1082. Circuit controllers operated by mechanical signals must be so adjusted that contacts will not function until signal blade is within 5 deg. of the controlling aspect.

1083. Circuit controllers, when operated by switch and lock movement slide bar or facing point lock plunger, must be so adjusted that contacts will not function until the slide bar or plunger has traveled to within $\frac{1}{2}$ in. of its stroke.

Conclusions

The committee recommended that the rules for signal maintainers, for signal maintenance interlocking (general) and for signal maintenance interlocking (mechanical) be approved for presentation at the annual meeting, the latter to supersede similar rules now in the Manual.

In addition to the above rules, examination questions and answers were presented on motor cars, hand cars, velocipedes, etc., signal maintenance, interlocking, me-

chanical, and on signal maintenance interlocking, general. It was recommended that these also be approved for presentation at the annual meeting.

Committee: G. K. Thomas (A. T. & S. F.), chairman; E. A. Black (N. Y. C.), vice-chairman; A. Vallee (D. & H.), vice-chairman; R. C. Bingham (I. C.) O. W. Brandt (U. P.), S. F. Cooper (Erie), A. Davies (C. P. R.), Caleb Drake (C. & N. W.), C. M. Duffy (C. R. I. & P.), H. J. Foale (Wabash), F. C. Foster (L. & N.), A. P. Hix (T. R. R. of St. L.), T. G. Inwood (N. Y. C.), J. A. Johnson (M. K. & T.), Arthur Kelly (C. C. & St. L.), F. A. Selke (C. I. & L.), A. W. Stewart (A. C. L.), F. A. Tegeler (C. B. & Q.), I. A. Uhr, (St. L. S. F.), E. Winans (A. T. & S. F.).

Discussion

G. K. Thomas (Chairman): The committee recommends, and I so move, that the general title of those subjects adopted in 1920 be changed so as to be uniform with the examination papers approved in 1921.

(Motion carried.)

(Chairman Thomas next submitted for consideration rules and revised examination papers on motor cars, hand cars, velocipedes, etc.)

C. K. Kelloway (A. C. L.): I would suggest adding the words "only on the authority of the dispatcher or superintendent" after Rule 204.

Chairman Thomas: Would not that result in considerable delay at times?

Mr. Kelloway: Not necessarily; if the order is given by the superintendent it will be accompanied by a train order to that effect.

W. C. Johnson (C. St. P. M. & O.): Many of the railroads which have lines extending into storm invaded territory have had their telephone lines and signal lines down for weeks, and that would make the delay of the maintainer too long. A signal maintainer should be allowed to use his own judgment if he cannot get authority from the train dispatcher or the superintendent.

T. S. Stevens (A. T. & S. F.): I move that the sentence be allowed to stand as presented.

(Motion carried.)

Mr. Kelloway: If Rule 204 is right, then Rule 207 is inconsistent.

W. J. Eck (Sou.): These rules are not in the same class as the standard code train rules, and at best they will be a guide for any individual railroad which desires to have a set of rules for that purpose. I therefore move the acceptance of the rules and the examination questions as they stand.

(Motion carried.)

(Chairman Thomas next submitted the rules and examination papers for signal maintenance interlocking.)

J. H. Oppelt (N. Y. C. & St. L.): The remarks of Mr. Eck apply to these rules equally well, and I therefore move that they be accepted as written.

(Motion carried.)

L. L. Whitcomb (N. Y. C.): Rule 1080 states, "The plunger of a facing point lock should have at least an eight-inch stroke," while Rule 310 (e); in the Report of the Committee on Mechanical Interlocking, states "Facing point lock plungers shall have a travel of not less than seven inches." There is a difference of one inch.

Mr. Kelloway: I would suggest that the figure be changed to seven in the maintenance rule.

(The committee accepted the change.)

Chairman Thomas: I move that the rules, questions and answers on motor cars, hand cars and velocipedes, and on interlocking, general and mechanical, be approved for presentation at the annual meeting.

(Motion carried.)

(The committee was dismissed with the thanks of the Signal section.)

Report on Highway Crossing Protection

Highway crossing traffic has become almost as interstate as railroad traffic because of the use of the automobile and the protection of these crossings presents a real problem. The committee feels that in this respect it is very desirable to make the aspects of all signs and signals intended to warn travelers on highways of possible or existing danger at railroad crossings uniform throughout the country. Twelve recommendations were drawn up by the committee and six drawings showing the aspects of the signs and signals accompanied the recommendations. These recommendations should form a basis for the universal standardization of crossing protection.

James B. Latimer
Chairman

James B. Latimer, signal engineer of the Chicago, Burlington & Quincy, is the first man to be appointed chairman of this committee which was authorized at the annual meeting last June. Forty years' experience in the engineering, operating and signal departments of the Chicago, Burlington & Quincy qualifies him to direct the work of this important committee. Owing to his extended contact with the problems of highway crossing protection, Mr. Latimer is able to appreciate the viewpoint of the railroads and also of the general public which is using the highways with volume and character of traffic unlike any thing anticipated in the past.

THIS COMMITTEE WAS appointed at a meeting of the Committee of Direction in Chicago on June 5, 1921.

Owing to the fact that considerable preliminary data as to the practice of various railroads and the requirements of public authorities had to be collected, it was impossible to hold the first meeting until November.

C. L. Bardo, chairman of the committee of the American Railway Association on the Prevention of Accidents at Highway Crossings and Trespassing, advised J. E. Fairbanks, general secretary, that his committee had recommended that the question of the standardization of mechanical and electrical devices installed at highway crossings as a substitute for crossing gatemen and flagmen be referred to the Signal section and that a subcommittee of his committee be appointed to confer with the committee of the Signal section. Mr. Bardo also stated that "the association has adopted standard approach warning signs which have been made legal in several of the states. It is quite important in the interests of safety, both to trains and to travelers on the highway, that the visual aspects of mechanical highway crossing devices should as far as possible be standard or confined within reasonable limits, otherwise the value of mechanical highway crossing signals intended for the control of traffic at grade crossings may be readily lost because of the unfamiliarity of travelers from other localities with that particular device."

Recommendations

It was agreed by the committee on Highway Crossing Protection to present the following recommendations and report for the consideration of the Signal section at the March stated meeting:

1. It is recommended that the use of the advance warning sign recommended by the Committee on Grade Crossing Protection and Trespassing of Division I of the American Railway Association in its report of October 16, 1916, be continued as standard practice.

2. That the use of the hand stop sign recommended by the same committee be continued as standard practice.

3. That the arms of highway crossing gates be painted with alternate black and white stripes diagonally across the arms when in the horizontal position, as recommended by the above named committee.

4. That a sign composed of cross boards bearing the words "Railroad Crossing" in black letters on a white field be recommended as standard practice.

5. That at crossings where it is desired that highway

traffic stop before crossing the railroad tracks, an additional sign bearing the word "Stop" shall be attached to the mast bearing the cross boards.

6. That where conditions justify or require that the sign referred to in recommendation No. 1, or the sign referred to in recommendation No. 5, shall be made conspicuous during the hours of darkness it may be illuminated.

7. That a red light shall be exhibited at crossings at highways with railroads to stop highway traffic only when a train is approaching.

8. That where practicable the sign recommended in recommendation No. 4 or any automatic warning sign should be placed in the center of the highway, provided the railroad company can be relieved from claims arising out of personal injury or damage to property on account of collision with the sign.

9. That while believing that a properly marked crossing coupled with proper responsibility on the part of the public provides best for public safety, automatic devices are sometimes required by law, ordinance or orders of public commissions. When this occurs aspects and operation should be uniform. It is therefore recommended that visual automatic devices to indicate the approach of trains be confined to a swinging disc and light, or a flashing light.

10. That when the swinging disc and light is used, the disc be circular, 24 in. in diameter, with the word "Danger" curved within the circle at the bottom, light in the center, white background, black letters and a black border corresponding with the word "Danger" parallel with the upper edge of the disc and shown on the accompanying diagram, marked Exhibit "F."

11. That where automatic devices are considered necessary or are specified by federal, state or local authorities for the protection of highway traffic, the use of two-position devices provide the necessary and desirable indication.

12. That when automatic signal devices are used to indicate the approach of trains they should be so arranged as to indicate for 20 sec. before the arrival of a train at the crossing, based upon the fastest trains operated over that crossing.

The flashing light signal has been considered, but the committee has not had sufficient time to draft a recommendation as to the proper aspects for such a signal.

The committee believes that these recommendations, if adopted, will form a basis for the universal standardization of highway crossing protection which at present is

anything but uniform throughout the country. The use of the automobile for long journeys has made highway traffic almost as interstate as the railroad traffic itself and the great desideratum, as it appears to the committee, is to make the aspects of all signs and signals intended to warn travelers on highways of possible or existing danger at railroad crossings uniform throughout the country.

In this report the committee has not, it feels, completed its work. A great deal will be gained in the interests of uniformity and economy of installation and maintenance by standardizing many of the parts of the apparatus recommended to be used, for instance, the bolt spacing of the foundations for all iron masts may be standardized to great advantage, also the size and type of socket used in electric light bulbs, size and type of oil lamps for illuminating purposes, and many other small matters. There-

Exhibit F, Banner for Automatic Highway Crossing Signal

fore the committee requests it be continued with a view to taking up such details.

Committee: J. B. Latimer (C. B. & Q.), chairman; C. J. Kelloway (A. C. L.), vice-chairman; C. A. Christofferson (N. P.), W. J. Eck (Sou.), A. R. Fugina (L. & N.), A. H. McKeen (U. P.), C. H. Morrison (N. Y. N. H. & H.), J. A. Peabody (C. & N. W.), E. K. Post (Penna.), W. Y. Scott (B. & M.), T. S. Stevens (A. T. & S. F.).

Discussion

J. B. Latimer (C. B. & Q.), Chairman, presented the report of Committee XX, Highway Crossing Protection.

Chairman Latimer: We were not given a definite assignment, but were asked to co-operate with the Committee on Grade Crossing Protection and Trespassing of Division 1, of which Mr. Barto is chairman.

(A motion to accept recommendations No. 1, No. 2 and No. 3 was carried.)

Chairman Latimer: The idea of this particular sign was taken from the A. R. E. A. crossing protection report, where they recommended cross-boards instead of triangular-shaped signs, and the dimensions were taken from the laws of 11 states.

W. H. Elliott (N. Y. C.): *I move the approval of this sign.*

(*Motion carried.*)

R. B. Elsworth (N. Y. C.): I would like some description of a crossing at which it is desired that a stop should be made before a vehicle or a person crosses the track.

Chairman Latimer: It was the sense of the committee that where we have wigwags and in some other places, it is not necessary for highway traffic to stop.

A. H. Rudd (P. R. R.): Isn't it a fact that the state of Illinois requires this stop sign at extra-hazardous crossings?

Chairman Latimer: I believe they do.

I. S. Raymer (P. & L. E.): I understand that the law in several states requires that in the case of all motor vehicles carrying passengers for fare, and of motor vehicles carrying freight, the driver of the vehicle must stop at all city railroad crossings and ascertain that the track is clear.

W. H. Elliott (N. Y. C.): I believe according to that view that recommendation No. 5 should be changed. I think the following should be included: "At a crossing where visual highway crossing signals are not plainly visible and effective, an additional sign bearing the word 'stop' is required and should be such and such a design."

O. R. Unger (M. P.): The rules for the operation of any particular device should be the same on all railroads, and we ought to arrange to have one system of crossing signals on the railroads at all crossings, so that when the people on the highway see them in the case of one railroad they will know what they mean when they see them on another railroad.

Mr. Elliott: I have suggested that if a light is displayed at a crossing of the highway with the railroad to stop traffic, a red light be used, and that only when a train is approaching.

(The revised wording suggested by Mr. Elliott, having the approval of the committee, was adopted.)

Mr. Rudd: Will the committee be willing to go further and say that where it was impracticable to place the warning sign in the center of the highway, it may be put on the right hand side?

Chairman Latimer: If you have two signs, the right hand one is more important, and if you have only one the center is the place.

J. C. Mock (M. C.): Some of us are figuring on less than ten feet as the height of these signs, because as vehicles approach the crossing the drivers do not look up, and if they are very close they cannot see up.

J. Pilkington (N. Y. N. H. & H.): There is a development, in regard to signboards throughout the country, of having an obstacle in the middle of the road—a concrete group, a mound of dirt, or a wooden fence—and in the center of the obstacle there is placed a sign at a low height, probably within five feet of the base of the mound, or lower. This comes within the range of an automobile headlight.

(Paragraph 8 as revised was adopted, after which Paragraph 9 was read.)

Mr. Rudd: There are many wigwag and flashing lights in service all over the country, but the instructions referred to the committee relate to the question of standardization of mechanical or electrical devices at highway crossings as a substitute for the crossing gateways.

The logical proposition is to display a stop sign stationary when trains are coming, and no sign when no trains are coming. A steady red light to be used when a train is approaching and no light shown when a train is not approaching.

E. G. Stradling (C. I. & L.): This section should not go on record as approving a swinging disc or any other automatic device to protect highway crossings.

Chairman Latimer: The committee does not recommend the use of a wigwag signal or any other automatic signal, but where a wigwag is ordered by the public authorities we think that we should standardize the use of the device.

T. S. Stevens (A. T. & S. F.): We have about 500 automatic flagmen and the Southern Pacific has probably the same number. They are good protection and we are winning suits by their use. We are taking off highway watchmen and putting in wigwags.

Mr. Rudd: I move that the last three lines read as follows: The committee therefore recommended that visual automatic devices to indicate the approach of trains be confined to either non-flashing light or lights, or to a mechanism displaying a stop sign and red light when train is approaching, no light or sign when train is not approaching

(Motion carried.)

Mr. Rudd: I move, the committee having received fairly 50-50 instructions, that this be referred back to the committee for further consideration.

(Motion carried.)

(Chairman Latimer then read Paragraph 10, after which a motion was made and carried that it be referred back to the committee.)

C. F. Stoltz (C. C. C. & St. L.): I would like to have the committee define a two-position wigwag.

Chairman Latimer: It is the language used by the trade. What the committee had in mind in referring to a two-position wigwag was one which hung still when no train was approaching and moved when a train was approaching.

Mr. Stoltz: I move that the words "two-position" in the next to the last line of Paragraph 11 be changed to "three-position."

(Motion lost.)

F. P. Patenall (B. & O.): I move that the matter in Paragraph 12 be made to read: "so arranged as to indicate for not less than 30 seconds before the arrival of a train at the crossing."

Mr. Mock: If you make it 30 seconds you are getting away beyond the distance necessary. It means also the revision of all of our bell circuits and crossing circuits.

C. J. Kelloway (A. C. L.): I move to amend that No. 12 be made to read "so arranged as to indicate for not less than 20 seconds."

(Motion as amended carried.)

(The committee was dismissed with the thanks of the Signal section.)

Report on D. C. Automatic Block Signaling

Requisites for signal circuits as presented in the report of the committee may be considered as a foundation on which to base a railroad signal system. The fundamentals of these requisites are gleaned from years of experience and conscientious, painstaking study, and will furnish the signal field established standards of control circuits, switch protection, fouling circuits, and proper methods of locating signals in order that traffic may be handled properly. The report on approach lighting includes statistics from 11 roads showing the actual cost of installation and operation of electric lighted signals, together with information on control circuits for the lights.

C. F. Stoltz
Chairman

C. F. Stoltz, signal engineer of the Cleveland, Cincinnati, Chicago & St. Louis was appointed chairman of this committee in 1919. Mr. Stoltz became a member of the Railway Signal Association in 1913, and in 1914 was appointed a member of Committee H. In 1910 he was appointed on the Committee on D. C. Relays where he has rendered valuable assistance in preparing specifications for the operating characteristics of signal relays. Mr. Stoltz entered railway service as a draftsman on the Cleveland, Cincinnati, Chicago & St. Louis in 1906. In 1910 he was appointed assistant signal engineer, and in 1913 he was promoted to signal engineer.

THE COMMITTEE SUBMITTED for consideration reports on: 1, Requisites for circuits, and on 2, Approach lighting of signals.

Requisites for Circuits

1. Insulated rail joints shall be placed opposite each other in main tracks and not less than 5 ft. or more than 15 ft. in advance of the signal.
2. Signals shall be controlled as far as practical by continuous track circuit.
3. All main track circuits shall be connected to provide the best possible protection against broken rails.
4. Turnouts and junctions shall be protected by track circuit extending to the clearance point or siding derail.
5. Non-interlocked clearances between main tracks, and between main and other tracks, shall be equipped with plunger circuit controllers and locked in the normal position. Lever operated to operate the lock and circuit controllers governing the signals in the direction signaled shall be located between the tracks in the center of crossover, or independent track circuit for protection of crossovers affecting the signals in the direction signaled may be used in lieu of the above.
6. All non-interlocked switches, derails, and movable point tracks or leading to the tracks signaled, shall be equipped with switch circuit controller, or plunger lock circuit controller, or lock.
7. At points where dead sections exceed five feet less than the distance between the inner wheel bases of opposite tracks on main track, track circuit or other special circuits of approved design shall be installed.

8. Track batteries shall be connected to feed away from crossings with electric railroads.
9. Each track circuit shall be insulated on all sides from all other track circuits, and from all siding, junction, and branch connections.
10. Control circuits for signals shall not be carried through contacts of tower indicators, switch indicators, or interlocking relays.
11. Where a signal location is between the fouling point of a trailing switch and a point 500 ft. in advance of the switch, protection shall be provided by the new signal in the rear through the use of an overlap.
12. Where a signal location is between the point of a facing switch and a point feet beyond, the signal shall be arranged to indicate stop when the switch is reversed or misplaced.
13. Where two signals governing in the same direction are located less than braking distance apart, either signal when indicating stop shall cause an approach indication to be displayed at a signal in the rear located at a point equal to or greater than the required minimum braking distance.
14. The aspect displayed to approaching trains must conform to true block conditions. A signal, in changing from proceed to approach, or approach to proceed, must be limited to display either the approach or proceed indication.
15. When a train, followed by a second train, reverses direction while between passing sidings, trains will receive stop indications at the first signal location in the rear of the point where the first train reversed its direction.
16. Circuits shall be so arranged that in no case will a stop signal, or a stop and proceed signal indicate approach until the

rear of a train is under the protection of the next signal governing in the same direction.

17. Circuits shall be so arranged where trains are liable to overrun, making it necessary to back up, such as stations, water tanks, coal chutes, etc., protection should be provided by the next signal in the rear through the use of an overlap.

18. The positive and negative sides of track circuit repeating relays used for controlling signal apparatus shall be broken by the controlling track relay.

19. The positive and negative sides of signal slots or holding coils shall be broken by a relay, or relays, protecting the entire block.

20. The control of signal shall be such as to provide:

(a) That each train is protected in the rear by at least one stop, and one approach indication, or by one permissive signal denoting block occupied by a train running the same direction, and one approach indication.

(b) That where a track is signaled in both directions, each train is protected against opposing movements by at least one approach and one positive stop signal.

(c) An approach indication before reaching a stop indication, excepting at the first signal of an installation or at the starting signal from meeting points, where traffic direction signaling is used, when trains may receive a stop indication without previously receiving an approach indication.

(d) Against misplaced switches or derails by at least one stop and one approach indication in each direction signaled.

(e) That where traffic direction signaling is used, the reversing or misplacing of a switch located between meeting points will set all signals governing toward the switch between it and both meeting points to the stop position.

(f) That two opposing signals governing over the same track will not display approach or proceed indication, simultaneously authorizing two trains to move opposing each other.

(g) That the proceed indication of each signal will be directly controlled by the next signal governing in the same direction.

(h) That in traffic direction signaling two positive opposing signals will not display the proceed (permissive approach or clear) indications, simultaneously authorizing two trains to move from meeting points opposing each other.

(i) That, as far as practicable, apparatus shall be so constructed and circuits so arranged that the failure of any part controlling the operation of a signal shall cause it to display its most restrictive indication.

(j) That the battery or power supply for line circuits be placed at the end of circuit farthest from the function operated.

21. Circuits controlling permissive signals, which denote block occupied, shall provide:

1. A slow speed indication to follow a train into an occupied block.

2. A stop indication against opposing trains in the same block where tracks are signaled in both directions.

3. That opposing signals governing over the same track shall indicate stop when a permissive signal indicates approach.

22. Take-siding indicators, when displaying an indication to take siding, shall cause the next signal in the rear to indicate approach and the automatic signal on the same mast to indicate

CIRCUIT ADJUNCTS

A. Signal governing in one direction caused to indicate stop, when a converging or opposing signal governing over the same track indicates proceed.

B. A timing element interposed between the restoration of a signal to the stop position and the clearing of an opposing or converging signal governing over the same track, thus preventing a hurried change of route.

Report on Approach Lighting of Signals

In gathering data with reference to the subject, inquiry was made, by the committee, of 33 different railroads. Replies indicate progress as follows:

11 railroads have extensive installations.

11 railroads have test installations.

4 railroads have no installations but replies indicate that tests are planned.

3 railroads have no installations and indicate no interest in subject.

4 railroads made no reply.

The practice of the different roads in automatic lighting is quite varied as to material used, but the circuits all fall within the following four schemes:

1. Using back circuit of track relay, when the track circuit is of sufficient length and curvature track such that light be shown before engineman came in view of signal.

2. Lighting circuit closed by circuit controller operated by the mechanism of the opposing signal.

3. Special relay in series with the control circuit of signal.

4. Special relay in series with track battery.

The design of the lamp bulb is a very important element in the successful operation of electric lighted signals. There seems to be in use at the present time two general types of lamps, the 3/2 volt lamp, developed by the Edison Lamp Works of the General Electric Company for this purpose and used on a separate battery, and a higher voltage lamp, about 12 or 13 1/2 volts, which is used on the operating battery. The large majority of roads use the 3/2 volt lamp. Committee VI is now working with lamp manufacturers to develop a suitable standard lamp for this purpose.

The general opinion seems to be in favor of a separate battery where primary battery is used on the signal system, the reasons being given as follows:

Reliability. In case of failure of signal operating battery, the light would still be functioning.

Steady Voltage. Free from the voltage fluctuations of a primary battery operating a motor signal.

No Failures Due to Lightning. Operating battery has line connection subject to lightning discharges and lamps connected thereto would be burned out.

Cost Data. Simple to keep data on cost of lighting signals.

Economical. With the 3/2-volt, 0.25-amp. lamps energy consumption is less than with the 13.5-volt lamp.

There seems to be no objection to the use of approach lighting on double or multiple tracks. The opinion is expressed, however, that on a railroad of four or more tracks, all signal indications in a given direction should light up on the approach of a train on any track. It is evident that this must be done on account of the possibility of a light failure when two or more trains are approaching signals at the same location at the same time. There seems to be no other real complication arising on double track signaling with approach lighting.

There have been several serious objections raised in applying approach lighting to single track signaling. It seems, however, that what appears to be an objection on the part of some railroads, is not seriously objected to by others, or the condition is being met in some way that is safe and satisfactory and preserves the advantages to be obtained by the approach lighting scheme.

It appears that the principal objection raised to the approach lighting scheme is on account of there being no night indications, under certain conditions, requiring either the use of an oil light on certain signals or a continuous burning electric light.

The economy effected by the approach lighting scheme is real and considerable. Data submitted by several railroads vary in some particulars, but the average ratio is 3.5 to 1, showing that it costs 3.5 times as much to light with oil. The committee does not feel that the data submitted have been compiled with the proper accuracy to consider this ratio exactly correct and is of the opinion that the ratio will not be quite as high, possibly more like 2 to 1.

The committee recommended that requisites for circuits be presented for discussion and that the report on approach lighting of signals be accepted as information.

Committee: C. F. Stoltz (C. C. C. & St. L.), chairman; R. E. Green (M. C.), vice-chairman; T. A. Jones (P. R. R.), vice-chairman; F. H. Bagley (L. & N.), M. A. Baird (Erie), F. W. Bender (C. R. R. of N. J.), E. E. Bradley (W. M.), J. H. Buttridge (L. C.), W. A. Dawson (N. Y. C.), G. H. Dryden (B. & O.), T. C. Hansen (N. P.), C. E. Hartvig (C. R. I. & P.), G. A. Kirley (B. & A.), W. J. Kocher (L. V.), H. H. Orr (C. & E. I.), E. B. Pry (P. R. R.), A. Reilly (D. L. & W.), B. H. Richards (D. & H.), C. Soper (L. I.), R. B. Arnold (C. & N. W.), R. S. Turner (U. P.), E. P. Weatherly (T. & P.).

Discussion

E. B. Smith (N. Y. C.): I don't believe that the Maintenance of Way Department will agree with us on installing insulated rail joints opposite each other in main tracks and on curves of more than 2 degrees.

B. J. Schwendt (T. & O. C.): As I understand it, these are requisites for direct current automatic signal circuits.

Chairman Stoltz: I do not see, if these are requisites, but what they would apply in any circuit, and if the gentleman finds that they will not apply in a. c. or in anything but d. c., we will be glad to consider changing them.

F. P. Patenall (B. & O.): Referring to Paragraph 2; "Signals shall be controlled as far as practical by con-

tinuous track circuit." Isn't that rather an unwise remark to make?

Chairman Stoltz: It will be impracticable to insulate a crossing frog and get a continuous track circuit through a solid crossing frog, and in that case the track circuit is not continuous.

Secretary Balliet: That statement is not a fact unless it is a solid frog which has been actually welded solidly—I mean a frog without splice bars in it. It can be done, and has been done for 20 years successfully.

Chairman Stoltz: It is not practicable to do so where there is only one track to cross.

W. H. Elliott (N. Y. C.): It would be well to revise Paragraph 7 to give a minimum length, rather than to state that it shall be 5 ft. less than the distance between the inner wheel bases of the shortest car length, etc. Our shortest car is a scale test car, which is 11 ft., and it is not practicable to arrange a special circuit for a 6 ft. length of dead section.

Chairman Stoltz: The committee will be glad to accept that and give it consideration.

A. R. Fugina (L. & N.): Referring to No. 6, I do not see the necessity of equipping the derail with a switch controller when the derail is pipe connected.

Chairman Stoltz: The committee is willing to go along with Mr. Fugina in a way, but not to eliminate the hand-thrown derail. It is not an interlocking derail, not a pipe connected derail.

J. C. Mock (M. C.): How about the words "provide the best possible protection against broken rails"? What does that mean?

Chairman Stoltz: In cases of junction in track, we can

either follow any junction, or in some cases we can run a series circuit.

E. B. Smith (N. Y. C.): Has the committee decided whether a lock is a better proposition than a series circuit, or a circuit on a cross-over for protection? I believe that the lever is superior to any special track circuit on a cross-over to take care of the condition.

Chairman Stoltz: I will be glad to have your opinion. We have none of our own yet.

Mr. Mock: I think that Paragraph No. 1 is a very expensive proposition. I do not know of many roads that really conform to that now.

Mr. Smith: This runs into money if you go into it wholesale, but it means very little when you are changing rails. When we started to place joints opposite on a tangent track it means a cost of about \$75,000 to make the change, but we placed them all opposite at but little cost when new rails were laid.

Mr. Kelloway: Referring to No. 1, I can readily see the necessity of insulated joints being placed opposite within interlocking territory, but I cannot see the necessity of them in automatic territory.

Mr. Post (P. R. R.): I think the reason that we placed the joints opposite each other was on account of some failures when the front wheels of the engine were passing over a joint—it was only 15 or 20 ft. between joints. The engine was moving very slowly, and in some way the signals were cleared up while the engine was passing that point.

(A motion to eliminate Paragraphs 15 and 17 and Sections F and H was carried, after which the committee was dismissed with the thanks of the Signal section.)

Report of Committee on Standard Designs

Continuing the work of standardization, the committee presented seven revised drawings covering signal pipe, trunking, switch point drilling, electric lock brackets, insulated switch adjustments and highway crossing gate lamps. Progress was reported on designs for switch fittings and on pipe and screw thread standardization. The investigation of and report on the best types of electric lamps for signal work was a subject assigned and after making various field observation tests, tentative voltage and current ratings, filament construction, bulb sizes, base, light center length and adapters were agreed upon. An adapter submitted for test purposes was approved.

F. P. Patenall
Chairman

F. P. Patenall is completing his seventh year as chairman of this committee. He has long been an active member of the association, having been president of the Railway Signal Association in 1914. He has had some forty-one years' experience in the railroad signal field, having started as a clerk in the signal department of the Lancashire & Yorkshire Railway in England in 1881. He worked for Stevens & Sons, signal contractors, for a year, and came to America in 1885 as an assistant foreman for the Union Switch & Signal Company. He was appointed signal supervisor of the Baltimore & Ohio in 1888 and to signal engineer in 1898.

THE COMMITTEE SUBMITTED for consideration the following revised standard designs and revisions in specifications, with the recommendations that they be approved for presentation at the annual meeting.

- 1115 One inch signal pipe and coupling (revised).
- 1176 Trunking—grooved type (revised)
- 1177 Trunking—built-up type (revised)
- 1179 Switch point drilling (revised)
- 1181 Electric lock brackets for applying locks in mechanical work (revised)
- 1192 Switch point bracket—insulated (revised)
- 1199 Highway crossing gate lamp (revised)

Specification for One Inch Soft Steel Signal Pipe

Section 3. Plugs (Revised). Plugs must be merchant steel 10 in. long, 31-32 in. in diam., drilled for 4 1/4

in. rivets with drill .257; spacing to be 1 in., 2 in., 4 in., 2 in., 1 in., the first and third holes to be in the same plane and the second and fourth holes at right angles thereto.

Specification for One-Inch Wrought Iron Signal Pipe

Section 3. Plugs (Revised). Plugs must be wrought iron or merchant bar steel, 10 in. long, 31-32 in. in diam., drilled for 4 1/4 in. rivets with drill .257; spacing to be 1 in., 2 in., 4 in., 2 in., 1 in., the first and third holes to be in the same plane and the second and fourth holes at right angles thereto.

Standard Designs for Switch Fittings

The committee reported progress. Two drawings showing two types of switch fittings are in process of

completion, and if permissible, the committee will submit these for approval at the annual meeting.

The Best Types of Electric Lamps for Signal Work

The committee reported progress.

Acting on the information obtained at the December, 1920, New York meeting, the committee has diligently prosecuted this matter to further conclusion, in connection with which valuable assistance has been rendered the committee by the lamp and lens manufacturers. For the purpose of field observations, the committee met at Corning, N. Y., in August and October, 1921, and after making various observation tests in the field, the following conclusions were tentatively agreed to:

Voltage Ratings. 3.5, 8, 10, 12, 13.5.

Current Ratings. 0.3 amp. for the 3.5 volt lamp, and 0.25 amp. for the 8, 10, 12 and 13.5 volt lamps.

Filament Construction. C-2 for the 3.5 volt lamp, and C-3 for the 8, 10, 12 and 13.5 volt lamps.

Bulb Sizes. S-11.

Base. Bayonet candelabra single contact.

Light Center Length. 1 1/4 in. measured from the top of the pins of the base to the center of the light source.

Adapters. Where an adapter is necessary in present installations to suit medium screw sockets, fitted thereto will be a single bayonet contact candelabra base and lamp.

A sample of this adapter was submitted to the committee and met its approval, and railroads have ordered a number of these adapters and lamps for practical test. The results will be reported at a later meeting.

Progress of Pipe Thread Standardization

The committee appointed E. K. Post as its representa-

tive to co-operate with the American Society of Mechanical Engineers, and a report concerning the conclusions arrived at is in the hands of the secretary. The American Society of Mechanical Engineers committee has been relieved. The committee recommended that the American Engineering Standards, pipe thread, approved December, 1919, as an American standard by the American Engineering Standards Committee be approved for presentation at the annual meeting.

Progress of Screw Thread Standardization

The committee appointed E. K. Post as its representative to co-operate with the American Society of Mechanical Engineers, and reported progress. The progress report made by the National Screw Thread Commission authorized by Congress, July 18, 1918, was approved June 19, 1920. A copy of this report is in the hands of the secretary.

Committee: F. P. Patenall (B. & O.), chairman; E. K. Post (P. R. R.), vice-chairman; C. A. Christofferson (N. P.), W. A. Hanert (N. Y. C.), C. J. Kelloway (A. C. L.), B. H. Mann (M. P.), J. C. Mock (M. C.), C. H. Morrison (N. Y. N. H. & H.), F. W. Pfeleging (C. P.), M. E. Smith (D. L. & W.), T. S. Stevens (A. T. & S. F.).

Discussion

(On motion, Drawings 1015, 1176, 1177, 1299, 1358 and 1499 were appointed. The specifications for one-inch soft steel and one-inch wrought iron signal pipe were also approved for presentation at the annual meeting, after which the committee was dismissed with the thanks of the Signal section.)

Report of the Committee on Batteries

The specifications for storage battery jars, as given in the committee report, offer a definite outline to be followed in the inspection and tests of either glass or hard rubber jars. Although no reference is made to the materials employed, it is presumed that lead jars are not considered as recommended practice to be used extensively in the signal field. In checking the sizes of the jars a mandrel 1/2 in. larger than the maximum outside dimension and 3/8 in. smaller than the minimum inside dimension is used to determine variations in the walls that would otherwise cause trouble when assembling the battery for service.

Albert B. Himes
Chairman

Albert B. Himes has been chairman of this committee for two years. Mr. Himes entered the service of the Pennsylvania Railroad as a clerk in the motive power department. From 1901 to 1903 he was a batteryman on the Lehigh Valley and the Long Island. During the eight years following 1901, he spent considerable time in the signal departments of the Pennsylvania, the Central of New Jersey, the Union Pacific, the Philadelphia and Reading, and the Baltimore & Ohio, being appointed signal supervisor of the last named road in 1909. He was later advanced to signal inspector and then promoted to assistant signal engineer of the B. & O.

THE COMMITTEE SUBMITTED (1) Specification for storage battery jar, and (2) Specification for cement concrete battery box.

Specification for Storage Battery Jar

1. *Purpose.* (a) The purpose of this specification is to provide for storage battery jars.
2. *Drawings.* (a) Purchaser's drawing accompanying this specification and forming an essential part thereof, is as follows: Drawing 1224.
3. *Material and workmanship.* (a) Material and workmanship shall be first-class in every respect.
4. *Variations.* (a) Variations shall be within the limits specified on drawing 1224.
5. *Inspection.* (a) Purchaser may inspect the material at all stages of manufacture.

(b) Purchaser may inspect the completed product to determine that the requirements of this specification have been met.

(c) If the material has not been accepted at point of production and if, upon arrival at destination, it does not meet the requirements of this specification, it may be rejected and the contractor, upon request shall advise the purchaser what disposition is to be made of the defective material. The contractor shall pay all freight charges.

(d) If purchaser is to make inspection at point of production, it shall be so stated.

6. *Tests.* (a) Tests may be made at point of production or on samples submitted and may also be made at destination.

(b) Contractor shall give the purchaser sufficient notice of time when material will be ready for testing.

(c) Contractor shall provide at point of production apparatus and labor for making the required tests under supervision of the purchaser.

(d) If tests are to be made at point of production, it shall be so stated. Purchaser will distinctly indicate which of the tests herein specified are to be made and what portion of the material shall be tested.

(e) In checking the sizes of jars, a mandrel 1/32 in. larger than the maximum outside dimensions and 1/32 in. smaller than the minimum inside dimensions, as specified on drawing 1224, shall be used. Mandrels shall move freely into the inside of jar for a distance of 5/6 of the depth of the jar and over the outside for a distance of 1 in. from the top of jar.

7. *Packing*, 8. *Marking* and 9. *Warranty* are standard sections adopted in 1919.

The committee recommended the approval of these specifications for presentation at the annual meeting.

Committee: A. B. Himes (B. & O.), chairman; A. H. Me-Keen (U. P.), vice-chairman; R. F. Anear (C. R. I. & P.), J. G. Bartell (L. V.), H. Hobson (A. T. & S. F.), J. F. Jacobs (C. R. R. of N. J.), T. L. Johnson (D. L. & W.), E. W. Kolb (B. R. & P.), H. G. Morgau (I. C.), S. U. Rhymer (C. & A.), F. C. Timmons (D. & H.), E. L. Watson (P. R. R.), A. H. Vocum (P. & R.)

Discussion

B. J. Schwendt (T. & O. C.): There is nothing mentioned as to the kind of jar, glass, rubber, or what.

A. B. Himes (Chairman): It is not provided in any place except in the drawing and the drawing will state it is glass.

Mr. Schwendt: May I suggest that the heading be "specification for glass storage battery jar."

Chairman Himes: The committee will consider that.

(On motion the specification was approved, after which the specification for cement concrete battery box was presented.)

T. S. Stevens (A. T. & S. F.): Has the committee given any consideration to the sheet iron cover?

Chairman Himes: The committee has given consideration to the sheet iron cover, and there is a sub-committee working on that subject now. This is a specification for the box which now appears in the Manual which provides for a cover of this kind.

E. J. Relph (U. P.): Committee 2 agreed that we would change our specification for sand to the following: "Sand shall be clean, sharp and coarse, free from humis content and from foreign matter that may contain a clay dust exceeding 5 per cent."

Mr. Kelloway: In accordance with the proposal which has been agreed upon in Committee 2, I would ask that the paragraph read as follows: "The size and pieces shall range from a minimum of 3/4 in. to a maximum of 3/4 in., in their greatest dimensions."

Chairman Himes: The committee will consider Mr. Relph: We also have added another clause which relates to a test for humis deposit in sand. It reads as follows: "Fill a wide-mouth bottle two-thirds full of the suspected material, and add sufficient 4 per cent solution of sodium hydroxide to fill the bottle. Shake occasionally, and if after 24 hr. solution is not darker than a straw color, it is safe; if very dark it must not be used."

(The committee was dismissed with the thanks of the Signal section.)

Report of Committee on Specifications for Oils

In order that the standard requirements for illuminating oils may be raised, permitting a better grade of oil to be obtained for railroad service, this committee has been making a careful study of the provisions which should be included in such a specification. The result of this study is incorporated in the specification presented for illuminating oil. It requires that the oil shall conform to certain requirements as to color, photometric test, flash test, cloud test, floc test, doctor test, sulphur content, distillation range and moisture. The methods to be employed in conducting the various tests are described in detail with a list of the apparatus required.

Ira S. Raymer
Chairman

Ira S. Raymer is completing his third year as chairman of the committee, having been appointed to this position in 1910. Mr. Raymer began work with the Union Switch & Signal Company in 1898 and in March, 1899 entered the signal department of the Pittsburgh & Lake Erie, on which road he is now signal engineer. In 1900 he became a member of the Railway Signal Club, later the Railway Signal Association and now the Signal section of the A. R. A. He has been active in committee work since 1907, when he was on the committee on Storage Batteries. He was also chairman of another committee of the Association for three years.

THE COMMITTEE submitted for consideration a specification for illuminating oil, with the view of raising the standard requirements.

Specification for Illuminating Oil

1. **Purpose.** (a) The purpose of this specification is to provide for a grade of illuminating oil for use where a long time burning oil is required.

2. **Material.** (a) The oil shall be free from water, and also from foreign matter.

(b) The oil shall conform to the following requirements:

1. **Color.** The oil shall be clear and the color shall not be darker than No. 21 Saybolt. The sample shall not be filtered before making color test.

2. **Photometric test.** At start of test, flame shall be not less

than candle power. At 24-hour period, flame shall not be less than candle power. At 48-hour period, flame shall not be less than candle power. At 72-hour period, flame shall not be less than candle power. At 96-hour period, flame shall not be less than candle power. At 120-hour period, flame shall not be less than candle power. At 144-hour period, flame shall not be less than candle power. At 168-hour period, flame shall not be less than candle power.

3. **Flash.** The flash point shall not be lower than 115 degrees F. (Tag closed cup.)

4. **Cloud.** The oil shall not show a cloud at 0 degree F.

5. **Floc.** The floc test shall be negative and shall not darken the color below No. 14 Saybolt.

6. **Doctor.** The doctor test shall be negative.

7. **Sulphur.** The sulphur shall not be more than 0.06 per cent.

8. Distillation Range. The temperature limits for the distillation shall be as follows:

	Fahrenheit
Initial boiling point.....	400 deg.
10% shall be distilled below.....	415 deg.
20% shall be distilled below.....	425 deg.
30% shall be distilled below.....	435 deg.
40% shall be distilled below.....	445 deg.
50% shall be distilled below.....	460 deg.
60% shall be distilled below.....	475 deg.
80% shall be distilled below.....	495 deg.
90% shall be distilled below.....	515 deg.
95% shall be distilled below.....	540 deg.
98% shall be distilled below (End point).....	550 deg.

The distillation loss shall not exceed 2 per cent when the residue in the flask is cooled and added to the distillate in the receiver.

9. Moisture. None.

3. Inspection is covered by standard sections (S. S. 6-b) 1919, (S. S. 6-c) 1919, (S. S. 6-d) 1917.

4. Tests. Tests are according to standard sections (a) (S. S. 7-a) 1919; (b) (S. S. 7-b) 1919; (c) (S. S. 7-c); (d) Samples for test shall be taken from near the bottom of the oil in the container by use of a thief.

5. Marking. (a) Purchaser's order, requisition and package number, name of consignor, and name and address of consignee, shall be plainly marked on outside of package.

(b) Detail list of containers and their contents shall be furnished for each shipment. Where carload shipments are made, routing and car identification shall be shown.

(c) Where carload shipments are made, each container shall be marked showing contents; order number and address may be omitted.

6. Packing. (a) The oil shall be put in clean, dry metal containers of the kind and capacity as specified by the purchaser.

7. Methods of testing. (a) Tests shall be made with the following methods and apparatus:

(b) Color Test: 1. Saybolt universal chromometer consists of two similar glass tubes 20 in. long and about five-eighths inch in internal diameter. One tube is open at both ends; the other (the oil tube) is permanently closed at the bottom with a colorless glass disk. The oil tube is provided with a pet cock on the side at the bottom. The tubes are supported in a vertical position above a mirror arranged to reflect light upward through the tubes. Above the tube is an eyepiece so designed that the field of vision is equally divided between the two tubes. A colored yellow glass disk is placed at the bottom of the open tube.

(c) Photometric Test. 1. The apparatus consists of a standard R. S. A. semaphore lamp, burner and chimney with the interior painted a flat black to absorb reflected rays, and a brass disk 5 in. in diameter by 1/2 in. thick, having a 2-in. circular hole in the center, replacing the lens. A 2-in. brass tube is fitted securely in the hole and extended outward 9.72 in. from the nearest surface of the lamp flame. The interior of the brass tube and disk are made a dull black to absorb reflected rays. A MacBeth illuminometer reading direct candle power is attached to the outer end of the brass tube.

2. Twenty-five ounces of the sample of oil to be tested shall be placed in the fount of the standard lamp, using a standard burner and chimney and a wick that has been washed in ether.

3. The wick shall be adjusted after the lamp has been burning one-half hour to get the best candle power of the flame and shall not be changed again during the test. The photometric value of the flame shall be taken one-half hour after the lamp is lighted and at each succeeding 24-hr. period until the end of the test.

(d) Flash Test. 1. The Tag closed tester consists of an oil cup surrounded by a water bath supported over an alcohol or gas burner. The water bath is provided with an overflow tube to maintain a constant level. The apparatus is provided with a cover, thermometer supports, test flame holder, and gage.

(e) Cloud Test. 1. Place 1 1/2 ozs. of the oil to be tested in a 4-oz. sample bottle. Insert cold test thermometer in the cork so that the bulb is centrally placed in the oil. Keep oil cooled to the specified temperature for 10 min. by placing the bottle in a cooling mixture of cracked ice and salt in proportion of one to two. The salt shall be dry and fine enough to pass through a 20-in. mesh screen. To keep all parts of the oil at a uniform temperature, the bottle should occasionally be given a rotary motion. The oil should not show a cloudy appearance at the end of the test.

(f) Flocc Test. 1. Place a small layer of sand in the bottom of a hemispherical iron dish. Filter if necessary to eliminate suspended matter, 300 c. c. of oil, which shall be placed in a 500 c. c. Florence or Erlenmeyer flask. Suspend the thermometer

in the oil by means of a slotted cork. Heat the bath so that the oil will reach the temperature of 255 deg. F. at the end of one hour, maintaining this temperature with a tolerance of 5 degrees for 6 hours. At the conclusion of the test the oil shall comply with the color requirement and on a slight rotary motion of the flask no suspended matter or floc shall be present.

(g) Doctor Test. 1. Preparation of Reagents: Sodium plumbite or "Doctor Solution." Dissolve approximately 125 grams of sodium hydroxide (NaOH) in a liter of distilled water. Add 60 to 70 grams of litharge (PbO) and shake vigorously for 15 to 30 mins., or let it stand with occasional shaking for a least a day. Allow to settle and decant or siphon off the clear liquid. Filtration through a mat of asbestos may be employed if the solution does not settle clear. The solution should be kept in a bottle tightly stoppered with a cork. Sulphur: Pure flowers of sulphur.

2. Making of test: Shake vigorously together two volumes of oil and one volume of the "doctor solution" (10 c. c. of oil and 5 c. c. of "doctor solution") in an ordinary test tube; or proportional quantities in a 4-oz. oil sample bottle may be conveniently used. After shaking for about 15 sec., a small pinch of flowers of sulphur should be added and the tube again shaken for 15 sec. and allowed to settle. The quantity of sulphur used should be such that practically all of the sulphur floats on the surface separating the oil from the "doctor solution."

3. Interpretation of results: If the oil is discolored or if the sulphur film is so dark that its yellow surface is noticeably masked, the test shall be reported as positive and the oil condemned as "sour." If the liquid remains unchanged in color and if the sulphur film is bright yellow or only slightly discolored with gray or flecked with black, the test shall be reported negative and the oil considered "sweet."

(h) Sulphur Test. 1. Apparatus includes a small lamp, an absorber containing glass beads, a chimney, an exit tube, and a wooden base for the absorbers; filter pump or some other means of obtaining an air suction on the absorber, extra wicking for lamps, rubber tubing for suction connected with exit, a solution of HCL (1 c. c.-0.002275 gm.), a solution of Na₂CO₃ (1 c. c.-0.003306 gm.) and a one per cent solution of methyl oranges. The absorber and chimney should be made of glass having a low solubility. For a lamp one can use a small Erlenmeyer flask (25 c. c.). Insert in the flask a cork, through which runs a glass tube. Inside the glass tube insert a wick made of cotton wicking. A slot should be made on the side of the cork to allow air to enter the Erlenmeyer flask and thus avoid a vacuum.

(i) Distillation Test. 1. Apparatus: Distillation flask and support. The flask used shall be the standard 100 c. c. Engler flask, described in the various text-books on petroleum. Position of vapor tube, 9 cm. (3.55 in.) above the surface of the oil when the flask contains its charge of 100 c. c. The flask shall be supported on a ring of asbestos having a circular opening 1 1/2 in. in diameter.

2. The thermometer shall be made of selected enamel-backed tubing having a diameter of between 5.5 and 7 mm. The total length shall be approximately 380 mm. The range shall cover 30 deg. F. to 750 deg. F. with the length of the graduated portion between 280 and 300 mm.

3. The condenser shall consist of a thin-walled tube of brass or copper, 1/2-in. internal diameter and 22 in. long. It shall be set at an angle of 75 deg. from the perpendicular and shall be surrounded with a cooling jacket of the through type. The lower end of the condenser shall be cut off at an acute angle and shall be curved down for a length of 3 in. The condenser jacket shall be 15 in. long.

The committee recommended that the specification for tests of illuminating oil be accepted for discussion.

Committee: I. S. Raymer (P. & L. E.), chairman; E. B. Smith (N. Y. C.), vice-chairman; C. H. Burnette (Monongahela); C. F. Jones (Sou. Lines West); L. E. Kinch (P. R. R.), B. F. Oler (P. R. R.), D. S. Rice (L. V.), B. H. Richards (D. & H.), W. S. Storms (Erie), Guy Tuft (P. R. R.).

Discussion

I. S. Raymer (Chairman): There is quite a difference of opinion as to how high the flame should be while the lamp is going through the test. We are pretty much of the opinion now that 1/2-in. flame is high enough for the maximum height, and that probably a 3/8-in. flame is not too low for the minimum height. We have found quite a variation in the performance of the wicks under capillary attraction and that temperature has quite an effect on the illuminating power of the oil. A drop of 50 deg. temperature will cause a drop of the flame of 1/8 in. If any oil has been received or is being received that is not sat-

isfactory, the committee would deem it a great favor if about one gallon of that oil were sent by express to the chairman. We are trying to develop information to determine whether it is not a fact that the distillation test, provided the oil is pure, will not run parallel with the illuminating test.

E. B. Smith: We have been trying to check the photometric test with the distillation range, to try to work the specification out so that the photometric test will tell you what your oil is.

Chairman Raymer: The distillation test is the most valuable test in the oil specification. It shows where the manufacturer has made his cut between gasoline and kerosene and between kerosene and the heavier fuel oil. We do not say anything about specific gravity. We do not want it. We want to have the manufacturer cut somewhere between 350 and 400 between gasoline and illuminating oil, and somewhere about 550 between the illuminating oil and the fuel oil. If we can get that put across, and in addition to that the test which will elimi-

nate the impurities, I believe we will have an oil that will burn for 15 or 20 days.

A. T. Ambach (B. & O.): The committee should consider the method of storage and handling of oil. That is one of the most vital things that the railroads are interested in.

Chairman Raymer: We have no instructions about the handling of the oil in the field, but if it is the wish of the Board of Direction to instruct us to bring in rules on the handling of oil, we would be glad to take that matter up.

Mr. Elliott: I would suggest that the Committee on Committees be instructed to look into that matter. We may have a good specification, yet at the same time we would spoil all we have secured by this good specification by improper methods of handling and storage.

The specification for illuminating oil, No. 5003, was approved for presentation at the annual meeting, and the committee dismissed with the thanks of the Signal section.

Report of Committee on D. C. Relays

In presenting tables showing relays of standard resistances and their operative characteristics the committee has attempted only to show those relays which predominate in railway signal work. The characteristics given are based on careful study and tests, and are presented for discussion. The importance of the relay to proper signal operation is unquestioned and it is essential that it operates under certain working conditions in order to reduce to a minimum false operation which might result in false proceed signal indications. Through the use of these tables, railroads may determine the condition of those relays which it has in service or stock.

Edward G. Stradling
Chairman

Edward G. Stradling is completing his fourth year as chairman of the committee, after having served previously as vice-chairman. He first engaged in signal work on the Union Pacific in 1906. After being with this company for two years, he resigned to accept an appointment as signal inspector on the Chicago, Indianapolis & Louisville, being promoted to signal engineer of this road in May, 1911. His jurisdiction was extended and his title changed to that of superintendent of telegraph and signals in May, 1920. He is a thorough student and has made a particularly close study of direct current relays, resulting in much constructive work.

THE COMMITTEE SUBMITTED a table of standard resistances of relays with their operative characteristics. This consisted of two tables showing relays of standard resistances and their operative characteristics.

Sub-committee B received statements showing that many railroads are using track relays of different resistances than the generally recognized 2 ohm and 4 ohm relays and the committee has endeavored to show, in the table, those relays that predominate. The values shown for the 4 ohm relays are in accordance with the requirements of the 1920 specifications of the Signal section, but the committee is of the opinion that with the improvement of the relay it should be possible to specify more desirable values. To obtain the values shown in both tables a relay mechanism built in accordance with the 1920 specification was used and coils of the various resistances shown in the tables were applied to this mechanism and the values secured for the operative characteristics.

The operative characteristics shown in the tables for the relays of the different resistances with the exception of the 7 ohm and 11 ohm relays were obtained by making tests on the relays of the different manufacturers. The characteristics shown for the 7 ohm and 11 ohm relays were obtained from the relays of only one manufacturer, as the others do not have these resistances. The values

were included in the table on account of the greater efficiency of these two relays, due to the characteristics of their coils.

Committee: F. G. Stradling (C. I. & L.), chairman; C. D. Cronk (N. Y. C.), vice-chairman; W. S. Adams (N. Y. C.), C. M. Acker (D. & H.), E. T. Ambach (B. & O.), B. H. Ayers (L. & N.), E. F. Champlin (Eric), J. I. Chaceoran (N. Y. C.), A. R. Engma (L. & N.), H. W. Lewis (L. V.), H. C. Price (Eric), C. E. Smith (U. D.), J. E. Stewart (D. R. R.), C. F. Stoltz (C. C. & St. L.), L. C. Walters (Son), W. B. Weatherbee (D. L. & W.), F. G. Wesson (C. B. & Q.).

Discussion

E. G. Stradling (Chairman): It appeared to the committee that under Table 1 some of these relays could be eliminated. The wide variety of resistances now used necessitates the manufacturer making and carrying on hand too many different resistances for track relays.

C. G. Stoltz (C. C. & St. L.): In order to get the sense of the meeting, I move that the relays of 7, 11 and 16 ohm resistance, shown in the first table, be eliminated as standard resistances.

T. S. Stevens (A. E. & S. E.): I do not believe any of these should be eliminated if they are used. I see no good reason why we cannot print all of these relays if they are in satisfactory operation. We are not recom-

mending them. They are already in use. We are not discrediting their use if we leave them in.

J. B. Latimer (C. B. & Q.): I agree with Mr. Stevens, that we had better leave this paper alone and accept it as it is. The relay question seems to be the most intricate question we have in our profession.

(An amendment was submitted, after which the motion and amendment was put to a vote and lost.)

C. Drake (C. & N. W.): There is quite a large demand for a lower pick-up, four-ohm four-contact relay. I believe such a relay can be built with a maximum pick-up of 65 mils. which is perfectly safe.

F. L. Dodgson (Ten. Ry. Leg. Co.): If we are going to make any practical use of the relay characteristics of different resistances, these characteristics must be based upon some standard. The resistance of the relay is not a standard, because in order to get the specific resistance and have the coil efficient, that is a full coil, one of two things must be done—either you must use odd sizes of wire or the coils must be left small with a lesser number of ampere turns than are necessary.

Chairman Stradling: I think that is taken care of by

the 1920 specifications, where we state, it should have full wound coil.

TABLE NO. I.
Operative Characteristics,
D. C. Relays Used for Track Circuits.

Nominal resistance	Voltage range	No. of front contacts	Physical resistance at 80° F.	Min. front contact pressure	Satur. amp.	Min. drop away with coil contact	Min. drop away with coil contact pressure	Maximum working current	Maximum working voltage
Ohms	Range	Contacts	Inches	Inches	Amps.	Amps.	Amps.	Amps.	Amps.
2	1st	2	.620	.080	4.0	.021	.41	.04	165
2	1st	4	.615	.080	4.0	.020	.47	.10	200
4	1st	2	.620	.080	4.0	.025	.30	.07	160

Operating Characteristics of D. C. Relays

(The committee was dismissed with the thanks of the Signal section.)

Report of Committee on Power Interlocking

In presenting specifications for the electric wiring of interlocking plants the committee has taken a long step in the direction of standardizing such construction. The requirement that 25 per cent space be allowed for additional wires in trunking or conduit, and the limiting of two wires to the terminal are good points in construction that were not considered in many past installations. Limiting the minimum size of conductors for various circuits and requiring the proper tagging are methods that will prove useful to those following the specifications. The requisite sheets will place a contract on a basis fair alike to the railroad and to the contractor.

Frank William Pffefing
Chairman

Frank William Pffefing is completing his first year as chairman of the committee, having been vice-chairman for one year, prior to which time he was a member of the committee for several years. He has been an active member in the signal field for a number of years, having been chairman of the Signal section during the preceding term. Mr. Pffefing entered railroad service as a signal maintainer on the Chicago & Eastern Illinois in 1899 and left this road in 1901 to join the signal department of the Union Pacific, where he was promoted to the position of signal engineer of the Lines East, the position which he now holds.

THE COMMITTEE SUBMITTED specifications for electric wiring for interlocking plants.

General

- (1) Purpose, and (2) Drawings, are standard sections, 1919.
- (3) Tender.—(a) The tender shall be for an installation meeting with the requirements of this specification. If the contractor wishes to vary from the specification, a tender may be submitted covering the changes he desires to make. This tender shall be accompanied by full information showing wherein the requirements of the specification are varied from.
- (4) Requisite Sheet, and (5) Material and Workmanship, are standard sections, 1919.
- (6) Inspection.—(a) Purchaser may inspect the installation at all stages to determine that the requirements of this specification have been met.
- (7) Tests.—(a) Contractor shall make such tests as may be necessary to demonstrate to the satisfaction of the purchaser that the installation is in accordance with the requirements of the specification. The contractor shall provide such instruments and apparatus as may be necessary for making the tests. The instruments and the apparatus shall remain the property of the contractor.
- (8) Warranty.—(a) Contractor shall replace at his own cost any part or parts of the installation furnished by him which shall within a period of one year from date of acceptance of installation fail to perform its proper function because of any defect in the application or erection of same.

- (9) Clearance.—(a) Clearance shall conform to A. R. A. requirements unless otherwise specified on requisite sheet.

Detailed Specifications

WIRING

- (10) Wiring.—(a) Underground and, or, aerial wiring from the interlocking machine to distributing points and between distributing points shall be multiple conductor cable, unless otherwise specified on requisite sheet. When not more than 10 wires are required, the aerial installation may be of single conductor wire.
 - (b) The wiring between apparatus in tower or power house and distributing points in tower shall be single conductor, unless otherwise specified on requisite sheet.
 - (c) The wiring from distributing points to units operated shall be of single conductor, unless otherwise specified on requisite sheet.
 - (d) Wire in trunking, chases or conduits shall be laid loosely without stretching or crowding, allowing a minimum of 25 per cent space for additional wires.
 - (e) Insulated wires or cables shall be drawn in by straight-away pull and wire shall not be bent or kinked in gripping to pull, or shall not be pulled around corners.
 - (f) Not more than 2 wires shall be connected to one binding post or terminal screw and they shall be separated by a washer.
 - (g) Wire leads to relays or other instruments which may be moved while in service, shall be of flexible wire as specified on requisite sheet.

(h) Wire and cables shall conform to A. R. A. Signal section specification, unless otherwise specified on requisite sheet.

(i) The wiring in tower and other associated buildings, shall be placed in metal conduit, unless otherwise specified on requisite sheet.

(11) **Underground Wiring.**—(a) Braided cable shall be used, unless otherwise specified on requisite sheet.

(b) Underground cable shall be drawn in accordance with A. R. A. specification, unless otherwise specified on requisite sheet.

(12) **Aerial Wiring.**—(a) Multiple conductor cable

1. Aerial braided cable, A. R. A. Signal section specification, shall be used, unless otherwise specified on requisite sheet.

2. Aerial braided cable shall be installed in accordance with A. R. A. specification, unless otherwise specified on requisite sheet.

3. Cables shall terminate in cable boxes, as shown on purchaser's drawings.

(b) Single conductor wiring

1. Line wire shall be as specified on requisite sheet.

2. Line wires shall be supported at each pole by crossarm, pins and insulators.

3. Crossarms, also braces, pins, bolts and other hardware shall be in accordance with A. R. A. Signal section specifications.

4. Line wires shall terminate at a crossarm.

(13) **Cable.**—(a) Cables shall be composed of conductors as specified on requisite sheet.

(14) **Wire Joints.**—(a) Wire joints shall be in accordance with A. R. A. Signal section specification.

(b) Potheads and cable splices shall be in accordance with A. R. A. specifications, unless otherwise shown on requisite sheet.

(c) Joints or breaks shall not be made in other than open line except by permission of the purchaser.

(d) Wire ends terminating on binding posts shall be formed according to A. R. A. Signal section specification unless otherwise specified on requisite sheet.

(15) **Conductors.**—(a) Gauge of conductors shall be of sufficient size to permit operation of apparatus in accordance with A. R. A. Signal section specifications.

(b) No single conductor wires smaller than No. 16 A.W.G. shall be used for interior wiring.

(c) No smaller than No. 14 A.W.G. shall be used for exterior wiring.

(d) Line wire with breaking strength less than that of No. 10 A.W.G. hard drawn copper shall not be used.

(e) In main line cable work spare wires up to 25 per cent and in branch cable up to 10 per cent of the number in use shall be provided, unless otherwise specified on requisite sheet. When spare wires are required in other than cable work, the number and size shall be specified on requisite sheet.

(f) Connections to track shall be in accordance with A. R. A. Signal section drawing, unless otherwise specified on requisite sheet.

(16) **Tagging.**—(a) Each wire shall be identified near each terminal by means of a non-metallic tag or label, on which is stamped the wire designation corresponding to that shown on the circuit and wiring plan.

(b) Where practicable, the tags shall be securely fastened adjacent to the terminal, so that the number can be easily read.

(c) A non corrosive metal tag identifying each line wire shall be nailed to the side of crossarm at each pole where wire terminates, unless otherwise specified on requisite sheet.

(17) **Lightning Arresters.**—(a) Lightning arresters shall be provided as specified on requisite sheet.

(b) Lightning arrester grounds shall conform to R. S. A. specification.

(c) Separate grounds shall be provided for high tension and low tension lightning arresters.

(18) **Wire Terminal.**—(a) Terminal blocks for wire and cable conductors shall be in accordance with R. S. A. 1056 and shall be installed in an accessible position and neatly arranged on terminal blocks in hoistings as shown on purchaser's plan.

(b) Wires used for maintainers' telephone shall be terminated as provided on requisite sheet.

The committee recommended that these specifications be adopted for presentation at the annual meeting.

Committee: J. W. Pileston (U. P.), chairman; B. J. Schwendt (C. & N. W.), vice-chairman; W. C. Sibola (N. Y. C.), vice-chairman; J. J. Altman (K. C. T.), F. T. Ambach (B. & O.), J. L. Ball (D. I. & W.), L. E. Carpenter (P. R. R.), S. L. Dewey (C. & C. S.), L. E. N. Fox (B. & M.), James Gultz (T. & E. A.), N. S. Lynch (Mo. Pac.), J. W. MacCormack (K. T.), W. W. Morrison (N. Y. C.), J. H. Oppelt (N. Y. C.), E. L. T. C. Seibert (C. B. & Q.), Walter Tyler (L. I.),

O. R. Unger (Mo. P.), W. R. Young (G. T.), G. A. Ziehlke (U. P.).

Discussion

E. B. Smith (N. Y. C.): Section 10, Paragraph G, states: "Wire leads to relays or other instruments which may be moved while in service, shall be a flexible wire as specified on requisite sheet." I do not understand what "may be moved" means there. I know several years ago we used flexible wire connections to our relays, but we have them all out today and find much better service by running a solid wire to the relay.

B. J. Schwendt (Vice-Chairman): The committee had in mind shelf pipe relays or any other type.

B. F. Oler (Penna.): It would be well to use eyelets instead of "flexible wire."

Vice-Chairman Echwendt: The matter of making wire ends is referred to further on, and while eyelets are not specified, we specified the method used by the R. S. A., and made provision for other usages that may cover your point. The breaking strength of No. 10 A. W. G. hard-drawn copper is 894 lb. Is this minimum high enough?

W. H. Elliott (N. Y. C.): Would it not be advisable to place the breaking strength of No. 10 A. G. W. hard-drawn copper wire in this specification, to make it clear as to what the desired minimum strength should be?

Vice-Chairman Schwendt: The committee will be very glad to do that.

Mr. Smith: I would like to know if the committee has taken into consideration the use of a smaller wall for the wall insulation on the wire used for the interior work; in other words, go from 5/64 to 3/64 wall for the interior wiring.

Vice-Chairman Schwendt: The tendency seems to be to use smaller wall insulation in tower or interlocking station wiring, and the provision herein will give you that opportunity.

R. M. Phinney (C. & N. W.): In Paragraph 17, the words "high tension" and "low tension" are used. These are indefinite terms, and I suggest that the voltage ranges be specified instead.

Vice-Chairman Schwendt: The committee is glad to accept that.

(The committee was dismissed with the thanks of the Signal section.)

On the "River Division"

Registration of Signal Section, A. R. A.

THE REGISTRATION OF members and guests of the Signal Section of the American Railway Association at the Drake hotel yesterday totaled 334, as compared with a similar registration for the first day two years ago (the last March meeting of the Section) of 346.

Board of Direction Meeting

The Board of Direction of the American Railway Engineering Association met in session at the Congress hotel yesterday to complete the work of the year and to prepare for the convention.

Annual Exhibit of the N. R. A. A. at the Coliseum

"Harding" Blue With White Features Decorative Scheme.
All Exhibit Space Taken by 176 Firms

"THE CANOPY MARKS THE ENTRANCE." With these words C. W. Kelly, secretary of the National Railway Appliances Association, concluded his remarks to the writer regarding the annual exhibit of that body which opened at the Coliseum yesterday. By way of the canopy, then, one enters the exhibit area which is located in the Annex and Coliseum, where every available inch of space has been taken up by the 176 exhibiting members at this year's show. The ballroom space has not been utilized, as a result of which it has been necessary in some instances to provide special table space for exhibitors.

The decorative scheme of this year is "Harding" blue with white and is most attractive. The booths are separated by white paneling, edged with "Harding" blue, while the firm names are in green on a white background and here and there the crest of the Association is emblazoned on the paneling. Festoons of yellow material are draped at short intervals across the false ceiling of oatmeal color, which is finished off where it strikes the booths with a flounce of the same material. The "Harding blue" effect is carried out further in the literature and badges.

The four days' attendance is expected to break all previous records, as it will be enlarged this year by the visitors to the March meeting of the Signal Section. Passes have been issued to the number of 13,500 and 75,000 invitations have been sent to railway officers, members of the Interstate Commerce Commission and like bodies, and to technical colleges. As was the case last year, a new record has been made in tickets requested by railway officers for themselves and subordinates; the number this year is greater than ever before. These facts and the large number of visitors on the first day forecast a record attendance.

Though there will be no band concerts this year, other arrangements will remain about the same as in the past. Public stenographers are in attendance and separate registration booths have been provided on the right as one enters the Annex for the members of the American Railway Bridge and Building Association, the Roadmasters' and Maintenance of Way Association, the Scalesmen's Association and the Signalmen's Association. A first class dining room is in operation at the show and great care has been taken to make the food and service of the best. One can therefore eat on the premises and it will not be necessary to go downtown to get a "regular" meal. The Association will hold its annual meeting in this dining room, which is down the stairs on the east side of the Coliseum, Tuesday morning at 11 o'clock.

The exhibit will be open each day from 8 a. m. to 6:30 p. m., with the exception of Tuesday, when the doors will be open until 11 p. m., and the last day, when they will be closed at 1 p. m.

The officers and members of the board of directors of the National Railway Appliances Association for the past year were: President, G. C. Isbester, American Chain Company, Chicago; vice-president, T. W. Aislton, National Malleable Castings Company, Chicago; secretary-treasurer, C. W. Kelly, Kelly-Deby Company, Chicago; honorary director, J. B. Strong, Ramapo Iron Works, Hillburn, N. Y.; directors, E. A. Johnson, Duff Manufacturing Company, Pittsburgh, Pa.; W. J. Gillingham, Hall Switch & Signal Company, Garwood, N. J.; L. W.

Shugg, General Electric Co., Schenectady, N. Y.; A. J. Filkins, Paul Dickinson, Inc., Chicago; A. A. Taylor, Fairbanks-Morse & Co., Chicago; and G. E. Geer, Wyoming Shovel Works, Chicago.

LIST OF EXHIBITORS

The following is a list of firms presenting exhibits, with the devices on display and the names of the representatives present at their booths:

Adams & Westlake Company, The, Chicago.—Signal lamp; lantern, stop sign; long time burners; switch lock; etc. Represented by A. S. Anderson, F. W. Foehringer, Wm. J. Pierson, Chas. B. Carson, J. F. Stender, H. G. Turney and G. L. Walters. Spaces 87, 88, 106 and 107.

Adams Motor & Manufacturing Company, Chicago.—Gasoline operated motor cars. Represented by W. E. Adams, R. S. Adams, W. M. McClintock and L. Gerhardt. Spaces 218 and 218½.

Air Reduction Sales Company, New York City.—Welding and cutting torches; oxyacetylene welding and supplies; oxygen and acetylene gas. Represented by H. H. Melville. Spaces 167, 167½ and 168.

American Abrasive Metals Company, New York City.—Safety treads. Represented by C. A. Barker. Space 172.

American Car & Foundry Company, Chicago.—Electric rivet heater; electric stock heater. Represented by C. P. Dickerman, A. F. Frost and A. G. Wood. Spaces 203 and 212.

American Chain Company, Inc., Bridgeport, Conn.—Welded-weldless chain; railroad specialties; castings and valves. Represented by W. T. Morris, A. P. Van Schaick, G. C. Isbester, A. H. Weston, R. T. Hatch, J. N. Ferguson, M. L. Chase, W. V. Walsh, G. B. Kutz and J. N. Lee. Spaces 81, 82 and 83.

American Hoist & Derrick Company, St. Paul, Minn.—Railroad ditcher. Represented by Helen M. Hoeller, W. B. Maurer, W. L. Manson, F. J. Johnson and J. L. Hickey. Space 88½.

American Kron Scale Company, New York City.—Automatic dial scales. Represented by Carl F. Larson and Ernst Ohnell. Space 125.

American Malleable Castings Association, Cleveland, Ohio.—Certified malleable castings and tests on same. Represented by Frank J. Lanahan and Enrique Touceda. Spaces 181, 182 and 183.

American Radiator Company, Chicago.—Heating outfits for stations and interlocking towers. Represented by J. H. Davis and W. J. Tuttle. Space 190.

American Steel & Wire Company, Chicago.—Wire rope; electrical wires and cables; rail bonds; trolley wire; fence; steel fence posts; steel gates. Represented by L. P. Shanahan, B. H. Ryder, J. W. Collins, A. R. Waterman, A. W. Froude, M. E. Evans and J. F. Alexander. Spaces 51½ and 52.

American Valve & Meter Company, The, Cincinnati, Ohio.—Water columns; Interlocking switch stand; safety switch lock; switch stands. Represented by J. T. McGarry, D. J. Higgins, F. C. Anderson and J. DePinal. Spaces 130, 131 and 132.

American Vulcanized Fibre Company, Wilmington, Del.—Vulcanized fibre for rail joint; steel tie; switchrod; bridge and hand-car insulation; fibre for mechanical and electrical use. Represented by C. W. Sutton, C. C. Bell, H. C. Hackett and John Barron. Space 126.

Argyle Railway Supply Company, Chicago.—Track devices; motive power; freight car specialties. Represented by George W. Bender and A. H. Green. Space 163½.

Armo Culvert & Flume Manufacturing Association, Middletown, Ohio.—Ingot iron culverts and sheets. Represented by G. F. Ahlbrandt, W. W. Lewis, Fred Melhope, H. L. Harris, H. W. Rinearson and A. B. Reineke. Spaces 99 and 100.

Asphalt Block Pavement Company, Toledo, Ohio.—Compressed asphalt flooring; paving blocks. Represented by E. J. Snyder, Fletcher Rogers and J. B. Weed. Space 166½.

Atkins, E. C. Company, Inc., Indianapolis, Ind.—Saws. Represented by L. L. Okey and E. S. Norvell. Space 219½.

Baker R & L Company, Cleveland, Ohio.—Crane truck; elevating platform truck; 3-wheel tractor. Represented by T. W. Barnes. Space 225.

Balkwill Manganese Crossing Company, The, Cleveland, Ohio.—Articulated cast manganese railroad crossings. Represented by Stephen Balkwill. Spaces 201 and 202.

Barrett Company, The, New York City.—Roofing; waterproofing for bridges and building foundations; tunnels and reservoirs;

wood preserving; road beds. Represented by William S. Babcock and Carl T. Bilyea. Spaces 107¹/₂ and 108.

Barrett Cravens Company, Chicago.—Lift trucks; portable floor crane; industrial tractor; steeple platforms. Represented by Edwin J. Heimer, C. F. Martin and V. M. Barrett. Space 14.

Bethlehem Steel Company, Bethlehem, Pa.—Switch stands; solid manganese tongue switches and mates; manard frogs. Represented by N. E. Salisch, G. S. Vickery, Fred Weymouth, B. W. Barnwell, Marshall Carroll, Harry Weymouth, G. H. Riddle, E. B. C. Goyne and J. S. Clark. Spaces 118, 119, 137 and 138.

Blaw-Knox Company, Pittsburgh, Pa.—Clam shell buckets; handy hoses. Represented by Irving G. Jackson, R. D. Allrich, R. B. Randall, I. A. Pfeil, W. H. Schutte, J. H. Flynn and C. H. Lehman. Space 89.

Boss Nut Company, Chicago.—Lock nuts; bolts; rivets and track bolts. Represented by J. A. MacLean, J. W. Fogg, J. P. Crowley, A. W. MacLean, W. G. Wilcoxson, E. T. McAuliffe and C. Beaumont. Spaces 1 and 2.

L. S. Brach Manufacturing Company, Newark, N. J.—Lightning arresters and signal accessories. Represented by G. Gort and L. S. Brach. Space 3.

Brown Hoisting Machinery Company, The, Cleveland, Ohio.—Locomotive cranes; car dumpers; buckets; boat unloaders. Represented by Geo. F. Chimo, J. P. Case and R. L. Meade. Space 4.

Bryant Zinc Company, Chicago.—Railway signal supplies. Represented by S. C. Bryant. Spaces 154 and 155.

Bucyrus Company, South Milwaukee, Wis.—Spreader plows; wrecking cranes; excavating machinery. Represented by Mark J. Woodhull. Spaces 213 and 214.

Buda Company, The, Chicago.—Motor cars; power car with tie tampers and electric bond drill and wood drill; electric head-light; all steel bumping post; switch stand; power unit; jacks; tool grinder; electric crossing gate; car replacers; rolled steel motor car; hand and push car wheels; track drill; bonding drill; track level; track gauge. Represented by L. M. Viles, F. E. Place, R. B. Fisher, C. H. Bull, M. H. Harkless, J. B. Conant, E. J. Conant, E. D. Conant, J. J. Gard, H. M. Sloan, H. L. Miller, C. T. Miller, J. R. Mayeskie, C. N. Bradley, M. A. Ross, W. P. Hunt, H. P. Bayley, G. E. Brvar, J. L. Artmaier, M. A. Evans, G. W. Hoover, J. E. Murray, F. R. Taggart and Wm. S. Weston. Spaces 61, 62, 63, 64 and 65.

Carbic Manufacturing Company, New York City.—Portable lights; motor car lights; welding and cutting outfits; acetylene generators. Represented by D. C. Duncan, A. D. Guthrie, Gordon Paterson and C. H. Bolinder. Space 15.

Carter Blossom Floor Company, Chicago.—Flooring. Represented by M. G. Truman, C. J. Carter, R. G. Stowell, A. B. McHenry, J. G. Galvin and F. L. Bronez. Space 219.

General Electric Company, Chicago.—Wires; cables; tape; lighting units; receptacles; plugs. Represented by A. L. McNeil, J. M. Lorenz, L. R. Mann, E. H. McNeil and R. N. Baker. Space 17.

Challenge Company, Batavia, Ill.—Complete working model of steel structure; 50,000-gallon tank with railroad fixtures. Represented by Frank Snow, E. W. Johnson, J. A. Anderson, D. C. Harker and R. L. Lewis. Space 109.

Chicago Bridge & Iron Works, Chicago.—Conical bottom and elliptical bottom; elevated locomotive water tanks; non-freeze spout fixtures. Represented by Merle J. Trees, H. C. Brown, L. McDonald, J. L. Zeller, H. B. Murphy, Ralph Green, R. M. Campbell, K. J. Small, Wallace Wyman, I. R. Donaldson, C. H. Schuman, C. S. Saugedahl, F. E. Alt, Clint M. Ladd and Cedric B. Smith. Spaces 33 and 34.

Chicago Malleable Castings Company, Chicago.—Two-way rail anchors; rail anchor tie plates. Represented by J. S. Ullwellen, Warren Osborn, W. L. Beudway, G. B. Greene, Geo. W. Stevens, A. R. Anderson and Watter Osborn. Space 142.

Chicago Pneumatic Tool Company, Chicago.—Electric and pneumatic appliances for track work. Represented by H. G. Barlee, A. Andreu, H. S. Runsey, N. S. Thulin and John D. Crowley. Spaces 200 and 215.

Chicago Railway Signal & Supply Company, Chicago.—Signal ing apparatus. Represented by F. W. Vogel, A. C. Dunne, R. S. Froese, A. E. Ferguson, John S. O'Fallon, Sidney Johnson, C. R. Ahrens, D. J. McCarthy, Wm. C. McClintock and C. A. Sahr. Spaces 77 and 79.

Chapman Chemical Engineering Company, Inc., New York City.—Chemical weed killer and equipment for application of chemical. Represented by R. N. Chapman, R. B. Davis and M. McComb. Space 90.

Cleveland Railway Supply Company, The, Cleveland, Ohio.—Steel wheels, wood rails, end guards, flange wheels; tie bolts and iron wheels, cranes. Represented by F. A. Peck, W. P. Stevens, A. W. Winger and C. F. Cary. Space 133.

Crescent Company, Inc., The, Hoboken, N. J.—Rail anchors. Represented by P. F. Erwin, John T. Reagin and Ray Dinklage. Space 7.

Crerar, Adams & Co., Chicago.—Track tools; jacks; track drills; rail saws; bonding drills. Represented by G. D. Bassett, J. A. Martin, Ed Mahlke, W. I. Cloek, E. C. Poehler, C. W. Gregory, Russell Wallace and R. M. Bullard. Space 28.

Deleo Light Company, Dayton, Ohio.—Light plants. Represented by J. A. Harlan. Space 7.

Detroit Graphite Company, Detroit, Mich.—Paints. Represented by T. R. Wyles, L. D. Mitchell, H. I. Miller, W. D. Waugh, C. A. Nye, J. R. C. Hintz, L. F. Flanagan and E. Booth. Space 108¹/₂.

Detroit Steel Products Company, Detroit, Mich.—Steel sash; sidewall sash. Represented by R. S. Bishop, Geo. P. Clagson, R. E. Tackaberg and H. C. Bruce. Space 166.

Diamond State Fibre Company, Bridgeport, Pa.—Methods in miniature of the manufacture of fibre insulation. Represented by G. Swallow, J. B. Rittenhouse and C. J. Simmons. Space 51.

Paul Dickinson, Inc., Chicago.—Jacks; chimneys; roof ventilators; model engine house. Represented by K. E. Cates, J. Brand, H. Knutson and A. J. Filkins. Space 98.

Dilworth, Porter & Co., Inc., Pittsburgh, Pa.—Spikes; tie plates. Represented by W. F. Schleiter and Joseph Dilworth. Space 27.

Direct Sales Company, The, Chicago.—Dry cell battery; carbon brushes; dry graphite; graphite lubricants; graphite paints; commutator stones; safety switches. Represented by Walter R. Pfisterer, Chas. S. Pfisterer, Chas. A. Robinson, C. P. Diebel and J. G. Drought. Space 156.

Doty Business Machines Company, Chicago.—Record calculating machines. Represented by Henry H. Doty, Henry F. Doty, A. C. Morgan, R. K. Buckman and E. H. Spencer. Space 164.

Duff Manufacturing Company, Pittsburgh, Pa.—Track jacks; car jacks; locomotive jacks; journal jacks. Represented by E. A. Johnson, C. N. Thulin, G. E. Watts, C. A. Methiessell, G. E. Anderson and W. G. Robb. Space 89¹/₂.

Edison, Inc., Thomas A., Bloomfield, N. J.—Batteries for signal and switch lighting; aligning instruments. Represented by L. W. McChesney, R. E. Trout, A. J. Loughren, L. S. Dunham, P. A. Garrity, E. W. Newcomb, E. W. Brown, B. F. Hines, F. S. Stallknecht and R. J. Frost. Spaces 18 and 19.

Edison Storage Battery Company, Orange, N. J.—Storage batteries; car lighting and signaling. Represented by D. C. Wilson. Space 20.

Electric Storage Battery Company, Philadelphia, Pa.—Storage batteries; floating systems for signals; highway crossing signal operations. Represented by Godfrey H. Atkin, Harry B. Marshall, H. B. Crantford, H. M. Beck, Stuart J. Dewey, Paul M. Ethers and T. Milton. Space 60.

Ellwell-Parker Electric Company, Chicago.—Heavy duty shop crane; elevating truck; heavy duty 3-wheel tractor. Represented by Joseph M. Brown, L. C. Brown and G. W. Brown. Spaces 226 and 227.

Engineering & Contracting, Chicago.—Copies of Engineering & Contracting Magazine. Represented by Lewis S. Louer, Robert W. Hume and Chas. T. Murray. Space 165.

Fymon Crossing Company, The—Marion, Ohio.—Continuous-rail crossing; cast manganese continuous rail. Represented by Byron E. Wilson, G. T. Wiswell, A. C. Queen and J. H. Fymon. Space 169¹/₂.

Fairbanks, Morse & Co., Chicago.—Gasoline motor cars; stand-pipe; type V oil engine; scale beam; centrifugal pumps; electric motors. Represented by A. A. Taylor, F. M. Condit, J. L. Jones, E. E. Pendray, L. H. Matthews, B. S. Spaulding, E. C. Golladay, F. J. Lee, D. K. Lee, H. E. Vogel, R. F. Lane, E. J. Coverdale, E. M. Underwood, W. F. Anderson, F. J. Davidson, F. D. Drinker, L. C. Flanagan, J. T. Frame, P. H. Gilleland, H. L. Hilleary, K. Jurgensen, G. W. Lewis, Stephen Smith, F. N. Whitesell, M. O. Southworth, S. G. Eaton, C. G. Mahana and H. E. Thompson. Spaces 73, 74, 75, 76, 92, 93, 94 and 95.

Fairmont Gas Engine & Railway Motor Car Company, Fairmont, Minn.—Motor cars, engines and wheels, inspection cars. Represented by H. F. Wade, W. F. Kasper, W. D. Brooks and J. P. Dunning. Spaces 41, 42 and 43.

Federal Electric Company, Chicago.—Electric lanterns; recharge batteries; renewable fuses; renewable fuse plugs; multi-phase renewable fuses, electric sirens, charging rack for lantern storage batteries. Represented by F. T. Baird, R. F. Powell, H. W. Neal, E. D. Forges, O. S. Burka and J. W. Curran. Space 169.

Federal Signal Company, Albany, N. Y.—Audible signal; switch current controller, direct current relays; alternating current relays, electric interlocking, electric switch machine; interlocked circuit controllers; automatic signal. Represented by A. H. Renshaw, Paul Renshaw, M. R. Briney, Carl Heuze, H. C. Ware, J. J. Hubbard, J. F. Kelley and S. J. Turrell. Spaces 47 and 48.

H. K. Ferguson Company, The, New York City.—Gap crane for locomotive shops; standard round house. Represented by H. K. Ferguson, H. S. Jacoby and K. C. Ferguson. Spaces 152 and 153.

Flanery Bolt Company, Pittsburgh, Pa.—Nuts and grease cups. Represented by F. S. Fitzsimmons and Wm. M. Wilson. Space 90.

T. W. Aishton, Vice-President
E. A. Johnson, Director
A. A. Taylor, Director

A. J. Filkins, Director

J. B. Strong, Honorary Director
G. C. Isbester, President

C. W. Kelly, Secretary-Treasurer
L. W. Shugg, Director
G. E. Geer, Director

W. J. Gillingham, Director

Minwax Company, Inc., New York City.—Waterproofing materials. Represented by A. S. Harrison. Table space.

Morden Frog & Crossing Works, Chicago.—Switches; manganese steel frog; steel yard frog with adjustable blocks; automatic ground throw switch stand; guard rail clamps; switch adjustments; rail braces; slide plates; open side sockets. Represented by W. J. Morden, Joseph Karcher, B. T. Gibbs, George Killmer, W. H. Hartz and H. Macke. Spaces 199 and 216.

Mudge & Co., Chicago.—Motor cars; combination trailer and push cars; pressed steel wheels. Represented by Burton Mudge, Robert D. Sinclair, Karl J. Eklund, H. W. Cutshall, E. R. Borden, J. M. Mulholland, J. K. Vanatta, C. P. Benning, L. O. Stratton and A. L. Pearson. Space 127.

National Boiler Washing Company of Illinois, Chicago.—Stemotomographs. Represented by Spencer Otis, Frederick A. Gale, John S. Maurer, J. M. Weir, T. G. Dalton, F. S. Wichman and F. W. Gale. Space 12.

National Carbon Company, Inc., Cleveland, Ohio.—Caustic soda; cells; carbon products. Represented by J. M. Spangler, A. E. Pratt, W. H. Arkenburgh, D. H. Green, P. G. Pendorf, J. S. Gemmill, R. J. Cox and W. A. Sisler. Spaces 150, 150½ and 151.

National Lead Company, New York City.—White lead; red lead and linseed oil. Represented by A. H. Sabin, W. B. Carlyle, R.

Hass, L. C. Ryan, W. H. Kofmehl, H. W. Schulze, A. N. Lucas, R. Rivett and Wm. Hogan. Spaces 10 and 11.

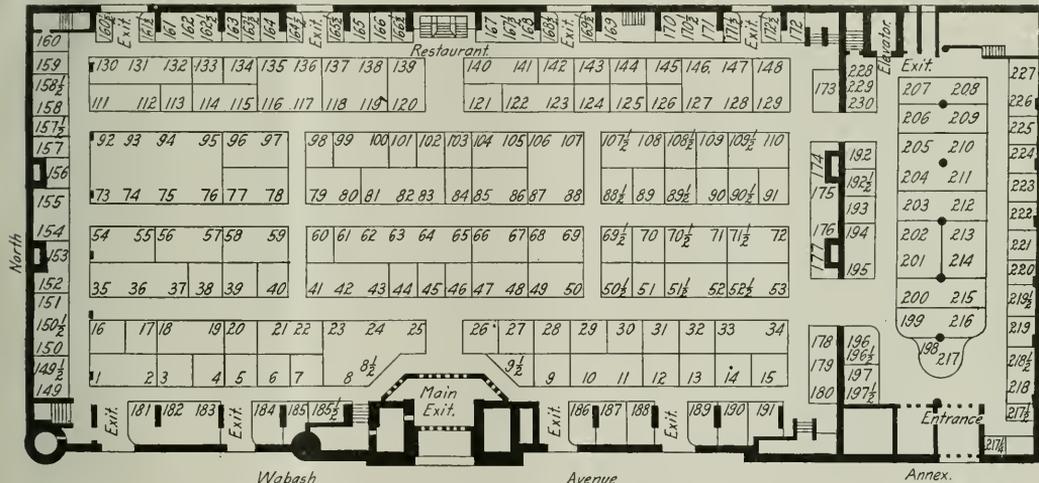

P. & M. Company, The, Chicago.—Rail anti-creeper or rail anchors, and bond wire protectors. Represented by F. A. Poor, Philip W. Moore, Fred A. Preston, Fred N. Baylies, D. T. Hallberg, H. G. Warr, S. M. Clancy, T. J. Byrne, John J. Gallagher, Frank N. Gray, Royal D. Hawley, George E. Johnson, J. E. Mahoney, William A. Maxwell, George E. Olson, William H. Reeves, P. V. Samuelson, L. S. Walker, Perry H. Hamilton and John Ritchie. Spaces 122 and 123.

Page Steel and Wire Company, Bridgeport, Conn.—Welding rods and electrodes; galvanized wire; track bonds, signal and telegraph wire. Represented by W. T. Kyle, C. A. McCune, E. J. Flood and W. A. Berner. Space 84.

Patterson, W. W., Company, Pittsburgh, Pa.—Tackle blocks. Represented by W. W. Patterson, Jr. Space 145.

Pittsburgh-Des Moines Steel Company, Pittsburgh, Pa.—Steel tanks. Represented by Messrs. A. C. Pearsall, H. W. Smith, J. E. O'Leary, O. D. DeHart, I. A. Bickelhaupt, M. P. Cogswell, W. A. DaLee and Max Whitacre. Space 157.

Pocket List of Railroad Officials, The, New York City.—Pocket List of Railroad Officials. Represented by J. Alexander Brown, Harold A. Brown and Charles L. Dinsmore. Space 26.

Floor Plan of the Coliseum and Annex

E. Wallace, F. A. Gregory, Jr., F. M. Hartley, Jr., W. B. Schofield, Chas. Haws and S. V. Van Riper. Space 9.

National Lock Washer Company, The, Newark, N. J.—Nut locks. Represented by J. Howard Horn, F. B. Archibald, A. T. Thompson, R. L. Cairncross, James J. Crawford, R. B. Cardozo and C. C. Washer. Space 192.

National Malleable Castings Company, Cleveland, Ohio.—Wrecking hooks; rail braces; the plates; bridge washers and spools. Represented by T. W. Aishton, R. W. Chambers, G. A. Fultz, C. H. Krakau, G. R. Rasmussen and L. S. Wright. Space 102.

Nichols, Geo. P., & Bro., Chicago.—Electric turntable tractor; model of electric transfer table. Represented by S. F. Nichols, N. Fries and G. M. Shearer. Space 173.

North Western Motor Company, Eau Claire, Wis.—Motor cars and engines. Represented by F. W. Anderson, A. H. Nelson and R. R. Rosholt. Space 196.

Ogle Construction Company, Chicago.—Model of concrete coaling station, with ground storage and reclaiming equipment in connection. Represented by C. F. Bledsoe, M. W. Powell and J. G. Forster. Space 157½.

Okonite Company, The, Passaic, N. J.—Insulated wires and cables; insulating tapes. Represented by F. Cazenove Jones, Lewis G. Martin, J. Delmar Underhill, Francis J. White and W. R. Van Steenburgh. Space 16.

O'Malley-Bear Valve Company, Chicago.—Globe, angle and check valves; blow-off cocks; locomotive valves; locomotive and car brasses. Represented by Thomas O'Malley, Edward O'Malley, J. N. Gallagher, J. M. Pigott, Walter Morris and J. E. Brown. Spaces 114 and 115.

Osweld Railroad Service Company, The, Chicago.—Welding and cutting equipment; welded frogs; switch points; battered rail joints and track tools. Represented by G. M. Crownover, F. C.

Portland Cement Association, Chicago.—Railway uses of concrete. Represented by D. A. Tomlinson, A. C. Sydel and J. A. Dunn. Space 217½.

Positive Rail Anchor Company, Marion, Ind.—Guard rail plates and fastenings; rail braces; the plates; rail anchors; wire rope clips. Represented by A. H. Told, E. A. LeBeau, L. C. Ferguson and J. T. Gelder. Spaces 178, 179 and 180.

Pyrene Manufacturing Company, Inc., New York City.—Hand fire extinguishers; chemical engines; gas masks; safety devices; safety cleaner. Represented by G. P. Rogers, J. P. Maloney and C. A. Ragland. Space 186.

Q & C Company, The, New York City.—Derails; compromise joints; bonzano joints; insulated joints; guard rail clamps; target stands; rail braces; car and engine replacers; replacer clamps; snaw melters; switch stands. Represented by R. J. McComb, E. R. Packer, L. T. Burwell, Lewis Thomas, E. M. Smith, J. L. Terry, F. F. Kister and C. F. Quincy. Spaces 120 and 139.

Rail Joint Company, The, Chicago.—Rail joints; continuous, compromise and frog and switch joints. Represented by V. C. Armstrong, J. C. Barr, B. G. Braine, E. A. Condit, Jr., Alex Chapman, C. A. Disbrow, J. A. Greer, C. B. Griffin, H. C. Hickey, Chas. Jenkinson, G. H. Larson, Milton Markley, J. N. Meade, J. G. Miller, R. W. Payne, F. C. Runyon, Thomas Ryan, R. R. Seward, E. F. Schermerhorn, McLeod Thomson, F. C. Welby, G. T. Willard, Benj. Wolhaupter, D. P. Wolhaupter and W. P. Thomson. Spaces 79 and 80.

Railroad Accessories Corporation, New York City.—Steel signal blades; power rail drilling machines; channel pins; bonds; lightning arresters; electric brackets. Represented by F. C. Lavarack and E. M. Deems. Space 184.

Railroad Herald, The, Atlanta, Ga.—Reception booth. Represented by E. C. Laird. Space 161½.

Railway Purchases & Stores, Chicago.—Publications. Represented by Edward J. Wray. Space 163.

Railroad Supply Company, The, Chicago.—Tie plates; derailleurs; wig wags; bell signals; relays; time element and car counter; compensating coils for relays; channel pins; lightning arresters; meters; etc. Represented by E. H. Bell, Paul W. Kohnen, H. M. Buck, T. B. Bowman, A. H. Smith, G. W. Xibbe, H. G. Van Nostrand, M. J. Fox, F. M. Hill, R. E. Bell, G. M. Kenyon, F. C. Webb, T. W. Nicholson and Geo. J. Schmitt, Jr. Spaces 104 and 105.

Railway Review, The, Chicago.—Railway Review, publications. Represented by Harold A. Smith, A. E. Hoover, J. E. Gougeon, Chas. L. Bates, C. H. Gertner and W. M. Camp. Space 44.

Ramapo Iron Works, Hillburn, N. Y.—Crossings; switch stands; manganese reinforced flange frogs; manganese reinforced switch point; double shoulder solid bottom switch slide plates; switch heel plates; guard rail clamps; adjustable rail braces. Represented by Thomas E. Akers, J. Edgar Davidson, R. J. Davidson, Jr., W. C. Kidd, Douglas E. Snow, John B. Snow, William W. Snow and James B. Stroug. Spaces 109₂ and 110.

Rawls Machine & Manufacturing Company, Chicago.—Track mower. Represented by S. E. Rawls, S. F. Francks, R. King and W. C. Irwin. Spaces 161, 162 and 162₂.

Raymond Concrete Pipe Company, Chicago.—Operating model of pile driver driving concrete piles; concrete piles and composite piles. Represented by H. D. Raymond, E. D. Watt, A. C. Everham and A. E. Cummings. Space 188.

Reade Manufacturing Company, Jersey City, N. J.—Equipment in operation showing the distribution of weed exterminator by the spray method. Represented by W. L. Geggus, R. C. Robins and R. H. Bogle. Spaces 228, 229 and 230.

Reliance Manufacturing Company, The, Massillon, Ohio.—Nut locks. Represented by H. C. Mull and H. J. McGinn. Space 221. Richards-Wilcox Manufacturing Company, Aurora, Ill.—Door hardware for engine houses and car repair shops; door hangers; overway conveying systems. Represented by A. J. Eggleston, E. J. G. Phillips, A. J. LaFluer, J. H. Wise and T. G. Perry. Spaces 170, 170₂ and 171.

Roberts, Geo. T. Company, The, Dayton, Ohio.—Miniature railroad water treating system in operation. Represented by John C. Jamieson. Spaces 160 and 160₂.

Sellers Manufacturing Company, Chicago.—Anchor bottom wrought iron tie plates. Represented by J. M. Sellers, G. M. Hogan, R. A. VanHouten, T. D. Crowley and R. J. Platt. Space 124.

Sherwin-Williams Company, The, Cleveland, Ohio.—Paints. Represented by P. L. Maury, R. V. Goodremont and W. F. Gallinger. Space 13.

Signal Accessories Corporation, Utica, N. Y.—Directional track instrument; switch point adjusters; signal blades; pipe carrier tops; screw locks; rail braces; foundation extensions; signal blade cleaners; terminals; lamp blocks. Represented by Wm. F. Bossert, Sidney G. Johnson and O. S. Flath. Space 113.

Simmons-Boardman Publishing Company, Chicago.—Railway publications, Railway Age; Railway Maintenance Engineer; Railway Signal Engineer; Railway Mechanical Engineer; Railway Electrical Engineer; Maintenance of Way Cyclopedic; Boiler Maker; Marine Engineering. Represented by L. B. Sherman, Henry Lee, F. H. Thompson, F. C. Koch, R. F. Dusters, J. M. Rutherford, B. J. Wilson, E. A. Lundy, Samuel O. Dunn, E. T. Howson, W. S. Lacher, K. E. Kellenberger, Milburn Moore, C. B. Peck, J. E. Cole, J. H. Dunn, Homer Beach, W. F. Rench and D. A. Steel. Space 46.

Snow, T. W., Construction Company, Chicago.—Water cranes; tanks and fixtures, tower hoists; coaling spouts; bucket loaders. Represented by T. W. Snow, O. T. Snow, B. I. Snow, S. C. Crawford and W. A. Lathrop. Space 50₂.

Templeton, Kerly & Co., Ltd., Chicago.—Lifting jacks. Represented by H. B. Burlow, A. C. Lewis, J. L. Crowley, P. H. McManis, J. S. Dolar, S. A. Nelson, M. T. Evans, J. J. O'Fallon, A. E. Ferguson, E. T. Schroeder, W. K. Kerly, T. L. Simpson, Wm. Simon and A. C. Mills. Space 32.

Thompson Bros. Company, Chicago.—Danger signals. Represented by W. F. Thompson, R. A. Thompson, E. W. Johnson, W. W. Beekwith and G. F. O'Connell. Table space.

Tobac Pipe Threading Machine Company, The, Toledo, Ohio.—Pipe threading and cutting tools. Represented by D. A. Langenacker. Space 31.

Track Supplies Company, Inc., New York City.—Guard rail bolts, rail points, guard rail braces, spikes, anchor plates, bolted, armored insulated track bolts, rail braces, track shims, etc. Represented by W. B. Tice. Space 39.

Traco Control Appliance Company, El Paso, Tex.—Automatic car represented by M. B. Billa and J. P. Naso. Space 171₂.

Truway Anchor Company, St. Paul, Minn.—Rail anchors.—Represented by J. L. VanDreuer. Table space.

U. S. Water Engine & Pump Company, Batavia, Ill.—Water pumps; water column valves; automatic control valves; pumps; etc. Represented by T. K. Campbell and Wood of tank materials. Rep-

resented by L. E. Wolcott, J. P. Prindle, F. E. Pearson, C. E. Ward and T. S. Daniels. Spaces 111 and 112.

Union Switch & Signal Company, Chicago.—Signals; relays; switch circuit controllers; rail joints; clockwork time release; detector bar rail clip. Represented by W. P. Allen, C. R. Beall, G. A. Blackmore, W. H. Cadvallader, Roy Clayburn, J. P. Coleman, J. Cozzens, A. Dean, M. L. Gray, H. W. Griffin, H. R. Shene, J. S. Hobson, L. F. Howard, L. V. Lewis, J. L. Locks, George Marloff, W. P. Neubert, H. McCready, J. E. Saunders, W. W. Talbert, J. F. Talbert and V. K. Spicer. Spaces 66 and 67.

Verona Tool Works, Pittsburgh, Pa.—Track tools; levels; gauges; track jacks; nut locks; verona rail springs. Represented by E. Woodings, J. S. Wincerantz, A. T. Richardson, W. W. Glosser, Porter L. Laughlin, F. B. Nimmo and Wm. F. Hart. Spaces 129 and 148.

Volkhardt Company, Inc., Stapleton, S. I., N. Y.—Railroad water hydrants, etc. Represented by Wm. Volkhardt. Space 160.

Wailes Dove-Hermiston Corporation, Cleveland, Ohio.—Protective coatings for steel bridges, tanks, buildings and other structures. Represented by Irving Noonan, J. A. Graves and Wm. P. Tobin. Spaces 149 and 149₂.

Warren Tool & Forge Company, The, Warren, Ohio.—Picks; adzes; track chisels; bars; punches. Represented by H. C. Mull, M. J. Konold and Geo. F. Konold. Space 222.

Waterbury Battery Company, The, New York City.—Unit cylinder cells and renewals. Represented by M. L. Martus, O. B. Frink, G. A. Nelson, G. S. Gaunt and S. J. Hough. Space 38.

Wayne Tank & Pump Company, Fort Wayne, Ind.—Portable rivet heaters; lubricating oils; storage systems; oil burning apparatus; oil filtration systems; water softeners. Represented by Fred H. McCulloch, F. J. Panot and James Stokoe. Space 144.

Werner Machine Company, West Allis, Wis.—Spike shakers. Represented by Ed J. Wind and F. A. Gardner. Space 164₂.

West Disinfecting Company, Chicago.—Insector devices; insecticides; roach powders; fumigators and disinfectants. Represented by H. E. Daniels, W. L. Larry and E. C. Daniels. Space 159.

Western Electric Company, Inc., Chicago.—Electrical lighting; power devices and supplies. Represented by George Hull Porter and Otis B. Duncan. Spaces 58 and 59.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.—Portable arc welding set; industrial motors; industrial control; turbine generator set; head lighter turbine sets. Represented by G. H. Jaspert. Space 191.

Wm. Wharton Jr. & Co., Inc., Easton, Pa.—Manganese steel tipped split switches; manganese steel rail-bound and plain bolted frogs, etc. Represented by H. F. McDermott. Spaces 116, 117, 135 and 136.

Wood Shovel & Tool Company, The, Piqua, Ohio.—Shovels; scoops; machine for testing wear and strength of shovels. Represented by C. L. Butts, M. H. Lytle and J. W. Browning. Space 185.

Woods Bros. Construction Company, Lincoln, Neb.—Standard current retard method of river bank protection, using as the anchors, concrete pile hydraulically sunk below scour. Represented by Bert Faulkner, J. G. Aldrich, Wayne Pringle and S. J. Chakow. Space 224.

Woolery Machine Company, Minneapolis, Minn.—Railway motor car and engines. Represented by H. E. Woolery and C. E. Berg. Space 223.

Wyoming Shovel Works, The, Wyoming, Pa.—Track shovels; picks; scuffle hoes. Represented by H. T. Potter, G. E. Geer and S. H. Smith. Space 103.

Engineers Hear Talk on Building Failures

The failure to employ competent structural engineers in the design of the Knickerbocker theatre at Washington, D. C., and the Masonic temple at Salina, Kans., was the underlying cause of the recent collapse of these two structures. This was the conclusion reached by T. L. Condon, consulting engineer, Chicago, in a paper presented last night to an audience of 260 in the rooms of the Western Society of Engineers. Mr. Condon made careful investigations and detailed reports on each of these failures and was able to show conclusive evidence of gross incompetence in the designs of these two buildings. The roof failure at Washington, which resulted in the loss of 98 lives, was caused by glaringly inadequate structural steel framing. "The lesson in these failures," said Mr. Condon, "is that the structural design of buildings cannot be entrusted to anyone who is not qualified by training and experience to take full responsibility for it."

White oak has long been considered the best of woods available in any commercial quantity for cross tie purposes, a condition which the Committee on Ties duly realized in submitting its plan for a standard test tie. The life of ties varies widely, however, even within the same class of wood, as the discussion brought out and as the committee no doubt realized. Two valuable suggestions were made during the discussion, namely, that the standard test tie shall be all heartwood and that all such ties shall be secured from the same section of the country. Since the number of ties needed for the purpose of establishing a basis of comparison will naturally be small and since the expense will likewise be small, if not even infinitesimal, when the advantages of the plan are considered, why not go a little further? Why not draw up a special specification for a standard test tie more rigid than the regular specification for white oak cross ties and incorporate in it every requirement necessary to secure a tie as uniform in its growth, structure and other characteristics as it is possible to get? Certainly such a specification could be compiled with easily for the limited quantities required and such a specification would render comparisons of tie life far more reliable and trustworthy. There is the objection to this that it might prevent a road from securing and installing standard

Securing the Best Test Tie

test ties but, on the other hand, it is reasonable to assume that any road sufficiently desirous of securing more comparable data through the use of a standard test tie, will not hesitate over the slight additional trouble caused by a more rigid specification.

test ties but, on the other hand, it is reasonable to assume that any road sufficiently desirous of securing more comparable data through the use of a standard test tie, will not hesitate over the slight additional trouble caused by a more rigid specification.

Define instructions for the making of shop or field tests and inspections of signal relays are presented for the first time in the report of the Committee on Electrical Testing. The reliable operation of the relay is of paramount importance in the working of railway signal apparatus. However, too

Testing Signal Relays

many roads neglect the proper inspection of relays at specified intervals, resulting in some cases in serious accidents. These specifications fix concisely the contact opening, the contact resistance, and the drop-away and pick-up values to be adhered to, leaving no room for the inspector to introduce individual opinions or erroneous instructions in this important part of signal maintenance work. It would seem advisable for roads which do not now have a complete system of testing to incorporate these specifications in their rules for signal maintenance.

There is food for thought in President Down's comments on the employment of engineers in railway service.

It Is Up to the Management

In his address yesterday morning he presented two pertinent facts—(1) that the railways are not getting their proportion of the engineering graduates and (2) that in one section of the country at least, the roads are paying the men from the technical schools less, to start, than they are paying firemen, brakemen or switchmen. Of course, the initial employment of the graduate on a railroad is in the nature of an apprenticeship during which he receives a training offering much greater opportunity for advancement than that open to the man entering train service. But whatever the merits from the standpoint of fair compensation, the real problem is a rate of pay for technical graduates which will attract high grade men. The efforts of an organization of technical men to cope with this problem were founded on an unsound premise and have been a conclusive failure. This is a problem for the managements, therefore it is up to the higher engineering officers to bring it to their attention.

The first report of the new committee on Economics of Railway Signaling, was presented at the meeting of the Signal section Tuesday.

Economics of Railway Signaling

The function of this committee is to secure information on the relative economic value of railway signaling installations as a means of protecting and facilitating the movement of trains and causing reductions in the cost of railroad operation. The members of this committee are in a position to secure accurate information presented in terms of dollars and cents regarding the actual economics derived from signal installations now in

service or installations that are proposed. Heretofore the real proof of the economic advantages of automatic signals has been more or less intangible. However, there is every evidence that the Signal section, by means of this new committee, means to show the railroad managements the benefits of signaling. It is to be hoped that the members of the Operating and Engineering divisions of the A. R. A., interested in this subject will give their assistance in the studies to be made by this new committee to the end that the railroads may be advised fully of the possible economies without delay.

Engineer or Railroad Man?

WHAT SHOULD BE the real purpose of the work of the civil engineer in railroad service? It should be the same as that of every man in every branch of the operating department. It should be to help the railways produce more and better ton miles and passenger miles and produce them cheaper.

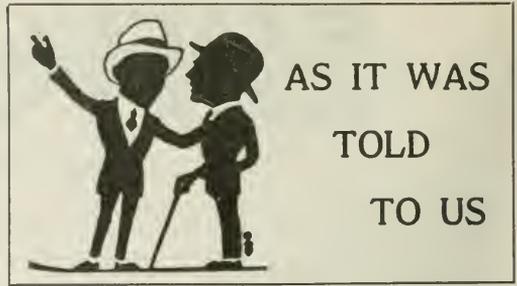

The railroad is simply one kind of a factory. It makes freight and passenger transportation. The only way men in the operating department, whether they be transportation men, mechanical men or engineering men, can contribute effectively toward the success of the railroads is by helping furnish better transportation and furnish it at the minimum practicable cost.

No engineer can do his part in bringing about the desired end unless he is a good engineer. It is equally true that no railroad-engineer can do his work efficiently unless he is a good railroad man. The best designed, constructed and maintained track, bridge or building, does not serve its true purpose unless it is so designed, constructed and maintained as to enable the railway to render service better or at a lower cost.

It is obvious, therefore, that an engineer, to be a real success in railroad work, must know a great deal besides engineering. This thought is implicit in the article by President Ashton of the American Railway Association, which was published in the Daily of March 14, although it is not expressed in so many words. No engineer can be of the greatest practicable value to his railroad unless in everything he does he considers clearly and thoroughly the effect it is going to have upon the efficiency and economy with which passenger and freight service are rendered. But nobody can clearly and fully consider the effect a piece of engineering work is going to have on the efficiency and economy of operation unless he constantly studies and acquires a thorough understanding of the economies of operation.

Unfortunately, some technical men on the railways do not recognize this fact and act accordingly. They study engineering mainly as a distinct science and carry on engineering work as a distinct art, instead of studying thoroughly its relationship to railroad operation and always doing their work with the definite purpose of providing facilities which the maintenance department and the operating department can use with the greatest economy.

It is a notable fact that the engineers who have risen to the highest executive positions on the railways always have been men of all railway men. That is the real reason that they rise to the highest positions. The engineer who never finds in engineering terms, reads only engineering literature and never considers any of the problems of any branch of the railroad business except the engineering part, will always be an engineer rather than a railroad man and will never rise above a subordinate position even in the engineering department. For every important civil engineer in the country is quite conversant with railroad work in its economic part.

The Atchison, Topeka & Santa Fe, Coast Lines, are proceeding with the construction of a second track on 75 miles of line between Yampai, Ariz., and Griffith, which will be equipped with color-light automatic block signals, operated by alternating current.

K. Furukawa, electrical engineer on the Japanese Government Railways, Tokyo, Japan, was in attendance at the Signal section meeting at the Drake hotel yesterday. He also intends to spend considerable time at the Coliseum, investigating various labor saving and other devices which are on exhibit.

The regular weekly luncheon of the Chicago Association of Commerce at the Hotel LaSalle this noon will be conducted under the auspices of the Railway Supplies Division of the association. Samuel O. Dunn, editor of the Railway Age, will speak on The Railway Situation to Date.

Among the roads which are going to heavier rail this season may be included the Great Northern, which has ordered a sufficient tonnage of 130-lb. P. S. rail to lay 5½ miles on sharp curves on its western mountain divisions. Up to the present time, rail of 90-lb. section has been the heaviest used on this road and so far as it is known this is the first instance of rail as heavy as 130-lb. being installed west of Chicago.

The executive committee of the Roadmasters' Association met at the Auditorium hotel yesterday to consider the affairs of that organization. A number of chairmen and members of the committees joined with the executive committee at luncheon at 12:30 after which the afternoon was spent in the consideration of the reports of the committees which will be presented at the convention in Cleveland in September.

Jukichi Fuzine of the South Manchuria railway, Dairen, Manchuria, probably holds the record of having traveled the longest distance to attend the convention. Mr. Fuzine registered yesterday as did also Leon F. Lomblad, consulting engineer, Latiba railway, Honduras, C. A. Mr. Lomblad was formerly chief engineer of the Missouri, Kansas & Texas of Texas.

The attendance at the Signal section stated meeting for the two days was the largest of which there is record, the total registration at the time of closing amounted to 100, 112 of whom were affiliated members and two guests. Five railroad departments were represented at the meeting, men being present from the operating, telegraph, maintenance of way and electrical departments in addition to representatives of the signal departments.

On Friday, March 17, the members and guests of the association are invited to visit the Buffington, Ind., plant of the Universal Portland Cement Company. Transportation to and from the plant will be provided either with motor buses traveling over the boulevard and park system of Chicago, or via a train leaving at 10 a. m. Luncheon will be served at the plant and the return trip made in time to reach the hotels at 3:30.

* * *

The Pittsburgh & Shawmut has recently awarded a contract to the Concrete Steel Bridge Company, Clarksburg, W. Va., for the construction of a reinforced concrete highway bridge at Colwell, Pa. The structure will be 220 ft. long with a 180-ft. span, 24 ft. wide and 110 ft. high. A contract has also been awarded to the Dwight P. Robinson Company, New York, for lining the Mauk tunnel with concrete.

* * *

The Northern Pacific is asking for bids for the installation of automatic block signals between Fargo, N. Dak., and Mandan, 151 miles of which is single track and 53 miles of double track, which will require 383 three-position upper-quadrant signals. This installation will be completed this summer and will constitute the last big gap not automatically block signaled between the Great Lakes and Puget Sound, a distance of about 2,227 miles.

* * *

Hjalmar Aberg, chief engineer, and Ture Hard, chief signal engineer, respectively, of the Swedish State Railways, are visiting the Railway Appliances Exhibit and the Signal convention in company with Hugo Wilson, chief engineer of the Switch and Signal Company of Sweden. Mr. Aberg and Mr. Hard are making an investigation of the application of automatic block signals to electrified track. An important feature of their tour of inspection was a study of the electrified lines of the Chicago, Milwaukee & St. Paul.

* * *

Members of the Santa Fe Signal Supervisors Committee, consisting of several officers of the signal department of the Santa Fe and former members of this organization, held their eighth annual luncheon at the Drake Hotel on March 13. Those present included T. S. Stevens, signal engineer system; L. Brown and G. K. Thomas, assistant signal engineers; H. Hobson, E. Hanson, E. Winans, signal engineers; G. R. Cowherd, signal engineer, E. P. & S. W.; B. T. Anderson, assistant signal engineer, D. L. & W.; H. K. Ferguson, president, The H. K. Ferguson Co.; P. B. Hyde, vice-president, General Battery Co.; J. S. Hobson, western manager, Union Switch & Signal Co., and J. E. Saunders, assistant chief engineer, Union Switch & Signal Company.

* * *

As an indication of the lively interest of the manufacturers of railway supplies in conventions being held by railway associations, it is of interest to note the action taken last Thursday and Friday in Pittsburgh, Pa., by the exhibit committee of the Railway Supply Manufacturers' Association. This committee definitely assigned and received payment for 91,000 sq. ft. of exhibit space on Young's "Million Dollar" steel pier at Atlantic City, out of a total of the 94,000 sq. ft. available for the June conventions of Section V, Mechanical Association; Section VI, Purchases and Stores; the A. R. A., and the semi-annual meeting of the Association of Railway Electrical Engineers. Two hundred and seventy-five exhibitors were given space, leaving only a few scattered spaces yet to be assigned. While some doubt was entertained initially as to the Machinery Hall being fully taken, all spaces in this section were definitely assigned.

Tickets for the annual dinner of the A. R. E. A., which will be held in the Gold room at 6:30, may be secured from W. A. Wallace of the Arrangements committee in the lobby back of the registration booth this morning. General R. C. Marshall, Jr., general manager, Associated General Contractors of America, Washington, D. C., and formerly chief of the Construction Division of the United States Army, will speak on "Some Needs of the Railroads"; Judge James A. Mulligan, Ottawa, Ontario, will discuss "Canada's Destiny," and Gus W. Dyer, Professor of Political Economy, Vanderbilt University, Nashville, Tenn., will talk on "Government and Business."

* * *

The St. Paul Sectional Committee of the Signal section, A. R. A., will hold its fifth meeting at Room 1110, in the Northern Pacific railway general office building, St. Paul, Minn., at 9:30 a. m., on Tuesday, March 28. Papers will be presented on the "Operation, Maintenance and Lubrication of Motor Cars," by W. E. Adams, president, Adams Motor & Mfg. Co.; "Armco Bond Wires for Signal Use," by Mr. McCune of the Page Steel & Wire Co.; "Grounds on Signal Circuits, Their Cause and Effects," by a representative of the General Railway Signal Company, and "Operation of Automatic Block Signals, Single and Double Track," by a representative of the Northern Pacific.

* * *

J. Beaumont, chief engineer for the Regan Safety Devices Company, Inc., interests abroad with offices in London and Paris returned to the United States on February 6, and was appointed vice-president and sales manager of this company, effective March 1. Mr. Beaumont's headquarters will be in Chicago. A. G. Shaver, chief engineer, has been appointed vice-president and chief engineer for this company, effective March 1, with headquarters at Chicago. B. W. Meisel has been promoted from engineer to resident engineer in the sales department, effective March 1. F. J. Le Preau, manager of the railroad department of the Macbeth-Evans Glass Company, has resigned to accept a position as resident engineer with the Regan Safety Devices Company, Inc., with headquarters for the present at Chicago. His appointment was effective March 12.

A. R. E. A. Program

The program of the American Railway Engineering Association for today is as follows, the morning session convening at 9 a. m. and the afternoon at 2 p. m.

V. Track	Bulletin 243
XXIII. Shops and Locomotive Terminals.....	Bulletin 241
I. Roadway	Bulletin 241
XVI. Economics of Railway Location.....	Bulletin 241
XVIII. Electricity	Bulletins 239, 242

XX. Uniform General Contract Forms.....	Bulletin 242

Signal Section Committee Meeting

The following committees of the Signal section, A. R. A., will meet Wednesday morning at 9 a. m., in the offices of the Association, in the Manhattan Building, Chicago.

- Committee V—Sub-Committee 2.
- Committee II—Mechanical Interlocking.
- Committee XIII—Electrical Testing.
- Committee V—Maintenance Rules and Instructions—will meet on Thursday morning at the same office.

The A. R. E. A. in Session at the Congress Hotel Tuesday Afternoon

Railway Engineering Association Proceedings

Crowd at Opening Session Yesterday Morning Taxed
Capacity of Florentine Room

ALL RECORDS OF attendance at an opening session of the conventions of the American Railway Engineering Association were broken yesterday when the meeting was called to order by President L. A. Downs, vice-president and general manager, Central of Georgia. Mr. Downs spoke briefly extemporaneously in lieu of a prepared address after which the reports of the secretary

and treasurer were presented. The association then began the consideration of the reports of the various committees.

Reports were presented by the committees on Yards and Terminals, Economics of Railway Labor, Ballast, Iron and Steel Structures, Standardization, Signals and Interlocking, Ties and Stresses in Railroad Track.

Address of President Downs

WE ARE JUST ABOUT ready to pass the twenty-third milestone in the existence of the American Railway Engineering Association, and I am pleased and happy to advise you that we did not move backward during the past year. Our financial statement is good. I am pleased to advise you that we made all of our expenses and nearly \$1,800 in addition, so that our financial affairs are in very good shape.

Our membership has increased. We received 129 new members into this association during the past year. That is on top of the big drive for membership made in the previous year when there were nearly 600 new members admitted, and we think that the record for last year is very gratifying. We now have a total of 1,960 members in the Association. We dropped an unusually large number of members the past year—115, on account of non payment of dues, the largest number we have ever dropped, but the home was cleaned this year and we have now a good going organization. There were 16 deaths during the past year, among the members of our association, one being C. O. Webb, of the Board of Directors, and another our first president, John L. Wallace.

We have resumed our relations with the American Railway Association in a very creditable manner, and I am pleased to announce to you that this convention is a meeting of the Engineering Section of the American Railway Association and is open to the American

Railway Association. We have co-operated with other organizations during the past year, especially with the Joint Committee on Concrete and Reinforced Concrete of the American Society of Civil Engineers, and the American Society for Testing Materials.

We have continued our contact, or rather tried to, with the universities. Dean Potter of Purdue University has invited a committee from this association to visit Purdue and it is hoped that a meeting there will be held in the near future. The association has authorized the appointment of a committee to work out a means whereby a better contact with universities could be made. We are very mindful that such a thing is necessary. I regret to say, nothing has been done, but we expect something constructive to be accomplished during this coming year and we hope that something will be done. We need the universities and the universities need us.

I sent a questionnaire to 19 universities a short time ago—19 representative technical schools of the United States—to which I received 15 replies. Out of these 15 replies there were 12 that gave definite information as to their graduates. During the past 10 years, from 1911 to 1921, there were 3,003 graduates in civil engineering, and, surprising as it may seem, only 272 or 9 per cent are working for railroads. I did not find out how many of the men of the engineering departments of the railroads were graduates of engineering schools, but in the case of

two railroads, where I had a count made, that employed about 350 engineers, only about 50 per cent are graduates of technical schools. Something must be done to bring technical men into railroad work.

In the southeast, I made a canvass to discover what wages are paid to the young engineering graduate who desires to enter railroad work in the engineering department, and I found that the average salary is \$118 monthly. I am not in sympathy with the so-called welfare work of another engineering society in its uplifting of wages, but I want to say that if the managers of the railroads of the United States want the services of trained men they must fix some attractive wage for college graduates to start on. When we pay a fireman \$175 a month to start, a flagman \$141, a switchman \$181, a car repairer \$143, and a graduate of a technical engineering school \$118, there is something wrong with the principles of the wages paid on railroads. (Applause.)

The real test of the work of this association is what the railroads are doing with our reports. The real test of the good that we may do is whether they are put into use on the railroads. Every head of every railroad in the United States should put it up to the head of his engineering department and ask him if he is using the reports of the A. R. E. A. on the railroad and if he is not, to give a reason for not doing so. The answers to that question to the heads of the railroads will be constructive criticism, and our association will know its destiny by such reports. I thank you. (Applause.)

Report of the Secretary

Exhibit A, appended hereto, gives a detailed record of the receipts and expenditures, from which the following items are abstracted:

Receipts	\$48,111.75
Expenditures	46,358.46
Excess of Receipts over Expenditures	\$ 1,753.29
Total Cash Assets.....	\$44,742.51

The following is a report on the present membership of the Association:

Membership March 1, 1921.....	1,951
Deceased members	16
Resignations and dropped	115
	—131
Additions during the year.....	128
Loss	3
Total membership March 1, 1922.....	1,948

DECEASED MEMBERS

The losses sustained by death during the year were:

- F. E. Bissell, consulting engineer.
- J. S. Browne, assistant to engineer maintenance of way, New York, New Haven & Hartford.
- F. F. Busteed, ex-general superintendent, Canadian Pacific.
- H. C. Ferris, receiver, Muskogee, Oklahoma & Gulf.
- F. W. Leatherbury, division engineer, Gulf, Colorado & Santa Fe.
- W. H. Given, operating department, Chicago, Rock Island & Pacific.
- J. F. Keegan, general superintendent, Baltimore & Ohio.
- G. C. Millet, assistant to chief engineer, Atchison, Topeka & Santa Fe, Coast Lines.
- Major John W. Moore, assistant engineer, Illinois Central.
- R. J. Parker, general manager, Atchison, Topeka & Santa Fe, Western Lines.

- R. M. Pearce, resident engineer, Pittsburgh & Lake Erie.
- C. W. Pifer, office engineer, U. S. Railroad Administration.
- J. R. Savage, general superintendent, Long Island Railroad.
- Colonel George D. Snyder, consulting engineer.
- John Findley Wallace (past-president), chairman, Chicago Railway Terminal Commission.
- Colonel George H. Webb (director), chief engineer, Michigan Central.
- John Ehrke, assistant to general superintendent, Grand Trunk, Chicago.
- C. H. Niemeyer, acting engineer maintenance on the Pennsylvania System, Williamsport, Pa.

THE REVISED MANUAL

Further time is requested in which to complete work on the revised Manual. Five hundred pages of the volume are already printed. It is now expected to have the Manual ready for distribution about June 1, 1922.

The recommendations adopted at the March, 1921, annual meeting of the American Railway Engineering Association—functioning also as the Engineering Division of the American Railway Association—were presented to the November, 1921, session of the latter organization for endorsement and a great many subjects received such endorsement by the American Railway Association.

STANDARDIZATION

The American Railway Association has taken out membership in American Engineering Standards Committee, and designated a member of the Engineering Division to be its official representative on that body. E. A. Frink, chairman of the Standardization committee of the Association, has been appointed to act in that capacity, with J. R. W. Ambrose as alternate.

Among the matters now pending before the A. E. S. C., with the view of standardization, in which the Association is concerned, are the following: Railroad cross-ties and switch-ties, pipe flanges and fittings, steel railway bridge specifications, grading of lumber, testing of wood, steel forgings, bolt, nut and rivet proportions, steel shapes, insulated wires and cables, overhead crossing specifications, electrical symbols, electrical power control and aluminum for conducting purposes.

AMENDMENTS TO CONSTITUTION

Two amendments to the Constitution were submitted to vote by letter-ballot during the year: (1) To amend Article V, Section 4, paragraph b, and (2) to amend Article VI, Section 2—the first amendment contemplating the inclusion of past or present members of the Board of Direction for eligible candidates for president and for vice-president; and the second amendment requiring the Nominating Committee to select two candidates for vice-president instead of one candidate.

Both amendments having received a majority number of those voting, the two amendments become effective immediately.

The vote on the two amendments is as follows:

For Amendment No. 1.....	658
Against Amendment No. 1.....	58
For Amendment No. 2.....	685
Against Amendment No. 2.....	31

Respectfully submitted,

E. H. FRITCH, Secretary.

**L. A. Downs
President**

Report on Yards and Terminals

In constructing warehouses in connection with l. c. l. freight houses some handicaps may be obviated by organizing a subsidiary company or by leasing to an independent company. It is desirable to eliminate interference between employees and patrons, and this can be done by providing separate facilities for each. The container system for l. c. l. freight shows many possibilities for economical operation. It is believed that no revisions are necessary in the present recommended lump grades in classification yards, and that in many of the lump yards now in existence, a departure yard is not required, while in many others its provision is problematical.

A. Montzheimer
Chairman

A. Montzheimer is completing his first year as chairman, having been vice-chairman for three years, prior to which he had been a member of the committee for 14 years. He has been chief engineer of the Elgin, Joliet & Eastern for 10 years. As this road is primarily a belt and switching line, Mr. Montzheimer has been brought intimately into contact with terminal operations on his own road and through observation with those on connecting lines. He is therefore particularly well qualified to direct the work of this committee in the investigation of subjects which are receiving so much attention from railway officers today.

Conclusions

1. The committee recommended the following definition for insertion in the Manual:

IN APPENDIX A, THE COMMITTEE submitted a report on the handling of freight, etc. A report was also submitted on classification and departure yards in Appendix B.

Sorting Yard.—A yard in which cars are classified in greater detail after having passed through a classification yard.

2. The committee recommended that its reports be received as progress reports.

Committee: A. Montzheimer (E. J. & E.), chairman; Hadley Baldwin (C. C. & St. L.), vice-chairman; J. E. Armstrong (C. P. R.), F. J. Ackerman (K. C. Term.), J. H. Brinkerhoff (N. P.), J. D'Esposito (Chi. Union Sta.), A. W. Eppright, Reuben Hayes (Sou.), J. B. Hunley (C. C. & St. L.), F. E. Morrow (C. & W. I.), O. Maxey (C. R. I. & P.), H. J. Pfeifer (St. L. Term. Assoc.), C. E. Smith (Cons. Engr.), C. H. Spencer (I. C. C.), E. E. R. Tratman (Engr. News Record), C. A. Briggs, Miles Bronson (N. Y. C.), A. E. Clift (I. C. C.), L. G. Curtis (B. & O.), H. T. Douglas, Jr. (C. & A.), E. M. Hastings (R. F. & P.), L. J. F. Hughes (C. R. I. & P.), D. B. Johnston (Penna.), B. H. Mann (M. P.), C. H. Mottier (I. C. C.), S. S. Roberts (Cons. Engr.), J. G. Wishart (C. R. I. & P.).

Appendix A—Warehouses in Connection With L.C.L. Freight Houses

Some of the principal advantages of constructing warehouses in connection with l. c. l. freight houses may be briefly stated as follows:

(1) The development of the air rights above the freight house for warehouse purposes creates an added source of revenue which helps reduce the charge for high land values which would otherwise be absorbed entirely by the freight house.

(2) The warehouse, by being located on the railroad company's property, attracts traffic to the railroad which might otherwise be lost.

(3) The occupant of the warehouse is saved the usual time and expense necessary to truck his goods between warehouse and freight station. In many locations, where streets are narrow and already congested with traffic, this elimination of trucking is desirable, both from the standpoint of the warehouse operator and the municipality.

Some of the principal disadvantages of constructing warehouses in connection with l. c. l. freight houses may be expressed as follows:

(1) There might be created by this arrangement considerable interference between the employees and patrons of the warehouse and those of the freight station, which would be objectionable.

(2) Railroads are not organized to conduct a warehouse business and some of them are legally restricted from engaging in such activities.

(3) A warehouse operated by a railroad company is governed by the regulations of the Interstate Commerce Commission, which is not the case with a privately operated warehouse company. This places the railroad company on an unfavorable competitive basis with the private company.

In numerous cases the last two handicaps have been overcome by the railroad company by either organizing a subsidiary warehouse company to operate the property or leasing it for a period of years to an independent company.

If a warehouse is to be operated most successfully in connection with an l. c. l. freight house, particularly if the latter is of some magnitude, it is desirable to eliminate interference between employees and patrons of the two facilities. It is, therefore, desirable in so far as possible, without a too great duplication, to provide separate and independent facilities for each. This applies particularly to tailboard space, railroad trackage, shipping platform space and elevator service. Adequate facilities should be provided for the warehouse without interfering with the freight house operation. To do this, it is necessary to determine the amount of trackage, tailboard space, shipping platform area and elevator service required for a given warehouse floor area.

Elevators.—The question of amount of warehouse space per elevator is one which does not admit of a definite solution and a very great variation might, therefore, be expected. The more recent installations have elevators with a capacity of four trucks, which requires an elevator platform approximately 9 ft. by 17 ft. It is also evident that the capacity of elevators in pounds has been increased in proportion to their size. There

has also been a tendency to increase the speed, but as an increase in speed very materially increases the cost of elevators the progress in this direction has not been as rapid as in the size and capacity.

In arriving at a suggested area of warehouse floor space per elevator, it is assumed that elevators will be installed of a size sufficient for four trucks, with a corresponding capacity and speed as dictated by modern warehouse practice, which seems to be a capacity of 10,000 lb. per elevator and a speed of 150 ft. per min.

Shipping Platform Space.—By shipping platform space is meant the area of platform adjacent to the railroad siding used exclusively for warehouse shipping. In numerous warehouses this space is made larger than required for shipping purposes in order to provide a small amount of storage space which, under certain conditions, is very desirable. The amount of space actually required in proportion to the total storage area of the warehouse depends largely on the extent to which the warehouse is supplied by rail.

From the data available it would appear that an allowance of 4 per cent would be ample and should allow some space on platform for storage purposes. The information would indicate that 3.5 per cent might be considered a reasonable minimum allowance.

The Amount of Railroad Car Trackage.—The amount of trackage required depends upon the extent to which the warehouse is supplied by rail and whether the shipments are from rail to rail or from rail to team or rail to boat. It is evident that the trackage requirements should be the greatest when shipments are from rail to rail. The length of turnover also influences the amount of trackage required.

Tailboard Frontage.—The amount of tailboard space is dependent upon the frequency of turnover and the extent to which teaming is used as a means of handling goods to and from the warehouse. It would appear from figures presented and observation of the warehouses that an allowance of 1,100 sq. ft. of warehouse floor space per foot of tailboard frontage is reasonable. If we use this figure and the suggested 17,600 sq. ft. of storage space per railroad car, it follows that 16 ft. of tailboard frontage should be provided per car.

Summary.—Summarizing the foregoing report as to the suggested relation between the various factors of design, we have the following, which are suggested for warehouses where the turnover of goods is moderately rapid.

(1) One elevator should be provided for each 40,000 sq. ft. of warehouse space served.

(2) The shipping platform area should be 4 per cent of warehouse storage floor area.

(3) There should be one car length of track siding for each 17,600 sq. ft. of warehouse storage area.

(4) There should be one foot of tailboard frontage for every 1,100 sq. ft. of warehouse storage area.

(5) There should be 16 ft. of tailboard frontage for each car length of siding.

The above figures do not represent exact limits of design, but are indicative of the proper relation which should exist based on experience of the warehouses studied in this report. An idea of the permissible variation from these figures may be obtained by a review of the foregoing tables.

HANDLING L. C. L. FREIGHT BY THE CONTAINER SYSTEM

In the handling of freight by mechanical means a recent development is the use of the container system for moving l. c. l. freight in lots between certain points. This system has been applied mainly to the transfer of freight in cities, but is used also in its transportation between cities. In both cases possibilities have been

developed in economy in time, cost, use of cars and freight house space.

City Transfer of L. C. L. Freight—The committee outlined the systems in use in Cincinnati and St. Louis and on the Chicago, Northshore & Milwaukee.

Inter-City Transfer of L. C. L. Freight—An experiment with railway transportation of freight and express in containers was begun early in 1921 by the New York Central Railroad but no regular service has been established. This system is being tried for handling freight between Cleveland and Chicago, and mail and express matter between New York and Chicago.

Container Systems on Foreign Railways—Both motor-truck and tractor-trailer container systems have been introduced by several European railways, largely for the store-door delivery service which is common in Europe. The railroad transportation of containers has been used by English railways for some years, particularly in handling mails, baggage and parcels where steamer transfer is involved, as on routes to France and Ireland.

Appendix B—Classification Yards, Including Methods of Switching From Classification Yards to Departure Yards

A questionnaire in regard to details of design and operation was sent to the railways which had constructed hump yards since the list appearing on page 133 of Volume 15 of the Proceedings was compiled, and a further questionnaire in regard to methods of switching from classification to departure yards, and in regard to the utility of sorting yards auxiliary to classification and departure yards, for more detailed classification of cuts, was sent to these railways as well as to all of the railways previously listed. A further investigation on the part of the sub-committee indicates that the Peoria & Pekin Union has converted its East Peoria hump yard to a flat yard; that the Nashville, Chattanooga & St. Louis has temporarily abandoned hump operation at Atlanta, and that the Kentucky & Indiana Terminal has abandoned hump operation in its Youngstown Yard at Louisville. Further revisions necessary to bring the list on page 133 of Volume 15 of the Proceedings up to date, in so far as the committee now has information, are the addition of:

Name of Railway	Location of Hump Yard
Canadian Pacific	Fort William Winnipeg City Calgary Vancouver
Central Railroad of New Jersey	Pembiscot, Pa.
Illinois Central	Markham (near Chicago)
Louisville & Nashville	DeCreev (near Cincinnati)
Milwagan Central	Niles
New York, New Haven & Hartford	Cedar Hill Providence
Norfolk & Western	East Portsmouth Wilbanson West Roanoke
Pennsylvania System	Cape Charles Renova Hawthorne (near Indianapolis)

HUMP YARD DESIGN AND OPERATION

An analysis of the information received leads the sub-committee to believe that no revisions are necessary in the present recommended hump grades. Although it is probable that these precise grades cannot be used in any given instance, they are a guide as to the grades which will probably be required under given conditions and if needed can readily be altered, as may be necessary to meet the exact conditions of any given climate or traffic.

The sub-committee believe that where it is possible economically to construct a classification yard of suffi-

cient length and number of tracks to permit of using it as a departure yard without interfering materially with its operation as a classification yard, a departure yard is not required and is an undesirable addition to the layout. When the volume of traffic is such as to require the constant use of the maximum economical classification yard, or when the tracks in the classification yard are shorter than the usual road train and cannot or should not be extended, a departure yard for the purpose of combining short cuts from several classification tracks into a single road train, and for the purpose of storing this road train during the interval between its assembly and the time of its departure, is of very great advantage in relieving congestion in the classification yard and in minimizing terminal delays. When a departure yard has been installed it may also be economically used for a certain amount of additional sorting of cars by flat switching after they have had a preliminary classification over the hump. It should not, however, be installed primarily for this purpose.

When the amount of business will not permit of re-humping cars, relief may be secured by building a flat sorting yard so located that cuts may be pulled from the classification yard by a sorting engine, resorted into these tracks, reassembled, and moved directly into the departure yard. If in any case the amount of re-sorting to be done should attain such magnitude that flat switching in this manner is no longer economical, a second hump yard tributary to all or any part of the classification yard and located between the classification yard and the departure yard in such a manner as to permit of re-humping cars without interfering with the operation of the main hump might be considered. The number and length of tracks required in a sorting yard depends upon the amount of resorting to be done and the number of secondary classifications to be made.

Based upon the information now in hand the sub-committee believes that in many of the hump yards now in existence a departure yard is not required, and that only in isolated cases where a departure yard is used, would a sorting yard be an economical adjunct.

CONCLUSIONS

The sub-committee is not yet prepared to make a definite recommendation as to when a departure yard, or a sorting yard for intermediate switching between the classification and departure yard is required, but submits the foregoing as information.

The sub-committee believes that no alterations should be made at the present time in the hump grades as now recommended.

Discussion

The report was presented by Chairman Montzheimer and the chairman of the sub-committees. Mr. Montzheimer presented the conclusions as given at the head of the report, and his motion that they be adopted was carried.

Chairman Montzheimer: I do not know of any subject that is more important to the railroads of this country than the question of reduction in the preparatory time and the leaving time of trains at terminals. It is a well known fact that there is a lot of time lost from the time the crew is ordered until they get out of the yard, and if the committee can go into the subject and present something that will be of value to this association, I think it will be well worth the time that we put in on the subject.

E. H. Lee (C. & W. I.): This is really a very important question, and I am very glad to see that the committee intends to devote some attention to this particular angle of the terminal situation during the coming year.

The speaker quite a number of years ago had occasion to investigate this precise question and some very astonishing results were developed at that time both to the men who made the investigation and to the men who were operating the railroads. I think our association is particularly well qualified to develop a great many of the fundamental facts on perhaps a great many railroads that many of the engineers, as well as operating men, do not at this time seem to understand.

R. G. Kenly (M. & St. L.): It is the function of this association so to design the engine lead from the house to the departure yard, or vice versa coming in, that it will take into consideration the question of facilities for

pumping up car line car inspection. I think it would be very pertinent if the functions of this committee can be enlarged to take care also of a little bit of the road facility. It has always been my idea that even the poorest of our railroads ought to have a bit of second track extending through its most important yards, and at least, far enough out into the country for the despatcher to get hold of his trainmen.

E. R. Lewis (M. C.): I would like to ask a little further consideration from the committee on subject No. 6, Transfer of laden bad order cars.

(The committee was excused with the thanks of the Association.)

Report of the Committee on Ballast

Time studies of track raising on stone and gravel ballast were utilized in the preparation of diagrams showing the organization and distribution of small ballast gangs. Detailed figures are given on the costs of ballasting, showing the time required as reduced from reports of representative railroads. Old style wooden "D" shovel handles are believed to be uneconomical because of breakage and the waste of material in manufacture. Neither are malleable "D" handles entirely satisfactory. The committee submitted designs for handles as information; and recommended the inclusion in the Manual of specifications for ballast shovels and a design of spot board.

F. J. Stimson
Chairman

F. J. Stimson is rounding out his first year as chairman, after serving as vice-chairman for one year. He has been a member of the committee for 16 years. Mr. Stimson was appointed chief engineer maintenance of way of the Southwestern Region of the Pennsylvania System on the reorganization of that road, which position he has held since March 1, 1920, prior to which time he was a division superintendent for several years. From over 25 years' experience in the maintenance engineering corps of the Grand Rapids & Indiana, during ten years of which time he was roadmaster he has acquired a thorough acquaintance with ballast problems.

IN APPENDIX B THE COMMITTEE submitted data received from various railroads compiled as far as practicable in uniform statements; also diagrams showing the proposed organization and distribution of men in a small emergency ballast raising gang (1) for stone ballast and (2) for gravel ballast. Appendix C gives proposed specifications for track shovels, suggested plans for different types of shovel handles and a plan for a Spot Board.

Conclusions

1. The committee recommended that there be added to the Manual the following definition:

SPOT BOARD—A sighting board laid across the rails in advance of a raising gang to govern the amount of raise and insure uniform grade line.

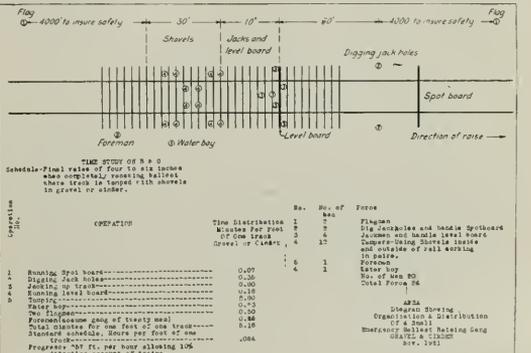

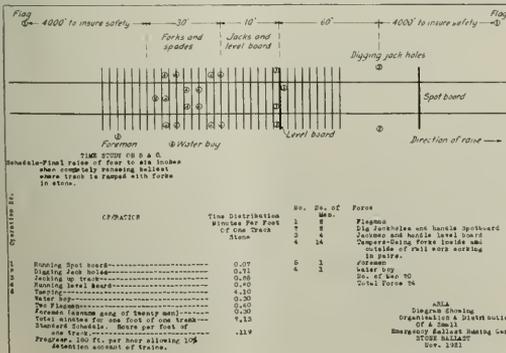

2. The committee recommended:
(a) That the diagrams in Appendix B be approved as recommended practice and printed in the Manual.

(b) That the matter referring to cost of ballast be accepted as information and the subject continued.

3. The committee recommended:
(a) That the specifications for ballast shovels shown in Appendix C be approved as recommended practice and printed in the Manual.

(b) That the plans of track shovels as shown in Appendix C be accepted as suggestions for trial and that the subject of the design of track shovel be continued.

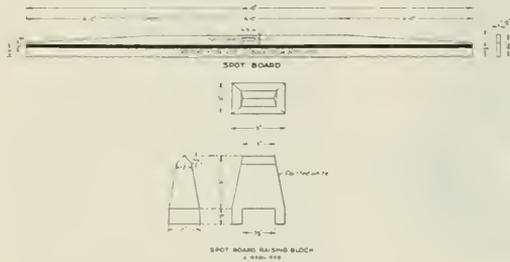

(c) That the plan of Spot Board as shown in Appendix C be approved as recommended practice and printed in the Manual.

Committee F. J. Stimson (Penna.), chairman; G. H. Harris (M. C.), vice-chairman; C. W. Baldrige (A. T. & S. F.), O. F. Barnes (Eric), Theo. Bloecher, Jr. (B. & O.), H. E. Boardman (N. Y. C.), C. J. Coon (Grand Cent. Term.), C. E. Dare (W. S.), H. M. Doughty (D. L. & W.), Paul Hamilton (C. C. C. & St. L.), A. G. Holt (C. M. & St. P.), F. A. Jones (M. P.), J. S. McBride (C. & E. I.), H. L. Ripley (N. Y. N. H. & H.), F. R. Ramsey (T. St. L. & W.), Hans Schantl (M. R. & B. T.), M. A. Stainer (F. W. & D. C.), Paul Sterling (N. Y. N. H. & H.), D. W. Thrower (L. C.), P. H. Winchester (N. Y. C.), Leif Winship (M. P.).

Appendix B—Application of Ballast

From time studies of raising track on both stone and gravel ballast, which were made available by the Baltimore & Ohio, diagrams were prepared showing the organization and distribution of small ballast gangs for the two classes of ballast, stone and cinders or gravel.

Details for a Standard Spotboard

It is considered that so far as application is concerned cinders and gravel will require the same kind of gangs. The diagrams as presented are recommended for adoption as recommended practice.

COST OF BALLASTING

A form which was prepared and sent out the early part of last year, asking for reports of the costs of ballasting in detail, brought replies from four railways.

Table No. 1—A, B, C, D and E, give the figures taken from the reports which were returned in the form asked for by the committee.

TABLE I-A—TIME REQUIRED AND COST OF SKELETONIZING TRACK PER CUBIC YARD OF MATERIAL REMOVED

Railway	Single or Double Track	Kind of Material	Number of Men in Gang		Time Removing Material From		
			Foremen	Men	Crib	Center Ditch	Shoulder

1.10 min.		1.15 min.	1.72 min.	8.35 min.	733
3.0 min.		1.29 min	0.15 min.	8.35 min.	782

TABLE I-E—RECAPITULATION—COST OF BALLASTING COST PER MILE EXPRESSED IN PAY-ROLL HOURS

Railway	Kind of Ballast	Single or Double Track	Kind of Cars	Hours Skeletonizing Track	Unloading Ballast	
6	Cleaning	Stone	Double	Hopper	9474	\$26 hr.
7	Ballasting	Stone	Double	Hopper	1379	75 hr.
8	Ballasting	R. Gravel	Single	Reg. Bal	684	254 hr.
9	Ballasting	Chats	Single	Reg. Bal	1204	90 hr.

First Raise	1 in. loading Ballast	Second Raise	Dressing Ballast	Lining Track	General Supervision	Total Labor	Work In Progress	Train Car Hours
894 hr	80 hr	830 hr	1984 hr	464 hr	178 hr	16672	78.1	91.6
260 hr	80 hr	600 hr	1276 hr	80 hr	150 hr	5530	26.0	550.0
540 hr			733 hr		16 hr	2170	21.0	462.0
940 hr		140 hr	753 hr	80 hr	10 hr	2913	12.0	40.0

17. The manufacturer shall furnish, without charge, all necessary facilities, and assistants, for making thorough inspection and tests at the works.

Rejection.—18. Individual tools, defective in any respect, and lots of tools not meeting the above requirements, shall be rejected.

Discussion

(The report was presented by Chairman Stimson, who moved the adoption of the definition for "spot board." The motion was carried. C. W. Baldridge (L. A. T. & S. F.) as chairman of the sub-committee on application of ballast, presented Appendix B and moved the adoption of the chart on gang organization. The motion was carried. A. G. Holt (C. M. & St. P.) as chairman of the sub-committee on ballast tools presented Appendix C.)

Chairman Stimson: While the recommendation of the committee is to the effect that the specifications for ballast shovels shown in Appendix C be approved as recom-

mended practice and printed in the Manual, it has seemed best to make these specifications in the nature of information instead of recommended practice, I therefore move that the specification for ballast shovels in Appendix C be accepted as information.

(Upon a question by President Downs it developed that the Ballast committee had not conferred with the Track committee with respect to the shovel designs, with the result that two designs were submitted.)

E. A. Frink (S. A. L.): It seems to me that both the specification and the design for shovels is exactly in the proper shape for presentation to the American Engineering Standards committee. I move to amend the motion before the house by substituting this motion: That the design and specifications for shovels prepared by this committee on Ballast be presented to the American Engineering Standards committee for their procedure.

(The motion as amended was carried and the committee was dismissed.)

Report on Iron and Steel Structures

Three changes are recommended in the general specification for steel railway buildings, 1920. Specifications for the erection of steel bridges are submitted for information. These specifications cover the erection of fixed spans less than 300 ft. long and include terms, materials, bearings, equipment, etc. The committee also submitted specifications for movable railway bridges, with specific and detailed rules for the design and manufacture of such structures as a guide to the designers and the shops. The specifications are based on the best general practice in the accepted types now in use on standard American and Canadian railways.

O. E. Selby
Chairman

O. E. Selby is completing his fifth year as chairman and his eleventh year as a member of the committee. Prior to his appointment as chairman he served for five years as vice-chairman. With the exception of one year he has been connected with the engineering department of the Cleveland, Cincinnati, Chicago & St. Louis and its subsidiary, the Louisville & Jeffersonville Bridge Company since 1890 and has been bridge engineer since 1905, taking over additional duties when he was appointed principal assistant engineer in 1915. He is a man of a scientific turn of mind with an active interest in organized technical work among engineers.

IN THE GENERAL SPECIFICATIONS for Steel Railway Bridges, 1920, three changes are recommended for adoption and printing in the Manual:

Article 47—Change the last sentence to read: "The unit stresses specified in Article 38 may be increased one-third for a combination of the secondary stresses with the other stresses, but the section shall not be less than that required when secondary stresses are not considered."

Article 48—Change to read: "The gross area of the compression flanges of plate girders and rolled beams shall not be less than the gross area of the tension flanges, but the stress per square inch shall not exceed

$$16000 - 150 \frac{l}{b}$$

l = the length of the unsupported flange between lateral connections or knee braces.

b = the flange width"

Article 243—Omit all of the fourth sentence after the word "Engineer," making the Article read

Eye-Bars.

243. Eye-bars shall be straight, true to size, and free from twists, folds in the neck or head, and other defects. The heads shall be made by upsetting, rolling or forging. Welding will not be allowed. The form of the heads will be determined by the nature of the work where the eye bars are made, if not factor in the Engineer. The thickness of the head and neck shall not vary more than $\frac{1}{16}$ in for bars 8 in. or less in diameter, or for bars more than 8 in. and not more than 12 in. in diameter, and $\frac{1}{8}$ in. for bars more than 12 in. in diameter.

The committee in Appendix A, submitted specifications for the Erection of Steel Railway Bridges as infor-

mation, but following the practice of the committee with respect to other important specifications in the past, desires that they appear in bulletin form for a year or so that the committee may get the benefit of a trial and discussion by users. In Appendix B, the committee submitted Specifications for Movable Railway Bridges as a conclusion for printing in the Manual. The statement in the appendix gives the history of their development. The committee believes them to be the best specifications for movable bridges now available.

Committee: O. E. Selby (C. C. & St. L.), chairman, P. B. Motley (C. P. R.), vice-chairman; F. Arnyausen (L. I.), J. A. Bohland (G. N.), W. S. Bouton, A. W. Carpenter (N. Y. C.), M. F. Clements (N. P.), J. F. Crawford (N. & W.), O. E. Dalstrom (C. & N. W.), F. O. Dufour (Stone & Webster), Thos. Earle (Beth Steel Brg. Corp.), W. R. Edwards (I. C. C.), C. R. Fiekes (C. B. & Q.), G. A. Haggander (C. B. & Q.), R. L. Huntley (L. P.), B. R. Leffler (N. Y. C.), P. G. Lang, Jr. (B. & O.), Albert Reichmann (Am. Brg. Co.), O. B. Robbins, A. F. Robinson (A. T. & S. F.), H. N. Rodenbaugh (E. F. C.), W. R. Roof (C. G. W.), J. M. Salmon (L. & N.), I. L. Simmons (C. R. I. & P.), I. E. Stern (Cons. Eng.), H. B. Stuart (G. T.), G. F. Tebbetts (Roberts & Schaefer), E. F. Turneure (Un. of Wis.), Dr. J. A. L. Waddell (Cons. Eng.), S. T. Wagner (P. & R.), H. T. Welty (N. Y. C.)

General Specifications for the Erection of Steel Railway Bridges

(For Fixed Spans Less Than 300 Ft. in Length)

Definitions of Terms.—1. The term "Engineer" refers to the chief engineer of the company or its subordinates in au-

thority. The term "Inspector" refers to the Inspector or Inspectors representing the Company. The term "Company" refers to the railway company or railroad company party to the agreement. The term "Contractor" refers to the erection contractor party to the agreement.

Work to Be Done.—2. The Contractor shall erect the metal work, make all connections and adjustments, remove the old structures and falsework and do all work required to complete the bridge or bridges, as covered by the agreement, in accordance with the plans and these specifications.

Drawings to Govern.—3. Where the drawings and the specifications differ, the drawings shall govern.

Plant.—4. The Contractor shall provide all tools, machinery and appliances, including drift pins and fitting up bolts, necessary for the expeditious handling of the work. The Contractor shall protect the Company against claims on account of patented devices or parts used by him on the work.

Plans.—5. The Company will furnish complete detail plans for the structure or structures to be erected, including shop details, camber diagram, erection diagrams, match-marking diagrams, list of field rivets and bolts, and copy of shipping statements showing a full list of parts and weights.

Materials.—6. The Contractor shall receive, f. o. b. cars, at the siding to be designated in the information to be given bidders, all materials entering into the finished structure.

Handling and Storing Materials.—7. The Contractor shall unload material promptly upon delivery, otherwise he shall be responsible for demurrage charges. Stored material shall be piled securely outside the tracks, and no material shall be placed closer than six feet to the nearest rail. Material shall be placed on skids, above the ground, be kept clean and properly drained. Girders and beams shall be placed upright and shored. Long members, such as columns and chords, shall be placed on skids near enough together to prevent injury by deflection. The Contractor shall check all material turned over to him against shipping lists and report promptly in writing any shortage or injury discovered. He will be held responsible for the loss of any material while in his care, or for any damage resulting from his work.

Falsework.—8. Unless otherwise provided, the Contractor shall prepare and submit to the Engineer for approval, plans for falsework or for changes in the existing structure necessary for maintaining traffic. The falsework shall be properly designed and substantially constructed and maintained for the loads which will come upon it. Approval of the Contractor's plans shall not be considered as relieving the Contractor of any responsibility. Temporary structures or falsework placed by the Company, if suitable, may be used by the Contractor.

Masonry.—9. The Company will construct the masonry to correct lines and elevations, and will establish the lines and elevations required by the Contractor for setting the steel.

Bearings and Anchorage.—10. Bed plates, bolsters and shoes shall be set level in exact position. They shall be given full and even bearing by setting them on a layer of Portland cement mortar or dry cement, or by tightly ramming in rust cement after blocking them accurately in position, as directed by the Engineer.

11. The Contractor shall drill the holes and set the anchor bolts, except where the bolts are built into the masonry. The bolts shall be set accurately and fixed with Portland cement grout completely filling the holes.

Methods and Equipment.—12. Before starting work, the Contractor shall advise the Engineer fully as to the method he proposes to follow, and the amount and character of equipment he proposes to use, which shall be subject to the approval of the Engineer. The approval of the Engineer shall not be considered as relieving the Contractor of the responsibility for the safety of his method or equipment or from carrying out the work in full accordance with the plans and specifications. No work shall be done without the sanction of the Engineer.

Assembling Steel.—13. All parts shall be accurately assembled as shown on the plans and any match-marks carefully followed. The material shall be carefully handled so that no parts will be broken or damaged. Hammering which will injure or distort the work will not be permitted. Bearing surfaces and surfaces to be in permanent contact shall be cleaned just before the members are assembled. Unless erected by the cantilever method, truss spans shall be erected on blocking so placed as to give the trusses proper camber until all tension chord splices are fully riveted and all other truss connections pinned and bolted. Rivets in splices of butt joints in compression members shall not be driven until the span has been swung. Splices and field connections shall have one-half of the holes filled with bolts and cylindrical erection pins (half bolts and half pins) before riveting. Splices and connections carrying traffic during erection shall have three-fourths of the holes so filled.

Fitting up bolts shall be of the same nominal diameter as the rivets, and the cylindrical erection pins shall be $\frac{1}{2}$ inch larger.

Riveting.—14. Riveting preferably shall be done with pneumatic riveters and buckers. Rivets larger than $\frac{7}{8}$ inch in diameter shall not be driven by hand. Connections shall be accurately and securely fitted up before the rivets are driven. Light drifting will be permitted to draw the parts together, but drifting to match unfair holes will not be permitted. Unfair holes shall be reamed or drilled. Rivets shall be heated to a light cherry color, and in driving shall be upset to completely fill the holes. Heads shall be full and symmetrical, concentric with the shank, and shall have full bearing all around. They shall be the same shape and size as the heads of the shop rivets. Rivets shall be tight and shall grip the connected parts securely together. No recapping or caulking will be permitted. Rivets shall not be overheated or burned. In removing rivets, the surrounding metal shall not be injured; if necessary, such rivets shall be drilled out. Cup faced dollys, fitting the head closely to insure good bearing, shall be used.

Bolted Connections.—15. In bolted connections, bolts shall be drawn up tight and threads burred so that nuts cannot become loose.

Pin Connections.—16. Pilot and driving nuts shall be used in driving pins. They will be furnished by the Company and shall be returned to the Company on completion of the work. Pin nuts shall be screwed up tight and threads burred so that the nuts cannot become loose.

Deck.—17. Where so specified, the ties, guard timbers, guard rails, fire decking, concrete decking, waterproofing, ballast, and deck planking, and the track rails and tie plates, shall be placed by the Contractor. The timber deck, if untreated, shall be framed and placed in accordance with the Company's plans. The ties shall be framed to give a full and even bearing on the girders and under the rails. The guard timbers shall be dapped and framed to a snug fit over the ties and fastened as shown on the plans. If treated timber is used, the Company will deliver it properly framed to the Contractor. If necessary to do any framing or cutting of treated timber, the resulting surfaces shall be given a brush treatment with wood preservative, as directed by the Engineer. Where concrete decking is used, or waterproofing is required, the specifications therefor will be furnished by the Company.

Misfits.—18. Corrections of minor misfits and a reasonable amount of reaming will be considered as a legitimate part of the erection. Any error in shop work which prevents the proper assembling and fitting up of parts by the moderate use of drift pins, and a moderate amount of reaming and slight chipping or cutting shall immediately be reported to the Inspector, and his approval of the method of correction obtained. The correction shall be made in the presence of the Inspector, who will check the time expended. The Contractor shall render within thirty days an itemized bill for such work of correction for the approval of the Engineer.

Painting.—19. Heads of rivets shall be painted by the Contractor. This painting shall not be done until the Inspector has examined the rivets and found them satisfactory. The tops of stringers and girders which are to carry ties shall be given one coat of field paint.

If the field painting is to be done by the Contractor, the specifications therefor will be furnished by the Company.

Removal of Old Structure and Falsework.—20. The Contractor shall dismantle the old structure and falsework and load the material on cars for shipment, or pile it neatly at a site immediately adjacent to the tracks, at a convenient elevation for future handling, as directed by the Engineer. When the old structure is of iron or steel and is to be used again, it shall be dismantled without unnecessary damage and the parts match-marked.

21. The Contractor shall remove the piling to the surface of the ground and all debris and refuse resulting from his work, leaving the site in good condition.

Superintendence and Workmen.—22. During the entire progress of the work the Contractor shall have a competent foreman or superintendent in personal charge of the work. Instructions given to the foreman or superintendent shall be considered as given to the Contractor. All work shall be done by skilled, competent workmen.

Interference With Traffic.—23. The Contractor shall conduct his work in such a manner that the track, while in service, will be safe and clear for the passage of trains. Tracks shall be disturbed or removed for the prosecution of the work during such times only as allowed by the Company. While the Contractor is actively engaged in the erection, trains will be required to approach the bridge prepared to come to a stop before crossing and will proceed only on signal. During the time the Contractor operates his equipment on the tracks or has occasion to make the tracks unsafe for the operation of trains, his operations will be in charge of a conductor or pilot who will arrange and control the train movements.

Company Equipment.—24. When the agreement provides that the Company shall furnish equipment to the Contractor,

such as flat cars, water cars, bunk cars, etc., the Contractor shall repair all damage to such equipment furnished for his use and return it in as good condition as when he received it.

Work Train Service.—25. When under the contract work train or engine service is furnished the Contractor without charge, the Contractor shall state in his bid the number of days such service will be required. Any excess over the time specified in this bid shall be paid for by the Contractor at the Company's schedule of rates.

Risk.—26. The Contractor shall be responsible for loss of or damage to materials and for all damage to persons or property and for casualties of every description caused by his operations during the progress of the work. Injuries or losses due to events beyond the control of the Contractor shall not be borne by him unless they occurred because of his dilatory methods in handling the work, extending the time beyond the time limit designated in the contract.

Inspection.—27. The work shall be subject at all times to inspection by the Engineer.

Laws and Permits.—28. The Contractor shall comply with federal, state and local laws, regulations and ordinances, and shall obtain at his own expense the necessary permits for his operations.

Appendix B—Specifications for Movable Railway Bridges

The purpose of the committee which wrote these specifications was to formulate specific and detailed rules for the design and manufacture of movable railway bridges, as a guide to both the designer and the shop, rather than to confine the specifications to a statement of principles or to limit them to rules defining the duties of the contractor. The intention was to describe the best general practice in the accepted types now in use for standard American and Canadian railways and to advance the causes of good design and workmanship. The requirements of light and branch railways and foreign practice have not been considered.

The specifications in preliminary form were printed in Bulletin No. 204 and in the Proceedings, Vol. 19, and

discussions and suggestions were invited. The discussions received were printed in Bulletin No. 228 in 1920. These, together with later written and verbal discussions, were considered by the committee in the final revision.

(These specifications covered 54 pages of Bulletin No. 240, too long to be reproduced here.)

Discussion

Chairman Selby submitted the recommendations for adoption and printing in the Manual as given at the head of the report and moved their approval by the convention. Motions to this effect were passed. He also introduced an additional change to article 157 of the specifications not covered in the committee's report as published in the bulletin. This provides that there is to be added under table of physical properties the following:

Elongation in 2 in. minimum per cent 22.

This change was also approved.

Mr. Selby then introduced specifications for the erection of steel railway bridges, explaining that these were submitted as information and that any comments or criticisms of these specifications would be considered by the committee in reviewing these specifications for re-submission in final form next year. A number of speakers submitted suggestions which the committee will take under advisement. A motion by Mr. Selby that the specifications be received as information for publication in the proceedings was carried.

The specifications which the committee submitted for movable railway bridges as referred to in Appendix B of the report was then submitted by Mr. Selby and after pointing out a number of typographical errors, he moved the adoption of these specifications for printing in the Manual. This motion was carried and the committee was dismissed with the thanks of the association.

Report on Signals and Interlocking

A committee of the American Railway Association is now studying the subject of automatic train control. The substitution of incandescent lamps in headlights results in the elimination of many difficulties in signal visibility due to the glare of arc lights. The committee recommends the installation of an arrangement of shields to prevent the light on approaching trains from showing through colored glass on dwarf signals and giving a wrong indication. Wrong indications due to the reflection of light can be eliminated by the use of convex roundels or the adjustment of the signal; the committee recommends the adoption of the former for new work and renewals.

W. J. Eck
Chairman

W. J. Eck is finishing his second year as chairman, after having served for four years as vice-chairman. He has been a member of the committee since 1911. Mr. Eck has been signal and electrical superintendent of the Southern Railway System since 1907. He has taken an active interest in the development of signal and electrical standards and has done much to promote their use, being one of the pioneers in the introduction of alternating current signals in this country. He has also been active in the work of the Railway Signal Association, now the Signal Section of the Engineering Division of the American Railway Association.

REPORTS ON COLORS for signals, light signals, requisites for signal locations and the aspect indicating that a train must take siding at a non-interlocked switch will be found in the proceedings of the American Railway Association, Signal Section. The subject of automatic train control is now being handled by the Joint Committee on Automatic Train Control.

The Effect of Electric Locomotive Headlights on Signals

But the difficulty has actually been experienced due to the effect of locomotive headlights and this has been largely eliminated with the abandonment of the arc light

and the use of incandescent lamps in the headlights, with the consequent reduction in candlepower as well as the difference in characteristics of the two lights. The difficulties remaining are three:

- (1) The inability of an engineman on one train to read the signals on account of the headlight on a train in the opposing direction blinding him.
- (2) The headlight on a train in the opposite direction showing through the colored glass on a dwarf signal other than the one in front of the lamp and so giving a wrong indication.
- (3) The light from a locomotive headlight on a train being reflected back from a signal and so giving a wrong indication.

The first of these difficulties has been obviated where they occur by having the enginemen dim the headlights

when approaching trains running in the opposite direction.

The second difficulty has been obviated by arranging a shield on dwarf signals behind the colored glass of spectacles which are not in front of the lamp.

The third difficulty has been obviated by either: (a) Adjustment of signal. (b) Use of convex roundels.

The use of such roundels will obviate the trouble should signal not be in proper adjustment.

The committee recommended:

(1) That shields be installed on dwarf signals behind the colored roundels not in front of the lamp.

(2) That convex roundels be used on all new work and renewals.

Committee: W. J. Eck (Sou.), chairman; W. M. Vandersluis (I. C.), vice-chairman; Azel Ames (Cons. Engr.), H. S. Balliet (N. Y. C.), A. M. Burt (N. P.), C. E. Denney (N. Y. C. & St. L.), F. L. Dodgson (Gen. Ry. Sig.), W. H. Elliott (N. Y. C.), G. E. Ellis (Aut. Train Con. Com.), J. G. M. Leisenring (I. T. S.), H. K. Lowry (C. R. I. & P.), J. C. Mock (M. C.), F. P. Patenall (B. & O.), J. A. Peabody (C. & N. W.), A. H. Rudd (Penna.), A. G. Shaver (Cons. Engr.), T. S. Stevens (A. T. & S. F.), E. E. Worthing (S. P.).

Discussion

W. J. Eck (Chairman): The material which the com-

mittee is reporting is for the purpose of information only.

C. E. Lindsay (N. Y. C.): What are the recommendations on the subject of railway lamps?

Chairman Eck: At the meeting of the Committee on Standardization, where the subject of railway lamps was discussed, the chairman of the Committee on Signals and Interlocking presented the series of lamps which had heretofore been adopted by the Signal Association. Since that meeting, however, the Signal Section has presented a revised drawing of one of the lamps and it was voted on yesterday. On account of the proposed revision of one of the lamps in the series, the chairman of the committee did not think the series was in shape to present to you today.

G. A. Mountain (Can. Ry. Co.): Has the committee considered the question of eliminating guard rails at interlocking crossings?

Chairman Eck: I have been a member of the committee for many years, and do not not recall the subject being discussed by the committee.

(The motion to accept the report as information was moved and carried.)

Report of Committee on Standardization

The committee reports progress in its efforts to secure the adoption of standards already approved by the association as well as in harmonizing differences of opinion regarding other specifications. Sponsorship for the unification of specifications for cross-ties and switch-ties offered by the American Engineering Standards Committee to the Association was accepted and the specifications approved by the Association will be offered as a basis for unified specifications. The belief is expressed that the present specifications for creosote oil tend to exclude what seems to be genuine coal tar creosote oils and that some change should be made to cover that point.

E. A. Frink
Chairman

E. A. Frink has been chairman of this special committee since its organization three years ago, the remainder of the committee consisting of the chairmen of the standing committees with two additional representatives from Canada. Mr. Frink has been principal assistant engineer of the Seaboard Air Line since April, 1914, prior to which time he was bridge engineer for eight years. He has long been an advocate of the more extensive use by the railways of the standards adopted by the association, and after the committee was organized to promote this end he was the logical selection for chairman. He also is a member of the A. E. S. Committee.

THE ASSOCIATION has approved as recommended practice, specifications and designs of the Ballast committee covering tamping bars, tamping picks and ballast forks of the Proceedings for 1921. These specifications and designs are being handled by this committee with the purpose of securing their adoption by the roads and producers.

Ties.—The association was represented by the Tie committee in a conference called by the American Engineering Standards Committee on the unification of Specifications for Cross-Ties and Switch Ties and the association was nominated as a sponsor for the project. The sponsorship has been accepted and Committee III expects to present the specifications approved by our association as a basis for unified specifications.

Rail.—During the year, the Rail committee endeavored to harmonize differences with the rail manufacturers on the standard specification for open-hearth steel rail, but so far without success. However, it is expected that some progress may be made, which will be reported to the convention.

Track.—The committee is glad to report that the manufacture of frogs and switches, previously adopted by the

association, is increasing rapidly and that the use of the association's accepted designs for cut and screw spikes is being promoted as much as possible.

Masonry.—The Committee on Masonry recommends that the Specifications and Tests for Portland Cement, adopted as recommended practice by the American Railway Engineering Association at the convention in 1917, be accepted for standardization, except that paragraph 36 be omitted, as noted in the report of that committee.

Signals and Interlocking.—The committee recommends that the following drawings showing oil burning railway lamps and detail parts, RSA 1100-1101, and ARA Signal Section Drawings 1430, 1440-1441-1442-1443-1445-1459-1460-1461-1470-1480-1496-1497-1498-1499, be submitted to the American Engineering Standards Committee for standardization.

Water Service.—The committee recommends the standardizing of the American Water Works Association's standards for cast iron pipe, hydrants, and valves.

Wood Preservation.—It would appear the present American Railway Engineering Association specifications for creosote oils tend to exclude what seem to be genuine coal tar creosote oils, and it is expected that there will

have to be a change in our creosote oil specification before the next annual meeting.

Electricity.—If approved by the convention, the specifications for friction and rubber tape will be presented to the American Engineering Standards Committee for standardization.

Conclusions

The committee recommended that the following subjects be submitted to the American Engineering Standards Committee by a representative of the American Railway Association before that committee as a basis for standardization:

1. American Water Works Association standards for cast iron pipe, hydrants and valves.
2. Tamping bars, tamping picks and ballast forks.
3. Specifications as prepared by the Tie Committee of the A. R. E. A.
4. Railway Lamps.
5. Commercial Adhesive Tape and Rubber Insulating Tape.

Committee: E. A. Frink (S. A. L.), chairman; J. R. W. Ambrose (Toronto Term.), vice-chairman; W. C. Barrett (L. V.), F. L. C. Bond (I. C.), W. A. Clark (D. & I. R.), A. F. Dorley (M. P.), W. T. Dorrance (N. Y. N. H. & H.), W. J. Eek (Sou.), J. M. R. Fairbairn (C. P. R.), W. D. Faucette (S. A. L.), A. S. Going (G. T.), W. H. Hoyt (D. M. & N.), Maro Johnston (I. C.), C. E. Johnston (K. C. S.), Edwin B. Katte (N. Y. C.), A. Montzheimer (E. J. & E.), F. E. Morrow (C. & W. I.), G. J. Ray (D. L. & W.), L. S. Rose (C. C. C. & St. L.), O. E. Selby (C. C. C. & St. L.), F. J. Stimson (Penna.), H. M. Stout (N. P.), C. M. Taylor (C. of N. J.), W. P. Wiltsee (N. & W.), J. J. Yates (C. of N. J.).

Discussion

(The report of the committee was presented by Chairman Frink who read a report outlining the purposes and functions of the American Engineering Standards Committee and reporting the progress in standardization in this country and abroad.)

Mr. Frink: I think that more assistance will be obtained from the American Engineering Standards Committee in the matter of standardization than in any other way that we might select. I therefore urge all, if possible, to vote favorably on the committee's recommendation to refer these five matters to the American Engineering Standards Committee for their action.

I move the approval of the Recommendations 1 to 5.

H. R. Safford (C. B. & Q.): I am thoroughly in accord with the recommendation and the comment I make is merely upon a technicality, as to whether we should take the action contemplated, especially with reference to item No. 4, which says: "Railway lamps as developed by the Committee on Signals and Interlocking, to be presented by that committee at the next convention." The point I want to raise is, can we at this time take action that places this matter before the American Engineering Standards Committee until it has been acted upon by the body from which it originated?

Chairman Frink: Our sending anything to the American Engineering Standards Committee does not signify that the Association has approved it at all. It simply means that the Association thinks that that particular thing should be standardized, and that we are willing to be sponsor for such standardization, but that we will not accept it unless it suits our convention after it is done.

J. J. Yates (C. of N. J.): I am a member of the Standards committee. The Standards committee in accepting a suggestion for standardization considers that the Association has come to an agreement on the specification and are ready to back it up. I think you are a little premature in subscribing a specification now that has not had the approval of this association.

C. A. Morse (C. R. L. & P.): I cannot help but agree

with the last speaker. It seems to me that we ought to be able to back these five things that we are to present to the Standardization committee.

Chairman Frink: It is almost inconceivable that anything that we may get up, no matter how carefully it is done, will suit all the different interests who are on the sectional committees of the American Engineering Standards Committee. If a subject has been approved by this convention, the Standards committee will be placed in the unenviable position of being asked to agree to a modification of something which the convention has approved.

W. M. Camp (Railway Review): If something which has been approved by this convention and is in our Manual is presented to the American Engineering Standards Committee will it come back to the A. R. E. A. to be modified?

Chairman Frink: It will come back to us, but not to be modified except as regards ourselves. We are our own court of last resort in regard to our own practice. We will adopt it or not, as we see fit.

Mr. Morse: In looking over these resolutions, I understand No. 4 is part of the work of the Committee on Signals and Interlocking, and that it is to be presented to this convention. No. 5 is part of the Committee on Electricity, and it is to be presented to this convention. It seems to me we could pass these resolutions as Mr. Frink wants with the proviso that if the convention approved them when they are reported from the various committees they are presented by, they are all right; if not, they are not.

Chairman Frink: The committee will accept that suggestion, I am sure.

(The motion was carried.)

Chairman Frink: Referring to the method of handling projects with the Engineering Standards Committee, I want to offer this motion:

Resolved, That whenever a project prepared for or approved by the proper standing committee is reported to the Board of Direction of the Association by our Committee of Standardization, with a recommendation for presentation to the American Engineering Standards Committee, said Board of Direction be and is hereby authorized to, in its discretion, present such project to said American Engineering Standards Committee with a request for action, this association to be a sponsor for such project.

That covers the point made by Mr. Safford a little while ago, but instead of making your standardization committee the direct intermediary with the Engineering Standards Committee, it makes the Board of Direction the intermediary.

H. Churchill (N. & W.): This motion is all right with one proviso, i. e., that this committee stand between this association and the A. R. E. A.

Chairman Frink: Inasmuch as the Board of Direction would take the action, and inasmuch as our secretary is also secretary of the Engineering division of the A. R. E. A., it was sufficiently safeguarded.

F. J. Stimson (Penna.): It should be made plain to the A. R. E. A., and I move that the resolution be amended in such a way as to provide that one year after the adoption of the A. R. E. A. recommended practice, that the Board of Direction, . . . We do not want to go on record at this time as authorizing the Standardization committee to make recommendations to the Board of Direction, and have the Board of Direction take action with the American Engineering Standards Committee before the matter has come before the convention.

(Motion as amended carried.)

(The committee was dismissed with the thanks of the association.)

Report of the Committee on Ties

Satisfactory reports on cross ties and preservative treatments are difficult to secure because of lack of proper data, and much trouble has arisen because of the effort to secure absolute rather than relative values for tie life. To remedy this a standard tie should be adopted and comparative tests made with other ties, according to a prescribed method. Tie plates should have a shoulder to maintain gage and to transmit the thrust properly to the tie through the plate. No movement should be allowed between the tie plate and the tie while a free-way of $\frac{1}{16}$ in. to $\frac{3}{16}$ in. should be maintained between the spike head and the rail base.

W. A. Clark
Chairman

W. A. Clark is completing his first year as chairman of this committee, prior to which he served as vice-chairman for two years. He has been a member of the committee for nine years. Like his predecessor, F. R. Layng, he is connected with one of the railway properties of the United States Steel Corporation, being chief engineer of the Duluth & Iron Range. He has long been an active student of the tie question and has had much to do with the work of the committee in its investigation of the relative economics of ties of various materials as well as of its inspections and reports on the various installations of substitute ties for steam railroads.

IN APPENDIX A the committee submitted the results of its study on the economics of the use of the various classes of cross-ties and various kinds of preservative treatment and also the classification of ties for various kinds of service.

The committee also presented its usual report on substitute ties. A report on the effect of the design of tie plates and track spikes on the durability of cross-ties and the results of improperly protecting ties from mechanical wear was given in Appendix C.

Conclusions

The committee recommended the following action on its report:

1. That the report covered in Appendix A be received as information and the recommendations pertaining to standard test ties be approved.
2. That the report on substitute ties be received as information.
3. That the report on Care of Ties after Distribution be continued.
4. That the report covered in Appendix C be received as information and the subject discontinued.

Committee: W. A. Clark (D. & I. R.), chairman; W. J. Burton (M. P.), vice-chairman; W. C. Baisinger (A. T. & S. F.), M. S. Blaiklock (G. T.), F. Boardman (N. Y. C.), S. B. Clement (T. & N. O.), E. L. Crugar (I. C.), John Foley (Penna.), O. H. Frick (C. M. & St. P.), G. F. Hand (N. Y. N. H. & H.), F. R. Layng (C. & L. E.), R. M. Leeds (D. L. & N.), A. F. Maischaider (C. C. & St. L.), A. J. Neafie (D. L. & W.), G. F. Palmer (E. & O. C. T.), L. J. Riegler (Penna.), E. W. Boots (P. & L. E.), H. A. Cassil (P. M.), F. W. Cherrington (Jennison-Wright Co.), J. F. Deimling (M. C.), H. C. Hayes (I. C.), Lowry Smith (N. P.), H. A. Anderson (S. P.).

Appendix A—Economics of the Use of Various Classes of Cross-Ties and Various Kinds of Preservative Treatment and Also the Classification of Ties for Various Kinds of Service

Satisfactory report on these subjects would require tie life data which is non-existent, and not only is this true, but the committee, after a careful consideration of the requirements, is of the opinion that the data from tests now under way will hardly be satisfactory for use in solving these problems. As the need for proper data will increase rather than decrease, with the diminishing timber supply, the committee desires to point out wherein tie-life data is unsatisfactory and wherein tests may be made to produce more usable results. The

committee realizes the difficulty of comparing installations under different conditions and is of the opinion that much of the trouble is due to an effort to obtain absolute rather than relative values for tie life.

If, in every test installation, there could be included a standard tie, to serve as a unit of comparison, the result, as measured by the standard tie, could be applied anywhere, where knowledge of the performance of the standard tie is available. The committee, therefore, recommended that in order to provide suitable data in the future the following practice with regard to test installations be followed:

- (a) Install at the same point, in the same track, under the same traffic and under the same conditions of rail, ballast, drain-

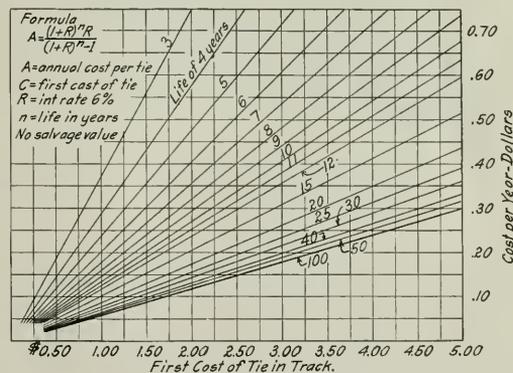

Fig. 1. Annual Renewal Costs, 6 Per Cent Compound Interest

age, sunlight, etc., an equal number, up to not less than 100, "Standard Test" ties.

- (b) Continue the test record until all standard test ties have been removed as well as all other ties of the test.

(c) Standard test tie to be A. R. E. A. 1921 specification, grade 3 (6 in. by 8 in.), class U, white oak, 8 ft. long, untreated.

(d) Record should include information called for on Form No. 1, Report of Experimental Test Tie Sections, as recommended by the Tie Committee, see page 339 of volume 22, A. R. E. A. Proceedings.

In using this form the following data should be given:

1. Gross tons per year passing over the test, freight plus passenger.

2. Average annual rainfall.
3. Mean temperature of locality for January, and July, and highest and lowest extremes.
4. Ballast—kind and depth.

The tie selected as standard test can be secured, at least in the small numbers needed for test installations, without an undue amount of transportation to most of the country. The Grade 3 is selected instead of Grade 5 because it has shorter life.

MECHANICAL STRENGTH

A tie performs three principal functions: (a) Acts as a beam to distribute the load, (b) Acts as a block to transmit the load from rail to ballast, and (c) Holds the rails in place.

It is, therefore, required to possess beam strength, crushing strength and ability to hold fastenings. As between the three, the beam strength is fundamental, because, if deficient in any given tie, there is no remedy, whereas a deficiency in crushing strength or ability to stand compression across the grain can be remedied by suitable tie plates and the ability to hold fastenings modified by the design of the fastenings.

EFFECT OF SIZE AND TIE PLATES

The replies to the committee's questionnaire indicated a general belief that ties 7 inches by 9 inches would outlast ones 6 inches by 8 inches when subjected to the

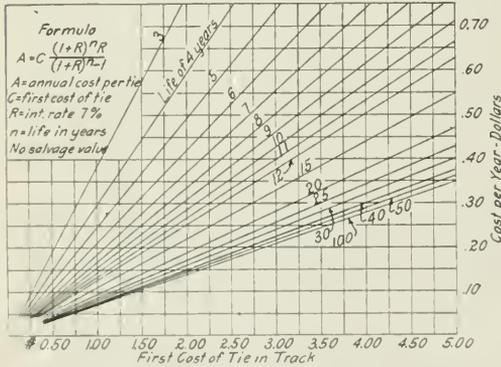

Fig. 2. Annual Renewal Costs, 7 Per Cent Compound Interest

same conditions. The replies would, perhaps, average 25 per cent. The data given in the questionnaire relative to ties failing by decay shows an average of 30 per cent greater life for the 7 inch ties, plated, over the 6 inch ties and 20 per cent for the 7 inch ties, unplated, over the 6 inch ties. These check the opinions fairly well. It is also found that the value of the tie plate in the case of 6 inch ties is 12 per cent, and in the case of the 7 inch ties 21 per cent. All of these percentages must be considered only approximate, due to the character of the data.

Figure 1 and 2 have been prepared from the formula recommended by this committee for ascertaining annual cost. They are self explanatory.

CONCLUSIONS

The life data does not exist from which satisfactory conclusion may be reached on the subjects assigned. Information lacking is partly as follows:

- (b) Information as to how the "average" life reported is obtained.
- (c) Information as to whether the relative resistance to decay of various woods is independent of climate.
- (d) Information as to whether the best decay resisting tie untreated is also the best decay resisting tie when treated, whether treatment results in the addition of a uniform number of years' life to all kinds of timber, or more to some kinds than others, or whether it results in giving all kinds of ties the same average life under the same conditions.
- (e) How mechanical strength is related to resistance to mechanical wear.
- (f) How mechanical strength varies with time in track, i. e., from the condition new to the condition when decay necessitates removal.

RECOMMENDATIONS

- (1) The inclusion of the standard test tie in all test installations, for the purpose of comparison, as more particularly outlined above.
- (2) The adoption of white oak ties, grade 3 (6 in. by 8 in.), class U, untreated, 8 ft. long, as standard for test purposes.
- (3) Laboratory test of the mechanical properties of tie timber, which has been subjected to contact with the soil for varying periods under conditions similar to those to which ties are subjected in track. Such tests should develop the relationship between strength and time exposed to the tie destroying agencies other than traffic.

Appendix C—Effect of the Design of Tie Plates and Track Spikes on the Durability of Cross-Ties

The following features should be provided for to ensure a minimum of damage to the tie:

- a. Adequate strength and area to prevent buckling and excessive settlement in the tie. The required bearing area and thickness will be governed by the kind of wood and character and amount of traffic. The distance the plate extends beyond either side of the rail base should be so proportioned as to prevent uneven settlement of the plate into the tie and consequent rolling of the rail. Allowance should be made for the deterioration of the tie plate which will normally take place, particularly near salt water or where there are brine drippings.
- b. It is important that the tie plate have a shoulder to maintain gage, so that the thrust from the rail is transmitted to the tie through the bearing area of the tie plate and the spikes as a unit, instead of being directly resisted by any spike.
- c. There should be no movement between the tie plate and the tie. The effect of any looseness is to make a "track which rattles," causing damage to the plate bearing area of the tie and enlargement of the spike holes. This close connection between tie plate and tie can best be accomplished by the use of separate fastenings which do not touch the rail and whose only function is holding down the plate. The ordinary means is to provide projections on the bottom of the tie plate; these should be deep enough to provide the required bond and to do their part in strengthening the tie plate, but so shaped and of a depth to do as little damage as possible to the tie, and it is believed that the depth of such projections should not exceed 3/8 in., and be so shaped as not to cut the fiber of the wood. When screw spikes are used, a rest shoulder should be provided on which the screw spike bears when driven home, leaving a freeway between the rail base and the under side of the spike head; this aids in making the bond between tie plate and tie. The freeway between the underside of the spike head and the rail base is of great importance and should be from 1/8 to 3/8 inch., depending on character of the subgrade.

SPIKE—EFFECT OF DESIGN

Safe and good track can be obtained by use of either screw spikes or different forms of cut spikes, and the choice between these is purely a question of which is more economical, all things considered; there is no evidence at this time that the screw spike in itself prolongs the life of the tie. The thread on the spike must be accurate in dimension and pitch (made to fit gages as recommended by the association standard), and so made in conjunction with a leader that the spike can be easily started in the hole in the tie by a light tap from a hammer. These features are provided for in the associa-

tion standard, and failure to observe them results in destruction of the screw threads in the wood either in the initial application of the spike or in replacing spikes when renewing rail. The necessary freeway between the screw spike head and the base of the rail should be secured through the design of the tie plate.

METHOD OF APPLICATION

The surface of the tie should have an accurate bearing surface to receive the tie plate; this is best accomplished by machine adzing. There is considerable advantage in prolonging the life of the tie by boring holes to receive the spikes; this is, of course, necessary to the application of screw spikes. If cut spikes are used the expense of boring untreated ties is not warranted, but all treated ties should be bored for spikes if the maximum life of the timber is to be secured. Such holes should preferably be bored entirely through the tie to ensure adequate depth when the tie plate has settled into the tie.

When treated ties are used all adzing and boring should be done before treatment. In case it becomes necessary to bore any holes in treated ties in the field, as in the case of switch ties, or to use tie plugs, the holes should receive an application of preservative before the spike or plug is applied. All tie plugs used in treated ties should be treated.

Attention is called to the danger of over-spiking. When the number of spikes is sufficient to hold the rail and gage properly, any additional spiking unnecessarily injures the tie at the most critical point. Additional spikes may be driven when actually required.

Discussion

V. K. Hendricks: The committee could get more reliable information by a study of the actual renewals on the different railroads, by going into more detail than has heretofore been done.

W. H. Courtenay (L. & N.): The committee seems to indicate that a white oak tie will last 6 yr. and a cypress tie will last 5.4 yr. This is certainly not true of certain parts of our country. In our part of the country a white oak tie, produced in that territory, will not last more than six years, and I have actually seen cypress ties

that have been in use for over 30 years. It is a matter of extreme difficulty to get correct information about ties.

W. J. Burton (Vice Chairman): Last year we tried to get information about cypress ties, but the L. & N. did not reply to it. We realize that this whole subject is one which with our present knowledge cannot be determined with mathematical accuracy.

F. J. Stimson (Penna.): The committee adopted the 6-in. tie, because it had a shorter life than the 7-in. I was looking at table one, which I understand shows the same life for the 6-in. white oak as for the 7-in. white oak.

Vice Chairman Burton: That is accounted for by the fact that the larger ties in general are used on roads of heavier traffic, and they are worn out.

W. R. Armstrong (O. S. L.): What application will this have to western roads that do not have any oak ties and do not use 6-inch ties?

The President: The idea is that the standard tie be used for testing, and not adopted as a standard tie for the roads.

J. L. Campbell (E. P. & S.): The ratio of the durability of the redwood ties, which go to make up the statement of these tables, as compared with the white oak appears to be surprisingly low on the basis of the quality of the redwood that used to be secured, but is not too low on the basis of some of the redwood ties that are secured in these days.

F. J. Angier (B. & O.): If you are basing the different ties on 6-in. by 8-in. white oak ties, giving a certain length of life, what kind of oak tie do you refer to—northern, southern, chestnut oak, i. e., what species of oak is it?

Vice Chairman Burton: That question is answered by the specification for white oak ties in last year's report. The proportion of sap and heart average is specified.

J. R. Leighty (Pres. Conference Committee): It is entirely possible that the plan the committee has outlined will establish what seems to me a very valuable factor for guiding the service-life of timber from the same species obtained in different parts of the country.

(The committee was dismissed with the thanks of the Association.)

Report of Special Committee on Stresses in Track

Discussion

Prof. A. N. Talbot (Chairman): This is only a progress report. The committee has some further work in charge, the results of which we hope to present in our next report.

C. H. Mottier (I. C.): Has the committee given any attention to the distribution of earth pressure or is that a field for further work.

THE PRINCIPAL WORK OF 1921 has been the reduction and correlation of the data of the field tests made in 1920. It will be recalled that tests were conducted on the tracks of the Illinois Central in Illinois, the Delaware, Lackawanna & Western in New Jersey, and the Atchison, Topeka & Santa Fe in New Mexico and Iowa. These tests were made on tangent and curved track, several different curvatures being used. A principal purpose of the tests was to find the effect of curvature of track upon the stresses in the rail (including lateral bending stresses) caused by locomotives of different types run at different speeds, as compared with the stresses developed in straight track. The time required for the reduction of the large amount of data accumulated in the tests has been much greater than was anticipated. The work has been carried on steadily, however, and good progress has been made. It is hoped that the committee will be able to present another report during this year. The results found indicate that information of value on stresses developed in curved track may be expected. Laboratory and field tests have also been conducted on rail joints and interesting results have been developed.

A. N. TALBOT (Univ. of Ill.), *Chairman*.

Chairman Talbot: The work on that has not gone very far. Tests in the laboratory were conducted which are applicable to the transmission of pressures through any granular material, and during the year some further effort has been made to find out whether there would be results of value following these tests in the laboratory on the way in which the pressures are transmitted in any granular material. So far as an attempt to do this in an embankment is concerned, I am afraid it would not result in anything of value unless it was done on such a greatly increased scale and under so many different conditions that the cost of the work would be entirely prohibitive.

(The committee was dismissed with the thanks of the Association.)

Report on Economics of Railway Labor

Considerable study was given to such data as could be acquired in order that conclusions might be drawn that would be of value in solving individual as well as general labor problems. The plans, submitted for insertion in the Manual, cover methods for obtaining railway labor and methods for training and educating employees in engineering and maintenance work, with definite conclusions. In studying the performance of maintenance of way work it was found that there was a remarkable uniformity in the output of gangs working under apparently widely varying conditions. Fundamental principles of good management are based on accurate units of measure.

C. E. Johnston
Chairman

C. E. Johnston is finishing his second year as chairman and his fourth year as a member of the committee. Mr. Johnston has been general manager of the Kansas City Southern for four years, prior to which he was chief engineer. He has taken a keen interest in maintenance of way labor problems for many years and has maintained a close contact with his forces. With his knowledge of the problems confronting the operating as well as the engineering officer, he has brought to the committee a breadth of vision and a realization of the magnitude of the labor problem, which has contributed much in a practical way to the work of the committee.

THE WORK OF THE COMMITTEE during the past year has, to a large extent, embraced a study of the data assembled during 1920, and the co-ordination of certain well-defined principles and practices in order to formulate conclusions that may be helpful to the railways in solving their individual as well as general labor problems. The committee recommended that the conclusions in Appendices A, B and C be approved and published in the Manual.

Committee. C. E. Johnston (K. C. S.), chairman; C. H. Stein (C. of N. J.), vice-chairman; W. J. Backes (N. Y., N. H. & H.), A. F. Blaess (I. C.), B. M. Cheney (C. B. & Q.), C. C. Cook (B. & O.), L. E. Dale (Penna.), John Evans (M. C.), R. H. Ford (C. R. I. & P.), L. C. Hartley (C. & E. I.), J. L. Haugh (U. P.), T. T. Irving (G. T.), R. E. Keough (C. P. R.), E. R. Lewis (M. C.), R. M. Pearce (P. & L. E.), W. H. Penfield (C. M. & St. P.), John C. Sesser (W. & L. E.), J. R. Sexton (Erie), Earl Stimson (B. & O.), R. C. White (M. P.).

Appendix A—Plans and Methods for Obtaining Railway Labor

The conclusions reached are as follows:

1. The problem of obtaining railway labor is broad and one deserving of careful consideration and organization.
2. In the interest of efficiency and economy maintenance employees should have the necessary mental and physical qualifications.
3. Best results may be obtained by providing some officer or some organization to supervise the selection and care of employees.
4. The living conditions of employees should be sanitary and comfortable. Food should be wholesome and of sufficient quantity, and work so regulated as not to be injurious to health.
5. Every encouragement, consistent with economy and efficiency, should be given to permanent employment throughout the year.
6. To avoid abuses, free transportation for railway labor should at all times be within the control of regularly delegated officers or employees.

