and plans were laid for a line from the southern Illinois coal fields into Peoria. The receivership period, which began in May, 1913, was one of contraction and concentration. Weak, unprofitable lines were lopped off and the good ones strengthened. Eight years ago the C. & E. I. had a secondary line, paralleling its main line for the 239 miles from Mokense, Ill., to Evansville, Ind. Today the property is no longer encumbered by this superfluous route. The lower leg of this, the Evansville, Indianapolis & Terre Haute, was disposed of finally by sale to the Cleveland, Cincinnati, Chicago & St. Louis during the past year. The northern portion, the Chicago & Indiana Coal Railway, extending from Mokense, Ill., to Brazil, Ind., with a branch to La Crosse, Ind., was eliminated by omitting it from the parcels of property purchased by the new Chicago & Eastern Illinois Railway Company at the foreclosure sale on April 5, 1921, and application has been made to the Interstate Commerce Commission for the abandonment of this line.

As now constituted the Chicago & Eastern Illinois consists of about 960 miles of line, comprising a main stem from Chicago to Evansville, Ind., a line to St. Louis branching from the Evansville line at Woodland, Ill., and a line into southern Illinois leaving the St. Louis line at Findlay, Ill. Branch lines and connections make up about 260 miles in addition. Approximately 50 per cent of the traffic handled by this road is coal from the southern Illinois and southern and western Indiana coal fields. The lines also handle a heavy through passenger business between Chicago and Evansville and between St. Louis and Chicago.

The elimination of unprofitable lines is by no means the only advantage accruing through the reorganization which was completed at the end of the past year. Although the capital liabilities have been reduced only from \$94,204,448 to \$91,033,750, there has been a marked reduction in the fixed charges—from \$3,759,996 to \$2,327,051. The securities now outstanding consist of fully 51 per cent of stock,

whereas under the old status only 21 per cent was in stock. The property is also in a much better physical condition as a consequence of a conservative yet consistent improvement of the revenue producing lines. Approximately \$7,000,000 was expended in additions and betterments during the course of the receivership. A large mileage of 90 lb. and 100 lb. rail has been laid, passing tracks have been extended and minor additions have been made to yards. Considerable additions and improvements have been made to shop and engine terminal facilities, principally at Danville, Ill., and at

Salem, and a new outbound freight house and a general office building were built at Chicago. Extensions to double track have been of rather small mileage but one of those in the vicinity of Okaw creek involved the building of a \$275,000 concrete arch bridge and closed the gap in double track between Chicago and Findlay, the junction of the St. Louis and the southern Illinois lines. A program of bridge strengthening was also carried out, permitting the operation of new Santa Fe and heavy Mikado locomotives. Train operation has been expedited by an increase in automatic block signals and an installation of automatic train control from yard center (Chicago) to Danville.

The credit for the progress which this property has made during the past 8½ years must be placed primarily with William J. Jackson, who was elected president of the new corporation on December 31, 1921, for he has been executive head of the

road ever since the receivership—as receiver and president of the corporation, except for the period from April 27, 1918, to March 1, 1920, when he served as federal manager. Not only has he evinced prudence in directing expenditures for improvements with the modest funds at his disposal but, possessed of an aggressive personality, he has developed the railway's coal traffic to its financial advantage and has placed the Chicago-St. Louis passenger business on a thoroughly established basis in spite of strong competition.

One element which has accrued to Mr. Jackson's advantage in obtaining favorable results on the C. & E. I. has been an aptitude in handling men. His thoroughly democratic character and manner combined with a prestige that comes to him through a 30-years' service with this property has served to make him very popular with his men. A hard worker himself, he requires good service from those working for him, but he does it with a consideration that inspires loyalty. His intimate knowledge of labor matters was recognized outside railway circles in his appointment by former

W. J. Jackson

Governor Deneen as a member of the Employers' Liability Commission of the State of Illinois.

William John Jackson, was born at Toronto, Ont., on December 28, 1859, the son of a hardware merchant. His education was limited to that obtained in the grammar and normal schools of Toronto and he entered railway service in 1877 as a machinist's helper in the Grand Trunk shops at that place. After a few months he was transferred to the freight department and for three years was a freight clerk at Toronto and for the following three years, chief claim clerk of the Chicago & Grand Trunk at Chicago. From August, 1885, to November, 1890, he was general freight foreman and from November, 1890, to August, 1891, he was assistant agent for the same road at Chicago. The beginning of his career with the Chicago & Eastern Illinois came in August, 1891, when he entered the service at Chicago as assistant local freight agent. He was promoted to agent in January, 1893, and to assistant general superintendent in 1899. On February 1, 1903, he was promoted to general superintendent, a position he occupied until November 15, 1906, when he was advanced to general manager. On December 3, 1909, at the time of the separation of the Rock Island and the Frisco systems he was made vice-president and general manager of the C. & E. I. and of Evansville & Terre Haute, which was later absorbed by the C. & E. I. In this position he was the active head of the properties for a little more than three years prior to the receivership.

Outside of the work for his own company, Mr. Jackson is well known among railway men through his work as chairman and member of the Special Committee on Relations of Railway Operation to Legislation, former chairman and member of the General Managers' Association of Chicago, and former chairman of the Association of Western Railways.

Free Life Insurance on D. & H.

L. LORRE, president of the Delaware & Hudson Company, in a circular to employees dated January 1, announces a contract between the D. & H. and the Metropolitan Life Insurance Company, of New York, under which all employees who have been in the service of the road two years or more and who make application on prescribed forms, may have free life insurance to the extent of \$500; and may take, at very low rates, additional insurance, up to an amount equal to their respective annual salaries (but not over \$5,000).

The Delaware & Hudson operates 900 miles of railroad and employs about 15,000 men. The circular offering this very substantial bonus is given below practically in full:

President Loree's Announcement

1. The Delaware & Hudson Company has entered into a contract with the Metropolitan Life Insurance Company by which it has insured the lives of all employees who have been continuously on its payrolls for more than two years, and who are actually and actively in its service on or after the 1st of January, 1911, securing for each employee having such minimum length of service, irrespective of the nature of his work, his age at the date of his health, and without cost to himself, a policy payable at death in the sum of \$500.

2. In case of total and permanent disability, the sum of \$500 will be paid to the insured employee in monthly installments. In case of death, payments will be made immediately to the beneficiary named by such policy. The contract also permits groups of employees who wish to do so, to take additional insurance, without medical examination and without reference to age, at the exceedingly low rates herein set forth.

3. To all such employees, who have been continuously in its service two years or more, wishing such additional life insurance, or protection against sickness or accident, the Company makes the following offer:

1. If any group of employees take, under this plan, more than \$500 additional life and total disability insurance, for each member, the company will pay the balance of the monthly premiums above the amount stated below, on such additional insurance in excess of \$500. A group, under this plan, must consist, under the life insurance law, of not less than three-fourths of the employees in any class; application therefor must be made before March 31, 1922; no employee can be insured for more than \$5,000, nor for more than the multiple of \$200 nearest his average compensation for the preceding two years. A group may consist of employees of the same class; as, for example, locomotive engineers, station agents, boilermakers, etc.; or, it may consist of those employed at the same place or within the same area.

Under this plan every employee with two years' length of service receive \$500 life and total disability insurance without cost. By co-operation with a sufficient number in his class, and the aid of the company, he can have a total of \$1,000 for 60 cents per month; \$2,000 for \$1.20 per month; \$3,000 for \$1.80 per month; \$4,000 for \$2.40 per month; or \$5,000 for \$3 per month; subject to the maximum limit above indicated. The cost in excess of these amounts will be paid by the company. Not only is the full amount of each policy payable to the beneficiary in case of death, but it is also payable in case of termination, total disability, whether from accident or sickness. In case of total and permanent disability, the life insurance company undertakes to pay the full amount of the policy in sixty monthly installments beginning within not more than six months.

2. A policy covering loss of work by sickness is provided for, under which the benefits are at the rate of \$15 per week for a period of 26 weeks, beginning with the eighth day of incapacity. The premium on this insurance is \$1.26 per month, or \$15.12 per year, and must be borne entirely by the policyholder. Application must be made, before March 31, by a group, as previously described.

3. A policy covering loss of work by accident, exclusive of injury covered by workmen's compensation laws, is provided under which benefits are at the rate of \$35 a week for a period of 26 weeks, beginning with the eighth day of incapacity. The premium for this insurance is 24 cents a month, or \$2.88 a year, to be paid by employees. Employees under 60 years of age may also obtain accident insurance covering death or dismemberment from any accident cause, including accidents covered by workmen's compensation laws, at the rate of \$4 a month, to be paid by employees. The total of such insurance may not exceed the amount of life insurance carried under the plan; application to be made before March 31, by a group, as previously described.

4. The company will undertake directly to insure employees against unemployment resulting from dismissal for any cause, providing payments of \$15 (employees whose average annual wages during the preceding two years do not exceed \$1,000) will be paid \$30 per week for the same period) per week for six weeks, or for so much of that time as a discharged employee may be unable to find employment, continuing until such employee having subscribed for and contributed toward the cost of at least two of the three forms of insurance provided under the group plan, as above outlined.

This provision for unemployment insurance is prompted by the desire of the company to provide continued employment under conditions as favorable as possible, to promote greater ease in the conditions of employment by freeing the employee from anxiety and to secure and maintain the most highly successful operation of the property, which is obtainable only through interested co-operation.

5. The company proposes to continue its present system of pensions, under which, in its discretion, pensions are granted to employees who have been in service of the company 25 years or more, and who have reached the age of 70, or who, upon reaching the age of 65, are incapacitated for service, and under which a monthly sum to be paid to the pensioned employee is determined equal to one per cent of the average monthly earnings of the employee during his preceding ten years' service multiplied by the number of months of service over the age of 65.

Those employees who have not been in the service of the company the full two years, will be included in this insurance plan, and entitled to all the benefits thereof, as soon as they have completed two years of continuous service.

Employees leaving the service of the company for any reason will be able, upon notice, to the life insurance company within 30 days, to exchange their certificates without medical examination for policies in the same amount, but will thereafter pay the regular rate for the ages at which such new insurance is subject to.

Employees who have been with the company as long as six months, but not for two years, will receive identical life and disability insurance, without expense to them, in the sum of \$250 and may take not more than \$250 additional, in groups, at a monthly cost to them of 18 cents. On attaining two years of service such employees will become entitled to all the benefits of the plan.

The within plan and offer are wholly voluntary on the part of the company, which reserves the right to discontinue or modify the plan and these offers, at any time. In case of the discontinuance of the plan the life insurance company undertakes to issue, to any employee requesting the same, provided individual application therefor is made within 31 days of the date of such discontinuance, a new policy or policies, upon plans applicable to the character of the risk, in equal amount or amounts, without medical examination, but at the ordinary rate for insurance at the age of the applicant.

I. C. C. Members Appear in Capper Bill Hearings

Explain Action in Ex Parte 74 and Urge That Rate-Making Law Be Given a Fair Trial

WASHINGTON, D. C.

THE SENATE COMMITTEE on Interstate Commerce on January 5 brought to an end the hearings which have been going on intermittently since October 24 on the Capper and other bills to amend the rate-making provisions of the transportation act. The final witnesses were three members of the Interstate Commerce Commission, who appeared at the request of the committee and expressed the opinion of the commission that it would be a serious mistake to amend the law as proposed. The committee will now proceed to a final determination as to whether a bill shall be reported, but it is understood that it proposes to wait for a time before taking definite action, for a decision of the United States Supreme Court in one of the cases involving orders of the federal commission requiring advances in intrastate rates, so that it seems very unlikely that there will be any legislation by Congress before the 5½ per cent provision of Section 15-a expires on March 1.

Commissioners Hall, Esch and Campbell Appear

H. C. Hall, who has been reappointed as a member of the commission, although the appointment has not yet been confirmed by the Senate, outlined in detail just what the commission did in advancing rates in Ex Parte 74 and in the subsequent proceedings involving intrastate rates, to show the committee that there was no foundation for many of the statements that had been made before it by witnesses representing the state commissions and western shippers of agricultural products who were advocating amendments to the act. He was followed by Commissioners Esch and Campbell, who made brief statements urging that the rate-making provisions of the law be given a fair trial.

How the \$18,900,000,000 Valuation Was Reached

Mr. Hall gave some hitherto unexplained details of the method by which the commission arrived at a tentative valuation of \$18,900,000,000 for the railroads. He denied the assertion frequently made that the property investment accounts of the railroads were taken as a basis and said that the equivalent of the work of one person for four years was required in its bureaus of valuation and statistics in assembling the figures in the possession of the commission from which the figure was finally arrived at. Before the hearing on the rate advance began, Mr. Hall said, Commissioner Aitchison was designated to take charge of the compilation of the data to be used in fixing the value.

Mr. Hall read from a statement prepared by Mr. Aitchison outlining the methods used in preparing the voluminous tables and schedules which were placed before the commission for its decision. This work represented 572 days of service of employees in the Bureau of Valuation and 494 days service of clerks in the Bureau of Statistics. The commission, he said, felt called upon to use to the fullest extent the results of the investigation made under the valuation act since 1913 in so far as it was deemed available. This was largely in the form of working papers and all results produced by the years of work by the bureau were utilized both as to particular roads and as to general principles. The facts taken into consideration were the original cost, the cost of reproduction, depreciation, amount of investment, corporate history of the property, the value of lands, and other values or elements of value. The commission also had before it the property investment accounts, which had been under the supervision of the commission since 1907, although it had not been possible to thoroughly police these accounts during

that time and a thorough study was made of the results of such inspections of the accounts and corrections of errors as had been made in particular investigations by the commission. There was also an investigation of the amount and distribution of additions and betterments that had been made since the date of valuation and of the amounts of working capital, materials and supplies, etc., on hand. The commission also had the earning power of the carriers under different levels of rates and the results during the three-year test period. Consideration was given to all these matters and the resulting sums were capitalized at various percentages.

The value finally determined, Mr. Hall said, happens to be the capitalization of the standard return on which the guaranty for the period of federal control was based, at 5¼ per cent, with due regard for additions and betterments, working capital, etc. "We had all these things before us and our minds finally settled on a figure," he said. "We didn't take \$18,900,000,000 and then distribute it; we worked up to it. We took all the testimony and considered it and our judgment in weighing it represents the composite of many minds." He pointed out that the carriers had claimed as their property investment, \$20,040,000,000.

In reply to a question Mr. Hall said that compilations based on the present market value of stocks and bonds are "not dependable." Testimony on that was offered the commission but no special study on that point was made by it.

Intrastate Rates

Mr. Hall said that the commission would have had to increase rates immediately regardless of the provisions of section 15-a. He denied the statements of advocates of the Capper bill that the commission had ordered state rates raised merely because they were lower than the interstate rates and without proof of specific discrimination. "We in no case," he said, "have regarded disparity alone as establishing either undue prejudice or unjust discrimination. If we had there would have been no occasion to hold any hearings. The disparity was obvious, but we proceeded to investigate each case in the same method that was followed in the Shreveport case. We received detailed evidence to show that the interstate rate was reasonable and in case of some particular rates we reserved our decision because we were not fully convinced that the interstate rate was a reasonable criterion for the intrastate rate. We found that the maintenance of the lower intrastate rate resulted in a manifest and unjust discrimination against interstate commerce and then we had to consider whether the surrounding circumstances and conditions were the same. We found that they were substantially the same. We took the same steps as were taken in the Shreveport case and found not only a difference in rates but unjust discrimination against persons and localities.

"There then remained the question as to how the discrimination should be removed. In the Shreveport case we did not have power to prescribe the intrastate rate. We required the carrier to maintain no higher rates for intrastate traffic than for interstate traffic. But here we followed section 13, paragraph 4, and prescribed the rate to be charged. That gave a short cut to the same result that was effected in the Shreveport case under the old law. The new law is the Shreveport doctrine pure and simple, modified only as to form. The effect was precisely the same."

Mr. Hall also defended the provisions of the Transportation Act which provide for making rates by groups, saying that experience has demonstrated that in large rate cases it

is necessary to consider the carriers in groups because different rates cannot be made for separate lines serving the same communities. "Congress has merely given a legislative sanction," he said, "to what has long been the usage."

Mr. Hall pointed out that only four states, except those that were controlled by state fare laws, had not adopted the increase in passenger fares as prescribed by the Interstate Commerce Commission and only three of the states declined to authorize any increases at all. He denied the repeated statements that had been made that the action of the federal commission had "frozen" the intrastate rate structure in 24 states. At the outside, he said, statements that state rates had been "frozen" could be true only of 13 or 14 states and then only as to particular rates, and the commission's order provided specifically that readjustments could be made in such a way that they did not result in discriminations against interstate commerce, and thousands of such readjustments have been made. He also said he did not recall a case where a state commission has applied to the Interstate Commerce Commission for a modification of the order, except that Kansas asked for a modification as to certain features of the law. Instead they have elected to go to the courts. The commission had received copies of a resolution adopted by the Chamber of Commerce of Aberdeen, S. D., protesting because state rates could not be changed except by order of the Interstate Commerce Commission but, Mr. Hall said, the commission had not made any order whatever as to South Dakota.

He said there is great misunderstanding on that point and in the states where there was no necessity for an order by the Interstate Commerce Commission there is nothing to prevent the state authorities from changing local rates. This question has been so grossly exaggerated, Mr. Hall said, that it is difficult to speak of it with moderation. He also referred to the reductions in hay and grain rates in the west, pointing out that corresponding reductions are being made in the intrastate rates without the necessity of any order by the federal commission. The commission's orders all contain a paragraph pointing out that the orders are without prejudice to any request for a modification in instances where the intrastate rate is not related to the interstate rate and Mr. Hall said that practically there have been no applications for such modification. The commission hopes soon to be able to vacate all of its orders and to put all the states in the same condition as California and other states that "followed suit" when the federal commission raised the interstate rates and thereby retained control of local adjustments.

Majority of Shippers Satisfied With Law

"I believe that the law is functioning," he said, "to the satisfaction of the majority of the shippers of the country and also to the satisfaction of a majority of the state commissions, because most of them have not been interfered with. Some have joined in complaining of our action, but it is largely in the nature of a sympathetic strike for the good of the order."

Senator Cummins referred to the frequent statements that if rates were reduced the net income of the carriers would be increased by reason of increased traffic. Mr. Hall said that is being constantly said and the commission is always open to proof on that point. The commission is now conducting a general rate investigation which will go into that subject. Mr. Hall said that the commission's orders in Ex Parte 74 and the state rate cases are a sufficient answer to all the complaints that have been made before the committee. However, the record in Ex Parte 74 is not before the Supreme Court in the Wisconsin case. In reply to Senator Pomerene, Mr. Hall said that the same questions which have been raised since the rate advance would undoubtedly have been raised if the Transportation Act had contained no new rate making provisions and he agreed with Senator Cummins, who re-

marked that much of the difficulty grew out of necessity for making rate changes in a wholesale way after the war.

Section 15-a Needed to Encourage Investment

Commissioner Esch said he wished merely to remark that Section 15-a was put into the law largely for the purpose of encouraging investment in railroad securities and that he still believes that the section has a function to perform and that its repeal would have an unfortunate effect. Senator Cummins remarked that if it had not been put into the law he believed half of the railroads would now be in the hands of receivers. Senator Pomerene said it is amazing that shippers are so ready to attribute all their ills from any cause to the fact that the law contained a definition of a fair return.

"Based on Public Interest"

Commissioner Campbell said that he was expressing his views as an individual rather than as a member of the commission and he read from notes that he had taken for the purpose of a speech giving his views as to how the law would affect the interests of shippers before he became a member of the commission. "I believe," he said, "that the Transportation Act is the most progressive piece of transportation legislation ever put on the statute books. It recognizes that transportation is a governmental function and that it is the duty of the government to see that proper and adequate transportation is furnished. It is based upon the public interest from beginning to end and it would be the gravest mistake to tamper with it in any way until it has been given a fair trial. The primary object was to stabilize railroad securities and restore the confidence of the investing public in the securities of the railroads. The law enacts into statutory form what the courts have invariably held, that the carriers are entitled to a fair return."

He added that he thought that the time has come when there should be co-ordination of rail and water facilities so that neither form of transportation should be allowed to force the other out of business. This can only be done, he said, by giving to the Interstate Commerce Commission control of water carriers similar to its control of rail carriers. "We are going to wake up some morning," he said, "to find that transportation is clogged and we will need both rail and water facilities."

Mr. Campbell said that he may differ from Congress somewhat in regard to the value of competition because competition and control by the government cannot consistently go hand in hand. It can only mean the survival of the fittest, but all transportation facilities which are serving the public must be allowed to survive and prosper because they are all necessary.

While the Capper bill and the Nicholson bill have been the ones most frequently referred to during the hearings, various modifications of these bills have also been suggested by representatives of the state commissions. Senator Capper has stated on the floor of the Senate that his bill was drafted by Chairman Reed of the Kansas Public Utilities Commission and John E. Benton, solicitor for the National Association of Railway and Utilities Commissioners.

REPORTS OF AUTOISTS running into the sides of trains, breaking down crossing gates and running down crossing flagmen come to one's attention constantly, but one does not often hear of railroad tracks being used for a highway. However, the Southern Pacific reports that at Barnard, Cal., two machines occupied by 8 people turned off the county road at a crossing because of snow and started down the tracks, which had been cleaned by a snow plow. One of the machines stuck in a frog and the other slipped from the ties to one side when the Shasta Limited came along, the engineer stopping the train only two car lengths from the first machine.

"M-V All Weather" Train Control on Raritan River

Induction Apparatus with Limited Speed Control Exhibited Near South Amboy, New Jersey

NEAR PARLIN, N. J., four miles west of South Amboy, on the Raritan River Railroad, on December 15, the M-V All Weather Train Controller Company, of Newark, N. J., gave an exhibition of its automatic train control before four or five hundred spectators, the party having been taken to Parlin in a special train over the Central of New Jersey and the Raritan River. A locomotive and five coaches were used and five tests were carried out satisfactorily.

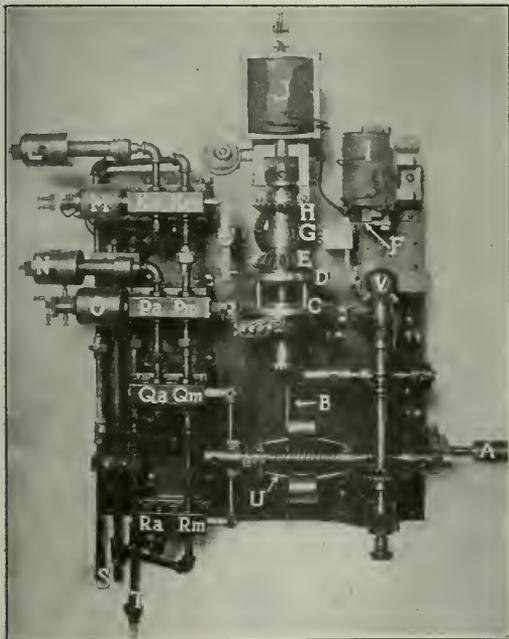

This device is of the induction type with no contact between the locomotive apparatus and the roadway, and no moving parts in the roadway member. The valves control-

stopping, or for slackening speed, the cam, by the influence of a magnet controlled from the roadway, is released, and before causing a brake application is reset at its starting point, to begin a new revolution, preparatory to causing a stop (if a stop shall be required) at the next point.

The air valves, controlling magnets and centrifugal governor (by which latter the speed of the train is made to control the setting of the brakes) are contained in a box fixed on the front of the locomotive and the half-tone illustration is a front view of these parts, the front cover of the box being off.

The collecting coil on the train is hung about 9 in above the level of the top of the rails, being supported on a longitudinal beam beneath the center of the tender. The track magnet is placed midway between the running rails, and the top of the box containing it is flush with the tops of the ties. The arrangement of the magnets of successive sections is shown below.

The scheme contemplates the use of blocks of a length which (including a suitable margin of safety) will correspond to the braking distance for the fastest trains; and the brakes of such trains, for stopping at the entrance of block B C will be applied at A (see diagram). Assuming the presence of a train in section B C, the track relay at B, being open, holds open the wire circuit which energizes the track magnets at sx and at ca. A following train, if moving at more than 30 miles an hour, has its brakes applied at A;

Brake-Setting Apparatus—M-V All-Weather Train Control System

and at sx, if block B C is still occupied, another application of the brakes is made, to bring the train to a stop before it reaches B. The second brake-applying point (sx) is fixed at a sufficient braking distance short of B to stop trains traveling at restricted speed (30 miles an hour). Further details are not made public at this time; but Dr. Charles W. Burrows, consulting engineer of the controller company, has favored us with the description, given below, of the valve-actuating apparatus by means of which the train brakes are set.

The track equipment, taking, for example, block B C, consists of the caution magnet ca, the stop magnet sx, the track circuit relay at B, the track circuit relay at A, and the power line. The roadway circuit which energizes ca and sx (in series) includes these two track magnets, the back contact of the track circuit relay at A, and the front contact of the track circuit relay at B. Each track magnet is virtually the primary of a transformer. This circuit is normally open, due to the fact that the track circuit relay at A is normally closed. When this is opened by the approaching train and that at B is closed (no train in block B C) the track magnets are both energized, preventing the application of brakes.

If a train passing A finds the track magnet at that point (ca) dead, the fact indicates that there is a train in block B C; no magnetic impulse being received from the roadway, the cam causes the application of the brakes until the speed is reduced to the restricted rate (30 miles an hour). If the second magnet (sx) is dead (block B C being still occupied) the valve to cause a full stop is opened. To stop a train the track magnets must be dead; and to allow

ling the setting of the brakes of the train are automatically opened at the approach to each block section, and the brakes are set, unless the valves are held closed, at that point. by what is equivalent to a proceed indication conveyed by induction from the roadway element. This periodical operation of the brake apparatus is accomplished by means of a cam which is revolved, slowly, by gearing actuated through a suitable connection to one of the front truck wheels of the locomotive. The scheme involves the division of the line of road into block sections of equal length, the gearing connecting the truck wheels and the cam or cams being so proportioned that the cam, in its revolution, will have reached its brake-setting position when the locomotive has reached the point on the road where it is desired that the brakes should be applied. If there is no reason for

it to proceed—to prevent the setting of the brakes—must be energized.

The electromagnets on the roadway are of the horseshoe type, consisting of two cores arranged vertically, and a yoke of laminated silicon steel. This yoke is about 30 in. long and of 2 in. x 2 in. section. The vertical members are about 8 in. x 8 in. The magnetizing coils, surrounding the cores, are energized by a 60-cycle alternating current. A magnet consumes, when operating, 30 watts.

The locomotive collecting coil is fixed on a bar of laminated steel fastened under the tender, and it constitutes the secondary of a transformer, the winding of the roadway element being the primary.

In the photographic illustration of the cab mechanism, A is the connection to the wheels of the locomotive and U is the centrifugal governor operating the two sets of valves, Qa-Qm and Ra-Rm. The continuously rotating element is indicated by V at the top of the vertical shaft at the right. The armature of the relay is indicated by F, shown resting against the detent of the lever; and the magnetizing solenoid is indicated by I; this is in series with the coil beneath the tender. The clutch member and the rotating switch are directly behind the miter gear A. The two cams, C and D, are driven, as shown, through a train of gears.

At the top of the picture is shown the cam-resetting magnet J; this is energized from a storage battery, the current of which is controlled by relay I; and when energized pulls up its armature, and with it the miter gear H. This gear rotates continuously whenever the locomotive is in motion, and is free to slide upon its shaft. Normally, H engages the gear G which in turn drives the gear E. This latter is rigidly attached to both cams so that whenever the gears are in the position shown and the locomotive is in motion, the cams are rotated.

When the magnet disengages II from G, the cams cease to revolve and the spring B restores them to normal position. In this position the cam system remains at rest until the re-setting magnet is de-energized and the gear H again engages G.

On the left of the photograph are four pairs of air valves, Ra-Rm; Qa-Qm; Pa-Pm and Ka-Km. Each controls two passages; one, designated by *a* is between the atmosphere and the engineer's valve reservoir (through the pipe T); the other *m*, connects the two sides of a differential air valve (through the two pipes S). The action of this differential air valve is such that the equalization of the pressure in the pipes shuts off communication between the main reservoir and the engineer's brake valve.

The valves Ra-Rm, Qa-Qm are for speed control only and are actuated by the governor U. The valve Ra-Rm is to prevent the maximum allowable speed being exceeded. The centrifugal governor pulls the valve stem to the right, opening pipe T to the atmosphere, making a reduction of pressure in the engineer's brake valve reservoir. Valve Rm connects pipes S, cutting off connection between the main reservoir and the train line. This valve is controlled entirely by the speed of the locomotive.

The valve Ka-Km is controlled by the cam D, as shown. The air passage at the left (Ka) opens into the atmosphere through the reducing valve L, thus connecting the engineer's brake valve reservoir and the atmosphere through the pipe T. The opening at the right (Km) connects the two pipes S and disconnects the main reservoir.

A similarity between the action of the valves Ra-Rm and Ka-Km is obvious. The former is controlled by the rate of the speed and the latter by the distance of travel of the locomotive and each one is independent of the other. While the latter two valves have functions similar to those just described, they differ in this important respect—the application of the air brakes requires the co-operative functioning

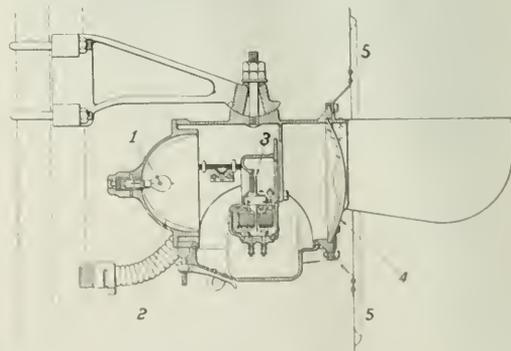

of both valves. Valve Qa-Qm is operated by the centrifugal governor, moving at lower speed than when it operates Ra-Rm. Valve Pa-Pm is operated by the distance of travel of the train but by a shorter distance than is required for Ka-Km. When the centrifugal governor has caused the ports of Qa-Qm to open, connection is made with the corresponding ports of Pa-Pm. If the ports of this valve are closed there is no resultant action on the brake. Valve Pa-Pm through the motion of cam C is open after the train has traversed the prescribed distance. The opening of the passage Pa of this valve connects the atmosphere, through the reducing valve N, to Qa. Consequently, it requires the co-operative action of these two valves to open up a continuous passage between pipe T and the atmosphere. Pm opens a passageway between the pipes S only when Qm is open.

The lower valve is entirely independent of all the other valves and has for its sole function the prevention of excessive speed. The upper valve is entirely independent of all other valves and when operated produces an absolute stop. The co-operating action of the other two valves permits a train to proceed, but at restricted speed.

Valves Pa-Pm and Ka-Km having been opened, there are no mechanical means for restoring them to their normal position. This is accomplished through the energization of the electromagnets M and O. Magnet M restores to its normal position the valve which has brought the train to a stop, but such a full stop will not occur if the engineer has been alert; and the key for closing this circuit is placed where he must descend to the ground to operate it. In the solenoid controlling the other valve, conditions are different; O may be energized from the inside of the cab. In addition, this latter magnet is always operated automatically whenever relay I is energized from the roadway.

The Hall Color-Light Signal

THE RARITAN RIVER RAILROAD, in connection with experiments being conducted with automatic train control, has installed automatic block signaling on a short section of its line, about four miles west of South Amboy, and uses for the visual indication the color-light signal re-

Hall Color-Light Signal

cently brought out by the Hall Switch & Signal Company. This signal, designed to give both day and night indications, consists of a single light, with a reflector, and three indications—red, yellow and green—are given by means of a moveable roundel which is brought into the proper position

for focusing the light on the roundel in accordance with the action of the controlling track relay.

As shown in the illustration, the electric bulb is mounted in the elliptical reflector, 2, the filament being so located as to concentrate the rays of the light on the colored roundel, 3; and these rays diverge again to fill the clear glass lens, 4. The colored roundels, which are one-sixteenth inch thick and one inch in diameter, are fixed in the vane of the operating mechanism. When the actuating relay is energized by current in one direction, the vane swings up and gives the green indication; when energized in the other direction, the vane swings down, showing yellow. In the neutral position (no current flowing) it shows red; and, of course, red would be displayed if the power should fail. The time required for a movement from yellow to green is less than one-sixteenth of a second. The lens, of the Fresnel type, is 10 1/2 inches in diameter.

For long range indications, the lamp is a 10-watt, Argon gas-filled bulb.

The lamp has two filaments looped one within the other, with which arrangement the light will continue to glow notwithstanding the burning out of the main filament.

The lamp has a hood extending in front, as shown, and also a circular disk, indicated by 5, 5, painted black, which serves as a daytime background. A polyphase vane relay movement is employed, but d c relays can be used, the member carrying the roundels being directly connected to a simple iron armature. The armature and its counterweight are the only moving parts.

THIRTY CARLOADS of "cars"—automobiles—were moved recently in a solid train from the plant of the Durant Motor Company, Long Island City, New York, through Canada (over the Canadian Pacific) to the Pacific Coast.

Freight Car Loading

WASHINGTON, D. C.

APPROACH of the holidays resulted in a reduction in freight traffic during the week ended on December 24, according to reports compiled by the Car Service Division of the American Railway Association. These show that 665,927 cars were loaded with revenue freight during that week compared with 727,003 cars the week before, or a decrease of 61,076 cars. This was an increase, however, of 17,521 cars as compared with the corresponding week of 1920 which included Christmas Day but a reduction of 18,857 cars compared with the corresponding week in 1919.

Reductions, compared with the previous week, were reported in the loading of all commodities except coal, which totaled 135,852 cars or 1,010 cars more than the week before. Compared with the corresponding week last year, a decrease of 42,335 cars was reported.

Loading of grain and grain products amounted to 36,793 cars, 10,590 less than the week before but 7,539 more than during the same week in 1920 and 3,501 more than the same week in 1919. Livestock with 22,958 cars was 10,903 less than the previous week but 2,340 more than the corresponding week last year. It was, however, 4,804 cars less than were loaded during the corresponding week in 1919.

Coke totaled 7,140 cars, five less than the week before, while ore declined 46 cars to a total of 5,489. There were 45,518 cars loaded with forest products, 3,172 cars less than during the week before. This was, however, 7,000 cars more than were loaded during the same period in 1920 and 3,598 more than during the corresponding week in 1919.

Loadings of merchandise and miscellaneous freight, which includes manufactured products, totaled 412,177 cars. While this was 37,370 cars below the total for the week before it

REVENUE FREIGHT LOADED—WEEK ENDED SATURDAY, DECEMBER 17, 1921

District	Year	Grain and grain products	Live stock	Coal	Coke	Forest products	Ore	Mdse. L. C. L.	Miscellaneous	Total revenue freight loaded

was 49,180 cars more than were loaded during the corresponding week last year, which included Christmas, and 14,315 cars more than were loaded during the corresponding week in 1919.

Compared by districts, reductions in the loading of all commodities under the week before were reported by all except the Pocalontas, which showed a slight gain but, with the exception of the Allegheny district, all reported increases over the corresponding week last year.

The summaries for the weeks of December 17 and December 24 are given on the preceding page.

The car surplus continues to increase. For the period ending December 23 the total was 404,214 cars, classified: Box cars, 157,695; gondolas, 197,232, and miscellaneous cars, 49,287. The total increase of 32,993 cars is 8.9 per cent over the figure for the week ended December 15.

The bad order cars, however, showed a decrease during the period ending December 15 to 308,556 or 13.5 per cent, as compared with 14 per cent on December 1.

Invariably during a period of rapidly increasing surplus of freight cars, such as exists at present, there arises discussion of the relation of the car hire or per diem rate between railroads and the trend of empty mileage. The Car Service Division has given very careful consideration to this question and has reached the following conclusions.

1. That the per diem rate is a comparatively minor factor in the per cent of empty mileage.

2. That the per cent of empty mileage is influenced primarily by fluctuations in traffic.

3. That sudden decreases in traffic always result in an immediate increase in the per cent of empty mileage, which, however, may vary according to the changes in the relation of the tonnage moved of one class of traffic to another.

For the period ended December 23 the surplus increased to 470,516 cars, of which 191,707 were box cars and 221,614 were coal cars.

Senate Delays Confirmation of I. C. C. Appointments

WASHINGTON, D. C.

PRESIDENT HARDING'S recent action in reappointing Commissioners Aitchison and Hall to the Interstate Commerce Commission upon the expiration of their terms on December 31 has caused a row in the Senate because of protests by Southern senators on the ground that the South was not given additional representation on the commission; this may delay confirmation by the Senate for some time.

The failure of the Senate to confirm the appointments before the holiday recess left two vacancies in the commission on January 1 although the two men were retained by the commission temporarily as special examiners. They did not sit during the arguments in the valuation cases heard by the full commission on January 4, 5 and 6, although Mr. Hall testified on behalf of the commission before the Senate committee on interstate commerce on January 5 in the hearing on the Capper bill.

Action by the Senate was also postponed partly because of the absence of Senator La Follette, who had announced his intention of presenting a minority report dissenting from the action of the Committee on Interstate Commerce which had approved of the nominations. The delay in confirmation also prevented Mr. Aitchison and Mr. Hall from sitting at the hearings in the general rate investigation which were resumed on January 11. They, with Commissioners Esch and Lewis, had been designated by the commission to hear the testimony in that case before the reappointments of Commissioners Aitchison and Hall had been sent to the Senate by the President.

Opposition to Mr. Aitchison's reappointment was voiced by Senator Trammell of Florida in open session of the Senate on January 5, when he introduced a bill providing that members of the Interstate Commerce Commission shall be appointed from 10 different sections of the United States, with one at large, and that not more than one member shall be appointed from any one state. Mr. Trammell said he had been informed by a man connected with the lumber industry of the South that Mr. Aitchison, after encouraging a reduction in lumber rates from the Northwest made voluntarily by the railroads, had tried to influence the commission against deciding in favor of a reduction in hardwood lumber rates from the South in the case now pending before the commission which has not been decided.

Senator Trammell said he had introduced the bill because it does not seem to be the policy of the President to appoint the membership of the commission from different sections. He said the great Southern part of the country has no representation upon the commission, while the Northwest has had three representatives, Mr. Hall from Colorado, Mr. Aitchison from Oregon, and Mr. Campbell from Washington. Wisconsin has two members, Mr. Meyer and Mr. Esch, and New Jersey has two, Mr. Daniels and Mr. Cox. The senator said he did not mean that the members of the commission would not feel disposed to represent the United States in general, but that unquestionably in dealing with problems with which they are more familiar they are in a better position to pass upon them and make equitable adjustments than if they have only the information that is brought to them when the particular rate question is pending.

Senator Simmons asked if the states of Colorado, Oregon and Washington are not in the same classification territory, but Senator Cummins pointed out that the railroad problems are not centered around or confined by classification territory. For instance, the problems of the Pacific Coast, which are said to be represented by Mr. Aitchison, are entirely different from the problems of the intermountain country from which Mr. Campbell comes, while Mr. Hall may be said to be familiar with the problems arising in the territory east of the Rocky Mountains. He pointed out that Commissioner McChord of Kentucky comes from the Southern classification territory, but he agreed that that does not meet the suggestion made by the senator from North Carolina and the senator from Florida, because the country extending southeast along the Atlantic Ocean in which land transportation must meet the competition of ocean transportation, has its big problems as well. He thought it would not be amiss if there were some member of the commission from that country.

Senator Ransdell asked if he would not extend it to the Gulf and take in Louisiana, Mississippi and Texas, to which Senator Cummins replied that the same suggestions could be made about that territory, but he was simply trying to explain that the difference in problems is not represented by classification territories.

In charging Mr. Aitchison with discrimination in favor of the Northwest against the South, Senator Trammell declared that while Mr. Aitchison was heartily in sympathy with the railroads making a voluntary reduction of about 16 per cent in the rates on lumber from the West to the Central West and the East, when the question of a reduction from the Southern states was raised, "Mr. Aitchison, instead of trying to assist in bringing about a voluntary reduction or a forced reduction, if necessary, in freight rates, balked in every way possible, I am informed, the plan to secure a reduction in the rates upon lumber especially from the South."

Senator Cummins immediately asked whether the senator had before him the record of the case to which he referred. Senator Trammell said he did not understand that the case had been decided, but that the information had been given him by a man familiar with the case. He said that it was

understood that the railroads had promised that if the hardwood case resulted in a reduction they would make similar reductions in the rates on yellow pine from Southern territory. He said he had been informed that "a few days ago, with nine members of the commission present, with five members probably against reducing the rates on hardwood lumber from Southern territory, Mr. Aitchison, who was against the rate reduction, attempted to force a decision in the case."

Senator McNary of Oregon rose to the defense of Mr. Aitchison, saying he believed it is unfair for any one to affirm he has not acted fairly and justly toward all sections and pointing out that for Western lumber the railroads came into competition with water carriers. Senator Overman of North Carolina said he knew of no reason why Mr. Aitchison should not be confirmed, but if what the Senator from Florida says is true, he ought not to be confirmed. He said he had held up the appointments before the holidays as a protest because the great Southern territory had been absolutely ignored, not only by President Harding, but by President Wilson. He said the South had had no representative since the death of Judge Clements and that he had heard

that when a question of rates on cotton recently came before the commission it developed there was not a member who knew what lint cotton was.

Senator Fletcher of Florida also joined in the debate and asked if the hardwood case has not been pending for some time and if the whole question of reducing the rates on yellow pine and other timber from the South is not dependent upon the decision in the hardwood case in which Mr. Aitchison was said to have opposed a reduction. Senator Cummins pointed out that there is no competition between the West and the South on hardwood and said it seemed to him to be very far-fetched to charge that because Mr. Aitchison may be opposed to a reduction in the rates on hardwood, he is doing the South an injustice. "I do not know that he is," he said. "I think that one ought to be pretty careful with respect to his facts before he makes a charge that an officer holding the position Mr. Aitchison does, is consciously influenced because of the interest he may have in the locality from which he comes."

The matter was considered in executive session later in the day, but no action was taken.

I. C. C. Proposes to Order Automatic Train Control

49 Roads Ordered to Show Cause Why Installation Should Not Be Required by July 1, 1924—Specifications

WASHINGTON, D. C.

THE INTERSTATE COMMERCE COMMISSION on January 10 served upon 49 railroads an order to show cause by March 15 why it should not adopt a report and enter an order requiring them to install by July 1, 1924, between designated points in their main lines, automatic train stop or train control devices complying with specifications and requirements set forth in the order which the commission has determined upon as the result of its investigation conducted pursuant to section 26 of the interstate commerce act.

The device, according to the proposed order, is to be applicable to or operated in connection with all road engines running on or over at least one full passenger locomotive division included in the part of the main line between the points named. It further provides that each carrier named shall submit to the commission complete and detailed plans and specifications prior to the installation and that by July 1, 1922, they shall file complete and detailed plans of the signal systems in use and a report of the number and type of locomotives assigned to or engaged in road service on the designated portions of line and shall proceed diligently and without unnecessary delay to select and install the devices as specified. They are also to file with the commission on or before July 1, and each three months thereafter full and complete reports of the progress made with the preparation for and the installation of the devices, which together with the manner and details of the installation shall be subject to the approval of the commission or the division of the commission to which the matter may be referred.

Report of the Commission

The report of the commission says:

This is a proceeding initiated by us under Section 26 of the interstate commerce act under which we are authorized after investigation to order any carrier by railway subject to the act to install automatic train-stop or train control devices or other safety devices.

Under Public Resolution No. 46, approved June 30, 1906, the Congress directed us to investigate and report on the use of and necessity for block signals for automatic control of railway trains in the United States. The sundry civil appropriation act,

approved May 26, 1908, contained a provision directed to the same end and appropriated some fifty thousand dollars for the purpose. Under the above resolution the Block Signal and Train Control Board was created and was employed by the commission from 1907 to 1912 to study the subject and to investigate numerous automatic train-stop and train-control devices presented by various designers and patentees. Reports of these investigations have been made to us with recommendation as to specifications and requirements. Since 1912 the commission's Bureau of Safety has continued these investigations. Under the United States Railroad Administration investigations were made by a special Automatic Train-Control Committee and further specifications and requirements were recommended. The records and files of this committee have been transferred to this commission.

Investigation Has Proved Worth

The conclusions arrived at as a result of these several investigations conducted from 1906 to 1920, were identical in substance, namely, that automatic control of trains is practicable; that the use of automatic train control devices is desirable as a means of increasing safety and that the development of automatic train-control devices had reached a stage warranting installation and use of such devices on a more extended scale. The results of these investigations and the conclusions thereon were published from time to time and attracted widespread attention commensurate with the importance of the subject. The attentive investigations with their satisfactory results, and the recognized obvious need for some such device resulted in the inclusion in the transportation act of 1920 of a section which places upon us the duty after investigation of ordering the installation by the carriers, in locations designated by us, of automatic train-stop or automatic train-control devices which comply with prescribed specifications and requirements.

Since that section was passed we have been urged to require the installation of various automatic train-control devices. We were not disposed, however, to issue an order requiring the installation by any carrier of any such device without further investigation and a review of past investigation and performances together with a thorough check under our own supervision of the actual performances of these devices as installed and in operation.

To that end and in order to carry out the provisions of Section 26 in the most effective and expeditious manner, we invited the co-operation of the American Railway Association. A joint committee on automatic train control consisting of representatives of the signal section and the operating, engineer and mechanical divisions of that association was appointed in November, 1920.

The joint committee has been engaged in connection with our Bureau of Safety, since November, 1920, in studying the perform-

ances of train-control devices under varying service conditions and has rendered us valuable aid. We have had the advantage of the specifications and requirements developed from these practical demonstrations.

Record has been kept by our Bureau of Safety of service operations on portions of the lines of the Chesapeake & Ohio, the Chicago, Rock Island & Pacific, and the Chicago & Eastern Illinois railroad companies, equipped with different automatic train-stop and train-control devices, each of which shows a high degree of efficiency. Data have been gathered upon the effect of the devices upon railroad operating conditions, upon problems of installation and maintenance on an extended scale, upon installation, operating and maintenance costs and upon the revisions made or required in the several devices.

Savings From Safety

The matter of cost is the basis upon which the carriers have raised objection to an order requiring the installation of automatic stop or train-control devices. Like objection has been made to the installation of all other safety devices which are now in use and which have long since demonstrated their practicability and necessity. This objection has been raised in prosperous as well as in non-prosperous years. Yet the compensation from a financial standpoint, which will result from the securing added safety in train operations should not be overlooked. In the hearings before the Committee on Interstate and Foreign Commerce when Section 26 was under consideration certain statistics gleaned from our accident reports were presented showing that from 1909 to 1917, both inclusive, there were 13,339 head-on and rear-end collisions resulting in damage to railroad property alone of over nineteen million dollars. These collisions resulted in death to 2,454 persons and injury to 37,724. In other words, the annual average of these collisions amounted to 1,482, the average number of killed to 272, and of injured to 4,191. During the two and one-half years from January 1, 1918, to June 30, 1920, inclusive, there were 3,226 such collisions, resulting in the deaths of 635 persons and injury to 6,240. The damage to railroad property amounted to over seven million dollars. If to the large property loss there be added the death losses and the damages paid for persons injured the total rises to enormous figures. If these vast sums which represent total losses to the carriers had been expended in the installation of block signal systems or automatic train-stop or train-control devices many thousands of miles of road could have been equipped.

In the report of the chief of the Bureau of Safety for the fiscal year ended June 30, 1921, it is shown that during the fiscal year 97 train accidents were investigated consisting of 62 collisions and 35 derailments. The collisions resulted in the death of 194 persons and the injury of 849 persons. The derailments resulted in the death of 77 persons and the injury of 518 persons, a total of 271 killed and 1,367 injured. Twenty-six of the collisions occurred on lines operated by the block signal and of these 17 occurred where automatic signals were used. Of the 17, 8 were rear-end collisions, 4 were head-end collisions, and 3 were side collisions. Of these 17 collisions occurring in block signal territory there were 13 cases in which engineers, pilots or motormen failed properly to observe or obey signal indications. These undoubtedly would have been prevented had an adequate automatic train control system been in use.

Recent Accidents

Since the above report was made several accidents resulting in large loss of life and property have occurred. A rear-end collision between two passenger trains on the Pennsylvania Railroad near Manhattan Transfer, New Jersey, in which 46 persons were injured could doubtless have been prevented had the automatic train control system in use from the Pennsylvania Terminal, New York City, to the Hackensack River been extended to the Manhattan Transfer, a distance of some two miles. In December, 1921, a wreck occurred on the Philadelphia & Reading road a few miles out of Philadelphia, resulting in the death of 23 persons and injury to many others. Had there been an adequate automatic train control device on that road this wreck would not have occurred.

Our investigations have shown that automatic train control has not only passed the experimental stage. In fact, no safety devices, such as the automatic coupler, the air brake and the automatic train signal, were perfected to as high a degree as the automatic train control before they were either ordered installed or were voluntarily adopted.

Practicable and Necessary

The thirteen years of investigation and study, the service tests under varying conditions and the results obtained in the actual implementation of the device, over periods of years upon some of the roads, have clearly demonstrated the practicability of and the necessity for automatic train-stop or train-control. The time has now arrived when the carriers should be required to select and install such device or devices which meet our specifications and

requirements. Under the act our order cannot be made effective before the expiration of two years from the date thereof. The fixing of a time limit must be based upon a consideration of the time which has already run since the passage of the act, and the progress and present state of automatic train control. There must be considered also the time reasonably required to enable the carriers to select suitable devices from among those available, to develop them and to meet their operating conditions and requirements in the designated locations and to provide for the manufacture and installation of the apparatus.

The definitions, functions, requirements and specifications which we have adopted are set forth in the appendix. They are based upon the facts developed in our investigations and upon the requisites laid down by the Block Signal and Train Control Board report in 1912, the requisites of the Railroad Signal Association adopted in 1914, and those of the Automatic Train Control Committee of the United States Railroad Administration in 1919, together with the definitions and functions reported by the Joint Committee on Train Control of the American Railway Association in March, 1921.

The railroads hereinafter designated which are required to install upon the designated portions of their roads, automatic train control devices in accordance with our specifications and requirements, have been selected with regard to the measure of the risk of accident in connection with traffic conditions thereon.

We have decided not to limit by our order the installation of these devices to roads or parts of roads already equipped with automatic block signals, because we have no desire to discourage efforts for automatically controlling trains without the aid of the fixed wayside signals. The statement, therefore, as to the primary function of automatic train-stop or train-control devices recognizes the possibility of establishing such a device without the use of automatic block signals in conjunction therewith.

The Roads Affected

The list of railroads to which the order was issued and the parts of their lines designated is as follows:

Atelison, Tonala & Santa Fe, between Chicago and Newton, Kan.
Atlantic Coast Line, between Richmond, Va., and Charleston, S. C.
Baltimore & Ohio, between Baltimore and Pittsburgh.
Boston & Albany, between Boston and Albany.
Boston & Maine, between Boston and Portland, Me.
Buffalo, Rochester & Pittsburgh, between Rochester and Lutter, Pa.
Central Railroad of New Jersey, between Jersey City and Scranton.
Chesapeake & Ohio, between Richmond, Va., and Clifton Forge, Va.
Chicago & Alton, between Chicago and Springfield, Ill.
Chicago & Eastern Illinois, between Chicago and Danville, Ill.
Chicago & Erie, between Chicago and Salamanca, N. Y.
Chicago & North Western, between Chicago and Omaha.
Chicago, Burlington & Quincy, between Chicago and Omaha.
Chicago, Indianapolis & Louisville, between Chicago and Louisville, Ky.
Chicago, Milwaukee & St. Paul, between Chicago and St. Paul.
Chicago, Rock Island & Pacific, between Chicago and Rock Island, Ill.
Chicago, St. Paul, Minneapolis & Omaha, between Minneapolis and Omaha.
Cincinnati, New Orleans & Texas Pacific, between Cincinnati and Knoxville, Tenn.
Cleveland, Cincinnati, Chicago & St. Louis, between Cleveland and St. Louis.
Delaware & Hudson Company, between Wilkes Barre, Pa., and Albany.
Delaware, Lackawanna & Western, between Hoboken and Buffalo.
Erie Railroad, between Jersey City and Buffalo.
Galveston, Harrisburg & San Antonio, between El Paso, Texas, and Houston.
Great Northern, between St. Paul and Minot, N. D.
Illinois Central, between Chicago and Menasha.
Kansas City Southern, between Kansas City and Texarkana, Texas.
Lehigh Valley, between Jersey City and Buffalo.
Long Island, between Jamaica and Montauk.
Louisville & Nashville, between Louisville and Birmingham.
Michigan Central, between Chicago and Detroit.
Missouri Pacific, between St. Louis and Kansas City.
New York Central, between Albany and Cleveland.
New York, Chicago & St. Louis, between Chicago and Cleveland.
New York, New Haven & Hartford, between New York and Providence, R. I.
Norfolk & Western, between Roanoke, Va., and Cambridge, Ohio.
Northern Pacific, between St. Paul and Minot, N. D.

Western Maryland, between Baltimore and Cumberland, Md.

Specifications and Requirements for Automatic Train-Stop or Train-Control Devices

The definitions, functions, requirements and specifications governing the installation and operation of automatic train-stop or train-control devices prescribed are given in the appendix as follows:

Purpose.

The purpose of this general specification is to define automatic train-stop or train-control devices and to outline essential features involved in their design, construction and installation on railroads.

Definition of Automatic Train-stop or Train-control Devices.

A system or installation so arranged that its operation will automatically result in either one or the other or both of the following conditions:

First—Automatic Train-stop—The application of the brakes until the train has been brought to a stop.

Second—Automatic Speed Control—The application of the brakes when the speed of the train exceeds a prescribed rate and continued until the speed has been reduced to a predetermined and prescribed rate.

Functions.

In prevailing practice the primary function of automatic train-stop or train-control devices is to enforce obedience to the indications of fixed signals; but the feasible operation of essentially similar devices used without working wayside signals may be regarded as a possibility. The following features may be included, separately or in combination, in automatic train-stop or train-control systems:

1. Automatic Train-Stop.

Without manual control by the engineman, requiring the train to be stopped; after which the apparatus may be restored to normal condition manually and the train permitted to proceed.

2. Automatic Train Control or Speed Control.

(a) Automatic stop, after which a train may proceed under low-speed restriction until the apparatus is automatically restored to normal or clear condition by reason of the removal of the condition which caused the stop operation.

(b) Low-speed restriction, automatic brake application under control of the engineman who may, if alert, forestall application at a stop indication point or when entering a danger zone and proceed under the prescribed speed limit, until the apparatus is automatically restored to normal or clear condition by reason of the removal of the condition which caused the low-speed restriction.

(c) Medium-speed restriction, requiring the speed of a train to be below a prescribed rate when passing a caution signal or when approaching a stop signal or a danger zone in order to forestall an automatic brake application.

(d) Maximum-speed restriction, providing for an automatic brake application if the prescribed maximum speed limit is exceeded at any point.

General Requirements.

1. An automatic train-stop device shall be effective when the signal admitting the train to the block indicates stop, and so far as possible when that signal fails to indicate existing danger conditions.
2. An automatic train-control or speed-control device shall be effective when the train is not being properly controlled by the engineman.
3. An automatic train-stop, train-control or speed-control device shall be operative at braking distance from the stop signal location if signals are not overlapped, or at the stop signal location if an adequate overlap is provided.

Design and Construction.

1. The automatic train-stop or train-control device shall meet the conditions set forth under general requirements applicable to each installation.
2. The apparatus shall be so constructed as to operate in connection with a system of fixed block or interlocking signals, if conditions so require, and so inter-connected with the fixed signal system as to perform its intended function:
 - (a) In event of failure of the engineman to obey the signal indications; and
 - (b) So far as possible, when the signal fails to indicate a condition requiring an application of the brakes.
3. The apparatus shall be so constructed that it will, so far as possible, perform its intended function if an essential

part fails or is removed, or a break, cross or ground occurs in electric circuits, or in case of a failure of energy.

4. The apparatus shall be so constructed as to make indications of the fixed signal depend, so far as possible, upon the operation of the track element of the train-control device.
5. The apparatus shall be so constructed that proper operative relation between the parts along the roadway and the parts on the train will be assured under all conditions of speed, weather, wear, oscillation and shock.
6. The apparatus shall be so constructed as to prevent the release of the brakes after automatic application until the train has been brought to a stop, or its speed has been reduced to a predetermined rate, or the obstruction or other condition that caused the brake application has been removed.
7. The train apparatus shall be so constructed that, when operated, it will make an application of the brakes sufficient to stop the train or control its speed.
8. The apparatus shall be so constructed as not to interfere with the application of the brakes by the engineman's brake valve or to impair the efficiency of the air brake system.
9. The apparatus shall be so constructed that it may be applied so as to be operative when the engine is running forward or backward.
10. The apparatus shall be so constructed that when two or more engines are coupled together, or a pushing or helping engine is used, it can be made operative only on the engine from which the brakes are controlled.
11. The apparatus shall be so constructed that it will operate under all weather conditions which permit train movements.
12. The apparatus shall be so constructed as to conform to established clearances for equipment and structures.
13. The apparatus shall be so constructed and installed that it will not constitute a source of danger to trainmen, other employees or passengers.
14. The apparatus shall be so constructed, installed and maintained as to be safe and suitable for service. The quality of materials and workmanship shall conform to this requirement.

Railroads Reducing Their Debt to the Government

WASHINGTON, D. C.

THAT THE RAILROADS are beginning to make some headway in reducing their indebtedness to the federal government, incurred during the war period and in connection with the transition from federal control to private management, is indicated by recent reports by various branches of the government.

A statement issued by the Treasury Department on January 3 shows that while a total of \$270,740,217 had been loaned to 72 companies from the revolving fund of \$300,000,000 created by Section 210 of the Transportation act, on certificates issued by the Interstate Commerce Commission, 17 of the railroads had made repayments amounting to \$32,423,360.65. Of the \$300,000,000 fund, \$40,000,000 was served by the commission for claims, judgments, etc., against the Railroad Administration arising out of federal control, but the fund has been considerably increased by interest payments by the roads which received loans, and by repayments. Under the law the time within which applications for loans may be made is limited to February 28, 1922.

The annual report of the War Finance Corporation also shows that of \$204,794,520 loaned to railroads since April 5, 1918, all but \$26,733,210 had been repaid. According to a report by the director general of railroads to the Senate (as of December 1) the railroads still owed the Railroad Administration \$507,628,508 on account of the \$1,144,000,000 of capital improvements made by the government while it was in control of the railroad properties, the balance having been taken care of partly in cash and partly in railroad securities which are gradually being

sold by the Railroad Administration to private investors. The sale of these securities has provided the Railroad Administration with funds with which to settle gradually its indebtedness to the railroads, amounting to \$750,670,588 on December 1, as the balance of the rental guaranteed during federal control, and on account of cash taken over when the railroads were taken, under-maintenance, materials and supplies, depreciation, and other accounts, including interest. In some cases the indebtedness of a road to the government is offset against what the government owes the company, in making final settlement, but in some other cases the amount owed by the road for additions and betterments is funded for a period of years and not used as an offset.

The bill proposed by the President to authorize the War Finance Corporation to purchase railroad securities from the Railroad Administration up to \$500,000,000 and thus enable it to effect its settlements with the railroads more rapidly, failed of passage in the Senate.

The repayments on loans made during 1920 and 1921 from the revolving fund have been as follows:

Ann Arbor	\$ 60,000.00
Atlanta, Birmingham & Atlantic	20 000.00
Bangor & Aroostook	4,000.00
Carolina, Clinchfield & Ohio	2,000,000.00
Chicago Great Western	240,000.00
Chicago, Indianapolis & Louisville	45,000.00
Chicago and Western Indiana	89,000.00
Great Northern	15,134,000.00
Illinois Central	296,000.00
Kansas City, Mexico & Orient	2,500,000.00
Long Island	219,000.00
Missouri Pacific	4,362,000.00
National Railway Service Corporation	388,660.65
New York Central	990,000.00
Northern Pacific	6,000,000.00
Salt Lake & Utah	15,700.00
Waterloo, Cedar Falls & Northern	60,000.00
	\$32,423,360.65

Since the last announcement on December 1 payments on loans certified by the Interstate Commerce Commission have been made as follows:

Alabama, Tennessee & Northern	\$ 399,000.00
Carolina, Clinchfield & Ohio	6,000,000.00
Chesapeake & Ohio	1,334,300.00
Chicago Great Western	240,000.00
Evansville, Indianapolis & Terre Haute	50,000.00
Kansas City, Mexico & Orient	2,500,000.00
Seaboard Air Line	139,500.00
Western Maryland	300,000.00
	\$10,963,000.00

Commission Resumes General Rate Inquiry

Carriers Present Additional Statistical Testimony—Willard Says Rate of Return Should Not Be Less Than 6 Per Cent

WASHINGTON, D. C.

HEARINGS in the rate inquiry being conducted by the Interstate Commerce Commission were resumed on Wednesday, January 11, before Commissioners Esch and Lewis. Later Commissioner Campbell joined them. Commissioners Hall and Aitchison were unable to sit because their reappointment as members of the commission have not been confirmed by the Senate. At the opening of the hearing, Richard Waterman, secretary of the Railroad Committee of the Chamber of Commerce of the United States, presented a letter from Joseph H. DeFrees of the chamber, asking the commission to invite Secretary Hoover of the Department of Commerce to appear as a witness before the commission as the official representative of American commerce, saying that it would add a great deal to the testimony to have the information at his disposal added to record. Commissioner Esch said that this plan would be carried out. Additional statistical testimony from the railroads in the various groups which had been requested by the commission, but which the railroads had been unable to furnish completely at the previous hearing, was then introduced by statistical witnesses.

Statistical Testimony

D. S. Brigham, assistant to the president of the Boston & Maine, presented an exhibit for the New England roads, excluding the Boston & Albany, showing that for the year from September, 1920, to October, 1921, these roads had had a deficit of \$7,913,789, a shortage of \$57,370,953 under a 6 per cent return. For the four months, July 1 to October 31, 1921, these roads had earned a net return at the rate of 2.3 per cent, or \$7,176,532. Mr. Brigham also presented an exhibit, as requested by representative of the shippers, showing the operating results of the year ended October 31 adjusted to meet present rates and costs. This showed a constructive net railway operating income of \$22,530,193 or at the rate of 2.61 per cent.

Only 13 Roads Earn Over 6 Per Cent

Exhibits presented by George M. Shriver for the Eastern roads, L. E. Wetling for the Western roads, and G. W.

Lamb for the Southern roads, showed that only 13 of the Class I railroads in the United States earned an excess over 6 per cent on their property investment during the year ended September 30, 1921. In the Eastern district there were seven such roads, the Cincinnati Northern; Delaware, Lackawanna & Western; Detroit & Toledo Shore Line; Lehigh & New England; Michigan Central and Perkiomen, while 14 roads in the Eastern district had actual deficits for the year. In the Western district 6 roads had an excess over 6 per cent, the Beaumont, Sour Lake & Western; Fort Worth & Denver City; Gulf, Colorado & Santa Fe; Louisiana Western; St. Louis, Brownsville & Mexico and Union Pacific, while 17 had deficits. In the Southern district all of the roads had a shortage under a 6 per cent return and 12 had deficits. For the Eastern roads the shortage under a 6 per cent return was \$321,671,713; for the Western roads it was \$267,130,827, and for the Southern roads it was \$187,643,605. These figures for the Eastern and Western districts are exclusive of certain roads which failed to report.

The exhibits for the three districts were compiled on the same basis and gave the percentage earned for each month since September, 1920, for the 12 months ending September 30 and for the available months since the wage reduction on July 1. The Eastern roads, which in the 12 months ending September 30 earned at the rate of 2.79 per cent during the five months from July 1 to November 30 earned at the rate of 4.40 per cent. The Western roads, which for the 12 months ending September 30 earned at the rate of 3.3 per cent during the five months since the wage reduction earned at the rate of 5.16, while the Southern roads, which for the 12 months' period earned at the rate of 1.95 during the five months' period earned at the rate of 3.81. The exhibits also gave a statement of the additions and betterments made during the year ended September 30 and an estimate of the amount required to be spent in 1922 chargeable to capital account. For the Eastern roads the amount required to be spent in 1922, based on the present volume of traffic, was estimated at \$458,280,327, with an addition of \$400,006,068 based on the volume of traffic under normal conditions. For the Western roads the requirement for 1922 based on present

volume of traffic was \$248,256,502 and the additional amount for a normal volume of traffic was \$128,534,845. For the Southern district the estimated requirement based on present volume of traffic was \$85,368,982 and the additional amount for a normal volume of traffic \$104,502,331.

Mr. Shriver had an exhibit based on reports of three railroads covering about 70 per cent of the total material purchases excluding fuel showing an increased cost at September, 1921, prices of 101.8 per cent over the test period but a decrease at October, 1921, prices of 28.6 per cent under the prices of September 1.

Efficiency of Operation

Testimony regarding the efficiency of railroad operation was given by R. H. Aishton, president of the American Railway Association, who described the organization and work of that association which through its various committees and divisions is constantly making studies of improved methods and practices for the benefit of all the roads.

"The association exercises no managerial functions," Mr. Aishton said, "and each railroad also has its own organizations of experts who are endeavoring at all times to find better methods, but this organization co-ordinates the best thoughts of the best railroad experts in the country and places the results where they may be used by the individual roads in their own way and applied to their own problems."

Mr. Aishton showed for example that progress has been made by the railroads in reducing the number of claims for loss and damage and the time required to adjust them. The average number of claims received by each road was reduced from 1,791 in September, 1920, to 907 in August, 1921, and the average time required to adjust claims has been reduced to about 20 days. Mr. Aishton also showed that the railroads had reduced their fuel consumption per train mile and per ton mile.

While the average mileage per car per day, the average car load and the percentage of empty car miles had shown decreases during 1921 he showed that this was the natural effect of the reduction in the volume of traffic. Excluding bad order and surplus freight cars, he showed, the average miles per freight car per day had increased in 1921 and the average train speed had increased from 10.3 to 11.6 miles per hour.

The Car Service Division, Mr. Aishton said, has given very constant study to the reduction of empty car mileage, but has found that this is very largely determined by the character and volume of business. For 15 years the average percentage of empty car mileage was 31.4. During the 26 months of federal control it was 31.6, although the cars were pooled, and for the 12 months ending September 30, 1921, it was 37 per cent.

Asked to make some general observations on the efficiency of railroad operation, Mr. Aishton said that it is difficult to find anything with which to make a comparison, but he said that in his 40 years of experience he had never seen any class of men that made greater efforts to bring about economy and efficiency than the railroad men. He was not prepared to say that any better results could be obtained by consolidation of terminals than are obtained today.

Mr. Aishton was followed by Daniel Willard, president of the Baltimore & Ohio, who gave a general statement reviewing the circumstances under which the transportation act was passed, the result which the framers of the act expected it to accomplish and the developments since with particular reference to the series of questions put to the carriers by the commission for the purposes of this inquiry.

Willard Says Rate Reductions Now Unwise

Mr. Willard said that the carriers are in no financial condition at present to make a general reduction in freight rates. Rates will eventually come down, Mr. Willard said,

but he added that to hasten the movement unduly would in his judgment be unwise and would not tend to promote the larger public interest.

"The carriers, unable to provide from earnings in the past reserves such as contemplated in the transportation act, are not now in position to make a general rate reduction in anticipation of possible lower operating costs to follow," said Mr. Willard. "While the present condition of affairs in the country and the rest of the world is difficult and trying, it is the logical sequence to the war and must be borne until by means of orderly and well considered processes a more normal condition can be brought about. I do not think the best interest of the public would be promoted at this time by action of any kind which would tend to immediately reduce the revenue of the carriers.

"High as railroad charges are, they are not higher relatively than other prices are or were and it is important to remember that railroad charges or prices were the very last to go up and in the nature of things can not be the first to come down. They can and will participate in the downward movement of all other prices."

Mr. Willard pointed out that even before the general freight increase went into effect on August 26, 1920, "the industrial and economic readjustments which were world wide and which were a natural outcome of the war had begun," only to be reflected some months later in this country by a sharp business decline.

"The carriers," he continued, "subject as they are to regulation by the governmental agencies of the states and nation were not able to promptly reduce their expenditures in keeping with their declining revenues and this in turn served to shrink the net earnings of the carriers so seriously that they were compelled, in order to maintain their financial integrity, to resort to forced economies in all directions, which in turn meant fewer men employed and less material used and purchased. This enforced policy on the part of the railroads contributed in a measurable degree towards accentuating the business depression."

Mr. Willard said the financial results already attained by the railroads have been accomplished "only by forced economies that are neither in the public interest nor can they be indefinitely continued."

"Railroad rates," Mr. Willard said, "are now and always have been subject to certain fundamental economic laws against which they can not prevail and the mere operation of such laws and influences will tend constantly to bring about lower rates just as has been the case not only during the last year but during all the years of railroad operation.

"I suppose the real question now is this—are railroad rates declining as rapidly as the public has fairly a right to expect? Are the railroad managers doing all that can be fairly expected of them to reduce the cost of transportation? My answer is 'yes.' In my opinion to accelerate the downward movement artificially at this time would injure the roads and would not benefit the public."

Mr. Willard proposed that not less than 6 per cent on the value of the property used for transportation purposes be adopted by the commission as constituting a rate of fair return after March 1 next when the percentages prescribed by the transportation act automatically expire under the law.

"When Congress," the witness said, "specified the rate of return now in the transportation act, it did so for the purpose of stabilizing railroad credit. Unfortunately because of conditions which were not foreseen—nor could they have been foreseen—by Congress, the results hoped for in this connection have not yet been realized. It is essential, however, that the credit of the railroads should be stabilized on a proper basis in order to restore the purchasing power of the railroads and put them in position not only to prop-

erly maintain their existing facilities, but to provide the additional facilities necessary in the public interest, and it is much more important to the public as a whole that there should be adequate transportation facilities with satisfactory service, than that there should be lower rates. Lower rates will come, but they should come only as and when the railroads are clearly in position to grant them without impairing their ability to render adequate and satisfactory service.

"Rate adjustments have already been made to correct disarrangements as to localities and some dislocations as to commodities, and in a few instances adjustments have been made for purely economic reasons as in the case of certain export rates revised in an effort to stimulate competition in world markets, and more recently with reference to agricultural products which perhaps have more widely and more completely been forced downward to a pre-war basis. More in this direction, however, the railroads cannot advisedly do at this time. Rates having generally been advanced on a uniform or percentage basis, it would seem desirable, in fact necessary, that when general reductions are made, they should be made in the same way. Adjustments, of course, must of necessity be made whenever it can be shown that existing relationships are clearly out of line. Certainly the carriers in the Eastern Region cannot make a general percentage reduction now of such an amount as to be definitely helpful, and it is doubtful if any substantial reduction could be justified with reference to any one commodity or class of traffic.

"With all this in mind I venture to think that this commission has ordered this inquiry not only for the purpose of determining what, if any, rate reductions may lawfully be

ordered at this time, but also what, if any, reductions may properly be ordered in harmony with the avowed purpose and spirit of the act. Mr. Shriver has shown that if the carriers in the Eastern region were to do over again the identical business that was done during the 12 months ending October 31st, but upon a basis of rates and costs for the entire period such as was actually in effect on November 1, 1921, the estimated net result so obtained would be \$473,914,000, or a return of approximately 5.4 per cent upon the property used, as tentatively valued by this commission, adjusted as has been explained in his presentation.

"I am inclined to think that Mr. Shriver's estimate is a very liberal one and might not be fully realized, but even if it could be realized it would be a mistake to view the situation so indicated as a satisfactory one, or one that would justify an immediate reduction in rates.

"Nevertheless, the railroads should be able to show substantial savings during the present year in the cost of material and fuel. They will also have the benefit for the full year of the wage reductions which were effective for only half of the last year, and it is believed that in harmony with the terms of the act and because of the lowered cost of living, as well as for other pertinent reasons, the Labor Board will feel justified in ordering still further wage reductions, particularly in connection with certain classes of railroad employees. It should be borne in mind, however, that such reductions, if made at all, will only be effective for a portion and not for the whole year."

Mr. Willard was to be followed by S. M. Felton, president of the Chicago Great Western; H. E. Byram, president of the C. M. & St. P.; W. L. Mapother, president of the L. & N., and Samuel O. Dunn, editor of the *Railway Age*.

Bureau of Accounts and Statistics, I.C.C.

Great Mass of Clerical Work, Incident to the Transition Period— Revision of Accounting Regulations

Parts of the annual report of the Interstate Commerce Commission were noticed in the *Railway Age* of December 10, page 1157, and December 31, page 1317; this present

article is an abstract of the annual reports of the Bureau of Accounts and the Bureau of Statistics of the Interstate Commerce Commission.

Bureau of Accounts

The reports of the Bureau of Accounts during the early part of the year were directed largely to implementing the adjustments of the railway operating income for the test period which were made necessary as a result of our examination of the accounts for the 3 years ended June 30, 1917, for the purpose of enabling us to make final certification to the President of the amount of average annual operating income of carriers under Federal control. The final certification for the year was made relatively small in number, but the adjustments were the subject of a considerable amount of the carriers affected.

Comments were made for the purpose of establishing the correctness of claims filed by carriers under sections 201 and 209 of the transportation act, 1916, and the basis of our certification in connection with such carriers, have been made. During the year we have also received reports of 160 carriers under section 204. Examination of the accounts for section 209 totaled 138. The examination of section 204 disclosed a general lack of uniformity in the accounts of the smaller carriers. In efforts to give its reports a uniformity we have been greatly helped by the carriers presenting. These special reports under sections 204 and 209 have shown that the carriers are relatively small and that the practical execution of the annual examinations which we deem necessary is not feasible. During the accounts of carriers and the amount of their rates of ac-

counting prescribed by our regulations. General examinations are now being resumed.

In our last report, reference was made to the creation of a depreciation section of the bureau, for the purpose of carrying out those provisions of section 20 of the interstate commerce act which require us to prescribe as soon as practicable classes of property for which depreciation charges may properly be included under operating expenses and the percentages of depreciation which shall be charged. Much progress has been made in the work of this section. It has been occupied with the many preliminary studies and analyses which must be the foundation of any determination of depreciable classes of property and the related percentages of depreciation for the various classes of carriers.

During the year work was begun on the revision of our accounting regulations. Those now in effect were last revised as of July 1, 1914. A further revision is imperative to make them responsive to requirements imposed by new legislation and to improve them further in the light of the experience gained in their practical application during the past 7 years. It has, however, been found necessary to provide for certain features in advance of the contemplated revision. This we have done through several orders formally amending the existing regulations.

Since the approval of the federal control act we have certified in tentative form the average annual railway operating income of 588 carriers for the three years ended June 30, 1917, amount-

ing in the aggregate to \$943,428,123. The sum stated does not represent the exact standard return of the carriers taken under federal control, because it has been necessary to make corrections on these tentative certifications and because it may yet be determined that some of the carriers whose income was so certified were not taken under federal control. During the year we made 3 tentative certifications, 137 corrected certifications, and ascertained that the income certified in 19 tentative certifications was computed in accordance with our accounting regulations.

Bureau of Statistics

The annual reports section receives and examines annually reports from more than 3,000 corporations, classified in 1920 as follows:

Stream railway companies	Number of annual reports
Class I	192
Class II	319
Class III	397
Switching and terminal	236
Lesser	456
	1,600
Electric railway	318
Sleeping car companies	1
Express companies	4
Telephone companies	1,070
Water lines	115
Telegraph and cable companies	15
Pipe lines	33
Total	3,156

General News Department

The Associated General Contractors will hold their annual convention at the Hotel Winton, Cleveland, Ohio, on January 17 to 19, inclusive.

Bullinger's Guide is now published in Boston, having been bought by the New England Railway Publishing Company. See notice under New Books.

The United States Supreme Court has ordered a reargument on March 13, of the Southern Pacific dissolution case involving the ownership by the Southern Pacific of the Central Pacific.

Representative Reece introduced in the House on January 5 a concurrent resolution authorizing the appointment of a joint Congressional commission to make another investigation of transportation.

The New York Section of the American Society of Civil Engineers held a meeting on January 11, at which the subject, "Traffic Handling—Its Engineering as Well as Regulatory Aspects," was discussed, the points brought out hinging chiefly on the problems that are found in the large cities such as New York.

The Air Mail Section of the Post Office Department reports for the last three months of 1921, that ten million letters were carried by airplane, and that all of them were delivered without injury. The distance traveled by the mail-carrying airplanes in that quarter was over 391,000 miles, and 87 per cent of the trips were completed on time.

A. F. Robinson, bridge engineer of the Atchison, Topeka & Santa Fe System, Chicago, will present a paper on the Santa Fe's Experience with Treated Timber in Bridges before a joint meeting of the Western Society of Engineers and the American Wood Preservers Association in the rooms of the former organization in Chicago on Wednesday evening, January 25.

The Savannah Sectional Committee of the Signal Section of the American Railway Association will hold its next meeting at the De Soto Hotel, Savannah, Ga., on Tuesday, January 17 (not January 19 as heretofore announced). At the morning session, the meeting will discuss maintenance of mechanical interlocking and rail bonding; and at the afternoon session H. S. Balliet, assistant terminal manager of the Grand Central Terminal, New York City, will give a historical lecture on signaling, illustrated.

Power Interlocking is to be the subject for discussion before the New York Sectional Committee of the Signal Section of the American Railway Association at its meeting in New York City on Thursday, January 19. The meeting will be at the Hotel McAlpin, Broadway and 34th street, beginning at 8 p. m. W. H. Reichard, consulting engineer of the Federal Signal Company, will give an illustrated address, and all signalmen are urged to come to the meeting and be prepared to discuss power interlocking in all its phases.

Regan Train Control Demonstration on the Great Eastern Railway of England

An official trial and demonstration of the Regan automatic train control appliances was made on the Great Eastern Railway of England at Fairlop, Essex, on November 1, 1921. A special train, consisting of an engine fitted with the device, five standard passenger cars and two private cars left Stratford at 10:05 a. m. A distinguished company was present, consisting of seven representatives from France, two representatives from Belgium, the military attache of the American embassy in London, a number of officers of the Great Eastern and other English railways, and

the Automatic Train Control Committee of the British Government, consisting of Col. Pringle (chairman); Sir Robert Turnbull of the North Eastern; Majors Hall and Edmonds of the Ministry of Transport; J. H. Thomas, M. P.; Mr. Afield, Superintendent of telegraph and signals, Midland Railway; and C. Tilden Smith (secretary). The demonstration received high commendation from Col. Pringle, Chairman of the Automatic Train Control Committee of England. The original installation on the Great Eastern was made in September, 1920.

Senate Railroad Inquiry to Be Concluded

The Senate committee on interstate commerce is planning to resume and conclude at an early date the hearings in its general railroad inquiry. Chairman Cummins has written letters to those who had asked for an opportunity to testify or those whose names had been proposed as witnesses, asking them when they can appear and how much time they desire. These include W. G. McAdoo, Walker D. Hines, W. Jett Lauck, H. T. Hunt, former member of the Railroad Labor Board; J. A. Emery, counsel for the National Association of Manufacturers, and various representatives of labor organizations. The railroads will also be given an opportunity for some further testimony.

Valuation Hearings

The Interstate Commerce Commission heard arguments at Washington on January 4, 5 and 6 in the valuation cases of the Kansas City Southern and the San Pedro, Los Angeles & Salt Lake, involving the protests of the former against the final value as reported by the commission and of the latter against the tentative valuation. In both cases the representatives of the roads contended that the commission should give a detailed analysis of the methods used in determining the "final value." S. W. Moore, for the Kansas City Southern, objected because the valuation had ignored the earning capacity of the road. A hearing in the case of the Elgin, Joliet & Eastern was begun on January 9.

American Society of Mechanical Engineers

The Executive Committee of the Railroad Division announces the following action taken at a meeting on December 28: James Partington, former secretary of the division, has been elected to the Executive Committee in place of George W. Rink, who has found it necessary to resign.