RECOMMENDATIONS

That the conclusions reached by the committee with reference to methods of obtaining labor be adopted and embodied in the Manual.

Appendix B—Methods for Training and Educating Employees in Engineering and Maintenance Work

The study was considered in the following light

- (A) Training and educating engineers or employees in the Engineering Department in maintenance work; and,
- (B) Training and educating employees (other than engineers) in the Maintenance of Way Department, looking to greater economy and efficiency as well as promotion.

CONCLUSIONS ON SUBJECT A

1. Engineers trained in maintenance work are essential to an efficient organization.
2. The systematic training of young engineers for maintenance work should be carefully undertaken, and if in due course they do not display necessary qualifications to combine practical and technical training with ability to organize, direct and supervise work, they should not be retained in this branch of service.
3. Training of young engineers in maintenance work may best be accomplished by rotation in service.
4. It is essential to the training of young engineers that they familiarize themselves with the rules and practices of the operating and accounting departments.
5. In the interest of an efficient organization it is desirable to maintain a fixed minimum engineering force throughout the year.
6. It is desirable that there be practical co-operation between railway managements and schools and colleges offering technical courses for the better preparation of young engineers entering railway service.

CONCLUSIONS ON SUBJECT B

1. A thorough and systematic method of training employees in maintenance work is essential for efficiency and for promotion to advanced positions.
2. In promotion, merit and fitness should govern. Employees having necessary qualifications should be given every legitimate opportunity and encouragement to obtain necessary training and experience.
3. To accomplish best results, methods should be installed to promote individual effort and interest. Personal contact and personal interest shown on the part of the supervisory forces will go far to bring this about in all cases.
4. Employees should be encouraged to seek additional and more thorough education from outside sources on general principles of railway operation, such as through correspondence, night schools and periodicals on railway maintenance.

Appendix C—Standard Method for Performing Maintenance of Way Work for the Purpose of Establishing Units of Measure of Work Performed

(1) STANDARD METHODS AND SCHEDULES

Standard schedules, or units of performance, should be established with great care, as it is essential that they be correct and that the organization of the gang and method of doing the work are the best that can be worked out.

The standard performance, or 100 per cent efficiency, is the output of a first-class gang working at a speed which can be continuously maintained without physical harm to the men, following an approved method of doing the work and consisting of the most effective number of men for the kind of work to be done.

To arrive at the 100 per cent standard, first-class gangs are to be selected and detail time studies made of the performance, the time studies being divided into as many moves and as much detail as possible in order that the various studies may be compared in detail and a standard method worked out which will eliminate all unnecessary moves. If it appears that an improvement can be made, the organization of the gang and the method of doing the work should be altered and new studies made. When the most satisfactory organization and method has been found, a final detail study is made of the performance of the gang, and this is established as 100 per cent efficiency and issued as a standard schedule. In this way schedules may be established for all of the more important items of maintenance work.

(2) INSTRUCTIONS TO FOREMEN

To form an accurate comparison of the performance of the various gangs, uniformity in the reports submitted by the foremen is necessary. Owing to the difficulty some foremen have in making reports, it is desirable to have all forms used by them as simple as possible.

A daily report by the foreman of time spent and the work done by each gang is necessary. Where there is in use a form of daily time report, it can readily be made suitable for this purpose.

It is, however, necessary that the distribution shown on the daily time report be made with care, so that each item of work can be correctly graded. To secure this result detail instructions governing the distribution and reporting of the time charges are required.

(3) PLANNING AND DISPATCHING

To outline the order of the work and to assign it to the gangs to follow in sequence, so as to reduce the loss of time consumed by the unnecessary movement of the gangs from place to place, a system of planning and dispatching is needed.

Early in the year the program of work for the season should be decided upon and charted on a planning sheet, the proposed work being shown in yellow. Thereafter as the work progresses, monthly planning sheets are prepared; the completed work is shown in green and the monthly program in red. A few days before the close of the month the division engineer calls a meeting of the supervisors for the purpose of planning the work for the month. The work to be done, the location and the relative order in which it is to be undertaken is decided upon and shown in red on the chart. The quantity of work to be accomplished is computed from the standard schedules and the force allotted for the month. The direction in which the work is to progress, the date on which it is to be commenced and the calculated date of completion are to be shown on the chart.

The chart is prepared in duplicate, one copy to be retained by the division engineer and the other for the use of the supervisor. Upon his return to headquarters, the supervisor transmits the program to the foreman by means of work orders, giving him the program for the entire month, or any part of it, as he may see fit. For this purpose a work order, or dispatch book, is provided. The book is bound in stiffback, note-book form, and contains 100 perforated leaves.

The work order is made out in duplicate, the carbon copy being filed on the dispatch board, serving as a ready reference showing the work being done by each gang and where working. The work order states the kind, location, amount of work to be done and the time to be consumed. Upon completion of the work the foreman dates and signs the order and returns same to the supervisor. The foreman is given a work order for all work to be done. This, however, does not relieve him of the responsibility of making unforeseen and emergency repairs.

(4) FORM AND REPORTS

For the purpose of recording the performance of the gangs two forms are used—one, a Daily Record of Track Work Performance, the other, a Monthly Record of Track Work Efficiency.

The result of each day's work as sent in by each foreman on the Daily Time Report is posted on the Daily Record Sheet, and the efficiency per cent of the day computed.

At the close of the month the "Monthly Record of Track Work Efficiency" is compiled from the totals of the "Daily Record." The monthly record shows the percentage of efficiency made by every gang on each class of work, the average of every gang on all work, and the average for the supervisor's subdivision—in other words, a detailed and an accurate record of the actual performance of every gang as compared with the standard performance. The "Standard" divided by the "Actual" gives the efficiency per cent.

The supervisors should not be required to handle the details of the operation of this system, as it is impossible for them to do so in addition to their regular duties. Each supervisor should be given an assistant, who devotes his entire time to the study of standard schedules and methods, to the recording and study of performances, to the instruction of the foremen in regard to standard practice, and to checking in the field the reports of work done to guard against errors.

(5) FORCE DISTRIBUTION

Incidental to standard methods in maintenance of way work is the feature which will provide for an equitable distribution of the available track force to the various sections. A procedure which the committee suggests for consideration is the reduction of all features of track to the equivalent of one mile of first main track. A table of values, derived from actual costs extending over a period of years, for a main line division which was subject of special study, follows:

One mile of first main track equivalent to:

- 1.15 miles of second main track;
- 1.33 miles of third or fourth main track;
- 2.00 miles of branch line track;
- 2.00 miles of passing and throughfare track;
- 3.33 miles of yard tracks;
- 12 main track switches;
- 20 side track switches;
- 10 railroad crossings;
- 12 city street crossings;
- 25 to 50 county road crossings;
- ½ miles track pans;
- 4 miles ditches.

For the purpose of elasticity in use of the above form to meet the changing conditions of various elements of the track, it is suggested that the condition of the main elements per section be stated monthly and a "Condition Per Cent" of the whole section determined. This result applied to the equivalent mileage of the preceding form gives the equated mileage for the section. The ratio of the equated mileage of the section to the total equated mileage of the division determines the number of men to be allotted to that section from the total number of men allotted the division. A form for noting "Condition Per Cent" per section shows tentative relative values for certain elements of track as determined from an analysis of the records of previous years modified so as to meet the renewal program and other seasonal work.

This force distribution plan is a product of the application of standard methods and schedules, and is a development of the methodical direction and measurement of track work. It is described herein simply to indicate the form in which it may be developed.

RECOMMENDATIONS

(1) That the main feature of this plan, as described in—

Section 1—Standard Methods and Schedules.

Section 2—Instructions to Foremen.

Section 3—Planning and Dispatching.

Section 4—Forms and Reports; also some supplementary matter, designated as Exhibits "A" to "H," inclusive, be adopted and published in the Manual.

(2) That Section 5—Force Distribution be received as information.

Discussion

This report was presented by Chairman Johnston.

E. A. Frink (S. A. L.): I would like to inquire whether the committee in conclusion number 3 means that some one officer, or some one organization should be entrusted with the matter of selecting and supervising the employees of the entire system. If that is what it means, it is open to objection, because it does not seem to me a central organization could handle the question of obtaining track labor and mechanical repair men and bridge men so well as the organizations that are right on the ground.

Chairman Johnston: It means that an executive or general officer should be charged with the responsibility of looking after that important part of the business, centralizing it so that it may be run as an important part of the business. It means that this one man will be at the head of the organization which will bring about these results.

Maurice Coburn (Penna.): We have had many discussions about methods of selecting employees, and whether intelligence tests, such as those the army uses should be adopted by us. Has the committee discussed this to any extent?

Chairman Johnston: The committee has discussed that feature a great deal, and its conclusion with respect to it is that each line must handle its individual conditions.

W. D. Faucette (S. A. L.): I would like the chairman to explain how he understands the machinery of conclusion 3 would work. Suppose the officer who is to supervise the selection of men is 1,000 miles away from where the men are to select, tracklaying gangs, bridge gangs, crane gangs, clerical help, etc.

Chairman Johnston: This man would be head of a personnel department. He would not personally supervise the employment of men 1,000 miles away, but he

would get a record of their physical examination and other data. He could lay down the particular section of the line on which a certain number of men would be required during certain seasons of the year, and he could be in touch with the executive who shifts the men from place to place.

Mr. Frink: This subject is of sufficient importance to be gone into a little further than the committee has gone in recommendation No. 3. I agree that the matter should be supervised by a central authority, but if the committee would map out how that can be best accomplished it would be much more helpful.

Chairman Johnston: We feel this way about the matter—this is the result of some few years' study of this problem, and to cover it generally is about as far as the committee feels it should go.

C. E. Lindsay (N. Y. C.): The subject is one of great importance, not only for the present maintenance of way organizations but for such organizations in the future. The past four years has given emphasis to seniority rights. Therefore, it behooves us to lay the foundation now for a system which will allow only those to enter the service who give promise of development and adaptability to the service that is necessary.

Chairman Johnston: I move that the Conclusions on Subject A be adopted and published in the Manual. (Motion carried.)

Chairman Johnston: The next is report upon methods for training and educating employees in engineering and maintenance work.

J. R. W. Ambrose (Toronto Term.): I move the adoption and placing in the Manual.

J. A. Stocker (T. & O. C.): Concerning the remarks in regard to the treatment of the young engineer. It occurs to me that many of us who are at the heads of the engineering departments forget how we felt as we came on up the line, and do not do our full duty towards these men along the lines of training and encouragement. Most of us are standing between our organizations and a superior, the president, vice-president or general manager, who may not appreciate the conditions, may not realize the value of training competent engineers, and I wonder whether we always do what we should do to present the case of the organization to the superior who controls our actions, and incidentally the treatment of all of these men?

Mr. Lindsay: I have listened carefully to your opening address, Mr. Chairman, and I was impressed with it. When a young man puts his foot on the bottom of the ladder in entering the railroad service, he should or must look to the top. If the railroad will have a well-defined ladder for an engineer entering the service, it will save them much trouble and will give great benefit to the engineer.

W. H. Courtenay (L. & N.): If a young man is charged with any investigation and makes a report, and the report is exceptionally good, it has been my practice when reporting to my superior to submit the young man's report. It gives the management some idea of the ability of the men in the engineering department; and it is fair to the young man.

Prof. A. N. Talbot (U. of Ill.): I am particularly pleased with the committee's recommendation concerning the training and education of the younger men, and the necessity for them taking part in conferences and having more responsibility.

W. L. R. Haines (Penna.): I think that Mr. Courtenay's suggestion that the report of the young engineer should be forwarded needs a little supplementing. When the young engineer makes a report which for some reason cannot be followed, he should be advised in what

respect his report or recommendation is faulty. That is quite as much a part of his education as any other part of his education.

H. T. Porter (B. & L. E.): When a young man enters our employ, I generally have a little conversation with him and I say to him: "Now if at any time you find that you are not getting along as fast as you would like to, and you hear of an opportunity of doing better elsewhere, you can follow this matter up openly, because I promise you that I am ready to help you."

R. H. Ford (C. R. I. & P.): Departmentalism is one of the features which works to the detriment of the average young engineer. The engineer from his training is more of a technical man, and too frequently his superior officer holds him too long on those features of work. Unless the young engineer can have an opportunity to display his talents other than in the narrow lines of the engineering departments, he will not get very far.

The committee this year in discussing this subject gave this a great deal of consideration, and you will note in its conclusions that they also give a great deal of weight to other departments.

P. H. Winchester (N. Y. C.) (after reviewing the circumstances attending railway employment at some length concluded as follows.) If the committee had presented nothing else outside of its six conclusions, I think its work has been well spent. They embody ideas that have not been presented on this floor in all the years of the history of this association. Ideas as forcible, as pertinent to the upbuilding and training of engineers in the railroad service, have never been presented before.

(The motion to adopt the conclusions on subject A was carried.) (Chairman Johnston then read the conclusions on Subject B.)

Chairman Johnston: The committee recommends that these conclusions be adopted and published in the Manual.

(The motion was carried.)

(Earl Stimson (B. & O.) then presented the portion of the report covered in Appendix C and moved that action be taken by the meeting as outlined in the "Recommendations." The motion was carried and the committee excused.)

Hearings Before the Labor Board

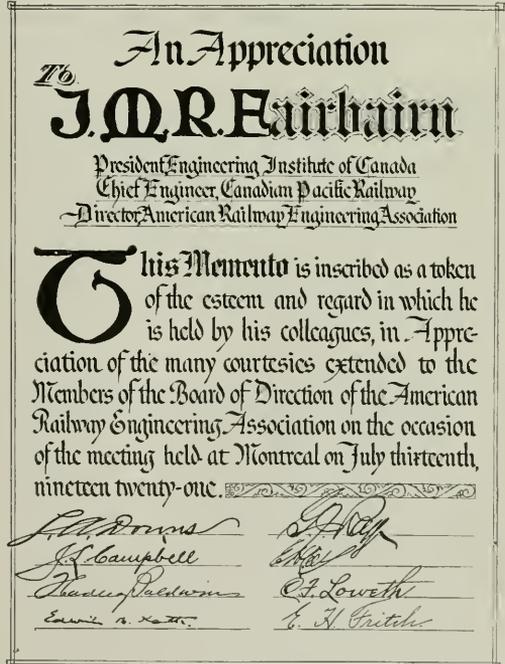

HEARINGS ON THE REQUESTS of practically all of the larger railroads of the country for reductions in the rates of pay of various classes of railway employees, including those in the maintenance of way department, are now being held before the Railroad Labor Board at its rooms in the Kesner building, Madison street and Wabash avenue. These hearings were opened on March 6, but because of a ruling made by the Board at that time, the discussion of rates of pay of maintenance of way workers will probably not begin until next week.

The opening statement of J. W. Higgins, executive secretary of the Association of Western Railways, however, contains an indication of the decreases in the pay of maintenance of way workers which are being sought at this time by the western railroads. Mr. Higgins, on behalf of 101 western carriers, at that time asked that authority be given these railroads to pay the prevailing rates in the territory employed for track and common labor in the maintenance of way department, now being paid from 28 to 40 cents per hour; for laborers around shops, now being paid from 31 to 43 cents per hour; for station and platform employees, now being paid from 37 to 49 cents per hour; and for common labor in station

forces now receiving from 28 to 40 cents per hour. Mr. Higgins also asked for authority to pay drawbridge tenders and assistants, now receiving \$75 a month, the prevailing rates in the territory in which they are employed. For mechanics in the maintenance of way and bridge and building departments, Mr. Higgins asked for a decrease of 5 cents per hour, the proposed new rate being 53 cents per hour, as compared with the present rate of 58 cents per hour. Other decreases requested by Mr. Higgins on behalf of the western carriers include mechanics' helpers, maintenance of way and bridge and building departments, from 44 cents to 36½ cents per hour; boiler room, water tenders and coal passers, from 35-40 cents to 31-42 cents per hour; signalmen, leading maintainers, gang foremen, etc., 78 to 72½ cents per hour; signalmen and signal maintainers, from 73 cents to 60-67½ cents per hour, and assistant signalmen and assistant signal maintainers, from 54-68 cents to 40-54 cents per hour.

Presentation to Mr. Fairbairn

AT THE INVITATION OF J. M. R. FAIRBAIRN, director of the American Railway Engineering Association and chief engineer of the Canadian Pacific, the Board of Direction of the A. R. E. A. held its mid-summer meeting at Montreal, Que., on July 13, at which

A Copy of the Expression of Appreciation

time those in attendance were the recipients of many courtesies extended by Mr. Fairbairn and his engineering colleagues of that city. At a later meeting of the Board of Direction in New York in November a beautifully engrossed expression of appreciation of this hospitality, autographed by those members of the Board who were present at the meeting, was presented to Mr. Fairbairn, a copy of which is shown herewith.

Signal Bridge, Chicago Terminal, Supported on Timbers as the Result of Recent Derailment.

Signal Section Concludes Its March Stated Meeting

Proposed Regulations Presented at Meeting for Government and Guidance of Signal Section

IMMEDIATELY AFTER THE OPENING of the session yesterday morning, Chairman F. B. Wiegand called on W. J. Eck, signal and electrical superintendent, Southern Ry., as chairman of the sub-committee of the Committee of Direction to report on the proposed regulations for the government and guidance of the Signal section which had been prepared by this sub-committee. In presenting these, Mr. Eck said that they are based largely on the constitution of the old Railway Signal Association and that the internal organization of the Signal section will be practically the same as that which was so successful with the R. S. A. during the existence of this body.

In the proposed regulations it is suggested that the membership of the Signal section shall consist of six classes—representative, representative of member, railway affiliated, affiliated, life and honorary. The regulations then defined the eligibility required for the various classes of members. The annual fee for railway affiliated members, which is to cover the cost of Advance Notices and Proceedings, shall be \$3; and for affiliated members, \$6; while representatives, representatives of members, life and honorary members will pay no fees. The officers of the Signal section shall consist of the chairman, a first vice-chairman, a second vice chairman and a secretary. These officers in addition to three directors are to be elected at each annual meeting from the representative and representative of members.

The Committee of Direction will consist of a chairman, first and second vice-chairmen and nine directors, together with the three latest past chairmen. The term of office for the chairman and vice-chairmen will be one year, while that of the directors will be three years. The regulations then specify the way in which the election of officers is to take place, and how the affairs of the Signal section are to be handled. The way in which the various committees are appointed and work to be assigned is specified. Meetings of the Signal section are to be held at a time and place to be fixed each

year by the Committee of Direction. The method in which business is to be handled is specified and the manner in which amendments must be presented is outlined.

Report on Economics

The Committee on Economics of Railway Signaling presented a progress report. This committee was appointed at the meeting of the Committee of Direction, Nov. 17, 1921. Three committee meetings have been held to organize the sub-committees, and the following committee assignments as indicated below have been made:

1. To determine the relative economic value of railway signaling as a means for protecting and directing the movement of trains and for reducing the cost of operation.

This will require the sub-committee to determine upon methods of procedure, roads to be studied, select the men to make the studies, compare results and submit a report covering the results of train operation as outlined in the assignment. On account of the large mileage of single track, there being over 200,000 miles in the United States, of which only 9 per cent is equipped with automatic block signals, the first studies of the committee should be confined to single track.

2. Study avoidable train delays, their causes and cost. Also report on delays at non-operated passing switches and the economic advantages of operating these switches by the installation of interlocking plants or low voltage switch machines.

3. Single track operation by signal indication, with particular reference to train orders, train order signals, train dispatching, and block signal systems.

Committee: B. T. Anderson (D. E. & W.), Chairman; F. L. Dodgson (Gen. Ry. Sig. Co.), W. M. Post (P. R. R.), F. W. Pfleging (C. P.), J. A. Peabody (C. & N. W.), H. M. Sperry (Publicity Representative), W. E. Boland (S. P.), A. R. Eugina (L. & N.), L. B. De Meritt (C. of Ga.), and G. S. Pfisterer (N. C. & St. L.)

Report of Committee on Electrical Testing

The new specifications for testing direct current relays present for the first time a complete set of directions and data on this subject. Definite limits of contact opening, armature end-play and air gap are set. Exact methods of testing the pick-up and drop-away are given for the direction of shop and field inspectors. In the past the railroads have in some cases depended too much on the personal experience of the inspectors to judge the proper limits to be used in checking relay operation, therefore these new specifications will answer a real need in the field by producing safer signal operation and therefore better train operation.

P. M. Gault
Chairman

P. M. Gault has been chairman of the committee for four years, and a member since 1915. His connection with the Railway Signal Association dates back to 1900, while he has a record of membership on two committees antedating his assignment to this one. Mr. Gault has seen service with two railroads. From 1906 to 1913 he was in the signal department of the Pennsylvania Lines, and since that year with the Illinois Central. In addition to a general field experience in signaling he served as pilot signal engineer and assistant engineer in the valuation department of the Illinois Central from 1917 to December, 1920, when he was made office engineer.

THE COMMITTEE SUBMITTED: 1. Instructions for inspecting and testing d.c. relays and indicators. 2. Method of testing first range d.c. bottom of mast, upper quadrant, motor signals, push clear type, in service. 3. Method of testing first range, upper quadrant, d.c. motor signals, top mast or bottom of mast types, having pull clear connections.

Instructions for Inspecting and Testing Direct Current Relays and Indicators.*

SHOP TESTS AND INSPECTIONS

1. **Coils.**—(a) At 20 degrees C., 68 degrees F., the percentage variation in the resistance of individual coils must not exceed: For 5 ohms, or less, plus or minus, 5 per cent. Above 5 ohms, plus or minus, 10 per cent.
- (b) When in place, coils must be fixed to prevent vibration.
2. **Binding Posts.**—(a) Right or left hand coil terminal, as specified, must be marked plus (+) and used for positive connections.
3. **Flexible Connections.**—(a) Flexible conductor connecting binding post and contact finger must be formed and attached so as not to affect the pickup or dropaway of the armature.
4. **Contacts.**—(a) Flexible part of fingers must be stiff enough to exert a contact pressure of not less than 1 oz. when armature is against the stop pin.
- (b) Finger contacts must meet contact surfaces squarely and simultaneously.
- (c) Finger contact must have a horizontal contact slide movement of not less than .010 in. against contact surfaces.
- (d) Metal support of the non-fusible contact element must be not less than 1/16 in. from the contact surface.
- (e) Opening between finger contact and back contact surface, with front contact just closed, must be not less than .020 in.
- (f) Front and polar contact openings for first range voltage must be not less than .050 in.
- (g) Front contact opening for second range voltage must be not less than .090 in.
- (h) Back contact opening for first range voltage with "working current or voltage" applied must be not less than .040 in.
- (i) The initial cleaned contact resistance when relay is energized at "working current or voltage" must not exceed the following: Metal to metal, .03 ohm per contact; metal to carbon, .18 ohm per contact; carbon to carbon, .40 ohm per contact.
5. **Armature End Play.**—(a) Armature end play must be not less than .010 in. and not more than .020 in.
6. **Air Gap.**—(a) Relays with adjustable stop pins. 1. A minimum working magnetic air gap (both neutral and polar) of .020 in. for a relay with two neutral contacts, and of .015 in. for a relay with three or four neutral contacts must be maintained by an adjustable hard drawn phosphor bronze stop pin so placed that its position relative to the cores will be fixed and so that when armature is picked up it will strike against the stop near the edge farthest from the bearings and midway between the cores. The physical working air gap (both neutral and

polar) must be not less than .018 in. for a relay with two neutral contacts and .013 in. for a relay with three or four neutral contacts. 2. A non-adjustable stop pin of phosphor bronze must be placed near each core near the edge farthest from the bearings protruding .010 in. from the under side of the core or the upper side of the armature for safety purposes.

(b) Relays without adjustable stop pins. The minimum working magnetic air gap (both neutral and polar) of .020 in. for a relay with two neutral contacts, and .015 in. for a relay with three or four neutral contacts must be maintained by two non-adjustable hard drawn phosphor bronze stop pins. The physical working air gap (both neutral and polar) must be not less than .018 in. for a relay with two neutral contacts and .013 in. for relay with three or four neutral contacts.

7. **Gaskets.**—(a) Defective gaskets must be replaced.
8. **Case.**—(a) Case must be so fixed as to insure a minimum clearance of 1/8 in. between it and movable parts.
9. **Meter Calibration.**—(a) Meters for shop use must be calibrated monthly.
10. **Repairing.**—(a) Test relay for defects, giving special attention to those noted on repair tag A. R. A. Signal section form 14. Make repairs and adjustments. Make and record test. A. R. A. Signal section form 10.

11. **Testing.**—(a) Pickup and dropaway must be determined as follows: 1. Initial charge. (a) Initial charge as specified on table No. 1, must be applied to coils for one minute.

2. Dropaway. (a) The initial charge must be applied to coils, then gradually reduced to the value at which front contacts open. This value is the dropaway with contact pressure.
3. Direct pickup. (a) Apply initial charge and take dropaway readings, then open circuit and again apply current to coils and gradually increase until front contact just closes. This value is direct pickup.
4. Reverse pickup. (a) Apply initial charge to coils in normal direction and decrease to zero. Reverse polarity and gradually increase energy to value at which front contact closes.
5. Direct working current or voltage. (a) Apply initial charge to coils in normal direction and decrease to zero. Gradually increase energy in same direction to value required to bring armature against stop pin.
6. Reverse working current or voltage. (a) Apply initial charge to coils in normal direction and decrease to zero. Reverse polarity and gradually increase energy to value required to bring armature against stop pin.
7. Polar pickup. (a) Without current in either direction, polarized armature with or without contact pressure must not move to the position opposite the last position operated. The current or voltage required to reverse the position of the polarized armature will be the polarized pickup.
8. Polar working current or voltage. (a) The value required to bring polar armature against stop pin in either operating position is the polar working current or voltage.
- (b) Relay operating requirements must be in accordance with Table 1.
- (c) In taking current readings the voltmeter should always be disconnected. In taking voltage readings the voltmeter should be directly across the coils of the instruments.
- (d) Tests as required by A. R. A. Signal section form 11 and

*The term "relay" where used in these instructions includes indicators other than switch indicators.

A R. V. Signal section forms 12 and 13 must be made and recorded at time relay is tested.

(e) Front, back and polar contacts of relays must be tested for contact resistance after case is in place and before relay is sealed.

(f) Insulation tests must be made between binding posts and relay tops. The insulation resistance must be not less than 1 meg-ohm.

(g) In determining the resistance of coils or contacts by ammeter and voltmeter method, simultaneous reading should be taken of current and voltage.

12. **Inspection.**—(a) Determine by actual operation that relay has a positive dropaway and relay contacts open without retardation of movement due to friction or external force.

(b) Before the case is placed, subject the relay to air blast to remove any foreign matter, then check to see that all parts are in proper position and in good condition.

13. **Sealing.**—(a) Relay case must be sealed.

14. **Final Test.**—(a) After relay is sealed, final dropaway, pick-up and working current test should be made. The values obtained should not vary more than 2 per cent from those of the previous test.

15. **Shipping.**—(a) Relays must be tested and must meet shop requirements before shipment.

(b) Each relay must be put in a separate carton or suitably wrapped before being placed in packing box.

FIELD TESTS AND INSPECTIONS

16. **Meter Calibration.**—(a) Meters must be calibrated before each cycle of test and as often as necessary for field use.

17. **Testing.**—(a) Test required by Sections 11-(f) and 12-(a) and A. R. A. Signal section form 11 must be made annually.

18. **Inspection.**—(a) Relays must meet shop requirements when placed in service, except in emergency, when relays meeting field requirements may be used.

(b) It must be determined by observation that sufficient front, back and polar contact opening exists.

(c) Determine by observing operation of relay, that sufficient clearance exists between case and movable parts.

(d) Parts enclosed must be free from foreign matter, in proper position and in good condition.

(e) Relays not meeting field requirements must be taken from service as promptly as possible.

19. **Repairing.**—(a) Emergency repairs and adjustment to insure positive operation of relay, for temporary use in emergency, may be made in the field by an authorized relay inspector.

20. **Recording.**—(a) Relays must be identified by serial number, which must be recorded. Manufacturer's serial number must be used if available.

(b) Inspectors must re-mark indistinct serial numbers.

(c) Relays that have illegible or no serial number must be assigned serial number, preceded by a letter. The letter to be used will be assigned by

(d) Inspectors must immediately record field readings on A. R. A. Signal section form 11, which, when filled, must be forwarded to

(e) Field readings must be transferred weekly from A. R. A. Signal section form 11 to A. R. A. Signal section form 10. One A. R. A. Signal section form 10 must be used for each relay.

The committee recommended that the instructions for inspecting and testing direct current relays and indicators be approved for presentation at the annual meeting.

Committee: P. M. Gault (I. C.), chairman; I. S. Gensheimer (P. R. R.), vice chairman; Harry Combs (I. F. & W.), Caleb Drake (C. & N. W.), C. I. Fairhart (A. & A.), Thos. Holt (C. U. D. Co.), I. E. Ireland (C. I. & L.), Malcolm McIntyre (M. C.), I. D. Moorchart (C. M. & St. P.), J. P. Miller (Southern), T. J. O'Mara (N. Y. C.), C. O. Seifert (B. & O.), E. B. Smith (N. Y. C.), I. L. Whitcomb (N. Y. C.), G. H. Person (B. R. & P.).

Discussion

A. R. Fugina (I. & N.): The relay specification does not provide for a non-adjustable pin.

E. B. Smith (N. Y. C.): There are relays in service with adjustable top pins and a lot with non-adjustable.

E. T. Ambach (B. & O.): What did the committee have in mind when they require a meter calibration to be made monthly? What kind of calibration do you expect to make a shop calibration or a manufacturers' calibration?

P. M. Gault (Chairman): It was the intention of the committee that that would mean that the meter should be compared with some other meter that is known to be correct.

Mr. Ambach: Referring to Table No. 1 the initial charge is shown as four times the direct pick-up. Now, under the shop requirements, what is this direct pick-up, with or without contact pressure? If the recommendations of Committee VII, which were accepted yesterday on operating characteristics of relays, are to be used in this particular instance it would mean a saturation of 393 mils against the recommendation of Committee VII of 450 mils. On the 2-ohm relay it is essential that you have 450 mils in order to get contact pressure on your fingers.

J. S. Gensheimer (Penna.): The initial charge in checking most of the relays against the present relay specification works out very well on four times the direct pick-up. This was checked with the manufacturers when this table was tentatively agreed upon.

S. M. Day (Gen. Ry. Sig. Co.): In 8-G, it states that simultaneous readings should be taken of current and voltage. If you take a simultaneous reading of current and voltage you are going to be led into error because your ammeter will indicate the current by the volt.

Chairman Gault: The committee will consider Mr. Day's suggestion.

G. K. Thomas (A. T. & S. F.): If the committee would make a definite recommendation as to the box in which the relays should be shipped, how it should be packed and going into details of that kind, it would help.

Mr. Gensheimer: The committee did go into that and found that several methods were suitable but we did not feel we should pick any one of those methods as the only method of shipping a relay.

Mr. Fugina: Referring to Table 1, the dropaway for motor contact states, "not less than 65 per cent of the original marking nor less than 35 per cent of pick-up—" I wonder why we have two values? I think the 70 per cent of the original marking is the proper value to use.

Mr. Gensheimer: To make that more accurate, it should say 70 per cent and the other one, I agree, it really should be 33 1/3. I worked it out that 33 1/3 and 70 will agree. The object of specifying the two was so that your direct pick-up would not increase on your drop-away figures.

Mr. Fugina: Will the committee take into consideration then to use the value of 33?

Chairman Gault: The committee will consider that. Mr. Fugina: Under 5-B of the Method of Testing First Range, Upper Quadrant, D. C. Motor Signals, it seems to me the wording "45 deg. position" could be eliminated. I do not believe you could make a test without having a 45-deg. position.

Chairman Gault: The committee will consider that.

Mr. Fugina: The specifications for the push-clear type are identical with those of the pull-clear type, except for a few tests. These two specifications could be combined by merely adding to the push-clear specification a clause at the end, that the following tests shall be made for the pull-clear type, and one paragraph in addition to 2-B, 2-E, 3-C and 4. Outside of this section, the two specifications are exactly identical.

Chairman Gault: The committee will consider the question of combining these instructions in one instruction.

(The instructions were approved for presentation at the annual meeting after which the committee was dismissed with the thanks of the Signal section.)

Report of Committee on Valuation

The average service life in years of the important units of the different types of signal installations is one of the most important questions occupying the attention of this committee. There has been a debated question between railroad and government forces from the time valuation work first started, as it is one on which little authentic information was to be had at that time. The committee presents the results of several years' study of the average service life of materials. A uniform method of reporting the materials used and the labor performed in construction has been a subject for careful study and suggested forms have been prepared.

J. M. Carley
Chairman

J. M. Carley was appointed chairman in December, 1918, when the committee was formed. He entered the service of the Lehigh Valley as a helper and telegraph operator in 1892, resigning in November, 1899, to go with the Buffalo, Rochester & Pittsburgh as a station agent. Two years later he went with the New York Central as a relief signalman. He served as one of the inspectors making a tentative valuation of signal equipment in 1911. Later Mr. Carley was transferred to the signal engineer's office at Albany, N. Y. In May, 1917, he accepted a position as signal estimator on the Boston & Albany, and is still engaged in valuation work.

THE COMMITTEE submitted for consideration reports on the average service life in years of the important units of the different types of signal installations and forms for reporting the distribution of signal labor and material charges and credits. The committee recommended that these reports be approved for presentation at the annual meeting.

Average Service Life of Signal Units (Obsolescence not considered)

Unit.	Service Life	
	Min.	Max.
Air compressor, steam.....	30	50
Air compressor, internal combustion.....	20	40
Air compressor, electric motor.....	40	60
Arms, cross, wood untreated.....	10	25
Arms, cross, treated.....	15	40
Arresters, lightning, over 600 V.....	20	50
Arresters, lightning, under 600 V.....	15	40
Bars, detector complete.....	10	20
Bars, deflecting.....	15	35
Batteries, portable storage.....	5	14
Batteries, stationary storage.....	6	25
Bells and buzzers.....	20	50
Bonding.....	5	20
Bonds, impedance.....	30	75
Brackets, signal.....	25	75
Bridges, signal.....	25	75
Cable, aerial, braided.....	15	40
Cable, aerial, lead sheath.....	25	60
Cable, aerial, steel sheath.....	20	50
Cable, submarine, armored.....	30	60
Cable, underground, braided.....	15	25
Cable, underground, lead sheath.....	25	50
Cable, underground, steel sheath.....	20	40
Carriers, pipe.....	20	50
Carriers, wire.....	20	50
Compensators.....	10	30
Conduit, clay.....	50	100
Conduit, concrete.....	50	100
Conduit, fibre.....	7	15
Conduit, fibre in concrete.....	25	50
Conduit, iron.....	20	50
Conduit, wood, untreated.....	7	15
Conduit, wood, treated.....	15	30
Concrete.....	50	100
Controllers, switch circuit.....	10	25
Controllers, all other circuit.....	25	50
Couplers, bridge (pipe and wire).....	15	35
Cranks.....	10	30
Engines, internal combustion.....	20	40
Engines, steam.....	30	50
Foundations, concrete.....	50	100
Foundations, iron.....	20	40
Foundations, wood.....	10	25
Gates, highway crossing, electric.....	20	40
Gates, highway crossing, mechanical.....	20	40

Gates, highway crossing, pneumatic.....	20	40
Gates, railroad crossing, electric.....	20	40
Gates, railroad crossing, mechanical.....	20	40
Gates, railroad crossing, pneumatic.....	20	40
Generators, electric.....	30	75
Housings, concrete.....	100

Wire, rubber-covered, copper, 12 A.W.G. and larger...	7	30
Wire, weatherproof	15	30
Wire, galvanized messenger, stranded.....	10	60
Wire, galvanized guy, stranded.....	10	40

Forms for Reporting Distribution of Signal Labor and Material Charges and Credits

Forms have been prepared to meet the requirements of Valuation Order No. 3 of the Interstate Commerce Commission, and, in addition, to provide for the allocation of costs, for estimating and statistical purposes, to the composite units shown to be printed on the back thereof. The use of the word "month" is merely as an example and the committee believes that the form may be used as a progressive or final statement or for such period as the supervising officer may elect, with practically the same results.

Where the word "Account" appears it will be understood to mean "Road and Equipment" (R. & E.), "Profit and Loss" (P. & L.), and Operation Expense Accounts, as shown in the classification of accounts for steam railroads, issued by the Interstate Commerce Commission, effective July 1, 1914.

Committee: J. M. Carley (B. & A.), chairman; C. Homewood (P. R. R.), vice-chairman; E. T. Ambach (B. & O.), B. T. An-

derston (D. L. & W.), R. B. Arnold (C. & N. W.), G. E. Beck (N. Y. C.), P. M. Gault (I. C.), C. O. Glenwright (P. R. R.), W. J. Koerber (L. V.), G. W. Kydd (B. & O.), S. W. Law (N. P.), J. W. MacCormack (K. C. Term.), J. P. Robinson (S. P.), C. H. Wiegand (A. C. L.), J. P. Zahnen (C. R. I. & P.).

Discussion

Mr. Stevens: The report states "obsolescence not considered." Obsolescence is a big thing. It seems to be the opinion of some public utility people that some value might be arrived at for obsolescence to take care of the actual value of stuff in service.

J. M. Carley (B. & A.): The committee has never taken any action on the subject of obsolescence.

A. H. Rudd (Penna.): I would like to ask if the committee took into consideration at all wear and tear in connection with this minimum life, or if they arrive at this in some other way.

Chairman Carley: This table was based on minimum ages of apparatus being used in the service and operated continuously, with maintenance but without any accidents, or anything except normal and natural wear.

(Sections 4 and 5 were approved for presentation at the annual meeting after some recommended changes in the column heading of the latter. This committee was then dismissed with the thanks of the Signal section.)

Report of Committee on D. C. Track Circuits

A discussion of the factors involved in the standards of safety for track circuits is one subject of importance presented by this committee. The track circuit is the foundation on which modern signal practice is based and many have had an erroneous idea that because of its apparent simplicity there are no complex characteristics to be considered. In establishing track circuit standards, factors such as ballast and rail resistance, train shunt resistance, switch fouling resistance, switch box shunt resistance, insulated joint and switch rod resistance, battery, relay characteristics and limiting resistance between battery and track must be considered.

A. R. Fugina
Chairman

A. R. Fugina has been the chairman of this committee since its organization two years ago. The need for such a committee was shown by the research work inaugurated by Mr. Fugina on his lines, which made it apparent that there were many problems to be solved. His appointment as chairman is in recognition of this work. Mr. Fugina entered railroad service in engineering location work on the Chicago & North Western in western Minnesota early in 1890. In July, 1907, he was transferred to the signal department of this road as assistant engineer. In December, 1910, he was appointed signal engineer of the Louisville & Nashville

THE FOLLOWING FACTORS involved in the safety of track circuits must be taken into consideration in the study of the track circuit and each has a vital bearing in establishing track circuit standards: Ballast resistance, rail resistance, train shunt resistance, switch fouling resistance, switch box shunt resistance, insulated joint and insulated switch rod resistance, battery, characteristics of the relay, and the limiting resistance between the battery and track.

Values for the various factors must be such as will prove practicable, and these must correlate properly with each other. The value of one is dependent upon the value of the others, and therefore in order to fix upon a standard value for any one of the factors, we should know what effect such value will have on the other factors.

The effect of the train shunt and the limiting resistance between battery and track in a typical track circuit, assuming different conditions for the battery, ballast and the relay. The fundamental conditions should be such that the relay will open when the track is shunted, either by a train or an opened switch, and will pick up again

when the shunt is removed. Assume a length of track circuit, 3,000 ft.; a 4 ohm 4 point track relay with R. S. A. pick-up; .078 amp. and drop-away .037; 3 cells caustic soda battery connected in multiple; gravel ballast reasonably well cleared from rails, and the resistance of the rails and bond wires 0.3 ohms. The limiting resistance between battery and rails, including the connecting wires, 2 ohm, this being within the R. S. A. recommended limit.

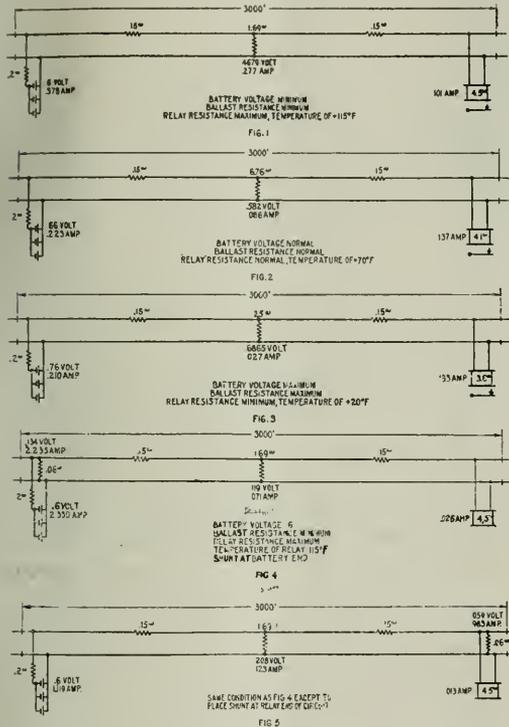

With these conditions we want to be assured that the relay will open when the track is shunted, and that the relay will again close when the shunt is removed.

It has been learned from experience that the adverse condition of battery, ballast and relay, as affecting the pick up of the relay, are present at the beginning of a rain on a hot summer day after a dry spell, with the battery nearing exhaustion and the resistance of the coils of the relay higher than normal, due to high temperature. Under these conditions the current and voltage readings of the circuit will approximate those shown in Fig. 1.

In Fig. 1, as well as in all of the following figures, the resistance of the wire connections between relay and rail

is assumed to be .1 ohm, and this is included in the figure of 4.5 ohms for the relay. When all conditions of the circuit are normal, the current and voltage readings will approximate those shown in Fig. 2.

When all conditions of the circuit are favorable, for example, in the winter time with the ballast frozen, just after the battery has been renewed, the current and voltage readings will approximate those shown in Fig. 3.

Diagrams of Track Circuit Tests—Figs. 1 to 5

It will be noted that under the adverse conditions we have .101 amp. flowing through the relay as compared with .183 amp. under the most favorable conditions. With the adverse conditions the relay will pick up with sufficient slide on the contacts to properly close the line circuits. Let us now see if the relay will drop away when the track is shunted.

Under our assumption, the limiting resistance between the battery and the track is within the limit set by the R. S. A. standard for direct current track circuit safety. This standard is based on a train shunt of .06 ohm, which figure is used for the shunt in checking the circuit. Conditions are assumed for the circuit and battery as shown in Fig. 1. We will first place the .06 ohm shunt across the rails at the battery end of the circuit as indicated in Fig. 4, and then at the relay end, as shown in Fig. 5.

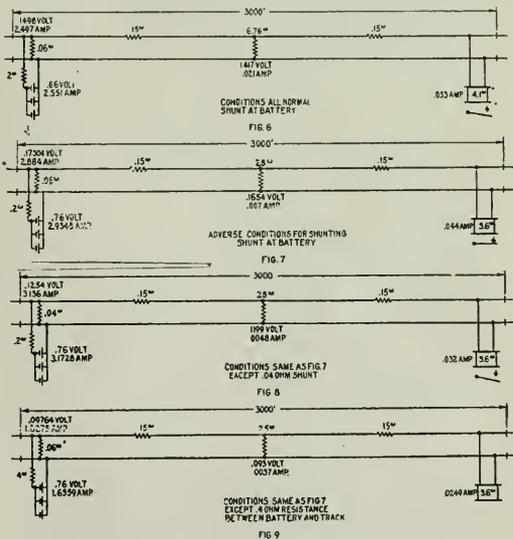

From Figs. 4 and 5 it will be noted that with the shunt at the battery end, the current flow through the relay is .026 amp., while with the shunt at the relay end the current flow through the relay is .013 amp. It is evident, therefore, that the shunt at the battery end is the more adverse as regards the shunting of the relay. In the fol-

lowing we will assume that the shunt will always be located at the battery end of the track circuit.

We will now assume conditions for the circuit and battery as shown in Fig. 2, which represents the normal condition, and will place a .06 ohm shunt across the rails. The results are illustrated in Fig. 6. Under Fig. 7 we assume the same conditions for the circuit and battery as shown in Fig. 3, which represents the adverse condition for shunting of the relay, with a .06 ohm shunt across the rails.

Therefore, under the three assumed conditions as shown in Figs. 4, 6 and 7, the following current flows respectively through the relay—.026 amp., .033 amp. and .044 amp. Under the last conditions with a .06 ohm shunt connected across the rails at the battery, there is a current flow of .044 amp. through the relay, whereas the R. S. A. drop-away value for the relay is .037 amp. The limiting resistance, shunt and battery voltage are within the standards as prescribed by the R. S. A., and yet there is enough current flowing through the relay to keep it from opening.

Obviously the R. S. A. standards should be adjusted, and apparently there are two ways to do it, namely: by reducing the resistance of the train shunt, or by increasing the resistance between the battery and track. The effect of using a .04 ohm train shunt instead of one of .06

Tests of D. C. Track Circuits—Figs. 6 to 9

ohm, is shown in Fig. 8, in which all conditions except the shunt are the same as given in Fig. 7.

Reducing the shunt from .06 ohm to .04 ohm reduces the current flow through the relay from .044 amp. to .032 amp. If a .02 ohm shunt is used, the current flow will be only .0175 amp. If instead of reducing the resistance of the train shunt we increase the limiting resistance between the battery and track from .2 ohm to .4 ohm we shall have the results shown in Fig. 9.

The increase of the limiting resistance from .2 to .4 ohm reduces the current flow through the relay from .044 amp. to .0249 amp. If a .6 ohm limiting resistance is used, the current flow through the relay will be reduced to .0174 amp.

In the foregoing the rail resistance has been considered

as a constant. To vary the rail resistance will, of course, give still different results.

D. C. Track Circuit Tests for Rail and Ballast Resistance

The formula for ballast resistance as printed in Committee IV's report on page 27 of the March, 1919, advance notice is in error. The formulae for rail and ballast resistance as printed in Committee IV's report on pages A-52 and A-53 of the 1919 proceedings are correct. The formula for ballast resistance as printed in Committee V's report on page A-159 of 1920 proceedings is in error, while the formula on page 14 of the 1920 letter ballot covering the report of Committee V is correct.

The committee has prepared a form covering instructions for making measurements and computations for rail and ballast resistance and for recording the same, which it proposes to use for collecting data concerning rail and ballast resistance.

The committee recommends that the form for direct current track circuit rail and ballast resistance report be approved for presentation at the annual meeting, being meanwhile referred to Committee XIII, Electrical Testing.

Committee: A. R. Fugina (L. & N.), chairman; R. M. Phinney (C. & N. W.), vice-chairman; B. T. Anderson (D. L. & W.), H. H. Appleton (P. R. R.), F. W. Bender (C. R. R. N. J.), Dwight Byers (N. Y. C.), E. B. DeMeritt (C. of Ga.), R. E. Green (M. C.), H. G. Morgan (L. C.), D. S. Rice (L. V.), K. W. Spain (R. I.), W. S. Storms (Eric), J. B. Weigel (L. & N.), L. S. Werthmüller (Mo. Pac.), A. J. Yarrell (C. I. & L.).

Discussion

A. R. Fugina (Chairman): The committee presents the report for discussion more as a thesis, discussing the factors involved in the standards of safety of track circuits. This is merely submitted to the association as information.

F. L. Dodgson (Gen. Ry. Sig. Co.): I think you know what the 0.06-ohm shunt meant, and how it was arrived at. The committee has shown quite conclusively that if the shunt on the relay is 0.06 ohm, under certain conditions the relays will not be properly shunted. This value of 0.06 ohm, when it is applied to a single car, even on a running line, has a very large factor of safety, probably a factor of safety greater than 10; but when it is applied to a shunt on a side track or a shunt track, the factor of safety in some cases may be zero, in fact, really no shunt at all. I would suggest to the committee that in their further consideration of this subject they divide track circuits which have switch shunts in them or switches, and prepare a table of limiting resistances for track circuits which do not have switches, and which are always in the running rail, that is, the running rail is clean, and another table for track circuits in which there are switches and practically

shunt tracks, and then consider what is going to happen in the shunt circuits under rusted rail conditions.

Chairman Fugina: The committee expects to present various tables of limiting resistances for various train shunts. I doubt very much whether we are going to be able to select a train shunt that will do for the side track fouling section, and will do for the main line. What we do attempt is to present a series of resistances that may be used on main line track, varying from 0.01 to 0.06 ohm, and then the engineer may take the table which he believes his standard will permit him to operate on. The present table of limiting resistances that is used will not hold good with the 0.06 train shunt.

A. J. Kelly (C. C. C. & St. L.): Where a 0.6-volt battery is used with a 2-ohm relay, the minimum allowable resistance, which is 0.3, is wrong. It is possible that you would have 0.5 volt at your relay. Now, transferring a 2-volt battery onto that same circuit, using the minimum allowable resistance, which is 1.1, you might have 2 volts or 5 mils flowing through. If it is not safe with the lower voltage battery, why is it with the 2-volt?

Chairman Fugina: Generally it will be found that the circuit will be safer with the higher voltage battery, because it is possible to cut in more limiting resistance between the battery and the track.

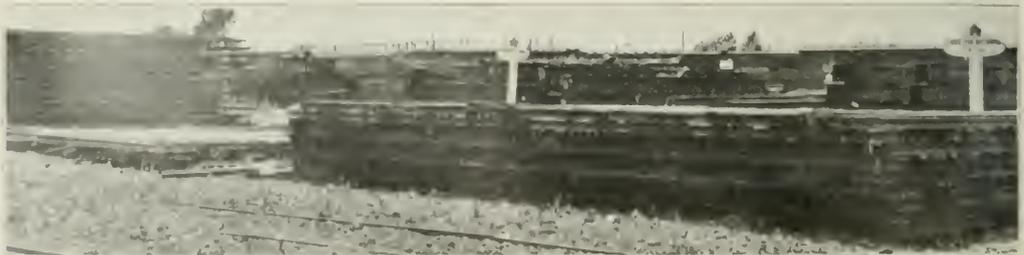

Mr. Kelly: Following the limiting resistance by the R. S. A., what is the guide to the maintainer? The maintainer is told that he may reduce his resistance to 1.1 ohms with a 2-volt battery and a 2-ohm relay, but by doing that it is possible he might get 500 mils through his relay.

Mr. Fugina: I stated before that the present table of limiting resistances is not correct for all values. With the 0.06 train shunt, the table of limiting resistance is all right. If the train shunt is different from that it will not work out.

S. M. Day (Gen. Ry. Sig. Co.): There are two ways, apparently, of adjusting the present R. S. A. standards, namely, by reducing the resistance in the train shunt, or by increasing the resistance between the battery and the track. That is perfectly correct, as far as it goes, but there are other ways still. One of the most important of them is to use a more efficient relay; in other words, if you use a relay which has a lower drop-away, cutting your minimum drop-away of a relay in service to a specified point which is higher than what it is now, a track circuit can be obtained which will give a much better characteristic.

Chairman Fugina: The committee appreciates that, but we have not a more efficient relay available; although we hope that we are going to get it.

(The report of the committee was approved for presentation at the annual meeting, after which the committee was dismissed with the thanks of the Signal section.)

Stock Piles of Relayer Rails

Report of Committee on Mechanical Interlocking

Concrete trunking, capping and supports are being used more extensively than formerly and the committee provided specifications covering the character of materials to be used and the workmanship necessary for a uniform product. The compensation of a pipe line is important, as the proper working of the operated unit depends on expansion and contraction being neutralized. The committee accordingly presented specifications and compensation charts pertaining to this work. The specifications for mechanical interlocking are brought up to date with the presentation of a revised specification in which is incorporated a requisite sheet covering construction.

Charles J. Kelloway
Chairman

Charles J. Kelloway is completing his twenty-fourth year as chairman of the committee, having held this office since the committee was organized, with the exception of the one year, 1920, during which he was chairman of the Signal division, A. R. A. As signal engineer of the Atlantic Coast Line he has had occasion to install and test out much of the mechanical interlocking apparatus recommended by the committee. Mr. Kelloway has also been in charge of the installation of the signaling and interlocking of the Jacksonville Terminal Company during the past three years. His untiring efforts have contributed largely to the excellent specifications produced.

THE COMMITTEE SUBMITTED specifications for concrete trunking, and unit specifications for universal compensation of pipe lines, together with drawings 1536; instructions for locating compensators, and compensating cranks 1537; compensation chart and 1538, crank chart, and revised specifications and requisite sheet for mechanical interlocking.

Specification for Concrete Trunking, Capping and Supports

(1) Purpose, (2) Drawings, (3) Material and Workmanship, are standard sections.

(4) Reinforcement.—(a) Reinforcing material shall be $\frac{3}{4}$ in. deformed square rod or its equivalent.

(5) Cement.—(a) The cement shall comply with specifications of the purchaser.

(6) Sand.—(a) Sand shall be clean, sharp and coarse. It shall be free from sticks and other foreign material, but may contain clay or loam not to exceed 5 per cent.

(7) Water.—(a) Water should be clean, fresh (not salt) and free from sewage or other impurities detrimental to the concrete.

(8) Stone or Gravel.—(a) Stone or gravel shall be sound, hard and durable and shall be clean and free from shale, dust, loam, clay or any foreign substances. If necessary to meet these requirements, broken stone shall be screened and washed. The size of pieces shall range from a minimum of $\frac{1}{4}$ in. to a maximum of $\frac{3}{4}$ in.

(9) Proportions.—(a) The concrete shall be mixed in the proportion of 1 part of cement to not more than 2 parts of sand and 2 parts of stone or gravel, measured, separately.

(10) Mixing.—(a) The mixing shall be done in a machine of the batch type.

(b) Each batch to be mixed not less than 1 minute nor more than $\frac{1}{2}$ mins.

(11) Consistency.—(a) The material shall be wet mixed and of such consistency as to cause it to flow into a form and about the metal reinforcements without permitting a separation of the coarse aggregates from the mortar, while the concrete is being conveyed from the place of mixing to the forms.

(12) Placing of Concrete.—(a) The concrete shall be spaded along each surface of the form as it is deposited, to insure the smoothest possible finish. Every section shall be completely filled before any portion of the concrete has set.

(b) Concrete that has partially set or has been mixed 30 mins. shall not be used.

(13) Temperature.—(a) Concrete shall not be mixed or placed when the temperature is below 40 degrees F.

(14) Forms.—(a) The forms shall be substantially built in such manner that the product shall conform accurately to the measurements as specified on drawings. The forms shall be water-tight and shall be coated with oil or grease to prevent adhesion to the concrete. The oil or grease shall be of such character that it will not discolor the concrete.

(15) Removing Forms.—(a) Forms shall not be removed until the concrete has attained a set sufficiently hard to prevent its adhering to the forms when they are removed.

(16) Tests, (a), (b), (c) and (d) are according to standard sections.

(f) Material shall be cured not less than 28 days before testing. Trunking shall be supported for a distance of 3 in. at each end. Where side walls are 5 in. high, outside dimensions, it shall support a weight of 500 lb., concentrated within 12 in. in the center, without showing cracks. Where side walls are 6 $\frac{1}{2}$ in. high, outside measurement, it shall support a weight of 800 lb., concentrated within 12 in. in the center, without showing cracks.

(17) Finishing.—(a) Before concrete is fully set, all sharp edges shall be removed.

(18) Outlets.—(a) Outlets for branch leads, when specified, shall be provided when pouring concrete, using blocks of the size required to admit branch leads.

(19) Finished Product.—(a) Trunking and capping shall be true to form and have a uniform thickness throughout not varying in thickness from drawings more than $\frac{1}{8}$ in.

(20) Curing.—(a) Upon removal of the forms the finished product shall be protected from the direct rays of the sun and wind for a period of 48 hr. and shall be kept wet by sprinkling for at least 7 days. The temperature of the air in which the curing is done shall be maintained above 40 degrees F., 4.44 degrees C., but artificial heat exceeding 110 degrees F. shall not be used.

(21) Inspection, (22) Packing, (23) Marking, and (24) Warranty, are standard sections.

The committee recommended that the specifications for concrete trunking, capping and supports be approved for presentation at the annual meeting for submission to letter ballot for inclusion in the Manual.

Specification for Universal Compensation of Pipe Line

(1) Purpose.—(a) The purpose of this specification is to provide for universal compensation of pipe line.

(2) Details of Work.—(a) Details of work are to be as herein described.

(3) General.—(a) Compensators shall be in accordance with R. S. A. 1013, 1014 and 1231, unless otherwise specified on requisite sheet.

(b) Drawing 1536, instructions for locating compensators and compensating cranks, shall govern: 1. Location of compensators and compensating cranks. 2. Reduction of stroke of cranks (note 1). 3. Determination of distance "B" (note 2).

(c) Ln connecting pipe to compensator, be governed by compensation chart 1537.

(d) In territory where temperature variation is less than 120 degrees F., compensation shall be provided for each pipe line as follows:

1. For switches, movable frogs and point details with 10x13-in. compensator cranks.

For 8 $\frac{3}{4}$ -in. stroke, lengths 40 to 800 ft.

For 9 $\frac{3}{4}$ -in. stroke, lengths 40 to 600 ft.

2. For facing joint locks, switch and lock movements, lift details and signals, with 10x13-in. compensator cranks.

For 8 $\frac{3}{4}$ -in. stroke, lengths 80 to 800 ft.

For 9 $\frac{3}{4}$ -in. stroke, lengths 80 to 900 ft.

3. For switches, movable frogs and point details with 10x16-

in compensator cranks, unless otherwise specified on requisite sheet

For 8 1/4-in. stroke, lengths 40 to 1100 ft.

For 9 3/4-in. stroke, lengths 40 to 900 ft.

4. For facing point locks, switch and lock movements, lift derails and signals, with 10x16-in. compensator cranks, unless otherwise specified on requisite sheet.

For 8 1/4-in. stroke, lengths 80 to 1100 ft.

For 9 3/4-in. stroke, lengths 880 to 900 ft.

(c) In territory where the temperature variation is more than 120 degrees F., compensation shall be provided for each pipe line as follows:

(i) In territory where the temperature variation is more than 120 degrees F., compensation shall be provided for each pipe line as follows:

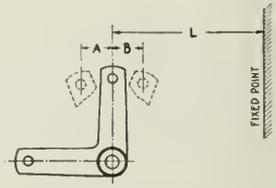

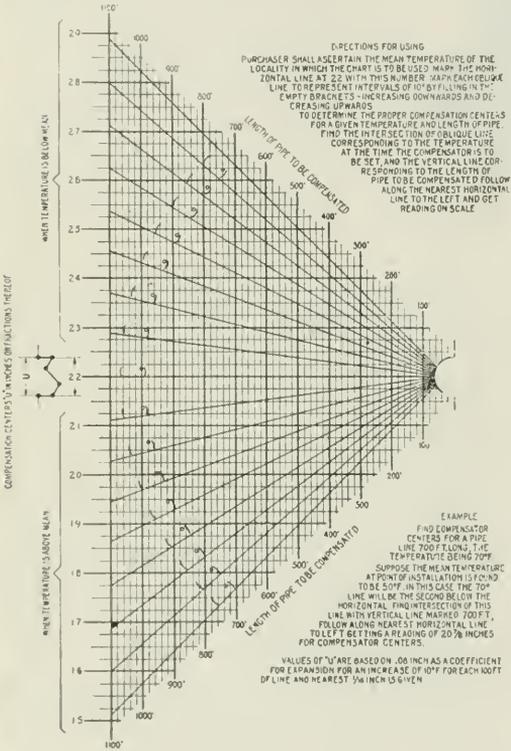

For 8 1/4-in. stroke, lengths 470 ft.

For 9 3/4-in. stroke, lengths 290 ft.

The committee recommended the approval of specification for universal compensation of pipe line and drawings 1536, 1537 and 1538 for presentation at the annual meeting.

Complete specifications for mechanical interlocking apparatus, a consumption of years of work on this subject, together with requisite sheets, were presented by the committee for approval for presentation at the annual meeting.

Committee: C. J. Kelloway (A. C. L.), chairman; W. N. Spangler (P. R. R.), vice-chairman; W. F. Zane (C. B. & Q.), vice-chairman; T. S. Adams (N. Y. C.), Larsen Brown (A. T. & S. F.), W. F. Cook (D. & H.), Oswald Frantzen (N. Y. N. H. & H.), Wm. Hiles (C. C. & St. L.), F. E. Jacobs (C. & W. L.), H. F. Lomas (I. C. E.), E. M. Eack (C. & E. L.), J. W. McClelland (P. & R.), W. B. Morrison (D. L. & W.), G. S. Pfisterer (N. C. & St. L.), E. J. Relph (N. P.), C. Smith (St. L.-S. F.), Chas.

Table of Crank Adjustments With Temperature Changes

Stephens (C. & O.), M. F. Sutherland (Maine Cent.), R. W. Taylor (B. & O.), J. I. Vernon (N. Y. N. H. & H.), E. L. Waltz (C. & W.)

Discussion

E. T. Ambach (B. & O.): The statement was made yesterday that there are no specifications for cement. The American Railway Engineering Association has a specification on cement and also on reinforced concrete.

1. For switches, movable frogs and point derails with 10x13-in. compensator cranks.

For 8 1/4-in. stroke, lengths 40 to 700 ft.

For 9 3/4-in. stroke, lengths 40 to 500 ft.

2. For facing point locks, switch and lock movements, lift derails and signals, with 10x13-in. compensator cranks

For 8 1/4-in. stroke, lengths 80 to 700 ft.

For 9 3/4-in. stroke, lengths 80 to 500 ft.

3. For facing point locks, switch and lock movements, lift derails and signals, with 10x16-in. compensator cranks, unless otherwise specified on requisite sheet

For 8 1/4-in. stroke, lengths 40 to 1000 ft.

For 9 3/4-in. stroke, lengths 40 to 800 ft.

4. For facing point locks, switch and lock movements, lift derails and signals with 10x16-in. compensator cranks, unless otherwise specified on requisite sheet

For 8 1/4-in. stroke, lengths 80 to 1000 ft.

For 9 3/4-in. stroke, lengths 80 to 800 ft.

(f) Horizontal cranks shall be in accordance with R. S. A. 1111

(g) Crank chart 1538 shall govern the setting of cranks in re-quirement of temperature.

(h) In territory where temperature variation is less than 120 degrees F., compensation shall be provided for each pipe line as follows:

For 8 1/4-in. stroke, lengths 40 to 1100 ft.

For 9 3/4-in. stroke, lengths 40 to 900 ft.

For 10x16-in. stroke, lengths 80 to 1100 ft.

The committee would do well to adopt something that some other section has, rather than to leave it open.

C. J. Kelloway (Chairman): The specification is very broad here. "Cement shall comply with specifications of the purchaser."

(A motion that the specifications for compensation of concrete trunking for presentation to the annual meeting was carried.)

Chairman Kelloway: The committee found that the clause for compensation was too voluminous to include in the major specification, and we have prepared a unit specification for compensation of pipe lines.

(A motion that the specifications for compensation of pipe line, and drawings 1536, 1537 and 1538, be accepted

for presentation to the annual meeting, was carried.)

Chairman Kelloway: The specifications for mechanical interlockers were discussed at length at the last meeting of this association. Most suggestions made have been incorporated in the specifications. The committee desires to change the paragraph on painting to read: "All unfinished parts of interlocking machine above the floor, including the levers, shall be painted one coat of red lead and three linseed oil and two coats black."

(A motion to this effect was carried.)

(A motion to the effect that the specifications for mechanical interlockers be approved for presentation at the annual meeting, with requisite sheets, was carried.)

(The committee was excused with thanks of section.)

Reports of the Committee on Contracts

The table of recommended unit values for the division of expense of installation, maintenance and operation of joint interlocking plants as applied to mechanical plants varies but little from the table adopted by the association in 1907. It has been supplemented by a few additional items for mechanical plants and by values assigned for power operated units which are considered equitable. Any table of units will prove equitable for dividing the cost of ownership installation, operation and maintenance when applied fairly and the law of averages allowed to apply, although it is conceded that no table can be made entirely equitable.

George E. Beck
Chairman

George E. Beck has been chairman of this committee since it was organized two years ago, prior to which time he was chairman of the old R. S. A. Committee on Storage Batteries and Charging Equipment. He started as a blacksmith in the signal department of the Michigan Central in 1898 and three years later transferred to the Lake Shore & Michigan Southern. He was promoted to foreman in March, 1902, and was appointed assistant supervisor two years later, being promoted to signal supervisor in 1906 and in 1913 to chief signal inspector. He was appointed assistant signal engineer of evaluation, N. Y. C., Lines West, in 1916.

THE COMMITTEE submitted a report, including a table of recommended unit values for the division of the expense of installation, maintenance and operation of joint interlocking plants.

In arriving at the following table it will be noted that the committee did not materially vary from the table of unit values adopted by the American Railway Engineering Association in 1907, as applied to mechanical plants.

The table has been supplemented by (a) a few additional items for mechanical plants and by (b) values assigned for power-operated units which are considered equitable either when used in a plant that is entirely power-operated or in combination.

The committee concedes that no table of units can be made which will be entirely equitable for dividing all the cost of ownership, installation, operation and maintenance, but experience has demonstrated that almost any table of units will prove equitable when applied fairly and the law of averages allowed to apply.

The committee recommended that this table of interlocking units and values be accepted for approval for presentation at the annual meeting.

Committee: G. E. Beck (N. Y. C.), chairman; H. F. Haag (K. C. S.), vice-chairman; J. B. Latimer (C. B. & Q.), H. C. Lorenzen (P. M.), J. C. Mock (M. C.), J. A. Peabody (C. & N. W.), W. F. Seemuth (C. M. & St. P.).

Discussion

R. M. Phinney (C. & N. W.): The use of the indicator for a unit is not good because it is not positive to determine just how many indicators are going to be used in a plant of that kind. The use of the railroad indicator leaving out the relay discriminates against the use of indicator or indicating relay.

R. B. Arnold (C. & N. W.): Is it the intention of the committee to call a lock, an indicator or an annunci-

Table of Interlocking Units and Values

Unit No.	Unit	Description	Mechanically Operated Units	Power Operated Units
1	ea.	Fixed signal arm or light (or combined)	1	1
2	ea.	Non-operated signal complete (mast, blade or light)	2	2
3	ea.	Signal operated by switch or derail	1	1
4	ea.	Signal, 2-position	4	4
5	ea.	Signal, 3-position	8	8
6	ea.	Single switch (2 points) derail, or torpedo machine	4	8
7	ea.	Derail pipe connected to, and operated by switch	1	
8	ea.	Movable point frog (4 points)	8	12
9	ea.	Single slip end (2 points)	4	8
10	ea.	Double slip end (4 points)	8	12
11	ea.	55 ft. of detector bar (or fraction thereof) on plant	2	2
12 (a)	ea.	Facing point lock or drawbridge lock with lever connection	2	6
(b)	ea.	Each additional lock when operated with other unit	1	1
13 (a)	ea.	Drawbridge circuit controller or pipe coupler when operated separately	4	8
(b)	ea.	Each additional controller or coupler when operated with other unit	2	2
14	ea.	Complete track circuit	2	2
15	ea.	Lock, indicator, annunciator, slot	1	1
16	ea.	Electric lock for outlying switch controlled from tower	2	2

ciator, one unit each in the table of units? It is common practice to include the lever lock and indicator in

The Making of the Railway Age March Dailies

Prompted by Numerous Inquiries the Editors Relate
How the Work Is Done from Beginning to End

ANOTHER YEAR HAS COME and with it the meetings of the American Railway Engineering Association and the Signal Section of the American Railway Association that bring you to Chicago. Perhaps as you sat down to your breakfast this morning you dwelt a little upon that thought. And as you turned it over in your mind while your fingers idly ruffled through the pages or marked a place where you had been reading in your copy of the Railway Age March Daily, another thought may have occurred to you. Whether your first Daily or, with the familiarity of an old member, your thirteenth Daily, your interest was aroused, maybe for only a moment, and you wondered how we did it, when and where. Regularly and unobtrusively, the Dailies, the largest issued by any publisher, have appeared at your hotel ready for you when you awoke to give you accurately and concisely the doings of the previous day's sessions and surrounding activities. To us familiar with the making of the Dailies, the complexities and details of publishing one every 24 hours, an issue of the size and character of the Railway Age March Daily, are still interesting. We think you will find them equally so.—
(THE EDITORS.)

The heart of the convention is the Florentine Room and it is there that much of the real benefit of the meeting is obtained. Discussion, as we all know, is the quickest way of smoothing out differences of opinion and advancing the status of engineering. The man who could attend all the sessions, hear all the discussion of all the reports, select the wheat from the chaff, keep his head clear and unconfused, store away in his mind what he has learned, visit with acquaintances, inspect the exhibits and discuss the things which he has seen, is not nor cannot be. It is too much for the most ambitious of men. He can only choose what is closest to his interests. Hence the Dailies, where he may review at his leisure moments during and after the sessions, the activities he was unable to take part in.

For weeks before the convention the work of organizing for the publication is carried on by the regular Railway Age staff and that staff alone carries it on through to the end. There is first among many things the reading and editing of the reports of the committees, the separating and condensing of data so that duplication may be avoided, retaining the heart of the report and yet keeping it all within the bounds of a paper that will be and can be read without taking too much of the valuable convention time. Illustrations for the reports must be prepared and portraits of the officers and others of the association must be secured, mounted, measured and photo-engravings made. Not one portrait can be dispensed with. The series must be complete.

From the experience gained in the past, it is possible to estimate the space required to cover the various activities which will take place during the convention. This estimate includes editorials, special articles, reports and discussions, news, articles about new devices and other miscellaneous matters and forms the nucleus around which the Dailies are built. While the reports are being edited and the photographs procured, arrangements are being made for the remainder of the editorial articles which can be prepared in advance. Heads are written for the reports and all material is sent to the printshop as soon as it is written. All of this done, the type must be meas-

ured for length, recorded and indexed, the proofs read, corrected and approved and everything put in readiness so that when wanted there will be no hitch to tangle up or slow down the work of publication when the real rush begins.

The things enumerated above are only the high points of the before-the-convention editorial work. From four to five editors are on this assignment regularly, yet it must not and does not interrupt or interfere with the regular publication work or the other papers of this company. Many a night sees the lights burning over editorial matter for the Dailies. It is not amiss to add here that the work, arrangements and schedules outlined above as well as those that will be mentioned later cover only the meetings of the American Railway Engineering Association. When the signal meetings are held, as they are this year and as they were two years ago, the work of preparation, not to speak of that of the actual publication, is increased twofold, yet the same staff handles both. Duties already double normal become quadrupled—still the Dailies appear.

In the meantime, arrangements are being made for the removal of the Railway Age staff from its regular offices to temporary offices in the hotel. Rooms must be acquired, furniture moved and procured, and living quarters assigned, for our editors must live at the hotel during the convention. Time is precious. Minutes, not hours, are the divisions. Printshop facilities, engravings, messenger, taxi, phone and telegraph service are arranged for, keyed up to the requisite speed and scheduled. Court reporters familiar with the convention work are secured. With all these thousand and one details, large and small, of which we have only suggested the high spots here, finished, the opening day of the signal meeting—one day previous to the A. R. E. A. convention—has arrived. One final conference of the staff is held, at which all of the details are checked carefully, assignments rehearsed, and then the real work starts.

The problem is to present the real meat of the discussion verbatim—not some one editor's impressions of what some member may have said, and again, as with the reports, to keep them within the bounds of a readable paper. Close up to the officers' table, the court reporter sits, taking down word for word what each member says. The senior member of the reportorial staff that takes down your words has seen each March Daily come and go since their inception. He knows most of the members by name and by road and, unless we are badly mistaken, we believe that in many cases he often knows what some are going to say before they have said it. At intervals each reporter is relieved by another, the break being made after short periods of time in order to speed up the transcription. The discussion already taken down in shorthand is then dictated to an experienced typist, who has also seen many an A. R. E. A. convention come and go. From the beginning of the morning session to well after the end of the afternoon session, this typist transcribes rapidly and steadily the words used but a few minutes before on the floor of the convention. Two copies are made and as soon as each sheet is completed, one copy is sent immediately to a nearby room where two editors are stationed in readiness, with everything necessary for the efficient, accurate and speedy editing of the discussion or "running

report," as it is called. This includes among many things, copies of the original reports, galley proofs of the reports as edited, estimates of space, pencils, ruler, scissors, paste pots, blank paper. Virtually if not actually, for quiet and freedom from interruption are paramount, these editors are locked in their room.

As each sheet of the discussion is received, it is read carefully, its importance weighed carefully, names, figures, words and expressions corrected where wrong, condensed where possible by judicious cutting, then check-read, numbered, stamped with the report number according to our print-shop and copy list schedule, approved and sent on its way. The next stop is the desk of the editor in charge of the Dailies who, closely familiar with the work of the convention, passes upon it to see that everything has been covered properly, that it has not been edited too closely or too loosely and that it is free from mistakes. An estimate is made of the length of the discussion of each report and its identification marks are re-checked to prevent any possible confusion. It is then dispatched by special messenger service to the printshop where the linotype operators seize upon it and quickly convert it into slugs of type. Galley proofs are struck off, submitted to the editorial make-up man and his assistant, both of whom are editors familiar with all phases of the publishing work and stationed at the printshop. They read, correct, measure and schedule them. This transposition of words to type actually takes only a short time, so smoothly and speedily does this system work.

While this work of editing the running report of the session is on, other editors are busy mixing with the members, sitting in the session, making notes on important points for editorial comment, studying the exhibits and otherwise doing the hundred and one little things that go to the securing and publishing of the up-to-the-minute news of the convention. Lines, paragraphs, articles, even photographs and whatnot from various sources and directions are correlated, passed upon, and dispatched to the linotype machines—all through one central "clearing house." At the registration desk two members of the staff aid in the registration of the members attending each session. At intervals during the day duplicate lists of the registrations are made up and sent to the editor in charge. These lists are checked against the membership list of the association and other data to insure accuracy, after which one copy is forwarded to the printshop. Each succeeding list is handled likewise, the names being arranged alphabetically after being set up in type. The duplicate list or lists are retained by the member of the staff who is in charge of the delivery of the Dailies. He arranges the names, not according to the letter of the alphabet, but according to the hotel addresses and room numbers of the members, and from this he is able to make his plans for the delivery of the copies.

By early afternoon, it is possible for the editor in charge, working with the editors in the printshop, to obtain a fairly accurate estimate of the amount of printed matter, better known as "copy," which will appear the next morning. Space is then allotted by pages to the various sections of the paper, after which the mechanical make-up is started—usually this is late in the afternoon. Careful attention to what may be considered by the layman as the way it is done, the type is assembled or, in the vernacular, the paper is made up, by sections, starting at the foot or editorial page, at the beginning of the convention session and at the last page. The first two sections are made up, working toward the back of the paper, while the third is worked forward. The closing of the paper is of course, delayed until the last copy has

come through and has been set up in type, but in the meantime, three-fourths or more of the paper has been put in page form, proofs have been taken, read and corrected for size of type, spacing, headings and typographical errors.

As soon as each page is made up it is placed in the forms, where it remains until all the spaces in the 4, 8 or 16-page forms, depending upon the number of pages in the paper, have been filled and the pages finally passed and approved. The forms are then locked and sent to the press room. Ordinarily this work, as outlined, is completed and the forms released by midnight or a little after, the scheduling calling for the press to be started on the last four by 2 o'clock in the morning at the latest. In order to catch any possible errors, one or more of the editors closely familiar with the sessions of the day and the editing of the running report go to the printshop in the evening after their other work has been completed to remain until the forms go on the press.

When photographs are taken of the convention in session added complications arise. Detailed arrangements are made beforehand for the photographer to take his picture with the minimum interruption to the meeting. The engraver is waiting for the photograph to be taken and accompanies the camera operator to his studio, where the plate is developed, a print made, and blotted to hasten its drying. He then takes it to his engraving shop by taxicab, where special men are retained to perform all of the complicated operations entering into the making of a half-tone. These operations being completed, in turn, the copper engraving is dispatched, again by messenger, to the printshop, where it is inserted into a space carefully measured beforehand and left for it and the forms are sent to the press.

The paper, as it leaves the press, is seized by the binders, still wet from the printing, who fold, bind, trim and handle it in quantities of 100 copies. This, as you may well surmise, happens along near the time when the sun is beginning to appear. Each lot of 100 copies is then loaded into taxicabs and accompanied by members of the Railway Age staff, delivery is begun. Time is still precious, for a copy must be addressed for each member attending the meeting and it must be delivered at the door of his room before the time he has decided to arise in the morning. Not only that but all of the regular subscribers of the Railway Age located in the downtown district of the city must also receive their copies by special messenger. In the meantime other copies are bound and taken to the postoffice for mailing to the subscribers to the Railway Age. By eight o'clock at the latest, and usually much before that, delivery is completed and another March Daily is out. Thus, the Railway Age March Dailies, no longer an innovation in magazine publishing but an institution, combining newspaper promptness and activity with magazine size, thoroughness and accuracy, are brought before you each morning.

First Railway Station at Anchorage, Alaska

American Railway Engineering Association Registration

THE REGISTRATION OF MEMBERS and guests of the American Railway Engineering Association yesterday totaled 666. This is the highest first day's registration in the history of the association, comparing with 593 last year and 534 in 1920. The crowded condition of the convention room and the numerous complaints from members who were unable to secure seats reflected this condition.

The registration follows:

- Abbott, F. E., insp. engr., Lackawanna Steel Co., Buffalo, N. Y.
 Abbott, R. B., asst. gen. supt., P. & R., Reading, Pa.
 Ackerman, F. J., sig. engr., K. C. Term., Kansas City, Mo.
 Albright, C. C., assoc. prof. ry. engr., Purdue Univ., Lafayette, Ind.
 Allen, L. B., engr. m. of w., C. & O., Huntington, W. Va.
 Allen, L. J., chf. engr., A. A., Owosso, Mich.
 Ambrose, J. R. W., chf. engr., Tor. Term., Toronto, Ont.
 Ames, Azel, Kerite Insulated Wire & Cable Co., New York.
 Amoss, F. X., Winnipeg, Man.
 Anderson, Irving, div. engr., A. T. & S. F., Marceline, Mo.
 Angerer, Victor, vice-pres., William Wharton, Jr. & Co., Easton, Pa.
 Angier, F. J., supt. timber pres., B. & O., Baltimore, Md.
 Armour, Robert, mas. engr., G. T., Montreal, Can.
 Armstrong, J. E., asst. engr., Can. Pac., Montreal, Can.

Improvements in the Eymon Continuous Rail Crossing

IMPROVEMENTS IN THE method of operating and locking the movable blocks in the Eymon continuous crossing have added materially to the ease of connecting it with interlocking facilities and to the safety of its operation. The principal feature of this crossing is four triangular blocks of steel, designed to fit into the exterior angles of the four corners of the crossing and arranged to slide in a direction perpendicular to a line bisecting the angle of a corner, so that either one or the other flangeway is

Photograph of a Crossing in Service

closed. Thus a continuous rail may be provided for either track at will.

The new system of operation and locking of the movable blocks is accomplished by the "lock and block" movement, shown in the photograph. This apparatus has been designed particularly for this crossing and yet employs the principle of locking familiar to interlocking men. The lock of this movement locks normal in one position and reverse in the other position, and is unlocked or neutral on the center. The quadrant of the locking lever in the interlocking machine is "notched" on the center to hold

the lever in the unlocked position, while throwing the lever used for shifting the movable blocks.

Referring to the photograph, it will be seen that the movable block "F" is held in its position by the locking rod "C," which fits in bar "D" attached to the movable block. When changing the line-up for traffic on the other road, the first movement is to withdraw the locking rod "C" and by switching the operating rod "B" away from the reader the block "F" is moved in the direction of the arrow by means of lugs on the bottom, which fit over an offset on the rod "B," which extends on through to the bearing "E." It will be seen that as the block "F" moves over the locking bar "D" is carried along to such a position that it is now possible to push the rod "A" into the notch "X."

By means of this apparatus it is possible to operate and lock the entire crossing with one lever in the interlocking machine. However, it should be understood that if the levers are available in the interlocking machine there would be no objection to using one lever to operate and another lever to lock each crossing, which is a question to be decided by the signal engineers of the individual roads. This crossing is manufactured by the Eymon Crossing Company, Marion, O.

Recent Developments in the Use of Concrete Poles on Railroads

THE LAST FEW YEARS have witnessed a considerable interest on the part of the railroads in the use of reinforced concrete poles and other similar structures, particularly where the requirements of low cost and utility are coupled with a desire for architectural treatment. In this connection, therefore, it is of interest to note the type of pole recently installed by the Pere Marquette at its depot at Belding, Mich.

These standards were furnished by the Massey Concrete Products Corporation, Chicago. They are 13 ft. high, of hexagonal cross-section, and embody what is known as the Hollowspun type of construction, the essential feature of which is the placing of a wet mixture of concrete in a form containing the reinforcing steel and revolving at a high rate of speed, an operation which not only serves to compact the concrete around the reinforcing steel but also to leave a cylindrical opening throughout the length of the pole, thereby reducing the weight and the attendant inconvenience of handling. The type of pole used in this case is shown in the accompanying illustration.

The Posts at Belding

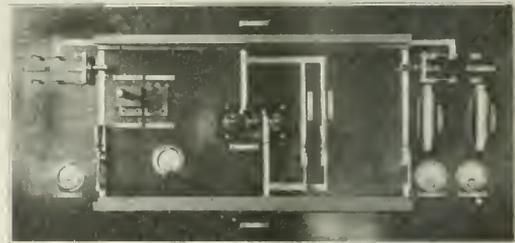

A similar type of lighting standard, though shorter in length, has been developed by the same company for mounting on bridge railings, and poles of the same construction, though circular in section, have recently been installed on several railroads as bridge warning supports. Examples of the latter are to be found in the poles used on the Illinois Central bridge over the Kankakee river at Kankakee, Ill., also the poles erected on the Pennsylvania at Philadelphia, the New York Central at Lyon, N. Y., and in the electrified zone of the Norfolk & Western near Norfolk, Va. One interesting observation to be made in connection with the strength of the pole is to be found in the survival of a transmission line of the American Telephone & Telegraph Company during a storm in New England last December,

which proved disastrous to most of the transmission lines in the section.

Miniature Track Circuit for Testing

SIGNALMEN HAVING trouble with track circuit adjustments are frequently required to wait from week to week in order to catch the extremes of wet track, frozen ballast or dry weather. On account of this tedious program the limiting resistance is often reduced to the minimum and left at this adjustment in order to insure proper operation during extreme conditions, regardless of the energy consumed. Also during tests carried on to determine the operating characteristics of track relays of different resistances, a means of expediting adjustments for different ballast conditions is very desirable.

The miniature track circuit shown in the photograph incorporates in a space readily seen at a glance, connections for the various batteries, resistance units, relays and

The Miniature D. C. Track Circuit

used in an ordinary track circuit. The double-pole double-throw switch at the right, when in the normal position, connects a primary battery to the rails and when reversed connects a storage battery to the circuit. A limiting resistance of 3.5 ohms is connected in series with the storage battery and a 0.3 ohm in series with the primary battery. The one ammeter indicates the battery discharge to the track circuit, while the other shows the charging rate of the storage battery.

The double-pole, double-throw switch at the left of the picture, when in the normal position, connects a 4-ohm relay to the rails or a 2-ohm relay to the same circuit when reversed. The ammeter below this switch indicates the milli-amperes going through the relay coils. The voltmeter between the rails may be connected by means of the multiplying switch to indicate the track volts at the relay end, the track volts at the battery, the voltage of the primary battery or the storage battery.

Each rail has a resistance of 0.3 ohms and between the rails is mounted an adjustable resistance box, by means of which resistances in tens, units and tenths may be set up to represent various track circuit leakages. The closing of either of the single pole switches to the right of the resistance box represents a train shunt of 0.12 ohms or with both closed a resistance of 0.06 ohms. The single pole switch at the left end of the rails acts as a train shunt at the relay, while the switch of the right end represents a train shunt of the battery end.

By assembling the various functions of the track circuits it is readily seen that the action of different units may be checked at one time. As a means of training new men in the signal work or as a method of demonstrating to maintenance of way or operating officers why certain track circuits need cleaning out, such a model should serve a valuable purpose. The Electric Storage Battery Company, to whom we are indebted for the photographs,

now have two such miniature track circuits which are used for demonstrating purposes.

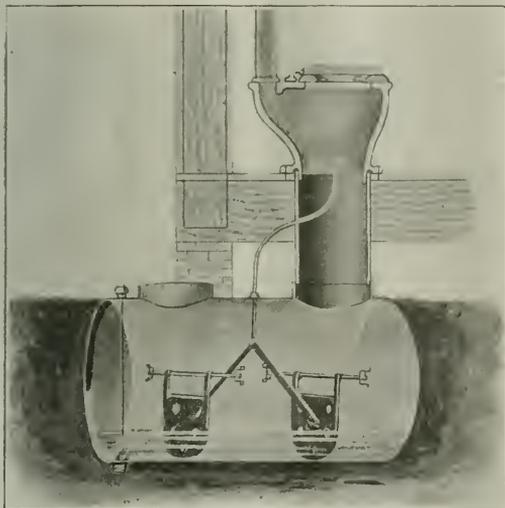

Chemical Toilets for Railway Service

THE CHEMICAL TOILET is a development of recent years. A system of sewage disposal based upon the deodorizing, decomposing and purifying action of a chemical solution and adapted to installation indoors is a marked improvement over the privy vault as a method of meeting the toilet problem at points where a sewerage system is either not possible for lack of a water supply for flushing and disposal purposes or an unwarranted ex-

The chemical itself is a caustic preparation which is prepared for use by dissolving in a pail of water, after which it is dumped into the tank and sufficient water added to give a three or four inch depth to the solution. The action of this chemical and the agitator serves thereafter to liquify all solid matter, kill germs, and suppress all offensive odors until after five or six months when the tank becomes about three-fourths full, when the contents are pumped out through the man-hole provided on the upper side of the cylinder or removed through the drain hole at one end of the under side, this drain being controlled, as shown in the photographic illustration, by a rod which extends up through the upper side of the tank.

For the use of this system in outfit cars a tank is now made of a size and shape which permits of its being installed securely above the truss rods at one end of the car. As shown in the illustration, the tank is secured to the car floor by two U-bolts. Within the car the equipment differs from the standard single bowl equipment in the use of a long steel tube of 12-in. diameter in the place of the shorter tube surmounted by the vitrified bowl. Similarly to the vitrified bowl this tube accommodates an appropriate cover and the regular ventilating system, but affords a less expensive construction. With this equipment it is necessary only to erect a false floor around the drop pipe to complete the installation for such purposes.

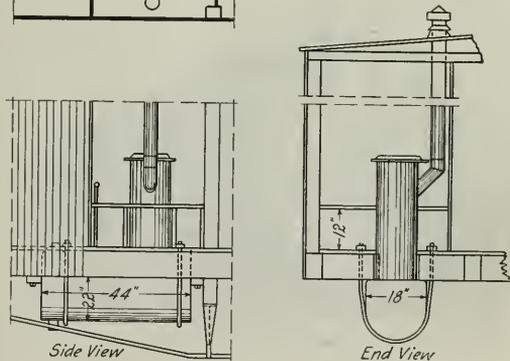

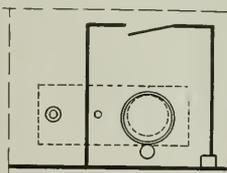

Constructed in the manner described the system allows adequate clearance below the car and occupies but little

A Sectional View of the Wolverine System

pense. On railways it thus invites consideration in connection with passenger depots, small shops, and construction camps at outlying or other points where the privy vault is tolerated only because of the lack of better facilities, and merits consideration also with respect to signal towers, watchmen's shanties and outfit cars, where, although some facilities are greatly to be desired, even the privy vaults are often wanting.

Constituting one of these systems the Wolverine equipment presents a new point of interest for railway men in the provision which has been made for its installation in outfit cars and similar places where space is limited and inexpensive though durable equipment is required. The modifications made in the equipment to this end will be more clearly brought out by first reviewing the design of the standard system. As shown in the accompanying illustration, the equipment consists of a cylindrical tank, horizontally placed beneath the building, and a pipe which extends to the floor line, where it connects with a vitrified bowl, this bowl carrying an appropriate seat and cover and accommodating a ventilating system which in turn consists of galvanized piping extending far enough above the roof to establish an effective draft. Within the cylinder are two paddles, each suspended from a horizontal shaft and both so connected to a rod extending above the floor as to require only a push on the rod to effect a proper mixing of the chemical with the other contents of the tank.

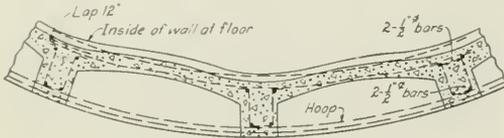

Method of Installing the Toilets in Outfit Cars

space within it. Obviously its value is particularly to be realized in bunk cars occupied during the winter season, and during summer seasons in those cases where cars are allowed to stand in one spot for long periods of time. The units require no more attention than should reasonably be given to a water flushed system and present no offensive features in connection with their emptying and recharging. The chemical is furnished in batch quantities, in cartons ready for mixing and while destructive to organic matter is not corrosive to the metal of the tanks. These systems are sold by the Superior Supply Company, Chicago.

New Data Bearing on Gunite in Tank Construction

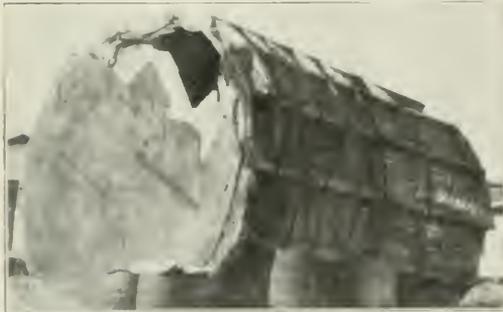

AN ACCOUNT of an old gunite-constructed tank was recently unearthed by the Cement-Gun Company, Inc., Chicago, to which considerable interest attaches by reason of the showing made by the gunite in this kind of construction and in the study it affords in structural design. A view of the tank as it was last found is shown in the accompanying illustration, it having been abandoned for purposes mentioned later. This tank was built in Henrietta, Okla., in 1917 for oil storage purposes and stood for 3½ years in such service, when a new purchaser of the property, who did not need the tank in

A Section of the Side of the Tank

his business and found it in the way of a building he desired to construct, undertook to remove it. Three shots of dynamite beneath the tank failing to do more than loosen ground around the foundation, resort was had to block and tackle and horses and finally after tipping the tank over on its side, it was rolled by means of tackle for a distance of 900 ft. to the point shown in the photograph. At the time the tank held about a half a car of crude oil, which was removed by drilling through the tank. It was also observed that no signs of oil were to be found on the exterior of the tank or other indications of any seepage through the structure during its life.

The excellent showing made by the tank during the 3½

The Tank After Its Demolition

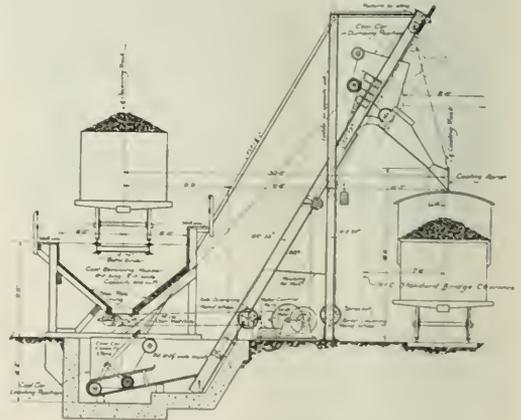

years in which it was in service and the resistance it presented to demolition are attributed to the manner in which the tank was constructed. The nature of this construction may be gathered from the accompanying photograph and drawing, in which it will be noted that the tank is essentially a system of vertical ribs occurring at intervals around the shell, coupled with a system of horizontal ribs situated at intervals above each other, varying according to the intensity of the pressure. In each vertical rib was a rod of reinforcing steel. The shell was built up by applying gunite to a steel mesh and, as is particularly to be noted, the term steel was entirely external, appearing in the photograph as so many hoops around the tank. By reason of this design, expansion and contraction was

evidently taken up adequately and the concrete was maintained under compression.

A New Development in Engine Coaling Equipment

IN THE ACCOMPANYING view is shown one of two small plants, one electrically and the other pneumatically operated, which have recently been developed by the Roberts & Schaefer Company, Chicago, to replace the old hand shoveling methods of coaling locomotives at outlying points, where the installation of more elaborate coaling facilities is not warranted, where the problem of engine coaling is of a nature to invite scientific treatment.

In these plants the coal is dumped from a gondola car into a receiving hopper, which can be designed for a capacity of 600 to 2,000 cu. ft. This receiving hopper is equipped with a 24 in. by 36 in. clam-shell gate, which is operated by a hand wheel in the hoist house, thereby making it possible for the coal to be fed by gravity into a two-ton car below the hopper. This car when filled is then elevated by air or electricity on a structural steel supporting frame to the dumping point above the coaling track, where a hooded apron is provided, by means of which the coal is spouted into the tender. When dumping, the coal car or bucket is supported on substantial

Plan of the Coaling Plant

dumping castings, and when empty is returned by gravity to the loading position. The trip from the loading point to the dumping point and return takes about 1½ min.

The electrically-operated plant is provided with a 20 hp. electric motor, with Cutter-Hammer hand controller, solenoid brake and a machine time limit switch, which automatically stops the bucket at the dumping point, and prevents any overwind. The motor is direct connected through cut steel gears to a cast iron base winding drum hoist. Standard New York Central bridge clearances are adhered to in designing the structure, which makes it possible to install this plant on main line, or yard tracks.

The operation of the plant is simple, the regular shop or yard forces being able to take care of the coaling of the engines along with their other duties. It is therefore possible to release cars promptly and to avoid keeping laborers on duty at all times to shovel coal by hand. As an additional feature or possibility of the plant obviously lies in the adaptability of it for transferring material from bad order cars.

It may reasonably be asserted that no phase of railroad-ing has been the object of more "wishy-washy" thinking, or the recipient of more "bunk" pass-

The Engineer and Corrosion

ing under the guise of scientific observations than the subject of pitting and grooving in locomotive boilers, unless, of course, it is the subject of boiler waters in general, of which pitting and grooving is an element. And yet it is important that the railroads understand thoroughly the phenomenon of corrosion in order that they may exercise a control over its underlying causes and thereby avoid the very considerable losses which arise annually from it. In view of this it is highly gratifying to note not only that the subject of pitting and grooving has been assigned for study to a special committee of the American Railway Engineering Association but also that definite progress has already been made. That is getting down to a proper appreciation of the subject and much of benefit should come of it. Contrary to the idea apparently entertained by some that pitting and grooving must remain a grievous trouble in the territories where it is encountered until some distinguished appearing individual appears on the scene with the solution of the problem in capsule form; pitting and grooving, while admittedly a baffling study and certainly a trouble not to be corrected by half-measures, is but a problem in science, which can be solved to the satisfaction of all con-

cerned. It is properly a problem for the attention of the engineer, and the Water Service committee in devoting attention to its solution, may not only derive satisfaction in the realization of its opportunity to work a very material and tangible benefit to the railroads, but also in its opportunity to show those who are skeptical, that the engineer is no less competent in this field of science than he has proven himself in others.

The constant growth in the American Railway Engineering Association from year to year has been emphasized in a striking manner this year by the inability of the Congress hotel to provide rooms for all who desired them and by the insufficiency of the seating capacity during sessions of the convention in the Florentine room. It is not the fault of the Congress hotel that this is so, for the housing of the annual meeting of an organization such as the Engineering Association, with its 2,000 members, augmented by those participating in the exhibit at the Coliseum, is a big task. It is evident, however, that the Board of Direction of the association must give careful attention to the matter of hotel facilities in the very near future. One of the provisions of the original constitution fixes Chicago as the location for the annual meeting, and few things have contributed more to the success of the meetings and to the constructive work of the association. The association cannot consider another city as its place of meeting. It should be mentioned, in this connection, that the Congress hotel is planning to build an addition.

Hotel Facilities Becoming Inadequate

The report of the Committee on Signs, Fences and Crossings calls attention to one feature of the permanent way which has been the subject of considerable development work during the last three years, namely, the highway crossing. There has been a concerted endeavor to devise substitutes for the plank crossing which has been the accepted standard on American railways for so long. This movement is probably receiving its principal impetus from the gigantic campaign of highway construction now-sweeping over this country, but higher costs of lumber and certain inherent disadvantages of the plank crossing are no doubt contributing factors. It is of interest to note in this connection that this subject has been given considerable attention by the Roadmasters' Association, that organization having received several committee reports bearing on this problem. The substitute crossings developed thus far may in general be divided into two classes—those comprising unit members capable of installation and removal in much the same manner as crossing planks, and the integral construction built in place over and around the cross ties so as to form

Substitute Highway Crossings

a fixed roadway which cannot be removed without more or less complete reconstruction. Judging from the reception which these two types of crossings have received from the roadmasters it would seem that the latter type has been considered with somewhat greater favor, objections arising from an inability to remove the crossing construction intact being answered by suggestions for securing a character of track construction that will insure reasonable security of surface and alinement within the limits of the crossing. The use of special length rails to avoid splices is one specific measure proposed in this connection. Obviously improvement in the character of roadway afforded the highway traffic is an important consideration and one to which the railway engineer must, of course, give reasonable consideration because of its influence on public relations. However, he must not lose sight of the fact that insofar as he is concerned the condition of the track structure is of first importance.

Secretary Fritch is to be congratulated on the improved presentation of the committee reports in the bulletins issued in advance of this convention.

An Improvement in the Bulletins

Obviously, some introductory statements are necessary to outline the work completed or under way by the committee, but this has been reduced in most cases to a brief synopsis. There is still room for some improvement in the way of a more uniform presentation by the various committees, but this is a condition for which the secretary cannot very well be held responsible. There is a definite limit to the possibilities of editorial modification by the secretary after the report leaves the hands of the committee chairman. One consideration which should be taken well into account in the preparation of committee reports is the impression to be made on the non-member. To this end introductory matter must be placed in a form that is readily understood without a detailed knowledge of the workings of the association. The A. R. E. A. is fortunate in having adhered to a simple form of procedure for the submission of matter and its approval by the convention. Certain other technical societies have fallen into the unfortunate error of adopting a complex procedure entailing the use of a cryptic nomenclature which makes the process virtually inexplicable except to the thoroughly initiated. This procedure cannot but discourage interest on the part of the outsider and the A. R. E. A. is fortunate in having avoided it.

No greater tribute can be paid to the memory of John F. Wallace than to point to the American Railway Engineering Association as a creation of his far sighted vision. To Mr. Wallace belongs the credit for the suggestions leading to the organization

A Tribute to

John F. Wallace

of this association and it was largely under his guidance during the first years of its organization that the association established for itself the principles which have been so largely instrumental in keeping it on a true course of constructive work which is excelled by none and equalled by few technical associations. At the memorial meeting yesterday morning reference was made repeatedly to the principles which he enunciated during the formative years of the association, which have now become such established practice that they are accepted as a matter of fact, whereas in their inception they were pioneer in their character. The fixing in the constitution of a central location for the meeting, the

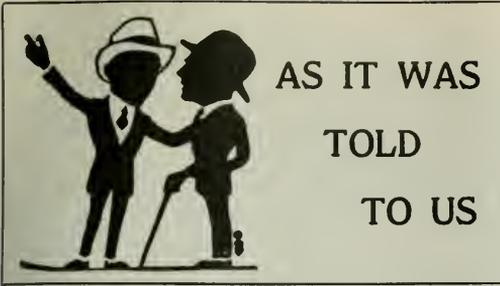

elimination of all social features, the separation of the commercial from the technical and the placing of the proceedings upon a high plane have served as a pattern for many other organizations since that time. It is impossible to estimate the present influences of the association in railway engineering matters in North America or, in fact, in the entire world. To Mr. Wallace and also his associates of those early days all credit is due and it was fitting that this should be freely expressed yesterday morning.

Readers of Chicago papers were given their daily thrill yesterday at the expense of the Chicago, Burlington & Quincy, which suffered the loss of a modern office building and records and files, the value of which cannot be estimated at this time. The Burlington building was a modern "fireproof" structure in the sense in which that term is commonly understood—a steel frame protected against damage from fire by a covering of refractory material of accepted standards. Insofar as protection for the steel frame is concerned, there is reason to believe that the fireproofing functioned effectively. More than this cannot be said for it. The building stands, but everything in it not enclosed in vaults has been destroyed. On the sides of the building facing the interior of the block in which it stands, the windows were of wire glass set in hollow sheet metal sash. On the sides facing on Jackson boulevard and Clinton street, the windows were of ordinary glass with wooden frames. This difference in the window construction is in accordance with the provisions of the Chicago Building Ordinance and is founded on the supposition that exposure to fire in buildings across a street of ordinary width is much less than from a fire immediately adjacent. The fire on Tuesday night demonstrated that this is a rather fine-haired distinction. The conflagration in the block across the street from the railroad building was of such magnitude that the width of the city street afforded no protection. The windows were quickly destroyed and the fire swept into the interior. No doubt the temperatures prevailing, as in the case of other great American fires, was so high that even the best of window construction would not have availed. However, it might have served to have delayed the progress of the fire in the Burlington structure to an extent that would have reduced the total damage done. If all buildings in the city were of fireproof construction so that any fires originating in them would be restricted to the burning of the contents of the individual rooms, the volume of the fire and the temperature attained probably would not be sufficient to communicate with buildings separated by the width of a street. But unfortunately, a great many highly combustible buildings are still in use today and consequently many so-called "fireproof" buildings are exposed to fire hazards against which they are not adequately protected. One lesson to be drawn from this is the greater use of more effectively protected window openings, but the real lesson lies in the elimination of combustible buildings which comprise a menace against which no building no matter how well constructed may be assumed to be fireproof.

"Fireproof" Buildings

Union Train Control on the Pennsylvania

The Pennsylvania has arranged with the Union Switch & Signal Company, Swissvale, Pa., for an installation of the Union full speed train control system on 49 miles of line between Lewistown and Sunbury, Pa.

Among the railway systems with large attendance at this convention, the Grand Trunk has, so far as known, taken the lead with 41 representatives.

* * *

George T. Stewart, chief engineer of the Cuba Railway, with headquarters at Camaguey, Cuba, registered at the convention at the Congress hotel Tuesday morning.

* * *

The Interstate Commerce Commission announced yesterday that the first of a series of hearings on its tentative consolidation plan will begin at Washington on April 24 before Commissioner Hall, with particular reference to the Southeastern region.

* * *

Lieutenant Colonel W. B. Causey, U. S. R., technical adviser to Austria, with headquarters at Vienna, registered yesterday. Colonel Causey has long been an interested attendant at the conventions of the Engineering Association.

* * *

William D. Pence, for eight years a member of the Engineering Board, Bureau of Valuation, Interstate Commerce Commission, and prior to that time engineer for the Wisconsin Railroad and Tax Commissions for seven years, has returned to practice as a consulting engineer with office at 108 South Dearborn street.

* * *

In spite of the remoteness of the headquarters of the Gulf, Colorado & Santa Fe, which are at Galveston, Tex., the engineering department of that road is well represented at the convention. F. Merritt, chief engineer, is here accompanied by J. L. Starkie, office engineer; K. B. Duncan, district engineer, and E. Hanson, signal engineer.

Excursion Plan Completed

Word has been received from the Universal Portland Cement Company that a sufficient number of railway men have signified their intention of taking the trip to Buffington to warrant arrangements for a special train. This train will leave the La Salle Street Station over the New York Central at 10 a. m. Friday.

Today's Program

The program for the American Railway Engineering Association today is as follows:

- VIII. Masonry Bulletin 242
- IV. Rail Bulletin 243
- VII. Wooden Bridges and Trestles..... Bulletin 243
- XXI. Economics of Railway Operation..... Bulletin 243
- VI. Buildings Bulletin 245
- XVII. Wood Preservation Bulletin 245
- XII. Rules and Organization..... Bulletin 245
- New Business.
- Election and Installation.
- Adjournment.

Burlington Building Damaged by Fire

FLAMES, WHICH FOR A TIME, threatened to repeat the famed Chicago fire of 1871, swept through the Union Depot business district of that city early yesterday morning and badly damaged in part the 15-story office building of the Chicago, Burlington & Quincy. The fire supposedly started at one o'clock in the morning in a building at 521 W. Jackson boulevard, just a few doors east of Clinton street and the Burlington headquarters, which are located at 547 W. Jackson boulevard. The flames spread with astounding rapidity among the neighboring buildings, which was due perhaps to a large quantity of oils and paints stored within several of the burning structures. The intense heat and blaze are first believed to have attacked the Burlington building at the thirteenth floor from which it soon spread to the two floors above, and five below. The city fire equipment was only capable of reaching as high as the eighth floor with water (this to be noted in the accompanying illustra-

Interior of the Burlington Office Building Burning During the Fire Early Tuesday Morning

tion), and while the lower part of the building remains practically untouched from the fire, this accounts for but a skeleton form supporting the upper seven floors. Windows on all of the top floors were blown out, with many likewise on the lower stories, especially on the Clinton street side and the rear of the building. Officers of the road were informed of the fire within a short time after the general alarm was turned in, and many were soon on the scene of activity.

Meetings were held throughout yesterday at temporary headquarters installed in the Otis Elevator building, one block west of the Burlington offices. It was decided then that if building inspectors would permit the company to use the first seven floors, steps would be taken immediately to utilize that space for all departments but the traffic, which has already been transferred to the old general office building. It is believed that many important papers, valuation records, engineering plans, and other valuable documents, some of which have been many years in the process of making, are destroyed, though it has been stated that some may be replaced from like copies on file with the Interstate Commerce Commission.

On the Famous Loop, Alaskan Railway

Railway Engineering Association Proceedings

An Account of Wednesday's Sessions, Including the Presentation of
Nine Committee Reports With Discussions

THE SECOND DAY'S SESSIONS of the convention of the American Railway Engineering Association was called to order promptly at 9 o'clock by President Downs. In spite of the early hour the room was well filled and every seat was taken within a short time. A special feature of the program was the setting aside of an hour at the close of the morning session for a memorial meeting for John F. Wallace, one of the founders

and the first president of the association, and Colonel George H. Webb, a member of the Board of Direction, both of whom died during the year. Reports were presented by the committees on Track; Shops and Locomotive Terminals; Roadway; Economics of Railway Location; Electricity; Records and Accounts; Signs, Fences and Crossings; Water Service and Uniform General Contract Forms.

Association Pays Tribute to John F. Wallace and Geo. H. Webb

SHORTLY BEFORE THE CLOSE of the morning session yesterday, the American Railway Engineering Association paused in its deliberations for a few minutes to pay tribute to the memory of John F. Wallace, one of the organizers and the first president of the association, and to Colonel George H. Webb, a member of the Board of Direction. In referring to Mr. Wallace, L. A. Downs, president, said:

"I consider it a great personal privilege to preside this morning. I regarded Mr. Wallace as a father, and those of you who were present at the annual dinner last year will recall that he spoke of me as one of his boys. He started, like most of us, as a rodman on a railroad out west, and came to the Illinois Central as chief engineer, where I first knew him. He advanced step by step after he left the road, and he went to Virginia, taking me with him. He remained there only a few months when he came back as assistant to the second vice-president and finally was made general manager of the Illinois Central.

"He was then appointed by the President of the United States as one of the Canal Commissioners, and was later made its first chief engineer. An unusual thing happened on his resignation as chief engineer of the Panama Canal, for he was publicly rebuked by the then secretary of war, a man who afterwards became President of the United States and is now Chief Justice. It was an unwarranted and uncalled-for action.

"I had occasion to visit the Panama canal while it was building, and found that the plans originally made by

Mr. Wallace were carried out to their completion. All honor to Col. Goethals for completing the Panama canal, but let us not forget the man who made the plans that were carried out. Robert Emmet said when he was condemned to die: 'Let no man dare, when I am dead, to charge me with dishonor. Let no man taint my memory by believing that I could have engaged in any cause other than that of my country's liberty and independence. Let not my epitaph be written until my country takes her place among the nations of the earth. Then, and not until then, let my epitaph be written.' I say—let not the epitaph of John F. Wallace be written until a committee of engineers, unbiased by politics, decide whose brains it was that built the Panama canal.

"Mr. Wallace returned from the canal broken in health. I visited him quite often at his home, and when he recovered he became president of Westinghouse, Church, Kerr & Co., afterwards becoming a consulting engineer. He was one of the few engineers who capitalized his brains and reaped a satisfactory dividend from it. He died in the harness on July 4, 1921, when he was in Washington to testify before the Interstate Commerce Commission. I admired Mr. Wallace as an engineer. I esteemed him as a superior officer on the railroad where I worked, and I loved him as a man."

Further tributes were made to Mr. Wallace by Hunter McDonald, Charles S. Churchill, W. C. Cushing, A. S. Baldwin, C. F. Loweth, C. A. Morse, T. L. Condron, J. L. Campbell, G. J. Ray, E. H. Lee, Edwin F. Wendt and W. M. Camp.

Following the conclusion of the tributes to Mr. Wallace, A. S. Baldwin referred to the death of Colonel Webb, in which he said in part:

"He was a very fine character and a very able man. I have never dealt with a man whom I believed to be fairer or more straightforward in his dealings than was Colonel Webb. At the call of his country he entered

the service of the United States and served in Europe for the entire period of the war, returning to this country after serving with distinction as a colonel of the United States Army."

Further tributes were paid to Colonel Webb by S. E. Emmons, W. E. Biggs, G. A. Mountain, J. F. Deimling and E. T. Howson.

Report of the Committee on Track

Supplementing the specifications for frogs, switches, crossings, and guard rails adopted last year, specifications covering the general conditions and imperfections of manganese steel track castings are submitted for insertion in the Manual, in addition a few other recommended revisions and additions. A number of typical plans of turnouts, crossovers, etc., were submitted for adoption, while a few were submitted for information only. After collaborating with the Committee on Ballast, plans for a number of track tools were recommended. No definite conclusions have been arrived at in regard to the effect of brine drippings on the plates or the canting of rail.

W. P. Wiltsee
Chairman

W. P. Wiltsee is completing his fourth year as chairman and his sixth year as a member of the Track Committee. He also served the Roadmasters and Maintenance of Way Association as president last year, while he is now a member of the American Railway Association's Committee on Train Control. Mr. Wiltsee is principal assistant engineer of the Norfolk & Western. As chairman of the Track Committee he has been particularly successful in enlisting the co-operation of the manufacturers of special track work in the preparation of standard designs for frogs, switches and crossings, which will be satisfactory alike to the builder and the user.

1. THE COMMITTEE recommended that the additions to the Manual as submitted in Appendix A be approved.

Conclusions

1. The committee recommended that the additions to the Manual as submitted in Appendix A be approved.
2. The committee recommended certain plans for adoption and others to be received as information. Appendix B also covers a progress report on uncompleted work, and reassignment of the subject is requested.
3. The committee recommended that the plans submitted be adopted and that the subject be reassigned, that the preparation of specifications which could not be completed may be continued.
4. The committee recommended that the specifications submitted be adopted, and the committee be authorized to continue its work on this topic.
5. The committee recommended one plan for adoption and another to be received as information, and submitted a list of certain A. R. A. signal section plans, which it recommended for endorsement by the association, and a progress report to be received as information. The committee recommended that this subject be continued.
6. The tables submitted in Appendix A, Item III, and explanatory report in Appendix F completes the work of this sub-committee. The committee recommended that this subject be discontinued.
7. The committee recommended that the progress reports in Appendix G and Appendix H be accepted as information and that the subject be continued.

Committee: W. P. Wiltsee (N. & W.), chairman; J. V. Neubert (N. Y. C.), vice-chairman; L. B. Allen (C. & O.), V. Anger (Wm. Wharton, Jr., & Co.), J. B. Baker (Penna.), R. A. Baldwin (C. N. R.), C. W. Breed (C. B. & Q.), G. H. Bremner, H. G. Clark (C. R. I. & P.), E. A. Hadley (M. P.), G. W. Hegel (C. S.), E. T. Howson (*Railway Age*), T. T. Irving (G. T.), H. A. Lloyd (Erie), J. deN. Macomb (A. T. & S. F.), W. S. McFetridge (B. & L. E.), F. H. McGuigan, Jr. (U. S. R. A.), J. B. Myers (B. & O.), F. L. Nicholson (N. S.), J. H.

Reinholdt (M. & St. L.), G. J. Slibeck (Pettibone-Mulliken), J. B. Strong (Ramapo Iron Works), J. R. Watt (L. & N.).

Appendix A—Revision of the Manual

The committee recommended the following supplement to the Specifications for Switches, Frogs, Crossings and Guard Rails, adopted March, 1921:

MANGANESE STEEL TRACK CASTINGS

1. General Conditions.—Castings shall be reasonably smooth and true to pattern in accordance with good foundry practice. Large lumps, sharp fins, sand and chills on the outside of castings shall be removed. The castings shall be free from such blow holes, sand holes, cracks, cold shuts and other defects which would impair their serviceability and as further specified below. Castings must be out of twist and reasonably true, both as to general surface and alignment, and must not show any signs of straining or undue denting produced in the straightening process.

The bottom part of castings which rest on ties shall be reasonably straight and out of twist, and shall be free from lumps or such imperfections as would prevent a good bearing.

2. Imperfections.—Tread surfaces within 2½ in. of gage line and side of groove 1 in. down from tread shall be free from physical defects, such as shrinkage cracks, sand holes, blow holes, cold shuts or segregation of metal, unless such defects are so small that they have been practically removed by the finish grinding, and there must be no indication of unsoundness of the metal. Shrinkage cracks, cold shuts or segregation of metal will not be allowed in any part of the tread surfaces. Sand holes, blow holes, and cold shuts in portions of the casting where they will not appreciably weaken the casting, or impair its wearing qualities, will be permitted. Castings must be free from shrinkage cracks running vertically in web members of solid work or horizontally at or near the ends or in corners of junction of projecting members or longitudinally in grooves. Other small shrinkage cracks which do not materially weaken the casting will be acceptable.

ITEM II

The committee recommended that plan No. 252, dated November, 1921, and titled "Details of Lamp Tips for Switch Stands," be adopted, and that Section 12 of "Requisites for Switch Stands, Including Connecting

Rods," adopted March, 1921, be revised to refer to this plan, to read:

"12. Lamp tips shall conform to plan No. 252."

In reference to article "Gage on Curves," adopted, Vol. 11, Part 2, 1910, pp. 942, 954, 955; Vol. 16, 1915, pp. 733, 1145, reading:

"GAGE ON CURVES"

Present

"Curves 8 deg. and under should be standard gage. Gage should be widened $\frac{1}{8}$ in. for each 2 deg. or fraction thereof over 8 deg., to a maximum of 4 ft. $9\frac{1}{4}$ in. for tracks of standard gage. Gage, including widening due to wear, should never exceed 4 ft. $9\frac{1}{2}$ in.

"Where frogs occur on the inside of curves, the gage at the frog should be standard or the flangeway of the frog should be widened to compensate for the increased gage."

Proposed

For general conditions in main line tracks, curves 8 deg. and under should be standard gage. Gage should be widened $\frac{1}{8}$ in. for each 2 deg. or fraction thereof over 8 deg., to a maximum of 4 ft. $9\frac{1}{4}$ in. for tracks of standard gage, including widening due to wear, should never exceed 4 ft. $9\frac{1}{2}$ in.

Where frogs occur on curves, the gage at the frog should be standard or the flangeway of the frog should be widened to compensate for the increased gage.

For the widening of gage and flangeways on curves for the operation of specific locomotives or for special conditions and for curved crossings, refer to Tables No. 1 and No. 2 for "Gages and Flangeways in Curved Track."

The committee recommended that the following supplementary tables be adopted and published in the Manual:

Table No. 1, dated November, 1921, and entitled "GAGES AND FLANGEWAYS IN CURVED TRACK"

Table No. 2, dated November, 1921, and entitled

"GAGES AND FLANGEWAYS IN CURVED TRACK—GAGE DIAGRAMS FOR RIGID WHEEL BASE LOCOMOTIVES"

An explanation of these tables is given in Appendix F.

Appendix B—Typical Plans of Turnouts, Crossovers, Slip Switches, Double Crossovers and Railroad Crossings

The committee recommended the following plans for adoption:

Bolted Rail Crossings

- Plan 701. Three rail design, angles 90 deg. to 50 deg. inclusive.
 Plan 702. Two rail design, angles 90 deg. to 50 deg., inclusive.
 Plan 703. Three rail design, angles below 50 deg. to 35 deg., inclusive.
 Plan 704. Two rail design, angles below 50 deg. to 35 deg., inclusive.
 Plan 705. Three rail design, angles below 35 deg. to 25 deg., inclusive.
 Plan 706. Two rail design, angles below 35 deg. to 25 deg., inclusive.
 Plan 707. Single rail design and two rail design with short easer rails, angles below 25 deg. and above 14 deg. 15 min.
 Plan 708. Single rail design and two rail design, angles below 25 deg. and above 14 deg. 15 min.
 Plan 709. Single rail design and two rail design with short easer rails, angles 14 deg. 15 min. to 8 deg. 10 min., inclusive.
 Plan 710. Single rail design and two rail design, angles 14 deg. 15 min. to 8 deg. 10 min., inclusive.

Manganese Steel Insert Crossings

- Plan 711. Design and dimensions of inserts, angles 45 deg. to 14 deg. 15 min., Detail "A."
 Plan 712. Design and dimensions of inserts, angles 45 deg. to 14 deg. 15 min., Detail "B."
 Plan 713. Design and dimensions of inserts, angles 14 deg. 15 min. to 8 deg. 10 min., inclusive.
 Plan 714. Three rail design, angles below 15 deg. to 35 deg., inclusive, Detail "A."
 Plan 715. Two rail design, angles below 45 deg. to 35 deg., inclusive, Detail "A."

Plan 756. Three rail design, angles below 35 deg. to 25 deg., inclusive, Detail "A."

Plan 757. Two rail design, angles below 35 deg. to 25 deg., inclusive, Detail "A."

Plan 758. Two rail design with short easer rails, angles below 25 deg. and above 14 deg. 15 min., Detail "A."

Plan 759. Two rail design, angles below 25 deg. and above 14 deg. 15 min., Detail "A."

Plan 760. Single rail design with short easer rails, angles below 25 deg. and above 14 deg. 15 min., Detail "A."

Plan 761. Single rail design, angles below 25 deg. and above 14 deg. 15 min., Detail "A."

Plan 762. Three rail design, angles below 45 deg. to 35 deg., inclusive, Detail "B."

Plan 763. Three rail design, angles below 35 deg. to 25 deg., inclusive, Detail "B."

Plan 764. Two rail design with short easer rails, angles below 35 deg. to 25 deg., inclusive, Detail "B."

Plan 765. Two rail design with short easer rails, angles below 25 deg. and above 14 deg. 15 min., Detail "B."

Plan 766. Single rail design with short easer rails, angles below 25 deg. and above 14 deg. 15 min., Detail "B."

Plan 767. Two rail design, angles 14 deg. 15 min. to 8 deg. 10 min., inclusive.

Plan 768. Single rail design, angles 14 deg. 15 min. to 8 deg. 10 min., inclusive.

Twelve of the above crossing plans were presented as information in report for annual meeting of March, 1921. These were resubmitted with such revisions as were found desirable, with additional plans to make the set complete.

The committee also recommended that the following plans be received as information only:

Plan 801. No. 8 double slip switch with movable center points with uniform risers.

Plan 802. No. 8 double slip switch with movable center points with graduated risers.

Plan 851. Details of No. 8 double slip switch with movable center points with uniform risers.

Plan 852. Details of No. 8 double slip switch with movable center points with graduated risers.

Appendix D—Specifications and Unit Track Work Schedules for Contracting Maintenance Work

The committee has confined its attention this year to the preparation of specifications and unit schedules for those classes of work which lend themselves most readily to unit measurements. Specifications and unit schedules are therefore presented for (1) the laying of rail, (2) the stripping of track, the removal of ties and the re-spacing of ties and (3) for ballasting.

SPECIFICATIONS FOR THE RELAYING OF RAIL

(1) The railway company's authorized representative shall arrive at a clear understanding with the contractor as to the force to be employed, the speed with which it is desired to have the work proceed, and the general traffic situation in the territory to be relaid, in order that proper plans may be made to proceed economically with the work specified. Prior to starting the work the contractor shall notify the railroad company's representative a sufficient time in advance so that speed and traffic restrictions in the territory in which the work is to be performed may be arranged with the operating department of the railway company.

(2) Rail must be closed for all scheduled passenger trains and as soon as possible after arrival, for all freight trains.

(3) Rail may be closed temporarily for the passage of trains during the hours while the work is in progress, inserted according to the standards of the railway company. All connections left in the track over night must be made with rails of full section and standard angle bars or joints. The railway company shall provide and the contractor shall pay for competent flagmen during the continuance of this work, to flag in accordance with the rules of the company for the protection of the work and traffic.

(4) The railway company will unload and distribute all rail, joints, bolts, spikes, tie plates, rail anchors and other materials to be inserted in the track.

(5) The contractor shall provide all tools needed in connection with this work.

(6) The railway company will provide the necessary inspector or inspectors and the instructions of such inspectors regarding the quality and type of work to be done shall be complied with at all times by the contractor.

(7) The contractor shall supply the necessary foremen and labor to prosecute the work properly and in such numbers as may be required by the chief engineer or his authorized representative, and at the request of the chief engineer or his representative will remove any foreman or man not satisfactory to the railway company.

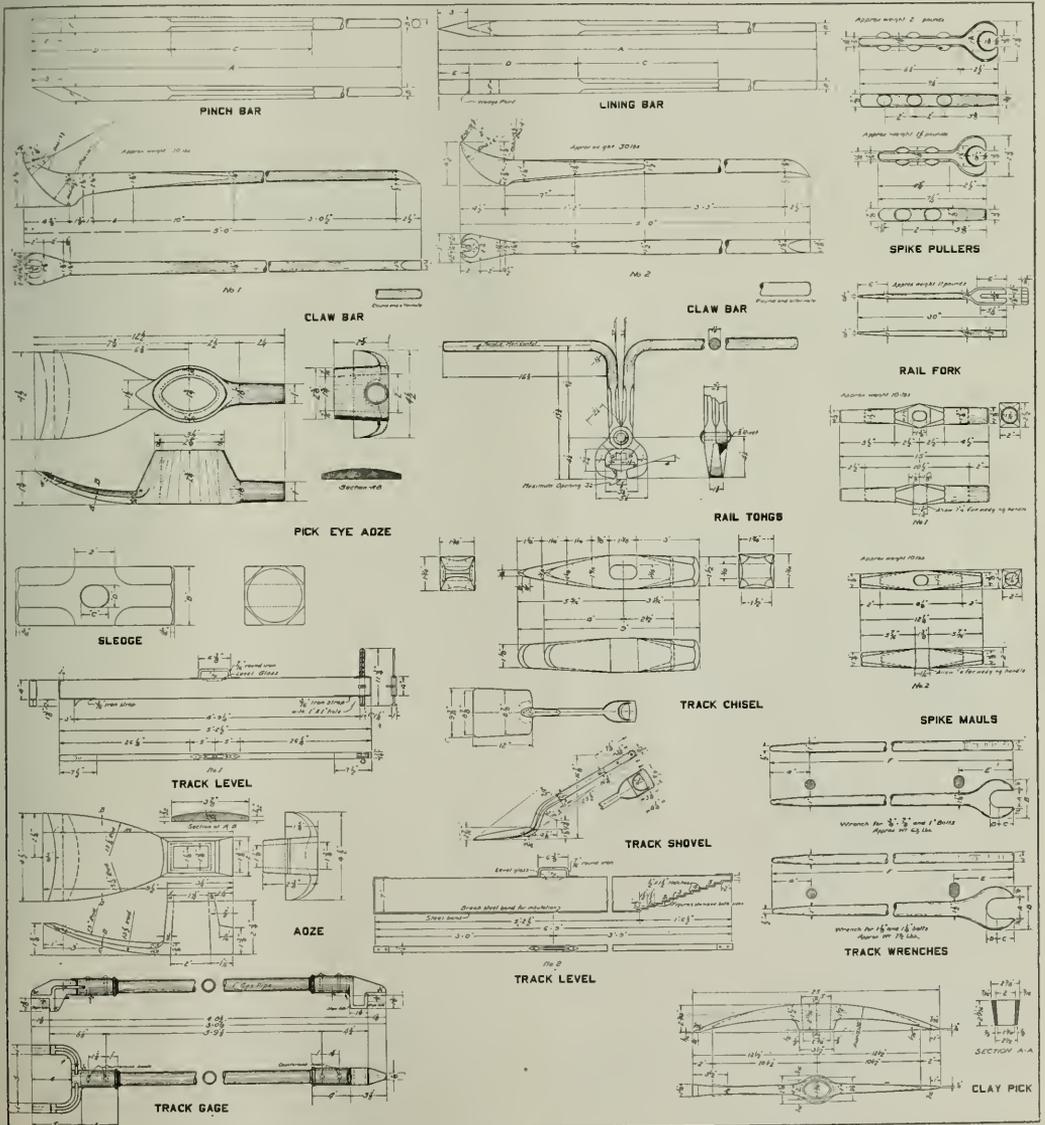

(8) Trains must not be permitted to use the track on tangents with spikes out of more than two consecutive ties and not more than six ties to any one rail, or on curves with the spikes removed from two consecutive ties. Proper gage must be maintained and all ties on which the rail does not have a full bearing must be tamped up and spikes driven down to avoid bending the rail.

(9) Track must not be allowed to go over night with spikes drawn in advance of the work.

(10) All spike holes must be plugged prior to adzing ties for rail or tie plate bearing.

(11) Ties must be adzed carefully, giving full bearing with the least possible cutting of ties. The bottom of the rail, the tie plate and the bearing surface of the tie shall be cleaned before the rail is laid. When replacing rail with rail of the same section, unless changing or adding tie plates, only two rows of spikes may be drawn, provided proper gage is maintained; in replacing rail with different section, three or four rows of spikes shall be drawn, as is necessary.

(12) Tie plates, when furnished, must be applied in a workmanlike manner at time rail is laid to avoid unnecessary spiking and must be so placed that the shoulder is in contact with the base of rail or the splice bar for the entire length of the shoulder.

(13) Metal expansion shims must be used to provide for the proper openings between the rails and a thermometer shall be used to determine the thickness of the shims to be used, in accordance with the standards of the American Railway Engineering Association.

(14) At the close of each day's work all joints shall be full bolted, the bolts made tight and the rail full spiked.

(15) Necessary gaging must be done at the time rail is laid and should conform to the railway company's standard practice.

(16) Old rail must be left parallel with the track with joints uncoupled and all old bolts, nuts, spikes, tie plates, joints, etc., must be gathered up and left in neat piles on the ground, separated as between usable and scrap material in accordance with the railway standards, convenient for picking up by work trains.

(17) Excess material distributed for rail laying must be picked up by the contractor and taken ahead where it can be used.

(18) In laying rail on tangents the staggering of joints must be provided and in laying rail on curves care must be taken to put in short length rails at proper intervals in the low rail and to maintain the proper stagger throughout the curve.

(19) As far as possible all joints should be kept out of street and road crossings, using long or short rails for this purpose.

(20) Rails must be spiked in full to each tie. The inside and outside spikes shall be as far apart as the face and character of the tie will permit. The inside spikes shall be on the same side of the tie.

(21) All spikes shall be started vertically and square with the rail and so driven that the face of the spike shall have a full hold on the base of the rail. Spikes must not be straightened while being driven.

(22) Spikes must be drawn carefully with a view of using them again.

(23) All switches, frogs and guard rails must be placed in accordance with the railway company's standards.

(24) Switches must be left in proper adjustment, special care being given to bending of the stock rail.

(25) The contractor must restore and secure promptly all stock-guards, crossing plank, or other facilities displaced by reason of the rail laying, and must replace all safety and foot blocking removed in changing out switches, frogs and guard rails.

(26) The contractor is to understand that any work not specifically mentioned in the specifications, but which is necessary, either directly or indirectly, for the proper carrying out of the intent thereof, shall be required and applied, and he shall perform all such work just as if it were particularly delineated or described. Unless specifically mentioned above, all work shall conform to the standards of the railway company.

SPECIFICATIONS FOR THE BALLASTING OF TRACK BY CONTRACT

(1) The railway company's authorized representative shall arrive at a clear understanding with the contractor as to the force to be employed, the speed with which it is desired to have the work proceed, the source of ballast supply and the general traffic situation in the territory to be ballasted, in order that proper plans may be made to proceed economically with the work specified. Prior to starting the work the contractor shall notify the railway company's representative a sufficient time in advance so that speed and traffic restrictions in the territory in which the work is to be performed may be arranged with the operating department of the railway company.

(2) The railway company will provide the necessary inspector or inspectors, and the instructions of such inspectors regarding the quality and type of work to be done shall be complied with at all times by the contractor.

(3) The contractor shall supply the necessary foremen and labor to prosecute the work properly and in such numbers as may be required by the chief engineer or his authorized representative, and at the request of the chief engineer or his representative will remove any foreman or man employed not satisfactory to the railway company.

(4) The railway company shall provide and the contractor shall pay for competent flagmen during the continuance of this work, to flag in accordance with the rules of the company for the protection of the work and traffic.

(5) Where required, links shall be widened to the proper width prior to starting ballast work and a sufficient time in advance so that there will be no interference. Such widening of embankments and the proper grading of public or private cross-roads shall be done by the railway company unless specific instructions are given by the representatives of the railway company to the contractor to do such work.

(6) If the contractor is to do link widening work, specifications for such work must be provided.

(7) Grade stakes will be set to the proper grade by the

representative of the railway company before the ballast material has been dumped and spread.

(8) All tile, box or other drains required to take care of water between the tracks shall be placed before the ballast material is unloaded.

(9) The railway company will supply all equipment and train crews required for the loading, transporting, unloading and spreading of the ballast. The contractor shall supply all tools needed in connection with this work.

(10) The railway company shall furnish all ballast as required in its own cars and shall transport and switch such ballast free of cost to the contractor to the point where it is to be applied.

(11) Ballast shall be unloaded by the contractor by dumping or plowing as the means provided by the railway company permit. If the ballast is in center dump cars it shall be unloaded by having one or more cars opened at a time, allowing the required amount of ballast material to flow out as the train is moved along slowly. If the material is on flat or open cars, it shall be plowed off by means of an unloading machine while the train is moving at such a rate of speed as to provide the desired amount of material as uniformly distributed as possible. The unloaded material shall be leveled down by means of a ballast plow or spreader. Care shall be taken not to destroy or disturb the grade stakes.

(12) The preliminary surfacing gang shall follow the unloading as closely as the regularity of the ballast supply will permit. In using jacks, they must be placed close enough together to prevent undue bending of the rail or strain on the joints. Both rails must be raised at one time and as nearly uniformly as possible. The track shall be so lifted that after a period of not less than three days after the last lift it will be necessary to give it a final lift of not less than one inch nor more than two inches to bring it to the grade of the stakes. All ties that are pulled loose or renewed shall be replaced to proper position and must have a bearing against the rail and be fully spiked, with all spikes driven home before tamping. In driving spikes, all spikes shall be started vertically and square with the rail, and so driven that the base of the spikes shall have a full hold on the rail. Spikes must not be straightened while being driven. Ballast shall be well packed or tamped with pick, shovel, tamping bar or tamping machine, as directed, from a point eighteen inches inside of each rail on both sides of the ties to the end of the ties, tamping the outside of the tie first.

(13) When the track has been raised to within one or two inches of the final grade and properly compacted by traffic, a finishing lift shall be made by jacking up the track to the exact height provided for by the grade stakes. All allowance for settlement shall be taken care of in the setting of the stakes and the necessary ballast forked or shoveled in, and then driven to place by tamping machines, tamping picks, bars or shovels, as directed by the proper representative of the railway company. In making the finishing lift the spot board and level board must be used with care and the track brought to as true a surface as possible.

(14) The track shall be placed in good alignment before the finishing lift is made, but a lining gang shall follow one or two days behind the finishing lift and shall spot in all places found not to be holding up to proper surface, and shall line the track to as accurate an alignment as possible. Center stakes shall be set for the alignment before the finishing lift is made and the final alignment must conform to the center stakes.

(15) The contractor shall trim the ballast to conform to the standard roadbed section, and the railway company for this purpose shall supply its standard cross-section template. The portion of the sub-grade outside the ballast line shall be left with a full even surface and the shoulder of the embankment properly dressed to the standard roadbed section. The contractor shall dispose of any surplus ballast after trimming the ballast section as directed by the representative of the railway company.

(16) The contractor must restore and secure promptly all stock-guards, crossing plank, or other facilities displaced by reason of the ballasting.

(17) After ten days' use of the track by the railway company the contractor shall go over same and surface and line low joints and spots which may have developed without extra charge to the railway company.

(18) The contractor shall remove from the railway company's property all rubbish and waste from any ballast work, or dispose of it as directed by the representative of the railway company. After completing the work the contractor shall remove from the railway company's property, and from all public and privately-owned property, at his own expense all temporary structures and waste resulting from his camping operations.

(19) In measuring the work, lining, surfacing and trimming turnouts and crossovers shall be considered as main track.

(20) The contractor is to understand that any work not specifically mentioned in the specifications, but which is necessary, either directly or indirectly, for the proper carrying out of the

intent thereof, shall be required and applied, and he shall perform all such work just as if it were particularly delineated or described. Unless specifically mentioned above, all work shall conform to the standards of the railway company.

SPECIFICATIONS FOR THE STRIPPING OF TRACK, THE RENEWAL OF TIES AND THE RESPACING OF TIES

(1) The railway company's authorized representative shall arrive at a clear understanding with the contractor as to the force to be employed, the speed with which it is desired to have the work proceed, the source of ballast supply and the general traffic situation in the territory in question, in order that proper plans may be made to proceed economically with the work specified. Prior to starting the work the contractor shall notify the railway company's representative a sufficient time in advance so that speed and traffic restrictions in the territory in which the work is to be performed may be arranged with the operating department of the railway company.

(2) The railway company shall furnish the ties required for renewal purposes at convenient points along the right-of-way.

are sidetracks on each side of the main track, the side track ties must be lined to the outside of such tracks.

(9) Picks should not be stuck into a tie to drag it into place, nor should ties be struck on the end with a tamping pick or spike maul. Tie tongs should be used to handle all ties.

(10) When old ties are taken from track, all tie plates and spikes must be carefully removed and preserved. The old ties shall be neatly piled for such inspection and disposition as the railway company's rules require.

(11) Ties should not be stood on end in close cuts.

(12) All treated ties shall be dated and where standard galvanized dating nails are used they shall be applied the day the ties are placed in the track. The position of the nail should be in accordance with standard instructions for that year.

(13) The spiking of the rails shall be done as directed by the railway company's representative. Where splices are slotted, spikes must be driven in the slots, except on bridges and open deck trestles, where spikes must not be driven either in the slots or against the ends of the splices. Two spikes shall be used with tie plates except when otherwise directed by the railway company's representative, only good or new spikes to be used. Spikes must be driven plumb and touching the base of the rail, so that when driven they will hold the rail to gage, and the under side of the head will have full bearing on the base of rail. They must be driven down until the head is tight against the rail, but no further blows should be struck after the spike has been driven home. Every hole from which a spike is drawn must be plugged in advance of the adzing. Spikes much be drawn carefully with a view of using them again.

(14) Joint ties shall be spaced in accordance with the railway company's standard plans, intermediate ties shall be spaced uniformly and all ties shall be laid square with the rail. The number of ties per rail shall be as required by the railway company's standard plans.

(15) The contractor is to understand that any work not specifically mentioned in the specifications, but which is necessary, either directly or indirectly, for the proper carrying out of the intent thereof, shall be required and applied, and he shall perform all such work just as if it were particularly delineated or described. Unless specifically mentioned above, all work shall conform to the standards of the railway company.

Table 1—Gages and Flange-Ways in Curved Track. TABLE No. 1. RIGID WHEEL-BASE LOGISTIC AND GAGE. Includes columns for 3 Spikes, 4 Spikes, 5 Spikes, 6 Spikes, 7 Spikes, 8 Spikes, 9 Spikes, 10 Spikes, 11 Spikes, 12 Spikes, 13 Spikes, 14 Spikes, 15 Spikes, 16 Spikes, 17 Spikes, 18 Spikes, 19 Spikes, 20 Spikes. Includes notes on minimum practical gage, distance between wheels, and allowances for play at journals.

Table 1—Gages and Flangeways in Curved Track

(3) The contractor shall supply all tools needed in connection with this work.

(4) The railway company shall provide the necessary inspector or inspectors and the instructions of such inspectors regarding the quality and type of work to be done shall be complied with at all times by the contractor.

(5) The contractor shall supply the necessary foremen and labor to prosecute the work properly and in such numbers as may be required by the chief engineer or his authorized representative, and at the request of the chief engineer or his representative will remove any foreman or man employed not satisfactory to the railway company.

(6) The track shall be skeletonized to not exceed two days in advance of the unloading of the ballast. Where the old material is suitable for sub-ballast and conditions permit the raising of the track, it will be raised and the old material spread under and between the ties to the proper width as uniformly as practicable. When conditions do not permit the raising of the track, the old material shall be removed to the required depth and disposed of as directed, or where the material is not suitable for sub-ballast, it shall be removed to the plane of the bottom of the ties, or deeper if necessary to preserve the grade line, and shall be placed on the outer shoulder of the road bed, preferably at such points as will tend to even up the line of the shoulder. Upon the completion of this work the surface of the sub-grade shall be sloped with reasonable uniformity so as to provide proper drainage to the shoulder of the embankment.

(7) Following the skeletonizing of the track, all old ties which are not fit for more than one year in track where gravel or cinder ballast is to be used, or for more than two years in track where stone or hard slag is to be used, shall be removed and new ties inserted in their places. The largest and best ties shall be used at the joints. The heart side of ties should generally be turned down, but they should be laid so as to obtain the best bearing. The adzing shall be done carefully and so as to provide full bearing for the tie plate or rail, with the least cutting possible to obtain bearing on solid wood.

(8) On single track ties shall be lined with the line rail on tangents, and with the inside rail on curves. On double track ties shall be lined to the outside of both tracks. Where there

Appendix E—Plans and Specifications for Switch Stands, Switch Lamps and Switch Locks

In Appendix A, Item II, plan 252, covering details of lamp tips for switch stands, was submitted for adoption as a supplement to the Manual, completing Section 12

Table 2—Gages and Flangeways in Curved Track. TABLE No. 2. GAGE DIAGRAMS FOR RIGID WHEEL-BASE LOGISTICS. Includes diagrams for guarded curves and plain unguarded curves. Includes notes on minimum practical gage, distance between wheels, and allowances for play at journals.

Table 2—Gages and Flangeways in Curved Track

of Requisites for Switch Stands, including Connecting Rods, adopted March, 1921.

The committee submitted plan No. 254 of 10-inch and 9-inch day target gages for attachment direct to switch lamps for low and extra low switch stands, and recommended that it be adopted as standard. This is an outline plan only and conforms to dimensions on A. R. A. Signal Section plan No. 1445 for the 10-inch day disc, to which reference is made for further details.

The committee also recommended that the following A. R. A. Signal Section plans of switch lamps be ap-

proved and endorsed without publication in the A. R. E. A. records:

Plan 1440. Switch lamp (spherical type), approved March, 1921.

Plan 1441. Switch lamp base-socket for spherical type switch lamp (Plan 1440), approved March, 1921.

Plan 1442. Lens, hoods and couplings for switch and semaphore lamps (see plans 1440 and 1460), approved March, 1921.

Plan 1443. Oil fount for spherical type lamp (Plan 1440), approved March, 1921.

Plan 1460. Switch lamp (cylindrical type).

Plan 1461. Switch lamp base-socket for cylindrical type switch lamp (Plan 1460).

Appendix F—Gages and Flangeways for Curved Crossings

Tables 1 and 2 are submitted in Appendix A, Item III, for adoption and publication in the Manual. Table 1 is based on the theoretical study submitted in last year's report. The columns on the left give the approximate rigid wheel base of locomotives in combination with the number of pairs of flanged drivers stated that will operate on the gage of the track shown on the right under "Degrees of Curvature." Two columns are given for the wheel bases; one for plain, unguarded curves, and the other for guarded curves and curved crossings.

Table 1 is sufficiently correct for general practical purposes. The figures for the gage are within $\frac{1}{8}$ in. and the figures for the wheel base within 6 in. in order to avoid the use of smaller fractions.

For finding the more nearly exact gage necessary for a given locomotive on a given curve in cases where it may be desirable, the graphic Table 2 is also submitted.

Discussion

(Chairman Wiltsee presented the report and moved the adoption of plans 701 to 710, bolted rail crossings.)

C. W. Baldrige (A. T. & S. F.): I do not find any built-up crossing showing an easer rail extending beyond the joint of the rail. I have had occasion to follow up some crossings with long easer rails, as compared with short easer rails, and an easer rail extending the matter of 14 or 18 in. beyond the joint will last longer than a similar crossing with a short easer rail.

(Motion carried.)

Mr. Wiltsee: I move the adoption of Plans 751 to 768 inclusive—Manganese Steel Insert crossings. These plans have been before the committee for several years, and are the result of the work of the Committee of Manganese Track Society in this committee.

(Motion carried.)

There seemed to be some misunderstanding. We did not print in this addendum the specifications which should have accompanied these crossing frog plans, and I will read them.

(Mr. Wiltsee then read the following):

APPLICATION OF CROSSING DESIGNS AND RECOMMENDED PRACTICES

1. Plans Nos. 701 to 710, inclusive, for bolted rail crossings, and plans Nos. 751 to 768, inclusive, for manganese steel insert crossings, are applicable for all rail sections from 80 pounds per yard up, and from 2½ to 3 in. inclusive, width of head.

2. The plans represent recommended practice for general conditions and are subject to modifications under special conditions. Added features such as guard rails or easer rails extended beyond the end joints may be specified without departing from the general design.

3. The single rail design for crossings below 25 deg. angles are recommended only for tangent track or for curved track not exceeding 6 deg.

4. Plain center frogs are not recommended below 8 deg. 15 min. on tangent track. For curved track the recommended bottom angle to road center frogs is 9 deg. 30 min. for curves 6 deg. and under, increasing one degree for each 2 degrees of angle over and under, to a maximum angle of 15 deg. 30 min. for 15 deg. curve and over. Movable point crossings are recommended below 15 deg. curve.

5. The gage of crossings in tangent track and curves up to 6 deg. shall be standard of 4 ft. 8½ in., and flangeway standard of 1¾ in. wide. In crossings on sharper curves the gage and width of flangeway shall be widened, if required, to suit the equipment operating through them. For economy in maintenance, curved crossings requiring wider than 4 ft. 9 in. gage, and 2¼ in. flangeway are not recommended.

6. In laying out bolted rail crossings to a given angle falling within the limits given on typical plans, follow general design, adjusting bolt spacing to suit angle, using number of bolts shown on plan.

7. Designs with easer rails are recommended for all but light traffic.

8. The use of base plates (either corner plates or continuous plates) is recommended for all bolted rail crossings from 35 deg. up and for designs with easer rails below 35 deg. For crossings of frog construction, 14 deg. 15 min. and under, special tie plates may be used in place of base plates.

9. For manganese steel insert crossings the size of the insert is determined by the formulae on plans Nos. 751, 752 and 753, for angle "A" of crossing expressed in degrees and decimals of a degree, and typical design followed in all other respects. For angles from 45 deg. to above 14 deg. 15 min. the plans cover two general types marked Detail "A" and Detail "B," respectively, to be selected as may be preferred.

10. Base plates on manganese steel insert crossings are recommended for all angles above 14 deg. 15 min. For crossings of frog construction, 14 deg. 15 min. and under, special tie plates may be used when so specified.

The President: Is there any discussion of these specifications?

J. V. Neubert (N. Y. C.): As I understand it, these are not specifications, but merely explanations of these plans.

Chairman Wiltsee: If it is in order, I will move the adoption of these explanations to be printed with the plan in the Manual.

Earl Stimson (B. & O.): In seconding the motion I would like to express confidence in the committee, that what they have to offer is not a specification, but merely an explanation, and that the plan would be rather incomplete unless that was included.

Mr. Neubert: I feel it is very improper to print something as recommended practice that has not been considered by the association.

E. A. Frink (S. A. L.): It will be unfortunate if this committee has to see the results of its work carried over for another year. A large part of it is explanatory, which we can adopt without question.

(A motion was then made to read the section by paragraphs, after which the entire section was adopted.)

(The motion to include the matter under consideration in the Manual was put and carried. Chairman Wiltsee then presented revisions of the Manual (Appendix A) which was adopted. T. T. Irving ((Grand Trunk)) then presented Appendix C on track tools and said):

"There is one dimension missing in the pick eye adze. In the elevation drawing the bottom dimension should be marked 3 in."

Chairman Wiltsee: I move the adoption for printing in the Manual of the following plans: Pinch bar, living bar, claw bar, track wrenches, adze, pick eye adze, spike pullers, rail fork, track gage, rail tongs, track chisel, clay pick, spike mauls, sledge, track level, track shovel.

C. E. Lindsay (N. Y. C.): The limit of wear on lining bars and switch bars is indicated in outline in the drawings by a measurement from the initial point of the bar. If the point is worn off there is no place to measure from. Also, I think it necessary to show the owner's name on the bar as the manufacturer's name. Why is it necessary to have bars of 18 lb. weight and bars of 20 lb. weight? Why not have two classes—18 lb. and 20 lb.?

Mr. Baldrige: The size of the jaws of the rail tongs appear unnecessarily close to the size of the present rail head. Rail tongs ordinarily last a good while and it would be better to allow a little larger spread and depth

to take care of a variation greater than is shown. I believe that 2¼ in. depth, which is the amount allowed here, is hardly enough clearance to protect against what may occur in the design of rail heads in the future, and there is no reason for holding to a close fit between the depth of the grip of the tongs and the rail head.

L. J. F. Hughes (C. R. I. & P.): In determining upon a design of track gage was the type of gage considered in which there is a curved fillet on the face that bears against the rail to allow for a possible bead on the rail? If this has been considered what are the reasons for not embodying this feature in the one set forth as standard?

Earl Stimson (B. & O.): The double-ended track wrench is in quite general use and I would like to have some expression from the committee as to why they limit the design to the single-ended wrench.

Chairman Wiltsee: The question of the track gage with a beaded edge to take care of the lip on the rail was before the committee and discussed considerably. On account of the wear, and not being able to get a very strong gage, especially at that point, the committee thought that this type of gage, which provides for gaging the track at a gage point ⅝ in. below the top, was a strong gage and better in all respects. In regard to the double-ended track wrench, the committee did consider that question, but decided that the single end wrench was preferable, although there is no objection to using a double-ended wrench if anyone desired. I think that ordinarily for rail-laying gangs the single-ended wrench is preferable, particularly with the drift end, but possibly on a section the double-ended wrench may be preferable. I did not include the track shovel in my motion to adopt this plan.

Mr. Baldrige: I am inclined to agree with the gentleman that spoke in regard to the track gage. This form of track gage as shown is all right to put on new rail, but practically all rail of the present day acquires a V, or an overhang projection on the gage side of the rail after comparatively short service. On the Santa Fe we use a gage which provides a recess at the upper corner under the gage at the gage point to take care of that irregularity in the head of the rail, and I think that such a gage is preferable to the one shown.

(The portion of the report in Appendix D was presented by E. T. Howson (*Railway Age*), chairman sub-committee.)

Chairman Wiltsee: *I move the adoption of the specifications in Appendix D be adopted and printed in the Manual.*

Mr. Stimson: Will the committee please state whether the unit track work schedules are to be made part of the specifications, and if not, just what they are supposed to be.

Mr. Howson: The unit track work schedules were submitted in accordance with our instructions and also as an example of the operations included within this specification.

Mr. Baldrige: I suggest, that a clause be inserted between articles 19 and 20, in the specifications for relaying rail, reading:

"New rail shall be so laid that insulated joints will be brought near enough to the old location of the insulated joints so that it will not be necessary to move trunking, wiring, etc.

Chairman Wiltsee: The committee will accept that amendment.

W. C. Barrett (L. V.): Has the committee considered in this specification for laying rail, the use of machines by contractors? Apparently the specification calls only for the laying of rail by hand.

Mr. Howson: The committee soon realized that it must confine its specifications to those details of work which were of fairly common application and endeavored to provide a skeleton and the basic principles which would serve any individual road, so reference to the use of mechanical equipment, which varies in detail, was left out.

Chairman Wiltsee: If the members will apply these specifications to their own conditions, they will find some few changes or revisions, which are naturally to be expected. I just had occasion to do this on our own road, and found that I had only a few changes to make to suit our conditions.

Mr. Lindsay: I would dislike very much to see this convention degenerate into a rubber-stamp. The committee gave no indication that this subject was to be included in the Manual. I think we should jealously safeguard the Manual. The whole subject of contract work is boiling. Nobody knows where we are. These specifications will be of value in guiding those who are undertaking other processes, but I submit that there has not been sufficient time to study this subject in its entirety and to go into it as it should be done before it is inserted in the Manual. *I therefore move to amend the motion to the effect that this subject be accepted as information and placed in the Proceedings.*

Mr. Stimson: I must say I concur fully in Mr. Lindsay's amendment. The question asked the committee was not answered with sufficient clearness as to just what use or what purpose unit track work schedules serve in the specification.

(*Mr. Lindsay's motion was adopted; also the original motion as amended.*)

(That portion of the report on plans and specifications for switch stands, switch lamps and switch locks was presented by J. deN. Macomb, A. T. & S. F., chairman of the sub-committee. Appendix E was then discussed and this was followed by a reference to six Signal section plans, the intention being to read them into the Manual, but not to republish the drawings or material as it is a duplication of Signal section material. In that connection the committee felt that this is the border line between the Signal section's jurisdiction and A. R. E. A. jurisdiction, and that recognizing the Signal section's standard is as far as it could go.)

Chairman Wiltsee: *I move the adoption and printing in the Manual of Plan No. 254 of 10 and 9 in. targets.*
(*Motion carried.*)

Chairman Wiltsee: *I move the adoption for printing in the Manual of our approval of the Signal section plans Nos. 1440-41-42-43-1460-61, these to be approved and endorsed without publication of the plans.*

(*Motion carried.*)

Chairman Wiltsee: (Reading on pp. 671 and 672.) *I move the adoption for printing in the Manual of Plan No. 252, and also the revision of Sec. 12 as proposed.*

(*Motion carried.*)

(Appendix F was presented by V. Angerer, chairman of sub-committee on Gages and Flangeways for Curved Crossings.)

Chairman Wiltsee: *I move that Tables Nos. 1 and 2 be adopted and printed in the Manual.*

(*Motion carried.*)

Chairman Wiltsee: There is revision of the Manual necessary in connection with Gage on Curves in Appendix A.

I move that these be adopted and printed in the Manual.

(*Motion carried.*)

On the subject, "(a) Tests of tie plates subject to

brine drippings; (b) effect of brine drippings on track appliances," we expect to conduct further inquiries and the committee will report at a later time.

The next subject is: "Investigation on reduction of

taper of tread to 1 in 38 and on canting the rail in track inward." The sub-committee has not been able to get much of value, and the report is submitted as information.

Report on Shops and Locomotive Terminals

The dependable operation of ash pits hinges on such factors as the use of mechanical equipment to make work more attractive to labor, the availability of spare parts to insure uninterrupted service, the provision for liberal storage space for ashes and their actual disposal. The recommendations of the committee outline how dependability may be obtained under different circumstances and with different classes of equipment. The committee presents a plan of a typical engine terminal for a 30-stall house and shop facilities with suggestions for adapting the plan to lesser needs. The design provides also for a future expansion of 100 per cent.

F. E. Morrow
Chairman

F. E. Morrow is finishing his second year as chairman of this, the newest of the association's standing committees, its appointment having been authorized only two years ago. In his capacity as assistant chief engineer of the Chicago & Western Indiana, the largest terminal railway in the Chicago district, Mr. Morrow is brought into daily contact with the problems of the committee. Because of this concentration upon terminal matters he is particularly well fitted to direct the committee in the development of its plans for the preparation of standard designs of the various types of terminal buildings and allied facilities for a period of over ten years.

THE COMMITTEE recommended that the findings and conclusions on Ash Pits, as embraced in the summary of Appendix A, be adopted and placed in the Manual in lieu of the material now appearing in the Manual under this subject.

The committee recommended that the findings and conclusions on Ash Pits, as embraced in the summary of Appendix A, be adopted and placed in the Manual in lieu of the material now appearing in the Manual under this subject.

The committee recommended that the findings and conclusions on Engine Houses, as shown in Appendix B under recommended changes in Manual, be adopted and placed in the Manual.

The committee recommended that the reports on Engine House Layouts and Car Shops, as shown in Appendices C and D, be accepted as information only and incorporated in the Proceedings.

Committee: F. E. Morrow (C. & W. I.), chairman; A. T. Hawk (C. R. I. & P.), vice-chairman; C. N. Bainbridge (C. M. & St. P.), Leland Clapper (D. & T. R.), George H. Gilbert (Son.), F. M. Haas, G. W. Harris (A. T. & S. F.), L. P. Kimball (B. & O.), M. A. Long, J. W. Pfau (N. Y. C.), John Schofield (C. N. R.), A. M. Zabriskie (C. of N. J.), G. W. Burpee, W. H. Cookman (Penna.), Walter Goldstraw (G. T.), R. J. Hammond (B. & M.), E. A. Harrison (A. T. & S. F.), W. T. Krausch (C. B. & Q.), J. B. Maddock (C. of Ga.), L. K. Silcox (C. M. & St. P.), L. L. Tallyn (D. L. & W.).

Appendix A—Ash Pits

(The following is an abstract of the summary of the report on this subject.)

RECOMMENDATIONS REGARDING COMMON TYPES OF ASH PITS AND METHODS OF ASH DISPOSAL.

(1) All ash pits should have water pipes conveniently arranged for quenching fire and for attachments of hand hose for use of fire cleaners on each side of each engine.

(2) In estimating ash storage, and deciding the required size of skips, hoppers, etc., the average amount of ash per engine and the maximum amount for any one engine should be determined from a knowledge of local conditions. With such information lacking, the average amount of ashes per engine should be assumed as not less than two yards and preferably two and one-half

yards; and in the design of skips and hoppers the maximum amount of ashes from any one engine should be assumed as not less than two and one-half yards and preferably three yards.

(3) Length of pits handling two engines per track should be from $1\frac{1}{2}$ to $1\frac{3}{4}$ times the length of a single engine, and length of pits handling three engines per track should be between $2\frac{1}{2}$ and $2\frac{3}{4}$ times the length of a single engine. The length of engine selected should suitably reflect existing and probable future operating needs.

(4) The cleaning of locomotive fires on the line is often an operating necessity, though it involves some risk to traffic unless ashes receive proper attention. Such fire cleaning should be prohibited, except at designated locations between fixed limits where proper attention can be given to the removal of the ashes.

(5) Where only a few engines are handled daily, many small ash pit arrangements may be suitable, but consideration should be given to the use of a shallow pit constructed of non-combustible material and located between the rails.

(6) The depressed track pit, with ashes removed to cars by hand, has given fairly satisfactory service throughout the country for many years at terminals handling from a few up to a hundred or more engines per day. With modern labor conditions and operating requirements, the general use of this type of pit is not recommended, though under favorable labor conditions, and under conditions not favorable to the use of machinery, such pits will probably continue in satisfactory service at some terminals. Where such pits are to be used, it is recommended that they generally embody the following features:

- (a) The concrete should be of a dense and rich mixture, with preferably slag or trap rock used for the aggregate.
- (b) For safety and economical maintenance, both rails should be supported on cast iron or cast steel pedestals, even though a continuous curtain wall be used under one rail.
- (c) The pavement should be of vitrified or fire brick on a concrete base.
- (d) The distance from base of rail to pavement should be not less than three, nor over four feet.
- (e) To prevent the washing of ashes down onto the depressed track, the retaining wall should project slightly above the paving, with drain holes through it.

(f) The vertical distance from top of rail of the depressed track to the edge of the shoveling platform should be not less than 4 ft. 6 in. and usually not over 5 ft. 6 in., based upon easy shoveling into cars of ordinary height and possible shoveling into cars nearly 11 ft. high.

Deep water pits are recommended for use where 60 or more engines are handled daily, provided the engine terminal layout is so fixed that the ash pit investment may be considered reasonably permanent, and provided that the climate is not so cold that great trouble is apt to be experienced with frozen ash cars. It is recommended that such pits embody the following features or ideas:

(a) Ashes should be removed to cars with clam shell buckets operated by locomotive, gantry or overhead cranes. At double pits, if the use of a locomotive crane is required for more than two or three hours per day, then dependability of operation will begin to be affected and an overhead crane should be installed.

(b) Engine and ash car tracks should be spaced far enough from adjacent tracks to afford suitable clearances for the future construction of an overhead crane runway.

(c) The smaller layouts should provide at least two engine tracks, or consist of two separate, single engine pits in the same track, with suitable crossovers to a running track and with an independent ash car track, this latter arrangement being recommended only where local conditions make the usual two-engine pit undesirable.

(d) The larger layouts should provide at least two engine tracks and one or more independent ash car track, all spanned or served by a crane. Where the extra cost involved can be justified, complete non-interference between the work of loading ashes and the cleaning and handling of engines can be obtained by locating the ash track between the engine tracks.

(e) The distance center to center of engine tracks over pits should be not less than 18 ft., and correspondingly increased if sidewalks are provided. The depth of pit and the slope of the side walls should be such that ashes will slide freely to the middle, where they can readily be reached by the bucket. Ashes will not flow freely on a slope less than one to one.

(f) Such rails as do not bear on side walls should be supported on pedestals spaced relatively close together in order to permit the use of shallow beams and reduce maintenance cost in the replacement of these beams. Spare bearing beams should be kept in stock at all times so that prompt replacement of defective beams can be made. The use of bare beams probably will be safer and cheaper than to attempt to protect such beams from rust and warping from the heat.

(g) The bottom of the pit should be protected with old rails or otherwise to guard against blows and scraping action of the clam shell bucket.

(h) Special attention should be given to the use of catch basins and other arrangements to keep the cinders from filling up drain pipes.

(i) Consideration should be given to safeguards against accidents resulting from men falling into the pit. Good protection is afforded by inner sidewalks with railings. These can be installed only when so provided in the original design, and even then at a decided increase in cost on account of increased track centers and depth of pit for equal ash storage.

Shallow water pits are recommended for use under and about the same conditions as are deep water pits. In all cases, the ashes should be handled by overhead crane. Comparing these two types, it may be said for equal lengths, the shallow water pit will be cheaper construction, and therefore more economical in fixed charges. If, however, on account of the reduced ash storage the length of the pits be increased, then the advantage of economy may be partly or wholly lost. Such pits should embody the following features:

(a) Engine tracks and ash car tracks should alternate in either a three or five track unit under one crane.

(b) The pits should be as wide between the rails as they can be constructed. The side walls and bottom of the pit should be protected against rubbing by clam shell bucket, which should be extra long to obtain good capacity. Height of pit walls should be not less than four feet or more than four feet six inches.

(c) Between tracks a water shedding pavement should be provided so sloped as to drain to the pits.

Appendix B—Engine Houses

The committee recommended that the text now appearing in the Manual, 1915 Edition, under the title "En-

gine House Design" be changed to read as follows. Sections changed are indicated by an asterisk:

Form.—*(a) The circular form under ordinary conditions is preferable.

*(b) Special conditions may render a rectangular house desirable, such as restricted location, small number of engines handled, greater ease of providing "X" than turntable, etc.

(c) At shops where a transfer table is used, a rectangular engine house served by the transfer table may be desirable.

Turntable.—(a) The turntables should be long enough to balance the engine when the tender is empty.

*(b) A deck turntable is preferable to a through table when the cost of construction is no greater.

*(c) At important terminals, turntables are most economically operated by mechanical means.

*(b) Where electric power is available, an electric tractor is the most efficient means of operating a turntable. The power wires may be led to the table either underground or overhead.

*(b) Where electric power is not available, a compressed air motor may be used to propel the table. In this case, the locomotive itself usually furnishes the compressed air.

(d) The deck on the turntable should be wide enough to provide a walk on each side and be protected with hand rails.

Turntable Pit.—*(a) The turntable pit should be drained and paved.

*(b) The circle wall should be of masonry, with proper supports and fastenings for rails on the coping. A timber coping is considered a proper support and preferable to a rigid masonry coping.

*(c) The circle rail should preferably bear directly on masonry base.

(d) Easy access to the parts of a turntable for the oiling of bearings, painting and inspection should be provided in the design of the turntable pit, unless ample provision is made in the turntable itself.

Door Openings.—*The clear opening of entrance doors should not be less than 13 ft. in width and 17 ft. in height.

Doors.—Doors should be easily operated, fit snugly, be easily repaired and maintained, and should admit of the use of small doors.

Tracks.—(a) Lead tracks to the turntable should line up with tracks of the engine house where possible.

(b) Tracks should be on a level grade and should be provided with stop blocks.

(c) Special fastenings of the track rails at the circle wall and on the turntable are desirable to prevent movement of the rails, to give good bearing and to lessen the damage from derailed wheels.

Position of Locomotive.—In a circular house the locomotive should stand normally with the tender toward the turntable.

Length of House.—The length of stall along center line of track should be at least 20 ft. greater than the overall length of the locomotive to provide trucking space of 10 ft. in width in front of the pilot and space in which to detach the tender and provide a walkway between it and the engine without opening the door.

Materials.—(a) The materials used in construction of the house should be non-corrosive, unless proper care be taken to prevent corrosion.

*(b) The additional security against interruption to traffic from fire warrants serious consideration of the use of a fireproof roof or dividing the engine house into units of approximately 10 stalls by the use of division walls of fireproof material.

*(c) Omit.

*(c) The portion of the wall directly in line of the track where the engine is liable to run into it, should be so constructed as to be easily replaced or repaired when damaged.

Engine Pits.—Engine pits should extend from a point 10 ft. from the inner circle columns to a point 13 ft. from the inner face of the outer circle wall. The clear width should be 4 ft.; depth below base of rail, minimum 2 ft. 6 in., increasing with the slope of the floor of the pit to at least 3 ft. 0 in. The walls should be about 2 ft. 7 in. thick to provide proper support for jacking timbers. The clear width may be reduced a few inches when direct heating is used to permit the provision of recesses in the side walls for radiators and still allow ample support for the rails.

The floor should be convex and the drainage toward the turntable unless topographical conditions dictate otherwise.

Smoke Jacks.—The smoke jacks should be fixed. The bottom opening should be not less than 42 in. wide, and long enough to receive the smoke from the stack at its limiting positions, due to the adjustment of the driving wheels to bring the side rods in proper position for repairs. The bottom of the jack should be as low as the engine will allow, and it should be furnished with a drip trough. The slope upward should be uniform to the

flue. The area of the cross-section of the flue should be not less than 7 sq. ft. The jack should be preferably non-combustible. Wooden jacks properly built are considered reasonably non-combustible.

(This type of jack applies to all houses where regulations will permit. In some cities, where smoke abatement laws are in force, special types of jacks are necessary.)

When the engine house is without a turntable, smoke jacks should be located at each end of each engine space.

***Floors.**—The floors should be of permanent construction sloped so as to drain properly. The floor around the outer circle and for the outer bay or outer two bays where trucking is carried on and most of the work is done, may advantageously be constructed of wood block, or vitrified brick on a concrete base, while the remainder of the floor between pits may for the sake of economy be of concrete.

***Drop Pits.**—The number and type of drop pits depends on the purpose for which the particular house is used and the class of power handled.

Ordinarily, a drop pit should be provided for driving wheels and supplemented as required by drop pits for engine truck, trailer, and tender wheels.

At points where considerable work is customarily performed on the wheels, the use of a drop table or unwheling hoist should be considered.

Heating.—(a) Heat should be concentrated at the pits.

(b) The general temperature of the house should be kept between 50 and 60 deg. F.

(c) The recommended method for heating houses of 10 stalls or over is by hot air driven by fans through permanent ducts located under the floors where practicable. The outlets should be located in the pits under the engine portion of the pits, and fitted with dampers to shut off the heat when necessary. Temperature of the hot air at the pits should be 130 to 150 deg. F.

The fan and distributing system should have a capacity for changing the air from 3 to 4 times an hour. The fresh air should be taken from outside the building. The fan intake should be so designed as to permit the use of all fresh air, all inside air, or part fresh and part inside air. A certain amount of recirculation, depending entirely on conditions, is permissible, particularly when the doors stand open for any length of time.

(d) In a small house, or in a larger house in some climates, analysis may show the direct system of heating to be more desirable. In such a case, the vacuum return system should be used. Radiators should be placed in the pits and properly protected from falling parts, and also on the outer walls and end or fire walls. Radiators on the outer walls should be so located as to be clear of the path an engine would take in going through the outer wall.

Windows.—(a) The disadvantages of skylights are so much greater than their advantages as to make them undesirable.

(b) Windows in the outer walls should be made as large as practicable with the largest glass or light area consistent with the strength of the structure. In general, the lower sill should be not more than four (4) ft. from the floor and the space between window frames and columns or pilasters and girders only that necessary to secure the window frames.

Windows in doors, when provided, should be furnished with wire glass.

***Electric Lighting.**—General distribution of illumination should be provided either by:

(a) Individual lights between pits arranged to avoid shadows, 300 to 500 watts to a stall, or;

(b) Flood lights on the outer and inner circle walls so arranged as to diffuse rays, eliminate the glare common with flood lights and avoid deep shadows. Usually two 100-watt lamps on the outer wall and one 60-watt lamp on the inner wall are sufficient.

Either system should be supplemented by plug outlets for drop cord lamps in each alternate space between pits.

Piping.—(a) The engine house should be provided with piping for air, steam and water supply and for boiler blow-off. The latter line should discharge outside the house and when a cooler washout system is installed, should discharge into the boiler reservoir.

(b) A boiler washout and refilling system is ordinarily desirable to provide hot water for washing and refilling and to make use of the steam and water blown off from locomotive for the purpose.

(c) The steam inlet should be located near the front end of the boiler. The blow-off line, the air, washout and refilling lines, and the hot water connection should be near the front end of the fire box. Connections should be provided in alternate spaces between stalls, except for the blow-off line, to which connections should be provided between each stall.

(d) Steam and hot water piping should be installed

***Machine and Tool Equipment.**—The space provided for machine tools and the extent of machine and tool equipment will depend entirely upon the location and method of operation of the house and must be made a subject of study for each house.

***Mechanical Handling Devices.**—Consideration should be given in the design of an engine house to the use of traveling cranes, jib cranes or monorails and provision made in the design of the structure for future installation if such is considered probable.

Appendix C—Engine Terminal Layouts

The committee presented a report, together with a plan of a typical engine terminal for a 30-stall engine house, indicating how it may be enlarged for the future, and suggesting that by a simple process of elimination, the terminal may be built for a twenty-stall or a ten-stall house. In arriving at the typical layout, the following assumptions controlled the committee's decision affecting the terminal layout:

(a) This is a division terminal not served by a back shop, but only where running repairs are made to about 150 locomotives daily.

(b) The terminal is situated near the throat of a freight yard and at a point near where power is released or returned to road service.

(c) In selecting a site, it is assumed that the terminal is within walking distance or at least a street car ride of an adequate supply of labor.

(d) Site to be selected after investigating the cost of real estate, restrictions by municipalities, ease of drainage, amount of grading and proximity of ample water supply.

(e) Trackage and other facilities are arranged, having in mind that the terminal will be called upon to clear from four to five locomotives per stall per day, and that the power may arrive in fleets at certain periods.

(f) It is assumed that in addition to the road power (passenger and freight) this terminal also serves a number of switching engines.

(g) No attempt has been made to fix the lengths of the inspection and ash pits, the capacity of the coaling station, the lengths of the turntable, the depth of the house, as these are subjects being handled by another sub-committee.

(h) Provision has been made for expanding the terminal capacity 100 per cent by adding to all facilities and by providing a second 30-stall house and a second turntable.

(i) The layout committee has been governed by the principle that it is not enough for an engine terminal layout and facilities to meet the normal demands, but if properly designed, it will function under the severest traffic and weather conditions.

Appendix D—Design of Car Shops

The committee made the following general comments and recommendations for the various subdivisions which make up a large passenger shop layout.

Coach Paint Shop.—The paint shop should be of fire-proof construction, light, airy, roomy, free from dirt and dust, and should be well heated in cold weather. The tracks should be 25 ft. from center to center. The floor should be concrete and should pitch to floor drains to allow for scrubbing and quick drying after.

Traveling cranes and supply tracks are not needed. Permanent scaffolds should be provided. Ample space should be allotted for storing and mixing paints. Ample toilets, wash and locker rooms should be provided.

Coach Repair Shop.—The same width and track arrangement is recommended as for the paint shop. The building should be divided into two main bays, one on either side, with a center aisle about twenty feet wide in which should be installed a fifteen-ton traveling crane.

The floor should be wood block. Permanent scaffolds should be provided.

The shop should be piped for compressed air, steam, water and acetylene, and ample electric connections should be provided. A certain space should be set aside for tools and machinery. The pipe shop, air room and tin shop should be annexed to this building, if possible, as the greater portion of that work comes from and goes back to the cars while in this shop.

Wash House.—The committee recommended that a separate department be assigned and be properly equipped for washing cars. The wash house should be well lighted, heated and ventilated so the cars will dry quickly. It should have a concrete floor, properly pitched, with frequent floor drains to give good drainage. Scaffolds should also be provided and the shop should have water and steam connections.

Stripping and Trimming Shop.—The committee recommended provision for a place for stripping cars of sash, doors, upholstery and fixtures as they pass into the shops and another for trimming them as they go out with space in between where the parts removed can be repaired.

Truck Shop.—A separate truck shop should be provided according to a transverse arrangement, with room on each track for two sets of trucks. The building should have two main bays on either side and a narrow bay at the center with a ten-ton traveling crane. A longitudinal track should run the full length of the building to facilitate the handling of mounted wheels and axles.

Wheel and Axle Shop.—This shop should be conveniently located to both the freight and passenger repair shops. Large yard space is necessary in connection with this department for the storage of wheels and axles, both mounted and unmounted. Free movement of this operation is essential to economical production and great care should be exercised in laying it out. Monorails form the best method for serving this shop.

Blacksmith and Machine Shop.—These two shops are treated together because most of the work progresses through the smith shop into the machine shop to be finished. They should be very conveniently located with respect to the truck shop and easily accessible for the coach repair shop, as these two departments furnish practically all the work.

Wood Mill, Pattern and Cabinet Shops.—These three sections are closely related. All do wood work, and in the majority of layouts are combined under one roof and it is proper that they are. The mill should be conveniently located with respect to both passenger and

freight car repair shops and should be so placed that ample yard and storage space is available for the storing of lumber. It should have as an accessory a dry kiln and large sheds for the storing of dried lumber.

Some means of disposing of sawdust and shavings must be provided. The preferable means of disposal is to bale for a commercial trade. If many patterns are to be made and stored, a separate fireproof storage should be provided.

Power Plant.—This involves a study in itself.

Discussion

(Chairman Morrow outlined the contents of the report and introduced G. H. Gilbert (Sou.), chairman of the sub-committee on Ash Pits, who presented the report on its subject, concluding with a motion to adopt the committee's conclusions for inclusion in the Manual.)

J. L. Campbell (E. P. & S. W.): Is the committee submitting this as information or statement of practice?

Mr. Gilbert: Both.

O. E. Selby (C. C. C. & St. L.): Without attempting to discredit the valuable work of the committee, I believe what they have submitted here is information and not recommended practice. I think the Manual would be better off without anything on the subject than to have something as general as this put in.

I move to amend the motion before the house by printing this as information in the Proceedings, and not in the Manual.

(The amendment was carried.)

(In the absence of Mr. Burpee, chairman of the sub-committee on engine houses, Mr. Kimball presented the report.)

L. P. Kimball (B. & O.): As a result of further study there is a recommendation for the replacement of the existing matter. (Appendix B.)

I move that this matter be accepted by the association and substituted for the present engine-house material in the Manual.

(Motion carried.)

Chairman Morrow: The work on engine house and power plants and shop extension was initiated in connection with our collaboration with the Mechanical section committee. This is presented simply as information.

This is followed by Appendix D, "Design of Car Shops," Report on Passenger Car Repair Shops. This is also presented as information.

The President: The convention will receive it as information. The committee is dismissed with the thanks of the association.

Coal Train on the Alaskan Railway

Report of Committee on Roadway

In the treatment of sliding cuts and fills as well as soft spots in excavations and embankments, all precautions should be taken to keep water away. Various methods designed to meet different conditions, but all based on the fact that the primary cause of slides is a lack of proper drainage, are submitted by the committee for inclusion in the Manual. Trestles should not be allowed to deteriorate too far before filling, otherwise serious difficulties will ensue. Drainage should be given careful attention, while allowance for probable future highways should be considered. Where possible, mechanical equipment should be used for ditching.

J. R. W. Ambrose
Chairman

J. R. W. Ambrose is a veteran in committee service, having been a member of the Roadway committee for twelve years. He is now rounding out his third year as chairman. Mr. Ambrose is chief engineer of the Toronto Terminal Railway Company, an organization created by the Canadian Pacific and the Canadian National railways to build and operate the new Union Station and adjacent terminal at Toronto. As a construction engineer of long experience Mr. Ambrose is in a position to appreciate the importance of drainage and the other problems of roadway construction and to direct studies leading to their solution in the future.

THE ACTION RECOMMENDED by the committee was:

1. That the definitions of terms under Revision of Manual (Appendix A) be approved for insertion in the Manual.
2. That the report on shrinkage and swell of grading material (Appendix B) be received as information.
3. That the conclusions in reference to methods employed and results secured in the treatment of sliding cuts and fills and soft spots in excavation and embankments (Appendix C) be approved and inserted in the Manual.
4. That a brief report on the effect of heavier power and increased tonnage upon roadbed previously considered stabilized be received as information.
5. That the report on filling of bridge openings (Appendix E) be received as information.
6. That the conclusions in the report on "Ditching" (Appendix F) be approved and inserted in the Manual.
7. That the report on chemical killing of weeds be received as information.
8. That a report on the design and use of reinforced concrete culvert pipe be received as information.
9. That a brief report on excessive cost of maintenance during the early period of operation be received as information.

Committee: J. R. W. Ambrose (Toronto Term.), chairman; C. M. McVay (K. & M.), vice-chairman; H. G. Aylesworth (C. B. & Q.), E. W. Bayer (C. C. C. & St. L.), C. W. Brown (L. & N. E.), H. W. Brown (Penna.), R. K. Brown (S. L. & U.), A. S. Butterworth (G. F. & A.), C. C. Cunningham (C. R. I. & P.), W. C. Cird (Cons. Engr.), C. A. Daley (Erie), S. B. Fisher (M. K. & T.), R. D. Garner (S. N. E.), R. C. Gowdy (C. & S.), F. M. Graham (Penna.), H. Hawgood (Cons. Engr.), E. G. Hewson (G. T.), W. H. Jaekle (S. F.), A. A. Matthews, W. H. Penfield (C. M. & St. P.), P. Petri (B. & O.), Frank Ringer (M. K. & T.), H. A. Roberts (O. W. R. R. & N.), R. B. Robinson (U. P.), R. A. Rutledge (A. T. & S. F.), G. L. Sitton (Son), E. G. Taber (S. I. R.), H. F. Tyrrell (Son), C. E. Weaver (C. of Ga.), W. H. Woolburly (D. & I. R.), J. C. Wrenshall (P. & R.).

Appendix A—Revision of Manual

The committee recommends the following definitions for the Manual.

Castings (verb).—Disposing of excavated material by a single operation either by hand or machinery.

Station Men (noun).—Men engaged in station work.

Station Work (noun).—A small piece of grading work extending over one or more stations.

Appendix B—Shrinkage and Swell of Grading Material

Considerable correspondence has been carried on by the sub-committee and additional information requested

from various sources, but very little has been received that would add to what has already been reported. The committee found nothing that would lead it to change any conclusions previously made as to this subject. No further density tests have been reported and there is nothing to add to the report of a year ago in this regard. It is hoped that some of the railroads will do more with this matter in the ensuing year. The committee again recommended that the subject be closed until additional investigation and experiments are available on this subject.

Appendix C—Methods Employed and Results Secured in the Treatment of Sliding Cuts and Fills and Soft Spots in Excavations and Embankments

Surface slides occur in nearly every class of material and combination or mixture of materials, except rock, in both excavations and embankments and are caused largely by the ground becoming saturated. The extra weight of the water in the ground upsets the equilibrium and reduces the cohesion and a slide is the result. In northern climates the action of frost greatly facilitates the action of the water by opening up crevices and making the ground porous.

Treatment in Excavations.—Surface water should be kept from the face of cuts as much as possible by the use of intercepting ditches constructed well back from the top of cut. These ditches should be constructed with care and should be well maintained so as not to let pockets form to hold water that will eventually soak into the ground and may be the cause of a slide.

Where cuts have a large number of springs on their surface, small concealed tile drains have been laid down the slopes of the ditches in order to keep the water from the numerous springs and saturating the soil. In many cases excellent results have been obtained by facing cuts with layer of engine cinders or fine slag about six inches deep. This tends to distribute any water reaching the face of the cut and prevents cutting, and also lessens the action of the frost. Where this method is used the cut should be faced to a reasonably true plane before the application of the coating.

In cities and towns sodding of slopes has been carried out with good success, but on account of the cost, this method of treatment has been confined mostly to densely inhabited districts where the esthetic value of this method is given consideration. The planting of vegetation (not trees) on the slopes of cuts has proven very successful in the cure of slides.

Embankments.—Small slides of embankments are treated in practically the same manner as above mentioned in cuts except for the drainage. The slopes have been sodded and faced with cinders in a manner similar to the treatment of cuts and with equal success. The flattening of the slope and the weighing of the toe of the slope with derrick rip rap where it is practical to do so, and where the toe of the slope is subject to the action of running or standing water, has proven successful.

In low-lying country where there is a large amount of surface and ground water, considerable trouble has been experienced in holding fills. To overcome this ditches have been dug near the right-of-way line some distance from the toe of the slope and the ground water level lowered with exceedingly good results. The depth of the ditches to be dug depends on the fall that can be obtained.

Slides or slips of great volume are hard to remedy. Each case must be studied and the cause determined, if possible, and this cause then removed. In nearly every case it is underground water or seepage that causes the trouble.

When a study has been made of the movement and its cause determined it is generally found that the slipping occurs on a stratum of inclined rock or clay. Sometimes the stratum of clay is only an inch or so thick. Water reaching the stratum of rock or clay is retained and forms a lubricant which upsets the equilibrium of the mass and the slide starts. The remedy is, of course, to intercept the water and to prevent it following the strata.

In many cases where the volume of the slip amounts to several thousand yards, the movement has been stopped by the use of concrete retaining walls, or pile bulkheads. A concrete retaining wall can be used only where a good foundation is procurable and its use is, therefore, considerably limited. In many cases, pile bulkheads have been the correct solution.

Soft Spots.—Soft spots in excavations and embankments, the origin of which is the result of geological formation, are hard to contend with and no uniform treatment can be applied to all cases. A method that has been successfully used in both excavations and embankments is the use of long ties. One of the railroads in the northwest reports an effective method of treatment by the construction of a reinforced concrete slab 12 in. thick, on which the track is carried. The foundation for the concrete slab is prepared by leveling off the sub-grade and applying a 12-in. layer of good engine cinders. The cinders furnish good drainage and the concrete slab distributes the load uniformly.

In some cases soft spots in cuts have been treated by driving piles along the ballast line with the idea of confining the material, and by driving pile butts from 6 to 12 ft. in length spaced from 3 to 4 ft. directly under each rail and sinking them 2 or 3 ft. below sub-grade. The latter method is reported as being more satisfactory. An effective method reported in the treatment of soft spots under embankments is the widening of the embankment until a point is reached where the pressure, due to the load, is distributed over a very large area.

CONCLUSIONS

The committee recommends the substitution of the following conclusions for those published in the new Manual, as follows:

(1) The primary cause of slides is the lack of proper drainage.

(2) In the construction of a new line when conditions indicative of future trouble with soft spots or slides are encoun-

tered, special attention to the diversion of the springs or streams which are likely to cause the trouble should be given.

(Change the numbers of Conclusions 1 to 9, inclusive, now in the Manual.)

(3) Conclusion 10. Facing the slopes with a coating of engine cinders or fine slag will prevent small slides.

Soft Spots.—Where soft spots cannot be effectively drained the bearing area of the track structure must be increased.

Definition of Soft Spot.—Soft spots are small areas in excavation or embankment, or the sub-soil under an embankment, saturated with water and having a relatively small supporting power.

Appendix E—Filling of Bridge Openings

A preliminary investigation must develop especially: The size of culvert necessary, which will generally govern the type of culvert to be used. The character of foundation available for the culvert. The character of foundation for the new fill.

The condition of the moisture with regard to withstanding the stresses incident to filling and carrying traffic at the same time; for if a trestle is allowed to deteriorate too far before filling, serious difficulties will be encountered in keeping the structure safe for traffic during the progress of filling. The availability and quality of material for making the fill, as both will affect the first cost, and the latter the future maintenance of the fill.

Whether or not the advantage of widening adjacent cuts from which the filling material may be excavated will by improved drainage and increased snow room justify this method of procedure as against getting all the material from one place.

Consideration should be given to the necessity of providing undergrade crossings to accommodate future as well as existing highways. Elimination of fire hazard by reason of filling wooden trestles should be taken into consideration.

CONSTRUCTION OF FILL AND CARE OF STRUCTURE DURING FILLING

Before starting to construct the fill, see if there are any springs in the area covered, and if so, build concrete boxes over them and pipe the water beyond the limit of the new fill. Where rock is available and fall is sufficient, french drains may be substituted for the pipe. In certain sections of the country where trestles are to be filled in marsh land, it is frequently found advantageous to lay a grillage consisting of a double layer of small tree trunks.

With wooden trestles, before starting a new fill, the trestle must be carefully gone over and put in shape to stand the stresses incident to filling.

In the case of iron and steel viaducts which are usually of greater height than wooden structures, precautions must be taken to prevent distortion of the columns. This can be accomplished by encasing the columns in reinforced concrete up to a point within 20 ft. of base of rail, or where there is no danger from fire satisfactory results have been obtained by the erection of intermediate wooden bents at suitable intervals in order to reduce the load upon the towers.

As the filling of the viaduct proceeds, all bracing, both longitudinal and transverse, should be cut loose from the bents as the fill reaches the connection points, for this bracing transfers a great deal of load to the bents, which increases the settlement and has a tendency to work the viaduct out of line. Vertical bracing need only be cut loose at the upper connection points.

Where foundation is good, and in case of low trestles, where it is not good, fills can be made by dumping directly from the structure to be filled. Good results may be obtained by use of a ditching machine in conjunction

with two 16-yd. air dump cars for jobs of approximately 5,000 cu. yd. or less, and by steam shovel and air dump cars for jobs of over 5,000 cu. yd., though this dividing line is by no means fixed, as it depends on the haul, the depth of cuts from which material is available, and the relative need for ditching the cuts in the vicinity of the structure.

Before dumping from the trestle, the wooden guard timbers should be removed and plank about 2 in. by 2 in. should be spiked on top of the ties, close to the rail, to prevent the ties from bunching. This applies to side dumping. When center dumping is employed, the same method may be followed by cutting out alternate ties between the inside line of the stringers.

When filling high trestles where the foundation is very bad and liable to give trouble due to settlement, and traffic may be sufficiently heavy to justify it, it may be advisable to build temporary trestles on each side of the main trestle, and located so that material dumped from them will spread to cover the area of the completed fill. The use of grab buckets from a cable way or the use of an endless belt conveyor may be employed to advantage in making fills of this character. Then by dumping simultaneously from all three trestles, or dumping simultaneously from the main trestle and cable ways, the settlement may be reduced and kept fairly uniform.

It is often advisable to haul filling material further, in order to obtain a better grade of material to stabilize the fill and reduce the cost of future maintenance.

Immediately after the completion of the filling of low trestles, the stringers should be removed, but in cases of high trestles, the stringers should not be removed until the fill has settled about all it will without the load of trains; except that, if trestle has become so badly out of line and surface that it cannot be resurfaced and relined, it is better to remove the stringers at once and put the load on the green fill, even if this requires considerable watching and resurfacing of track for some time.

Appendix F—Ditching

Ditching on different railroads is done under many varying conditions; using practically the same method, the unit costs for work of like character vary about as follows:

Casting	\$0.42 to \$1.00	per cu. yd.
Company forces with wheelbarrow or		
push cars50 to 1.95	per cu. yd.
Spreader car09 to 1.75	per cu. yd.
Ditching machine04 to .72	per cu. yd.
Teams and scrapers50 to 1.37	per cu. yd.

These figures may have some significance, but are of little value in drawing conclusions without a complete statement of the conditions under which each job was done.

Good roadbed drainage is the foundation of economical track maintenance; therefore, the ditching of cuts is of great importance and should be carried out currently with the regular yearly maintenance program.

Ditching, in ordinary material, may be subdivided into two principal classes:

Class "A"—Cuts not more than six feet deep in average open country.

Class "B"—Cuts more than six feet deep.

CLASS "A"—CUTS LESS THAN SIX FEET DEEP

Company forces. On line where traffic is heavy and ditching is done currently the work can usually be done economically by company forces, the material being cast out of the cut and hauled back so as to prevent it from washing down into the ditches.

Contract forces; station men; teams and scrapers. These methods are found to be economical on lines of

heavy traffic where, on account of deferred maintenance or nature of material, the volume to be handled is large.

Spreader cars equipped with wings for shaping ballast shoulders, roadbed shoulders, ditches and slopes; These machines may be used to advantage on lines of moderate traffic in ordinary material, but their use is not recommended on heavy traffic, single track, lines with frequent trains; nor is the use of other ditching machines recommended under similar conditions.

CLASS "B"—CUTS MORE THAN SIX FEET DEEP

Company forces provided with push cars and dump beds, wheelbarrows or trackbarrows. Loading and hauling out: This method will be found to be economical on heavy traffic lines, and also on lines with moderate traffic, where ditching machines are not available, or where the volume of material to be handled would not justify their use.

The use of work trains with hand labor is generally uneconomic, and is not recommended.

Teams and scrapers on yardage basis: Where the character of material is suitable, and the volume to be handled comparatively large, teams and scrapers may be used to advantage under unit cost contract provided the cuts are of sufficient width to permit of safe operation.

Auxiliary track and small cars: This method may be used economically on heavy traffic lines where operating tracks cannot be interfered with and where there is sufficient clearance, provided the haul is long and volume of material to be handled would justify the initial cost of the plant installation.

DITCHING MACHINES

The use of steam ditchers and their equipment is recommended in work where the cuts are long and deep, or where the volume of material to be moved is great; or where the material is wet and difficult to handle by other methods. Their use is also recommended where cuts are resloped or widened to such a limited extent as not to justify the use of steam shovel. Under similar conditions they may be used for widening embankments. They are particularly efficient in removing small slides or other like emergencies where material is wet or hard to handle.

Locomotive cranes equipped with clam-shell buckets of 1 to 1½ cu. yd. capacity can be used successfully in cleaning out cut ditches where it is desirable not to disturb the slopes and will produce a ditch of uniform width and depth without handling surplus material or requiring any redressing by hand.

Where, on account of long haul in disposing of material, it is necessary to load many cars before dumping, ditching equipment is recommended which will operate over a series of flat cars with a proper mechanical device or plow for unloading.

There may be isolated cases where it is economical to use scoop ditches, but it is believed the steam ditcher or the locomotive crane will accomplish the same results with a greater flexibility.

Work incidental to ditching such as shaping roadbed and ballast shoulders is primarily hand work after the major work of ditching is complete, but by the use of spreader cars with proper attachments this work may be done at a cost that is comparatively very low and their use is recommended for these purposes when the nature of material will permit and where traffic conditions are not such as to prohibit such interference.

Discussion

Chairman Ambrose: The first subject is Revision of the Manual under Appendix A. I move that these be approved and placed in the Manual.

(Motion carried.)

(The subject, Shrinkage and Swell of Grading Material, Appendix B, was presented by the sub-committee chairman, C. M. McVay (K. & M.) and was accepted as information.)

Edwin F. Wendt: Before that subject is passed I note that in the text your committee have expressed a desire that further consideration of shrinkage and swell of grading material be discontinued at least temporarily. I trust that the committee will not press that request, and that the Board of Direction and the Committee on Outline of Work will continue this subject. The subject is one of much more importance than is generally understood. The committee states that there is no real information on this subject. It seems to me that is a very good reason why the committee should constantly be looking for added and reliable data.

The President: Your suggestion will be given consideration by the Committee in Outline of Work.

(The matter on Appendix C, "Methods Employed and Results Secured in the Treatment of Sliding Cuts and Fills and Soft Spots in Excavations and Embankment," was presented by C. H. Daley, chairman of the sub-committee.)

Chairman Ambrose: *I move that the conclusions in Appendix C be adopted and placed in the Manual as read.*

(Motion carried.)

(The subject relating to the filling of bridge openings was presented by J. C. Wrenshall (P. & R.)

Mr. Wrenshall: It is the thought of the sub-committee that this report dealing with the physical character of the work should be continued with advantage and amplified by a consideration of the economics of fillings, and I would like to see the committee continued along those lines. *I therefore move that the report be received as information and published in the Proceedings of the association.*

(Motion carried.)

Chairman Ambrose: Mr. Wrenshall's committee in reality has prepared a specification. I think that the information in this report will form the basis for a perfectly good specification for bridge filling.

(In the absence of H. E. Tyrrel, chairman of the sub-committee on Ditching, Appendix F, this report was presented by F. Ringer (M. K. & T.)

Chairman Ambrose: *I move that these conclusions be approved and placed in the Manual.*

C. A. Morse (C. R. I. & P.): I would like to hear some discussion with reference to the use of spreader cars equipped with wings for shaping ballast shoulders, road shoulders, ditches and slopes.

R. H. Ford (C. R. I. & P.): Mechanical ditching as a part of the regular program, and on heavy and light traffic lines, has become a factor from which we cannot get away. There is no reason why a mechanical ditcher cannot be used on lines of all classes of traffic. There is no justification for spending our money on maintenance by hand ditching. It should be all done mechanically, and mechanical means have been developed for the purpose, irrespective of the traffic on the lines. The Rock Island is ditching at the rate of about twenty-five miles a day with ditching machines. With reference to the height of the cuts, I think that point is open to some question, but I did not take exception to it. The feature Mr. Morse raises is very pertinent. The density of the traffic does not interfere.

Chairman Ambrose: Perhaps Mr. Morse was a little misled. If you will notice, you are quoting on the section under shallow cuts.

Mr. Ford: I want to make it plain that it does not make

any difference whether it is a shallow cut or a deep cut. Ditching can be done better by mechanical means irrespective of the size or depth of the cut or of the density of traffic.

Mr. Ringer: I do not think the sub-committee could agree with Mr. Ford that the density of traffic is not a factor in the cost of ditching. I think it is just the reverse. The recommendation will not tend to increase the use of the spreader car and ditching equipment on modern traffic.

Mr. Ford: I hope the convention will be willing to require the committee to take this subject under further consideration next year. I have no objection to the first definition and its conclusion.

J. A. Stocker (T. & O. C.): I agree with Mr. Ford. I think it is a mistake in this report not to put more emphasis on mechanical ditching and less on hand ditching. We use mechanical ditchers for depths less than 6 ft. I think we use them for ditching 6 in. deep.

Chairman Ambrose: The committee's idea is based on economy, and we are for mechanical ditching just so long as it spells economy. If we find we can ditch by hand for less money than otherwise, we prefer that.

J. V. Hanna (K. C. T.): I would like to ask whether the committee has any actual cost figures to support its claim that there are times when hand work is economical.

Mr. Ringer: One answer to that is the fact that it is being done.

Mr. Hanna: I want to ask Mr. Ford if he has included in hand work the use of teams?

Mr. Ford: No, I excluded teams. We had a case on one division on spreader work where there was a difference of over \$200,000 as to team work done one year and the complete elimination the second year. *I want to ask that the motion for the approval of this report be confirmed only to the first paragraph under conclusions, and that all others be referred back to the committee.*

J. V. Neubert (N. Y. C.): I would like to ask Mr. Ford how he is going to handle it in rock cuts?

Mr. Ford: The first thing to do is to get enough rock out so that some means can be taken mechanically to remove it.

W. H. Penfield (C. M. & St. P.): In listening to Mr. Ford it occurred to me that he is only talking of one class of ditching machines. The committee, before preparing any conclusion or recommendation, went into the matter thoroughly, and they outlined here some of the machines that were recommended as being in use on the various railroads in the country. The spreader cars that Mr. Ford speaks of are comparatively new in the bulk of the railroads, and I think the questionnaire that we sent out brought out replies from but a few railroads that were familiar with them; at least, the replies would indicate that they had not been used to any extent. I was in thorough accord with the committee's conclusions or recommendations, and I think that that was borne out by what little data we could get as to the cost of ditching.

R. G. Kenly (M. & St. L.): I would like to suggest the last paragraph under class A the committee consider eliminating the last three lines, from the word "but." We have had exactly the same experience as the Rock Island, not in such an extensive way probably, but the spreader car has come to stay.

The President: Will that satisfy you, Mr. Ford?

Mr. Ford: It will satisfy me this way, that it leaves the report without any punch in it, and it seems to me that what the committee ought to do is to take it back, because seriously it represents one of the greatest opportunities for saving, it is one of the places where we can get some money. This committee ought to come

back next year with a report, which is a good one, and take the other back for a year and give it some study.

(*Mr. Ford's amendment was carried.*)

The President: Now we have reached the motion to print the first paragraph in the Manual.

(*Motion carried.*)

(S. B. Fisher (M. K. & T.) presented the report of the sub-committee on "Chemical killing of weeds on and removal of killed weeds from the roadbed.")

The President: This is to be received as information. Any discussion? If not, we will pass to the next.

(W. C. Curd, chairman of the sub-committee on design and use of reinforced concrete pipe, next reported and his report was received as information.)

(The excessive cost of maintenance during the early

period of operation was presented by C. C. Cunningham (C. R. I. & P.), chairman of the sub-committee, and it was received as information.)

Mr. Wendt: I note that this subject is entitled "The excessive cost of maintenance." I would like to suggest to the committee as well as to the Board that the word "excessive" gives rise to a very false understanding. I would suggest that the word "excess" be eliminated because it gives rise to a false understanding.

Mr. Ray: The committee used the word excessive, where the instructions said excess. It makes quite a little difference.

Chairman Ambrose: We stand corrected.

(The committee is dismissed with the thanks of the association.)

Report on Records and Accounts

The forms for recording data for keeping up to date records of property changes and valuation of railroads which were submitted as information last year were presented again and recommended for inclusion in the Manual. It was the opinion of the committee that the electric wiring symbols adopted by the National Electrical Contractors' Association and the American Institute of Architects should be adopted. The study on the feasibility of reporting railway engineering data in graphic form will be continued as well as the study of the feasibility of reducing the number of forms used in the engineering and maintenance of way departments.

H. M. Stout
Chairman

H. M. Stout, who is completing his second year as chairman and his eighth year as a member of the committee, is record engineer of the Northern Pacific. He is therefore in a position to appreciate the value of records to an extent not commonly found among engineers and to realize their present limitations and short-comings. At the present time there is need for more complete and accurate records to meet the demands of regulating authorities and valuation officers, and this committee can do much constructive work. From his long contact with the problems on which the committee is working Mr. Stout is peculiarly qualified to direct its work on constructive lines.

THE COMMITTEE submitted a number of proposed changes in the Manual in Appendix A. A progress report was submitted on cost-keeping methods and statistical records and also on forms for recording data for keeping up to date records of property changes and valuation of railroads. In Appendix D the committee submitted a report on conventional signs for architectural details.

Conclusions

1. The committee recommended that changes in the Manual, as submitted in Appendix A, be approved and the revised matter be substituted for the present subject-matter in the Manual.

2. The committee reported progress on the subject of cost-keeping methods and statistical records, and recommended that it be reassigned.

3. The committee submitted three forms, shown here as Exhibits A, B, and C, revisions of those offered last year, and recommended their adoption and publication in the Manual. The committee recommended the continuation of the subject.

4. The committee has under study the subject of the feasibility of reporting engineering data in graphic form and recommended that it be reassigned.

5. The committee reported progress on the subject of the feasibility of reducing the number of forms used in the engineering and maintenance of way departments, eliminating forms and simplifying those retained, and recommended that it be reassigned.

6. The committee recommended the adoption and publication in the Manual of the electrical symbols given

under Exhibit D and that a set of architectural symbols be accepted as information and the subject continued.

7. The committee reported progress and recommended reassignment of the subject of methods for recording and accounting for the determination of proper allowances for maintenance of way expenses due to increased use and increased investment.

Committee: H. M. Stout (N. P.), chairman; Henry Lehn (N. Y. C.), vice-chairman; A. M. Blanchard (G. T.), H. Bortin (Cons. Engr.), H. A. Campbell, Armstrong Chinn (C. R. & Q.), R. A. Cook (C. & A.), E. B. Crane (C. M. & St. P.), E. B. Fithian (M. P.), J. H. Milburn (B. & O.), W. F. Ogle (C. R. I. & P.), H. J. Sargent (Wabash), H. F. Sharpley (C. of G.), Chas. Silliman (Pres. Conf. Comm.), C. W. Simpson (D. I. & W.), T. H. Strate (C. M. & St. P.), W. A. VanHook, V. R. Walling (C. & W. E.), W. D. Wiggins (Penna.).

Appendix A—Revision of Manual—Definitions

Account (present text)—A statement required to enable payment to be made for labor performed and material furnished or to establish the detail, total and comparative cost of work and various classes of expenses.

Account (revision)—A statement required to enable payment to be made for labor performed, material furnished or to establish the detail, and total cost of work or class of expense.

Ledger Accounts (present text)—Statement kept in ledger form in order to establish the detail, total and comparative cost of individual pieces of work or classes of expenses.

Ledger Account (revision)—An account of an individual piece of work or class of expense kept in ledger form.

Appendix C—Forms for Recording Data for Keeping Up to Date Property Changes and Valuation of Property of Railroads

Three forms which were submitted to the association last year as information were presented again as Exhibits A, B, and C, and were recommended for adoption.

Appendix D—Conventional Signs for Architectural Details

Electrical wiring symbols, designated as Exhibit D, and which have been adopted by the National Electrical Contractors' Association and the American Institute of Architects, were submitted and it was the opinion of the sub-committee that these symbols should be approved and adopted.

Discussion

(Chairman Stout abstracted the report and moved that the revised definitions be accepted and substituted for those appearing in the Manual.)

E. F. Wendt (Con. Engr.): The definitions which now appear in the Manual have been there for over 15 years. They were formulated very largely by the late

Walter E. Berg, chief engineer of the Lehigh Valley, than whom there was no greater authority on definitions. When they were adopted they were thought to be as near perfect as they could be made. I would like to have the committee explain what difference there is between the definitions now in the Manual and the proposed revised ones.

(Chairman Stout gave a brief explanation of changes made.)

(Motion carried.)

(E. B. Crane (C. M. & St. P.) presented the matter under Appendix C.)

Chairman Stout: *I move that the three forms referred to, together with the specifications and instructions, be accepted and published in the Manual.* (Motion carried.)

Chairman Stout: *I move that the electrical symbols shown in Exhibit D be accepted and published in the Manual.*

(Motion carried.)

(The architectural symbols under Exhibit E were received as information and the committee was excused with thanks.)

Report on Uniform General Contract Forms

Some revisions in the Manual are submitted to secure uniformity and to coordinate certain matters in relation to specifications for roadway which were compiled before the organization of the Committee on Uniform General Contract Forms. A recommendation is made that the two committees concerned revise the specifications so that the "General Conditions" of the specifications now included in the Manual may be omitted and in the future be covered by the General Conditions of the construction contract forms. A Form of License for Wires, Pipes, Conduits and Drains on Railroad Property was submitted for inclusion in the Manual.

W. D. Faucette
Chairman

W. D. Faucette is finishing his second year as chairman of the committee, of which he has been a member for six years. He has been in the continuous service of the Seaboard Air Line since 1901 and has been chief engineer since January 1, 1913, prior to which time he was an assistant engineer and later for three years chief clerk to the president. In directing the work of this committee he has done much to stimulate interest in what is commonly regarded as an uninteresting subject. He represented the association in a recent meeting called by the Associated General Contractors at Washington to consider a uniform contract form.

IN APPENDIX A, covering revision of the Manual, certain changes were recommended for adoption by the association. In Appendix B was submitted the final draft of a "Form of License for Wires, Pipes, Conduits and Drains on Railroad Property," which was recommended for approval and insertion in the Manual. An agreement for private road crossing was submitted in tentative form in an appendix.

Conclusions

(1) The committee recommended the changes in the Manual as set forth in Appendix A be adopted and that the Committee on Roadway be requested to make the revisions referred to in Appendix A.

(2) The committee recommended "Form of License for Wires, Pipes, Conduits and Drains on Railroad Property," printed in Appendix B, adopted and printed in the Manual.

(3) The committee recommended that the report in its Appendix C on "Form of License for Private Road Crossings" be received as information, with the request that any criticism and suggestions be given this committee in order that a final report may be made next year.

Committee: W. D. Faucette (S. A. L.), chairman; C. A. Wilson (Cons. Engr.), vice-chairman; C. F. Allen (M. I. T.), J. C. Irwin (B. & A.), C. B. Niehaus (C. of Ga.), O. K. Morgan (C. C. & O.), H. A. Palmer (G. T.), C. J. Parker (N. Y. C.), E. L. Taylor (N. Y. N. H. & H.), Frank Taylor (C. P. R.), A. C. Shields (C. R. I. & P.), J. B. Carothers (B. & O.), W. H. Brameld (Erie), W. A. Duff (C. N. R.), F. H. Fechtig (A. C. L.), Clark Dillenebeck (P. & R.).

Appendix A—Revision of Manual

PROPOSED REVISIONS TO THE MANUAL—"Form of Construction Contract," Section 38, "Final Estimates," page 665:

(1) It was recommended that the word "whole" be omitted from the second line, as indicated below:

Upon the completion and acceptance of the work, the Chief Engineer shall execute a certificate over his signature that the whole work provided for in this agreement has been completed and accepted by him under the terms and conditions thereof, whereupon the entire balance found to be due to the Contractor, including said retained percentage, shall be paid to the Contractor at the office of the Treasurer of the Company within days after the date of said final certificate.

(2) As regards the use of the word "railway" and the word "railroad" in the Manual, for uniformity it is

recommended that hereafter the word "Railway" shall be used in all forms and specifications, and when the Manual is reprinted wherever the word "railroad" occurs it shall be changed to "Railway."

(3) "Specifications in the Manual in connection with which any uniform general contract form would or should be used."

It has been found that the Specifications for Roadway were compiled before the organization of the Committee on General Contract Forms, and included therein general conditions for the construction of such roadway and stated in these conditions that the Specifications and General Conditions formed the entire agreement. The committee recommended that the Committee on Roadway and the Committee on Uniform General Contract Forms be requested to revise the Specifications for Roadway so that the "General Conditions" of the Specifications as now printed in the Manual be omitted from the Specifications and covered by the General Conditions of the Construction Contract Form.

Appendix B—Form of License for Wires, Pipes, Conduits and Drains on Railway Property

THIS AGREEMENT, made this day of 19....., by and between the hereinafter called the Railway Company, and having a principal office or place of business in hereinafter called the Licensee, WITNESSETH:

WHEREAS, the Licensee desires to construct, maintain and use upon the property of the Railway Company, situated and substantially as shown on the plan hereto attached, designated as dated and made a part hereof:

It is mutually agreed as follows:

- 1. The Railway Company grants permission to the Licensee to construct, maintain and use upon the property of the Railway Company, in accordance with said plan and the specifications forming a part hereof, and subject to the requirements of the Railway Company.
2. In consideration of this license, the Licensee shall pay to the Railway Company, in advance, the sum of per beginning
3. Every cost and expense of construction, maintenance, use and removal resulting from this license, shall be paid by the Licensee. The Railway Company may perform, without notice, any work which it considers necessary to the safe operation of the railroad. The Licensee shall do no work under this license, which may interfere with the operation of the railroad without the written permission of the Railway Company.
4. Use of the property of the Railway Company, however long continued, shall not create any estate or easement in the Licensee or any rights other than license.
5. The Licensee shall indemnify, protect, and save harmless, the Railway Company from and against all claims, suits, costs, charges, and damages, made upon or incurred by the Railway Company in connection with this license.
6. This agreement may be terminated by either party by notice to the other party, or without notice on disuse by the Licensee for
7. Any notice given by the Railway Company to the Licensee

shall be deemed to be properly served if the notice be delivered to the Licensee, or if left with any responsible agent of the Licensee, or if mailed, postpaid, addressed to the Licensee at the last known place of business of the Licensee.

8. Upon termination hereof the Licensee shall forthwith remove all the Licensee's constructions from the property of the Railway Company, to the satisfaction of the Railway Company. In case of the Licensee's failure so to do, the Railway Company may at its option either retain such construction or remove them at the cost of the Licensee.

9. This agreement shall not be assigned or in any manner transferred, without the written consent of the of the Railway Company.

10. Until terminated as hereinbefore provided, this agreement shall inure to the benefit of and be binding upon the legal representatives and successors of the parties, respectively.

IN WITNESS WHEREOF, the parties hereto have executed this agreement on the day and year first above written.

WITNESS RAILWAY COMPANY.
WITNESS LICENSEE.
By.....

Discussion

(The report on Uniform General Contract Forms was presented by W. D. Faucette (C. M. & St. P.). Appendix A was presented and adopted for inclusion in the Manual.)

(Chairman Faucette then abstracted Appendix B and said:) There seems to be a great deal of difference among ourselves as to a proper liability clause in this tentative report, and we were unable to come to any final conclusion. In this connection it is proper to say that this committee has been in contact with the American Railway Development Association and will report to you next year what we have developed.

Chairman Faucette: Mr. Irwin will present the report on "Form of License for Wires, Pipes, Conduits and Drains on Railway Property."

J. C. Irwin (B. & A.) then abstracted the report.)

Chairman Faucette: I move that the proposed form be adopted and printed in the Manual.

Hunter McDonald: I assume of course that this committee has been in touch with the Committee on Electricity. Are you satisfied there will be no objection raised by that committee?

Mr. Irwin: This committee has conferred with the Committee on Electricity and the Committee on Roadway and they are in agreement with it.

(Motion carried.)

Mr. Irwin: The further work of the sub-committee consists of a typical form of agreement for trackage rights, which is based on agreements of 34 roads throughout the United States and Canada, and we have started on the preparation of such a typical form and propose to present it next year.

(The committee was then excused.)

Report on Economics of Railway Location

THE COMMITTEE has studied the effect of curvature on cost of maintenance of way and equipment and has reached the conclusion that it is difficult to present information on this subject that would be of practical value. It would be possible to work out results for a larger number of factors after extended research, tests and experiments; but the practical value of such results would be doubtful. For these reasons, it was the recommendation of the committee that this subject be dropped.

The sub-committee assigned to the subject of Railway

Locomotive Power is making a study of locomotive tractive effort and the various processes proposed for predicting tractive effort at various speeds, in the expectation of revising the present section on "power" in the Manual, where necessary. This work could not be completed in time for presentation with this report. It was therefore recommended that the subject be continued for the ensuing year.

(Committee: A. S. Going (G. T.), chairman; H. R. Carpenter (M. P.), vice chairman; F. H. Alfred (P. M.), R. N. Bejten (B. & O.), C. T. Delamere (C. P. R.), W. A. James (C. P. R.),

Fred Lavis (Cons. Engr.), E. C. Schmidt (U. S. A.), A. K. Shurtliff (A. R. E. A.), C. W. Stark (N. Y. N. J. Com.), Walter Loring Webb (Cons. Engr.), M. A. Zook (I. C. C.), Willard Beahan (N. Y. C.), J. C. Beye, A. S. Cutler (Univ. of Minn.), E. E. King (Univ. of Ill.), E. H. McHenry, H. C. Searls, C. H. Splitstone (Eric), J. G. Sullivan (Cons. Engr.), J. W. Walter.

Discussion

The report of the Committee on Economics of Railway Location was presented by A. S. Going, Engineer of Construction of the Grand Trunk and was considered as a progress report.

Report of Committee on Water Service

Attention is called to the regulations directing the notification of health authorities of water supply points, ownership of sources and other details. The enforcement of provisions of the Interstate Quarantine Regulations prohibiting the contact of ice with water for drinking purposes has been set forward to July 1, 1921. Local deposits are an important factor to be considered in relation to the pollution of surface and shallow well water supplies. A questionnaire sent out for the purpose of securing data on the pitting and corrosion of boiler tubes and sheets brought out some interesting replies on the possible causes and their remedies.

A. F. Dorley
Chairman

A. F. Dorley is the dean of the committee chairmen of the Association, as he is rounding out his ninth year in this position. He has been a member of the committee for eleven years. Mr. Dorley is district engineer on the eastern lines of the Missouri Pacific, prior to which time he was engineer of water service for a number of years. He has given close attention to water treatment and was instrumental in the launching of an extensive program of this character on his road several years ago. Under his leadership the committee has done much to stimulate interest in this important but too frequently neglected phase of railway operation.

THE COMMITTEE requested the following action on its report:

- (1) That the definitions given be approved and inserted in the Manual; and that the subject of examination of the subject-matter in the Manual be again referred to the committee for further study and report.
- (2) That the report on progress of drinking water regulations be received as information and that the subject be reassigned to the committee for further study and report.
- (3) That the subject of specifications for contracting water service work be reassigned to the committee for further study and report.
- (4) That the final report on effect of local deposits on the pollution of surface and shallow well water supplies be received as information.
- (5) That the progress report on the study of pitting and corrosion of boiler tubes and sheets be received as information, and that the subject be reassigned to the committee for further study and report.
- (6) That the report on specifications for the various chemicals used in water treatment be adopted and published in the Manual.
- (7) That the report on centrifugal pumps for railway water service be received as information.
- (8) That the specifications of the American Water Works Association covering cast iron pipe and special castings, and hydrants and valves be adopted and published in the Manual.
- (9) That certain reference to work of interest to railway water supply being done at universities be accepted as information.

Appendix A—Revision of Manual

Due to an oversight, the following definition for a continuous treating plant was omitted last year:

Continuous Plant.—"One so designed that the untreated water may be pumped to it without interruption and where the volume of the chambers through which it passes before flowing to storage is sufficient for complete chemical reaction and precipitation."

The committee added the following explanatory note at the bottom of Table 2, shown on page 450 of the 1915 Manual:

"Table is based on use of calcium oxide or lump lime. To obtain equivalent value for hydrated lime, multiply lime value shown in table by 1.32."

Under definitions published in Volume 21 for insertion in the new Manual, the following corrections have been made: Group A, third item, eighth and twenty-second words, "strainer" to read "screen," to conform with the sixth item.

Considering the definitions, the word "penstock" has been eliminated in question 23, under "Examination Questions for the Care of Boilers."

The committee recommended the following additions and changes in the new Manual:

Under Definitions of Terms used in Railway Water Service, Group G, are definitions for single and double-acting pumps. The following definition for a double-stroke pump should be added:

Double-Stroke Deep Well Pump.—One that employs two separate balanced lines of pump rods and attached water pistons. The two lines of pump rods and their respective pistons alternate with each other in such a way that the weight, or load, lifted by each rod is carried only in its tension, or upstroke.

Alkali Water.—A term in common use, meaning water containing in solution any compound of sodium or potassium in appreciable amounts.

Corrosion.—The eating away of the surface of metal by chemical action, either regularly and slowly as by rusting in air, or irregularly and rapidly as by pitting and grooving in the interior of boilers.

Appendix B—Federal or State Regulations Pertaining to Drinking Water Supplies

The Interstate Quarantine Regulations and Standard Railway Sanitary Code furnish full information on subjects pertaining to railway sanitation and laws governing same and is recommended to the notice of all concerned. The committee desires to call attention to the regulations

directing the notification of health authorities as to the location of the water supply points and ownership of sources, this to be done twice yearly with proper certification and permission of the surgeon general for use of water on interstate carriers. The posting of signs forbidding the use of water considered unsafe for public use is now done by federal or state health authorities and notice is signed either by the United States Public Health Service, or the state health authorities or both, thus relieving the railroads of this responsibility. The collection of water samples from indicated sources of supply is performed in most of the states by state health authorities, the iced containers being shipped by the railroads to the state laboratories for analysis. The examination is usually without cost to the railroad.

Section 19, Subdivision (d), Interstate Quarantine Regulation, provides that drinking water shall be handled in such a manner as not to impair its sanitary quality or safety and already surveys have been made by state and federal health authorities tending towards betterment in methods of handling now being followed, their recommendations being directed toward the cleanliness of drinking water coolers, containers used in carrying water from source to coolers, and directing that ice shall not come in contact with water. This latter provision, it will be noted, is not in accordance with an already existing provision that properly handled ice shall not necessarily be kept separated from water until July 1, 1922, and in accordance with recently received information contained in Circular No. 2131, Medical and Surgical Section, American Railway Association, and dated March 7, 1921, an enforced separation of ice and water has been postponed until July 1, 1924.

Instructions are also given that containers shall be cleaned once each week and that storage tanks shall be flushed and drained once a month; hose used in filling containers shall have a protected metal nozzle kept clean by flushing and washing.

Circular No. 2140 of the American Railway Association contains, among other matters, a letter written by Assistant Surgeon General McLaughlin, "that if permission to use water is given a community by the state having jurisdiction the use of such water by a carrier should be permitted." This brings up the question of temporary provisional certification, which is for water not fully approved by reason of a by-pass in the water system, connection with impure water supply for emergency use, unsatisfactory operation or similar reasons, the intent and purpose of such certification being to give opportunity for advised and needed repairs or improvements. This matter was taken up with the United States Public Health Service and it was stated that a ruling covering provisional certification would be contained in the revised edition Interstate Quarantine Regulations, which, however, was omitted.

The appointment of a joint committee from the Medical and Surgical Section, also the Mechanical Section, of the American Railway Association and from the Water Service committee of the American Railway Engineering Association, is looked upon as a valuable forward step in the splendid efforts which the railroads are putting forth to give the public their best, in service, in equipment and in courtesy, and the resultant action is looked forward to by all.

Appendix D—A Report on the Pitting and Corrosion of Boiler Tubes and Sheets

It cannot be expected that the committee can find the solution of this problem in a short space of time and this report is submitted as a progress report only. The following questionnaire prepared at a committee meeting in Chicago on May 6, 1921, was sent to all members of

the sub-committee and replies were received from nine of the eleven members:

(1) *What In Your Experience Have Been the Causes of Corrosion?*

The experience of the committee indicates that general corrosion is prevalent where acid waters, or waters with a high percentage of chloride or sulphate hardness are used without treatment.

(2) *What In Your Experience Has Been the Cause of Pitting?*

The replies indicate that pitting in locomotive boilers results from electrolytic action, the underlying causes of the electrolytic action being due to chemical or mechanical action or both.

The presence in the water of an electrolyte such as sodium sulphate or sodium chloride is necessary in sufficient quantities to convey the electric current between spots of impurities in the material which have different potentials, thereby resulting in a wasting of the metal at the negative pole. The presence of dissolved oxygen in the water materially assists the electrolytic action by removing the corrosion by-products and allowing the destructive action to continue.

(3) *What In Your Experience Has Been the Cause of Grooving?*

The causes of grooving are also ascribed to electrolytic action. The strained metal of a boiler plate that is not completely covered by a rivet head becomes eaten away or perhaps a plate becomes strained at a point by temperature stress, and the strained streak is corroded. In each case the strained metal is of greater corrosibility and it acts as one of the plates of an electric battery, in which the other plate of the battery is the unstrained metal of the boiler shell and the electrolyte is the water in the boiler.

(4) *What Is Your Method of Prevention?*

To date efforts toward prevention of corrosion, pitting and grooving have been chiefly confined to chemical treatment of the water. No means of complete prevention have as yet been found although in actual practice the trouble has been very materially decreased on some railroads by maintaining a caustic alkalinity in the boilers which appears to have an inhibitive effect on the corrosive action. Apparently, little work has been done toward improving the character of boiler materials and methods of handling with a view to securing a more homogenous material and eliminating strains and stresses which appear to be responsible in part at least for much of the grooving, ring pitting and similar forms of corrosion.

(5) *Have You Laboratory Tests Confirming Specific Causes of Corrosion, Pitting and Grooving?*

Laboratory tests were reported which indicated that pitting takes place in commercial boiler steel immersed in water very readily where oxygen and carbon dioxide are present and is accentuated by increased amounts of sodium sulphate or sodium chloride and also by higher difference of potential with an increased rate of electrolysis. It is also shown that this action is inhibited to a considerable extent by the addition of sodium carbonate or caustic soda. Other tests were presented which strongly indicated the presence of spots of impurities which had been rolled into the material and made up into flues.

(6) *Have You Any Laboratory Tests to Suggest to Confirm Your Findings or That Would Be of Assistance In the Study of This Subject?*

Inasmuch as it has been found in practice, that treatment with caustic soda inhibits to a greater or lesser extent the pitting action, it is suggested that during the coming year careful tests be made to determine the minimum and maximum effective limit of caustic soda treatment with special relation to varying concentrations of sodium sulphate and sodium chloride, these being the principal electrolytes found in boiler waters.

This subject in general is intimately connected with departments other than engineering and it is respectfully suggested that the Board of Direction request that a committee be appointed from the mechanical section to work in coöperation with this committee, so that all phases including the manufacture and fabrication of material may be considered as well as the character of the water supply.

Appendix E—Specifications for Various Chemicals Used in Water Treatment

STANDARD SPECIFICATIONS FOR SODA ASH TO BE USED IN WATER TREATMENT

Definition.—1. Soda ash is the anhydrous normal carbonate of soda.

Classes.—2. Soda ash is commercially divided into two classes:

- (a) Light;
- (b) Dense.

3. Dense soda ash shall be rejected.

(I) Chemical Properties and Tests

Sampling.—4. The samples shall be a fair average of the shipment, and shall be taken from the surface to the center of package.

The vendor shall take a one pound sample from four packages in various locations in each carload or less and forward to the purchaser. The sample, on receipt by the purchaser, shall be immediately transferred to air-tight containers in which the unused portion shall be stored until the soda ash has been finally accepted or rejected by the purchaser.

Check tests on samples taken from cars at their destination will occasionally be made, and should agree within reasonable limits with initial sample.

Chemical Properties.—5. (a) The classes and properties of soda ash shall be determined by standard methods of chemical analysis.

(b) Soda ash shall conform to the following requirements as to chemical composition:

Normal sodium carbonate—95 per cent minimum.

(II) Physical Properties and Tests

6. The material shall be in dry powdered form and shall be free from lint, chips, ash or other foreign matter.

Fineness.—7. A 100-gram sample shall not have more than 0.5 per cent by weight, insoluble in cold distilled water.

(III) Packing and Marketing

Packing.—9. Soda ash shall be packed in cloth or duck bags of not more than 100 lb. net weight, or in paper bags of not more than 50 lb. net weight.

Marking.—10. The name of manufacturer and net weight shall be plainly marked on each package, or attached by tag thereto.

(IV) Inspection, Penalization and Rejection

Inspection.—11. (a) All soda ash shall be subjected to inspection.

(b) The soda ash may be inspected at the place of manufacture or point of delivery, or both, as arranged at the time of purchase.

(c) The inspector representing the purchaser shall have free entry at all times, while work on the contract of the purchaser is being performed, to all parts of the manufacturer's works which concern the manufacture of the soda ash ordered. The manufacturer shall afford the inspector all reasonable facilities for inspection and sampling, which shall be so conducted as not to interfere unnecessarily with the operation of the works.

(d) The purchaser may make the tests to govern the acceptance, penalization or rejection of the soda ash in his own laboratory or elsewhere. Such tests, however, shall be made at the expense of the purchaser.

Penalization.—12. All prices shall be based upon the percentage of normal sodium carbonate. If a lower grade is furnished than the one specified, provided it is not less than 80 per cent sodium carbonate, it may be accepted by the purchaser upon the vendor making a rebate equal to percentage of sodium carbonate below the minimum designated.

Rejection.—13. (a) Unless otherwise specified, any rejection based on failure to pass tests prescribed in these specifications shall be reported within 10 working days from the taking or receipt of samples by the purchaser.

(b) Rejected soda ash shall be returned to the shipper or as he may direct. All freight charges in both directions to be paid by the shipper.

Rehearing.—14. Samples which represent rejected soda ash shall be preserved in air-tight containers for 10 working days from the date of test report. In case of dissatisfaction with the result of the tests, the manufacturer may make claim for a rehearing within that time.

STANDARD SPECIFICATIONS FOR HYDRATED LIME TO BE USED IN WATER TREATMENT

Definition.—1. Hydrated lime is a dry flocculent powder resulting from the hydration of quicklime.

Classes.—2. Hydrated lime for water treatment is commercially divided into two classes:

- (a) High-Calcium;
- (b) Calcium.

Basis of Purchase.—3. The particular class of hydrated lime desired shall be specified in advance by the purchaser. Unless otherwise specified high-calcium lime shall be furnished.

(I) Chemical Properties and Tests

Sampling.—4. The sample shall be a fair average of the shipment. Three per cent of the packages shall be sampled. The sample shall be taken from the surface to the center of the package. A 2-lb. sample to be sent to the laboratory shall immediately be transferred to an air-tight container, in which the unused portion shall be stored until the hydrated lime has been finally accepted or rejected by the purchaser. Check tests on samples taken from cars at their destination will occasionally be made, and should agree within reasonable limits with initial sample.

Chemical Properties.—5. (a) The classes and chemical properties of hydrated lime shall be determined by standard methods of chemical analysis.

(b) The hydrated lime shall conform to the following requirements as to chemical composition:

High Calcium—Not less than 90 per cent Calcium Hydroxide (Ca(OH)₂).

Calcium—Not less than 85 per cent Calcium Hydroxide (Ca(OH)₂).

(II) Physical Properties and Tests

Fineness.—6. A 100-gram sample shall leave by weight a residue of not over 2 per cent on a standard 100-mesh sieve and not over 0.5 per cent on a standard 20-mesh sieve.

(Note—Paragraphs covering Packing and Marking; and Inspection, Penalization and Rejection, are all the same as given for soda ash.)

STANDARD SPECIFICATIONS FOR QUICKLIME TO BE USED IN WATER TREATMENT

Definition.—1. Quicklime for use in water treatment is a material the major part of which is calcium oxide, which will slake on the addition of water.

Grades.—2. Quicklime is divided into two grades:

(a) Selected.—Shall be well-burned, picked free from ashes, coke, clinker or other foreign material.

(b) Run-of-Kiln.—Shall be well-burned, without selection. It shall be free from large lumps of unburned or foreign material.

Forms.—3. Quicklime is shipped in two forms: (a) Lump—shall be kiln size. (b) Pulverized—shall be reduced in size to pass a 1/2-in. screen.

Classes.—4. Quicklime for water treatment is divided into two classes: (a) high calcium, (b) calcium.

Basis of Purchase.—5. The particular grade, form and class of quicklime desired shall be specified in advance by the purchaser. Unless otherwise specified, high-calcium quicklime shall be furnished.

(I) Chemical Properties and Tests

Lime in Barrels.—6. Quicklime shall be shipped in barrels, or other containers of similar size. At least 3 per cent of the number of barrels shall be sampled. They shall be taken from various parts of the shipment, dumped, mixed and sampled. The samples shall comprise at least 10 shovelfuls taken from different parts of the shipment. The total sample taken shall weigh at least 100 lb. and shall be crushed to pass a 1-in. ring, and quartered to provide a 15-lb. sample for the laboratory.

Laboratory Samples.—7. All samples to be sent to the laboratory shall be immediately transferred to an air-tight container in which the unused portion shall be stored until the quicklime shall finally be accepted or rejected by the purchaser.

Check tests on samples taken from car at destination will

occasionally be made, and should agree within reasonable limits with initial sample.

(B) Chemical Tests

Chemical Properties.—8. (a) The classes and chemical properties of quicklime shall be determined by standard methods of chemical analysis.

(b) Samples shall be taken as specified in sections 6 and 7.

(c) Quicklime shall conform to the following requirements as to chemical composition:

Chemical Composition

Properties Considered	High-Calcium		Calcium	
	Selected	Run-of-Kiln	Selected	Run-of-Kiln
Calcium Oxide, per cent	90 (min.)	90 (min.)	85-90	85-90
Calcium Oxide plus Magnesium Oxide, min., per cent	90	85	90	85
Carbon Dioxide, max., per cent	3	5	3	5
Silica plus Alumina plus Oxide of Iron, max., per cent	5	7.5	5	7.5

(II) Inspection, Penalization and Rejection

(Same as for soda ash.)

STANDARD SPECIFICATIONS FOR SULPHATE OF ALUMINA TO BE USED IN WATER TREATMENT

Definition.—1. This chemical shall be the commercial product known as Basic Sulphate of Alumina.

(1) Chemical Proportion and Tests

Sampling.—2. The sample shall be a fair average of the shipment. Five per cent of the packages shall be sampled. The sample shall be taken from the surface to the center of the package. A five-pound sample shall be sent immediately to the laboratory and transferred to an air-tight container in which the unused portion shall be stored until the alumina has been finally accepted or rejected by the purchaser.

Check tests on samples taken from cars at their destination will occasionally be made, and should agree within reasonable limits with initial sample.

Chemical Properties.—3. (a) The chemical proportion of basic sulphate of alumina shall be determined by standard methods of chemical analysis.

(b) Basic sulphate of alumina shall contain not less than 17 per cent water soluble aluminum oxide (Al_2O_3); 3 per cent by weight of the aluminum oxide shall be in excess of the theoretical amount required to combine with the sulphuric acid present.

(II) Physical Properties and Tests

4. The material shall be in dry lump form and shall be free from lint, chips, ash or other foreign matter.

(III) Packing and Marking

5. Basic sulphate of alumina shall be packed in cloth or duck bags of not more than 50 lb. net weight, or in barrels or containers of not more than 300 lb. net weight.

6. The name of manufacturer, net weight and percentage of water soluble alumina shall be plainly stencilled on each end of package or marked on tag securely attached thereto.

(IV) Inspection, Penalization and Rejection

(Same as for soda ash.)

STANDARD SPECIFICATIONS FOR SULPHATE OF IRON TO BE USED IN WATER TREATMENT

Definition.—1. Sulphate of iron is the ferrous sulphate, the chemical formula of which is $FeSO_4 \cdot 7H_2O$.

Classes.—2. Sulphate of iron commercially does not have exactly seven molecules of water combined with one molecule of anhydrous ferrous sulphate.

3. Commercially there are three grades:
 (a) Prime green, select, or stick crystal.
 (b) Seconds or bottom.
 (c) Green lat or sugar sulphate of iron.

(1) Chemical Properties and Tests

Sampling.—4. The samples shall be a fair average of the shipment and shall be taken from the surface to center of each package.

Five one-pound samples shall be taken from packages in various positions in each rail or lot. These samples shall be thoroughly mixed and quartered. One quarter shall then be placed in a suitable container and submitted to the purchaser's laboratory for tests.

Check tests on samples taken from cars at their destination will occasionally be made, and should agree within reasonable limits with initial sample.

Chemical Properties.—5. (a) The chemical properties of the material shall be determined by standard methods of analysis, and the shipments shall conform to the following minimum requirements:

- (b) Impurities: Not over 2 per cent.
 (c) Anhydrous ferrous sulphate $FeSO_4$: Not less than 53.5 per cent.
 (d) Free Sulphuric Acid: Not over .025 per cent.

(II) Physical Properties and Tests

Physical Properties.—6. Shipments of seconds or bottoms shall be rejected. Either Grade (a) or Grade (c) shall be furnished as specified on the purchase order. Unless otherwise specified, Grade (c) shall be furnished.

(III) Packing and Marking

Packing.—7. Sulphate of iron shall be packed in cloth or duck bags of not more than 100 lb. net weight, or in barrels or containers of not more than 250 lb. net weight as specified in purchase order.

Marking.—8. The name of the manufacturer, net weight and grade of sulphate of iron shall be stencilled on each package, or marked on tag securely attached thereto.

(IV) Inspection and Rejection

(Same as for soda ash.)

Appendix G—Standards

During the past year the committee gave careful consideration to the adoption of standard specifications covering cast iron water pipe and special castings, and standard specifications for hydrants and valves. The conclusion reached was that the standard specifications of the American Water Works Association were complete in every detail and so well established that practically all cast iron pipe specials, valves and hydrants now used by railroads were furnished under these specifications. Therefore, upon the recommendation of the Standardization committee, the Board of Direction instructed the committee to present these specifications to the Association for approval.

The specifications are Standards for Cast Iron Water Pipe (adopted by the American Water Works Association May 12, 1908) and Standards for Hydrants and Valves (adopted by the American Water Works Association June 24, 1912. Revised June 9, 1916).

Discussion

(In the absence of Chairman Darley through illness, C. R. Knowles (I. C.) presented the report. Mr. Knowles abstracted Appendix A appertaining to the revision of Manual and moved that the report be accepted, which motion was carried.) Mr. Knowles then presented in their turn, Appendix B, on federal or state regulations pertaining to water supplies; Appendix C, appertaining to the effect of local deposits in pollution of surface and shallow well water supplies; and Appendix I, appertaining to studies on pitting and corrosion, all of which were accepted either as information or a report of progress.

Mr. Knowles then abstracted Appendix E, appertaining to the specifications for soda ash in water treatment and moved that the specification be approved for publication in the Manual. The motion was carried. Mr. Knowles then abstracted Appendix F, appertaining to centrifugal pumps and moved that this be accepted as information. Motion carried.

Mr. Campbell (E. P. & S. W.): In our experience we find the centrifugal pump a very useful and economical means of lifting water in reasonable limits, up to 200 ft. We have one installation in which we are lifting water 400 ft., but we are not finding that economical, and we are now proposing to take that out and substitute another style of pump.

(Mr. Knowles abstracted Appendix G and moved that these specifications be adopted for publication in the Manual.)

The President: May I ask if the American Water-

works Association collaborated with your committee when these standards were adopted?

Mr. Knowles: They did not. They gave us permission to use them.

C. E. Lindsay (N. Y. C.): Will the committee consent to substitute the word "specification" for the word "standards" in the large heavy type "Specifications for cast iron water pipes" and "specifications for hydrants and valves"?

Mr. Knowles: The committee will accept that.

Mr. Lindsay: Also omit "standard" from the word "specifications" following.

Mr. Knowles: The committee will be glad to accept that.

(*Motion carried.*)

(Mr. Knowles abstracted an Appendix appertaining to the university work of interest to railway water supply, and said:) It is the desire of the committee to cooperate with the universities in the study of this work, so that the results will be consistent, and not in conflict with actual practice and experience. This report is submitted as information.

D. A. Steel (*Railway Age*): Concerning the review made by the committee of the work done by me at the University of Montana in 1920, I do not want to convey the impression of criticizing this review, because I am very grateful to know that the committee saw fit to take notice of the work, and I realize that in making the review the sole desire was to bring out the interest on the part of the universities throughout the country to cooperate with the railways in solving this problem, but I am afraid that some of the phraseology in this review might have a damaging effect on the value of the report. Take, for instance, the words "electrolytic phase" in the statement of the review, "An investigation of interest in connection with the study of the electrolytic phase of pitting and corrosion was carried on." I think the inference which would be drawn by almost anyone in reading this casually would be that the committee referred to the report as a brief for a definite school of thought on

this subject. On the contrary, the work involved no underlying intention of supporting any one school of thought, simply to bring forth some very patent observations in connection with the corrosion, so that all parties concerned might appreciate the nature of it.

Mr. Knowles: The objections raised by Mr. Steel do not seem to be very serious, and I think with his explanation included, it will be clear to all who read it.

I know it was Mr. Dorley's intention to make a few comments on water service, and in his absence I have a few remarks which, with your permission, I will present to the convention.

(Mr. Knowles then presented the following:)

A water supply, ample in quantity and of satisfactory quality, is one of the essential requirements for the successful operation of a steam railroad. A survey of the field in this country indicates that a conservative estimate of the annual water consumption on American railroads is approximately nine hundred billion gallons. In the neighborhood of 14,000 water stations are required to supply this amount of water, involving a very large initial investment. The annual expenditure for operation and maintenance is in excess of \$100,000,000. While this figure represents an important item of expense in railroad operation, it is small in comparison to the expense involved from the effect on locomotive upkeep and operation, caused by use of unsatisfactory or inadequate supplies, and the time will come when the extravagance of water waste and scale in boilers will not be tolerated.

There appears to have been but little progress in the development of suitable organization to handle this important feature of railroad operation. It is a significant fact that where special attention has been given this subject, very satisfactory economies have been effected, together with improvement of the property and power. It is therefore desired to call the attention of the members of the association to the possibilities of the water service organization as approved last year for publication in the Manual of recommended practice.

(The committee was excused with thanks.)

Report on Signs, Fences and Crossings

A questionnaire sent to the railroads in regard to the location of signs did not disclose any laws or orders of public utility commissions which conflict with or vary much from the recommendations in the report of the committee. Wherever possible a uniform distance for all signs from the center of the track is better than variable distances for different classes of signs although a uniform distance will require the widening of the roadbed at the location of the sign on fills. A total of 17 substitutes for wood crossing planks were grouped in five classes, installations of most of which have been in service too short a time to offer any definite conclusions.

Maro Johnson
Chairman

Maro Johnson is rounding out his first year as chairman of the committee after serving as vice-chairman for one year. He has been a member of the committee for eight years. He is an assistant engineer on the staff of the bridge engineer of the Illinois Central, in which capacity he was in charge of the construction of the St. Charles Air Line bridge with its 260-ft. bascule span across the Chicago river at Chicago, which was placed in service about a year ago. As a member of this committee he has been active in the preparation of standard designs for roadway signs and in the promotion of uniform practices in their installation.

Conclusions

THE COMMITTEE SUBMITTED A REPORT on the location of roadway signs in Appendix A. A report on substitutes for crossing planks was presented as information in Appendix B.

In Appendix C were presented tentative specifications for all concrete posts and tentative plans for round and square line posts.

The committee recommended that the statement in Appendix A relating to the location of signs be adopted and printed in the Manual.

Committee: Maro Johnson (I. C.), chairman; T. E. Rust (W. C. F. & N.), vice-chairman; Anton Anderson (C. I. & L.), Arthur Anderson (N. Y. C.), F. D. Batchellor (B. & O.),

C. H. N. Connell (C. N.), A. Crumpton (G. T.), L. B. Curtis (N. P.), A. Daniels (C. M. & St. P.), G. N. Edmondson (N. Y. C.), W. J. Harris (C. B. & Q.), R. A. Harry, S. C. Jump (I. C.), L. C. Lawton (A. T. & S. F.), O. H. Sessions (G. T.), S. E. Shoup (K. C. S.), W. C. Swartout (M. P.), R. L. Turner (Erie), W. D. Warren (N. Y. N. H. & H.), K. G. Williams (Union).

Appendix A—Location of Signs

In studying the location of signs, the committee sent a circular to a large number of railroads asking for information as to their general practice in locating signs, with the purpose of finding out if there were any unusual conditions which should be taken into consideration, also with the idea of avoiding a recommendation that would vary too much from present practice. The information obtained included the location of signs with relation to the track; location with relation to the objects affected, and details of local, state, or public service commission laws or orders applying to the location of signs.

SUMMARY OF REPLIES TO QUESTIONNAIRE

Distances from the track: The replies to the questionnaire show considerable variation in the distances used, but the majority are less than recommended in this report.

Distances along track, from the object affected: In most instances, the sign itself indicates the location. Where it does not, varying locations are given in the replies.

Laws or orders of public utilities commissions: These affect primarily highway crossings, drawbridges and whistle posts. The questionnaire does not disclose any law or order which will conflict with, or vary much, from the recommendations of this report. If such variations do occur, the law, of course, will govern.

Safety and clearance are naturally combined. This association has previously adopted a clearance diagram applying to bridges requiring horizontal clearance of eight feet from the center of the track and signs should not encroach on this.

The committee believes it would generally be better to adopt a uniform distance for all signs wherever possible rather than vary it for different classes of signs, the main consideration being safety for employees, which is controlled by distance from the track.

Roadbed width may also be considered important; by roadbed width we mean the width of sub-grade. Even with the widest roadbed now in use, based on this information, it would be necessary, in order to get good clearance from the track, to build out the shoulder properly to support signs located on embankments.

Clearance required for snow plow wings, roadbed spreaders and weed destroyers which are used on practically all railroads has been investigated and we believe that sufficient clearance has been provided for this equipment.

The committee recommended the distances given on a table of signs submitted with its report, appreciating the fact that widening of the roadbed on fills will be necessary, and further, that this is the practice in vogue on railroads at the present time where signs are located at a sufficient distance from the track to require it.

Appendix B—Substitutes for Wood Crossing Planks

In 1913 this committee submitted a report on "Track Construction and Flagways at Paved Street Crossings and in Paved Street," which applied more particularly to crossings constructed of the same material as the adjoining street. The present preliminary report is more general and includes all kinds of crossings.

In recent years the high price of wood crossing plank

has resulted in the introduction of a number of substitutes, of which 17, if paving blocks are included, have come to the attention of this committee. These may be grouped in five classes in accordance with the material of their construction. So classified, these substitutes are listed below. The figures under the group headings indicate the number of crossings of that group included in this report.

Concrete 21	(a) Solid Concrete. (b) Precast slab. (c) Concrete plank.
Bituminous Material 57	(a) Tarvia. (b) Headley Good Roads Oil (c) Emulsified Asphalt. (d) Kentucky Rock Asphalt. (e) Sheet Asphalt. (f) Paving Pitch.
Steel or Iron 3	(a) Innu Armo Iron Highway Crossing. (b) Jennings Steel Crossing (c) Railroad Rails.
Paving Blocks 8	(a) Granite. (b) Brick. (c) Wood.
Ballast Material 1	(a) Gravel. (b) Disintegrated Granite.

For the most part, these crossings have been in use but a short time, and definite conclusions as to maintenance cost and serviceability cannot be reached. A number of roads, however, in addition to those reported on, are giving consideration to the adoption of one or the other of the substitutes.

Briefly summarized, the status of each group is as follows:

Solid Concrete—We do not find many crossings of this type, and, where used, they have been on tracks where there is little railroad traffic.

Precast Concrete Slab—This type of crossing has been used on a number of railroads, though of varying design. Most of the installations have been made subsequent to 1919, so that they have hardly been in service long enough to obtain information as to their durability and cost of maintenance. One thing that has been demonstrated is that when concrete slabs are placed, crossings should have good drainage to prevent heaving in winter time.

Concrete Plank—The C. B. & Q. has tried out a number of these crossings. The main trouble seems to be that the upper corners of the concrete plank disintegrate under service, indicating that such plank should have some sort of corner protection.

Bituminous Materials—There are more crossings of this type in service than any of the others. The first cost of installation is lower and they are easily installed.

Steel or Iron, Plate Type—This type of crossing is not used extensively and seems to be in an experimental stage. One of these was installed in 1918, on the C. C. C. & St. L., at Seventy-first street, Carthage, Ohio. After 17 or 18 months it was taken up on account of the plates not being heavy enough to carry the trucks which passed over them. These crossings are now being made of heavier material. One will be installed on the B. & O., at Cincinnati, Ohio. There seems to be a tendency for horsedrawn vehicles to avoid this type of crossing when possible.

Railroad Rails, Steel or Iron—These crossings consist of rails laid between the running rails, and spaces filled in with concrete or other material. They have not been used in high speed tracks.

Paving Blocks—This type of crossing is used mostly

in cities and particularly where the adjacent street is paved with blocks or where ordinances require their use.

Ballast Material—Crossings of this type seem to be used mostly at farm crossings, and on highways with light traffic.

Appendix C—Specifications for Concrete Fence Posts

(I) MATERIALS

1. **Intent.** The intent of these specifications and the plans of which they form a part is to produce concrete fence posts having a uniform and sufficient strength and durability at a minimum of cost. On account of the thinness of the section, this can only be accomplished by intelligent and constant attention to securing proper proportions of all ingredients.

2. **Cement.** Cement shall conform to the present Standard Specifications and Tests for Portland Cement of the American Railway Engineering Association and subsequent revisions thereof.

3. **Fine Aggregate.** Fine aggregate shall consist of sand, stone screenings, or a combination thereof, having clean, hard, strong, durable, uncoated grains, and free from injurious amounts of dust, lumps, soft or flaky particles, shale, alkali, organic matter, loam or other deleterious substances. It shall range in size from fine to coarse, preferably within the following limits:

- Passing through a No. 4 sieve.....not less than 95%
- Passing through a No. 50 sieve.....not more than 30%
- Weight removed by decantation.....not more than 3%

4. **Coarse aggregate.** Coarse aggregate shall consist of crushed stone, gravel, or combination thereof, having clean, hard, strong, durable, uncoated particles free from injurious amounts of soft, friable, thin, elongated or laminated pieces, organic or other deleterious matter. It shall range in size from fine to coarse within the following limits:

- Passing a 1/2" screen.....not less than 95%
- Passing a No. 4 screen.....not more than 15%
- Passing a No. 8 screen.....not more than 5%

5. **Bank Gravel.** Natural combinations of fine and coarse aggregate, in the form of bank gravel, may be used providing its particles meet all the requirements in paragraphs 2 and 3 above, and provided such particles are properly graded from fine to coarse within the following limits:

- Passing a 1/2" screen.....not less than 95%
- Passing a 3/4" screen.....from 35% to 55%
- Passing a No. 50 screen.....not more than 15%
- Weight removed by decantation....not more than 1 1/2%

6. **Water.** Water for concrete shall be clean and free from oil, acid, alkali, organic or other deleterious substance.

7. **Metal Reinforcement.** Steel reinforcement shall be hard steel and shall conform to the present Standard Specifications for Steel Reinforcement of the American Railway Engineering Association or, if wire is used, to the present Tentative Specifications for Cold-Drawn Steel Wire of the American Society for Testing Materials, or to such modifications of either of such specifications as may hereafter be adopted by the American Railway Engineering Association. Reinforcement shall be in the form of round or square bars, preferably deformed, or steel wires. Crimped, stranded or flat reinforcing shall not be used. Reinforcing, before being placed in the molds, shall be thoroughly cleaned of mill and rust scale, and of coating that will destroy or reduce the bond.

(II) PROPORTIONING AND MIXING CONCRETE

8. **Proportioning.** The unit of measure shall be the cubic foot. One bag of Portland cement shall be considered as one cubic foot. Each of the constituent materials shall be measured separately by volume, using a method which will secure the specified proportions. The water shall be measured by an automatic device that will secure the same quantity in successive batches.

9. **Strength.** The proportion of cement, water and aggregate shall be such as to produce a concrete having a compressive strength at 28 days of 2,000 lb. per sq. in. The proportions of fine and coarse aggregate to produce such a concrete shall be determined by making a screen analysis of the available aggregates and using such a mixture as will secure a maximum density. To such a mixture sufficient cement shall then be added to produce concrete of the desired strength. If bank gravel is used it shall be screened and remixed, if necessary in order to produce concrete of the desired strength, or if such screening and remixing will produce concrete of the desired strength with enough less cement so that the saving in the cost of cement will exceed the cost of screening and remixing.

10. **Consistency.** No more water shall be used than is necessary to produce a concrete which can be worked thoroughly

into the forms and around the reinforcing. The consistency shall be measured by the slump test in the method described in the 1921 report of the Committee on Masonry, American Railway Engineering Association. The maximum slump shall not exceed six inches. The consistency shall be checked up from time to time.

11. **Mixing.** Mixing shall be done in a batch mixer of approved type, equipped with a suitable charging hopper, water storage, and water measuring device. The entire contents of the drum shall be discharged before recharging. Each batch shall be mixed for not less than 1 1/2 min. after all the materials are in the mixer, during which time the mixer shall rotate at a peripheral speed of about 200 ft. per min. The volume of the mixed batch shall not exceed the manufacturer's rated capacity. The retémpering of concrete which has partially hardened shall not be permitted. In cold weather aggregate shall be heated, if necessary, to remove frost and frozen lumps.

(III) DEPOSITING CONCRETE

12. **General.** Before depositing concrete the molds shall be thoroughly cleaned and coated with non-staining mineral oil or other approved material. The mixer should be so located that the concrete can be discharged directly into the molds or conveyed to the molds in such a manner as to cause no separation of the ingredients. Each mold shall be completely filled in one continuous operation.

13. **Molds.** Molds shall be substantial, rigid, and true to plan. Metal molds are more satisfactory than wooden molds.

14. **Placing Reinforcing.** The reinforcing shall be securely and continuously held in its proper position in the post during the placing of the concrete and until the post is removed from the mold. Metal spacers that would cause distinct lines of cleavage in the post shall not be used. The reinforcing shall be supported as often as is necessary to prevent its sagging into any appreciable extent due to its own weight or to the weight of the wet concrete.

15. **Compacting.** Concrete shall be thoroughly compacted into the molds and around the reinforcing. This is best accomplished by giving the molds a joggng or vibratory motion during and after depositing.

16. **Finish.** All posts shall have a clean, smooth finish. If any pockets or holes are discovered upon removal from the molds, they shall be immediately filled with a mixture of one part cement to two parts fine aggregate. Pockets or holes more than 1/2 in. in depth or more than 1/2 in. in diameter, or any exposure of the reinforcing shall cause the rejection of the post.

(IV) CURING AND HANDLING POSTS

17. **Curing.** The posts shall remain in the molds until the concrete has thoroughly hardened and in no event for less than 24 hours after placing. During this time and until they are cured the posts shall be carefully handled and protected from shock. When the posts are removed they shall be stocked in a nearby vertical position and protected from direct sunlight. They shall be kept wet by sprinkling for eight or ten days after being made. They should be cured for not less than 90 days, when cured naturally, before being shipped or set. Posts shall not be cured out of doors during freezing weather.

(V) MISCELLANEOUS

18. **Inspection.** All materials and all processes of manufacture shall be subject to inspection and approval at all times. Free access shall be provided for all authorized inspectors to all parts of the plant in which the posts or the materials are made, stored or prepared.

19. **Tests.** All testing of materials used in the manufacture of posts, all preparing, storing and testing of concrete specimens, as provided in Section 8 hereof, and all screen analyses of aggregates, shall be made in accordance with the methods adopted or approved by the American Railway Engineering Association and in effect at the time such tests, analyses, etc., are carried out. In case the American Railway Engineering Association shall not have approved or adopted any methods for such tests, analyses, etc., the same shall be made in accordance with the methods then adopted or approved by the American Society for Testing Materials.

20. **Patents.** The manufacturer or contractor shall pay all royalties for the use of patented designs or devices or forms of construction and protect the railway company from all claims of infringements or liability for the use of such patents.

Discussion

Chairman Johnson abstracted the report and moved the adoption of the conclusions.

(Motion carried.)

A. V. Brown (Lake Shore Elec.): The highway crossing signs for the purpose of warning the public is not the

same which was adopted by the association several years ago.

Chairman Johnson: It is not the intention to differ from the sign shown in the Manual and adopted some years ago.

C. E. Lindsay (N. Y. C.): The committee says it would generally be better to adopt a uniform distance for all signs wherever possible rather than vary it for different classes of signs, the main consideration being safety for employees, which condition is controlled by distance from the track.

I agree with that. There are some signs which have been obscured by other signs not necessary for the en-

gineer, and they should be placed a certain distance from the track, otherwise there may be some conflict.

Chairman Johnson: The third subject is "Highway grade crossings." The committee has not concluded its work on that subject. The next subject is "substitutes for wood crossing planks." That part of the report will be presented by Mr. Batchellor.

(F. D. Batchellor (B. & O.) abstracted the report and offered it as information.)

(T. E. Rust, chairman of the Subcommittee on Fence Posts, presented his report and it was received as information.)

(The committee was dismissed with thanks.)

Report of Committee on Electricity

Lack of sufficient time to study the Super Power Survey prevented the submission of an extensive report on it, although a summary is given. The survey deals with the sources of power available for railroad operation within economical reach of the Niagara and St. Lawrence rivers and tributaries. The National Electrical Safety Code standards are satisfactory and in accord with good practice. They are not intended as a designing specification but are primarily rules establishing minimum requirements. Working specifications including lower factors of safety are not consistent with the code and the revision of the Manual is therefore recommended.

Edwin B. Katte
Chairman

Edwin B. Katte has been chairman for five years and a member of the committee for eleven years. As chief engineer of electric traction of the New York Central since 1906 he has been in intimate contact with the Grand Central terminal development of that road since its inception. He has thus had intimate contact with the development of steam railway electrification from the construction and more recently from the operating standpoint. This extended experience peculiarly qualifies him to direct the work of this committee in a field which is now receiving increasing attention from year to year as its possibilities become better understood.

1. THE COMMITTEE recommended that its report on Electrical Interference be accepted as information, published in the Proceedings and the subject continued.

1. The committee recommended that its report on Electrical Interference be accepted as information, published in the Proceedings and the subject continued.

2. The committee recommended that the report on Water Power (see Appendix B) be accepted as information, published in the Proceedings and the subject continued.

3. The committee recommended that its report on Electrolysis and Insulation be accepted as information and published in the Proceedings, that the subject be continued and the committee authorized to continue its representation on the American Committee on Electrolysis and that the report of the American Committee on Electrolysis be accepted, printed in the Manual and in the Bulletin for convenient reference.

4. The committee recommended that its report on the National Electrical Safety Code (see Appendix D) be accepted as information, published in the Proceedings and the committee authorized to continue its conference with the U. S. Bureau of Standards.

5. The committee recommended that the progress report on Overhead Transmission Line Construction be accepted as information, published in the Proceedings and the subject continued.

6. The committee recommended that its Third Rail and Overhead Clearance Tables be accepted as information and published in the Proceedings.

7. The committee recommended that its report on collaborating with the committee on Economics of Rail-

way Location be accepted as information and the cooperation continued.

8. The committee recommended that (a) the Railroad Specifications for Commercial Adhesive Tape for Electrical Purposes, and (b) the Railroad Specifications for Rubber Insulated Tape (see Appendix H) be approved and printed in the Manual as recommended practice.

9. In an addenda to its report, the committee submitted a revision of the association's "Railroad Specifications for Wire Crossings," with recommendation for their approval.

Committee: Edwin B. Katte (N. Y. C.), chairman; D. J. Brumley (I. C.), vice-chairman; H. M. Bassett (N. Y. C.), R. D. Coombs (Cons. Engr.), J. C. Davidson (N. & W.), G. Eisenhauer (Erie), F. D. Hall (B. & M.), G. W. Kirtledge (N. Y. C.), W. L. Morse (N. Y. C.), M. Schreiber (P. S. R. of N. J.), W. M. Vandersluis (I. C.), S. Withington (N. Y. N. H. & H.), R. Beeuwkes (C. M. & St. P.), F. J. Correll (B. & O.), J. V. Duer, R. H. Ford (C. R. I. & P.), H. K. Lowry (C. R. I. & P.), A. E. Owen (C. of N. J.), E. B. Temple (Penna.), L. S. Wells (I. C.).

Appendix B—Water Power

The committee was instructed to continue the subject and report on the utilization of water power for railroad electric operation, cooperating, if desirable, with the United States Geological Survey in its Super Power Survey. The report of the Super Power Survey was not available until shortly prior to the conclusion of this report and the committee therefore was not afforded opportunity to give it the comprehensive study that the importance of the subject deserves. It studied the sources of electric power available for the operation of railroads, within economical reach of the Niagara and St. Law-

rence rivers and tributaries of the St. Lawrence river and presented the following conclusions:

SUMMARY

1. There are at present at Niagara Falls Hydro-Electric developments under United States control totaling 486,000 h. p., of which amount practically none is available for railroad electrification.

2. There are being developed at Niagara Falls under existing treaty revisions 600,000 additional h. p., of which 210,000 is on the American side. Of this latter amount 100,000 h. p. is available for railroad electrification and is sufficient for local requirements only.

3. There are possibilities, subject to Treaty revisions, of developments on the American side of 600,000 additional horsepower, of which the greater part may be available for railroad electrification. This would be sufficient to furnish power to a large portion of the steam railroads within economical transmission distance.

4. There are existing, or under development, other installations, such as the Canadian Chippewa-Queens-town project and that at Shawinigan falls. Power from these plants is not available for railroad electrification in the United States.

5. There are under contemplation other projects, such as the Niagara Falls Junior and the St. Lawrence Waterway. While such power would be available for railroad electrification, it is not believed that such projects have yet reached the stage where this committee can report as to their applicability.

6. The transmission of power developed at Niagara Falls is limited in distance only by ability to economically construct and safely insulate the transmission lines.

7. Power from Niagara Falls can be delivered to large consumers, within economical transmission distance, at approximately 1 cent per k. w. hr., which figure is sufficiently attractive as compared with present cost of steam production to warrant serious consideration as to its use for railroad electrification.

8. Hydro-electric power from Niagara Falls is constant because of the enormous storage reservoir afforded by the Great Lakes. None of the Niagara plants are augmented by steam electric stations common to many other hydro-electric installations.

Appendix D—Co-operation With the U. S. Bureau of Standards

The committee was directed to continue co-operating with the U. S. Bureau of Standards in the revision of the National Electrical Safety Code. The third revision of this Code is dated October 31, 1920, and was distributed in April of this year, printed in two volumes of the "Handbook Series" of the Bureau of Standards. The committee prepared a commentary on the national electrical safety code, with the object of acquainting the members of the association with the manner in which it can be used to advantage and wherein the Code requirements differ from accepted railroad practice.

CONCLUSIONS

1. The Code purports to establish a National Standard of Safety for the users of electrical apparatus. In general the standard is satisfactory and in accordance with good practice.

2. The rules establish minimum requirements. Greater margins of safety are not prohibited. The committee does not therefore fail to support the Code when as in the case of Part 2 it suggests greater safety provisions.

3. It was not the intention of the Bureau of Standards that the Code should be regarded as a designing specification. It is therefore not inconsistent that the

Code be supplemented by working specifications that specify factors of safety not less than those established by the Code.

RECOMMENDATIONS

The committee recommended that the Railroad Specifications for Electric Light, Power Supply and Trolley Lines Crossing, Steam and Electric Railways, adopted by the Association and printed in the Proceedings, Volume 21, 1920, page 208, be opened for revision with a view to make them conform with the Code as far as consistent with established railroad standards.

Appendix H—Standardization

The committee elected this year to report on friction and other tapes presented specifications which were the result of review of the A.S.T.M. specifications, somewhat modified but agreeable in such form, to the committee of the A.S.T.M. and to be by them in that form adopted. It was pointed out that the A.S.T.M. proposes these specifications as tentative, which is their practice with regard to all specifications for the first year after adoption. It is recommended that these specifications be adopted as recommended practice and printed in the Manual.

Discussion

(The report of the Committee on Electricity was presented by Chairman Katte.)

Chairman Katte: This year the Committee on Direction charged the Committee on Electricity with reporting on 9 subjects.

(The second subject, that of electrical interference, was presented by the chairman of that sub-committee, W. M. Vanderluis (I. C.). The report was received as information. W. L. Morse (N. Y. C.), chairman of the sub-committee on Water power, presented the report, which was received as information. The report on "Electrolysis" was presented by Chairman Katte.)

Chairman Katte: The sub-committee on electrolysis devoted its time during the past year to cooperation with the American Committee on Electrolysis. You will find this report of considerable value as a book of reference, as it contains the very last word on methods for mitigating electrolytic damage.

The committee moves that the report of the American Committee on Electrolysis be accepted as information, and published in the Manual as valuable permanent engineering data.

(Motion carried.)

Chairman Katte: The next item, "Co-operation with the U. S. Bureau of Standards," is shown in Appendix D. Since the committee formulated the conclusions there has been considerable activity in the matter of overhead crossings, and the committee has prepared an addenda to its report which is submitted as information. If this addenda is accepted it will form a part of the existing specifications.

I move that this addenda be approved and made part of the existing wire-crossing specifications.

(Motion carried.)

("Overhead Transmission Line Construction" was presented by S. Withington (N. Y. N. H. & H.), chairman of the sub-committee, and was received as information.)

(Chairman Katte reported on "Clearances—Rail and Overhead," in the absence of Mr. Bassett, while W. L. Morse reported on collaboration with Committee XVI—Economics of Railway Location, in the absence of Mr. Brumley. These reports were received as information.)

Chairman Katte: Appendix H—Standardization. This specification as written is precisely as the existing tentative specification of the A. S. T. M. and since the print-

ing a number of important changes and additions have been made and the committee therefore does not desire to recommend that the specification as printed in the Bulletin be adopted.

I move that these specifications, instead of being submitted as recommended practice, be accepted as information.

(This portion of the report will be received as information.)

Chairman Katte: Since the committee's report was completed, the Board of Direction submitted another subject to the committee, viz.: "The Protection of Oil Sidings from Danger Due to Stray Currents."

The President: The report will be received as information.

Chairman Katte: I move that the report of the Committee on Electricity as modified by this meeting be accepted.

(Motion carried.)

G. J. Ray (D. L. & W.): As a matter of information I would like to get straight the motion which was passed at the beginning of the committee's report to place the entire report on electrolysis in the Manual. Is that the intent of that motion?

Chairman Katte: Yes, that was the intention. You will find that that report is really a valuable book of reference. Only a limited number were printed.

Mr. Ray: I think it should appear in the Annual Proceedings. We had a similar case yesterday and the matter was negated on account of the length and character of the report. This would make a very large addition to the Manual.

Chairman Katte: The reason the committee recommends putting it in the Manual is that in effect it is a book of rule; it is a standard work, and we thought that the Manual was a handy place for it where it would not be forgotten.

H. L. Ripley (N. Y. N. H. & II.): We are loading our Manual to a point where it is no longer a hand book but has become a text book.

Chairman Katte: *I move that portion of the motion be reconsidered, and in lieu thereof that the report on electrolysis merely appear in the Manual by reference and cross-reference so that its location in the proceedings can be readily found.*

(The motion was carried and a motion that the report be referred to by cross-references in the Manual was carried. The committee was then dismissed.)

Engineering Association Holds Annual Dinner

Three Speakers Addressed Twenty-third Annual Banquet
in Gold Room Last Evening

THE ANNUAL DINNER of the American Railway Engineering Association was held in the Gold room of the Congress hotel last evening with President L. A. Downs presiding. R. C. Marshall, Jr., general manager, Associated General Contractors of America, Washington, D. C., spoke on Some Needs of the Railroads. Judge James A. Mulligan, Ottawa, Ont., discussed The Basis of Patriotism, and Gus M. Dyer, professor of political economy, Vanderbilt University, Nashville, Tenn., talked on Government and Business. An interesting feature of the dinner was the presentation to President Downs of a badge by his fellow alumni of Purdue University. The presentation was made by A. A. Potter, dean of engineering of that institution, who spoke in part as follows:

"The Purdue members of the A. R. E. A. have requested me to present to you in their name a token of their esteem. They are greatly appreciative of your truly human qualities which have endeared you to your associates and to those who have been so fortunate as to have been employed under you. These alumni of Purdue University are pleased and proud of your accomplishments, of your unselfish devotion to your professions and of your active interest in your alma mater. It is with a deep sense of pleasure, Mr. President, that I now avail myself of the honor of presenting to you this certificate on behalf of the Purdue Alumni, together with their sincere wishes for your continued happiness and success."

Brief abstracts of the addresses follow:

General Marshall's Address

The United States has approximately 260,000 miles of railroads in operation or 2,600 miles per 1,000,000 inhabitants, whereas in 1910 we had 2,700 miles per million inhabitants. The amount constructed in the decade just passed is less than 50 per cent of that constructed 1880-1890 and less than that constructed in any decade since 1860. The decrease in railroad construc-

tion has occurred since 1913. To make up that deficiency as well as to keep pace with the normal increase in population will require building 6,000 miles of new track this year and every year for 10 years.

After the civil war this country gradually awoke to the fact that the construction of transportation facilities would open the avenue for national development, which in turn paid the debt of the war. It is a fact that more than 50 per cent of our vast country is even now unused and waiting to be developed. Much of this development depends upon reclamation and irrigation. But perhaps more important than any of these, our development requires an adequate transportation system, whether that be through roads, railroads, or canals.

A great deficit in railroad construction has piled up year by year since 1913. Railroad construction is not the only construction that has so piled up a deficit. This is also true of public utilities, public works, water developments, hydraulic developments, reclamation and irrigation, and housing. This creates an accumulated demand for construction such as exists in no other industry. The general contractor is only one element of the construction industry; but he is an element through whose hands a large percentage, if not all almost all, of the money passes that goes into that industry.

One of the great criticisms heard concerning construction companies is that they are not managed along the lines recognized and established in other industries, and that they are far behind in matters of estimating and cost accounting. An extensive study into these matters has shown that this condition will not be overcome until the basic agreements under which they work are brought into some semblance of harmony. Many revelations of conditions existing in the building and general construction industries during the past two years, show a need of better understanding between that industry and the others for which it works. It is only in recent years that building contracts have been drawn so that they contained any semblance of mutuality.

In the case of the railroads some years ago construction contracts as drawn by the legal department were about in keeping with the general policies of sovereignty pursued by the roads and had it not been for the fairness with which engineers administered these contracts it is questionable whether railroad development could have taken place. The American Railway Engineering Railway Association has done an excellent work in standardizing railroad contracts, but advices from various sections of the country indicate that in many cases the railroads have not grasped the value and scope of such an undertaking. Some action should be taken to show them that a very urgent need in future railroad development is a standard of contractual relation which will permit dealing along the lines recognized and approved by modern industry.

The fundamental principle that these contracts should express the rights of contractor and owner, so that the laws of proper economics might be carried out, has been working in the minds and consciences of those in the industry until at last it has found voice. This is recognized by the fact that in December a committee representing eight great national Associations got together to consider this subject. It seems to me perfectly clear that if this committee were to come to a unanimous conclusion, representing the composite individual opinions of those on the committee, after they have extensively discussed the several questions involved, that each of us should realize that we would be acting in the common good should we accept that conclusion without reservation.

It has been suggested that a universal construction agreement be adopted which will cover the obligations common to all work, leaving to several sets of general conditions those provisions which are peculiar to each individual type. In such manner we would be able to set up clearly the obligations of construction and to build up a strong foundation of precedents which would establish an ethical practice throughout. The principal idea behind the move for standardization is to coordinate these existing standards and adopt universal clauses wherever they can be used. Though the legal talent might not profit by such standardization the engineering department and individual engineers and architects undoubtedly would. This is one need of the railroad which concerns the engineering department directly and which the engineers will have to sponsor if it is carried out properly.

There is still another need of the railways which greatly concerns their future expansion, and in which the engineer will doubtless find an interest. This is the development of more executives with both engineering skill and a knowledge of business and transportation economies.

The difficulties attending future development of railways as private projects have greatly increased in complexity since the last generation. Railway executives are faced today with more puzzling difficulties than ever before. Labor troubles, legislation, government regulation and transportation economics greatly complicate the study to be made in pushing out new lines. There will doubtless be a closer liaison between engineering and the study of present and future markets. These new problems open an extensive field for combined engineering and economic studies. There is every reason to believe that the engineer can take up these studies of railroad building and solve their problems more readily than an executive with no engineering experience. This new field offers an opportunity for development of the highest type of executive ability, and with it will doubtless go a high degree of prestige and compensation.

Government and Business

In discussing this subject, Mr. Dyer said in part: "I have much sympathy for the railway officer today. Every man should be an optimist under present conditions. However, if a railway man is an optimist today, the Labor Board will hold him up, while if he is a pessimist, his bankers will hold him up. If he is an optimist he must be a pessimistic optimist, while if he is a pessimist, he must be an optimistic pessimist.

"Our industrial life is controlled by great natural laws. Is it not controlled by chance. When natural laws are violated, disease results. When laws of industrial life are violated, trouble and panic result. Much of our trouble today is because of the belief that wages result from bargaining between employer and employe. A second fallacy is that wages and profits come out of the same fund and that wealth comes from the exploitation of labor.

"The present wage levels of railroad employes are now on an artificial level far above their natural rates. Because of the specialization which has come in industry we need some common standard as a basis for all wages.

"Our chief troubles today are a result of the mistakes of government in its relations to business. It is the function of government to see that fair play exists between groups. But we are departing from this theory. Under the Labor Board government is entering as a co-director of business. Any kind of a co-directorship is antagonistic to efficiency. Furthermore, when the government has no definite policy business cannot anticipate its actions and this uncertainty is deadly. The Adamson law and the legislation creating the Labor Board are ransoms paid to organized minorities.

"The time has come when intelligent leadership in business shall stand together and demand that the government withdraw from the sphere of production, that it shall curb any organization which tries to interfere with productive efficiency and that it shall define some theory of relation with industry and stand by it against minorities."

James A. Mulligan

The Canadian speaker was James A. Mulligan, of Ottawa, Ont, who opened his address by a tribute to the engineering profession. In his opinion its services to society are not appreciated in full measure. His real theme was the Government of Canada, its differentiation from that of the United States and the possibilities of any change from its present form. Mr. Mulligan punctuated his remarks with many a pointed story, and his address was enjoyed thoroughly by those present.

In the Snowshed

The A. R. E. A. Elects New Officers

Results of Annual Election Announced Yesterday; Sketch of
President-Elect J. L. Campbell

AT THE CLOSE OF THE SESSION yesterday afternoon President Downs announced the results of the election of officers for the ensuing year. The names of those elected are as follows:

President—J. L. Campbell, chief engineer, El Paso & Southwestern, El Paso, Tex.

Vice-President—G. J. Ray, chief engineer, Delaware, Lackawanna & Western, Hoboken, N. J.

Treasurer—George H. Bremner, consulting engineer, Chicago.

Secretary—E. H. Fritch, Chicago.

Directors—D. J. Brumley, chief engineer, Chicago Terminal Improvements, Illinois Central, Chicago; Maurice Cohn, engineer maintenance of way, Pennsyl-

vania System, Indianapolis, Ind.; H. T. Douglas, Jr., chief engineer, Chicago & Alton, Chicago.

the fact that, like other men coming from the more remote portions of the country who are denied the opportunities of intimate contact with men in the same line of work, he has felt that the annual conventions afford him an opportunity which he desired to utilize to the utmost. In spite of the obstacle of remote residence, Mr. Campbell has set an excellent example in his whole-hearted interest in committee work, which has repeatedly won him the offer of chairmanships but which he has as consistently declined because he felt that others more conveniently located could conduct the work of committees with greater effectiveness.

In Mr. Campbell's presidency the great west is for the first time truly represented, for he is truly of the west.

E. H. Lee
First Vice-President

J. L. Campbell
President

G. J. Ray
Second Vice-President

vania System, Indianapolis, Ind.; H. T. Douglas, Jr., chief engineer, Chicago & Alton, Chicago.

Nominating Committee—A. M. Burt, assistant to vice-president operation, Northern Pacific, St. Paul, Minn.; J. V. Hanna, chief engineer, Kansas City Terminal, Kansas City, Mo.; P. B. Motley, engineer bridges, Canadian Pacific, Montreal, Que.; W. J. Backes, engineer maintenance of way, New York, New Haven & Hartford, New Haven, Conn.; A. O. Ridgway, assistant chief engineer, Denver & Rio Grande Western, Denver, Colo.

John Logan Campbell, President of the American Railway Engineering Association

J. L. Campbell, the twentieth president of the American Railway Engineering Association, needs no introduction to those of its members who have attended the convention, for few men have taken a more consistent and regular part in the discussions. By the same token, few of the members who participate in the work of the association have carried a more painstaking study of the reports in advance of the meetings. Nor is this thoroughness to be only attributed. His consistent attendance at every session portrays a broad scope of interest which has been equaled in few men. Perhaps

Going from his home in Illinois to El Paso as a young man in 1888, he participated in the pioneer development of a new country and as the sober, law abiding element was gradually organized to establish law and order, John Logan Campbell, the engineer and railway officer, identified himself as a citizen who saw responsibilities outside the scope of his regular employment.

There is a departure from the conventional in Mr. Campbell's career as a railway man. Normally the young man in railway service is transplanted from his home surroundings to distant places by reason of his employment by the railroad. But we find that young Campbell went into western Texas to take up land and mining engineering and was established as a resident of western Texas for some years before he entered railway employment. In fact, he served for four years as city engineer of El Paso, Tex., before becoming a resident engineer on the construction of the Rio Grande Northern in 1894, his first railway connection. Developing proficiency in railway location and construction, his employment carried him over a considerable area of the west for a period of nearly ten years. But the fates decided that he was to be returned to the scene of his first engineering experience and for the last 17 years he has been responsible

for maintenance of way, location and construction on the El Paso & Southwestern System—from 1905 to 1920 with the title of engineer maintenance of way and since 1920 as chief engineer. Fortune was also kind to him in that she placed his destinies with a railway property of more than average financial stability. Virtually his position has been that of development engineer for the Phelps-Dodge mining interests and he has in consequence been afforded opportunities for the exercise of engineering ability along broader lines than those permitted the engineering officers of less favored properties. His connection for a number of years with the Water Service Committee of the association may properly be explained by his own interest in water service problems, as these have comprised one of his major responsibilities on the El Paso & Southwestern.

The White Mountain water supply system, with a capacity of 7,000,000 gal. daily and a pipe line 141 miles long, which is probably the most comprehensive water service project ever carried out by any railroad, was developed under his direction and embodies many features that bear the stamp of the master engineer.

N. R. A. A. Past Presidents Group

FOR THE FIRST TIME in the history of the National Railway Appliances Association all of the past presidents were present at the exhibit Wednesday afternoon. These men, with the exception of N. Hench, and with C. W. Kelly, secretary and treasurer of

- G. Stanton, Cleveland Railway Supply Co.
- W. F. Schleiter, Dilworth, Porter Co.
- T. W. Snow, T. W. Snow Construction Co.
- R. E. Belknap, American Chain Co.
- A. P. Van Schaick, Bethlehem Steel Co.
- T. R. Wyles, Detroit Graphite Co.
- N. Hench, Carnegie Steel Co.
- P. W. Moore, P. & M. Co.
- H. M. Sperry, Signal Companies.
- E. H. Bell, Railroad Supply Co.
- M. J. Trees, Chicago Bridge & Iron Works.
- P. C. Jacobs, Johns-Manville Inc.
- J. B. Strong, Ramapo Iron Works.
- G. C. Isbester, American Chain Co.
- T. W. Aishton, National Malleable Casting Co.
- C. W. Kelly, secretary and treasurer, Kelly-Derby Co.

A. R. E. A. Registration

THE REGISTRATION of members of the American Railway Engineering Association yesterday aggregated 146 and of guests 48, making a total registration for the day of 193. Including the registration of 666 Tuesday, the total registration for the two days reaches 859, as compared with 718 for the same period last year. Of this latter total 687 were members.

- Abbott, W. P., asst. div. engr., B. & O., Cincinnati, Ohio.
- Anderson, Arthur, instrumentman, N. Y. C., Chicago.
- Armstrong, H. J., asso. prof. c. e., Armour Institute, Chicago.
- Bainbridge, C. N., engr. of des., C. M. & St. P., Chicago.
- Baldwin, Hadley, asst. ch. engr., C. C. C. & St. L., Cincinnati, Ohio.
- Ballard, E. E., office engr., M. K. & T., St. Louis, Mo.

Top Row, Left to Right—H. M. Sperry, E. H. Bell, M. J. Trees, C. W. Kelly, P. C. Jacobs, J. B. Strong, G. C. Isbester and T. W. Aishton.

Bottom Row, Left to Right—G. Stanton, W. F. Schleiter, T. W. Snow, R. E. Belknap, A. P. Van Schaick, T. R. Wyles and P. W. Moore.

the association, were assembled at 3:30 for a group photograph. These men each served a year as president of the association and are named in order as here given, starting with 1909.

ing 20 to 26½ brake horsepower; unit 25 running at 900 to 1,400 r. p. m., and developing 20 to 28 brake hp.; unit 30, running at 800 to 1,250 r. p. m. and developing 24 to 35 brake hp.; unit 40, running at 800 to 1,000 r. p. m. and developing 31 to 40 brake hp., and unit 50, running at 700 to 1,000 r. p. m. and developing 30 to 51 brake hp.

While particularly adapted for the generating of electric current for use in lighting, storage battery charging, arc-welding outfits, or electric operation of machines, the plant is also adapted to drive triplex and other types of pumps, various kinds of hoists, concrete mixers, air compressors and other kinds of machinery. When connected to an electric generator the plant will furnish power according to the following table:

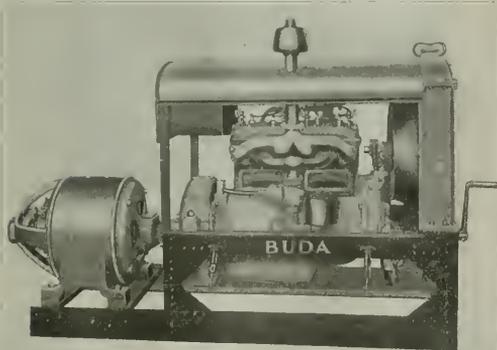

Unit No.	Direct Current		Alternating Current	
	R. P. M.	K. W.	R. P. M.	K. W.
20	1450	16.5	1200	14
30	1200	20	1200	20
40	1000	25	900	22.5
50	925	30	900	30

The engine is furnished with or without the generator, together with radiator, complete head and side covers, water pumps, fan and belt, carburetor, air cleaner, magnet with coupling, muffler, flexible power transmission coupling, starting crank, gasoline tank and speed-regulating governor, and, where required, is also furnished with a friction clutch or with a driving pulley for attaching to the drive shaft. Before leaving the factory each engine is subjected to a series of tests covering three periods; the first covers the running-in process and the second the power test. After this the engine is completely dismantled, inspected and re-assembled for the final test which is made to ascertain what electric power it is capable of delivering.

Obviously the character of the device gives it a wide scope of use in railway service such as that of furnishing lighting at outlying depots or shops, of furnishing power to operate machinery in shops or of pumps in water stations and for use in track maintenance in supplying electricity for arc-welding sets or in driving air compressors. The machine runs 10 hours on 1 gal. of gasoline.

A General Utility Power Plant

AMONG A NUMBER of recent developments in equipment and machinery of interest to railways is a four-cylinder gasoline-operated power unit now being manufactured by the Buda Company, Chicago. The machine is essentially an automobile engine, which has been modified only enough to permit of general use. Originally designed and perfected for the propelling of heavy duty motor trucks and still manufactured on a large scale for this purpose, the power unit presents a particularly interesting object of study on the part of railway

The Buda Unit Power Plant Connected to an Electric Generator

engineers by reason of such features as the workmanship it embodies, the efficiency of its operation and performance, its adaptability for many kinds of service for which an automobile type of engine is particularly suited, and for the relatively low cost permitted by the large scale upon which the engines are manufactured.

As shown by the illustration, the plan consists simply of accommodating the engine to a steel platform and hood by reason of which it may be transported from place to place for use in a variety of operations or bolted to a permanent foundation. The machine weighs about 1,000 lb., and is manufactured in five sizes, unit 20 running at 1,000 to 1,450 r. p. m., and develop-

Automatic Protector for Controllers

EVERY USER of electric controllers has experienced more or less trouble from arcing and burning of the contacts, especially where there are unskilled attendants or where frequent electrical inspection is not the rule. The burning takes place when the contact is made or broken, especially where heavy current is handled or high voltage is used.

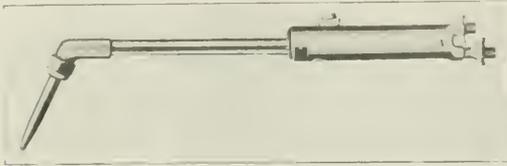

An automatic device has recently been developed that completely eliminates this objectionable burning and the consequent replacement of fingers and contacts by making and breaking the circuit entirely outside the controller. By positive mechanical means the first motion of the controller handle actuates a switch in the closing coil circuit of a magnetic switch or circuit breaker which closes the circuit just after the first contact is made by the controller fingers. The circuit is held closed as long as it is desired to operate the motor. The least motion of the controller handle toward the off position opens the auxiliary switch, thereby opening the motor circuit through the circuit breaker with no possible burning of the controller contacts. The handle has to be returned to the off position before the switch can be closed again.

In short, with this protector, which is made by Geo. P. Nichols & Bro., Chicago, the controller performs all its usual functions, except the actual making and breaking of the circuit, and burning of the contacts is made impossible. Furthermore, its use makes it possible to em-

ploy the ordinary types of controller where otherwise contactor panels with master switches would have to be used.

A New Acetylene Torch for Welding and Cutting Operations

IN THE LAST FIVE YEARS there has been an extensive development in the use of the gas flame and electric arc in railway service and the interest taken in them by railway engineering officers has increased accordingly by reason of the possibilities afforded of effecting economies or facilitating work in the field as well as in the shop. As might be expected from the fact of its receiving such attention, extensive developments have also been made in the equipment used for the purpose.

The Milburn Cut-Weld Torch

One development of a recent date along this line is a combination cutting and welding torch now being manufactured by the Alexander Milburn Company, Baltimore.

The torch is known as the cut-weld torch. Having been designed to meet the need of apparatus equally adapted to both welding and cutting operations, it is of particular interest to railway officers by reason of the diversified nature of the service ordinarily required of any one outfit. With this torch it is possible to cut 19-in.

Cutting a 19-in. Billet in One Operation

steel and by merely changing the tip to weld any thick metal lending itself to welding. As the hose connections are not disturbed, no gas is wasted. The accompanying illustration shows the torch in the process of cutting 19 in. steel with one cut, for which purpose a four foot oxygen manifold is used, furnishing oxygen at 190 lb. and acetylene at 15 lb. pressure. As a further illustration of the ability of the torch the manufacturers call attention to a test recently made in an eastern railway shop in which 341 1/2 in. rivets were cut per hour, a performance which is said to have established a new speed record for the entire system.

In railway service, in addition to rivet cutting, the torch has also shown decided economies thus far in such work as the cutting of locomotive fire box sheets, steel ties and frames, and in the wrecking of bridges and steel structures, as well as in reclamation yards and in the cutting of steel cars. The torch is claimed to be economical in its consumption of gas, both in cutting and in welding work. When welding 1.2-in. metal with a gage pressure of acetylene at 6 1/2 lb. and the oxygen at 9 lb., the torch consumes 72 cu. ft. per hour of each gas.

A Jack for Extracting and Lowering Poles

IT IS NOT UNCOMMON in railway service to encounter jobs involving the withdrawing of poles from the ground or their lowering into position. In such cases it is often the practice to perform the work with whatever equipment is at hand. In view of this fact, it is

Two Joyce Pole Jacks in Position for Extracting a Loaded Pole

of interest to note a recent development for this purpose.

The Joyce Pole Jack No. 88, as this device is known, is designed both for pulling and replacing loaded poles. As shown in the illustration, it is built upon a pivoted base and has an unusually long rack which carries a dog at the top to hold the chain. This jack is 38 in. high, has a lift of 27 in., weighs 150 lb. complete with chain and lever, and has a lifting capacity of 15 tons. The mechanism consist of two coils and a large spring, and the construction is such as to afford security against breakage at any point, particularly in the base, which is usually the weakest point of such devices.

The jack is operated by means of a lever as any ordinary jack and is secured against the possibility of dropping the load, the operation of lowering the pole requiring the operator only to reverse the control lever at the side of the jack whereupon the load is lowered automatically one notch at a time, in the same manner as it was raised. The double lever socket shown in the illustration is provided to permit of its easy operation when

the jack is pivoted on its base against the pole. Where it is simply required to extract the pole, one jack is sufficient, the reason for using the two jacks shown in the illustration arising from the fact that the pole was a loaded one which it was intended to hold in place while the butt end was sawed off. This device is manufactured by the Joyce-Cridland Company, Dayton, Ohio.

A Coaling and Sanding Plant With Ground Storage Facilities

THE CENTRAL VERMONT has recently replaced its coaling plant at St. Albans, Vt., with facilities which present a distinctly novel treatment of the coal and sanding problem. The installation is a creation of the Roberts & Schaefer Company, Chicago, and consists essentially of a 300-ton capacity Roberts & Schaefer counterbalanced bucket, shallow pit type coaling station of frame construction and a 50-ton "RandS" gravity sand plant, together with ground storage facilities for 20,000 tons of coal.

The novel features of this installation will be apparent from an examination of the illustrations and from the following description of its operation: The coal is first dumped into a receiving hopper 20 ft. in length, from which it is fed through an undercut gate into a 2-ton capacity elevating bucket, which is then hoisted in the usual manner to the point of dumping. Unlike the usual design, however, the coal in this case may either be

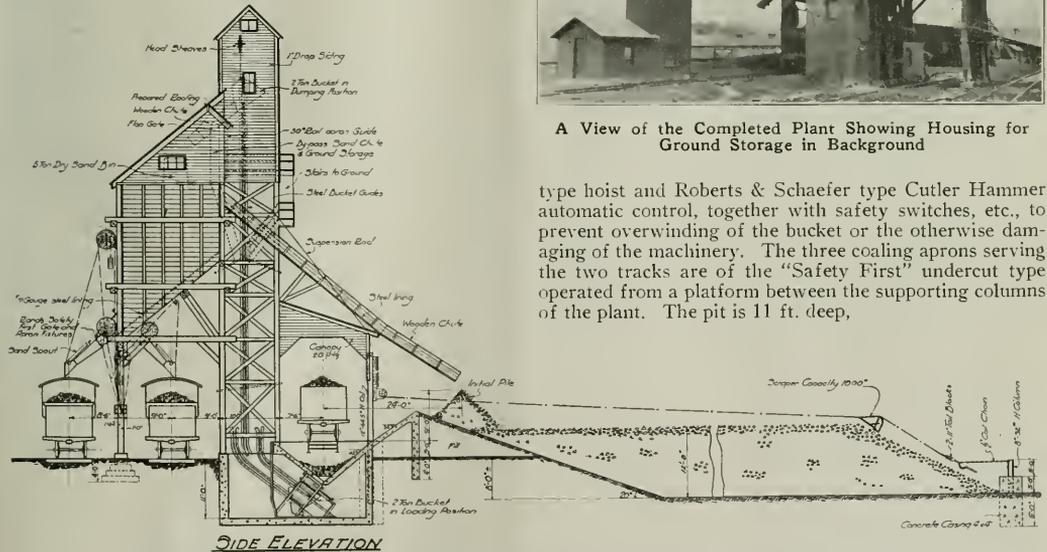

coal the operation then consists simply of dragging the coal by means of the drag scraper into the initial storage pit and over the hump into the coal hopper, from which it is elevated into the bin by the elevating buckets the same as coal from cars.

In the case of the sand plant, the wet sand is elevated in the same bucket used for coal and is spouted into a 50-ton capacity storage bin, from which it is fed by gravity into a Beamer Patent steam sand dryer. When dry the sand is then elevated by air pressure to an overhead storage bin of 5 tons capacity, from which it is fed by gravity to the engine as required.

The coaling plant has an elevating capacity of 75 tons per hour. The elevating bucket is self-opening and self-closing and all elevating machinery is automatic in its operation, the latter equipment consisting of a 22-hp. General Electric reversible motor with cast iron base drum

A View of the Completed Plant Showing Housing for Ground Storage in Background

Diagrammatic View of Central of Vermont Coaling and Sanding Plant at St. Albans, Vt., Showing Ground Storage Arrangement

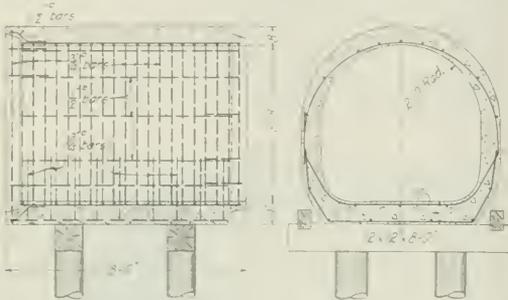

dumped directly into the coal bin or into a by-pass chute, as shown in the drawing, the latter serving to divert the coal into a storage pit situated on the ground at one side of the plant, all coal intended for storage thenceforth being distributed by means of a 1,000-lb. capacity drag scraper over the storage area, where it may be piled to a depth of 13 ft. When it is desired to use this storage

type hoist and Roberts & Schaefer type Cutler Hammer automatic control, together with safety switches, etc., to prevent overwinding of the bucket or the otherwise damaging of the machinery. The three coaling aprons serving the two tracks are of the "Safety First" undercut type operated from a platform between the supporting columns of the plant. The pit is 11 ft. deep,

The storage machinery consists of a double drum hoist and belt drive motor, located in a separate building at the side of the coaling plant, together with a system of I-beam posts distributed around the storage area to guide the drag scraper. The capacity of the machinery is about 100 tons per hour. The ground storage equipment was furnished by the R. H. Beaumont Company, Philadelphia.

Something Different In Pre-Cast Concrete Pipe

THE "SOMETHING DIFFERENT" in pre-cast concrete pipe alluded to in the title has reference to the design of sewer pipe recently adopted by the Lehigh Valley in connection with the filling in of a considerable area around the Jersey shore of the New York harbor incident to the development of the new Claremont freight terminal. In connection with this improvement it was nec-

Something Different in Pre-cast Concrete Pipe—Details of One of the Pipe

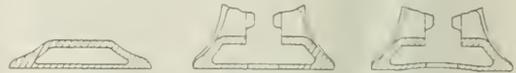

essary to extend two Jersey City sewers a distance of about 2,000 ft. As the area to be filled in was covered with about 4 ft. of water at low tide, and as it was necessary to locate the sewer extension above high tide, the problem involved the adopting of a type of construction which could be installed without interfering with the remainder of the work and at the same time provide for the proper handling of the discharge from the two city sewers. Having determined to support the new sewer on a pile trestle at the elevation of high tide, it then remained to select a suitable type of sewer. To this end consideration was given to the use of monolithic concrete, but on account of the possible action of salt water to which the concrete would be exposed, it was decided to use pre-cast concrete.

As shown in the accompanying drawing, the pipe was furnished in 8 ft. tongue and groove sections, 7 ft. 2 in. high and 7 ft. 2 in. wide over all with a flat trough; the flat floor having been adopted to insure the maximum stability of construction. Each section weighed 17,800 lb., as a result of which a rather difficult problem in handling presented itself. The new fill on which the Lehigh Valley yard will be laid will bury the pipe to a depth of about 6 ft.

This pipe was made by the Massey Concrete Products Corporation at its Newark, N. J., plant, according to a design worked out under the direction of F. E. Schall, bridge engineer of the Lehigh Valley. The work of installing the pipe was handled by Henry Steers, Inc., New York.

A New Form of Track Jack Base

THAT THE CONSTRUCTION of the base of a track is a detail which often has a marked influence upon the utility of such a tool in performing track work is well known by officers who have occasion to use such equipment or who have had such work under their charge. Particularly is the tendency of the base of any jack to bend a defect of consequence. Such a jack is a source of more or less danger on the one hand by reason of tendency to kick out from under its load and

Cross-Sectional Views of the Jack Base

on the other hand it often gives rise to trouble in lining track by reason of the tendency of the jack to cant and otherwise fail to hold its proper position. In view of this it is of interest to note the development which has been made by the Templeton Kenly Company, Chicago, in the construction of the base of its Simplex track jack.

The construction is shown in the accompanying illustration, the drawing at the left being a section through the toe of the jack and that in the middle a cross-section through the center. As noted, the feature of this base lies in the cored or hollow construction, as distinguished from a solid section. Aside from furnishing a stable support for the load, this base was constructed primarily to overcome bending, and thereby to eliminate the troubles that arise from bent bases while in use and the damage that frequently arises from fractures by repeated efforts to straighten bases which have bent while in service. The fact that the metal in the base is thin is also claimed to be an advantage on the hypothesis that a heavier section of metal in the base than in the standard often gives rise to stresses and strains during cooling or annealing of the casting which result in weakness. Furthermore, as the base is malleable, it adapts itself to the line of pressure, and ultimately assumes a concave base surface under service, thus transmitting the burden of the load to the rim. This feature is shown in the illustration at the right, which represents the base of the jack after the pressure has produced a permanent set.

Many visitors at the National Railway Appliances exhibit at the Coliseum do not have an opportunity to talk to representatives of the different companies about their products on exhibit and as a result they only casually glance over the contents of the booths. In this way, many an interesting point or special feature of a device is overlooked by those whom the exhibitors wish to reach. Because of this fact, some few exhibitors have labeled their various devices with attractive placards, to bring out the points of interest regarding them. Unfortunately, many other companies have made no effort to do this. It is to be hoped that this expedient may receive more general application next year. In this way greater interest will be manifested in the exhibit as a whole and in many individual devices as well.

Why Not Label Exhibits?

The American Railway Engineering Association has shown wisdom in the selection of its presidents. As men with executive training they have manifested skill in conducting the sessions. Be this as it may, few of the past presidents, if any, have equalled the record of President Downs as presiding officer. With a voice which could be heard in the remote corners of the hall, he set an excellent example for clear and distinct speech, so necessary in the Florentine room, but his real service to the association was in the expeditious conduct of the transactions. The organization has grown to be a large one;

L. A. Downs Presiding Officer

the committee reports are voluminous, and it is only by strict adherence to the business in hand that the program of the convention may be completed. It is possible that some committee reports were not given as much time as they deserved. However, there is no question but that the time available in the five short sessions was applied in the most profitable manner under the able leadership of President Downs.

From the comments which have come to our attention it is evident that the suggestion made in yesterday morning's daily that the Board of Direction of the American Railway Engineering Association give more attention to the hotel facilities necessary to house the convention properly, have been misunderstood in some quarters. It is a fact that the Congress hotel was unable to care for all of those who desired rooms, but the same would be true of any hotel which might endeavor to house as large an organization as this. It is not to be hoped that all of the members who desire can be taken care of in any hotel, particularly those who make reservations late or who come without reservations. The principal criticism has been with the inability of all who desired to secure seats in the convention in the Florentine room. This condition indicates the necessity for the Board of Direction considering the advisability of transferring the convention to the Gold room in the same hotel, which room will seat more than twice as many as the Florentine room. It is unfortunate that arrangements were not made for the convention to be held there this year, particularly since the hotel was in a position to offer this room until a late date. If our editorial of yesterday morning was not understood, it was because of the fact that we did not make reference to the Gold room, thinking that all of the members knew of it.

Not long ago a manufacturer of railway equipment approached the president of a large road with figures showing that an investment in this equipment would yield the road a return of 18 per cent. The president's reply was, that if he had the money which the investment in this equipment would require he could put it to other use on the line where it would yield even larger returns and that these other investments must therefore receive first consideration. There is, therefore, competition between manufacturers of non-competing equipment for the funds which the railways have available for investment. Numerous recent developments in equipment and materials offer possibilities for large reductions in cost, frequently sufficient to pay for the equipment within a relatively short time. Railway officers are unusually alert for opportunities to effect savings at the present time. Under these conditions the manufacturers of equipment

Buying With Savings Produced

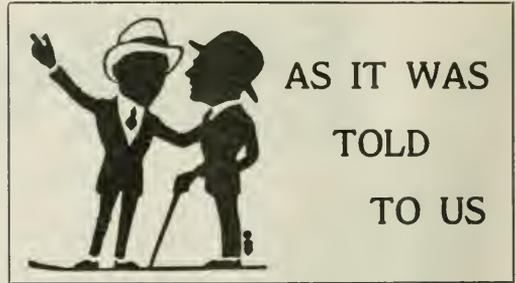

which will produce economies in a limited time are sure of securing a hearing. That the manufacturers are alive to this condition was evident at the Coliseum this week, where a number of devices were offered with the understanding that if they did not produce the economies which would pay for them in the course of a short time they could be returned. As earnings are improving and as the necessity for the restriction of expenditures is being correspondingly decreased, the roads are in a better position to avail themselves of new equipment of this character.

Is Your Road Represented?

FOR SOME YEARS the American Railway Engineering Association has been confronted with a serious problem in determining the committee personnel because of the rapid increase in the number of members. Thus in only ten years the membership of the association has practically doubled, while but little increase has occurred in the number of places on committees. At present there are about 2,000 members and only 500 places on committees, so that only one man in four can participate in the committee work.

In one sense this is not an unmixed evil. It affords considerable choice in the selection of the committee personnel, which, theoretically at least, is governed by considerations of special qualification and training, and partly by a due allowance for geographic distribution and proportionate representation by the railways. However, as the Association is one of individuals rather than of railways the last consideration is not a primary one.

There is no question but that the officers and directors of the association are meeting this problem with reasonable discretion and that those who desire places on committees are accommodated in so far as practicable. Actually, personal acquaintance and a degree of interest on the part of the individual play an important part in the determination of committee personnel with the result that some railroads receive much greater representation than others. Excluding the Committee on Electricity, which is concerned with problems peculiar to a small number of roads, there are 22 regular committees with an enrollment of about 450 men, of whom 400 are directly in the employ of railroads. Of this number 119, or 30 per cent, are connected with six roads covering 43,000 miles of line or about 14 per cent of the total railroad mileage of the United States and Canada. This preponderance of representation is easily explained. It means that these six roads are represented in the membership of the association by a large number of men with enough initiative and industry to strive for places on the committee and who show by their efforts that their selection has been well founded. There is, however, one other factor which must not be overlooked and that is the attitude of the railway managements toward participation in association affairs on the part of their officers and employees. If a considerable number of men from any railroad are prominently identified in the work of the association, it is proof positive that they are receiving a considerable measure of encouragement from the management, that their superior officers are also active in the work or that they have been given to understand that it is incumbent at conventions and committee meetings to be considered as justifying absence from their place of duty. Railway executives who will review the work of the American Railway Engineering Association in the light of the part which their own men are taking in it may well consider what they can do to see that their roads bear a proportionate share in the work.

Antonio E. Vera, assistant chief engineer, National Railways of Mexico, Mexico City, spent the last two days studying the exhibit at the Coliseum.

* * *

The friends of C. F. Loweth, chief engineer of the Chicago, Milwaukee & St. Paul, among the members of the American Society of Civil Engineers in the vicinity of Chicago, have inaugurated a movement to secure his nomination as a candidate for president of that society. One hundred members signed the original petition and this number is being augmented daily. The members will receive requests from the secretary of the society in April to indicate their preference for nominations for officers in 1923. Mr. Loweth has served the A. R. E. A. as a member of the board of direction during the last three years.

A. R. E. A. Registration

Twenty-six members and eight guests registered yesterday in addition to the 687 members and 172 guests who registered on the two preceding days.

Baldwin, L. W., vice-pres., I. C., Chicago.
 Barry, H. B., princ. asst. engr., St. L.-S. P., St. Louis, Mo.
 Bassett, J. S., asst. engr., Mo. Pac., St. Louis, Mo.
 Dougherty, R. E., des. engr., N. Y. C., White Plains, N. Y.
 Farrin, J. M., asst. engr., I. C., Chicago.
 Fatherson, T. W., supt., C. G. W., Clarion, Iowa.
 Fithian, E. B., div. engr., Mo. Pac., Poplar Bluff, Mo.
 Fritch, L. C., vice-pres. in charge of construction, maintenance and capital expenditures, C. R. I. & P. and M. & St. L., Chicago.
 Heimerding, W. E., asst. engr., C. R. I. & P., Estherville, Ia.
 Hodgman, B. B., vice-pres. and ch. engr., National Water Mau Cleaning Co., New York.
 Irwin, A. Chas., engr., struct. bur., Portland Cement Association, Chicago.
 King, H. F., spec. engr., Erie, New York.
 Knecht, H. D., asst. engr., Mo. Pac., St. Louis, Mo.
 Lewis, E. M., engr. m. of w., C. G. W., Des Moines, Iowa.
 Lynch, H. A., asst. engr., B. & O., Wheeling, W. Va.
 Mains, J. S., asst. engr., G. T., Detroit, Mich.
 Maynard, R. P., asst. engr., G. N., Hibbing, Minn.
 McNally, J. F., asst. supt., A. T. & S. E., Emporia, Kan.
 Petersen, W. H., engr. m. of w., C. R. I. & P., Des Moines, Iowa.
 Rex, George F., vice-pres., Natl. I. & B. Co., Kansas City, Mo.
 Sexton, H. J., dis. engr., G. N., Superior, Wis.
 Snyder, H. G., asst. div. engr., B. & O., Garrett, Ind.
 Splintstone, C. H., supt. of cons. & surveys, Erie, New York.
 Teal, J. E., asst. engr., B. & O., Baltimore, Md.
 Westcott, G. R., asst. engr., Mo. Pac., Poplar Bluff, Mo.
 Wouison, S. L., br. engr., Mo. Pac., St. Louis, Mo.

Guests

Borrett, P. T., of engr., C. & W. I., Chicago.
 Cayley, W. G. T., Stratford, Ont.
 Jaff, S. R., C. B. & Q., Chicago.
 Liebbourne, W. B., and b. supt., London, Ont.
 Lachy, C. A., gen. insp., C. & N. W., Chicago.
 Sims, H. A., railroad contractor, Chicago.
 Remert, W. A., asst. prof. of e., Armour Institute, Chicago.
 Wheaton, F. L., div. engr., D. L. & W., Buffalo, N. Y.

A Suburban Station on the Lackawanna.

Proceedings of the Engineering Association

The Last Day's Sessions Included the Presentation of Seven Reports and Installation of Officers

THE TWENTY-THIRD ANNUAL CONVENTION of the American Railway Engineering Association came to a close at four o'clock yesterday afternoon after the officers had been installed for the coming year. Although it has been the custom of the association in recent years to complete all of its work on the last day in one session, the discussion yesterday morning was so

valuable that President Downs permitted it to run at some length, with the result that adjournment was taken at 12:30 until 2 o'clock with three reports held over for the afternoon session. The reports presented were those of the Masonry, Rail, Wooden Bridges and Trestles, Economics of Railway Operation, Buildings, Wood Preservation and Rules and Organization committees.

Report on Economics of Railway Operation

Last year the report and the discussion were largely in respect to the theoretical factors which determine the traffic capacity. For that reason the committee undertook to secure data covering actual phases of operation to substantiate or disprove what had been already covered. The data secured covered 23 operating districts, each being somewhat of a problem in itself and more or less complete. It was found that trains can be operated successfully on multiple tracks against the current of traffic and this method should receive serious consideration when it is necessary to secure increased capacity on lines already seriously congested.

L. S. Rose
Chairman

L. S. Rose has been a member of the committee since its organization in 1918, and is completing his second year as chairman. He has long exhibited a particular interest in the operating phases of engineering problems. As division engineer of the Cleveland, Cincinnati, Chicago & St. Louis for six years and later as signal engineer, he gave much attention to the operating possibilities of engineering improvements. As assistant to the general manager for the last three years he has specialized in the study of methods of promoting economics of operation through the more intensive use of existing facilities, a circumstance beneficial to the Association.

REPORTS ON METHODS for increasing the traffic capacity of a railway, the effect of speed of trains upon the cost of operation and methods for the determination of proper allowances for maintenance of way expenses due to increased use and increased investment are contained in Appendices "A" and "B."

A report on the economical operation of trains against the current of traffic on multiple track railroads is contained in Appendix "D," with definite recommendations.

Action Recommended

1. That the conclusions of the committee given in Appendix D, relating to the economical operation of trains against the current of traffic on multiple track railways, be approved and published in the Manual.

Committee: L. S. Rose (C. C. C. & St. L.), chairman; G. D. Brooke (B. & O.), vice-chairman; E. G. Allen, W. G. Arn (I. C.), J. B. Babcock, 3d (M. T. T.), M. C. Blanchard (A. T. & S. F.), J. M. Brown (C. R. I. & P.), J. W. Burt (C. C. C. & St. L.), M.

Coburn (Penna.), H. H. Garrigues (Penna.), H. B. Grimshaw (S. A. L.), R. B. Jones (C. F. R.), E. T. Howson (*Railway Age*), E. E. Kimball (Gen. Elect.), F. H. McGuigan, Jr., F. G. Nicholson (C. & E. I.), J. F. Pringle (G. T.), W. G. Raymond (Un. of Iowa), H. A. Roberts (O. W. R. R. & N.), Mott Sawyer (C. M. & St. P.), R. T. Scholes (C. B. & Q.), D. L. Sommerville (N. Y. C.), J. E. Teal (B. & O.), F. H. Watts (Penna.), J. L. Wilkes (Jacksonville Term.), C. C. Williams (Un. of Kans.), Louis Yager (N. P.).

Appendix A—Methods for Increasing the Traffic Capacity of a Railway

Last year the report dealt in part with a few of the physical elements which more or less determine the capacity of a railroad. The discussion was largely academic and requires results of actual operations to prove its value. For this reason the committee undertook to collect data on the physical characteristics of a number of different roads and the traffic which was being handled, for the purpose of noting to what extent the theory was applicable to practical operation. Replies to a questionnaire have been received covering the characteristics and operating data of 23 operating districts.

It has, therefore, been decided to use one or two of the simpler cases which have been worked up to develop the theoretical discussion a step or two farther so that next year wider applications of the theory can be made.

THE DETERMINATION OF THE TRAFFIC CAPACITY—CONCLUSIONS

1. The committee has not been able to analyze sufficient data to show how close it is possible to approach the theoretical limit of track capacity in actual practice. Two essentially single track divisions with very few passenger trains have been partially analyzed, but the conclusions which can be drawn from the analyses of these two cases cannot be taken as final. Before making final conclusions it is important to know if there are any other divisions which are doing better with equal facilities and also to secure opinions from those operating these divisions regarding their estimates of how soon additional track facilities will be required.

2. It has been found that train operations can be represented by a mathematical law, the development of which was given in an Exhibit A of the committee's report.

3. The application of this law to different sets of observations makes it possible to compare several months' operation of a given division on a more equal basis. Likewise operations of different divisions which are more or less similar can be compared on more nearly the same basis.

4. By such comparisons it is felt that the effect of extreme weather conditions, greater track facilities, characteristics of motive power, character of commodities and supervisory methods on the average time on the road can be more accurately determined.

Appendix B—Effect of Speed on the Cost of Operation—Tentative Conclusions

1. Other conditions remaining unchanged, the cost of maintenance of way increases with increased speed of operation.

Exact relation has not been established nor can it be established alike for all conditions of track, roadbed and traffic.

For minor differences in cost due to minor changes in speed not requiring changes in maintenance standards it may be assumed, until experiment proves otherwise, that the cost of maintenance of way varies with speed of operation as set forth in the report of the committee in the Proceedings of 1921 at pages 760 to 772.

2. Cost of transportation will vary materially with variation in speed, but it is not possible to determine in general a most economical speed expressed in miles per hour. The effect of variations of speed will depend on the characteristics of the division under consideration, on the wage system, on the character of the traffic, and on commercial considerations.

a. Since varying speed affects the load that can be hauled, the effect of speed cannot be considered apart from the train load. Provided there are no pusher grades, and that the wage system is a straight hourly pay system, traffic that does not require quick movement is moved most economically in maximum trains, defined to be those that can be handled at minimum speed on the de facto ruling grade of the division. Under these conditions the most economical speed for the maximum train is the fastest speed that can be made safely over the division.

b. Subject to the limiting effect of pusher grades and wage system it may be said that with a given weight of train the most economical speed is the fastest that can be made safely over a division.

c. The operating cost is a minimum under conditions "a" and "b" when the resulting speed is the one which permits the locomotive to be operated at the most economical rate of power production.

Appendix D—The Economical Operation of Trains Against the Current of Traffic on Multiple Track Railways

A questionnaire was sent to the chief operating officers of 48 roads whom it was thought might be able to present information on the subject.

CONCLUSION

The replies to the questionnaire have demonstrated that trains can be operated successfully on multiple tracks against the current of traffic in the regular course of business, thereby facilitating their movement and effecting material economies without introducing additional hazards when proper precautions are taken; also in some cases avoiding or delaying the construction of additional main and passing tracks. The following is, therefore, recommended for insertion in the Manual:

Operation of trains against the current of traffic on multiple tracks should receive consideration with other methods whenever congestion, delay or overtime prompt investigation of means of facilitating the movement of traffic or increasing the capacity of a line.

Discussion

(The report of the committee was introduced by Chairman Rose and presented in sections by the various chairmen of the sub-committees, the first section dealing with the methods for increasing the traffic capacity of a railway being presented by G. D. Brooke (B. & O.).

Mr. Brooke: The high ratio of actual track capacity to theoretical track capacity which the committee has been able so far to develop has been about 25 per cent and the highest number of trains per day over a single track railroad for a period of a month is a little below 30. There are doubtless engine districts, single track, in the country which are handling more traffic than that, but the railroads have not reported to the committee.

Hunter McDonald: We have on our line a section of about 45 miles, principally mountain road, where we have to operate over a single track a minimum in normal times of practically 60 trains a day, and we sometimes go as high as 90. The success of that operation is brought about by cooperation among the operating men. The average speed of freight trains over that section is

about 8 mi. an hr. We have lately presented a report to our management to the effect that by the installation of automatic signals and complete interlocking and the absolute annulment of all train orders we would increase the capacity of the line to 12 mi. an hr. The investment in one instance represents about \$125,000, most of which can be recovered when double tracking is resorted to, as against \$2,200,000 for double-tracking. There was also a section of 6 miles of track that was divided into three block controls, and during the 24 years of that operation we moved, if I remember correctly, as high as 119 trains over that single track and 220 trains over the double track.

Mr. Brooke: The committee will be indeed glad to get the information as to this piece of busy railroad. It will be most interesting, I think, for the committee to follow the development of the traffic and to make use of that in developing our studies of the subject.

(J. H. Brown, chairman of the sub-committee on the

subject of operating trains against the current of traffic, next presented that section of the report, the conclusion being approved by the association for inclusion in the Manual. Prof. C. C. Williams (U. of Kans.) then presented the portion of the report relating to the effect of speed on the cost of maintenance of way. The committee also reported progress on other subjects assigned to it.)

C. A. Morse (C. R. I. & P.): I was very much interested in what this committee has done. I have had occasion to try to justify the installing of double track more or less in the last 20 years, and every time I went into the literature to find out what had been said on the subject, I found that everybody was steering clear of it. The committee has it in hand and I hope they will keep at it.

(Mr. Morse then cited some practical problems in second track in which the work of the committee would be of value. The committee was then excused with thanks.)

Report of Committee on Buildings

The preparation of specifications for buildings for railway purposes which was begun last year was continued along similar lines and has resulted in the presentation of specifications covering seven subjects. The proper arrangement of icing facilities is found to have important relationship to economies of operation. Duplicate handling such as the back travel of ice must be avoided as well as the use of tunnels, the construction and maintenance of which are expensive. Since the failures of creosoted structures can be attributed largely to untreated surfaces left by sawing, etc., instructions for field treatment are very necessary.

W. T. Dorrance
Chairman

W. T. Dorrance, who is rounding out his second year as chairman of the committee, is designing engineer of the New York, New Haven & Hartford. In his seven years' service with the committee he has had an active part in the constructive work which it has done in standardizing methods of construction of railway buildings and of the materials which enter into them. The report of this year is a continuation in this respect of those of previous years. Mr. Dorrance's experience on the New Haven, with its intensive development in the industrial centers of New England, gives him a fund of information to draw on in directing the committee's work.

THE COMMITTEE PRESENTED specifications covering seven subjects relating to Appendix A. These covered 64 pages, too long to reproduce here. The committee offered as information a report on ice houses and icing stations given in Appendix B. The committee offered as information a preliminary report on floors for railway buildings in an Appendix C. No matter was offered by the committee for approval and inclusion in the Manual.

Committee: W. T. Dorrance (N. Y. N. H. & H.), chairman; J. W. Orrock (C. P. R.), vice-chairman; G. A. Belden (C. of Ga.), Eli Christiansen (C. R. I. & P.), D. R. Collin (architect), Arthur Crable (H. V.), W. L. Darden (S. A. L.), F. M. Davison, J. B. Gaut (G. T.), A. M. Griffin (A. C. L.), A. C. Irwin (Portland Cement Assoc.), F. R. Judd (I. C.), G. A. Mitchell (G. T.), Hugo Filippi (I. C.), R. V. Reamer (C. of N. J.), C. W. Richey (Penn.), G. A. Rodman (N. Y. N. H. & H.).

Appendix B—Ice Houses and Icing Stations

Ordinarily not enough thought is given to arrangement of rooms and machinery. Poor arrangement will increase the cost of filling a house as much as five or more per cent per ton. This also applies to the movement of ice from storage to cars. Some consider the number of rooms an essential point; the larger the number of rooms, the easier to keep things moving smoothly—in fact, the amount of ice that can be harvested is proportionate to the number of rooms. Wide doors are also a help. The doors must be wide enough to admit a chute built so that the ice can run either way—i. e., wider in the clear than the diagonal of the cake.

An icing station of simple construction is usually a one-room storage with a gig elevator at one end which runs in a vertical direction through the ante-room annex to the storage room. Below the ante-room is an unloading platform of 3 ft. 6 in. above rail. This is not enclosed. Directly above the ante-room is the crusher room to which block ice is delivered. The gig may be reached at any one of the three elevations or at any elevation from the storage side. The opening to the storage side may be enclosed with hinged doors or boarded up and insulated as the house is filled, removing them as the ice is removed. The floor of the ante-room should be pitched, with a trough or gutter at one side. The ante-room is used mainly as a storage space for block ice and carts for handling crushed ice, which facilitates the quick icing of a train. Platforms are usually 12 ft. wide by 200 ft. or more in length and 16 ft. 6 in. high, running parallel to ice house and directly connected with ante-room of same. These ice houses are usually of frame construction, asphalt shingles, and a straw or hay loft constructed between the collar beams and rafters of the roof construction.

A wall construction that has been successful in this type of house is constructed of 2 by 12 studs, placed 24-in. centers, covered on either side with 1 by 6 D. & M., diagonally, and over this a good, waterproof paper. On the interior an additional layer of 1 by 6 is laid; on the exterior, drop siding. The space between the studs is filled with dry, handmade, white pine shavings or similar material which will not pack. To prevent the passage of

moisture to the insulation above, due to capillary action, it is preferable to fill the lower seven to ten feet of wall with granulated cork.

On the interior surface of the building it is desirable to use a good, waterproof paint, or spar varnish. The underside of the roof rafters should be ceiled up, leaving space at the ends of about two feet, forming a channel parallel with the rafters, allowing a circulating space for the warm air to ascend to ridge of the building. There should be an open monitor on the ridge of the roof. This need not be very high—just enough so that the rain will not beat in, and allow enough space for the warm air to pass out. One of the essential points in wall construction is that careful consideration be given to the sill plate that there be no air leaks. This can be effected by the use of offset joint well coated with car glue or other waterproofing material.

Due to the difference in temperature between the exterior and interior, walls exposed to the sun for a large portion of the day, especially south walls, are liable to warp. To overcome this, an additional air space formed of 2 by 6 studs and one layer of drop siding is built on the exterior face of the building after the storage wall is finished. There should be an open space left at the bottom and top for circulation, allowing hot air to pass out at the top.

The floors of some refrigerated houses are constructed of cinders 12 in. thick and in some cases over this a two-inch plank floor on sleepers has given good results. The floors should pitch slightly toward the center, so that when the house is filled the ice forms an arch and does not throw any stress on the outside walls. In floor construction, water has to be contended with, due to poor drain-

age, and also where there is a great amount of shrinkage of ice on account of the heat transmitted from the ground.

There seems to be a difference in opinion as to the width of platforms. Some roads build platforms 12 ft. wide; these being constructed of wood posts, joists and 2-in. plank floor, with guide strips for ice of oval iron let down flush with the floor, with slots between for dripping.

On the far side from the track, platforms have a guard railing, usually 3 feet high with electric light poles with an overhanging arm. These poles are generally placed 32 ft. on centers. The arm projects out to the opposite side of the platform so as to get a maximum amount of light at the desired point at side of car. Some roads use island platforms between tracks. This has some advantage, as it allows two trains to be iced at one time.

Salt boxes are installed in connection with platforms. These are spaced about forty feet apart and hung below the floor boards of the platform. The salt is handled by means of a shovel from car to storage box. In some cases elevators are used to carry salt, receiving supply from cars delivered to an overhead bin, using overhead trolley buckets or wheelbarrows to transfer to boxes under platform or other location.

Where crushed ice is handled, loaded wheel carts are stored until train time. Loading is then made by spouts or troughs, which allows for a double deck platform.

Discussion

(The report of the Committee on Buildings was presented by W. T. Dorrance, Chairman, who outlined the work which the committee had been doing during the past year; after which the report was accepted as information by the association and the committee dismissed with the thanks of the association.)

Report of the Committee on Rail

The rail failure statistics for 1920 show that there was a continuous decrease in failures from 1908 to 1917, the latter year being the low one to date, with a gradual increase in failures up to 1917. The figures for 1916 and 1917 are, of course, based on a study for short periods of service. War conditions were believed to be the cause of the increasing number of failures which will probably reach a peak for the year 1917. Data include both Bessemer and open hearth steel—A schedule for the inspection of steel rails was submitted for inclusion in the Manual, consisting of a chief rail inspector, three or more assistant inspectors, some chemists and a chemist

G. J. Ray
Chairman

G. J. Ray is rounding out his fourth year as chairman and his sixth year as a member of the committee. He has also been active in other work of the association, having served as chairman of the Track Committee for several years and a member of the Board of Direction from 1914 to 1917, and again for the year now closing. He has been chief engineer of the Delaware, Lackawanna & Western for 12 years, during which time this road has carried on an unusually extensive construction program. Mr. Ray has been a keen student of the rail problem for years, and has pioneered in a number of developments relating to both construction and maintenance.

THE REPORT ON THE RAIL FAILURE STATISTICS for the period ending October 31, 1920, is submitted as Appendix A. The committee in Appendix B presented abstracts of the replies to a questionnaire, a discussion of the methods used for the inspection of steel rails and a schedule of Recommended Practice for Inspection of Steel Rails. The committee recommended the schedule of recommended practice for the inspection of steel rails, submitted in Appendix B, be adopted and included in the Manual.

Committee: G. J. Ray (D. I. & W.), chairman, J. M. R. Kelley (C. P. R.), ex-chairman, J. F. Adams (U. P.), J. C. Gault (H. C. & O.), W. C. Barnes, W. C. Gusting (Penn.), P. J. Conroy (N. Y. C. & H. R.), J. W. Leitch (A. T. & S. F.), L. C. French (C. R. & E.), J. H. Galloway (N. & W.), A. W. Gibbs

(Penn.), C. R. Harding (S. P.), J. D. Isaacs (S. P.), H. G. Kelley (G. T.), H. D. Knecht (M. P.), R. Montfort (L. & N.), A. W. Newton (C. B. & Q.), J. R. Onderdonk (B. & O.), F. S. Stevens (P. & R.), F. M. Waring (Penn.), M. H. Wickhorst, J. B. Young (P. & R.)

Appendix A—Rail Failure Statistics for 1920

By M. H. WICKHORST

This report covers rollings for 1915 and succeeding years and the ages of the rolling would average in track about the years shown below:

1915—5 years	1918—2 years
1916—4 years	1919—1 year
1917—3 years	1920—several months

The tonnages and track miles of rail represented by the statistics in this report are as follows:

Year Rolled	Tons	Track Miles
1915	1,091,876	7,346.50
1916	1,193,905	8,062.10
1917	1,096,395	7,334.40
1918	990,820	6,658.80
1919	989,398	6,676.60
1920	759,071	5,064.20
Total	6,121,465	41,142.60

The average results of all the rails reported on are shown in Table 1, together with the results taken from previous reports, including both Bessemer and open-hearth rails. The measure of the performance of a lot of rails as regards failures is taken as the failures per 100 track miles for five years' service and it will be noted that there was a continuous decrease in the failures from the rails rolled in 1908 with a record of 398.1 to those rolled in 1914 with a record of 74.0. The rails rolled in 1915 showed an increase to 82.4 failures per 100 track miles for five years' service and a study of the records for lesser periods of service indicates that the rails rolled in 1916 and 1917 will show successively increased numbers of failures. This unfortunate performance is probably to be regarded as a by-product of the war and the manufacturing conditions that prevailed during the war and for a while thereafter. Under-maintenance during the same period probably contributed to increase the general failure records, but it is to be noted that the 1914 rails, which have given the best record, also went through the same period of under-maintenance. The general average results for the whole country are presented diagrammatically in Fig. 1. Here again will be noted how the failure curve showed continuous decrease in failures until the present year, which shows an increase. The curve will acquire an ugly hump which we hope will reach its peak in the record of the 1917 rails. As interesting information, the average weight of the rails rolled at each of the mills is presented in Table 2.

In conclusion it may be remarked that the failures had been showing a gratifying decrease from year to year until the World War came on. The "war-time" rollings, however, and particularly the rails rolled in 1917, are not showing up so well, due probably to the unfavorable manufacturing conditions that prevailed when they were made and also to the lack of the usual care in the track that the railroads were able to give them during the same period.

TABLE 1—AVERAGE FAILURES PER 100 TRACK MILES

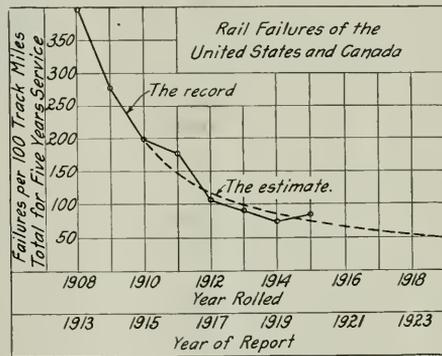

Year Rolled	Years Service					
	0	1	2	3	4	5
1908						398.1
1909					224.1	277.8
1910				124.0	152.7	198.5
1911			77.0	104.4	135.3	176.3
1912		28.9	32.1	49.3	78.9	107.1
1913	2.0	12.5	25.8	44.8	69.5	91.9
1914	1.2	8.2	19.8	32.9	50.8	74.0
1915	0.7	8.9	19.0	34.2	53.0	82.4
1916	1.6	11.8	29.2	47.7	70.6	
1917	5.3	21.6	38.9	66.0		
1918	1.6	8.9	27.6			
1919	2.0	14.8				
1920	3.9					

TABLE 2—AVERAGE WEIGHTS OF RAILS COMPILED FROM TONNAGES USED IN THIS REPORT

Mill	1915	1916	1917	1918	1919	1920
Algoma	90.1	90.1	85.0		94.2	101.7
Bethlehem	98.6	99.2	103.0	104.3	109.3	120.3
Cambridge	102.5	103.4	115.4	118.9	112.1	130.0
Carnegie	89.8	100.7	100.2	104.1	105.6	101.7
Colorado	89.8	89.0	90.4	90.3	87.7	90.5

Maryland	104.4	102.8	106.7	104.2	93.6	85.0
Pennsylvania	104.6	102.0		100.0	101.2	103.0
Tennessee	88.1	88.5	87.9	88.3	89.1	88.6
Average	94.6	94.3	95.1	96.1	94.2	95.4

Appendix B—Recommended Practice for Inspection of Steel Rails

1. Chief Rail Inspector.
2. Three or more assistant inspectors as size of mill and rate of rolling may require.
3. One or more checkers, depending upon rapidity of loading.
4. One chemist if check analyses are made in mill laboratory.
 1. The chief rail inspector shall supervise the inspection force, mill practice, drop tests and make records.
 2. One assistant inspector shall follow the mill practice closely, i. e., time of charging, time of tapping, cutting of tests, etc.; record any irregularities, such as too rapid pouring, charging cold ingots, rolling cold bloom, low finishing temperature, behavior of rails under straightening presses or any other departures from good mill practice which may affect the service of the rails.
 3. One assistant inspector for night duty shall make drop tests if necessary and follow the mill practice.

The Rail Failure Record to Date

4. One or more assistant inspectors shall inspect the rails on the loading beds for surface defects, straightness, etc.
5. One or more checkers shall record the number of rails of each heat accepted and loaded in each car. A record of the car number and the number of rails of each heat in the car shall be sent to the division engineer, the supervisor, the roadmaster or other officer to whom the rails are consigned. This prevents the loading of rails rolled from odd ingots, or the loading of more rails than were originally rolled in a heat, or the loading of rails from rejected heats. It also furnishes a check record of the location of the rails if at any time in the future it is desired to remove the rails of a particular heat for any cause whatever.
6. A chemist shall make check analysis of drillings taken from corner of head of the rail, no rails being loaded until the check analysis is finished. The office to which the rail inspection force reports should keep a record of the history of each heat in a convenient form, so the results obtained from the service of the rails may be traced to the manufacture of the steel or rails.

Rail inspectors should be selected with care and men not familiar with rolling mill practice should not be sent to inspect rails except under the supervision of an experienced rail inspector. As far as possible the inspections should be made by the same men, as they then become familiar with the methods of manufacture peculiar to each mill, for no two mills follow the same procedure even though owned by the same company.

Acceptance of heats meeting the technical require-

ments of specifications, but in the judgment of the inspector of inferior quality should be deferred pending decision of engineer of tests after full report and review of conditions; conversely, rejections of heats whose deficiencies may be technical only should be similarly governed. The inspectors cannot be too careful and must exercise good judgment and all possible tact.

Discussion

(The report of the Committee on Rail was presented by G. J. Ray, Chairman, the section under Appendix B, Recommended Practice for Inspection of Steel Rails, being approved by the Association for inclusion in the Manual. The chairman next brought up the question of a revision of the specification which the committee expected to present at this meeting.)

Chairman Ray: During the past season the committee has paid particular attention to mill practice at various mills, and as a result of the studies which have been made the committee thought best to prepare a new specification or to revise the old specification with a view of eliminating segregated steel as far as possible. We have felt it advisable to get the manufacturers to produce the steel in the furnace as far as possible, rather than in the ladle or in ingot. We have before us an experiment specification which has not been passed on by the committee, in which we are endeavoring to get a rail which will be without excessive segregation. This may permit the manufacturer to eliminate the nick-and-break test from the specification. I will say frankly that some of the members of the committee think that it is a mistake to eliminate this test. We do not want to get steel which is piped, but if we permit the manufacturer to roll his steel which contains a pipe in the ingot, rather than segregated steel, we hope to get steel which is safer in the track than much of the steel we get now, which we know is often badly segregated. There is a general impression about piped rails that is not founded on proper knowledge of the situation. If the rail is badly segregated and exceedingly hard, it will be safer on the outside, because the carbon and sulphur are segregated towards the center, and it will break down in the head. That rail is a dangerous rail compared with a piped rail or a rail which has a natural lamination in the center due to the cavity in the top of the ingot. We think that most of the trouble is due to split-head rails, which are caused by bad segregation. Therefore, the specification is gotten up with the idea of producing an ingot which will contain what is known as piped steel rather than segregated steel. We are not looking for piped steel, but we are trying to get away from the segregated steel, and we want to give the manufacturer an opportunity to do that.

C. W. Gennet, Jr. (Robert W. Hunt & Co.): Indisputably the best rails are produced when the steel mills are running constantly, for then the various steps of the process are in better harmony and the machinery and the workmen are keyed to the proper pitch. In 1921 the inspection of approximately two million heavy section rails produced about 1.8 per cent of No. 2 rails and about 1.9 per cent of scrap rails, all so classified because of flaws, which figures are fairly representative of good practice. Of these rails approximately 40 per cent were made to some specification requiring a nick and break test from "A" or top rails and then classifying according to the appearance of the fracture. The number of "A" rails condemned because of showing interior defects on the fracture test amounted to 1.3 per cent of the total rolled under such specifications, but the number from one mill amounted to 0.2 of 1 per cent, while that from another mill amounted to 4.2 per cent. These figures

emphasize the wide difference that may be found in mill practice.

No important change in any customary mill practice has marked the past year, but of course, the times have not been propitious for making either radical changes or improvements. A new rail manufacturer, the Standard Steel Company, has entered the field, however, and among the facilities for rail-making that have been provided in the mill, are the adaptation for delivering long rails, and the disposition into other products, including tie-plates, of what would ordinarily be the "A" or top-rail metal.

Experience has demonstrated repeatedly that the most constant cause of criticism is the incessant fault found with the action of "A" or top rails in track. It is plain that until the mills generally adopt some method of casting hot-top and big-end up ingots the liability of obtaining piped and segregated unhomogeneous steel in the top rails is so great as to require the adoption of more positive methods for combating the difficulties. Testing the top rail of each ingot is one method for protecting against the shipment of inferior metal. In lieu of such testing methods, it has now been deemed practicable to provide for the disposition of the "A" rail metal by agreeing to its use in the form of hot worked tie plates. It is hoped that early in the future, more mills may see their way clear to adapt themselves to such manufacture.

It has been suggested that rail steel should contain a higher silicon content than heretofore has been common in this country, although some English rail steel has long been conspicuous for its high silicon. The English steel contains much less carbon than ours does, and the question of possible brittleness in the high carbon steel containing high silicon and perhaps silica, is important for investigation. No doubt, the more extensive use of silicon, if possible, at the mills, will make the steel more homogeneous in some directions, but it is hazardous to expect it to so reduce segregation as to make that evil a matter of history, and seriousness of the increased piping must not be underestimated.

W. C. Cushing (Penna.): Several large railroads have been considering increasing the weight of rail in use on these roads, and studying the design which they should use in making that change. The Rail committee is not ready to make any report on the subject. It has been estimated that the 130-lb. rail on the Pennsylvania System outlasts the 100-lb. section by 2½ times and is worth 23 per cent more in reduced maintenance on heavy curvature districts. It has also been well established that the failures of 130-lb. rail on the Pennsylvania System are many times fewer than those of the 100-lb. section, notwithstanding the fact that they are located where the traffic and alignment conditions are of the severest. I do not believe that the time has come for making any change in the present adopted "RE" sections, especially as the 100 lb. and 130-lb. sections are now rolled.

Hunter McDonald (N. C. & St. L.): I would like to bring to the attention of the Rail committee with as much emphasis as I can the problem that a number of our roads have before them of recommending an increase in rail section. I know that the tendency of most of the roads having dense and heavy traffic has been to make one big jump from a 100-lb. section or perhaps 105-lb. section to as high as 130 and 136-lb. The committee now has under consideration the using of a 150-lb. section, as announced by the chairman. I think the majority of our membership is much more interested in the establishment and stabilizing of the intermediate sections between 100 and 150 than they are in the completion of the 150-lb. section. The question of whether he is likely to strike what will be the future standard

when he goes from a 90-lb. rail to a higher section, is very important, and it devolves upon the engineer making this recommendation to forecast correctly what the final action of the committee is to be. An effort should be made to stabilize this question as quickly as possible.

I would also like to ask the committee if it will not revive the question of using longer rails than 33 ft.

The President: That concludes the report of the committee, and it is dismissed with the thanks of the Association.

Report of Committee on Masonry

The committee recommended that the paragraph dealing with the permissible variation in the fineness of cement be omitted from the Manual since by agreement among the parties interested it has been omitted from the specifications which, as so amended, have been adopted by the American Engineering Standards Committee as tentative standards. The elimination of this clause will make the two specifications identical in content. In view of the advancement in concrete work, it was recommended that certain changes be made in the Manual dealing with consistency, impurities and steel reinforcement so as to keep the specifications up to date.

J. J. Yates
Chairman

J. J. Yates, chairman of the committee, is completing his third year in this capacity and has been a member of the committee since 1912. During this long period of service he has played an important part in the work. He has served as the representative of the Association on the joint committee on specifications for Portland cement and is now vice-chairman of the new joint committee on concrete and reinforced concrete. As bridge engineer of the Central Railroad of New Jersey he has had an opportunity to obtain a first hand contact with a variety of problems relating to concrete, particularly those concerning its use in salt water.

THE COMMITTEE recommended that the following action be taken on its report:

1. That the following requirement as it appears in the 1921 Manual, covering a variation in fineness of cement, be omitted and the remaining paragraphs renumbered. See Appendix A.)

Permissible Variation.—36. A permissible variation of 1 will be allowed, and all results in excess of the specified limit, but within this permissible variation shall be reported as 22 per cent.

2. That the revisions and additions as they appear in Appendix A be issued as a supplement to the Specifications for Plain and Reinforced Concrete and for Steel Reinforcement as it appears in the Manual.

3. That Appendix B covering specifications for cold drawn wire, Abrams' selective concrete strength tests and the colorimetric test of sands be received as information.

4. That an Appendix C reporting progress of the Joint Committee on Specifications for Concrete Pipe be received as information.

5. That the recommendations of the committee as they appear in its Appendix D be approved as the outline work for the ensuing year.

Committee: J. J. Yates (C. of N. J.), chairman; Job Tuthill (P. M.), vice-chairman; J. T. Andrews (B. & O.), R. Armour (G. T.), T. L. Condon (Cons. Engr.), W. A. Christian, J. E. Freeman (Port. Cem. Assoc.), T. L. D. Hadwen (C. M. & St. P.), Dr. W. K. Hatt (Purdue Univ.), S. C. Hollister (Cons. Engr.), Richard L. Humphrey (Cons. Engr.), Noah Johnson (Wabash), S. A. Jordan (B. & O.), W. S. Lacher (Railway Age), J. C. Nagle (A. & M. Col.), C. P. Richardson (C. R. I. & P.), F. E. Schall (L. V.), Z. H. Sikes (N. Y. C.), F. P. Sisson (G. T.), G. H. Tinker (N. Y. C. & St. L.), C. C. Westfall (I. C.).

Appendix A—Revision of Manual

Since the adoption of a Specification and Tests for Portland Cement in 1917, the allowance of a variation of 1 per cent passing the No. 200 sieve, as provided in the Tests for the Determination of Fineness, has under an agreement by those interested been omitted from the specification. The specification as amended has been

approved on January 15, 1921, as "Tentative Standard" by the American Engineering Standards Committee. The committee is recommending that we omit paragraph 36 in order to make our specification identical.

The Progress Report of the Joint Committee on Standard Specifications for Concrete and Reinforced Concrete was submitted to the constituent organizations June 4, 1921, and it has been issued to the members of the American Railway Engineering Association. It is the recommendation of the Masonry committee that certain changes and additions to the Specifications for Plain and Reinforced Concrete and for Steel Reinforcement be issued as a supplement to the Manual as follows:

For Paragraph 11, on Consistency, substitute the following:

11. (a) The quantity of water used in mixing shall be the least amount that will produce a plastic or workable mixture which can be properly compacted in the forms and around the reinforcement. Under no circumstances shall the consistency of the concrete be such as to permit a separation of the coarse aggregate from the mortar in handling.

(b) The Engineer shall determine and specify the consistency of the concrete for various portions of the work based on test of the materials to be used. The consistency of the concrete shall be measured by the slump test (for description of test and methods of making slump tests, see Vol. 22, Proceedings for 1921, pages 553 to 564, inclusive).

(c) The consistency of the concrete shall be checked at the beginning of each daily run, and at least once a day thereafter during the progress of the concreting, or when the size of any aggregate or its moisture condition changes.

Under the general heading of Materials, Paragraphs 1 to 7, inclusive, add the following paragraph:

ORGANIC IMPURITIES IN SAND.—Natural sand which shows a color darker than the standard color when tested in accordance with the Colorimetric Test for Sands (see Appendix B) shall not be used unless the concrete made with the materials and in the proportions to be used on the work is shown by tests to be of the required strength.

As a footnote to the section on Steel Reinforcement, Paragraph 7, add the following:

See Appendix C for "Tentative Specifications for Cold-Drawn Steel Wire for Concrete Reinforcement."

Include under section on Steel Reinforcement the following:

Standard Sizes of Bars. Reinforced bars shall conform to the areas and equivalent sizes shown in Table 1.

TABLE 1—SIZES AND AREAS OF REINFORCED BARS

Size of Bar Inches	Area, sq. in. Round	Square
3/8	0.110
1/2	0.196	0.250
5/8	0.307
3/4	0.442
7/8	0.601
1	0.785	1.000
1 1/8	1.266
1 1/4	1.563

The areas of deformed bars shall be determined by the minimum cross-section thereof.

Include under Section 11, on Depositing, Paragraphs 23 to 28, the following provision for Spouting:

SPOUTING.—When authorized by the engineer, concrete may be conveyed by spouting, in which case the plant shall be of such size and design as to insure a practically continuous flow in the spout. The angle of the spout with the horizontal shall be such as to allow the concrete to flow without separation of the ingredients. The spout shall be thoroughly flushed with water before and after each run. The delivery from the spout shall be as close as possible to the point of deposit. When operation must be intermittent, the spout shall discharge into a hopper.

Appendix B—Developments in the Art of Making Concrete

TENTATIVE SPECIFICATIONS FOR COLD-DRAWN STEEL WIRE FOR CONCRETE REINFORCEMENT*

Material Covered.—1. These specifications cover cold-drawn steel wire to be used as such, or in fabricated form, for the reinforcement of concrete, in gages not less than 0.080 in. nor greater than 0.500 in.

Basis of Purchase.—2. When wire is ordered by gage number the following relation between number and diameter, in inches, shall apply unless otherwise specified.

Gage Number	Equivalent Diameter, Inches	Gage Number	Equivalent Diameter, Inches
00000000	0.4900	5	0.2070
0000000	0.4615	6	0.1920
000000	0.4305	7	0.1770
00000	0.3938	8	0.1620
0000	0.3625	9	0.1483
000	0.3310	10	0.1350
00	0.3065	11	0.1205
0	0.2830	12	0.1055
.....	0.2625	13	0.0915
.....	0.2437	14	0.0800
.....	0.2253

(I) Manufacture

Process.—3. (a) The steel shall be made by either or both the following processes: Bessemer or open-hearth.

Drawing.—(b) The wire shall be cold drawn from rods hot rolled from billets.

(II) Physical Properties and Tests

Tension Tests.—4. (a) The wire, except as specified in paragraphs (b) and (c), shall conform to the following minimum requirements as to tensile properties:

Tensile strength, lb. per sq. in.	80,000
Reduction of area, per cent.	30

(b) For wire to be used in the fabrication of mesh a minimum tensile strength of 70,000 lb. per sq. in. shall be permitted.

(c) For wire testing over 100,000 lb. per sq. in. tensile strength the reduction of area shall be not less than 25 per cent.

Bend Tests.—5. The test specimen shall withstand being bent cold through 180 deg. without cracking on the outside of the bent portion, as follows:

For wire 0.3 in. in diameter or under a pin the diameter of which is equal to the diameter of the specimen.

For wire over 0.3 in. in diameter, a pin the diameter of which is equal to twice the diameter of the specimen.

Test Specimens.—6. Tension and bend test specimens shall be of the full cross section of the wire as drawn.

Number of Tests.—7. (a) One tension and one bend test shall be made for each 10 tons or less of each size of wire.

(b) If any test specimen shows defects or develops flaws, it may be discarded and another specimen substituted.

(III) Permissible Variations in Gage

8. The diameter of the wire shall not vary more than 0.003 in. from the size ordered.

(IV) Workmanship and Finish

9. The finished wire shall be free from injurious defects and shall have a workmanlike finish with smooth surface.

(V) Inspection and Rejection

Inspection.—10. The manufacturer shall afford the inspector, without charge, all reasonable facilities to satisfy him that the wire is being furnished in accordance with these specifications. All tests and inspection shall be made at the place of manufacture prior to shipment, unless otherwise specified, and shall be so conducted as not to interfere unnecessarily with the operation of the works.

Rejection.—11. Wire which shows injurious defects subsequent to its acceptance at the manufacturer's works will be rejected, and the manufacturer shall be notified.

Discussion

(The revision of the Manual, Appendix A of the report, was presented by the chairman of the sub-committee, W. S. Lacher (*Railway Age*). Following is an explanation of each section, J. J. Yates (chairman of the committee) moved its adoption. All clauses were approved by the Association in turn with the exception of the clause relating to the spouting of concrete.)

Mr. Lacher: The present specification makes no reference to spouting concrete. It is the opinion of the committee that the user of the specification has a right to some information, to some of the best thought, at least, on the subject of spouting, and for that reason the committee at this time submits a specification for the spouting of concrete, this being the clause that the Joint committee has now in its tentative specification. This clause does not say that spouting must be done. It still puts the matter up to the engineer on the job, but if the engineer decides that he does want to permit spouting of concrete, this clause gives him a specification under which that may be done.

Chairman Yates: I move the adoption of this clause for insertion in the Manual.

G. J. Ray (D. L. & W.): I should hate to see that part of the report go into the Manual at this time. As I understand the situation the committee does not recommend and will not recommend to the Association at the present time the adoption of the joint report. This clause is to bring our specification up to conform to the joint report. I think some of us do not yet agree that we should adopt the joint report, and until that is done I hardly see the necessity of putting into our specification a clause which stamps our approval on spouting. I therefore wish to make an amendment to the motion, that this clause be inserted merely as information for the present, and not be inserted in the Manual.

Chairman Yates: There has been a demand on the Masonry committee for a clause on spouting. We have had many discussions on this subject, both in the Joint committee on concrete and reinforced concrete, and in the Masonry committee itself, and this clause appears therein to meet that demand. It is the best we can do at the present time. It agrees quite closely with the Joint committee's report.

(Motion as amended carried.)

(Chairman Yates then reviewed the work of the committee with respect to the Joint committee for concrete and reinforced concrete.) * * *

Mr. Ray: I would like to call the attention of all concerned to the importance of this report. This Association is going to be called upon in another year to pass on this joint report or this tentative report which is now before us, and it is of the utmost importance that every man in the Association study that report and be prepared to submit to this committee his conclusions and recommendations with respect to it. The suggestion that the contractor will be required to make concrete which will meet definite requirements as to strength is an all-important and far-reaching proposition. My own thought

* From A. S. T. M. Transactions, 1910, p. 41.

is at this time, after looking it over quite carefully, that it will mean a very material increase in the price of concrete if it is put in under that specification. I have during the past season been carrying on a few tests in an experimental way in actual practice to see what we could do ourselves in meeting the requirements of that specification. I have been amazed to find out how difficult it is for us to do it. If we cannot do it ourselves, how

can we expect the contractor to know what he does when he bids on our work?

Chairman Yates: The Joint committee's report is a preliminary report, and there is no doubt there will be many modifications and changes, and we want the benefit of discussion on this matter.

(The committee was dismissed with the thanks of the Association.)

Report of Committee on Wood Preservation

A revision of the Manual covering the retention of creosote oil in timber and the permeation of the sap wood was submitted to change the specifications for the preservative treatment of wood by the empty cell process with final vacuum. As everyone who is interested desires definite information regarding tie life, nothing but completed tests should be published in the future. Due to the price and scarcity of creosote oil, it was thought imperative that, in order to treat sufficient ties and to secure the greatest economy in tie life, the Burnett process should be used. Good creosoting offers the best protection to marine piling found so far.

C. Marshall Taylor
Chairman

C. Marshall Taylor is completing his fourth year as chairman and his twelfth year as a member of the committee. He has also been president of the American Wood Preservers' Association during the last year. Mr. Taylor is an enthusiastic advocate of the more extended use of treated timber by the railways and has done much to stimulate its consumption individually and through association activities. As superintendent of the Port Reading creosoting plant of the Philadelphia & Reading and the Central Railroad of New Jersey, he has been able to bring to the committee the combined viewpoint of the plant operator and the railway engineer.

PROPOSED CHANGES or additions to the Manual are indicated by italics in the appendices. In Appendices

A, F and G the committee submitted changes and additions and recommended their adoption under the heading of "Conclusions." In Appendix B the committee submitted tables (omitted here) indicating the life of ties treated with zinc, zinc creosote and creosote, taking as a basis the service life of ties of the different kinds of woods in various sections of the country. Also, the committee made definite recommendations covering the selection, installation and record of test sections. In an Appendix D the committee on Pacific Coast Marine Piling gave the history of the protection that has been used in that territory, and also submitted information concerning the biological phases of our problem, together with records of some structures that have given excellent service in that district. The committee on Research covering Marine Piling gave a full report of the investigations that have been carried out in this country and abroad considering a problem that has come to the attention of engineers the world wide. A brief summary of this report is given in Appendix E. In Appendix F the committee submitted for adoption definite additions to the General Requirements, and which are recommended for adoption as Recommended Practice under the heading of "Conclusions." In Appendix G the committee submitted additions to the General Requirements and recommended them for adoption as Recommended Practice under the heading of "Conclusions."

Conclusions

The committee made the following recommendations to the association for adoption and publication in the Manual:

Subject (1)

(a) Revise specifications for the Preservative Treatment of Wood with Creosote Oil (Empty Cell Process with Final Vacuum).

(b) New specification for Preservative Treatment to be used on Piles and Timbers in Land Construction.

(c) New specification covering Methods for Storing Lumber and Piling for Air-seasoning Preliminary to Preservative Treatment.

Committee: C. M. Taylor (C. of N. J.), chairman; S. D. Cooper (A. T. & S. F.), vice-chairman; F. J. Angier (B. & O.), R. S. Belcher (A. T. & S. F.), H. C. Bell (N. & W.), E. H. Bowser (I. C.), Z. M. Briggs (Penna.), W. E. Burkhalter (O. W. R. R. & N.), H. A. Dixon (C. N. R.), C. F. Ford (C. R. I. & P.), Andrew Gibson (N. P.), C. E. Gosline (D. L. & W.), W. L. R. Haines (Penna.), E. B. Hillegass (A. C. L.), R. H. Howard (Wabash), A. B. Ilsley (Sou.), W. H. Kirkbride (S. P.), J. K. Melton (I. C.), J. F. Pinson (C. M. & St. P.), B. H. Prater (O. S. L.), H. von Schrenk (Cons. Engr.), W. D. Simpson (S. A. L.), O. C. Steinmayer (St. L.-S. F.), J. H. Waterman (C. B. & Q.).

Appendix A—Revision of the Manual

The committee has revised the specification for the Preservative Treatment of Wood with Creosote Oil (Empty Cell Process with Final Vacuum), as shown on page 332 of the 1920 Proceedings. The third paragraph of the specification has been changed to read as follows:

"The material shall retain an average of at least 6 pounds of creosote oil per cubic foot which will permeate all of the sapwood and as much of the heartwood as practical," and no charge shall contain less than 90 per cent nor more than 110 per cent of the quantity per cubic foot that may be specified.

Appendix B—Service Test Records

There are many different chemical preservatives used, and as creosote oil, zinc chloride, and a mixture of these two, are more widely used than the others, these only will be discussed in this report.

Of these preservatives there is no question about the use of creosote oil being preferable. Zinc chloride and a mixture of zinc chloride and creosote oil are used with much success in certain regions.

The committee is of the opinion that it will be much more desirable in the future to publish nothing but completed tests. Completed tests will be reported each year.

ZINC CHLORIDE (BURNETTIZING) PROCESS

With the present scarcity of creosote oil resulting in high prices, and the large number of cross ties to be

treated, economy demands that some other preservative be used. For some time there will not be sufficient creosote oil to treat the required number of ties. Therefore, it is imperative that the Burnett process of treatment be more widely used in order to secure the greatest possible economy in the use of ties.

Below are given the governing features for maximum service life and economy in the use of ties treated by this process:

Conditioning required for satisfactory treatment:

(1) Preliminary seasoning—Be sure that the ties to be treated have been thoroughly seasoned and that decay has not already begun.

(2) Proper treatment—To secure this the treatment should be supervised by a competent treatment inspector under the jurisdiction of the engineering department of the railroad.

(3) Subsequent seasoning—Care should be taken to see that the ties are thoroughly seasoned after treatment. They should be piled in close piles with end ties on edge (as per sketch), to prevent excessive checking.

(4) All piles should be placed in dry places and kept free from weeds.

Maximum service results will be obtained only upon observance of the following:

(1) Drainage—Good drainage of the roadbed is absolutely necessary to secure maximum results.

(2) Ballast—The ballast should be sufficient and of the best available materials, and should be kept clean.

(3) Tie plates—Tie plates of proper size and thickness should be used on all treated ties to prevent destruction by mechanical wear.

(4) Rail anchors—Use rail anchors where necessary to prevent creepage of rail, and slewing of ties.

(5) Distribution of ties—When practicable use hardwood ties on curves and softwood ties on tangents.

(6) Tie plugs—Whenever it is necessary to re-spike a treated tie, treated tie plugs should be applied, and when possible to do so the spike should be redriven into the tie plug.

(7) "S" Irons—"S" irons should be applied to hardwood ties before treatment, preferably in the woods at time of manufacture, or, if not then, immediately after the inspection.

Appendix E—Research Work on Marine Piling

Wooden piles used in marine construction have since the earliest days been subject to attack by various forms of marine borers, including members of the genera, *Teredo*, *Nyctrota*, *Limnoria*, *Sphaeroma*, etc. Very little definite information, however, is available with reference to exact distribution of the various forms, their specific identity, the conditions under which they live, influence of temperature and salinity of waters, the methods of reproduction, feeding habits and kindred points.

Realizing the international character of marine borer activities, the National Research Council was appealed to for the purpose of formulating a broad program to co-ordinate the various investigative activities now being conducted and to stimulate additional research work. The committee recommended that the A. R. E. A. continue to actively participate in the prosecution of the research work so necessary for a proper understanding of the habits of marine borers and methods for their control.

Recommendations: The result of examination of service records of piling on all coasts during the past few years leads the committee to recommend that good creosoting will offer the best protection so far found. By good creosoting the committee means a treatment conforming to the recommended practices of the A. R. E. A. both as to oil and treatment. It does not believe that there is sufficient knowledge as yet to warrant the use of special oils and that the A. R. E. A. No. 1 creosote oil should still be regarded as the standard for piling protection.

Appendix F—Preservative Treatment to Be used on Piles and Timbers in Land Construction

The committee recommended the following additions to the General Requirements:

Piling for Land Construction

Treatment shall be in accordance with specifications for preservative treatment of wood with creosote oil (full cell process). The net amount of oil left in the piling shall be not less than 15 lb. per cu. ft. of wood.

Timbers in Land Construction

Treatment shall be in accordance with any of the following specifications:

1. Specification for preservative treatment of wood with creosote oil (full cell process).

2. Specification for preservative treatment of wood with creosote oil (empty cell process, with final vacuum).

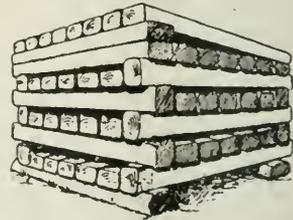

3. Specification for preservative treatment of wood with creosote oil (empty cell process, with initial air and final vacuum).

The various processes of treatment shall be so manipulated as to reach a net retention of not less than 12 lb. of oil per cubic foot in all timbers, excepting bridge ties and guard rails in which the minimum amount may be not less than 8 lb. of oil per cubic foot of wood.

Failure of some creosoted structures in the past can be attributed to untreated surfaces exposed to decay when sawing off piles, framing, and boring of holes. The committee is of the opinion that instructions for field treatment of creosoted materials are very necessary and offered the following:

Instructions for Field Treatment for Creosoted Material

All treated timber and piling which is cut or bored after treatment shall have the surfaces so exposed covered with creosote oil. Where cut, the surfaces shall be painted thoroughly with

Method of Piling Zinc Treated Ties

creosote. Where holes are bored, they shall be poured full of creosote where possible.

Horizontal holes such as those for Stave Brace Bolts shall be filled by pouring creosote into them through a bent funnel.

The creosote shall be heated before using.

Where it is absolutely necessary to bore holes in piles to support scaffolding, or for other reasons, the holes shall not be left open, but shall be poured full of creosote and a tight-fitting creosoted timber plug inserted.

Appendix G—Methods for Storing Lumber and Piling for Air-Seasoning Preliminary to Preservative Treatment

It is the opinion of the committee that the top of the treated sills or stringers used for piling and lumber should be at least 12 in. above the ground instead of 6 in., as now provided; and it is suggested that the Manual be revised to read as below, with the changes underscored:

"Material should not be treated until seasoned. If it arrives at the treating plant in a seasoned condition, ready to treat, it may be loaded directly from the cars to the trams; otherwise it shall be stacked; if ties, they should be stacked in layers of one or two and seven to ten, depending on the width of the ties, with alleys at least 3 ft. wide between rows of stacks extending between tracks, and at least 6 in. off the ground on treated sills; if lumber, it shall be segregated according to size and each layer in the pile shall be separated by at least 4-in. strips with an air space of 1 in. or more between each piece of lumber in any layer. For caps, stringers and other large timbers, 4-in. by 4-in. strips should be used to separate layers in piling, with alleys at least 3 ft. wide between rows of stacks extending between tracks and at least 12 in. off the ground on treated sills; if piles, they shall be stored in a like manner, placing only one length in a pile, using strips 4 in. by 4 in. or saplings of equal size between each layer; reversing all sticks in every other layer in order to keep the pile level, with alleys at least 3 ft. wide between rows

of stacks and at least 12 in. off the ground on treated sills. The space under and between the rows of stacks at all times should be kept free of rotting wood, weeds, or rubbish. The yard to be so drained that no water can stand under the stacks or in their immediate vicinity."

The following paragraph should be added as the next to the last paragraph, under General Requirements:

"In some localities, where weather conditions make it difficult to properly season piling or large timbers, it may be found desirable to locate the piles with ends to the east and west in order to secure direct rays of the sun on the ends of the sticks."

Discussion

(The report of the committee was presented by C. M. Taylor, Chairman. The section regarding the revision of the Manual on the recommended practice for the empty cell treatment with final vacuum was accepted. Mr. Taylor stated that the use of white oak for a standard test tie was acceptable to the committee. He called attention to the successful use of dating nails and urged that the railroads give this method of keeping accurate track of the life of their ties wise and serious consideration. F. J. Angier (B. & O.) stated that although

he had used them for a long term of years, the Baltimore & Ohio had given up the use of dating nails, believing that they were a needless expense when considered in connection with the numerous reports which it is customary to make when they are used. G. J. Ray (D. L. & W.) stated that the Lackawanna had been using dating nails for 12 years and expected to continue as he believed the psychological effect of the nail on the foreman to be good. It was the sense of the meeting that dating nails be used in treated ties.

(The discussion on dating nails was followed by the presentation of the sections on the Preservative Treatment of Douglas Fir and the Treatment of Piles and Timbers for Marine Structures and Appendix E on Research Work on Marine Piling which were accepted as information. The sections in Appendix F dealing with the preservative treatment of piling and timbers in land construction, and the sections in Appendix G concerned with the methods of storing lumber and piling were adopted for inclusion in the Manual.

(The committee was dismissed with the thanks of the Association.)

Report on Wooden Bridges and Trestles

Following out its work on plans for wooden trestles, the committee recommended a number of plans for insertion in the Manual this year covering open deck pile and frame trestles, of both light and heavy design and a standard ballasted deck trestle. While a 12-ft. span was recommended in the progress report last year to avoid the use of large sized stringers it was thought advisable because of varying conditions to include also a 16-ft. span. The use of the open system of stringers with plank covering was considered better for ballasted deck trestles because of its convenience for repair, the lessened tendency to decay and the economical use of material.

W. H. Hoyt
Chairman

W. H. Hoyt has served as chairman of the committee for four years, prior to which he was vice-chairman for the same period. He has been intimately connected with the railway development on the Missabe range since its earliest days, having been assistant chief engineer of the Duluth, Missabe & Northern for 19 years and chief engineer for the last two years. In these capacities he has had supervision over the construction and maintenance of the large elevated ore docks of that road at Duluth. Mr. Hoyt is an enthusiastic worker in the engineering societies, particularly in the Duluth Engineers' Club and the Federated Engineering Societies of Minnesota.

IN APPENDIX A are given the changes and addition to the Manual assigned to this committee.

In Appendix B the committee reported on wooden trestles—open deck, multiple-story and ballast-deck.

In Appendix C the committee submitted a report on fireproofing wooden bridges and trestles.

Conclusions

The committee recommended that the changes and additions to the Manual as given in Appendix A be approved. The committee recommended that the plans for standard Open-Deck Pile Trestles, Light Design; standard Open-Deck Pile Trestles, Heavy Design; standard Open-Deck Frame Trestle, Light Design; standard Open-Deck Frame Trestle, Heavy Design; and standard Ballast-Deck Trestles; be approved for printing in the Manual as recommended practice. The committee recommended that the recommendations as good practice in the report on fireproofing wooden bridges and trestles, as given in Appendix C, be approved for printing in the Manual.

Committee: W. H. Hoyt (D. M. & N.), chairman; A. O. Ridgway (D. & R. G. W.), vice-chairman; H. Austill (M. & O.), O. C. Badger (A. T. & S. F.), C. H. Blackman (L. & N.), H. J. Hansen (C. M. & St. P.), W. E. Hawley (D. M. & N.), H. T. Hazen (C. N. R.), C. S. Heritage (K. C. S.), E. M. Lewis (C.

G. W.), J. B. Maddock (C. of Ga.), D. W. Smith (H. V.), L. L. Sparrow (A. C. L.), G. C. Tuthill (M. C.), A. M. VanAuken, S. L. Wonson (M. P.).

Appendix A—Revision of Manual

The committee recommended the following changes in the Definitions, now in the Manual:

PRESENT FORM	PROPOSED FORM
Cap —The horizontal member upon the top of piles or posts, connecting them in the form of a bent.	Cap —A horizontal member on the top of piles or posts, connecting them to form a bent.
Straight —Having a straight line of an axis.	Straight —Having a right line axis.

Add the following definition:

Ballast Curb—A longitudinal timber placed along the outer edge of the floor on ballast deck bridges to retain the ballast.

Appendix B—Standard Plans for Wooden Trestles

The committee spent a large amount of time and thought on the length of spans to be recommended. In last year's progress report it suggested a 12-ft. span. After careful consideration of the advantages of a 16-ft. span, where flood conditions exist and in zones where western fir can be readily secured, it decided to include both spans. The committee carefully considered the loadings and decided to keep in harmony with those of

the steel specifications, which are Cooper's E-60 and a load which shall not be in any case lighter than three-fourths of the above. The committee believes that for any structures designed to carry more than E-60, steel and concrete will be given serious consideration.

The question of design stresses was carefully investigated and studied. Without holding too closely to fixed stresses, the committee wished to be consistent in the choice of design stresses for all four designs and has, therefore, not exceeded 1,481 lb. per sq. in. in extreme fiber in bending, and 221 lb. per sq. in. in compression between the cap and stringer. The stresses have been investigated on the basis of possible actual sizes, the minimum sizes permitted by the specifications of A. R. E. A., rather than the nominal sizes.

The committee believes that conservation of our present timber supply is necessary and therefore that the use of a 7-in. by 16-in. stringer, which can be cut from the smaller timber is a measure of conservation in that it increases the number of trees which can supply stringer material.

The committee recommended four-pile bent for the light 12-ft. span, five-pile bent for the heavy 12-ft. span, five-pile bent for the light 16-ft. span and six-pile bent for the heavy 16-ft. span, and that the same number of posts be used in timber bents as for the corresponding spans and loadings of the pile bent designs. This gives a consistent series considering the loading and spans without excessive pile loading. All but the center one or two piles are shown driven on a batter to give greater stiffness to the bent.

The committee in presenting plans for ballast deck timber trestles felt that experience indicates that the open system of stringers with plank covering was the better type because of convenience of repair, less tendency to decay and the economical use of stringer material. The committee chose the single span length stringer lapping by on the caps the full width of cap because this plan enables the use of shorter timbers, the removal and repair of one panel at a time, and where creosoted timber is used, the avoidance of cutting the stringers after treatment.

Appendix C—Recommendations on Fireproofing

All locomotives shall have adequate and well maintained spark screens in the front end and ash pans shall be maintained with a tight fit so that fires and hot coals cannot drop out.

The decks of wooden bridges shall be protected from fires starting from hot coals dropped from locomotives, preferably by adopting ballasted deck trestles; otherwise, by covering the deck with rust-resisting sheet metal or covering the stringers and caps with rust-resisting sheet metal.

When ties or other timbers are exposed, all decayed timber shall be kept trimmed off.

All brush and weeds shall be kept cut down for a distance of at least 25 ft. from the bridge, both underneath and on the embankment at the ends of the bridge. Also all sod shall be removed from under timber bridges for a distance of three feet outside of the timber.

Water barrels with buckets shall be maintained on all timber bridges, one barrel each for structures up to 50 ft. long and one additional barrel for each additional 150 ft.

On long bridges it is advisable to protect the bridge by introducing fire barriers at intervals of about 400 ft. This will reduce the hazard by preventing loss of the entire structure in case of fire.

Special fire fighting apparatus and watchman shall be employed in unusual cases where conditions warrant.

Discussion

(A. O. Ridgway (D. & R. G.) presented the matter on changes in the Manual and *moved its adoption. The motion was carried.*)

Chairman Hoyt: The second subject assigned to the committee is "Wooden Trestles—Open-Deck, Multiple-Story and Ballast Deck." *I would move the acceptance of the plans for standard open-deck trestles, light design, and also heavy design; standard open-deck frame trestle, light design and heavy design, as given in the committee's report for inclusion in the Manual.*

A. F. Robinson (A. T. & S. F.): In my opinion, this report is all right if it is submitted as a progress report and not submitted for inclusion and publication in the Manual.

There are features in these plans that I do not think any of us would want to accept in the way that they are given. There are some features that are admirable, others not so good. For example, the plans do not give any working dimensions. They say a 12-in. by 14-in. cap, a 7-in. by 16-in. stringer, and all these must have working depths. Another item on the sheet shows that the sills of frame bents are concrete. They are only frames in name. They have the braces at the bottom, but if you are to have a bent that will do service it is best to have a bent with a cap and a sill.

I do not think the longitudinal bracing has been carefully studied out.

To go to the ballast deck, you will find 8-in. by 8-in. ballast guards with vertical bolts down through them. You will not be able to hold these in that position without "S" straps.

It would be interesting, perhaps, to know something about how the unit stresses in the stringer run. I note that they show 7 in. by 16 in. stringers and 9 in. by 18 in. The plans also show 12 in. by 14 in. caps, and also 14 in. by 14 in. They ought to be made one or the other.

In running over hurriedly the 12-ft. panels, the light design, I find that they allow the impact conditions that are required by our steel bridge specifications under the E-60 loading, in which case the fibre stresses show 3,290 lb. per sq. in. In the 16-ft. panel, light design, the fibre stresses in the stringers E-60 are 3,520 lb. Another feature is that we are figuring now on the E-60 loading, but we are going to get heavier loading and we must provide in advance for further increases. Let us hold off for another year; until the committee can get the question of impact and unity stresses in line and have their plans thoroughly and properly worked out. I do not believe any of you would accept the plans presented for drafting room work. I hope the committee will change their recommendation and submit the plans as a progress report.

Chairman Hoyt: Mr. Robinson has referred to several items that will come up later. We are only submitting now the four standard for light and heavy, pile and frame trestles. The committee did not ignore the question of impact by any means. It was thoroughly and carefully considered, but in submitting the plans the committee did so on the basis that the design was amply strong to take care of the strains within reasonable limits, as they would be applied. In adopting the E-60 it was assumed—and I think rightly—that most roads will give consideration to their steel or concrete structures. That is the basis on which they arrive at these points.

On the matter of simplifying the number of spans, it seemed impossible to submit a standard trestle with a

standard stringer, or a standard cap that would fit all conditions. It was the aim of this committee to submit something toward which the designs can be brought, in order to bring about more or less standardization and provide a larger market for standard sized timbers and as to various other points.

Mr. Robinson: As these plans are designed, they will oblige us to use fir timber almost entirely for our stringers. When you get to the 9-in. by 16-in., it is practically impossible to obtain southern pine that is more than 16 in. in depth for stringers. We should not make our design so that it will rule out all of the territory that is supplied with material and stringers from the south.

E. A. Frink (S. A. L.): I would go further than Mr. Robinson in regard to the size of the stringers. Instead of saying that the stringer should not be over 16 in., I

would say that 14 in. would be sufficient. We must not make the mistake of placing too great importance on theoretical designs in a matter where some of the assumptions are somewhat doubtful.

(The motion made by Chairman Hoyt for the adoption of the designs of trestles was carried.)

Chairman Hoyt: *I move that the report of the committee for multiple story trestles be approved and printed in the Manual.*

(Motion carried.)

Chairman Hoyt: *I move that the recommendation of the committee for ballast for trestles be approved and printed in the Manual.*

(Motion carried.)

(The recommendations on fireproofing were approved for printing in the Manual. The committee was then excused.)

Report on Rules and Organization

Some revision of the Manual in respect to the duties of signal maintainers was thought necessary in order to make such rules harmonize with the rules of the signal section of the A. R. A. A part of the report, covering rules of conduct of work, signals and interlocking, was recommended for insertion in the Manual as an addition to the Manual of Rules for the Guidance of Employees of the Maintenance of Way Department. An organization should be developed on the railways which would be responsible for the proper handling of mechanical work equipment and tools. The head of this organization should be a supervisor of work equipment.

W. C. Barrett
Chairman

W. C. Barrett, who is now completing his second year as chairman of the committee and his fourth year as a member of the committee, has been able to bring to it the mature viewpoint of the operating officer with an engineering training. As a trainmaster on the Lehigh Valley and formerly a division engineer, he is in a position to appreciate the importance of well thought out, practical rules for the guidance of employees engaged in the maintenance of railway tracks and structures. Mr. Barrett is a thorough student of fundamental problems and has brought to the work of this committee the results of intensive study to the advantage of that work.

THE COMMITTEE SUBMITTED its report on revision of the Manual in an Appendix A. In its Appendix B the committee recommended for adoption and printing in the Manual, rules for conduct of Signal Work, and presented for information only, rules for the conduct of bridge and building work. The use of mechanical appliances and tools, and organization of labor involved was covered in Appendix C and presented for information only.

Conclusions

1. The committee recommended the adoption of that portion of Appendix A covering duties of signal maintainers, and that these rules be substituted for those now appearing in the Manual under the same heading.
2. The committee recommended the adoption of that portion of Appendix B covering rules for conduct of work, Signals and Interlocking, to be added to the "Manual of Rules for the Guidance of Employees of the Maintenance of Way Department," and printed in the Manual.

Committee: W. C. Barrett (L. V.), chairman; E. H. Barnhart (B. & O.), vice-chairman; F. D. Anthony (D. & H.), D. P. Beach (Penna.), H. L. Browne (C. B. & Q.), S. E. Coombs (N. Y. C.), J. L. Downs (I. C.), H. H. Edgerton (C. G. W.), J. M. Fair (Penna.), R. H. Gaines (T. & P.), R. H. Hallsted (Mo. Pac.), H. H. Harsh (B. & O.), B. Herman (Sou.), E. F. Manson (C. R. I. & P.), E. L. Martin (M. K. & T.), R. N. Priest (A. T. & S. F.), R. E. Warden (M. P.), A. A. Woods (Sou.).

Appendix C—Use of Mechanical Appliances and Tools

The committee recommended the following organization for handling and care of the work equipment of a railroad. At the head of this organization there should be a supervisor of work equipment, reporting to the chief engineer, or to the chief engineer of maintenance. This officer's duties include the following:

He has charge of all work equipment including—Hoists or clam shells, in the yards, at the roundhouse or out on line; hoists in the store department; steam shovels; ditchers; spreaders; motor cars; weed mowers; tie tampers; rail layers; portable rail saws, etc.

He arranges for systematic inspection of equipment.

Instructs operators in charge of equipment.

Has charge of all equipment inspectors.

Has general supervision over district or division repairmen on special equipment.

Arranges for distribution of equipment and transfer of equipment when so directed by his superior officer.

He has charge of repair shops where machines are repaired if there is sufficient work to justify one shop, otherwise he instructs and directs shop superintendent as to nature and amount of repairs to be done.

Engineers on hoists and every one above the rank of laborer on all steam work equipment are employed by the supervisor of work equipment and then are turned over to the division forces. But, they must be satisfactory to the division men to whom they report. They are responsible only to the supervisor of work equipment for care of the machine they are in charge of.

ORGANIZATION OF OUTFITS

Steam Shovels.—The equipment moved over the system as a unit includes a shovel, a bunk car, a tool car and dump cars. The crew comprises an engineer, a crane-man, a fireman and a watchman. They are employed by the supervisor of work equipment and carried on the division payroll.

Ditchers: Each one is considered as a complete unit and moved together over the system. It consists of a ditcher, a flat car, a dump car, a bunk car, a spreader and a clam shell attachment.

The crew comprises an engineer and a fireman, employed as wanted through the supervisor of work equipment. Labor is employed by the division where the machine is in operation.

Locomotive crane: Includes a crane, a bunk car and a boom car. The crew comprises an engineer and a fireman, employed as wanted by the supervisor of work equipment.

Spreader: One operator, employed as wanted by the supervisor of work equipment.

Portable Rail Saw. (Industrial Iron Works, Bay City, Mich.)—Mounted on a car and moved over the system. Has no power of its own. Uses a locomotive to furnish steam. Takes a day to dismantle and three days to set up. The side rods are taken off the locomotive and it is then blocked to the track and is used as a stationary boiler. The crew includes a foreman, an engineer, a crane-man and a fireman, employed by the supervisor of work equipment and carried on the division payroll. Laborers, employed by the division, 2 drillers, 2 chippers, 2 on car old rail is on; 2 air hoists; 5 tablemen; 2 loaders; 3 on the ground at odd jobs. The largest output is 376 rails complete in 8 hours, drilled, chipped, and loaded on cars. Average daily run during the year, 366 rails.

System of Repairs.—Inspected. Repair parts ordered and sent to where repairs are to be made. Work list is made out showing what is to be done. Engineer of the machine is sent to the shop where the repairs are made and oversees the work done.

Distribution of Machines.—The distribution for the season is fixed by the supervisor of work equipment in conference with the chief engineer or chief engineer maintenance of way, or whoever decides for the whole system what the outline of the season's expenditures is going to be. Points to consider: Men who operate the machines should be so assigned as to be nearest their homes. New machines should be put on the hardest work. Sources of water and fuel for the machines come in for thorough consideration. The individuality of the men is better adapted to some locations than to others. A little powder work of blasting can be done by some men and not by others.

Division Repair Shops.—These are used for motor cars only, but they can also be used to repair track mowers and other small maintenance of way equipment.

Motor Cars.—District Inspector.—One to about 4,000 miles—700 cars. Reports to engineer maintenance of way of the district. Looks after motor cars and tie tampers.

Division Inspectors.—One or two motor car inspectors to each division, 30 to 40 cars to each inspector. Reports to division engineer.

Each has a standard list of parts, and keeps in stock one or two extra power plants, motor engines for the cars. He travels on a motor car of his own, and carries an outfit of tools, and small repair parts. He makes minor repairs and adjustments in the field and instructs the foremen in the care and operation of the cars. If he finds a bad power plant on a car, too bad to be repaired on the ground, he sends in for his extra engine and when it arrives installs it. Does not handle steam shovels or water service.

Reports on Motor Cars.—Each car the inspector inspects and repairs he reports on and the report is signed by the foreman, to whom car is assigned. This gives the supervisor information on what their foremen are doing to keep up their cars.

Discussion

The report was presented by W. C. Barrett, Chairman.)

Chairman Barrett: In taking up the work of promulgating rules for signal interlocking we discovered that the signal section of the American Railway Association had formulated rules covering the duties and work of signal maintenance employees, and these rules had been approved by the American Railway Association. The committee thought it would be proper for us to go over our rules already in the Manual covering signal maintenance, and make them agree with the rules already formulated by the signal section and approved by the American Railway Association. I move

you that the rules for signal maintenance be approved by this Association for printing in the Manual.

C. E. Lindsay (N. Y. C.): Did the committee consider these rules from a strictly maintenance standpoint, and are there any objections to them from that standpoint?

Chairman Barrett: The rules were really gotten up in the first place largely from that standpoint, and the only revision was in order to make them agree with the rules that the signal section had promulgated.

(Motion carried.)

Chairman Barrett: I move that the report of Appendix B covering signals and interlocking, be approved by this Association for printing in the Manual.

(Motion carried.)

(The balance of the information in Appendix B was then presented and accepted as information only, as well as Section 3 on the use of mechanical appliances and tools and the organization of labor, after which the committee was dismissed with the thanks of the Association.)

Closing Business of the Association

With the closing of the presentation of the committee reports E. A. Frink (S. A. L.), stated that a number of members of the Association regarding the American Engineering Standards Committee. This committee does no constructive work on the formation of standards—it is simply in effect a clearing house, an executive body that considers forms of standards submitted by interested bodies. He thought that it would not be necessary to get standards into finished form before submitting them to the Standards committee, thus saving time and labor by letting that committee do the work. C. A. Morse (C. R. I. & P.) took exception to this, stating that it was the duty of the Association in working with the Standards committee to see that the work of the committee did not interfere with good practice on the railroads. J. L. Campbell (E. P. & S. W.) moved that the relation of the A. R. E. A. to the A. E. S. C. be referred to the Board of Direction with power to act. Following this motion, the new President, Mr. Campbell, took the chair and after a short talk, declared the convention adjourned.

Positive Public Regulations Work

THE PURPOSE of public relations work is to make the public understand the problems of the railroads, appreciate the benefits they confer, and comprehend why their managements cannot make lower rates or give better and more adequate service unless the public will permit the creation of conditions which will make these things possible.

Public relations work should be both positive and negative. In the past it has been too largely negative. It has been restricted too narrowly to remedying conditions which caused and justified complaints about service instead of preventing development of the conditions in the first place. It has consisted too largely of explaining transactions after they have been criticised instead of explaining them promptly in order to prevent misunderstanding and criticism of them. It has been devoted too much to disproving charges of mismanagement which never could have been effectively made if the good features in railroad management had been pointed out to the public before the misleading attacks upon it had occurred.

In 1920 the railways made the best record for safety in operation in their entire history. In spite of the great increase in their mileage, in the number of employes and in the amount of traffic handled they killed fewer people than in any year since 1899. This remarkable achievement should have been made known through advertising to all the people of the United States. Attention was called to it in an editorial in the *Railway Age* which was reprinted in many newspapers. It was not, however, given anywhere near the publicity it deserved, and consequently the railways did not get anywhere near the credit for it they deserved. In many cases a single accident has been given more publicity and has influenced the attitude toward the railways of more people than all the facts about the accident record of 1920, which reflected the results of ten years of effective "safety first" work. Adequate public relations work of the right kind would have brought this remarkable achievement to the attention of the people in every community.

Many passenger trains are late. Many people think most of them are late. The percentage of passenger trains on time on the leading railways of the country is, however, relatively high. The public ought to be given every good record of "on time" performance so that it may not base

its opinion of passenger train service on the relatively small number of cases where trains are late.

The average capitalization per mile of the railways of the United States is the smallest of any important system of railways in the world. The comparative statistics regarding railway capitalization in this and other countries should be presented to the public over and over again through advertising. This positive presentation of facts will, in the long run, produce more effect than all the refutations that can be made of charges that the railways are overcapitalized.

The rapid development, and the great increase of wealth and comfort in the United States have been mainly due to the rapid development of our railways and to the fact that they have been the leaders of the world in providing cheap transportation. Every railway has a history which, if skillfully and interestingly told through advertising as a part of the history of the territory and the communities it serves, would tend to make the public understand and appreciate it better.

Great pleasure can be derived from a trip by railroad under favorable conditions. The railroads have spent large amounts of money for advertising to tell the public about the attractions of Colorado, California and Florida. Why not spend some of this money to call the public's attention to the comfort and safety with which the railway trips may be made to these places and to the perfect organization, the fine equipment, the good roadbeds, the block signal systems, which have to be provided and are maintained at great expense to make these long trips by railroad in comfort and safety possible?

These are but a few examples of innumerable forms of public relations work besides arguments about valuation, wages and "states' rights" which could be and ought to be carried on with benefit to both the railroads and the public.

In order to sell anything permanently to the public at a profit the public must be convinced that it is a good thing and that those who sell it are entitled to make a profit on it. The railways must adapt to the conditions in their business the methods of salesmanship, publicity and advertising used by concerns of other kinds if they are ever to so sell their service to the public as to cause the public gladly to pay what it is reasonably worth.

If we contrast the price of goods to the producer with the cost to the consumer, as compared to the difference which existed seven years ago, we will find that the spread is now much greater. This distortion seriously affects the interests of one or both parties. It is particularly severe in the case of the former. The economic balance must be reestablished in the United States as soon as possible. A considerable part of the increased spread is due to taxation and there is very little likelihood of this being materially reduced for a long time. The other alternative is to restore the balance by increasing the efficiency of production, transportation and distribution. The last two phases are of special interest to the railroads. The last point—distribution—makes an especial appeal to railroaders from the standpoint of reducing the costs of handling freight at terminals and also through direct or store door delivery in large cities. While much consideration has been given to these questions in recent years, the economic urge at the present time is such as to force focusing greater attention upon them.

Short Time-Limit for Damage Claims

If you were to ride on a drover's pass on the Oregon Short Line, and were to be injured in a collision or derailment by the railroad's fault, you would need to be alert to present your claim for damages; for one of the conditions of the pass stipulates that claims must be presented to the general manager in writing within 30 days; a claim presented after that would have no standing in a court. This is the decision of the Supreme Court of the United States, as reported in our last issue, page 588. The fact that the railroad company's physician knew that the drover was injured and was confined to the hospital for about 30 days did not excuse the claimant for neglecting to write. We do not know how many other roads include such a time limit in the conditions on their passes, but it seems proper to call particular attention to this decision, because of the unusual circumstances, that so far as the lawyers could discover, this point concerning the time limit had never before been presented to any court. The fine distinctions between freight damage claims and bodily injury claims concerning which three of the judges of the Supreme Court differed with the other six, suggest that our courts are not likely ever to go out of business for lack of hairs to split.

The application of paint to railroad equipment by the spraying process may safely be said to have passed the experimental stage. In fact some roads have developed paint spraying to such an extent that a large proportion of all equipment, including both cars and locomotives, is painted in this way. The essential advantage of spraying is the greater speed with which surfaces can be covered, but it is often possible to utilize a lower priced operator than would be necessary with brush painting and the total reduction in labor cost is increased proportionately. Paint can readily be sprayed in corners and crevices which would be difficult, if not impossible, to reach with a brush; and with the proper precautions practically no paint is wasted. While more paint is required to cover a given surface with a spray as compared with a brush, one coat applied by the former method is said to be equal to two applied by the latter and there is a saving of material as well as labor. It has been found possible to spray varnish, in which case an enamel finish is secured and this fact has broadened the field of paint spraying to include passenger as well as freight cars. The possibilities of economy may be appreciated by consideration of a typical

example. A box car has been spray-painted by one 54-cent man in 15 minutes, whereas it would take a 72-cent man about four hours to apply the paint with a brush. The relative amounts of paint used are 9 and 11 gallons.

The exhibit committee of the Railway Supply Manufacturers' Association, which has charge of the exhibit at Atlantic City conventions of the Mechanical Division and the Purchases and Stores Division of the American Railway Association in June, is facing an embarrassing situation. It has 95,000 square feet of exhibit space at its disposal, not including the space in the balconies in the main entrance hall. This was used two years ago, but did not prove entirely satisfactory. Over 90,000 square feet was allotted at a meeting of the exhibit committee held at Pittsburgh on March 10. Since that time a number of additional applications have been received, some by telegraph. It will be difficult, if not impossible, to provide additional space of a satisfactory sort, and the prospects are that many of those who want to exhibit will be turned away this year. It is not too early to look ahead to 1923 to determine what arrangements can be made to furnish more adequate exhibit quarters for the meeting in that year. The educational value of the exhibit has been more and more appreciated in recent years—the wise exhibitor, realizing this, has studied to make his exhibit as effective as possible from this standpoint. The number of subordinate officers and foremen who visit the conventions, largely to see and study the latest devices and best practices, has steadily increased from year to year, and will no doubt surpass previous records this year. With the success of the exhibit fully assured, it is to be hoped that the Mechanical Division will exercise more than usual care in the preparation of its technical program. Detailed reports on standards and recommended practices are good, as are also studies and research data as to devices and designs. There are, however, more important problems which in the past have not received the consideration which they deserved and which must be recognized in the future if this Division is to hold its own. These include problems relating to the human element, management and operating questions, as well as to a consideration of many of the larger and broader technical problems, including the selection of equipment, and its proper repair and maintenance. Many of these were referred to in special articles which were published in the *Railway Age* of June 10 and August 20, 1921. Will the Mechanical Division measure up to the opportunity which lies before it?

Discussions of contemplated railroad consolidations appear in the public prints in such a variety of interesting forms that it is difficult to avoid being facetious with reference to them. We are, in this note, going to succumb to the temptation. About two years ago there appeared in the *Atlantic Monthly* an interesting article purporting to be an interview with Dame Experience and a description of the work done in her well known School of Experience. Our memory of the article is hazy but as we remember, the theme was that Dame Experience had a large number of pupils who had been attending the school for many years with more or less uncertain results. There were also some comments about the tuition, the expensiveness of which, the interviewer quoted Dame Experience as saying, had not served as a deterrent on the size of the enrollment. This analogy we can apply to Dame Rumor. Apparently she also has a school, one of the most promising departments of which is the class which is specializing at present on the Consolidation of Railroads. Apparently this

Big Exhibit in Atlantic City

The Class in Consolidations

class in Railroad Consolidations had its mid-year graduating exercises last week and some unusual graduation theses were presented. One dealt with the consolidation of the Missouri Pacific and the Texas & Pacific. Another with that of the Ann Arbor and Pere Marquette. A third with the joint control of the Nickel Plate and Clover Leaf. The scholar that presented the last named must have received a degree with distinction because he amplified the idea that probably this meant a new system consisting of the Lackawanna, the Nickel Plate and the Clover Leaf. Dame Rumor's scholars have one advantage that other college men do not have and that is the wide publicity given the ideas they present. This has been especially true of the members of the class in consolidations. Without intending any reference to the consolidations above mentioned, we often wonder how Dame Rumor's scholars must feel in case their ideas prove true after all—that is, in the few cases when they do prove true.

Managements may make rules governing safety requirements and employees may read them carefully, yet no rules of this sort can be 100 per cent effective at all times when, as prevails in the majority of cases, their enforcement depends largely upon the judgment and responsibility of the men concerned. A recent accident, although happening in England, where eight men out of a track gang of nine were killed while working on the line, is an example. In this case the foreman, a railroad man with 19 years' experience, depended upon hearing approaching trains when a train was passing the gang on an adjacent track. Although the rules stated that where danger might arise a lookout or whistle man should be used, the foreman, in his endeavor to get his work completed, evidently assumed this task himself, only to forget it in the performance of the work, such as a foreman may naturally do. As stated, the enforcement of any rule governing safety first, or, to be specific, the use of a whistle-man or the clearing of tracks by track forces, depends largely upon the foreman. If his judgment is sound and his understanding of the risks and hazards involved is complete, the responsibility is well placed, but it is by no means entirely his alone. The dividing line between a safe condition and a hazardous one is not clearly defined; rather it is an area wherein the actual safety or risk at any one point may be influenced or controlled largely by the attitude of the management. If in the matter of whistle-men, the management shows a coolness toward their free use because of financial or other reasons, foremen are going to assume the task themselves and the danger element has increased. Even though there is no coolness on the part of the management there is still a wide difference between passive encouragement and positive encouragement. To be effective, encouragement must be along positive lines, not only for the paramount factor of safety but for more material reasons as well. Men invariably work with greater freedom and perform better when assured of proper protection.