A. F. Stuebing has been elected secretary of the division in place of Mr. Partington.

W. H. Winterrowd was elected vice-chairman to succeed Mr. Rink.

William Elmer of Altoona, Pa., has been added to the Membership Committee of the division.

An invitation from the Metropolitan Section has been accepted to hold a joint meeting with them in the Engineering Societies' building, New York City, on May 16, 1922. The subject of this meeting will be Railroad Refrigeration—Natural and Mechanical.

Railroad Earnings for November

Reports to the Interstate Commerce Commission from 200 Class 1 railroads with a mileage of 235,556 miles show that in November the railroads had a net operating income of \$65,965,382, which would be at the annual rate of return of 3.8 per cent on their property investment.

Due largely to the fact that the volume of traffic decreased 20 per cent the net operating income in November was approximately \$39,488,000 below that in October. Compared with November, 1920, an increase of \$15,130,000 or 29.8 per cent was reported.

Forty-nine railroads suffered operating deficits in November.

20 in the Eastern, 8 in the Southern and 21 in the Western district compared with a total of 30 in October. The ratio of expenses to operating revenues in November was 79.06 per cent compared with 74.20 per cent in October.

The total operating revenues amounted to \$465,353,144 or 21.4 per cent less than during the same month of 1920 while operating expenses totaled \$367,912,287, a reduction of 28.4 per cent compared with November, 1920. The net operating income, which amounted to \$63,965,382, fell short \$37,168,618 of the amount contemplated by the Transportation Act.

During November the railroads of the United States expended \$166,321,423 for maintenance purposes, 25 per cent less than was spent during that month the previous year.

The net operating income of the carriers during the first 11 months in 1921 was \$561,411,608, which would be at the annual rate of return of 3.3 per cent on their tentative valuation fixed by the commission for rate-making purposes. During that period they failed by \$464,605,392 or by a little less than half, of earning the amount contemplated under the rates prescribed by the commission.

Annual Meeting of A. S. C. E.

to Discuss Transportation

The transportation problems of the country will be the feature of the annual meeting of the American Society of Civil Engineers to be held at the Engineering Societies building, New York, on January 18 to 20, inclusive. The first day will be devoted to the regular business meeting, followed by a luncheon and an inspection of the McGraw-Hill Company's printing plant in the afternoon and a reception and dinner dance in the evening.

The morning session of January 19 will cover the subject of water transportation and will be addressed by the following speakers: Emory R. Johnson, dean of the Wharton School of Finance and Economy, University of Pennsylvania, Philadelphia, Pa.; R. H. M. Robinson, president, United American Lines, New York; Winthrop L. Marvin, vice-president and general manager, American Ship Owners' Association, New York, and Samuel O. Dunn, editor of the *Railway Age*.

The afternoon session of the same day will be confined to railway transportation and will be addressed by the following speakers: Howard Elliot, chairman of the Northern Pacific, New York; George W. Simmons, vice-president, Simmons Hardware Company, St. Louis, Mo.; William F. Doak, vice-president, Brotherhood of Railway Trainmen, Washington, D. C.; F. A. Molitor, chairman, Board of Economics and Engineering, National Association of Owners of Railroad Securities, New York, and Edgar E. Clark, formerly chairman, Interstate Commerce Commission, Washington, D. C. There will also be an excursion on January 19 to include the New York Stock Exchange, the Hell Gate power station and other places. The evening will be given over to a smoker, before which Frank A. Vanderlip, formerly president, National City Bank, New York, will present an address on World Activities and Their Effect Upon the Engineer. On the last day, the subject of highway transportation will be the sole topic in a three session meeting. Among the speakers of this session will be Robert S. Parsons, general manager, Erie Railroad, New York.

Denial of Application to Hold Offices or Directorates with More Than One Railroad

The Interstate Commerce Commission has issued a large number of finance docket orders since the issuance of the blanket order on December 31, authorizing railroad officers and directors to hold positions with more than one carrier. It has also, however, issued a number of orders denying such authority. John G. Shedd was authorized to hold until further order the position of director of the Baltimore & Ohio and the Chicago, Rock Island & Pacific, but in so far as it relates to the further holding of the position of director of the Illinois Central, the application was denied. The application of J. Ogden Armour to retain office as director of the Illinois Central and of the Chicago, Milwaukee & St. Paul, was denied on the ground that "after due investigation it has not been shown that neither public nor private interests would be adversely affected."

An order was issued authorizing common officers and directors among the companies subsidiary to and affiliated with the Illinois

Central System, but with exceptions. W. Averell Harriman was authorized to hold the position of director of the Union Pacific and of certain named subsidiaries and the position either of director of the Illinois Central and certain named subsidiaries, or director of the Baltimore & Ohio. Cornelius Vanderbilt was authorized to hold the positions of member of the board of managers and member of the executive committee of the Delaware & Hudson, and the position either of director of the Illinois Central and certain subsidiaries, or director of the Missouri Pacific. They were given 30 days within which to report to the commission which of the alternative positions they will elect to hold.

A supplemental order was issued in the case of George F. Baker, authorizing him to hold the positions of chairman and director of the Central of New Jersey, president and director of the New York & Long Branch, and director of two other subsidiaries, and the position of director of the Erie and the New York, Susquehanna & Western, and director of either the New York Central and subsidiaries, or the Delaware, Lackawanna & Western or the Lehigh Valley. In the original order the Erie was made an alternative.

Among the other orders issued were those authorizing common officers and directors among the companies comprising the systems of the Carolina, Clinchfield & Ohio, the Kansas City Southern, Chicago, Rock Island & Pacific, Norfolk & Western, Atchison, Topeka & Santa Fe, El Paso & Southwestern and the Southern.

Administration Trying to Prevent

Railroad Labor Conflict

President Harding and Secretary Hoover have recently been interesting themselves in trying to find a way to avert any possible interference with transportation resulting from a conflict between the railroads and their employees growing out of the efforts of the railroads to reduce wages and effect some changes in working conditions which are about to be referred to the Labor Board. In pursuance of this purpose and at the request of the President, the Secretary of Commerce invited some of the principal railway executives and the heads of the "big four" train service brotherhoods to a dinner on Saturday, January 7, at which various aspects of the situation were discussed and it was disclosed at the White House that there are to be further conferences, although no information was given as to the details.

Those present at the dinner on Saturday included Thomas DeWitt Cuyler, chairman of the Association of Railway Executives; Daniel Willard, president of the Baltimore & Ohio; A. H. Smith, president of the New York Central; W. W. Atterbury, vice-president of the Pennsylvania; Warren S. Stone, grand chief of the Brotherhood of Locomotive Engineers; L. E. Sheppard, president of the Order of Railway Conductors; W. S. Carter, president of the Brotherhood of Locomotive Firemen and Engineers, and W. G. Lee, president of the Brotherhood of Railroad Trainmen. Nothing was made public about the conference and apparently some efforts were made to keep the fact quiet, because no information about it could be obtained at Mr. Hoover's office, although the fact that there had been a conference was confirmed later by President Harding. It is understood, however, that there have been some apprehensions among high officers of the administration as to the possibility of trouble with the railroad labor organizations this spring at about the same time that the controversy over coal mine wages becomes acute with the termination of the present wage contracts, and that a very serious situation might be created if the train employees and the miners were to threaten a strike at the same time.

Secretary Hoover some time ago made some efforts to bring about an amicable understanding between the coal operators and the mine workers, which have thus far proved unavailing and he is also trying to do what he can to smooth out the complicated railroad labor situation, but whether he has any definite plan has not been disclosed. It is understood that the brotherhoods have expressed more concern over the efforts of the railroads to change some of the rules and working conditions which the brotherhoods have won after many years of struggle than they have over the wage question; and it has been suggested that there may be a possibility of compromise along these lines; also that Mr. Hoover is trying, if possible, to bring about a settlement without the necessity of going before the Labor Board or at least without a strike threat.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF NOVEMBER AND ELEVEN MONTHS OF CALENDAR YEAR 1921

Table with columns: Name of road, Average mileage operated, Operating revenues (Freight, Passenger, Total), Maintenance of Way and Equip. ment, Traffic, Trans. portation, Total, Operating ratio, Net income from railway, Operating income (loss), Net rentals, Net after rentals 1920, Net after rentals 1921.

Traffic News

The annual meeting and election of officers of the Transportation Club of Louisville, Ky., will be held on February 14.

The Texas Passenger Agents' Association will hold its annual convention at Corpus Christi, Tex., on January 21 and 22.

W. J. Ryan has been appointed assistant traffic manager of the American Tobacco Company at New York, and H. P. Hatfield, assistant traffic manager at Louisville, Ky.

The Traffic Club of Chicago held a memorial luncheon at the Hotel LaSalle on January 12, in honor of Henry C. Barlow, traffic director of the Chicago Chamber of Commerce, who died recently.

The Houston Traffic Club, Houston, Tex., has elected the following officers: president, A. Kimpbell (Houston Drug Company); vice-presidents, Blakely Smith, S. J. Westheimer and F. L. Salisbury (L. & N. R. R.); secretary, F. A. Moulton; treasurer, G. L. Thacker.

The Stark County (Ohio) Traffic Club has elected the following officers: president, A. J. Burns (Bonnot Company); vice-president, J. R. Ellis (Superior Sheet Metal Company); secretary, M. L. Underwood (Buckeye Cereal Company); and treasurer, W. E. Beamer (Penn. R. R.).

Managers of independent oil refineries in the Tulsa (Oklahoma), district met at Tulsa on January 6, to confer on their proposed action looking to the readjustment of tank car rates from Oklahoma to the east. This rate hearing has been scheduled for February 16, at Washington, D. C., before the Interstate Commerce Commission.

The Transportation Club of Decatur, Ill., has elected the following officers: president, T. C. Burwell (A. E. Staley Manufacturing Company); vice-presidents, Porter Milliken (Union Iron Works) and L. F. Boss (Wabash Railway); secretary, S. F. Coay (Leader Iron Works); treasurer, Miss Addie Hambleton, traffic manager of the Mueller Fountain Fixture Company.

The Minneapolis Passenger Traffic Club has been organized at Minneapolis, Minn., and the following officers have been elected: President, W. L. Hathaway, general agent, passenger department, Chicago, Rock Island & Pacific; vice-president, W. E. Gilson; treasurer, A. R. Woods, and secretary, J. J. Oslie; members executive committee: B. G. Benson, A. E. Hoadley, H. F. Bostwick, G. H. Feyder, A. W. Saunders and L. P. Green.

At a conference of representatives of several of the intermountain states at Salt Lake City on December 30, initial steps were taken toward the organization of an association representing that territory which will present evidence at the approaching hearings before the Interstate Commerce Commission at Washington on the feasibility of reducing freight rates. H. W. Prickett, of Salt Lake City, was elected president of the association, and T. C. Gill, also of Salt Lake, secretary.

The New York Central reports the arrival in New York City on Monday morning, January 10, of the greatest number of through passengers on limited trains ever recorded at that terminal on a single morning. There were 21 through trains, in all, including The Twentieth Century Limited, four sections; the Fifth Avenue Special, three sections; The Wolverine, two sections; The Detroitier, five sections; and The Beaver, two sections. Between Albany and New York, 143 miles, passengers on these trains were served with breakfast to the number of 1,875.

During a two weeks' campaign on the Chicago, Rock Island & Pacific along 150 miles of its lines in the state of Missouri, demonstrations were held by representatives of that road to promote pure bred stock, better poultry and fruit raising. The Missouri campaign followed like campaigns in eastern Colorado and Oklahoma. In all of these territories the representatives held meetings in which local merchants joined with the farmers, the

State Board of Agriculture and the railroad to make the campaign a success. In many cases the representatives visited the farms to hold their demonstrations.

The Great Northern and the Chicago, Milwaukee & St. Paul have declined to accede to the request of the United States Shipping Board that they abrogate their reciprocal traffic arrangements with Japanese steamship lines, which the board had declared detrimental to its efforts to establish freight and passenger service between the North Pacific coast and the Orient. Following a hearing before a committee of the Shipping Board at which all other railroads having contracts with foreign steamship companies practically agreed to abrogate them, the board asked the roads to give it definite advice by January 1 of their intentions, and all of the roads except the St. Paul and the Great Northern had agreed to cancel the contracts by that date.

Hon. Henry C. Wallace, Secretary of Agriculture, in an address before the Traffic Club of Philadelphia on January 9, declared that railroad deficits "must be met by reductions in operating costs rather than by advances in rates." Agriculture, he said, "urgently needs the adjustment of freight rates on farm products to a point at which they bear about the same ratio to the price the farmer received for those products as prevailed before the war." An efficient agriculture and an efficient transportation system, Mr. Wallace declared, are indispensable to the national welfare and are dependent upon one another. The relation between the two industries is so very intimate that neither can afford to acquiesce in a condition which seriously affects the other.

Coal Production

The year 1921 was one of prostration for the coal and coke industries, says the weekly bulletin of the Geological Survey. To match the 407,000,000 tons of soft coal produced, one must go back 10 years, to match the 26,000,000 tons of coke, it is necessary to go back 17 years. To match the completeness of the depression, one must go back to 1893, because the tonnage comparisons ignore the normal increase from year to year. Anthracite stands as an exception. Until late November the hard coal mines continued in active operation and the total output for 1921 fell not far behind the two years just preceding. Production of bituminous coal in the last week of the year, which included the Christmas holiday, is estimated at 5,960,000 net tons.

Railroads Refuse to Cancel Contracts

With Japanese Steamship Lines

The United States Shipping Board has asked for the co-operation of the Interstate Commerce Commission in dealing with the situation created by the refusal of the Chicago, Milwaukee & St. Paul and the Great Northern railways to cancel, at the request of the Board, their reciprocal traffic contracts with the Japanese steamship companies, the Osaka Shosen Kaisha and the Nippon Yusen Kaisha. The Seattle Chamber of Commerce and the newspapers of that city have been sending the board numerous protests against the cancellation of the contracts on the ground that contracts between the steamships and the Canadian lines may be substituted and the business diverted to the port of Vancouver. Members of the Shipping Board have been conferring with a committee of the Interstate Commerce Commission on matters in which both bodies are interested and after the Seattle protest had been laid before it the commission voted to meet with representatives of the Shipping Board, the railroads and the port of Seattle to explore the entire question. The meeting is to be held in Washington on January 24. At the hearing last month before members of the Shipping Board, Vice-Presidents R. M. Calkins of the Chicago, Milwaukee & St. Paul and W. P. Kenney of the Great Northern said that if they gave up their contracts with the Japanese lines there would be no assurance that the traffic would go to the Shipping Board boats in service between the Puget Sound and the Orient because it is largely controlled by the Japanese soliciting agencies and that it would very likely be transferred to the Canadian Pacific so far as the rail haul is concerned. Most of the other roads that had foreign steamship contracts readily agreed to give them up and at the request of the board this was confirmed in writing before January 1, but the St. Paul and Great Northern declined.

Commission and Court News

Interstate Commerce Commission

The commission has issued some modifications of the rules and regulations it recently issued prescribing forms of uniform domestic bill of lading and uniform live stock contract.

The commission, on the petition of the American Railway Express Company, has reopened its investigation of the issuance and use of passes, trunks and free passenger service.

The commission has suspended until April 25, the operation of schedules published by the Southern Pacific which propose increases in the rates on shingles from points in Oregon and Washington to destinations in Nevada and California.

The commission has suspended from January 11 until May 11 the operation of certain schedules which propose increases and reductions in rates on sugar from New Orleans, La., and points taking same rates to points in Illinois, Iowa, Wisconsin, Minnesota and Missouri.

The commission has suspended until April 23, the operation of certain schedules published by the Missouri Pacific which provide reductions in the rates on bituminous coal, from mines on the Missouri Pacific in Southern Illinois to destinations in Arkansas and Louisiana.

The commission has suspended from January 16 until May 16 the operation of items published by the Bessemer & Lake Erie which provide reduction in the rate on chrome ore from Bessemer, Pa., and other points to Gary, Ind., South Chicago, Ill., Youngstown, Ohio, Farrell and Sharon, Pa.

The commission has suspended until May 3 the operation of certain schedules published by the New York Central, which propose increases in charges for intermediate switching by the N. Y. C. at Toledo and Vulcan, Ohio, from \$3.50 to \$5.50 a car for loaded cars, and from \$2 to \$3 a car for empty cars.

The commission has suspended until May 1, the operation of certain schedules published by the Midland Continental, which propose to increase the switching charges from \$4 to \$5.50 per car on all non-competitive traffic at Jamestown, N. D., between connection of the Northern Pacific and industries on the Midland Continental tracks.

The commission has suspended until May 29 the operation of schedules published by the Louisville & Nashville, which propose reductions in the rates on bituminous coal, carloads, from mines on the Louisville & Nashville in southeastern Kentucky and Tennessee and Virginia to destinations on the Southern in Indiana and Illinois.

The receivers of the Denver & Salt Lake have filed a petition with the commission asking it to issue an order providing for increased divisions to be paid to it by its connectings lines, which, the petition says, are reasonably able to earn a net operating income greatly in excess of 5 1/2 per cent under existing conditions, while the Denver & Salt Lake cannot earn any return at all.

The commission has suspended from January 8, until May 8, 1922, the operation of schedules published by the Illinois Central, which provide reductions of 5 cents per ton on coal from Alabama, Kentucky and Illinois mines to Gulfport, Miss., when for bunkering, for export, or when for points in Florida and Texas accessible by water, but an increase of 20 cents per ton when handled through tippie for other purposes.

The commission has suspended until May 5 the operation of certain schedules, which propose increases and reductions in rates on prepared roofing, asphalt shingles, building and roofing paper, and related articles from Chicago, East St. Louis, Marseilles, Teoria, St. Louis and points taking same rates to Missouri river points, St. Paul and Duluth, Minn., and to interior jobbing points in Minnesota, the Dakotas, Nebraska, Kansas, Missouri and Colorado.

Foreign Railway News

Electrification in the Philippines

The Manila Railroad contemplates electrification by means of power from the Agno River in Central Luzon, which is believed to possess a potential capacity of from 12,000 to 15,000 h.p., according to the Times (London) Trade Supplement.

Australian Railway in Market for Signals

The Victorian Government Railways, Australia, are in the market for a considerable quantity of power signaling apparatus, including track and line relays, electric signal mechanisms, electro-mechanical interlocking apparatus and 50 miles of insulated copper wire, according to the Times (London) Trade Supplement. Bids for some of this material will be closed on February 15, for others on February 22 and for the remainder on March 1.

Amalgamation of the L. & N. W. and the L. & Y.

The Amalgamation Tribunal, the body set up under the English Railways Act to oversee the mergers of the companies into four territorial groups, has according to the Railway Gazette (London), approved the plans for the consolidation of the Lancashire & Yorkshire with the London & North Western. The amalgamation will take effect on January 1, 1922. Effective on that date the consolidated carriers will operate under a plan of organization embodying a number of changes from previous practice. Details of this plan will appear in these pages at a later date.

Bids for Electrification of Brazilian Railway

The long-expected notice for sealed bids for the electrification of the Central of Brazil was recently announced, according to Assistant Trade Commissioner Embry at Rio de Janeiro. The notice calls for proposals on the electrification of stretches of the line, the supplying of traction and transport material, the construction of substations and various other improvements. The proposals will be received on March 30, 1922, at 1 p. m. A bond of 200 contos (\$216,000) is exacted to guarantee the signature of the contract. After that day and following a judgment of the fitness of the competitors, a day will be set for the opening of the proposals, following which a selection will be made.

Only those competitors will be considered as fit who can prove in addition to sufficient financial capacity, that they have furnished and installed other large and complete equipment for electric traction including installations for large railway yards. In order to guarantee the execution of the contract, the bond will be raised to 500 contos of reis (\$540,000).

The work relating to the suburbs of Rio de Janeiro is to be concluded within a period of two years and the other works within a period of three years, both counting from the date of registry and approval by the Tribunal de Contas.

There will be three or four substations. Thirty locomotives will be furnished, 10 for freight and 20 for passenger service. For the suburban service, 60 electric cars (carros motores) will be acquired, composed of 60 first-class cars and 6 second class.

Railway Excursions in Great Britain

LONDON

With the handing back of the English railways to private ownership on August 20, last, a decided and most welcome advance has been made in the facilities provided by the various companies for the traveling public by the reintroduction of day excursions at the rate of a single fare for the round-trip and cheap period excursions at the rate of a single fare and a third for the round-trip. The general public has shown great appreciation of the facilities offered by the railways, and this appreciation is further greatly increased by the frank recognition that the restoration of all pre-war conditions at the present time is

not possible. Owing to the increased cost of labor and materials, ordinary fares and freight rates cannot be brought down to the pre-war level.

Evidence of the approaching return to pre-war conditions is shown by the manner in which the railway companies are doing all in their power to attract business to their lines by the inauguration of day and half-day excursions, special excursions to country fairs, football matches, industrial shows, and during the month of August special cheap tickets were issued from the outlying stations to London in order to give the public an opportunity of visiting the bargain sales held in London during that month. This was the first time this latter privilege had ever been offered and the railways consider that it was a very successful venture. Daily excursions are also run from London to seaside vacation resorts such as Southend-on-Sea, about 35 miles from London, at a fare of 4 shillings (approximately 97 cents at the normal rate of exchange) for the round-trip; Brighton, a distance of 50 miles, at the rate of 7 shillings 6 pence (about \$1.82) for the round-trip; to Margate, a distance of 74 miles, at the rate of 11 shillings (about \$2.70) for the round-trip; and to Bournemouth, a distance of 107 miles from London, at the rate of 15 shillings 9 pence (\$3.83). Daily excursions are also run to most of the large industrial centers throughout the different lines, and daily excursions are run from the principal stations to London and from various points on the various systems to neighboring towns. These daily excursion tickets are good only on specified trains both on the outward and homeward journeys at the rate of a single fare for the round-trip.

Cheap week-end tickets were also introduced on the first week-end after the "decontrol" of the railways to all the principal vacation resorts and industrial centers throughout the country at the rate of a single fare and a third for the round-trip, with a minimum of 10 shillings (\$2.43 at the normal rate of exchange) first class and 5 shillings (\$1.21) third class. These tickets are available by any train on the outward journey on the Saturday and for return by any train on the Sunday after 6 p. m. up to and including any time on Monday.

In addition to these arrangements, 8-day or 15-day third class excursions have been inaugurated. These excursion trains generally leave on Friday, and the tickets issued by these trains are available for return on the Friday following date of issue or on the Friday two weeks following date of issue. The ticket rates for these excursions like the week-end tickets, are based on a single fare and a third for the round-trip.

Daily and period excursions to the Continent have also been run.

The Great Eastern railway has inaugurated a special railway and hotel accommodation excursion to Harwich from London, a distance of about 71 miles, the fare being inclusive of rail fare and dinner and tea on day of arrival, breakfast, luncheon, tea and dinner on following day, breakfast on third day, and attendance and room for the whole time. The ordinary fare for this round-trip from London is 35 shillings (or \$8.50 at the normal rate of exchange), first class, whereas the round-trip first class excursion fare inclusive of hotel accommodations and meals is 59 shillings (about \$14.35).

The ordinary third class round-trip fare is 20 shillings 10 pence (\$5) and the excursion fare inclusive of accommodation and meals is 42 shillings (\$10.20).

The Great Western has inaugurated special day and half day combined rail and river trips from London and various suburban stations and has also organized a circular tour on the River Thames from Kingston to Oxford, a distance of 91 miles.

Further daily excursions have been inaugurated by various tourist companies on all railways throughout Great Britain, and in connection with these excursions the tourist companies are compelled to guarantee 300 passengers for each excursion.

It is stated by the railway companies that the re-introduction of this excursion traffic has met with great success. The companies generally consider these excursions as profitable, although it is too soon to estimate the actual increase due to their introduction. The advertising of excursion facilities is done by means of posters and handbills distributed throughout the various railway stations and advertisements inserted in all the principal local newspapers and in the London daily papers.

Special excursion departments have been organized on nearly all railways under the direction of the superintendents of the line, which take charge of all matters appertaining to excursion traffic.

Equipment and Supplies

Freight Cars

The BUFFALO, ROCHESTER & PITTSBURGH is inquiring for from 20 to 30 caboose cars with steel underframes.

The KIMBERLY-CLARK COMPANY, 51 Chambers street, New York City, is inquiring for 6 flat cars.

THE JOHN MORRELL COMPANY, Ottumwa, Iowa, has awarded the contract for 100 refrigerator cars to the American Car & Foundry Company.

The BENGAL & NORTH WESTERN (India), reported in the *Railway Age* of December 31 as inquiring for 25 cars has ordered 25 logging cars from Cravens, Ltd., England.

The ASSAM BENGAL (India), reported in the *Railway Age* of December 31 as inquiring for 100 cars, has ordered 100 open top cars from the Birmingham Railway Carriage & Wagon Company, Ltd., England.

The ILLINOIS CENTRAL, reported in the *Railway Age* of November 19, as inquiring for 2,500 gondola cars has placed orders for 2,000 gondola cars as follows: Haskell & Barker Car Company, 700; Western Steel Car Company, 400 and Standard Steel Car Company 400, all these cars to have 8 drop doors, and American Car & Foundry, 500 cars to have 12 drop doors.

THE UNION PACIFIC has awarded contracts for 4,500 cars as follows: 1,000 all-steel automobile cars to the Pullman Company; 1,000 steel frame automobile cars to the General American Car Company, and 500 of the same type to the Standard Steel Car Company; 1,000 box cars each to the Mount Vernon Car & Manufacturing Co., and the American Car & Foundry Company.

Passenger Cars

The PENNSYLVANIA RAILROAD will in the near future place orders for cars for passenger service to include 20 all steel dining cars.

Iron and Steel

THE LOUISVILLE & NASHVILLE is inquiring for 50,000 tons of rails.

THE KANSAS CITY SOUTHERN has awarded a contract for 6,000 tons of rails to the Illinois Steel Company.

THE LOUISVILLE & NASHVILLE has ordered 50,000 tons of rail from the Tennessee Coal, Iron & Railroad Company.

THE GOVERNMENT RAILWAYS OF JAPAN have ordered through Mitsui & Co., New York, 13,000 tons of 75-lb. and 60-lb. rail, from the United States Steel Products Company.

Machinery and Tools

THE SEABOARD AIR LINE has ordered a gap lathe from Manning, Maxwell & Moore; a vertical turret lathe from the Bullard Machine Tool Company; a horizontal turret lathe from Warner & Swasey; a wheel press, car wheel borer, engine lathe, 10-ton crane and a steam hammer from the Niles-Bement-Pond Company.

WILLIAM S. WOLLNER, general safety agent of the Northwestern Pacific, has been chosen secretary-treasurer of the San Francisco Engineering Council.

THE FREIGHT REVISION BUREAU of the New York Central at New York city has been transferred to and consolidated with the Freight Revision Bureau at Cleveland, Ohio. All waybill and waybill correction forms and merchandise waybilling instructions are under the jurisdiction of this office. The manager is W. E. Munger.

Supply Trade News

Walter Hasendahl, 1213 Fuller avenue, Los Angeles, Cal., has been appointed representative at Los Angeles of the Orton & Steinbrenner Co., Chicago.

Carl H. Peterson, has been appointed secretary, treasurer and general manager of the **Maier Engineering Company**, Peoples Trust & Savings Bank building, Chicago.

J. A. Connelly, manager of the Tampico, Mexico, office of the Petroleum Iron Works Company, Sharon, Pa., has been appointed sales manager with headquarters at Sharon.

S. F. Bowser, founder and president of **S. F. Bowser & Co.**, Fort Wayne, Ind., has retired from the presidency of the company and will be succeeded by **S. B. Bechtel**, general manager.

The **Pilliod Company**, manufacturer of the Baker locomotive valve gear, has opened a western office at 750 Railway Exchange building, Chicago, in charge of **Burton Mudge**, vice-president.

O. I. Eberhardt, Board of Trade building, Scranton, Pa., has been appointed a special representative of the **Roller-Smith Company**, New York City. His territory includes several counties in the northeastern part of Pennsylvania.

Albert J. Leonard has been appointed eastern sales representative of the **Handlan-Buck Manufacturing Company**, St. Louis, Mo. Mr. Leonard's headquarters are at the eastern office of the company, 52 Vanderbilt avenue, New York City.

The firm of **Black-Matthews Company, Inc.**, 25 Church street, New York City, has been organized by Edward J. Matthews and J. Nelson Black to transact business in iron and steel products, together with machinery and railway equipment.

The **Automatic Railway Gate Company**, Milwaukee, Wis., has been incorporated with a capital stock of \$5,000, to manufacture safety devices for railroad crossings. The incorporators are **Frank P. Mansfield**, 426 Thirty-first street and **Ottmar Kloetzner, Jr.**

Howard J. Charles, formerly with the purchasing and engineering department of the Union Pacific, at New York, who entered the service of the **Elvin Mechanical Stoker Company**, in June, 1921, has been appointed assistant treasurer of the latter company, with office at 50 Church street, New York City.

Robert C. Weller, formerly industrial agent of the New York Central Lines West, and more recently general sales manager of the **Lakewood Engineering Company**, Cleveland, Ohio, resigned on January 1. He has been elected president of the **Marsh-Capron Company**, Chicago, manufacturers of rail-track concrete mixers.

The **Ohio Structural Steel Company** has established a plant at Newton Falls, Ohio. **M. H. Stauffer**, formerly of the **Niles Forge & Manufacturing Company**, Niles, Ohio, has been appointed president and general manager and **J. S. Mitchell**, formerly with the **Kansas City Structural Steel Company**, Kansas City, Mo., chief engineer.

The **Missouri Tie & Lumber Company** has been organized with offices in the Railway Exchange building, St. Louis, Mo., with **C. O. Deabler**, formerly with the **Abeles & Taussig Tie Company** and prior to that tie and timber agent of the Southwestern region of the United States Railroad Administration, as president and **James J. Searey** as secretary treasurer.

W. H. Graul, department sales manager, and **J. J. Hughes**, manager of the order department of the **American Steel Foundries**, Chicago, have organized the firm of **Hughes &**

Graul, manufacturers representatives, with headquarters in the Peoples Gas Building, Chicago. The company will represent The Ohio Steel Foundry Company, Lima, Ohio, cast steel manufacturers, and The McConway & Torley Company, Pittsburgh, Pa.

The **Hall Switch & Signal Company**, Garwood, N. J., has arranged with the **General Electric Company, Limited**, of London, to manage the sales in foreign countries of the **Hall Color-Light Signal** and other signal apparatus of Hall manufacture. This arrangement includes France, Belgium, Holland, China, India, Siam, South Africa, New South Wales, Victoria, New Zealand, Western Australia, Argentine and Chili. It is also announced that the Hall products will be sold in Canada by the **M. & S. Company**, of Montreal.

The Interstate Commerce Commission on January 9, issued an order authorizing the **Pullman Company** to issue 165,000 shares of its capital stock for the purpose of acquiring all the assets of the **Haskell & Barker Car Company**. The company proposes to increase its authorized capital stock from \$120,000,000 to \$135,000,000 and to issue 150,000 shares, plus 15,000 shares held in its treasury. The commission expresses the opinion that it was not necessary for the company to apply to it for permission to issue the securities, but says that counsel for the applicant think otherwise and since there is room for doubt concerning the matter, it has decided to assume jurisdiction. Commissioner Eastman dissented, agreeing that it was not necessary for the applicant to come to the commission, but not agreeing that the commission should assume jurisdiction. Because the applicant is in part a common carrier and in part a manufacturing corporation, he said, the transaction in question has nothing to do with the performance of the applicant's functions as a common carrier.

Trade Publications

THAWING OUTFITS.—An eight-page booklet has been issued by the **Maclod Company**, Cincinnati, Ohio, on its extensive line of kerosene oil burning torches for use in thawing out switches, turntables, ash hoists, cars and other equipment susceptible to freezing during cold weather. Each of the several types of torches mentioned is described fully, with illustrations.

CRAWLING TRACTOR CRANE.—The **Industrial Works**, Bay City, Mich., has issued an eight-page booklet illustrating and describing the construction and application of the "Industrial" crawling tractor cranes. In addition to describing its line of cranes, some space is given to the history of the company as a manufacturer of industrial cranes, and particular attention is given to showing the advantages afforded by power operated cranes in railway and other industrial service.

Interior of Private Car Built in Formosa Under the Direction of Chief Mechanical Engineer, Government Lines

Railway Construction

CHICAGO, MILWAUKEE & GARY.—This company, which was noted in the *Railway Age* of December 24 (page 1286), as having applied to the Interstate Commerce Commission for authority to construct an extension between Aurora, Ill., and Joliet, a distance of approximately 29 miles, where the company now operates over the tracks of the Elgin, Joliet & Eastern, has received permission to build this line. The entire cost of this work is estimated at \$2,700,000.

CHICAGO, MILWAUKEE & GARY.—The Interstate Commerce Commission has issued a certificate authorizing the construction of a line from a point 3.4 miles north of this company's terminals at Aurora, Ill., to a point 3.33 miles east of its terminals at Joliet, Ill., a distance of 29.2 miles.

CHICAGO UNION STATION.—A contract has been awarded to the Lamson Company, Boston, Mass., for the conveyors, chutes, and other mechanical handling equipment to be installed in the \$4,000,000 railway mail terminal now being constructed as a part of the Chicago Union Station project.

INTERMOUNTAIN COAL & LUMBER Co.—This company contemplates the construction of a railroad, to extend from near Poorfork, Ky., on the Cumberland Valley division of the Louisville & Nashville, into the Grassy and Bad creek territory, a distance of approximately 12 miles.

INTERSTATE.—This company has awarded a contract to the McClintic-Marshall Company, Pittsburgh, Pa., for the fabrication and erection of 15 deck plate girder bridges for its Guest river extension and seven deck plate girder and four half through girder bridges for replacing those in its main line between Appalachia, Va., and Norton.

MINERETS & WESTERN.—This company is receiving bids for the construction of a 35.5 mile standard-gage railroad extending from Fresno, Cal., into timber lands. This work is to include the grading, filling, excavating, trestle construction, masonry, etc. In addition the Sugar Pine Lumber Company will construct a 19.5 mile extension from the new terminus of the Minerets & Western into its timber property. The construction work of the entire 55-mile line is estimated to cost \$2,500,000.

MISSOURI, KANSAS & TEXAS.—This company, which was noted in the *Railway Age* of December 31 (page 1332), as contemplating extensive construction work in connection with a new freight terminal, including buildings, a yard and connections at Denison, Tex., has now prepared definite plans for the project. The work involves the acquiring of 400 acres of land; the laying of 57 miles of track; the construction of culverts aggregating 6,000 cu. yd. of concrete; 800,000 cu. yd. of grading; a 22-stall round-house and shop; a power house, a store house and other locomotive and car facilities, the entire cost of which is estimated at \$3,000,000. The necessary land has been purchased and a contract for the grading and the culverts has been awarded to C. R. Cummins Company, Cleveland, Ohio. It is expected that bids for the buildings and structures will not be called for before spring.

MISSOURI PACIFIC.—This company will receive bids until January 16 for the construction of a station at Nashville, Ark., estimated to cost \$12,000.

MOBILE & OHIO.—This company is now constructing coal and cinder handling facilities at Jackson, Tenn., estimated to cost \$25,000.

UNION PACIFIC.—This company, in conjunction with the city of Denver, Col., will construct a viaduct in that city, extending from Twenty-sixth and Market streets, north across the Union Pacific tracks. The work is estimated to cost approximately \$500,000, and will be handled by the city under a contract which has not yet been awarded.

Railway Financial News

CAIRO, TRUMAN & SOUTHERN.—*Authorized to Issue Notes.*—The Interstate Commerce Commission has authorized an issue of \$250,000 of five-year promissory notes at 6 per cent, \$172,000 to be used to cover floating debts and \$78,000 to provide funds for construction and repairs. The authorization is subject to the condition that to the extent that notes are used to cover indebtedness incurred on account of operating expenses or to provide funds for expenditures properly chargeable to operation, they shall be paid from earnings and not made a basis of any future capitalization.

CENTRAL OF NEW JERSEY.—*New Directors.*—The new board of directors consists of William G. Besler, Henry Graves, Jr., Ernest R. Ackerman and Howard W. Maxwell, who were re-elected, and Theodore W. Reath, A. H. Harris, George M. Shriver, Robert E. McCarthy and C. S. W. Packard, who were elected to succeed George F. Baker, former chairman, Robert W. de Forest, E. T. Stotesbury, Daniel Willard and Agnew T. Dice.

CHICAGO & EASTERN ILLINOIS.—*Ends Receivership.*—See article on another page of this issue.

CHICAGO & NORTH WESTERN.—*Company's Strong Position.*—President W. H. Finley is quoted as follows:

The Chicago & North Western has no floating debt and owes nothing beyond usual current bills. Cash stands at a higher figure than for some years and will be increased by settlement for the guaranty period, against which the company's claim is \$16,509,185.

The December business was not as large as November, loadings being 84,507 cars against 126,100 in November, but earnings in both months were seriously affected by shippers' disposition to hold off for lower rates where possible. Reductions are now effective and increased earnings are in prospect.

Improvement in the case of the Chicago & North Western may be predicted to occur about March, in anticipation of the reopening of lake navigation. In the event of a pronounced revival of business the road will be found ready to furnish ample service. The property has been fully maintained. While some shops are running four days a week, bad order cars average less than 6 per cent.

CHICAGO, MILWAUKEE & ST. PAUL.—*Acquisition of Chicago, Milwaukee & Gary.*—In regard to the proposed acquisition of the Chicago, Milwaukee & Gary, noted in last week's issue of the *Railway Age*, Dow, Jones & Co. quotes H. E. Byram, president of the Chicago, Milwaukee & St. Paul, as follows:

The acquisition of the Chicago, Milwaukee & Gary coal line operating over approximately 120 miles, forms a natural connection with the St. Paul's main line and the Terre Haute road. It affords easy access to 75 per cent of its territory in the West and Northwest where coal is consumed over a route shorter than via Chicago. Grades are more favorable and will expedite movement. Coal traffic on the road is increasing rapidly. Fifteen-mile savings is effected by diverting traffic destined to Northwest via Gary line and connecting with St. Paul's main line at Kirkland, Ill. There is also saving of two miles on business destined to La Crosse. The deal also gives the St. Paul direct connection with the New York Central, enabling it in times of congestion and embargoes in Chicago to transfer business for the East and save several days.

The St. Paul guarantees interest on \$3,000,000 bonds, guarantee to begin January 1, 1924.

CHICAGO, MILWAUKEE & GARY.—*Acquisition Sought.*—See Chicago, Milwaukee & St. Paul.

CHICAGO, ROCK ISLAND & PACIFIC.—*Statement on Valuation.*—The relation of the tentative valuation of the Chicago, Rock Island & Pacific and the Chicago, Rock Island & Gulf, as issued by the Interstate Commerce Commission in September, to the present capital liabilities of these properties, is made clear in a statement issued to the Rock Island stockholders on January 7. This shows that the commission's valuation exceeds the liabilities as of June 30, 1921, by \$9,801,315. An abstract of this statement follows:

After six years' work the tentative valuation of your company's properties was announced by the Interstate Commerce Commission in September at approximately \$335,500,000, as of June 30, 1915. This is for carrier property only.

In order to make a comparison of the value announced by the commission with the company's present capitalization, it is necessary to exclude the value of certain leased lines whose capital stock is not entirely owned by this company and to bring the

figures down to date by adding additions and betterments since the date of valuation. So stated, the comparison is as follows:

PHYSICAL PROPERTY AS OF JUNE 30, 1915, AS ANNOUNCED BY COMMISSION	
(a) Carrier property (C. R. I. & P. C. R. I. & G., and Morris Terminal).....	\$335,539,013
(b) Non-carrier property.....	5,745,895
Total.....	\$341,284,908
From the foregoing should be excluded the values of the following leased lines, which are not controlled through the ownership of entire capital stock:	
Keokuk & Des Moines.....	\$3,464,958
Peoria & Bureau Valley.....	1,650,000
White & Black River.....	700,000
	5,814,958
Balance, excluding these lines.....	\$335,469,950
There should also be deducted cash and materials on hand June 30, 1915, as found by the commission.....	9,022,288
Remainder, representing physical property owned directly or through stock ownership, as of June 30, 1915, as found by commission.....	\$326,447,662
Add: Additions and betterments July 1, 1915, to June 30, 1921.....	36,374,458
Cash and materials, June 30, 1921.....	25,455,222
Total, June 30, 1921.....	\$388,277,342
LIABILITIES JUNE 30, 1921, ACCORDING TO COMPANY'S BOOKS	
Long term debt.....	\$234,505,515
Loans and bills payable.....	14,930,000
Preferred stock.....	54,557,989
Total capital liabilities ahead of common stock.....	\$303,993,504
Common stock outstanding.....	74,482,523
Total capital liabilities.....	\$378,476,027
Amount by which value as found by commission exceeds total capital liabilities as of June 30, 1921.....	\$9,801,315
Amount of equity represented by common stock (difference between property values of \$388,277,342 and total of senior obligations).....	84,283,838
Same per share of \$74,482,523 of common stock.....	\$113.16

This valuation, officially determined by the United States Government, refuses for all time and for all purposes the suggestion sometimes made by the uninformed, that this company is over-capitalized. We regard the valuation established by the commission as being much less than the actual value of the property, and have filed the protest contemplated by law in the hope that, upon a hearing, the commission will substantially increase its valuation; but, even on the commission's minimum basis, this valuation must be taken as establishing a property value behind our stocks and bonds, much in excess of their par value.

Asks Authority to Issue Bonds and Hold Stock.—The Chicago, Rock Island & Pacific has applied to the Interstate Commerce Commission for authority to issue \$1,000,000 of general mortgage gold bonds to reimburse the treasury for expenditures out of income and to be deposited with the trustee of the first and refunding gold mortgage as the basis for an issue of \$1,000,000 of bonds, authority for which is also requested, to be held in the treasury as collateral security to be used from time to time for short term notes. The company has also applied to the commission for an order approving the owning and holding by the Rock Island of 35,120.5 shares of the preferred stock and 68,140.5 shares of the common stock of the Chicago & Alton, which ownership results from the litigation growing out of the ownership by the Rock Island of collateral trust bonds of the Toledo, St. Louis & Western.

ERIC—Surplus for 1921—In refutation of reports concerning reorganization and receivership resulting from the low quotations of all Erie stocks on January 9, Vice-President G. F. Brownell said that the Erie will be able to show a "comfortable surplus" for 1921, after allowing for fixed charges.

Mr. Brownell explained that no new financing was contemplated by the Erie in 1922, and added that he was at a loss to account for the movement. The common stock closed at 7 1/2, the lowest in more than twenty years. All of the company's interest charges and rentals, due on January 1, amounting to about \$2,000,000, were "promptly paid." Mr. Brownell said, "The \$1,000,000 mortgage for fixed charges April 1, as well as the \$2,000,000 for July 1, would be handled 'without difficulty.'"

Mr. Brownell explained that the matter of the Erie's \$15,000,000, three-year 7 per cent notes, falling due on April 1, 1922, "was receiving attention." Of this \$15,000,000 issue, the War Finance Corporation had already bought \$9,000,000, and the balance of approximately \$2,500,000 is held by the public.

GAINESVILLE & NORTHWESTERN—Loan Authorized—The Interstate Commerce Commission has approved this company's application for a loan of \$75,000 and has granted authority to issue that amount of first mortgage bonds to be pledged with the Secretary of the Treasury as security.

MOORE RIVER & TEXAS—Plan Operative—J. & W. Selig-

man & Co. and Hallgarten & Co., reorganization managers, announce that the securities called for under the reorganization plan have been deposited in such volume that the plan will be declared operative at once. More than 85 per cent of all the bonds called for deposit have accepted the plan, exclusive of the first mortgage 4s. A substantial majority of the stock has also been deposited, but the figures are incomplete on account of foreign stock in transit.

The reorganization plan was outlined in the *Railway Age*, of November 26, 1921, page 1043.

NORFOLK SOUTHERN.—Asks Loan from Revolving Fund.—This company has applied to the Interstate Commerce Commission for a loan of \$1,000,000 for 10 years.

OREGON SHORT LINE.—Authorized to Issue Bonds.—The Interstate Commerce Commission has authorized an issue of \$16,424,000 of consolidated first mortgage 5 per cent gold bonds to be sold at not less than 91, to retire maturing bonds.

RIO GRANDE SOUTHERN.—Protective Committee.—As a result of the default by this company in the payment of interest on its first mortgage 4 per cent bonds on January 1, a committee to protect the interests of the holders of those bonds has been formed. Its members are Arthur Coppell, of Maitland, Coppell & Co., chairman; Theodore G. Smith, vice-president, Central Union Trust Company; and F. J. Lisman, of F. J. Lisman & Co.

SEABOARD-BAY LINE.—Applies for a Loan for Equipment.—This company has applied to the Interstate Commerce Commission for a loan of \$4,679,892 for 15 years to enable it to acquire equipment for sale or lease to the Seaboard Air Line.

Railroad Administration Settlements

The United States Railroad Administration reports the following final settlements, and has paid out to the several roads the following amounts:

Peoria & Pekin Union.....	\$135,000
Union Depot Company, of Columbus, Ohio.....	30,000
Central of Georgia.....	1,000,000
Ocean Steamship Company of Savannah.....	2,275,000
Yazoo & Mississippi Valley.....	5,075,000
Illinois Central Paid Director General.....	7,750,000

SHORT LINES

Kentwood, Greensburg & Southwestern.....	\$17,000
San Joaquin & Eastern.....	10,000
Nez Perce & Idaho.....	6,000
Waterville Railway.....	3,000

The payment of these claims on final settlement is largely made up of balance of compensation due, but includes all other disputed items as between the railroad companies and the administration during the 26 months of federal control.

Dividends Declared

Nashville, Chattanooga & St. Louis.—3 1/2 per cent, semi-annually, payable February 1 to holders of record January 21.

Pittsburgh & Lake Erie.—\$2.50, semi-annually, payable February 1 to holders of record January 25.

BARNEY ODFIELD states that never in a road race or on any occasion did he cross a railroad at speed or with his car in first drive; he has always slowed down and shifted to second before crossing. He slows down to look and listen and crosses in second to eliminate the chance of a stalled motor.—B. R. & P. Circular.

THE TRINITY & BRAZOS VALLEY RAILROAD has asked the Texas Railroad Commission for permission to drill six oil wells upon its right of way in the Mexia field, the first application of its kind that ever came before the Commission. The question involved is whether or not under its charter the railroad company can legally engage in the oil production business, and the public hearing on the question brought forth strong opposition. This opposition came chiefly from Morris Frankel and associates who asserted that they had paid \$1,000,000 for a lease of ten acres of land, bordering the right of way of the railroad and that if the road should be permitted to drill for oil it would mean a heavy loss to him and his associates. The Trinity & Brazos Valley is owned jointly by the Colorado & Southern and the Rock Island companies.

Railway Officers

Executive

L. D. Gilbert has been elected president of the Lufkin, Hemphill & Gulf; **Arthur Temple**, first vice-president; **E. C. Durham**, second vice-president, treasurer and general manager; **C. M. McWilliams**, secretary, and **C. A. Jordan**, assistant secretary. This road has recently been acquired by the interests which control the Texas South Eastern and of the newly appointed officers Messrs. Temple, Durham and Jordan also hold positions with the latter company.

Frank G. Nicholson, whose election as vice-president and general manager of the Chicago & Eastern Illinois, with headquarters at Chicago, was announced in the *Railway Age* of January 7 (page 162), was born at Gonzales, Tex., on December 17, 1876, and was educated in the public schools, Austin College and at the University of Texas. He entered railroad service in 1899 as a clerk in the offices of the Missouri, Kansas & Texas. He left in 1904, to become secretary to the general manager of the Chicago, Rock Island & Pacific at Chicago, which position he held until 1905, when he entered the service of the Chicago & Eastern Illinois as secretary to the vice-president and general manager. He was promoted successively to chief clerk to the vice-president and general manager, assistant to the receiver and to general manager, which latter position he was holding at the time of his recent promotion.

Thomas D. Heed, whose election as vice-president of the Chicago & Eastern Illinois, with headquarters at Chicago, was announced in the *Railway Age* of January 7 (page 162), was born on March 19, 1873, at St. Louis, Mo. He entered railroad service in January, 1896, in the general auditor's office of the Missouri, Kansas & Texas, at St. Louis. Since that time he has been successively field paymaster for the construction department of the Standard Oil Company; cashier of the Southwestern Passenger Bureau; chief clerk in treasury department of the St. Louis-San Francisco at St. Louis; and assistant secretary and assistant treasurer of the same company with the same headquarters; from 1903 to 1913, assistant secretary and assistant treasurer of the Chicago & Eastern Illinois, with headquarters at Chicago; and from 1913 to 1915, assistant to the receiver of the same company, with the same headquarters. He left railroad service in 1916, but returned in 1918 as receiver and president of the Chicago & Eastern Illinois to act in that capacity during W. J. Jackson's term as federal manager. Upon the return of the railroads to their owners, Mr. Heed became financial assistant to the receiver (Mr. Jackson) which position he was holding at the time of his recent election.

T. D. Heed

Financial, Legal and Accounting

Charles Elsey, whose appointment as vice-president and treasurer of the Western Pacific, with headquarters at San Francisco, Cal., was announced in the *Railway Age* of November 26 (page 1071), was born at Oakland, Cal., on September 18, 1880. He entered railroad service in November, 1907, as assistant treasurer of the Western Pacific, with head-

quarters at San Francisco. He has been successively treasurer, and secretary and treasurer, which latter position he was holding at the time of his recent promotion.

Oliver G. Browne has been appointed claims attorney of the New York Central, the Cleveland, Cincinnati, Chicago & St. Louis, the Michigan Central and the Toledo & Ohio Central, with headquarters at New York.

Operating

C. G. Stevens has been appointed superintendent of the new consolidated St. Louis division of the Baltimore & Ohio, with headquarters at Washington, Ind.

J. D. Fraser, acting superintendent of the Esquimalt & Nanaimo, with headquarters at Victoria, B. C., has been promoted to superintendent with the same headquarters.

O. F. Clark, superintendent of transportation of the Grand Trunk, with headquarters at Chicago, has been appointed car accountant with the same headquarters. He will be succeeded by **J. A. Clancey**, heretofore trainmaster, with headquarters at Battle Creek, Mich.

H. S. Smith has been appointed trainmaster of the Baltimore & Ohio with headquarters at Washington, Ind. **K. S. Pritchett** has been appointed to a similar position with headquarters at Flora, Ill., and **J. B. Purkhiser** has been appointed trainmaster with headquarters at North Vernon, Ind.

J. C. McPherson, assistant general superintendent of the Pacific Electric, with headquarters at Los Angeles, Cal., has been appointed superintendent of the newly created East Bay Electric division of the Southern Pacific, with headquarters at Oakland, Cal. This new division, which embodies the electric suburban lines in Oakland, Alameda, and Berkeley, was formerly a part of the Western division.

B. H. Hammer has been appointed trainmaster of the Fargo division of the Northern Pacific, with headquarters at Dilworth, Minn., succeeding **J. F. Tracy**, and **O. F. Ohlson** has been appointed trainmaster of the Montana division, with headquarters at Livingston, Mont. **F. L. Birdsall** has been appointed trainmaster, with headquarters at Duluth, Minn., succeeding **T. B. Quinn**, transferred, and **H. J. Councilman** has also been appointed trainmaster with the same headquarters, succeeding **D. E. Nichols**, transferred.

Traffic

R. M. Taliaferro has been appointed commercial agent of the Norfolk & Western with headquarters at Columbia, S. C.

C. J. Nelson has been appointed general agent of the Chicago, Burlington & Quincy with headquarters at Herrin, Ill., effective December 27.

W. P. Withers, general agent of the Gulf & Ship Island, with headquarters at Hattiesburg, Miss., has been transferred to Dallas, Tex., in charge of the newly-created traffic office there.

H. N. Stout, traveling freight agent of the Fort Dodge, Des Moines & Southern, with headquarters at Chicago, has been promoted to general agent, with the same headquarters, succeeding **C. E. Carson**, resigned.

F. C. Coley, assistant general passenger agent of the New York, New Haven & Hartford and the Central New England, has been promoted to general passenger agent, succeeding **A. B. Smith**, resigned to accept service with another company.

A. M. Thomas has been appointed commercial agent of the Atlantic Coast Line with headquarters at Jacksonville, Fla. **J. L. Moorman** has been appointed to a similar position at Orlando, Fla., and **M. A. Spooner** to a similar position at St. Petersburg, Fla.

Albert Cotsworth, assistant general passenger agent of the Chicago, Burlington & Quincy, with headquarters at Chicago,

has been transferred to Omaha, Neb., succeeding L. W. Wakely, general passenger agent, who has been granted a leave of absence due to ill health.

J. C. Willis has been appointed general agent of the Atlanta & West Point, the Atlantic Coast Line, the Georgia, the Louisville & Nashville, the Louisville, Henderson & St. Louis and the Western Railway of Alabama, with headquarters at San Francisco, effective January 1.

B. P. Stedman has been appointed general agent of the Louisiana Railway & Navigation, with headquarters at Alexandria, La. T. F. Wilder, commercial agent, with headquarters at Alexandria, has been transferred to New Orleans, La., succeeding John A. Smith, resigned.

William King has been appointed freight claim agent of the New York, New Haven & Hartford, the Central New England, the New England Steamship Company and the New Bedford, Martha's Vineyard & Nantucket Steamboat Company with headquarters at Boston, Mass., effective January 15.

Archibald Gray, general freight agent of the Western Pacific, with headquarters at San Francisco, Cal., has been promoted to assistant to the traffic manager, with the same headquarters. He has been succeeded by J. D. Mansfield, manager of the traffic department of the Seattle Chamber of Commerce, Seattle, Wash., who was formerly assistant general freight agent of the road.

The following appointments in the traffic department of the Canadian Pacific are announced, effective January 1: J. J. Morton, foreign freight agent, New York; W. I. Chudleigh, import freight agent, Chicago; W. C. Bowles, assistant freight traffic manager, Montreal; R. E. Larmour, general freight agent, Montreal; S. C. Hurkett, assistant general freight agent, Montreal; C. E. Jefferson, general freight agent, Winnipeg.

Mechanical

J. J. Herlihy, has been appointed master mechanic of the Baltimore & Ohio with headquarters at Washington, Ind.

W. G. McPherson, master mechanic of the Regina division of the Canadian Pacific, with headquarters at Regina, Sask., has been transferred to Moose Jaw, Sask.

C. H. Creager has been appointed road foreman of engines of the Baltimore & Ohio with headquarters at Washington, Ind., and S. A. Rogers has been appointed to a similar position with the same headquarters.

Engineering, Maintenance of Way and Signaling

J. Hewes, Jr., has been appointed division engineer of the Baltimore & Ohio with headquarters at Washington, Ind.

W. H. Coverdale, consulting engineer, with headquarters at New York, has been appointed consulting engineer of the Chicago & Eastern Illinois, with the same headquarters.

P. T. Robinson, assistant division engineer of the Southern Pacific, with headquarters at Oakland Pier, Cal., has been promoted to division engineer, with headquarters at Oakland, Cal.

A. N. Reece, division engineer of the Kansas City Southern, with headquarters at Texarkana, Tex., has been promoted to chief engineer, with headquarters at Kansas City, Mo., succeeding J. M. Weir, who has resigned to enter the service of the National Boiler Washing Company, Chicago. In connection with this change, Mr. Reece, who was also formerly chief engineer of the Texarkana & Fort Smith, will become the consulting engineer of that road. He will likewise succeed Mr. Weir as chief engineer of the Poteau Valley and of the Arkansas Western.

Purchasing and Stores

C. B. Tobey, assistant general storekeeper of the Lehigh Valley, with headquarters at Packerton, Pa., has been promoted to general storekeeper, with the same headquarters,

succeeding C. C. Huntington, who has left the service due to ill health.

W. A. Summerhays, whose appointment to the newly created position of lumber and tie agent of the Illinois Central, with headquarters at Chicago, was announced in the

W. A. Summerhays

Railway Age of January 7 (page 162), entered railroad service in June, 1898, as an engineering apprentice of the Illinois Central, and was assigned to track work on the Chicago division. He was promoted to section foreman in 1900, and the following year he was made general foreman on double track and construction work. The latter part of the same year he was promoted to assistant general storekeeper in charge of track materials in the newly created supply department. In 1910, he was promoted to general storekeeper with headquarters at Burnside, Ill., and in 1917, he was promoted to assistant purchasing agent. Mr. Summerhays was in charge of the purchasing department during the period of federal control, at the end of which he was appointed purchasing agent, which position he was holding at the time of his recent appointment.

Joseph J. Bennett, whose appointment as purchasing agent of the Illinois Central, with headquarters at Chicago, was announced in the *Railway Age* of January 7 (page 162), was

J. J. Bennett

born at Centralia, Ill., on July 7, 1885. He entered railroad service in 1902, as an expense clerk in the local freight office of the Illinois Central at Centralia. In 1903 he left to enter the employ of the Centralia Coal Company, for which company he worked in various capacities at the mines, and was later promoted to top superintendent. In July, 1907, he re-entered the service of the Illinois Central as coal inspector at Centralia. He was promoted to traveling coal inspector, Southern lines, with headquarters at Princeton, Ky., in March, 1909, and to fuel agent, with headquarters at Chicago on October 10, 1910. On January 1, 1913, Mr. Bennett was promoted to assistant purchasing agent, with the same headquarters, which position he was holding at the time of his recent promotion.

Obituary

J. R. Walsh, pioneer railroad builder and financier and formerly president of the Southern Indiana, died on January 11 at his home in Chicago.

J. H. Collins, division storekeeper of the Southern Pacific, with headquarters at Los Angeles, Cal., died of pneumonia on December 4, at his home in that city. Mr. Collins had been in the service of the Southern Pacific since 1906.

Railway Age

The Table of Contents Will Be Found on Page 5 of the Advertising Section

The orders placed for passenger cars in 1922 will exceed those for 1921. This is written the third week in January.

1922 Orders Exceed Last Year's

Rather early in the year, some will say, to make a prophecy of such far-reaching character. But not too early, because insofar as the Class I railroads are concerned the prophecy has already been fulfilled. The orders for passenger cars for service in United States placed during 1921 totaled 246, of which 207 were placed by the Class I roads. The passenger car orders placed by the Class I roads so far in 1922 total 222, already 15 more than last year's total. The orders represent one week's business and are reported in this week's Equipment and Supplies column. They include 127 cars ordered by the Chicago, Burlington & Quincy, 45 by the Chicago & North Western and 50 by the Long Island. But for the fact that the 1921 orders were so extremely small, one could say that the railroads in this country have placed the equivalent of a year's business in a single week. Unfortunately comparisons with 1921 do not mean much. Nevertheless, orders for 222 passenger train cars in one week set a good pace. It is as good as could be supplied when business was at its best in the good old times. Presumably, of course, the pace which January has set in passenger car business will not be kept up for the year, but that does not get around the fact that there are still a number of roads which have been asking prices on passenger cars and whose passenger car orders have not yet been let.

The Interstate Commerce Commission's proposed order for the installation of automatic train stops on prominent railroads throughout the country (printed last week, page 189) will be of value chiefly as a starting point for discussion. It aims to bring to an end a period of controversy and experiments which has extended over 15 years, an aim which everybody must approve; every progressive railroad officer must wish to see this period of uncertainty brought to an end. The delay of 15 years since this subject was first broached in Congress has seemed intolerable; yet everyone must recognize that the underlying cause of delay has been the same in every quarter; the large and uncertain cost of an improvement which aimed at just one danger. But much progress has been made in the last 10 years, and automatic train control is now recognized as having possibilities of economy in operation aside from the narrow question of safety. The Chicago & Eastern Illinois has been using automatic stops for over eight years; and the commission will no doubt now call upon other roads to explain the causes of the differences between their views, or their standards, and those of the C. & E. I. (The C. & E. I. system is of the intermittent electrical contact or ramp type.) The commission has taken a wise step in declaring that the stage of preliminary experiment must be brought to an end and in preparing to open the way for the testing of other types. There is another condition, however, which the commission is in duty bound to terminate; the condition of doubt as to how this costly improvement is to be paid for. Under the Transportation Act, 1920, the commission can, in theory, improve the railroads' incomes to match their increased ex-

The Call for Automatic Train Stops

penses, but no one knows, as yet, how this theory is going to work out. The commission virtually commands these 49 railroads to spend, each, a very considerable sum for a radical experiment in safety. This and the numerous technical questions which have long needed a thorough airing will have to be thrashed out in the hearings which the commission no doubt will hold.

F. V. Russell, superintendent of operation of the Great Eastern Railway of England, who has just returned after traveling some 25,000 miles inspecting the railways of the United States and Canada, is quoted by the Philadelphia Public Ledger as suggesting an interchange of railway operating men between the United States and England. Mr. Russell, the dispatch to the Public Ledger says, is of the opinion that England could learn from us in handling freight and that we could well study some of England's methods in transporting passengers. This conclusion seems logical enough. If some such arrangement could be worked out, much good might come of it. The proportion of our railway officers who seek to improve their knowledge of railroading by a study of methods in foreign countries is very small, perhaps smaller than that of any other country, and yet in some portions of the United States railroading has already become almost as intensive as it is in England. We should not, however, expect a group of American railway men to return from England with ideas which would revolutionize our methods overnight. We should rather expect that an inspection of English practices would provide information for the formulation of a far-seeing policy for future development in this country. The occasion of the International Railway Congress in Rome in April provides an additional incentive for American railway officers who are in a position to make the trip. At all events the matter is one worthy of consideration.

Learning Railroading Abroad

The railways have made extremely drastic retrenchments since the decline in business. Probably most of them have saved as much money as they could in most ways. The statistics indicate, however, that they have not reduced expenses in one way as much as they could. The decline in passengers carried one mile in the first ten months of 1921, as compared with the first ten months of 1920, was over 19 per cent. There was practically no reduction, meantime, in the amount of passenger service rendered. The decline in passenger trains run one mile in the country as a whole was only 1.5 per cent. There was some curtailment of the number of passenger cars run in each train, but the reduction of passenger train car miles was only about three per cent. In western territory the decline of passenger traffic was almost 25 per cent, and this actually was accompanied by a very small increase in passenger train service. The difficulties in the way of reducing passenger train service are much greater than those met in reducing freight train service. The public usually complains about almost every reduction of passenger train service and often the consent of railroad commissions

Passenger Traffic and Passenger Service

211

to take off trains cannot be obtained. It is difficult to believe, however, that with such a large reduction of passenger business as occurred the railways could not have obtained the consent of the commissions to reduce passenger service substantially more than they have and satisfied the public that it was justifiable. It is true that during the war years there was much over-crowding of trains due to curtailment of the service accompanied by a large increase of travel, and that the railways since they were returned to private operation have been engaged in restoring the passenger service to normal. It seems plain, however, that during the last year more passenger service was rendered than general business conditions and the earnings of the railways warranted, and that this was largely due to competition between the railways. It is far better to reduce expenses by curtailing train service than by deferring maintenance. The former makes real savings, while the latter does not. Competition in service is desirable, but it ought not to be allowed to prevent real economies from being made at a time when maintenance expenses are being cut to the bone, and when, in spite of this, the net return being earned is wholly inadequate.

A newspaper which we had never seen before came to our offices last week. In size and subject matter it did not differ greatly from the average small town newspaper. But in the excellence of its cartoons, illustrations and general composition it was the equal of most of our large metropolitan dailies. This paper was the first issue of the Pennsylvania News, a publication for the employees of the Central Region of the Pennsylvania Railroad. Every two weeks from now on it will be published and distributed among the employees of that region and, if we are any judge of newspapers, it will be eagerly read: First, because it is devoted entirely to news about those for whom it is intended and, second, though just as important, because it shows the skill of an able editor in the manner in which it is made easy to read by the use of cartoons, illustrations, careful writing, well selected type and other devices known to the schooled newspaper man. The News is a welcome addition to the large family of railway periodicals. We predict its success. Meanwhile those interested in employees' magazines will watch it with interest.

The Pennsylvania News

One oft-heard commentary on the movement toward deflation is that the reduction in the costs of raw or basic materials is not adequately reflected in the prices of finished products. This complaint cannot be made with any degree of justice in the case of the steel fabricating industry. Inquiries for any appreciable tonnages in a form permitting of a fair amount of duplication in operations are sure to bring forth bids that represent an extremely small margin over current prices of the plain material. This may be explained only in part by unusually favorable arrangements between the fabricator and the mill. It must be accounted for very largely by minimum allowances for fabricating costs. Because of the relatively small amount of work being offered the shops have been compelled to make concessions to get the business. Obviously, this is a most favorable time for the contracting of steel bridge and building work and in the case of certain projects which have been dormant or only nominally in progress for a number of years, enormous savings have been accomplished through the deferment of this work until the end of the high price period. It is well known that the railroads have postponed a great many major railway bridge projects. In fact, very little work of first magnitude has been carried on for several years except such as had its inception early in the

The Conditions Are Most Favorable

war period. Work of this kind cannot be put off indefinitely and in view of the present favorable aspect of the structural steel market, a number of the railroads are reviewing their plans for the reconstruction of several large bridges.

The advantages of good light in railroad shops and engine-houses are readily apparent but in many cases seem to be overlooked. At least that is the impression gained by visiting a large proportion of existing locomotive terminals and repair shop buildings. The walls and ceilings are black; smoky winds admit feeble rays of light; and electric lamps of small candle power are located at infrequent intervals high above the floor. An inspection of almost any modern manufacturing plant on the other hand will show exactly the reverse of these conditions and prove how great importance is placed on adequate lighting facilities. Increased production and more accurate work are made possible; accidents are far less common, and workmen are not only able but willing to apply themselves more diligently in proportion to the light and cheerfulness of their surroundings. These facts explain why many shop and enginehouse employees do not feel an excess of either ambition or energy upon entering their places of daily employment. The work is often unavoidably greasy and dirty and this disadvantage, combined with poor light and gloomy surroundings, is bound to have a depressing influence. How can conditions be improved? The proportion of window to wall space in existing shops and enginehouses is fixed and, while usually less than called for by modern practice, cannot be increased except at a prohibitive cost. There are many things, however, which can be done at small expense to admit more light and brighten up the interiors. The first step is to provide means for carrying off as completely as possible gas and dust from locomotives, furnaces, forges, or what not. The walls and ceilings can then be whitewashed with the assurance that they will remain white for a reasonable length of time and reflect the light admitted through periodically washed windows. Brightening up machinery and other shop equipment by painting it a light color has also been tried in industrial plants with good results. With careful attention to these details the best light which it is possible to obtain during the daytime will be available. On dark days and at night artificial light must be used and many shops are poorly equipped in this respect. Great improvements can be made in the better location of existing lights, the cleaning and rearrangement of reflectors or the provision of more powerful lights when necessary. It has been demonstrated many times in industrial plants and in some railroad shops and enginehouses that time and money spent on improved lighting facilities is a most profitable investment.

Recently an important building in one of the large railroad terminals required painting. The expenditure was authorized, the money spent and after the paint was on the structure looked considerably more respectable than it had before. To all appearances a good job had been done economically. More recently, however, after only a few weeks in fact, it has come to light that neither was the job a good one nor an economical one. The building still appears to be painted, but what was initially paint now represents itself as powder, yielding to the touch. Manifestly something went wrong somewhere, but while inquiries, made for the purpose of finding out what the trouble was, are circulating about, this material must be removed and new paint applied—at a cost for removing of more than one-half that involved in the first

All That Glitters Is Not Gold

painting, together with an additional cost of repainting equal to that of the cost of the first painting. This, of course, is waste, not economy. Painting to be sure is a very ordinary occupation on every railroad and it is not surprising from the amount of painting done each year and the striking contrast which a freshly painted surface presents to the old surface, that men who are not painters themselves lose sight of the fact that anything at all will not do for paint and that any old way will not do for painting. The truth in the adage that "all that glitters is not gold" is particularly applicable to the painting problem. While railroads may ignore it they must eventually pay. Recognizing this, the officers upon whom any responsibility rests in connection with the painting on railroads should cultivate an interest in this work other than merely that of having it done, and will usually find it profitable to demonstrate occasionally by word or act an appreciation for whatever thought and skill the painters put into their work.

The Trend of Railway Construction

NUMEROUS INDICATIONS point to the resumption of construction work on a considerable number of roads next spring. Because of this fact it is pertinent to call attention to the gradual but steady transition from the extensive to the intensive development of the railway properties in recent years. This change will be particularly noticeable as work is resumed after the inactivity of the last three years. It is of special importance to the engineering officers of the railways, but hardly less important to those who sell construction equipment and to the contractors who specialize in railway work.

In the early days of American railway development, construction work was almost all of the extensive character—the construction of extensions and new lines. Even as recently as 15 years ago when the St. Paul and the Western Pacific were building to the Pacific Coast and other roads were constructing large mileages of branch lines, the work was principally of this character. This extensive work led to the formation of large contracting organizations which were prepared to handle the entire construction of lines several hundred miles long, including the grading, bridging and the laying of the track itself.

As the traffic has increased it has become necessary to revise the existing lines and to add to the facilities along them. While large areas still await railway facilities in this country, such widespread activity as was seen in 1906 has gone permanently. With the return of railway conditions to normal, branch line construction may be expected to increase materially. However, the great development of the future will be of an intensive character—the amplification of existing facilities. The trend of railway work in this direction is indicated by the following statement issued by the Atchison, Topeka & Santa Fe: "Railroad managements prefer to improve their plants for the efficient handling of the traffic offered, rather than to build new lines at this time to take care of business in various stages of development. A good deal of work will be done in the direction of improving roadbeds and terminal facilities, and possibly some short extensions will be made to round out certain properties, but virgin territory probably will have to wait awhile for transportation facilities."

In the conduct of intensive development work a new problem arises which is not present in the construction of new lines, namely, the necessity for the handling of traffic during the progress of the work. This necessitates a revision of methods. Much improvement work can be done most economically by making use of existing tracks and other facilities, and thus, potentially at least, disturbing regular traffic. The result is that the railways must of necessity exercise

much closer supervision over the construction work, and in many cases they are taking it over and performing it with their own forces, in order to avoid any division of responsibility. This tendency is increasing and it will bring the railways into the market for more construction equipment such as steam shovels, ditchers, dump cars, spreaders and concrete mixers, as well as a wide variety of auxiliary appliances.

Marked Improvements in the Railroad Situation

WHILE THE YEAR 1921 was the worst in railway history the changes in the railway situation which have been occurring within recent months afford grounds for optimism as to the future.

In spite of the fact that the total traffic moving is still abnormally small, the net financial results obtained by most railways within recent months have been better than they were a year ago, and much better than they were last spring. The net return earned by the railways is of the greatest importance not only to the railroads themselves, but also to the industries of numerous kinds from which they buy equipment and supplies. The record of many years shows that the volume of orders the railways place follows closely the net return earned by them, declining when it declines and increasing when it increases.

The traffic handled in November was smaller than in October, and the net return earned in that month was much less than in October. The net return earned in November, however, was almost \$70,000,000, or 30 per cent more than in November, 1920.

We have now complete statistics of earnings and expenses for 11 months of 1921. Probably the most outstanding feature of these statistics is the striking contrast presented by the net results of operation in the first six months of 1921, and in the next five months. In the first six months of the year the operating expenses consumed over 88 per cent of the total earnings, and the net operating income earned was only \$142,000,000, or at the annual rate of 1.8 per cent on the valuation made by the Interstate Commerce Commission. On the other hand, in the five months July to November, inclusive, the operating expenses consumed less than 76.50 per cent of the earnings, and the net operating income was over \$418,000,000, or at the annual rate of 4.72 per cent on the valuation.

The railways were making drastic retrenchments in maintenance in both periods. It follows that this marked improvement in the net results was due chiefly to real economies in operation. The statistics regarding the unit costs of labor, coal, materials, etc., support this conclusion.

The railway situation has been improved not only by the increase in the net return being earned, but by changes in general business conditions. There has been for months a steady increase in the amount of new capital seeking investment, and, in consequence, a decline in the general rate of interest. This decline in interest rates, as is always the case, is causing a rise in the market prices of stocks and bonds. The market prices of most railway stocks and bonds have largely advanced owing both to this improvement in underlying financial conditions and to the increases in net return being shown by most railways. Every increase in the market prices of railway securities brings nearer the time when the railways can market a substantial amount of new securities at reasonable prices. Their ability to market their securities at reasonable prices is, in turn, the main thing needed to enable them to increase the amount of equipment bought by them and the development work of other kinds done by them. One effect of the improvement in their financial condition which already has occurred is seen in the largely increased

orders for equipment and materials of all kinds which they have placed within recent months, and the additional large orders which are under consideration.

Whatever improves the railway situation is sure, by increasing the volume of purchases they make, to improve general business conditions because under normal conditions not only are their purchases vast, but they are made, directly and indirectly, from the producers of almost every class of basic commodities. Whether the railway situation will continue to improve will depend largely upon the policy of the Interstate Commerce Commission regarding rates and of the Railroad Labor Board regarding wages. It seems extremely doubtful, however, that the policies of these two government bodies will be such as actually to reduce the net returns now being earned. They must see that this would be contrary to the interest of the public itself. Furthermore, the net return now being earned, while much larger than in the first half of 1921, is still so small that probably the railways could defeat attempts to reduce it by appealing successfully to the courts upon the ground that it would involve confiscation.

On the whole, therefore, while the railway situation cannot yet be said to be satisfactory, it can be said that it is far better than it was a year ago and that all signs indicate that in respect to net return earned, to equipment and materials bought and to development work done by many railways, the record of the year 1922 will be far better than the record of the year 1921. The year 1921 was a year of positive retrogression in the railway field. The year 1922, in contrast, promises to be one of real progress. If, as appears probable, there shall be an increase in traffic and, therefore, in total earnings, the progress made toward normalcy will be not only real but substantial.

Probably the most significant feature of the general business situation is the large and general advance in the prices of securities of almost all kinds which recently has been shown on the stock market. A falling stock market almost invariably presages a decline in general business activity; while a rising stock market, such as the present one, almost invariably presages a general increase of production and commerce. A general increase of production and commerce would cause an increase of railway traffic; and a substantial increase of traffic in 1922 would do more than anything else could to restore the normal earning capacity and normal expenditures of the railways.

Many things remain to be done to make the railway situation what it should be; but the number of substantial reasons for hope regarding the future is greater now than for many months, and is constantly increasing.

New Books

Proceedings of the American Society for Testing Materials, 1198 pages, illustrated, 6 in. by 9 in. Bound in cloth. Published by the society, 1315 Spruce street, Philadelphia, Pa.

This volume contains the proceedings of the twenty-fourth annual meeting of the society which was held at Asbury Park, N. J., on June 21-24, 1921. It includes 32 reports on a wide variety of subjects, such as the heat treatment of iron and steel; the corrosion of iron and steel; preservative coatings for structural materials; coal and shipping containers. This volume also contains 93 tentative specifications which were submitted or revised at the 1921 annual meeting as well as five tentative revisions of A. S. T. M. standards. Following the reports and specifications there appear 24 technical papers including those on "A Proposed Method of Estimating the Density and Strength of Concrete and of Proportioning the Materials by the Experimental and Analytical Consideration of the Voids in Mortar and Concrete" by A. N. Talbot, and on "Wear Tests of Concrete" by D. A. Abrams.

Letters to the Editor

[The RAILWAY AGE welcomes letters from its readers and especially those containing constructive suggestions for improvements in the railway field. Short letters—about 250 words—are particularly appreciated.]

How to Reduce the Cost of Living

ALTOONA, Pa.

TO THE EDITOR:

One naturally hesitates to approach the unpopular and distasteful. As a member of that great body called "railroad labor" I am not entirely devoid of that hesitancy. We must, however, take the advice of the poet and

" . . . be up and doing
With a heart for any fate,"

fully realizing the important part we must take in the necessary industrial readjustment.

The railroads have said to labor: "We must reduce your wages in order to meet the demands of the public for lower freight rates."

Labor has replied: "We will accept no reduction," following its refusal with a few arguments and some threats. Its leading argument deserves the most frank criticism. It is this: "Reduce the cost of living first and then we will accept a reduction in our wages." The same reply to this demand will apply to the wage question in all forms of industry.

As I see it, to bring about a general and permanent reduction in the cost of living, without first reducing wages, is just about as feasible as making the cart run along in front of the horse.

Railroad labor has received one reduction and, it must be admitted, that was not very large. Other business has probably suffered more. A lowering of the cost of necessities has followed, as the following figures, taken from my household records, will show:

	Cost	
	September, 1920	December 1921
Potatoes, per bushel.....	\$2.00	\$1.40
Bread, per loaf.....	.10	.08
Milk, per quart.....	.14	.11
Milk, per small can.....	.08	05½
Coffee, per pound.....	.45	.28
Bacon, per pound.....	50	25
Lard, per pound.....	22	12½
Ham, per pound (whole).....	.55	18

Many other items, showing like comparisons, are to be found in this record.

It is quite true that the lowering of these costs began before there was any actual reduction in the railroad wage, and continued without any reduction in freight rates at all. Wages in the productive industries, that is, those which produce the food, clothing and shelter, had already been lowered before there was any favorable change in the living costs. Other conditions possibly had some influence in this downward trend.

The last month in 1920 saw the beginning of the labor curtailment in this place; before the third month of the new year was spent the labor force was reduced to the point where only one man was working instead of three. This had the effect of reducing the public's buying power here to one-third of what it had been formerly.

This is true because here the railroad is the main source of employment. When it retrenches the other industries do likewise, because of their direct or indirect dependence upon it.

This sudden decrease in the people's buying power possibly had something to do with the reduction in the sales prices of our commodities, but it must be admitted that business

would not long survive with such forced methods alone. Any schoolboy can see that when goods are gotten ready for the market during the prevalence of high wages they must be sold at a figure that will pay for the labor of producing and getting them ready for and to the market, as well as paying interest on the money invested in the machinery and equipment used in producing and transporting them. If sold for less, someone loses. Then it follows that to reduce naturally and healthfully, there must first be a reduction in the cost of production. Labor is such a large factor in the production of every necessity, comfort or luxury that all other factors are comparatively dwarfed to nothing.

Take for example the coat I have on. It is made of wool and cotton. Labor housed the sheep, planted, cultivated, harvested their feed and fed them; labor sheared the wool from their backs, sorted, carded and spun it into threads; labor planted the cotton, cultivated, picked, sorted and drew it into threads; labor manufactured the dyes with which to color these woolen and cotton threads, and labor wove the two into cloth; labor cut and sewed this cloth into the garment; it was labor that produced the locomotives and cars with which to transport, and transported it over mountains and through valleys for hundreds of miles where I could get it. After labor, what else is there?

History will certainly point to the action of labor in this, the world's greatest readjustment period, and place the blame where it belongs, for these years' delay in the progress of civilized activities.

A. C. MYERS,
Clerk, Pennsylvania System.

Deferring Repairs a Costly Policy

NEW YORK

TO THE EDITOR:

Putting off the evil day—in no other terms can the deferred maintenance of roadway, structures, and equipment, now being practiced to an increasing extent by many railroads, be characterized.

The recent statistics of the principal railroads furnished by the Interstate Commerce Commission show that the net income is greater in most cases than for the corresponding period one year ago. In the face of a small reduction in wages and a very much greater reduction in gross earnings this is not exactly consistent, other things being equal. Right here is the point: other things are not equal, for there has been an enormous reduction in expenditures covering maintenance of roadway, structures, and equipment, and this answers the seeming paradox and explains the "improved" net income.

An analysis of the physical condition of passenger train cars operated by one of the larger railroads in December, 1921, as compared to December, 1920, clearly indicates the result of enforced savings due to deferred maintenance. The state of affairs indicated by the data shown in the following paragraphs is unquestionably typical to a greater or less extent of the situation in which many railroad managements now find themselves, not only in respect to passenger cars but more than probably in respect to freight cars, locomotives, buildings and structures, and roadway.