**Safety First
and Management
Responsibility**

The acquisition by the Van Sweringen interests of a controlling interest in the Toledo, St. Louis & Western, as announced by O. P. Van Sweringen last week, is the most interesting development of its kind that has taken place since Henry Ford acquired the D., T. & I. The step establishes a community of interest between the Nickel Plate and the Clover Leaf which should be of far-reaching importance. Benefit should result to both companies concerned and if things work out as one would naturally expect, there will be a considerable effect on traffic relationships in the highly competitive territory between

Buffalo and the Mississippi river. In spite of the Van Sweringen activity in the new terminal project at Cleveland the Nickel Plate has not been much in the public eye in recent months. The road has, however, been doing some exceedingly interesting work. Its success in moving fast freight trains promptly and efficiently has in a measure made it the envy of some of its competing and connecting lines and the road "stands in" extremely well with the shippers. The Nickel Plate operates 523 miles of line all constituted in the main line from Buffalo to Chicago. Its operating statistics would, of course, reflect the advantage of having no branch lines; they also seem to indicate that the road is taking full advantage of its being all main line. The Clover Leaf is similarly a line without branches. It extends from St. Louis to Toledo, 453 miles, and access to Detroit is given through joint control with the Grand Trunk Western of the Detroit & Toledo Shore Line. Connection with the Nickel Plate is made at Continental, Ohio. The Clover Leaf's position in the highly competitive territory it serves should be considerably improved by its being in the same hands as the Nickel Plate. The Nickel Plate will presumably be in a much better position insofar as concerns St. Louis business and it is to be expected that the Clover Leaf will have the advantage in a much greater degree than it now has of Nickel Plate traffic solicitation for the routing via Continental. If the expected happens the Nickel Plate-Clover Leaf route will become one of the leaders in St. Louis-Buffalo fast freight business.

The local agent is one of the chief points of contact between the railway and the public. He is, probably more often than not, a member of the local chamber of commerce or other business organization and upon his ability to represent the railroad adequately depends, to a considerable extent, its standing in the community. The agent should be able to interpret his company, and the railroads in general for that matter, to his fellow citizens. To do this he should be generally informed about the problems of his railroad and be in a position to meet with facts any misstatements or thoughtless criticism which might injure his company or tend to influence public opinion against the railroads in general. With this in mind it was with considerable pleasure that we learned that special meetings of agents with the division superintendents on several divisions of at least one important road had been called to better equip the agents concerning their opportunities in this direction. At one of these meetings each agent was asked to describe the railroad's public relations position in his city. It was found that criticism for the most part was directed at rates. Apparently the general public has a very inadequate conception of the reductions in rates which have already been made. Accordingly it was decided to ask the traffic department for a concise summary of the reductions that had been brought about, in order that the agents might easily give some figures to offset careless criticism whenever the opportunity should present itself. As a good, broad summary of present railroad conditions, Secretary Hoover's recent testimony at the Interstate Commerce Commission rate hearings was read and discussed and copies distributed for further study. Agents were urged to watch local papers carefully for criticism of the railways and to appeal to their superiors for means to meet criticisms which they found difficult to answer. Those in attendance at the meeting seemed thoroughly alive to their opportunities in this field and interested in helping with the work. Enlisting the agents as spokesmen appears to be one of the first steps which a railroad should take in securing public support. It should not, however, be the only effort put forth in that direction.

So interwoven are all the economic factors which together bring about general prosperity or depression that anyone can well doubt a sweeping statement to the effect that improvement of conditions in agriculture, foreign trade or any other one field of activity is the key to the present situation. The fact is that, in most cases, prosperity in one will more likely parallel than follow prosperity in another industry. That a revival of foreign trade can be expected as financial conditions abroad gradually improve seems to be a safe assumption. There are doubtless ways and means by which this improvement could be expedited. To discuss these matters is the object of the Ninth National Foreign Trade Convention which will be held at Philadelphia on May 10, 11 and 12. These annual foreign trade conventions and the National Foreign Trade Council, under whose auspices they are held, have accomplished a great deal in educating American manufacturers regarding the importance of foreign trade and in the best methods of building up a foreign market. The ninth convention will carry on the good work of the former conventions. The program for this year, however, shows the same lack of appreciation of the importance of the railway transportation and the railway supply aspects of foreign trade that was shown in the preparation of the program for last year's convention, which was held at Cleveland. The American equipped railway abroad is a natural promoter of American trade in other commodities. In many of the foreign countries which are looked upon as the most promising markets for American goods the railways are now operated under European methods and with European equipment, in spite of the fact that under conditions of high tonnage of low grade freight and sparse population American methods have proved their superiority. Furthermore, American investments abroad, which play such an important part in creating a market for our products, go largely into railway construction and equipment. Railway men who appreciate the value of foreign trade as a builder of traffic and supply manufacturers who desire to increase their sales abroad will find much to interest them at this convention. It is unfortunate, however, that those in charge of these conventions are continuing to show such a slight appreciation of the railway and railway supply aspects of the foreign trade problem.

Railway Rates, Coal Prices and Miners' Wages

NO OTHER INDUSTRY is more interested in the present wage controversy between the coal operators and miners than the railroad industry. The railroads buy more coal than any other industry. The necessity for their present rates is due to their present operating expenses and their present operating expenses are due, in a substantial degree, to the prices they are paying for coal. The prices they are paying for coal in turn, are due largely to the present high wages of the miners. The prices the railways are paying for coal have declined substantially within the last year. The average paid by them reached its maximum in December, 1920, when it was \$4.80. It declined throughout the year 1921 until at the end of the year it was only \$3.65. These figures include the freight rates in all cases where railways pay freight on their coal. The average price paid in the entire year 1921 was \$4.14.

The average price paid by the railways in 1916 was \$1.76. Their locomotive fuel in that year cost them \$250,500,000. In 1920, it cost them \$673,000,000. In 1921, owing to reductions both in the prices paid and the amounts of coal consumed, the total cost of fuel was approximately \$557,000,000. While this represents a substantial reduction as compared with 1920, it represents an increase over 1916

of over \$300,000,000, or 133 per cent. Even at the end of 1921 the average cost per ton of railroad coal was more than twice as great as in 1916. The coal mine operators contend that the present freight rates are too high in proportion to the present prices of coal and should be reduced. But the rates are not as high in proportion as the present prices. The railways naturally take the view that as long as the prices are so high they, as the largest buyers of coal, should not be required to reduce the rates on it.

The fact is that the wages of the miners, the prices charged by the operators, and the freight rates of the railways ought all to be reduced in the order mentioned. The present wages of the miners were fixed two years ago when prices of commodities, cost of living, and wages of all classes of labor were at their peak. They are practically the only class of working men who since then have not had their wages reduced. The mine operators should have the support of every purchaser of coal and of railroad transportation in their efforts to secure reductions in miners' wages. Any interference by the Government which may tend in the slightest degree to prevent a prompt and adequate reduction of miners' wages should receive prompt condemnation from public sentiment.

Rolling Tie Plates from Rail Steel

IN SPITE OF ALL the attention which railway men and manufacturers have given the rail problem during the last ten years failures continue to occur in large numbers and the situation is far from reassuring. While progress has been made in eliminating certain types of defects, other and more dangerous ones have appeared in even greater numbers. Although the rails from certain mills appear to show a larger proportion of failures than those from other mills, no mill seems to be immune.

It is common knowledge that the poorer metal is found in the top of the ingot from which the rails are rolled. In recognition of this fact all specifications provide for this metal at the top to be discarded, the amount of this discard commonly being left indefinite under the provision that "sufficient metal shall be sheared from the top of the ingot to insure sound rails." It is to be expected that the manufacturers endeavor to reduce this discard to the minimum since this metal can be used elsewhere only at a loss. That this discard is not in general sufficient to eliminate all of the unsound metal is indicated by the fact that over one-half of all of the rail failures occur in the "A" or top rails of the ingot. In other words, if the "A" rails could be eliminated the failures would be cut in half. Surely this is an objective worth working for, but other uses must be found for this discard.

While this is a manufacturing rather than a railway problem, if the roads can assist in its solution they will aid their own cause. One recent entrant into the rail manufacturing field has agreed to discard all "A" rails and to find use for this metal for other purposes in its plant. The percentage of "A" rails to the total ranges from 15 to 20 according to the size of the ingot, or sufficient to provide a full complement of tie plates for the rails.

The use of tie plates of rail steel is not new, for a number of roads have, for several years, accepted plates which have been rolled from the off-heats or those which have failed to comply with the specifications and they have given satisfactory service in track. The use of high carbon steel-plates is increasing each year, although at the present time over 60 per cent of the plates rolled are still of low carbon content. If the roads which are now using these low carbon steel tie plates should agree to accept those of high carbon steel they would afford an outlet for a large part of the "A" rails and remove the most serious objection which the steel manufacturers could offer to an increased discard.

Effects of Electric Power Used for Traction

The Question of Inductive Interference and Electrolysis as Related to Railroad Electrification

By Professor Chas. F. Scott

THE STEAM RAILROADS of the United States are carefully studying improvements that will enable them to handle their traffic as soon as general business conditions reach a normal state. These investigations naturally bring the question of electrification into prominence and incidentally other problems related to electrical operation. In the past there has been considerable discussion of both inductive interference and electrolysis that may result from alternating current or direct current electrifications. It should be fully recognized that changes in the method of operating such extensive public utilities as the railroads are liable to cause disturbance in exposed circuits of communication companies, if no preventive measures are taken in the individual systems or their mutual relations. This has been the record of the past and the modifications introduced have generally resulted in the betterment of both services to the public. A review of the past and present conditions show that remarkable progress has been made in overcoming the difficulties encountered and that the conditions surrounding interference and electrolysis are now pretty well understood.

Telephone circuits are quite liable to induction from adjacent circuits unless suitable precautions or remedial measures are taken. A second telephone circuit causes cross-talk unless the wires are suitably transposed. Similarly, telephone circuits are liable to reproduce the clicks in nearby telegraph wires. The telephone has experienced some new trouble from each new kind of power circuit during the past 30 years; the direct current railway, arc lighting, alternating current transmission and alternating current railways have produced their own individual and particular problems. In a sense none of these problems have been solved as each condition constitutes a continuing problem; each new case as it arises may have special features calling for particular consideration.

A score of years ago the noise in telephone circuits having a single wire and ground return, which was caused by the ripples in the current to street cars, was taken to the courts for settlement. The telephone has changed its circuits, the

complete metallic circuit is less susceptible to disturbances; the ripples in trolley current have been reduced; and engineering conferences have replaced controversy in court. The improvements have been progressive. Telephone circuits are better insulated; they are better balanced and transposed and changes in apparatus have been made. Power generators have been improved and power circuits are planned in various ways to lessen the amount of induction in parallel circuits. In spite of all these things there remains the inherent sensitivity of telephone circuits to interference rendering each installation a problem for specific consideration.

Difficulty With Early Electrifications

In recounting experience with specific electrifications, it will be found that great progress has been made in reducing interference incident to both direct current and alternating current railways.

The New York, New Haven & Hartford was the first large alternating current electrification put into operation. A commercial telegraph line along the right-of-way requiring reconstruction in part on account of physical hazard was moved to a distance to avoid anticipated inductive interference. The induced voltages were very large but the railroad telegraph lines along the right-of-way continued in service by means of compensating transformers.

When the electrification was extended from Stamford to New Haven the three-wire power system was devised and installed. In the change to the three-wire system on the original electrification, the existing trolleys and feeders were simply reconnected to balancing transformers. A very great reduction in inductive interference resulted, which is satisfactory to the telephone company and enables the railroad to operate its telegraph and telephone service in a cable along the railroad with drainage coils and without compensating transformers.

On the New Canaan branch of the New Haven system, where the conditions were peculiarly difficult, changes were

made which reduced the very severe interference to the telephone when short circuits occurred on the railroad averaging a few times a month (at rare intervals occurring several times a day) to the point where there is little interference.

In the Paoli electrification of the Pennsylvania near Philadelphia modifications in the power system and various measures taken in the telephone plant have very greatly reduced the ringing of the telephone bells and the breaking down of protectors when short circuits occur. Short circuits are now comparatively infrequent.

Another installation, the Norfolk & Western, installed nearly 10 years ago, where the heaviest train service in the world (considering weight of trains, grades and speed) is handled, has not produced serious inductions.

The latest alternating electrification, the Chestnut Hill branch of the Pennsylvania near Philadelphia, profiting by past experience and embodying the latest engineering, has not produced interference.

Summarizing, on some of the single phase railways designed 15 years ago and 10 years ago, there were difficulties which have been greatly reduced or eliminated by changes in the power system and in the telephone apparatus; in the latest railway installed there has been no interference. This is a story of experience which gives good promise for the future.

It may be noted that the methods employed for obtaining this improved service are not revolutionary nor difficult of application but are adaptations of well known appliances or methods to secure the desired results. The early plants were the first in a new field of operation. The data obtained in tests made after installation and under operating conditions in these plants enable calculations to be made beforehand and as a result of the experience thus gained, the handling of future installations is on a very different basis from that which obtained in the past. It may be noted, however, that the conditions which determine the amount and effective position of the railway return current which diverges from the track and flows through the earth are important factors. These are variable elements whose value in a particular locality can be accurately determined only by test. Favorable earth conditions due to networks of underground pipes, may have been a contributing factor in the Chestnut Hill line.

Although it is known that too high induction under ordinary operating conditions may cause interference, a great many engineers have been surprised that the important problem in connection with alternating current railways is not avoidance of noise but that the serious disturbances to the telephone occur only for the instant that high voltage is induced under emergency conditions such as short circuits. It is, therefore, important to consider the matter of short circuits and the methods of minimizing their effects.

A significant comparison has been made between the voltage induced in the telephone circuits by short circuits in an alternating current railway and in power circuits with solidly grounded neutral for a number of corresponding conditions believed to be such as might arise in practice. The disturbance in the telephone circuits was in all cases greater when caused by a power circuit than by a railway, ranging from an increase of 30 per cent to several hundred per cent.

The obvious conclusion is that power transmission circuits with solidly grounded neutral may be expected to produce telephone disturbances of the same kind and even of greater intensity than those caused by electric railways. The latter, however, may occur more frequently as trolley lines supplying locomotives are more liable to accidental short circuit than transmission lines supplying substations.

Comparison Between Alternating and

Direct Current Railways

On the alternating current railroads referred to noise has not been a factor of any consequence but on the Chicago,

Milwaukee & St. Paul, the outstanding direct current electrification, the noise conditions under normal operation were such as to require a remedy which was found by a change in generator construction and the installation of resonant shunts.

Interference with grounded telegraph or other types of grounded signaling may occur due to difference of direct ground potential in d.c. railways. The difference in ground potentials incident to a 3,000-volt installation may far exceed those caused by a 600-volt system.

The greatest problem in telephone interference from alternating current railways occurs at the time of the momentary maximum current or short circuit. The principal effect is the breakdown of telephone protective devices which may result in acoustic shock. If the conditions are made such that the induced voltage caused by short circuit is within proper limits the conditions under normal operation will in general be quite satisfactory.

Under short circuit conditions on d.c. railroads tests have shown that telephone protectors may be grounded by the action of the momentary induced voltages and that light acoustic shocks may be experienced by persons listening on nearby parallel telephone circuits.

Comparison between the effects of a.c. and d.c. short circuits shows that the effects of short circuit surges will be less severe with a high voltage d.c. system than with an a.c. system. While there may not be large differences in the peak voltages induced in the two cases the amount of energy transferred to the communication circuits will be greater in the a.c. case due to the longer duration of the short circuit condition, since the initial transient is followed by several cycles of short circuit current. In the d.c. case, there is only the brief initial surge followed as a rule by a smaller voltage of still shorter duration in the reverse direction, and, as experience shows, the effect is comparatively small.

The remedy for serious inductive interference when short circuit occurs may, therefore, be anticipated in a quick-acting circuit breaker for alternating current. Such a breaker is now being designed and its successful completion will enable the effects of short circuits to be very greatly reduced.

In case of either a.c. or d.c. electrifications, there will be alternating current transmission lines for supplying power to the substations. The transmission lines of 60 cycles for supplying the direct current trolley system give rise to inductive interference which is greater than when caused by a.c. transmission lines of 25 cycles serving the a.c. trolley system. This fact made the use of loud speaking telephones necessary on the Chicago, Milwaukee & St. Paul dispatching telephone circuits.

The New Haven four-track electrification handles heavy traffic through a succession of towns and cities. The Paoli four-track and Chestnut Hill double-track branches of the Pennsylvania provide frequent service to the suburbs of Philadelphia. These alternating current railroads pass through highly congested districts where the effects of interference are liable to be much more serious than elsewhere.

The Chicago, Milwaukee & St. Paul direct current has occasional trains on a single track road extending many hundred miles through the mountains and a sparsely settled country.

The conditions are not comparable. If the initial direct current 3,000-volt electrifications had been called upon to meet the New Haven or Pennsylvania requirements, the experience with direct current operation would have been quite different from that recorded for the Chicago, Milwaukee & St. Paul or the experimental line at Erie, on which the maximum distance for which tests are recorded is 1.8 miles.

The Telephone Circuit

It has been customary to classify as incident to interference with communication system a long list of possibilities.

It does not appear that certain of these possibilities have rarely if ever been realized; for example, magnetization of loading coils, and the breakdown of the insulation of cables or of interior equipment, such as coils, condensers and associated wiring. Nor is there any statement that the overheating of apparatus or a fire hazard are other than apprehensions after many years of experience. They must all, however, be classed as possibilities, although they may never have occurred by induction from railways. Some of these phenomena have been caused by induction from power transmission circuits.

The purpose of the protector (which places short air gaps between each wire and ground) is to form a ready path for high voltages to pass to earth, thus protecting the telephone. The protection, however, is not ideally perfect as high voltages, such as may be caused by lightning or short circuits in parallel electric circuits, may cause acoustic shock. The conditions are delicate and exacting so that improvements are difficult. But an ideal protector would go far to reduce the affect of short circuits, just as an ideal line insulator would go far to prevent short circuits. Ideal perfection in each seems remote, but improvements are much to be desired.

It is generally recognized that precautions must be taken in the layout of both a.c. and d.c. electrifications to avoid interference that will affect the service given by telephone systems. On the whole, the d.c. has an advantage over the a.c. from the standpoint of interference but in planning either a d.c. or an a.c. electrification special precautions must be taken. The precautions may involve special features in the electrification plans.

In both systems of electrification supplementary measures must be taken in the layout of the communication circuits as well as every effort taken to maintain first class conditions in the telephone systems. Generally comparisons that have been made of the relative modifications necessary on electrifications have not been on systems having similar service conditions. While it is recognized that modifications are necessary, definite estimates should be the basis of decision rather than general indefinite assumptions as to complication and expense of some particular feature. Judgment as to the merit of a particular project should be left until the final plans and estimates are completed.

Electrolysis

The effects of corrosion by the alternating current under ordinary conditions of practice may be considered negligible. The well-known electrolytic action of 600-volt street railways occurs also with high voltage systems. The "high voltage," however, implies less current and hence less electrolysis for the same power delivered. Furthermore, much of the mileage of a high voltage railway is presumably in the country where underground pipes are few. These features obviously render the electrolytic problem less serious than it would be if the voltage were lower and there were pipes along the right-of-way.

On the other hand, the power and the current taken by heavy trains reach large figures, and the railways have city terminals and in some cities there is large mileage in the city districts. Chicago, for example, has several thousand miles. Precautions may be taken by arranging short feeding distances, but this implies additional substations and substations with 3,000-volt motor-generator sets and usually with expert attendance tend to increase cost. Substations will necessarily be needed near city passenger terminals and freight yards where heavy currents for starting trains are needed. The corrosion of pipes said to have occurred in the pipe near substations along the Milwaukee 3,000-volt railway indicate conditions which may have far more serious results when the substations are in large cities unless suitable precautionary measures are taken. These should be provided and their cost considered on the same basis as measures to obviate inductive interference in the a.c. system.

Summary

The following specific statements regarding inductive interference, and electrolysis by alternating current railways, supplement the preceding general discussion and the comparison between the effects caused by direct current and by alternating current railways:

1. *Inductive Interference.*—The problems involved are complex, but the conditions are pretty well understood so that provision can be made for mitigating disturbances. In alternating current electrification great progress has been made in handling inductive interference. Theory and the experience gained on several roads under different conditions have been continuously contributing to the solution of the problem. The latest installation has produced no interference. Certain changes in alternating current railway equipment and in telephone equipment will go far to avoid difficulties elsewhere.

In direct current high voltage electrification the experience is practically limited to one system. It is stated that the difficulties there encountered have been overcome by changes in generators and by the addition of the resonant shunts.

Although in both alternating and direct current electrification the general causes and conditions are known, it is important to determine what measures should be taken to meet the particular situation in each case. The problem is to determine the best solution. It may call for modifications in the railway system, or in the telephone system or in both. Determination of the course to be taken should as far as practicable be made before installation and should be such as to involve the least total cost for rendering both services.

2. *Electrolysis.*—The effects of corrosion by alternating currents under ordinary conditions of practice may be regarded as negligible.

Direct current railways, whether at high or low voltage, have the same inherent tendency to corrosion on underground metal by electrolysis. The same kind of remedial measures which are employed in connection with street railways are applicable to the high voltage systems. The cost should be included as a part of the cost of the electrification.

It is generally agreed that inductive interference and electrolysis are matters which should be taken into consideration when an electrification is being planned; that provision be made to prevent difficulties; that the plan should, on general principles, be that which is cheapest, whether this means special arrangements in the power system or in the telephone system, or separation of the two, the plan in a particular case being that which will involve minimum cost.

Students Helping During Strike in Germany

The Burlington Uses Creosoted Cypress Piling

By G. A. Haggander

Bridge Engineer, Chicago, Burlington & Quincy

FOR A NUMBER OF YEARS the Chicago, Burlington & Quincy has been using red oak piles treated with creosote for the larger part of its pile trestle bridges. The results obtained have been satisfactory, but the care required to get the piling properly cut, loaded and seasoned has been very great. At times the market has been such that this kind of timber has been hard to get.

In looking around for a possible substitute it was found that there was a large amount of cypress available close to its lines. This is known as white cypress and is found in south-eastern Missouri and north-eastern Arkansas. It has considerable sapwood and if used untreated would have a short life. Heart cypress resists decay well and it was thought that if the sapwood was thoroughly treated good results as to life would be obtained. After purchasing a small amount of this early in 1921 serious doubts were en-

This pressure was held until the end of the pressure period, at which time the pump did not take anything out of the measuring tank for one hour. A final vacuum was drawn for 30 min. The net absorption was 23.01 lb. of oil per cubic foot.

In treating piling of this kind for regular work it is proposed to leave in about 13 lb. of creosote oil per cu. ft. The piling will be steamed for two hours at a pressure of from 15 to 20 lb. per sq. in. A vacuum will then be drawn and held for at least 15 min. after the maximum has been reached. Before the creosote solution, heated to 180 deg. to 200 deg. F. is introduced, the vacuum will be broken to such an extent that the kick back will be large enough to leave about 13 lb. of creosote per cu. ft. in the pile. Forty-five minutes will be taken to bring the pressure up to the maximum of 150 lb. per sq. in., and it will be held until the refusal point is reached. A final vacuum will be drawn until the piling can be withdrawn from the retort without drip.

About 150 piling, 50 ft. in length, have been driven recently in a river bridge through coarse sand and gravel. The penetration obtained has been 40 ft., but the driving is so difficult that even with the aid of jet pipes an average time of nearly 1½ hours is required on each pile. The piling has

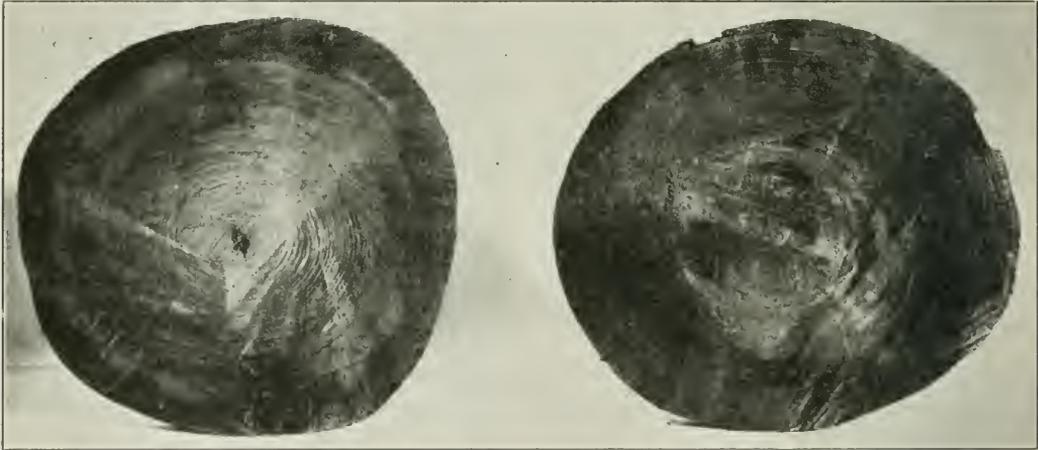

Fig. 1

Fig. 2

tertained as to whether it could be treated properly. Experiences of others were that it was highly resistant to the absorption of creosote and as far as known it had not been treated successfully.

J. H. Waterman, superintendent of timber preservation of this road, felt confident that this particular kind of cypress would take treatment and after the piling had been seasoned somewhat experiments began. The piling was still a little green and the creosote oil not first-class, but the treatment of the first charge was successful. The piling was steamed three hours and subjected to a vacuum for four hours, after which creosote to the extent of 28 per cent by volume was injected. A good penetration was found.

After the piling was seasoned thoroughly and some first-class creosote oil received other tests were made. Charges of piling 30 ft long and 60 ft. long were treated to refusal, after which some piling was cut to obtain cross sections, and others were tested by means of an increment borer. The piling was first steamed for two hours at 20 lb. pressure. A vacuum was drawn for four hours with a maximum of 24 in. The solution pressure was then applied for 11 hrs. 20 min., working up to the maximum pressure of 175 lb. in one hour

stood up under this severe service in an excellent manner, driving fully as well as red oak and far superior to cedar. Most of these piling were cut 4 ft. from the butt end, and typical cross sections are shown in the illustrations. Penetration in practically all cases is very thorough.

From the data obtained, the treatment can be done satisfactorily; the piling will stand extremely hard driving and the life of the piling will be as great as that of any other kind obtainable on the territory through which the road passes; this, because of a lower cost for the timber, results in a substantial economy.

NO PASSENGER KILLED, or seriously injured, in 1921, is the record of the British (civilian) airplanes, according to a London paper. This record covers an extensive traffic. During the summer, between 400 and 500 people a week were crossing the channel by air, and well over 1,000 a week were being taken up for joy rides in England. Credit is given to the skill of the pilots and mechanics, the aeronautical inspection department and the controller of aerodromes and licenses. Only first class men and machines have been allowed to carry passengers.

Commission Brings Rate Hearings to a Close

Shippers Base Argument for Reductions Mainly on Claim That They Would Stimulate Traffic

WASHINGTON, D. C.

THE GENERAL RATE HEARING before the Interstate Commerce Commission which has been in progress since December 14 was concluded on March 13 after five days of oral argument. The direct argument on behalf of the railroads was presented on March 8, as reported last week. This was followed by arguments on behalf of the shippers and state commissioners, most of whom based their contentions on the theory that rate reductions would so stimulate traffic as to tend to increase revenues. Some did not directly ask for rate reductions but merely asked that if the commission found any reductions justified their commodities should be given early consideration or not be left out. Railroad rebuttal argument on behalf of the carriers was heard on March 11 and 13.

F. W. Putnam of the Minnesota commission devoted his argument mainly to urging a reduction of passenger fares. The present rates, he said, are keeping people from traveling except where it is necessary and are inducing them to ride in automobiles in many cases instead of by train. He urged it particularly, he said, from the standpoint of public relations, saying that whereas 18 months ago the carriers had the good will of the public, now they have the bad will of the public and this condition can be changed if they will go back to a three cent a mile rate. He claimed this would not result in a reduction of revenues.

When Mr. Putnam said that with a normal traffic the present rates would make more than six per cent, Commissioner Potter asked if it is not necessary for the commission to establish a rate basis that will make substantially more than six per cent part of the time in order that the average income shall be a fair return. John E. Benton also made an additional argument on behalf of state commissions.

N.I.T.L. Asks General Reduction If Any

John S. Burchmore, for the National Industrial Traffic League, urged a general reduction of rates as soon as the carriers can stand the reduction on the ground that the rates constitute a burdensome tax on industry. The thinking public, he said, has been in doubt as to the facts as to the ability of the carriers to stand a rate reduction, but the commission should now be in a position to decide as a result of this investigation, and the league took the position that any reduction should be general and horizontal, applied to all commodities, corresponding to the method by which the rates were advanced. He suggested that if the commission should not find a general reduction justified at this time it would have a stabilizing effect if the commission could issue a definite statement that rates will not be reduced for a certain period. He also suggested that the commission should give the railroads moral support by a public announcement that it is the high labor bill that makes high rates.

Commissioner McChord asked if the commission should deal in the same way with other expenses. Mr. Burchmore said the commission could properly do so, but that he did not think the facts were the same. Commissioner Daniels asked if the record before the commission is sufficient to justify it in making such a statement. Burchmore replied that at least the commission should go as far as the record would justify.

Referring to statements that any reduction that could now be made would be too small to be felt if made general, Mr. Burchmore recalled that the commission once took 19,000 pages of testimony on a five per cent advance in eastern territory.

R. C. Fulbright, on behalf of the Southwestern Industrial Traffic League, said that the operating costs during 1921 largely reflected the peak prices of materials and supplies purchased in 1920 and that large reductions have since been made. He also predicted an increase of traffic in 1922 and on this basis declared that under present rates the railroads would earn an excessive income.

S. H. Cowan, representing livestock interests, said that the requirement of the six per cent rule is impossible of fulfillment when taken in connection with the requirement that rates shall be reasonable and is, therefore, not obligatory upon the commission. The livestock industry, he said, cannot pay the rates and survive, while the railroads say they cannot reduce rates and survive; hence the only rule for the commission is to order reasonable rates under Section 1. That, he said, will meet the requirement "as nearly as may be."

Paul E. Blanchard for the National Fertilizer Association, asked a reduction of 25 per cent in rates on farm fertilizer and fertilizer materials. He said that every other factor in the industry except freight rates has been reduced to the 1913 basis, and that for every ton of fertilizer the railroads carry they will have from one to four tons of some other commodity to haul next year. He contended that a reduction in rates would be given to the consumer in the form of a reduction in price and would, therefore, increase buying power.

Thorne Asks That Rates Be Deflated

Clifford Thorne asked a reduction in rates on petroleum and products on the ground of the condition of the producers and the high percentage of freight rate to f. o. b. prices, which, he said, had been greatly deflated. He asked that the railroads be required to make a similar deflation of their rates. He said that the Ex Parte 74 advance had had a demoralizing effect on the industry and over 50 per cent of the refining plants in the mid-continent field are now idle.

Speaking for the American Farm Bureau Federation, Mr. Thorne said:

"We heartily commend the action of the commission in making the reductions on grain, hay and livestock. We appreciate what the carriers did in making the general reduction of 10 per cent on other agricultural products throughout the United States, the first reduction on any basic commodity nation-wide in its extent. But we desire the commission to notice that the general 10 per cent reduction was not proposed by the carriers until after the decisions in the grain and livestock cases had been entered, and not until after a petition had been filed with this commission requesting a general reduction of 10 to 20 per cent on basic commodities throughout the United States. Consequently the assistance and the action of this commission constituted a very potential factor in securing this result.

"We sincerely trust that this commission, or the carriers, will make such further reductions as the facts will justify. For that reason we are profoundly concerned in a fair accounting of the carriers' revenues and expenses and in the determination of that fundamental issue. What constitutes a reasonable rate of return? Specifically, as to agricultural products, at this time we have a few definite recommendations to make.

"First, we believe the reductions previously ordered by this commission as to grain, hay and livestock, should be extended throughout the balance of the United States. The

revenue involved in these further reductions would not be large in extent.

Our second recommendation is that those other farm products which have not received the 10 per cent reduction shall be granted the same. Ground phosphate rock was being produced in the spring of 1920 in large quantities and the plants were going to full capacity; but in the fall of that year, within two months of the effective date of the Ex Parte 74 rates resulting from that decision, half of these plants were closed down and one of the largest went into bankruptcy. We do not believe the railroads would make serious objection to a 25 per cent reduction in the freight rates on this commodity. The facts would seem to warrant such action." He also asked for reductions on seeds and agricultural limestone.

Mr. Thorne said that while the constructive year exhibits showed a net return of 4.8 per cent, or \$907,000,000, based on the traffic of last year, the net for the last half of 1921 was three times as great as that for the first half, and that assuming the increase in tonnage that may be expected, the railroads should earn over a billion dollars, or over 5 per cent for 1922. He said since the tentative valuation of \$18,900,000,000 and the return of 6 per cent were adopted in 1920, wholesale prices have dropped 50 per cent, and interest rates 25 per cent. He also attacked the statements that the showing of 1921 was made largely at the expense of maintenance. If the entire Ex Parte 74 advance cannot now be removed at least half of it should be removed, particularly on basic commodities. Mr. Thorne said, and the case should be kept open for further hearings from time to time as to particular commodities. It is not necessary at this time for the commission to announce a percentage which constitutes a fair return. This should be done only after a careful investigation, he said.

Reduction in Coal Rates Urged

Rush C. Butler, on behalf of the National Coal Association, said that material reductions in bituminous coal rates should be required and are necessary before there can be a revival of business and industry. The economic importance of coal, he said, is such that these rates deserve special consideration and lower rates on coal will reduce the unit operating expenses of the carriers. The rates, he said, should be cut "not by a mere 5 per cent or 10 per cent, but substantially, to the bottom."

C. B. Ellis, on behalf of the Southern Traffic League, took the "constructive year" exhibit filed by the Southern roads based on the traffic of 1921, and by assuming a normal yearly increase in traffic said it showed they would earn more than 6 per cent in 1922.

W. E. McCormack, representing interior Iowa packers, said that under existing rates they cannot compete in trunk line territory. Twenty per cent of their product is fresh meat, but the difference of 40 per cent in the rate on meat over that on hogs has made it impossible to ship the meat at a profit, and they cannot exist under this differential. He asked that the relationship which existed before General Order 28 be restored.

Edwin Brooker, for the National Association of Sand and Gravel Producers, urged a reduction on the ground that the present rates are so high as to produce only a minimum of revenue.

Francis B. James, on behalf of the lake furnace interests, objected because the railroads had reduced ex lake ore rates without similarly reducing the coal rates, in which his clients are interested. He said the railroads were trying to show they had made so many reductions on other commodities that they could not afford to reduce coal rates. He urged a reduction in coal rates as the one commodity that enters into every kind of industry and the one in which a reduction would have the greatest effect in stimulating other industries.

Wilbur La Roe, Jr., appeared for the Chicago Association

of Commerce in place of his partner, former Commissioner E. E. Clark, who had been retained by the association to support the position that any reduction in rates should be general and horizontal. Mr. Clark is ill. If any reduction should be made, he said, it should be a moderate horizontal reduction, with possibly a few special exceptions. The association does not ask for a reduction in freight rates and does not take the position that the decline in business was solely due to freight rates, but it believes that any reductions should be made on a horizontal basis in the way they were advanced.

Mr. La Roe opposed the suggestions made by Secretary Hoover that class rates be not reduced or possibly be advanced, pointing out that they include not only high-class merchandise but also many raw materials and others that are of the same character as articles that are given commodity rates. He also said that an advance in class rates would increase the disadvantage of the l. c. l. shipper. In view of the concentration of coal traffic on certain roads, he said he could not understand how any one who intends to be fair can argue for a reduction of 50 or 75 cents a ton on coal rather than a general reduction. A general reduction, he said, would narrow the increased differentials which are a burden to so many shippers.

Any substantial reductions, Mr. La Roe said, would not be warranted at this time, but the entire country needs help and a rate reduction would stimulate traffic slightly. He said he would not ask a reduction in passenger fares. He suggested that if a 10 per cent increase were made and failed to stimulate business the commission could put the rates back, but he agreed with Commissioner Hall that such action would have a most unfortunate effect.

Speaking for his own clients, Mr. La Roe said that if any general reduction is made, roofing slate should not be left out, on the ground that the present rates are most indefensible because they are higher than rates on prepared roofing. Commissioner Potter asked if it would not be better to stabilize industry on the present rates than to make small reductions now with the possibility of having to increase them later. Mr. La Roe said he could not see how the commission could take any very definite action with the Labor Board occupying the position it does.

R. W. Ropieque argued for a reduction in coal rates on the ground that as a basic commodity a reduction would stimulate industry and thus lead to an increase in the tonnage of the coal-carrying roads. The only way to get back to normalcy, he said, is to cut every kind of cost to the bone.

F. L. Ballard asked for reductions on furnace materials and anthracite coal. He said it costs \$13 today merely to "fetch" the materials entering into a ton of pig iron which sells for \$20, leaving only \$7 to buy the materials. The market will not pay more than \$20 and unless there can be a radical reduction in freight rates it is impossible to sell it at cost. Speaking for the anthracite operators not affiliated with railroads, Mr. Ballard urged a reduction to enable a reduction in the price to the consumer.

J. Van Norman, representing the southern hardwood lumber interests, said it is admitted by all that rates are too high and that it is the commission's duty to exercise a business judgment in fixing rates in an attempt to produce a given return. He argued that the commission should reduce rates on raw materials which move long distances and as to which the rate bears a high proportion to the price. In his opinion the only real question before the commission is as to whether a reduction in rates would stimulate traffic so as to increase rather than reduce revenues. Naturally, this question is not susceptible of concrete proof, but he contended that all human experience is that a reduction in price induces consumption.

Asked by a commissioner as to the effect of the reductions ordered by the commission in the Southern hardwood lumber

case, Mr. Van Norman said the reduction were not sufficient to move a pound of lumber, but that they have not yet been put into effect. Mr. Van Norman said that the Illinois Central is pursuing a policy of adjusting its local rates to move the traffic, where it can be done without discrimination and without breaking with the other roads, and that last year it made 11 per cent on its invested capital. "If we had in this country 300 railroad executives like C. H. Markham, business would be on its feet in 90 days," he said.

F. B. Dow, representing petroleum interests, quoted from a speech by W. W. Atterbury, saying that if present rates are long continued the railroads will lose traffic by the relocation of industries to points nearer the markets. The petroleum traffic, he said, is getting away from the railroads to pipe lines and water transportation. The total loss of traffic in petroleum to the railroads in 1921 amounted to 21,000,000 barrels. The railroads handled only 6.9 per cent of the crude oil run by refineries. He said it is now possible to move oil from the mid-continent field to the Gulf, around to the Atlantic coast and inland as far as Cleveland by pipeline and water for the amount of the rail rate from Oklahoma to Ohio.

In reply to Commissioner Daniels Mr. Dow said it is unquestionably true that in general crude oil should be transported by pipe lines but there are many situations in which rail transportation should be cheaper. The railroads have recently removed the Ex Parte 74 advance on exports from Kansas, Oklahoma and Texas to the Gulf and, Mr. Dow said, it had resulted in a large increase in traffic and he insisted that further reductions would be beneficial to the railroads as well as to the industry.

Hoke Smith Asks Reduction on Watermelons

Former Senator Hoke Smith of Georgia appeared on behalf of Georgia watermelon growers to urge a reduction in their rates. He said the present rates will check, if they do not destroy, the watermelon business out of Georgia, but if they are lowered to a figure which will leave a profit for the watermelon growers, with the spread of the boll weevil in Georgia, it is probable that this business will largely increase; lowering these rates so as to encourage rather than destroy the business, will be profitable to the railroads as well as to the watermelon growers.

"The transportation charges averaged in the state \$55.56 in excess of the gross return per car to the growers," Mr. Smith said. It was shown that the average cost of producing a carload of melons, including the marketing, but not including freight, is \$109.75 per carload.

"With the present freight rates the watermelon grower must go out of business. His freight rate, with New York City as the terminal point, from South Georgia points and Middle Georgia points, is between 13½ and 14 mills per ton-mile. Prior to the increase in freight rates in 1918, it was between 8 and 8¾ mills per ton-mile. The rate on watermelons from South and Middle Georgia to New York City, estimated in mills per ton-mile, is more than 25 per cent higher than the rate on iron and steel products from Georgia points to New York City. It is approximately 20 per cent higher than building material to New York City from South Georgia. If permitted to remain, it will kill the business, and stop the freight. While the rate prior to June, 1918, was 8.8 mills per ton-mile, I believe they could stand a rate of 10 mills per ton-mile now. As melons begin to move the latter part of June, and largely move in July, the decreases to save this year's crop from being a loss must take place prior to that time."

Plumb Asks Commission to Avoid Wage Issue

Glenn E. Plumb filed a brief for the "standard" railway labor organizations asking the commission to disregard any evidence and not to enter any orders or findings in any way

relating to the justness or reasonableness of the wages. He also asked the commission to reduce its finding of the aggregate value of the railroad property and to reduce the rate of return to some figure below 6 per cent. In reducing the valuation he suggested that the commission use a figure based on the results of the valuation so far established and he presented a calculation based on the tentative valuations by which he arrived at a figure of \$13,627,589,375. This calculation was based on the relation of value found to capital account. By another method he reached a figure of \$10,806,000,000. The evidence clearly shows, he said, that the prices now charged for transportation act as an embargo upon transportation and the employees are interested in the restoration of a volume of traffic that will lead to a restoration of the former volume of labor employed.

Security Association Wants

Higher Percentage of Return

Forney Johnston, representing the National Association of Owners of Railroad Securities, said the carriers had been conservative in asking that the rate of return be fixed at not less than 6 per cent. He pointed out that the obligation of the commission to prescribe a definite rate of return was entirely distinct from the subsequent obligation of the commission to adjust rates from time to time in the bona fide effort to produce the declared rate of return. In determining the base rate, he urged the commission not to be influenced by the fact that for the time being the return to the carriers on the actual value of their investment is materially below 6 per cent. He stated that whatever ratio might be fixed by the commission as a result of the present inquiry would be likely to endure for several years, as it is beyond the physical capacity of the commission to have repeated prolonged hearings involving changes in the rate of return, and that 6 per cent should not be regarded as an adequate permanent base.

"If accordingly," said Mr. Johnston, "the commission were to feel that in establishing the rate of return its discretion should be influenced by existing adverse conditions, that result would not be accomplished which is clearly contemplated by the statute, that is, the ascertainment and making public of a rate of return which the railroads, regarded as a national system of transportation, are entitled to receive in order to survive on a wholesome basis.

"In like manner, the commission should not regard its obligation to establish this rate of return as if it were sitting as a court to determine the lowest rate of return which would avoid the charge of confiscation."

He also pointed out the difference between the conditions confronting the commission and the conditions which existed when Congress prescribed a rate of return of from 5½ to 6 per cent for the two years transition period, calling attention to the fact that the rate of return intended to prevail during the period immediately following federal control, when the relation of rates to cost of transportation had been entirely destroyed by the rate policy of the administration, was a very different proposition from the declaration of a fair rate of return necessary to sustain transportation in a sound condition after this transition period has passed.

Railway Rebuttal Arguments

Appearing for the Eastern carriers with respect to bituminous coal and coke, W. S. Bronson argued against any reduction being made in the freight rates on coal and asserted that such action would not stimulate traffic.

"Prices of coal, according to witnesses for the coal producers before the commission, have declined approximately \$1 a ton in the last year, but that has failed to stimulate buying," said Mr. Bronson. "Why should a smaller reduction in the freight rate on coal bring about a stimulation in the movement of that commodity?"

Mr. Bronson said that with the railroads using approxi-

mately 28 per cent of the coal output of the country, public utilities, 6 per cent, and householders 10 per cent, little stimulation in buying could be anticipated, as it has been shown that the demand from these sources is fairly constant. Substantially all the remainder of the soft coal produced in the United States, he said, is used by industrial concerns, largely manufacturing. The stimulation in traffic resulting from a reduction in the bituminous coal rates, if there should be any, must therefore come from an increased demand by purchasers of manufactured articles," said Mr. Bronson. "Unless the manufacturer elects to translate his reduction in coal rates into a reduction in the selling price of his manufactured articles, reductions in the coal rates cannot stimulate the movement of traffic.

"A large number of witnesses have said that a reduction in the coal freight rates would benefit industries and some have said that it would stimulate business, but not a single manufacturer, so far as the record discloses, has affirmatively stated that he would translate a reduction in his coal freight rates, thereby reducing his costs of manufacture, into a reduction of selling price of his manufactured articles. Neither has anyone explained how in the absence of a reduction in the selling price of the manufactured articles, stimulation in traffic could obtain."

Mr. Bronson said the fact is that the freight charges on bituminous coal represent so small a proportion of the total cost of all manufactured articles that any reasonable coal rate reduction would reduce the cost of manufactured articles too little to reasonably expect such a reduction to be reflected in the selling price of articles manufactured through the use of coal, while it would reduce the carriers' revenues in the Eastern district millions of dollars annually.

H. A. Taylor, of the Erie, replied to the argument of anthracite coal producers, and A. P. Humburg, of the Illinois Central, discussed the coal rates in the West and South. If the large reductions made in the prices of bituminous coal have had no effect in stimulating business, he asked how a reduction in freight rates can be expected to accomplish the same object. "Does a freight rate dollar contain more cents than a dollar of price?" he asked. Commissioner Campbell asked if the point was not that all kinds of business must be readjusted before conditions become normal rather than the direct effect of a reduction as to any commodity.

"But the transportation machine must be permitted to go," said Mr. Humburg.

"The business machine must be permitted to go, too, and the transportation machine cannot go unless the business machine goes," interjected Chairman McChord.

A 50 per cent per ton cut in coal rates would reduce the income of the Southern and Western districts by \$50,000,000, Mr. Humburg said, and a 75 per cent cut would reduce the revenues \$75,000,000. A reduction in coal rates, he said, would be felt particularly by the roads which handle a large percentage of coal traffic, and some of the same roads have been particularly hit by the reduction on agricultural rates. Chairman McChord asked if the commission should reach the conclusion that reductions can and should be made, what commodities should be selected. Mr. Humburg said he was not prepared to answer that question, but that possibly Mr. Thom would. Chairman McChord said the commission would like to have an answer.

Clyde Brown, of the New York Central, replied to arguments for a reduction of the Pullman surcharge or of passenger fares. He showed that the fluctuations in surcharge revenue have been much less than those in passenger revenue, indicating that this class of travel is less affected by business conditions and pointed out that a reduction of 16 2/3 per cent in passenger fares from 3.6 to 3 cents would amount to \$177,000,000. It would require an increase in business of 20 per cent to offset this, he said.

Fred H. Wessel replied to some of the criticism of the con-

structive year exhibits and pointed out that in January, 1922, the roads earned only about 2.6 per cent and the western roads only about 1.2 per cent.

Mr. Thom's Argument

Alfred P. Thom, counsel for the Association of Railway Executives, made the concluding argument for the carriers. He said that the shippers who want their rates reduced should go to the Labor Board, and he asked the commission to find that rates cannot be reduced until operating costs are reduced by a wage reduction.

Mr. Thom began by replying to Chairman McChord's question, but said there is difference of opinion among railway officers as to whether any reduction should be general or confined to specific commodities and it would not be proper for him, representing all the carriers, to state an opinion. Mr. Thom argued that the case should be considered not from the standpoint of private interest but that of public interest, in adequate transportation and in enabling the railroads to prepare themselves for a period of prosperity. He pointed out that what has been done for the carriers has not been prompted by a spirit of favoritism to them but because of the public interest involved, and that the Transportation Act was adopted as representing a new policy in an effort to provide an adequate transportation system. The question, therefore, is not whether the railroads should share in the public distress or contribute to other industries but whether the carriers shall be enabled to provide for an expansion of business.

The roads are not now in a condition to buy large quantities of new equipment, he said, but they are trying to reduce the percentage of bad order cars from 15 to 5, which would add 250,000 cars to the available equipment of the country. He said that the evidence before the commission is that a reduction in rates by any reasonable amount would not create the demand which is necessary for a restoration of normal business and that the country is not being held back from normality by the freight rates. The shippers who want lower rates should go to the forum where they could get relief by a reduction in the labor costs of transportation, which are the cause of the present freight rates, but, he said, there had been thinly veiled threats of political results if this case is not decided the way certain advocates would have it decided.

"They think the railroads are the line of least resistance," Mr. Thom said, "yet we know there can be no reduction of rates that will not injure these transportation facilities without a reduction in costs. Why can't this commission say so? Without passing on the level of wages you can say that the cost of producing transportation is the impediment in the way of reductions in rates. If you would do that you would get rid of all your perplexities."

On the other hand, Mr. Thom said, if the commission should reduce rates, and the Labor Board should not reduce wages, it would have a deadly effect on the efficiency of transportation.

In reply to a question by Clifford Thorne as to why we cannot "stop babying the railroads," Mr. Thom said the answer is because they haven't the freedom of other industries. He pointed out that the railroads were excluded from the prosperity felt by industry in general during the war and given no opportunity to set aside for the period of deflation to come, while their wages are fixed by one body and their rates by another. He also replied to Mr. Thorne's comparisons of the yield of railroad and industrial securities, saying that the problem of the railroads is how to raise new capital. "Mr. Thorne has been coming here filing his statistics and making his prophecies as to railroad credit for 10 years," he said. "He has been demonstrated to be an unsafe advisor and the commission has found it necessary to repudiate his advice."

Along the Government Lines in New Brunswick

Problem of Government Railways in Canada

Turning of National Lines Over to Canadian Pacific for
Operation Offered as a Solution

By W. T. Jackman,

Associate Professor of Economics, University of Toronto, Toronto, Can.

WHILE THOSE charged with the operation of the government system placed their main reliance upon a gradually increasing development of traffic over a period of years as the means of reducing and finally wiping out the deficit, the government seemed to lay much stress upon the need of taking over the Grand Trunk and adding it to the other lines if the deficit were to be extinguished. We have already referred to the supposed necessity of thus "rounding out" the government system if it were to be successful in operation, and we have said that this was probably the best reason why the government should take over the Grand Trunk. But when we consult the management of the government system we do not find them enthusiastic as to the good results that might be secured from this inclusion of the Grand Trunk and its co-ordination with the existing organization.

The results of the co-ordination of the Grand Trunk Pacific with the Canadian Northern for operating purposes were described by one of the officials in the following words:

" . . . It has been found possible to close a considerable number of stations, freight sheds, and a couple of engine terminals, besides abolishing numerous duplicate offices, the whole resulting in a substantial decrease in the combined cost of operation. . . . It does not seem possible to eliminate any large proportion of mileage in this way." When asked as to the effect of co-ordinating the Grand Trunk with the other government lines, he said: "Unquestionably co-ordination will result in improved service in some places. On the whole it will tend to increase the volume of traffic, lengthen the haul, and effect savings in certain localities."

These expressions from the man who has charge of operation and maintenance do not hold out very great hope that much economy will ensue from the unification of all these railways under a central management. The mere tendency to effect savings in certain places does not give much en-

couragement that these economies will contribute to any great extent towards the reduction of the \$70,000,000 deficit.

But there is one result which should come with the association of the Grand Trunk with the other lines in the government system; that is, there should be on the latter a larger amount than heretofore of the higher class freight from which greater revenue should be received. The Canadian Northern lines in the east touch but few of the manufacturing centres, where high-class traffic is found in abundance; and even at those centres which it did reach the Canadian Pacific and the Grand Trunk had already established themselves before the advent of the Canadian Northern, so that the latter was handicapped in securing a share of this business. But now that the Grand Trunk is linked with the Canadian Northern its better paying traffic will help to augment the revenue of the National System by having commodities carried all the way across the continent on these lines.

There is little reason to doubt, however, that the boasted advantages of Grand Trunk co-ordination, by which the government system was to be transformed from a financially unsuccessful to a financially successful enterprise, are foredoomed to defective, if even partial, realization. Those persons and places which are on the existing lines of railway will certainly oppose any effort on the part of the management to reduce the character of the service; on the contrary, people are keenly desirous of having the quality of the service improved, and any effort to take off certain trains or to curtail in any other way the facilities for shipment or travel would meet with immediate antagonism.

Had such co-ordination been carried out before the great series of lines were laid down it could have been effective; but when once the network has been completed and the service established on a certain scale, so that businesses located along the line expect the continuation of that service which induced them to establish their plants there in the first place, it would be highly derogatory in many instances to the welfare of the railway, as well as of the country, to permit any significant change in the character of that service. Of course, there

*This is the second of two articles on this subject, the first having appeared in the *Railway Age* of March 11, page 567.

could be, as in the United States during government wartime control of the railroads, the elimination of duplication in ticket offices, freight agents, terminal facilities in some cases, clerical staffs to some degree, and in other similar respects; but the economy effected in these ways, as was found in the United States in 1918, is an almost negligible fraction of the operating expenses of the railway system. It is certain that those who anticipate large savings through co-ordination of the Grand Trunk with the other parts of the national system will find the outcome not in accord with their exaggerated expectations.

Here, then, are the conditions as we have them today: There are included under the government the former Canadian Northern, the Intercolonial, the National Transcontinental and the Grand Trunk Pacific and its branches, amounting in all to about 17,000 miles of line, in the operation of which there was in 1920 a deficit of \$70,000,000 including fixed charges. The Grand Trunk Railway System of over 5,300 miles, which in 1920 paid its operating expenses but fell short of meeting its fixed charges by \$6,563,091.33, has now been added to those just mentioned, so that now there is well over 22,000 miles under government ownership. The different units of this aggregation show each a deficit, as follows:

Canadian Northern:			
Deficit in operation.....	\$16,258,579.80		
Fixed charges:			
Due the public.....	13,837,118.51		
Interest due government.....	10,318,869.97	\$40,414,568.28	
Canadian Government Railways (including National Transcontinental, Intercolonial, Prince Edward Island, and a number of shorter railways):			
Deficit in operation.....		10,449,876.43	
Grand Trunk Pacific:			
Deficit in operation.....	\$10,134,513.94		
Fixed charges:			
Due the public.....	6,048,950.60		
Interest due government.....	2,475,474.00		
Interest on receiver's certificates for 1920.....	808,351.63	19,467,290.17	
		\$70,331,734.88	
Grand Trunk Railway:			
Due on fixed charges.....		6,563,091.88	

Under these conditions, it seems almost inevitable that when these properties are combined and operated under one management there should still be a deficit; in fact, it is anticipated that the deficit for the next year will be at least \$100,000,000. To continue to pile up such additions to the taxpayers' burdens year after year is nothing short of a crime. The government has persisted in saying that in nationalizing the railways it was carrying out the will of the people, although it never gave the people any opportunity of expressing their wish regarding this issue. Even when the parliamentary committee was appointed in the spring of the present year to inquire into the problem of the National Railways the scope of the inquiry was so circumscribed as to render the work of the committee practically useless.

What is the Remedy?

What is the best way to deal with these financially embarrassed railways, now that they have been grouped under government ownership? It seems as if the only conclusion reached by the government is to let them alone, in the hope that the progress of immigration and the upbuilding of the country may ultimately enable them to pay their way, and in the meantime let the people pay the mounting deficits. At the time of great prosperity, the people sanctioned the construction of railways for the opening up of the great west, and gave largely in the way of national assistance for this purpose. But because people could not foresee the war and the economic depression which has accompanied and followed it is no reason for saying, now, "Let the people pay the price of their undue optimism." Such a fatalistic method of dealing with the problem is not in accordance with the spirit of a progressive people.

The government has virtually acknowledged that it has no other than the existing policy, namely, to drift along and let

enormous amounts of the people's taxes go yearly to the payment of these railway deficits, concerning the accrual of which they have not been allowed to have an effective voice. It is not to be expected, of course, that the government, after pushing its nationalization policy to the present extreme, should acknowledge that this policy has been disastrous. It has reiterated that its railway policy was the only one that was possible under the circumstances, and we could not expect that it would now admit its error. Relief, therefore, must come, if at all, from some other source, for the present government shows no disposition to reconsider the scheme upon which it has embarked.

There are some who really believe in the principle of public ownership, and of these only one man in public life seems to have any suggestion for relief. His plan includes, first, a complete reorganization of the operating end so as to avoid duplication, and cease operating those lines which have no prospect of being profitable; second, to write down the assets to their proper value; and, third, to encourage a sound policy of immigration, which shall place men on the land and thus develop business for the railways. As to the first, there is no question that duplication of facilities has been a great waste. When the railway lines which were formerly in competition are brought under one control, many trains may be taken off which were formerly run unprofitably; there may be considerable saving of capital and expenditures in the matter of terminals; there may be the reduction of some of the expenses of maintenance of way and structures and the number of higher officials in the service may be reduced. In these and other ways there might be economies of operation and maintenance which would be important.

Yet even here there is likely to be exaggeration as to the amount which can be saved. On lines which have been in operation for many years people become accustomed to a certain quality of service and any curtailment of this would be, as in some cases it has been, strongly opposed. The amount spent for maintenance of way and structures will be almost as much whether one train or three or four trains per day pass along the line. The number of officials to take care of a large traffic is little, if any, more than the number required for a smaller traffic, because the work of each is specialized. It is very easy to overestimate the amount which can be saved through the avoidance of duplication. Moreover, to cease operating those lines which have no prospect of paying seems at first thought the part of wisdom. But we must remember that very few such lines have been constructed, especially by private capital; they may have had little traffic at first but the prospect of better things has been the inducement which led to the construction of railways into new territory, and the development of new areas. We venture to say that the mileage built that had no prospect of being profitable is very small.

As to the second measure of relief, namely, to write down the assets to a proper point, very little can be said in favor of this. It is true that when a merchant has goods on his shelves that he cannot sell, his bank will insist upon his writing down his assets below their book value in order to present a clear statement of where he stands. But this is not comparable at all with the railway for the latter does not sell its service according to cost. It charges what the traffic will bear. Moreover, it would be useless for the railway to write down the value of its assets, for its financial standing is not determined by this means, but rather by the amount and regularity of its income. There is not necessarily any direct connection between the amount of the assets and the amount of the income; for some roads with a small amount of rolling stock regularly employed have a larger and more uniform income than other roads with a much larger amount of physical assets.

The contention, then, that the assets of these railways under government ownership should be reduced to a proper

point has absolutely no bearing upon the problem of the railway deficits. What is needed is, not the writing down of the value of the assets, but the reduction of the fixed charges and operating expenses to the lowest minimum and the increase of the earnings to the greatest possible extent.

As to the third phase of this proposed change, namely, the pursuit of a wise policy of immigration and the proper distribution of the immigrants so as to augment the amount of farm produce available for carriage by the railways, nothing in the way of criticism can be directed against this significant suggestion. Far too much of the immigrant tide has flowed into the cities and towns of this country and has engaged in occupations which furnish but little traffic to the railways. The country development has been delayed by not attracting to the land those whose interests in their former homes have been mainly agricultural; and a more enlightened policy should be pursued for the opening up of the great areas in the west and north that are capable of yielding, not only good homes to the settlers, but abundance of produce for rail shipments. Even if the government were to pursue this plan, it would be a long time before there could be much increase of traffic as a result of its adoption, and during that time there would be the expenditure of many hundreds of millions of dollars of the people's money to pay the vast deficits which are accumulating at such an alarming rate. This policy, therefore, does not seem to offer the best solution of the railway entanglement.

One Possible Solution

In what direction may we most hopefully look for relief? In ordinary business, if a large concern faces insolvency, there are two courses open by which its affairs may be adjusted. If it is a new corporation, which is just seeking to establish its place in the business world, it is usually allowed to go into bankruptcy and then its affairs are closed up. But if it is an old-established firm, which has worked its way into the public esteem and which, if it were to go into bankruptcy, would cause a shattering of public confidence, it is frequently saved by a stronger firm coming to its rescue. This is recognized as a good principle in the case of banks, and the example of the Ontario Bank, which was taken over by the Bank of Montreal, is within the memory of many today. Many instances of the same kind could be cited in the history of the United States. The combination movement in industry shows a great variety of illustrations of the same procedure, by which concerns which were almost "on the rocks" have been taken over and their managements merged with those of stronger businesses. This would seem to point the way to the most appropriate solution of the railway problem, which I now desire to present.

Briefly, if we desire operating efficiency for the government-owned roads, the best way by which to secure it would be to link them with the Canadian Pacific. The interests of all are identical; the private road is subject to the same conditions as to rates, service and regulation as the government roads, but the private road has obtained an enviable position as the largest and most successful corporation in the railway world. It would, therefore, be a tower of strength to those roads which are now in such desperate financial need.

Fortunately, Lord Shaughnessy, the chairman of the Canadian Pacific directorate, has already presented a personal memorandum to the government upon this subject, and has shown that by having the government roads operated under the Canadian Pacific management the deficit of the national lines would be reduced at once to eleven or twelve millions per annum. By this country, which has an enormous debt and faces a deficit of perhaps a hundred millions in the operation of its railways during the present year, such a safe proposal, which would reduce this railway deficit to one-eighth of its great aggregate, should be welcomed eagerly.

The removal of this railway incubus from the country and

the freeing of the people from the burden of such vast anticipated annual contributions for no productive purpose is a consummation which should be effected as speedily as possible. Of course, it is not in the interests of the Canadian Pacific stockholders that their company should align itself along with a combination of decrepit railways such as those owned by the government, for the resources of the Canadian Pacific and the company's great future under its present management are clearly indicative of still better things for the stockholders. By undertaking to carry along the government roads, the Canadian Pacific would really be sacrificing its own best interest in order to assist in a great work of national rehabilitation by gradually placing these almost derelict railways upon a sound basis, through bringing its own financial resources and its unparalleled organization to contribute to their restoration.

As was suggested by Lord Shaughnessy, if as a result of negotiations between the government and the Canadian Pacific some plan were finally drawn up by which the latter would operate the national lines in conjunction with its own, the government becoming responsible for the amount of the deficit which still remained in the operation of its roads, but which would decrease from year to year, the arrangement would have to assume much of the aspect of permanence. The railway business is one which cannot prosper except under a policy which has all the elements of continuity. Its expenditures, many of them, must be made a long time in advance, so as to prepare for the increasing volume of traffic which frequently comes with unexpected suddenness. A hand-to-mouth existence is impossible for a railway which would serve the country effectively.

So that if the Canadian Pacific were to undertake the operation of the public railways the contract would have to be drawn up in such a way as to permit policies once inaugurated to be carried into effect over a protracted period. Of course it would not be necessary to have an absolutely perpetual arrangement, but one which would have such a degree of perpetuity as would assure the Canadian Pacific that when it embarked upon a policy of building up the assets and the earning power of the other roads it would be enabled to secure some reasonable compensation for this service.

A contract entered into for a period of, say, 99 years would have all the elements of continuity which would be requisite. But, instead of having one fixed financial arrangement for that entire period, there should be the possibility of some measure of elasticity. It is recognized now by those who know best the operating conditions of the government roads that it would take at least 15 to 20 of the most prosperous years that Canada has known before the national lines will be in a position to meet all their expenses.

If, therefore, an agreement were entered into now upon terms that would be satisfactory to both parties, it would be advisable to have the contract such that if at the end of, say, 20 years the earnings of the national lines should exceed a certain amount, due partly to the general development of the country and partly to the efficient management of the Canadian Pacific, there might be a new financial adjustment, so that while the company was allowed adequate compensation for its risk and management the public would also secure a fair share of the results which accrued from the growth of population and the expansion of the country's business. These periods of reconsideration of the finances of the combined systems should take place thereafter at regular intervals of perhaps 10, 15 or 20 years, so that the entire arrangement might have some of the spirit of a partnership for the public welfare.

Under these conditions, where monopoly would be substituted for partial competition, our regulative system would have to be adjusted accordingly. Some of the sources of trouble which now exist would even then call for the exercise of the same authority by the Board of Railway Commis-

sioners; and, on the other hand, not a few of the cases which now come before the board would disappear from the docket of that body. In certain respects the regulation of a monopoly of railway transportation would be more easily effected than when there are several railways operating in the same territory, and among other things there would have to be greater publicity of accounts so as to acquaint the public with the facts.

By securing the assistance of the best men in railway economics, railway law and railway management, the government would soon be able to devise a system of regulation which would be equitable and would safeguard the public interests; and as a result of this new system of control there would be the infusion of a new life into the entire railway organization. It would be highly desirable, since the Canadian Pacific would have the management of not only its own property but that of the people of Canada, that a majority of its stock should be held in this country; otherwise we might have the possibility of groups of foreign shareholders getting an undue share in the election of directors of the company and in this way we should have foreign control of the property belonging to the Canadian people.

There are still some people who cling to the hope that as the country grows up to the measure of its transportation facilities the railways owned by the government will prove a profitable enterprise. To cherish such a hope is to live in a world of delusion. A director of the National System recently declared that if the "right men" were chosen to manage this system they would do it "just as well as if they were looking after their own business." To make such a statement as this is to display great ignorance of human nature or else to confess that the "right men" are seldom found.

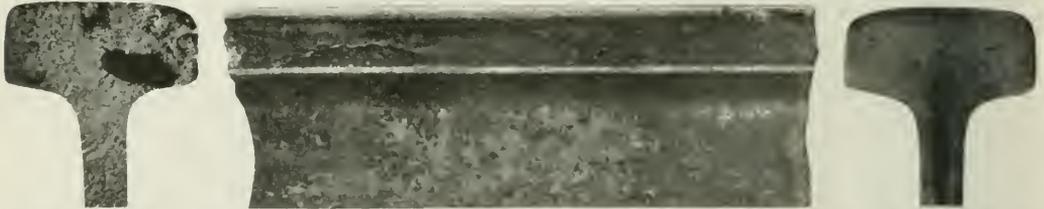

The facts of experience of state railways in other countries are irrefutable and human nature and human motives are no different in Canada from what they are elsewhere. At the risk of repetition, I venture to give the words of Mr. Acworth before a committee in Washington in 1917: ". . . that it is impossible to procure, under any system of state management in a democratic state that has yet existed, an author-

stage has been reached when stagnation of enterprise must materialize? Or, will they seek the best means by which these government-owned railways may be transferred to private control and individual initiative under conditions which will make for the continuous rebuilding of a transportation mechanism responsive to the requirements of a young and progressive country? The demands during the recent (1921) session of the House for information regarding the government railways is but a forecast that in future more complete information will have to be given to the public, and it is evident that the people's representatives in parliament will secure greater and greater control over these railways when they must vote such large amounts to pay for the present deficits.

These circumstances clearly indicate that if the roads are retained by the government there will be a more direct interference by parliament in their management. This would lead to the same unfortunate conditions as in the case of the Intercolonial. We are firmly convinced that the present distressing system of management cannot long be endured, nor is it capable of much, if any, improvement so long as the policy of government ownership is continued.

A Peculiar Rail Failure

SOMETIME ago trackmen on a western road noticed a peculiar mark on the gage side of the head of a rail in service, indicative of the presence of a horizontal or perhaps a compound internal fissure. The rail was removed from track and broken to see what internal condition existed. Not only was a compound internal fissure definitely located but in addition the rail was found to be badly piped and the fracture also showed signs of its being badly segregated. The rail was sent to Robert W. Hunt & Co., Chicago, for examination, to whom we are indebted for the photographs and the following data. One of these pictures shows a side view of a piece of the rail about 8 in. long as it was broken after having been removed from the track, while another

Sections Showing (at Left) Compound Fissure in Head and Fine Grained Structure, Indicating Segregation; (in Center) Crack Indicating Compound Fissure and (at Right) a Pipe

ity that is left to consider impartially, undisturbed by political influences, the interests of the whole public as distinguished from the particular or local interest of certain places or certain trades. I think that is really the sum of the evidence . . . all the evidence is that in a democratic state the interference with the impartiality of management in the interest of the whole community, the intrusion of unjustifiable demands on behalf of certain favored individuals or favored localities or favored trade interests has never been prevented.

These are the conclusions of one who today stands without a peer in regard to his knowledge of the results of railway operation both under government and private ownership, and he states without any equivocation that government ownership invariably means favoritism rather than impartiality of operation in the public interest.

Will the people of Canada learn the lesson before that

picture shows the left-hand view of the cross section of this piece and reveals a compound internal fissure, which it will also be seen extends horizontally in the head. Another picture shows the results of a strong acid etching of the right-hand end section about 8 in. from the fissure, revealing the pipe plainly as well as evidences of unsoundness.

The chemical composition of drillings taken from a location adjacent to the above etching was as follows, the mill analysis of the heat also being shown for comparison.

	Specife-I	Mill Ladle Test Analysis	Analysis of Sample	
			Corner of head	Junction of head and web
Carbon	.63 - 75	.72	.74	.87
Manganese	.60 - 90	.71	.73	.75
Phosphorus	Not over .01	.029	.024	.034
Sulphur		.038	.033	.043
Silicon	Not less than .10	.25	.27	.27

It will be noticed that the silicon content of the heat is fairly high, which fact is confirmed by the analysis of the

broken rail. This fact alone, however, did not prevent the rail from being badly segregated, a condition which may have contributed to the formation of the internal fissure, though to what extent is, of course, problematical. This was an "A" or top rail of an ingot and had been in service approximately three years.

The drop test pieces cut from the top end of three "A" rails were all satisfactory. Two of them successfully withstood one blow of the top falling from a height of 17 ft., and gave an elongation of seven per cent and five per cent in two inches, when tested base up. The fractures of the three pieces were satisfactory and all rails were accepted.

Employees Question Legality of Wage Conferences

B. M. Jewell Charges Roads Are Not Properly Before Labor Board
—Burlington Clerks Agree to Cut

BEFORE ENTERING into the discussion of what constitutes just and reasonable wage scales under present conditions, representatives of the various organizations now before the Railroad Labor Board to fight proposed reductions in wages will attempt to prove that many of the carriers involved in this controversy are not properly before the Board because the negotiations preceding the submission of the various disputes to the Board were not brought about in compliance with the provisions of the Transportation Act and the orders of the Labor Board. This offensive defense was disclosed when hearings in the controversy were resumed on March 13, following a recess of two days. B. M. Jewell, president of the Railway Employees Department of the American Federation of Labor, in opening his presentation on behalf of the Federated Shop Crafts, gave notice of his intention to attempt to prove by correspondence and the testimony of general chairmen on various carriers, that the manner in which the joint conferences required by the Transportation Act were announced and held was not in compliance with the law and that therefore disputes over wage reductions are not at the present time properly before the Railroad Labor Board.

The case of the Wabash was first taken up, Mr. Jewell reading correspondence between representatives of the Federated Shop Crafts on that road and the management. He drew from this correspondence the inference that proper notice of the conferences required by the law was not given to the employees involved and that in fact bona-fide conferences on the subject of just and reasonable wages, taking into consideration the seven relevant factors enumerated in the Transportation Act, were not held. Representatives of the carriers told of the progress of the wage reduction movement, the negotiations on this subject, the manner and time in which they were held, the testimony indicating that all of the procedure prior to the submission of the dispute to the Labor Board was in compliance with the Transportation Act.

J. W. Higgins, executive secretary of the Association of Western Railways, in defending the manner in which the Wabash had called and handled conferences with the representatives of the Federated Shop Crafts, characterized the delay brought about by representatives of the employees as the only irregularity in the procedure. "Delay" he characterized as the "strategy" of the employees in this case.

The objections of the labor leaders voiced at this session seemed to be based largely on technical grounds; maintaining that the failure of the carrier to go into detail as to their proposals, the arguments therefor and the arrangements for conferences constituted a violation of the procedure outlined in the Act.

Representatives of the carriers, in reply, contended that these charges were groundless, the result being a large amount of quibbling as to duties and responsibilities of both carriers and employees in initiating wage in-

crease or decrease movements. A similar discussion involving the Missouri Pacific, the Chicago, Milwaukee & St. Paul, and the Pere Marquette followed, with practically the same result in each case.

Mr. Jewell Requests Analysis of Railroad Propaganda

Before going into this phase of the controversy, Mr. Jewell requested that the Board and the members thereof, make the necessary arrangements to examine their own and the Board's files "to determine the amount of communication, publications, pamphlets, etc., that have been received by the Board and members" to "ascertain the amount of propaganda, the amount of publications or 'yellow sheets' that have been received from the Association of Railway Executives, giving the number and date of the first one, and the number of the last pamphlet and the date it was received; the general contents and make-up of these." He also requested a similar investigation of material received from "interests or parties or organizations other than either railroad managements or organizations or railroad employees' organizations." This information was desired, he said, to ascertain whether these organizations "are familiar with or interested in or affected by or clearly understand, except as somebody indicates to them, railroad labor and management problems." At the same time he also asked that an investigation be made of similar material received from labor organizations other than those of railroad employees.

Board Rules Out Testimony on Contract Work

The second attempt by the labor leaders to bar a number of railroads from the wage hearing failed when B. W. Hooper, vice-chairman of the Board, ruled against the introduction of evidence by representatives of the employees purporting to show that the roads in question have violated the law by contracting shop work to outside firms. Mr. Hooper's ruling developed the fact that the Board will soon render its decisions in cases of this character involving the Erie, the Indiana Harbor Belt and the New York Central, who have been charged with violation of the Transportation Act by contracting shop work to outside firms and whose cases are now pending before the Board. The ruling against evidence on this subject was predicated on the fact that the whole question is now before the Board and therefor should not be argued in connection with wage reduction pleas. The question at issue, Mr. Hooper said, was one of the most important the Board has faced and added that if such contract work was declared legal "the ground would be cut out from under this Board and the vitals of the Transportation Act would be killed."

The ruling was made over the vigorous protest of Mr. Jewell, who asserted that if railroad shops were to be closed one day and opened by a contractor at lower wages the next, the railroads were setting an example which might convince the employees that "the very small number we have termed

radicals were right and the great majority of sane-minded employees is 100 per cent wrong."

Estimates of Savings Requested by Board

The Labor Board, through representatives of the western, eastern, and southeastern carriers, has requested that a compilation be made showing what the annual saving would be if the present requests of the carriers for wage decreases were granted by the Board. This request is the outgrowth of a previous discussion between A. O. Wharton, labor member on the Board, and Mr. Higgins, as to the savings which might be passed on to the public in the form of lower freight and passenger rates.

Additional Testimony Presented by Several Carriers

The Board's session on March 8 was taken up with the presentation of evidence by various railroad officers in western territory who had acted as chairmen of state or city committees which gathered information as to the rates of pay, overtime provisions and hours of service of employees in other industries performing work comparable to that performed by railway shop employees. In addition, L. W. Baldwin, vice-president of the Illinois Central, G. S. Waad, vice-president and general manager of the Southern Pacific, Lines in Texas and Louisiana, and W. E. Williams, assistant to the chief operating officer of the Missouri, Kansas & Texas, presented short statements on behalf of their roads, pointing out conditions peculiar to the carriers in question and amplifying the testimony already presented on behalf of all western railroads by Mr. Higgins.

The "ability of the carrier to pay" again bobbed up before the Board at this session when B. W. Proctor, assistant general manager of the International & Great Northern, E. E. Nash, vice-president and general manager of the Minneapolis & St. Louis, W. H. Gemmill, president of the Minnesota & International, S. M. Russell, receiver of the Toledo, Peoria & Western, and B. A. Worthington, president of the Cincinnati, Indianapolis & Western, in separate presentations called attention to the financial condition of their roads and the necessity for consideration of their wage problems with this particular phase in mind.

W. A. Northcutt Appears on Behalf

of Southeastern Roads

W. A. Northcutt, general solicitor of the Louisville & Nashville, appeared before the Board on March 10, on behalf of the southeastern carriers filing exhibits dealing with revenues, expenses and railway operating income, employees and their compensation and the wage proposals of the southeastern roads. Mr. Northcutt briefly outlined the financial condition of the southeastern roads in general and cited the increases in labor costs on various carriers which he characterized as "the main cause for the deplorable condition" of those carriers to whom Herbert Hoover recently referred in his testimony before the Interstate Commerce Commission when he said, "in surveying the situation by districts we find that the whole of Class 1, southern roads, barely earned enough money to cover the interest on their bonds * * in spite of the fact that maintenance of the property had been held during that period to a low level."

After analyzing the increases in wage rates and the relation of these wage increases to increases in the cost of living, Mr. Northcutt added, "while the rate for machinists is now 77 cents per hour and we are proposing a split rate of 66 and 63 cents, outside industries in the territory served by the Atlantic Coast Line are paying a weighted average rate of 62.2 cents per hour; the Chesapeake & Ohio, 60.4 cents per hour, the Louisville & Nashville, 58.6 cents per hour, the Nashville, Chattanooga & St. Louis, 66.2 cents per hour, the Seaboard Air Line, 62.3 cents per hour and the Norfolk & Western, 39 cents per hour. Similarly

Mr. Northcutt showed that whereas the southeastern roads are paying boiler makers, blacksmiths, sheet metal and electrical workers, 77 cents per hour, the rate for employees performing analogous work in other industries along the southeastern lines are receiving rates ranging from 48 to 67½ cents per hour.

The testimony presented by Mr. Jewell during the remainder of the week was devoted wholly to an attempt to prove that the negotiations preceding the submission of this controversy to the Board were perfunctory and not in compliance with the terms of the Transportation Act. A great deal of time was taken up with the reading of transcripts of conferences held between representatives of the carriers and their employees and upon being questioned by the Board as to how much longer the presentation of testimony of this character would take Mr. Jewell indicated that it was his desire to offer proof of similar charges against practically all carriers parties to the dispute.

Clerical Forces on C. B. & Q. Agree to Wage Cut

Clerical employees of the Chicago, Burlington & Quincy have agreed to wage decreases averaging about six or seven per cent, according to a recent announcement. The lower rates of pay were effective on February 1 and are to remain in effect for at least one year. Although the agreement was reached in the latter part of January, it was not announced until recently. Its provisions may be summarized as follows:

The rates of pay for clerks and clerical supervisory forces are reduced to "a rate equal to \$39.28 over the rate received in December, 1917, for all those who were receiving \$62.50 or less in that month, except (a) that station baggagemen and mail handlers * * will not be reduced below \$67.50 per month, and (b) that baggage and mail truckers at Lincoln, Omaha, Union Pacific Transfer, Quincy and Galesburg who received less than \$62.50 per month in December, 1917, will not be reduced below \$93.62." For the group of employees designated as "train and engine crew callers, assistant station masters, train announcers, gatemen, and baggage and parcel room employees" the same ruling applies except that the new rate is equal to \$31.12 over the rate received in December, 1917, etc. Furthermore an adjustment "equivalent to a saving of one per cent per hour is made on all of the positions enumerated above such adjustment to be distributed by mutual agreement; piece work rates to be adjusted in proportion."

A reduction of seven cents per hour is provided for employees listed as "janitors, elevator and telephone switchboard operators, office, station and warehouse watchmen and employees engaged in assorting way bills and tickets, operating appliances or machines for perforating, addressing envelopes, numbering claims and other papers, gathering or distributing mail, adjusting cylinders and other similar work, * * office boys, messengers, chore boys and other employees, under 18 years of age, filling similar positions and station attendants."

Freight handlers and truckers and others similarly employed, upon entering the service, are to be started at "a minimum of 35 cents per hour and increased two cents per hour after each six months of continuous service until they receive rates of pay five cents per hour less than those now existing, except where reduction of five cents per hour would make them less than 35, the 35 cent rate shall obtain continuously. Piece work rates are to be adjusted in proportion."

The differential of one cent per hour between rates of pay of sealers, scalers and fruit and perishable inspectors and of two cents per hour between the rates of pay of stowers or stevedores, callers and loaders, locators and coopers and the rates of pay of truckers are continued "provided that those hereafter entering such positions will receive the respective differentials over the present truckers' rate reduced by five cents, except that if a trucker now in service and

not affected by such five cent decrease be promoted to a position (such as sealer, etc.) the differential over his present rate will be applied."

The employees named in the last two paragraphs "will be considered in service and not affected by the rate change, who have been laid off in reduction of forces * * ."

The rates of pay of all common laborers in and around stations, storehouses and warehouses are adjusted to conform to the "going rate" in the locality employed with a minimum rate of 30 cents per hour. The piece work rates of these employes are adjusted in proportion.

"New positions since December, 1917 or positions not now filled but which may be refilled when forces are enlarged as business picks up will be rated in conformity with the adjusted rates for positions of similar scope and responsibility. The foregoing contemplates the abandonment of the rates established for certain years of experience; and hereafter fixing rates for positions."

The Burlington did not apply to the Labor Board for decreases in the wages of clerical forces. Other western carriers have asked for reductions running from 10 to 15 per cent and for a reduction of the war time minimum from \$87.50 to \$73.22.

Insofar as the carrier is concerned the effect of this decision will be to permit of savings immediately instead of after extended hearings and a ruling by the Labor Board. Insofar as the employees involved are concerned it will eliminate the chances of a heavier cut by the Board.

Buffalo & Susquehanna Cited to Appear Before Board

A. M. Darlow, general manager of the Buffalo & Susquehanna, was cited by the Board to appear on March 14 to answer charges made by E. J. Manion, president of the Order of Railroad Telegraphers, to the effect that the Board's wage decisions have been violated by that carrier. The Buffalo & Susquehanna, Mr. Manion charged, defied the Board and cut the wages of operators and station agents, threatening the men with the loss of their positions unless they signed agreements to the reductions. Most of the men, Mr. Manion said, signed and later repudiated the agreements and refused to accept the reductions.

Commission Sustains Short Line Interpretation of "Deficit"

WASHINGTON, D. C.

THE INTERSTATE COMMERCE COMMISSION has issued a decision construing the word "deficit" as used in paragraph a of Section 204 of the Transportation Act, which provides for the reimbursement of the short lines for losses sustained during that part of the federal control period after they were relinquished by the Railroad Administration and were privately operated, to mean, "a deficiency or decrease in a carrier's railway operating income for that portion of the control period during which it operated its own railroad as compared with its average railway operating income for the corresponding portions of the test period."

Commissioners Meyer, Hall, Aitchison and Eastman dissented, on the ground that the word "deficit" has a very definite meaning which does not support the finding of the majority decision.

Paragraph c of Section 204 provided that as soon as practicable after March 1, 1920, the Commission should ascertain for every carrier, for every month of the federal control period during which its railroad was not under federal operation, its railway operating deficit, or its railway operating income and the average of its railway operating deficit or of its railway operating income for the three corresponding months of the test period; it being further provided that these "control returns" and "test returns" should be used as

bases for computing the amounts payable to the carriers. Pursuant to this requirement the Commission issued, on March 4, 1920, an order requiring the carriers to report the data deemed necessary in ascertaining these "returns." In this order it announced, in effect, that carriers which did not sustain a railway operating deficit for that portion of the federal control period during which they were privately operated were not covered by Section 204.

This announcement, the Commission now says, was made out of abundant caution at a time when it had had no opportunity to give to the section, especially to paragraph a thereof, the critical and mature consideration essential to its correct interpretation. Notwithstanding this announcement, various carriers whose railway properties were privately operated during a portion of the federal control period, and which, for such period of private operation as a whole, had railway operating incomes, but smaller incomes than their average incomes for corresponding portions of the test period, presented to it requests for certification of payments under Section 204. As it was still in doubt as to the proper construction of this section, these requests were informally denied. Thereupon these carriers asked for a hearing, which was held on November 4, 1921.

The Commission says in its report:

In paragraph a the term "carrier" is declared to mean a carrier which, among other things, "sustained a deficit in its railway operating income for that portion (as a whole) of the period of federal control during which it operated its own railroad or system of transportation." The phrase "deficit in its railway operating income," in that definition, is not employed by accountants. In the system of accounts prescribed by us, the phrase "railway operating deficit" is employed in a sense antithetical to "railway operating income," and, thus used, means an excess of operating expenses and taxes over operating revenues. It is apparent that the phrase, if employed to express the same idea, is an inaccurate use of words, which are self-contradictory. There is no doubt, however, that this phrase, "deficit in railway operating income," is used in paragraphs b, c and f to express an excess of railway operating expenses over railway operating revenues in one period without reference to another period, just as in paragraphs d and e the word "deficit" is used in the same sense. If this meaning be given to the phrase "deficit in railway operating income," as used in paragraph a the effect is to limit the benefits of Section 204 to those carriers which sustained railway operating deficits for that portion of the federal control period during which they were privately operated. The protestants contend that this construction results in injustice and unfair discrimination, in that it excludes from the benefits of the section those carriers which had a net income for that portion of the federal control period during which they were privately operated, although they may have suffered substantial decreases in income as compared with their incomes in the test period. They insist that Congress could not have intended such an inequitable result. And they point out that paragraph a may be harmonized with the remainder of the section by construing the phrase "deficit in railway operating income" to mean a deficiency or decrease in railway operating income, as compared with the average income for the corresponding portions of the test period.

The basic principle which underlies all rules of statutory construction is that the purpose, the intent of the lawmaker constitutes the law.

If the word "deficit" is construed as a deficiency or decrease in income under private operation in the federal control period as compared with the income during the test period, the definition of "carrier" is completely harmonized with both the letter and spirit of the remaining paragraphs of the section. If, however, this word is given its technical meaning as used by accountants, the effect is to make the right to reimbursement contingent upon the carrier's having sustained a technical or absolute deficit while privately operated in the federal control period, a result which is in direct conflict with the plan of reimbursement set forth in detail in the section. The rule is thoroughly established that if a word or phrase is susceptible of two constructions, one of which will effectuate the evident purpose of the statute and one of which is inconsistent or in conflict with that purpose, the former must control. We are, therefore, unable to resist the conclusion that, in the definition of "carrier" in paragraph a, Congress meant those carriers which sustained losses in income under private operation in the federal control period as compared with the test period.

The idea that Congress, in the definition of "carrier," intended

those carriers only which sustained actual deficits under private operation in the federal control period, is not only in direct conflict with the plan of reimbursement detailed in the remaining paragraphs of the section but it is negated by the fact that such a classification of carriers would be purely arbitrary and wholly unsupported by any sound reason. The purpose of the section is to reimburse carriers for losses sustained because of federal control. It is obvious that a carrier which had a net income under private operation in the federal control period may have sustained a loss by reason of federal control equal to or greater than that of a carrier which sustained a deficit during such period of private operation. And there is nothing in the circumstances surrounding these carriers which raises any presumption that those which sustained actual deficits were more necessitous than those which had net incomes. Moreover, such a classification leads to results which are so inequitable as to be absurd.

Commissioner Meyer, in his dissenting opinion, said that the holding of the majority, in his opinion, contemplates the payment of a large sum to the short line railroads without warrant of law, through the disregard of what was intended to be an important condition limiting the benefits of that section to carriers of a particular class. The effect of the majority opinion, he said, is to treat that portion of the definition of "carrier" under discussion as surplusage; for the process of computation detailed in paragraphs c, d, e, culminating in paragraph f, would in itself result in reimbursing all of the short lines in the amount of their decrease in income as compared with the test period income.

The word "deficit," he said, is one of frequent use in accounting, and when used in connection with railway earn-

our function to administer the law, not to make it. If Congress had intended to extend the terms of Section 204 to all short line roads, rather than to the more necessitous of such roads, appropriate language would have been used. If our former interpretation is incorrect, the courts could have rectified our error in an appropriate case; and, if correct, the remedy of the carriers, if any, is an appeal to Congress for an amendment of the law."

Freight Car Loading

WASHINGTON, D. C.

THE NUMBER of cars loaded with revenue freight during the week ended March 4 exceeded the 800,000 mark for the first time since the first part of November and showed a large increase as compared with the corresponding week of last year while nearly reaching the figure for 1920. The total was 803,255, as compared with 711,367 in 1921 and 811,106 in 1920. This was also 68,000 more than for the previous week which included a holiday. Gains as compared with last year were shown in the loading of all classes of commodities except livestock, forest products and ore, and in all districts except the southwestern. While much of the increase was in coal, large increases were also shown in grain, merchandise and miscellaneous. The summary follows:

REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

* Revised March 14, 1922.

ings has become so common as to have passed from the class of technical accounting terms. It occurs many times in the reports of the proceedings in Congress and before its committees prior to the passage of the transportation act. The word "deficit" is used 13 additional times in Section 204, and is also used in Section 209, and in all of these instances it is admitted that it has no reference to a comparison of the income for one period with that of another. It thus appears, he said, that the application of the word in paragraph (a) of Section 204, as contended for by the short lines and accepted by the majority, is without precedent or parallel.

"The majority report," Commissioner Meyer said, "appears to be animated by a belief that hardship will be suffered by certain short lines if we adhere to the interpretation twice placed by us upon this section. But, if true, this would not justify us in extending the benefits conferred by Section 204 beyond the limits placed upon them by Congress. It is

The freight car surplus showed another reduction during the week ended February 28 to 245,100, of which 95,361 were box cars and 97,634 were coal cars while 19,955 were stock cars.

THE TRANS-CANADA LIMITED, the Canadian Pacific train which is run daily during the summer months between Montreal and Vancouver, in addition to the all-year-round train known as the Imperial, will be put in service on May 21. The equipment involved in the running of this train is valued at about \$600,000 as the daily run involves the operation of 59 sleeping cars, 15 dining cars, 12 observation cars, 5 compartment cars, 12 baggage cars, and 24 locomotives. The through trains between Vancouver, Minneapolis, St. Paul and Chicago, known as No. 13 and No. 14, will be put in service in connection with the Soo Line on June 24.

Can We Look to the Tropics for Our Tie Supply?

Two Writers Point Out the Impossibility of Drawing On These Regions for Relief in the Near Future

WITH EACH recurring agitation concerning the depletion of the forest resources of North America, the attention of railway men is directed towards the large forests in the tropical areas of South America and elsewhere. This has led to considerable study of the timbers in these areas with particular reference to their suitability for use as ties under the climatic and service conditions existing in this country. The results of two such investigations are abstracted below.

The Feasibility of Introducing Tropical Ties in the United States*

By Nelson Courtlandt Brown

The question of our future tie supply in the United States has long been an important one and is growing more serious each year. This problem will some day be acute and it must be solved (1) by growing a sufficient tie supply in our native American forests by an improved system of forestry, (2) by making both our present and future native supplies last longer by preservative treatment and proper tie protective devices, or (3) by the introduction of ties from foreign sources of supply.

A study of the world's timber supply and the interdependence of various nations upon each other for their wood supplies has demonstrated that the tropics are the only regions of large timber supply left and that comparatively little exact scientific knowledge is available regarding them. By the tropics we must consider not only those nearby such as the West Indies, Central America, and northern South America, but also the Philippines, Africa, the Far East and the Pacific islands included in the tropical zone. The nearby regions such as the West Indies and Central and South America are, of course, of greatest interest.

Ties have been brought here from Cuba, Columbia, Brazil, Argentine and Africa, as well as Venezuela. Generally speaking, the atmosphere and soil conditions are much more severe, as affecting the life and utility of ties, in those countries than in this country. Moisture, warm air, etc., induce the growth of fungi which cause decay and in addition they commonly have white ants, etc., which are exceedingly destructive to these woods.

About 25,000 ties were imported from the Amazon district of Brazil and placed in the tracks of about five eastern railways in 1915, 1916 and 1917. One railway placed 5,000 ties, including 15 to 20 different varieties of hard, heavy

woods from Brazil. They were presumably well-seasoned when put into service. It is reported that all have failed and have been removed from the track during the past year except one species locally known as Masaranadauba. The failure was reported due principally to "brooming" and to some extent to decay. All of these ties were 7 in. by 9 in. by 8½ ft. Among the 5,000 ties tried out by the one railroad, many had to be removed during the second summer and a large percentage had to be removed during the fourth summer of service on account of severe checking and "brooming." All of these ties had been adzed and bored at a treating plant but were used untreated.

In British Guiana tests were made by a local railway on 13 varieties of treated native wood and Baltic pine. The native woods were all of hardwood, measuring 4½ in. by 9 in. by 9 ft. long. The ties were grooved ½ in. in depth to receive the rails and bored with ⅞ in. holes for nail spikes. After eight years all varieties except

three were sound and in good condition. These three were Kautaballi, untreated Mora and treated Baltic pine which was badly decayed throughout. The latter wood is the one chiefly used by European railways and lasts about 25 years in England when treated. The tests showed that: (1) The native woods, after treatment, were far superior to the treated Baltic pine; (2) mora and wallaba (*Eperua falcata*), when treated, resist decay under extremely adverse conditions of climate, precipitation and poor ballast.

Both mora and wallaba are abundantly available and can be produced fairly cheaply. There are three varieties of mora of which the red mora (*Dimorphandra mora*) is by far the best. When properly seasoned it makes an excellent tie timber. This experiment would seem to bear out the contention that tropical ties should be used only when treated. If this is so, it is unlikely that we shall look to the tropics to supply any considerable portion of our cross tie supply for a long time to come.

One large American railway carried on a test covering 30 varieties of tropical ties, chiefly of South American origin. Most of these failed in seven years due to both splitting and decay. Some only lasted two to five years while a few such as mora, cacaque, roble pellin and quebracho remained for 10 to 12 years except the mora, which varied in service from 4 to 12 years.

Another railway in the east used several thousand Brazilian ties in recent years. Of 2,647 ties examined closely, 827 were removed from the track on account of splitting and

*Abstracted from a paper presented before the annual convention of the American Wood Preservers' Association at Chicago on January 25.

"brooming" and decay after a service of 2½ to 3½ years. The engineer of tests stated that many more will have to be removed after slightly longer service.

To sum up the situation:

1—No definite conclusions can be established regarding the feasibility of introducing tropical ties on account of lack of definite experimental tests on a sufficient scale.

2—Great confusion exists in nomenclature and classification.

3—Too little is known of the relative merits, such as durability, etc., of these woods, even in their native habitat.

4—Very little is known of the seasoning qualities, with particular reference to the effect of changes of climate and temperature on their usefulness.

The Tropical Hardwood Tie Question

C. D. Meil.

People who like to talk in millions should revel in discussing the propositions pertaining to tropical hardwood ties for the American markets. There are few subjects about which there is so much idle speculation as the tie question. When a promoter of tropical woods hears that the railroads in the United States use about 110,000,000 ties annually, that the forests producing them are being rapidly depleted, and that the prices are high, he concludes at once that there must be a sure outlet for his wood in the form of ties for use in the United States.

He soon discovers that there are more than 70 different kinds of woods in this country which are being accepted by railroads here for ties, and that the demand has never exceeded the supply. Moreover, he soon learns that the prices paid for ties of native-grown timbers are much less than he had anticipated and also that railroads will not become interested in foreign woods for ties about which there are no data as to their fitness. It is safe to predict that another 20 years will pass before American capital will become interested in so speculative a venture as a tropical tie operation.

Entirely aside from the doubt whether the woods are hard and durable enough for tie purposes in the United States, the promoter or the timber owner himself is invariably uninformed as to what the railroads here require in the way of specifications. It is, of course, a relatively easy matter to teach the men in the forest to reduce the logs to a specified dimension so that the ties will pass inspection as far as their sizes are concerned, but there are other requirements that ties must meet and there are many kinds of defects which may render them unavailable. Trees in the tropical forests do not grow according to prescribed rules; the struggle for light and growing space is far keener in the dense forests of the tropical regions than it is in most parts of the temperate zone. It is hardly an exaggeration to say that 90 per cent of the trees large enough to yield ties of the required sizes are too defective to make them available for making ties. Of the remaining 10 per cent fully half are too valuable for other purposes and could not be turned into ties except at a distinct loss. This means, then, that only 5 per cent of the trees in the average tropical forest are available for use as ties, provided, of course, that they are not rendered unfit by improper felling.

Few promoters are considering carefully the question of inspection. Whether this is done at the point of origin or at the port of entry in the States there will doubtless be a good many rejections or at least degrading if the contract should call for more than one class. As already stated the logs or trunks of trees in the average tropical forest are as a rule very defective, which invariably will show in one form or another in the finished ties. These defects, minor as many of them might appear, will nevertheless constitute the most serious drawback to the tropical tie business. This was illus-

trated by a small parcel of about two dozen sample ties from South America that arrived in New York about two years ago. These ties were selected especially to meet the approval of probable buyers of a half million ties that were offered, but a cursory examination of the lot revealed the fact that there was not a single tie among them that would have answered the specifications under the most lax inspection. In another instance over 60 per cent of a lot of about 200,000 ties cut some years ago in Colombia for use in Panama were rejected by the inspectors, which was more than sufficient to wipe out all possible profits in the transaction.

In considering this problem one must bear in mind that there is a demand locally in all the tropical American countries for logs and lumber from the native forests. The very best timbers are the kinds in common use, and in almost every instance these are the very woods that would be available for ties. The market price for such wood is based on what the native labor is willing to get the material out of the forest and deliver it to the market for. The cheapest way, and, at present the only practical way, to get these logs out is that followed by the native woodsmen, whose wages are calculated on their native monetary basis. The price set by local operators for logs delivered to market will be more advantageous to American operators than that which their logs of similar quality and sizes would bring, if they were reduced to ties and delivered to the United States.

In all tropical American countries there is a demand for ties and even in Brazil, where forests without end are said to occur, there is often a shortage of ties. The specifications there are less rigid than in the United States. Crooked ties will do as well as perfectly straight ones. Knotty, split, grooved and inbarky with sap are usually included among ties used in the tropics. Even logwood logs are used and as a rule they are very irregular. Thus, all things considered, the prospects for selling ties from the tropical woods are better in the tropics than in the United States. So long as there is no shortage of ties produced in the United States, it would seem highly inadvisable to attempt to bring untried woods here when the ocean freight alone may be equal to the cost of the untreated ties of known lasting qualities laid down alongside the tracks of the consuming lines.

THE MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE has announced its intention to transport free of charge all supplies given by the citizens of Wisconsin for the American Committee of Russian Famine Relief.

What Shop Equipment Means To a Railroad*

Central Railway Club Discusses Relation of Maintenance and
Repair Facilities to Equipment Owned

By V. Z. Caracristi
Consulting Engineer, New York

RAILROAD MOTIVE POWER departments are continually being pressed for reasons why they demand from the higher officials appropriations to cover machine tools and shop facilities, and the repetition of statements that these facilities are required to take care of current work is usually countered by explaining that the need for such facilities will have disappeared by the time the equipment and facilities can be received and installed. Operating revenue, having so many mouths to feed, must be largely conserved for purposes which cannot be deferred, and in the face of the large demands, the weak voice of the motive power department is drowned by the clamor of what at the moment appear to be more important demands.

Starting out on the basis that there can be no question as to the necessity for providing facilities of some nature to take care of each unit of power or equipment acquired, I am endeavoring to crystallize the tangible requirements and to point out the reasons why such requirements exist. Eliminating the equally important necessity for yard and terminal facilities, I would like to offer a chart (Fig. 1) showing the expenditures which experience has led me to believe necessary to take care of the locomotives and cars coming immediately under the jurisdiction of the motive power department.

To summarize, the object of this paper is to point out briefly the reason why equipment is compelled to stand idle when it should be at its best condition to meet operating demands, as well as to endeavor to create as a basis for further discussion the actual capital requirements in terms of equipment owned or in future to be purchased.

Available Hauling Capacity Not Utilized

As a matter of interest the data (Tables 1 and 2) on actual locomotive operation are submitted, locomotives being selected for the reason that they offer a well-defined measuring stick

to compare relatively what is being accomplished by them in repayment for the labor, material, and money which have gone toward their creation. This measuring stick can best be expressed by their hauling capacity. The relation between weight, hauling capacity, and cost is practically constant. A definite amount of weight is necessary for each pound of hauling capacity available, and the locomotives are themselves purchased indirectly on a weight basis.

The purchase of additional hauling capacity immediately entails an obligation on the part of the purchaser to utilize such facilities, and to secure revenue therefrom through the handling of freight or passengers.

The uniform system of accounting used by railroads, based on regulations of the Interstate Commerce Commission makes available as a whole the total tractive power and ton-miles of freight hauled.

In order to make a division line between the freight and passenger service, it is necessary to convert passenger earnings into ton-miles. In my opinion this conversion can best be made on a basis of earning capacity, for which purpose the equated ton-miles on passenger basis can be obtained by multiplying the ton-miles of freight by the total passenger revenue and dividing this figure by the total freight revenue, the underlying thought being that the decreased tonnage will be offset by the increased rate. Such figures, although perhaps of no other value, will result in a ton-mile basis which is comparative from year to year. A comparison made on this basis, using Interstate Commerce Commission statistics of Class I railroads for the years 1902 to 1919 inclusive, brings out startlingly the fact that in spite of advanced facilities in design during the 18-year period the amount of work performed by the locomotive was seriously decreased, as is evidenced by the fact that the increase in tonnage available was 233 per cent; the increase in the number of locomotives was 173 per cent, with an increase in the hauling capacity of 299 per cent. The efficiency of the 1902 locomotive being used as a basis, the railroads during the year 1917 could have

*Abstract of a paper read before the March 9, 1922, meeting of the Central Railway Club at the Hotel Iroquois, Buffalo, N. Y.

handled \$6,000,000,000 more revenue ton-miles than they did; in 1918, 76,000,000,000 more revenue ton-miles, and in 1919, 139,000,000,000 more revenue ton-miles.

In other words, had each pound of tractive power been utilized at the same efficiency as in 1902 there would have been a large surplus of locomotives during these peak periods.

These analyses cover totals for the 12 months of each year, and it may be claimed that peak traffic demands during individual months produced conditions not reflected by the yearly average. However, it should be remembered that the

power delays brought about by inadequacy of repair shop facilities. Power of sizes and weights out of line with shop equipment result not only in increased repair expense but what is more serious, in great delay in getting power back into service.

Adequate provisions in the way of machine tools will have a great influence on recovering, if not passing established records previously made in ton-miles per pound of tractive power available.

Capital account expenditures cannot be made to better

TABLE I—COMPARATIVE ANNUAL STATISTICS OF LOCOMOTIVE OPERATION ON CLASS I ROADS

Year	No. locomotives, total	Tractive power total pounds	Revenue ton miles	Total passenger revenue, dollars	Freight train revenue, dollars	Equated ton miles passenger	Equated ton miles, to all freight and passenger
1902	37,516	768,502,279	157,289,370,000	\$392,963,243	\$1,207,228,000	51,109,045,250	208,398,415,250

* Does not include returns from terminal and switching companies.
† Excluding mail, express, milk, parlor cars, switch and special train income.
‡ Equated ton miles = passenger = ton miles (freight) X passenger revenue.

Freight revenue

relative peaks which existed during 1902 also existed in 1919. In other words, seasonal demands will not startlingly increase without reflection in the traffic during those months of lesser traffic movement.

Lack of Repair Facilities Decreases Net Returns

The reasons for the decrease in economic returns are a little complex, but they can be roughly analyzed as follows: (a) The increased ratio of the power available does not appear to be serious.

(b) The lack of corresponding increases in terminal facilities in the way of increased length of receiving tracks, etc., as well as lack of expenditures for increased passenger facilities, are serious.

(c) The dominating influence affecting the decrease in work performed per unit of power available lies in the lack of capital expenditures for maintenance of equipment purposes. Individual road performance and increase in tonnage per locomotive mile run has been more than offset by motive

advantage at this time in any direction by the railroads than through provisions for modern repair shops and equipment.

The selection of machine tools, traveling cranes, small tools, jigs and fixtures can easily be made to meet any motive power requirements. The principal danger in the selection of machine tools is in giving undue weight to maximum performance of individual items.

The purchase and installation of special high-powered individual-purpose tools should be made only after the most minute analysis of the actual immediate and prospective requirements. Each expenditure in the way of machine tool facilities should be made so as to give the maximum return in the way of plant output and not considered on the basis of the output of the individual unit. Over-equipment of individual departments does not assist either the time or cost element of a locomotive which has to be passed through all the departments of the repair terminal.

Equipment Maintenance in Slack Periods

It is well to point out the fact that the railroads of this country have been, and now are, compelled to operate under serious handicaps in order to meet the current financial requirements necessary to keep them out of the hands of receivers.

A more specific explanation for the reasons resulting in this condition is readily found in either one or a combination of the following facts, all of which are subject to correction either by the railroads or the Interstate Commerce Commission.

First. The railroad companies appear to have purchased power at a higher ratio than the normal increase in tonnage available justified, causing power to remain idle.

Second. In the efforts of railroad officials to maintain a uniform ratio between income and expense, it is customary to reduce the maintenance of equipment appropriations during the slack months, thus causing the power in many cases, to be unavailable to take care of the peak load transportation in the fall and winter months without the assistance of the locomotive builders.

TABLE II—SUPPLEMENTARY DATA ON CLASS I ROADS' LOCOMOTIVE OPERATION

Year	Ton miles per lb. tractive power	Ratio of passenger to freight earnings	Capacity at 1902 efficiency	Surplus capacity, ton miles		Per cent	Earnings per lb. tractive power available
				9	10

1919	117.7	1.116	6,419,619,967	19,111,177,666	38.6	2.05	

Third. Unfortunately, it has been the custom of motive power and transportation officials when purchasing new power, to endeavor to "keep up with the Joneses" by purchasing power in large sizes, and in a number of cases the tonnage available, yard facilities, bridge, and right-of-way limitations, and other local causes have prevented the full utilization of all of the extra drawbar pull available.

Fourth. Labor conditions, both in the transportation and motive power departments, have tended to decrease power and operating efficiencies.

Fifth. The amount of money expended by the railroads for logical repair shop facilities has been lamentably out of proportion with the amount of money expended for motive power and cars, resulting in inadequate facilities for needed repair and modernizing work. The reason for this is probably due somewhat to the fact that it is easier to secure financial assistance through car or locomotive trust certificates than it is to secure money on blanket or other mortgages to be used for the purpose of shop extensions or construction.

Sixth. The analysis of data from individual railroads shows that the purchase of power has in some cases been

power just out of the builder's shop, the enormous size of the economic loss to the railroads can be visualized.

I am not an advocate of the attachment on the locomotive of every piece of apparatus that presents itself which theoretically might affect savings in operation, and I do not belittle the value of cold-blooded analysis of what the over-all economic results of each individual application will mean to the railroad organization as a whole. There are so many conditions of local operation which affect and govern, that each proposal can only be made the subject matter of intelligent decision by those intimately familiar with the governing factors.

A locomotive, when out of service for the most trivial cause, is just as expensive to the property as a whole as one legitimately tied up waiting for periodical over-hauling, and too much attention cannot be devoted to the necessity for adequate facilities. Each railroad should have every locomotive surveyed to determine if its useful life is actually finished through use or inadequacy, and if there is not the possibility of placing this engine on an equal basis with an engine just received from the builder, through application in its own shops of such modern improvements as super-heaters, feed water heaters, cut-off indicators, brick arches, power reverse gears, valve gears, etc.

Trust Certificates Suggested for Betterment Work

Full capital account credit should be given for all betterment work and additions made to old power, and a new value placed on the entire locomotive after the completion of such betterments, in line with its ability to compete with a new unit of equal capacity, irrespective of its old arbitrary or book value. A market might be created for equipment betterment trust certificates to cover a proportion of the capital account betterment cost. Such certificates would have more equity behind them than if applied against new units, and would make available the necessary capital to rehabilitate railroad property with the advantage of utilizing in full capital previously expended.

Repair work should be equalized over the 12-months' period by arbitrary charges against income in the months of great business for credit and use during periods of revenue depressions.

Each purchase of new locomotive equipment should be made the subject of special study by the accounting, motive power and transportation officials assisted by outside advice if necessary, to determine: (a) Actual necessity, (b) size and capacity which will give the greatest net returns to the company, (c) type.

Locomotive purchases are in nearly all cases made at a time when erecting shop space is at a premium. This condition could be obviated by cold-blooded expenditures for repair facilities in combination with the scrapping of all papers relative to monthly budget allowance for maintenance of equipment work.

The railroad repair shops are usually operated at their peak during those months in which the cost of doing the work is at its highest, and what little organization remains in the spring time is engaged in hoeing the grass between the stones of the shop highways. The fluctuations in the pay-roll of both the classified and running repair shops are appalling, and these fluctuations are largely brought about by the month-to-month method of accounting and record-keeping in vogue by the transportation systems. Expending freely for maintenance account when earnings are temporarily good, at the expense of a starvation policy when earnings fall off due to natural seasonal conditions, is not a good business policy.

Explanation of Chart

This chart (Fig. 1) represents the amount of capital necessary for repair facilities, including yard, track, and

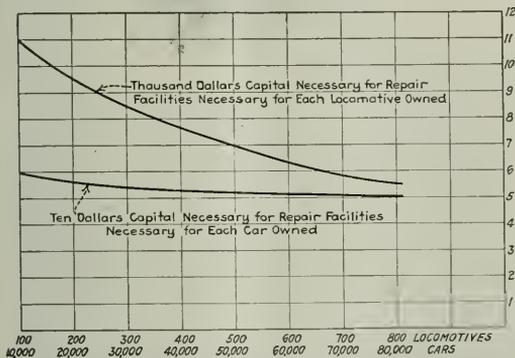

Fig. 1—Chart Showing Desirable Relation of Repair Facilities to Equipment Owned

justified and that the tons hauled per pound of available tractive power show decreases not out of line with changes in operating and labor conditions.

Taken as a whole, however, the figures clearly indicate a tendency to purchase power in advance of traffic requirements and further show inadequate provision for the round-house and general repair work necessary to keep the investment for power active.

Lack of Shop Facilities Delays Improvement Programs

The lack of adequate shop facilities is the greatest factor obstructing the purchase and application of modern fuel saving or other devices which would permit the increase of revenue ton-miles per pound of tractive power available. Lack of facilities to take care of such equipment when installed, and the fact of additional engine failures and delays has naturally resulted in the motive power department's being averse to take on additional obligations for maintenance with the fore-knowledge of inability properly to care for the same. As a matter of self-defense this tendency is a natural one, and as long as reasonably adequate supplies of tools and facilities are not available the position is well justified.

When the fact is taken into consideration that progress in locomotive development in the past few years has been almost entirely in the direction of devices which can be applied to existing power, and that the application of such equipment will make any existing locomotive as efficient as one of equal

other work, for every locomotive added to the property.

For instance, a property having 500 locomotives should have, in the way of facilities for the repair and upkeep of these locomotives, property having a value of \$3,500,000, and if 50 additional locomotives were purchased, the amount of money which should be expended for addition to the repair facilities is \$6,700 for each locomotive, or \$325,000 for 50, thus making the amount of money expended in facilities for the repair and upkeep of 550 locomotives \$3,825,000.

Fig. 1 also shows the amount of money which should be expended for capital account purchases in the way of repairs, tracks, and facilities for the running and heavy repairs of freight cars. It will be evident that a property having 20,000 cars should have an investment of this nature having a value of \$1,140,000 and in the event of the addition of 2,000 cars, \$56.00 represents the amount of investment necessary to take care of each car, or a total of \$112,000, thus making the total investment to take care of 22,000 cars \$1,252,000.

Freight Transportation de Luxe

THE PICTURE shown below represents the special hundred-car freight train, filled with Durant automobiles (described in the *Railway Age* of February 4, pages 339 and 340), as it passed around the Horse Shoe Curve on the Pennsylvania Railroad, about eight miles west of Altoona, Pa., on January 6, last. In this unique photograph it is possible to distinguish more than 90 of the 100 cars in the train; and by the exercise of a little imagination it is possible to do so in the reduced-size engraving here shown.

An officer of the Pennsylvania informs us that the train of 100 cars was kept intact from Greenville (Jersey City) to Ogden, Utah, 2,387 miles. At the time this picture was taken there were four locomotives, two at the front and two at the rear.

The train started from Greenville on Monday, January 2;

Train of 100 Cars, Ascending Grade at Horse Shoe Curve on the Pennsylvania

The leading locomotives, seen at the extreme upper left hand corner of this picture, are about seventy-five feet higher than the cahoose, which appears in the foreground.

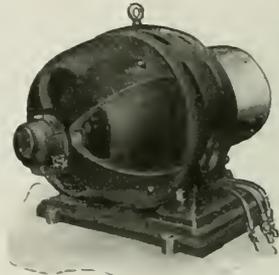

it was stopped over night at Harrisburg, Pa., and over two days at Altoona.

At Ogden it was divided into two trains of 50 cars each, and these trains left there on Tuesday, January 17, arriving at Sacramento, Cal., 3,080 miles from the starting point, on Thursday morning, January 19. As noted in our former article, the train was routed through various cities for advertising purposes and the time through, 17 days, includes many stops.

Self-Starting Induction Motors

THREE-PHASE induction motors with a centrifugal switch and a resistance mounted in the rotor have been developed by the Triumph Electric Company, Cincinnati, Ohio, which are called self-starting motors. All 3-phase induction motors are self-starting, but the feature of this particular type is that high torque is provided automatically at the time of starting.

The more common types of induction motors which are

A 50 h p. Motor May Be Started with a Single Throw Switch

provided with a wound rotor and resistance for the purpose of obtaining high starting torque, are equipped with an external resistance starting control or with a resistance mounted in the rotor. This resistance affords the desired starting torque and it is cut out by a hand operation when the motor attains full speed so that high power factor and high efficiency may be obtained when the motor is working under load. The fundamental difference of the Triumph motors is that this resistance, mounted in the rotor, is cut out by an automatic switch when the motor reaches normal speed.

The centrifugal governor is mounted on the shaft inside the end bracket and is entirely automatic and independent of the operator. The stator frame is made of close grained soft iron and is bolted to a cast iron base. The bearings are made of bronze and are provided with pressure release grooves drained to the oil well. The "TR" automatic induction motors, as they are called, are made in sizes ranging from 3 hp. to 50 hp., and are designed for operation on 220, 440, or 550-volt, two or three-phase, 60-cycle circuits.

Gasoline Motor Cars with Four-Wheel Drive

For Passenger, Freight and Light Switching; Increased Tractive Effort by Using All Wheels as Drivers

INCLUDED among the rail motor cars now in service are a number manufactured by the Four-Wheel Drive Auto Company of Clintonville, Wis. As the driving power on these cars is applied to all four wheels they have a number of advantages over cars which are driven by only one pair of wheels. Making every wheel a driving wheel and equally distributing the load over the wheels gives the car the greatest possible adhesion and permits the use of high tractive effort. This is important on roads which have numerous steep grades or are located in sections where winter weather is severe and the rails often are covered with snow and ice. In actual operation the cars have travelled over rails covered with

manufacturer, anticipating its use for such purposes, has applied standard M. C. B. couplers on the front and rear of the car. This enables owners to attach trailers and increase the carrying capacity to meet traffic demands.

Details of Design

The standard rail motor car chassis weighs 8,400 lb. and has a 13-ft. wheelbase. The frame is 16 ft. 8 in. long and 3 ft. wide. The wheels are 36 in. diameter with rolled steel rims of M. C. B. contour. Both axles are of the rigid type, full floating. The engine has four cylinders, each 5.1 in. diameter by 5.5 in. stroke, and a power rating of 42 hp.,

Four-Wheel Drive Rail Car Used on a Sixty-Mile Run Between New Orleans and Buras

snow to a depth of approximately one foot and in places drifted to a depth of two feet. This was done with little difficulty and without falling behind the regular schedule.

Another advantage gained through the application of power to each of the four wheels is that it eliminates the necessity of a pony truck. When rounding a curve, the differentials in the front and rear axles take care of the difference in speeds of the wheels on the inside and outside tracks and do away with the rail climbing action which has given trouble on rear driven rail equipment. At Clintonville, where numerous demonstrations in freight and passenger service have been given, there is a 16 deg. curve at one place in the track. Train operators are warned not to exceed a speed of 15 m.p.h. on this curve, yet during these demonstrations the motor cars have rounded it with ease at a speed of 23 m.p.h.

The increased available adhesion resulting from the four-wheel drive principle peculiarly adapts this type of car to use with trailers or for light hauling and switching. The

S. A. E. rules, but actually develops 68 hp. on a brake test. The transmission provides for three speeds. There is a choice of five gear ratios ranging between 5 to 1 and 12.05 to 1, which are suitable for speeds in high of 35, 30, 25, 20 or 14 m. p. h. With a gear ratio of 5 to 1 the maximum drawbar pull is 1,968 lb. at 8.7 m.p.h. and 492 lb. at 35 m.p.h. while with a gear ratio of 12.05 to 1 the drawbar pull is 4,755 lb. at 3.5 m.p.h. and 1,189 lb. at 14 m.p.h.

The car is equipped with a high-speed reverse gear which enables it to travel at the same speed in reverse as it does forward. This reverse mechanism is composed of a nest of bevel gears on the order of the conventional bevel gear differential, only much larger and of superior design and construction.

There is a service foot brake and an emergency hand brake, both of the external band type. In addition, Westinghouse air brakes can be applied if desired. Sanders are located at both ends.

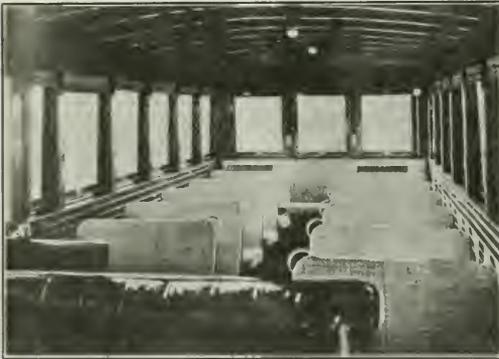

An outstanding feature of the FWD design is the readi-

ness and cheapness with which it can be converted from a highway truck to an efficient car for railway service. This fact is borne out by the continual increase in the number operated by the government at various arsenals and proving grounds throughout the country. There is now a total of 28 FWD cars in government service operating on rails, all of which were formerly used on highways and were converted at only the expense necessary to change from rubber tires to flanged steel rims, mount standard M. C. B. couplers front and rear, and install a high-speed reverse gear and a sanding device. Where cars are to be used for passenger service the expense of conversion must include body equipment and is, of course, somewhat greater.

Cars Now in Service

The first truck of this type put into operation on rails was a standard three-ton truck converted by the Northwestern Pacific at San Francisco, Cal., into a car suitable for light switching. A tunnel was being constructed and it was found that a steam locomotive filled the tunnel with smoke and made it impossible for the men to see or breathe after the engine had been inside. After investigation, the FWD truck was decided upon and with little expense one of them was converted into a car which filled the requirements so well that it is still being operated in light switching service.

At New Orleans, La., an FWD rail passenger car seating

Interior of Passenger Car on New Orleans & Lower Coast

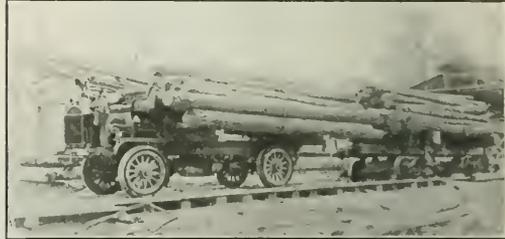

32 persons, operates on a 60-mile run between that city and Buras over the New Orleans & Lower Coast. This car makes one round trip, or a total of 120 miles per day. Latest reports show that the car, during a period of 13 months, operated at an average cost of 15 cents per mile as compared to 90 cents per mile with a steam train. These figures include operator's wages, fuel, lubrication, supplies, maintenance and insurance but do not include anything for depreciation. The motor car averaged $7\frac{1}{2}$ miles per gallon of gasoline. This short line formerly operated a steam train at a loss and was obliged to discontinue service during the war. After the war it purchased a gasoline rail car and resumed operations. It was then found that not only was this car cheaper to operate but, with its weight of $6\frac{1}{4}$ tons, the depreciation of the track was much less than with the 25-ton locomotive hauling one or two 15-ton coaches.

The New Orleans & Lower Coast Railroad has, with this rail car, operated at a comfortable profit and has since the inauguration of this service enjoyed such a substantial increase in patronage that it has become necessary to increase the capacity by the purchase of a trailer coach, which will seat 40 passengers. This installation is a good illustration of what the rail car can accomplish for short line rail roads and on short runs on main line tracks.

The Oil Fields Short Line, which operates from Dilworth, Okla., in the oil fields to Clifford, where it connects with the St. Louis & San Francisco, is at present installing an FWD rail car. This line is only about six miles in length and the traffic is too light to warrant the operation of a steam train. This is typical of numerous short lines throughout the country, which might operate more successfully with a light rail car than with a heavy steam train.

The Ashley Lumber Company of Hamburg, Ark., uses one of these cars for hauling logs from the woods to their mill. The car operates satisfactorily with trailers and gives a cheap and efficient service.

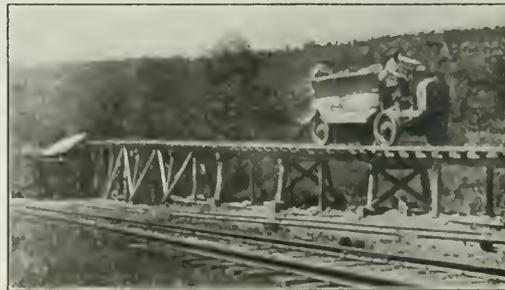

At Rockland, Mich., the Michigan Copper Mining Company operates a rail car which is equipped with a steel side dump body and is used for hauling ore from the mine to

The Ashley Lumber Company Employs a Motor Car to Haul Logs from Woods to Mill

railroad cars, a distance of about one mile. In 1919 when the mine was operating at full capacity this car operated continuously and hauled on an average of 219 tons of ore per day.

The Cripple Creek Consolidated Gold Mining & Milling Company of Cripple Creek, Colo., is operating a motor car on rails between their mines and the city of Cripple Creek. This car was formerly a standard three-ton truck used for road service, but was converted into a rail car and equipped with a passenger body which has a seating capacity of ap-

A Rail Motor Car with Dump Body Hauls Copper Ore from Mine to Main Line Connection

proximately 30 persons. It is used for hauling miners and from the mines.

Including those operated by the government, there are now over 60 four-wheel drive rail motor cars in freight and passenger service in the United States and foreign countries.

THE PROVINCE OF ALBERTA announces that 93 miles of new railway was constructed in the province last year, bringing the total mileage up to 4,789, as compared with 1,782 in 1910, and 1,060 in 1905.

General News Department

The Shops of the Pennsylvania at Olean, N. Y., were damaged by fire on March 5; estimated total loss including some damage to 25 locomotives, \$100,000. The number of men at work in these shops was about 300.

Sleeping Car Conductors Meet in Chicago

The national convention of the Order of Sleeping Car Conductors was held at Chicago during the first three days of this week. This organization has negotiated a working agreement with the Pullman Company and is one of the labor groups not before the Railroad Labor Board in the present wage hearing.

Disastrous Fire Wrecks Burlington's

General Office Building

The 15-story general office building of the Chicago, Burlington & Quincy at Chicago was badly damaged by fire on March 15. The fire started at one o'clock in the morning in a neighboring building and soon spread throughout the Union Station business district, destroying several large structures. The upper seven floors of the Burlington building were seriously damaged, nothing but the main partition walls remaining. Many important papers, valuation records and engineering plans were lost.

Legislates Against Branch Line Abandonments

By a vote of 18 to 17, the Kentucky State Senate defeated the Perry bill on March 8, providing for the abandonment of branch lines in that State. The bill was originally intended to permit the abandonment of a nine-mile branch line of the Southern between Burgin, Ky., and Harrodsburg.

Santa Fe's Solicitation Campaign

For the past two months the Atchison, Topeka & Santa Fe has been conducting a campaign for the solicitation of business by employees. Post cards bearing well-worded "traffic tips" have been distributed widely among employees and their co-operation requested. An employee filling out a card puts upon it the names and addresses of business prospects, and sends it to the proper division superintendent, who, in turn, places it in the hands of a local agent. The enthusiasm with which the employees have entered into the work has accomplished results, and the campaign is to be continued.

Derailment at Union City, Ga.

Seven passengers (two of them employees of the road) were killed and 16 injured in the derailment of the rear car of a passenger train on the Atlanta, Birmingham & Atlantic, near Union City, Ga., on March 13. The car was derailed by the breaking of a wheel while on a trestle, or just before entering on the trestle, and broke away from the car ahead of it and fell 50 ft. to the stream below. The occupants of the car numbered about 30 altogether, and a number of the injured were not expected to live. The Receiver of the road issued a statement saying that the wheel that broke was a new one.

Power Brake Investigation

The Interstate Commerce Commission, in connection with its investigation of power brakes and appliances, has ordered that upon application of Clark & La Roe, attorneys for the Automatic Straight Air Brake Company, the deposition of F. K. Vial of Chicago, with respect to the authorship and the subject matter stated in a certain communication addressed by him to H. I. Miller, president, Automatic Straight Air Brake Company, New York, N. Y., under date of September 20, 1918; and also with respect to the authorship of and the subject matter in a paper

read before the Richmond Railroad Club, April, 1915, "The Chilled Iron Wheel," be taken before Examiner John T. Money, at the offices of said Vial, in Chicago, on March 20.

I. C. C. Proposes Conference With State Commissions

The Interstate Commerce Commission has addressed a letter to President Jackson of the National Association of Railway and Utilities Commissioners suggesting a conference to be arranged in the near future between a committee representing the association and a committee representing the commission. The commission wishes particularly to consider what can appropriately be done in view of the declarations made by the Supreme Court in its decision in the Wisconsin intrastate rate case, in which it was stated that although the commission had authority to order increases in the state rates to prevent discrimination, conference between the Interstate Commerce Commission and the state commissioners may dispense with the necessity for any rigid federal order as to the intrastate rates, and leave to the state commissions power to deal with them and increase or reduce them at their discretion. The commission says it could participate in such a conference if it were held in Washington at any time during the latter part of this month after the 14th.

Labor Board to Investigate Erie's

Contract with Meadville Company

The Labor Board has ordered a thorough investigation of a contract for shop work which the Erie has made since the subject of contract work came before the Board and has authorized a member of the Board to make an investigation and "invoke the aid and counsel of the Department of Justice." The resolution ordering this investigation specifically mentions the contract made recently with the Meadville Machinery Company for the operation of the Erie's shops at Meadville, Pa., and says in part:

"Since the hearing (of the contract cases, reported recently in the *Railway Age*) information has come to the Board that the Erie without awaiting the decision of the Board upon said contract cases has entered into a further contract by virtue of which all the shops of the entire Erie system, including those involved in the above cases, have been contracted to a newly incorporated company called the Meadville Machinery Company. Public announcement has been made of the fact that the officers of the Meadville Machinery Company are the recent officers of the Erie.

"The principal question involved in the above cases is whether or not the employees of the companies to which certain shops had been contracted are in law and in fact the employees of the Erie and therefore still subject to the rules, working conditions and wages established by the order of this Board.

"Said employees having now been shifted a second time before the Board had rendered its decision in said pending cases and said contract system having been extended so as to embrace all other shops on the road it becomes the duty of the road upon its own motion to investigate the facts surrounding this alleged contract of the carrier with the Meadville Machinery Company.

"The Board therefore orders: 1—That the contract cases be reopened for the purpose of taking additional proof as to the issues involved in said cases; 2—That a thorough investigation be made of all the facts and circumstances surrounding said alleged contract and the operations being conducted thereunder; 3—That a member of this Board accompanied by such expert and stenographic assistance as may be deemed necessary be authorized and directed to go on the property of said carrier to conduct said investigation and to institute such legal proceedings as may be deemed necessary to effectuate this order after having first secured all the information possible here in Chicago; 4—That the member of the Board conducting said investigation be and is hereby authorized to invoke the aid and counsel of the Department of Justice at Washington if he deems advisable."

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF JANUARY, 1922—Continued

Table with columns: Name of road, Average mileage operated per period, Operating revenues (Freight, Passenger, Inc. misc.), Total, Maintenance of way and equipment, Traffic, Trans- portation, Net from operations, Operating income (or loss), Net after rentals, and Retainers. Rows list various railroads such as Grand Trunk Western, Chesapeake & Delaware, Great Northern, etc.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF JANUARY, 1922.—CONTINUED

Table with columns: Name of road, Average mileage during period, Operating revenues (Freight, Passenger, etc.), Maintenance of way and equip., Operating expenses (Traffic, Transportation, etc.), Total, Operating ratio, Net railway operating income (or loss), Net after rental 1921, Net after rental 1922.

*This is the first month that this road has filed.

Management and Transportation Unions

Fail to Reach Agreement

The Eastern railroads and the leaders of the engineers' and firemen's brotherhoods announce that the regional conferences came to an end last week because of disagreement over the fundamental demands. All disputes concerning adjustments of wages and rules and working conditions will now be taken before the United States Railroad Labor Board. John G. Walber, secretary of the committee of managers, said that after it was apparent that a mutually satisfactory agreement could not be arrived at it was decided, as previously agreed, that all propositions made by either side in the hope of a settlement should be considered as though they had not been proposed. The leaders of these two brotherhoods have intimated that further negotiations may be had with some individual roads.

Wage Statistics for November

The Interstate Commerce Commission's summary of railroad wage statistics for November, 1921, shows a decrease of 21,783 in the number of employes as of the middle of the month compared with October. The total compensation decreased \$12,298,953. For the maintenance of way and structures group the October report showed an increase of 6,171 employes over September, but in November there was a reduction of 31,140, or 7½ per cent. For the maintenance of equipment and stores group there was an increase in October compared with September of 18,823 employes and in November the number was further decreased by 11,594 employes, or 2.3 per cent. The total number of employes for November for Class I roads was 1,732,353 and the total compensation was \$225,304,006.

Railway Returns for January

Reports of railway revenues and expenses filed with the Interstate Commerce Commission for the month of January make a very unsatisfactory showing in spite of the reductions in expenses that have been made. A preliminary compilation covering 199 Class I roads shows a net railway operating income of \$29,560,210, which is at an annual rate of return of 2.6 per cent on the tentative valuation. For January, 1921, however, these same roads had a deficit of \$1,525,500. The operating revenues of these roads, \$394,786,058, showed a decrease of 16.1 per cent. Freight revenues decreased 15 per cent and passenger revenues 20 per cent. Preliminary reports show a decrease of about 9 per cent in net ton miles as compared with January, 1920, and the passenger traffic showed an even greater falling off. For the Western district the decrease in revenues was 17.3 per cent. Operating expenses of the 199 roads, however, \$337,053,161, were 23.8 per cent less than for January, 1920. The Eastern district roads show a decrease of 25.3 per cent. It is estimated that the Eastern roads show a net return at the rate of approximately 4 per cent, the Southern roads 2½ per cent and the Western roads 1¼ per cent.

Hayden and Bell Required to

Give Up Interlocking Directorates

The Interstate Commerce Commission has issued an order holding that Charles Hayden and M. L. Bell cannot continue to hold their offices with the Chicago, Rock Island & Pacific and at the same time similar offices with the Minneapolis & St. Louis. The commission had previously issued the order authorizing them to hold their positions temporarily pending a hearing on a protest filed by Newman Erb. Mr. Bell is authorized to hold the position of vice-president, director and general counsel of the Rock Island, and offices with subsidiary companies, or the positions of director and general counsel of the Minneapolis & St. Louis and director, member of executive committee and vice-president of the Chicago & Alton. Mr. Hayden is authorized to hold his positions as director of the Pere Marquette, director and treasurer of the Ray & Gila Valley, and director and vice-president of the Bingham & Garfield and the Nevada Northern; and either the positions of director, chairman of board, chairman of finance committee and member of executive committee of the Chicago, Rock Island & Pacific and of director of the Choctaw, Oklahoma & Gulf, or the positions of director, chairman of board of di-

rectors and chairman of executive committee of the Minneapolis & St. Louis, of director of the Railway Transfer Company of Minneapolis and of director and member of executive committee of the Chicago & Alton.

Mr. Hayden's application to hold the position of director of the American Railway Express Company is dismissed as unnecessary within the meaning of paragraph 12 of Section 20-a of the interstate commerce act. L. C. Fritch has withdrawn his request for authority to hold the position of vice-president of the Minneapolis & St. Louis.

Commission to Begin Hearings on Consolidation Plan

The Interstate Commerce Commission has announced the first of a series of public hearings on its tentative plan for the consolidation of the railroads into a limited number of systems which was adopted by the commission on August 3. The first hearing is to be held at Washington beginning on April 24 before Commissioner Hall. Evidence at this hearing will be confined to that part of the proceeding which affects the Southeastern region as described and referred to in Chapter 4 of the appendix to the commission's tentative plan. The appendix consists of Prof. Ripley's report on the subject. Respondents and other parties desiring to be heard should promptly advise the secretary of the commission, stating the interests they represent and their best estimate of the time they will require so that a schedule for the hearing may be prepared.

Convention of International Railway Fuel Association

The International Railway Fuel Association was organized to bring together railroad men interested in the use of fuel or its purchase and the mine operators or oil producers who supply railroad fuel. The program for the annual meeting of the association to be held at the Auditorium Hotel, Chicago, on May 22 to 25, embraces topics of interest to all these groups and in fact to everyone who is in any way concerned with the railroad fuel problem. A list of the papers and addresses which have been secured up to the present time is given below.

Opening Address—L. W. Baldwin, vice-president, Illinois Central.

Fuel Conservation from the Standpoint of

(a) Division Superintendent—Sidney U. Hooper, division superintendent, Baltimore & Ohio.

(b) Representative of Department Operating—Coaling Stations—W. S. Burnett, district engineer, Cleveland, Cincinnati, Chicago & St. Louis.

(c) Locomotive Engineer—C. J. Barnett, Illinois Central. The Economic Considerations Governing the Use of Oil as a Locomotive Fuel—M. C. M. Hatch, mechanical engineer, Missouri Kansas & Texas.

Colloidal Fuel—Lindon W. Bates.

Mechanical Mining of Bituminous Coal—George T. Peart. Standard Grading of Coal or Stabilization of Bituminous Coal—George H. Cushing, managing director, American Wholesale Coal Association.

Assigned Cars for Railroad Fuel—C. G. Hall.

The Relation of Overdevelopment of the Bituminous Coal Industry to Transportation—C. F. Leshner, editor, Coal Age.

The Government and the Coal Industry—T. H. Watkins. Considering the Locomotive as a Big Investment, How Can We Get More Service Out of It?—G. M. Basford, president, G. M. Basford Company.

The Various Items of Saving by Using a Better Quality of Coal—Earl Cobb, president, Southwestern Coal Company.

The Effect of Tonnage Rating and Speed on Fuel Consumption—J. E. Davenport, engineer dynamometer tests, New York Central.

Educational Work Along Fuel Economy Lines—D. G. Buell, director, Railway Educational Bureau.

Standard Railroad Coal Contract—W. J. Tapp, fuel supervisor, Denver & Rio Grande.

Incentives for Promoting Fuel Economy—A Survey of Existing and Proposed Practices—O. S. Beyer, Jr.

In addition, papers will be presented by Professor E. J. Babcock, Harrington Emerson and F. S. Peabody.

Traffic News

R. C. Dearborn has been appointed chairman of the National Perishable Freight Committee, headquarters at Chicago, succeeding E. S. Briggs, resigned.

C. H. Easum, traffic manager for the Mississippi Lime & Material Company, and formerly associated with the Illinois Central, died at his home in Alton, Ill., on March 3.

E. W. Owen has been appointed traffic manager for the Southern Cypress Manufacturers' Association, at New Orleans, La., succeeding E. W. McKay, who has been elected secretary-manager.

The Southern Pacific has installed dining cars on its lines in Mexico between Nogales and Mazatlan. Combination cafe-parlor cars with a seating capacity in the dining room of 12 persons are used.

J. K. More, formerly associated with the Corporation Commission of Oklahoma, has been elected secretary-manager of the Oklahoma Traffic Association, Oklahoma City, succeeding H. D. Driscoll, who has resigned to practice law in that city.

The House committee on interstate and foreign commerce has decided to begin hearings on March 21 on the bill recently passed by the Senate authorizing the Interstate Commerce Commission to require the railroads to issue an interchangeable mileage book at a reduced rate.

The Transportation Club of Peoria, Ill., at its annual meeting held on February 28, elected G. I. Sweny, president; N. M. Love and O. F. Becker, vice-presidents; O. B. Eddy, secretary-treasurer; G. A. Smith, B. C. Fitton, E. M. Jones, F. B. Martin, and J. F. Hobin, directors.

The Southern Pacific was authorized by the Railroad Commission of California to put into effect on one day's notice round trip excursion fares from San Francisco to Calistoga, Napa, North Vallejo, St. Helena and Yountville. The tickets will be sold daily with a return limit of 25 days.

The Union Pacific has announced its intention to reduce trans-continental freight rates from 10 to 50 per cent on building materials and accessories (asbestos, cement, sheetings, roofings and bath tubs); eggs, nuts, insecticides, poultry, fish food, ammunition, glycerin, soda-fountain supplies, furniture parts, pole-line construction material, auto chassis and rotary blowers. The Southern Pacific has made a similar announcement.

The Traffic Club of Memphis, Tenn., has given its sanction to the proposed plan for a national association of traffic clubs. Preliminary plans for such an organization were made by a number of traffic club presidents at a meeting recently held in New York. It is expected that invitations will soon be sent to all traffic clubs asking that they join the Association and send two delegates to a first national convention.

Deep snow, with many drifts delayed all traffic between the Pacific Coast and points east during the last half of last week. The Western Pacific's trains between Salt Lake City and San Francisco were more than 18 hours late in some instances. The Chicago, Rock Island & Pacific's trains arrived in Kansas City 12 hours behind. The heavy snow and high wind storm visited practically the entire area of Kansas, Missouri, Oklahoma, Northern Arkansas, and the Texas Panhandle.

The presidents of seven of the leading traffic clubs of the country and representatives of a number of other traffic clubs met and formed a temporary organization in New York city on February 20 to further a movement to establish a nationwide organization of traffic clubs. W. J. L. Banham, chairman of the public affairs committee of the traffic club of New York and traffic manager for the Otis Elevator Com-

pany, was appointed chairman of the temporary organization and N. G. Campbell, president of the Newark Traffic Club, was appointed secretary.

Frank T. Riley, freight agent of the Michigan Central at Jackson, Mich., has been elected president of the newly organized Jackson Transportation Club. Other officers are: Vice-president, J. J. Lynch, traffic manager of the Hayes Wheel Company; secretary, J. C. Graham, traffic manager of the Chamber of Commerce; treasurer, W. R. Klien, chief clerk, Michigan Central; directors, G. B. Hunt, general freight and passenger agent, Michigan United Railways Company; Warren Zerby, traffic manager of the Earl Motors, Inc., and M. S. Hatch, ticket agent, Michigan Central. The club has 75 members.

The Wisconsin Traffic League held its annual meeting at Milwaukee, on February 25, and elected the following officers: President, C. M. Starks, traffic manager, Oshkosh Chamber of Commerce; vice-president, A. Murawsky, Milwaukee; secretary-treasurer, H. Dehrcke, Milwaukee; directors, Max Bloch, Racine; C. R. Jeffrey, Waukesha; E. E. Meadley, Ashland; O. A. Kroos, Kohler; F. M. Elkinton, Milwaukee; George Mergener, Milwaukee; W. H. Reynolds, LaCrosse; W. W. West, LaCrosse; A. C. Uecke, Milwaukee; L. A. Zimmerman, Beaver Dam; L. B. Maxfield, Milwaukee; W. J. Lahl, Chicago, Ill.; J. C. Chandler, Sheboygan; and C. J. Landuskey, Milwaukee.

Coal Production

Production of soft coal continues to increase slightly, according to the weekly bulletin of the Geological Survey. The output for the week ended March 4 is estimated at 10,536,000 net tons, an increase of 1.6 per cent over the week preceding. Production is still some 2,600,000 tons short of the maximum reached just before the mine strike of 1919.

Anthracite Shipments in February

Shipments of anthracite for February, as reported to the Anthracite Bureau of Information, Philadelphia, show a substantial increase over the two preceding winter months; 5,239,014 gross tons as compared with 4,848,053 tons in January, and 4,635,922 in December.

Shipments by originating carriers were as follows:

	February 1922	February 1921	January 1922
P. & R.	1,160,685	1,170,753	1,052,852
L. V.	857,579	1,063,508	766,602
C. of N. J.	537,214	515,551	542,558
D., L. & W.	755,923	926,788	743,768
D. & H.	670,323	813,191	619,762
Penna.	402,762	426,350	331,871
Eric.	492,262	633,706	466,495
N. Y., O. & W.	141,929	153,017	101,779
L. & N. E.	220,337	269,237	221,346
	5,239,014	5,966,101	4,848,053

Elwell-Parker Electric Station Truck in Use on Government Railway, Japan

Commission and Court News

Interstate Commerce Commission

The Commission has issued an order in accordance with Section 441 of the transportation act designating points on railroads at which information shall be available concerning the handling of export shipments by common carriers by water in foreign commerce, and at which through bills of lading to foreign destinations in connection with ocean carriers, whose vessels are registered under the laws of the United States, to points in non-adjacent foreign countries, shall be issued.

State Commissions

The Louisiana Public Service Commission has imposed on the Louisiana Railway & Navigation Company a fine of \$2,000 for violation of the terms of an order issued by the Railroad Commission in March, 1919, which required the road to repair and place in satisfactory condition its entire roadway, which was in very bad condition. On January 26, 1921, representatives of the railroad appeared before the Commission and stated that they had made every effort within their means to comply with the order and wished extended time to further carry out the betterment programs, which request was granted. The Commission now concludes, however, that little or nothing has been done to comply with that agreement. Service continues poor and derailments, congestions and other inconveniences are common. The present order calls for a further payment of \$200 for each day hereafter that the railroad fails or refuses to comply with the original order.

Court News

Employee's Assumption of Risk—Irregular Trains

The Missouri Supreme Court holds that a man who had been in the railroad's service 25 years as engineman and knew there were no rules prescribing signals to employees when a train running west was using an eastbound track, and knew trains were run irregularly, assumed the risk of injury in stepping on the track, under the federal rule that a servant assumes extraordinary risks incident to his employment, or risks caused by the master's negligence, obvious or fully known and appreciated by him.—*Quigley v. Hines* (Mo.), 235 S. W. 1050.

United States Supreme Court

Intrastate Fares in New York

The State of New York sought by bill in equity to enjoin the enforcement of an order of the Interstate Commerce Commission requiring interstate railroads to charge 3.6 cents a mile for all intrastate passengers, to increase excess baggage rates to intrastate passengers, 20 per cent, to make a surcharge on sleeping-car passengers, and a 20 per cent increase in intrastate rates on milk, all for the purpose of bringing the intrastate rates to the level of the interstate rates previously fixed by the commission. The federal district court dismissed the complaint. The railroads appealed to the Supreme Court of the United States. That court has affirmed the judgment of the district court, saying in part: "The main objections to the order are the same as those presented, considered and overruled in the Wisconsin Rate case just decided (*Railway Age*, March 4, page 519). The evidence in this case shows that if the passenger and other rates here in controversy were to continue in force as ruled by the Public Service Commission of New York, the annual gross revenues of the interstate railroads operating in the State of New York from both interstate and intrastate passenger and milk business would be less by nearly \$12,000,000 than those revenues if the intrastate rates were on the same level as the interstate rates. If the lower level of intrastate fares and rates is to be maintained, it will discriminate against interstate commerce, and will require higher fares and rates in interstate commerce. . . ."—Opinion by Mr. Chief Justice Taft. Decided February 27, 1922.

Foreign Railway News

Proposed Increase in Indian Railway Fares

LONDON. In the budget recently introduced to the Legislative assembly at Delhi, there is a proposal to increase railway fares in India by 25 per cent.

German Locomotives on Russian Railways

LONDON. It is reported that the locomotives ordered by Russia from Germany are too heavy for the Russian railways and have caused the collapse of some of the railway bridges.

France May Lease State Railway

According to press dispatches to the New York Times, the French government is preparing definite plans for leasing the State Railway to a corporation. This system is one of the largest in France and for a number of years it has been the most unsuccessful from a financial standpoint, having piled up millions of francs in deficits.

French Railway Bonds on Sale in New York

New York investment houses are offering for sale 25,000,000 francs of bonds of the Midi Railway, France. These bonds bear 6 per cent interest and, since they are payable principal and interest in Paris, will increase in value as the exchange value of the franc returns to normal. The bonds are guaranteed principal and interest by the French government.

Big British Locomotive Company Closes Plant

LONDON. Sir W. G. Armstrong, Whitworth & Co., Ltd., has decided to suspend operations at its Elswick steel works and its forge and stamping departments, owing to the high costs of production. No new contracts can be obtained on the basis of the selling prices which must be charged, and as it would be impossible to keep the shops open except at a loss, there is no alternative to the closing of them down.

British Roads Pay Dividends from Surplus

The Great Northern (England) earned a corporate net of £1,949,172 in 1921, a decrease of £300,968 compared with 1920, according to the *Railway Gazette* (London). In order to pay the 4½ per cent dividends on its ordinary shares, it is proposed to withdraw £207,261 from reserve funds. The company's business fell off tremendously in 1921 as compared with the previous year. Passengers (exclusive of season ticket-holders) fell off from 36,576,771 to 27,828,130. Season ticket-holders dropped from 60,275 to 55,725. Merchandise tonnage (long tons) dropped from 2,838,223 to 2,344,619 and fuel traffic from 6,731,018 to 3,272,984.

By the transfer of £205,000 from reserve funds the London, Brighton & South Coast proposes to maintain the regular dividend rate on its ordinary shares.

New Line from Tampico to Matamoros Proposed

The A. P. Turner Construction Company has applied to the Department of Communications and Public Works of Mexico for a concession to construct a railroad between Matamoros and Tampico, about 315 miles, according to advices from Matamoros. The company proposes that the government issue 6 per cent bonds to cover the cost of construction, the sale of the bonds to be undertaken by the company. The construction of this proposed line of railway has been under consideration from time to time for the last 30 years. When B. F. Yoakum and associates built the St. Louis, Brownsville & Mexico down the lower Gulf coast of Texas to Brownsville, situated just across the Rio Grande from

Matamoros, they had in view the extending of the road down the Mexican coast to Tampico. Inability to finance the project caused its abandonment. The Mexican Government took up the matter of constructing the line and work on it was about to be started when the revolutionary period began and put an end to these plans. The territory through which the road would pass is rich in natural resources but is wholly undeveloped. It would shorten the rail distance between the Rio Grande and Tampico by nearly 200 miles.

Government Railways in Australia Lose Heavily

Taxpayers pay heavily for government control of Australian railways, according to the Wall Street Journal. Accounts for year ended June 30, 1921, show an aggregate loss for the commonwealth and five state governments of £3,793,365 after costs of operation and the interest charges.

The loss quota of the commonwealth government was £166,551. The Trans-Australian line earned 8s. 9d. a train mile, and cost 12s. 7½d.; loss, exclusive of interest, amounting to £91,339. The Onoadata line lost £60,460, and the Northern Territory line £15,337. Loss on the Trans-Australian line was greater than in the previous year; freight receipts were £53,160 less than 1920, although passenger traffic gave increased revenue.

Reports of five state railroad administrations follow:

State	Earnings		Deficit	
	1920-21	1920-21	1920-21	1920-21
New South Wales	£14,267,205	£577,032		
Victoria	9,795,763	651,635		
Queensland	5,279,412	1,418,473		
South Australia	2,942,028	561,304		
Western Australia	2,270,032	418,370		
Total	£34,554,440	£3,626,814		

Store-Door Delivery in England

Cartage is one of the functions of the British railways, as a supplement to rail transport. The following description of the system appeared in Commerce Reports:

"Motor trucks have a well-defined and growing place in British transportation, for not only do they compete for traffic with the railways, but they are used by the carriers themselves in carrying on their business. The growth of motor transport during the past five years may be realized when it is stated that in 1916 there were but 600 road transport undertakings in England, while in 1921 this number had grown to 3,000 with a capital of £117,000,000, exclusive of business men who use their own fleets of motor trucks. A recent press estimate of merchandise hauled by road transport in the United Kingdom in 1921 was 6,000,000 tons.

"In Great Britain, railway freight traffic is divided into eight classes: A, B, C, 1, 2, 3, 4, 5. The rates for these classes graduate upward from class A. Goods embraced in the lettered classes include heavy basic commodities, such as coal, iron, cement, etc., charged at station-to-station rates, and are trucked by consignor at origin and by consignee at destination. The numbered classes are charged at what are known as 'collection and delivery' rates, which cover cartage from consignor's premises, the rail haul, and delivery at consignee's premises within a reasonable radius, which in London is about 4 miles and in rural districts 1 mile.

"At big railway centers, the trucking is usually done by the railways; but at rural stations, and even in some important towns, the companies occasionally contract with an agent to do the trucking for them. Under the regulations, a trader may elect to do his own trucking of freight in the numbered classes, in which event reduction from the rail rates is made as follows:

Class of freight	In Lon- don.		In rural districts.	
	£	d.	£	d.
Class A	9	0	4	3
Class B	9	10	4	10
Class C	11	6	5	6
Class 1	11	5	6	6
Class 2	14	10	8	2

"There are certain modifications of these allowances in some rural districts, but the above is a fair average and is representative.

"In addition to this freight traffic, the railways handle 'parcel traffic'—a business similar to that conducted by express companies in America. The British railways collect and

deliver these goods from the shipper's door to the consignee's door at destination, the charges including collection, rail haul, and delivery.

"An important factor in British transportation is the cartage agent or forwarder. These firms maintain large fleets of vehicles, both horse-drawn and motor, and collect and deliver freight in London and most other large cities and towns. They charge the shipper the package rate, consolidate shipments for various destinations, turn them over to the railway companies in bulk, and are charged by the latter the lower rates which are applicable to large shipments after the fashion of the 'consolidated car' companies of the United States. The cartage agent thus makes the difference between the door-to-door railway package rates and the wholesale railway rates, while the railways are saved the expense of collection and have the advantage of handling one large shipment instead of a number of smaller ones. It is estimated that the railway companies receive and deliver about 70 per cent of their parcels business, the rest being handled by the forwarders."

Mexican (Vera Cruz) Railway to Build New Line

Following close upon the recent announcement of a modification by the Mexican government of the concession for the construction of the Pachuca & Tampico Railroad comes the authorized statement that the Mexican (Vera Cruz) Railway Company, a British corporation, has purchased a controlling interest in the Pachuca & Tampico from the heirs of the late Richard Honey and will finish building the line as fast as the work can be done. The Mexican (Vera Cruz) Railway runs between the port of Vera Cruz and Mexico City. It was one of the first railroads to be built in Mexico.

The taking over of this project by the strong British interests that own the Mexican (Vera Cruz) Railway is regarded as an assurance that it will be pushed to fulfillment as rapidly as possible. It is one of the most important transportation projects ever undertaken in Mexico for the reason that it will give direct connection between Mexico City and Tampico, shortening the rail distance between the two points by about 200 miles, and opening to agricultural development a big scope of rich lands. The fact that the road will have to mount from sea level to an altitude of more than 6,000 feet within a distance of 30 miles in order to reach the plateau region makes the engineering features of the project of unusual interest. It is explained, however, that a feasible route for this part of the line has been found and that the grade will not be excessive.

Approximately 45 miles of the Pachuca & Tampico already has been constructed. This part of the line runs from Pachuca to Ixmiquilpan. At Pachuca the new line connects with the branch road of the Mexican (Vera Cruz) Railway that runs to Ometusco where connection is made with the Mexico City-Vera Cruz line. The branch road will be made a part of the trunk line between Mexico City and Tampico, it is stated.

Announcement of the purchase of the majority stock of the Pachuca & Tampico Railroad comes from B. E. Holloway, general manager of the Mexican (Vera Cruz) Railway with headquarters at Mexico City. The chairman of the board of the latter road is Vincent M. Yorke, of London, England. Mr. Holloway in speaking of the new transaction said in part:

"It is the intention of the Mexican (Vera Cruz) Railway to carry out the construction of the line to Tampico but its progress will greatly depend on how quickly funds can be obtained for carrying out the project.

"We have acquired very little rolling stock, an engine or two in need of repairs, and a few cars of various descriptions, so it will be necessary to restock the line with new material bought in the United States. The road will be single track, standard gage."

The route of the proposed extension of the Pachuca & Tampico Railroad, so far as surveyed and tentatively located, passes through the heart of the gulf coast oil fields. It will run just to the west of the interoceanic canal that connects the Panuco and the Tuxpam rivers. It will connect with the Tampico-San Luis Potosi division of the National Railways of Mexico at or near Tamos, about 30 miles from Tampico. The construction of a railroad between Tampico and Mexico City was started about 11 years ago by the National Railways of Mexico. More than 100 miles of grade was built and about 50 miles of track laid. The project was abandoned on account of the revolutionary disturbances.

Equipment and Supplies

Locomotives

THE CHICAGO & EASTERN ILLINOIS, is inquiring for 10 Pacific type locomotives.

THE KENTUCKY & TENNESSEE has ordered 1 Mikado type locomotive from the American Locomotive Company.

THE U. S. GYFSUM COMPANY, Chicago, has ordered from the American Locomotive Company 1, 0-6-0 type locomotive. This locomotive will have 20 x 26 in cylinders and a total weight in working order of 130,000 lb.

CASTNER, CURRAN & BULLITT, Inc., Boston, Mass., has ordered from the American Locomotive Company 1, 0-4-0 type tank locomotive. This locomotive will have 14 by 22 in. cylinders and a total weight in working order of 79,000 lb.

JOHN B. SMITH & SON, LTD., Toronto, Ontario, has ordered from the American Locomotive Company 1, 0-4-0 type tank locomotive. This locomotive will have 13 by 20 in. cylinders and a total weight in working order of 65,000 lb.

THE ST. LAWRENCE BRICK COMPANY, Montreal, Quebec, has ordered from the American Locomotive Company 1, 0-4-0 type tank locomotive. This locomotive will have 9 by 14 in. cylinders and a total weight in working order of 29,000 lb.

THE AMERICAN BRAKE SHOE & FOUNDRY CO., New York City, has ordered from the American Locomotive Company, 1, 0-4-0 type tank locomotive. This locomotive will have 16 by 24 in. cylinders and a total weight in working order of 99,000 lb.

THE CALDAS RAILWAY, Columbia, South America, has ordered from the American Locomotive Company, 1 Mikado type locomotive. This locomotive will have 16 by 22 in. cylinders, a total weight in working order of 105,000 lb. and will be equipped with a superheater.

Freight Cars

THE NEW YORK, CHICAGO & ST. LOUIS is inquiring for 50 underframes.

THE GRAND TRUNK is asking for bids for the repair of from 250 to 500 box cars.

THE STANDARD OIL COMPANY of New Jersey is inquiring for 10 coal cars, of 50 tons' capacity.

THE CHICAGO, INDIANAPOLIS & LOUISVILLE is inquiring for 100 sets of underframes and superstructures for gondola cars.

THE UNITED FRUIT COMPANY, New York, has ordered 25 ballast cars of 30 tons capacity from the Magor Car Company for export to Honduras.

THE GULF, MOBILE & NORTHERN is having repairs made to 100 steel underframe box cars, at the shops of the Anniston Electric Steel Corporation, Anniston, Ala.

DAVIS EQUIPMENT COMPANY, 50 Church street, New York City, is asking for prices on 40 gondola cars of 40 tons' capacity and 30 steel gondola cars of 30 tons' capacity for export to China.

THE TENNESSEE COAL, IRON & RAILROAD COMPANY, reported in the *Railway Age* of March 11, as inquiring for 150 ore dump cars has ordered this equipment from the Chickasaw Shipbuilding Company.

THE CHICAGO & NORTH WESTERN, noted in the *Railway Age* of March 11 as inquiring for 2,700 freight cars is inquiring for 1,250 40-ton box cars; 500 40-ton stock cars; 250 40-ton refrigerator cars; 250 50-ton gondola cars, and 500 50-ton flat cars.

THE DELAWARE, LACKAWANNA & WESTERN reported in the *Railway Age* of February 18, as asking for prices on the repair

of about 900 cars has given an order to the American Car & Foundry Company for the repair of 985 steel hopper cars, of 40 tons capacity.

THE NEW YORK CENTRAL has ordered 250 steel underframe, double sheathed box cars of 40 tons capacity from the American Car & Foundry Company and has equally divided an order for 750 steel hopper cars of 55 tons capacity between the Pressed Steel Car Company, the Standard Steel Car Company and the Pullman Company.

Passenger Cars

THE FLORIDA EAST COAST is inquiring for 10 baggage cars.

THE CENTRAL OF BRAZIL is inquiring through the car builders for 50 first class coaches and 58 pairs of motor trucks.

THE LOUISVILLE & NASHVILLE is inquiring for 5 baggage cars, 5 combination baggage and horse cars, 6 coaches, 4 combination passenger and smoking cars and 5 combination passenger and baggage cars.

Iron and Steel

THE SOUTHERN RAILWAY is asking for bids until 12 o'clock noon, March 20, on 26,600 tons of 85 lb. A. S. C. E. section rail for delivery in approximately equal monthly installments from June to December 1, 1922.

THE GREAT NORTHERN is inquiring for 10,400 tons of structural steel for a 350 pocket ore dock; and 1,450 tons of structural steel for ore spouts, including bails and pins, at Superior, Wis.; and also for 750 tons of structural steel for reinforcement including stringers and shoes for four truss spans.

Miscellaneous

THE DIERKS LUMBER & COAL COMPANY, DeQueen, Ark., is inquiring for 40 arch bar trucks.

THE NEW YORK CENTRAL will receive bids until 12 o'clock noon, March 22, covering its requirements of track bolts, track spikes, fence wire, angle bars, offset splice bars, blank splice bars, frogs, switch points, track switches, crossings, bridge warning poles, structural steel, castings and rollers for repairs to bridges, lead covered cable, copper wire, repair parts for turntables, black galvanized and blue annealed sheets, driving and truck tires for locomotive service, seamless steel tubes, axles for car and locomotive repairs, wire nails and staples, steel bars, steel shapes, steel plates and steel billets.

Signaling

MITSUI & COMPANY, New York City, have ordered 62 sets of three color light signals from the Union Switch & Signal Company. These signals are for use on the Osaka Electric Railway, Japan.

THE UNITED STATES RAILROAD LABOR BOARD was created by an act of Congress on April 16, 1920, and was given an appropriation of \$50,000 to cover all necessary expenditures up to and including June 30 of that year. This was known as the fiscal year of 1920 and the entire sum authorized was expended during that three months' period. The fiscal year of 1921 began July 1, 1920, and \$450,000 was appropriated for this period of which amount \$50,000 was available for either the fiscal year of 1920 or 1921. The sum of \$17,604.18 was spent from this \$50,000 in 1920, leaving a balance of \$32,395.82. From the remaining \$400,000, \$399,821.23 was spent in the next year, leaving a balance of \$178.77. The appropriation for the present fiscal year which will end on June 30 next, amounted to \$370,000 of which sum \$243,046.92, has already been expended. This leaves \$126,953.08 available for use during the next four months. The expenditures of the labor board are said to average approximately \$30,000 a month.

Supply Trade News

Ross E. Willis, formerly sales engineer of the Lakewood Engineering Company, Cleveland, Ohio, in the southern Michigan territory, has become associated with Wm. F. V. Newmann & Sons, Detroit, Mich., representing the Baker R. & L. Company in the Detroit territory.

William D. Pence, for eight years a member of the Engineering Board, Bureau of Valuation, Interstate Commerce Commission, and prior to that time engineer for the Wisconsin Railroad and Tax Commissions for seven years, has returned to practice as a consulting engineer with office at 608 South Dearborn street, Chicago.

The Imperial Appliance Company and the Pressed Steel Manufacturing Company have been merged with the Union Metal Products Company. The business of the three firms will be continued under the name of the Union Metal Products Company, with headquarters at Chicago, and no change will be made in the location of the various offices or in the personnel.

E. S. Fitzsimmons has been appointed manager of sales of the Flannery Bolt Company, Pittsburgh, Pa. He was born on April 12, 1876, at Columbus, Ohio. He served his apprenticeship with the Chicago, Rock Island & Pacific at Horton, Kan., leaving that company in 1899 to become foreman boilermaker with the Delaware, Lackawanna & Western at Scranton, Pa. In 1904 he served as general boiler inspector of the New York, New Haven & Hartford and from 1905 to 1907 as general foreman boilermaker of the Erie. He was then promoted to master mechanic at Galion, Ohio, and in 1908 was transferred as master mechanic to Hornell, N. Y., which position he held until 1912, when he was promoted to mechanical superintendent Erie, Lines West. In 1914 he was transferred to New York as mechanical superintendent of the Erie, Lines East, resigning in 1918 to become works manager for the McCord Manufacturing Company, Detroit, Mich. Mr. Fitzsimmons entered the service of the Flannery Bolt Company at Pittsburgh as salesman in December, 1920, and now becomes manager of sales of the same company.

E. S. Fitzsimmons

Bucyrus Company

The annual report of the Bucyrus Company for the year ended December 31, 1921, shows earnings of approximately \$4 a share on common stock aggregating \$445,905, a decrease of \$365,079. The balance after dividends was \$115,905, a decrease of \$425,079. The ratio of current assets to liabilities was nearly 6 to 1, as there were current assets of \$4,636,737, not including \$163,530 in securities and current liabilities of \$728,059, including \$352,126 of accrued taxes and miscellaneous reserves. The statement follows:

	1921	1920
Net earnings	\$445,905	\$1,010,984
Dividends	3,000,000	480,000
Profits	11,005	530,984
Reserves, a. c.	1,111,608	2,587,671
Total current assets	3,589,511	3,116,067

RESOURCES

Cash	268,139	567,083
Securities	714,524	163,903
Accounts and bills receivable	1,159,450	1,764,076
Inventories	2,638,152	3,179,007
Property account	7,187,303	7,126,091
Total	\$11,987,571	\$12,800,163
LIABILITIES		
Accounts payable	142,954	624,673
Advance payments received	162,978	296,367
Preferred dividends payable	70,000	210,000

Common	4,450,000
Surplus December 31, 1921	7,255,000.00
	\$13,115,423.00

Midvale Steel & Ordnance Company

The annual report of the Midvale Steel & Ordnance Company and subsidiary companies for the year ended December 31, 1921, shows a net loss after all charges of \$5,313,513, as compared with a net income in the previous year of \$12,424,920. After payment of dividends, the deficit was \$6,313,513, against a surplus of \$4,242,920 in 1920.

The company's balance sheet shows inventories valued at \$36,319,212. Current assets amounted to \$64,452,883 against current liabilities of \$6,479,533. Of the assets, \$4,336,120 consisted of cash and \$13,222,718 government securities.

Obituary

Webb C. Ball, pioneer jeweler and general time inspector of the Official Bureau of Railroad Time Service, died on March 7, after several weeks of illness at his home in Cleveland, Ohio.

Mr. Ball was born on a farm in Ohio in 1847. His first position was that of an apprentice to a watchmaker. After ten years' experience in that line of work he came to Cleveland and entered the retail jewelry business at which occupation he has been actively engaged for a period of over 50 years, his equipment gradually increasing from the original work bench and two show cases to an entire building and its furnishings. It was a railroad tragedy that gave Mr. Ball his greatest opportunity of

W. C. Ball

service. On April 19, 1891, a collision occurred at Tipton, Ohio, between a fast mail and an accommodation train, and from the inquiry which followed, it was found that the accident was due to defective watches in the hands of the train crews. Mr. Ball testified at the trial and was afterwards asked to further investigate the existing conditions and plan a reform. As the immediate result of his recommendation, he was authorized to inaugurate a standard system of time service and watch inspection for the Lake Shore & Michigan Southern, which system has since come in use on many large trunk lines. In August, 1913, he established a wholesale watch and jewelry business in Chicago, known as the Norris-Alister-Ball Company. Five years later he organized and chartered the Official Bureau of Railroad Time Service in both the United States and Canada and was made general time inspector of this organization, in which capacity he was serving at the time of his death. He is the originator of the "Ball" Watch.

Otis H. Cutler

Otis H. Cutler, chairman of the board of directors of the American Brake Shoe & Foundry Company, New York, who died at Miami, Florida, on March 4, as was noted in the

Railway Age of March 11, has been a well known figure in the railway supply field for many years.

Mr. Cutler was born in New York city and educated at the Rockland Military Academy, Nyack, N. Y., and the Washington Law University. He served as private secretary to Senator William P. Frye, of Maine, from 1884 to 1895 and for the following three years was a member of the New York State Assembly from Rockland county. He started his business career as secretary of the North

Otis H. Cutler

River Bridge Company and later became manager of the Ramapo Iron Works. He was instrumental in forming the American Brake Shoe & Foundry Company, serving as its

vice-president and general manager in 1902, and from 1903 to 1916 as president, when he resigned and became chairman of the board of directors, the position he held at the time of his death.

During the recent war Mr. Cutler volunteered his services to the American Red Cross and organized and was the first manager of its Insular and Foreign Division. For his work in this direction he was made a major. After the armistice he spent considerable time in Europe assisting in the organizing of the League of Red Cross Societies, headquarters of which are at Geneva, Switzerland.

Mr. Cutler was identified with large and important enterprises in the industrial and financial world, being associated with many of the J. P. Morgan undertakings and he was director in numerous corporations, including: The Railway Steel Spring Company; American Arch Company; Bronze Metal Company; American Manganese Steel Company; Manganese Steel Rail Company; Southern Wheel Company; American Malleables Company; Dominion Brake Shoe Company, Ltd., and New York Telephone Company. He was also a member of many clubs and societies.

Trade Publications

LOCOMOTIVE BOOSTERS.—The Franklin Railway Supply Company, New York, has issued a new bulletin, No. 976, describing the locomotive booster and showing how it helps in railroad operation. The possibilities of increased tonnage and greater revenue earning capacity from locomotives equipped with a booster are pointed out and diagrams are given which graphically show the increased tractive power in starting and at slow speeds.

CUTTING TORCH.—A leaflet fully describing the various features of design and construction of the Airco "D" cutting torch has been issued by the Air Reduction Sales Company, New York. Sectional views of the torch are shown and tables given showing the thicknesses of metals that can be cut, the pressures of oxygen and acetylene necessary, and the gas consumption in cubic feet per hour when using tips adapted to the cutting of steel, cast iron or rivets.

THE SHEPARD ELECTRIC LIFTABOUT.—The Shepard Electric Crane & Hoist Co., Montour Falls, N. Y., has recently issued a small illustrated folder descriptive of a new and smaller type of electric hoist, manufactured by that company. The text and illustrations show a wide number of purposes for which this hoist can be utilized to advantage such as the loading and unloading of freight, the shifting or storing away of material in storehouses, etc.

Dining Compartment in Private Train Which Carried Princess Mary and Viscount Lascelles from London After Their Wedding

Railway Construction

ALBERTA & GREAT WATERWAYS.—This company contemplates the construction of a boat landing at Waterway, Alta.

ATCHISON, TOPEKA & SANTA FE.—This company is accepting bids until March 20 for the construction of two one-story brick lavatory buildings in Chicago, one 24 ft. by 132 ft. and the other 216 ft. by 42 ft.

CANADIAN NATIONAL.—This company will extend its Vancouver, B. C., line for a distance of about 10 miles, the grading for which has already been completed and it is expected that the work will be undertaken by company forces as soon as weather conditions are favorable. The same company will also construct a line 3.5 miles in length connecting the Grand Trunk Pacific's Riverhurst, Sask., subdivision, and the Canadian National's, Craik, Sask., subdivision. The Saskatchewan Legislature Assembly recently adopted a resolution authorizing petitions to the Dominion Government asking immediate appropriations of money for the completion of the Canadian National branch lines projected into that province; and for the continuance of the construction of such lines until finished. Figures show that 342 miles of branch lines in this province have been graded, but only 231 miles of track laid thereon.

CANADIAN PACIFIC.—This company will construct coaling plants at Swift Current, Sask., and Medicine Hat, Alta., of 280 tons capacity, and like plants at La Riviere, Man., and Eagle River, Ont., of 100-tons capacity. An old trestle chute at Estevan, Sask., will be replaced by a more modern plant. The same company will also install automatic signals at Sidney, Man., and Ruler Creek, B. C.

CHICAGO, OTTAWA & PEORIA.—This company has been petitioned by the city of Ottawa, Ill., through the Illinois Commerce Commission, to rebuild its bridge across the Fox river at Main street in that city.

CHICAGO, ROCK ISLAND & PACIFIC.—This company has been petitioned by the city of Trenton, Mo., through the Missouri Public Service Commission, to construct a viaduct over its tracks at 12th or 13th streets, in that city.

GULF & SHIP ISLAND.—This company is constructing a new engine house 105 ft. by 220 ft., and a new machine shop of steel frame and brick construction, 75 ft. by 200 ft., to replace property destroyed by fire on February 25, of which a loss was estimated at \$75,000.

ESQUIMALT & NANAIMO.—This company, in conjunction with the city of Victoria, B. C., is constructing a general traffic bridge over the harbor at Johnson street, in that city. A contract for the construction of the bascule span was awarded to the Canadian Bridge Company, Walkerville, Ont.

GREAT NORTHERN.—This company closed bids on March 15 for the construction of a 30-stall roundhouse, shop buildings, storehouses and other terminal facilities at Minneapolis Junction, Minnesota.

ILLINOIS CENTRAL.—This company, which was noted in the *Railway Age* of March 4 (page 549), as accepting bids for the construction of a third track from Tucker, Ill., to Kankakee, a distance of approximately 5 miles, has awarded a contract for the work to M. I. Windham, Centralia, Ill.

MISSOURI PACIFIC.—This company, which was noted in the *Railway Age* of March 11, page 592, as accepting bids for the construction of a frame and stucco combination freight and passenger station, 23 ft. by 74 ft., at Jerome, Ark., has awarded a contract for this work to Jerome Moss, Chicago.

NEW YORK, NEW HAVEN & HARTFORD.—This company has awarded a contract to the Roberts & Schaefer Company, Chicago, for the construction of an 800-ton capacity reinforced concrete and steel coaling plant at Providence, R. I.

NORTH SHORE CONNECTING RAILROAD.—This company has applied to the Illinois Commerce Commission for authority to construct an electric railway system to extend through Evanston, Ill., and the village of Wilmette.

OKLAHOMA-SOUTHWESTERN.—This company contemplates the construction of extensions to its lines which will total approximately 33 miles.

PHILADELPHIA & READING.—This company has announced its intention to begin work on its ferry and railway passenger terminal at Camden, N. J., at a comparatively early date in order to complete the structure before the summer tourist season of 1923. The work will involve the expenditure of approximately \$3,000,000.

PITTSBURGH & SHAWMUT.—This company has awarded a contract to the Concrete Steel Bridge Company, Clarksburg, W. Va., for the construction of a reinforced concrete highway bridge over Colwell Cut, Colwell, Pa. The structure will be 220 ft. long with a span of 180 ft., 24 ft. wide, 110 ft. high and 24 ft. wide. The company has also awarded a contract to the Dwight P. Robinson Company, New York, for lining the remainder of its Mauk tunnel with concrete. Of this tunnel 1,200 ft. have already been so lined, with 900 feet yet remaining. The company has recently placed in service a new storehouse, oilhouse and car repair shed at its Brookville shops.

SALT LAKE & DENVER.—This company has been granted a two-year extension of time by the Public Utilities Commission of Utah in which to begin the construction of a railroad which will tap and develop the Uinta Basin, Utah. This corrects the item in the *Railway Age* of February 25 (page 502), which stated that this company was authorized to construct an extension to its lines from Springville Utah, to the Uinta Basin.

ST. LOUIS-SAN FRANCISCO.—This company contemplates the construction of an extension from Vinita, Okla., to the mines of the Central Coal & Coke Company, a distance of about 5 miles. While surveys for this extension have been made, no definite decision has been reached as to the undertaking of the work.

YAZOO & MISSISSIPPI VALLEY.—This company is accepting bids for the construction of a passenger station at Webb, Miss.

FIVE CARLOADS OF ROSE BUSHES. a single shipment, were recently moved by freight across the continent from Los Angeles, California, to Riverton, N. J., 3,323 miles, in 12 days, or at the rate of about 276 miles per day. The movement was over the Southern Pacific, the Southern and the Pennsylvania. The shipment weighed 129,360 pounds.

Efficiency on the Missouri, Kansas & Texas

Railway Financial News

ATLANTA, BIRMINGHAM & ATLANTIC.—Bondholders Start Foreclosure Proceedings.—Foreclosure bills against this railroad were filed in the United States District Court at Atlanta, Ga., on March 11 by the Old Colony Trust Company of Boston, which holds \$4,022,000 of bonds secured by a first mortgage on the line between Tifton and Montezuma, and by the Columbia Trust Company, of New York, which holds \$5,161,000 of bonds secured by income mortgage bonds on the whole property except the physical property covered by the Old Colony Trust Company's mortgage. By consent of attorneys for these companies their bills were consolidated with the foreclosure bill brought a year ago by the Birmingham Trust & Savings Company. Judge Sibley ordered that Col. B. L. Bugg, the receiver in charge under the Birmingham Trust & Savings Company's foreclosure brought a year ago, should continue in charge and continue operation of the road pending the final determination of the foreclosure.

CENTRAL OF GEORGIA.—Asks Authority for Equipment Trust.—This company has applied to the Interstate Commerce Commission for authority to create an equipment trust under the Philadelphia plan for the purchase of 500 ventilated box cars at a cost of \$825,000. It is proposed to pay 20 per cent of the cost from current funds and to issue \$660,000 of 5½ per cent certificates which it is proposed to sell through Kuhn, Loeb & Co., or other bankers at 98.

CHICAGO, INDIANAPOLIS & LOUISVILLE.—New Directors.—Evans Woolen, Walter J. Riley, Philip A. Carroll and Lewis Iselin have been elected directors to succeed Fairfax Harrison, Adrian Iselin, Guy Cary and F. S. Wynn, who resigned last year.

CISCO & NORTHEASTERN.—Granted Loan from Revolving Fund.—The Interstate Commerce Commission has certified a loan of \$31,000 to this company to assist it in acquiring two locomotives.

DENVER & SALT LAKE.—Application for a Loan Denied.—The Interstate Commerce Commission has denied the application of the receivers for a loan of \$6,500,000 to enable the company to construct the tunnel through James Peak. The denial was based on the ground that the loan is not necessary to enable the company properly to perform the public service and that it is not justified by the prospective earning power of the road.

DETROIT & Ironton.—Proceedings Dismissed.—The Interstate Commerce Commission has dismissed the proceedings relating to the application of this company for authority to acquire control of the Detroit, Toledo & Ironton by lease and for authority to assume obligations and liabilities in respect of certain securities of the lessor. The commission had previously granted the first application of this company for authority to construct an extension and a second application for authority to issue \$1,000,000 of capital stock, but consideration of the application for authority to lease the road and to assume obligations and liabilities was deferred. The applicant does not desire to press the matter to a conclusion at this time and in order to close the record both applications, in so far as they relate to matters not already passed on, will be dismissed. The lease was opposed by certain minority stockholders who claimed that Ford was trying to "freeze" them out.

ESCANABA & LAKE SUPERIOR.—Asks Authority to Abandon Line.—This company has asked the Interstate Commerce Commission for authority to abandon a portion of its Northland branch from Northland to Camp Ten, 14 miles.

GREAT NORTHERN.—Dividends on Semi-Annual Basis.—The directors on Wednesday unexpectedly changed the dividend payments from a quarterly to a semi-annual basis making the payments February 1 and August 1 of each year.

A statement by Louis W. Hill, chairman of the board, says: It is hoped that the regular 7 per cent basis will be continued, and that the 3½ per cent semi-annual dividend will be paid on August 1. By June conditions should be more settled and the directors will be able to appraise the business year of 1922. The Great Northern's earnings are always relatively low and expenses high during the winter months. At so early a date as the middle of March, when May 1 dividend must be acted upon, agricul-

tural conditions and the season's probable results are unknown. These have been among the controlling factors in our changing to a semi-annual dividend basis. It is particularly advantageous this year for us to defer action until June.

LOUISVILLE & NASHVILLE.—Authority to Abandon Line Denied.—The Interstate Commerce Commission has denied the application for authority to abandon a portion of a branch line from West Point to Pinkney, Tenn., 1.76 miles, as not justified in the public interest.

LOUISIANA & NORTHWEST.—Purchased by Oil Company.—Charles N. Haskell, former governor of Oklahoma and chairman of the board of the Middle States Oil Corporation, has purchased this road. It runs between McNeil, Ark., and Chestnut, La., through the Haynesville and Homer oil fields.

The Louisiana & Northwest has been in the hands of receivers since August 23, 1913. In June, 1919, the road was advertised for sale at an upset price of \$600,000, but there were no bidders.

The new board of directors consists of J. T. Monahan, vice-president of the Metropolitan Trust Company of New York; W. M. Cannon, general counsel of Middle States Oil Company; Adam H. Davidson, of Dallas, Tex.; W. F. Carter, general counsel of the Boatmen's Bank, of St. Louis, and J. Sherry O'Brien, of New York.

Asks Authority to Issue Notes.—This company has applied to the Interstate Commerce Commission for authority to issue \$400,000 of 7 per cent. promissory notes.

MIDLAND RAILWAY.—Receivership Sought.—Upon petition of T. R. Bennett, state superintendent of banks of Georgia, W. J. Donaldson, W. J. Oliver and H. B. Lindsay, Judge Meldrim in the Superior Court at Savannah, Ga., on March 7, issued an order for the Midland Railway to show cause on March 16 why a receivership should not be granted.

The petition alleges that the railroad is insolvent and is indebted to the Oglethorpe Savings & Trust Company to the extent of \$275,000.

MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE.—Dividends Reduced.—This company has declared semi-annual dividends of 2 per cent on the common and preferred stocks, payable April 15 to stock of record March 22. Previously the company paid 3½ per cent. semi-annually on both classes of stock.

MORENCI SOUTHERN.—Asks Authority to Abandon Line.—This company has asked the Interstate Commerce Commission for authority to abandon its line from Guthrie to Morenci, Ariz., 18.41 miles.

NEW YORK, CHICAGO & ST. LOUIS.—Asks Authority for Equipment Trust.—This company has applied to the Interstate Commerce Commission for authority to enter into an equipment trust agreement for an issue of \$360,000 of 10-year equipment trust certificates at 5½ per cent for the purchase of 300 composite stock cars. The certificates are to be issued by the Union Trust Company and sold at 96¼.

NEW YORK, CHICAGO & ST. LOUIS.—Control of Clover Leaf.—See editorial in this issue entitled "Clover Leaf Acquired."

NEW YORK, NEW HAVEN & HARTFORD.—Authorized to Extend European Debentures.—The Interstate Commerce Commission has authorized this company to enter into agreements with the holders of \$14,118,000 of dollar debentures and 69,762,500 francs of franc debentures of its European loan of 1907 for the extension of the maturity thereof from April 1, 1922, to April 1, 1925, and to increase the rate of interest from 4 per cent to 7 per cent. The agreement provides for the payment in cash of 10 per cent of the principal of the debentures to be extended and the commission has approved a loan of \$2,758,000 to the company for this purpose. The company originally applied for a loan of \$31,000,000 to pay off the loan and to provide additions and betterments to the amount of \$3,000,000, but the plan of extension was later arranged. The commission has deferred consideration of the balance of the application.

Decree of 1914 Amended.—Judge Learned Hand in the United States District Court on March 10 signed an order extending until July 1, 1923, the time allowed the New Haven Railroad, by the dissolution decree of Oct. 17, 1914, to dispose of certain holdings in various New England trolley lines.

PENNSYLVANIA RAILROAD.—*Net after Rentals in 1921.*—For the 12 months ended December 31, 1921, this company's "Net after rentals" was \$41,104,031, instead of \$1,104,031 as was incorrectly given in the tables of Revenues and Expenses of Railways in the *Railway Age* of February 25, 1922.

TOLEDO, ST. LOUIS & WESTERN.—*Van Sweringen Company Acquires Control.*—The Van Sweringen Company of Cleveland, Ohio, has purchased the controlling interest in this road. O. P. Van Sweringen, vice-president of the Van Sweringen Company, is chairman of the board of the New York, Chicago & St. Louis, and, with associates controls it.

See editorial in this issue entitled "Clover Leaf Acquired."

TOLEDO TERMINAL.—*Asks Authority to Issue Bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue \$400,000 of first mortgage 4½ per cent gold bonds to reimburse the treasury for expenditures and to make additions and betterments. It is proposed subsequently to sell these bonds and \$214,000 of similar bonds now in the treasury but no arrangements for the sale have been made and the commission is asked to fix the price at which they shall be marketed.

UNION PACIFIC.—*Equipment Trust Agreement Authorized.*—This company has been authorized by the Interstate Commerce Commission to assume obligation and liability in respect of \$6,800,000 of Union Pacific equipment trust certificates to be issued by the Commercial Trust Company of Philadelphia.

ZWOLLE & EASTERN.—*Authorized to Abandon Line.*—The Interstate Commerce Commission has issued a certificate authorizing this company to abandon its line amounting to about 10 miles in Sabine Parish, La.

Railroad Administration Settlements

The United States Railroad Administration reports the following final settlements, and has paid out to the several roads the following amounts:

Louisville & Nashville.....	\$7,000,000
Alabama & Vicksburg.....	275,000
Minneapolis, St. Paul & Sault Ste. Marie.....	525,000
Narragansett Pier.....	7,500
Winona Bridge.....	47,000
SHORT LINES	
Spokane & British Columbia Railway Company.....	7,500

The payment of these claims on final settlement is largely made up of balance of compensation due, but includes all other disputed items as between the Railroad Companies and the administration during the 26 months of federal control.

Dividends Declared

Minneapolis, St. Paul & Sault Ste. Marie.—Common, 2 per cent, semi-annually; preferred, 2 per cent, semi-annually; both payable April 15 to holders of record March 22. Leased lines, \$2, semi-annually, payable April 1.

Pittsburgh, Bessemer & Lake Erie.—Common, \$0.75, payable April 1 to holders of record March 15.

Trend of Railway Stock and Bond Prices

	March 14	Last week	Last year
Average price of 10 representative railway stocks, close of business.....	61.45	59.66	54.11
Average price of 10 representative railway bonds, close of business.....	82.50	82.31	73.61

THE NUMBER OF PERSONS employed by the Interstate Commerce Commission on December 31, 1921, was 512 less than it was at the beginning of the year, according to a statement covering the various departments of the government furnished to the Senate by the United States Bureau of Efficiency. The decrease is mainly accounted for by the reduction in the valuation forces. On January 1, 1921, the commission had, according to this statement, 2,192 employees, of whom 975 were in the District of Columbia and 1,217 in the field. Most of these in the field were in the valuation bureau. At the end of the year the total was 1,680, of whom 1,416 were in the District of Columbia and only 264 in the field. A large number of the valuation employees were transferred to Washington as the district offices were discontinued.

Railway Officers

Operating

C. F. Urbutt, trainmaster of the Chicago, Milwaukee & St. Paul, with headquarters at Perry, Iowa, has been transferred to Savanna, Ill., succeeding F. H. Allard, who has been transferred to Ottumwa, Iowa. Mr. Allard succeeds **T. P. Horton**, who has been transferred to Portage, Wis., to succeed **W. G. Bowen**, who has been transferred to Perry, succeeding Mr. Urbutt.

Engineering, Maintenance of Way and Signaling

G. H. Nickerson, superintendent of construction in the county engineer's office, Merced County, Cal., has been appointed chief engineer of the Yosemite Valley Railroad, with headquarters at Merced.

Traffic

J. R. Hundley, traveling freight agent of the Wabash at St. Louis, Mo., has been promoted to district freight agent with headquarters at East St. Louis, Ill., succeeding **J. H. Wack**, transferred.

Purchasing and Stores

C. C. Kyle, acting general storekeeper of the Northern Pacific, with headquarters at St. Paul, Minn., has been promoted to general storekeeper with the same headquarters, succeeding **O. C. Wakefield**, deceased.

Special

A. K. Ragsdale, traveling passenger agent of the San Antonio & Aransas Pass, with headquarters at San Antonio, Tex., has been promoted to general inspector, with the same headquarters. He will have supervision over safety, service and efficiency on the system.

Obituary

W. J. Jackson, division engineer of the Chicago & North Western, with headquarters at Winona, Minn., died on March 13, from pneumonia.

James S. Mackie, formerly treasurer of the Chesapeake & Ohio, the Hocking Valley, the Chicago & Alton and the Toledo, St. Louis & Western, died at Hackettstown, N. J., on March 11, at the age of 67.

Albert A. Polhamus, general agent, passenger department, of the Canadian Pacific, with headquarters at Los Angeles, Cal., died at his home in Pasadena, Cal., on March 10, from the results of internal injuries sustained in a fall.

John Wynn, assistant to the general manager of the Northern Pacific, with headquarters at St. Paul, Minn., died at his home there on March 9. Mr. Wynn was 58 years of age and had been connected with the Northern Pacific since 1889.

George K. Caldwell, chairman of the Southern Freight Rate Committee, with headquarters at Atlanta, Ga., died at Montclair, N. J., on March 8. Up to the time of his appointment on this committee, Mr. Caldwell was assistant traffic manager of the Southern Railway, with the service of which road he had been connected 26 years.

C. H. Niemeyer, acting engineer maintenance of way of the Pennsylvania, with headquarters at Williamsport, Pa., died on March 4 at Philadelphia. Mr. Niemeyer was born in 1869 and was graduated from Cornell University in 1891. The following year he entered the service of the engineering department of the Pennsylvania and served continuously in that department until the time of his death.

EDITORIAL

Railway Age

The Table of Contents Will Be Found on Page 5 of the Advertising Section

A perusal of the reports of the Telegraph and Telephone Section, A. R. A., presented at the March stated meeting held in Richmond, Va., this week gives evidence that this association is doing a great deal to increase the efficiency of the railroad communication systems.

Activities of the T. & T. Section

One report of 92 pages, describing in detail various telegraph and telephone circuits, could well serve as a text book for any one desiring a general knowledge of railroad communication circuits. Standard minimum clearances between wires of crossarms and the running rail have been established by the association, and the committee on wire crossings has fixed the minimum clearance between power wires and communication circuits. Of special interest to operating officers is the finding of this association that the interchange of traingrams between railroads as an overnight feature would not meet the requirements for such communications, and that because of the postal laws and the added expense of extra messengers at transfer points the introduction of such a practice is considered to be impracticable. In another report the association offers suggestions to the users of telephones that will materially increase the efficiency of transmission. By rendering such practical service the Telegraph and Telephone Section is serving the railroads in a commendable way and should receive the co-operation of the other units of the A. R. A. in order that the efficiency of railroad communication may be increased to meet the growing demand for this important service.

To what extent are the railroads aware of the advantages to be derived from a definite organization for water supply service? How many roads have established and now maintain such organizations? These are questions which arose prominently upon the reading of certain communications presented by the Committee on Water Service during the convention of the American Railway Engineering Association on March 16.

An Organization for Water Service

Following an introductory statement to the effect that a water supply of ample quantity and of satisfactory quality is one of the essential requirements for the successful operation of a steam railroad (a truth which in itself does not always appear to receive the general recognition it deserves), this communication brought to light certain significant facts concerning this phase of railway operation. The annual water consumption on American railways, the communication showed, is approximately 900,000,000,000 gal., with nearly \$40,000,000 expended annually in merely operating and maintaining the 14,000 stations which supply this water. This expenditure assumes special significance when one considers the using as well as the obtaining of much of this water. It is not surprising that students of this subject should advance the plea made by the Water Service Committee for a definite water supply organization on each road. Those departments of water service which hold out the greatest promise for economies and improved service deal with phases of work which demand special study and close application as distinguished from the superficial attention of

those who are either not especially trained or by reason of their other responsibilities are unable to give the subject the thought it requires. No better proof of this is to be found than the fact that those roads which maintain special organizations have secured the most satisfactory results. A specialized organization thus not only appears to be desirable in water service as in other departments of railway work, but has definitely proved itself so and those roads that do not maintain such organizations now might well direct close attention to this phase of the railway problem.

The matter of New England divisions has been carried into the courts. A considerable list of trunk line and C. F. A.

New England Divisions

carriers have filed in the federal court at New York a bill in equity asking for an injunction to restrain the enforcement of the Interstate Commerce Commission's order for increased divisions of the through rates. The New York Central is not included in the list of carriers mentioned because, it is understood, that carrier will carry on an independent action related more particularly to the Boston & Albany, leased by the New York Central which, although almost entirely in New England, was not a party with the New England carriers. The Pennsylvania and Baltimore & Ohio also are not parties. This New England division's affair has become one of the most complicated matters of its kind which has been offered for solution in a long time. The present divisions in themselves are complicated. The scope of the authority of the Interstate Commerce Commission, insofar as concerned its power to order a general blanket increase in divisions, was in question as is shown by the fact that the increase which has been ordered and which is now still in question was made only after a rehearing and supplementary decision. The question has also arisen as to whether other carriers may not also be entitled to treatment similar to that given the New England lines. Insofar as concerns the New England carriers it must be admitted that they are meeting almost unsurmountable difficulties in overcoming the handicaps which confront them as a result of federal control. The *Railway Age* believes it unfortunate, however, that the two sides are so far from agreement that the matter must be taken into the courts.

There is an impression which prevails among many railroad officers that the Air Brake Association is composed of a body of inspectors whose efforts are

The Air Brake and Train Operation

largely devoted to matters relating to the maintenance of the various air brake devices and that consequently they belong solely to the mechanical department. While it is true that maintenance matters do demand a large amount of attention from the men who make up this association, the fact that much of their work is vitally connected with matters that concern train operation should not be overlooked. The air brake has become such a common thing that one is apt to overlook the fact that its development has made possible the handling of long, heavy

freight trains and has brought about the modern freight locomotive of high tractive effort. Moreover, if it were not for reliance upon the air brake, it would be impossible to handle passenger traffic with reasonable safety even at greatly reduced speeds. It is not too much to say that our present practices in train operation have largely been built up on the foundation of the air brake. The men composing the Air Brake Association have assisted materially in bringing the brake to its present high state of development and with proper support undoubtedly will assist in meeting the needs of future requirements. This is possible because the men are in the field so much of the time riding locomotives and helping enginemen and trainmen obtain the best results from the brake. Even maintenance and yard inspection work has to do so directly with train movements that the work of the association should interest transportation officers even more than it does those in the mechanical department. A broader appreciation of the valuable work of the association on the part of higher railroad officers and their support in making the annual meetings a success would make the association of increasing usefulness.

The railway problem, aside from its financial aspects, of India, South America, Australia, China, Africa or, in fact, almost every part of the world except Western Europe, is essentially the same as that of the United States. In other words, most countries need railways so constructed and equipped that they can

operate profitably and efficiently with rather light traffic, made up in large proportion of low grade commodities. Under such conditions heavy train loading—which entails heavier cars, heavier power, stronger draw gear and air brakes—is necessary for efficiency. Also, under such conditions, it will be found that double track cannot, generally speaking, be profitably utilized and that a single track only can be provided. Railway development to meet such conditions as these has unquestionably advanced further in this country than anywhere else in the world. Why is it, then, that in most of the countries we have named we find the railways built and equipped upon lines suggested by the practice of Western Europe, where intense traffic is the rule? The answer is that capital from Western Europe built these railways and naturally patterned them after their own carriers. Until recent years this country was in no position to build foreign railways but lately we have advanced millions of dollars for railway development abroad and the field for profitable investment in this direction is practically unlimited. The mere sending of dollars, however, is not enough. With money for development should go American equipment and American railway men. Otherwise the countries where extensive railway development is contemplated will be unable to secure the full advantage which our experience with problems, identical with theirs, can give them.

The Great Northern directors, at their meeting in New York on March 15, deferred action on the usual quarterly dividend on the seven per cent preferred stock.

The hope was expressed that it would be possible to maintain the present seven per cent rate, but that the procedure in the future would be to put the dividends on a semi-annual instead of on a quarterly basis. This announcement, which is given in greater detail in the financial columns of this issue, was received with mixed emotion in Wall Street. The Street showed itself skeptical, in particular, as to whether the hope of the semi-annual dividend would be realized. Great Northern stock which

had been quoted between a high of 80 $\frac{3}{4}$ and a low of 70 $\frac{1}{4}$ in the first two and one-half months of 1922 and which on March 14 closed at 80 $\frac{3}{4}$, broke sharply on March 15 (the day of the directors' meeting) and closed at 77 $\frac{3}{4}$. On Thursday it closed at 76; on Monday of the present week it closed at 75. The Great Northern has only one issue of stock, the preferred. This stock has paid dividends regularly for an indefinite period. The seven per cent rate was established in 1900 and has been maintained since that time. The railroad man as a rule is not inclined to agree in many cases with Wall Street's opinion of railroad operations. In the case of the Great Northern, the railroad man will have to admit, however, that Wall Street was correct. Wall Street has been dealing in Great Northern stock at about 75. This is a low price for a seven per cent stock. It evidences that Wall Street has known that Great Northern has been confronted with many difficulties and that the Street has, on the whole, diagnosed the situation correctly. The Great Northern is at present showing signs of improvement, but because of the manner in which the larger part of the road's traffic moves in the latter part of the year, not much value can be placed on the January and February returns. It will be interesting, therefore, to watch the course of quotations on Great Northern stock during the coming months.

It is human nature to be fascinated by the spectacular, deeply interested in the unusual, but often neglectful of common things of much greater aggregate importance.

The Neglected Engine Lathe

In the railroad mechanical world attention is focused on large shops and terminals, which as a rule benefit by new machinery and equipment purchased. This occurs in spite of the fact that three-quarters of the locomotive shops in the country are relatively small, having an output of 10 heavy classified repairs per month or less. Two-thirds of the enginehouses also are small with not more than 10 stalls per house. It is obvious that the use of large capacity, highly specialized machines would not be justified in these small shops and enginehouses which sorely need an adequate amount of the more commonly used machinery, as efficient in operation and power consumption as possible. The importance of turret lathes, automatics and other production machines in the larger shops is rightly emphasized, but the more common engine lathe should not be forgotten. Aside from drills, the engine lathe is the only turning machine in many small shops, and even in large shops it outnumbers any other type of machine three to one. On the basis of the actual number of machine tools in operation in railroad shops and enginehouses the lathe is easily of first importance. It should not be forgotten in requisitions for new tools because much money can be saved or lost depending upon the condition of lathe equipment. The modern product, of which manufacturers are justly proud, combines adequate power with high production, accurate work and ease of control. These features, together with efficient tools and jigs for each particular job, greatly conserve the operator's time, increase output and decrease costs.

The Chicago, Burlington & Quincy office building fire has been studied with great interest by structural engineers because it has served as a practical demonstration of the behavior of the modern protected steel frame building in the face of a great fire.

Protecting Records From Fire

Investigation indicates that the building is structurally intact and there is reason to believe that it served effectively as a barrier to the progress of a great fire which

otherwise might have wiped out a large part of the city of Chicago. Speculation along that line gives but scant consolation for the loss of valuable records suffered by the Burlington as the result of fire which came in through the windows and destroyed the combustible contents of seven floors of the office building except where locked in vaults. In the case of a great fire such as occurred in the highly combustible buildings in the block adjacent to the Burlington structure, the window is the vulnerable detail and it is doubtful if any form of window construction would have prevented the ignition of the woodwork inside of the Burlington offices. In the face of such a hazard, therefore, no scrap of paper is safe unless it is enclosed in a fireproof vault of approved construction, for in the Burlington building filing cases afforded no protection whatever for their contents. These facts having been presented, the reader must be left to apply his conclusions with respect to his own files for in no two cases will the hazard be exactly the same. In general, it may be said that a record is not safe unless it is stored in a fireproof vault and that it would be well to keep within the walls of the vault all papers not required for current work. Working files cannot be kept there at all times, nor is it practical to store them all in vaults over night, but a large part of the records and files can be so protected. In the interest of security, therefore, it is important to study the actual hazard to which they are imposed under normal working conditions.

The Automatic Train Control Hearing

THREE POINTS STAND out in the hearing before the Interstate Commerce Commission on its automatic train control order. These are: That in the proposed order the specifications have been so amended that a simple automatic stop device would appear to be ruled out; that additional data had been collected by the American Railway Association without the co-operation of the Bureau of Safety, and that it is the view of the carriers, after 15 or 20 years' investigation and test, that train control devices are still in the experimental stage.

Referring to the specifications in the proposed order: A year ago general requisites for automatic stops and automatic speed control were adopted by the A.R.A. Committee on Automatic Train Control and by the Bureau of Safety of the Interstate Commerce Commission. When the tentative order was issued by the Interstate Commerce Commission on January 10 last, paragraph b, under Automatic Stop, reading "under control of enginemen, who may, if alert, forestall an automatic brake application and proceed" had, for some reason, been eliminated. This apparently would tend to prevent the use of devices having that feature. At the same time, reference is made by the commission to the service records of the three roads having devices in use (C. & O.; C. & E. I.; C. R. I. & P.), which apparently do not qualify under the requisites. In this connection it was the feeling of the committee representing the railroads (the "Denney Committee") that this paragraph should be restored, for reasons well set forth by A. M. Burt.

Certain defects which might cause objectionable or dangerous failures of the three devices in service, collected during the last 15 months, were pointed out by the railroads' committee and were concurred in by representatives of the Bureau of Safety. At the hearing it developed that the Denney committee had recently placed sub-committees on the different roads, without the co-operation of the Bureau of Safety, in order to observe conditions during winter weather, as a result of which some additional data were presented at the hearing. In these later records the Bureau of Safety stated that it did not concur, and so wished to go on record, as none of its representatives were

present. It was on the basis of defects found to exist on these three installations and the desire to try out other types, that the carriers made their plea to have the order withheld. However, it is well to point out that with the exception of some 12 additional defects found by the sub-committee, information on this subject was in possession of the commission some time before the tentative order was issued and it is to be presumed that this was considered carefully before it was drawn up.

Another argument advanced by the railroads why the order should not be entered was that because of the defects found in these inspections, and the fact that changes in design were being made and improvements added, the art was in the experimental stage. The fact that the feasibility of the inductive type of apparatus has not as yet been demonstrated and that it shows promise, was dwelt upon as an additional reason why the order should not now be issued. Several roads, in their separate pleas, pointed out the desirability of installing automatic block signals throughout their principal lines before being required to install train control.

It would appear that any order issued by the commission should be amended as regards the present requisites, in line with the request of the carriers. One railroad system ought not to be required to make double installations, as is required in two instances; and there is force in the contention that much more good may be accomplished if certain carriers are permitted to make installations of automatic block signals in many places where they are badly needed, before such an order is made applicable to them. The one constructive result of the hearing is the proposal embodied in paragraph 3 of Mr. Denney's memorandum, wherein the railroads promise, both jointly and individually, to continue all reasonable assistance in the work of development, as the commission may direct. The only result expected from this hearing was the establishment of a basis for modifying the commission's drastic proposal of January 10; and this paragraph 3 constitutes a definite step in that direction.

The Railway Wage Situation

THE TESTIMONY introduced by the witnesses for the railroads in the wage hearings now going on before the Railroad Labor Board has proved at least three very important facts of great pertinency in relation to the question whether railway wages should be readjusted downward. These are:

First, that the present wages of most classes of railway employees are higher in proportion to the cost of living than when the Labor Board awarded a reduction last year, and much higher in proportion to the cost of living than at the beginning of the World War. This is not true, however, as to all classes of employees, especially certain classes in train service.

Second, that the wages paid in outside industries for labor doing similar kinds of work vary widely in different territories and even in different communities in the same territory.

Third, that in almost every part of the United States the railroads are paying higher wages than outside industries to labor doing comparable work.

The two principal standards established by the Transportation Act for the measurement of the reasonableness of railway wages are the cost of living and wages paid in other industries. The reduction in the cost of living which has occurred within the last two years is under the law a valid argument for greater reductions in wages than have been made. Measured by the standard of wages paid in other industries, there is under the law justification not only for substantial reductions in the wages of many classes of railway employees, but for very extensive readjustments in them. If wages in the railroad industry are to be measured at all

by wages in other industries, there can be no defense for the Labor Board maintaining throughout the country wages, such as those for common labor, which are much higher than those paid for similar labor in any other industry. When railway wages are kept higher than those in other industries and railway rates are maintained to pay these higher wages, railway labor becomes a privileged class which is subsidized largely at the expense of the large majority of the population which has smaller incomes than railway labor has.

Two of the most significant features of the statistics concerning the wages being paid in other industries are, first, as already indicated, that wages in outside industries vary widely in different territories and communities; and secondly, that the differentials between the wages of skilled and unskilled labor are much greater in other industries than they are at present on the railroads. The former condemns the present system under which railway wages are standardized throughout the country. How, in strict accordance with the provisions of the Transportation Act, can the Labor Board require the railroads to pay virtually the same amount for common labor in the southwest and in the northwest, when in other industries common labor is paid only 10 to 25 cents an hour in the southwest and from 31 to 45 cents in the northwest?

Perhaps, however, the most indefensible feature of the present railway wage scales is that they force the payment to unskilled labor of wages which are relatively much too high in comparison with those paid to skilled labor. This is contrary to every sound principle, whether the matter be regarded from the standpoint of labor, of the railroads, or of the public. It destroys the incentive of the unskilled man to become skilled, and the incentive of the skilled man to maintain and try to increase his skill. They thus tend directly to reduce the efficiency of all classes of labor. The wage scales proposed by the railroads are sound in proposing to widen the differentials between the pay of the unskilled and the skilled.

The leaders of the shop crafts unions have intimated that they will not only resist reductions, but even seek increases in wages. As in previous hearings they will doubtless suggest that the railroads pay excessive prices for coal, equipment and materials; that the concerns from which they buy these things are under the same financial control as the railroads and make large profits, and that if the railroads would pay lower prices for the other things they buy they could pay higher wages to labor. In the first place, however, it is simply not true that these concerns are under the same financial control as the railroads. In the second place, it can easily be shown that at the present time these concerns are not paying as high wages as the railroads. Therefore it may occur to the representatives of the employees of the equipment companies and the steel and other material companies to suggest that if any of the alleged huge profits and surpluses of these companies are to be used to pay labor higher wages, these higher wages should be paid to the employees of these companies, and not to the employees of the railroads.

It is a very ungrateful task to advocate reductions in the wages of any class of workmen, but no industry can pay out for labor, coal, material and taxes more than it can earn. Furthermore, no industry can live, much less prosper, without earning a reasonable net return on the investment in it. The railroads are confronted with a practically universal demand for reductions in rates. If substantial reductions in rates are to be made, they must be made either at the cost of some reduction in wages, or at the cost of the bankruptcy of the railroad industry.

There is only one way in which labor, as a class, can hope to secure a large and permanent increase in its real wages, and that is through a large increase of production. Unless railway employees, by more efficient work, will contribute their share toward this increase in production, they cannot

get their share of the increase in real wages which it would make possible. Unfortunately, the very labor leaders who demand the highest wages for labor are the most active and effective in securing reduction of hours, and restrictive working conditions, which place the greatest obstacles in the way of securing the needed increases in production.

Well, Where Are We Now?

“WHEN THE MARINER has been tossed for many days on an unknown sea he naturally avails himself of the first pause in the storm, the earliest glance at the sun, to take his latitude and ascertain how far the elements have driven him from his true course.” So much for the mariner. Back in November, 1921, there appeared in the columns of this paper an article entitled “The Interior Treatment of Boiler Waters,” and in the same issue a brief editorial comment by way of ushering, as it were, the subject matter involved to the forum of thought, of consideration and discussion. That was four months ago.

Since then, what vicissitudes have not been the lot of this well-meaning article, even the editorial comment not escaping the storm. Expressions of approval have run counter with condemnation—for the original article one moment and subsequent contributions the next. “Mules” have joined company with passages from Latin, “surface tension” and “parts per million” have sat at the same table, and the “last three grains per gallon” have talked the matter over with “sand filters.” Truly, even one versed in the technique of such a subject could scarcely avoid floundering, so involved and diversified at this date have things become. Small wonder then if the others, taking their cue from the mariner of Daniel Webster’s creation, should stick their periscopes above the turbulent sea of comment and in good old Anglo-Saxon express themselves, “Well, where are we now?”

Consider then the initial article. “Specifically,” it was said in the previous editorial, “the article concerns itself with boiler compounds and points out the possibilities of this much applauded and berated and withal too little understood method of improving the locomotive performance in bad water areas.” This statement was applicable then and may be reiterated now. And what of the discussion since? Has it made out a case against treating plants as one writer was evidently under the impression the initial article would? Has it dispelled the suspicions concerning boiler compounds as others have apparently entertained fears that it might? It must be confessed that the reflections made against treating plants, considered at least with reference to specific installations, have not been entirely without foundation and it cannot be refuted that boiler compounds have not been divested of all their shortcomings.

But, relieving the voluminous discussion of its many digressions and occasional personalities, does it not give emphasis to the observations made heretofore that there is both merit in boiler compounds and justification for treating plants; and giving due consideration to the very appropriate distinction made in the discussion between anti-scale compounds and anti-boiler compounds and the caution held out against crediting the results obtained by the one upon the ledger of the other, is not the fundamental conclusion to be drawn, still the one previously made that “the problem of improving boiler waters in short is no longer one of arbitrarily installing a treating plant or of prescribing a preparation for locomotive boiler or tender treatment, but rather that of choosing that method which is best adapted to solve the particular problem, whether it be a particular kind of interior treatment alone, a special kind of exterior treatment alone, or a combination of the two.” If the discussion has established this impression, the query, where are we now, has been advanced to good purpose.

Fundamental Considerations in Locomotive Operation

IN CONSIDERING the features to be included in new motive power railroad men are generally confronted with conflicting viewpoints. One person may claim that efficiency consists solely in getting heavy train loading and therefore the tractive effort should be made just as great as possible. Another may lay the greatest stress on fuel costs and advocate a design in which fuel economy is given first consideration. Still a third may be most concerned with getting locomotives that will be easy to maintain and make a high mileage on a monthly basis and between shoppings.

All three of the viewpoints mentioned are based on important factors in locomotive operation. No one alone is a safe guide for the selection of economical locomotives but all must be considered jointly to attain the object for which railroad men are striving—minimum over-all cost. The principal difficulty is in giving each its proper importance. Probably the best procedure is to work out estimates of the cost of operation for different designs. This is not always satisfactory because accurate figures cannot be obtained in advance. The whole problem is so complex that it requires careful study. However, a few general principles can be pointed out as a guide toward the desired end.

The cost of operating a modern locomotive of the Mikado type, for example, is about \$4.00 to \$4.55 an hour for the wages of the enginemen and trainmen and from \$9.50 to \$19.70 an hour for fuel, or an average for the country of about \$11.40 based on a consumption of 6,000 lb. The fixed charges on the train-hour basis will vary with the first cost and the proportion of time in service to total time and will range from \$.90 to as much as \$5.00 an hour. Repairs will show considerable variation depending on the class of service, water supply and design of the locomotive. An average value would be approximately \$5.60 per hour of service.

These figures show that the largest item of expense in the operation of modern locomotives is fuel. Because it is the greatest, it should have first consideration. The boiler and machinery should be designed to get the maximum practicable efficiency. Any device that will save in fuel an appreciable amount over the cost of maintenance and the fixed charges is a money-earner. There is a tendency to hold the dime spent for maintenance so close to the eye that it completely hides the dollar saved in fuel. If every road made out debits and credits for each appliance, there would be more fuel-saving devices applied.

Coming now to maintenance expense, there are three primary items to consider in deciding on the design; repair cost, operating cost and first cost. Reliability is a necessary characteristic of a locomotive and railroad men generally associate reliability with simplicity. The two qualities do not necessarily go together. Perhaps there is room for improvement in mechanical details by refined design that will add to the life of such vital factors as tires, driving boxes and rods.

The greater first cost would not be a serious factor if improved design could either increase the percentage of time the locomotive spent in actual service or reduce the cost of repairs.

The question of wages, which most operating men would probably place first, is only in third place in the items of expense. The reason is that wages no longer afford the major opportunities for saving. A net train load of 500 tons would represent a wage cost of about \$0.0008 per ton-mile. With a train load of 1,000 tons, which is conservative for a Mikado locomotive, the cost would be only \$0.0004 per ton-mile. Assume that the rated tractive effort can be increased one-fourth. This would decrease the wage cost per ton one-fifth, provided the full tractive effort could be developed and

utilized. There would almost necessarily be an increase in maintenance costs for both the locomotive and the cars which would tend to offset this economy. Furthermore, the same gross saving could be effected by an eight per cent decrease in fuel costs as by a 20 per cent decrease in wage costs. This should not be interpreted to mean that possible savings in wages are negligible, but the question goes deeper than mere rated tractive effort. Wages can be saved by speeding up operation as well as by increasing train loads and the minimum-wage cost can only be obtained by combining high tractive effort with other features that make it possible to speed up trains and cut down overtime.

The last of the items to be considered is that of fixed charges. Probably many will be surprised to find that in some cases it may amount to more than wages. Perhaps the relative importance of this item can best be illustrated by a comparison with electric operation. The electric locomotive costs probably two and one-half times as much as a steam locomotive of equal power and, furthermore, it requires expensive overhead construction and power stations. In spite of these facts electrification can show savings under favorable conditions because electric locomotives save fuel, reduce maintenance costs and speed up train service. It will pay likewise to spend more money for steam locomotives and related facilities that will accomplish similar results. Railroads have learned to buy coal not on price, but on the basis of heat units or ton-miles per dollar. In purchasing locomotives the measure of value is the same. To be sure, the problem is more complicated, but it is also more important and well worth the attention that is necessary to find the right answer.

New Books

Traffic Management. By George A. Denfield, President and Professor of Traffic Management, Western University of Commerce and Law, Portland, Oregon. 367 pages. 6 in. x 9½ in. Bound in cloth. Published by the author.

The author of this book has taught traffic management in Georgia, Montana and Oregon and he has packed into this book, we should say, every fact bearing on this subject that he was able to gather in all of these states; over 300 pages, with no room wasted. He has posted himself fully and in every detail concerning the operation of freight houses, local and general freight offices, the making of rates and the solicitation of freight; and, as in the case of Goldsmith's schoolmaster, the reader wonders that one head can carry all that he knows.

He has divided the work into five parts and 12 chapters, as noted below; but each chapter contains such a bewildering mass of facts that the only discernible rule for selection or classification of material seems to have been to set the reader to thinking, throughout the whole traffic field, in each chapter.

The introductory chapter treats of transportation, from the dawn of civilization; and the geographical study of the United States, occupying 12 pages, is so detailed as to remind one of the celebrated English geologist, who could find his way in a strange county on a dark night by picking up and tasting a lump of earth. The principal traffic routes of the United States are traced from A. D. 1815, down to 1921, and evidence of up-to-dateness is seen in a reference to the anxieties felt by the shippers of hops in the Western states because of the passage of the 18th amendment to the constitution.

The matter in the book is voluminous; overwhelming; not thoroughly digested; a judicious selection would have been more useful. The professor's students are not likely, however, to find in this condition any excuse for neglecting to

give their lessons thorough study for, following the last chapter, there are 75 pages filled with questions; concrete, abstract and mixed. Five hundred and ninety-six of these questions are labeled "Practical Problems." Evidently Professor Denfield has read every one of the freight rate decisions issued during the past dozen years by the Interstate Commerce Commission and has committed them to memory; and the hundreds of knotty problems with which those decisions are sprinkled are here set forth for the perusal of the unsophisticated reader who aspires to fill one of the "thousands" of traffic managerships which large mercantile and manufacturing establishments are now waiting to confer on competent young men at "promising salaries."

Following the "practical problems" there are 825 questions written in the ordinary style, many of them filling but a single line, by which the student can test the degree of success with which he has absorbed the contents of the book. On the subject of freight classification alone there are 300 of these questions; and so far as can be judged by the make-up of the list, or of the chapter to which it refers, the student is expected to answer the whole of them at one sitting!

The only rational conclusion that we are able to reach concerning the scheme of this book is that it is a transcript or revision of all the notes that have been made by the author in an extended experience as teacher or lecturer; made without sufficient attention to the needs of the student, and leaving a considerable task for the teacher who would use the book as a guide. Traffic management is a pretty difficult subject to systematize, and we are not blaming the author of this book for not doing it; but it is only fair to readers to tell them that this mine of useful information contains a large percentage of highly refractory ores.

The author has done well to make himself intimately acquainted with numerous competent railroad traffic officers and he gives the reader the full benefit of their wisdom on a thousand different points; but he too readily follows some of their careless habits in the use of words. Also there are occasional infelicities of language on the part of the author himself, indicating that some of the work was done too hurriedly.

The five parts of the book are entitled; (1) tonnage and rate construction territories; (2) classification; (3) tariffs; (4) transportation services and (5) traffic administration. The first part is divided into (1) introduction, commerce, industry and transportation; (2) physical and productive regions of the United States; (3) channels of traffic and (4) geographical relationship of traffic territories and rate construction points. Part 5, which is chapter 12, deals with administration of both railroad and industrial traffic departments.

Some of the "practical problems" referred to above are notable for their oddity. Others seem to be designed to stump the young student in various ways. Problem No. 13, of part 1, reads: "The southern mountaineer, who is able to grow corn on the mountain slopes claims that lack of transportation is the reason for his moonshining operations and illicit stills; that transportation will not allow him a profit on taking his goods to market. Therefore, he must have a product of high value and low bulk. Do you agree with the claims that are set forth? Will the government's aid and development of dairying and cheese making improve conditions?"

Under the head of classifications we find, for example: "Classify all athletic, gymnastic and sporting goods for the A. G. Spaulding Company, who desire to open a new store in Pittsburgh, and are planning to ship the goods from either New York or Chicago. Try and show them which would give them the better rating."

Problem No. 147, on page 284, reads: "The speaker on the Socialist program remarked that freight rates on cotton and woolen goods was discriminative, such as ratings on over-

alls and woolen suits. Show his line of argument and your opinion."

Were it not for limitations of space we could go on indefinitely with illuminating questions and comments concerning race-horses, planographs, garages, nitroleum, Oklahoma basing points, skirt forms with standards detached, proper location of tanneries, rates on human hair, C. L., and proper allowance for outage in tank cars; rates on kitchens, K. D., best place to make crude balsam, how to get a monopoly on the bottle business, how to ship a circus without being troubled by "cooties" and such like—and so on for pages and pages.

One thing that we have not found in the book, but which is of the first importance to the young student of traffic problems, is a warning that very frequently he will find the science of his business not only too complicated and confusing to be kept clearly in mind when soliciting a shipment from an ugly customer, but also too dim and remote to be satisfactorily defined; too much like a radio message from Australia. At the risk of being cited for contempt of the traffic court we will remind the student that, in difficult cases such as are here suggested, a knowledge of what your competitor is doing, or can do, or hopes to do, will often take the place of a great lot of scientific knowledge. Many of the most successful traffic men have had but scant knowledge of traffic science; but they have been adept in the art of guessing the other fellow's thoughts.

Moody's Analyses of Investments, Steam Railroads. By John Moody. 9 in. by 11 in. 1,314 pages. Bound in cloth. Published by Moody's Investors' Service, 35 Nassau Street, New York. Price \$20.

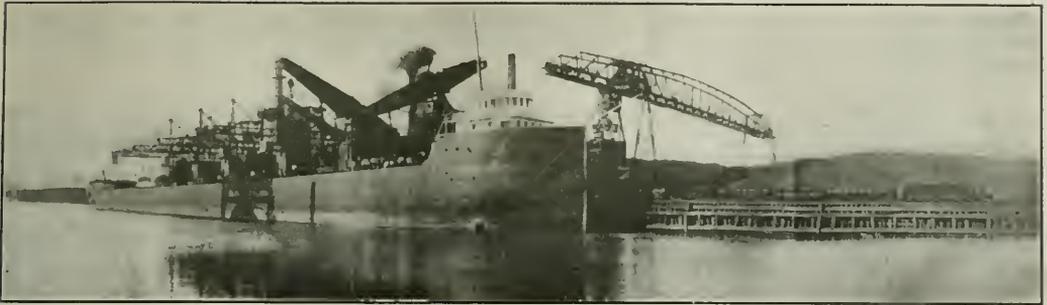

This is a new edition of Moody's Rating Book or Analyses of Railroads. The book combines the features of a manual on railroads with those of a rating book, performing the same function in respect to the investment standing of securities, as the credit agency rating books do on credits. The work, however, goes farther in that it presents the data upon which the ratings are based together with the full descriptions of properties and information regarding earnings, traffic statistics, officers and directors, price range of securities for years and other details of this nature.

All of the financial statements and earnings reports are analyzed. The percentage earned on different classes of stocks is shown, as well as the margin of safety for bond interest, average income available for fixed charges or dividends, with the amount required for such purposes. Comments are given on the equity of security issues and their market ability and other deductions are presented in concise, easily-understood tables.

Their system of investment ratings is simple, yet specific. Securities of the highest investment character, issues strongly protected by assets and earning power, whose position is secure beyond the shadow of doubt are rated Aaa—the next rating Aa, then A, Baa, Ba, B, etc. Atchison Topeka & Santa Fe General Mortgage 4s of 1995 are rated Aaa; Chicago Great Western First Mortgage 4s of 1959 are assigned a Baa rating; Norfolk & Western Common stock is rated A—Seaboard Air Line, preferred, carries the rating C.

The book covers all railroads in the United States and Canada and prominent South American systems.

For many years Moody's Rating Books have been part of the regular equipment of banks and financial institutions but recently, due to the general interest in railroad securities and railroad operations, the Railroad Rating Book especially has come into greater use upon the part of the public. This book will be found instructive and valuable to anyone who is interested in any phase of the transportation industry. The purchase price of \$20, includes also Monthly Bulletins of New and Revised Ratings and Monthly Earnings Reports.

The Ore Dock at Huron

Wheeling & Lake Erie Watches Cost Factors Closely

Coal and Ore Traffic Predominate—Road in Much Better Physical Condition Than Formerly

By Charles W. Foss

PART I

THE WHEELING & LAKE ERIE'S net after rentals for the year 1921 was \$1,755,356. For 1920 the road had a net railway operating deficit of \$401,694. In 1919 and 1918—during the federal control period—there was a net railway operating income of approximately \$1,000,000 in each year. The 1921 increase in net was in spite of a sharp falling off in traffic. For the year the net ton-miles, revenue and non-revenue, totaled 1,097,087,936, as compared with 1,580,700,825 in 1920.

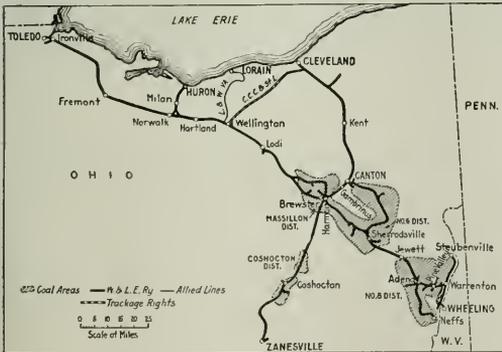

The operating ratio for the year was 79.55 per cent, the

better shape than the average. For instance, the per cent of bad order cars on February 15 was 8.1; for all the roads on that date, the percentage was 14.5.

A number of factors are responsible for the operating economies which have been brought about. One is the careful supervision given to cost factors, particularly, perhaps, with reference to the effort made to keep down overtime. Another is the manner in which the co-operation of the men has been secured by prizes to yardmasters and train and en-

TABLE I—REVENUES AND EXPENSES OF OPERATION, 1912 TO 1921

Years ending June 30	Coal rev. in cents	Per cent of total freight	Total coal rev.	Pas-senger revenues	Total revenues	Total expenses	Net operating revenue

1921	6,561,349	44.36	12,729,201	952,305	14,791,993	11,767,602	3,024,991

The Wheeling & Lake Erie

transportation ratio 38.70. For several months during the middle of the year, the operating ratio averaged nearer 70 per cent and the transportation ratio around 32. These averages indicate economies of a drastic sort. The road in 1921 sharply reduced its expenses for maintenance of way and equipment. It succeeded during 1921, nevertheless, in making substantial improvements to its roadbed. The index to equipment maintenance—the percentage of bad order cars—shows that throughout the year the road's cars were in

gine crews for good records in operation. Frequent conferences are held for the purpose of bringing about co-operation among the different departments. The practice is to give subordinate officers both information and authority. The terminal trainmasters are especially given real authority, which they use not only in giving service but in securing business from the industries with which they deal.

The Wheeling & Lake Erie is a comparatively small road in highly competitive territory. It has fallen upon adversity in former years and has been in receivership on a couple of occasions. It was operated by a receiver from 1908 to the end of 1916; it came out of the hands of receivers in considerably better shape physically than it went in, large expenditures having been made from income and from the proceeds of receivers' certificates for grade revision, new yards, engine terminals, shop facilities, etc. When it was reorganized, the new capitalization included, in addition to the

funded debt, 7 per cent cumulative prior lien stock, 3 per cent non-cumulative preferred and common stock. Fixed charges have been earned since with a margin to spare, but no dividends have been paid on the prior lien stock to date.

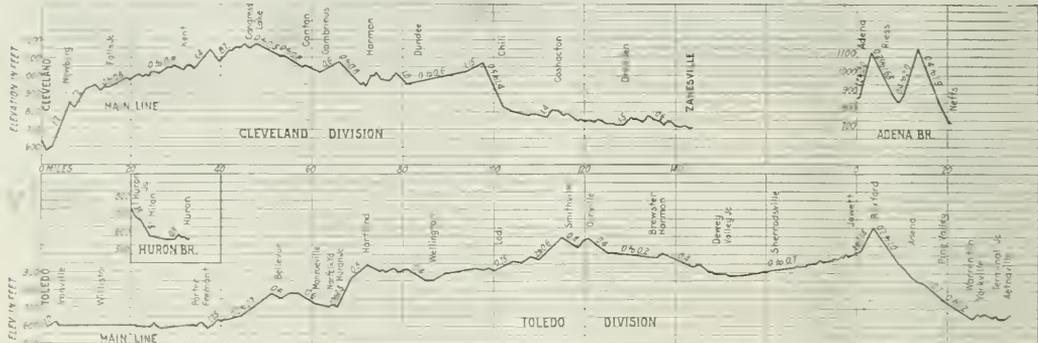

Physical Characteristics—Maintenance

The Wheeling & Lake Erie's mileage totals 512. Its main lines extend from the Ohio river to Toledo and from Cleveland to Zanesville, the two lines crossing each other approximately at right angles. The line from the Ohio to Toledo is the road's main stem. The line to Cleveland is also im-

quantity of new rail is needed; even on the Toledo division there are some rather rough spots due to old rail, although this latter factor is slated for early improvement. Crossing signs, stations, etc., need paint badly.

Equipment

The equipment seems to be in rather better shape than track as is indicated by the percentage of bad order cars on February 15 of 8.1. The road owns 10,126 freight cars, including a large proportion of comparatively new cars. This last is a factor of more than passing interest because it

Condensed Profiles of the Toledo and Cleveland Divisions and the Huron and Adena Branches

portant, but it is a question if the section extending southward to Zanesville is an important asset of the system. There are various branch lines, as will be seen from the map and the road's strategic position at Toledo, Cleveland and Canton is considerably strengthened by so-called belt lines. The Lorain & West Virginia, Lake Junction to South Lorain, 25 miles, is operated by the Wheeling & Lake Erie and controlled by ownership of practically all the capital stock.

The W. & L. E. is single track practically throughout. The larger part of the line is ballasted with rock or prepared slag. The rail on the main lines is 90-lb. White oak or treated ties are used, the former predominating. Tie-plates are used on all curves and on all treated ties in tangent track. The roadbed at present is in fair condition but not in as good condition as the officers would like to have it. The company contends that the lines were undermaintained during the federal control period. Although the reduction in maintenance expenses which were made during 1921 would hardly indicate it, considerable progress was made in maintenance during the year. Particular attention was given to improving the track foundation and to ballasting in general. The end of the year found the road in much better shape in this respect than it was at the beginning. Illustrations are given of some of the Wheeling & Lake Erie's best stretches of track. The track shown is ballasted with prepared slag. For 1922 the program includes a large amount of tie renewals, the ties for this purpose having already been obtained. A large

was not so many years ago that W. & L. E. conditions were quite the opposite. The locomotives total 221, including 25 passenger, 33 switching and 163 road freight locomotives. In rating its locomotives, the W. & L. E. has a method whereby locomotives of 40,000-lb. tractive effort are designated 40 per cent engines; of 60,000-lb. tractive effort, 60 per cent, etc., and similarly the locomotives are numbered accordingly. Thus there are 31 Consolidations of 41,360-lb. tractive effort. These are designated 41.3 per cent locomotives and are numbered from 4101 on. Speaking more generally, the freight locomotives include 10 Mallet locomotives of 80,000 tractive effort (80 per cent), 20 Mikados of 84,000-lb. tractive effort (84 per cent), 20 Consolidations of 60,000 tractive effort (60 per cent), and various other Consolidations of 30,000; 35,000; 41,360, and 43,000-lb. tractive effort and a number of older Tea-wheel locomotives.

The Mikado and Mallet locomotives are, like a fair proportion of the cars, comparatively recent acquisitions. The Wheeling & Lake Erie was assigned by the Railroad Administration 20 heavy Mikado, 10 light Mallet and 5 Eight-wheel switching locomotives and 1,000 50-ton composite gondola cars, all of which equipment was financed in the general equipment trust covering the standard equipment. During 1920, the road placed orders for 1,000 box and 2,000 50-ton gondola cars, which equipment was financed through the assistance of the National Railway Service Corporation.

TABLE II—DETAILS OF EXPENSES AND PER CENT OF EACH TO TOTAL OPERATING REVENUES, 1911 TO 1921

Year ending	Maint. equip.	Per cent	Traffic	Per cent	Transportation	Per cent	Total	Per cent		
1910	\$ 88,871	11.63	\$1,416,139	18.80	\$3,486,731	33.02	\$5,071,446	67.33

Locomotives are shopped at Brewster and cars receive heavy repairs at Ironville. Both shops are modern and of a good standard. Insofar as concerns the shops at Ironville, however, the criticism might be made that they might be better located if they were at Brewster in the center of things rather than at the extreme end of the line.

The road in recent years has been devoting considerable

the road, including Steubenville, Canton, Cleveland, Toledo, etc. There is a sizable quantity used for railroad fuel. Mines on the Wheeling & Lake Erie in the No. 8 district supply coal to such roads as the Nickel Plate, the Erie, the Lackawanna, the Pere Marquette, etc. The larger part of the coal tonnage, however, is moved to the lakes and is dumped into lake vessels at Huron. From Huron there is a sizeable

Some of the Wheeling & Lake Erie's Best Stretches of Track

attention to yards, notably at Canton or Gambirinus and at Jewett. The road is not equipped with block signals nor has it many interlocking plants. Operations are governed entirely by time-table and train orders.

Serves Pittsburgh No. 8 Field

Of the Wheeling & Lake Erie's traffic, about 45 per cent is bituminous coal. There is also a substantial tonnage of iron

back haul on iron ore—primarily to steel mills along the Ohio river. Some 400,000 or 500,000 tons are supplied yearly to the Canton district. Inasmuch as the No. 8 coal district is at the east end of the line and the larger part of the coal moves to Huron, whereas the ore moves from Huron back to the Ohio river points, the road secures a haul on a large portion of its traffic of nearly the entire length of the line. The road handles but a relatively small quantity of mani-

Figures for 1918, 1919 and 1920 represent consolidated corporate and federal accounts with inter-account items eliminated. The Wheeling & Lake Erie's standard return for operations under federal control was \$1,586,037. Corporate income account for 1918 shows a net corporate income of \$300,295; for 1919, \$306,636, and for 1920, \$56,725. The 1920 corporate accounts include tentative figures of \$264,340 for compensation for January and February, and \$1,458,622 for guaranty

fest freight. A small road in highly competitive territory has both its advantages and its disadvantages. One of the advantages is the better supervision permitted. This is a real asset when it comes to service and is of value as concerns ordinary freight service as it would also be in the case of manifest service. The Wheeling & Lake Erie is not a rich road, and it is far from being extravagantly provided with terminal facilities at the competitive centers, although its several belt lines do help it measurably. The road's ability to give service and the supervision which brings about this ability are outstanding factors in the work which the road is doing in these competitive centers, both as applies to coal and ore traffic and to traffic in manufactured products.

Back Haul on Iron Ore from Huron

The total tonnage handled by the Wheeling & Lake Erie approximates 14,000,000 tons annually. The bituminous coal tonnage fluctuates considerably and runs from 4,000,000 to 6,000,000 tons. Ore totals about 2,000,000 tons. The road formerly handled a heavy coke tonnage, sometimes over 1,000,000 tons annually, but in recent years this traffic has become of less importance. In 1920, in which year the road handled more ton-miles than in any previous year, the total tonnage of all commodities was 14,840,524. Of this, coal made up 6,596,663 tons; ore (including ore concentrates) 2,118,309 tons; coke, 440,446; products of mines, as a whole, 9,988,200, and manufactures, 4,114,402 tons.

The relationship between the tons of coal carried and the tons of iron ore is an important factor. The road as has been noted, carries the larger portion of its coal to Huron where it is dumped into lake vessels. From Huron there is a back haul on ore, which movement utilizes equipment which otherwise would return empty. The facilities at Huron include for handling coal, two car dumping machines and for handling ore, four of the so-called rapid unloading machines and two Hulett unloaders. An illustration shows the ore dock in operation. There is, of course, also a large storage space and facilities for handling ore which is to be stored, as will also be seen from the illustration. The pier is of wooden construction and the road is now replacing it with concrete, one-third to be finished by the opening of the lake season.

The coal dumped into vessels at Huron during the 1921 season held up fairly well as compared with 1920 or 1919 as was the case at most of the other lake piers. In 1921, the coal dumped by the Wheeling & Lake Erie at Huron totaled 1,622,968 tons; in 1920, it was 1,958,446, and in 1919, 1,488,516 tons. By the way of comparison, it might be noted that several piers on Lake Erie dumped over 2,000,000 tons in this period, notably the Baltimore & Ohio at Toledo and Lorain; the Pennsylvania at Cleveland and Ashtabula. The Hocking Valley at Toledo dumped over 4,500,000 tons.

The ore received at Huron during 1921 totaled 624,744 net tons; the road shipped from Huron 625,768 tons and on January 1, 1922, it had on its dock 758,676 tons. The ore business was at a low ebb in 1921 because of idleness in the steel industry. This is evidenced by the fact that the shipments of 625,768 tons from Huron in 1921 compared with 1,060,602 net tons in 1920. The W. & L. E. also handles ore from South Lorain and Toledo, although not over its own piers. Shipments from the three ports, Huron, South Lorain and Toledo in 1921 totaled 986,475 tons as compared with 2,074,208 tons in 1920. The figures showing ore shipped and those relating to coal dumped will give a ready comparison of the relative importance the ore traffic plays from the standpoint of supplying a back haul from the lake.

THE CONSUMPTION OF FUEL OIL in 1921 by locomotives of the railroads in the United States amounted to 38,824,000 barrels as compared with 45,847,000 barrels in 1920. Of the total now reported, 27,415,000 barrels were domestic oil and 11,209,000 barrels were Mexican.

B. M. Jewell Attacks Legality of Wage Conferences

WHETHER OR NOT PROPER conferences preceded the submission of the present wage controversy to the Railroad Labor Board has, during the past week, been made the issue in this controversy rather than the justness and reasonableness of the wages proposed by the carriers. For several days B. M. Jewell, president of the Railway Employees Department of the American Federation of Labor, has been reading extracts from the stenographic reports of the conferences held on various railroads, drawing from this testimony the inference that the procedure outlined in the Transportation Act and ordered by the Labor Board has not been followed, and that practically all of the railroads, parties to this dispute, are not properly before the Board.

On March 20 Mr. Jewell completed the presentation of evidence of this character and called upon the Board to render an immediate decision as to the legality of the conferences and to remand the whole controversy over wages to further negotiation between the carriers and the employees involved. In closing his arguments, he said in part:

"We are firm in the conviction that I have presented a picture of what efforts were made by the railroads to confer with representatives of their employees; that we have justified and proven conclusively that Section 301 of the Transportation Act has not been complied with; that there are no disputes, so far as the shop craft employees are concerned, the merits of which this Board can lawfully pass upon in these hearings."

The answer of the railroads to Mr. Jewell's testimony on the question of the legality of these conferences was started on the same day when J. L. Coleman, general attorney of the Atchison, Topeka & Santa Fe, read some correspondence between Mr. Jewell and the members of the Federated Shop Crafts containing specific instructions as to how and when negotiations should be conducted with representatives of the carriers. He drew from this correspondence and from other material the inference that "there is no possibility that those men (representatives of the Shop Crafts) could sit down and negotiate questions with the management."

Regarding the excerpt from the stenographic report of the conferences held between employees and the representatives of various railroads, Mr. Coleman developed the fact that Mr. Jewell had read only portions of these reports and produced as the first witness for the carriers, H. T. Dick, general solicitor of the Chicago & Eastern Illinois, who immediately proceeded to read the many portions of the stenographic report of the conference on that road which had been omitted by Mr. Jewell, and which showed that the questions of cost of living and wages in other industries and similar relevant factors had been discussed at these conferences.

Similar testimony was presented by J. L. Coleman, general attorney of the Atchison, Topeka & Santa Fe, and J. A. Cochrane, assistant to the vice-president of the Great Northern, appearing on behalf of the Spokane, Portland & Seattle, in defence of the conferences held between these roads and representatives of their shop employees. It was shown by the reading of omitted portions of the stenographic report of these conferences that there had been a bona fide effort to discuss present and proposed wage scales.

In response to a request of Mr. Jewell, Mr. Higgins read a list of 19 roads in Western territory which are pleading financial inability to pay the present wage scales as part of their presentation on behalf of lower rates of pay. These carriers include the Chicago & North Western, the Chicago, Milwaukee & St. Paul, the International & Great Northern, the Minneapolis & St. Louis, the Minneapolis, St. Paul & Saulte Ste. Marie, the Missouri Pacific, the Texas & Pacific, the Toledo, Peoria & Western and the Western Pacific.

Telegraph and Telephone Section March Meeting

Reports Set Limits on Clearance at Wire Crossings and Explain the Proper Use of a Transmitter

THE FIFTH SESSION of the Telegraph and Telephone Section, American Railway Association, was opened at the Hotel Jefferson, Richmond, Va., on March 21 by an address of welcome by George Ainslie, Mayor of Richmond. The committee of direction, in its report, told what action had been taken regarding the specifications and recommendations presented to the section. The standing committees appointed last September for handling the work for this year were announced and a memorial in memory of E. A. Chenery of the Missouri Pacific was presented. Additional reports on creosoted poles, reinforced concrete poles and permanent pole lines and tools and equipment were presented at the first day's session. The report on wire line crossings brought out considerable discussion before its adoption.

Construction and Maintenance—Outside Plant

Committee 1, of which G. A. Cellar, general superintendent of telegraph, Pennsylvania System, is chairman, presented new specifications on pole line construction in which it was recommended poles shall be set so that the minimum horizontal clearance of any wire, guy or other attachment will be 8 ft. from the outer edge of the nearest main track rail. Under normal conditions with poles carrying ten-pin cross arms, this minimum clearance will be obtained by setting the poles 13 ft. from the rail. The lowest crossarm should be not less than 25 ft. above the rail.

At sidings, poles may be set with a minimum horizontal clearance of 7 ft. from the outer edge of the nearest track rail. At railroad crossings clear headroom between the lowest wire or cable and the top of the rail shall be not less than 27 ft., except where the wires for cables are paralleled on the same highway by a trolley contact conductor on a lower level, in which case the clearance between such wires at the top of the rail may be reduced to 25 ft. Lines along highways or city streets shall have a minimum clearance above the ground of 18 ft. If telegraph and telephone lines, parallel supply lines (electric light or power) a minimum separation equal to the height of the taller lines should be the minimum between the two systems. A clearance of at least 4 ft. from trees and other brush should, where practical, be provided.

The sub-committee on "Wire Crossings" has co-operated with the public utilities companies and the state commissions in the production of specifications which will be satisfactory to all concerned. As a result of their deliberations it has been agreed that where the sum of the distances from the point of intersection to the nearest supporting structure of each span does not exceed 100 ft. the minimum clearance at the point of intersection or between communication lines and power supply lines, carrying from zero to 750 volts, must be not less than 2 ft. However, if the power lines carry over 750 volts the clearance must be 4 ft. or more. At wire crossings a 50 ft. pole must be set 7 ft. in the earth or $4\frac{1}{2}$ ft. in solid rock. Poles of other lengths are set to corresponding depths. The minimum sag for No. 6, A.W.G. bare hard-drawn copper wire is set at 4 in. for a 100 ft. span at 40 deg. F. and the sag for other lengths of span and different degrees is given in a table in the report. According to the report of the sub-committee on "Transposition" the locations of the poles on which the transpositions are made are to be marked with letters 2 in. high and 2 in. wide, painted on the poles at a height of 5 ft. from the ground. The sub-committee on "Underground Construction" offers detailed drawings and specifications for a mandrel for underground conduit testing and construction.

Construction and Maintenance—Inside Plant

This committee with W. Rogers, telegraph and telephone engineer of the Missouri Pacific, as chairman, presented a report including a specification for lead sheathed office cable, non-quadded, with a twisted pair of cotton or silk and cotton covered enameled No. 18 A.W.G. conductors. Drawings and specifications for cross connecting rings, porcelain fuse blocks with fittings and porcelain terminal blocks are also included in this report. The report of sub-committee "H," included diagrams showing the location and layout for the operator's table, wall panel and test connections in telegraph and telephone way offices, station buildings and interlocking towers. In this work the committee co-operated with the Signal Section to provide space for interlocking apparatus.

The installation and maintenance of caustic soda cells and storage batteries was explained in detail, by chemical equations, diagrams and photographs in the report of sub-committee "K." This report also included a table record form for recording the assignment of wire in cables. The reports of sub-committee "J"—Circuits and Current Supply—included a complete revision of the specification for wire chief's equipment and the routine in railroad offices which was submitted for discussion at the September, 1921, meeting and now incorporates suggested revisions made at that time.

Message Traffic

G. H. Hood, superintendent of telegraph of the Chicago, Rock Island & Pacific, presented the report of this committee. The committee does not recommend the interchange of traingrams between railroads as a general practice because of the fact that the postal laws do not permit intermediate handling of railroad mail; also that traingram service, in order to be dependable, must have close supervision at transfer points and that an additional messenger would have to be employed. As traingram service is primarily an over-night proposition, it is doubtful if the interchange service would meet these ends. Exhibit "E" of this report offered the recommended routine for handling telegrams by telephone. In transmitting numbers each figure shall be given separately by name; for example, \$345 in the original copy will be passed over the wire as ("Figures") "dollar sign, three-four-five, three hundred and forty-five dollars." Words having similarity of sound must be spelled and each word pronounced after it is spelled. Guard words are found to be of advantage in identifying the letters of the alphabet. For example, A for Adams, B for Boston, O for Ocean, etc.

Telegraph and Telephone Transmission

This committee, of which Stanley Rhoads, telegraph and telephone engineer of the New York Central Lines, is chairman, presented interesting information on telephone transmission, including the effect of resistance, inductance, electrostatic capacity, leakage, cross talk, and noise. The incorrect use of the telephone, especially the failure to have the speech actuate the diaphragm to the best efficiency, can be corrected by educating the users. Losses in transmission equivalent to $3\frac{1}{2}$ miles of cable are caused by the lips being placed $\frac{1}{2}$ in. from the mouthpiece and of $5\frac{1}{2}$ miles by a distance of $1\frac{1}{2}$ in. from the transmitter.

Telegraph and Telephone Development

This committee reports that an automatic electric lighting outfit for camp cars has been developed which greatly reduces the fire risk from oil and gas lamps for isolated quar-

ters and camp cars. This outfit consists of a small gasoline engine connected to a motor which develops 110 volts and current to light twenty-four 25-watt lamps. Interesting information is also given on the reclamation of exhausted dry batteries. It is found that salt, and also salammoniac, if dissolved in the water in which the cells are placed, will cause the cells to recuperate and last a day or two longer.

One trunk line railroad has made use of a frequency doubling coil arrangement to increase a 110-volt, 60-cycle, a. c., single-phase power to 120-cycle for use with composite ringers. This arrangement is considered to be a desirable improvement over the composite ringer operating with the interrupter unit as a means of eliminating battery units with its moving parts.

Reports of Other Committees

An organization chart is presented and explained in detail in the report of the committee on Rules and Organization, describing the various employees and the duties of each man necessary to the proper handling of telephone and telegraph equipment on the modern railroad. The duties of the superintendent of telegraph, the telegraph and telephone engineer, chief dispatcher, supervisor, chief inspector, chief lineman, etc., are each explained in detail in order that there will be no overlap in the carrying out of their several duties.

The report of the committee on Radio and Wired Carrier System gives the details of the test made last November on the New York Central at which time the carrier-current apparatus was tested successfully on a 600-volt trolley wire system. Buzzer signals were sent out from the sub-stations and were received by loud speakers in the waiting rooms or on moving trains and could be heard some distance away.

The committee on Education and Training of Telegraph and Telephone Employees has outlined a definite course of instruction. While it will generally be necessary to employ the correspondence method, due to the character of the work and the location of the employee, better and more immediate results will be obtained where the courses can be administered under the direct supervision of an instructor. It is the intention of the committee to suggest to engineering schools subjects that might be well taught in order to prepare trained men to enter the telegraph and telephone field after graduation. Among the problems with which the department has to deal are transmission, design of circuits, specifications and tests for construction and maintenance material, electrolysis, etc.

Warfield Warns Against Attacks on Transportation Act

WASHINGTON, D. C.

THE NATIONAL ASSOCIATION OF OWNERS of Railroad Securities has issued a pamphlet analysis of the Supreme Court's decision in the Wisconsin rate case, by S. Davies Warfield, its president, which views with alarm (although it is stated that no criticism is intended) current reports "that railroads are preparing to attempt to enjoin the commission from putting into effect the division of the excess revenue provision of section 15-a of the Transportation Act." "The fatal consequences that must attend the mutilation of section 15-a," he says, "have been shown and made clear by the Supreme Court's decision," and "it cannot be supposed that the excess earnings provision of section 15-a can be shot to pieces by opposition of individual railroads affected and that the carriers will still be left in unlimited possession of the benefits of section 15-a. This section, which formed the basis for the Supreme Court's decision, cannot survive unless the railroads themselves show a proper conception of the national public interest on which it is based."

Important as the decision is in defining the relation of the Interstate Commerce commission and of the state commis-

sions to the adjustment of railroad rates, Mr. Warfield says, even more important is the basis upon which the court reached a unanimous conclusion fully sustaining the broad purposes of the revenue provisions of the Transportation Act as embodied in section 15-a. After calling attention to the fact that this section represents the rate-making principle advocated by the association, which included provision for the disposition of the excess revenue to be produced, Mr. Warfield says that the association's counsel, in the brief submitted to the Supreme Court in this case, had attached fundamental importance to the percentage rule of rate-making in 15-a as justifying the commission's action in advancing state rates. He intimates that counsel for the railroads had rested in the contention that the commission had ample authority for its orders under the so-called Shreveport power to deal with discrimination, without reference to 15-a, and points out that the court held that the "sweep of the order" could not be sustained on the showing of discrimination against persons or places alone and had based its decision on the necessity for adequate revenues to sustain the national transportation system.

"It was plain to counsel for the association of security owners," he says, "that the commission's orders relating to interstate fares in Wisconsin could not be sustained on the sole theory of discrimination as against individuals and localities, familiarly known as the doctrine of the Shreveport case. It was considered that not only would the case be lost, but that the broad principle of carrier revenue and the group or national consideration underlying section 15-a would be jeopardized unless the case were decided on broader grounds.

"The court recognized that section 15-a brought into the regulation of transportation for the first time in any effective way the element of revenue consideration. The court refers to this new element as the 'most important purpose of the legislation.' The chief purpose was to provide sufficient revenue to conduct transportation as a whole, in the public interest, and to prevent interference with this result on the part of either a state or a railroad.

"This problem of rates to sustain a national railway system without yielding to certain minority carriers in the system more revenue than the public and public authority will stand for, was the problem of the Transportation Act, solved by section 15-a. It is based on the division of that surplus revenue produced by rates adjusted to the necessities of the majority carriers which, for convenience, was designated 'excess earnings'—as a matter of fact, a misnomer. It is not earnings. It is a by-product arising from revenue necessities. If the state cannot obstruct the authority of Congress to sustain the national character of an interstate system of transportation, it is obvious that no railroad forming a part of this system can obstruct that result by contending that rates must be allowed to each carrier in its sole right and free from adjustment of revenue in excess of its individual right.

"The full revenue produced would not have been allowed the minority carriers if rates had been made for them alone, and the excess is subject to such disposition as Congress may make of it in the general public interest in transportation—provided a reasonable return is allowed on the property of the particular carrier affected by the administration of the act. If it were practically possible for the commission to make rates for each of these minority carriers alone, there is no reason to assume that the rates thus made would yield a return greater—perhaps not as much—as these same carriers may be expected to receive as a reasonable return on their property devoted to the public use under the provision of section 15-a of the act, with a division of excess allowed.

The court's decision places railroad policy in a new and significant position. It means that private ownership of railroads can only survive if the carriers are willing to acknowledge themselves as part of a national railway system. But if aid is lent to assaults on section 15-a through repudia-

tion of the national aspects of the subject established by unanimous action of the Supreme Court, that section will go out of existence and private ownership will go with it.

"The question now is whether the railroads will themselves attempt to nullify the first and only constructive and remedial legislation adopted by Congress in their interest and for their protection since 1884, by disrupting the basis on which that relief has been granted; a national system of transportation of which all essential carriers are parts.

"Should it come to pass that the necessities of transportation would force the government to take over a number of railroads, the position of the remaining carriers would be precarious. In the contingency of government operation, arising out of the necessity to maintain essential systems, it is a grave question whether it would be possible for the remaining railroads, in competition with the government, to meet operating conditions that might be forced upon them."

The second part of the pamphlet also refers to the car pooling plan proposed by the association's board of economics and engineering, and says that after the recent appearance before the commission of the representatives of the association, statements were immediately made that the existing railroad agencies have been bringing or can bring about the freight car economies that were suggested, without pooling. "It was pointed out in the statements," Mr. Warfield says, "that these agencies were co-operating with the commission and through the powers given the commission by the Transportation Act to re-allocate freight cars in emergencies, the service and economies which the suggestions contemplate could be obtained."

Mr. Warfield also says that the association had requested certain information for its study of the question of consolidations in September last from all Class I roads, but that while 70 important carriers, constituting about 40 per cent of the mileage, have been very prompt in their responses and have furnished important data, 67 declined to give the information and the remaining 68 have not been heard from, "leaving the supposition that the information asked will not be forthcoming." He says that in recent appearances before the commission, the association's representatives stated that it was believed that more effective and immediate results can be obtained by consolidating or extending the joint use of railroad facilities rather than by attempting to consolidate their corporate organizations at present. The board will shortly make a report in respect to joint terminal uses.

Mr. Warfield also refers to reports that railroads would attempt to enjoin the commission from putting into effect the division of rates between the eastern and New England carriers recently ordered by the commission. He says that without entering into the merits of these cases it seems plain that suits of this nature would be contrary to the spirit and purpose of the Transportation Act and contrary to the Supreme Court's clear recognition of the relation under Section 15-a of each railroad to the transportation systems as a whole. He says the right of any railroad to test the reasonableness or application in detail by the commission of the basic principles of the Transportation Act is not questioned. What is questioned is the propriety or expediency of the attack upon those principles which in themselves are vital to the welfare of the railroads.

Maine Central Shows Deficit of \$2,165,362

State of Maine Excise Tax Big Factor. Lower Wages and Fuel Costs Indicate 1922 Improvement

THE MAINE CENTRAL is the first Class I carrier to make public its annual report for the year ended December 31, 1921. The report is further of interest because the road is the first of the New England carriers to make public its figures for the period in question.

The Maine Central did not succeed in 1921 in overcoming—to put it in its broadest terms—the fact that it is a New England carrier. The road had a deficit, after a payment of interest, of \$2,165,362. In 1920, when it was able to rely upon its standard return for two months and its guaranty for six, it showed a net of \$304,433, out of which and from surplus, it paid dividends of five per cent on its preferred stock and six per cent on its common, which dividends totaled \$653,166. In 1921 no dividends were paid.

One of the Maine Central's handicaps is, as has been pointed out in these columns before, that it has to serve more or less in the role of Atlas for the financial structure of the state of Maine. Whereas Atlas had the task of supporting the world on his shoulders, the Maine Central has to help support on its shoulders the state's finances. This is due to the excise tax. In 1920 the road's total of taxes, including federal taxes, was \$1,163,289. In 1921 it had to pay \$1,263,982. Of the 1920 taxes the state of Maine's excise tax constituted \$795,907. The excise tax in 1921 totaled \$972,863. The total tax increased \$100,694, but the excise tax increased \$176,956. It has been stated on more than one occasion that relief for the railroads of New England should come from the people of New England. The *Railway Age* does not necessarily agree with this view, but it is to be feared that the people who express it may find considerable material for their suggestion in this excise tax situation.

The question that naturally arises in reviewing an annual

report of a railroad like the Maine Central is its prospects for the coming year and whether it is going to succeed in overcoming the disadvantages which now confront it. One would naturally expect that the recent decision in the New England's division case should permit the road to make a better showing for 1922 than for 1921, although the threatened litigation still leaves that uncertain. Other factors that will have an effect are the decrease in wages and the lessening cost of fuel.

The operating expenses for the railroad in 1921 showed a decrease from 1920 of \$3,141,771 of which \$114,553 was maintenance of way; \$347,284 maintenance of equipment and \$2,571,823 transportation. Insofar as concerns the decrease in transportation expenses, one notices particularly the decrease in wages and a decrease of \$1,136,075 in fuel for train locomotives. Of course, part of this decrease in fuel expenses is due to the smaller amount used because of the lesser traffic, but the principal reason is the lower unit cost. The expenses for maintenance of way indicate that the railroad in 1921 paid considerable attention to maintenance. Increases are shown for the items of cross ties and rails particularly. In 1921 the road laid 6,923 tons of new 85-lb. rail and put in track 537,123 ties. These figures represent a considerable increase over those for the other years for which figures are available, as is shown by the following tabulation:

Year	Rail Tons	Ties Number
1916	6,173	395,965
1917	2,669	137,790
1920	4,689	355,020
1921	6,923	537,123

The year 1921 also evidenced considerable progress in the matter of shop facilities. The new machinery was installed

in the car repair shop at Bangor, greatly improving the facilities at that point. Several new machine tools were added at Waterville and a new 85-ft. turntable was installed at Rockland. During the year the car repair shop at Rumford and the enginehouse and shop at Calais were destroyed by fire. The facilities at Calais were replaced by an 8-stall enginehouse and a modern repair shop of brick construction which were completed and put in service late in the year. Plans have been made for a new shop building at Rumford but its construction has been deferred for the present.

The freight revenues of the Maine Central in 1921 totaled \$14,275,951, as compared with \$14,331,295 in 1920. In 1921 the total revenue tons of freight carried were 7,027,505 as compared with 8,753,065 in 1920 and the revenue tons one mile were 787,141,374 in 1921 as against 948,186,188 in 1920. Thus there was a decrease of 20 per cent in revenue tons and 17 per cent in tons one mile. The reduction was primarily due to the small amount of traffic in the paper and lumber industries. There was also a considerable decrease in tonnage of products of mines but a considerable improvement is noted in the traffic in the products of agriculture although not sufficient to balance the decrease in other respects. The passenger revenue for 1921 totaled \$4,909,998 as compared with \$5,394,285. There was a decrease in passengers carried and passengers carried one mile of 20 per cent.

The Maine Central has many branch lines and is in a position where it is not able to secure a heavy train load or a heavy traffic density. Its net tons per train, including both revenue and non-revenue, were only 375. Its net tons per loaded car were 22.2 and its net ton-miles per train hour, only 4,206. Its car miles per day were 16.5. According to the December monthly statement to the Interstate Commerce Commission the road had a deficit after rentals of \$466,962 in 1921 as compared with a deficit of \$2,573,706 in 1920. This indicates that there was improvement in 1921 but unfortunately this improvement is not reflected in the corporate net after interest charges, because the 1920 corporate income account as above noted included standard return for two months and guaranty for the guaranty period.

Electric Switching Service on the New Haven

By F. W. Carter

Westinghouse Electric & Manufacturing Company

ELECTRIC SWITCHING LOCOMOTIVES are used in four freight yards on the New York, New Haven & Hartford. When the yards were electrified, every three electric locomotives replaced five steam locomotives which had been used for switching service.

The sixteen 80-ton electric switching locomotives are of the single-phase, 25-cycle, 11,000-volt, alternating-current type, having two articulated trucks. The over-all length of these locomotives is approximately 37½ ft. They have a tractive effort of about 23,200 lb. with a horsepower rating of 752, and a maximum speed of 25 miles per hour. Each locomotive has four motors geared to the axles. The diameter of the drivers is 63 in.

Five of these locomotives are located at the Oak Point yard, two at the Westchester yards, two at the Stamford yards, three at the Harlem river yards, one used for transfer of freight on the New York, Westchester & Boston Railway, and the remaining three held at the shops for inspection or use at whatever point the service demands.

The three main electrically equipped yards on the New Haven are the Oak Point yard, having a length of about 37 miles, with a total of 35.5 miles of electrified track, the Harlem river yard, having a length of about 23 miles; and

the Westchester yard, with about the same trackage as the Harlem river yard.

The number of electric switching locomotives assigned to the Oak Point yard varies at times from five to seven, according to the amount of traffic to be handled. The locomotives in this yard are used in two different classes of service, four of them being assigned to what is known as "float yard" service, to unload eastbound cars from the floats and to load westbound cars on floats, and also to do whatever switching is necessary with the westbound cars. The New Haven has approximately 16 tug boats with from 350 to 1,200 horsepower each for transporting the freight cars between the terminals by floats, the floats having a carrying capacity of from 12 to 22 cars each. The fifth locomotive used in these yards takes the eastbound cars from the float yard to the classification yard and makes up the eastbound trains. In looking over the records one month was selected as a representative month, which showed an average of 43 floats handled daily at the Oak Point yards. With an average tonnage of 900 for the eastbound float loads, and 600 for the westbound, the four locomotives assigned to the float yards handle approximately 16,000 tons each in a 24-hour service. The locomotive working in the classification yards handles about 75 per cent of the eastbound cars received, the other 25 per cent being taken to the Westchester yards by the transfer engines. This makes the average daily tonnage for these locomotives approximately 18,000. In addition to loading and unloading the floats the four locomotives in the float yard do a certain amount of switching of westbound cars and various miscellaneous work in the yards. The figure of 18,000 tons, therefore, seems to be a very fair average tonnage for the locomotives working in this yard.

The following is the monthly mileage made by some of these locomotives in switching service:

Locomotive No. 0202	— 4,356 miles per month
Locomotive No. 0203	— 4,446 miles per month
Locomotive No. 0204	— 4,392 miles per month
Locomotive No. 0208	— 4,320 miles per month
Locomotive No. 0211	— 4,404 miles per month

The locomotives are kept in service 24 hours a day by using three 8-hour crew shifts, and after the completion of 2,500 miles they are sent to the Van Nest shops for a light inspection. A day force working eight hours is employed for locomotive inspection and the work is usually done at the rate of two locomotives per day.

A number of these electric locomotives have made records of 24 hours a day for 30 days without any interruption.

The principal advantages ascribed to electric locomotives in switching service are that they conserve the fuel supply, affect car-mile economies, expedite the operation of trains and reduce the number of locomotives required to do the work.

Passenger Station at Genoa, Italy

A Means of Determining the Average Life of Ties

An Explanation of the Fluctuations in Requirements on New Lines and a Method of Anticipating Them

By V. K. Hendricks

ONE OF THE VEXING problems that is ever with the railroads is the determination of the average life which is being obtained from cross-ties. Because of the many factors which affect the question, this determination is frequently not susceptible to exact solution, and at best the results will often be an approximation. Records are not always available covering tie renewals over a sufficient period; the tie renewals are frequently affected by the financial situation of the railroad at times, thus making an ab-

lines to the establishment of test sections of track, with careful records of each original tie installation and reliable inspection and records of all renewals within each section. This method will probably give more reliable results than the dating of all ties in track, but it will require time to secure results and a very large number of each of the kinds of ties must be included in the test sections in order to determine accurately their average life.

A comprehensive study of the cross tie situation on a

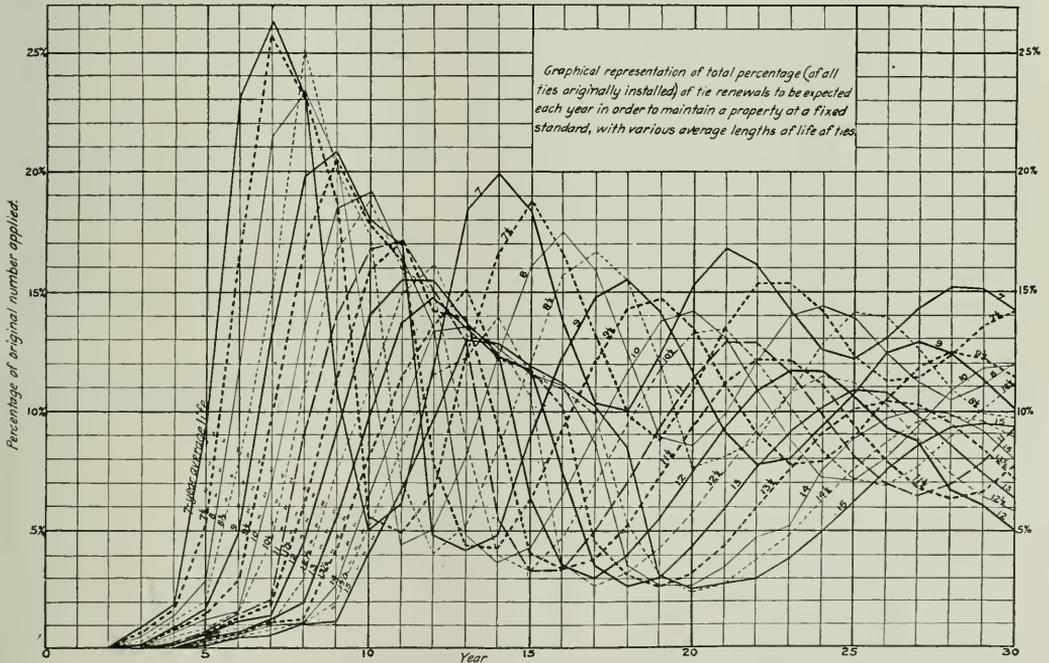

Plate 1. A Chart of Annual Renewals in Per Cents of Ties Originally Installed

normally light renewal in some years which must be made up in others; the mileage does not always remain uniform; a change in the standard of maintenance sometimes occurs, due to a change in supervision or in traffic conditions; and a change is sometimes made in the kind of ties used—all of which complicates the problem. In all such cases the best that can be done is to see that the method used in the determination will give the closest approximation possible to the true average life at the time of the investigation.

Some years ago considerable expenditures were made by many lines for the purchase and application of dating nails so that accurate records of tie life could be procured. This practice, however, was generally abandoned after a few years' trial, partly because of the expense but mainly due to the fact that, for various reasons, the results obtained were not dependable. Recourse was then taken on a number of

railroad necessitates the closest practicable determination of the average life of ties; without this information their relative economy as compared with other kinds of ties cannot be ascertained. Anything which will aid in securing a reliable average or a closer approximation to the true average life, is, therefore, of material value.

Some four years ago Mabel E. Thorne, statistician of the U. S. Forest Products Laboratory, made a study of the "Relation between Average Life of Ties and Percentage of Renewals," and in January, 1918, presented the results in a paper before the American Wood-Preservers' Association. It was based on records, collected over several years by the Forest Products Laboratory, of tie replacements and removals, covering 12,185 untreated and 30,751 treated ties, or a total of 42,936 ties, and is the best information available on that subject. Her results then indicated that the

renewals in proportion to the average life are the same for untreated ties as they are for treated ties, and reliable records on some 43,000 ties should afford a very close determination of the law governing the rate of tie failures.

To make this valuable data readily available for the de-

failures each year during the life of all of the original ties—that is, it does not provide for renewals of any ties. Table II shows the total percentage of all failures in the original ties to date each year. Table III shows the percentage of renewals each year in order to maintain a property at a given stand-

Table II.—Cumulative Percentage (of All Ties Installed) to Date, of Failures to Be Expected Each Year from Ties Having Various Assumed Average Lengths of Life, and No Renewals Being Made

These tables are based on the actual record of renewals instead of on the theoretical curve, except that 100 per cent instead of 99.9 per cent has been taken as removed at 200 per cent of the average life, and some slight adjustments have been made to avoid self-evident inconsistencies. If

hereafter will not make any radical changes in the tables, this being especially true of Tables II and IV, covering total renewals to date.

Plates 1 and 2 are the graphical representations of Tables III and IV, respectively. A study of Plate 1 (showing the

Table III: Total Percentage of All Ties Originally Installed of Tie Renewals to Be Expected Each Year in Order to Maintain a Property (Including Renewal of Renewed Ties) with Various Assumed Average Lengths of Life of Ties. The table has 30 rows and 15 columns of percentages under the heading 'AVERAGE LIFE IN YEARS'.

Table III.—Total Percentage (of All Ties Originally Installed) of Tie Renewals to Be Expected Each Year in Order to Maintain a Property (Including Renewal of Renewed Ties) with Various Assumed Average Lengths of Life of Ties

these tables were platted, therefore, the curves would not be perfectly true curves, but their irregularities would be of slight moment. It is probable that additional data secured

percentage of tie renewals each year) indicates that the irregularities or inconsistencies in the basic data will gradually become "ironed out" as the age of the road increases, so that

Table IV: Cumulative Percentage (of All Ties Originally Installed) to Date, of Tie Renewals to Be Expected Each Year in Order to Maintain a Property (Including Renewal of Renewed Ties) with Various Assumed Average Lengths of Life of Ties. The table has 30 rows and 15 columns of cumulative percentages under the heading 'AVERAGE LIFE IN YEARS'.

Table IV.—Cumulative Percentage (of All Ties Originally Installed) to Date, of Tie Renewals to Be Expected Each Year in Order to Maintain a Property (Including Renewal of Renewed Ties) with Various Assumed Average Lengths of Life of Ties

the renewal curves become more regular, while it will be seen from Plate 2 that the slight irregularities in the curves showing the total renewals to date are practically insignificant from the start. Even in Plate 1 there should be little difficulty in determining which curve most nearly fits renewals which have actually been made on a railroad. When sufficient additional basic data have been secured the results can be tabulated and platted into consistently smooth curves which will show the true average rates of failures, to the same extent as has been the case in preparing mortality tables for insurance purposes.

If complete records of tie renewals on a railroad are available from the time of original construction, the total to date renewals each year in terms of the percentage of all ties in track (assuming the entire original installation to have been made in one year) can be plotted and the average life of the ties can be closely approximated at once by finding which curve on Plate 2 most nearly corresponds with the result. Even the determination of only one point on the curve (the percentage to date for the last year for which records are available) might give reliable results, but it would be best to plot the complete curve to make sure that there has been no change in the average life of the ties during the life of the railroad. If the renewals for the first few years are not available, the renewals for each year available can be plotted in terms of the percentage of all ties installed, and by comparison with Plate 1 (bearing in mind the relation between the time of original installation and the time covered by the available records) the average life obtained can be closely approximated. While there are two checks on this method, provided there has been no change in the average life (one being the actual percentages and the other the direction or course of the curve at that stage of the life of the road) the method of using Plate 2 will be more reliable, and should be used wherever practicable.

It should always be borne in mind, in order that comparisons of the kind mentioned above may be dependable in their results, that the investigation should cover a large number of ties; if only a small number of ties is involved the irregularities in the lines of individual ties may cause incorrect conclusions or obscure results. Also a change in the kind of ties used, or a change in the standard of maintenance will have its effect on renewals. Without realizing the natural cause which makes necessary a material variation in the annual renewals during each cycle of the average life of ties, there is a natural tendency on the part of a railroad management towards uniform annual renewals before the road is old enough to have reached that stage itself; furthermore the financial situation of the road may cause unusual retrenchments at times. These causes will affect the renewal curves, so that they will not fit the theoretical curves as closely as desirable. All these objections, however, pertain to any method whatever of determining the average life, and due allowance must be made for them in the best manner possible. The situation can be better studied and understood by graphical representation than otherwise.

There will be many cases where this method of determination can be used to advantage on small roads or on the different portions of a large system, or it can be applied to a system as a whole by combining the results obtained by working up separately the renewals of ties for each year's original installation. Tables III and IV and Plates 1 and 2 should also be extended through a greater number of years, and it might be possible to develop a practicable means of recognizing in renewal curves a change in average life due to a change in standard of maintenance or change in kind of ties. Any change in average life would be noticeable in the plotting and it a ready means of recognizing the full meaning of the change could be developed it would be of value.

It is not claimed that this method will wholly solve the question of average life, for there will be cases where lack

of records, changes in the cross tie situation, and other difficulties will make a very close approximation impossible. However, the basic data are such that the tables and plates presented in this discussion closely represent the true average conditions, and much closer approximations to the actual average life can be made in this way, where this method can be applied, than in any other manner.

A method which has been used to some extent heretofore is to consider that the number of years after the construction of a line, until the total to date of renewals is the same as the total number of ties originally installed, represents the average life of the ties. By reference to Table IV it will be found

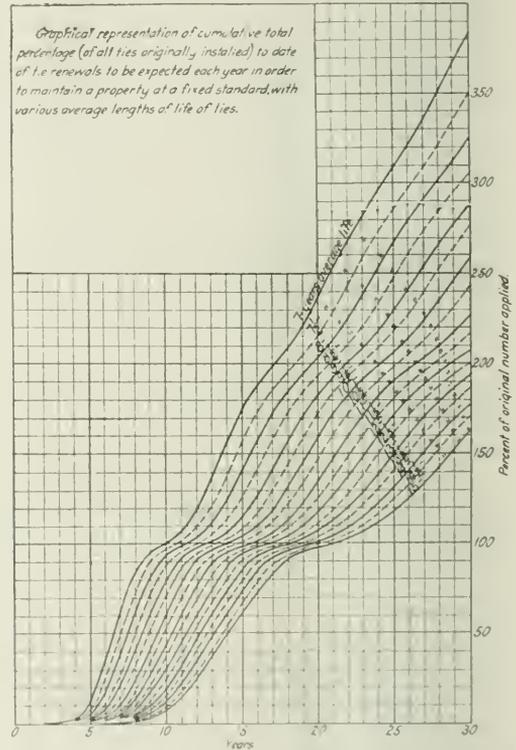

Plate 2. A Chart of Cumulative Renewals in Per Cent of Ties Originally Installed

that this is incorrect according to the best information now available, as a total of 100 per cent renewals is not obtained for from three (for 7-year ties) to six years (for 15-year ties) after the road has been constructed for that length of time. At the age of the average life of the ties, only slightly more than 60 per cent of the ties have been removed.

The use of the data submitted by Miss Thorne for the purpose covered by this discussion involves a large amount of calculation. Tables I to IV place her data in convenient form for ready use for that purpose, as well as for other purposes. By the use of these data it will no doubt be found that the average life of ties can be determined with reasonable accuracy in many cases where it has seemed impracticable to obtain any reliable result by other methods.

The preceding discussion has dealt mainly with roads, or portions of roads, which are comparatively young. If a road is, say, 50 years old, it would hardly be of much value to

plat the renewals to date from the time of construction, for such a road would surely have had many changes in its mileage during its life, as well as changes in its kinds of ties, standards of maintenance, etc. In such cases the usual method of averaging renewals over a considerable period of years is necessary, but if the renewals have been made just as physically needed, the plating of the renewals will give a wavy line, with the length of the waves just equal to the average life of the ties. This wave length will afford a check on the result obtained by averaging the renewals. If the waves vary much above and below the average line, the number of years averaged should be some multiple of the average life determined by measuring the wave length, so that the average may not include too many of the years either above or below the line.

It is probable that the plating of the renewals may not, in many cases, show any reasonably pronounced wave lengths in practicable application, but bearing this feature in mind may, in some cases, be an aid in indicating the probable reliability of the conclusions. The failure to show waves, assuming a constant mileage, would indicate either that the

age of the road is such that renewal requirements have become practically uniform (which, under normal conditions, would be at an age of some 40 years for 7-year ties, some 65 years for 9-year ties, etc.—see articles by S. S. Roberts and Lowry Smith in the *Railway Maintenance Engineer* for June, 1920) or some change in the average life, or that, from some cause or other, tie replacements have been forced towards uniform renewals without full regard to the actual physical requirements.

It is to be hoped that the railroads will secure additional data as may be practicable, covering the relation between average life and percentage of renewals, and see that all are collected at some one source, so that information on that subject may in time reach the same degree of reliability as do mortality tables. The renewal of ties constitutes a very large item in maintenance expenses, and would justify a more thorough scientific investigation than has frequently been customary heretofore. In many cases such a consideration of the subject might far more than pay for itself by affording the most intelligent method possible for regulating tie renewals from year to year.

Four Objections to Installing Automatic Stops

Abstract of Memorandum Presented at Washington, March 20, by

A. R. A. Committee, C. E. Denney, Chairman

THE COMMITTEE appointed by the railroads affected by the Interstate Commerce Commission's order of January 10, 1922, calling for the installation of automatic train control devices, presented a memorandum at the hearing before the Commission in Washington on Monday last, rehearsing the objections to the issuance of a positive order by the Commission at the present time and classifying them under four heads, as set forth below; and also presented other statements, prepared by Messrs. Burt and Peabody, containing the results of investigations made by the committee. This committee consists of C. E. Denney, B. R. Pollock, A. M. Burt, W. P. Wiltsee, E. B. Katte, R. W. Bell, C. F. Giles, W. J. Eck and C. H. Morrison.

This abstract is in the nature of a supplement to our report of the Washington hearing, which is printed elsewhere, and some details of the memorandum which have already been covered in the larger report are omitted here.

1. No automatic train stop or train control device has been sufficiently developed to justify the issuance of the proposed order. That the state of the art as it existed up to the beginning of the year 1920 did not warrant any extended use of the devices in question is, we submit, not open to debate. The Committee of the United States Railroad Administration (1919) summarized the situation thus:

"Generally speaking, it may be said that the tests which have thus far been conducted have demonstrated that the functions of automatic train control devices are possible of accomplishment under actual service conditions. But while these functions may be accomplished at comparatively isolated locations with the high degree of maintenance ordinarily given to test installations of this character, it is an entirely different problem, and a far more complex one, to apply these devices to the various operating conditions encountered in railroad service * * * on several hundred miles of a busy railroad. * * * Automatic train control devices are still in the development stage, and many problems in connection with their practical application remain to be solved."

These views are consonant with those of the Block Signal and Train Control Board (June 29, 1912), also with the reports of the Commission's Bureau of Safety. While progress has been made during the past two years, it is still true that *many problems in connection with practical operation remain to be solved.*

The only systems which have been in service under actual operating conditions and dependable and continuous observation for any considerable length of time, are those of the Regan, the

Miller and the American, now in service to a limited extent on the Rock Island, the C. & E. I., and the C. & O. These three are the only installations of which specific mention is made in the Commission's report of January 10, 1922, which, we submit, warrants the inference that the Commission had them in mind when it said that "14 years of investigation have demonstrated the practicability of and the necessity for automatic train control." In any event, the failure of the Commission, in its report, to direct attention to any other particular installation, must lead to the conclusion that in the judgment of the Commission no other system of train stop or train control has been sufficiently tried out to warrant even the suggestion that it be generally adopted.

The three installations above referred to have been the subject of special investigations conducted by a subcommittee of the Joint Committee on Automatic Train Control of the American Railway Association. The report of such committee shows, among other things, with respect to each of the devices in question:

(a) Numerous objectionable mechanical and engineering features remaining to be corrected;

(b) Many operating difficulties which have not yet been satisfactorily taken care of;

(c) A relatively large number of failures.

In short, this report conclusively establishes not only that the devices in question have not yet been brought up to the point where it can be said that they show a "high degree of efficiency" under general service conditions, but also that they, like all other kindred devices, are still in the experimental or development stage and that many problems remain to be solved before they can be considered as practicable and reliable for the purposes of the Commission's proposed order.

We are dealing with a very different proposition from that of the automatic coupler, the air brake or the block signal.

The Commission's observation to the effect that the automatic coupler, the air brake and the automatic block signal were not perfected to as high a degree as the automatic train control before they were either ordered installed or were voluntarily adopted, appears to be at variance with the facts.

The records of the Master Car Builders' Association show that the automatic freight car coupler was a subject of discussion and experimentation from 1870 to 1887, a period of 17 years, before it was adopted by the association as recommended practice. It was six years later than this before its use was required by law. Prior to its requirement by law it was a well recognized safety device.

The air brake was a subject of discussion and experimentation from 1870 to 1888, a period of 18 years, before it was adopted as recommended practice, and it was 23 years before it was required

by law; then it was a safety device recognized by all of the more progressive railroads of the country.

Automatic block signals had reached a much higher degree of development than train control devices have at present before any such extensive installations were made as is contemplated in the proposed order, and the installation of automatic block systems was a much smaller matter than the installation of automatic train control devices. With an automatic train control system no engines can be operated under it except those equipped with a device that will function in conjunction with the system installed upon the roadway. The adoption of the automatic coupler and air brake did not affect the capacity of a railroad; their practicality had been demonstrated beyond a reasonable doubt before their use was required by law.

2. The order would be premature if issued at this time because the carriers have not had opportunity to make adequate service tests of devices designed to function on different principles from the devices specifically mentioned in the Commission's report. Each of the three systems specifically mentioned in the Commission's report is so designed as to require the use of a ramp located alongside or between the rails.

Efforts are now being made to develop automatic train control devices designed to function on the induction principle, and it is the opinion of the engineering and operating officers of numerous carriers that such type gives promise of overcoming many of the objectionable features inherent in the ramp type. Train control systems designed to operate on the induction principle have lately been installed or are contemplated in the immediate future, viz.: the Sprague, the Postwick and the Union Switch & Signal devices. These appear to possess merit and the result of the tests may warrant their extension. No order, therefore, should be issued until such time as the carriers have had ample opportunity to ascertain whether or not some one or more of such systems is practicable and reliable for the purposes of the Commission's order.

3. The carriers are making every reasonable effort to co-operate with the Commission in testing all meritorious devices and will continue such efforts as the Commission may direct.

In view of the activities of this committee since its appointment in November, 1920, as disclosed by this report, it would appear that the issuance of the proposed order, which cannot now be applied with, will tend to retard rather than promote the development of a proper system. The committee as well as the individual carriers will continue to render all reasonable assistance in the proper testing and development of these devices.

The proposed order requires a much greater number of and more expensive installations than are warranted at the present time. The carriers named in the order of January 10 except Pennsylvania, the Pittsburgh, Cincinnati, Chicago & St. Louis and the West Jersey & Seashore companies, to a questionnaire submitted by this committee, indicate that compliance with the proposed order by the carriers answering the questionnaire (43 in number) will require the installation of the devices in question on approximately 6,126 miles of railroad, 10,285 miles of track and 3,225 locomotives, the cost of which will aggregate many millions.

It is manifest that such systems as recommended themselves to the Commission have been just as thoroughly tried out by continued operation between the Commission and the American Railway Association along the lines heretofore followed, as can be done by the extensive installation contemplated by the proposed order, which would require the expenditure of vast sums of money unreasonably.

Increased Efficiency in Propeller Blower

AN INTERESTING TYPE of propeller blower manufactured by the Coppus Engineering & Equipment Co., Worcester, Mass., is a screw blade unit which delivers air at higher pressures than usual and with good efficiency. The blowers are of the class which delivers the air parallel to the axis and operates against pressures up to 8 in. of water at efficiencies up to 80 per cent. Another factor of interest is that the power consumption at constant speed is practically unaffected by variations in air delivery or pressure. The blowers are high-speed machines requiring comparatively small driving units.

The principal feature of the blower is a stationary guide vane located beyond the propeller in the direction of the flow. The air current leaving the propeller is radially subdivided by the individual guide vane blades which have a curvature, increasing in the direction of the propeller. These guide vane blades concentrate the air current and give it a further acceleration inside of the stationary guide vane so that a

The New Coppus Propeller Blower

considerable part of the pressure is produced in the latter. A large part of the end thrust is thus taken up by the stationary guide vane casing. The air streams, into which the flow of air has been subdivided, leave the guide vane casing, on account of the kinetic energy, slightly rotating and converging toward the axis so that the smallest section of the air flow is reached beyond the guide vane casing.

The blowers are of such a design that they can be installed readily in pipe lines, working at the same efficiency when installed at the inlet or outlet of the line as a blower or an exhaustor, respectively.

OVERLOADED AUTOMOBILES are very common on the highways, according to reports from the inspectors of the Department of Agriculture. On the road from Hartford, Conn., to Springfield, Mass., and on the Boston Post road in Connecticut every third truck was found to be loaded beyond the capacity of the truck and the tires, according to a record covering two weeks of investigation on each roadway. Overloading was most common on trucks of 3 to 5 tons capacity. It was found that 89 per cent of the trucks on regular trucking lines had a total weight of truck and load in excess of 12½ tons, the maximum weight allowed by State law.

Burlington Offices at Chicago Suffer Fire Damage

Contents of Seven Floors Destroyed But Structural Steel Frame Escapes Serious Injury

AS NOTED BRIEFLY in the *Daily Railway Age* of March 16, the 15-story office building of the Chicago, Burlington & Quincy at Clinton street and Jackson boulevard, Chicago, was visited by a disastrous fire early on the morning of March 15. The contents of the upper seven floors of the building were entirely destroyed and considerable damage was done on the lower floors by water. Owing to the fact that this is a modern fireproof building, completed in 1912, the cause of the fire, the extent of the damage and

keep the fire out, but the heat was so intense on the upper floors that the men were compelled to retreat and from the ninth to the fifteenth floors, inclusive, the fire practically destroyed the combustible contents. This included all papers and records except such as were stored in fireproof vaults. Below the ninth floor the loss was limited entirely to water damage.

A preliminary investigation of the building would indicate that the steel frame is entirely uninjured. The fireproofing on the interior consists of hollow tile including flat tile arches for the floors. Barring the flaking off of practically all of the plaster and some minor spalling the tile appears to be in excellent condition. The exterior of the building on the street fronts is faced with a cream colored glazed terra cotta and on the Clinton street side, which faced the great fire and flying embers, the terra cotta has spalled to a considerable extent, especially around the window openings, but this spalling has not served to uncover the steel work at any point. The window construction in the Burlington building comprises wire glass in hollow metal frames in the court and alley frontage, but with plate glass and wood frames on the

Copyright by Underwood & Underwood

The Burlington Office Building After the Fire

the effects, if any, on the building frame, are of interest to engineers and architects. The following facts are based on a preliminary inspection in advance of a detailed study and report by officers of the railroad and the Chicago building department.

The fire was of outside origin. It started in one of a group of buildings occupying the block immediately east of the Burlington offices. These were a miscellaneous block of old buildings of varied types of construction, although all of them proved to be of a highly combustible nature. One of them was an eight-story building covering a considerable ground area. The initial blaze spread rapidly to the entire block and, owing to the height of some of these buildings, produced a fire of unusual intensity. The wind was blowing toward the west and southwest and soon caused fires in a number of buildings in adjacent blocks and for a time there was great danger of a general conflagration.

The Burlington building was almost directly in the path of the great flame blast from this seething furnace of burning buildings, being separated from them only by the width of Clinton street, 80 ft. The building is equipped with stand-pipes having four hose outlets on each floor and supplied with water by independent fire pumps in the basement of the building which draw water from the city supply. As soon as it was seen that the railroad office building was in danger, First Assistant Fire Marshal E. J. Buckley sent his men into the building and did everything possible to

Copyright by Underwood & Underwood

The Lower Floors Were Not Damaged by Fire But Were Bombarded by Flying Missiles from the Fire Across the Street

street frontage except opposite fire escapes, this being strictly in accordance with the building ordinance requirements of the city. The fire passed over the building from the east to the west and destroyed a large part of the windows. A few of the wire glass windows on the rear of the building are intact but in many cases the window construction is entirely gone.

Fortunately for the records, nearly all of the accounting

offices were located below the ninth floor. These included the offices of the auditors of expenditure and of freight and ticket accounts, the car accountant and the freight claim and employment departments. The portion of the building swept by the fire housed the executive offices; the operating, traffic, purchasing, transportation, engineering, real estate and land, industrial, and valuation departments; and the offices and record files of the Central Western region, United States Railroad Administration. In these offices the loss included practically all current correspondence files of the various departments, the records of the United States Railroad Administration, the valuation files and records, the drawings of the building department, and the tariff files. Although the vaults on the seven upper floors had not all been opened at the time of writing, there is every reason to believe that all of their contents were saved. These include such records as the bridge engineer's drawings, track standards, maps, and real estate records.

The value of enclosed elevator shafts and stairways is emphatically demonstrated in the building. These were not injured in any way other than the warping of some of the elevator doors and the melting of some of the wire glass.

Copyright by Underwood & Underwood

View of the Upper Seven Floors from the Couri

The evidence is conclusive that the fire was not communicated from floor to floor in this building. In other words, there was an independent fire on each of the seven floors, communicated from the outside. The most positive evidence of this fact is to be found in the attic above the fifteenth floor. This attic space has no window exposure other than skylights and suffered in no way from the fire. Elevator machinery, blue print apparatus and storage files in this attic are entirely uninjured and the elevators were restored to operation very shortly after the fire.

ACCORDING to the Canadian Engineer, Toronto, water power developed and utilized in Canada in 1920 averaged 280 hp. per 1,000 of population whereas in the United States only 93 hp. had been developed per 1,000 inhabitants.

THE SOUTHERN PACIFIC, to cope with the flagrant carelessness of motorists who run into crossing gates, or into the sides of trains, has adopted the policy of seeking damages from the owners of such machines. During 1921, on the Pacific System, 186 automobiles were driven into the sides of trains; 85 crossing gates were broken down, often resulting in injuries to crossing flagmen; and 46 cars skidded into the sides of trains.

Increased Divisions Ordered for Missouri & North Arkansas

WASHINGTON, D. C.

AS A FURTHER STEP to enable the Missouri & North Arkansas to resume and continue operation, the Interstate Commerce Commission has issued an order providing that, effective as of March 1, the divisions of joint interstate rates received by its connecting lines on freight traffic interchanged with the Missouri & North Arkansas shall be reduced by from 10 to 25 per cent of the divisions in effect on January 1, the difference to accrue to the M. & N. A. in addition to the divisions it has received. Divisions on traffic as to which the M. & N. A. is an intermediate carrier are not, however, to be affected.

Although certain of its connecting lines had suggested that the southern portion of the line be abandoned, the commission holds that the road is a public necessity in its entirety and that its operation should be resumed and continued. To this end the commission on January 16 had approved an increase in its freight rates, estimated to amount to approximately \$208,000 a year, and the Railroad Labor Board had authorized a 25 per cent reduction in the wages of its employees, estimated at \$310,000, on condition that the owners of the property should receive no return on their investment until wages are returned to the standard scale. The road runs from Joplin, Mo., to Helena, Ark., 359 miles, and has branches making its total mileage 364.5 miles. Its investment in road and equipment is stated as \$18,160,186. The company was organized in 1906 and has never been profitable. It was placed in a receivership in 1912 and suspended operation last July. In the complaint filed against its connecting roads, the Atchison, Topeka & Santa Fe; Chicago, Rock Island & Pacific; Kansas City Southern; Missouri, Kansas & Texas; Missouri Pacific; St. Louis-San Francisco, and Yazoo & Mississippi Valley, it asked for an increase in its divisions of 25 per cent, stating that an increase in rates alone would not alter its situation. The road admitted that, judged by mileage alone, it has received its full measure of divisions, but it contended that under the standards prescribed by the present law its divisions are unreasonable and unjust because insufficient to pay operating expenses, taxes and a fair return on its investment.

As the result of a conference with the commission a committee of traffic managers of connecting lines was appointed to study the traffic situation. This committee considered three plans, the first of which contemplated a diversion of tonnage to the road, the second an increase of the divisions, and the third an increase in rates. The first plan was discarded because of the lack of sufficient tonnage unrouted by shippers which could be diverted. An increase in divisions was not recommended but the committee recommended an increase in rates, estimated to amount to \$208,673, the entire amount to accrue to the M. & N. A., and a reduction in wages. On petition of the receivers the Labor Board agreed to a reduction on the condition named and the commission approved a rate increase substantially as recommended but on complaint it also took up consideration of the divisions.

The report, after a discussion of the intent of the new provisions relating to divisions inserted in the law by the transportation act, says that the general increase in rates authorized in Ex Parte 74 was intended to permit a return of six per cent within the rate districts, under normal traffic conditions, but that it appears that the M. & N. A. could not, if operated, derive a share of the revenues thus provided fairly proportioned to the amount and character of its service.

In its conclusion the commission says in its report that it has taken into consideration the relation between the earnings realized by the carriers involved and the earnings contemplated by section 15-a; also the value of the property of each carrier.

"Notwithstanding the fact," the commission says, "that the record raises a strong presumption that most of the respondent's connecting lines are not now earning a return as great as is contemplated by section 15-a, we believe we are not precluded from making such adjustment of divisions as we find just and reasonable. It is necessary that all essential transportation facilities of the country be kept in operation. It is clear that in order to resume and continue operation, the Missouri & North Arkansas must have additional revenues, and irrespective of its nature, it is entitled to divisions which are just, reasonable and equitable under the standards prescribed in paragraph 6 of Section 15 of the interstate commerce act. We are convinced that, having fair regard for the necessities of all the carriers and considering all proper circumstances of the traffic, the divisions of interstate rates now accorded the Missouri & North Arkansas by its connections are unjust, unreasonable and inequitable. . . ." Commissioner Daniels dissented.

In order that it may keep in touch with the situation and if necessary make further adjustments, the commission's order requires that the Missouri & North Arkansas and its connecting lines shall jointly report to the commission on or before May 15 the divisions established under the order, together with the number of tons and ton-miles of freight for the year ending December 31, 1917, and the revenues, to include all increases of rates effective since 1917, of each carrier as to traffic moving under interstate joint rates between each of the stations or groups of stations for which divisions are determined. They are also to report jointly thereafter the tons, ton-mile and revenues with respect to such traffic actually interchanged for the period from January 1 to June 30, 1922, and from July 1 to December 31, 1922.

In addition to this W. A. Colston, director of the Bureau of Finance of the commission, has written a letter to R. E.

Cave and Festus J. Wade, president of the Mercantile Trust Company of St. Louis, by authority of Division 4 of the commission, stating that the commission will approve a loan of \$3,500,000 recently applied for, to the Missouri & North Arkansas or its approved successor, of which \$3,000,000 would be for the purpose of meeting maturing indebtedness reduced to a judgment in receivership proceedings and foreclosure suits in the United States district court for the eastern district of Arkansas, and \$500,000 for additions and betterments, on certain conditions. The conditions are that there shall be such sale or other disposition of the property as will release it entirely from all existing claims and obligations so that the government loan may be secured by an absolute first lien on the property, and before the loan is made such proceedings shall be taken as may be necessary to cancel all stocks, bonds and other securities of the Missouri & North Arkansas or of others in any way resting on the property and the new property shall be covered by two issues of securities only: \$5,000,000 of first mortgage bonds to be given as security for the government loan and \$3,000,000 of stock to be turned over to such representative or committee as may be organized or authorized to receive same for those who will pay or secure the payment of \$500,000 of additional working capital. It is to be understood that this working capital is in addition to any current assets which may be obtained in the purchase of the railway property, rights and franchises. Also conveyance will be made to the reorganized company or to the new company to be formed of all current assets and equipment, materials and supplies in addition to roadway and appurtenances. The committees, owners, or representatives of the property shall secure the undertaking of the Mercantile Trust Company of St. Louis to supervise the distribution of the proceeds of the loan and shall provide \$60,000 to be used in connection with payments to secure competent supervision and operation.

Railroads' Arguments Against Automatic Stops

Carriers Claim Devices Are in Development Stage and That Proposed I. C. C. Order is Too Drastic

CLAIMING that no automatic train stop or train control device has been sufficiently developed to warrant installation on such an extensive scale as is outlined in the proposed order of the Interstate Commerce Commission and that the American Railway Association is diligently working for the development of a practical device which will meet the Commission's order and serve the purpose of the railroads, Alfred P. Thom, counsel for the Association of Railway Executives, speaking at the hearing in Washington on March 20, urged that the Commission refrain from issuing such an order. A committee of the American Railway Association, representing 40 of the 49 railroads included in the proposed order, presented supporting evidence. This evidence was presented by R. H. Aishton, president of the American Railway Association; C. E. Denney, vice-president and general manager of the New York, Chicago & St. Louis, and chairman of the railroads' committee; A. M. Burt, assistant to the vice-president of the Northern Pacific, and J. A. Peabody, signal engineer of the Chicago & North-Western. The hearing was held before Commissioners McChord, Esch and Lewis. After the carriers' committee had finished presenting its data the individual roads submitted additional statements as to why the order should not be entered against them, or should be modified.

Mr. Aishton outlined the formation of the joint committee and the co-operation of the American Railway Association

with representatives of the Bureau of Safety of the Interstate Commerce Commission and said that in connection with the work the association in the last 15 months has spent \$20,000. Mr. Aishton said that the carriers' committee does not represent the Chicago & Eastern Illinois, the Chicago, Rock Island & Pacific, the Long Island, the Norfolk & Western, the Pennsylvania, the Philadelphia & Reading, the Pittsburgh, Cincinnati, Chicago & St. Louis, the West Jersey & Seashore and the Chesapeake & Ohio. Continuing, he said:

"The following questions naturally presented themselves for answer:

"(1) Has automatic train control reached a point of development reasonably justifying an order requiring its extensive installation at this time? The committee's answer to this is, No. * * *

"(2) If installation for further tests is advisable, is duplication of tests necessary? The committee expresses the opinion that such duplication will not serve any practical purpose.

"(3) Are further developments probable; or other principles than those now being advocated and under development? The committee is of the opinion that induction methods of train control are being rapidly developed and that tests now being arranged for will give valuable information and promise progress.

"(4) Are the proposed requirements such as best cover

the situation? The committee will propose amendments.

"(5) The committee has not entered into the financial side of the question in any manner, but it is a serious question for this Commission whether automatic train control will provide greater additional safety for a given expense than the same expenditure will produce through the installation of automatic signals, extensions of double track, etc., * * * and other improvements which not only increase safety, but increase the capacity of the railroad and produce large economies in operation. It is an open question, whether any of the devices so far tested do not have a tendency to decrease the capacity of a railroad.

"The policy of the railroads is now, as it has been in the past, that within their financial ability they are continually seeking to find better methods for promoting safety as well as economy and the production of better service. Applications to the Commission for authority for financing disclose that a large part of the money for which authority is now asked is to be devoted to purchases which tend toward better operation, greater safety and better service. Under present financial conditions expenditures should be confined as largely as possible to known and demonstrated channels * * *."

Commissioner Esch then asked if, in the opinion of Mr. Aishton, carriers had properly co-operated in the development of automatic train control; the matter had been brought up over 14 years ago. Mr. Aishton replied that he could not say, except for the last 15 months, in which period he felt that progress had been made. Prior to that time and during the war and under Federal control little could be done except to keep trains moving. Commissioner Esch called attention to the final report of the Block Signal & Train Control Board, made in 1912, in which it was stated that ten or fifteen devices had sufficient merit to justify further test, and asked if since 1912, up to the war, whether the financial status of the railroads was such as to prevent them acting on development of such devices. Mr. Aishton, in reply, called attention to the fact that during that period legislation on electric headlights and steel cars was passed, which required large expenditures by the railroads, and that this may have diverted the railroads from the automatic train control question.

Brief Submitted by Mr. Denney

The brief of the carriers, submitted by Mr. Denney, will be found under another head. In connection with it he said that the American Railway Association was co-operating with the Interstate Commerce Commission. Two additional installations of train control apparatus have been arranged for, one on the Southern Pacific, and one on the New York Central; and he referred to the experimental installations of the General Railway Signal Company's device on the Buffalo, Rochester & Pittsburgh; the International Signal Company's device on the Erie, and the Shadle device on the Cincinnati, Indian Wells & Western. He also referred to the Union Switch & Signal Company's plan for making an installation on the Pennsylvania Railroad. Mr. Denney emphasized the fact that it has been and will be the aim of the American Railway Association to co-operate with the Commission.

Commissioner Esch asked as to the powers given the A. R. A. committee on automatic control to secure the co-operation of the railroads. Mr. Denney replied that the committee was not authorized to spend any money. As to whether automatic stops would increase the capacity of a railroad, Mr. Esch quoted a statement made in March, 1920, by J. M. Waldron, signal engineer of the Interboro Rapid Transit Company, New York, that automatic train control had increased the capacity of these lines 43 per cent. Mr. Denney replied that conditions on the Interboro were in no way comparable to those on steam operated railroads in the open. Mr. Esch asked about the A. R. A. inspections on the Chicago, Rock Island & Pacific, the Chicago & Eastern Illinois, and

the Chesapeake & Ohio by the American Railway Association in February. Mr. Denney stated that the main purpose was to have these men watch operation during severe winter weather.

A. M. Burt's Report

Mr. Burt presented a report on the views of the railroads' committee with respect to differences between the specifications (a) as adopted by the committee of the American Railway Association and representatives of the Bureau of Safety of the Interstate Commerce Commission and (b) the specifications included in the Commission's proposed order. There is one difference which is felt to be important. In this connection he said in part:

"Under 'Automatic Train Stop,' the Commission in its proposed order has eliminated entirely the following paragraph in the requirements of the A. R. A. committee:

"(b) Under control of engineer, who may, if alert, forestall automatic brake application and proceed."

"The omission of this paragraph will make the use of a simple automatic train stop so restrictive that it will practically eliminate such devices from consideration. It is fundamental that trains should be stopped only when necessary in connection with their service or when necessary in the interest of safety. There are many times when it is proper for a train to pass an automatic signal in the stop position without coming to a full stop. Signals are now very generally located only a short distance from a siding switch and it is often desirable for a train to be admitted to a siding by a man on the ground, either a switch-tender or a trainman of another train. If no permissive device is allowed on the engine, it will be impossible for the engineer of the approaching train to pass the signal and enter the siding without having his train brought to a stop unnecessarily by the automatic device.

"* * * If an order is entered by the Commission it should be so flexible as to permit the installation of the simpler devices. The most that can now be expected from any automatic device is to have it operate when the human element fails to do so through inadvertence or physical inability. An engineer must be relied upon a great many times to exercise judgment and caution and it is entirely illogical to take from him, in one particular, his right to use his intelligence and discretion and at the same time rely on such intelligence and discretion at many other points. * * *"

The question of interchangeability was also raised by Mr. Burt. In order to get full protection from an automatic train control device upon engines, it must be so designed that it will function with the roadside apparatus on any of the railroads over which these engines operate. * * * In considering the necessity for interchangeability it should be remembered that the railroads would have to carry a stock of repair parts at various points on their lines. Before making large installations it is of the greatest importance that, so far as possible, there should be standardization. It will readily be conceded that the need for absolute interchangeability is not the same as the need for interchangeability in freight car couplers or air brake apparatus. There is, however, a very real need and this need of interchangeability will increase as time goes on rather than lessen. The major problems in connection with it should be brought much nearer to solution before extended installations of train control devices are undertaken."

Mr. Peabody Reports on Three Devices

J. A. Peabody presented reports on the American Train Control Company's installation on the Chesapeake & Ohio, the Miller Train Control Corporation's device on the Chicago & Eastern Illinois and the Regan device on the Chicago, Rock Island & Pacific. A brief description of the device was first given and the objections raised by the chief inspectors

were stated, after which was set forth the action taken by the companies to meet criticisms. He presented in each case a comparison showing how the device met the requirements laid down in the Commission's proposed order. Data sheets were presented showing the number of operations per failure, etc., and conclusions were drawn as to the effect of these devices upon train operation.

On the Chesapeake & Ohio, 32 specific points were brought up for correction; on the Chicago & Eastern Illinois, 13, and on the Chicago, Rock Island & Pacific, 29.

After the presentation of this information, in which all failures were noted, W. P. Borland, Chief of the Bureau of Safety, Interstate Commerce Commission, stated that he did not concur in this report, inasmuch as his inspectors did not co-operate with the special American Railway Association committee in the preparation of the document presented by Mr. Peabody and that a number of objections were raised which had not been concurred in by inspectors from his department. Mr. Peabody replied that he did not say the Bureau of Safety had co-operated, but that it did concur in pointing out certain undesirable features. Commissioner Esch then asked if the additional undesirable features (which had not been concurred in by the Bureau) had been called to the attention of the owners of the devices, and Mr. Peabody stated that they had not, so far as he knew; the report had only been finished during the last week. Its main purpose was to show that the train control question was in the development stage. Commissioner Esch asked Mr. Peabody if it was the primary purpose of the committee to find defects and Mr. Peabody said that it was; this in order to determine what is necessary to get reliability.

Pleas of Individual Roads

After the conclusion of the joint presentation, the Southern Pacific and the Southern Railway presented additional briefs pertaining to their particular roads. The Southern Pacific desired to adopt the responses made by the carriers' committee and further asked to be exempted from making a double installation, the Southern Pacific and the Galveston, Harrisburg & San Antonio being parts of the same system. It was the feeling of this company that the order should not apply to it, inasmuch as it is now co-operating in the development of an induction type near San Francisco.

The Southern Railway also supported the carriers' committee report and asked that it be not required to make duplicate installations which would be necessary if the order were to be entered, as the C. N. O. & T. P. was part of the Southern system. Automatic train control devices should not be required on these lines until additional automatic signals have been installed. W. J. Eck, signal superintendent, said that "the Southern Railway and the C. N. O. & T. P. have not been rerriss in the installation of safety devices of all kinds; they have been among the first in this regard. They expect to continue the policy in the future; and when the principal main lines of the system are provided with other safety devices now recognized as desirable for a well regulated railroad, your honorable commission may be assured that this system will not hesitate to install automatic train control. The management is interested in the subject, has assisted in its development and will doubtless some day have it installed on many miles. It does not believe, however, that it should be installed now upon an entire engine division so long as there are hundreds of miles of important main lines without the very great safety afforded by the automatic block system. * * *

A Plea for Signals

B. H. Mann, signal engineer of the Missouri Pacific, said that an order as to his road would be premature. It should be permitted to expend its available funds in providing interlocking for its unprotected crossings and automatic block

signals for its main lines before paying for a device to compel obedience to signals. He estimated the cost of equipping the line from St. Louis to Kansas City with an automatic train control system at \$911,950, for 276 miles, and said the company should spend \$19,251,000 for automatic signals and interlocking. The estimate for automatic train control, he said, was \$1,500 per mile and \$750 per locomotive, and was based on information from other roads that have made installations. He thought the 49 roads should not be required to spend money for the installation of a device which would be scrapped when a more satisfactory type is developed. The Missouri Pacific feels that its important problem is to reduce the unproductive time of freight trains, which can be done by signals, and it trusts that the Commission will not compel it to disrupt its present plans. It hopes that it may be relieved of the order entirely and allowed to devote its available revenues to other safety devices. Mr. Mann referred to the installation of signals as preparatory to automatic train control.

Chairman McChord asked how long it would take to complete the signal program. Mr. Mann replied that it would take several years. W. P. Borland, director of the Bureau of Safety, then brought out that the Missouri Pacific has installed automatic block signals on 365 miles since 1904, and 154 miles since 1912, and said that at that rate it would take over 100 years to "prepare for automatic train control." In reply to questions, Mr. Mann said that passenger engines run through from St. Louis to Kansas City and that passenger crews run through to Sedalia. He was asked the cost of installing train control between St. Louis and Jefferson City and said \$316,200, but that that is not a crew run. He said his company has been looking into the Bostwick device and the three ramp types investigated by the committee.

Means Installation on Entire Line

When W. D. Duke, general manager of the Richmond, Fredericksburg & Potomac, said he desired to adopt the testimony presented on behalf of the committee, Chairman McChord reminded him that he was under oath. Mr. Duke said the proposed order covers his entire main line from Washington to Richmond, over which locomotives of six foreign lines are operated. He said that in the present state of the art, his company should not be required to install a safety device not thoroughly approved in actual practice. Proprietors of three or four devices have been permitted to use the company's tracks and locomotives for experiments during the past six or eight years, but the experience has not justified adopting any of them; he thought further time should be allowed for development of the induction type. He suggested 12 to 18 months as possibly sufficient time. Mr. McChord asked if the road is taking any steps itself to make tests on its own line. Mr. Duke replied that it expected to profit by the experience of others. Mr. McChord said that it seems to be the policy of Congress that something should be done, and that he understood that many good devices have never been tested. "We think we have done our share in proportion to our mileage," said Mr. Duke.

L. W. Baldwin, vice-president of the Illinois Central, asked that an order be not issued as to his road, saying that more time should be allowed. Commissioner Lewis asked how much time should be allowed. Mr. Baldwin said that would depend on the period required for development beyond the experimental stage. He said he had based his conclusions on what he had read and on reports of his officers; he had not personally studied automatic train control on the ground. Mr. Borland asked Mr. Baldwin what difference there was in operating conditions on the C. & E. I., the Rock Island or the Chesapeake & Ohio (which have reported that the train control devices used by them had met their operating conditions satisfactorily) and those on the Illinois Central. Mr. Baldwin said there is a difference of opinion

on that subject. While he was not familiar in detail with the operating conditions on the other roads, he did not see how it could be said that operating conditions were being satisfactorily met until those roads should be fully equipped. The Illinois Central has looked into the Sprague device and that of the Union Switch & Signal Co., to some extent, but is not testing any device.

Severe Winters

B. R. Pollock, vice-president and general manager of the Boston & Maine, asked that his road be exempted from any order, on the ground that it operates in a district of severe winter weather in which the practicability of automatic train control has not yet been demonstrated; and that the portion of its line designated was one of very heavy passenger traffic which would be adversely affected by any device which should cause additional stops. He said the locomotives of three other divisions also are run over this division so that the order would require the equipment of many additional engines.

C. C. Hine, general solicitor of the Chicago, Indianapolis & Louisville, said that his operating officers know very little about train control devices, but he wished to file an objection on the ground that an order as to his road would not be justified because its operating conditions are such that the additional protection is not required. Of the 475 miles of main line, 360 are equipped with automatic signals and on the lines where there are no signals there are long intervals between trains. No passenger has been killed in a train accident since 1897, except a mail clerk, in 1912, and the company feels that the money could be spent to better advantage for additional protection at highway crossings.

C. H. Stein, general manager of the Central of New Jersey, said his company is not opposed to automatic train control but is in sympathy with the proposition; but it has investigated 46 devices and feels that none of them has reached such a state of perfection that would warrant the expense of an installation. He believed that new possibilities are just coming to the surface and that a wireless device may be developed. Pointing out that in recent years only from 252 to 271 passengers have been killed per annum, and that only a part of these could have been saved by automatic train control, Mr. Stein said that the train control device itself might easily be the cause of accidents. Those now in service are under special scrutiny. He thought the capital required might be more profitably invested in other directions. In reply to Chairman McChord's question as to what his company is doing to help bring train control to a stage of perfection, Mr. Stein said it was keeping in touch with the experiments being carried on but does not feel like duplicating the work being done on other roads until it finds a device it considers worth trying.

"Suppose all the roads took the same position," said Mr. McChord.

"Then maybe we would take it up," replied Mr. Stein.

Mr. Borland asked Mr. Stein if he saw any insuperable difficulties in the way of standardizing the equipment to overcome the objections made on the ground of lack of interchangeability. Mr. Stein said that would be a question for the mechanical department. When he concluded, Chairman McChord asked Mr. Stein to file with the Commission the reports of the investigations of the 46 devices referred to.

Offered Prize for Device

The New York, New Haven & Hartford gave a long list of reasons why the order should not be issued on its line. No device had been found practical for use on the lines covered in the Commission's order and the company has been trying to find a device since 1912, having offered a reward of \$10,000 for such a one. Over 1,400 patent papers have been examined and innumerable inventors

and proprietors of devices had been dealt with. Inspections have been made of practically all installations on other roads, and since 1918 the company had employed a special engineer who devoted all his time to this subject; and in addition a special committee was at work. The company showed that it had made a trial installation of the Union Switch & Signal Company's device in 1913 and of the International Signal Company's device from 1915 to 1917, but the tests were found unsatisfactory. Another objection raised to the issuance of the order was that in the operating of its trains over the Pennsylvania and the New York Central in electrified territory no automatic stop shoe could be used that would come within the allowable clearance.

During the presentation of the New York, Chicago & St. Louis road's brief, by Mr. Denney, Commissioner McChord asked about the work of the subcommittee, operating under Mr. Denney's direction, saying that Mr. Borland had no record of what occurred in connection with its inspection of the Regan and the Miller devices; while the inspector of the Bureau of Safety on the C. & O. had no knowledge of what these men were doing; and that the records of this subcommittee do not check up with the Commission's records. Mr. McChord also wished to know the conditions under which this subcommittee conducted the surprise tests.

The Burden of Two Installations

W. M. Jeffers, general manager of the Union Pacific, asked that that system be relieved of the burden of making two installations, as would be required by the proposed order, one on the Union Pacific and one on the Oregon & Washington Railroad & Navigation Company, and expressed the opinion that the test on an entire engine district is not essential, but said that the road desires to co-operate in a helpful way with the commission and offered to co-operate with the Bureau of Safety in making a test of any proper device which is not being tested. Chairman McChord said it was not the policy of the Bureau of Safety to say what devices should be installed. Mr. Jeffers said he thought the Union Pacific had spent more money per mile in safety work than any other road and that 85 per cent of its main line is equipped with block signals, but it feels that train control is still in its infancy and he knew of no device that he would want to put on extensively. There are many problems to be worked out, particularly in connection with heavy tonnage trains on grades.

He also made a point of the fact that train control would tend to take control of the train away from the engineer and said it is a question whether this remedy would not be worse than the disease. Mr. Borland asked if he had any idea that it was proposed to take the responsibility away from the engineer. Mr. Jeffers replied that he did not know that it was specifically proposed but any time responsibility is divided between the engineer and a device there is liability to trouble. When Mr. Borland cited two accidents on the Union Pacific caused by the failure of the engineer to see signals, Mr. Jeffers agreed that those accidents might have been prevented by an automatic train control device, but he said the device might have caused an accident on some of the hundreds of thousands of movements made since. Mr. Jeffers said that the ramp adds an unnecessary element of danger and that it would leave insufficient clearance for the rotary snow plow. He also thought the tendency would be to reduce the air pressure in descending heavy grades, saying that it takes years of experience for an **engineer** to learn how to handle his train under such conditions. Commissioner Esch asked whether he thought there was any objection on the part of those interested in wayside signals for fear that automatic train control would supplant them. Mr. Jeffers replied that he thought not because automatic train control should be used in conjunction with signals.

A. W. Trenholm, vice-president of the Chicago, St. Paul, Minneapolis & Omaha, said that the division of his road mentioned in the order has been proposed for double tracking, which would necessitate changing the apparatus if it were installed at this time, and he also said that it would be necessary to install automatic block signals at the same time. He submitted an estimate of the cost, saying he did not know whether it could be relied on and that probably an order of the commission would result in increase in the price of automatic train control. He discussed the financial condition of his road to show that it would be difficult to sell securities to meet the expense and said that the money could be used to better advantage for additional double tracking or signalling. He pointed out that crossing accidents had resulted in more casualties than collisions.

When Mr. Trenholm referred to the proposed order as arbitrary, Commissioner Esch said that Congress had passed the law two years ago and that the commission had waited this length of time before issuing an order. Mr. Trenholm replied that the law had left the matter in the discretion of the commission and he thought the burden should be on the patentees to perfect their systems until they are safe to put on a railroad. Mr. Esch said that in view of the stagnation in the development of train control in recent years Congress evidently expected some action on the part of the commission.

A. M. Burt was recalled to speak for the Northern Pacific. He described the expenditures made by this road for safety appliances and the proposed extensions of its automatic block signals. He said that the installation would not be warranted by the density of traffic on the divisions proposed in the order and that the ramp would introduce complications in a country exposed to snow drifts, because it would promote the formation of drifts and would also be an obstruction to the snow plows.

Five Installations Required on One System

W. E. Elliott, signal engineer of the New York Central, described the work which that company has done for many years in investigating train control, after C. C. Paulding, as counsel for the road, had pointed out that the proposed order would require five installations on the New York Central System, on the Pittsburgh & Lake Erie, Boston & Albany, Michigan Central, Chicago, Cincinnati, Cleveland & St. Louis, and the New York Central itself. Mr. Elliott said he had had experience in investigating train control since 1893 when the Chicago, Milwaukee & St. Paul, of which he was then signal engineer, made an experimental installation of the Kinsman device. He said that the special committee organized by the New York Central had adopted a train control device several years ago for use in the Detroit tunnel, but had not yet been convinced of the practicability of any device for general installation. He referred to negotiations with the Sprague Company since 1914 and said that under arrangements made during the winter its device has been installed on one track $6\frac{1}{2}$ miles long, including five blocks, and on one passenger engine and preliminary tests were begun on February 20. Specific tests under the direction of the joint committee and the Bureau of Safety are to be made next week. If the tests turn out satisfactorily it is the intention to equip a double track section of the New York Central and Michigan Central between Toledo and Detroit, 54 miles, with automatic signals and an automatic train control device for a service test. He said the ramp type would not be suited to the New York Central because of interference with the third rail and because of the snow and ice conditions during the winter.

Mr. Peabody, appearing for the Chicago & North Western, said that the installation would cost \$1,657,700 and the company felt that this money could be spent more profitably for block signals. George J. Ray, chief engineer of the Dela-

ware, Lackawanna & Western, said his company had devoted much attention to tests of automatic train control devices for many years, and it does not ask for postponement of the order because of its financial condition or because of a belief that signals should be installed first, because the greater part of its line is already equipped with automatic signals and it is ready to install a train control device whenever it is convinced that one is suitable for its operation and would be a help rather than a hindrance, but if this order is made permanent it would have to install a ramp type device and it believes that in a year or two some other type will have been developed more satisfactorily. Meantime, it believes it ought to be allowed to continue experiments.

Objects to Ramp

H. T. Douglas, chief engineer of the Chicago & Alton, said he believed that the ramp type is most undesirable and that the induction type will produce better results. He said that according to the best information he could obtain the installation on his road would cost over a million dollars and he thought it would be most unfortunate for the commission to require this expenditure for an experiment when there are so many other ways in which the money could be more profitably used, if it had the million dollars, which it has not. As various witnesses gave estimates of the cost, Chairman McChord asked for an itemized statement showing how the estimate was made up. Mr. Douglas said he had consulted men who had experience on other roads, but that the proprietors, he understood, were not in a position to give prices because they have no contracts for the manufacture. J. Beaumont stated that the manufacturers would be in a position to state prices and that such information has been available for some time.

F. P. Patenall, signal engineer of the Baltimore & Ohio, described the work his company has done in the way of investigating automatic train control devices and said that 75 per cent of them are "not worth the paper they are written on." Chairman McChord asked why the railroads have not done more to develop the other 25 per cent. Mr. Patenall said that no good purpose could be served by duplicating tests and that he felt his company had been of assistance in helping to ascertain changes that should be made in those that have been installed. He estimated the cost at from \$2,000 to \$6,000 a mile and said that greater benefit would be derived from the expenditure of this money for signals. He asked that the commission modify its order and permit an installation of 10 or 15 miles in connection with a proposed installation of signals. A number of the roads were asked by Chairman McChord to file statements of the cost involved in some of the principal accidents that have occurred in recent years, and also any other accidents which could have been prevented by train control.

Following the railroad testimony the representatives of train control companies were to be heard.

SOUTHERN PACIFIC SAFETY RECORD.—The total number of injuries sustained by employees of the Southern Pacific's Pacific System was approximately 20 per cent less in 1921 than in any other year since 1906.

STOP, LOOK AND LIVE.—With the first warm days of spring, automobiles will again take to the highways. The death rate at grade crossing is growing year by year. The evil may only be met by education. The Buffalo, Rochester & Pittsburgh Railway will issue warning bulletins from time to time during the summer, and these cards will be distributed to automobile clubs, gas stations and other suitable localities. In educational work the automobile clubs have accomplished wonders; we ask them to double their efforts. Our aim in this educational work is entirely unselfish and is entirely human. * * *—*B. R. & P. Circular.*

Freight Car Loading

Washington, D. C.

THE NUMBER of cars loaded with revenue freight showed another increase during the week ended March 11, according to the weekly report of the Car Service Division of the American Railway Association, to 829,128, as compared with 700,440 during the corresponding week of 1921 and 819,329 in 1920. The increase as compared with the previous week was 26,000 cars. The principal increase as compared with last year was in coal loading, 68,000 cars, but there was also an increase of 21,000 cars in miscellaneous freight and of 29,000 in merchandise. Decreases as compared with last year were shown only as to forest products and ore. Increases as compared with 1920 were shown as to grain and grain products, livestock, coal and merchandise. All districts showed increases as compared with last year. The summary for the week is given in the table below and the trend is shown in the chart.

The freight car surplus for the week ending March 8 was 22,846, a reduction of 21,254 as compared with February 28. Of the total 88,974 were box cars and 86,464 were coal cars.

The percentage of bad order freight cars on March 1 was 14.7 as compared with 14.5 per cent on February 15.

Announcement Regarding Consolidation Hearings

WASHINGTON, D. C.

FOR THE GUIDANCE of respondents and others to be represented at the hearing on the Interstate Commerce Commission's consolidation plan on April 24, at Washington, the commission has issued an announcement as to certain phases of the subject to be borne in mind.

The evidence received at the hearing beginning on that date will be confined to railway properties in the southeastern region as that region is described and referred to in Chapter IV of the appendix to the tentative plan of the commission, adopted August 3, 1921.

It was there found for the purposes of this tentative plan that the railway properties in that region may be consolidated under the statute into the following systems:

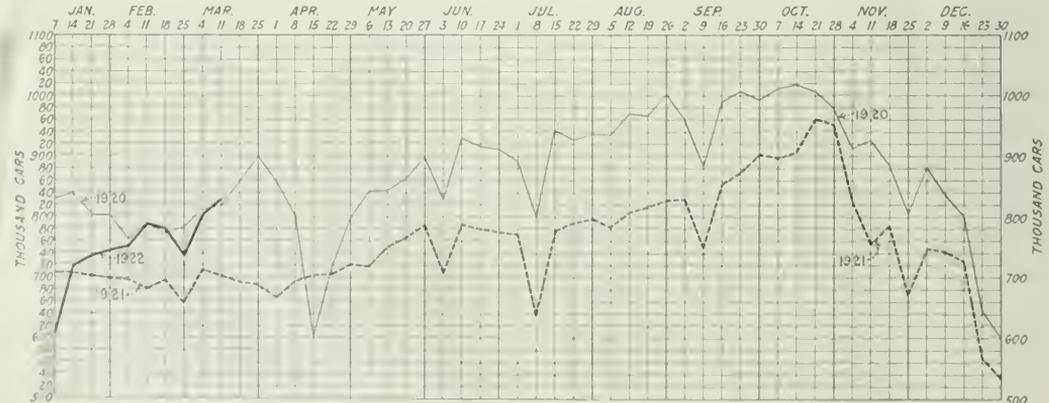

SYSTEM NO. 10. - SOUTHERN

- Southern
 - Alabama Great Southern
 - Georgia, Southern & Florida
 - Mobile & Ohio
 - Southern Railway in Mississippi
 - Northern Alabama
 - Cincinnati, New Orleans & Texas Pacific
 - New Orleans Great Northern
 - Alabama & Viecksburg
- Note.—Prof. Ripley recommends inclusion of the Georgia Southern & Florida Branch from Valdosta, Ga., to Palatka, Fla., in Seaboard system.

REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

SUMMARY—ALL DISTRICTS, COMPARISON OF TOTALS THIS YEAR, LAST YEAR, TWO YEARS AGO. WEEK ENDED SATURDAY, MARCH 11, 1922.

Districts	Year	Total revenue freight loaded								This year, 1922	Corresponding year, 1921	Corresponding year, 1920
		Grain and grain products	Live stock	Coal	Coke	Forest products	Ore	Misc. L. C. L.	Miscellaneous

Revenue Freight Car Loadings to March 11, 1922

SYSTEM No. 11.—ATLANTIC COAST LINE—LOUISVILLE & NASHVILLE

Atlantic Coast Line
 Atlanta and West Point
 Charleston & Western Carolina
 Louisville & Nashville
 Nashville, Chattanooga & St. Louis
 Louisville, Henderson & St. Louis
 Western Railway of Alabama
 Richmond, Fredericksburg & Potomac
 Norfolk Southern
 Atlanta, Birmingham & Atlantic
 Winston-Salem Southbound
 Roanoke to Winston-Salem branch of Norfolk & Western
 Florida East Coast
 Carolina, Clinchfield & Ohio
 Georgia & Florida
 Gulf, Mobile & Northern
 Mississippi Central
 Notes.—Prof. Ripley recommends that the Richmond, Fredericksburg & Potomac and Florida East Coast retain their present status without inclusion in any system.
 The Carolina, Clinchfield & Ohio may be included in system No. 12, Illinois Central-Seaboard. Prof. Ripley recommends inclusion in system No. 10 Southern.
 The Gulf, Mobile & Northern and Mississippi Central are not specifically included in any system under Prof. Ripley's report.

SYSTEM No. 12.—ILLINOIS CENTRAL-SEABOARD

Illinois Central
 Yazoo & Mississippi Valley
 Central of Georgia
 Seaboard Air Line
 Lynnhire, Va., to Durham, N. C., branch of Norfolk & Western
 Gulf & Ship Island
 Tennessee Central
 Carolina, Clinchfield & Ohio
 Notes.—Prof. Ripley recommends that a separate system be built around the Seaboard Air Line.
 The Gulf & Ship Island is not included in any system by Prof. Ripley.
 The Carolina, Clinchfield & Ohio may be included in system No. 11, Atlantic Coast Line-Louisville & Nashville.

In so far as practicable, the commission says, evidence should be presented in respect of these railway properties in the order in which they are listed in each system, and all evidence with respect to one system, e. g., System No. 10.—Southern, should be completed before passing to the next system.

Evidence as to the carriers not included in the tentative plan, such as industrial and terminal carriers should be presented in connection with that as to the system in which it is believed that they should be included.

In order that the evidence may be confined to relevant matters attention is also directed to paragraph (4) of section 5 of the Interstate Commerce Act.

Summarized, the requirements with which the commission must comply in preparing a plan for consolidating the railway properties into a limited number of systems, are:

- (1) Competition must be preserved as fully as possible;
- (2) Existing routes and channels of trade and commerce must be maintained;
- (3) Subject to (1) and (2) the several systems must be so arranged that the cost of transportation as between competitive systems and as related to the values of the properties through which the service is rendered shall be the same, so far as practicable, so that these systems can employ uniform rates in the movement of competitive-traffic and under efficient management earn substantially the same rate of return upon the value of their respective railway properties.

Attention is also directed to paragraph (6) of the same section, which reads as follows:

(6) It shall be lawful for two or more carriers by railroad, subject to this act, to consolidate their properties or any part thereof, into one corporation for the ownership, management, and operation of the properties theretofore in separate ownership, management, and operation, under the following conditions:

- (a) The proposed consolidation must be in harmony with and in furtherance of the complete plan of consolidation mentioned in paragraph (5) and must be approved by the commission;
- (b) The bonds at par of the corporation which is to become the owner of the consolidated properties, together with the outstanding capital stock at par of such corporation, shall not exceed the value of the consolidation properties as determined by the commission. The value of the properties sought to be consolidated shall be ascertained by the com-

mission under section 19-a of this act, and it shall be the duty of the commission to proceed immediately, to the ascertainment of such value for the properties involved in a proposed consolidation upon the filing of the application for such consolidation.

"It will be seen," the commission says, "that stress is laid throughout upon the value of the properties to be consolidated, but that value will not be a controlling factor until application is made for the consolidation of two or more railway properties after the complete plan shall have been adopted. It would seem, therefore, that evidence as to value will not be helpful, if indeed material, at the present stage of the inquiry, and certainly not evidence as to the financial structure of the respective carriers. This has particular reference to the contention that the credit of the so-called strong roads will be impaired by consolidation with so-called weak roads, weak in many instances in the sense that they have not had the benefit of conservative financial policies.

"The statute contemplates consolidation into one corporation for the ownership, management and operation of the properties theretofore in separate ownership, management and operation. This would seem to exclude from consideration general projects or proposals based in whole or in substantial part on contemplated running rights, track-age agreements, and the like, or on new construction.

"As stated in 63 I. C. C., 455, the tentative plan was put forward in order to elicit a full record upon which the plan to be ultimately adopted can rest, and without prejudgment of any matter which may be presented upon that record. This announcement should not be construed as indicating in detail what evidence should be adduced. The purpose is to again call attention to the broad general grounds of the statute on which the complete plan must rest. It is understood, of course, that alternative or modified plans may be submitted in lieu of any system proposed in the tentative plan."

THE STATE OF MINNESOTA received from its 40 railroads for 1921, on account of the five-per-cent gross earnings tax, \$1,762,651 less than in 1920, the aggregate gross earnings reported by the roads being only \$146,011,564, or \$35,241,457 less than the year before. No major road reported an increase in earnings from its Minnesota operations during 1921. The railroads which suffered most were the ore-carriers.

Accident Near Union City, Georgia, March 13, Thought to Have Been Caused by a Broken Wheel

Treated Water Improves Locomotive Performance

Six Years' Use of Soda Ash Demonstrates Value in Avoiding Failures, Reducing Repairs and Saving Fuel

By W. A. Pownall
Mechanical Engineer, Wabash Railway

THE ARTICLE on Interior Treatment of Boiler Water by C. R. Knowles of the Illinois Central, published in the *Railway Age* of November 12, 1921, deals with a very important subject and seems to have inspired considerable comment from railroad and supply men actively interested in this question. The writer has always taken great interest in the matter of scale prevention in boilers because of the large financial returns possible and would like to present for the information of those interested the results of systematic methods of boiler water treatment as in effect on the Wabash for the past 10 years.

Tests of Soda Ash Treatment

During the period 1902 to 1906, extensive service tests of soda ash treatment and observations of results were made on one of the large railroads. These tests showed conclusively that the treatment of all waters with enough soda ash to neutralize the sulphate hardness and provide enough excess always to show an excess of sodium carbonate in water drawn from the boiler, in connection with the systematic blowing off of the boiler through a blowoff cock properly located would accomplish the following principal results:

- (1) Keep heating surfaces comparatively free from scale.
- (2) Cause the scale forming solids, instead of crystallizing on the heating surface, to be deposited as a soft sludge and be carried back to the point of least circulation, the back mud ring, where it could be removed through means of a perforated pipe connected to the blow-off cock in the back corner.
- (3) Practically eliminate engine failures due to leaking flues, fire boxes, stay bolts, mud rings, etc.
- (4) Reduce stay bolt breakage and fire box renewals to a very low figure.
- (5) Decrease the cost of boiler repairs from 30 to 65 percent.
- (6) Increase mileage between boiler washings to any desired amount. The tests also established the fact that the boiler would foam when the total dissolved solids were about 240 parts per 100,000 and that enough blowing off must be done always to keep below that point.

With full knowledge that these results were being obtained and that all methods were based not on any theorizing as to effects, but on actual observations of results, the Wabash started this method of treating water in roadside supply tanks with soda ash only and at every station where water contained any sulphates of lime and magnesia. Waters containing natural sodium carbonate, even though having a hardness of 20 to 40 parts per 100,000 are used in stationary boilers at several of our plants and do not form scale, the boilers being free from scale after having been in service for many years. Observations of boilers using this type of water ought to be evidence enough to any thoughtful investigator that similar results can be obtained on other waters containing sulphate hardness if enough soda ash is added to neutralize this hardness, or in other words to make it like the natural non-scaling water.

Let me emphasize, before discussing results, the fact that this method demands that all sulphate hardness waters over an operating district must be treated in order to obtain results. Treatment here and there by soda ash only will give practically no good results, and it is probable that experience with this sort of partial treatment has condemned this method in many cases.

Water treatment was started on the Wabash in 1912, and

gradually extended until complete in 1916, when the total number of waters treated was 109. On one division this company operates over another road, and has not therefore been in a position to treat the water at roadside tanks. However, treatment has just been started on this division by placing enough soda ash in the tank at the terminal to treat all water used over the division, and although this is a crude method and one needing careful supervision, the results at the present writing are encouraging.

Engine Failures Due to Leaky Flues, Staybolts, Fireboxes, Etc.

A failure due to boiler leaking is an expensive failure since it usually involves giving up the train and having another engine and crew come out after the train and failed engine. Aside from the expense, leaking boiler failures are an absolute indication, particularly in cold weather, as to whether or not heating surfaces have scale on them, and are also evidence of all the other incidental troubles that go with scale. The following table shows the improvement in reducing failures due to leaking for the year 1921, as compared with the year 1911, the year before treatment was started.

ENGINE FAILURES DUE TO LEAKING FLUES, FIREBOXES, ETC.

Division	No. of failures		Per cent Decrease	Miles per failure	
	1911	1921		1911	1921
Detroit	141	0	100.0	21,653	No failures
Peru	236	2	99.1	12,811	1,160,425
Decatur	232	4	98.3	20,878	989,068
Springfield	57	0	100.0	33,303	No failures
Moberly	265	23	91.3	25,596	248,035
Total	931	29	96.9	20,770	541,748

It will be noted that on two divisions the failures were entirely eliminated, and on two other divisions they were practically eliminated and for all divisions the percentage of decrease was 96.9. The mileage per failure increased from 20,700 in 1911 to 541,748 in 1921. This improvement has not been made through the welding of flues into sheets, as this has been done on only a few engines and only on the superheater flues on divisions where the erratic water conditions and necessity for occasional use of very bad water made it seem advisable to weld in some of the superheater flues after they have been in service a year or two.

A good example of what has been accomplished is shown by the performance of 25 2-10-2 engines placed in service in July, 1917, on what was before treatment considered the hardest water division. These engines have flues 23 ft. long. During the 4½ years of service there have been seven failures due to leaking flues. The average time to first resetting of flues was 39 months, thirteen of the engines making from 40 to 48 months actual service. The average flue mileage on the ten highest engines (and one has not yet had the flues reset) is 116,477. Each engine has 3,047 staybolts including 2,320 rigid stays, 639 American flexible stays and 88 Tate flexible staybolts. There have been only 14 staybolts broken on the entire 25 engines. There are passenger engines running on this same division with nearly 300,000 miles between flue resetting.

Fire Box and Staybolt Renewals

Up to 1915 the firebox work on the Wabash was rather heavy, and the road did not begin to really feel the effect of water treatment in decreased firebox renewals until after 1915. However, from that time on there was a steady decrease in the number of new fireboxes applied each year, the

records for the last three years showing a reduction in firebox renewals of 93 per cent over 1915. At the same time there have not been many renewals of side sheets or part side sheets. It is to be expected that there will be certain cycles of firebox life and that there may be in the future a few years with heavier firebox renewal, but generally speaking the indications are that obsolescence will overtake renewal.

The records of staybolt renewals per locomotive per year show that on the best treated division about one bolt per locomotive per year is renewed, whereas on the one division that has not had treated water, and which is not a really bad water division, the broken bolts per locomotive per year are 52. The broken bolts on the heaviest power on the Wabash consisting of Pacific, Consolidation, Mikado and Santa Fe type locomotives, all of which operate under treated water conditions, was from June, 1920, to July, 1921, only 0.77 bolts per locomotive per year. These locomotives are equipped with flexible staybolts in the breaking zones only.

Fuel Performance

Keeping heating surface free from scale results in considerable fuel saving. As a rough method of showing the fuel saving the total tons of coal used in locomotive service each year have been divided by total equivalent ton miles, obtained by assigning an increased ton mile value to passenger car ton miles and assuming that switch engine ton miles is a function of freight ton miles. The omission of a separate figure for switching service ton miles explains what may appear to be a high value for "lb. of coal per ton mile." This figure was kept up to 1919 and shows the following:

	1912	1913	1914	1915	1916	1919
Year ending June 30,						(Dec. 31)
Lb. coal equivalent per 100 ton miles	32.7	31.65	30.93	29.2	27.0	25.75
Per cent decrease over 1912	0	3.21	5.41	10.69	17.41	21.25

The decrease in fuel consumption from the year previous to water treatment to 1919 was 21.25 per cent, part of which can be attributed to extended use of superheater engines and brick arch, and the formation of a competent fuel organization.

Cost of Water Treatment

Considerable has been said in articles in the *Railway Age* about the heavy cost of blowing out. The officers of the Wabash realize that considering the waste of fuel and water, the cost of blowing off is possibly the major part of the cost of water treatment, but there is no guess work as to this expense. On an ordinary division where the treatment will average 0.6 lb. of soda ash per 1,000 gallons of water, after the engine has made several hundred miles since the boiler was washed, it will then be necessary to blow out about 4 per cent of the water to keep below the foaming point. This will entail a fuel waste of approximately 1.1 per cent of the coal used, and the total cost of the coal and water wasted would be about \$0.026 per 1,000 gallons. The average cost between washouts will be less than this, since very little blowing is done after washout until the concentration has reached the foaming point. This cost should always be considered as a part of the cost of water treatment. Under ordinary conditions it is usually cheaper to blow out a boiler than to wash it out at the terminal, but this cost of blowing out should never deter one from treating water, as it is much more than offset by fuel saving from clean heating surfaces and by other attendant benefits.

One thing that is very essential to the successful use of treated water is the support of the enginemen. It is their intelligent use of the blow-off cock that makes it possible to use this method of treatment. Blowing off a glass of water when the engine reaches its terminal relieves the engineman of part of the burden, but in freight service it is still necessary for considerable blowing off to be done between terminals.

I have read carefully the various articles brought about by Mr. Knowles' paper, and I do not feel like criticising any of the statements made but simply wish to present results

that speak for themselves, and which will always be open to investigation by anybody interested. As regards the use of boiler compound, I agree with Mr. Bardwell—there is no mystery. It is a clean-cut proposition in which one knows what is used for treatment, and knowing what is in the water, and the amount of treatment applied, should know what to expect in the way of results. The use of anti-foaming compound reduces the amount of blowing off necessary, and where the alkali salts in the treated water are not very high and it is not desired to make large mileage between washouts or water changes, the use of the anti-foaming compound should make it possible to get along without blowing off. On districts where the natural alkali salts are high, the anti-foaming compound is a necessity for practical operation.

The statement made by Mr. Coyle of the Great Northern, that a foaming point of 200 grains per gallon had been settled on because it happened to be the foaming point in a boiler where a lot of sludge and fine scale was set loose, does not agree with our experience. We have found through analyses of many thousands of waters taken from locomotive boilers which have been free from scale for years, that the water will foam when the concentration of dissolved solids is about 240 parts per 100,000. This varies somewhat; it will be a little lower if there is any unusual amount of mud in the water or decayed vegetable matter, and will run a little higher when all waters are clear.

Wabash boiler waters are in general not high in sulphate hardness, although rather high in total hardness, so that when untreated they form heavy scale. We appreciate that waters on railroads further west and in the Southwest are in many cases very high in sulphates as well as in foaming solids, and that treatment presents a much more serious and difficult problem than we have had to deal with.

Any steam user who does not use some method of treatment to prevent scale formation in his boilers is over-looking an opportunity to save much money. Whether scale prevention is to be accomplished by the use of boiler compound, by soda ash, or by water softeners is governed by financial conditions—any method pays; but any one of these methods in order to be successful must be accompanied by proper and intelligent supervision. The greatest argument against the treatment with soda ash alone is the foaming tendency of the treated water or the cost of blowing off to overcome this foaming tendency. If all waters were treated through the softener the low amount of lime solids in the treated water would make it possible to run with higher concentration before foaming took place, and consequently with a lower cost for blowing off. Information as to how high concentration can be carried in the boiler water before foaming takes place when all waters are treated through softeners could possibly be furnished by a few roads that have a complete division or divisions equipped with softeners. This figure may be rather high where anti-foaming compound is used in connection with the completely softened water. On the other hand, there is the possibility of some one, or several plants not operating properly at all times which would mean an increase in lime solids with resultant foaming concentration not much greater than with other methods of treatment.

The saving due to reducing blowing off can be figured at a definite value per 1,000 gallons of water and set against the interest, depreciation and operating charges for the softeners. Similarly, costs can be figured in determining whether the use of anti-foaming compound to reduce the amount of blowing off would be profitable. Some value should be attached to the psychological effect on enginemen of not having to do so much blowing off.

Nothing in the foregoing should be construed as in opposition to any method of treatment. Each method, if properly supervised, may accomplish from partial to complete results in scale prevention, and I have merely tried to show results which have been obtained on the Wabash through the use of soda ash, and are possible on any other railroad.

General News Department

The **Post Office Appropriation Bill** as passed by the Senate on March 20 carries an item of \$93,000,000 for inland transportation by railroad routes.

The **Railway Accounting Officers' Association** will hold its annual meeting at the Hotel Cleveland, Cleveland, Ohio, beginning Wednesday, June 7. It was previously announced that the meeting would be held beginning June 14.

Representative Beck has introduced in the House of Representatives a bill authorizing the Interstate Commerce Commission to approve or disapprove contracts involving the construction or repair of locomotive engines, cars and maintenance work for railroads engaged in interstate commerce.

The **freight transfer station** of the Delaware, Lackawanna & Western at Scranton, Pa., employing about 100 men, is to be operated under contract by Downey Brothers, of Binghamton, N. Y. According to local reports the pay of the men will be only about six per cent lower than they have received from the railroad company.

The **Chicago, Rock Island & Pacific** is consulting with radio-phone experts with a view of determining if it is practicable to install complete radio-phone and radiograph outfits on its Rocky Mountain Limited and Golden State Limited trains, to provide passengers with news bulletins during the day and with musical concerts during the evening.

The **Interstate Commerce Commission** has issued an order giving additional regulations for the recovery and payment of excess railway operating income for the year ended December 31, 1921, under the provisions of Section 15-a of the interstate commerce act. The commission had previously issued a similar order covering the income in 1920. Reports for 1921 are to be submitted on or before May 1, 1922.

Rock Island to Issue Historical Booklet

The **Chicago, Rock Island & Pacific**, in connection with the observance of the 70th anniversary of the road, next October, will distribute a booklet giving interesting historical facts regarding the development of the road since the first passenger train was run from Chicago to Joliet, Ill., on October 10, 1852. This was the same year that the first railroad train reached Chicago from the east.

Repeal of New Jersey Full-Crew Law

The legislature of New Jersey has repealed the full-crew law of that state, passed in 1913, and amended in 1917, and has enacted a new law, under which employees may apply to the State Utilities Commission if they have complaints to make concerning the number of men employed in the crews of trains on the railroads of the state. The action of the legislature was vetoed by the governor, but was at once passed over the veto.

Thirty-four Indicted for Theft at Buffalo

Employees of the New York Central indicted in court at Buffalo, N. Y., on March 16, in connection with thefts of freight, are charged with their accomplices, thirty-four. This includes a number of the company's police force, and some former policemen who were dismissed about three months ago. It is said that the indictments are based on evidence, given before the grand jury, to the effect that the railway plans were in operation, covering large trunks, yards, to hauls, and at other places, and that employees of the road were found to be in collusion with burglars. It is said that the thieving has not been in existence for three years and that during the past 12 months it has carried off large quantities of whiskey and alcohol.

Pacific Railway Club

At the annual meeting of the Pacific Railway Club held at Oakland, Cal., on March 9, the following officers were chosen for the ensuing year: President, F. S. Foote, professor of railroad engineering, University of California; first vice-president, J. N. Clark, chief, fuel bureau, Southern Pacific; treasurer, R. G. Harmon, chief clerk, traffic department, Western Pacific and Denver & Rio Grande railroads. William S. Wollner (N. W. P.), who has been secretary of the club since its organization, was reelected for another year.

New Haven to Speed Up Settlement of Freight Claims

Freight claim agents, to deal directly with shippers and consignees, have been appointed on the New York, New Haven & Hartford for each of the nine divisions of the road; and, as a rule, these agents will adjust loss and damage claims for not more than \$300 on their own authority, obviating the delay incident to correspondence with the general office. This road also, some months ago, adopted a rule under which the local freight agents at 43 stations are at liberty, when, in their judgment, it is wise to do so, to settle freight claims not exceeding \$50.

Lackawanna Agrees Not to Reduce

Wages of Enginemen

The Delaware, Lackawanna & Western and its enginemen and firemen, represented by the Brotherhood of Locomotive Engineers and the Brotherhood of Locomotive Firemen and Enginemen, have agreed upon wages and working conditions affecting these employees. The contract, which runs to April 1, 1923, and thereafter unless cancelled, calls for the maintenance of present wage rates and working conditions during the life of the contract, excepting that if changes are made in the basis of overtime payment on other Eastern railroads as a result of agreement between management and employees or by a decision of the Labor Board, such changes will also be made effective on the Lackawanna insofar only as they apply to payment for overtime work.

Unit Costs of Train Operation

The average cost per freight train mile, for the selected accounts which the Interstate Commerce Commission uses to indicate unit costs of train service, for the year 1921 was \$1,799, according to the commission's monthly bulletin for December and 12 months, as compared with \$2,054 in 1920, a reduction of 12 per cent. Reductions were shown for each of the accounts used. The cost of coal per net ton, including freight, was \$4.10 as compared with \$4.20 in 1920. The total of these selected accounts per 1,000 gross ton miles was \$1,253 as compared with \$1,424 in 1920, a reduction of 11 per cent, and the cost per passenger train mile was \$993, as compared with \$1,098, a reduction of about 10 per cent. The selected accounts are locomotive repairs, engine house expenses, enginemen, trainmen, fuel and other locomotive and train supplies.

National Engineer Standards

The movement to develop national engineering standards sponsored by the American Engineering Standards Committee has made considerable progress during the past year. Among the standards approved during 1921 are method of sampling coal, a safety code for the protection of the heads and eyes of industrial workers, specifications for steel automatic screw stock and specifications and tests for Portland cement. Standards before the committee at the close of the year included a national

electrical safety code, specifications for car and locomotive forgings and a safety code for abrasive wheels. Numerous other projects of direct interest to railroads are now in the hands of the committee. The activities of the American Engineering Standards Committee have developed to such an extent that there is now work under way on a total of 79 distinct projects in which 160 bodies of national importance are co-operating.

Seek Grade Elimination Work

Various city councils have been actively engaged during the past few weeks in pressing their demands on certain railroads for an explanation of tardiness in carrying out state commission orders for grade elimination work in the localities in question. The city council of Milwaukee, Wis., has requested a reason for the delay of the Chicago & North Western in separating certain grades on its line through the southwest side of that city. It is expected that similar requests will be made of the Chicago, Milwaukee & St. Paul for like work in the northwest side of Milwaukee. The city council of Akron, Ohio, has also prepared extensive plans for grade elimination work in that city, and states that several years ago the railroads had promised to undertake the work in conjunction with the city, just as soon as their finances warranted.

Demand for Copies of Testimony

Before Senate Committee

The Senate has ordered printed as a Senate document 2,500 copies of Volume 4 of the testimony before the committee on interstate commerce in its general investigation of the railroad situation. This is the part including the testimony of Walker D. Hines and W. G. McAdoo. This action was proposed by Senator Kendrick of Wyoming, who originally asked that Volume 3 be also included, but withdrew the request because the cost of the two exceeded the limit (\$500) beyond which the Senate may not authorize printing without the concurrence of the House. Senator Cummins stated that the request would undoubtedly be followed by requests for other parts of the testimony, as there has been a very widespread demand for it, and the copies which the committee was authorized to have printed have been exhausted. He said that of Volume 3, covering 450 or 500 pages of the testimony of Frank J. Warne, the witness

for the labor unions, 15,000 or 20,000 had been ordered by certain unions, who had paid for them; but the printing had worn out the type so that if the entire testimony is to be reprinted that part would have to be reset.

Purdue University's Experimental Locomotive

The Purdue testing locomotive, Schenectady No. 3, will soon be placed in the shops of the Monon railway at Lafayette, Indiana, to undergo a general overhauling and receive the application of several new parts and economy devices. The placing of this locomotive in 1897 in the locomotive laboratory at Purdue was primarily the result of the efforts of W. F. M. Goss, then Dean of the Schools of Engineering. Co-ordinating with Dean Goss in his efforts was the generous interest manifested by the Schenectady Locomotive Works and various other manufacturers, chief among which were the following: Bethlehem Steel Company, American Steel Casting Company, Ashton Valve Mfg. Company, Detroit Lubricator Company, and the Keasby and Mattison Company. The product, known as Schenectady No. 2, was a saturated steam locomotive with a boiler designed to carry a pressure of 250 lb. per sq. in.

In 1910, certain modifications including new flue sheets, were made to provide for the application of a Schmidt superheater by the American Locomotive Company. The designation of the locomotive was then changed to Schenectady No. 3, the locomotive as it stands today in the locomotive laboratory.

The new work contemplates chiefly the application of new cylinders and outside valve gears. Donations towards this work have either been received or promised as follows: Baldwin Locomotive Works, new cylinders and piston valves, outside steampipes, pistons, crossheads and guides, main crank pins, and Walschaert valve gear complete; Locomotive Firebox Company, thermic syphon; Sunbeam Electric Company, complete headlight and cab lighting equipment; Nathan Mfg. Company, injectors, boiler checks and water glass; Locomotive Fuel Economizer Company, Boyce fuel economizer, and Southern Valve Gear Company, complete valve gear.

A. R. A. Acts on Power Brake Investigation

In the matter of the Interstate Commerce Commission's order relating to the investigation of power brakes and calling for certain information to be supplied by April 1, 1922, and further advising of hearing on the subject set for April 6, 1922, at Washington, the General Committee of the Mechanical Division of the American Railway Association at its meeting in Chicago, Tuesday, March 14, reached the following conclusions:

(a) That the time was not sufficient to assemble the data required; (b) that for the hearing on April 6 it is suggested each carrier send its representative to Washington with whatever information can be obtained by that date; (c) that the Committee on Safety Appliances of the Mechanical Division, consisting of C. E. Chambers (chairman), superintendent motive power and equipment, Central Railroad of New Jersey; C. E. Fuller, superintendent motive power and machinery, Union Pacific; W. J. Tollerton, general mechanical superintendent, Chicago, Rock Island & Pacific; J. T. Wallis, chief of motive power, Pennsylvania System; C. F. Giles, superintendent machinery, Louisville & Nashville, and T. H. Goodnow, superintendent car department, Chicago & North Western, be delegated to handle the matter for the association and that it be given any assistance necessary by the Train Brake and Signal Equipment Committee; (d) further, that the Committee on Safety Appliances be directed to advocate that present brake arrangements are satisfactory and that the percentage of mileage on grades is too small in proportion to total mileage to warrant any greater investment in brake appliances.

Subsequent to the meeting, it was requested that all information developed by each of the carriers and supplied to the Interstate Commerce Commission be forwarded to C. E. Chambers, superintendent of motive power and equipment, Central Railroad of New Jersey. If possible, a supplementary order will be obtained extending the time for supplying information and the date of the hearing.

RAILWAY REVENUES FOR JANUARY, 1922, AND LAST YEAR

	1922	1921
Average number of miles operated.....	235,388.82	234,888.55
Revenues:		
Freight	\$276,473,266	\$324,934,826
Passenger	83,720,061	105,243,307
Mail	7,375,700	8,220,831
Express	6,519,221	7,441,230
All other transportation.....	12,025,806	13,433,588
Incidental	8,392,282	10,596,054
Joint facility, Cr.	607,740	704,211
Joint facility—Dr.	173,287	185,071
Railway operating revenues.....	394,940,789	470,388,976
Expenses:		
Maintenance of way and structures..	48,666,568	60,756,654
Maintenance of equipment.....	93,506,246	124,077,708
Traffic	7,170,601	7,342,614
Transportation	171,137,867	230,812,638
Miscellaneous operations	3,689,267	4,522,229
General	13,514,767	15,262,423
Transportation for investment—Cr.	416,194	577,938
Railway operating expenses.....	337,269,122	442,196,328
Net revenue from railway operations....	57,671,667	28,192,648

Net railway operating income.....	29,476,422	1,525,630
Ratio of expenses to revenues (per cent)	85.40	95.01

Note—Excludes Detroit, Toledo & Ironton report not having been filed at date of compilation.

¹Includes \$2,251,981, sleeping and parlor car surcharge.

²Includes \$2,445,079, sleeping and parlor car surcharge.

Traffic News

R. A. Davis has been elected secretary of the Railway Traffic Club of Springfield, Ill., succeeding M. C. Lauterbach.

The Interstate Commerce Commission has reopened the various intrastate express rate cases for such oral argument or reargument as the commission may hereafter direct.

The "Pittsburgh Plus" hearings being conducted by John W. Bennett, examiner of the Federal Trade Commission, were resumed at Chicago on March 20. The principal witnesses heard the first day were George E. Lasker, managing partner of the Lasker Iron Works, Chicago, and Eugene H. Heller, president of the Hill Pump Valve Company, Chicago. Both witnesses maintained that Chicago and the West are discriminated against and that their industries suffer because of the practice.

Walker D. Hines Retained by I. C. C.

The Interstate Commerce Commission has retained the services of former Director General of Railroads, Walker D. Hines, to represent the commission in the court proceedings growing out of its order in the New England divisions case.

N. E. Freight Rates; Injunction Asked For

The Trunk lines, including all of the principal roads in Eastern territory, west of the Hudson river, except the Pennsylvania and the Baltimore & Ohio, joined in petitions to the United States District Court, at New York city, on March 20, asking for an injunction against the enforcement of the recent order of the Interstate Commerce Commission requiring the revision of the divisions, as between the Trunk lines and the New England lines, on through freight to and from New England points; which order would increase by 15 per cent the share allotted to the New England lines, and decrease the share accruing to the lines west of the Hudson river by a sum equal to the increase allotted to the New England lines. Plaintiffs allege that the order is arbitrary and is not within the lawful power of the Interstate Commerce Commission.

The New York Central, because of its lease of the Boston & Albany, filed a separate petition.

It is estimated that the amount which would be added to the receipts of the New England roads by the carrying out of the Commission's order would be \$7,500,000 annually. It is understood that the Pennsylvania and the Baltimore & Ohio hope to induce the New Haven road to join in a comprehensive revision of all through freight rates. One objection to the action of the Commission is that it is a blanket order, not based on the actual conditions of any one rate or any class of traffic; or upon any suitable record of freight movement.

Arguments will be presented on March 30.

Rate Decision First Week of April

That the Interstate Commerce Commission hopes to be able to announce its decision in the general rate advance case about the first week in April was stated by Commissioner Esch at a hearing before the House committee on interstate and foreign commerce on March 21. The hearing was called to consider various bills to require the railroads or authorize the Interstate Commerce Commission to require the railroads to issue interchangeable mileage book tickets at reduced rates. Mr. Esch opposed the bill recently passed by the Senate, giving authority to the commission to require the issuance of mileage tickets at a rate to be determined by the commission, saying that a majority of the commission, including its legal division, believe it to be unconstitutional. He said the question whether a reduced rate mileage book should be required is one of policy for Congress to determine. The commission will enforce any law that Congress may

pass, leaving its interpretation to the courts, but he raised the question whether a reduction on mileage books would not interfere with reductions in rates which would be open to the entire public and not limited to a class. He also said the effect of a reduction in the revenues of the carriers should be considered in view of the fact that the roads are earning less than 6 per cent.

Representative Kahn of California, advocated his bill providing for a rate of 2½ cents a mile and Senator Poindexter advocated the Senate bill.

Former Senator Hoke Smith of Georgia also appeared before the committee to advocate a reduced rate mileage book, on behalf of a number of commercial travelers' organizations.

Coal Production

Production of soft coal passed the 11,000,000 ton mark during the week ended March 11. The output is placed by the Geological Survey at 11,058,000 net tons, an increase of 505,000 tons over the week preceding. The bulletin calls attention to the fact that the present course of production is strangely like that in late September and October when consumers were purchasing in anticipation of a possible railroad strike. However, a further increase of 2,000,000 tons a week would be necessary to raise the current output to the level attained just before the mine strike of 1919.

I. C. C. and State Commissioners Confer

Relations between federal and state regulation of rates were discussed at a conference between members of the Interstate Commerce Commission and a committee of state railroad commissioners at Washington on March 17, called at the invitation of the Interstate Commerce Commission following suggestions made by Chief Justice Taft in the decision in the Wisconsin rate case that a plan of co-operation between state and federal authorities may obviate the necessity for rigid orders of the Interstate Commerce Commission affecting state rates.

No announcement was made of any results of the conference and it was stated that no arrangements had been made for another meeting. It is understood that the attitude of the state commissioners is such that no agreement could be reached until they have definitely ascertained whether they have a chance of success in their efforts to have Congress change the provisions of the transportation act from which the commission derived its authority to order statewide increases in intrastate rates. This attitude was indicated shortly before the conference by John E. Benton, general solicitor of the National Association of Railway & Utilities Commissioners, in a statement at a hearing before the House committee on interstate and foreign commerce on the bills to amend the law to meet the views of the state commissioners. He said: "It cannot be possible that anything which will cure the situation which has been laid before your committee can come out of agreements. The law is in such shape that the carriers are under no obligation to present applications for increases to the state authorities."

The Interstate Commerce Commission was represented at the conference by chairman McChord and Commissioners Hall, Esch, Lewis and Eastman, while the state commissions were represented by Carl D. Jackson, of the Wisconsin commission, president of the National Association of Railway and Utilities Commissioners; Clyde M. Reed, chairman of the Kansas commission; W. D. B. Ainey, of the Pennsylvania commission; Alexander Forward, of the Virginia commission; H. G. Taylor, of the Nebraska commission, and Henry G. Wells, of the Massachusetts commission.

EXPORTS OF FLOUR from Canada in the five months ending January aggregated 3,255,400 barrels, as compared with 2,935,789 barrels for the corresponding period of the previous year.

JOBS FOR TRAVELING PASSENGER AGENTS. The province of British Columbia has decided to have a "British Columbia Invitation Week" from April 3 to April 8, inclusive, when every man, woman and child in British Columbia is expected to write a letter to a family or friend inviting them to come and visit the Pacific Coast during the summer.

Commission and Court News

Interstate Commerce Commission

The commission has modified its order in the Texas intrastate rate case so as to exclude from its provisions rates on refined sugar in carloads from Sugarland, Tex., to Texas common points.

The commission has reopened the Oklahoma intrastate rate case for argument at Washington on March 30 on a motion to dismiss the proceeding made by the Oklahoma commission, and a motion for further hearing filed by the respondent carriers.

Coal Rate Division to Be Investigated

The commission has ordered an investigation concerning the propriety and reasonableness of the divisions accorded to the Baltimore & Ohio, the Norfolk & Western and the Chesapeake & Ohio out of the joint rates on bituminous coal to and from points on those lines and points in Michigan, Ohio, Indiana, Illinois and Michigan. The commission, in Ex Parte 74, had stated that divisions stated in specific amounts should be increased in the same percentages as the through rates; but the three roads mentioned filed a petition with the commission stating that their connecting lines had refused to accord them divisions as contemplated by the commission's report.

State Commissions

The Oregon Public Service Commission and the Arizona Corporation Commission have issued orders requiring that commercial auto buses and trucks operating over the highways of those states be brought to a full stop before crossing railroad tracks. The orders are similar to those issued recently in California and Nevada.

Railroad Crossing for School Children

The Illinois Commerce Commission denied an application by the directors of a school district for the establishment of a grade crossing near a schoolhouse for the use of pupils, the power of the Commission in a matter of this kind being limited to granting its permission to establish a grade crossing of a highway over railroad tracks.

United States Supreme Court

Abandonment of Intrastate Road Is a Local Question

The United States Supreme Court in an opinion handed down on March 14 denied the authority of the Interstate Commerce Commission to authorize the abandonment of the Eastern Texas Railroad under the provisions of the Transportation act, 1920, on the ground that the railroad lies entirely within a single state, is owned and operated by a corporation of that state, is not a part of another line, and its continued operation cannot be a more than local concern. The case was brought by the state of Texas on appeal from the federal district courts, which had sustained the commission, the plea being that the commission's order was an encroachment upon the jurisdiction of the state. The court held that in this case interstate and foreign commerce will not be burdened or affected by any shortage in the earnings, nor will any carrier in such commerce have to bear or make good any shortage. The court said it was the intention of Congress to enact a law to regulate interstate and foreign commerce and to affect intrastate commerce only as may be incidental to the effective regulation and protection of interstate.

Opinion by Justice Van Devanter. The court decided not to pass upon the question whether the railroad company was entitled to abandon its line, because that question was not presented in this case. The opinion was unanimous.

Foreign Railway News

New Line from Chile to Argentina Authorized

The expenditure of some \$16,000,000 has been authorized for the construction of a railway line connecting the Chilean coal fields in the south with the Buenos Aires Great Southern Railway at Zapata, Argentina, according to the Wall Street Journal. Financing will be arranged by taxes on fuel.

New Railway in Bolivia

The present session of the Bolivian Congress will, according to the Wall Street Journal, be asked to authorize financing to allow the construction of a railway from Potosi to Sucre, a distance of 121 miles. In 1918, 29 miles of this line was completed but nothing more was done because of the inability of the government to secure capital. It is believed that the government now has a definite proposal of financial backing and that the work can be undertaken if the congress gives the necessary authority.

All-Highway Freight Traffic in England

Motor truck competition presents a serious problem to the British railways. They use motor trucks themselves in carrying on their "store-door" delivery services, but few of the companies are privileged to engage in all-highway transportation. The following is from Commerce Reports: "Railway companies in Great Britain are being offered serious competition by motor highway transport, which is making great headway and is viewed with considerable alarm by railway officials. High railway rates, an excellent system of highways, and the release of large numbers of motor vehicles formerly used for military purposes, together with the men who drove them, all combined with a winter climate not unduly severe, serve to advance this competition. However, in some quarters its importance is thought to be over-estimated, because motor traffic will ultimately be compelled to bear its proportion of taxes for maintenance of the highways; furthermore, doubts exist as to whether any of the motor transport companies are setting aside the proper sums for repair and renewal of vehicles.

"Within certain limits road motor transport companies are considered common carriers and are subject to the provisions of the Transport Act of 1919, under which any person considering rates charged to be excessive may apply to justices of the peace; but this is rarely done in the case of motor transport companies. Aside from this, there is no legal limitation to the charges which they may impose.

"A comparison of the road transport companies' charges with those of railways is given in the following table of average rates per ton:

	Road charges.		Rail charges.	
	s.	d.	s.	d.
London to—				
Bristol	43	9	59	4
Birmingham	45	0	56	10
Brighton	31	0	39	7
Leicester	44	0	52	6
Southampton	39	6	51	8

"Approximate haulage rate for an average distance of 12 miles by motor truck, including collection and delivery, is 7d. per ton-mile. For longer distances the rate is somewhat less, and for shorter distances the rate is relatively higher.

"In the report of a committee appointed by the Ministry of Transport to inquire into the question of railways engaging in road motor transport, it is pointed out that a considerable bulk of paying traffic is being diverted from the railways by road transport companies. It is the desire of the railways to recover this traffic for their own lines by means of road traction if necessary.

"The North Staffordshire and the Great Northern of Scotland railways have already obtained statutory powers to carry goods upon the highways, while the Lancashire & Yorkshire operates 13 services. The London & Northwestern

maintains a motor-car freight service between Manchester and Macclesfield and Buxton, and between Coventry and Nuneaton. The Midland has a similar service between Derby and Matlock districts; the London & Southwestern between London and Putney, Mortlake, Barnes, East Sheen, and Roschampton; the South-eastern & Chatham provides service between London and Nunhead, Lewisham, Catford, Brockley, Blackheath, Lee, Herne Hill, and Penge. The carriers deliver to distances as far as 50 or 60 miles from their centers.

"The committee was not certain that railway companies should be permitted to proceed without limit in the development of road transport; but it was of the opinion that for developing districts in which no transport by independent road carriers existed railway companies might, with the consent of the Ministry of Transport, establish and operate such service for a limited period, even if conducted at a loss. Serious opposition has developed to the railways engaging in highway motor transportation, chamber of commerce, and agricultural and other associations feeling that it would result in a complete monopoly and nullification of the present competition.

"One of the largest transport concerns has developed the use of demountable truck bodies to a large extent, having over 400 in service in conjunction with 200 motor trucks. It is the opinion that for efficient operation there should be at least three bodies to each chassis, thus permitting one body to be left at starting point, one to be carried, and one waiting at destination. The loaded bodies are handled by a mechanical device, delays in loading and unloading are eliminated, and a wider use of the motor itself is made possible."

Czecho-Slovak Railways

The railway mileage of Czecho-Slovakia is 8,488, of which private companies operate about 610 miles. Of the government operated lines 590 miles are double tracked, according to Commerce Reports. A definite program of extension has been adopted by the government which calls for double tracking to bring the percentage of line mileage so equipped up to 16 per cent of the total; and for new lines totaling 346 miles.

There are 4,280 locomotives in the country and 106,250 cars, of which about 10,000 are for passenger train service. Equipment has been so far restored to normal that unserviceable locomotives represent but 14 per cent and bad order cars 8 per cent of the total.

Railway Car Builders Strike in Great Britain

London

Over 10,000 members of the Amalgamated Society of Railway Vehicle Builders, Wheelwrights, Carpenters and Mechanics are on strike against wage reductions proposed by the employers which it is stated would represent such heavy decreases as 40s. 9d. (approximately \$9.90 at the normal rate of exchange) per week per man for piece work and 33s. (\$8.02) per week per man for time work. Railway car builders and kindred workers all over the country are affected by the strike. Approximately 90 per cent of the members of the society are on piece work. In the year 1919 a production payment of 25 per cent was added to the wages earned above £3 (\$14.58) per week on piece work.

The employers demand that wages should be reduced by 15 per cent on basic rates and that the 26s. 6d. (\$6.44) weekly bonus should be eliminated. Nationally the employers are concentrating on piece work reductions, but in certain districts the employers are also asking that time workers should accept a reduction of 6s. 3d. (\$1.52) per week, which is equal to a reduction of 10 per cent, in addition to the surrender of the weekly bonus of 26s. 6d. (\$6.44).

The wages are now 110 per cent above the pre-war rates, but the employees contend that the pre-war standard was too low and that the present wage rates in view of the circumstances of the time and the altered conditions should remain operative. In January this year, the men accepted wage reductions of 10 per cent on piece work and 6s. (\$1.46) per week on time work, in addition to having surrendered 7½ per cent of the 12½ per cent "Churchill" bonus.

Equipment and Supplies

Locomotives

THE NEW YORK CENTRAL is inquiring for 50, 0-8-0 type switching locomotives.

THE CHICAGO & NORTH WESTERN will probably buy 50 locomotives in the near future.

THE LOUISVILLE & NASHVILLE is inquiring for 6 Mikado type locomotives and 4, 0-8-0 switching locomotives.

THE STUDEBAKER CORPORATION, South Bend, Ind., has ordered 2, 0-6-0 type locomotives from the American Locomotive Company.

Freight Cars

THE SOUTHERN PACIFIC is inquiring for 2000 automobile box cars, of 55 tons capacity.

THE LOUISVILLE & NASHVILLE is inquiring for 500 all steel hopper cars, of 55 tons capacity; also for from 500 to 1,000 composite gondola cars, of 50 tons capacity.

THE CHICAGO & NORTH WESTERN noted in the *Railway Age* of March 11 as inquiring for 2750 freight cars, has put out an additional inquiry for 300 ballast cars and 50 tank cars.

THE NORFOLK & WESTERN, reported in *The Railway Age* of March 11 as inquiring for 4000 steel hopper cars, has ordered 1000 from the Standard Steel Car Company, 1000 from the American Car and Foundry Co., and 2000 from the Pressed Steel Car Company.

THE NEW YORK CENTRAL may place orders for several thousand new freight cars. As noted in the *Railway Age* of March 18, contracts have already been let for 1000 new cars. The company is also placing contracts for the repair of a large number of freight cars, including 300 cars to the Ryan Car Co.; and a number to the Streater Car Company, the Buffalo Steel Car Company and the Euclid Steel Car Company, for the Michigan Central; also 500 to the Ralston Steel Car Company, for the Toledo & Ohio Central. All the cars for repair are steel gondola and hopper cars.

Passenger Cars

THE MISSOURI, KANSAS & TEXAS has renewed its inquiry for 30 passenger cars.

THE CHESAPEAKE & OHIO is asking for bids on 30 all steel passenger coaches, 8 all steel combination passenger and baggage cars and 25 all steel express cars.

Iron and Steel

THE GREAT NORTHERN is inquiring for 380 tons of fabricated "I" beam spans for 59 steel bridges.

THE CHESAPEAKE & OHIO reported in the *Railway Age* of February 25 as inquiring for 21,000 tons of rail including 3,000 tons for the Hocking Valley, has placed orders as follows: Inland Steel Company, 9,000 tons, Illinois Steel Company 7,000 tons, Bethlehem Steel Company, 1,000 tons, and 3,000 tons with another company for the Hocking Valley.

Machinery and Tools

THE GREAT NORTHERN is inquiring for a 1,400-ton full hydro-pneumatic 52 in. car wheel press including a 7½ h. p. 3 phase, 60 cycle, 440-volt motor complete with starter; 1, 24 in. vertical turret boring mill, including a 15 h. p. 3 phase, 60

cycle, 440-volt motor and starter with 1 set of standard tool equipment; 1, 36 in. heavy duty upright common drill press, including motor and starter; 1, 30 in. high duty lathe connected to suitable motor and starter; 1, 600-ton full hydro-pneumatic slanting head driving wheel press with 13 in. throat, with motor and starter; 1 throatless shear with suitable motor; 2 pneumatic riveting hammers for driving ½ in. rivets; 1, ½ in. double headbolt cutter with motor and full set of dies; 1 pipe threading machine for cutting ¼ in. to 2 in. pipe, with motor and dies; 1 crank pin turning tool. 1, No. 5, cylinder grinding machine for cylinders from 3 in. to 8 in.; 1, 15 h. p. 3 phase 60 cycle, 440-volt squirrel cage induction motor with starter; and 1, 30 in. selective head lathe 7 ft. between centers with motor and starter.

Miscellaneous

THE CHICAGO, MILWAUKEE & ST. PAUL is inquiring for its gasoline, kerosene and long time burner oil requirements for the period from April 1, 1922, to December 31, bids to be submitted before noon of March 27 at Chicago.

THE NEW YORK CENTRAL will receive bids until 12 o'clock noon March 31 for its requirements until July 1, 1922, for the Line Buffalo and East of fuel oil (paraffine base), gasoline, kerosene, long time burning semaphore oil, turpentine substitute coach candles, mineral seal oil, common black oil, West Virginia black oil and gas oil also for its requirements until May 1, 1922, for the Line Buffalo and East of asphaltum base fuel oil.

Signaling

THE MISSOURI PACIFIC has ordered a 12-lever Saxby & Farmer interlocking machine from the General Railway Signal Company, for installation at Columbia, La.; and also the same type of machine for a second installation at Alexandria, La. The construction work will be done by the railroad company's forces.

THE NORTHERN PACIFIC has let the contract for its automatic block signals to the General Railway Signal Company, Rochester, N. Y. These signals, as noted in our issue of March 15, page 625, are to equip the line from Fargo, N. D., to Mandan, 204 miles, of which 151 miles is single track and 53 miles double. Three-position upper-quadrant semaphores will be used.

THE GREAT NORTHERN has ordered from the General Railway Signal Company "A. P. B." automatic block signals system, for installation on single track between Newport, Wash., and Bonner's Ferry, Idaho; between Troy, and Rexford and between Whitefish and Strykers, Mont., an aggregate distance of 165 miles. Installation will be made by the signal company's forces.

Supply Trade News

J. Ross Bates, formerly with Vonhan Bates & Goode Trading Corporation, New York City and Boston, Mass., will in the future represent the Orton & Steinbrenner Company, Chicago. Mr. Bates has offices at 136 Liberty street, New York City, and 128 School street, Watertown, Mass.

George H. Green, who has been elected vice-president and secretary of the Universal Packing and Service Company, was born on December 19, 1886, at Chicago. He entered business in the testing department of the Chicago, Rock Island & Pacific in 1906 and during the succeeding eight years served as inspector and chief inspector of materials. In 1914, he was appointed railroad representative of the Garlock Packing Company, and two years later he entered the service of the National Waste Company as sales representative. During the war Mr. Green served as a lieutenant in the field artillery branch of the service and upon his return to this country entered the service of the National

G. H. Green

Waste Company. In 1919, he was elected vice-president of the company, which position he still retains in addition to his new duties with the Universal Packing and Service Company.

John P. Landreth, who has been elected president and treasurer of the Universal Packing and Service Company, Chicago, was born at Beloit, Kan., on August 11, 1883, and attended the public schools and a business college at Joplin, Mo., and later the Missouri Military Academy at Mexico, Mo. He entered business with the Joplin Water Works Company, Joplin, Mo., as a collector and inspector of accounts. Later he served as a car clerk on the Denver & Rio Grande at Salida, Colo., and, in 1902, became associated with the English Iron Works at Kansas City, later entering the railway specialty sales department of this company at St. Louis. In 1904 he became associated

J. P. Landreth

with the Garlock Packing Company as traveling salesman, and on January 1, 1905, was transferred to St. Louis as city salesman. One year later he was placed in charge of the Kansas City office of the company and in May, 1908, was made Chicago manager, which position he held until July, 1916. On the latter date he was appointed western sales manager of the Anchor Packing Company of Philadelphia, Pa., with headquarters at Chicago, which position he still retains in addition to his duties as president and treasurer of the Universal Packing and Service Company.

On the Gothard Tunnel Line, Switzerland

C. E. Skinner, manager of the research department of the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has been appointed assistant director of engineering. His duties will cover research, standards and other work along these lines. Mr. Skinner was born near Redfield, Ohio, on May 30, 1865, and was graduated in 1890 from Ohio State University. The same year he joined the Westinghouse organization in the controller department, and supervised the construction of the first controller turned out by that company. Soon afterward he was placed in charge of the testing of insulation, and in 1892 he was transferred to the research laboratory. In 1895 he was placed in charge of insulation design in the engineering department, taking charge, in 1902, of the insulation division of that department, together with the chemical and physical laboratories. Four years later he organized the research division, of which he has been in charge until his present promotion. In 1915 he was a special representative of the American Institute of Electrical Engineers, of which he is a fellow, at the international conference on electrical standards held in London, and he is now a member of the committee representing the Institute of the International Electrotechnical Commission. He was chairman of the American delegates to the Brussels meeting in 1920.

Merger of Machine Tool Manufacturers

Negotiations to merge a number of machine tool manufacturers are said to have been completed, according to recent announcement. The name of the new corporation has not yet been decided upon. The companies included in the merger are the Lodge & Shipley Machine Tool Company, Carlton Machine Tool Company, Newton Machine Tool Works, Inc., Betts Machine Company, Colburn Machine Tool Company, Hilles & Jones Company, Modern Tool Company, and the Dale Machinery Company.

Obituary

William Boughton, district representative at Detroit, Mich., of the Superheater Company, New York city, died at his home in Detroit on March 8, of heart disease. Mr. Boughton was born in Ontario county, New York, in 1861. He went to Saginaw, Mich., in 1876, and a year later began his railroad career with the Pere Marquette as a machinist's apprentice. Two years later he was advanced to brakeman, later to fireman, and in 1882 to engine man. In 1898, Mr. Boughton was promoted to road foreman of engines, and seven years later he was appointed master mechanic of the Saginaw division. In 1909 he became general master mechanic of the entire system and later was promoted to superintendent of motive power. He resigned from the service of the Pere Marquette in 1912 to become district representative at Detroit of the Superheater Company, New York city, which position he held at the time of his death.

Trade Publications

AUTOMATIC DRIVING BOX WEDGES.—The Franklin Railway Supply Company, New York, has issued a phantom view of the Franklin automatic adjustable driving box wedge showing the construction of the wedge and related parts and giving instructions for proper methods of lubrication.

GLASS TILE.—The Federal Cement Tile Company, Chicago, has issued a leaflet describing and illustrating a form of tile which it manufactures which contains wire glass panels for lighting purposes. The leaflet includes a view of an installation of this tile in roof construction and a list of other installations of these products.

CROSS TIES.—The Century Wood Preserving Company, Pittsburgh, Pa., has issued a 16-page booklet on the storing and seasoning of cross ties. The bulletin is chiefly reading matter directed to the end of discussing the various factors influencing air seasoning, tie deterioration, etc., and shows the proper methods of storing ties under various conditions. Aside from the reading matter, several illustrations are included to show actual views of ties in storage.

Railway Construction

ATCHISON, TOPEKA & SANTA FE.—This company, which was noted in the *Railway Age* of February 18 (page 453), as contemplating the construction of an extension to its lines from Owen, Okla., to Pawhuska, a distance of approximately 40 miles, has awarded a contract for this work to Maney Bros., Oklahoma City, Okla.

ATCHISON, TOPEKA & SANTA FE.—This company has been granted authority by the Kansas State Charter Board to construct a cut-off extending from Eldorado, Kans., to Ellinor, a distance of about 43 miles, to further include a four-mile belt line just east of Eldorado. This line will be known as the Eldorado & Santa Fe.

CANADIAN PACIFIC.—This company is now receiving bids for the construction of a freight terminal building at Windsor, Ont., to include a one-story office building 40 ft. by 60 ft., and a shed 40 ft. by 300 ft.

CANADIAN PACIFIC.—This company is asking for bids for the construction of a new bridge across the Coquitlam River, Vancouver, B. C., to replace the old one washed away during the heavy floods of November. The new structure, which will be built of steel, is to be about 300 feet long with concrete piers. The concrete abutments will be placed farther apart than in the former structure to make more allowance for another possible swelling of the river.

CHESAPEAKE & OHIO.—This company closed bids on March 22, for the construction of a 500-ton reinforced concrete coaling station at Peach Creek, W. Va., and one at Thurmond.

CHICAGO & ALTON.—This company, in conjunction with the residents of Greene and Jersey counties, Illinois, will construct an extension to its lines from Titus, Ill., to Reddish Road, a distance of about 3.77 miles, and a further extension from a point approximately half-way on this line, to Hardin, Ill., a distance of about 1.8 miles. Farmers in this vicinity will furnish the right-of-way and ties, and do the grading. The Illinois Commerce Commission has authorized this extension and a petition for permission to do this work is now on file with the Interstate Commerce Commission.

CHICAGO & EASTERN ILLINOIS.—This company, and the Pittsburgh, Cincinnati, Chicago & St. Louis, have been petitioned by Arthur, Ill., through the Illinois Commerce Commission, to construct a suitable station at that point.

CHICAGO & WESTERN INDIANA.—This company, which was noted in the *Railway Age* of March 4 (page 548), as having closed bids on February 28, for the remodeling of its passenger station at 63rd and Wallace streets, Chicago, has awarded a contract for this work to Rowley Bros., in that city.

CHICAGO, BURLINGTON & QUINCY.—This company has awarded a contract to John Griffiths & Sons, Chicago, for the remodeling of its 15-story office building in that city which was badly damaged by fire on March 15.

CHICAGO, BURLINGTON & QUINCY.—This company has awarded a contract to John Griffiths & Son for the construction of a four-story reinforced concrete and steel inbound freight house, 300 ft. by 700 ft., at Chicago, the foundation for which was completed some time ago. The same company contemplates the construction of a brick passenger station at Westmont (near Hinsdale), Ill., and one at Franklin, Neb.

CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.—This company and the Lake Erie & Western have been petitioned by the city of Bloomington, Ill., through the Illinois Commerce Commission, to separate their grades at South Main street in that city.

CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.—This company has applied to the Interstate Commerce Commission for authority to construct a 3.5 mile cut-off in Delaware county, Ohio.

DENVER & RIO GRANDE WESTERN.—This company contemplates the construction of a subway under its tracks near Overland Park, a suburb of Denver, Colo., although no definite plans have as yet been made for this project.

GREAT NORTHERN.—This company, which was noted in the *Railway Age* of February 11 (page 401), as contemplating the construction of a second main track between Williston, N. D., and Spring Brook, a distance of about 8 miles, has awarded a contract for the grading to A. Guthrie & Co., St. Paul, Minn., and for the bridge and culvert work, to W. F. Hill, Superior, Wis.

GREAT NORTHERN.—This company will soon receive bids for the construction of terminal facilities at Wenatchee, Wash., to include a 24-stall roundhouse, storehouse, coaling station, water supply equipment, boiler washing plant and other necessary buildings. As much material and equipment as possible will be reclaimed from the recently abandoned terminal at Bowdoin, Mont.

GREAT NORTHERN.—This company contemplates the construction of a one-story car repair shop 40 ft by 300 ft., at Minot, N. D., estimated to cost \$85,000.

KANSAS, OKLAHOMA & GULF.—This company has petitioned the Kansas Public Utilities Commission for authority to construct an extension from Baxter Springs, Kan., to Military, a distance of about 6.5 miles, where a connection will be made with the Missouri, Kansas & Texas. It is expected that the hearing on this petition will be held the latter part of this month.

LEAVENWORTH & TOPEKA.—This company contemplates the construction of a new bridge across the Delaware river at Osawkie, Kan. An application for a loan has been made to the Interstate Commerce Commission, part of which is needed to finance this construction.

LOS ANGELES & SALT LAKE.—This company has petitioned the railroad commission of California for authority to construct a railroad from Fullerton, Cal., to Anaheim, in Orange county. This proposed road is an extension of a branch line, the work of which was commenced in 1916, and discontinued under federal control.

MICHIGAN CENTRAL.—This company closed bids on March 21, for the construction of a brick passenger station, 33 ft. by 94 ft., with slate roof, estimated to cost about \$25,000, at Hastings, Mich.

MIDLAND VALLEY.—This company has awarded a contract to the Ogle Construction Company, Chicago, for the construction of a 100-ton frame coaling station at Panama, Okla., and a similar one at Lefebvre.

MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE.—This company, in conjunction with the Chicago & North Western and the City of Ironwood, Mich., noted in the *Railway Age* of February 4, page 353, as receiving bids for the construction of a reinforced concrete viaduct 1,500 ft. in length over 23 tracks at Mansfield street, Ironwood, has awarded a contract for this work to the Albinston Construction Company, Minneapolis, Minn. The work will cost \$92,700 and will be commenced at once.

NORTHERN PACIFIC.—This company contemplates the construction of a three-story combination brick passenger station and office building at Glendive, Mont., estimated to cost \$150,000.

SOUTHERN.—This company will construct a second main track between Morrystown, Tenn., and New Line, a distance of about 1.5 miles.

WARASH.—This company has been petitioned by Decatur, Ill., through the Illinois Commerce Commission to separate grades and construct a subway under its tracks at an intersection with a public highway, east of that city.

WASHINGTON, BRANDYWINE & POINT LOOKOUT.—This company has applied to the Interstate Commerce Commission for authority to increase its capital stock from \$100,000 to \$500,000 for the purpose of constructing an extension from Mechanicsville to Point Lookout, Md., with branches to Drum Harbor and St. Mary's City.

Railway Financial News

AKRON, CANTON & YOUNGSTOWN.—Equipment Trust Certificates Authorized.—The Interstate Commerce Commission has authorized this company to assume obligation and liability in respect of \$270,000 of equipment trust certificates to be issued under the Akron, Canton & Youngstown engine trust of 1921 in connection with the procurement of nine locomotives.

ALABAMA GREAT SOUTHERN.—Income Statement.—The income statement for the year ended December 31, 1921, shows the following results:

Gross operating revenues	\$9,542,225
Total operating expenses	8,196,320
Net revenue from operation	\$1,345,905
Taxes and uncollectible railway revenue	328,427
Equipment and joint facility rents (Debit)	3,303
Railway operating income	\$1,020,786
Other income	427,697
Total gross income	\$1,448,483
Deductions from gross income	402,606
Total available income	\$1,045,877
Interest on mortgaged, bonded and secured debt	510,787
Balance of income over charges	\$535,090

APACHE.—Application to Issue Securities Denied.—The Interstate Commerce Commission has denied this company's application for authority to issue 550 shares of its capital stock and a promissory note for \$455,000 to be secured by a second mortgage as not found compatible with the public interest and reasonably necessary for the proper performance of service to the public as a common carrier.

ASHLAND, ODANAH & MARENGO.—Asks Authority to Abandon Line.—This company has applied to the Interstate Commerce Commission for certificate authorizing the abandonment of its tracks which consist of about 20 miles running from Odanah, Wis., to certain lumber tracts on which the lumber has been cut.

ATLANTA & ST. ANDREWS BAY.—Abandonment of Branch Line.—The Interstate Commerce Commission has made public a proposed report of Attorney Examiner Clarke recommending that a certificate be issued, authorizing the abandonment of the operation of a branch line between Panama City and St. Andrews Bay, Fla. This line was previously permitted to be abandoned for an experimental period, since which there has been a re-hearing of the case.

ALTON & SOUTHERN.—Guaranty Certified.—The Interstate Commerce Commission has issued a certificate for \$100,000 as due this company on account of its six months guaranty.

BUFFALO, ROCHESTER & PITTSBURGH.—Guaranty Certified.—The Interstate Commerce Commission has issued a certificate for \$61,093 as representing the amount now due this company to make good its guaranty for the six months period of 1920.

CHICAGO & ALTON.—Directors Resign.—Charles Hayden and M. L. Bell have resigned as members of the board and of the executive committee.

CINCINNATI, NEW ORLEANS & TEXAS PACIFIC.—Income Statement.—The income statement for the year ending December 31, 1921 shows the following results:

Gross operating revenues	\$17,170,446
Total operating expenses	14,789,237
Net revenue from operation	\$2,381,209
Taxes and uncollectible railway revenue	631,633
Equipment and joint facility rents (Debit)	212,869
Railway operating income	\$1,942,444
Other income	276,869
Total gross income	\$2,219,313
Deductions from gross income	1,362,133
Total available income	\$857,180
Interest on equipment obligations	153,645
Balance of income over charges	\$703,535

DENVER & RIO GRANDE.—Guaranty Certified.—The Interstate Commerce Commission has issued a certificate placing the amount

necessary to make good this company's guaranty for the six months period of 1920 as \$1,415,453 of which \$477,953 is still due.

DULUTH & NORTHERN MINNESOTA.—Abandonment of Line.—The Interstate Commerce Commission has made public a proposed report of Attorney Examiner Clarke recommending that the commission affirm its former conclusion in authorizing a certificate for the abandonment of this company's line from Knife River to Cascade, Minn., 99.25 miles.

EL PASO & SOUTHWESTERN.—Partial Payment on Guaranty.—The Interstate Commerce Commission has certified to the treasury a partial payment of \$500,000 on account of this company's guaranty for 1920.