	1920	1921	Change 1921 Compared With 1920 Per Cent
Number of passenger train cars.....	880	865
Average time out of general repair shop, as of Dec. 1.....	15.1 mo.	19.2 mo.	27.15 increase
Number of cars receiving classified repairs, for year.....	698	482	30.94 decrease
"Saving" due to deferred maintenance at \$650 per car.....		\$140,400	

Briefly the above data, based on 15 months between shoppings, which is considered about the correct length of time

by most mechanical officers and which was approximately in effect up to and including 1920 on the road in question, shows that the general mechanical condition of passenger equipment has deteriorated 27 per cent at the cost of a "saving" of 31 per cent due to deferred maintenance.

If there is no way found during the year 1922 to spend more money for maintenance than was spent in 1921 an analysis, as above, at the close of 1922 will show the following interesting conditions:

	1920	1922	Change 1922 Compared With 1920 Per Cent
Average time out of general repair shop, as of Dec. 1.....	15.1 mo.	23 mo.	52.3 increase

This shows a situation bordering on the absurd and it is obvious that there must be a decided change for the better and that it must be very soon.

To restore the physical condition of passenger cars during the year 1922 to that condition prevailing during 1921, all of the cars owned will have to be overhauled and the average cost will undoubtedly be 20 per cent higher per car than the estimated cost, \$650, shown for 1921, due to the general condition of cars being much worse than it was one year ago.

On this basis, the cost of one year's deferred maintenance on passenger cars would be:

Cost of overhauling cars for 12 months		
1920—698 cars at \$650 each.....		\$453,700
1921—482 cars at \$650 each.....		313,300
1922—865 cars at \$780 each.....		674,700

Deferred maintenance of passenger cars during 1921 made possible a "saving" of \$140,400, but to restore their physical condition to normal, if it is done during 1922, will mean an expenditure of \$221,000 more than that of 1920, and \$361,400 more than that of 1921.

This gives a fairly accurate index to what can be expected in the way of added cost due to putting off necessary repair work until some future time.

The sooner means can be found to enable the roads to catch up on deferred repairs, the less evil, of course, will be the day when the process starts.

Lurking in the shadows of the background of the present unfavorable maintenance situation is the haunting fear of possible accidents which might conceivably result from causes traceable to less-than-standard maintenance conditions of rolling stock or roadway, and it is not too much to say that conscientious railroad men are fervently looking forward to the time when the evil day will have to be postponed no longer.

M. S. ROBERTS.

A CONTRACT has been awarded by the Chicago region of the Erie to the A. S. Hecker Company, Cleveland, Ohio, for the maintenance of track and the protection of highway crossings on the Chicago, Marion and Cincinnati divisions. According to the plan provided in this contract all the track foremen, track laborers and crossing watchmen have been released from the service of the railroad company and are now employees of the A. S. Hecker Company. Circular issued by the railroad covering this arrangement is as follows:

"Effective January 1, 1922, the maintenance of track and protection of highways on the Chicago, Marion and Cincinnati divisions of the Erie Railroad Company will be handled by the A. S. Hecker Company, contractors, of Cleveland, to whom a contract has been awarded, covering all work incidental to track and crossing operation.

"All track foremen, track laborers and crossing watchmen will be released from the service of the railroad company, effective at midnight of December 31, 1921. All employees desiring to continue work in the employment of the A. S. Hecker Company will be given a chance to signify their intention to a representative of the A. S. Hecker Company on December 31, 1921."

The Chilean Railroad Problem and Its Solution

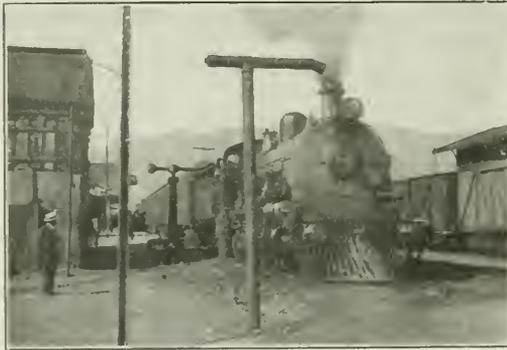

Electric Operation Will Increase Track Capacity, Lower
Operating Costs and Improve Service

By David C. Hershberger

General Engineer, Westinghouse Electric & Manufacturing Company

THE TRANSPORTATION system has a particularly vital influence on the development of Chile, because of the peculiar location of the natural resources of the country. Located between the summit of the Andes and the Pacific Coast, Chile occupies a domain 2,600 miles in length from north to south and varying in width from 60 to 280 miles. While there is considerable coastwise steamer traffic, especially in the northern part, the railroad system is the main artery of transportation serving the central and southern sections of the nation.

It is essential that this system be kept up to the most

Express Train at Til Til Drawn by a Baldwin Locomotive

modern standards in order to serve the country adequately and efficiently. To attain this objective, the government of the Republic of Chile has undertaken the most extensive electrification in progress at this time. This procedure is in strict accordance with the well known progressive policy of our southern neighbor.

The urgent necessity for electrification was brought to the attention of the government during the world war by the congestion of traffic in the first zone. This zone comprises the section of the line between Valparaiso and Santiago, and the branch from Las Vegas to Los Andes. The Valparaiso-Los Andes section forms a part of the transcontinental system to Argentina, the Transandine Railroad continuing eastward from Los Andes. During this congestion, which occurred in 1917, the steam locomotives used in this zone were of relatively small capacity, which necessitated the operation of a large number of trains in order to move the freight tonnage and handle the passenger traffic. The lack of adequate motive power caused a congestion of traffic which was rapidly approaching the capacity of the line. It was at one time considered necessary to lay a second track on a considerable portion of the line in addition to that which was already double tracked. The 1917 congestion was relieved to a considerable extent several years ago when 20 Mikado type steam freight locomotives were put in service in the first zone.

Chilean engineers and business men have recognized for many years that the tremendous amount of water power avail-

able could be used profitably not only for industrial purposes, but for the operation of the railroad transportation system as well.

In 1918 a commission consisting of Rafael S. Edwards and Ricardo P. Solar was appointed to prepare a report on the electrification of the broad gauge lines which extend from Valparaiso southward to Puerto Montt. These lines are divided into four zones. The first zone has been described, and the others extend southward in numerical order. The commission completed its report covering all four zones in 1918, and the decision to electrify the first zone followed, as a result of the economies and advantages set forth in this report.

The specifications required the bidders to supply not only the electrical equipment, but to execute the construction work as well, and to turn over to the government ready for operation the complete electrification. These stipulations make it necessary for the bidders to construct the substation buildings and erect the overhead contact lines complete.

The contract for this large undertaking was awarded to Errazuriz, Simpson & Company. This company will execute the construction work while the electrical equipment will be supplied and installed by the Westinghouse Electric International Company. The former company is a well-known Chilean firm which has completed important engineering work in Chile. In addition to conducting a large

View of the Double Track Section, Looking East from Ocoa

importing and exporting business, this company markets in Chile the electrical apparatus of the Westinghouse Electric International Company.

Track and Roadway

Electrification will change the complete status of the railroad as to track capacity, as the flexibility of electric transportation is such as to provide not only the possibility of trebling the traffic of the road, but of going to much greater limits if necessary.

The extensive electrification which has been undertaken comprises a complete steam engine division—a distance of

116 miles between Valparaiso and Santiago, and 28 miles between Las Vegas and Los Andes. From the port of Valparaiso the railroad skirts the bay of the same name nearly to Miramar, and then passes through Vina del Mar, a famous summer resort and exclusive residence district. After crossing a low coast range the line follows the Aconcagua River to Las Vegas through the fertile valley in the Quillota district.

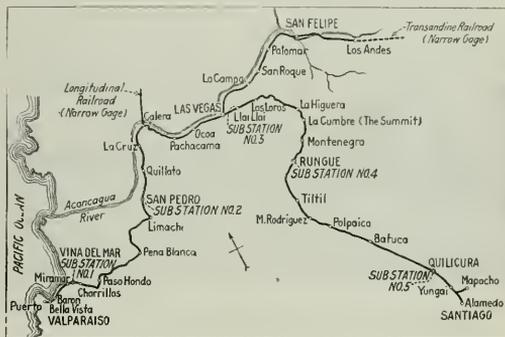

At Calera, the Longitudinal Railroad starts northward to Antofagasta and Iquique, while at Las Vegas the Los Andes branch leaves the main line. Llai Llai, located approximately half way between Valparaiso and Santiago, is the meeting point for all passenger trains making connections with the Los Andes branch trains. At this point the heavy grade section over the mountain begins, and ends near Batuco on the eastern side of the mountain range.

The curvature, considering the entire line, may be considered to be of medium severity. Starting from Puerto, the line circles the bay to Miramar and has considerable curved track over the low coast range and along the Aconcagua River. The most severe curves are located on the section of the line between Llai Llai and Til Til. The maximum curves are ten degree and are located near Los Loros. On the eastern slope the maximum curve is 9.5 degrees located near San Ramon. The line between Batuco and Quilicura is practically level tangent track.

The road is double tracked between Valparaiso and Limache, a distance of 27 miles; between Ocoa and Llai Llai, 8 miles, and between Yungai and Mapocho Station, a distance of 1 1/2 miles, making a total distance of 36 1/2 miles of double track line. The track is 5 ft. 6 in. gauge, laid on Chilean oak ties and is rock ballasted for practically the entire length of the line in the first zone. Eighty-five pound rails are used between Llai Llai and La Cumbre and between Calera and Ocoa. The rest of the line between Valparaiso and Santiago is laid with 80 pound rails, while the branch to Los Andes is laid with 75 pound rails.

The track is well maintained. Due to the absence of severe cold weather, the sub-grade is not subject to alternate freezing and thawing. This condition contributes to the low track maintenance costs. The wheel loadings will be such

the six tunnels. The first three tunnels are located on the Tabon or maximum grade section between Llai Llai and La Cumbre. All the tunnels are dry except San Pedro, so that the problem of corrosion of overhead material is not serious. The clearances from rail to roof do not seriously interfere with the design of the overhead material or the locomotives. The smoke conditions in these tunnels are a detriment to providing the best working conditions for the train crews and traveling service to the public. The elimination of these con-

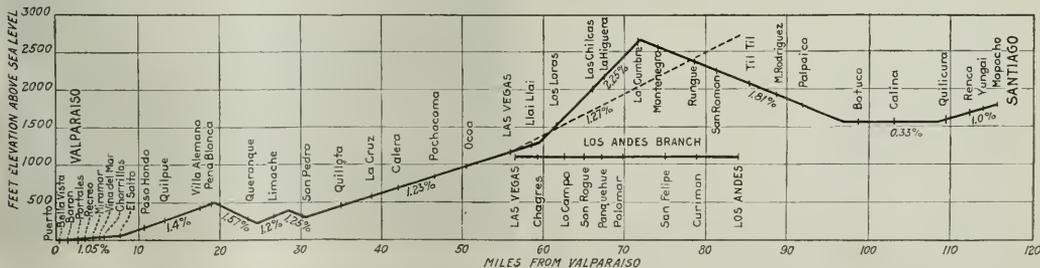

Map of Zone Being Electrified

ditions by electric operation constitutes an important improvement in operation.

The grade conditions have always been an obstacle in the way of moving, advantageously, the traffic in the first zone. It has been necessary to maintain several helper sections to handle the freight traffic, while practically all passenger trains require helpers ascending the Tabon grade between Llai Llai and La Cumbre. With electric operation all helper service will be eliminated, except in connection with the freight trains ascending the Tabon grade.

The condensed profile gives a general idea of the grade

Condensed Profile of the First Zone of the Chilean State Railways to Be Electrified

that with most of the locomotives, though much more powerful than the steam locomotives being replaced, the duty on the track from static loading will be less than that with the steam locomotives.

The largest bridge is that over the Vina del Mar River near Valparaiso, known as the Las Cucharas Bridge. This is a steel structure of the cantilever type, 440 feet long and carries two tracks. There are a number of girder type bridges, the longest of which is 250 feet in length.

There are six tunnels on the main line, namely: Los Maquis, Los Loros, Centinela, San Pedro and the two Paso Hondo tunnels, the latter being located on the double track section. San Pedro is 1,600 feet in length; the longest of

conditions. The maximum grade, which is 2.25 per cent, is located on the Tabon between Llai Llai and La Cumbre, the summit. This is the most severe grade in the first zone and forms the major part of the twelve mile grade. The summit has an elevation of 2,600 feet above sea level. The maximum grade on the eastern slope is 1.81 per cent and is located near San Ramon. The elevation of Santiago is 1,800 feet, so that the most severe hauling conditions are south bound, or toward Santiago.

To provide for increased traffic under steam operation would require heavier locomotives than those in service at present which would probably necessitate the installation of heavier rails. This in turn would involve a relatively large

expense, and the maintenance expense would increase proportionately.

The change to electric operation permits of increasing the tonnage tremendously without the necessity of changing rails, by reason of lower track stresses, even with engines of greater power than those in service at the present time. The more efficient use of the trackage by electric operation due to being able to handle not only a greater number of trains, but a greater tonnage per train, is an extremely important con-

Puerto Station, Valparaiso. The Station Building Is on the Right

sideration. For equal tonnage the track maintenance will be less with electric operation than with steam.

The Fuel Situation

While it was realized that the problem of traffic congestion could perhaps be solved by the use of larger and more powerful steam locomotives, it was further recognized that steam operation would not solve the fuel problem. This problem has two serious phases; first, the cost of fuel; and second, the partial dependence upon imported coal.

The railroad fuel bill has in the past few years reached excessive figures due to the high price of coal. The price of coal in Chile is governed, not by the price of coal mined in Chile, but by the price of imported coal, much of which in the last few years has come from the United States. To the cost of the coal must be added ocean freight transportation, and lighterage charges, so that before the war the cost varied from \$7.00 to \$10.00 per ton for imported coal of good quality. During the war it is understood to have risen as high as \$25.00 to \$28.00 per ton, while more recently the price has ranged from \$15.00 to \$20.00 per ton.

The price of Chilean coal has been slightly less than these values, but it is readily seen that with the almost unlimited hydro-electric power available, sold at a reasonable rate, the electrification program is not only justified, but is the solution of the fuel problem from the cost standpoint. The further energy economies made possible with electric motive power by the reduction of standby losses in freight, passenger and switching service, and as a result of the energy returned to the line by regenerative electric braking, are not to be ignored.

The elimination of transportation of fuel for railroad use not only releases this car and locomotive equipment for hauling revenue freight, but will assist in supplying needed rolling stock for the transportation of products of the South. The railroads in the past have been embarrassed seriously at times due to inability to obtain sufficient coal for their operation at times of labor troubles in the Chilean mines, as well as from other causes. At these times it has been necessary to curtail the service with the consequent inconvenience to the traveling and shipping public. By the use of hydro-electric power for transportation, this situation will be entirely relieved and the nation will be wholly self dependent.

Present and Future Freight Service

The southbound tonnage consists largely of imports such as coal, merchandise, machinery, automobiles, food products, etc. Part of this tonnage results from the coastwise steamer traffic in handling the transfer of products of the nation from one point to another.

The northbound traffic is composed largely of agricultural products such as wheat, corn, rye, potatoes, alfalfa, tobacco, beans, fruits of all kinds, dairy products, wool, wine, live stock, coal, copper and lumber from the great forests of the South. Much of this tonnage is destined for the central and northern sections of Chile, while a considerable part of it is exported to other countries.

The principal exportation in the past has been nitrate of soda and copper. Large quantities of iodine, borax, sulphur, salt and iron ore are also exported.

Freight tonnage southbound from Valparaiso averages approximately 3,600 gross tons daily in normal times, while that passing Las Vegas in the same direction is 3,900 tons. The northbound traffic is only slightly less than that of the southbound.

At present, the freight trains going toward Santiago are made up of 20 to 30 cars each, or a trailing load of 550 tons. These trains are hauled by Mikado type steam locomotives assisted by a Borsig Consolidation between El Salto and Pena Blanca and on the Tabon grade. In the opposite direction a helper locomotive is used between Til Til and Rungue.

With electric motive power 770 ton trailing loads will be hauled by one locomotive in either direction, except in ascending the Tabon grade a helper will be used. The trailing weights will be increased 40 per cent and the number of trains reduced approximately 28 per cent.

The locomotives employed for this service will weigh 113 tons and have a nominal rating of 1,680 hp. At this rating the speed will be 22.6 miles an hour, with a tractive effort

Las Cuchuras Bridge Spanning the Vina del Mar River near El Salto

of 27,950 pounds. These engines will be of the Baldwin-Westinghouse design with 0-6-0 + 0-6-0 wheel arrangement. The two three-axle trucks will be connected by a Mallet hinge and all the buffing strains will be transmitted through the underframing. The maximum speed of these engines will be 40 miles an hour.

Electro-pneumatic control will be used for the control equipment, so arranged as to provide for regenerative braking. A motor generator set will supply current for separately exciting the motor fields in regeneration.

Westinghouse EL air brake equipment will be used. It has the straight air feature for control of the engine and automatic air for control of both the locomotive and train.

The Westinghouse air brake has been the standard air brake equipment of Chilean railroads for many years.

A considerable reduction in running time will be made by the freight trains. Through freight trains that now make the one-way trip in 10 to 12 hours will be capable of going through in six to seven hours. With the faster schedules the crew expense will not only be less, due to the reduction of time on the road, but fewer locomotives will be required to handle the service, on account of the shorter running time. The increasing of the freight train trailing loads alone will result in reducing the number of trains and the crew expense by approximately 28 per cent on the basis of present traffic.

Helpers Will Be Eliminated in Passenger Service

Under normal conditions the express passenger trains carry six to ten cars, or a trailing load of 200 to 300 gross tons in either direction between Valparaiso and Santiago. Occasionally these trains are composed of as many as 16 cars, and helpers are used on the Tabon grade. The express passenger trains are for the accommodation of first and second class passenger traffic and are the fastest trains in the service, making only a few stops in the 116 mile run. The omnibus trains which make all stops between Valparaiso and

East Portals of the Paso Hondo Tunnel

Santiago are always the most heavily loaded passenger trains in the service and carry cars for the accommodation of first, second and third class passengers.

The electric locomotives will be capable of hauling the 300 ton trains in either direction without the aid of helpers on any section of the line. These locomotives will have a nominal rating of 2,250 hp. corresponding to a speed of 37 miles per hour at a tractive effort of 23,400 pounds. They will weigh 127 tons and will have 105 tons on the drivers. The wheel arrangement will be 2-6-0 + 0-6-2, a two-wheeled guiding truck being used at each end of the locomotive.

The two three-axle trucks will be connected at the inner end by a drawbar held in tension spring buffers. These locomotives will be capable of making a maximum speed of 62½ miles per hour. The cabs will be very similar to the freight engine cabs and will carry virtually duplicate control equipment.

Local passenger trains are operated between Valparaiso and Llai Llai and intermediate points. At present many of these trains carry ten cars between Valparaiso and Vina del Mar, while the locomotive ratings provide for a maximum of 12 cars per train. These trains are composed of first, second and third class cars, usually hauled by one locomotive as this section of the line does not have the most severe grade conditions.

The new motive power for this service will consist of 80-ton double truck locomotives having the inner ends of the trucks connected by a Mallet hinge. The wheel arrangement will be 0-4-0 + 0-4-0. Each of the four axles will be equipped with a direct geared motor the same as the express passenger locomotives. The engine rating will be 1,500 hp. corresponding to a tractive effort of 15,600 pounds at a speed of 37 miles per hour. The maximum speed of these locomotives will be 56 m.p.h. The profile over which these locomotives will operate does not justify the use of regenerative electric braking so that this feature will not be included in the design. These engines will be required to haul trains of 260 to 350 tons on the local runs, including the 300 ton trains of the Los Andes branch.

In the interest of improving the service, faster schedules are desirable. These cannot be obtained with the present steam equipment and in fact with heavy traffic the present time tables are maintained by double-heading on the grades. With electric operation it is proposed to reduce the running time of the fastest passenger trains between Valparaiso and Santiago from three hours and forty minutes to three hours and fifteen minutes, or a twenty-five minute reduction in running time. The way passenger, as well as the local trains will also operate at higher speeds, with a consequent reduction in running time.

The switching will be performed by 65-ton double truck locomotives. These locomotives will have a rating of 480 hp. or a tractive effort of 15,600 pounds, at a speed of 11.6 m.p.h.

Locomotive Maintenance and Renewals

The maintenance of the steam locomotive equipment is of a high order on the State Railways. Many of the executives of the State Railways have had foreign experience in railroad shops of the largest systems in the United States and England—a number at the Altoona shops of the Pennsylvania.

Repairing of electric locomotives does not present a difficult problem to the railroad as the present shop equipment is, with the exception of a few items, adequate to handle this work. High grade skilled labor is available so that with a certain amount of training, covering the care and maintenance of electrical equipment, this work can be handled readily.

Chile has purchased most of her modern locomotives in the United States. However, a number have been and are now being reconditioned in her shops, while in the past some have been designed and built there entirely. It is apparent that the wisest course is that of investing in locomotives which will give the longest life in order to avoid frequent foreign purchases. The electric locomotive fills this requirement and has the added advantage of being ready for service a greater percentage of the time than the steam engine.

In some respects the purchase of electric motive power can be regarded as being part of a program of normal renewal of motive power equipment in view of the necessity of purchasing more steam locomotives to replace obsolete types and provide for increasing traffic.

The maintenance and operation of water stations involves a considerable expense. Furthermore, the loss of time at these stations by the trains represents an additional loss with steam operation that will be eliminated by the new system of operation. Many of these water stations require the maintenance of pumping stations, which represents an added expense.

All steam locomotives are coaled by hand rather than by automatic coaling stations, so that this expense is considerable. The elimination of these stations will make available additional yard trackage.

With continued steam operation it would have been necessary to have invested in a number of new enginehouses.

This expense is now eliminated, due to the fact that much less space is required by the use of a fewer number of locomotives to handle the service.

Energy generated by hydro-electric plants will be purchased by the railroad for the operation of its trains. One of these generating stations is now in course of construction by the Chilean Electric Tramway and Light Company, Ltd., and known as the Maitines station. From this station, the power will be carried to the receiving station at Santiago and on through to Valparaiso by 110,000 volt transmission lines. The end substations will be served by 1,200 volt transmission lines, while the three intermediate stations will receive their power from 44,000 volt transmission lines fed through step-down stations from the 110,000-volt lines.

Each of the five railway substations will contain two 2,000 kw. motor generator sets. The sets will supply the overhead lines with direct current at 3,000 volts.

The climatic conditions are remarkably favorable to the successful operation of electrical equipment with the possible exception of that part of the line located along the seashore which requires consideration on account of the salt air from the ocean. The rainfall is limited in this district and snow is unusual. In the summer season the air temperature is high in the daytime, due to intense sun, while the nights are always cool due to the cool air from the Andes Mountains.

Storms are almost unknown except by the seashore. The wind velocity is very low, especially in the Los Andes branch district. Even lightning is infrequent, and is not severe in the district of the first zone.

It may be said that the electrification of the first zone of the Chilean State Railways solves most, if not all, of the serious operating problems of this section of the system. The advantages to be gained by electric operation are:

- (1) An increase in the capacity of the present trackage to provide for future increase in traffic:
 - a. Faster schedules.
 - b. Heavier trains.
- (2) A reduction in operating expenses by reducing:
 - a. Fuel costs.
 - b. Locomotive maintenance costs.
 - c. Crew costs.
 - d. Elimination of coaling and watering stations.
 - e. Reducing track maintenance costs.
- (3) Provision for motive power and rolling stock additions and renewals.
- (4) Better traveling conditions.

The full realization of all the operating economies will be attained when the entire system is electrified so that all advantages can be taken of the characteristics of electric motive power.

W. G. Bierd Opposes Regional Board of Adjustment

IN A LETTER setting forth the reasons why the Chicago & Alton is not willing to join in the support of the Train Service Board of Adjustment for the western territory, W. G. Bierd, president of the road, has presented forcibly the position of railways that are opposed to such boards. He proposes that, if the present committee system of the road is not satisfactory to the employees, all committeemen of the railway itself be called in and a board for the road itself be organized to which disputes shall be referred regarding which the local and general committees and the management cannot agree.

The principal reasons why the management of the road is not willing to become a member of the regional board of adjustment are stated to be that, first, it is impossible for any board whose members are not employees of the company to dispose of disputes in as equitable a manner as can a committee composed of employees of the railroad, and second, "these boards of adjustment, labor boards, commissions and committees, other than our own employees and officers serve only to further separate the management and the employees

and bring about misunderstandings instead of perfecting understanding."

Mr. Bierd's letter reads in part as follows:

"We believe it impossible for any board whose members are not employees of the company to be as familiar with the conditions surrounding disputes that may arise between the officers of the company and your organizations as would a committee composed of employees of the Alton railroad, or be as able to dispose of such disputes in as equitable a manner. I fully agree with you that such minor disputes as do arise should be referred to the United States Railroad Labor Board for decision only as a last resort, and as you are well aware, it has been our policy, both through the Railroad Administration period and at the present time, to settle these matters ourselves and not refer them to any board. In fact, only three or four submissions have been made since the beginning of government control.

"However, the principal objection of the officers of this company is that these boards of adjustment, labor boards, commissions and committees, other than our own employees and officers, serve only to further separate the management and the employees and bring about misunderstandings, instead of perfecting understandings. Therefore, the officers of this company are opposed to every form of board of adjustment that lodges our own misunderstandings with any body of men other than Alton officers and Alton employees, for no set of men, no matter who they may be, can deal with these subjects as fairly, intelligently and honestly as the employees and officers themselves.

"We are equally opposed to the principle of the Labor Board because that board has also helped to pull apart the officers and employees of the railroad, and it will always be so as long as there are such boards foreign entirely to the railroad company itself. No matter what board may pass upon these matters it cannot be properly informed and cannot pass upon them as intelligently, as fairly and as honestly as the management and the employees can through the regular channels that have been built up during the past 25 or 30 years, namely, the proper practical operating officers and the proper practical men who form your committees. If we cannot agree fairly and justly, then an entire stranger, foreign to our interests, cannot decide such questions intelligently.

"However, we have the Labor Board. It was created by law and we cannot control that situation. Therefore, we must accept it, and in doing so we accept every ruling of the Labor Board cheerfully and fairly and try to carry them out honestly and intelligently. We are trying to give the Labor Board just as much assistance as we can in order that it may be just as successful as possible. Therefore, since we must have the Labor Board and pay the cost of handling these matters before it, we should confine ourselves strictly to it. Surely the employees have paid a very severe tax for these large meetings, committees and conferences that have involved hundreds of men during the past four years and still are continuing, but we should take absolutely no cases to the Labor Board or any other board that we can work out ourselves and we should not create another board of adjustment to still further confuse the situation and make matters worse.

"In our opinion these boards have been the most harmful influence for the railroads and their employees that has developed during the past four years, for they have only helped to pull the management and the employees apart and to create bad feeling between the two classes of men who must work and should work closely together, and as a result have destroyed the good service built up in years past.

"We understand clearly that there must be some proper means of adjusting these disputed questions and we believe that on a road of our size where the general officers can be in constant touch with the employees and where the employees have an open door to come to the general officers at any time

and in any way, the employees and the management will be best served and best satisfied to handle these subjects with our own committees constituted as they are. We can know and understand the rules better than any board of adjustment and can settle such disputed questions more fairly and more honestly to all concerned than a body of strangers who have no particular interest in the Alton railroad or its employees.

"It is the belief of the officers of this company that nothing will help the present disturbed condition more than to get back to the point where the management and employees will deal with each other face to face across their own table. Therefore, we believe that the recently created board to which you refer is unnecessary and is not good for the employees or the management of the Alton railroad.

"The officers of this company believe we will best prosper by handling these matters as we now handle them. However, as above stated, we also recognize that it has become a belief that there must be a practical board to hear such disputes where the committee and management cannot agree. While this is not our view, if you and the employees you represent believe there should be such a board, then we want to join you, with all other committees and employees of the Alton railroad and create a board of our own—of Alton men and for Alton interests—which will be far better than a board of strangers or people far removed from our interests. If such a board should fail, as I think it would seldom do, the case could be submitted to the Labor Board as the law makes it possible for either side to do."

Commissioner Potter Expresses Views on Rates and Wages

THAT FREIGHT RATES are too high and ought to be reduced immediately but that there does not appear to be any possibility of a proper reduction in the near future or until railroad operating costs are reduced, is the opinion expressed by Mark W. Potter, of the Interstate Commerce Commission, in a letter dated December 22 to Philip S. Tuley, president of the Kentucky Manufacturers' Association, who has made it public in a bulletin.

Mr. Tuley had asked Mr. Potter to comment upon a resolution on the subject of transportation adopted by the association. The commissioner's letter was in part as follows:

Excepting only that part of the resolution which favors abolishing the Railroad Labor Board and delegating to the Interstate Commerce Commission jurisdiction over wage rates, I am in entire accord with the sentiment of the resolution. I have not permitted myself to arrive at final opinions as to whether the Railroad Labor Board should be abolished, or as to what, if any, jurisdiction should be given to this commission over wages. Aside from the fact that I have not permitted myself to become committed in my own mind on these questions, it is obvious that propriety should impel me to withhold an expression of my views regarding them.

There is no question in my mind but that freight rates are too high. The welfare of the country demands that they be reduced promptly. There should obtain in this country a constant tendency of freight rates to reduce. This should be the natural result of increasing efficiency, increase of business, expansion of industrial development of the country and the promotion of a proper relation between railroads. The increases in recent years are fundamentally abnormal and unsound as permanent adjustments. They must be eliminated before the country can go back to normal and continue its onward movement. There will not be a sound and permanent resumption of prosperity and healthy industrial and commercial activity under the present scheme of freight rates. They ought to be reduced and be reduced immediately. Unfortunately there does not appear to be any possibility of a proper reduction in the near future. I do not see how the reduction which the welfare of the country so urgently demands can be accomplished until operating costs are reduced. To a considerable extent the railroads are in no position to control their costs. The right and power to deal with labor which is the most important element of operating costs has been taken away from the

carriers. The Congress has determined that wage questions shall not be handled in the manner that they are handled in ordinary industrial enterprises. The hands of the carriers have been tied by the law which prescribes the manner in which railway wage adjustments and determinations shall be brought about. The jurisdiction has been taken over by the Railroad Labor Board, a governmental agency. Unless and until that Board acts, the carriers are going to be helpless and can not be blamed for not making those rate reductions which a wage reduction would permit. With a scale of wages paid to railway employees universally known and recognized to be higher than the scale which obtains in other industries, with costs of living substantially reduced, there seems to be no prospect of getting the problem of wage adjustment before the Labor Board for determination for several months to come. If the carriers are not to be allowed to handle their own labor problems—if the law of supply and demand is not to apply to railroads as it applies to other industries—the shipping public, it seems to me, must pay the price for the system which their representatives have established by the controlling law, and be patient until the government agency which has the power sees fit to exercise it.

Railroads Should Be Run for People as a Whole

I am perfectly clear on one question and that is that the railroads of the country exist and should be run for the people as a whole and not for the employees. The people as a whole have the right to have the railroads run on a scale of wages which will permit a scale of rates which industry can afford to pay provided men can be found to run the roads upon that basis. Rates which the shipping public can afford to pay should be made the basis of determination of wage scales and preferential wage determination should not determine rates. The interests of the 100,000,000 people are supreme and should not give way to the demands of the 2,000,000 merely because those demands are backed by threats of distress to the nation if they are not acceded to. Just now the thought in some high places seems to be that what is a proper wage is the first question to consider and that rates are a secondary consideration. The first thing to do is to bring about a sound fundamental basis on which to consider these questions. In my judgment, it is the province of the Interstate Commerce Commission to determine what rates industry can stand and that determination should be accepted as a basic factor in determining what wages the railroads can afford to pay. The thought of the Railroad Labor Board apparently is that the basic question is as to what wages should be paid and that this commission must accept that determination as a basis for fixing rates. I do not venture an opinion as to whether the Labor Board should be abolished and I am sure this commission does not want any more burdens thrown on it, because it now has more than it can do. I do so, however, that the present system by which the labor board and our commission operate independently upon the same subject matter has caused and is sustaining a hybrid system of regulations barren of satisfactory results.

The Justification for Unions

What I have said above is said by one who is friendly to labor and a believer in the principles of labor organization. I would be the last to contend that in the past labor has had its fair share of what the public pays for the products of the joint activities of capital and labor. I want to see a gradual improvement of the status and conditions of employees in all industries.

It should be borne in mind too that the principles of labor organizations are justified in so far as they advance and protect the interests of labor generally, and deal fairly with all classes of labor. No particular class of employees has the right in the name of labor to use labor organizations for the benefit of the few, and against labor generally, by demanding high wages for the few, which repress industry generally and throw many more millions of laborers out of employment. The position recently taken by certain classes of employees has injured employees generally more than anything else. A few are insisting upon profiting at the expense of the many. This, it seems to me, is a prostitution and a misapplication of the principles of labor organization. Just how long labor generally and the public are going to stand for this is an interesting question. One of the troubles that I see is due to the fact that labor has been led or misled into taking arbitrary positions without consideration or regard for the interests of others who are involved. Neither owners nor employees have the right to be arbitrary. The Railroad Labor Board was created as a protection to employees, employers and the public. It is the tribunal which the law has created to guard them all. When labor leaders refuse to utilize that tribunal and threaten nation-wide strikes and national distress, if they are required to follow the procedure which the law provides, I am suspicious of their confidence in the merit of their claim.

Results of the National Perfect Package Campaign

THE AMERICAN RAILWAY ASSOCIATION and the American Railway Express Company, which jointly conducted the national perfect package campaign during the month of November, 1921, have prepared a 16-page pamphlet telling of the results of that campaign as compiled from the reports of 1,294 participating cities and towns. It is generally believed that the good effects emanating from this effort to improve the packing and handling of packages cannot be measured in dollars and cents, nor entirely by the large number of irregularities which were corrected at the

month 92,165 packages were refused acceptance by the Bureau's inspectors and returned to the shippers to be re-coopered and repaired. This totaled 150 per cent more package refusals than recorded by that bureau during the previous month, and, according to freight claim representatives, it is a fair indication that closer supervision of this sort had been long needed. In addition, shipping and receiving clerks, as well as the shipping public, obtained an intensified education in the requirements of the freight classification. Propaganda, in the form of circulars and pamphlets, articles in the newspapers and trade journals, as well as numerous lectures, have all helped to provide for the establishing of an efficient freight and package handling system which had been greatly deficient before. It is felt that

TABLE 1—TABULATION OF IRREGULARITIES

	Freight	Per cent	Express	Per cent	Total	Per cent
Number of errors discovered in bills of lading or express receipts.....	25,965	28.0	45,406	56.7	71,371	41.0
Number of errors discovered in marking shipments.....	46,590	50.2	22,395	27.9	68,985	40.0
Number of other defects discovered in packing or packages.....	20,168	21.8	12,320	15.4	32,487	19.0
Total.....	92,723	100.0	80,130	100.0	173,853	100.0
Percentage of shipments received without exception.....	98.91%		99.26%		99.10%	

point of shipment. However, the country-wide interest attracted to the importance and necessity of starting shipments right—well packed, in adequate containers, and correctly marked—has amply repaid those who have helped to make the work a success.

The campaign is considered to have developed broader and more cordial relations between shippers and carriers. This is evidenced by the permanent joint committees which have been established at many shipping points. Furthermore, work of this kind enabled the railroads to determine, at practically every receiving station, which of the shippers were at fault in their method of packing. It also definitely established the extent of the imperfection of the packages being delivered to the carriers by the shipping public. The Western Weighing & Inspection Bureau reported that during the perfect package

the accomplishment of this work will be of particular value to the claim agents in their efforts to make favorable claim settlements.

Table No. 1 shows that the greatest number of errors reported during the perfect package campaign were the result of inaccuracy in the marking of shipments.

Table No. 2 gives the recapitulation of the detailed reports contained within the pamphlet. The reports of the 1,294 cities and towns are grouped with respect to their size and are summarized accordingly.

The above tables are considered more of an "indication" than a fact. The wide range of differences in the figures indicate inaccuracy which is due to the variability in the efficiency of the freight inspection service throughout the country.

TABLE 2—RECAPITULATION OF DETAILED REPORTS HEREWITH

Group	Population	Freight		Express		Freight and express		Combined per cent perfect

AN APPEAL TO AUTOISTS—The New Year will see a thousand or so new graves and the hospitals will care for thousands more who will be seriously injured, all due to careless autoists at railroad crossings. Are you, Mr. Autoist, going to fill a grave in 1922? Are you going to supply patients for the hospitals? Or are you going to drive with care and stop and look and listen at the railroad crossings?—*R. P. & P. Circular*

F. A. SANDLIN, agent of the Southern Railway at Old Fort, N. C., is complimented by the auditing department for reporting for the month of November, when his business amounted to 21,677, uncollected bills of only \$552; and the auditor says, in his letter, that this is not materially different from the reports of the preceding ten months. Mr Sandlin has been in the service 34 years, a part of the time as train dispatcher

Practical Education in the Car Department*

Systematic Instruction and Examination of Inspectors and Foremen and Annual Staff Conventions

By C. G. Juneau

Master Car Builder, Chicago, Milwaukee & St. Paul

THE EXPERIENCE of ages has been used to build up and advance most of our methods of transportation, but in railroading we have only the wisdom of a hundred years to help solve our problems. And as the United States contains some 60 per cent of the railroad mileage of the world and the remaining 40 per cent is scattered over the face of the earth, we cannot even turn for help to others but must confine our studies to an analysis of our own experiences in the endeavor to solve our difficulties.

Examination of the industry of railroading reveals, first, that it is immense. Excluding agriculture, it is the largest single industry in the country, and it approaches in size a majority of the other industries combined. Its very immensity means to it many problems. Second, it is very complex in its make-up, including, as it does, large and varied forms of activities. Wide experience is a first necessity to a successful railroad man. Third, it is variable, ever fluctuating in quantity and changing in character. The problem of how to handle a certain quantity of coal today will be replaced tomorrow by a deeper problem, because of the changing of the chief commodity to be moved to wheat, lumber, or oil. There is nothing tangible to guide railroads; and as business conditions change much more rapidly than it is possible to alter existing equipment or provide new equipment, only by careful study of all forms of industrial and agricultural conditions, politics, money markets, and general world conditions, can an intelligent forecast of demands upon the railroads be arrived at.

The fact that the undertaking is so immense at once suggests that railroad employees should be drawn from particular schools or universities wherein they would be specially trained for one or another of the phases of railroad work. No educational institution can produce a railroad man for the reason that railroading is complex and fluctuating. His education must accompany his experience, and must change to conform to fluctuations in railroad conditions.

Lacking centuries of experience on which to base their judgment, unable to use the experience, of other countries, and unable to turn to educational institutions to provide a trained personnel, the railroads' one chance of resurrection seems to lie in the education of their own employees along the lines of their employment.

Railroad education might be divided into three phases, viz., (1) education of the men; (2) education of their officials, and (3) education of the public. I am going to deal mainly with the first subject and confine my remarks to our own experiences in the mechanical department of the railroad I serve.

Systematic Education of Foremen and Inspectors

As a prelude to our educational campaign, it was laid down that all officers in the mechanical department should endeavor to educate those responsible to them to help in making railroad service a vital response of human effort and energy. It was realized that the first milestone could not be successfully and safely approached unless those interested undertook their work seriously, and this could not be brought about until those in charge had created an atmosphere of

respect and established the fact that there was need for each employee's best effort.

The multiplicity of instructions and the rapidity with which they were issued during government control made compliance with them almost a human impossibility. Conflict, doubt and confusion existed. Our then master car builder drew up and issued a booklet laying down guiding rules for every phase of work in the car department. This was issued to all supervisory forces, and its effect was electrical. Summed up in the terms of the carman, "it put the car department on the map." The principal parts of this booklet were published in the *Railway Mechanical Engineer*, commencing in January, 1920. This move may be termed the real beginning of our educational system in the mechanical department. At the present time, a book covering the maintenance of and repairs to locomotives, and instituting standard practices even to the finest detail, is in process of completion. In the meantime the information is utilized by being issued piece by piece in the form of circular letters.

Following the issuance of the first booklet, a concerted move was made to have every foreman or group of foremen provided with a *Car Builders' Dictionary* and to supplement this later with other books. Those engaged in special undertakings were induced to obtain the most authoritative publications dealing with their particular work, and many of our car department supervisors became connected with institutions and organizations which conducted discussions and issued current literature on terse subjects.

Monthly educational bulletins have been issued which deal systematically with the various phases of the car department work. One series of articles covers air brake work, another safety appliances, etc. The bulletins are furnished in sufficient quantities to make the information available to every employee in the department, no matter where located. Questions arising in connection with the articles are taken up by the men direct with whoever is conducting the publication, without passing through any official channels, and the questions and the answers both appear in the next issue of the bulletin. When necessary, the bulletins are supplemented with blueprints or sketches.

It was realized, however, that results would be derived more from successful application than from any particular virtue of the scheme itself. We therefore arranged for every inspector—freight and passenger—to be examined by our general safety appliance inspector, and later all foremen were similarly questioned. When this questioning was completed, a regular monthly examination system was inaugurated. This is conducted by sending to the district general car foremen 20 questions, based on information previously published in the educational bulletins, which on a given day are distributed to inspectors and foremen. Below each question, space is provided for the answer. When filled in the papers are returned and marked; five marks per question are allowed. The results are systematically recorded in my office and bulletined locally.

As a result of this system we have effected an improvement beyond our most sanguine expectations. The first report on our educational campaign stated that the then existing opinion that bad safety appliance conditions on our cars and locomotives was due to negligence was not correct; it was

* Abstract of a paper read before the Western Railway Club, Chicago, on January 16, 1922.

due to ignorance. It went on to say that not more than ten per cent of the inspectors on the system could pass an 85 per cent examination, and not 25 per cent could pass a 50 per cent test. That report was made less than two years ago, but today the number not regularly obtaining 90 per cent is negligible. Of course there has been quite a little transferring of men to other work, and in some instances inspectors have had to be taken out of service. But our inspectors today—the men we regard as of primary importance to the movement of our equipment—wear an air of confidence born of knowledge. Our derailments and accidents have decreased, and our percentage of on-time trains has risen to a very pleasing degree.

The examinations so far have been confined to safety appliances and matters connected directly and indirectly therewith. Extension to air brakes is being made, and we propose gradually to include questions concerning wheels, axles, general repairs, etc. Now no carman is appointed an inspector unless he can pass the necessary practical examination. Men desirous of promotion are voluntarily taking the monthly examinations, and we have at present a considerable number of men fast qualifying for positions of responsibility. The enthusiasm alone displayed by the men has been full reward for the effort necessary to inaugurate and sustain the campaign, but I feel that the big harvest is yet to be reaped.

Annual Department Staff Meetings

It was realized that as a group railroad employees attained a tremendous measure of experience, due to the large scope of the work, but that failure resulted from lack of opportunity for exchanging ideas. Accordingly, it was arranged to hold annual staff meetings of the car department and the locomotive department at Milwaukee. Later we inaugurated conventions of the blacksmiths, traveling engineers, and others interested in a particular phase of railroad work. At these staff meetings and conventions, prepared papers are read and discussed. The keen interest of the management in the meetings has been evidenced by the attendance of the president, vice-president, general manager, general superintendent of motive power and other officers. Such meetings as these wherein matters are discussed without restraint are most valuable educational schools. Foremen or master mechanics opposed to a scheme proposed by the management will leave such meetings enthusiasts for the scheme by virtue of knowledge of the other man's viewpoint; or, on the other hand, modification and even withdrawal of schemes may result from cold facts produced by unrestrained discussion.

At these staff meetings supervisors are educated as to how to deal with their men, to lay out their work, to handle their material. The papers and the discussions are printed and circulated, so that every foreman on the system may obtain the fullest possible benefit from the meetings. The papers are not contributed wholly by men within the mechanical department, but also by those in other departments, and even by persons entirely outside of the railroad field. Our aim is to secure as authentic articles as possible, to spread their contents by means of discussion, and then to make them available as guides for the following year's work.

Special instructions prepared and issued for various classes of service include, in addition to safety appliances and air brake, already mentioned, valve motion for locomotives, electricity, and the federal locomotive inspection law. Monthly reports covering all phases of the department's operations are issued to principal supervisors and, in condensed form to every foreman on the system.

Education of Operating Officers

Because the mechanical side of railroading has never ceased to advance, there arises the necessity of educating those we serve in the operating department to the viewpoint

resulting from our experience and experiments. This task is simplified somewhat where officials have served in the ranks, or made more difficult where they have not. It is not an easy matter to impart one's knowledge to another, and the added handicap of lack of time and opportunity often makes it a difficult problem. The need of having those administering a department made aware of all that is involved, however, stands out very clearly in my mind. The means we endeavor to employ to attain the desired result is discussion of each problem by the men on the spot. This admittedly does not entirely serve the purpose, and greater education in this direction is much to be desired.

Education of the Public

Although the railroads are servants of the public, it is astonishing what colossal ignorance exists in regard to even the simplest phases of their operation. This alone is a severe handicap to railroads in their present dilemma; but when public opinion is fed by contributions to a vicious press by authors often ignorant of anything beyond the most elementary railroad matters, they are even further harassed. I do not refer to the press as a whole, but to a certain section of it which allows its remarks on railroad problems to take the form of destructive criticism. Such articles are not productive of any good, but do the railroads much damage. If the section of the press referred to is attempting to harm the railroads, its attitude is a great success. If it is trying to better conditions for the public, it is a drastic failure.

Partially as a result of the attitude referred to, we occupy the very unpleasant position of having a portion of the public believe that the railroads are nothing but a network of intrigue—rotten in morals and with only sordid aims in view. To those who have devoted the best part of their lives to the work, not because they received adequate monetary or other reward, but because the word "service" meant to them what the colors mean to a regiment in battle, this is indeed their cup of bitterness. It is time for action. Let us concert our efforts to have the public know that the railroad man is not a rotter, not an ignoramus, but their efficient most loyal servant, and a worthy citizen of this great republic.

EXPORTS OF APPLES from Halifax, N. S., this season have amounted to 613,886 barrels, 5,635 boxes and 3,739 half barrels. These apples have gone to Liverpool, London, Manchester, Glasgow, Hull, Avonmouth, Cardiff, Newfoundland, West Indies, New York and Boston.

Handling Freight in the Country's Largest Terminal

Marked Reductions in Costs Obtained by Operating Electric Tractors and Trailer Trucks

THE PENNSYLVANIA has recently revised its method of handling less-than-carload freight at its new terminal at Polk street, Chicago, with excellent results. Hauling by trailer trucks and electric tractors is the outstanding feature of the new system. Introduced in July, 1920, and enlarged upon in the following year, the equipment and the system built around it has operated to accomplish marked economies. The amount of labor required for the handling of the freight has been reduced more than half and the tonnage handled per man has more than doubled. Greater elasticity in performance has obtained, while business is

months of tractor operation the equipment was enlarged by the addition of two tractors and a sufficient number of trailer trucks to bring the total up to 725.

The System of Handling the Freight

The system under which the haulage operations are performed with this equipment is as follows: The building being divided into outbound and inbound sections; outbound freight delivered to the house by street vehicles is received at any one of 33 doors, unless it is a load of seven packages or less in which case it is received only at a package door, or unless it is a load of perishable freight when it is received only at a perishable freight door. At these doors the vehicle is met by a gang of three men consisting of a receiving clerk, truckman and loader, who with the exception of the gangs at the package and perishable freight doors, are assigned to two doors.

These men proceed to load the goods received from the vehicles upon the empty trailer trucks which are distributed by tractor under orders from a supervisor. Only that freight may be placed on any one truck which is to go into one car even though it amounts to no more than a single package. As soon as this freight is loaded on the trailer trucks, they are pushed to the nearest elevators, the average

A Typical Tractor Train on the Freight House Floor

handled with greater dispatch and less demand on floor space.

As described in the *Railway Age* of August 2, 1918, shortly before the opening of this large freight house, the Polk street terminal is a four-story structure, 450 ft. wide and 745 ft. long, which is built over 19 tracks with a standing capacity of 375 cars; the first or street level floor constituting the freight house proper and the upper three floors being utilized for storage by a warehousing concern. All merchandise is handled between the several floors and the track level platforms by 32 elevators, 8 of which are three-ton, 21 five-ton and 2 10-ton.

From the opening of the building in 1918 to July, 1920, the hauling was accomplished by hand-trucking. The equipment consisted of the ordinary two-wheel trucks and 25 trucks of the four-wheel type, and the system required each trucker to push his load from the point of loading to its destination. Meanwhile the Western Warehousing Company, a subsidiary of the Pennsylvania, which occupies the 600,000 sq. ft. of storage room on the upper three floors, had adopted and was operating to advantage a system of tractor haulage, the warehousing equipment consisting of three tractors and 200 trailer trucks.

Hand trucking in the freight house never having been very satisfactory and having afforded little opportunity to reduce a considerable expense and annoyance of handling freight by this means in so large a building, observations were made of the warehousing company's system, and some experimenting was done on the freight house floor itself. As a result of these observations it was finally decided to inaugurate tractor haulage and pursuant to the decision four Mercury tractors and an equipment of trailer trucks were installed in July, 1920. In November, 1921, after 15

Tractor Trains Operating on the Track Platforms

distance to which is 40 ft., where they are surrendered to an elevator man who lowers them to the track level and pushes them out upon the platforms. Here they are arranged into trains by a "floating stevedore" under a plan whereby all of the trucks for each track are assembled together. They are then picked up by a tractor and hauled to their destinations, the tractor in every case picking up the trucks as it proceeds from the outer end of the platform toward that end which permits it to pass around the end of the tracks.

The plan also provides that on any one trip only those trailer trucks are picked up for transit which are to be delivered to the platform for which the tractor train is enroute. Having reached the platform in question, each truck is then set out at a point adjacent to the car in which the contents are to be loaded, this operation being performed by

the one man, aside from the motorman, who accompanies the tractor train. When the freight is received by rail in trap or transfer cars the system differs only in the fact of its operations being carried on entirely at track level without the intervening steps introduced by elevator operation.

The Inbound Operations Are Just the Reverse

In handling inbound freight the packages are loaded upon the trailer trucks under a tallyman's direction and according to a plan whereby each truck is loaded only with that freight marked for the same destination in the house. After

in use at the Polk street terminal is that the benefits which are now accruing from it are the results of considerable development and have increased steadily as the men have become more accustomed with the system and as the amount of equipment has been enlarged. A good indication of this is furnished by the fact that while the average tons handled per man per hour was 1.20 for the first six months of 1921, it has increased to an average of 1.76 for the last six months and for the last three months the figure has averaged above 1.80.

We are indebted for the above information to E. H. Kirk-

TRUCKING OPERATIONS AT THE PENNSYLVANIA'S POLK STREET TERMINAL BEFORE AND AFTER TRACTOR INSTALLATIONS

						Tractor operators and helpers	Total	Truckers	Tractor operators and helpers	Total	Truckers		
January	195	43,651	37,038	.85	June	90	8	98	18,922	1,740	20,662	33,712	1.63
February	183	48,763	45,940	.94	July	80	8	88	16,275	1,454	17,729	29,773	1.68
March	328	85,023	56,611	.66	August	82	8	90	19,444	1,902	21,346	35,710	1.67
April	155	37,339	22,926	.61	September	84	8	92	17,815	1,782	19,597	35,256	1.80
May	199	49,785	38,104	.77	October	83	8	101	19,734	1,862	21,596	39,921	1.85
June	256	69,674	55,107	.79	November	86	12	98	17,964	2,346	20,310	37,356	1.84
Average men per month	219.3	334,635	255,726	.764	Avr'ge. men per month	85.8	8.7	94.5	110,154	11,086	121,240	211,728	1.746

the trucks are loaded each truck is pushed to the nearest elevator where an elevator man raises it to the first floor, the operation thereafter consisting of its haulage by tractor to the proper destination which may be in the alphabetical section of the house, such as Section D for Duncan Brothers, a section specially restricted for a particular shipper; the cold storage room, or a point where cars are loaded for the underground tunnel system. Arriving at these points, the trucks are uncoupled from the train and the freight is either unloaded or left on the trucks, depending upon the demand for trucks at the time and the likelihood of their being released within a period not to exceed 48 hours.

The trains ordinarily consist of seven or eight trucks but often carry as many as 14 or 15 loads, this loading being governed almost entirely by the bulkiness of the packages and operating convenience rather than by consideration of tractive power. As has been stated above, the tractor crew consists only of a motorman and an attendant although some conditions arise where it is found advisable to engage the assistance of additional attendants temporarily as where a long train of bulky material must be assisted around sharp corners or along narrow platforms of which there are several in the house.

Marked Results Have Been Obtained

The benefits which have arisen from the tractor operation are several. A comparison of the records for the last six months of this year with those for the six months immediately preceding the inauguration of the present system bring this out. As the accompanying table shows, between these periods the average number of tons handled per trucker has been increased from 1167 to 2228, or 90 per cent, while the number of tons handled per man per hour has been increased from an average of 0.764 to 1.746 or 128 per cent, or if compared with the records of the last three months of the year from an average of 0.764 to above 1.80. This reduction in the forces actually handling the freight has also permitted some reductions to be made in clerical forces. The average size of the gangs receiving the freight from vehicles and of those loading or unloading the cars has been reduced from 6 or 7 men to 2 and 3. It has also been possible to cut down the distance through which the truckmen are required to operate from an average of 1,000 ft. or more to less than 50.

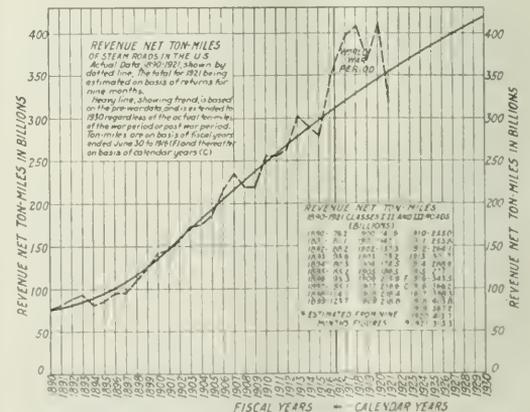

One interesting point which arises in studying the system

land, freight agent and Oscar Hess, general freight foreman, of the Pennsylvania Terminal, under whose direction these trucks have been installed.

Trend of Freight Traffic

WASHINGTON, D. C.

THE Interstate Commerce Commission has given to the press the accompanying chart prepared by its Bureau of Statistics, showing the trend of railway freight traffic since 1890, which indicates that, based on the rate of growth prior to the war period, and disregarding the great increase during the war period, which was lost in 1921, it would take until 1929 to reach the high level that was reached in

A Trend Curve of Revenue Ton Miles

1920. The dotted line of the chart shows the revenue net ton-miles, 1921 being estimated on the basis of the actual figures for nine months, while the heavy line shows the trend extended on the basis of the pre-war data. The 1921 ton mileage is estimated at 313,300,000,000, which is less than for any year since 1915.

Railroads Conclude Rate Testimony Before I. C. C.

Testimony and Cross-Examination of Executives to Be Followed
by Testimony of Shippers on Particular Commodities

WASHINGTON, D. C.

S. M. FELTON, president of the Chicago Great Western; H. E. Byram, president of the Chicago, Milwaukee & St. Paul; W. L. Apolther, president of the Louisville & Nashville, and Samuel O. Dunn, editor of the *Railway Age*, testified before the Interstate Commerce Commission in its general rate inquiry on January 12, 13 and 14, after which three days, January 16, 17 and 18, were devoted to cross-examination of the railroad witnesses. Daniel Willard, president of the Baltimore & Ohio, was also questioned by the commissioners at some length following the reading of his prepared statement on January 11.

Commissioners Aitchison and Hall resumed their attendance at the hearing on January 17, joining Commissioners Esch and Lewis after their appointments had been confirmed by the Senate the day before.

The commissioners asked numerous questions as to the possibility of increased efficiency and economy from various methods which have been very generally suggested, such as joint use of terminals, pooling of equipment, electrification, abolition of passes and "private" cars, etc. At one point Commissioner Lewis said, however, that the fact that questions were asked which had been suggested did not necessarily mean that the commission was impressed with the suggestion. All of the railroad witnesses agreed that there are many opportunities for greater economies but that the important ones usually require the investment of considerable amounts of capital for better or more facilities. While they also agreed on the importance of small economies, and Mr. Byram particularly described many ways in which economy or increased efficiency had been brought about by plans for enlisting the co-operation of the employees, Mr. Willard said the railroad problem is not to be solved by saving on lead pencils or abolishing private cars or passes. All of the executives said that the percentage to be prescribed by the commission as constituting a fair return after March 1 should be not less than six per cent.

Felton Says Rates Cannot Now Be Reduced

There can be no hope in the railroad situation if freight rates are to be reduced at the first sign of improvement, Mr. Felton said.

"The position of the railways," said Mr. Felton, "is that no further reductions of rates can be borne by them until labor costs and other expenses are reduced. The western lines in company with the other railways of the country are just beginning to struggle to their feet financially. The increases in their net operating income, which have been secured within recent months, have been partly due to reductions of wages and other costs but even more to extremely drastic retrenchments. The facts show that no reduction of rates sufficient to have any considerable tendency to increase the traffic moving could be made, unaccompanied by corresponding reductions of labor costs, without throwing the western railways back financially in as unpromising a situation as they were in a year ago.

"There is still room for effecting large economies in operating expenses, but this can only be accomplished by very heavy capital expenditures. Much has been done along this line in the past, and much more can be done. The capital required, however, can only be obtained on fair terms, if the credit of the roads is good, and that must depend to a large part on the operating results which may be secured.

"If rates are placed on such a level that the return is reduced to the minimum, the prospect of obtaining the vast

amount of additional capital is far from promising. On the other hand, if the railroads' credit is such that they can raise the necessary capital and thus be enabled to embark on a program of wise improvement in and additions to their properties, with all that means in the matter of making a market for the materials that go into the work and the employment it will give to thousands who are now out of work. I know of no other single factor which will go farther towards reviving industry.

"It is impossible to estimate prospectively the effect upon net income of economies which may be made through increased efficiency and the use of more economical methods in any given period of time. Efficiency of management must be tested by results and railroad executives have a right to demand that they be so tested. The record of the American railroads for the past 30 years is a record of progressive efficiency through which billions of dollars have been saved to the public in the lessened expenses of operation and but for which the transportation bill of the country would be greatly in excess of what it is."

To Fix Rate Below 6 Per Cent a Blow to Credit

Mr. Felton said it would be entirely wrong to predicate any action on the somewhat improved situation during the four months ending October 31. In making the recent reductions on agricultural products the carriers have gone the limit as to rate reductions until they reach a stabilized basis either by reduced costs or increased traffic. In speaking of the need for heavy capital expenditures he recalled the fact that in his testimony in Ex Parte 74 he had referred to the need of more facilities but, he said, periods of depression must be disregarded in planning for the future. It is the judgment of the railway executives, he said, that there has been no change in conditions to warrant the commission in prescribing a less percentage of return than that provided in the transportation act for the period ending March 1, and there could be no greater blow to the credit of the railroads than an act of the commission fixing a rate lower than six per cent. This, he said, should also be regarded as an average so as to make up in prosperous times for periods of depression. If it is to be regarded as the limit in good times and the roads cannot attain it in dull times there is no hope for the roads.

Replying to inquiries by Commissioner Lewis, both Mr. Willard and Mr. Felton expressed the opinion that a reduction in the passenger rates from 3.6 cents to 3 cents per mile would not stimulate traffic sufficiently to offset the decrease of \$280,000,000 in the carriers' revenues which such a reduction would mean.

Mr. Willard Questioned

Commissioner Esch inquired of Mr. Willard as to the losses that come from the issuance of passes and the use of private cars. Mr. Willard said that while he did not think it could be said that there was no loss from the use of passes, the complete abolition of passes "would not have a controlling influence over the present situation."

Mr. Willard told of economy measures that have been taken by the Baltimore & Ohio, particularly in relation to the saving of fuel. He said even to teach firemen to save one scoop of coal a mile would mean a saving to that road annually of 500,000 tons which Commissioner Lewis pointed out would mean an annual saving of \$1,500,000.

Questioned regarding the use of private cars, Mr. Willard

said: "That is another thing which has been very much misunderstood. Of course the private car is just as much of a working institution of the railroad as the office."

Mr. Willard said that while there may have been some abuses of the private car in the past, in his belief there is no ground for complaint on this score at the present time.

"Take my own case," he continued. "When I am on the road it is the same as when I am in my office. My secretary is with me. My files are with me. I get my messages and carry on my business the same as I would if I were at home. A car is of very great assistance and what is true in my own case is true of all other officers who are provided with cars."

"Is it true that New York bankers have passes over practically all roads?" asked Commissioner Lewis.

"It is not true of the Baltimore & Ohio," replied Mr. Willard with emphasis.

Pointing out that coal shipments constitute approximately 48 per cent of the traffic over the Baltimore & Ohio, Mr. Willard said that should a ten per cent reduction in coal freight rates be made, his road would be required to handle 20 per cent more coal or 60 million tons additional in order to make up for the loss in such revenues. Such a thing, he said, would be impossible because the Baltimore & Ohio has not got the facilities to handle such an increase.

View Rate Reduction With Apprehension, Says Byram

Mr. Byram and Mr. Mapother both asserted that while some relief has already been provided the carriers through the action of the Railroad Labor Board in reducing wages, it is inadequate to enable any further reduction in rates at this time.

Mr. Byram told the commission that despite the fact that his road had taken advantage of every available resource to promote efficient and economical operation it has been unable to produce net returns for its stockholders "and during several months in the last year has failed to earn its fixed charges."

"The universal demand for further reduction in freight rates presents a situation, therefore, which we must view with apprehension," he said.

Mr. Byram added that while immense opportunities are available for further increasing economy of operation by large investments in reducing grades, double track, improving and increasing terminal facilities, etc., these improvements cannot be made because they would "require the investment of immense sums of new capital which cannot be obtained unless the earnings of the railroads are such as to satisfy investors that such investments in railroad securities would be safe and productive."

"At the present time," he continued, "because of the impaired credit of the railroads generally, money for improvements cannot be borrowed in the usual way except at rates considerably above the rates permitted by the Transportation Act to be earned on the value of the improvement."

"Therefore, it would seem that the need of the immediate situation requires a reduction in operating costs and fuel and labor, which absorb 80 per cent of the total operating cost, must bear the larger portion of the reduction. Fuel and other supplies already are coming down and the United States Railroad Labor Board decision 147 decreased our payroll almost 11 per cent or about \$770,000 per month effective last July. These changes have been helpful but it is evident from figures already submitted that greater relief is needed to keep the transportation system intact."

W. L. Mapother for Southern Roads

After reviewing the financial condition of the southern railroads which for the year which ended on October 1, 1921, earned only 1 1/4 per cent on their investment, Mr. Mapother said:

"Rates cannot be reduced without a very material reduc-

tion in operating costs, which latter cannot be produced without the modification of rates of pay and working conditions along the lines suggested. Any arbitrary or premature reduction of the revenues of the carriers would certainly prove ruinous to the general business interests."

Mr. Mapother said "present conditions of business do not justify an optimistic expectation for an early commercial revival."

"Judged even by the net railway operating revenue of the southern carriers for the four months' period since the wage reduction, from July 1, 1921, to October 31, 1921, the yield on the investment falls about 33 1/3 per cent short of that contemplated by law," he continued. "Had not the traffic movement in October been influenced by abnormal conditions the deficiency in the return on the investment for the four months' period since July 1, 1921, would have been even greater. The management of almost every road in the southern region has given expression to a deferred maintenance in 1921, particularly in equipment. Had the full complement of maintenance been effected, the yield on the investment would have been still further reduced."

"I believe that thrifty and careful administration has been practiced to the maximum extent and it is quite evident that the exigencies of the transportation situation during the past year have forced the application of economy upon a scale which, if continued for any great length of time, must ultimately rebound to the detriment of the public interest."

Mr. Mapother said "wages of railroad employees should be more flexible and in a larger degree determined by the management."

"In this way," he said, "railroad operations will more quickly adjust themselves to economic conditions and the ability of the railroads to pay a given wage under certain conditions will be given consideration in fixing wages. The standardization of railroad wages is wrong in principle. There is no logical reason why railroad labor should not be amenable to the law of supply and demand to the same extent as labor engaged in other lines of industrial endeavor. Aside from this discussion, however, the first essential to increasing the net income of carriers in the southern region is a reduction in wages."

"While the greatly increased cost of fuel in recent years has been a substantial factor, the excessively high expenditures for labor have presented by far the most formidable barrier in the way of smaller costs of operation and incidentally the greatest obstacle against the realization of a satisfactory income under the Transportation Act. Labor costs, although measurably modified by recent revisions in wage schedules and agreements, are still overstepping all bounds of proportion in comparison with other charges and their absorption of gross earnings is yet substantially greater than was ever recorded under normal or pre-war conditions."

Joint Facility Savings Much Exaggerated

Mr. Mapother said that in his opinion the saving which it is claimed would result from greater use of joint facilities is very much overestimated.

"It is not believed," Mr. Mapother said, "that any enhanced economy can be produced in this direction without incurring an enormous expenditure for rearranging and expanding the existing terminal facilities. Personally, I believe that the somewhat popular idea that great economy and improved efficiency can be brought about through a more intensive joint use of the existing terminal facilities has been very much exaggerated or is, in fact, a fallacy."

"Joint facilities are now being made use of in most instances wherein the handling of traffic can be expedited and economies effected. During federal control much effort was made to extend the joint use of facilities, but the results were according to my observation, very far from satisfactory. In many instances, it was not only clearly demonstrated that no

economy resulted, but the expedition of traffic was impaired; shippers were subjected to great inconvenience and much dissatisfaction resulted.

"The joint facility accounts of the Southern lines for the year which ended on September 30, 1921—showing a debit of \$1,550,273—indicate that the exchange of facilities is being practiced on a very considerable scale. Additional arrangements of this character are being and will be effected whenever the possibility of more economical operation may present itself, but nothing short of complete reconstruction and enlargement of the existing facilities would render it possible to uniformly establish joint operations at all important terminals."

Decline in Railway Development

Pointed Out by S. O. Dunn

The progressive decline in railway development in the United States as measured by miles of line and cars and locomotives ordered and built in recent years was shown by Mr. Dunn in tabulations of statistics compiled by the *Railway Age* and confirmed by official reports of the Interstate Commerce Commission. This decline, Mr. Dunn showed, has been accentuated since the war and by 1920 there was an actual reduction in the mileage of line and in the number of locomotives and freight and passenger cars in service, but the decline in the annual rate of increase had begun long before the war.

In each of the last five years the mileage of railroad line abandoned in the United States has exceeded the mileage of new line built, Mr. Dunn said, and in 1921 the mileage of new line and the cars and locomotives ordered were less than in almost any previous year in railway history. The new railroad mileage built in 1921 was 475 miles, or less than has been reported in any previous year except 1920, when only 314 miles were built. In the four years ending with 1901 the new mileage averaged 4,524 miles a year; in the four years ending with 1905 the average was 4,974 miles; in the four years ending with 1909 it was 4,449 miles; in the four years ending with 1913, 3,314 miles; in the four years ending with 1917, 1,135 miles, and in the four years ending with 1921, 549 miles.

For the five years 1917 to 1921 inclusive, the mileage of railroad abandoned in the United States has totalled 4,939 miles, of which 1,714 miles represents track actually torn up and the balance represents mileage on which operation was suspended. In 1921 operation was suspended on 1,409 miles, 217 miles of line were actually torn up and authority was asked of regulating authorities to abandon 575 miles.

The Interstate Commerce Commission during the year ending October 31 issued certificates authorizing the construction of 405 miles of new line and the abandonment of 702 miles. Mr. Dunn also quoted from Interstate Commerce Commission records which show a decrease in the total mileage of railroad owned in the United States from 254,251 in 1916 to 253,708 in 1920.

Few New Cars and Locomotives Acquired

The number of locomotives in service on the railways of the United States increased 7,378 in the four years ended with 1913, Mr. Dunn said, but only 473 in the four years ended with 1917 and 617 in the four years ended with 1920. The number built for service in the United States and Canada in 1921 was 1,185, or less than the number built for the United States alone in any year since 1897.

The average number of locomotives built annually in the United States and Canada in the four years ending with 1909 was 4,319; in the four years ending with 1913 it was 4,137; in the four years ending with 1917 it was 2,126 and in the four years ending with 1921 it was 2,259. The number of locomotives ordered in 1921 for service in the United States was 239, which is the smallest number ever reported except in 1919, when it was 214. The average number of

locomotives ordered annually for 21 years has been 3,225, while the average number ordered annually during the last four years was only 1,384.

As to freight cars, Mr. Dunn showed that the average number built for the United States for the six years ending with 1904 was 123,256. In the five years ending with 1904 it was 111,824, and in the four years ending with 1921 it was only 65,823. The number built in 1921 was only 40,292, which is the smallest number ever reported since the *Railway Age* began to compile the statistics in 1899. In 1906 and 1907 alone the number built was 516,667.

The number of passenger cars built in 1921 for use in the United States was 1,275, the smallest number ever reported except in 1920 and 1919 and the number of new passenger cars ordered during the year was only 246.

Mr. Dunn Questioned

Commissioner Lewis asked if these statistics were presented to show that the railroad plant is not being kept up properly. Mr. Dunn replied that he had been asked to present the statistics, but he had no doubt that if compared with those of other industries they will show that the railroad plant has not kept pace with the development of other industries. Asked whether the railroads would be able to meet a normal demand for transportation, Mr. Dunn said he did not think they would. He recalled some of the experiences of the years 1917, 1918 and 1920 when the shippers of many kinds of commodities were unable to get cars.

Commissioner Lewis suggested that some people say there is less need for new cars than for better handling of cars. Mr. Dunn replied that that is undoubtedly true to some extent and in many cases it is not so much a question of cars as of having enough locomotives and other facilities to handle them promptly. But, he said, the figures show the same reduction in orders for new locomotives and new track facilities as in cars.

"Why haven't the railroads provided the facilities?" asked Mr. Lewis.

"Because they haven't had the money," Mr. Dunn replied.

"These figures on their face indicate a very unsatisfactory situation," said Mr. Lewis. "If that condition continues, what will be the effect?"

"The most important result will be the effect on the public," said Mr. Dunn. "If the development of the railways fails to keep pace with other business we are going to come to a condition where the railways will be wholly unable to handle the business. Many industries have undergone a great increase in capacity in recent years."

Questions regarding the reasons for the decline in railway development led to a discussion of the rate of return earned by the railways. Clifford Thorne asked if it was not a fact that in the three years prior to federal control the railways had earned a greater return than in any previous three-year period. Mr. Dunn said he had made a very careful check of that and had ascertained that it is not a fact.

Cross-Examination

Resuming the stand for the purpose of cross-examination, Mr. Felton said that his road had saved a considerable amount of money owing to the difference in labor costs through the repair of cars in outside shops.

Work which the Chicago Great Western estimated would cost \$1,100 per car, Mr. Felton said, cost only \$800 under contract while the cost of repairing five locomotives which that company has sent to outside shops was about 30 per cent less than what the same work would have cost in the company shops.

He told of having steel freight cars repaired in this manner and said the work was done for about one third less than it would have cost had his road had the facilities to perform the work. A large part of the equipment which that road had

repaired outside, Mr. Felton said, was equipment which had been roaming around the country during the period of federal control under the general plan of pooling equipment.

Representatives of shippers questioned Mr. Felton regarding coal prices now being paid. The witness said that many of the western roads are now storing coal in anticipation of a possible coal strike on April 1 next, but that this coal can be bought from \$2.10 to \$2.20 a ton at the mines compared with \$4 and \$5 a ton in the fall of 1920, and \$2.75 to \$3.75 on present contracts. Mr. Felton denied in reply to a question by Glenn E. Plumb, that this reduction in price was being granted by the coal operators contingent on an alleged agreement by the carriers to aid them in reducing wages.

At Mr. Fulbright's request, the carriers agreed to furnish the commission with comparisons of wages being paid railroad employees in the various districts with the "going rate" for other labor in the same territory.

Mr. Shriver, Mr. Aishton and Mr. Wettling were recalled for cross-examination on Monday. Most of the time was taken up by questions by Clifford Thorne, on behalf of the shippers' committee, regarding the statistical testimony, which seldom elicited an affirmative answer from the witnesses. Mr. Thorne tried several times to get Mr. Shriver to admit that the railroads had charged \$200,000,000 to operating expenses in 1920 or 1921, representing the increase in the inventory value of materials and supplies turned back by the Railroad Administration as compared with the value at the beginning of federal control without any increase in out of pocket cost. Mr. Shriver declined to agree to the statement, saying that new material that cost even more was also used and that it was charged out on the basis of the average stock price. Mr. Thorne said he was trying to make the point that this situation invalidated the comparison of maintenance expenditures. He also tried unsuccessfully to get Mr. Shriver to admit that the difference of some \$4,000,000,000 between the net capitalization and the property investment accounts of the railways must represent what has been acquired through the use of surplus earnings or charged to expenses, or gifts. Mr. Shriver said that if the balance sheets are properly related it would be impossible to arrive at any such conclusion.

Referring to the chart published in the *Railway Age* comparing the increases in prices and rates since 1890, which Mr. Shriver had used in an exhibit, Mr. Thorne asked if he had made any comparisons based on the period immediately preceding the war. Mr. Shriver said such a comparison would be absolutely erroneous because during that period the railroads had been forced to sell their product at a rate far below the prevailing level of prices. They had only been able to do this, he said, by the expenditure of large sums of new capital on which no return was earned.

Mr. Shriver Questioned by Clifford Thorne

In reply to questions by Mr. Thorne regarding the sums paid to the roads or due them from the government as rental or guaranty, Mr. Shriver said the roads in 1916 had earned a net operating income of \$1,055,000,000 or 5.92 per cent on the property investment, and in 1917, \$986,000,000, or 5.8 per cent. For 1918 and 1919 the roads taken over by the government were guaranteed a rental of \$897,000,000, which was equal to 4.83 per cent on the property taken over. For 1920, if the roads finally get half a year's rental for the six months' guaranty, without deduction on account of maintenance, they should receive \$848,000,000, or 4.28 per cent. If they do not receive the full amount of their expenditures during the six months period this amount would be reduced. For two months of 1920 the roads received \$151,000,000 as rental, their guaranty for six months was \$484,000,000, and there was a deficit for that period to be made up of \$216,000,000. Mr. Thorne asked if it is not fair to say that the railroads have received in addition to the rates paid by the public, a billion and a half dollars since 1917. Mr. Shriver pointed

out that the companies had not received the revenues, nor the amounts necessary to meet deficits, but in reply to the question he made up a statement showing that in 1918 the Railroad Administration had earned \$255,000,000 less than the rental, in 1919 \$448,000,000 less and in the first two months of 1920, \$99,000,000 less than the rental, making a total of \$802,000,000 paid from taxation rather than from rates. The six months guaranty added \$484,000,000, making a total of \$1,286,000,000 and in addition there was a deficit of \$216,000,000. Mr. Shriver said the average net operating income of the test period was 5¼ per cent but when applied to the property actually taken over it produced only 4.83 per cent.

In questioning Mr. Wettling, Mr. Thorne referred to the railroad claims against the Railroad Administration for undermaintenance and asked if the expense of making up deferred maintenance in 1920 should properly be charged to current expenses. Mr. Wettling said they should not if they are reimbursed by the government but Mr. Thorne apparently wanted to consider the claims as a real account to which they could be charged.

Mr. Willard, Benjamin Campbell, vice-president of the New York, New Haven & Hartford, Edward Chambers, vice-president of the Atchison, Topeka & Santa Fe, C. R. Capps, vice-president of the Seaboard Air Line, and W. C. Maxwell, vice-president of the Wabash, were cross-examined on Tuesday.

Mr. Thorne questioned Mr. Willard closely regarding the basis for his statement that the rate of return should not be less than 6 per cent. Mr. Willard declined to be drawn into a discussion of intricate financial questions. He said that during the last 10 years the percentage of return had only exceeded 6 twice and with the experience of the past in mind he was convinced that nothing less than 6 per cent would meet the situation. As long as the United States government will not lend to the roads for less than 6 per cent on first class collateral, he said, it is difficult to see how stock can be sold on a lower basis. He said, of course, the percentage now to be fixed is not necessarily to be permanent. Under other conditions it might later be reduced. Railroads must be in a position eventually to sell stock at par and in his opinion the Baltimore & Ohio couldn't sell stock at par unless it paid 8 or 9 per cent.

After Mr. Thorne had referred to various statements made by Mr. Willard in the past the witness turned the tables by reading from a statement recently made by Mr. Thorne before the Senate committee, saying he did not wish to leave the impression that he thought it wise to starve the railroads or to have them undermaintained or have poor credit. On that statement Mr. Willard said he was in accord with Mr. Thorne.

In speaking of measures of economy and efficiency, Mr. Willard described a plan which the Baltimore & Ohio has recently developed carefully of holding cars of through traffic for certain principal destinations until there are enough cars to make up a 50-car train, which is then run through without intermediate switching, saving more than enough time to make up for the initial delay. He said other roads had done the same thing but he thought his road had given it more attention than some others and had found it necessary to work out a complete book of instructions to show all employees concerned just what to do.

When Mr. Dunn was recalled for cross-examination Mr. Thorne again brought up the discussion in connection with his assertion that the percentage earned by the railways in the three years ending June 30, 1917, was larger than that for any preceding three-year period. Mr. Dunn said he had received a statement on that point from the statistical bureau of the commission which showed an average return during the three years ending with 1907 of 5.62 per cent; during the three years ending with 1911 of 5.32 per cent, and during the three years ending with 1917 of 5.36 per cent. Mr.

Thorne took the position that accrued depreciation should be deducted from the property investment in the latter period before computing the percentage, saying that the commission did not require the roads to report the depreciation in the former period and that if the figures were placed on a comparable basis the result would be different from that shown by the statement.

Banker Discusses Rate of Return

Jerome J. Hanauer, of Kuhn, Loeb & Co., New York, testified on January 18, regarding the rate of return. He said in part:

The particular problem which is the occasion of this hearing is not only difficult, it is insoluble. The transportation act has made it mandatory upon this commission to initiate, modify, establish or adjust rates so that carriers, in groups which you have designated, will, under honest, efficient and economical management and reasonable expenditures for maintenance of way, structures and equipment, earn, as nearly as may be, a fair return upon their aggregate value. The commission is now required by law to determine the fair rate of return after March 1, 1922 and until again changed by it. In enacting this law, Congress omitted to provide that the shippers of the country should furnish the traffic necessary to make the law effective. The mandatory provisions of the act violate economic laws in so far as they require rates to be increased in times of depression when there is a minimum demand for transportation and to decrease the same in times of great prosperity, when the demand is at its maximum. At no time since the passage of the act have the carriers earned the permissive return, and, contrary to the belief held by many, there is no guarantee whatsoever. The companies are to earn the return if they can, but if they do not, they are not even permitted, except to a limited extent and for special purposes, to recoup themselves, out of earnings in excess of the permissive rate, earned in more prosperous times. Transportation companies are subject to the same economic forces as any other business endeavor; they will have good years and bad years and, unless they have a guarantee (which I do not favor), they must be permitted to build up a substantial surplus in the good years, to enable them to survive in times of depression. Only thus can their credit be stabilized, so that they will be able to give to the country that efficient service, without which its industrial life will be stifled.

Because the railroads perform a great public service, investment in their securities should be encouraged by a return at least as large and if possible more stable than that which can be obtained from any form of private investment having similar risks and similar opportunities.