ERIE.—Authorized to Issue Bonds.—The Interstate Commerce Commission has authorized an issue of \$5,000,000 of consolidated mortgage 7 per cent extended bonds at such price as to make the average cost to the applicant not to exceed 7.30 per cent per annum to maturity, including all costs of negotiation and sale. The company is also authorized to pledge \$2,500,000 of bonds pending their sale as security for short term notes and to pledge certain other bonds as security for a one-year, 6 per cent note for \$10,000,000 to the War Finance Corporation.

GREAT NORTHERN.—New Dividend Policy.—In a letter to the stockholders (Chairman Louis W. Hill explains the change in dividend payments from a quarterly to a semi-annual basis as follows:

Present cash situation of the company is satisfactory and funds are available from which the customary quarterly dividend could be paid, together with such other payments as are apt to arise in the near future. It is of greatest importance, however, that this strong cash position should not be impaired and the directors believe it to be in the best interest of shareholders to ascertain more accurately the probable results of the present year before determining finally upon the dividend policy.

Even in normal times the directors could act on dividends with much more confidence in June than in March. Crop prospects always are an important factor; they are unknown in March of any year. Likewise the season's iron ore traffic, as well as the general business, is measurably determined by June 20.

Another important consideration is that the Chicago, Burlington & Quincy pays its dividends semi-annually in June and December, so that available funds from that source will be known in acting upon Great Northern dividends prior to August and February, respectively.

It is confidently hoped there will be such an improvement in business, and that such substantial additional reductions in wages and other costs shall be realized in advance of further rate reductions that by about June 20, when consideration must be given to the August 1 dividend, the directors will be justified in declaring a 3/4 per cent semi-annual dividend.

The company has been fortunate in being able to continue its regular 7 per cent basis throughout the war and post-war period. In 1921, the most difficult year the railroads have ever experienced, the net income from railroad operations available for dividends was only 3 1/2 per cent on its capital stock; but it received an extra dividend from the Chicago, Burlington & Quincy stock (of which it owns nearly 49 per cent) and by this means was able to pay the 7 per cent dividend out of 1921 income.

Two of the principal commodities handled by the Great Northern are products of agriculture and products of mines. The present unsatisfactory state of the agricultural industry generally is only too well known. In 1921 crops along the Great Northern lines were almost average in yield, but the prices received by the farmers were so low that the result of the season's farm operations showed little, if any, profit. It is impossible at this time to forecast agricultural results for the coming season. Iron ore traffic, which for a period of years has averaged 11,000,000 tons, in 1921 was only 4,300,000 tons, and it is not yet possible to forecast what it will be for the current year.

Operating expenses have been abnormally high. In 1921 they totaled nearly 80 per cent of gross revenues, compared with approximately 60 per cent in 1916, the last pre-war year. Cost of coal in 1921 was \$13,000,000, or 2.4 times as much per ton as in 1916. The payroll, which is the largest single item of expense, being 58 per cent of the total, was in 1921 \$47,000,000. The average pay per man per hour in 1921 was two and one-seventh times as much as in 1916. Officials of the Great Northern have endeavored to reach an agreement with employees on lower wages, but have failed. The dispute has been referred to the Labor Board, which is the only method of procedure under the law.

The present uncertainty is augmented by threatened trouble in the coal mining industry by wage controversies pending before the Labor Board, and by agitation for immediate further rate reductions.

In order to have even moderately successful results, we must have a larger volume of traffic and lower operating costs before any general reduction is made in freight rates.

The company is entitled to a reasonable return on the value of its property used for transportation purposes. Pending the determination of such value by the Interstate Commerce Commission, the book investment in road and equipment is being used as a basis of value. This basis, assuming that the Interstate Commerce Commission should decide 6 per cent is a fair return, will entitle the company to retain over \$20,000,000 from railway operations after paying operating expenses. The actual value when fixed, should substantially increase this amount. Should it earn more than what is considered a fair return by the commission the company must pay to the government one-half of such excess earnings, but net earnings of \$29,000,000, which we are chiefly entitled to, are ample to pay all fixed charges and leave a safe margin after paying 7 per cent dividend. This, of course, comes about largely from the fact that earnings have been put back into the property and have been capitalized in any way.

See editorial in this issue entitled "The Great Northern Dividend."

JACKSONVILLE TERMINAL.—Authorized to Issue Bonds.—The Interstate Commerce Commission has authorized an issue of \$3,100,000 of refunding and extension mortgage bonds of which \$2,000,000 are to be exchanged for a like amount of first and general mortgage bonds and \$1,100,000 are to be sold at not less than 95 and accrued interest and the proceeds used for capital purposes. The Atlantic Coast Line, Florida East Coast, Seaboard Air Line and Southern were authorized to guarantee the bonds.

MAINE CENTRAL.—Annual Report.—The corporate income account for the year ended December 31, 1921, compares as follows:

Operating revenues:	1921	1920
Freight	\$14,275,951	\$12,645,031
Passenger	4,909,997	4,817,085
Total, including other.....	\$20,590,064	\$18,737,811
Operating expenses:		
Maintenance of way and structures.....	\$3,926,106	\$3,444,946
Maintenance of equipment.....	4,704,186	4,186,040
Traffic	1,741	149,474
Transportation	1,857,089	10,882,653
General	555,820	540,000
Total operating expenses.....	\$19,533,352	\$19,248,820
Net revenues from railway operations.....	1,056,712	Def. 511,009
Railway tax accruals.....	1,263,982	996,722
Railway operating income.....	Def. 210,180	Def. 1,509,611
Total non-operating income.....	623,037	4,276,535
Gross income.....	412,857	2,766,924
Total deductions.....	2,578,219	2,462,491
Net income.....	Def. 2,165,362	304,433
Dividends (5 per cent on preferred; 6 per cent on common).....	653,166	19,138
Sinking fund	15,691	19,138
Income balance.....	Def. 2,181,053	Def. 367,871

*Revenues and expenses are for the ten months, March to December. Includes two months' proportion of standard return due from United States Railroad Administration, and amount charged against the United States account of guaranty under the Transportation Act, for the six months, March to August, inclusive.

The annual report of the Maine Central is reviewed in an article on another page of this issue entitled "Maine Central Shows Deficit of \$2,181,053."

MAXTON, ALMA & SOUTHBOND.—Application for Loan Denied.—The Interstate Commerce Commission has denied this company's application for a loan of \$84,290 on the ground that the public necessity for the line is small and its prospective earning power does not indicate sufficient security.

MIDLAND RAILWAY.—Receivership.—George M. Brinson, president of this company, has been appointed receiver. The road operates between Savannah and Stevens Crossing, Ga., 88 miles.

MINNEAPOLIS & ST. LOUIS.—Directors Resign.—Charles Hayden has resigned as a director and chairman and M. L. Bell has resigned as a director in accordance with the recent ruling of the Interstate Commerce Commission that they could not hold offices with the Chicago, Rock Island & Pacific and at the same time similar offices with the Minneapolis & St. Louis. Jules S. Baché has been elected chairman of the board. L. W. Baldwin and P. V. Davis have been elected to fill the vacancies on the board.

MISSOURI PACIFIC.—Bonds Sold.—Kuhn, Loeb & Co. have sold \$18,000,000 first and refunding mortgage 6 per cent gold bonds, series "D," due February 1, 1949, at 98 3/4 per cent and accrued interest to yield about 6.10 per cent to maturity. The bonds are issued to provide funds for the retirement of \$13,641,000 bonds maturing January 1, 1923, and to reimburse the company for other capital expenditures. The sale of these bonds is subject to the approval of the Interstate Commerce Commission.

NEW ORLEANS & NORTHEASTERN.—Income Statement.—The income statement for the year ended December 31, 1921, shows the following results:

Gross operating revenues.....	\$6,329,586
Total operating expenses.....	5,854,466
Net revenue from operation.....	\$475,120
Taxes and uncollectible railway revenue.....	583,017
Equipment and joint facility rents.....	151,693
Railway operating income.....	Def. 629,591
Other income.....	\$61,484
Total gross income.....	\$401,893
Deductions from gross income.....	103,134
Total available income.....	\$298,759
Interest on mortgaged, bonded and secured debt.....	408,637
Deficit for year.....	\$106,878

NEW YORK CENTRAL.—Separate Suit in New England Rate Case.—This company will begin an independent suit in the New England rate case based upon the fact that it is the only trunk line system operating or controlling a line into New England. Under the Interstate Commerce Commission's order, which is now held up by a temporary injunction returnable March 30, the Boston & Albany, operated by the New York Central under lease, was excluded from the benefits of the 15 per cent increase in the New England share of the through rates, although the Boston & Albany operates wholly in New England. The New York Central will show that it has made expenditures of more than \$36,000,000 on the Boston & Albany since it took over operation of the line in 1900.

NORFOLK & WESTERN.—Authorized to Issue Bonds.—The Interstate Commerce Commission has authorized an issue of \$666,000 of first consolidated mortgage 4 per cent bonds to be sold at not less than 90 per cent of par and accrued interest and the proceeds to be used for reimbursement of the treasury for the payment of \$600,000 of underlying bonds.

NORTHERN PACIFIC.—Reduces Dividends.—The directors have declared a quarterly dividend of 1¼ per cent, payable May 1 to stock of record April 12. This is a reduction of the rate from 7 per cent to 5 per cent annually.

Following the directors' meeting, Howard Elliott, chairman of the board, made the following statement:

"In declaring a dividend of 1¼ per cent payable May 1 to stockholders of record April 12, the directors feel they are best serving the interests of the stockholders and are hopeful that conditions will warrant the resumption of the rate of 1¾ per cent quarterly in the future."

Dividends at the rate of 7 per cent had been paid since 1903, with an extra of 11.26 per cent in 1908 from accumulated surplus of the Northwestern Improvement Company. In 1902 dividends were 5½ per cent, in 1900, 4 per cent, and initial payment 2 per cent in 1899.

PARIS-LYONS-MEDITERRANEAN.—Bonds Sold.—Kuhn, Loeb & Co., and the National City Company have sold \$30,000,000 6 per cent external fund gold bonds, due August 15, 1958, at 83, and interest to yield about 7.35 per cent to maturity. In case of earlier redemption of the entire issue at 103 per cent, the yield gradually increases to a maximum of 8.78 per cent, if called on February 15, 1932, the earliest date on which the entire issue may be redeemed, and in case of any bonds redeemed at 100 per cent by the sinking fund to a maximum of 9.22 per cent as to any bonds redeemed on August 15, 1929.

An issue of £5,000,000 in bonds of the same type as the dollar issue was sold recently in London at 86—now quoted at 90½. The proceeds of the American issue are to be utilized for the purchase of additional rolling stock, electrification of some lines and other improvements.

RICHMOND, FREDERICKSBURG & POTOMAC.—Sues City.—This company has brought suit against the city of Richmond, Va., for \$346,950. This suit is the outcome of the arrangements entered into in 1915 between the company and the city for the lowering of the railroad tracks along the James River branch of the railroad, running from Acca to James River, and the construction of bridges over Broad Street, Monument, Patterson and Grove Avenues. This work was completed on September 23, 1920. The company alleges the city promised to defray half the expenses of the work, but that it has not done so.

SOUTHERN RAILWAY.—Income Statement.—The income statement for the year ended December 31, 1921, shows the following results:

Gross operating revenue	\$128,715,150
Total operating expenses	105,829,007
Net revenue from operation	\$22,886,143
Taxes and uncollectible railway revenue	4,667,336
Equipment and joint facility rents	4,247,025
Railway operating income	\$13,971,782
Other income	4,239,193
Total gross income	\$18,210,975
Deductions from gross income	4,207,802
Total available income	\$14,003,173
Interest on mortgaged, bonded and secured debt	11,976,550
Balance of income over charges	\$2,026,623

TENNESSEE, ALABAMA & GEORGIA.—Sale Postponed.—There were no bids received when this road was offered for sale at Chattanooga, Tenn., on March 18, so the sale was postponed for the sixth time to April 1.

WISCONSIN CENTRAL.—Stockholders' Committee Formed.—Minority common stockholders of this road have formed a committee to inquire into the affairs and accounts of the company to determine whether it is receiving the full return to which it is entitled from the Minneapolis, St. Paul & Sault Ste. Marie Railway, as lessee. The committee consists of W. J. Wollman, chairman; John E. Fritsche, William Hamm, Harry E. Kohn and William P. Tuttle.

In a circular letter asking for the deposit of the common stock of the Wisconsin Central, the committee states that much stock was purchased when the Minneapolis, St. Paul & Sault Ste. Marie, controlled by the Canadian Pacific, made the lease, it being assumed that a large increase in the Wisconsin Central's gross and net earnings would result. While the expected increase in gross receipts occurred, the committee says, there has been no corresponding benefit to the common shareholders.

Sales of Equipment Trust Certificates

Director General Davis of the Railroad Administration has announced additional sales at par plus accrued interest, of railroad equipment trust certificates held by the government, to:

Messrs. Lamport, Barker & Jennings, New York.....	
Northwestern Pacific, 1923 to 1935, incl.....	\$156,000
Alfred Burden, New York.....	
Chicago Junction Railway, 1923 to 1935, incl.....	276,900
Detroit & Toledo Shore Lines, 1923 to 1935, incl.....	289,900
	\$722,800

The sales comprise approximately two-thirds of all the maturities of these equipment trust issues. The balance of one-third of all maturities will be stamped as subordinated, in accordance with the agreement as amended under the plan recently announced. The total amount of equipment trust certificates sold by the government to date, at par plus accrued interest, is \$221,080,900.

Tentative Valuations

The Interstate Commerce Commission has issued tentative valuation reports in which it places the final value of the property of the Arizona Eastern as of 1915 at \$10,681,198 for the property owned and \$13,392,214 for the property used. The final value of the property of the Delray Terminal as of 1918 is placed at \$154,264 and of the Duluth Terminal Railway as of 1916 at \$515,000.

Railroad Administration Settlements

The United States Railroad Administration reports the following final settlements, and has paid out to the several roads the following amounts:

Central New York Southern.....	\$42,500.00
Maxton, Alma & Southbound.....	13,500.00
Augusta Union Station.....	400.00
Tampa Union Station.....	11,500.00
Birmingham Terminal.....	1,824.78

The payment of these claims on final settlement is largely made up of balance of compensation due, but includes all other disputed items as between the railroad companies and the administration during the 26 months of federal control.

Dividends Declared

Cleveland, Cincinnati, Chicago & St. Louis.—1¼ per cent, quarterly, payable April 20 to holders of record March 31.
 Kansas City Southern.—Preferred, 1 per cent, quarterly, payable April 15 to holders of record March 31.
 Philadelphia & Trenton.—2½ per cent, quarterly, payable April 10 to holders of record April 1 to April 11.
 Philadelphia & Western.—Preferred, 1½ per cent, quarterly, payable April 15 to holders of record March 31.

Trend of Railway Stock and Bond Prices

	March 21	Last week	Last year
Average price of 20 representative railway stocks, close of business	61.18	61.45	54.14
Average price of 20 representative railway bonds, close of business.....	83.41	82.50	73.83

Railway Officers

Executive

J. B. Finley, general superintendent of the Southern Pacific of Mexico, with headquarters at Empalme, Sonora, Mex., has been promoted to vice-president and general manager, with the same headquarters, succeeding **L. H. Long**, retired.

Louis H. Long, vice-president of the Southern Pacific of Mexico, with headquarters at Tucson, Ariz., and of the Arizona Eastern, with the same headquarters, with supervision over both operating and engineering departments, retired from railroad service on March 1. Mr. Long was born in Solano county, Cal., and educated at the University of California. He began railroad work on September 20, 1885, in the service of the Southern Pacific on railroad location projects. Since that time he has been assistant engineer on location and construction; engineer in charge of construction; since February 1, 1909, chief engineer of the Southern Pacific of Mexico; and since July 15, 1913, vice-president of that road and the Arizona Eastern, which positions he has held up to the time of his recent retirement.

C. M. Scott, general manager of the Arizona Eastern, with headquarters at Phoenix, Ariz., has been elected vice-president and general manager, with the same headquarters, succeeding **L. H. Long**, retired.

Mr. Scott was born in Hamilton county, Ohio, on April 10, 1872. He entered railroad service in 1890, as chief clerk in a trainmaster's office of the Baltimore & Ohio Southwestern, and was subsequently chief clerk in a superintendent's office, and train dispatcher. In 1896 he entered the service of the Chicago, Burlington & Quincy, as chief operator in the dispatcher's office at St. Joseph, Mo., and he later became secretary to the general superintendent. He left in 1900 to enter the service

of the Atchison, Topoka & Santa Fe, in the general freight and passenger agent's office at Prescott, Ariz. The following year he was employed in the chief engineer's office, and later in the general manager's office of the same road, at Prescott. In 1905 he left to become secretary to the president of the Arizona Eastern and the Southern Pacific of Mexico at Tucson, Ariz. Later he became chief clerk to the president and in 1907 he was promoted to superintendent of the Phoenix division of the Arizona Eastern, with headquarters at Phoenix, which position he held until August, 1918, when he was promoted to general manager with the same headquarters. He was holding that position at the time of his recent election.

Operating

B. S. Barker, vice-president and general manager of the Gainesville & Northwestern, has resigned to become secretary of the Atlanta Chamber of Commerce, Atlanta, Ga.

J. H. Lambert, general freight and passenger agent and trainmaster of the Gainesville & Northwestern, has been appointed superintendent of this company, with headquarters at Gainesville, Ga.

E. A. Wheeler has been appointed chief dispatcher of the Medicine Hat division of the Canadian Pacific, with headquarters at Medicine Hat, Alta., succeeding **G. A. Davidson**, transferred.

Mechanical

F. S. Brown, mechanical engineer of the Erie, with headquarters at Meadville, Pa., has been appointed chief mechanical engineer with headquarters at New York and **G. T. Dupue** has been appointed mechanical superintendent of the Ohio and Chicago regions, with headquarters at Youngstown, Ohio, to succeed **Charles James**. **Winfield S. Haynes**, formerly master mechanic, with headquarters at Dunmore, Pa., has been appointed superintendent of shop operation with headquarters at New York. He will report directly to the general manager.

Engineering, Maintenance of Way and Signaling

C. K. Bowen, special engineer of the Southern Pacific of Mexico, with headquarters at Puga Nayarit, Mex., has been promoted to chief engineer, with headquarters at Empalme, Sonora, Mex., succeeding **L. H. Long**, retired.

J. C. McClure, assistant to the president of the Arizona Eastern, with headquarters at Tucson, Ariz., has been appointed chief engineer in addition to his present duties, with the same headquarters, succeeding **L. H. Long**, retired.

T. J. Irving, assistant engineer of the Iowa division of the Chicago & North Western, with headquarters at Boone, Iowa, has been promoted to division engineer of the Minnesota division, with headquarters at Winona, Minn., succeeding **W. J. Jackson**, deceased. Mr. Irving will be succeeded at Boone by **C. H. Wells**.

Purchasing and Stores

A. J. Mello has been appointed purchasing agent of the San Diego & Arizona, with headquarters at San Diego, Cal., succeeding **S. P. Howard** resigned.

Obituary

F. H. Drake, vice-president of the Louisiana & Arkansas, with headquarters at Minden, La., died at his home in that city on March 11.

Charles Whipple Case, formerly general manager of the Great Northern, with headquarters at St. Paul, Minn., died at his home in Minneapolis, Minn., on March 18. Mr. Case was born on October 22, 1834, at Buffalo, N. Y. He entered railroad service on August 31, 1851, as a brakeman on the Milwaukee & Mississippi. He was promoted to fireman in November of that year, and in November, two years later, he left to become locomotive engineer on the Milwaukee & Watertown. From September, 1855 to December, 1861, he was a locomotive engineer on the LaCrosse & Milwaukee, and from September, 1865 to May 31, 1867, he was an agent on the Winona & St. Peter (Chicago & North Western), successively at Rochester, Minn., Kasson, Owatonna, and Winona. From June, 1867, to November of that year, he was agent of the Chicago, Milwaukee & St. Paul at Cresco, Iowa, and from November 15, 1867, until November 1, 1876, he was freight and ticket agent of the same road at Minneapolis, Minn. From November, 1876, until January, 1882, he was successively assistant superintendent of the Iowa & Minnesota, River and Hastings & Dakota divisions. He was promoted to superintendent of the Hastings & Dakota division on January 1, 1882, which position he held until February 20, 1883, when he was transferred to the River and Duquoc divisions. On September 15, 1886, he was made assistant general superintendent. He left on October 1, 1888, to become general superintendent of the St. Paul, Minneapolis & Manitoba (Great Northern), with headquarters at Minneapolis. He was promoted to general manager on December 1, 1893, which position he held until August, 1894, when he retired from railroad service.

Which is more effective, a written story or one enacted before our eyes as in moving pictures, for example? Doubtless the latter, for conditions or events actually seen make a much stronger impression than those we only read of or hear about. In a general way railroad men admit that the present lack of adequate,

**Show
the
Boss**

modern machinery and labor-saving devices in most repair shops and enginehouses limits output and increases unit repair costs. The men who most fully realize the needs, however, are the shop or roundhouse foremen on the job who must get results with limited equipment. These men can see with their own eyes how worn-out machines are increasing shop costs and when possible they should get the higher mechanical department and executive officers out into the shops so that they too can see and better visualize the needs. If this impression is backed up by accurate, comprehensive figures proving that new machinery will make a net return of over 12 per cent (as it often does) on the investment, the necessary capital will be forthcoming. Present inadequate facilities in the way of shop machinery and equipment are taken too much for granted. It is a serious question if the lack of capital for necessary improvements is not also taken too much for granted. The mechanical department in its request for better shop and enginehouse facilities has a good case which should be presented forcefully and continuously to the highest authority. Show the boss.

The criticism is sometimes made and, we fear, with more or less truth, that motive power officers are not keen in the search after improvements in details of locomotive equipment and at times even oppose the application of devices of proved value. This attitude appears at first to be somewhat difficult to explain as these are the very men from whom new and advanced ideas should normally be expected. Natural conservatism, developed from constant contact with mechanism that is at least doing the work, does not offer a sufficient explanation. The real reason will, we think, be found in the character of the railroad organization and the relationship of responsibility and credit between the mechanical and the operating departments. Motive power officers are too prone to note that any savings which result from the adoption of improved attachments are reflected in reduced costs of operation and that the credit for such gains goes to the operating department. At the same time every motive power officer knows that each added device increases somewhat the cost of inspection and maintenance which is entered on the books as a charge against his department without any offsetting credit. The majority of locomotive shops and terminals are already taxed to so near their maximum capacity that it is not surprising that every little additional burden is feared lest it prove to be the last straw to break the camel's back. There is unquestionably a pressing need for increased shop facilities to enable railroads to obtain a fuller degree of service from the locomotives which they already have. However, neither lack of shop facilities nor the fact that a saving obtained is credited on the accounts to some

**A Broad View
of Locomotive
Improvements**

other department should blind the eyes of an officer to the benefits that can be obtained from various improvements. In such matters the outlook must be a broad one and reach beyond departmental lines.

From now on, we are informed, it will be a matter of but slight difficulty to strike up an acquaintanceship with the passenger train engineers on the St. Louis-San Francisco. This opportunity has been brought about by the recent decision of the Frisco management to feature the name of each passenger engineer who has a regular run, in gold leaf on a black enameled glass plate background, which will be located prominently on the cab of his engine; the name plate to be a sliding device which may be removed from its holder at the end of a run. In the main, this novel idea is conceived as a means of establishing closer personal relations between the road in question and the general public. It should have practically the same effect, we believe, as the numbering of athletic contestants in college games for the benefit of the spectators. In both cases this gives the public a chance to come in more intimate contact with those who are "playing the game." Besides, there is a certain pleasing and psychological aspect to an arrangement of this kind which is particularly attractive to human nature. It is said that the 130 engineers, who are to have their names thus emblazoned to the world, have expressed keen gratification at the announcement, and there is no doubt but that the plan will be welcomed by the public. This is a step towards "Positive Public Relations Works," along lines advocated in an editorial by that title in the March 18 issue of the *Railway Age*.

**Let's
Get
Acquainted**

**Foreign Jobs
for American
Railway Men**

If a young British railway man tires of his country and seeks foreign service for a change, he has every opportunity for gratifying his desires. Especially if he has a technical education and is otherwise fitted it is possible for him to secure some kind of official position on a British colonial railway or a British owned road in some foreign country. This is only one of the advantages accruing to the people of Britain out of their ownership and operation of colonial and foreign railways. When American money goes into foreign railway construction it generally goes in the form of a loan to an established line already operated by foreigners. When British money goes into foreign railways, generally speaking, British railway men go with it to build the roads and operate them. American railway men are interested in foreign railways. The many inquiring letters which come to the *Railway Age* prove that to us. We have pointed out previously in these columns that most foreign countries could learn more from American railway practices than from those of western Europe. One of the best ways to give these countries the benefit of our experience is to send Americans to help them operate their railways. When we lend money to foreign countries for railway expansion, it is unfair to our manufacturers of rail-

way equipment and supplies and to our railway men who seek foreign experience that such loans should not be conditioned upon the purchase of some of the needed equipment in this country and the employment of American railway men.

The National Foreign Trade Council is planning to hold a convention called the Ninth National Foreign Trade Convention at Philadelphia on May 10, 11 and 12. One looks in vain in the program of the convention for any reference to railroads and their relation to foreign trade either as regards the interest that railroads in the United States may take in encouraging export trade or as regards the importance of our enormous exports in railroad supplies. The *Railway Age* believes that the relation of railroads to foreign trade should be given further attention. One bears in mind, for instance, that the railroads of this country are greatly interested in any traffic that they may be able to secure for carriage to the ports. This matter has been given special consideration because of President Harding's recent address to Congress with reference to ship subsidies. Reference may also be made to the report prepared under the direction of the United States Shipping Board in which it was said:

The railroad systems of the United States feel the need of definite import and export working agreements with steamships engaged in foreign trade. It would seem expedient and wise to permit reasonable working agreements to exist between the railroads and steamships. The problem is fully and completely coordinating our rail and water transportation and is acute and important.

This report and President Harding's address have already borne fruit because the ship subsidy bill recently introduced proposes an amendment to the Panama Canal Act which will allow railroads to own vessels engaged in other than coastwise traffic or traffic through the Panama Canal or across the Great Lakes. The President and the Shipping Board have thus evidenced their interest in the relationships of the railroads with our foreign trade. Does it not appear strange that the Foreign Trade Convention, which is supposed to be held in the interests of the leaders in our country's export trade, should have failed to do likewise?

Two Ways of Attacking the Rail Problem

ALTHOUGH THE RAIL PROBLEM has been prominently before railway men and steel manufacturers for more than 10 years and although it has received continuous attention from both groups during this time, the progress which has been made has fallen far short of the objective. Work on behalf of the railroads has centered in the Rail Committee of the American Railway Association, under whose direction a metallurgist has given his full time to research for several years.

In planning its line of action, the committee has had open to it two courses. On the one hand, as the representative of the consumers it could prepare specifications independently of the producers which, according to the best information available, would eliminate those influences in mill practice which have proven detrimental to the rails, with only secondary consideration to the manufacturing problems involved and submit these specifications to the steel companies for adoption. The alternative would contemplate the co-operation of the representatives of the roads and the manufacturers in the development of a specification which would involve certain concessions from the ideal conditions sought by the railroads but which would be acceptable to the producers. Until recently the committee has chosen the first plan and has concentrated its attention on the preparation of

specifications which represented the best obtainable practice in the opinion of the committee. These specifications have been accepted by the mills only with the payment of a premium so high as to be prohibitive. The result has been that the specifications have been non-existent as far as the rollings of rails is concerned.

More recently certain influences on the committee have advocated the other course, as a result of which a revised specification has been prepared which, while not yet approved by the Rail Committee, has been accepted by the manufacturers who have agreed to roll some rails under it this year without additional charge. While this specification falls short of some of the objectives of the committee, it represents a step in advance of existing specifications in others. As such it offers the possibility of a step forward in the solution of the rail problem in that it makes possible the production of rails in which certain objectionable characteristics now existing are expected to be eliminated.

The rail which will be rolled under this specification will be subjected to intensive scrutiny both in the mills and in the track to determine the effect of the changes in the specifications upon the service rendered with a view to determining upon such further revisions in the specifications as may be necessary before issuing them finally.

Are the Roads Ready for a Car Pool?

THE NATIONAL Association of Owners of Railroad Securities has proposed a comprehensive plan for the pooling of freight cars which includes not only the central control of the distribution of equipment but proposes to relieve the railroads of individual responsibility for the design of new equipment as well as for all maintenance except running repairs. In a communication appearing in this issue a transportation officer, in discussing some phases of this plan, takes exception to our comment which appeared on page 508 of the March 4 issue, on the ground that it did not discuss the feasibility of the plan itself but was confined to its incidental features.

It is true that in that editorial no attempt was made to discuss the practicability of the plan in detail. But an analysis of the estimated savings set forth by the sponsors of the plan indicates a lack of conservatism which, although not conclusive, does cast some suspicion on the claims of the sponsors to speak with authority on other phases of the subject. Probably no one will question the need for reform in many of the elements affecting the character and cost of car service. It is doubtful, however, whether all will agree that a revolutionary change such as is implied in a complete car pool is likely to produce better or quicker results than may be effected by placing the present system on an economically sound basis. It may be accepted as fundamental that the willing acceptance of a sweeping equipment pool, such as that proposed by the Security Owners' Association, by all the parties affected, including railway executives as well as transportation and mechanical department officers, must be preceded by a thorough understanding of all of the possibilities of such a plan as well as the reasons why satisfactory results are not now obtained.

With a general understanding of these facts it is quite possible that by far the greater part of the results to be obtained from the car pool might be effected with no change in the system of car ownership or distribution. At the present time, however, it is of less moment by what means the best results ultimately may be obtained than it is that a thorough appreciation of all of the factors which enter into the cost and character of car service may be obtained by everyone who exercises control over any of these factors. To that end the *Railway Age* will welcome the comments of its readers on this much discussed but still controversial question.

Mr. Jewell Starts a Revolution

B. M. JEWELL, in opening the case of the railway shop crafts in the wage hearings before the Labor Board this week, practically abandoned the case and started trying to revolutionize the entire industry of the United States.

Representatives of the railways have introduced statements and exhibits showing that employees in railroad shops are being paid wages much higher in proportion to the cost of living than before the war, and also higher than those of men doing comparable work in other industries. Mr. Jewell made a general denial; but, tacitly admitting that shopmen's wages are higher than those of men in other industries, he attacked the entire existing industrial system and the wages of all workers. "We come here," he said, "to challenge the justice of the wage rates of all productive labor; to challenge the very principle (cost of living and comparison with wages in other industries) upon which the railroads propose that rates of pay be adjusted. We propose to show how the entire purpose for which industry is operated can and must be changed."

Mr. Jewell contended that an industry which cannot pay an employee a wage sufficient to maintain an "average family of five" according to a "healthful standard of living" is as truly bankrupt as if it could not pay its fixed charges. He introduced a budget to show that to thus maintain a family of five requires \$2,637 a year. "To secure what this budget provides," he said, "the railway mechanics must earn 40 per cent more than they are now being paid by the railroads." Other shop employees, especially helpers, would have to be given still greater increases. Labor leaders in other arbitrations have contended that the minimum income required properly to maintain a "family of five" is \$2,260. Mr. Jewell is more advanced.

His conclusion as to the wage that should be paid is based not upon the productive efficiency of the average railway shop employee, but upon the needs of a family of five. But one family of five has needs as great as another. Therefore, on his theory, each railway employee of every class should be paid an average of \$2,637. There are at present about 1,700,000 railway employees. An average wage of \$2,637 for all would make the railway payroll over four billion five hundred million dollars a year, or about one billion seven hundred million dollars more than in 1921. If the railways had had this payroll in 1921, and all other expenses had been the same, their expenses and taxes would have exceeded their earnings by about one billion dollars—they would not have had a cent for fixed charges. Under normal business conditions the railways have about two million employees. The average wage advocated by Mr. Jewell would make the normal payroll about five billion two hundred seventy-five million dollars, or almost equal to their total earnings in 1921.

The net operating income of the railways in 1921 was only six hundred and fifteen million dollars. Where, then, does Mr. Jewell expect the railways to get the additional money with which to pay these higher wages? He intimates where he thinks part of it could be gotten. It has recently become the practice of railway labor leaders to charge that the railways and the concerns from which they buy coal, equipment and supplies are under the same financial control; that in consequence the railways pay excessive prices for these things, with the result that the concerns from which they buy them make excessive profits. They urge that if the railways would pay lower prices they could pay higher wages.

Mr. Jewell evidently intends to use this theory in the present case. He calls the "steel corporations, equipment and other supply companies" the "profit making part of the railroad industry" and says that these concerns, including the coal and coke companies, "piled up" surpluses during

the years 1916 to 1920 aggregating about one billion three hundred million dollars.

In the first place, however, a large part of these surpluses has been wiped out by losses in the present business depression. In the second place, is it not possible the employees of the coal, equipment and supply companies may say that pluses of these companies, their own employees, and not if any group of workers has claims upon the profits or surpluses of these companies, their own employees, and not those of the railways, have these claims? Most of their employees are not being paid as much as railway employees. The wages of railway employees have within recent years absorbed most of the profits formerly made by the railroads. On what ground does Mr. Jewell base his theory that railway wages should in the future absorb also the profits of the coal mining, and equipment and supply industries?

However, Mr. Jewell generously constitutes himself the spokesman of all productive labor, and proposes an average wage for all of \$2,637 a year. We look forward with great interest to whatever exposition he may make of the source from which this large average wage is to be derived. We should be most glad to see every worker in the United States receive even more than the wage Mr. Jewell mentions. But the industry of the country cannot meet the payroll that would result without a vast increase of production. The statistics of the census show that there are about forty-two million persons "gainfully employed" in this country. To provide them the average income, Mr. Jewell suggests would require an aggregate annual production of one hundred and eleven billion dollars.

The most complete and authoritative investigation of the production and income of the people of the United States ever made is that recently conducted under the auspices of the National Bureau of Economic Research, the results of which have been published in a book entitled "The Income in the United States." This shows that the total production and income of our people reached its maximum in 1919 when it was sixty-six billion dollars. This was measured in the high prices prevalent at that time. Equated on the basis of the prices of 1913, the production and income of the country reached their maximum in 1917 when they were forty-one billion dollars. Therefore, on the basis of the prices of 1919, Mr. Jewell proposes a payroll for industry exceeding by forty-five billion dollars, the largest total production ever attained, and on the basis of the prices of 1913 a payroll exceeding by seventy billion dollars, or 170 per cent, the largest production ever attained.

It is hardly necessary to say that the adoption of Mr. Jewell's wage scale would speedily result in the profits of all industry being absorbed by the payroll. But this does not daunt him. He says his plan of industrial revolution "frankly contemplates a situation in which temporarily they (profits) may have to cease." He adds: "Until that situation has been accepted, the conflict between capital and labor will continue."

Mr. Jewell and other labor leaders who assume the same general attitude, jauntily ignore vital facts. First, they ignore the fact that an enormous increase in production would have to be secured before any such average wage as they suggest could be paid. At the same time, they use all the power of their organizations to secure the adoption and perpetuation of hours of work and working rules and methods which help prevent the very increases in production which are essential to make possible the payment of the high wages they demand. Second, they disregard the fact that the "average family" in this country is not a family of five. The records of the census show that the average family contains 4.3 persons. Third, they usually disregard the fact that the average family is not supported by the earnings of one person. The number of families in the country is about 24,200,000. Since the number of persons "gainfully em-

played" is forty-two millions, it follows that the average family enjoys the income of one and three-fourths persons, and not of one person. Therefore, if each person gainfully employed had an income of \$2,637, the income of the average family would be \$4,600 a year, not \$2,637, and would therefore be much larger than Mr. Jewell says it needs! It would require an average income per worker of only \$1,510 to give the average family an income of \$2,637.

Mr. Jewell may answer, his figures show the average railway shop employee's family has five members and only one person earning income. If that is true, then the average shop employee's family is larger than, and has only a little over one-half as many income producers as, the average American family. But if railway shop employees choose to have larger families than the average, and fewer of the members of their families elect to work, is that any reason why they should be paid higher wages than other workers?

Mr. Jewell's argument might be listened to with respect in a socialist convention where neither law, facts nor logic are admitted. It has no bearing on any question pending before the Railroad Labor Board. The Board is required to fix reasonable wages for railway employees, measured by certain standards specifically mentioned in the Transportation Act. The most important of these standards are the cost of living and the wages paid for comparable work in other industries. The law takes no account of the fact that a railway mechanic's family may be larger or contain fewer workers than the family of a mechanic employed in a factory. It does not contemplate that the Railway Labor Board shall award wages exceeding on the average those which any industry ever did pay or could pay under present conditions.

Mr. Jewell's presentation will do his followers no good in the present case. It will help to disseminate false ideas and aggravate unrest among working people. It will also, let us hope, make clear to the farmers and business men of the United States that the attacks of radical railroad labor leaders are not directed merely against reasonable profits and private management in the railroad business, but against reasonable profits and private management in every business. The adoption of Mr. Jewell's program would wipe out profits in every business and leave all private property valueless in the hands of its owners.

The Battle of the Brakes

FOR THE OLDER railroad man the expression "the battle of the brakes" will at once arouse memories of the epoch making Burlington brake tests of 1886 and 1887, the intensely interesting reports and discussions at the Master Car Builders' conventions of that period and the air brake developments which took place soon after. The 1886 tests sounded the death knell of all forms of brakes except those of the compressed air or vacuum types. The tests made during the following year were marked by the advent of electrical control of both compressed air and vacuum brakes and conclusively demonstrated that the use of power brakes for controlling long freight trains would be feasible only when such brakes were caused to apply instantaneously by electricity or by a very rapid serial action. At the close of the tests it appeared that the aid of electricity would be necessary and the committee in charge of the tests so reported. Before many months had elapsed, however, improvements in the quick-action triple valve caused electrical brake control to be abandoned for the time being. Another matter that should not be overlooked is the fact that these tests demonstrated the advantages of close coupling and were more responsible than anything else for the introduction of the M.C.B. coupler.

The significance of these events may not at first be so

apparent to the younger railroad men of today, but it is well to stop a moment and think of the far-reaching effects which the battle of the brakes has had upon transportation development.

The vacuum brake made its appearance in this country almost as soon as the air brake. In its plain form it was used on all elevated cars in New York, controlled the cable cars on the Brooklyn Bridge for years and was more or less extensively used on many railroads. In its automatic form it was not as widely applied but the fight between the advocates of the compressed air and the vacuum brakes was a long and bitter one.

It was at once apparent that the two systems could not exist side by side. To equip freight cars with both types of brakes so that they could be interchanged and a road could use whichever one it deemed best was far too great an economic waste to be considered seriously. No one recognized these facts any better than did the brake manufacturers themselves. By 1890 the air brake had conquered and the vacuum brake manufacturers had turned their attention to the development of an air brake. Since that time there have been a number of changes in air brake devices, but with all the progress the new devices have been obliged to work in harmony with those already in service. This country was saved the confusion of an extensive application of two radically different brake systems. It thus seems strange to us to note the conditions which prevail in England and in some other countries today. Railroads are just beginning to equip freight train cars with power brakes and with two types of brakes in use on passenger trains the battle of the brakes which was fought to a finish in this country more than 30 years ago is now being waged again over there. The situation will seem stranger still after one reads the results of some recent vacuum brake tests described in an article in this week's issue and after one notes that the stops are considerably longer than we are accustomed to consider necessary for safe train operation.

New Books

Kidder's Architects' and Builders' Handbook. Thomas Nolan, editor-in-chief, professor of architectural construction, University of Pennsylvania, Philadelphia, Pa. Illustrated. 4½ in. by 7 in. 1,907 pages. Bound in flexible leather. Published by John Wiley & Sons, Inc., New York.

This is the seventeenth edition, revised and enlarged, of the handbook originally published by the late Frank E. Kidder in 1884. The general form of this book has not changed from the previous issues—a voluminous compilation of engineering data for the design and construction of all types of buildings. Thus, Part I deals with practical mathematics, Part II with strength of materials and structural design, and Part III with useful information for architects, builders and superintendents on supplementary matter relating to buildings. The revisions made in this edition are largely in the nature of alterations and additions required because of the advancement of the art. This is particularly the case with Part II in which two new chapters have been added on specifications for structural steel work and on domical and vaulted structures. The chapters on fireproofing of buildings and reinforced concrete have been re-written so as to cover new types of construction. In Section III the chapters on heating and ventilating have been re-written and a new section of chimneys and chimney design has been added. Additions have also been made in Part III under the head of registration of architects and standard documents of the American Institute of Architects. This edition is well up to the standard set and maintained for many years by the preceding editions.

Letters to the Editor

[The RAILWAY AGE welcomes letters from its readers and especially those containing constructive suggestions for improvements in the railway field. Short letters—about 250 words—are particularly appreciated.]

An Answer to Sir William Acworth

CHICAGO

TO THE EDITOR:

The answer to Sir William Acworth's citation of the New Haven as an example of a situation where the state (New England) might assume some portion of the railway's burden of providing transportation for the community is that the traffic of its territory was ample to furnish the necessary service at about half the cost 15 years ago, before union labor succeeded in imposing nationalization of wages and working conditions on a section of the country of limited earning capacity.

Let me specify. In 1907 the operating revenues of the New Haven were \$55,601,000; in 1920, \$123,512,000, an increase of 122 per cent, largely due to increased rates and fares now as high as the traffic will bear. In the meantime freight tonnage increased only 30 per cent and passengers carried only 57 per cent. Between 1907 and 1920 the average number of employees increased from 36,481 to 40,612, or a little over 11 per cent. Prior to the introduction of the eight-hour day there was an actual decrease in the number of days worked. But the real death's head at the New Haven board, banishing all prospects of dividends and surplus, and actually jacking operating expenses to over 100 per cent of operating revenues in 1920 (91 per cent in 1921) was the increase in the payroll from \$24,052,644 in 1907 to \$78,939,151 in 1920, or 228 per cent.

Let Sir William study these figures and ask himself if any system of railway operation on earth, private, national or hybrid, can survive such treatment. The pre-eminence of New England as an economical summer resort for the rest of the Union has been imperiled by its railway wage scale reacting on every other industry in the territory.

SLASON THOMPSON,

Director Bureau of Railway News and Statistics.

A Word for the Security Owners' Car Pooling Plan

HOUSTON, TEXAS

TO THE EDITOR:

I have been awaiting the comment of your journal on the proposal recently made by the National Association of Owners of Railroad Securities to the Interstate Commerce Commission with respect to reforms in car handling. Your editorial on page 508 of the March 4 issue is rather disappointing, at least to those of us who had looked upon the Association's suggestion as a possible realization of the long deferred hope of a freight car pool. As a matter of fact you have said very little about the pooling of cars, your remarks being confined to criticisms of the incidental features of the car pool, such as car construction, capitalization and repairs. (In considering these features as incidental I am guided less by the relative importance of the concrete monetary savings involved than by the fact that the primary object being sought is the maximum freight car utilization.)

A car pool has been advocated by progressive transportation men for a generation. The Association's plan, it is true,

includes the car repair pool feature, but this is merely the logical complement of the distribution pool, the lack of which in previous pool proposals has been the main basis of attack by the opponents of pooling. The Association has, however, gone a step farther and undertakes to provide for an eventual standardization of equipment, thereby removing another of the arguments frequently urged against the freight car pool.

It is to be expected that any proposal of this kind will be general in its nature and that the various details will have to be worked out in "careful and detailed analysis by competent railroad officers," as suggested in the concluding paragraph of your editorial. Would it not have been better to leave all of these technical and detailed objections to those who are opposed to a pool per se?

The need for a car pool is self-evident. There is hardly a transportation man of any prominence in the country today who will not admit this. There is no doubt in my mind that when the principle of common control of freight cars is approved by railroad executives, the necessary machinery will be found to put the principle into effect. The experience of the railroads during federal control demonstrated conclusively that a transportation car pool cannot be successfully worked without a reform in the methods of handling car repairs. In my opinion the one big mistake of the Railroad Administration in its car handling policy was the virtual abandonment of the pool early in 1919 and the inauguration of a plan looking to the return of cars to the lines of their original owners. If the efforts of the Administration at that time had been directed toward a rational program of car repairs, an opportunity would have been afforded during the continuation of federal control to demonstrate or disprove the practicability of a general car repair pool. This experiment would have involved considerable expense but the expense would have followed the responsibility for the condition of the equipment at that time rather than being carried over and eventually saddled on the carriers.

In your criticism of the estimates made by the Association you entirely ignore the possible saving through reduction of empty car mileage as a result of adoption of a pooling plan. Possibly this is because that item forms but a small proportion of the \$300,000,000 which the Association expects to save. As a matter of fact the Association's estimate of the possible saving in this particular field is entirely too low. Excess empty car mileage is a rather intangible item, but it is perfectly susceptible of demonstration that the excess empty hauls which result from an unnecessary home movement of cars place an enormous burden of expense on the carriers, generally at a time when they are least in position to stand it. The figures used in the Association's estimate cover a period of years and the natural tendency is to smooth out peaks during periods when such wasteful handling was most marked. Figures which were prepared by a number of transportation officers covering the latter part of 1920 and early part of 1921 indicated that the expense of relocating equipment at that time approximated \$40 per car. In the month of December, 1920, alone there were over 200,000 cars relocated, the expense of this movement being about \$8,000,000. The excess movement was not confined to December but continued in a greater or less degree for several months. It is, of course, true that this wild scramble to get cars home does not occur every year, but there are always periods of the year when cars are being moved unnecessarily in certain territories. These movements would be minimized under a general pooling plan.

While I share your apparent regret that this proposition has been brought into the limelight by an association outside the family of railroad operating officers, I do not agree with your apparent feeling that this should condemn the plan. It is a well known fact that transportation officers have for years endeavored to work out a practical pooling plan that would appeal to their superior officers. The Securities Own-

ers have been wise enough to adopt the best features of other plans which have been put forth in the past.

It is perfectly true, as you state, that the railroads cannot afford to let the proposal pass without subjecting it to critical analysis, but in my opinion the proposition should be approached from the standpoint of a desire to adopt the most progressive methods available, rather than with a view to finding technical defects which would condemn the plan.

O. C. CASTLE,
Superintendent, Transportation Southern Pacific Lines

"The Veterans of the Railroad Service"

WASHINGTON, D. C.

TO THE EDITOR:

At a recent memorial service it was said that "the boys in blue saved the country, but the railroad boys *made* the country." It was to perpetuate the memory of these "railroad boys" that the Veteran Associations were organized.

The movement originated about 20 years ago on the Pennsylvania. The initial branch was known as the Philadelphia Division, with headquarters in Philadelphia. Others soon spread over the four regions of that system. The original idea was purely social. It was quite patent to the laymen that the man who has spent half his life in the service of the railroads has acquired a spirit of railroad morale which means much to the public in the way of efficient service. To solidify and preserve the "family tie," these men came together voluntarily. By this close association they learned that it was not to their advantage to injure the business in which they were engaged and on whose prosperity and ability to function they, as a part of the public, were entirely dependent.

The railroad veteran movement spread slowly to other roads in the middle and western states. In 1912 the New England Association of Railroad Veterans was organized through the efforts of Earl H. Morton, then president of the Order of Railroad Station Agents. E. F. Brooks was elected president; F. H. Sidney, secretary, and E. H. Morton, chairman of the executive committee.

The main object of the New England Association was to build up a strong organization of all branches of the service, from track walker to president, so that a more complete understanding of each other's problems might be obtained with a view to their satisfactory solution. It sought to re-establish the old days when superintendents and even general officers could call their men by name, a custom which almost entirely disappeared with the expansion of the roads.

The movement in New England has prospered. From a nucleus of 77 charter members it extended rapidly over every railroad in that section, until today it has a total membership of about 7,500. It includes the presidents and general officers, men in all branches of train service, shopmen, maintenance of way employees, all classes of employees in station service and clerks in the general offices. Through its committees it handles all pension matters. All discussions on the subject of wages and working conditions are excluded. Careful watch is kept, however, on all legislative matters which affect the interests of the roads. Such legislation is endorsed or condemned, as the case may be, because these men realize that any bill that would adversely affect the employer could not fail to affect the employee vitally.

The New England Association recently endorsed the Winslow bill. What other body of railroad employees took similar action? Many railroad organizations not only passed resolutions condemning the bill but engaged in an active campaign to defeat it.

In 1914 resolutions were adopted by this association condemning the plan of dissolving the New England lines; favoring a fall five per cent increase in rates and calling for a square deal for the railroads. As early as February, 1915,

the veterans went on record as favoring "greater compensation to the railroads for the handling and storing of mail." It has been instrumental in bringing about the adoption of the second Sunday in May as an International Memorial Day for all railroad men.

The prime motive of a Veterans' Association is, of course, the establishment of a uniform system of pensions that are adequate but not burdensome. To this end it favors the adoption by the railroads of a uniform system of co-operative pensions for all railroad employees. Briefly outlined this system provides: that all men who are in the service at the time of its adoption be given the opportunity of entering into a general health, accident, retirement (pension) and life insurance plan to which they would contribute in monthly installments a small per cent of their monthly or weekly wage, the money to be deducted by the paymaster at each pay-period and turned over by him to the treasurer of the association, who would be properly bonded. The fund thus obtained would be known as the Annuity and Health Fund. From it would be paid sick benefits of not less than \$5 per week, accident insurance of stated amounts according to extent of injury; monthly pensions (upon retirement) based upon a plan, i.e., one per cent of yearly wage to be multiplied by total number of years in service. To this amount the railroads would contribute a like amount, handled in similar manner either through one central organization or separately. This plan would necessarily be sanctioned by a proper law passed by Congress by which both parties would be obliged to carry out its letter and spirit.

This system provides further that all employees entering the service 30 days after such a law is passed must agree in writing to enter the insurance and pension plan. Those now in service shall be given the privilege of voting on the plan. After 90 days' consideration, their decision shall be final. Thus the constitutionality of any such law would be established. One important and incalculable effect of the adoption of the co-operative pension plan would be the impossibility of any general railroad strike. At a time when threats of strikes are two-edged swords held over the heads of the public, any preventative that is also a cure would be welcome to all the parties concerned. E. H. MORTON.

An Example of Reciprocity?

NORTH CAROLINA

TO THE EDITOR:

In the *Railway Age* of February 25, page 459, you suggest reciprocity on the part of railroads in the maintenance of railroad crossings. This subject comes home to me in very painful form. Ours is a junior road crossing another at two points. We maintain the crossing and the towers and the approaches on both of the lines. As suggested in your editorial, we were compelled three years ago to install anti-creeper on the tracks of the other road in order to hold the crossing in place. But our principal grievance relates to the loading of our maintenance expenditures by alleged co-operation or supervision on the part of forces of the other railroad. When we have made repairs at these crossings, the other road has insisted on having its own section forces work with ours, the "co-operation" consisting mainly in seeing that our forces do most of the work. When possible they have had two gangs and two foremen in attendance.

Until recently the other road has had two signal supervisors, each of whom visited the plant at least twice a month. Usually they spent about 30 minutes at the crossing, but invariably we received a bill of about \$15 for each visit. I submit this as the character of reciprocity received by the junior lines at railroad crossings, particularly where the junior line is a short line not able to retaliate at some other point.

GENERAL MANAGER.

The Difficult Loop Section of the Alaska Railroad

Completing the Government Railroad in Alaska

Passengers and Freight Now Transported Between Seward
and Fairbanks—A Distance of 467 Miles

AS CONCERNS operation between the ends of its line, the Government Railroad in Alaska, now officially called the Alaska Railroad, is completed, the actual opening of the line between Seward on Resurrection Bay and Fairbanks in the interior, occurring on February 5, 1922. Pre-

proaches, forms the main item in the budget for the fiscal year 1922-23. Other items of interest are a steel bridge at Spencer Glacier to replace a wooden structure now in use, the ballasting of about 50 miles of line in Broad Pass laid in the fall of 1921, and the widening to standard gage of about 56 miles of the narrow-gage Tanana Valley Railroad to Fairbanks. When this is carried out, the Alaska Railroad will have a through, 467-mile standard-gage line, with a total mileage, branches included, of about 539. Built

The Docks at Nenana on the Tanana River

vious to this time, trains had been operated over sections of the line as completed, and although transfer of passengers and freight is now effected through to Fairbanks, it is not carried out as yet by through rail connection except in the winter season. Actually Nenana on the Tanana river is the northern terminal of the road, passengers and freight being transferred at this point, ferried across the river and then carried to Fairbanks over a narrow-gage line. In the winter the narrow-gage tracks are laid on the ice in the river and the transfer from standard to narrow-gage made at Nenana. Bids now being received by the government call for the construction and completion of a 700-ft. span structure across the Tanana river on or before March 1, 1923.

The completion of this structure with the necessary ap-

A Sight No Longer As Familiar As It Was Some Twenty Years Ago

through practically a wilderness, under trying conditions of weather and surroundings, aggravated numerous times by difficult physical obstacles, the railroad is an undertaking the completion of which is a credit to all concerned. Its construction recalls some of the more difficult of the pioneer railway building of the West with the addition further that it was carried on more than 2,000 miles from its base of sup-

plies and in a country where there were few trails and roads.

The authorization of the project was through an act of Congress passed on March 12, 1914, the cost being fixed at \$35,000,000. Increasing prices for labor and materials during 1918 and 1919 soon developed the fact that the road could not be completed for that sum, and an additional authorization of \$17,000,000 was made in 1919, making \$52,000,000. This was still insufficient to complete the road and \$4,000,000 more was requested. Based on a total expenditure of about \$56,000,000, the Alaska Railroad will have cost, exclusive of equipment, etc., an average of about \$78,000 per mile of line. With all facilities included, the cost is about \$120,000 per mile of line. Articles descriptive of the progress of the railroad since its inception have appeared regularly in the *Railway Age* and are suggested as references in connection with this article.

Government Road Includes Two Existing Railroads

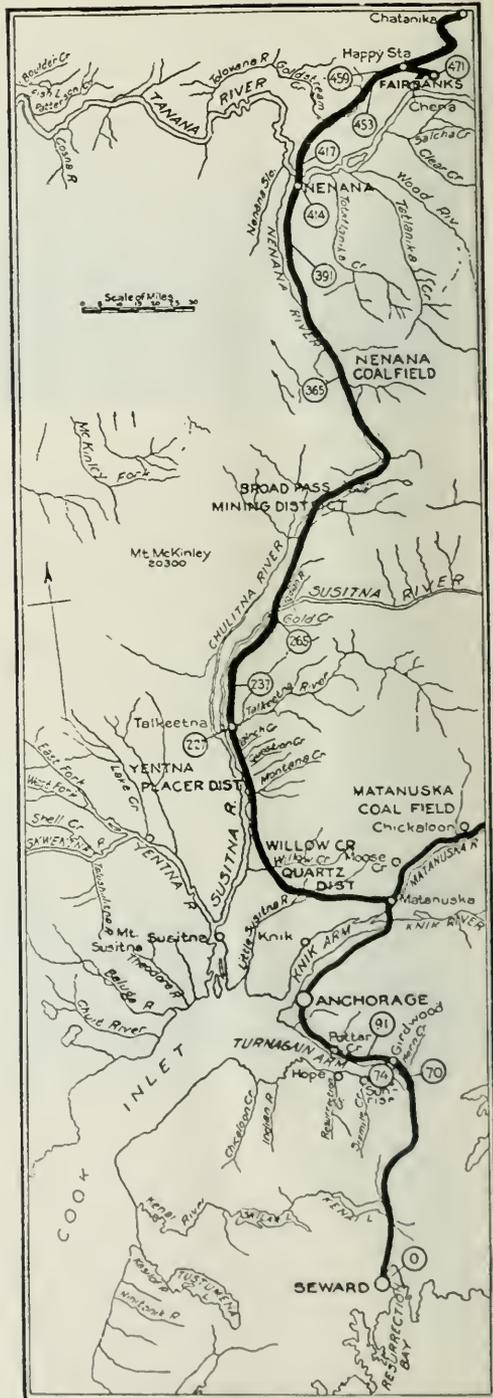

The line chosen for the government road includes two railroads initiated by private enterprise. It runs generally northward from Seward, a port open all the year, across the Kenai peninsula to Anchorage at the head of Cook Inlet,

Completing One of the Trestles Along Turnagain Arm

thence north along the general line of the Susitna river until reaching the main part of the Alaskan range. In this section Mt. McKinley is but a short distance to the west, the boundaries of the reservation extending to the line of the railroad. The railroad passes over the Alaskan range through a section known as Broad Pass and emerges on the north onto the cañon lands of the Nenana river, and the valley lands of the Tanana river into the town of Nenana, 411 miles from Seward. From the bank of the river opposite Nenana, the line swings to the east, reaching Fairbanks at mile post 467. This is considered the northern terminus although the old Tanana Valley Railroad, of which more mention will be made later, extends on to Chatanika, a distance of 39 miles.

One of the several primary purposes of the government railroad was to tap and thus develop some of the great coal fields of Alaska as a source of fuel not only for the navy but for other shipping and mining facilities as well. It is interesting to know that Alaska contains practically the only satisfactory steaming coal on the Pacific coast as far south as Chile in South America. Another purpose was to transport inland the equipment and supplies needed to develop the mining and agricultural possibilities of the territory and to move out their raw and finished products. Coal, for instance, which formerly cost \$18 a ton at Seward, was re-

The Line of the Alaska Railroad

duced to \$9 to \$10 a ton as soon as the line had reached the Matanuska coal fields, about 190 miles from Seward, and the first objective. The price of other products and supplies has been reduced since the completion of the line in a like or greater proportion with positive year-around deliveries in contrast to the old closed season of about four to six months when nothing could be moved in or out.

The backbone of the southern end of the line was furnished through the acquisition by the government of the Alaska Northern Railway, formerly the Alaska Central. The original intention behind this road had been to tap the Matanuska coal fields but because of financial difficulties the work had never been completed. Seward was its deep water terminus and the old wharves of that road were rehabilitated by the government for use with the federal line. These wharves form the only berthage for vessels coming into this port. Resurrection Bay, although indented 20 miles and an excellent harbor so far as navigation is concerned, has the draw-

established at Nenana and construction started south from this point toward the lignite coal fields in that section of the country. The narrow-gauge Tanana Valley Railroad was acquired at about the same time and its rehabilitation commenced.

Leaving Seward the road crosses two divides, reaching the summit of the first at Mile 12 with an elevation of 700 ft., after which the general grade descends, slightly rising again to the second summit at about Mile 45, elevation 1100 ft. The maximum grades in this section are 2.2 per cent compensated for curvature, with curves as sharp as 14 deg., of which, however, there are, in proportion, only a few. Descending from the summit the line follows the drainage of the Placer river and then enters the section where the heaviest construction of the line occurred. This is the loop section of the railroad. It contains numerous tunnels and a large amount of trestle work built of Douglas fir. Indicative of the class of work in this section is one trestle with a maximum

The Coal Town of Chickaloon in the Matanuska Fields

back of having from 50 to 150 fathoms of water, making it practically impossible for ships to lie at anchor.

Rehabilitating the Old Alaska Northern

Leaving Seward, the Alaska Northern had completed about 71 miles, over which it operated intermittently. Owing to financial troubles, it later reduced the mileage in operation to 35, using a light gasoline car to which a trailer was sometimes attached. During this period the roadbed was allowed to deteriorate and one of the first things which was done when the government took hold was to rebuild this line. New trestles and bridges, ties and rails were installed, while curves were straightened or eliminated and grades reduced and standardized. Approximately four and one-half million dollars were expended in this work, which, up to Mile 71, formed the first undertaking of the Alaskan Engineering Commission. At about the same time a base was established on Ship Creek at the head of Cook Inlet. This was named Anchorage and became the headquarters from which all construction was controlled. All equipment, such as steam shovels, dredges, barges, locomotives, cars, etc., was landed at this base and much of it consisted of equipment brought up from Panama, where it was no longer needed. Work was started from this point toward the Matanuska coal fields and south toward Seward. About one year later a base was

height of 106 ft. on a 14 deg. curve. From Mile 49 on to about Mile 61 is the glacier section of the road, the line passing at varying distances from Bartlett Glacier, Spencer Glacier and Portage Glacier. It is also the section in which most of the trouble from snow slides has occurred, practically all of the snow sheds being located at points between roughly Mile 43 to 80, the latter point being 9 miles beyond the end of the old Alaska Northern.

It was necessary to enlarge the tunnels of the old road and to rebuild practically all of the trestles. The grade reduction and other work also required some heavy construction in the form of cuts and fills most of which was carried out in hard rock that was difficult to handle. Being in the glacier section considerable trouble has been encountered in the tunnels through seepage of water under pressure, which, as soon as it strikes the air, freezes on the tunnel roof and rapidly forms large heavy icicles causing some danger to train operation. It is hoped to remedy this later by the installation of some kind of a heating system.

The Problem of Snow Slides At Turnagain Arm

The waters of Cook Inlet branch out at their head to the south and north forming two bodies known respectively as Turnagain Arm and Knik Arm. This forms a small point of land, upon about the western point of which is located

Anchorage at Mile 114. The head of Turnagain Arm strikes the railroad at about Mile 67, the line of the road following the shore line of Turnagain Arm into Anchorage, thence around the shore of Knik Arm on easy grades to about the head of the lhere where it turns north a short distance reaching Matanuska on the river of the same name at Mile 152. In order to avoid several bad snow slides along Turnagain Arm, the railroad is carried out about $\frac{1}{4}$ mile from the side hills on a trestle about one mile in length. A series of spur dikes were installed partly as a protective measure against ice and partly with the idea that the tidal action might eventually make a fill at this point. The tide in Turnagain Arm averages about 38 ft. from high to low and one can walk nine miles across the arm at low tide as far as from 18 to 20 miles from its head.

The coal fields are located approximately 40 miles from the main line of the railroad and are reached by a branch following the Matanuska river. This river overflows in certain sections, often cutting new channels and causing considerable trouble. In addition much of it runs between shale bluffs from 150 ft. to 250 ft. high and from 1,000 to 6,000 ft. apart. These are, for the most part, a partially disintegrated shale with a nearly vertical dip and are badly shattered. Through these points the line has been diverted away from the bluffs, since it was found that if they were cut into, immense quantities of this shale would have to be moved and even then there would always be danger of slides. As a consequence, the line has been thrown out into the stream in various places and in order to protect it from the action of the ice and water, sheer dams about 60 ft. long and filled with rock were built at various points during construction to deflect the river away from the track but later hard rock

miles. The construction in places is heavy, the topography of the country requiring a large number of 100 and 120-ft. span bridges with approach trestles and considerable heavy cutting and filling. The construction of this section along the Susitna river was attacked at various points, the materials being moved in by water and by wagon road. From about Mile 233 the line leaves the flat lands adjacent to the river and follows the toe of the slope along the hills, holding very closely to the river edge. In one or two places the road passes over sections of the river bed. The grades are comparatively light with a maximum of one per cent in the heavy construction section.

At Mile 264 the river swings to the east, the railroad crossing it and continuing north into the Alaskan Range on a

Freighting in Supplies Over Trails Built by the Railroad Forces

The Snow Sheds Are Built Primarily for Protection from Slides

rip rip was found sufficient to protect the roadbed. The maximum grades used in the Matanuska coal field extension are 0.4 per cent against outbound loaded movement and 1.0 per cent against inbound empty movement. Thus for seven months of the year at least, it is possible to move out large quantities of coal in heavy tonnage trains to Anchorage for shipment out of Alaska.

Building North Along the Susitna River

Leaving Mile Post 152 where the Matanuska branch connects, the main line swings to the west and with a gradual curve to the north approaches the Susitna river and follows the river, more or less closely, for a distance of about 75

1.75 per cent grade compensated for curves. The Susitna bridge was described in detail in the *Railway Age* of July 16, 1921, page 103. It consists of one main span of a 504-ft. steel truss, spanning the entire river from bank to bank to avoid the menace to channel piers from the rush of the ice in the spring break-up.

The Crossing at Hurricane Gulch

From Mile 264 the line ascends Indian river, a tributary of the Susitna, with increasingly heavy construction running into a section about 18 miles long, beginning at about Mile 284 and on which the cost of bridging was exceptionally heavy. The glacial streams in this section had eroded deep valleys which extend for many miles above the line crossing. The more spectacular of these crossings, known as Hurricane Gulch, is at Mile 284 where a deep gorge in the mountain side crosses the line, with a difference of elevation between the grade of the road and the bottom of the gorge of about 300 ft. The bridge used consists of a 384-ft. deck spandrel arch together with a number of steel girder approach spans carrying a total length of about 920 ft. Construction was carried on entirely from the south end. A cable tramway of large capacity was first installed to serve the dual purpose of transporting bridge materials across to the bridge gangs and food and other supplies to a large grading camp on the north side. A large derrick was installed on the north side and as soon as construction had reached a point where it was practical, it was put into service. Materials including the steel bridge members were brought out upon the completed part of the structure where a locomotive crane picked them up and lowered them over the end of the cantilevered

end of the partly completed bridge. The derrick on the north side then made fast and working together, the two cranes swung the heavy material to the far side where the derrick was able to place it in position.

Ascending to Broad Pass the construction was much lighter. Broad Pass is an opening through the Alaskan Range of unusual topography. It is 6 to 8 miles wide and from 20 to 25 miles long and dotted with numerous lakes. From Broad Pass the road drops down to the line of the Nenana river which it follows generally. This river flows in more or less of a canyon and is very crooked with cut banks nearly the entire distance. Through this section the tracks were kept away, as far as possible, from the action of the river. It was necessary to make a high level crossing of Riley Creek at Mile 347 on a steel viaduct. The crossing of the Nenana river at Mile 373 was made at an elevation providing only for a normal clearance over high water. In addition there were numerous other bridges and trestle work. Grades averaged between one per cent and 1.5 per cent as a maximum through this section which ran until the flat valley lands of Tanana river were reached, the line being comparatively level into Nenana.

The Reconstruction of the Tanana Valley Railroad

The Tanana Valley Railroad which forms the northern section of the line is a narrow-gage road 39.2 miles in length with termini at Chatanika and Fairbanks. A line 32 miles long extends to Chatanika in the mining district from a junction point 7 miles from Fairbanks. One of the first acts of the Commission was the reconstruction of the Tanana Valley and the construction of about 49 miles of new line to connect up Fairbanks with Nenana. This was done in conjunction with the work of building south from Nenana and was for the purpose of reaching the lignite coal fields as quickly as possible so that cheap fuel might be obtainable for the mining industries. A sidelight on the fuel question prior to the completion of this work is the fact that the timber in the vicinity of the mining district had been cut and burned as fuel for a distance of 16 miles back. The price had reached \$15 to \$20 a cord.

In constructing the line from Nenana to Fairbanks the new section was laid to narrow gage as a temporary expedient. Grading, ballasting, bridges, ties, etc., were carried out on the basis of standard-gage construction, the rail being laid to the gage required by the existing Tanana Valley equipment. The extension of the road running from the junction point to Chatanika was simply reconstructed as narrow gage

and will be left and operated that way. With the closing up of the Government Railroad by the completion of the bridge across the Tanana river, the narrow gage to Fairbanks will be widened to standard although the section of line between that terminal and the junction point will be operated both as narrow and standard gage. The bridge across the river will be of the same general design as that across the Susitna river although naturally of a much longer span, 700 ft. in the clear as against 504 ft. at the Susitna crossing. The estimated cost of the structure including several miles of approach grades and trestles is given as \$1,800,000 and one of the requirements of the construction is that it must be built between November 1, 1922, and March 1, 1923.

We are indebted to Col. Frederick Mears, chairman and chief engineer, and C. L. Mason, chief clerk, of the Alaskan Engineering Commission for the information contained in this article.

Freight Car Loading

WASHINGTON, D. C.

THE NUMBER of cars loaded with revenue freight during the week ended March 18 showed a decrease of about 5,000 as compared with the week before, according to the weekly report compiled by the Car Service Division of the American Railway Association. The reduction was due to decreases in grain and grain products and also in coal in spite of the threatened strike, but the figures for the week show an increase of 132,000 as compared with the corresponding week of last year. The total was 823,369 as against 691,396 in 1921 and 855,060 in 1920. In basing estimates of traffic on the carloading figures, however, it is well to take into consideration the fact that the average loading per car this year is less than it was last year. For January the average carload was 27.6 tons as compared with 30.1 in 1921.

As compared with last year increases in loading were shown as to all classes of commodities except ore, and increases were shown in all districts except the Southwestern. There was a gain as compared with last year of 65,000 cars in coal and of 30,000 in miscellaneous.

The summary for the week is given in the table at the bottom of this page.

The number of surplus freight cars showed another reduction during the week ended March 15 to 216,661, of which 79,803 were coal cars and 89,356 were box cars.

Mileage Book Legislation Would Reduce Passenger Revenues

WASHINGTON, D. C.

TESTIMONY ON behalf of the railroads regarding bills to require the roads to issue interchangeable mileage books at a reduced rate was given at the hearing before the House committee on interstate and foreign commerce on March 28. Alfred P. Thom, general counsel of the Association of Railway Executives, said the carriers are opposed on principal to legislation of this nature and do not regard it as wise public policy but do not desire to be contentious. Therefore they would confine themselves to furnishing information as to the results of the study of men who have devoted their lives to the subject of passenger fares and submit it to the committee without argument. He read a letter from H. J. Hart, general counsel of the Bangor & Aroostook, who said that such legislation would be disastrous to his road, which operates its passenger service at a loss solely for the convenience of the public in its territory. Its fares are now on a basis of 4.5 cents a mile on main lines and 5.4 cents on branch lines, yet its operating ratio in passenger service runs from 108 to 110 and a reduced rate mileage book would still further reduce its revenues.

E. L. Bevington, chairman of the Transcontinental Passenger Association, gave estimates of the effect of a mileage book ticket on the passenger revenues of the roads, based on the experience of the past when mileage books have been used territorially or on single roads. He said the passenger revenues of the roads in 1920 were \$1,288,808,159 and in 1921 \$1,153,752,002, or an average of \$1,221,280,085, from which he deducted \$32,828,600 representing the Pullman surcharge, \$56,750,000 representing commutation revenue and \$131,701,485 representing revenue from special excursion traffic, leaving about \$1,000,000,000 which might be affected by a reduced mileage book rate. He estimated that a 1,000 mile ticket would affect about 25 per cent of that and a 20 per cent reduction to a rate of 2.88 cents per mile would amount to \$50,000,000, but if the rate were reduced from 3.6 to 2.5 cents per mile, or 30.5 per cent, a larger percentage would be affected and it would reduce the revenues by \$137,000,000. A 3,000 mile book would cause a loss of \$30,000,000 if sold at a reduction of 20 per cent or \$76,000,000 if the reduction were 30.5 per cent, while a 5,000 mile book would cause a loss of \$20,000,000 if sold at a 20 per cent reduction or of \$38,000,000 if sold at a 30.5 per cent reduction. The higher the denomination, the less would be the effect because fewer people would buy books.

Mr. Bevington said it is impossible to estimate exactly the effect of a mileage book good on all roads but that a few years ago when mileage books were used about 20 per cent of the traffic in the territory involved moved on mileage books and in some districts as high as 60 per cent. In 1917 a 2-cent a mile book was used in the Southeast when the basic rate was 2½ cents and it was used by a major part of the traffic between the principal commercial centers. A generally interchangeable ticket with a greater reduction in rate would affect a larger proportion of the traffic. He illustrated how a 1,000 mile book could be used to defeat regular rates by showing that at 2½ cents a mile the one-way passenger fare from Chicago to New York would be reduced from \$32.70 to \$22.70. Members of the committee asked the usual questions as to why a lower rate would not stimulate traffic enough to make up for the reduction in rate. Mr. Bevington said that a temporary excursion rate will stimulate traffic but a reduction in the basic rate, available at any time, has very little effect. He recalled that when passenger fares were reduced from 3 to 2 cents a mile in many states there was a stimulation of travel for only about three months and pointed out that an interchangeable mileage book would practically affect the basic rate. A large reduc-

tion in rates would undoubtedly stimulate traffic somewhat, he said, but this would be largely offset by the reduction in the revenue from the ordinary traffic and the increased traffic would cause an increase in expense. In reply to Representative Cooper, he said that a 43 per cent increase in traffic between New York and Chicago would be necessary to make up in total revenue for the loss of \$10 a ticket, to say nothing of the increased expense that would be caused.

Representative Johnson of Mississippi created a diversion by demanding that Mr. Bevington state the amount of his salary. This aroused a discussion among the members of the committee as to whether it was a proper question. Mr. Johnson insisted that "the railroads are guaranteed at the expense of the taxpayers and if they are paying fabulous salaries the public has a right to know it." Chairman Winslow finally ruled that a member of the committee had a right to ask such a question but that the witness might properly decline to answer it. Mr. Bevington then said he had no objection to stating that after 32 years of service he is receiving the munificent sum of \$9,000 a year." Representative Johnson then asked that the entire colloquy except the question and the answer be stricken from the record.

Continuing his testimony on March 29, Mr. Bevington showed that the average cost of passenger service per car mile is above 40 cents, which would be about the revenue received at a rate of 2½ cents a mile on the average of 16.54 passengers per car. If a concession were granted to purchasers of mileage books, the railroads would not only lose the amount of revenue represented by the reduction to commercial travelers, but also more, because a large percentage of general passengers would avail themselves of the reduction. He also pointed out that even if the books were made non-transferable it would be impossible to prevent their manipulation by scalpers and others; also they would lead to the practice of checking baggage between points between which the holders of the tickets themselves did not travel. In reply to the claim that the railroads would make money by the interest on the advance payments for mileage books, Mr. Bevington said that the average life of a thousand-mile book is only about two months and the carriers would have the use of the money in advance on the average only for one-half of that time. For this period the interest figures out at 14.4 cents. On the other hand, the cost of a mileage book is about 15 cents and reducing this to 13 cents by crediting the passenger with the cost of 20 single tickets at a cost of 2 cents, this leaves a margin of only 1.4 cents for the railroad to cover the additional cost of accounting.

Mr. Bevington also said that the Interstate Commerce Commission has always opposed the idea of reducing rates on the wholesale principle, and that while a carload rate is usually less than the l. c. l. rate the shipper of one car pays the same rate as the shipper of 5,000 cars. He pointed out that the carload rate would not be extended to a shipper who would pay in advance for a number of carloads and then ship in small quantities and that commercial travel does not represent the wholesale principle, but a large number of small retail transactions. Purchasers of one-way long distance tickets between thousands of points in the United States pay for more transportation at one time than the commercial traveler would pay for a mileage book and thousands of round trip tickets are sold that cost more than a 5,000 mile book.

When Mr. Bevington referred to reduced rate mileage book for commercial travelers as representing a discrimination, he was asked a number of questions as to why reduced fares for conventions, etc., are not discriminatory. He pointed out that such special fares are restricted to destinations and dates, that they stimulate traffic by inducing people to travel who otherwise would not, and that they fill the trains by concentrating the travel on given days, whereas the reduction in the basic rate or a reduced mileage book rate would

not be sufficient to fill the trains and would apply to a large portion of the ordinary travel for which trains are run on fixed schedules.

Representatives of a number of organizations of commercial travelers had previously testified before the committee

urging legislation to require a reduced rate mileage book, saying that the "policy" of the railroads is driving traffic away because the high rates are leading traveling salesmen to use automobiles. One witness said there are 650,000 commercial travelers in the United States.

Carriers Denounce Delay in Wage Reduction Case

Railroad Representatives Attempt to End Further Quibbling Before Labor Board

STRATEGY, COLDLY CALCULATED to interfere and delay" was the term given by J. W. Higgins, representing the western railroads before the Railroad Labor Board to the recent effort of the Railway Employees Department of the American Federation of Labor to obtain wage increases in the face of the railroads' requests for lower rates of pay. At the same time the charges of B. M. Jewell, president of the Railway Employees Department of the Federation, that the railroads are not legally before the board in the present wage reduction case were characterized by Mr. Higgins as "unfair and unsupported." These answers came on March 24 after a week of argument as to whether or not "proper conferences" as contemplated by the Transportation Act, had been held prior to the submission of the case to the board.

"As to Mr. Jewell's sweeping charge of bad faith and indifference in not even attempting to negotiate an agreement with the system organizations or employees," Mr. Higgins said, "the Railway Employees Department sent out a circular letter signed by Mr. Jewell instructing each system federation to request conferences immediately with the railroads for the purpose of negotiating a wage increase of five cents per hour above the rates established by Decision 2. This action was taken in the face of the fact that the board had, in its decision 147, recognized a downward trend, and named rates which it considered just and reasonable under the provisions of the Transportation Act, and also in spite of the further fact that there had been a continued downward trend since the issuance of Decision 147.

"Keeping in mind these conditions, and also the ability of the gentlemen directing the movement on the other side, there is no escape from the conclusion that the inauguration of this program for a wage increase was to checkmate the proposed decreases by requesting such abnormal increases as to make any sort of an agreement impossible. As such an increase as they requested, or in fact, any increase, could not be in justice obtained under existing conditions, then the movement must have had another purpose. I hold that we have proved that their plan was coldly calculated to interfere with and delay the decision in this case. From their viewpoint, it was good strategy, because so far as I know, no wage decrease has as yet been made retroactive."

In support of this position, Mr. Higgins quoted portions of Mr. Jewell's letter of instructions to the representatives of the shop men on the various railroads, and asked if these instructions were not given to delay meeting the railroads on the merits of the proposed decreases, and to inject into the wage conferences demands for abnormal increases, and to insist upon these increases being discussed, thereby showing the railroad proposition into the background, and forcing disagreements on the proposed increase only.

Referring to Mr. Jewell's allegation that railroad operating officers were without authority in the matter of wage rates because of an alleged arbitrary plan imposed upon them by higher authority, Mr. Higgins said: "No such plan

ever existed, and is therefore wholly imaginary." He then outlined in detail the manner in which the western railroads arrived at the proposed new rates of pay, adding:

"There was nothing mysterious or nothing arbitrary about the source of the rates proposed in western territory. The rates came from the knowledge, experience and judgment of operating officers of the western railroads. There was no consultation or conference with either of the other sections of the country. The rates named (by the operating officers) were recommendatory, and it was well understood that each western railroad could exercise its individual judgment with respect to such rates in order to reach a settlement satisfactory to it."

The agreement recently reached between the Chicago, Burlington & Quincy and its clerical forces was cited by Mr. Higgins as an example of what could have been accomplished. He added:

"I believe the shop men on that railroad or any other railroad could have settled, had the representatives shown the spirit of compromise shown by the clerical men on the Burlington.

Shop Employees Seek Irrelevant

Data In Wage Conferences

"One year ago," Mr. Higgins continued, "similar conferences were held in a general wage movement, which resulted in Decision 147. You may recall that in the hearing at that time protests were made by this organization against the early disposition of the question—they wanted it delayed, but not on account of the conferences. They claimed that until rules and working conditions then pending had been decided, the board was not in position to fix wage rates that could be considered just and reasonable. At the present time all rules have been decided by this board, and the means for gaining delay have been shifted to the attack upon the conferences held upon the individual railroads.

"Furthermore I ask you to note the character of the information each of the chairmen insisted upon having from managers, superintendents, mechanical superintendents, master mechanics or other local officers whose chief duty and concern is the safe movement of passenger and freight trains, or the safe maintenance of the equipment. They have, as a rule, no direct connection with, and are therefore unfamiliar with the larger financial, traffic and accounting features which the federated chairmen, for the first time, invariably wanted to talk about. These features included, for example, capital stock, bonded debt, gross and net earnings, traffic outlook, development and fluctuations, and ability to pay. These matters the federated chairmen insisted on knowing all about from the operating officers before they would discuss wages. Much of this information for which the chairmen seemed to hunger was seldom, if ever before, discussed even incidentally, much less used in local wage conferences, but this time the chairmen put questions on some or all of these subjects, but studiously avoided such things

as new facilities, new equipment and new wage rates.

"There was such a striking contrast in the uniformity of action on one side, and lack of it on the other in these conferences as to clearly point to the side that was thoroughly schooled, drilled and disciplined in the prearranged program. It did not matter whether the chairmen were nearby neighbors in the same city, or whether they were thousands of miles apart, they had an insatiable appetite for the same baffling information.

Charges of Bad Faith Unfair

"I submit it is most unfair to bring charges of bad faith against these men, alleging that they were unprepared in that they did not have or withheld proper information, and that they lacked authority merely because the federation chairmen called for a mass of irrelevant information. These conferences were held in good faith, they were of the same character as last year's conferences or any other conferences having to do with wage rates or working conditions. It does not follow that we held these conferences with less respect merely because federation chairmen, for some reason as yet unexplained, for the first time departed from long established custom and practice by calling for information of no practical use in solving the issue in the local conference—information of a character known only to men handling the financial, accounting or traffic work of these western roads.

Holds Conferences Proper

"We hold that proper conferences were held," Mr. Higgins said in closing. "We produced evidence from the individual railroads that established beyond a doubt that the railroads, in these conferences, were prepared to sustain, and did adequately sustain their proposed rates, with supporting data as to rates paid in outside industries, deflations in living costs, etc. We have shown that definite and distinct disputes resulted from these conferences. We have shown that the federation chairmen were not free agents. We showed that not one of them would even consider the rates established by Decision 147 as the basis for discussion or negotiation—that such freedom as they may have had was limited strictly to the range between 77 cents per hour (the present rate) and 90 cents per hour (the new rate proposed by Mr. Jewell) and we also showed that they would not join the railroad officers in a study of the rates in other industries.

"The railroad companies have, so far as the shop men are concerned, presented their argument for a decrease. We have not attempted to inject extraneous matter. It is our aim to be helpful in assisting the board to decide the question. It is not our desire to interfere in any manner with the presentation of evidence germane to these disputes, nor is it our wish to criticize the strategy or attack of the other side in any respect, but we have the right, and we do earnestly protest against the unfair and unsupported charges of bad faith made by Mr. Jewell and against his attempt at this late date to obstruct and further delay the hearings."

J. G. Walber Points Out Fallacy

of Shop Crafts' Position

Mr. Jewell's efforts to have the wage reduction controversy remanded for further conferences are based wholly on a misinterpretation of the Transportation Act, according to J. G. Walber, representing the eastern carriers, who followed Mr. Higgins.

"It is obvious," Mr. Walber said, "that Mr. Jewell is laboring under a misconception as to the meaning of words. He seems to think that the word 'conference' is synonymous with 'imposition' and that because the managements on the several roads were unwilling to compromise, therefore, they were not conferring and, further, as the managements did not accept suggestions from the employees of splitting the difference between the increases they proposed and the

decreases which the management proposed, which would have resulted in increases over the existing rates of pay, it was evidence to Mr. Jewell's mind that bona fide conferences did not take place.

"It is apparent that Mr. Jewell has confused the requirements of Section 301 of the Transportation Act with the obligations imposed upon the board by the provisions of Section 307. It is necessary under the requirements of Section 307 for the board in considering disputes which have been submitted to it, to give consideration among other relevant circumstances to the seven specific elements therein mentioned, while no such obligation is cast upon the parties to the conference by the requirements of Section 301, and if in the conference held under Section 301, by inadvertence or otherwise, some of the elements mentioned in Section 307 were not referred to and discussed, it does not in the slightest vitiate said conferences.

Joint Submissions

"Even aside from all that has thus far been said there is another reason which in and of itself should be accepted as sufficient cause for the dismissal of Mr. Jewell's contention that the conferences were not proper in the case of the eastern railroads. The submissions of disputes between carriers and the shop craft employees in a number of instances are joint: as a matter of fact on some 14 railroads in the eastern territory both parties have jointly certified to this board that they have conferred and having disagreed, invoke the jurisdiction of the board. This condition absolutely estops either party from now urging that the certificate which is signed in the joint submission was fictitious. On practically all of the other eastern roads Mr. Jewell himself has certified to this board ex-parte submissions of disputes in the matter of proposals for increases in pay. Having in mind that in practically every case joint conferences dealt both with the proposal for increases and the proposal for decreases, it is impossible to understand on what theory it can be contended that the conferences were proper as to the application for increases and improper as to the application for decreases.

"Considering all the phases of the situation, i.e., the conviction on the part of the managements that decreases were justified and the corresponding conviction on the part of the employees that increases were justified; the difference between the requirements of Sections 301 and 307; and the bona fide conferences held under the requirements of the act—we submit that these cases should not be remanded by the board for further conferences. To decide otherwise would open the way for either side to prevent local settlements of disputes and at the same time make it impossible to submit unsettled questions to the board."

New Rules for Stationary Engineers

A new code of rules to govern the working conditions of railway employees, members of the International Union of Steam and Operating Engineers, on the Baltimore & Ohio Chicago Terminal, the Chicago & Alton, the Kanawha & Michigan and the New York Central was announced by the Labor Board on March 27. The new rules, which are effective April 1, govern the hours of service and working conditions of stationary engineers on these roads, except those covered by the provisions of the Board's Decision No. 222, reported in the *Railway Age* of August 27, 1921, page 419. Included in the new code are provisions for the working of these employees on "split tricks," 8 hours within a spread of 12 hours; where service is intermittent and for the payment of time and one-half for overtime after the tenth hour of continuous service. The rules relative to payments for work not continuous with the regular work period and for Sunday and holiday work are similar to those announced by the Labor Board to apply to other groups of railway employees and described in previous issues of the *Railway Age*.

B. M. Jewell Attacks Nation's Industrial System

Justice of Rates of Pay of All Productive Labor Challenged —
Asks "Living Wage" of \$2,636

THE JUSTICE of the wage rates of all productive labor in this country and the principle upon which the railroads have proposed that rates of pay of railway employees be adjusted were attacked by B. M. Jewell, president of the Railway Employees Department of the American Federation of Labor, in taking up, on behalf of the Federated Shop Crafts, the defense of the present rates of pay of railway shop employees before the Railroad Labor Board on March 27.

"We propose to show how the entire purpose for which industry is operated can and must be changed. The so-called law of supply and demand will never afford a living wage in a system organized according to modern business principles," Mr. Jewell said. Declaring that the existing wage scales are insufficient to enable wage earners to maintain a "minimum of decent living" Mr. Jewell declared that an investigation conducted by economists in the employ of the Shop Crafts indicated that "low standards of living are due largely to an unfair division of the country's products."

"The railroads are saying to their employees, 'we cannot afford to pay a living wage,' while we say that the railroad industry must pay at least that," Mr. Jewell added. "This issue is not confined to railroad workers; the country must pay all productive workers a living wage."

After analyzing the necessity for the railroad industry paying its way, Mr. Jewell declared that this is an unwarranted distinction between the transportation system and the whole industry of the country. "Surely the whole industry of the country must pay its way if the country is not to go bankrupt," he said. "But to argue that each separate industry, run without co-ordination to the whole, must pay its way is as contrary to the facts as to argue that a given railroad siding or spur track must pay its way independently. If an industry can afford only a starvation wage it stands self-condemned. But our study has convinced us that taken as a whole industry can pay a living wage, and we are going to outline for the board the basis of this conclusion."

"We feel that mere adjustment of wage rates to minute variations in the cost of living would be a purely statistical problem for the board's force, requiring no hearing or elaborate preparation on either side. If the board should interpret its function to be merely to determine the level of wage rates established in the outside labor market, it would thereby become a mere game and so defeat the purpose for which it was established."

The Shop Crafts' argument will take the following form, Mr. Jewell said: (1) an examination of the connection between wages being paid on the railroads and in industry as a whole and the cost of the necessities of healthy family life; (2) an exposition of the forces operating to determine wages in the labor market; (3) a study of the national income with a view to ascertaining whether industry can afford to pay a living wage; (4) a forecast of the effect upon the country's general prosperity which would result from the payment of a living wage.

Mr. Jewell Presents Detailed Food Budgets

In support of his charge that "the railroad industry is not today paying a living wage to the mechanics employed in its shops," Mr. Jewell presented a mass of cost of living data prepared by various members of the Federated Shop Crafts and including itemized monthly expense accounts, food budgets and other information of a similar character. These data disclosed, according to Mr. Jewell, that "the ex-

penditures made by railroad employees' families for food falls far short of the minimum requirements for bare subsistence, below which it is dangerous to go, according to Professor M. E. Jaffa of the University of California, a specialist in food budgets and dietetics." Mr. Jewell's data indicated that mechanics in railroad shops were able to purchase about 64 per cent of the meat, fish, milk and eggs necessary to maintain their actual families at the lowest level of safety; 77 per cent of the necessary cereal foods, 91 per cent of the necessary vegetables and fruits, and 71 per cent of the necessary butter and oils.

"The deficit in railroad wages does not appear in dollars and cents," Mr. Jewell added, "it appears in a shortage of food. This is as truly a deficit to railroad industry as would be a failure to meet interest on bonded indebtedness. The result of such a deficit in terms of the general physique of the country and also in terms of the efficient operation of the railroads are sufficiently obvious. If an industry cannot meet its first fixed charge, the payment of a healthful livelihood to its employees, it is indeed bankrupt.

"It is argued that the railroads must meet their fixed charges. The general rule in business is that a concern which cannot meet its fixed charges is bankrupt. It seems to us that a healthful standard of living for his family represents a man's fixed charge. Failure to meet this means the realest kind of bankruptcy. It will mean eventual physical and moral bankruptcy to the nation."

Mr. Jewell's budget for railway shop employees requires annual earnings averaging for the entire country of \$2,636.97 or \$300 more than the budget prepared by the Department of Labor.

"Some people will undoubtedly want to interject some comment upon the absurdity of a mere workers' expecting an income of this size," Mr. Jewell said. "If they are honest they will recognize that they are remarking on the absurdity of the workers of the country receiving as much goods as are enumerated in the budget. The mere dollars and cents mean nothing; it is what they purchase that counts. If such people are really honest they will then proceed to enumerate the articles or quantities which it is absurd that a worker's family should have and will further state clearly what, in their opinion, a worker may expect as a minimum allowance of good things in return for his service to society."

To secure what this budget provides, railroad mechanics would have to earn 40 per cent more than they now earn, according to Mr. Jewell.

Wage Deflation Opposed on Grounds That

Inflation Has Never Taken Place

Mr. Jewell's argument against the deflation of the wages of railway employees was based on the charge that the "rail and other workers of America never received 'inflated' wages." His economists disclosed, he said, that the only marked effect of inflation and deflation in wages is a weakening of the bargaining power of labor during the deflation period. Analysis of the financial history of the metal, chemical, cloth, clothing, food products, fuel, building material and house furnishing industries show, Mr. Jewell contended, that "throughout prosperity and depression, wages are tied close to the subsistence level."

"Corner Storekeeper" Defended by Mr. Jewell

"Wage earners are not the only victims of deflation," Mr. Jewell added. "The storekeeper suffers equally, because as

wage rates do not increase with wholesale prices, the consumer cannot sustain retail prices which keep pace with wholesale prices. The corner storekeeper must stand the difference and hope to recuperate slightly as wages and retail prices lag behind descending prices."

"But here is the rub," continued Mr. Jewell, "the increase in prices is slow, extending over several years, but the men who profit largely in the ascent and stand to lose in the period of decline have control of the situation and plunge the country into deflation so suddenly that the possible gains of the corner storekeeper and the wage earner are entirely swallowed up because unemployment and part time reduce the purchasing power.

"It was not a buyers' strike but a buyers' lock-out which precipitated the depression with its unemployment. With a monopoly control of credit and prices and with a monopoly control of jobs, they precipitated a lock-out which by its suddenness and completeness forced the small business man, the farmer and the wage earner to carry the whole burden of deflation."

Mr. Jewell's study of the relation between prices and wages is based on the wholesale price index numbers of the United States Department of Labor and the figures gathered by the New York State Industrial Commission.

Mr. Jewell Asks for Immediate Ruling on Question of Jurisdiction

Prior to the presentation of his case as abstracted above, Mr. Jewell requested that the Board adjourn the hearings and immediately pass upon the request to remand the whole wage controversy to further conferences between the carriers and employees involved, in order that "railroad shop craft employees shall at this time be definitely assured that this Board will not sanction or approve non-compliance or perfunctory compliance with the law." At the same time he questioned the Board as to a press report stating that "the Board has decided to over-rule the union's request that the carriers requests be thrown out." The Board's answer to Mr. Jewell's demand for an immediate ruling and for information as to its attitude on the subject of conferences as indicated in this press statement was given in the form of a resolution of the Board read by Chairman Barton. This resolution said:

"It is the order of the Board that when both the representatives of the railroads and employees have completed their presentation on the issue as to whether proper conferences have been held, the hearing at once proceed on other phases of the case and the Board reserves the right to pass on the question as to conferences after the entire case has been heard. This order shall apply to the shop craft hearings and all the other classes before the Board on this hearing."

Mr. Jewell protested against this ruling as representing a departure from his "understanding of the procedure of any similar, or generally speaking, so-called judicial tribunal wherein the merits of the case are required to be discussed before that Board or that tribunal prior to the time that Board or tribunal determines whether or not it has jurisdiction."

"We stand here expounding the gospel of regular and orderly procedure," Mr. Jewell added. "This action on the part of the Board does not, in our opinion, make for the preservation of these things; it does not make for the encouragement of them. The success of the railroad industry must depend on the continuation of that procedure in our opinion."

This allegation was denied by G. W. W. Hangar, acting chairman in the temporary absence of Judge Barton, by stating that this action "is in accordance with the methods of the Board in previous cases where questions of jurisdiction have been raised."

Employees Again Ask for

Investigation of Railroad Publicity

Mr. Jewell again asked the Board to investigate the publicity material put out in the name of the Association of Railway Executives and presented to the Board, as examples of this material, several bulletins issued under the authority of the Association and containing abstracts of the wage data recently submitted to the Board by Mr. Walber. The chairman of the Board stated that no action had been taken on the previous request of a similar nature but that the matter would be called to the attention of the Board in the near future.

St. Paul Clerks' Case Before Board

Clerical forces on the Chicago, Milwaukee & St. Paul could not agree with the management of the carrier regarding proposed wage decreases and the dispute has been submitted to the Labor Board. The carrier asked for a 10 per cent reduction and representatives of the clerks held out for a smaller reduction, citing the recent agreement on the Burlington as justification of their stand.

Albert Phillips, Labor Board Member, Resigns

Albert Phillips, formerly vice-president of the Brotherhood of Locomotive Firemen and Enginemen, and for the past two years a member of the labor group on the Labor Board, has tendered his resignation from that body to President Harding to become effective April 15. Mr. Phillips has been ill for some time and has not appeared at any of the Board's public hearings since last December. No information has been received at the Board so far as to Mr. Phillips' future plans, but it is understood that as soon as his health permits, he will resume his duties with the Brotherhood of Locomotive Firemen and Enginemen.

Labor Board to Move

The Labor Board will, after April 24, be located on the twenty-second floor of the Transportation Building, Harrison and Dearborn streets, Chicago, instead of the Kesner Building, its present location. The new quarters will enable all the Board's offices to be consolidated on one floor instead of three as is the case at present.

Hearings on Enginemen's Working Rules

The Board on March 29 adopted a resolution ordering hearings on disputes between the carriers and their engineers and firemen as to rules and working conditions, to begin immediately after the present wage reduction hearings are closed. No mention is made in the resolution regarding similar disputes between the carriers and their conductors and trainmen.

The Same Design on Rail and Road

The Manhattan City & Interurban Railway of Manhattan, Kan., has changed from electric trolley cars to gasoline rail cars of the FWD type, the new cars being much lighter and cheaper to operate. At the end of the line the rail car connects with a motor bus of similar design which operates to outlying points.

Vacuum Brake Tests on English Freight Trains

Results of Great Northern Trials Reported Before Institution of Civil Engineers

THE USE OF VACUUM brakes both in England and in the United States is almost as old as that of air brakes. In this country the vacuum brake many years ago practically passed out of existence except for a few industrial locomotives. In England the vacuum brake has been continued in service and is even now extensively employed, and the same is also true to a large extent of some other European countries, as well as India, Australia, Africa and South America.

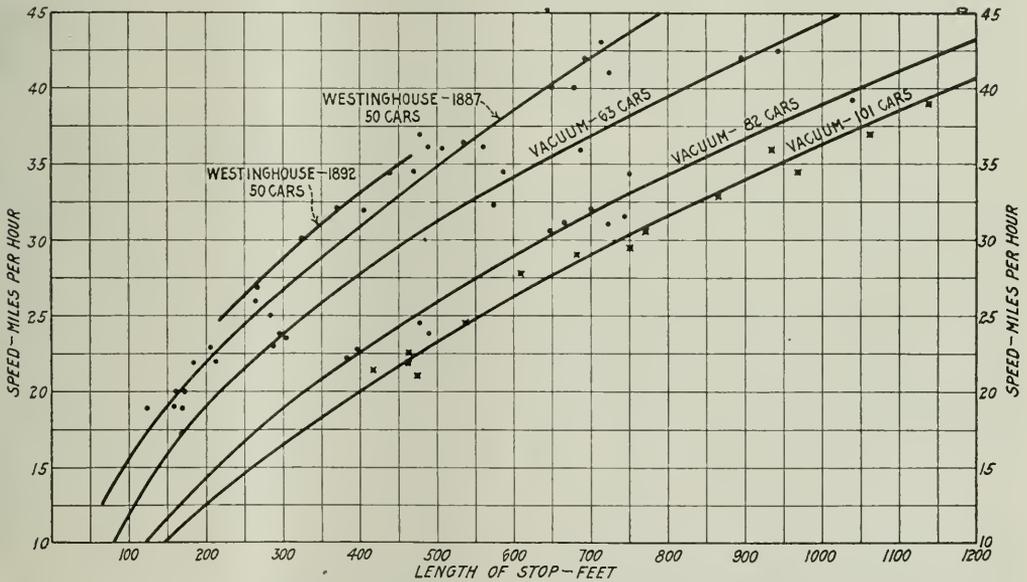

Evolution of the Vacuum Brake

In its evolution during the last 50 years the vacuum brake passed through changes paralleling those which took place

in England has been quite limited. The steadily increasing length and weight of passenger trains as well as a growing demand for power brakes on freight trains has, however, led to the development of accelerating or rapid action valves for the quicker application of the brakes on longer trains. These, however, have not yet been extensively applied.

Advantages and Disadvantages of the Vacuum Brake

To an American who has been accustomed to the air brake only, or who perhaps recalls the vacuum brake as largely an old experimental device, it is somewhat surprising to learn that the vacuum brake is even more common in England

Comparative Stops with English Vacuum Brakes and American Westinghouse Air Brakes

in the air brake. At first, a plain vacuum brake met the requirements. The brake pipe was normally open to the atmosphere and an ejector was used to create a vacuum in the brake pipe and diaphragm or cylinder on the various cars when it was desired to apply the brakes, the vacuum being destroyed to release the brakes. This system was long ago superseded by the automatic vacuum brake in which a vacuum is constantly maintained in the brake pipe and in the enlarged chamber or attached reservoir above the brake piston, the vacuum being partially or fully destroyed to apply the brakes and again restored to release the brakes. A combined ejector and brake valve is commonly employed to create the vacuum and to control the admission of air to the brake pipe. This ejector has two nozzles, a large one for creating the initial vacuum and for releasing the brakes and a small nozzle for maintaining the vacuum after the brakes have been released.

Thus far the application of power brakes to freight equip-

ment in England has been quite limited. This raises the question as to why the vacuum brake has been able to retain its position and what advantages it possesses. The outstanding reasons appear to be: the simplicity of the mechanism and its low expense of maintenance; the perfect control of braking due to the fact that the braking pressure can be increased or decreased at will without releasing the brakes; and the smoothness of the stops, this last feature being due partly to the use of lower rates of retardation than are demanded by American railroads. There is a distinct disadvantage in the relatively large size of the brake cylinders which is a result of the low cylinder pressure of less than 10 lb. per sq. in. This is only one-sixth of the pressure used in air brake cylinders.

Vacuum Brake Tests on the Great Northern

With a view to ascertaining the suitability of the vacuum brake for long freight trains, a series of trials was carried out during the summer of 1919 on the Great Northern Rail-

way. These tests were under the supervision of Sir Henry Fowler and H. N. Gresley who presented a paper before the Institution of Civil Engineers on January 10, 1922, giving the results of the runs. The facts given herewith are taken from this paper.

The main difference between braking freight trains and passenger trains are briefly as follows.—(a) The greater length of freight trains. (b) The necessity of running loaded and empty cars together in freight trains. (c) Even if screw couplings are used, the need of quickly coupling and uncoupling when switching will probably result in the couplings being screwed up less tightly than in passenger trains. This tendency to couple loosely enhances the need for a smooth and uniform action of the brake throughout the train.

For these tests the following conditions were laid down as a standard of satisfactory performances:

That trains of 100 cars, close coupled, must be stopped:

- (1) By emergency applications without shock and without any risk of parting the train.
- (2) By service applications without shock or risk of parting, and in such a manner that the train could be restarted immediately after coming to rest.
- (3) That the speed of the train could be reduced as required.

The tests were carried out on the Great Northern railway between Petersborough and Firsby, this portion of the line being practically free from grades and curves.

Trains and Equipment

The locomotive was of 2-6-0 type. The weight of the locomotive in working order and the tender two thirds loaded with coal and water was 213,920 lb. All wheels were braked with the exception of those of the front truck. The ejector was a Gresham and Craven combined 20 mm. and a 25 mm. Drednaught.

The train consisted of Great Northern railway eight-ton covered vans or box cars, having an average light weight of 16,150 lb and fitted with the G.N.R. standard vacuum brake, with the Westinghouse Brake Company's accelerators and reducing nipples. In addition to these the train included three Midland railway six-wheeled cars carrying the necessary recording instruments. One of these was placed at the front of the train, one in the middle, and one at the rear.

All the cars were unloaded and provided with screw couplings. The brakes were tested for leakage before the trials, and the travel of the brake pistons adjusted as required. The instruments comprised speed recorders and duplex vacuum recorders. The latter instruments (one of which was placed in the front, middle and rear vans) recorded the pressure in the train pipe and brake cylinder reservoir.

The average retarding force is the basis usually adopted for comparing brake stops. This force is convenient to express as a percentage of the weight of the train, and in the calculations, the weight of the train is taken as the gross weight of the train increased by the equivalent rotary inertia percentage, which was found from calculation to vary from 10.4 to 10.7 per cent of the weight of the train, being about 7.3 per cent for the locomotive and tender and 11.1 per cent for the cars. The forces concerned, inclusive of brake power, friction and gravity, are assumed to be acting uniformly throughout the stop.

The standard vacuum carried in the brake pipe was 20 in. and the average effective vacuum in the car brake cylinders with the brakes fully applied was 17 in. or 8.33 lb. per sq. in. The brake shoe pressure equalled 61 per cent of the weight of the locomotive and tender, 90 per cent for the cars and 86 per cent for the train complete with the locomotive.

Results on Trains of Various Lengths

The first tests were made with a 63-car train, each car being fitted with an accelerator and a standard reducing nipple between the brake pipe and the under side of the piston in the vacuum brake cylinder. The standard size of choke is 3/16 in. diameter for a 15-in. cylinder and 5/16 in. for an 18-in. cylinder. The weight of the 63 cars was 455.25 long tons or 1,019,760 lb. All emergency stops made under these conditions were satisfactory. It was found necessary, in making speed reductions or service stops, to apply the brake gradually, otherwise the accelerators operated, and unless the speed was high, say over 30 miles per hour, the train came to a stand before the brakes could be released.

The 80-car train was made up by attaching nine cars at the front of the previous 63-car train and eight cars at the rear; these cars had no accelerators or reducing nipples. Five emergency stops were made from speeds ranging between 22 and 42 miles per hour, but the shocks were so severe that in one case the train parted. The front nine cars were switched out and another emergency stop made, but the shock was so bad that the train again parted. The records of these stops were spoilt on account of the effect of the shocks on the instruments, and it was decided to abandon further trials with trains not completely fitted with accelerators.

The next tests were made with an 82-car train, fitted with accelerators and standard reducing nipples throughout. The total weight of the cars was 587.5 long tons or 1,316,000 lb. At speeds above 40 miles per hour the stops were fairly smooth, but between 30 and 40 miles per hour there was a rough jerk just before stopping, and for stops from 20 to 30 miles per hour the jerk was very severe just before coming to rest. The stopping distances of this train were almost identical with that of the 63-car train. Emergency stops were then tried with the working vacuum reduced to 16 in. These were fairly smooth except at the lower speeds, but the stopping distance was increased by about 20 per cent.

The next change was to reduce the size of the chokes in the nipples to 7/64 in. diameter for a 15-in. cylinder and to 1/8 in. for an 18-in. cylinder. The train consisted of the same 82 cars fitted with accelerators. The effect of the reduced nipples was to make the stops at all speeds quite satisfactory as regards being smooth, but increased the stopping distance by about 25 per cent.

Following these tests the length of the train was increased to 101 cars, the total weight of the cars being 719.5 long tons or 1,611,680 lb. All cars were fitted with accelerators as well as specially reduced nipples of the same size as those used on the preceding 82-car train. The emergency stops were quite satisfactory as regards being smooth, but compared with the standard of comparison—63-car train—the stopping distance was increased by about 35 per cent. Emergency stops were also made working with a 16-in. vacuum. In this case the stops were very smooth, but the stopping distance compared with the standard was increased approximately by 50 per cent.

General Conclusions

(1) The trials demonstrate that it is practicable with the vacuum brake to work long trains of up to 100 cars, provided that suitable accelerators and reducing nipples are used.

(2) Emergency stops can be made without shock with trains consisting of up to 100 cars.

(3) Service stops and speed reductions can be made and the train restarted promptly, provided that when running at speeds less than 30 miles per hour air is admitted slowly so as not to operate the accelerators. This necessitates the braking being spread over some distance, but allows time to have the brakes partly released when the desired reduced speed is reached, or just before stopping, and thereby en-

The Theory and Practice of Store Door Delivery

Seven Speakers Discuss Possibilities and Problems of the Subject
Before New York Railroad Club

AT THE MEETING of the New York Railroad Club on Friday, March 17, store door delivery was discussed as to its history, the practice in foreign countries, its advantages, the objections to it and actual experience with it in this country.

The speakers were Colonel Charles Hine, Robert E. Thayer, J. Shirley Eaton, W. J. L. Banham, T. C. Powell, W. C. Brinton and B. F. Fitch. Colonel Hine gave a brief sketch of the history of store door delivery in this country. Mr. Thayer, who is European editor of the *Railway Age* and but recently returned from England, told of the working of the plan in England, where it has been in operation since the early days of the railways. Mr. Eaton, who made an extensive study of the problem for the Federal Trade Commission, spoke upon the relation of store door delivery to markets. Mr. Banham, the general traffic manager of the Otis Elevator Company and who is one of the strongest advocates of the innovation, outlined its economic advantages to carrier and shipper alike. Mr. Brinton, consulting engineer and president of the Terminal Engineering Company, explained the operation of the system in Montreal and exhibited some lantern slides illustrating some practical suggestions for solving the problem. Mr. Fitch told of the advantages of the system and the methods of overcoming obstacles based upon his observations of the Cincinnati plan.

Address of T. C. Powell

T. C. Powell, vice-president of the Erie, described in detail that company's plan of store door delivery in New York. A brief description of this plan was published in the *Railway Age* of January 21, page 233. Mr. Powell's address was particularly informative and valuable in that it not only described a practical system of store door delivery which is in actual operation but because it touched upon the especially perplexing problem of distribution in New York, for which many and varied solutions have been proposed.

New York's problem arises from the fact that all but three of the important lines entering the metropolitan district terminate on the New Jersey or Staten Island side of the Hudson river. All these railroads maintain freight stations in piers on the New York side of the river and cars are floated to them from the Jersey side. The Erie plan is important, therefore, not only because it involves store door delivery, but because it contemplates the loading of motor trucks directly on the Jersey side and the movement of the trucks across the Hudson river to New York on ferries which radiate, fanlike, from the Jersey side to several points in New York. The New York pier freight stations can thus in large measure be abandoned and car floating reduced to a minimum.

Mr. Powell said in part:

The Erie Plan

"What the Erie has done in New York is the first move by a rail carrier of which I am advised, to deliver freight to an inland station and to make direct delivery to a consignee as the result of an investigation and of a decision that this was the thing to do, rather than as the result of competition of some other source of carriage or through a suggestion of a private individual who organizes a separate company.

"Before I describe in detail the Erie method I would like to revert a little bit to what has been growing in my mind for a number of years with respect to this kind of handling. I have only been with the Erie Railroad about two years.

When I came I found that Mr. Underwood, the president, was very much interested in this question of making delivery by means of trucks, and had made considerable progress toward the plan finally adopted as I will describe later.

"During the Federal Administration, the Interstate Commerce Commission, at the request of the administration, investigated the possibility of some such plan as we have since put into effect. At that time they found a great deal of opposition from the numerous trucking concerns, and from some others, and that scheme fell to the ground. The term of office of the particular commissioner in charge afterwards expired, and there was no one else on the commission who had taken a special interest in it.

Private Company Contracts to Do Trucking

"The United States Trucking Corporation (New York) which is the largest trucking corporation of the city, has been found to be large enough to assume the responsibilities that must be connected with this class of service.

"Something over 20 years ago there was in the little town of Gainesville, Georgia, an enterprising truckman who undertook to do exactly what we are doing today, and he was very successful in doing it, so successful that he finally persuaded all the merchants in town to sell to him their trucks and teams and wagons, so that he performed not only the service to and from the freight stations, but also all the delivery service in the town. That was successful, and it was broken up only by reason of another railroad coming in and jealously trying to change the arrangement, and finally breaking up the contract.

"Years ago, also, I appreciated that the ultimate result of the extraordinary values of terminal property would be a financial problem quite as much as a physical problem. It was clear to me that in the congested areas (in which areas the less than carload freight is largest in volume) the price of land and the cost of maintenance would become so high that there would be no way of solving the problem except by extension of the facilities by means of a truck or dray, and that was before the automobile was in active service. I also observed at different places in the south, such, for instance, as Birmingham, that where the railroad was able to assign a definite space in the freight station to a transfer company under contract, not owned by the railroad, but under bond to the railroad, and under contract with the consignees whereby that transfer company could immediately collect the freight at the station and deliver it, that a space of 25 feet square under that arrangement, filled and emptied time and time again during the day by prompt service, accomplished just as much in the delivery of the freight as the space in the station the size of this hall under the ordinary 48 hours free time, and with shipments frequently remaining over because of delay of consignees. . . .

"In St. Louis the condition was a little different from any of the cities that I have described. It is in geography the exact reverse of New York; in other words, you look from East St. Louis west across the Mississippi river to St. Louis, and here you look east from Jersey City across the Hudson river to New York.

"Now, originally the rates into St. Louis from all the eastern territory were made just as much higher than East St. Louis as the drayage charge; in other words, the drayage charge was commuted, and the rates were fixed on that basis, so that naturally a drayage service grew up from East St. Louis to the merchant warehouse without any regard to

whether the railroad running into East St. Louis wanted it or not. The shipper had the option of sending his team to East St. Louis and hauling his freight with his own team, or he had the option of making a contract with some transfer company, such as the St. Louis Transfer Company, and making the delivery in that way.

Advantages of the Ferry

"When I was living in St. Louis there was a great effort made by the real estate fraternity of St. Louis to force the railroads, such as the Southern, the Big Four, the Pennsylvania, the Alton, and the B. & O. principally, to purchase property in St. Louis, making out of course that that was for the benefit of St. Louis. It was the first time, and I trust the last, that I will ever be cartooned in a newspaper, because it so happened that I was very much in opposition to the plan of locating additional stations in St. Louis. I pointed out that the two cities were located in an ideal relation to each other to permit of what I called a fan-shaped distribution by railroad or by trucks from East St. Louis into St. Louis. At that time the Wiggins Ferry Company was operating its boats so that the teams could move to the ferry and be transported to a point opposite the center of the city, to a point opposite the lower part of the city, or to a point opposite the upper part of St. Louis, with a minimum of effort on the part of the horses and the quickest possible delivery without going through the congested streets of the city. In other words, where they did go through the thickly congested streets, they only teamed to the nearby points. Where they had to go to far points they went on the ferry to the nearest landing to those far points, so that always there was a minimum haul on land. . . .

With all those thoughts in my mind, and that is my only reason for making that review, I said to Mr. Underwood when he broached the subject here to me, and showed me the difficulties that had been experienced in New York, that this to my mind was just as ideal a place for trucking service as St. Louis was, and as I pointed out, it is merely the reverse geographically. The problem, then, was to reach an understanding with a trucking corporation, the only one large enough being the United States Trucking Corporation. As you know, the freight coming across the river is unloaded in the piers. We use principally for the congested districts, piers 20 and 21, North river, but our problem was more than merely the congestion of the merchandise. That happens to be the location to which a large part of the fruit from the west comes into the city, amounting last year to something like 30,000 carloads. In 1900 it was less than 5,000, and in that period it has gone up to 30,000.

"There is not room on these piers for merchandise and the fruit. It is imperative to handle the fruit, and therefore we saw our merchandise gradually shifting to other points. Sometimes we had to borrow the premises of another railroad, so that we were forced to consider this question as a practical means of relieving our piers, 20 and 21.

The Problem of the Trucking Contract

"It was not so simple to put this arrangement into effect as one might at first think. It seemed to be an easy thing to say to the United States Trucking Corporation, or any large company (because you must have a large company), 'We would like to have you take our freight at Jersey City and deliver it in New York, and we will pay you for doing so.'

"Immediately the question came up as to the competing lines. They naturally said, 'What are you going to pay the trucking corporation for doing that work? Are you going to pay them so much, even though you might save money by doing so, that they can make an absurdly low rate to a consignee and thereby deliver direct to the store door at a lower cost than the consignee will have to pay in a combination of rail charge and private trucking charge via other railroads?'

"Again, there was the question of responsibility as between the carrier on the one hand, the trucking corporation on the other, and also the responsibility of the shipper. So that while we started this negotiation in the latter part of 1920 and carried it pretty well along in 1921, it was not until the very last part of 1921 that we were able to put the arrangement into effect.

"One of the things that we were insistent upon from the beginning was that whatever contract we made with the trucking corporation should be so open and aboveboard, and so fair to the trucking corporation and to the shipper and to the railroad as to be a document that we could hand to any one of the competing roads, such as the Lackawanna, the Lehigh, the West Shore, or the Central Railroad of New Jersey, and say, 'Here is our contract. If you duplicate that we have no objection.' A provision in the contract is that the trucking corporation shall not deal with any other railroad without our consent, but we have already given our consent to their dealing with several that they have asked permission to deal with.

"You all know that West street (New York) constitutes an eastern line for the piers and that there are no business houses on the west side of West street. In other words, at West street you are right at the edge of the water, practically. Therefore, we drew the line at the west curbline of West street. I might say that in St. Louis they drew the line in the center of the Eads Bridge, at the west end of the Eads Bridge. Up to that point the railroad assumes responsibility.

"The truck backs up to the car, or the platform in Jersey City, unloads the freight from the car, or takes it from the platform and puts it in the truck, brings it across the river on the ferry, for which we give free ferriage, and then through the ferry house, and at the moment the truck enters West street, if the consignment is going direct to the shipper's warehouse, the trucking company becomes the shipper's agent. Our responsibility to the consignee stops as soon as the truck crosses the west line of West street, if it is going to the shipper's warehouse, but the trucking corporation is responsible to the Erie Railroad as soon as the trucking corporation accepts the freight from the car.

New Freight Stations

"In all arrangements for so-called store deliveries, one of the great troubles has been the lack of option on the part of the consignee. We anticipated that, and we installed, or rather, we opened several inland stations. Of course we could not afford, nor could any railroad afford to purchase sufficient property in New York City to put up warehouses, unless they also went into the warehousing business as an adjunct to the particular warehouse. Therefore, through the trucking corporation we contracted for space. That space is on the ground floor. We have nothing to do with what is above the ground floor. Now, if a shipper says, 'I have purchased a carload of stuff, but I have room for only one truckload at my house, and I want the carload delivered at the inland freight station until I can get time in the next 48 hours to have it hauled to my place of business,' he gives that order to the trucking corporation. We permit no freight to be handled by the trucking corporation direct to a shipper's warehouse without the consent of the shipper. He must sign a memorandum or an order calling for that service. We do not force it upon a shipper. Therefore, if he does not give such an order, if he refuses to give an order, or for any lack of knowledge of the immediate transaction he does not know of the shipment coming in, it is delivered to one of our inland stations, because we are gradually closing our river stations, that is, the piers. We have closed Duane street to merchandise, as such, reserving it for the perishable goods. And we have given notice of closing pier 39, North river, excepting the space that is occupied by 39 people who rent the pier, and we are proceeding along that line to close the piers

which we rent from the city, as we divert the business to the inland stations and to the direct service.

"An additional obligation in this contract is that the trucking corporation shall not make any extraordinary low rates from West street to the consignee's warehouse merely in consideration of our having already paid them for the service across the river. In other words, we have attempted to keep down the payment to the trucking corporation to what we believe is an amount that covers only their cost of service, and a reasonable return for the use of their equipment, including the risk on their equipment. . . .

Store Door Delivery an Ultimate Necessity

"In my opinion this kind of service is the ultimate necessity of this country, not because it has been practiced before, but simply because as an economic matter, as a matter of dollars and cents in the way of investing in terminal property it becomes a necessity. You can today, therefore, from St. Louis give your freight to the Columbia Transfer Company to be delivered in New York by the United States Trucking Corporation from door to door. You can in a sense do that same thing from Chicago because there are transfer companies there, but there is no local arrangement at Chicago such as there is at St. Louis, or as there is at New York. . . .

"My own conception of the thing is that ultimately all the stations in Jersey City, or on the west side of the Hudson river, whatever point is selected, it may be further back than Jersey City, will be combined into a large, comprehensive freight house into which all the freight trains will be discharged, and all the freight will be then brought over to New York. I do not mean by automatic tunnels necessarily, but through other tunnels or bridges and by ferry.

"There is one advantage that St. Louis has that we do not have here, and that is they have a bridge, and as yet there is no bridge here. The Jersey City-New York tunnel will be a great help in this arrangement. The tunnel will also be open to everybody else, just as it will be open to those who ship freight over the Erie.

Bills of Lading

"I should say something about the bills of lading. The United States Trucking Corporation handles all the documents at these terminal stations, and also where they handle the shipments direct to and from the shipper's warehouses.

"We use our Duane street station because that is known to everybody as our billing station, and the papers are delivered there to our agent as the truckman goes by, so that the billing is all in the hands of the railroad. The collection of money is made direct by the Erie from the trucking corporation; they collect it direct from the consignees.

"The trucking corporation is required by the contract (we have them under heavy bond) to observe every detail of the tariff and of the Interstate Commerce Commission Law, and they are under just the same regulations as to extending credit as any one of our own agents is under, and they are supervised just as strictly."

New Specification for Rails

THE RAIL COMMITTEE of the American Railway Engineering Association has given close attention to the manufacture of steel rails for more than 10 years. In this study it has had for its aim the improving of the quality of the steel entering into rails and the consequent reduction in the number of failures. The work of the committee has been directed largely towards the investigation of those influences which are detrimental to sound rail steel with the purpose of eliminating them in the specifications. This work led the committee to prepare specifications for rails which were adopted by the association in 1915 and revised in 1920. However, no rails have been rolled under these revised specifications because of the unwillingness of the manufacturers to accept them except with the payment of a premium so heavy as to be prohibitive.

During the past year the committee has been devoting considerable attention to the details of the rail manufacturing practices of the several rail mills of the country with reference particularly to the influence they have on the properties of the finished rail. Probably the most important item of manufacture that affects the quality of the finished rail is the condition of the steel as it is poured into the molds. A well-made steel thoroughly deoxidized with silicon or other deoxidizer sets quietly in the molds with a flat top on the ingot. A steel not fully deoxidized, however, effervesces in the mold and sets with a "horney" top on the ingot. The upper third of an ingot cast with effervescing steel is spongy inside with numerous small holes but with only a small central "pipe." Such steel also shows considerable interior segregation of carbon, phosphorus and sulphur, resulting in a brittleness in the interior of the head of the upper rail of the ingot. The quiet setting steel is free from interior sponginess, the segregation is much lower and the interior steel of the upper third of the ingot is denser and more ductile, but the ingot has a larger central pipe, which shows as a lamination in the web of the rail lower down from the top of the ingot than in rail made from effervescing steel.

As a result of this study a new specification has been prepared for dead-setting open-hearth carbon steel which has for its special purpose the elimination of segregation. While this specification was presented to the association at its recent annual meeting it was submitted as an experimental specification which had not, in fact, been passed on by the committee itself, but which the manufacturers have agreed to accept for rails rolled this year without additional charge.

The principal change in the specification as compared with the 1915 specification is in the raising of the silicon content from not less than 0.10 to a minimum of 0.20. Other chemical limits remain the same. The new specifications require that test specimens shall not fracture in the drop test, while tests for elongation and permanent set shall be conducted for information only. The height of drop is increased and option is afforded of two blows or of one blow with a higher drop. The specifications state that thoroughly deoxidized and quiet setting steel is desired, teemed into the molds at the lowest temperature consistent with the avoidance of stopper troubles and excessive ladle skull. Additions to the ladle shall be made in liquid form so far as practicable; if necessary to make cold additions, they shall be crushed to pass an inch and a half screen. The ladle should be held before teeming for the maximum time consistent with smooth operating conditions, so that the reactions may become complete, and their by-products properly vented. Ingots which have become cold shall be reheated in such a manner as to avoid injury. Sufficient discard shall be taken from the ingot to ensure freedom from injurious segregation and pipe. The supports for rails in the straightening presses shall have flat surfaces and be free from twists and shall be spaced not less than 60 in.

THE DELAWARE, LACKAWANNA & WESTERN announces that its experiments in the use of telephones for communicating to and from moving trains, which were suspended at the beginning of the war, in 1914, are to be resumed; and on Wednesday, April 7, a radiophone test will be made on a special train, which is to be run for Cornell students on that day, from Ithaca, N. Y., to New York City. It is expected to give the passengers the privilege of listening to concerts and other matter broadcasted on that day and also to try transmission of messages from the moving train to stations along the line, within short distances. L. B. Foley, superintendent of telegraph, New York City, has charge of the radio experiments.

Wheeling & Lake Erie Watches Cost Factors Closely

Heavy Car and Train Loading—Prizes for Good Service and Checking of Details Promote Efficiency

By Charles W. Foss

PART II

THE NO. 8 coal field, as has been noted, is the most important of the four coal districts served by the Wheeling & Lake Erie. This field is served also by the Pennsylvania, the Baltimore & Ohio and the New York Central. The mines from which the W. & L. E. secures tonnage lie along its main line from about east of Jewett to the Ohio river at Warrenton. There are also various branches, of which that to Neffs—the Adena branch—is the most important. The latter branch reaches a rich coal area

These Mallets make two round trips in eight hours. The reason for operating in this way is the necessity for taking proper care of the Canton district, notably with respect to the ore tonnage which is delivered to steel mills at that point. The Wheeling & Lake Erie serves about 100 industries at Canton. Gambrinus yard is a hump yard of about 1,000 cars capacity. Property has been secured and has now been held for some time sufficient to permit its enlargement to 5,000 cars capacity. From Gambrinus to Cleveland, 63 miles, is operated as a separate freight district. The so-called 60 per cent locomotives are used and are rated at 3,060 tons to Kent and from Kent to Cleveland at 3,650.

Spectacular Work in Heavy Car Loading

The Wheeling & Lake Erie in 1920 secured an average net tons per train of 1033. In other words, it was one of a few roads the average train load of which exceeded 1,000 tons. Its average net tons per car for the year were 42.9. This figure was exceeded by various roads handling coal to Lake Erie or ore away from it, but it is a fact, nevertheless, that the road has done some rather spectacular work in the matter of heavy car loading. Figures are available showing the

Freight Station at Canton

which is, if anything, in process of development. It contributes in normal times over 200 cars daily.

The procedure followed in moving coal from the No. 8 field is about as follows: Operation centers on Pine Valley, which is at the eastern end of the line. Mallet locomotives are operated from Pine Valley to Brewster, the district being 63 miles long. They are loaded from Pine Valley to Jewett (20 miles) at about 2,680 tons and are filled out at Jewett to 5,360 tons. Formerly the method was to load the locomotives at Adena and then to use a helper or pusher, but this method was abandoned about two years ago because of congestion at Adena. Work is now in progress to put more of the work at Jewett, the scheme being to make the yards at Jewett a central assembly point, to weigh the coal there, etc. The coal is classified at Brewster for north, south or west. In winter, some 50 per cent of the tonnage goes west over the Toledo division; in summer, when the lakes are open, a much greater proportion. The Toledo division has no heavy grades; heavy Mikado or Consolidation locomotives of 60,000-lb. tractive effort are used, the locomotives being rated at 3,650 or 3,850 tons. From Brewster to Ironville, the terminal point just outside of Toledo is 136 miles; from Brewster to Huron, 82 miles. The eastbound rating on these same locomotives to Brewster is 3,360 tons. Helpers are used for tonnage trains out of Huron from Milan on the Huron branch to Hartland on the main line.

Brewster is a classification yard of about 1,650 cars capacity and is for both coal and ore traffic. There is a considerable movement of both classes of traffic north towards Cleveland. The scheme of operation is to use Mallet locomotives from Brewster to Gambrinus (Canton), 12½ miles.

Station and Office Building at Brewster

number of tons, the number of cars and the average tons per car of coal dumped at the several Lake Erie piers during the 1921 season. The Wheeling & Lake Erie's average tons per car dumped at Huron was the highest figure for each of the several piers for every month but one from January to October. For the first four months of the year the W. & L. E. average at Huron was 63.02 tons; for May, it was 61.18; June, 61.54; July, 61.36; August, 57.77; September, 56.97 and for October, 59.12. The average for all the piers during these several months ranged between 52.31 and 53.89 tons.

The Wheeling & Lake Erie owns about 8,000 gondola and hopper cars of which about 2,600 are of 70-ton capacity and most of the remainder of 50-ton capacity. The heavy

Overtime Report

Another interesting form is the daily report of man hours or the report showing the amount of overtime. This report is compiled and placed on the desk of each operating officer within 48 hours after the occurrence. This enables the heads of the departments to be in absolute touch with the overtime made in their departments. They are held strictly accountable for such overtime and all overtime must be explained in detail. The information is of great value to the heads of such departments as it assists them in keeping overtime down to the minimum. Further than that, a detailed report relative to train service overtime is required from the chief dispatcher. The report shows the amount of overtime applying to different classes of service and in addition gives figures showing the number of orders issued by each dispatcher.

Report of Daily Expenses

Finally there is another form giving a report of daily expenses in the maintenance-of-way, bridge and building, transportation, and locomotive and car departments. This is prepared daily and telegraphed or telephoned to the heads of the various departments. The report shows wages only and is in the hands of the various departments within two days after the performance. With this information the heads of the different departments know just what amount of money is being expended for labor. It is of great assistance in the way of adding to or decreasing the forces so as to keep within the budget allowance for the various departments.

Use of the Several Reports

With reference to all these various forms, a Wheeling & Lake Erie officer said, "We have found that by supplying officers as well as subordinate officers with such information they will be continually on the alert and catch any increases that might develop. It also creates an incentive on the part of such officers or subordinates to feel that the money which is being expended should be just as judiciously expended as

Passenger Station at Zanesville on the W. & L. E.

if it was their own, all of which is, indeed, conducive to co-operation as well as economical operation."

This officer might also have drawn attention to the conferences which are held with the view of keeping the departments working together. There is another thing also that impresses one about the Wheeling & Lake Erie and that is the co-operation between the operating and traffic departments. This is secured on the one hand by the manner in which authority is given to such officers as terminal train masters who work closely with the shippers in their districts. This means that complaints are brought to the attention of the operating department before they become too serious for the best interests of the company and that accordingly they are promptly remedied.

Concentrating Pullman Reservations at San Francisco

THE SOUTHERN PACIFIC has recently installed a new telephone system for the handling of sleeping car ticket sales in its San Francisco offices which has greatly expedited the service. All train charts showing the Pullman space on every train are kept at one central office, reservations being made by telephone from the various ticket offices scattered about the city and surrounding territory. This system eliminates the possibility of duplicate sale of space while a close check can also be kept on the number of cars required on any train. This telephone exchange, built by the Western Electric Company, contains three 20-line switchboards and two cabinets for sleeping and

A Portion of the Pullman Checking Desk

parlor car reservations. Eight operators can use the board simultaneously, although during the absence of any of the operators, the remaining men can take care of incoming calls without changing their positions. When but one man is on duty, he can reach all the charts without leaving his seat.

The revolving cabinets above the desk, called "turrets," contain charts showing the reservations on each of the 22 trains running out of San Francisco daily. Each box in a turret contains charts for two trains, one face of the box having the charts for each day from the first to the fifteenth of the month and the next face having those for the sixteenth to the thirty-first. The two remaining faces of the box have similar charts for another train.

All of the city ticket offices have wires coming into this desk, as has each counter man in the consolidated ticket office. Ticket offices within a radius of 15 miles of San Francisco obtain their Pullman space in the same manner, and this has eliminated the necessity of assigning a certain amount of space to these outside offices. Trunk wires connect the checking desk with the main switchboard at the general offices of the road, through which communication may be established with any Southern Pacific station within a radius of 200 miles.

The central information desk is in the same room with the Pullman checking desk and telephone operators at the general office send here all telephone requests for information. Any of the clerks may answer the call.

Electrical Operation in Mountain Districts*

An Outline of What Is Being Done on the Chicago,
Milwaukee & St. Paul

FOLLOWING is an abstract of a paper read by Frank Rusch, superintendent of motive power, C. M. & St. P., Tacoma, Wash., at a traveling engineers' staff meeting held at Milwaukee, Wis., November 28, 1921:

We are operating electrically on the main line over five mountain ranges, formerly the most difficult parts of the system, the Cascade and Saddle mountains in Washington, and the Bitter Root, Rocky and Belt ranges in Montana. On a total of about 660 route miles we have two maximum gradients of 2 per cent to 2.2 per cent for about 20 miles; two grades of 1.6 per cent to 1.7 per cent, and several of 1 per cent.

In freight service on grades of less than one-half per cent we can handle as much tonnage as the operating conditions will permit with one electric locomotive at speeds which may vary up to 30 miles an hour. On 1 per cent grade ascending one electric locomotive will handle 3,500 tons; on 2 per cent grade, 1,250 tons; on 2.2 per cent grade, 1,100 tons; all at a speed of about 15 miles an hour. We ordinarily use a helper locomotive in freight service on mountain grades so that our average freight trains will run about as follows:

1 per cent grade.....	3,500 tons
1.6 per cent grade.....	3,200 tons
1.7 per cent grade.....	2,800 tons
2.0 per cent grade.....	2,500 tons
2.2 per cent grade.....	2,200 tons

These ratings are based on the continuous capacity of the locomotives which occurs at 15 miles an hour at full trolley pressure of 3,000 volts.

In making comparison with the steam locomotives that were used prior to the electrification the tonnage rating and what was actually hauled over the Rocky mountains is as follows and applies to freight trains only:

2 Mallets, Butte Yard to Donald.....	2,500 tons
2 L2 Engines, Butte Yard to Donald.....	1,600 tons
2 Electric, Butte Yard to Donald.....	3,200 tons
2 Mallets, Piedmont to Donald.....	1,800 tons
2 L2 Engines, Piedmont to Donald.....	1,400 tons
2 Electric, Piedmont to Donald.....	2,500 tons

The tonnage hauled over this mountain is greatly in favor of the electric motors. The mountain grade from Butte Yard to Donald is 1.6 per cent and from Piedmont to Donald on the east slope is 2 per cent.

On the 2 per cent grade over the Saddle mountains in Washington two electric motors haul 2,200 tons at a speed of 15 miles an hour, whereas two Mallet engines haul 1,600 tons at a speed of about eight or ten miles an hour.

In passenger service we are not using any helper power. These locomotives are built strong enough to handle 960 tons of passenger equipment over any portion of our track. They make good speed in ascending grades and their speed on level track is only limited by operating conditions.

In switching service we have electric locomotives at Butte, Deer Lodge and Othello. In special service we have used electric locomotives to push snow plows, on work trains and for wrecking outfits, and obtained efficient results.

Fuel and Water Stations Eliminated

One thing which seems of considerable importance to the steam man in first operating an electric locomotive and which is soon likely to be forgotten with other commonplace things, is that no stops are necessary for fuel or water.

*Milwaukee Employees' Magazine, March, 1922.

When you consider the delays, train troubles and extra work of watering engines, encountered in mountain traffic, you can see that the complete elimination of such is no small item in bettering train operation. When you consider that a large part of our mountain district is through comparatively dry territory the elimination of pumping plants to supply this water represents economy.

Another feature which applies to all kinds of service and of which we have good report is that although the electric locomotives weigh more on drivers than any steam power, they are easier on curved track, at least, than the steam engines. On tangent track the difference is not so apparent, but it may be stated that there have been no radical changes made in track construction since we electrified, nor has there been any apparent reason for making changes. Considering that mountain trackage has a high percentage of curvature, this advantage of electrical operation is appreciable.

But in order to deal specifically in bringing out advantages of electric motive power in the mountains, it will be better to go more into detail. I can perhaps do this best by considering different kinds of service separately and by giving examples of actual operation.

First in importance is the freight service in which we have reduced the number of engines required and the work of keeping them in service. We have practically reduced our running time between points by 40 per cent and have increased our tonnage in the worst districts by about the same amount. In spite of increased tonnage the drawbar reports show a decreased number of accidents of this nature after the men have become accustomed to electric operation. The fuel consumption or kilowatt hours at the locomotive shows marked economy and there is no doubt but that with a sufficient number of trains operating, marked economy for the whole system is possible over steam operation.

Regenerative Braking Does More Than

Return Power to Trolley

Freight trains can be handled over mountain grades without stopping and due to the regenerative feature may be handled without applying an air brake on the whole train, unless for some reason it is necessary to come to a dead stop. The regenerative braking not only saves the brake rigging but also returns energy to the trolley which may be utilized in helping move other trains. Whatever may be the return on this regenerated energy the saving made in ease of train handling with less number of break-in-twos with consequent damage and delays, is an important advantage.

The various tests on brake shoes in making a run from Avery to Harlowton show that about one-fourth of the brake shoe was worn away in controlling the speed of the trains on mountain grade, while in the westward movement between these two points it showed approximately one-fifth of the brake shoe worn away. A conservative figure on the value of the metal dissipated through brake shoe wear during a thirty-day month period would be \$6,000; this is not including the saving in the way of cracked wheels through overheating. Both of these items of expense have been practically eliminated through electric operation.

We expect at some future date to combine regenerative braking which sends the current back into the wire and which we have at present, with rheostatic braking which consumes the braking energy in the starting resistors, so that we can use electric braking at speeds down to prac-

tically a standstill. This will be a matter for experimentation.

Starting freight trains on ascending mountain grades is comparatively easy and not at all likely to result in drawbar damage. The helpers are placed in the middle of the train and the head locomotive can when starting let the slack back as far as the helper. The helper man then can advance his controller to give maximum tractive effort and is ready to follow with the slack when the head locomotive starts. With electric operation we have quit breaking drawbars almost entirely in the mountains.

We do not need engine watchmen with electric motive power and at any point where one of these machines is tied up it is only necessary for the enginemen to drop the pantographs and shut the doors and windows. This is particularly advantageous at helper tie-up points. At Butte and Piedmont when we first electrified we had as high as six to ten steam engines, mainly required for helper service. These were replaced with two electric locomotives, which have successfully done the freight helper work since. The passenger trains not requiring helpers have to some extent made this possible of course, but this itself is also another advantage of electrical operation.

Regenerative braking makes it a decided advantage to use a helper descending a grade as well as in going up on the other side. We have only one heavy grade on the Cascade mountains where this is not applicable. Otherwise our helpers ordinarily go clear over the summits. It is common for a helper to go in a train upgrade to Boylston and down to Beverly then back to Kittitas light with zero net consumption of kilowatt hours, or regeneration in this case, making it possible to operate helpers in eastward traffic from this point at no fuel expense whatever.

The increased safety in having two locomotives in trains of this sort on heavy grades can be appreciated.

In passenger service the delays and rough handling necessary to the operation with helpers is entirely eliminated. The same locomotive which may haul the train at 50 miles per hour can also handle it with ease and certainty on a 2.2 grade.

Here again the regenerative braking feature is important. One who has tried to sleep in a passenger train through mountain districts and has been kept awake by application of brakes at frequent intervals can readily appreciate the comfort of an electrically operated mountain trip in which it is impossible to tell from the way the train is handled as to whether a grade is being ascended or descended.

The smooth handling of passenger trains is a point of merit and occasions many favorable comments from passengers about our service.

The entire absence of cinders and a certain amount of grime from coal burning locomotives is appreciated by the passengers. Complaints of delays caused by poor fuel, engine not steaming and sundry things have become things of the past. We do have our troubles with electrical failures, it is true, but these are nearly all in a class not to be called serious and fortunately are of uncommon occurrence.

Electric Switching

In electric switching service we find that the energy or fuel expense at the locomotive has been more than cut in two over steam operation. The locomotives are quick in acceleration, easy to handle and because the engineer has little to look out for other than the operation of starting and stopping, he can lend his whole attention to the business at hand and thus gets as much work done as the yardman can attend to.

The maintenance of these machines is slight and because of taking but little energy the extra demand for power that they require is not very noticeable at the substations which furnish it.

Wherever the trolley wire goes the electric locomotive has given particularly good results. In re-railing cars or engines or pushing snow plows the uniform rate of speed for a given load and the ease with which the locomotives can be controlled make their use decidedly advantageous.

The rated tractive effort of an electric locomotive is usually given as that within the continuous or 24-hour capacity of the traction motors. This is 72,000 lb. for our freight locomotives, but does not mean very much as compared to the maximum tractive effort which the locomotive can exert. This is only limited on these machines by the slipping point of the wheels. With sand used on the rail they have been known to exert a tractive force of 160,000 lb., and this could be maintained for a period of time until the tractive motors are in danger of overheating due to the large flow of current through them. Such tractive effort makes these machines efficient in handling certain work under adverse conditions as mentioned above.

Each Locomotive Its Own Dynamometer Car

Because the tractive effort is nearly proportional to the current flowing through the motors regardless of the speed, it is very easy to judge train weights, proper ratings and other things. In fact, every electric locomotive is equipped with its own instruments so that it is a very good dynamometer itself, and in cases where the engineer runs into conditions of overloading, he can readily judge the amount and reduce as necessary. There is no argument as to whether one man can get more out of an engine of this kind than another—they are all placed on an even basis. Moreover, the normal running times are so uniform that the dispatchers, as a general rule, do not have to figure much on the personal element of the enginemen in supervising train operations.

There are possibly other benefits to be derived from electrification, but I have endeavored to stay within the limitations applying to the locomotives alone. There are disadvantages too, of course, and there is a need for improvements and developmental changes as is true of all electrical equipment. However, the field for experiment and such changes is large, and with the successful electric motive power we now have, we have made the start, and further improved features can be inaugurated if necessary.

An Illustration Typical of the Construction Conditions Encountered in Alaska

The Lachine Bridge at Montreal

C. P. R. Soon to Own Fleet Totaling 438,604 Tons

Operates Over 14,000 Miles of Railway, Several Hotels, Etc.—
Wide Margin for 10 Per Cent Dividends

LAST DECEMBER the Canadian Pacific sold in the New York market \$25,000,000 of its four per cent consolidated debenture stock. In his statement in the annual report for the year, President E. W. Beatty says that the stock was sold "at prices which under the prevailing market

among American investors, it received widespread and ready distribution." The C. P. R. stock is, of course, not a stock in the sense that that term is used in this country. It is, rather, a bond, differing from the bond issues of the United States railroads in that it has no definite term but is perpetual. There is a very good reason why the Canadian Pacific securities should have been well received in the New York market. The reason is, of course, the long dividend record of the Canadian Pacific and the respect which must be paid to its able management over an extended period of time.

There is no doubt that the New York market had fully in mind also the fact that the C. P. R. was not subjected to 26 months of federal control. Canada had its war problems and they extended over a longer period than our own. The Canadian Pacific naturally had to bear its burdens in as great degree as the country it served but it bore these burdens under its own management. It was not subjected to the fancies of a beneficent railroad administration or made the victim of a wide variety of more or less valuable ideas. Although it did have to contend with higher costs of fuel and material, and, although it did have to meet the same increases in wages as were made in the United States, it retained, on the other hand, its most important asset, its morale. One of the most difficult tasks which has confronted many American railroads since the end of federal control has been the restoration of this important factor. Some have had marked success. The point is, however, that the Canadian Pacific has had the advantage of not having to meet this particular and very serious problem.

Although it cannot be said that 1921 was a markedly prosperous year, the details concerning Canadian Pacific operations as given in the report for the year have an optimistic aspect. The system's revenues totaled \$193,021,854 as compared with \$216,641,349 in 1920, a decrease of \$23,619,494, this decrease reflecting the general business depression, a decrease in passenger fares in January and July and in freight rates in December and a partial crop failure

Connaught Tunnel—Western End

conditions were extremely favorable, reflecting the high credit which the company enjoys. The sale of this stock in New York was effected in an eminently satisfactory manner, and although the security was of a character practically unknown

in some parts of western Canada. The operating expenses, inclusive of taxes totaled \$158,820,114 as compared with \$183,488,305, a decrease of \$24,668,191. The result was a net of \$34,201,740 as compared with \$33,153,045 in 1920, an increase of \$1,048,695. The operating ratio in 1921 was 82.28 as against 84.70 in 1920.

Handled More Grain

The C. P. R. in 1921 handled 23,710,606 tons of freight as compared with 30,160,134 tons in 1920. The ton mileage was 10,811,087,106 as against 13,994,508,975. This indicates a greater decrease in business than is shown in revenues, the reason being that the earnings per ton-mile were 1.19 cents in 1921 and 1.04 cents in 1920. Decreased traffic was shown in lumber, livestock, manufactures, etc., but the grain and flour business showed marked increases. Whereas in 1920 9,144,410 barrels of flour were transported, in 1921 the total was 11,718,510 barrels. The increase in grain traffic was sufficient as to exceed even the record of 1920. In 1918 the system carried 137,000,000 bushels of grain; in 1919, 121,000,000 bushels; in 1920 it suddenly increased this total to 173,000,000 bushels but in 1921 the total exceeded 175,000,000 bushels. However, in view of what we have been hearing about how grain moved through Montreal last year, the increase does not appear so striking as might have been expected.

The optimistic aspect of the C. P. R.'s present situation comes in the ambitious program of improvements which the stockholders are to be asked to approve. It is proposed to make expenditures on capital account "as and when conditions warrant such expenditures" of \$10,622,137. The stock-

438,604 Tons of Shipping

A matter of special interest to the United States readers at the present time is the C. P. R. steamship services. It is of interest primarily in view of the pending ship subsidy bill which proposes an amendment to the Panama Canal Act so as to permit railroads to own and operate ocean-going vessels. As this bill receives increased attention there is no question but that one of the first things that will be brought up is the success the C. P. R. has been having with its ship services. The Canadian Pacific operates ships with Montreal to Liverpool and Southampton and from Halifax to Liverpool. On the Pacific it operates a line from Vancouver to Japan, Shanghai, Hongkong, and the Philippines and also a line from Vancouver to Australia and New Zealand via the Hawaiian Islands. These activities are expanding, as is evidenced by the additions which are planned for the extensive and up-to-date facilities at Vancouver and by the tonnage of the C. P. R. shipping. At the end of 1920 the total tonnage inclusive of coastwise services was 301,219; at the end of 1921 it had increased to 406,754 tons. New vessels building and the recent acquisition of four former German ships will shortly bring the total to 438,604 tons, a fleet which will be noted for its size and for its standard of excellence alike. When it is realized that the C. P. R. itself operates or has under construction 14,784 miles of line; that it also controls the Minneapolis, St. Paul & Sault Ste. Marie, 4,376 miles; the Duluth, South Shore & Atlantic, 621, and the Mineral Range, 101, and is about to bring its fleet to 438,604 gross tons, the real extensiveness of the C. P. R. system will perhaps be the more readily appreciated.

The net earnings of the C. P. R. from railway operations

CANADIAN PACIFIC OPERATING RESULTS 1912-1921

Year ended	Mileage	Freight revenue	Total Operating revenue	Operating expenses	Net operating revenue	Operating ratio	Revenue tons	Revenue ton miles	Revenue per mile of road	Revenue train load	Revenue car load

holders were asked last year to approve a similar program totaling \$4,316,236. The increase to over \$10,000,000 this year may be regarded, one trusts, as the C. P. R.'s opinion that prosperity is about to return and as a hint to the present depression that it is about time to withdraw from the scene. The program includes such items as \$1,021,700 for "replacement and enlargement of structures in permanent form"; \$1,005,200 for "additional stations, round houses, freight sheds, shops, etc."; \$1,500,700 for heavier rail; \$1,550,000 for the new pier at Vancouver, \$1,454,500 for the Chateau Frontenac Hotel, Quebec, \$439,000 for machinery at various shops; \$218,400 for improvements to plant and machinery at Angus shops; \$755,600 for line diversions, etc. The first projects to be given attention are the new pier at Vancouver and the Chateau Frontenac Hotel, both of which are now under way. The road is also about to extend the mileage of its lines. The C. P. R. has entered into an agreement with the government of Alberta relative to the construction and the operation for 25 years of an extension of the Central Canada Railway for 25 miles west from Peace River Landing to Berwyn and has also made a similar agreement with the Province of Quebec for the construction by a Canadian Pacific subsidiary, the Interprovincial & James Bay Railway, of a line from Kipawa to the Des Quinze river, 77 miles.

in 1921 were, as above noted, \$34,201,740. Fixed charges totaled \$11,519,072 and there was \$500,000 contributed to the pension fund, leaving \$22,182,668 available for dividends. It is the C. P. R.'s practice to pay from its railroad net dividends of four per cent on its preferred stock and seven on its common. After the deduction of these dividends there was a net surplus for the year of \$755,392 as compared with \$450,359 in 1920. The other three per cent of the total of ten per cent paid on the common is derived from other income. This other income in 1921 totaled \$29,567,491, which compared with \$26,380,292 in 1920. The net earnings of the ocean and coastal steamship lines totaled \$2,785,615, or about the same as in 1920. There was \$4,053,386 derived as net earnings from the commercial telegraph and news department, hotels, etc.

THIRTEEN HUNDRED EMPLOYEES of the Chicago, Burlington & Quincy general offices at Chicago went to work on March 21, a little over five days after flames devastated the building. During the days following the fire, plasterers, bricklayers and carpenters worked incessantly to repair the damage caused by the flames and water. All offices in the building from the first to the eighth floor are now occupied and all departments are operating.

More Railroads Object to Train Control Order

Varied Reasons for Using Money Elsewhere—Pere Marquette
to Experiment with Clark's Wireless

THE INTERSTATE COMMERCE COMMISSION continued, at Washington, on Thursday, March 23, its hearing on the reasons for and against the issuance of its proposed order requiring the extensive installation of automatic train control apparatus, reported in the *Railway Age* last week, pages 783 and 787. Statements were presented by the St. Louis-San Francisco, the Pere Marquette, the Chesapeake & Ohio, the Chicago, Milwaukee & St. Paul and other roads; and by two manufacturers.

The hearing was continued on Friday, at the close of which it was announced that other proprietors of train control devices would be heard on April 12.

J. C. Mills, signal superintendent of the Chicago, Milwaukee & St. Paul, asked that the commission postpone any order as to his road. The company is now under orders of states and municipalities for grade crossing separation and other safety work to the amount of \$13,000,000. When Commissioner Esch asked if this would not be spread over a period of years, he said that the date for the completion of the work had already passed, as the authorities had allowed it to be deferred from time to time; and it was now necessary to finish the work as rapidly as possible. The company cannot get the capital for automatic train control apparatus in addition to the heavy expenditures now required.

H. R. Safford, vice-president of the Chicago, Burlington & Quincy, said his company desired to indicate its sympathetic interest in train control development and to express the hope that investigations may continue aggressively, but he did not believe the ramp type would prove satisfactory. The problem of getting an impulse from the roadside apparatus to the locomotive is a detail yet to be perfected. Chairman McChord asked him to file with the commission a statement of the costs in property damage and personal injury damages of train accidents on the Burlington during the last 10 years which might have been prevented by an automatic train control.

A. W. Smith, superintendent of the Hagerstown division of the Western Maryland, asked that his company be relieved of the order, on the ground that there is practically no passenger traffic over the division contemplated by the order, only one passenger train each way a day and a maximum of nine freight trains. He said that there had been no loss of life in this territory as the result of a train accident in six years or since the installation of automatic signals. If the money were available the company should extend its signal installation before spending the money for train control.

C. J. Kelloway, superintendent of signals of the Atlantic Coast Line, declared it impracticable to install train control with wayside signals. If a cab signal were used it would distract the attention of the engineman from the lookout. He submitted an estimate of the cost of equipping 120 miles of road with a "continuous control" apparatus, the type which the Pennsylvania proposes to install, based on estimates furnished by the Union Switch & Signal Company. This covered 242 miles of track and 251 blocks and the equipment of 12 passenger, 18 freight and 13 extra locomotives, a total of \$315,785. Mr. Borland asked why he had used estimates for the continuous control type when the intermittent induction type would be cheaper. Mr. Kelloway replied that he understood that the continuous control type was the only one that would meet the specifications of the commission. He understood that intermittent induction apparatus would not meet the specifications of the commission

on a number of points, but when Chairman McChord asked him to point them out, he hesitated; and finally said that he assumed that No. 5 calls for continuous control; but Mr. Borland said that it did not. Mr. Borland thought that an intermittent type, either ramp or induction, would meet the conditions of the Atlantic Coast Line, to which Mr. Kelloway replied that in the opinion of signal engineers the continuous control type is better and that if the road is going to make an installation the best is none too good.

The Erie's Uses for Its Money

R. S. Parsons, general manager of the Erie, said that the proposed order apparently requires two installations, one for the Erie and one for the Chicago & Erie. His signal engineer had given estimates that 125 miles on the Chicago & Erie would cost \$243,000 or \$345 per roadway indication and \$1,600 per locomotive; for the Delaware division the cost would be \$316,000. He said he did not know what device this estimate covered, but it is impossible to get accurate estimates because the devices are not yet in a marketable condition. It is difficult for the Erie to get money for any purpose. If it had the money it would prefer to complete its double track, which would cost \$3,000,000; and there are two divisions on the main line between Chicago and New York not yet equipped with automatic signals. The company is anxious to complete this work and it would cost about the same as the train control installation contemplated by the commission's order. The company would also like to buy some steel passenger cars and complete its stone ballasting; and it is continually embarrassed by state orders for the elimination of grade crossings. It is now under orders of courts and commissions to spend \$10,000,000 for this purpose, and some of the work is under contract. He thought the burden of experimenting with train control should be borne by others. Passenger traffic of the Erie is thin, with only two through passenger trains between Chicago and New York and about two local trains each way a day. The company has laid great stress on requiring obedience to signals on the part of its enginemen and every year conducts from 30,000 to 40,000 surprise tests. It is a very rare thing for an engineman to run past a signal except for a short distance. Mr. Parsons said he was not opposed to automatic stops, but the Erie has not for 20 years had a passenger train accident which would have been prevented by one. It has been experimenting with various devices. There is no question but that they stop trains, but many operating problems are involved. If a division were to be equipped now it would undoubtedly have to be changed in two or three years. He recommended that the commission arrange with the American Railway Association to pick one railroad to make a thorough test, the expense of which should be shared by all roads; the Erie would be glad to pay its share.

A. H. Rice, signal engineer of the Delaware & Hudson, asked that the order be not entered as to his road, on the ground that the only satisfactory type would be a continuous induction type, which he thought had not been sufficiently developed. He estimated the cost of the installation at \$927,500, for 301 locomotives and apparatus at 104 roadside points.

T. S. Stevens, signal engineer of the Atchison, Topeka & Santa Fe, filed a statement by A. G. Wells, vice-president. The Santa Fe has made no plans for installation, awaiting the commission's final order. The company is ready to stand

its share of the expense of testing any device which the commission or the A. R. A. committee thinks should be tested. Commissioner Lewis said that most of the roads take the position that other work should be done before automatic train control is installed, and asked if the road would make the same plea if automatic train control devices were in a higher stage of development. Mr. Stevens said that for himself he held that the most important thing is signalling.

Charles Stephens, signal engineer of the Chesapeake & Ohio was called to the stand and asked to comment on the report submitted by Mr. Peabody of inspections on the C. & O. He said certain defects referred to would be corrected; others are fundamental, but a way would be found to correct them. He said, however, that the report of the A. R. A. observers did not correspond with the records of the railroad; there are serious discrepancies. He filed a record which he said showed only two clear failures in two years out of 1,200,000 operations, but he admitted that there had been a great deal of difficulty with damaged shoes. This, however, was a question of clearance. The company should not be required to extend its installation at this time because it is necessary to change the location of the shoe on the engines. He believed this would eliminate the shoe trouble, but it would cost about \$30,000, which the company is not now in a position to spend.

"Is this a practicable device?" asked Commissioner Lewis.

"It has worked very satisfactorily," replied Mr. Stephens.

"Is it still in the experimental stage?" asked Mr. Lewis.

Mr. Stephens replied in the affirmative. "We are now engaged in re-designing the apparatus."

Commissioner Lewis asked if it unnecessarily slows up the traffic. Mr. Stephens replied in the affirmative, but this can be overcome by a permissive form of speed control. He said that the formation of ice on the shoe or the ramp causes no difficulty; but hard packed snow such as is found in the northwest would probably break off the shoe.

M. E. Miller, representing the Simplex Train Control Company, said that his device had been tested on the Buffalo, Rochester & Pittsburgh, and he asked that a representative of that road who was present be called to state the result of the test. E. W. Kolb, signal engineer of the Buffalo, Rochester & Pittsburgh, expressed reluctance to testify, saying he was present only to get information, but Commissioner McChord insisted that he state the result of the tests. He said the Simplex company had asked for an opportunity to make a test and the road had permitted this to be done on a branch line. Tests were made on two separate days during the last six months with an engine and one car; and the device did all that was claimed for it. It stopped the train. But there was nothing to show how it would work with a longer train. The officers of the road do not approve of the device for it includes insulated sections of track and it would leave part of the track unprotected by the automatic block system. Mr. Miller said the objections could easily be overcome and his company was anxious to get permission from any road to make an installation over several miles at its own expense.

Industrial Development Calls for Varied Expenditures

B. A. Hamilton vice president in charge of operation of the St. Louis San Francisco asked that that road be relieved of the proposed order in view of the present expenses confronting it in connection with proposed second main track and grade reduction work. In view of the commercial and industrial development now taking place throughout the southwest he would prefer to use the sum required for automatic train control for other purposes such as new cars and better highway crossing protection. To install train control over 2.5 miles would cost \$412,000. The territory named in the commission's order has an average of 18 trains each way daily. If the commission should not see fit to

relieve his road he requested permission to make a combined installation of automatic train control and automatic block signals over the territory from Monett, Mo., to Aston, Oklahoma, a distance of 72 miles, all single track except five miles.

The representative of the Pere Marquette endorsed and adopted the report of the railroads' committee, especially the conclusion. Plans have been made to test the wireless type of train control as developed by T. E. Clark of Detroit. Ten miles of track have been set aside for this purpose near Detroit. It is planned to begin work in 30 days and to equip three or four locomotives. An installation of this apparatus over 150 miles with 65 locomotives would cost probably \$260,000. This road made the plea that, in view of this proposed test, it be omitted from any orders. A. L. Grandy, chief engineer of the road, thought that a year to a year and a half would be necessary for satisfactory experiments. A 10-mile installation is sufficient; this road needs its money for automatic signals, interlocking, grade separation, etc. When asked how long it would take to complete these improvements he replied, "at least 10 years." Commissioner McChord asked whether it was the intention of the Pere Marquette to make an extensive installation if this test proved satisfactory, but Mr. Grandy could not say. The commissioners then called his attention to the present good financial showing of the Pere Marquette and asked why such an installation should not be made if the test proved satisfactory.

Cost of the Chesapeake & Ohio Experiments

H. B. Wickham, vice-president and general counsel of the Chesapeake & Ohio, asked that his line be not required to make an installation throughout the entire limit designated in the Commission's order, as with the completion of the installation through Staunton, Va., train control would be in service over 61 miles of road. It had been found necessary to redesign the apparatus and it was still in the experimental and development stage. With the completion of the installation through Staunton, the cost to the railroad company will have been \$372,742 with an annual charge of \$30,166. For the visual (light) signals the sum of \$74,326 was spent. The maintenance on this is estimated at \$13,604 a year, making a total installation cost of \$447,068 and total annual maintenance charge of \$43,770; and he felt that his road had complied with the spirit and intent of the Commission's order.

H. F. Haag, signal engineer of the Kansas City Southern, explained the situation on that road. It does not operate trains of such a character, number, or speed as would bring it properly within the class of the other roads named in the order. It has but four through passenger trains a day, two in each direction, and these are somewhat local in character, averaging approximately 25 miles an hour gross speed. During 1921 only 8.7 freight trains a day were run on the division from Kansas City to Pittsburg, 128 miles; the average train would have about seven meeting or passing points in 122 miles. Railroads running more trains have not been included in the proposed order. The number of collisions which might have been prevented by train control apparatus on the Kansas City Southern has been very small. In the last nine years between Kansas City and Texarkana, 487 miles, there have been only 24 collisions, which show a total property damage of \$59,792, and personal injury bills amounting to \$114,015, a total cost of \$173,807, or an average per year per mile of \$39.57. These figures do not include the portion of the cost borne by other roads involved. The trains are operated by the train order system entirely; there is no block system. From Kansas City to Pittsburg there have been only three accidents in the nine years, involving a total cost of between \$10,000 and \$11,000. The Kansas City Southern being a comparatively

new railroad, much work of a permanent character remains to be done of a more elementary character than a highly specialized device such as train control. Many improvements which it deems necessary would increase safety as well as economy and efficiency in operation. For instance there are still some timber trestles remaining in the main line, and some of the main track has not yet been ballasted. There are also still a few sags and bad curves which should be eliminated as soon as the company is financially able to do the work. The expenditure necessary to install an automatic train control system on a full passenger division Mr. Haag estimated at \$625,000, which he said is beyond the ability of the road to furnish. The estimate is based on equipping 30 locomotives at prices from \$400 to \$3,000 per locomotive, and from \$200 to \$1,000 a mile for roadside equipment. It also includes the cost of installing automatic block signals. In reply to questions by Chairman McChord the witness said his estimates were based on figures from five train control companies, from which he had made a weighted average. He was asked to file the detail figures for the record.

J. E. Muhlfield, consulting engineer, described the physical and operating conditions of the Kansas City Southern, explaining the improvements which should be made as soon as they can be financed, which improvements, in the opinion of the management, should take precedence over any expenditure for train control.

Data Furnished by Train Control Proprietors

In order that representatives of two train control companies on the Pacific Coast need not stay over for the hearing on April 12, the Commission heard them on Friday. F. F. Bostwick of the National Safety Appliance Company, San Francisco and R. L. Miller of the Otis Automatic Train Control Company, Spokane, Wash., presented brief statements and were followed by A. J. Brookins.

Mr. Bostwick emphasized the advantages of the magnetic system, not affected by weather, and said that the last four months' service on the Southern Pacific near Oakland, California, had demonstrated that maintenance cost would be low. His apparatus had been tested by Japanese engineers in Manchuria and Japan, where the weather conditions were satisfactorily met. During these tests the clearance between track element and the engine element was increased to 10 in. and the magnet of a track element had been set off the center 4 in. without harmful result. The track element was also surrounded with iron and the voltage of the track battery was lowered one-half but the device functioned satisfactorily. The engine equipment would have to be cleaned and oiled every three months. The track element had been under water for two weeks at one time but it worked all right. The maximum cost of the locomotive equipment would be \$350; and of the track appliances \$400 [per block]. The labor of installing the locomotive device would cost \$25 and the track installation \$175. The additional cost of installing the speed control feature at each magnet location would be probably \$150. These prices Mr. Bostwick gave as maximum.

Mr. Brookins said that his device had received the approval of the Bureau of Safety as to its mechanical features. He had attempted to get a trial on the Chicago & Alton and also on the Atchison, Topeka & Sante Fe but had been unable to make any progress.

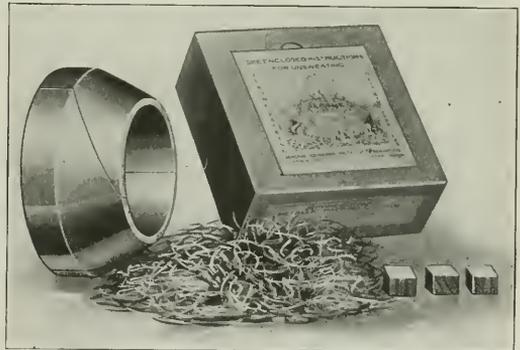

R. L. Miller said that tests had been made of his apparatus in June, 1920, and February, 1921, on the Canadian Pacific (Spokane International) at Spokane; and since then a number of changes had been made in the device.

M. B. Bulla, of the Bulla Train Control, El Paso, Texas, stated that his device had passed the experimental stage four years ago and that over 100,000 tests had been made over 124 miles of track on the El Paso & Southwestern. His

estimated cost was \$150 a mile and \$200 a locomotive, for blocks from 4,000 ft. to 8,000 ft. long. He further stated that this device had been in operation on one locomotive for six years. When asked why the railroad did not make an installation he said that the road did not want to spend the money at this time, but that he had a verbal agreement whereby his device was to be used if the road should be forced to make an installation.

Solid Packing Rings for King-Type Cups

ONE of the great difficulties encountered in the use of metallic packing rings for King type cups arises from the fact that the packing must be divided into two or three sections. Holding these sections together while boring out the packing is a matter requiring considerable care and there is also a heavy loss of material because of the ease with which the thin edges of the sections become bent or broken in handling between the manufacturer and the point of application. In order that these difficulties may be overcome and that each set of packing may reach the locomotive in perfect condition the Jerome-Edwards Metallic Packing Company, Chicago, has developed and patented a method of packing and delivering Jerome packing for King type cups whereby

Sweated Ring Packed in Carton with Waxed Excelsior

the packing reaches the shop in a solid ring. In the final process of manufacture before the packing is prepared for shipment the three sections of each ring are sweated together and are intended to remain in this condition until the ring has been bored out and is ready for application.

The box in which the ring is packed contains a small quantity of waxed excelsior and three small blocks which support the ring slightly above the bottom of the box. When the ring is ready to apply it is replaced in the box and a match touched to the excelsior, which in burning produces sufficient heat to melt out the solder in the joints without injuring the sections themselves. This requires from three to five minutes, after which the sections fall apart. They are then wiped clean of the fused solder and are ready for application to the rod in perfect condition.

REPRESENTATIVE BECK has introduced in Congress a bill "to provide for the inspection of railroad tracks which are alleged to be inadequately maintained and in unsafe condition and authorizing and requiring the Interstate Commerce Commission to make the necessary investigations and order the employment of additional men."

General News Department

The Full-Crew Law of Maryland has been repealed by the legislature.

The Directors of the Missouri Pacific are still considering a tentative budget of \$6,000,000, chargeable to capital account, for improvements to roadway and existing equipment.

The Interstate Commerce Commission has sent to the Senate committee on interstate commerce an unfavorable report on the bill, introduced by Senator Cummins, to require the railroads to run their trains on "summer" time.

A Mass Meeting will be held in Sweetwater, Texas, on April 10, under the auspices of the West Texas Chamber of Commerce, to discuss the means of saving the Kansas City, Mexico & Orient from being abandoned, as is now threatened.

The Superpower System will be the subject of a paper presented in two parts by Henry Flood, Jr., and L. E. Inlay, at the spring convention of the American Institute of Electrical Engineers, to be held at the Drake Hotel, Chicago, April 19-21, 1922.

The Interstate Commerce Commission has denied the application of the Norfolk Southern for authority for its officers and directors to hold positions with other carriers in so far as it relates to the holding by C. McD. Carr of the positions of director of the Durham & Southern and of the Norfolk Southern.

The Savannah Sectional Committee of the American Railway Association, Signal Section, will hold its fourth meeting at Ansley Hotel, Atlanta, Ga., on Thursday, April 6, beginning at 10 a. m. V. Pagett, of Mudge & Company, Chicago, will speak on railroad motor cars, their maintenance and operation; and there will be a general discussion of rail bonding. Informal reports are expected from members who visited Chicago on the occasion of the March meeting of the Signal Section in that city.

Big Four Reopens Shops Under Contract

The Beech Grove (Ind.) shops of the Cleveland, Cincinnati, Chicago & St. Louis, have been reopened for operation under contract by the Railway Service & Supply Corporation. The shops had been closed for more than a month.

Chicago Car Foreman's Association to Meet

The Car Foreman's Association of Chicago will meet on April 10 at the Great Northern Hotel in that city, at which time a paper entitled, "Transferring of Bad Order Cars" will be presented by J. A. Deppe, assistant to the master car builder of the Chicago, Milwaukee & St. Paul, at Milwaukee, Wis.

Power Brake Hearing Postponed

The Interstate Commerce Commission has postponed from April 6 to May 17 its hearing at Washington in connection with its investigation of power brakes and appliances, and the time limit of its order requiring the carriers to furnish certain information regarding power brakes and appliances has been extended from April 1 to May 1.

Contents of Burlington Vaults Saved from Fire

When the steel vaults in the office building of the Chicago, Burlington & Quincy in Chicago were opened on March 21, six days after the disastrous fire of March 15, it was found that the documents, maps and records in them were unharmed. While all of the maps and blueprints in the offices of the engineering and

mechanical departments other than those contained in the vaults were destroyed, marked progress has already been made in duplicating these records from prints received from outlying points.

"The Spirit of Transportation"

With the above title as the principal inspiration, the Clark Equipment Company, Buchanan, Mich., a concern which deals in automobile parts, offers a prize of \$1,000 for an ode on transportation and has appointed a committee to judge the manuscripts received. Last year the Clark company gathered twelve paintings by famous artists, each depicting the artist's own conception of "The Spirit of Transportation." It is now proposed to publish reproductions of the pictures, accompanied by a poem or ode on the same theme.

New York-New Jersey Tunnel

The tunnel from Canal street, Manhattan, New York City, to Henderson street, Jersey City, for highway traffic, is to begin in about six weeks. This tunnel is being built by the joint action of the states of New York and New Jersey. The New York Legislature has passed the principal appropriation bill for \$5,500,000; and on March 28 the commissions in charge of the work, at a joint session in New York City, awarded the contract for construction to the Booth & Flink Company, of New York and Pittsburgh, at \$19,330,000.

Conductor and Engineman Imprisoned

Charles L. Evans, conductor and Walter Yeakle, engineman, convicted in court at Norristown, Pa., in February, for responsibility for the disastrous collision on the Philadelphia & Reading near Woodmont, on December 5, were on March 20 sent to jail, Evans for nine months and Yeakle for six months; each also being fined \$500 and costs. A petition, said to have been signed by 5,000 persons, asked the court to suspend the sentences, but Judge Swartz after considering the petition for a half hour, said that to grant it would be a shirking of his duty.

Revenues and Expenses For February

A preliminary compilation of reports of revenues and expenses filed with the Interstate Commerce Commission for February by 137 Class 1 roads shows net operating income of \$37,647,000 as against a deficit of \$10,364,000 for those roads in February last year. The total operating revenues increased two-tenths of 1 per cent, while operating expenses show a reduction of 16.2 per cent. In the Eastern district there was an increase in revenues of 4 per cent, while in the Western district there was a decrease of 7.3 per cent and in the Southern of 2.5 per cent. On the basis of these returns, it is roughly estimated that the roads will show a return at the rate of approximately 4 per cent per annum for February.

Railway Development Association of the Southeast

This association held its third annual meeting at Atlanta, Ga., on February 22 and 23, with President Jesse M. Jones in the chair.

Most or all of the members of this association belong also to the American Railway Development Association and the discussions at the meetings were largely on topics which have been considered at recent meetings of the national association.

The members were unanimous in the opinion that the discontinuance of cotton raising should be resisted, while at the same time other cash crops, such as sweet potatoes, hogs, and dairy products ought to be encouraged. All agreed that carpet grass ought to be introduced extensively in the South, with a view to the promotion of the raising of live stock and the extension of pastures. A law to promote national

reclamation was favored. A number of instances were reported where two or more railroads in competitive territory have been working in unison to help the farmers.

The officers elected for the ensuing year were: President, J. F. Jackson (C. Ga.); senior vice-president, W. R. Tucker (A. B. & A.); agricultural vice-president, H. B. Holroyd (L. & N.); industrial vice-president, E. S. Center (A. & W. P.); immigration vice-president, E. D. Mays (S. A. L.); secretary, H. S. McLendon (F. E. C.), St. Augustine, Fla.

Railroad Meeting of Virginian Section A. S. M. E.

The Virginian Section of the American Society of Mechanical Engineers will hold a meeting at Newport News on April 7 and 8 at which engineering problems pertaining to locomotives and cars will be discussed. The subjects of the papers and the authors are as follows: Locomotive Operation, John A. Pilcher, mechanical engineer, Norfolk & Western; Car Design, L. E. Endsley, University of Pittsburgh; Truck Design, George A. Boyden. A paper on The Modern Trend of Locomotive Design will be presented, the name of the author not being available at this time.

Transportation Division of A. R. A.

to Meet in Chicago

The annual session of the Transportation division of the American Railway Association will meet at the Blackstone Hotel, Chicago, on Wednesday, April 19. The business before this meeting will be the consideration of, and action upon, the reports of the committees on car service; demurrage; storage, reconsignment and diversion; freight handling service; railroad business mail and records. In view of the importance of the reports to be considered, it is expected that there will be a full discussion on all of the subjects presented and members have been requested to come prepared for a possible two-day session. All car accounting and transportation officers are urged to be present.

Railway Business Association

President Alba B. Johnson, of the Railway Business Association announces that for three-year terms he has reappointed as members of the general executive committee W. E. Clow, Chicago, president James B. Clow & Sons; G. F. Downs, Buffalo, president Lackawanna Steel Co.; E. J. Kearney, Milwaukee, secretary Kearney Trecker Co.; E. B. Leigh, Chicago, president Chicago Railway Equipment Co.; Herbert I. Lord, Detroit, vice-president Detroit Lubricator Co.; William E. Sharp, Chicago, president Grip Nut Co.; and has appointed the following three new members: J. M. Davis, New York, president Manning, Maxwell & Moore; J. E. Galvin, Lima, Ohio, president Ohio Steel Foundry Co.; Samuel M. Hastings, Chicago, president Dayton Scale Co.

Administration Gives Up Efforts to Avert Coal Strike

The strike of coal miners called for April 1 was one of the principal subjects discussed at the cabinet meeting on Friday, March 24, but it was stated later at the White House that the administration had practically given up hope of averting a strike by its efforts to bring the labor leaders and the operators into a conference. It was pointed out in this connection that while recently the operators have refused to go into a general conference, last October when the administration, through Secretary Hoover, tried to take steps to forestall a strike, the union leaders were unwilling to confer. It was indicated that the administration expects to find some way to act to prevent a shortage of coal. President Harding is very much interested in seeing the cost of coal reduced by a lowering of the cost of production and also of the cost of transportation. He takes the position that because of the excess capacity of the mines the cost of production could be reduced by a development of coal exports which at present are out of the question because of the high level of wages and freight rates.

Operating officers of the eastern coal-carrying roads held a meeting at the office of the Car Service Division of the American Railway Association at Washington on March 28 to consider plans for diverting coal during the period of the strike.

The Bureau of the Census and the Geological Survey have

prepared jointly a report on stocks of coal as of March 1, which shows that on that date consumers had in storage approximately 52,500,000 tons of soft coal. By April 1, considering the rate at which coal has been leaving the mines recently, it is estimated that this reserve will have increased to at least 63,000,000 tons. At the rate of consumption prevailing in January and February, the reserve on March 1 was sufficient to last 43 days if evenly divided, which approximates the maximum stocks on hand at the end of the war. In addition, there were 5,160,000 tons on the upper lake docks and a further reserve of at least 674,000 tons was held in storage by the purchasers of coal either at the mines or intermediate points. The American Railway Association has supplied information as to the quantity of coal held by the carriers on March 1 for railroad use. The roads already heard from had a total of 14,850,000 tons and it was expected that complete reports would show over 16,000,000 tons. As the largest stocks on record in the past were 13,640,000 tons on January 1, 1919, it will be seen that the railroads have accumulated what is for them an enormous reserve of coal, sufficient to last on the average 42 days at the present rate of consumption. The stocks on the day of the armistice were sufficient for only 31 days, part of the difference being due to the greater requirements of the roads at that time.

Strike on Western Maryland

Shopmen and trackmen on the Western Maryland struck on Saturday, March 25, against the action of the railroad in dismissing them and leaving them to work for contractors. According to press dispatches, considerable numbers left their work at Baltimore, Hagerstown and Cumberland, Md.; Elkins, W. Va., and Connellsville, Pa. Most of the work in these departments on the Western Maryland is now in the hands of contractors, the Dickson Construction & Repair Company, of Youngstown, Ohio, and the strikers are nearly all employees of this concern. Representatives of the contractors said, at Baltimore, on the 27th, that there was difficulty in filling the places of the strikers and that they would not be taken back. On the evening of the 28th, reports from Hagerstown said that there had been some rioting in the yards there, when non-union men were set at work.

Shopmen on the Western Maryland have the full authority and sanction of their union to go on strike, according to B. M. Jewell, president of the Railway Employees Department of the American Federation of Labor. The proper vote and compliance with union laws were fulfilled before the men walked out.

Meetings and Conventions

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

- AIR BRAKE ASSOCIATION.—F. M. Nellis, 165 Broadway, New York City. Next meeting, May 9-12, 1922, Hotel Washington, Washington, D. C. Exhibit by Air Brake Appliance Association.
- AIR BRAKE APPLIANCE ASSOCIATION.—J. F. Gettrust, The Ashton Valve Company, 318 W. Washington St., Chicago. Meeting with Air Brake Association.
- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontious, Supervisor of Demurrage and Storage, C. & N. W. Ry., Chicago.
- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—L. A. Stone, C. & E. I. Ry., Chicago. Annual meeting, Oct. 17-20, San Francisco, Cal.
- AMERICAN ASSOCIATION OF ENGINEERS.—C. E. Drayer, 63 E. Adams St., Chicago.
- AMERICAN ASSOCIATION OF GENERAL BAGGAGE AGENTS.—E. L. Durcan, 332 So. Michigan Ave., Chicago. Next meeting, June 28 and 29, Minneapolis, Minn.
- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Next meeting, Nov. 21-22, Pinehurst, N. C.
- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—J. Rothschild, Room 400, Union Station, St. Louis, Mo. Next convention, August 23-25, 1922, Kansas City, Mo.
- AMERICAN ELECTRIC RAILWAY ASSOCIATION.—J. W. Welsh, 8 W. 40th St., New York.
- AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPE FITTERS' ASSOCIATION.—C. Borcherdt, 202 North Hamlin Ave., Chicago, Ill.
- AMERICAN RAILWAY ASSOCIATION.—J. E. Fairbanks, General Secretary, 75 Church St., New York, N. Y. Annual meeting, November, 1922.

Division 1—Operating.

Freight Station Section (including former activities of American Association of Freight Agents). R. O. Wells, Freight Agent, Illinois Central Railroad, Chicago, Ill.

Medical and Surgical Section. J. C. Cavistoa, 75 Church St., New York.

(Continued on Page 844)

Compared with January, 1921, for Roads with Annual Operating Revenue above \$25,000,000.

- Protective Section (including former activities of the American Railway Chief Special Agents and Chiefs of Police Association), J. C. Caviston, 75 Church St., New York, N. Y.
- Telegraph and Telephone Section (including former activities of the Association of Railway Telegraph Superintendents).—W. A. Fairbanks, 75 Church St., New York, N. Y. Annual meeting, September 20-22, 1922, Grand Olympic Hotel, New York, N. Y.
- Safety Section.—J. C. Caviston, 75 Church St., New York.
- Division II—Transportation (including former activities of the Association of Transportation and Car Accounting Officers).—G. W. Covert, 431 South Dearborn St., Chicago, Ill.
- Division III—Traffic, J. Gottschalk, 143 Liberty St., New York.
- Division IV—Engineering, E. H. Fritch, 431 South Dearborn St., Chicago, Ill. Exhibit by National Railway Appliances Association.
- Construction and Maintenance Section.—E. H. Fritch.
- Electrical Section.—E. H. Fritch.
- Signal Section (including former activities of the Railway Signal Association).—H. S. Balliet, 75 Church St., New York, N. Y. Next meeting, March 13 and 14, Drake Hotel, Chicago. Annual meeting, June 14-16, 1922, Monmouth Hotel, Spring Lake, N. J.
- Division V—Mechanical (including former activities of the Master Car Builders' Association and the American Railway Master Mechanics' Association).—V. R. Hawthorne, 431 South Dearborn St., Chicago, Ill. Annual convention, June 14-21, 1922, Atlantic City, N. J. Exhibit by Railway Supply Manufacturers' Association.
- Equipment Painting Section (including former activities of the Master Car Builders' Association and Painters' Association).—V. R. Hawthorne, 431 South Dearborn St., Chicago, Ill.
- Division VI—Purchases and Stores (including former activities of the Railway Storekeepers' Association).—P. Murphy, General Store Keeper, New York Central, Collingwood, Ohio. Annual meeting, June 19-21, 1922, Hotel Traymore, Atlantic City, N. J.
- Division VII—Freight Claims (including former activities of the Freight Claim Association).—Lewis Pilcher, 431 South Dearborn St., Chicago, Ill.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W. Ry., 319 N. Waller Ave., Chicago. Next convention, October 17-19, 1922, Cincinnati, Ohio. Exhibit by Bridge and Building Supply Men's Association.
- AMERICAN RAILWAY DEVELOPMENT ASSOCIATION.—I. F. Jackson, C. of G. Ry., Savannah, Ga. Annual meeting, May 10-12, 1922, Denver, Colo.
- AMERICAN RAILWAY ENGINEERING ASSOCIATION.—(Works in co-operation with the American Railway Association, Division IV.)—E. H. Fritch, 431 South Dearborn St., Chicago. Exhibit by National Railway Appliances Association.
- AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—(See American Railway Association, Division 5.)
- AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—R. D. Fletcher, 1145 East Marquette Road, Chicago. Exhibit by Supply Association of the American Railway Tool Foremen's Association.
- AMERICAN SHORT LINE RAILROAD ASSOCIATION.—T. F. Whittelsey, Union Trust Bldg., Washington, D. C. Annual meeting, May 10, Washington, D. C.
- AMERICAN SOCIETY FOR STEEL TREATING.—W. H. Eisenman, 4600 Prospect Ave., Cleveland, Ohio. Sectional meeting, May 23-26, Bureau of Mines Auditorium, Pittsburgh, Pa. Annual convention, Oct. 2-7, 1922, General Motors Building, Detroit, Mich.
- AMERICAN SOCIETY FOR TESTING MATERIALS.—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa. Annual meeting, June 26-30, 1922, Chalfonte Haddon Hall, Atlantic City, N. J.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—F. M. Chandler (acting secretary), 33 W. 39th St., New York. Regular meetings 1st and 3d Wednesdays in month, except July and August, 33 W. 39th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York. Next meeting, May 8-11, Atlanta, Ga.
- Railroad Division, A. F. Stuehling, Managing Editor, Railway Mechanical Engineer, Woolworth Bldg., New York. Next meeting, May 16, 1922, 29 W. 39th St., New York.
- AMERICAN TRAIN DISPATCHERS ASSOCIATION.—C. L. Darling, 1310-1311 Mallers Bldg., Chicago, Ill. Next convention, June 18, 1923, Chicago.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.—George M. Hunt, Chemist, Forest Products Laboratory, Madison, Wis. Next meeting, January 23, 1923, New Orleans, La.
- ASSOCIATION OF RAILWAY CLAIM AGENTS.—H. D. Merris, Northern Pacific R. R., St. Paul, Minn. Next meeting, May 17-19, 1922, Montreal.
- ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucci, C. & N. W. Ry., Room 412, C. & N. W. Sta., Chicago. Next meeting, June 12, Dennis Hotel, Atlantic City, N. J. Exhibit by Railway Electrical Supply Manufacturers' Association.
- ASSOCIATION OF RAILWAY EXECUTIVES.—Thomas De Witt Cuyler (chairman), 61 Broadway, New York, N. Y.
- ASSOCIATION OF RAILWAY SUPPLY MEN.—A. W. Cleley, 1655 McCormick Bldg., Chicago, Ill. Meeting with International Railway General Foremen's Association.
- ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—(See American Railway Association, Division 1.)
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—(See American Railway Association, Division 1.)
- BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—D. J. Higgins, American Lumber Co., 332 S. Michigan Ave., Chicago. Meeting with convention of American Railway Bridge and Building Assn.
- CANADIAN RAILWAY CLUB.—W. A. Broth, 53 Rushbrooke St., Montreal, Que.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Vernon Kline, 676 North Pine Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, New Morrison Hotel, Chicago.
- CAR FOREMEN'S ASSOCIATION OF ST. LOUIS.—Thomas B. Koeneke, 604 Federal Reserve Bldg., St. Louis, Mo. Meetings, first Tuesday in month at the Amer. Inn Hotel Annex, St. Louis.
- CENTRAL RAILWAY CLUB.—Harry D. Vought, 26 Cortlandt St., New York. Regular meetings, 2d Thursday in January, March, May, September and November, Hotel Ironquins, Buffalo, N. Y.
- CHIEF INTERCHANGE CAR INSPECTORS AND CAR FOREMEN'S ASSOCIATION.—W. P. Elliott, Terminal Railroad Association of St. Louis, East St. Louis, Ill.
- CHIEF INSPECTORS OF CAR INSPECTORS AND CAR FOREMEN'S SUPPLY MEN'S ASSOCIATION.—D. B. Wright, 4th St. and Arden Ave., Chicago, Ill. Meeting with Chief Interchange Car Inspectors' and Car Foremen's Association.
- CINCINNATI RAILROAD CLUB.—W. C. Cooder, Union Central Bldg., Cincinnati, Ohio. Meetings, 2d Tuesday in February, May, September and November.
- EASTERN RAILROAD ASSOCIATION.—E. N. Bessling, 614 F St., N. W., Washington, D. C. Annual meeting May 11, 1922, Radrod Club of New York.
- FREIGHT CLAIM ASSOCIATION.—(See American Railway Association, Division VII.)
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—C. H. Treichel, Grand Central Station, Chicago. Regular meetings, Wednesday preceding 3d Friday in month, Room 1414, Manhattan Bldg., Chicago.
- INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—W. J. Mayer, Michigan Central R. R., Detroit, Mich. Exhibit by International Railroad Master Blacksmiths' Supply Men's Association.
- INTERNATIONAL RAILROAD MASTER BLACKSMITHS' SUPPLY MEN'S ASSOCIATION.—George J. White, 747 Railway Exchange, Chicago. Meeting with International Railroad Master Blacksmiths' Association.
- INTERNATIONAL RAILWAY ASSOCIATION.—(President), V. Tondelier, President Belgian State Railway System, Brussels. Next congress, April 18-30, Fine Arts Exposition Palace, Rome, Italy.
- INTERNATIONAL RAILWAY FUEL ASSOCIATION.—J. G. Crawford, 702 E. 53rd St., Chicago. Next annual meeting, May 22-25, 1922, Auditorium Hotel, Chicago. Exhibit by International Railway Supply Men's Association.
- INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1061 W. Wabasha Ave., Winona, Minn.
- INTERNATIONAL RAILWAY SUPPLY MEN'S ASSOCIATION.—C. W. Sullivan, Garlock Packing Co., 126 W. Madison St., Chicago. Meeting with International Railway Fuel Association.
- MAINTENANCE OF WAY MASTER PAINTERS' ASSOCIATION.—E. E. Martin, Union Pacific R. R., Room No. 19, Union Pacific Bldg., Kansas City, Mo. Annual convention, 1922, Buffalo, N. Y.
- MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 26 Cortlandt St., New York. Next convention, May 23-26, 1923, Hotel Sherman, Chicago.
- MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION.—(See A. R. A., Division V.)
- MASTER CAR BUILDERS' ASSOCIATION.—(See A. R., Division V.)
- NATIONAL ASSOCIATION OF RAILWAY TOOL PRODUCERS.—Warren C. Nixon, Western Tie & Timber Co., 905 Syndicate Trust Bldg., St. Louis, Mo.
- NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES COMMISSIONERS.—James B. Walker, 49 Lafayette St., New York. Next convention, September 26, 1922, Detroit, Mich.
- NATIONAL FOREIGN TRADE COUNCIL.—O. K. Davis, 1 Hanover Square, New York. Next convention, May 10-12, Philadelphia, Pa.
- NATIONAL RAILWAY APPLIANCES ASSOCIATION.—C. W. Kelly, People's Gas Bldg., Chicago. Annual exhibition at convention of American Railway Engineering Association.
- NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 681 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, excepting June, July, August and September.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 26 Cortlandt St., New York. Regular meetings, 2d Friday in month, except June, July and August, at 29 W. 39th St., New York.
- PACIFIC RAILWAY CLUB.—W. S. Wollner, 64 Pine St., San Francisco, Cal. Regular meetings, 2d Thursday in month, alternately in San Francisco and Oakland.
- RAILWAY ACCOUNTING OFFICERS' ASSOCIATION.—E. R. Woodson, 1116 Woodward Building, Washington, D. C. Annual meeting, June 7, 1922, Hotel Cleveland, Cleveland, Ohio.
- RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 600 Liberty Bldg., Broad and Chestnut Sts., Philadelphia, Pa. Annual dinner, February 1, Waldorf-Astoria, New York.
- RAILWAY CLUB OF PHILADELPHIA.—J. D. Conway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month, except June, July and August, Fort Pitt Hotel, Pittsburgh, Pa.
- RAILWAY DEVELOPMENT ASSOCIATION.—(See Am. Ry. Development Assn.)
- RAILWAY ELECTRICAL MANUFACTURERS' ASSOCIATION.—J. Scribner, General Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.
- RAILWAY EQUIPMENT MANUFACTURERS' ASSOCIATION.—R. J. Himmelricht, 175 East 42nd St., New York. Meeting with Traveling Engineers' Association.
- RAILWAY FIRE PROTECTION ASSOCIATION.—R. R. Hackett, Baltimore & Ohio R. R., Baltimore, Md.
- RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrison, C. & O. Ry., Richmond, Va. Next meeting, October 10-13, 1922, Pittsburgh, Pa.
- RAILWAY SIGNAL ASSOCIATION.—(See A. R. A., Division IV, Signal Section.)
- RAILWAY STOREKEEPERS' ASSOCIATION.—(See A. R., Division IV, Division VI.)
- RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 1841 Oliver Bldg., Philadelphia, Pa. Meeting with A. R. A., Division V.
- RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 30 Church St., New York.
- RAILWAY TRUCK SUPPLY OFFICERS ASSOCIATION.—L. W. Cox, Commercial Trust Bldg., Philadelphia, Pa.
- ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrew, C. & N. W. Ry., Sterling, Ill. Annual convention, September 19-21, 1922, Hotel Staller, Cleveland, Ohio. Exhibit by Truck Supply Association.
- ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August.
- SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, Sunbeam Electric Manufacturing Co., New York City. Meeting with American Railway Association, Signal Section.
- SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, P. O. Box 1205, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.
- SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, Western Ry. of Ala., Atlanta, Ga.
- SUPPLY ASSOCIATION OF AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—H. S. White, 9 N. Jefferson St., Chicago.
- TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meets with Roadmasters' and Maintenance of Way Association.
- TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, Marine Trust Building, Buffalo, N. Y. Exhibit by Railway Equipment Manufacturers' Association.
- WESTPHALIA RAILWAY CLUB.—Bruce V. Crandall, 14 E. Jackson Boulevard, Chicago. Regular meetings, 3d Monday each month except June, July and August.

Traffic News

C. B. Rader has been reappointed secretary and traffic commissioner of the Denver Grain Exchange Association of Denver, Colo.

The National Railways of Mexico announce that first class passenger fares have been increased 16 2/3 per cent, and second class fares 20 per cent.

The Pennsylvania has announced reduced round trip excursion tickets from Chicago to Washington, D. C., at \$38.90, to be on sale on April 24, May 29, and June 26. The tickets will be good for one week and will be honored on all trains with the exception of the Broadway Limited.

The Chicago, Burlington & Quincy recently announced a 25 per cent reduction in its dining car prices, and has in addition, inaugurated a new system of table d'hotel meals, offering six combination breakfasts, ranging in prices from 40 cents to one dollar; a dollar luncheon; and a dinner for \$1.25. A la carte service will be continued.

At a meeting of the Southeastern Passenger Association held in February, it was announced that the United Confederate Veterans would be given a one way rate for the round trip to their annual reunion at Richmond, Va. This brought such a storm of protests from the veterans that it has since been decided to place the old cent a mile rate in effect.

Coal Production

The demand for soft coal slackened perceptibly during the week of March 18, according to the weekly bulletin of the Geological Survey, and production declined from 11,115,000 to 10,784,000 net tons. It is estimated, however, that this so exceeded consumption as to provide nearly 2,500,000 tons to be added to consumers' stock piles. How much is in storage will not be accurately known until the forthcoming report on stocks is issued.

More States' Rights Bills

Senator Ladd has introduced in Congress a bill to define commerce and establish when an article or commodity is in interstate commerce and when subject to the laws of a state. It provides that "no article of commerce shall be deemed to be in interstate commerce or subject to the federal control or jurisdiction until the same shall have been loaded for shipment and the bill of lading provided for its transportation beyond the borders of the said state and until such time it shall remain subject to the laws of the state. Any article or product shipped from one state to another and billed to its destination shall cease to be treated as in interstate commerce when at the said destination it is unloaded or removed from the system or means of transportation employed in conveying said article or product and shall then be subject to the provisions of the state laws."