In considering the rate of return necessary to attract investment funds into railroads, it does not avail to be guided by the rate at which old outstanding issues of underlying mortgage bonds are selling or that at which a very limited number of new issues of some of the few still prosperous companies have recently been sold. To all intents and purposes, first mortgage bonds are a thing of the past. The large additional amounts required hereafter must be raised by junior securities, for which the obligation itself of the particular company will be the main reliance, and by the sale of additional preferred or common shares. It is many years since any new issues of shares have been sold. Few companies could today sell any large amount of common stock and not many more could sell preferred stock and, of course, these are those companies that have the least need of new capital. And yet if our transportation system is to be enlarged and improved, if outlying sections of the country are to have railroads, if branch lines are to be built to the farming districts, to factories and to mines, much of the needed capital should be, probably will have to be, found by the issuance of new shares. In some quarters it seems to be expected that railroad companies can go on increasing their debt forever without increasing the equity behind it, yet how generally it is understood that little encouragement would be given to the owner of a house or a factory by the holder of his mortgage if he suggested that the mortgagee should increase his loan for the purpose of making additions and improvements, without the owner establishing an additional equity by providing, say one-third of the new money required.

Investors in railroad securities, as in fact in any securities, do not consider them as a class; they study the situation of the particular security in which they are asked to invest. Unless the margin of earnings is sufficiently ample to safeguard that security during lean periods, the security is discriminated against. Some railroad common shares yield, at current prices and with current dividends, about 6 per cent

and others as high as 9½ per cent per annum, all, however, with limited markets.

In determining the just rate of return upon the value of railroads, as established by this commission, much consideration must be given to the present physical condition of the companies' roads and equipment, and the conditions affecting the companies during and since government operation.

During the war the government recognized the necessity of being very liberal with manufacturers and others engaged in providing necessary war supplies. All such were permitted to earn large profits, the government relying upon the income and excess profits taxes to cover part of these profits into the Treasury. But all those engaged in these occupations were quite properly permitted, and did charge off out of profits before such taxes were figured, large amounts for the depreciation of their facilities due to the excess war costs, in addition to the customary charges for depreciation and depletion. These industrial concerns were thus enabled to set aside large reserves to tide over the difficult times which have come to them in the last year. Not so, unfortunately, with the railroads.

While the government spent great sums to provide other war facilities, all capital expenditures on the railroads were charged to the companies. In particular, there were purchased at inflated war prices, locomotives and cars costing almost \$400,000,000, which could today be produced for a much lesser amount, and from which the railroads could obtain no financial benefit until after the close of the guaranty period soon after which the business depression set in. No part of this cost was assumed by the government as a war cost and, therefore, the same must be borne by the roads and passed on eventually to the public.

These conditions have resulted in the railroads being in a poor situation to meet the depression which ensued after the boom period following the armistice. In order to maintain their solvency, they were compelled to reduce maintenance to a minimum, a policy which would, if persisted in for a longer period, place the properties in such a position as to be unable to meet the requirements of commerce when normal conditions return. Not alone this, but the absence from the market of large purchases by railroads, the discharge of labor employed in railroad maintenance, and in the production of railway supplies further greatly depresses business, causes much unemployment in other lines, and results in an endless chain of stagnation.

Liberal Rate of Return Necessary

Full consideration of the conditions affecting railroads and the relations of investors thereto, some of which I have endeavored to outline, lead conclusively to the decision that a liberal return on the value of the railroads is essential, not only to their prosperity, but to the prosperity of the entire country.

No figures of the exact division of railroad securities between bonds and shares is available to me. The percentage of shares is increased by the fact that a considerable part has been issued in reorganizations in which bondholders were compelled to exchange bonds for shares. In order, however, to be ultra-conservative with our figures, let us assume that two-thirds of the value of the properties is represented by bonds and only one-third by shares. The average net cost of the part represented by bonds is surely 5 per cent, probably more. The part represented by stock should, in view of no profit being figured in this calculation on the part represented by bonds, earn a profit of not less than 10 per cent to allow for a fair dividend, certain capital expenditures and a margin of safety for lean years. This would make a fair return on the entire capital value (not, of course, capital securities outstanding) 6½ per cent per annum. It is quite impossible to fix rates which would bring this return under anything like present conditions. No good purpose would be served by attempting to do so. The purpose now provided by the transportation act is not being reached even with present reduced expenditures for maintenance. An increase of the permissive return can, therefore, be left to future consideration, but on the other hand, any indication of reducing the rate of return now permitted, in the face of the fact that this rate is far below that required to induce investment in junior securities and shares of railroads, and far below the return obtainable from other forms of investment, would alienate whatever confidence remains in the future of our railroads and their securities.

Mr. Hanauer Cross-Examined

Mr. Hanauer was cross-examined by Mr. Thorne and other representatives of the shippers in an effort to show that the condition of railroad credit is no worse than that of other industries or public utilities. He said he was not trying to

make any such comparison but to show that the prospect of a return in the case of railroads is not sufficient to induce the investment of new capital. When Mr. Thorne asked him if he would agree that section 15-a ought to be repealed, he said he would if it were made entirely clear to the public that it was repealed because it is not wise to limit railroad return in good times without any guarantee for bad times, rather than allow the public to believe it was repealed because 6 per cent is too much.

On January 19 testimony in behalf of the shippers was begun, two days being allowed on coal and coke.

Freight Car Loading

WASHINGTON, D. C.

LOADING of revenue freight totaled 605,992 cars during the week ended on January 7, compared with 531,034 during the previous week or an increase of 74,958, according to reports compiled by the Car Service Division of the American Railway Association. In both instances the comparisons were between five-day weeks owing to the observance of a holiday in each. Compared with the corresponding week of 1921 the total for the week of January 7 was a decrease of 91,649 while it was a reduction of 224,681 compared with the corresponding week in 1920.

With the exception of ore, which showed a loss of 562 cars compared with the week before, increases were reported in the loading of all commodities.

The greatest increase over the previous week was in coal, the total being 136,982 or 31,320 cars more than were loaded during the week which ended on December 31, but this was 54,251 less than during the corresponding week last year and 72,356 less than the corresponding week in 1920. Loading of merchandise and miscellaneous freight amounted to 350,279 cars, a gain of 22,262 over the week before but 24,185 less than the total for the same week last year.

Grain and grain products totaled 40,673 cars, 10,598 more than the preceding week and 1,585 more than during the same week one year ago. It was, however, 182 under the total for the same week in 1920.

Livestock, with a gain of 1,091 cars over the week before, totaled 25,658 cars, which was 5,469 under the corresponding week in 1921, while coke showed a gain over the week before of 584 cars, which brought the total to 7,008.

Compared by districts, increases were reported in the loading of all commodities over the preceding week.

The freight car surplus for the period ending January 8 showed a further increase to 496,357 cars, of which 208,929 were box cars and 219,444 were coal cars.

Regional Conferences Proposed to Adjust Disputes with Brotherhoods

WASHINGTON, D. C.

DEFINITE PROGRESS toward an amicable adjustment of the differences between the railroads and the train service brotherhoods regarding wages and rules governing working conditions was reached at a conference of railway executives and the heads of the "big four" brotherhoods on Monday with Secretary Hoover of the Department of Commerce. It was decided, according to an announcement issued after the meeting by Secretary Hoover, to submit to the railway companies and to the train and engine service organizations the proposal that the pre-war regional conferences should be convened to consider the endeavor to adjust all questions between the railways and the brotherhoods, the conferences to be held as near to February 10 as practicable.

This was the second of the conferences called by Mr. Hoover, at the suggestion of the President, to try to bring about an adjustment between the roads and the brotherhoods that would eliminate the danger of an interruption of transportation this spring as the result of a conflict that would be coincident with the wage dispute arising from the expiration of the mine wage contracts on March 31. The first conference, attended by the brotherhood leaders and half a dozen railway executives, was held at a dinner at Mr. Hoover's residence on January 7.

The Secretary of Commerce tried to get the railroad and labor leaders onto common ground which would result, if possible in a settlement without the delay incident to a proceeding before the Railroad Labor Board. He has also been trying to bring about an adjustment of the mine wage controversy.

The conference on Monday was attended by the same men who were at the dinner and by a number of other executives. It was held in the offices of the American Railway Association.

In announcing the result, Mr. Hoover said the conference was entirely informal and in full accord with Section 301 of the Transportation Act which makes it the duty of the railroads and their employees to try to reach an agreement before referring a dispute to the Labor Board.

"Neither wages nor rules were discussed," he said. "The sole question was on the practicability of re-establishing the conferences, thereby to facilitate the work of the Railroad Labor Board and above all to create a spirit of working good will by adjustment instead of litigation."

The railway executives were to meet in Chicago on Saturday.

A Tractor and Trailer in the Erie Freight Service

Erie Adopts Direct Freight Delivery at New York

Plan Involves Breaking Bulk at Jersey City, N. J., and Use of Auto Trucks, Tractors and Trailers and Ferries

THE ERIE RAILROAD has recently inaugurated a new method of handling freight at the Port of New York which combines the features of the store door delivery and the container car ideas for the moving of freight. Under the immediate direction of J. J. Mantell, regional manager, the plan has been developed to the point where the road now has in actual operation two inland freight forwarding and receiving stations with arrangements for the proper complement of trucks and trailers. Two additional stations are to be opened shortly, while a plan is under advisement for the extension of the present newly installed method by the utilization of breaking bulk at a transfer, transferring the freight to containers which will be moved by special container floats to a centrally located pier and then by trucks to destination or to inland stations.

Port Congestion Is Cause of Change

The method installed by the Erie is a distinct departure from that which has been in vogue in the past at New York City. Under the plan now common to the railroads entering the port, the cars of freight received at the break-up yard and destined for New York City are placed on car floats. These car floats are then taken, either by tugs or under their own power, to different freight piers on the New York shore, where the freight is unloaded and trucked in or otherwise moved onto the floor of the pier proper. Final delivery to the consignee is made by or through the consignee, who sends his trucks to the pier, where they are loaded at his expense. This has resulted in considerable congestion, due to the fact that it is not always possible to secure immediate loading of the truck, not to speak of the delays caused by the numerous rehandlings of the freight.

The plan which the Erie has now put into operation involves the breaking of bulk of all domestic freight except a few products, such as perishables and dairy products, at

Jersey City. To date this covers only freight destined for points south of 14th street in Manhattan. Instead of moving the cars across the river on car floats, the freight is transferred to automobile trucks or to tractors or trailers, which are then transported to the city by the ferries, after which the trucks or trailers travel direct to destination. At present where tractors are used, three trailers have been provided in order to keep the tractors constantly at work, thus reducing to a minimum any possible wastes due to waiting time. In this manner carload freight, which ordinarily forms about 60 per cent of the tonnage handled is delivered directly to the consignee or to an inland station, if so desired. Outbound freight is handled in a similar manner at the option of the consignee.

The outbound freight, whether collected direct from the consignee or indirectly through the inland stations, is moved by truck and ferry to Jersey City, where it is loaded into cars designated for through movement to points on the Erie or to connections with that road. In this way, only one handling by freight is necessary between the time that it is loaded upon the trucks or trailers and the time that it reaches its destination.

Proposed Extension of Plan

Although the present plan is intended to cover only the area south of 14th street, New York, it is hoped to extend it shortly so as to cover all of Greater New York and vicinity. This will be done through a utilization of the container plan of freight handling, and, in a way, will be carried forward in two steps. At first, it is planned to break bulk at the transfer, loading the freight into containers of all-steel or steel-frame construction, so built as to be handled quickly and economically by cranes. These containers will measure approximately 17 ft. 5 in. by 8 ft. by 8 ft. 5 in. They will be loaded at the transfer point on flat cars, which

will be moved to Pier H at the Weehakwen, N. J., waterfront. This pier is equipped with four electric cranes of 20-ton capacity, and is also capable of handling 125 cars at a time. On a basis of two containers to a car, this pier will have a capacity of approximately 250 containers at a setting.

After the cars are spotted on the pier, the containers will be lifted by cranes, and placed on the deck of a car float. Each car float will have sufficient room on its deck for 60 containers if placed in a single tier, and double that when two tiers are used. These car floats will then be towed to a centrally located pier on the Manhattan side, also equipped with cranes, which will remove the containers and load them up on motor trucks. The trucks will then make delivery direct to the consignee, or to inland stations where immediate delivery is not desirable or necessary. The inland stations will be equipped likewise with crane facilities so that the containers can be removed promptly and the trucks released, the containers being unloaded at the inland stations, and the freight handled as desired. In instances where the consignee is receiving or dispatching large tonnages of freight, it is expected that crane facilities will be installed at the consignee's place of business so that the containers can be handled in a manner comparable to that for the inland stations. Where this is not the case, the freight will be unloaded direct from the container onto the truck in much the same manner as it is now being done. The outbound freight under this plan will be handled in a similar manner.

Second Step Contemplates Use of Container Cars

The development of what might be called the second step of this extended plan contemplates the utilization of the

container system in connection with container cars to serve the New Jersey territory. This business is more or less short-haul business, and originates in the various industrial centers of New Jersey, such as, for instance, Newark, Passaic, Middletown, and Port Jervis. Through the use of the container-car system, it is expected to move carload and less-than-carload from these points, and other similar ones, to New York, and the reverse without rehandling. This will eliminate the breaking of bulk at any point, and will eliminate one of the heaviest expenses connected with short-haul traffic. Thus, for instance, freight destined to some particular consignee in New York City may be loaded into a container, after which the container will be moved direct to the consignee without any handling further than that performed by the cranes in making the transfer of the containers from the car to the float, and from the float to the truck. The delivery of containers will not be limited to Manhattan alone since the plan is sufficiently flexible to permit the moving of container car floats to either the Bronx, Brooklyn, or Staten Island.

The Erie's plan for the handling of freight at the port of New York has been developed by J. J. Mantell, manager of the New York region, under the general direction of F. D. Underwood, president. It has been based upon studies made of terminal operations and costs, including all details such as switching, yard work, pier handling and lighterage.

In conjunction with the United States Trucking Corporation, New York, studies were made by the road on costs of handling freight by this method, as well as possible routes to secure the most economical and satisfactory deliveries by trucks or tractors and trailers.

Further Reports of I. C. C. Work for 1921

Complaints, Formal and Informal; 444 Suspensions Asked for; Obstacles to Uniform Classification

Supplementing previous articles on the annual report of the Interstate Commerce Commission, submitted to Congress on December 7, we give herewith abstracts of those portions

referring to the Formal Docket; the Bureau of Informal Cases, the Bureau of Traffic and the chapter on Divisions of Joint Rates.

Formal Docket

Since our last report, the forms relating to the monthly operating statistics have been revised after a conference with a committee representing the American Railway Association.

The wage statistics section has been recently organized to examine and compile the monthly reports of the service and compensation of railroad employees required by our order of April 18, 1921, effective July 1, 1921. These reports are designed to meet both our needs and those of the Railroad Labor Board.

The accident statistics section prepares quarterly and annual bulletins of railroad accident statistics. The analysis of causes of accidents has been elaborated to meet the needs of those engaged in accident prevention.

To effect the more expeditious issue of our monthly and quarterly statements the use of card-punching and tabulating machines has been extended and centered in a mechanical tabulation section. A reference room is maintained for the use of the public in consulting the files of annual, quarterly, and monthly reports of carriers.

The increased duties imposed upon us by the transportation act, 1920, have necessarily increased the amount of statistical work to be done. The marked growth in the number of clerks employed by railroads frequently gives rise to the suggestion that perhaps much unnecessary information is being collected by the government. Careful consideration is given to all such comments and from time to time requirements are eliminated where the data are no longer needed. The annual report form for 1917 was thoroughly

revised from this standpoint. In 1920 the distribution of locomotive-hours was eliminated. Proposals for important additions to statistical requirements are discussed before adoption with representatives of railroads to ascertain the cost of compiling them. The importance of supplying adequate information regarding wages and hours of service as having a bearing on our analysis of railroad costs, being necessary in the work of the labor board, and assisting in the formation of an enlightened public opinion on this subject, justified the expansion of the wage statistics above referred to. Much of the accounting and statistical burden felt in recent years

Formal complaints filed.....	456	838	1,040	1,487
Cases at issue but not set for hearing.....	21	54	146	201
Cases set for hearing but not heard.....	142	192	92	205

Cases disposed of.....	653	598	670	1,021

by railroads is due to the passage of the properties from private to public control and back again to private control.

The transportation act provides that complaints praying for reparation on account of damage caused by rates collected through the President during the period of federal control may be filed with us within one year after the termination of federal control. By reason of this provision an unusually large number of complaints was filed during the months immediately preced-

ing March 1, 1921. More than 900 such complaints were filed during February, 1921.

The formal complaints filed numbered 1,487, of which 1,307 were original complaints and 180 subnumerators, an increase of 447 as compared with the previous year. We decided 840 and 841 have been dismissed by stipulation, or on complainants' request, making a total of 1,021 disposed of, as compared with 620 during the previous period. We conducted 1,616 hearings and took approximately 185,111 pages of testimony, as compared with 1,303 hearings and 150,986 pages of testimony during the preceding period. The following statement shows certain facts with respect to the condition of our docket as of October 31 of the years indicated:

	1918	1919	1920	1921

Bureau of Informal Cases

The number of informal complaints received was 7,811, an increase of 3,603. The director general of railroads and carriers filed 2,350 special docket applications for authority to refund amounts collected under the published rates, admitted by them to have been unreasonable, an increase of 552. Orders authorizing refund were entered in 1,289 cases, a decrease of 564, and reparation thereon was awarded in amounts aggregating

gating \$798,278.23. In addition, 211 cases were dismissed or otherwise disposed of without orders. The bureau also handled approximately 91,500 letters, an increase of 52,500. Many of these had the characteristics of complaints, although not so classified. Others sought general information and informal rulings upon the respective rights and obligations of the public and common carriers under existing statutes.

The provisions of section 206 (c) of the transportation act, 1920, and the ruling of the director general of railroads that so-called straight overcharge claims were included therein, largely accounts for the increase in the number of informal complaints filed and letters received.

Bureau of Traffic

This bureau has jurisdiction over all matters dealing directly with the charges for transportation and transmission, by freight, passenger, express, pipe line, and telegraph service, other than proceedings on the formal docket and complaints handled by the bureau of informal cases.

In addition to the special work of the various units of the bureau, its activities are directed toward the adjustment of controversies with respect to the legal charges under the tariffs on such matters as duplicate rate situations involving readjustments of kinds, classifications and charges of all kinds. These adjustments are accomplished by correspondence and by informal conferences with shippers and carriers.

The work of the bureau has been especially heavy and important during the past year. The increases authorized in *Increased Rates, 1920, supra*, were allowed to become effective by the publication of supplements to all existing tariffs, the supplements containing percentage tables under which the increased rates are computed.

As anticipated, these general increases not only have called for many important readjustments of the rates themselves, but, because of the impossibility of publishing the increased rates specifically and the necessity of using percentage tables, have added greatly to the difficulty of ascertaining the legal rates and charges, thereby materially increasing the number of controversies between shippers and carriers. In the endeavor to settle as many of these controversies as possible without the delay and expense incident to formal proceedings, numerous conferences have been held, both in Washington and at other points accessible to the interested parties.

To remove the difficulties caused by use of percentage tables in increasing the rates we have required carriers to reissue their tariffs as promptly as possible and therein to state the rates specifically. Tariffs containing 432,429 pages of rates, rules, and regulations were so supplemented following *Increased Rates, 1920, supra*, and of these tariffs 360,220 pages have been reissued to bring them into conformity with our tariff rules up to and including September 1, 1921, the latest period available, leaving 132,209 pages yet to be reissued. This work under our instructions should be completed by March 1, 1922.

It has been our policy, in dealing with rate readjustments, to encourage such changes as would tend promptly to relieve the existing depression of business in so far as changes in transportation charges may effect this result. Pursuant to this policy we have allowed changes in rates to be published upon less than the statutory 30 days' notice in a greater number of cases under more liberal rules than heretofore.

Tariffs

There were filed 103,748 tariff publications containing changes in freight, express, and pipeline rates, passenger fares, and classification ratings; and 201,656 certificates of concurrence and powers of attorney. A large majority of these changes have resulted in reductions of charges, many of the changes being due to readjustment of rate inequalities and relationships which had been disturbed by the percentage increases.

Rate memoranda have been supplied in 6,574 cases for our use and for shippers, carriers and other branches of the government. In addition to these memoranda many informal rate quotations and verifications are made daily.

CLASSIFICATION OF FREIGHT

In our last annual report we described the consolidation of official, southern, and western classifications, effective December 30, 1919.

Many of the ratings were thereby made uniform. Another issue of the consolidated classification was filed with us during the year. The following analysis thereof indicates the degree of uniformity reached:

Less-than-carload ratings.....	10,790				
Carload ratings.....	4,940				
Total number of ratings.....	15,730				
		Less than carload	Per cent	Carload	Per cent
Ratings not uniform					
Alike in official and southern.....	1,369	12.69	671	13.58	
Alike in official and western.....	2,012	18.65	1,435	29.05	
Alike in southern and western.....	906	8.49	1,449	29.57	
All different.....	1,303	12.08	1,531	30.99	
Total.....	6,590	61.08	3,986	80.69	
Uniform					
Total.....	4,200	38.92	954	19.31	
Total ratings.....	10,790	100.00	4,940	100.00	

Representatives of the shipping public appearing at public hearings conducted by the classification committees during the period covered by this report generally have protested against any changes in classification resulting in increases, whether made to cure some patent inconsistency in the classification or for the sake of uniformity. They have particularly opposed the latter. Owing to the general increases in rates resulting from our report in *Increased Rates, 1920, supra*, the carriers concluded to defer special efforts towards uniformity along lines suggested in *Consolidated Classification, 1921, I. C. C.*

There has been no material change in the situation relative to state classifications. Negotiations are in progress looking to the adoption of the consolidated classification rules and items with western classification ratings and southern classification ratings for application within the states of Iowa and Georgia, respectively. The Illinois classification has been revised along the lines of the consolidated classification as to rules and items. Generally the same ratings as in official or western classification have been established therein, depending upon competition which Illinois shippers have to meet. Some delay has been, and is being, experienced in unifying the ratings between the official and western classifications. Consequently some delay has resulted in adjusting ratings in Illinois on certain commodities, notably food products and paints.

SUSPENSIONS

Upon the investigation and suspension docket, 207 proceedings were received as an increase of 141 as compared with the preceding year. Of these, 157 were disposed of, an increase of 124. Rate readjustments were protested and suspension asked in 444 instances, an increase of 304 over the previous year. These protested adjustments often represent not only a number of rate schedules, but many rates and many points of origin and destination. One of them involved more than 1,000 tariffs and more than 100,000 rates covering traffic between a considerable portion of southeastern and Mississippi Valley territory, on the one hand, and a large part of the United States, on the other. Of these protested rate readjustments 43 represented reductions and 401 increases.

In 168 cases we refused to suspend, in 27 the protests were received too late for action, in 14 the protests were withdrawn by the protesters, and in 28 carriers withdrew the protested schedules prior to their effective dates. Of the rate adjustments representing reductions which were protested, 11 were suspended, 31 not suspended, and 1 is still pending.

THE FOURTH SECTION

In our last annual report we stated that since the return on March 1, 1920, of the transportation systems to corporate control and the removal of more active competition between individual carriers there has been a growing increase in the number of applications for relief from the provisions of the fourth section. That this condition still continues is evidenced by the fact that more than twice as many applications have been filed than during the preceding year.

The number of applications for relief received was 408, an increase of 208 over the preceding year. The number of orders entered was 426, of which 218 were for permanent and 208 for temporary relief. Orders granting relief in whole or in part totaled 278. Orders denying relief in whole or in part numbered 148. In 9

instances applications were assigned in whole or in part for bearing in connection with other proceedings.

Pursuant to *Memphis-Southwestern Investiga-*

tion, 55 I. C. C., 515, referred to in our last annual report, the class rates between the Ohio and Mississippi river crossings and the Gulf ports generally have been revised in accordance with the provisions of the fourth section. On commodities between the same points rates have been filed which would correct the fourth section departures existing in these rates. The commodity rates proposed for this purpose are not yet effective, pending determination of the proceeding instituted by us to determine their reasonableness. Whatever the decision may be, it will result in the establishment of rates between all Ohio river and Mississippi river crossings and Gulf ports, by the principal direct lines between these points, which will conform to the provisions of the fourth section.

There is also in progress as a result of our decision in the *Memphis-Southwestern Investigation, supra*, and in other cases involving the rates in southwestern territory, a revision of the commodity rates to, from, and between points in southeastern Missouri and Arkansas and Louisiana, the effect of which will be to remove entirely fourth section departures on the direct routes to and from points in this section. The rates which have been proposed by the carriers for this purpose are now under consideration.

The transcontinental carriers have brought to our attention great increases since the close of the war in the movement of traffic by water between the Atlantic and Pacific seabards via the Panama Canal. A considerable portion of this traffic, it is claimed, is being diverted from the rail line, because of the lower rates accorded by the water carriers.

The rail lines are expressing concern over the situation and, for the purpose of meeting water competition, have filed applications for fourth section relief to establish rates from the Atlantic seaboard and Gulf ports to Pacific Coast terminals, also from Pacific coast terminals to certain Atlantic ports, which shall be lower than rates from and to intermediate points.

Divisions of Joint Rates

Paragraph 4 of section 1 of the interstate commerce act makes it the duty of carriers to establish reasonable joint rates and equitable divisions thereof.

In *New England Divisions, 62 I. C. C., 513*, the carriers operating most of the mileage in New England sought blanket increases in their divisions of the joint rates with connecting lines. That is to say, they urged that the divisions be treated "as a whole," without regard to the specific divisions of individual joint rates, contending that under the law "mileage is no longer the yard-stick by which divisions are to be measured," and that the disproportionate increases in the expenses of the New England roads and their financial condition, with other circumstances, justified the relief sought. We declined to grant blanket increases and found that the record afforded no basis upon which might rest a valid prescription of specific divisions. The existing divisional arrangements, however, were found to be incongruous and chaotic, and the parties to the case were advised to designate appropriate committees, so that they might "promptly submit to us proposed readjustments that will remove the inconsistencies portrayed of record and bring into conformity with the provisions of law and equity expressed in the act the divisional arrangements, individually and as a whole."

The Interest of the Employees in Railroad Earning Power*

By Robert S. Binkerd

Assistant to the Chairman, Association of Railway Executives

THE RAILROADS of the United States cannot give to the public the good service which they want to give without the whole-hearted co-operation of the railroad employees. Management and employees are genuine partners in a great co-operative enterprise. Work must be performed efficiently and in good spirit, and the employees themselves must be treated and must be convinced that they are treated reasonably, justly and humanly by the railroad companies. Despite all the controversies railway executives are looking forward again to the day when the loyalty and devotion of their employees to their company and their work will be the outstanding characteristic of the American railroad man.

Nevertheless, assuming that management makes every effort in its power, this day will not arrive until the great majority of railway employees are themselves convinced of the futility and impropriety of some of the important policies to which labor at the moment seems to be committed.

We are now suffering hard times, for which there is no quick relief in sight. These hard times spring from various causes, some of which are international in character and beyond our control. But there is a principal factor in the present depression which is within the control of the American people. That factor is found in the unbalanced relationship between the prices of farm products and most other basic commodities, on the one hand, and the prices of manufactured goods, transportation service and various other services and products on the other hand.

If the price of manufactured goods and of railroad transportation had declined as much as the prices of farm products have now declined, the farmers' purchasing power would be unimpaired. There would be substantially the same volume of domestic business and substantial normal employment in domestic manufacturing. But, by reason of the fact that manufactured goods and transportation have not declined upon an equal basis, the farmers' purchasing power is greatly decreased and an effective blockade is created against the resumption of normal business.

The attempt of organized labor to maintain wartime wage rates and working conditions which make against high output is, therefore, fundamentally unsound.

Back of this policy there is the thoroughly unsound assumption that capital pays wages. The truth is that wages are paid out of production. That production must leave, in addition to wages, a surplus for the compensation of capital and for the marketing and sale of the product. The price of the product is ultimately fixed by the consuming public itself, and sooner or later any product or service which cannot be produced or given profitably at a price which the public is willing to pay must go out of existence.

Now, it is true that the railroad service cannot go out of existence. But it is equally true that what may be charged for that service must, in the long run, be determined by the value of the commodities to be moved. The charges collected by the railroads must not be higher than will permit the fullest economical distribution of those commodities, and, therefore, for transportation, as for everything else, there is an economic limit to what can be charged. Inside of that limit must be found the wages of labor and the compensation of management and capital.

Fundamental Economic Law

Management is just as powerless as labor to avoid the compulsion of fundamental economic law. The annual trans-

portation bill of the American people is, with declining commodity values, now tending to get outside the economic limit above referred to. The cost of transportation must be reduced. This involves, among other things, the necessity of reduction in basic wages. This need not necessarily mean any decline in real wages, because, paralleled by decreases in wages in other industries, it should result in a living wage for themselves and the possibility of renewed employment for hundreds of thousands of their fellow workers.

It would be a sad mistake for the employees to believe that there is any insuperable conflict between an adequate compensation for railroad capital and a decent standard of living for railroad labor.

Disregarding the whole period of federal control, on account of its necessarily abnormal aspects, it is a fact susceptible to the easiest demonstration that the standard of living of the American railroad employee is primarily the result of the effort of capital and management. If you will look at the 20 years before the European war you will see:

That passenger traffic increased 162 per cent;

That the cost of carrying a passenger one mile decreased one per cent;

That the number of tons of freight carried one mile increased 259 per cent;

That the average receipts per ton-mile decreased over 11 per cent;

And that the compensation of the employees increased approximately 200 per cent.

Improvements in Operation

This increase in the compensation of employees was made possible because of the increase in the production power of each employee, brought about by improvements made in the operation of the railroads. Had there been no such improvements, it would have taken approximately three times as many employees, and three times as many cars and locomotives to haul a traffic which had tripled. There could, therefore, have been neither any decrease in the cost of transportation to the public, nor any increase in the wages paid to labor.

The increase which was paid to labor was the outcome of investments made by railroad management, whereby it hauled a tripled traffic with only a 75 per cent increase in locomotives; only a 61 per cent increase in passenger cars; only an 87 per cent increase in freight cars; and less than a 100 per cent increase in employees. Hence, there was created a surplus, and out of this surplus came the increase in wages and the increase in the standard of living of the railway employees.

Nothing now is more important for the interest and welfare of the employees than that the earning power of the railroads should be restored at the earliest possible date. For it must be plain to all that some of the processes by which the railroads achieved their extraordinary improvement, in the face of declining rates and advancing costs, prior to the war, are tending to become exhausted. New methods will have to be found to increase the mileage of freight cars, to decrease the expense of handling passenger traffic, and to intensify the use of the enormous and costly terminal facilities in our cities. Whatever these new methods may turn out to be, one thing is sure, and that is that they will call for the investment of enormous sums of new capital. The possibility of increasing the production power of the railroad employees and of further advancing their standard of living will, therefore, be entirely dependent upon the ability of the railroads to raise upon their credit enormous sums of money. This money cannot be raised except upon the basis of the surety of past investments and the attractiveness of the investments still to be made. An adequate earning power in the railroads of the United States is the best friend that the railroad employee can ever have.

*From an address before the Chamber of Commerce, Altoona, Pa., on January 5, 1922.

Conditions Affecting the Head of a Rail*

Modern Track Conditions and Wheel Loads Produce Overstrained Steel—A Serious Problem

UNDER CERTAIN CONDITIONS of loading every steel structure will ultimately fail. Steel rails are subject to such loads in kind and often in degree. Interest does not attach alone to conditions which affect the head of the rail, but the head is the most critical part. The rail problem is an open one and will so remain, at least, until there is a general understanding of the destructive influences which prevail and the necessary modifications made to ameliorate them.

It is not the gross load which rails carry, as such, which makes the problem a difficult one, but the manner in which the load is applied. The prime and practically the only irremediable cause of rail failures, in the final analysis of the case, is the excessive impinging pressure between the head of the rail and the tread of the wheel.

Attention Concentrated Upon Head of Rail

These remarks refer specifically to the head of the rail. It is an elementary principle in engineering practice to maintain a certain relation between the gross load and the number of square inches of metal provided to sustain it. No application of such a rule is witnessed in respect to the heads of rails. The impinging pressures, in all cases, exceed many times the permissible loads per square inch allowed in other engineering examples. While this disparity goes on increasing, no permanent relief is in sight.

In regard to the choice of steel for rails, the opportunity is open to make any desired choice, within limits. Track conditions, however, restrict the choice to hard steel—a steel which in earlier days would have been considered very hard. The softer grades will not sustain present wheel loads without objectionable deformation.

Steel structurally sound, free from interior seams and streaks, is best adapted to meet the general conditions of rail service. It is the task of the steel maker to keep inferior seaminess at a minimum, and when this is accomplished the head of the rail will be in a condition to endure wheel pressures, as favorable as falls within the ability of the steel maker to control. External seaminess of the rail may be regarded as a negligible factor since failures from such a cause have not been witnessed.

First Strains Introduced at Time of Fabrication

The first straining of the metal of a rail takes place during cooling, at the time of fabrication. Internal strains of compression are acquired by the metal adjacent to the top and sides of the head. In order to balance these compressive strains at the periphery, the metal at the interior of the head is put into a state of tension. The stresses equivalent to these strains amount to thousands of pounds per square inch. They have been measured many times in longitudinal direction. There is no reason for supposing that cooling strains of corresponding degree do not exist in lateral directions, thus subjecting the interior of the head to cubic extension.

At times these cooling strains have caused the formation of internal cracks at the center of the head and at the junction of the web and the base. Waring and Hofmann at the Altoona Laboratory of the Pennsylvania Railroad, first called attention to a shattered zone which they found along the center of the head in a new rail. Subsequent investiga-

tion showed that a similar zone existed at the junction of the web and the base in certain rails. It was further noted that these shattered zones did not extend to the hot sawed ends of the rails. The last circumstance fixed the time of their development at the cooling stage, following the last pass of the rail mill. A careful search was instituted for shattered metal in rails taken from the track which resulted in their discovery in quite a number of cases. The rails in which they were found were of high carbon steel. Shattered metal was not found in rails of medium carbon content. The widths of these cracks were infinitesimal, with no foreign substance enclosed.

Forming Internal Cracks Experimentally

Internal cracks have been experimentally formed in rails, resembling those in tires more closely than the shattering cracks which have presented themselves in rails. Steel is known to be more sensitive to thermal treatment when first cooled from the ingot than upon subsequent reheating and cooling, a circumstance which may assist in explaining the difficulty in producing at will shattered zones in rails.

After the cooling strains of fabrication are acquired, the next thing that may happen to the head of the rail is straightening at the gagging press. No instance has come to notice in which the fracture of a rail in the track could be attributed to the immediate influence of the gag. Gagging, however, profoundly affects existing cooling strains, causing their rearrangement and even reversing their values. Cooling strains of compression may be changed to strains of tension. Internal strains do not admit of being eliminated by cold bending loads. There will be zones in a neutral state, and those zones may be shifted in position by gagging. The effacement of internal strains, complete or partial, is accomplished only by annealing the steel.

Elongation in Drop Test Specifications

Rails may be tested with the head down, and the elongation measured on the running surface. Those of the heavier sections tested in this manner not infrequently rupture without developing their normal extensions. The abrupt change in cross section dimensions at the fillets under the head causes rupture to have its origin at that place, thence extending to the top of the head. In such a fracture the metal does not display normal elongation. It is possible that a heat may be rejected, not through any fault of the steel, but on account of the design of the rail.

Notwithstanding the disparity in size, comparing a rail with the locomotive which it supports, the bending stresses involved, taken by themselves alone, are not disquieting. Track tests made by the speaker in the past and recent tests by others, with different classes of engines, on rails of different weights, and on different kinds of ballast, show a range in fibre stresses which would not be considered sufficient to cause rupture. Under vertical loads rail failures may be traced to definite causes of which bending stresses are components but not the principal ones.

A particular condition which leads to large numbers of rail failures is the cold rolling of the head by the wheels. Rails reach the track in a certain primitive state of internal strain. Additional strains are at once introduced by the impinging pressures of the wheels, which go on increasing until, perchance, rupture ensues. This destructive influence

*Paper read before the New York Railroad Club January 20, 1922 by James E. Howard, engineer physicist, Interstate Commerce Commission.

is accountable for many rail failures, for which little consideration has been given.

Exterior strains of compression are necessarily opposed by interior strains of tension. The problem is how to preserve the integrity of the metal in the interior of the head, against strains of tension both lengthwise and crosswise. Failures from longitudinal strains of tension in the interior of the head result in the display of transverse fissures; those from crosswise strains of tension become split heads. No mystery attaches to the formation of either a transverse fissure or a split head; a common cause exists for each. They are the direct consequences of high wheel pressures. Together they constitute practically all the head failures of rails.

Split head fractures occur when lateral flow, penetrating the head sufficiently, encounters an interior seam or streak of structurally weak metal. A minute separation of the metal occurs—the incipient point of a split head fracture. The formation of this incipient crack gives some relief to the internal strains. Wheel pressures restore the state of strain, however, and the incipient crack is increased in size. The process is repeated and a split head fracture is thus progressively formed. Under ordinary track conditions considerable time should elapse before the accumulated internal strains become adequate to start an incipient crack. Once started the rate of development should be an accelerating one. A split head fracture may eventually extend many feet in length, possibly originating at more than one place along the length of the rail.

Data of Proper Sort Is Lacking

Evidence which would lead to the identification of an internal strain which is on the verge of causing rupture seems lacking. There is a flattening of the grain of the steel adjacent to the running surface. In cross section, a central zone shows flattening without drift. On each side of this central zone flattening of the grain occurs with lateral flow or drift toward the nearest side of the head. The split head fracture does not have its origin in this upper zone of the head, but within its influence and below where, microscopically, the grains are distorted in shape. Internal strains of thousands of pounds per square inch exist without microscopic evidence of their presence. Divested of the phenomenon of permanent set or general elongation the actual separation of adjacent particles when ruptured by shear or by tension does not reach a measurable quantity. These characteristic features which lead to rupture demand consideration. The display of inherent primitive properties occurs as a rule only in tests for acceptance of the steel.

A split head fracture is regarded as the failure of structurally unsound steel. It is believed that rails of perfectly sound steel would not display this type of fracture. If the grade of steel was too soft to sustain the wheel loads a mashed head would result, not a split head.

The dimensions of the head, even in the widest rails, admit of lateral distortion, a condition not experienced in lengthwise direction of the rail. No relief is afforded the lengthwise strains except such lateral increase in width as expressed by Poisson's ratio, that is, the lateral expansion will be from one-quarter to one-third of the direct compression.

Longitudinal strains due to normal cooling at fabrication acquire moderate values in the head; higher in other parts of the cross section. The peripheral metal of the head for the most part is left after cooling in a state of compression, the interior acquiring a state of tension.

The Question of Transverse Fissures

Stresses exceeding 20,000 lb. per sq. in. compression have been found in the upper part of the head, in rails taken from the track. The interior of the head was in a state of tension. Here are the conditions which account for the development of transverse fissures. This explanation of their occurrence

was given in the first report of the Interstate Commerce Commission upon this type of fracture, in connection with the Manchester accident of August, 1911.

Following the discovery of a shattered zone in the head of a rail, it was asserted that the proximate cause of transverse fissured rails had been found in this development. Investigation did not confirm this assertion. Transverse fissures were found in rails with shattered zones and in rails without shattered zones, also shattered zones were present in rails without transverse fissures. The results of investigation raised the doubt whether the shattered zone even shortened the life of the rail; whether diffusion of the strains from the wheel loads did not occur and thus an influence was presented which tended to prolong its life.

Possible for Railroads to Acquire

More Definite Information

The railroads are not without opportunity to acquire extended information in respect to the physical condition of the rails since the number of transverse fissures amount to some three thousand reported in one state alone, representing over 1,200 different heats. The practice in vogue of removing from the track all rails of a given heat, when a certain number have displayed transverse fissures does not constitute a corrective measure, nor does it increase the common stock of information when no examination is made of the rails removed.

There is similarity between the development of transverse fissures and split head fractures. Each is progressive in its development, each starts from a definite nucleus, and each usually requires a term of years of service before it makes its appearance as a fractured rail. Transverse fissures usually require for their display a term of four to ten years in the track, but there is no definite period within which they occur. It is a matter of track conditions, not one of time which governs the development of these fractures.

Little Known Regarding Internal

Strains in Manganese Steel Rail

Manganese steel rails display transverse *fractures* but not of the type called transverse *fissures*. Transverse fractures in these rails have their origins at the running surface and do not start at the interior of the head; in this respect they are distinguished from transverse fissured rails. The phenomenal toughness of this steel is completely destroyed by the cold rolling action of the wheels. A surface film, a few hundredths of an inch in depth, is affected. Incipient cracks are formed in this shallow film, some of which may extend downward separating the head and possibly a portion of the web, if not earlier removed from the track. A fine hair line marks the presence of such a fracture. Nothing is known concerning internal strains in manganese steel. The difficulty of machining the steel presents an insuperable obstacle.

Notwithstanding the complete loss of toughness at the running surface leading to the fracture of the entire head and half of the web, the rail will still retain toughness in the remaining part of its cross-section. In such a condition the strength of a carbon steel rail would be a negligible quantity. Absolute brittleness in the balance of its section would prevail. No lurking danger has been detected in a manganese steel rail, and from this standpoint it is a safe rail. Its ability to retain toughness under such adverse conditions makes it not only a safe rail, but the only safe rail under parallel conditions. Its superior resistance against abrasion has long been known.

Wheel Burning a Contributing Factor

A source of injury to the heads of rails, of common occurrence, is wheel burning. They constitute the most numerous group of injuries which are apparent to the eye. Fortunately they are not always as bad as they seem. At times the

hardened layers caused by wheel burning flake off. Again cracks in the steel are not arrested at the junction of the hard and soft metal but extend into the normal metal below. This extension of the cracks is a dangerous development. Rails in this condition are among those which are seemingly least affected by wheel burning. Such rails have been found on curves; cracks being formed at close and regular intervals and present on both the high and the low rails.

Wheel burning may occur in which so much heat is generated—heating such a large part of the rail—that hardening by conductivity will not take place. The term “snow burning” is used in some parts of the country having the same meaning as wheel burning, but applying specifically to the stalling of an engine in a snow drift. Under such a condition the head is so generally heated that hardening does not always take place. The severe abrasion and roughening of the surface which results on such occasions weakens the rail and leads to early failure.

Prolonging the Life of Rail

It will be realized from this review of the conditions which affect the head of a rail how serious are the influences which

are encountered when the rail reaches the track. The destructive tendencies are clearly in evidence from which no rail escapes. Rails are overstrained members. Increase the overstraining forces and rupture will inevitably follow. Decrease the overstraining forces and the lives of rails will be increased.

At best, the problem is how to prolong the lives of rails. They reach the track with a certain margin in strength and therefore of safety. This margin is weakened in all rails and in some destroyed, and all steel is breakable. There are inexorable exigencies of service, as some would have it believed, that impose excessive demands upon steel, of such a nature that no relief is possible. The oft-repeated remark is heard that steel makers know the conditions of service and must make rails to meet them, without considering whether these demands transgress natural laws governing the strength of steel. A corresponding remark might with propriety be addressed the designers of motive power and equipment where wheel loads are established. The exhibit presented in the annual report of rail failures, of which there is no parallel in engineering literature, gives emphasis to the subject.

A Plea for Recognition of the Traveling Auditor

Writer Adds This Office to List of “Railroad Goats”
Now Including Secretaries and Chief Clerks

By A Traveling Auditor

THE communications that have recently appeared in the columns of the *Railway Age* relative to the lack of recognition given the chief clerk and particularly the letter to the editor in the issue of September 24 written by a secretary and entitled, “The Official Goats,” induce me to write a few words on another Railroad Goat—the traveling auditor.

Higher-up officers have always drawn larger salaries and continued demands by trainmen and other union members have put them in the prosperous class, but the traveling auditor is still hardworked and ill-paid. He is another example of the skilled brain worker whose services are necessary to a great business but who is treated much less liberally than the man who works with his hands.

Traveling auditors are usually appointed from clerks who have served eight or ten years in the various departments of accounting. They are then given a certain territory or number of station accounts to supervise and audit twice yearly and as many more times as the occasion demands.

A traveling auditor's duties are numerous. He must be a gentleman and at all times be dignified and courteous in his treatment of those, whose duties are under his supervision. Undue familiarity with an agent or any of his office force is frowned upon by the general auditor, as it is an unwritten law that a traveling auditor is not to accept the hospitality of an agent. When an auditor strikes a station in a town that does not boast of a hotel, he enacts the role of the Lord Mayor of Cork and fasts. He is even supposed to smoke his own cigars and not depend upon the agent's bulky and gorgeously banded, two-for-a-nickel brand.

The Work Performed by the Traveling Auditor

The audit of the account is naturally the first requirement.

The auditor sees that the agent is neither over nor short in the cash transactions, that all reports are neatly and ac-

curately rendered, records properly filed and company property safeguarded. If the cash drawer should be 17 cents short, whether through error in making change, an accounting error, or the agent's fondness for the delicacies of the season, the auditor looks very serious, impresses the culprit with his grave danger and paints a mental picture of the yawning doors of the penitentiary. If several dollars have been mysteriously mislaid, it is called a shortage and so reported to the general auditor, with a letter explaining the circumstances in detail, giving suggestions as to criminal intent involved and recommending leniency or dismissal.

A waybill is really an invoice of a shipment made out at the station from which the shipment originates and shows destination, shipper, to whom consigned, commodity, weight, rate, and the amount of charges prepaid or to be collected upon delivery of freight. These waybills have to be reported in the receiving agent's ledger, the amount of collect charges thereon showing as a debit to the account. When charges are collected, they are posted on the credit side of the ledger and must agree with the amount shown in the cash book, which in turn is supposed to balance with the amount remitted to the bank. This reporting and posting has to be checked over by the auditor and the amounts deposited verified. The agent has to show the freight itself, the cash, showing delivery has been accomplished, or some evidence that a box, crate or keg, did actually contain certain commodities.

For instance, if a shipment consisted of a box of limburger cheese, a crate of garlic or a keg of whiskey, and was received with containers empty, through theft, leakage or evaporation, (as is often the case with the last mentioned), the auditor can, by exercising his trained sense of smell, determine just what the contents have been. If, after repeated sniffs of the keg, and a once-over of the box and crate, he is satisfied that pilfering has been done, the agent is relieved of the charges shown on the waybill by a special credit

and an investigation is indulged in to find out what gentleman with an Italian appetite, or with an uncurbed fondness for liquid refreshments, is on the pay-roll.

An inexperienced agent, if dishonestly inclined, often makes the mistake of thinking he can collect charges on a waybill, pocket them and by destroying the waybill get rich quick. This is an error of judgment that agents soon find is disastrous to them, as they fail to take into consideration that all waybills are checked from the forwarding station, and if not shown on station reports to which destined, an immediate investigation is made.

After the freight accounts come the tickets. An agent is charged with a certain number which he has to have on hand or be able to show have been sold and proper fare collected and remitted. Irregularities in these accounts are easily detected, as all tickets are numbered consecutively and each number must be accounted for.

A final balance of all ledgers and a grand summary of all business done, showing to a conclusion that all waybills, adjustments, tickets and cash, has been accounted for, completes the financial part of the audit.

Between Three Not Two Fires

The traveling auditor then answers about 75 questions on a personal report, covering general conditions, the efficiency of the agent and office force, together with observations as to the cause of irregularities, if any. The agent's neatness, cleanliness and morality are noted. If the report is favorable, the general auditor calls the T. A. down for not discovering a shortage or other irregularity. If unfavorable, the superintendent jumps on him for picking on the men on his division and if it is just between the two, the agent greets him on his next visit with an injured air and the question, "Why didn't I receive a letter of commendation, as a result of your last audit?"

There you are, the harassed T. A. is up against it whichever way he turns.

As an Instructor, Commences with Multiplication

As an instructor, this traveling phenomenon is supposed to know everything about the railroad business. He must be able to take charge of a station efficiently in an emergency and answer the calls and needs of other departments besides the accounting. He instructs raw material in the first step to a railroad presidency. He scolds, coaxes and pleads with the boy from the farm, whom the superintendent picks up, gives a uniform of brass buttons, a cap with "Agent" in near-gold letters on the front and tells, "If there is anything you don't know, and want to know about, send an S. O. S. for the traveling auditor."

In many cases, the auditor has to commence with the multiplication table (most of the embryo agents know their A. B. C.'s) and step by step under the watchful and guiding eye of their teacher, the subjects rise to positions of great responsibility with salaries many times greater than that of the poor, patient, plodding representative of the accounting department.

The ability to administer proper encouragement and to give sound advice is, besides a portfolio of blanks, pencils and a ham sandwich, part of the traveling auditor's equipment. He buoys up the agent with praises as to his unusual aptness, whether deserved or not. He shows him how to prepare his reports and how not to prepare them, encourages him to keep all records up-to-date and helps him do it. He shows him also how to facilitate the preparation and rendering of reports from the accounting department to the president each month. He enthusiastically pictures success and promotion, which strict attention to minor details of the work, as well as the general duties, will warrant. He even listens sympathetically to the domestic troubles of the agent, such as his wife's fondness for the movies to the neglect of the tooth-

cutting embryo agent and her hardworking husband. He not only listens but suggests remedies.

The traveling auditor is being continually called upon by the general auditor to criticize prevailing methods of accounting with a view to improving and devising efficient short-cuts, and securing the maximum result with minimum labor and time. It is necessary for him to keep in touch with the agent's method of living, his associates and to be quick in investigating the source of an unusual display of wealth on the part of an agent whose salary will not warrant it. He is not only an auditor but he is an instructor, a Sherlock Holmes, a sympathizing parent and an ever-present help in time of trouble.

No Eight-Hour Day

No eight-hour day with pay for overtime is allowed. The T. A. has a certain number of offices to audit twice yearly, besides taking care of transfers of agents, in which latter cases a thorough audit is made to allow the incoming agent to start with an absolutely clean slate. This means hard work, early and late, and the T. A.'s work is far from completed when he reaches his headquarters at night, as he then has to make out his daily report of activity, schedule for the next day, answer correspondence and maybe take an unofficial trip out on the division to help some poor agent make out a balance sheet, or locate a difference.

The attitude of an agent, cashier or accountant, especially at the smaller agencies, to a traveling auditor, is usually antagonistic. This is a great handicap, as the agent can, when so minded, help along considerably by volunteering information, as to the why and wherefore of different adjustments and entries. This reticence to meet the auditor halfway and expedite the work of the auditor, usually makes it less pleasant for the agent, as the longer an auditor pokes around through the account, the more little irregularities he finds, while if the agent is helpful, the cash balances and reports are neatly and accurately rendered and all questions answered cheerfully and promptly, the auditor is more than likely to assume responsibility for the correct performance of minor duties without an investigation. Of course, the figures are there and all transactions must be verified, but it takes less time to verify a condition than to develop and then verify it.

Does Not Pay to Regard Agents With Suspicion

In my earlier experience, I was taught to consider all agents and cashiers as second-story men, but I soon found that method unjust, as well as a handicap to my work. If an agent sees he is regarded with suspicion, he naturally resents it and puts all kinds of obstacles in the way of a speedy audit. If he is kept in good humor and treated as a respectable business associate, and if possessing any intelligence at all, he is only too glad to do all he can to shorten the auditor's visit. When a shortage or any serious irregularity, which has taken some time to develop, is found, there is a bare possibility that the auditor will receive a letter from the general auditor commending him on his work, but the chances are in favor of a curt note, requesting advice as to why it was necessary to spend so much time at a station that usually requires but a short time to audit. They work on schedule in the general office, 9 a. m. to 5 p. m., with half holiday Saturday, and any deviation caused by exceptional conditions on the road, cannot be understood. It is thought that if some previous audit was made in a day, all subsequent audits should be made as speedily, there apparently being little conception of the diabolical mess an untutored agent can get an account into.

A small account is not necessarily the easiest to balance. In fact, I have had more headaches over accounts kept at a one-man station than over those at larger stations, where it took a month to strike a balance.

The Comforts of Travel

The operating department, from the general manager down, thinks a traveling auditor has a wonderfully good time, traveling around seeing the country, but they do not take into consideration the hardships with which he has to contend. The traveling auditor has no private car but is dependent on regular passenger trains, the schedules of which are unfortunately arranged for the convenience of the traveling public. It means no regular hours, meals at random and hotel beds, where the springs have escaped their mooring and bulge up here and there, making it necessary to practice the convolutions of a snake to enable one to lie in them and sleep the troubled sleep of the just. Then in the small town, there are the hotel rooms with the musty neglected odor, that probably have not been occupied for months, except by tiny unwelcome visitors whose company would sooner be foregone.

There is not much time for recreation, as an auditor is subject to call, Sundays and holidays, and he must at any hour be ready to pack his grip and sally forth.

An auditor doing the same class of work in other lines and under similar conditions, could demand \$10,000 a year and get it. Railroad accounting is more complicated and has more detail work than any other. You ask, why then doesn't he go to work for some commercial concern? Simply because his entire training has been in the railroad business, probably ten years in a clerical capacity, before he is eligible for the intricate duties of an auditor. He gets in a rut, subdued by his lack of adequate compensation and consideration and he feels that he cannot do commercial auditing. He could, however, and it would be easy after his railroad training. In justice to the man of the road, the minimum salary should be \$6,000 a year, ranging from that to \$10,000, according to experience and length of service.

A Comparison with Accounting Office Chief Clerks

Chief clerks in the accounting department receive better salaries than do the traveling auditors and their duties cover supervision of but one class of the accounting work. They are not supposed to be conversant with the workings of another department; for instance, the chief clerk of the freight accounts has nothing to do with the ticket accounts, and vice versa. The chief clerk in charge of claims and adjustments would not necessarily have to know what a freight or ticket

balance sheet looked like, while a traveling auditor has to have an intimate and working knowledge of all this, besides numerous other details at the stations with which chief clerks never have to worry.

I do not wish to deprecate the value of chief clerks as they have great responsibilities and are well worth all they receive, but is it not reasonable to assume that the traveling auditor, whose knowledge embraces all departments of accounting, should at least have a salary equal to that of those whose duties end in one department?

I personally know one chief clerk, who asked one of his assistants what an advance charge on a waybill meant. Another chief clerk of tickets, upon seeing some Pere Marquette abstracts headed, "P. M.," wondered why it was all those reports were prepared in the afternoon, thinking that was what "P. M." stood for. These men were both efficient and knew the workings of their department from A to Z, but there it ended.

Suggests a Voice as to Appointment and Promotion of Agents

A traveling auditor should be recognized by the various departments as something more than a necessary evil. A most excellent move would be to give him a say as to the promotion and appointment of agents. Having authority in this respect would insure a better feeling between agent and auditor and the agents would then work with the auditor, instead of against him. Certainly the latter has a better idea of men with whom he comes in direct contact.

There has recently been organized a traveling auditors' union. It is thought by some that it is non-ethical for a supervising official to belong to a union but from results already obtained in the way of increased compensation, it is a question whether upholding ethics is paramount to the embarrassment of an unpaid grocery bill.

Due to the fact that all of my energy is needed in an attempt to check the progress of a few million tubercular germs, I am probably out of the game for good, and will check no more railroad accounts but I feel, from my experience as a traveling auditor for 12 years, that too little is actually known by higher officials of the man who does so much toward making efficient agents, insuring correct accounting and safeguarding railroad revenue.

Yard at an English Colliery

General News Department

A Freight House of the Chesapeake & Ohio at Norfolk, Va., was damaged by fire on January 13; estimated loss \$75,000.

The American Society for Testing Materials announces that its twenty-fifth annual meeting will be held at the Chalon Hotel, Atlantic City, N. J., beginning on June 26 next.

Professor William Z. Ripley, of Harvard University, is to lecture at the Polytechnic Institute of Brooklyn, New York, on Tuesday evening, January 24, on "The National Railroad Situation." The auditorium of the Polytechnic Institute is at 99 Livingston street, near the Borough Hall. This lecture is one of a course given at the Institute on National problems in their relation to the industries of greater New York.

The Summary of Wage Statistics, issued by the Interstate Commerce Commission for the month of September, 1921, compared with August, shows an increase of 38,403 in the number of employees of the railroads of the country as of the middle of the month, while their total earnings decreased \$3,773,073. The number of employees was 1,718,330, and their total compensation was \$223,972,822. The decrease in earnings is said to be due to the fact that there were 27 working days in August, while there were only 25 in September. The statistics do not include the Detroit, Toledo & Ironton, which had not yet filed its report.

A Census of Safety Workers

The National Safety Council, Chicago, is now taking a census of those who are directly charged with the duty of promoting safety through inspection, safety investigations, safety education, control of health hazards, or similar work in industries and on the railroads. This is the first time any attempt has been made to obtain a census of the persons engaged professionally in the safety movement.

C. E. Denny Predicts Revival of Railroad Construction

C. E. Denny, vice-president and general manager of the New York, Chicago & St. Louis, in an address before the annual convention of the Associated General Contractors at Cleveland was reported in the daily press as predicting that the railways of the country will do more construction during the first six months of the current year than in any similar period since the beginning of federal control. Furthermore, the press reports said, he stated that there would be greater activity during the last six months than during the first.

Baltimore & Ohio Consolidates Divisions

Effective Jan. 1, the Indiana and Illinois divisions of the Baltimore & Ohio were consolidated into the St. Louis division, with headquarters at Washington, Ind. The mileage of the new division will be approximately 640, and it will be composed of the main line and the branches between Cincinnati, Ohio, St. Louis, Mo. This will include 400 miles of the original Illinois division with the branches to Springfield, Ill., and Shawneetown, and 240 miles of the Indiana division including the line to Louisville, Ky.

New Postal Buildings at New York City

The Postmaster General has been authorized, following extended preliminary negotiations, to contract with the Pennsylvania and the New York Central for the use of large new buildings, to be put up by these railroad companies, on the west side of New York City, for the accommodation of the postal service. The New York Central plans to put up a building at Tenth avenue and Thirtieth street, providing 356,400 sq. ft. of space, the rental to be \$145 a sq. ft. The Pennsylvania is to put up a

building above its tracks in the rear of the present general post office, Thirty-second street and Eighth avenue, to provide 592,000 sq. ft. The rental is to be \$170 a sq. ft., the estimated cost of the building being \$10,000,000.

Accident Bulletin No. 80

The Interstate Commerce Commission has issued its eightieth bulletin of statistics of railroad accidents; it is for the three months ending with June, 1921. In that quarter the number of persons killed in train accidents was 88 and of injured 942, as compared with 128 killed and 1,984 injured in the same quarter of 1920. Adding the casualties in train service accidents the totals for this quarter are 1,268 persons killed and 9,511 injured, as compared with totals in the same quarter of the former year of 1,451 killed and 14,367 injured.

Of passengers killed in train accidents, the total in the quarter now reported is 24, as compared with 29 a year ago; passengers injured, 603 this year, 1271 last year.

Nominations for Labor Board Soon

As the time approaches for the expiration of the terms of three members of the Railroad Labor Board, A. O. Wharton, representing the employees; J. H. Elliott, representing the railroads, and G. W. W. Hangar, representing the public, the candidacy of several prominent labor leaders have been announced. B. M. Jewell, president of the Railway Employees' Department of the American Federation of Labor, will be the Federation's candidate to succeed Mr. Wharton, according to reports circulated on January 16. At the Labor Board it was stated that Mr. Wharton will also be a candidate for renomination. All of the nominations to fill vacancies on the Board are to be presented to President Harding on March 1.

Celebrating Franklin's Anniversary

The month of January has been designated as "Thrift Month" by the Chicago, Rock Island & Pacific. Special posters have been put up in all the shops, roundhouses, and offices of the system, urging employees to "Save Today and You Will Have Something Tomorrow." The January issue of the Rock Island magazine is called the "Thrift" Number. It contains articles by prominent bankers, United States Treasury officials, officers and employees of the road. "Thrift and Savings" were made a feature of a special meeting held on January 11 at Chicago, attended by both officers and employees of the company, when George S. Hovey, president of the Interstate National Bank, Kansas City, Mo., delivered the main address.

Mr. Hoover on Electrification

Herbert Hoover, Secretary of Commerce, made special reference to the subject of electrification at the annual meeting of the American Engineering Council of the Federated American Engineering Societies, held at Washington, D. C., on January 5 and 6. Mr. Hoover stated that he thought of electrification as one of the biggest problems confronting the country, and suggested that the engineers tackle this problem in the form of a waste survey. Such a survey, he said, afforded at this time great possibilities in the direction of effective leadership in the elimination of waste. The proposed superpower area along the Atlantic seaboard in the region between Boston and Washington was the starting point, he said, for prodigious development in consolidating the electrical powers of the country along national lines which would affect every village and hamlet, combine into super-power stations thousands of minor electrical plants with millions of horsepower and result in tremendous savings to industry.

Dispatchers' Chief Scores Hoover Conferences

The Hoover conferences in Washington between labor leaders and members of the Association of Railway Executives constitute an "attempt to establish a super Railroad Labor Board," and will impair the prestige of the Board functioning under the Transportation Act, according to J. G. Luhrsens, president of the American Train Dispatchers' Association.

"At a time when the Labor Board must fight to have its powers determined in the federal courts (referring to the injunction suit brought by the Pennsylvania), we have a cabinet officer setting himself up as an intermediary between litigants, past, present and prospective, before the Labor Board," said Mr. Luhrsens in a statement issued on January 16. The statement contends the outcome of the Pennsylvania suit should be awaited and that railway employees should meanwhile keep their faith in the United States Railroad Labor Board.

Common Officers for Various

Pennsylvania Companies Allowed

The Interstate Commerce Commission has issued an order comprising 50 typewritten pages authorizing common officers and directors among the various companies affiliated with the Pennsylvania System. In the original order Charles E. Ingersoll was authorized to hold until further order the positions of director of the Pennsylvania Railroad, the Pennsylvania Company, the Philadelphia, Baltimore & Washington, and president of the North Pennsylvania, and either the position of director of the Missouri Pacific or president of the Midland Valley. He was given 30 days to make his election which position he will hold. Later the commission issued a supplemental order authorizing Mr. Ingersoll to hold until further notice all of these positions.

Shop Employes Decide Not to Take Strike Vote

No strike vote will be taken by shop employes as the result of the Labor Board's recent rulings on the working conditions of these employes, according to an announcement made on January 15, by B. M. Jewell, president of the Railway Employes Department of the American Federation of Labor. A committee of shop men has been considering the new shop craft rules and it was decided to ask the Railroad Labor Board for a rehearing on some of the new provisions. Particular objection was raised to the rule eliminating punitive overtime for Sunday and holiday work for those employes necessary for continuous operation.

"As the rules now stand, they may mean anything," Mr. Jewell said. "We want the board to interpret them so we can tell just what they mean. Therefore, we are going to reopen the case and find out just where we stand before we act."

Burlington Establishes Pension System

The Chicago, Burlington & Quincy has followed up its announcement of December 1, indicating that the road was about to inaugurate a pension system, with a circular to the employes of the road, dated January 1, giving the plan and the conditions under which it is to be operated. The plan provides that, after a continuous service of at least 20 years, pensions may be granted to trainmen, enginemen, yardmen, and foremen in track and bridge service, who have reached the age of 65 years, after an examination by the Pension Board, and to all employes after the age of 70 years is attained, except when upon application of such employes and in the judgment of the Board their service does not demand retirement. In the event of physical disability before the age limit has been reached, pensions may be awarded after a continuous service of 25 years. The pension allowance per month is based upon the average of the monthly wages received for the ten years preceding retirement and is set at one per cent of that amount for each year of continuous service, but in no case is the allowance to be less than \$1 for each year of continuous active service nor less than \$25 per month, and in no case greater than \$150 per month. The entire cost is to be paid by the company without contribution by the employes. The Board of Pensions as appointed for the first year is as follows: Chairman H. R. Safford, vice-president; E. P. Bracken, vice-president; W. F. Thiehoff, general manager; F. A. Torrey,

general superintendent of motive power; H. W. Johnson, controller; and secretary, J. N. Redfern, superintendent, relations and employment department.

Mr. Schwab Pleads for the Railroads

Charles M. Schwab, chairman of the board of the Bethlehem Steel Corporation, speaking before the Ohio Society of New York at its annual meeting on January 14, told his hearers some incisive truths about the railroad situation. He said, in part:

"The greatest of American interests next to agriculture is that of transportation. I have been told that it would take five billion dollars to put our transportation companies abreast of the commercial requirements of the nation and to make up for their inability to expand and progress during the last few years. Our railroads for the last two years have abandoned more miles of track than they have built, and have probably retired from service more freight and passenger cars than they have installed. In a country like ours, with its great future still ahead of it, that is an impossible situation.

"We have imposed upon our railroads a network of laws and restrictions which has made their rates no longer responsive to the changing commercial needs of the country. The way to get results in life and in industry is to put your faith in men. We should stop knocking our railroad presidents. The railroads have had an awful drubbing such as no other industry has ever gone through. There have been evils in the past, but the damage done through the laws which have been passed has been infinitely greater than all the material harm due to the financial scandals. We should of course prevent evil and scandal, but we must also be careful not to stifle progress.

"But no matter what has taken place in the past, I am firmly of opinion that no finer and more conscientious lot of men was ever attempting to discharge their duties to the public under difficult conditions than the men who are today running the railroads of the United States. Do you know a single one who does not deserve your implicit confidence? They are not speculators; they are not grafters; they are high minded public servants deserving of public trust and of public enthusiasm. There isn't a man today at the head of an American railroad who is not a credit to the industry and an asset to his country. . . . Let us back our railroad officers as the manager of a great industry would get behind his department heads. At every turn they are hemmed in by restrictions which prevent the exercise of the sound business judgment which has grown out of their long experience. You never make progress by ham-stringing ability and initiative, and no industry ever gave good service long if it wasn't prosperous itself. . . . Maintain such regulations of railroads as actual experience shows to be justified, but abandon all the regulation which is based merely upon political motive and popular prejudice."

New A.S.C.E. Constitution to Be Given a Chance

The sentiment as expressed by those attending the annual meeting of the American Society of Civil Engineers held on Wednesday, January 18, through the medium of their votes, indicated a desire on the part of the members to give the newly adopted constitution of the society a chance to show what results it can produce. Two groups of amendments came before the annual meeting, the first group being introduced with the approval of the societies' counsel for the purpose of clarifying some inconsistencies in the constitution. This group was approved by the meeting and will be sent out for letter ballot with that approval. The second group dealt with numerous changes which it was hoped would tend to further and advance the local activities of the society. In the discussion regarding the second group of amendments it was brought out that the board of direction had been and was still continuing to give the subject of local activities serious consideration; that the revised constitution had been revised at a considerable cost, and much effort and study had been expended upon it to improve it and in particular those sections which dealt with local activities. It was urged that since this constitution had only been in effect since November 5, 1921, the time elapsed had not been sufficient to judge accurately just how well it was going to come up to expectations and that therefore at least a year should be allowed to pass before any amendments, such as in the second group, were considered. It was voted to send out the amendments for letter ballot with an adverse recom-

mendation. A call for a division of the meeting into members from District 1 and from all other districts showed that there were 223 members present from District 1 and 150 from the others. Honorary memberships were presented to Samuel Rea, president, Pennsylvania Railroad; Charles Prosper Eugene Schneider, Paris, France; Luigi Luiggi, Rome, Italy; Ambrose Swasey and Howard A. Carson.

Supply Men's Association Announces

June Convention Details

J. D. Conway, secretary of the Railway Supply Manufacturers' Association, has sent out invitations and exhibit blanks for the convention of the Railway Supply Manufacturers' Association to be held June 14 to 21 on Young's Million Dollar Pier, Atlantic City, N. J., in conjunction with the meeting of the American Railway Association, Division V. The communication which is designated "Official Circular No. 1" says that it is anticipated that "we will also have Division VI, Purchases and Stores, join with us." The circular says that though it was considered advisable to cancel the convention scheduled to be held in June, 1922. A general canvass of the manufacturers shows that they very largely favor an exhibit, and "the many inquiries we are receiving evidences a greater interest than in any previous year."

The circular gives complete details concerning the exhibit. The track exhibits will be arranged for as usual and a number of changes have been made on the pier which it is believed will improve its exhibit conditions.

New York Central Veterans

The Metropolitan Chapter of the New York Central Veterans' Association is the name of the old-timers' organization recently established by New York Central officers and employees in New York City. It is open to all who have been with the company fifteen years or more, and was launched with more than 500 charter members. A. S. Lyman, General Attorney, was temporary chairman of the organization meeting. Lieutenant Colonel William L. Burnett, assistant conductor on the Electric division, was elected president; William O. Wichman, engine man on the Electric division, vice-president; J. M. Woodridge, chief clerk to the General Attorney, secretary-treasurer, and Fred T. Slack, inspector of passenger service, historian. It is expected that veterans at Albany, Buffalo and other centers also will form chapters.

Chauncey M. Depew, chairman of the Board of Directors and one of the charter members of the new association, in a letter to his fellow veterans said in part:

"On the first day of January, 1922, I completed 50 years of service in the company. That I am in about as good shape in this January, 1922, as I was in January, 1866, is a tribute to the health and happiness and longevity which comes from service in the New York Central. . . . Every organization is divided into boosters and knockers. A knocker is one who is dissatisfied with everybody above him, everybody around him, and especially, with the organization with which he is working. A railroad man should leave criticism and complaints against his job to the commuter, the shipper, the politician and the fellow who cannot get on the payroll.

"The booster is always healthy, always happy, and always cheerful. He helps others and in that way helps himself. He has pride in his organization, pride in his train, pride in his locomotive, pride in what he believes can be done by his company better than by any other in the world. A knocker is a poor citizen, a booster is a good one."

President A. H. Smith addressing the meeting, said that the difference between officers and me is an invisible line; the officers are of not much consequence without the men behind them, and to have the men behind them, if they are willing and earnest is what gets the answer. Mr. Smith praised warmly the spirit of patriotism and loyalty that enabled the railroad workers to accomplish seeming miracles during the terribly cold winter of 1918, when the country was at war and the Allies calling for munitions. "You will never get the credit, because credit does not come after those troubles are over, but I know it and you know it, and it is perhaps sufficient that we do know it. As long as I live, I never can find words to express to you and the others my appreciation of the efforts then put forth."

Traffic News

The Transportation Club of Flint, Mich., at its annual meeting on January 12, elected the following officers: President, F. A. McHale; vice-president, L. F. Burckart; secretary, Paul Heyer; treasurer, J. E. Clark; board of directors, E. F. Bilo, John S. Gibson, F. J. Shepner and V. A. Rogers.

The Industrial Traffic Club of Portland, Ore., at its annual meeting on January 4, elected the following officers: President, W. H. Sainsbury; vice-president, F. G. Donaldson; secretary, F. P. Kensingler; treasurer, F. A. Baker; directors, J. L. McConnell, W. O. Rogers, R. C. Long, F. L. Miller and T. H. Spencer.

The Federal Trade Commission will open a hearing on January 30 at Milwaukee, Wis., on the "Pittsburgh plus" case. This case was initiated in 1919 by the Western Association of Rolled Steel Consumers, and since that time the American Farm Bureau Federation, the National Association of Purchasing Agents, the Southern Association of Rolled Steel Consumers, and the legislatures of Illinois, Wisconsin, Minnesota, Iowa and Missouri and the state senate of Georgia, have joined with this company to fight the case.

The differential system of making passenger fares between New York and Chicago which prevailed prior to federal control was re-established on January 1 by the lines other than the New York Central and the Pennsylvania, when the Interstate Commerce Commission failed to suspend the tariffs filed by the former "differential" lines, although urged to do so by the two "standard" lines. In filing the tariffs providing for the reduced rates the roads said they had lost a large share of their through passenger business after their fares had been put on the same basis as those of the New York Central and the Pennsylvania.

The American Short Line Railroad Association, through its Bureau of Tariffs and Printing, announces that in order to give prompt service to its patrons in the Western territory, the National Reproduction Company of Chicago, has been engaged to print 1,200 pages of planograph matter daily as required. Western Trunk Line Territorial Directory No. 1-A of 350 pages was recently reproduced in four days, and in emergency this time can be reduced. Experienced tariff men are now on duty in the Chicago office, and the time required for the communication and handling of Western orders will be reduced. The Chicago office is at 5 North Wabash avenue, and the manager is I. T. Hanson.

The ninth annual meeting of the Southern Hardwood Traffic Association was held at Memphis, Tenn., January 6. J. H. Townshend, secretary-manager of the association, was delegated to "obtain rates, route all freight traffic from and to all points and handle traffic matters generally" for nearly 100 different companies and it is expected that he will receive authority from 225 additional firms within a few days. S. M. Nickey, president of the Green River Lumber Company, Memphis, was re-elected president of the association; vice-presidents for the district offices were elected as follows: J. F. McSwain, Memphis; S. W. Richey, Cincinnati, Ohio; F. A. Norman, Jr., Louisville, Ky.; L. E. Moore, New Orleans, La.; A. C. Thompson, Helena, Ark. Elliott Lane was re-elected treasurer. The directors re-elected Mr. Townshend, secretary-manager and J. V. Norman of Louisville, Ky., as general counsel.

The American Farm Bureau Federation has announced a program which it proposes to submit to the national agricultural conference to be convened at Washington on January 3. This will suggest immediate reductions in freight rates, all savings in operating costs to be further reflected in further rate reductions until the entire increase of August 26, 1920, is wiped out, and repeal or amendment of the Adamson law. The conference will also be asked to declare for the repeal or amendment of the Esch-Cummins law so as to abrogate what is called the "guaranty" clause, and to "revitalize the

Railroad Labor Board and co-ordinate wage-making powers with the rate-making power of the Interstate Commerce Commission." J. E. Gorman, president of the Chicago, Rock Island & Pacific, has been invited to attend the conference as a representative of transportation.

Shippers in New York and Boston, and other Atlantic seaboard territory, following a recent meeting in New York City, have organized a committee to protest, at Washington, against any increase in freight rates which shall put eastern territory at a disadvantage compared with Chicago; the argument being that the Interstate Commerce Commission, unless restrained, may authorize important reductions from Chicago while not allowing similar changes from eastern cities. W. H. Chandler, of Boston, manager of the Transportation Bureau of the Boston Chamber of Commerce, was appointed chairman of a committee to follow the hearings which are to be given by the Interstate Commerce Commission. P. W. Moore, secretary of the shippers' conference committee and manager of the Traffic Bureau of the Queensborough Chamber of Commerce; E. Grace, of the Brooklyn Chamber of Commerce, and W. J. Banham, traffic manager of the Otis Elevator Company, are to be other members. Mr. Banham will serve as New York chairman.

The National Industrial Traffic League will hold a special meeting at Washington, D. C., on January 27, to consider the report of the legislative committee, suggesting certain desired changes in the Transportation Act. At the same meeting the general rate inquiry of the Interstate Commerce Commission which will be resumed on January 11, will be discussed and the attitude of the league's witnesses before the commission will be decided. J. H. Beek, secretary of the league, at Chicago on January 5, said: "The rate reductions which have been made voluntarily by the carriers or ordered by the commissions since April 26, 1920, have been largely for the benefit of specific commodities. The National Industrial Traffic League favors reductions in all rates, both class and commodity, made upon a percentage basis if the commission finds that a reduction is warranted. When the rates were advanced they were advanced on a percentage or horizontal basis and if rates are to be reduced we believe they should be reduced in a similar manner."

The Pennsylvania Railroad announces new arrangements concerning the stop-over privilege. The passenger must apply to the conductor of the train entering the place where the stop-over is to be made, and ordinarily the ticket must be deposited by the passenger with the station ticket agent immediately on arrival, but all-year tourist, summer tourist and winter tourist tickets will permit stop-over at any point without deposit. On one way and 30-day round trip tickets a stop-over, not to exceed ten days, will generally be allowed. The passenger may enjoy the stop-over privilege at as many authorized stop-over points as he may desire. In general the cities authorized as stop-over points are as follows: Akron, O.; Baltimore, Md.; Buffalo, N. Y.; Canton, O.; Chicago, Ill.; Cincinnati, O.; Cleveland, O.; Columbus, O.; Cumberland, Md.; Dayton, O.; Detroit, Mich.; Elmira, N. Y.; Ft. Wayne, Ind.; Hagerstown, Md.; Harrisburg, Pa.; Hibbard, Ind.; Indianapolis, Ind.; Lima, O.; Louisville, Ky.; Mansfield, O.; Marion, O.; Mayville, N. Y.; New York, N. Y.; Philadelphia, Pa.; Pittsburgh, Pa.; Rochester, N. Y.; St. Louis, Mo.; Salamanca, N. Y.; Sandusky, O.; Springfield, O.; Toledo, O.; Valparaiso, Ind.; Warren, O.; Washington, D. C.; Watkins N. Y.; Wheeling, W. Va.; Wilkes-Barre, Pa.; Wilmington Del., and Youngstown, O.

The Long Island Railroad, in presenting its argument for enough income to enable it to properly expand its facilities so as adequately to deal with an increasing volume of freight traffic is able to use a striking and concrete example, namely, the great activity in construction of new buildings throughout the territory served by the railroad—which territory has no other railroad. In 1921 these buildings have numbered 11,000, a total much larger than in any previous year. The railroad delivered 111,868 tons of brick, or more than twice the quantity recorded in 1920, and very large increases are recorded in cement, lumber and other articles. Speaking to the "Knot Handlers," a club of lumber dealers, and alluding to other figures, Donald Wilson, general freight agent of the road, emphasized that the railroads are generally sick abed, and need the sympathy and co-operation of

the public, who pays the bills. The governmental bodies which regulate both wages and rates, do not always assume responsibility as to the successful operation of the roads. There is an idea in the minds of many people that the freight rates on building materials are so burdensome that building construction has consequently been limited; but a well-known architectural engineer has recently analyzed the owner's direct building costs, and finds that only 8.3 cents of each dollar spent in the construction of a typical industrial building goes toward paying the freight charges on building materials.

Coal Production

Production of soft coal recovered appreciably during the first week of 1922, according to the weekly bulletin of the Geological Survey. The output is estimated at \$7,460,000 tons. The New Year holiday was observed in some districts but not in all.

The joint international commission of the governments of the United States and Canada has submitted to President Harding a report which he has in turn transmitted to Congress, containing a comprehensive proposition for the improvement of the St. Lawrence River between Montreal and Lake Ontario, as well as the completion of the new Welland ship canal, the connecting link between Lakes Ontario and Erie. The cost is estimated at over \$250,000,000 for the work on the St. Lawrence and \$60,000,000 for the Welland improvement. The purpose is to open up a waterway which will enable ocean vessels to pass into the Great Lakes, and the commission recommends a draft of 25 feet in the canals and 30 feet in the sills of the locks.

Anthracite Shipments for December

The effect of the abnormally mild temperatures that existed during December, and the general industrial depression are reflected in a decrease of approximately 1,800,000 tons in the shipments of anthracite as compared with the corresponding month of 1920, and of nearly 680,000 tons as compared with November. Shipments last month (4,635,922 gross tons) were the smallest since September, 1920, when the "vacation" strike of the mine workers reduced the shipments to 3,592,954 tons.

The total shipments for the year 1921 amounted to 67,617,713 tons against 68,627,125 tons in 1920.

Shipments by initiating carriers were as follows:

	December 1921	December 1920	November 1921
P. & R.	985,262	1,324,004	1,017,409
L. V.	801,796	1,161,305	913,737
C. of N. J.	532,597	497,735	512,613
D. L. & W.	626,377	840,515	814,131
D. & H.	654,987	806,475	736,598
Penna.	307,520	457,242	429,638
Erie	450,465	675,979	503,488
N. Y. O. & W.	107,107	164,557	136,945
L. & N. E.	169,811	318,508	229,455
	4,635,922	6,436,320	5,314,014

Light Hay Movement Due to Other

Factors Than Freight Rates

A general review of the hay market situation just completed by the Department of Agriculture shows, according to its publication "Weather, Crops and Markets," that while the movement of the marketable surplus of hay to December 15, 1921, was considerably less than normal, the cause is not entirely attributable to freight rates, as has frequently been asserted. This publication says:

"There are several other important factors, such as high marketing costs, mild weather in several important consuming sections, local forage, and general business depression. Marketing costs including the freight, total more in many instances than the amount received for the hay. Baling charges have been reduced about \$1 to \$1.50 per ton, baling wire is less expensive, and hauling charges are less than they were one year ago, but with the exception of one or two markets no reduction has been made in the terminal market charges.