Representative McClintic has also introduced a bill to amend sections 402, 406 and 416 of the interstate commerce act "for the purpose of restoring to state commissions certain jurisdiction exercised over intrastate questions prior to the war with Germany."

Representative Bacharach of New Jersey has also introduced a bill by which federal courts would be prohibited from considering actions at law to suspend or restrain the enforcement of orders by state regulating authorities under state laws.

The House committee on interstate and foreign commerce is continuing its hearings on the Sweet bill, at which a number of state commissioners and John E. Benton, general solicitor of the National Association of Railway and Utilities Commissioners, have been heard to advocate the amendment of provisions of the transportation act, recently sustained by the Supreme Court, under which orders of state commissions have been nullified because of discrimination against interstate commerce.

Freight Commodity Statistics for 1921

The Interstate Commerce Commission has issued a statement showing the freight tonnage transported by Class I steam railways for the year ended December 31, 1921. The figures in this statement will not agree with the corresponding totals of the four quarters already published; mainly for the reason that for the first quarter the report of the New York Central did not include the tonnage transported over the Boston & Albany, and also on account of corrections in the first three quarterly reports of the New York, New Haven & Hartford resulting from the transfer from "Tonnage originated" to "Tonnage received from connecting carriers" of certain shipments of cotton, anthracite coal, and bituminous coal received at tidewater.

The following is a comparison, by general classes of commodities, of the tonnage transported in 1920 with that transported in 1921:

Classes of Commodities	NUMBER OF TONS ORIGINATED		
	Year ended Dec. 31, 1920	Year ended Dec. 31, 1921	Percent decrease 1921 from 1920
	Products of agriculture	110,839,554	114,016,652
Animals and products	26,594,856	24,273,370	8.73
Products of mines	712,154,458	510,360,112	28.27
Products of forests	100,765,537	76,922,790	23.66
Manufactures and miscellaneous	251,864,290	172,176,614	31.64
Merchandise—All L. C. L. traffic	53,202,296	42,079,815	20.91
Total	1,255,420,991	940,329,353	25.10

Classes of Commodities	TOTAL TONS CARRIED		
	Year ended Dec. 31, 1920	Year ended Dec. 31, 1921	Percent decrease 1921 from 1920
	Products of agriculture	320,049,724	222,722,672
Animals and products	44,853,503	41,794,508	6.82
Products of mines	1,209,097,673	876,645,798	27.33
Products of forests	195,579,878	148,138,456	24.26
Manufactures and miscellaneous	494,556,078	333,150,182	32.64
Merchandise—All L. C. L. traffic	89,901,495	67,165,435	25.29
Total (1)	2,259,983,278	1,691,617,051	25.15

* Increase.

(1) Includes 5,944,927 tons for which distribution by classes of commodities was not furnished.

New England Division Order Modified

The Interstate Commerce Commission has issued a modification of its order in the New England division's case, dealing with the rates of the Boston & Albany, which was a defendant. The order now provides that of the joint class rates and of the joint commodity rates which are divided on the same basis as are applied to joint class rates, between points on defendants' lines, other than the lines of the Boston & Albany of which the New York Central is lessee, and points on complainants' (New England) lines, other than the lines of complainant the Bangor & Aroostook, complainants shall receive, on and after April 1, 1922, divisions which shall be not less than 115 per cent of their present divisions, except in cases where their present divisions or their present divisions plus those of the Boston & Albany where it participates in the traffic as an intermediate carrier, are greater than the divisions now accruing to defendants, other than the Boston & Albany, in which cases complainants shall receive divisions which shall be not less than:

(1) Where the Boston & Albany does not so participate in the traffic, their present divisions plus 15 per cent of the present divisions accruing to defendants.

(2) Where the Boston & Albany does so participate in the traffic, their present divisions plus that proportion of such 15 per cent as their present divisions may be of the total of their present divisions and the division of the Boston & Albany.

The several carriers, other than the complainants and the Boston & Albany participating therein shall receive on and after April 1, the amounts remaining of said joint rates after deducting the divisions so to be received by complainants and the present divisions of the Boston & Albany where it participates in the traffic, such amounts so remaining to be divided among such other carriers in the same ratio as their present divisions respectively bear to each other, or otherwise as they may agree, or failing such agreement, as may be determined by the commission upon application therefor.

It is provided, however, that the first month for which the carriers will be required to state and make their current accounts and settlements in accordance with this order will be the month of June, 1922; the accounts and settlements for the months of April and May, 1922, in accordance with this order, may be stated and made at any time up to August 1, 1922.

Commission and Court News

Interstate Commerce Commission

The Interstate Commerce Commission has vacated its order of suspension of proposed proportional rates representing reductions from Chicago and related points to South Atlantic and Gulf ports for application on traffic consigned to the Pacific coast by steamship lines operating through the Panama Canal.

The Interstate Commerce Commission has reopened the case in which it reduced rates on grain, hay and grain products in the West, to the extent necessary for consideration of a petition filed by the carriers in which they allege that the order of November 21 includes a portion of Illinois territory not embraced within the issues in the proceeding and ask that the order be modified. The petition is assigned for hearing at Chicago on April 10 before Examiner Barclay.

The commission has suspended, July 23, the operation of certain schedules published in supplements to Agent F. A. Leland's tariffs which propose to establish proportional rates on grain from Sioux City, Iowa, to stations in Louisiana and Texas, uniformly five cents higher than the proportional rate on the same commodities from Omaha, Neb., to same destinations. At the present time there are no through proportional or reshipping rates on grain from Sioux City.

The commission has suspended from March 31 to July 29 the operation of schedules which propose the cancellation of the present provisions for the application of an estimated weight of 7.4 pounds per gallon and the substitution thereof of provisions of the application actual weight per gallon applicable on crude or fuel oil in tank cars from Kansas, Missouri, Oklahoma and Texas to Arizona and New Mexico, also to Cananea, Mexico.

Western Coal Rates

The commission has ordered an investigation to determine whether the rates on coal from producing points in the states of Montana, Wyoming, Colorado and New Mexico and all states west thereof, to destinations in the said states, or any of them, and to El Paso, Texas, are unjustly discriminatory or otherwise in violation of law.

State Commissions

The Southern Pacific and the San Diego & Arizona have petitioned the Railroad Commission of California to approve an agreement covering the joint use of locomotives and shop facilities of the Southern Pacific at Calexico, Cal., and the joint use of the Southern Pacific main line between El Centro and Calexico.

The Public Service Commission of Oregon recently examined the rules and practices under which the Oregon-Washington Railroad & Navigation Company operates trains through its Peninsula tunnel, near St. Johns Junction, Portland, Ore. This investigation was brought about by an accident in the tunnel on December 25, last, resulting in one death and the partial suffocation of other members of a train crew. The commission finds that the practices, service and facilities are unsafe and do not afford adequate protection to the health and safety of employees and passengers. It is held that the staff section, the limits of which straddle the track through the tunnel, should be extended so that trains will be manned a clear track of not less than 100 ft. on either end. The blow down (deflector) must be placed on all engines operating regularly through the tunnel, and must be checked by all men operating through the tunnel. The commission also found it either of the staff section, except by emergency, and an engineering study must be made with the commission detailing the feasibility of artificial ventilation by shafts, forced draft or other suitable means.

Labor Board Decisions

Clerk Receives Pay Benefit of Outside Experience

A case was presented to the Labor Board with respect to a woman who entered the service of the St. Louis-San Francisco on July 16, 1920, as a general clerk in the car accountant's office at Springfield, Mo. The employees contend that she had been employed previously in clerical work of a similar nature and was, therefore, entitled to the rate paid clerks of more than one year's experience. The carrier took the position that she did not have one or more year's experience in railroad clerical work or that of a similar nature and was not, therefore, entitled to the rate for clerks of one or more years' experience. The position of the employees was sustained.—*Decision No. 783.*

Dispatcher Permitted to Hold Seniority Rights While Working Extra on Another Division

A train dispatcher on the St. Louis division of the Chicago, Rock Island & Pacific was transferred temporarily to the Kansas division to relieve the chief dispatcher, assistant chief dispatcher and trick dispatcher while they were taking their vacations. It was the contention of the American Dispatchers' Association that this man, by accepting service on the Kansas division, lost his seniority rights as a dispatcher on the St. Louis division and that the action of the carrier in permitting him to return to the St. Louis division was in violation of rules. The carrier contended that at the time the transfer was made dispatchers were considered as officers and that this man was permitted to accept temporary promotion rather than to employ a dispatcher from the outside who was not familiar with the system of dispatching in vogue. The Labor Board denied the claim of the employees.—*Decision No. 781.*

Yard Checker Entitled to Exercise Seniority Rights for Call Boy's Position

A position as yard checker was abolished by the Lehigh Valley incident to a reduction in force. The employee holding this position sought to exercise his seniority rights to displace an employee holding the position of caller. The road declined his request on the ground that he did not possess sufficient fitness and ability to qualify for this position. The Labor Board decided that as he had filled the position of yard checker satisfactorily he had demonstrated his fitness and ability to justify his assignment as a call boy and ordered that he be given that position and reimbursed for all monetary loss incurred since the date he made application for the position, less any amount earned in other employment since that date.—*Decision No. 735.*

Differential Rates Allowed for Positions of Varying Importance

The express foreman at the Western Maryland station at Cumberland, Md., received \$10 a month less than the express foreman at the Baltimore & Ohio station at that place. The employees contended that the two men were performing the same class of work and that the disparity in wages constituted a discrimination which should be adjusted in accordance with Section 1, Article 1 of Supplement 19 to General Order No. 27, U. S. R. A., which provides for the equalization of rates of pay for the same work at the same agency or upon the same messenger run. The carrier contended that the equalization of wages of employees performing the same work at the same agency emphasized that the work must be the same and this, it maintained, was in this case not true, for the Western Maryland station at Cumberland was a comparatively unimportant station office whereas that of the Baltimore & Ohio was a large and important one. The Board upheld the carrier in its contention that the work was not the same and decided against the employees.—*Decision No. 698.*

Foreign Railway News

Chile Buys German Rails

The Chilean State Railways have contracted with Stinnes and Krupp interests for 13,000 tons of steel rail, according to the Wall Street Journal. Terms of payment have evidently not been decided, because it is said that Chile is seeking to pay in nitrates and that the Germans are resisting this.

Italy Cancels Order for German Locomotives

The Italian government has announced, according to dispatches to the New York Herald, that it is cancelling in part its orders for 300 locomotives to be built in Germany and charged to Germany's reparations accounts to Italy. It is understood that this cancellation was due largely to the dissatisfaction of Italian industries which felt that they were being discriminated against.

Argentina to Build Railway in Bolivia

The Argentine government has signed an agreement with the Bolivian government for the construction of a railway in Bolivia, on the understanding that Bolivia can purchase at any time she desires, according to Modern Transport (London). The road will cross the border at Yacuiba and will connect with the Argentine State Railways, and tap territory in eastern Bolivia, from which it is expected Argentina will be able to draw valuable raw materials. The development of petroleum fields in eastern Bolivia is expected to be one important result of the undertaking.

Exports of Car Wheels and Axles in December

Exports of car wheels and axles in December totaled \$102,880 in value. Totals by countries, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Dollars	Countries	Dollars
Canada	9,754	China	37,200
Honduras	1,265	Japan	16,498
Mexico	10,706	British South Africa	4,228
Cuba	4,391	Other Countries	638
Dominican Republic	700		
Brazil	4,554	TOTAL	102,880
Colombia	13,126		

December Locomotive Exports

In December 65 locomotives, valued at \$2,178,620, were exported from this country. Of these 26 went to Mexico and 30 to Argentina. Totals by countries as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Number	Dollars
Mexico	26	556,900
Jamaica	1	3,000
Cuba	1	10,580
Argentina	30	1,168,000
Chile	5	225,000
Japan	2	15,140
Total	65	2,178,620

Military Control Cuts Chinese Road's Revenues

During the closing quarter of 1921 the earnings of the Peking-Hankow Railway were greatly reduced by the taking over of the lower end of the line by military officials, according to Commerce Reports. This greatly reduces the railway's capacity to meet its commitments, which have during the past year been increased considerably through purchases of additional equipment. It may also deter the awarding of the contract for the Yellow River bridge, designs and proposals for which were considered during the summer by a special board of foreign experts retained by the Chinese railways for the purpose.

Losses of New Zealand's Government Railways

The New Zealand Government Railways are losing £1,000,000 per annum, according to the Times (London) Trade Supplement. Rates have been reduced recently, but train service has been severely curtailed and employees reduced to the minimum. One cause of heavy expense is said to be the small sums spent recently

in carrying out needed improvements. Some £4,000,000 will be needed to bring about these improvements. It is pointed out that the government is not pledged to making its purchases in Britain, but that as a matter of practice it does so, even paying higher prices where necessary.

Electrification and New Equipment in Hungary

The Hungarian State railways are reported to have placed orders with a consortium of Hungarian car manufacturers for 2,000 cars, practically all for freight service, according to Commerce Reports. The state railway shops were given an order for 50 locomotives, while an order for 100 more is under consideration. The installation of a double track on the Budapest-Szabadka line is to be continued, and other lines will be double-tracked as soon as possible.

Present conditions seem to indicate the probability of electrification of some of the Hungarian railways. Although the government has not arrived at any decision regarding this matter, it is proposed ultimately to electrify all trunk lines radiating from Budapest—a total of about 1,400 kilometers, or 2,000 kilometers including double tracks. No decision has been reached as to the system of electrification, though a new split-phase system, somewhat similar to that of the Norfolk & Western Elkhorn grade, will be given a trial. An experimental run will be started about the end of April on a short line of about 15 kilometers, equipped with overhead construction. If the test proves satisfactory, a definite decision will be arrived at next year, and general electrification will be pushed as rapidly as financial and manufacturing conditions will permit.

Meter Gage Mallets for Burma

The accompanying photograph depicts a locomotive recently built by the North British Locomotive Company, Ltd., Glasgow, Scotland, for the Burma Railways (meter gage). This locomotive is a Mallet articulated compound and develops 22,170 lb. tractive effort at 50 per cent of its working pressure, which is 180 lb. The wheels are 3 ft. 3 in. in diameter. High pressure cylinders are 15½ in. in diameter and low pressure cylinders 24¼

Mallet With Tractive Effort of 22,170 Pounds

in. Saturated steam is used and is generated by a grate area of 33 sq. ft. The engine weighs 133,000 lb. and is equipped with a Pyle National electric headlight. These locomotives are the sixth lot of North British locomotives delivered to India and Burma. They were built in accordance with the instructions of Messrs. Rendel, Palmer and Tritton, consulting engineers for the Burma Railways. The photograph and the data presented here were taken from Modern Transport (London).

Americans Finance Railway in Australia

The government of the State of Queensland, Australia, has recently negotiated a loan from American bankers for the purpose of constructing a railroad to develop lands on the Upper Burnett, Callide Valley, upon which it is intended to locate settlers upon very favorable terms, according to Commerce Reports. The Bureau of Foreign and Domestic Commerce is endeavoring to arrange to have American manufacturers given an opportunity to bid upon the rails, equipment, construction machinery, and other materials needed for the project. The specifications have not yet been completed, but information on this subject can be obtained, as soon as it is received from Australia, from the Iron and Steel Division of the Bureau at Washington.

Equipment and Supplies

Locomotives

THE PEORIA & EASTERN is inquiring for repairs on 17 locomotives.

THE BOSTON & MAINE may ask for about 20 locomotives in the near future.

PHELPS, DODGE & Co. has ordered two locomotives from the H. K. Porter Company.

THE MIDLAND VALLEY has ordered 3 Mikado type locomotives from the Baldwin Locomotive Works.

THE MOBILE & OHIO is inquiring for 10 Mikado type locomotives. These locomotives will have 26 by 30 in. cylinders.

THE PHILADELPHIA & READING has ordered 25 Consolidation type locomotives from the Baldwin Locomotive Works.

THE CARNEGIE STEEL COMPANY has ordered from the American Locomotive Company one locomotive for its Youngstown plant.

LEONARD KENNEDY & Co., 67 Wall street, New York City, has ordered 4, 0-6-0 type locomotives from the Baldwin Locomotive Works. These locomotives are for export to Brazil.

THE LEHIGH & NEW ENGLAND, reported in the *Railway Age* of March 4 as inquiring for locomotives, has ordered 4 Consolidation type locomotives from the American Locomotive Company.

THE LEHIGH VALLEY is having repairs made and superheaters installed on 14 ten-wheel locomotives at the Dunkirk shops of the American Locomotive Company. This is the beginning of a well defined program for modernizing the small motive power on this road.

Freight Cars

THE NEWPORT NEWS SHIPBUILDING & DRY DOCK Co., is inquiring for 1 flat car of 120 tons capacity.

THE CHICAGO & NORTH WESTERN, noted in the *Railway Age* of March 11 and 25 as inquiring for 3,100 freight cars has opened bids for this equipment. It is expected that contracts will be awarded by the end of this week.

THE NORTHERN PACIFIC, reported in the *Railway Age* of February 11 as inquiring for 500 refrigerator cars has ordered 1,000 refrigerator cars from the American Car & Foundry Co. The company is now inquiring for 60 express refrigerator cars.

THE CHICAGO, MILWAUKEE & ST. PAUL, noted in the *Railway Age* of February 11 as inquiring for 1,000 or more 40-ton box cars, has ordered 4,000 cars distributed 1,000 each to the Pullman Company and the Western Steel Car & Foundry Company; 1,500 to the Bettendorf Company; and 500 to the General American Car Company.

THE NEW YORK CENTRAL is negotiating with car builders to place contracts for freight cars, reported to be about 16,000. The orders are expected to be divided about as follows: To the American Car & Foundry Company, 5,500; Standard Steel Car Company, 5,500; Ralston Steel Car Company, 500, and divided between the Pressed Steel Car Company and the Pullman Company, 4,500 cars.

Passenger Cars

THE BOSTON ELEVATED is inquiring for 100 cars.

THE WESTERN PACIFIC is inquiring for 5 dining cars.

THE WYOMING is inquiring for 8 coaches, 9 chair cars, 2 buffet cars, 2 cafe chair cars and 4 dining cars.

THE SOUTHERN PACIFIC has ordered 50 steel cars for service on its Pacific Electric division from the St. Louis Car Company, the electrical equipment to be furnished by the Westinghouse Electric & Manufacturing Company.

Iron and Steel

THE BOSTON ELEVATED has ordered 600 tons of structural steel for a shed from the McClintic-Marshall Company.

THE SEABOARD AIR LINE is inquiring for 300 tons of structural steel for a bridge over the Altamaha river in Alabama.

THE LOUISVILLE, HENDERSON & ST. LOUIS has ordered 3,000 tons of rails from the United States Steel Corporation.

THE SOUTH MANCHURIAN RAILWAY is inquiring through export houses in New York City for 8,000 tons of rail.

THE DELAWARE, LACKAWANNA & WESTERN has ordered from the American Bridge Company 1,800 tons of structural steel for bridge repairs at various places on the road.

THE CHICAGO, ROCK ISLAND & PACIFIC has awarded a contract to the Fort Pitt Bridge Company, Pittsburgh, Pa., for 1,662 tons of steel to be used in a bridge over Sylvan Slough, Rock Island, Ill.

THE LEHIGH & NEW ENGLAND has ordered about 500 tons of steel from the Bethlehem Steel Bridge Corporation for new bridges and about 300 tons of tie plates from the Bethlehem Steel Company.

THE GREAT NORTHERN has awarded a contract to the American Bridge Company, Chicago, for 997 tons of steel to be used for repairs to a bridge at St. Cloud, Minn., and for spans in connection with grade separation work at Minneapolis, Minn.

THE LEHIGH VALLEY is inquiring for 700 tons of structural steel for a number of bridges. A contract was given recently by this company to the Bethlehem Steel Company for 1,600 tons of structural steel for use at its Claremont, N. J., terminal.

THE PHILADELPHIA & READING has ordered from the Bethlehem Steel Company 10,000 tons of 100-pound rails and 3,000 tons of 130-pound rails; also from the Carnegie Steel Company 5,000 tons of 130-pound rails, and from the Midvale Steel Company 2,000 tons of 130-pound rails. All the rails are for delivery during the latter half of this year.

Machinery and Tools

THE SEWELL VALLEY has given orders for the following machinery: To the Niles-Bement-Pond Company, a 20-ton electric traveling crane with 5-ton auxiliary, 56-ft. 3-in. span, and a 36 in. by 36 in. by 10 ft., and three head motor driven Pond planers; to the Mott & Merryweather Company, Pittsburgh, Pa., a No. 4 plain Cincinnati milling machine, motor driven; to Manning, Maxwell & Moore, Inc., Philadelphia, Pa., a 400-ton Chambersburg wheel press, motor driven; and to Wilmarth & Norman, a No. O cutter, reamer and drill grinder, motor driven. The company also expects to place an order shortly for additional machinery.

Miscellaneous

THE ILLINOIS CENTRAL is inquiring for 2,000 tons of tie plates.

THE NORTHERN PACIFIC is inquiring for 5,000 tons of tie plates, and also contemplates purchasing spikes and bolts.

THE DEPARTMENT OF DOCKS, New York city, expects to come in the market soon for a large amount of equipment for the Staten Island docks at St. George. The inquiry will include railroad tracks, frogs and switches.

THE CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS is inquiring for its requirements of 32-34 gravity fuel oil in tank cars, for the period from April 1, 1922, to June 1, bids on which are to be in before 12 o'clock noon April 3.

Supply Trade News

William Ochse, for the past two years sales representative of Manning, Maxwell & Moore, Inc., at Chicago, has been appointed efficiency engineer of the Ohio Machine Tool Company, Kenton, Ohio.

E. H. Walker has resigned as president of the Standard Coupler Company, New York, effective March 15. Mr. Walker will enter business for himself, an announcement of which will be made later.

Joseph B. Turbell, president of the American Brake Shoe & Foundry Co., New York, has been elected also chairman of the board and **James S. Thompson**, vice-president, has been elected also a director to succeed Otis H. Cutler, deceased.

The **Reed Railway Supply Company** has leased for general headquarters a four-story building at 113 N. Second street, St. Louis, Mo. **Joseph Reed**, formerly president of the Southern Hardware & Supply Company, is president of the company.

Fred Mathews, formerly vice-president of the Union Metal Products Company, has been appointed general railway sales representative of the **A. O. Smith Corporation**, Milwaukee, Wis. Mr. Mathew's office is at 1306 Consumers building, Chicago, Ill.

W. F. Hayes has been appointed general time inspector of the **Official Bureau of Railroad Time Service**, to succeed **Webb C. Ball**, deceased. Since Mr. Ball's death, the service has been organized with

H. J. Cowell, in charge of the Cleveland office as assistant to Mr. Hayes, **Laurence L. Doty** at the Chicago office, **O. H. Pyper** at the Winnipeg office, **S. A. Pope** at San Francisco and **V. A. Corrigan** at the Houston office. Mr. Hayes was born on a farm near Palmyra, Wis. He served his apprenticeship as a watchmaker, at which trade he remained for 15 years. For several years he was in the jewelry business in Janesville, Wis., where he was local watch inspector for the Chicago & North Western and the Chicago, Milwaukee & St. Paul. In 1903 he became associated with Mr. Ball, having jurisdiction over the Chicago, San Francisco, Houston and Winnipeg offices.

Fred Mathews, formerly vice-president of the Union Metal Products Company, Chicago, has been appointed general railway sales representative of the A. O. Smith Corporation of Milwaukee, Wis. Mr. Smith's offices are at 1306 Consumers Building, Chicago.

Edward B. Craft, assistant chief engineer of the **Western Electric Company** has been appointed chief engineer with headquarters at New York; **Dr. F. B. Jewett**, vice-president of the company at New York, who preceded Mr. Craft as chief engineer, is now in charge of the telephone department, which includes the engineering department, the telephone sales department and the manufacturing department.

The **Black & Decker Manufacturing Company**, Baltimore, Md., has removed its Cleveland, Ohio, office from 6225 Carnegie avenue to 2030 East Twenty-second street. This office is in charge of **Dan Paul**, formerly manager of the company's

Pittsburgh, Pa., office. **W. C. Allen**, former manager of the Philadelphia branch, and subsequently special representative, has been made branch manager of the Chicago territory; Mr. Allen was formerly connected with the Manley Manufacturing Company, as assistant sales manager and has been associated with the Black & Decker Manufacturing Co. for about three years.

A. S. Duncan, storekeeper at the East Pittsburgh works of the **Westinghouse Electric & Manufacturing Company**, East Pittsburgh, Pa., has been appointed general storekeeper of finished stocks. **H. L. Jones**, assistant superintendent, has been appointed superintendent of the switchboard and detail department; **A. J. Bastian**, assistant superintendent, has been appointed superintendent of the insulating department; **W. H. Miller** has been appointed supervisor of tools and gages and **W. F. Ablauf** has been appointed supervisor of mica and mica processes in the inspection and testing department—all with headquarters at East Pittsburgh.

Air Reduction Sales Company Acquires Davis-Bournonville Company

The Air Reduction Sales Company, New York, on March 17, acquired all the assets, including the patents, trade marks and trade names, of the Davis-Bournonville Company of Jersey City, N. J. The consolidation brings together two large companies, whose histories have, to a great extent, been the history of the development of the oxyacetylene welding and cutting industry.

The Air Reduction Sales Company is a pioneer in the extraction of gases from the air for industrial use. Its principal product is oxygen, which is used to the greatest extent, in conjunction with acetylene, in producing the high-temperature oxyacetylene flame. The Air Reduction Company further produces nitrogen and argon for incandescent lamp manufacture, and neon for electrical devices, of which the new and highly useful Airco ignition gage is an example. Acetylene ranks second to oxygen in importance in the list of Airco products.

The Davis-Bournonville Company was organized in 1907 by **Augustine Davis**, **Eugene Bournonville** and **C. B. Wortham** and at once took up the manufacture of oxyacetylene torches. As success was attained in connection with the welding torch, the company's activities were directed to the development of oxyacetylene cutting torches, acetylene generators, and finally to machines for welding and cutting. It is the intention of the Air Reduction Sales Company to continue the manufacture of D-B torches, acetylene generators, special machines, etc., under the supervision of the men who developed them. The equipment will be marketed under the trade name of Airco-Davis-Bournonville.

American Steel Foundries

The American Steel Foundries reports earnings from operations for the year ending December 31, 1921, of \$1,428,188, as compared with \$6,915,734 in the previous year. After deducting depreciation and fixed charges and adding non-operating income, the net profits were \$675,009, as against \$4,496,442 in 1920. During the year \$5,150,000 of notes were paid, inventories were reduced one-third and accounts payable were cut in half. Current liabilities were reduced from approximately \$11,000,000 to \$3,700,000. Working capital was \$13,125,542 at the close of the year and current assets were more than 4 to 1 in relation to current liabilities.

The balance sheet, December 31, 1921, shows the following:

ASSETS	
Real estate equipment, etc., less depreciation reserve	\$33,276,843
Preferred stock sinking fund (in bank)	85,593
Current assets	16,888,503
Deferred charges to operations	123,809
	\$50,374,748
LIABILITIES	
Capital stock	\$28,782,300
Capital stock of subsidiary company	4,733,336
Four per cent debentures	340,800
Current liabilities	3,762,961
Sundry operating reserves	470,174
Appropriated surplus	3,314,144
Unappropriated surplus	8,971,033
	\$50,374,748

Bethlehem Steel Corporation

The annual report of the Bethlehem Steel Corporation for the year ended December 31, 1921, shows net incomes after charges of \$10,332,804, as compared with \$14,458,836 for 1920. The value of current assets as of December 31, 1921, was \$87,748,433 in excess of current liabilities, compared with \$77,473,917 excess at the end of 1920. Of the total current assets \$54,881,227 consisted of cash and marketable securities, largely obligations of the United States Treasury. The balance sheet showed further that inventories at the close of last year had been reduced to \$39,240,537, as compared with \$73,208,678 as of December 31, 1920. The unappropriated surplus at the close of 1921 was \$12,418,929.

The comparative income account for the years ended December 31, 1921 and 1920, is as follows:

	19 21	19 20
Gross sales and earnings	\$147,794,353	\$274,431,236
Less: Manufacturing cost, administrative, selling and general expense, and taxes	125,943,819	239,468,865
Net manufacturing profit	\$21,850,533	\$34,962,372
Interest, dividends and other miscellaneous income	3,904,144	1,389,182
Total net earnings	\$25,754,678	\$36,351,554
Less: Interest charges, including proportion of discount on and expense of bond and note issues	9,419,158	7,951,203
Balance	\$16,335,519	\$28,400,350
Provision for depreciation, obsolescence and depletion	6,002,715	13,941,515
Net income for the year	\$10,332,804	\$14,458,835

The Westinghouse Air Brake Company

The financial results of the Westinghouse Air Brake Company for the year ended December 31, 1921, shows net earnings of \$1,412,490. This compares with \$6,580,404 in the previous year. The balance, surplus, December 31, 1921, was \$12,931,103 as compared with \$16,140,580 at the close of 1920.

H. H. Westinghouse, chairman of the board, in his report to the stockholders, said:

"As outlined in our last annual report to the stockholders, we entered the year 1921 with a fair volume of unfilled orders on hand and as a consequence our shipments for the first quarter were fairly satisfactory; but on account of the general business depression and particularly the curtailing of purchases by the railroads of the country, our orders received during the year under review amounted to less than 50 per cent of normal, which resulted in plant operations and shipments for the year of approximately this same percentage. Under existing conditions it would be difficult and useless to endeavor to forecast the future. With a return, however, of better general conditions and railroad buying resumed, your company's business should rapidly return to normal."

The consolidated balance sheet for 1921 follows:

ASSETS	
Cash	\$3,109,607
Accounts and bills receivable	5,068,744
Loans to banks and other U. S. obligations	1,784,188
Inventories	10,802,339
Investments	8,946,623
Equities	10,666,758
Real estate, other than for factories	2,152,153
Patent rights	4,437
Deferred charges	176,547
	\$47,648,902
LIABILITIES	
Bills payable	\$ 800,000
Accounts payable	1,115,491
Transients, accrued, not yet due	118,202
Reserve for Federal taxes (1920-1921)	629,400
Capital stock, at par, of subsidiary companies not held by the Westinghouse Air Brake company	19,608
Stock purchase contracts (amounting to amount held against patent and stock contracts)	2,893,807
Capital stock, issued	\$29,165,800
Long term treasury	21,600
	29,144,700
	12,931,103
	\$47,648,902

Obituary

Harvey E. Grace, vice president and treasurer of the William Gray Company, Chicago, railroad contractors, died suddenly on March 21, at his home in that city.

Railway Construction

ALASKA ENGINEERING COMMISSION.—This commission will receive bids until May 1, for the construction of a single track structural steel bridge on the Alaska Railroad.

ATLANTON, TOPEKA & SANTA FE.—This company, which was noted in the *Railway Age* of March 18 (page 762), as receiving bids for the construction of two one-story brick lavatory buildings at Chicago, has awarded the contract for this work to Jerome Moss, of that city.

CENTRAL OF NEW JERSEY.—This company is contemplating some heavy grade crossing elimination at Perth Amboy, N. J., in conjunction with the Lehigh Valley and the Pennsylvania Railroad. A total of five highway or street grade crossings and one railroad crossing will be eliminated of which four of the street crossings will be done by the Jersey Central, and one by the Lehigh, the railroad crossing being a joint proposition.

CHATTANOOGA-CROSSVILLE PROJECT.—A survey is now being made for the construction of a railroad to extend from Chattanooga, Tenn., to Crossville, a distance of about 35 miles, at which latter point a connection will be made with the Tennessee Central. It is expected that the construction of this line will be completed by the end of the coming summer and that the road will traverse through the largest undeveloped coal fields in that state. C. E. James of Chattanooga is in charge of the project.

CHICAGO, BURLINGTON & QUINCY.—The statement which appeared in the *Railway Age* of March 25, page 803, to the effect that this company had awarded a contract to John Griffith and Sons for the construction of a four-story inbound freight house in Chicago was incorrect. Bids are still being received for this work.

GREAT NORTHERN.—This company, which was noted in the *Railway Age* of March 25 (page 803), as about to receive bids for the construction of terminal facilities at Wenatche, Wash., has let a contract to A. Guthrie & Co. for the grading and work has already been started in the preparation of the ground for the buildings. The total expenditure for this project will aggregate approximately \$1,500,000.

GREAT NORTHERN.—This company, noted in the *Railway Age* of March 18, as having closed bids on March 15 for the construction of a 30-stall roundhouse, shop buildings, storehouses and other terminal facilities at Minneapolis Junction, Minn., has awarded a contract for this work to A. Guthrie & Co., St. Paul.

LOUISVILLE, HENDERSON & ST. LOUIS.—This company has awarded a contract for the construction of a 100-ton reinforced concrete coaling and sanding plant at Owensboro, Ky., to the Howlett Construction Company, Mohne, Ill.

MISSOURI PACIFIC.—This company will receive bids until April 8, for the replacing of 10 wooden trestles near Aurora, Mo., with concrete structures and earth embankments.

NASHVILLE CHATTANOOGA & ST. LOUIS.—This company contemplates the reconstruction of its three-story brick office building at Nashville, Tenn., which was recently destroyed by fire. No definite plans have been made as yet.

NEW YORK & LONG BRANCH.—This company has awarded a contract to Charles Ward Hall, Inc., New York City, for the construction of a new brick and limestone passenger station, covered platforms and roadways, etc., at Asbury, N. J. Estimated cost is \$125,000.

WICHITA FALLS & OKLAHOMA.—This company has applied to the Interstate Commerce Commission for authority to construct a new line from the present terminus at the Texas-Oklahoma state line northeast to Waurika, Okla., 7½ miles, and a line from Byers, Texas, to the Oklahoma state line, 5.8 miles.

Railway Financial News

ANN ARBOR.—*Merger Plans Denied.*—See Pere Marquette.

ASHERTON & GULF.—*Application to Issue Bonds Denied.*—The Interstate Commerce Commission has denied this company's application for authority to issue \$436,000 of first mortgage bonds on the ground that a satisfactory showing of its ability to earn the interest has not been made.

BOSTON & MAINE.—*Granted Loan from Revolving Fund.*—The Interstate Commerce Commission has certified a loan of \$5,000,000 to this company to enable it to meet a previous loan from the revolving fund maturing June 1.

CANADIAN PACIFIC.—*Annual Report.*—This company's annual report for 1921 is reviewed in an article on another page of this issue entitled "C. P. R. Soon to Own Fleet Totaling 438,604 Tons." See also excerpts from annual report on adjacent pages.

CENTRAL OF GEORGIA.—*Equipment Trust Certificates Authorized.*—This company has been authorized by the Interstate Commerce Commission to assume obligation or liability in respect of \$660,000 of equipment trust certificates.

CHICAGO, INDIANAPOLIS & LOUISVILLE.—*Annual Report.*—The annual report issued this week shows a condensed income statement for the years ended December 31, 1921 and 1920 as follows:

	1921	1920
Gross operating revenues.....	\$15,162,870	\$13,611,131
Total operating expenses.....	12,181,950	13,210,542
Net operating revenues.....	2,980,920	400,588
Taxes, etc.....	738,000	492,431
Net operating income.....	2,242,919	Def. 91,842
Other income.....	249,905	133,907
Standard return.....	459,751	270,000
Guaranty U. S. government.....	459,751	815,249
Total other income.....	\$709,656	\$1,219,156
Total gross income.....	2,952,576	1,127,313
Deductions from total gross income for fixed charges including interest on funded debt.....	2,229,012	2,261,207
Balance of income over charges, carried to credit of profit and loss.....	723,564
Balance of deficit carried to debit of profit and loss.....	1,133,893
less.....	370,223
Dividends declared.....	370,225
Surplus (credit).....	\$353,339
(debit).....	\$1,504,117

CHICAGO, PEORIA & ST. LOUIS.—*Receivers' Certificates Authorized.*—The receivers have been authorized by the Interstate Commerce Commission to issue \$335,000 of receivers' certificates to be sold at not less than par and the proceeds used to pay indebtedness incurred in the operation of the property.

DELAWARE & HUDSON.—*Bonds Offered.*—Kuhn, Loeb & Co. and the First National Bank are offering at 98 and interest to yield 5.70 per cent of \$7,500,000 15-year 5½ per cent bonds, due May 1, 1937. The bonds, which are sold subject to approval of the Interstate Commerce Commission, are not redeemable for the first ten years. Thereafter they will be redeemable as a whole on May 1, 1932, at 105 and interest, or any subsequent interest date at 105, less ½ per cent for each six months from May 1, 1932, to redemption date upon sixty days' notice.

DELAWARE, LACKAWANNA & WESTERN.—*Financing Plan of Lessor Company.*—See New York, Lackawanna & Western.

DENVER & RIO GRANDE.—*Perkins Committee to Survey Property.*—The Perkins committee, headed by James Perkins, president of the Farmers Loan & Trust Company, has arranged with Coverdale & Colpitts, consulting engineers, for a survey and report on the property of this railroad. This committee represents Denver & Rio Grande refunding 5s and is opposed to the Western Pacific's plan of reorganization. It is expected that the work will take two or three months. The Perkins committee adopted this action so that it could have an independent report of the Denver's condition. It may lead to the announcement of a new reorganization plan by this committee.

The Hammond committee, representing the refunding 5s in favor of the Western Pacific plan, has asked for the deposit of

80 per cent of the bonds in the hands of the public for the consummation of that plan. Neither this committee nor the Perkins committee is understood to have 25 per cent of the \$31,616,000 outstanding bonds. With a deposit of 50 per cent either group thinks that it will be able to control the situation.

ERIE.—*Authorized to Issue Notes.*—This company has been authorized by the Interstate Commerce Commission to issue \$10,000,000 of demand promissory notes for one year at 6 per cent and \$2,500,000 of 6 per cent demand notes to be delivered to the War Finance Corporation upon the cancellation of a like face amount of three-year 6 per cent gold notes maturing on April 1.

ERIE.—*Bonds Offered.*—White, Wells & Co., Cassatt & Co., and West & Co. are offering \$5,000,000 consolidated mortgage 7 per cent gold bonds of the Erie, due September 1, 1930, at 103¼, to yield more than 6.40 per cent.

GOLDEN BELT.—*Application for Certificate of Public Convenience Denied.*—The Interstate Commerce Commission, after a rehearing, has affirmed the conclusion reached in a former report that this company's application for a certificate authorizing the construction of a line from Great Bend to Hays, Kans., should be denied. The commission says the line would prove a convenience to a considerable number of people, but that fact alone cannot be relied upon to justify the addition to the transportation resources of the country of an enterprise which gives no promise of being self-sustaining.

ILLINOIS CENTRAL.—*Equipment Trusts Sold.*—The Commercial & Financial Chronicle states that the Kuhn, Loeb & Co. have sold privately \$3,255,000 5½ per cent equipment trust certificates, series "H."

MANISTIQUE & LAKE SUPERIOR.—*Authorized to Abandon Branch Line.*—The Interstate Commerce Commission has issued a certificate authorizing the abandonment of the McNeil branch in Schoolcraft County, Mich., 7½ miles.

MIDLAND.—*Application for Loan Denied.*—The Interstate Commerce Commission has denied this company's application for a loan of \$200,000.

MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE.—*Asks Authority to Sell Bonds.*—This company has applied to the Interstate Commerce Commission for authority to sell \$2,500,000 of first refunding mortgage 6 per cent bonds now held in the treasury, the issue of which was previously authorized by the commission. It is proposed to sell the bonds to Dillon, Read & Co., at 101½.

MISSOURI PACIFIC.—*Asks Authority to Sell Bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue \$18,096,500 of first and refunding mortgage 6 per cent gold bonds. The application is dated March 24, which was the date an advertisement appeared stating that the bonds had been sold. Of the total, \$13,641,000 is to discharge or refund first and refunding mortgage 5 per cent bonds and \$4,455,500 is to reimburse the treasury for expenditures.

NEW YORK CENTRAL.—*Proposed Acquisitions.*—This company's application for authority to purchase the stock of the Chicago River & Indiana and to lease the Chicago Junction with an option to purchase its stock has been assigned for oral argument before the full membership of the Interstate Commerce Commission at Washington on April 5.

NEW YORK, LACKAWANNA & WESTERN.—*Financing Plan.*—A special meeting of the stockholders will be held on April 25 to ratify a proposed increase in capital stock from \$10,000,000 to \$15,000,000 and a bond issue of \$30,000,000. If authorized, these issues will be used to pay or refund \$22,000,000 outstanding bonds, a \$1,640,000 note held by the Delaware, Lackawanna & Western; and for future capital expenditures.

The New York, Lackawanna & Western has \$12,000,000 first 6s which were taken up by the Delaware, Lackawanna & Western on maturity, January 1, 1921, and \$10,000,000 construction and improvement bonds, of which \$5,000,000 are due in May, 1923, and \$5,000,000 in August, 1923. These are guaranteed by the Delaware, Lackawanna & Western, which owns about \$2,000,000 of them. According to the plan, the Delaware, Lackawanna & Western is to be reimbursed for advances by means of the new issues.

NEW YORK, LACKAWANNA & WESTERN.—Financing Plan.—A special meeting of the stockholders will be held April 25 to ratify a proposed increase in capital stock from \$10,000,000 to \$15,000,000 and a bond issue of \$30,000,000. These issues if authorized will be used for payment or refunding of \$22,000,000 outstanding bonds and a \$1,040,000 note held by Delaware, Lackawanna & Western; also for future capital expenditures.

The company has \$12,000,000 first 6s, which were taken up by the Delaware, Lackawanna & Western on maturity January 1, 1921, and \$10,000,000 construction and improvement bonds due 1923, guaranteed by D. L. & W., of which the latter owns about \$2,000,000.

Plan is to reimburse D. L. & W. for advances by means of the new issues, but whether this will involve any public offering company officials have not yet determined.

NEW YORK, NEW HAVEN & HARTFORD.—Authorized to Issue Bonds.—This company has been authorized by the Interstate Commerce Commission to issue \$2,758,000 of the first and refunding mortgage bonds to be pledged with the Secretary of the Treasury as partial security for a loan. The commission has also authorized the sale of \$1,790,000 of equipment trust notes, the proceeds to be used toward payment of certain promissory notes.

Stockholders' Meeting.—The stockholders at their meeting in New Haven, Conn., on April 19 will pass on the acceptance of an extension of time for the European loan from April 1, 1922, to April 1, 1925. Besides considering proposed new bond issues there will also be the question of acceptance of the equipment agreement with the federal Railroad Administration as amended under date of January 22, 1922; the approval of a lease to the New York, Westchester & Boston Railway of that portion of this company's right of way between Mount Vernon, N. Y., and Larchmont, N. Y., on which the railway company's tracks are now constructed and operated.

NORFOLK & WESTERN.—Annual Report.—The corporate income account for the year ended December 31, 1921, compares as follows:

	1921	1920
Operating revenues:		
Freight	\$67,221,426	
Passenger	10,077,720	
Total, including other	\$80,718,802	
Operating expenses:		
Maintenance of way and structures	\$11,783,699	
Maintenance of equipment	19,841,345	
Traffic	843,161	
Transportation	29,849,426	
General	1,842,025	
Total operating expenses	\$64,346,857	
Net revenue from railway operations	16,371,945	
Railway tax accruals	4,730,000	
Railway operating income	11,641,945	
Net railway operating income	14,479,836	\$17,055,345*
Total non operating income	1,107,507	881,395
Gross income	15,587,343	17,936,740
Total deductions	5,544,162	5,439,951
Net income	10,043,181	12,496,788
Dividends on adjustment preferred stock	919,692	919,692
Income balance	9,123,489	11,577,096

*Operation during 1920 having been for two months under federal control for six months under the government's guaranty, and for four months without government relationship, no comparisons of items of railway operating income and expenses are shown in this statement. Balance federal control period—Jan. 1, to Feb. 29, 1920, \$31,417,877. Estimated balance guaranty period—March 1, to Aug. 31, 1920, 10,405,436. Railway company's operations—Sept. 1, to Dec. 31, 1920, 1,281,122.

Dividends on the common stock in 1921 totaled 7 per cent amounting to \$2,790,180.

To Pay Notes. The Norfolk & Western has called for payment at 101, on May 1, 1922, its entire issue of \$2,500,000 four year 6 per cent notes due May 1, 1924.

NORTHERN RAILWAY (FRANCE).—Bonds Sold in London. An issue of Nord Railway £5,000,000 6 per cent bonds were sold in London, England, on March 23, at 90, according to a cable to the New York Journal of Commerce.

NORTHEASTERN OKLAHOMA.—Application for Loan Denied.—The company's application for a loan of \$500,000 has been denied by the Interstate Commerce Commission.

PIRE VALLEY SOUTHERN.—Application for Loan Denied.—The Interstate Commerce Commission has denied this company's application for a loan of \$150,000.

PERE MARQUETTE.—Merger with Ann Arbor Denied.—E. N. Brown, chairman of the board, has flatly denied any negotiations between this company and owners of the Ann Arbor to acquire the latter. Mr. Brown said his auditors went over the books of the Ann Arbor a few months ago in response to a request from Ann Arbor interests who were seeking to interest Pere Marquette in the matter. He said undoubtedly this was what caused the rumor of possible negotiations to be circulated. On the report of the auditors the Pere Marquette board decided that it would not be warranted in considering acquisition of the Ann Arbor.

SALINA NORTHERN.—Application for Loan Denied.—The Interstate Commerce Commission has denied the application of the receivers for a loan of \$308,630.

SHEARWOOD.—Application for Loan Denied.—The Interstate Commerce Commission has denied this company's application for a loan of \$9,500.

TENNESSEE RAILROAD.—Application for Loan Denied.—The Interstate Commerce Commission has denied this company's application for a loan of \$100,000 for additions and betterments.

WABASH.—Equipment Trusts Sold.—Speyer & Co. and the Equitable Trust Company have sold \$6,546,800 equipment trust 6 per cent gold notes at prices to yield 5.40 to 5.75 per cent according to maturity.

WYOMING.—Application for Loan Denied.—The Interstate Commerce Commission has denied this company's application for a loan of \$100,000.

Tentative Valuations

The Interstate Commerce Commission has issued a number of additional tentative valuation reports in which it finds the final value to be as follows:

	Property owned	Property used
Columbia Union Station Company	1919 \$162,331	\$175,671
Duluth & Superior Bridge	1916 640,000	
Linville River	1916 249,662	249,709
Louisiana Railway & Navigation Co.	1917 10,856,479	10,796,479
Northern Alabama	1916 3,189,429	
Raritan River	1916 1,215,416	1,216,646
Wildwood & Delaware Bay	1916 190,000	150,704

Railroad Administration Settlements

The United States Railroad Administration reports the following final settlements, and has paid out to the several roads the following amounts:

Louisville, Henderson & St. Louis	\$660,000
Toledo Terminal	100,000
Erie and Lehigh Valley, as Joint Lessees of the Railroad of the Buffalo Creek Railroad Company	185,000

The payment of these claims on final settlement is largely made up of balance of compensation due, but includes all other disputed items as between the Railroad Administration and the railroad companies during the 26 months of federal control.

Dividends Declared

Northern Pacific—1 1/2 per cent, quarterly, payable May 1 to holders of record April 12.
Northern Railroad of New Hampshire—1 1/2 per cent, quarterly, payable April 1 to holders of record March 13.
Old Colony—1 1/2 per cent, quarterly, payable April 1 to holders of record March 11.

Trend of Railway Stock and Bond Prices

	Last Week	Last Year
Average price of 20 representative railway stocks, close of business	60.60	61.18
Average price of 20 representative railway bonds, close of business	83.19	83.41

THE ARMS-YAGER RAILWAY CAR COMPANY has succeeded the Arms Palace Horse Car Company, the change of name having been announced by W. A. Yager, president, on March 1. For this company's cars the American Railway Association has assigned new reporting marks—"A. Y. R. X.", and the cars will be lettered as early as practicable.

Annual Report

Canadian Pacific Railway Company—Forty-First Annual Report

To the Shareholders:

The accounts of the Company for the year ended December 31st, 1921, show the following results:—

Gross Earnings	\$193,021,854.40
Working Expenses (including all taxes)	158,820,114.09
Net Earnings	\$34,201,740.31
Deduct Fixed Charges	11,519,071.97
Surplus	\$22,682,668.34
Contribution to Pension Fund	500,000.00
	\$22,182,668.34

From this there has been charged a half-yearly dividend on Preference Stock of 2 per cent., paid October 1st, 1921	\$1,613,638.42
And three quarterly dividends on Ordinary Stock of 1 3/4 per cent. each, paid June 30th, 1921, October 1st, 1921, and December 31st, 1921	13,650,000.00
	15,263,638.42
	\$6,919,029.92

From this there has been declared a second half-yearly dividend on Preference Stock of 2 per cent. payable April 1st, 1922	\$1,613,638.42
And a fourth quarterly dividend on Ordinary Stock of 1 3/4 per cent., payable April 1st, 1922	4,550,000.00
	6,163,638.42

Leaving net surplus for the year	\$755,391.50
In addition to the above dividends on Ordinary Stock, three per cent. was paid from Special Income.	

SPECIAL INCOME FOR YEAR ENDED DECEMBER 31st, 1921.

Balance at December 31st, 1920	\$20,530,292.08
Less: Dividend paid April 1st, 1921	1,950,000.00
Net Revenues from Investments and Available Resources, Exhibit "C"	2,307,332.06
Interest on Deposits, and Interest and Dividends on Other Securities less Exchange	1,840,866.51
Net Earnings Ocean and Coastal Steamship Lines	2,785,614.93
Net Earnings Commercial Telegraph and News Department, Hotels, Rentals and Miscellaneous	4,053,385.62
	\$29,567,491.20

Less: Payments to Shareholders in dividends: June 30th, 1921, October 1st, 1921, and December 31st, 1921	5,850,000.00
	\$23,717,491.20

From this a dividend has been declared payable April 1st, 1922 \$1,950,000.00

2. The working expenses for the year, including all taxes, amounted to 82.28 per cent. of the gross earnings, and the net earnings to 17.72 per cent., as compared with 84.70 per cent. and 15.30 per cent. respectively in 1920.

3. The gross earnings of your transportation system during the fiscal year under review were less than those of 1920 by \$23,619,494, but the net earnings increased by \$1,048,693. The large decrease in the gross earnings is attributed to the business depression which set in at the end of 1920 and continued practically without interruption during the fiscal year under review, to the decrease in passenger fares in January and July and in freight rates in December, and to partial crop failure in some portions of Western Canada in areas served by your lines of railway. Of the expenses of the year, 53.84 per cent. was disbursed on account of labor, 25.92 per cent. for material and miscellaneous supplies, 15.51 per cent. for fuel and other locomotive supplies and 3.49 per cent. for taxes. The balance, 1.24 per cent., was necessary to meet Loss and Damage claims. By the exercise of the strict economy and the deferring of work which could be postponed, especially during the early part of the year when traffic was particularly light, and by the savings effected through the reduction in wages secured in September, your Officers were able to reduce expenses to already mentioned. In the circumstances, the year's operations must be regarded as satisfactory, particularly having regard to the decrease in passenger and freight rates mentioned above. The operating ratio compares most favorably with that of other systems.

4. The sales of agricultural land in the year were 153,304 acres for \$2,872,999, being an average of \$18.74 per acre. Included in this area were 6,686 acres of irrigated land, which brought \$53.13 per acre, so that the average price for the balance was \$17.17 per acre. The sales of land in Western Canada were naturally very seriously affected by the economic conditions which prevailed during the year, resulting in a very large decrease in the acreage acquired by purchasers either from your Company or other landowners. Your Directors are in favor of the adoption of reasonable immigration laws designed to encourage the entry into Canada of immigrants of the right type, you may look forward to a distinct improvement in the volume of land sales during the next few years.

During the year your Directors disposed of London stock of \$4,800,000 (of which \$4,504,423 was delivered prior to December 31st), and in New York of \$25,000,000 of Five per cent. Consolidated Debenture Stock, the issuance and sale of which you had previously authorized, at prices which under the prevailing market conditions were extremely favorable, re-

flecting the high credit which the Company enjoys. The sales of this Stock in New York were effected in an eminently satisfactory manner, although the Security was of a character practically unknown among American investors it received widespread and ready distribution. In order to meet the requirements of the United States market the certificates of the Debenture Stock the issues were made in bearer form with interest coupons attached, under conditions which permit of the conversion into registered Stock at the option of the holder, and you will be asked to give your sanction to By-law No. 47, Sub-section D, enacted by the Directors providing for the issue of certificates in this form.

The market for the Company's Consolidated Debenture Stock being so favorable both in the United States and in England, it was not considered desirable or necessary to create and issue bonds, debentures or other securities secured by pledge of Consolidated Debenture Stock, which you authorized at the special general meeting held on the fourth day of May of last year.

6. During the year your Directors consented to the issue of \$2,671,000 Five per cent. Consolidated Bonds of the Minneapolis, St. Paul and Sault Ste. Marie Railway Company for the purpose of making payment for the property of the Wisconsin and Northern Railway Company, the purchase of which had been arranged by the Board of the former Company. They also consented to the issue and sale of \$10,000,000 of the Minneapolis, St. Paul and Sault Ste. Marie 10-year Six and a half per cent. Notes to be secured collaterally by a portion of the \$15,000,000 First Refunding Mortgage Six per cent. Bonds which that Company had power to issue. Both issues were made after the approval of the Interstate Commerce Commission was obtained.

In common with other American railroads the revenues of the Minneapolis, St. Paul and Sault Ste. Marie Railway Company and its subsidiaries fell off very materially during the past year and its operations were in particular seriously affected by the United States tariff against Canadian wheat and the practical shutting down of the iron ore mines in Michigan and Minnesota. Their revenues were also adversely affected through the depression in the Lumber and Livestock business. In these circumstances the Directors of that Company determined upon the reduction of the Preferred and Common Stock dividends to the basis of four per cent. per annum, and in their decision your Directors have concurred. A substantial improvement in traffic conditions on the railways of your United States subsidiaries is confidently looked forward to.

7. The four steamers under construction for the Atlantic and Pacific services will all be in commission for the present season. The S.S. "Kaiserin Auguste Victoria" has already been delivered and the "Empress of Canada" and "Empress of Canada" will be delivered in April and May. The S. S. "Princess Louise," constructed for the Pacific Coast Service, has been put into service and is in every respect satisfactory for the trade in which she is engaged. During the year the Company purchased the steamships "Kaiserin Auguste Victoria," "Prinz Friedrich Wilhelm" and "Fritz" for extremely low prices. The "Kaiserin Auguste Victoria" has been renamed the "Empress of Scotland," the "Prinz Friedrich Wilhelm" the "Empress of India" and the "Fritz" the "Empress of Australia." The two first named will be added to the Atlantic fleet and the "Empress of Australia" will be added to the Pacific fleet. The cost of the ships under construction will exceed the original estimates by a considerable sum, due to protracted labor troubles, increased cost of materials and difficulties in the ship yards during the construction period. With the addition of the new ships constructed and purchased the total tonnage of your fleet will be 438,674 tons—the largest in the history of the Company, and the fleet, in numbers and in the character of ships in service, is in the opinion of your Directors amply able to maintain the high reputation of the Company on Atlantic, Pacific and coastal routes.

8. In anticipation of your confirmation your Directors authorized capital appropriations, in addition to those approved at the last annual meeting, aggregating for the year 1921, \$1,743,444, and ask your approval to expenditures on capital account during the present year, as and when the conditions warrant such expenditures, of \$10,622,137. Of this amount the principal items are:—

Replacement and enlargement of structures in permanent form	\$1,021,700
Additional stations, round houses, freight sheds and shops, traffic control buildings, and extensions to existing buildings	1,008,200
Tie plates, rail anchors, ballasting, ditching and miscellaneous roadway betterments	243,200
Replacement of rail in main and branch line tracks with heavier section	1,500,700
Additional terminal and side track accommodation	431,500
New Pier "BC" at Vancouver	1,550,000
Extension work on Chateau Frontenac Hotel, Quebec	1,454,500
Additional lining, Connaught Tunnel	550,000
Mechanical Department, machinery at various points	439,000
Improvements to plant and machinery, Angus Shops	218,400
Improvements in connection with Telegraph service	291,400
Line Diversion at Port McNicoll	355,600
LaSalle Loop Line, South Bank Branch, Montreal	300,000
Line Diversion at Kingston Jct.	100,000

The balance of the amount is required for miscellaneous works to improve facilities and effect economies over the whole system.

Your Directors feel that expenditures, for the first part of the year at all events, should be made with exceptional care in view of the existing traffic conditions, and therefore only authorize expenditures to the amount of \$3,958,770, more than \$3,000,000 of which is for the continuance of the work on the Chateau Frontenac and the new pier at Vancouver which has already been commented.

9. At the request of the Government of Alberta your Directors have entered into an agreement for the construction and operation of an extension of the Central Canada Railway for twenty-five miles westerly from Peace River Landing to Berwyn. The terms of the agreement for operation are similar to those entered into with the Government, the stockholders of the Edmonton, Duvevean and British Columbia and the Central Canada Railway Companies and the Union Bank of Canada, under which the properties of the two companies are operated by your Company. The cost of the construction of the extension is, of course, to be borne by the Province of Alberta.

10. As intimated in the last annual report your Directors entered into an agreement with the Province of Quebec for the construction by your subsidiary, the Interprovincial and James Bay Railway Company, of a railway

extending from Kipawa to the Des Quinze River, having a total mileage of approximately seventy-seven miles. The lease of the railways of that Company to your Company on the usual terms will be submitted for your approval.

11. Your Directors have authorized the preparation and erection of a bronze memorial statue to those in the Company's service who lost their lives in the Great War. The statue will be erected in the Windsor Station, Montreal, and replicas placed at Winnipeg and Vancouver. In addition, bronze plaques have been prepared for placing in the principal stations and offices of the Company from London to Hong Kong. Your Directors feel that the heroism, self sacrifice and high sense of duty which the Company's employees showed should be perpetuated in a prominent way throughout the system.

12. The death occurred on the 29th of November last at his home, Brocket Hall, Hatfield, Hertfordshire, of the Right Honorable Lord Mount Stephen, the first President of the Company in the ninety-third year of his age. Lord Mount Stephen was President from the incorporation of the Company in the year 1881 until August, 1888, and thereafter remained a director until May, 1893, when, finding himself unable to discharge the

duties of a director to his own satisfaction owing to his absence from Canada, he retired from the Board. Lord Mount Stephen had been the master spirit of the enterprise from its beginning, and his safe conduct through its earlier perils to the strong and proud position it occupied when he retired from the Presidency was almost entirely due to his great ability, courage, tenacity and inspiring integrity. Your Directors recorded their appreciation of his services by a resolution upon the occasion of his retirement and as a memorial of the lasting benefit to the Company of his invaluable services have also recorded upon their Minutes a renewed expression of the Board's appreciation of that service, together with an expression of their profound regret at his removal by death.

13. The undermentioned Directors will retire from office at the approaching Annual Meeting. They are eligible for re-election:—

- Mr. J. K. L. ROSS,
- RIGHT HON. LORD SHAUGHNESSY, K.C.V.O.
- SIR THOMAS SKINNER, BART.
- For the Directors,

E. W. DEATY, *President*

MONTREAL, March 13th, 1922.

AUDITORS' CERTIFICATE

We have examined the Books and Records of the Canadian Pacific Railway Co. for the year ending December 31st, 1921, and having compared the annexed Balance Sheet and Income Account therewith, we certify that, in our opinion, the Balance Sheet is properly drawn up so as to show the true

financial position of the Company at that date, and that the relative Income Account for the year is correct.

Railway Officers

Financial, Legal and Accounting

H. E. Jarvis, an employee of the Chicago, Burlington & Quincy, since 1882, and assistant secretary of the corporation for the last 13 years, resigned March 9, on account of ill-health.

James A. Minor, assistant general land and tax agent of the Erie, has been appointed general land and tax agent with headquarters at New York, succeeding H. M. Andrews, deceased. **Kenneth Mayo** succeeds Mr. Minor as assistant general land and tax agent.

Operating

W. J. Etter, assistant to the operating vice-president of the Atchison, Topeka & Santa Fe, with headquarters at Chicago, has been appointed acting general manager of the Eastern lines, with headquarters at Topeka, Kan., effective April 1, to relieve F. C. Fox, on leave of absence.

D. F. Stevens, superintendent of the Baltimore & Ohio, with headquarters at New Castle Junction, Pa., has been appointed superintendent of the new Akron division with headquarters at Akron, Ohio, effective April 15. The Akron division is a consolidation of the Cleveland and New Castle divisions and will embrace 694 miles of line.

C. D. Baker, assistant general superintendent of the Long Island, with headquarters at Jamaica, Queensboro, New York City, has been appointed general superintendent, effective April 1, succeeding J. R. Savage, deceased. The positions occupied by **W. E. Canning**, superintendent in charge of freight transportation, and of **Ralph Peters, Jr.**, superintendent of passenger transportation, have been abolished. Mr. Canning has been appointed superintendent to perform the duties formerly assigned to the assistant general superintendent and Mr. Peters has been appointed assistant superintendent and his duties have been increased to include supervision over freight as well as passenger operations.

Mechanical

G. T. Depue, whose appointment as mechanical superintendent of the Ohio and Chicago regions of the Erie was announced in the *Railway Age* of March 25, page 806, was born December 2, 1872, at Hornell, N. Y., and was educated in the grammar schools of that city. On March 1, 1889, he entered the employ of the Erie as a machinist's apprentice. He afterwards worked as a machinist and extra gang foreman until March, 1901, when he was promoted to general foreman at Bradford, Pa. In August of the same year he became general foreman of the Hornell shops and in July, 1903, master mechanic at Hornell. In 1908 he was transferred in a similar capacity to Galion, Ohio.

G. T. Depue

In August, 1913, he became shop superintendent at Galion and in 1916 was transferred in similar capacity to Susquehanna, Pa. At the termination of federal control he was appointed mechanical superintendent of the Chicago region and was appointed master mechanic at Marion when the consolidation

of the mechanical departments of the Ohio and Chicago regions which took place in 1921.

J. R. Sexton will resume his former position as mechanical superintendent of the Northern District of the Atchafalaya, Topeka & Santa Fe, with headquarters at La Junta, Colo., succeeding **E. E. Machovec**, acting mechanical superintendent, who has been assigned to other duties.

Traffic

C. R. Hartshorn has been appointed commercial agent of the Delaware, Lackawanna & Western, at Toledo, Ohio.

G. D. Brophy, district passenger agent of the Canadian Pacific, with headquarters at Banff, Alta., has been transferred to Regina, Sask., to succeed **J. A. McDonald**, transferred.

Eugene M. Peck, city passenger agent of the Chicago Great Western, at Kansas City, Mo., has been promoted to district passenger agent with the same headquarters, succeeding **Frank E. Hurless**, deceased.

Robert McDowell, traveling freight agent of the Southern Pacific, at Cincinnati, Ohio, has been promoted to general agent, with headquarters at the newly reopened Cleveland, Ohio, traffic office, effective April 1.

Engineering, Maintenance of Way and Signaling

G. W. Rear, general bridge inspector of the Southern Pacific, has been given the newly created title of engineer of bridges.

Obituary

Wendell H. Stillwell, supervisor of Safety and Fire Prevention of the Chicago, Rock Island & Pacific and formerly general superintendent of the Lines East, died suddenly at Rock Island, Ill., on March 28, at the age of 63.

F. J. Angier, superintendent of timber preservation of the Baltimore & Ohio, with headquarters at Baltimore, Md., died on the morning of March 24, at Mercer Hospital, Baltimore, from the effects of an operation for appendicitis. Mr. Angier was born December 22, 1866, at Beardstown, Ill., and entered railway service at the age of 16 as a roundhouse helper on the Chicago, Burlington & Quincy, at Aurora, Ill. On January, 1883, he was made a clerk in the mechanical and supply department at Beardstown, and he was appointed a clerk in the mechanical department at Ottumwa, Iowa, in December, 1893. In July, 1897, he entered the laboratory at Aurora, Ill., as a clerk and later as a chemist where he remained until September, 1898, when he was promoted to superintendent of the tie plant at Edgemont, S. D. He held this position at Edgemont and later at Sheridan, Wyo., when the plant was moved to the latter point, until 1908, when he was promoted to superintendent of timber preservation with headquarters at Galesburg, Ill. He left the service of the Chicago, Burlington & Quincy on May 1, 1910, to enter the employ of the Kettle River Company at St. Louis, where he remained until 1911, when he became superintendent of tie preservation on the Baltimore & Ohio, the duties of which position together with additional duties of inspecting all ties purchased by that road, Mr. Angier assumed until his death. Mr. Angier was secretary of the American Wood Preservers' Association for 13 years, during which he was one of the most prominent factors in building

F. J. Angier

up this organization. He was elected president of this organization at its convention in Chicago last January.

William T. McCulloch, auditor of revenue of the New York Central, died suddenly in Cleveland, Ohio, on March 23. Mr. McCulloch was born in Kittanning, Pennsylvania, in 1859. He began his railroad career with the Pittsburgh, Titusville & Buffalo (now a part of the Pennsylvania) as clerk at Oil City, Pennsylvania; later, in 1882, becoming traveling auditor of the Western New York & Pennsylvania (also a part of the Pennsylvania) and, in 1887, traveling auditor for the New York Central. From 1890 to May, 1891, he was assistant superintendent of the Western division. In May, 1891, he returned to the accounting department as assistant auditor of freight accounts and in March, 1899, became auditor of freight accounts. In 1910 he was appointed auditor of revenue, which position he held at the time of his death. As a member of the Railway Accounting Officers' Association, he was active in committee work. Mr. McCulloch resided in Haworth, New Jersey.

W. T. McCulloch

L. M. Sullivan, purchasing agent of the Texas & Pacific, with headquarters at Dallas, Texas, who died recently, was born at Denison, Texas, on August 29, 1891, and attended school at the Christian Brothers College, St. Louis, Mo., until 1907, when he entered railway service on the Ohio river and Columbus at Ripley, O., as ticket agent. The same year he became bookkeeper for the American Coal Company at Ripley but re-entered railway service shortly thereafter as an index and bill clerk on the Chicago, Rock Island & Pacific at Argenta, Ark. From December, 1908, to May, 1910, he was a stenographer in the chief dispatcher's office at El Reno, Okla., and later held various positions in the superintendent's office until the latter part of 1910, when he entered the service of the Cincinnati, Hamilton & Dayton, as a correspondence clerk in the engineering department. He was later promoted to secretary to the general superintendent and was subsequently made secretary to the assistant to the president at Cincinnati, O., where he remained until April, 1911, when he became a trainmaster's clerk on the Missouri, Oklahoma & Gulf at Calvin, Okla. Later in the same year he entered the employ of the Missouri Pacific as a stenographer in the office of the superintendent of transportation, from which he was later transferred to the office of the first vice-president. From November, 1911, to March, 1915, he was secretary to the vice-president, resigning in 1915 to become secretary to the first vice-president of the Texas & Pacific. From 1915 to October, 1916, he was chief clerk to the first vice-president and on the latter date was transferred to chief clerk to the receiver and the president. He held this position until his promotion to purchasing agent in 1920.

The Pennsylvania Railroad Company's total net expenditures for additions and betterments during 1921 totaled \$1,066,049. As is pointed out in the analysis of the company's 1921 operations, which appears on another page of this issue, the railroad should make each year expenditures for capital account of about \$50,000,000—the Pennsylvania System, as a whole, \$75,000,000. That is to say, the property investment should be expanded to that extent to keep up with the growth of the road's territory and traffic. The fact that the expenditures were \$1,000,000 instead of \$50,000,000 reflects the trying conditions in 1921 that we all hope have now been left behind us. The Pennsylvania, as fortune would have it, has this week supplied no less than 250 good and satisfactory reasons for feeling optimistic about the present situation. The 250 reasons are represented in the form of orders for 250 steel passenger train cars. This order, placed by a single system, is more than the number of passenger cars ordered by all roads during the year 1921. It is the largest order for passenger train equipment placed by a single system in several years.

250 Passenger Cars

The ship subsidy bill now before Congress provides that railroads may own and operate ships in other than coast-wise or Great Lakes trade or through the Panama Canal. Although even these prohibitions may well be thought ill-advised, still the authority to engage in overseas trade might prove of great importance. The Canadian Pacific has shown what a railway can do in this direction. If the ship subsidy bill is approved as introduced, ocean shipping may prove a lucrative business. If it should, there seems to be no good reason why some of our larger railroads should not enter the field as carriers of both passengers and freight. Such a move would certainly tend to bring about closer co-ordination of ship and rail lines to the benefit of the owners, as well as of shippers and passengers. This provision should make the ship subsidy bill a matter of great interest to railroad men and, if the bill becomes a law, inquiries should be made by the larger roads as to the advisability of their engaging in ocean shipping.

The Ship Subsidy and the Railroads

The railroad officer who aims to recommend his road to the public and increase its popularity has varied avenues in which to work. His task is not merely to show that passengers are carried safely and quickly, by courteous and efficient trainmen and station men; that freight is moved cheaply and promptly and losses are quickly repaired; that money received from the public will not be misspent. These are outstanding features. But the manifestations of a friendly and human spirit is likewise important. An example of this last, in which all railroad officers will be interested, is given on another page, a miniature reprint of an advertisement published in the newspapers of Georgia and Alabama by W. A. Winburn, president of the Central of Georgia Railway. To

Disarming Critics by Frankness

reduce the great and increasing number of grade crossing horrors is a troublesome problem, in which the general public ought to be interested as definitely as any railroad company; and Mr. Winburn's brief essay is notable as a skilful marshalling of facts in such a way as to show Mr. Average Citizen that the railroad is actuated only by the most helpful public spirit. The fireman who regretted killing people because it mused up his engine is a fiction; and so also is the railroad president who is coldly indifferent to the woes of people who are struck by trains. Mr. Winburn's advertisement tells little that is new, but it deserves special credit for its candor and comprehensiveness. He has succeeded in putting a new face on a hackneyed subject. The "crusade" which he proposes should be begun with legislators.

While most of the railroads have considerable stocks of coal on hand and non-union mines will take care of part of the demand, it is probable that the coal strike will cause the roads much inconvenience unless it is speedily settled. The operation of the check-off system has placed the miners' unions in a strong financial position and it is unlikely that they will give in soon. It is interesting in this connection to note to what extent the railroads have contributed to the war chest of the unions. According to Coal Age, the average check-off rate in Illinois mines during the last ten weeks of 1921 was 7.9 cents a ton. Illinois produced approximately 68,000,000 tons of bituminous coal and at that rate the miners' union received an income of \$5,372,000 in one year from Illinois alone. This is a high check-off rate; the average was probably about 6 cents a ton. The railroads' consumption of coal from union mines is estimated at about 80,000,000 tons. At this rate the union assessment increased the railroad fuel bill about \$4,800,000 a year. This is an item of expense which the economists for the labor unions have never given much publicity but it is an economic waste nevertheless and should be eliminated in the future.

Helping Finance
the
Coal Strike

In laying out a new railway line it has ordinarily been customary to seek a route that could be followed with a minimum of expenditure for construction. As time went on and traffic increased it frequently was found to be good management to relocate the line and thus secure a shorter and more direct route or reduce the grades despite the fact that the change involved large expenditures for tunnels, bridges or other construction work. Even the small boy quickly learns the advantage of cutting across lots and taking the most direct route. In laying out railroad shops, machine tools have frequently been placed where they could be conveniently driven by an old arrangement of line shafting or so that machines of the same general type would be grouped together. But little thought was given to the expense of moving the work back and forth through the machine shop as it passed from one operation to another. Common labor was abundant and as it was paid a low hourly rate it was

Take the Short Cut

457

thought to be cheap. If there ever was a period when work could be economically moved back and forth, that age passed long ago and will no more return than will cheap labor. Even if crane and other labor saving devices are provided every unnecessary move adds to the expense of doing a job, to say nothing of the delay involved. In many a shop large economies in operation could be effected by relocating certain machine tools to permit of work being passed through the shop by a direct route and so as not to interfere with other work. By the use of group or individual motor drive far more satisfactory layouts are now obtainable. If those directly responsible for shop operation would take this opportunity of slackness to study the movements of the important jobs and calculate the savings that could be obtained by better machine locations, they would be able to present an argument that would command attention. Other things than roadbed should be relocated to meet present conditions.

In this day no one questions the validity of engineering as an important item of expense in any construction project.

Investigate the Foundations More Carefully

Yet there is still some difference of opinion as to the amount of money that may be spent legitimately for this purpose; one item of importance to be considered under this head is that of foundation investigations. Although a thorough knowledge of the foundation may effect a saving in the preparation of plans alone equal to the expense of the foundation investigation, the designer is often required to content himself with very meagre information on the assumption that the actual conditions will be learned as soon as the excavation is opened and that this will permit of necessary modifications in the design in ample time to carry out the work effectively. The difficulty with this plan is that the entire design selected may be found unsuitable for foundation conditions differing widely from those assumed, thereby resulting in practices which cannot be considered good engineering. Ordinarily, these comments do not apply to the procedure in the case of important structures, but in too many instances this is a just criticism of practices applying to the culverts and smaller bridges built in large numbers by the railroads, a perfunctory probing of the ground with an iron rod and the testimony of a local resident or an old employee being made to suffice as foundation data. How wide from the mark a superficial examination may be was indicated in recent work on a series of bridge piers. The examination indicated that a rock foundation would be available for these piers at a depth of 10 ft. below the ground level, yet it was necessary to carry one of these piers down 50 ft. before a secure foundation was obtained. One important item in the determination of foundation conditions is the record of past experience at the same site. In this respect the knowledge of the man in charge of the previous work is of great importance, but it is folly to depend upon memory for such information. The only safe way is to insist on a thorough record of foundation data so that they will be available in the future no matter what changes of personnel occur.

The report of the Interstate Commerce Commission regarding the contract for locomotive repairs is an important document. It deserves careful attention because the investigation itself represents a new field of activity for the commission and also because the intervention of the unions was largely responsible for the inquiry. At present the latter is the more important aspect of the matter. The charges of waste and graft made by the unions at the time the inquiry was started received

wide publicity in daily newspapers and the public now is interested in learning whether the charges made by the labor organizations have been substantiated. Anyone who reads the report will see that the unions' charges were disproved and while the commission finds the New York Central and Pennsylvania were not justified in making the repair contracts, it criticizes the roads only for what it feels was an error of judgment. Even on this question the commission was quite evenly divided. Six to five is a small majority and the forcefulness of the dissenting opinions shows there are excellent reasons for defending the course which the railroads pursued. But the railroads have lost the case nevertheless. They have lost because the daily press in most cases accepted the majority opinion as the decision of the entire commission and gave little attention to the dissenting opinions. Three Hundred Millions Wasted by the Railroads makes a startling headline and probably few readers were sufficiently interested to continue to the end of the article where in most cases a single sentence stated that five commissioners dissented. This is a striking example of how easily public sentiment unfavorable to the railroads can be formed. One cannot help wondering whether the commission considered this outcome of its decision and if it had whether it would have been so quick to censure the roads. The harm has now been done. The unions will no doubt make the commission's decision the basis for charges of mismanagement which will be revived at every rate and wage bearing. It is unfortunate that such an interpretation can be put on the report for it requires years of constructive work on the part of the railroads to efface the effect of misrepresentation of one such decision.

Ford's Railroad Reports in Red

HENRY FORD'S NEWSPAPER reputation as a railroad wizard was not sufficient to keep his Detroit, Toledo & Ironton railroad from relapsing in December into its old habit of earning a deficit. According to its report of earnings and expenses for that month, which has just been filed with the Interstate Commerce Commission, two months late, the Detroit, Toledo & Ironton during December failed to earn its expenses and taxes by \$331,240, thereby wiping out all the net operating income that it had accumulated since July 1. This compares with a deficit of \$226,246 in December, 1920, under the old management. For the year 1921, however, the net operating income was \$43,322, which is much better than the showing for the previous years but still far short of enough to pay bond interest, to say nothing of dividends.

For several months the Interstate Commerce Commission has been issuing its statistical summaries with a footnote showing that the returns of the D., T. & I. had not been filed and the report for December was not received until after the other roads had reported for January and most of them for February also, and after the report of the D., T. & I. itself for January had been filed. No explanation was given as to whether the delay was caused by a too drastic reduction in the accounting force of the road, because it had failed to keep up a supply of red ink, or because of modest reluctance to make the results public.

It is not probable that a deficit of \$331,000 is sufficient to cause Mr. Ford to lose much sleep, nor is a deficit a new experience for the D., T. & I., but this is its first experience of the kind since the Ford management took charge last March. Following the one big jump in earnings in April, the net operating income in each succeeding month of the year showed a decline as compared with the month before, although in January, 1922, the road again had a net of \$23,000. The December report, therefore, is of some interest in view of the fuss that was made when the road showed an increase of some \$200,000 in net in one month under Ford's new management last April and how Mr. Ford ex-

plained in interviews that "anybody could do it"; he had merely applied "common-sense principles" to railroading for the first time.

A railroad cannot be shut down when business is light as an automobile plant can and when business falls off many of the expenses are inclined to continue. For December the deficit is explained by a rather heavy decrease in revenues unaccompanied by a proportionate reduction in expenses. The operating revenues were \$337,380, a decrease of \$171,286 as compared with December, 1920, and less than half what they were in some earlier months, while the operating expenses were \$553,977, a decrease of \$129,759. There was also an increase in taxes and a large increase in rental of equipment, from \$54,953 to \$95,123, for the D., T. & I. traffic is handled largely in cars of other railroads for which it pays a per diem rate.

For the year as a whole the showing is more favorable, although the net result is less than had been shown in several single months. The net of \$43,322 represents an increase of \$1,572,628 as compared with 1920, when there was a deficit of \$1,529,306; for the ten years before there was a deficit each year except in 1916. Most roads earned some net in 1921 as compared with deficits in 1920, under the influence of higher rates and somewhat reduced expenses, in spite of decreased traffic, but the D., T. & I. showing for the year reflects the benefit of the increased earnings resulting from the diversion to it of Ford Motor Company tonnage.

The operating revenues were \$6,453,669, an increase of \$1,233,064 over 1920, while the operating expenses were \$5,406,761, a decrease of \$910,428. Taxes increased by \$48,748 to \$157,023 and the debit balance of equipment rentals increased from \$291,845 to \$795,063, or \$503,218. The report shows that the saving in expenses was effected largely in the maintenance accounts. For maintenance of way and structures \$1,431,675 was expended in 1921, or \$460,227 less than for 1920, while maintenance of equipment cost \$1,112,137, a reduction of \$276,995. Transportation expenses were \$2,545,042, a decrease of \$154,838; traffic expenses, \$85,357, an increase of \$953; general expenses, \$233,744, a decrease of \$21,219. The ratio of operating expenses to revenues was 83.8 as compared with 121 in 1920, a creditable showing, but the percentage of revenues expended for maintenance dropped from 62.8 in 1920 to 39.4 in 1921 and the percentage of maintenance to total dropped from 51.9 to 47.

For the month of December there was an especially heavy reduction in maintenance expenditures, amounting to more than the reduction in total expenses. Maintenance of way and structures expenses for the month were \$124,514, a decrease of \$60,840, while maintenance of equipment expenses were \$130,090, a reduction of \$114,586, with the transportation expenses, \$272,888, were \$48,705 greater than in December, 1920, when the earnings were greater. The ratio of expenses to revenues for December was 164.2 as against 134.4 for December, 1920.

For January, 1922, the D. T. & I. made a better showing than it has made since September, with a net operating income of \$23,000 as compared with a deficit in January, 1921. As illustrating the ups and downs of Mr. Ford's railroad venture, it may be recalled that the road had a deficit in January and February, 1921, in March a net operating income of \$77,985, and in April a net operating income of \$276,452. This represented the effect of the new traffic which came to the road after the Ford management took charge in March. For May, however, there was a slight drop in net to \$263,293, in June to \$261,259; in July to \$187,395; in August, to \$70,643; in September, to \$46,749; in October, to \$15,191; in November, to \$5,335, and in December five months' net was wiped out by the deficit.

Reports of the operating performance of the Ford road, which have also left the Interstate Commerce Commission statistics of Class I roads incomplete for several months,

are being awaited with interest in order that we may see how far Mr. Ford has fulfilled his promise to show up the bigger roads by speeding up the movement of cars.

Why Eliminate Permissive Feature From Automatic Stop?

IT IS NO DOUBT the purpose of the Interstate Commerce Commission in issuing its proposed order for the installation of automatic train control devices to promote more rapid experimentation with and development of equipment of this character with a view of determining which types will be most practical under varying conditions on different railroads. To this end certain specifications were made a part of the order. These specifications were based in large part on the requisites adopted by the Joint Committee on Automatic Train Control of the American Railway Association and the Bureau of Safety of the commission slightly over a year ago.

One of the most important departures from these requisites is the elimination of Paragraph *b* which would allow an automatic stop to be installed so that it is "under control of engineman," who may, if alert, forestall automatic brake applications and proceed. The reason for the elimination of this paragraph by the commission has been the cause of much conjecture among railroad men, and at the hearing at Washington two weeks ago they indicated their desire that it be reinstated. The importance of this suggestion arises from the fact that a wide difference of opinion prevails at present regarding the merits of the different types of train control, and the nature of the requirements desired, which difference increases the necessity for the widest possible variety of tests in order that the data which may be obtained therefrom and from which the commission will make such revisions in its requisites and specifications as appear necessary, shall be as comprehensive as possible. Therefore it is to be hoped that nothing will be done to hinder the widest possible development and experimentation.

While it was probably not the intention of the commission to prevent the use of a simple automatic stop the specification seems to be so drawn as to allow only for the installation of devices with speed control features. Such a condition, if allowed to remain, is unfair to the railroads, the train control companies and to the commission itself. The commission, for a number of years, has recommended in its accident reports that automatic train control be installed. These recommendations could only have been based on the performance records of automatic stop devices. Surely the specifications should be made broad enough to include those devices which have a number of years of practical operation behind them.

The one great trouble in the past has been that all requisites and specifications for train control were drawn largely upon an ideally theoretical basis. It must be realized that no device approaching the ideal can be obtained until it has gone through an extensive development period. For these reasons and those presented at the hearing by A. M. Burt, of the railroads' committee, it appears all the more desirable that Paragraph *b* should be reinserted in the specifications. Certainly it cannot be the commission's intention to rule out devices which have already demonstrated their usefulness, nor can it afford to, if it expects to make its order on train control effective. By making the specifications broad enough to give the railroads reasonable latitude in selecting their devices the art will be developed much more rapidly. Some roads may desire to install simple automatic stops while others may wish to use speed control and other adjuncts. In this way comparative data may be collected which will be of value to all roads.

A Refreshing Breeze From the West

IN THESE DAYS when the railways are being taxed so heavily for the construction of highways over which competing motor trucks may be operated while paying only nominal license fees, a decision which has just been rendered by the Public Utilities Commission of Colorado comes as a refreshing breeze from the west. The commission in this decision denied the application of a motor stage operator for a certificate of "public convenience and necessity" for a service over a highway paralleling the railway in Eagle and Garfield counties during the summer months. The commission held in this instance that "the railway service was adequate; that it would be unfair to permit the applicant to 'skim the cream' of the business in the summer months, leaving the railroad to meet public requirements in the winter months when operating conditions are difficult and traffic light; and that in view of the larger sums paid by the railroad in taxes, and especially in taxes for highways, it would be unjust to allow the applicant to compete over these highways paid for in large part by the railroad's money."

The commission further pointed out that the seven trucks registered in Eagle county paid \$54.24 and that the 61 in Garfield county paid \$765.02 into the state treasury in license fees or a total of \$819.27 for the use of the state and county highways, while the Denver & Rio Grande Western paid \$38,023.94, or more than 46 times as much for highways which it did not use at all. The commission further stated that "public convenience and necessity, by which must be understood the convenience and necessity of the people at large, as contra-distinguished from the convenience and necessity of a very small number of persons who seek to derive a profit from the farmers' and home owners' investment in roads, never contemplated that the truck driver should destroy that, to the cost of construction of which he contributed little or nothing, or that he should reap where he has not sown. When the taxing laws of this state are so amended that the truck driver operating over state highways shall contribute his due proportion of the cost of construction and maintenance of our highways, then, and not until then, can this commission regard his use, under proper conditions and restrictions, of a great and tremendously expensive public facility as of equal dignity and equal benefit to the people with the moderate use thereof by the ordinary taxpayer."

The commission is to be commended for the attitude which it has assumed in this case. It is to be hoped that other commissions, seeing the logic of its argument, will follow it in the regulation of this later form of "jitney" competition.

An Opportunity for the A. R. A.

THE GROWING REALIZATION by the public of its vital interest in adequate and inexpensive railroad transportation is tending toward the frequent development of proposals for the improvement of railroad service from groups or individuals not directly connected with railroad operation or management. Some of the suggestions that are thus likely to be placed before the public will not be constructive. Others may be fundamentally sound but impracticable of more than a very limited application. It is even possible that suggestions may appear which are worthy of unqualified approval. But whatever the nature of these proposals, in the existing state of public opinion, they will be received with more than an open mind. In this very fact lies an element of danger to the well being of the railroads, or an opportunity which may be turned to good account for the development of a sound public opinion based on real knowledge.

The possibility for improving the effectiveness and

economy with which the railroads function fall in two groups, i. e., those which can be effected by the individual roads and those which require the united action of groups of railroads or of the railroads as a whole. The outside proposals most likely to receive wide public attention belong to the second class and hence cannot be dealt with or answered effectively by individual roads. At the present time there are two such suggestions before the public mind. One is the question of car pooling recently revived by the proposal of the National Association of Owners of Railroad Securities and the other is the question of the unification of terminals which is receiving considerable attention nationally as well as in various localities.

The fact that such questions cannot be dealt with constructively or effectively by the railroads individually suggests the possibility for the organization of a commission or a group of committees, either by the Association of Railway Executives or the American Railway Association, to consider the practicability and the limitations of such suggestions and proposals and then, on the basis of the findings, make recommendations that can be used to clarify public opinion and relieve the railroads of the charge of neglect which silence with regard to these questions inevitably suggests. Such a body, properly organized, could go even further and anticipate outside suggestions by the constant considerations of the possibilities for improvements through concerted action and the development of practical means for carrying them into effect. Such an agency should not be representative in character in the sense that members of the American Railway Association are representative, but the members should be chosen rather for their thorough knowledge of railway operating conditions and their ability to consider the possibility for organized activities with strict impartiality.

New Books

Use of Southern Yellow Pine in Car Construction. By H. S. Sackett. 55 pages, 6 in. by 9 in., illustrated. Published by Southern Pine Association, New Orleans, La.

This booklet will be of interest to and should be in the hands of all those who have to do with the design, operation or maintenance of wooden or composite railway cars. It is well illustrated and is filled with much valuable information and many good suggestions. A considerable portion of the subject matter is applicable not only to yellow pine lumber but also to other woods.

The book is divided into four parts. Part I outlines railroad car development from the early beginning of a century ago. Particular attention is given to the use of wood in freight car construction and the advantages of the composite design. Box, gondola, stock and refrigerator cars are discussed separately. Part II treats of the methods for storing and handling, or the care and protection which should be given to prevent decay and guard against fires. Part III deals with preservative treatments, offers practical suggestions, and suggests an extension of the practice. Part IV is devoted to the properties of Southern yellow pine and contains a number of tables relative to mechanical properties, hardness, strength, weight, recommended working stresses, etc., which add to the value of the book for reference purposes.

INSURANCE ON PARCELS, left at stations, is now offered by the Pennsylvania Railroad to the extent of \$300. The rate on valises or packages left at the station parcel rooms to be called for, is ten cents for each \$100 over the railroad's present liability of \$25. Articles exceeding \$300 in value will not be accepted. Persons desiring to insure will be required to sign a paper showing the value, and excess value stamps will be affixed by the agent.

Letters to the Editor

[The RAILWAY AGE welcomes letters from its readers and especially those containing constructive suggestions for improvements in the railway field. Short letters—about 250 words—are particularly appreciated.]

A Locomotive Engineer Tells How to Improve Operation

CHICAGO.

TO THE EDITOR:

We railroad employees, and our employers, should feel encouraged in one thing at least. That is, there seems to be an appreciable reduction in the "small-boy-stuff" of calling each other names; this is being superseded by across-the-table conferences upon at least a semblance of mutual respect.

But there are still some officials who are persistently squawking against punitive overtime; the odd part of it, to me, is that those who are crying the loudest are really benefited by the present overtime rules. Right here on my job, if overtime at time-and-a-half were to be replaced by our former arbitraries, whereby we got terminal overtime, switching allowances, etc., I would draw a larger check each pay-day than I do now—for the same work. But I'd rather things stay as they are, for with penalty overtime hanging over them, the trainmasters, dispatchers and yardmasters are up on their toes more than they would be without it and get us over the road in less time than if nobody cared how long it took us to get in. Surely, any high operating officer who cannot see his advantage in this is penny-wise and pound-foolish. If he would only give as much attention to real operating as he does to wage-cutting, he could see where he has the best of the deal when the penalty overtime rules are in effect.

And there are so many ways he can "warm things up." First, the terminals and intermediate yards. I do not know how it is on all roads, but on ours we have many yardmasters who were made from yard-clerks. They never switched a car in their lives and wouldn't know how to start. They will send a yard engine off on a 30-minute job and be perfectly satisfied when the engine returns after two hours, not knowing how long it really should take to do the job. Or, on the other hand, a yard conductor who really has a two-hour job is severely "bawled out" because he does not finish it in 30 minutes. A yardmaster should *know* how long it takes to do a given job. But with a perversity beyond all understanding, railroads make a yardmaster's pay such that a yard conductor with the training and ability to handle a yard, turns up his nose when it is offered to him. Also, there seems to be a growing tendency to pile more "pencil-work" onto the yardmasters.

Which brings me to trainmasters. A few years ago, the trainmasters were out on the road most of the time, riding trains and overseeing things generally. But now they appear to have so much office work that we rarely see one out on the road. A trainmaster is the man who actually runs the railroad, but making a clerk out of him is keeping him away from his work and the very fact that he does not get out as he used to is reflected in train movements, which are not what they were a few years ago.

Dispatching is not up to former par either. A few years ago I worked on a western road during a "rush." They were moving about 75 trains daily in each direction over 95 miles of single track and we were never over nine hours covering the division, meeting one to five trains at each siding. Where I am now we have all double track and a few

stretches of three and four tracks. Can you imagine how those dispatchers would have gloried in having so many tracks? And yet, we frequently get into a "jam" now, when nobody seems to know what to do. Sometimes I think the road would make money if it tore up all but one main track and hired some real dispatchers.

In spite of all our battles, most of we American railroad men are loyal and want to see the operation at the highest possible standard. We wouldn't quit the game if we could. It's a he-man's job and we love it, with all of its dirt, long hours, poor grub, hard beds and grief, but we would like to see some of our operating officials get on the job—have less talking and more doing. Get some real yardmasters, who can run a yard. Cut out the office work and give the trainmasters a chance to run the railroad as it should be run. The superintendent's office could handle much of the correspondence that the trainmaster gets. And, last but not least, when friend wife's nephew comes out of college, don't make a train dispatcher of him with no actual preliminary experience. Make a brakeman or fireman of him first—unless you are afraid it will drive him away from a railroad for all time. But small loss if it does, for if he has not guts enough to stick and learn, he is no good anyhow.

LOCOMOTIVE ENGINEER.

The Chief Clerk Is Not Buried

WISNESPEG, MD.

TO THE EDITOR:

My attention has been drawn to the letter from "Operating Official" entitled "What Is Ahead of the Chief Clerk" published in your issue of February 25. I would like to take decided issue with the opinion of that gentleman, as to the capability of men trained in an office to successfully assume official positions of the rank of superintendent, or greater. As a matter of fact, he will not have to look far to find dozens of these men occupying positions ranging all the way from superintendent to president on roads all over the United States and Canada. I venture to say that in proportion to their numbers there are at least as many, if not more, such men occupying important official positions in great American railway organizations as of graduates from any other branch of railway service.

Quite true, outside experience or training is a very necessary part of an officer's equipment, but first of all should come the mental capacity necessary to enable him most intelligently to make use of and apply such training. I have seen operating officials whose experience was entirely in outside positions, who lacked that capacity to a much greater extent than the average chief clerk. The chief clerk is in a position where he can receive a more general training than he could in almost any other place, except that of an official position itself, and, admitting an equal mental capacity with an outside trained officer, his adaptability should enable him to pick up the outside knowledge much more quickly than the outside officer can familiarize himself with the workings of an office.

Particularly in an operating office the variety of subjects that a chief clerk is daily called upon to deal with is very great, and no other occupation in the ranks or among the semi-official positions calls for the display of greater adaptability or quicker or more accurate thinking.

Of course there are many fine examples of railway officers in the higher ranks who have come up through station service, train service, dispatching service, and the mechanical and engineering departments, and my letter is in no way intended to imply that chief clerks are in any class by themselves. I am firmly convinced, and I believe that an analysis of official positions will bear me out, that in proportion to their numbers, there are as many men occupying official positions who

were trained through the office as from any other class of railway employees, and that they are filling them just as acceptably.

Our great Canadian systems have several officers of outstanding ability who received their first railway training in offices, and were promoted therefrom directly to operating official positions. E. J. STONE.

The Consolidation of Freight Terminals

CHICAGO.

TO THE EDITOR:

I have read with great care the article by F. J. Lisman entitled "The Consolidation of Freight Terminals" which appeared in the *Railway Age* of February 25, 1922, page 477. This article treats of a subject of such vital importance that Congress has given the Interstate Commerce Commission specific authority to handle it. However, the article contains so much material of which we have heard before and so little suggestion as to remedies that I am venturing to write upon it.

Consolidation and joint operation are two entirely different measures. Joint operation, of which the article treats exclusively under the garb of consolidation, is neither an experiment nor a new method of terminal operation. Joint operation has some advantages, as well as some disadvantages over individual operation, some of which are pointed out in the article. However, an operating system of "consolidated terminals" is the real solution of the problem.

In the beginning, joint terminals were unknown but as traffic and traffic carriers increased congestion developed in the large centers, making some change necessary. Then came gradually the joint use of tracks which was an improvement and later as the business grew and carrier lines increased still further, joint operation of the terminal facilities of two or more trunk lines was resorted to. This plan was an improvement, but finally difficulties again increased until some other method of handling these terminals became imperative, resulting in the organization of corporations composed of the interested railroads for the purpose of distributing the local and through business of those lines. The new experiment worked out very satisfactorily to the public, to the owners and to those roads entering the terminal, not participants in the joint organization. But business still increased and the demands of the carriers (which really were the demands of the public) became more and more exacting until the present unsatisfactory condition developed.

What is the answer? It would seem that after all our past experiences there can be but one, viz.: "independent consolidation." Railway operation is a scientific profession and not a "catch as catch can" proposition requiring no training or experience. The professions and businesses—medicine, law, banking, merchandising, manufacturing, etc.—are divided into departments, the heads of which may have knowledge of the entire operation in a general way, but each department head is a specialist in his own line—so it should be in the operation of a railroad. Often a road officer is lost when called upon to take charge of the operation of a large terminal, and vice versa, notwithstanding the fact that each may rank among the ablest in his own particular specialty. This applies not only to the mere movement of trains and cars but to the location and arrangement of facilities in such a way as to produce facilities capable of rapid, economical and satisfactory handling of freight. To do this requires ability, experience, forward looking men of initiative who are in constant touch with the public and the operating forces.

Can the executives and directors (to whom in the last analysis all capital expenditures must be referred and by

them approved) located in New York, Philadelphia, Richmond, Cleveland, Chicago, St. Louis, Detroit, etc., do these things more ably than the executives and boards of directors of an entirely independent terminal corporation, the officers and directors of which have neither personal nor sentimental interest in any one of the main or trunk lines with which their property connects? Is not their job, first to serve the public and the stockholders in their corporation satisfactorily? In doing this have they not satisfactorily served each individual trunk line railroad connecting with their rails?

What are the functions of a trunk line? Are they not to serve satisfactorily the public and produce the greatest net revenue for its stockholders? What are the ambitions of its executives and subordinates? Are they not to perform this function by the adoption of the most up-to-date methods with the least possible expense that they may have the personal knowledge of duty well performed, that their efforts and accomplishments may appear to their stockholders and the public as of the very highest order? Are these incentives and ambitions not the identical and constant pressure that will force the independent terminal organization on to the same successful far-sighted management?

There is no argument against the fact that the independent terminal company is in a far better position to improve the facilities, decrease the operating cost, and develop the present facilities (tracks, warehouses and grounds) to a point where the returns will be on the credit rather than the debit side of the ledger, for the reason that they are constantly on the ground with no entangling alliances to distract their attention from the concentrated job. Under this plan the consolidated terminal would bear the same revenue relation to the connecting line as any other connecting line and its earnings on line traffic would be adjusted as a division of the rate just the same as the revenue on shipments from coast to coast is adjusted with any of the intermediate lines.

This can all be accomplished. Terminals would be a monetary asset instead of a liability as now. The public will be better served and have a more intimate interest in the operation of terminals than now. The chief argument against this plan will be objection to loss of identity and loss of business from industries located on the individual line's terminal rails. There is no foundation for this argument for the reason that as the bulk of the tonnage originating in Chicago, for example, goes to the trunk line from rails other than its own there is always the "goat" in the form of the intermediate switching line whose service, in the event of terminal delays, immediately forms the "alibi." The activity and personality of the traffic department plus the carriers through service, are the items that make for an increasing and growing business. WILLIS E. GRAY.

THE DENVER & RIO GRANDE WESTERN recently conducted an investigation in Colorado to determine how much higher the wages paid by the railroads operating in that state were over those paid for similar work in other industries. In the process of the investigation, which covered 140 industries in Colorado cities, towns and rural communities in which a total of 7,396 men were employed, it was found that only one out of five industrial employees received a rate of pay equal to or exceeding that paid by the carriers for like services. Of the 1,651 shop employees covered in this survey, 1,375 or 83.3 per cent were receiving lower wages than paid by the railroads, while 276 or 16.7 per cent were being paid the same or higher wages.

VICTORIA, BRITISH COLUMBIA, expecting a large number of tourists this year, is to establish a ferry service to Anacortes, Washington. The ferry will have a capacity of 30 automobiles and will run daily, beginning on May 1. Anacortes is about 35 miles east of Victoria, and is 88 miles north of Seattle by railroad.

Remarkable Improvement Shown by Pennsylvania

Operating Expenses Decreased \$190,000,000 in 1921. Only Small Amount of Additions and Betterments

THE PENNSYLVANIA RAILROAD'S report of the operations of the Pennsylvania System in 1921 offers an unusual study in contrasts. One of these is that shown between results in 1921 and those in 1920. The other is the contrast between what the system did in 1921 and what it should have been able to do had conditions not been so abnormal.

Insofar as concerns the comparison between 1921 and 1920, the outstanding feature is an improvement in operating efficiency of such character as to bring about a decrease in operating expenses of \$190,918,090 and an increase of \$103,336,579 in net railway operating income. In 1920 there was a deficit after rentals of \$62,622,483; in 1921, a net of \$40,714,096. Whereas one year ago the Pennsylvania's morale—that of officers and men alike—was conspicuous for what was lacking in connection with it, today that morale has been restored. Evidences of this change are apparent in many ways, but perhaps in no better way than that when the strike of the train service brotherhoods was threatened last November, the trainmen on the Pennsylvania Lines East and the conductors on both the Lines East and West were among the few who cast majority votes against going out on strike. A year ago shippers were chary about praising Pennsylvania service; their comments were to the effect that Pennsylvania service was discouragingly poor. Today, on the contrary, shippers are inclined rather to praise. Their testimony is, generally speaking, that Pennsylvania service is excellent. The fast freight service which a year ago was especially criticized is now especially well spoken of.

With reference to the contrast between what the Pennsylvania System did in 1921 and what it should have been

able to do had conditions been more nearly normal, one is first confronted by the fact that the traffic carried by the system, measured in net ton-miles, was in 1921, 23 per cent less than in 1920. It was 30 per cent less than the traffic of 1917, the system's peak year. It was actually less than in 1911. Another factor is the reduction in April, 1921, from a 6 per cent to a 4 per cent dividend rate. In spite of the fact that the net railway operating income of the system did represent an increase of \$103,000,000 over the 1920 figure, it gave a rate of return on the property investment of but 1.9 per cent.

Capital Expenditures \$1,000,000

The Pennsylvania Railroad—speaking of it now as a railroad of 7,406 miles rather than as a system of over 11,000—should, in keeping up with the growth of its territory and traffic, expend for capital improvement approximately \$50,000,000 annually. In 1921 the net charges—that is, after the deduction of retirements, transferred items, etc.—for capital account aggregated only slightly more than \$1,000,000.

In discussing the operating results of a system like the Pennsylvania, one must realize that he is dealing with a unit constituting about one-twentieth the total mileage of the country's Class 1 railroads, owning about one-ninth of the country's freight cars and carrying about one-tenth of the traffic which moves by rail. This system serves the larger part of that area lying east of the Mississippi and north of the Ohio and Potomac rivers. Naturally, therefore, its operations reflect the prosperity or depression of the country's industry and commerce. Serving as it does

the important ports of New York, Philadelphia, Baltimore and Norfolk, it feels the effects of a prosperous or stagnant export trade. Further than that, its operations must necessarily serve as a mirror of the country's success in solving the railway problem. What is true of the activities of the Pennsylvania System must, speaking generally, be true of the activities of the country's railroads as a whole.

Corporate Net Income \$24,307,669

For purposes of analysis it is advisable to distinguish between the Pennsylvania Railroad, the parent company, and the Pennsylvania System as a whole. The parent company operates 7,406 miles of line; the system, 11,714. In making a comparison between the operating results of 1921 and those of 1920, it must necessarily be remembered that the 1920 figures include standard return for the first two months and the guaranty for the following six. For this reason in discussing the corporate income we shall deal with the Pennsylvania Railroad and in discussing the actual operations of the property with the Pennsylvania System. The annual report is prepared in such a manner as to make this the natural step to take and it would be difficult to get an adequate picture in any other way.

The corporate income account of the Pennsylvania Railroad Company shows for 1921 a gross income, including the net railway operating income, dividend income of the subsidiary lines, etc., of \$79,258,435, or \$8,639,542 less than in 1920. There was a decrease of \$21,881,900 in net railway operating income; in other words the company in 1921 did not earn as much as the standard return and guaranty gave it in 1920. There was an increase of over \$13,000,000 in non-operating income. The net income for 1921 was \$24,307,669, a reduction of \$8,494,004 from 1920. This net was equivalent to 4.87 per cent on the company's

is not hard to understand. The reduction was made last April, at a time when Pennsylvania conditions looked very bad and very serious. The reduction disturbed a record which had lasted for 22 years, for in not a single year since 1899, prior to which 5 per cent dividends were paid, had the rate been below 6 per cent; in fact, in 1906 and 1907 it was more. This feeling on the part of the Pennsylvania organization is important. Every effort is being directed towards restoring the 6 per cent rate at the earliest possible time. That is the standard towards which every responsible officer on the road is working.

Reduction of \$190,000,000 in Operating Expenses

Referring now to the actual operating results for 1921 and therefore to the results of the Pennsylvania System as

THE 1921 OPERATING RESULTS—PENNSYLVANIA SYSTEM			
	1921	Increase	Decrease
Railway operating revenues:			
Freight	\$420,081,057		\$67,916,416
Passenger	183,484,099		4,099,760
Total	\$662,756,803		\$82,092,183
Railway operating expenses:			
Maintenance of way and structures	\$87,648,038		\$33,423,479
Maintenance of equipment	174,048,714		55,940,394
Traffic	7,488,238	317,947	
Transportation	288,274,205		98,565,764
General	18,178,387		1,401,958
Total	\$580,310,839		\$190,918,090
Net revenue from railway operations	\$82,445,964	\$108,825,907	
Railway tax accruals	29,616,299	2,980,798	
Railway operating income	52,674,467	105,759,448	
Net hire of equipment—dr. balance	11,048,284	3,223,287	
Net railway operating income	\$40,714,076	\$103,336,579	

a whole, the first question that arises is as to the manner in which the reduction of \$190,000,000 in operating expenses and the increase in net after rentals of \$103,000,000 were made. One of the questions that arises is as to whether the reduction in operating expenses was proportionately as great as was made on the railways of the country as a whole. Another is: Were the reductions in operating expenses at the expense of maintenance?

In 1921 the Pennsylvania System carried 34,589,953,448 net ton-miles of revenue freight as compared with 44,863,566,384 in 1920, a reduction, as above noted, of 23 per cent. The passenger miles in 1921 totaled 6,323,414,240, or 14 per cent less than in 1920. The freight revenues totaled \$420,081,057, a reduction of \$67,916,416 or 13.92 per cent; the total revenues were \$662,756,803, 11.02 per cent or \$82,092,183 less than in 1920.

The total operating expenses for the system were \$580,310,839—this being the figure in which there was the \$190,918,090 reduction. The reduction in operating revenues, as noted, was 11.02 per cent—the reduction in operating expenses amounting to 24.75 per cent. A comparison with the figures for all the Class I railroads of the country will show that the Pennsylvania suffered a greater proportionate loss of revenue than the total Class I average but that it also succeeded in reducing its operating expenses in greater proportion than the average. Whereas the total operating revenues of the Class I carriers were 10.6 per cent less in 1921 than in 1920, the Pennsylvania suffered a loss of 11.02 per cent. Whereas the operating expenses of all the Class I carriers were reduced 21.1 per cent in 1921 as compared with 1920, the Pennsylvania's reduction was 24.75 per cent.

Reductions Proportionately Greater

Than Those of All Class I Roads

The Pennsylvania's reduction in maintenance of way expenses was 38.8 per cent; for all Class I railroads it was 25.9 per cent. In maintenance of equipment, the Pennsylvania's figure was 24.32 per cent as compared with 21.3 for all Class I railroads. In transportation expenses, the

SOME COMPARISONS BETWEEN 1911 AND 1921 PENNSYLVANIA SYSTEM

	Years ended December 31		Per cent increase over 1911
	1921	1911	
Miles of first main track operated (including 79 miles of canals and ferries)	11,713	11,419	2.6
Miles of all tracks operated	27,341	25,024	9.3
Gross investment in road and equipment	\$2,102,582,603	\$1,568,863,769	34.0
Other investments (book value)	163,461,228	161,657,846	1.1
Total investment	2,266,043,831	1,730,521,615	30.9

Ton miles	34,589,953,448	35,477,637,865	D. 2.5
Average revenue per ton per mile (cents)	1.208	0.600	94.8
Average train load (tons)	717	568	4.5
Average car load (tons)	38.8	35.6	12.5
Passenger miles (per passenger mile)	6,323,414,240	4,433,884,913	49.0
Average revenue (per passenger mile)	0.875	1.824	57.6
D—Signifies decrease			

THE PENNSYLVANIA RAILROAD COMPANY

Number of shares	148,000	73,165	93.7
------------------	---------	--------	------

\$499,173,400 outstanding capital stock. The dividends paid totaled \$19,966,936, or \$9,983,468 less than in 1920, and the net balance carried to profit and loss was \$433,107 or \$178,372 less than in 1920.

The stockholders actually received during the year dividends amounting to 4 1/2 per cent, this being due to the fact that the first quarterly dividend each year is charged against the earnings of the last quarter of the preceding year. The Pennsylvania organization has acute feelings about the reduction from 6 to 4 per cent in the dividend rate. This

Pennsylvania System made a reduction of 24.48 per cent; the Class I railroads, as a whole, of 21.2 per cent.

These greater proportionate reductions may mean several things, but there is no question but that they mean that the Pennsylvania was able to secure a very decided grip on its operating expenses. They indicate that there was some operating efficiency of a high order—of a very different order from that which was in evidence a year ago.

Railroad officers the country over have been much interested in the success of the new Pennsylvania regional system which was put in effect at the end of federal control. This is not the place to enter into a detailed discussion of the regional organization, but one cannot but express the opinion that if the regional system enabled the Pennsylvania to get control of its operating expenses in the manner in which this was done in 1921 the new method of organization must have the necessary elements of success.

Maintenance

The next question is as to whether the savings in operating expenses may not have been the result of too severe savings in maintenance. Insofar as refers to equipment, this appears to be the case since the Pennsylvania System's percentage of bad order cars on January 1, 1922, was 12.2 per cent. The normal bad order car percentage should be from 4 to 7 per cent. However, on the date given, the Pennsylvania's percentage was slightly less than that of the railroads as a whole. In the case of unserviceable locomotives the Pennsylvania's per cent on January 1, namely 22.7 per cent, compared with the country's average of 18.7 per cent.

Insofar as concerns maintenance of way, it is apparent that the Pennsylvania, despite a reduction in expenses of maintenance of way and structures of 28.8 per cent, actually improved its maintenance condition as compared with 1920. This is evident to anyone who has traveled on the Pennsylvania in recent months. It is further shown by the figures. The Pennsylvania System put in track in 1921, 149,765 tons of new rail, or 42,507 tons more than in 1920. It put in 6,027,879 ties, an increase of 732,342. These totals are not up to the averages of former years. It would be too optimistic to say that the Pennsylvania is entirely restored to its old time standard. During federal control the deficiency in applying track material, it is estimated, amounted on the Pennsylvania System to 5,500,000 ties, 160,000 tons of new rail and 530,000 cubic yards of stone ballast. This presumably represents the ground that the system must cover to restore its former high standards.

Of the reduction of \$190,000,000 in operating expenses, \$98,000,000 was in transportation expenses. This was partly due to the reduction in service and to lower costs of fuel, but when all is said and done, in the case of transportation expenses and in maintenance expenses alike, the real reason for much of the savings in operating expenses was due to decreased labor costs and the increased efficiency of the organization and the employees as a whole. The reduction in the number of employees was drastic—the payroll for December, 1920, carried 280,733 names; that for December, 1921, 218,859, a decrease of 22 per cent. In addition, there were the wage reductions of 12 per cent in July and modifications of the rules and working conditions. Similarly there was increased efficiency of the personnel and a reduction in overtime. Savings in the closing down of the shops, restrictions in the use of materials and supplies and certain eliminations of service also counted heavily. The reductions were drastic and their extent, if nothing else, shows how severe was the task confronting the system under the 1921 conditions.

The Question of Labor

In speaking further of the labor problem one prefers to quote from the annual report itself, the subject having been

covered so adequately in President Rea's remarks. On this subject he says:

"It is appropriate to refer to the labor situation, as it is of vital interest to the stockholders, as well as to the general public, that right relations should exist between the employees and the company. Fortunately, the strikes, or threatened disruptions of railroad service to the public, in the last two years have signally failed, because they were strongly condemned by public opinion. The controversy with the shop crafts' union has already been explained to the stockholders, and the question of the jurisdiction of the Labor Board as to details of management is now before the federal court. It is hoped that when this question is settled, the relations with our employees will pass entirely out of the controversial stage, and that the spirit of co-operation, already so much in evidence, will result in the full development of a permanent and mutually satisfactory plan. Experience plainly indicates that, in order to maintain these mutually satisfactory relations, it is necessary for the owners and users of the railroad, as well as the employees, the management and the public authorities, to be kept advised of the true facts as they affect their respective interests, so that each may know that what is being done is fair to all.

"It is due to the employees of the Pennsylvania System to say that they have already evidenced a keen appreciation of this necessity, and it is a pleasure to commend their patience and co-operation during this adjustment period, through which the country is passing.

"Certain wages and working conditions are yet much out of line with those in effect prior to the war, and further adjustments are essential to reduce the cost of transportation, adequately maintain the property, and enable the company to pay a fair return to the stockholders. The employees shared in the high wages of the war period, but the stockholders' dividends were not increased in that period. Since the war their dividends have been reduced, and your directors feel that an obligation rests on the management to restore the 6 per cent dividend rate as soon as it can be done without detriment to the maintenance of the property. Capital is just as much entitled to a fair return as labor is to receive fair wages, and no more salutary step could be taken to restore public confidence, and improve existing conditions, than for your company to be able to resume its 6 per cent dividends, and reduce traffic rates as the result of increasing economical operation—secured largely through adjustments in wages and working conditions."

Not Much Progress Made With Leases

The Pennsylvania Railroad last year worked out a plan whereby the parent company proposed to lease 16 subsidiary companies which were already controlled by ownership of all or nearly all the capital stock. One of the important reasons for the plan was the desire to eliminate, insofar as possible, the accounting expense incident to keeping separate accounts for subsidiary lines already operated as parts of the Pennsylvania System. These economies were not realized because the plans could not be carried out as expected. Five leases were submitted to the Interstate Commerce Commission for approval, but final approval has not yet been granted owing, the annual report says, to certain conditions formulated by the commission in connection therewith, which could not be accepted by the lessee.

The matter is still under consideration and the applications to the I. C. C. for approval of the remaining leases have been withheld. The proposed lease of the Pan Handle has been further delayed by the opposition of two minority stockholders. The Pennsylvania System, it will be borne in mind, originally consisted of over 600 constituent transportation companies. At present it consists of a total of 107 active companies including 16 railroad operating companies, 49 companies whose roads are operated under lease or contract and various bridge, canal companies, etc. The total active and inactive companies, including those jointly owned, is 178.

THE TOTAL EXPENDITURES on government railroads in the province of Alberta, Canada, during 1921 was \$4,334,811. The greater part of this sum was spent in the reconditioning of the lines north of Edmonton, although a heavy expense was also involved in the laying of 93 miles of new track. The amount spent was slightly under that authorized in the 1921 budget, which was \$4,700,000.

Proposed Acquisition of Chicago Junction

WASHINGTON, D. C.

ORAL ARGUMENTS were heard by the full membership of the Interstate Commerce Commission on April 5 in the long-drawn-out proceedings on the application of the New York Central for approval for the acquisition of the Chicago Junction and the Chicago River & Indiana, which was recently recommended in a revised tentative report of an examiner containing a large number of conditions regarding the future operation of the property. R. J. Cary, representing the New York Central, said that the company had objected only in principle to the 17 conditions attached to the original tentative report of the examiner, except that it would like to suggest certain changes of language, but he characterized the plan proposed in the revised report as "the biggest outrage in the world." He said these conditions create special duties relating to details of operation for the future to be performed by the railroads and make the commission a "super-manager" to supervise the performance of those duties which he called a "very far departure from the act."

Mr. Cary declared that it would be an "outrageous proposition" to prejudice operation in advance in this way and declared that the conditions proposed are contrary to the spirit of the transportation act, which intends to leave railroads great freedom in the operation of their properties. He also said that conditions would be discriminatory because competing roads in Chicago would be left free.

Commissioner Eastman remarked that the conditions are intended to preserve the present situation, to which Mr. Cary replied that the original 17 conditions do that, but that the revised conditions go much further. Commissioner Potter asked if it would not be just as reprehensible to impose the conditions as it would be to impose them on the Chicago Junction today, to which Mr. Cary replied in the affirmative, saying the company is entitled to operate its property in any way that is lawful and that the commission should not impose precautionary conditions to insure operation in accordance with the law. Condition 18, which provided that the commission's order authorizing the transaction may at any time be cancelled for good cause shown, whereupon the lease of the junction properties shall automatically cease, Mr. Cary said, would not be within the power of the commission and it would mean that the property would be only tentatively sold; it would be impossible to borrow money, and any improvements would be subject to forfeit. If this condition were held void the entire transaction would be nullified because of a further condition that if any clause, sentence, paragraph, condition or part of the order shall for any reason be adjudged to be invalid the entire order and the authorizations shall be void. He said it was absurd in view of the fact that the new provisions of the law have not yet been construed by the courts to impose such conditions, particularly as Paragraph 3 of Section 5 of the act would keep the case open so that the commission could issue supplemental orders at any time.

Luther M. Walter, representing the other Chicago railroads that have intervened in opposition to the granting of the application, said that the Chicago Junction property was built up out of earnings contributed by the various trunk lines in the form of switching charges and that the New York Central is trying to acquire the right to get the line haul revenue, amounting to \$150 to \$250 per month on the valuable traffic originated by this road. Commissioner Potter asked if the intervening carriers are not putting themselves in a similar position when they ask to be allowed to run the traffic, to which Mr. Walter replied that they want to maintain the present situation, under which all are treated on equal terms, and that it is in the public interest

to maintain the present condition of equality instead of giving the traffic to a richer road.

He pointed out that 77 per cent of the traffic of the Chicago Junction is livestock and its products and that 65 per cent of it is controlled by four packers, so that it would be easy to control it in the interest of a single trunk line.

The intervenors asked the commission, first, to deny the application, but if it is not denied they ask that conditions be imposed to put it beyond the power of the New York Central to "wreck the present system of equality." These roads are willing to join with the New York Central in acquiring the property jointly under conditions to be fixed by the commission and he argued that this road in the heart of the greatest railroad center in the country could well be treated as the nucleus of something on which to build a joint terminal. Commissioner Potter asked how the Chicago Junction could now be prevented from giving advantages to the New York Central if it so desired. Mr. Walter said that the law prohibits one carrier preferring one connection over another, but if the New York Central owned the property discriminations could not be policed. Moreover, he said, under present conditions, there is no incentive for such preference.

Shippers Asked to Co-operate in Car Handling

WASHINGTON, D. C.

M. J. GORMLEY, chairman of the Car Service Division of the American Railway Association has addressed a circular to the shipping public in response to a general demand for a brief yet clear statement of what may reasonably be expected of shippers toward observing the Car Service Rules adopted by all railroads.

It is suggested that where practical this circular be given to shippers by trainmasters and other officers and agents who are familiar with and competent to explain the rules in detail. The circular is as follows:

Car Service Rules which govern the movement and interchange of freight cars between railroads serve also the self interest of the shippers since compliance with them enables the roads to furnish the type of car required as well as to insure a more adequate supply. This because:

1. The primary purpose of such rules is to keep cars on the lines of the owning railroad.
2. Each railroad customarily purchases equipment to meet the need of its own shippers which are thereby furnished with the particular class and type of equipment which best suits their individual needs.
3. Cars can best be maintained for service in the shops of the owning railroad; cars at home are kept in better physical condition than when scattered throughout the country.

Shippers will therefore best conserve their own interests by adhering to the underlying principles governing car service between railroads. These are:

1. HOME CARS, which are cars owned by the railroad on which located, should not be loaded off the home road when other suitable cars are or can reasonably be made available for use.
2. FOREIGN CARS, which are cars owned by railroads other than that on which car is located, should be loaded
 - (a) to a point on the owning railroad, or
 - (b) to a point reached via the owning railroad, or
 - (c) in the direction of the owning railroad.

These basic principles of the Car Service Rules are subscribed to by all railroads with agreement as to uniform adherence. Shippers can render material assistance in confining cars to the proper channels of traffic by loading in accordance with these rules.

Shippers can also assist in rule compliance by ordering cars for shipments as much in advance as possible, specifying full routing and by not reloading cars more empty at plants contrary to above principles.

Railroad representatives will gladly give any additional information which may be necessary to insure proper compliance with the rules in the handling of individual cars.

YOUR CO-OPERATION IN CAR HANDLING IS EARNESTLY SOLICITED.

I. C. C. Reports on Outside Locomotive Repairs

Six Commissioners Think N. Y. C. and P. R. R. Incurred Excessive Costs But Find No Ulterior Motives

WASHINGTON, D. C.

THE INTERSTATE COMMERCE COMMISSION on March 31 made public reports on its investigation of the contracts for the repair of locomotives in the shops of locomotive builders entered into by the Atlantic Coast Line, New York Central and Pennsylvania railroads early in 1920 in their efforts to prepare for a record-breaking traffic. In the case of the Atlantic Coast Line the commission reports that although based on excessive costs the contracts were not found, in the circumstances, to have been unwarranted. In the cases of the New York Central and the Pennsylvania the commission reports by a majority of 6 to 5 that the cost to each railroad was approximately \$3,000,000 in excess of the cost at which the work might have been done in its own shops and that the work could have been done in the railroad shops within a reasonable time or within the time in which the contract work was done. Five commissioners, Potter, Lewis, Hall, Daniels and Campbell vigorously dissented from this finding in both cases on the ground that it is beyond the province of the commission and the majority reports find no support in the record for the imputation of the American Federation of Labor and affiliated railroad labor organizations, who intervened in the proceeding, of an ulterior or dishonest motive on the part of the railroad officials.

The investigation was instituted on the commission's own motion on charges made publicly and in a petition filed with the commission by railroad labor organizations that the contracts with outside shops were in disregard of efficient and economical management, resulting in unreasonable expenditures, and otherwise contrary to law. It was also charged that the railroads had made such contracts with the expectation of charging the cost against the government guaranty for the six months following the termination of federal control and that those in control of the railroads were interested in the profits of the outside companies. Abstracts of the majority and dissenting opinions, omitting most of the discussion of the details of the evidence, are given herewith. In the Pennsylvania case the commission says in part:

Majority Report in Pennsylvania Case

March 10, 1920, respondent entered into a contract with the Baldwin Locomotive Works for the repair of 200 locomotives and that contract and its incidents are reviewed at length in the evidence. The questions for consideration present themselves as follows: (1) The justification for having the work done in outside shops; (2) the cost of repairs so made as compared with the cost had the work been done in respondent's shops; and (3) the providence or improvidence of the particular contract and of settlements thereunder.

Prior to the hearing, and pursuant to our order which initiated the proceeding, one of our locomotive inspectors, together with one of our examiners of accounts, made a preliminary investigation, in the course of which respondent's shop records and the records of the United States Railroad Administration and of this commission were examined, and the results were duly introduced in evidence. Some evidence also was submitted by representatives of the Railroad Administration and by the interveners. The evidence in respondent's behalf was adduced by its chief of motive power.

As a general outline of the situation, respondent's witness submitted, in substance, the following: Early in March, 1920, he found on the system a shortage of locomotives and cars to meet the demands of shippers, and, having already accepted all contracts holding over from the Railroad Administration, let two other car contracts and the locomotive contract in question. The locomotives in and awaiting shop for classified repairs and for running repairs requiring 24 hours or over during 1920 are exhibited by weeks from January 3 to December 25. For the week ended February 28, practically the end of federal control, 240 locomotives are shown as then receiving and 300 as awaiting classified repairs, and 383 then under and 368 awaiting the heavy run-

ning repairs, a total of 1,291. A further exhibit, by months during 1920 and the first quarter of 1921, shows, as of February 28, 1920, 261 locomotives under and 340 awaiting class repairs, a total of 601, or 61 more than shown for that date on the exhibit before mentioned. The later exhibit also tabulates, as of the end of each month of the period covered, the estimated further available service of the motive power before class repairs should become necessary. As of February 28, 1920, it shows 724 locomotives good for 1 month's service, 399 for 2 months, 446 for 3 months, and so forth, up to 12 months or over. For the first five months of 1920 the locomotives successively indicated as good for 1 month's additional service range from 75 to 224 in excess of 500, stated by the witness in that connection to approximate the normal capacity of respondent's shops.

The contract was on a cost-plus basis, that is, the cost of materials, at stipulated prices, and of direct labor, plus 90 per cent of the distributed labor cost to cover all overhead expense, plus 15 per cent of the whole for profit. All scrap material resulting from the work was to become the property of the Baldwin plant, and respondent was to bear in all freight charges on materials and on the completed locomotives. Deliveries were to be made within three to four months after receipt of the first locomotive at the Baldwin plant, barring certain contingencies; and in fact commenced in April and ended in September.

Cost of Repairs

The aggregate cost of the repairs under the contract, upon final audit, is stated by the witness to have been \$4,496,820. This figure, however, does not include the cost of inspection in that connection, represented by a force of 32 inspectors kept by respondent at the Baldwin shops for that purpose during the contract period and whose maintenance was chargeable wholly to the repair work. Taking types of locomotives so repaired, the contrasted cost per H-9-s (freight) locomotive for class-3 repairs in respondent's Altoona, Pa., shops is given as \$9,453, as against \$25,799 for each of the 13 repaired by Baldwin. For like repairs per L-1-s, a somewhat heavier type of locomotive, the cost at Altoona is given as \$9,989, as against \$21,692 for each of 15 at Baldwin's. The figures for Altoona, however, include allocations to overhead on the Baldwin basis as far as respondent has corresponding items; on respondent's own basis of accounting, including items directly entering into the work, the respective costs are shown as \$8,452 and \$8,892. Even at the higher figures, the exhibited excess costs, exclusive of the supervision, approximate \$16,000 and \$11,000, respectively, per locomotive.

Briefly, respondent bases the claimed necessity for invoking the aid of the Baldwin plant upon the condition of its motive power at the end of federal control, the inadequate capacity of its own shops for making the requisite class repairs, and the then existing and prospectively increasing volume of traffic. Of the array of figures and other data introduced by the several witnesses, apart from some irreconcilable conflicts in the evidence, much is without probative value in respect of the real questions. The only practicable means of determining the issues seem to lie in comparisons of conditions, performances, and results, using such factors as the record affords; and as but portions of the available material go back of the period of federal control, the years 1919 and 1920 will be taken for the purpose.

At the outset the matter of ascertaining whether the 200 locomotives could have been repaired in respondent's own shops, giving consideration to conditions which obtained at the date of the Baldwin contract, is complicated by respondent's widely varying statements of the capacities of its shops for class repairs and by the testimony of its witness that those indicated capacities depend materially upon the heavy running repairs the shops are called upon to make. While testifying that such running repairs are more or less frequently made in the shops, and that in some degree class repairs are made in the roundhouses, he could give no estimate of the extent of these interchanges.

A further contention is that the invocation of outside aid was justified by the event, in which connection respondent cites its inability to furnish cars during the summer of 1920 and to illustrate which it exhibits the cars requisitioned and furnished and the layover of cars in yards for the last 10 months of the year. But nothing is offered to attribute the situation to motive-power conditions, without regard for the many other matters that might affect that situation, such as the "outlaw strike" which aided in bringing the April lay-over up to 91.9 per cent, the highest shown. The lay-over for March approximated that for the entire year;

and, whereas it was stated that "anything over 50 per cent represents abnormal condition," it is of interest that from July to December, inclusive, the lay-over exceeded that percentage and that during each of those months respondent made reductions in his shop and roundhouse forces, in all a very considerable number. At the same time, fully conceding the necessity for maintaining the motive power then and at all times, the real question is, whether respondent could have done the repair work in its own shops.

It is not questioned that the cost of the contract work exceeded that for which the work could have been done in respondent's shops, assuming the adequate capacity of the latter. The investigators compute the excess cost, including the pay of the 32 inspectors, deducting additions and betterments made at the Baldwin plant, and making certain other appropriate adjustments, including an allowance for overhead expense, to have been \$3,173,982.33, a little less than the total indicated by respondent's figures. Respondent secured no other bids for the work, and the possibility of obtaining the repairs at other contract shops at a lower cost can not be determined.

Respondent's records indicated that, of the 200 locomotives in question, 5 received class-2 repairs, 153 received class-3 repairs, 3 received class-4 repairs, and 39 received class-5 repairs. A check of the repairs actually made, however, disclosed that 44 locomotives shown as having had class-3 repairs in fact received class-4 or class-5 repairs, although this does not mean that respondent paid class-3 prices therefor. The check also indicated that the Baldwin repairs and those currently made in respondent's shops were comparable in character.

To a criticism that respondent paid twice for some of the repair work defectively done in the Baldwin shops in the first instance and then replaced or corrected, respondent answers on brief that the payments were in strict conformity with the contract, and adds the comment that it would be interesting to know if the representatives of the commission think that in like circumstances the railroad should make a deduction from the wages of its employees. The comment is wholly beside the question, especially as the payments to Baldwin were not in fact in accordance with the terms of the contract. That instrument provided, as before stated, for the addition of 90 per cent of distributed labor to cover all overhead expenses, including "rentals, * * * errors or defects," etc.

Company's Action Called "Precipitate"

Weighing one thing with another, the record indicates to us that at best respondent was precipitate in resorting to outside shops, at an added expense of more than \$3,000,000, almost immediately upon its resumption of its property. It is obvious that every consideration of good management dictated the restoration of the locomotives, with earning capacities ranging upward of \$12,000 to \$17,000 monthly, to a serviceable condition without undue delay, but the same considerations also dictated the accomplishment of that end without unnecessary expenditures. Upon a careful review of the record we conclude that a more thorough survey of respondent's facilities in the light of past demands and performances would have disclosed a capacity to do the work itself within a reasonable time by an appropriate coordination of efforts and by such added exertions as relieved the situation in the preceding year. The interveners' imputation to respondent of an ulterior or dishonest motive has no support in the record.

Potter Finds Criticism Not Warranted

Commissioner Potter in a lengthy dissenting opinion said in part:

Faced with the serious consequences of a shortage of power, the respondent, in order to make repairs more rapidly than they could be made in its own shops, contracted to have 200 of its 7,300 locomotives repaired in the best outside shops available. The majority report finds that later this decision was found to be a mistake. This alleged mistake of judgment is the sole basis for the criticism. The good faith of the officials of the respondent is not questioned, and they are completely exonerated by the majority report from every improper motive.

As there is no imputation of bad faith the promulgation of our report raises very serious questions as to the function and power of the commission. I deplore the taking on of work which I believe is not intended for us. The duty of this commission to consider the burden upon its authority is of such vital importance to the public that our system or regulation is to endure, that I think we can well afford to discuss it in the form of our reports.

It is not our duty to do the thing which his judgment, based on his knowledge and experience, at the time he is called upon to act, would think he should do. For him, that decision is right and free from criticism for all time which seems right when made, no matter how it turns out later. What would we have done if we had been in his place, with his perplexities, doubts, and forebodings, only fair and proper question for us to consider. If the inquiry were more thus limited, as obviously it should be

there is not in the record any basis for criticism. In fact, the majority report seems to admit this, for the main reliance of the majority report is upon testimony, not as to the conditions which actually confronted the officials when they made their decision, but as to conditions and happenings later. If later it had turned out (which it is shown it did not) that the work could have been done at home, it by no means would follow that the March decision was not the correct decision for March.

In working toward a conclusion we are bound to accept the facts that the chosen representatives of the stockholders and directors of the respondent, brought up in its management, recognized throughout the transportation world as men of high skill, charged with the responsibility of managing its affairs, acting in good faith in accordance with their judgment, decided it was best to send this work out. I can not see that we are charged with any duty or responsibility which requires us to review their judgment, or that we have any authority to do so. We are not competent to review it. These officials understood the needs of their company as we can not. They understood the territory they served, and its commercial and industrial conditions, and the probabilities of tonnage as they existed when it was decided to send the work out. They understood their shops and forces and knew, far better than we could, how to handle their labor. No one knew what might happen at almost any minute, and the best preparation was required at every point. If they felt it was necessary to make their company independent and strong in the face of what threatened, or that it was good policy to build independent resources, free from outside interference, we have no right to say that, from the standpoint of company policy or of public interest, their conclusion was wrong. The responsibility was theirs. We should not reverse their judgment upon a record made at this late date, which, in the nature of things, can not possibly give us even an outline sketch of the picture which confronted them.

We must remember that the steam locomotive is the heart of American industry, without which railways can not operate and industry, in a broad sense, can not be carried on. Almost it might be said that upon each one of these locomotives depends one seventy-thousandth part of the prosperity of the nation and the protection of the nation's property, peace, and order. The value to the nation of one month's service of a locomotive in busy times, is worth far more than the cost of locomotive itself. There is never an excuse for any carrier to run any risk with respect to its motive power. Chance may be taken with cars, and all other things, but never with locomotives. The one thing that never should be excused in a manager is avoidable risk regarding the effectiveness of his motive power. Particularly in times of stress he should not stop to make close estimates or draw fine distinctions as to how or where repairs should be made or as to relative cost. He should consider first how to be absolutely certain under every possible contingency to have his power ready.

Commission Not Equipped for Management

We are equipped for regulation within the law, regarding rates and other matters clearly within our proper function and with which continually we are called upon to deal. We are not equipped for problems of management and operation. These are beyond the lines that define our field. The idea that we, a commission of 11 men, brought from different walks, none of whom was selected because he had any knowledge regarding practical railway operation, can, in spite of our inexperience, two years after the fact, on an incomplete record of conditions, put ourselves in the chair of the general manager or master mechanic of the largest system of railroads in the United States, and say how, in perilous times, he should have handled a very difficult operating problem, and justly criticize him for error, does not find favor with me.

We have been given no roving commission to investigate and criticize. Federal control ended at midnight, February 29, 1920, and under the law in effect since then the carriers are to be managed by the chosen representatives of their owners and not by us.

We are not making any order upon our report and are giving no direction and we have no authority to do either. Our report is only criticism of management where responsibility for management is not on us. No complaint of violation of the law has been made, and we have found no violation. In such a situation I see no right to interfere with criticism and disturb and irritate with expressions of our opinions. If the officers of the respondent have not exercised good judgment, they are accountable to its stockholders, and not to us.

The procedure we have adopted in making this inquiry can not be supported by the provisions of the transportation act under which honesty, efficiency, and economy of management are to influence the determination of rate scales. We have not proceeded as in a rate inquiry for rate-making purposes. Our report can be of no service for rate-making purposes. It determines nothing respecting the honesty, efficiency, or economy of respondent's management. It deals only with one transaction that occurred two years ago in one branch of carrier operation. A mistake might have been made in this matter and yet the respondent might be

the most efficiently operated carrier in the country. There might be warrant in conducting a general inquiry as to carrier efficiency shown by the respondent's operations generally, but the discussion of an isolated transaction under unusual conditions can not be helpful to us on any question we have jurisdiction to determine.

This is one of several investigations we are carrying on of a similar nature and under similar circumstances regarding different carriers throughout the country. They are taking an enormous amount of precious time and are costing many thousands of dollars—without accomplishing any result of the slightest value to anyone.

Criticism of a transaction in a particular situation can do no good. It may do harm. No helpful lesson is to be learned from our action. If in the future the officials again should be confronted with what seems to them an emergency situation and they recall our criticism in the present case, they would do one of two things—either disregard our criticism and boldly go ahead and do what they thought they ought to do, as they should, or they would say: "We did what we thought was best before and were reprimanded. Now we will play safe. We will try to repair the locomotives ourselves. If we fail, only the public will suffer. The responsibility will be on the Interstate Commerce Commission and our failure will never be known." To encourage such an attitude and to so dissipate ambition and resolution, as it seems to me might be the effect of adopting the policy of our report, would be unwise. We should stimulate initiative, courage, and prompt action and a willingness to take on and quickly solve big problems. If railway operating officials, responsible for furnishing transportation for the public needs, are to stop before acting and wonder whether we are going to criticize them or not, the result, as far as the country is concerned, will be far worse than the occasional losses which may occur through the courageous and prompt exercise of judgment.

There has been a full hearing. Our own attorney conducted the proceeding—certainly with all the zeal that impartial investigation permitted. The intervening labor organizations had vigorous representation before us. After an investigation so made, no suspicion beyond the facts found by us can be entertained. If the record is not complete, our finding stands condemned. The presumption of innocence until proven guilty prevails before us. The greater the official power the greater the duty to respect and guard the private right.

In the foregoing I have dealt with this case without regard to the testimony as to what happened after March 10, 1920. To exclude such testimony seems to me our obvious duty. If it were proper to consider such testimony my study of it convinces me that the majority view involves a misunderstanding of the record, which, to my mind, demonstrates by subsequent events that the contract in question was justified.

Under the circumstances it was certainly incumbent upon the management to do everything possible to bring the Pennsylvania system to the utmost of operating efficiency, and if the condition of motive power interfered or was likely to interfere in any respect with the movement of traffic offered, it was the duty of the management to rectify that condition at once.

Railroad Shops Worked to Full Capacity

Although the respondent's chief of motive power testified at the hearing that in his opinion the average capacity of the shops for classified repairs was 500 per month, it would seem from the evidence that the respondent would have been justified on the 1st of March, 1920, in assuming that under favorable conditions an average capacity of 525 classified repairs per month could be obtained during the ensuing few months and at the same time heavy running repairs be maintained. It is argued in the majority report that assuming a shop capacity of 525, the average monthly output for the year under respondent's figures was but 483, and therefore 42 below the desired minimum. It is then reasoned that by using its shops to the full capacity of 525, the respondent could have cared for the 200 locomotives sent to Baldwin's in five months, or in seven months under the investigators' figures as to output, the former figure being well within the time consumed by the Baldwin plant. This certainly is close figuring to the point of danger, but it is impossible to apply this argument to the facts shown. I have already pointed out that the average monthly output for the six months immediately following federal control was approximately 525 and it, therefore, equaled the estimated capacity. This is the only period that can be considered with any justice to the respondent, for the whole purpose of sending the locomotives in question to the outside shop was to restore them to use in time for the expected summer and fall business. The contract called for their delivery in from three to four months from the delivery of the first engine, and the last of them was in fact delivered on September 19, 1920. The question is not whether these locomotives could have been repaired in the Pennsylvania shops some time within the ensuing year, but whether they could have been repaired very early in the year. The testimony is conclusive that they could not, for without them

the shops were worked to their full capacity of 525 for the six months following the making of the contract. There is nothing in the evidence to indicate that the shop capacity of the respondent could have been increased materially beyond the output shown during the six months in question. Much less is there anything to indicate that respondent's officials had any reason to expect as of the 10th of March, 1920, that a greater output could be obtained.

The concurring opinions evince a point of view which helps to account for the error into which I think the majority has fallen. They urge that the fact of chief public interest "is the discrepancy between the cost of the contract work done by the Baldwin shops, and the cost of precisely similar work done in respondent's shops." The comparison "between system shop repairs at approximately \$9,000 per locomotive and contract shop repairs at approximately \$25,000 per locomotive" is made all persuasive. In this case, as everywhere, failure to utilize the available material of important basic facts is to build conclusion without sound foundation. Obviously, the helpful comparison in this case is not between \$9,000 and \$25,000, but between \$9,000 and that figure less than \$25,000 which would remain after deducting the earnings of the locomotives which the company was able to enjoy as the result of making the repairs outside. The majority opinion, while recognizing that the earning capacity of a locomotive ranged upward from \$12,000 to \$17,000 monthly, ignores as an element in the determination of the net cost of the repairs, the additional earnings which the locomotives made because they were sent out.

Any theoretical or abstract objection to the contract because it was not entered into after competitive bidding, or because of any of the terms which it contained, or of the manner in which the work was to be done or paid for under it, is out of place when coming from us, because we, who made the record, have failed to show that any better terms were available. The burden of the attack was upon us, and it was incumbent upon us to show, by affirmative testimony, that this particular contract was not justified by the conditions under which it was made. We do not know whether any better terms could have been obtained and therefore can not find against what was done. This inquiry respecting the outside repairs made for the respondent is in a proceeding which involves outside repairs arranged for by other carriers. A comparison of the respondent's contract with the other contracts before us does not indicate in the respondent's contract exceptional characteristics justifying criticism. We may not apply abstract theory to such situations. Nor may we indulge in assumptions, implications, suppositions and presumptions.

Whatever the actual net cost of these repairs to respondent may have been, if in fact the earnings of locomotives restored to service were not greater than the repair expenditure, the expenditures were justified from the point of view of the management in March, 1920, when it faced the uncertainties of the coming year. It was not time to hesitate when the public service depended on the amount of available motive power. The evidence all goes to show that the decision made had ample warrant in the facts before those who made it and was justified by subsequent events. We have not been erected into a supreme directorate of all the railways of the country, and I conceive that it would be beyond our province and unwise to criticize those who are responsible, even if in the exercise of their judgment we thought an error had been made.

Lewis Calls Policy of Condemnation Dangerous

Commissioner Lewis in his dissenting opinion said:

I am not in accord with the majority. The cost of repairs undoubtedly was higher than had the work been done in the Pennsylvania's shops. As it transpired, the Pennsylvania could have made the repairs later in the year. These, however, are not the controlling factors. If judgment is to be passed it must be on the question of whether, in March, 1920, the company was justified in sending the work out.

At that time the carriers were facing the return of their properties from government operation. There was general recognition that private operation was then put on final trial. Traffic was heavy. Complaints were general. There were repeated warnings that service must be improved. There was every reason to anticipate the still greater demands which came in the spring, summer, and early fall of 1920. Under all these conditions the company was under obligation to make every effort not only to maintain but to improve its facilities for transportation. Locomotives in repair had an earning power in excess of \$12,000 a month. More important, however, was that on an adequate supply of motive power depended both the success or failure of private operation and the high industrial and commercial activity of the country.

The decline in traffic in the latter months of 1920 could not be foreseen. This commission in authorizing rates to yield a definite return upon the values of the carriers' properties was unable several months later and after a series of hearings of national

scope, to predict the collapse of traffic then only a few weeks distant. I can not, therefore, concur in a condemnation that, in light of a specific finding that no ulterior or dishonest motives were shown, must rest on conditions which arose subsequent to sending the needed locomotives to outside shops.

The government has decided against government management of the railroads. It has set up regulation and has definitely adopted a policy of protection. The record does not give warrant for condemnation on the ground of dishonesty or inefficiency. The pressing consideration in March, 1920, was service, and whatever might be said in criticism on the ground of uneconomical management disappears when there is taken into consideration the earning power of locomotives in service.

The adoption of a policy of condemnation is dangerous. The prosperity of the country is dependent on exercise of broadest vision and boldest initiative by those in charge of the railroad facility. Responsibility should not be impaired by intimidation and menace of public censure except in instances of most extreme provocation. Management having been placed, as a national policy, in the hands of the railroad executives, the government should not condemn actions that appear when taken to be to the best interest of all concerned, except upon a conclusive showing of improper motives or public injury.

Commissioners Hall, Daniels, and Campbell also dissented.

Chairman McChord Defends Majority Report

Chairman McChord wrote a concurring opinion in defense of the majority report "to correct any possible misapprehension which may result from the dissenting interpretations of that report."

The majority distinctly recognize, that the award of the contract is to be considered in the light of the contemporaneous circumstances, and the conclusion reached is in no sense or degree based upon subsequent developments. The necessity for the contract, at admittedly and serious increased costs for the work performed, is considered by contrasting the motive-power demands that faced respondent upon the resumption of private control with the like demands in 1919 and the accomplishments in rehabilitation of the power in that year as affording the best criterion of what might reasonably have been expected in respondent's own shops to meet the prospective requirements with the advent of private control. In the survey of the situation the majority report also takes due account of the respectively available power and of the contemporaneously increasing traffic. With an even greater burden of class repair work impending on March 1, 1919, and a concurrently mounting volume of traffic, respondent met the demands in its own shops and within a brief period during that year brought its bad-order power within safe limits.

The record denotes that the contract, made almost immediately upon the resumption of private control, was entered upon without that precautionary survey of respondent's own facilities and equipment and of their capacity which mere good judgment and a fit sense of obligation should have dictated.

The investigation was entered upon by unanimous vote of the commission, and I think it rather late in the day now to question that action. Indeed, by the interstate commerce act itself we are expressly authorized to inquire into the management of the business of all common carriers subject to the act, and directed to keep ourselves informed as to the manner and method in which the same is conducted, and empowered to obtain from the carriers full and complete information necessary to enable us to perform the duties and carry out the objects for which this commission was created. The authority to inquire is not limited to specific matter. Improvident operating costs are always of concern to us, and to the public which ultimately pays the bills, as in the end they have a very material bearing upon the carriers' revenue needs, which must be met by increased rates, security issues, or loans from the general railroad contingent fund. For a number of years the carriers of the country have repeatedly and sharply brought to our attention the matter of high operating costs as cutting them to increased rates or other relief, and I do not understand that we exceed our charter when at any time we undertake to ascertain if money in large amounts has been, or is being, needlessly expended.

The matter of honest, efficient, and economical management is the basic consideration upon which the rate of return and the necessity of enlarging the transportation facilities of the country are dependent, but even under that provision, I do not understand that we may lawfully investigate the question of management only when it has the purpose of the carriers to file applications for increased rates or when a specific question of enlarging transportation facilities is presented.

I note the criticism that we are assuming to set up our judgment upon a matter peculiarly within the competency of experienced operating officials and upon which they were called upon to exercise their best judgment in an emergency which de-

manded prompt action. It seems to me to require no expert judgment to determine, as between system shop repairs at approximately \$9,000 per locomotive and contract shop repairs at approximately \$25,000 per locomotive, the necessity for a reasonably definite ascertainment, before entering into such a contract, that past demands and performances were inconsistent with the prospect of doing the work in season in respondent's own shops.

While the statement in the majority report with reference to ulterior motives is made in response to an unsupported charge made by the interveners, I think it wholly immaterial. That question has not been inquired into by us, our purpose being to ascertain whether the 200 locomotives could seasonably have been repaired in respondent's shops and whether the amount paid the Baldwin Locomotive Works was excessive by comparison.

Commissioner Eastman, concurring in the majority report, said:

But this discrepancy in cost is not the only startling thing about the Baldwin contract, for the contract itself and the manner in which it was interpreted are startling. It appears that no competitive bids were sought and that the contract was made on what has come to be known as the "cost-plus" basis. It further appears that the 90 per cent of the labor cost to be added for overhead was to include "errors and defects." Notwithstanding this provision, in hundreds of cases where, because of errors or defects, it became necessary to do the work a second time, respondent paid for the work entailed in remedying the error or defect, and this labor cost was included in computing the 90 per cent for overhead and the 15 per cent for profit.

In other words, as I understand it, it is conceded, not only that respondent let the contract without competitive bids, but also that it agreed to an interpretation of the contract which made it possible for the Baldwin company actually to profit by negligent or inefficient work.

I submit that these are important facts for the public to know. If our great railroad companies are at such a disadvantage in dealing with outside supply companies that they must agree to arrangements of this nature, it lends force, among other things, to the suggestion recently made by the National Association of Owners of Railroad Securities that much expense could be saved if the railroad equipment of the country were pooled and all repair and construction work handled through centralized agencies. The facts so disclosed also make me unwilling to subscribe to the statement of the majority with respect to respondent's motives in the premises. I do not understand that motives were under investigation and no finding, therefore, upon this matter is appropriate. But if it were our duty to make such a finding, I confess that the evidence has not left me free from doubt as to what the finding should be.

Report in New York Central Case

In the report in the New York Central case the commission said in part:

In addition to such repairs as were made in its shops during 1920, respondent contracted in that year for the repair of a number of its locomotives by the American Locomotive Company, the Lima Locomotive Works, the Rome Manufacturing Company, and the Baldwin Locomotive Works. Most, if not all, of the locomotives sent to the contract shops had been built by the American Locomotive Company.

The contracts were not uniform. In all cases test locomotives were first sent to the contract shops for inspection, jointly by representatives of respondent and of the shops, as bases for bids for the required repairs, and contracts at flat prices thereafter were closed with all except the Baldwin plant. The Baldwin contract was made on a cost-plus basis, that is, the cost of materials used, at stipulated prices, and of direct labor, plus 120 per cent of distributed labor to cover all overhead expenses, plus 15 per cent of the whole for profit; respondent having deemed that basis more favorable than the flat prices quoted. The Rome contract provided for the repair of 50 locomotives, with the option on respondent's part, after 40 had been repaired, of extending the contract to cover an additional 50. The contracts with the Lima and American shops were not for specified numbers. The Baldwin contract provided for the repair of 100 locomotives. In all, 112 locomotives were repaired and returned under the contracts in 1920.

According to respondent's principal witness, the contracts were the result of a depreciated condition of motive power toward the end of federal control. This condition first developed on the lines west of Buffalo, and the American and Lima contracts, negotiated in January, and the Rome contract, entered into in March, had in contemplation motive power of the lines west only. It was not until the latter part of June that the power situation on the lines east reached a stage which necessitated the repair of locomotives

from that region in contract shops. The preceding two winters had been the severest in respondent's experience; a congested car situation developed in the Toledo, Ohio, territory in January, which effectually blockaded the Toledo terminal and necessitated embargoes against traffic movements through it; and respondent was asked to furnish locomotives to assist the Pere Marquette in relieving the blockade, some of which were supplied by the lines west, and to compensate which region locomotives were transferred thereto from the lines east. The general power condition then being extremely bad and the weather severe, with a prospective heavy traffic, the witness was asked by the federal manager of respondent's lines, now vice-president in charge of company operations, to get into touch with the Rome plant to obtain relief from that source. The witness did so and also opened negotiations with the American and Lima shops for the same purpose. Contract arrangements with those concerns having been made in January and March, as stated, and the prosecution of repair work in respondent's and the contract shops failing to keep the motive power abreast of the traffic demands, negotiations with the Baldwin plant were begun in June and completed in August, although the formal contract was not signed until October 1. Almost all of the repair work under the several contracts was performed after federal control ended.

While the data pertaining to the state of the motive power are not satisfactory and the record affords no certain means of ascertaining respondent's maximum shop capacity, there is abundant reason to question the necessity for the repair of at least the major portion of the locomotives in the contract shops. Similar contracts in earlier years had made known the enhanced cost of class repairs in such shops, admittedly not properly equipped for such work; and, while the maintenance of motive power at all times is of prime importance, recourse to the costlier outside means should be had only in compelling circumstances and in any case limited to its necessities. Even conceding that reasonably anticipated traffic demands so early in 1920 and the limitations of shop facilities and forces justified the invocation of some outside assistance, it quite clearly appears that this was carried considerably further than the exigencies required. It is disclosed that, although reductions in respondent's shop forces were considered in September and begun in October, 23 locomotives were sent to the American shops, under a contract for no particular number, in the face of that program of reduction. As before noted, also, there is evidence of record reasonably leading to the conclusion that the scope of the Rome contract, if not its real inception, was primarily in the interest of that plant, albeit with some immediate assistance in mind and with a view to the future availability of the plant as an accessory in case of need. This and other considerations included in the foregoing review tend to impeach in turn the award of the Baldwin contract for so large a number of locomotives. It further appears, as stated, that of the stipulated numbers respondent eventually withheld 21 locomotives from Baldwin and 5 from Rome on the ground of insufficient funds, also assigned as the moving cause of the shop-force reductions. Contract obligations are not to be lightly regarded, of course, but the financial situation that began with the business depression in September or October nevertheless led successively to reductions in shop forces and to the arbitrary withholding of locomotives from those plants; and the same self-interest that prompted the latter action, apparently without evoking protest from either plant, might well have induced respondent to attempt to obtain assent to an earlier cessation of the contract work and the longer retention of its own less expensive organization.

We conclude that the record does not establish a seriously depreciated condition of motive power at the end of federal control, and that, even conceding that with the advent of 1920 or upon respondent's resumption of its property its shops were not fully able to cope promptly with all current demands, nevertheless, by an energetic effort at least the larger number of the locomotives in question could have been repaired in those shops within the time in which the contract work was done and at a materially lower cost.

The foregoing review and comment are not intended to suggest, and the evidence does not indicate, that any sinister disregard of respondent's interests or otherwise dishonest motive entered into the award or execution of the contracts.

Dissenting Opinions

Commissioners Potter and Lewis also filed brief dissenting opinions in this case and Commissioners Hall and Daniels also registered their dissent.

Commissioner Campbell in a dissenting opinion said:

We find no proof of improper motive and no willful act of wrong, but the record does suggest that the officials in charge may have acted largely upon intuition rather than upon thorough investigation. If they had had before them the facts that subsequent events disclosed they might have done differently. But

human nature must be recognized. The railroads had just been returned to their owners and private ownership and operation were on trial. The possibility of public criticism that was likely to follow failure to handle traffic expeditiously had to be reckoned with. This contract was made at a time when most everyone connected with the operation of a railroad was acting under pressure, traffic was heavy, and heavier traffic was in prospect. Naturally there must have been more or less feeling of nervous haste. Under all the circumstances, while the record does not warrant unqualified approval of the action taken by the officials in charge, it is perfectly clear to me that we should not condemn them.

Atlantic Coast Line Contract

In the Atlantic Coast Line case the commission said:

About the middle of 1919, in anticipation of a heavy citrus-fruit movement and a heavy tourist travel in the following winter months, respondent's present executive vice-president, then federal manager of the system, took up with the regional director the question of having 30 locomotives, needing class-2 repairs or heavier, repaired in outside shops. Nothing was accomplished at that time, and in August a shopmen's strike, which suspended repair work for about 18 days, aggravated the motive-power situation. After some delay, and on November 25, the federal manager wired the regional director that the system had over 100 locomotives awaiting shop, which, because of scarcity of mechanics and for other reasons, could not be put in serviceable condition to meet the approaching winter's demands, and asked if the assistance of other shops could be had. On the following day the regional director replied that he was uncertain of the attitude of other railroads at the time, it having then been supposed that federal control would end with the calendar year, and recommended communication with the American Locomotive Company or Baldwin Locomotive Works to ascertain if relief could be had from one or both. Later, the matter was taken up with the Railroad Administration at Washington. By wire of January 8, 1920, the regional director asked the administration if arrangements could be made for the repair of 50 of respondent's Pacific-type locomotives in other railroad shops, preferably Norfolk & Western. The administration replied that there was no available space in railroad shops, but mentioned as available for prompt handling the Richmond, Va., shops of the American Locomotive Company, and suggested that the respondent corporation, as the director general's successor, effect a contract with that company with a view to prompt action.

It appearing, upon opening negotiations with the Baldwin and American plants, that neither then desired to take 30 locomotives at once, surveys of the engines were made and successive bids were secured for the repair work in three lots of 10 locomotives each. The Baldwin bid of \$230,000 having been the lower, a contract with that concern at that figure for the first 10 was signed January 10, 1920. A second contract of like tenor was made April 17, 1920. Because the Baldwin bid of \$267,000 for the third lot was deemed too high, a contract was entered into with that plant on a cost-plus basis, maximum \$230,000, November 29, 1920.

In the circumstances disclosed by the record much of the detailed evidence may be disregarded. The evidence concerning respondent's handicap in the matter of fire-box work is not disputed, and otherwise the shops and roundhouses appear to have had constantly more than their capacity quota of average class and running repair work during the period in question. Some new locomotives were added during the year, but the added tractive power did not offset the bad-order power.

It appears of record that in April, 1919, the superintendent of the Waycross shop suggested that the boilers of the locomotives then needing new fire boxes be removed from the running gear and stripped and sent to the American or Baldwin plant for application of fire boxes and flues, the balance of the repair work to be done in respondent's shops. The suggestion seems not to have been favorably considered, and, while the greater portion of the cost of the contract work is represented by the repair of the machinery of the locomotives, the record is devoid of evidence which would indicate the feasibility or economy of such a division of the work during the period in question.

While the record indicates that the contract costs were excessive, nevertheless they appear to have been the lowest offered to respondent; and, considering the character of the necessary work to be done, the limitation of the contracts to locomotives requiring that class of repairs, and respondent's shop situation which necessitated the contracts for reasonable relief, the record does not afford grounds for condemnation of the action taken.

Commissioner Hall filed a dissenting opinion in this case, saying:

"Honest, efficient and economical management" was the due of every corporation, railroad or other, before those words were written into the interstate commerce act. The duty rests upon

Officers and directors of railroads, but not by virtue of that act. Failure in that duty violates no provision of the act which we administer, and we hold no roving commission as public monitor or critic. In the plenitude of our powers it should not be forgotten that they do not include those of general manager. We have gone beyond our province in this investigation and, whatever our findings, can enter no valid order. The results of our comparative and other studies could doubtless be made helpful, in a less obtrusive way, to those who bear responsibility for railroad operation, and constructive suggestions would doubtless be welcomed for what they are worth. With such a course I would be and am in full accord. But I dissent from all reports in this investigation. It should be discontinued.

Commissioner Potter also dissented from the finding of the report that the contract costs of the work in question were excessive.

New York Central and Pennsylvania Issue Statements

Samuel Rea, president of the Pennsylvania, and the executive offices of the New York Central, have issued statements commenting upon the commission's findings in this case. The burden of these statements is that traffic conditions were such at the time that outside contracts were let that every possible effort had to be exerted to prevent further congestion. Unfortunately traffic slumped after the contracts were awarded, but the railway managements could not foresee that. They were faced with an acute situation which demanded prompt action. Mr. Rea commented upon

the number of commissioners who dissented from the majority opinion, saying that their opinions gave ground for expecting that the commission "is not reverting to its former policy of railroad criticism instead of railroad regulation."

Freight Car Loading

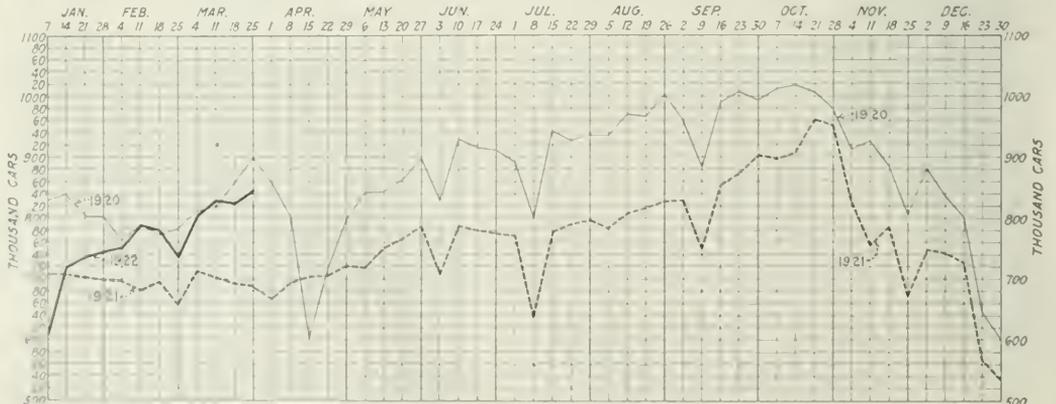

WASHINGTON, D. C.

THE NUMBER of cars loaded with revenue freight increased again during the week ending March 25 to the highest point reached this year. The total was 846,035, an increase of over 22,000 as compared with the week before. This compares with 686,567 in the corresponding week of 1921 and 895,386 in the corresponding week of 1920. There was an increase of approximately 14,000 cars as compared with the week before in the loading of coal and there were also increases in coke, forest products, merchandise and miscellaneous. As compared with the corresponding week of last year there were increases in all districts and in all classes of commodities except ore, but the largest increase as compared with last year is shown in coal loading, which increased 83,000 cars. There was also an increase of 35,000, however, in the loading of miscellaneous freight. The summary as compiled by the Car Service Division of the American Railway Association is as follows:

REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

SUMMARY—ALL DISTRICTS, COMPARISON OF TOTALS THIS YEAR, LAST YEAR, TWO YEARS AGO. WEEK ENDING SATURDAY, MARCH 25, 1922

Districts	Year	Grain and grain products	Live stock	Coal	Coke	Forest products	Ore	Merchandise L.C.L.	Miscellaneous	Total revenue freight loaded

Revenue Freight Car Loadings Up to March 25, 1922

Simple in Design and Pleasing in Appearance

Bridge Slabs Waterproofed Before Erection

Interesting Procedure Developed by Philadelphia & Reading to Avoid Delay to Traffic

By Harry B. Glisson

Assistant Engineer, Philadelphia & Reading, Philadelphia, Pa.

THROUGH THE DEVELOPMENT and utilization of an interesting method of pre-cast concrete construction in practically every detail, the Philadelphia & Reading has completed an eight-track bridge over Oley street in Reading, Pa., with little disturbance to railway traffic and none to the

passenger trains and 70 freight trains. On the two tracks east of the main tracks, the deliveries to the industries and the freight station require an almost continuous shifting service.

To rebuild this bridge it was necessary to design a structure which could be placed with the least interference with the traffic, as the location is but a short distance from the important junction of the main line with the Lebanon Valley

The Old Structure

highway. Special means were employed in pre-casting certain parts and pouring others of the structure, which is of the concrete slab type, to secure accuracy and the quick use of the bridge as each section was placed and to insure adequate protected waterproofing without the necessity of placing any concrete during the erection period.

Three of the eight tracks are main tracks, used for passenger and freight traffic; two tracks east of the main tracks are used for deliveries to the industries and the principal freight station in the city, and the three tracks west of the main tracks for the storage of freight cars. Much of the traffic of the main line and practically all of the freight traffic, do not pass through the city but are carried via the Reading Belt along the west side of the city. The traffic on the main tracks over this bridge in 24 hours consists of 46

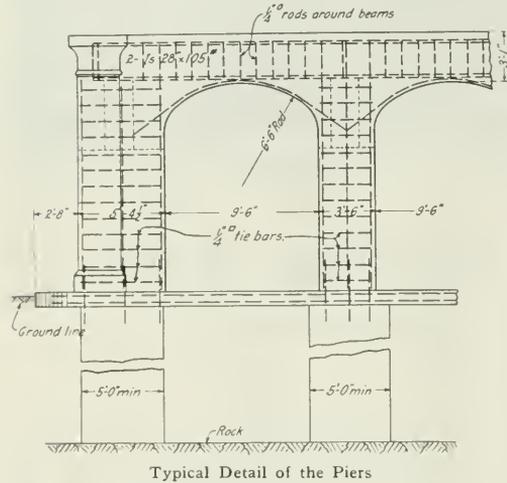

Replacements for Four Tracks Have Been Completed with Four Remaining to Be Done

branch, and within the limits of a large electric interlocking plant, controlling the traffic. No change in the track layout was considered permissible and the City of Reading would not grant permission to occupy any portion of the streets, except for such supports located along the curb lines and in the center of the street, as it was considered impossible to avoid.

The old structure was a deck girder span, supported by Phoenix columns located on each curb line, resting on stone

masonry footings, and with stone masonry abutments on the house lines. The width of the street is 60 ft., with two sidewalks, each 13 ft. wide, and a 34-ft. roadway. This old structure was too light to carry the locomotives of the Mikado type used in the freight service over the Lebanon Valley and East Penn branches. The new structure is a reinforced concrete slab bridge. It was built using the present abutments and constructing concrete columns on the curb lines and in the center of the street. The total distance face to face of bridge floor is 109 ft. 6 in. under copings, and 112 ft. 1 in.

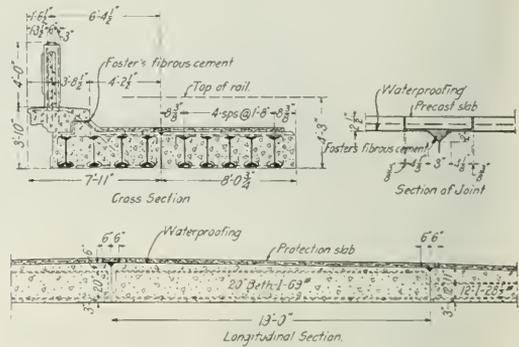

Typical Detail of the Piers

between faces of copings. The angle between the center line of the tracks and the center line of the street is 81 deg. 56 min.

The work required the removal of the stone masonry bridge seats of the abutments and replacing with reinforced con-

crete bridge seats. In order to remove the masonry footings of the columns, and the masonry bridge seats and back walls, it was necessary to place wooden trestle bents on each side of the Phoenix columns. The bents on the abutment side were placed close to the face of the abutment and carried the old superstructure on wooden stringers supported by the bents and blocking

Details of the Slab Construction Showing the Method of Waterproofing

placed back of the back wall of the abutment. The trestle bents were about 13 ft. center to center. The Phoenix columns were then removed and the excavation made for the new column footings.

The concrete column footings were three feet by five feet in area, and the foundations were carried to lime stone rock, which was found at an average depth of 31 ft. below the curb level. The least depth was 17 ft. and the greatest about 39 ft.

The construction of the columns in the center of the street did not require any supports for the existing bridge, but necessitated a change in location of a 10-in. water main, and the construction of two supports and a reinforced con-

Waterproofing the Pre-Cast Slabs on the Casting Platforms

crete bridge seats. The removal of the masonry supports for the Phoenix columns, located back of the curb lines, and the construction of the concrete columns in the center of the street. All of this work was done without interruption of the traffic on the railroad or the street

crete saddle, over a 4-ft. by 6-ft. egg-shaped storm water sewer, located directly under the end column on the west side of the bridge.

Excavation was carried on simultaneously in three column footings and the concrete foundations were placed before

starting work on the other foundations. The columns in the center of the street were constructed first. Above the foundations, concrete was placed in one operation to the spring line of the arches connecting the columns, and at the same time in the small 1-ft. 9-in. square supports to carry two I-beams at the top of the columns. The balance of the concrete for four columns was then completed in one operation. A construction joint was made at the center of the arch joining the columns. The corners of the columns were cast square, no fillets being used on the inner corners of the forms.

A total of 56 slabs were required, consisting of 14 rows, four in each row. The end slabs are 6 ft. 4½ in. in width, the others being about 8 ft. ¾ in. wide. Of the end slabs, the ones adjoining the abutments were each 15 ft. 9 in. long, from 1 ft. 6 in. to 2 ft. 2 in. thick, and contained two 12-in. 28.5 lb. I-beams, 13 ft. 10 in. long and three 12-in. I-beams 11 ft. 9 in. long. Their weight was 54,000 lb. each. Other slabs ranged from 12 ft. 7 in. long to 19 ft. long, reinforced in some sizes with 20 in. 69 lb. I-beams and in another with 28.5 lb., with individual weights ranging from 34,000 lb.

Placing the Slabs in Position—Note the Shoulder on the Slabs for the Protection Coating

to 68,000 lb. Expanded metal caging was used on the bottoms of all I-beams and ½-in. square reinforcing rods on 24-in. centers were used across the top and bottom of all beams.

To cast the 56 concrete slabs, a space 85 ft. by 25 ft. was graded to a level surface near the bridge. This surface, which was on an embankment composed of engine ashes, was thoroughly compacted, and a concrete slab three inches in thickness was placed to give a smooth and level working surface. At a later date, an additional casting platform about 50 ft. by 20 ft. in size was constructed.

On the larger platform, 24 slabs were cast at one operation, and the water proofing and the protection coat of concrete placed before the slabs were removed from the platform. The slabs were numbered as to relative position and date of casting, and were placed in the permanent floor of the bridge, in the same relative position as cast. In pouring, every other slab was formed, the position being similar to the blocks on a checkerboard, and when the concrete was hardened sufficiently, the wooden forms were removed. Two thicknesses of rubber roofing were then fastened against the concrete, and the next slabs cast, using the sides of the surrounding

slabs to act as forms. This made the adjoining faces of the slabs conform to each other, thus compensating for any movement in the wooden forms while casting and resulting in better joints when in permanent position in the bridge floor. Great care was taken to cast the slabs as nearly according to plan as possible; the lines for the forms were all checked carefully, and plugs placed so that they could be rechecked easily at any time during the casting operations, and this was done.

The Waterproofing

The slabs were waterproofed with three layers of saturated cotton fabric, mopped with hot asphalt before placing. Upon this waterproofing a 2½-in. layer of concrete was placed, reinforced with No. 12 electrically welded wire, with a 4-in. by 4-in. mesh. The protection coat terminated six inches from the vertical face of the slab, which had beveled edges. When the slabs were placed in position, these beveled edges formed large grooves, which were filled with fibrous waterproofing cement, and the surface of the exposed waterproofing, and the vertical faces of the protection coat of the slabs, were given a half-inch coat of the fibrous waterproofing cement. This space was then covered with small pre-cast sections of the reinforced protection coat, pressed into the fibrous cement thus waterproofing all the joints between the slabs. These pre-cast slabs were about 4 ft. long, 11¾ in. wide and 2½ in. thick, some with square ends and the others with ends making the same angle with the sides as the angle between the center line of the bridge and the center line of the street. These slabs were also reinforced with the electrically welded wire mesh. The whole plan was designed for the purpose of permitting the use of the bridge as soon as the new slabs could be placed in position and the tracks relaid, without delaying traffic while waiting for the concrete to get sufficiently hard to sustain the weight of the passing traffic.

The method adopted for placing the slabs in position on the bridge was to load the slabs on cars on the preceding day, and abandon two tracks at a time, beginning on the east side, previous notice of the date on which the tracks were to be out of service having been given and the industries and freight house having been served. The tracks were removed at about 8 a. m. and relaid and traffic resumed about 6 p. m. of the same day.

A wrecking train removed the old superstructure and placed the new slabs in position. The position of each joint parallel with the center line was marked upon the abutments and tops of the columns. While the slabs were being placed in position, great care was exercised to have the joints conform to the plan location, which had been marked previously on the bridge seats and the tops of the columns. Just previous to placing the slabs, the tops of the columns and the bridge seats were given a thin coat of cement mortar, to provide a uniform bearing. While the slabs were being placed, a tight or a normal joint spacing between the slabs was made, and this aided in preserving the plan for location for the joints. The concrete coping, posts and railing were not cast in place until after the permanent floor had been placed.

The new bridge is well lighted at night by incandescent electric lights, each sidewalk having 5 lights on the sidewalk side of the columns, and three lights on the columns on each side of the roadway, a total of 10 for the sidewalks and 6 for the roadway. Two lights, one on each face of the structure, illuminate its outline when viewed by approaching traffic. The wiring is all concealed in metal conduits.

The work was carried out under the direction of Samuel T. Wagner, chief engineer, and Clark Dillenbeck, assistant chief engineer. The plans were prepared in the office of P. S. Baker, engineer of bridges and buildings, and the field work was in charge of the writer.

Coal Strike Makes Big Cut in Rail Traffic

THE IMPORTANCE of the coal strike insofar as concerns the railroads is embodied primarily in the fact that of the total tonnage carried by the railroads about 30 per cent is bituminous coal and approximately 6 per cent anthracite coal. Naturally interest is being directed chiefly at the coal carrying roads, the coal traffic of some of which runs as high as 50, 60, 80 or even 90 per cent of their total tonnage. The question at present is one primarily of traffic considerations. The matter of fuel supply is made more or less secondary because of the large storage of fuel which has been accumulated for an extended period prior to April 1—the date on which, in accordance with schedule, the coal strike began.

In the Anthracite Fields

The effect on the rail carriers thus far has been such as would naturally be expected from the cessation of so large a percentage of the total traffic. This is shown, for example, by the anthracite carriers. Practically no anthracite is being mined. The anthracite carriers have, therefore, in some cases, made drastic cuts in their forces. The Delaware & Hudson, for instance, whose anthracite tonnage makes up about 42 per cent of its total traffic, has laid off 1,000 men, including employees in train service and in shops and round-houses.

Eastern Bituminous Fields

The situation in the soft coal fields may be summarized by saying that the union mines in every district responded to the strike call. It appears, however, that the non-union fields are but little affected. Coal Age in its issue of April 6 gives the following details:

One thing is clear at the outset and that is that there has been no general exodus of non-union workers. Here and there disaffections are shown in what were commonly supposed to be un-organized areas, but these are of minor importance.

West Virginia is largely non-union. Such districts as Pocahontas, Tug River, Kenova-Thacker and Logan are entirely unaffected. Winding Gulf is reported to be working 90 per cent, but New River is practically closed down.

In the Kanawha district reports vary, but show from 12 to 23 mines working. The Fairmont region, a closed-shop district, reports that of 136 mines in Harrison County, 95 mines in Marion County and 33 mines in Taylor County, a total of 264 mines, 18 were working open shop on Monday, April 3. In this region approximately 17,000 men are on strike.

In the Monongalia region from Parkers Run, W. Va., to Point Marion, Pa., no men were at work. Elsewhere in northern West Virginia there were few mines at work on Monday. Seven mines on the Morgantown & Kingwood R.R., one mine on the Cumberland division of the Baltimore & Ohio and five mines on the West Virginia Northern remained at work.

The situation in the Upper Potomac region may be briefly stated. Reductions in wages have previously been effected here. There is an agreement between the local union and the operators providing for a 90-day period after April 1 for negotiations without suspension. This is being observed and the miners are working. In Georges Creek the mines on the Big Vein are working, while those on the thin vein are closed.

The Connellsville, Uniontown and Johnstown regions, all non-union, are working, save that four mines of the H. C. Frick Co.—the Gates, Ronco, Edlenborn and Lekkone properties—were closed by a strike. Somerset County and adjacent non-union districts are reported working full, with the exception of 100 men at St. Michaels.

Northeastern Kentucky is working, as is southwestern Virginia. In Tennessee about half the mines that were operating in March are closed.

In further explanation of the details as given in Coal Age, it should be stated that the Pocahontas, Tug River and Kenova-Thacker fields which are noted as "entirely unaffected" are served by the Norfolk & Western. This means that the N & W will be but slightly affected by the strike and may, on the contrary, benefit from it through increased pro-

duction by the non-union mines. The Logan field, also "entirely unaffected," is a Chesapeake & Ohio field. Winding Gulf field, "reported to be working 90 per cent," and New River, "practically closed down," supply traffic to both the Chesapeake & Ohio and Virginian. The Kanawha field is also a C. & O. field.

Illinois, Kentucky and Indiana

Approximately 12 roads serve the coal fields of Illinois, Kentucky and Indiana, from which a very large proportion of all the coal consumed in the territory west of the Alleghenies and east of the Missouri river is obtained. Some 12 roads depend in large part for their traffic from coal mined in this territory. Of these, the Chicago & Eastern Illinois and the Chicago & Alton are affected to the greatest extent by the strike. Coal represents about 60 per cent of the business of the Chicago & Eastern Illinois, with 95 per cent of this coal originating on its own lines. Practically all of this coal, coming as it does from the Illinois fields which are now inoperative, has resulted in an immediate falling off of business on this line. To meet this situation heavy reductions have already been made in forces, practically all employees involved in the work of switching and handling coal business at originating points having been laid off indefinitely. The company has about 80 days' supply on cars for itself.

Coal represents almost 50 per cent of the Chicago & Alton's tonnage and 30 per cent of its revenue. Since this coal is also obtained almost entirely from Illinois fields which are now inoperative, the result has been to necessitate an immediate reduction in forces everywhere including many offices, some terminal points having been shut down entirely and the forces at other points largely reduced or put on a shorter working week. The supply which the company has for its own use will probably last until the first of July.

Next to the Chicago & Alton, the Illinois Central has been affected the most heavily by the coal strike, nearly 45 per cent of Illinois Central tonnage consisting of coal which is obtained from fields of Indiana, Kentucky and Illinois. One interesting observation to be made in connection with the Illinois Central's situation, however, is that the Kentucky fields from which 20 per cent of the Illinois Central coal is obtained are still working and will undoubtedly continue in operation. Of the remaining roads in this territory affected by the situation are to be found the Burlington, the St. Paul and the Great Western, approximately 20 per cent of all Burlington business consists of coal, with the percentage running between 25 and 30 per cent for the lines east. As in the case of the Chicago & Eastern Illinois, this coal is obtained almost entirely from southern Illinois fields necessitating heavy reductions in forces involved in transporting it. On the St. Paul, coal constitutes from 15 to 20 per cent of the business, 692,000 tons of a total of over 2,000,000 coming from the Indiana fields. As in the case of the other roads, coal for company use is in storage both in cars and on the ground and will last for about 40 days. On the Chicago Great Western the supply for company use is almost entirely on the ground and will last in excess of two months.

LUMBER EXPORTS from British Columbia to the United States during the year 1921 amounted to 26,712,000 board feet; of which quantity 5,431,000 went to the Atlantic seaboard and 20,000,000 to California.

THE BACON HOG is the chief subject of the latest science of agricultural lectures to be "broadcast" through the country by means of a special train. This train is operated under the auspices of the Alberta Department of Agriculture and, beside the hog industry, will demonstrate dairying and other branches of agriculture. The train will shortly begin its journey at Edmonton.

A Reply to McAdoo's Charges Before Committee

Daniel Willard Denies That Federal Control Was Required
Because of Railroad Breakdown

WASHINGTON, D. C.

THE SENATE COMMITTEE on interstate commerce on April 4 resumed its post-mortem investigation of the federal control period, which has come about as an incident to its general railroad inquiry instituted early last year. Testimony on behalf of the railroad executives was first presented before the committee, which was followed by other testimony, largely in the nature of rebuttal, by representatives of the railroad labor organizations and by the former director generals, William G. McAdoo and Walker D. Hines. Their testimony in reply to the railroad executives contained many statements to which the railroad executives have asked an opportunity to reply, and Daniel Willard, president of the Baltimore & Ohio, was the first witness called by the railroads in rebuttal. Replying particularly to the testimony of Mr. McAdoo, Mr. Willard denied that there had been any breakdown in 1917 which necessitated the taking over of the railroads by the government.

"I am unable to find anything in the record to justify the statement made by Mr. McAdoo that the railroads in this country have ever broken down at any time, either before, during or since federal control," Mr. Willard said. "The actual performance of the carriers during 1917, when measured in terms of ton-miles and passenger miles, together with the statements which I have quoted in that connection from officials of the government in position to know, would seem to clearly establish the contrary for that year at least. A serious and troublesome situation, it is true, did develop in the fall of 1917, but it cannot fairly be contended that it was due to a breakdown of the railroads. It might well be argued, however, that the situation was due to a breakdown, or I should prefer to say, to a failure of certain governmental agencies to deal effectively with a most unusual and unforeseen situation. It might even be said also that there had been a failure if not a breakdown, of our system of railroad regulation as then in effect, but certainly not a breakdown of the railroads themselves.

"Mr. McAdoo has pointed with pride, and justifiably so, to the accomplishments of the railroads under his direction during 1918, but the figures show that the same railroads that moved 430 billion ton-miles in 1917, moved only 440 billion ton-miles in 1918, or about two per cent more than they moved during the previous year, and I submit that a difference in accomplishment of only two per cent between the two periods under consideration is hardly sufficient to indicate a breakdown in the one year and a satisfactory accomplishment in the other. The effect of the breakdown, as I use the term, certainly could not be measured by a mere difference of two per cent. If it could, then it might with equal force be urged that the railroads in 1918, while under federal control, had broken down, because substantially the same properties in 1920 under private control and operation moved 447 billion ton-miles, or nearly two per cent more than was moved in 1918. But no one claims that the railroads broke down in 1918 and of course we all know that they did not break down in that year."

Mr. Willard said that the trouble in 1917 was not that the railroads broke down but the fact that there was no one in authority who could say at that time what freight should be moved and what should wait. The enormous increase in the export business and the great stimulation of manufacturing and other industries due to the war naturally seriously affected the railroads, Mr. Willard said, but the railroad congestion was centered in the territory between Balti-

more and Bridgeport, Conn., and was due to the railroads bringing in freight faster than it could be unloaded.

It was not until after the roads were taken over by the President that there was any central governmental agency authorized to deal broadly and effectively with the relative importance of the traffic to be moved, the witness said. This lack of such supervision and direction he added was largely, if not entirely responsible for the unusual accumulation of cars in the fall of 1917, particularly at eastern terminals.

One of the outstanding reasons, however, for the President's action in taking over control of the railroad systems of the country, Mr. Willard said, was the financial condition of the carriers, "which condition had been brought about by the rapidly mounting cost of operation, caused by the war, together with a fixed basis of earnings."

"Some have said that this in itself indicated a breakdown of the railroads," Mr. Willard said. "I cannot agree with that point of view. I repeat, however, that it might be said that the situation indicated a breakdown or failure of the form of regulation in effect at that time, when subjected to the severe test of conditions brought about by the war."

Declaring that he desired to reply "to certain statements made early in the period of federal control which tended—whether meant to do so or not—to cast discredit unjustly upon the private management of the railroads," Mr. Willard called attention to statements made by Mr. McAdoo in his testimony and in his annual report that from December 28, 1917, to January 5, 1918, 132 engines were frozen up at the east side Philadelphia roundhouse of the Baltimore & Ohio and that the roundhouses were obsolete and were still being used to house locomotives more than twice the size for which the houses were designed. Mr. Willard said that both he and F. H. Clark, general superintendent motive power of the Baltimore & Ohio, had investigated the matter shortly after the charge had been originally made and found that, while some pipes had been allowed by the enginemen to freeze, out of the total number of engines reported frozen up 108 actually came into the terminal hauling their trains while the cost of repairing the 132 locomotives totaled \$126.29, or less than the average of \$1 per engine.

Mr. Willard said he called the Railroad Administration's attention to a statement identical to that of Mr. McAdoo's which appeared in the operating section of Mr. McAdoo's annual report for 1918 and pointed out that such a statement was not only inaccurate but gave a wrong impression. The statement remained, however, in the annual report.

"Why should such a matter as that be so magnified?" asked Chairman Cummins and Senator Fernald of Maine.

"It was for the purpose of discrediting private ownership, at least that is my own private guess," replied Mr. Willard.

Replying to statements that have been made as to the inefficiency of labor during the war, and referred to by Mr. McAdoo in his testimony, Mr. Willard said that he did not think this criticism applied to the men in the train and engine service generally but that it did apply particularly to the unskilled labor and to the men connected with the shop crafts. Mr. Willard said that he had no reason to say that those men were not loyal and patriotic but that regardless of their patriotism and loyalty they were not in all cases as efficient in their positions as the men whose places they had taken, oftentimes because of their physical ability, skill and mechanical efficiency.

"I think there has been much misunderstanding as to what

is meant by inefficiency of labor," he said. "It was only natural that young, active and ambitious men should leave our employ and take better paying positions offered them with other industries. The railroads were compelled to employ men who because of their age, physical condition and skill, were not as efficient as the men who made up our rank and file under ordinary conditions previous to the war."

Mr. Willard said he was not discussing federal control of the railroads as a critic. He was in favor of the President taking over the railroads in the fall of 1917 and when his opinion was asked had unhesitatingly recommended that the President should exercise the power granted him in the army appropriation act of 1916. The railroads as common carriers, under the law were required to serve all without discrimination, but innumerable representatives of the government were issuing conflicting orders. He also pointed out that no suggestion that the railroads had broken down in 1917 is to be found in any of the public utterances of President Wilson. Mr. Willard said he could not help thinking that perhaps some of the unjustified criticism of the railroads of the character of that relating to the roundhouses and frozen engines "might have a tendency to stimulate, even if it did not justify other criticism of the character complained of by Mr. McAdoo and adverse to federal control."

In reply to Mr. McAdoo's statement that railroad managers claim that the roads were in "first-class condition in every respect" when taken over, Mr. Willard said that may be true of some of the roads and such a statement may have been made by some of the managers, although he could not recall ever having seen it. Certainly he had made no such statement, but he reiterated what he had previously said, that the Baltimore & Ohio was "in good serviceable condition for efficient operation when taken over by the government and that its standard of condition was substantially lower when surrendered by the government.

"That, however," he said, "is being fully investigated by the present director general and I have no doubt that the facts which I now state will be established. But whether the policy of the director general in that connection was wise or unwise, does not seem to me to be a question."

Referring to Mr. McAdoo's quotation, in opposition to statements by Mr. Willard, of a letter by J. J. Tatum, general supervisor of freight car repairs of the Railroad Administration, regarding the system of classifying bad order cars adopted by the administration, Mr. Willard said he had talked with Mr. Tatum and found nothing inconsistent between their statements. He said, and he quoted a new letter from Mr. Tatum to show, that the federal administration did order the establishment over the United States of a better system of classifying bad order cars than had been in effect generally, which was substantially the same as the system which for some years had been in effect on the Baltimore & Ohio. Mr. Tatum also said that efforts were made to comply with the system but that, owing to the urgent demand for cars and also to restrictions which were placed by the federal administration upon the amount of money which the federal managers were permitted to spend for car repairs and maintenance of equipment generally, the roads were not able to carry out the plan in its entirety or live up to the specifications and standards which were established. Mr. Willard said that personally he thought the administration had pursued the proper policy as to maintenance in 1918 while the war was still in progress but that during 1919 effective steps should have been taken to put the equipment in as good condition as it was when the government took possession.

Commenting on Mr. McAdoo's statement that the movement of bread cereals by the railroads in February and March, 1918 was one of the outstanding accomplishments of federal control and had "saved the war for America and the Allies" Mr. Willard said that the official records show

that the total amount of grains received at Boston, New York, Philadelphia and Baltimore for export during those months was 17,521,614 bushels and that during February and March, 1917, over 54,000 bushels of grain were delivered to the same four ports for export.

"Assuming that the entire amount which was received at the four ports mentioned—Boston, New York, Philadelphia and Baltimore—during the whole of the two months of February and March had been moved during the 30 day period between February 8 and March 15, within which time Mr. McAdoo states the situation was cleared up, it would have required an aggregate average movement of only 357 cars per day by all the railroads available for the service. Of the 17,500,000 bushels under consideration, however, only 8,170,000 were received at New York and having in mind the other uses to which the Baltimore & Ohio and the Pennsylvania facilities were primarily assigned at that time, it may be assumed, that the burden of moving the grain which reached New York, rested chiefly upon the New York Central, Erie, Lackawanna and Lehigh Valley Railroads and that it required an average aggregate daily movement by all of these lines of only 160 cars.

"It would appear that the burden which was thrown on the four northern roads in connection with the movement of bread cereals to our Allies and in connection with which he said it was necessary to absolutely arrest the domestic commerce of America did not exceed an average daily delivery of 160 loads in the aggregate at New York and was certainly well within the combined carrying capacity of all of the four lines mentioned or of any of them. Whatever was required of the railroads in that connection, however, was apparently performed in a satisfactory manner and if it resulted in saving the 'War for America and the Allies' as Mr. McAdoo asserted, we have much reason to be satisfied with and proud of the accomplishment."

"During the late summer and fall of 1917," Mr. Willard continued, "the Railroad War Board, having no such broad authority as the director general, nevertheless ordered and accomplished the movement of more than 35,000 empty box cars from the east to the west for return loading, practically three times as many cars as were involved in the particular movement referred to by Mr. McAdoo. It also appears in the report of the Railroad War Board that during the life of that Board in 1917 it actually ordered and largely accomplished the movement of more than 222,000 empty cars from places where they were not needed, to other places where they were needed. It might be thought from Mr. McAdoo's statement that the movement of empty cars ordered by him was something unprecedented. The report of the Railroad War Board already filed with this Committee shows clearly that such a thought would not be justified."

Taking up the serious coal situation that prevailed in New England in the winter of 1917-18, Mr. Willard said that "one might gain the impression from reading Mr. McAdoo's statement that the condition which he describes was brought about . . . by the inefficiency of the railroads."

"The coal situation in New England during the winter," said Mr. Willard, "was the logical and natural result of the policy of the government in commandeering all available bottoms for use in connection with the naval program. I think the policy which the government pursued in that connection was the proper one under all the circumstances. It was one of the conditions which was likely to arise when a nation goes to war, but upon the whole it seems to me that the situation was taken care of in a very creditable manner. I have no desire to minimize the accomplishment of the federal administration in that or any other connection. I simply desire that all the facts should be known, particularly so if the case itself has any bearing upon this hearing. Mr. McAdoo apparently seems to think that it has." Mr. Willard was to continue his statement on Friday.

Dinner in Honor of William G. Besler, President of the Central Railroad of New Jersey, Upon the Twentieth Anniversary of His Connection With That Road

Making Good With the Employees and the Public

How One Executive Has Gained the Confidence of His Co-workers
and the Communities Served

TWO OF THE MANY serious problems which confront railway executives today stand out so prominently that they overshadow all the others—these relate to securing better relations between the railroads and the public, and to the development of a more cordial spirit of co-operation between the managements and the employees. Upon the right solution of these two problems, and to a certain extent they are inter-related, depends not only the successful operation of a road but its very life indeed.

Some few roads have been eminently successful in improving their relations with the public and with their employees. Among these is the Central Railroad of New Jersey. The secret of its success in these respects was clearly demonstrated at a dinner which was given to its president, William G. Besler, on March 18, 1922, at the Hotel Biltmore, New York, in honor of his twentieth anniversary as an officer of that road. Among the speakers were the toastmaster, C. H. Stein, assistant to the president, Central Railroad of New Jersey; W. A. Garrett, general transportation manager, Baldwin Locomotive Works; F. T. Dickerson, secretary and treasurer, Central Railroad of New Jersey; Robert W. DeForest, vice-president and general counsel of the same road; DeWitt Van Buskirk, president of the Mechanics Trust Company, Bayonne, N. J.; B. E. Chapin, editor of the Railroad Employee; Clarence H. Howard, president of the Commonwealth Steel Company; Clarence E. Case of the New Jersey Senate, and Frank Hedley, president of the Interborough Rapid Transit Company.

The New General Manager

How Mr. Besler came to be connected with the Central Railroad of New Jersey was explained in a few words by Mr. Dickerson: "On March 18, 1902, I was a clerk in the executive department of the New Jersey Central. It was a Tuesday, and the late George F. Baer, who was president of the company, had, in accordance with his custom, come over from Philadelphia that morning. Our Lehigh and Susquehanna division, which is our main line in Pennsylvania,

was cut in two and out of business due to the devastating freshets and floods of the winter of 1901 and 1902. A strike at the coal mines in Pennsylvania, known as the Mitchell strike, was impending.

"President Baer came to my desk, with an expression upon his face that I can never forget. A desperate situation confronted him. He dictated the following telegram addressed to Mr. Besler, who was general superintendent of the Philadelphia & Reading: 'You are appointed general manager of the New Jersey Central, effective at once.' The next day a comparatively young man walked into our office and introduced himself as our new general manager."

In addition to the serious conditions in the flooded districts of Pennsylvania, Mr. Besler found the property generally in unsatisfactory condition. The roadway and structures were under-maintained and a goodly portion of the equipment was in a deplorable state. The spirit and morale of the employees was practically destroyed, the men being disgruntled and discouraged. The general public, antagonized, was unfriendly and the local press was hostile.

Cultivating the Public

In explaining the situation as to the relations with the public, Senator Case related the following incident: "I remember just prior to the time of his coming to the road there was a good deal of complaint on the part of those who had occasion along the line of the Central as passengers to use that road, and a committee was sent from our town to interview the then manager. He saw this committee—honest, perhaps, mistaken souls, thinking that they could make suggestions to a railroad management—and they were told very gruffly that a car of freight from California was worth more than all the passengers along the line. Now, there may have been a good deal of truth in that, but that is one of the things that Mr. Besler has had the good sense not to tell us. He has been exceedingly considerate and wise and expedient in his methods with those of us who live along the road."