The large amount of local forage available in sections which are usually heavy buyers of hay from other sections is

probably an important factor and is one which is being made of great importance by the financial condition of the consumers who are using all substitutes available. Consumption, where it depends upon the activity of commercial enterprises, such as sawmills, lumber camps, coal and other mines, or construction camps, is very light. . . . There are numerous territories in which only a general return to normal conditions will bring the demand for hay back to normal."

A Plea for the Truck Horse

The suggestion of Major Church, transportation engineer of the Port of New York Authority, in favor of the creation of special motor truck highways to be equipped with stations and with the same regulations respecting traffic schedules as railways is very interesting.

His article would have been more interesting had he mentioned that it was his purpose to have these highways built by taxation. He proposes to create competition for the railways at the expense of the taxpayers; and the railways are among the heaviest taxpayers.

The more logical course would be to build a complete system of railways under the Port of New York Authority at the expense of the taxpayers; such railways will cost less than the very expensive type of motor roads which the Major proposes will last five times as long, and the engines, rolling stock, etc., required will cost much less because of their longer life and much slower depreciation; while the expense of transporting goods will be definitely less on account of the much larger loads which can be hauled.

If we must develop added transportation facilities for freight at public expense, by all means go the whole distance and build state-owned railways to reach every part of the city. . . . No city can give adequate service to its merchants and factories unless adequate freight and express terminals are provided. Short cartage hauls favor business by reducing delivery costs. Cities which provide numerous team tracks give their merchants and manufacturers a substantial advantage over cities not so well planned.

Boston with many wharves and team tracks has very few hauls that are not under two miles for the round trip, and Boston moves her enormous shipments of wool, leather, fish, vegetables, fruits, etc., at a very low cost. Seventy-five per cent of her merchandise is horse-drawn, and she enjoys the distinction of having the best lot of horses on the average of any city in America.

Philadelphia, with numerous wharves along the river and frequent team tracks, is also a city where merchants and manufacturers enjoy the advantage of short hauls, and here again we find keen appreciation of the economy of horses in such work.

Investigations covering six months—January 1 to July 1 this year—were made in New York, Philadelphia, Baltimore, Washington, Boston, Springfield, Hartford, New Haven, Lowell, Providence and other Eastern cities, and from studies, other surveys and figures furnished by firms who own and use 51,927 head of horses, we can say positively that on hauls within a horse's working radius, i. e., the distance a team can travel in a day, horses furnish more economical service than motorized equipment. This holds good on both straightaway, heavy duty hauls and on house-to-house delivery.

On local delivery work from store to store, or house to house, the evidence is overwhelmingly for horse-drawn equipment. Ice companies, coal companies, groceries, bakeries and milk companies agree emphatically with the great packing companies whose verdict is that on all hauls under twenty miles a day the horse is most economical.

The packers emphasize four fundamental features of horse use in their report—low initial investment, long life, low repair cost and moderate maintenance.—*Wayne Dinsmore in the New York Times.*

SAFETY FIRST AND EARLY—As our most lasting impressions and characteristics are formed in childhood, it is the duty of every parent and teacher to indelibly impress on the mind of the child never to walk along the tracks, and at railroad crossings to stop and look carefully in each direction before crossing. In all sincerity we ask every parent and every teacher to teach this lesson fervently and frequently.—*B. F. & P. Circular.*

Commission and Court News

Interstate Commerce Commission

The commission has suspended from January 24 until May 24, the operation of schedules which propose to increase the rates on common window glass, carloads, from Oklahoma and Arkansas producing points to Sioux Falls, S. Dak., from 46 to 49½ cents per 100 pounds.

In response to a resolution passed by the Senate at the instance of Senator Pittman of Nevada, the Interstate Commerce Commission has ordered a proceeding of inquiry and investigation regarding the organization, management and control of the Transcontinental Freight Bureau.

The commission has suspended until May 15 the operation of schedules which propose the establishment of increased and reduced rates on asphalt, road oil, etc., from points in Missouri, Kansas, Oklahoma and Arkansas to points in Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North and South Dakota and Wisconsin.

The commission has suspended until May 15 the operation of schedules published by the Duluth, Winnipeg & Pacific which propose increase and reductions in rates on prepared roofing, etc., between Chicago, Peoria, Ill.; St. Louis, Mo., and other points, and Mankato, Minn., and Hawarden, Ia., and points taking same rates, and from Duluth to Virginia, Minn.

The commission has suspended until May 11 the operation of certain schedules which propose to reduce to 14 cents per 100 pounds the present proportional carload rates of 19 cents per 100 pounds on petroleum and its products from Shreveport, La., and group points to Natchez, Miss., via the Louisiana & Arkansas, to Vicksburg, Miss., via the Vicksburg, Shreveport & Pacific, and to Baton Rouge, La., via the Louisiana Railway & Navigation Company.

The commission has suspended from February 15, until June 15, the operation of schedules which propose to establish reduced proportional class and commodity rates from Chicago, Ill., Ohio and Mississippi river points, and points taking same rates, to Gulf ports, New Orleans, La., to Pensacola, Fla., inclusive, and to South Atlantic ports, Jacksonville, Fla., to Wilmington, N. C., inclusive, applicable to shipside for transshipment via the Panama Canal to Pacific Coast points in the United States and British Columbia.

The commission has suspended from January 2, until May 2, 1922, the operation of schedules published by the American Railway Express Company, which propose the establishment of a rule in connection with its mileage scale of rates applicable on milk, cream, buttermilk and condensed milk between points west of the Mississippi river, except the Pacific Coast states, providing that where there are two or more routes between points of origin and destination the distance via the route actually used will determine the rate.

The commission has suspended from January 2, until May 3, 1922, the operation of schedules published by the New York, New Haven & Hartford, which provide that shippers are required to ice less than carload shipments of less than 5,100 quarts of buttermilk, condensed milk, cream, evaporated milk, milk, potcheese and skim milk moving between points on the New York, New Haven & Hartford and Central New England and from points on these lines to New York and vicinity in connection with the Erie, New York Central, and New York, Ontario & Western.

State Commissions

The Board of Railway Commissioners for Canada announces the appointment of R. Richardson as assistant secretary and registrar, and George A. Brown as assistant chief traffic officer; headquarters, Ottawa.

The Railroad Commission of California, on December 21, denied the application of the railroads of that state to increase freight rates on petroleum road oil.

The Public Utilities Commission of Michigan on December 28, assumed authority to fix the annual rentals that railroad companies charge for portions of their right-of-way, used by coal dealers, grain elevators, etc. Chairman Sherman T. Handy filed an order in the case of E. B. Muller & Company, of Port Huron, against the Pere Marquette, in which the commission refused to consider the contention of the railroad company that the act under which the state assumed to fix rates is unconstitutional. The order reduces the rentals on the Muller Company's stations at Elkton, Sandusky, McGregor and Deckerville.

Personnel of Commissions

The appointments of Henry C. Hall and Clyde B. Aitchison as members of the Interstate Commerce Commission were confirmed by the Senate on January 16, after a delay of over two weeks. Their terms expired on December 31 and pending confirmation they were retained by the commission as special examiners.

Court News

Automatic Bell Ringer Within the Inspection Act

The Circuit Court of Appeals, Seventh Circuit, holds that a bell ringer is a part or an appurtenance of a locomotive and tender within the Boiler Inspection Act, and that if an engine is equipped with an automatic ringer which is out of repair, a hand operated bell cord cannot be accepted as a substitute, especially where the hand operated bell is utterly insufficient.—Hines v. Smith, 275 Fed. 766.

Disregard of Signals by Taxicab Driver

The Wisconsin Supreme Court holds that a taxi-cab driver killed at a crossing in a city was guilty of contributory negligence, barring recovery for his death, where the signalman signaled him to stop about 80 ft. from the crossing and continued to signal him until he was forced to step aside to avoid being run over by the taxi.—Rowart v. Kewaunee, Green Bay & Western (Wis.), 185 N. W. 189.

No Lookout Duty Owing to Employee Off Duty

The Kentucky Court of Appeals holds that a railroad company owed no lookout duty to a member of a fencing crew housed in a bunk car on a side track, who was struck by a train as he was entering the car at night while off duty. To impose such a duty on the company would require it to maintain a lookout for its employees both day and night over practically all of its tracks.—C. N. O. & T. P. v. Brown (Ky.), 234 S. W. 455.

Automobile Drivers in New Mexico

The New Mexico Supreme Court holds that where one approaching a crossing in an automobile, according to his own testimony stopped, looked and listened at a distance of 57 ft. from the track, and did not thereafter again stop, look and listen, but drove upon the track, he is guilty of contributory negligence, and cannot recover for injury to himself or his car by collision with a train.—Morehead v. Atchison, T. & S. F. (N. Mex.), 201 Pac. 1048

Employers' Liability—Federal Rule

of Damages Controlling

In actions brought in state courts under the federal Employers' Liability Act, the proper measure of damages to be awarded for ascertained future earnings must be settled according to general principles of law administered by the federal courts. The Supreme Court of the United States seems to have definitely decided that in such cases the sum to be awarded for the anticipated earnings of a decedent must be the present worth only of such earnings; that it is the duty of state courts to so direct the jury; and it has reversed the Kentucky Court of Appeals, for no other reason than that the state court failed to comply with the rule

of the federal courts in that respect. See *Chesapeake & O. v. Kelly*, 241 U. S. 485, 36 Sup. Ct. 630; *C. & O. v. Gadney*, 241 U. S. 494, 36 Sup. Ct. 633. For the same reason the Nebraska Supreme Court in two recent cases reversed judgments for the plaintiffs—*Sweat v. Hines* (Neb.) 184 N. W. 927. *Sheehan v. Hines* (Neb.), 184 N. W. 934.

Fences Not Required at Station Grounds

The Montana Supreme Court holds that Rev. Codes, § 4308, requiring fences and cattle guards, is not applicable to tracks at station grounds. Liability for injury to animals straying on the grounds depends on negligence in managing the trains. If the company does fence at places not required by the statute, there is no presumption that the fences constitute a trap for animals killed straying into the grounds, so as to make the company liable in the absence of negligence in moving the train.—*Bowers v. Chicago, M. & St. P.* (Mont.), 201 Pac. 825.

Safety Appliance Act—Car in Steel Company's Yard

A steel company's brakeman was injured attempting, under the orders of his yardmaster, to uncouple cars, one of which belonging to a railroad company, had no uncoupling lever. The brakeman, however, would not have been injured but for the steel company's engine being moved the wrong way by its employees' erroneous signal or failure to observe a signal. The Ohio Supreme Court holds that the railroad was not liable under either the federal or state Safety Appliance act.—*Loucks v. New York, Chicago & St. Louis* (Ohio), 132 N. E. 849.

Carrier Not Liable for Injury to Goods

Improperly Loaded by Shipper

In an action for damage to furniture alleged to be due to negligence in transportation, the Virginia Supreme Court of Appeals holds, citing the authorities, that where a shipper for purposes of his own convenience undertakes to load and unload the goods, the carrier is not responsible for injuries received in transportation traceable solely to improper loading and packing. In this case it was not the practice of the railroad to make inspection of carloads loaded by shippers. The court said that a different question would be raised if the improper loading were manifest to ordinary observation when the car was received. There was evidence proving that the furniture was not properly loaded and packed in the car by third parties employed by the shipper. There was ample evidence of the railroad's employees to overcome the presumption of negligent transportation arising from the arrival of the goods in a damaged condition, and to prove that damage would not have occurred if the car had been properly loaded and the goods properly packed. Judgment for the plaintiff was therefore reversed.—*Hives v. Buchanan* (Va.), 109 S. E. 219.

Service of Summons on Soliciting Agent Invalid

In a personal action in a federal court of Minnesota against the Union Pacific, a foreign railroad corporation operating no lines within the state, on a cause of action arising in another state, service was attempted to be made by delivering a copy of the summons to the company's soliciting freight and passenger agent at Minneapolis. The district court holds that the fact that the company maintains an office in the state with such an agent, who has, however, no authority to make contracts, issue bills of lading or passenger tickets, or to collect freight charges, does not constitute doing business in the state such as would validate the service.—*Stephan v. Union Pacific*, 275 Fed. 709.

Liability for Injuries Resulting From Quarrel

Two employees of a railroad, both engaged in shoveling coal, quarreled as one was quitting and the other starting for the day as to the amount of work done by each. In the course of the quarrel one, while leaving the premises, was struck by a lump of coal thrown by the other. In a proceeding under the Workmen's Compensation Act, the Indiana Appellate Court holds that the Industrial Board was warranted in finding that the applicant received his injury by an accident arising out of his employment;

this on the theory that the disagreement arose out of the employer's work in which both men were engaged.—Payne v. Wall (Ind. App.), 132 N. E. 707.

United States Supreme Court

Regulation as to Manner of Tendering Base for Lien Lands Within Power of Secretary of Interior

The Supreme Court of the United States has affirmed the judgment of the Court of Appeals of District of Columbia (263 Fed. 637), holding that under a railroad land grant (of the Southern Pacific), providing that when land is lost to the company for any of the reasons mentioned in the grant, other lands may be selected by the railroad in lieu thereof, "under the direction of the Secretary of the Interior," a ruling of the Secretary that land tendered as a base for lien lands must not be tendered in fractions of 40 acres, is a matter of administration, committed by Congress to the sound discretion of the Secretary, and as such not subject to the control of the courts. Mr. Justice Van Devanter said in part that "the regulation is merely an administrative measure designed to facilitate the examination and disposal of the selection lists and to be fair alike to the claimant and the government. It neither abridges the right of selection nor unreasonably obstructs its exercise, but on the contrary leaves the claimant free to select and obtain indemnity for all losses if only the lands available in the indemnity limits are sufficient for the purpose."—Southern Pacific v. Fall. Decided January 3, 1922.

North Dakota Excise Tax Held

Invalid as to Interstate Railroads

The Director General of Railroads and five railroad companies sued to enjoin the collection of a special excise tax assessed against each of the companies for 1918 and 1919 under the North Dakota tax law of 1919, c. 222. The companies were all organized under the laws of other states, and all own lines running into or through North Dakota. The lines during those years were all under federal control.

The taxing officers at first assessed the tax for 1918 against the companies by taking the value of their property within the state at that proportion of the total value of their stocks and bonds that the main track mileage within the state bears to the main track mileage of the entire line of each company, as prescribed in the second proviso of the statute. The United States Supreme Court held, however, that the tax so assessed was an unwarranted interference with interstate commerce and a taking of property without due process of law. Wallace v. Hines (1920) 253 U. S. 66. Thereupon the taxing officers assessed the tax for that year, and also for 1919, by using the ratio specified in the last preceding clause of the statute applicable to corporations in general—that is, a ratio fixed by contrasting the value of each company's railroad within the state with the value of its entire railroad within and without the state.

The validity of the tax on this new basis was challenged on the ground, among others, that as to railroad companies whose lines lie partly within and partly without the state the statute does not authorize or sanction a tax assessed on that basis. This contention is sustained by the Supreme Court, because of the above-mentioned proviso or excepting clause in the statute coming immediately after the clause relating to other corporations, providing that in the case of a railroad with lines running into or across the state, "property within the state shall be held to mean that proportion of the entire property of such corporation engaged in such business which its mileage within the state bears to its entire mileage within and without the state." Although this provision was held in Wallace v. Hines to be in conflict with constitutional limitations and indefensible as respects these railroad companies, it must still be regarded as part of the act for all the purposes of construing the remainder of the act. Therefore the taxing officers, on finding that the tax could not constitutionally be assessed on the basis specially prescribed in the statute, were not at liberty to assess it on another basis which the statute shows was not to be applied to railroads such as these. The tax was accordingly held invalid and its collection enjoined. Davis v. Wallace. Decided January 9, 1922. Opinion by Mr. Justice Van Devanter.

Labor Board Decisions

Right to Dismiss Section Foreman for

Inefficiency Sustained

In a case against the Texas & Pacific, the Labor Board sustained the action of the railroad in dismissing R. Phillip, section foreman, because he had not maintained his section properly.—Decision No. 551.

Carpenters Refuse to Aid in Strike Duty

Three carpenters on the Pennsylvania Railroad refused to work on bunk cars required by railroad police during the outlaw switchmen's strike in April, 1920. In a case involving the pay of these carpenters for the time not employed during the strike, the Labor Board held that the men were not entitled to it.—Decision No. 517.

Wage Increase to Painters

In a complaint by the United Brotherhood of Maintenance of Way Employees and Railway Shop Laborers against the Delaware, Lackawanna & Western, the Board held that painters were entitled to an increase of 15 cents an hour as specified in decision No. 2 and as covered in paragraph B of decision No. 92, effective March 1, 1920.—Decision No. 518.

Terminal Mileage Denied Enginemen

Operating Milk Trains

In a controversy between the New York, Ontario & Western and the men in engine service on milk trains the Labor Board decided that the article of the schedule on which the employees based their claim for terminal mileage, refers to passenger service only. Under the provisions of the schedule the engineers and firemen employed on milk trains receive freight service rates.—Decision No. 482.

Employees Discharged for Furnishing Information for Railroad Labor Board Are Reinstated

Switchman and a fireman submitted information to their respective brotherhood executives that had been requested of the brotherhoods by the Labor Board. The Interstate Railroad requested these men to promise not to take up such questions with their brotherhoods in the future and on refusal the men were discharged. The Labor Board decided that the employees should be reinstated and paid for time lost.—Decision No. 528.

No Additional Compensation for

Clerical Employees for Saturday Afternoon

Twenty-nine employees of the Chicago, Milwaukee & St. Paul requested overtime for three hours' extra work on September 10, 1920, quoting Rule 57 of the agreements to substantiate their claim. The Board, in its decision, held that the last paragraph of Rule 57, upon which the claim was based, did not contemplate that clerical employees should be paid overtime for Saturday afternoons, but provided for a continuation of allowing employees to be off part of a day on certain days.—Decision No. 468.

Conductor Dismissed for Disobedience

of Operating Rule Denied Reinstatement

A train on the Bangor & Aroostook had passed a station without sufficient time to make the next station for a first-class train. The conductor discovered the error and stopped the train by applying the air from the rear. After the train was stopped a back-up signal was given to the engineer, and the train backed up to the south end of the passing track against traffic and without flag protection. The railroad discharged the

conductor for this infraction of the rules. The Labor Board ruled that while the permanent dismissal of the conductor was a severe penalty, the Board could not condone the violation of important operating rules or interfere with the management in the application thereof. The request for reinstatement was, therefore, denied by the Board.—*Decision No. 498.*

Seniority Rights for Less Than Six Months' Service

Three Italian track laborers on the Buffalo, Rochester & Pittsburgh were laid off in January, 1921, on account of reduction in force, and entered a complaint before the Labor Board because they were not allowed to displace other laborers junior to them in the service. They had been in the employ of the road less than six months. The Board decided that while it favors close observance of the seniority rule, it does not construe the provision of this agreement as making it compulsory for the carrier to regard seniority of employees until they have been in service six months. The complaint was, therefore, denied.—*Decision No. 523.*

Leaving Duty Without Permission

A. L. Callahan, yard foreman on the International & Great Northern at Fort Worth, Tex., was discharged for leaving his work and going to town at 3 p. m. on September 16, 1920, after having obtained permission from Roadmaster Grizzle for whom he was handling some work train service. The railroad contended that Callahan should have known that the permission of the roadmaster applied only so far as he was concerned personally and that Callahan had no right to leave without permission from the general yardmaster. The Labor Board refused to reinstate Yard Foreman Callahan or pay him for lost time.—*Decision No. 496.*

Enginemen's Request for Change

in Flaggin' Rules Denied

In a complaint against the Virginian Railway by the Brotherhood of Locomotive Engineers and the Brotherhood of Locomotive Firemen and Enginemen the employees requested that a special rule of that road to the effect that the enginemen of a following or incoming train is responsible for a collision at a station, coaling plant or water tank be rescinded. In its place the enginemen requested that the standing train be required to be protected by flagmen in accordance with standard rule 99. The carrier's contention that the promulgation of operating rules is solely a managerial question and that there is no reason for a change was sustained by the Board.—*Decision No. 488.*

Conductors' Claim for Switching Run Rate Sustained

For many years turn-around service has been operated between Elizabeth, Ga., and Tate (a distance 40 miles each way), and the mine- or switching-run rate of pay was applied thereto; but, effective May 30, 1920, this turn around service was discontinued and runs 17 and 18 were put on to operate in through-freight service between Elizabeth and Copperhill (95 miles). On June 27, 1920, they were made to run between Elizabeth and Blue Ridge (81 miles), and have been paid through-freight rates. It is the conductors' contention that these changed runs should still be paid the mine- or switching-run rates because of doing station switching.

It is the position of the carrier that switching of the kind cited should not be classified as mine- or switching-run work as covered by section d, Article IV of the existing agreement; that station switching by through-freight trains between terminals does not operate to change the classification of the service nor the rate applicable to through-freight service, as clearly indicated in the Director General's ruling cited above, and fully confirmed by subsequent decisions of the Railway Board of Adjustment No. 1.

The Labor Board decided that under the provisions of the schedule and the instructions issued when the straight-away runs were inaugurated, supplemented by the actual switching done at stations, the position of the employees is sustained.—*Decision No. 481.*

Foreign Railway News

Wage Reductions in Britain

Under the sliding scale of wages in Great Britain, whereby railway wages are increased or decreased in accordance with the cost of living index number, wage rates suffered a further decrease of from 2 to 6 shillings (\$1.50 to \$1.50) per week, effective January 1, according to the Railway Gazette (London).

Private Companies May Operate French Railways

LONDON.

The French parliamentary committee appointed to inquire into the condition of the government railway services in France have recommended by a majority that these lines be handed over to a private company to be worked. The state will still remain the owner.

British Company to Build Locomotives in Austria

According to an Associated Press dispatch appearing in the New York Times, the Vickers-Armstrong Company, a British concern, has made an offer to the Austrian government for the Woellersdorf Arsenal. The British company, it appears, wishes to turn the arsenal into a plant for the manufacture of locomotives.

Rates Increased in Argentina

LONDON.

It is reported that the outcome of a meeting between the Minister of Public Works, of Argentina, representatives of commerce and industry in the regions affected and directors of the Entre Rios and the Argentine North Eastern railways, the former railway is to be allowed to increase its rates by 17 to 23 per cent and the latter company by 25 per cent. Passengers, livestock and oranges are exempted from the higher tariffs.

Russians Seek to Hold Chinese Eastern

John J. Oblomievsky, a Russian railway engineer, arrived in Washington recently to work for the preservation of Russian control over the Chinese Eastern. Mr. Oblomievsky, as reported in the daily press, said in part:

We hope that the Washington conference will remember that the Chinese Eastern Railway was built with money taken from the Russian people and that the loss of this railway to Russia would mean the cutting off of Siberia from the Pacific. We hope the conference will act as moral trustees of Russia at this time of her temporary disability. We trust that the conference will confirm the Russian-Chinese Treaty of 1896, and will call upon the Chinese Government to revise the private agreement of the Russian management of the railway with the Chinese Government, concluded on October 12, 1920, inasmuch as in some parts this agreement contradicts the fundamental treaty of 1896.

The recognition of the Russian legitimate rights in accordance with the treaty of 1896 would make it possible to establish the Council of Consuls in Harbin as a body that would supervise the execution of the treaty by both contracting parties. In this capacity the Council of Consuls would succeed the Interallied Technical Board, now in Harbin, which was organized only as a temporary body for the purpose of supervising various technical matters connected with the presence of the allied troops in Siberia. In order that the Chinese Eastern Railway could continue to function normally, it is necessary that an authoritative body be established able to regulate questions of general policy connected with the railway, and to supervise the execution of the Russian-Chinese Treaty.

The Chinese Eastern Railway is a part of the Transsiberian. For twenty years it operated with great yearly deficits, bringing the total Russian expense to about 500,000,000 gold rubles. Russia met the expense, looking upon the Transsiberian Railway as a means of bringing life, culture and prosperity to the vast spaces of Siberia.

During the 25 years of its existence millions of Chinese have settled in the railway zone and where there was at one time a vast wilderness. The treaty of 1896 gives China the right to

redeem the road after 36 years of operation, on repayment to Russia of all that the railroad cost her. According to another provision, the railway will pass into China's possession after 80 years of operation without any compensation on China's part.

Reduction in English Freight Rates

LONDON.

The decision of the English and Welsh railway companies in regard to the lowering of railway rates has proved very disappointing to business interests. The decision to limit the reduction of rates to coal, coke, patent fuel, iron and steel, limestone for chemical works and limestone used for iron and steel making has caused numerous comments from the British industries.

The reduction will operate from January 1, 1922, and will amount to 25 per cent of the present increase of 100 per cent. It is agreed among all the large associations of shippers that this limited concession can have little, if any, effect on a general trade revival. They are not in a position, however, to question the railway companies' statement that even this small concession will mean a reduction in railway revenue of £10,000,000 (\$48,600,000 at normal rate of exchange) a year, but they do state that this figure may easily be reduced by increase of traffic.

The railway companies in putting forward this reduction state that they would have been unable to face this reduction were it not that they look for relief at an early date from a further fall in the prices of materials and the automatic reduction of wages arising from the fall in the cost of living bonus.

Reorganization of the L. & N. W. and the L. & Y.

The London & North Western and the Lancashire & Yorkshire, as was briefly noted in these columns last week, will be consolidated on the first day of next year under a new scheme of organization. The new organization, which has been announced, embodies some novel features.

In accordance with customary English practice, the head of the system will be the general manager, Arthur Watson. Mr. Watson is at the present time the general manager of both companies, so that feature of the plan calls for no changes.

In general, the most distinctive feature of the new arrangement is the divisional organization. For operating and traffic purposes the combined railways are divided into two divisions, the Northern and the Southern. The former is made up of the entire Lancashire & Yorkshire and that part of the London & North Western lying to the north of Crewe. The Southern division is that portion of the London & North Western lying south of Crewe.

On the other hand, for engineering, mechanical and stores department services the combined carriers are divided into divisions A and B. Division A is the London & North Western as it now stands and division B is the Lancashire & Yorkshire as it now stands. Thus, while many changes are necessary in the operating and traffic departments, the present organizations of the engineering and mechanical departments of both roads are maintained in large part with, of course, a new authority placed above both of them.

Furthermore, the chief goods manager will cease to be an operating officer and will devote his attention entirely to duties similar to those of the freight traffic manager of an American railway. Details concerning the passenger traffic will apparently, however, continue to be handled by the operating department.

At the head of the Northern and Southern divisions are divisional general superintendents. Reporting to them will be, as suggested by the Railway Gazette (London), those officers responsible for passenger traffic work, the operation of trains and yards, the collection and delivery of freight, the operation of freight and passenger stations and the marine department.

The electrical department is combined with the mechanical and the head of the department will be known as the chief mechanical and electrical engineer.

Other changes are less striking.

Arthur Watson, the general manager, will have seven assistants. H. G. Burgess will be principal assistant and H. Marriott will be assistant to the general manager, parliamentary. Other assistants to the general manager will have charge respectively of rates and fares, general matters, staff, "indoor" and statistical.

The divisional general superintendents will be Ashton Davies for the Southern division and L. W. Horne for the Northern. The chief goods manager will be S. H. Hunt. Under him will be divisional goods managers on the Northern and Southern divisions.

The chief engineer, E. F. C. Trench, will have under him divisional engineers of divisions A and B, who will oversee all engineering and signal work.

The chief mechanical engineer, G. Hughes, will have under him two divisional mechanical engineers, H. P. M. Beames and G. N. Shawcross. Directly under him also will be divisional electrical engineers and the divisional carriage and wagon superintendents.

Poland to Permit Railway Construction

by Private Concerns

The Polish government will permit the construction and operation of railway lines by private concerns, but under such unfavorable terms that it may be of interest to follow the situation to see to what extent the opportunity will be taken advantage of. Some of these provisions are:

The company must secure the permission of the government before it can make preliminary surveys and studies.

The Minister of Railways decides upon the granting of the concession, depending upon his opinion regarding the desirability of the proposed railway and the financial and other arrangements advanced by the company. The company must assure the Minister of its ability to finance the project.

At the end of 99 years the railway so constructed, with all its buildings, real properties, rolling stock, etc., automatically become the property of the government—without compensation to the company.

The government may buy the railway at any time before the concession expires by the payment of a sum arrived at as follows: Average annual net income for the best 6 of the preceding 8 years (but not less than 4 per cent on the outstanding stock) capitalized at 5 per cent (if the concession has 20 years or more to run—otherwise the average annual net income multiplied by the years the concession has to run).

The government is not limited in granting concessions to other companies for lines connecting with the one to be built.

The Minister of Railways must approve the detailed construction plans. He will supervise the work of construction. He may order the construction of new buildings.

The company, upon the demand of competent authority, must rebuild any bridges or highways affected by its activities and, apparently, must provide overhead or subway structures for all highways.

The Minister may lower rates as he sees fit or allow the government to participate in profits over a certain amount.

The government has the right-of-way for telegraph and telephone lines along the railway.

The company will be required to transport postal parcels and employees free of charge and, when cars are provided by the postal authorities, handle and repair these cars at the company's expense.

The company must enter into such relations as to joint use of facilities or equipment as the Minister may require.

THE NATIONAL SAFETY COUNCIL, 168 North Michigan avenue, Chicago, is to compile a census of safety managers, superintendents, and all safety workers, and requests everyone who ought to be included in that census to send in the necessary data. Each individual should say how long he has been in his present position and what technical or special training he has had for it.

The principal points asked for are: Name; Company; City; State; Nature of company's business; Is safety your principal work? Whether or not engaged in other activities: fire protection, health and sanitation, workmen's compensation and claims, manager or superintendent, engineering (other than safety), legal, insurance, welfare, educational.

Equipment and Supplies

Freight Cars

THE UNION PACIFIC is inquiring for 70 double truck caboose cars.

THE FRUIT GROWERS' EXPRESS, Washington, D. C., will be in the market soon for 100 refrigerator cars.

THE NORFOLK & WESTERN contemplates carrying out an extensive program for the repair of coal cars.

THE ELYRIA ENAMELED PRODUCTS COMPANY, 101 Park avenue, New York City, is inquiring for 10 milk cars.

THE NORTHERN REFRIGERATOR CAR COMPANY, Milwaukee, Wis., has ordered 500 refrigerator cars from the Haskell & Barker Car Company.

THE CENTRAL OF GEORGIA, reported in the *Railway Age* of December 17, as inquiring for 500 box cars, has ordered this equipment from the Mt. Vernon Car Manufacturing Company.

THE LONG ISLAND, reported in the *Railway Age* of November 12, 1921, as inquiring for 10 caboose cars, has ordered 10 steel underframe caboose cars from the American Car & Foundry Company.

THE PACIFIC FRUIT EXPRESS, reported in the *Railway Age* of January 7, as about to ask for prices on refrigerator cars, is inquiring, through the Southern Pacific, for 3,000 refrigerator cars, also for 300 additional for replacement purposes.

Passenger Cars

THE LONG ISLAND, reported in the *Railway Age* of December 17 as inquiring for 40 motor cars for electric service and 10 steel coaches for steam service, has ordered this equipment from the American Car & Foundry Company.

THE CHICAGO & NORTH WESTERN, reported in the *Railway Age* of November 26, as inquiring for 9 baggage cars, 5 combination baggage and mail, 20 coach and 10 smoking cars has given an order for 45 steel cars for passenger train service, to the American Car & Foundry Company.

THE CHICAGO, BURLINGTON & QUINCY, reported in the *Railway Age* of November 26, as inquiring for 124 cars for passenger train service, has placed orders for 62 passenger cars and 12 dining cars with the Pullman Company and for 53 baggage and mail cars, with the Standard Steel Car Company.

Iron and Steel

THE GRAND TRUNK, Western Lines, has ordered from the Illinois Steel Company 9,500 tons of 100 lb. rail.

THE CHICAGO UNION STATION COMPANY, through Graham Anderson Probst & White, architects, are inquiring for approximately 15,000 tons of structural steel.

THE NEW YORK, NEW HAVEN & HARTFORD will receive bids until 12 o'clock, noon, January 31, 1922, at New Haven, Conn., for its requirements of steel castings, to be ordered as required during the year ending December 31, 1922.

THE "CONSCIENCE FUND" of the Southern Pacific has received since 1907, contributions ranging in amount from 3 cents to \$75, and aggregating altogether \$1,164. A resident of Bakersfield, Cal., sent \$1.53 to cover an additional amount due to the railroad, as the result of a 13-year-old boy riding from Fresno to Bakersfield on a half fare ticket. An employee in Los Angeles refunded \$5.13, which was a result of overcharges in his expense account. From Portland, Ore., a man sent 80 cents to defray the loss of two barrel covers owned by the company which he had thrown into the Marys river.

Supply Trade News

The Bird-Archer Company has moved its offices from 90 West street to 33 Rector street, New York City.

J. C. Donaldson has been appointed sales engineer of the Hall Switch & Signal Company, Garwood, N. J.

Fairbanks Morse & Co., Chicago, are transferring the marine engine department of the company from Three Rivers, Mich., to Beloit, Wis.

The Railways Ice Company, Chicago, will erect a two-story ice manufacturing plant at Clearing, Ill., 150 ft. by 300 ft., at an estimated cost of \$200,000, including machinery.

The Interstate Car Company, Indianapolis, Ind., is planning the erection of a one-story foundry for the production of iron castings, estimated to cost approximately \$25,000.

E. O. Schneider has been appointed representative in eastern Pennsylvania of the McDougall-Butler Company, Inc., Buffalo, N. Y. Mr. Schneider will have his headquarters at Philadelphia, Pa.

The Streets Company, Chicago, which has heretofore confined itself largely to the construction and repair of wooden freight cars, has issued an inquiry for certain equipment for the manufacture and repair of steel cars.

W. F. Cremean, representative at New York, of the Wine Railway Appliance Company, Toledo, Ohio, has been appointed sales engineer, with headquarters at Toledo, and Peter P. Beck succeeds Mr. Cremean as eastern representative, with office in the Grand Central Terminal, New York City.

Atlee B. Saurman, has been appointed general sales manager of the Standard Underground Cable Company with headquarters at Pittsburgh, Pa. Mr. Saurman has been connected for over 20 years with the company's New York, Boston, San Francisco and Philadelphia sales offices, having served successively as manager of the last three offices.

B. B. Milner, formerly engineer motive power and rolling stock of the New York Central, who for the past year has been with the Frazar importing-exporting interests, is returning to the Orient where he will establish his own practice as consulting sales engineer. A photograph of Mr. Milner and a biographical sketch appeared in the *Railway Age* of September 17, 1920, page 504.

The personnel of the executive staff of the Bridgeport Brass Company, Bridgeport, Connecticut, is now as follows: F. J. Kingsbury, chairman of the board; Carl F. Dietz, president and general manager; W. R. Webster, vice-president; F. J. Kingsbury, treasurer; R. I. Neithercut, secretary; W. D. Blatz, general sales manager; W. R. Clark, general works manager; E. G. Oakley, works manager fabricating division, and Arthur Brewer, works manager mill products division.

The Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa., announces a number of changes and transfers in personnel in its railway sales department, the organization of which is now as follows: F. H. Shepard, director of heavy traction; M. B. Lambert, manager; E. D. Lynch, office manager; F. F. Rohrer, assistant to manager in charge of contracts; C. H. Long, section manager railway equipment contracts and orders; R. Seybold, manager price section; T. H. Stoffel, electric railway freight haulage export; W. R. Stinemetz, manager, and R. W. Carter, assistant manager of the heavy traction division; K. A. Simmon, manager, light traction division; J. L. Crouse, manager and J. W. Lewis, assistant manager, railway development and supply division; H. A. Campe has been appointed manager of the small motor appliance section of the industrial department, succeeding

V. M. Beeler, who has been transferred to the Springfield office. H. B. Smith has been appointed manager of the domestic service section of the department, succeeding Mr. Lampe and G. L. Washington has been appointed to manager of the Havana, Cuba, office of the Westinghouse Electric International Company.

Pullman Company Reorganization

At a special meeting of the stockholders of the Pullman Company at Chicago, on January 14, the company was reorganized, following its absorption of the Haskell & Barker Car Company. John S. Runnells retired as president of the company and was elected chairman of the board of directors succeeding Robert T. Lincoln, and Edward F. Carry, president of the Haskell & Barker Car Company was elected president to succeed Mr. Runnells. Charles A. Liddle, vice-president of the Haskell & Barker Car Company and David A. Crawford, treasurer, were elected vice-presidents of the Pullman Company.

John Sumner Runnells was born at Effingham, N. H., on July 30, 1844, and was educated at Amherst College, graduating with the degree of A.B. in the class of 1865. During 1868, he served as private secretary to Governor Merrill of Iowa. From 1869 to 1871, he was consul at Tunstall, Eng., returning to this country during the latter year and being

to the vice-president and then to general manager, which position he resigned on January 1, 1916, to become vice-president of the Haskell & Barker Car Company, the position he occupied at the time of his recent appointment.

The Warren Tool & Forge Company, Warren, Ohio, has purchased the American Block & Manufacturing Company and the General Malleable Company, both of the same city. The American company manufactures malleable unions with bronze inserted seats, for the production of which the plant has a capacity of about 250,000 per month. The General Malleable Company manufactures malleable castings, a large proportion of which are used by the railroads and the total capacity for the production of which is about 600 tons per month. These companies will henceforth be operated as a part of the Warren Company, the capitalization of which under the merger is \$1,800,000. The company will continue to operate under the present management.

The Portland Cement Association, Chicago, has organized a railway bureau to compile and present authoritative data on railway uses of concrete. D. A. Tomlinson, who has been appointed manager of this bureau, was graduated from the Massachusetts Institute of Technology in 1912, following which he entered the engineering department of the Chicago

C. A. Liddle

E. F. Carry

J. S. Runnells

admitted to the bar. He practiced law at Des Moines, Iowa, from 1871 to 1887, during which time he was a reporter for the Supreme Court of Iowa, and later United States district attorney. In 1887, Mr. Runnells was appointed counsel for the Pullman Company, and, in 1905, was promoted to vice-president retaining his duties as general counsel. He was elected president in 1911.

Edward F. Carry was born at Fort Wayne, Ind., on May 16, 1867, and was educated in the public schools of that city. He began his business career with the Wells & French Car Company at Chicago, and at the time of the consolidation of this company with the American Car & Foundry Company, was serving as secretary. He served the last named company successively a district manager, first vice-president, second vice-president, and first vice-president and general manager, a service extending over a period of 28 years. On January 1, 1916, Mr. Carry was elected president of the Haskell & Barker Car Company, which position he occupied at the time of his recent appointment.

Charles A. Liddle, who has been elected vice president of the Pullman Company, was educated in the public schools at Philadelphia, Pa., and entered business as an employee of the Allison Manufacturing Company at Philadelphia. Mr. Liddle later served the Jackson & Sharpe Company and the Harlan & Hoopingsworth Company at Wilmington, Del., and the Pressed Steel Car Company at Allegheny, Pa. In 1901, he entered the service of the American Car & Foundry Company as an engineer. Later he was promoted to assistant

& Western Indiana. Five years later, while occupying the position of assistant engineer of that road, with headquarters at Chicago, Mr. Tomlinson enlisted in the army, serving as a captain in the coast artillery and instructor in railway artillery and orientation at the heavy artillery camp at Fort Monroe, Va. For the past two years he has been connected with the structural bureau of the Portland Cement Association, with headquarters at Chicago.

John M. Weir, whose resignation as chief engineer of the Kansas City Southern, to become general superintendent of construction of the National Boiler Washing Company, Chicago, was noted in the *Railway Age* of January 14 (page 210), was born in Ireland on July 31, 1879. He entered railway service with the Illinois Central in June, 1899, as a track apprentice and after occupying various positions, was promoted to resident engineer in charge of construction in March, 1907. Later he was concerned for a time with the construction of a small railway in Canada. After completing this work he returned to this country and entered the service of the St. Louis-San Francisco as assistant engineer at Springfield, Mo. Subsequent to 1908, he was made assistant engineer in the chief engineer's office in charge of construction of the Gainesville & Northwestern in Georgia and not long thereafter he entered the valuation department of the Chicago, Rock Island & Pacific. He served this company as assistant engineer of track of the Chicago terminal and as assistant engineer in charge of terminal valuation. In June,

1916, he was appointed division engineer of the Kansas City Southern, with headquarters at Pittsburg, Kan., and was promoted to chief engineer in March, 1917.

Harry Barrett Marshall, who for 13 years served as manager of the St. Louis branch of The Electric Storage Battery Company, Philadelphia, Pa., has been placed in charge of

all railway sales work of the company. Mr. Marshall, who will be located at Philadelphia, has been associated with the company for the past 16 years. He graduated from the Armour School of Technology in 1905, and a few months afterwards, joined The Electric Storage Battery Company, serving in a clerical position at the Chicago branch. In 1909, he was appointed manager of the St. Louis branch, which position he held until his recent appointment in charge of all railway sales work. From the company, Mr. Marshall has devoted considerable time to the question of rail-

way sales.

Alfred E. Pratt, sales engineer of the National Carbon Company, Inc., Cleveland, Ohio, has been appointed assistant manager of the railroad department with headquarters at Cleveland. Mr. Pratt

was born at West Scarborough, Maine, December 11, 1887, and was educated at Mount Union College and Western Reserve University. After leaving college he spent two years in the maintenance of way department and signal construction on the western lines of the Erie Railroad. In October, 1909, he was appointed supervisor of signals of the Buffalo Creek Railroad at Buffalo, N. Y. In January, 1913, he became general signal foreman of construction with the

Erie Railroad while automatic signals were being installed on four divisions. In November, 1916, he was appointed signal supervisor of the Buffalo division of the Erie Railroad and in April, 1917, was transferred to the Kent division with headquarters at Marion, Ohio. On March 1, 1918, he resigned to accept the position as sales engineer in the railroad department of the National Carbon Company.

THE NEW YORK CENTRAL VETERANS' ASSOCIATION was formally launched at meetings held in New York City on Sunday, January 8, (about 2,000 persons being present), and on Wednesday, January 11. This local organization, as before announced, is intended to promote a better acquaintance between all classes of persons employed by this road in New York City and vicinity and northward as far as Albany; and is open to officers and employees of all ranks who have been in the service 15 years.

Railway Construction

ATCHISON, TOPEKA & SANTA FE.—This company will make repairs and alterations to its grain elevators at Argentine, Kan., at an estimated cost of approximately \$15,000.

CANADIAN PACIFIC.—This company, in conjunction with the Canadian National, is contemplating the construction of a union station at Peterborough, Ont.

CENTRAL OF GEORGIA.—This company which was noted in the *Railway Age* of December 3, page 1121, as receiving bids for the construction of a 500-ton concrete coaling station at Columbus, Ga., has awarded a contract for the work to the Ogle Construction Company, Chicago.

CHICAGO, BURLINGTON & QUINCY.—This company will receive bids until January 27 for the construction of an addition and alterations to its hotel and eating house at Cody, Wyo. The structure is to be two stories and of bishopric board construction.

CHICAGO UNION STATION.—This company plans to complete its passenger terminal at Chicago within two years.

FORT WORTH & DENVER CITY.—This company has awarded a contract to Joseph E. Nelson & Sons, Chicago, for the construction of a two-story brick hotel at Texline, Tex., estimated to cost \$75,000.

ILLINOIS TERMINAL.—The Interstate Commerce Commission has issued a certificate authorizing the construction of an extension from Le Clair to O'Fallon, Ill., 14 miles.

MISSOURI PACIFIC.—This company will construct a new passenger station, 24 ft. by 115 ft. of fireproof hollow tile and stucco construction with a slate roof, and reinforced concrete and hardwood floors, at Earle, Ark. A concrete foundation for this building has recently been completed by company forces, and it is expected that bids for the construction of the superstructure will be requested at an early date. The work is estimated to cost \$23,000.

NEW YORK CENTRAL.—This company has awarded a contract to the Walsh Construction Company, Syracuse, N. Y., for grade elimination at North Tonawanda, N. Y., to cost in the neighborhood of \$500,000. The work, which will eliminate two grade crossings involves a change of line and the contract includes track work, bridge work and grading.

NORFOLK & WESTERN.—This company has awarded a contract for a reinforced concrete coaling station, including mechanical equipment, to be constructed at Williamson, West Virginia, estimated to cost \$75,000, to the Roberts & Schaefer Company, Chicago.

NORTHERN PACIFIC.—This company, in conjunction with the Great Northern, is planning for extensive grade crossing elimination work in northeast Minneapolis, Minn. The preliminary plan which was prepared by the city and accepted by the companies provides for track elevation, including twelve bridges, which will accommodate from two to six tracks. The work is estimated to cost \$5,000,000 and, according to an ordinance recently passed by the city council, must be completed within five years.

WENATCHEE SOUTHERN.—This company which was noted in the *Railway Age* of December 24 (page 1286), as having been organized to construct a railroad from Wenatchee, Wash., to Kennewick, a distance of approximately 132 miles, has applied to the Interstate Commerce Commission for authority to construct this line.

WESTERN PACIFIC.—This company has been authorized by the State Railroad Commission of California to extend its San Jose branch across the Santa Cruz line of the Southern Pacific at College Park, Cal. This permission was granted after the above lines agreed to install an interlocking plant at that point which will be in operation on or about March 15.

Railway Financial News

BOSTON & MAINE.—*Modification of Decree Opposed.*—A resolution has been filed with the Massachusetts legislature upon petition of Edmund D. Codman, former president of the Fitchburg Railroad, in opposition to any modification of the decree relative to the Boston & Maine by the New York, New Haven & Hartford.

The attorney general now has under consideration a proposal to modify the dissolution decree of 1914 under which the New Haven was ordered to divest itself of Boston & Maine control by sale of all Boston & Maine stock directly or indirectly owned by it. Pending such sale the stock was placed in the hands of federal trustees.

The Codman interests assert that the proposed modification would be prejudicial to the public interest and a grave menace to the interests of all individual shareholders of the Boston & Maine "by reason of the fact that the possibility of independent operation of the Boston & Maine would be eliminated and its financial restoration would become subordinated to the interests of the New Haven railroad whose solvency is far from certain."

CHICAGO & WESTERN INDIANA.—*Asks Authority to Issue Bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue \$223,000 of consolidated mortgage 4 per cent bonds to be disposed of at par to lessee companies to retire and replace general mortgage bonds.

CHICAGO, BURLINGTON & QUINCY.—*Authorized to Issue Bonds.*—The Interstate Commerce Commission has authorized an issue of \$30,000,000 of first and refunding mortgage bonds under a proposed mortgage, to be sold at not less than 89½ per cent, for the purpose of reimbursing the treasury for expenditures for additions and betterments during the period from February 1, 1916, and January 31, 1921.

CHICAGO, MILWAUKEE & ST. PAUL.—*Loan Approved.*—The Interstate Commerce Commission on January 18 announced its approval of a loan to this company of \$25,000,000 for five years.

DAYTON, TOLEDO & CHICAGO.—*Claim for Guaranty Period Denied.*—The Interstate Commerce Commission has denied the claim of this company for a guaranty for the six-months guaranty period of 1920 on the ground that it is not subject to the guaranty provision provided in Section 209 of the Interstate Commerce Act.

DENVER & RIO GRANDE.—*Protective Committee.*—A protective committee has been formed for the 7 per cent cumulative adjustment mortgage bonds, due April 1, 1932, and for the holders of certificates of deposit of the New York Trust Company with respect to this issue. The committee consists of Richard Sutro, chairman of Sutro Bros. & Co., of New York; Thomas L. Robinson, vice-president of the American Exchange National Bank, and William Loeb, Jr., vice-president of the American Smelting and Refining Company. Samuel Untermyer is counsel and Harry Hoffman, of 120 Broadway, is secretary.

There are \$10,000,000 of the bonds outstanding, all of which are secured by a mortgage to the New York Trust Company as trustee. The company defaulted interest on the issue on October 1, 1921. The bondholders are asked by the committee to deposit their holdings not later than February 28.

GREAT NORTHERN.—*Authorized to Abandon Line.*—The Interstate Commerce Commission has issued a certificate authorizing the abandonment of a branch line from Northport to Rossland, Wash., 16.96 miles.

LEHIGH VALLEY.—*New Directors.*—Charles D. Norton and Edward S. Moore, both of New York, have been elected directors to succeed George F. Baker and William H. Moore. Mr. Baker, complying with a recent ruling of the Interstate Commerce Commission, chose to remain on the New York Central Board rather than that of the Lehigh Valley. William H. Moore resigned.

MIDLAND VALLEY.—*Authorized to Issue Bonds.*—The Interstate Commerce Commission has authorized an issue of \$363,000

of first mortgage 5 per cent gold bonds to be sold at not less than 75 or to be pledged as collateral security for short term notes.

MISSOURI PACIFIC.—*Director Resigns.*—Cornelius Vanderbilt has resigned as a director in compliance with the order of the Interstate Commerce Commission, noted in last week's issue of the *Railway Age*, page 196, which stated that Mr. Vanderbilt might remain on the Board of either the Missouri Pacific or the Illinois Central, but not on both.

NEW YORK, CHICAGO & ST. LOUIS.—*Authorized to Issue Bonds.*—The Interstate Commerce Commission has authorized an issue of \$1,008,000 series A and \$3,027,000 series B second and improvement mortgage 6 per cent gold bonds to be pledged as collateral security for a note to the director general of railroads and for short term notes.

NEW YORK, NEW HAVEN & HARTFORD.—*Proposed Modification of Dissolution Decree.*—See Boston & Maine.

SAN DIEGO & ARIZONA.—*Authorized to Assume Obligation.*—The Interstate Commerce Commission has authorized this company to assume obligation and liability in respect of \$600,000 of equipment trust certificates guaranteed by the Southern Pacific.

SOUTHERN RAILWAY.—*Bond Offering.*—A syndicate headed by J. P. Morgan & Co., and including the First National Bank, the National City Company, Harris, Forbes & Co., the Guaranty Company and the Bankers Trust Company, is offering \$30,000,000 6½ per cent development and general mortgage bonds maturing April 1, 1936 at 94½ and interest, to yield over 6.90 per cent. The development and general mortgage dated April 18, 1906, provides for a rate of 4 per cent. It is proposed to enter into a supplemental indenture providing for the obligation to pay the additional interest to increase the rate to 6½ per cent. The proceeds are to be used in liquidation of existing obligations and in reimbursement of capital expenditures. This issue was authorized by the Interstate Commerce Commission on January 14.

TERMINAL RAILROAD OF ST. LOUIS.—*Authorized to Issue Bonds.*—The Interstate Commerce Commission has authorized an issue of \$65,000 of general mortgage 4 per cent bonds in payment for certain real estate.

Additional Sales of Equipment Trust Certificates

The director general of railroads announced on January 12 that he had, with the consent of the President, confirmed additional sales, at par plus accrued interest, of railroad equipment trust certificates now held by the government, as follows:

To Salomon Brothers & Hutzler and Kidder Peabody & Co., of New York:	
Atlantic Coast Line, 1925-1928, inclusive.....	\$1,701,200
To Cassatt & Co., of Philadelphia:	
Monongahela Railway Company, 1928-1935, inclusive.....	263,200
To Kuhn, Loeb & Co., of New York:	
Pennsylvania Railroad Company, 1923.....	3,894,000
To Freeman & Co., of New York:	
Colorado & Southern Railway Company, 1923-1935, inclusive..	910,000
Total amount of these sales is.....	\$6,768,400

The sales were arranged by Eugene Meyer, Jr., managing director of the War Finance Corporation. The total amount of equipment trust certificates sold by the government to date, at par plus accrued interest, is \$147,391,400. The figures given in the last announcement, plus the sales given above, aggregate \$142,401,100, the difference being due to the advance payment of January 15, 1922, maturities by certain roads since the date of the last announcement.

Additional sales were announced on January 17 as follows:

To Poe & Davies, Baltimore, Indiana Harbor Belt, 1928 to 1935, inclusive.....	\$314,400
To Continental & Commercial Trust and Savings Bank, Chicago, Pennsylvania, 1927.....	3,894,000

This increases the total amount of equipment trust certificates sold to \$164,226,100.

Dividends Declared

Central of New Jersey—\$2, quarterly, payable February 1 to holders of record January 27.
 Huntington & Broad Top Mountain R. R. & Coal Co.—Preferred, \$0.50, payable February 15 to holders of record February 1.
 Mine Hill & Schuylkill Haven—\$1.25 payable February 1 to holders of record January 14.

Railway Officers

Executive

Will Hartwell Lyford, whose election as vice-president and general counsel of the Chicago & Eastern Illinois, with headquarters at Chicago, was announced in the *Railway Age* of

W. H. Lyford

January 7 (page 162), was born at Waterville, Me., on September 15, 1858. After being graduated from Colby College in 1879, he entered railroad service on July 15 of that year as an assistant engineer on the Chicago & Eastern Illinois. He worked in this capacity until 1881, at which time he was made stenographer to the general superintendent, holding that position until 1882, when he was promoted to chief clerk to the general manager at Chicago. From 1883 to 1884 he was claim agent with the same head-

quarters. After being admitted to the bar in 1884, he was promoted to assistant general solicitor, which position he held until 1888, when he was appointed attorney in charge of the law department. He was promoted to general counsel on March 15, 1892, and to vice-president and general counsel for the receivers in December, 1920, which position he was holding at the time of his recent election.

John W. Platten, whose election as chairman of the board of directors of the Chicago & Eastern Illinois, was announced in the *Railway Age* of January 7 (page 162), was born at

J. W. Platten

Port Perry, Ontario, and was educated in the public and high schools of that city. He began his business career in a bank at Toronto and came to the United States in 1888 to a position in the office of the assistant general passenger agent of the New York, Pennsylvania & Ohio (the Erie) at Cleveland, O. In 1889, he went to New York and entered the office of the second vice-president and general manager of the Erie. During the period of fifteen years which Mr. Platten served with the Erie in New York, he was successively chief clerk in the insurance department, chief clerk in the operating department, assistant purchasing agent and, finally, treasurer. In 1903, he left the Erie to become assistant to the president of the Lehigh Valley, having charge of the financial, accounting and purchasing departments. In 1904, he was promoted to second vice-president of that company but left that position in 1905 to become vice-president of the United States Mortgage & Trust Company. In 1910 he succeeded to the presidency of this company which position he still holds. Mr.

Platten is also the chairman of the board of directors of the Gulf, Mobile & Northern and the Meridian & Memphis and is an officer and director of a number of companies. He has acted as chairman of various reorganization committees of several transportation companies.

Financial, Legal and Accounting

Robert S. Henry, whose appointment as associate counsel and director of public relations of the Nashville, Chattanooga & St. Louis, with head-

R. S. Henry

quarters at Nashville, Tenn., was announced in the *Railway Age* of December 10 (page 1178), was born at Clifton, Tenn., on October 20, 1889. He was graduated from the law school of Vanderbilt University in 1911. Mr. Henry entered railroad service on December 1, 1921, when his recent appointment became effective.

J. E. Taylor has been appointed general attorney of the Kansas, Oklahoma & Gulf, with headquarters at Muskogee, Okla. He will have supervision over the legal and claim departments.

William King has been appointed freight claim agent of the New York, New Haven & Hartford with headquarters at Boston, Mass., succeeding **J. A. Beahan** who has been promoted to assistant general freight agent.

Operating

Henry Flanagan has been appointed trainmaster of the St. Paul division of the Northern Pacific, with headquarters at Minneapolis, Minn., succeeding **F. L. Birdsall**, transferred.

G. E. Dornblaser, assistant division superintendent of the St. Louis-San Francisco with headquarters at Sapulpa, Oklahoma, has been promoted to superintendent of terminals with headquarters at West Tulsa, Okla.

Traffic

R. P. DeCamp has been appointed assistant coal traffic manager of the Illinois Central, with headquarters at Chicago.

Alan McMichael has been appointed coal freight agent of the New York Central, Lines East, with headquarters at New York.

H. L. Carey has been appointed general freight agent and auditor of the Sabine & Neches Valley, with headquarters at Deweyville, Tex.

J. Noble Snider has been appointed coal traffic manager of the New York Central Lines East, with headquarters at New York, succeeding **G. N. Snider**, resigned.

R. C. Hicks has been appointed traffic manager of the Georgia & Florida with headquarters at Augusta, Ga., succeeding **J. A. Streyer**, resigned to engage in other business.

R. E. Buchanan, division freight agent of the St. Louis-San Francisco, with headquarters at Memphis, Tennessee, has been promoted to general agent, with the same headquarters as heretofore.

Arthur J. Chouinard, traffic manager of the Wabash, Ches-ter & Western, has resigned from the service of that company effective January 15, to take charge of the sales

organization work at Rockford, Illinois, for the Petroleum Motors Corporation.

Arthur B. Smith, general passenger agent of the New York, New Haven & Hartford, with headquarters at New Haven, Conn., has been appointed passenger traffic manager of the Northern Pacific, with headquarters at St. Paul, Minn., succeeding **A. M. Cleland**, who has retired after 31 years of service with that road.

C. W. Andrews, traveling freight agent of the Chicago, Burlington & Quincy, with headquarters at Chicago, has been promoted to general agent, with headquarters at Indianapolis, Ind. **E. E. Morris**, chief rate clerk in the freight traffic department at Chicago, has been promoted to commercial agent, with headquarters at Paducah, Ky.

W. F. Knobeloch, whose appointment as assistant general freight agent of the St. Louis Southwestern, with headquarters at St. Louis, Mo., was announced in the *Railway Age* of December 10 (page 1178), was born at St. Louis, Mo., on March 31, 1888. He entered railroad service on May 15, 1905, as an office boy in the freight traffic department of the St. Louis Southwestern, since which time he has progressed through various promotions in that department to his present position.

C. J. Nelson, commercial agent of the Chicago, Burlington & Quincy, with headquarters at Paducah, Ky., has been promoted to general agent, with headquarters at Herrin, Ill. Mr. Nelson was born on a farm in Madison County, Iowa, on September 1, 1887. He entered railroad service in May, 1905, as a telegraph operator on the Chicago Great Western, which position he held until the following year when he left to become manager for the Western Union Telegraph Company at Fairfield, Iowa. He had worked at this position but a short time when he entered the service of the Chicago, Burlington & Quincy, as an operator, later becoming both operator and station agent at various points on the main line in Iowa, in which capacity he worked until May, 1912, when he was promoted to traveling freight agent, Iowa lines, with headquarters at Burlington, Iowa. During the war he was granted a leave of absence in order that he might serve with the Inland Traffic Service Bureau of the War Department. After having been two years engaged in this work he returned to the Burlington as commercial agent, with headquarters at Paducah, Ky., which position he was holding at the time of his recent promotion. His new duties give him jurisdiction over all matters pertaining to traffic in his territory with particular reference to coal traffic.

Mechanical

C. H. Norton has been appointed master mechanic of the Susquehanna and Tioga divisions of the Erie.

Wm. N. Nelson, mechanical engineer of the Minneapolis, St. Paul & Sault Ste. Marie, with headquarters at Minneapolis, Minn., has been appointed mechanical engineer of the Kansas City Southern, with headquarters at Pittsburg, Kan., succeeding **E. P. O'Connor**, assigned to other duties.

C. T. Ripley, general mechanical inspector of the Atchison, Topeka & Santa Fe, with headquarters at Chicago, has been promoted to the newly created office of chief mechanical engi-

neer, with the same headquarters. **H. H. Lanning**, assistant mechanical engineer, with headquarters at Topeka, Kan., has been promoted to mechanical engineer with the same headquarters.

Engineering, Maintenance of Way and Signaling

N. F. Brown, assistant to the chief engineer of the Pennsylvania, has resigned to become vice-president of the Dravo Contracting Company, Pittsburg, Pa.

George T. Anderson, roadmaster of the Kansas City Southern, with headquarters at Spiro, Okla., has been promoted to the newly created position of general roadmaster, with headquarters at Texarkana, Tex., his jurisdiction extending over the engineering and roadway departments. The position of division engineer at Texarkana, Tex., has been abolished. Mr. Anderson has also been appointed general roadmaster of the Texarkana & Fort Smith, a subsidiary line, and the position of chief engineer of that road has been abolished.

Arthur Nelson Reece, whose appointment as chief engineer of the Kansas City Southern, the Poteau Valley and the Arkansas Western, and consulting engineer of the Texarkana & Fort Smith, with headquarters at Kansas City, Mo., was announced in the *Railway Age* of January 14 (page 210), entered railroad service in June, 1903, after having studied civil engineering at the University of Kansas for three years. He was successively chairman, rodman, draftsman and instrumentman on the Atchison, Topeka & Santa Fe from June, 1903, to April, 1905. From the latter date until March, 1911, he was instrumentman, inspector on building construction, assistant engineer and chief clerk to the general superintendent of the St. Louis-San Francisco. He entered the service of the Kansas City Southern in March, 1911, as assistant engineer. He left in November, 1912, to become chief engineer of the Hanna & Hickey Construction Co., Fort Worth, Tex., re-entering the service of the Kansas City Southern in November, 1913, as office engineer, with headquarters at Kansas City. He was later promoted to division engineer with headquarters at Texarkana, Tex., which position he was holding at the time of his recent promotion.

C. B. Brown, Jr., who has been appointed engineering assistant to the vice-president of the Canadian National, was born on August 27, 1879, at Ithaca, N. Y. He was educated at Cornell University, from which institution he was graduated in 1901 with a degree in civil engineering. He began his railroad career at once as a draughtsman and rodman for the Canadian Pacific at Trail, B. C. The following year he became assistant engineer in the bridge department. He was next, until 1904, resident engineer on the Ontario division. In 1906 he was promoted to division engineer at St. John, N. B. In 1908 he was transferred in a similar capacity to Montreal. Four years later he became principal assistant engineer, Eastern lines, with headquarters at Montreal and the following year was appointed chief engineer of the Canadian Government Railways with headquarters at Moncton, N. B. In 1917 he was appointed assistant general manager, Eastern lines, in addition to his duties as chief engineer, relinquishing the latter title in 1918. The Canadian Government Railways had now become the Eastern lines of the larger Canadian National system and Mr. Brown remained as chief engineer of these Eastern lines until his appointment as engineering assistant to the vice-president of the entire Canadian National system.

Obituary

James H. Glynn, general agent of the Southern Pacific, with headquarters at Boston, Mass., died at his home in Dorchester, Mass., on December 31.

George T. Boggs, who was vice-president, assistant secretary and assistant treasurer of the Chicago, Rock Island & Pacific in 1911, when he retired, died in New York on January 16 as the result of an operation.

At a recent meeting of the Institution of Locomotive Engineers (England), H. N. Gresley of the Great Northern

Alloy Steels for Locomotives

Railway of England, pointed out the advantages of the chrome nickel steel used for the side rods and valve gear parts of locomotives which he recently designed. The advantages of this material apply particularly to locomotive main rods. These rods are subject to buckling either in a vertical or lateral direction, but by using the alloy steel the weight of the rod can be reduced without impairing its strength. The rod is also subjected to stress due to its own inertia when the engine is running at high speed. The inertia sets up alternately reversed stresses in the top and bottom flanges of the rod and if the steel can be made stronger it has a further advantage, as the lightening of the rod reduces these stresses. The use of alloy steel is advantageous under conditions existing in Great Britain. It is almost compulsory on American locomotives if satisfactory results as regards counterbalancing and track stresses are to be secured. Railroads that want to get the best in modern motive power should not fail to consider alloy steels when preparing locomotive specifications.

Glenn E. Plumb, in a recent open letter to President Markham of the Illinois Central, has afforded another fine example of the misrepresentation of the railways which prevails in the labor union propaganda against private management. He charges that the railways are violating the law by giving rebates to favored shippers. He alleges as evidence in support of his charge that payments for loss and damage of freight increased from \$22,000,000 in 1910 to \$122,000,000 in 1920. No more preposterous misrepresentation or one worse adapted to serve as evidence in support of his charge could have been made. In 1913 the loss and damage claims paid amounted to \$22,738,893. In 1917, the last year before the government operation, they had increased to \$34,079,757. In 1919, the second year of government operation, they were \$104,507,174. Plumb frankly says that his entire attack is upon private ownership and management, but these figures show an increase of over 200 per cent in two years in loss and damage claims paid under government management. Of course, he ignores this increase under government management entirely. He has only interpretation of the facts which would show that more than three times as much rebates were paid in the form of loss and damage claims under government operation than two years before under private operation. Instead, therefore, of citing the figures for 1919 he cites those of 1920, and exaggerates them. The total freight loss and damage payments in 1920 were \$120,939,903. But these figures do not indicate an increase of rebating under either government or private operation. There was during these years an increase in the total freight handled. There was a very large increase in the prices of commodities. If there had been no increase whatever in the amount of freight lost and damaged there would necessarily have been an increase in payments for loss and damage due merely to

the increase in the value of the freight lost and damaged. Plumb's efforts to prove an increase in rebating by the increase in payments for loss and damage of freight helps to show what the *Railway Age* repeatedly has charged, namely, that there is almost no form of misrepresentation or falsification to which the advocates of the Plumb plan will not resort in their efforts to discredit private management of railways.

As a result of the conferences between officers of the four train service brotherhoods and railway executives in Washington, held under the sponsorship of Secretary Hoover, the Association of Railway Executives has announced that conference committees will be formed in the Eastern, Southern and Western territories to meet with representatives of the brotherhoods "in a fair effort to compose and adjust all points at issue." These conferences which the Association of Railway Executives has gone on record as favoring should not be confused with the regional boards of adjustment, upon which the association took no action as a whole. These regional boards were set up by only those carriers which approved of them. The regional boards are restricted to the consideration of individual grievances. The territorial conferences will not take up such matters, but will deal with general disputes such as wages and working conditions. In the case of the conferences, however, as with the regional boards, no road need become a party unless it so desires. Both of these movements, that for the regional boards and that for the territorial conferences, are in the nature of experiments, but both have the laudable purpose of settling points of difference without taking them before the Labor Board. There is a distinction between the nature and purposes of the two, however, which should not be overlooked.

During the past few years many important developments and practical applications have been made in the field of wireless telegraphy and telephony. Therefore, it is of interest to note that the Nashville, Chattanooga & St. Louis has recently installed wireless stations at Tullahoma, Tenn., and Guntersville, Ala., and is now awaiting a government license before inaugurating regular day and night message service. These two stations were selected for the first installation on the N. C. & St. L. on account of the difficulty of building land line communications because of the waterways, it being estimated that a pole line between the two points would cost \$25,000 as compared with \$2,000 for radio equipment. It is now proposed to follow this installation by others between the general office in Nashville, Tenn., and the various division headquarters. Almost all railroads have been inconvenienced because of important inter-office circuits being out of service when pole lines were torn down by wind, sleet or floods. The increased mileage of a circuit adds to the chances for trouble, whereas the limits of wireless apparatus depend primarily on the power of the sending equipment.

Territorial Conference Committees

Wireless Railroad Communication

There are, therefore, numerous conditions on the railroads under which wireless communication might well produce economies and supply more reliable service. For this reason it would seem advisable that the railroads should keep informed as to the progress in wireless communication on the N. C. & S. L.

With its eighteenth annual meeting completed, as recorded elsewhere in this issue, the American Wood-Preservers' Association is well along in the second decade of its career. The paper by A. F. Robinson recording the results secured by the Atchison, Topeka & Santa Fe System, after more than 20 years' experience in the construction of creosoted trestles with ballasted decks, also serves to show how well established is the treatment of timber. There is ample evidence that money thus expended has paid satisfactory returns in decreased annual cost of the structures protected. However, as in the case of cross ties, there is an utter lack of uniformity in the application of these methods by the railroads throughout the country. Preservative processes as applied particularly to bridges, have had their greatest application in the south where climatic conditions are unusually favorable for decay and where timber may begin to rot before it can be hauled out of the woods. In such an environment the introduction of timber treatment is particularly favorable—the beneficial results are especially tangible. The fact that conditions in the northern states are not so conducive to decay serves to explain, but does not necessarily justify, the failure of many of the northern roads to avail themselves of the advantages that would accrue from applying creosote or other preservative processes to their wooden structures. Yet, it is a fact that a great many of the roads have made little or no use of these treatments. On some roads a consistent policy toward progressive elimination of all timber bridges makes the subject of less importance. On others, an extreme restriction of funds precludes the use of anything but the very cheapest of structures. But in spite of the variation in conditions, there would appear to be an unwarranted disparity of practice and until this has been overcome the railroads cannot be said to have derived the full benefit to be gained from the work of such technical organizations as the American Wood-Preservers' Association.

Progress in Timber Treatment

experience in the construction of creosoted trestles with ballasted decks, also serves to show how well established is the treatment of timber. There is ample evidence that money thus expended has paid satisfactory returns in decreased annual cost of the structures protected. However, as in the case of cross ties, there is an utter lack of uniformity in the application of these methods by the railroads throughout the country. Preservative processes as applied particularly to bridges, have had their greatest application in the south where climatic conditions are unusually favorable for decay and where timber may begin to rot before it can be hauled out of the woods. In such an environment the introduction of timber treatment is particularly favorable—the beneficial results are especially tangible. The fact that conditions in the northern states are not so conducive to decay serves to explain, but does not necessarily justify, the failure of many of the northern roads to avail themselves of the advantages that would accrue from applying creosote or other preservative processes to their wooden structures. Yet, it is a fact that a great many of the roads have made little or no use of these treatments. On some roads a consistent policy toward progressive elimination of all timber bridges makes the subject of less importance. On others, an extreme restriction of funds precludes the use of anything but the very cheapest of structures. But in spite of the variation in conditions, there would appear to be an unwarranted disparity of practice and until this has been overcome the railroads cannot be said to have derived the full benefit to be gained from the work of such technical organizations as the American Wood-Preservers' Association.

Railways and Train Service Employees

IN ACCORDANCE with a resolution adopted by the Association of Railway Executives on October 14 the various railroads have been holding conferences with all their employees preliminary to hearings before the Railroad Labor Board on the question of a further general reduction of wages. Secretary Hoover has started a movement which makes it possible that the question of reduction of the wages of employees engaged in the operation of trains will be settled without hearings by the Labor Board.

Secretary Hoover, acting evidently with the backing of the Harding administration, brought about informal conferences between the heads of the four principal train service brotherhoods and a number of railway executives. The result on the railways' side was a meeting of the Association of Railway Executives in Chicago on January 21 at which an important resolution was adopted. This provides that conference committees representing the railways in the eastern, southeastern and western territories, respectively, shall be constituted and authorized to meet with the four train and engine service brotherhoods "in a fair effort to compose and adjust all points now at issue, no restrictions to be imposed upon the

consideration of any and all questions of wages and rules governing working conditions." The resolution expressly states that any individual railroads that prefer to do so shall carry on negotiations with their own employees rather than participate in the territorial negotiations. If agreements are not reached the differences left unsettled must, of course, be brought before the Labor Board.

One may or may not believe that these direct negotiations between groups of railways in the various territories and the train service brotherhoods are likely to result in satisfactory settlements. It is merely summarizing recent history to say it has been a very long time since direct negotiations between the train service brotherhoods and the railways resulted in anything except disagreements which were followed by threats of strikes and finally by arbitration of one kind or another, or by legislation such as the Adamson Act. On the other hand, it is clearly desirable that amicable settlements of questions affecting wages and working conditions shall be attained by direct negotiations if possible. Furthermore, their attainment in this way, if possible, is in strict accordance with the spirit and the specific provisions of the Transportation Act. No proceeding involving wages or working conditions can legally be brought before the Labor Board until the matters in controversy have been made the subject of direct negotiations and have resulted in a disagreement.

From the standpoint of both the railways and the train service employees an amicable settlement of all their differences regarding wages and working conditions would be most desirable. The train service employees, as the *Railway Age* repeatedly has pointed out, are almost the only employees who are peculiarly railroad men, and the only ones a strike by whom would immediately result in an interruption of transportation. Therefore, these employees are peculiarly charged with a duty to the public, and at the same time it is of peculiar importance to the public to prevent strikes by them. It should be easier at present for the railways to effect an amicable settlement with them than with almost any other class of employee. As the *Railway Age* said in an editorial in its issue of October 29, 1921, in discussing how railway wages should be readjusted, "full consideration should be given to the fact that the advances in wages which have been received by the employees in train service have been relatively less than the advances which have been given to many other classes of employees." The very fact that this has been true necessarily dictates that the railways should ask relatively smaller reductions in the wages of these employees than in those of most other classes. Since the railways are bound to ask them to give up relatively less than other employees it should be easier to get the train service employees voluntarily to give up whatever they reasonably should.

There is an almost universal demand for reductions of freight rates. The railways have promised to try to secure further reductions of wages and to give the public the full benefit of them in reductions of rates. The railways and the leaders of the train service brotherhoods, in entering the negotiations, must both of them recognize this public sentiment regarding rates and bear in mind the promise the railways have made to the public relative to reductions of wages and reductions of rates. While the train service employees cannot reasonably be asked to accept as large reductions of their compensation as most other classes of employees, the negotiations would be rendered futile, if the labor leaders should enter them with a determination to make no concessions which would cost the employees anything, or effect any real reduction in railway expenses. There are involved not only the questions of wages but those of punitive rules and of time and one-half for overtime in freight service. The present wages of at least two classes of train service employees, firemen and brakemen, are too high compared with those of engineers and conductors and compared with

the present cost of living. Time and one-half for overtime in freight service is economically unsound. No settlement which the railways themselves can defend before the bar of public opinion can be reached unless both sides enter the negotiations with a disposition to be fair and to consider the public interest as well as their own.

Can Railways Earn a Fair Return?

WE PUBLISH elsewhere in this issue an article by the distinguished railway economist, Sir William Acworth, discussing the question "Can the Railways Earn a Fair Return"? The conclusion he apparently reaches is somewhat startling. Surveying conditions throughout the world, he seemingly decides that under these conditions railways cannot in most countries charge, or will not be permitted by the public to charge, rates sufficient to make them self-sustaining. Whether under government or private operation, they are in practically all countries failing to earn a net return sufficient to pay interest on the investment in them. He seemingly believes this will continue to be the case and that the deficits, if paid at all, must be paid from public taxation.

Everybody who is informed regarding world railway conditions knows that, as stated by Sir William Acworth, almost without exception railways owned and operated by governments are incurring huge deficits. These deficits are, and of course must be, paid from taxes. Most privately owned and operated railways also have been incurring recently the equivalent of deficits, since they have been failing to earn sufficient net returns to pay even the interest rates that prevailed before the war upon their total investment. The total fixed charges of the Class I railways of the United States, including interest and rentals of leased property, are now about \$640,000,000 a year. Their net dividends in 1920 were \$271,500,000. This added to the fixed charges makes a total of \$911,500,000. Their net operating income in 1921 is estimated at \$616,000,000, or almost \$300,000,000 less than their present fixed charges and their dividends of last year. The loss incurred under private ownership and operation falls, where there are no government guarantees, as is now the case in the United States, upon private investors.

The important question is whether the losses from railway operation being incurred under both government and private management are to be perpetuated or are temporary; and if they are to be perpetuated whether they are unavoidable or due to governmental policy. Sir William Acworth makes some statements from which the conclusion might be drawn that he thinks they are unavoidable in many countries, and will continue to be incurred because traffic cannot bear rates high enough to pay all railway expenses and an adequate return upon railway investment. He clearly recognizes the fact, however, that in the long run if railway service is to be continued, whether under government or private ownership, all the expenses and an adequate return upon the investment must be paid. Hence his apparent conclusion that in future in most or all countries the cost of railway service must be partly paid from taxes.

The growth of railways throughout the world during the last century has been due to the fact that they have been able to carry goods and passengers by land cheaper in proportion to the quality of the service rendered than any other agency. Has this ceased to be true? There is no evidence to support the view that it has. Motor vehicles operating over highways provided by public taxation recently have become active competitors of the railways for longer and longer hauls. If, however, the total cost of motor transportation, including interest on the investment in and the expense of

maintaining the highways, were made the basis for the rates charged for motor transportation it never could compete with railway transportation except for very short distances. Insofar as motor transportation has succeeded in competing with railway transportation in this country for considerable distances, it has been due to the policy of the governments of virtually subsidizing it by allowing commercial vehicles to use highways built by the public without making any adequate charge for their use of the highways.

Whatever may be true in England where the railways have to meet water as well as motor competition on almost every hand, it is demonstrable that, in the United States, it is wholly unnecessary, except temporarily, to operate the railways at a loss and then pay the deficit in taxes. The traffic handled by our Class I railways in the year ended September 30, 1921, was almost the same as in the year ended June 30, 1916. In these five years the total earnings increased about 75 per cent. This indicates how large were the total advances in rates meantime. The much lower rates charged in 1916 yielded the railway companies a net return of \$985,000,000, or 5.9 per cent. The traffic had no difficulty whatever in standing rates at that time which yielded that much net return. The increase in traffic that year was the largest ever known. In the year ended September 30, 1921, the net return earned was only \$542,400,000, or 2.75 per cent on the property investment, and yet in that year there was an enormous decline of traffic and loud outcries that the rates were higher than the traffic could bear. The net return in 1916 was one-third of the total earnings. If it had been as large in 1921 as it was in 1916 it would have been only one-sixth of the total earnings, and being what it actually was it was only one-tenth of them.

It is clearly evident that if in 1921 the rates had been as much higher than they were, as would have been necessary to have given the companies a net return twice as large as they received the difference in the rates would have had practically no effect upon the amount of traffic moved. The main things that made necessary the advances in rates were an increase between 1916 and 1921 of \$2,200,000,000, or 127 per cent, in operating expenses, and an increase from \$146,000,000 to \$286,000,000, or 94 per cent, in railway taxes. The real question seems to be not whether the traffic can stand rates that will yield a fair return, but whether it can stand rates high enough to pay such enormous increases in expenses and taxes. In this connection, it will be noted that the taxes paid by the railways of the United States from their earnings in 1921 were almost exactly equal to the amount by which they failed to earn their fixed charges and dividends equal to those of 1920. If they must be subsidized, why not do it by the simple process of exempting them from taxation instead of first collecting taxes from them, and then paying part or all of their deficits from the taxes collected?

There is no serious difficulty in the United States in the way of fixing railway rates which the traffic can easily bear and which at the same time will yield an adequate net return to the companies, except a system of government regulation which is predicated mainly upon an entirely false economic principle. As a result of enormous exaggeration of the extent to which the amount of the rates charged is determined by the efforts of the companies to make profits our whole system of regulation is predicated mainly upon the principle that the way to secure reasonable rates is narrowly to limit the net returns earned. The inevitable tendency of the extreme application of this theory is to increase rather than to reduce the rates the railways must be allowed to charge. All the large economies in operation have been obtained through investments of capital in improvements of plant having the sole and specific purpose of reducing expenses. The policy of regulation followed for fifteen years has steadily reduced the amount of new capital invested in

economy-producing improvements and has therefore directly tended to maintain and increase operating expenses, thus putting upon those who pay transportation rates a much heavier burden that would have been put upon them if reasonable net returns had been allowed to be earned.

Perhaps Sir William Acworth, for whose opinions we have great respect, would answer that it makes no real difference, if the net return is adequate, whether it is derived from freight rates or taxes. But no responsible American railroad management would ever, so long as the railways are privately owned and operated, rely upon government appropriations to make up railway deficits. Very recent experience with government guarantees is all the experience of that kind that the railways of this country ever want. Government ownership and operation would be far preferable in this country to a policy of regulation and management under which the rates were deliberately and for a long period so fixed that they would not yield the companies a reasonable net return. Under the former policy the government would have to pay the deficits and there might be adequate development of railways. Under private management nothing could be surer than that unless the companies are allowed to get adequate net returns out of their rates and earnings they will never get them at all, and that there will not be adequate development of the railways.