In telling why Mr. Besler had made the road popular

with the public which it served, Mr. Van Buskirk said: "I have found Mr. Besler very responsive indeed to any suggestions that might be made to him along the lines of civic betterment, wherein the railroad could in any way perform a part. Mr. Besler has always been willing to meet with the heads of the industries, and confer with them about improvements that may be made that enter into their problems and the railroad problems."

Continuing, he said: "I know of Mr. Besler's interest in the civic interests of the various communities around New York. I have very frequently attended gatherings of chambers of commerce, boards of trade, and so forth, where he has spoken, and he has always been a welcome guest. He has always had something constructive to bring forward, and I believe that there is no man along the line of the Jersey Central that is more respected and beloved in the railroad fraternity than is Mr. Besler. He has, in every case where he could see his way clear to do it, given service, and he has regulated the train service to satisfy the requirements of the various communities."

Other speakers indicated that in cultivating the public Mr. Besler took special pains to cultivate the acquaintanceship of the editors of the local newspapers.

One speaker said: "He personally attended conferences and meetings of boards of trade, civic associations, and other public bodies and made them all see that he really was anxious to know their problems, and to co-operate in protecting their interests. He thus created a cordial relationship, and a spirit of mutual understanding with the patrons, based upon the motto, which originated with himself, 'A satisfied patron is our best advertisement.' The result has been that the relations with the public were never more harmonious and cordial than now, and this friendly attitude has been uniformly maintained for years."

A Big Family

In commenting upon the conditions as to the employees which existed on the Central of New Jersey prior to Mr. Besler's advent, Mr. Chapin said that he "knew of engineers coming to my office and saying, 'Well, I will let the damned old engine break down, what do I care?'"

Mr. Stein told about one of the engineers who came into his office recently and said: "Mr. Stein, you were not here when Mr. Besler came among us, you don't know the war that was on foot at that time, you don't know the spirit of the employees as they looked for this new manager, and how every one of them was up in arms, so you cannot appreciate the real seriousness of the situation as it existed then. The moment he lighted on the property and got among us he simply seemed to sweep away all discontent and all dissension, and everybody seemed to be happy; he brought about a spirit of concord and unity that we had never known before on the Jersey Central."

The exact way in which Mr. Besler brought about an improvement in the situation was related by Mr. Dickerson: "In his intercourse with the men in the service, Mr. Besler always applied the principles of the Golden Rule. His slogan was 'A happy and contented employee is our greatest asset'; and he enabled the men to see that he was not only preaching the Golden Rule, but that he was being guided by it in his dealings with them. He accomplished this by holding meetings with groups of employees, as well as by personal contact, and thus, by personal work, and by example and precept, an era of good feeling between employer and employee was established. One of the means that he made use of to establish personal relations with the men was through the Veterans' Association. The annual reunion of that association has been marked for many years as the occasion for a heart to heart talk, where Mr. Besler presents his problems to the men, and the men discuss their problems with him."

"The result of this policy is shown by the fact that when this company was face to face with the threatened strike of 1916, the pensioned and retired veterans volunteered to resume their old jobs, and keep the trains running."

"Another indication of Mr. Besler's interest in the welfare of the men may be shown by the fact that in the passenger station at Jersey City, through his generous support, an athletic association, which has grown to a membership of 1,800, was organized and provided with accommodations for recreation, social and educational purposes, thus adding greatly to the happiness and comfort of the men in the terminal district."

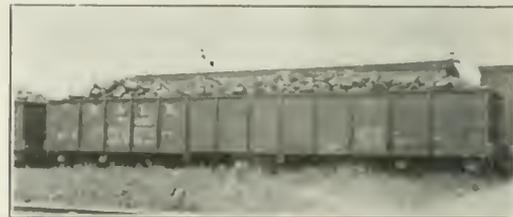

"Let me give an illustration of his method of leadership. Some of us will recall the unusually heavy snow storm of Sunday, March 1, 1914. In the afternoon it turned to sleet. Trains were stalled, telegraph poles and wires had fallen in a tangled mass across the tracks and on top of the stalled trains over practically our entire system. Telegraph and telephone communication along the line was impossible. Wreck trains and work trains, with gangs of men, were sent out to help clear the road and restore normal conditions as soon as possible."

"Mr. Besler had been confined to his home under the doctor's care, but knowing the conditions which confronted us he left a sick bed and took personal charge of the work, thus inspiring and encouraging the men—with the result that the road was soon cleared of poles, wires, snow and ice, and he and his crews then proceeded to assist a neighboring line in opening up its tracks."

"As an illustration of the friendly regard which our men have for our president, I might state that it is not unusual to see men from the ranks seeking just a moment of his time for the exchange of friendly greetings. It might be a pilot, a man from the shops, or a locomotive engineer, or conductor. I recall, not long ago, that we had a visit from the vice-president of another road. The president was engaged at the time, and the situation was explained to the caller. In a few moments two of our locomotive engineers, dressed in overalls, walked out of the president's office with smiles that were born of the heart. The vice-president who was calling and who seemed surprised at what he saw, asked me concerning this incident, and I explained that this was of frequent occurrence; that our employees from every branch of the service delighted in calling to pay their respects to the president, and always found him accessible and a welcome awaiting them."

The extracts from the addresses quoted above indicate some of the things which were done by Mr. Besler to bring about the conditions which exist today. They are simple and not at all spectacular, and yet they have secured results—results which are lacking on too many roads.

That Mr. Besler enjoys a correspondingly good standing with the executives of other roads is indicated by his selection as first vice-president of the American Railway Association.

A Well-Loaded Car on the W. & L. E.

Engine Terminal at West Roanoke

N. & W. Increases Net Operating Revenue

Net Increases 373 Per Cent—Gross Declines 8.73 Per Cent and Expenses 24.65 Per Cent—Maintenance No Lower

THE NORFOLK & WESTERN annual report made public on Monday of last week has a special interest because it was the first report covering the year ended December 31, 1921, to be issued by one of the larger roads. It is interesting to examine the figures given in the report, therefore, not only with a view to seeing what they tell about the operations of this particular carrier in 1921 but also with a view to getting an idea as to the kind of reports we may expect to see from the other important railroads.

First of all, the Norfolk & Western report shows a large measure of improvement over 1920 conditions. It does not show an improvement to a pre-war status, but the amount and kind of improvement is such as to augur well for 1922. The corporate income account, which in the final analysis is the principal factor, showed for 1921 a net income available for dividends of \$10,043,181 as compared with \$12,496,788 in 1920, a decrease of 19.63 per cent. The usual dividends were paid, namely four per cent on the preferred, totaling \$916,692, and seven per cent on the common, or \$8,505,271.

The difficulty of using net corporate income in comparing 1921 with 1920 is that one is unable to get an idea of the real operating conditions because in 1920 operations for two months were covered by the standard return and for six months by the guaranty. A better guide it would seem, there-

fore, would be net after rentals. This figure shows the actual results of operation and it is to be presumed that if there was any kind of an improvement at all, it would continue into the present year and perforce be reflected in the corporate net for 1922. The Norfolk & Western's net after rentals in 1921 was, as reported in the December earnings' statement to the Interstate Commerce Commission, \$14,870,021 as compared with \$3,655,717 in 1920. Although this represents an increase of about four times it does not bring the Norfolk & Western back to its pre-war standard of earnings. The standard return based on the average net after rentals in the three years ending June 30, 1917, is as good a basis of comparison as may be found. The Norfolk & Western's standard return was \$20,534,163.

Continuing our idea of using the Norfolk & Western's figures as an index to what we may expect in the annual reports of the other railroads of the country for 1921, let us next examine its gross earnings and expenses. In 1921, the Norfolk & Western carried 33,100,267 tons of revenue freight, a decrease of 11,000,808 tons from 1920, or 27.04 per cent. Its revenue ton-miles totaled 8,482,095,487, a decrease of 23.33 per cent. Its freight revenues totaled \$67,294,972, a decrease of \$6,623,330, or of 8.96 per cent, which latter per cent is smaller than the decrease in revenue tons

NORFOLK AND WESTERN OPERATING RESULTS 1912-1921

Year ended June 30	Freight revenue	Total operating revenue	Operating expenses	Net operating revenue	Operating ratio	Revenue tons	Per cent of coal tons to total	Revenue ton miles	Avg. Revenue haul train load	Revenue car load
1912	\$34,022,572	\$39,735,237	\$25,669,430	\$14,065,807	64.60	29,335,583	67.60	8,030,301,398	274	692
1913	37,588,024	43,739,921	28,565,813	15,174,108	65.31	32,701,743	64.71	8,856,070,381	271	764
1914	38,038,622	44,470,619	29,935,842	14,534,777	67.32	34,000,572	68.30	9,155,506,727	269	802
1915	36,550,550	42,987,044	27,831,815	15,155,228	64.74	32,767,701	71.05	8,918,549,288	272	841

Year ended Dec. 31										
1916	51,114,186	59,449,982	33,508,732	25,941,249	56.36	46,421,391	66.03	12,110,422,936	261	980
1917	56,381,036	65,910,242	41,161,503	24,748,739	62.45	48,196,792	60.18	12,456,970,303	258	1,021
1918	68,752,260	82,004,034	61,579,297	20,424,737	75.09	46,601,920	58.77	12,255,303,617	262	1,041
1919	62,681,028	76,925,599	64,021,285	12,904,314	83.22	37,944,615	63.95	10,026,871,317	264	1,106
1920	73,918,301	88,489,356	84,943,837	3,545,519	95.99	40,685,743	63.99	11,063,033,480	272	1,107
1921	67,294,972	80,760,589	64,006,171	16,754,418	79.25	29,684,935	73.33	8,482,095,487	286	1,013

because of an increase in receipts per ton-mile of 18.71 per cent. Total operating revenues in 1921 were \$80,760,589 as compared with \$88,489,356, a decrease in 1921 as compared with 1920 of 8.73 per cent.

Increased Net Operating Revenue of 372.55 Per Cent

The real story of Norfolk & Western improvement in 1921 came in the decrease in operating expenses. As compared with a decrease of 8.73 per cent in operating revenues, there was a decrease of 24.65 per cent in operating expenses. The result was a percentage increase in net operating revenue of—the figure is so large as to sound incorrect—372.55 per cent.

Total operating expenses in 1921 were \$64,006,171 as compared with \$84,943,837 in 1920. The net operating revenue was \$16,754,418 as against \$3,545,519 in 1920. The operating ratio in 1921 was 79.25; in 1920, 95.99.

In view of the decreased revenue ton-miles which figured out at 23.33 per cent and the increase in net operating revenue of 372.55 per cent, it would seem somewhat unnecessary to make any extended comment on what the Norfolk & Western net would have been with a larger volume of traffic.

The next question that arises is the manner in which the Norfolk & Western succeeded in decreasing its operating expenses to the extent of 24.65 per cent. An analysis will show that the decrease came about through lessened wage costs, and lower material and fuel costs. For 1921 as compared with 1920, payrolls decreased 30.8 per cent (the number of employees at the beginning of the year was 30,993; at the end 22,732); cost of fuel decreased 28.5 per cent and cost of other materials decreased 17.0 per cent. With reference to the reduction in fuel costs, whereas in 1920 the average cost of fuel was \$4.33 a ton in 1921 it was but \$3.39 a ton. The company secured 547,790 tons of its fuel

ing up and improving these standards. First as to equipment. The total expenses for maintenance of equipment were reduced 34.88 per cent. That sounds as if the road may have cut its maintenance of equipment unduly. One of the best means of checking a thing of that sort is the percentage of bad-order cars and unserviceable locomotives. The figures show that the Norfolk & Western's equipment condition is much better than the average. The latest figures available are those for March 1, 1922. On that date the road had on its line 1,045 bad-order cars needing light repairs and 1,590 needing heavy repairs, a total of 7.1 per cent. The average for all the roads in the country on that date was 14.7 per

The New Tie Treating Plant at East Radford, Va.

cent. The N. & W. locomotives out of service on March 1 for repairs requiring over 24 hours totaled 8.2 per cent of the engines in service. The average for all roads on the same date was 20.2. It should be sufficiently evident that the Norfolk & Western—despite its sharp decrease in maintenance of equipment expenses—did not make these decreases at the expense of its maintenance condition. It is interesting in this connection to notice that the repairs, depreciation and retirement expenses for steam freight locomotives in 1921 were decreased from \$11,001 to \$6,792 per locomotive, or 38.3 per cent; and of freight cars from \$281.64 to \$194.70 per car, or 30.6 per cent.

The decrease in maintenance of way expenses was \$1,032,545 or 8.06 per cent. There were several of the primary accounts, however, which showed a marked increase, notably ties, \$794,186 or 46.25 per cent, and rails, \$375,774 or 70.43 per cent. Track laying and surfacing, however, showed a decrease of \$754,373 or 26.09 per cent and ballast \$337,717 or 67.32 per cent. Taking the situation as a whole it is evident that the savings made were in labor and that they did not represent scrimping in maintenance standards.

More Rail and Ties

It is of interest to put this in terms of materials, bearing in mind, of course, that to a certain extent expenses for material may be charged partly to capital account as additions and betterments. The figures show that the Norfolk & Western laid more rail, and put in more ties than its annual average for the past few years, but that this statement does not similarly apply to ballast. The figures follow:

Year	New rail laid tons	Ties number	Tie plates number	Ballast yards
1916	26,853	1,504,019	337,598	954,303
1917	11,530	1,143,069	473,911	693,733
1918	17,980	1,201,601	357,790	679,389
1919	7,510	1,079,230	316,627	650,750
1920	8,856	1,252,680	453,049	557,639
1921	39,940	1,703,232	1,089,027	379,464
		Treated 83,808		

During the year there were laid 42 miles of new 130-lb. rail, a new departure for the Norfolk & Western. There were laid also 142 miles of 100-lb. rail. At the end of the year of a total trackage of 4,313 miles, 44 were laid with

A View of the 200,000 Gal. Storage Basin for the New Water Supply Plant at Roanoke

supply from its own mines at an average cost of \$2.92 per ton.

Charges to maintenance of way in 1921 totaled \$11,778,985 or 8.06 per cent less than in 1920; to maintenance of equipment, \$19,342,536 or 34.88 per cent less and to transportation \$30,018,159 or 24.06 per cent less. The ratio of transportation expenses to total revenues in 1921 was 37.17 in 1921 as compared with 44.67 in 1920, but it will be noted that the decrease in transportation expenses was not quite as large as the decrease in revenue ton miles.

Bad-Order Cars on March 1, Only 7.1 Per Cent

Norfolk & Western maintenance standards are high. It is apparent that during 1921 much effort was devoted to keep-

130-lb. rail; 1,249 with 100-lb. rail and 2,080 with 85-lb. rail, the remainder, principally branches, sidings, etc., with lighter rail. The road's practice in the past has been to use white oak ties and although it is still using white oak ties, their installation is being confined chiefly to heavy traffic curves and tangent track where mechanical wear is the determining life factor. About 20 per cent of the annual tie requirements are being met through the use of treated red oak, a plant capable of four different preservative methods having been built at East Radford, Va., with a capacity of 1,500,000 tons annually. The increased attention thus given to the securing of a greater tie life has resulted in the use of a greater amount of tie plated track, the benefits of which, in connection with the treated ties, will not be immediately apparent. The details given should indicate that the Norfolk & Western maintenance of way standards have apparently been much improved during the past year in spite of the decrease in maintenance of way expenses of 3.06 per cent.

Speaking further of improvements, it should be noted that the total additions and betterments charged to capital account in 1921 were \$5,297,395 including \$994,566 for new branches and extensions, \$4,658,773 to other way and structures and \$638,622 to equipment. The big item under new branches and extensions was the Lenore branch 18 miles, Lenore, W. Va., to the coal lands of the United Thacker Coal Company in Mingo County, W. Va. This was completed November 1; its total cost was \$2,200,000 and it serves coal lands leased by the coal company extending over 26,000 acres. Other important improvements completed were the tie-treating plant at East Radford, Va., already mentioned, new engine house facilities at West Roanoke, a new 16-stall roundhouse at Bristol, Va., a new pumping plant at East Radford, etc.

Coal 73.33 Per Cent of Total Tonnage

One of the most interesting features of Norfolk & Western operations in 1921 was the manner in which its coal traffic held up proportionally to the other traffic. Its total bituminous coal tonnage was 21,766,196 as compared with 26,035,500 in 1920. This was a decrease of 4,269,304 tons as compared with a decrease of all revenue tonnage of 11,696,975. The result was that whereas in 1920 bituminous coal tonnage made up 63.99 per cent of the total tonnage, in 1921 it made up 73.33 per cent. Although the coal tonnage held up, speaking comparatively, it was the smallest for several years, for in 1919 it totaled over 24,000,000 tons; in 1918, over 27,000,000 and in 1917 over 29,000,000. The interesting factor in the Norfolk & Western's coal business is the coal dumpings at Norfolk. It is presumably well known that the N. & W. dumps more coal at its Norfolk piers than is dumped at any other Atlantic Coast pier., In 1920 when America through its coal export trade was realizing on the difficulties occasioned to the British operators by the coal strike there were dumped at Norfolk 8,807,803 gross tons. In 1919, the dumpings totaled 6,820,341 gross tons, which decrease while large does not seem to be as great as might have been expected under the conditions. The figures for coal dumpings at Norfolk for the past several years are as follows:

Year	Cars	Tons
1915		7,503,607
1916	141,193	7,450,802
1917	102,498	6,321,457
1918	132,790	7,914,644
1919	96,896	5,874,540
1920	147,750	8,807,803
1921	116,172	6,820,341

Although the tonnage the Norfolk & Western moves to its Norfolk piers is a most important factor in the road's operations and was the primary reason why it has secured 100 and 120-ton coal cars, it will also be borne in mind that the road through its connections has a good route to the lakes. The lake coal business of the carriers in general was good

during 1921 and it is to be presumed that the Norfolk & Western supplied its proper share of it. The uncertain feature of the coal business at present and, therefore, of the Norfolk & Western earnings is the labor situation in the coal industry. The coal fields served by the Norfolk & Western are the Thacker, Pocahontas, Tug River, Clinch Valley and Kenova. These are all non-union and will, it is expected, not participate in the strike. Whether they do or not, is an important factor to be watched in connection with the Norfolk & Western's operating results for the coming few months.

Lehigh Valley Offers Employees Insurance at Reduced Rates

THE LEHIGH VALLEY, according to a plan just announced, is offering accident and life insurance at exceptionally low rates to all its employees. The company has arranged with the Travelers' Insurance Company of Hartford, Conn., to handle the insurance and the group policy totals about \$50,000,000, said to be the largest policy of its kind ever written.

The plan is optional and is open to all active employees who have been in service a year or more. Some 18,500 of the Lehigh Valley's 20,000 employees are eligible. Enrollment of 75 per cent of the employees on each division was necessary to put the plan in force on that division. Every one of the road's divisions have exceeded this percentage. Premiums will be deducted from earnings. No medical examinations are required.

The insurance protects the families of employees against the death of the breadwinner and also provides accident benefits against death, dismemberment or loss of sight. The amount of insurance allowed to each man ranges from \$2,000 to \$4,000 according to the classification in which he falls. This amount is divided equally between life and accident insurance. Engineers, conductors, shop foremen, and supervisory forces are entitled to \$4,000. Trainmen not included in the preceding classifications are entitled to \$3,000. Other employees fall in the \$2,000 class. All over 70 years of age are limited to \$1,000.

The amount of the life insurance is payable in the event of the employee's death from any cause while his insurance is in force, to the person named as beneficiary. If an insured employee becomes wholly disabled by either bodily injuries or disease before his sixtieth birthday and will be permanently prevented thereby for life from engaging in any occupation, the amount of his life insurance will be paid to him in a fixed number of instalments chosen by him. If he dies before receiving all of the instalments, they will go to his beneficiary until completed.

The policy regards the irrecoverable loss of both eyes or the loss of the use of both hands, both feet, or the loss of the use of one hand and one foot as permanent total disability. Under the accident part of the policy the employee is insured against loss resulting from bodily injuries. It pays the principal sum for loss of life, both eyes, both hands or both feet and one hand and one foot, and pays half the principal sum for the loss of one hand or one foot or one eye.

Premiums are 80 and 90 cents and \$1.00 a month, depending upon occupation, for both \$1,000 of accident and \$1,000 of life insurance. Rates on different amounts are proportionate.

Termination of employment with the company cancels the insurance, except that the employee leaving the service may continue his life insurance with the insurance company without a physical examination. This insurance he may continue in any form except term insurance, but he is required to pay regular premium rates, and not the reduced rate secured while in the employ of the Lehigh Valley.

Labor Leaders Argue for Large Wage Increases

B. M. Jewell and F. J. Warne Present Labor Board With Mass of Data on Railroad Situation

HEARINGS BEFORE the Railroad Labor Board in the present controversy over proposed reductions in the wages of the railway shop employees continued during the past week with Frank J. Warne presenting a mass of statistics, charts and oral testimony on the financial history of the railroads, interlocking directorates, freight and passenger rates and many other phases of the general railroad situation. The introduction of evidence of this character was protested by representatives of the carriers as entirely irrelevant but the Board permitted Mr. Warne to continue. A great deal of Mr. Warne's testimony is the same as that which he presented before the Senate committee on Interstate Commerce during the course of its recent hearings.

B. M. Jewell's Testimony

B. M. Jewell, president of the Railway Employees Department of the American Federation of Labor, completed his testimony (the greater part of which was abstracted in last week's *Railway Age*) on March 30. In closing he said:

My purpose has been to describe as well as we could in brief space the working of the present wage system. For it is only against such a background that the full implications of the present case can be seen. From the facts developed it appears that there is a steady tendency for decisions vitally affecting the livelihood of the people to be made according to business standards, that is, according to standards which place interest, rents and dividends ahead of the return to wage earners of the regular supplies which their families need for health and comfort. The results are apparent enough, an increasing absorption of national purchasing power by so small a percentage of the population that it ceases to create a normal demand for the production of enough essentials to meet the real requirements of the country. It is our belief that, wholly aside from the justice of wage demands, this tendency cannot continue indefinitely without undermining the very foundation of the social structure.

Early in my presentation we asked two questions:

First—If industry can pay a living wage but will not, what should be the attitude of the workers?

Second—If industry as at present operated cannot pay a living wage, what should be the attitude of the workers?

Our study of the wage question during the inflation period has developed clearly that the extent to which industry is able to pay a living wage has nothing to do with its payment. Labor does not share as a partner in the increased profits of prosperity. Whether prices rise or fall, whether production goes up or down, labor is tied close to the lowest level at which it can be bought in the market which capital owns and controls. Therefore, it is clear that industry does not intend to pay a living wage.

Our study of the ability of industry as at present organized has further shown us that the prime purpose for which business is today operated will always prevent the production of those goods necessary to a comfortable living in sufficient quantity to be able to afford them to every family.

The "Will to Pay a Living Wage"

As a matter of fact the two questions are really one. So long as industry will not pay a living wage it cannot, because purchasing power creates the demand which production satisfied. Without that purchasing power, extra production of wheat and corn and vegetables and fruit would be dumped in the creeks and rivers as oversupply. But our examination of the possibility of physical production shows us that the converse is also true. If industry will pay a living wage it can pay a living wage.

Our physical resources, our plant, our labor power, our scientific knowledge, all these are more than adequate. Only the will to pay a living wage is absent. We came here, then, as consumers seeking recognition of our right to sufficient purchasing power to enable us to call forth such products as are essential to the well-being and homely comforts of family life. We have developed clearly in our study the nature of the market in which wages are determined, that is, in which the purchasing power of the community is apportioned. This market operates according to the unending law of commercialism, "charge what the traffic will

bear," "capitalization based on the highest limit of prospective earning power." The productive system and its product are considered as the property of commercial capital. From the sale of the product commercial capital pays costs and keeps the rest as a return on property,—either rent, interest or profits. Labor is merely one of the costs like upkeep of machinery. Capitalization of prospective profits means that capital must absorb all increased productivity.

In our study of the deflation period we have seen the operation of the system in its crudest form. We are now in such a period. Our findings may be summarized in a single brief paragraph which places the present wage demands of railroad management, together with all the wage data which they have presented in their true setting.

Industry Preparing to Absorb Entire

Increase When Production Increases

The interests in control of prices and jobs have put the lid on domestic consumption at just the time when wages are beginning to overtake prices. They are holding the lid on until they get low wages in all industries, including low returns to farmers. They are pursuing this policy in order that when increased production is again initiated they can again absorb the entire increase. The process which we traced through the inflation period, prices running ahead of wages, will then be repeated.

This is the way the business cycle works. If the Labor Board, constituted to provide just and reasonable wages, must conform to this cycle, then the employees of industry will have to answer the question which we have asked in terms which will protect their interests as consumers. That, to our mind, is a justification, and completely so, for the request for increases that we have presented to this Board.

F. J. Warne Attacks Carrier's Evidence

on "Wages in Other Industries"

The first part of Mr. Warne's testimony was devoted to an attempt to discredit the material which has been submitted to the Board by representatives of the carriers and dealing with the "wages being paid by other industries." In beginning his presentation he said:

It is quite evident at the very outset that we must know the exact meaning or application of "other industries" if this Board in its decision is to mete out economic and industrial justice to the railway employees.

By "other industries" it unquestionably cannot be meant to include any industry of which any railroad company as a corporation is in control, or in the affairs of which it has any influence, either direct or indirect, in the determination of wages to employees in that industry. Otherwise the provision of the Transportation Act above referred to would be subject to justifiable ridicule.

This is true, for the reason that the result would be that wages of railway employees, which this Board has been authorized and directed to determine to be just and reasonable, would be determined, in so far as such a comparison enters into the determination, by the wages in "other industries" which have been fixed by the railroad corporations in control of or having influence over them. In brief wages of railway employees would be determined by the railroad corporations and not by this Board.

He then attempted to support this position by reciting a long list of interlocking directorates and purporting to show the interests of certain railway directors in other industries. Upon being questioned, Mr. Warne indicated that the holding of an interest in any "outside" company by a railway officer should automatically eliminate the wages paid by that company as factors in the determination of just and reasonable wage scale for railway employees.

B. W. Hooper Defends President Harding

and the Administration

On March 31, Mr. Warne opened his testimony by referring to the "conspiracy charges" recently made by Senator

LaFollette. This reference immediately brought forth a long and extended cross examination of the witness by J. L. Coleman, counsel for the western roads in which the latter exploded Mr. Warne's charges and the former took refuge in evading questions on the grounds that he had prepared his testimony and desired to present it in a certain way.

During the course of this cross examination Mr. Coleman made the statement that the first suggestion that labor costs be reduced came from the Interstate Commerce Commission and that later President Harding with his cabinet became interested in the suggestion. Ben W. Hooper, member of the public group on the Board and acting as chairman at the time, misunderstanding the import of Mr. Coleman's remarks, immediately rose to the defense of the administration stating:

Infsofar as the members of this Board are concerned, neither the President nor any member of his cabinet or anyone highly connected with the administration has ever given the slightest intimation publicly or privately as to what course should be pursued in regard to the increase or reduction of wages of the employees. The President himself, I happen to know, has very scrupulously kept separate and apart from any discussion of that matter and from any appearance of wanting to indicate to the Board in any way as to what its course should be in regard to that particular proposition.

F. J. Warne Continues Presentation

of Employee's Case

On the strength of the fact that certain carriers, parties to this dispute, have pleaded inability to pay as a factor in their requests for lower wages, Mr. Warne took up several of the board's sessions with the presentation of lengthy arguments on the financial condition of the carriers, their revenues and expenses, and other subjects of a similar nature. All of this material had previously been presented to the Senate Committee on Interstate Commerce. He was frequently interrupted and examined by representatives of the carriers who sometimes protested against the introduction of this data and at other times pointed out the fallacy in Mr. Warne's reasoning, his lack of qualifying experience, etc. He was, nevertheless, allowed to continue with this testimony.

The next point taken up by Mr. Warne was an attempt to prove that there is no relation between transportation rates and the wages of railway employees. After considerable discussion on the increases in transportation rates which have been allowed by the Interstate Commerce Commission, during the course of which Mr. Warne several times quoted from the transcript of hearings before the Interstate Commerce Commission, the chairman of the board said:

"Do you not think that this hearing is degenerating into a situation where, if someone should drop in here and listen to the discussions going on, that person would suspect that he was listening to a hearing before the Interstate Commerce Commission and not to a hearing before the Labor Board, and ought it not be pretty well understood by both parties to the controversy that the board will not put itself in the position of bargaining off the wages of railway employees for a prospective or already realized reduction in passenger or freight rates, or both? This board can only consider those things set out in the statute and the elements there laid down for consideration. While all of this discussion about freight rates may be entertaining to you gentlemen, it at the same time involves something of an assumption that the board is going to bargain off the wages of employees for a reduction in rates. I do not believe the board could be expected to do that and it can only act upon testimony that has a bearing on the seven elements that are set out in the Transportation Act."

Mr. Warne closed this phase of his testimony with the statement that:

"The point is that increases in rates have been considerably more than the increases in wages in the same period

of time and that there could be, if necessary, a rate reduction (although I would like to have it understood that the employees are not arguing for a reduction of transportation rates) but if there had to be a rate reduction, it can be made without reductions in rates of wages and still the relative proportion of freight rate increases to the wage increases would be greater."

Mr. Warne, in addition, presented considerable evidence to show that business was rapidly approaching normal and closed this phase of his testimony with the statement that:

"Because of this marked tendency towards industrial revival and an increase in consequence in the volume of railway traffic, which by itself will increase the operating revenues of the carriers, the railway employees contend most emphatically that there is no economic nor even political necessity at the present time for a decrease in their wages in order to secure the much to be desired reductions in the present high transportation rates."

The testimony of Frank J. Warne before the Labor Board in the wage reduction case was concluded on April 4, Mr. Warne being recalled to Washington to appear before the Interstate Commerce Commission. Mr. Jewell, directing the presentation of the shop crafts' case, then called upon representatives of the organizations comprising the federated shop crafts to present specific rebuttal testimony to the evidence presented by the carriers.

Group Three Nominates Representatives

for Labor Board

Officers of those unions whose membership embraces employees in "Group 3" as defined by the Interstate Commerce Commission, met at Chicago on April 3 and made the following nominations for appointment to the Railroad Labor Board to fill the vacancy caused by the recent resignation of Albert Phillips.

J. H. Sylvester, vice-president of the Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees; D. W. Helt, president of the Brotherhood of Railway Signalmen; Timothy Healy, president of the Brotherhood of Stationary Firemen and Oilers; J. J. Farnan, vice-president of the United Brotherhood of Maintenance of Way Employees and Railway Shop Laborers; J. F. Dewey and C. Z. Taylor, Order of Railroad Telegraphers. These names will be submitted to President Harding at once. Various of the labor leaders at the meeting stated that in view of the fact that almost 71 per cent of the railway employees were in this group they are entitled to a representative on the board.

Clerks Petition for Abolition of Labor Board

Protesting the alleged "unfair treatment" accorded their members by the Labor Board, the Eastern Federation of the Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees recently forwarded to the board a copy of a resolution to petition President Harding to abolish that body immediately. The resolution declared it was "self-evident that recent decisions are unfair, unjust and contrary to the principles of fair play." It referred particularly to several recent decisions, upholding the right of the carriers to lay off men one day a week after reaching an agreement to do so with the employees.

Manufacturers Present Wage Data to Board

The Illinois Manufacturers Association recently submitted to the board an exhaustive survey of the wages being paid in other industries in various cities in Illinois and substantiating the material already presented to the board by the railroads.

In submitting the results of this independent study to the board, George R. Myercord, chairman of the railway com-

mittee of the Illinois Manufacturers Association, said in part:

Our independently gathered statistics show the same results as those gathered by the railroads. It is apparent that the wages paid in the small industrial centers are very much lower than those paid in the large communities and the object of this letter is to acquaint you with the fact that we wish to go on record to the effect that the statistics submitted to your board by the railroads are a true representation of fact as to wages paid in private industry in the different communities.

As it is vital to industry that lower freight rates obtain, we plead with you to take into consideration in your decision the fact that industrial wages are lower and vary with communities.

We respectfully point out that you will completely disrupt the industrial foundations of communities if your decision is based on a uniform percentage reduction in crafts and you see fit to ignore the great difference in wages existing between communities.

Wage Cut Hearings to End Before May 1

At the end of the Board's session on March 31 the Board announced that the hearing of the dispute as to rules and working conditions between the carriers and the Brotherhood of Locomotive Engineers and the Brotherhood of Firemen and Enginemen would begin on May 1 and that the hearing now in progress should be completed before that date. The division of time between the various classes of employees and the carriers was left for settlement by conference.

Pennsylvania-Labor Board Dispute

Before Federal Court

The controversy between the Pennsylvania and the Labor Board as to the authority of that body to authorize the procedure to be followed in the election of representatives of employees with whom new rules and working conditions could be negotiated was finally heard by Judge George M. Page of the United States District Court at Chicago on April 3 and 4. The hearings before Judge Page were on a temporary injunction against the Board granted the Pennsylvania several months ago and restraining the Board from issuing an order which the Pennsylvania believed would be unfair. The district attorney's office which is handling the case for the Labor Board is petitioning for the dismissal of this temporary injunction.

Blackburn Esterlin, special assistant to the attorney general of the United States, and Judge R. M. Barton, chairman of the Railroad Labor Board, presented the Board's case before Judge Page, contending that the court did not have jurisdiction in the dispute, inasmuch as the board is part of the administrative branch of the government. Judge Barton also contended that if this position were to be overruled by the court the Board was still within its authority in prescribing the procedure by means of which representatives of the employees on the Pennsylvania should be selected.

T. J. Scofield, appearing on behalf of the Pennsylvania, presented a lengthy brief setting forth the contentions of the carrier and argued in opposition to the contentions of both Mr. Esterlin and Judge Barton. Mr. Scofield introduced arguments on the powers of the Board under various sections of the Transportation Act and declared there was no authority in the act to allow the board to declare contracts void, as was done when the Pennsylvania negotiated new rules and working conditions with its employees. At the close of the hearing Judge Page announced that he would hand down his decision in the immediate future.

A BUILDING AND LOAN ASSOCIATION has been started by the employees of the Pennsylvania Railroad, in the general offices at Philadelphia, to be called the "Broad Building and Loan Association." E. T. Kennah, superintendent of car service is president and Walton M. Wentz, vice president; Charles P. Brady is secretary and William Leutz, treasurer.

White Gasoline Motor Car on Tennessee, Kentucky & Northern

IN 1919 the Tennessee, Kentucky & Northern decided to install a gasoline motor car for handling its passenger traffic. At the time there were very few cars of this type in service and the officers were unable to get information regarding the construction of such equipment. Nevertheless, the railroad worked out plans for a car which was built by the White Motor Company at Nashville, Tenn., and put in service in July, 1919.

The car has a seating capacity of 20, the body being 14 ft. 10 in. long, 7 ft. 6 in. wide and 6 ft. 9 in. high. The front of the car is carried on a four-wheel truck with 20-in. diameter wheels; the car is driven from the two rear wheels, which are 33 in. in diameter. It was first put in service with a two-wheel front truck but this was not satisfactory and was soon changed to the four-wheel truck now in use. The wheel-

Gasoline Motor Car, in Service Since 1919 on the T. K. & N.

base of the car is 14 ft. 8 in. and the light weight 9,000 lb. It has the White two-ton truck motor, transmission and brakes, hand-operated sander, and a whistle operated by the exhaust from the engine.

Since it was put in service, the car has made two round trips of 36 miles daily over tracks that have 75 curves in 18 miles.

The curves range from 3 degrees to 20 degrees. The line also has grades as high as three per cent with several 1½ per cent grades two miles long. The average daily mileage is 75 and the total to date about 100,000 miles.

The performance of the car has been entirely satisfactory. It is operated by one man and makes about 13 miles per gallon of gasoline and 270 miles per gallon of oil. The railroad states that the operating expenses per mile amount to 9.8 cents and that the car has increased passenger revenues at least 100 per cent.

"FACTS AND FACTORS in Proper Grain Door Installation and Conservation" is the title of a large illustrated poster prepared by the Grain Door Reclamation and Coöperation Bureau, Chicago, and recently issued by the General Managers' Association of that city. The problem discussed is that of over-nailing and spiking grain doors to the door posts of freight cars. "This," says the poster, "causes delay to the unloaders and often results in needless destruction of the grain doors; also, over-sized nails are usually left in the posts which damage other freight later shipped in the same cars. Recommendations of suitable nail dimensions, varying according to the thickness of the grain doors, and illustrations showing both correct and incorrect methods of installing grain doors and reinforcements are given in the association's poster.

General News Department

Train No. 10, the northbound Florida Limited, of the Seaboard Air Line, was derailed on April 4, at Ford, Ga.; several passengers were slightly injured.

R. H. Ford, assistant chief engineer of the Chicago, Rock Island & Pacific, will present a paper on Labor Saving Appliances in Railroad Work before the Western Society of Engineers, at Chicago, on April 20.

In the Shops of the Philadelphia & Reading the working time has been reduced to five days a week; and in the coal regions, where mining has been suspended, numbers of car inspectors have been laid off.

Malicious Loosening of a Rail is given as the cause of the derailment of freight train No. 92 of the Atlanta, Birmingham & Atlantic on the night of March 28, near Manchester, Ga. The fireman was killed and the engineman fatally injured.

Ten Bandits held up a freight train on the New York Central near Poughkeepsie, N. Y., early in the morning of April 2. Several cars were entered but nothing was stolen. The robbers evidently mistook the train for a silk train which passed the point some minutes before.

The Mexican Chamber of Commerce of the United States has been incorporated in New York and has opened offices in the Woolworth building, New York. The directorate is composed equally of citizens of both countries and the purposes of the organization to foster trade between the two countries and to foster friendly relations generally.

William S. Wollner, general safety agent of the Northwestern Pacific, has been elected vice-president of the Society of Safety Engineers of California. Wollner is a past president of the American Association of Engineers and at the time of his appointment as general safety agent of the Northwestern Pacific was assistant to the chief engineer of that company.

Missouri Pacific passenger train No. 12, enroute from Kansas City, Mo., to St. Louis, was derailed on March 31 by a landslide near Boles, Mo., 50 miles west of St. Louis. The engine and the first four cars left the tracks and plunged down a fairly steep embankment to the edge of the Missouri river. It is said that recent heavy rains caused parts of high bluffs along the right of way to fall under additional weight. There were no casualties.

Grade Separation in Texas

During the past three years the State Highway Commission of Texas, according to J. P. Fauntleroy, State highway engineer, has made provisions for the elimination of 150 railway grade crossings and contemplates the elimination of crossings at 50 more points.

Derailment on the Pennsylvania

In the derailment of a passenger train on the Pennsylvania Railroad near Halifax, Pa., early on the morning of March 31, five sleeping cars and one coach were ditched and a dozen passengers were injured; but the injuries are reported as slight and the cars remained upright. The train was southbound express No. 574, the Dominion Express, from Buffalo, N. Y., to Washington, D. C. Halifax is 18 miles north of Harrisburg.

Illinois Central Wins 28-Year Old Suit

After 28 years of litigation, a \$100,000 damage suit of the Illinois Central against the city of Chicago was settled by a compromise on March 28, the city agreeing to pay the road \$39,050. The suit was the result of damages caused by the

burning of box cars by strikers during the A. R. U. conflict on July 5, 1894. The railroad maintained that this damage could have been averted if the city had provided adequate police protection.

Western Railway Club

The Western Railway Club will hold a meeting at the Great Northern Hotel, Chicago, on April 17, at which a paper entitled "Locomotive Types from a Transportation View Point," will be read by J. F. Porterfield, general superintendent of transportation of the Illinois Central, and will be the general topic of discussion. This club will hold its annual meeting on May 15, at the Drake Hotel in that city, and has made arrangements for securing several speakers of national reputation.

Railway Returns for February

Preliminary compilations of reports to the Interstate Commerce Commission by 192 roads of their earnings and expenses for the month of February show a net railway operating income of \$44,843,404, which is at the annual rate of approximately 4½ per cent on the tentative valuation. This compares with a deficit for those roads of \$8,343,000 in February last year. The total operating revenues of these roads, \$383,000,000, show a decrease of 1.3 per cent as compared with last year, although the western roads show a decrease of 8 per cent. The total operating expenses, \$311,000,000, show a decrease of 15.7 per cent.

Laws Proposed in Senate

The Senate committee on interstate commerce, on April 3, favorably reported a bill introduced by Senator Cummins to provide that the United States safety appliance acts shall not apply to the Territory of Hawaii.

The Senate committee on interstate commerce on April 3 favorably reported a bill, introduced by Senator Cummins, to amend Section 10 of the Transportation Act by substituting for Paragraph 3 new provisions to strengthen the prohibition against false billing, false description, false report of weight, etc. Such actions are made subject to a fine of not exceeding \$5,000 or imprisonment not exceeding two years, or both.

Government Delegates to International

Railway Congress

The corrected list of delegates appointed by the United States Government to attend the Ninth Congress of the International Railway Association at Rome, Italy, consists of the following four all of whom are now in Europe or on the way there:

General W. W. Atterbury, vice-president, Pennsylvania Railroad.

D. F. Crawford, vice-president, Locomotive Stoker Company.

J. W. Lieb, formerly vice-president of the American Society of Mechanical Engineers.

Walter F. Schleiter, vice-president, Dilworth, Porter & Co.

Roads Reporting as to Excess Earnings

In response to the recent order of the Interstate Commerce Commission, railroads have been filing reports of their earnings for that part of 1920 during which they were not under government guaranty, on the basis of which they are expected to pay into the United States Treasury one-half of any excess in their net railway operating income over 6 per cent, in accordance with the so-called recapture provision of the transportation act. Under the commission's order the railroads reporting a return in excess of 6 per cent were to send

checks for the amount payable to the government to Secretary McGinty of the commission. He has thus far received no checks and very few roads reported a net income in excess of 6 per cent for this period. A number of the roads in reporting stated a belief that that part of the law is unconstitutional, but that the issue would not be raised at this time because they did not earn in excess of 6 per cent, and it is understood that one carrier which earned in excess of 6 per cent has informed the commission that the recapture provisions are unconstitutional and that it would decline to pay over any money unless compelled to do so by court proceedings. It is understood that the commission expects to make public the names of any roads that report earnings in excess of 6 per cent.

Wage Statistics for 1921

The Interstate Commerce Commission's summary of wage statistics for December and for the 12 months of 1921 shows the number of employees of Class 1 railroads was less in every quarter of 1921 than in the corresponding quarter of 1920. The reduction averages 19.1 per cent for the year. Compensation decreased 22.9 per cent. In 1921 the number decreased from 1,804,822 in January to 1,542,716 in April. Beginning with May the employment increased from month to month until in October it reached 1,754,136. November reports showed a decrease of 21,783, and a further decrease of 95,202 is shown for December. The returns by quarters are compared as follows:

Quarter	1920		1921	
	Average number employees	Compensation Thousands	Average number employees	Compensation Thousands
Jan.-March	1,993,524	\$795,616	1,691,471	\$757,325
April-June	1,604,766	801,067	1,568,143	699,684
July-Sept.	1,879,869	1,052,109	1,677,706	666,058
Oct.-Dec.	2,060,368	982,606	1,707,880	677,828
Year	1,684,160	\$3,631,396	1,661,301	\$2,800,896

A comparison of the number of employees and their compensation, by months, for the period covered by the new classification, excluding the Detroit, Toledo & Ironton, which has not filed its report, shows the following:

Month	Number of employees	Total compensation
July, 1921	1,634,872	\$214,339,385
August, 1921	1,679,927	227,745,895
September, 1921	1,718,330	223,972,822
October, 1921	1,754,136	337,602,950
November, 1921	1,732,353	235,304,006
December, 1921	1,637,151	214,921,396

Annual Meeting, Short Line Association

The American Short Line Railroad Association has called its annual meeting to be held at the Washington Hotel, Washington, D. C., on April 25 and 26. The call for the meeting states that the executive board has been constrained to change the time for the annual meeting and direct that it be held in Washington on the date fixed, "for the reason that the legislative situation in Congress is such as to force the belief that there is grave danger that interests opposed to the railroads will succeed in having some of the vital principles of the Transportation Act repealed; bills for that purpose are pending in both the Senate and House. The committee on interstate and foreign commerce of the House is conducting extensive hearings on bills intended to repeal the most important and most essential principles of the transportation act. A vigorous effort is being made to accomplish that result, and in that way, among other things, overturn the recent decision of the Supreme Court of the United States in the Wisconsin and New York cases."

That committee is at present considering the interchangeable mileage book bill, and has other important objectionable bills pending before it. The situation demands not only the attendance of the strongest and most influential officers, or officers, of all roads, but that they carefully consider pending legislation and thereafter make a most earnest effort to confer with their respective officers and congressmen, and give them full information as to the effect of each of the pending bills."

The announcement also calls attention to the importance to the short line of the consolidation hearings, valuation proceedings and other matters pending before the Interstate Commerce Commission. In addition to the foregoing important matters

the annual meeting will discuss divisions; labor; claims for federal control period; claims for guaranty period; self-propelled motor vehicles; motor truck competition; excess earnings; accounting; federal taxes; car hire; loans and railway mail pay.

Communication With Moving Trains

Experiments are again being made on the Delaware, Lackawanna & Western with radio telephony and telegraphy as a means of communication between a moving train and established radio stations. At the present time a car running between the Lackawanna terminal, Hoboken, N. J., and South Orange, N. J., has been equipped with several different types of receiving apparatus and a sending outfit. On April 5 a car similarly equipped was run on a special train carrying students from Cornell University at Ithaca, N. Y., to New York City. The receiving set on this car was equipped with a loud-speaking device. Among the different types of equipment being tried is the super-heterodyne outfit which was used for receiving messages

Photo by Kodak & Herbert.

Radio Equipment in Operation on Car

in Scotland from amateur radio operators in the United States. The transatlantic tests were made in December, 1921.

So far, operations on the Lackawanna have been limited to communication between a train running at full speed with amateur radio stations within a radius of 30 miles.

Wider possibilities have been opened by recent developments in radio equipment. Radio stations can be connected with ordinary telephone circuits, and with radio stations located at intervals along the right-of-way, it should be possible for a person on a moving train to communicate with any point reached by regular telephone service.

Illinois Central Advertises Safety

In its most recent newspaper advertisement in its campaign to inform the public regarding railway operation, the Illinois Central cites the excellent records recently made in the reduction of fatalities. In 1920 the railroads of the United States carried 16,239,774 passengers for each passenger fatally injured in a train accident. To load 16,239,774 passengers into 70-ft coaches (88 passengers each) would require 184,542 coaches, which would make up a train 2,446 miles long.

Trespassing and automobile grade-crossing accidents accounted for nearly one-half of all the fatalities on the railroads in 1920.

The number of fatalities on the Illinois Central System in 1921 was the smallest in 24 years. In the road service of the Illinois Central System there has not been a passenger fatally injured in a train accident in more than four years. In the suburban service at Chicago, only one passenger has been fatally injured in a train accident in the entire history of this service, which was established in 1856, and which has grown until it now amounts to nearly 30,000,000 passengers a year.

"We believe the public will agree with us that the handling of a heavier business, with a smaller number of fatalities, is a barometer of railway efficiency. The Illinois Central System pledges renewed effort toward rendering to the public a transportation service of safety and satisfaction, and asks the co-operation of the public."

Extensive Railroad Advertising

The Central of Georgia Railway has been communicating with the public through the newspapers once each month since last October, and finds the results of this policy eminently satisfactory. The address on safety at highway crossings, reproduced in minia-

Traffic News

The Grand Rapids (Mich.) Traffic Club recently elected the following officers for the ensuing year: President, Harry E. Willard; vice-presidents, Clare J. Hall and William Vyn; secretary, Walter H. Condin; treasurer, Frank E. Coombs.

Mileage Book Hearing

The hearing on proposed mileage book legislation before the House committee on interstate and foreign commerce was continued on March 31 and April 4. Bird M. Robinson, president, and B. B. Cain, vice-president, of the American Short Line Railroad Association, described the effect a reduced rate mileage book would have on the revenues of the weaker roads. They suggested that the bill be amended to authorize the Interstate Commerce Commission to exempt any line upon a showing of inadequate revenue; and also to provide that the mileage tickets be exchanged, each trip, for regular tickets in order to avoid abuse of the baggage checking privilege.

M. O. Lorenz, statistician for the Interstate Commerce Commission, also testified before the committee, giving statistics of railroad earnings and expenses during the past year and since the passage of the Transportation Act.

Coal Production

A final spurt of activity in anticipation of the strike carried production of soft coal up to 11,437,000 tons in the week ended March 25, according to the weekly bulletin of the Geological Survey. The output was the largest recorded since December, 1920, and exceeded by nearly 400,000 tons the lesser peak reached last October when consumers anticipated a possible railroad strike. Production was still far short of what the mines can produce and the railroads transport, for in the last week before the great coal strike of 1919, a total of 13,140,000 tons was recorded. As the present rate of consumption at home and shipments abroad is not more than 8,300,000 tons a week, the bulletin says, the output in the week of March 25 provided at least 3,000,000 tons to be added to consumers' stock piles. This confirms the Geological Survey's forecast that stocks in the hands of consumers would reach 63,000,000 tons by April 1.

Kansas City, Mexico and Orient Asks Increased

Divisions and Diversion of Traffic

The Kansas City, Mexico & Orient and the Kansas City, Mexico & Orient of Texas have filed an application with the Interstate Commerce Commission alleging that their revenues are insufficient to enable them to render such transportation service as will properly meet the needs of the public and requesting such orders from the commission respecting divisions of joint rates and such orders with respect to traffic not routed by the shippers as will result in increasing their revenues. In two separate orders the commission has instituted investigations for the purpose of inquiring into the matter, first, relating to the divisions of joint rates, and the second, as to whether or not the public interest in a fair distribution of the traffic requires that as to traffic not routed by the shipper the commission shall, under the provision of Paragraph 10 of Section 15 of the interstate commerce act, direct that a greater proportion of such traffic shall be routed over the lines of the applicants than is at present so routed, and, if so, the changes in routing that should be ordered. Some 40 connecting and intermediate railroads are made respondents in the division case, which is assigned for hearing before Examiner Burnside at Washington on May 15. Both the applicants and the respondents are ordered to file with the commission before that date statements in detail regarding the interchange of traffic, etc. The routing case is assigned for hearing before Examiner Bartel at Washington on May 1. In this case all carriers by railroad subject to the interstate commerce act are made respondents.

CENTRAL OF GEORGIA RAILWAY DIRECTS ATTENTION TO THE GRADE CROSSING PROBLEM

For the four-year period ended December 31, 1920, there were 4,350 persons killed and 12,750 persons injured in automobile grade crossing accidents in the United States.

For the same period there were 32 persons killed and 215 persons injured in automobile grade crossing accidents on the Central of Georgia Railway. During 1921 there were 84 grade crossing accidents in which 17 people were killed and 95 injured. Analysis of these cases shows that crossings considered the safest are actually the most dangerous.

A serious automobile grade crossing accident, involving personal injury or loss of life, is usually followed by a demand upon the railway for the elimination or "protection" of the crossing involved.

Crossing gates do not entirely eliminate accidents. People become educated to rely upon the gateman instead of upon their own faculties. If the gateman errs, the danger of accident is very great.

Electric warning bells do not entirely eliminate accidents. If they ring a great deal, automobilists disregard them. In addition, there is always the possibility that a bell may not be in order just at the moment of greatest danger.

Crossing flagmen are not infallible. The human element enters into most accidents, and crossing flagmen are like other human beings. Some of the most disastrous automobile grade crossing accidents have occurred at crossings where flagmen were on duty.

One of the results of crossing "protection" is to teach the public that crossings are safe. The opposite should be taught. All railway grade crossings are dangerous—the "protected" as well as the unprotected crossings. This should be impressed upon the minds of everybody, beginning with the children in the schools.

There are about 1,557 grade crossings on the Central of Georgia Railway. It would cost approximately fifty million dollars, or substantially more than all the outstanding bond issues of the Company, to eliminate them by separation of the grades. The following is quoted from the report made by the Grade Crossing Committee of the National Association of Railway and Utilities Commissioners at Washington in November, 1920: "To eliminate all grade crossings in the United States would probably cost as much as all the railroads in the United States have cost."

Outstanding features of this question are: 1.—Inability of the railroads to eliminate all grade crossings at any period within present vision. 2.—The unreasonableness of some communities insisting upon the railroads doing things for them that cannot be done for all. Every community has its dangerous crossings.

One state could not reasonably expect the railroads to eliminate all of its grade crossings, unless the same thing were done in neighboring states—in all states. The same principle applies to cities and towns.

The railway grade crossing problem is usually considered from two viewpoints—the railways and the public. There is the viewpoint of engineers and firemen, which should be considered. Their duties are nerve-racking, and the habit of automobilists in racing to crossings, and darting upon the track immediately in front of locomotives has a great tendency to confuse and distress them. They do not want to be involved in accidents causing personal injury or loss of life. They ought to have some assurance that an automobile will be brought to a stop before it is permitted to cross a railway track.

The benefits derived from the elimination of grade crossings by the construction of overhead bridges and underpasses—the only plan promising absolute safety—accrue largely to the public in safety and convenience. Therefore, when crossings are eliminated, the expense should be divided on some fair basis between the taxpayers receiving the benefits and the railway.

The automobile, in proper hands, is an agency of safety at railway grade crossings. It can be driven up close to the tracks and stopped in perfect safety. That cannot always be done with a spirited horse. Therefore, the increasing use of the automobile and the decreasing use of the horse should be solving the grade crossing problem, instead of making it worse.

We recognize there are crossings that should be eliminated, but the crying need is for some plan of action that will prevent loss of life and destruction of property in automobile grade crossing accidents that can be put into effect immediately. One practicable remedy, which would cost but little, would be to inaugurate a great crusade against carelessness of automobilists at railway grade crossings. Require them to Stop, Look and Listen. No automobilist who does that will ever meet with an accident at a railway crossing.

Constructive criticism and suggestions are invited.
W. A. WINBURN,
President, Central of Georgia Railway Company.

ture on this page, is an example of one of these advertisements. Our illustration is reduced about one-half, in width and height, from the size in which the display is usually made.

The advertisements are published in cities adjacent to the Central's lines in Georgia, Alabama and Tennessee, and always deal with some topic of general or local interest. They are given to 28 daily papers and 66 weekly papers of general circulation.

Commission and Court News

Interstate Commerce Commission

The commission has suspended until July 30 the operation of schedules published by various carriers in Trunk Line and C. F. A. territories which propose reduced rates on iron ore.

The commission has suspended until July 30 the operation of certain schedules published by the Chicago, Burlington & Quincy which propose to increase the rates on slack coal from Sheridan, Wyo., district to Crawford, Neb., and other stations by from 40 to 74 cents a ton.

The commission has suspended until July 30 the operation of schedules making increases in export rates on iron and steel from C. F. A. territory to Texas Gulf ports, as shown in agent W. J. Kelly's tariff which propose to establish, for export, rates the same as the domestic rates from the same territory to New Orleans.

The commission has suspended until July 30 the operation of certain schedules published by the Illinois Central which propose reductions in rates on grain from points in Illinois to St. Louis, Mo., Cairo, Brookport, East St. Louis and Metropolis, Ill., Evansville, Ind., Louisville, Ky., and other Ohio River Crossings.

The Commission has ordered the cancellation of tariffs filed by the railroads proposing reduced rates on coal from mines in the Rock Springs and Kemmerer districts in Wyoming to points in Utah, south of Ogden, on the Oregon Short Line and its connections, on the ground of the relation between these rates and rates from Utah mines.

The Interstate Commerce Commission has issued a decision finding justified proposed reduced rates on bituminous coal from points on the Chesapeake & Ohio in Eastern Kentucky and West Virginia and consequent proposed reduced rates from destinations in Northern Tennessee, Eastern Kentucky and Southwestern Virginia on the Louisville & Nashville to points west of Louisville, Ky., on the St. Louis division of the Southern Railway in Indiana and Illinois and to St. Louis, Mo. The orders of suspension were vacated.

Restriction on Kansas Intrastate Rates Removed

The Commission on April 1 issued an order vacating its orders increasing intrastate rates in Kansas, which were issued to remove discrimination against interstate commerce following the increases in Ex Parte 74. By an order entered April 1 the Public Utilities Commission of Kansas, successor to the Court of Industrial Relations, has set aside the order of October 9, which authorized maximum increases in the intrastate rates less than those authorized by the federal commission as to interstate rates. The federal commission's order says that the increased intrastate rates prescribed by its orders will continue in effect as the lawfully established and applicable intrastate rates unless and until changed by further affirmative order of the competent authority of the state. The effect of this is to remove any cause for complaint that the state rates have been "frozen" by the order of the federal commission, the state commission is now free, without the necessity for applying to the interstate commission, to make adjustments in local rates, provided such local rates do not discriminate against interstate commerce.

Personnel of Commissions

President Harding on April 5 sent to the Senate the names of G. W. W. Hanger, I. H. Elthott and A. O. Wharton for reappointment as members of the Railroad Labor Board for a new term upon the expiration of their present term on April 15. He has not yet nominated anyone to succeed Albert Phillips, resigned.

Labor Board Decisions

Deny Reinstatement of Man 51 Years Old

A transferman employed by the American Railway Express was dismissed from service on January 8, 1921, for alleged inability to perform properly the duties assigned to him. The employees contend that this man executed adequately all work assigned to him, except heavy labor. The company states that the man was 51 years of age, was employed during war time and under normal conditions would not have been hired. Further, during the war period the volume of business was sufficiently large to enable the company to divide the work so as to give the lighter duties to this man. The Labor Board sustained the contention of the carrier.—*Decision No. 817.*

Management Is Judge of Qualifications

In a case brought against the Delaware, Lackawanna & Western by the United Brotherhood of Maintenance of Way Employees and Railway Shop Laborers, it was shown that four carpenters were laid off while men younger in the service were retained. The contention of the management was that the employees in question did not have the qualifications necessary to perform high grade carpenter work in an efficient manner within reasonable time. The Labor Board sustained the railroad, stating that the language of the agreement definitely leaves the matter largely in the hands of the carrier to determine whether or not an employee is capable of doing work.—*Decision No. 807.*

Engine Crew Granted Run-Around On A

Terminal Delay Feature

Enginemen Diggs and Pannell were assigned to the extra list, "first in, first out" on the Missouri, Kansas & Texas, at Denison, Texas. Engineman Diggs was called at 4:45 a. m. for a turn-around trip between Denison and Greenville over the Dallas division; and engineman Pannell was called at 5:25 a. m. to take a light engine from Denison to Waco, also over the Dallas division. He left the terminal at 5:25 a. m., while engineman Diggs did not leave until 7 a. m. The employees claim run around pay for the first crew called. The carrier claims that as engineman Diggs was called to move a train from Ray Yards and engineman Pannell, although called 40 minutes later, was assigned to handle a light engine from Denison roundhouse, starting from a point three miles east of Ray, engineman Diggs at no time ran around engineman Pannell, although both were moving in the same general direction to different terminals. However, the Labor Board decided that the first crew called had been run around in the terminal and should be paid 100 miles.—*Decision No. 774.*

To Ballot as To Whether O. R. T. is to Negotiate

For Agents and Agent Telegraphers

The Order of Railroad Telegraphers contends that this organization is entitled to negotiate an agreement with the Buffalo & Susquehanna covering rules and working conditions for agents, agent-telegraphers and telegraphers. In recent negotiations the carrier sought to exclude from the agreement employees classified as agents and agent-telegraphers, subsequently negotiating individually on acceptable terms with these employees. It contends that existing wages and working conditions are satisfactory and that there is no discussion among the employees. The Labor Board decided that a conference should be held on April 1, 1922, at which time a secret ballot should be canvassed between duly authorized representatives of the O. R. T. and of 100 or more unorganized employees, after which, the chosen representative shall proceed with the negotiation of rules.—*Decision No. 826.*

Practically the same decision was rendered by the Labor Board in the contention of the O. R. T. that this organization should negotiate for the agents and agent telegraphers on the Cincinnati, Indianapolis & Western.—*Decision No. 825.*

Foreign Railway News

Americans to Build Line in Jugo-Slavia

According to cable dispatches from Rome to the Philadelphia Public Ledger, a group of Americans, including the American Car & Foundry Company, the American Locomotive Company and the Equitable Trust Company, have received a concession from the Jugo-Slav government for the construction of a railway from the Adriatic ports of Spalato and Sebenico. The line, which will have many branches, will connect with the railways of Roumania by a bridge over the Danube and will be completed in six years. The estimated cost of the project is \$187,000,000. Interests in Trieste and Fiume are reported to be disturbed over the plan, since they see in the plan a probable diversion of Jugo-Slav traffic now passing through these Italian ports.

Austrian Railway Rates and Fares

LONDON.

A report to the Department of Overseas Trade, England, states that freight rates and passenger fares on the Austrian railways have been repeatedly increased in the endeavor to keep up with the fall in the value of the currency, though the deficit in working the railways has also steadily grown larger. Freight rates have, on the average, increased by 1,187 times and passenger fares by 465 times. The value of the Austrian crown in Vienna, compared with the pound, has in the meantime fallen to less than one fifteen-hundredth of its pre-war value and it therefore follows that most of the new rates when measured in sterling or other stable currency are still much below the pre-war rates.

Austria Builds 300 Locomotives in 1921

The locomotive works of Austria were well employed during 1921, chiefly on foreign orders, according to Commerce Reports. About 300 locomotives were built and delivered, as against 211 and 144 in the two preceding years. In order to keep up with the increased demand the leading firms have undertaken large additions and improvements of their plants. On account of the light demand within the country the railway car establishments were obliged to undertake foreign orders. They also had a great deal of repair work to do for foreign countries. It is difficult to obtain orders for cars from the Succession States because they are trying to get their cars from Germany by way of reparations payments.

Car Exports in December

In December our exports of freight cars totaled 298, valued at \$227,154. No passenger cars were shipped. Parts of cars exported totaled \$406,261 in value. Detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Freight and Other.		Parts of Cars. Dollars
	Number	Dollars	
England	14,198
Canada	80,337
Honduras	25	19,735	705
Mexico	33	71,225	14,352
Cuba	176	100,519	11,194
Dominican Republic	2,448
Brazil	144,905
Chile	1,126
Peru	1,109
Venezuela	2,000	125
Cbina	86,987
Japan	23,895
Australia	16	11,800	417
Philippine Islands	5,270
British So. Africa	1,173
British East Africa	45	21,875
Portuguese Africa	4,357
Egypt	6,083
Scotland	1,510
Argentina	2,633
Other Countries	3,537
Total	298	227,154	406,261

December Track Material Exports

Rail exports totaled 14,943 tons, valued at \$557,337, in December. Miscellaneous track materials shipped were valued at \$181,372 and spikes at \$24,203. Totals by countries, as compiled by the Bureau of Foreign and Domestic Commerce, are:

Countries	Railroad Spikes. Pounds	Rails of Steel. Tons	Switches, Frogs, Splice Bars, Etc.
			Dollars
England	38	19,440
Canada	9,070	2,242	50,069

Bill Allowing British Railways to Engage in Highway Transport

A bill has been presented in Parliament to allow the railways of the Northwestern and Midland group to engage in highway transport in competition with regular motor trucking concerns.

On the railroad's behalf it is argued that they should be allowed to enter this field and to transport goods by highway where it is cheaper to do so than by rail. If they are to be kept from the highways, they will be forced to meet competition of motor trucking concerns under unequal terms.

The shippers are contesting the granting of highway privileges to the railways for fear that they will reduce rates and put the trucking companies out of business and then raise rates again.

Against the shipper's position is the argument that railway rates are subject to review by the Railway Rates Tribunal and that, by law, rates must be sufficiently high to give a fixed return to the owners of the property. It is not, however, the standard class rates which the shippers object to, but the "exceptional" rates which are not less than 5 per cent or more than 40 per cent under standard charges which may be used to meet competition. The railways, however, are backing a clause in the bill to require road rates to be sufficiently high to provide returns to capital after expenses are paid.

The objections of shippers to the granting of the powers asked for are stated afresh in a letter which Sir W. Peter Rylands has addressed to the Warrington Chamber of Commerce. He accepts the statement of the railway companies that road transport is filching from them the most favorable types of traffic, which must, in consequence, have a tendency to put up the cost of the traffic for which road transport is less suited, but which, so far as it is raw material, largely constitutes the foundation of industry. The aggregate reduction of traffic may, in addition, tend to reduce the efficiency of the railways. On the other hand, it is pointed out that any serious development by the railway companies in the direction of road transport must tend to increase the amount of traffic diverted from the railways, and thereby aggravate the evil.

It is felt that it would be desirable that for a few years, at all events, the railway companies should devote their undivided energy and attention to improving the efficiency of the railways, and seek rather from that point of view to prevent any further diversion of traffic to the roads, rather than themselves take a hand in stimulating road transport. It is suggested that many things may happen during the next few years, including consideration of the question of the charges to be levied upon road transport as a contribution to wear and tear; also that railway companies might be well advised to delay a decision on such an important matter of policy until times are normal, rather than frame a policy when conditions are to a large extent abnormal, and may lead to errors of judgment. These arguments are not new, but their reiteration is evidence of the continued hostility of a section of the shipping community to the idea of railways engaging in road transport.

Equipment and Supplies

Locomotives

THE CHICAGO, PEORIA & ST. LOUIS is inquiring for 3 locomotives.

THE KENTUCKY & INDIANA TERMINAL is inquiring for 5 locomotives.

THE TENNESSEE CENTRAL is inquiring for from 4 to 6 Mikado type locomotives.

THE NEW JERSEY, INDIANA & ILLINOIS is inquiring for one Mogul type locomotive.

THE U. S. COAL & COKE COMPANY, Pittsburgh, Pa., is inquiring for one 6-wheel switching locomotive.

HOEKAIKO KOGYO TETSUDO, Japan, has ordered 2 prairie type locomotives from the Baldwin Locomotive Works.

THE MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE in the near future may ask for prices on about 10 locomotives.

THE TEMPLE LUMBER COMPANY, Pineland, Texas, has ordered one Mikado type locomotive from the Baldwin Locomotive Works.

THE ALABAMA & VICKSBURG has ordered 2 Mikado type and 1 Santa Fe type locomotives from the Baldwin Locomotive Works.

THE DELAWARE, LACKAWANNA & WESTERN has ordered 1, 4-wheel saddle tank switching locomotive from the Baldwin Locomotive Works.

THE INTERNATIONAL PAPER COMPANY, Glens Falls, N. Y., has ordered two 0-4-0, saddle tank switching locomotives from the Baldwin Locomotive Works.

DWIGHT P. ROBINSON & COMPANY, INC., New York City, has ordered from the Baldwin Locomotive Works, 12, 0-4-0 saddle tank locomotives for export to Brazil.

THE BUFFALO, ROCHESTER & PITTSBURGH reported in the *Railway Age* of February 18 as inquiring for 20 locomotives is now asking for 14 Mallet type, 5 Pacific type and 9 Switching locomotives.

THE CHICAGO, MILWAUKEE & ST. PAUL reported in the *Railway Age* of March 11, as inquiring for 50 Mikado type locomotives, has ordered from the Baldwin Locomotive Works, 25 Mikado type locomotives.

THE APALACHICOLA NORTHERN has ordered 2 Consolidation type locomotives from the American Locomotive Company. These locomotives will have 18 by 24 in. cylinders and a total weight in working order of 124,000 lb.

THE DENVER & RIO GRANDE WESTERN, reported in the *Railway Age* of February 18 as asking for prices on 20 Pacific type locomotives, has ordered 10 Mountain type locomotives from the American Locomotive Company.

THE SOLWAY PROCESS COMPANY, SYRACUSE, N. Y., has ordered two 4-wheel switching locomotives from the American Locomotive Company. These locomotives will have 13 by 20 in. cylinders and a total weight in working order of 65,000 lb.

THE LOUISVILLE & NASHVILLE, reported in the *Railway Age* of March 25 as inquiring for 6 Mikado type locomotives, has ordered this equipment from the American Locomotive Company. These locomotives will have 26 by 30 in. cylinders; a total weight in working order of 295,000 lb. and will be equipped with superheaters.

Freight Cars

THE PEORIA & ST. LOUIS is asking for prices on 400 refrigerator cars.

THE MISSOURI PACIFIC is inquiring for repairs to 200 refrigerator cars.

THE ARGENTINE STATE RAILWAYS are inquiring through the car builders for 50 caboose cars.

THE MERCHANTS' DISPATCH will build from 1,000 to 1,500 refrigerator cars at its own shops.

THE MISSOURI, KANSAS & TEXAS in the near future may ask for prices on 2,000 automobile cars.

THE AMERICAN REFRIGERATOR TRANSIT COMPANY, St. Louis, Mo., is inquiring for 2,000 refrigerator cars.

THE TENNESSEE CENTRAL is inquiring for 300 composite gondolas, 50 single sheath box cars, and 50 stock cars.

THE CHESAPEAKE & OHIO is asking for bids until April 17 for 1,500, 40-ton box cars and 200, 40-ton stock cars.

THE EAST INDIA RAILWAY COMPANY is inquiring through the car builders for 350 open and 150 covered goods wagons.

THE GRAND TRUNK is having 250 refrigerator cars repaired at the shops of the National Steel Car Corp., Hamilton, Ont.

THE LAKE CHAMPLAIN & MORIAH has ordered 10 ore cars and 12 ore car bodies, of 50-ton capacity, from the Pressed Steel Car Company.

THE JACOB DOLD PACKING COMPANY, Buffalo, New York, is inquiring for from 50 to 100 wooden refrigerator cars, with steel end sills, of 30 tons capacity.

THE CHICAGO & NORTH WESTERN, which was noted in the *Railway Age* of April 1 as having opened bids on inquiries for 3,100 freight cars, has rejected all bids. It has not been definitely decided when new inquiries will be called for.

Passenger Cars

THE SEABOARD AIR LINE is inquiring for 5 dining cars.

THE ST. LOUIS SOUTHWESTERN is inquiring for six chair cars and six coaches.

THE ARGENTINE STATE RAILWAYS, are inquiring through the car builders for 50 baggage cars.

THE COWLITZ CHEHALIS & CASCADE is in the market for a gasoline propelled motor passenger car, with seating capacity for 41 passengers and an eight-foot compartment for express.

THE BOSTON & MAINE reported in the *Railway Age* of March 11 as inquiring for 50 cars for passenger service and 25 milk cars, has ordered 65 coaches, 20 smoking cars, 8 combination smoking and baggage cars and 5 baggage and mail cars from the Osgood-Bradley Car Company and 25 milk cars from the Laconia Car Company.

THE PENNSYLVANIA RAILROAD has placed orders for the 250 cars for passenger service which were recently authorized, as noted in the *Railway Age* of March 11. The orders were distributed as follows: Pressed Steel Car Company, 75 coaches; American Car & Foundry Company, 65 coaches; Standard Steel Car Company, 50 coaches; Bethlehem Shipbuilding Corporation, Harlan Plant, 35 combination passenger and baggage cars and the Pullman Company, 25 combination baggage and mail cars.

Iron and Steel

THE NEW YORK CENTRAL will receive bids until 12 o'clock noon, April 20, for 32,000 tons of rail.

THE CHICAGO & EASTERN ILLINOIS has ordered 1,250 100 per cent rail joints from the Rail Joint Company.

THE ATCHISON, TOPEKA & SANTA FE has ordered 18,000 100 per cent joints from the Rail Joint Company.

THE NASHVILLE, CHATTANOOGA & ST. LOUIS has ordered 2,000 tons of rails from the Tennessee Coal Iron & Railroad Co.

THE CHICAGO, INDIANAPOLIS & LOUISVILLE has placed an order for a number of 100 per cent rail joints with the Rail Joint Company.

THE SOUTHERN RAILWAY, reported in the *Railway Age* of March 18, as inquiring for 26,000 tons of 85 lb. rail, has ordered this tonnage from the Tennessee Coal, Iron & Railroad Co.

Machinery and Tools

THE VIRGINIAN RAILWAY has given an order to the Industrial Works for a 200-ton wrecking crane, and has also given an order to the American Hoist & Derrick Company, for one American ditcher.

THE ATCHISON, TOPEKA & SANTA FE is inquiring for one heavy-duty double-end car axle lathe with motor drive, one 90-in. motor driven driving wheel lathe, one wheel press, one four-foot radial drill and one 300-lb. Beadry hammer.

Miscellaneous

THE WABASH has placed an order with the Illinois Steel Company for 160,000 tie plates.

THE MISSOURI PACIFIC has placed an order with the Railway Supply Company for 500,000 tie plates.

THE MISSOURI, KANSAS & TEXAS is inquiring for 360 wheels (135 tons) for the 30 passenger coaches, inquiry for which was noted in *Railway Age* of March 25.

THE CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS is inquiring for 75 low switch stands and two No. 10, 90-lb. manganese frogs, bids on which are due before noon, April 14.

THE IMPERIAL JAPANESE GOVERNMENT RAILWAYS have ordered through Mitsubishi Shoji Kaisha, Ltd., 120 Broadway, New York City, 3,500 steel ties from the Consolidated Steel Corporation.

THE CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS is inquiring for bolts, screws, nuts, shapes and bars, plates, billets, locomotive tires, nails, wire, axles, and tubes, to be supplied for the period from April 1, 1922, to July 1, bids on which must be in by 12 o'clock, noon, April 10.

THE HOUSE COMMITTEE on labor, which has been holding hearings this week regarding the coal situation, at which President Lewis of the United Mine Workers testified, on April 4 ordered telegrams sent to a large number of bituminous coal operators in the central competitive field asking them to meet officials of the miners' union on April 10 to negotiate a new wage agreement. Mr. Lewis had stated that if sufficient of the operators responded to this request, it would be ample basis for negotiations for new contracts.

Supply Trade News

H. H. Bingham, vice-president, secretary and controller of the Charcoal Iron Company of America, Detroit, Mich., has been made general manager, succeeding F. W. Hutchings, resigned.

The Pyrene Manufacturing Company, Inc., has moved its offices and factory into a modern fireproof building at 520 Belmont avenue, Newark, N. J. The general offices formerly were in New York City and all manufacturing departments are now located under one roof.

Howard K. Moore, secretary of the Portsmouth-Solvay Coke Company prior to its joint absorption by the Wheeling Steel Corporation and the American Rolling Mill Company, has been appointed assistant general manager of the Steubenville, Ohio, works, Wheeling Steel Corporation.

Combustion Engineering Corporation, New York City, announce the opening of a new branch office at 1137 Guardian building, Cleveland, Ohio. This office will be in charge of Frank Henderson, who has been associated with several stoker companies in this territory for many years.

R. C. Haley, salesman and inspector for the United States Light & Heating Corporation resigned on March 10, to accept the position of sales engineer with the Edison Storage

R. C. Haley

Battery Company, with office in the Railway Exchange building, St. Louis, Mo. Mr. Haley will have charge of sales and service for the car lighting, signaling and industrial trucks in the central southern territory for the railway department. He entered the railway electrical field in 1899 with the Wagner Electric Company in St. Louis, and in 1902, he became associated with the Consolidated Electric Lighting and Equipment Company of New York. In 1906, when the Missouri Pacific

equipped a number of its cars with axle lighting equipment, Mr. Haley was appointed assistant chief electrician of that road. He also became associated with the electrical department of the St. Louis-San Francisco and later, for a second time, with the Consolidated Railway Electric Lighting and Equipment Company. In 1907 he entered the service of the Bliss Electric Car Lighting Company at Milwaukee, Wis., and a few years later when this organization was merged into the present United States Light & Heating Corporation, Mr. Haley was appointed salesman and inspector, which position he held until his recent appointment.

H. Fowler has been appointed district sales manager of the Cincinnati, Ohio, territory of the Carborundum Company, Niagara Falls, N. Y., succeeding C. R. Cox. The appointment will be effective July 1 when Mr. Cox will be transferred to the main office as sales statistician.

A. E. Nelson, district sales representative of the National Cast Iron Pipe Company, with headquarters at Kansas City, Mo., has been promoted to western sales manager, with headquarters at the main office in the Peoples Gas building, Chicago, succeeding W. E. Neal, who has resigned to accept a similar position with the Somerville Iron Works, Somerville, N. J., with headquarters at Chicago.

H. B. Thurston on April 1 was appointed sales manager of the **Talmage Manufacturing Company**, Cleveland, Ohio. Mr. Thurston has been connected for the past ten years with the Bureau of Locomotive Inspection, Interstate Commerce Commission, in charge of its work in the Pittsburgh district.

A. P. Blackstead, formerly chief engineer of the Camden Iron Works, Camden, N. J., and prior to that hydraulic engineer of the Henry R. Worthington Company, New York, has become associated with the engineering staff of the **Dayton-Dowd Company**, Quincy, Ill., manufacturers of centrifugal and fire pumps.

The **Detroit Seamless Steel Tubes Company**, Detroit, Mich., has established its own branch sales office in the Canadian Pacific building, 342 Madison avenue, New York City. H. C. Kensing has been appointed sales manager for the New York territory. Mr. Kensing was formerly manager of the steel tubing department in the New York branch of the U. T. Hungerford Brass & Copper Company.

The **Westinghouse Electric & Manufacturing Company**, has separated the power and railway divisions of the Pittsburgh office. **Barton Steveson**, who has been manager of both divisions, will continue as manager of the power division and **F. G. Hickling** has been appointed manager of the railway division; **S. R. Shave** has been appointed manager of the price section of both the power and railway divisions in the Pittsburgh office.

American Brake Shoe and Foundry Company

The report of the American Brake Shoe and Foundry Company for the year ended December 31, 1921, shows net income of \$1,320,271 after all charges and federal taxes, equivalent after dividends on subsidiary companies' stocks and preferred dividends to \$4.41 a share on the company's outstanding common stock of no par value. This compares with \$2,571,848, or \$13.08 a share in the previous year.

Joseph B. Terbell, president, in his statement to the stockholders says in part:

"Your company has passed through one of the most trying years in its experience. Incoming orders during the first half of the year were at a very low ebb, but in July an improvement was noticeable and continued throughout the last six months. The amount of sales at no time reached a normal volume.

"During the present year every effort will be made to reduce production costs to the lowest possible level consistent with good management and maintenance of our present standard and quality of product. We expect a further reduction in costs will enable our sales force to make substantial increases in the volume of sales in all departments.

"Competition is very keen and our products are being sold on a narrow margin of profit. For our earnings we are, therefore, relying on the volume of business transacted rather than on a high percentage of profit. While there are many unfavorable features in the present situation, the general exhaustion of the stocks of our products in the hands of our customers should necessitate their now buying in amounts equal to their current consumption. This, we anticipate will result in a substantial increase in incoming orders as compared with 1921."

The consolidated balance sheet of the American Brake Shoe and Foundry Company, as of December 31, 1921, follows:

ASSETS		
Cash		19,711
Marketable securities and investments		\$596,066
Accounts receivable		985,398
Notes and mortgages receivable		2,798,733
Inventory		406,556
Deferred assets		2,648,304
Capital stocks of associated companies		108,809
Plant and equipment less depreciation		3,880,162
Patents, goodwill, etc.		5,953,485
		6,817,134
		\$11,194,116
LIABILITIES		
Accounts and wages payable		\$1,110,873
Federal taxes (estimated)		262,136
Unpaid debt		170,000
Reserves		179,008
Preferred stock		9,518,300
Common stock		*11,781,719
Capital stock of subsidiary companies		1,800
		\$11,194,116

* Outstanding 148,851 shares of no par value represented by surplus of \$11,781,719.

Western Electric Company

The total sales of the Western Electric Company, Incorporated, for the year ended December 31, 1921, were \$189,765,000, which compares with \$206,112,000 in 1920. The unfilled orders of the company at December 31, 1921, aggregated \$75,525,000, as compared with \$82,655,000 at the end of the year 1920, and \$47,442,000 at the end of the year 1919.

The net earnings for the year 1921 were \$10,166,337, out of which were paid interest amounting to \$5,842,340 and dividends amounting to \$3,500,000—\$10 per share on the common stock—leaving a balance carried to common stock of \$823,997. This compares with net earnings of \$8,277,414 and a balance of \$894,769 in the previous year.

The company's bills payable were reduced during the year from \$42,730,000 to \$29,050,000, a reduction of \$13,700,000, while the cash on hand increased \$5,438,000, making a total improvement for the year in its financial position of \$19,138,000. In the two months since the end of the year, according to the company's annual report, a further improvement of about \$8,500,000 has been made in the financial position.

The balance sheet, December 31, 1921, follows:

ASSETS		
Total plant		\$45,569,836
Merchandise	\$58,978,025	
Cash	13,262,880	
Bills receivable	779,019	
Trade acceptances	573,474	
Marketable securities	833,268	
Accounts receivable	39,035,927	
Total current assets		113,462,593
Trustees, employees' bond purchase plan		465,464
Sundry investments		2,315,471
International Western Electric Company, Incorporated, of Delaware		17,988,053
Grand total		\$179,801,417
LIABILITIES		
Common stock, 500,000 shares authorized, 350,000 shares issued, no par value	\$58,773,450

Total current liabilities		43,084,549
Reserve for depreciation on plant	27,924,413	
Reserve for employees' benefit fund	1,600,000	
Reserve for contingencies	4,819,005	
Total reserves		34,343,418
Grand total		\$179,801,417

Trade Publications

ELECTRIC HEADLIGHTS.—The Pyle National Company, Chicago, has recently issued a 22-page illustrated catalog (No. 101) describing its line of electric lighting equipment and accessories for locomotives, shops and yards. Sectional views show the construction, adjustment and maintenance of headlights, turbo-generators, flood-light units and switches. Diagrams of the complete circuits for locomotives are given, together with lists of material and directions for installation.

OUTSPINNING THE SPIDER.—An interesting book of 137 pages, illustrated, has recently been issued by John A. Roehling's Sons Company, Trenton, N. J., in which the history of wire is traced from its development. The story is told in a smooth, easy-reading, non-technical manner beginning at the time of the first wire cable built by the founder of the company, up through the increasing uses for such products, the building of suspension bridges, to the manufacturing processes of making all forms of modern finished wire, from furnace to shipping room.

LAP ROBES, free, may be had by passengers on the Baltimore & Ohio trains 5, 6, 7 and 8 between New York and Chicago when they desire to make use of the observation end of the train to enjoy the scenery. It is found that many passengers like to watch a sunrise, sunset or other scenic effect while enjoying the fresh air; but at this time of the year the early morning air may be too chilly on the observation platform, without protection, so lap robes were provided. These robes may be obtained from the Pullman conductor or porter upon request. The innovation has proven popular so far.

Railway Construction

BOSTON & MAINE.—This company is contemplating the construction of an engine house at Portsmouth, N. H.

CANADIAN PACIFIC.—Work is progressing on the extension of this company's line from Kipawa to Les Quinze at the further end of Lake Temiskaming, 800 men being at present employed on the work.

CENTRAL OF NEW JERSEY.—This company is constructing a new bridge across the Lehigh river at Nesquehoning, Pa., in connection with a revision of line at this point. S. B. Mutchler & Co., Newark, N. J., has the contract for the substructure and the Bethlehem Steel Bridge Corporation for the superstructure which will be five deck plate spans each 93 ft. long. The new structure will be on a six degree curve instead of ten degrees as with the old. The cost is estimated at about \$850,000. A new interlocking plant will be installed also.

ELDORADO & SANTA FE.—This company has applied to the Interstate Commerce Commission for a certificate authorizing the construction of three lines in Kansas, one line of 3 miles in Chase county, another of 38 miles in Chase and Butler counties and another of 2½ miles in Butler county. It is stated that the first and second lines with the existing line of the Atchison, Topeka & Santa Fe will furnish a direct route from Ellinor to Eldorado, reducing the haul for through trains by 13.65 miles, and that the third line, together with 1½ miles of the second line, will furnish a belt line around the east side of the city of Eldorado.

ILLINOIS CENTRAL.—This company, the Bloomington & Normal Railway and Light Company and the Union Gas & Electric Company are named as defendants in a petition of the City of Bloomington, Ill., set for a hearing before the Illinois Commerce Commission at Springfield, Ill., April 4, involving the separation at grades at Washington, Clay, Justin and Grove streets in Bloomington.

OREGON SHORT LINE.—This company has applied to the Interstate Commerce Commission for a certificate authorizing the construction of a branch line from Homedale, Ida., in a southeasterly direction for 7½ miles.

PENNSYLVANIA.—This company has announced that it will undertake additions and betterments in the Pittsburgh district to cost about \$8,000,000, details of which will be announced later.

PENNSYLVANIA.—This company has entered into an agreement with the Pere Marquette, the Wabash and the Union Station in Detroit, under which it has obtained trackage rights over the Ann Arbor from Toledo to Lexa Junction, from which point trains will be operated over the Pere Marquette to Carlton, thence over 20 miles of line to be constructed by the Pennsylvania to Del Rae, beyond which trains will be operated over the Wabash to River Rouge Junction and thence over the Pere Marquette to the Union Station. Included in the 20 miles of new line to be constructed by the Pennsylvania in the near future, will be a terminal yard at Del Rae.

PERE MARQUETTE.—This company has completed plans for a \$7,500 heating plant for installation in its resort hotel at Charlevoix, Mich., in time for the opening of the hotel about July 1.

VIRGINIAN & WESTERN.—This company has applied to the Interstate Commerce Commission for authority for the construction of a line of 3.6 miles in Wyoming county, Virginia, to be leased to the Virginian, which has also applied for authority for the lease.

WESTERN PACIFIC.—This company, now owner of the Sacramento Northern, an electric line running from Sacramento to Chico, with branches to Oroville, Colusa and Woodland, and owner also of a line extending from Woodland to Fairfield, has begun surveys for an extension of approximately 42 miles from Woodland to Vacaville, and from the terminus on its tracks near Fairfield to the vicinity of Vallejo.

Railway Financial News

ANN ARBOR.—*Railroad Sustained.*—A decision has been handed down in the Court of Appeals, State of Ohio, sustaining the contention of this company that the reorganization of the Pere Marquette five years ago automatically terminated the contract for the use of the Ann Arbor terminal at Toledo, Ohio, by the Pere Marquette and requiring the latter road to enter into a new contract, retroactive five years.

ATLANTA, BIRMINGHAM & ATLANTIC.—*Proposes State Purchase.*—Senator Frank Manson, representing the Atlanta district, recently proposed that the state of Georgia purchase this road, which is now in the hands of receivers and in danger of being scrapped. Mr. Manson said that many members of the legislature from sections contiguous to the road had promised to support the plan and indicated that such a bill would be offered in the legislature this summer. He expressed the opinion that the Atlanta, Birmingham & Atlantic could be purchased for \$10,000,000 by issuance of bonds.

ATLANTIC & CAROLINA.—*Asks Certificate to Operate Line.*—This company has applied to the Interstate Commerce Commission for a certificate authorizing the operation of the Atlantic & Carolina Terminal, formerly operated as a private logging road.

BOSTON & MAINE.—*Annual Report.*—The annual report issued Thursday shows the corporate income for the year ended December 31, 1921:

	1921	1920
Railway operating revenue	\$78,477,418	\$75,539,327
Railway operating expenses	73,158,885	76,346,024
Net railway operating revenue	5,318,533	Def. 806,697
Railway tax accruals	2,728,224	2,469,913
Railway operating income	2,583,028	Def. 3,312,291
Total non-operating income	1,568,332	14,536,286
Gross income	4,151,360	11,223,995
Hire of freight cars—debit balance	3,178,427	3,866,942
Interest on funded debt	5,966,305	5,272,223
Net deduction from gross income	10,763,781	10,609,265
Net income	Def. 6,612,421	614,730
Income applied to sinking funds	205,836	410,978
Dividends	1,227,948
Equipment trust installments	548,979	340,496
Net appropriation of income	754,815	1,979,423
Net deficit transferred to profit and loss	7,367,236	3,366,692
* Interest amounting to \$141,230 accrued on bonds held in sinking funds is included below in account "Income Applied to Sinking Funds."		

The annual report of the Boston & Maine will be reviewed editorially in next week's issue.

CHICAGO & ILLINOIS MIDLAND.—*Authorized to Issue Notes.*—The Interstate Commerce Commission has authorized an issue of \$484,000 of 7 per cent promissory notes, the proceeds to be used in payment for rebuilt equipment.

CHICAGO & ILLINOIS WESTERN.—*Bond Authorization Modified.*—The Interstate Commerce Commission has issued a modification of its previous order to authorize this company to issue \$291,000 of 7 per cent non-cumulative preferred stock instead of \$600,000.

CHICAGO GREAT WESTERN.—*Annual Report.*—The annual report issued this week shows an income statement for December 31, 1921, as follows:

	*1921	1920
Operating revenues	\$24,273,653	\$24,032,435
Operating expenses	20,989,981	26,452,243
Net revenue from operating	\$3,283,672	Def. 2,419,808
Taxes	899,938	1,010,657
Railway operating income	\$2,383,085	Def. \$3,429,543
Equipment, rents, debit	776,909	29,933
Joint facilities, debit	792,495	698,868
Net operating income	\$812,681	Def. \$4,158,341
Received from U. S. Government	3,185,000
Net income	\$812,681	Def. \$973,344
Other income	376,552	683,211
Gross income	\$1,189,233	Def. \$290,133
Deductions from gross	1,781,834	1,665,036
Net deficit	\$592,601	\$1,955,169
Lap-over adjustment, credit	406,794
Net deficit	\$592,601	\$1,548,375

*Guarantee period lap-over items excluded.

CINCINNATI, INDIANAPOLIS & WESTERN.—*Authorized to Procure the Authentication and Delivery of Bonds.*—This company has been authorized by the Interstate Commerce Commission to procure the authentication and delivery of \$1,129,000 of first mortgage 5 per cent gold bonds to be held in its treasury.

CISCO & NORTHEASTERN.—*Application for Loan Approved.*—The Interstate Commerce Commission has approved a loan of \$114,500 to this company to assist it in making additions and betterments.

DELAWARE & HUDSON.—*Asks Authority to Issue Bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue \$7,500,000 of 15-year 5½ per cent gold bonds to be sold at not less than 84 or pledged at not less than 70. It is proposed to use \$6,024,000 to discharge or refund at maturity on July 1 a like amount of first lien equipment 4½ per cent bonds and the balance to discharge or refund demand notes.

DENVER & RIO GRANDE.—*Time Extended.*—The Hammond committee has extended until April 21, 1922, the time for depositing the Denver & Rio Grande first refunding mortgage 5 per cent gold bonds under the reorganization agreement dated January 27, 1922. Arrangements have been made for the purchase of the coupon dated February 1, 1922, as heretofore. More than 25 per cent of the \$31,114,000 bonds outstanding have been deposited under the plan.

The Sutro committee, representing the 7 per cent cumulative adjustment mortgage bonds, has announced an extension of time to and including April 21, 1922, for the deposit of bonds and certificates of deposit representing the same.

James H. Perkins, chairman of the protective committee of the Denver & Rio Grande first and refunding 5 per cent bonds, stated that the time for the deposit of these bonds under the deposit agreement of January 31, 1922, has been extended until and including April 21.

EASTERN MAINE.—*Asks Authority to Issue Securities.*—This company, which has been organized to build a line of 128 miles to Bangor, Me., has filed an application with the Interstate Commerce Commission for authority to issue \$1,400,000 of common stock and \$7,000,000 of 30-year, 7 per cent gold bonds.

HOCKING VALLEY.—*New Director.*—Thomas J. Davis, of Cincinnati, has been elected a director to succeed John Galvin, deceased.

MANILA RAILROAD.—*Trustee of Bond Issue.*—The Chase National Bank has been appointed trustee of an issue of \$1,500,000 Manila Railroad Company 15-year 7 per cent sinking fund collateral bonds, principal and interest guaranteed by the government of the Philippine Islands.

NEW YORK, NEW HAVEN & HARTFORD.—*Time Extension for Depositing Debentures.*—The time limit for the deposit of dollar and franc debentures under the terms of the plan for handling the \$27,582,691 European loan has been extended from April 1 to April 15, 1922. The dollar debentures may be deposited with the Bankers Trust Company of New York, with the Old Colony Trust Company of Boston, or with Drexel & Co., of Philadelphia. The franc debentures may be deposited with the Equitable Trust Company in New York, Paris, or London, or with the American Trust Company in Boston, or the Rhode Island Hospital Trust Company in Providence.

A writ of attachment against the New York, New Haven & Hartford was served on April 3 upon C. F. Hall, assistant treasurer at the Grand Central Terminal, New York City, in an action begun by Howard Major and Charles B. Squier, seeking judgment in the amount of \$10,000 and \$20,000 respectively. Their petition, made before Supreme Court Justice Lehman, charges that the company failed to meet on April 1 last maturing franc debenture bonds included in the European loan which the railroad company is endeavoring to extend until 1925.

The Interstate Commerce Commission has authorized the New Haven to extend its European debentures. See *Railway Age* March 25, 1922, page 763.

NORFOLK & WESTERN.—*Notes Paid.*—An issue of \$1,000,000 three-year 6 per cent collateral trust gold notes extended to April 1, 1922, were paid off at maturity at the office of the Central Union Trust Company, New York City. The issue

fell due on April 1, 1920, but was extended at that time to April 1, 1922, with interest at 7 per cent.

NORFOLK & WESTERN.—*Annual Report.*—See article on another page of this issue entitled "N. & W. Increases Net Operating Revenues 373 Per Cent."

PENNSYLVANIA.—*Annual Report.*—The corporate income for the year ended December 31, 1921, compares as follows:

	1921	*1920
Railway operating revenues:		
Freight	\$328,932,914
Passenger	129,324,480
Total, including other	500,175,084
Railway operating expenses:		
Maintenance of way and structures	61,093,428
Maintenance of equipment	132,091,758
Traffic	5,312,286
Transportation	210,350,455
General	13,636,341
Total, including other	430,758,629
Net railway operating income	41,221,968	\$11,965,688
Non-operating income:		
Miscellaneous rent income	1,967,267	1,905,996
Dividend income	15,988,560	14,771,513
Income from funded securities	2,297,795	1,885,520
Income from unfunded securities accounts	5,894,663	4,337,849
Miscellaneous income	11,201,264	616,418
Total non-operating income, including other	38,036,467	24,562,834
Gross income	79,258,435	87,666,701
Deductions from gross income:		
Rent from leased roads	15,617,101	22,741,979
Interest on funded debt	25,808,688	18,448,750
Interest on unfunded debt	8,803,980	7,826,208
Total deductions from gross income, including other	54,950,766	54,865,028
Net income	24,307,669	32,801,673
Disposition of net income:		
Income applied to sinking and other reserve funds	1,147,830	2,239,790
Dividend appropriations of income (4 per cent in 1921; 6 per cent in 1920)	19,966,936	29,950,404
Construction expenditures on leased and branch roads directly operated, borne by the Pennsylvania Railroad Company	2,759,796
Balance transferred to credit of profit and loss	433,107	611,479

*Operation during 1920 having been for two months under federal control, for six months under the government's guaranty, and for four months without government relationship, no comparisons of items of railway operating revenues, expenses, etc., are shown in this statement.

The annual report of the Pennsylvania is reviewed in an article on another page of this issue entitled "Remarkable Improvement Shown by Pennsylvania."

New Director.—Spencer O. Gilbert has been elected a director to fill the unexpired term of Joseph Wood, who died March 4 last.

PERE MARQUETTE.—*Dividends.*—This company has declared a dividend of 1½ per cent on the 5 per cent preferred stock for the four months ending April 30 and 1 per cent on account of the arrearage of the cumulative dividend on the same stock. The regular 1¼ per cent prior preference has also been declared. All dividends are payable May 1 to stock of record April 15. Hereafter dividends on the preferred stock will be payable quarterly on the same dates as those on which dividends are paid on the prior preference.

PITTSBURGH, BESSEMER & LAKE ERIE.—*New Director.*—J. G. Frazer has been elected a director to succeed D. M. Clemson, retired.

ST. LOUIS-SAN FRANCISCO.—*Asks Authority to Issue Bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue \$11,453,000 of prior lien 5½ per cent gold bonds to be sold at not less than 80 or pledged at not less than 70. It is proposed to issue \$10,932,000 in lieu of and on surrender of a like amount of prior lien 6 per cent gold bonds authorized by the commission last year and the balance to provide for the refunding of equipment notes.

Railroad Administration Settlements

The United States Railroad Administration reports the following final settlements, and has paid out to the several roads the following amounts:

New England Steamship Company	\$100,000
Wilkes-Barre Connecting Railroad Company	27,500
Chicago Heights Terminal Transfer Railroad Company	500

The payment of these claims on final settlement is largely made up of balance of compensation due, but includes all other disputed items as between the railroad companies and the administration during the 26 months of federal control.

Sales of Equipment Trust Certificates

The director general has announced additional sales at par plus accrued interest, of railroad equipment trust certificates held by the government, to:

Alfred Borden, New York:	
Detroit, Toledo & Ironton, 1923 to 1935, inclusive.....	\$487,500
Speyer & Company, New York:	
Wabash, 1923 to 1935, inclusive.....	6,546,800
	<hr/>
	\$7,034,300

The sales comprise approximately two-thirds of all the maturities of these equipment trust issues. The balance of one-third of all maturities will be stamped as subordinated, in accordance with the agreement as amended under the plan recently announced. The total amount of equipment trust certificates sold by the government to date, at par plus accrued interest, is \$228,115,200.

Payments to Railroads

Total payments by the Treasury Department to railroads and other transportation companies under various provisions of the Transportation Act up to March 31, according to an announcement issued by the Treasury Department on April 1, have been as follows:

(a) Under Section 204, as amended by Section 212, for reimbursement of deficits during Federal control:		
(1) Final payments, including partial payments previously made.....	\$1,378,369	
(2) Partial payments to carriers as to which a certificate for final payment has not been received by the Treasury from the Interstate Commerce Commission.....	1,815,841	
Total payments account reimbursement of deficits.....		\$3,194,210
(b) Under Section 209, as amended by Section 212, for guaranty in respect to railway operating income for first six months after Federal control:		
(1) Final payments, including advances and partial payments previously made.....	8,248,174	
(2) Advances to carriers as to which a certificate for final payment has not been received by the Treasury from the Interstate Commerce Commission.....	259,510,874	
(3) Partial payments to carriers as to which a certificate for final payment has not been received, as stated above.....	164,652,775	
Total payments account of said guaranty.....		432,411,823
(c) Under Section 210, for loans from the revolving fund of \$300,000,000 therein provided.....	298,478,717	
Total.....		\$734,084,750

Repayments of loans amounting to \$74,003,570 have been made by 22 companies.

Dividends Declared

Atchison, Topeka & Santa Fe.—Common, \$1.50, quarterly, payable June 1 to holders of record May 5.
 Bangor & Aroostook.—Common, 2 per cent; preferred, 3½ per cent; both payable April 1.
 Delaware, Lackawanna & Western.—3 per cent, quarterly, payable April 20 to holders of record April 8.
 Georgia Railroad & Banking.—3 per cent, quarterly, payable April 15 to holders of record April 1.
 Meadville, Conneaut & Linesville.—2 per cent, payable April 1 to holders of record March 15.
 New London Northern.—2½ per cent, quarterly, payable April 1 to holders of record March 16.
 New York, Chicago & St. Louis.—First preferred, \$1.25, quarterly, payable April 20 to holders of record April 8; first preferred, \$1.25, quarterly, payable June 30 to holders of record June 19; first preferred, \$1.25, quarterly, payable September 30 to holders of record September 19; first preferred, \$1.25, quarterly, payable December 30 to holders of record December 19; second preferred, \$1.25, quarterly, payable April 20 to holders of record April 8.
 Pere Marquette.—Five per cent preferred stock, 2½ per cent; five per cent prior preference stock, 1½ per cent; both payable May 1 to holders of record April 15.
 Pittsburgh & West Virginia.—Preferred, 1½ per cent, quarterly, payable May 31 to holders of record May 3.

Trend of Railway Stock and Bond Prices

Railway Officers

Executive

W. A. Colston has resigned as director of the Bureau of Finance of the Interstate Commerce Commission and has been appointed vice-president and general counsel of the New York, Chicago & St. Louis, succeeding H. D. Howe, deceased.

G. W. Lupton, superintendent of terminals of the Atchison, Topeka & Santa Fe at San Francisco, Cal., has been appointed assistant to the vice-president in charge of operation, with headquarters at Chicago, effective April 1, to succeed W. K. Etter, whose appointment as acting general manager of the Eastern lines, with headquarters at Topeka, Kan., was announced in the *Railway Age* of April 1.

J. B. Finley, whose promotion to vice-president and general manager of the Southern Pacific of Mexico, with headquarters at Empalme, Sonora, was reported in the *Railway Age* of March 25, was born November 22, 1856, at Santa Rosa, Cal., and entered railway service in September, 1882, as a warehouseman on the Southern Pacific of Mexico. He was employed in 1883 as a car sealer, from 1884 to 1886 as a car carpenter, from 1887 to 1897 as master car repairer, and in 1908 became general storekeeper following which he served in the capacities of master car repairer, commissary agent, and purchasing agent until 1911, when he became assistant general superintendent.

J. B. Finley

He held this position until September 1, 1920, when he was promoted to general superintendent, the position he occupied at the time of his promotion to vice-president and general manager on March 1, 1922.

Financial, Legal and Accounting

J. W. Broome has been elected secretary and assistant treasurer of the Western Maryland with headquarters at New York. S. R. Gehlert has been appointed treasurer and assistant secretary with headquarters at Baltimore, Md.

M. L. Countryman, general solicitor of the Great Northern, whose promotion to general counsel, with headquarters at St. Paul, to succeed E. T. Lindley, was noted in the *Railway Age* of March 4, has been elected vice-president as well as general counsel. F. G. Dorety, assistant general counsel, has been promoted to general solicitor to succeed Mr. Countryman. A. L. Janes, assistant general solicitor, has been promoted to assistant general counsel to succeed Mr. Dorety. R. J. Hagman has been promoted to assistant general solicitor to succeed Mr. Janes.

F. G. Dorety, assistant general counsel of the Great Northern who has been promoted to general solicitor with headquarters at St. Paul, Minn., was born on July 20, 1878, at Boston, Mass., and studied law at the University of California and Harvard University from which he graduated in 1900 and 1903, respectively. He entered railway service on October 1, 1908, as an assistant attorney on the Great Northern at Seattle, Wash., since which he has served as attorney

from 1910 to 1915; attorney for the Great Northern and for Oregon-Washington Railroad & Navigation Company from 1915 to 1918; and assistant general counsel of the Great Northern with headquarters at St. Paul from 1918 to the time of his recent promotion. As general solicitor, Mr. Dorey will have general jurisdiction over all litigation and legal matters throughout the system except the Canadian provinces.

Edith Jarvis Alden, who has been doing confidential work in the office of the secretary and treasurer of the Chicago, Burlington & Quincy for a number of years, has been elected assistant secretary of the corporation to succeed H. E. Jarvis, resigned. Mrs. Alden was born and educated in Burlington, Iowa, and entered the service of the Burlington in May, 1918, as an assistant in the treasury department in charge of liberty bonds. Upon the completion of this work in 1921, she became an assistant to H. E. Jarvis, until November of that year, when she assumed the office of assistant secretary left vacant as the result of the absence of Mr. Jarvis on account of ill-health. Her appointment as assistant secretary took effect March 9.

Edith J. Alden

M. L. Countryman, whose election as vice-president and general counsel of the Great Northern, with headquarters at St. Paul, was announced in the *Railway Age* of March 4, was born at Nininger, Minn., on August 27, 1862, and studied law at Washington University, St. Louis, Mo., from which he was graduated in 1886. Mr. Countryman entered the service of the Great Northern in 1903 as an assistant general solicitor with headquarters at St. Paul, and held this position until 1916, when he was promoted to general attorney, with the same headquarters. He was promoted to general solicitor in 1918, and held this position with headquarters also at St. Paul, Minnesota, until his recent election as vice-president and general counsel.

Underwood & Underwood Studios, N. Y.

M. L. Countryman

Operating

W. C. Showalter has been appointed acting superintendent of the Seattle division of the Northern Pacific with headquarters at Seattle, Wash., to succeed **T. H. Lantry**, appointed acting general superintendent, Western lines, with headquarters at Seattle. Mr. Lantry succeeds **A. D. Brown** who has been appointed acting general manager, Lines West, with headquarters at Seattle succeeding **E. C. Blanchard** who has been elected to serve on the Train Service Board of Adjustment for the Western Region with offices in Chicago, for the period April 1 to August 1.

W. E. Canning, whose appointment as superintendent of the Long Island was announced in the *Railway Age* of April 1,

page 855, was born on February 5, 1867, at Jamaica, Queensboro, New York City, and was educated in the public schools of Jamaica. He entered the service of the Long Island as a messenger in the train dispatcher's office in 1880 and two years thereafter became a telegraph operator. During the next forty years, up until the time of his recent appointment, Mr. Canning has served as towerman, train dispatcher, chief dispatcher, assistant train master, freight train master, assistant superintendent and superintendent of freight transportation.

C. D. Baker, whose appointment as general superintendent of the Long Island was announced in the *Railway Age* of April 1, page 855, was born on September 21, 1873, at Suffern, New York. He was graduated from Rockland College in 1890 and entered the service of the Long Island in 1891 as a car record clerk. Subsequently he served successively as staff record clerk, stenographer and clerk, timekeeper in the transportation department and chief clerk to the general superintendent. In 1909 he was appointed train master in charge of electric lines and four years later had his jurisdiction extended to cover all train operations. On April 20, 1916, he was promoted to superintendent and on the termination of federal control on March 1, 1920, to assistant general superintendent, which position he was holding at the time of his recent promotion.

C. D. Baker

W. K. Etter, whose appointment as acting general manager of the Eastern lines of the Atchison, Topeka & Santa Fe, with headquarters at Topeka, Kan., to relieve **F. C. Fox**, was

announced in the *Railway Age* of April 1, was born at Shippensburg, Pa., on January 16, 1874, and entered railway service as a rodman on the Atchison, Topeka & Santa Fe, at Wichita, Kan., on June 1, 1891, following which he was employed consecutively as a stenographer, timekeeper and clerk at Wichita, Kan., and Arkansas City, Kan., until May, 1893, when he became stenographer and chief clerk in the assistant superintendent's office at Fort Madison, Iowa. He held the latter position until June 10, 1894, when he became stenographer, clerk, and chief clerk to the superintendent at Las Vegas, N. M., and later at Needles, Cal., where he remained until October, 1901, at which time he was appointed chief clerk to the general superintendent at La Junta, Colo., a position which he later occupied at Topeka, Kan. In July 1, 1905, Mr. Etter was promoted to trainmaster of the Eastern division at Topeka, Kan., and on January 1, 1906, he was made a superintendent with jurisdiction first over the Rio Grande division at San Marcial, N. M., and later of the Oklahoma division, with headquarters at Arkansas City, Kan., in November, 1916, he was promoted to general superintendent, with headquarters at Newton, Kan., where he remained until November, 1918, when he was promoted to assistant general

W. K. Etter

manager at Topeka, Kan. He was appointed assistant to the operating vice-president with headquarters at Chicago, in April, 1921, the position he occupied at the time of his recent appointment.

A. T. Owen, assistant superintendent of transportation and superintendent of stations and transfers of the Philadelphia & Reading, has been appointed superintendent of transportation,

effective April 1. Mr. Owen succeeds **Oscar W. Stager**, who has retired after almost 59 years of service with the Philadelphia & Reading. Mr. Owen was born April 6, 1870, at Norristown, Pa. He was graduated from the Norristown High School and entered the service of the Philadelphia & Reading on July 1, 1886, as a clerk at Philadelphia. He was promoted to the position of yardmaster at West Falls on July 1, 1900, and to yardmaster at Pencoysd on December 1, 1900; agent at Pencoysd on April 1,

1902; and agent at Wayne Junction Transfer on October 15, 1906. He was promoted to the position of supervising agent of the Philadelphia division on July 1, 1918, and on April 1, 1919, was appointed superintendent of stations and transfers; on August 1, 1921, he was appointed assistant superintendent of transportation in addition to his duties as superintendent of stations and transfers.

A. T. Owen

Traffic

C. S. Bourque has been appointed commercial agent of the Southern with headquarters at Cincinnati, Ohio.

E. D. Osterhout, assistant general passenger agent of the Philadelphia & Reading with headquarters at Philadelphia, has been appointed general passenger agent with the same

headquarters, succeeding **E. L. Lewis**, promoted. Mr. Osterhout was born in Philadelphia on October 13, 1887. He began his railroad career with the Pennsylvania at its North Philadelphia station in 1903. On November 1 of the same year he entered the employ of the Philadelphia & Reading as a clerk in the general passenger department. He served in that capacity until May 1, 1910, when he was appointed chief rate clerk. On November 1, 1917, he was appointed special representative of the department and

on October 1 of the following year was promoted to assistant general passenger agent, which position he was occupying at the time of his recent promotion.

R. L. Baylor has been appointed district freight and passenger agent of the Tennessee Central, with headquarters at Knoxville, Tenn.

Frank G. Nigg, traveling freight agent of the Union Pacific at Chicago, has been promoted to freight traffic agent with the same headquarters.

G. C. Speight has been appointed manager of the land and industrial department of the Norfolk Southern, succeeding **C. I. Millard**, resigned.

D. C. Stephenson has been appointed commercial agent of the Chicago, Rock Island & Pacific with headquarters at Kansas City, Mo., effective April 1.

C. A. Washer, acting coal and ore agent of the New York Central, with headquarters at Cleveland, Ohio, has been appointed coal and ore agent with the same headquarters.

T. B. Porr, traveling freight agent of the Missouri, Kansas & Texas, has been promoted to division passenger agent, with headquarters at Austin, Tex., to succeed **T. L. Darneal**.

C. C. Williams has been appointed district passenger agent of the Philadelphia & Reading, with headquarters at Philadelphia, succeeding **G. F. Ingram**, promoted, effective April 1.

J. P. Thomas, general agent of the Los Angeles & Salt Lake, with headquarters at Chicago, has been transferred to Riverside, Cal., succeeding **J. H. Burtner**, district freight and passenger agent, who has been appointed agriculturist.

E. L. Lewis, general passenger agent of the Philadelphia & Reading with headquarters at Philadelphia, has been promoted to passenger traffic manager, succeeding **E. J.**

Weeks, who after many years of service has been relieved from active duty and appointed assistant passenger traffic manager. Mr. Lewis was born on September 17, 1882, and entered railroad service as a stenographer in the employ of the Central of New Jersey. On March 12, 1903, he left that position to enter the service of the Philadelphia & Reading in the same capacity in the office of the general passenger agent at Philadelphia. In 1906 he was appointed assistant chief clerk in that department and on December 1, 1909, was promoted to district passenger agent at Philadelphia. On April 11, 1917, he was appointed assistant general passenger agent, which position he resigned on July 1, 1918, to become assistant sales manager of the Packard Motor Car Company. With this company he served as sales manager, general distribution manager and assistant general manager, which latter position he resigned on March 1, 1920, to return to the Philadelphia & Reading as general passenger agent, in which position he was serving at the time of his recent promotion.

E. L. Lewis

E. T. Reynolds, formerly commercial agent of the Pere Marquette at Pittsburgh, Pa., and more recently traffic manager for the C. H. Wills Company, Marysville, Mich., has been appointed general agent of the Pere Marquette, with headquarters at Detroit, Mich.

Rufus D. Heusner, New York State freight agent of the Philadelphia & Reading with headquarters at Rochester, N. Y., has been appointed division freight agent with headquarters at Harrisburg, Pa., succeeding **C. H. Morgan**, deceased. **E. H. Stone**, succeeds Mr. Heusner at Rochester.

J. E. Light, district freight and passenger agent of the Southern Pacific, with headquarters at Salt Lake City, Utah, has been transferred to Los Angeles, Cal., to fill a vacancy made some time ago by the promotion of **L. C. Zimmerman**.

P. Bancroft, district freight and passenger agent, with headquarters at Phoenix, Ariz., will succeed Mr. Light, and will be succeeded himself by **D. Smith**.

E. D. Osterhout

William Pugh has been appointed assistant general freight agent of the Buffalo, Rochester & Pittsburgh, with headquarters at Rochester, N. Y. Everett D. Davis has been appointed to a similar position with the same headquarters, and R. R. Williams has been appointed division freight agent with headquarters at Rochester, N. Y.

A. J. Grummett, whose appointment as assistant general freight agent of the Great Northern, with headquarters at Seattle, Wash., was announced in the *Railway Age* of February 18 (page 455), entered railroad service as a freight handler on the Chicago, Milwaukee & St. Paul. He was promoted successively to foreman's clerk, check clerk, receiving clerk, billing clerk, freight received clerk, and assistant cashier. In 1898 he took a position with the Minnesota Transfer (St. Paul) in the "over, short and damage" department. He entered the service of the Great Northern in 1900 as a revising clerk in the accounting department, and three years later he was transferred to the claim department as a rate clerk. In 1905 he was made assistant chief clerk in the traffic department of that road, since which time he has been consecutively transcontinental clerk, chief tariff clerk, chief clerk to the assistant traffic manager, and chief clerk to the general traffic manager. He was holding the latter position at the time of his recent promotion.

G. F. Ingram, district passenger agent of the Philadelphia & Reading, has been appointed assistant general passenger agent with headquarters at Philadelphia. Mr. Ingram was born on June 24, 1886.

He entered the service of the Philadelphia & Reading on July 10, 1902, as an office boy in the office of the vice-president. For the next 11 years he was employed in the operating and executive departments and in 1913 entered the traffic department. In 1915 he was appointed advertising and publicity agent and, in 1917, district passenger agent. During the period of federal control he was assigned to duty in the office of the federal manager and, in March, 1920, returned to his former position of district passenger agent, which he was occupying at the time of his recent promotion.

G. F. Ingram

Mechanical

M. J. McGraw has been appointed superintendent of motive power and cars of the Wheeling & Lake Erie with headquarters at Brewster, Ohio, succeeding J. F. Hill, who has been appointed assistant superintendent of motive power and cars, effective April 1.

Engineering, Maintenance of Way and Signaling

F. M. Siefer, division engineer of the Sacramento division of the Southern Pacific at Sacramento, Calif., has been transferred to the Stockton division at Stockton, Calif., to succeed J. B. Dawson, resigned.

R. C. Miller, division engineer of the Chicago Terminal division of the Northwestern region of the Pennsylvania, with headquarters at Chicago, has been transferred to the Philadelphia division, with headquarters at Harrisburg, Pa., to succeed Elmer Irving, promoted to engineer maintenance of way of the Central Pennsylvania division. C. L. Barnaby, division engineer, at Fort Wayne, Ind., has been transferred to the Chicago Terminal division, to succeed Mr. Miller; J. K. Sherman, division engineer at Grand Rapids, Mich., has been transferred to Fort Wayne, to succeed C. L. Barnaby,

and E. L. Hoops, supervisor on the Eastern region with headquarters at Huntingdon, Pa., has been promoted to division engineer, with headquarters at Grand Rapids, Mich., to succeed J. K. Sherman.

C. K. Bowen, whose appointment as chief engineer of the Southern Pacific of Mexico with headquarters at Empalme, Sonora, was reported in the March 25 issue of the *Railway Age*, was born on March 15, 1878, at Galveston, Tex. Following the completion of his engineering course at the Agricultural and Mechanical College of Texas in 1898, he entered railway service with the Santa Fe as an assistant on preliminary location and on construction in East Texas, where he remained until 1902, when he entered the service of the Hill-Polley Land Company at Center, Tex. In July, 1903, Mr. Bowen re-entered railway service as a draftsman on the Pacific Electric at Los Angeles, Cal. He became chief draftsman on the same road in 1906 and served in this capacity until 1908, when he was promoted to assistant engineer in charge of constructing various track extensions, power plants, bridges, etc. He became field engineer in general charge of all engineering and construction for the same company in 1910, and in 1913 and 1914 served as acting chief engineer. He left this road in 1918 to enter military service as a field engineer with the 81st engineers, from which he was discharged in 1919 as a captain. He then re-entered the employ of the Pacific Electric with direct charge of all engineering and construction, and continued in this capacity until his connection with the Southern Pacific of Mexico as noted above.

Purchasing and Stores

W. C. Bower has been appointed assistant manager of purchases and stores of the New York Central Lines. The title of general purchasing agent of the New York Central Railroad and the Pittsburgh & Lake Erie has been abolished.

A. J. Mello, whose appointment as purchasing agent of the San Diego & Arizona, with headquarters at San Diego, Cal., to succeed F. C. Howard, was announced in the *Railway Age*

of March 25, was born December 20, 1866, at Jackson, Cal. After completing a course in a business college in that city in 1906, he entered the service of the Southern Pacific as a trucker in the freight sheds at Sacramento, where he remained until March 28, 1907, when he became a clerk in the general stores at Sacramento. In November, 1910, he was promoted to accountant. In July, 1913, he became a stationery storekeeper with headquarters at Oakland, and in February, 1918, he was promoted to general stores inspector in the general storekeeper's office at San Francisco. In August, 1918, he was promoted to traveling storekeeper and in September, 1921, became superintendent of the commissary stores at San Francisco, the position he held at the time of his recent promotion to purchasing agent.

A. J. Mello

Obituary

John W. Midgely, who was chairman of the Western Freight Association until its dissolution in 1898 and who organized the Bureau of Car Performances, which became the Railway Clearing House Bureau, died in Chicago on April 4 at the age of 79. Mr. Midgely was instrumental in the agitation which resulted in putting car rentals on a per diem rather than a mileage basis. He retired in 1908 owing to his loss of sight. Mr. Midgely was born in Leeds, England.

Annual Reports as a Medium of Publicity

IT WILL be generally admitted, we believe, that it is considered quite the proper thing for a railroad to devote some attention to telling the public something about its problems or its accomplishments. And yet there may be some question as to how generally this thesis is admitted. In spite of the large sums which are spent for publicity and—in the case of some roads—for advertising, it is still disconcerting, in fact, discouraging, to see how reticent some carriers can be. It would appear that the idea of publicity is regarded as correct theoretically but that in too many cases the practical applications receive a different kind of consideration.

Now publicity is neither simple, nor is it a science. We do not desire at this time to enter into a discussion of its manifold applications. We do desire, however, to point out that frequently much is lost that might be gained were it not for a mistaken attitude as regards the value of publicity, or possibly because of a failure to realize the possibilities of a situation. These thoughts are not new or original. They are, however, brought to mind by the recent advent of what can be aptly termed the annual report season.

A great deal of money is spent in the preparation, publication and distribution of annual reports. Some of them have an extremely wide distribution or, as it would be termed in the publishing field, a large and influential circulation.

It would be interesting to calculate the aggregate circulation of all the annual reports published in a single year, or to estimate the number of people interested in railroads who are reached by them. It would be a commonplace to say that the value of this circulation reaches high proportions. The question arises: Is this circulation properly used? The answer must be in the negative.

Some of the annual reports are truly formidable documents. They contain, in many cases, seemingly numberless pages of statistics of all kinds, a large proportion of which, we fear, are frequently not understandingly intelligible even to the officers of the roads which publish them. Of course, it is usually the case that these statistics for one reason or other must appear in some form or another, for there must be a readily available record for the use of those sufficiently driven, skilled, patient—or all three—to peruse them.

Nevertheless, it must be surprising if not also disappointing to a layman or a mere stockholder to see how much mate-

rial can appear in a report statistically and yet how little can be gleaned from this vast maze of statistics as to the actual operations of the railroad in which he is interested, or as to the railroad problem as a whole. And who is more entitled to have these details than the stockholder? Who is it more useful to inform than he who is already in a receptive frame of mind? The situation as it exists today is not fair to the stockholder. In view of the expense incurred in getting out the annual reports, it is still less fair to the railroad company.

There is a remedy for this, and an extremely simple one. It is merely to expand on the president's remarks to his stockholders—to give in addition to the income account, balance sheet, statement of revenues and expenses and all the other necessary figures, something more than a mere perfunctory statement explaining these figures. Why not discuss in an interesting manner such things as the conditions of the year on the railroads in general and on the railroad issuing the annual report, in particular; the amount of business, why it increased or decreased, the matter of costs, relationships with labor, competition with the motor truck, problems of increasing taxation, new engineering projects proposed or under way and the various other details in which the public is primarily interested? There is a story to tell in the case of every railroad. Why not tell it?

This idea contains nothing particularly new or particularly startling, in proof of which we should suggest the perusal of the annual reports of such lines as the Pennsylvania, the Boston & Maine, the Southern and others of a small minority of railroads which have realized the value of these important documents. These reports all constitute interesting and informative reading and they all follow the ideas herein suggested. The Pennsylvania report, incidentally, adopts the valuable idea of pointing out the net after rentals and return on the investment, a good idea truly in view of the importance given these figures in section 15-a of the Transportation Act. The Southern issues its preliminary remarks in a small booklet distinct from the annual report itself, which booklet is sufficiently interesting to assure one that it must be of great value for purposes of telling the railroad's story. In the case of the Lackawanna, the most authoritative information concerning the contemplated electrification project at Scranton, a matter of very lively interest,

appears in the 1920 annual report with a resulting increase in the interest and value of the report.

Roads which are adopting this policy in connection with their annual reports are utilizing the opportunity presented. They give the stockholder details characterized by their value and interest alike, and sufficiently well gotten up and worded so that the person who receives the report is not unduly wearied in reading them understandingly.

Publicity schemes usually cost large sums of money and require much time and thought. Annual reports are expensive and elaborate—and also necessary. Why not use them to best advantage and make them worth while—without additional expense—by causing them to play their part in the publicity scheme?

The railroads that are already taking the very simple steps to utilize their annual reports in the manner suggested are "selling" their railroads to their own stockholders.

It has been stated over and over again, in addresses, newspapers, magazines, and even books, that the railways are

The Engineer Can Play a Part

seriously behind as to adequate facilities, terminal and otherwise. The public, in its way, realizes this. Yet the public is fickle and that characteristic must be recognized as we have stated in previous editorials. The engineer can play no small part in helping to educate the public, for it is the work his department is doing or is intending to do, that will remedy much of the inadequateness of facilities. And the describing of this work, whether under way or projected, will do much to prove to the public that the railways are really endeavoring to overcome the deficiencies. Too often the details, or for that matter even the general outline, of the work being undertaken are not released to the newspaper and technical magazines until the work is so far along—even completed—that the opportunity of producing a real effect on the public has passed. It is no longer news—it has seeped into the public's mind by degrees and so slowly that the people fail to recognize that something is being done for their ultimate benefit. Stop hiding your light under a bushel! Some roads have and the rest should do so!

Each year sees a large number of small construction tasks, such as the building of tool sheds, section houses, box culverts

Every Day Economy Possibilities

and other miscellaneous work, whose performance is usually considered as a routine matter. Such work is commonly carried out with the regular forces and the cost, while more or less simple to compute, varies with the materials employed, the labor and its relative efficiency. There are possibilities for making savings in this work which, while not large in any particular instance, may amount to a substantial and worthwhile sum when taken as a whole. A method not exactly new, yet certainly not common, is the assignment of this work to capable, regular forces with the understanding that, in addition to their wages, they will be given, for instance, one-half of whatever they save in the cost of the work. This estimated cost can be figured quite accurately, the figures used being based on the amount of work ordinarily performed in a given territory by the labor assigned to it. Any saving in the cost is a clear gain for the railroad, as it is so many dollars actually saved; in addition indirect benefits may be derived through the data so obtained and through the training of the men to plan their work.

Occasionally critics of the railroads refer to the provisions of the Transportation Act—which for the two years ended on February 29 directed the Interstate Commerce Commission to try so to adjust rates as to give the railroads of the United States as a whole a return of 5½ to 6 per cent on their value—

A "Fair Return" for Railroads and for Ships

constituting a subsidy. In this connection it may be noted that the administration plan for giving a real subsidy to the operators of merchant ships contemplates 10 per cent on the invested capital as a fair return. Robert H. Montgomery, the accounting expert who testified before the Congressional committees as to this provision of the ship subsidy bill, explained as the reason for proposing a 10 per cent return for shipping that "if 6 per cent is considered a reasonable return on capital invested in railroads and other public utilities which are monopolistic in character and whose earnings are subject to far less fluctuation, a minimum of 10 per cent would appear to be a fair return on capital employed in the hazardous business of overseas shipping." Recent history shows, however, that even railroading is subject to rather violent fluctuations, since the traffic of 1921 was approximately one-fourth less than that of 1920. The ship subsidy bill, it is true, does not in any way provide for a guaranty of 10 per cent, or any other per cent, any more than the railroad law provides for a guaranty, as indicated by the fact that during the period this so-called guaranty provision was in effect the railroad net return scarcely exceeded three per cent. The shipping bill provides that companies having a net operating income in excess of 10 per cent shall return to the government one-half of such excess, whereas the Transportation Act provides that any railroad shall return one-half of any excess over 6 per cent. But there is also another difference. The shipping bill provides for the "recapture" of one-half of the excess only up to the amount of the direct subsidy that may have been received, while a railroad earning more than 6 per cent is required to give up one-half of the excess although it has received no subsidy; it has merely been allowed to charge rates which were sufficient to enable railroads as a whole to earn three per cent.

Every catastrophe brings to light certain shortcomings in practice. The recent destruction of a large part of the contents of the Burlington general office building in Chicago furnishes another illustration of this fact. This fire occurred in a building of the most modern construction, as is indicated by the fact

The Protection of Records

that it was given the lowest insurance rate of any office building in the city. In spite of the terrific attack to which it was subjected, the building did as well as could reasonably be expected of it. The fire did not extend from one floor to another but each floor suffered an individual conflagration communicated from the exterior. Yet the contents of seven floors were entirely consumed and large quantities of records were destroyed, many of which can never be replaced. This fire demonstrated the inherent weakness of ordinary window construction. While past experience had not shown the necessity of wire-glass window construction on the sides of buildings facing streets, this was the vulnerable point in the Burlington building. There is rather conclusive evidence that wire glass windows would not have withstood the flames, but it is reasonable to expect that they might have delayed the progress of the fire to such an extent that the fire department would have had a chance to have fought it to better advantage. The fire also demonstrated the importance of reducing the combustible contents of an office building to the minimum, for while metal furniture would not have withstood the flames, it would not have added fuel to the con-

flagration. However, the lesson of this catastrophe is that no building designed for efficient office use can be secure against fire hazard from outside sources. When a building of as nearly fireproof construction as the Burlington building was can be gutted by a fire, the danger to the average railway office building can be realized. In addition to reducing the fire hazard in offices and record rooms to the minimum, the railways also face the necessity of taking such steps as may be reasonably practicable to reduce the possibility of loss if such a fire should occur. This involves consideration of the advisability of duplicating important records for storage at widely separated locations, the installation of ample fireproof vaults in which records in current use may be stored over night and similar measures. The time for action is now while the danger is fresh in mind.

The International Railway Congress will be held at Rome, Italy, from April 18 to 30. The American delegates, of whom there are a goodly number and whose names have appeared previously in these pages, are already in Europe at the Rome Congress or on the way there. The *Railway Age* will be represented by its editor, Samuel O. Dunn, who sailed on April 4. Mr. Dunn's observations of the congress will be published in the *Railway Age*. After the congress, he will spend several weeks traveling in Europe. He expects to record his impressions for *Railway Age* readers in the form of weekly letters.

The *Railway Age* has received information, which will doubtless be of interest to many of its readers, that Clifford Thorne, now of the Chicago law firm of Thorne & Jackson, who as attorney for various organizations of shippers and for a time as chairman of the Iowa railroad commission has for several years been one of the most prominent if not one of the most successful of railroad baiters, is about to announce a campaign for the seat in the United States Senate which will become vacant upon the expiration of the term for which W. S. Kenyon, recently appointed a federal judge, was elected. If Mr. Thorne should succeed at the polls the state of Iowa, which has always been especially interested in railroad affairs, would be represented in the Senate by two widely differing varieties of statesmanship in relation to transportation questions. Senator Cummins, now chairman of the Senate Committee on Interstate Commerce, stands for the constructive policy represented by the Transportation Act, which seeks to make the railroads an adequate and effective instrument of commerce. For a good many years Mr. Thorne has been collecting fees for his efforts to have the laws relating to railroads made and enforced in the interests of his clients. These efforts and those of others in a similar direction have been among the causes that finally made it necessary to enact a law which, in the interest of the public as a whole, would contain a recognition of the rights of railroads as well as of shippers. Whether this has led to a situation such that Mr. Thorne has decided it is time for him to seek a broader field of activity, or whether he considers that his influence on railroad laws may be more potently exercised from within the lawmaking body than from without, we are not informed, but we believe that Mr. Thorne's kind of activity was somewhat more effective while he was occupying a public office and speaking in the name of the public as a representative of the Iowa and other state commissions than it has been when exerted in behalf of private interests. At any rate it takes all kinds of people to make a world and Mr. Thorne doubtless realizes that the statement also applies to the electorate of Iowa.

Best Accident Record in History

THE RAILWAYS of the United States in the year 1921 made the best record for safety of operation that they have ever made in the 34 years since accident statistics have been compiled by the Interstate Commerce Commission. Undoubtedly the record was the best ever made as it is not probable that any better record was made before the statistics began to be compiled.

The statistics of accidents in 1921 the Commission has just made public are not quite complete, but they are near enough so to indicate beyond any question what the complete statistics will show. The statistics for 1920 showed that in proportion to the number of persons employed by the railroads and the amount of traffic handled, the number of persons of all classes killed in that year was the smallest in history. Most of the statistics for 1921 just made public by the commission are much better than those for 1920. This seems fully to warrant the conclusion that when they are available the complete statistics for 1921 will be better than the complete statistics for 1920.

Only the figures regarding persons killed will be given here, as owing to the changes in the ways of reporting them, those regarding persons injured are always of doubtful significance.

The total number of employees on duty killed in train or train service accidents in 1921 was 1,096. This was a reduction of 1,011, or 48 per cent, as compared with 1920. It is the smallest number of employees on duty ever killed in any year for which statistics are available. The number of passengers killed was 205. This is a reduction of 24, or 10½ per cent, as compared with 1920. It is the smallest number of passengers ever killed in any year for which statistics are available except 1895, 1896 and 1915. The total number of employees on duty and passengers killed in train and train service accidents was 1,301 as compared with 2,336 in 1920—a reduction of 44 per cent, and the smallest ever reported. The total number of "non-trespassers"—that is employees, passengers and all other persons having a right to be on railway property—killed was 3,106, as compared with 4,329 in 1920, a reduction of over 28 per cent.

The foregoing statistics do not include fatalities resulting from "industrial and other non-train" accidents—that is accidents occurring in shops and other places which were not due to the operation of trains. The number of persons killed in such accidents in 1920 was 463, and in 1921, 409, a reduction of 12 per cent.

The only class of persons the fatal accidents to which showed an increase was trespassers. The number of these persons killed in 1920 was 2,166, while in 1921 it was 2,481, an increase of 14½ per cent.

The Commission's statistics of accidents for the last 15 years reflect an increase in the safety of railway operation in the United States which probably has not been surpassed, and may not have been equalled, in any other industry in this country, or on the railways of any other country.

The fatalities on railroads reached their maximum in 1907. In that year the total persons of all classes killed was 11,839. Of these, 4,534 were employees and 610 were passengers. The number of fatal accidents has fluctuated from year to year since then, but has shown a generally declining tendency. The traffic of 1921 represented a very large decline from that of 1920, but the decline in fatalities to employees and passengers was relatively much greater. In 1921 the railroads handled about one-third more passenger business and about one-half more freight business than in 1907, but the number of employees and passengers killed was almost exactly 66 per cent less than in 1907.

There has not been a corresponding reduction in the number of trespassers and other classes of persons killed. Auto-

mobile accidents have seriously interfered with efforts to reduce the number of people killed at highway crossings. Nevertheless, when the complete figures for 1921 are available they will show that the total number of persons of all classes killed was only about 6,000. It was only about one-half the number killed in 1907, and probably was less than the number killed in any year since 1889.

When it is considered that the total number of persons killed in 1921 was about the same as in 1889, while since then the number of employees has increased about 140 per cent, the passenger traffic handled about 225 per cent and the freight business handled about 400 per cent, some idea of the increase in the safety of operation which has occurred within the last 30 years, and especially during the last 15 years can be formed.

The great increase in safety of operation has been largely due to improvements in the railway plant. It has been very much more largely due to the education of employees to the need of observing the rule of "safety first" in their work, for the great majority of accidents always has been due to man failures rather than to plant failures.

Make the Valuation Reports Easier to Use

THE VALUE of any work may be measured by the use to which it may be put. Based on this premise the work of the federal valuation forces is falling far short of its possibilities and the Division is not fully discharging its obligation to the public. This work has now been in progress for nearly ten years and has cost the carriers and the government over \$80,000,000.

Tentative reports have been issued on nearly 200 properties and this number is being increased almost daily. Copies of these reports are being sent to the railways concerned, to the governors and the public service commissions of the states in which the properties are located, and to the attorney general of the United States. These, however, constitute only a small portion of those interested; the investors in the securities of the railways have a direct interest, as do the shippers and the public at large. In view of these vast expenditures of time and money it is important that the reports be presented in a manner which will enable these various interests to place the same interpretations upon the information and make them of the maximum value to all interested parties. This is not now being done. Undertaken originally as a means of protecting the public from the evils of over-capitalization then feared, the valuation work is now seen to afford protection to the investor.

The reports as now issued contain a vast mass of information concerning the properties which is bewildering to the average railway man, investor, or public officer, and is understandable only to the expert; moreover, because of their complicated make-up they may be misused to the detriment of public interest. Important and necessary as this information is, it would seem highly desirable for the commission which has prepared the report and collected the information incorporated in it, to summarize this information in a brief introductory statement in which there would appear those figures in which the vast majority of the people are interested. These include the commission's findings of value, including the property owned and used for transportation purposes, the land and buildings owned but not used for transportation, and other investments in contrast with the capitalization, and the carrier's and the commission's book record of investment in road and equipment. Further than this, many are interested in the cost of reproduction and the cost of reproduction less depreciation of the property owned and used, and of that owned but not used for transportation purpose.

By summarizing this and other basic data which would involve little additional work, the commission would protect its report from mis-use and mis-interpretation and would complete the service to the public for which the Division of Valuation was created. The commission owes it to itself, as well as the public, to complete its report in this way to protect itself against the mis-use of its information and to enable the public regulatory bodies, the railways and investors to avoid all possibility of confusion as to results. The commission will render a great service to the railways and to those interested in them by presenting such a summary in order that "he who runs may read."

Railroad Terminals Come High

A MAN who enters a manufacturing venture is confronted with an exceedingly difficult problem in the design of his plant. Obviously he must plan for the future, but his efforts at a solution are hampered by the necessity of making some exceedingly rough approximations concerning future requirements. He can only guess at the growth in the volume of his business and the probable character of the product most in demand, and it is, of course, impossible for him to forecast improvements in manufacturing processes which may render a large part of his plant obsolete. He must also guard against excessive capital expenditures. As a result, his provisions for the future are necessarily limited, and as years go by he is compelled to discard portions or even entire units of his plant to make way for new facilities adapted to new requirements.

So it has been with railroad terminals. Changes in conditions, too well understood to require mention here, are constantly compelling the roads to raze existing terminals and replace them with new ones designed to meet the requirements of the present with further allowance for the future. In general, such replacements cannot be considered as added facilities, but merely as enlargements of the existing plants. Yet in spite of this, the expenditures which are entailed in such replacements assume enormous proportions. Thus, in the city of Chicago, the railroads are committed to an expenditure of 150 million dollars for track elevation. This enormous outlay, two-thirds of which has already been made, will add little to the facilities for the conduct of railway transportation.

The renewal of passenger and freight terminals in that city also involves an enormous expenditure. That of the North Western, completed within the last ten years, totaled more than 20 million dollars. The work now in progress for passenger and freight facilities in what is known as the Union Station group will cost over 65 million, while the improvements to which the Illinois Central is committed are estimated to cost 85 million. The remaining group of railroads, which includes those using the Dearborn, La Salle and Grand Central stations, are now using passenger and freight facilities which are admittedly inadequate and various plans completed or now under consideration indicate that not less than 50 million dollars is necessary to effect the replacements of existing terminals to meet the needs of the immediate future.

The aggregate of all these expenditures reaches a total approaching a half billion dollars, and represents an outlay that is not designed to open new markets for transportation, but provides simply for the renewal of terminals which, while required primarily for increases in traffic, are nevertheless an enormous additional charge against transportation over a railway mileage which has not measurably increased. This unquestionably imposes one of the greatest burdens on our national transportation system and occupies an important place in what is termed our "transportation problem."

Railroads Are Buying!

THE RAILWAYS are preparing for the country's expected prosperity and the resulting increased business. They are ordering freight and passenger cars in unusual volume and the announcements of authorizations for the expenditure of millions for additions and improvements by the various roads are tripping so closely upon one another's heels that it is becoming difficult to realize how much there is to be done.

The *Railway Age*, in its issues in January, reported the placing of orders for 7,960 freight cars; in February, for 14,771 and in March, for 6,550, a total for the three months of 29,281. In the two issues which have been issued so far in April, excepting, that is, the present issue, orders for 5,010 cars were reported, or a total to date of 34,291. In the first three months, as noted, the total was 29,281, which compares with total domestic orders in all 12 months of 1921 of 23,346. A comparison with 1921 is not of great value because 1921 was characterized as being an exceedingly poor year. But, nevertheless, 1921 had to be tolerated and that we are now out of it is not the least of the things we can be thankful for. The year 1916 may perhaps be a better year to choose for purposes of comparison. In the first three months of 1916 the freight car orders totaled 38,169.

THE CAR AND LOCOMOTIVE ORDERS OF 1922

	Freight cars	Passenger cars	Locomotives
January	7,960	235	5
February	14,771	160	8
March	6,550	25	77
Three months	29,281	420	90
April, first two weeks	5,010	423	86
Total	34,291	843	176

It is too early in the week at the time this is written to estimate how many cars will be reported as ordered before the week is ended. The number will be considerable for the placing of orders by the New York Central for 16,000 cars, and of large orders by other companies, guarantees that the present week will see the placing of more business than has been the case for any week in many months.

A feature of the 1922 freight car business has been the size of the orders as evidenced by the New York Central's 16,000, the Burlington's 7,300; the St. Paul's 4,000; the Norfolk & Western's 4,000; the Union Pacific's 4,500; the Pacific Fruit Express' 3,300, etc.

The passenger car business has come into its own after a long-drawn-out period of lethargy. Passenger car orders were omitted from the scheme of things during federal control. During all 1921, the passenger car orders totaled only 246. In the first three months of 1922, the orders totaled 420; in the *Railway Age* of April 1, there were reported 50, and in that of April 8—last week's issue—there were reported 373, a total thus far this year, therefore, of 843. The figure for the first three months of 1922—420—compares with that of the 537 for the first three months of 1916. But it is worth remembering that in one week of 1922, the issue of January 21, more passenger car orders were reported than the figure for Class I roads in all of 1921, or that in last week's issue the Pennsylvania's order for 250 cars again exceeded the 1921 figure.

The buying of locomotives has not yet reached the same proportion as in the case of cars. A buying movement has started, however, and should soon be showing results.

Last year was not a good year. It was, on the contrary, an exceedingly poor one. A comparison between the record of an exceedingly good period such as we are now in, with the poor conditions of 1921, therefore, has some interesting results. There are several railway supply concerns that report having taken more business in one month—in some cases, in one week—than in all 12 months or all 52 weeks of

1921. A marked change indeed, and, no doubt, all the more appreciated because of the sharpness of the contrast.

"Philadelphia & Reading's Improvements to Cost \$15,000,000," "Pennsylvania to Spend \$8,000,000 in Pittsburgh District," "Union Pacific Plans \$29,000,000 Outlay." These are typical of the headlines which one can see with increasing frequency in the daily papers. They indicate optimism—practical optimism, that is—and prosperity. The railways went through a very trying year in 1921. They earned for the year but 3.3 per cent on their property investment. The amount of traffic they handled was comparatively small—so much below 1920 as to be hardly comparable. Although the 1921 net was not as great as the Transportation Act requires, it was greatly in excess of the 1920 figure. The reason for the increased net with the greatly decreased traffic was the extremely severe cuts in expenses. Except in the matter of wages—still under consideration—the railways succeeded in getting things back on a rock bottom basis. They made savings in maintenance—less, insofar as concerns the final result, in way and structures than in equipment.

As concerns equipment, the railways now have a higher percentage of bad order cars and unserviceable locomotives than is advisable. This means that there is still a large amount of repair work to be done although it is also to be presumed that the proportion of bad orders will be reduced in due time through retirements of worn out or obsolete equipment. Track is better now than it was in 1920 in spite of the 25.9 per cent reduction in expenses of maintenance of way in 1921. It is by no means restored to pre-war standards. Further than that, there is to be overcome the suspension which took place in 1919, 1920 and 1921 in improvement work. The railways, in short, have a big program of catching up ahead of them. The placing of these large orders for freight and passenger cars and the authorizations of expenditures for other kinds of improvements show a realization of that fact. They also show a will to accomplish that which is necessary to supply a pre-war standard of transportation service.

The most practical feature of the situation, however, is the manner in which preparations are being made for the coming of prosperity. This program would not now be under way if the railroads were not convinced that business is about to pick up and to pick up in considerable extent. But, further than that, the railways are, in fact, taking the lead in the whole situation and by so doing are themselves starting the ball rolling. By and large, things look good for 1922. It seems safe to feel optimistic and enthusiastically optimistic at that.

New Books

Modern Tunneling, by Brunton & Davis. Second edition with new chapters on railroad tunneling, by J. Vipond Davies. 6½ in. by 9 in. 612 pages. Illustrated. Bound in cloth. Published by John Wiley & Sons, New York.

As stated above this is a revision and enlargement of the first edition published in 1914, the revision consisting in the addition of 200 pages devoted to railroad or larger bore tunnels. The earlier edition was confined primarily to water and mining tunnels of smaller section than those used in railway work. Apparently, the first 400 pages have not been revised in the new edition since all data and references antedate 1914, the date of previous publication. Consequently, references to the more recent tunnel projects do not cover their completion subsequent to that time. This seems rather unfortunate in the case of the table of noted railroad tunnels on page 32 since it omits reference to the Rogers Pass or Connaught tunnel, the longest railway bore in

America. The arrangement of the text very properly is topical, taking up the various factors entering into tunnel work in separate chapters, including such subjects as machinery, ventilation, drilling, timbering, blasting, etc. Another noteworthy feature of the book is the large amount of space given to bibliography. This amounts to 60 pages in the older portion and is supplemented in the newer part by 9 pages. The 200 pages on railroad tunneling are subdivided into chapters dealing with the general subject and construction and are followed by chapters treating of the building of tunnels through different classes of materials, beginning with hard rock, following with loose rock and softer materials and terminating with a rather extended treatment of subaqueous tunnels. In this connection it is to be noted that outside of the Mount Royal and Rogers Pass tunnels, the principal references to particular projects relate to tunnels built in the vicinity of New York City.

The Transition Spiral. By Arthur Lovat Higgins, assistant lecturer in engineering in the Victoria University of Manchester, England. 5 in. by 7½ in., 110 pages, illustrated. Bound in cloth. Printed in Great Britain. D. Van Nostrand Company, New York.

This handbook deals with the development of a transition spiral which will be of easy and practical application in the field and yet afford an effective compromise between the elements necessary for that result and those for correct mathematical truths. The curve developed is the clothoid which, according to the author, does not necessitate the use of tables, is virtually interchangeable with the cubic parabola and lends itself readily to the three characteristic modes utilized in American spiraling practice; i. e., a constant chord length, the number of chords constant, and constant deflection angles.

Earthwork in Railway Engineering. By John W. F. Gardner. 6 in. by 9 in., 152 pages, illustrated. Bound in cloth. Printed in England. D. Van Nostrand Company, New York.

The apparent intent of the author, an Englishman with experience on English railways, has been the presentation of the underlying principles controlling earthwork in a practical and easily understandable manner. In many respects, he has succeeded admirably although the book, so far as its application to American uses is concerned, suffers somewhat from the handicap of being largely descriptive of English practices. Much of the chapter dealing with the execution of earthwork, as well as the chapters on drainage and, in particular, slips in earthwork, are quite applicable to any practice and are interesting and instructive for students of railway construction.

Design of Steel Mill Buildings. By Milo S. Ketchum, director of the department and professor of civil engineering, University of Pennsylvania. 6½ in. by 9 in., 632 pages, 410 illustrations. Published by the Mc Graw-Hill Book Company, New York.

This is the fourth edition of this book on the design of steel mill buildings; it has been rewritten and enlarged. In the original edition, it was intended to provide a short course in the calculation of stresses in framed structures and to give a brief discussion of mill building construction, with the underlying idea of presenting methods, data, and details on design and the making of estimates not ordinarily found available. The fourth edition, following along these lines, has been enlarged to include a discussion of the calculation of the stresses in statically indeterminate trusses and frames, several problems in framed structures, detailed designs of a frame girder, a roof truss and a steel frame mill building. The text has been divided into three parts and an appendix, the latter covering specifications for steel frame buildings.

Letters to the Editor

[The RAILWAY AGE welcomes letters from its readers and especially those containing constructive suggestions for improvements in the railway field. Short letters—about 250 words—are particularly appreciated.]

Standardization of Automatic Connectors

NEW YORK

TO THE EDITOR:

I have read with much interest the editorial on The Future of the Automatic Hose Connector which appeared in the *Railway Age* of February 11. I note in the article the following paragraph: "There will be no extensive application of connectors to freight equipment until through some agency all but one type of gasket face and one type of gathering device has been eliminated. But who ought to do the eliminating?" That is now the heart of the connector question. "Who ought to do the eliminating?" Some contend, and I understand your article to contend, that the connector manufacturers should do it, while others claim it is a matter for the railways. It seems to me that the latter is the correct view.

For the manufacturers to undertake to determine the standard connector would be much like a lawyer acting as advocate and judge in his own case. The railways are the customers for the connector. Is it not their wish, expressed through a proper committee, which should be the deciding factor in arriving at a standard? Can it be regarded as likely that any association of connector manufacturers could persuade all the railways of the United States and Canada operating approximately three million cars, to use a single connector type merely because they recommend it? Granting that such a thing is possible, which I do not believe, would it be the logical course from the viewpoint of the railways? The connector manufacturers are not immune from the commercial instinct any more than any one else. As between a good device, which they cannot control by patents, and a good device which they can control, it would be but natural that they should recommend the latter. The railways, on the other hand, would prefer to select the device least protected by patents.

Thus the standardization of a connector is confronted, at the outset, with a conflict of interests, the consumer desiring to adopt, as far as possible, an unpatented device and the producer desiring to protect his shareholders, and his own heavy investment in time and money, by getting adopted something which his patents control. To my knowledge, one of the two connector companies now most active has spent several years of hard effort, and probably a half million dollars bringing its device to a state of efficiency, while the other company has spent more than a million dollars and fourteen years of equally hard effort developing the connector it offers. Naturally they will labor earnestly to secure some benefit from a thing obtained at so dear a price.

This is the chief difficulty in the way of realizing the goal which could come from the acceptance of your suggestion that the connector manufacturers voluntarily "get together." An endeavor to accomplish this has been repeatedly made during the past ten years, and in each instance it has failed because of the inability of the connector companies to agree upon the consideration to be awarded the different companies for their patent rights. Each concern believes in the merit of its device and regards it as the one which the railroads should adopt. It is to no purpose to

disagree with them. Until the railroads have indicated what they want in a connector, these companies are about as well off in the argument as those who may oppose their convictions. As matters stand, it is simply a matter of difference of opinion. Until the railroads have decided on a standard connector, the companies do not know where their respective devices stand and cannot negotiate intelligently.

A few months ago, for instance, when this matter of getting together was up among the connector people, one concern having but one connector and only eight patents (as far as I know) to contribute, demanded 60 per cent of the benefits of the entire combination. How is it possible to make any headway toward "getting together" under such circumstances? Except for the extent of their demand, the attitude of this company is typical. It has a device which is being favorably received, its officers are honest, conscientious men who really believe their device superior to all others. Until some disinterested, authoritative committee has confirmed, or rejected, their conviction, the likelihood of "getting together" with them is remote.

You may say leave them out, but that would not cure the difficulty. Where and by whom would the line be drawn on the leaving-out process? Besides, this concern may be entirely justified in its conviction. I do not, of course, think it is, but after all that is only my opinion. It may be that this company has a device which the railroads should use, in which case it is entitled to the larger share. But who is to determine whether it has or has not such a device? Can it be expected that a committee made up of engineers, representing the different competitive connector manufacturers (which would be the expected of course if the connector manufacturers are to get together, and themselves decide upon a connector to be offered for standardization), would render a decision acceptable to this company? Each member of such a committee would be prejudiced by his own ideas of connector design, and it is extremely doubtful that his vote would fail to reflect this prejudice. Is not the question of standardization really one for the railroads? It is they who must be satisfied as to design.

Even if it were possible for the connector manufacturers to get together at this time, what good would it accomplish? I cannot imagine the railroads adopting a connector merely because it is presented to them by the various connector manufacturers as a body. The roads would, and with good cause, insist upon thorough demonstration. Why not then have this demonstration now? Let a committee representing the railroads select the various connector designs which it regards worthy of trial and put them through a series of conclusive elimination tests, select therefrom the connector most desirable for standardization and then compel the connector manufacturers to get together on patents, with a penalty for failure of refusal by the roads to standardize any connector. Such a course would bring to light the connector the roads are willing to use, and would make known to the connector manufacturers what they were to get together on. Under such circumstances it can scarcely be doubted that they would get together. To refuse would be to stand in their own light and postpone the general use of any connector.

Until something of this kind is done, it seems to me that any attempt to get together on the part of the connector manufacturers on a basis involving the giving up of patent rights, which I understand to be the basis your article suggests, would be to negotiate in the dark. Each concern would hesitate to give up any of its rights in return for a share in the rights of something which they do not know the railroads want, and which they conscientiously believe less meritorious than their own device. Could you blame them for this? None of us like to "buy a pig in a poke," and that would be the nature of such a trade in the absence of some indication by the railroads as to exactly what they want in the standard connector.

Considerable impetus would undoubtedly be given the subject if the connector manufacturers would come together in a friendly association, not involving any sacrifice of patent rights, but compelling each joining company to work in harmony with its member companies for the adoption of a connector by the railroads (leaving it to the railroads to determine what design they want), and to accept the railroads' fair recommendation as to patent rights and price at which the connector should sell. I have long advocated such an association and would be glad to do anything I can to bring it about.

JOSEPH ROBINSON.

The Boiler Compound

CHICAGO.

TO THE EDITOR:

I desire to take exception to a number of statements which appeared in "a criticism" of the article entitled *The Interior Treatment of Boiler Waters* (November 12, 1921, page 935), which criticism appeared in the *Railway Age* of December 24, 1921, page 1241. It is being admitted more and more generally that there is more in the field of chemistry that relates to water treatment than lime and soda ash. In a paper presented before the Western Railway Club of Chicago two years ago on the treatment of water for locomotive use, the consulting chemist of the Union Pacific system said:

"It is a mistake to believe that treatment with boiler compound is identical with the process of water softening. If anyone has the idea that the manufacture of boiler compounds is a sort of hit-or-miss proposition, I would ask you to correct this impression. There is room for more variation in the composition of boiler compound than there is in outside treatment. Because fraud may have been detected in attempts to sell boiler compounds that have no value, I do not believe in condemning the use of honestly made compounds."

The United States Geological Survey has, for many years, published the following statement in its water supply papers, its first appearance being probably in Water Supply Paper No. 164, eight or ten years ago:

"An honestly prepared boiler compound has many advantages. * * * Such compounds, when intelligently and carefully prepared, are efficient and satisfactory."

Recently two very carefully developed articles have appeared in the *Journal of the American Water Works' Association*. One by Milton F. Stein contains the following paragraph, referring to the results of the reactions where lime is used to precipitate the carbonates of lime and magnesia:

"The calcium carbonate formed is only soluble to the extent of about 13 p.p.m. and so precipitates out. The magnesium carbonate, being soluble to the amount of about 100 p.p.m., remains in solution to that extent, and requires additional lime for its removal as the insoluble hydroxide. At least this is the theory, but in practice such ideal conditions do not obtain. The solubility of the calcium carbonate as precipitated from a solution seems to be greater than the amount which can be dissolved by shaking it in the powdered form with water. The presence of magnesium carbonate affects the solubility of calcium carbonate, as there appears to be a definite limit to the combined solubility of the two salts. The presence of other compounds, particularly sodium chloride, tends to increase these residual solubilities, and they are also affected by the temperature of the water. The magnesium hydroxide forms very slowly and is apt to assume a colloidal condition, and to return to its former state by absorbing carbonic acid from the air."

Then, with reference to the reaction, using carbonate of soda, he states that the use of soda ash is on a more precarious basis, due to the fact that in the cold the reactions occurring are very sluggish and sometimes are not even completed.

In the same number of this journal appeared an article by W. A. Sperry of Grand Rapids, who opens his article with the following sentence: "To soften water with lime is

beautifully simple in theory, but in practice there are difficulties that are both vexing and perplexing."

Among the difficulties, he gives one: "The fact that approximately 30 p.p.m. of the calcium carbonate produced is soluble, varying somewhat with the temperature and pressure"—and again—"Contrary to the general rule, calcium salts are more soluble in cold water than in warm, the completeness of reaction being greatly accelerated or seriously retarded by an increase or decrease of temperature, as in changes from summer to winter conditions, with a corresponding change in the time element necessary,"—and again—"The ideal condition for a lime softening plant is expressed in some form of the hot water softening system."

In both of these articles, the point discussed was what change or improvement should be made in the method of treating to eliminate this incompleteness of reaction as well as the development of what are called "after deposits," and in both cases the fallacy of putting too much faith in a method of such antiquity is emphasized.

If heat is necessary to complete a reaction, and this heat is obtained in the neighborhood of the boiler, the only difference between this method of treatment and that of the so-called interior treatment is that in one case materials are present to control the separation of the incrusting salts in the boiler, and in the other nothing at all is present, and the precipitate usually forms in a distinctly crystalline condition and deposits just as though no treatment of any kind had been attempted.

Another point that the writer of this article went into great detail on was that relative to foaming. Much has been done in the way of foaming, and much has been learned. Many complicated causes have been detected, but it is recognized that concentrated soda salts stimulate as well as create a foaming tendency.

The matter of boiling is considerably more than the forming of steam bubbles. It is a matter of getting the steam bubbles out of the water and into the steam spaces, and foaming more than anything else, is a matter of surface tension. Surface tension is the force developed to hold together the film of water which makes the division between the liquid and the gaseous space above. The increase of certain soluble salts makes this film tougher, and the presence of other salts makes it weaker. So far as we know to date, inorganic compounds invariably increase the surface tension, and, if, in addition to the increased concentration of soda salts, which are the principal soluble salts to be reckoned with, there is an increase in the quantity of sludge in the boiler, there will be increased foaming because there will be more bubbles trying to break through this surface film.

However, there is quite as apt to be sludge in the boiler from an outside treated water as from an inside treated water, and, in the first case, the sludge is quite apt to be crystalline and get nearer to boiler surfaces, and just as apt to become the nucleus of the steam bubbles as the other sludge, which in many cases of interior treatment is intentionally controlled through organic materials, which not only assist in making this sludge light and flocculent, but, through their organic qualities, exert an action upon the surface film, making it less tenacious and more liable to break when the bubbles reach it.

With reference to the ideas regarding soda ash, it is not necessary to specify all the discussions. All of the authorities referred to in this article have made statements of more or less definite character on the importance of soda salts in stimulating foaming. Dole and Stabler, working for the United States Reclamation Service, and attaching their names to numerous publications of the government, are very definite with reference to its quality. Quoting from one of the government bulletins to which R. B. Dole's name is attached is the following:

"Foaming is believed to be due principally to sodium and potas-

sium, which remain in solution after most of the other bases are precipitated, and which increase the surface tension of the water. The increased surface tension tends to prevent the steam bubbles from bursting and escaping. Other factors undoubtedly affect, or cause foaming, but sodium and potassium are the chief causes."

With reference to the use of an anti-foaming compound, it is true that the United States government, through the agency of the United States Railway Administration, conducted a test on one of the western railways, using a commercial anti-foaming preparation of relatively high quality, and, as a result of this test, published a bulletin in which it was shown that with the treatment in question it was possible to increase the total mileage two to three times over the normal at which the water foamed before this type of trouble would begin to be experienced. This service would greatly reduce the expense of boiler washing and real data rather than guesses proved that the savings were well worth considering.

Rough-Riding Passenger Cars

SMALL TOWN, N. Y.

TO THE EDITOR:

Your remarks from time to time on the passenger transportation problem are to the point. I often have to travel and by nature prefer to go by rail rather than road. I have a keen interest in the railroad on which I live, having money invested in it and having been employed by it. And yet I usually travel by motor for two reasons—the bad riding quality of the coaches, and lack of punctuality. The steel coaches of this company were originally equipped with the orthodox six-wheel truck and were quite comfortable to ride in. Since then they have substituted a truck which, for maintenance, may be an improvement but for riding qualities is worthless. The trouble is due to the weight being carried entirely on short plate springs rather than partly by coil springs as in the conventional truck. This sets up a vibration in the interior of the car causing a sensation on the ear drums only one degree less annoying than the noise emitted by a locomotive when standing with a hole in the tire.

Nowadays the aim seems to be the building of a ponderous car to withstand collision but with no thought as to comfort. As I sit in one of these battering rams and try to divert my thoughts from the vibration, I wonder how much of my fare is absorbed by a car weighing 75 tons instead of 50 tons of the coach of 20 years ago. The thought comes that in automotive engineering, steel has been substituted for wood, without any increase in weight or decrease in strength; that the tendency has been to build motor cars lighter; that the lesser weight has been accompanied by better riding qualities through better suspension; that, although collisions with other vehicles and with trains at crossings occur, often with serious fatalities, the automobile is not built armored for these occasions.

On the other hand, when I travel in an English passenger coach 70 ft. long and weighing less than 40 tons, I appreciate how comfortably it rides, how all the shocks and noises are deadened. The reason is that the designer deliberately tried to do it. The wheels, for instance, have a wooden filler between the hub and rim; the long wheelbase of the truck, the long springs making contact with the truck frame through rubber blocks all contribute to the desired end. We frequently criticize the British for not profiting by our methods of handling freight. Why don't we profit by their way of handling passengers?

W. G. LONDON.

The St. Louis (Mo.) Chamber of Commerce invited the Chicago city passenger agents of various railroads to be its guests in St. Louis on April 15 and a party of 75 Chicago passenger representatives attended.

Modern Tendencies in Locomotive Design*

Need of Increased Economy in Use and Production of Steam; Turbine and Internal Combustion Locomotives Possible

By James Partington

Estimating Engineer, American Locomotive Company, New York

THE TYPES, weights and general details of construction of locomotives have undergone striking changes in the last 20 years. A study of these changes will show in a great measure the modern trend of locomotive design.

Modifications of type may be briefly summarized as follows: Eight-wheel passenger locomotives have been superseded by Pacific and Mountain types; Consolidation freight locomotives have been superseded by Mikado and Santa Fe types, and to some extent by Mallets; four and six-wheel switchers have been, to a large extent, superseded by eight-wheel switching locomotives.

The weight per axle has been increased from time to time as track and bridges would permit so that 60,000 lb. per axle is a common axle load today and 70,000 lb. is sometimes reached.

The boiler of moderate size with a narrow firebox between the frames or between the drivers has been superseded by a modern steam plant with wide firebox above the wheels, fitted with superheater, brick arch, flexible staybolts, feed-water heater, thermic syphons, circulating devices, combustion chambers, exhaust steam injectors, etc.

Stephenson valve gear and slide valve cylinders have been superseded by piston valve cylinders with outside steam pipes and outside valve gears of a number of different types.

Some Prime Requisites

All locomotives should conform to certain prime requisites that may be stated as follows: (1) A drawbar pull that will handle the largest tonnage that road conditions permit; (2) The production and delivery of drawbar horsepower at minimum cost; (3) Careful designing to embody road standards, to meet Interstate Commerce Commission requirements and to keep maintenance charges down to a minimum.

To meet the first requirement all the physical conditions of the road must be carefully studied, the horse power curves of different types of locomotives at the speeds they will have to operate analyzed and the type selected that best fulfills the needs of the service.

Importance of Economy

In designing locomotives to meet the second requirement, all the devices which make for economy of fuel must be considered. The application of a brick arch in the firebox and a fire-tube superheater are items of general design which have shown noteworthy reductions in coal and water and are being applied in all modern locomotives. The use of a feedwater heater or an exhaust steam injector is a comparatively recent development in American practice although each of these devices has shown marked saving in fuel in European operation. The use of these is now becoming more common on our railroads. On many designs of locomotives the use of a combustion chamber, providing a longer flame-way and an opportunity for secondary combustion before the flame and gases enter the tubes, shows an economy which is available with but slight additional first cost.

A more careful consideration of diameter of tubes as a factor of the length over tube sheets may also be cited. For the best results with bituminous coal the length of the

boiler tubes should be approximately within the following limits:—

Out. diam. of tube	Distance over tube sheets
2 in.	18 ft. 0 in. to 19 ft. 6 in.
2¼ in.	22 ft. 6 in. to 24 ft. 6 in.
2½ in.	28 ft. 0 in. to 30 ft. 0 in.

These proportions are based on the evaporative values of tubes of varying lengths and can serve only as a guide in deciding tube diameters, especially for the intermediate lengths not covered by the table where a choice of either of two diameters can be made without sacrificing efficiency. For example, 2 in. or 2¼ in. tubes may be used for a length over tube sheets of 21 ft. unless there are special conditions of draft or fuel which require separate consideration.

The tendency which was frequently indicated after the introduction of superheaters, to curtail the steam space of the boiler, is being avoided to as large an extent as possible in the locomotive of today. Sufficient steam space and a throttle designed and located to deliver dry steam to the superheater are recognized items having an important bearing on the performance of the locomotive.

The type of throttle usually applied now is designed to permit entrance to the boiler through the dome without removing the throttle, thus avoiding the use of an auxiliary or inspection dome.

The boiler and cylinder proportions of modern locomotives are such that extravagant forcing of the fire is unnecessary, the heating surface and the grate area being sufficient to provide the maximum amount of steam required with a coal consumption per square foot of grate per hour not exceeding 120 lb. for bituminous coal, and not exceeding 55 lb. to 70 lb. for anthracite.

Present day locomotives are usually designed to be as large and powerful as the roadbed, bridges and clearances will permit. This makes it necessary to apply automatic stokers to supply the large amount of coal consumed, the limit per hour for hand firing by one fireman being about 6,000 lb.

In connection with the economical production of steam there are a number of other devices coming into use, important among which the following may be mentioned:

The application of two or three thermic syphons; the number depending on the width of the grate. These provide a considerable amount of additional heating surface in the most effective location, i. e., in the firebox, and contribute toward a better circulation of water over the firebox crown.

Another method of improving circulation which has been applied on a number of recent locomotives, embodies the application of a horizontal plate laterally in the boiler shell, located so that about one-half of the tube heating surface is above this plate, the balance below it, causing a lower circulation of water toward the back tube sheet and sides of the firebox and an upper circulation forward.

A generous use of flexible staybolts is noticeable in all modern boilers on account of the noteworthy saving in frequency of inspection and cost of renewals.

On account of the weight necessary to provide for boilers of ample size and the auxiliary attachments necessary for the most economic production of steam, the weight of the machinery parts must be carefully proportioned to keep them down to a safe minimum. This has caused a demand for the

*Abstract of a paper presented April 7, 1922, at the Newport News meeting of the American Society of Mechanical Engineers, Virginia Section.

employment of special alloy steel for many parts subject to severe stress and fatigue.

To secure materials which can be readily repaired or replaced by the ordinary railroad shop the present trend is toward the employment of alloy steels which will give the required additional strength and tenacity without the necessity of heat treatment of these special forgings.

The employment of a booster to gain additional tractive power by utilizing the adhesive weight on truck wheels and the application of cylinders on the tender in a number of cases may be noted as one of the recent developments intended to provide increased tractive power for emergencies, such as short steep grades, starting trains on a grade, etc.

Maintenance Cost Must Be Kept Down

In designing locomotives to meet the third requirement—keeping down the maintenance charges—the engineers of the railroads and of the locomotive builders are giving special attention to the following points:

Careful determination of the stresses in all parts of the locomotive and tender and securing proportions and materials which will withstand these stresses and avoid costly failures in service.

Adoption of designs which will reduce the number of parts as much as possible thus keeping bolted connections to a minimum.

Avoidance of construction which cannot readily be removed for repair or renewal or repaired in place at reasonable cost.

Due consideration of the question of lubrication and making the engine parts accessible for lubrication and inspection. Nearly all bearings on modern designs are arranged for grease lubrication.

Possible Future Developments

Whether the design of locomotives of the future will continue along conventional lines will depend largely on experiments along new lines and the success or failure of such experiments.

The writer believes we will see more successful adaptation of three-cylinder locomotives in which the advantages secured will be greater and the complications of construction will be simplified. Increased efficiency will also be sought by the employment of higher boiler pressures and higher degrees of superheat. To secure higher boiler pressures without entailing prohibitive increased charges for boiler maintenance, a new type of boiler may be necessary. To secure higher degrees of superheat, the changes involved can readily be worked out and adapted as required.

It may be that the merits of internal combustion will be tested out on our railroads, although the complications involved do not appeal strongly to the maintenance departments. Several locomotives of this type are being developed in other countries.

Progress is being made abroad in condensing turbine driven locomotives and the results thus far obtained have been encouraging.

Further improvements in the draft appliances and reduction in the back pressure of exhaust are being diligently sought. The improvement of locomotives from the standpoint of design and operation is a fascinating subject on which much time and study has been expended in the past, is being expended at the present time and will undoubtedly attract as much if not greater effort in the future. The promise of the future is bright. May the accomplishments of the next decade equal, yes, may they exceed what has been attained in the past etc.

Discussion

L. D. Freeman, *Assistant Superintendent Motive Power, Seaboard Air Line*. An interesting feature in the design of modern locomotives is found in a comparison of the Mountain type locomotive of Seaboard Air Line

with locomotive No. 50000 built by the American Locomotive Company in 1910. In 1913 the largest passenger locomotive on the Seaboard Air Line was a Pacific type of 36,000 lb. tractive effort, the maximum permissible wheel load at the time being 47,000 lb. per pair of driving wheels, necessitating double-heading on regular trains.

Based on the proportions of locomotives No. 50000, ten Mountain type locomotives were built in 1914 by the American Locomotive Company having 47,800 lb. tractive power and weighing 209,000 lb. on four pair of drivers, or 52,250 lb. average per pair, which is still the maximum permissible wheel load on that road. After experience with these locomotives five more were built in 1917 and ten more in 1922.

The performance of these locomotives over a period of seven years indicates that the original design was correct and no changes were found necessary in the two repeat orders. It is felt that in view of this performance the statement that the basic principles developed in the design of locomotive No. 50000 were correct is fully justified.

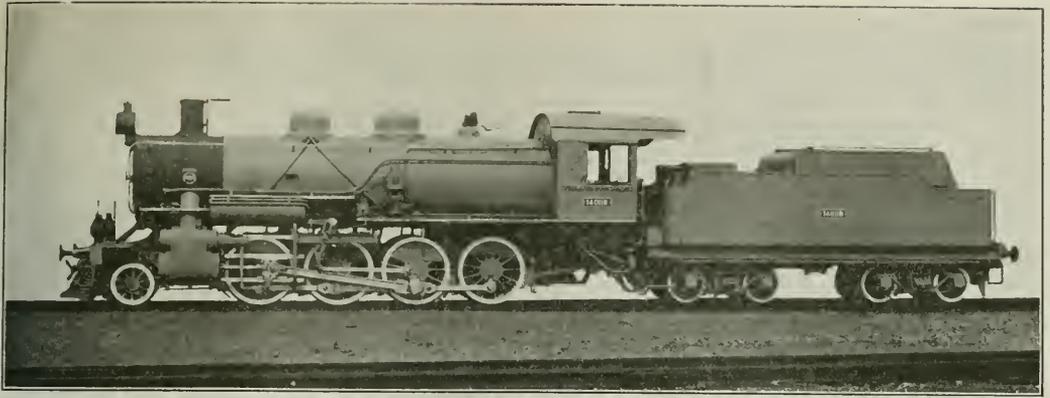

The locomotives in question are successfully operating over a very congested section of single track regularly handling 11 steel cars weighing 75 tons each or 825 tons behind tender at 28 m.p.h. over ruling grades of 1.1 per cent with a maximum speed restriction of 50 m.p.h. over a division of 154.7 miles, making an average speed of 34.9 m.p.h. On the next division under the same conditions the train is handled 202.3 miles, making an average speed of 36.7 m.p.h. When conditions require, these locomotives handle up to 13 cars weighing 75 tons each, or 975 tons behind the tender over the 1.1 per cent ruling grade at 22 to 25 m.p.h. and maintain the regular schedules.

The average fuel consumption in winter months is 120 lb. of coal per locomotive mile with an average of 12 cars per train which takes into account the varying condition of the entire group of locomotives of this class. The first ten locomotives have performed since 1914 a total average mileage of 370,000 per engine, with an average mileage between the general repairs of 95,000 miles and in a few exceptional cases of 180,000 miles, indicating proper design of details.

In recent years many improvements tending to economy in steam production have been made in the locomotive boiler by the addition of superheaters, brick arches, feedwater heaters, mechanical stokers, power grate shakers and improvements in grate arrangements, ash pans and front ends.

Unfortunately the same degree of improvement in the use of steam in locomotive cylinders has not been attained. After nearly a hundred years of locomotive building we have still retained the slide valve, or in cylindrical shape the piston valve, to admit steam to and to exhaust steam from the cylinders, the latter with increased cylinder clearances. The most objectionable feature in connection with the use of a single slide valve or piston valve is the fact that when the valve travel is decreased to reduce the steam cut-off the exhaust closes earlier, causing high back pressure and necessitating comparatively large cylinder clearance space to prevent compression in excess of boiler pressure, which results in considerable loss due to the comparatively low ratio of expansion at short cut-off and early release periods.

Experiments are now being made of applying to a locomotive a valve arrangement consisting of four valves for each cylinder, two for intake and two for exhaust, operated by a modified Walschaert valve motion, the object being to apply the best principles of the four-valve non-releasing Corliss valve mechanism as used in high speed stationary engines to a locomotive, with a view of reducing the cylinder clearance, delaying the exhaust closure to reduce the back pressure and increase the ratio of expansion by providing a constant point of exhaust opening independent of the point of cut-off of the steam inlet valves. While this arrangement is still in the experimental stage it appears to point the way for a substantial increase in steam economy for locomotives.

On a Previous Trip Mr. Vauclain Sold to Roumania 50 Locomotives Like This

An Interview With Samuel M. Vauclain

Returns from Extensive Trip in Europe and Discusses
Economic Conditions There

IN 1920, Samuel M. Vauclain, president of the Baldwin Locomotive Works, spent some two months in Europe, his itinerary including France, Poland, Roumania, Serbia and England.

The substance of an interview with Mr. Vauclain in his London office, given just before he left for America, appeared on page 1506 of the May 28, 1920, issue of the *Railway Age*. Later, on September 21, 1920, Mr. Vauclain talked in more detail about his trip at a meeting of the Western Railway Club in Chicago. Summed up, the contracts for locomotives made by Mr. Vauclain during his 1920 trip as modified later, were as follows: 150 Consolidations for Poland, payable in Polish government bonds; and 50 of the same type for Roumania, payable 10 per cent in either cash or oil, the balance to be covered by government notes payable in 60 monthly payments either in oil or in cash plus 6 per cent interest, and 1 per cent yearly for financing, the interest to be included in the face value of the notes. The contract for 50 engines was supplemented by orders for a lot of spare parts and \$507,000 worth of machinery and supplies.

On December 14, 1921, Mr. Vauclain again went abroad, returning to the United States on February 15, last. This time he covered much of the same ground, visiting Paris; Brussels, Antwerp and Liege, Belgium; Essen and Berlin, Germany; Stockholm and Gothenborg, Sweden; Christiania, Norway; Warsaw, Poland; Vienna, Austria; Budapest, Hungary, and London.

During the 1920 trip Mr. Vauclain wrote in some detail to the Philadelphia office, interspersing business transactions with accounts of people he met and the way in which he was entertained by royalty and others, and with observations of the countries through which he passed, their people and activities. The letters proved "so full of human interest, keen business observation and humor" to those at the home office that they were reproduced in pamphlet form "for the confidential information of directors, officers and foreign sales organization of the Baldwin Locomotive Works; also for a few of Mr. Vauclain's friends."

Our London interview in 1920 having proved fruitful, we approached Mr. Vauclain some days after his return to

Philadelphia from his last trip; and in his usual frank manner he talked freely about the results of his observations. As in 1920, he kept his office informed of his doings; and these letters, too, are being put in type for limited circulation.

Paris having been Mr. Vauclain's first, as well as his next to last objective, it was but natural that he should first discuss France. He was astonished at the progress made since his previous visit in reconditioning the French railways, particularly the all but war-destroyed Nord, and in rebuilding the towns which were demolished, in whole or in part, during the war. Generally, the French trains were on time, the cars clean and the roadway smooth. As to locomotives, Mr. Vauclain found that the railways have a sufficient number in good condition and that there is no chance that any will be bought outside of France for a long time to come, the locomotive building shops of the country having ample facilities for taking care of normal requirements.

In Belgium Mr. Vauclain found considerable industrial activity, although labor conditions were far from good. Many factories that had been dismantled by the Germans during the war were being rebuilt with machinery supplied by Germany under the reparations agreement.

As to Essen, Berlin and Germany, generally, Mr. Vauclain made a number of facetious remarks about the time consumed and the trouble to which he had been put in getting in and out of the country. At Essen he found that part of the Krupp plant which he visited to be working under severe handicaps in the way of obsolete machinery and methods, the only compensating feature from the viewpoint of competition being the cost of labor, which is only about 10 per cent of what we pay for similar work. The locomotive shop was turning out only about one engine a day. At the time of his visit, Germany was in the throes of a railway strike. He found the cars dirty and the morale of the train crews at low ebb. "One could buy the whole train from the conductor," he said; adding, "It was worse than in Russia in 1914 and it will require a long time for Germany to correct it."

In Sweden Mr. Vauclain found the country alive with activity. The various locomotive builders were busy in their comparatively slow way on the order for one thousand engines

for Russia. At the rate at which they are being turned out the order will not be filled until 1926. All of the locomotives are being assembled at the plant of the Russian-Swedish Locomotive Works at Trollhattan, near Gothenburg, and shipped to tidewater by canal. Mr. Vauclain pronounced as good both materials and workmanship of the locomotives.

Contrary to Sweden, Norway was found to be commercially stagnant, due to a severe depression in its fisheries, the life of the nation.

From Stockholm, Mr. Vauclain had intended to go to Russia; but on advice he decided to postpone his visit indefinitely, especially as at that time troops were being massed on the Finnish border.

As to Poland, Mr. Vauclain found marked progress since his visit in 1920; but he does not look for much business for America until a way can be found to provide the country with much needed working capital. He hopes that Americans with real vision will appreciate the possibilities for increasing our exports to Poland and furnish the necessary credit.

Czecho-Slovakia seemed to Mr. Vauclain to be teeming with prosperity, while Austria, especially Vienna, was in a pitiable state of inactivity. Hungary he found fairly prosperous and busy.

When asked specifically about the chances for orders for locomotives in the near future from the countries of Central and Western Europe, Mr. Vauclain said: "All of the countries are amply supplied, with the exception of Poland and Roumania. They could use a few more profitably; but with us negotiations are out of the question because of the necesse Works have been pioneers in the matter of trading city for extending long time credits. The Baldwin Locomotives for commodities and the outcome to date has been very satisfactory. However, I feel that for the present we have done all that we should."

Coal Production During First Week of the Strike

WASHINGTON, D. C.

THE TOTAL production of all coal—anthracite and bituminous—in the first week of the strike was the lowest in modern coal history, according to the weekly bulletin issued by the Geological Survey. The output of bituminous coal dropped to approximately 3,500,000 tons, and in the anthracite region work ceased entirely. During the 1919 strike the anthracite mines operated at capacity.

The reports so far received consist of the number of cars loaded on each division of 130 of the principal coal-carrying railroads. They show that from 60 to 64 per cent of the bituminous tonnage of the country has been closed by the strike. Of the remaining tonnage a significant portion had not been operating recently for lack of demand. In the first week of the 1919 strike 71 per cent of the tonnage was closed. The smaller portion closed during the present strike is partly explained by the fact that certain organized districts whose contracts did not expire on April 1 have continued to operate.

The following statement shows the cars of soft coal loaded daily, according to telegraphic reports received from the carriers. As April 1 is a union holiday, loadings on that day did not reveal the extent of the strike. The first test came on Monday, April 3. On that day 11,445 cars were loaded, against 38,056 cars on the preceding Monday. Another loading for the balance of the week was: Monday, April 3, 11,445; Tuesday, April 4, 11,019; Wednesday, April 5, 11,411; Thursday, April 6, 11,061; Friday, April 7, 11,334; Saturday, April 8, 8,881; Monday, April 10, 10,773. During April 1921, the average loading was 20,054 cars daily and for the year 1921 the average daily loading was

24,295. The total output for the week will be in the neighborhood of 3,500,000 tons. In the first week of the 1919 strike 3,582,000 tons were produced.

Reports from all non-union fields to the National Coal Association state that production is running at various rates from 40 per cent to 70 per cent or 80 per cent of normal and that the only reason for the failure to produce more is the indifference of consumers. Thousands of cars of coal are standing on the mine sidings and in railroad yards awaiting billing orders from consumers. Consumers are said to manifest no anxiety with respect to their future stocks of coal. Large amounts of coal produced in the union fields during the last week before the strike are remaining unsold upon the sidings.

The week's output falls short of what the mines not affected by the strike can produce if the demand is active. From mines in many non-union districts reports of "dull market," and "no orders" have been received, and there is a large number of loaded cars unbilled on the sidings, some of which are in fields closed by the strike. Even during the week before the strike it was reported that 30 per cent of full-time output was lost because of no market.

Production of soft coal continued to increase during the last five days before the strike, but because of the decline on Saturday the total output for the week ended April 1 was less than the week before. Including lignite and coal coked, the production is estimated at 10,453,000 net tons.

The record of production during March removed all reasonable doubt that the 52,500,000 net tons of soft coal in the hands of consumers on March 1 had increased to 63,000,000 tons, or more, by the opening day of the strike. The quantity on hand on April 1 was therefore equal to the maximum stock at the end of the war.

At the rate of consumption prevailing in January and February the reserve in the hands of consumers April 1 was sufficient to last 52 days, if evenly divided. But stocks are never evenly divided. There are some consumers who store virtually no coal, and in some entire states the average stock is much lower than in others. Further, a certain minimum reserve is necessary for steady operation of utilities.

Back of this stock of 63,000,000 tons in the hands of consumers April 1 there was a further reserve of over 4,000,000 tons on the Upper Lake Docks, and a smaller quantity stored on the ground at the mines or at intermediate storage yards. These figures take no account of the coal on wheels, including a heavy tonnage of unbilled loads on hand at the mines when work stopped in the union districts on Saturday.

Anthracite is stored commercially in three places—in retail coal yards, on the Upper Lake Docks, and in the storage yards of the producers. Retail coal dealers' stocks on March 1 were about the same as a year ago, but much larger than in 1919 and 1920. Stocks on the Lake Docks were 821,000 tons on the same date. No statistics of anthracite in producers' storage are available for March 1. On November 1 last there were 4,500,000 gross tons in the yards, of which 40 per cent was domestic sizes. In addition there is a surplus of 1,000,000 tons of coke on hand at by-product coke works, much of which may be considered a substitute for anthracite.

Under the stimulus of heavy demand due to the approaching miners' strike, production in March passed the 50,000,000 ton mark. Estimates based on statements of cars loaded place the total at 50,193,000 net tons, against 40,951,000 tons in February. This was the highest record for any March during the past ten years, the period over which the Geological Survey's records of monthly production extend. In round numbers, this was an increase over March, 1921, of 19,800,000 tons, or 64 per cent, and it even exceeded the corresponding month in the war years 1917 and 1918 by more than 2,000,000 tons.

The total production during the coal year 1921-22 is estimated at 434,279,000 tons, the lowest for many years.

Daniel Willard Testifies Before Senate Committee

President of Baltimore & Ohio Refutes Statements of
Messrs. Warne and McAdoo

WASHINGTON, D. C.

DANIEL WILLARD, president of the Baltimore & Ohio, on April 8 completed his statement before the Senate Committee on Interstate Commerce in rebuttal of statements reflecting on the railroads made by W. G. McAdoo and Frank J. Warne.

Mr. Willard concluded his statement with the following summary:

"In conclusion. I gathered from a careful reading of his statement before this committee that Mr. McAdoo desired to show:

1. That the railroads under private management and previous to federal control had broken down as transportation agencies, and that it became necessary on that account for the President to take possession and assume control of the railroads as a war measure.

2. That the operation of the railroads while under federal control had been much more efficient and economical than under private control, and that the properties were returned to their owners on March 1, 1920, with facilities and equipment much improved.

3. That the railway managers found it necessary soon after the termination of federal control to call on the Interstate Commerce Commission for help, and, further, because of the abandonment of the unified practices introduced during federal control, the operation of the roads under their owners was less efficient and less economical in 1920 than it was during the period of operation by the director general.

No Breakdown of Railroads

"I have endeavored to show to this committee that not only had the railroads *not* broken down as transportation agencies in 1916 and 1917, as stated by Mr. McAdoo, but that on the contrary they performed in 1917 the greatest transportation service ever accomplished up to that time.

"I do not question Mr. McAdoo's statement that the railroads were efficiently operated while under federal control and that they met the transportation requirements incidental to the government's war program. Freed from all the restrictions surrounding their operations during the previous year, it is not surprising that the railroads in 1918 should have been able under governmental control to move in the aggregate approximately 2 per cent more tonnage than they moved in 1917.

"The contention of Mr. McAdoo that the railroads were returned to their owners in better physical condition than when taken over by the President can not, in my opinion, be sustained, but whether it can be sustained or not, that question has no direct bearing whatever upon the merits or demerits of federal control. It does, however, involve an important question or fact. If it is true, as the railway managers claim, and as I believe, that the condition of the carriers as a whole was lower at the end of federal control than at the beginning, then the difference in standard, however great, must be made up, and unless it is made up from monies paid to the carriers by the director general on account of under-maintenance, it will, of course, have to be done with monies collected from the people through the medium of transportation charges. The question itself has a very intimate relation with the future basis of rates.

Railroad Record Broken in 1920

"It is true, as Mr. McAdoo states, that the railway managers did take up with the Interstate Commerce Commission shortly after the termination of federal control, and as contemplated in the Esch-Commins act, certain matters pertaining to the then transportation situation. It is also true that in co-operation with the commission, and in full accord with the provisions of the act, the railroads under private management in 1920 were able to move and actually did move nearly 2 per cent more ton-miles than they ever moved before under any circumstances. It seems to me that the results so obtained not only justified the carriers in their action, but also fully justified the act itself.

"I have not attempted to reply in a critical manner to the criticisms—personal or otherwise—contained in Mr. McAdoo's statement. In fact, I am inclined to believe that the real merits of the questions actually before this committee have been obscured and made more difficult of ascertainment because of too much criticism on both sides.

Railroads Taken Over Only for War Purposes

"My own judgment leads me to the following conclusions:

1. Congress itself acted wisely in 1916 when it made provision in advance for the taking over of the railroads by the President whenever

such action in his judgment should seem necessary as a war measure.

2. The President, under the circumstances, acted wisely when in the exercise of the power granted him as a war measure, he took possession of the railroads on December 28, 1917.

3. After the Armistice there was certainly no reason why the President should longer retain possession of the properties as a war measure. It was recognized by all, however, that it would be both unwise and destructive to terminate federal control until Congress should provide a better method of regulation than had been in effect previous thereto. Owing to the magnitude of the problem so presented to Congress, it was necessary to prolong the period of federal control until March 1, 1920.

4. Inasmuch as Congress had never authorized the President to take possession and assume control of the railroads for the purpose of developing the relative merits of private ownership and operation versus Government control and operation, any steps in that direction which were taken during the period of federal control and which resulted in any manner inimical to the best interests of the public or of the carrier properties so seized, were unfair, unwarranted and illegal because they were not justified by law.

5. Congress itself having decided upon the policy of private ownership and operation of the railroads, with governmental regulation, provided by suitable legislation for the continuance of the method so determined upon. Nothing has yet developed to show that Congress erred in its decision either to terminate federal control and operation, or in the scheme of regulation which it provided for the future operation of the roads, while much that has happened since the termination of federal control, tends to justify the action of Congress and confirm the wisdom of the Transportation Act.

What the Railroads Need

6. What the railroads need more than anything else at the present time is an opportunity under the terms of the act to work out their problems without unnecessary and burdensome interference, and I have the utmost confidence that they will successfully surmount their present difficulties if given a fair chance to do so. I am also confident that they will provide the people of this country with adequate transportation at reasonable rates and lower rates than are to be found for similar service in any other country in the world. This the railroads did do under the faulty scheme of regulation in effect before the war, and much more should they be able to do so under a better and wiser scheme of regulation now in effect."

Mr. Willard Stands on His Record

Mr. Willard said it had not been his intention to refer to the letters introduced by Mr. McAdoo, which he had written shortly after becoming director general in 1918 to a number of eastern railroad presidents, expressing dissatisfaction with the operation of their roads, but at the request of members of the committee he submitted a statement outlining his railroad experience of 40 years, beginning as a track laborer and recently having been chosen by the railroads of the United States as chairman of the advisory committee of the Association of Railway Executives and chairman of the board of directors of the American Railway Association.

Mr. Willard also pointed out that while he was serving the government in Washington in 1917 the Baltimore & Ohio under his general direction had handled more freight business than ever before, 19 billion ton-miles, and that for 1920, when he resumed its management after the expiration of federal control it also performed more freight service than ever before, 21,600,000,000 ton-miles, as compared with 17,700,000,000 in 1918 and 17,900,000,000 in 1919. He also said Mr. McAdoo's letter criticizing the performance of the Baltimore & Ohio and other roads was written on January 17, 1918, only 21 days after he had become director general, without consultation with him or any officer of the Baltimore & Ohio regarding its conditions, and only six days after Mr. Willard had resigned as chairman of the War Industries Board to devote his entire time to the Baltimore & Ohio.

Regarding the alleged dismissal of the railroad presidents in May, 1918, Mr. Willard said that C. H. Markham, regional director, had asked him to become federal manager of the eastern lines of the B. & O., but that he had elected to remain with the company. He said that he and President Rea of the Pennsylvania had been called to Washington to

see Mr. Hines, then assistant to the director general, and had been informed of the plan to separate the officers reporting to the companies and those reporting to the administration. Mr. Willard said they were told that undoubtedly Mr. Markham would be glad to appoint them federal managers but that it was assumed they would prefer to remain with their companies and they did so. "We were told we were not dismissed," he said, "but evidently something got crossed in their publicity department, because it was given out that we were fired."

Mr. Willard said he did not recall hearing any railroad president criticize the administration because of increasing the wages of railroad employees as a class, but he thought there was quite a general belief among railroad managers and others, which he shared, that with respect to rules and working conditions the director general made concessions that seemed unwise, uneconomical and unnecessary.

Regarding statements made before the committee by Mr. McAdoo, and by Mr. Warfield as to the economies to be realized by unification and joint use of facilities, Mr. Willard said he was inclined to think they were not fully advised concerning all that the railroads had done and are still doing in the way of joint use of facilities. As bearing upon this point, he filed a statement on this subject based on a questionnaire prepared by Julius H. Parmelee, director of the Bureau of Railway Economics, which he had used in his recent testimony before the Interstate Commerce Commission.

Denying numerous statements made before the committee by Frank J. Warne, Mr. Willard said the Baltimore & Ohio is not interested through stock ownership or otherwise in any company making commercial shipments of coal from mines tributary to its lines, or for that matter, from anywhere else.

B. & O. Has No Interest in

Commercial Coal Operations

"I have been president of the Baltimore & Ohio since January 1910," he said, "and from my personal knowledge the company has had no interest whatever in commercial coal operations since that time. The only interest the Baltimore & Ohio previously had in coal operations making commercial shipments, was in the Consolidation Coal Company. It did, as stated by Mr. Warne, own 52 per cent of the stock of that company, which in turn owned extensive operations in Maryland, Pennsylvania and West Virginia and from which company there was purchased at advantageous figures (the prices for years being from 85 cents to \$1 per ton) a large proportion of the railroad's fuel requirements. Anticipating the public sentiment which later developed against such dual ownership, the Baltimore & Ohio, more than 14 years ago, sold its entire interest in that company to former Senator C. W. Watson, of West Virginia, and his associates. Since then, as stated above, the Baltimore & Ohio has not been interested in any commercial coal operations on its lines or elsewhere. Mr. Warne could easily have ascertained the facts in this connection if he had desired to do so.

"For a time following this sale the Baltimore & Ohio held certain fixed interest bearing obligations of Mr. Watson and his associates, secured by a pledge of the stock which was deposited with the Empire Trust Company as trustee. In 1913, the purchasers paid these obligations in full and since that date the Baltimore & Ohio has had no investment or interest directly or indirectly in the Consolidation Coal Company.