How Freight Shipments Increased and Decreased

COMPLETE STATISTICS regarding freight car loadings in 1921 are very interesting because they show just what increases and decreases occurred in the shipments of the various classes of commodities during the year. Many people will be surprised by a reference to "increases" in shipments. Most people think that shipments of all kinds declined. This, however, is not true. The total freight business of the railways declined more than in any other year in history, but this decline in total business was accompanied by some remarkable increases in the movement of certain classes of commodities.

Relatively the greatest decline of shipments was in ore shipments, which decreased from 2,413,893 carloads in 1920 to 904,513 in 1921, or 63 per cent. This largely accounts for the extent to which the earnings of some roads handling a large amount of this business, such as the Great Northern and the Chicago & North Western, have suffered.

The decline of coal business had the greatest absolute effect upon the total traffic moved. The coal business fell from 10,082,450 carloads in 1920 to 7,934,048 carloads in 1921, or over 21 per cent. The decline in the coal business accounts for more than one-third of the total reduction in carloadings.

The number of carloads of forest products shipped declined from 3,056,923 in 1920 to 2,483,079 in 1921, or 18.7 per cent. Shipments of miscellaneous commodities declined from 16,503,179 carloads to 12,957,857, or 21½ per cent. The decline in shipments of livestock was small—¾ per cent.

There were two remarkable increases in shipments. The first was in grain and grain products, the shipments of which in 1921 amounted to 2,281,852 carloads as compared with 1,843,018 in 1920, an increase of 24 per cent. In absolute amount the increase in less than carload merchandise shipments was the largest. In 1920 they amounted to 9,017,074 carloads, while in 1921 they amounted to 10,677,226, an increase of 18.4 per cent. This very large increase in less than carload shipments unquestionably was due to the fact that many concerns which in 1920, when business was good, shipped in carload quantities, found it convenient in 1921, when business was poor, to ship in less than carload lots.

The foregoing statistics not only show clearly the classes of commodities in which the largest decreases of shipments took place, but also plainly suggest a conclusion as to why they took place. The increases occurred in the shipments of grain and grain products, all of which are food-stuffs, and in merchandise, which consists very largely of commodities daily used and consumed in ordinary living. On the other hand, the greatest declines in shipments which occurred were in the cases of basic commodities—coal, lumber, ore, etc.—and undoubtedly were due to the general stoppage of the enlargement of the physical plant of industry and the general depression in the manufacture of things largely used in the development of this physical plant. There are persons who attribute the decline in freight movement largely to the advances in rates. They will find it difficult to get any support for this view in the figures showing the actual increases and decreases in the amount of the various commodities shipped.

New Books

Railway Signaling. By E. E. King, professor of railway civil engineering, University of Illinois, Urbana, Ill. 371 pages. 349 illustrations and 13 plates. 6 in. by 9 in. Bound in cloth. Published by the McGraw-Hill Book Co., New York.

This is a work which will be widely welcomed. It gathers into one book a great variety of facts concerning signaling, and especially signal apparatus, which hitherto have been accessible only in scattered places—the Signal Dictionary, the files of the *Railway Signal Engineer* and the catalogs of the signal manufacturers. The author has done his work with careful fidelity. It is a systematic treatise; but to many readers a large part of the material will be rather unattractive because it is too much like a text-book—facts packed together in such solid fashion that considerable study or reflection will be required to get at the whole meaning. A comprehensive book on signaling has been waited for by many persons—railroad men and others—who have not the time or ambition to do much studying.

This book is, frankly, made up largely from material supplied by the signal manufacturers; and the records of the Signal Section of the American Railway Association have also been drawn upon. Some of this material is quoted without any clear explanation of whether the Association is responsible, or it is only an expression of a committee.

The book consists of 16 chapters and three appendices. It opens with a brief outline of the development of signaling. It is primarily devoted to the description and uses of the different classes of apparatus employed in block and interlocking signaling, but does not enter into engineering features to any extent. For example, under the head of track circuit, no mention is made of the effect of rail and ballast resistance on efficient track operation. No mention is made of the development of the welded rail bond in steam railroad practice. In some cases too much space has been devoted to apparatus which, while still in use, is fast becoming obsolete.

A chapter might well have been devoted to later developments, such as remote control of outlying switches. Automatic train control receives only a single paragraph.

As already intimated, this book "fills a long felt want"; but this want is felt largely by a class of readers who, when they get hold of the book, will swallow it whole. This is the reason for mentioning these criticisms. To the practical signal man, these and other faults will not appear very large. He will in most cases note them and soon lose sight of them, because of their relative unimportance as compared with the great mass of useful information to be found in the book.

The language is simple and non-technical and the hundreds of illustrations appear to have been selected, from the thousands available, with excellent judgment.

Can the Railroads Earn a Fair Return?

If Rates Will Not Yield a Reasonable Revenue, the Balance
Should Be Made Up by Taxation

By Sir William M. Acworth

LONDON, England.

THE GREAT WAR has changed everything, not only objective conditions but mental attitudes. For one thing, it has brought into prominence a fundamental difference, which even students of transport questions have not hitherto appreciated, between ordinary commercial undertakings and public utility companies. There can be few trading or manufacturing companies which have not at some period, either during or since the war, made exceptionally large profits. Even the shipping trades, which from many points of view are analogous to railroads, had several years of unprecedented prosperity.

On the other hand, railroads and street railways, and—in England at least, for I cannot speak from personal knowledge of other countries—gas and electric supply companies have a record of continuous adversity. The bulk of the railroads on the Continent of Europe are at the present moment not earning their operating charges. Even in England and in the United States, where things are somewhat better, their condition is precarious. Experience has shown that public utilities cannot adjust their charges to their expenses in times of emergency. Further, it has become not unreasonable to question whether the pre-war situation, when it was taken for granted that railroad corporations as a whole could and would earn at least a living wage, has not passed away forever.

Present Scale of Rates Excessive

Your Congress at Washington and our Parliament at Westminster have passed laws very much to the same effect. Congress has enacted that the Interstate Commerce Commission shall fix such rates as will with efficient and economical management produce a net return of $5\frac{1}{2}$ per cent or 6 per cent on the value of railroad property devoted to public service. Here in England, where there has never been any question of "water," and where before the war gross and net revenues hardly varied from year to year, the law says that railway rates shall be so fixed as to produce the pre-war net income, which is to be regarded as the new standard net revenue. But the rates that have been fixed so far have completely failed in both countries to provide the required result; and it is already evident that, if the existing rates have failed to produce it, it will not be produced by raising these rates still higher. And this for two reasons. Not only will public pressure prevent rates being still further raised, but railway men themselves in both countries admit that the present scale is excessive, that it is in some cases at least throttling trade; and that increased net revenue is more likely to be obtained by judicious reductions than by further increases.

At this point the difference between the situation in the two countries should be noted. Speaking broadly, our railway system is complete. With the exception of urban and suburban passenger lines, of which there will be more to say presently, we are not likely to build new railways, nor to need to purchase additional equipment. The result of the great amalgamations now to take place is indeed likely to be that we shall find too many miles of track and too many locomotives and cars, rather than too few. Electrification is the only direction in which, with us, much capital expenditure seems likely to be required. Such comparatively small sums as may be needed can in case of necessity be found by issuing

prior charge stocks; for with us the debenture debt is at present less than 30 per cent of the total capital.

The United States is in a very different position. Much new capital expenditure is imperative at this moment, and will be required annually for many years to come. It is obvious that from their own resources the railroads cannot raise it, unless they have a prospect of a reasonable commercial return, which no one is likely to put at a lower figure than $5\frac{1}{2}$ per cent.

But apart from this difference, which is not fundamental, the situation in the two countries is substantially the same. The public have at least learned one lesson from the war, that railroads are essential, that they must be adequate for the service that they are called on to render, and that, if they are inadequate, the public suffers. We seem then to have reached this conclusion, that railway revenues are inadequate; that somehow they must be made adequate; but that this cannot be done by further increasing railway charges. And this brings us up against a reconsideration of first principles.

Should Railways Pay Their Own Way?

In England and in America we have hitherto taken it for granted that railroad corporations, like any other enterprise, must pay their own way; and very broadly, taking the rough with the smooth, they have done so, for there have been no subsidies to railway enterprise in Great Britain, and your land grants and state and municipal subscriptions to bonds are a flea-bite to the mass of private money invested in the United States railways. In the nature of things there was no reason why this should be so. Taking the world over, railways have not been expected to be self-supporting, at least in their development period. In almost every country in the world—Canada is a sufficiently conspicuous instance—public money has been spent to provide railroads, or public guarantees have been given on capital privately provided. And why not?

The provision of roads is universally accepted as a natural function of government. Normally the road, built wholly at public expense, is thrown open to free use by the community at large. For the use of particular roads tolls are sometimes charged, while in other cases license duties are levied on vehicles which use the road. But in no case do tolls and license duties cover anything like the total cost. Here in England, for instance, we have new and greatly increased taxation of motor vehicles. The taxes bring in £10,000,000 per annum. The cost of road maintenance is over £50,000,000. Does a road cease to be a road when it becomes a railroad; when its capacity for public service is increased ten-fold by laying steel rails on the top of it? And if not, why should the universal principle that the roads are provided for public use at public cost fail to apply?

I have been discussing the matter so far as one of principle. The working out of the principle in practice is another matter. For my own part, I see no great difficulty. We start from the point that Congress and Parliament have fixed the return which it is reasonable that the private investor should receive in both countries. There are expert tribunals whose business it is to fix such scales of rates as it is reasonable that the customer should pay. And no better definition of reasonableness can be found than the much-

abused phrase, "what the traffic can bear," remembering that this means, not the last ounce which can be squeezed out of the customer, but such a rate as will not check the growth of trade, the development of new industries, and the opening up of new districts. If rates and fares, reasonable when tried by this standard, will not yield such a revenue as will provide a reasonable return, not only on existing capital but new capital as it requires to be employed, then the balance, whatever it is, falls to be made up from general taxation.

Suggests a Subsidy

I fully expect that a suggestion of this kind will meet with serious opposition from railway men themselves. They will argue that, if public subsidy is given, greater public control will be enforced in return. I do not think the argument is sound. The theory both of the English and the American legislation is that the rate-fixing tribunal shall be satisfied that, as a condition of being permitted to earn the standard net revenue, the railway management shall be efficient and economical. And the inspection necessary to satisfy the tribunal that the management is in fact efficient and economical is precisely the same whether the desired revenue is postulated to be 5½ per cent, or 4 per cent, or 3 per cent, or any other figure.

Before passing from this point, however, a query may perhaps be interposed as to how the criterion of efficiency and economy is to be applied in practice. The standard revenue is in the United States to be fixed either for the whole country or for a great territorial group as the commission may decide. So far they have decided to fix it by groups. What is to happen, if in any given group the commission is satisfied that the management of ten companies is efficient and economical, while the eleventh falls short? Is there to be a *pro rata* reduction of the permitted revenue of the whole group? This would seem a hardship upon the ten just managements which need no repentance.

The alternative, to forbid the ill-managed company to charge the same rates as its neighbor, is clearly impossible. For the limitation of the charges of the ill-managed company is in effect the limitation of the practical maxima of the well-managed ones so far as they are in competition. Even at points where they are not in competition, it seems to be impossible for any company to have different scales and rates in different parts of its territory, for this would be to penalize that portion where the ill-managed company does not compete.

In Great Britain, where the railways are to be grouped in four districts, mainly non-competitive, the theoretical difficulty is not so great. It will be possible in theory to have a higher scale of rates, at least for local and retail traffic, in one district of the country than in another. But in the long run this will be impossible for bulk traffic, for which railway rates are a serious item in production cost. Serious difficulties in pressure of railway rates must tell on the competitive industrial strength of the various districts, and may even in certain cases enforce the transference of great industries from one district to another, and so defeat the very object sought to be attained by the imposition of higher rates.

Metropolitan Rapid Transit

I have spoken hitherto of railways as a whole and have suggested what seems to me to be a tendency of the future, rather than proposed a measure which can be considered to be within the range of practical politics at the present moment. But when we consider, not main line railways, but the rapid transit undertakings of the great cities, the question is one of practical urgency. The population of Greater London and Greater New York continues to increase. Not only is it necessary to provide new accommodation for the increasing population, but it is an accepted rule that the greater the population the greater number of rides per head. Now it is

clear that on the present scale of fares no one can afford to build a new rapid transit line as a commercial proposition. It is equally clear, at least in London, that existing fares cannot be raised further: passengers disappear and the expected increase of revenue does not materialize.

On the other hand, it is essential in the interest of public health that the population shall be dispersed and the crowding at the centre lessened. And this can only be effected by rapid transit railways. If then rapid transit lines must be built, that portion of the cost which is not met by the fares paid will have to be provided from public taxation.

There is another point which perhaps applies more to London than to New York. Underground or overhead railways undoubtedly relieve street congestion. If the underground or overhead railways are not made, or if, owing to prohibitive rates they are not fully used, street congestion increases till street widenings become imperative. And these are most required precisely where land is most valuable, and therefore the cost highest. Now the entire cost of street widening is borne as a matter of course by local taxation. A given sum spent on a new railway, which can move many hundreds of passengers at a time, in trains succeeding each other at 90 seconds' interval, will do far more to relieve congested traffic than any conceivable street widening. In other words, a new underground street is not only more efficient, but more economical than a surface street; and further, whereas the community bears the entire cost of the provision of the surface street, to the cost of the sub-street it is only asked to contribute.

From every point of view, then, it seems reasonable to accept the general principle that urban rapid transit must be provided at the joint cost of the community and the actual users and for their joint benefit. And further, it would seem that, under the new conditions that have arisen, the old idea must be abandoned, according to which not only in New York but also in Paris the municipality has sought to obtain from the passenger fares—sometimes successfully, sometimes not—the full interest on the bonds which it has issued to meet construction cost.

Assuming the acceptance of the theory that it is right that new railroads should be provided in part out of the proceeds of taxation, there is clearly a distinction to be drawn between main lines and urban railroads. Main line subsidies must apparently be made out of national taxation. Not so in the case of cities. A city has a distinct common life and fixed boundaries, and the land within these boundaries is a definite area. Assuming that the urban railways are fairly distributed over the area, the whole of the land within the area is enhanced in value: Wall Street, because a larger population is brought to it from the outskirts, just as much as the Bronx, because the land there is made accessible for the residence of those who have business in Wall Street. It would seem to be not only equitable but reasonably practicable to impose a special land tax to meet some portion at least of the cost of construction of new urban railways.

A BILL TO COMPEL railroads to use steel passenger cars under certain conditions was introduced in the Senate on January 18 by Senator Harris of Georgia.

TRADES UNIONISM and the refusal of employees to do an honest day's work for an honest day's pay, constitute the most perplexing problem before the managers of the railways of Canada, according to Hon. F. B. Carvell, chairman of the Canadian Railway Commission, as recently quoted in the *Quebec Chronicle*. Examining the records of the inspection of an electric warning at a crossing of the Grand Trunk at Lachine he found that as high as 25 hours a month was spent in the inspection of this bell and its wiring. "The railways are in the hands of these labor unions," said Mr. Carvell. The railway, he thought, was spending more for the operation of the bell than it was worth.

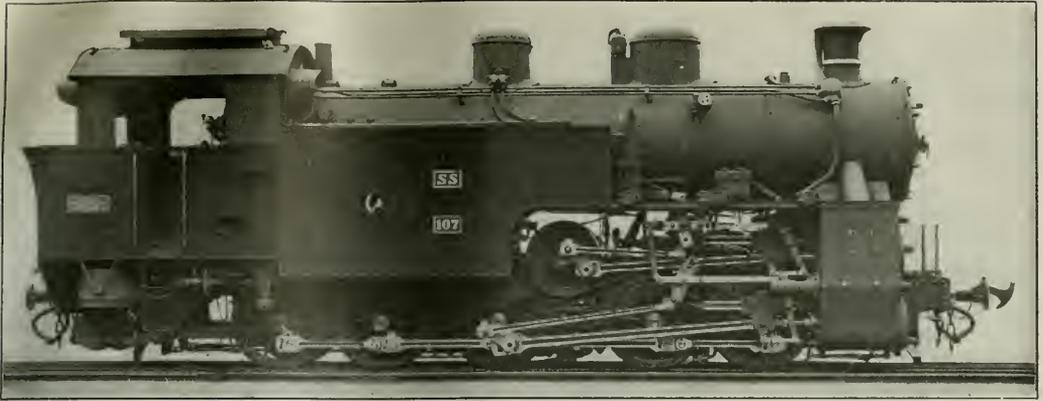

Fig. 1.—Adhesion and Rack Locomotive of 0-10-2 Type

Adhesion and Rack Locomotive for Sumatra

Interesting Design of 0-10-0 Type Superheater Four-Cylinder Compound Locomotive for Dutch State Railways

By S. Abt

THE DUTCH STATE Railways on the west coast of Sumatra operate about 152 miles of line of 3 ft. 6 in. gage with about 70 locomotives. From Padang, the terminal of this line, to Fort de Kock and to the coal fields of Ombilia there are some very heavy grades. Portions of this line are provided with a rack bar of the Rigenbach type. The

Fig. 2.—Train of 360 Tons on a Heavy Grade with Two 0-8-2 Type Locomotives

grades on the adhesion track vary from 0.6 per cent to a maximum of 2.3 per cent, and on the rack portion of the line from 5.1 per cent to 6.8 per cent, the total length of the rack line being 22.5 miles. The radius of the sharpest curves on this part of the line is about 500 ft.

Six types of locomotives have been built up to the present time for service on the mixed track. The first four designs were of the four-wheel coupled type and had simple cylinders. The sizes of these locomotives and the year in which they were delivered are shown in table No. 1:

TABLE NO. 1

Year received	1889	1892	1893	1894
Type	0-4-2	0-4-0	0-4-0	2-4-0
Cylinder diameter, in.	13½	17	17	17
Cylinder stroke, in.	19½	19½	19½	19½
Weight in working order, lb.	57,900	46,200	47,650	64,500
Heating surfaces, sq. ft.	777	350	650	817
Grate area, sq. ft.	15.2	9.6	14.3	13.8
Boiler pressure, lb.	162	162	176	176

The bulk of these locomotives were constructed by the Esslingen Machine Works.

The new design of locomotive shown in Fig. 1, is of the 0-10-0 type and was built by the Swiss Locomotive and Machine Works, Winterthur. This type of locomotive was proposed as far back as 1906, when it was found that the four-wheel coupled locomotives were too small, but the first locomotives of a larger type were only built in 1912, when three 0-8-2 type locomotives were constructed. This design is similar to that built for the Brunig Railway by the same company. Fig. 2 illustrates the manner in which the trains are operated on this line. It shows a train of 360 tons handled by two locomotives of the 0-8-2 type, one in the middle of the train and the second at the rear.

The latest engines which are described herewith were pro-

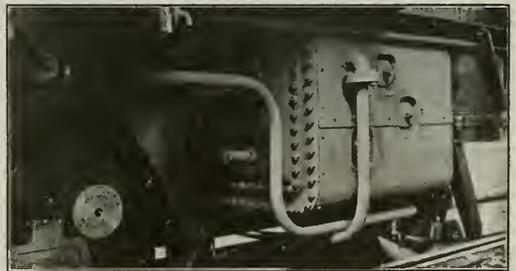

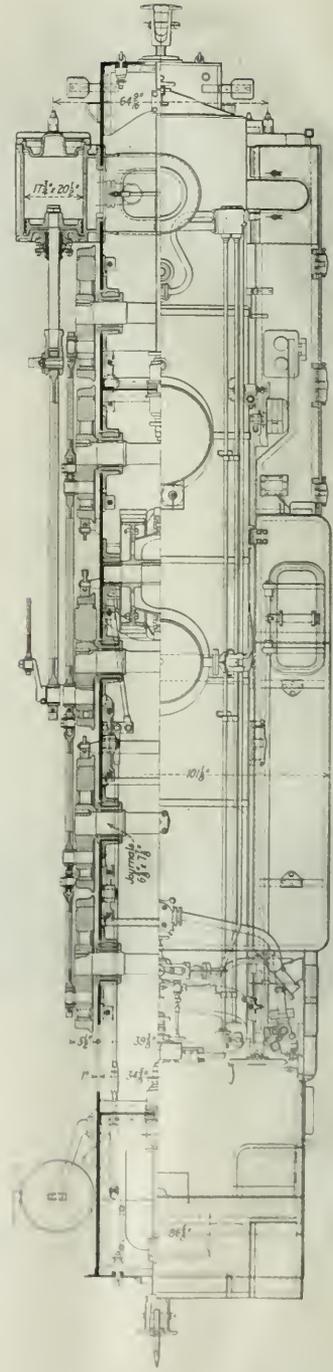

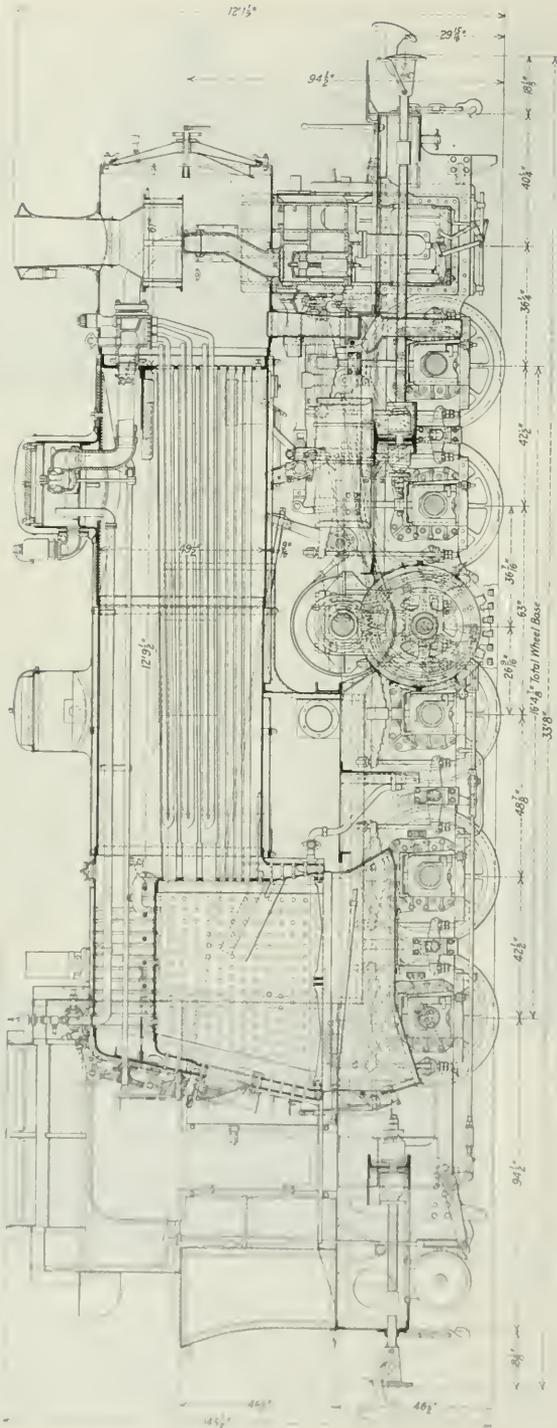

Fig. 3.—The Feedwater Heater Is Located Under the Cab

posed in 1916 and have but recently been completed. Nine of them were built by the Swiss Locomotive and Machine Works, Winterthur, and six by the Esslingen Works, the latter working to the plans furnished by the Winterthur company. Three of these locomotives are equipped with the Caille-Potonic system of feedwater heating and two are

Elevation and Plan of Adhesion and Rack Locomotive for Sumatra

equipped with the Titan dumping grate as used on the Hungarian State Railways. These engines will exert a maximum tractive effort of 14,000 kilograms (30,865 lb.); that is, they will handle a train of 200 metric tons on a 5.8 per cent grade.

The principal features of the new 0-10-0 type locomotive are shown in the drawings. The boiler is the same as that used on the 0-8-2 locomotive with the exception that it is provided with a Schmidt superheater. The barrel of the boiler consists of two courses, has an inside diameter of 1,230 mm. (48.5 in.) and contains 64 tubes, 3,900 mm. (12 ft. 9½ in.) long and 18 flues of the same length for the superheater elements. The tube and flue evaporating surface is 64.5 sq. m. (694 sq. ft.) and the superheater elements have

tions. When it is desired to place the low-pressure cylinders, which operate the rack-wheel, into operation the engineer, by means of a steam operated valve, changes the flow of the exhaust steam from the high-pressure cylinders into the steam chest of the rack or low-pressure cylinders. From these cylinders it passes to the exhaust. In this way the

Superheating surface.....	331 sq. ft.
Grate area.....	19.9 sq. ft.

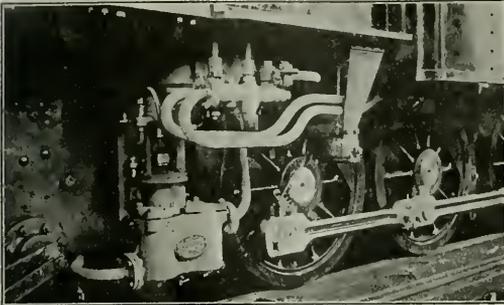

Fig. 4—Double-Acting Caille-Potonie Feedwater Pump

a heating surface of 30.8 sq. m (331 sq. ft.). The firebox, which is made of copper, has a heating surface of 7.06 sq. m. (76 sq. ft.). The working pressure of the boiler is 14 atmospheres (205 lb. per sq. in.). The firebox has a grate area of 1.85 sq. m. (19.9 sq. ft.). The smoke box is provided with a hopper, operated by a lever on the right hand side of the engine, and is cleaned by a jet of hot water, as is also the ash pan. The two 3-in. safety valves, located on the back of the dome are of the Coale type. The boiler is insulated by white asbestos mattresses and sheet lagging.

The driving wheels are 1,000 mm. (39¾ in.) in diameter. The leading and trailing drivers have a side play of 22 mm. (about 7⁄8 in.). The locomotive frame is suspended by laminated springs with equalizers between the fourth and fifth pair of drivers. The total wheel base is 5,000 mm. (16 ft. 4¾ in.).

The rack-wheel is driven from a separate set of cylinders, located above the main cylinders, through a jack-shaft located across the top of the locomotive frame. On this jack-shaft is mounted a spur gear which meshes with a gear on the cog-wheel axle. The pitch diameter of the driving rack-wheel is 975 mm. (38¾ in.). The gearing between the crank axle and the main cog-wheel axle has a ratio of 1 to 2.033. The gear teeth are of the helical type with a pitch angle of 23 deg.

As will be seen from the illustration, the locomotive is of the four cylinder compound Winterturth type with all four cylinders located outside the frames, two on each side. They are provided with piston valves operated by Walschaert valve gear and controlled by one screw reversing gear. The lower cylinders are the high-pressure cylinders and drive the five coupled adhesion axles. They are cast separately in order to facilitate removal and repairs. The upper or low-pressure cylinders drive the main cog-wheel as mentioned above. These are not placed in operation while the locomotive is running on the adhesion track.

The exhaust steam after leaving the high pressure cylinders passes direct to the exhaust pipe under ordinary condi-

tions. When it is desired to place the low-pressure cylinders, which operate the rack-wheel, into operation the engineer, by means of a steam operated valve, changes the flow of the exhaust steam from the high-pressure cylinders into the steam chest of the rack or low-pressure cylinders. From these cylinders it passes to the exhaust. In this way the

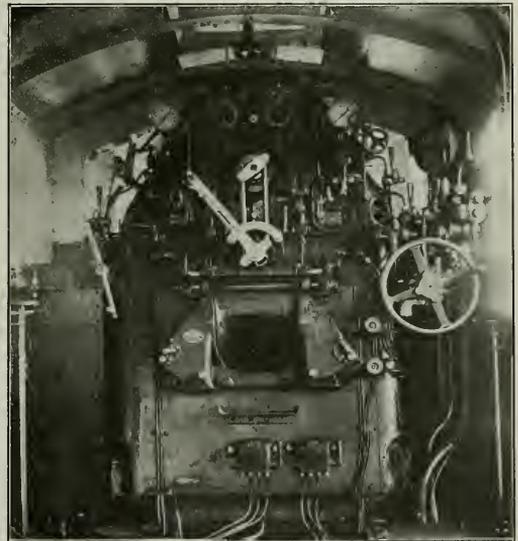

Fig. 5—Cab Arrangement of the Sumatra Adhesion-Rack Locomotive

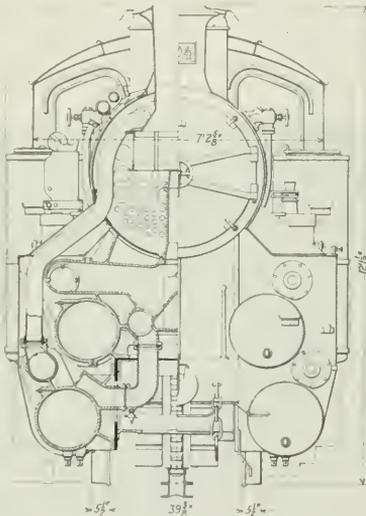

locomotive works as a twin engine. The four cylinders are of the same diameter and have the same stroke.

The locomotive is equipped with three kinds of brakes; an air counterpressure or repression brake is used in going down hill and acts on all four cylinders, or independently on either pair of them. For working this brake a valve is fitted under the smoke box which closes the passage from the cylinders to the exhaust and opens a passage to the atmosphere. By reversing the valve gear the cylinders draw in the air which is compressed, the discharge being made through a small pipe leading to a small perforated chamber at the top of the stack. In order to counteract the heat produced by compression, water is sprayed in the exhaust

passages of the cylinders, the resulting mixture being driven through the superheater into the header passing out through the discharge pipe mentioned above. By regulating the valve which controls the discharge of the compressed air the locomotive engineer is able to regulate the speed of the train. This is the ordinary way of braking a descending train under normal conditions.

Brake shoes are provided on the second, third and fourth pairs of driving wheels and are operated either by two vacuum cylinders or by hand from the fireman's side of the cab. In addition to this there is a powerful band brake acting on the crank pin disc of the rack engine. This consists of steel bands lined with brass blocks that fit into a series of grooves cut into the circumference of the discs and are worked by a screw.

The Caille-Potonie feedwater heater and feedwater pump form an important addition to three of these engines as already mentioned. The feedwater heater is shown in Fig. 3, and the double acting feedwater pump shown in Fig. 4. The heater consists of 264 tubes of between $\frac{5}{8}$ in. and $\frac{3}{4}$ in.

Front Elevation and Cross Section

in diameter. These tubes pass through the water chamber and have a heating surface of 10.8 sq. m. (116 sq. ft.). The steam required for this heater is taken from the exhaust of the cylinders and admitted to the heater through a regulating valve.

Fig. 5 shows the cab arrangement of the 0-10-0 locomotive. The firebox is fitted with the F. Marcotty smoke consuming device. There are two water gage glasses of the Klinger type, two injectors of the Friedmann pattern No. 7 and an Hausshalter speed recorder. The cab is well arranged and has a ventilated double roof.

Two Bosch mechanical feed lubricators, having six feeds form part of the equipment. Gresham and Craven's steam sanding devices are applied to the leading and main driving wheels, sand being delivered from a sand box on top of the boiler.

The coal bunker in the rear of the cab has a capacity of 1,200 kg. (2,425 lb.) and the combined capacity of the water tank is 5,000 litres (1,320 gal.). Tool boxes are provided in the two corners in front of the coal bunkers and their covers serve as seats.

The total weight of the locomotive in working order is 51.98 metric tons (114,600 lb.) distributed approximately as follows: Leading axle, 10.96 tons (24,200 lb.); second axle, 11 tons (24,250 lb.); main axle, 9.98 tons (22,000 lb.); fourth axle, 10.11 tons (22,300 lb.), and the rear axle, 9.93 tons (21,900 lb.).

The principal dimensions of these locomotives are given in Table No. 2. A comparison between Table No. 2 and Table No. 1 indicates the change which has taken place in operating conditions.

Railway Session of the A. S. C. E.

THE ANNUAL MEETING of the American Society of Civil Engineers, held in New York on January 18-20, devoted one afternoon to a discussion of railway transportation matters. The speakers at this session were Howard Elliot, chairman of the Northern Pacific; William N. Doak, vice-president of the Brotherhood of Railroad Trainmen, and Col. F. A. Mollitor, chairman of the Board of Economics and Engineering, National Association of Owners of Railroad Securities, New York.

Mr. Elliot presented an extensive paper which, while covering some of the important engineering developments of the Northern Pacific, dealt chiefly with the situation of the railroads at the present time in contrast with the situation and development of the country over a long period of years. In regard to the present situation, he stated that there is too great a tendency on the part of the public and the law-makers to see only minor mistakes and that, in other words, they "hold the penny of failure so close to their eyes that they cannot always see the 20-dollar gold piece of accomplishment." He laid particular stress upon the question of an adequate return upon the investment in the railroads and added that although the railroads are in distress, agriculture in trouble, and industry slack and business poor, that those who are now advocating that one way to bring about a resumption of business activity is to further reduce railway income should handle the subject with care. He pointed out that private industries were afforded an opportunity to build up and make vital improvements to their plants during the war period. The railroads were not—in fact the opposite conditions prevailed—and thus it is only the more imperative that they be given a chance to build up their systems to a more normal basis.

He also spoke on numerous other problems concerned with railway transportation, concluding his talk with the following pertinent statement: "Railroads are common carriers of people and property; they are not common carriers of all the economic troubles of the country. These cannot be cured by reducing rates, by tuning the railroads and perhaps forcing government ownership, to which this country is opposed. Give brains, courage and management a chance once more. Declare a 10-year holiday in the ceaseless investigation of the transportation question and let the undivided attention and energy of owners, managers and employees be devoted to maintaining, operating and perfecting this engine of civilization—the wonderful railroad system of the United States."

Mr. Doak's remarks were concerned with the relation of employees and employers and expressed a belief on his part that the best results in the solution of the problems between the two would come through direct conferences and meetings. He condemned the large amount of ill-advised propaganda and half truths which had been and were still being disseminated, since it was undermining the faith of the public in the railroads and creating a spirit of bitter bi-partisanship. He stated that the managements and the employees should conduct a campaign of education based on a fair investiga-

tion and presentation of the facts to restore public confidence.

In regard to labor disputes, Mr. Doak brought out that compulsory arbitration had been tried in other countries and here and that it had generally failed as a means of satisfactory labor adjustment. He strongly favored mediation and conciliation, and bi-partisan regional boards of adjustment, with the selection of high-class men to act as mediators. The Labor Board should be given a fair trial to show what it can do; so far it has been in existence too short a period to judge fairly as to its merits, though he did not believe that tripartite boards would be ultimately successful because of the inexperience and lack of knowledge of one-third of the membership. There was always the possibility, he thought, of the presence of partisanship, because of the opportunity of being able, in a way, to pass the responsibility to a third party. Management, labor and industry, he said, were all right if permitted to follow a normal and proper course. The problem of today should be judged from a practical business standpoint and the theories, speculations and cries of the reformers should be disregarded.

Colonel Molitor discussed the situation of railway securities, bringing out the decline in the volume of sales as well as the decrease in their prices, as an indication of the decrease

in interest in them on the part of the investor and thus a weakening of the credit position of the roads. One of the chief factors which helped to bring about this state of affairs was the operation of the roads by the government. The continuation of the meagre return to the investors will keep railway credit at a low ebb, he stated, and unless the railway problem is removed from politics and an economic and liberal policy pursued instead, the result can only be financial disaster and early government ownership. In regard to the latter, he added that while the general public had been lulled into security since the passage of the Transportation Act, the undercurrent of political affairs was such, at present, to cause the belief that public ownership of railroads was closer today than three years ago.

Colonel Molitor offered as suggested remedies: That any further general reductions in freight rates should be discontinued; labor wages should be adjusted to the cost of living; the Labor Board should be transferred to the Interstate Commerce Commission; and the six per cent return should be continued as a measure of rate making. He also added that railway employees should be prohibited by statute from striking and that labor unions should be required to incorporate and to file financial reports to the Secretary of Labor.

Interchangeable Mileage Bill Passed by Senate

Strong Objections Offered Because It Favors a Class That Can Best Afford to Pay Full Rates

WASHINGTON, D. C.

A BILL directing the Interstate Commerce Commission to require the railroads to issue interchangeable mileage tickets for not less than 1,000 nor more than 5,000 miles and to prescribe the rate therefor was passed by the Senate on January 21, after three days of debate, in the form of a substitute offered by Senator Cummins for S. 848, which would have directly required the railroads to issue 5,000-mile tickets at a rate of $2\frac{1}{2}$ cents a mile. There was no record vote. The substitute as originally offered by Senator Cummins would have "empowered" the commission to require the mileage ticket. Before passage this was amended to "direct" the commission, and the bill as passed is as follows:

Be it enacted, etc., That section 22 of the act entitled "An act to regulate commerce," approved February 4, 1887, as amended, is hereby amended by inserting "(1)" after the section number at the beginning of such section and by adding to the section two new paragraphs, as follows, to wit:

(2) The commission is directed to require, after notice and hearing, each carrier by rail, subject to this act, to issue at such offices as may be prescribed by the commission joint interchangeable mileage tickets at a just and reasonable rate per mile, good for interstate passenger carriage upon the passenger trains of any and all other carriers by rail subject to this act. Such tickets may be required to be issued for any distance not exceeding 5,000 miles nor less than 1,000 miles. Before making any order requiring the issuance of any such tickets the commission shall make and publish such reasonable rules and regulations for their issuance and use as in its judgment the public interest demands; and especially it shall prescribe whether such tickets are transferable or non-transferable, and if the latter, what identification may be required; and especially, also to what baggage privileges the lawful holders of such tickets are entitled.

(3) Any carrier which, through the act of any agent or employee, willfully refuses to issue or accept any such ticket demanded or presented under the lawful requirements of this act, or willfully refuses to conform to the rules and regulations lawfully made and published by the commission hereunder, or any person who shall willfully offer for carriage any such ticket contrary to the said rules and regulations shall be deemed guilty of a misdemeanor, and upon conviction shall be fined not to exceed \$1,000.

The title was amended so as to read: "A bill to amend section 22 of the act entitled 'An act to regulate commerce,' approved February 4, 1887, as amended."

The bill, S. 848, introduced by Senator Watson of Indiana at the instance of the commercial travellers' organizations, was but one of several which have been introduced in Congress. Hearings had been held by a subcommittee of the

Senate committee on interstate commerce, but no action had been taken by the committee when Senator Robinson of Arkansas obtained the unanimous consent of the Senate to discharge the committee from consideration of the bill and to take it up in the Senate.

Attempt Made to Fix Rate Per Mile

It was apparent at once that there was a strong sentiment in the Senate for a mileage book at a reduced rate but after Senator Cummins had proposed his substitute there was a vigorous debate between those who, under Senator Robinson's leadership, desired to fix the rate per mile in the bill, and those who strongly insisted that the rate and the terms should be left to the commission. While the bill was proposed and discussed largely from the standpoint of the commercial traveller, many senators dealt with it mainly as a means for reducing passenger fares, and the debate was made the occasion for a wide range of discussion of the railroad rate situation, both freight and passenger, in which the present level of rates was charged by many with a large share of the responsibility for the depressed condition of business. A number of the advocates of the bill desired to reduce the mileage to 2,000 or even 1,000 miles in order to make the mileage books more generally available.

Senator Cummins read a letter from Commissioner Esch, on behalf of the legislative committee of the Interstate Commerce Commission, pointing out many defects in the bill as it stood and the inadvisability of fixing rates or fares by statute.

Senator Robinson and other advocates of the bill fixing the rate insisted that the railroad revenues would be increased rather than diminished by the reduction, and in answer to the contention that the rate should be left to the commission, said that the membership of the commission is divided in opinion both as to their power, without additional legislation, to require interchangeable mileage tickets and as to the policy of doing so. Senator Robinson said that while W. G. McAdoo was in charge of the railroads he had issued an

order abolishing reduced mileage book rates for the purpose of reducing travel rather than for the purpose of increasing revenues. Senator Cummins retorted that if it was McAdoo's purpose to reduce travel he failed signally, because until 1921 the passenger travel upon the railroads increased by leaps and bounds under the increased rates.

May Prevent Reduction of Freight Rates

Senator Cummins made a long speech in which he said he believed in the system of mileage book tickets and that he had no doubt that the commission when vested with power will speedily make the necessary order. He did not, however, feel like reviewing the action of the Interstate Commerce Commission and insisting that it is less qualified to enter a judgment upon this question than the Congress, which must necessarily act with very inadequate and imperfect information. First, Senator Cummins said, the bill as proposed would be obviously unconstitutional, as fixing an arbitrary rate without proper investigation as to the difference warranted between the mileage rate and the regular rate and, second, if it were constitutional it is manifestly unwise for Congress to attempt to fix either freight rates or passenger rates. His third objection was that at this time no obstacle should be put in the way of the efforts of the commission or of the carriers to reduce freight rates. "The passage of this bill," he said, "will just as surely arrest the progress of that movement as that time is to go on."

His fourth objection was that the difference of over 1 cent a mile would be the grossest sort of discrimination in favor of corporations and individuals who can afford to buy \$125 worth of transportation at one time. The fifth point was that the bill would take direct possession of the authority which, in his judgment, is vested in the several states, because it attempted to fix passenger rates within the states.

In reply to Senator Robinson's assertion that reduced rates will produce greater revenues, Senator Cummins said the commission is now investigating that question, but, he said, "there is not a man of intelligence within the borders of the United States who will assert that the revenues of the railroad companies are now more than they ought to be," and "there is not a lawyer in the United States who will assert that if the Interstate Commerce Commission did anything that reduced their revenues below the point at which they now stand the order of the commission would be sustained in any court."

Senator Cummins said that the Senator from Arkansas and Senator Smith of South Carolina, who had also criticized the present rates, assume that "all that is the trouble with the world is either a high passenger rate or a high freight rate." "The world is sick," he said, "with a great variety of diseases, and high rates may be one of these diseases."

When Senator Robinson asked whether Senator Cummins thought it is possible to restore vitality and prosperity to American business without a reduction of rates, he replied in the affirmative.

"Suppose the price of corn were \$1 a bushel, or \$1.50 a bushel," he said, "our farmers would not lack prosperity on account of the high freight rates. Freight rates have nothing to do with making the corn worth \$1.50 a bushel. Freight rates have a good deal to do with the amount which the farmer receives from the price paid for his corn. If the farmer could sell his product at \$1.50 a bushel in my state, he would be prosperous even though he paid the present high rates."

Prices and Freight Rates

This led to an interesting discussion of prices and freight rates, in which Senator Cummins said the low price of corn is brought about because there are a great many people who do not want to buy corn. Senator Robinson insisted that there are millions of people who are anxious to buy corn at a reasonable price if it can be transported to them at a

reasonable price. Senator Cummins pointed out that the freight rates are borne by the farmer and that high rates in the United States do not produce the trouble in Europe or the reasons why Europe does not buy more of our corn.

"To suggest that the high freight rates and the high passenger rates are the cause of all the evils with which we are now afflicted," he said, "is to close our eyes to countless evidences of misadjustment and maladjustment not only throughout our own country, but throughout the world. I want to see freight rates come down, but I want the system of transportation which we have built up maintained at the same time."

When the time came for a vote on the bill, Senator Robinson proposed the amendment "directing" the commission instead of merely "empowering" it, and said with that modification he would somewhat reluctantly accept the Cummins amendment. Senator Harris of Georgia attempted to add an amendment requiring railroads to use steel cars for passenger service, but it was ruled out on a point of order. Senator Trammell, before Senator Cummins' substitute had been voted on, secured the adoption of an amendment to the original bill, to provide for 1,000-mile books instead of 5,000-mile books, but after the adoption of Senator Robinson's amendment, the Cummins substitute was adopted. Among those who supported Senator Cummins in opposing the fixing of rates by statute were Senators Pomerene, Kellogg and Capper, while Senators Poindexter and Smith were the principal speakers with Senator Robinson in favor of fixing the rate by statute. Senator Smith said that Congress should direct the Interstate Commerce Commission to lower freight rates a certain percentage, the percentage to be governed very largely by the current average cost of material now used as compared with the cost at the time when the rates were advanced.

The letter from Commissioner Esch in commenting on S. 848, said in part:

"It may be proper to remark that in the past bills somewhat similar to this one have been referred to us for our views, and we have expressed our disapproval of them, not only on the grounds indicated but on account of the inadvisability, as it seems to us, of fixing rates or fares by statute.

"It has seemed to us that when reductions in fares were warranted they should be made in such a way that all travelers could benefit by them.

"The bill, in effect, creates a privileged or favored class into which no one may enter who has not \$125 available for the purpose. Whatever reduction in cost of travel is thus effected would inure, not to those of small means, who need it most, but to those with abundant moneys in hand, who need it least. The mileage ticket sought at a rate of 2.5 cents per mile would enable the holder to travel over the Southern Pacific line in Arizona or Nevada, where the base rate is 4.8 cents per mile, or over other lines in the state where the base rate is still higher, and in doing so to ride in Pullman cars without paying the so-called Pullman surcharge, which accrues to the rail carrier. His fellow passengers, sharing the same accommodations, would pay twice as much.

"The bill does not declare the existing base fares to be unreasonable. It amends an act under which we have found them reasonable. But, without any finding of the reasonableness which the act enjoins upon all rail carriers, it proposes to require them all to establish and maintain a much lower rate per mile for those who can afford to lay out \$125 in order to secure it. It also provides that as the general rate of fare for the rest of the public is reduced from its present exceptionally high level this special base shall be reduced in proportion, so that, whatever happens, the holders of these tickets shall always travel for less than anyone else.

"The bill disregards the fact that the President, through the director general, determined that a base rate lower than 3 cents per mile was too low and that the commission has since authorized 20 per cent increase in that base rate.

"It further raises the question whether any rail carrier subject to the act could justly any base higher than 2.5 cents per mile for any passenger after this bill should become law.

"The bill repeals portions of section 2 of the interstate commerce act, which provide for compliance with section 6 of that act in respect of the filing and publication of joint tariffs and which make applicable the penalties provided under section 10 of that act.

"The bill lays its obligation to sell and honor these interchangeable mileage tickets upon 'each common carrier by railroad, or partly by railroad and partly by water, within the continental United States, subject to this act,' and thus upon common carriers which now publish no passenger tariffs and carry no passenger traffic.

"The ticket may be issued and all the money collected by a carrier which does not participate in the transportation and is financially irresponsible.

"These are some of the obvious defects of the bill."

Wood Preservers Discuss Economics of Ties

Proceedings at Annual Convention
Demonstrate Advance in the
Use of Treated Timber

THE American Wood-Preservers' Association held its eighteenth annual convention at the Hotel Sherman, Chicago, on January 24-26, inclusive. This organization of men interested in the preparation and use of treated timber includes a large proportion of railway officers and is by far the largest single factor in promoting the use of treated cross ties in this country. For the railroad man particular interest is attached to the papers relating to the economics of tie utilization and tie production.

Earl Stimson, chief engineer of maintenance of the Baltimore & Ohio, presented a paper in answer to the question "Should Cost of Treating Ties Be Charged to Maintenance or Capital Account"? Mr. Stimson stated that the position of the railroad with respect to this depends upon the degree of prosperity or state of business credit. He himself favors the present practice of charging the cost of treating ties to maintenance.

Advance in the application of treated timber to car construction was reported by a committee on car lumber and a paper by Forrest S. Shinn on the Treatment of Car Sills and Decking. These papers and others of perhaps less specific application to the railroads are presented in abstract below.

The officers of the American Wood-Preservers' Association during the past year were: President, C. M. Taylor, superintendent, Port Reading Creosoting Plant (C. R. R. of N. J.-P. & R.), Port Reading, N. J.; first vice-president, F. J. Angier, superintendent timber preservation, Baltimore & Ohio, Baltimore, Md.; second vice-president, H. S. Valentine, assistant general manager, Eppinger & Russell Company, New York City; secretary-treasurer, G. M. Hunt, engineer, Forest Products Laboratory, Madison, Wis.

In the election of officers held on Thursday the following were elected: President, F. J. Angier; first vice-president, W. H. Grady, vice-president, American Creosoting Company, Louisville, Ky.; second vice-president, H. S. Sackett, assisting purchasing agent, Chicago, Milwaukee & St. Paul, Chicago; secretary-treasurer, George Hunt.

Factors Affecting the Cost of Treated Cross Ties

By E. E. Pershall

Vice-President, T. J. Moss Tie Company, St. Louis, Mo.

The purchase of timber for conversion into cross ties is largely made in two general ways, i. e.:

1. The purchase of land and timber in fee.
2. The purchase of timber only on certain described lands.

The land values on which the timber may be standing has a very direct bearing on the cost of stumpage, as timber land having a relatively high potential value for farms or ranges, in most cases carries with it taxes that are very closely related to its future use. For example, there are certain swamp timbered areas, particularly where cypress, oak, and gum comprises the major portion of the stands, that make

Loblolly Pine Trees Treated with Zinc Chloride—Condition After 16 Years of Service in Oklahoma.

The convention was opened by an address by R. H. Aishton, president of the American Railway Association, who commented on the insistent demand for efficiency in all phases of railway operation. He paid a tribute to the wood preserving industry for the constructive work which it is doing in stimulating the treatment of timber and thereby extending its life. He pointed out the close relationship of this industry to the railways as is evidenced by the fact that over 90 per cent of all of the timber treated is used by the railways and that their use of this material is increasing more rapidly today than ever before. He emphasized the importance of the Wood Preservers' Association giving more publicity to the constructive work which it is doing in order that the public at large may know what it and the railways are doing to promote economy and efficiency.

Following Mr. Aishton's address C. M. Taylor, president, reviewed the work of the association during the past year. Mr. Taylor placed particular emphasis upon the suggestion made by Mr. Aishton regarding the importance of disseminating information concerning the possibilities of timber preservation and the results which have already been accomplished. Mr. Taylor also pointed out that the association should keep constantly in mind that it is not sufficient for an industry to depend upon its past performances but that the success of the association, aside from its ability to make known what it is accomplishing, depends upon the industry and co-operation of all members to study along new lines and to develop the work of wood preservation in its diversified branches. He called particular attention to the necessity of studying the properties of the creosote oils as prepared at the present time and concluded his address by urging the members to keep constantly in mind the importance of the problem of wood preservation both to the railways and to the public at large.

exceedingly rich farm lands after the timber is removed and drainage ditches constructed.

Estimating the Value of Timber

Values of timber and timber lands, as may be used for the manufacture of cross ties, are in most cases determined by experienced timbermen, who are not only expert at estimating the amounts of the various kinds of timber standing, but much more importantly the numerous considerations involved in the profitable removal of the timber from stump to river bank or railroad. The amount of labor in the imme-

ties from which, by carrying out the various methods, the inconsistency of methods *a* and *b* was clearly shown, leaving only method *c* as a logical solution. Mr. Hendricks also offered the following as the factors which must be taken into consideration in determining the first cost of a tie in place.

1. Purchase price of ties, f. o. b. cars.
2. Inspection (of ties and treatment) and handling charges, including distribution of ties.
3. Work train charges or estimated cost of transporting over company lines (both to and from the treating plant in the case of treated ties).
4. Freight charges over foreign lines, and switching charges.
5. Interest on the cost of ties during the period they are held for seasoning, provided this is not included in the purchase price.

6. Interest on investment in any real estate, plant, tracks, or other facilities required for procuring, seasoning, or treating the ties, when not included in the purchase price, and also maintenance of such property.
7. Cost of adzing and boring before treatment, and any similar expenses not included in the cost of treatment.
8. Cost of treatment.
9. Cost of the plates. We have no authentic information as to the life of tie plates, but if we assume the life the same as the life of a treated tie, then for a tie having only half that life we should include only half the cost of tie plates, and for other lives in proportion.
10. Cost of spikes. In comparing wooden ties with wooden ties, however, the cost of spikes will be the same and that cost could be omitted without material error; in comparing wooden with metal ties, the spikes must be included to correspond with the metal tie fastenings.
11. Cost of placing ties in track.

The Use of Treated Timber in Cars

The Committee on Car Lumber presented a report on the treatment of timbers used in cars and submitted recommendations on practice applicable to this particular field for the treatment of timber. An abstract of the report follows:

Since decay is responsible for more repairs to wooden cars than any other single factor it follows that a way must be found to prevent decay without retarding the work of shop forces engaged in repairing the cars. The pressure treatment is superior to other known methods of preserving wood and creosote is the best agency by which its physical life may be extended. Zinc chloride and sodium fluoride are also proven wood preservatives of high rank, but to be of any material value they must be applied under pressure, while the application of creosote by means other than pressure, such as non-pressure treatments, will unquestionably add to the life of the timber so treated.

The committee has studied every conceivable method of treating car timbers by the pressure process after they have been framed, and has found them impracticable. In most cases treating plants are located many miles from the car shops, meaning that after the timbers have been framed they must be loaded on cars and sent to the plant for treatment.

There is also the usual objection to the use of creosoted timbers that is always met with on account of refusal of

labor, especially the semi-skilled labor, usually employed around car shops, to handle these timbers after they have been treated. However, this feature could be overcome by the use of zinc chloride or sodium fluoride, which are not offensive to handle, and if it were practical to apply either preservative without pressure our problems would be nearer solution.

This committee earnestly desires to see some definite step taken toward preserving car lumber and recommends the very simple method of giving all points of contact a brush treatment, using two brush coats of hot creosote. This should also apply to roofing and in the case of open and stock cars to the decking, posts and entire interior of the car.

This treatment should be applied to all points of contact regardless of whether the timber is green or dry, or whether it is white oak, red oak, pine, fir, or any other species. The best results will be obtained if the timber is dry, but it is not always dry when put in a car and we must face the conditions as they actually exist. It is certainly better to paint creosote on a green piece of timber than to put none on it at all, and this principle if accepted, must be general and cover all lumber used in freight car construction and maintenance.

It has been suggested that the actual application of the creosote be supervised by the department of timber preservation of the railroad.

Burlington Treats Car Lumber

Supplemental to the above report, Forrest S. Shinn, supervisor of plant, Chicago, Burlington & Quincy at Galesburg, Ill., presented a statement of the progress in preserving car timbers on that railroad. An abstract of Mr. Shinn's statement follows:

The Burlington has treated 1,297,188 ft. b. m. of car sills and 1,815,804 ft. b. m. of car decking. These were treated with the straight creosote process in the following years:

Year	Sills, Board feet	Decking, Board feet
1911.....	104,700	115,728
1912.....	409,764	1,087,116
1913.....	339,720	153,012
1914.....	223,500	89,892
1915.....	53,736	56,688
1916.....	166,068	176,796
1917.....	79,888
1918.....	56,688
Total.....	1,297,188	1,815,804

We are not in a position as yet to know just what results will be obtained from this treatment, as none of the lumber has been taken out for any cause except on account of being broken; however, in view of the fact that we are taking out yearly a large amount of untreated flooring on account of rot we feel that the money spent for treatment has brought good returns. We have not made any tests on this material,

comparing the strength of the treated lumber with the untreated, but from close observation have come to the conclusion that treatment very materially increases the hardness and makes it much more resistant to wear. We find that many untreated planks in cars built in 1911 and 1912 have been worn so thin that they had to be replaced.

In November, 1921, two treated planks were removed for inspection from the end of C. B. & Q. car 67391, built in May, 1912, with treated sills and flooring; two treated gangway planks from C. B. & Q. car 67190, built in February, 1912, with treated sills and flooring; and two treated gangway planks from C. B. & Q. car 68729, built in September, 1915, with treated sills and flooring. There was no sign of decay on either the sills or flooring. The planks were slightly worn but were perfectly sound and, from all appearances, were good for as many years more life as they had already given. On the same day two untreated gangway planks were also removed from C. B. & Q. car 67261. This car was built in March, 1912, with treated sills and flooring, with the exception of the gangway plank which was not treated. These two untreated planks were warped, shattered on the ends, and worn down to less than half the original thickness.

In the last month I have inspected 200 stock cars built in

1914 or earlier, 100 of which were built with treated sills and decking and 100 built with untreated sills and decking. The treated decking is in as good condition as when first laid down, showing no signs of decay, warp, or check, while the untreated decking is badly warped or buckled and all of it is more or less checked, and in a large percentage the ends are badly shattered.

We feel that some time in the future we are going to be able to prove conclusively that the treatment of sills is justifiable. I have seen many decayed sills in cars built 1900 to 1906 and I am sure that everyone will agree with me that a

well treated car sill will never show any signs of decay unless it was decayed before being treated.

In addition to the treatment of sills and decking for stock cars we treated, with the Burnettizing process, sub-flooring for one dining car that was placed in service May, 1921, and one that was placed in service June, 1921. We also treated sub-flooring with the Card process (zinc chloride and coal tar creosote) for two dining cars that will be placed in service soon. We have found that sub-flooring in the kitchens of these cars rots quickly and are sure that we can overcome this by preservative treatment.

Report on San Francisco Bay Marine Piling

The conditions in San Francisco Bay and the study of constructions that will resist the inroads of marine borers was the subject of another extended report presented by a special committee organized for this purpose. This same subject was treated in a previous report which was abstracted in the RAILWAY AGE of February 18, 1921, page 420, and the present report covers much of the same ground but in greater detail and in the light of more complete information. The conclusions of the committee which are given below are presented in the same form as in the report abstracted in the RAILWAY AGE of February 18, 1921, the changes from the previous report being shown in italics. These conclusions are as follows:

(1) Marine borers are very active in San Francisco Bay and connected waters, and in places where their attack is severe will destroy untreated piling in as short a time as six to eight months. In other places the untreated piling may last from two to four years.

(2) The information secured indicates that it is reasonable to expect a life of five to eight years from paint and batten protections in *sheltered waters*, if the work is well done. If it is not well done, or if the covering is damaged by careless handling or if *unprotected wood is exposed by mud scour*, this range of life cannot be expected.

(3) *The data so far in hand indicates that it is fair to expect creosoted Douglas fir piling in San Francisco Bay to give a life of 15 to 20 years under present conditions. Certain piles are of authentic record from the Oakland Long Wharf which were sound when removed after a service of 29 years. Poor treatment, or damage to creosoted piling by careless handling, rafting, storage or construction, will materially reduce the life which might otherwise be rendered by such piling.*

(4) Most of the attack on creosoted piling by marine borers, which the committee has observed throughout this survey, appears to have begun in spots where untreated wood has been exposed by damage in handling the piles or placing the superstructure. It is urgently recommended that improvements be made in the methods of handling creosoted piles and building structures upon them, so that damage to the surface of the piles may be reduced to a minimum.

(5) Precast reinforced concrete piles and pile casings have not been in use in San Francisco Bay a sufficient length of time to determine their ultimate life. A detailed examination of those structures which have been in service for 10 years shows no evidence of deterioration *below high water line*, and they seem capable of a long further life. The length of life to be expected from this type of construction is largely dependent upon the quality of materials and workmanship and the skill and care with which they are employed; and any laxity in these particulars will materially shorten the length of service which may be secured.

(6) *Reinforced concrete cylinders cast in open caissons have been in use for 12 years. Although the average life of many earlier cylinders has been considerably shortened by construction defect, these cylinders with minor repairs still give promise of a long period of service. Similar cylinders designed and constructed in accordance with best modern concrete practice should constitute a type of construction only excelled for longevity by solid fill or mass concrete.*

(7) Cast in place concrete pile jackets may be expected to give satisfactory results if properly constructed of suitable materials and proper regard is given toward exclusion of sea water from forms. The difficulties of this type of construction, however, are of such a nature that the probability of securing a maximum length of life is less than in the case of precast concrete piles or pile casings.

(8) *Copper sheathed piles have given very satisfactory service*

in locations where damage from abrasion and theft can be minimized. Such piles carefully prepared and handled fall into the class of best surface protections, when used under the conditions indicated.

(9) The selection of a type of piling or pile protection for a given structure must be made upon the basis of cost and permanence of the materials under consideration, the character of the structure and the probable need for future alterations to meet the changing requirements of commerce. When a comparatively short increase over the life of *untreated* wooden piling is sufficient, the surface protections will often be found economical in waters not exposed to severe storm action; if a moderately long physical life approximating the average economic life of marine structures in this harbor is desired, a good creosote treatment will provide it at the lowest annual cost so far as present knowledge goes; if conditions warrant building for the greatest permanence, with less regard for first cost, concrete construction *has shown a high value in this harbor*. For the protection from further damage of wooden piles already in place and showing attack by borers, not yet severe enough to require condemnation, the concrete casting, precast or poured in place, is the only means of salvage so far found by the committee.

The subject of plant operation treated by sub-committees covered six phases of this work. Papers presented include one on the Requirements for Pressure Machinery Utilized in Preserving Plants and one on Material Handling, which was devoted primarily to the equipment required in large lumber yards.

The Committee on Preservatives presented a report on the properties and supply of certain special oils including vertical retort tar oils, low temperature coal tar oil, blast furnace oil and high temperature petroleum gas tar oil. Tentative specifications were also submitted for creosote oil to be used for non-pressure treatment and for creosote oil to be used for marine piling treatment. C. Henri Strawn, official photographer of the Atchison, Topeka & Santa Fe, Topeka, Kan., presented a paper on Photography in Wood Preservation.

The Committee on Utilization and Service prepared reports by sub-committees on Economics, Track, and Flooring and Paving.

The sub-committee on tie service test records presented the usual tabular statement of the service records prepared by the Forest Products Laboratory at Madison. No detailed report was presented on the results obtained on an individual railroad.

At THE OPENING SESSION on January 30 of the annual meeting of the National Civic Federation at the Hotel Astor, New York, the question of industrial mediation and conciliation will be discussed. The proposals to make the decisions of the Railroad Labor Board mandatory, to combine the Board with the Interstate Commerce Commission or to abolish it entirely will be taken up. The principles involved in a court of industrial relations such as that in Kansas will be discussed. Among the speakers will be Ben W. Hooper, of the Labor Board, B. M. Jewell, of the Railway Employees' Department of the American Federation of Labor, and Charles P. Neill, umpire in disputes arising between coal operators and the anthracite miners.

Proposal for a Commissioner General of Transportation

WASHINGTON, D. C.

THE COMMITTEE on Railroads of the Chamber of Commerce of the United States has prepared a summary of the recommendations to be made in its report to the board of directors, which is to be considered at the meeting of the National Council of the chamber to be held on February 8 and 9, at which time that body will be asked to advise the board of directors on the questions involved.

It is the sense of the committee that there should be some governmental agency adequately equipped, having appropriate jurisdiction, and the duty to promote, sustain and develop the transportation facilities of the country in the light of the public interest, before committees of Congress and before the various governmental agencies now in existence or hereafter created that have power of action or decision in respect to any matters affecting transportation.

Pursuant to this principle the committee presents the following recommendations:

1. That the Chamber of Commerce urge Congress to enact appropriate legislation authorizing the President to appoint and prescribe the compensation of a special administrative officer with the title of commissioner general of transportation.

2. The commissioner should hold office subject to the will of the President, and upon the occurrence of a vacancy in the office the President should appoint and prescribe the compensation of a successor.

3. The commissioner should be selected because of his familiarity and experience with transportation conditions, problems and necessities, and should keep himself informed of the transportation needs of the country and make such recommendations to all governmental agencies charged with the regulation of interstate transportation as he may find will be for the public interest and will tend to coordinate the administration of the laws respecting interstate transportation by land, water and air for the promotion and development of a national system of rail, water, highway and aerial transportation, and will make possible the articulation and economical use of all transportation facilities including tracks, highways, terminals, transfer facilities, docks and landing places. The commissioner should make an annual report of these matters to the President for transmission to Congress.

4. The commissioner should not be permitted to engage in any other business, vocation or employment during his term of office, nor to be eligible for any elective office within two (2) years after he ceases to be commissioner.

5. The commissioner should ascertain and report to the President from time to time for transmission to Congress each and all conflicting or inharmonious functions and rulings of any one or more boards, commissions, bureaus or other governmental agencies with respect to interstate transportation as related to the functions and rulings of any or all other such agencies that cannot be so reconciled by administrative practices as to promote the general development of a coordinated system of interstate transportation; such report to be accompanied by recommendations of the commissioner designed to correct and remove such inharmonious provisions and practices.

6. The commissioner should render all possible assistance to the Interstate Commerce Commission in facilitating and advancing the consolidation of railroads into a limited number of competing systems as authorized in the Transportation Act, 1920.

7. The commissioner should be notified of all hearings before any board, commission, bureau or other governmental agency now existing or hereafter created with respect to trans-

portation, rates, fares, regulations, terminal charges, wages, working conditions or other subject matter affecting interstate transportation; and should be entitled to be heard in person or by representative at all such hearings and to produce evidence that will tend towards a result that will promote and facilitate the continuous development of an interstate transportation system that will be adequate and efficient to meet the transportation needs of the country.

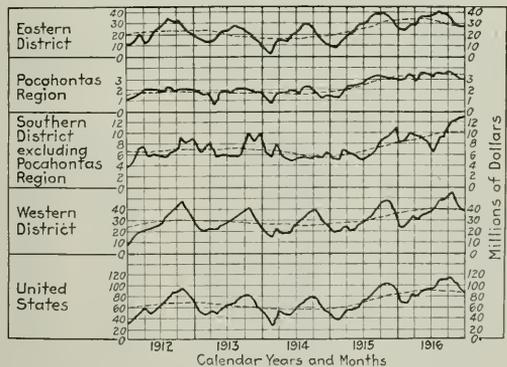

8. The commissioner should be authorized to call upon any department or bureau of the government for any information as to interstate transportation matters that may be needed by him in the performance of his duties; and such departments and bureaus should be required to furnish such information on his request.

9. The commissioner should be authorized to grant federal charters to corporations proposing to engage in interstate transportation by land, water or air, and upon application therefor, to convert state corporations so engaged into federal corporations so that by such conversion the existing corporation shall not close or interrupt its business as a common carrier, nor shall any of its existing obligations to others nor any existing obligations of others to it be in any manner prejudiced or impaired, but it shall continue as a corporation with the same officers and directors until other directors shall have been chosen under the federal charter and the same property assets and business as before its conversion, save only that jurisdiction over it as a corporation shall be vested in the government of the United States.

10. The Congress should make adequate appropriations for carrying out the foregoing provisions until such time as receipts from charter license fees to be authorized by Congress are sufficient for this purpose.

The Seasonal Variation of Operating Income*

THE TRANSPORTATION ACT, 1920, has made it necessary to know what rate of return upon investment is earned each year by steam roads. Before the actual earnings for an entire year are available, it is desirable to know how nearly the 5½ or 6 per cent standard is being reached. In

The Seasonal Variation of Operating Income

order to utilize the monthly reports of revenues and expenses for this purpose, it is necessary to know what fraction of the year's income ought normally to be expected each month. One-twelfth of the annual amount is not an accurate standard

*A statement issued by the Bureau of Statistics of the Interstate Commerce Commission.

for what each month ought to contribute. As Congress made the three years ended June 30, 1917, the test of the rental to be paid for the use of the railroad properties, it may seem that this so-called "test period" should be taken as a basis for a statement of monthly variations in earnings. It happens, however, that this period is one in which there was a rapid growth of traffic so that the earnings of various months in each year were affected by the general annual trend upward, and by the abnormalities incidental to the war, as well as by seasonal changes.

Where the fiscal year ending June 30 is taken as the base, it may be noted that the result is to understate the relative importance of the months from July to December. For ex-

distorted by extraordinary fluctuations in revenues and expenses.

The plan of procedure was to compute a moving monthly average of twelve months, month by month for the five-year period. The deviation each month from this average was considered as the seasonal influence for that month. The following chart shows by districts the actual variation in railway operating income for each month of the five-year period and also the moving average representing the other than seasonal influences. It will be observed that in the Eastern district the peak usually appears in August; in the Southern district, in December; and in the Western district and the United States as a whole in October. The Pocahontas region

TABLE I—NET RAILWAY OPERATING INCOME WHICH CLASS I STEAM ROADS SHOULD EARN EACH MONTH IN EACH GEOGRAPHICAL DISTRICT TO PRODUCE AN ANNUAL RETURN OF 6 PER CENT ON AN INVESTMENT OF \$18,599,000,000, AS OF DECEMBER 31, 1920

Month	Eastern district		Pocahontas region		Southern district (excl. Pocahontas)		Western district		United States	
	Amount (thousands) (a)	Per cent (b)	Amount (thousands) (c)	Per cent (d)	Amount (thousands) (e)	Per cent (f)	Amount (thousands) (g)	Per cent (h)	Amount (thousands) (i)	Per cent (j)
January	\$23,926	5.3	\$3,046	7.5	\$9,732	7.4	\$27,080	5.5	\$63,784	5.7

May	36,115	8.0	3,453	8.5	9,996	7.6	32,988	6.7	82,552	7.4
June	42,435	9.4	3,575	8.8	9,075	6.9	37,912	7.7	92,997	8.3
July	44,693	9.9	3,453	8.5	8,680	6.6	42,835	8.7	99,661	8.9
August	51,916	11.5	4,021	9.9	9,864	7.5	49,728	10.1	115,529	10.4
September	49,659	11.0	3,818	9.4	10,785	8.2	56,129	11.4	120,391	10.8
October	47,853	10.6	3,696	9.1	13,284	10.1	60,560	12.3	125,393	11.2
November	38,372	8.5	3,250	8.0	12,494	9.5	51,206	10.4	105,322	9.4
December	32,955	7.3	3,209	7.9	14,073	10.7	41,358	8.4	91,595	8.2
Total	\$451,440	100.0	\$40,620	100.00	\$131,520	100.0	\$492,360	100.0	\$1,115,940	100.0

ample, in the test period, the three months of July are July, 1914, 1915 and 1916, while the three months of June are June, 1915, 1916, and 1917. The June average thus represents conditions nearly one year later than the July average. The distorting effect of the growth in traffic in over-emphasizing the earnings of the month of June, compared with July, is readily seen from the following:

	Class I roads Railway operating revenues	
	June	July
1914	\$255,958,639
1915	\$249,495,045
1916	\$300,019,380	303,232,007
1917	349,669,869
Average	\$299,728,098	\$272,802,601

When the calendar year is used, the same distortion occurs, December being overemphasized as compared with January.

shows the least monthly variation, but August, on an average, is somewhat better than any other month.

It should be emphasized that we are here dealing with operating income, and not revenues or expenses. Expenses are spread more evenly throughout the year than are revenues, and hence the resultant income varies more widely from month to month than do the revenues. The percentage hereinafter given for monthly income variations should not be taken as the seasonal variation in the amount of business.

The results reached by the method above described have been modified slightly in preparing Table I in order to make the totals in both directions exactly consistent. The table shows the distribution of 6 per cent return on the investment of Class I steam roads by districts and by months. The investment is based on the tentative valuation as of December 31, 1919, used by the Interstate Commerce Commission for

TABLE II—CUMULATIVE TOTALS FROM JANUARY 1, FOR DATA SHOWN IN TABLE I

Months ending with—	Eastern district		Pocahontas region		Southern district (excl. Pocahontas)		Western district		United States

December	306,666	67.9	40,620	100.0	131,520	100.0	492,360	100.0	1,115,940	100.0

It becomes necessary, therefore, to segregate the seasonal variation from the general annual trend.

For the purpose of this study, the five-year period ending December 31, 1916, has been chosen. The reason for not going back of 1912 is that it is desirable to have the results by geographical districts, and the monthly returns were not so divided for a full year prior to 1912. The reason for stopping with 1916 is that the returns for the later years are

the purposes of Ex Parte 74, Increased Rates, 1920, 58 I. C. C. 229, with suitable modification for the classes of roads covered and for the increased investment of 1920. In Table II the same results appear cumulatively for successive periods from January. In getting the rate of return for any month or period, the process is to take such a proportion of six as the net railway operating income of the month is of the sums shown for the month or period in the tables.

Reclaiming Sheets of Outside Metal Car Roofs

Important Savings in Car Repair Costs Result from
Moderate Expenditures for Facilities

AS ONE of the results of pooling equipment and deferring maintenance during the period of federal control, owner lines are now having returned to them a great number of box cars requiring extensive repairs to roofs. At the present time one large eastern line has from 10,000

Car with Roof of Reclaimed Sheets

to 15,000 box cars equipped with various makes of metal roofs which are in need of roof repairs. Making new metal for the roofs of these 10,000 to 15,000 cars would entail an expenditure of from \$500,000 to \$750,000. To avoid this heavy expense, the road has established plants for reclaiming used roof sheets at 31 points on its system where cars are repaired.

In the great majority of instances, the wear in the original metal sheets was due to poor material supplied during the war period, resulting in leaks occurring at the lower edge of the sheets at the eaves of the car where the sheets overlap the flashing. The plan for reclaiming the sheets involves their removal from the car, cutting off the worn end, reforming and painting.

The roofing sheets, now being reclaimed, originally were

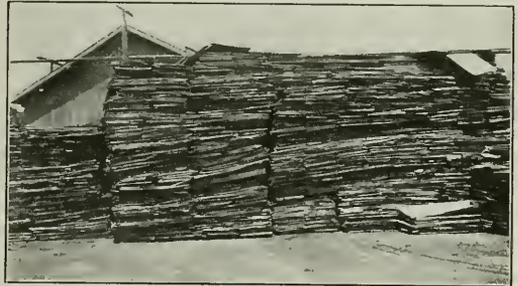

Sheets Before and After Reclaiming

of two lengths, 4 ft. 6 $\frac{5}{8}$ in. and 4 ft. 8 $\frac{7}{8}$ in. Both length sheets were used with 4 $\frac{1}{4}$ in. flashing. As reclaimed the 4 ft. 6 $\frac{5}{8}$ in. sheets are cut back to a length of 4 ft. 3 in. and used with 7 in. flashing if the wear in the original permits. Where the wear is greater the sheets are cut back to a length of 4 ft. 0 in. and used with 10 in. flashing. Sheets originally 4 ft. 8 $\frac{7}{8}$ in. long when reclaimed are cut back

to 4 ft. 5 $\frac{1}{2}$ in. for use with 7 in. flashing and to 4 ft. 2 $\frac{1}{2}$ in. when 10 in. flashing is used.

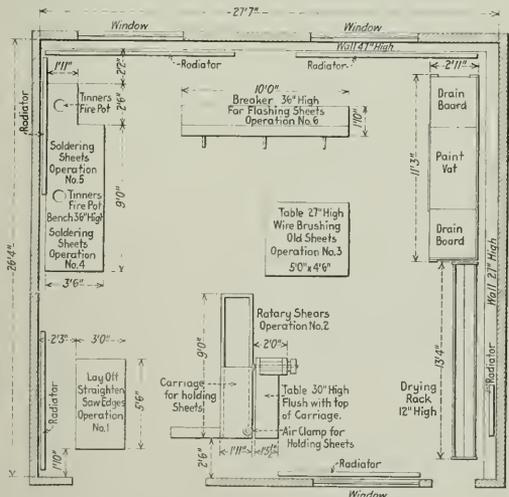

Roof sheets which are not suitable for use with either the 7 in. flashing or 10 in. flashing are squared and split in the center of the width after all defective metal has been cut off the ends, and are then formed into 7 in. flashing. The 10 in. wide flashing is made from new galvanized iron.

The drawing showing the arrangement of the facilities in

Defective Roof Sheets Formerly Used for Building Purposes or Sold for Scrap

the car roof reclaiming shop illustrates the simple and inexpensive layout and equipment required. The building is of frame construction, 26 ft. 4 in. wide and 27 ft. 7 in. long. The equipment is standard and includes facilities for straightening the sheets, rotary shears for cutting the sheets

Layout of Shop

and the flashing, a table used in connection with the shears for holding the sheets while being cut, a break machine for reforming the ends of the roof sheets and the flashing, a

table and wire brushes for cleaning old sheets, tinning and soldering outfits and painting vats and drying racks.

The reclaiming involves six operations; straightening, clipping, cleaning, soldering, reforming and painting. The painting is done by the bath method, and a second coat of paint is applied to the top of the sheets and the flashing after the roof has been rebuilt and applied.

In applying the reclaimed material to the car roofs standard practice, as it obtains with new material, is followed closely. The flashing is nailed to the side fascia and a hold-on-clip or cleat is used to hold the flashing. This is nailed to the roof carlines or to the sheathing. Where there is no carline for the nails they are driven through the sheathing and clinched. The flashing has an interlocking seam at each end to prevent leaks.

One of the photographs shows a pile of defective roof sheets. Before the plan for reclamation was perfected these sheets were used for building purposes, covering bridge ties and so on. Many of them were sold as scrap or disposed of in fills along the right-of-way. Another photograph shows piles of roof sheets before and after reclaiming, while a third photograph shows a car roofed with the reclaimed material.

With the facilities described a daily output of sheets and flashing sufficient to provide roofing for five cars is secured at each of the plants. This is done with an expenditure totaling less than \$28 per day per plant or, in other words, at a cost slightly in excess of \$5 per roof.

President Discusses Transportation

GREATER ATTENTION to the development of inland waterways and to plans for the electrification of railroads was urged by President Harding in his address at the agricultural conference at Washington on January 23. In discussing transportation the President said:

"No country is so dependent upon railroad transportation as is the United States. The irregular coast lines of Europe, its numerous indenting arms of the sea, as well as its great river system, afford that Continent exceptional water transportation. The vast continental area of the United States is quite differently situated, its greater dependence upon railroad transportation being attested by its possession of nearly one-half the railroad mileage of the world, and even this is not adequate. The inevitable expansion of population will enormously increase the burden upon our transportation facilities, and proper forethought must dictate the present adoption of wise and far-seeing policies in dealing with transportation.

"If broad-visioned statesmanship shall establish fundamentally sound policies toward transportation, the present crisis will one day be regarded as a piece of good fortune to the nation. To this time railroad construction, financing and operation have been unscientific and devoid of proper consideration for the wider concerns of the community. To say this is simply to admit a fact which applies to practically every railroad system in the world. It is as true regarding the railroads of Canada and Great Britain as it is in reference to those of the United States. It is equally applicable to the railways of Continental Europe, in whose development considerations of political and military availability have too far overweighed economic usefulness. In America we have too long neglected our waterways. We need a practical development of water resources for both transportation and power. A large share of railway tonnage is coal for railroad fuel. The experience of railway electrification demonstrates the possibility of reducing this waste and increasing efficiency.

"We may well begin very soon to consider plans to electrify

our railroads. If such a suggestion seems to involve inordinate demands upon our financial and industrial power, it may be replied that three generations ago the suggestion of building 260,000 miles of railways in this country would have been scouted as a financial and industrial impossibility.

"The waterway improvement represents not only the possibility of expanding our transportation system, but also of producing hydro-electric power for its operation and for the activities of widely diffused industry.

"I have spoken of the advantage which Europe enjoys because of its easy access to the sea, the cheapest and surest transportation facilities. In our own country is presented one of the world's most attractive opportunities for extension of the seaways many hundred miles inland. The heart of the continent with its vast resources in both agriculture and industry would be brought in communication with all the ocean routes by the execution of the St. Lawrence waterway project. To enable ocean-going vessels to have access to all the ports of the Great Lakes would have a most stimulating effect upon the industrial life of the Continent's interior. The feasibility of the project is unquestioned and its cost, compared with some other great engineering works, would be small.

"Disorganized and prostrate, the nations of Central Europe are even now setting their hands to the development of a great Continental waterway, which, connecting the Rhine and Danube, will bring water transportation from the Black to the North Sea, from Mediterranean to Baltic. If nationalist prejudices and economic difficulties can be overcome by Europe, they certainly should not be formidable obstacles to an achievement, less expensive, and giving promise of yet greater advantages to the peoples of North America. Not only would the cost of transportation be greatly reduced, but a vast population would be brought in immediate touch with the markets of the entire world."

Many of the speakers at the conference urged a reduction in freight rates as one of the most important means of improving the condition of the farmers.

The conference appointed a general committee on transportation, with H. J. Waters of Missouri as chairman, and also committees on railway, waterway and highway transportation. Among the members of the committee on railway transportation are E. E. Clark, former chairman of the Interstate Commerce Commission; T. C. Powell, vice-president of the Erie; M. J. Gormley, chairman of the Car Service Division, American Railway Association; Clifford Thorne, of Chicago, and S. H. Cowan, of Texas. Julius H. Parmelee, director of the Bureau of Railway Economics, is secretary of the committee. B. M. Robinson, president of the American Short Line Railroad Association, was appointed a member of the waterway transportation committee, and J. E. Forman, president of the Chicago, Rock Island & Pacific, a member of the committee on highway transportation.

JOHN G. WAIBER, speaking for the Eastern railways, calls attention to the extravagance of the statements in the newspapers, to the effect that the revision in the rules for clerks announced last week by the United States Railroad Labor Board would result in a saving for the carriers of \$50,000,000 a year. The same figure was named, not long ago, in connection with the revision of the shipmen's rules. Neither of these estimates was authorized by the Labor Board or by any member of it. When employees, of the classes referred to, had their pay advanced in December, 1919, it was estimated that the total increased cost of labor would be \$25,000,000. It is obvious that a revision of only a portion of the rules, applying to less than 38 per cent of the employees covered by the \$25,000,000 estimate would not result in a saving of twice twenty-five millions.

Labor Board Announces New Rules for Clerks

Punitive Overtime After Ninth Hour and Employment of Men on "Split Tricks" Authorized

A NEW SET of 51 rules to govern the working conditions of railroad clerical employees was announced by the Railroad Labor Board on January 23. The most important departures from the provisions of the clerks' national agreement, which will be superseded by the new code, are contained in new rules relative to the payment of overtime, the so-called arbitraries or punitive payments and the employment of men on "split tricks." Under the new rules regarding overtime for clerical workers time and one-half is paid after the ninth hour instead of after the eighth hour as was the case under the overtime rule of the national agreement.

The principle of the eight-hour day, however, is specifically retained in the rules as it was in the recently announced codes to govern the working conditions of shop and maintenance of way employees. Where clerical work is intermittent, the new provisions permit the employment of men on "split tricks"—prohibited by certain provisions of the national agreement.

A dissenting opinion directed at the new overtime rules was made by the three railroad members on the Board, Samuel Higgins, J. H. Elliott and Horace Baker. This opinion termed the payment of punitive overtime for any service rendered by the clerical employees within the ten hour period as "unjust, unfair and unreasonable." This dissenting opinion was answered at length by W. L. McMenimen of the labor group on the Board and B. W. Hooper and G. W. W. Hanger, members of the public group. A. O. Wharton also appended a dissenting opinion, concurring in the statement signed by Messrs. McMenimen, Hooper and Hanger but expressing opposition to the provisions of the new overtime rule on the grounds that punitive overtime should begin after the eighth hour instead of the ninth.

The new provisions are effective February 1, and apply to each of the carriers parties to the dispute covered by the decision, except in such instances as any particular carrier may have agreed with its employees upon any one or more of such rules, in which case the rule or rules agreed upon by the carrier and its employees shall apply on said road."

Board Approves 27 Rules of the Clerks' National Agreement

The clerks' national agreement contained 87 rules. The new code announced by the Board contains 51 rules, of which 27 are reproductions of rules of the national agreement. Six rules of the national agreement are automatically eliminated by new conditions and 15 rules have been changed—but 11 materially. Thirty-nine of the rules of the national agreement have not been mentioned in the new code, the points involved being left for negotiation between the individual carriers and their own clerical forces. Three rules covering new points of controversy have been added by the Board.

The 15 rules which have been changed in this order are in some cases more elastic and in others more specific. The principal change, as stated above, has been made in the provision pertaining to overtime. Under the clerks' national agreement hourly rated employees received time and one-half for overtime after the eighth hour and daily rated employees received time and one-half for overtime for work in excess of the full number of hours per week (produced by multiplying by eight the days of the weekly assignment). Under the new rule no such distinction is made

and all employees are paid pro-rata rates for the ninth hour and time and one-half thereafter for overtime.

Rules Requiring Punitive Payments Altered

The group of rules relating to payments for intermittent service, for reporting, for work during meal periods, when notified or called, when Sunday or holiday work takes less than a full day period, and for travel time in camp cars, have been revised in general to cut down partly payments to employees for which no service is received. The changes which have been made in these rules are summarized as follows:

Rule 58 of the national agreements provided in part that employees should be paid time and one-half on the minute basis for service performed continuous with and in advance of the regular work period.

The new rule eliminates this provision but continues the remaining part of the rule which provides for the payment of a minimum of three hours for two hours work or less when called to perform work not continuous with the regular work period.

Board Authorizes "Split Tricks"

Rule 49 of the national agreement relating to intermittent service prohibited the working of "split tricks," by providing for the payment of a flat monthly rate and setting a minimum of 48 hours per week for workers so employed. The new rule covering this point states:

Where service is intermittent 8 hours actual time on duty within a spread of 12 hours shall constitute a day's work. Employees filling such positions shall be paid overtime for all time actually on duty or held for duty in excess of 8 hours from the time required to report for duty to the time of release within 12 consecutive hours, and also for all time in excess of 12 consecutive hours computed continuously from the time first required to report until final release. Time shall be counted as continuous service in all cases where the interval of release from duty does not exceed one hour.

Under the old rule an employee reporting for duty at eight a. m. received time and one-half overtime after four p. m., although during that period he might have had several hours of idleness. The decision of the Board on this point was influenced by the charges which have been made that employees actually performed other work in such intervals. For instance at a station under the present rule where all the work, due to the arrival and departure of trains only in the morning and evening, comes within a spread of 12 hours, an employee covered by this provision would report for work in the morning, be released in the middle of the day without pay and report in the evening for the remainder of the day's work of 8 hours. Under the old rule he would have been paid punitive overtime for the work performed in the evening, or it would have been necessary to employ two shifts.

In commenting on this rule at the Labor Board it was said, "Employment conditions of this sort at the smaller stations caused criticism by the farmers who contended that the employment of unnecessary men and the payment of punitive overtime, because of periods of enforced but compensated idleness, exerted a demoralizing influence on labor conditions in the country. The new rule will not only allow the railroads to open many small stations with one shift of employees, but at the larger terminals, where the arrival and departure of trains is bunched, to employ baggagemen, train announcers, gatemen, train and engine crew callers,

and employees in similar positions on 'split tricks' instead of having to maintain two shifts."

Other Changes in Punitive Payment Provisions

Rule 50 of the national agreement, providing for the payment of a minimum of three hours' pay for employees called and not used, and for the payment of eight hours' pay if an employee so called is released before the end of a full day's work, has been changed to provide for the payment, under such conditions, of a minimum of but two hours instead of three, and for the payment of a minimum of four hours if worked any portion of the day, or the payment of eight hours where the employee is worked in excess of four hours. A provision has also been added to this rule stating that it does not apply "to regular employees who lay off of their own accord before completion of the day's work."

Rule 54 of the national agreement, providing for the payment of time and one-half to employees who work through their regular meal period, has been changed to provide for the payment of but pro-rata rates under these conditions.

Rule 65 of the national agreement, providing for the payment of a minimum of two hours at overtime rates for two hours' work or less, and pro-rata rates after the second hour of each tour of duty, to employees who are called to work on Sundays and holidays for a less number of hours than constitutes a day's work, has been changed to provide for the payment of employees under these conditions at the pro-rata rates for actual time worked with a minimum of three hours, and for the payment of time worked before or after the limits of the regular week day assignment in accordance with Rule 57, which has already been described.

Rule 66 of the national agreement, containing a method for determining the daily rate of employees who have heretofore been paid on a monthly or weekly basis, has been re-written to eliminate the specific method of computation. The remainder of the rule remains unchanged.

Rule 69 of the national agreement, providing for the payment of straight time to employees traveling in boarding cars during regular working hours, for traveling on Sundays and holidays during the hours established for work periods on other days, and for the payment of half time for time spent in traveling in boarding cars after 10 p. m. and before 6 a. m., has been changed to eliminate the necessity for paying for any time so spent after the regular work period hours.

In addition to these changes, the scope of the rules has been changed so that the clerks which this agreement covers have been divided into two classes, *i. e.*, clerical workers and machine operators. The exceptions to this rule have been changed so that "laborers" instead of "employees" on coal and ore docks, elevators, piers, wharves, etc., are excepted from its provision. The paragraphs of this rule, providing for the exception of personal office forces, chief clerks, supervisory agents at larger stations, foremen who supervise sub-foremen, etc., have been eliminated.

The rule of the national agreement, relating to the qualifications and definition of clerical workers, has been re-written to conform to the classification mentioned in the preceding paragraph and is less specific in excepting certain classes of employees from the provisions of the rule. In this connection a new class of clerical workers, "student and apprentice qualifying for specific clerical work or as machine operators," are excepted.

Rule 76 of the national agreement defining "daily assigned representative," has been re-written to include not only "the regularly constituted committee representing the class of employees on the railroad where the controversy arose, but to include any representative or representatives employees directly interested may select or designate."

A new rule adopted by the Board requires the carriers to

give employees who are leaving the service a letter showing the length of their service, the capacity in which they were employed and their cause for leaving, if the employee requests it.

The other changes made in the rules are of a minor nature and will not bring about any decided changes in the working conditions of clerical employees.

The rules of the national agreement which have been continued in the new code are those headed or pertaining to promotion, the eight-hour day, length of meal periods, continuous work without meal period, time of the meal period, changing starting time, starting time of shifts, employees recalled after completing their regular tour of duty, absorbing overtime, authorizing overtime, notification when time claims are disallowed, day of rest, temporary assignment, witnesses when attending court, rating positions, preservation of rates, pay of women employees, pay in new positions, posting notices, transfer by management and by seniority, transportation, incapacitated employees, furnishing of machines, bond premiums, free transportation and rates.

The rules of the national agreement which are remanded to negotiation between the individual carriers and their clerical forces include those headed or pertaining to vacancies and new positions, declining promotions, failure to qualify, declaring former position vacant, bulletins, temporary appointments, short vacancies, indefinite vacancies, long vacancies, change in rates, bidding for positions after absence, more than one vacancy, changing starting time, reducing forces, rosters, scope of roster, filing applications, transferring, consolidations, positions abolished, re-entering service, excepted positions, validating records, exercising seniority, hearings, appeals, further appeal, grievances, representation, right of appeal, advice of cause, exoneration, date of suspension, transportation, organization membership, pending decision, time limit, leave of absence and extension of seniority. These rules in general compromise Articles III, IV and V of the clerks' national agreement covering broadly the regulation of seniority, discipline and grievances and leaves of absence.

Regarding rules on vacations and sick leave with pay, the Board's decision says: In the opinion of the Labor Board the question of vacations and sick leave with pay is one which should be left at this time to the carriers and their respective employees for the adoption of such rules as may be severally and mutually agreed upon.

Those rules in the new code which are similar to rules of the national agreement do not carry with them the interpretations of the Railroad Administration, adjustment boards or similar agencies, according to the closing terms of this decision.

Railroad Members of Board File Dissenting Opinion

The dissenting opinion of Messrs. Higgins, Elliott and Baker, the railroad representatives on the Board, gave as reasons for their objection to the provision of the new rule which provides for punitive payment for service rendered beyond the ninth hour, the following:

Prior to Federal control of railroads, clerical forces generally were paid a monthly rate basis which covered all service rendered.

Other classes of employees covered by the clerks' agreement, including freight house laborers and other station employees, generally worked 10 hours per day and were paid at pro-rata rates for all time worked, or, during the same hours of service per day are now required to meet business needs throughout the country along the lines of the carriers.

The clerks' rules govern a large class who are not clerks either by training or special skill required, such as yard clerks, messenger boys, chore boys, laborers, students, apprentices, et cetera.

The work of all classes covered by this agreement is to an extent intermittent and does not require constant application. With a less or day than 10 hours the carriers cannot, with economy and efficiency, meet the demands of the public.

Punitive payment has but one justification, namely, preventing the working of unreasonable hours; therefore, it is our judgment

that the imposing of rules requiring punitive payment for any service rendered by employees covered by this decision within the 10-hour period is unjust, unfair, unreasonable, and burdens the carrier with an uneconomical condition.

Labor and Public Members Join

in Answering Dissenting Opinion

The answer to this opinion by Messrs. McMenimen, Hooper and Hanger takes up the dissenting opinion of the railroad representatives in detail. The following is an abstract of this answer:

The first paragraph of the dissenting opinion stating that "prior to federal control of railroads clerical forces generally were paid on a monthly rate basis which covered all service rendered" is termed "erroneous to the extent that a number of carriers were paying overtime to clerical and station employees prior to federal control."

The second paragraph of the dissenting opinion stating that employees covered by the clerks' agreement generally worked ten hours per day and were paid pro rata rates for all time worked is characterized as "erroneous to a very large degree" and "rather indefinite." In support of this opinion Messrs. McMenimen, Hooper and Hanger cite a large number of responses by individual railroads to a questionnaire sent out during federal control to ascertain certain facts with respect to the conditions of employment governing employees covered by Supplement 7 to General Order 27 which, it is claimed, covers the employees in question. Most of the answers quoted indicate that clerical employees did not work ten hours a day as a rule, the answers varying on different carriers. To further sustain their position, Messrs. McMenimen, Hooper and Hanger quote from the monthly report on employees' service and compensation of the Interstate Commerce Commission for the month of July, 1921, which shows that the various classes of employees covered by the clerks' national agreement during that month worked from 169 to 222 hours per employee on straight time, and from 1 to 17 hours overtime.

The statement in the dissenting opinion to the effect that "the Clerks' rules govern a large class who are not clerks, either by training or skill required, such as yard clerks, messenger boys, chore boys, laborers, students, apprentices, etc." is refuted by the statement that the inexperienced clerical workers "comprise a very small percentage of the total." It is said, for instance, that the "yard clerks are among the most important clerks on the railroad and their work not only requires training and special skill but considerable responsibility."

Referring to the paragraph in the dissenting opinion which states that "the work of all classes covered by this agreement is to an extent intermittent and does not require constant application," Messrs. McMenimen, Hooper and Hanger again cite figures from the report of employees and compensation for July showing that the number of employees in that month, subject to the provisions of the clerks' rule, was 309,793. They add "it will be noted that approximately 205,000 of these employees are clerical workers. It has been conservatively estimated by certain railroad managers that about 50 percent of clerical workers in railroad service are employed in the general offices and a large percentage of the balance are in the larger freight stations, division offices and store departments where the work performed requires continuous application throughout the entire tour of duties. In any event Rule 49 of this decision provides that the eight hours work may be distributed within a spread of 12 hours without payment of any overtime."

A. O. Wharton Files Separate Opinion

Mr. Wharton's statement accompanying the Board's decision says:

"I concur in the statement made by the majority, although opposed to the provisions of Rule 57 for reasons set out in

the majority statement and because the principle of punitive payment for overtime after eight hours, for service of this character, is so well established and so generally recognized, and for the further reason that it is not my conception of the purposes of the Transportation Act wherein the Labor Board is charged with the duty of establishing 'just and reasonable' working conditions."

Interstate Cited

The Labor Board has cited the Interstate Railroad to appear before it on February 6 to determine whether or not that road has violated a decision of the Board in a controversy between this carrier and the Brotherhood of Railroad Trainmen and the Brotherhood of Locomotive Firemen and Enginemen. On December 31, 1921, the Labor Board ordered the Interstate Railroad to reinstate a switchman and fireman who claimed to have been discharged because they had responded to requests from union officers for information as to the status of wages being paid on the carrier. The carrier, according to the Labor Board, did not combat these charges but replied to the effect that it did not care to present any evidence in the case because it did not deal with its employees through the representatives of labor organizations.

The Board then sustained the position of the labor organizations and ordered the reinstatement of these men with pay for time lost. It is now charged that the carrier has refused to allow them to re-enter the service.

Automatic Train Stops in Use on American Railroads

THE notice of the Interstate Commerce Commission, calling upon prominent railroads to install automatic train stops, which was published in the *Railway Age* of January 14, page 189, has revived interest in the general subject of automatic stops, and many inquirers are calling for information concerning it. Apparatus of this character is already in use on 11 railroads in this country, of which four run both passenger and freight trains, and it will be of interest at this time to note briefly the situation on these railroads. The list below, "List A," gives the names of these roads, with some data concerning the kinds of apparatus and the extent of the installations.

This list begins with elevated and subway intramural railroads, the situations of which are so different from those of ordinary railroads that most students of the problem have paid little heed to the question of adapting the simple mechanical trips of these city railroads to the needs of heavy and mixed trunk-line service; but it is proper to include the city lines in this list, for two reasons: First, the main reason for classing the simple trip as available only on these city roads is that it is particularly susceptible to being interfered with by snow and frost; but the government now calls for installations where snow and frost do not make much trouble; and the adaptation of the principles of these trips to apparatus usable in cold climates has not as yet been thoroughly studied.

Second, the experience of the subways and the elevated lines should be availed of by all railroads in the matter of discipline of runners. One of the persistent arguments against the use of automatic train stops is that they will make, or tend to make, all enginemen careless. But officers of roads using the stops give strong testimony that the actual effect is exactly the other way; the stops make the men more careful. Testimony on this point on the Boston Elevated covers a period of over 20 years. The Chicago & Eastern Illinois, with its more varied traffic and different conditions, confirms the story of the Boston Elevated. An

important element in the successful operation of automatic stops on a busy line is the success or (un)success) with which the enginemen maintain smooth and regular operation; and no road can afford to ignore the records of the years of successful operation on these city railroads, with their many hundreds of motormen.

In a second list, "List B," there are shown the names of roads on which experimental installations have been made. Of the 16 items in this list, five—Nos. 1, 6, 7, 13 and 15—have been the subject of recent published descriptions or news notes, as shown in the list. Item 12 refers to a recently reported contract, concerning which we have no detailed information. The other 10 refer to experiments which have been closed, or which have lain dormant for a considerable length of time.

"List C" is a rearrangement of the items given in "List B."

The most recent comprehensive publication relating to automatic train stops is the report of the Automatic Train Control Committee (A. M. Burt, chairman), of the United States Railroad Administration, which report was transmitted to the director-general of railroads on December 31, 1919, and abstracted in the *Railway Age* of January 16 and 30, 1920, pages 227 and 382. This report, hereinafter referred to as the Burt Report, gave the results of a thorough and intimate study made by a committee of seven, including six railroad officers and engineers, and W. P. Borland, chief of the Bureau of Safety of the Interstate Commerce Commission.

Besides analyzing and describing the different types of apparatus and giving brief descriptions of devices examined, the report, following its general conclusions, gives a comprehensive bibliography of the subject; and a list of 17 devices, more or less fully developed, which were deemed worthy of further tests. Eleven of these devices are noted in the tables which are printed herewith.

The report of this committee was extremely cautious, the most progressive paragraph being that to the effect that, on lines of heavy traffic, fully equipped with automatic block signals, the use of train control devices "is desirable." The committee recommended that after the termination of federal control of the railroads, its work should be continued by a committee of the American Railway Association; and such a committee was established. Of this committee, C. E. Denney, vice-president of the New York, Chicago & St. Louis, is chairman, and G. E. Ellis, Chicago, is secretary.

This last named committee, in conjunction with the Bureau of Safety of the Interstate Commerce Commission, issued a list of requisites for automatic train control which was noticed in the *Railway Age* of March 4, 1921.

LIST A—AUTOMATIC STOPS IN USE

- a Boston Elevated—Stops in use over 20 years. Simple mechanical trip. Described in Signal Dictionary, pages 122-124.
- b Interborough Rapid Transit Co., New York—Subway and elevated lines. Simple mechanical trip. Described in Signal Dictionary, page 117.
- c Hudson & Manhattan (Subway).—New York and Jersey City. Same general type as above. Signal Dictionary, page 108.
- d Pennsylvania, New York City Terminal. Tunnels; also in unprotected stations. The Hill mechanical trip. Described in Bulletin No. 63 of the Union Switch & Signal Co. and in the *Signal Engineer* of January, 1912.
- e Brooklyn Rapid Transit Co. (N. Y.) Subway and elevated lines.
- f Chicago & Eastern Illinois—Used on both passenger and freight trains over about 100 miles of line. Miller Train Control Corporation, apparatus described in the *Railway Age*, November 27, 1914.
- g Chesapeake & Ohio Single Track Train Control Company, in use on about 50 miles, single track. Apparatus described in *Railway Age*, March 24, 1919. Rump type.
- h Chicago, Rock Island & Pacific. Regan Safety Device Co. Described in *Railway Age*, April 9, 1919, page 1243. Rump type, with speed control.

NOTE: The three last preceding installations have been under inspection during the past year by the Bureau of Safety of the Interstate Commerce Commission and the Train Stop Committee of the American Railway Association.

- i Cincinnati, Indianapolis & Western. The Shadle automatic train control, intermittent electric contact type. *Railway Age*, October 1, 1919.

- j Washington Water Power Company. This is a trolley road; overhead automatic stops in use on 22 miles. Described in Signal Dictionary, page 112.
- k San Francisco-Oakland. Double track line, overhead trip, Signal Dictionary, page 113.

LIST B—AUTOMATIC TRAIN-STOP EXPERIMENTS

- 1 Buffalo, Rochester & Pittsburgh—General Railway Signal Co., induction apparatus; *Railway Age*, October 29, 1921, page 817.
- 2 Canadian Pacific.—Prentice "wireless" apparatus. *Railway Age*, June 23, 1911.
- 3 Chicago, Burlington & Quincy.—Gollos automatic stop. *Railway Age*, March 21, 1916.
- 4 Delaware, Lackawanna & Western.—Wooding's train control. *Railway Age*, September 14, 1917, and November 9, 1917.
- 5 Interborough Rapid Transit Co.—G. P. Finnigan's induction apparatus. Described by J. M. Waldron in the *Railway Age*, June 16, 1911.
- 6 Erie.—International Signal Company's apparatus; Webb system. *Railway Age*, January 14, 1922, page 175.
- 7 New York Central.—Sprague induction system. *Railway Age*, November 26, 1921, page 1051.
- 8 New York Municipal Railways (Brooklyn Rapid Transit Co.) Elaborate speed control system, made by the General Railway Signal Co.; subjected to elaborate tests in 1916. Description in the *Signal Engineer*, August, 1915.
- 9 New York, New Haven & Hartford.—The Webb apparatus, noticed above, was subjected to extensive tests in 1917.
- 10 Pennsylvania (Western Lines).—Gray-Thurber system; tested by the Division of Safety, Interstate Commerce Commission, in 1914. Report submitted to Congress on January 9, 1915.
- 11 Philadelphia & Reading.—Schweyer's induction system. *Railway Age*, June 21 and July 5, 1918.
- 12 Pittsburgh & Lake Erie.—Union Switch & Signal Co.
- 13 Raritan River.—M-V All-weather train control. *Railway Age*, January 14, 1922, page 185.
- 14 Southern (C. N. O. & T. P.)—Julian-Beggs automatic speed control. *Railway Age*, March 21, 1916.
- 15 Southern Pacific.—National Safety Appliance Co. Experimental plant is now being installed between Hayward, Calif., and Halverton.
- 16 Western Pacific.—National Safety Appliance Company's induction apparatus subjected to extensive tests near Oroville, Cal. *Railway Age*, October 8, 1915.

LIST C—INDEX TO NAMES OF PROPRIETORS IN LISTS A AND B

NOTE:—The numbers at the left refer to the position of the items in Table B, and the letters to Table A.

a. Bostwick—See National Safety Appliance Company.

5. Finnigan—Interborough Rapid Transit Co.

1. General Railway Signal Co.—B. R. & P. Ry.

3. General Railway Signal Co.—B. R. T. Co. (N. Y. Municipal Railways)

3. Gollos—C. E. & Q. R. R.

6. Gray-Thurber—Pennsylvania

6. International Signal Co.—Erie and N. Y., N. H. & H.

14. Julian-Beggs—Southern.

13. M-V All-weather train control—Raritan River.

f. Miller—Chicago & Eastern Illinois.

16. National Safety Appliance Co.—Western Pacific.

15. National Safety Appliance Co.—Southern Pacific.

2. Prentice—Canadian Pacific.

h. Regan—Chicago, Rock Island & Pacific.

k. Schweyer—Philadelphia & Reading.

i. Shadle—Cincinnati, Indianapolis & Western.

7. Sprague—New York Central.

12. Union Switch & Signal Co.—Pittsburgh & Lake Erie.

6. Webb (See International Signal Co.)

4. Wooding—Delaware, Lackawanna & Western.

The devices named by the Burt Committee, December, 1919, as available for test, were as follows: In Table A, items f, g, h, i; in Table B, items 1, 4, 6, 7, 11, 12, 15.

The following references to the *Railway Age* will be of interest to those who may wish to examine the subject of cab signals, some of the details of which are of value in connection with the automatic stop problem:

1. May 7, 1920. Description of Augereau's wireless cab signal, as installed on France.
2. July 2, 1920. Page 29. Historical review of cab signal experiences in Europe, by Louis Weissenbruch, secretary of the International Railway Association.
3. March 4 and 18, 1921. Report of New York State Public Service Commission on automatic stops.
4. April 22, 1921. J. B. Latimer on automatic stops and audible signals.
5. December 3, 1921; page 1119. Recent improvements in cab signals in France.

Matter supplementary to the above mentioned article by Mr Weissenbruch may be found in a paper by F. Maison, in the Bulletin of the International Railway Association for November, 1921. Mr Maison's paper has been prepared for the International Railway Congress which is to be held in Rome next April. It fills about ninety pages of the Bulletin. Like Mr Weissenbruch's paper, it covers experiences terminating about 1914; and the author promises a second paper dealing with developments in this field since 1914.

Shippers Urge Reductions in Freight Rates

Program Provides for Testimony as to Various Groups of Commodities and on Behalf of Public and Labor

WASHINGTON, D. C.

THE RATE HEARING before the Interstate Commerce Commission since January 19 has been devoted to testimony of shippers as to particular commodities, beginning with coal and coke on January 19 and 20, and ore, furnace materials and iron and steel articles on January 21 and 23, and sand and gravel, brick, lime, cement, gypsum and asphalt on January 24 and 25. A revised schedule of dates for the hearing as to various commodities has been published, which devotes four days, January 30 to February 4, to testimony of the public and shippers as to general aspects of the case. It is understood that during this period Secretary of Commerce Hoover and Walker D. Hines, former director general of railroads, will appear. February 10-11 has been set aside for the railway labor organizations.

The other dates for commodities are as follows: January 26-27, lumber and forest products; January 28, fertilizers and materials, sulphuric acid, phosphate rock; February 8, vegetable oil and soap; February 9, grain, flour and agricultural products; February 15, canned goods and wholesale groceries; February 16, fruits and vegetables; February 18, milk, cream and dairy products; February 20, beverages and beverage containers; waste material; February 21-22, livestock and packing house products; February 23-24, petroleum and petroleum products; February 25, other commodities. Announcement will be made later of dates for carriers' rebuttal evidence and for oral argument. In beginning the commodity testimony Commissioner Hall asked the witnesses to bear in mind that the investigation is not being held for the purpose of going into questions of relationships, differentials, etc.

Coal

J. D. Morrow, vice-president of the National Coal Association, the first witness on behalf of shippers, urged a heavy nation-wide cut in freight rates on coal as a means of lowering the cost to the ultimate consumer and improving the economic position of the nation as the first to be made if the commission finds that any rate reductions are warranted. He said, however, that the association does not have a sufficient knowledge of the details of the carriers' finances to attempt to say whether rates generally can be reduced or to what extent, and it is entirely satisfied to leave the determination of that question to the commission.

"We feel," he said, "that the position of bituminous coal in the economic life of the nation is such that under present circumstances the rates on this commodity deserve special consideration. Our position is that material reductions in these rates should reduce the unit operating expenses of the carriers and tend to increase their traffic. Moreover, we are convinced that such rate reductions are necessary to the revival of business and industry, upon which the carriers must depend primarily for increased revenue. Although not an issue here, the inflated wage scales in the mines and upon the railroads are an important part of these economic conditions and I would not feel that I had stated clearly the position of the bituminous coal producers as I understand it, did I not recognize that fact and state it as the conviction of these men that such inflated wage scales on the roads and in the mines must be readjusted. I wish it clearly understood at the outset that the National Coal Association wants the carriers to receive a fair and adequate return, not only because such return is just to them, but because it is even more essential to the prosperity of the United States

and the welfare of its citizens. We approach this inquiry with every desire to give full weight to the requirements of the carriers' financial position."

Although not definitely suggesting what particular cut in rates the railroads ought to make, Mr. Morrow said that through the savings to the carriers in fuel coal alone, and making allowance for the saving in freight rates on their own fuel coal, the railroads undoubtedly would be justified in making a reduction of 75 cents a ton, although, he said, it might be only 50 cents. Mr. Morrow also referred to the reductions in prices of some of the other materials used by the railroads, but said he did not wish to over-estimate the extent of such reductions, because he was not familiar with the financial position of the producers and manufacturers of railway supplies nor with their ability to pass on the full measure of any reduction in their production costs.

When Mr. Morrow had urged a reduction in export coal rates, Commissioner Hall remarked that it seems to be "a little strong" to say that the rail rate is the main cause of the loss of export business. It remains to be demonstrated, he said, whether a reduction of the rail rate to nothing at all would be sufficient to enable the American producers to compete with foreign coal.

Mr. Morrow cited figures showing that the railroads are paying considerably less for bituminous coal than for months past and quoted witnesses for the carriers as admitting that their fuel costs for the coming year, particularly for the coal year beginning April 1 next, after wage readjustments are made in the unionized coal mines, will be considerably lower than for the past year.

As indicating the excessive freight charge on haulage of coal today, Mr. Morrow pointed out that the average rate per ton is \$2.27, as against an average sales price at the bituminous mines of \$2.13 a ton, or 14 cents higher than the cost of the coal.

"The freight charge of \$150 or \$200 on a car of coal which can be bought at the mines for from \$50 to \$100," said Mr. Morrow, "shows on its face the disproportion between the transportation cost and the market value of the commodity."

"Doubling the freight rate on a carload of motor cars, for example, from Detroit to Washington between 1914 and 1922, added only \$15 or \$20 to the price of a car selling at approximately \$1,000 to \$1,500. Such a condition makes no material difference to the customer who is ready to pay \$1,000 for a motor car, but an increase of \$50 or \$100 a car on coal which is being sold at the mines for less than the transportation charge on that coal to destination, will quite obviously have a deterrent effect upon the consumer of that coal who expects to use it in industrial establishments."

To make plain the relation of the transportation charges to the present high price of delivered coal, Mr. Morrow stated that 43½ per cent of each dollar paid for coal ordered by the manufacturer goes to the operator, out of which all his costs must come, while 51½ per cent goes to pay the freight on the coal.

Mr. Morrow quoted from reports just obtained by the National Coal Association from operators with 55,460,000 tons of bituminous tonnage during the 7 months from April 1 to October 31, 1921, showing that during those months there was an average loss of 2 cents a ton, while the reports for November and December showed even further losses.

Mr. Morrow pointed out that, while wage cuts in the union mines "would result in some lowering" of the mine price of coal, still the effect of such reductions already has

been discounted in several fields through reductions in the mine price to meet lower wage and mine prices in competing non-union fields.

George H. Cushing, managing director of the American Wholesale Coal Association, said the present rates on coal are not necessary to allow the railroads to collect the needed revenues and he produced voluminous statistics to show that with a normal tonnage the railroads could stand a reduction of 13.87 per cent of their revenues and still earn 6 per cent on their value. Rates that will do this, he said, are unreasonably high, and he did not understand that the carriers contend for a schedule of rates so high that they can earn 6 per cent in years of depression. The rates, Mr. Cushing contended, should be no higher than 50 per cent above the rates of April, 1917.

Mr. Cushing attempted to predict the future traffic of the carriers by estimating a continued increase in coal production based on an analysis of the recovery after periods of depression in the past and then declared that the statistics indicate that the growth of coal production measures precisely the expansion of all business. The figures of the American Coal Association show, he said, that for each car of coal loaded, the railways load a fraction more than three cars of all freight other than coal. In addition to a general reduction of coal rates, he said, the rates now applying on export coal are unreasonable to the extent of \$1 a ton, that in any readjustment of rates the differentials as between producing districts which obtained on April 6, 1917, should be preserved and that reassignment and demurrage charges should be reduced.

Mr. Cushing said the railways have a reasonable expectancy of business arising from the fact that the business of the country is likely to continue to grow, that the railways are by law guaranteed against those fluctuations of earnings which formerly arose from competitive rates and that this expectancy of steadily increasing business at stable rates is a sufficient guarantee for any business concern.

Mr. Morrow and Mr. Cushing were recalled by the commission to discuss the question of seasonal coal rates or any other method of equalizing the production of coal throughout the year. Both expressed the opinion that it would take more than a difference in the freight rate to overcome the conditions which lead consumers to buy coal in general only as they need it and that the only solution of the problem of seasonal fluctuations is to find a way to equalize the need for coal. Mr. Cushing said the coal industry had always made seasonal coal prices but they had had little effect in encouraging people to buy coal when they didn't want it. Mr. Cushing said that the need of industry for coal is largely controlled by the seasonal buying power of the farmer. Both expressed the opinion that they would prefer to have the present freight rates and good railroad service than lower rates and an inferior service.

H. W. Prickett of Salt Lake City, on behalf of Utah and Wyoming coal producers, said that water-borne coal from Australia and from Cardiff is being sold at San Francisco and other coast cities at \$7.50 to \$8.00 a ton, whereas the rail rate alone from Utah to San Francisco is \$7.25. When A. P. Hamburg, commerce attorney of the Illinois Central, said the rate had been reduced to \$6, Mr. Prickett said the reduction was still under discussion.

A. H. Campbell, traffic manager of the International Paper Company, urged a reduction in the rates on coal, which he said had become so burdensome that his company had converted two of its mills in Maine to oil-burning. His company pays over a million dollars a year in freight and coal alone, he said, and the rates are now close to 250 per cent of the mine price of coal.

E. E. Kelley, representing the state of North Dakota, said the present rates on coal are excessive and unreasonable.

W. J. Thompson, secretary of the Anthracite Producers'

Association, said that present prices of anthracite are too high for the average consumer to pay. The anthracite producers, he said, "gravely doubt" that general rate reductions would restore general prosperity, but consider that freight rates on their product should be lowered to nearer the rates on bituminous.

Iron, Steel and Ore

Shippers of iron and steel articles in general asked for an elimination of the increases made by the commission in Ex Parte 74, although most of them disclaimed any intention to deprive the carriers of adequate revenues. M. D. Langhorne, speaking for the Virgiuia Pig Iron Association, declared that every blast furnace and ore mine in his state is closed down because they cannot operate without losing from \$4 to \$5 on each ton of pig iron produced. He said that if rates on basic commodities should be reduced, the movement will be so stimulated that the carriers will receive a larger net revenue than they are receiving at present. A. G. MacKenzie, testifying on behalf of the Utah chapter of the American Mining Congress, said that freight rates constitute 22 per cent of the cost of producing the metals that come from the mines in Utah, which are now operating at about 28 per cent of capacity. Every item of cost of production had been reduced, he said, except freight rates.

J. A. Topping, chairman of the Republic Iron & Steel Company, appeared as spokesman for 40 independent iron and steel manufacturers. He said that excessive freight rates, like excessive prices for iron and steel, were both the outgrowth of war conditions. The manufacturers have taken steps to bring about liquidation and deflation and they believe that freight reductions are essential to a normal consumption of iron and steel. He recognized that the problem is whether the cost of conducting transportation can be reduced sufficiently and that this is largely a labor question. Yet, he said, this item has hardly been touched. The reduction in railroad wages has amounted to only about 12 per cent while the wages of most other labor have been reduced from 30 to 50 per cent. He said that if the Adamson law stands in the way, its repeal should be urged in the public interest and he advocated making the Railroad Labor Board subject to the orders of the Interstate Commerce Commission on the principle that two boards dealing with the same subject or parts of the same subject cause only confusion. Specifically, Mr. Topping advocated the cancellation of the increases made in Ex Parte 74, and such other adjustments as might appear equitable upon the completion of the commission's investigation. He thought that with special readjustments the volume of tonnage would be increased to such an extent that there would be no material shortage in the net revenue of the carriers below a fair return.

Cancellation of the increases made in Ex Parte 74 was also advocated by F. A. Ogden, general freight agent of the Jones & Laughlin Steel Company; Robert Hula for the independent plants in the Chicago district, and L. C. Bihler, traffic manager of the Carnegie Steel Company, who appeared also for the American Steel & Wire Company, American Sheet & Tin Plate Company, American Bridge Company and the Lorain Steel Company.

"We feel," said Mr. Bihler, "that the iron and steel industry has long borne and is still bearing more than its proper share of transportation charges and, therefore, in connection with any reductions in rates, special consideration should be given to specific reductions on all the inbound raw materials and the outbound products, pig iron and furnace products, semi-finished and finished products of the mills." He said that the iron and steel industry has done its full share in bringing about liquidation and that a restoration of normal conditions in this industry will almost double the number of people employed directly, in addition to the increased employment in related industries.

I. C. C. Finds Hardwood Lumber Rates Unreasonable

Six Commissioners Favor Slight Reduction, Two for Larger Reductions and Three Disapprove of Any

WASHINGTON, D. C.

THE WIDE DIFFERENCES of opinion which exist among the members of the Interstate Commerce Commission as to how rates ought to be reduced are strikingly illustrated in the report made public on January 20 in the Southern hardwood lumber case, the third important case in which the commission has prescribed rate reductions since its order in Ex Parte 74. The majority report, which represents the views of 6 of the 11 commissioners, finds that the rates on hardwood lumber and forest products from points in Missouri, Arkansas, Texas, Louisiana, Mississippi, Alabama, Georgia, Florida, South Carolina, North Carolina, Virginia, West Virginia, Tennessee and Kentucky to central territory and other defined territories north of the Ohio river are and will be for the future unreasonable to the extent that they exceed the rates in effect August 25, 1920, by more than the amounts shown in a table in the report, which range from 6 to 11 cents per 100 pounds.

As in the reports in the western livestock and hay and grain cases, no order was issued, but the report says the carriers will be expected to file and make effective rates in accordance with the findings made not later than March 6, by publication upon not less than 10 days' notice.

In the hay and grain case, after the railroads had failed to file the tariffs by the date named, a formal order was issued for a later date.

Two Dissenting Opinions

There were two concurring and two dissenting opinions. Chairman McChord said he concurred in the conclusions reached by the majority as far as they go, but thought they fell short of substantial justice to the shippers, and to his mind the commission should issue an order prescribing more substantial reductions. Commissioner Campbell subscribed to Mr. McChord's views.

Commissioner Potter concurred in the report with respect only to reductions of rates to points where such reductions make for a restoration of relationships as they existed prior to August 26, 1920, while Commissioner Daniels filed a dissenting opinion, objecting that the finding was based on "inadequate and tenuous grounds" and is "particularly unfortunate because it comes at a time when we are conducting a general investigation to determine whether we may lawfully require further rate reductions than those already made, not including this, and without awaiting the outcome of that inquiry."

Commissioner Eastman also dissented, saying that while the reductions are not large in amount and while he agreed that the restoration of rate differences as they existed prior to August 26, 1920, is desirable, it does not seem to him that this proves that the rates assailed are unreasonable.

Those who presumably favored the majority report, therefore, were Commissioners Cox (who is named as the author of the report), Aitchison, Esch, Hall, Lewis and Meyer. Commissioner Aitchison was recently attacked in a speech in the Senate by Senator Trammell of Florida who said that Mr. Aitchison had tried to bring the case to a vote at a time when two commissioners were absent and it appeared that a majority of those present would oppose a reduction in the rates. This speech was also made the occasion of a protest by a number of Southern senators because the President had not given the South additional representation upon the commission, although Chairman McChord is from Kentucky, and Senator Trammell introduced a bill to provide

for a geographical distribution of commissioners in future appointments.

Pending Since October 10

The case has been pending before the commission since October 10 and the report is dated January 16. The complaint was initiated by the Southern Hardwood Traffic Association and other hardwood interests intervened in support of the complaint, which attacked as unreasonable the rates on hardwood logs, bolts, billets and other rough material between points in the South, and as unreasonable, unjustly discriminatory and unduly prejudicial, the rates on hardwood lumber and other hardwood forest products taking lumber rates or arbitrary higher from points in the states named to the Ohio river crossings and to destinations beyond. The general rate level was assailed rather than individual rates, it being alleged that the increases since June 24, 1918, have resulted in transportation charges greater than the traffic can bear and in undue prejudice to complainants and undue preference of competing shippers in Wisconsin, Michigan and other northern states because of the widening of the spread in favor of such competing points, resulting from percentage increases in rates. Later that part of the complaint dealing with logs was withdrawn.

The report says the hardwood industry of the South is in a state of prostration. While there was a considerable falling off during 1921 in the hardwood lumber movement, it was represented that loss of traffic in the near future may be still greater because the logging operations have been greatly curtailed. Complainants did not seriously contend that the increases in freight rates alone are the cause of the business depression as it affects them, but admitted the fact of lessened demand and rapidly falling prices. To meet the changed market conditions, they had made substantial reductions in their operating costs. The commission says that the admission that transportation charges cannot be said to have caused the present condition of the industry is confirmed by the fact that prices of hardwood lumber at such a destination point as Cincinnati were, generally speaking, materially lower after the freight rate increases of August 26, 1920, than immediately prior thereto. The plea for the removal of the 1920 increases was based primarily on the effect of percentage increases on long haul traffic. The report continues in part:

"Defendants oppose the reductions sought primarily because of their own unfavorable financial condition and secondarily because, in their judgment, the rates assailed are not unreasonable and are not responsible for the present plight of complainants. The testimony shows that more hardwood moved from certain points in the south during selected periods of 1921 than moved during corresponding periods in 1920. As previously indicated, however, the increased movement during 1921 may be attributed, at least in part, to the fact that large stocks of lumber were on hand at the beginning of the year and also to unexpired contracts previously entered into. . . .

Conditions in Hardwood Industry Not Encouraging

"While the figures reflect a rather unfavorable financial condition of the defendants, this fact does not preclude us from finding particular rates or rates on particular commodities to be unreasonable when the facts are sufficient to justify such a finding.

"The present financial condition and business outlook of

the southern hardwood industry are far from encouraging. Defendants insist that this condition has resulted largely from stagnation in building and general business depression as well as from the increased use in recent years of cement and other lumber substitutes and is not the result of increased freight rates. On the other hand, as already pointed out, there is considerable testimony to the effect that if the reductions sought are established many of the lumber mills would resume operations. Complainants urge that the situation here is similar to that in *Rates on Grain, Grain Products, and Hay*, 64 I. C. C., 85, but the fact must not be overlooked that the carriers in the western district, which was principally affected by our decision in the *Grain Case*, were earning a return somewhat in excess of the return to which they were entitled under the transportation act, 1920, whereas the carriers principally affected in the present case are and have been earning as a whole substantially less than the return to which they are entitled under the law. Nevertheless it does not necessarily follow that the present earnings on hardwood lumber are properly adjusted to the aggregate earnings of the region, or that some readjustment may not be reasonable.

"The percentage increases, as applied to rates on hardwood lumber from points on defendants' lines to points in western trunk line, central freight, and eastern trunk line territories have to a considerable extent disturbed the relationship of rates between the more distant hardwood-producing points of the South and the comparatively near-by producing points of Michigan, Wisconsin, and other northern states. Manifestly this disturbance has been greater at some points than at others and the present record is inadequate for determination of the precise extent to which this disturbance has resulted at all destination points involved. In the basis which we prescribe herein, consideration has been given to the measure of the rates and also to a contraction of the spread between the rates from northern and southern producing points to common markets, with a view to making the spread for the future bear a closer relationship to that which existed prior to August 26, 1920. A revision of rates on hardwood lumber from southern points may stimulate the movement from those points to the destination territory described, and thereby increase rather than diminish the net revenue of the southern carriers."

Concurring and Dissenting Opinions

Commissioner McChord, in stating that he would approve more substantial reductions, said that conceding that there may still be some play of other economic factors in the situation, it is manifestly antagonistic to the interests of both carriers and producers to maintain rates at levels that tend to curb rather than to stimulate a flow of traffic. Commissioner Potter expressed the opinion that the complainants are entitled to reductions necessary to restore relationships and without regard to the other circumstances mentioned in the report, his thought being that the disproportionate increases by percentages of the long haul rates have, under existing conditions, become unjust and unreasonable and, therefore, the resulting rates are not just and reasonable.

Commissioner Daniels said that the sweeping finding of unreasonableness is not supported in the report by any citation of ton-mile earnings. If the rates prescribed were to be applied universally on lumber and forest products, the effect on carrier revenue might well prove revolutionary. No evidence of record is cited in the report, he says, that shows or tends to show that the rates reduced are unreasonable from the standpoint of earnings and on the showing made, the commission must be confronted with complaints from hardwood producers in the Northwest and Central Freight Association territory for corresponding reductions in their rates. The indeterminate standards of reasonableness on rates from the South, set up by this report, necessarily extend in their influence to all forest products from the South and this in

turn affects all from the Pacific Coast and Inland Empire which will bring into direct issue the rates from Wisconsin and Michigan and reduction there will start the wheel revolving again. Continuing, he says:

"The commission thus in effect sets up a criterion of reasonableness which is impossible of application unless it be assumed that all rates in this country were reasonable on some past date. August 25, 1920, is the date taken here, although on that date all the general percentage increases had been made except that under *Ex Parte* 74. Logically we should go back to the fore part of 1914, and starting from that must find that every percentage increase was unlawful to the extent that it changed the difference in amounts per unit between rates for longer and shorter hauls. It is of the essence of percentage increase that it should do that very thing. I am unable to accept the doctrine that every carrier which has made percentage increases under our express authorization will violate the law in maintaining the rates so established, and this report is bedded on that doctrine, whether consciously or not.

"The findings in the report are really less serious in their immediate effect on carrier revenue than in their prospective effect on future rate adjustments generally. There seems not unlikely an eventual equilibrium of general prices perhaps 50 per cent over the prewar level. To the new level, whatever it be, an adjustment must eventually be made. But until carriers' costs have been adjusted thereto, the reduction in rates, if it outruns the contemporaneous reduction in expenses, means progressive inability to meet the needs of traffic, indefinite postponement of securing additions and betterments which the normal growth of traffic renders indispensable, and will only intensify the distress that is certain to come, if and when industry again resumes its normal stride. For this reason it is imperative that reductions which we require should be made upon a carefully reasoned program, and not upon such inadequate and tenuous grounds as we here cite for our action."

Freight Car Loading in 1921

WASHINGTON, D. C.

THE NUMBER of freight cars loaded with revenue freight during the year 1921 was 39,037,817 as compared with 45,118,863 in 1920, 42,180,328 in 1919 and 44,755,041 in 1918, according to a compilation just made by the Car Service Division of the American Railway Association of the weekly reports made to it by the railroads. The 1921 figures represent a decrease of 13.7 per cent as compared with 1920, of 7.4 per cent as compared with 1919 and of 12.8 per cent as compared with 1918.

The average loading of freight per car in 1921 was slightly less than in 1920, due to the fact that since there were plenty of cars available throughout the year the shippers were less inclined to load cars heavily. Therefore, the actual reduction in the volume of freight handled was somewhat less than is indicated by the car loading figures. The statistics of ton miles of freight handled are available only for the first 10 months of 1921. For that period the reduction as compared with 1920 was 23 per cent.

The loading of grain and grain products in 1921 was greater than that for previous years, 2,281,852 cars as compared with 1,843,018 in 1920 and 2,048,968 in 1919.

The loading of less than carload merchandise was also much greater than for the preceding years, 10,677,226 cars as compared with 9,017,074 in 1920 and 3,165,619 in 1919.

The loading of other classes of freight, however, showed decreases as compared with 1920 and in most cases as compared with 1919 also. Live-stock loading was less than for the two previous years, 1,495,344 cars as compared with 1,553,424 in 1920 and 1,732,852 in 1919. Coal loading was

also much less than in the two preceding years, 7,934,048 cars as compared with 10,082,450 in 1920 and 8,829,883 in 1919.

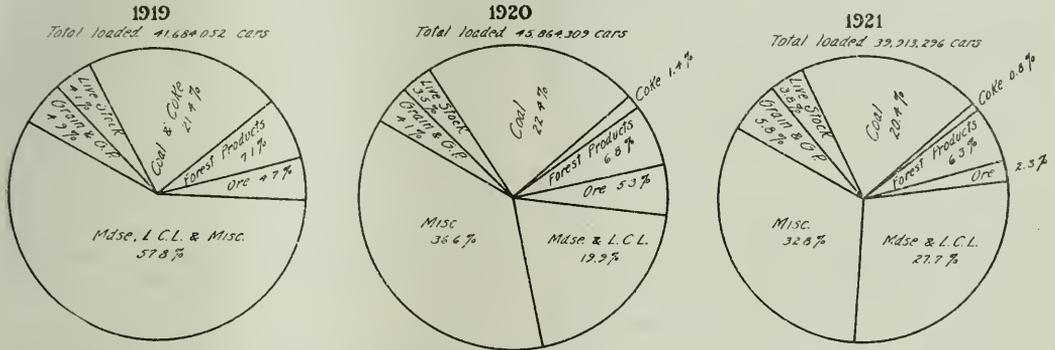

The number of cars of coke loaded was 303,898 as compared with 648,902 in 1920 and 225,517 in 1919; of forest products, 2,483,079 as compared with 3,056,923 in 1920 and 2,988,807 in 1919; of ore, 904,513 as compared with 2,413,893 in 1920 and 1,949,909 in 1919, and of miscellaneous freight, 12,957,857 as compared with 16,503,179 in 1920 and 21,201,811 in 1919.

Reports received by the Car Service Division of the American Railway Association show that 720,877 cars were

Coal also showed an increase of 22,263 cars over the previous week, the total being 159,245, but this was 23,551 cars less than during the same week last year. Reports showed 36,165 cars loaded with livestock, an increase within a week of 10,507 and 1,000 more than during the corresponding week of 1921. Loadings of grain and grain products amounted to 50,187 cars, an increase of 9,514 cars over the previous week and 4,702 more than the same week last year. It also was an increase of 9,367 over the corresponding week in 1920.

Forest products with a total of 48,490 cars showed an increase of 7,419 over the previous week and 3,876 more

REVENUE FREIGHT LOADED

EXPLANATION. Complete circle represents total loaded. Sectors of circle represent proportion of commodity indicated to total.

loaded with revenue freight during the week ending January 14. This was an increase of 114,885 cars over the week before, which was, however, a holiday week owing to the observance of New Year's day.

The total was an increase of 5,022 cars over the corresponding week in 1921, but 119,647 cars less than for the corresponding week in 1920.

Loading of merchandise and miscellaneous freight amounted to 415,081 cars, an increase over the week before of 64,802 cars and 27,328 cars more than were loaded during the corresponding week in 1921. It was, however, 57,660 less than were loaded during the corresponding week in 1920.

than during the same week in 1921. It was, however, less than in 1920. Ore loading increased 130 cars within a week to a total of 4,451 cars while coke totaled 7,258 cars or an increase of 250 cars over the week before.

Compared by districts, increases over the corresponding week in 1921 in the loading of all commodities were reported in all except the Allegheny, Central and Southwestern districts which showed decreases.

The freight car surplus for the period ending January 15 showed a considerable decrease over the previous week, amounting to 439,982, of which 190,180 were box cars, and 195,284 were coal cars.

Toronto Electrification Disapproved by Canadian Commission

A PLAN for establishing a system of radial electric lines extending in several directions from Toronto has been investigated and disapproved by the commission appointed to inquire into hydro-electric railways. The majority report opposing the plan as presented is signed by four commissioners while the minority report approving it is signed by one.

The railroads included in the proposal are spoken of as the hydro-radials and include a total of 325 miles of line. This total is divided among five radial lines varying in length from 44 to 83 miles, including one line which runs from Toronto to Niagara Falls. A part of these lines are to be built, while some are already in existence, owned by private corporations or by the Dominion government, and operated by the Canadian National Railways. Agreements are proposed for the interchange of freight and for operating over the tracks of other railroads at certain points. The project involves an expenditure of about \$45,000,000.

Outstanding Features of the Proposed Project

The hydro-radials, as proposed in the plan, are to be constructed and operated under co-operative public ownership. Power is to be obtained from Niagara Falls and from other hydro-electric plants in the vicinity.

The type of electric railway proposed is a counterpart of a high class steam road operating between large cities. It is proposed to combine the interurban passenger business with the shorter suburban and in some instances local city services, all for passenger transportation, with freight business, doing heavy carload service along with the lighter l. c. l. business; and express service. These additional classes are proposed to be superimposed upon an interurban railway, thus loading it to a capacity limited only by the practical operating conditions of its various lines.

The area proposed to be served by the projected system is not only the most populous in Ontario, but to some extent surrounds and is tributary to the capital city, with its population of over half a million. There have been no recent developments of suburban service by the steam roads in Toronto, and this has doubtless had a strong influence towards encouraging the project of hydro-radials.

Findings of the Commission

The commission was appointed under Order-in-Council and was directed to inquire into and report on the whole question of hydro electric railways and all matters which in the opinion of the commissioners were relevant thereto. It was also directed to make such suggestions and recommendations as might be deemed desirable.

Various matters having a bearing on the subject were raised and discussed and the findings of the commission, as published in the majority report, are as follows:

(1) "The financial condition of electric railways in Ontario and the United States in and prior to 1920 has been so precarious and unsatisfactory, and the outlook for improvement so dubious and discouraging, that the construction of the proposed system of electric railways should not, in our judgment, be entered upon unless the evidence of competent operating experts fully justified the conclusion that they will be self-supporting.

(2) "Upon full consideration of the evidence, and the greater weight to be given to the witness, we are of opinion that the proposed electric railways would not be self-supporting.

(3) "We are further of opinion that the construction of the proposed electric railways, paralleling and competing as they would with the Canadian National Railway System, would be unwise and financially insound and would strike

a serious blow at the success of government ownership.

(4) "We are further of opinion that until the Chippawa power scheme, now estimated to cost \$60,000,000 or upwards, is completed and has been in operation for sufficient length of time to be self-supporting, the Province would not be justified in endorsing the construction of an electric railway system at an initial estimated cost of \$45,000,000.

(5) "We are further of opinion that the endorsement by the Province of bonds of the Hydro Electric Power Commission for systems of electric railways in various parts of the Province, at the instance of the municipalities concerned, is highly dangerous and may lead the Province into great financial difficulties. The endorsement for one locality would give rise to demands for the like accommodation for other localities, which it will be hard for any government to refuse, and might result in the Province being drawn into serious financial liabilities, and we would therefore suggest that government endorsement of such bonds should be discontinued. To the risk involved in accommodation endorsements, it is no answer to say that they are mere matters of form involving no real liability. Individual and corporate experience is to the contrary.

(6) "Further, we are of opinion that the expenditure of \$25,000,000 on improvement of public highways in the Province having been begun, it would be unwise to commence the construction of the electric railways in question until the effect in the improvement of these highways has been ascertained, and the use of them by motor cars and motor trucks (whose competition with electric railways has been found so keen and difficult to meet elsewhere) made clearly apparent.

(7) "We are further of opinion that the rapidly increasing debts and financial commitments of the Dominion, Province and municipalities have aroused well-founded apprehension in the minds of thoughtful citizens, and are a cogent reason against the embarkation at this time in the construction of the contemplated electric railways."

The opinion is also expressed by the railway commission that the Hydro Electric Power Commission of Ontario made a fundamental error when preparing the original estimates, which was repeated when the supplementary estimates were prepared, in not seeking and securing the assistance of experienced operating men, particularly insofar as operating costs and possible revenues were concerned.

Alternative Suggestions

As the situation in the city of Toronto naturally separated itself from the rest of the project in the province, the commission deemed that it should be treated as a purely local problem and worked out with the view that the city of Toronto should undertake the construction and operation as a municipal enterprise co-ordinated with other undertakings of a similar nature now in hand. This alternative suggestion crystallizes into a purely radial scheme based on Toronto.

The term "radial" which was applied to the hydro-radial railway project had its inception in Toronto, where it is particularly applicable, and appears to have grown outward from its center.

The commission states that in general such a Toronto radial scheme, as it might be worked out, appears to offer various advantages. It would, states the report, supply an opportunity for a truly "radial" system of railways operating into the city from a suburban belt up to say 10 or 15 miles radius.

Such a unified transportation system, according to the report would enable the Civic Commission to work out its own plans in conjunction with the problem of the street railway proper when taken over, and would not put it in the position of being a competitor with another transportation system operating within its area, such as the hydro-radials might be.

Walker D. Hines Reviews Federal Control Period

Before Senate Committee Former Director General Replies to Criticisms of Railroad Administration Policies

WASHINGTON, D. C.

WALKER D. HINES, formerly director general of railroads, testified before the Senate Committee on Interstate Commerce on January 24 at the request of the committee, in connection with its general investigation of the railroad situation, presenting an extended statement reviewing some of the principal developments of the federal control period. Mr. Hines devoted particular attention to answering criticisms of the government's administration of the railways, and statements made by railroad officers attributing increases in operating expenses in 1920 to the results of the practices or policies of the Railroad Administration during 1919 or 1918. He was to be followed by W. G. McAdoo, who was director general in 1918.

Mr. Hines said he felt great pride in what was accomplished, particularly in view of the exceptional difficulties after the armistice, such as the diminution in morale; the loss of many of the most experienced railroad men in the Railroad Administration, such as Carl Gray, R. S. Lovett, A. H. Smith and C. H. Markham, and the impossibility at that late date to obtain other men of equal experience; the violent fluctuations in business on account of the slump in the first six months of 1919 and the nation-wide coal strike in the last two months, and the tendency to let down in morale as the change of control approached.

Operating Statistics Compared With 1920

He showed that compared with 1916 and 1917 the year 1919 made a far more favorable showing as to car shortages, notwithstanding that in September and October, 1919, the business had been exceedingly heavy, and was also more favorable as to the number of passenger train car miles and freight train car miles per locomotive mile, also as to passenger miles per passenger train mile, and also as to revenue ton miles per locomotive mile or per freight train mile. He said 1919 was also more favorable than 1920 in all these respects except revenue ton miles per freight train mile, and that in this respect also 1919 was more favorable than 1920 in what he termed the only two fairly comparable months—September and October.

Mr. Hines also asserted that, contrary to many representations, the car miles per day in 1919 had made an exceedingly favorable showing for the only months where comparison was fair, and that for practically all the months of 1919 the showing was better than in 1921.

He said that the year 1919 made a better showing than any of the preceding three years in the consumption of fuel, and also compared most favorably with 1920.

He called attention to the fact that in 1920 the transportation results obtained had been greatly applauded and also mentioned that they had not been exclusively through the action of the railroad companies but that the railroad executives had had to appeal to the Interstate Commerce Commission for its aid through unifying anew certain phases of transportation.

Mr. Hines claimed that the quotations he made from the reports of the regional directors for 1918 and 1919 show a vigilant and efficient performance of the public service and a satisfactory handling of the business under peculiarly difficult conditions. He mentioned specially the attention to insuring the scheduled performance of passenger trains, the handling of live stock, oil, and packing house products, etc., improvement in the freight claim situation, in fuel economies and in the methods of the stores' departments in handling

materials and supplies. These reports, he said, suggested the exceptional degree of initiative and energy displayed by the able railroad men who were charged with seeing to the adequate performance of the public service. He emphasized that such evidence had the advantage of viewing the whole situation and that no adequate idea could be obtained of the results by paying attention simply to extreme cases which could not reflect the general average of results achieved.

He stated that the federal managers were expected to operate according to established practices subject to the direction of regional directors, and subject to the policies of the central administration. He pointed out that these federal managers were absolutely free to select and change their subordinate officers just as under private control.

Mr. Hines then took up the question of efficiency of railroad labor. He said the true basis of comparison was the number of man hours paid for, since the change to the eight-hour day made comparison of the number of employees misleading and that the traffic units of service per man hour had increased from 82 in 1915 to 96 in 1917 and 1918 and to 100 in 1919, thus showing more traffic units per man hour than ever before. He stated that "with this start" the result had been even better in 1920 when 101 traffic units were realized for each man hour paid for. He suggested that 1921 ought to show even better results, especially since increased efficiency was to be expected as unemployment increased.

Maintenance

The allegations that the railroads were turned back in an under-maintained and broken-down condition were next discussed. Mr. Hines said this was a "fiction representing extraordinary distortion of the facts" and that if such conditions had existed, the regional directors would have been the first to know it and to comment upon it. He said their reports could be searched in vain for anything indicating a broken-down condition of the properties, but on the contrary, they showed the properties had been substantially maintained, except for some shortage of rails, ties and ballast upon some of the railroads. He elaborated upon this by quoting from reports of the various regional directors.

The critics of the Railroad Administration's maintenance policy, Mr. Hines said, seem to take the remarkable position that the Railroad Administration ought not to place any limitations upon the amount of maintenance, although every railroad company makes it the policy to limit its officers strictly in the amount of maintenance. Mr. Hines said it was indispensable to have a limitation to protect the government and that the Railroad Administration had adopted the perfectly proper limitation that the amount of maintenance should correspond reasonably with the government's contract obligations, except in circumstances where still more maintenance was necessary for safety, or in order to do the business satisfactorily.

Taking up equipment specifically, Mr. Hines said that the railroad executives seemed to take as a starting point the idea that their equipment was in an ideal condition at the beginning of federal control, but that this was wholly wrong. He quoted from testimony of President Rea of the Pennsylvania Railroad Company before the Interstate Commerce Commission in the Rate Advance Case in 1917, in which Mr. Rea said that it had been impossible to maintain passenger car equipment, that freight cars had been in service so continu-

ously that comparatively little general repair work had been done and a great many cars were in need of general repairs but had been kept in service by patching and that on account of insufficient and inefficient labor the locomotives were improperly prepared for road service and would break down en route, and that the Pennsylvania Railroad System, like the Eastern carriers as a whole, was in a situation where it had had to curtail maintenance expenses.

Mr. Hines also stated that Carl R. Gray, now president of the Union Pacific, transmitted with his report for 1918 as director of the Division of Operation in the Railroad Administration, a report from his mechanical department, which stated that one of the prime reasons why the government had to take possession of the railroads was the generally bad condition of locomotives and cars.

Because of the bad condition of equipment at the beginning of federal control and of the heavy use to which it had to be subjected during the war the shops had been worked from 60 to 70 hours per week until after the armistice, but were then reduced to eight hours per day. In the spring of 1919 the federal managers on account of the slump in business had reduced the shop hours and forces to some extent and the number of bad order cars considerably increased.

On this account in June instructions were issued to all the regional directors to restore all car repair forces to eight hours, in August instructions were issued to increase the car repair forces to nine hours, and in September these instructions were reiterated together with the direction that even if car repairs were low on a particular road it should work on repairs to cars from other railroads when feasible.

Mr. Hines explained that although it was believed that in view of the bad condition of equipment at the beginning of federal control and the heavy expenditures upon it, the government had substantially over-maintained the equipment, yet in order to handle the business an extensive maintenance program was carried on; but that naturally under such circumstances the government wished the maintenance put on equipment which it could use, and hence various instructions were issued to give the preference to repairs which could be made promptly so that the equipment could be speedily put in service in order to meet the heavy business that developed in mid-summer and the fall.

Mr. Hines contradicted a statement by Daniel Willard to the effect that the Railroad Administration had ordered a change in the standard of what made a bad order car. Mr. Hines said that, on the contrary, the tests of inspection were probably more strict during federal control than prior thereto, and in substantiation of this position he quoted from a memorandum prepared in November, 1919, by J. J. Tatum of the Baltimore & Ohio, who during the war was in the mechanical department of the Railroad Administration, to the effect that standards of inspection were higher during federal control than prior thereto. Mr. Hines also said that in the rate investigation before the Interstate Commerce Commission in 1917 Mr. Willard had shown that under private management the railroad companies were giving preference to repairs which could speedily be made, in order to get cars quickly back into service, rather than to make heavy repairs, and said this was precisely what Mr. Willard was attempting to condemn the Railroad Administration for doing.

The effect of his advice at the end of federal control, Mr. Hines said was that at that time locomotives were in distinctly better condition than at the beginning and that the condition of freight cars would compare favorably with the condition at the beginning. He emphasized that it must be remembered that both locomotives and freight cars were, generally speaking, in an exceedingly poor condition at the beginning of federal control and in a poorer condition in fact than was indicated by statistics, since the congestion and exceedingly abnormal conditions kept both locomotives and

cars from being classed as needing repairs when they really ought to have been so classed.

As to maintenance of way and structures, Mr. Hines explained that careful studies were made so as to enable the government to control the maintenance according to its contract obligation. He pointed out that the complaints offered to the limitations placed on maintenance rested necessarily on the untenable position that the government should have left the maintenance at the unlimited discretion of the regional directors and federal managers. He showed that aside from a temporary limitation for the month of June, which was "designed to get control of the situation," the limitation was simply to conform to the contract obligation. He maintained, however, that in doubtful cases it was better to fall somewhat short of the contract obligation rather than to exceed it, because the contract expressly gave the corporation a claim for the shortage and did not expressly give the government a correspondingly clear claim for the excess.

Labor Policies of the Railroad Administration

Turning to the labor policies of the Railroad Administration Mr. Hines said critics of these policies necessarily imply that they should have been left as they were before the war, but this was impossible because wages were known to be low and relations between managements and employees were decidedly strained and getting more so. The Railroad Administration was called upon to assume responsibility and to unify control and it had to adopt a policy. The critics offered no policy except the impossible one of leaving things as they were.

Mr. Hines characterized as extraordinary the apparent position of various critics that the railroad managers should have continued to have the final say as to all questions of discipline. He said the government could not tell the employees they must not strike because conditions had changed and they were working for the government and at the same time leave them subject to the same railroad managers without any supervision whatever by the government.

The necessity for government supervision was so obvious, Mr. Hines said, that the practical railroad men in the Railroad Administration promptly sanctioned the creation of the boards of adjustment and these were created by agreements between the regional directors and the representatives of organized labor. Mr. Hines said he understood all these agreements had the approval of Mr. Gray, director of the Division of Operation, and now president of the Union Pacific.

He had never heard any suggestion that any better method could have been selected for the discharge by the government of its responsibility in this matter than the method provided by these agreements entered into by the regional directors. He also said he believed these agreements constituted an important and beneficial precedent in dealing with the railroad labor problems of the country and that this was true whether such boards of adjustment in the future were local or national.

There had been much criticism of the excessive general level of railroad wages and of the excessive number of railroad employees, but after the return to private control, the Labor Board had shown that the general level of wages during federal control was not excessive by approving a further increase of over \$600,000,000 per year and the railroad executives had shown that the number of employees was not due to political considerations, because in 1920 they increased the number of employees by 118,000, and it then came to be more clearly realized that the director general was right in explaining that the increase in the number of employees was due to the eight-hour day and did not mean that the railroads had to pay for an increased number of hours.

Mr. Hines said that numerous comments had been made upon specific instances of excessive pay and no doubt among

nearly two million employees there would be a considerable number of cases of this sort, but that these cases were not typical, and it was precisely their extreme character which had caused them to be so widely discussed.

National Agreements

Taking up the national agreement with the shopcrafts, which was signed September 20, 1919, and made effective October 20, Mr. Hines said there were numerous important misconceptions tending to confuse the committee, particularly the notion that this national agreement accounted for a very large part of the heavy increase of \$345,000,000 in the cost of maintenance of equipment in 1920 as compared with 1919. He said that, contrary to the implications on the part of many of the critics of this agreement, the rules involving possibility of relatively great increases in cost had not been put into effect by the agreement but had been in effect throughout the year 1919. He pointed out that the recognition of the shopcrafts organizations and the handling of grievances by Board of Adjustment No. 2 were already in effect in 1918.

The points most discussed by critics before the committee and in the press, Mr. Hines said, were the standardization of pay and classification of work, resulting in making rates of pay uniform throughout the country and defining work so that it might be necessary for employees of several classes to work on the same job though a small one. He said these provisions of the national agreement were almost identical in language with the general order issued July 25, 1918, and hence they were in effect throughout 1919 and could not account for the increased expense in 1920, and the same was true as to time and a half for overtime over eight hours and for all time on Sundays and holidays. He said that there had also been much comment on the elimination of piecework but that this did not originate with the national agreement but resulted from instructions in December, 1918.

He also pointed out that numerous railroad companies had agreements similar to the national agreement prior to federal control, this being particularly true of the railroads in the Southwest, including Atlantic Coast Line, Norfolk & Western and Southern Railway and numerous others, and that agreements containing numerous similar provisions were in effect on many Southwestern and Northwestern railroads, and also that rules on many other railroads established many of the principles contained in the national agreement.

In order to show the bearing of this national agreement upon the increase of costs in 1920 over 1919, Mr. Hines said, it would have been necessary to eliminate the questions of standardization, classification, time and a half and piecework on all railroads and also to eliminate operations on a great many railroads to the extent that they had similar provisions before federal control, and that the result would have been so to narrow the effect of the national agreement as to force the railroad executives to omit the national agreement as a leading explanation for the increase of 1920 over 1919.

Mr. Hines claimed that, as a matter of principle, it was right and proper to establish by agreement a code of rules to protect the employees; that the railroad companies themselves had done this long before as to train and engine men and many of them had done so as to the shopcrafts. He explained that as to procedure the provisions of great relative importance, from a pecuniary standpoint, were already in effect and that all the provisions were considered and heartily recommended by W. T. Tyler, director of the Division of Operation, who had supervision of the negotiation and was in daily contact with it and who had the benefit of the advice of both the management and labor members of the Railroad Administration's Board of Wages. Mr. Hines claimed that these facts substantially contradicted the misleading statements by representatives of the organization of railway executives to the effect that he had signed an agreement gotten up solely by representatives of organized labor.

Why Rates Were Not Advanced in 1919

It seemed desirable, Mr. Hines said, to state the facts bearing upon the question of making an increase in rates in 1919, since most of the comment on that subject appeared to be made without knowledge of the facts. He explained that the entire deficit of Class I railroads in federal control up to October 1, 1919, was \$480,000,000 and would have been eliminated if the rate increases which took effect in June, 1918, could have taken effect January 1, 1918. This constituted a striking parallel to the condition in 1920, when practically the entire deficit for the 12 months could have been avoided if the rate increase had taken effect at the beginning of the year, instead of in September. But the necessary delay in the effective date of the increase in 1920 was not regarded as a reason for an additional increase. Another striking parallel existed between the first six months of 1919 and the twelve months of 1921, he said, in that in both these periods the failure to pay in full the contract rental or the statutory return was largely due to a slump in business, but no one claimed that there should be a further increase in rates on account of the slump in business.

By reason of these conditions, so similar to subsequent happenings, and because of the impracticability of an accurate estimate of operating cost on the basis of normal traffic, there was no plausible basis for an additional rate increase in the early part of 1919, Mr. Hines contended. Congress certainly manifested entire lack of sympathy with a further rate increase because it repealed the director general's right to put rates into effect without suspension by the Interstate Commerce Commission, removed any presumption of reasonableness attached to rate increases made by him, and also prohibited any increase in intrastate rates without consent of state commissions. While this bill was vetoed by the President on the ground that it subjected the federal power to the power of the states, it was clearly understood that the other features of the legislation would be adopted if rate increases were attempted.

As a result any rate increase in 1919 would have consumed several months because the commission naturally would not have assumed the greater responsibility which the proposed legislation would have imposed upon it except after thorough investigation.

When suggestions for a rate increase became insistent in the summer of 1919, it was evident they could not be made effective much, if any, before the return of the railroads to private control, which the President had announced would be on December 31.

The director general was unwilling in such conditions to attempt to make a rate increase which would be practically entirely for the benefit of private management, especially since the statutory power to make an increase seemed to contemplate that it would be for the purpose of paying operating costs and rental during the period of operation by the government as a unified system. In any event, such an increase would not have met conditions after the return to private control because the return contemplated by the statute was \$200,000,000 more than the rental payable by the government. In addition the increase in traffic made such a favorable showing in July, August and September, 1919, that only five per cent, or at most ten per cent, increase in freight rates appeared necessary to meet all conditions other than those of further wage increases and yet after the return to private control the railroads estimated they needed about \$900,000,000 increase, aside from wage increases. Hence in any event a second increase would be necessary after the return to private control, Mr. Hines said, and it was clear that two different increases would be so disturbing as to be seriously contrary to the public interest. Indeed, if a rate increase had been made effective, say in December, 1919, it is probable that public antagonism would have been so aroused as to make

the further increase necessary on the return to private control impracticable.

Mr. Hines said that he was thoroughly convinced that a rate increase under such conditions would be contrary to the public interest, would be detrimental rather than helpful to the railroad companies themselves and instead of promoting railroad credit would have been injurious to it.

In discussing the general financial results of federal control, Mr. Hines said two separate purposes must be clearly distinguished. One purpose was to ascertain the total appropriations which Congress had made and would have to make and that this purpose called for consideration of every character of expense connected with federal control. But, he said, the purpose primarily related to the Senate inquiry was entirely distinct, and was the purpose of comparing the federal operation of the Class I railroads with the private operation of those same railroads. For this purpose there were numerous expenses incurred by the government which had no bearing whatever and only those expenses should be considered which were embraced in the operating costs as defined by the commission's accounting rules. He pointed out that operating statistics of Class I railroads under private operation were not charged with differences between quantities of materials on the first and last of the year, not for loss on additions and betterments made for special purposes or for other items outside of regular operating costs.

None of these matters, Mr. Hines said, had any proper relation to a comparison of operating results of Class I railroads under private control and federal control. For the purpose of a fair comparison the entire deficit for the 26 months of federal control for the Class I railroads was the excess of the rental over the net railway operating income, or about \$714,000,000 for the 26 months, as compared with about one million dollars on the same basis for the first 12 months of private operation. But he said that was not a satisfactory basis for comparison because it depended so largely upon the level of rates and the dates when rate increases became effective. The true basis of comparison should be the total cost, which consists of total operating expenses, tax accruals, etc. On this basis the total cost of operating Class I railroads was:

In 1917	\$3,080,000,000
In 1918	4,240,000,000
In 1919	4,690,000,000
In 1920	6,109,000,000

Testimony of Labor Representatives

Mr. Hines was followed by J. E. Anderson, vice-president of the International Association of Machinists, representing the Railway Employees' Department of the American Federation of Labor, who made a general statement denying that the national agreements had caused unnecessary expense or had hampered the operations of the railways, saying that the cases cited by railroad officers to discredit the national agreements were extreme cases. Some of the cases, he said, did occur and some were only partly true, while others were wholly fictitious and in some cases the effects cited were due to the inefficiency of the management in administering the rules. He asserted that many of the rules had been in effect on hundreds of railroad before the national agreements, and he filed with the committee a statement which he said contained detailed answers to every example of the effect of the national agreements which had been cited by representatives of the railroads. He said there had never been an opportunity to present these in full either to the committee or to the Railroad Labor Board and that the labor board had recently issued a decision as to the rules which he considered most unjust and to his mind indicated that the board had been influenced by the railroad propaganda. In reply to a question by Senator Cummins, Mr. Anderson said that there

is no authority that can figure out the exact cost of the national agreements as they have been applied under abnormal conditions.

J. J. Dermody, vice-president of the Order of Railroad Telegraphers, presented a statement prepared by E. J. Manion, president of that organization. Mr. Manion said that the railroads in their testimony had apparently desired to leave the impression that if they had not been taken over by the government wages would not have been substantially increased and that the increases made were excessive and left as a heritage to the private managements on the return of the railroads. He said that when the government took over the railroads there were pending demands for wage increases from practically all classes of employees and that the first increases made during federal control in 1918 were, therefore, in the nature of a heritage from private control. He declared that railroad employees had been so underpaid before that time that the percentages of increase seemed high. He went into detailed analysis of the wage schedules from the standpoint of the telegraphers.

H. T. Hunt Testifies

Henry T. Hunt, formerly a member of the labor board, gave a general discussion of the railroad situation, taking as a text a statement made in testimony by A. H. Smith, president of the New York Central, that "95 per cent of this railroading is human." Mr. Hunt took the position that the railroad problem is rather of men than money and that one of the most important essentials to an improvement of the railroad situation is a greater degree of co-operation between the managements and the employees. He said two things are necessary, a better morale among the personnel of the railroads and better credit for the railroads. He declared that railroad employees never have been and are not overpaid, but that the difficulties of the railroads do not arise so much from their wage costs as from the methods of the railroad managements in handling their labor and capital. He recognized that many economies in railroad operation could be brought about by greater capital expenditures but he said the railroads are not now using the money that is available in the ways that will tend toward the greatest of economies. The railroad executives say that they are doing all they can do to bring about greater co-operation with their employees, but they are not acting in such a way as to convince the employees of their sincerity and the employees do not think the managements have done all they can to bring about good will.

For example, he said, frequently thousands of railroad employees are laid off without warning because all the available income is required to meet interest payments, yet at the same time the employees see the railroads spending money for competitive purchases, such as the proposed purchase of the Chicago Junction by the New York Central. In other words, he said, the managements do not give labor sufficient consideration in planning their outlays. If certain capital expenditures resulted in labor saving to such an extent as to require less men, the men could adjust themselves to that condition, but the ways in which the railroads now economize frequently result in large lay-offs without warning.

Good management, he said, could stabilize the number of employees and thus improve the quality of labor. He also pointed out that the fixing of just and reasonable wage rates by some authority does not insure an adequate compensation to the men, because the board in fixing the wage rates assumes continuous employment and when the men are laid off the effect is destroyed. As one remedy he suggested that the employees ought to have a greater degree of participation in the management, including representation on the boards of directors, and he suggested that banking interests should nominate representatives of labor for membership on the boards.

General News Department

The Interstate Commerce Commission has issued orders authorizing common directors among the companies comprising the systems of the Philadelphia & Reading and the Boston & Maine.

The Nashville, Chattanooga & St. Louis, on January 9, changed its engine terminals from Lexington, Tenn., to Hollow Rock Junction where new repair shops and other buildings will be provided.

Senator La Follette has published in the Congressional Record of January 23 a memorandum report of the alleged "secret" conference held at Washington on December 9, attended by representatives of the railroads and shippers, including several farm organizations.

The Youngstown Equipment Company has taken a contract to operate the Kent (Ohio), shops of the Erie Railroad. Webster W. Warner, superintendent of shops has resigned his position with the railroad to become manager for the equipment company.

The United States Supreme Court on January 23 denied the petition of the state of North Dakota for permission to file an original bill against the order of the Interstate Commerce Commission increasing intrastate rates in North Dakota. The court held that the case must be first taken up in the district court.

The engineman and fireman of the Southern Pacific operating their locomotives with the greatest efficiency in the use of fuel oil, are to be awarded gold badges. The name of the winner with the date of the award is to be inscribed on the back of the medal. If a man wins an award a second time, a red enameled star will be inserted in the badge. The award is to be made on a three months' performance basis.

Passenger train punctuality on the Pennsylvania railroad during the year recently ended is reported as 11 per cent better than the previous year. For the period from March to December, inclusive, for the two years, 93.9 per cent of the passenger trains operated were on time in 1921, as against 82.5 per cent on time during the same period in 1920. In 1921 the percentage of trains making schedule time was 96.8, an improvement over 1920 of 4.8 per cent.

Theft of a locomotive and a carload, of cheese from the Chicago & North Western yards in Milwaukee, Wis., is the charge against two men now under arrest in that city. The men obtained the locomotive by posing as railroad employees. They ran engine and car 18 miles, but were halted at a crossing by another train and were forced to make a get-away. It was the plan of the thieves to unload the cheese into a truck and then dispose of the loot through the establishment of one of the men, who had a commission business.

Meals at a fixed sum of one dollar are now furnished at mid-day and evening on the dining cars of the Sunset Limited express trains of the Southern Pacific, the diner having a choice of meat or fish, two vegetables, bread and butter and coffee, tea or milk. The commissary department of the Southern Pacific now furnishes from its headquarters at West Oakland, Cal., the material for 250,000 meals monthly. The West Oakland plant is now being enlarged and will soon be the largest and most complete establishment of its kind in the world, so far as is known.

The New York Farm Bureau Federation announces that efforts are to be made at once to secure the repeal of the New York State full-crew law. S. L. Strivings, president of the Federation, in a statement issued at Syracuse, says

that advices received from the railroads show that the unnecessary expenses incident to this law in New York State amount to \$2,000,000 yearly—or to \$3,000,000 when freight traffic is heavy. During the seven years and five months that this law has been in effect, the railroads have been put by it to an unnecessary expense of about \$16,000,000.

Engineers of seven different classes are now wanted by the Interstate Commerce Commission, for duty in connection with the valuation of railroads and telegraph lines; and the Civil Service Commission, Washington, announces that applications will be received until further notice. Salaries range from \$1,320 for junior engineers to \$2,700 for senior engineers, grade 2. Appointees whose salary is \$2,500, or less, and whose services are satisfactory, may be allowed the regular bonus of \$20 a month. Engineers of the several grades are wanted in the fields of civil, electrical, mechanical, signaling, architectural and telegraph engineering.

Edward H. Shaughnessy, second assistant postmaster general, speaking at a hearing before the post office committee of the House at Washington has set forth the reasons which make desirable a general and extensive enlargement of the air mail service. He says that business interests, particularly bankers, are calling for additional air mail service, especially night flying, by which they would save large sums of interest by exchanging their clearings from city to city in less time. Representative Steenerson, chairman of the committee, has prepared a bill under which the postmaster general would contract for the establishment of routes and would prescribe, for transportation of first class mail by airplane, rates three times the regular postage rates.

Tentative Valuations

The Interstate Commerce Commission has issued tentative valuations in which it finds the final value of the property of the Durham & South Carolina as of June 30, 1917, to be \$460,796 and of the Ulster & Delaware for 1916 to be \$6,472,889 for the property used and \$6,468,019 for the property owned.

Sleeping Cars for the Canadian Pacific

In the description of the new sleeping cars for the Canadian Pacific published on page 1301 in the issue of December 31, 1921, it was stated that the frames and trucks were built by the Canadian Car & Foundry Company. We are now informed that the frames and trucks of 18 of the 12-section sleeping cars were built by the National Steel Car Corporation, Ltd., Hamilton, Ont.

I. C. C. Appropriation

The independent offices appropriation bill reported by the House appropriation's committee on January 18 provides for an appropriation of \$4,859,500 for the Interstate Commerce Commission for the fiscal year 1923, of which \$1,300,000 is for the valuation work. The valuation appropriation is \$450,000 less than the appropriation for 1922 and \$200,000 less than was recommended by the Budget Bureau.

Examination for Locomotive Inspectors

The United States Civil Service Commission announces an open competitive examination for inspectors of locomotives on March 8 and 9, 1922. Vacancies in the Bureau of Locomotive Inspection of the Interstate Commerce Commission at salaries of \$3,000 a year and in positions requiring similar qualifications will be filled from this examination. Applica-

tions for the examination should be made on Form 1892 which can be obtained from the Civil Service Commission, Washington, D. C.

The June Conventions

In the *Railway Age* of January 21, in a news item announcing the arrangements of the Railway Supply Manufacturers' Association for exhibits at the annual convention of the American Railway Association, Division V, appeared a statement to the effect that, although it was considered advisable to cancel the convention in 1922, manufacturers were showing great interest in the plans for this year's convention. This statement is plainly a typographical error. The sentence referred to the convention which was cancelled in 1921 and not to this year's convention. Otherwise the item is correct. Plans are being made to hold the convention this year with exhibits, on June 14-21, at Atlantic City.

Feiker to Continue With Department of Commerce in Advisory Capacity

F. M. Feiker, vice-president of the McGraw-Hill Publishing Company, who for the past eight months has been assisting Secretary of Commerce Herbert Hoover in the reorganization of the department has resigned. Mr. Feiker has not, however, completely severed his relations with the department. He has been appointed a special agent of the Bureau of Foreign and Domestic Commerce, to continue in a consulting capacity the work he has begun. Under the direction of Mr. Feiker and Dr. Julius Klein, director of the Bureau of Foreign and Domestic Commerce, the industrial and business contacts of that Bureau have been enlarged, business relations with trade association committees have been established and the so-called commodity division of the Bureau created.

Union Leaders Dissatisfied With Labor Board Decisions

E. H. Fitzgerald, president of the Clerks Organization, in commenting on the new rules (see page 277 of this issue) declared that the recent action of the Labor Board in abolishing time and one-half for the ninth hour "virtually had created a nine-hour day contrary to the intent of the Transportation Act and to common practice in all industries." Mr. Fitzgerald said he and the members of his organization were

greatly disappointed over the decision, terming it "a hard blow, especially in view of the proposed further wage reduction to be sought."

"We are also opposed to that part of the decision covering intermittent service because it provides split tricks, whereby employees are required to be available for duty 12 hours in order to gain pay for eight," he added.

Following conferences at Chicago extending for over two weeks, a committee of 100, representing the six federated shop crafts, decided on January 24, to open a fight on the overtime provisions of the new shop crafts working rules announced by the Labor Board recently. A circular will be issued ordering the system federations on the individual carriers to institute new disputes with the railway managements. If no agreement is reached the issue will be brought before the Labor Board again.

Resumption of Service on the Southern Pacific of Mexico

Service will be restored over the rehabilitated lines of the Southern Pacific of Mexico into Tepic and Nayarit, on February 2. Trains will be run from Nogales, twice weekly, on Thursdays and Sundays. In announcing this service, H. B. Titcomb, president of the Southern Pacific of Mexico, states that it is difficult to forecast the time when the complete reconstruction of the properties will be made, and also the time when reconstruction will be undertaken on the Tonichi and the Mamos branches. Mr. Titcomb said that the Mexican officials were in full accord with the reconstruction program and that they are now considering seriously the question of financing the amounts due to the Southern Pacific of Mexico.

Pressed Steel Mfg. Co. Wins Patent Suit in District Court

In the suit of the Pressed Steel Manufacturing Company, Chicago, and W. P. Murphy, against the Mt. Vernon Car Manufacturing Company, Mt. Vernon, Ill., for patent infringement, a decision has been handed down by the United States judge for the Eastern District of Illinois, sustaining the validity of all of the claims of the plaintiff's patents at issue. The patents involved are known as the Murphy-Sisson patent No. 1,031,571, Sisson re-issued patent No. 14,434, Murphy patent No. 1,058,880, Sisson patent No. 1,271,234 and Sisson patent No. 1,254,860, and contain a large number of claims, only 13 of which are at issue. The claims

I. C. C. SUMMARY OF RAILWAY REVENUES AND EXPENSES FOR NOVEMBER (241 ROADS)

	November		11 months	
	1921	1920	1921	1920
1 Average number of miles operated	235,583.62	235,086.98	355,758.82	347,544.11
2 Revenues				
3 Freight	\$342,024,698	\$436,801,309	\$1,615,562,465	\$3,341,811,442
4 Passenger	182,653,536	210,665,315	1,065,431,278	4,135,626,356
5 Mail	7,241,535	8,341,313	85,806,900	143,176,199

 3 Includes sleeping and parlor car surcharge.
 4 Includes sleeping and parlor car surcharge.

involved are all basic, covering the corrugated steel plate end for freight cars; and the court has decided that they are valid and have been infringed by the defendant, the Mt. Vernon Car Manufacturing Company, in building 1,000 box cars for the Baltimore & Ohio, which were equipped with corrugated steel plate ends furnished by the Chicago-Cleveland Car Roofing Company. An injunction and order for accounting has been granted by the court.

Notice of appeal has been filed by the defendant.

University of Illinois—

Research Graduate Assistantships

The University of Illinois announces that there are ten vacancies for the position of Research Graduate Assistant in the Engineering Experimental Station and also one position for a man who wishes to specialize in gas engineering. These positions are open to graduates of approved American and foreign universities and technical schools who are prepared to undertake graduate study in engineering, physics and applied chemistry. Appointments are made for two consecutive years, at the expiration of which period, if requirements have been met, the degree of Master of Science will be conferred. Not more than half of the time of the assistant is required in connection with the work of the department, the remainder being available for graduate study. Research work and study may be undertaken in railway, mechanical, electrical or civil engineering and also in other branches.

Attached to the position is an annual stipend of \$600 and freedom from fees except these in connection with matriculation. Additional information and application blanks can be obtained from the Director, Engineering Experimental Station, Urbana, Illinois.

"Conditions Affecting the Head of a Rail"

The discussion of the paper presented by James E. Howard, engineer physicist, Interstate Commerce Commission, before the New York Railroad Club on January 20, while brief, brought out that there was a considerable variance of opinion regarding rail failures from that expressed in the paper. Robert Job, chemist, Montreal, Canada, stated that there were other factors to be considered aside from the question of wheel loads. The condition of the steel was highly important in this connection as, for instance, experience had shown that there was a tremendous decrease in fissures when brittleness was eliminated. He also took exception to the statement regarding impinging pressures since fissures do occur under light pressures. He cited in detail some of the results obtained in Austria where there are light wheel loads and where fissures have occurred in number but only where the steel was unsound.

C. B. Bronson, mechanical engineer, New York Central, stated the roads must secure rail to meet the conditions since they have heavy wheel loads and cannot escape from them. On the New York Central, he said, there had been an enormous increase in traffic during past years, with an increase in wheel loads but on the other hand the number of rail failures had decreased. He cited numerous examples of where heavy wheel loads were common yet the occurrences of fissures was comparatively rare. He said that the roads recognized the responsibility resting upon them in this respect but believed that it was a joint responsibility with the manufacturers. He emphasized this point by citing some stretches of line where fissures had been numerous with one make of rail but when a different make had been substituted, the trouble had stopped and no fissures had been recorded to date. Decreasing rail failures was a problem regarding which both the road and the steel companies must co-operate closely and where that was done, better results would be secured.

National Chamber of Commerce

To Consider Railroad Situation

The railroad situation and what should be done about it will be considered at a meeting of the National Council of the Chamber of Commerce of the United States to be held in Washington on Wednesday and Thursday, February 8 and 9. The council is made up of one representative each

from the 1,400 business organizations within the membership of the chamber.

Some business men see a drift towards government ownership and operation unless the roads can be put on a self-supporting basis. They feel that the transportation act should be given a longer trial and that attempts which are being made in Congress to amend the act, if successful, will precipitate a crisis which may make it impossible for the roads to continue under private management. The chamber's railroad committee is of the opinion that the transportation act can be left untouched and at the same time there can be worked out a constructive plan. It will suggest to the council meeting a program for dealing with the situation. This committee in the past has made suggestions which have been adopted by the chamber's membership and some of the corresponding principles subsequently have appeared in legislation. The transportation act itself contains many features which the committee strongly recommends as a result of the years of study which it has devoted to railroad transportation in the United States.

Negotiations Between Railways

and Train Service Brotherhoods

A meeting of the member roads of the Association of Railway Executives was held in Chicago on January 21 to consider whether negotiations between various groups of the railways and the train service brotherhoods should be reopened in an attempt to arrive at a settlement of existing differences by direct negotiations. The meeting grew out of informal conferences between several railway executives and the heads of the train service brotherhoods which were initiated by Secretary of Commerce Hoover.

Following the meeting in Chicago, Thomas DeWitt Cuyler, chairman of the Association of Railway Executives, authorized the following statement, which shows the decision reached by the railways at their meeting:

"On Monday, January 16, Secretary Hoover issued a statement referring to an informal meeting held in Washington on that date between some of the railway executives and representatives of the train service organizations, and said in part:

"It was decided to submit to the railway companies and to the train and engine service organizations the proposal that the pre-war regional conferences should be convened to consider and endeavor to adjust all questions between the railways and the four brotherhoods."

"At a meeting of the member roads of the Association of Railway Executives, held in the Hotel Blackstone today, this suggestion was submitted, and the following resolution adopted:

"Resolved, That it is the sense of this association, as one of the methods provided by Section 301 of the Transportation Act, that conference committees, representing the railway managements in the Eastern, Southeastern and Western territories of this association, similar in nature to those which in some territories handled negotiations with the four brotherhoods prior to federal control, be constituted and be authorized to meet with the four train and engine service brotherhoods, in a fair effort to compose and adjust all points now at issue, no restrictions to be imposed upon the consideration of any and all questions of wages and rules governing working conditions.

"In default of an understanding mutually agreeable in any territory, recourse to be had to the Labor Board in the regular manner provided by the Transportation Act.

"This resolution shall not be construed so as to prevent separate negotiations in additional territories not mentioned above, if desired by the roads in such territory, nor shall it be construed as preventing railroads individually from exempting themselves from such general negotiations, substituting therefor individual negotiations with their own men."

"The four transportation brotherhoods above referred to are the Brotherhood of Locomotive Engineers, Brotherhood of Locomotive Firemen and Enginemen, Order of Railroad Conductors, and Brotherhood of Railroad Trammens, and constitute approximately one-quarter of the railway employees of the country.

"This action does not involve an abandonment by the railways of their previously pledged policy to seek a reduction in the labor cost of railway operation, the benefit of which

is to be turned over to the public in reduced rates. It simply represents an attempt, by direct negotiation and discussion with the leaders of these four organizations, to arrive at a fair and amicable settlement of the present questions affecting those employees."

National Railway Appliances Association Exhibitors

The following firms have taken space and are arranging to participate in the exhibit which the National Railway Appliances Association will present in the Coliseum, Chicago, on March 13-16, during the annual convention of the American Railway Engineering Association and the stated meeting of the Railway Signal Association. As noted, this list includes 161 firms which have taken place to date.

Adams & Westlake Company, Chicago.
Adams Motor & Manufacturing Company, Chicago.
Air Reduction Sales Company, New York.
American Abrasive Metals Company, Chicago.
American Car & Foundry Company, Chicago.
American Casting Company, Birmingham, Ala.
American Chain Company, Inc., Bridgeport, Conn.
American Hoist & Derrick Company, St. Paul, Minn.
American Kron Scale Company, New York, N. Y.
American Malleable Castings Association, Cleveland, Ohio.
American Radiator Company, Buffalo, N. Y.
American Steel & Wire Company, Chicago.
American Valve & Meter Company, Cincinnati, Ohio.
American Vulcanized Fibre Company, Pittsburgh, Pa.
Argyle Railway Supply Company, Chicago.
Armo Culvert & Flume Manufacturers' Association, Middletown, Ohio.

R. & L. Baker Company, Cleveland, Ohio.
Balkwill Manganese Crossing Company, Cleveland, Ohio.
Barrett Company, New York.
Barrett-Cravens Company, Chicago.
Bethlehem Steel Company, Bethlehem, Pa.
Boss Nut Company, Chicago.
Blaw-Knox Company, Pittsburgh, Pa.
L. S. Brach Manufacturing Company, Newark, N. J.
Brown Hoisting Machinery Company, Cleveland, Ohio.
Bucyrus Company, South Milwaukee, Wis.
Bryant Zinc Company, Chicago.
Buda Company, Chicago.

Carbie Manufacturing Company, Duluth, Minn.
Carter Bloxwood Flooring Company, Chicago.
Challenge Company, Batavia, Ill.
Chicago Bridge & Iron Works, Chicago.
Chicago Flag & Decorating Company, Chicago.
Chicago Malleable Castings Company, Chicago.
Chicago Pneumatic Tool Company, Chicago.
Chicago Railway Signal & Supply Company, Chicago.
Central Electric Company, Chicago.
Cleveland Railway Supply Company, Cleveland, Ohio.
Crerar, Adams & Company, Chicago.
Chipman Chemical Engineering Company, Inc., New York.
L. & R. Culvert Company, Chicago.

Delco-Light Company, Dayton, Ohio.
Detroit Graphite Company, Chicago.
Detroit Steel Products Company, Detroit, Mich.
Diamond State Fibre Company, Bridgeport, Pa.
Dickinson, Paul, Inc., Chicago.
Dilworth, Porter & Company, Inc., Pittsburgh, Pa.
Direct Sales Company, Chicago.
Doty Business Machines Company, Chicago.
Duff Manufacturing Company, Pittsburgh, Pa.
Edison Storage Battery Company, Orange, N. J.
Edison, Thos. A., Incorporated, Bloomfield, N. J.
Electric Storage Battery Company, Philadelphia, Pa.
Elwell-Parker Electric Company, Chicago.
Engineering & Contracting Publishing Company, Chicago.
Eymon Crossing Company, Marion, Ohio.
Fairbanks, Morse & Co., Chicago.
Fairmount Gas Engine & Railway Motor Car Company, Fairmount, Minn.
Federal Signal Company, Albany, N. Y.
Federal Electric Company, Chicago.

Flannery Bolt Company, Pittsburgh, Pa.
Fisg. Switch & Manufacturing Company, Carlisle, Pa.

General Automatic Scale Company, St. Louis, Mo.
General Electric Company, Schenectady, N. Y.
General Railway Signal Company, Rochester, N. Y.
Globe Company, Chicago.
Grave Construction Company, Chicago.
W & I E. Gates, Inc., N. Y.

Hall Signal & Signal Company, Garwood, N. J.
Hawley Rail Joint Company, Macon, Ga.
Hayes Tank Apparatus Company, Richmond, Ind.
Hazard Manufacturing Company, Chicago.
Headley Good Roads Company, Philadelphia, Pa.

Howlett Construction Company, Moline, Ill.
Hubbard & Company, Pittsburgh, Pa.
Illinois Steel Company, Chicago.
Ingersoll-Rand Company, New York.

Johns-Manville, Inc., New York.
O. F. Jordan Company, East Chicago, Ind.

Kalamazoo Railway Supply Company, Kalamazoo, Mich.
Kaustine Company, Inc., Buffalo, N. Y.
Kelly-Derby Company, Inc., Chicago.
Kerite Insulated Wire & Cable Co., Inc., Chicago.
Keuffel & Esser Company, New York.
Keystone Tool Grinder & Manufacturing Company, Pittsburgh, Pa.
Kilbourne & Jacobs Manufacturing Company, Columbus, Ohio.
Kochring Company, Milwaukee, Wis.

Lehon Company, Chicago.
Lorain Steel Company, Lorain, Ohio.
Lufkin Rule Company, Saginaw, Mich.
Lundie Engineering Corporation, The, New York.

M. W. Supply Company, Philadelphia, Pa.
Mac Rae's Blue Book, Chicago.
Maintenance Equipment Company, Chicago.
Massey Concrete Products Corporation, Chicago.
McGraw-Hill Company, Inc., New York.
Mechanical Manufacturing Company, Chicago.
Midvale Steel & Ordnance Company, Philadelphia, Pa.
Miller Train Control Corporation, Danville, Ill.
Milwaukee Tank Works, Milwaukee, Wis.
Morden Frog & Crossing Works, Chicago.
Mudge & Company, Chicago.

National Boiler Washing Company of Illinois, Chicago.
National Carbon Company, Inc., Cleveland, Ohio.
National Lead Company, New York, N. Y.
National Lock Washer Company, Newark, N. J.
National Malleable Castings Company, Cleveland, Ohio.
Geo. P. Nichols & Bros., Chicago.
Northwestern Motor Company, Eau Claire, Wis.

Ogile Construction Company, Chicago.
Okonite Company, Passaic, N. J.
O'Malley Beare Valve Company, Chicago.
Oxweld Railroad Service Company, Chicago.

P. & M. Company, Chicago.
Page Steel & Wire Company, New York City.
Patterson Company, W. W., Pittsburgh, Pa.
Pittsburgh-Des Moines Steel Company, Pittsburgh, Pa.
Pocket List of Railroad Officials, New York.
Positive Rail Anchor Company, Marion, Ind.
Pyrene Manufacturing Company, Chicago.

Q and C Company, New York.

Rail Joint Company, New York.
Railroad Accessories Corporation, New York.
Railroad Herald, Atlanta, Ga.
Railroad Supply Company, Chicago.
Railway Purchases & Stores, Chicago.
Railway Review, Chicago.
Railway Safety Tie Company, Milwaukee, Wis.
Ramapo Iron Works, Hillburn, N. Y.
Raymond Concrete Pipe Company, Kansas City, Mo.
Rawls Machine & Manufacturing Co., Chicago.
Reade Manufacturing Co., Jersey City, N. J.
Richards Manufacturing Company, Massillon, Ohio.
Richards-Wilcox Manufacturing Company, Aurora, Ill.
Geo. J. Roberts Company, Dayton, Ohio.

Sellers Manufacturing Company, Chicago.
Signal Accessories Corporation, Utica, N. Y.
Sherwin-Williams Company, Cleveland, Ohio.
Simmons-Boardman Publishing Company, New York.
T. W. Snow Construction Company, Chicago.

Templeton, Kenly & Company, Ltd., Chicago.
Toledo Pipe Threading Machine Company, Toledo, Ohio.
Track Specialties Company, New York City.
Train Control Appliance Company, El Paso, Texas.

Union Switch & Signal Company, Swetsville, Pa.
U. S. Wind Engine & Pump Company, Batavia, Ill.

Verona Tool Works, Pittsburgh, Pa.
Volkhardt Company, Inc., Stapleton, S. I., N. Y.

Wales Dove-Hermiston Corporation, Cleveland, Ohio.
Warren Tool & Forge Company, Warren, Ohio.
Watersbury Battery Company, New York.
Wayne Oil Tank & Pump Company, Fort Wayne, Ind.
Werner Machine Company, West Mills, Wis.
West Disinfecting Company, New York.
Western Electric Company, Inc., New York.
Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.
Wm. Wharton, Jr. & Co., Inc., Easton, Pa.
Wood Shovel & Tool Company, Piqua, Ohio.
Woods Bros. Construction Company, Lincoln, Neb.
Woolery Machine Company, Minneapolis, Minn.
Wyoming Shovel Works, Wyoming, Pa.

Traffic News

F. P. Dougherty has been appointed traffic manager of the Beaver Board Companies, with headquarters at Buffalo, N. Y., succeeding G. E. Griffith, who has resigned.

The Chesapeake & Ohio has reopened its office at Seattle, Wash., and it is in charge of I. W. Dudley, general agent, who was in charge at the time of closing the office when the government took over the railroads.

The Seattle Transportation Club elected the following officers on January 10: President, Alpheus Byers; vice-presidents, I. P. Iversen and W. S. Elliott; secretary-treasurer, R. A. Nichols; directors, W. J. Barr, R. E. Johnston and O. H. Wood.

The Traffic Club of Kalamazoo, Mich., has elected the following officers: President, J. F. Campbell, traffic manager, A. M. Todd Company; vice-president, C. E. Reed, agent, Grand Trunk; secretary, C. H. Winslow, assistant traffic manager, Kalamazoo Chamber of Commerce; treasurer, L. E. Weirs, agent, Chicago, Kalamazoo & Saginaw.

The re-establishment of week-end excursion fares, abolished in 1918, is indicated by an application of the Southern Pacific, approved by the railroad commission of the state of California, on January 13, introducing such fares from Oakland and San Francisco to points in northern California and to towns in Contra Costa county.

Traffic men of Texas will meet at Dallas, on February 8, to confer and decide upon a policy with which to go before an examiner of the Interstate Commerce Commission at St. Louis, Mo., on February 20, at a hearing to consider the establishment of a mileage scale of class rates from Mississippi river crossings to points in Texas.

Senator Trammell of Florida, submitted in the Senate on January 19, a resolution directing the committee on interstate commerce to investigate the present express rates on citrus fruits, vegetables and other perishable farm products with a view to bring about early legislation that will result in a reduction. The resolution was referred to the committee.

The Indianapolis Traffic Club has elected the following officers: president, F. A. Butler, secretary-treasurer, C. B. Cones & Son Manufacturing Company; vice-presidents, W. H. Coltharp, traffic manager, Midwest Engine Company; G. J. Jeffries, general superintendent, Terre Haute, Indianapolis & Eastern Traction Company and Herbert Clark, traffic manager, Ball Brothers, Muncie, Ind.; secretary-treasurer, George N. Baker, freight traffic agent, Monon.

Secretary Hoover, of the Department of Commerce, is warning the public and large consumers of coal that the stage is apparently set for a strike of coal miners on April 1 when the present wage contracts expire and that it would be well for coal consumers to stock up in advance. In this connection he has observed that there has been a general disposition to hold off orders in the hope of a reduction in the freight rates on coal, but has ascertained that there is practically no possibility that any such reduction could be made effective before April 1.

Maine Roads Not Included

in Agricultural Rate Reduction

In the issue of December 31 there was published a statement that the Interstate Commerce Commission on December 22 had granted permission to the New England railroads, at their request, to make the general 10 per cent reduction in rates on agricultural products. We have since been advised that this item was incorrect in giving the impression that all the New England lines were to reduce the rates. The Canadian Pacific lines in Maine, the Bangor & Aroostook, and the Maine Central refused to join in making the reduction. The potato, apple and hay crops were

very large in Maine last year and the three Maine roads felt that they should not be called upon to make the reduction, particularly as at least two of the roads were not in a financial position to reduce their revenues.

Coal Production

During the week ended January 14 bituminous coal production increased to 8,268,000 net tons, according to the weekly report of the Geological Survey. This is a larger production than has been reported since late in November.

Railroads Decline to Reduce Export Coal Rates

R. N. Collyer, on behalf of the tidewater coal carriers, has advised Chairman McChord, of the Interstate Commerce Commission and Secretary Hoover, of the Department of Commerce, that the railroads have given further consideration to the suggested reduction of one dollar a ton in the inland freight rate on coal for export by water and have come to the conclusion that they can find no justification for the reduction. The letter says the present export coal situation appears to be the result of an economic condition caused by unstable foreign credit and exchange, and industrial depression; and also by the comparatively high costs in this country. Also that it is clearly shown that the rate proposed would be ineffective in meeting foreign competition either in the Mediterranean or the West Indies and South America.

Perfect Package Month

The "perfect package campaign," carried out throughout the month of November by the American Railway Express Company and the American Railway Association, resulted in a mass of statistics, made up from data gathered in 1,294 cities, showing that 99.1 per cent of the shipments made during that month at the several express offices and freight stations in those cities were in satisfactory condition. The other nine-tenths of one per cent consisted of shipments in which the carriers made some exception, because of faulty packing, marking or billing. The total number of shipments recorded was 20,239,097, of which a little more than half were by express and a little less than half by freight. The report, issued by Lewis Pilcher, secretary, Chicago, on behalf of the American Railway Association, and by J. H. Butler, New York City, on behalf of the express company, says that some of the local committees which were formed to carry out this campaign, have been continued, for the purpose of providing facilities for the discussion, between shippers and carriers, of problems of mutual interest.

Dinner of Chicago Traffic Club

The fifteenth annual dinner of the Traffic Club of Chicago was held at Hotel La Salle on January 24, with an attendance of about 800 and President R. B. Robertson in the chair. The toastmaster was George A. Blair, general traffic manager of Wilson & Company. Governor Henry J. Allen of Kansas was the first speaker. He said, in part: Labor has killed the goose that laid the industrial egg. More than six million men are now idle because of unstable labor conditions. He dwelt largely upon the success of the Industrial Court of Kansas, where, out of 40 decisions affecting wages and working rules 37 have satisfied both sides. The weakness of the Railroad Labor Board results from the fact that its decisions need not be obeyed.

The next speaker was George M. Barnard, Public Service Commissioner of Indiana. He attacked the apathy of the American people in politics which has allowed our legislation to drift without national aim resulting in Congress being coerced into passing the Adamson Law, on what he called the blackest day in American history; four hundred thousand controlled destiny of over one hundred and ten million. He said that the railroads should be emancipated. The Railroad Labor Board should be abolished or else combined with the Interstate Commerce Commission.

Both speakers were agreed in the opinion that the railroad wage scales should be adjusted so as to permit freight rates to be lowered and thus pave the way for a return of normalcy.

Commission and Court News

Interstate Commerce Commission

The Commission has issued an order authorizing common officers and directors among companies subsidiary to or affiliated with the Chicago & North Western.

The commission has suspended from January 24 until May 24, the operation of certain schedules which provide for the non-application of rates on lumber and other forest products in connection with the Colorado & Southern Ry., when originating in California and Nevada and destined to points in Colorado, leaving combinations applicable.

The commission has suspended from January 26 until May 26, the operation of certain schedules published by the Chicago, Burlington & Quincy which propose the cancellation of transit privileges on grain or seeds at Schuyler, Neb., when originating on the Chicago, Burlington & Quincy in Kansas, Nebraska, Colorado, South Dakota, Montana and Wyoming and destined to Missouri River points, Chicago, St. Paul, Duluth, etc., and points taking same rates, routing via Columbus, Neb., and Union Pacific to Schuyler, Neb., and move out via the Union Pacific, Fremont, Neb., and Chicago, Burlington & Quincy, resulting in the application of combination rates in lieu of the present through rates plus transit charge of 5½ cents per 100 pounds.

State Commissions

The Public Utilities Commission of the state of Michigan, on January 18, opened an inquiry as to whether freight rates on farm products in the state are too high. All Michigan railroads have been ordered to appear on February 15 to show why these rates should not be reduced. The summons states that five different associations of shippers had appeared before the commission and obtained reduction in rates affecting their business but that the farmers, having no organization for gathering the necessary data, had not appeared.

Court News

Gates or Flagman Not Required

The Minnesota Supreme Court holds, in a crossing accident case, that, while the crossing was on a much traveled highway and within the corporate limits of a village, where there were no houses in its immediate vicinity and the view was not obstructed for travelers, and the line was a branch line over which a passenger and freight train passed each way daily, a finding of negligence in failing to maintain gates, a flagman or other warning device, in the absence of a statutory requirement, was not justified.—Hollister v. Hines (Minn.), 184 N. W. 857.

Freight Agent Cannot Agree

to Purchase Damaged Shipment

In an action by a consignee for damages to a shipment of canned tomatoes plaintiff relied upon a statement of the local freight agent as to the damaged cans, that "we will take care of them." The Maine Supreme Judicial Court holds this did not mean that the railroad would take the goods off the plaintiff's hands, but meant no more than that it would dispose of them as it could and account to the plaintiff for the proceeds. Moreover, the power to admit liability for negligence in transportation or to make contract in whatever amount to purchase at face value damaged goods in the hands of dissatisfied consignee is far outside the scope of the freight agent's employment. The company having disposed of the damaged goods and tendered the proceeds to the plaintiff, verdict for the plaintiff for that amount only was affirmed.—A. Gauthier & Son v. Hines (Me.), 115 Atl. 258.

Sunday Held a Holiday Within

48-Hour Limit of Liability

The New York Appellate Division holds that Sunday must be deemed a legal holiday within the provisions of the uniform bill of lading making a carrier liable as a warehouseman only for loss by fire occurring after 48 hours exclusive of legal holidays after notice of arrival. So far as the court found, the only reported decisions construing these provisions on this point are *Hussa Brewing Co. v. C. & N. W.*, 151 Wis. 666, 139 N. W. 415, and *St. Louis B. & M. v. Hicks* (Tex. Civ. App.) 158 S. W. 192, and in both of them it was held that Sunday was excluded.—*Cereal Products Co. v. D. L. & W.*, 190 N. Y. Supp. 698.

Necessity for Structure Along Line a Question

For the Executives, Not for a Jury

The New York Appellate Division holds that the necessity of building fences, water plugs, mail cranes, and other structures along the line of a railroad for the transaction of business, is a question of judgment, depending upon many facts not readily susceptible of proof, and is a question for the executives of the company, not for a jury to decide (*Southern Pacific v. Berkshire*, 254 U. S. 417). When the company has erected its structure, it then may become a question of fact as to whether the location was made and the construction done in a negligent manner.—*Long v. Payne*, 190 N. Y. Supp. 803.

Not Liable for Goods Stolen Before Received for

In an action for the value of a bale of cotton, it appeared that the plaintiff had bought the bale from a farmer, who delivered it on the platform and notified the plaintiff, but not the defendant. During the day plaintiff bought 15 other bales, which were similarly placed. At the end of the business day he applied for a bill of lading. The first bale placed on the platform had disappeared and the agent refused to receipt for it. The railroad had posted a notice that it would not be liable for goods left on the platform until issuance of bill of lading. The South Carolina Supreme Court holds the railroad was not liable, notwithstanding the shipper's custom of so leaving bales purchased by him.—*Behrmann v. Atlantic Coast Line* (S. Car.) 109 S. E. 397.

Cold Waiting Room—Damages Must Be Shown

The Mississippi Supreme Court holds that the mere violation of the statute requiring railroads to heat and light their passenger waiting rooms for 30 minutes after the arrival of trains for the use of disembarking passengers does not give a right to recover damages unless it is also shown that the violation resulted in injury to a passenger having the right to use the waiting room. This was regarded by the court as an unusual case, in that the plaintiff, with her husband and two children, was unable to get accommodation for the night at a hotel, and but for the friendly shelter of the waiting room, in which they might have built a fire, they would have had to stay out in the open all night in extremely cold weather.—*Davis v. Day* (Miss.) 89 So. 814.

Railroad Held to Have Acquired Title

by Adverse Possession for 70 Years

In an action in ejectment by the City of New York to recover possession of a strip of land 66 feet in width running from 72d street, New York, to Spuyten Duyvil creek, now used by the New York Central as a part of its system, the New York Appellate Division holds that, the railroad having constructed its tracks on land owned by the city under a claim that its franchise from the state entitled it to do so, and having used the land as a right of way for more than 70 years under this claim, and paid taxes thereon as its property, the railroad had acquired title to the land by adverse possession. Judgment of dismissal was therefore affirmed.—*City of New York v. New York Central*, 190 N. Y. Supp. 777.

Labor Board Decisions

Section Foreman Reinstated

A section foreman on the Central of New Jersey was dismissed on April 2, 1920, as a matter of discipline. The Labor Board decided that the discipline administered was too severe and that he should be reinstated to his former position with seniority rights unimpaired; but not paid for the time lost.—*Decision No. 579.*

Dismissal of Freight Brakeman

for Inefficiency Sustained

A brakeman riding three loaded oil cars that were "kicked" onto a side track failed to stop the cars in time to prevent the loaded cars from striking an empty flat car and breaking it in two. The carrier contended that the accident was the fault of the brakeman for not slackening the speed in time and that his former record was indicative of carelessness and indifference. The Labor Board decided that the claims of the employee for reinstatement could not be sustained.—*Decision No. 527.*

Five-Day Week Not Violation of Rules

On February 9, 1921, the Central of New Jersey found it necessary to make further reductions in expenses and to avoid further decreasing its forces it introduced the five-day week. Maintenance of way employees objected to this measure and quoted Section 1, Article V, of the agreement which reads: "Gangs will not be laid off for short periods when proper reductions of expenses can be accomplished by first laying off the junior men." The Labor Board decided that the railroad did not violate the meaning and intent of the section and that the employees were not entitled to claims for payment for the days lost.—*Decision No. 519.*

Runaround Claims Denied

At Duran, N. M., a terminal on the El Paso & Southwestern where no switch engine is employed, two extras east had been called. While they were coupled onto and making up their trains and drawing time under the schedule, an express train of cantaloupes arrived. Another engine and crew were called and got out ahead of both of the other extras. The carrier contended that the first-in-first-out rule did not apply where engine crews had been called to make up their own trains, which custom had been borne out by past practice. The claims of the enginemen of the first two extras for runaround pay was denied by the Board.—*Decision No. 486.*

Extra Men for Winter Work Not Section Laborers

During the winter of 1920-1921, extra gangs were employed by the Chicago & North Western for removing snow from the right-of-way, the men in some cases working with regular section men. These men were paid straight time for the ninth and tenth hours, but contended that because they were employed with section hands they were entitled to time and one-half after eight hours. The railroad contended that it was within its rights in organizing extra gangs for extra work at any time and the men must be paid in accordance with rules governing the payment of extra gangs. The decision of the Board sustained the contention of the railroad.—*Decision No. 522.*

Full Day for 6½ Hours and Pay for 3 Hours for Reporting When Not Notified Not to Report

Under Rule 50 of the national agreement, the employees contended that two clerks who had reported for work on the Pere Marquette at their regular starting time, having not been notified, and were then sent home without working,

were entitled to three hours' pay therefor; and that three men, who worked 6½ hours, were entitled to not less than 8 hours' pay. The carrier took the opposite view but the Board held that the men having been regularly employed, were entitled to compensation as contended by their representatives and the position of the employees was sustained.—*Decision No. 566.*

Daily Rated Clerical Employees

Allowed Pay for Armistice Day

The employees at a freight station of the Pere Marquette at Lansing, Mich., with daily rating on the payroll, were notified not to work on Armistice Day, November 11, 1920, this day being declared a legal holiday. The employees claimed one day's pay which had been deducted from their wages on the ground that Rule 66, as it referred to holidays designated in Rule 64, did not cover the case, as the railroad contended. The board upheld the contention of the employees, ruling that since other holidays had not been agreed upon in addition to those in Rule 64 the employees involved were entitled to receive pay for Armistice Day.—*Decision No. 574.*

Right of Clerical Employee to Seniority Right

The position of clerk in the enginehouse of the New York, New Haven & Hartford, at East Providence, R. I., was abolished and the road declined to allow the employee released to exercise his seniority in claiming a position in the enginehouse at Providence, R. I. The employee contended that in the absence of an agreement the seniority districts established by Supplement No. 7, to General Order No. 27, remained in effect, and therefore he had the right to exercise his seniority rights. The board upheld his contention and ruled that he should be permitted to exercise his seniority to any position within the scope of the national agreement and that he should also be reimbursed for the time lost on account of being refused the right to the transfer when his position was abolished.—*Decision No. 578.*

Extra Gang Men Refuse to Work Late

for Straight Time

On July 12, 1921, 23 extra gang laborers on the Delaware, Lackawanna & Western were engaged in unloading ballast under conditions that made it desirable to have them work overtime, the assistant foreman advising them that they were to be paid straight time for so doing. Previous to this they had been paid time and one-half for overtime, but in accordance with Addendum No. 2, to Decision No. 119, pro rata rates had been established, of which however, the men were not aware. Consequently they refused to work and were dismissed. The Labor Board sustained the action of the carrier but decided that the railroad must not discriminate against these men in case they apply for re-employment.—*Decision No. 588.*

Dismissal of Section Foreman Not Sustained

A section foreman on the San Antonio, Uvalde & Gulf at North Pleasanton, Tex., was dismissed on January 27, 1921, on the ground that he had not been sufficiently attentive in watching his mail box for instructions coming to him by mail or telegraph, as a consequence of which he failed to cover up some oil as instructed in a telegram. The carrier also contended that his failure to follow instructions in this case was a culmination of numerous failures to do so and that he also failed to detect broken angle bars about 2½ months earlier. Inquiry developed that the failure to find the telegram in his mail box was not considered adequate reason for discharging the foreman and that the matter of the angle bars had not been called to his attention at any previous time. The decision of the board was that the management of the railroad was not justified in relieving Mr. Davis and he was restored to his position with seniority rights and paid for time lost.—*Decision No. 552.*

Train Dispatcher Paid for Time Absent on Account of Sickness

In a case between the American Train Dispatchers' Association and the Denver & Rio Grande, it was contended that a dispatcher should be paid for time absent on account of sickness from May 14 to June 20, 1920, inclusive, in accordance with a rule of the road to the effect that dispatchers should be accorded the same treatment as the other division officers for loss of time on account of sickness. The carrier contended that it was not the practice to pay division officers for time lost on account of sickness when necessary to employ some one in their places, and also that the dispatchers are on an eight-day basis while the other division officers are on a monthly basis. The Labor Board sustained the position of the dispatcher.—*Decision No. 564.*

Reduction of Earnings of Clerical Employees to 4½ Days a Week Not Upheld

Five employees in the purchasing department of the Gulf & Ship Island at Gulfport, Miss., were required to work 4½ days a week or 20 days a month, on account of a decrease in business. These employees entered a complaint, contending that the action of the carrier was in conflict with Rule 66, while the carrier contended that the action was taken to avoid reducing the force, that all but one employee expressed willingness on circulation of a petition and that protest was not made until April, 1921, although the change was made in January. The board held that the reduction of the working days of the employees below six days a week was in violation of Rule 66 and that the employees should be compensated for the cut.—*Decision No. 572.*

Section Foremen Not Paid Extra for Work on Holidays

The United Brotherhood of Maintenance of Way Employees and Railway Shop Laborers presented a claim for compensation for section foremen on the Southern Pacific for work performed on holidays. Prior to federal control section foremen were paid by the calendar month for service including Sundays and holidays. The increase under Supplement No. 8 to General Order No. 27 made no change in the number of days constituting a month's work. Under the National Agreement, effective December 16, 1919, the section foremen were placed on a 313-day basis, allowing extra compensation for Sunday work. The carrier continued this plan after March 1, 1920, but the Brotherhood contended for a 306-day basis to allow for seven regular holidays. The board sustained the action of the carrier.—*Decision No. 546.*

Track Watchmen Should Be Paid a Monthly Basis

On the Lehigh & Susquehanna division of the Central of New Jersey, 74 men are employed as track watchmen and 6 are classified as tunnel watchmen, assigned to eight-hour shifts, paid a monthly rate of \$114.67 and allowed overtime for any service outside of the eight-hour tour of duty. On another division of the railroad these men are paid by the hour, the same as track walkers. The contention of the men was that they should be paid on an hourly basis, the same as on other divisions of the railroad, but the railroad contended that this work was of a special nature requiring the men to spend practically all of their time on inspection work and that under the provision of Section 4-12, Article V of the agreement promulgated by the United States Railroad Administration, these men should be paid a monthly rate and that they are not track walkers in the ordinary sense of the term. The Labor Board sustained the railroad.—*Decision No. 583.*

THE CANADIAN PACIFIC, according to a statement attributed to an officer of the company, is going to establish through fortnightly passenger service between England and the Orient through Canada. The steamship agents report fairly heavy through bookings for this service already.

Foreign Railway News

Polish Railway Rates to Be Reduced

LONDON.

According to a Reuter dispatch, the Polish government has decided to reduce railway fares by 50 per cent.

Electrification of Greek Railways

LONDON.

Approximately 300 miles of line are to be electrified in Greece, in which is included the railways of New Greece. This electrification it is estimated will represent a saving of about 3,000 tons of coal in about 15 to 20 years.

Head of Swiss Federal Railways Resigns

Hans Dinkelmann, for many years president and director general of the Swiss Federal Railways, has been elected director of the International Bureau of Railroads at Berne, Switzerland, succeeding the late Mr. Forrer. Mr. Dinkelmann has resigned from the service of the Swiss Federal Railways.

Proposed Electrification in Serbia

LONDON.

The Yugoslav government has submitted to the Parliament a proposal for the electrification of the Serbian railways. The length of line proposed to be electrified is 530 miles and will involve the construction of a number of hydro-electric stations. The £4,000 (\$19,464 at normal rate of exchange) granted to Serbia by the British government is to be used in railway construction.

Oil Fuel for Russian Locomotives

LONDON.

Reports from Moscow state that the Soviet government intends to import a large amount of corn and meat from Siberia during January, and has given instructions for the locomotives of the Zlatomst railway to be adapted for the consumption of oil fuel. The railway employees are promised special bonuses payable in money and bread if the task is carried out successfully.

Passenger Tickets Include Hotel Accommodations

LONDON.

The London, Brighton & South Coast railway, have arranged in conjunction with Thos. Cook & Son, tourist agents, to issue combined railway and hotel weekend tickets from London to Brighton and Eastbourne, seaside holiday resorts close to London. The tickets will provide for hotel accommodation and will be available from Friday or Saturday to the following Monday.

Exports of Locomotives in November

Sixty-one steam locomotives, valued at \$2,558,771, were exported in November, as compared with 92, valued at \$3,509,440 during October. Mexico continued as the largest purchaser, receiving 40 of the month's total. Detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Number	Dollars
Mexico	40	1,756,270
Cuba	2	31,341
Dominican Republic	1	29,000
Brazil	1	23,500
Chile	10	360,000
China	3	300,000
Philippine Islands	4	58,660
Total	61	2,558,771

A Correction

In the item on the reorganization of the London & North Western and the Lancashire & Yorkshire, published in our last week's issue, it was incorrectly stated the reorganization was to take effect next year. Instead the changes have already been brought about. It should also be noted that

Ashton Davies is superintendent of the Northern division and L. W. Horne of the Southern, whereas the reverse was stated.

Exports of Car Wheels and Axles in November

Exports of car wheels and axles in November totaled \$60,625, as against \$142,895 during October. Detailed figures by countries as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Dollars
Canada	6,972
Honduras	192
Mexico	2,220
Jamaica	53
Cuba	1,987
Dominican Republic	246
Brazil	785
Colombia	291
Ecuador	460
Venezuela	160
China	37,200
British India	314
Hongkong	3,510
Japan	5,863
Australia	350
Total	60,625

New Line in Mexico

Construction of the Chihuahua & Orient Railroad will be started soon by William D. King, who recently obtained a concession from the Mexican Government for the project, according to reports from Candelaria, Mexico. It is explained that while the proposed railroad will be in the nature of a separate and private enterprise its primary object is to afford a transportation outlet for the ores of the mines of the Eripcion Mining Company and that this corporation will finance the construction of the line. The proposed railroad will run from a point on the Juarez-Chihuahua division of the National Railways of Mexico, near Candelaria, to the Los Lamentos Mountains and thence to the Chocolate Mountains. According to the terms of the concession plans and specifications must be submitted for approval to the secretary of Public Works within 80 days from the date of signing the contract and active construction work must be started within sixty days after the plans and specifications have been approved.

Waste on Russian Railways

LONDON

According to recent advices, the Russian Commissary for Communication, Djerdjinsky, has handed to the Petrograd Soviet a report complaining of waste on the railways which states that 80 per cent more fuel is consumed than formerly. He further states that for economical reasons and because of the difficulty in procuring the necessary food, fuel, and so forth, the railway system of Russia is to be worked in three sections. The first will be the only one of the three to receive all its requirements from the state, this being because of its necessity in the transport of food and fuel. The second section will receive half its requirements from the state and the third will receive only 30 per cent, the balance in both the second and third sections being provided by the local population. Owing to the difficulty of fixing railway rates in consequence of the fluctuations in the value of the ruble, a proposal has been made that freight for the transport of goods should be paid in natura, the railways taking a percentage of the goods transported.

Repair of Italian Rolling Stock

LONDON

The locomotives owned by the Italian State Railways at the present time number 6,150, and all of them are badly in need of repairs, nothing having been done to them since before the war. In order to improve the condition of the rolling stock, the Italian State Railways Administration, has decided to give repairs to national and foreign firms in addition to the government repair shops. It is estimated that the present need requires that 120 to 125 locomotives be repaired monthly, whereas the government works are only able to repair 60 locomotives monthly and private works 15 monthly. With the increase in the number of repair shops, namely 17 as against 6 in the year 1920, it is expected that the required number will soon be reached. German and Austrian firms have receive 450 locomotives for repairs. It is stated that

the cost of repairing locomotives in the government works is from 10 to 15 per cent lower than that of the private repair shops.

Italy has under construction three new types of locomotives, namely: (1) a four-axle, coupled locomotive for fast trains to be used on the lines of low gradients, (2) a five-axle, coupled locomotive for passenger trains, to be used on the mountain lines, and (3) a tank locomotive with four axles, coupled, for the lines of the Appennino.

Car Exports in November

In November, 11 passenger cars were exported from this country. None were exported in October. One hundred sixty-three freight cars were exported in November, valued at \$222,630, as against 83, valued at \$278,412 in October. Detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Passenger		Freight and other		Parts of cars
	Number		Number		
Belgium					\$15,153
Germany					1,920
Spain					10,305
England					1,939

British Owners of Interoceanic

(Mexico) Become Restive

The British owners of the Interoceanic Railway of Mexico are growing restive at the delay of the Mexican government in handing back their properties and in making compensation for using them. The properties have been operated by the National Railways of Mexico and during the past seven years the company has received no compensation.

The present administration in 1920 made the promise to meet its obligations. In the light of the promise the company is of the opinion that the government is unduly slow in making good. The chairman of the company likened President Obregon's plea that the properties should not be returned until they were restored physically to a tenant who wrote his landlord as follows:

"I am not sending you a check for the quarter's rent, as my children have done so much damage to the nursery that I am using the rent to carry out the necessary repairs."

At a meeting of the stockholders it was resolved:

"That the holders of debenture and capital stocks in the Interoceanic Railway of Mexico (Acapulco to Vera Cruz), Ltd., a British undertaking incorporated under the Companies Acts of Great Britain and the bulk of whose debenture and stocks and capital is held by British subjects, most indignantly and emphatically protest against the arbitrary action of the Mexican government in retaining the railways for upwards of seven years and in not returning them to the rightful owners, while neither paying over the compensation due to the company, as laid down by the Railway Law of Mexico, nor even remitting the net earnings of the company's lines."

A similar resolution was passed at a meeting of the stockholders of the Mexican Southern, a railway leased by the Interoceanic.

Track Material Exports in November

Track spikes, weighing 818,840 lb. and valued at \$23,385, were exported in November, as against 1,035,484, valued at \$41,780, in October. Exports of steel rails jumped from the October figure of 9,976 tons to 15,026 tons, valued at \$677,032, in November. Switches, frogs, splice bars, etc. exported were valued at \$333,495, as against \$194,855 in October. Detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Railroad spikes, pounds	Rails of steel, tons	Switches, frogs, splice bars, etc.
Canada	147,000	2,502	\$3,521
Costa Rica	7,000	110,464
Honduras	86,900	1,144	2,044
Nicaragua	600	5,253
Panama	15	4,655
Salvador	7,700	224	1,407
Mexico	34,973	978	1,380
Cuba	90,400	552	23,196

Total quantity	818,840	15,026
Total value	\$23,385	\$677,032	\$333,495

Exposure of Graft on Mexico's Railways Reported

Since Ramon P. de Negri became a member of the administrative staff of the National Railways of Mexico as the personal representative of President Alvaro Obregon nearly eight months ago a number of changes and reforms have been accomplished in the management of the government controlled property, according to advices from Mexico City. According to Mr. Negri's own statement one of the most difficult problems and abuses he has had to meet was the widespread system of graft that was in operation in every department of railroad service when he entered upon his new duties. He asserted in a recent statement that during the last ten months of the year 1921 the National Railways lost approximately \$300,000,000 by graft. This is exclusive of an enormous sum of money which was taken out of the pockets of shippers by the same system of graft. Such a strong hold had the practice of taking tribute from the railroad and shippers become that Mr. Negri found his efforts to eliminate this enormous leakage opposed at every turn. The fact, however, that he has plenary powers granted him by President Obregon enabled him to go to the heart of the abuses in many instances and as a result of his efforts much of the graft has been abolished.

It is stated that formerly commanding officers of the army in a number of cases exercised absolute jurisdiction over the movement of trains in their respective military zones. No shipments could be made without money tribute being first paid to them. In other instances government officials apportioned to their personal use a certain percentage of the freight and passenger receipts of the stations in the territory over which they exercised jurisdiction. So extensive was this practice of graft that in order to get a car of freight moved the shipper had first to pay the yardmaster, switchmen and engine crew a bonus; then when the car was finally attached to the train, the entire crew from the conductor to the brakeman had to be "sugared" in order to insure the movement of the car to destination. If this was not done the car would be set out on some remote siding and perhaps not heard of again for weeks or months.

Another phase of the many peculiar arrangements which he found was that of farming out railroad cars and engines to private corporations, especially large manufacturing and mining concerns. There were even private transportation companies organized for this purpose. Although the freight rate charged by these private transportation companies was 50 per cent higher than the regular rates many shippers found it to their advantage to patronize them because better and prompter service was obtained by that method than by the railroad itself. This novel method of handling shipments has been done away with

Equipment and Supplies

Locomotives

The DONNER STEEL COMPANY, Buffalo, N. Y., is inquiring for 1, 0-6-0 type locomotive.

THE ERIE RAILROAD is having 5 Santa Fe type locomotives repaired at the shops of the Lima Locomotive Works.

THE DELAWARE, LACKAWANNA & WESTERN, reported in the *Railway Age* of December 10, as inquiring for 5 Pacific type locomotives has ordered this equipment from the American Locomotive Company.

THE CHICAGO, BURLINGTON & QUINCY, noted in the *Railway Age* of November 12 (page 959), as having authorized the purchase of 55 locomotives for heavy passenger and heavy and light freight service, is now inquiring for this equipment.

Freight Cars

THE NATIONAL RAILWAYS OF MEXICO have ordered 250 tank cars from the General American Tank Car Corporation.

THE UNITED FRUIT COMPANY, New York, is inquiring for 50 fruit cars of 30 tons capacity, for use on the Tela Railway.

THE CENTRAL OF GEORGIA is having a number of steel hopper cars repaired at the shops of the Chickasaw Shipbuilding Company.

THE NEW YORK, CHICAGO & ST. LOUIS has ordered 300 steel underframe stock cars from the Illinois Car & Manufacturing Company.

THE CHICAGO, BURLINGTON & QUINCY is expected to order the greater part of the freight cars which it has on inquiry about January 30.

THE ATLANTIC COAST LINE will build 50 box cars at its Waycross, Ga., shops and is inquiring for steel super structures and steel underframes for these cars.

THE GREAT NORTHERN, it is expected, will place contracts for refrigerator and passenger cars which it is inquiring for about February 15, while the date of ordering the other equipment on inquiry is indefinite.

Passenger Cars

THE BALTIMORE & OHIO is inquiring for 40 coaches, 2 dining cars, 3 combination baggage and mail and 5 mail cars.

THE ATCHISON, TOPEKA & SANTA FE reported in the *Railway Age* of August 6 as inquiring for 10 dining cars, has ordered 8 dining cars from the Pullman Company.

THE CHICAGO & NORTH WESTERN has ordered 3 combination baggage and smoker cars and 3 chair cars from the American Car & Foundry Company. This order is in addition to the order for 44 cars noted in the *Railway Age* of January 21 (page 251) and makes a total of 50 passenger cars ordered by this road.

Iron and Steel

THE SOUTHERN is inquiring for prices on 26,600 tons of 85-lb. rail and 8,500 tons of 100-lb. rail.

THE FLORIDA EAST COAST has ordered 2,500 tons of rail from the Tennessee Coal, Iron & Railroad Company.

THE CAROLINA, CLINCHFIELD & OHIO has ordered 5,000 tons of rail from the Tennessee, Coal, Iron & Railroad Company.

THE MINARETS & WESTERN has ordered 10,000 tons of 60 and 75 lb. rail from the American representative of the Forges de la

Providence Marchienne-Au-Pont, Belgium. This company has also purchased 300 tons of structural steel for bridge work from the American Bridge Company.

Miscellaneous

The NORFOLK & WESTERN will receive bids until 12 o'clock noon February 8, at Roanoke, Va., for 2,100 lbs. of tie dating nails and 1,726,459 tie plates.

TAKATA & Co., New York City, has ordered from the United States Steel Products Company, 2,000 axles to be used on freight cars in Japan.

THE CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS is inquiring for approximately 5,000 bbl. of cement for the period from February 1, 1922, to April 1, bids to be submitted to W. J. Hiner, Cincinnati, Ohio, before 12 o'clock noon on February 1.

THE NEW YORK CENTRAL will receive bids until 12 o'clock noon February 3, for its requirements of track bolts, splice bars, frogs, switch points, track switches complete, offset splice bars, iron pipe farm gates, fence wire, crossing frogs, double curved frogs and railroad crossings.

THE CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS is inquiring for 15 openhearth, rigid frogs; 14 openhearth, spring frogs; 2 manganese frogs, insert type, and 66 switch points. Bids are to be submitted to W. J. Hiner, Cincinnati, Ohio, before 12 o'clock noon on February 1.

THE NEW YORK CENTRAL will receive bids until 12 o'clock noon, February 8, for the requirements of the New York Central and subsidiary companies of track spikes and angle bars. Bids will also be received until 12 o'clock noon February 9, for the requirements of the same companies of steel wheels for locomotive, passenger car and tender repairs.

The NORFOLK & WESTERN will receive bids until 12 o'clock noon, February 1, at Roanoke, Va., for 1,100 bars of reinforcing steel, 120 billets of welding steel, 1,000 sheets of polished steel; requirements for one year of certain renewal parts for electrical equipment and certain electrical apparatus, and the like; repairs to electrical apparatus and repair parts for mechanical stoker; one 5,000 kva. transformer; 500 tons of steel rail and 150 steel tees.

Signaling

THE PHILADELPHIA & GARRETSFORD STREET RAILWAY, Philadelphia, Pa., has let a contract to the Union Switch & Signal Company, Swissvale, Pa., for an electro pneumatic interlocking at the 59th street terminal, Philadelphia. This plant will have 21 switches and 22 signals.

Fighting the Snows in Canada

Supply Trade News

W. Rutherford, formerly managing director of Dick Kerr & Co., Ltd., and subsequently of the English Electric Co., Ltd., has been elected a director of G. D. Peters & Co., Ltd., London, Eng.

E. H. Dewson has retired as district engineer of the Westinghouse Air Brake Company, Wilmerding, Pa., in the Eastern territory with headquarters at New York City and will henceforth serve the company in a consulting or advisory capacity.

E. H. Dewson

J. C. McCune, assistant district engineer at New York, has been appointed district engineer to succeed Mr. Dewson. E. H. Dewson has been with the Westinghouse interests since 1901, when the old Standard Brake Company was acquired by Mr. Westinghouse and moved to Wilmerding, Pa., to be known as the Standard Traction Brake Company. Mr. Dewson had been chief engineer of the Standard Brake Company, a position which

he retained under the new management. Several years later the engineering departments of the several Westinghouse companies at Wilmerding were consolidated, the Standard Traction Brake Company changing to the Westinghouse Traction Brake Company and Mr. Dewson became assistant chief engineer of the united organization. When the district organizations of the Westinghouse Air Brake Company were created, Mr. Dewson was named resident engineer for the

J. C. McCune

Eastern district, embracing New England, New York, New Jersey, Eastern Pennsylvania, Maryland and Delaware. He has since remained in this position with headquarters in New York City. He has been closely identified with many important improvements in the air brake field during the last quarter of a century and is especially well known for his intimate knowledge of operating problems and traffic conditions in the city of New York. Mr. Dewson now resides at Quincy, Mass., where he plans to spend

most of his time while enjoying the greater leisure which his new position will afford. Joseph C. McCune, who succeeds Mr. Dewson as district engineer of the Eastern territory, is his former assistant. Mr. McCune received his early training under the late W. V. Turner, and has held positions of importance in the Westinghouse organization for a number of years. He joined the Westinghouse Air Brake Company after graduation from Cornell University in 1911. He served through the war as an officer of engineers, acting as an instructor in the Third Officers Training Camp at Camp Lee,

Va., and later saw service in France as a member of the Expeditionary Forces. He will maintain his present headquarters in New York City.

William J. Cleary has been appointed assistant general sales manager of the Sharon Pressed Steel Company, Sharon, Pa., effective February 1. Mr. Cleary's headquarters will be in the Dime Bank building, Detroit, Mich.

The **Dayton-Dowd Company**, Quincy, Ill., has opened a district office at Pittsburgh, Pa., at 809 Keenan building, in charge of T. J. Barry, who has been in the engineering and sales departments in the Quincy office for several years.

David A. Crawford, treasurer of the Haskell & Barker Car Company, who has been elected a vice-president of the Pullman Company, as was announced in the *Railway Age* of January 21, was born at St. Louis, Mo., on April 1, 1880. He was graduated from the University of Wisconsin in 1905, and for the following two years served as an instructor at the university. In 1907 he was appointed secretary to E. F. Carry, vice-president of the American Car & Foundry Company, and five years later was elected assistant secretary of the company. He was elected treasurer of the Haskell & Barker Car Company on January 13, 1916, which position he occupied at the time of his recent election, as above noted.

D. A. Crawford

Leroy Holt, assistant purchasing agent of the Tennessee Coal, Iron & Railroad Company and the Chickasaw Shipbuilding Company, Birmingham, Ala., has been appointed purchasing agent, succeeding **George Gray**, who has resigned, effective January 1, to become associated with the Wofford Oil Company.

The **Pressed Steel Car Company** and **Western Steel Car & Foundry Company** have discontinued their Washington, D. C., office effective February 1. **L. O. Cameron**, who has been a representative of these companies in the Southern territory for many years, has severed his connections with these companies, but will continue his office in the Munsey building to handle other accounts.

C. W. Johnson, formerly of the Chas. W. Johnson Lumber Company, Seattle, Wash., has been elected vice-president of

the **Duncan Lumber Company**, Portland, Ore., and will be in charge of general operations, effective February 1. **C. D. McCoy**, formerly sales manager of the company, has been elected a vice-president and will be in charge of the eastern sales of the company, with headquarters in the McCormick building, Chicago.

The **Combustion Engineering Corporation**, New York, has opened its own office in the First National Bank building, Pittsburgh, Pa., and will soon open an office in Cleveland, Ohio, both of which will be in charge of **W. C. Stripe**, former manager of the Philadelphia office, arrangements having been made between this corporation and the **George J. Hagan Company** of Pittsburgh, whereby the Hagan Company discontinues representation of the Combustion Engineering Corporation. The Hagan Company will retain the exclusive agency for the type H stoker, formerly known as the American stoker, for use in Hagan industrial furnaces.

Edwin F. Wendt, consulting engineer, has opened an office at room 513, Union Trust Co. Building, Washington, D. C., for the general practice of engineering in connection with valuation, financing, consolidation and regulation of railroads, telegraphs, water lines and other common carrier properties. Mr. Wendt was a member of the Engineering Board, Bureau of Valuation, Interstate Commerce Commission, in charge of the Eastern District from May 1, 1913 to October 31, 1921. This district included the states in New England and in addition, New York, New Jersey, Pennsylvania, Delaware, Maryland, the District of Columbia, West Virginia, Virginia and North Carolina. Mr. Wendt was graduated from Geneva College in 1888. After graduation he entered the service of the Pittsburgh & Lake Erie at Pittsburgh, Pa., and was, until he entered government service, engineer in charge, in various capacities, of construction and maintenance work. He was a member of the New York Central Lines' Engineering Committee from 1907 to 1913; a member of the commission to inspect the Government Railroad in Alaska in 1917, and president of the American Railway Engineering Association in 1913. He is a member of the American Society of Civil Engineers.

Trade Publications

CENTRIFUGAL PUMPS.—Much valuable data regarding centrifugal pumps is contained in Bulletin W605 published by the Worthington Pump & Machinery Corporation, New York. The bulletin is, in reality, a handbook for operating engineers. It covers thoroughly the question of installation, operation and maintenance of centrifugal pumps. One of the features of the book is a curve showing the maximum water temperature allowable for varying suction lifts which, it is stated, has never been printed before. Curves are also included to show the head-capacity and efficiency-capacity characteristics of centrifugal pumps. The concluding pages contain a large amount of valuable tabular matter to facilitate the solution of pumping problems.

The New York Central's 60th Street Yard, New York City

Railway Construction

ARIZONA EASTERN.—This company, in conjunction with the Atchison, Topeka & Santa Fe, will construct a union station at Phoenix, Ariz. Plans have been prepared and it is expected that bids will be requested as soon as several agreements between the companies have been settled.

ATCHISON, TOPEKA & SANTA FE.—This company will accept bids until February 1, for the rebuilding of a bridge across the Des Moines river at Dumas, Mo. The work is estimated to cost about \$80,000.

ATCHISON, TOPEKA & SANTA FE.—This company has awarded a contract to the Federal Engineering Company, Chicago, for the installation of oil-handling facilities, including a steel trough 380 ft. in length, a pump, and numerous pipe lines, at Argentine, Kan., estimated to cost \$18,000.

ATCHISON, TOPEKA & SANTA FE.—This company which was noted in the *Railway Age* of October 22, page 804, as contemplating extensions and improvements to its machine shops at San Bernardino, California, estimated to cost \$224,000 closed bids for the same on January 25.

CHICAGO GREAT WESTERN.—This company will receive bids until February 1, for the construction of a steel coaling station at Chicago.

FORT WORTH & DENVER CITY.—This company has awarded a contract to the Federal Engineering Company, Chicago, for the installation of a heating and plumbing system in its new hotel building at Texline, Tex., to cost \$15,000.

LEHIGH VALLEY.—This company has submitted preliminary plans to the Board of Utility Commissioners and to the city authorities proposing the elimination of two grade crossings at Perth Amboy, N. J.

LOUISIANA RAILWAY & NAVIGATION.—This company is preparing plans for the construction of a new station at New Orleans, La. The same company is also planning to take bids for the construction of a gravel washing plant estimated to cost about \$50,000.

MISSOURI PACIFIC.—This company which was noted in the *Railway Age* of December 31 (page 1333), as accepting bids until January 9, for the construction of a frame freight and passenger station at Zeigler, Ill., and the remodeling of a brick roundhouse at Coffeyville, Kans., has awarded a contract for this work to J. D. Fitzgibbon, St. Louis, Mo. The same company noted in the *Railway Age* of January 14 (page 207), as receiving bids until January 16, for the construction of a station at Nashville, Ark., estimated to cost \$12,000, also awarded the contract for this work to J. D. Fitzgibbon.

NORTHERN PACIFIC.—This company contemplates the removal of its tracks from the University of Minnesota campus and the construction of a bridge, 1,200 ft. in length, over the Mississippi river at Minneapolis, which projects are estimated to cost \$2,000,000, of which the state will contribute \$750,000. This road also plans the construction of a 300-ft. tunnel at Plateau, Mont., estimated to cost \$107,000; and the construction of a 60 ft. concrete subway under six tracks at Livingston, Mont., estimated to cost approximately \$100,000.

PHILADELPHIA & READING.—This company has awarded a contract to A. L. Carhart, Philadelphia for the erection of a 60 ft. span concrete arch to carry a highway over its Frackville branch at Mill Creek Jct., near Port Carbon, Pa.

TENNESSEE CENTRAL.—This company contemplates extending its lines from Hopkinsville, Kentucky, to Paducah, a distance of about 70 miles.

VIRGINIAN.—This company has awarded a contract to the Federal Engineering Company, Chicago, for the installation of a heating plant in its new roundhouse at Elmore, W. Va., to cost \$15,000.

Railway Financial News

BALTIMORE & OHIO.—*Income Account for 1921.*—The income statement for the 12 months to December 31, 1921, partly estimated, shows:

Net railway operating income.....	\$22,440,294
which is after charging approximately \$3,400,000 on account of lap-overs from the "guaranty period" which is reflected in credit to other income of like amount, making—	
Total of non-operating income.....	9,136,221
And total income (December partly estimated)...	\$31,576,515
a decrease of \$257,639, compared with previous year.

Leaving net corporate income of.....	\$6,029,544
a decrease of \$1,215,936.	
Out of which have been declared semi-annual dividends at the rate of 2 per cent (4 per cent for the year) upon the preferred stock (paid September 1, 1921, and payable March 1, 1922).....	2,354,531
Leaving surplus of approximately.....	\$3,675,013

GRAND TRUNK.—*Asks Bond Listing.*—This company has applied to the New York Stock Exchange for permission to list \$25,000,000 15-year 6 per cent sinking fund debenture bonds due September 1, 1936.

ILLINOIS CENTRAL.—*Director Resigns.*—J. Ogden Armour has resigned as a director in accordance with the Interstate Commerce Commission's order on interlocking directorships. He will remain a director of the Chicago, Milwaukee & St. Paul.

MISSOURI, KANSAS & TEXAS.—*Suit.*—Judge Walter H. Sanborn of the United States Circuit Court of Appeals of St. Louis, has granted The Central Trust Company of New York leave to file suit for foreclosure of a mortgage of \$3,254,000. The suit is the first of several similar ones to be filed under the reorganization plan to clear up titles to property of company under various mortgages. The petition states that the mortgage was issued November 1, 1894, and would mature in 1944. The railroad has defaulted payment of all interest since November 1, 1915.

NEW YORK CENTRAL.—*New Director.*—Warren S. Hayden, of Cleveland, has been elected a director to succeed Samuel Mather. *Special Meeting Postponed.*—A special meeting of stockholders called for action on leasing the Toledo & Ohio Central has been adjourned to February 3.

PITTSBURGH & WEST VIRGINIA.—*Authorized to Acquire Control.*—The Interstate Commerce Commission has granted authority to this company to acquire control of the railroad of the West Side Belt through an agreement providing for the operation of the properties of both companies by the Pittsburgh & West Virginia. The Pittsburgh & West Virginia has also filed an application with the commission under Section 5 of the Interstate Commerce Law for authority to acquire control of the road by purchase of its corporate property, rights and credits, not including franchise. The application states that this does not involve a consolidation. The Interstate Commerce Commission recently denied a similar application on the ground that it had not been filed under Section 5.

RICHMOND TERMINAL.—*Asks Authority to Issue Bonds.*—This company and the Richmond, Fredericksburg & Potomac and Atlantic Coast Line have applied for authority for the issue by the Terminal Company of \$3,380,000 of first mortgage, 30-year 5 per cent gold bonds guaranteed by the Richmond, Fredericksburg & Potomac and the Atlantic Coast Line for funding the indebtedness incurred in connection with terminal facilities at Richmond. The bonds have been sold subject to the commission's approval to Kuhn, Loeb & Co., at 92.75.

TENNESSEE, ALABAMA & GEORGIA.—*Sale Postponed.*—The sale of this road has again been postponed until March 18. The original upset price of \$400,000 has been reduced by court order to \$200,000.

TENNESSEE CENTRAL—Sale.—This road was sold at auction on January 10 to C. M. Hovey, assistant general manager of the Nashville Industrial Corporation for \$1,500,000.

The Tennessee Central operates 293 miles, its main line extending between Harriman, Tenn., and Hopkinsville, Ky., 247 miles. The road has been in the hands of receivers since January 1, 1913.

TERMINAL RAILROAD ASSOCIATION OF ST. LOUIS.—Six Months Guaranty Determined.—The Interstate Commerce Commission has issued a certificate stating the final amount of the guaranty to this company and its subsidiaries for the six months period of 1920, amounting to \$1,693,960, of which \$287,960 is now payable.

TOLEDO, ST. LOUIS & WESTERN.—Proceeds of Settlement.—Edwin G. Merrill, chairman for the 4 per cent collateral trust bonds of 1917, series "A" has sent a letter to holders of certificates of deposit and to non-depositing holders announcing that the settlement of the litigation concerning the "Clover Leaf" 4s of 1917 has been approved and confirmed by the United States District Court. The proceeds of the settlement became available for distribution beginning January 20, 1922.

The New York Life Insurance & Trust Company has been appointed by the court and by the bondholders' committee as agent to carry out the distribution. Holders of certificates of deposit representing the 4 per cent bonds on surrender of their holdings, indorsed in blank to the insurance and trust company, will receive the following distributive shares with respect to each \$1,000 face amount of the bonds represented by the certificates surrendered:

- (1) \$152 in cash.
- (2) Certificates of deposit representing 1.8 shares of common stock.
- (3) Certificates of deposit representing 1.8 shares of preferred stock of Toledo, St. Louis & Western.
- (4) Certificates representing 12.5 shares of common stock of the Chicago & Alton.
- (5) Certificates representing 5.6 shares of the preferred stock of the Chicago & Alton.

Certificates will not be issued for fractional shares. In all cases where the aggregate face amount of bonds represented by the certificates of deposit surrendered by any one depositor is such that distribution upon the set ratio would result in the delivery of fractional shares the trust company will adjust such fractions.

WEST SIDE BELT.—Acquisition.—See Pittsburgh & West Virginia.

Additional Sales of Equipment Trust Certificates

January 20, 1922.

The director general of railroads has confirmed additional sales, at par plus accrued interest, of railroad equipment trust certificates held by the government, as follows:

- To Robinson & Company, New York:
- Toleah & Ohio Central Railroad, 1923-1935, inclusive..... \$1,882,400
- To the Guaranty Trust Company of New York:
- Southern Railway Company, 1923-1935, inclusive..... \$5,946,000

This latter sale comprises two-thirds of all the maturities of this equipment trust issue. The government will hold the balance of one-third of all maturities stamped as subordinated, in accordance with the agreement as amended. Other sales are under negotiation.

Railroad Administration Settlements

The United States Railroad Administration reports the following final settlements, and has paid out to the several roads the following amounts:

Chattanooga, New Orleans & Texas Pacific Railway Co.....	\$525,000.00
Delta Southern Railway.....	60,000.00

- Chattanooga, New Orleans & Texas Pacific—Preferred, 4 1/2 per cent, payable March 1 to holders of record February 18.
- Railroad & Ohio—Preferred, 2 per cent, semi-annually, payable March 1 to holders of record February 28.
- Delaware & Hudson—1 1/2 per cent, quarterly, payable March 20 to holders of record February 28.
- Houston & Brazos Valley—1 1/2 per cent, quarterly, payable March 1 to holders of record February 1.
- Toledo & Western—Common, 1 1/2 per cent, payable March 18 to holders of record February 28.
- Missouri Railroad—Preferred, 4 per cent, quarterly, payable February 28 to holders of record February 1.
- Railroad & Ohio—Preferred, 1 per cent, quarterly, payable March 1 to holders of record February 17.

Railway Officers

Executive

G. B. Butts has been elected president of the Roby & Northern with headquarters at Roby, Texas.

H. W. Stanley, receiver of the Tennessee Central since 1917, with headquarters at Nashville, Tenn., has been elected president and G. G. Morse and C. K. Boettcher vice-presidents, with the same headquarters.

Financial, Legal and Accounting

Eugene Wright, general storekeeper of the Long Island, has been elected secretary, effective January 16, succeeding Frank E. Haff.

John E. Taylor, whose appointment as general attorney of the Kansas, Oklahoma & Gulf, with headquarters at Muskogee, Okla., was announced in the *Railway Age* of January 21 (page 255), was born at Foster, Ky., on February 21, 1879. He has been a practicing attorney in Missouri since May 7, 1900, and was associated with the law firm of Karnes, New & Krauthoff, and the successors to that firm, Miller, Comack, Winger & Reeder, with offices in Kansas City, Mo. Mr. Taylor has been connected with the legal affairs of the Kansas, Oklahoma & Gulf through association with Arthur Miller, member of the above mentioned firm and general counsel of that railroad. He was engaged in this work up to the time of his recent appointment.

Operating

James E. Bradford has been appointed assistant general manager of the Dansville & Mount Morris with headquarters at Dansville, N. Y.

J. C. McPherson, whose appointment as superintendent of the newly created East Bay Electric division of the Southern Pacific, with headquarters at Oakland, Cal., was announced in the *Railway Age* of January 14 (page 209), was born in Ireland.

J. C. McPherson

When 16 years old he came to America and shortly thereafter entered railroad service in a shop of the Atchison, Topeka & Santa Fe. Through various promotions he was successively advanced to the position of locomotive fireman, and later locomotive engineer. He came to California in 1895 to enter the service of the Los Angeles & Pasadena Interurban, the first unit of the present Pacific Electric system. He was successively

dispatcher, chief dispatcher, trainmaster and assistant superintendent. He left in 1907, to accept the position of superintendent of the Los Angeles Interurban railway. Later when this company was absorbed by the Pacific Electric, Mr. McPherson was appointed superintendent of its Northern division. In 1913, he was appointed superintendent of the Southern Pacific's electric lines in Oakland, Alameda and Berkeley, or what now comprises the East Bay Electric division. During the recent war he served as a captain in the 66th engineers, and for a brief period before the armistice he was superintendent of terminals at the Vincennes docks,

with headquarters at Bordeaux, France. At the conclusion of his military service he re-entered the employ of the Pacific Electric as assistant general superintendent, with headquarters at Los Angeles, Cal., which position he was holding at the time of his recent appointment.

W. C. Higginbottom has been appointed superintendent of the Richmond division of the Pennsylvania, succeeding A. C. Watson, transferred.

P. W. S. Joy, trainmaster of the Southern Pacific, with headquarters at Sparks, Nev., has been transferred to Tracy, Cal., succeeding W. T. Small, who has taken service with another company. Mr. Joy will be succeeded by **B. S. Richart**, trainmaster at Carlin, Nev.

Traffic

H. P. Smith has been appointed commercial agent of the Seaboard Air Line with headquarters at Denver, Colo., effective January 20.

W. R. Canova has been appointed general agent of the Seaboard Air Line with headquarters at Tallahassee, Fla., effective February 1.

C. J. O'Neill has been appointed assistant freight claim agent of the San Antonio, Uvalde & Gulf, with headquarters at San Antonio, Tex.

Alexander M. Cleland, whose retirement as passenger traffic manager of the Northern Pacific, was announced in the *Railway Age* of January 21 (page 256), was born at Alliance,

Ohio, on November 22, 1862. He entered railroad service in 1879 as a ticket seller on the Pennsylvania. From 1881 to August 1886, he was a ticket seller at the Union station, Chicago, and from that date to May, 1890, he was a ticket seller on the Chicago, Milwaukee & St. Paul, at Chicago. On the latter date he entered the service of the Northern Pacific as a ticket seller at St. Paul, Minn. On April 30, 1892, he was made a clerk in the passenger department at St. Paul, and in November, 1896,

he was promoted to chief clerk in that department. In February, 1901, he was made assistant general passenger agent, with headquarters at St. Paul, and on April 1, 1904, he was promoted to general passenger agent, with the same headquarters. He was promoted to passenger traffic manager, with the same headquarters, on May 1, 1919, which position he was holding at the time of his recent retirement.

Archibald Gray, whose appointment as assistant to the traffic manager of the Western Pacific, with headquarters at San Francisco, Cal., was announced in the *Railway Age* of January 14 (page 210), was born at Strachur, Scotland, on August 12, 1863. He entered railroad service on August 1, 1887, as a clerk in the local freight office of the St. Paul, Minneapolis & Manitoba (Great Northern) at Minneapolis, Minn. He was later promoted to chief clerk in that office, and in 1893, he was made chief clerk to the general traffic manager at St. Paul, Minn. From 1894 to 1896 he was assistant general freight agent, with headquarters at St. Paul. He was transferred to Butte, Mont. in June, 1896, and was promoted to assistant general freight and passenger agent on June 1, 1905, which position he held until October 1 of that year, when he was transferred to Sioux City, Iowa. From January 1, 1907, until April 1, 1911, he was assistant

general freight agent at Seattle, Wash., and from the latter date until October 16 of that year, he was assistant general freight and passenger agent, with headquarters at Portland, Ore. He left the service in October, 1911, to become general freight agent of the Western Pacific, with headquarters at San Francisco, Cal. He was appointed traffic agent, with the same headquarters on April 16, 1919, and again general freight agent at San Francisco on March 1, 1920, which position he was holding at the time of his recent promotion.

A. B. Chown whose appointment as assistant general passenger agent of the Grand Trunk Railway in Chicago was announced in the *Railway Age* of December 10, page 1178,

was born in Belleville, Ontario, in 1887. He was graduated from the public and high schools and took a course at the Ontario Business College in Belleville. He entered the service of the Grand Trunk at Belleville as a ticket clerk in 1907, in which capacity he remained until 1911 when he was promoted to soliciting passenger agent at Toronto. He was appointed traveling passenger agent in 1913 with headquarters in Pittsburgh. In June, 1918, he was transferred to New York. In December, 1918, he

was appointed acting general agent, passenger department. He was appointed general agent, passenger department in March, 1919, and in July, 1920, was appointed general agent, passenger department, of the Canadian National-Grand Trunk system, in which capacity he was serving at the time of his recent promotion.

Wilbur E. Coman, whose appointment as western traffic manager of the Northern Pacific, with headquarters at Seattle, Wash., was announced in the *Railway Age* of December 3 (page 1123),
